### PART I

---

### Getting Started with Device Configuration 83

#### CHAPTER 1

#### Device Management 1

##### About Device Management 1

##### About the Firewall Management Center and Device Management 1

##### What Can Be Managed by a Secure Firewall Management Center? 2

##### About the Management Connection 3

##### Beyond Policies and Events 3

##### About Device Management Interfaces 4

##### Management and Event Interfaces on the Firewall Threat Defense 4

##### Using the Firewall Threat Defense Data Interface for Management 4

##### Management Interface Support Per Device Model 5

##### Network Routes on Device Management Interfaces 6

##### NAT Environments 7

##### Management and Event Traffic Channel Examples 9

##### Requirements and Prerequisites for Device Management 10

##### Log Into the Command-Line Interface on the Device 11

##### Complete the Firewall Threat Defense Initial Configuration for Manual Registration 13

##### Complete the Firewall Threat Defense Initial Configuration Using the Firewall Device Manager 13

##### Complete the Firewall Threat Defense Initial Configuration Using the CLI 19

##### Configure an Event Interface 26

##### Manage Devices 28

##### About the Device Management Page 28

##### Add a Device Group 29

##### Register With the Management Center 29

##### Add a Device Using a Registration Key 29

Add a Device Using the Serial Number (Zero-Touch Provisioning)	34
Add a Chassis	40
Register With a New Management Center	42
Resolve Serial Number (Zero-Touch Provisioning) Registration Issues	43
Delete (Unregister) a Device from the Firewall Management Center	47
Shut Down or Restart the Device	48
Download the Managed Device List	49
Migrate Firewall Threat Defense Devices	50
Supported Devices for Migration	50
License for Migration	50
Prerequisites for Migration	51
What Configurations Does the Wizard Migrate?	51
Limitations for Migration	52
Best Practices for Threat Defense Device Migration	53
Switch Managers	53
Switch from the Firewall Device Manager to the Firewall Management Center	53
Switch from Firewall Management Center to Firewall Device Manager	58
Hot Swap an SSD on the Secure Firewall 3100/4200	59
History for Device Management	62

---

**CHAPTER 2**
**Device Settings 67**

Edit General Settings	67
Generate Troubleshooting Files	69
View CLI Output	71
Copy a Configuration to Another Device	73
Export and Import the Device Configuration	74
Edit License Settings	79
View System Information	79
View Device Inventory	80
View the Inspection Engine	81
Edit Health Settings	81
Edit Management Settings	81
Configure a Redundant Manager Access Data Interface	81
Change Manager Access Interface Settings	87

Change the Device IP Address	87
Change the Firewall Management Center IP Address	99
Change Both Firewall Management Center and Threat Defense IP Addresses	100
Change the Manager Access Interface	104
Troubleshooting the Management Connection	115
Manually Roll Back the Configuration if the Firewall Management Center Loses Connectivity	115
Troubleshoot Management Connectivity on a Data Interface	117
View Inventory Details	121
Edit Applied Policies	122
Edit Advanced Settings	124
Configure Automatic Application Bypass	125
Configure Object Group Search	125
Configure Interface Object Optimization	127
Edit Deployment Settings	127
Edit Cluster Health Monitor Settings	130
History for Device Settings	135

---

## CHAPTER 3

<b>Users</b>	<b>139</b>
About Users	139
Internal and External Users	139
CLI Access	139
CLI User Roles	140
Requirements and Prerequisites for User Accounts for Devices	140
Guidelines and Limitations for User Accounts for Devices	141
Add an Internal User at the CLI	141
Configure External Authentication for the Firewall Threat Defense	143
About External Authentication for the Firewall Threat Defense	143
About LDAP	144
About RADIUS	144
Add an LDAP External Authentication Object for Firewall Threat Defense	145
Add a RADIUS External Authentication Object for Firewall Threat Defense	150
Enable External Authentication for Users on Firewall Threat Defense Devices	155
Troubleshooting LDAP Authentication Connections	155
History for Users	157

---

**CHAPTER 4****Change Management 159**

- About Change Management 159
  - How to Configure Devices in the Change Management Workflow 160
  - Creating Separate Approver and Configuration Roles 160
  - Policies and Objects that Support Change Management 161
- Requirements and Prerequisites for Change Management 163
- Guidelines and Limitations for Change Management 163
- Enabling or Disabling Change Management 164
- Managing Tickets 165
  - Creating Change Management Tickets 166
  - Opening a Ticket for Configuration Changes 167
  - Previewing a Ticket 167
  - Submitting a Ticket 168
  - Discarding a Ticket 168
  - Approving or Rejecting a Ticket 169
- History for Change Management 169

---

**CHAPTER 5****Configuration Deployment 171**

- About Configuration Deployment 171
  - Configuration Changes that Require Deployment 171
  - Deployment Preview 172
  - Selective Policy Deployment 173
  - System Username 175
  - Auto-Enabling of Application Detectors 176
  - Asset Rediscovery with Network Discovery Policy Changes 176
- Snort Restart Scenarios 176
  - Restart Warnings for Devices 176
  - Inspect Traffic During Policy Apply 177
  - Snort Restart Traffic Behavior 178
  - Configurations that Restart the Snort Process When Deployed or Activated 180
  - Changes that Immediately Restart the Snort Process 181
- Requirements and Prerequisites for Policy Management 181
- Best Practices for Deploying Configuration Changes 182

Deploy the Configuration	183
Deploy Configuration Changes	183
Redeploy Existing Configurations to a Device	189
Manage Deployments	191
View Deployment Status	191
View Deployment History	191
Set the Number of Configuration Versions	195
Roll Back a Deployment	196
Perform a Rollback	198
View the Deployment Rollback Transcript	200
Download Policy Changes Report for Multiple Devices	200
Compare Policies	201
Generate Current Policy Reports	202
History for Configuration Deployment	203

---

## PART II

---

## Device Operations 207

### CHAPTER 6

## Transparent or Routed Firewall Mode 209

About the Firewall Mode	209
About Routed Firewall Mode	209
About Transparent Firewall Mode	210
Using the Transparent Firewall in Your Network	210
Passing Traffic For Routed-Mode Features	210
About Bridge Groups	211
Bridge Virtual Interface (BVI)	211
Bridge Groups in Transparent Firewall Mode	211
Bridge Groups in Routed Firewall Mode	212
Allowing Layer 3 Traffic	213
Allowed MAC Addresses	213
BPDU Handling	213
MAC Address vs. Route Lookups	214
Unsupported Features for Bridge Groups in Transparent Mode	215
Unsupported Features for Bridge Groups in Routed Mode	216
Default Settings	217

Guidelines for Firewall Mode 217

Set the Firewall Mode 218

## CHAPTER 7

### Logical Devices on the Firepower 4100/9300 221

About Interfaces 221

Chassis Management Interface 221

Interface Types 222

FXOS Interfaces vs. Application Interfaces 224

Shared Interface Scalability 226

Shared Interface Best Practices 226

Shared Interface Usage Examples 228

Viewing Shared Interface Resources 234

Inline Set Link State Propagation for the Firewall Threat Defense 235

About Logical Devices 235

Standalone and Clustered Logical Devices 236

Logical Device Application Instances: Container and Native 236

Container Instance Interfaces 236

How the Chassis Classifies Packets 237

Classification Examples 237

Cascading Container Instances 241

Typical Multi-Instance Deployment 242

Automatic MAC Addresses for Container Instance Interfaces 243

Container Instance Resource Management 244

Performance Scaling Factor for Multi-Instance Capability 244

Container Instances and High Availability 244

Container Instances and Clustering 244

Licenses for Container Instances 244

Requirements and Prerequisites for Logical Devices 245

Requirements and Prerequisites for Hardware and Software Combinations 245

Requirements and Prerequisites for Container Instances 247

Requirements and Prerequisites for High Availability 248

Requirements and Prerequisites for Clustering 249

Guidelines and Limitations for Logical Devices 252

Guidelines and Limitations for Interfaces 252

General Guidelines and Limitations	255
Configure Interfaces	256
Enable or Disable an Interface	256
Configure a Physical Interface	256
Add an EtherChannel (Port Channel)	257
Add a VLAN Subinterface for Container Instances	259
Configure Logical Devices	260
Add a Resource Profile for Container Instances	261
Add a Standalone Firewall Threat Defense	262
Add a High Availability Pair	267
Change an Interface on a Firewall Threat Defense Logical Device	268
Connect to the Console of the Application	270
History for Logical Devices	272

---

## CHAPTER 8

<b>Multi-Instance Mode for the Secure Firewall 3100</b>	<b>279</b>
About Multi-Instance Mode	279
Multi-Instance Mode vs. Appliance Mode	279
Chassis Management Interface	280
Instance Interfaces	280
Interface Types	280
Chassis Interfaces vs. Instance Interfaces	281
Shared Interface Scalability	283
Shared Interface Best Practices	283
How the Chassis Classifies Packets	285
Classification Examples	286
Cascading Instances	289
Typical Multi-Instance Deployment	290
Automatic MAC Addresses for Instance Interfaces	291
Performance Scaling Factor for Multi-Instance Mode	292
Instances and High Availability	292
Licenses for Instances	292
Requirements and Prerequisites for Instances	292
Guidelines and Limitations for Instances	294
Configure Instances	296

Enable Multi-Instance Mode	296
Add a Multi-Instance Chassis to the Firewall Management Center	299
Configure Chassis Interfaces	301
Configure a Physical Interface	302
Configure an EtherChannel	305
Configure a Subinterface	309
Add an Instance	311
Customize the System Configuration	317
Configure SNMP	317
Import or Export the Chassis Configuration	318
Configure Chassis Platform Settings	321
Create a Chassis Platform Settings Policy	321
Configure DNS	322
Configure SSH and SSH Access List	323
Configure Syslog	328
Configure Time Synchronization	333
Configure Time Zones	335
Manage Multi-Instance Mode	336
Change Interfaces Assigned to an Instance	336
Change Chassis Management Settings at the FXOS CLI	338
Monitoring Multi-Instance Mode	341
Monitoring Multi-Instance Setup	341
Monitoring Instance Interfaces	342
History for Multi-Instance Mode	344
<b>CHAPTER 9</b>	<b>High Availability 345</b>
About Secure Firewall Threat Defense High Availability	345
High Availability System Requirements	345
Hardware Requirements	346
Software Requirements	346
License Requirements for Firewall Threat Defense Devices in a High Availability Pair	346
Failover and Stateful Failover Links	347
Failover Link	347
Stateful Failover Link	348

Avoiding Interrupted Failover and Data Links	349
MAC Addresses and IP Addresses in High Availability	350
Stateful Failover	352
Supported Features	352
Unsupported Features	353
Bridge Group Requirements for High Availability	354
Failover Health Monitoring	354
Unit Health Monitoring	354
Heartbeat Module Redundancy	355
Interface Monitoring	355
Failover Triggers and Detection Timing	357
About Active/Standby Failover	358
Primary/Secondary Roles and Active/Standby Status	358
Active Unit Determination at Startup	358
Failover Events	358
Config-Sync Optimization	359
Requirements and Prerequisites for High Availability	360
Guidelines for High Availability	360
Add a High Availability Pair	363
Configure Optional High Availability Parameters	365
Configure Standby IP Addresses and Interface Monitoring	366
Edit High Availability Failover Criteria	366
Configure Virtual MAC Addresses	367
Manage High Availability	368
Switch the Active Peer in the Firewall Threat Defense High Availability Pair	368
Refresh Node Status for a Single Firewall Threat Defense High Availability Pair	368
Suspend and Resume High Availability	369
Replace a Unit in Firewall Threat Defense High Availability Pair	370
Replace a Primary Firewall Threat Defense HA Unit with no Backup	370
Replace a Secondary Firewall Threat Defense HA Unit with no Backup	371
Break a High Availability Pair	371
Delete (Unregister) a High Availability Pair and Register to a New Firewall Management Center	373
Monitoring High Availability	374
View Failover History	374

View Stateful Failover Statistics	375
Troubleshoot Configuration Sync Failure	375
History for High Availability	376

---

**CHAPTER 10**
**Clustering for the Secure Firewall 3100/4200 379**

About Clustering for the Secure Firewall 3100/4200	379
How the Cluster Fits into Your Network	379
Control and Data Node Roles	380
Cluster Interfaces	380
Cluster Control Link	380
Configuration Replication	380
Management Network	380
Licenses for Clustering	381
Requirements and Prerequisites for Clustering	381
Guidelines for Clustering	382
Configure Clustering	386
About Cluster Interfaces	386
Cluster Control Link	386
Spanned EtherChannels	388
Cable and Add Devices to the Firewall Management Center	391
Create a Cluster	393
Configure Interfaces	400
Configure Cluster Health Monitor Settings	401
Manage Cluster Nodes	406
Add a New Cluster Node	406
Break a Node	408
Break the Cluster	409
Disable Clustering	410
Rejoin the Cluster	411
Change the Control Node	411
Edit the Cluster Configuration	412
Reconcile Cluster Nodes	413
Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center	415
Monitoring the Cluster	416

Cluster Health Monitor Dashboard	418
Viewing Cluster Health	419
Cluster Metrics	420
Troubleshooting the Cluster	421
Perform a Ping on the Cluster Control Link	422
Examples for Clustering	423
Firewall on a Stick	424
Traffic Segregation	425
Reference for Clustering	425
Firewall Threat Defense Features and Clustering	425
Unsupported Features with Clustering	425
Centralized Features for Clustering	426
Connection Settings and Clustering	427
FTP and Clustering	427
Multicast Routing in Individual Interface Mode	427
NAT and Clustering	427
Dynamic Routing	429
SIP Inspection and Clustering	429
SNMP and Clustering	430
Syslog and Clustering	430
Cisco TrustSec and Clustering	430
VPN and Clustering	430
Performance Scaling Factor	430
Control Node Election	431
High Availability Within the Cluster	431
Node Health Monitoring	431
Interface Monitoring	432
Status After Failure	432
Rejoining the Cluster	432
Data Path Connection State Replication	433
How the Cluster Manages Connections	433
Connection Roles	433
New Connection Ownership	435
Sample Data Flow for TCP	435

Sample Data Flow for ICMP and UDP	436
History for Clustering	437

---

**CHAPTER 11**
**Clustering for Threat Defense Virtual in a Private Cloud 439**

About Threat Defense Virtual Clustering in the Private Cloud	439
How the Cluster Fits into Your Network	439
Control and Data Node Roles	440
Individual Interfaces	440
Policy-Based Routing	441
Equal-Cost Multi-Path Routing	441
Cluster Control Link	442
Cluster Control Link Traffic Overview	442
Configuration Replication	443
Management Network	443
Licenses for Threat Defense Virtual Clustering	443
Requirements and Prerequisites for Threat Defense Virtual Clustering	444
Guidelines for Threat Defense Virtual Clustering	445
Configure Threat Defense Virtual Clustering	446
Add Nodes to the Management Center	446
Create a Cluster	446
Configure Interfaces	455
Configure Cluster Health Monitor Settings	455
Manage Cluster Nodes	460
Add a New Cluster Node	460
Break a Node	462
Break the Cluster	463
Disable Clustering	464
Rejoin the Cluster	465
Change the Control Node	465
Edit the Cluster Configuration	466
Reconcile Cluster Nodes	467
Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center	469
Monitoring the Cluster	470
Cluster Health Monitor Dashboard	472

Viewing Cluster Health	473
Cluster Metrics	474
Troubleshooting the Cluster	475
Perform a Ping on the Cluster Control Link	476
Reference for Clustering	477
Threat Defense Features and Clustering	477
Unsupported Features and Clustering	477
Centralized Features for Clustering	478
Connection Settings and Clustering	479
Dynamic Routing and Clustering	479
FTP and Clustering	479
NAT and Clustering	480
SIP Inspection and Clustering	481
SNMP and Clustering	481
Syslog and Clustering	481
Cisco Trustsec and Clustering	482
VPN and Clustering	482
Performance Scaling Factor	482
Control Node Election	482
High Availability within the Cluster	483
Node Health Monitoring	483
Interface Monitoring	483
Status After Failure	483
Rejoining the Cluster	484
Data Path Connection State Replication	484
How the Cluster Manages Connections	485
Connection Roles	485
New Connection Ownership	486
Sample Data Flow for TCP	486
Sample Data Flow for ICMP and UDP	487
History for Threat Defense Virtual Clustering in a Private Cloud	489
<b>CHAPTER 12</b>	<b>Clustering for Threat Defense Virtual in a Public Cloud</b>
	491
	About Threat Defense Virtual Clustering in the Public Cloud
	492

How the Cluster Fits into Your Network	492
Individual Interfaces	492
Control and Data Node Roles	493
Cluster Control Link	493
Cluster Control Link Traffic Overview	493
Configuration Replication	494
Management Network	494
Licenses for Threat Defense Virtual Clustering	494
Requirements and Prerequisites for Threat Defense Virtual Clustering	495
Guidelines for Threat Defense Virtual Clustering	496
Deploy the Cluster in AWS	498
AWS Gateway Load Balancer and Geneve Single-Arm Proxy	498
Sample Topology	499
End-to-End Process for Deploying Threat Defense Virtual Cluster on AWS	499
Templates	501
Deploy the Stack in AWS Using a CloudFormation Template	502
Deploy the Cluster in AWS Manually	514
Create the Day0 Configuration for AWS	514
Deploy Cluster Nodes	515
Configure Target Failover for Secure Firewall Threat Defense Virtual Clustering with GWLB in AWS	516
Enable Target Failover for Secure Firewall Threat Defense Virtual Clustering in AWS	517
Deploy the Cluster in Azure	518
Sample Topology for GWLB-based Cluster Deployment	518
Azure Gateway Load Balancer and Paired Proxy	519
End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with GWLB	520
Templates	522
Prerequisites	522
Deploy Cluster on Azure with GWLB Using an Azure Resource Manager Template	523
Sample Topology for NLB-based Cluster Deployment	526
End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with NLB	526
Templates	528
Prerequisites	529
Deploy Cluster on Azure with NLB Using an Azure Resource Manager Template	529

Deploy the Cluster in Azure Manually	531
Create the Day0 Configuration for Azure	531
Deploy Cluster Nodes Manually - GWLB-based Deployment	533
Deploy Cluster Nodes Manually - NLB-based Deployment	535
Troubleshooting Cluster Deployment in Azure	536
Deploy the Cluster in GCP	537
Sample Topology	538
End-to-End Process for Deploying Threat Defense Virtual Cluster in GCP	538
Templates	540
Deploy the Instance Group in GCP Using an Instance Template	540
Deploy the Cluster in GCP Manually	541
Create the Day0 Configuration for GCP	542
Deploy Cluster Nodes Manually	544
Allow Health Checks for GCP Network Load Balancers	544
Add the Cluster to the Management Center (Manual Deployment)	546
Configure Cluster Health Monitor Settings	553
Manage Cluster Nodes	558
Disable Clustering	558
Rejoin the Cluster	558
Reconcile Cluster Nodes	558
Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center	559
Monitoring the Cluster	560
Cluster Health Monitor Dashboard	563
Viewing Cluster Health	564
Cluster Metrics	565
Troubleshooting the Cluster	566
Perform a Ping on the Cluster Control Link	567
Upgrading the Cluster	568
Reference for Clustering	569
Threat Defense Features and Clustering	569
Unsupported Features and Clustering	569
Centralized Features for Clustering	570
Cisco Trustsec and Clustering	570
Connection Settings and Clustering	570

Dynamic Routing and Clustering	571
FTP and Clustering	571
NAT and Clustering	572
SIP Inspection and Clustering	573
SNMP and Clustering	573
Syslog and Clustering	573
VPN and Clustering	573
Performance Scaling Factor	574
Control Node Election	574
High Availability within the Cluster	575
Node Health Monitoring	575
Interface Monitoring	575
Status After Failure	575
Rejoining the Cluster	575
Data Path Connection State Replication	576
How the Cluster Manages Connections	576
Connection Roles	576
New Connection Ownership	578
Sample Data Flow for TCP	578
Sample Data Flow for ICMP and UDP	579
History for Threat Defense Virtual Clustering in the Public Cloud	580

---

**CHAPTER 13**
**Clustering for the Firepower 4100/9300 583**

About Clustering on the Firepower 4100/9300 Chassis	583
Bootstrap Configuration	584
Cluster Members	584
Cluster Control Link	584
Size the Cluster Control Link	585
Cluster Control Link Redundancy	585
Cluster Control Link Reliability for Inter-Chassis Clustering	586
Cluster Control Link Network	586
Management Network	586
Management Interface	586
Cluster Interfaces	586

Spanned EtherChannels	586
Connecting to a Redundant Switch System	587
Configuration Replication	587
Licenses for Clustering	587
Requirements and Prerequisites for Clustering	588
Clustering Guidelines and Limitations	591
Configure Clustering	595
FXOS: Add a Firewall Threat Defense Cluster	595
Create a Firewall Threat Defense Cluster	595
Add More Cluster Nodes	606
Firewall Management Center: Add a Cluster	609
Firewall Management Center: Configure Cluster, Data Interfaces	615
Firewall Management Center: Configure Cluster Health Monitor Settings	617
FXOS: Remove a Cluster Node	621
Firewall Management Center: Manage Cluster Members	623
Add a New Cluster Member	623
Replace a Cluster Member	624
Deactivate a Member	625
Rejoin the Cluster	626
Delete (Unregister) a Data Node	626
Change the Control Unit	627
Reconcile Cluster Members	628
Firewall Management Center: Monitoring the Cluster	628
Cluster Health Monitor Dashboard	630
Viewing Cluster Health	631
Cluster Metrics	633
Firewall Management Center: Troubleshooting the Cluster	633
Perform a Ping on the Cluster Control Link	634
Examples for Clustering	636
Firewall on a Stick	636
Traffic Segregation	637
Reference for Clustering	637
Firewall Threat Defense Features and Clustering	637
Unsupported Features with Clustering	637

Centralized Features for Clustering	638
Connection Settings	639
Dynamic Routing and Clustering	639
FTP and Clustering	640
Multicast Routing and Clustering	640
NAT and Clustering	640
SIP Inspection and Clustering	641
SNMP and Clustering	641
Syslog and Clustering	642
TLS/SSL Connections and Clustering	642
Cisco TrustSec and Clustering	642
VPN and Clustering	642
Performance Scaling Factor	642
Control Unit Election	642
High Availability Within the Cluster	643
Chassis-Application Monitoring	643
Unit Health Monitoring	643
Interface Monitoring	644
Decorator Application Monitoring	644
Status After Failure	644
Rejoining the Cluster	644
Data Path Connection State Replication	645
How the Cluster Manages Connections	646
Connection Roles	646
New Connection Ownership	647
Sample Data Flow for TCP	647
Sample Data Flow for ICMP and UDP	648
History for Clustering	649

---

**PART III**
**Interfaces and Device Settings 655**

---

**CHAPTER 14**
**Interface Overview 657**

Management Interface 657

Management Interface 657

Diagnostic Interface	658
Interface Mode and Types	658
Security Zones and Interface Groups	659
Auto-MDI/MDIX Feature	660
Redundant Interfaces (Deprecated)	661
Default Settings for Interfaces	661
Create Security Zone and Interface Group Objects	661
Enable the Physical Interface and Configure Ethernet Settings	662
Configure EtherChannel Interfaces	665
About EtherChannels	665
About EtherChannels	665
Guidelines for EtherChannels	668
Configure an EtherChannel	670
Sync Interface Changes with the Firewall Management Center	673
Manage the Network Module for the Secure Firewall 3100/4200	676
Configure Breakout Ports	677
Add a Network Module	680
Hot Swap the Network Module	682
Replace the Network Module with a Different Type	684
Remove the Network Module	688
Merge the Management and Diagnostic Interfaces	690
Unmerge the Management Interface	696
History for Interfaces	698

---

**CHAPTER 15**
**Regular Firewall Interfaces 701**

Requirements and Prerequisites for Regular Firewall Interfaces	701
Configure Firepower 1010 Switch Ports	701
About Switch Ports	702
Understanding Switch Ports and Interfaces	702
Auto-MDI/MDIX Feature	703
Guidelines and Limitations for Switch Ports	703
Configure Switch Ports and Power Over Ethernet	704
Enable or Disable Switch Port Mode	704
Configure a VLAN Interface	705

Configure Switch Ports as Access Ports	707
Configure Switch Ports as Trunk Ports	709
Configure Power Over Ethernet	711
Configure Loopback Interfaces	712
About Loopback Interfaces	712
Guidelines and Limitations for Loopback Interfaces	713
Configure a Loopback Interface	713
Rate-Limit Traffic to the Loopback Interface	714
Configure VLAN Subinterfaces and 802.1Q Trunking	718
Guidelines and Limitations for VLAN Subinterfaces	718
Maximum Number of VLAN Subinterfaces by Device Model	719
Add a Subinterface	720
Configure VXLAN Interfaces	722
About VXLAN Interfaces	722
Encapsulation	722
VXLAN Tunnel Endpoint	722
VTEP Source Interface	723
VNI Interfaces	723
VXLAN Packet Processing	724
Peer VTEPs	724
VXLAN Use Cases	725
Requirements and Prerequisites for VXLAN Interfaces	729
Guidelines for VXLAN Interfaces	729
Configure VXLAN or Geneve Interfaces	730
Configure VXLAN Interfaces	730
Configure Geneve Interfaces	733
Allow Gateway Load Balancer Health Checks	735
Configure Routed and Transparent Mode Interfaces	735
About Routed and Transparent Mode Interfaces	735
Dual IP Stack (IPv4 and IPv6)	736
31-Bit Subnet Mask	736
Guidelines and Limitations for Routed and Transparent Mode Interfaces	737
Configure Routed Mode Interfaces	738
Configure Bridge Group Interfaces	743

Configure General Bridge Group Member Interface Parameters	743
Configure the Bridge Virtual Interface (BVI)	745
Configure IPv6 Addressing	747
About IPv6	747
Configure the IPv6 Prefix Delegation Client	748
Configure a Global IPv6 Address	751
Configure IPv6 Neighbor Discovery	756
Configure Advanced Interface Settings	758
About Advanced Interface Configuration	758
About MAC Addresses	758
About the MTU	759
About the TCP MSS	760
ARP Inspection for Bridge Group Traffic	761
MAC Address Table	762
Default Settings	762
Guidelines for ARP Inspection and the MAC Address Table	763
Configure the MTU	763
Configure the MAC Address	764
Add a Static ARP Entry	765
Add a Static MAC Address and Disable MAC Learning for a Bridge Group	766
Set Security Configuration Parameters	766
History for Regular Firewall Interfaces	768

---

## CHAPTER 16

### **Inline Sets and Passive Interfaces** 775

About IPS Interfaces	775
Inline Sets	775
Multiple Inline Pairs and Asynchronous Routing	776
Passive Interfaces	777
About Hardware Bypass for Inline Sets	778
Hardware Bypass Triggers	778
Hardware Bypass Switchover	778
Snort Fail Open vs. Hardware Bypass	778
Hardware Bypass Status	779
Requirements and Prerequisites for Inline Sets	779

Guidelines for Inline Sets and Passive Interfaces	780
Configure a Passive Interface	782
Configure an Inline Set	783
History for Inline Sets and Passive Interfaces	787

---

## CHAPTER 17

### **DHCP and DDNS 791**

About DHCP and DDNS Services	791
About the DHCPv4 Server	791
DHCP Options	791
About the DHCPv6 Stateless Server	792
About the DHCP Relay Agent	792
Requirements and Prerequisites for DHCP and DDNS	793
Guidelines for DHCP and DDNS Services	793
Configure the DHCPv4 Server	795
Configure the DHCPv6 Stateless Server	796
Create the DHCP IPv6 Pool	796
Enable the DHCPv6 Stateless Server	799
Configure the DHCP Relay Agent	801
Configure Dynamic DNS	802
History for DHCP and DDNS	808

---

## CHAPTER 18

### **SNMP for the Firepower 1000/2100 809**

About SNMP for the Firepower 1000/2100	809
Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100	809
Creating an SNMP Trap for Firepower 1000/2100	811
Creating an SNMP User for Firepower 1000/2100	812

---

## CHAPTER 19

### **Quality of Service 815**

Introduction to QoS	815
About QoS Policies	815
Requirements and Prerequisites for QoS	816
Rate Limiting with QoS Policies	816
Creating a QoS Policy	817
Setting Target Devices for a QoS Policy	818

Configuring QoS Rules	818
QoS Rule Components	819
QoS Rule Conditions	820
Interface Rule Conditions	820
Network Rule Conditions	821
User Rule Conditions	821
Application Rule Conditions	821
Port Rule Conditions	823
URL Rule Conditions	824
Custom SGT Rule Conditions	824
ISE SGT vs Custom SGT Rule Conditions	824
Autotransition from Custom SGTs to ISE SGTs	825
History for QoS	825

---

## CHAPTER 20

### Platform Settings 827

Introduction to Platform Settings	828
Requirements and Prerequisites for Platform Settings Policies	828
Manage Platform Settings Policies	828
Chassis Platform Settings	829
ARP Inspection	829
Banner	831
DNS	831
External Authentication	834
Fragment Settings	839
HTTP Access	840
ICMP Access	841
NetFlow	843
Add Collector in NetFlow	844
Add Traffic Class to NetFlow	844
SSH Access	845
SMTP Server	847
SNMP	847
About SNMP	849
SNMP Terminology	849

MIBs and Traps	850
Supported Tables and Objects in MIBs	850
Add SNMPv3 Users	854
Add SNMP Hosts	857
Configure SNMP Traps	859
Configure SSL Settings	861
About SSL Settings	861
Syslog	865
About Syslog	865
Severity Levels	866
Syslog Message Filtering	867
Syslog Message Classes	867
Guidelines for Logging	870
Configure Syslog Logging for Firewall Threat Defense Devices	871
Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages	872
Enable Logging and Configure Basic Settings	872
Enable Logging Destinations	874
Send Syslog Messages to an E-mail Address	875
Create a Custom Event List	876
Limit the Rate of Syslog Message Generation	877
Configure Syslog Settings	878
Configure a Syslog Server	879
Timeouts	881
Time Synchronization	883
Time Zone	884
UCAPL/CC Compliance	885
Performance Profile	886
History for Platform Settings	887

---

## CHAPTER 21

### Network Address Translation 895

Why Use NAT?	895
NAT Basics	896
NAT Terminology	896
NAT Types	896

NAT in Routed and Transparent Mode	897
NAT in Routed Mode	897
NAT in Transparent Mode or Within a Bridge Group	898
Auto NAT and Manual NAT	899
Auto NAT	899
Manual NAT	899
Comparing Auto NAT and Manual NAT	900
NAT Rule Order	900
NAT Interfaces	902
NAT Exemption	903
Configuring Routing for NAT	903
Addresses on the Same Network as the Mapped Interface	904
Addresses on a Unique Network	904
The Same Address as the Real Address (Identity NAT)	904
Requirements and Prerequisites for NAT Policies	905
Guidelines for NAT	905
Firewall Mode Guidelines for NAT	905
IPv6 NAT Guidelines	905
IPv6 NAT Best Practices	906
NAT Support for Inspected Protocols	906
FQDN Destination Guidelines	908
Additional Guidelines for NAT	909
Manage NAT Policies	911
Creating NAT Policies	912
Configuring NAT Policy Targets	912
Configure NAT for Threat Defense	913
Customizing NAT Rules for Multiple Devices	914
Searching and Filtering the NAT Rule Table	917
Enabling, Disabling, or Deleting Multiple Rules	917
Dynamic NAT	918
About Dynamic NAT	918
Dynamic NAT Disadvantages and Advantages	919
Configure Dynamic Auto NAT	920
Configure Dynamic Manual NAT	921

Dynamic PAT	923
About Dynamic PAT	923
Dynamic PAT Disadvantages and Advantages	924
PAT Pool Object Guidelines	924
Configure Dynamic Auto PAT	925
Configure Dynamic Manual PAT	928
Configure PAT with Port Block Allocation	931
Static NAT	933
About Static NAT	933
Configure Static Auto NAT	937
Configure Static Manual NAT	938
Identity NAT	941
Configure Identity Auto NAT	942
Configure Identity Manual NAT	943
NAT Rule Properties for Firewall Threat Defense	946
Interface Objects NAT Properties	946
Translation Properties for Auto NAT	947
Translation Properties for Manual NAT	948
PAT Pool NAT Properties	949
Advanced NAT Properties	950
Translating IPv6 Networks	951
NAT64/46: Translating IPv6 Addresses to IPv4	952
NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet	952
NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet and DNS Translation	954
NAT66: Translating IPv6 Addresses to Different IPv6 Addresses	958
NAT66 Example, Static Translation between Networks	958
NAT66 Example, Simple IPv6 Interface PAT	961
Monitoring NAT	964
Examples for NAT	965
Providing Access to an Inside Web Server (Static Auto NAT)	965
Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server	968
Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)	974
Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)	977
Different Translation Depending on the Destination (Dynamic Manual PAT)	985

Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)	992
NAT and Site-to-Site VPN	998
Rewriting DNS Queries and Responses Using NAT	1003
DNS64 Reply Modification	1004
DNS Reply Modification, DNS Server on Outside	1011
DNS Reply Modification, DNS Server on Host Network	1014
History for Firewall Threat Defense NAT	1018

---

## CHAPTER 22

### Alarms for the Cisco ISA 3000 1021

About Alarms	1021
Alarm Input Interfaces	1022
Alarm Output Interface	1022
Syslog Alarms	1023
SNMP Alarms	1023
Defaults for Alarms	1023
Requirements and Prerequisites for Alarms	1024
Configure the Alarms for the ISA 3000	1024
Configure Alarm Input Contacts	1024
Configure Power Supply Alarms	1027
Configure Temperature Alarms	1029
Monitoring Alarms	1032
Monitoring Alarm Status	1032
Monitoring Syslog Messages for Alarms	1032
Turning Off the External Alarm	1033
History for Alarms	1033

---

## PART IV

### Routing 1035

---

## CHAPTER 23

### Static and Default Routes 1037

About Static and Default Routes	1037
Default Route	1037
Static Routes	1038
Route to null0 Interface to Drop Unwanted Traffic	1038
Route Priorities	1038

Transparent Firewall Mode and Bridge Group Routes	1038
Static Route Tracking	1039
Requirements and Prerequisites for Static Routes	1039
Guidelines for Static and Default Routes	1040
Add a Static Route	1040
Reference for Routing	1042
Path Determination	1042
Supported Route Types	1042
Static Versus Dynamic	1042
Single-Path Versus Multipath	1043
Flat Versus Hierarchical	1043
Link-State Versus Distance Vector	1043
Supported Internet Protocols for Routing	1043
Routing Table	1044
How the Routing Table Is Populated	1044
How Forwarding Decisions Are Made	1046
Dynamic Routing and High Availability	1047
Dynamic Routing in Clustering	1047
Dynamic Routing in Individual Interface Mode	1048
Routing Table for Management Traffic	1049
Equal-Cost Multi-Path (ECMP) Routing	1050
About Route Maps	1051
Permit and Deny Clauses	1051
Match and Set Clause Values	1051

---

**CHAPTER 24**
**Virtual Routers 1053**

About Virtual Routers and Virtual Routing and Forwarding (VRF)	1053
About Virtual Routers and Dynamic VTI	1054
How to Configure a Virtual Router with Dynamic VTI	1054
Applications of Virtual Routers	1054
Global and User-Defined Virtual Routers	1055
Configuring Policies to be Virtual-Router-Aware	1056
Interconnecting Virtual Routers	1057
Overlapping IP Addresses	1058

Configuring SNMP on User-Defined Virtual Routers	1059
Maximum Number of Virtual Routers By Device Model	1060
Requirements and Prerequisites for Virtual Routers	1061
Guidelines and Limitations for Virtual Routers	1061
Modifications to the Firewall Management Center Web Interface - Routing Page	1063
Manage Virtual Routers	1064
Create a Virtual Router	1064
Configure a Virtual Router	1065
Modify a Virtual Router	1066
Remove Virtual Routers	1067
Monitoring Virtual Routers	1067
Configuration Examples for Virtual Routers	1068
How to Route to a Distant Server through Virtual Routers	1068
How to Provide Internet Access with Overlapping Address Spaces	1073
How to Allow RA VPN Access to Internal Networks in Virtual Routing	1080
How to Secure Traffic from Networks in Multiple Virtual Routers over a Site-to-Site VPN	1083
How to Secure Traffic from Networks with Multiple Virtual Routers over a Site-to-Site VPN with Dynamic VTI	1086
How to Route Traffic between Two Overlapping Network Host in Virtual Routing	1088
How to Manage Overlapping Segments in Routed Firewall Mode with BVI Interfaces	1091
How to Configure User Authentication with Overlapping Networks	1095
How to Interconnect Virtual Routers using BGP	1101
History for Virtual Routers	1106

---

## CHAPTER 25

### ECMP 1109

About ECMP	1109
Guidelines and Limitations for ECMP	1109
Manage ECMP Page	1110
Create an ECMP Zone	1111
Configure an Equal Cost Static Route	1112
Modify an ECMP Zone	1113
Remove an ECMP Zone	1113
Configuration Example for ECMP	1114
History for ECMP in Secure Firewall Threat Defense	1117

---

<b>CHAPTER 26</b>	<b>Bidirectional Forwarding Detection Routing</b>	<b>1119</b>
	About BFD Routing	1119
	Guidelines for BFD Routing	1119
	Configure BFD	1121
	Configure BFD Policies	1121
	Configure Single-Hop BFD Policies	1122
	Configure Multi-Hop BFD Policies	1122
	History for BFD Routing	1123

---

<b>CHAPTER 27</b>	<b>OSPF</b>	<b>1125</b>
	OSPF	1125
	About OSPF	1125
	OSPF Support for Fast Hello Packets	1127
	Prerequisites for OSPF Support for Fast Hello Packets	1127
	OSPF Hello Interval and Dead Interval	1127
	OSPF Fast Hello Packets	1127
	Benefits of OSPF Fast Hello Packets	1127
	Implementation Differences Between OSPFv2 and OSPFv3	1128
	Requirements and Prerequisites for OSPF	1128
	Guidelines for OSPF	1128
	Configure OSPFv2	1131
	Configure OSPF Areas, Ranges, and Virtual Links	1131
	Configure OSPF Redistribution	1134
	Configure OSPF Inter-Area Filtering	1135
	Configure OSPF Filter Rules	1136
	Configure OSPF Summary Addresses	1137
	Configure OSPF Interfaces and Neighbors	1138
	Configure OSPF Advanced Properties	1140
	Configure OSPFv3	1143
	Configure OSPFv3 Areas, Route Summaries, and Virtual Links	1143
	Configure OSPFv3 Redistribution	1145
	Configure OSPFv3 Summary Prefixes	1147
	Configure OSPFv3 Interfaces, Authentication, and Neighbors	1147

Configure OSPFv3 Advanced Properties	1150
History for OSPF	1153

---

## CHAPTER 28

### **EIGRP 1155**

About EIGRP Routing	1155
Requirements and Prerequisites for EIGRP	1156
Guidelines and Limitations of EIGRP Routing	1156
Configure EIGRP	1158
Configure EIGRP Settings	1158
Configure EIGRP Neighbors Settings	1159
Configure EIGRP Filter Rules Settings	1159
Configure EIGRP Redistribution Settings	1160
Configure EIGRP Summary Address Settings	1161
Configure EIGRP Interfaces Settings	1162
Configure EIGRP Advanced Settings	1162
History for EIGRP	1164

---

## CHAPTER 29

### **BGP 1165**

About BGP	1165
Routing Table Changes	1165
When to Use BGP	1166
BGP Path Selection	1167
BGP Multipath	1167
Requirements and Prerequisites for BGP	1168
Guidelines for BGP	1168
Configure BGP	1169
Configure BGP Basic Settings	1170
Configure BGP General Settings	1172
Configure BGP Neighbor Settings	1173
Configure BGP Aggregate Address Settings	1177
Configure BGPv4 Filtering Settings	1178
Configure BGP Network Settings	1179
Configure BGP Redistribution Settings	1179
Configure BGP Route Injection Settings	1180

Configure BGP Route Import/Export Settings	1181
History for BGP	1183

---

## CHAPTER 30

### **RIP** 1185

About RIP	1185
Routing Update Process	1185
RIP Routing Metric	1186
RIP Stability Features	1186
RIP Timers	1186
Requirements and Prerequisites for RIP	1187
Guidelines for RIP	1187
Configure RIP	1188

---

## CHAPTER 31

### **Multicast** 1191

About Multicast Routing	1191
IGMP Protocol	1191
Stub Multicast Routing	1192
PIM Multicast Routing	1192
PIM Source Specific Multicast Support	1193
Multicast Bidirectional PIM	1193
PIM Bootstrap Router (BSR)	1194
PIM Bootstrap Router (BSR) Terminology	1194
Multicast Group Concept	1195
Multicast Addresses	1195
Clustering	1195
Requirements and Prerequisites for Multicast Routing	1195
Guidelines for Multicast Routing	1195
Configure IGMP Features	1196
Enable Multicast Routing	1197
Configure IGMP Protocol	1197
Configure IGMP Access Groups	1199
Configure IGMP Static Groups	1199
Configure IGMP Join Groups	1200
Configure PIM Features	1201

Configure PIM Protocol	1201
Configure PIM Neighbor Filters	1202
Configure PIM Bidirectional Neighbor Filters	1203
Configure PIM Rendezvous Points	1204
Configure PIM Route Trees	1205
Configure PIM Request Filters	1205
Configure the Secure Firewall Threat Defense Device as a Candidate Bootstrap Router	1206
Configure Multicast Routes	1207
Configure Multicast Boundary Filters	1208

---

## CHAPTER 32

### Policy Based Routing 1211

About Policy Based Routing	1211
Guidelines and Limitations for Policy Based Routing	1213
Path Monitoring	1214
Configure Path Monitoring Settings	1216
Configure Policy-Based Routing Policy	1217
Add Path Monitoring Dashboard	1220
Configuration Example for Policy Based Routing	1220
Configuration Example for PBR with Path Monitoring	1226
History for Policy Based Routing	1228

---

## PART V

### Objects and Certificates 1231

---

## CHAPTER 33

### Object Management 1233

Introduction to Objects	1234
The Object Manager	1236
Importing Objects	1236
Editing Objects	1239
Viewing Objects and Their Usage	1240
Filtering Objects or Object Groups	1241
Object Groups	1241
Grouping Reusable Objects	1242
Object Overrides	1243
Managing Object Overrides	1244

Allowing Object Overrides	1244
Adding Object Overrides	1245
Editing Object Overrides	1245
AAA Server	1246
Add a RADIUS Server Group	1246
RADIUS Server Group Options	1246
RADIUS Server Options	1248
Add a Single Sign-on Server	1249
Access List	1250
Configure Extended ACL Objects	1251
Configure Standard ACL Objects	1254
Address Pools	1255
Application Filters	1255
AS Path	1256
BFD Template	1256
Cipher Suite List	1257
Creating Cipher Suite Lists	1258
Community List	1258
Extended Community	1259
DHCP IPv6 Pool	1261
Distinguished Name	1261
Creating Distinguished Name Objects	1263
DNS Server Group	1264
Creating DNS Server Group Objects	1264
External Attributes	1265
Dynamic Objects	1265
Create Dynamic Objects for the First Time	1265
Create Dynamic Objects with the Embedded Cisco Secure Dynamic Attributes Connector	1267
Create Dynamic Objects with Cisco Defense Orchestrator	1268
Create Dynamic Objects with the On-Premises Cisco Secure Dynamic Attributes Connector	1269
Work With Dynamic Objects	1269
Dynamic Object Mappings	1270
About API-Created Dynamic Objects	1270
Security Group Tag	1271

Creating Security Group Tag Objects	1272
File List	1272
Source Files for File Lists	1273
Adding Individual SHA-256 Values to File Lists	1273
Uploading Individual Files to File Lists	1274
Uploading Source Files to File Lists	1275
Editing SHA-256 Values in File Lists	1276
Downloading Source Files from File Lists	1276
FlexConfig	1277
Geolocation	1278
Creating Geolocation Objects	1278
Interface	1278
Key Chain	1279
Creating Key Chain Objects	1279
Network	1281
Network Wildcard Mask	1282
Creating Network Objects	1283
Importing Network Objects	1284
PKI	1284
Internal Certificate Authority Objects	1285
CA Certificate and Private Key Import	1285
Importing a CA Certificate and Private Key	1286
Generating a New CA Certificate and Private Key	1286
New Signed Certificates	1287
Creating an Unsigned CA Certificate and CSR	1287
Uploading a Signed Certificate Issued in Response to a CSR	1287
CA Certificate and Private Key Downloads	1288
Downloading a CA Certificate and Private Key	1288
Trusted Certificate Authority Objects	1289
Trusted CA Object	1289
Adding a Trusted CA Object	1289
Certificate Revocation Lists in Trusted CA Objects	1290
Adding a Certificate Revocation List to a Trusted CA Object	1290
External Certificate Objects	1291

Adding External Certificate Objects	1291
Internal Certificate Objects	1292
Adding Internal Certificate Objects	1292
Certificate Enrollment Objects	1293
Adding Certificate Enrollment Objects	1294
Add Certificate Enrollment	1296
Certificate Enrollment Object EST Options	1296
Certificate Enrollment Object SCEP Options	1297
Certificate Enrollment Object Certificate Parameters	1298
Certificate Enrollment Object Key Options	1299
Certificate Enrollment Object Revocation Options	1300
Policy List	1301
Port	1302
Creating Port Objects	1303
Importing Port Objects	1304
Prefix List	1304
Configure IPv6 Prefix List	1304
Configure IPv4 Prefix List	1305
Route Map	1306
Security Intelligence	1309
How to Modify Security Intelligence Objects	1311
Global and Domain Security Intelligence Lists	1311
Security Intelligence Lists and Multitenancy	1311
Add Entries to Global Security Intelligence Lists	1312
Delete Entries from Global Security Intelligence Lists	1313
List and Feed Updates for Security Intelligence	1314
Changing the Update Frequency for Security Intelligence Feeds	1314
Custom Security Intelligence Lists and Feeds	1315
Custom Lists and Feeds: Requirements	1315
URL Lists and Feeds: URL Syntax and Matching Criteria	1315
Custom Security Intelligence Feeds	1317
Custom Security Intelligence Lists	1318
Sinkhole	1320
Creating Sinkhole Objects	1320

SLA Monitor	1321
Time Range	1322
Creating Time Range Objects	1322
Time Zone	1324
Tunnel Zone	1324
URL	1324
Creating URL Objects	1325
Variable Set	1326
Variable Sets in Intrusion Policies	1327
Variables	1327
Predefined Default Variables	1328
Network Variables	1330
Port Variables	1332
Advanced Variables	1333
Variable Reset	1333
Adding Variables to Sets	1334
Nesting Variables	1335
Managing Variable Sets	1337
Creating Variable Sets	1338
Managing Variables	1338
Adding Variables	1339
Editing Variables	1340
VLAN Tag	1341
Creating VLAN Tag Objects	1341
VPN	1342
Certificate Map Objects	1342
Secure Client Custom Attributes Objects	1343
Add Secure Client Custom Attributes Objects	1344
Add Custom Attributes to a Group Policy	1345
Firewall Threat Defense Group Policy Objects	1346
Configure Group Policy Objects	1346
Group Policy General Options	1347
Group Policy Secure Client Options	1349
Group Policy Advanced Options	1352

Firewall Threat Defense IPsec Proposals	1353
Configure IKEv1 IPsec Proposal Objects	1354
Configure IKEv2 IPsec Proposal Objects	1354
Firewall Threat Defense IKE Policies	1355
Configure IKEv1 Policy Objects	1355
Configure IKEv2 Policy Objects	1357
Secure Client Customization	1358
File Objects	1358
History for Object Management	1360

---

**CHAPTER 34**
**Certificates 1365**

Requirements and Prerequisites for Certificates	1365
Secure Firewall Threat Defense VPN Certificate Guidelines and Limitations	1365
Managing Firewall Threat Defense Certificates	1366
Automatically Update CA Bundles	1367
Installing a Certificate Using Self-Signed Enrollment	1369
Installing a Certificate using EST Enrollment	1370
Installing a Certificate Using SCEP Enrollment	1371
Installing a Certificate Using Manual Enrollment	1371
Installing a Certificate Using a PKCS12 File	1372
Troubleshooting Firewall Threat Defense Certificates	1373
History for Certificates	1374

---

**PART VI**
**VPN 1375**

---

**CHAPTER 35**
**VPN Overview 1377**

VPN Types	1377
VPN Basics	1378
Internet Key Exchange (IKE)	1379
IPsec	1379
VPN Packet Flow	1380
IPsec Flow Offload	1381
VPN Licensing	1381
How Secure Should a VPN Connection Be?	1382

Complying with Security Certification Requirements	1382
Deciding Which Encryption Algorithm to Use	1382
Deciding Which Hash Algorithms to Use	1383
Deciding Which Diffie-Hellman Modulus Group to Use	1384
Deciding Which Authentication Method to Use	1384
Pre-shared Keys	1385
PKI Infrastructure and Digital Certificates	1385
Removed or Deprecated Hash Algorithms, Encryption Algorithms, and Diffie-Hellman Modulus Groups	1386
VPN Topology Options	1387
Point-to-Point VPN Topology	1387
Hub and Spoke VPN Topology	1387
Full Mesh VPN Topology	1388
Implicit Topologies	1389

---

## CHAPTER 36

<b>Site-to-Site VPNs</b>	<b>1391</b>
About Site-to-Site VPN	1391
Secure Firewall Threat Defense Site-to-site VPN Guidelines and Limitations	1393
Types of Site-to-Site VPN Topologies	1394
Requirements and Prerequisites for Site-to-Site VPN	1394
Manage Site-to-Site VPNs	1395
Configure a Policy-based Site-to-Site VPN	1396
Firewall Threat Defense VPN Endpoint Options	1397
Firewall Threat Defense VPN IKE Options	1401
Firewall Threat Defense VPN IPsec Options	1403
Firewall Threat Defense Advanced Site-to-site VPN Deployment Options	1406
Firewall Threat Defense VPN Advanced IKE Options	1406
Firewall Threat Defense VPN Advanced IPsec Options	1407
Firewall Threat Defense Advanced Site-to-site VPN Tunnel Options	1408
About Virtual Tunnel Interfaces	1409
Static VTI	1410
Dynamic VTI	1411
Guidelines and Limitations for Virtual Tunnel Interfaces	1413
Add a VTI Interface	1417

Create a Route-based Site-to-Site VPN	1418
Configure Endpoints for a Point to Point Topology	1419
Advanced Configurations for a Point to Point Topology in a Route-based VPN	1421
Configure Endpoints for a Hub and Spoke Topology	1422
Advanced Configurations for Hub and Spokes in a Route-based VPN	1424
Configure Multiple Hubs in a Route-based VPN	1425
Configure Routing for Multiple Hubs in a Route-based VPN	1427
Verify the Multiple Hubs Configuration in a Route-based VPN	1429
Route Traffic Through a Backup VTI Tunnel	1429
Configure Dynamic VTI for a Route-based Site-to-Site VPN	1431
How to Configure a Virtual Router with Dynamic VTI	1431
Configure Routing and AC Policies for VTI	1431
View Virtual Tunnel Information	1434
Deploy a SASE Tunnel on Umbrella	1434
Guidelines and Limitations for Configuring SASE Tunnels on Umbrella	1435
How to Deploy a SASE Tunnel on Umbrella	1436
Prerequisites for Configuring Umbrella SASE Tunnels	1437
Map Management Center Umbrella Parameters and Cisco Umbrella API Keys	1437
Configure a SASE Tunnel for Umbrella	1439
View SASE Tunnel Status	1440
Monitoring the Site-to-Site VPNs	1441
History for Site-to-Site VPN	1447

---

**CHAPTER 37**
**Remote Access VPN 1451**

Remote Access VPN Overview	1451
Remote Access VPN Features	1452
Secure Client Components	1454
Remote Access VPN Authentication	1454
Understanding Policy Enforcement of Permissions and Attributes	1456
Understanding AAA Server Connectivity	1456
License Requirements for Remote Access VPN	1457
Requirements and Prerequisites for Remote Access VPN	1457
Remote Access VPN Guidelines and Limitations	1458
Configuring a New Remote Access VPN Connection	1461

Prerequisites for Configuring Remote Access VPN	1462
Create a New Remote Access VPN Policy	1462
Update the Access Control Policy on the Secure Firewall Threat Defense Device	1465
(Optional) Configure NAT Exemption	1466
Configure DNS	1467
Add Secure Client Profile XML File	1467
(Optional) Configure Split Tunneling	1468
(Optional) Configure Dynamic Split Tunneling	1469
Verify Dynamic Split Tunneling Configuration	1470
Verify the Configuration	1470
Create a Copy of an Existing Remote Access VPN Policy	1471
Set Target Devices for a Remote Access VPN Policy	1471
Associate Local Realm with Remote Access VPN Policy	1472
Additional Remote Access VPN Configurations	1472
Configure Connection Profile Settings	1472
Configure IP Addresses for VPN Clients	1473
Configure AAA Settings for Remote Access VPN	1475
Create or Update Aliases for a Connection Profile	1490
Configure Access Interfaces for Remote Access VPN	1491
Configure Advanced Options for Remote Access VPN	1493
Cisco Secure Client Image	1493
Remote Access VPN Address Assignment Policy	1495
Configure Certificate to Connection Profile Mapping	1496
Configure Group Policies	1496
Configuring LDAP Attribute Mapping	1497
Configuring VPN Load Balancing	1499
Configure IPsec Settings	1502
Customize Cisco Secure Client	1507
Configure Secure Client Management VPN Tunnel	1518
Requirements and Prerequisites for Secure Client Management VPN Tunnel	1519
Limitations of Secure Client Management VPN Tunnel	1519
Configuring Secure Client Management VPN Tunnel on Firewall Threat Defense	1519
Multiple Certificate Authentication	1521
Guidelines and Limitations of Multiple Certificate Authentication	1522

Configuring Multiple Certificate Authentication	1522
Customizing Remote Access VPN AAA Settings	1523
Authenticate VPN Users via Client Certificates	1523
Configure VPN User Authentication via Client Certificate and AAA Server	1525
Manage Password Changes over VPN Sessions	1527
Send Accounting Records to the RADIUS Server	1527
Delegating Group Policy Selection to Authorization Server	1528
Override the Selection of Group Policy or Other Attributes by the Authorization Server	1529
Deny VPN Access to a User Group	1530
Restrict Connection Profile Selection for a User Group	1531
Update the Secure Client Profile for Remote Access VPN Clients	1531
RADIUS Dynamic Authorization	1532
Configuring RADIUS Dynamic Authorization	1533
Two-Factor Authentication	1534
Configuring RSA Two-Factor Authentication	1534
Configuring Duo Two-Factor Authentication	1535
Secondary Authentication	1537
Configure Remote Access VPN Secondary Authentication	1537
Single Sign-On Authentication with SAML 2.0	1539
Guidelines and Limitations for SAML 2.0	1540
Configuring a SAML Single Sign-On Authentication	1541
Configuring SAML Authorization	1542
Advanced Secure Client Configurations	1544
Configure Secure Client Modules on a Firewall Threat Defense	1544
Types of Secure Client Modules	1544
Prerequisites for Configuring Secure Client Modules	1545
Guidelines for Configuring Secure Client Modules	1546
Install Secure Client Modules using a Firewall Threat Defense	1547
Configure a Remote Access VPN Group Policy with Secure Client Modules	1548
Verify Secure Client Modules Configuration	1548
Configure Application-Based (Per App VPN) Remote Access VPN on Mobile Devices	1549
Prerequisites and Licensing for Configuring Per App VPN Tunnels	1549
Determine the Application IDs for Mobile Applications	1550
Configure Application-Based VPN Tunnels	1551

Verify Per App Configuration	1552
Remote Access VPN Examples	1552
How to Limit Secure Client Bandwidth Per User	1552
How to Use VPN Identity for User-Id Based Access Control Rules	1553
Configure Firewall Threat Defense Multiple Certificate Authentication	1553
History for Remote Access VPNs	1557

---

**CHAPTER 38**
**Dynamic Access Policies 1561**

About Secure Firewall Threat Defense Dynamic Access Policy	1561
Hierarchy of Policy Enforcement of Permissions and Attributes in Firewall Threat Defense	1561
Prerequisites for Dynamic Access Policy	1563
Guidelines and Limitations for Dynamic Access Policies	1563
Configure a Dynamic Access Policy (DAP)	1563
Create a Dynamic Access Policy	1563
Create a Dynamic Access Policy Record	1564
Configure AAA Criteria Settings for DAP	1564
Configure Endpoint Attribute Selection Criteria in DAP	1565
Add an Anti-Malware Endpoint Attribute to a DAP	1566
Add a Device Endpoint Attribute to a DAP	1567
Add Secure Client Endpoint Attributes to a DAP	1567
Add NAC Endpoint Attributes to a DAP	1568
Add an Application Attribute to a DAP	1568
Add a Personal Firewall Endpoint Attribute to a DAP	1568
Add an Operating System Endpoint Attribute to a DAP	1569
Add a Process Endpoint Attribute to a DAP	1569
Add a Registry Endpoint Attribute to a DAP	1569
Add a File Endpoint Attribute to a DAP	1570
Add Certificate Authentication Attributes to a DAP	1570
Configure Advanced Settings for DAP	1571
Associate Dynamic Access Policy with Remote Access VPN	1571
History for Dynamic Access Policy	1572

---

**CHAPTER 39**
**VPN Monitoring and Troubleshooting 1573**

VPN Summary Dashboard	1573
-----------------------	------

Remote Access VPN Dashboard	1573
SD-WAN Summary Dashboard	1575
Prerequisites for Using SD-WAN Summary Dashboard	1575
Monitor WAN Devices and Interfaces Using the SD-WAN Summary Dashboard	1578
Monitor Application Performance Metrics of WAN Interfaces Using the SD-WAN Summary Dashboard	1580
VPN Session and User Information	1580
Viewing Remote Access VPN Active Sessions	1580
Viewing Remote Access VPN User Activity	1580
Site to Site VPN Connection Event Monitoring	1580
View Site to Site VPN Connection Events	1581
VPN Troubleshooting	1582
System Messages	1582
VPN System Logs	1582
Debug Commands	1582
debug aaa	1584
debug crypto	1584
debug ldap	1587
debug ssl	1588
debug webvpn	1588

---

**PART VII**
**Access Control 1591**

---

**CHAPTER 40**
**Access Control Overview 1593**

Introduction to Access Control	1593
Introduction to Rules	1594
Filtering Rules by Device	1594
Rule and Other Policy Warnings	1595
Access Control Policy Default Action	1596
Deep Inspection Using File and Intrusion Policies	1598
Access Control Traffic Handling with Intrusion and File Policies	1599
File and Intrusion Inspection Order	1600
Access Control Policy Inheritance	1601
Best Practices for Application Control	1602

Recommendations for Application Control	1602
Best Practices for Configuring Application Control	1605
Application Characteristics	1606
Application-Specific Notes and Limitations	1607
Best Practices for Access Control Rules	1608
General Best Practices for Access Control	1608
Best Practices for Ordering Rules	1609
Rule Preemption	1610
Rule Actions and Rule Order	1610
Application Rule Order	1611
URL Rule Order	1612
Best Practices for Simplifying and Focusing Rules	1612
Maximum Number of Access Control Rules and Intrusion Policies	1613

---

**CHAPTER 41**
**Access Control Policies 1615**

Access Control Policy Components	1615
System-Created Access Control Policies	1616
Requirements and Prerequisites for Access Control Policies	1616
Managing Access Control Policies	1617
Creating a Basic Access Control Policy	1618
Editing an Access Control Policy	1619
Locking an Access Control Policy	1621
Managing Access Control Policy Inheritance	1622
Choosing a Base Access Control Policy	1622
Inheriting Access Control Policy Settings from the Base Policy	1623
Locking Settings in Descendant Access Control Policies	1623
Requiring an Access Control Policy in a Domain	1624
Assigning Devices to an Access Control Policy	1624
Logging Settings for Access Control Policies	1625
Access Control Policy Advanced Settings	1626
Associating Other Policies with Access Control	1631
Viewing Rule Hit Counts	1632
Analyzing Rule Conflicts and Warnings	1634
Searching for Rules	1636

History for Access Control Policies 1637

---

## CHAPTER 42

### Access Control Rules 1641

Introduction to Access Control Rules 1641

Access Control Rule Management 1643

Access Control Rule Components 1644

Access Control Rule Order 1645

Access Control Rule Actions 1646

Access Control Rule Monitor Action 1646

Access Control Rule Trust Action 1646

Access Control Rule Blocking Actions 1647

Access Control Rule Interactive Blocking Actions 1648

Access Control Rule Allow Action 1648

Requirements and Prerequisites for Access Control Rules 1649

Guidelines and Limitations for Access Control Rules 1650

Managing Access Control Rules 1651

Adding an Access Control Rule Category 1651

Create and Edit Access Control Rules 1651

Access Control Rule Conditions 1653

Enabling and Disabling Access Control Rules 1660

Copying Access Control Rules from One Access Control Policy to Another 1660

Moving Access Control Rules to a Prefilter Policy 1661

Positioning an Access Control Rule 1663

Adding Comments to an Access Control Rule 1664

Examples for Access Control Rules 1664

How to Control Access Using Security Zones 1664

How to Control Application Usage 1665

How to Block Threats 1666

History for Access Control Rules 1669

---

## CHAPTER 43

### Cisco Secure Dynamic Attributes Connector 1671

About the Cisco Secure Dynamic Attributes Connector 1671

How It Works 1672

History for the Cisco Secure Dynamic Attributes Connector 1674

System Requirements for the Cisco Secure Dynamic Attributes Connector	1674
Enable the Cisco Secure Dynamic Attributes Connector	1674
Configure Networks and Subnets for Docker Containers	1675
About the Dashboard	1677
Dashboard of an Unconfigured System	1678
Dashboard of a Configured System	1679
Add, Edit, or Delete Connectors	1681
Add, Edit, or Delete Dynamic Attributes Filters	1682
Create a Connector	1684
Amazon Web Services Connector—About User Permissions and Imported Data	1684
Create an AWS User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector	1685
Create an AWS Connector	1686
Azure Connector—About User Permissions and Imported Data	1687
Create an Azure User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector	1687
Create an Azure Connector	1689
Create an Azure Service Tags Connector	1690
Create a Generic Text Connector	1691
Create a GitHub Connector	1693
Google Cloud Connector—About User Permissions and Imported Data	1693
Create a Google Cloud User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector	1694
Create a Google Cloud Connector	1695
Create an Office 365 Connector	1696
vCenter Connector—About User Permissions and Imported Data	1697
Create a vCenter User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector	1697
Create a vCenter Connector	1698
Create a Webex Connector	1701
Create a Zoom Connector	1702
Create Dynamic Attributes Filters	1702
Dynamic Attribute Filter Examples	1704
Manually Get a Certificate Authority (CA) Chain	1705
Use Dynamic Objects in Access Control Policies	1708

About Dynamic Objects in Access Control Rules	1708
Dynamic Attributes Rule Conditions	1709
Create Access Control Rules Using Dynamic Attributes Filters	1709
Disable the Cisco Secure Dynamic Attributes Connector	1710
Troubleshoot Using the Command Line	1711
Troubleshoot Using the Firewall Management Center	1713
Manually Get a Certificate Authority (CA) Chain	1713
Security Requirements	1716
Internet Access Requirements	1717
History for the Cisco Secure Dynamic Attributes Connector	1718

---

**CHAPTER 44**
**URL Filtering 1719**

URL Filtering Overview	1719
About URL Filtering with Category and Reputation	1720
URL Category and Reputation Descriptions	1721
URL Filtering Data from the Cisco Cloud	1721
Best Practices for URL Filtering	1721
Filtering HTTPS Traffic	1724
Use Categories in URL Filtering	1725
License Requirements for URL Filtering	1726
Requirements and Prerequisites for URL Filtering	1726
How to Configure URL Filtering with Category and Reputation	1727
Enable URL Filtering Using Category and Reputation	1728
URL Filtering Options	1728
Configuring URL Conditions	1730
Rules with URL Conditions	1731
URL Rule Order	1732
DNS Filtering: Identify URL Reputation and Category During DNS Lookup	1732
Enable DNS Filtering to Identify URLs During Domain Lookup	1732
DNS Filtering Limitations	1733
DNS Filtering and Events	1733
Manual URL Filtering	1733
Manual URL Filtering Options	1734
Supplement or Selectively Override Category and Reputation-Based URL Filtering	1734

Configure HTTP Response Pages	1735
Limitations to HTTP Response Pages	1735
Requirements and Prerequisites for HTTP Response Pages	1736
Choosing HTTP Response Pages	1736
Configure Interactive Blocking with HTTP Response Pages	1737
Configuring Interactive Blocking	1738
Setting the User Bypass Timeout for a Blocked Website	1738
Configure URL Filtering Health Monitors	1739
Dispute URL Category and Reputation	1739
If the URL Category Set Changes, Take Action	1740
URL Category and Reputation Changes: Effect on Events	1741
Troubleshoot URL Filtering	1741
History for URL Filtering	1744

---

## CHAPTER 45

### Security Intelligence 1747

About Security Intelligence	1747
Best Practices for Security Intelligence	1748
License Requirements for Security Intelligence	1748
Requirements and Prerequisites for Security Intelligence	1749
Security Intelligence Sources	1749
Configure Security Intelligence	1750
Security Intelligence Options	1752
Security Intelligence Categories	1753
Block List Icons	1755
Configuration Example: Security Intelligence Blocking	1755
Security Intelligence Monitoring	1756
Override Security Intelligence Blocking	1757
Troubleshooting Security Intelligence	1757
Security Intelligence Categories Are Missing from the Available Options List	1758
History for Security Intelligence Block Listing	1758

---

## CHAPTER 46

### DNS Policies 1759

DNS Policy Overview	1759
Cisco Umbrella DNS Policies	1760

DNS Policy Components	1760
License Requirements for DNS Policies	1761
Requirements and Prerequisites for DNS Policies	1761
Managing DNS and Umbrella DNS Policies	1762
Creating Basic DNS Policies	1762
Editing DNS Policies	1763
DNS Rules	1764
Creating and Editing DNS Rules	1764
DNS Rule Management	1765
Enabling and Disabling DNS Rules	1765
DNS Rule Order Evaluation	1766
DNS Rule Actions	1766
DNS Rule Conditions	1767
Security Zone Rule Conditions	1767
Network Rule Conditions	1768
VLAN Tags Rule Conditions	1768
DNS Policy Rule Conditions	1769
How to Create DNS Rules	1769
Controlling Traffic Based on DNS and Security Zone	1769
Controlling Traffic Based on DNS and Network	1770
Controlling Traffic Based on DNS and VLAN	1770
Controlling Traffic Based on DNS List or Feed	1771
DNS Policy Deploy	1772
Cisco Umbrella DNS Policies	1772
How to Redirect DNS Requests to Cisco Umbrella	1772
Prerequisites for Configuring the Umbrella DNS Connector	1773
Configure Cisco Umbrella Connection Settings	1774
Create an Umbrella DNS Policy	1775
Edit Umbrella DNS Policies and Rules	1775
Associate the Umbrella DNS Policy with an Access Control Policy	1776
<hr/>	
<b>CHAPTER 47</b>	<b>Prefiltering and Prefilter Policies 1777</b>
	About Prefiltering 1777
	About Prefilter Policies 1777

Tunnel vs Prefilter Rules	1778
Prefiltering vs Access Control	1779
Passthrough Tunnels and Access Control	1781
Best Practices for Fastpath Prefiltering	1782
Best Practices for Encapsulated Traffic Handling	1782
Requirements and Prerequisites for Prefilter Policies	1783
Configure Prefiltering	1784
Tunnel and Prefilter Rule Components	1785
Prefilter Rule Conditions	1787
Interface Rule Conditions	1787
Network Rule Conditions	1787
VLAN Tags Rule Conditions	1788
Port Rule Conditions for Prefilter Rules	1788
Time and Day Rule Conditions	1789
Tunnel Rule Conditions	1789
Encapsulation Rule Conditions	1789
Tunnel Zones and Prefiltering	1790
Using Tunnel Zones	1790
Creating Tunnel Zones	1792
Moving Prefilter Rules to an Access Control Policy	1793
Prefilter Policy Hit Counts	1795
Large Flow Offloads	1795
Flow Offload Limitations	1796
History for Prefiltering	1798
<b>CHAPTER 48</b>	<b>Service Policies 1799</b>
About Threat Defense Service Policies	1799
How Service Policies Relate to FlexConfig and Other Features	1800
What Are Connection Settings?	1800
Requirements and Prerequisites for Service Policies	1801
Guidelines and Limitations for Service Policies	1801
Configure Threat Defense Service Policies	1802
Configure a Service Policy Rule	1803
Bypass TCP State Checks for Asymmetrical Routing (TCP State Bypass)	1805

The Asymmetrical Routing Problem	1806
Guidelines and Limitations for TCP State Bypass	1807
Configure TCP State Bypass	1807
Disable TCP Sequence Randomization	1809
Examples for Service Policy Rules	1810
Protect Servers from a SYN Flood DoS Attack (TCP Intercept)	1810
Make the Firewall Threat Defense Device Appear on Traceroutes	1813
Monitoring Service Policies	1815
History for Threat Defense Service Policy	1816

---

**CHAPTER 49**
**Threat Detection 1817**

Portscan Detection and Prevention	1817
Pre-Defined Sensitivity Levels for Portscan Detection	1817
Detection in the Low Sensitivity Level	1819
Best Practices for Portscan Prevention	1819
Requirements and Prerequisites for Threat Detection	1820
Guidelines and Limitations for Threat Detection	1820
Configure Portscan Detection and Prevention	1821
Monitoring Threat Detection	1823
Viewing Portscan Alerts	1823
Monitoring Portscan on the Firewall	1824
Unblocking A Host	1825
History for Threat Detection	1825

---

**CHAPTER 50**
**Intelligent Application Bypass 1827**

Introduction to IAB	1827
IAB Options	1828
Requirements and Prerequisites for Intelligent Application Bypass	1830
Configuring Intelligent Application Bypass	1830
IAB Logging and Analysis	1831

---

**CHAPTER 51**
**Content Restriction 1835**

About Content Restriction	1835
Requirements and Prerequisites for Content Restriction	1836

Guidelines and Limitations for Content Restriction	1837
Using Access Control Rules to Enforce Content Restriction	1837
Safe Search Options for Access Control Rules	1838
Using a DNS Sinkhole to Enforce Content Restriction	1838

---

## CHAPTER 52

### Zero Trust Access 1841

Zero Trust Access	1841
How Threat Defense Works with Zero Trust Access	1842
Why Use Zero Trust Access?	1843
Components of a Zero Trust Access Configuration	1843
Zero Trust Access Workflow	1844
Limitations for Zero Trust Network Access	1845
Prerequisites for Zero Trust Application Policy	1846
Manage Zero Trust Application Policies	1846
Create a Zero Trust Application Policy	1847
Create an Application Group	1848
Create an Application	1849
Set Targeted Devices for Zero Trust Access Policy	1851
Edit a Zero Trust Application Policy	1852
Monitor Zero Trust Sessions	1853
History for Zero Trust Access	1855

---

## PART VIII

### SD-WAN 1857

---

## CHAPTER 53

### SD-WAN Capabilities 1859

Overview of SD-WAN Capabilities	1859
Features	1860
Use Cases for SD-WAN Capabilities	1861

---

## PART IX

### Intrusion Detection and Prevention 1863

---

## CHAPTER 54

### Network Analysis and Intrusion Policies Overview 1865

Network Analysis and Intrusion Policy Basics	1865
How Policies Examine Traffic For Intrusions	1867

Decoding, Normalizing, and Preprocessing: Network Analysis Policies	1867
Access Control Rules: Intrusion Policy Selection	1869
Intrusion Inspection: Intrusion Policies, Rules, and Variable Sets	1869
Intrusion Event Generation	1871
System-Provided and Custom Network Analysis and Intrusion Policies	1871
System-Provided Network Analysis and Intrusion Policies	1872
Benefits of Custom Network Analysis and Intrusion Policies	1874
Benefits of Custom Network Analysis Policies	1874
Benefits of Custom Intrusion Policies	1875
Limitations of Custom Policies	1876
License Requirements for Network Analysis and Intrusion Policies	1878
Requirements and Prerequisites for Network Analysis and Intrusion Policies	1878
Guidelines and Limitations for Network Analysis and Intrusion Policies	1878
The Navigation Panel: Network Analysis and Intrusion Policies	1879
Conflicts and Changes: Network Analysis and Intrusion Policies	1880
Exiting a Network Analysis or Intrusion Policy	1882

---

**CHAPTER 55**
**Getting Started with Intrusion Policies 1883**

Intrusion Policy Basics	1883
License Requirements for Intrusion Policies	1884
Requirements and Prerequisites for Intrusion Policies	1885
Managing Intrusion Policies	1885
Custom Intrusion Policy Creation	1886
Creating a Custom Snort 2 Intrusion Policy	1886
Editing Snort 2 Intrusion Policies	1887
Intrusion Policy Changes	1888
Access Control Rule Configuration to Perform Intrusion Prevention	1888
Access Control Rule Configuration and Intrusion Policies	1889
Configuring an Access Control Rule to Perform Intrusion Prevention	1889
Drop Behavior in an Inline Deployment	1889
Setting Drop Behavior in an Inline Deployment	1890
Drop Behavior in a Dual System Deployment	1891
Intrusion Policy Advanced Settings	1891
Optimizing Performance for Intrusion Detection and Prevention	1892

**CHAPTER 56****Tuning Intrusion Policies Using Rules 1893**[Intrusion Rule Tuning Basics 1893](#)[Intrusion Rule Types 1893](#)[License Requirements for Intrusion Rules 1894](#)[Requirements and Prerequisites for Intrusion Rules 1895](#)[Viewing Intrusion Rules in an Intrusion Policy 1895](#)[Intrusion Rules Page Columns 1895](#)[Intrusion Rule Details 1896](#)[Viewing Intrusion Rule Details 1897](#)[Setting a Threshold for an Intrusion Rule 1898](#)[Setting Suppression for an Intrusion Rule 1898](#)[Setting a Dynamic Rule State from the Rule Details Page 1899](#)[Setting an SNMP Alert for an Intrusion Rule 1900](#)[Adding a Comment to an Intrusion Rule 1900](#)[Intrusion Rule Filters in an Intrusion Policy 1900](#)[Intrusion Rule Filters Notes 1901](#)[Intrusion Policy Rule Filters Construction Guidelines 1901](#)[Intrusion Rule Configuration Filters 1903](#)[Intrusion Rule Content Filters 1904](#)[Intrusion Rule Categories 1905](#)[Intrusion Rule Filter Components 1905](#)[Intrusion Rule Filter Usage 1906](#)[Setting a Rule Filter in an Intrusion Policy 1906](#)[Intrusion Rule States 1907](#)[Intrusion Rule State Options 1907](#)[Setting Intrusion Rule States 1908](#)[Intrusion Event Notification Filters in an Intrusion Policy 1909](#)[Intrusion Event Thresholds 1909](#)[Intrusion Event Thresholds Configuration 1909](#)[Adding and Modifying Intrusion Event Thresholds 1910](#)[Viewing and Deleting Intrusion Event Thresholds 1911](#)[Intrusion Policy Suppression Configuration 1912](#)[Intrusion Policy Suppression Types 1912](#)

Suppressing Intrusion Events for a Specific Rule	1913
Viewing and Deleting Suppression Conditions	1913
Dynamic Intrusion Rule States	1914
Dynamic Intrusion Rule State Configuration	1915
Setting a Dynamic Rule State from the Rules Page	1916
Adding Intrusion Rule Comments	1917

---

**CHAPTER 57**
**Custom Intrusion Rules 1919**

Custom Intrusion Rules Overview	1919
License Requirements for the Intrusion Rule Editor	1920
Requirements and Prerequisites for the Intrusion Rule Editor	1920
Rule Anatomy	1920
The Intrusion Rule Header	1921
Intrusion Rule Header Action	1922
Intrusion Rule Header Protocol	1922
Intrusion Rule Header Direction	1923
Intrusion Rule Header Source and Destination IP Addresses	1923
Intrusion Rule Header Source and Destination Ports	1926
Intrusion Event Details	1927
Adding a Custom Classification	1930
Defining an Event Priority	1931
Defining an Event Reference	1931
Custom Rule Creation	1932
Writing New Rules	1932
Modifying Existing Rules	1933
Viewing Rule Documentation	1934
Adding Comments to Intrusion Rules	1935
Deleting Custom Rules	1936
Searching for Rules	1937
Search Criteria for Intrusion Rules	1937
Rule Filtering on the Intrusion Rules Editor Page	1938
Filtering Guidelines	1938
Keyword Filtering	1939
Character String Filtering	1940

Combination Keyword and Character String Filtering	1940
Filtering Rules	1940
Keywords and Arguments in Intrusion Rules	1941
The content and protected_content Keywords	1942
Basic content and protected_content Keyword Arguments	1943
content and protected_content Keyword Search Locations	1944
Overview: HTTP content and protected_content Keyword Arguments	1947
Overview: content Keyword Fast Pattern Matcher	1950
The replace Keyword	1953
The byte_jump Keyword	1954
The byte_test Keyword	1956
The byte_extract Keyword	1958
The byte_math Keyword	1961
Overview: The pcre Keyword	1963
pcre Syntax	1964
pcre Modifier Options	1966
pcre Example Keyword Values	1969
The metadata Keyword	1971
Service Metadata	1972
Metadata Search Guidelines	1977
IP Header Values	1978
ICMP Header Values	1980
TCP Header Values and Stream Size	1981
The stream_reassembly Keyword	1985
SSL Keywords	1985
The appid Keyword	1987
Application Layer Protocol Values	1988
The RPC Keyword	1988
The ASN.1 Keyword	1988
The urilen Keyword	1989
DCE/RPC Keywords	1990
SIP Keywords	1993
GTP Keywords	1995
SCADA Keywords	2007

Modbus Keywords	2007
DNP3 Keywords	2008
CIP and ENIP Keywords	2011
S7Commplus Keywords	2012
Packet Characteristics	2013
Active Response Keywords	2015
The resp Keyword	2015
The react Keyword	2016
The detection_filter Keyword	2017
The tag Keyword	2018
The flowbits Keyword	2019
flowbits Keyword Options	2019
Guidelines for Using the flowbits Keyword	2021
flowbits Keyword Examples	2021
The http_encode Keyword	2026
http_encode Keyword Syntax	2027
http_encode Keyword example: Using Two http_encode Keywords to Search for Two Encodings	2027
Overview: The file_type and file_group Keywords	2027
The file_type and file_group Keywords	2028
The file_data Keyword	2029
The pkt_data Keyword	2030
The base64_decode and base64_data Keywords	2030

---

**CHAPTER 58**
**Layers in Intrusion and Network Analysis Policies 2033**

Layer Basics	2033
License Requirements for Network Analysis and Intrusion Policy Layers	2033
Requirements and Prerequisites for Network Analysis and Intrusion Policy Layers	2034
The Layer Stack	2034
The Base Layer	2035
System-Provided Base Policies	2035
Custom Base Policies	2035
The Effect of Rule Updates on Base Policies	2036
Changing the Base Policy	2037

The Cisco Recommendations Layer	2037
Layer Management	2038
Shared Layers	2039
Managing Layers	2040
Navigating Layers	2041
Intrusion Rules in Layers	2041
Configuring Intrusion Rules in Layers	2042
Removing Rule Settings from Multiple Layers	2043
Accepting Rule Changes from a Custom Base Policy	2044
Preprocessors and Advanced Settings in Layers	2045
Configuring Preprocessors and Advanced Settings in Layers	2046

---

## CHAPTER 59

<b>Tailoring Intrusion Protection to Your Network Assets</b>	<b>2049</b>
About Cisco Recommended Rules	2049
Default Settings for Cisco Recommendations	2050
Advanced Settings for Cisco Recommendations	2051
Generating and Applying Cisco Recommendations	2052
Script Detection	2053

---

## CHAPTER 60

<b>Sensitive Data Detection</b>	<b>2055</b>
Sensitive Data Detection Basics	2055
Global Sensitive Data Detection Options	2056
Individual Sensitive Data Type Options	2057
System-Provided Sensitive Data Types	2058
License Requirements for Sensitive Data Detection	2058
Requirements and Prerequisites for Sensitive Data Detection	2059
Configuring Sensitive Data Detection	2059
Monitored Application Protocols and Sensitive Data	2060
Selecting Application Protocols to Monitor	2061
Special Case: Sensitive Data Detection in FTP Traffic	2062
Custom Sensitive Data Types	2062
Data Patterns in Custom Sensitive Data Types	2063
Configuring Custom Sensitive Data Types	2065
Editing Custom Sensitive Data Types	2066

---

**CHAPTER 61****Global Limit for Intrusion Event Logging 2067**

- Global Rule Thresholding Basics 2067
- Global Rule Thresholding Options 2068
- License Requirements for Global Thresholds 2069
- Requirements and Prerequisites for Global Thresholds 2070
- Configuring Global Thresholds 2070
- Disabling the Global Threshold 2071

---

**CHAPTER 62****Intrusion Prevention Performance Tuning 2073**

- About Intrusion Prevention Performance Tuning 2073
- License Requirements for Intrusion Prevention Performance Tuning 2074
- Requirements and Prerequisites for Intrusion Prevention Performance Tuning 2074
- Limiting Pattern Matching for Intrusions 2074
- Regular Expression Limits Overrides for Intrusion Rules 2075
- Overriding Regular Expression Limits for Intrusion Rules 2076
- Per Packet Intrusion Event Generation Limits 2077
- Limiting Intrusion Events Generated Per Packet 2077
- Packet and Intrusion Rule Latency Threshold Configuration 2078
  - Latency-Based Performance Settings 2078
  - Packet Latency Thresholding 2078
    - Packet Latency Thresholding Notes 2079
    - Enabling Packet Latency Thresholding 2080
    - Configuring Packet Latency Thresholding 2080
  - Rule Latency Thresholding 2081
    - Rule Latency Thresholding Notes 2082
    - Configuring Rule Latency Thresholding 2083
- Intrusion Performance Statistic Logging Configuration 2084
- Configuring Intrusion Performance Statistic Logging 2084

---

**PART X****Network Malware Protection and File Policies 2087**

---

**CHAPTER 63****Network Malware Protection and File Policies 2089**

- About Network Malware Protection and File Policies 2089

File Policies	2090
Requirements and Prerequisites for File Policies	2090
License Requirements for File and Malware Policies	2091
Best Practices for File Policies and Malware Detection	2091
File Rule Best Practices	2091
File Detection Best Practices	2092
File Blocking Best Practices	2092
File Policy Best Practices	2093
How to Configure Malware Protection	2094
Plan and Prepare for Malware Protection	2095
Configure File Policies	2096
Add File Policies to Your Access Control Configuration	2096
Configuring an Access Control Rule to Perform Malware Protection	2097
Set Up Maintenance and Monitoring of Malware Protection	2098
Cloud Connections for Malware Protection	2099
AMP Cloud Connection Configurations	2100
Requirements and Best Practices for AMP Cloud Connections	2100
Choose an AMP Cloud	2101
Cisco AMP Private Cloud	2101
Managing Connections to the AMP Cloud (Public or Private)	2103
Change AMP Options	2104
Dynamic Analysis Connections	2104
Requirements for Dynamic Analysis	2104
Viewing the Default Dynamic Analysis Connection	2104
Dynamic Analysis On-Premises Appliance (Cisco Secure Malware Analytics)	2105
Enabling Access to Dynamic Analysis Results in the Public Cloud	2106
Maintain Your System: File Types Eligible for Dynamic Analysis	2107
File Policies and File Rules	2108
Create or Edit a File Policy	2108
Advanced and Archive File Inspection Options	2109
Managing File Policies	2112
File Rules	2113
File Rule Components	2113
File Rule Actions	2114

Creating File Rules	2121
Access Control Rule Logging for Malware Protection	2123
Retrospective Disposition Changes	2123
File and Malware Inspection Performance and Storage Options	2123
Tuning File and Malware Inspection Performance and Storage	2124
(Optional) Malware Protection with Secure Endpoint	2125
Comparison of Malware Protection: Firepower vs. Secure Endpoint	2126
About Integrating Firepower with Secure Endpoint	2126
Benefits of Integrating Firepower and Secure Endpoint	2127
Secure Endpoint and AMP Private Cloud	2127
Integrate Firepower and Secure Endpoint	2127
History for Network Malware Protection and File Policies	2130

---

**PART XI**
**Encrypted Traffic Handling 2131**

---

**CHAPTER 64**
**Traffic Decryption Overview 2133**

Traffic Decryption Explained	2133
TLS/SSL Handshake Processing	2134
ClientHello Message Handling	2135
ServerHello and Server Certificate Message Handling	2138
Decryption Rule and Policy Basics	2140
The Case for Decryption	2140
When to Decrypt Traffic, When Not to Decrypt	2141
Decrypt and Resign (Outgoing Traffic)	2142
Known Key Decryption (Incoming Traffic)	2143
Other Decryption Rule Actions	2143
Decryption Rule Components	2143
Decryption Rule Order Evaluation	2144
Multi-Rule Example	2145
TLS Crypto Acceleration	2147
TLS Crypto Acceleration Guidelines and Limitations	2148
View the Status of TLS Crypto Acceleration	2149
How to Configure Decryption Policies and Rules	2150
History for Decryption Policy	2151

**CHAPTER 65****Decryption Policies 2155**

- About Decryption Policies 2155
- Requirements and Prerequisites for Decryption Policies 2156
- Create a Decryption Policy 2156
  - Create a Create a Decryption Policy with Outbound Connection Protection 2156
  - Create a Create a Decryption Policy with Inbound Connection Protection 2158
- Decryption Policy Exclusions 2159
- Generate an Internal CA for Outbound Protection 2162
- Upload an Internal CA for Outbound Protection 2163
- Upload an Internal Certificate for Inbound Protection 2164
- Create a Create a Decryption Policy with Other Rule Actions 2165
- Decryption Policy Default Actions 2166
- Default Handling Options for Undecryptable Traffic 2166
  - Set Default Handling for Undecryptable Traffic 2168
- Decryption Policy Advanced Options 2169
  - TLS 1.3 Decryption Best Practices 2170

**CHAPTER 66****Decryption Rules 2173**

- Decryption Rules Overview 2173
- Requirements and Prerequisites for Decryption Rules 2173
- Decryption Rule Guidelines and Limitations 2174
  - Guidelines for Using TLS/SSL Decryption 2174
- Decryption Rule Unsupported Features 2175
- TLS/SSL Do Not Decrypt Guidelines 2176
- TLS/SSL Decrypt - Resign Guidelines 2177
- TLS/SSL Decrypt - Known Key Guidelines 2179
- TLS/SSL Block Guidelines 2180
- TLS/SSL Certificate Pinning Guidelines 2180
- TLS/SSL Heartbeat Guidelines 2181
- TLS/SSL Anonymous Cipher Suite Limitation 2181
- TLS/SSL Normalizer Guidelines 2181
- Other Decryption Rule Guidelines 2181
- Decryption Rule Traffic Handling 2182

Encrypted Traffic Inspection Configuration	2184
Decryption Rule Order Evaluation	2185
Decryption Rule Conditions	2186
Security Zone Rule Conditions	2187
Security Zone Conditions and Multitenancy	2187
Network Rule Conditions	2188
VLAN Tags Rule Conditions	2188
User Rule Conditions	2188
Application Rule Conditions	2189
Port Rule Conditions	2190
Category Rule Conditions	2191
Server Certificate-Based Decryption Rule Conditions	2191
Certificate Decryption Rule Conditions	2192
Distinguished Name (DN) Rule Conditions	2192
Trusting External Certificate Authorities	2197
Certificate Status Decryption Rule Conditions	2198
Cipher Suite Decryption Rule Conditions	2201
Encryption Protocol Version Decryption Rule Conditions	2204
Decryption Rule Actions	2204
Decryption Rule Monitor Action	2204
Decryption Rule Do Not Decrypt Action	2205
Decryption Rule Blocking Actions	2206
Decryption Rule Decrypt Actions	2206
Monitor TLS/SSL Hardware Acceleration	2207
Informational Counters	2207
Alert Counters	2207
Error Counters	2208
Fatal Counters	2208
Troubleshoot Decryption Rules	2209
About TLS/SSL Oversubscription	2209
Troubleshoot TLS/SSL Oversubscription	2209
About TLS Heartbeat	2211
Troubleshoot TLS Heartbeat	2211
About TLS/SSL Pinning	2213

Troubleshoot TLS/SSL Pinning	2213
Troubleshoot Unknown or Bad Certificates or Certificate Authorities	2215
Verify TLS/SSL Cipher Suites	2217
Troubleshooting Using Crypto Archives	2218

---

## CHAPTER 67

### Decryption Rules and Policy Example 2221

Decryption Rules Best Practices	2221
Bypass Inspection with Prefilter and Flow Offload	2222
Do Not Decrypt Best Practices	2223
Decrypt - Resign and Decrypt - Known Key Best Practices	2223
Decryption Rules to Put First	2224
Decryption Rules to Put Last	2224
Recommended Policy and Rule Settings	2225
Recommended Policy and Rule Settings	2225
Decryption Policy Settings	2226
Access Control Policy Settings	2228
Decryption Policy Walkthrough	2229
Recommended Policy and Rule Settings	2230
Decryption Policy Settings	2231
Access Control Policy Settings	2233
Decryption Rule Examples	2234
Traffic to Prefilter	2234
	2235
: Decrypt Specific Test Traffic	2235
Do Not Decrypt Low-Risk Categories, Reputations, or Applications	2235
Create a Decrypt - Resign Rule for Categories	2237
Decryption Rules: Block or Monitor Certificates and Protocol Versions	2238
Decryption Rule Settings	2243

---

## PART XII

### User Identity 2245

---

## CHAPTER 68

### User Identity Overview 2247

About User Identity	2247
Identity Terminology	2248

About User Identity Sources	2248
Best Practices for User Identity	2250
Identity Deployments	2252
How to Set Up an Identity Policy	2253
The User Activity Database	2256
The Users Database	2256
Host and User Limits	2257
Host Limit	2257
User Limits for Microsoft Active Directory	2258
User Limits for Microsoft Azure Active Directory Realms	2260
Identity Realm Limit	2262
User Limits for Microsoft Azure Active Directory Realms	2262

---

**CHAPTER 69**
**Realms 2265**

License Requirements for Realms	2265
Requirements and Prerequisites for Realms	2265
Create a Microsoft Azure AD Realm	2266
About Entra ID and Cisco ISE with Resource Owned Password Credentials	2266
About Entra ID and Cisco ISE with TEAP/EAP-TLS	2267
How to Create a Microsoft Azure AD Realm	2268
Configure Microsoft Entra ID	2269
How to Configure ISE for Microsoft Azure AD	2270
Get Required Information For Your Microsoft Azure AD Realm	2271
Create an Azure AD Realm	2273
Azure AD User Session Timeout	2275
Create an LDAP Realm or an Active Directory Realm and Realm Directory	2275
About Realms and Realm Sequences	2277
Realms and Trusted Domains	2279
Supported Servers for Realms	2283
Supported Server Object Class and Attribute Names	2284
Prerequisites for Kerberos Authentication	2285
Realm Fields	2285
Realm Directory and Synchronize fields	2289
Connect Securely to Active Directory or LDAP	2291

Find the Active Directory Server's Name	2291
Export the Active Directory Server's Root Certificate	2292
Synchronize Users and Groups	2294
Create a Realm Sequence	2295
Configure the Firewall Management Center for Cross-Domain-Trust: The Setup	2296
Configure the Secure Firewall Management Center for Cross-Domain-Trust Step 1: Configure Realms and Directories	2297
Configure the Secure Firewall Management Center for Cross-Domain-Trust Step 2: Synchronize Users and Groups	2302
Configure the Secure Firewall Management Center for Cross-Domain-Trust Step 3: Resolve Issues	2303
Manage a Realm	2304
Compare Realms	2305
Troubleshoot Realms and User Downloads	2305
Detect Realm or User Mismatches	2309
Troubleshoot Cross-Domain Trust	2310
History for Realms	2313

---

## CHAPTER 70

<b>User Control with ISE/ISE-PIC</b>	<b>2315</b>
The ISE/ISE-PIC Identity Source	2315
Source and Destination Security Group Tag (SGT) Matching	2316
License Requirements for ISE/ISE-PIC	2317
Requirements and Prerequisites for ISE/ISE-PIC	2317
ISE/ISE-PIC Guidelines and Limitations	2317
How to Configure ISE/ISE-PIC for User Control	2320
How to Configure ISE/ISE-PIC Without a Realm	2320
How to Configure ISE/ISE-PIC for User Control Using a Realm	2321
Configure ISE/ISE-PIC	2323
Configure Security Groups and SXP Publishing in ISE	2323
Export Certificates from the ISE/ISE-PIC Server for Use in the Firewall Management Center	2325
Export a System Certificate	2326
Generate a Self-Signed Certificate	2327
Import ISE/ISE-PIC Certificates	2327
Configure ISE for User Control	2328
ISE/ISE-PIC Configuration Fields	2330

Troubleshoot the ISE/ISE-PIC or Cisco TrustSec Issues 2331

History for ISE/ISE-PIC 2333

---

## CHAPTER 71

### User Control with Captive Portal 2335

The Captive Portal Identity Source 2335

About Hostname Redirect 2336

License Requirements for Captive Portal 2336

Requirements and Prerequisites for Captive Portal 2336

Captive Portal Guidelines and Limitations 2336

How to Configure the Captive Portal for User Control 2339

Configure the Captive Portal Part 1: Create a Network Object 2340

Configure the Captive Portal Part 2: Create an Identity Policy and Active Authentication Rule 2342

Update a Custom Authentication Form 2344

Configure the Captive Portal Part 3: Create a TCP Port Access Control Rule 2344

Configure the Captive Portal Part 4: Create a User Access Control Rule 2345

Captive Portal Example: Create a Decryption Policy with an Outbound Rule 2346

Configure Captive Portal Part 6: Associate Identity and Decryption Policies with the Access Control Policy 2348

Captive Portal Fields 2349

Exclude Applications from Captive Portal 2350

Troubleshoot the Captive Portal Identity Source 2351

History for Captive Portal 2353

---

## CHAPTER 72

### User Control with Remote Access VPN 2355

The Remote Access VPN Identity Source 2355

Configure RA VPN for User Control 2356

Troubleshoot the Remote Access VPN Identity Source 2356

Not Observing Correct Settings for VPN Statistics 2357

History for RA VPN 2358

---

## CHAPTER 73

### User Control with TS Agent 2359

The Terminal Services (TS) Agent Identity Source 2359

TS Agent Guidelines 2360

User Control with TS Agent 2360

Troubleshoot the TS Agent Identity Source 2360

History for TS Agent 2361

---

## CHAPTER 74

### User Identity Policies 2363

About Identity Policies 2363

License Requirements for Identity Policies 2364

Requirements and Prerequisites for Identity Policies 2364

Create an Identity Policy 2365

    Create an Identity Mapping Filter 2366

Identity Rule Conditions 2367

    Security Zone Rule Conditions 2367

        Security Zone Conditions and Multitenancy 2368

    Network Rule Conditions 2368

        Redirect to Host Name Network Rule Conditions 2368

    VLAN Tags Rule Conditions 2369

    Port Rule Conditions 2369

        Port, Protocol, and ICMP Code Rule Conditions 2370

    Realm & Settings Rule Conditions 2371

Create an Identity Rule 2373

    Identity Rule Fields 2374

Sample Identity Policies and Rules 2375

    Create an Identity Policy with a Passive Authentication Rule 2376

    Create a Sample Identity Policy with an Active Authentication Rule 2378

        Active Authentication Using a Realm 2380

        Active Authentication Using a Realm Sequence 2381

Manage an Identity Policy 2382

Manage an Identity Rule 2383

Troubleshoot User Control 2383

---

## PART XIII

### Network Discovery 2387

---

## CHAPTER 75

### Network Discovery Overview 2389

About Detection of Host, Application, and User Data 2389

Host and Application Detection Fundamentals 2390

Passive Detection of Operating System and Host Data	2390
Active Detection of Operating System and Host Data	2390
Current Identities for Applications and Operating Systems	2391
Current User Identities	2392
Application and Operating System Identity Conflicts	2393
NetFlow Data	2393
Requirements for Using NetFlow Data	2394
Differences between NetFlow and Managed Device Data	2394

---

**CHAPTER 76**
**Host Identity Sources 2397**

Overview: Host Data Collection	2397
Requirements and Prerequisites for Host Identity Sources	2398
Determining Which Host Operating Systems the System Can Detect	2398
Identifying Host Operating Systems	2398
Custom Fingerprinting	2399
Managing Fingerprints	2400
Activating and Deactivating Fingerprints	2400
Editing an Active Fingerprint	2401
Editing an Inactive Fingerprint	2401
Creating a Custom Fingerprint for Clients	2402
Creating a Custom Fingerprint for Servers	2404
Host Input Data	2407
Requirements for Using Third-Party Data	2407
Third-Party Product Mappings	2408
Mapping Third-Party Products	2408
Mapping Third-Party Product Fixes	2409
Mapping Third-Party Vulnerabilities	2410
Custom Product Mappings	2411
Creating Custom Product Mappings	2412
Editing Custom Product Mapping Lists	2413
Activating and Deactivating Custom Product Mappings	2413
Configuring the Host Input Client	2413
Nmap Scanning	2414
Nmap Remediation Options	2415

Nmap Scanning Guidelines	2419
Example: Using Nmap to Resolve Unknown Operating Systems	2420
Example: Using Nmap to Respond to New Hosts	2421
Managing Nmap Scanning	2422
Adding an Nmap Scan Instance	2423
Editing an Nmap Scan Instance	2424
Adding an Nmap Scan Target	2425
Editing an Nmap Scan Target	2426
Creating an Nmap Remediation	2426
Editing an Nmap Remediation	2428
Running an On-Demand Nmap Scan	2429
Nmap Scan Results	2430
Viewing Nmap Scan Results	2430
Nmap Scan Results Fields	2431
Importing Nmap Scan Results	2432
History for Host Identity Sources	2432

---

## CHAPTER 77

### Application Detection 2433

Overview: Application Detection	2433
Application Detector Fundamentals	2434
Identification of Application Protocols in the Web Interface	2435
Implied Application Protocol Detection from Client Detection	2436
Host Limits and Discovery Event Logging	2436
Special Considerations for Application Detection	2437
Application Detection in Snort 3	2438
Requirements and Prerequisites for Application Detection	2439
Custom Application Detectors	2439
Custom Application Detector and User-Defined Application Fields	2439
Configuring Custom Application Detectors	2442
Create a User-Defined Application	2443
Specifying Detection Patterns in Basic Detectors	2444
Specifying Detection Criteria in Advanced Detectors	2445
Specifying EVE Process Assignments	2446
Testing a Custom Application Protocol Detector	2447

Viewing or Downloading Detector Details	2448
Sorting the Detector List	2448
Filtering the Detector List	2448
Filter Groups for the Detector List	2449
Navigating to Other Detector Pages	2450
Activating and Deactivating Detectors	2450
Editing Custom Application Detectors	2451
Deleting Detectors	2452

---

## CHAPTER 78

<b>Network Discovery Policies</b>	<b>2453</b>
Overview: Network Discovery Policies	2453
Requirements and Prerequisites for Network Discovery Policies	2454
Network Discovery Customization	2454
Configuring the Network Discovery Policy	2455
Network Discovery Rules	2455
Configuring Network Discovery Rules	2456
Actions and Discovered Assets	2456
Monitored Networks	2457
Port Exclusions	2459
Zones in Network Discovery Rules	2461
The Traffic-Based Detection Identity Source	2461
Configuring Advanced Network Discovery Options	2464
Network Discovery General Settings	2465
Configuring Network Discovery General Settings	2465
Network Discovery Identity Conflict Settings	2466
Configuring Network Discovery Identity Conflict Resolution	2466
Network Discovery Vulnerability Impact Assessment Options	2467
Enabling Network Discovery Vulnerability Impact Assessment	2467
Indications of Compromise	2467
Enabling Indications of Compromise Rules	2468
Adding NetFlow Exporters to a Network Discovery Policy	2469
Network Discovery Data Storage Settings	2469
Configuring Network Discovery Data Storage	2471
Configuring Network Discovery Event Logging	2471

Adding Network Discovery OS and Server Identity Sources	2472
Troubleshooting Your Network Discovery Strategy	2473

---

## PART XIV

---

### FlexConfig Policies 2475

## CHAPTER 79

### FlexConfig Policies 2477

FlexConfig Policy Overview	2477
Recommended Usage for FlexConfig Policies	2478
CLI Commands in FlexConfig Objects	2478
Determine the ASA Software Version and Current CLI Configuration	2479
Prohibited CLI Commands	2479
Template Scripts	2481
FlexConfig Variables	2482
How to Process Variables	2482
How to See What a Variable Will Return for a Device	2485
FlexConfig Policy Object Variables	2486
FlexConfig System Variables	2487
Predefined FlexConfig Objects	2488
Predefined Text Objects	2493
Requirements and Prerequisites for FlexConfig Policies	2497
Guidelines and Limitations for FlexConfig	2497
Customizing Device Configuration with FlexConfig Policies	2498
Configure FlexConfig Objects	2500
Add a Policy Object Variable to a FlexConfig Object	2502
Configure Secret Keys	2503
Configure FlexConfig Text Objects	2504
Configure the FlexConfig Policy	2505
Set Target Devices for a FlexConfig Policy	2506
Preview the FlexConfig Policy	2507
Verify the Deployed Configuration	2508
Remove Features Configured Using FlexConfig	2509
Convert from FlexConfig to Managed Feature	2511
Examples for FlexConfig	2511
How to Configure Precision Time Protocol (ISA 3000)	2512

How to Configure Automatic Hardware Bypass for Power Failure (ISA 3000) 2515

Migrating FlexConfig Policies 2518

History for FlexConfig 2520

---

## PART XV

---

### Advanced Network Analysis and Preprocessing 2523

## CHAPTER 80

### Advanced Access Control Settings for Network Analysis and Intrusion Policies 2525

About Advanced Access Control Settings for Network Analysis and Intrusion Policies 2525

Requirements and Prerequisites for Advanced Access Control Settings for Network Analysis and Intrusion Policies 2525

Inspection of Packets That Pass Before Traffic Is Identified 2526

Best Practices for Handling Packets That Pass Before Traffic Identification 2526

Specify a Policy to Handle Packets That Pass Before Traffic Identification 2526

Advanced Settings for Network Analysis Policies 2527

Setting the Default Network Analysis Policy 2528

Network Analysis Rules 2529

Network Analysis Policy Rule Conditions 2529

Configuring Network Analysis Rules 2531

Managing Network Analysis Rules 2531

---

## CHAPTER 81

### Getting Started with Network Analysis Policies 2533

Network Analysis Policy Basics 2533

License Requirements for Network Analysis Policies 2533

Requirements and Prerequisites for Network Analysis Policies 2534

Managing Network Analysis Policies 2534

Create a Network Analysis Policy 2535

Modify the Network Analysis Policy 2535

Custom Network Analysis Policy Creation for Snort 2 2536

Creating a Custom Network Analysis Policy 2536

Network Analysis Policy Management for Snort 2 2537

Network Analysis Policy Settings and Cached Changes 2538

Editing Network Analysis Policies 2538

Preprocessor Configuration in a Network Analysis Policy for Snort 2 2539

Preprocessor Traffic Modification in Inline Deployments 2540

Preprocessor Configuration in a Network Analysis Policy Notes	2540
---	------

---

## CHAPTER 82

### Application Layer Preprocessors 2543

Introduction to Application Layer Preprocessors	2543
License Requirements for Application Layer Preprocessors	2544
Requirements and Prerequisites for Application Layer Preprocessors	2544
The DCE/RPC Preprocessor	2544
Connectionless and Connection-Oriented DCE/RPC Traffic	2545
DCE/RPC Target-Based Policies	2546
RPC over HTTP Transport	2547
DCE/RPC Global Options	2547
DCE/RPC Target-Based Policy Options	2549
Traffic-Associated DCE/RPC Rules	2553
Configuring the DCE/RPC Preprocessor	2553
The DNS Preprocessor	2555
DNS Preprocessor Options	2556
Configuring the DNS Preprocessor	2558
The FTP/Telnet Decoder	2559
Global FTP and Telnet Options	2559
Telnet Options	2559
Server-Level FTP Options	2560
FTP Command Validation Statements	2562
Client-Level FTP Options	2563
Configuring the FTP/Telnet Decoder	2564
The HTTP Inspect Preprocessor	2566
Global HTTP Normalization Options	2567
Server-Level HTTP Normalization Options	2568
Server-Level HTTP Normalization Encoding Options	2575
Configuring the HTTP Inspect Preprocessor	2578
Additional HTTP Inspect Preprocessor Rules	2580
The Sun RPC Preprocessor	2581
Sun RPC Preprocessor Options	2581
Configuring the Sun RPC Preprocessor	2582
The SIP Preprocessor	2583

SIP Preprocessor Options	2583
Configuring the SIP Preprocessor	2586
Additional SIP Preprocessor Rules	2587
The GTP Preprocessor	2588
GTP Preprocessor Rules	2588
Configuring the GTP Preprocessor	2588
The IMAP Preprocessor	2589
IMAP Preprocessor Options	2590
Configuring the IMAP Preprocessor	2591
Additional IMAP Preprocessor Rules	2592
The POP Preprocessor	2592
POP Preprocessor Options	2593
Configuring the POP Preprocessor	2594
Additional POP Preprocessor Rules	2595
The SMTP Preprocessor	2595
SMTP Preprocessor Options	2596
Configuring SMTP Decoding	2600
The SSH Preprocessor	2601
SSH Preprocessor Options	2602
Configuring the SSH Preprocessor	2604
The SSL Preprocessor	2605
How SSL Preprocessing Works	2606
SSL Preprocessor Options	2606
Configuring the SSL Preprocessor	2608
SSL Preprocessor Rules	2609

---

**CHAPTER 83**
**SCADA Preprocessors 2611**

Introduction to SCADA Preprocessors	2611
License Requirements for SCADA Preprocessors	2611
Requirements and Prerequisites for SCADA Preprocessors	2612
The Modbus Preprocessor	2612
Modbus Preprocessor Ports Option	2612
Configuring the Modbus Preprocessor	2613
Modbus Preprocessor Rules	2614

The DNP3 Preprocessor	2614
DNP3 Preprocessor Options	2614
Configuring the DNP3 Preprocessor	2615
DNP3 Preprocessor Rules	2616
The CIP Preprocessor	2616
CIP Preprocessor Options	2617
CIP Events	2617
CIP Preprocessor Rules	2618
Guidelines for Configuring the CIP Preprocessor	2618
Configuring the CIP Preprocessor	2619
The S7Commplus Preprocessor	2620

## CHAPTER 1

# Device Management

---

This guide applies to an *on-premises* Secure Firewall Management Center, either as your primary manager or as an analytics-only manager. When using the Cisco Defense Orchestrator (CDO) Cloud-Delivered Firewall Management Center as your primary manager, you can use an on-prem Firewall Management Center for analytics. Do not use this guide for cloud-delivered Firewall Management Center management; see [Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Defense Orchestrator](#).

You can add and manage devices in the Secure Firewall Management Center.

- [About Device Management, on page 1](#)
- [Requirements and Prerequisites for Device Management, on page 10](#)
- [Log Into the Command-Line Interface on the Device, on page 11](#)
- [Complete the Firewall Threat Defense Initial Configuration for Manual Registration, on page 13](#)

- [History for Device Management, on page 62](#)

## About Device Management

Use the Firewall Management Center to manage your devices.

## About the Firewall Management Center and Device Management

When the Firewall Management Center manages a device, it sets up a two-way, SSL-encrypted communication channel between itself and the device. The Firewall Management Center uses this channel to send information to the device about how you want to analyze and manage your network traffic to the device. As the device evaluates the traffic, it generates events and sends them to the Firewall Management Center using the same channel.

By using the Firewall Management Center to manage devices, you can:

- configure policies for all your devices from a single location, making it easier to change configurations
- install various types of software updates on devices
- push health policies to your managed devices and monitor their health status from the Firewall Management Center

**Note** If you have a CDO-managed device and are using the on-prem Firewall Management Center for analytics only, then the on-prem Firewall Management Center does not support policy configuration or upgrading. Chapters and procedures in this guide related to device configuration and other unsupported features do not apply to devices whose primary manager is CDO.

The Firewall Management Center aggregates and correlates intrusion events, network discovery information, and device performance data, allowing you to monitor the information that your devices are reporting in relation to one another, and to assess the overall activity occurring on your network.

You can use the Firewall Management Center to manage nearly every aspect of a device's behavior.

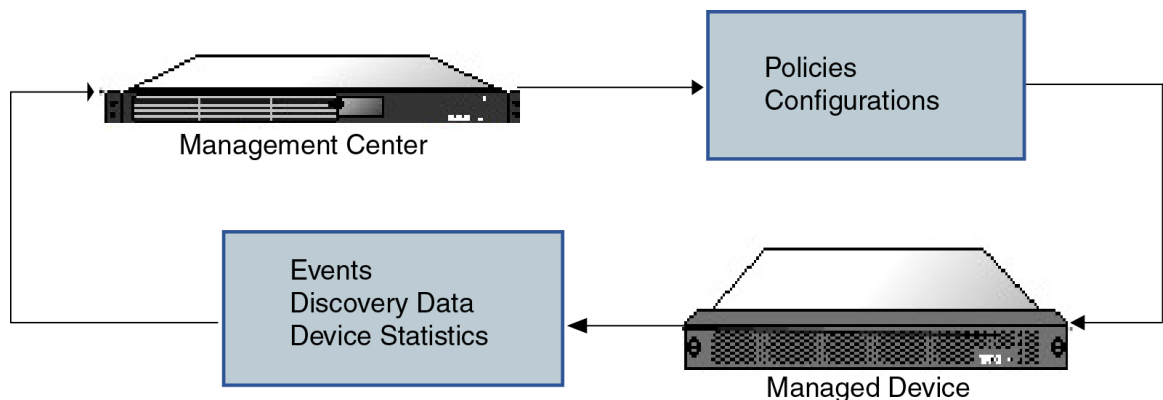

**Note** Although the Firewall Management Center can manage devices running certain previous releases as specified in the compatibility matrix available at <http://www.cisco.com/c/en/us/support/security/defense-center/products-device-support-tables-list.html>, new features that require the latest version of Firewall Threat Defense software are not available to these previous-release devices. Some Firewall Management Center features may be available for earlier versions.

## What Can Be Managed by a Secure Firewall Management Center?

You can use the Secure Firewall Management Center as a central management point to manage Firewall Threat Defense devices.

When you manage a device, information is transmitted between the Firewall Management Center and the device over a secure, TLS-1.3-encrypted communication channel. You do not need to run this traffic over an additional encrypted tunnel such as Site-to-Site VPN for security purposes. If the VPN goes down, for example, you will lose your management connection, so we recommend a simple management path.

The following illustration lists what is transmitted between the Firewall Management Center and its managed devices. Note that the types of events and policies that are sent between the appliances are based on the device type.

## About the Management Connection

After you configure the device with the Firewall Management Center information and after you add the device to the Firewall Management Center, either the device or the Firewall Management Center can establish the management connection. Depending on initial setup:

- Either the device or the Firewall Management Center can initiate.
- Only the device can initiate.
- Only the Firewall Management Center can initiate.

Initiation always originates with eth0 on the Firewall Management Center or with the lowest-numbered management interface on the device. Additional management interfaces are tried if the connection is not established. Multiple management interfaces on the Firewall Management Center let you connect to discrete networks or to segregate management and event traffic. However, the initiator does not choose the best interface based on the routing table.

Make sure the management connection is stable, without excessive packet loss, with at least 5 Mbps throughput. By default, the management connection uses TCP port 8305 (this port is configurable). If you place another Firewall Threat Defense between devices and the Firewall Management Center, to prevent potential management disruption, be sure to exempt management traffic from deep inspection by applying a prefilter policy for it.

---

**Note** The management connection is a secure, TLS-1.3-encrypted communication channel between itself and the device. You do not need to run this traffic over an additional encrypted tunnel such as Site-to-Site VPN for security purposes. If the VPN goes down, for example, you will lose your management connection, so we recommend a simple management path.

---

## Beyond Policies and Events

In addition to deploying policies to devices and receiving events from them, you can also perform other device-related tasks on the Firewall Management Center.

### Backing Up a Device

You cannot backup a physical managed device from the FTD CLI. To back up configuration data, and, optionally, unified files, perform a backup of the device using the Firewall Management Center that is managing the device.

To back up event data, perform a backup of the Firewall Management Center that is managing the device.

### Updating Devices

From time to time, Cisco releases updates to the Firepower System, including:

- intrusion rule updates, which may contain new and updated intrusion rules
- vulnerability database (VDB) updates
- geolocation updates
- software patches and updates

You can use the Firewall Management Center to install an update on the devices it manages.

## About Device Management Interfaces

Each device includes a single dedicated Management interface for communicating with the Firewall Management Center. You can optionally configure the device to use a data interface for management instead of the dedicated Management interface.

You can perform initial setup on the management interface, or on the console port.

Management interfaces are also used to communicate with the Smart Licensing server, to download updates, and to perform other management functions.

## Management and Event Interfaces on the Firewall Threat Defense

When you set up your device, you specify the Firewall Management Center IP address or hostname that you want to connect to, if known. In this case, the device initiates the connection, and both management and event traffic go to this address at initial registration. If the Firewall Management Center is not known, then the Firewall Management Center establishes the initial connection. In this case, it might initially connect from a different Firewall Management Center management interface than specified on the Firewall Threat Defense. Subsequent connections should use the Firewall Management Center management interface with the specified IP address.

If the Firewall Management Center has a separate event-only interface, the managed device sends subsequent event traffic to the Firewall Management Center event-only interface if the network allows. In addition, some managed-device models include an additional management interface that you can configure for event-only traffic. Note that if you configure a data interface for management, you cannot use separate management and event interfaces. If the event network goes down, then event traffic reverts to the regular management interfaces on the Firewall Management Center and/or on the managed device.

## Using the Firewall Threat Defense Data Interface for Management

You can use either the dedicated Management interface or a regular data interface for communication with the Firewall Management Center. Manager access on a data interface is useful if you want to manage the Firewall Threat Defense remotely from the outside interface, or you do not have a separate management network. Moreover, using a data interface lets you configure a redundant secondary interface to take over management functions if the primary interface goes down.

### Manager Access Requirements

Manager access from a data interface has the following requirements.

- You can only enable manager access on a physical, data interface. You cannot use a subinterface or EtherChannel, nor can you create a subinterface on the manager access interface. You can also use the Firewall Management Center to enable manager access on a single secondary interface for redundancy.
- This interface cannot be management-only.
- Routed firewall mode only, using a routed interface.
- PPPoE is not supported. If your ISP requires PPPoE, you will have to put a router with PPPoE support between the Firewall Threat Defense and the WAN modem.
- The interface must be in the global VRF only.

- SSH is not enabled by default for data interfaces, so you will have to enable SSH later using the Firewall Management Center. Because the Management interface gateway will be changed to be the data interfaces, you also cannot SSH to the Management interface from a remote network unless you add a static route for the Management interface using the **configure network static-routes** command. For Firewall Threat Defense Virtual on Amazon Web Services, a console port is not available, so you should maintain your SSH access to the Management interface: add a static route for Management before you continue with your configuration. Alternatively, be sure to finish all CLI configuration (including the **configure manager add** command) before you configure the data interface for manager access and you are disconnected.
- You cannot use separate management and event-only interfaces.
- Clustering is not supported. You must use the Management interface in this case.

### High Availability Requirements

When using a data interface with device high availability, see the following requirements.

- Use the same data interface on both devices for manager access.
- Redundant manager access data interface is not supported.
- You cannot use DHCP; only a static IP address is supported. Features that rely on DHCP cannot be used, including DDNS and zero-touch provisioning.

#### Note

If you use zero-touch provisioning to register the device, when you use the outside interface for manager access, it uses DHCP by default. Before you can enable high availability, you need to change the IP address to a static address. See [Change the Device IP Address, on page 87](#). Alternatively, you can use the Management interface instead; DHCP is supported on Management with high availability.

- Have different static IP addresses in the same subnet.
- Use the same manager configuration (**configure manager add** command) to ensure that the connectivity is the same.
- You cannot use the data interface as the failover or state link.

## Management Interface Support Per Device Model

See the hardware installation guide for your model for the management interface locations.

#### Note

For the Firepower 4100/9300, the MGMT interface is for *chassis* management, not for Firewall Threat Defense logical device management. You must configure a separate interface to be of type mgmt (and/or firepower-eventing), and then assign it to the Firewall Threat Defense logical device.

See the following table for supported management interfaces on each managed device model.

**Table 1: Management Interface Support on Managed Devices**

Model	Management Interface	Optional Event Interface
Firepower 1000	management0 <b>Note</b> management0 is the internal name of the Management 1/1 interface.	No Support
Firepower 2100	management0 <b>Note</b> management0 is the internal name of the Management 1/1 interface.	No Support
Secure Firewall 3100	management0 <b>Note</b> management0 is the internal name of the Management 1/1 interface.	No Support
Secure Firewall 4200	management0 <b>Note</b> management0 is the internal name of the Management 1/1 interface.	management1 <b>Note</b> management1 is the internal name of the Management 1/2 interface.
Firepower 4100 and 9300	management0 <b>Note</b> management0 is the internal name of this interface, regardless of the physical interface ID.	management1 <b>Note</b> management1 is the internal name of this interface, regardless of the physical interface ID.
ISA 3000	br1 <b>Note</b> br1 is the internal name of the Management 1/1 interface.	No support
Secure Firewall Threat Defense Virtual	eth0	No support

## Network Routes on Device Management Interfaces

Management interfaces (including event-only interfaces) support only static routes to reach remote networks. When you set up your managed device, the setup process creates a default route to the gateway IP address that you specify. You cannot delete this route; you can only modify the gateway address.

---

**Note** The routing for management interfaces is completely separate from routing that you configure for data interfaces. If you configure a data interface for management instead of using the dedicated Management interface, traffic is routed over the backplane to use the data routing table. The information in this section does not apply.

---

You can configure multiple management interfaces on some platforms (a management interface and an event-only interface). The default route does not include an egress interface, so the interface chosen depends on the gateway address you specify, and which interface's network the gateway belongs to. In the case of multiple interfaces on the default network, the device uses the lower-numbered interface as the egress interface.

At least one static route is recommended per management interface to access remote networks. We recommend placing each interface on a separate network to avoid potential routing problems, including routing problems from other devices to the Firewall Threat Defense.

---

**Note** The interface used for management connections is not determined by the routing table. Connections are always tried using the lowest-numbered interface first.

---

## NAT Environments

Network address translation (NAT) is a method of transmitting and receiving network traffic through a router that involves reassigning the source or destination IP address. The most common use for NAT is to allow private networks to communicate with the internet. Static NAT performs a 1:1 translation, which does not pose a problem for Firewall Management Center communication with devices, but port address translation (PAT) is more common. PAT lets you use a single public IP address and unique ports to access the public network; these ports are dynamically assigned as needed, so you cannot initiate a connection to a device behind a PAT router.

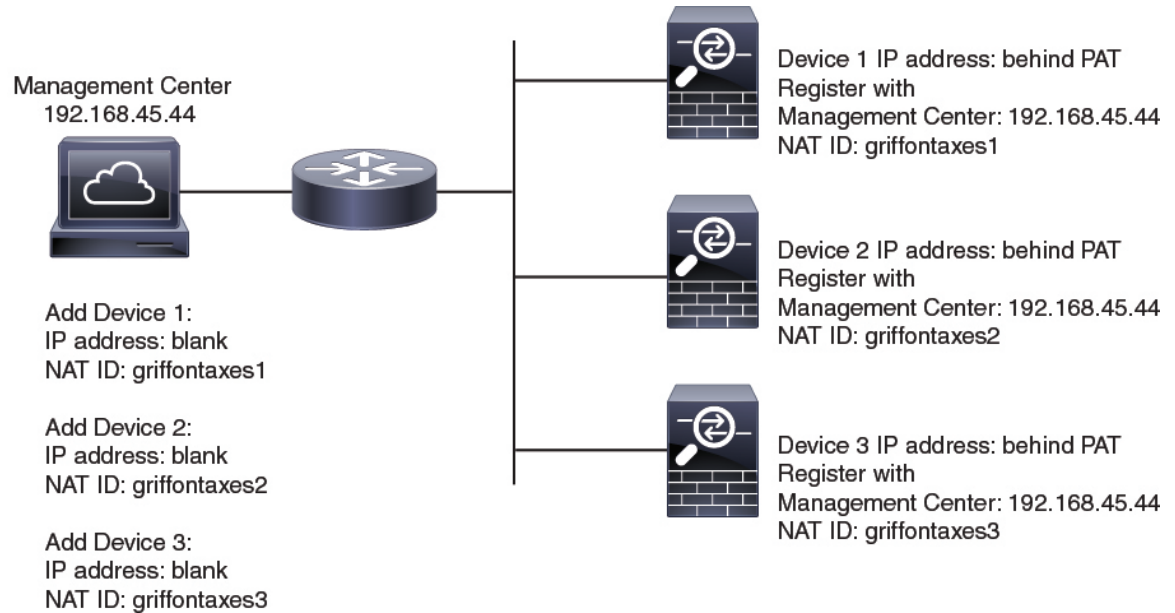

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the Firewall Management Center specifies the device IP address when you add a device, and the device specifies the Firewall Management Center IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. The Firewall Management Center and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

For example, you add a device to the Firewall Management Center, and you do not know the device IP address (for example, the device is behind a PAT router), so you specify only the NAT ID and the registration key on the Firewall Management Center; leave the IP address blank. On the device, you specify the Firewall Management Center IP address, the same NAT ID, and the same registration key. The device registers to the Firewall Management Center's IP address. At this point, the Firewall Management Center uses the NAT ID instead of IP address to authenticate the device.

Although the use of a NAT ID is most common for NAT environments, you might choose to use the NAT ID to simplify adding many devices to the Firewall Management Center. On the Firewall Management Center, specify a unique NAT ID for each device you want to add while leaving the IP address blank, and then on each device, specify both the Firewall Management Center IP address and the NAT ID. Note: The NAT ID must be unique per device.

The following example shows three devices behind a PAT IP address. In this case, specify a unique NAT ID per device on both the Firewall Management Center and the devices, and specify the Firewall Management Center IP address on the devices.

**Figure 1: NAT ID for Managed Devices Behind PAT**

The following example shows the Firewall Management Center behind a PAT IP address. In this case, specify a unique NAT ID per device on both the Firewall Management Center and the devices, and specify the device IP addresses on the Firewall Management Center.

**Figure 2: NAT ID for Firewall Management Center Behind PAT**

## Management and Event Traffic Channel Examples

**Note** If you use a data interface for management on a Firewall Threat Defense, you cannot use separate management and event interfaces for that device.

The following example shows the Firewall Management Center and managed devices using only the default management interfaces.

**Figure 3: Single Management Interface on the Secure Firewall Management Center**

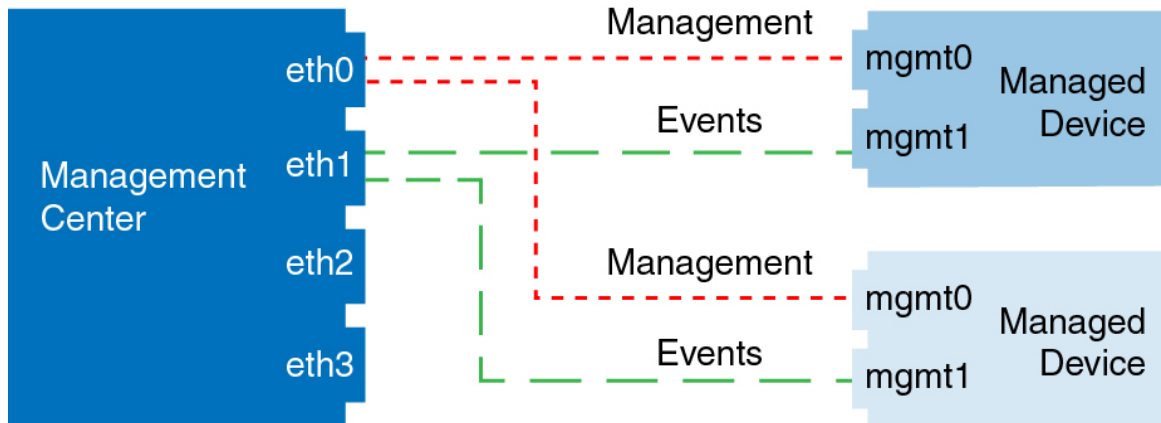

The following example shows the Firewall Management Center using separate management interfaces for devices; and each managed device using 1 management interface.

**Figure 4: Multiple Management Interfaces on the Secure Firewall Management Center**

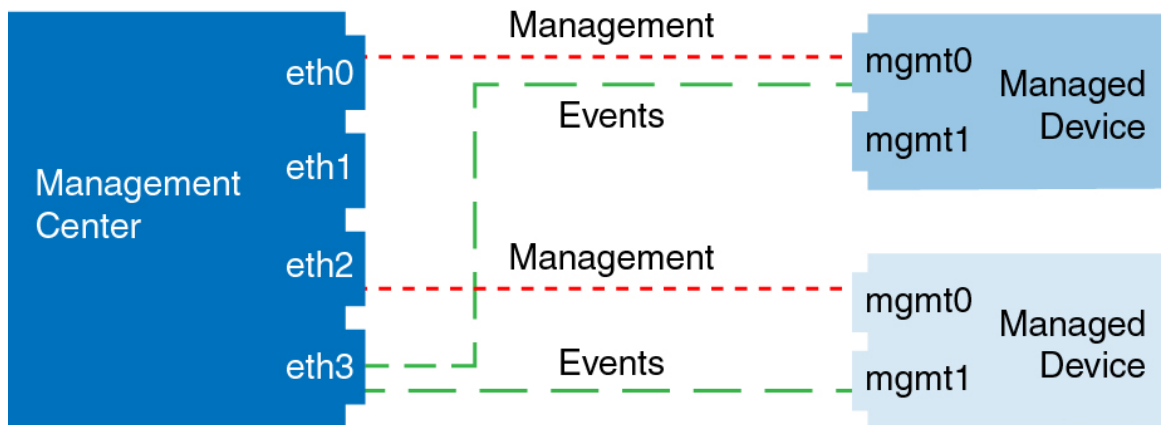

The following example shows the Firewall Management Center and managed devices using a separate event interface.

Figure 5: Separate Event Interface on the Secure Firewall Management Center and Managed Devices

The following example shows a mix of multiple management interfaces and a separate event interface on the Firewall Management Center and a mix of managed devices using a separate event interface, or using a single management interface.

Figure 6: Mixed Management and Event Interface Usage

## Requirements and Prerequisites for Device Management

### Supported Domains

The domain in which the device resides.

### User Roles

- Admin
- Network Admin

### Management Connection

Make sure the management connection is stable, without excessive packet loss, with at least 5Mbps throughput.

### Zero-Touch Provisioning Requirements

Zero-Touch Provisioning is not supported with clustering or multi-instance mode.

High availability is only supported when you use the Management interface because zero-touch provisioning uses DHCP, which is not supported for data interfaces and high availability.

Zero-Touch Provisioning is supported on the following models using 7.4 or later:

- Firepower 1010
- Firepower 1100
- Secure Firewall 1200
- Firepower 2100 (on supported device versions)
- Secure Firewall 3100

## Log Into the Command-Line Interface on the Device

You can log directly into the command-line interface on Firewall Threat Defense devices. If this is your first time logging in, complete the initial setup process using the default **admin** user; see [Complete the Firewall Threat Defense Initial Configuration Using the CLI, on page 19](#).

**Note** If a user makes three consecutive failed attempts to log into the CLI via SSH, the system terminates the SSH connection.

### Before you begin

- Create additional user accounts that can log into the CLI using the **configure user add** command.
- If you get unreadable characters when connecting to the console port, verify the port settings. If they are correct, try the cable with another device using the same settings. If the cable is good, you might need to replace the hardware for the console port. Also consider trying a different workstation to make the connection.

### Procedure

**Step 1** Connect to the Firewall Threat Defense CLI, either from the console port or using SSH.

You can SSH to the management interface of the Firewall Threat Defense device. You can also connect to the address on a data interface if you open the interface for SSH connections. SSH access to data interfaces is disabled by default. See [SSH Access, on page 845](#) to allow SSH connections to specific data interfaces.

For physical devices, you can directly connect to the console port on the device. See the hardware guide for your device for more information about the console cable. Use the following serial settings:

- 9600 baud
- 8 data bits

- No parity
- 1 stop bit

The CLI on the console port is FXOS (with the exception of the ISA 3000, where it is the regular Firewall Threat Defense CLI). Use the Firewall Threat Defense CLI for basic configuration, monitoring, and normal system troubleshooting. See the FXOS documentation for information on FXOS commands.

For a chassis in multi-instance mode, you can connect to FXOS on the console port, or you can enable SSH for the Management interface according to [Configure SSH and SSH Access List, on page 323](#). SSH is disabled by default.

**Step 2** Log in with the **admin** username and password.

**Example:**

```
firepower login: admin
Password:
Last login: Thu May 16 14:01:03 UTC 2019 on ttyS0
Successful login attempts for user 'admin' : 1

firepower#
```

**Step 3** If you used the console port, access the Firewall Threat Defense CLI.

**connect ftd**

**Multi-instance mode:**

**connect ftd *name***

To view the instance names, enter the command without a name.

**Note**

This step does not apply to the ISA 3000.

**Example:**

```
firepower# connect ftd
>
```

**Step 4** At the CLI prompt (>), use any of the commands allowed by your level of command line access.

To return to FXOS on the console port, enter **exit**.

**Step 5** (Optional) If you used SSH, you can connect to FXOS.

**connect fxos**

To return to the Firewall Threat Defense CLI, enter **exit**.

**Step 6** (Optional) Access the diagnostic CLI:

**system support diagnostic-cli**

Use this CLI for advanced troubleshooting. This CLI includes additional **show** and other commands.

This CLI has submodes: user EXEC mode, privileged EXEC mode. More commands are available in privileged EXEC mode than user EXEC mode. To enter privileged EXEC mode, enter the **enable** command; press enter without entering a password when prompted.

**Example:**

```
> system support diagnostic-cli
firepower> enable
Password:
firepower#
```

To return to the regular CLI, type **Ctrl-a, d**.

## Complete the Firewall Threat Defense Initial Configuration for Manual Registration

You can complete the Firewall Threat Defense initial configuration using the CLI or the Firewall Device Manager for all models except for the Firepower 4100/9300. For the Firepower 4100/9300, you complete initial configuration when you deploy the logical device. See [Logical Devices on the Firepower 4100/9300, on page 221](#).

For zero-touch provisioning (serial number registration), you should not log into the device or perform initial setup. See [Add a Device Using the Serial Number \(Zero-Touch Provisioning\), on page 34](#).

## Complete the Firewall Threat Defense Initial Configuration Using the Firewall Device Manager

When you use the Firewall Device Manager for initial setup, the following interfaces are preconfigured in addition to the Management interface and manager access settings:

- Ethernet 1/1—"outside", IP address from DHCP, IPv6 autoconfiguration
- Ethernet 1/2 (or for the Firepower 1010, the VLAN1 interface)— "inside", 192.168.95.1/24
- Default route—Obtained through DHCP on the outside interface

Note that other settings, such as the DHCP server on inside, access control policy, or security zones, are not configured.

If you perform additional interface-specific configuration within Firewall Device Manager before registering with the Firewall Management Center, then that configuration is preserved.

When you use the CLI, only the Management interface and manager access settings are retained (for example, the default inside interface configuration is not retained).

- The Secure Firewall 4200 does not support the Firewall Device Manager. You need to use the CLI procedure: [Complete the Firewall Threat Defense Initial Configuration Using the CLI, on page 19](#).
- This procedure does not apply for CDO-managed devices for which you want to use an on-prem Firewall Management Center *for analytics only*. The Firewall Device Manager configuration is meant to configure the primary manager. See [Complete the Firewall Threat Defense Initial Configuration Using the CLI, on page 19](#) for more information about configuring the device for analytics.

- This procedure applies to all other devices except for the Firepower 4100/9300 and the ISA 3000. You can use the Firewall Device Manager to onboard these devices to the Firewall Management Center, but because they have different default configurations than other platforms, the details in this procedure may not apply to these platforms.

## Procedure

### Step 1

Log into the Firewall Device Manager.

- Enter the following URL in your browser.
  - Inside—**https://192.168.95.1**.
  - Management—**https://management\_ip**. The Management interface is a DHCP client, so the IP address depends on your DHCP server. You will have to set the Management IP address to a static address as part of this procedure, so we recommend that you use the inside interface so you do not become disconnected.
- Log in with the username **admin**, and the default password **Admin123**.
- You are prompted to read and accept the End User License Agreement and change the admin password.

### Step 2

Use the setup wizard when you first log into the Firewall Device Manager to complete the initial configuration. You can optionally skip the setup wizard by clicking **Skip device setup** at the bottom of the page.

After you complete the setup wizard, in addition to the default configuration for the inside interface, you will have configuration for an outside (Ethernet1/1) interface that will be maintained when you switch to the Firewall Management Center management.

- Configure the following options for the outside and management interfaces, and click **Next**.

- 1. Outside Interface Address**—This interface is typically the internet gateway, and might be used as your manager access interface. You cannot select an alternative outside interface during initial device setup. The first data interface is the default outside interface.

If you want to use a different interface from outside (or inside) for manager access, you will have to configure it manually after completing the setup wizard.

**Configure IPv4**—The IPv4 address for the outside interface. You can use DHCP or manually enter a static IP address, subnet mask, and gateway. You can also select **Off** to not configure an IPv4 address. You cannot configure PPPoE using the setup wizard. PPPoE may be required if the interface is connected to a DSL modem, cable modem, or other connection to your ISP, and your ISP uses PPPoE to provide your IP address. You can configure PPPoE after you complete the wizard.

**Configure IPv6**—The IPv6 address for the outside interface. You can use DHCP or manually enter a static IP address, prefix, and gateway. You can also select **Off** to not configure an IPv6 address.

- 2. Management Interface**

You will not see Management Interface settings if you performed initial setup at the CLI.

The Management interface settings are used even if you enable manager access on a data interface. For example, the management traffic that is routed over the backplane through the data interface will resolve FQDNs using the Management interface DNS servers, and not the data interface DNS servers.

**DNS Servers**—The DNS server for the system's management address. Enter one or more addresses of DNS servers for name resolution. The default is the OpenDNS public DNS servers. If you edit the

fields and want to return to the default, click **Use OpenDNS** to reload the appropriate IP addresses into the fields.

**Firewall Hostname**—The hostname for the system's management address.

- b) Configure the **Time Setting (NTP)** and click **Next**.
  - 1. **Time Zone**—Select the time zone for the system.
  - 2. **NTP Time Server**—Select whether to use the default NTP servers or to manually enter the addresses of your NTP servers. You can add multiple servers to provide backups.
- c) Select **Start 90 day evaluation period without registration**.

Do not register the Firewall Threat Defense with the Smart Software Manager; all licensing is performed on the Firewall Management Center.
- d) Click **Finish**.
- e) You are prompted to choose **Cloud Management** or **Standalone**. For Firewall Management Center management, choose **Standalone**, and then **Got It**.

**Step 3** (Might be required) Configure the Management interface.

You may need to change the Management interface configuration, even if you intend to use a data interface for manager access. You will have to reconnect to the Firewall Device Manager if you were using the Management interface for the Firewall Device Manager connection.

- Data interface for manager access—The Management interface must have the gateway set to data interfaces. By default, the Management interface receives an IP address and gateway from DHCP. If you do not receive a gateway from DHCP (for example, you did not connect this interface to a network), then the gateway will default to data interfaces, and you do not need to configure anything. If you did receive a gateway from DHCP, then you need to instead configure this interface with a static IP address and set the gateway to data interfaces.
- Management interface for manager access—If you want to configure a static IP address, be sure to also set the default gateway to be a unique gateway instead of the data interfaces. If you use DHCP, then you do not need to configure anything assuming you successfully get the gateway from DHCP.

**Step 4** If you want to configure additional interfaces, including an interface other than outside or inside that you want to use for manager access, choose **Device**, and then click the link in the **Interfaces** summary.

Other Firewall Device Manager configuration will not be retained when you register the device to Firewall Management Center.

**Step 5** Choose **Device > System Settings > Central Management**, and click **Proceed** to set up the Firewall Management Center management.

**Step 6** Configure the **Management Center/CDO Details**.

Figure 7: Management Center/CDO Details

### Configure Connection to Management Center or CDO

Provide details to register to the management center/CDO.

#### Management Center/CDO Details

Do you know the Management Center/CDO hostname or IP address?

☒ Yes    ☐ No

Management Center/CDO Access Interface

☐ Data Interface

Please select an interface

☒ Management Interface [View details](#)

CANCEL
CONNECT

- a) For **Do you know the Management Center/CDO hostname or IP address?**, click **Yes** if you can reach the Firewall Management Center using an IP address or hostname, or **No** if the Firewall Management Center/CDO is behind NAT or does not have a public IP address or hostname.

At least one of the devices, either the Firewall Management Center or the Firewall Threat Defense device, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices.

- b) If you chose **Yes**, then enter the **Management Center/CDO Hostname or IP Address**.
- c) Specify the **Management Center/CDO Registration Key**.

This key is a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the Firewall Threat Defense device. The registration key must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID can be used for multiple devices registering to the Firewall Management Center.

- a) Specify a **NAT ID**.

This ID is a unique, one-time string of your choice that you will also specify on the Firewall Management Center. The NAT ID must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID *cannot* be used for any other devices registering to the Firewall Management Center. The NAT ID is used in combination with the IP address to verify that the connection is coming from the correct device; only after authentication of the IP address/NAT ID will the registration key be checked. We recommend that you always use the NAT ID even when it is optional, but it is required if:

- You set the Firewall Management Center IP address to **DONTRESOLVE**.
- When adding the device on the Firewall Management Center, you do not specify a reachable device IP address or hostname.
- You use the data interface for management, even if you specify IP addresses on both sides.
- The Firewall Management Center uses multiple management interfaces.

## Step 7 Configure the **Connectivity Configuration**.

- a) Specify the **FTD Hostname**.

If you use a data interface for the **Management Center/CDO Access Interface** access, then this FQDN will be used for this interface.

- b) Specify the **DNS Server Group**.

Choose an existing group, or create a new one. The default DNS group is called **CiscoUmbrellaDNSServerGroup**, which includes the OpenDNS servers.

If you intend to choose a data interface for the **Management Center/CDO Access Interface**, then this setting sets the *data* interface DNS server. The Management DNS server that you set with the setup wizard is used for management traffic. The data DNS server is used for DDNS (if configured) or for security policies applied to this interface. You are likely to choose the same DNS server group that you used for Management, because both management and data traffic reach the DNS server through the outside interface.

On the Firewall Management Center, the data interface DNS servers are configured in the Platform Settings policy that you assign to this Firewall Threat Defense device. When you add the Firewall Threat Defense device to the Firewall Management Center, the local setting is maintained, and the DNS servers are *not* added to a Platform Settings policy. However, if you later assign a Platform Settings policy to the Firewall Threat Defense device that includes a DNS configuration, then that configuration will overwrite the local setting. We suggest that you actively configure the DNS Platform Settings to match this setting to bring the Firewall Management Center and the Firewall Threat Defense device into sync.

Also, local DNS servers are only retained by the Firewall Management Center if the DNS servers were discovered at initial registration.

If you intend to choose the Management interface for the **Management Center/CDO Access Interface**, then this setting configures the Management DNS server.

- c) For the **Management Center/CDO Access Interface**, choose any configured interface.

You can change the manager interface after you register the Firewall Threat Defense device to the Firewall Management Center, to either the Management interface or another data interface.

**Step 8** (Optional) If you chose a data interface, and it was not the outside interface, then add a default route.

You will see a message telling you to check that you have a default route through the interface. If you chose outside, you already configured this route as part of the setup wizard. If you chose a different interface, then you need to manually configure a default route before you connect to the Firewall Management Center.

If you chose the Management interface, then you need to configure the gateway to be a unique gateway before you can proceed on this screen.

**Step 9** (Optional) If you chose a data interface, click **Add a Dynamic DNS (DDNS) method**.

DDNS ensures the Firewall Management Center can reach the Firewall Threat Defense device at its Fully-Qualified Domain Name (FQDN) if the IP address changes. See **Device > System Settings > DDNS Service** to configure DDNS.

If you configure DDNS before you add the Firewall Threat Defense device to the Firewall Management Center, the Firewall Threat Defense device automatically adds certificates for all of the major CAs from the Cisco Trusted Root CA bundle so that the Firewall Threat Defense device can validate the DDNS server certificate for the HTTPS connection. Firewall Threat Defense supports any DDNS server that uses the DynDNS Remote API specification (<https://help.dyn.com/remote-access-api/>).

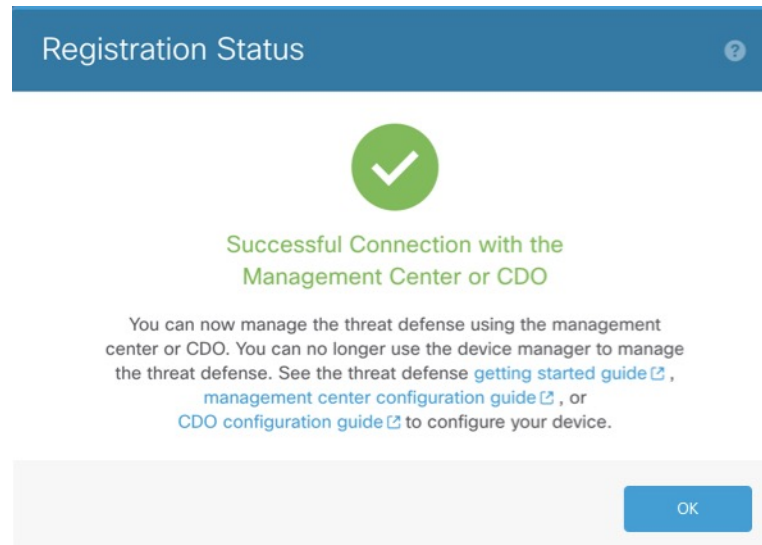

DDNS is not supported when using the Management interface for manager access.

**Step 10** Click **Connect**. The **Registration Status** dialog box shows the current status of the switch to the Firewall Management Center. After the **Saving Management Center/CDO Registration Settings** step, go to the Firewall Management Center, and add the firewall.

If you want to cancel the switch to the Firewall Management Center, click **Cancel Registration**. Otherwise, do not close the Firewall Device Manager browser window until after the **Saving Management Center/CDO Registration Settings** step. If you do, the process will be paused, and will only resume when you reconnect to the Firewall Device Manager.

If you remain connected to the Firewall Device Manager after the **Saving Management Center/CDO Registration Settings** step, you will eventually see the **Successful Connection with Management Center/CDO** dialog box, after which you will be disconnected from the Firewall Device Manager.

**Figure 8: Successful Connection**

## Complete the Firewall Threat Defense Initial Configuration Using the CLI

Connect to the Firewall Threat Defense CLI to perform initial setup, including setting the Management IP address, gateway, and other basic networking settings using the setup wizard. The dedicated Management interface is a special interface with its own network settings. If you do not want to use the Management interface for manager access, you can use the CLI to configure a data interface instead. You will also configure Firewall Management Center communication settings. When you perform initial setup using the Firewall Device Manager, *all* interface configuration completed in the Firewall Device Manager is retained when you switch to the Firewall Management Center for management, in addition to the Management interface and manager access interface settings. Note that other default configuration settings, such as the access control policy, are not retained.

This procedure applies to all models except for the Firepower 4100/9300. To deploy a logical device and complete initial configuration on the Firepower 4100/9300, see [Logical Devices on the Firepower 4100/9300, on page 221](#).

### Procedure

- 
- Step 1** Connect to the Firewall Threat Defense CLI, either from the console port or using SSH to the Management interface, which obtains an IP address from a DHCP server by default. If you intend to change the network settings, we recommend using the console port so you do not get disconnected.
- (Firepower and Secure Firewall hardware models) The console port connects to the FXOS CLI. The SSH session connects directly to the Firewall Threat Defense CLI.
- Step 2** Log in with the username **admin** and the password **Admin123**.

(Firepower and Secure Firewall hardware models) At the console port, you connect to the FXOS CLI. The first time you log in to FXOS, you are prompted to change the password. This password is also used for the Firewall Threat Defense login for SSH.

**Note**

If the password was already changed, and you do not know it, you must reimage the device to reset the password to the default.

For Firepower and Secure Firewall hardware, see the [Reimage Procedures](#) in the [Cisco FXOS Troubleshooting Guide for the Firepower 1000/2100 and Secure Firewall 3100/4200 with Threat Defense](#).

For the ISA 3000, see the [Cisco Secure Firewall ASA and Secure Firewall Threat Defense Reimage Guide](#).

**Example:**

```
firepower login: admin
Password: Admin123
Successful login attempts for user 'admin' : 1

[...]

Hello admin. You must change your password.
Enter new password: *****
Confirm new password: *****
Your password was updated successfully.

[...]

firepower#
```

**Step 3** (Firepower and Secure Firewall hardware models) If you connected to FXOS on the console port, connect to the Firewall Threat Defense CLI.

**connect ftd**

**Example:**

```
firepower# connect ftd
>
```

**Step 4** The first time you log in to the Firewall Threat Defense, you are prompted to accept the End User License Agreement (EULA) and, if using an SSH connection, to change the admin password. You are then presented with the CLI setup script.

**Note**

You cannot repeat the CLI setup wizard unless you clear the configuration; for example, by reimaging. However, all of these settings can be changed later at the CLI using **configure network** commands. See the [threat defense command reference](#).

Defaults or previously entered values appear in brackets. To accept previously entered values, press **Enter**.

**Note**

The Management interface settings are used even when you enable manager access on a data interface. For example, the management traffic that is routed over the backplane through the data interface will resolve FQDNs using the Management interface DNS servers, and not the data interface DNS servers.

See the following guidelines:

- **Do you want to configure IPv4?** and/or **Do you want to configure IPv6?**—Enter **y** for at least one of these types of addresses.
- **Enter the IPv4 default gateway for the management interface** and/or **Enter the IPv6 gateway for the management interface**—If you want to use a data interface for manager access instead of the Management interface, choose **manual**. Although you do not plan to use the Management interface, you must set an IP address, for example, a private address. Make sure this interface is on a different subnet from the manager access interface to prevent routing issues. You cannot configure a data interface for management if the management interface is set to DHCP, because the default route, which must be **data-interfaces** (see the next bullet), might be overwritten with one received from the DHCP server.
- **Enter the IPv4 default gateway for the management interface** and/or **Configure IPv6 via DHCP, router, or manually?**—If you want to use a data interface for manager access instead of the management interface, set the gateway to be **data-interfaces**. This setting forwards management traffic over the backplane so it can be routed through the manager access data interface. If you want to use the Management interface for manager access, you should set a gateway IP address on the Management 1/1 network.
- **If your networking information has changed, you will need to reconnect**—If you are connected with SSH but you change the IP address at initial setup, you will be disconnected. Reconnect with the new IP address and password. Console connections are not affected.
- **Manage the device locally?**—Enter **no** to use the Firewall Management Center. A **yes** answer means you will use Secure Firewall Device Manager instead.
- **Configure firewall mode?**—We recommend that you set the firewall mode at initial configuration. Changing the firewall mode after initial setup erases your running configuration. Note that data interface manager access is only supported in routed firewall mode.

### Example:

```
You must accept the EULA to continue.
Press <ENTER> to display the EULA:
Cisco General Terms
[...]
```

```
Please enter 'YES' or press <ENTER> to AGREE to the EULA:
```

```
System initialization in progress. Please stand by.
You must configure the network to continue.
Configure at least one of IPv4 or IPv6 unless managing via data interfaces.
Do you want to configure IPv4? (y/n) [y]:
Do you want to configure IPv6? (y/n) [y]: n
Configure IPv4 via DHCP or manually? (dhcp/manual) [manual]:
Enter an IPv4 address for the management interface [192.168.45.61]: 10.89.5.17
Enter an IPv4 netmask for the management interface [255.255.255.0]: 255.255.255.192
Enter the IPv4 default gateway for the management interface [data-interfaces]: 10.89.5.1
Enter a fully qualified hostname for this system [firepower]: 1010-3
Enter a comma-separated list of DNS servers or 'none'
[208.67.222.222,208.67.220.220,2620:119:35::35]:
Enter a comma-separated list of search domains or 'none' [:] : cisco.com
If your networking information has changed, you will need to reconnect.
Disabling IPv6 configuration: management0
Setting DNS servers: 208.67.222.222,208.67.220.220,2620:119:35::35
Setting DNS domains:cisco.com
Setting hostname as 1010-3
Setting static IPv4: 10.89.5.17 netmask: 255.255.255.192 gateway: 10.89.5.1 on management0
Updating routing tables, please wait...
All configurations applied to the system. Took 3 Seconds.
```

Saving a copy of running network configuration to local disk.  
For HTTP Proxy configuration, run 'configure network http-proxy'

```
Manage the device locally? (yes/no) [yes]: no
DHCP server is already disabled
DHCP Server Disabled
Configure firewall mode? (routed/transparent) [routed]:
Configuring firewall mode ...
```

```
Device is in OffBox mode - disabling/removing port 443 from iptables.
Update policy deployment information
- add device configuration
- add network discovery
- add system policy
```

You can register the sensor to a Firepower Management Center and use the Firepower Management Center to manage it. Note that registering the sensor to a Firepower Management Center disables on-sensor Firepower Services management capabilities.

When registering the sensor to a Firepower Management Center, a unique alphanumeric registration key is always required. In most cases, to register a sensor to a Firepower Management Center, you must provide the hostname or the IP address along with the registration key.  
'configure manager add [hostname | ip address ] [registration key ]'

However, if the sensor and the Firepower Management Center are separated by a NAT device, you must enter a unique NAT ID, along with the unique registration key.  
'configure manager add DONTRESOLVE [registration key ] [ NAT ID ]'

Later, using the web interface on the Firepower Management Center, you must use the same registration key and, if necessary, the same NAT ID when you add this sensor to the Firepower Management Center.  
>

## Step 5 Identify the Firewall Management Center that will manage this Firewall Threat Defense.

**configure manager add** {hostname | IPv4\_address | IPv6\_address | **DONTRESOLVE**} reg\_key [nat\_id] [display\_name]

### Note

If you are using CDO for management, use the CDO-generated **configure manager add** command for this step.

- {hostname | IPv4\_address | IPv6\_address | **DONTRESOLVE**}—Specifies either the FQDN or IP address of the Firewall Management Center. If the Firewall Management Center is not directly addressable, use **DONTRESOLVE** and also specify the *nat\_id*. At least one of the devices, either the Firewall Management Center or the Firewall Threat Defense, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices. If you specify **DONTRESOLVE** in this command, then the Firewall Threat Defense must have a reachable IP address or hostname.
- *reg\_key*—Specifies a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the Firewall Threat Defense. The registration key must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-).
- *nat\_id*—Specifies a unique, one-time string of your choice that you will also specify on the Firewall Management Center when you register the Firewall Threat Defense. The NAT ID must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-).

(-). This ID cannot be used for any other devices registering to the Firewall Management Center. The NAT ID is used in combination with the IP address to verify that the connection is coming from the correct device; only after authentication of the IP address/NAT ID will the registration key be checked. We recommended that you always use the NAT ID even when it is optional, but it is required if:

- You set the Firewall Management Center IP address to **DONTRESOLVE**.
- When adding the device on the Firewall Management Center, you do not specify a reachable device IP address or hostname.
- You use the data interface for management, even if you specify IP addresses on both sides.
- The Firewall Management Center uses multiple management interfaces.
- *display\_name*—Provide a display name for showing this manager with the **show managers** command. This option is useful if you are identifying CDO as the primary manager and an on-prem Firewall Management Center for analytics only. If you don't specify this argument, the firewall auto-generates a display name using one of the following methods:
  - *hostname* | *IP\_address* (if you don't use the **DONTRESOLVE** keyword)
  - **manager-timestamp**

#### Example:

```
> configure manager add MC.example.com 123456
Manager successfully configured.
```

#### Example:

If the Firewall Management Center is behind a NAT device, enter a unique NAT ID along with the registration key, and specify **DONTRESOLVE** instead of the hostname, for example:

```
> configure manager add DONTRESOLVE regk3y78 natid90
Manager successfully configured.
```

#### Example:

If the Firewall Threat Defense is behind a NAT device, enter a unique NAT ID along with the Firewall Management Center IP address or hostname, for example:

```
> configure manager add 10.70.45.5 regk3y78 natid56
Manager successfully configured.
```

### Step 6

If you are using CDO as your primary manager and want to use an on-prem Firewall Management Center for analytics only, identify the on-prem Firewall Management Center.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE} reg_key [nat_id]
[display_name]
```

#### Example:

The following example uses the generated command for CDO with a CDO-generated display name and then specifies an on-prem Firewall Management Center for analytics only with the "analytics-FMC" display name.

```
> configure manager add account1.app.us.cdo.cisco.com KPOOP0rgWzaHrnj1V5ha2q5Rf8pKFX9E
LzmlHOynhVUWhXYWz2swmkj2ZWsn3Lb account1.app.us.cdo.cisco.com
Manager successfully configured.
```

```
> configure manager add 10.70.45.5 regk3y78 natid56 analytics-FMC
Manager successfully configured.
```

### Step 7 (Optional) Configure a data interface for manager access.

#### **configure network management-data-interface**

You are then prompted to configure basic network settings for the data interface.

#### **Note**

You should use the console port when using this command. If you use SSH to the Management interface, you might get disconnected and have to reconnect to the console port. See below for more information about SSH usage.

See the following details for using this command. See also [Using the Firewall Threat Defense Data Interface for Management, on page 4](#).

- The original Management interface cannot use DHCP if you want to use a data interface for management. If you did not set the IP address manually during initial setup, you can set it now using the **configure network {ipv4 | ipv6} manual** command. Make sure this interface is on a different subnet from the manager access interface to prevent routing issues. If you did not already set the Management interface gateway to **data-interfaces**, this command will set it now.
- When you add the Firewall Threat Defense to the Firewall Management Center, the Firewall Management Center discovers and maintains the interface configuration, including the following settings: interface name and IP address, static route to the gateway, DNS servers, and DDNS server. For more information about the DNS server configuration, see below. In the Firewall Management Center, you can later make changes to the manager access interface configuration, but make sure you don't make changes that can prevent the Firewall Threat Defense or Firewall Management Center from re-establishing the management connection. If the management connection is disrupted, the Firewall Threat Defense includes the **configure policy rollback** command to restore the previous deployment.
- DDNS ensures the Firewall Management Center can reach the Firewall Threat Defense at its Fully-Qualified Domain Name (FQDN) if the IP address changes. If you configure a DDNS server update URL, the Firewall Threat Defense automatically adds certificates for all of the major CAs from the Cisco Trusted Root CA bundle so that the Firewall Threat Defense can validate the DDNS server certificate for the HTTPS connection. The Firewall Threat Defense supports any DDNS server that uses the DynDNS Remote API specification (<https://help.dyn.com/remote-access-api/>).
- This command sets the *data* interface DNS server. The Management DNS server that you set with the setup script (or using the **configure network dns servers** command) is used for management traffic. The data DNS server is used for DDNS (if configured) or for security policies applied to this interface.

On the Firewall Management Center, the data interface DNS servers are configured in the Platform Settings policy that you assign to this Firewall Threat Defense. When you add the Firewall Threat Defense to the Firewall Management Center, the local setting is maintained, and the DNS servers are *not* added to a Platform Settings policy. However, if you later assign a Platform Settings policy to the Firewall Threat Defense that includes a DNS configuration, then that configuration will overwrite the local setting. We suggest that you actively configure the DNS Platform Settings to match this setting to bring the Firewall Management Center and the Firewall Threat Defense into sync.

Also, local DNS servers are only retained by the Firewall Management Center if the DNS servers were discovered at initial registration. For example, if you registered the device using the Management interface, but then later configure a data interface using the **configure network management-data-interface** command, then you must manually configure all of these settings in the Firewall Management Center, including the DNS servers, to match the FTD configuration.

- You can change the management interface after you register the Firewall Threat Defense to the Firewall Management Center, to either the Management interface or another data interface.
- The FQDN that you set in the setup wizard will be used for this interface.
- You can clear the entire device configuration as part of the command; you might use this option in a recovery scenario, but we do not suggest you use it for initial setup or normal operation.
- To disable data management, enter the **configure network management-data-interface disable** command.

**Example:**

```
> configure network management-data-interface
Data interface to use for management: ethernet1/1
Specify a name for the interface [outside]:
IP address (manual / dhcp) [dhcp]:
DDNS server update URL [none]:
https://dwinchester:pa$$w0rd17@domains.example.com/nic/update?hostname=<h>&myip=<a>
Do you wish to clear all the device configuration before applying ? (y/n) [n]:

Configuration done with option to allow manager access from any network,
if you wish to change the manager access network
use the 'client' option in the command 'configure network management-data-interface'.

Setting IPv4 network configuration.
Network settings changed.

>
```

**Example:**

```
> configure network management-data-interface
Data interface to use for management: ethernet1/1
Specify a name for the interface [outside]: internet
IP address (manual / dhcp) [dhcp]: manual
IPv4/IPv6 address: 10.10.6.7
Netmask/IPv6 Prefix: 255.255.255.0
Default Gateway: 10.10.6.1
Comma-separated list of DNS servers [none]: 208.67.222.222,208.67.220.220
DDNS server update URL [none]:
Do you wish to clear all the device configuration before applying ? (y/n) [n]:

Configuration done with option to allow manager access from any network,
if you wish to change the manager access network
use the 'client' option in the command 'configure network management-data-interface'.

Setting IPv4 network configuration.
Network settings changed.

>
```

**Step 8** (Optional) Limit data interface access to a manager on a specific network.

**configure network management-data-interface client *ip\_address netmask***

By default, all networks are allowed.

**What to do next**

Register your device to a Firewall Management Center.

## Configure an Event Interface

You always need a management interface for management traffic. If your device has a second management interface, for example, the Firepower 4100/9300 and Secure Firewall 4200, you can enable it for event-only traffic.

**Before you begin**

To use a separate event interface, you also need to enable an event interface on the Firewall Management Center. See the [Cisco Secure Firewall Management Center Administration Guide](#).

**Procedure**

**Step 1** Enable the second management interface as an event-only interface.

**configure network management-interface enable management1**

**configure network management-interface disable-management-channel management1**

You can optionally disable events for the main management interface using the **configure network management-interface disable-events-channel** command. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

**Example:**

```
> configure network management-interface enable management1
Configuration updated successfully

> configure network management-interface disable-management-channel management1
Configuration updated successfully

>
```

**Step 2** Configure the IP address of the event interface.

The event interface can be on a separate network from the management interface, or on the same network.

a) Configure the IPv4 address:

**configure network ipv4 manual ip\_address netmask gateway\_ip management1**

Note that the *gateway\_ip* in this command is used to create the default route for the device, so you should enter the value you already set for the management0 interface. It does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you create a static route separately for the event-only interface.

**Example:**

```
> configure network ipv4 manual 10.10.10.45 255.255.255.0 10.10.10.1 management1
Setting IPv4 network configuration.
Network settings changed.
```

```
>
```

b) Configure the IPv6 address:

- Stateless autoconfiguration:

**configure network ipv6 router management1**

**Example:**

```
> configure network ipv6 router management1
Setting IPv6 network configuration.
Network settings changed.
```

```
>
```

- Manual configuration:

**configure network ipv6 manual ip6\_address ip6\_prefix\_length management1**

**Example:**

```
> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.
```

```
>
```

### Step 3

Add a static route for the event-only interface if the Firewall Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface.

**configure network static-routes {ipv4 | ipv6} add management1 destination\_ip netmask\_or\_prefix gateway\_ip**

For the *default* route, do not use this command; you can only change the default route gateway IP address when you use the **configure network ipv4** or **ipv6** commands (see, [Step 2, on page 26](#)).

**Example:**

```
> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully
```

```
> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64
2001:0DB8:BA98::3211
Configuration updated successfully
```

```
>
```

To display static routes, enter **show network-static-routes** (the default route is not shown):

```
> show network-static-routes
-----[ IPv4 Static Routes ]-----
```

```

Interface          : management1
Destination        : 192.168.6.0
Gateway            : 10.10.10.1
Netmask            : 255.255.255.0
[...]
```

---

## Manage Devices

Register and unregister devices to the Firewall Management Center.

### About the Device Management Page

The **Devices > Device Management** page provides you with range of information and options.

- **View By**—View devices based on group, licenses, model, version, or access control policy.
- **Device State**—View devices based on state (**Error**, **Warning**, etc.). You can click on a state icon to view the devices belonging to it. The number of devices belonging to the states are provided within brackets.
- **Search Device**—Search for a device by device name, host name, or IP address.
- **Add**—Add devices and other manageable components.
- **Columns**—Click the column head to sort by that column.
  - **Name**
  - **Model**
  - **Version**
  - **Chassis**—For supported models, click **Manage** to bring up the integrated Chassis Manager. For the Firepower 4100/9300, the link cross-launches the Firewall Chassis Manager.
  - **Licenses**
  - **Access Control Policy**—Click on the link in the Access Control Policy column to view the policy that is deployed to the device.
  - **Auto-Rollback**—Shows whether auto-rollback of the configuration is enabled (🔌) or disabled (🔌) if the deployment causes the management connection to go down. See [Edit Deployment Settings, on page 127](#).
- **Edit**—For each device, use the **Edit** (✎) icon to edit the device settings.  
You can also just click on the device name or IP address.
- **More**—For each device, click the **More** (⋮) icon to execute other actions:
  - **Delete**—To unregister the device.

- **Packet Tracer**—To navigate to the packet tracer page for examining policy configuration on the device by injecting a model packet into the system.
- **Packet Capture**—To navigate to the packet capture page, where, you can view the verdicts and actions the system takes while processing a packet.
- **Revert Upgrade**—To revert the upgrade and configuration changes that were made after the last upgrade. This action results in restoring the device to the version that was before the upgrade.
- **Health Monitor**—To navigate to the device's health monitoring page.
- **Troubleshoot Files**—Generate troubleshooting files, where you can choose the type of data to be included in the report.

## Add a Device Group

The Firewall Management Center allows you to group devices so you can easily deploy policies and install updates on multiple devices. You can expand and collapse the list of devices in the group.

If you add the primary device in a high-availability pair to a group, both devices are added to the group. If you break the high-availability pair, both devices remain in that group.

Groups are not supported in a multidomain environment.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> .   |
| <b>Step 2</b> | From the <b>Add</b> drop-down menu, choose <b>Add Group</b> .  |
|               | To edit an existing group, click <b>Edit</b> (✎) for the group you want to edit.   |
| <b>Step 3</b> | Enter a <b>Name</b> .  |
| <b>Step 4</b> | Under <b>Available Devices</b> , choose one or more devices to add to the device group. Use Ctrl or Shift while clicking to choose multiple devices. |
| <b>Step 5</b> | Click <b>Add</b> to include the devices you chose in the device group.   |
| <b>Step 6</b> | Optionally, to remove a device from the device group, click <b>Delete</b> (🗑) next to the device you want to remove.                                 |
| <b>Step 7</b> | Click <b>OK</b> to add the device group.   |
- 

## Register With the Management Center

The Firewall Management Center offers multiple methods to register your devices.

### Add a Device Using a Registration Key

Use this procedure to add a single device to the Firewall Management Center using a registration key. If you plan to link devices for high availability, you must still use this procedure; see [Add a High Availability Pair, on page 363](#). For clustering, see the clustering chapter for your model.

You can also use this procedure to add a device that is managed by a Cloud-Delivered Firewall Management Center, and you want to use the on-prem Firewall Management Center for event logging and analytics purposes only.

If you use Firewall Management Center high availability, add devices *only* to the active Firewall Management Center. Devices registered to the active Firewall Management Center are automatically registered to the standby.

### Before you begin

- Set up the device to be managed by the Firewall Management Center. See:
  - [Complete the Firewall Threat Defense Initial Configuration for Manual Registration, on page 13](#)
  - The getting started guide for your model
- The Firewall Management Center must be registered to the Smart Software Manager. A valid evaluation license is sufficient, but if it expires, you will not be able to add new devices until you successfully register.
- If you registered a device using IPv4 and want to convert it to IPv6, you must delete and reregister the device.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** From the **Add** drop-down menu, choose **Device**.
- The **Registration Key** method is selected by default.

Figure 9: Add Device Using a Registration Key

**Add Device** ?

Select the Provisioning Method:

☒ Registration Key ☐ Serial Number

☐ CDO Managed Device

Host:†

10.89.5.40

Display Name:

10.89.5.40

Registration Key:\*

....

Group:

None ▼

Access Control Policy:\*

inside-outside ▼

**Smart Licensing**

Note: All virtual Firewall Threat Defense devices require a performance tier license. Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. Click [here](#) for information about the Firewall Threat Defense performance-tiered licensing. Until you choose a tier, your Firewall Threat Defense virtual defaults to the FTDv50 selection.

Performance Tier (only for Firewall Threat Defense virtual 7.0 and above):

Select a recommended Tier ▼

- ☒ Carrier
- ☒ Malware Defense
- ☒ IPS
- ☒ URL

**Advanced**

Unique NAT ID:†

test

☒ Transfer Packets

Cancel Register

**Step 3**

If you want to add a cloud-managed device to your on-prem Firewall Management Center for analytics only, check **CDO Managed Device**.

The system hides licensing and packet transfer settings because they are managed by CDO (formerly CDO). You can skip those steps.

Figure 10: Add Device for CDO

**Add Device**

Select the Provisioning Method:

☒ Registration Key ☐ Serial Number

Transfer Packets is configured in CDO

Cancel Register

- Step 4** For the **Host**, enter the IP address or the hostname of the device you want to add. Leave this field blank if you don't know the device IP address (for example, it's behind NAT).
- If you leave this field blank, the initial configuration on the device needs to include a reachable Firewall Management Center IP address or hostname plus the NAT ID. For more information, see [NAT Environments, on page 7](#).
- Step 5** For the **Display Name**, enter a name for the device as you want it to display in the Firewall Management Center. You cannot change this name later.
- Step 6** For the **Registration Key**, enter the same registration key in your initial configuration. The registration key is a one-time-use shared secret. The key can be up to 37-characters in length and include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). The registration key does not need to be unique per device.
- Step 7** (Optional) Add the device to a device **Group**.
- Step 8** Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.
- If the device is incompatible with the policy you choose, deploying will fail. This incompatibility could occur for multiple reasons, including licensing mismatches, model restrictions, passive vs inline issues, and other misconfigurations. After you resolve the issue that caused the failure, manually deploy configurations to the device.
- Step 9** Choose licenses to apply to the device.

You can also apply licenses after you add the device, from the **System** (⚙️) > **Licenses** > **Smart Licenses** page.

For Firewall Threat Defense Virtual, you must also select the **Performance Tier**. It's important to choose the tier that matches the license you have in your account. Until you choose a tier, your device defaults to the FTDv50 selection. For more information about the performance-tiered license entitlements available for Firewall Threat Defense Virtual, see *FTDv Licenses* in the [Cisco Secure Firewall Management Center Administration Guide](#).

**Note**

If you are upgrading your Firewall Threat Defense Virtual to Version 7.0+, you can choose **FTDv - Variable** to maintain your current license compliance.

**Step 10** If you specified a NAT ID during initial configuration, in the **Advanced** section enter the same NAT ID for the **Unique NAT ID**.

The **Unique NAT ID** specifies a unique, one-time string of your choice that you will also specify on the device during initial configuration. It is required when one side does not specify a reachable IP address or hostname, for example if you left the **Host** field blank. Although technically optional, we recommend always specifying the NAT ID even when you know the IP addresses of both sides because it is required in certain situations. The ID can be up to 37-characters in length and include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the Firewall Management Center.

**Step 11** Check **Transfer Packets** so that for each intrusion event, the device transfers the packet to the Firewall Management Center for inspection.

This option is enabled by default. For each intrusion event, the device sends event information and the packet that triggered the event to the Firewall Management Center for inspection. If you disable it, only event information will be sent to the Firewall Management Center; the packet will not be sent.

**Step 12** Click **Register**.

It may take up to two minutes for the Firewall Management Center to verify the device's heartbeat and establish communication. If the registration succeeds, the device is added to the list. If it fails, you will see an error message. If the device fails to register, check the following items:

- Ping—Access the device CLI, and ping the Firewall Management Center IP address using the following command:

```
ping system ip_address
```

If the ping is not successful, check your network settings using the **show network** command. If you need to change the device IP address, use the **configure network {ipv4 | ipv6} manual** command.

- Registration key, NAT ID, and Firewall Management Center IP address—Make sure you are using the same registration key, and if used, NAT ID, on both devices. You can set the registration key and NAT ID on the device using the **configure manager add** command.

For more troubleshooting information, see <https://cisco.com/go/fmc-reg-error>.

## Add a Device Using the Serial Number (Zero-Touch Provisioning)

Zero-Touch Provisioning lets you register devices to the Firewall Management Center by serial number without having to perform any initial setup on the device. The Firewall Management Center integrates with CDO for this functionality.

When you use zero-touch provisioning, the following interfaces are preconfigured. Note that other settings, such as the DHCP server on inside, access control policy, or security zones, are not configured.

- Ethernet 1/1—"outside", IP address from DHCP, IPv6 autoconfiguration
- Ethernet 1/2 (or for the Firepower 1010, the VLAN1 interface)— "inside", 192.168.95.1/24
- Default route—Obtained through DHCP on the outside interface

Zero-Touch Provisioning is not supported with clustering or multi-instance mode.

High availability is only supported when you use the Management interface because zero-touch provisioning uses DHCP, which is not supported for data interfaces and high availability.

Zero-Touch Provisioning is only supported on the following models using 7.2, 7.4 or later (prior to 7.2.4, the Firewall Management Center must be publicly reachable):

- Firepower 1010
- Firepower 1100
- Firepower 2100
- Secure Firewall 3100

### Before you begin

- Make sure the device is unconfigured or a fresh install. Zero-Touch Provisioning is meant for new devices only. Pre-configuration can disable zero-touch provisioning, depending on your settings.
- Cable the outside interface or Management interface so it can reach the internet. If you use the outside interface for zero-touch provisioning, do not also cable the Management interface; if the Management interface gets an IP address from DHCP, the routing will be incorrect for the outside interface.
- Make sure you have at least one access control policy configured on the Firewall Management Center so you can assign it to new devices. You cannot add a policy using CDO.
- If the device does not have a public IP address or FQDN, or you use the Management interface, set a public IP address/FQDN for the Firewall Management Center (if different from the Firewall Management Center management interface IP address; for example, it is behind NAT) so the device can initiate the management connection. See **System > Configuration > Manager Remote Access**. You can also configure the public IP address/FQDN in CDO during this procedure.
- The Firewall Management Center must be registered to the Smart Software Manager. A valid evaluation license is sufficient, but if it expires, you will not be able to add new devices until you successfully register.
- If you registered a device using IPv4 and want to convert it to IPv6, you must delete and reregister the device.

## Procedure

### Step 1

The first time you add a device using a serial number, you need to complete the following prerequisites. After the first time, you can skip to adding the devices directly in CDO.

- a) In the Firewall Management Center, choose **Devices > Device Management**.
- b) From the **Add** drop-down menu, choose **Device**.
- c) Click **Serial Number** for the provisioning method.

**Figure 11: Add Device by Serial Number**

Add Device ?

---

Select the Provisioning Method:

☐ Registration Key ☒ Serial Number

**1 Step 1: Create Cisco Defense Orchestrator (CDO) and SecureX accounts**  
 CDO and SecureX are cloud services that are required for serial-number onboarding.  
 If you already have separate accounts, you need to link them. [Learn more](#)  
 If you don't already have accounts, perform the following:

- Request a CDO tenant. [Learn more](#)
- Create a SecureX user. [Learn more](#)

**2 Step 2: Integrate the Management Center with SecureX**  
 SecureX integration is required to add an on-prem management center to CDO.  
[SecureX Integration](#)

**i Complete above prerequisites before registering**

- d) Create a CDO account.

#### Note

If you already have preexisting but separate SecureX and CDO accounts, you need to link them. See <https://cisco.com/go/cdo-securex-link> for more information about linking accounts.

If you don't already have accounts, perform the following:

- Create a Cisco Security Cloud (formerly SecureX) account. See the [CDO documentation](#) for information about how to create one.
- Request a CDO tenant. See the [CDO documentation](#) for information about requesting a new CDO tenant.

- e) Integrate the Firewall Management Center with Cisco Security Cloud (formerly SecureX). Click the link to open the **SecureX Integration** page in the Firewall Management Center.

Click the **Enable SecureX** to open a separate browser tab to log you into your Cisco Security Cloud account and confirm the displayed code. Make sure this page is not blocked by a pop-up blocker.

For detailed information, see the "Enable SecureX Integration" section in the [Cisco Secure Firewall Management Center Administration Guide](#).

CDO onboards the on-prem Firewall Management Center after you integrate the Firewall Management Center with Cisco Security Cloud. CDO needs the Firewall Management Center in its inventory for zero-touch provisioning to operate. CDO's Firewall Management Center support is limited to device onboarding, viewing its managed devices, viewing objects associated with the Firewall Management Center, and cross-launching the Firewall Management Center.

**Note**

For a Firewall Management Center high-availability pair, you also need to integrate the secondary Firewall Management Center with Cisco Security Cloud.

- f) Click **Launch** CDO if you do not already have it open, or log in here: <https://www.defenseorchestrator.com/>

Make sure CDO is not blocked by a pop-up blocker.

**Step 2**

On the CDO **Dashboard** (<https://www.defenseorchestrator.com/>), click **Onboard** (  ).

**Step 3**

Click the **FTD** tile.

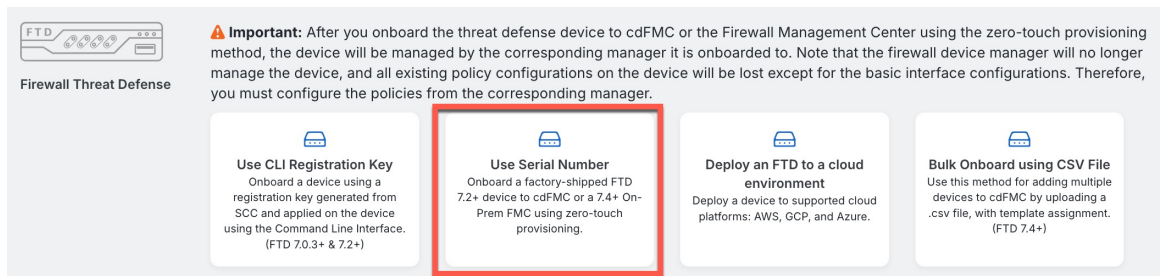

**Figure 12: FTD Tile**

**Step 4**

On the **Onboard FTD Device** screen, click **Use Serial Number**.

**Figure 13: Use Serial Number**

**Step 5**

In **Select FMC**, choose an **On-Prem FMC** from the list, and click **Next**.

Figure 14: Select FMC

1 Select FMC

Select FMC ⓘ For more details, [Click Here](#)

Select

Cloud-Delivered FMC

3 Password Reset

4 Policy Assignment

5 Subscription License

6 Done

If the Firewall Management Center has a public IP address or FQDN set, it will show after you choose it.

Figure 15: Public IP Address/FQDN

1 Select FMC

Select FMC ⓘ For more details, [Click Here](#)

Boulder FMC 740-48 1543

(IP/FQDN: fmc-techpubs.cisco.com)

ⓘ Specify the IP/FQDN value unless the FTD is publicly reachable, running a version older than 7.4 and connected with the data interface. Click [FMC Public IP](#) to configure FMC's FQDN.

Next

The Firewall Management Center needs a public IP address/FQDN if the device does not have a public IP address/FQDN or if you use the Management interface for zero-touch provisioning. You can set the Firewall Management Center public IP address/FQDN by clicking the **FMC Public IP** link. You see the following dialog box.

Figure 16: Configure FMC Public IP/FQDN

Configure FMC Public IP/FQDN

Selected FMC: Boulder FMC 740-48 1543

Provide FMC Public IP address or FQDN

IP Address/FQDN

fmc-tech-pubs.cisco.com

FQDN preferred

ⓘ Specify this value unless the FTD is publicly reachable, running a version older than 7.4, and connected with the data interface.

Save

**Note**

For a Firewall Management Center high-availability pair, you also need to set the public IP address/FQDN on the secondary Firewall Management Center. You can't set value this using CDO; you need to set it in the secondary Firewall Management Center. See **System > > Configuration > Manager Remote Access**.

**Step 6**

In **Connection**, enter the device's serial number and device name. Click **Next**.

**Figure 17: Connection**

**Step 7**

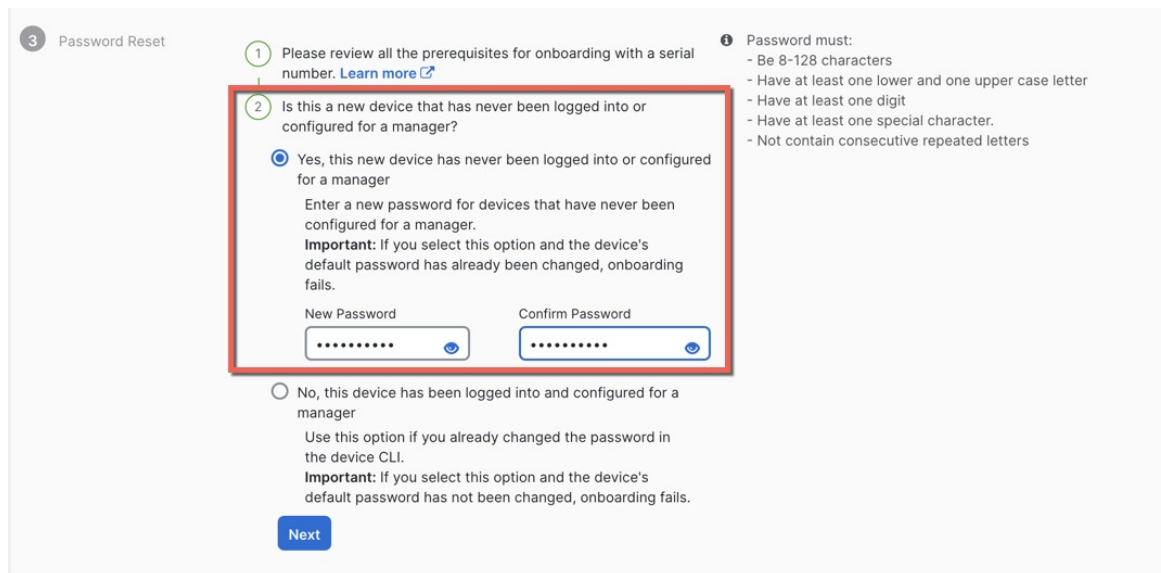

In **Password Reset**, click **Yes...**. Enter a new password and confirm the new password for the device, then click **Next**.

For zero-touch provisioning, the device must be brand new or has been reimaged.

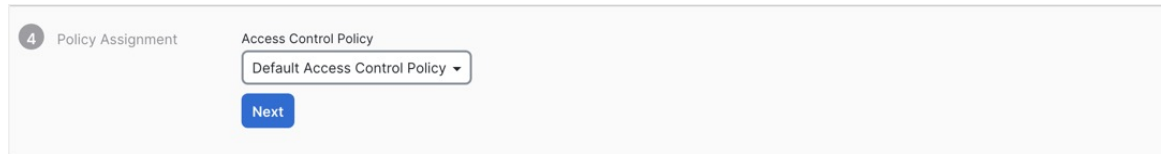

**Note**

If you did log into the device and reset the password, and you did not change the configuration in a way that would disable zero-touch provisioning, then you should choose the **No...** option. There are a number of configurations that disable zero-touch provisioning, so we don't recommend logging into the device unless you need to, for example, to perform a reimage.

**Figure 18: Password Reset**

**Step 8**

In **Policy Assignment**, use the drop-down menu to select an access control policy for the device. If you have not added a policy on the Firewall Management Center, you should go to the Firewall Management Center and add one now. Click **Next**.

**Figure 19: Policy Assignment**

4 Policy Assignment

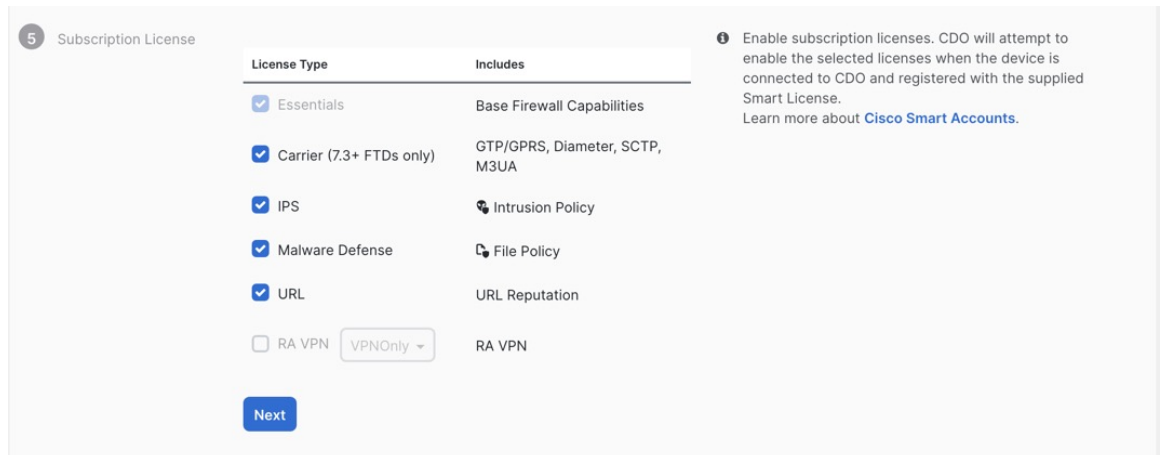

Access Control Policy

Default Access Control Policy ▼

Next

**Step 9**

In **Subscription License**, select the licenses for the device. Click **Next**.

**Figure 20: Subscription License**

5 Subscription License

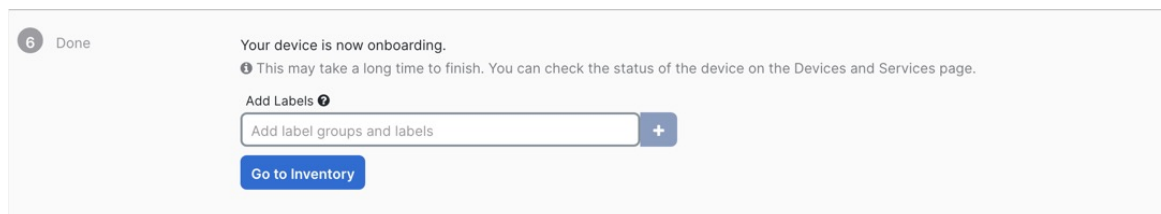

License Type	Includes
<input checked="" type="checkbox"/> Essentials	Base Firewall Capabilities
<input checked="" type="checkbox"/> Carrier (7.3+ FTDs only)	GTP/GPRS, Diameter, SCTP, M3UA
<input checked="" type="checkbox"/> IPS	Intrusion Policy
<input checked="" type="checkbox"/> Malware Defense	File Policy
<input checked="" type="checkbox"/> URL	URL Reputation
<input type="checkbox"/> RA VPN	VPNOnly ▼ RA VPN

Next

Enable subscription licenses. CDO will attempt to enable the selected licenses when the device is connected to CDO and registered with the supplied Smart License. Learn more about [Cisco Smart Accounts](#).

**Step 10**

In **Done**, you can add labels to the device that show in CDO; they are not used on the Firewall Management Center.

**Figure 21: Done**

6 Done

Your device is now onboarding.

This may take a long time to finish. You can check the status of the device on the Devices and Services page.

Add Labels ⓘ

Add label groups and labels

Go to Inventory

In the Firewall Management Center, the device is added to the **Device Management** page. You can also click **Go to Inventory** to see the devices in CDO. On-prem Firewall Management Center devices are viewable in CDO inventory for information purposes.

When using zero-touch provisioning on the outside interface, CDO acts as a DDNS provider and does the following:

- Enables DDNS on outside using the "fmcOnly" method. This method is only supported for zero-touch provisioning devices.
- Maps the outside IP address with the following hostname: *serial-number.local*.
- Provides the IP address/hostname mapping to the Firewall Management Center so it can resolve the hostname to the correct IP address.

- Informs the Firewall Management Center if the IP address ever changes, for example, if the DHCP lease renews.

If you use zero-touch provisioning on the Management interface, DDNS is not supported. The Firewall Management Center must be publicly reachable so the device can initiate the management connection.

You can continue to use CDO as the DDNS provider, or you can later change the DDNS configuration in the Firewall Management Center to a different method. See [Configure Dynamic DNS, on page 802](#) for more information.

If the device fails to register, see [Resolve Serial Number \(Zero-Touch Provisioning\) Registration Issues, on page 43](#).

## Add a Chassis

You can add a Firepower 4100/9300 chassis to the Firewall Management Center. The management center and the chassis share a separate management connection using the chassis MGMT interface. The Firewall Management Center offers chassis-level health alerts. For configuration, you still need to use the Secure Firewall Chassis Manager or FXOS CLI.

**Note** For the Secure Firewall 3100, the manager configuration is completed as part of the conversion to multi-instance mode. See [Enable Multi-Instance Mode, on page 296](#). After you enable multi-instance mode, see [Add a Multi-Instance Chassis to the Firewall Management Center, on page 299](#).

### Procedure

**Step 1** Connect to the chassis FXOS CLI, either using the console port or SSH.

**Step 2** Configure the Firewall Management Center.

**create device-manager** *manager\_name* [**hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}] [**nat-id** *nat\_id*]

You are prompted for the registration key.

You can enter this command from any scope. This command is accepted immediately without using **commit-buffer**.

- **hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}—Specifies either the FQDN or IP address of the Firewall Management Center. At least one of the devices, either the Firewall Management Center or the chassis, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices. If you do not specify a **hostname**, then the chassis must have a reachable IP address or hostname and you must specify the **nat-id**.
- **nat-id** *nat\_id*—Specifies a unique, one-time string of your choice that you will also specify on the Firewall Management Center when you register the chassis when one side does not specify a reachable IP address or hostname. It is required if you do not specify a **hostname**, however we recommend that you always set the NAT ID even when you specify a hostname or IP address. The NAT ID must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the Firewall Management Center.

- **Registration Key:** *reg\_key*—You will be prompted for a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the chassis. The registration key must not exceed 37 characters. Valid characters include alphanumeric characters (A–Z, a–z, 0–9) and the hyphen (-).

**Example:**

```
firepower# create device-manager boulder_fmc hostname 10.89.5.35 nat-id 93002
(Valid registration key characters: [a-z],[A-Z],[0-9],[ -]. Length: [2-36])
Registration Key: Impala67
```

**Step 3** In the Firewall Management Center, add the chassis using the chassis management IP address or hostname.

- a) Choose **Devices > Device Management**, and then **Add > Chassis**.

**Figure 22: Add Chassis**

**Figure 23: Add Chassis**

- b) In the **Hostname/IP Address** field, enter the IP address or the hostname of the chassis you want to add.

If you don't know the hostname or IP address, you can leave this field blank specify the **Unique NAT ID**.

- c) In the **Chassis Name** field, enter a name for the chassis as you want it to display in the Firewall Management Center.
- d) In the **Registration Key** field, enter the same registration key that you used when you configured the chassis to be managed by the Firewall Management Center.

The registration key is a one-time-use shared secret. The key can include alphanumeric characters and hyphens (-).

- e) In a multidomain deployment, regardless of your current domain, assign the chassis to a leaf **Domain**.  
If your current domain is a leaf domain, the chassis is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the chassis. A chassis can only belong to one domain.

- f) (Optional) Add the chassis to a **Device Group**.
- g) If you used a NAT ID during chassis setup, expand enter the same NAT ID in the **Unique NAT ID** field.

The NAT ID can include alphanumeric characters and hyphens (-).

- h) Click **Submit**.

The chassis is added to the **Devices > Device Management** page.

## Register With a New Management Center

This procedure shows how to register with a new Firewall Management Center. You should perform these steps even if the new Firewall Management Center uses the old Firewall Management Center's IP address.

### Procedure

- Step 1** On the old Firewall Management Center, if present, delete the managed device. See [Delete \(Unregister\) a Device from the Firewall Management Center, on page 47](#).

You cannot change the Firewall Management Center IP address if you have an active connection with the Firewall Management Center.

- Step 2** Connect to the device CLI, for example using SSH.

- Step 3** Configure the new Firewall Management Center.

```
configure manager add {hostname | IPv4_address | IPv6_address | DONTRESOLVE } regkey [nat_id]
[display_name]
```

- {hostname | IPv4\_address | IPv6\_address}—Sets the Firewall Management Center hostname, IPv4 address, or IPv6 address.
- **DONTRESOLVE**—If the Firewall Management Center is not directly addressable, use **DONTRESOLVE** instead of a hostname or IP address. If you use **DONTRESOLVE**, then a *nat\_id* is required. When you add this device to the Firewall Management Center, make sure that you specify both the device IP address

and the *nat\_id*; one side of the connection needs to specify an IP address, and both sides need to specify the same, unique NAT ID.

- *regkey*—Make up a registration key to be shared between the Firewall Management Center and the device during registration. You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the Firewall Management Center when you add the Firewall Threat Defense.
- *nat\_id*—Make up an alphanumeric string from 1 to 37 characters used only during the registration process between the Firewall Management Center and the device when one side does not specify an IP address. This NAT ID is a one-time password used only during registration. Make sure the NAT ID is unique, and not used by any other devices awaiting registration. Specify the same NAT ID on the Firewall Management Center when you add the Firewall Threat Defense.
- *display\_name*—Provide a display name for showing this manager with the **show managers** command. This option is useful if you are identifying CDO as the primary manager and an on-prem Firewall Management Center for analytics only. If you don't specify this argument, the firewall auto-generates a display name using one of the following methods:
  - *hostname* | *IP\_address* (if you don't use the **DONTRESOLVE** keyword)
  - **manager-timestamp**

#### Example:

```
> configure manager add DONTRESOLVE abc123 efg456
Manager successfully configured.
Please make note of reg_key as this will be required while adding Device in FMC.
>
```

#### Step 4 Add the device to the Firewall Management Center.

## Resolve Serial Number (Zero-Touch Provisioning) Registration Issues

If the device fails to register using the serial number, the device may not have successfully connected to the cloud. If the **S** or **M** LED is alternating green and amber, this failure might occur because of one of the following causes:

- **Cause:** You performed initial configuration at the CLI and disabled zero-touch provisioning.  
**Symptom:** Registration will time out.  
**Workaround:** See [Restart Zero-Touch Provisioning at the CLI, on page 45](#).
- **Cause:** You performed initial configuration in the Firewall Device Manager and disabled zero-touch provisioning.  
**Symptom:** Registration will time out.  
**Workaround:** See [Restart Zero-Touch Provisioning Using the Firewall Device Manager, on page 46](#).
- **Cause:** The serial number was already claimed by another manager in your tenant.  
**Symptom:** You will see a **A device with serial number <serial-number> already exists in the Security Cloud Control tenant** error in the Firewall Management Center.

**Workaround:** If you already unregistered the device or you're unsure which Firewall Management Center has claimed it, then see [Check for Changes in CDO, on page 44](#).

If the device is registered to another Firewall Management Center in your tenant for which you don't have access, you can either [Reset the Device, on page 46](#) or [Restart Zero-Touch Provisioning at the CLI, on page 45](#).

- **Cause:** The serial number was already claimed by another manager in another tenant.

**Symptom:** You will see a **A device with serial number <serial-number> already exists in another Security Cloud Control tenant** error in the Firewall Management Center.

**Workaround:** See either [Reset the Device, on page 46](#) or [Restart Zero-Touch Provisioning at the CLI, on page 45](#).

If you want to bypass any serial number troubleshooting, you can always [Use Manual Registration and a Registration Key, on page 46](#).

For other requirements for serial number registration, see [Add a Device Using the Serial Number \(Zero-Touch Provisioning\), on page 34](#).

To work around a registration failure, do one of the following tasks.

### Check for Changes in CDO

If you unregister the device from a Firewall Management Center, CDO may not have removed the device from your inventory yet. You can force a refresh in CDO to free up the serial number.

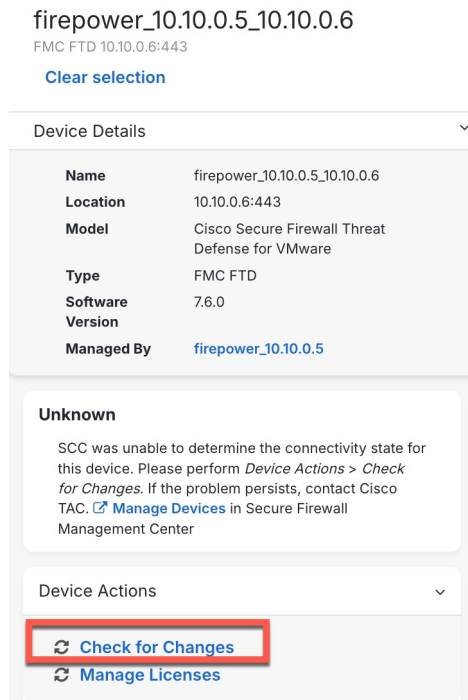

1. Log into CDO at <https://security.cisco.com>.
2. Choose **Security Devices**, and then search for your serial number.

*Figure 24: Search by Serial Number*

If the device did not appear in the search results, it may be registered to a different tenant. In this case, see [Reset the Device, on page 46](#) or [Restart Zero-Touch Provisioning at the CLI, on page 45](#).

3. Select the device and click **Check for Changes** on the right.

**Figure 25: Check for Changes**

If the device was unregistered, it will disappear from the list and the device will attempt to connect to the cloud again.

If the device does not disappear, that means it's registered to another manager in the tenant. The name of the device includes the manager it is registered to, for example, **firepower\_10.89.5.36\_1010-1**. If you still want to register the device to a different manager, and you don't have access to the Firewall Management Center to unregister it, you can either [Reset the Device, on page 46](#) or [Restart Zero-Touch Provisioning at the CLI, on page 45](#).

### Restart Zero-Touch Provisioning at the CLI

You can unregister the serial number, clear the configuration and any existing management connection, and start the process over.

1. Connect to the FXOS CLI using SSH or the console port.

If you used SSH, you connect to the Firewall Threat Defense CLI. In this case, enter **connect fxos**. If you used the console port, you connect directly to FXOS.

```
> connect fxos
firepower#
```

2. Enter local management.

**connect local-mgmt**

```
firepower# connect local-mgmt
firepower(local-mgmt)#
```

3. Deregister the device from the Cisco cloud.

#### cloud deregister

```
firepower(local-mgmt)# cloud deregister
Release Image Detected RESULT=success MESSAGE=SUCCESS 10, X-Flow-Id:
2b3c9e8b-76c3-4764-91e4-cfd9828e73f9
```

4. Erase the configuration to restore cloud connectivity.

#### erase configuration

```
firepower(local-mgmt)# erase configuration
All configurations will be erased and system will reboot. Are you sure? (yes/no):yes
Removing all the configuration. Please wait....
Configurations are cleaned up. Rebooting....
```

5. [Add a Device Using the Serial Number \(Zero-Touch Provisioning\), on page 34](#)

### Restart Zero-Touch Provisioning Using the Firewall Device Manager

You can accidentally disable low-touch provisioning if you log into the Firewall Device Manager. In this case, you can restart zero-touch provisioning within the Firewall Device Manager.

---

**Note** If the serial number was already claimed, see [Restart Zero-Touch Provisioning at the CLI, on page 45](#) instead.

---

1. In the Firewall Device Manager, click **Device**, then click the **System Settings > Cloud Services**.
2. Check **Auto-enroll with Cisco Defense Orchestrator or Secure Firewall Management Center**.
3. Click **Register**.
4. [Add a Device Using the Serial Number \(Zero-Touch Provisioning\), on page 34](#)

### Reset the Device

Supported for the following models:

- Firepower 1010
- Firepower 1100
- Secure Firewall 3100

If you do not have access to the CLI and want to make sure your device is unconfigured and ready for zero-touch provisioning, reset the device to its default state by press the small, recessed Reset button for longer than five seconds. See your hardware installation guide for more information.

### Use Manual Registration and a Registration Key

If zero-touch provisioning fails, the easiest way to complete registration is to use the registration key method.

1. See [Complete the Firewall Threat Defense Initial Configuration for Manual Registration, on page 13](#) or [Complete the Firewall Threat Defense Initial Configuration Using the Firewall Device Manager, on page 13](#).
2. If you are not presented with the initial setup tasks, it's possible your device was successfully registered to another Firewall Management Center. You must first delete the management connection and then re-register with the correct manager.

- a. First, check if registration has completed:

```
> show managers
Type                : Manager
Host                : 10.10.1.4
Display name        : 10.10.1.4
Identifier           : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration         : Completed
Management type      : Configuration
```

- b. If **Registration** shows **Completed**, you need to delete the manager:  
**configure manager delete**
- c. You can then register the device at the CLI using **configure manager add**.

## Delete (Unregister) a Device from the Firewall Management Center

If you no longer want to manage a device, you can unregister it from the Firewall Management Center.

To unregister a cluster, cluster node, or high availability pair, see the chapters for those deployments.

Unregistering a device:

- Severs all communication between the Firewall Management Center and the device.
- Removes the device from the **Device Management** page.
- Returns the device to local time management if the device's platform settings policy is configured to receive time from the Firewall Management Center using NTP.
- Leaves the configuration intact, so the device continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the device again to the same or a different Firewall Management Center causes the configuration to be removed, so the device will stop processing traffic at that point.

Before you delete the device, be sure to export the configuration so you can re-apply the device-level configuration (interfaces, routing, and so on) when you re-register it. If you do not have a saved configuration, you will have to re-configure device settings.

After you re-add the device and either import a saved configuration or re-configure your settings, you need to deploy the configuration before it starts passing traffic again.

### Before you begin

To re-apply the device-level configuration if you re-add it to the Firewall Management Center:

- Export the device configuration. See [Export and Import the Device Configuration, on page 74](#).

## Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to unregister, click **More** (⋮), and then click **Delete**.

*Figure 26: Delete*

**Step 3** Confirm that you want to unregister the device.

**Step 4** You can now change your manager.

- Re-register the device to this Firewall Management Center—If you know the registration key and NAT ID, refer to [Add a Device Using a Registration Key, on page 29](#). If you need to reset them, you can reconfigure the manager as though it's new. See [Register With a New Management Center, on page 42](#).
- Register to a new Firewall Management Center—[Register With a New Management Center, on page 42](#).
- Change to the Firewall Device Manager—[Switch from Firewall Management Center to Firewall Device Manager, on page 58](#).
- Delete the manager without specifying a new one—To sever the management connection on the Firewall Threat Defense without identifying a new manager (no manager mode), from the Firewall Threat Defense CLI use the **configure manager delete** command.

## Shut Down or Restart the Device

It's important that you shut down your system properly. Simply unplugging the power or pressing the power switch can cause serious file system damage. Remember that there are many processes running in the background all the time, and unplugging or shutting off the power does not allow the graceful shutdown of your firewall.

See the following task to shut down or restart your system properly.

**Note** After restarting your device, you may see an error that the management connection could not be reestablished. In some cases, the connection is attempted before the Management interface on the device is ready. The connection will be retried automatically and should come up within 15 minutes.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device that you want to restart, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** To restart the device:
- a) Click **Restart Device** (↺).
  - b) When prompted, confirm that you want to restart the device.
- Step 5** To shut down the device:
- a) Click **Shut Down Device** (✖) in the **System** section.
  - b) When prompted, confirm that you want to shut down the device.
  - c) If you have a console connection to the firewall, monitor the system prompts as the firewall shuts down. You will see the following prompt:
- ```
System is stopped.  
It is safe to power off now.  
Do you want to reboot instead? [y/N]
```
- If you do not have a console connection, wait approximately 3 minutes to ensure the system has shut down.
- For the ISA 3000, when shutdown is complete, the System LED will turn off. Wait at least 10 seconds before you remove the power.
- 

## Download the Managed Device List

You can download a report of all the managed devices.

### Before you begin

To perform the following task, you must be an Admin user.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Click the **Download Device List Report** link.

- Step 3** You can download the device list in CSV or PDF format. Choose **Download CSV** or **Download PDF** to download the report.
- 

## Migrate Firewall Threat Defense Devices

The Secure Firewall Threat Defense model migration wizard enables you to migrate configurations from an earlier Firewall Threat Defense model. After the migration, all routing and interface configurations from the source Firewall Threat Defense device are available in the target Firewall Threat Defense.

The wizard supports multiple models as source and target devices, for more information see [Supported Devices for Migration](#), on page 50.

### Supported Devices for Migration

#### Supported Source Devices

- Cisco Firepower 1120
- Cisco Firepower 1140
- Cisco Firepower 1150
- Cisco Firepower 2110
- Cisco Firepower 2120
- Cisco Firepower 2130
- Cisco Firepower 2140

#### Supported Target Devices

- Cisco Secure Firewall 3105
- Cisco Secure Firewall 3110
- Cisco Secure Firewall 3120
- Cisco Secure Firewall 3130
- Cisco Secure Firewall 3140

#### Supported Migration Paths

The following table lists the supported target Firewall Threat Defense models that you can migrate to from your source Firewall Threat Defense model.

### License for Migration

- Your Smart Licensing account must have the license entitlements for the target device.
- You must register and enroll the device with the Smart Licensing account. The migration copies the source device licenses to the target device.

## Prerequisites for Migration

### • General device prerequisites

- Register the source and the target devices to the Firewall Management Center.
- Ensure that the target device is a newly registered device without any configurations.
- Source and target devices must be in the same state and modes:
  - Domain
  - Firewall mode: Routed or Transparent
  - Compliance mode (CC or UCAPL)
- Ensure that you have permission for modifications on the devices.
- Ensure that the configurations on the source device are valid and have no errors.
- Deployment, import, or export tasks must not run on either of the devices during the migration. The source device can have pending deployments.

### • Prerequisites for HA devices

## What Configurations Does the Wizard Migrate?

The migration wizard copies the following configurations from the source device to the target device:

- Licenses
- Interface configurations
- Inline sets configurations
- Routing configurations
- DHCP and DDNS configurations
- Virtual router configurations
- Policies
- Associated objects and object overrides
- Platform settings
- Remote branch deployment configurations

The migration wizard copies the following policy configurations from the source device to the target device:

- Health policy
- NAT policy
- QoS policy
- Remote access VPN policy
- FlexConfig policy

- Access control policy
- Prefilter policy
- IPS policy
- DNS policy
- SSL policy
- Malware and File policy
- Identity policy

The migration wizard copies the following routing configurations from the source device to the target device:

- ECMP
- BFD
- OSPFv2/v3
- EIGRP
- RIP
- BGP
- Policy Based Routing
- Static Route
- Multicast Routing
- Virtual Router

The migration wizard copies the following interfaces from the source device to the target device:

- Physical interfaces
- Sub-interfaces
- EtherChannel interfaces
- Bridge group interfaces
- VTI interfaces
- VNI interfaces
- Loopback interfaces

The migration wizard retains the device group of the target device.

## Limitations for Migration

### Limitations

- The migration wizard does not migrate:
  - Site-to-site VPN policies

- You can perform only one migration at a time.
- Remote access VPN trustpoint certificates are not enrolled after migration.
- For HA devices:
  - Target device: You cannot migrate a standalone device to an HA device.

## Best Practices for Threat Defense Device Migration

After a successful migration, we recommend that you perform the following actions before the deployment:

- IP addresses of the interfaces are copied to the target device from the source device. Change the IP addresses of the target device interfaces, if the source device is live
- Ensure that you update your NAT policies with the modified IP addresses.
- Configure the interface speeds if they are set to default values after migration.
- Re-enroll the device certificates, if any, on the target device.
- (Optional) Configure SNMP for Firepower 1100 and 2100 using the platform settings for the device.
- (Optional) Configure remote branch deployment configurations.

If the source or target device had manager access through a data interface, after the migration, the manager access will be lost. Update the manager access configuration on the target device. For more information, see the *Change the Manager Access Interface from Management to Data* topic in the Cisco Secure Firewall Management Center Device Configuration Guide or the Online Help.

- Configure site-to-site VPN, if required. These configurations are not migrated from the source device.
- View the deployment preview before the deployment. Choose **Deploy > Advanced Deploy** and click the **Preview** (📄) icon for the device.
- Monitor the health of the device in the health monitor (choose **Troubleshooting > Health > Monitor**). After migration, the health policy of the source device becomes the health policy of the target device. You can also configure a new health policy for the device.

After migration, the device monitoring dashboard may temporarily display redundant colored lines because the device has different UUIDs before and after migration. This redundancy appears only during the migration time. An hour after migration, the dashboard will show a single line per metric.

## Switch Managers

You can change between managers if needed.

## Switch from the Firewall Device Manager to the Firewall Management Center

When you switch from the Firewall Device Manager to the Firewall Management Center, all interface configuration is retained, in addition to the Management interface and the manager access settings. Note that other configuration settings, such as the access control policy or security zones, are not retained.

After you switch to the Firewall Management Center, you can no longer use the Firewall Device Manager to manage the Firewall Threat Defense device.

### Before you begin

If the firewall is configured for high availability, you must first break the high availability configuration using the Firewall Device Manager (if possible) or the **configure high-availability disable** command. Ideally, break high availability from the active unit.

### Procedure

---

**Step 1** In the Firewall Device Manager, unregister the device from the Cisco Smart Software Manager.

**Step 2** (Might be required) Configure the Management interface.

You may need to change the Management interface configuration, even if you intend to use a data interface for manager access. You will have to reconnect to the Firewall Device Manager if you were using the Management interface for the Firewall Device Manager connection.

- Data interface for manager access—The Management interface must have the gateway set to data interfaces. By default, the Management interface receives an IP address and gateway from DHCP. If you do not receive a gateway from DHCP (for example, you did not connect this interface to a network), then the gateway will default to data interfaces, and you do not need to configure anything. If you did receive a gateway from DHCP, then you need to instead configure this interface with a static IP address and set the gateway to data interfaces.
- Management interface for manager access—If you want to configure a static IP address, be sure to also set the default gateway to be a unique gateway instead of the data interfaces. If you use DHCP, then you do not need to configure anything assuming you successfully get the gateway from DHCP.

**Step 3** Choose **Device > System Settings > Central Management**, and click **Proceed** to set up the Firewall Management Center management.

**Step 4** Configure the **Management Center/CDO Details**.

Figure 27: Management Center/CDO Details

### Configure Connection to Management Center or CDO

Provide details to register to the management center/CDO.

**Management Center/CDO Details**

Do you know the Management Center/CDO hostname or IP address?

☒ Yes ☐ No

Threat Defense Hostname

1120-3

DNS Server Group

CustomDNSServerGroup

Management Center/CDO Access Interface

☐ Data Interface

Please select an interface

☒ Management Interface [View details](#)

CANCEL
CONNECT

- a) For **Do you know the Management Center/CDO hostname or IP address?**, click **Yes** if you can reach the Firewall Management Center using an IP address or hostname, or **No** if the Firewall Management Center/CDO is behind NAT or does not have a public IP address or hostname.

At least one of the devices, either the Firewall Management Center or the Firewall Threat Defense device, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices.

- b) If you chose **Yes**, then enter the **Management Center/CDO Hostname or IP Address**.
- c) Specify the **Management Center/CDO Registration Key**.

This key is a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the Firewall Threat Defense device. The registration key must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID can be used for multiple devices registering to the Firewall Management Center.

- a) Specify a **NAT ID**.

This ID is a unique, one-time string of your choice that you will also specify on the Firewall Management Center. The NAT ID must be between 2 and 36 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID *cannot* be used for any other devices registering to the Firewall Management Center. The NAT ID is used in combination with the IP address to verify that the connection is coming from the correct device; only after authentication of the IP address/NAT ID will the registration key be checked. We recommend that you always use the NAT ID even when it is optional, but it is required if:

- You set the Firewall Management Center IP address to **DONTRESOLVE**.
- When adding the device on the Firewall Management Center, you do not specify a reachable device IP address or hostname.
- You use the data interface for management, even if you specify IP addresses on both sides.
- The Firewall Management Center uses multiple management interfaces.

## Step 5 Configure the **Connectivity Configuration**.

- a) Specify the **FTD Hostname**.

If you use a data interface for the **Management Center/CDO Access Interface** access, then this FQDN will be used for this interface.

- b) Specify the **DNS Server Group**.

Choose an existing group, or create a new one. The default DNS group is called **CiscoUmbrellaDNSServerGroup**, which includes the OpenDNS servers.

If you intend to choose a data interface for the **Management Center/CDO Access Interface**, then this setting sets the *data* interface DNS server. The Management DNS server that you set with the setup wizard is used for management traffic. The data DNS server is used for DDNS (if configured) or for security policies applied to this interface. You are likely to choose the same DNS server group that you used for Management, because both management and data traffic reach the DNS server through the outside interface.

On the Firewall Management Center, the data interface DNS servers are configured in the Platform Settings policy that you assign to this Firewall Threat Defense device. When you add the Firewall Threat Defense device to the Firewall Management Center, the local setting is maintained, and the DNS servers are *not* added to a Platform Settings policy. However, if you later assign a Platform Settings policy to the Firewall Threat Defense device that includes a DNS configuration, then that configuration will overwrite the local setting. We suggest that you actively configure the DNS Platform Settings to match this setting to bring the Firewall Management Center and the Firewall Threat Defense device into sync.

Also, local DNS servers are only retained by the Firewall Management Center if the DNS servers were discovered at initial registration.

If you intend to choose the Management interface for the **Management Center/CDO Access Interface**, then this setting configures the Management DNS server.

- c) For the **Management Center/CDO Access Interface**, choose any configured interface.

You can change the manager interface after you register the Firewall Threat Defense device to the Firewall Management Center, to either the Management interface or another data interface.

**Step 6** (Optional) If you chose a data interface, and it was not the outside interface, then add a default route.

You will see a message telling you to check that you have a default route through the interface. If you chose outside, you already configured this route as part of the setup wizard. If you chose a different interface, then you need to manually configure a default route before you connect to the Firewall Management Center.

If you chose the Management interface, then you need to configure the gateway to be a unique gateway before you can proceed on this screen.

**Step 7** (Optional) If you chose a data interface, click **Add a Dynamic DNS (DDNS) method**.

DDNS ensures the Firewall Management Center can reach the Firewall Threat Defense device at its Fully-Qualified Domain Name (FQDN) if the IP address changes. See **Device > System Settings > DDNS Service** to configure DDNS.

If you configure DDNS before you add the Firewall Threat Defense device to the Firewall Management Center, the Firewall Threat Defense device automatically adds certificates for all of the major CAs from the Cisco Trusted Root CA bundle so that the Firewall Threat Defense device can validate the DDNS server certificate for the HTTPS connection. Firewall Threat Defense supports any DDNS server that uses the DynDNS Remote API specification (<https://help.dyn.com/remote-access-api/>).

DDNS is not supported when using the Management interface for manager access.

**Step 8** Click **Connect**. The **Registration Status** dialog box shows the current status of the switch to the Firewall Management Center. After the **Saving Management Center/CDO Registration Settings** step, go to the Firewall Management Center, and add the firewall.

If you want to cancel the switch to the Firewall Management Center, click **Cancel Registration**. Otherwise, do not close the Firewall Device Manager browser window until after the **Saving Management Center/CDO Registration Settings** step. If you do, the process will be paused, and will only resume when you reconnect to the Firewall Device Manager.

If you remain connected to the Firewall Device Manager after the **Saving Management Center/CDO Registration Settings** step, you will eventually see the **Successful Connection with Management Center/CDO** dialog box, after which you will be disconnected from the Firewall Device Manager.

Figure 28: Successful Connection

## Switch from Firewall Management Center to Firewall Device Manager

You can configure the Firewall Threat Defense device currently being managed by the on-premises or cloud-delivered Firewall Management Center to use the Firewall Device Manager instead.

You can switch from the Firewall Management Center to the Firewall Device Manager without reinstalling the software. Before switching from the Firewall Management Center to the Firewall Device Manager, verify that the Firewall Device Manager meets all of your configuration requirements. If you want to switch from the Firewall Device Manager to the Firewall Management Center, see [Switch from the Firewall Device Manager to the Firewall Management Center, on page 53](#).

### Caution

Switching to the Firewall Device Manager erases the device configuration and returns the system to the default configuration. However, the Management IP address and hostname are preserved.

### Procedure

**Step 1** In the Firewall Management Center, delete the firewall from the **Devices > Device Management** page.

**Step 2** Connect to the Firewall Threat Defense CLI using SSH or the console port. For SSH, open a connection to the **management IP address**, and log into the Firewall Threat Defense CLI with the **admin** username (or any other user with admin privileges).

The console port defaults to the FXOS CLI. Connect to the Firewall Threat Defense CLI using the **connect ftd** command. The SSH session connects directly to the Firewall Threat Defense CLI.

If you cannot connect to the management IP address, do one of the following:

- Ensure that the Management physical port is wired to a functioning network.

- Ensure that the management IP address and gateway are configured for the management network. Use the **configure network ipv4/ipv6 manual** command.

**Step 3** Verify you are currently in remote management mode.

**show managers**

**Example:**

```
> show managers
Type                : Manager
Host                : 10.89.5.35
Display name        : 10.89.5.35
Identifier           : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration         : Completed
```

**Step 4** Delete the remote manager and go into no manager mode.

**configure manager delete uuid**

You cannot go directly from remote management to local management. If you have more than one manager defined, you need to specify the identifier (also known as the UUID; see the **show managers** command). Delete each manager entry separately.

**Example:**

```
> configure manager delete
Deleting task list
Manager successfully deleted.

>
> show managers
No managers configured.
```

**Step 5** Configure the local manager.

**configure manager local**

You can now use a web browser to open the local manager at **https://management-IP-address**.

**Example:**

```
> configure manager local
Deleting task list

> show managers
Managed locally.
```

---

## Hot Swap an SSD on the Secure Firewall 3100/4200

If you have two SSDs, they form a RAID when you boot up. You can perform the following tasks at the Firewall Threat Defense CLI while the firewall is powered up:

- Hot swap one of the SSDs—If an SSD is faulty, you can replace it. Note that if you only have one SSD, you cannot remove it while the firewall is powered on.
- Remove one of the SSDs—If you have two SSDs, you can remove one.
- Add a second SSD—If you have one SSD, you can add a second SSD and form a RAID.

**Caution**

Do not remove an SSD without first removing it from the RAID using this procedure. You can cause data loss.

**Procedure****Step 1**

Remove one of the SSDs.

- a) Remove the SSD from the RAID.

**configure raid remove-secure local-disk {1 | 2}**

The **remove-secure** keyword removes the SSD from the RAID, disables the self-encrypting disk feature, and performs a secure erase of the SSD. If you only want to remove the SSD from the RAID and want to keep the data intact, you can use the **remove** keyword.

**Example:**

```
> configure raid remove-secure local-disk 2
```

- b) Monitor the RAID status until the SSD no longer shows in the inventory.

**show raid**

After the SSD is removed from the RAID, the **Operability** and **Drive State** will show as **degraded**. The second drive will no longer be listed as a member disk.

**Example:**

```
> show raid
Virtual Drive
ID: 1
Size (MB): 858306
Operability: operable
Presence: equipped
Lifecycle: available
Drive State: optimal
Type: raid
Level: raid1
Max Disks: 2
Meta Version: 1.0
Array State: active
Sync Action: idle
Sync Completed: unknown
Degraded: 0
Sync Speed: none

RAID member Disk:
Device Name: nvme0n1
```

```

Disk State:                in-sync
Disk Slot:                 1
Read Errors:               0
Recovery Start:            none
Bad Blocks:
Unacknowledged Bad Blocks:

Device Name:               nvme1n1
Disk State:                in-sync
Disk Slot:                 2
Read Errors:               0
Recovery Start:            none
Bad Blocks:
Unacknowledged Bad Blocks:

> show raid
Virtual Drive
ID:                        1
Size (MB):                 858306
Operability:               degraded
Presence:                  equipped
Lifecycle:                  available
Drive State:               degraded
Type:                       raid
Level:                      raid1
Max Disks:                  2
Meta Version:               1.0
Array State:                active
Sync Action:                idle
Sync Completed:             unknown
Degraded:                   1
Sync Speed:                 none

RAID member Disk:
Device Name:               nvme0n1
Disk State:                in-sync
Disk Slot:                 1
Read Errors:               0
Recovery Start:            none
Bad Blocks:
Unacknowledged Bad Blocks:

```

- c) Physically remove the SSD from the chassis.

## Step 2

Add an SSD.

- a) Physically add the SSD to the empty slot.
- b) Add the SSD to the RAID.

**configure raid add local-disk {1 | 2}**

It can take several hours to complete syncing the new SSD to the RAID, during which the firewall is completely operational. You can even reboot, and the sync will continue after it powers up. Use the **show raid** command to show the status.

If you install an SSD that was previously used on another system, and is still locked, enter the following command:

**configure raid add local-disk {1 | 2} *psid***

The *psid* is printed on the label attached to the back of the SSD. Alternatively, you can reboot the system, and the SSD will be reformatted and added to the RAID.

## History for Device Management

| Feature                                                                                                                                       | Minimum Firewall Management Center | Minimum Firewall Threat Defense                                                                                           | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|---------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chassis-level health alerts for the Firepower 4100/9300.                                                                                      | 7.4.1                              | 7.4.1                                                                                                                     | <p>You can now view chassis-level health alerts for Firepower 4100/9300 by registering the chassis to the Firewall Management Center as a read-only device. You must also enable the Firewall Threat Defense Platform Faults health module and apply the health policy. The alerts appear in the Message Center, the health monitor (in the left pane, under Devices, select the chassis), and in the health events view.</p> <p>You can also add a chassis (and view health alerts for) the Secure Firewall 3100 in multi-instance mode. For those devices, you use the Firewall Management Center to manage the chassis. But for the Firepower 4100/9300 chassis, you still must use the chassis manager or the FXOS CLI.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Add &gt; Chassis</b></p> |
| Zero-Touch Provisioning to register the Firepower 1000/2100 and Secure Firewall 3100 to the Firewall Management Center using a serial number. | 7.4.0                              | <p>Mgmt. center <i>is</i> publicly reachable: 7.2.0</p> <p>Mgmt. center <i>is not</i> publicly reachable: 7.2.4/7.4.0</p> | <p>Zero-Touch Provisioning (also called low-touch provisioning) lets you register Firepower 1000/2100 and Secure Firewall 3100 devices to the Firewall Management Center by serial number without having to perform any initial setup on the device. The Firewall Management Center integrates with SecureX and CDO for this functionality.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Add &gt; Device &gt; Serial Number</b></p> <p>Version restrictions: This feature is not supported on Version 7.3.x or 7.4.0 Firewall Threat Defense when the Firewall Management Center is not publicly reachable. Support returns in Version 7.4.1.</p>                                                                                                                                                 |

| Feature                                              | Minimum Firewall Management Center | Minimum Firewall Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|------------------------------------------------------|------------------------------------|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Merged management and diagnostic interfaces.         | 7.4.0                              | 7.4.0                           | <p><b>Upgrade impact. Merge interfaces after upgrade.</b></p> <p>For new devices using 7.4 and later, you cannot use the legacy diagnostic interface. Only the merged management interface is available.</p> <p>If you upgraded to 7.4 or later and:</p> <ul style="list-style-type: none"> <li>You did not have any configuration for the diagnostic interface, then the interfaces will merge automatically.</li> <li>You have configuration for the diagnostic interface, then you have the choice to merge the interfaces manually, or you can continue to use the separate diagnostic interface. Note that support for the diagnostic interface will be removed in a later release, so you should plan to merge the interfaces as soon as possible.</li> </ul> <p>Merged mode also changes the behavior of AAA traffic to use the data routing table by default. The management-only routing table can now only be used if you specify the management-only interface (including Management) in the configuration.</p> <p>For platform settings, this means:</p> <ul style="list-style-type: none"> <li>You can no longer enable HTTP, ICMP, or SMTP for diagnostic.</li> <li>For SNMP, you can allow hosts on management instead of diagnostic.</li> <li>For Syslog servers, you can reach them on management instead of diagnostic.</li> <li>If Platform Settings for syslog servers or SNMP hosts specify the diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices.</li> <li>DNS lookups no longer fall back to the management-only routing table if you do not specify interfaces.</li> </ul> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Interfaces</b></p> <p>New/modified commands: <b>show management-interface convergence</b></p> |
| Migrate Firepower 1000/2100 to Secure Firewall 3100. | 7.4.0                              | Any                             | <p>You can now easily migrate configurations from the Firepower 1000/2100 to the Secure Firewall 3100.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Migrate</b></p> <p>Platform restrictions: Migration not supported from the Firepower 1010 or 1010E.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## CHAPTER 2

# Device Settings

---

After you add a device, you can edit device-related settings on the **Device** page.

1. Choose **Devices** > **Device Management**.
2. Next to the device you want to modify, click **Edit** (✎).
3. Click **Device**.
  - [Edit General Settings, on page 67](#)
  - [Edit License Settings, on page 79](#)
  - [View System Information, on page 79](#)
  - [View the Inspection Engine, on page 81](#)
  - [Edit Health Settings, on page 81](#)
  - [Edit Management Settings, on page 81](#)
  - [View Inventory Details, on page 121](#)
  - [Edit Applied Policies, on page 122](#)
  - [Edit Advanced Settings, on page 124](#)
  - [Edit Deployment Settings, on page 127](#)
  - [Edit Cluster Health Monitor Settings, on page 130](#)
  - [History for Device Settings, on page 135](#)

## Edit General Settings

The **General** section of the **Device** page displays the settings described in the table below.

Figure 29: General

| General                  |                                                                        |
|--------------------------|------------------------------------------------------------------------|
| Name:                    | 10.10.0.6                                                              |
| Transfer Packets:        | Yes                                                                    |
| Troubleshoot:            | <a href="#">Logs</a> <a href="#">CLI</a> <a href="#">Download</a>      |
| Mode:                    | Routed                                                                 |
| Compliance Mode:         | None                                                                   |
| Performance Profile:     | Default                                                                |
| TLS Crypto Acceleration: | Disabled                                                               |
| Device Configuration:    | <a href="#">Import</a> <a href="#">Export</a> <a href="#">Download</a> |
| OnBoarding Method:       | Registration Key                                                       |

Table 2: General Section Table Fields

| Field                    | Description                                                                                                                                                                                            |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Name                     | The display name of the device on the Firewall Management Center.                                                                                                                                      |
| Transfer Packets         | This displays whether or not the managed device sends packet data with the events to the Firewall Management Center.                                                                                   |
| Troubleshoot             | Lets you generate and download troubleshooting files and also see CLI command output. See <a href="#">Generate Troubleshooting Files, on page 69</a> and <a href="#">View CLI Output, on page 71</a> . |
| Mode                     | The displays the mode of the management interface for the device: <b>routed</b> or <b>transparent</b> .                                                                                                |
| Compliance Mode          | This displays the security certifications compliance for a device. Valid values are CC, UCAPL and None.                                                                                                |
| Performance Profile      | This displays the core allocation performance profile for the device, as configured in the platform settings policy.                                                                                   |
| TLS Crypto Acceleration: | Shows whether TLS crypto acceleration is enabled or disabled.                                                                                                                                          |
| Device Configuration     | Lets you copy, export, or import a configuration. See <a href="#">Copy a Configuration to Another Device, on page 73</a> and <a href="#">Export and Import the Device Configuration, on page 74</a> .  |
| OnBoarding Method        | Shows whether the device was registered using a registration key or using the serial number (zero-touch provisioning).                                                                                 |

You can edit some of these settings from this section.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to modify, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** In the **General** section, click **Edit** (✎).
- Enter a **Name** for the managed device.
  - Check **Transfer Packets** to allow packet data to be stored with events on the Firewall Management Center.
  - Click **Force Deploy** to force deployment of current policies and device configuration to the device.
- Note**  
Force-deploy consumes more time than the regular deployment since it involves the complete generation of the policy rules to be deployed on the Firewall Threat Defense.
- Step 5** For **Troubleshoot** actions, see [Generate Troubleshooting Files, on page 69](#) and [View CLI Output, on page 71](#).
- Step 6** For **Device Configuration** actions, see [Copy a Configuration to Another Device, on page 73](#) and [Export and Import the Device Configuration, on page 74](#).
- Step 7** Click **Deploy**.
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Generate Troubleshooting Files

You can generate and download troubleshooting files for each device and also for all cluster nodes. For a cluster, you can download all files as a single compressed file. You can also include cluster logs for the cluster for cluster nodes.

You can alternatively trigger file generation from the **Devices > Device Management > More** (≡) > **Troubleshoot Files** menu.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device or cluster you want to view, click **Edit** (✎).
- In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.
- Step 3** Click **Device** or **Cluster**.
- Step 4** Generate logs for the device or for all cluster nodes.

- a) On the **General > Troubleshoot** section, click **Logs**.

**Figure 30: Logs**

The screenshot shows the 'General' configuration page for a device. The 'Troubleshoot' section has three buttons: 'Logs' (highlighted with a red box), 'CLI', and 'Download'. Other settings include Name: 10.10.0.6, Transfer Packets: Yes, Mode: Routed, Compliance Mode: None, Performance Profile: Default, TLS Crypto Acceleration: Disabled, Device Configuration: Import, Export, Download, and OnBoarding Method: Registration Key.

- b) You are prompted to choose the logs you want to include. For a cluster, under **Device**, you can choose **All Devices** or an individual node. A cluster also has the **Cluster Logs** available.

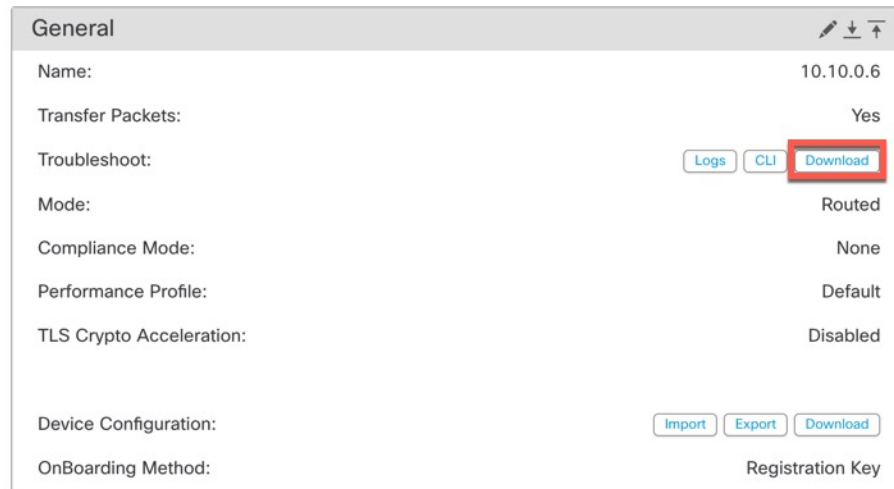

**Figure 31: Generate Troubleshoot Files**

The screenshot shows the 'Generate Troubleshoot Files - 10.10.0.6' dialog box. It contains a message: 'This operation may take several minutes to complete, the status can be tracked in Message Center Tasks.' Below this, it says 'Please select the data to include:' and lists several options, all of which are checked: 'All Data', 'Snort Performance and Configuration', 'Hardware Performance and Logs', 'System Configuration, Policy, and Logs', 'Detection Configuration, Policy, and Logs', 'Interface and Network Related Data', 'Discovery, Awareness, VDB Data, and Logs', 'Upgrade Data and Logs', 'All Database Data', 'All Log Data', 'Network Map Information', and 'Deployment Logs'. At the bottom, there are 'Cancel' and 'Generate' buttons. The 'Generate' button is highlighted with a blue box.

- c) Click **Generate**.

**Step 5** To download the generated logs, on the **General > Troubleshoot** section, click **Download**.

**Figure 32: Download**

The screenshot shows the 'General' tab of the 'Troubleshoot' section. It contains various configuration fields and buttons. The 'Download' button, located next to the 'Logs' and 'CLI' buttons, is highlighted with a red rectangular box. Other visible fields include 'Name' (10.10.0.6), 'Transfer Packets' (Yes), 'Mode' (Routed), 'Compliance Mode' (None), 'Performance Profile' (Default), 'TLS Crypto Acceleration' (Disabled), 'Device Configuration' (Import, Export, Download buttons), and 'OnBoarding Method' (Registration Key).

The logs are downloaded to your computer.

## View CLI Output

You can view a set of pre-defined CLI outputs that can help you troubleshoot the device or cluster. You can also enter any **show** command and see the output.

For a device, the following commands are executed:

- **show version**
- **show asp drop**
- **show counters**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**

For a cluster or cluster node:

- **show running-config cluster**
- **show cluster info**
- **show cluster info health**
- **show cluster info transport cp**
- **show version**
- **show asp drop**

- **show counters**
- **show arp**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**
- **show interface *ccl\_interface***
- **ping *ccl\_ip* size *ccl\_mtu* repeat 2**
- **show nve**
- **show route**
- **show tech-support**

## Procedure

**Step 1** Choose **Devices > Device Management**.

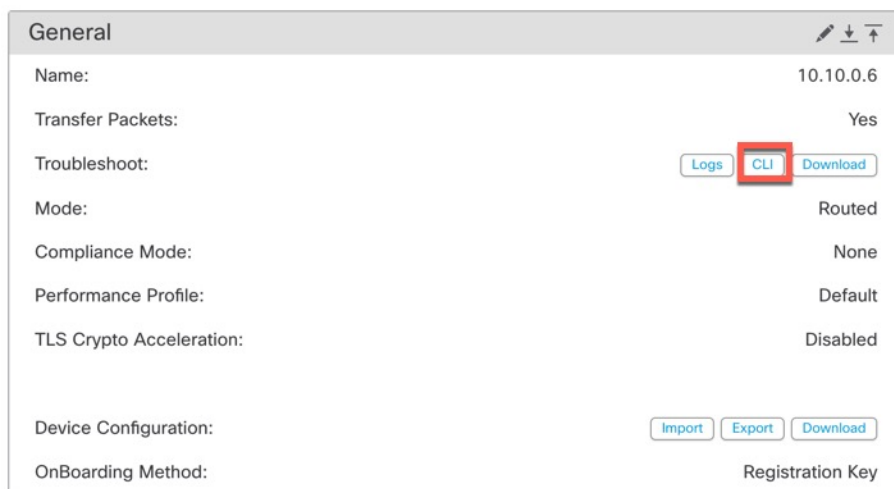

**Step 2** Next to the device or cluster you want to view, click **Edit** (✎).

In a multidomain deployment, if you are not in a leaf domain, the system prompts you to switch.

**Step 3** Click **Device** or **Cluster**.

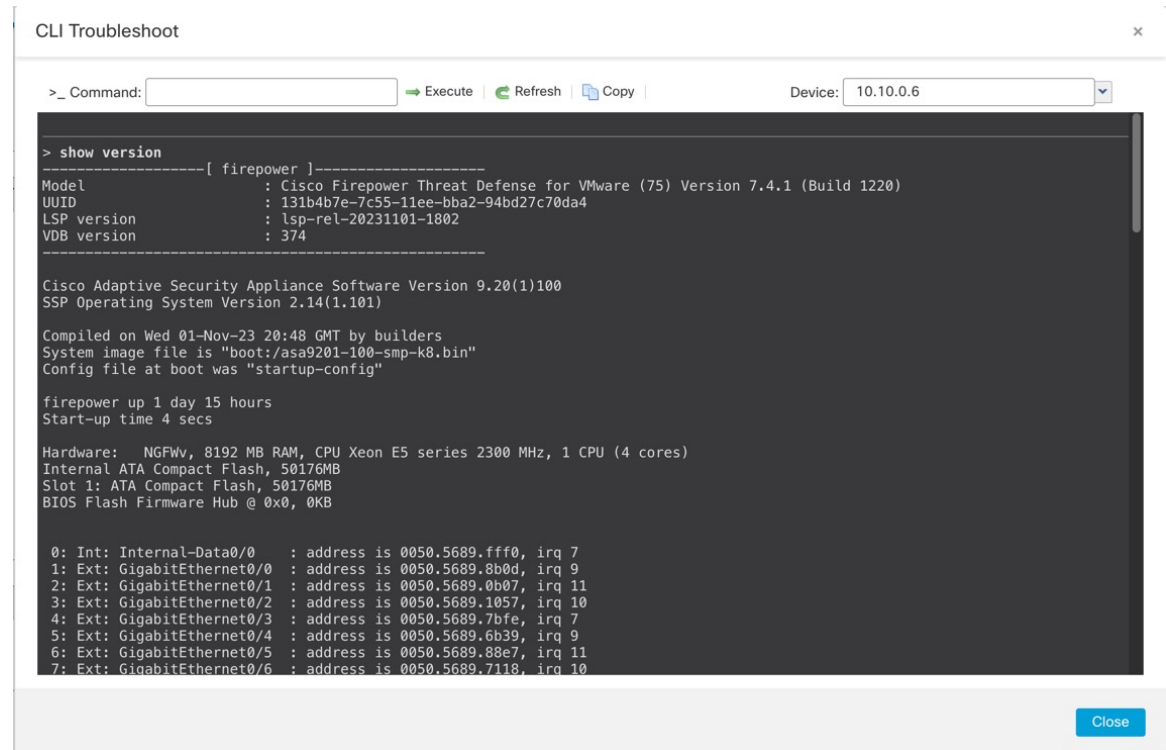

**Step 4** In the **General > Troubleshoot** section, click **CLI**.

**Figure 33: CLI**

The **CLI Troubleshoot** dialog box appears with the pre-defined CLIs executed.

Figure 34: CLI Troubleshoot

**Step 5** On the **CLI Troubleshoot** dialog box, you can perform the following tasks.

- Enter a **show** command in the **Command** field, and click **Execute**. The new command output will be added to the window.
- Click **Refresh** to re-run the predefined CLIs.
- Click **Copy** to copy the output to your clipboard.
- For a cluster, choose a different node from the **Device** drop down list.

**Step 6** Click **Close**.

## Copy a Configuration to Another Device

When a new device is deployed in the network you can easily copy configurations and policies from a pre-configured device, instead of manually reconfiguring the new device.

### Before you begin

Confirm that:

- The source and destination devices are the same model and are running the same version of the software.
- The source is either a standalone device or a high availability pair.

- The destination device is a standalone device.
- The source and destination devices have the same number of physical interfaces.
- The source and destination devices are in the same firewall mode: routed or transparent.
- The source and destination devices are in the same security-certifications-compliance mode.
- The source and destination devices are in the same domain.
- Configuration deployment is not in progress on either the source or the destination devices.

## Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the device you want to modify, click **Edit** (✎).

**Step 3** Click **Device**.

**Step 4** In the **General** section, do one of the following:

- Click **Get Device Configuration** (↓) to copy device configuration from another device to the new device. On the **Get Device Configuration** page, select the source device in the **Select Device** drop-down list.
- Click **Push Device Configuration** (↑) to copy device configuration from the current device to the new device. On the **Push Device Configuration** page, select the destination to which configuration is to be copied in the **Target Device** drop-down list.

**Step 5** (Optional) Check **Include shared policies configuration** check box to copy policies.

Shared policies like AC policy, NAT, Platform Settings and FlexConfig policies can be shared across multiple devices.

**Step 6** Click **OK**.

You can monitor the status of the copy device configuration task on **Tasks** in the Message Center.

When the copy device configuration task is initiated, it erases the configuration on the target device and copies the configuration of the source device to the destination device.

### Warning

When you have completed the copy device configuration task, you cannot revert the target device to its original configuration.

## Export and Import the Device Configuration

You can export all of the the device-specific configuration configurable on the Device pages, including:

- Interfaces

- Inline Sets
- Routing
- DHCP
- VTEP
- Associated objects

You can then import the saved configuration for the same device in the following use cases:

- Moving the device to a different Firewall Management Center—First delete the device from the original Firewall Management Center, then add the device to the new Firewall Management Center. Then you can import the saved configuration.
- Moving the device between domains—When you move a device between domains, some device-specific configuration is not retained because supporting objects (such as interface groups for security zones) do not exist in the new domain. By importing the configuration after the domain move, any necessary objects are created for that domain, and the device configuration is restored.
- Restore an old configuration—If you deployed changes that negatively impacted the operation of the device, you can import a backup copy of a known working configuration to restore a previous operational state.
- Reregistering a device—If you delete a device from the Firewall Management Center, but then want to add it back, you can import the saved configuration.

See the following guidelines:

- You can only import the configuration to the same device (the UUID must match). You cannot import a configuration to a different device, even if it is the same model.
- Do not change the version running on the device between exporting and importing; the version must match.
- If you make inventory changes after your export (such as adding or deleting network modules or configuring or joining breakout ports), the device inventory will not match the Firewall Management Center. In this case, the device inventory will be maintained, and you will be prompted to sync the interfaces (see [Sync Interface Changes with the Firewall Management Center, on page 673](#)) and discard incompatible configuration in the Firewall Management Center when you try to deploy. You will have to repeat the inventory changes and related configuration in the Firewall Management Center.
- If you export a standalone configuration, you cannot import it to a high availability pair or vice versa.
- When moving the device to a different Firewall Management Center, the target Firewall Management Center version must be the same as the source version.
- If an object doesn't exist, it will be created. If an object exists, but the value is different, see below:

**Table 3: Object Import Action**

| Scenario                                    | Import Action           |
|---------------------------------------------|-------------------------|
| Object exists with the same name and value. | Reuse existing objects. |

| Scenario                                              | Import Action                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object exists with the same name but different value. | <p>Network and Port objects: Create object overrides for this device. See <a href="#">Object Overrides, on page 1243</a>.</p> <p>Interface objects: Create new objects. For example, if both the type (security zone or interface group) and the interface type (routed or switched, for example) do not match, then a new object is created.</p> <p>All other objects: Reuse existing objects even though the values are different.</p> |
| Object doesn't exist.                                 | Create new objects.                                                                                                                                                                                                                                                                                                                                                                                                                      |

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device you want to edit, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** Export the configuration.
  - a) In the **General** area, click **Export**.

**Figure 35: Export Device Configuration**

The screenshot shows the 'General' configuration tab for a device. The fields and their values are:

- Name: 192.168.0.197 FTDv
- Transfer Packets: Yes
- Mode: Routed
- Compliance Mode: None
- TLS Crypto Acceleration: Disabled

At the bottom right, there are three buttons: 'Import', 'Export', and 'Download'. The 'Export' button is highlighted with a red rectangle.

You are prompted to acknowledge the export; click **OK**.

**Figure 36: Acknowledge Export**

The screenshot shows a dialog box titled 'Device Configuration Export'. The message inside says: 'Device configuration export task initiated. View the progress of task from Tasks view.' At the bottom right, there is a blue 'OK' button.

You can view the export progress in the **Tasks** page.

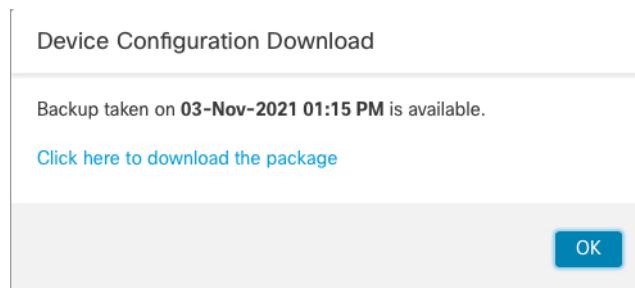

- b) On the **Notifications > Tasks** page, ensure that the export has completed; click **Download Export Package**. Alternatively, you can click the **Download** button in the **General** area.

**Figure 37: Export Task**

You are prompted to download the package; click **Click here to download the package** to save the file locally, and then click **OK** to exit the dialog box.

**Figure 38: Download Package**

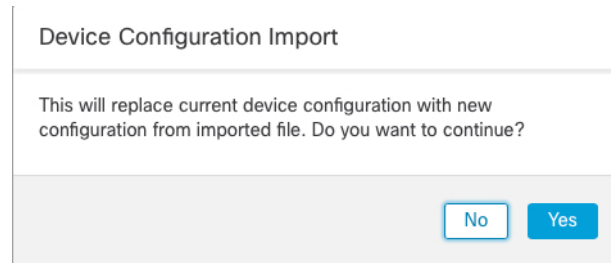

## Step 5 Import the configuration.

- a) In the **General** area, click **Import**.

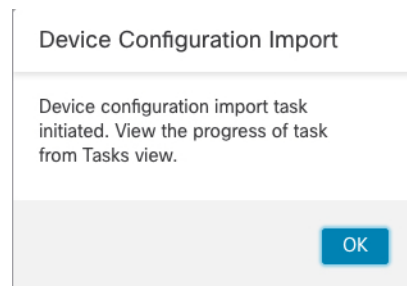

**Figure 39: Import Device Configuration**

You are prompted to acknowledge that the current configuration will be replaced. Click **Yes** and then navigate to the configuration package (with the suffix `.sfo`; note that this file is different from the Backup/Restore files).

**Figure 40: Import Package****Figure 41: Navigate to Package**

You are prompted to acknowledge the import; click **OK**.

**Figure 42: Acknowledge Import**

You can view the import progress in the **Tasks** page.

- b) View the import reports so you can see what was imported. On the **Notifications > Tasks** page for the import task, click **View Import Report**.

**Figure 43: View Import Report**

The **Device Configuration Import Reports** page provides links to available reports.

## Cisco Firepower Management Center

### Device Configuration Import Reports

| Device                              | Shared Policies       | Device Configurations                               |
|-------------------------------------|-----------------------|-----------------------------------------------------|
| 0434ef00-15bb-11ec-bb94-93bde3ad19d | Report does not exist | <a href="#">Device configurations import report</a> |

- c) Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Edit License Settings

The **License** section of the **Device** page displays the licenses enabled for the device.

You can enable licenses on your device if you have available licenses on your Firewall Management Center.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to enable or disable licenses, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** In the **License** section, click **Edit** (✎).
- Step 5** Check or clear the check box next to the license you want to enable or disable for the managed device.
- Step 6** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## View System Information

The **System** section of the **Device** page displays a read-only table containing system information, as described in the following table.

You can also shut down or restart the device from this pane, using the icons at the top-right corner.

Figure 44: System

System

Model: Cisco Firepower 1010 Threat Defense

| <b>Serial</b>                                                                                             | Serial number of the managed device's chassis.                                            |
| <b>Time</b>                                                                                               | Current system time of the device.                                                        |
| <b>Time Zone</b>                                                                                          | Time zone.                                                                                |
| <b>Version</b>                                                                                            | Version of the software currently installed on the managed device.                        |
| <b>Time Zone setting for Time based rules</b>                                                             | Current system time of the device in the time zone specified in device platform settings. |
| <b>Inventory</b>                                                                                          | Inventory details. See <a href="#">View Device Inventory</a> .                            |

## View Device Inventory

Click **View** next to **Inventory** in the **System** section to view a table of device inventory information including Fans, Memory, CPU, Power Supply, Storage, and Network Modules.

The **Inventory Details** table displays information about all the Cisco products installed in the Firewall Threat Defense devices assigned with a product identifier (PID). The PID is the product name using which the product can be ordered.

Figure 45: Inventory Details

## View the Inspection Engine

The Inspection Engine section of the **Device** page shows whether your device uses Snort 2 or Snort 3. To switch the inspection engine, see [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).

## Edit Health Settings

The **Health** section of the **Device** page displays the information described in the table below.

Table 5: Health Section Table Fields

| Field    | Description                                                                                                                       |
|----------|-----------------------------------------------------------------------------------------------------------------------------------|
| Status   | An icon that represents the current health status of the device. Clicking the icon displays the Health Monitor for the appliance. |
| Policy   | A link to a read-only version of the health policy currently deployed at the device.                                              |
| Excluded | A link to the <b>Health Exclude</b> page, where you can enable and disable health exclusion modules.                              |

## Edit Management Settings

These settings control how the Firewall Management Center establishes the management connection with the device.

## Configure a Redundant Manager Access Data Interface

When you use a data interface for manager access, you can configure a secondary data interface to take over management functions if the primary interface goes down. You can configure only one secondary interface. The device uses SLA monitoring to track the viability of the static routes and an ECMP zone that contains both interfaces so management traffic can use both interfaces.

High availability is not supported.

### Before you begin

- The secondary interface needs to be in a separate security zone from the primary interface.
- All of the same requirements apply to the secondary interface as apply to the primary interface. See [Using the Firewall Threat Defense Data Interface for Management](#), on page 4.

### Procedure

**Step 1** On the **Devices > Device Management** page, click **Edit** (✎) for the device.

**Step 2** Enable manager access for the secondary interface.

This setting is in addition to standard interface settings such as enabling the interface, setting the name, setting the security zone, and setting a static IPv4 address.

- Choose **Interfaces > Edit Physical Interface > Manager Access**.
- Check **Enable management on this interface for the Manager**.
- Click **OK**.

Both interfaces show (**Manager Access**) in the interface listing.

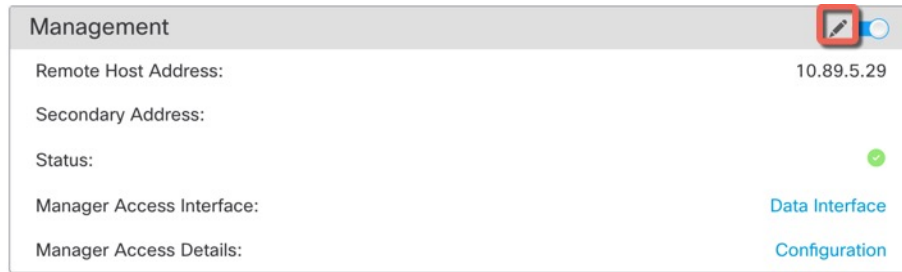

*Figure 46: Interface Listing*

| Interface                    | Logical Name | Type     | Security Zones |
|------------------------------|--------------|----------|----------------|
| Diagnostic1/1                | diagnostic   | Physical |                |
| Ethernet1/1 (Manager Access) | outside      | Physical | outside        |
| Ethernet1/2                  |              | Physical |                |
| Ethernet1/3                  |              | Physical |                |
| Ethernet1/4                  |              | Physical |                |
| Ethernet1/5                  |              | Physical |                |
| Ethernet1/6                  |              | Physical |                |
| Ethernet1/7                  |              | Physical |                |
| Ethernet1/8 (Manager Access) | redundant    | Physical | mgmt           |

**Step 3** Add the secondary address to the **Management** settings.

- Click **Device**, and view the **Management** area.
- Click **Edit** (✎).

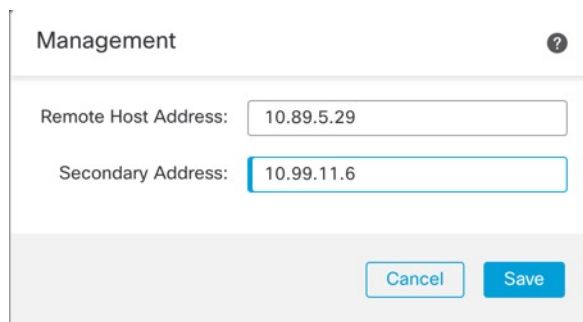

**Figure 47: Edit Management Address**

The Management dialog box displays the following fields and values:

| Field                     | Value                |
|---------------------------|----------------------|
| Remote Host Address:      | 10.89.5.29           |
| Secondary Address:        |                      |
| Status:                   | Green checkmark icon |
| Manager Access Interface: | Data Interface       |
| Manager Access Details:   | Configuration        |

- c) In the **Management** dialog box, modify the name or IP address in the **Secondary Address** field

**Figure 48: Management IP Address**

The Management dialog box shows the following input fields:

| Field                | Value      |
|----------------------|------------|
| Remote Host Address: | 10.89.5.29 |
| Secondary Address:   | 10.99.11.6 |

Buttons: Cancel, Save

- d) Click **Save**.

**Step 4** Create an ECMP zone with both interfaces.

- Click **Routing**.
- From the virtual router drop-down, choose the virtual router in which the primary and secondary interfaces reside.
- Click **ECMP**, and then click **Add**.
- Enter a **Name** for the ECMP zone.
- Select the primary and secondary interfaces under the **Available Interfaces** box, and then click **Add**.

Figure 49: Add an ECMP Zone

The screenshot shows a configuration window titled "Add ECMP". At the top, there is a "Name" input field with the text "redundant-mgmt". Below this, the window is divided into two main sections: "Available Interfaces" on the left and "Selected Interfaces" on the right. The "Available Interfaces" section is currently empty. The "Selected Interfaces" section contains two entries: "outside" and "redundant", each with a small trash icon to its right. An "Add" button is located between these two sections. At the bottom right of the window, there are "Cancel" and "OK" buttons.

f) Click **OK**, and then **Save**.

**Step 5**

Add equal-cost default static routes for both interfaces and enable SLA tracking on both.

The routes should be identical except for the gateway and should both have metric 1. The primary interface should already have a default route that you can edit.

Figure 50: Add/Edit Static Route

Cancel OK

- Click **Static Route**.
- Either click **Add Route** to add a new route, or click **Edit** () for an existing route.
- From the **Interface** drop-down, choose the interface.
- For the destination network, select **any-ipv4** from the **Available Networks** box and click **Add**.
- Enter the default **Gateway**.
- For **Route Tracking**, click **Add** () to add a new SLA monitor object.
- Enter the required parameters including the following:
  - The **Monitor Address** as the Firewall Management Center IP address.
  - The zone for the primary or secondary management interface in **Available Zones**; for example, choose the outside zone for the primary interface object, and the mgmt zone for the secondary interface object.

See [SLA Monitor](#), on page 1321 for more information.

- h) Click **Save**, then choose the SLA object you just created in the **Route Tracking** drop-down list.
- i) Click **OK**, and then **Save**.
- j) Repeat for the default route for the other management interface.

**Step 6**

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

As part of the deployment for this feature, the Firewall Management Center enables the secondary interface for management traffic, including auto-generated policy-based routing configuration for management traffic to get to the right data interface. The Firewall Management Center also deploys a second instance of the **configure network management-data-interface** command. Note that if you edit the secondary interface at the CLI, you cannot configure the gateway or otherwise alter the default route, because the static route for this interface can only be edited in the Firewall Management Center.

## Change Manager Access Interface Settings

Changing any manager interface settings on the device or on the Firewall Management Center can disrupt the management connection. See the following scenarios to change interface settings and reestablish the management connection.

### Change the Device IP Address

Change the device IP address, and then update the address in the Firewall Management Center.

#### Set the Device IP Address

Use one of the following methods to set the manager access interface IP address.

#### *Modify Firewall Threat Defense Management Interfaces at the CLI*

Modify the management interface settings on the managed device using the CLI. Many of these settings are ones that you set when you performed the initial setup; this procedure lets you change those settings, and set additional settings such as enabling an event interface if your model supports it, or adding static routes.

**Note** This topic applies to the dedicated Management interface. You can alternatively configure a data interface for management. If you want to change network settings for that interface, you should do so within Firewall Management Center and not at the CLI. If you need to troubleshoot a disrupted management connection, and need to make changes directly on the Firewall Threat Defense, see [Modify the Firewall Threat Defense Data Interface Used for Management at the CLI, on page 93](#).

For information about the Firewall Threat Defense CLI, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

**Note** When using SSH, be careful when making changes to the management interface; if you cannot re-connect because of a configuration error, you will need to access the device console port.

**Note** If you change the device management IP address, then see the following tasks for Firewall Management Center connectivity depending on how you identified the Firewall Management Center during initial device setup using the **configure manager add** command (see [Register With a New Management Center, on page 42](#)):

- **IP address—No action.** If you identified the Firewall Management Center using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in Firewall Management Center to keep the information in sync; see [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable Firewall Management Center IP address, then see the procedure for NAT ID below.
- **NAT ID only—Manually reestablish the connection.** If you identified the Firewall Management Center using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in Firewall Management Center according to [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#).

**Note** In a High Availability Firewall Management Center configuration, when you modify the management IP address from the device CLI or from the Firewall Management Center, the secondary Firewall Management Center does not reflect the changes even after an HA synchronization. To ensure that the secondary Firewall Management Center is also updated, switch roles between the two Firewall Management Centers, making the secondary Firewall Management Center the active unit. Modify the management IP address of the registered device on the device management page of the now active Firewall Management Center.

### Before you begin

- You can create user accounts that can log into the CLI using the **configure user add** command; see [Add an Internal User at the CLI, on page 141](#). You can also configure AAA users according to [External Authentication, on page 834](#).

### Procedure

- Step 1** Connect to the device CLI, either from the console port or using SSH.  
See [Log Into the Command-Line Interface on the Device, on page 11](#).
- Step 2** Log in with the Admin username and password.
- Step 3** (Firepower 4100/9300/Secure Firewall 4200 only) Enable the second management interface as an event-only interface.

**configure network management-interface enable management1**

**configure network management-interface disable-management-channel management1**

You always need a management interface for management traffic. If your device has a second management interface, you can enable it for event-only traffic.

You can optionally disable events for the main management interface using the **configure network management-interface disable-events-channel** command. In either case, the device will try to send events on the event-only interface, and if that interface is down, it will send events on the management interface even if you disable the event channel.

You cannot disable both event and management channels on an interface.

To use a separate event interface, you also need to enable an event interface on the Firewall Management Center. See the [Cisco Secure Firewall Management Center Administration Guide](#).

### Example:

```
> configure network management-interface enable management1
Configuration updated successfully

> configure network management-interface disable-management-channel management1
Configuration updated successfully

>
```

- Step 4** Configure the IP address of the management interface and/or event interface:

If you do not specify the *management\_interface* argument, then you change the network settings for the default management interface. When configuring an event interface, be sure to specify the *management\_interface* argument. The event interface can be on a separate network from the management interface, or on the same network. If you are connected to the interface you are configuring, you will be disconnected. You can re-connect to the new IP address.

a) Configure the IPv4 address:

- Manual configuration:

**configure network ipv4 manual** *ip\_address netmask gateway\_ip [management\_interface]*

Note that the *gateway\_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *gateway\_ip* as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *gateway\_ip* for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

**Example:**

```
> configure network ipv4 manual 10.10.10.45 255.255.255.0 10.10.10.1 management1
Setting IPv4 network configuration.
Network settings changed.

>
```

- DHCP (supported on the default management interface only):

**configure network ipv4 dhcp**

b) Configure the IPv6 address:

- Stateless autoconfiguration:

**configure network ipv6 router** *[management\_interface]*

**Example:**

```
> configure network ipv6 router management0
Setting IPv6 network configuration.
Network settings changed.

>
```

- Manual configuration:

**configure network ipv6 manual** *ip6\_address ip6\_prefix\_length [ip6\_gateway\_ip] [management\_interface]*

Note that the *ip6\_gateway\_ip* in this command is used to create the default route for the device. If you configure an event-only interface, then you must enter the *ip6\_gateway\_ip* as part of the command; however, this entry just configures the default route to the value you specify and does not create a separate static route for the eventing interface. If you are using an event-only interface on a different network from the management interface, we recommend that you set the *ip6\_gateway\_ip*

for use with the management interface, and then create a static route separately for the event-only interface using the **configure network static-routes** command.

**Example:**

```
> configure network ipv6 manual 2001:0DB8:BA98::3210 64 management1
Setting IPv6 network configuration.
Network settings changed.

>
```

- DHCPv6 (supported on the default management interface only):

**configure network ipv6 dhcp**

**Step 5**

For IPv6, enable or disable ICMPv6 Echo Replies and Destination Unreachable messages. These messages are enabled by default.

**configure network ipv6 destination-unreachable {enable | disable}**

**configure network ipv6 echo-reply {enable | disable}**

You might want to disable these packets to guard against potential denial of service attacks. Disabling Echo Reply packets means you cannot use IPv6 ping to the device management interfaces for testing purposes.

**Example:**

```
> configure network ipv6 destination-unreachable disable
> configure network ipv6 echo-reply disable
```

**Step 6**

Enable a DHCP server on the default management interface to provide IP addresses to connected hosts:

**configure network ipv4 dhcp-server-enable start\_ip\_address end\_ip\_address**

**Example:**

```
> configure network ipv4 dhcp-server-enable 10.10.10.200 10.10.10.254
DHCP Server Enabled

>
```

You can only configure a DHCP server when you set the management interface IP address manually. This command is not supported on the Firewall Management Center Virtual. To display the status of the DHCP server, enter **show network-dhcp-server**:

```
> show network-dhcp-server
DHCP Server Enabled
10.10.10.200-10.10.10.254
```

**Step 7**

Add a static route for the event-only interface if the Firewall Management Center is on a remote network; otherwise, all traffic will match the default route through the management interface.

**configure network static-routes {ipv4 | ipv6} add management\_interface destination\_ip netmask\_or\_prefix gateway\_ip**

For the *default* route, do not use this command; you can only change the default route gateway IP address when you use the **configure network ipv4** or **ipv6** commands (see [Step 4, on page 88](#)).

**Example:**

```
> configure network static-routes ipv4 add management1 192.168.6.0 255.255.255.0 10.10.10.1
Configuration updated successfully

> configure network static-routes ipv6 add management1 2001:0DB8:AA89::5110 64
2001:0DB8:BA98::3211
Configuration updated successfully

>
```

To display static routes, enter **show network-static-routes** (the default route is not shown):

```
> show network-static-routes
-----[ IPv4 Static Routes ]-----
Interface           : management1
Destination          : 192.168.6.0
Gateway              : 10.10.10.1
Netmask              : 255.255.255.0
[...]
```

**Step 8** Set the hostname:

**configure network hostname** *name*

**Example:**

```
> configure network hostname farscape1.cisco.com
```

Syslog messages do not reflect a new hostname until after a reboot.

**Step 9** Set the search domains:

**configure network dns searchdomains** *domain\_list*

**Example:**

```
> configure network dns searchdomains example.com,cisco.com
```

Set the search domain(s) for the device, separated by commas. These domains are added to hostnames when you do not specify a fully-qualified domain name in a command, for example, **ping system**. The domains are used only on the management interface, or for commands that go through the management interface.

**Step 10** Set up to 3 DNS servers, separated by commas:

**configure network dns servers** *dns\_ip\_list*

**Example:**

```
> configure network dns servers 10.10.6.5,10.20.89.2,10.80.54.3
```

**Step 11** Set the remote management port for communication with the Firewall Management Center:

**configure network management-interface tcpport** *number*

**Example:**

```
> configure network management-interface tcpport 8555
```

The Firewall Management Center and managed devices communicate using a two-way, TLS-1.3-encrypted communication channel, which by default is on port 8305.

**Note**

Cisco **strongly** recommends that you keep the default settings for the remote management port, but if the management port conflicts with other communications on your network, you can choose a different port. If you change the management port, you must change it for **all** devices in your deployment that need to communicate with each other.

**Step 12**

(Firewall Threat Defense only) Set the management or eventing interface MTU. The MTU is 1500 bytes by default.

**configure network mtu** [*bytes*] [*interface\_id*]

- *bytes*—Sets the MTU in bytes. For the management interface, the value can be between 64 and 1500 if you enable IPv4, and 1280 to 1500 if you enable IPv6. For the eventing interface, the value can be between 64 and 9000 if you enable IPv4, and 1280 to 9000 if you enable IPv6. If you enable both IPv4 and IPv6, then the minimum is 1280. If you do not enter the *bytes*, you are prompted for a value.
- *interface\_id*—Specifies the interface ID on which to set the MTU. Use the **show network** command to see available interface IDs, for example management0, management1, br1, and eth0, depending on the platform. If you do not specify an interface, then the management interface is used.

**Example:**

```
> configure network mtu 8192 management1
MTU set successfully to 1500 from 8192 for management1
Refreshing Network Config...
NetworkSettings::refreshNetworkConfig MTU value at start 8192

Interface management1 speed is set to '10000baseT/Full'
NetworkSettings::refreshNetworkConfig MTU value at end 8192
>
```

**Step 13**

Configure an HTTP proxy. The device is configured to directly-connect to the internet on ports TCP/443 (HTTPS) and TCP/80 (HTTP). You can use a proxy server, to which you can authenticate via HTTP Digest. After issuing the command, you are prompted for the HTTP proxy address and port, whether proxy authentication is required, and if it is required, the proxy username, proxy password, and confirmation of the proxy password.

**Note**

For proxy password on Firewall Threat Defense, you can use A-Z, a-z, and 0-9 characters only.

**configure network http-proxy**

**Example:**

```
> configure network http-proxy
Manual proxy configuration
Enter HTTP Proxy address: 10.100.10.10
Enter HTTP Proxy Port: 80
```

```
Use Proxy Authentication? (y/n) [n]: Y
Enter Proxy Username: proxyuser
Enter Proxy Password: proxypassword
Confirm Proxy Password: proxypassword
```

**Step 14**

If you change the device management IP address, then see the following tasks for Firewall Management Center connectivity depending on how you identified the Firewall Management Center during initial device setup using the **configure manager add** command (see [Register With a New Management Center, on page 42](#)):

- **IP address—No action.** If you identified the Firewall Management Center using a reachable IP address, then the management connection will be reestablished automatically after several minutes. We recommend that you also change the device IP address shown in Firewall Management Center to keep the information in sync; see [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#). This action can help the connection reestablish faster. **Note:** If you specified an unreachable Firewall Management Center IP address, then you must manually reestablish the connection using [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#).
- **NAT ID only—Manually reestablish the connection.** If you identified the Firewall Management Center using only the NAT ID, then the connection cannot be automatically reestablished. In this case, change the device management IP address in Firewall Management Center according to [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#).

---

### *Modify the Firewall Threat Defense Data Interface Used for Management at the CLI*

If the management connection between the Firewall Threat Defense and the Firewall Management Center was disrupted, and you want to specify a new data interface to replace the old interface, use the Firewall Threat Defense CLI to configure the new interface.

If the management connection is active, then you should make any changes to an existing data interface using the Firewall Management Center (see [Modify the Firewall Threat Defense Data Interface Used for Management in the GUI, on page 96](#)). For initial setup of the data management interface, see the **configure network management-data-interface** command in [Complete the Firewall Threat Defense Initial Configuration Using the CLI, on page 19](#).

For high-availability pairs, perform all CLI steps on both units. Within the Firewall Management Center, perform steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

**Note**

This topic applies to the data interface that you configured for Management, not the dedicated Management interface. If you want to change network settings for the Management interface, see [Modify Firewall Threat Defense Management Interfaces at the CLI, on page 87](#).

For information about the Firewall Threat Defense CLI, see the [Cisco Secure Firewall Threat Defense Command Reference](#).

## Procedure

**Step 1** If you are changing the data management interface to a new interface, move the current interface cable to the new interface.

**Step 2** Connect to the device CLI.

You should use the console port when using these commands. If you are performing initial setup, then you may be disconnected from the Management interface. If you are editing the configuration due to a disrupted management connection, and you have SSH access to the dedicated Management interface, then you can use that SSH connection.

See [Log Into the Command-Line Interface on the Device, on page 11](#).

**Step 3** Log in with the **admin** username and password.

**Step 4** Disable the interface so you can reconfigure its settings.

**configure network management-data-interface disable**

### Note

If you only want to set a new IPv4 address on the same interface and not make any other changes, you can skip this step. Other changes require you to disable the interface first.

### Example:

```
> configure network management-data-interface disable

Configuration updated successfully.!!!
```

```
Configuration disable was successful, please update the default route to point to a gateway
on management interface using the command 'configure network'
```

**Step 5** Configure the new data interface for manager access.

**configure network management-data-interface**

You are then prompted to configure basic network settings for the data interface.

If you change the data management interface to a new interface on the same network, use the same settings as for the previous interface except the interface ID. In addition, for the **Do you wish to clear all the device configuration before applying ? (y/n) [n]:** option, choose **y**. This choice will clear the old data management interface configuration, so that you can successfully reuse the IP address and interface name on the new interface.

```
> configure network management-data-interface
Data interface to use for management: ethernet1/4
Specify a name for the interface [outside]: internet
IP address (manual / dhcp) [dhcp]: manual
IPv4/IPv6 address: 10.10.6.7
Netmask/IPv6 Prefix: 255.255.255.0
Default Gateway: 10.10.6.1
Comma-separated list of DNS servers [none]: 208.67.222.222,208.67.220.220
DDNS server update URL [none]:
Do you wish to clear all the device configuration before applying ? (y/n) [n]: y
```

```
Configuration done with option to allow manager access from any network, if you wish to
```

```
change the manager access network
use the 'client' option in the command 'configure network management-data-interface'.
```

```
Setting IPv4 network configuration.
Network settings changed.
```

```
>
```

**Step 6** (Optional) Limit data interface access to the Firewall Management Center on a specific network.

**configure network management-data-interface client** *ip\_address netmask*

By default, all networks are allowed.

**Step 7** [Update the Hostname or IP Address in the Firewall Management Center, on page 97.](#)

The connection may be reestablished automatically, but disabling and reenabling the connection in the Firewall Management Center will help the connection reestablish faster. Or you may need to update the device IP address in the Firewall Management Center according to the linked procedure.

**Step 8** Check that the management connection was reestablished.

**sftunnel-status-brief**

See the following sample output for a connection that is up, with peer channel and heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Peer channel Channel-A is valid type (CONTROL), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Peer channel Channel-B is valid type (EVENT), using 'eth0', connected to '10.10.17.202' via
'10.10.17.222'
Registration: Completed.
IPv4 Connection to peer '10.10.17.202' Start Time: Wed Jun 10 14:27:12 2020 UTC
Heartbeat Send Time: Mon Jun 15 09:02:08 2020 UTC
Heartbeat Received Time: Mon Jun 15 09:02:16 2020 UTC
```

**Step 9** In the Firewall Management Center, choose **Devices > Device Management**, and click **Edit** (✎). In the **Device > Management** area, click **Refresh** next to **Manager Access - Configuration Details**.

The Firewall Management Center detects the interface and default route configuration changes and blocks deployment to the device. When you change the data interface settings locally on the device, you must reconcile those changes in the Firewall Management Center manually. You can view the discrepancies between the Firewall Management Center and the device on the **Configuration** tab.

**Step 10** Choose **Interfaces**, and make the following changes.

- Remove the IP address and name from the old data management interface and disable manager access for this interface.
- Configure the new data management interface with the new settings (the ones you used at the CLI) and enable manager access for it.

**Step 11** Choose **Routing > Static Route** and change the default route from the old data management interface to the new one.

**Step 12** Return to the **Manager Access - Configuration Details** dialog box, and click **Acknowledge** to remove the deployment block.

The next time you deploy, the Firewall Management Center configuration will overwrite any remaining conflicting settings on the Firewall Threat Defense. It is your responsibility to manually fix the configuration in the Firewall Management Center before you re-deploy.

You will see expected messages of "Config was cleared" and "Manager access changed and acknowledged."

### *Modify the Firewall Threat Defense Data Interface Used for Management in the GUI*

If the management connection is up, but you want to change the IP address of the data interface used for manager access, follow these steps. For example, if you register a device using zero-touch provisioning, then you need to change the IP address to a static address before you can enable high availability.

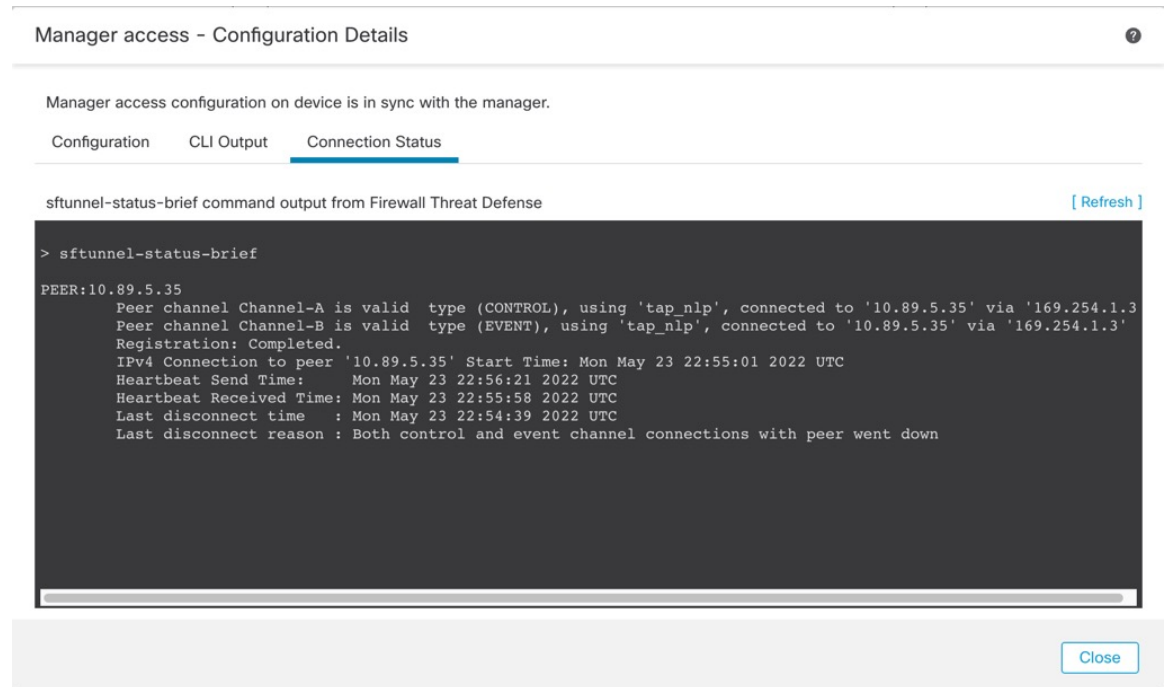

You can alternatively change interface settings at the CLI, but we recommend only using that method if the management connection is down. Any changes you make at the CLI will have to be replicated in the GUI anyway.

#### **Procedure**

- 
- Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) next to the device.
- Step 2** Choose **Interfaces**.
- Step 3** If you want to change the interface used for manager access:
- Remove the IP address and name from the old data management interface and disable manager access for this interface.
  - Configure the new data management interface with the new settings and enable manager access for it.
  - If you use a static IP address, you are reminded to make sure you have a default route. Click **Yes**.
  - Click **OK** to exit the interface.
  - Click **Save** on the **Interfaces** page.
- Step 4** If you only want to change the IP address:
- Change the IP address.
  - For a static IP address, you are reminded to make sure you have a default route. Click **Yes**.
  - Click **OK** to exit the interface.
  - Click **Save** on the **Interfaces** page.
- Step 5** Choose **Routing > Static Route** and add or change the default or static route for the manager access interface.
- Step 6** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).
- The Firewall Management Center will deploy the configuration changes over the current connection. After the deployment, the data interface will have a new IP address, so the management connection will need to be reestablished.
- Step 7** [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#).
- Step 8** Ensure the management connection is reestablished.
- In the **Device > Management** area, click **Manager Access Details: Configuration** and then click **Connection Status**.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

**Figure 52: Connection Status**

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface](#), on page 117.

## Update the Hostname or IP Address in the Firewall Management Center

If you edit the hostname or IP address of a device after you added it to the Firewall Management Center (using the device's CLI, for example), you need to use the procedure below to manually update the hostname or IP address on the managing Firewall Management Center.

To change the device management IP address on the device, see [Modify Firewall Threat Defense Management Interfaces at the CLI](#), on page 87.

If you used only the NAT ID when registering the device, then the IP shows as **NO-IP** on this page, and you do not need to update the IP address/hostname.

If you used zero-touch provisioning to register the device on the outside interface, the hostname is automatically generated along with a matching DDNS configuration; you cannot edit the hostname in this case.

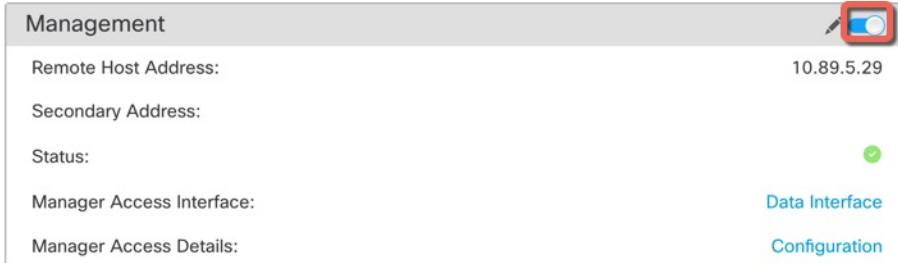

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to modify management options, click **Edit** (✎).

**Step 3** Click **Device**, and view the **Management** area.

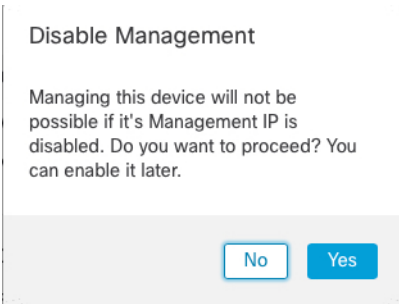

**Step 4** Disable management temporarily by clicking the slider so it is disabled **Slider disabled** (.

*Figure 53: Disable Management*

| Management                |                                                                                     |
|---------------------------|-------------------------------------------------------------------------------------|
| Remote Host Address:      | 10.89.5.29                                                                          |
| Secondary Address:        |                                                                                     |
| Status:                   |  |
| Manager Access Interface: | Data Interface                                                                      |
| Manager Access Details:   | Configuration                                                                       |

You are prompted to proceed with disabling management; click **Yes**.

**Disable Management**

Managing this device will not be possible if it's Management IP is disabled. Do you want to proceed? You can enable it later.

Disabling management blocks the connection between the Firewall Management Center and the device, but does **not** delete the device from the Firewall Management Center.

**Step 5** Edit the **Remote Host Address** IP address and optional **Secondary Address** (when using a redundant data interface) or hostname by clicking **Edit** (.

*Figure 54: Edit Management Address*

| Management                |                                                                                       |
|---------------------------|---------------------------------------------------------------------------------------|
| Remote Host Address:      | 10.89.5.29                                                                            |
| Secondary Address:        |                                                                                       |
| Status:                   |  |
| Manager Access Interface: | Data Interface                                                                        |
| Manager Access Details:   | Configuration                                                                         |

**Step 6** In the **Management** dialog box, modify the name or IP address in the **Remote Host Address** field and the optional **Secondary Address** field, and click **Save**.

For information about using a secondary manager access data interface, see [Configure a Redundant Manager Access Data Interface, on page 81](#).

Figure 55: Management IP Address

**Step 7** Reenable management by clicking the slider so it is enabled **Slider enabled** (  ).

Figure 56: Enable Management Connection

## Change the Firewall Management Center IP Address

If you change the Firewall Management Center IP address or hostname, you should also change the value at the device CLI so the configurations match. Although in most cases, the management connection will be reestablished without changing the Firewall Management Center IP address or hostname on the device, in at least one case, you must perform this task for the connection to be reestablished: when you added the device to the Firewall Management Center and you specified the NAT ID only. Even in other cases, we recommend keeping the Firewall Management Center IP address or hostname up to date for extra network resiliency.

### Procedure

**Step 1** Change the Firewall Management Center IP address.

#### Caution

Be careful when making changes to the Firewall Management Center interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the Firewall Management Center console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.

- Choose **System** (  ) > **Configuration** > **Management Interfaces**.
- In the **Interfaces** area, click **Edit** next to the interface that you want to configure.
- Change the IP address, and click **Save**.

**Step 2** At the Firewall Threat Defense CLI, view the Firewall Management Center identifier.

**show managers**

**Example:**

```
> show managers
Type                : Manager
Host                : 10.10.1.4
Display name        : 10.10.1.4
Identifier           : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration         : Completed
Management type      : Configuration
```

**Step 3** At the Firewall Threat Defense CLI, edit the Firewall Management Center IP address or hostname.

**configure manager edit identifier {hostname {ip\_address | hostname} | displayname display\_name}**

If the Firewall Management Center was originally identified by **DONTRESOLVE** and a NAT ID, you can change the value to a hostname or IP address using this command. You cannot change an IP address or hostname to **DONTRESOLVE**.

The management connection will go down, and then reestablish. You can monitor the state of the connection using the **sftunnel-status** command.

**Example:**

```
> configure manager edit f7ffad78-bf16-11ec-a737-baa2f76ef602 hostname 10.10.5.1
```

## Change Both Firewall Management Center and Threat Defense IP Addresses

You might want to change both Firewall Management Center and Firewall Threat Defense IP addresses if you need to move them to a new network.

### Procedure

**Step 1** Disable the management connection.

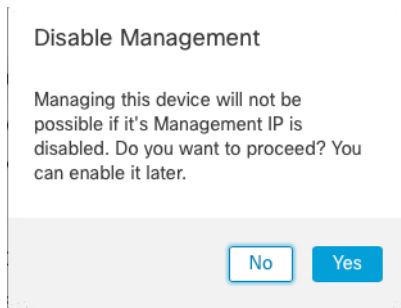

For a high-availability pair or cluster, perform these steps on all units.

- a) Choose **Devices > Device Management**.
- b) Next to the device, click **Edit** (✎).
- c) Click **Device**, and view the **Management** area.
- d) Disable management temporarily by clicking the slider so it is disabled ().

**Figure 57: Disable Management**

| Management                |                |
|---------------------------|----------------|
| Remote Host Address:      | 10.89.5.29     |
| Secondary Address:        |                |
| Status:                   | ✓              |
| Manager Access Interface: | Data Interface |
| Manager Access Details:   | Configuration  |

You are prompted to proceed with disabling management; click **Yes**.

**Disable Management**

Managing this device will not be possible if it's Management IP is disabled. Do you want to proceed? You can enable it later.

**Step 2** Change the device IP address in the Firewall Management Center to the new device IP address.

You will change the IP address on the device later.

For a high-availability pair or cluster, perform these steps on all units.

- Edit the **Remote Host Address** IP address and optional **Secondary Address** (when using a redundant data interface) or hostname by clicking **Edit** (✎).

**Figure 58: Edit Management Address**

| Management                |                |
|---------------------------|----------------|
| Remote Host Address:      | 10.89.5.29     |
| Secondary Address:        |                |
| Status:                   | ✓              |
| Manager Access Interface: | Data Interface |
| Manager Access Details:   | Configuration  |

- In the **Management** dialog box, modify the name or IP address in the **Remote Host Address** field and the optional **Secondary Address** field, and click **Save**.

Figure 59: Management IP Address

Management

Remote Host Address: 10.89.5.29

Secondary Address: 10.99.11.6

Cancel Save

**Step 3** Change the Firewall Management Center IP address.

**Caution**

Be careful when making changes to the Firewall Management Center interface to which you are connected; if you cannot re-connect because of a configuration error, you need to access the Firewall Management Center console port to re-configure the network settings in the Linux shell. You must contact Cisco TAC to guide you in this operation.

- Choose **System** (⚙) > **Configuration** > **Management Interfaces**.
- In the **Interfaces** area, click **Edit** next to the interface that you want to configure.
- Change the IP address, and click **Save**.

**Step 4** Change the manager IP address on the device.

For a high-availability pair or cluster, perform these steps on all units.

- At the Firewall Threat Defense CLI, view the Firewall Management Center identifier.

**show managers**

**Example:**

```
> show managers
Type                : Manager
Host                : 10.10.1.4
Display name        : 10.10.1.4
Identifier           : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration         : Completed
Management type      : Configuration
```

- Edit the Firewall Management Center IP address or hostname.

**configure manager edit identifier {hostname {ip\_address | hostname} | displayname display\_name}**

If the Firewall Management Center was originally identified by **DONTRESOLVE** and a NAT ID, you can change the value to a hostname or IP address using this command. You cannot change an IP address or hostname to **DONTRESOLVE**.

**Example:**

```
> configure manager edit f7ffad78-bf16-11ec-a737-baa2f76ef602 hostname 10.10.5.1
```

**Step 5** Change the IP address of the manager access interface at the console port.

For a high-availability pair or cluster, perform these steps on all units.

If you use the dedicated Management interface:

**configure network ipv4**

**configure network ipv6**

If you use the dedicated Management interface:

**configure network management-data-interface disable**

**configure network management-data-interface**

**Step 6** Reenable management by clicking the slider so it is enabled (  ).

For a high-availability pair or cluster, perform these steps on all units.

*Figure 60: Enable Management Connection*

**Step 7** (If using a data interface for manager access) Refresh the data interface settings in the Firewall Management Center.

For a high-availability pair, perform this step on both units.

- Choose **Devices > Device Management**, and click **Manager Access - Configuration Details**, and then click **Refresh**.
- Choose **Devices > Device Management**, and click the **Interfaces** tab and set the IP address to match the new address.
- Return to the **Manager Access - Configuration Details** dialog box, and click **Acknowledge** to remove the deployment block.

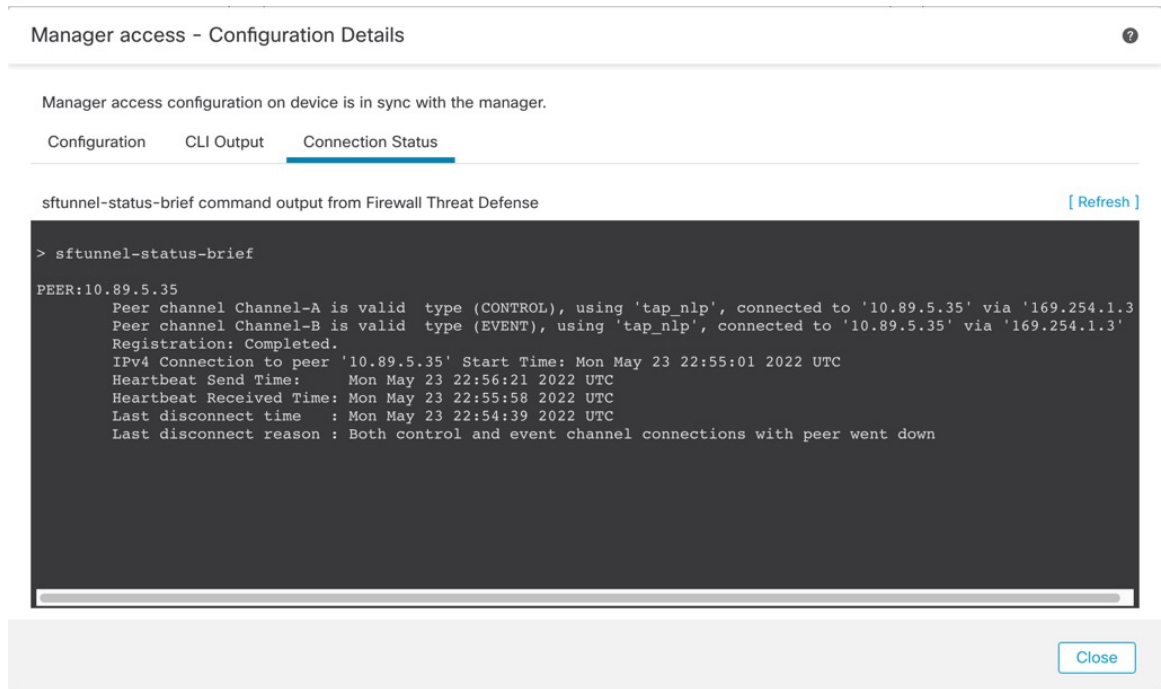

**Step 8** Ensure the management connection is reestablished.

In the Firewall Management Center, check the management connection status. Navigate to the **Devices > Device Management**, and click **Management** section under the **Device** tab. Then, click **Manager Access - Configuration Details** to view the **Connection Status** page.

At the Firewall Threat Defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

Figure 61: Connection Status

- Step 9** (For a high-availability Firewall Management Center pair) Repeat configuration changes on the secondary Firewall Management Center.
- Change the secondary Firewall Management Center IP address.
  - Specify the new peer addresses on both units.
  - Make the secondary unit the active unit.
  - Disable the device management connection.
  - Change the device IP address in the Firewall Management Center.
  - Reenable the management connection.

## Change the Manager Access Interface

After you register the device, you can change the manager access interface, between the Management interface a data interface.

### Change the Manager Access Interface from Management to Data

You can manage the Firewall Threat Defense from either the dedicated Management interface or from a data interface. If you want to change the manager access interface after you added the device to the Firewall Management Center, follow these steps to migrate from the Management interface to a data interface. To migrate the other direction, see [Change the Manager Access Interface from Data to Management, on page 108](#).

Initiating the manager access migration from Management to data causes the Firewall Management Center to apply a block on deployment to the Firewall Threat Defense. To remove the block, enable manager access on the data interface.

See the following steps to enable manager access on a data interface and also configure other required settings.

### Before you begin

For high-availability pairs, unless stated otherwise, perform all steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

## Procedure

### Step 1

Initiate the interface migration.

- a) On the **Devices > Device Management** page, click **Edit** (✎) for the device. Click **Device**, and in the **Management** area, click the **Manager Access Interface** link.

The **Manager Access Interface** field shows the current Management interface. When you click the link, choose the new interface type, **Data Interface**, in the **Manage device by** drop-down list.

**Figure 62: Manager Access Interface**

Manager Access Interface

This is an advanced setting and need to be configured only if needed.  
See the [online help](#) for detailed steps.

Manage device by

Data Interface

Switching the manager access interface from Management to Data interface causes the deployment to be blocked. To unblock the deploy, pick a data interface and enable it for manager Access. See the [online help](#) for detailed steps.

Close Save

- b) Click **OK** and then **Close**.

You must now complete the remaining steps in this procedure to enable manager access on the data interface. The **Management** area now shows **Manager Access Interface: Data Interface**, and **Manager Access Details: Configuration**.

Figure 63: Manager Access

| Management                |                                |
|---------------------------|--------------------------------|
| Remote Host Address:      | 10.10.1.12                     |
| Secondary Address:        |                                |
| Status:                   |                                |
| Manager Access Interface: | <a href="#">Data Interface</a> |
| Manager Access Details:   | <a href="#">Configuration</a>  |

If you click **Configuration**, the **Manager Access - Configuration Details** dialog box opens. The **Manager Access Mode** shows a Deploy pending state.

- Step 2** Enable manager access on the data interface(s). Click **Interfaces**, click **Edit** (✎) for the interface, and then click **Manager Access**.
- Check **Enable management access** and click **OK**. By default, all networks are allowed, but you can limit access as long as the Firewall Management Center address is allowed.
- If the manager access interface uses a static IP address, you are reminded to configure routing for it.
- Click **Save** on the **Interfaces** page. See [Configure Routed Mode Interfaces, on page 738](#) for more information about interface settings. You can enable manager access on one routed data interface, plus an optional secondary interface. Make sure these interfaces are fully configured with a name and IP address and that they are enabled.
- If you use a secondary interface for redundancy, see [Configure a Redundant Manager Access Data Interface, on page 81](#) for additional required configuration.
- Step 3** (Optional) If you use DHCP for the interface, enable the web type DDNS method on the **DDNS** page. Navigate to **Devices > Device Management**, and then click **DDNS** under the **DHCP** tab.
- See [Configure Dynamic DNS, on page 802](#). DDNS ensures the Firewall Management Center can reach the Firewall Threat Defense at its Fully-Qualified Domain Name (FQDN) if the FTD's IP address changes.
- Step 4** Make sure the Firewall Threat Defense can route to the Firewall Management Center through the data interface; add a static route if necessary on the Static Route page. Navigate to **Devices > Device Management** and then click **Static Route** under the **Routing** tab.
- See [Add a Static Route, on page 1040](#).
- Step 5** (Optional) Configure DNS in a Platform Settings policy, and apply it to this device at **Devices > Platform Settings > DNS**.
- See [DNS, on page 831](#). DNS is required if you use DDNS. You may also use DNS for FQDNs in your security policies.
- Step 6** (Optional) Enable SSH for the data interface in a Platform Settings policy, and apply it to this device at **Devices > Device Management** page. Click **Edit** (✎) for the device and then click **SSH Access**.
- See [SSH Access, on page 845](#). SSH is not enabled by default on the data interfaces, so if you want to manage the Firewall Threat Defense using SSH, you need to explicitly allow it.
- Step 7** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

You will see a validation error to confirm that you are changing the manager access interface. Check **Ignore warnings** and deploy again.

The Firewall Management Center will deploy the configuration changes over the current Management interface. After the deployment, the data interface is now ready for use, but the original management connection to Management is still active.

- Step 8** At the Firewall Threat Defense CLI (preferably from the console port), set the Management interface to use a static IP address and set the gateway to use the data interfaces. For high availability, perform this step on both units.

**configure network {ipv4 | ipv6} manual ip\_address netmask data-interfaces**

- *ip\_address netmask*—Although you do not plan to use the Management interface, you must set a static IP address, for example, a private address so that you can set the gateway to **data-interfaces** (see the next bullet). You cannot use DHCP because the default route, which must be **data-interfaces**, might be overwritten with one received from the DHCP server.
- **data-interfaces**—This setting forwards management traffic over the backplane so it can be routed through the manager access data interface.

We recommend that you use the console port instead of an SSH connection because when you change the Management interface network settings, your SSH session will be disconnected.

- Step 9** If necessary, re-cable the Firewall Threat Defense so it can reach the Firewall Management Center on the data interface. For high availability, perform this step on both units.

- Step 10** In the Firewall Management Center, disable the management connection, update the **Remote Host Address** IP address and optional **Secondary Address** for the Firewall Threat Defense in the **Devices > Device Management** page in the **Management** area under the **Device** tab, and reen able the connection.

See [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#). If you used the Firewall Threat Defense hostname or just the NAT ID when you added the Firewall Threat Defense to the Firewall Management Center, you do not need to update the value; however, you need to disable and reen able the management connection to restart the connection.

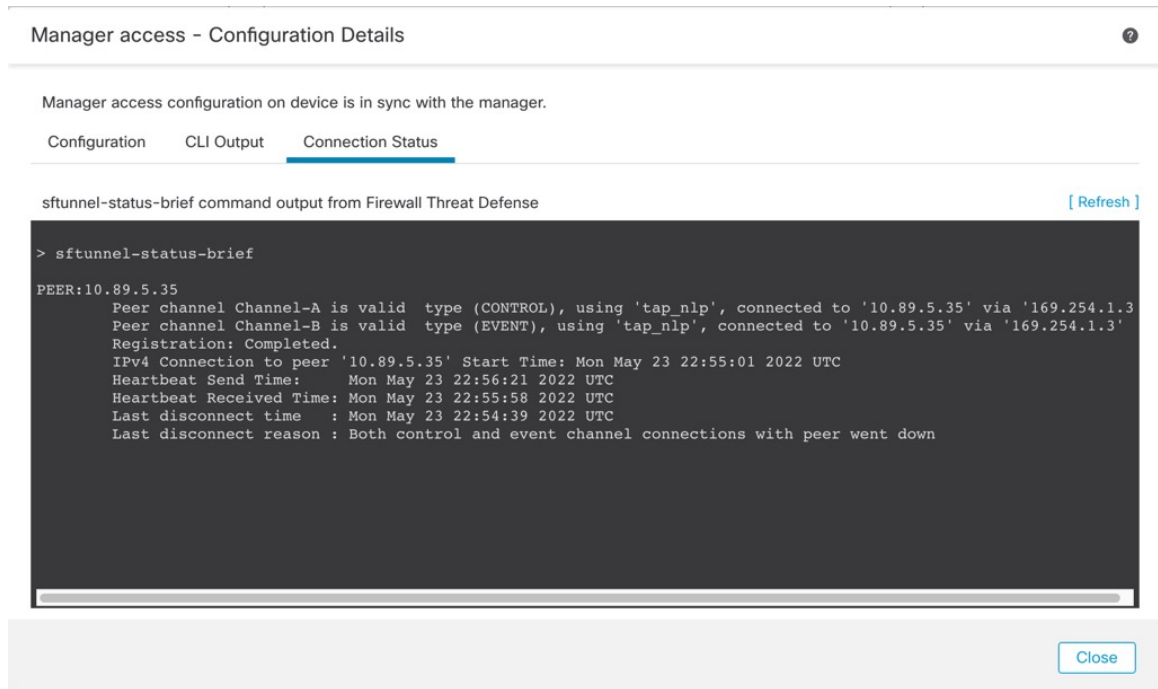

- Step 11** Ensure the management connection is reestablished.

In the **Devices > Device Management** page, click **Manager Access Details: Configuration** and then click **Connection Status**.

Alternatively, you can check at the Firewall Threat Defense CLI. Enter the **sftunnel-status-brief** command to view the management connection status.

The following status shows a successful connection for a data interface, showing the internal "tap\_nlp" interface.

Figure 64: Connection Status

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 117](#).

## Change the Manager Access Interface from Data to Management

You can manage the Firewall Threat Defense from either the dedicated Management interface or from a data interface. If you want to change the manager access interface after you added the device to the Firewall Management Center, follow these steps to migrate from a data interface to the Management interface. To migrate the other direction, see [Change the Manager Access Interface from Management to Data, on page 104](#).

Initiating the manager access migration from data to Management causes the Firewall Management Center to apply a block on deployment to the Firewall Threat Defense. You must disable manager access on the data interface to remove the block.

See the following steps to disable manager access on a data interface, and also configure other required settings.

### Before you begin

For high-availability pairs, unless stated otherwise, perform all steps only on the active unit. Once the configuration changes are deployed, the standby unit synchronizes configuration and other state information from the active unit.

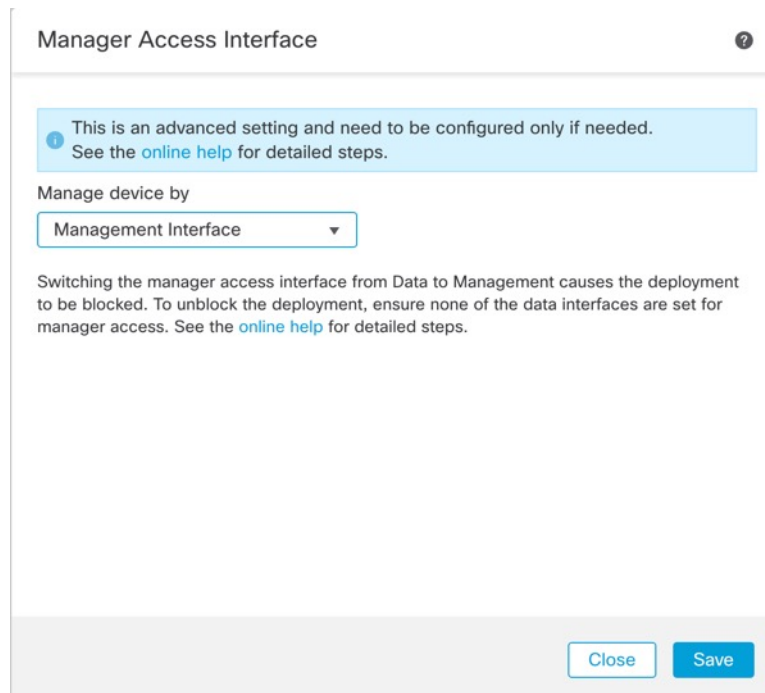

## Procedure

**Step 1** Initiate the interface migration.

- a) On the **Devices > Device Management** page, click **Edit** (✎) for the device. Click **Device**, and in the **Management** area, click the link for **Manager Access Interface**.

The **Manager Access Interface** field shows the current management interface as data. When you click the link, choose the new interface type, **Management Interface**, in the **Manage device by** drop-down list.

**Figure 65: Manager Access Interface**

The screenshot shows a configuration window titled "Manager Access Interface" with a help icon in the top right. A light blue information box contains the text: "This is an advanced setting and need to be configured only if needed. See the [online help](#) for detailed steps." Below this, the "Manage device by" section features a dropdown menu currently set to "Management Interface". A warning paragraph states: "Switching the manager access interface from Data to Management causes the deployment to be blocked. To unblock the deployment, ensure none of the data interfaces are set for manager access. See the [online help](#) for detailed steps." At the bottom right, there are "Close" and "Save" buttons.

- b) Click **Save**.

Click **OK** and then **Close**.

You must now complete the remaining steps in this procedure to enable manager access on the Management interface. The **Management** area now shows the **Manager Access Interface: Management Interface**.

**Figure 66: Manager Access**

The screenshot shows the "Management" configuration page with a toggle switch in the top right. The fields are: "Remote Host Address:" with the value "10.10.1.12", "Secondary Address:" (empty), "Status:" with a green checkmark icon, and "Manager Access Interface:" with the value "Management Interface" in blue text.

- Step 2** Disable manager access on the data interface(s). Click **Interfaces**, click **Edit** (✎) for the interface, and then click **Manager Access**.

Uncheck **Enable management access** and click **OK**. Click **Save** on the **Interfaces** page. This step removes the block on deployment.

- Step 3** If you have not already done so, configure DNS settings for the data interface in a Platform Setting policy, and apply it to this device at **Devices > Device Management** page. Click **Edit** (✎) for the device and then click **DNS**.

See [DNS, on page 831](#). The Firewall Management Center deployment that disables manager access on the data interface will remove any local DNS configuration. If that DNS server is used in any security policy, such as an FQDN in an Access Rule, then you must re-apply the DNS configuration using the Firewall Management Center.

- Step 4** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

The Firewall Management Center will deploy the configuration changes over the current data interface.

- Step 5** If necessary, re-cable the Firewall Threat Defense so it can reach the Firewall Management Center on the Management interface. For High Availability, perform this step on both units.

- Step 6** At the Firewall Threat Defense CLI, configure the Management interface IP address and gateway using a static IP address or DHCP. For high availability, perform this step on both units.

When you originally configured the data interface for manager access, the Management gateway was set to data-interfaces, which forwarded management traffic over the backplane so it could be routed through the manager access data interface. You now need to set an IP address for the gateway on the management network.

**Static IP address:**

```
configure network {ipv4 | ipv6} manual ip_address netmask gateway_ip
```

**DHCP:**

```
configure network {ipv4 | ipv6} dhcp
```

- Step 7** In the Firewall Management Center, disable the management connection, update the **Remote Host Address** IP address and optional **Secondary Address** for the Firewall Threat Defense in the **Devices > Device Management, Management** section under **Device** tab, and reenale the connection.

See [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#). If you used the Firewall Threat Defense hostname or just the NAT ID when you added the Firewall Threat Defense to the Firewall Management Center, you do not need to update the value; however, you need to disable and reenale the management connection to restart the connection.

- Step 8** Ensure the management connection is reestablished.

In the Firewall Management Center, check the management connection status on the **Devices > Device Management, Management** section under **Device** tab, **Status** field or view notifications in the Firewall Management Center.

At the Firewall Threat Defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 117](#).

## View Manager Access Details for Data Interface Management

When you use a data interface for Firewall Management Center management instead of using the dedicated Management interface, you must be careful about changing the interface and network settings for the device in the Firewall Management Center so you do not disrupt the connection. You can also change the data interface settings locally on the device, which requires you to reconcile those changes in the Firewall Management Center manually. The **Devices > Device Management > Device > Management > Manager Access - Configuration Details** dialog box helps you resolve any discrepancies between the Firewall Management Center and the Firewall Threat Defense local configuration.

Normally, you configure the manager access data interface as part of initial Firewall Threat Defense setup before you add the Firewall Threat Defense to the Firewall Management Center. When you add the Firewall Threat Defense to the Firewall Management Center, the Firewall Management Center discovers and maintains the interface configuration, including the following settings: interface name and IP address, static route to the gateway, DNS servers, and DDNS server. For the DNS server, the configuration is maintained locally if it is discovered during registration, but it is not added to the Platform Settings policy in Firewall Management Center.

After you add the Firewall Threat Defense to the Firewall Management Center, if you change the data interface settings on the Firewall Threat Defense locally using the **configure network management-data-interface** command, then the Firewall Management Center detects the configuration changes, and blocks deployment to the Firewall Threat Defense. The Firewall Management Center detects the configuration changes using one of the following methods:

- Deploy to the Firewall Threat Defense. Before the Firewall Management Center deploys, it will detect the configuration differences and stop the deployment.
- The **Sync** button in the **Interfaces** page.
- The **Refresh** button on the **Manager Access - Configuration Details** dialog box.

To remove the block, you must go to the **Manager Access - Configuration Details** dialog box and click **Acknowledge**. The next time you deploy, the Firewall Management Center configuration will overwrite any remaining conflicting settings on the Firewall Threat Defense. It is your responsibility to manually fix the configuration in the Firewall Management Center before you re-deploy.

See the following pages on this dialog box.

### Configuration

View the configuration comparison of the manager access data interface on the Firewall Management Center and the Firewall Threat Defense.

The following example shows the configuration details of the Firewall Threat Defense where the **configure network management-data-interface** command was entered on the Firewall Threat Defense. The pink highlights show that if you **Acknowledge** the differences but do not match the configuration in the Firewall Management Center, then the Firewall Threat Defense configuration will be removed. The blue highlights show configurations that will be modified on the Firewall Threat Defense. The green highlights show configurations that will be added to the Firewall Threat Defense.

## Manager access - Configuration Details

Manager access configuration on device have been updated outside of Manager. Review the differences and update Manager values accordingly.

Configuration CLI Output Connection Status

## Troubleshooting the Management Connection

.

### Manually Roll Back the Configuration if the Firewall Management Center Loses Connectivity

If you use a data interface on the Firewall Threat Defense for manager access, and you deploy a configuration change from the Firewall Management Center that affects the network connectivity, you can roll back the configuration on the Firewall Threat Defense to the last-deployed configuration so you can restore management connectivity. You can then adjust the configuration settings in Firewall Management Center so that the network connectivity is maintained, and re-deploy. You can use the rollback feature even if you do not lose connectivity; it is not limited to this troubleshooting situation.

Alternatively, you can enable auto rollback of the configuration if you lose connectivity after a deployment; see [Edit Deployment Settings, on page 127](#).

See the following guidelines:

- Only the previous deployment is available locally on the Firewall Threat Defense; you cannot roll back to any earlier deployments.
- Rollback is supported for high availability but not supported for clustering deployments.
- The rollback only affects configurations that you can set in the Firewall Management Center. For example, the rollback does not affect any local configuration related to the dedicated Management interface, which you can only configure at the Firewall Threat Defense CLI. Note that if you changed data interface settings after the last Firewall Management Center deployment using the **configure network management-data-interface** command, and then you use the rollback command, those settings will not be preserved; they will roll back to the last-deployed Firewall Management Center settings.
- UCAPL/CC mode cannot be rolled back.

- Out-of-band SCEP certificate data that was updated during the previous deployment cannot be rolled back.
- During the rollback, connections will drop because the current configuration will be cleared.

## Procedure

**Step 1** At the Firewall Threat Defense CLI, roll back to the previous configuration.

### **configure policy rollback**

After the rollback, the Firewall Threat Defense notifies the Firewall Management Center that the rollback was completed successfully. In the Firewall Management Center, the deployment screen will show a banner stating that the configuration was rolled back.

#### **Note**

If the rollback failed and the Firewall Management Center management is restored, refer to <https://www.cisco.com/c/en/us/support/docs/security/firepower-ngfw-virtual/215258-troubleshooting-firepower-threat-defense.html> for common deployment problems. In some cases, the rollback can fail after the Firewall Management Center management access is restored; in this case, you can resolve the Firewall Management Center configuration issues, and redeploy from the Firewall Management Center.

#### **Example:**

For the Firewall Threat Defense that uses a data interface for manager access:

```
> configure policy rollback
```

```
The last deployment to this FTD was on June 1, 2020 and its status was Successful.
Do you want to continue [Y/N]?
```

```
Y
```

```
Rolling back complete configuration on the FTD. This will take time.
```

```
.....
```

```
Policy rollback was successful on the FTD.
```

```
Configuration has been reverted back to transaction id:
```

```
Following is the rollback summary:
```

```
.....
```

```
.....
```

```
>
```

**Step 2** Check that the management connection was reestablished.

In Firewall Management Center, check the management connection status on the Connection Status page. Navigate to **Devices > Device Management** and then navigate to **Management** area under the **Devices** tab. Then in the **Manager Access - Configuration Details** screen, click **Connection Status**.

At the Firewall Threat Defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 117](#).

## Troubleshoot Management Connectivity on a Data Interface

When you use a data interface for manager access instead of using the dedicated Management interface, you must be careful about changing the interface and network settings for the Firewall Threat Defense in the Firewall Management Center so you do not disrupt the connection. If you change the management interface type after you add the Firewall Threat Defense to the Firewall Management Center (from data to Management, or from Management to data), if the interfaces and network settings are not configured correctly, you can lose management connectivity.

This topic helps you troubleshoot the loss of management connectivity.

### View management connection status

In the Firewall Management Center, check the management connection status on the **Devices > Device Management** page.

At the Firewall Threat Defense CLI, enter the **sftunnel-status-brief** command to view the management connection status. You can also use **sftunnel-status** to view more complete information.

See the following sample output for a connection that is down; there is no peer channel "connected to" information, nor heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Registration: Completed.
Connection to peer '10.10.17.202' Attempted at Mon Jun 15 09:21:57 2020 UTC
Last disconnect time : Mon Jun 15 09:19:09 2020 UTC
Last disconnect reason : Both control and event channel connections with peer went down
```

See the following sample output for a connection that is up, with peer channel and heartbeat information shown:

```
> sftunnel-status-brief
PEER:10.10.17.202
Peer channel Channel-A is valid type (CONTROL), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Peer channel Channel-B is valid type (EVENT), using 'eth0', connected to '10.10.17.202'
via '10.10.17.222'
Registration: Completed.
IPv4 Connection to peer '10.10.17.202' Start Time: Wed Jun 10 14:27:12 2020 UTC
Heartbeat Send Time: Mon Jun 15 09:02:08 2020 UTC
Heartbeat Received Time: Mon Jun 15 09:02:16 2020 UTC
```

### View the Firewall Threat Defense network information

At the Firewall Threat Defense CLI, view the Management and manager access data interface network settings:

#### show network

```
> show network
===== [ System Information ] =====
Hostname           : FTD-4

### Check that the Firewall Threat Defense registered with the Firewall Management Center

At the Firewall Threat Defense CLI, check that the Firewall Management Center registration was completed. Note that this command will not show the *current* status of the management connection.

#### show managers

```

> show managers
Type                : Manager
Host                : 10.10.1.4
Display name        : 10.10.1.4
Identifier           : f7ffad78-bf16-11ec-a737-baa2f76ef602
Registration         : Completed
Management type     : Configuration

```

### Ping the Firewall Management Center

At the Firewall Threat Defense CLI, use the following command to ping the Firewall Management Center from the data interfaces:

**ping *fmc\_ip***

At the Firewall Threat Defense CLI, use the following command to ping the Firewall Management Center from the Management interface, which should route over the backplane to the data interfaces:

**ping system *fmc\_ip*****Capture packets on the Firewall Threat Defense internal interface**

At the Firewall Threat Defense CLI, capture packets on the internal backplane interface (nlp\_int\_tap) to see if management packets are being sent:

**capture *name* interface nlp\_int\_tap trace detail match ip any any****show capture *name* trace detail****Check the internal interface status, statistics, and packet count**

At the Firewall Threat Defense CLI, see information about the internal backplane interface, nlp\_int\_tap:

**show interface detail**

```
> show interface detail
[...]
Interface Internal-Data0/1 "nlp_int_tap", is up, line protocol is up
  Hardware is en_vtun rev00, BW Unknown Speed-Capability, DLY 1000 usec
  (Full-duplex), (1000 Mbps)
  Input flow control is unsupported, output flow control is unsupported
  MAC address 0000.0100.0001, MTU 1500
  IP address 169.254.1.1, subnet mask 255.255.255.248
  37 packets input, 2822 bytes, 0 no buffer
  Received 0 broadcasts, 0 runts, 0 giants
  0 input errors, 0 CRC, 0 frame, 0 overrun, 0 ignored, 0 abort
  0 pause input, 0 resume input
  0 L2 decode drops
  5 packets output, 370 bytes, 0 underruns
  0 pause output, 0 resume output
  0 output errors, 0 collisions, 0 interface resets
  0 late collisions, 0 deferred
  0 input reset drops, 0 output reset drops
  input queue (blocks free curr/low): hardware (0/0)
  output queue (blocks free curr/low): hardware (0/0)
  Traffic Statistics for "nlp_int_tap":
  37 packets input, 2304 bytes
  5 packets output, 300 bytes
  37 packets dropped
    1 minute input rate 0 pkts/sec,  0 bytes/sec
    1 minute output rate 0 pkts/sec,  0 bytes/sec
    1 minute drop rate, 0 pkts/sec
    5 minute input rate 0 pkts/sec,  0 bytes/sec
    5 minute output rate 0 pkts/sec,  0 bytes/sec
    5 minute drop rate, 0 pkts/sec
  Control Point Interface States:
  Interface number is 14
  Interface config status is active
  Interface state is active
```

**Check routing and NAT**

At the Firewall Threat Defense CLI, check that the default route (S\*) was added and that internal NAT rules exist for the Management interface (nlp\_int\_tap).

**show route**

```
> show route
```

```
Codes: L - local, C - connected, S - static, R - RIP, M - mobile, B - BGP
       D - EIGRP, EX - EIGRP external, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2, V - VPN
       i - IS-IS, su - IS-IS summary, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, * - candidate default, U - per-user static route
       o - ODR, P - periodic downloaded static route, + - replicated route
       SI - Static InterVRF

Gateway of last resort is 10.89.5.1 to network 0.0.0.0
```

```
S*      0.0.0.0 0.0.0.0 [1/0] via 10.89.5.1, outside
C       10.89.5.0 255.255.255.192 is directly connected, outside
L       10.89.5.29 255.255.255.255 is directly connected, outside

>
```

### show nat

```
> show nat
```

```
Auto NAT Policies (Section 2)
1 (nlp_int_tap) to (outside) source static nlp_server_0_sftunnel_intf3 interface service
  tcp 8305 8305
  translate_hits = 0, untranslate_hits = 6
2 (nlp_int_tap) to (outside) source static nlp_server_0_ssh_intf3 interface service
  tcp ssh ssh
  translate_hits = 0, untranslate_hits = 73
3 (nlp_int_tap) to (outside) source static nlp_server_0_sftunnel_ipv6_intf3 interface
  ipv6 service tcp 8305 8305
  translate_hits = 0, untranslate_hits = 0
4 (nlp_int_tap) to (outside) source dynamic nlp_client_0_intf3 interface
  translate_hits = 174, untranslate_hits = 0
5 (nlp_int_tap) to (outside) source dynamic nlp_client_0_ipv6_intf3 interface ipv6
  translate_hits = 0, untranslate_hits = 0

>
```

### Check other settings

See the following commands to check that all other settings are present. You can also see many of these commands on the Firewall Management Center's **Devices > Device Management** page.

#### show running-config sftunnel

```
> show running-config sftunnel
sftunnel interface outside
sftunnel port 8305
```

#### show running-config ip-client

```
> show running-config ip-client
ip-client outside
```

#### show conn address fmc\_ip

```
> show conn address 10.89.5.35
5 in use, 16 most used
Inspect Snort:
```

```

preserve-connection: 0 enabled, 0 in effect, 0 most enabled, 0 most in effect

TCP nlp_int_tap 10.89.5.29(169.254.1.2):51231 outside 10.89.5.35:8305, idle 0:00:04,
bytes 86684, flags UxIO
TCP nlp_int_tap 10.89.5.29(169.254.1.2):8305 outside 10.89.5.35:52019, idle 0:00:02,
bytes 1630834, flags UIO
>

```

### Check for a successful DDNS update

At the Firewall Threat Defense CLI, check for a successful DDNS update:

#### debug ddns

```

> debug ddns
DDNS update request = /v3/update?hostname=domain.example.org&myip=209.165.200.225
Successfully updated the DDNS sever with current IP addresses
DDNS: Another update completed, outstanding = 0
DDNS: IDB SB total = 0

```

If the update failed, use the **debug http** and **debug ssl** commands. For certificate validation failures, check that the root certificates are installed on the device:

#### show crypto ca certificates *trustpoint\_name*

To check the DDNS operation:

#### show ddns update interface *fmc\_access\_ifc\_name*

```

> show ddns update interface outside

Dynamic DNS Update on outside:
  Update Method Name Update Destination
  RBD_DDNS not available

Last Update attempted on 04:11:58.083 UTC Thu Jun 11 2020
Status : Success
FQDN : domain.example.org
IP addresses : 209.165.200.225

```

### Check Firewall Management Center log files

See <https://cisco.com/go/fmc-reg-error>.

## View Inventory Details

The **Inventory Details** section of the **Device** page shows chassis details such as the CPU and memory.

**Figure 70: Inventory Details**

| Inventory Details  |                             |
|-------------------------------------------------------------------------------------------------------|-----------------------------|
| CPU Type:                                                                                             | CPU Xeon E5 series 2300 MHz |
| CPU Cores:                                                                                            | 1 CPU (4 cores)             |
| Memory:                                                                                               | 8192 MB RAM                 |
| Storage:                                                                                              | N/A                         |
| Chassis URL:                                                                                          | N/A                         |
| Chassis Serial Number:                                                                                | N/A                         |
| Chassis Module Number:                                                                                | N/A                         |
| Chassis Module Serial Number:                                                                         | N/A                         |

To update information, click **Refresh** .

## Edit Applied Policies

The **Applied Policies** section of the **Device** page displays the following policies applied to your firewall:

**Figure 71: Applied Policies**

| Applied Policies  |                                                                                                                         |
|--------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| Access Control Policy:                                                                                 | <a href="#">Initial AC Policy</a>  |
| Prefilter Policy:                                                                                      | <a href="#">Default Prefilter Policy</a>                                                                                |
| SSL Policy:                                                                                            |                                                                                                                         |
| DNS Policy:                                                                                            | <a href="#">Default DNS Policy</a>                                                                                      |
| Identity Policy:                                                                                       |                                                                                                                         |
| NAT Policy:                                                                                            |                                                                                                                         |
| Platform Settings Policy:                                                                              |                                                                                                                         |
| QoS Policy:                                                                                            |                                                                                                                         |
| FlexConfig Policy:                                                                                     |                                                                                                                         |

For policies with links, you can click the link to view the policy.

For the Access Control Policy, view the **Access Policy Information for Troubleshooting** dialog box by clicking the **Exclamation**  icon. This dialog box shows how access rules are expanded into access control entries (ACEs).

**Figure 72: Access Policy Information for Troubleshooting**

You can assign policies to an individual device from the **Device Management** page.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to assign policies, click **Edit** (✎).
- Step 3** Click **Device**.
- Step 4** In the **Applied Policies** section, click **Edit** (✎).

**Figure 73: Policy Assignments**

Policy Assignments

Access Control Policy: Initial AC Policy

NAT Policy: None

Platform Settings Policy: None

QoS Policy: None

FlexConfig Policy: None

Cancel Save

- Step 5** For each policy type, choose a policy from the drop-down menu. Only existing policies are listed.

**Step 6** Click **Save**.

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Edit Advanced Settings

The **Advanced Settings** section of the **Device** page displays a table of advanced configuration settings, as described below. You can edit any of these settings.

**Table 6: Advanced Section Table Fields**

| Field                         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

If you select this option, also select the <b>Object Group Search</b> option to reduce memory usage on the device.</p>                                                                                                                                                                                                                                                                                                                                                  |

The following topics explain how to edit the advanced device settings.

**Note** For information about the Transfer Packets setting, see [Edit General Settings, on page 67](#).

## Configure Automatic Application Bypass

Automatic Application Bypass (AAB) allows packets to bypass detection if Snort is down or, for a Classic device, if a packet takes too long to process. AAB causes Snort to restart within ten minutes of the failure, and generates troubleshooting data that can be analyzed to investigate the cause of the Snort failure.

**Caution** AAB activation partially restarts the Snort process, which temporarily interrupts the inspection of a few packets. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information.

See the following behavior:

**Firewall Threat Defense Behavior:** If Snort is down, then AAB is triggered after the specified timer duration. If Snort is up, then AAB is never triggered, even if packet processing exceeds the configured timer.

**Classic Device Behavior:** AAB limits the time allowed to process packets through an interface. You balance packet processing delays with your network's tolerance for packet latency.

The feature functions with any deployment; however, it is most valuable in inline deployments.

Typically, you use Rule Latency Thresholding in the intrusion policy to fast-path packets after the latency threshold value is exceeded. Rule Latency Thresholding does not shut down the engine or generate troubleshooting data.

If detection is bypassed, the device generates a health monitoring alert.

By default the AAB is disabled; to enable AAB follow the steps described.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to edit advanced device settings, click **Edit** (✎).
- Step 3** Click **Device**, then click **Edit** (✎) in the **Advanced Settings** section.
- Step 4** Check **Automatic Application Bypass**.
- Step 5** Enter a **Bypass Threshold** from 250 ms to 60,000 ms. The default setting is 3000 milliseconds (ms).
- Step 6** Click **Save**.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Configure Object Group Search

While operating, the Firewall Threat Defense device expands access control rules into multiple access control list entries based on the contents of any network or interface objects used in the access rule. You can reduce the memory required to search access control rules by enabling object group search. With object group search enabled, the system does not expand network or interface objects, but instead searches access rules for matches

based on those group definitions. Object group search does not impact how your access rules are defined or how they appear in Firewall Management Center. It impacts only how the device interprets and processes them while matching connections to access control rules.

Enabling object group search reduces memory requirements for access control policies that include network or interface objects. However, it is important to note that object group search might also decrease rule lookup performance and thus increase CPU utilization. You should balance the CPU impact against the reduced memory requirements for your specific access control policy. In most cases, enabling object group search provides a net operational improvement.

By default, the object group search is enabled for the threat defense devices that are added for the first time in the Firewall Management Center. In the case of upgraded devices, if the device is configured with disabled object group search, then you need to manually enable it. You can enable it on one device at a time; you cannot enable it globally. We recommend that you enable it on any device to which you deploy access rules that use network or interface objects.

**Note** If you enable object group search and then configure and operate the device for a while, be aware that subsequently disabling the feature might lead to undesirable results. When you disable object group search, your existing access control rules will be expanded in the device's running configuration. If the expansion requires more memory than is available on the device, your device can be left in an inconsistent state and you might see a performance impact. If your device is operating normally, you should not disable object group search once you have enabled it.

### Before you begin

- Model Support—Threat Defense
- We recommend that you also enable transactional commit on each device. From the device CLI, enter the **asp rule-engine transactional-commit access-group** command.
- Changing this setting can be disruptive to system operation while the device recompiles the ACLs. We recommend that you change this setting during a maintenance window.
- You can use FlexConfig to configure the **object-group-search threshold** command to enable a threshold to help prevent performance degradation. When operating with a threshold, for each connection, both the source and destination IP addresses are matched against network objects. If the number of objects matched by the source address times the number matched by the destination address exceeds 10,000, the connection is dropped. Configure your rules to prevent an excessive number of matches.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the Firewall Threat Defense device where you want to configure the rule, click the **Edit** (✎).
- Step 3** Click the **Device** tab, then click the **Edit** (✎) in the **Advanced Settings** section.
- Step 4** Check **Object Group Search**.
- Step 5** To have object group search work on interface objects in addition to network objects, check **Interface Object Optimization**.

If you do not select **Interface Object Optimization**, the system deploys separate rules for each source/interface pair, rather than use the security zones and interface groups used in the rules. This means the interface groups are not available for object group search processing.

**Step 6** Click **Save**.

## Configure Interface Object Optimization

During deployment, interface groups and security zones used in the access control and prefilter policies generate separate rules for each source/destination interface pair. If you enable interface object optimization, the system will instead deploy a single rule per access control/prefilter rule, which can simplify the device configuration and improve deployment performance. If you select this option, also select the **Object Group Search** option to reduce memory usage on the device.

Interface object optimization is disabled by default. You can enable it on one device at a time; you cannot enable it globally.

**Note** If you disable interface object optimization, your existing access control rules will be deployed without using interface objects, which might make deployment take longer. In addition, if object group search is enabled, its benefits will not apply to interface objects, and you might see expansion in the access control rules in the device's running configuration. If the expansion requires more memory than is available on the device, your device can be left in an inconsistent state and you might see a performance impact.

### Before you begin

Model Support—Threat Defense

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the Firewall Threat Defense device where you want to configure the rule, click the **Edit** (✎).
- Step 3** Click the **Device** tab, then click **Edit** (✎) in the **Advanced Settings** section.
- Step 4** Check **Interface Object Optimization**.
- Step 5** Click **Save**.

## Edit Deployment Settings

The **Deployment Settings** section of the **Device** page displays the information described in the table below.

**Figure 74: Deployment Settings**

| Deployment Settings                       |          |
|------------------------------------------------------------------------------------------------------------------------------|----------|
| Auto Rollback Deployment if Connectivity fails                                                                               | Disabled |
| Connectivity Monitor Interval (in Minutes)  | 20 Mins. |

**Table 7: Deployment Settings**

| Field                                          | Description                                                                                                                                                                                                                                |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Auto Rollback Deployment if Connectivity Fails | <p>Enabled or Disabled.</p> <p>You can enable auto rollback if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface.</p> |
| Connectivity Monitor Interval (in Minutes)     | Shows the amount of time to wait before rolling back the configuration.                                                                                                                                                                    |

You can set deployment settings from the **Device Management** page. Deployment settings include enabling auto rollback of the deployment if the management connection fails as a result of the deployment; specifically if you use data for management center access, and then you misconfigure the data interface. You can alternatively manually roll back the configuration using the **configure policy rollback** command (see [Manually Roll Back the Configuration if the Firewall Management Center Loses Connectivity, on page 115](#)).

See the following guidelines:

- Only the previous deployment is available locally on the Firewall Threat Defense; you cannot roll back to any earlier deployments.
- Rollback is supported for high availability but not supported for clustering deployments.
- The rollback only affects configurations that you can set in the Firewall Management Center. For example, the rollback does not affect any local configuration related to the dedicated Management interface, which you can only configure at the Firewall Threat Defense CLI. Note that if you changed data interface settings after the last Firewall Management Center deployment using the **configure network management-data-interface** command, and then you use the rollback command, those settings will not be preserved; they will roll back to the last-deployed Firewall Management Center settings.
- UCAPL/CC mode cannot be rolled back.
- Out-of-band SCEP certificate data that was updated during the previous deployment cannot be rolled back.
- During the rollback, connections will drop because the current configuration will be cleared.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device where you want to assign policies, click **Edit** ().
- Step 3** Click **Device**.

**Step 4** In the **Deployment Settings** section, click **Edit** (✎).

**Figure 75: Deployment Settings**

Deployment Settings

Auto Rollback Deployment if Connectivity Fails: ☐

Connectivity Monitor Interval (in Minutes): 20

The connectivity failure timeout will be applicable from next deployment incase, the deployment for this device is already in progress.

Cancel Save

**Step 5** Check **Auto Rollback Deployment if Connectivity Fails** to enable auto rollback.

**Step 6** Set the **Connectivity Monitor Interval (in Minutes)** to set the amount of time to wait before rolling back the configuration. The default is 20 minutes.

**Step 7** If a rollback occurs, see the following for next steps.

- If the auto rollback was successful, you see a success message instructing you to do a full deployment.
- You can also go to the **Deploy** and then **Advanced Deploy** screen and click the **Preview** (📄) icon to view the parts of the configuration that were rolled back (see [Deploy Configuration Changes](#), on page 183). Click **Show Rollback Changes** to view the changes, and **Hide Rollback Changes** to hide the changes.

Download as PDF OK

- In the Deployment History Preview, you can view the rollback changes. See [View Deployment History, on page 191](#).

#### Step 8 Check that the management connection was reestablished.

In Firewall Management Center, check the management connection status on the connection status page. Navigate to **Devices > Device Management** and then in **Management** area under the **Devices** tab, click **Connection Status** to view the **Connection Status** page.

At the Firewall Threat Defense CLI, enter the **sftunnel-status-brief** command to view the management connection status.

If it takes more than 10 minutes to reestablish the connection, you should troubleshoot the connection. See [Troubleshoot Management Connectivity on a Data Interface, on page 117](#).

## Edit Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 77: Cluster Health Monitor Settings

| Cluster Health Monitor Settings |          |                           |                    |
|---------------------------------|----------|---------------------------|--------------------|

|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Timeouts</b>             |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Hold Time                   | Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.                                                                                                             |
| Interface Debounce Time     | Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.                                                                                                                                                                                                                                          |
| <b>Monitored Interfaces</b> | The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. |
| Service Application         | Shows whether the Snort and disk-full processes are monitored.                                                                                                                                                                                                                                                                                                                                                                            |
| Unmonitored Interfaces      | Shows unmonitored interfaces.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Auto-Rejoin Settings</b> |                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Cluster Interface           | Shows the auto-rejoin settings after a cluster control link failure.                                                                                                                                                                                                                                                                                                                                                                      |

| Field                            | Description                                                                                                                                              |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>Attempts</i>                  | Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.                                                                 |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| Data Interfaces                  | Shows the auto-rejoin settings after a data interface failure.                                                                                           |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |
| System                           | Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on. |
| <i>Attempts</i>                  | Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.                                                                              |
| <i>Interval Between Attempts</i> | Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.                                            |
| <i>Interval Variation</i>        | Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.                                    |

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

**Figure 78: Disable the System Health Check**

Edit Cluster Health Monitor Settings

Health Check ☒ ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6** Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.

Figure 79: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

### Step 8

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

Unmonitored Interfaces ⓘ

☒ Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9**

Click **Save**.

**Step 10**

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## CHAPTER 3

# Users

---

Managed devices include a default **admin** account for CLI access. This chapter discusses how to create custom user accounts.

- [About Users, on page 139](#)
- [Requirements and Prerequisites for User Accounts for Devices, on page 140](#)
- [Guidelines and Limitations for User Accounts for Devices, on page 141](#)
- [Add an Internal User at the CLI, on page 141](#)
- [Configure External Authentication for the Firewall Threat Defense, on page 143](#)
- [Troubleshooting LDAP Authentication Connections, on page 155](#)
- [History for Users, on page 157](#)

## About Users

You can add custom user accounts on managed devices, either as internal users or as external users on a LDAP or RADIUS server. Each managed device maintains separate user accounts. For example, when you add a user to the Firewall Management Center, that user only has access to the Firewall Management Center; you cannot then use that username to log directly into a managed device. You must separately add a user on the managed device.

## Internal and External Users

Managed devices support two types of users:

- Internal user—The device checks a local database for user authentication.
- External user—If the user is not present in the local database, the system queries an external LDAP or RADIUS authentication server.

## CLI Access

Firepower devices include a Firepower CLI that runs on top of Linux. You can create internal users on devices using the CLI. You can establish external users on Firewall Threat Defense devices using the Firewall Management Center.

**Caution**

Users with CLI Config level access can access the Linux shell using the **expert** command, and obtain `sudoers` privileges in the Linux shell, which can present a security risk. For system security reasons, we strongly recommend:

- Only use the Linux shell under TAC supervision or when explicitly instructed by Firepower user documentation.
- Make sure that you restrict the list of users with CLI access appropriately.
- When granting CLI access privileges, restrict the list of users with Config level access.
- Do not add users directly in the Linux shell; only use the procedures in this chapter.
- Do not access Firepower devices using CLI expert mode unless directed by Cisco TAC or by explicit instructions in the Firepower user documentation.

## CLI User Roles

On managed devices, user access to commands in the CLI depends on the role you assign.

**None**

The user cannot log into the device on the command line.

**Config**

The user can access all commands, including configuration commands. Exercise caution in assigning this level of access to users.

**Basic**

The user can access non-configuration commands only. Only internal users and Firewall Threat Defense external RADIUS users support the Basic role.

## Requirements and Prerequisites for User Accounts for Devices

**Model Support**

- Threat Defense—Internal and external users

**Supported Domains**

Any

**User Roles**

Configure external users—Admin FMC user

Configure internal users—Config CLI user

# Guidelines and Limitations for User Accounts for Devices

## Username

- You cannot add the same username for both internal and external users. If the external server uses a duplicate username, the deployment to the device fails.
- The username must be Linux-valid:
  - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
  - All lowercase
  - Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

## Defaults

All devices include an **admin** user as a local user account; you cannot delete the **admin** user. The default initial password is **Admin123**; the system forces you to change this during the initialization process. The agent stores the modified credentials in the Windows registry and uses the same encryption as the Firewall Management Center, which is Cipher Block Chaining (CBC). See the getting started guide for your model for more information about system initialization.

## Number of User Accounts

You can create a maximum of 43 user accounts for the Firepower 1000 and 2100.

# Add an Internal User at the CLI

Use the CLI to create internal users on the Firewall Threat Defense.

## Procedure

- 
- Step 1** Log into the device CLI using an account with Config privileges.
- The **admin** user account has the required privileges, but any account with Config privileges will work. You can use an SSH session or the Console port.
- For certain Firewall Threat Defense models, the Console port puts you into the FXOS CLI. Use the **connect ftd** command to get to the Firewall Threat Defense CLI.
- Step 2** Create the user account.
- configure user add** *username* {**basic** | **config**}
- *username*—Sets the username. The username must be Linux-valid:
    - Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)

- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)
- **basic**—Gives the user basic access. This role does not allow the user to enter configuration commands.
- **config**—Gives the user configuration access. This role gives the user full administrator rights to all commands.

**Example:**

The following example adds a user account named johnrichton with Config access rights. The password is not shown as you type it.

```
> configure user add johnrichton config
Enter new password for user johnrichton: newpassword
Confirm new password for user johnrichton: newpassword
> show user
```

| Login       | UID  | Auth  | Access | Enabled | Reset | Exp   | Warn | Str | Lock | Max |
|-------------|------|-------|--------|---------|-------|-------|------|-----|------|-----|
| admin       | 1000 | Local | Config | Enabled | No    | Never | N/A  | Dis | No   | N/A |
| johnrichton | 1001 | Local | Config | Enabled | No    | Never | N/A  | Dis | No   | 5   |

**Note**

Tell users they can change their own passwords using the **configure password** command.

**Step 3** (Optional) Adjust the characteristics of the account to meet your security requirements.

You can use the following commands to change the default account behavior.

- **configure user aging** *username max\_days warn\_days*

Sets an expiration date for the user's password. Specify the maximum number of days for the password to be valid followed by the number of days before expiration the user will be warned about the upcoming expiration. Both values are 1 to 9999, but the warning days must be less than the maximum days. When you create the account, there is no expiration date for the password.

- **configure user forcereset** *username*

Forces the user to change the password on the next login.

- **configure user maxfailedlogins** *username number*

Sets the maximum number of consecutive failed logins you will allow before locking the account, from 1 to 9999. Use the **configure user unlock** command to unlock accounts. The default for new accounts is 5 consecutive failed logins.

- **configure user minpasswlen** *username number*

Sets a minimum password length, which can be from 1 to 127.

- **configure user strengthcheck** *username {enable | disable}*

Enables or disables password strength checking, which requires a user to meet specific password criteria when changing their password. When a user's password expires or if the **configure user forcereset** command is used, this requirement is automatically enabled the next time the user logs in.

**Step 4** Manage user accounts as necessary.

Users can get locked out of their accounts, or you might need to remove accounts or fix other issues. Use the following commands to manage the user accounts on the system.

- **configure user access** *username* { **basic** | **config** }

Changes the privileges for a user account.

- **configure user delete** *username*

Deletes the specified account.

- **configure user disable** *username*

Disables the specified account without deleting it. The user cannot log in until you enable the account.

- **configure user enable** *username*

Enables the specified account.

- **configure user password** *username*

Changes the password for the specified user. Users should normally change their own password using the **configure password** command.

#### Caution

Do not use the Linux **passwd** command in Expert Mode to change the admin user password. This command can cause file system corruption. Only use the regular Firewall Threat Defense CLI **configure user password admin** command (if you are not admin) or **configure password** command (if you are admin). If you don't know the password and can't log in at all, see the [password recovery](#) procedure.

- **configure user unlock** *username*

Unlocks a user account that was locked due to exceeding the maximum number of consecutive failed login attempts.

---

## Configure External Authentication for the Firewall Threat Defense

To enable external authentication for Firewall Threat Defense devices, you need to add one or more external authentication objects.

### About External Authentication for the Firewall Threat Defense

When you enable external authentication for Firewall Threat Defense users, the Firewall Threat Defense verifies the user credentials with an LDAP or RADIUS server as specified in an *external authentication object*.

External authentication objects can be used by the Firewall Management Center and Firewall Threat Defense devices. You can share the same object between the different appliance/device types or create separate objects. For the Firewall Threat Defense, you can only activate one external authentication object in the platform settings that you deploy to the devices.

**Note** The timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-30 seconds for LDAP, and 1-300 seconds for RADIUS). If you set the timeout to a higher value, the Firewall Threat Defense external authentication configuration will not work.

Only a subset of fields in the external authentication object are used for Firewall Threat Defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for other device types, those fields will be used.

LDAP users always have Config privileges. RADIUS users can be defined as either Config or Basic users.

You can either define users on the RADIUS server (with the Service-Type attribute), or you can pre-define the user list in the external authentication object. For LDAP, you can specify a filter to match CLI users on the LDAP server.

**Note** Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you:

- Restrict the list of users with Linux shell access.
- Do not create Linux shell users.

## About LDAP

The Lightweight Directory Access Protocol (LDAP) allows you to set up a directory on your network that organizes objects, such as user credentials, in a centralized location. Multiple applications can then access those credentials and the information used to describe them. If you ever need to change a user's credentials, you can change them in one place.

Microsoft has announced that Active Directory servers will start enforcing LDAP binding and LDAP signing in 2020. Microsoft is making these a requirement because when using default settings, an elevation of privilege vulnerability exists in Microsoft Windows that could allow a man-in-the-middle attacker to successfully forward an authentication request to a Windows LDAP server. For more information, see [2020 LDAP channel binding and LDAP signing requirement for Windows](#) on the Microsoft support site.

If you have not done so already, we recommend you start using TLS/SSL encryption to authenticate with an Active Directory server.

## About RADIUS

Remote Authentication Dial In User Service (RADIUS) is an authentication protocol used to authenticate, authorize, and account for user access to network resources. You can create an authentication object for any RADIUS server that conforms to [RFC 2865](#).

Secure Firewall devices support the use of SecurID tokens. When you configure authentication by a server using SecurID, users authenticated against that server append the SecurID token to the end of their SecurID PIN and use that as their password when they log in. You do not need to configure anything extra on the Secure Firewall device to support SecurID.

# Add an LDAP External Authentication Object for Firewall Threat Defense

Add an LDAP server to support external users for Firewall Threat Defense management.

In a multidomain deployment, external authentication objects are only available in the domain in which they are created.

## Sharing External Authentication Objects

External LDAP objects can be used by the Firewall Management Center and Firewall Threat Defense devices. You can share the same object between the Firewall Management Center and devices or create separate objects. Be sure that both the Firewall Threat Defense and the Firewall Management Center can reach the LDAP server, even if you are not sharing the object. The Firewall Management Center is essential to retrieving the user list and downloading it to the device.

**Note** For LDAP, the timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-30 seconds). If you set the timeout to a higher value, the deployment to the Firewall Threat Defense will fail.

## Firewall Threat Defense Supported Fields

Only a subset of fields in the LDAP object are used for Firewall Threat Defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for the Firewall Management Center, those fields will be used. This procedure only covers the supported fields for the Firewall Threat Defense. For other fields, see [Add an LDAP External Authentication Object for the Firewall Management Center](#).

## Username

Username must be Linux-valid usernames and be lower-case only, using alphanumeric characters plus period (.) or hyphen (-). Other special characters such as at sign (@) and slash (/) are not supported. You cannot add the **admin** user for external authentication. You can only add external users (as part of the External Authentication object) in the Firewall Management Center; you cannot add them at the CLI. Note that internal users can only be added at the CLI, not in the Firewall Management Center.

If you previously configured the same username for an internal user using the **configure user add** command, the Firewall Threat Defense first checks the password against the internal user, and if that fails, it checks the LDAP server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

## Privilege Level

LDAP users always have Config privileges.

## Before you begin

You must specify DNS server(s) for domain name lookup on your device. Even if you specify an IP address and not a hostname for the LDAP server on this procedure, the LDAP server may return a URI for authentication that can include a hostname. A DNS lookup is required to resolve the hostname. See [Modify Firewall Threat Defense Management Interfaces at the CLI, on page 87](#) to add DNS servers.

## Procedure

- 
- Step 1** Choose **System** (⚙️) > **Users**.
- Step 2** Click the **External Authentication** tab.
- Step 3** Click (+) **Add External Authentication Object**.
- Step 4** Set the **Authentication Method** to **LDAP**.
- Step 5** Enter a **Name** and optional **Description**.
- Step 6** Choose a **Server Type** from the drop-down list.
- Step 7** For the **Primary Server**, enter a **Host Name/IP Address**.
- If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.
- Step 8** (Optional) Change the **Port** from the default.
- Step 9** (Optional) Enter the **Backup Server** parameters.
- Step 10** Enter **LDAP-Specific Parameters**.
- Enter the **Base DN** for the LDAP directory you want to access. For example, to authenticate names in the Security organization at the Example company, enter `ou=security,dc=example,dc=com`. Alternatively click **Fetch DNs**, and choose the appropriate base distinguished name from the drop-down list.
  - (Optional) Enter the **Base Filter**. For example, if the user objects in a directory tree have a `physicalDeliveryOfficeName` attribute and users in the New York office have an attribute value of `NewYork` for that attribute, to retrieve only users in the New York office, enter `(physicalDeliveryOfficeName=NewYork)`.
  - Enter a **User Name** for a user who has sufficient credentials to browse the LDAP server. For example, if you are connecting to an OpenLDAP server where user objects have a `uid` attribute, and the object for the administrator in the Security division at your example company has a `uid` value of `NetworkAdmin`, you might enter `uid=NetworkAdmin,ou=security,dc=example,dc=com`.
  - Enter the user password in the **Password** and the **Confirm Password** fields.
  - (Optional) Click **Show Advanced Options** to configure the following advanced options.
    - **Encryption**—Click **None**, **TLS**, or **SSL**.  
If you change the encryption method after specifying a port, you reset the port to the default value for that method. For **None** or **TLS**, the port resets to the default value of 389. If you choose **SSL** encryption, the port resets to 636.
    - **SSL Certificate Upload Path**—For **SSL** or **TLS** encryption, you must choose a certificate by clicking **Choose File**.  
If you previously uploaded a certificate and want to replace it, upload the new certificate and redeploy the configuration to your devices to copy over the new certificate.
- Note**  
TLS encryption requires a certificate on all platforms. For **SSL**, the Firewall Threat Defense also requires a certificate. For other platforms, **SSL** does not require a certificate. However, we recommend that you *always* upload a certificate for **SSL** to prevent man-in-the-middle attacks.
- (Not Used) **User Name Template**—Not used by the Firewall Threat Defense.

- **Timeout (Seconds)**—Enter the number of seconds before rolling over to the backup connection, between 1 and 30. The default is 30.

**Note**

The timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-30 seconds). If you set the timeout to a higher value, the Firewall Threat Defense LDAP configuration will not work.

**Step 11** Configure **Attribute Mapping** to retrieve users based on an attribute.

- Enter a **UI Access Attribute**. **Note:** This field is not used for device CLI access; however, it is a required field, so you need to enter a value. You can just enter the same value that you enter for the **CLI Access Attribute**.
- Set the **CLI Access Attribute** if you want to use a CLI access attribute other than the user distinguished type. For example, on a Microsoft Active Directory Server, use the `sAMAccountName` CLI access attribute to retrieve CLI access users by typing `sAMAccountName`.

**Note**

Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you restrict the list of users with CLI or Linux shell access.

**Note**

Deploying an external authentication object that allows a large number of users with CLI access may cause deployments to time out and fail while waiting for the users to be created.

**Step 12** Set the **CLI Access Filter**.

Choose one of the following methods:

- To use the same filter you specified when configuring authentication settings, check the check box of **Same as Base Filter**.
- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses. For example, if all network administrators have a `manager` attribute which has an attribute value of `shell`, you can set a base filter of `(manager=shell)`.

The usernames must be Linux-valid:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

**Note**

If you previously configured the same username for an internal user, the Firewall Threat Defense first checks the password against the internal user, and if that fails, it checks the LDAP server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported.

**Step 13** Click **Save**.

**Step 14** Enable use of this server. See [External Authentication, on page 834](#).

**Step 15** If you later add or delete users on the LDAP server, you must redeploy the Platform Settings on managed devices. The Firewall Management Center redownloads the user list and deploys it to the device. See [Deploy Configuration Changes, on page 183](#).

## Examples

### Basic Example

The following figures illustrate a basic configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 389 for access.

**External Authentication Object**

Authentication Method: LDAP

CAC: ☐ Use for CAC authentication and authorization

Name: Basic Configuration Example

Description:

Server Type: MS Active Directory Set Defaults

**Primary Server**

Host Name/IP Address:  ex. IP or hostname

Port: 389

**Backup Server (Optional)**

Host Name/IP Address:  ex. IP or hostname

Port: 389

**LDAP-Specific Parameters**

Base DN: ou=security, DC=it, DE=example, C ex. dc=sourcefire, dc=com Fetch DNs

Base Filter:  ex. (cn=jsmith), (&(cn=jsmith)(cn=bsmith)(cn=csmith\*))

User Name: CN=admin, DC=example, DC=com ex. cn=jsmith, dc=sourcefire, dc=com

Password: \*\*\*\*\*

Confirm Password: \*\*\*\*\*

► Show Advanced Options

This example shows a connection using a base distinguished name of `OU=security, DC=it, DC=example, DC=com` for the security organization in the information technology domain of the Example company.

**Attribute Mapping**

UI Access Attribute \*

CLI Access Attribute \*

▸ Group Controlled Access Roles (Optional)

**CLI Access Filter**

CLI Access Filter ☒ Same as Base Filter

(Mandatory for FTD devices)

ex. (cn=smith), (cn=smith), (&(cn=smith))((cn=smith)(cn=csmith\*))

**Additional Test Parameters**

User Name

Password

\*Required Field

A **CLI Access Attribute** of `sAMAccountName` causes each `sAMAccountName` attribute to be checked for all objects in the directory for matches when a user logs into the Firewall Threat Defense.

Note that because no base filter is applied to this server, the Firewall Threat Defense checks attributes for all objects in the directory indicated by the base distinguished name. Connections to the server time out after the default time period (or the timeout period set on the LDAP server).

### Advanced Example

This example illustrates an advanced configuration of an LDAP login authentication object for a Microsoft Active Directory Server. The LDAP server in this example has an IP address of 10.11.3.4. The connection uses port 636 for access.

**External Authentication Object**

Authentication Method

CAC ☐ Use for CAC authentication and authorization

Name \*

Description

Server Type

**Primary Server**

Host Name/IP Address \*  ex. IP or hostname

Port \*

This example shows a connection using a base distinguished name of `OU=security,DC=it,DC=example,DC=com` for the security organization in the information technology domain of the Example company. However, note that this server has a base filter of `(cn=*smith)`. The filter restricts the users retrieved from the server to those with a common name ending in `smith`.

Only a subset of fields in the RADIUS object are used for Firewall Threat Defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for the Firewall Management Center, those fields will be used. This procedure only covers the supported fields for the Firewall Threat Defense. For other fields, see [Add a RADIUS External Authentication Object for Firewall Management Center](#) in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Username

You cannot add the **admin** user for external authentication. You can only add external users (as part of the External Authentication object) in the Firewall Management Center; you cannot add them at the CLI. Note that internal users can only be added at the CLI, not in the Firewall Management Center.

If you previously configured the same username for an internal user using the **configure user add** command, the Firewall Threat Defense first checks the password against the internal user, and if that fails, it checks the RADIUS server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported. For users defined on the RADIUS server, be sure to set the privilege level to be the same as any internal users; otherwise you cannot log in using the external user password.

## Procedure

**Step 1** Define users on the RADIUS server using the Service-Type attribute.

The following are supported values for the Service-Type attribute:

- Administrator (6)—Provides Config access authorization to the CLI. These users can use all commands in the CLI.
- NAS Prompt (7) or any level other than 6—Provides Basic access authorization to the CLI. These users can use read-only commands, such as **show** commands, for monitoring and troubleshooting purposes.

The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a sign (@) or slash (/)

Alternatively, you can predefine users in the external authentication object (see, [Step 12, on page 152](#)). To use the same RADIUS server for the Firewall Threat Defense and Firewall Management Center while using the Service-Type attribute method for the Firewall Threat Defense, create two external authentication objects that identify the same RADIUS server: one object includes the predefined **CLI Access Filter** users (for use with the Firewall Management Center), and the other object leaves the **CLI Access Filter** empty (for use with Firewall Threat Defenses).

**Step 2** In the Firewall Management Center, choose **System** (⚙️) > **Users**.

**Step 3** Click **External Authentication**.

**Step 4** Click (+) **Add External Authentication Object**.

**Step 5** Set the **Authentication Method** to **RADIUS**.

**Step 6** Enter a **Name** and optional **Description**.

**Step 7** For the **Primary Server**, enter a **Host Name/IP Address**.

Only IPv4 is supported.

**Note**

If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field.

**Step 8** (Optional) Change the **Port** from the default.

**Step 9** Enter the **RADIUS Secret Key**.

**Step 10** (Optional) Enter the **Backup Server** parameters.

**Step 11** (Optional) Enter **RADIUS-Specific Parameters**.

- a) Enter the **Timeout (Seconds)** in seconds before retrying the primary server, between 1 and 300. The default is 30.

**Note**

The timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-300 seconds). If you set the timeout to a higher value, the Firewall Threat Defense RADIUS configuration will not work.

- b) Enter the **Retries** before rolling over to the backup server. The default is 3.

**Step 12** (Optional) Instead of using RADIUS-defined users (see, [Step 1, on page 151](#)), in the **CLI Access Filter** area **Administrator CLI Access User List** field, enter the user names that should have CLI access, separated by commas. For example, enter **jchrichton, aerynsun, rygel**.

You may want to use the **CLI Access Filter** method for Firewall Threat Defense so you can use the same external authentication object with Firewall Threat Defense and other platform types.

**Note**

If you want to use RADIUS-defined users, you must leave the **CLI Access Filter** empty.

Make sure that these usernames match usernames on the RADIUS server. The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

**Note**

Users with CLI access can gain Linux shell access with the **expert** command. Linux shell users can obtain root privileges, which can present a security risk. Make sure that you restrict the list of users with CLI or Linux shell access.

**Note**

Deploying an external authentication object that allows a large number of users with CLI access may cause deployments to time out and fail while waiting for the users to be created.

**Step 13** (Optional) Click **Test** to test Firewall Management Center connectivity to the RADIUS server.

This function can only test Firewall Management Center connectivity to the RADIUS server; there is no test function for managed device connectivity to the RADIUS server.

**Step 14** (Optional) You can also enter **Additional Test Parameters** to test user credentials for a user who should be able to authenticate: enter a **User Name** and **Password**, and then click **Test**.

**Tip**

If you mistype the name or password of the test user, the test fails even if the server configuration is correct. To verify that the server configuration is correct, click **Test** without entering user information in the **Additional Test Parameters** field first. If that succeeds, supply a user name and password to test with the specific user.

**Example:**

To test if you can retrieve the `JSmith` user credentials at the Example company, enter `JSmith` and the correct password.

**Step 15**

Click **Save**.

**Step 16**

Enable use of this server. See [External Authentication](#), on page 834

**Examples****Simple User Role Assignments**

The following figure illustrates a sample RADIUS login authentication object for a server running Cisco Identity Services Engine (ISE) with an IP address of 10.10.10.98 on port 1812. No backup server is defined.

**External Authentication Object**

Authentication Method:

Name \*:

Description:

**Primary Server**

Host Name/IP Address \*:  ex. IP or hostname

Port \*:

RADIUS Secret Key \*:

The following example shows RADIUS-specific parameters, including the timeout (30 seconds) and number of failed retries before the system attempts to contact the backup server, if any.

This example illustrates important aspects of RADIUS user role configuration:

Users `ewharton` and `gsand` are granted web interface Administrative access.

The user `cbronte` is granted web interface Maintenance User access.

The user `jausten` is granted web interface Security Analyst access.

The user `ewharton` can log into the device using a CLI account.

**RADIUS-Specific Parameters**

|                                         |                                                                                                                                                                                                          |
|-----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Timeout (Seconds)                       | <input type="text" value="30"/>                                                                                                                                                                          |
| Retries                                 | <input type="text" value="3"/>                                                                                                                                                                           |
| Access Admin                            | <input type="text"/>                                                                                                                                                                                     |
| Administrator                           | <input type="text" value="evb@carbon.ocsand"/>                                                                                                                                                           |
| Discovery Admin                         | <input type="text"/>                                                                                                                                                                                     |
| External Database User                  | <input type="text"/>                                                                                                                                                                                     |
| Intrusion Admin                         | <input type="text"/>                                                                                                                                                                                     |
| Maintenance User                        | <input type="text" value="abronite"/>                                                                                                                                                                    |
| Network Admin                           | <input type="text"/>                                                                                                                                                                                     |
| Security Analyst                        | <input type="text" value="j@carbon"/>                                                                                                                                                                    |
| Security Analyst (Read Only)            | <input type="text"/>                                                                                                                                                                                     |
| Security Approver                       | <input type="text"/>                                                                                                                                                                                     |
| Threat Intelligence Director (TID) User | <input type="text"/>                                                                                                                                                                                     |
| Default User Role                       | <div> <input type="text" value="Discovery Admin"/> <input type="text" value="External Database User"/> <input type="text" value="Intrusion Admin"/> <input type="text" value="Maintenance User"/> </div> |

To specify the default user role if user is not found in any group

**CLI Access Filter**  
(For FMC (all versions) and FTD (5.2.3 and 5.3), define users for CLI access. For FTD 5.4 and later, we recommend defining users on the RADIUS server. Click [here](#) for more information)

|                                    |                                         |
|------------------------------------|-----------------------------------------|
| Administrator CLI Access User List | <input type="text" value="evb@carbon"/> |
|------------------------------------|-----------------------------------------|

ex. user1, user2, user3 (lowercase letters only)

The following graphic depicts the role configuration for the example:

### Roles for Users Matching an Attribute-Value Pair

You can use an attribute-value pair to identify users who should receive a particular user role. If the attribute you use is a custom attribute, you must define the custom attribute.

The following figure illustrates the role configuration and custom attribute definition in a sample RADIUS login authentication object for the same ISE server as in the previous example.

In this example, however, the `MS-RAS-Version` custom attribute is returned for one or more of the users because a Microsoft remote access server is in use. Note the `MS-RAS-Version` custom attribute is a string. In this example, all users logging in to RADIUS through a Microsoft v. 5.00 remote access server should receive the Security Analyst (Read Only) role, so you enter the attribute-value pair of `MS-RAS-Version=MSRASV5.00` in the **Security Analyst (Read Only)** field.

The screenshot shows the 'Security Analyst (Read Only)' field set to 'MS-RAS-Version=MSRASV5.00'. Below it are empty fields for 'Security Approver' and 'Threat Intelligence Director (TID) User'. The 'Default User Role' dropdown menu is open, showing options: 'External Database User', 'Intrusion Admin' (selected), 'Maintenance User', and 'Network Admin'. A note states: 'To specify the default user role if user is not found in any group'. The 'CLI Access Filter' section has a note: '(For FMC (all versions) and FTD (6.2.3 and 6.3), define users for CLI access. For FTD 6.4 and later, we recommend defining users on the RADIUS server. Click [here](#) for more information)'. The 'Administrator CLI Access User List' field contains 'ewharton', with a note: 'ex. user1, user2, user3 (lowercase letters only)'. The 'Define Custom RADIUS Attributes' section has a table with columns: Attribute Name, Attribute ID, and Attribute Type. The first row shows 'MS-Ras-Version' as the name, '5' as the ID, and 'string' as the type. There are 'Add' and 'Delete' buttons.

## Enable External Authentication for Users on Firewall Threat Defense Devices

Enable External Authentication in the Threat Defense Platform Settings, and then deploy the settings to the managed devices. See [External Authentication, on page 834](#) for more information.

## Troubleshooting LDAP Authentication Connections

If you create an LDAP authentication object and it either does not succeed in connecting to the server you select or does not retrieve the list of users you want, you can tune the settings in the object.

If the connection fails when you test it, try the following suggestions to troubleshoot your configuration:

- Use the messages displayed at the top of the web interface screen and in the test output to determine which areas of the object are causing the issue.
- Check that the user name and password you used for the object are valid:
  - Check that you have the rights to browse to the directory indicated in your base-distinguished name by connecting to the LDAP server using a third-party LDAP browser.
  - Check that the user name is unique to the directory information tree for the LDAP server.
  - If you see an LDAP bind error 49 in the test output, the user binding for the user failed. Try authenticating to the server through a third-party application to see if the binding fails through that connection as well.
- Check that you have correctly identified the server:
  - Check that the server IP address or host name is correct.
  - Check that you have TCP/IP access from your local appliance to the authentication server where you want to connect.

- Check that access to the server is not blocked by a firewall and that the port you have configured in the object is open.
- If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used for the server.
- Check that you have not used an IPv6 address for the server connection if you are authenticating CLI access.
- If you used server type defaults, check that you have the correct server type and click **Set Defaults** again to reset the default values.
- If you typed in your base-distinguished name, click **Fetch DNs** to retrieve all the available base distinguished names on the server, and select the name from the list.
- If you are using any filters, access attributes, or advanced settings, check that each is valid and typed correctly.
- If you are using any filters, access attributes, or advanced settings, try removing each setting and testing the object without it.
- If you are using a base filter or a CLI access filter, make sure that the filter is enclosed in parentheses and that you are using a valid comparison operator (maximum 450 characters, including the enclosing parentheses).
- To test a more restricted base filter, try setting it to the base distinguished name for the user to retrieve just that user.
- If you are using an encrypted connection:
  - Check that the name of the LDAP server in the certificate matches the host name that you use to connect.
  - Check that you have not used an IPv6 address with an encrypted server connection.
- If you are using a test user, make sure that the user name and password are typed correctly.
- If you are using a test user, remove the user credentials and test the object.
- Test the query that you are using by connecting to the LDAP server and using this syntax:

```
ldapsearch -x -b 'base_distinguished_name'
-h LDAPserver_ip_address -p port -v -D
'user_distinguished_name' -W 'base_filter'
```

For example, if you are trying to connect to the security domain on `myrtle.example.com` using the `domainadmin@myrtle.example.com` user and a base filter of `(cn=*)`, you could test the connection using this statement:

```
ldapsearch -x -b 'CN=security,DC=myrtle,DC=example,DC=com'
-h myrtle.example.com -p 389 -v -D
'domainadmin@myrtle.example.com' -W '(cn=*)'
```

If you can test your connection successfully but authentication does not work after you deploy a platform settings policy, check that authentication and the object you want to use are both enabled in the platform settings policy that is applied to the device.

If you connect successfully but want to adjust the list of users retrieved by your connection, you can add or change a base filter or CLI access filter or use a more restrictive or less restrictive base DN.

While authenticating a connection to Active Directory (AD) server, rarely the connection event log indicates blocked LDAP traffic although the connection to AD server is successful. This incorrect connection log occurs when the AD server sends a duplicate reset packet. The Firewall Threat Defense device identifies the second reset packet as part of a new connection request and logs the connection with Block action.

## History for Users

| Feature                                                                                                | Minimum Firewall Management Center | Minimum Firewall Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## CHAPTER 4

# Change Management

---

You can enable Change Management if your organization needs to implement more formal processes for configuration changes, including audit tracking and official approval before changes are deployed.

- [About Change Management, on page 159](#)
- [Requirements and Prerequisites for Change Management, on page 163](#)
- [Guidelines and Limitations for Change Management, on page 163](#)
- [Enabling or Disabling Change Management, on page 164](#)
- [Managing Tickets, on page 165](#)
- [History for Change Management, on page 169](#)

## About Change Management

Some organizations need to implement a formal approach to deploying configuration changes. This might include more auditing, and an official approval process that must happen before configuration changes can be made to a device.

If your organization uses a more formal configuration change process, you can enable Change Management to enforce the process. With Change Management, administrators must open tickets before they can make configuration changes. Then, once the change is complete, they must submit the ticket for approval before they can deploy the proposed changes. This allows you to enforce your official approval process and ensure that the right employees make the final decisions.

When using Change Management, administrators can see their own changes within a ticket, but they cannot see changes anyone else has made within a ticket. Because a policy is locked once a user makes a change within a ticket, users should not be able to make interfering changes. However, users will not be able to make changes while another user has made a change that is pending approval.

Administrators can create multiple tickets so that a single ticket contains only logically-related policy changes. Tickets with a more limited scope are also easier to evaluate and approve quickly.

The following topics explain the Change Management Workflow and which policies and objects are subject to the ticketing and approval process.

## How to Configure Devices in the Change Management Workflow

When you enable Change Management, users who configure devices need to change their approach slightly. Configuration specialists need to take the following approach when making configuration changes to supported policies and objects.

### Procedure

---

**Step 1** Create a ticket.

**Step 2** Open the ticket.

**Step 3** Make the configuration changes.

Note that the procedures explained in the online help and user guides assume that Change Management is not active, and omit any steps for creating, opening, or submitting tickets.

**Step 4** Optionally, preview and validate the ticket to ensure the changes are complete and correct.

**Step 5** Submit the ticket. At this point, the approver can either approve or reject the ticket.

- If the ticket is approved, deploy the changes.
  - If the ticket is rejected, address the issues, and resubmit the ticket.
- 

## Creating Separate Approver and Configuration Roles

Some system-defined roles have permissions to modify (create/open/discard) and review (approve/reject) tickets:

- To both modify and review tickets:
  - Admin
  - Network Admin
- To modify tickets only:
  - Access Admin
  - Intrusion Admin
- To review tickets only:
  - Security Approver

If you need more granular roles to separate these activities due to your organizational requirements, you can create separate roles to ensure that ticket approval is assigned only to those users who have the organizational authority to approve changes. To create new user roles, go to **System > Users**, and select the **User Roles** tab..

Following are the permissions, in the **System > Change Management** folder, relevant to ticket usage and approval. Note that these permissions are available only after you enable Change Management.

- **Modify Tickets**—To create tickets (for yourself), to use tickets for configuration changes, and to discard tickets.
- **Review Tickets**—To approve or reject tickets.
- **Both Modify and Review Tickets**—To create tickets for yourself and others, use tickets, and approve/reject tickets.

The approach you take depends on your precise requirements. For example:

- If your approvers should also be allowed to make configuration changes, you can simply assign them the system-defined roles, such as Administrator. Then, create custom configuration-only roles that include the same permissions but not the Review Tickets permission.
- If you need complete separation between approvers and those who make configuration changes, create custom roles for both, limiting the roles to either the Modify Tickets or the Review Tickets permission plus all other needed permissions for viewing or changing the supported policies and objects.

## Policies and Objects that Support Change Management

If a policy or object supports the change management workflow, then creating, editing, or deleting the policy or object, including assigning a policy to a device, must be done in an open ticket.

Any action, policy, or object that does not support the change management workflow can be created, edited, or deleted, and so forth, without an open ticket. Even if a ticket is open, the changes made to unsupported policies are not included in the ticketed changes and are available for deployment immediately.

The following lists include the policies and objects that are supported. Anything not listed is unsupported.

### Supported Policies

- **Access Control**, including rules, references to other policies, and inheritance settings. Cloning access control policies is not included within a ticket. The clone is immediately accepted and available to all users.
- **Device Configuration policies**:
  - Interfaces
  - Inline Sets
  - DHCP
  - VTEP
  - All Routing
- **FlexConfig**
- **Intrusion policy and Network Analysis Policy (NAP)**, Snort 3 only.
- **Network Address Translation (NAT)**
- **Platform Settings**
- **Prefilter**

- QoS
- Umbrella SASE Topology
- VPN policies, both site-to-site and remote access
- Zero Trust Access

**Supported Objects**

- AAA Server
- Access List
- Address Pools
- AS Path
- Community List
- DHCP IPv6 Pools
- DNS Server Group
- FlexConfig objects
- Group policy
- Interface
- Key Chain
- Network
- Policy List
- Port
- Prefix List
- Route Map
- SLA Monitor
- Time Range
- Time Zone
- Tunnel Zone
- URL
- Variable Set
- VLAN Tag
- VPN objects (IKEv1, IKEv2 IPsec and policy, PKI enrollment, certificate map)

# Requirements and Prerequisites for Change Management

## Model Support

Management Center

## Supported Domains

Any

## User Roles

- To enable or disable Change Management: Admin.
- To both modify and review tickets:
  - Admin
  - Network Admin
- To modify tickets only:
  - Access Admin
  - Intrusion Admin
- To review tickets only:
  - Security Approver

# Guidelines and Limitations for Change Management

- When operating in change management mode, users can make changes to supported policies, but they cannot save the changes. For example, you could go through the dialog box to create a new Platform Settings policy without an open ticket, but when you click OK to actually create the policy, you will get an error and the policy will not be created.
- The following activities require that all tickets be in a terminal state, that is, approved or discarded: backup/restore, moving a device between domains, upgrading Firewall Management Center.
- Deleting a device from the inventory requires that all tickets involving that device be approved or discarded.
- Some processes, such as deployment and backup/restore, prevent you from changing the Change Management mode. Wait until the process completes to change the mode.
- Your ability to create objects while configuring a feature is constrained based on whether the feature and objects are all supported by change management. For example, importing a configuration is not supported by change management. Therefore, you cannot create security zone objects, which are supported, during the import. On the other hand, you can create new objects while configuring access control rules, because both are supported.

- When using Cloud-Delivered Firewall Management Center, a user defined in Cisco Defense Orchestrator is available to be assigned tickets only after the user cross-launches cdFMC at least once. Until the first cross-launch, the user does not exist in cdFMC.

## Enabling or Disabling Change Management

The default is that the Change Management workflow is disabled. Users do not need to open tickets and get approval when making configuration changes. If you want to enforce the Change Management workflow, you must enable it globally for the system.

### Before you begin

There are several system processes that prevent you from enabling/disabling change management. If any of the following are in process, you need to wait for them to complete before changing these settings: backup/restore; import/export; domain movement; upgrade; Flexconfig migration; device registration; high-availability registration, creation, break, or switch; cluster create, registration, break, edit, add or remove nodes; EPM break out or join.

An access control policy cannot be locked when you change these settings. If a policy is locked, you must wait for the lock to be released before enabling/disabling this feature.

### Procedure

---

**Step 1** Choose **System** (⚙️) > **Configuration**.

**Step 2** Click **Change Management**.

**Step 3** Select **Enable Change Management**.

To disable the feature, deselect the option. All tickets must be approved or discarded to disable Change Management. You cannot disable Change Management if any ticket is in the In Progress, On Hold, Rejected, or Pending Approval state.

**Step 4** Select the **Number of approvals required**, which is how many administrators must approve the change for the ticket to be approved and deployable. The default is 1, but you can require up to 5 approvers per ticket. Users can override this number when creating tickets.

**Step 5** Select the **Ticket Purge Duration**, which is the number of days to keep approved tickets, from 1-100 days. The default is 5 days.

**Step 6** (Optional.) Enter the **Reply to Address** and the email addresses for the **List of Approver Addresses**. You must also configure the Email Notification system settings for email to work.

**Step 7** Click **Save**.

The system adds the **Ticket** (📄) shortcut to the menu bar, and the **System** (⚙️) > **Change Management Workflow** command. Users can manage tickets using these methods.

---

# Managing Tickets

When you enable Change Management, configuration changes for supported policies must be done within the context of a ticket. You open a ticket, make your changes, then submit the ticket for approval.

You can see a list of tickets, and create new ones, either on the Change Management page or through the Ticket quick-access menu. All ticket changes are synchronized in each menu, so you can switch back and forth at your convenience and use whichever method you prefer.

## Note

When you open a ticket and make a change to a supported policy, that policy is locked from changes by other users or through other tickets. The policy remains locked until the ticket is approved or discarded.

## Procedure

**Step 1** Do any of the following:

- Choose **System** (⚙️) > **Change Management Workflow** to open a page showing existing tickets.
- Click the **Ticket** (📄) quick-access menu. The icon can either be named Select a Ticket (if no ticket is opened), the ticket name if a ticket is opened, or unnamed if no tickets exist.

Both pages are organized the same. The **Ticket** tab lists all tickets, whereas the **Review** tab lists tickets that have been submitted for approval. The default view shows your tickets only.

**Step 2** On the **Ticket** tab, take any of these actions:

- To create a new ticket, click **Add Ticket**.
- To view the details of a ticket, click the > next to the ticket name. The Details page includes UUID, name, description, user, last modified date, and comments. The History page includes the status changes for the ticket. The image at the top shows where the ticket stands in the overall workflow.
- To preview the configuration changes for an open ticket, click **Preview** (📄).
- To validate the configuration changes in an open ticket, click **Validate** (🔍) or **More** (⋮) > **Validate**. A dialog box opens showing error, warning, and informational messages, if there are any validation errors.
- To open a ticket, click **Open** (🔑) or **More** (⋮) > **Open**.
- To close an open ticket, click **Put Ticket on Hold (X)** or **More** (⋮) > **Put Ticket on Hold**. Closing a ticket does not submit it for review, nor does it release any locks placed on edited policies.
- To submit an open ticket for review and approval, click **Submit for Approval** (📄) or **More** (⋮) > **Submit for Approval**. The ticket must be open to be submitted.
- To discard a ticket, click **Discard** (🗑️) or **More** (⋮) > **Discard**.
- To search for a ticket, type a string in the search box. The search looks at ticket name, description, and responsible user.

- To filter the list by ticket status (on the Change Management Workflow page), click the status above the list: **New**, **Open**, **On Hold** (ticket was closed), **Rejected**, **Pending Approval**, **Approved**. Each status has a count of the number of tickets in that state. Click **All** under **My Tickets** to return to the default of showing all of your tickets, or **All** under **Tickets in System** to see everyone's tickets.

**Step 3** On the **Reviews** tab, take any of these actions on submitted tickets. The list is empty if there are no submitted tickets. In addition, only users with Review Ticket permissions can see this tab.

- To preview the configuration changes for a ticket, click **Preview** (🔍).
- To validate the configuration changes in an open ticket, click **Validate** (✅) or **More** (⋮) > **Validate**.
- To approve the ticket, click **Approve** (👍) or **More** (⋮) > **Approve**.
- To disapprove the ticket, click **Reject** (👎) or **More** (⋮) > **Reject**.

## Creating Change Management Tickets

When using the Change Management workflow, you must do all configuration changes within the context of an open ticket. If you do not already have a ticket, you must create a new one.

### Procedure

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** Click **Add Ticket**.

**Step 3** Configure the ticket options:

- **Name**—The name of the ticket. The name can include letters, numbers, spaces, and the following special characters: # \_ !
- **Description**—An optional description of what you intend to configure using this ticket. For example, if you have a case number related to what you intend to fix using this ticket, that would be useful information in a description.
- **Number of Approvers**—How many administrators must approve the change for the ticket to be approved and deployable. You can specify 1-5.
- **Assign to**—Select the user who will own the ticket and be responsible for implementing the changes. Choose **self** to assign it to yourself.

**Step 4** Click one of the following: .

- **Create**—The ticket is added to the list of tickets, but it is not opened. You need to open it before you can work within the context of the ticket.
- **Create and Open**—The ticket is added to the list of tickets and also opened.

## Opening a Ticket for Configuration Changes

Before you can make changes within a ticket, you must open the ticket.

If you have another ticket open, the system puts it on hold (closes it) for you before opening the new one.

### Procedure

---

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** On the **Tickets** tab, click **Open** (📄) or **More** (⋮) > **Open** for the ticket.

**Step 3** Optionally, enter a comment for the action.

**Step 4** Click **Open**.

You can now start your configuration changes. The name of the Ticket icon changes to the name of the open ticket.

---

## Previewing a Ticket

You can preview a ticket while making your configuration changes, or before approving it. The preview shows all configuration changes made within the context of the ticket.

### Procedure

---

**Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.

**Step 2** Click **Preview** (📄) for the ticket.

The Preview dialog box opens. Changes are color coded according to the legend at the top of the dialog box.

**Step 3** Select the policy whose changes you want to view in the Changed Policies list.

You are shown both the current version of the policy as it is defined in Secure Firewall Management Center (on the left) and the proposed changes defined within the ticket.

For policies that contain pages, such as Platform Settings, you can select the overall policy to see all changes, or specific pages within the policy, in the Changed Policies list.

You cannot alter the changes from within the preview. If you need to change something, you must close the preview and return to the policy you want to change.

**Step 4** Optionally, click **Download as PDF** to save the preview to a PDF file for offline viewing or archival purposes.

**Step 5** Click **OK**.

---

## Submitting a Ticket

After you have completed the changes needed for a ticket, you can preview and validate the changes. Then, when you are satisfied with the changes, submit the ticket for review and approval.

Changes made within the ticket are not applied until you submit the ticket and the ticket is approved. Until approval happens, all policies modified within a ticket are locked to that ticket and cannot be changed by anyone else.

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.
  - Step 2** Click **Submit for Approval** (📄) or **More** (⋮) > **Submit for Approval** for the open ticket.
  - Step 3** Optionally, enter a comment for your action.
  - Step 4** Click **Submit**.
- 

## Discarding a Ticket

If you no longer need to make the changes for which you created a ticket, you can discard the ticket. When you discard a ticket, any changes that you made within the ticket are removed.

You cannot undo this action and retrieve a ticket with its changes. If you need them, you must create a new ticket and start over.

You cannot discard a ticket after you submit it. However, if the approver rejects the ticket, you can then discard it.

---

**Note** If you have permission to modify tickets, you can discard tickets that belong to another user. This makes it possible to deal with situations where an admin is on vacation or otherwise unavailable to manage an in-process ticket.

---

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.
  - Step 2** Click **Discard** (🗑️) or **More** (⋮) > **Discard** for the ticket.
  - Step 3** Optionally, enter a comment for your action.
  - Step 4** Click **Discard**.
-

## Approving or Rejecting a Ticket

When a user submits a ticket, it must be approved for the changes made within the ticket to become active and available for deployment.

Whether you can approve your own tickets, or there is a separate approver, depends on your workplace policies and how user roles are assigned, not on the management software.

The Details view includes a summary of how many approvers are required for the ticket, and who has approved the ticket.

If the changes are inadequate or undesirable, you can reject the ticket. Rejected tickets go back to the submitter, who can then make additional changes and resubmit the ticket, or simply discard the ticket and the configuration changes it contains.

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Change Management Workflow**, or click the **Ticket** (📄) shortcut menu.
- Step 2** On the **Review** tab, click **Preview** (📄) for the ticket and evaluate the proposed changes.
- You can also click **Validate** (🔍) or **More** (⋮) > **Validate** to check for errors.
- Step 3** After completing your evaluation, do one of the following:
- To approve the ticket, click **Approve** (✅) or **More** (⋮) > **Approve**.
  - To disapprove the ticket, click **Reject** (❌) or **More** (⋮) > **Reject**.
- Step 4** Optionally, enter a comment for your action.
- Step 5** Click **Approve** or **Reject**, as appropriate.
- 

## History for Change Management

| Feature            | Minimum Firewall Management Center | Minimum Firewall Threat Defense | Details                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## CHAPTER 5

# Configuration Deployment

This chapter describes how to download configuration changes to one or more managed devices.

- [About Configuration Deployment, on page 171](#)
- [Requirements and Prerequisites for Policy Management, on page 181](#)
- [Best Practices for Deploying Configuration Changes, on page 182](#)
- [Deploy the Configuration, on page 183](#)
- [Manage Deployments, on page 191](#)
- [History for Configuration Deployment, on page 203](#)

## About Configuration Deployment

All device configuration is managed by the Firewall Management Center and then deployed to the managed devices.

## Configuration Changes that Require Deployment

The system marks out-of-date policies with red status text that indicates how many of its targeted devices need a policy update. To clear this status, you must re-deploy the policy to the devices.

### Deployment Required

Configuration changes that require a deployment include:

- Modifying an access control policy: any changes to access control rules, the default action, policy targets, Security Intelligence filtering, advanced options including preprocessing, and so on.
- Modifying any of the policies that the access control policy invokes: the SSL policy, network analysis policies, intrusion policies, file policies, identity policies, or DNS policies.
- Changing any reusable object or configuration used in an access control policy or policies it invokes:
  - network, port, VLAN tag, URL, and geolocation objects
  - Security Intelligence lists and feeds
  - application filters or detectors
  - intrusion policy variable sets

- file lists
- decryption-related objects and security zones
- Updating the system software, intrusion rules, or the vulnerability database (VDB).

Keep in mind that you can change some of these configurations from multiple places in the web interface. For example, you can modify security zones using the object manager (**Objects > Object Management**), but modifying an interface type in a device's configuration (**Devices > Device Management**) can also change a zone and require a deployment.

### Deployment Not Required

Note that the following updates do **not** require a deployment:

- automatic updates to Security Intelligence feeds and additions to the Security Intelligence global Block or Do Not Block list using the context menu
- automatic updates to URL filtering data
- scheduled geolocation database (GeoDB) updates

## Deployment Preview

Preview provides a snapshot of all the policy and object changes to be deployed on the device. The policy changes include the new policies, changes in the existing policies, and the deleted policies. The object changes include the added and modified objects which are used in policies. The unused object changes are not displayed because they are not deployed on the device.

Click the **Preview** icon next to a deployment job to view the configuration change log for that are pending to be deployed on the device. The change log includes:

- **Comparison View:** Displays a side-by-side comparison of all the device configuration changes made since your last deployment.
- **Advanced View:** Displays the pending CLI commands to be applied to the device.

For more information about viewing the deployment preview, see [Deploy Configuration Changes, on page 183](#).

The preview shows all the default values, even when they are not altered, along with the other configured settings when an interface or a platform settings policy is added for the first time. Similarly, the high availability-related policies and default values for settings are shown, even when they are not altered, in the first preview after a high availability pair is configured or disrupted.

To view changes due to an auto rollback, see [Edit Deployment Settings, on page 127](#).

### Unsupported Features

- Object additions and attribute changes are displayed in the preview only if the objects are associated with any device or interface. Object deletions are not displayed.
- Preview is not supported for the following policies:
  - High availability

- Network discovery
  - Network analysis
  - Device settings
- User information at the rule level is not available for intrusion policies.
  - The preview does not show the reordering of rules across policies.

For DNS policies, reordered rules appear in the preview list as rule additions and deletions. For example, moving a rule from position 1 to position 3 in the rule order is displayed as if the rule was deleted from position 1 and added as a new rule in position 3. Similarly, when a rule is deleted, the rules under it are listed as edited rules as they have changed their positions. The changes are displayed in the final order in which they appear in the policy.

- Preview is not supported in the following HA scenarios:
  - If a device was in standalone mode and if a chain is made, then an auto-deployment is triggered. For that particular job, preview is not supported. On hover over the **Preview** (🔍), a message is displayed that it is a HA bootstrap deployment, and no preview is supported.
  - **Configuration groups** - Consider a flow in which a device was initially standalone. Subsequently, three deployments took place. In the fourth deployment, the device was a HA bootstrap deployment. After these, the user deploys devices 5, 6, and 7. The deployment 7 is an HA break deployment, and the user deploys devices 8, 9, and 10.  
  
In this flow, the preview between 3 and 5 is not supported because 4 was a HA deployment. Similarly, the preview between 8 and 3 is also not supported. Preview is supported only from 3 to 1, 7, 6, 5, 4, and 10, 9, and 8.
- If a device is broken (HA is broken) then the new device is considered as a fresh device.

## Selective Policy Deployment

The Firewall Management Center allows you to select a specific policy within the list of all the changes on the device that are due for deployment and deploy only the selected policy. Selective deployment is available only for the following policies:

- Access control policies
- Intrusion policies
- Malware and file policies
- DNS policies
- Identity policies
- SSL policies
- QoS policies
- Prefilter policies
- Network discovery

- NAT policies
- Routing policies
- VPN policies

There are certain limitations to selectively deploying policies. Follow the contents in the table below to understand when selective policy deployment can be used.

**Table 9: Limitations for Selective Deployment**

| Type                         | Description                                                                                                                                                                                                                                                                               | Scenarios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Full deployment              | Full deployment is necessary for specific deploy scenarios, and the Firewall Management Center does not support selective deployment in such scenarios. If you encounter an error in such scenarios, you may choose to proceed by selecting all the changes for deployment on the device. | <p>Scenarios wherein a full deployment is required are:</p> <ul style="list-style-type: none"> <li>• The first deployment after you have upgraded the Firewall Threat Defense or the Firewall Management Center.</li> <li>• The first deployment after you have restored the Firewall Threat Defense.</li> <li>• The first deployment after modifications in the Firewall Threat Defense interface settings.</li> <li>• The first deployment after modifications in the virtual router settings.</li> <li>• When the Firewall Threat Defense device is moved to a new domain (global to sub-domain or sub-domain to global).</li> </ul>                        |
| Associated policy deployment | The Firewall Management Center identifies interdependent policies which are interlinked. When one of the interlinked policies is selected, the remaining interlinked policies are automatically selected.                                                                                 | <p>Scenarios wherein an associated policy is automatically selected:</p> <ul style="list-style-type: none"> <li>• When a new object is associated with an existing policy.</li> <li>• When an existing policy's object is modified.</li> </ul> <p>Scenarios wherein multiple policies are automatically selected:</p> <ul style="list-style-type: none"> <li>• When a new object is associated with an existing policy, and the same object is already associated with other policies, all the associated policies are automatically selected.</li> <li>• When a shared object is modified, all the associated policies are automatically selected.</li> </ul> |

| Type                                                         | Description                                                                                                                                                                                                           | Scenarios                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interdependent policy changes (shown using color-coded tags) | The Firewall Management Center dynamically detects dependencies in-between policies, and between the shared objects and the policies. The interdependency of the objects or policies is shown using color-coded tags. | <p>Scenarios wherein color-coded interdependent policies or objects are automatically selected:</p> <ul style="list-style-type: none"> <li>When all the out-of-date policies have interdependent changes.</li> </ul> <p>For example, when an access control policy, an intrusion policy, and a NAT policy are out-of-date. Since access control policy and NAT policy share an object, all policies are selected together for deployment.</p> <ul style="list-style-type: none"> <li>When all out-of-date policies share an object, and the object is modified.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Access Policy Group specifications                           | Access Policy Group policies are listed together in the preview window under <b>Access Policy Group</b> when you click <b>View</b> (👁).                                                                               | <p>The scenarios and the expected behavior for Access Policy Group policies are:</p> <ul style="list-style-type: none"> <li>If the access control policy is out-of-date, all other out-of-date policies under this group, except file policy and intrusion policy, are selected when the access control policy is selected for deployment.</li> </ul> <p>However, if the access control policy is out-of-date, intrusion and file policies can be individually selected or deselected irrespective of whether the access control policy is selected or not, unless there are any dependent changes. For example, if a new intrusion policy is assigned to an access control rule, it indicates that there are dependent changes, then both the access control policy and the intrusion policy will be automatically selected when either of them is selected.</p> <ul style="list-style-type: none"> <li>If no access control policy is out-of-date, other out-of-date policies in this group can be selected and deployed individually.</li> </ul> |

## System Username

The Firewall Management Center displays the username as **system** for the following operations:

- Rollback
- Upgrade
- Firewall Threat Defense backup and restore
- SRU update

- LSP update
- VDB update

## Auto-Enabling of Application Detectors

If you are performing application control but disable required detectors, the system automatically enables the appropriate system-provided detectors upon policy deploy. If none exist, the system enables the most recently modified user-defined detector for the application.

## Asset Rediscovery with Network Discovery Policy Changes

When you deploy changes to a network discovery policy, the system deletes and then rediscovers MAC address, TTL, and hops information from the network map for the hosts in your monitored networks. Also, the affected managed devices discard any discovery data that has not yet been sent to the Firewall Management Center.

## Snort Restart Scenarios

When the traffic inspection engine referred to as *the Snort process* on a managed device restarts, inspection is interrupted until the process resumes. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information. Additionally, resource demands may result in a small number of packets dropping without inspection when you deploy, regardless of whether the Snort process restarts.

Any of the scenarios in the following table cause the Snort process to restart.

**Table 10: Snort Restart Scenarios**

| Restart Scenario                                                                               | More Information                                                                                        |
|------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| Deploying a specific configuration that requires the Snort process to restart.                 | <a href="#">Configurations that Restart the Snort Process When Deployed or Activated, on page 180</a>   |
| Modifying a configuration that immediately restarts the Snort process.                         | <a href="#">Changes that Immediately Restart the Snort Process, on page 181</a>                         |
| Traffic-activation of the currently deployed Automatic Application Bypass (AAB) configuration. | <a href="#">Configure Automatic Application Bypass, on page 125</a>                                     |
| Enabling or disabling "Logging connection events to RAM disk" feature.                         | See the section <b>Log to Ramdisk</b> in <a href="#">Troubleshoot Drain of FMC Unprocessed Events</a> . |

## Restart Warnings for Devices

When you deploy, the **Inspect Interruption** column in the deploy page specifies whether a deployed configuration restarts the Snort process on the Firewall Threat Defense device. When the traffic inspection

engine referred to as *the Snort process* restarts, inspection is interrupted until the process resumes. Whether traffic is interrupted or passes without inspection during the interruption depends on how the device handles traffic. Note that you can proceed with the deployment, cancel the deployment and modify the configuration, or delay the deployment until a time when deploying would have the least impact on your network.

When the **Inspect Interruption** column indicates **Yes** and you expand the device configuration listing, the system indicates any specific configuration type that would restart the Snort process with an **Inspect Interruption** (). When you hover your mouse over the icon, a message informs you that deploying the configuration may interrupt traffic.

The following table summarizes how the deploy page displays inspection interruption warnings.

**Table 11: Inspection Interruption Indicators**

| Type                    | Inspect Interruption                                                                                                    | Description                                                                                                                                                                                                                                     |

For information on all configurations that restart the Snort process for all device types, see [Configurations that Restart the Snort Process When Deployed or Activated](#), on page 180.

## Inspect Traffic During Policy Apply

**Inspect traffic during policy apply** is an advanced access control policy general setting that allows managed devices to inspect traffic while deploying configuration changes; this is the case unless a configuration that you deploy requires the Snort process to restart. You can configure this option as follows:

- **Enabled** — Traffic is inspected during the deployment unless certain configurations require the Snort process to restart.

When the configurations you deploy do not require a Snort restart, the system initially uses the currently deployed access control policy to inspect traffic, and switches during deployment to the access control policy you are deploying.

- **Disabled** — Traffic is not inspected during the deployment. The Snort process always restarts when you deploy.

The following graphic illustrates how Snort restarts can occur when you enable or disable **Inspect traffic during policy apply**.

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#).

## Snort Restart Traffic Behavior

The following tables explain how different devices handle traffic when the Snort process restarts.

**Table 12: The Firewall Threat Defense and the Firewall Threat Defense Virtual Restart Traffic Effects**

| Interface Configuration                        | Restart Traffic Behavior                                                                                                                                                                                                                                          |
|------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| inline: <b>Snort Fail Open: Down:</b> disabled | dropped                                                                                                                                                                                                                                                           |
| inline: <b>Snort Fail Open: Down:</b> enabled  | <p>passed without inspection</p> <p>Some packets can be delayed in buffer for several seconds before the system recognizes that Snort is down. This delay can vary depending upon the load distribution. However, the buffered packets are eventually passed.</p> |

| Interface Configuration                                                                                                                                                                                                                                                                | Restart Traffic Behavior                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <p>routed, transparent (including EtherChannel, redundant, subinterface): <b>preserve-connection</b> disabled (<b>configure snort preserve-connection disable</b>)</p>                                                                                                                 | dropped                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| inline: tap mode                                                                                                                                                                                                                                                                       | egress packet immediately, copy bypasses Snort                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| passive                                                                                                                                                                                                                                                                                | uninterrupted, not inspected                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Note** In addition to traffic handling when the Snort process is down while it restarts, traffic can also pass without inspection or drop when the Snort process is busy, depending on the configuration of the Snort Fail Open **Busy** option (see [Configure an Inline Set, on page 783](#)). A device supports either the Failsafe option or the Snort Fail Open option, but not both.

**Note** When the Snort process is busy but not down during configuration deployment, some packets may drop on routed, switched, or transparent interfaces if the total CPU load exceeds 60 percent.

**Warning** Do not reboot the system while the Snort Rule Update is in progress.

Snort-busy drops happen when snort is not able to process the packets fast enough. Lina does not know whether Snort is busy due to processing delay, or if is stuck or due to call blocking. When transmission queue is full, snort-busy drops occur. Based on Transmission queue utilization, Lina will try to access if the queue is being serviced smoothly.

## Configurations that Restart the Snort Process When Deployed or Activated

Deploying any of the following configurations except AAB restarts the Snort process as described. Deploying AAB does not cause a restart, but excessive packet latency activates the currently deployed AAB configuration, causing a partial restart of the Snort process.

### Access Control Policy Advanced Settings

- Deploy when **Inspect Traffic During Policy Apply** is disabled.
- Add or remove an SSL policy.

### File Policy

Deploy the first or last of any one of the following configurations; note that while otherwise deploying these file policy configurations does not cause a restart, deploying non-file-policy configurations can cause restarts.

- Take either of the following actions:
  - Enable or disable **Inspect Archives** when the deployed access control policy includes at least one file policy.
  - Add the first or remove the last file policy rule when **Inspect Archives** is enabled (note that at least one rule is required for **Inspect Archives** to be meaningful).
- Enable or disable **Store files** in a **Detect Files** or **Block Files** rule.
- Add the first or remove the last active file rule that combines the **Malware Cloud Lookup** or **Block Malware** rule action with an analysis option (**Spero Analysis** or **MSEXE**, **Dynamic Analysis**, or **Local Malware Analysis**) or a store files option (**Malware**, **Unknown**, **Clean**, or **Custom**).

Note that access control rules that deploy these file policy configurations to security zones or tunnel zones cause a restart only when your configuration meets the following conditions:

- Source or destination security zones in your access control rule must match the security zones associated with interfaces on the target devices.
- Unless the destination zone in your access control rule is *any*, a source tunnel zone in the rule must match a tunnel zone assigned to a tunnel rule in the prefilter policy.

### Identity Policy

- When SSL decryption is disabled (that is, when the access control policy does not include an SSL policy), add the first or remove the last active authentication rule.

An active authentication rule has either an **Active Authentication** rule action, or a **Passive Authentication** rule action with **Use active authentication if passive or VPN identity cannot be established** selected.

### Network Discovery

- Enable or disable non-authoritative, traffic-based user detection over the HTTP, FTP, or MDNS protocols, using the network discovery policy.

### Device Management

- MTU: Change the highest MTU value among all non-management interfaces on a device.
- Automatic Application Bypass (AAB): The currently deployed AAB configuration activates when a malfunction of the Snort process or a device misconfiguration causes a single packet to use an excessive amount of processing time. The result is a partial restart of the Snort process to alleviate extremely high latency or prevent a complete traffic stall. This partial restart causes a few packets to pass without inspection, or drop, depending on how the device handles traffic.

### Updates

- System update: Deploy configurations the first time after a software update that includes a new version of the Snort binary or data acquisition library (DAQ).
- For managed devices running Snort 3, deploying configurations the first time after installing a vulnerability database (VDB) update may temporarily interrupt application detection, but there will be no traffic interruptions.

## Changes that Immediately Restart the Snort Process

The following changes immediately restart the Snort process without going through the deploy process. How the restart affects traffic depends on how the target device handles traffic. See [Snort Restart Traffic Behavior](#), on page 178 for more information.

- Take any of the following actions involving applications or application detectors:
  - Activate or deactivate a system or custom application detector.
  - Delete an activated custom detector.
  - **Save and Reactivate** an activated custom detector.
  - Create a user-defined application.

A message warns you that continuing restarts the Snort process, and allows you to cancel; the restart occurs on any managed device in the current domain or in any of its child domains.

- Create or break a Firewall Threat Defense high availability pair.

A message warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

# Best Practices for Deploying Configuration Changes

The following are guidelines for deploying configuration changes.

**Reliable Management Connection**

The management connection between the Firewall Management Center and the device is a secure, TLS-1.3-encrypted communication channel between itself and the device.

You do not need to run this traffic over an additional encrypted tunnel such as Site-to-Site VPN for security purposes. If the VPN goes down, for example, you will lose your management connection, so we recommend a simple management path.

**Caution**

We recommend against a device's management connection going through a VPN tunnel that terminates on the device itself. If you deploy a configuration change that causes the VPN to go down, the management connection will be disconnected and you will not have any way to recover the configuration without connecting directly to the device.

If management traffic exits a VPN-terminating interface, be sure to exclude the management traffic from the VPN tunnel.

**Maximum Concurrent Deployments**

You should not deploy to more than 25% of the maximum devices allowed for a Firewall Management Center in the same job. For example, for the FMCv300, the maximum job size should be 75 devices (25% of 300). Concurrent deployment to more devices can cause performance issues.

**Deployment of Shared Policies**

For best performance, deploy to devices that use the same policies. Create separate deployment jobs for each group of devices that share policies.

**Time to Deploy and Memory Limitations**

The time it takes to deploy depends on multiple factors, including (but not limited to):

- The configurations you send to the device. For example, if you dramatically increase the number of Security Intelligence entries you block, deployment can take longer.
- Device model and memory. On lower-memory devices, deploying can take longer.

Do not exceed the capability of your devices. If you exceed the maximum number of rules or policies supported by a target device, the system displays a warning. The maximum depends on a number of factors—not only memory and the number of processors on the device, but also on policy and rule complexity. For information on optimizing policies and rules, see [Best Practices for Access Control Rules, on page 1608](#).

### Use a Maintenance Window to Lessen the Impact of Traffic Interruptions

We *strongly* recommend you deploy in a maintenance window or at a time when interruptions will have the least impact.

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#).

For the Firewall Threat Defense devices, the **Inspect Interruption** column in the Deploy dialog warns you when deploying might interrupt traffic flow or inspection. You can either proceed with, cancel, or delay deployment; see [Restart Warnings for Devices, on page 176](#) for more information.

[Snort Restart Scenarios, on page 176](#)

## Deploy the Configuration

After you configure your deployment, and any time you change that configuration, you must deploy the changes to affected devices. You can view deployment status in the Message Center.

Deploying updates the following components:

- Device and interface configurations
- Device-related policies: NAT, VPN, QoS, platform settings
- Access control and related policies: DNS, file, identity, intrusion, network analysis, prefilter, SSL
- Network discovery policy
- Intrusion rule updates
- Configurations and objects associated with any of these elements

You can configure the system to deploy automatically by scheduling a deploy task or by setting the system to deploy when importing intrusion rule updates. Automating policy deployment is especially useful if you allow intrusion rule updates to modify system-provided base policies for intrusion and network analysis. Intrusion rule updates can also modify default values for the advanced preprocessing and performance options in your access control policies.

## Deploy Configuration Changes

After you change configurations, deploy them to the affected devices. We *strongly* recommend that you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#).

**Before you begin**

- Be sure all managed devices use the same revision of the Security Zones object. If you have edited security zone objects: Do not deploy configuration changes to any device until you edit the zone setting for interfaces on *all* devices you want to sync. You must deploy to all managed devices at the same time.
- To preview the deployment changes, enable REST API access. To enable the REST API access, follow the steps in *Enabling REST API Access* in the [Cisco Secure Firewall Management Center Administration Guide](#).

**Note**

The deployment process fails if the device configuration is being read at the device CLI during deployment. Do not execute commands such as **show running-config** during the deployment.

**Procedure**

- 
- Step 1** On the Firewall Management Center menu bar, click **Deploy**.
- Step 2** For a quick deployment, check specific devices and then click **Deploy**, or click **Deploy All** to deploy to all devices. Otherwise, for additional deployment options, click **Advanced Deploy**.
- The rest of this procedure applies to the **Advanced Deploy** screen.

Figure 81: Quick Deploy

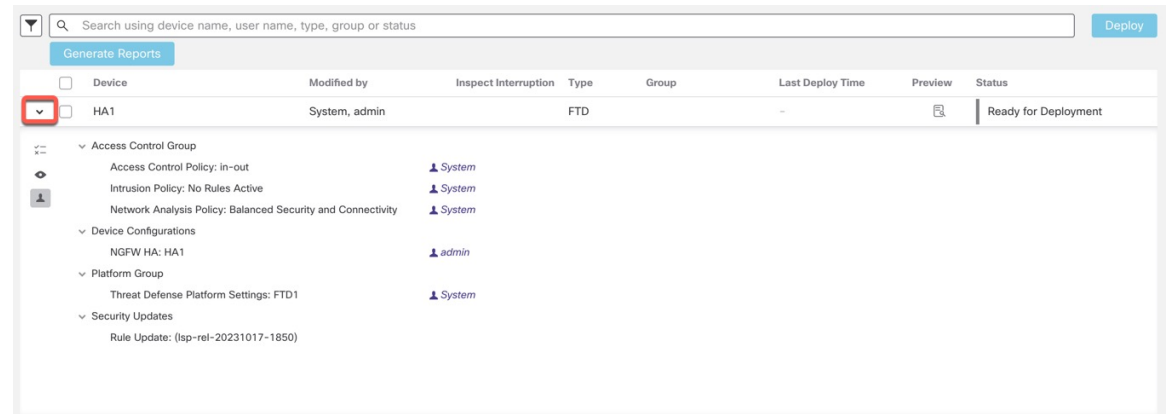

Figure 82: Advanced Deploy

**Step 3** Click **Expand Arrow** ( ▾ ) to view device-specific configuration changes to be deployed.

Figure 83: Expand

- The **Modified By** column lists the users who have modified the policies or objects. On expanding the device listing, you can view the users who have modified the policies against each policy listing. For information about when the **System** user is shown (instead of the logged-in user), see [System Username](#), on page 175.

#### Note

Usernames are not provided for deleted policies and objects.

The **Filter** (  ) lets you filter the policies at the user level and policy level.

The right pane lists all the additions, changes, or deletions in the policy, or the object selected in the left pane. The two columns on the right pane provide the last deployed configuration settings (in the **Deployed Version** column) versus the changes that are due for deployment (in the **Version on Firewall Management Center** column). The last-deployed configuration settings are derived from a snapshot of the last saved deployment in the Firewall Management Center and not from the device. The background colors of the settings are color-coded as per the legend available on the top-right of the page.

The **Modified By** column lists the users who have modified, or added the configuration settings. At the policy level, the Firewall Management Center displays all the users who have modified the policy, and at the rule level, the Firewall Management Center displays only the last user who has modified the rule.

You can download a copy of the change log by clicking the **Download Report** button.

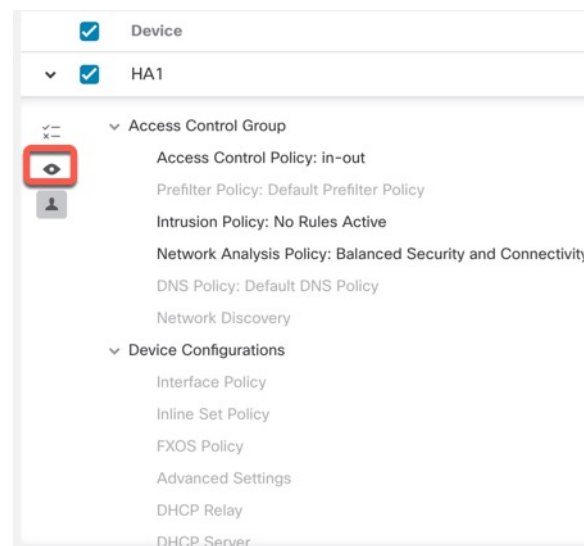

The **Advanced View** tab shows the CLI commands that will be applied. This view is useful if you are familiar with ASA CLI, which is used on the back end of the Firewall Threat Defense.

**Figure 86: Advanced View**

**Step 5** Use **Show or Hide Policy** (  ) to selectively view or hide the associated unmodified policies.

**Figure 87: Show or Hide Policy**

**Step 6** Check the box next to the device name to deploy all configuration changes, or click **Policy selection** (  ) to select individual policies or configurations to deploy while withholding the remaining changes without deploying them.

You can also view the interdependent changes for a certain policy or configuration using this option. The Firewall Management Center dynamically detects dependencies between policies (for example, between an access control policy and an intrusion policy), and between the shared objects and the policies. Interdependent changes are indicated using color-coded tags to identify a set of interdependent deployment changes. When one of the deployment changes is selected, the interdependent changes are automatically selected.

For more details, see [Selective Policy Deployment, on page 173](#).

**Note**

- When the changes in shared objects are deployed, the impacted policies should also be deployed along with them. When you select a shared object during deployment, the impacted policies are automatically selected.
- Selective deployment is not supported for scheduled deployments and deployments using REST APIs. You can only opt for complete deployment of all the changes in these cases.
- The pre-deployment checks for warnings and errors are performed not only on the selected policies, but on all the policies that are out-of-date. Therefore, the warnings or errors list shows the deselected policies as well.
- Similarly, the **Inspect Interruption** column indication on the Deployment page considers all out-of-date policies and not just the selected policies. For information on the **Inspect Interruption** column, see [Restart Warnings for Devices, on page 176](#).

**Step 7** After you select the devices or policies to deploy, click **Estimate** to get a rough estimate of the deployment duration.

**Figure 88: Estimate**

**Figure 89: Deploy Time**

The time duration is a rough estimate (having around 70% accuracy), and the actual time taken for deployment may vary for a few scenarios. The estimate is dependable for deployments of up to 20 devices.

When an estimate is not available, it indicates that the data is not available, since the first successful deployment on the selected device is pending. This situation could occur after the Firewall Management Center reimaging, version upgrade, or after a high availability failover.

**Note**

The estimate is incorrect and unreliable for bulk policy changes (in case of bulk policy migrations), and selective deployments because the estimate is based on the heuristic technique.

**Step 8** Click **Deploy**.

**Step 9** If the system identifies errors or warnings in the changes to be deployed, it displays them in the **Validation Messages** window. To view complete details, click the arrow icon before the warnings or errors.

You have the following choices:

- **Deploy**—Continue deploying without resolving warning conditions. Check the **Ignore warnings** checkbox, to ignore warnings and deploy the changes. You cannot proceed if the system identifies errors.
- **Close**—Exit without deploying. Resolve the error and warning conditions, and attempt to deploy the configuration again.

---

### What to do next

- (Optional) Monitor deployment status; see *Viewing Deployment Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- If the deployment fails, see [Best Practices for Deploying Configuration Changes, on page 182](#).
- During deployment, if there are specific configuration changes in the deployment, the deployment failure may lead to traffic being interrupted. For example, in a cluster environment, an erroneous configuration of an IP address that is not in the same subnet as the Site IPs is configured on the interface. Due to this error, deployment fails and the device attempts to clear the configuration while the rollback operation is being processed. These events collectively lead to a deployment failure that interrupts the traffic.

See the following table to know what configuration changes may cause traffic interruption when deployment fails.

| Configuration Changes                                      | Exists? | Traffic Impacted? |
|------------------------------------------------------------|---------|-------------------|
| Threat Defense Service changes in an access control policy | Yes     | Yes               |
| VRF                                                        | Yes     | Yes               |
| Interface                                                  | Yes     | Yes               |

## Redeploy Existing Configurations to a Device

You can force-deploy existing (unchanged) configurations to a single managed device. We *strongly* recommend you deploy in a maintenance window or at a time when any interruptions to traffic flow and inspection will have the least impact.

**Caution**

When you deploy, resource demands may result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the target device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) and [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#).

**Before you begin**

Review the guidelines described in [Best Practices for Deploying Configuration Changes, on page 182](#).

**Procedure**

**Step 1** Choose **Devices > Device Management**.

**Step 2** Click **Edit** (✎) next to the device where you want to force deployment.

**Step 3** Click **Device**.

**Step 4** Click **Edit** (✎) next to the **General** section heading.

**Step 5** Click **Force Deploy** (➡).

**Note**

Force-deploy takes more time than the regular deployment because it involves the complete generation of the policy rules to be deployed on the Firewall Threat Defense.

**Step 6** Click **Deploy**.

The system identifies any errors or warnings with the configurations you are deploying. You can click **Proceed** to continue without resolving warning conditions. However, you cannot proceed if the system identifies an error.

**What to do next**

- (Optional) Monitor deployment status; see *Viewing Deployment Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- If deploy fails, see [Best Practices for Deploying Configuration Changes, on page 182](#).

**Related Topics**

[Snort Restart Scenarios, on page 176](#)

# Manage Deployments

## View Deployment Status

On the Deployment page, the **Status** column provides the deployment status for each device. If a deployment is in progress, then the live status of the deployment progress is displayed, else one of the following statuses is displayed:

- Pending—Indicates that there are changes in the device that are to be deployed.
- Warnings or errors—Indicates that the pre-deployment checks have identified warnings or errors for the deployment, and you have not proceeded with the deployment. You can continue with the deployment if there are any warnings, but not if there are any errors.

---

**Note** The status column provides the warning or error status only for a single user session on the deployment page. If you navigate away from the page or refresh the page, the status changes to pending.

---

- Failed—Indicates that the previous deployment attempt failed. Click on the status to view the details.
- In queue—Indicates that deployment is initiated, and the system is yet to start the deployment process.
- Completed—Indicates that deployment has completed successfully.

## View Deployment History

In the deployment history, the last 10 successful deployments, the last 5 failed deployments, and last 5 rollback deployments are captured.

### Procedure

---

- Step 1** On the Firewall Management Center menu bar, click **Deploy** and then click **Deployment History** (🔍).

Figure 90: Deployment History Icon

A list of all the previous deployment and rollback jobs is displayed in reverse chronological order.

Figure 91: Deployment History Page

Figure 94: Transcript Details

The transcript includes the following sections:

- **Snort Apply**—If there are any failures or responses from Snort-related policies, then the messages are displayed in this section. Normally, the section is empty.
- **CLI Apply**—This section covers features that are configured using commands that are sent to the device.

**Note**

The transcript for the rollback operation does not provide the CLI commands information. To view the rollback commands, see [View the Deployment Rollback Transcript, on page 200](#).

- **Infrastructure Messages**—This section shows the status of different deployment modules.

In the **CLI Apply** section, the deployment transcript includes commands that are sent to the device, and any responses returned from the device. These responses can be informative messages or error messages. For failed deployments, look for messages that indicate errors with the commands. Examining these errors can

be particularly helpful if you are using FlexConfig policies to configure customized features. These errors can help you correct the script in the FlexConfig object that is trying to configure the commands.

#### Note

There is no distinction that is made in the transcript between commands that are sent for managed features and those generated from FlexConfig policies.

For example, the following sequence shows that Firewall Management Center sent commands to configure GigabitEthernet0/0 with the logical name **outside**. The device responded that it automatically set the security level to 0. Firewall Threat Defense does not use the security level for anything.

===== CLI APPLY =====

FMC >> interface GigabitEthernet0/0

FMC >> nameif outside

FTDv 192.168.0.152 >> [info] : INFO: Security level for "outside" set to 0 by default.

#### Step 4

(Optional) Click **Preview** (📄) to view the policy and object changes deployed on the device versus the previously deployed version.

Figure 95: Preview Icon

| Job Name      | Deployed by | Start Time            | End Time             | Status | Deployment Notes |

Changed Policies

Access Control Policy

#### Note

The drop-down boxes also show failed deployments.

- The **Modified By** column lists the users who have modified the policies or objects.
  - At the policy level, Firewall Management Center displays all the user names who have modified the policy.
  - At the rule level, Firewall Management Center displays the last user who has modified the rule.
- You can also download a copy of the change log by clicking **Download Report**.

**Note**

- Deployment history preview is not supported for certificate enrollments, HA operations, and failed deployments.
- When a device is registered, preview is not supported for the job history record that is created.

**Step 5** (Optional) Against each deployment job, click the **More** (⋮) icon and execute other actions:

- **Bookmark**—To bookmark the deployment job.
- **Edit Deployment Notes**—To edit your custom deployment notes that you added for a deployment job.
- **Generate Report**—To generate a deployment report, which can be used for auditing. This report includes job properties with preview and transcript information, and the report can be downloaded as a PDF file.
  - Click **Generate Report** to generate a deployment report.

**Figure 97: Generate Report**

Job Name Deploy\_Job\_1

Number of device(s) 1

Email ☒

Relay Host No Relay Host  

Recipient List

Cancel Generate

- In the **Generate Report** popup window, check the **Email** checkbox.
- The report can also be sent through email if mail relay host is configured. If the mail relay host is not configured, use the **Edit** (✎) icon to configure or modify the mail relay host. For more information, see *Configuring a Mail Relay Host and Notification Address* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- In the **Recipient List**, you can enter multiple email addresses, separated by semicolons.
- Click **Generate** to generate the report, and this report is emailed to the recipients.
- In the Notifications task tab, you can track the progress. After the report generation is complete, click the link in the notification task tab to download the PDF report.

## Set the Number of Configuration Versions

The Firewall Management Center stores device configuration history files on the disk as configuration versions. You can specify the number of configuration versions that you want to retain for a device. This setting allows you to estimate the size of the device configuration files on the disk and keep it within the allowed limit.

Reducing the number of configuration versions can reduce the backup size and improve the high-availability synchronization speed of the Firewall Management Center.

In a Firewall Management Center high-availability deployment, configuration version setting is available only on the active Firewall Management Center.

### Before you begin

This feature is not supported in Version 7.4.0.

### Procedure

- 
- Step 1** On the Firewall Management Center menu bar, choose **Deploy > Deployment History** (🔍).
  - Step 2** Click **Deployment Setting**.
  - Step 3** Choose the number of configuration versions that you want to retain for a device from the **Number of Versions to Retain** drop-down list.

#### Note

Reducing the number of versions removes the oldest configuration versions to match the version size you have selected. You cannot roll back or preview the removed versions.

- **Maximum Permitted Disk Size:** The maximum size for storing configuration versions is 20 GB. The Firewall Management Center calculates the size of configuration versions periodically and sends a health alert if the size of the configuration versions exceeds 20 GB. To resolve the health alert, choose a **Number of Versions to Retain** for which the estimated configuration version size is less than 20 GB.
- **Current Configuration Version Size:** The size of the configuration files on the Firewall Management Center for the previous deployment.
- **Estimated Configuration Version Size:** The approximate size of the configuration files on the Firewall Management Center. It is calculated based on the number of configuration versions you chose to retain.

- Step 4** Click **Save**.
- 

## Roll Back a Deployment

You can roll back a device to a previously deployed configuration. After a policy deployment, if the traffic through the device is affected in an unintended way, rollback provides an option to revert the device to the earlier state, which existed before the faulty deployment.

Rollback is a disruptive operation: all the existing connections and routes are dropped, and the traffic is disrupted.

### Identifying the Disruptive Configuration

When a deployment has gone awry and caused traffic interruption in an unintended way, you should identify the change in the deployment that caused the condition and fix it so your next deployment will be successful.

See the following ways to compare configurations.

### Before a Rollback

1. Choose **Deploy > Deployment History**, expand the last deployed job (that caused the traffic disruption), and click the **Preview** (🔍).

The preview page provides an option to compare deployments, which can be useful to identify specific changes for a deployment compared to a previous deployment.

2. After identifying the change causing the problem, rectify the configuration, and redeploy it on the device.

### After a Rollback

1. After a successful rollback operation, choose **Deploy > Deployment**, and click the **Preview** icon next to the rolled back device.
2. View the changes between the rolled back configuration and the current changes in the Firewall Management Center that are pending deployment.
3. After identifying the change causing the problem, rectify the configuration, and redeploy it on the device.

### Rollback Guidelines and Limitations

- You can roll back to any one of the last 10 versions before the currently deployed version. Rollback to versions prior to these are not supported. The rollback icon is greyed out for unsupported versions.
- You have to perform a deployment before you can roll back again.
- After you perform a rollback, the rolled back devices are marked as out-of-date on the Firewall Management Center. The changes you made to the configuration are still pending for the next deployment. To see the pending changes, choose **Deploy > Deployment**, and click the **Preview** icon next to the rolled back device.
- For devices with very large access lists, if the **Object Group Search** setting is disabled, then the rollback operation may take a longer duration to complete. To verify the **Object Group Search** setting, choose **Devices > Device Management**, and then select the device and click **Edit Advanced Settings**.
- For the Firepower 4100/9300, make sure your current Firewall Chassis Manager interface configuration is the same for any rollback versions. Otherwise, the rollback interface configuration may not match your actual interfaces.
- Rollback is not supported if the manager access interface (Manager or data interface) is different between the rollback version and the current version.
- Independent certificate enrollments are also listed as deployment jobs in the Deployment History page. However, you cannot roll back to these versions. A rollback from a deployment version created after certificate enrollments reverts the certificate associations as well. In the next deployment after a rollback, manually associate the certificates before proceeding with the deployment.
- If you upgrade the Firewall Management Center, all rollback versions from the previous software release will no longer be available for devices, even if you did not upgrade the devices.
- If you upgrade the device, you can only roll back to versions on the current software release.
- If a deployment for a device with a FlexConfig object configured with a deployment frequency set to **Once** is rolled back, then you will not be able to redeploy the object even though it is displayed as out-of-date on the Preview page. After a rollback, you will have to manually unassign and then reassign the FlexConfig object to the device before the next deployment.

- For High Availability, rollback is not supported in the following scenarios:
  - When the version you want to roll back to contains the high-availability bootstrap configuration. In other words, the deployment when you first formed high availability for the standalone devices.
  - When a device that is currently in standalone mode was part of a high availability pair in the previous deployment version.
- For clustering, see the following guidelines:
  - Rollback is not supported when a device that is currently in standalone mode was part of a cluster in the previous deployment version.
  - (Secure Firewall 3100/4200 and Firewall Threat Defense Virtual in a private cloud) If you change the clustering bootstrap configuration or add or delete nodes, you cannot roll back to a version prior to those changes.

### Configurations Not Reverted After a Rollback

Rollback reverts all the configurations on the device except a few. See the table below for details.

| Configurations that are reverted during a rollback                                                                                                                                                                                                                       | Configurations that are not reverted during a rollback                               |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>• All policy configurations</li> <li>• Interface configurations</li> <li>• SRU configurations</li> <li>• VDB configurations</li> <li>• LSP configurations</li> <li>• VPN configurations</li> <li>• FXOS configurations</li> </ul> | <ul style="list-style-type: none"> <li>• Snort binaries</li> <li>• Geo DB</li> </ul> |

## Perform a Rollback

You can roll back a device to a previously deployed configuration. After a policy deployment, if the traffic through the device is affected in an unintended way, rollback provides an option to revert the device to the earlier state, which existed before the faulty deployment.

Rollback reverts the configuration only on the selected devices.

### Procedure

- 
- Step 1** Choose **Deploy >Deployment History** (🕒).
- A list of all the previous deployment jobs is displayed in reverse chronological order.
- Step 2** Click **Rollback**.

- Step 3** Filter the list of devices displayed by either clicking **Job** and choosing a job from the **Selected Job** drop-down list, or by clicking **Device List**.
- Step 4** (Optional) Enter the device name in the **Search Device** search box to filter the device list.
- Step 5** Check the box next to the devices you want to roll back and choose the version for each device from the **Rollback Version** drop-down list.

The job names and associated deployment notes are also listed for a particular rollback version.

- Step 6** (Optional) Click the **Preview** () to view the changes deployed in the selected version.
- Step 7** Click **Rollback**.

**What to do next**

To know the status of the rollback, choose **Deploy > Deployment**. You can view the rollback status next to the device name.

**View the Deployment Rollback Transcript**

Rollback transcript is a written version of the commands that are sent to the device, along with the responses returned from the device. If a rollback operation has failed, the transcript in the **Deploy > Deployment History** page provides the reason for the failure. However, to know the CLI commands executed for a successful rollback operation, follow the steps given below after a rollback operation has completed. Note that this information is available only until the next deployment.

**Note** The CLI command information is available after a rollback is complete and is available only until the next deployment. The first deployment after a rollback operation erases all the rollback-related information.

**Note** For any rollback deployment, the Deployment Notes are updated automatically as Rollback Job. In the **Deployment History** page, the user can filter the Rollback Jobs easily using the Search option.

**Procedure**

- Step 1** On the Secure Firewall Management Center menu bar, choose **System (⚙️) > Health > Monitor**.
- Step 2** Select the device, which was rolled back, from the left pane.
- Step 3** Click **View System & Troubleshooting Details** link.
- Step 4** Click **Advanced Troubleshooting**.
- Step 5** Click **Threat Defense CLI**.
- Step 6** Select **show** from the **Command** drop-down box.
- Step 7** Enter **running** in the **Parameter** field.
- Step 8** Click **Execute**.

**Download Policy Changes Report for Multiple Devices**

Download reports on the policy and object changes made since your last deployment for multiple Firewall Threat Defense devices. You can download the reports in the form of a zip file that contains the following reports:

- A pending changes report for each device, that previews the additions, updates, or deletions in the policy, or the objects that are to be deployed on the device. For more information, see [Deploy Configuration Changes, on page 183](#) and [Deployment Preview](#).
- A consolidated report that categorizes each device based on the report status.

## Procedure

- 
- Step 1** Choose **Deploy > Advanced Deploy**.
- Step 2** Check the check box next to the devices for which you want to generate a pending policy changes report, and then click **Pending Changes Reports**.
- Step 3** Click **Pending Changes Reports**. Reports are generated in the background.
- Step 4** On the Firewall Management Center menu bar, choose **Notifications > Tasks** to view the report generation task.
- When the report request task is complete, the download link appears within the task notification.
- Step 5** Click the **Download Report(s)** link to download the reports.
- 

## Compare Policies

To review policy changes for compliance with your organization's standards or to optimize system performance, you can examine the differences between two policies or between a saved policy and the running configuration.

You can compare the following policy types:

- DNS
- File
- Health
- Identity
- Network Analysis
- SSL

The comparison view displays both policies in a side-by-side format. Differences between the two policies are highlighted:

- Blue indicates that the highlighted setting is different in the two policies, and the difference is noted in red text.
- Green indicates that the highlighted setting appears in one policy but not the other.

### Before you begin

You can compare policies only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

## Procedure

- 
- Step 1** Access the management page for the policy you want to compare:

- DNS—**Policies > Access Control heading > DNS**
- File—**Policies > Access Control heading > Malware & File**
- Health—**System (⚙️) > Health > Policy**
- Identity—**Policies > Access Control heading > Identity**
- Network Analysis—**Policies > Access Control heading > Access Control**, and then click **Network Analysis Policy** or **Policies > Access Control heading > Intrusion**, and then click **Network Analysis Policies**.

**Note**

If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control heading > Decryption**

**Step 2** Click **Compare Policies**.

**Step 3** From the **Compare Against** drop-down list, choose the type of comparison you want to make:

- To compare two different policies, choose **Other Policy**.
- To compare two revisions of the same policy, choose **Other Revision**.
- To compare another policy to the currently active policy, choose **Running Configuration**.

**Step 4** Depending on the comparison type you choose, you have the following choices:

- If you are comparing two different policies, choose the policies you want to compare from the **Policy A** and **Policy B** drop-down lists.
- If you are comparing the running configuration to another policy, choose the second policy from the **Policy B** drop-down list.

**Step 5** Click **OK**.

**Step 6** Review the comparison results:

- Comparison Viewer—To use the comparison viewer to navigate individually through policy differences, click **Previous** or **Next** above the title bar.
- Comparison Report—To generate a PDF report that lists the differences between the two policies, click **Comparison Report**.

## Generate Current Policy Reports

For most policies, you can generate two kinds of reports. A report on a single policy provides details on the policy's current saved configuration, while a comparison report lists only the differences between two policies. You can generate a single-policy report for all policy types except health.

**Note**

Intrusion policy reports combine the settings in the base policy with the settings of the policy layers, and make no distinction between which settings originated in the base policy or policy layer.

### Before you begin

You can generate policy reports only if you have access rights and any required licenses for the specific policy, and you are in the correct domain for configuring the policy.

### Procedure

**Step 1** Access the management page for the policy for which you want to generate a report:

- Access Control—**Policies > Access Control heading > Access Control**
- DNS—**Policies > Access Control heading > DNS**
- File—**Policies > Access Control heading > Malware & File**
- Health—**System (⚙️) > Health > Policy**
- Identity—**Policies > Access Control heading > Identity**
- Intrusion—**Policies > Access Control heading > Intrusion**
- NAT—**Devices > NAT**
- Network Analysis—**Policies > Access Control heading > Access Control**, and then click **Network Analysis Policy** or **Policies > Access Control heading > Intrusion**, and then click **Network Analysis Policies**

**Note**

If your custom user role limits access to the first path listed here, use the second path to access the policy.

- SSL—**Policies > Access Control heading > Decryption**

**Step 2** Click **Report** (📄) next to the policy for which you want to generate a report.

## History for Configuration Deployment

## CHAPTER 6

# Transparent or Routed Firewall Mode

This chapter describes how to set the firewall mode to routed or transparent, as well as how the firewall works in each firewall mode.

### Note

The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes. See [Inline Sets and Passive Interfaces, on page 775](#) for more information about IPS-only interfaces. Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode described in this chapter or the firewall-type interfaces.

### Caution

- Use FTD CLI commands to set "Firewall Mode."

- [About the Firewall Mode, on page 209](#)
- [Default Settings, on page 217](#)
- [Guidelines for Firewall Mode, on page 217](#)
- [Set the Firewall Mode, on page 218](#)

## About the Firewall Mode

The Firewall Threat Defense supports two firewall modes for regular firewall interfaces: Routed Firewall mode and Transparent Firewall mode.

### About Routed Firewall Mode

In routed mode, the Firewall Threat Defense device is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet.

With Integrated Routing and Bridging, you can use a "bridge group" where you group together multiple interfaces on a network, and the Firewall Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. The Firewall Threat Defense device routes between BVIs and regular routed interfaces. If you do not need clustering or EtherChannel member interfaces, you might consider using routed

mode instead of transparent mode. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.

## About Transparent Firewall Mode

Traditionally, a firewall is a routed hop and acts as a default gateway for hosts that connect to one of its screened subnets. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices. However, like any other firewall, access control between interfaces is controlled, and all of the usual firewall checks are in place.

Layer 2 connectivity is achieved by using a "bridge group" where you group together the inside and outside interfaces for a network, and the Firewall Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. You can have multiple bridge groups for multiple networks. In transparent mode, these bridge groups cannot communicate with each other.

## Using the Transparent Firewall in Your Network

The Firewall Threat Defense device connects the same network between its interfaces. Because the firewall is not a routed hop, you can easily introduce a transparent firewall into an existing network.

The following figure shows a typical transparent firewall network where the outside devices are on the same subnet as the inside devices. The inside router and hosts appear to be directly connected to the outside router.

**Figure 100: Transparent Firewall Network**

92411

## Passing Traffic For Routed-Mode Features

For features that are not directly supported on the transparent firewall, you can allow traffic to pass through so that upstream and downstream routers can support the functionality. For example, by using an access rule,

you can allow DHCP traffic (instead of the unsupported DHCP relay feature) or multicast traffic such as that created by IP/TV. You can also establish routing protocol adjacencies through a transparent firewall; you can allow OSPF, RIP, EIGRP, or BGP traffic through based on an access rule. Likewise, protocols like HSRP or VRRP can pass through the Firewall Threat Defense device.

## About Bridge Groups

A bridge group is a group of interfaces that the Firewall Threat Defense device bridges instead of routes. Bridge groups are supported in both transparent and routed firewall mode. Like any other firewall interfaces, access control between interfaces is controlled, and all of the usual firewall checks are in place.

### Bridge Virtual Interface (BVI)

Each bridge group includes a Bridge Virtual Interface (BVI). The Firewall Threat Defense device uses the BVI IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the bridge group member interfaces. The BVI does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.

In transparent mode: Only bridge group member interfaces are named and can be used with interface-based features.

In routed mode: The BVI acts as the gateway between the bridge group and other routed interfaces. To route between bridge groups/routed interfaces, you must name the BVI. For some interface-based features, you can use the BVI itself:

- DHCPv4 server—Only the BVI supports the DHCPv4 server configuration.
- Static routes—You can configure static routes for the BVI; you cannot configure static routes for the member interfaces.
- Syslog server and other traffic sourced from the Firewall Threat Defense device—When specifying a syslog server (or SNMP server, or other service where the traffic is sourced from the Firewall Threat Defense device), you can specify either the BVI or a member interface.

If you do not name the BVI in routed mode, then the Firewall Threat Defense device does not route bridge group traffic. This configuration replicates transparent firewall mode for the bridge group. If you do not need clustering or EtherChannel member interfaces, you might consider using routed mode instead. In routed mode, you can have one or more isolated bridge groups like in transparent mode, but also have normal routed interfaces as well for a mixed deployment.

### Bridge Groups in Transparent Firewall Mode

Bridge group traffic is isolated from other bridge groups; traffic is not routed to another bridge group within the Firewall Threat Defense device, and traffic must exit the Firewall Threat Defense device before it is routed by an external router back to another bridge group in the Firewall Threat Defense device. Although the bridging functions are separate for each bridge group, many other functions are shared between all bridge groups. For example, all bridge groups share a syslog server or AAA server configuration.

You can include multiple interfaces per bridge group. See [Guidelines for Firewall Mode, on page 217](#) for the exact number of bridge groups and interfaces supported. If you use more than 2 interfaces per bridge group, you can control communication between multiple segments on the same network, and not just between inside and outside. For example, if you have three inside segments that you do not want to communicate with each other, you can put each segment on a separate interface, and only allow them to communicate with the outside interface. Or you can customize the access rules between interfaces to allow only as much access as desired.

The following figure shows two networks connected to the Firewall Threat Defense device, which has two bridge groups.

**Figure 101: Transparent Firewall Network with Two Bridge Groups**

## Bridge Groups in Routed Firewall Mode

Bridge group traffic can be routed to other bridge groups or routed interfaces. You can choose to isolate bridge group traffic by not assigning a name to the BVI interface for the bridge group. If you name the BVI, then the BVI participates in routing like any other regular interface.

One use for a bridge group in routed mode is to use extra interfaces on the Firewall Threat Defense instead of an external switch. For example, the default configuration for some devices include an outside interface as a regular interface, and then all other interfaces assigned to the inside bridge group. Because the purpose of this bridge group is to replace an external switch, you need to configure an access policy so all bridge group interfaces can freely communicate.

**Figure 102: Routed Firewall Network with an Inside Bridge Group and an Outside Routed Interface**

## Allowing Layer 3 Traffic

- Unicast IPv4 and IPv6 traffic requires an access rule to be allowed through the bridge group.
- ARPs are allowed through the bridge group in both directions without an access rule. ARP traffic can be controlled by ARP inspection.
- IPv6 neighbor discovery and router solicitation packets can be passed using access rules.
- Broadcast and multicast traffic can be passed using access rules.

## Allowed MAC Addresses

The following destination MAC addresses are allowed through the bridge group if allowed by your access policy (see [Allowing Layer 3 Traffic, on page 213](#)). Any MAC address not on this list is dropped.

- TRUE broadcast destination MAC address equal to FFFF.FFFF.FFFF
- IPv4 multicast MAC addresses from 0100.5E00.0000 to 0100.5EFE.FFFF
- IPv6 multicast MAC addresses from 3333.0000.0000 to 3333.FFFF.FFFF
- BPDU multicast address equal to 0100.0CCC.CCCD

## BPDU Handling

To prevent loops using the Spanning Tree Protocol, BPDUs are passed by default.

By default BPDUs are also forwarded for advanced inspection, which is unnecessary for this type of packet, and which can cause problems if they are blocked due to an inspection restart, for example. We recommend

that you always exempt BPDUs from advanced inspection. To do so, use FlexConfig to configure an EtherType ACL that trusts BPDUs and exempts them from advanced inspection on each member interface. See [FlexConfig Policies, on page 2477](#).

The FlexConfig object should deploy the following commands, where you replace <if-name> with an interface name. Add as many access-group commands as needed to cover each bridge group member interface on the device. You can also choose a different name for the ACL.

```
access-list permit-bpdu ethertype trust bpdu
access-group permit-bpdu in interface <if-name>
```

## MAC Address vs. Route Lookups

For traffic within a bridge group, the outgoing interface of a packet is determined by performing a destination MAC address lookup instead of a route lookup.

Route lookups, however, are necessary for the following situations:

- Traffic originating on the Firewall Threat Defense device—Add a default/static route on the Firewall Threat Defense device for traffic destined for a remote network where a syslog server, for example, is located.
- Voice over IP (VoIP) and TFTP traffic, and the endpoint is at least one hop away—Add a static route on the Firewall Threat Defense device for traffic destined for the remote endpoint so that secondary connections are successful. The Firewall Threat Defense device creates a temporary "pinhole" in the access control policy to allow the secondary connection; and because the connection might use a different set of IP addresses than the primary connection, the Firewall Threat Defense device needs to perform a route lookup to install the pinhole on the correct interface.

Affected applications include:

- H.323
  - RTSP
  - SIP
  - Skinny (SCCP)
  - SQL\*Net
  - SunRPC
  - TFTP
- Traffic at least one hop away for which the Firewall Threat Defense device performs NAT—Configure a static route on the Firewall Threat Defense device for traffic destined for the remote network. You also need a static route on the upstream router for traffic destined for the mapped addresses to be sent to the Firewall Threat Defense device.

This routing requirement is also true for embedded IP addresses for VoIP and DNS with NAT enabled, and the embedded IP addresses are at least one hop away. The Firewall Threat Defense device needs to identify the correct egress interface so it can perform the translation.

Figure 103: NAT Example: NAT within a Bridge Group

## Unsupported Features for Bridge Groups in Transparent Mode

The following table lists the features are not supported in bridge groups in transparent mode.

Table 13: Unsupported Features in Transparent Mode

| Feature                 | Description                                                                                                                                                                                                                                                                                                                                    |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic DNS             | —                                                                                                                                                                                                                                                                                                                                              |
| DHCPv6 stateless server | Only the DHCPv4 server is supported on bridge group member interfaces.                                                                                                                                                                                                                                                                         |
| DHCP relay              | The transparent firewall can act as a DHCPv4 server, but it does not support DHCP relay. DHCP relay is not required because you can allow DHCP traffic to pass through using two access rules: one that allows DHCP requests from the inside interface to the outside, and one that allows the replies from the server in the other direction. |

| Feature                             | Description                                                                                                                                                                                                                                                                                                                                                                 |
|-------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dynamic routing protocols           | You can, however, add static routes for traffic originating on the Firewall Threat Defense device for bridge group member interfaces. You can also allow dynamic routing protocols through the Firewall Threat Defense device using an access rule.                                                                                                                         |
| Multicast IP routing                | You can allow multicast traffic through the Firewall Threat Defense device by allowing it in an access rule.                                                                                                                                                                                                                                                                |
| QoS                                 | —                                                                                                                                                                                                                                                                                                                                                                           |
| VPN termination for through traffic | The transparent firewall supports site-to-site VPN tunnels for management connections only on bridge group member interfaces. It does not terminate VPN connections for traffic through the Firewall Threat Defense device. You can pass VPN traffic through the Firewall Threat Defense device using an access rule, but it does not terminate non-management connections. |

## Unsupported Features for Bridge Groups in Routed Mode

The following table lists the features are not supported in bridge groups in routed mode.

**Table 14: Unsupported Features in Routed Mode**

| Feature                        | Description                                                                                                                                                                                                      |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EtherChannel member interfaces | Only physical interfaces, redundant interfaces, and subinterfaces are supported as bridge group member interfaces.<br>Management interfaces are also not supported.                                              |
| Clustering                     | Bridge groups are not supported in clustering.                                                                                                                                                                   |
| Dynamic DNS                    | —                                                                                                                                                                                                                |
| DHCPv6 stateless server        | Only the DHCPv4 server is supported on BVIs.                                                                                                                                                                     |
| DHCP relay                     | The routed firewall can act as a DHCPv4 server, but it does not support DHCP relay on BVIs or bridge group member interfaces.                                                                                    |
| Dynamic routing protocols      | You can, however, add static routes for BVIs. You can also allow dynamic routing protocols through the Firewall Threat Defense device using an access rule. Non-bridge group interfaces support dynamic routing. |
| Multicast IP routing           | You can allow multicast traffic through the Firewall Threat Defense device by allowing it in an access rule. Non-bridge group interfaces support multicast routing.                                              |
| QoS                            | Non-bridge group interfaces support QoS.                                                                                                                                                                         |

| Feature                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VPN termination for through traffic | <p>You cannot terminate a VPN connection on the BVI. Non-bridge group interfaces support VPN.</p> <p>Bridge group member interfaces support site-to-site VPN tunnels for management connections only. It does not terminate VPN connections for traffic through the Firewall Threat Defense device. ## Default Settings

### Bridge Group Defaults

By default, all ARP packets are passed within the bridge group.

## Guidelines for Firewall Mode

### Bridge Group Guidelines (Transparent and Routed Mode)

- You can create up to 250 bridge groups, with 64 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firewall Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- An IP address for the BVI is required for each bridge group for to-the-device and from-the-device management traffic, as well as for data traffic to pass through the Firewall Threat Defense device. For IPv4 traffic, specify an IPv4 address. For IPv6 traffic, specify an IPv6 address.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).
- Management interfaces are not supported as bridge group members.
- For multi-instance mode, shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode).
- For the Firewall Threat Defense Virtual on VMware with bridged ixgbevf interfaces, transparent mode is not supported, and bridge groups are not supported in routed mode.
- For the Firepower 2100 series, bridge groups are not supported in routed mode.
- For the Firepower 1010, you cannot mix logical VLAN interfaces and physical firewall interfaces in the same bridge group.
- For the Firepower 4100/9300, data-sharing interfaces are not supported as bridge group members.

- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firewall Threat Defense as the default gateway.
- In transparent mode, the *default* route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- Transparent mode is not supported on threat defense virtual instances deployed on Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Oracle Cloud Infrastructure.
- In routed mode, to route between bridge groups and other routed interfaces, you must name the BVI.
- In routed mode, Firewall Threat Defense-defined EtherChannel interfaces are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the Firewall Threat Defense when using bridge group members. If there are two neighbors on either side of the Firewall Threat Defense running BFD, then the Firewall Threat Defense will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

## Set the Firewall Mode

You can set the firewall mode when you perform the initial system setup at the CLI. We recommend setting the firewall mode during setup because changing the firewall mode erases your configuration to ensure you do not have incompatible settings. If you need to change the firewall mode later, you must do so from the CLI.

### Procedure

- 
- Step 1** Unregister the Firewall Threat Defense device from the Firewall Management Center.
- You cannot change the mode until you unregister the device.
- Performance profiles are retained across firewall mode changes and can't be changed after you re-register. You must set the performance profile to Default. See the **Performance Profile** page in your platform settings policy (choose **Devices > Platform Settings**, and then click **Edit** (✎) for your policy).  
Deploy the configuration to make these changes.
  - Choose **Devices > Device Management**.
  - Next to the device you want to unregister, click **More** (⋮), and then click **Delete**.
- Step 2** Access the Firewall Threat Defense device CLI, preferably from the console port.
- Step 3** Change the firewall mode:
- ```
configure firewall [routed | transparent]
```

**Example:**

```
> configure firewall transparent
This will destroy the current interface configurations, are you sure that you want to
proceed? [y/N] y
The firewall mode was changed successfully.
```

- Step 4** Re-register with the Firewall Management Center. See [Complete the Firewall Threat Defense Initial Configuration Using the CLI, on page 19](#) and [Add a Device Using a Registration Key, on page 29](#).
-

## CHAPTER 7

# Logical Devices on the Firepower 4100/9300

The Firepower 4100/9300 is a flexible security platform on which you can install one or more *logical devices*. Before you can add the Firewall Threat Defense to the Firewall Management Center, you must configure chassis interfaces, add a logical device, and assign interfaces to the device on the Firepower 4100/9300 chassis using the Secure Firewall Chassis Manager or the FXOS CLI. This chapter describes basic interface configuration and how to add a standalone or High Availability logical device using the Secure Firewall Chassis Manager. To add a clustered logical device, see [Clustering for the Firepower 4100/9300, on page 583](#). To use the FXOS CLI, see the FXOS CLI configuration guide. For more advanced FXOS procedures and troubleshooting, see the FXOS configuration guide.

- [About Interfaces, on page 221](#)
- [About Logical Devices, on page 235](#)
- [Licenses for Container Instances, on page 244](#)
- [Requirements and Prerequisites for Logical Devices, on page 245](#)
- [Guidelines and Limitations for Logical Devices, on page 252](#)
- [Configure Interfaces, on page 256](#)
- [Configure Logical Devices, on page 260](#)
- [History for Logical Devices, on page 272](#)

## About Interfaces

The Firepower 4100/9300 chassis supports physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. EtherChannel interfaces can include up to 16 member interfaces of the same type.

## Chassis Management Interface

The chassis management interface is used for management of the FXOS Chassis by SSH or Firewall Chassis Manager. This interface appears at the top of the **Interfaces** tab as **MGMT**, and you can only enable or disable this interface on the **Interfaces** tab. This interface is separate from the mgmt-type interface that you assign to the logical devices for application management.

To configure parameters for this interface, you must configure them from the CLI. To view information about this interface in the FXOS CLI, connect to local management and show the management port:

```
Firepower # connect local-mgmt
```

```
Firepower(local-mgmt) # show mgmt-port
```

Note that the chassis management interface remains up even if the physical cable or SFP module are unplugged, or if the **mgmt-port shut** command is performed, or if the logical device is offline.

---

**Note** The chassis management interface does not support jumbo frames.

---

## Interface Types

Physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces can be one of the following types:

- **Data**—Use for regular data. Data interfaces cannot be shared between logical devices, and logical devices cannot communicate over the backplane to other logical devices. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another logical device.
- **Data-sharing**—Use for regular data. Only supported with container instances, these data interfaces can be shared by one or more logical devices/container instances (Firewall Threat Defense-using-Firewall Management Center only). Each container instance can communicate over the backplane with all other instances that share this interface. Shared interfaces can affect the number of container instances you can deploy. Shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode), inline sets, passive interfaces, clusters, or failover links.
- **Mgmt**—Use to manage application instances. These interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. You can only assign one management interface per logical device. Depending on your application and manager, you can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management. For information about the separate chassis management interface, see [Chassis Management Interface, on page 221](#).

---

**Note** Mgmt interface change will cause reboot of the logical device, for example one change mgmt from e1/1 to e1/2 will cause the logical device to reboot to apply the new management.

---

- **Eventing**—Use as a secondary management interface for Firewall Threat Defense-using-Firewall Management Center devices. To use this interface, you must configure its IP address and other parameters at the Firewall Threat Defense CLI. For example, you can separate management traffic from events (such as web events). See the [management center configuration guide](#) for more information. Eventing interfaces can be shared by one or more logical devices to access external hosts; logical devices cannot communicate over this interface with other logical devices that share the interface. If you later configure a data interface for management, you cannot use a separate eventing interface.

**Note** A virtual Ethernet interface is allocated when each application instance is installed. If the application does not use an eventing interface, then the virtual interface will be in an admin down state.

```
Firepower # show interface Vethernet775
Firepower # Vethernet775 is down (Administratively down)
Bound Interface is Ethernet1/10
Port description is server 1/1, VNIC ext-mgmt-nic5
```

- **Cluster**—Use as the cluster control link for a clustered logical device. By default, the cluster control link is automatically created on Port-channel 48. The Cluster type is only supported on EtherChannel interfaces. For multi-instance clustering, you cannot share a Cluster-type interface across devices. You can add VLAN subinterfaces to the Cluster EtherChannel to provide separate cluster control links per cluster. If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster. The Firewall Device Manager and CDO does not support clustering.

**Note** This chapter discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the Firewall Threat Defense application. See [FXOS Interfaces vs. Application Interfaces, on page 224](#) for more information.

See the following table for interface type support for the Firewall Threat Defense and ASA applications in standalone and cluster deployments.

**Table 15: Interface Type Support**

Application		Data	Data: Subinterface	Data-Sharing	Data-Sharing: Subinterface	Mgmt	Eventing	Cluster (EtherChannel only)	Cluster: Subinterface
<b>Firewall Threat Defense</b>	Standalone Native Instance	Yes	—	—	—	Yes	Yes	—	—
	Standalone Container Instance	Yes	Yes	Yes	Yes	Yes	Yes	—	—
	Cluster Native Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	Yes	Yes	—
	Cluster Container Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	Yes	Yes	Yes

Application		Data	Data: Subinterface	Data-Sharing	Data-Sharing: Subinterface	Mgmt	Eventing	Cluster (EtherChannel only)	Cluster: Subinterface
ASA	Standalone Native Instance	Yes	—	—	—	Yes	—	Yes	—
	Cluster Native Instance	Yes (EtherChannel only for inter-chassis cluster)	—	—	—	Yes	—	Yes	—

## FXOS Interfaces vs. Application Interfaces

The Firepower 4100/9300 manages the basic Ethernet settings of physical interfaces, VLAN subinterfaces for container instances, and EtherChannel (port-channel) interfaces. Within the application, you configure higher level settings. For example, you can only create EtherChannels in FXOS; but you can assign an IP address to the EtherChannel within the application.

The following sections describe the interaction between FXOS and the application for interfaces.

### VLAN Subinterfaces

For all logical devices, you can create VLAN subinterfaces within the application.

For container instances in standalone mode only, you can *also* create VLAN subinterfaces in FXOS. Multi-instance clusters do not support subinterfaces in FXOS except on the Cluster-type interface. Application-defined subinterfaces are not subject to the FXOS limit. Choosing in which operating system to create subinterfaces depends on your network deployment and personal preference. For example, to share a subinterface, you must create the subinterface in FXOS. Another scenario that favors FXOS subinterfaces comprises allocating separate subinterface groups on a single interface to multiple instances. For example, you want to use Port-channel1 with VLAN 2–11 on instance A, VLAN 12–21 on instance B, and VLAN 22–31 on instance C. If you create these subinterfaces within the application, then you would have to share the parent interface in FXOS, which may not be desirable. See the following illustration that shows the three ways you can accomplish this scenario:

Figure 104: VLANs in FXOS vs. the Application for Container Instances

## Scenario 1 (recommended)

## Scenario 2 (not recommended, worse performance)

## Scenario 3 (recommended, but lacks EtherChannel redundancy)

## Independent Interface States in the Chassis and in the Application

You can administratively enable and disable interfaces in both the chassis and in the application. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and application.

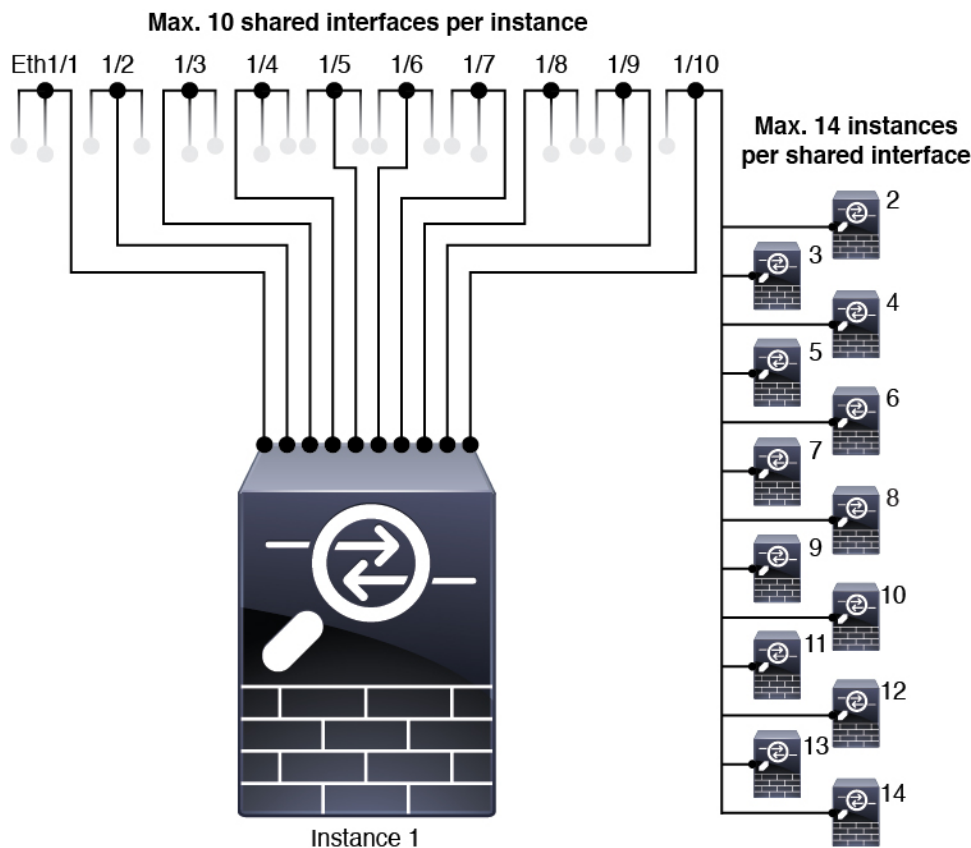

The default state of an interface within the application depends on the type of interface. For example, the physical interface or EtherChannel is disabled by default within the application, but a subinterface is enabled by default.

## Shared Interface Scalability

Instances can share data-sharing type interfaces. This capability lets you conserve physical interface usage as well as support flexible networking deployments. When you share an interface, the chassis uses unique MAC addresses to forward traffic to the correct instance. However, shared interfaces can cause the forwarding table to grow large due to the need for a full mesh topology within the chassis (every instance must be able to communicate with every other instance that is sharing the same interface). Therefore, there are limits to how many interfaces you can share.

In addition to the forwarding table, the chassis maintains a VLAN group table for VLAN subinterface forwarding. You can create up to 500 VLAN subinterfaces.

See the following limits for shared interface allocation:

## Shared Interface Best Practices

For optimal scalability of the forwarding table, share as few interfaces as possible. Instead, you can create up to 500 VLAN subinterfaces on one or more physical interfaces and then divide the VLANs among the container instances.

When sharing interfaces, follow these practices in the order of most scalable to least scalable:

1. Best—Share subinterfaces under a single parent, and use the same set of subinterfaces with the same group of instances.

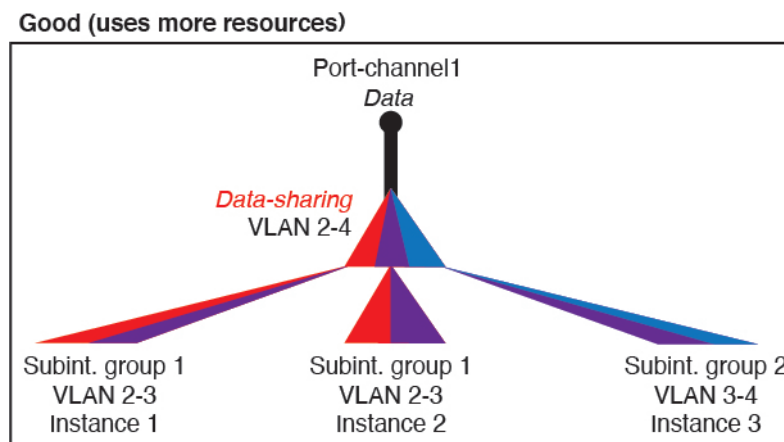

For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel: Port-Channel1.2, 3, and 4 instead of Port-Channel2, Port-Channel3, and Port-Channel4. When you share subinterfaces from a single parent, the VLAN group table provides better scaling of the forwarding table than when sharing physical/EtherChannel interfaces or subinterfaces across parents.

**Figure 105: Best: Shared Subinterface Group on One Parent**

If you do not share the same set of subinterfaces with a group of instances, your configuration can cause more resource usage (more VLAN groups). For example, share Port-Channel1.2, 3, and 4 with instances 1, 2, and 3 (one VLAN group) instead of sharing Port-Channel1.2 and 3 with instances 1 and 2, while sharing Port-Channel1.3 and 4 with instance 3 (two VLAN groups).

**Figure 106: Good: Sharing Multiple Subinterface Groups on One Parent**

## 2. Fair—Share subinterfaces across parents.

For example, share Port-Channel1.2, Port-Channel2.3, and Port-Channel3.4 instead of Port-Channel2, Port-Channel4, and Port-Channel4. Although this usage is not as efficient as only sharing subinterfaces on the same parent, it still takes advantage of VLAN groups.

**Figure 107: Fair: Shared Subinterfaces on Separate Parents**

3. Worst—Share individual parent interfaces (physical or EtherChannel).  
This method uses the most forwarding table entries.

**Figure 108: Worst: Shared Parent Interfaces**

## Shared Interface Usage Examples

See the following tables for examples of interface sharing and scalability. The below scenarios assume use of one physical/EtherChannel interface for management shared across all instances, and another physical or EtherChannel interface with dedicated subinterfaces for use with High Availability.

- [Table 16: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with Three SM-44s, on page 229](#)
- [Table 17: Subinterfaces on One Parent and Instances on a Firepower 9300 with Three SM-44s, on page 230](#)
- [Table 18: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with One SM-44, on page 232](#)
- [Table 19: Subinterfaces on One Parent and Instances on a Firepower 9300 with One SM-44, on page 233](#)

### Firepower 9300 with Three SM-44s

The following table applies to three SM-44 security modules on a 9300 using only physical interfaces or EtherChannels. Without subinterfaces, the maximum number of interfaces are limited. Moreover, sharing multiple physical interfaces uses more forwarding table resources than sharing multiple subinterfaces.

Each SM-44 module can support up to 14 instances. Instances are split between modules as necessary to stay within limits.

**Table 16: Physical/EtherChannel Interfaces and Instances on a Firepower 9300 with Three SM-44s**

Dedicated Interfaces	Shared Interfaces	Number of Instances	% Forwarding Table Used
<b>32:</b> <ul style="list-style-type: none"> <li>• 8</li> <li>• 8</li> <li>• 8</li> <li>• 8</li> </ul>	<b>0</b>	<b>4:</b> <ul style="list-style-type: none"> <li>• Instance 1</li> <li>• Instance 2</li> <li>• Instance 3</li> <li>• Instance 4</li> </ul>	16%

Dedicated Interfaces	Shared Interfaces	Number of Instances	% Forwarding Table Used
<b>32:</b> <ul style="list-style-type: none"> <li>• 16 (8 ea.)</li> <li>• 16 (8 ea.)</li> </ul>	<b>4:</b> <ul style="list-style-type: none"> <li>• 2</li> <li>• 2</li> </ul>	<b>4:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 2</li> <li>• Instance 3-Instance 4</li> </ul>	24%
<b>24:</b> <ul style="list-style-type: none"> <li>• 8</li> <li>• 8</li> <li>• 8</li> </ul>	<b>8</b>	<b>3:</b> <ul style="list-style-type: none"> <li>• Instance 1</li> <li>• Instance 2</li> <li>• Instance 3</li> </ul>	37%
<b>10:</b> <ul style="list-style-type: none"> <li>• 10 (2 ea.)</li> </ul>	<b>10</b>	<b>5:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 5</li> </ul>	69%
<b>10:</b> <ul style="list-style-type: none"> <li>• 6 (2 ea.)</li> <li>• 4 (2 ea.)</li> </ul>	<b>20:</b> <ul style="list-style-type: none"> <li>• 10</li> <li>• 10</li> </ul>	<b>5:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 3</li> <li>• Instance 4-Instance 5</li> </ul>	59%
<b>14:</b> <ul style="list-style-type: none"> <li>• 12 (2 ea.)</li> </ul>	<b>10</b>	<b>7:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 7</li> </ul>	109% DISALLOWED

The following table applies to the Firepower 9300 with one SM-44 using subinterfaces on a single parent physical interface. For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel. Sharing multiple physical interfaces uses more forwarding table resources than sharing multiple subinterfaces.

The Firepower 9300 with one SM-44 can support up to 14 instances.

**Table 19: Subinterfaces on One Parent and Instances on a Firepower 9300 with One SM-44**

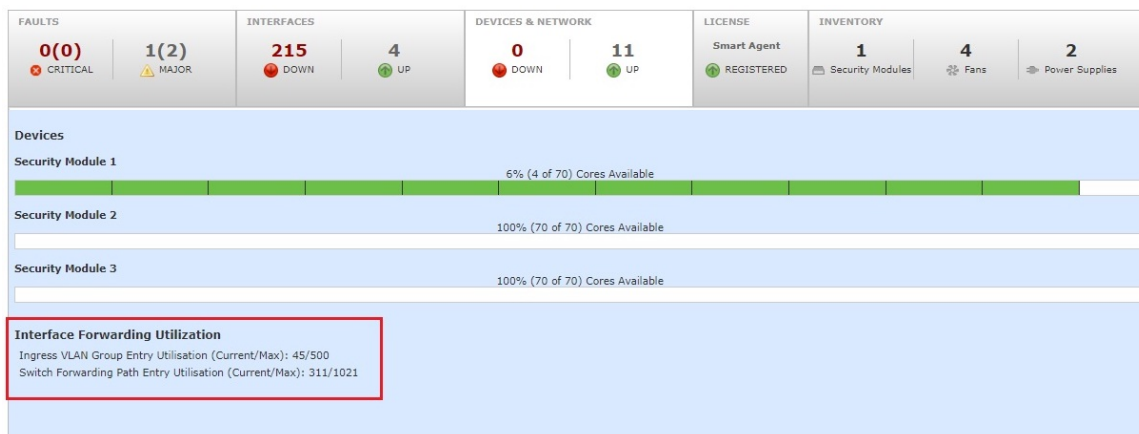

Dedicated Subinterfaces	Shared Subinterfaces	Number of Instances	% Forwarding Table Used
<b>112:</b> <ul style="list-style-type: none"> <li>• 112 (8 ea.)</li> </ul>	<b>0</b>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 14</li> </ul>	17%
<b>224:</b> <ul style="list-style-type: none"> <li>• 224 (16 ea.)</li> </ul>	<b>0</b>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 14</li> </ul>	17%
<b>14:</b> <ul style="list-style-type: none"> <li>• 14 (1 ea.)</li> </ul>	<b>1</b>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 14</li> </ul>	46%

Dedicated Subinterfaces	Shared Subinterfaces	Number of Instances	% Forwarding Table Used
<b>14:</b> <ul style="list-style-type: none"> <li>• 7 (1 ea.)</li> <li>• 7 (1 ea.)</li> </ul>	<b>2:</b> <ul style="list-style-type: none"> <li>• 1</li> <li>• 1</li> </ul>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 7</li> <li>• Instance 8-Instance 14</li> </ul>	37%
<b>112:</b> <ul style="list-style-type: none"> <li>• 112 (8 ea.)</li> </ul>	<b>1</b>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 14</li> </ul>	46%
<b>112:</b> <ul style="list-style-type: none"> <li>• 56 (8 ea.)</li> <li>• 56 (8 ea.)</li> </ul>	<b>2:</b> <ul style="list-style-type: none"> <li>• 1</li> <li>• 1</li> </ul>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 7</li> <li>• Instance 8-Instance 14</li> </ul>	37%
<b>112:</b> <ul style="list-style-type: none"> <li>• 112 (8 ea.)</li> </ul>	<b>2</b>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 14</li> </ul>	46%
<b>112:</b> <ul style="list-style-type: none"> <li>• 56 (8 ea.)</li> <li>• 56 (8 ea.)</li> </ul>	<b>4:</b> <ul style="list-style-type: none"> <li>• 2</li> <li>• 2</li> </ul>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 7</li> <li>• Instance 8-Instance 14</li> </ul>	37%

<b>140:</b> <ul style="list-style-type: none"> <li>• 70 (10 ea.)</li> <li>• 70 (10 ea.)</li> </ul>	<b>20:</b> <ul style="list-style-type: none"> <li>• 10</li> <li>• 10</li> </ul>	<b>14:</b> <ul style="list-style-type: none"> <li>• Instance 1-Instance 7</li> <li>• Instance 8-Instance 14</li> </ul>	37%

## Viewing Shared Interface Resources

To view forwarding table and VLAN group usage, see the **Devices & Network > Interface Forwarding Utilization** area. For example:

## Inline Set Link State Propagation for the Firewall Threat Defense

An inline set acts like a bump on the wire, and binds two interfaces together to slot into an existing network. This function allows the system to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of an inline set unless explicitly dropped.

When you configure an inline set in the Firewall Threat Defense application and enable link state propagation, the Firewall Threat Defense sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the chassis senses the change and updates the link state of the other interface to match it. Note that the chassis requires up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

**Note** Do not enable Hardware Bypass and link state propagation for the same inline set.

## About Logical Devices

A logical device lets you run one application instance (either ASA or Firewall Threat Defense) and also one optional decorator application (Radware DefensePro) to form a service chain.

When you add a logical device, you also define the application instance type and version, assign interfaces, and configure bootstrap settings that are pushed to the application configuration.

**Note** For the Firepower 9300, you can install different application types (ASA and Firewall Threat Defense) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

## Standalone and Clustered Logical Devices

You can add the following logical device types:

- Standalone—A standalone logical device operates as a standalone unit or as a unit in a High Availability pair.
- Cluster—A clustered logical device lets you group multiple units together, providing all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Multiple module devices, like the Firepower 9300, support intra-chassis clustering. For the Firepower 9300, all three modules must participate in the cluster, for both native and container instances. The Firewall Device Manager does not support clustering.

## Logical Device Application Instances: Container and Native

Application instances run in the following deployment types:

- Native instance—A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance.
- Container instance—A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances. Multi-instance capability is only supported for the Firewall Threat Defense using Firewall Management Center; it is not supported for the ASA or the Firewall Threat Defense using Firewall Device Manager.

**Note** Multi-instance capability is similar to ASA multiple context mode, although the implementation is different. Multiple context mode partitions a single application instance, while multi-instance capability allows independent container instances. Container instances allow hard resource separation, separate configuration management, separate reloads, separate software updates, and full Firewall Threat Defense feature support. Multiple context mode, due to shared resources, supports more contexts on a given platform. Multiple context mode is not available on the Firewall Threat Defense.

For the Firepower 9300, you can use a native instance on some modules, and container instances on the other module(s).

### Container Instance Interfaces

To provide flexible physical interface use for container instances, you can create VLAN subinterfaces in FXOS and also share interfaces (VLAN or physical) between multiple instances. Native instances cannot use VLAN subinterfaces or shared interfaces. A multi-instance cluster cannot use VLAN subinterfaces or shared interfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel. See [Shared Interface Scalability, on page 226](#) and [Add a VLAN Subinterface for Container Instances, on page 259](#).

**Note** This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the Firewall Threat Defense application. See [FXOS Interfaces vs. Application Interfaces, on page 224](#) for more information.

## How the Chassis Classifies Packets

Each packet that enters the chassis must be classified, so that the chassis can determine to which instance to send a packet.

- **Unique Interfaces**—If only one instance is associated with the ingress interface, the chassis classifies the packet into that instance. For bridge group member interfaces (in transparent mode or routed mode), inline sets, or passive interfaces, this method is used to classify packets at all times.
- **Unique MAC Addresses**—The chassis automatically generates unique MAC addresses for all interfaces, including shared interfaces. If multiple instances share an interface, then the classifier uses unique MAC addresses assigned to the interface in each instance. An upstream router cannot route directly to an instance without unique MAC addresses. You can also set the MAC addresses manually when you configure each interface within the application.

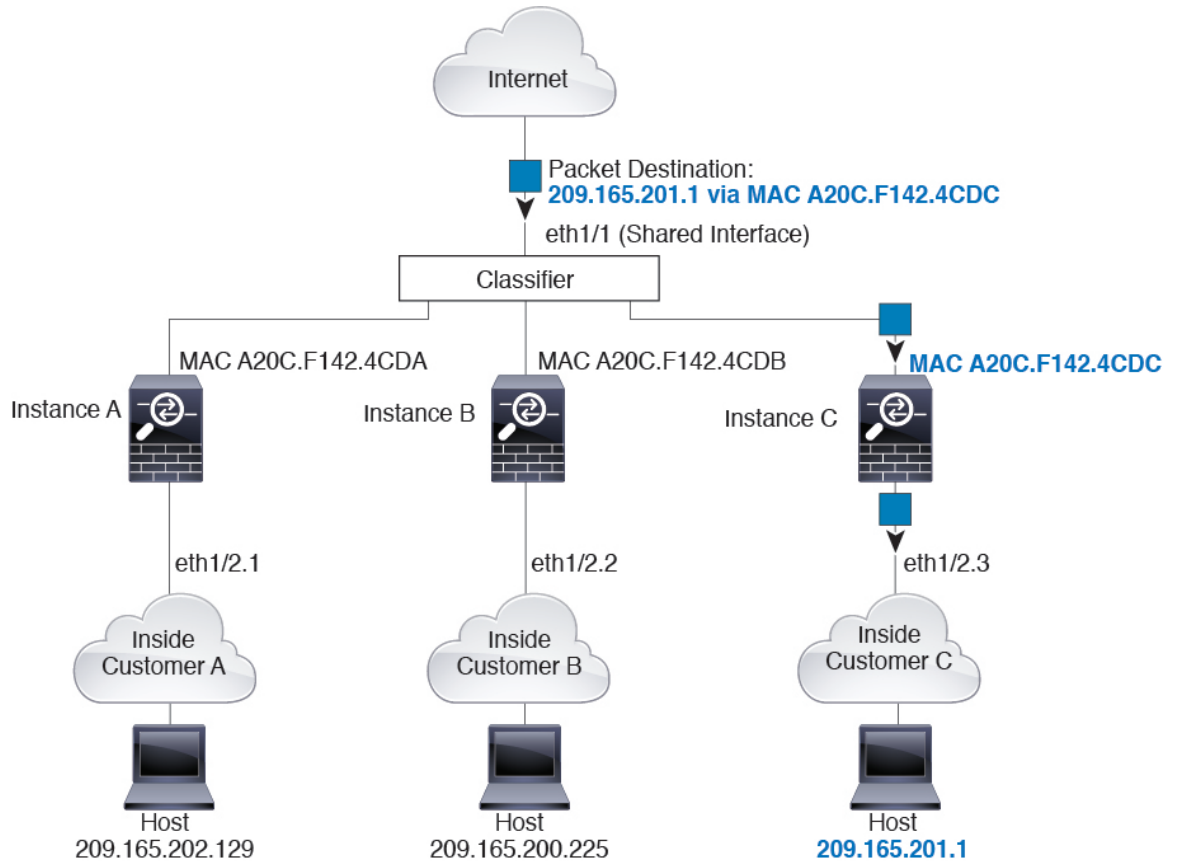

**Note** If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each instance.

## Classification Examples

### Packet Classification with a Shared Interface Using MAC Addresses

The following figure shows multiple instances sharing an outside interface. The classifier assigns the packet to Instance C because Instance C includes the MAC address to which the router sends the packet.

**Figure 109: Packet Classification with a Shared Interface Using MAC Addresses**

### Incoming Traffic from Inside Networks

Note that all new incoming traffic must be classified, even from inside networks. The following figure shows a host on the Instance C inside network accessing the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

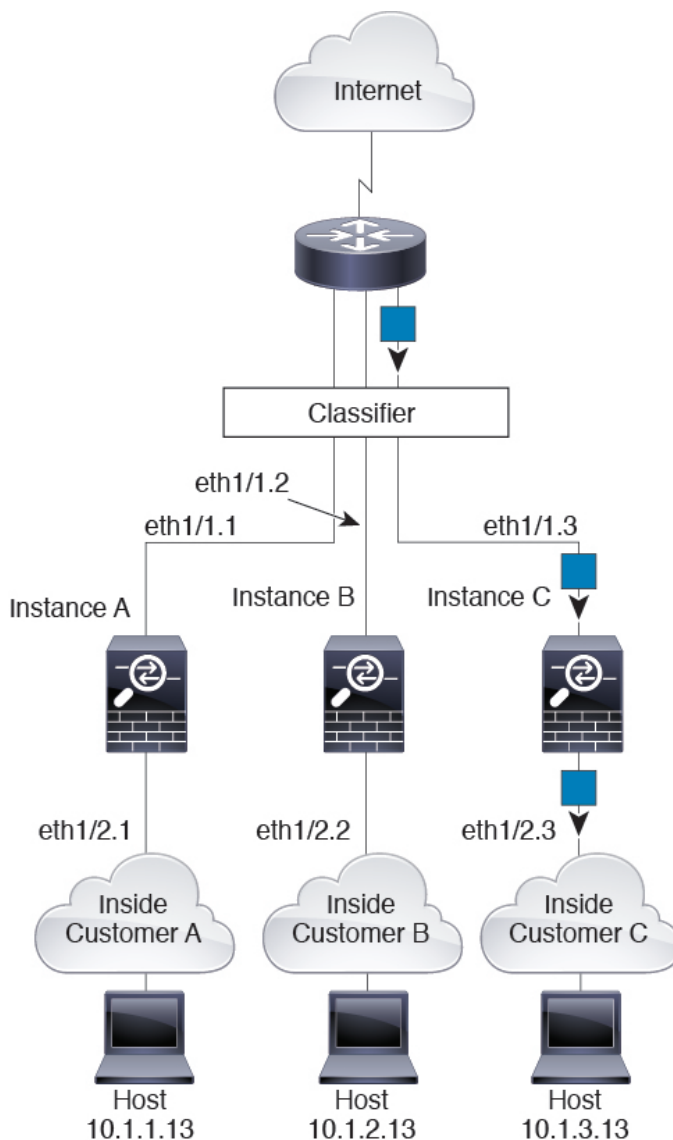

**Figure 110: Incoming Traffic from Inside Networks**

### Transparent Firewall Instances

For transparent firewalls, you must use unique interfaces. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

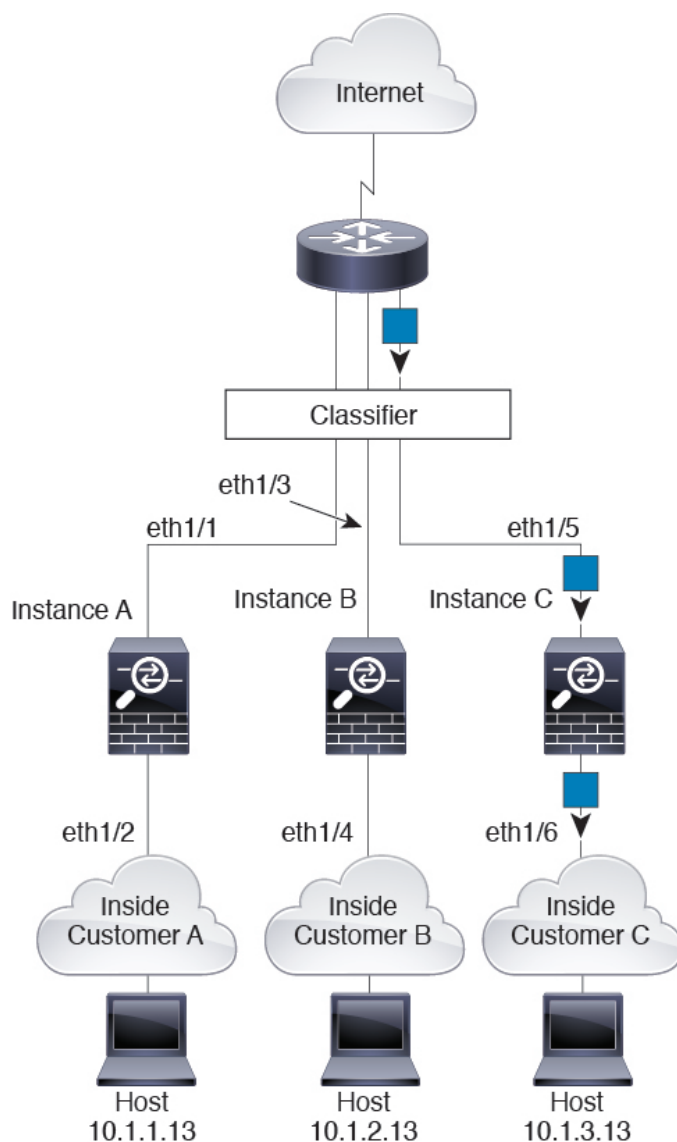

Figure 111: Transparent Firewall Instances

### Inline Sets

For inline sets, you must use unique interfaces and they must be physical interfaces or EtherChannels. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/5, which is assigned to Instance C.

Figure 112: Inline Sets

## Cascading Container Instances

Placing an instance directly in front of another instance is called *cascading instances*; the outside interface of one instance is the same interface as the inside interface of another instance. You might want to cascade instances if you want to simplify the configuration of some instances by configuring shared parameters in the top instance.

The following figure shows a gateway instance with two instances behind the gateway.

Figure 113: Cascading Instances

**Note** Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.

## Typical Multi-Instance Deployment

The following example includes three container instances in routed firewall mode. They include the following interfaces:

- **Management**—All instances use the Port-Channel1 interface (management type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same management network.
- **Inside**—Each instance uses a subinterface on Port-Channel2 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

- Outside—All instances use the Port-Channel3 interface (data-sharing type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same outside network.
- Failover—Each instance uses a subinterface on Port-Channel4 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

## Automatic MAC Addresses for Container Instance Interfaces

The chassis automatically generates MAC addresses for instance interfaces, and guarantees that a shared interface in each instance uses a unique MAC address.

If you manually assign a MAC address to a shared interface within the instance, then the manually-assigned MAC address is used. If you later remove the manual MAC address, the autogenerated address is used. In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, we suggest that you manually set the MAC address for the interface within the instance.

Because autogenerated addresses start with A2, you should not start manual MAC addresses with A2 due to the risk of overlapping addresses.

The chassis generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix or a system-defined prefix, and zz.zzzz is an internal counter generated by the chassis. The system-defined prefix matches the lower 2 bytes of the first MAC address in the burned-in MAC address pool that is programmed into the IDPROM. Use **connect fxos**, then **show module** to view the MAC address pool. For example, if the range of MAC addresses shown for module 1 is b0aa.772f.f0b0 to b0aa.772f.f0bf, then the system prefix will be f0b0.

The user-defined prefix is an integer that is converted into hexadecimal. For an example of how the user-defined prefix is used, if you set a prefix of 77, then the chassis converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the chassis native form:

A24D.00zz.zzzz

For a prefix of 1009 (03F1), the MAC address is:

A2F1.03zz.zzzz

## Container Instance Resource Management

To specify resource usage per container instance, create one or more resource profiles in FXOS. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance. To view the available resources per model, see [Requirements and Prerequisites for Container Instances, on page 247](#). To add a resource profile, see [Add a Resource Profile for Container Instances, on page 261](#).

## Performance Scaling Factor for Multi-Instance Capability

The maximum throughput (connections, VPN sessions, and TLS proxy sessions) for a platform is calculated for a native instance's use of memory and CPU (and this value is shown in **show resource usage**). If you use multiple instances, then you need to calculate the throughput based on the percentage of CPU cores that you assign to the instance. For example, if you use a container instance with 50% of the cores, then you should initially calculate 50% of the throughput. Moreover, the throughput available to a container instance may be less than that available to a native instance.

For detailed instructions on calculating the throughput for instances, see <https://www.cisco.com/c/en/us/products/collateral/security/firewalls/white-paper-c11-744750.html>.

## Container Instances and High Availability

You can use High Availability using a container instance on 2 separate chassis; for example, if you have 2 chassis, each with 10 instances, you can create 10 High Availability pairs. Note that High Availability is not configured in FXOS; configure each High Availability pair in the application manager.

For detailed requirements, see [Requirements and Prerequisites for High Availability, on page 248](#) and [Add a High Availability Pair, on page 267](#).

## Container Instances and Clustering

You can create a cluster of container instances using one container instance per security module/engine. See [Requirements and Prerequisites for Clustering, on page 249](#) for detailed requirements.

# Licenses for Container Instances

All licenses are consumed per security engine/chassis (for the Firepower 4100) or per security module (for the Firepower 9300), and not per container instance. See the following details:

- Essentials licenses are automatically assigned: one per security module/engine.
- Feature licenses are manually assigned to each instance; but you only consume one license per feature per security module/engine. For example, for the Firepower 9300 with 3 security modules, you only need

one URL Filtering license per module for a total of 3 licenses, regardless of the number of instances in use.

For example:

**Table 20: Sample License Usage for Container Instances on a Firepower 9300**

Firepower 9300	Instance	Licenses
Security Module 1	Instance 1	Essentials, URL Filtering, Malware Defense
	Instance 2	Essentials, URL Filtering
	Instance 3	Essentials, URL Filtering
Security Module 2	Instance 4	Essentials, IPS
	Instance 5	Essentials, URL Filtering, Malware Defense, IPS
Security Module 3	Instance 6	Essentials, Malware Defense, IPS
	Instance 7	Essentials, IPS

**Table 21: Total Number of Licenses**

Essentials	URL Filtering	Malware Defense	IPS
3	2	3	2

## Requirements and Prerequisites for Logical Devices

See the following sections for requirements and prerequisites.

## Requirements and Prerequisites for Hardware and Software Combinations

The Firepower 4100/9300 supports multiple models, security modules, application types, and high availability and scalability features. See the following requirements for allowed combinations.

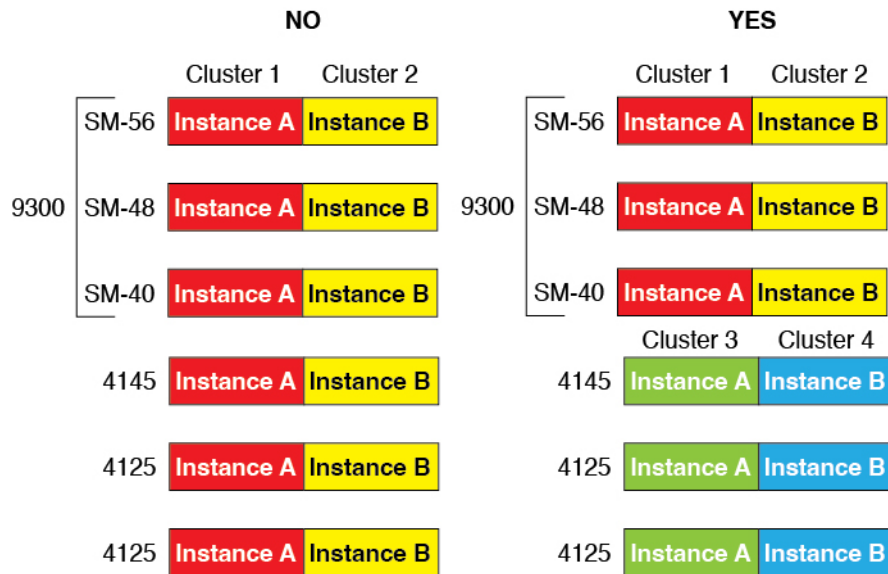

### Firepower 9300 Requirements

The Firepower 9300 includes 3 security module slots and multiple types of security modules. See the following requirements:

- **Security Module Types**—You can install modules of different types in the Firepower 9300. For example, you can install the SM-48 as module 1, SM-40 as module 2, and SM-56 as module 3.
- **Native instance Clustering**—All security modules in the cluster, whether it is intra-chassis or inter-chassis, must be the same type. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots. For

example, you can install 2 SM-40s in chassis 1, and 3 SM-40s in chassis 2. You cannot use clustering if you install 1 SM-48 and 2 SM-40s in the same chassis.

- **Container instance Clustering**—You can create a cluster using instances on different model types. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. You *cannot* mix the Firepower 9300 and the Firepower 4100 in the same cluster, however.

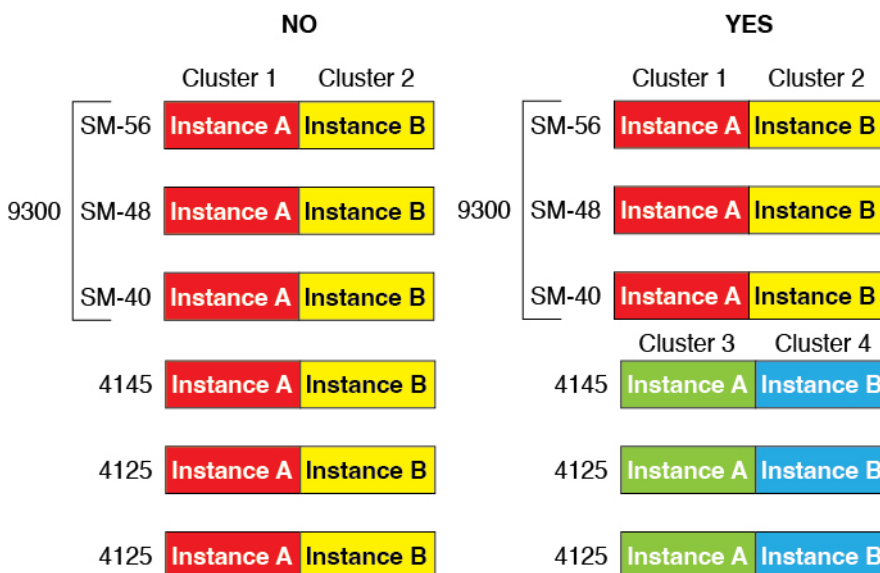

- **High Availability**—High Availability is only supported between same-type modules on the Firepower 9300. However, the two chassis can include mixed modules. For example, each chassis has an SM-40, SM-48, and SM-56. You can create High Availability pairs between the SM-40 modules, between the SM-48 modules, and between the SM-56 modules.
- **ASA and Firewall Threat Defense application types**—You can install different application types on separate modules in the chassis. For example, you can install ASA on module 1 and module 2, and Firewall Threat Defense on module 3.
- **ASA or Firewall Threat Defense versions**—You can run different versions of an application instance type on separate modules, or as separate container instances on the same module. For example, you can install the Firewall Threat Defense 6.3 on module 1, Firewall Threat Defense 6.4 on module 2, and Firewall Threat Defense 6.5 on module 3.

## Firepower 4100 Requirements

The Firepower 4100 comes in multiple models. See the following requirements:

- **Native and Container instances**—When you install a container instance on a Firepower 4100, that device can only support other container instances. A native instance uses all of the resources for a device, so you can only install a single native instance on the device.
- **Native instance Clustering**—All chassis in the cluster must be the same model.
- **Container instance Clustering**—You can create a cluster using instances on different model types. For example, you can create a cluster using an instance on a Firepower 4145 and a 4125. You *cannot* mix the Firepower 9300 and the Firepower 4100 in the same cluster, however.

- High Availability—High Availability is only supported between same-type models.
- ASA and Firewall Threat Defense application types—The Firepower 4100 can only run a single application type.
- The Firewall Threat Defense container instance versions—You can run different versions of Firewall Threat Defense as separate container instances on the same module.

## Requirements and Prerequisites for Container Instances

For information about high-availability or clustering requirements with multi-instance, see [Requirements and Prerequisites for High Availability, on page 248](#) and see [Requirements and Prerequisites for Clustering, on page 249](#).

### Supported Application Types

- The Firewall Threat Defense using Firewall Management Center

### Maximum Container Instances and Resources per Model

For each container instance, you can specify the number of CPU cores to assign to the instance. RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

**Table 22: Maximum Container Instances and Resources per Model**

Model	Max. Container Instances	Available CPU Cores	Available RAM	Available Disk Space
Firepower 4112	3	22	78 GB	308 GB
Firepower 4115	7	46	162 GB	308 GB
Firepower 4125	10	62	162 GB	644 GB

Model	Max. Container Instances	Available CPU Cores	Available RAM	Available Disk Space
Firepower 4140	7	70	222 GB	311.8 GB
Firepower 4145	14	86	344 GB	608 GB
Firepower 9300 SM-40 security module	13	78	334 GB	1359 GB
Firepower 9300 SM-48 security module	15	94	334 GB	1341 GB
Firepower 9300 SM-56 security module	18	110	334 GB	1314 GB

### Firewall Management Center Requirements

For all instances on a Firepower 4100 chassis or Firepower 9300 module, you must use the same Firewall Management Center due to the licensing implementation.

## Requirements and Prerequisites for High Availability

- The two units in a High Availability Failover configuration must:
  - Be on a separate chassis; intra-chassis High Availability for the Firepower 9300 is not supported.
  - Be the same model.
  - Have the same interfaces assigned to the High Availability logical devices.
  - Have the same number and types of interfaces. All interfaces must be preconfigured in FXOS identically before you enable High Availability.
- High Availability is only supported between same-type modules on the Firepower 9300; but the two chassis can include mixed modules. For example, each chassis has an SM-56, SM-48, and SM-40. You can create High Availability pairs between the SM-56 modules, between the SM-48 modules, and between the SM-40 modules.
- For container instances, each unit must use the same resource profile attributes.
- For container instances: Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.
- For other High Availability system requirements, see [High Availability System Requirements, on page 345](#).

# Requirements and Prerequisites for Clustering

## Cluster Model Support

The Threat Defense supports clustering on the following models:

- Firepower 9300— You can include up to 16 nodes in the cluster. For example, you can use 1 module in 16 chassis, or 2 modules in 8 chassis, or any combination that provides a maximum of 16 modules. Supports clustering with multiple chassis and clustering isolated to security modules within one chassis.
- Firepower 4100—Supported for up to 16 nodes using clustering with multiple chassis.

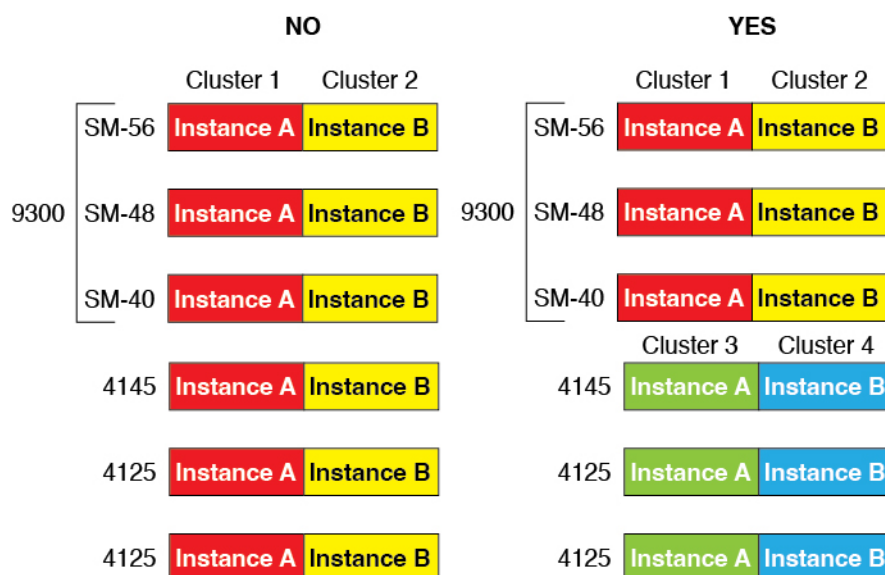

## User Roles

- Admin
- Access Admin
- Network Admin

## Clustering Hardware and Software Requirements

All chassis in a cluster:

- Native instance clustering—For the Firepower 4100: All chassis must be the same model. For the Firepower 9300: All security modules must be the same type. For example, if you use clustering, all modules in the Firepower 9300 must be SM-40s. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots.
- Container instance clustering—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Must run the identical FXOS and application software except at the time of an image upgrade. Mismatched software versions can lead to poor performance, so be sure to upgrade all nodes in the same maintenance window.
- Must include the same interface configuration for interfaces you assign to the cluster, such as the same Management interface, EtherChannels, active interfaces, speed and duplex, and so on. You can use different network module types on the chassis as long as the capacity matches for the same interface IDs and interfaces can successfully bundle in the same spanned EtherChannel. Note that all data interfaces must be EtherChannels in clusters with multiple chassis. If you change the interfaces in FXOS after you enable clustering (by adding or removing interface modules, or configuring EtherChannels, for example), then perform the same changes on each chassis, starting with the data nodes, and ending with the control node.
- Must use the same NTP server. For Firewall Threat Defense, the Firewall Management Center must also use the same NTP server. Do not set the time manually.

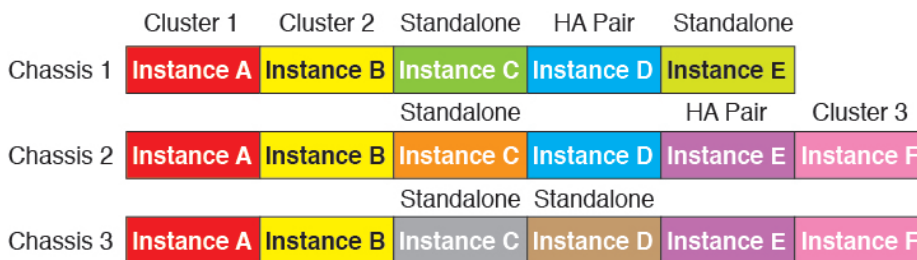

### Multi-Instance Clustering Requirements

- No intra-security-module/engine clustering—For a given cluster, you can only use a single container instance per security module/engine. You cannot add 2 container instances to the same cluster if they are running on the same module.

- Mix and match clusters and standalone instances—Not all container instances on a security module/engine need to belong to a cluster. You can use some instances as standalone or High Availability nodes. You can also create multiple clusters using separate instances on the same security module/engine.

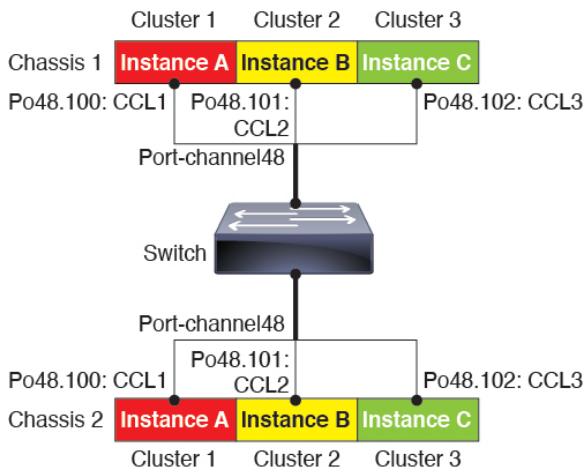

- All 3 modules in a Firepower 9300 must belong to the cluster—For the Firepower 9300, a cluster requires a single container instance on all 3 modules. You cannot create a cluster using instances on module 1 and 2, and then use a native instance on module 3, or example.

- Match resource profiles—We recommend that each node in the cluster use the same resource profile attributes; however, mismatched resources are allowed when changing cluster nodes to a different resource profile, or when using different models.
- Dedicated cluster control link—For clusters with multiple chassis, each cluster needs a dedicated cluster control link. For example, each cluster can use a separate subinterface on the same cluster-type EtherChannel, or use separate EtherChannels.

- No shared interfaces—Shared-type interfaces are not supported with clustering. However, the same Management and Eventing interfaces can be used by multiple clusters.
- No subinterfaces—A multi-instance cluster cannot use FXOS-defined VLAN subinterfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel.
- Mix chassis models—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300

security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Maximum 6 nodes—You can use up to six container instances in a cluster.

### Switch Requirements

- Be sure to complete the switch configuration and successfully connect all the EtherChannels from the chassis to the switch(es) before you configure clustering on the Firepower 4100/9300 chassis.
- For supported switch characteristics, see [Cisco FXOS Compatibility](#).

## Guidelines and Limitations for Logical Devices

See the following sections for guidelines and limitations.

### Guidelines and Limitations for Interfaces

#### VLAN Subinterfaces

- This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the Firewall Threat Defense application. See [FXOS Interfaces vs. Application Interfaces, on page 224](#) for more information.
- Subinterfaces (and the parent interfaces) can only be assigned to container instances.

**Note**

If you assign a parent interface to a container instance, it only passes untagged (non-VLAN) traffic. Do not assign the parent interface unless you intend to pass untagged traffic. For Cluster type interfaces, the parent interface cannot be used.

- Subinterfaces are supported on Data or Data-sharing type interfaces, as well as Cluster type interfaces. If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster.
- For multi-instance clustering, FXOS subinterfaces are not supported on Data interfaces. However, subinterfaces are supported for the cluster control link, so you can use either a dedicated EtherChannel or a subinterface of an EtherChannel for the cluster control link. Note that *application*-defined subinterfaces are supported for Data interfaces.
- You can create up to 500 VLAN IDs.
- See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  - You cannot use subinterfaces for an Firewall Threat Defense inline set or as a passive interface.
  - If you use a subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links. You cannot use some subinterfaces as failover links, and some as regular data interfaces.

**Data-sharing Interfaces**

- You cannot use a data-sharing interface with a native instance.
- Maximum 14 instances per shared interface. For example, you can allocate Ethernet1/1 to Instance1 through Instance14.

Maximum 10 shared interfaces per instance. For example, you can allocate Ethernet1/1.1 through Ethernet1/1.10 to Instance1.

- You cannot use a data-sharing interface in a cluster.
- See the following limitations within the logical device application; keep these limitations in mind when planning your interface allocation.
  - You cannot use a data-sharing interface with a transparent firewall mode device.
  - You cannot use a data-sharing interface with Firewall Threat Defense inline sets or passive interfaces.
  - You cannot use a data-sharing interface for the failover link.

### Inline Sets for Firewall Threat Defense

- Supported for physical interfaces (both regular and breakout ports) and EtherChannels. Subinterfaces are not supported.
- Link state propagation is supported.
- Do not enable Hardware Bypass and link state propagation for the same inline set.

### Hardware Bypass

- Supported for the Firewall Threat Defense; you can use them as regular interfaces for the ASA.
- The Firewall Threat Defense only supports Hardware Bypass with inline sets.

- Hardware Bypass-capable interfaces cannot be configured for breakout ports.
- You cannot include Hardware Bypass interfaces in an EtherChannel and use them for Hardware Bypass; you can use them as regular interfaces in an EtherChannel.
- Hardware Bypass is not supported with High Availability.
- Do not enable Hardware Bypass and link state propagation for the same inline set.

### Default MAC Addresses

#### For native instances:

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- EtherChannels—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.

#### For container instances:

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See [Automatic MAC Addresses for Container Instance Interfaces](#), on page 243.

## General Guidelines and Limitations

### Firewall Mode

You can set the firewall mode to routed or transparent in the bootstrap configuration for the Firewall Threat Defense.

### High Availability

- Configure high availability within the application configuration.
- You can use any data interfaces as the failover and state links. Data-sharing interfaces are not supported.

### Multi-Instance

- Multi-instance capability with container instances is only available for the Firewall Threat Defense using Firewall Management Center.
- For Firewall Threat Defense container instances, a single Firewall Management Center must manage all instances on a security module/engine.
- For Firewall Threat Defense container instances, the following features are not supported:
  - Radware DefensePro link decorator

- Firewall Management Center UCAPL/CC mode
- Flow offload to hardware

## Configure Interfaces

By default, physical interfaces are disabled. You can enable interfaces, add EtherChannels, add VLAN subinterfaces, and edit interface properties.

### Enable or Disable an Interface

You can change the **Admin State** of each interface to be enabled or disabled. By default, physical interfaces are disabled. For VLAN subinterfaces, the admin state is inherited from the parent interface.

#### Procedure

**Step 1** Choose **Interfaces** to open the Interfaces page.

The Interfaces page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2** To enable the interface, click the disabled **Slider disabled** () so that it changes to the enabled **Slider enabled** ()

Click **Yes** to confirm the change. The corresponding interface in the visual representation changes from gray to green.

**Step 3** To disable the interface, click the enabled **Slider enabled** () so that it changes to the disabled **Slider disabled** ()

Click **Yes** to confirm the change. The corresponding interface in the visual representation changes from green to gray.

### Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex. To use an interface, it must be physically enabled in FXOS and logically enabled in the application.

#### Note

- For QSFP40G-CUxM, auto-negotiation is always enabled by default and you cannot disable it.
- If you replace an SFP on a port with a different SFP module, the speed, duplex, and auto-negotiation of the interface is not updated automatically. You must manually re-configure the interface.

### Before you begin

- Interfaces that are already a member of an EtherChannel cannot be modified individually. Be sure to configure settings before you add it to the EtherChannel.

### Procedure

- 
- Step 1** Choose **Interfaces** to open the Interfaces page.
- The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.
- Step 2** Click **Edit** in the row for the interface you want to edit to open the **Edit Interface** dialog box.
- Step 3** To enable the interface, check the **Enable** check box. To disable the interface, uncheck the **Enable** check box.
- Step 4** Choose the interface **Type**:
- See [Interface Types, on page 222](#) for details about interface type usage.
- **Data**
  - **Data-sharing**—For container instances only.
  - **Mgmt**
  - **Firepower-eventing**—For Firewall Threat Defense only.
  - **Cluster**—Do not choose the **Cluster** type; by default, the cluster control link is automatically created on Port-channel 48.
- Step 5** (Optional) Choose the speed of the interface from the **Speed** drop-down list.
- Step 6** (Optional) If your interface supports **Auto Negotiation**, click the **Yes** or **No** radio button.
- Step 7** (Optional) Choose the duplex of the interface from the **Duplex** drop-down list.
- Step 8** (Optional) Explicitly configure **Debounce Time (ms)**. Enter a value between 0-15000 milli-seconds.
- Note**  
Configuring Debounce Time is not supported on 1G interfaces.
- Step 9** Click **OK**.
- 

## Add an EtherChannel (Port Channel)

An EtherChannel (also known as a port channel) can include up to 16 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface. The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU)s between two network devices.

You can configure each physical Data or Data-sharing interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

**Note** It may take up to three minutes for an EtherChannel to come up to an operational state if you change its mode from On to Active or from Active to On.

Non-data interfaces only support active mode.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

When the Firepower 4100/9300 chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state for Active LACP mode or a **Down** state for On LACP mode until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state in the following situations:

- The EtherChannel is added as a data or management interface for a standalone logical device
- The EtherChannel is added as a management interface or cluster control link for a logical device that is part of a cluster
- The EtherChannel is added as a data interface for a logical device that is part of a cluster and at least one unit has joined the cluster

Note that the EtherChannel does not come up until you assign it to a logical device. If the EtherChannel is removed from the logical device or the logical device is deleted, the EtherChannel will revert to a **Suspended** or **Down** state.

## Procedure

**Step 1** Choose **Interfaces** to open the Interfaces page.

The **All Interfaces** page shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2** Click **Add Port Channel** above the interfaces table to open the **Add Port Channel** dialog box.

**Step 3** Enter an ID for the port channel in the **Port Channel ID** field. Valid values are between 1 and 47.

Port-channel 48 is reserved for the cluster control link when you deploy a clustered logical device. If you do not want to use Port-channel 48 for the cluster control link, you can delete it and configure a Cluster type EtherChannel with a different ID. You can add multiple Cluster type EtherChannels and add VLAN subinterfaces for use with multi-instance clustering. For intra-chassis clustering, do not assign any interfaces to the Cluster EtherChannel.

- Step 4** To enable the port channel, check the **Enable** check box. To disable the port channel, uncheck the **Enable** check box.
- Step 5** Choose the interface **Type**:
- See [Interface Types](#), on page 222 for details about interface type usage.
- **Data**
  - **Data-sharing**—For container instances only.
  - **Mgmt**
  - **Firepower-eventing**—For Firewall Threat Defense only.
  - **Cluster**
- Step 6** Set the required **Admin Speed** for the member interfaces from the drop-down list.
- If you add a member interface that is not at the specified speed, it will not successfully join the port channel.
- Step 7** For Data or Data-sharing interfaces, choose the LACP port-channel **Mode**, **Active** or **On**.
- For non-Data or non-Data-sharing interfaces, the mode is always active.
- Step 8** Set the required **Admin Duplex** for the member interfaces, **Full Duplex** or **Half Duplex**.
- If you add a member interface that is configured with the specified duplex, it will not successfully join the port channel.
- Step 9** To add an interface to the port channel, select the interface in the **Available Interface** list and click **Add Interface** to move the interface to the Member ID list.
- You can add up to 16 member interfaces of the same media type and capacity. The member interfaces must be set to the same speed and duplex, and must match the speed and duplex that you configured for this port channel. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface.
- Tip**
- You can add multiple interfaces at one time. To select multiple individual interfaces, click on the desired interfaces while holding down the **Ctrl** key. To select a range of interfaces, select the first interface in the range, and then, while holding down the **Shift** key, click to select the last interface in the range.
- Step 10** To remove an interface from the port channel, click the **Delete** button to the right of the interface in the Member ID list.
- Step 11** Click **OK**.
- 

## Add a VLAN Subinterface for Container Instances

You can add between 250 and 500 VLAN subinterfaces to the chassis, depending on your network deployment. You can add up to 500 subinterfaces to your chassis.

For multi-instance clustering, you can only add subinterfaces to the Cluster-type interface; subinterfaces on data interfaces are not supported.

VLAN IDs per interface must be unique, and within a container instance, VLAN IDs must be unique across all assigned interfaces. You can reuse VLAN IDs on *separate* interfaces as long as they are assigned to different container instances. However, each subinterface still counts towards the limit even though it uses the same ID.

This document discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the Firewall Threat Defense application. For more information on when to use *FXOS* subinterfaces vs. application subinterfaces, see [FXOS Interfaces vs. Application Interfaces](#), on page 224.

## Procedure

---

**Step 1** Choose **Interfaces** to open the **All Interfaces** tab.

The **All Interfaces** tab shows a visual representation of the currently installed interfaces at the top of the page and provides a listing of the installed interfaces in the table below.

**Step 2** Click **Add New > Subinterface** to open the **Add Subinterface** dialog box.

**Step 3** Choose the interface **Type**:

See [Interface Types](#), on page 222 for details about interface type usage.

- **Data**
- **Data-sharing**
- **Cluster**—If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster.

For Data and Data-sharing interfaces: The type is independent of the parent interface type; you can have a Data-sharing parent and a Data subinterface, for example.

**Step 4** Choose the parent **Interface** from the drop-down list.

You cannot add a subinterface to a physical interface that is currently allocated to a logical device. If other subinterfaces of the parent are allocated, you can add a new subinterface as long as the parent interface itself is not allocated.

**Step 5** Enter a **Subinterface ID**, between 1 and 4294967295.

This ID will be appended to the parent interface ID as *interface\_id.subinterface\_id*. For example, if you add a subinterface to Ethernet1/1 with the ID of 100, then the subinterface ID will be: Ethernet1/1.100. This ID is not the same as the VLAN ID, although you can set them to match for convenience.

**Step 6** Set the **VLAN ID** between 1 and 4095.

**Step 7** Click **OK**.

Expand the parent interface to view all subinterfaces under it.

---

# Configure Logical Devices

Add a standalone logical device or a High Availability pair on the Firepower 4100/9300.

For clustering, see [Clustering for the Firepower 4100/9300, on page 583](#).

## Add a Resource Profile for Container Instances

To specify resource usage per container instance, create one or more resource profiles. When you deploy the logical device/application instance, you specify the resource profile that you want to use. The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

- The minimum number of cores is 6.

**Note** Instances with a smaller number of cores might experience relatively higher CPU utilization than those with larger numbers of cores. Instances with a smaller number of cores are more sensitive to traffic load changes. If you experience traffic drops, try assigning more cores.

- You can assign cores as an even number (6, 8, 10, 12, 14 etc.) up to the maximum.
- The maximum number of cores available depends on the security module/chassis model; see [Requirements and Prerequisites for Container Instances, on page 247](#).

The chassis includes a default resource profile called "Default-Small," which includes the minimum number of cores. You can change the definition of this profile, and even delete it if it is not in use. Note that this profile is created when the chassis reloads and no other profile exists on the system.

Changing the resource profile after you assign it is disruptive. See the following guidelines:

- You cannot change the resource profile settings if it is currently in use. You must disable any instances that use it, then change the resource profile, and finally reenable the instance.
- If you change the resource profile settings after you add the Firewall Threat Defense instance to the Firewall Management Center, then update the inventory for each unit on the Firewall Management Center. Choose **Devices > Device Management**, click **Edit** (✎) for the instance, then click **Refresh** (🔄) on the **Device > Inventory Details** area.
- If you assign a different profile to an instance, it reboots.
- If you assign a different profile to instances in an established high-availability pair, which requires the profile to be the same on both units, you must:
  1. Break high availability.
  2. Assign the new profile to both units.
  3. Re-establish high availability.
- If you assign a different profile to instances in an established cluster, which allows mismatched profiles, then apply the new profile on the data nodes first; after they all come back up, you can apply the new profile to the control node.

## Procedure

- 
- Step 1** Choose **Platform Settings > Resource Profiles** , and click **Add**.  
The **Add Resource Profile** dialog box appears.
- Step 2** Set the following parameters.
- **Name**—Sets the name of the profile between 1 and 64 characters. Note that you cannot change the name of this profile after you add it.
  - **Description**—Sets the description of the profile up to 510 characters.
  - **Number of Cores**—Sets the number of cores for the profile, between 6 and the maximum, depending on your chassis, as an even number.
- Step 3** Click **OK**.
- 

## Add a Standalone Firewall Threat Defense

Standalone logical devices work either alone or in a High Availability pair. On the Firepower 9300 with multiple security modules, you can deploy either a cluster or standalone devices. The cluster must use all modules, so you cannot mix and match a 2-module cluster plus a single standalone device, for example.

You can use native instances on some modules, and container instances on the other module(s).

### Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.

---

**Note** For the Firepower 9300, you can install different application types (ASA and Firewall Threat Defense) on separate modules in the chassis. You can also run different versions of an application instance type on separate modules.

---

- Configure a management interface to use with the logical device. The management interface is required. Note that this management interface is not the same as the chassis management port that is used only for chassis management (and that appears at the top of the **Interfaces** tab as **MGMT**).
- You can later enable management from a data interface; but you must assign a Management interface to the logical device even if you don't intend to use it after you enable data management. See the **configure network management-data-interface** command in the [FTD command reference](#) for more information.
- You must also configure at least one Data type interface. Optionally, you can also create a firepower-eventing interface to carry all event traffic (such as web events). See [Interface Types, on page 222](#) for more information.

- For container instances, if you do not want to use the default profile, add a resource profile according to [Add a Resource Profile for Container Instances, on page 261](#).
- For container instances, before you can install a container instance for the first time, you must reinitialize the security module/engine so that the disk has the correct formatting. Choose **Security Modules** or **Security Engine**, and click the **Reinitialize icon**. An existing logical device will be deleted and then reinstalled as a new device, losing any local application configuration. If you are replacing a native instance with container instances, you will need to delete the native instance in any case. You cannot automatically migrate a native instance to a container instance.
- Gather the following information:
  - Interface IDs for this device
  - Management interface IP address and network mask
  - Gateway IP address
  - Firewall Management Center IP address and/or NAT ID of your choosing
  - DNS server IP address
  - Firewall Threat Defense hostname and domain name

## Procedure

**Step 1** Choose **Logical Devices**.

**Step 2** Click **Add > Standalone**, and set the following parameters:

**Add Standalone** ? X

Device Name:

Template:

Image Version:

Instance Type:

**i** Before you add the first container instance, you must reinitialize the security module/engine so that the disk has the correct formatting. You only need to perform this action once.

OK Cancel

a) Provide a **Device Name**.

This name is used by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

### Note

You cannot change this name after you add the logical device.

- b) For the **Template**, choose **Cisco Firepower Threat Defense**.
- c) Choose the **Image Version**.
- d) Choose the **Instance Type**: **Container** or **Native**.

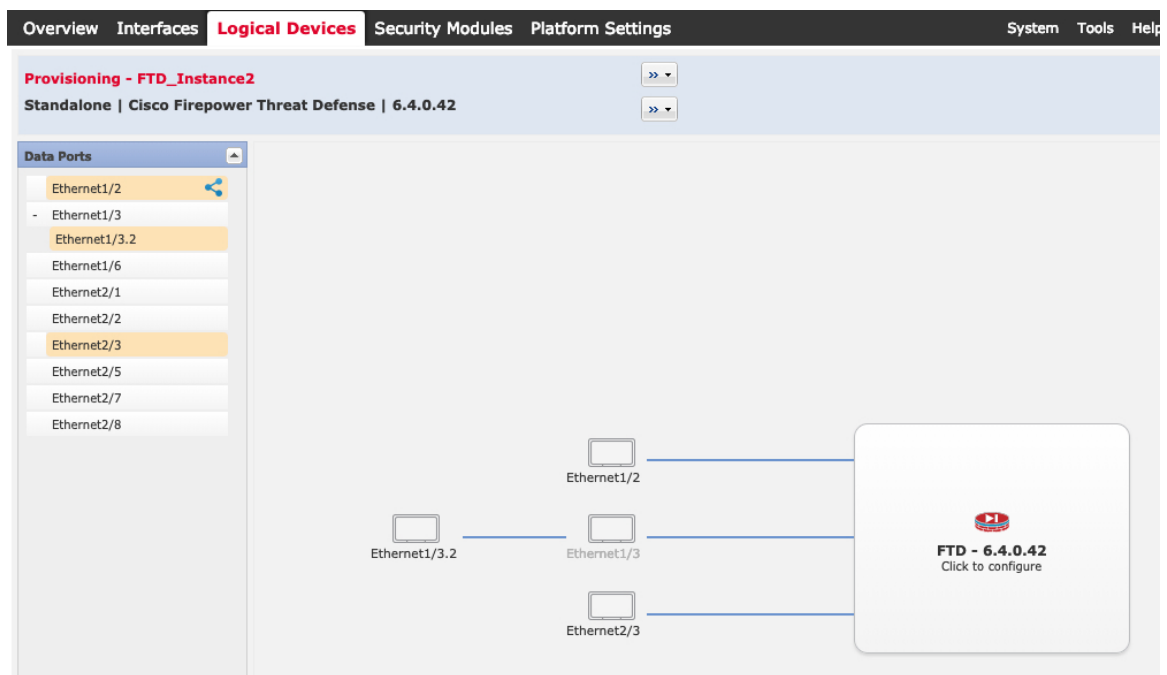

A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance. A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances.

e) Click **OK**.

You see the Provisioning - *device name* window.

### Step 3

Expand the **Data Ports** area, and click each interface that you want to assign to the device.

You can only assign data and data-sharing interfaces that you previously enabled on the **Interfaces** page. You will later enable and configure these interfaces in Firewall Management Center, including setting the IP addresses.

You can only assign up to 10 data-sharing interfaces to a container instance. Also, each data-sharing interface can be assigned to at most 14 container instances. A data-sharing interface is indicated by the sharing icon (🔗).

Hardware Bypass-capable ports are shown with the following icon: 🔄. For certain interface modules, you can enable the Hardware Bypass feature for Inline Set interfaces only (see the Firewall Management Center configuration guide). Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures. If you do not assign both interfaces in a Hardware Bypass pair, you see a warning message to make sure your assignment is intentional. You do not need to use the Hardware Bypass feature, so you can assign single interfaces if you prefer.

### Step 4

Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

### Step 5

On the **General Information** page, complete the following:

- a) (For the Firepower 9300) Under **Security Module Selection** click the security module that you want to use for this logical device.
- b) For a container instance, specify the **Resource Profile**.

If you later assign a different resource profile, then the instance will reload, which can take approximately 5 minutes.

#### Note

If you later assign a different profile to instances in an established high-availability pair, which requires the profile to be the same on both units, you must:

1. Break high availability.
  2. Assign the new profile to both units.
  3. Re-establish high availability.
- c) Choose the **Management Interface**.  
This interface is used to manage the logical device. This interface is separate from the chassis management port.
  - d) Choose the management interface **Address Type**: **IPv4 only**, **IPv6 only**, or **IPv4 and IPv6**.
  - e) Configure the **Management IP** address.  
Set a unique IP address for this interface.
  - f) Enter a **Network Mask** or **Prefix Length**.
  - g) Enter a **Network Gateway** address.

### Step 6

On the **Settings** tab, complete the following:

The screenshot shows the 'Cisco Secure Firewall Threat Defense - Bootstrap Configuration' window with the 'Settings' tab selected. The 'General Information' tab is also visible. The 'Settings' tab contains the following fields and values:

Field	Value
Management type of application instance:	FMC
Permit Expert mode for FTD SSH sessions:	yes
Search domains:	cisco.com
Firewall Mode:	Routed
DNS Servers:	10.89.5.67
Fully Qualified Hostname:	td2.cisco.com
Password:	*****
Confirm Password:	*****
Registration Key:	****
Confirm Registration Key:	****
CDO Onboard:	
Confirm CDO Onboard:	
Firepower Management Center IP:	10.89.5.35
Firepower Management Center NAT ID:	test
Eventing Interface:	

At the bottom of the dialog are 'OK' and 'Cancel' buttons.

- a) For a native instance, in the **Management type of application instance** drop-down list, choose **FMC**.  
Native instances also support Firewall Device Manager as a manager. After you deploy the logical device, you cannot change the manager type.
- b) Enter the **Firepower Management Center IP** of the managing Firewall Management Center. If you do not know the Firewall Management Center IP address, leave this field blank and enter a passphrase in the **Firepower Management Center NAT ID** field.
- c) For a container instance, **Permit Expert mode from FTD SSH sessions**: **Yes** or **No**. Expert Mode provides Firewall Threat Defense shell access for advanced troubleshooting.

If you choose **Yes** for this option, then users who access the container instance directly from an SSH session can enter Expert Mode. If you choose **No**, then only users who access the container instance from the FXOS CLI can enter Expert Mode. We recommend choosing **No** to increase isolation between instances.

Use Expert Mode only if a documented procedure tells you it is required, or if the Cisco Technical Assistance Center asks you to use it. To enter this mode, use the **expert** command in the Firewall Threat Defense CLI.

- d) Enter the **Search Domains** as a comma-separated list.
- e) Choose the **Firewall Mode**: **Transparent** or **Routed**.

In routed mode, the Firewall Threat Defense is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

- f) Enter the **DNS Servers** as a comma-separated list.

The Firewall Threat Defense uses DNS if you specify a hostname for the Firewall Management Center, for example.

- g) Enter the **Fully Qualified Hostname** for the Firewall Threat Defense.

- h) Enter a **Registration Key** to be shared between the Firewall Management Center and the device during registration.

You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the Firewall Management Center when you add the Firewall Threat Defense.

- i) Enter a **Password** for the Firewall Threat Defense admin user for CLI access.
- j) Choose the **Eventing Interface** on which events should be sent. If not specified, the management interface will be used.

This interface must be defined as a Firepower-eventing interface.

- k) For a container instance, set the **Hardware Crypto** as **Enabled** or **Disabled**.

This setting enables TLS crypto acceleration in hardware, and improves performance for certain types of traffic. This feature is enabled by default. You can enable TLS crypto acceleration for up to 16 instances per security module. This feature is always enabled for native instances. To view the percentage of hardware crypto resources allocated to this instance, enter the **show hw-crypto** command.

#### Step 7

On the **Agreement** tab, read and accept the end user license agreement (EULA).

#### Step 8

Click **OK** to close the configuration dialog box.

#### Step 9

Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can start configuring the security policy in the application.

#### Step 10

See the Firewall Management Center configuration guide to add the Firewall Threat Defense as a managed device and start configuring your security policy.

## Add a High Availability Pair

Firewall Threat Defense High Availability (also known as failover) is configured within the application, not in FXOS. However, to prepare your chassis for high availability, see the following steps.

#### Before you begin

See [Requirements and Prerequisites for High Availability](#), on page 248.

## Procedure

**Step 1** Allocate the same interfaces to each logical device.

**Step 2** Allocate 1 or 2 data interfaces for the failover and state link(s).

These interfaces exchange high availability traffic between the 2 chassis. We recommend that you use a 10 GB data interface for a combined failover and state link. If you have available interfaces, you can use separate failover and state links; the state link requires the most bandwidth. You cannot use the management-type interface for the failover or state link. We recommend that you use a switch between the chassis, with no other device on the same network segment as the failover interfaces.

For container instances, data-sharing interfaces are not supported for the failover link. We recommend that you create subinterfaces on a parent interface or EtherChannel, and assign a subinterface for each instance to use as a failover link. Note that you must use all subinterfaces on the same parent as failover links. You cannot use one subinterface as a failover link and then use other subinterfaces (or the parent interface) as regular data interfaces.

**Step 3** Enable High Availability on the logical devices. See [High Availability, on page 345](#).

**Step 4** If you need to make interface changes after you enable High Availability, perform the changes on the standby unit first, and then perform the changes on the active unit.

## Change an Interface on a Firewall Threat Defense Logical Device

You can allocate or unallocate an interface, or replace a management interface on the Firewall Threat Defense logical device. You can then sync the interface configuration in the Firewall Management Center.

Adding a new interface, or deleting an unused interface has minimal impact on the Firewall Threat Defense configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the Firewall Threat Defense configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the Firewall Management Center.

Deleting an interface will delete any configuration associated with that interface.

### Before you begin

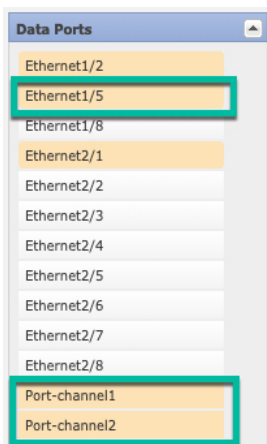

- Configure your interfaces, and add any EtherChannels according to [Configure a Physical Interface, on page 256](#) and [Add an EtherChannel \(Port Channel\), on page 257](#).
- If you want to add an already-allocated interface to an EtherChannel (for example, all interfaces are allocated by default to a cluster), you need to unallocate the interface from the logical device first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the device.
- If you want to replace the management or eventing interface with a management EtherChannel, then you need to create the EtherChannel with at least 1 unallocated data member interface, and then replace the current management interface with the EtherChannel. After the Firewall Threat Defense device reboots (management interface changes cause a reboot), and you sync the configuration in the Firewall

Management Center, you can add the (now unallocated) management interface to the EtherChannel as well.

- For clustering or High Availability, make sure you add or remove the interface on all units before you sync the configuration in the Firewall Management Center. We recommend that you make the interface changes on the data/standby unit(s) first, and then on the control/active unit. Note that new interfaces are added in an administratively down state, so they do not affect interface monitoring.
- In mult-instance mode, for changing a sub-interface with another sub-interface with the same vlan tag, you must first remove all the configuration (including nameif config) of the interface and then unallocate the interface from Firewall Chassis Manager. Once unallocated, add the new interface and then use sync interfaces from the Firewall Management Center.

## Procedure

- Step 1** In the Firewall Chassis Manager, choose **Logical Devices**.
- Step 2** Click the **Edit** icon at the top right to edit the logical device.
- Step 3** Allocate a new data interface by selecting the interface in the **Data Ports** area.
- Do not delete any interfaces yet.

- Step 4** Replace the management or eventing interface:
- For these types of interfaces, the device reboots after you save your changes.
- Click the device icon in the center of the page.
  - On the **General** or **Cluster Information** tab, choose the new **Management Interface** from the drop-down list.
  - On the **Settings** tab, choose the new **Eventing Interface** from the drop-down list.
  - Click **OK**.
- If you change the IP address of the Management interface, then you must also change the IP address for the device in the Firewall Management Center: go to **Devices > Device Management > Device/Cluster**. In the **Management** area, set the IP address to match the bootstrap configuration address.
- Step 5** Click **Save**.
- Step 6** Sync the interfaces in the Firewall Management Center.

- a) Log into the Firewall Management Center.
- b) Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- c) Click the **Sync Device** button on the top left of the **Interfaces** page.
- d) After the changes are detected, you will see a red banner on the **Interfaces** page indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.
- e) If you plan to delete an interface, manually transfer any interface configuration from the old interface to the new interface.

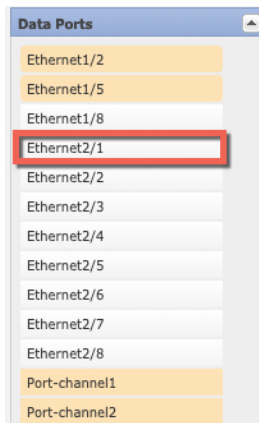

Because you have not yet deleted any interfaces, you can refer to the existing configuration. You will have additional opportunity to fix the configuration after you delete the old interface and re-run the validation. The validation will show you all locations in which the old interface is still used.

- f) Click **Validate Changes** to make sure your policy will still work with the interface changes.

If there are any errors, you need to change your policy and rerun the validation.

- g) Click **Save**.
- h) Click **Deploy > Deployment**.
- i) Select the devices and click **Deploy** to deploy the policy to the assigned devices. The changes are not active until you deploy them.

**Step 7** In the Firewall Chassis Manager, unallocate a data interface by de-selecting the interface in the **Data Ports** area.

**Step 8** Click **Save**.

**Step 9** Sync the interfaces again in the Firewall Management Center.

## Connect to the Console of the Application

Use the following procedure to connect to the console of the application.

### Procedure

**Step 1** Connect to the module CLI using a console connection or a Telnet connection.

**connect module** *slot\_number* { **console** | **telnet** }

To connect to the security engine of a device that does not support multiple security modules, always use **1** as the *slot\_number*.

The benefits of using a Telnet connection is that you can have multiple sessions to the module at the same time, and the connection speed is faster.

**Example:**

```
Firepower# connect module 1 console
Telnet escape character is '~'.
Trying 127.5.1.1...
Connected to 127.5.1.1.
Escape character is '~'.
```

```
CISCO Serial Over LAN:
Close Network Connection to Exit
```

```
Firepower-module1>
```

**Step 2** Connect to the application console.

**connect ftd** *name*

To view the instance names, enter the command without a name.

**Example:**

```
Firepower-module1> connect ftd ftd1
Connecting to ftd(ftd-native) console... enter exit to return to bootCLI
[...]
>
```

**Step 3** Exit the application console to the FXOS module CLI.

- Firewall Threat Defense—Enter **exit**

**Step 4** Return to the supervisor level of the FXOS CLI.

**Exit the console:**

- a) Enter ~

You exit to the Telnet application.

- b) To exit the Telnet application, enter:

telnet>**quit**

**Exit the Telnet session:**

- a) Enter **Ctrl-], .**

# History for Logical Devices

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Synchronization between the Firewall Threat Defense operational link state and the physical link state	6.7	Any	<p>The chassis can now synchronize the Firewall Threat Defense operational link state with the physical link state for data interfaces. Currently, interfaces will be in an Up state as long as the FXOS admin state is up and the physical link state is up. The Firewall Threat Defense application interface admin state is not considered. Without synchronization from Firewall Threat Defense, data interfaces can be in an Up state physically before the Firewall Threat Defense application has completely come online, for example, or can stay Up for a period of time after you initiate Firewall Threat Defense shutdown. For inline sets, this state mismatch can result in dropped packets because external routers may start sending traffic to the Firewall Threat Defense before the Firewall Threat Defense can handle it. This feature is disabled by default, and can be enabled per logical device in FXOS.</p> <p><b>Note</b> This feature is not supported for clustering, container instances, or Firewall Threat Defense with a Radware vDP decorator. It is also not supported for the ASA.</p> <p>New/Modified Firepower Chassis Manager screens: <b>Logical Devices &gt; Enable Link State</b></p> <p>New/Modified FXOS commands: <b>set link-state-sync enabled, show interface expand detail</b></p>
Firewall Threat Defense configuration backup and restore using Firewall Management Center for container instances	6.7	Any	<p>You can now use the Firewall Management Center backup/restore tool on Firewall Threat Defense container instances.</p> <p>New/Modified Firewall Management Center screens: <b>System &gt; Tools &gt; Backup/Restore &gt; Managed Device Backup</b></p> <p>New/Modified Firewall Threat Defense CLI commands: <b>restore</b></p> <p>Supported platforms: Firepower 4100/9300</p> <p><b>Note</b> Requires FXOS 2.9.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Support for VLAN subinterfaces on a Cluster type interface (multi-instance use only)	6.6	Any	<p>For use with multi-instance clusters, you can now create VLAN subinterfaces on cluster type interfaces. Because each cluster requires a unique cluster control link, VLAN subinterfaces provide a simple method to fulfill this requirement. You can alternatively assign a dedicated EtherChannel per cluster. Multiple cluster interfaces are now allowed.</p> <p>New/Modified Firepower Chassis Manager screens:</p> <p><b>Interfaces &gt; All Interfaces &gt; Add New</b> drop-down menu <b>Subinterface &gt; Type</b> field</p> <p>New/Modified FXOS commands: <b>set port-type cluster</b></p> <p><b>Note</b> Requires FXOS 2.8.1.</p>
Firewall Threat Defense on the Firepower 4112	6.6	Any	<p>We introduced the Firepower 4112.</p> <p><b>Note</b> Requires FXOS 2.8.1.</p>
TLS crypto acceleration for multiple container instances	6.5	Any	<p>TLS crypto acceleration is now supported on multiple container instances (up to 16) on a Firepower 4100/9300 chassis. Previously, you could enable TLS crypto acceleration for only <i>one</i> container instance per module/security engine.</p> <p>New instances have this feature enabled by default. However, the upgrade does <i>not</i> enable acceleration on existing instances. Instead, use the <b>enter hw-crypto</b> and then the <b>set admin-state enabled</b> FXOS commands.</p> <p>New/Modified Firepower Chassis Manager screens:</p> <p><b>Logical Devices &gt; Add Device &gt; Settings &gt; Hardware Crypto</b> drop-down menu</p> <p><b>Note</b> Requires FXOS 2.7.1.</p>
Firewall Threat Defense on the Firepower 4115, 4125, and 4145	6.4	Any	<p>We introduced the Firepower 4115, 4125, and 4145.</p> <p><b>Note</b> Requires FXOS 2.6.1.157.</p>
Firepower 9300 SM-40, SM-48, and SM-56 support	6.4	Any	<p>We introduced the following three security modules: SM-40, SM-48, and SM-56.</p> <p><b>Note</b> Requires FXOS 2.6.1.157.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Support for ASA and Firewall Threat Defense on separate modules of the same Firepower 9300	6.4	Any	You can now deploy ASA and Firewall Threat Defense logical devices on the same Firepower 9300.  <b>Note</b> Requires FXOS 2.6.1.157.
Support for SSL hardware acceleration on one Firewall Threat Defense container instance on a module/security engine	6.4	Any	You can now enable SSL hardware acceleration for one container instance on a module/security engine. SSL hardware acceleration is disabled for other container instances, but enabled for native instances.  New/Modified FXOS commands: <b>config hwCrypto enable</b>  No modified screens.  <b>Note</b> Requires FXOS 2.6.1.157.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Multi-instance capability for Firewall Threat Defense on the Firepower 4100/9300	6.3	Any	<p>You can now deploy multiple logical devices, each with a Firewall Threat Defense container instance, on a single security engine/module. Formerly, you could only deploy a single native application instance.</p> <p>To provide flexible physical interface use, you can create VLAN subinterfaces in FXOS and also share interfaces between multiple instances. Resource management lets you customize performance capabilities for each instance.</p> <p>You can use High Availability using a container instance on 2 separate chassis. Clustering is not supported.</p> <p><b>Note</b> Multi-instance capability is similar to ASA multiple context mode, although the implementation is different. Multiple context mode is not available on the Firewall Threat Defense.</p> <p>New/Modified Firewall Management Center screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Edit icon Interfaces tab</b></li> </ul> <p>New/Modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Overview &gt; Devices</b></li> <li>• <b>Interfaces &gt; All Interfaces &gt; Add New drop-down menu Subinterface</b></li> <li>• <b>Interfaces &gt; All Interfaces &gt; Type</b></li> <li>• <b>Logical Devices &gt; Add Device</b></li> <li>• <b>Platform Settings &gt; Mac Pool</b></li> <li>• <b>Platform Settings &gt; Resource Profiles</b></li> </ul> <p>New/Modified FXOS commands: <b>connect ftd <i>name</i>, connect module telnet, create bootstrap-key PERMIT_EXPERT_MODE, create resource-profile, create subinterface, scope auto-macpool, set cpu-core-count, set deploy-type, set port-type data-sharing, set prefix, set resource-profile-name, set vlan, scope app-instance ftd <i>name</i>, show cgroups container, show interface, show mac-address, show subinterface, show tech-support module app-instance, show version</b></p> <p>Supported platforms: Firepower 4100/9300</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster control link customizable IP Address for the Firepower 4100/9300	6.3	Any	<p>By default, the cluster control link uses the 127.2.0.0/16 network. You can now set the network when you deploy the cluster in FXOS. The chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: <code>127.2.chassis_id.slot_id</code>. However, some networking deployments do not allow 127.2.0.0/16 traffic to pass. Therefore, you can now set a custom /16 subnet for the cluster control link in FXOS except for loopback (127.0.0.0/8) and multicast (224.0.0.0/4) addresses.</p> <p>New/modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Logical Devices &gt; Add Device &gt; Cluster Information &gt; CCL Subnet IP field</b></li> </ul> <p>New/Modified FXOS commands: <b>set cluster-control-link network</b></p> <p>Supported platforms: Firepower 4100/9300</p>
Support for data EtherChannels in On mode	6.3	Any	<p>You can now set data and data-sharing EtherChannels to either Active LACP mode or to On mode. Other types of EtherChannels only support Active mode.</p> <p>New/Modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Interfaces &gt; All Interfaces &gt; Edit Port Channel &gt; Mode</b></li> </ul> <p>New/Modified FXOS commands: <b>set port-channel-mode</b></p> <p>Supported platforms: Firepower 4100/9300</p>
Support for EtherChannels in Firewall Threat Defense inline sets	6.2	Any	<p>You can now use EtherChannels in a Firewall Threat Defense inline set.</p> <p>Supported platforms: Firepower 4100/9300</p>
Inter-chassis clustering for 6 Firewall Threat Defense modules	6.2	Any	<p>You can now enable inter-chassis clustering for the Firewall Threat Defense. You can include up to 6 modules in up to 6 chassis.</p> <p>New/modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Logical Devices &gt; Configuration</b></li> </ul> <p>Supported platforms: Firepower 4100/9300</p>
Hardware bypass support on the Firepower 4100/9300 for supported network modules	6.1	Any	<p>Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Edit Physical Interface</b></li> </ul> <p>Supported platforms: Firepower 4100/9300</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Inline set link state propagation support for the Firewall Threat Defense	6.1	Any	<p>When you configure an inline set in the Firewall Threat Defense application and enable link state propagation, the Firewall Threat Defense sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down.</p> <p>New/Modified FXOS commands: <b>show fault  grep link-down, show interface detail</b></p> <p>Supported platforms: Firepower 4100/9300</p>
Support for intra-chassis clustering on the Firewall Threat Defense on the Firepower 9300	6.0.1	Any	<p>The Firepower 9300 supports intra-chassis clustering with the Firewall Threat Defense application.</p> <p>New/Modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Logical Devices &gt; Configuration</b></li> </ul> <p>New/Modified FXOS commands: <b>enter mgmt-bootstrap ftd, enter bootstrap-key FIREPOWER_MANAGER_IP, enter bootstrap-key FIREWALL_MODE, enter bootstrap-key-secret REGISTRATION_KEY, enter bootstrap-key-secret PASSWORD, enter bootstrap-key FQDN, enter bootstrap-key DNS_SERVERS, enter bootstrap-key SEARCH_DOMAINS, enter ipv4 firepower, enter ipv6 firepower, set value, set gateway, set ip, accept-license-agreement</b></p> <p>Supported platforms: Firepower 4100/9300</p>

## CHAPTER 8

# Multi-Instance Mode for the Secure Firewall 3100

You can deploy the Secure Firewall 3100 as a single device (*appliance mode*) or as multiple container instances (*multi-instance mode*). This chapter describes how to deploy the device in multi-instance mode.

- [About Multi-Instance Mode, on page 279](#)
- [Licenses for Instances, on page 292](#)
- [Requirements and Prerequisites for Instances, on page 292](#)
- [Guidelines and Limitations for Instances, on page 294](#)
- [Configure Instances, on page 296](#)
- [Monitoring Multi-Instance Mode, on page 341](#)
- [History for Multi-Instance Mode, on page 344](#)

## About Multi-Instance Mode

In multi-instance mode, you can deploy multiple container instances on a single chassis that act as completely independent devices.

## Multi-Instance Mode vs. Appliance Mode

You can run the device in either multi-instance mode or appliance mode.

### Appliance Mode

Appliance mode is the default. The device runs the native Firewall Threat Defense image and acts as a single device. The only chassis-level configuration available (on the **Chassis Manager** page) is for network module management (breakout ports or enabling/disabling a network module).

### Multi-Instance Mode

If you change to multi-instance mode, the device runs the Secure Firewall eXtensible Operating System (FXOS) on the chassis, while each instance runs separate Firewall Threat Defense images. You can configure the mode using the FXOS CLI.

Because multiple instances run on the same chassis, you need to perform chassis-level management of:

- CPU and memory resources using resource profiles.

- Interface configuration and assignment.
- Deployment and monitoring of instances.

For a multi-instance device, you add the *chassis* to the Firewall Management Center and configure chassis-level settings on the **Chassis Manager** page.

## Chassis Management Interface

### Chassis Management

The chassis uses the dedicated Management interface on the device. Multi-instance mode does not support using a data interface for chassis management or DHCP addressing for the Management interface.

You can only configure the chassis Management interface at the Firewall Threat Defense CLI (at initial setup) or FXOS CLI (after you convert to multi-instance mode). See [Enable Multi-Instance Mode, on page 296](#) for initial setup. See [Change Chassis Management Settings at the FXOS CLI, on page 338](#) to change Management interface settings in multi-instance mode.

**Note** By default, SSH is not allowed to this interface in multi-instance mode unless you enable the SSH server and an SSH access list. This difference means that you can connect to the application-mode threat defense Management interface using SSH, but after you convert to multi-instance mode, you can no longer connect using SSH by default. See [Configure SSH and SSH Access List, on page 323](#).

### Instance Management

All instances share the chassis management interface, and each instance has its own IP address on the Management network. After you add the instance and specify the IP address, you can make changes to the network settings at the Firewall Threat Defense CLI.

The instance Management IP address allows SSH by default.

## Instance Interfaces

To provide flexible physical interface use for instances, you can create VLAN subinterfaces on the chassis and also share interfaces (VLAN or physical) between multiple instances. See [Shared Interface Scalability, on page 283](#) and [Configure a Subinterface, on page 309](#).

**Note** This chapter discusses *chassis* VLAN subinterfaces only. You can separately create subinterfaces within the Firewall Threat Defense instance. See [Chassis Interfaces vs. Instance Interfaces, on page 281](#) for more information.

## Interface Types

Physical interfaces, VLAN subinterfaces, and EtherChannel interfaces can be one of the following types:

- **Data**—Use for regular data or the failover link. Data interfaces cannot be shared between instances, and instances cannot communicate over the backplane to other instances. For traffic on Data interfaces, all traffic must exit the chassis on one interface and return on another interface to reach another instance. You can add VLAN subinterfaces to a data interface to provide separate failover links per High Availability pair.
- **Data-sharing**—Use for regular data. These data interfaces can be shared by one or more instances. Each instance can communicate over the backplane with all other instances that share this interface. Shared interfaces can affect the number of instances you can deploy. Shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode), inline sets, passive interfaces, or failover links.

## Chassis Interfaces vs. Instance Interfaces

At the chassis level, you manage the basic Ethernet settings of physical interfaces, VLAN subinterfaces for instances, and EtherChannel interfaces. Within the instance, you configure higher level settings. For example, you can only create EtherChannels in the chassis; but you can assign an IP address to the EtherChannel within the instance.

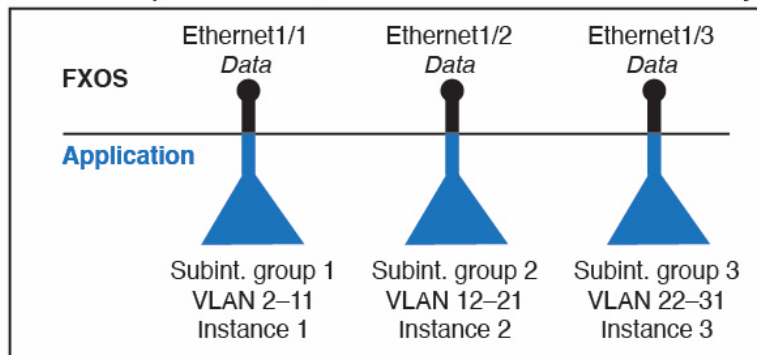

The following sections describe the interaction between the chassis and the instance for interfaces.

### VLAN Subinterfaces

You can create VLAN subinterfaces within the instance, just as you would for any device.

You can *also* create VLAN subinterfaces in the chassis. The instance-defined subinterfaces are not subject to the chassis limit. Choosing in which location to create subinterfaces depends on your network deployment and personal preference. For example, to share a subinterface, you must create the subinterface on the chassis. Another scenario that favors chassis subinterfaces comprises allocating separate subinterface groups on a single interface to multiple instances. For example, you want to use Port-channel1 with VLAN 2–11 on instance A, VLAN 12–21 on instance B, and VLAN 22–31 on instance C. If you create these subinterfaces in the instance, then you would have to share the parent interface in the chassis, which may not be desirable. See the following illustration that shows the three ways you can accomplish this scenario:

Figure 114: VLANs in the Chassis vs. the Instance

**Scenario 1 (recommended)****Scenario 2 (not recommended, worse performance)****Scenario 3 (recommended, but lacks EtherChannel redundancy)****Independent Interface States in the Chassis and in the Instance**

You can administratively enable and disable interfaces in both the chassis and in the instance. For an interface to be operational, the interface must be enabled in both locations. Because the interface state is controlled independently, you may have a mismatch between the chassis and instance.

The default state of an interface within the instance depends on the type of interface. For example, the physical interface or EtherChannel is disabled by default within the instance, but a subinterface is enabled by default.

## Shared Interface Scalability

Instances can share data-sharing type interfaces. This capability lets you conserve physical interface usage as well as support flexible networking deployments. When you share an interface, the chassis uses unique MAC addresses to forward traffic to the correct instance. However, shared interfaces can cause the forwarding table to grow large due to the need for a full mesh topology within the chassis (every instance must be able to communicate with every other instance that is sharing the same interface). Therefore, there are limits to how many interfaces you can share.

In addition to the forwarding table, the chassis maintains a VLAN group table for VLAN subinterface forwarding. You can create up to 500 VLAN subinterfaces.

See the following limits for shared interface allocation:

## Shared Interface Best Practices

For optimal scalability of the forwarding table, share as few interfaces as possible. Instead, you can create up to 500 VLAN subinterfaces on one or more physical interfaces and then divide the VLANs among the container instances.

When sharing interfaces, follow these practices in the order of most scalable to least scalable:

1. Best—Share subinterfaces under a single parent, and use the same set of subinterfaces with the same group of instances.

For example, create a large EtherChannel to bundle all of your like-kind interfaces together, and then share subinterfaces of that EtherChannel: Port-Channel1.2, 3, and 4 instead of Port-Channel2,

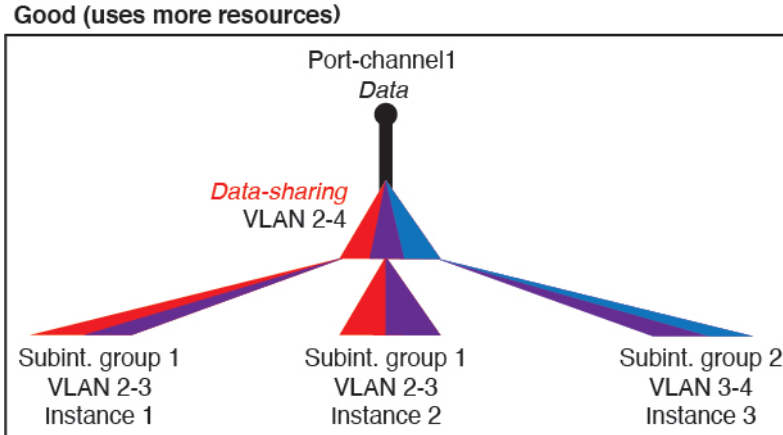

Port-Channel3, and Port-Channel4. When you share subinterfaces from a single parent, the VLAN group table provides better scaling of the forwarding table than when sharing physical/EtherChannel interfaces or subinterfaces across parents.

**Figure 115: Best: Shared Subinterface Group on One Parent**

If you do not share the same set of subinterfaces with a group of instances, your configuration can cause more resource usage (more VLAN groups). For example, share Port-Channel1.2, 3, and 4 with instances 1, 2, and 3 (one VLAN group) instead of sharing Port-Channel1.2 and 3 with instances 1 and 2, while sharing Port-Channel1.3 and 4 with instance 3 (two VLAN groups).

**Figure 116: Good: Sharing Multiple Subinterface Groups on One Parent**

## 2. Fair—Share subinterfaces across parents.

For example, share Port-Channel1.2, Port-Channel2.3, and Port-Channel3.4 instead of Port-Channel2, Port-Channel4, and Port-Channel4. Although this usage is not as efficient as only sharing subinterfaces on the same parent, it still takes advantage of VLAN groups.

**Figure 117: Fair: Shared Subinterfaces on Separate Parents**

3. Worst—Share individual parent interfaces (physical or EtherChannel).  
This method uses the most forwarding table entries.

**Figure 118: Worst: Shared Parent Interfaces**

## How the Chassis Classifies Packets

Each packet that enters the chassis must be classified, so that the chassis can determine to which instance to send a packet.

- **Unique Interfaces**—If only one instance is associated with the ingress interface, the chassis classifies the packet into that instance. For bridge group member interfaces (in transparent mode or routed mode), inline sets, or passive interfaces, this method is used to classify packets at all times.
- **Unique MAC Addresses**—The chassis automatically generates unique MAC addresses for all interfaces, including shared interfaces. If multiple instances share an interface, then the classifier uses unique MAC addresses assigned to the interface in each instance. An upstream router cannot route directly to an instance without unique MAC addresses. You can also set the MAC addresses manually when you configure each interface within the application.

### Note

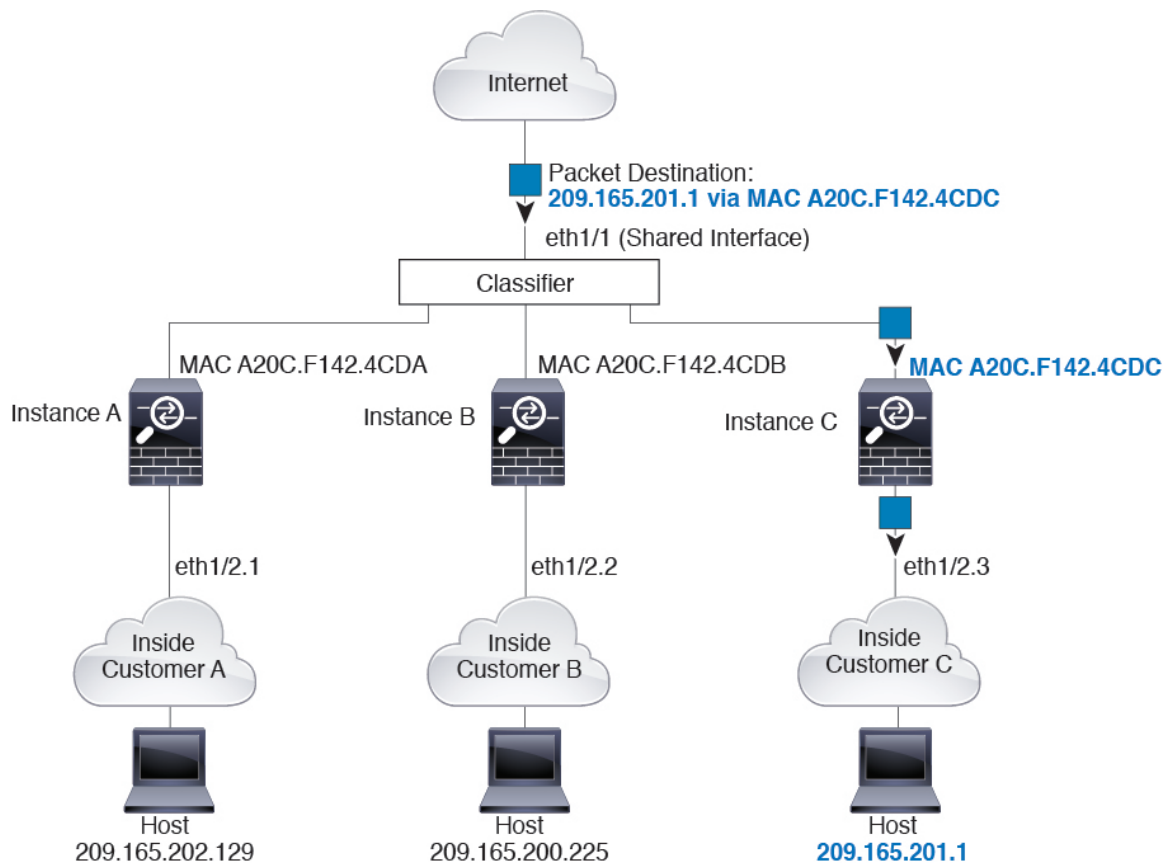

If the destination MAC address is a multicast or broadcast MAC address, the packet is duplicated and delivered to each instance.

## Classification Examples

### Packet Classification with a Shared Interface Using MAC Addresses

The following figure shows multiple instances sharing an outside interface. The classifier assigns the packet to Instance C because Instance C includes the MAC address to which the router sends the packet.

**Figure 119: Packet Classification with a Shared Interface Using MAC Addresses**

### Incoming Traffic from Inside Networks

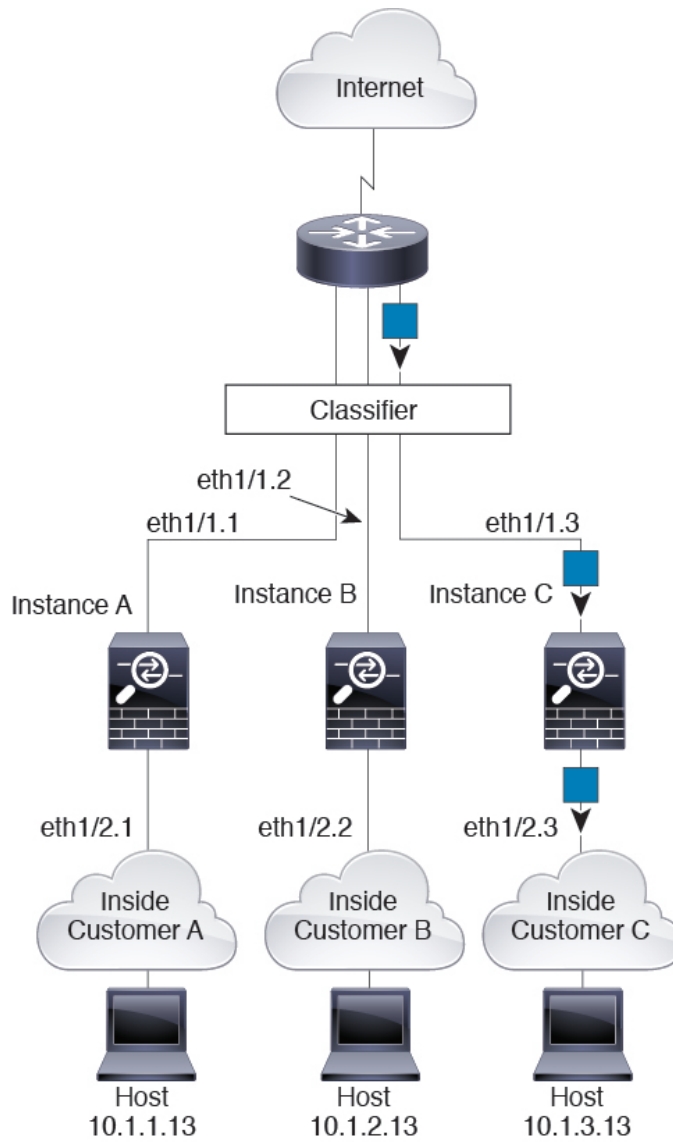

Note that all new incoming traffic must be classified, even from inside networks. The following figure shows a host on the Instance C inside network accessing the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

**Figure 120: Incoming Traffic from Inside Networks**

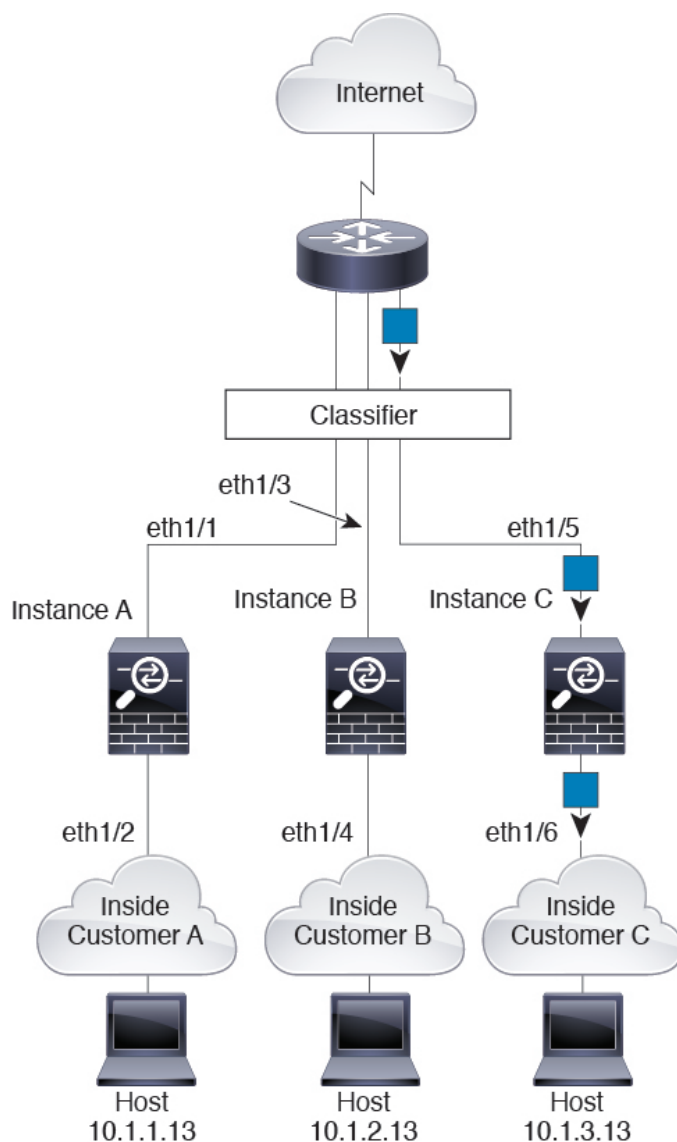

### Transparent Firewall Instances

For transparent firewalls, you must use unique interfaces. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/2.3, which is assigned to Instance C.

**Figure 121: Transparent Firewall Instances****Inline Sets**

For inline sets, you must use unique interfaces and they must be physical interfaces or EtherChannels. The following figure shows a packet destined to a host on the Instance C inside network from the internet. The classifier assigns the packet to Instance C because the ingress interface is Ethernet 1/5, which is assigned to Instance C.

Figure 122: Inline Sets

## Cascading Instances

Placing an instance directly in front of another instance is called *cascading instances*; the outside interface of one instance is the same interface as the inside interface of another instance. You might want to cascade instances if you want to simplify the configuration of some instances by configuring shared parameters in the top instance.

The following figure shows a gateway instance with two instances behind the gateway.

Figure 123: Cascading Instances

**Note** Do not use cascading instances (using a shared interface) with High Availability. After a failover occurs and the standby unit rejoins, MAC addresses can overlap temporarily and cause an outage. You should instead use unique interfaces for the gateway instance and inside instance using an external switch to pass traffic between the instances.

## Typical Multi-Instance Deployment

The following example includes three container instances in routed firewall mode. They include the following interfaces:

- **Management**—All instances and the chassis use the dedicated Management interface. Within each instance (and the chassis), the interface uses a unique IP address on the same management network.
- **Inside**—Each instance uses a subinterface on Port-Channel1 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

- Outside—All instances use the Port-Channel2 interface (data-sharing type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Within each application, the interface uses a unique IP address on the same outside network.
- Failover—Each instance uses a subinterface on Port-Channel3 (data type). This EtherChannel includes two 10 Gigabit Ethernet interfaces. Each subinterface is on a separate network.

Figure 124: Typical Multi-Instance Deployment

## Automatic MAC Addresses for Instance Interfaces

The chassis automatically generates MAC addresses for instance interfaces, and guarantees that a shared interface in each instance uses a unique MAC address.

If you manually assign a MAC address to a shared interface within the instance, then the manually-assigned MAC address is used. If you later remove the manual MAC address, the autogenerated address is used. In the rare circumstance that the generated MAC address conflicts with another private MAC address in your network, we suggest that you manually set the MAC address for the interface within the instance.

Because autogenerated addresses start with A2, you should not start manual MAC addresses with A2 due to the risk of overlapping addresses.

The chassis generates the MAC address using the following format:

A2xx.yyzz.zzzz

Where xx.yy is a user-defined prefix or a system-defined prefix, and zz.zzzz is an internal counter generated by the chassis. The system-defined prefix matches the lower 2 bytes of the first MAC address in the burned-in MAC address pool that is programmed into the IDPROM. Use **connect fxos**, then **show module** to view the

MAC address pool. For example, if the range of MAC addresses shown for module 1 is b0aa.772f.f0b0 to b0aa.772f.f0bf, then the system prefix will be f0b0.

The user-defined prefix is an integer that is converted into hexadecimal. For an example of how the user-defined prefix is used, if you set a prefix of 77, then the chassis converts 77 into the hexadecimal value 004D (yyxx). When used in the MAC address, the prefix is reversed (xxyy) to match the chassis native form:

A24D.00zz.zzzz

For a prefix of 1009 (03F1), the MAC address is:

A2F1.03zz.zzzz

## Performance Scaling Factor for Multi-Instance Mode

The maximum throughput (connections, VPN sessions) for a platform is calculated for an appliance mode device's use of memory and CPU (and this value is shown in **show resource usage**). If you use multiple instances, then you need to calculate the throughput based on the percentage of CPU cores that you assign to the instance. For example, if you use an instance with 50% of the cores, then you should initially calculate 50% of the throughput. Moreover, the throughput available to an instance may be less than that available to an appliance.

For detailed instructions on calculating the throughput for instances, see <https://www.cisco.com/c/en/us/products/collateral/security/firewalls/white-paper-c11-744750.html>.

## Instances and High Availability

You can use High Availability using an instance on 2 separate chassis; for example, if you have 2 chassis, each with 10 instances, you can create 10 High Availability pairs. You can also have standalone instances on the same chassis as High Availability instances. For detailed requirements, see [Requirements and Prerequisites for Instances, on page 292](#).

---

**Note** Clustering is not supported.

---

## Licenses for Instances

All licenses are consumed per chassis and not per instance. See the following details:

- Essentials licenses are assigned to the chassis as a whole, one per chassis.
- Feature licenses are assigned to each instance, but you only *consume* one license per feature per chassis.

## Requirements and Prerequisites for Instances

### Model Support

- Secure Firewall 3110

- Secure Firewall 3120
- Secure Firewall 3130
- Secure Firewall 3140

**Note** The Secure Firewall 3105 is not supported.

### Maximum Container Instances and Resources per Model

For each container instance, you can specify the number of CPU cores (or more specifically, threads) to assign to the instance. We use the term "core" generically to account for different hardware architecture. RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance.

**Table 23: Maximum Container Instances and Resources per Model**

Model	Max. Container Instances	Available CPU Cores (Threads)
Secure Firewall 3110	3	22
Secure Firewall 3120	5	30
Secure Firewall 3130	7	46
Secure Firewall 3140	10	62

### Software Requirements

- You can run different versions of Firewall Threat Defense software on each instance as long as they are all compatible with the version of FXOS running on the chassis.
- You cannot deploy an instance with a patch version of the Firewall Threat Defense software because it is not a complete bundle. You need to first deploy the major or maintenance version, and then patch it after deployment.

### High Availability Requirements

- The two instances in a High Availability configuration must:
  - Be on separate chassis.
  - Be on the same model.
  - Have the same interfaces assigned. All interfaces must be preconfigured in the chassis identically before you enable High Availability.
  - Use the same resource profile attributes. The profile names can be different, but the definitions need to match.

### Firewall Management Center Requirements

For chassis management and all instances on the chassis, you must use the same Firewall Management Center due to the licensing implementation.

## Guidelines and Limitations for Instances

### General Guidelines

- A single Firewall Management Center must manage all instances on a chassis, as well as manage the chassis itself.
- For instances, the following features are not supported:
  - TLS crypto acceleration
  - Clustering
  - Firewall Management Center UCAPL/CC mode
  - Flow offload to hardware
- Primary management of the chassis by CDO cloud-delivered Firewall Management Center and separate analytics-only management of the chassis by an on-prem Firewall Management Center is not supported. You can however add CDO-managed instances to an analytics-only on-prem Firewall Management Center.

### Management Interface

- No support for a data interface for chassis management; only the dedicated Management interface can be used
- No DHCP addressing for the Management interface

### VLAN Subinterfaces

- This document discusses *chassis* VLAN subinterfaces only. You can separately create subinterfaces within the instance.
- If you assign a parent interface to an instance, it only passes untagged (non-VLAN) traffic. Do not assign the parent interface unless you intend to pass untagged traffic.
- Subinterfaces are supported on Data or Data-sharing type interfaces.
- You can create up to 500 VLAN IDs.
- You cannot use subinterfaces for an inline set or as a passive interface.
- If you use a subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links. You cannot use some subinterfaces as failover links, and some as regular data interfaces.

## EtherChannels

- You can configure up to 48 EtherChannels, limited by the number of physical interfaces.
- The EtherChannel can have up to 8 active interfaces.
- All interfaces in the EtherChannel must be the same media type and speed capacity. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, unless you set the speed to **Detect SFP**; in this case, you can use different interface capacities, and the lowest common speed is used.
- The chassis does not support LACPDUs that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS **vlan dot1Q tag native** command, then the chassis will drop the tagged LACPDUs. Be sure to disable native VLAN tagging on the neighboring switch.
- In Cisco IOS software versions earlier than 15.1(1)S2, the chassis did not support connecting an EtherChannel to a switch stack. With default switch settings, if the chassis EtherChannel is connected cross stack, and if the primary switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.

## Data-sharing Interfaces

- Maximum 14 instances per shared interface. For example, you can allocate Ethernet1/1 to Instance1 through Instance14.

Maximum 10 shared interfaces per instance. For example, you can allocate Ethernet1/1.1 through Ethernet1/1.10 to Instance1.

- You cannot use a data-sharing interface with a transparent firewall mode instance.
- You cannot use a data-sharing interface with inline sets or passive interfaces.
- You cannot use a data-sharing interface for the failover link.

#### Default MAC Addresses

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See [Automatic MAC Addresses for Instance Interfaces, on page 291](#).

## Configure Instances

Before you configure instances, you need to enable multi-instance mode, add the chassis to the Firewall Management Center, and configure chassis interfaces. You can also customize the chassis settings.

### Enable Multi-Instance Mode

You need to connect to the Firewall Threat Defense CLI at the console port to enable multi-instance mode. After you configure the mode, you can add it to the Firewall Management Center.

**Note** Although you can connect to SSH on the management port, we recommend using the console port to avoid multiple disconnections. This procedure covers the console port.

## Procedure

**Step 1** Connect to the chassis console port.

The console port connects to the FXOS CLI.

**Step 2** Log in with the username **admin** and the password **Admin123**.

The first time you log in to FXOS, you are prompted to change the password.

**Note**

If the password was already changed, and you do not know it, you must reimage the device to reset the password to the default. See the [FXOS troubleshooting guide](#) for the [reimage procedure](#).

**Example:**

```
firepower login: admin
Password: Admin123
Successful login attempts for user 'admin' : 1

[...]

Hello admin. You must change your password.
Enter new password: *****
Confirm new password: *****
Your password was updated successfully.

[...]

firepower#
```

**Step 3** Check your current mode, Native or Container. If the mode is Native, you can continue with this procedure to convert to multi-instance (Container) mode.

**show system detail**

**Example:**

```
firepower # show system detail

Systems:
  Name: firepower
  Mode: Stand Alone
  System IP Address: 172.16.0.50
  System IPv6 Address: ::
  System Owner:
  System Site:
  Deploy Mode: Native
  Description for System:
```

```
firepower #
```

**Step 4** Connect to the Firewall Threat Defense CLI.

**connect ftd**

**Example:**

```
firepower# connect ftd
>
```

**Step 5** The first time you log in to the Firewall Threat Defense, you are prompted to accept the General Terms. You are then presented with the CLI setup script.

The setup script lets you set the Management interface IP address and other settings. However, when you convert to multi-instance mode, the only settings that are retained are the following.

- Admin password (that you set at initial login)
- DNS servers
- Search domains

You will reset the Management IP address and gateway as part of the multi-instance mode command. After you convert to multi-instance mode, you can change Management settings at the FXOS CLI. See [Change Chassis Management Settings at the FXOS CLI, on page 338](#).

**Step 6** Enable multi-instance mode, set the chassis management interface settings, and identify the Firewall Management Center. You can use IPv4 and/or IPv6 static addressing; DHCP is not supported. After you enter the command, you will be prompted to erase the configuration and reboot. Enter **ERASE** (all caps). The system reboots and, as part of changing the mode, erases the configuration with the exception of the Management network settings you set in the command and the admin password. The chassis hostname is set to "firepower-model."

**IPv4:**

**configure multi-instance network ipv4** *ip\_address network\_mask gateway\_ip\_address manager*  
*manager\_name {hostname | ipv4\_address | DONTRESOLVE} registration\_key nat\_id*

**IPv6:**

**configure multi-instance network ipv6** *ipv6\_address prefix\_length gateway\_ip\_address manager*  
*manager\_name {hostname | ipv6\_address | DONTRESOLVE} registration\_key nat\_id*

See the following **manager** components:

- *{hostname | ipv4\_address | DONTRESOLVE}*—Specifies either the FQDN or IP address of the Firewall Management Center. At least one of the devices, either the Firewall Management Center or the chassis, must have a reachable IP address to establish the two-way, SSL-encrypted communication channel between the two devices. If you don't specify a manager hostname or IP address in this command, then enter **DONTRESOLVE**; in this case, the chassis must have a reachable IP address or hostname, and you must specify the *nat\_id*.
- *registration\_key*—Enter a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the chassis. The registration key must not exceed 37 characters. Valid characters include alphanumeric characters (A–Z, a–z, 0–9) and the hyphen (-).

- *nat\_id*—Specifies a unique, one-time string of your choice that you will also specify on the Firewall Management Center when you register the chassis when one side does not specify a reachable IP address or hostname. It is required if you do not specify a manager address or hostname, however, we recommend that you always set the NAT ID even when you specify a hostname or IP address. The NAT ID must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the Firewall Management Center.

To change the mode back to appliance mode, you must use the FXOS CLI and enter **scope system** and then **set deploymode native**. See [Change Chassis Management Settings at the FXOS CLI, on page 338](#).

**Example:**

```
> configure multi-instance network ipv4 172.16.0.104 255.255.255.0 172.16.0.1 manager
fmc1 172.16.0.103 impala67 winchester1
WARNING: This command will discard any FTD configuration (except admin's credentials).
Make sure you backup your content. All previous content will be lost. System is going to
be re-initialized.
Type ERASE to confirm:ERASE
Exit...
>
```

## Add a Multi-Instance Chassis to the Firewall Management Center

Add the multi-instance chassis to the Firewall Management Center. The management center and the chassis share a separate management connection using the chassis MGMT interface.

You can use the Firewall Management Center to configure all chassis settings as well as instances. The Secure Firewall Chassis Manager or configuration at the FXOS CLI is not supported.

**Before you begin**

Convert the chassis to multi-instance mode. See [Enable Multi-Instance Mode, on page 296](#).

**Procedure**

- Step 1** In the Firewall Management Center, add the chassis using the chassis management IP address or hostname.
- Choose **Devices > Device Management**, and then **Add > Chassis**.

*Figure 125: Add Chassis*

Figure 126: Add Chassis

**Add Chassis**

This operation is only supported on 3100, 4100 & 9300 chassis

Hostname/IP Address†  
10.89.5.9

Chassis name  
eng1

Registration key\*  
....

Device Group  
Select...

Unique NAT ID†  
winchester

† Either host or NAT ID is required.

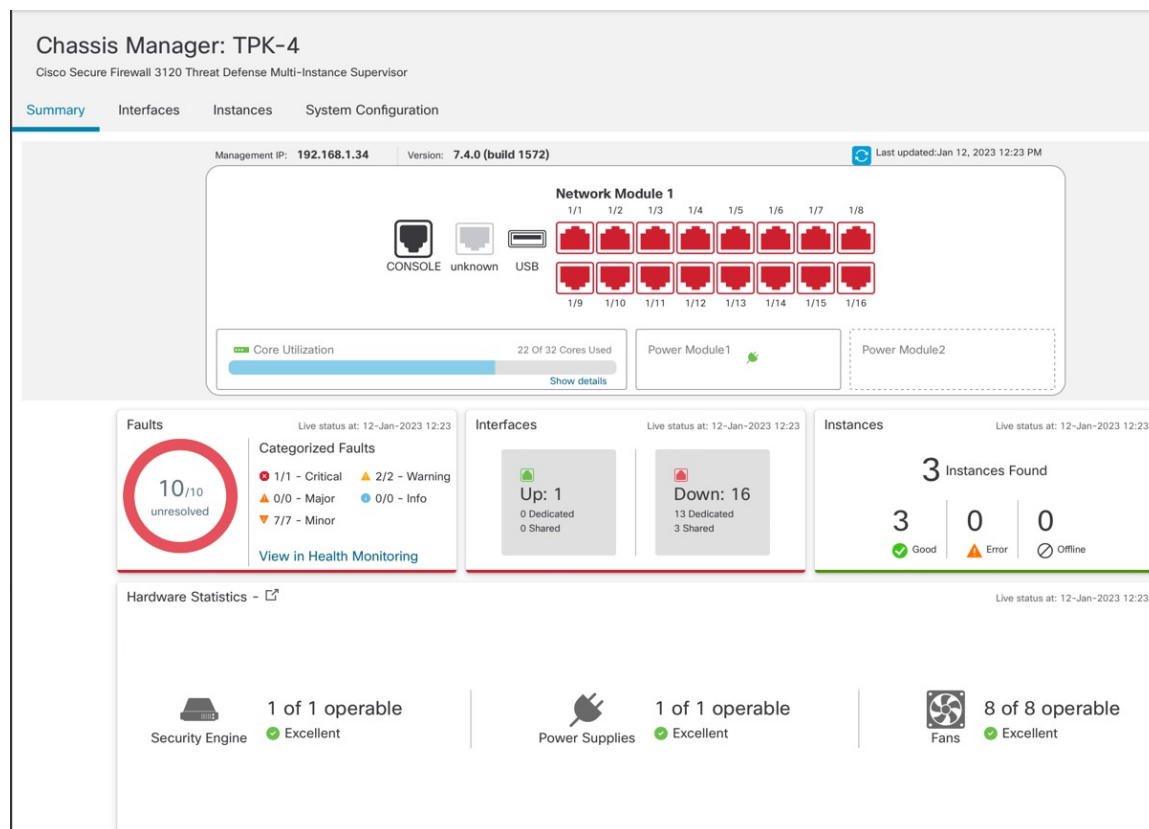

Cancel Submit

- b) In the **Hostname/IP Address** field, enter the IP address or the hostname of the chassis you want to add.  
If you don't know the hostname or IP address, you can leave this field blank specify the **Unique NAT ID**.
- c) In the **Chassis Name** field, enter a name for the chassis as you want it to display in the Firewall Management Center.
- d) In the **Registration Key** field, enter the same registration key that you used when you configured the chassis to be managed by the Firewall Management Center.  
The registration key is a one-time-use shared secret. The key can include alphanumeric characters and hyphens (-).
- e) In a multidomain deployment, regardless of your current domain, assign the chassis to a leaf **Domain**.  
If your current domain is a leaf domain, the chassis is automatically added to the current domain. If your current domain is not a leaf domain, post-registration, you must switch to the leaf domain to configure the chassis. A chassis can only belong to one domain.
- f) (Optional) Add the chassis to a **Device Group**.
- g) If you used a NAT ID during chassis setup, expand enter the same NAT ID in the **Unique NAT ID** field.  
The NAT ID can include alphanumeric characters and hyphens (-).
- h) Click **Submit**.  
The chassis is added to the **Devices > Device Management** page.

**Step 2** To view and configure the chassis, click **Manage** in the **Chassis** column, or click **Edit** (✎).

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Figure 127: Chassis Summary**

## Configure Chassis Interfaces

At the chassis-level, you configure basic Ethernet settings of physical interfaces, VLAN subinterfaces for instances, and EtherChannel interfaces. By default, physical interfaces are disabled.

**Note** To configure breakout ports and perform other network module operations, see [Manage the Network Module for the Secure Firewall 3100/4200](#), on page 676.

**Note** For information about the **Sync Device** button, see [Sync Interface Changes with the Firewall Management Center](#), on page 673.

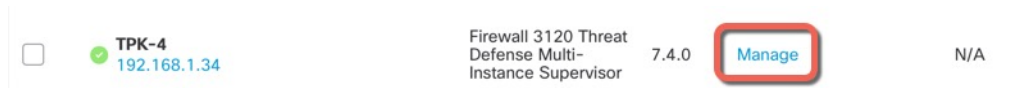

## Configure a Physical Interface

You can physically enable and disable interfaces, as well as set the interface speed and duplex and other hardware settings. To use an interface, it must be physically enabled for the chassis and logically enabled in the instance. By default, physical interfaces are disabled. For VLAN subinterfaces, the admin state is inherited from the parent interface.

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

*Figure 128: Manage Chassis*

<input type="checkbox"/>	TPK-4 192.168.1.34	Firewall 3120 Threat Defense Multi- Instance Supervisor	7.4.0	<a href="#">Manage</a>	N/A
--------------------------	-----------------------	---	-------	------------------------	-----

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Interfaces**.

Figure 129: Interfaces

Ethernet1/14	Data			10Gbps	Full	Enabled	Yes	Auto	
Ethernet1/15	Data			10Gbps	Full	Disabled	Yes	cl108-rs	

**Step 3** Click **Edit** () for the interface you want to edit.

Figure 130: Edit Physical Interface

Figure 130 shows the 'Edit Physical Interface' configuration window. The 'Interface ID' is set to 'Ethernet1/8' and the 'Enabled' checkbox is checked. The 'Port Type' is set to 'Data'. The 'Admin Duplex' is set to 'Full'. The 'Admin Speed' is set to '1Gbps'. The 'LLDP Transmit' and 'LLDP Receive' checkboxes are unchecked. The 'Auto Negotiation' checkbox is checked. The 'Flow Control Send' checkbox is unchecked. The 'Cancel' and 'Save' buttons are at the bottom right.

**Step 4** Enable the interface by checking the **Enabled** check box.

**Step 5** For the **Port Type**, choose **Data** or **Data Sharing**.

Figure 131: Port Type

Figure 131 shows the 'Port Type' dropdown menu. The menu is open, showing 'Data' and 'Data Sharing' as options.

**Step 6** Set the **Admin Duplex**.

Speeds of 1Gbps and higher only support **Full** duplex. SFP interfaces only support **Full** duplex.

**Step 7** Set the **Admin Speed**.

For SFPs, Choose **Detect SFP** to detect the speed of the installed SFP module and use the appropriate speed. Duplex is always Full, and auto-negotiation is always enabled. This option is useful if you later change the network module to a different model, and want the speed to update automatically.

**Step 8** (Optional) Check **LLDP Transmit** and/or **LLDP Receive** to enable Link Layer Discovery Protocol (LLDP) packets.

**Step 9** (Optional) Check **Flow Control Send** to enable pause (XOFF) frames for flow control.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If the threat defense port experiences congestion (exhaustion of queuing resources on the internal switch) and cannot receive any more traffic, it notifies the other port by

sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note**

The Firewall Threat Defense supports transmitting pause frames so that the remote peer can rate-control the traffic.

However, receiving of pause frames is not supported.

The internal switch has a global pool of 8000 buffers of 250 bytes each, and the switch allocates buffers dynamically to each port. A pause frame is sent out every interface with flow control enabled when the buffer usage exceeds the global high-water mark (2 MB (8000 buffers)); and a pause frame is sent out of a particular interface when its buffer exceeds the port high-water mark (.3125 MB (1250 buffers)). After a pause is sent, an XON frame can be sent when the buffer usage is reduced below the low-water mark (1.25 MB globally (5000 buffers); .25 MB per port (1000 buffers)). The link partner can resume traffic after receiving an XON frame.

Only flow control frames defined in 802.3x are supported. Priority-based flow control is not supported.

**Step 10** (Optional) Check **Auto Negotiation** to set the interface to negotiate the speed, link status, and flow control. You cannot edit this setting for speeds lower than 1Gbps. For SFP interfaces, you can only disable auto-negotiation when the speed is set to 1Gbps.

**Step 11** Click **Save** and then **Save** in the top right of the **Interfaces** page.

You can now **Deploy** the policy to the chassis. The changes are not active until you deploy them.

---

## Configure an EtherChannel

An EtherChannel (also known as a port channel) can include up to 8 member interfaces of the same media type and capacity, and must be set to the same speed and duplex. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, unless you set the speed to **Detect SFP**; in this case, you can use different interface capacities, and the lowest common speed is used.

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDUs) between two network devices. LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

When the chassis creates an EtherChannel, the EtherChannel stays in a **Suspended** state for Active LACP mode or a **Down** state for On LACP mode until you assign it to a logical device, even if the physical link is up. The EtherChannel will be brought out of this **Suspended** state when it is added to an instance.

### Before you begin

Enable physical interfaces and set hardware parameters. See [Configure a Physical Interface, on page 302](#).

## Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

**Figure 132: Manage Chassis**

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Interfaces**.

Ethernet1/14	Data			10Gbps	Full	Enabled	Yes	Auto
Ethernet1/15	Data			10Gbps	Full	Disabled	Yes	cl108-rs

**Step 3** Click **Add > EtherChannel Interface**.

Figure 134: Add EtherChannel

**Step 4** Set the following **Interfaces** parameters.

Figure 135: Interfaces Settings

- For the **EtherChannel ID**, specify an ID between 1 and 48.
- Check **Enabled**.
- For the **Port Type**, choose **Data** or **Data Shared**.

For information about the port type, see [Interface Types, on page 280](#).

- To add a physical interface to the EtherChannel, select click **Add (+)** in the **Available Interfaces** list to move it to the **Selected Interfaces** list.

To add or remove all interfaces, click the double arrow button.

**Note**

You cannot add an interface that is already assigned to an instance.

**Step 5** (Optional) Set the following **Configuration** parameters.

Many of these settings (excluding the LACP settings) set the requirements for interfaces to be included in the EtherChannel; they do not override the settings of member interfaces. So if you check **LLDP Transmit**, for example, you should only add interfaces that have that setting. If you set the **Admin Speed** to 1Gbps, then only 1Gbps interfaces can be included.

**Figure 136: Configuration Settings**

The screenshot shows a web-based configuration interface for adding an EtherChannel interface. The title is 'Add EtherChannel Interface'. There are two tabs: 'Interfaces' and 'Configuration', with 'Configuration' being the active tab. The configuration options are as follows:

- Admin Duplex:** A dropdown menu set to 'Full'.
- Admin Speed:** A dropdown menu set to '1Gbps'.
- LACP Mode:** A dropdown menu set to 'Active'.
- LACP Rate:** A dropdown menu set to 'Default'.
- Checkboxes:**
  - ☒ Auto Negotiation
  - ☐ LLDP Transmit
  - ☒ LLDP Receive
  - ☐ Flow Control Send

At the bottom right, there are two buttons: 'Cancel' and 'Save'.

- Choose the required **Admin Duplex** for the member interfaces, **Full Duplex** or **Half Duplex**.  
If you add a member interface that is configured with the specified duplex, it will not successfully join the port channel.
- Choose the required **Admin Speed** for the member interfaces from the drop-down list.  
If you add a member interface that is not at the specified speed, it will not successfully join the port channel.
- Choose the **LACP Mode**, **Active** or **On**.
  - **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
  - **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

**Note**

It may take up to three minutes for an EtherChannel to come up to an operational state if you change its mode from On to Active or from Active to On.

- d) Choose the **LACP Rate**, **Default**, **Fast**, or **Normal**.

The default is **Fast**.

- e) Choose the required Link Layer Discovery Protocol (LLDP) settings for member interfaces by checking **LLDP Transmit** and/or **LLDP Receive**.
- f) Check the required **Flow Control Send** setting for member interfaces.

**Step 6** Click **Save** and then **Save** in the top right of the **Interfaces** page.

You can now **Deploy** the policy to the chassis. The changes are not active until you deploy them.

## Configure a Subinterface

You can add up to 500 subinterfaces to your chassis.

VLAN IDs per interface must be unique, and within an instance, VLAN IDs must be unique across all assigned interfaces. You can reuse VLAN IDs on *separate* interfaces as long as they are assigned to different instances. However, each subinterface still counts towards the limit even though it uses the same ID.

This section discusses *FXOS* VLAN subinterfaces only. You can separately create subinterfaces within the instance. See [Chassis Interfaces vs. Instance Interfaces](#), on page 281.

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

1 Agreement — 2 Instance Configuration — 3 Interface Assignment — 4 Device Management — 5 Summary

End User License Agreement

Effective: May 10, 2022

Secure Firewall Terms and Conditions

By clicking 'Accept' below or using this Cisco Technology, you agree that such use is governed by the Cisco End User License Agreement and applicable Product Specific Terms available at:

<https://www.cisco.com/c/en/us/about/legal/cloud-and-software/software-terms.html>

You also acknowledge that you have read the Cisco Privacy Statement at:

<https://www.cisco.com/c/en/us/about/legal/privacy-full.html>

If you are a Cisco partner accepting on behalf of an end customer, you must inform the end customer that the EULA applies to such end customer's use of the Cisco Technology and provide the end customer with access to all relevant terms. If you do not have authority to bind your company and its affiliates, or if you do not agree with the terms of the EULA, do not click 'Accept' and do not use the Cisco Technology.

☒ I understand and accept the agreement.

Cancel Next

**Step 4** On **Instance Configuration**, set the instance parameters, then click **Next**.

**Figure 144: Instance Configuration**

- **Display Name**

- **Device Version**—Versions listed are packages currently downloaded to the chassis. Patch versions are not listed and cannot be used because they don't contain the entire bundle. To upgrade to a new package, see **Devices > Upgrade > Chassis Upgrade**. When you upgrade, both the old Firewall Threat Defense version and the new Firewall Threat Defense version will be listed in the menu. To download an older package, you need to use the FXOS CLI. Note: Both FXOS and Firewall Threat Defense images are included in the same package. See the [troubleshooting guide](#) for more information.

For example:

```
firepower-3110# scope firmware
firepower-3110# download image
https://10.10.7.89/Cisco_FTD_SSP_FP3K_Upgrade-7.4.1-1.sh.DEV.tar
Please use the command 'show download-task' or 'show download-task detail' to check
download progress.
% Download-task Cisco_FTD_SSP_FP3K_Upgrade-7.4.1-1.sh.DEV.tar : completed successfully.
```

- **IPv4, IPv6, or Both**—Set a **Management IP** address on the same network as the chassis Management interface. Set the **Network Mask** and gateway (likely the same gateway as the chassis). The chassis Management interface is shared with each instance, and each instance has its own IP address on the network. You can SSH to this IP address by default to reach the Firewall Threat Defense CLI.
- (Optional) **FQDN**
- **Firewall Mode**—**Routed** or **Transparent**. For more information about the firewall mode, see [Transparent or Routed Firewall Mode, on page 209](#).
- **DNS Servers**—Enter a comma-separated list of DNS servers for management traffic only.
- (Optional) **Permit Expert Mode for CLI**—Expert Mode provides Firewall Threat Defense shell access for advanced troubleshooting.  
  
If you enable this option, then users who access the instance directly from an SSH session can enter Expert Mode. If you disable this option, then only users who access the instance from the FXOS CLI can enter Expert Mode. We recommend disabling this option to increase isolation between instances.  
  
Use Expert Mode only if a documented procedure tells you it is required, or if the Cisco Technical Assistance Center asks you to use it. To enter this mode, use the **expert** command in the Firewall Threat Defense CLI.
- **Resource Profile**—The resource profile sets the number of CPU cores; RAM is dynamically allocated according to the number of cores, and disk space is set to 40 GB per instance. The chassis includes the following default resource profiles: Default-Small, Default-Medium, and Default-Large. You can add additional profiles for this chassis by clicking **Add (+)**. You cannot later edit the resource profile.

**Figure 145: Add Resource Profile**

Add resource profile

Name\*

silver

(Set the name of the profile between 1 and 64 characters.)

Description

Number of Cores\*

24

Assign an even number of cores, 6 to 100.

Cancel Add

- The minimum number of cores is 6.

**Note**

Instances with a smaller number of cores might experience relatively higher CPU utilization than those with larger numbers of cores. Instances with a smaller number of cores are more sensitive to traffic load changes. If you experience traffic drops, try assigning more cores.

- You can assign cores as an even number (6, 8, 10, 12, 14 etc.) up to the maximum.
- The maximum number of cores available depends on the model; see [Requirements and Prerequisites for Instances](#), on page 292.

If you later assign a different resource profile, then the instance will reload, which can take approximately 5 minutes. Note that for an established High Availability pair, if you assign a different-sized resource profile, be sure to make all members the same size as soon as possible.

- **Device SSH Password**—Set the Firewall Threat Defense admin user password for CLI access, either SSH or console. Repeat the password in the **Confirm Password** field.

**Step 5** On **Interface Assignment**, assign the chassis interfaces to the instance, then click **Next**.

Cancel Back Save

You can edit any settings on this screen before saving the instance. After you save, the instance is added to the **Instances** screen.

**Step 8** On the **Instances** screen, click **Save**.

**Step 9** Deploy the chassis configuration.

After deployment, the instance will be added as a device on the **Device Management** page.

## Customize the System Configuration

You can configure chassis-level settings such as SNMP. You can also import or export the chassis FXOS configuration.

### Configure SNMP

You can access chassis-level MIBs through the data interface of one of the instances, which you specify in the chassis system configuration. You can only use this instance for chassis SNMP information. You cannot access SNMP through the chassis Management interface.

### Before you begin

Configure SNMP for one of the instances. See [SNMP, on page 847](#).

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

*Figure 149: Manage Chassis*

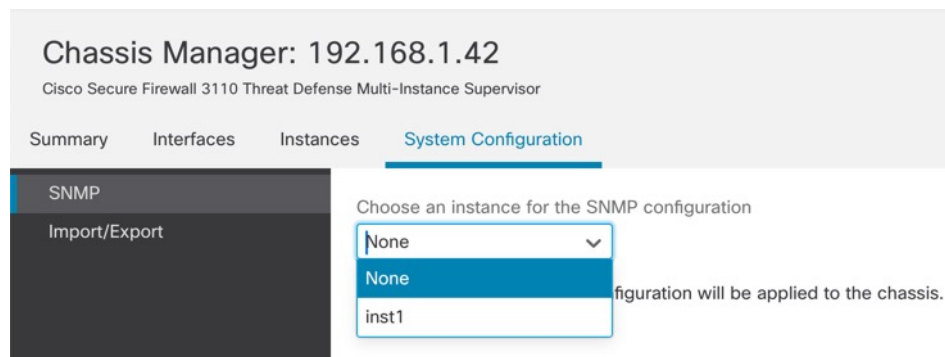

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **System Configuration**.

**Step 3** Click **SNMP**, and choose the instance from the drop-down list.

*Figure 150: SNMP*

SNMP on the chassis will be accessible from the selected instance.

**Step 4** Click **Save**.

**Step 5** Deploy the chassis configuration.

## Import or Export the Chassis Configuration

You can use the configuration export feature to export an XML file containing chassis configuration settings to your local computer. You can later import that configuration file to quickly apply the configuration settings to your chassis to return to a known good configuration or to recover from a system failure. You can also import the chassis configuration to a new chassis, for example for an RMA, as long as the prerequisites are met.

When exporting, only chassis configurations are exported; instance configuration settings are not exported. Instances need to be backed up separately using the device backup/restore feature.

When importing, all existing configurations on the chassis will be replaced by the configuration in the import file.

### Before you begin

For the chassis where you want to import a configuration, the following characteristics must match:

- Same chassis software version
- Same Firewall Threat Defense instance images
- Same network modules

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

*Figure 151: Manage Chassis*

<input type="checkbox"/>	<span style="color: green;">●</span> <b>TPK-4</b> 192.168.1.34	Firewall 3120 Threat Defense Multi- Instance Supervisor	7.4.0	<b>Manage</b>	N/A
--------------------------	---	---	-------	---------------	-----

The **Chassis Manager** page opens for the chassis to the **Summary** page.

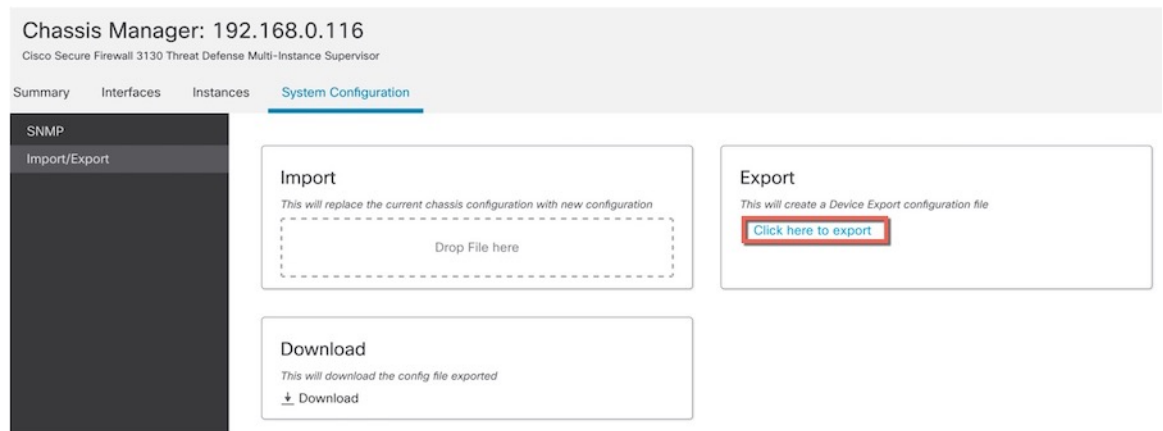

**Step 2** Click **System Configuration**.

**Step 3** Click **Import/Export**.

**Step 4** To export the configuration, follow these steps.

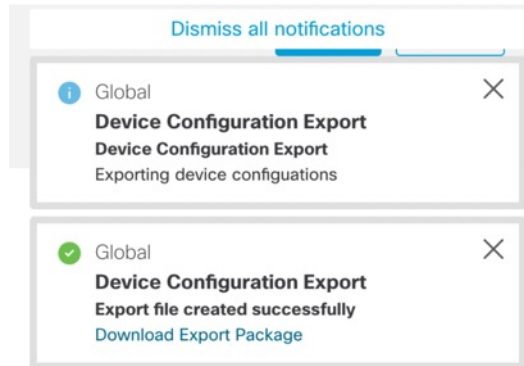

a) In the **Export** area, click **Click here to export**.

*Figure 152: Create Export File*

b) Monitor the notifications for the **Export file created successfully** message.

**Figure 153: Export File Created Successfully**

- c) Download the export file by clicking the notification message (**Download Export Package**) or by clicking **Download**.

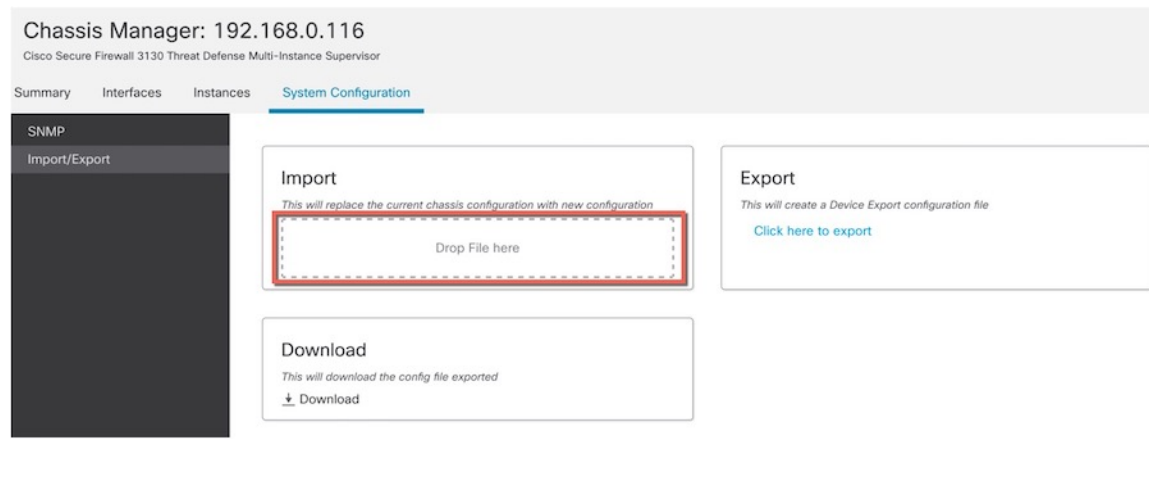

**Figure 154: Download**

The file is saved with the **.sfo** extension.

- Step 5** To import a configuration, drag the **.sfo** file on the **Import > Drop File here** area.

Figure 155: Import

## Configure Chassis Platform Settings

Chassis platform settings configure a range of features for managing the chassis. You can share the policy among multiple chassis. If you want different settings per chassis, you must create multiple policies.

### Create a Chassis Platform Settings Policy

Use the **Platform Settings** page (**Devices > Platform Settings**) to manage platform settings policies. This page indicates the type of device for each policy. The **Status** column shows the device targets for the policy.

#### Procedure

**Step 1** Choose **Devices > Platform Settings**.

**Step 2** For an existing policy, you can **Copy** (📋), **Edit** (✎), or **Delete** (🗑) the policy.

#### Caution

You should not delete a policy that is the last-deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

**Step 3** To create a new policy, click **New Policy**.

- Choose **Chassis Platform Settings** from the drop-down list.
- Enter a **Name** for the new policy and optionally, a **Description**.
- Optionally, choose the **Available Chassis** where you want to apply the policy and click **Add** (or drag and drop) to add the selected chassis. You can enter a search string in the **Search** field to narrow the list of chassis.
- Click **Save**.

The system creates the policy and opens it for editing.

- Step 4** To change the target chassis for a policy, click **Edit** (✎) next to the platform settings policy that you want to edit.
- Click **Policy Assignment**.
  - To assign a chassis to the policy, select it in the **Available Chassis** list and click **Add**. You can also drag and drop.
  - To remove a chassis assignment, click **Delete** (🗑) next to a chassis in the **Selected Chassis** list.
  - Click **OK**.

## Configure DNS

You need to specify a DNS server if the chassis requires resolution of hostnames to IP addresses. These chassis DNS settings are separate from the DNS settings per instance, which are configured in the device platform settings.

When you configure multiple DNS servers, the chassis uses servers in a random order. You can configure up to four servers across four DNS server groups. For example, you can configure a single server group with four servers, or you can configure four server groups with one server each.

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.

**Step 2** Choose **DNS**.

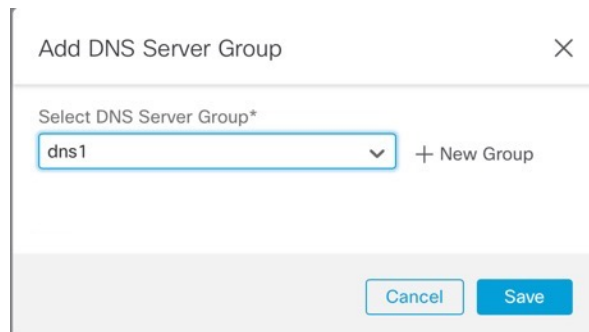

*Figure 156: DNS*

The screenshot shows the configuration interface for 'MI\_chassis\_settings'. On the left is a sidebar menu with options: DNS (selected), SSH, Time Synchronization, Time Zones, and Syslog. The main content area is titled 'DNS Resolution Settings' and includes the instruction 'Specify DNS servers groups.' Below this is a toggle switch for 'Enable DNS name resolution by device', which is currently turned on. Under the heading 'DNS Server Groups', there is an 'Add' button and a list containing 'dns1 (default)' with edit and delete icons next to it.

**Step 3** Enable the **Enable DNS name resolution by device** slider.

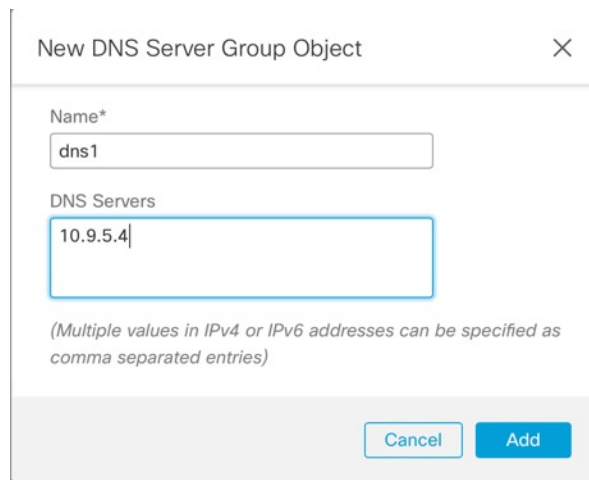

**Step 4** Click **Add** to add a DNS server group.

**Figure 157: Add DNS Server Group**A dialog box titled "Add DNS Server Group" with a close button (X) in the top right corner. Below the title bar, there is a label "Select DNS Server Group\*" followed by a dropdown menu showing "dns1" and a "+ New Group" link. At the bottom of the dialog, there are two buttons: "Cancel" and "Save".

- Step 5** Either select an existing DNS server group (see [Creating DNS Server Group Objects, on page 1264](#)), or click **(+) New Group**.

If you add a new group, you see the following dialog box. Provide a name and up to four DNS server IP addresses as comma-separated values, and click **Add**.

**Figure 158: New DNS Server Group Object**A dialog box titled "New DNS Server Group Object" with a close button (X) in the top right corner. Below the title bar, there is a label "Name\*" followed by a text input field containing "dns1". Below that is a label "DNS Servers" followed by a text input field containing "10.9.5.4". Below the input field, there is a note: "(Multiple values in IPv4 or IPv6 addresses can be specified as comma separated entries)". At the bottom of the dialog, there are two buttons: "Cancel" and "Add".

- Step 6** Click **Save** to add the DNS server to the list.
- Step 7** Repeat these steps to add additional server groups.  
Make sure you only identify a maximum of four DNS servers in all groups combined.
- Step 8** Click **Save** to save all policy changes.

## Configure SSH and SSH Access List

To allow SSH sessions from the admin user to the chassis on the Management interface, enable the SSH server and configure the allowed networks.

## Procedure

**Step 1** Choose **Devices** > **Platform Settings** and create or edit the chassis policy.

## Step 2 Choose SSH.

**Step 3** To enable SSH access to the chassis, enable the **Enable SSH Server** slider.

**Step 4** To set the allowed **Algorithms**, click **Edit** ().

Figure 160: Add Algorithms

- a) Select the **Encryption** algorithms.
- b) Select the **Key Exchange** algorithms.

The key exchange provides a shared secret that cannot be determined by either party alone. The key exchange is combined with a signature and the host key to provide host authentication. This key-exchange method provides explicit server authentication.

- c) Select the **Mac** integrity algorithms.

**Step 5** For **Host Key**, enter the modulus size for the RSA key pairs.

The modulus value (in bits) is in multiples of 8 from 1024 to 2048. The larger the key modulus size you specify, the longer it takes to generate an RSA key pair. We recommend a value of 2048.

**Step 6** For the server **Volume Rekey Limit**, set the amount of traffic in KB allowed over the connection before FXOS disconnects from the session.

**Step 7** For the server **Time Rekey Limit**, set the minutes for how long an SSH session can be idle before FXOS disconnects the session.

**Step 8** For the **SSH Client**, configure the following settings.

Figure 161: SSH

The screenshot shows the 'MI\_chassis\_settings' configuration page. On the left is a sidebar with navigation links: DNS, SSH (selected), Time Synchronization, Time Zones, and Syslog. The main content area is divided into two sections: 'SSH Server' and 'SSH Client'.

**SSH Server Configuration:**

- Enable SSH Server:** A toggle switch is turned on.
- Algorithms:** A list of algorithms is shown, categorized under 'Encryption' and 'Key Exchange'. The 'Encryption' list includes: aes128-cbc, aes128-ctr, aes128-gcm\_openssh\_com, aes192-cbc, aes192-ctr, aes256-cbc, aes256-ctr, aes256-gcm\_openssh\_com, and chacha20-poly1305\_openssh\_com. The 'Key Exchange' list includes: ecdh-sha2-nistp256.
- Host Key:** A dropdown menu is set to '2048'.
- Volume Rekey Limit:** A dropdown menu is set to 'none' with a unit of 'KB'.
- Time Rekey Limit:** A dropdown menu is set to 'none' with a unit of 'Minutes'.

**SSH Client Configuration:**

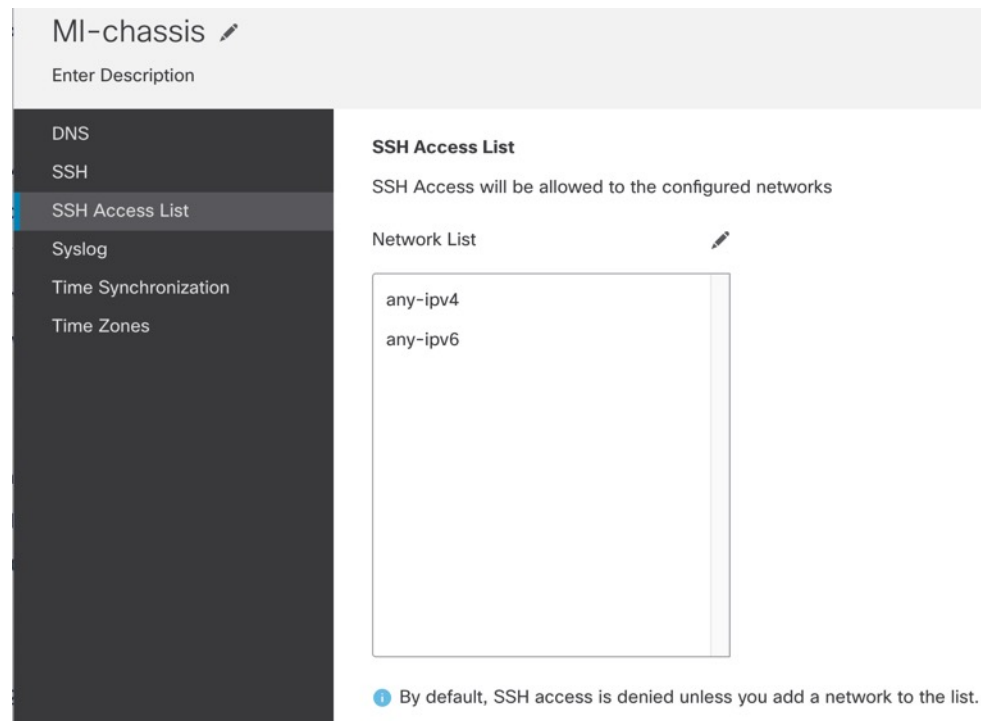

- Strict Host Keycheck:** A dropdown menu is set to 'disable'.
- Algorithms:** A list of algorithms is shown, categorized under 'Encryption' and 'Key Exchange'. The 'Encryption' list includes: aes128-cbc, aes128-ctr, aes128-gcm\_openssh\_com, aes192-cbc, aes192-ctr, aes256-cbc, aes256-ctr, aes256-gcm\_openssh\_com, and chacha20-poly1305\_openssh\_com. The 'Key Exchange' list includes: curve25519-sha256.
- Volume Rekey Limit:** A dropdown menu is set to 'none' with a unit of 'KB'.
- Time Rekey Limit:** A dropdown menu is set to 'none' with a unit of 'Minutes'.

At the top right of the page, there is a status bar indicating 'You have unsaved changes' with 'Cancel' and 'Save' buttons. Below the status bar, it says 'Policy Assignments (1)'.

- **Strict Host Keycheck**—Choose **enable**, **disable**, or **prompt** to control SSH host key checking.
  - **enable**—The connection is rejected if the host key is not already in the FXOS known hosts file. You must manually add hosts at the FXOS CLI using the **enter ssh-host** command in the system/services scope.
  - **prompt**—You are prompted to accept or reject the host key if it is not already stored on the chassis.
  - **disable**—(The default) The chassis accepts the host key automatically if it was not stored before.
- **Algorithms**—Click **Edit** (✎), and select the **Encryption**, **Key Exchange**, and **Mac** algorithms.
- **Volume Rekey Limit**—Set the amount of traffic in KB allowed over the connection before FXOS disconnects from the session.
- **Time Rekey Limit**—Set the minutes for how long an SSH session can be idle before FXOS disconnects the session.

**Step 9**

Choose **SSH Access List**. You need to allow access to IP addresses or networks before you can use SSH. You can add up to 25 access lists.

## Configure Time Synchronization

NTP is used to implement a hierarchical system of servers that provide a precisely synchronized time among network systems. This kind of accuracy is required for time-sensitive operations, such as validating CRLs, which include a precise time stamp. You can configure up to four NTP servers.

### Note

- FXOS uses NTP version 3.
- If the stratum value of an external NTP server is 13 or greater, the application instance cannot sync to the NTP server on the FXOS chassis. Each time a NTP client syncs to a NTP server, the stratum value increases by one.

If you have set up your own NTP server, you can find its stratum value in the `/etc/ntp.conf` file on the server. If the NTP server has stratum value of 13 or greater you can either change the stratum value in the `ntp.conf` file and restart the server, or use a different NTP server (for example: `pool.ntp.org`).

### Before you begin

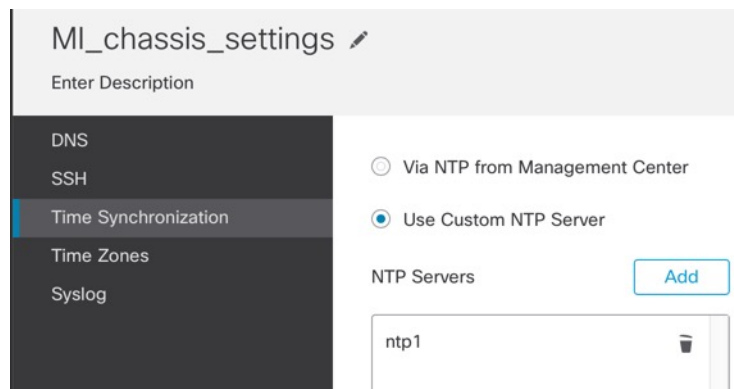

If you use a hostname for the NTP server, you must configure a DNS server. See [Configure DNS, on page 322](#).

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.

**Step 2** Choose **Time Synchronization**.

*Figure 167: Time Synchronization*

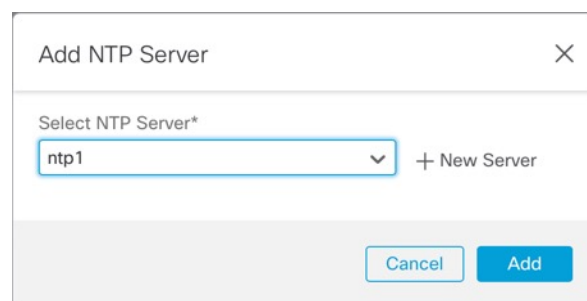

**Step 3** If you want to obtain the time from the Firewall Management Center, click **Via NTP from Management Center**.

This option ensures both the chassis and the Firewall Management Center have the same time.

**Step 4** To use an external NTP server, click **Use Custom NTP Server**.

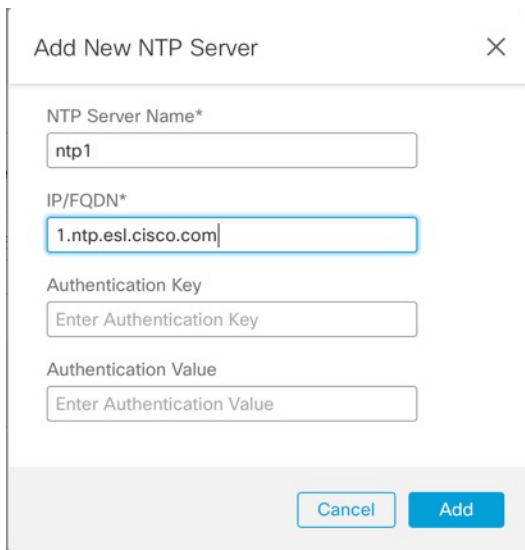

a) Click **Add** to add a server.

*Figure 168: Add NTP Server*

b) Choose any already-defined servers from the drop-down menu and click **Add**, or click **+ New Server** to add a new server.

Figure 169: Add New NTP Server

c) For a new server, enter the following fields, and click **Add**.

- **NTP Server Name**—A name to identify this server.
- **IP/FQDN**—The IP address or hostname of the server.
- **Authentication Key** and **Authentication Value**—Obtain the key ID and value from the NTP server. For example, to generate the SHA1 key on NTP server Version 4.2.8p8 or later with OpenSSL installed, enter the **ntp-keygen -M** command, and then view the key ID and value in the ntp.keys file. The key is used to tell both the client and server which value to use when computing the message digest.

Only SHA1 is supported for NTP server authentication.

**Step 5** Click **Save** to save all policy changes.

## Configure Time Zones

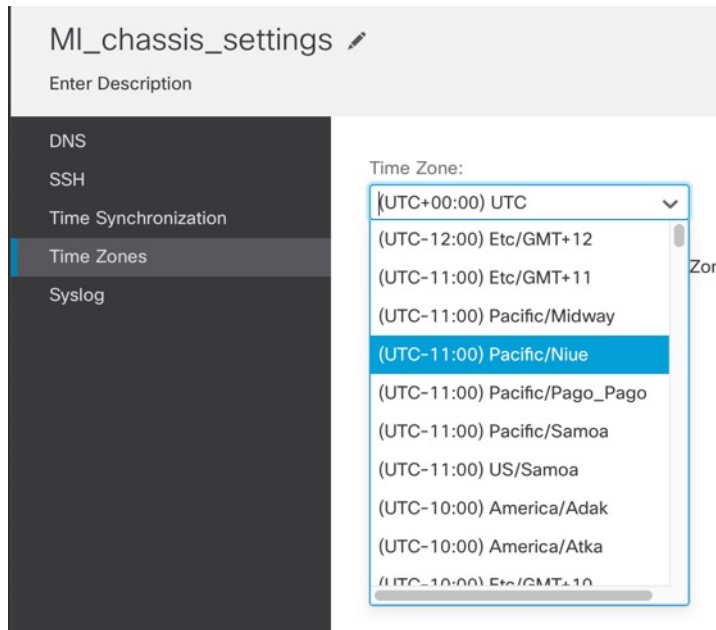

Set the time zone for the chassis.

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the chassis policy.

**Step 2** Choose **Time Zones**.

Figure 170: Time Zones

**Step 3** Choose your **Time Zone** from the drop-down menu.

**Step 4** Click **Save** to save all policy changes.

## Manage Multi-Instance Mode

This section describes less common tasks, including changing settings at the FXOS CLI or changing interfaces assigned to the chassis.

### Change Interfaces Assigned to an Instance

You can allocate or unallocate an interface on the instance. Adding a new interface, or deleting an unused interface, has minimal impact on the instance configuration. You can also edit the membership of an allocated EtherChannel without affecting the instance. However, deleting an interface that is used in your security policy will impact the configuration.

Interfaces can be referenced directly in many places in the instance configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface.

Policies that refer to security zones are not affected.

**Note** For high availability, you need to make the same interface changes for the other unit. Otherwise, high availability might not operate correctly.

**Before you begin**

- Configure your interfaces according to [Configure Instances, on page 296](#).
- If you want to add an already-allocated interface to an EtherChannel, you need to unallocate the interface from the instance first, then add the interface to the EtherChannel. For a new EtherChannel, you can then allocate the EtherChannel to the instance.

**Procedure**

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column or click **Edit** (✎).

**Figure 171: Manage Chassis**

<input type="checkbox"/>	TPK-4 192.168.1.34	Firewall 3120 Threat Defense Multi- Instance Supervisor	7.4.0	<b>Manage</b>	N/A
--------------------------	-----------------------	---	-------	---------------	-----

The **Chassis Manager** page opens for the chassis to the **Summary** page.

**Step 2** Click **Instances**, and click **Edit** (✎) next to the instance for which you want to change interfaces.

**Figure 172: Instances**

Chassis Manager: TPK-4 Save Cancel

- Port-channel1

**Selected Interfaces (3)**

- Ethernet1/2
- Ethernet1/4
- Ethernet1/5

Cancel Back Next

Shared interfaces show the sharing icon ( ).

**Step 4** Make your interface changes, and then click **Next**.

**Step 5** Click **Save** on the **Summary** screen.

**Step 6** For high availability, you need to make the same interface changes for the other unit. Otherwise, high availability might not operate correctly.

## Change Chassis Management Settings at the FXOS CLI

If you want to change the chassis management interface IP address and gateway, change the Firewall Management Center to a new manager, change the admin password, or disable multi-instance mode, you can do so from the FXOS CLI.

### Procedure

**Step 1** Connect to the chassis console port.

The console port connects to the FXOS CLI.

**Note**

We recommend using the console port. You can also connect using SSH to the management interface, if configured in the chassis platform settings in the Firewall Management Center; however, if you change the management IP address, you will be disconnected.

**Step 2** Log in with the username **admin** and the password you set during initial setup.

**Step 3** Change the Management IP address. You can use a static IPv4 and/or IPv6 address.

**IPv4:**

**scope fabric-interconnect**

**set out-of-band static ip** *ip\_address* **netmask** *network\_mask* **gw** *gateway\_ip\_address*

**IPv6:**

**scope fabric-interconnect**

**scope ipv6-config**

**set out-of-band static ipv6** *ipv6\_address* **ipv6-prefix** *prefix\_length* **ipv6-gw** *gateway\_address*

**Example:**

**IPv4:**

```
firepower-3110# scope fabric-interconnect
firepower-3110 / fabric-interconnect # set out-of-band static ip 10.5.23.8 netmask
255.255.255.0
gw 10.5.23.1
```

**IPv6:**

```
firepower-3110# scope fabric-interconnect
firepower-3110 / fabric-interconnect # scope ipv6-config
firepower-3110 / fabric-interconnect / ipv6-config # set out-of-band static ipv6 2001:DB8::34
ipv6-prefix 64 ipv6-gw 2001:DB8::1
```

**Step 4** Change the Firewall Management Center.

You should first unregister the chassis from the current Firewall Management Center.

**enter device-manager** *manager\_name* [**hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}] [**nat-id** *nat\_id*]

You are prompted for the registration key.

You can enter this command from any scope.

- **hostname** {*hostname* | *ipv4\_address* | *ipv6\_address*}—Specifies either the FQDN or IP address of the Firewall Management Center. At least one of the devices, either the Firewall Management Center or the chassis, must have a reachable IP address to establish the two-way, TLS-1.3-encrypted communication channel between the two devices. If you do not specify a **hostname**, then the chassis must have a reachable IP address or hostname and you must specify the **nat-id**.
- **nat-id** *nat\_id*—Specifies a unique, one-time string of your choice that you will also specify on the Firewall Management Center when you register the chassis when one side does not specify a reachable IP address

or hostname. It is required if you do not specify a **hostname**, however we recommend that you always set the NAT ID even when you specify a hostname or IP address. The NAT ID must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-). This ID cannot be used for any other devices registering to the Firewall Management Center.

- **Registration Key:** *reg\_key*—You will be prompted for a one-time registration key of your choice that you will also specify on the Firewall Management Center when you register the chassis. The registration key must not exceed 37 characters. Valid characters include alphanumerical characters (A–Z, a–z, 0–9) and the hyphen (-).

#### Example:

```
firepower-3110# enter device-manager boulder_fmc hostname 10.89.5.35 nat-id 93002
(Valid registration key characters: [a-z],[A-Z],[0-9],[-]. Length: [2-36])
Registration Key: Impala67
```

### Step 5 Change the admin password.

#### scope security

#### set password

Enter a password: *password*

Confirm the password: *password*

#### Example:

```
firepower-3110# scope security
firepower-3110 /security # set password
Enter new password: Sw@nsong67
Confirm new password: Sw@nsong67
firepower-3110 /security #
```

### Step 6 Disable multi-instance mode and set the system back to appliance mode.

#### scope system

#### set deploymode native

You are prompted to reboot.

#### Example:

```
firepower-3110# scope system
firepower-3110 /system # set deploymode native
All configuration and bootable images will be lost and system will reboot.
If there was out of band upgrade, it might reboot with the base version and
need to re-image to get the expected running version.
Do you still want to change deploy mode? (yes/no):yes
firepower-3110 /system #
```

To change the mode back to multi-instance mode, enter **set deploymode container**. You can check the current mode using the **show system detail** command.

# Monitoring Multi-Instance Mode

This section helps you troubleshoot and diagnose your multi-instance mode chassis and instances.

## Monitoring Multi-Instance Setup

### show system detail

This FXOS command shows the current mode, Native or Container. If the mode is Native (also known as appliance mode), you can convert to multi-instance (Container) mode. Note that the prompt/name in multi-instance mode is generic "firepower-<model>" while the prompt in appliance mode is the hostname you set for the Firewall Threat Defense (by default "firepower")

```
firepower # show system detail

Systems:
  Name: firepower
  Mode: Stand Alone
  System IP Address: 172.16.0.50
  System IPv6 Address: ::
  System Owner:
  System Site:
  Deploy Mode: Native
  Description for System:
firepower #
```

### scope system > show

This FXOS command shows the current mode in a table format. Note that the prompt/name in multi-instance mode is generic "firepower-<model>" while the prompt in appliance mode is the hostname you set for the Firewall Threat Defense.

```
firepower-3110# scope system
firepower-3110 /system # show

Systems:
  Name           Mode           Deploy Mode System IP Address System IPv6 Address
  -----
  firepower-3110
                   Stand Alone Container   10.89.5.42           ::

3110-1# scope system
3110-1 /system # show

Systems:
  Name           Mode           Deploy Mode System IP Address System IPv6 Address
  -----
  3110-1         Stand Alone Native   10.89.5.41           ::
3110-1 /system #
```

## Monitoring Instance Interfaces

### show portmanager switch forward-rules hardware mac-filter

This command shows the internal switch-forwarding rule for two instances with a dedicated physical interface assigned to each instance. Ethernet 1/2 is assigned to ftd1 and Ethernet 1/1 is assigned to ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

```
secfw-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
```

	VLAN	SRC_PORT	PC_ID	SRC_ID	DST_PORT	PKT_CNT	DMAC
1	0	17	0	17	19	29164	0:0:0:0:0:0
2	0	19	0	19	17	67588	0:0:0:0:0:0
3	0	1	0	101	1541	0	a2:5b:83:0:0:15
4	0	1	0	101	1541	8181	ff:ff:ff:ff:ff:ff
5	0	2	0	102	1540	0	a2:5b:83:0:0:18
6	0	2	0	102	1540	431	ff:ff:ff:ff:ff:ff
7	0	17	0	0	0	11133	0:0:0:0:0:0
8	0	17	0	0	0	0	0:0:0:0:0:0

This command shows the internal switch-forwarding rule for two instances with shared physical interfaces assigned to two instances. Ethernet 1/1 is shared between ftd1 and ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

MCAST group 4096 is used for replicating broadcast traffic between ftd1 and ftd2.

```
firepower-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
```

	VLAN	SRC_PORT	PC_ID	SRC_ID	DST_PORT	PKT_CNT	DMAC
1	0	17	0	17	19	2268	0:0:0:0:0:0
2	0	19	0	19	17	4844	0:0:0:0:0:0
3	0	1	0	101	1541	0	a2:5b:83:0:0:9
4	0	1	0	101	4096	546	ff:ff:ff:ff:ff:ff
5	0	1	0	101	1540	0	a2:5b:83:0:0:c
6	0	17	0	0	0	1263	0:0:0:0:0:0
7	0	17	0	0	0	0	0:0:0:0:0:0

This command shows the internal switch-forwarding rule for two instances with shared subinterfaces assigned to both instances. Ethernet 1/1.2452 is shared between ftd1 and ftd2.

ECMP group 1540 is assigned to ftd1 and ECMP group 1541 is assigned to ftd2.

MCAST group 4097 is used for replicating broadcast traffic between ftd1 and ftd2.

```
firepower-3140(local-mgmt)# show portmanager switch forward-rules hardware mac-filter
```

	VLAN	SRC_PORT	PC_ID	SRC_ID	DST_PORT	PKT_CNT	DMAC
1	0	17	0	17	19	21305	0:0:0:0:0:0
2	0	19	0	19	17	50976	0:0:0:0:0:0
3	2452	1	0	101	1541	430	a2:5b:83:0:0:f
4	2452	1	0	101	4097	0	ff:ff:ff:ff:ff:ff
5	2452	1	0	101	1540	0	a2:5b:83:0:0:12
6	0	17	0	0	0	11038	0:0:0:0:0:0
7	0	17	0	0	0	0	0:0:0:0:0:0

### show portmanager switch ecmp-groups detail

Use this command to list each Instance Ecmp-Vport-Physical port mapping detail.

**Note** Physical-Port 18 is the backplane uplink interface between the internal switch and the instance.

```
firepower-3140(local-mgmt)# show portmanager switch ecmp-groups detail
      ECMP-GROUP  VPORT      PHYSICAL-PORT
1       1536       256        18
2       1537       257        18
3       1538       258        18
4       1539       259        18
5       1540       260        18
6       1541       261        18
7       1542       262        18
8       1543       263        18
9       1544       264        18
10      1545       265        18
```

#### **show portmanager switch mcast-groups detail**

Use this command to list MCAST group membership details.

```
firepower-3140(local-mgmt)# show portmanager switch mcast-groups detail
      MCAST-GROUP
1       4096
      Member-ports
      Ethernet 1/1
      ECMP-ID 1541
      ECMP-ID 1540
```

#### **show portmanager counters mcast-group**

Use this command to check the MCAST group packet counter.

```
firepower-3140(local-mgmt)# show portmanager counters mcast-group 4096
PKT_CNT: 8106
```

#### **show portmanager counters ecmp**

Use this command to check the ECMP group packet counter.

```
firepower-3140(local-mgmt)# show portmanager counters ecmp 1541
PKT_CNT: 430
```

# History for Multi-Instance Mode

Table 24:

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details

In multi-instance mode, you can deploy multiple container instances on a single chassis that act as completely independent devices. Note that in multi-instance mode, you upgrade the operating system and the firmware (<i>chassis upgrade</i>) separately from the container instances (<i>Firewall Threat Defense upgrade</i>).</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Add &gt; Chassis</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Chassis Manager</b></li> <li>• <b>Devices &gt; Platform Settings &gt; New Policy &gt; Chassis Platform Settings</b></li> <li>• <b>Devices &gt; Chassis Upgrade</b></li> </ul> <p>New/modified Firewall Threat Defense CLI commands: <b>configure multi-instance network ipv4</b>, <b>configure multi-instance network ipv6</b></p> <p>New/modified FXOS CLI commands: <b>create device-manager</b>, <b>set deploymode</b></p> <p>Platform restrictions: Not supported on the Secure Firewall 3105.</p>

## CHAPTER 9

# High Availability

---

The following topics describe how to configure Active/Standby failover to accomplish high availability of the Firewall Threat Defense.

- [About Secure Firewall Threat Defense High Availability, on page 345](#)
- [Config-Sync Optimization, on page 359](#)
- [Requirements and Prerequisites for High Availability, on page 360](#)
- [Guidelines for High Availability, on page 360](#)
- [Add a High Availability Pair, on page 363](#)
- [Configure Optional High Availability Parameters, on page 365](#)
- [Manage High Availability, on page 368](#)
- [Monitoring High Availability, on page 374](#)
- [Troubleshoot Configuration Sync Failure, on page 375](#)
- [History for High Availability, on page 376](#)

## About Secure Firewall Threat Defense High Availability

Configuring high availability, also called failover, requires two identical Firewall Threat Defense devices connected to each other through a dedicated failover link and, optionally, a state link. Firewall Threat Defense supports Active/Standby failover, where one unit is the active unit and passes traffic. The standby unit does not actively pass traffic, but synchronizes configuration and other state information from the active unit. When a failover occurs, the active unit fails over to the standby unit, which then becomes active.

The health of the active unit (hardware, interfaces, software, and environmental status) is monitored to determine if specific failover conditions are met. If those conditions are met, failover occurs.

---

**Note** High availability is not supported on Firewall Threat Defense Virtual running in the public cloud. See the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#) for more information about configuring the Firewall Threat Defense Virtual device for high availability.

---

## High Availability System Requirements

This section describes the hardware, software, and license requirements for Firewall Threat Defense devices in a High Availability configuration.

## Hardware Requirements

The two units in a High Availability configuration must:

- Be the same model. In addition, for container instances, they must use the same resource profile attributes.

For the Firepower 9300, High Availability is only supported between same-type modules; but the two chassis can include mixed modules. For example, each chassis has an SM-56, SM-48, and SM-40. You can create High Availability pairs between the SM-56 modules, between the SM-48 modules, and between the SM-40 modules.

If you change the resource profile after you add the High Availability pair to the Firewall Management Center, update the inventory for each unit on the **Devices > Device Management > Device > System > Inventory** dialog box.

If you assign a different profile to instances in an established high-availability pair, which requires the profile to be the same on both units, you must:

1. Break high availability.
2. Assign the new profile to both units.
3. Re-establish high availability.

- Have the same number and types of interfaces.

For the Firepower 4100/9300 chassis, all interfaces must be preconfigured in FXOS identically before you enable High Availability. If you change the interfaces after you enable High Availability, make the interface changes in FXOS on the Standby unit, and then make the same changes on the Active unit.

If you are using units with different flash memory sizes in your High Availability configuration, make sure the unit with the smaller flash memory has enough space to accommodate the software image files and the configuration files. If it does not, configuration synchronization from the unit with the larger flash memory to the unit with the smaller flash memory will fail.

## Software Requirements

The two units in a High Availability configuration must:

- Be in the same firewall mode (routed or transparent).
- Have the same software version.
- Be in the same domain or group on the Firewall Management Center.
- Have the same NTP configuration. See [Configure NTP Time Synchronization for Threat Defense](#).
- Be fully deployed on the Firewall Management Center with no uncommitted changes.
- Not have DHCP or PPPoE configured in any of their interfaces.
- (Firepower 4100/9300) Have the same flow offload mode, either both enabled or both disabled.

## License Requirements for Firewall Threat Defense Devices in a High Availability Pair

Both Firewall Threat Defense units in a high availability configuration must have the same licenses.

High availability configurations require two license entitlements: one for each device in the pair.

Before high availability is established, it does not matter which licenses are assigned to the secondary/standby device. During high availability configuration, the Firewall Management Center releases any unnecessary licenses assigned to the standby unit and replaces them with identical licenses assigned to the primary/active unit. For example, if the active unit has a Essentials license and a IPS license, and the standby unit has only a Essentials license, the Firewall Management Center communicates with the Smart Software Manager to obtain an available IPS license from your account for the standby unit. If your license account does not include enough purchased entitlements, your account becomes Out-of-Compliance until you purchase the correct number of licenses.

## Failover and Stateful Failover Links

The failover link and the optional stateful failover link are dedicated connections between the two units. Cisco recommends to use the same interface between two devices in a failover link or a stateful failover link. For example, in a failover link, if you have used eth0 in device 1, use the same interface (eth0) in device 2 as well.

### Failover Link

The two units in a failover pair constantly communicate over a failover link to determine the operating status of each unit.

#### Failover Link Data

The following information is communicated over the failover link:

- The unit state (active or standby)
- Hello messages (keep-alives)
- Network link status
- MAC address exchange
- Configuration replication and synchronization

#### Interface for the Failover Link

You can use an unused data interface (physical, or EtherChannel) as the failover link; however, you cannot specify an interface that is currently configured with a name. You also cannot use a subinterface with the exception of a subinterface defined on the chassis for multi-instance mode. The failover link interface is not configured as a normal networking interface; it exists for failover communication only. This interface can only be used for the failover link (and also for the state link).

The Firewall Threat Defense does not support sharing interfaces between user data and the failover link. You also cannot use separate subinterfaces on the same parent for the failover link and for data (multi-instance chassis subinterfaces only). If you use a chassis subinterface for the failover link, then all subinterfaces on that parent, and the parent itself, are restricted for use as failover links.

**Note** When using an EtherChannel as the failover or state link, you must confirm that the same EtherChannel with the same member interfaces exists on both devices before establishing high availability.

See the following guidelines for the failover link:

- Firepower 4100/9300—You cannot use the management-type interface for the failover link.
- See the following guidelines for sizing the link.

**Table 25: Failover Link Size**

Model	Interface Size for Combined Failover and State Link
Firepower 1010	1 Gbps
Firepower 1100	1 Gbps
Secure Firewall 3100	Secure Firewall 3105—1 Gbps Secure Firewall 3110—1 Gbps Secure Firewall 3120—1 Gbps Secure Firewall 3130—10 Gbps Secure Firewall 3140—10 Gbps
Secure Firewall 4200	10 Gbps
Firepower 9300	10 Gbps

The alternation frequency is equal to the unit hold time.

**Note** If you have a large configuration and a low unit hold time, alternating between the member interfaces can prevent the secondary unit from joining/re-joining. In this case, disable one of the member interfaces until after the secondary unit joins.

For an EtherChannel used as the failover link, to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a failover link.

## Connecting the Failover Link

Connect the failover link in one of the following two ways:

- Using a switch, with no other device on the same network segment (broadcast domain or VLAN) as the failover interfaces of the Firewall Threat Defense device.
- Using an Ethernet cable to connect the units directly, without the need for an external switch.

If you do not use a switch between the units, if the interface fails, the link is brought down on both peers. This condition may hamper troubleshooting efforts because you cannot easily determine which unit has the failed interface and caused the link to come down.

## Stateful Failover Link

To use Stateful Failover, you must configure a Stateful Failover link (also known as the state link) to pass connection state information.

## Shared with the Failover Link

Sharing a failover link is the best way to conserve interfaces. However, you must consider a dedicated interface for the state link and failover link, if you have a large configuration and a high traffic network.

## Dedicated Interface for the Stateful Failover Link

You can use a dedicated data interface (physical or EtherChannel) for the state link. See [Interface for the Failover Link, on page 347](#) for requirements for a dedicated state link, and [Connecting the Failover Link, on page 348](#) for information about connecting the state link as well.

For optimum performance when using long distance failover, the latency for the state link should be less than 10 milliseconds and no more than 250 milliseconds. If latency is more than 10 milliseconds, some performance degradation occurs due to retransmission of failover messages.

## Avoiding Interrupted Failover and Data Links

We recommend that failover links and data interfaces travel through different paths to decrease the chance that all interfaces fail at the same time. If the failover link is down, the failover operation is suspended until the health of the failover link is restored.

See the following connection scenarios to design a resilient failover network.

### Scenario 1—Not Recommended

If a single switch or a set of switches are used to connect both failover and data interfaces between two Firewall Threat Defense devices, then when a switch or inter-switch-link is down, both Firewall Threat Defense devices become active. Therefore, the two connection methods shown in the following figures are **not** recommended.

**Figure 174: Connecting with a Single Switch—Not Recommended**

**Figure 175: Connecting with a Double-Switch—Not Recommended**

### Scenario 2—Recommended

We recommend that failover links not use the same switch as the data interfaces. Instead, use a different switch or use a direct cable to connect the failover link, as shown in the following figures.

**Figure 176: Connecting with a Different Switch**

**Figure 177: Connecting with a Cable****Scenario 3—Recommended**

If the Firewall Threat Defense data interfaces are connected to more than one set of switches, then a failover link can be connected to one of the switches, preferably the switch on the secure (inside) side of network, as shown in the following figure.

**Figure 178: Connecting with a Secure Switch**

## MAC Addresses and IP Addresses in High Availability

When you configure your interfaces, you can specify an active IP address and a standby IP address on the same network. Generally, when a failover occurs, the new active unit takes over the active IP addresses and MAC addresses. Because network devices see no change in the MAC to IP address pairing, no ARP entries change or time out anywhere on the network.

**Note** Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state. You also cannot connect to the standby unit on that interface for management purposes.

The IP address and MAC address for the state link do not change at failover.

### Active/Standby IP Addresses and MAC Addresses

For Active/Standby High Availability, see the following for IP address and MAC address usage during a failover event:

1. The active unit always uses the primary unit's IP addresses and MAC addresses.
2. When the active unit fails over, the standby unit assumes the IP addresses and MAC addresses of the failed unit and begins passing traffic.
3. When the failed unit comes back online, it is now in a standby state and takes over the standby IP addresses and MAC addresses.

However, if the secondary unit boots without detecting the primary unit, then the secondary unit becomes the active unit and uses its own MAC addresses, because it does not know the primary unit MAC addresses. When the primary unit becomes available, the secondary (active) unit changes the MAC addresses to those of the

primary unit, which can cause an interruption in your network traffic. Similarly, if you swap out the primary unit with new hardware, a new MAC address is used.

If you disable high availability and set the failover configurations to a disabled state, you will need to manually resume high availability, or reboot the device. It is recommended to use the command **configure high-availability resume** and resume the high availability instead of rebooting the device. If you reload the standby unit with the failover configuration disabled, the standby unit boots up as the active unit and uses the primary unit's IP addresses and MAC addresses. This leads to duplicate IP addresses and causes network traffic disruptions. Use the command **configure high-availability resume** to enable failover and restore the traffic flow.

**Note** If you enable failover on a standalone device, the data interfaces go down at negotiation state of failover, interrupting traffic.

Virtual MAC addresses guard against this disruption, because the active MAC addresses are known to the secondary unit at startup, and remain the same in the case of new primary unit hardware. We recommend that you configure the virtual MAC address on both the primary and secondary units to ensure that the secondary unit uses the correct MAC addresses when it is the active unit, even if it comes online before the primary unit. If you do not configure virtual MAC addresses, you might need to clear the ARP tables on connected routers to restore traffic flow. The Firewall Threat Defense device does not send gratuitous ARPs for static NAT addresses when the MAC address changes, so connected routers do not learn of the MAC address change for these addresses.

### Virtual MAC Addresses

The Firewall Threat Defense device has multiple methods to configure virtual MAC addresses. We recommend using only one method. If you set the MAC address using multiple methods, the MAC address used depends on many variables, and might not be predictable.

For multi-instance capability, the FXOS chassis autogenerates only primary MAC addresses for all interfaces. You can overwrite the generated MAC address with a virtual MAC address with both the primary and secondary MAC addresses, but predefining the secondary MAC address is not essential; setting the secondary MAC address does ensure that to-the-box management traffic is not interrupted in the case of new secondary unit hardware.

### MAC Address Table Update in Failover

During failover, the device that is designated as the new active device generates multicast packets for each MAC address entry in the MAC table and sends them to all the bridge group interfaces. This action prompts the upstream switches in the bridge group to update their routing tables with the new active device's interface to ensure accurate traffic forwarding.

The time taken to generate multicast packets and update the routing tables of the upstream switches depends on the number of entries in the MAC address table and the number of bridge group interfaces. Use the **show failover statistics state-switch-delay** command to display statistics related to the delays encountered during failover events.

# Stateful Failover

During Stateful Failover, the active unit continually passes per-connection state information to the standby unit. After a failover occurs, the same connection information is available at the new active unit. Supported end-user applications are not required to reconnect to keep the same communication session.

## Supported Features

For Stateful Failover, the following state information is passed to the standby Firewall Threat Defense device:

- NAT translation table.
- TCP and UDP connections and states, including HTTP connection states. Other types of IP protocols, and ICMP, are not parsed by the active unit, because they get established on the new active unit when a new packet arrives.
- Snort connection states, inspection results, and pin hole information, including strict TCP enforcement.
- The ARP table
- The Layer 2 bridge table (for bridge groups)
- The ISAKMP and IPsec SA table
- GTP PDP connection database
- SIP signaling sessions and pin holes.
- Static and dynamic routing tables—Stateful Failover participates in dynamic routing protocols, like OSPF and EIGRP, so routes that are learned through dynamic routing protocols on the active unit are maintained in a Routing Information Base (RIB) table on the standby unit. Upon a failover event, packets travel normally with minimal disruption to traffic because the active secondary unit initially has rules that mirror the primary unit. Immediately after failover, the re-convergence timer starts on the newly active unit. Then the epoch number for the RIB table increments. During re-convergence, OSPF and EIGRP routes become updated with a new epoch number. Once the timer is expired, stale route entries (determined by the epoch number) are removed from the table. The RIB then contains the newest routing protocol forwarding information on the newly active unit.

---

**Note** Routes are synchronized only for link-up or link-down events on an active unit. If the link goes up or down on the standby unit, dynamic routes sent from the active unit may be lost. This is normal, expected behavior.

---

- DHCP Server—DHCP address leases are not replicated. However, a DHCP server configured on an interface will send a ping to make sure an address is not being used before granting the address to a DHCP client, so there is no impact to the service. State information is not relevant for DHCP relay or DDNS.
- Access control policy decisions—Decisions related to traffic matching (including URL, URL category, geolocation, and so forth), intrusion detection, malware, and file type are preserved during failover. However, for connections being evaluated at the moment of failover, there are the following caveats:
  - AVC—App-ID verdicts are replicated, but not detection states. Proper synchronization occurs as long as the App-ID verdicts are complete and synchronized before failover occurs.

- Intrusion detection state—Upon failover, once mid-flow pickup occurs, new inspections are completed, but old states are lost.
- File malware blocking—The file disposition must become available before failover.
- File type detection and blocking—The file type must be identified before failover. If failover occurs while the original active device is identifying the file, the file type is not synchronized. Even if your file policy blocks that file type, the new active device downloads the file.
- User identity decisions from the identity policy, including the user-to-IP address mappings gathered passively through ISE Session Directory, and active authentication through captive portal. Users who are actively authenticating at the moment of failover might be prompted to authenticate again.
- Network AMP—Cloud lookups are independent from each device, so failover does not affect this feature in general. Specifically:
  - Signature Lookup—If failover occurs in the middle of a file transmission, no file event is generated and no detection occurs.
  - File Storage—If failover occurs when the file is being stored, it is stored on the original active device. If the original active device went down while the file was being stored, the file does not get stored.
  - File Pre-classification (Local Analysis)—If failover occurs in the middle of pre-classification, detection fails.
  - File Dynamic Analysis (Connectivity to the cloud)—If failover occurs, the system might submit the file to the cloud.
  - Archive File Support—If failover occurs in the middle of an analysis, the system loses visibility into the file/archive.
  - Custom Blocking—If failover occurs, no events are generated.
- Security Intelligence decisions. However, DNS-based decisions that are in process at the moment of failover are not completed.
- RA VPN—Remote access VPN end users do not have to reauthenticate or reconnect the VPN session after a failover. However, applications operating over the VPN connection could lose packets during the failover process and not recover from the packet loss.
- From all the connections, only established ones will be replicated on the Standby device.

## Unsupported Features

For Stateful Failover, the following state information is not passed to the standby Firewall Threat Defense device:

- Sessions in plaintext tunnels other than GREv0 and IPv4-in-IP. Sessions inside tunnels are not replicated and the new active node will not be able to reuse existing inspection verdicts to match the correct policy rules.
- Decrypted TLS/SSL connections—The decryption states are not synchronized, and if the active unit fails, then decrypted connections will be reset. New connections will need to be established to the new active unit. Connections that are not decrypted (in other words, those that match a TLS/SSL Do Not Decrypt rule action) are not affected and are replicated correctly.

- TCP state bypass connections
- Multicast routing.

## Bridge Group Requirements for High Availability

There are special considerations for high availability when using bridge groups.

When the active unit fails over to the standby unit, the switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss on the bridge group member interfaces while the port is in a blocking state, you can configure one of the following workarounds:

- Switch port is in Access mode—Enable the STP PortFast feature on the switch:

```
interface interface_id
    spanning-tree portfast
```

The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- If the switch port is in Trunk mode, or you cannot enable STP PortFast, then you can use one of the following less desirable workarounds that impacts failover functionality or STP stability:
  - Disable interface monitoring on the bridge group and member interfaces.
  - Increase the interface hold time in the failover criteria to a high value that will allow STP to converge before the unit fails over.
  - Decrease the STP timers on the switch to allow STP to converge faster than the interface hold time.

## Failover Health Monitoring

The Firewall Threat Defense device monitors each unit for overall health and for interface health. This section includes information about how the Firewall Threat Defense device performs tests to determine the state of each unit.

### Unit Health Monitoring

The Firewall Threat Defense device determines the health of the other unit by monitoring the failover link with hello messages. When a unit does not receive three consecutive hello messages on the failover link, the unit sends LANTEST messages on each data interface, including the failover link, to validate whether or not the peer is responsive. The action that the Firewall Threat Defense device takes depends on the response from the other unit. See the following possible actions:

- If the Firewall Threat Defense device receives a response on the failover link, then it does not fail over.
- If the Firewall Threat Defense device does not receive a response on the failover link, but it does receive a response on a data interface, then the unit does not failover. The failover link is marked as failed. You should restore the failover link as soon as possible because the unit cannot fail over to the standby while the failover link is down.

- If the Firewall Threat Defense device does not receive a response on any interface, then the standby unit switches to active mode and classifies the other unit as failed.

## Heartbeat Module Redundancy

Each unit in the HA periodically sends a broadcast keepalive heartbeat packet over the cluster control link. If the control plane is too busy handling traffic, sometimes the heartbeat packets do not reach the peers, or the peers do not process the heartbeat packets due to CPU overloading. When peers cannot communicate the keepalive status within the configurable timeout period, a false failover or split-brain scenario occurs.

The heartbeat module in the data plane helps to avoid the occurrence of false failover or split-brain due to traffic congestion in the control plane.

- The additional heartbeat module works similarly to the control plane module but sends and receives heartbeat messages using the data plane transport infrastructure.
- When the peer receives heartbeat packets in the data plane, a counter gets incremented.
- If the heartbeat transfer in the control plane fails, the node checks the heartbeat counter in the data plane. If the counter is incrementing, then the peer is alive, and the cluster does not perform a failover in this situation.

### Note

- The additional heartbeat module is enabled by default whenever HA is enabled. You do not have to set a poll interval for the additional heartbeat module in the data plane. This module uses the same heartbeat interval that you set for the control plane.

## Interface Monitoring

When a unit does not receive hello messages on a monitored interface for 15 seconds, it runs interface tests. If one of the interface tests fails for an interface, but this same interface on the other unit continues to successfully pass traffic, then the interface is considered to be failed, and the device stops running tests.

If the threshold you define for the number of failed interfaces is met (see **Devices > Device Management > High Availability > Failover Trigger Criteria**), and the active unit has more failed interfaces than the standby unit, then a failover occurs. If an interface fails on both units, then both interfaces go into the “Unknown” state and do not count towards the failover limit defined by failover interface policy.

An interface becomes operational again if it receives any traffic. A failed device returns to standby mode if the interface failure threshold is no longer met.

If an interface has IPv4 and IPv6 addresses configured on it, the device uses the IPv4 addresses to perform the health monitoring. If an interface has only IPv6 addresses configured on it, then the device uses IPv6 neighbor discovery instead of ARP to perform the health monitoring tests. For the broadcast ping test, the device uses the IPv6 all nodes address (FE02::1).

### Interface Tests

The Firewall Threat Defense device uses the following interface tests. The duration of each test is approximately 1.5 seconds.

1. **Link Up/Down test**—A test of the interface status. If the Link Up/Down test indicates that the interface is down, then the device considers it failed, and testing stops. If the status is Up, then the device performs the Network Activity test.
2. **Network Activity test**—A received network activity test. At the start of the test, each unit clears its received packet count for its interfaces. As soon as a unit receives any eligible packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the ARP test.
3. **ARP test**—A test for successful ARP replies. Each unit sends a single ARP request for the IP address in the most recent entry in its ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If the unit does not receive an ARP reply, then the device sends a single ARP request for the IP address in the *next* entry in the ARP table. If the unit receives an ARP reply or other network traffic during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then the device starts the Broadcast Ping test.
4. **Broadcast Ping test**—A test for successful ping replies. Each unit sends a broadcast ping, and then counts all received packets. If the unit receives any packets during the test, then the interface is considered operational. If both units receive traffic, then testing stops. If one unit receives traffic, and the other unit does not, then the interface on the unit that does not receive traffic is considered failed, and testing stops. If neither unit receives traffic, then testing starts over again with the ARP test. If both units continue to receive no traffic from the ARP and Broadcast Ping tests, then these tests will continue running in perpetuity.

## Interface Status

Monitored interfaces can have the following status:

- **Unknown**—Initial status. This status can also mean the status cannot be determined.
- **Normal**—The interface is receiving traffic.
- **Normal (Waiting)**—The interface is up, but has not yet received a hello packet from the corresponding interface on the peer unit.
- **Normal (Not-Monitored)**—The interface is up, but is not monitored by the failover process.
- **Testing**—Hello messages are not heard on the interface for five poll times.
- **Link Down**—The interface or VLAN is administratively down.
- **Link Down (Waiting)**—The interface or VLAN is administratively down and has not yet received a hello packet from the corresponding interface on the peer unit.
- **Link Down (Not-Monitored)**—The interface or VLAN is administratively down, but is not monitored by the failover process.
- **No Link**—The physical link for the interface is down.
- **No Link (Waiting)**—The physical link for the interface is down and has not yet received a hello packet from the corresponding interface on the peer unit.
- **No Link (Not-Monitored)**—The physical link for the interface is down, but is not monitored by the failover process.

- Failed—No traffic is received on the interface, yet traffic is heard on the peer interface.

## Failover Triggers and Detection Timing

The following events trigger failover in a Firepower high availability pair:

- More than 50% of the Snort instances on the active unit are down.
- Disk space on the active unit is more than 90% full.
- The **no failover active** command is run on the active unit or the **failover active** command is run on the standby unit.
- The active unit has more failed interfaces than the standby unit.
- Interface failure on the active device exceeds the threshold configured.

By default, failure of a single interface causes failover. You can change the default value by configuring a threshold for the number of interfaces or a percentage of monitored interfaces that must fail for the failover to occur. If the threshold breaches on the active device, failover occurs. If the threshold breaches on the standby device, the unit moves to **Fail** state.

To change the default failover criteria, enter the following command in global configuration mode:

**Table 26:**

Command	Purpose
<b>failover interface-policy num [%]</b>  hostname (config)# failover interface-policy 20%	Changes the default failover criteria.  When specifying a specific number of interfaces, the <i>num</i> argument can be from 1 to 250.  When specifying a percentage of interfaces, the <i>num</i> argument can be from 1 to 100.

The following table shows the failover triggering events and associated failure detection timing. If failover occurs, you can view the reason for the failover in the Message Center, along with various operations pertaining to the high availability pair. You can configure these thresholds to a value within the specified minimum-maximum range.

**Table 27: Firewall Threat Defense Failover Times**

Failover Triggering Event	Minimum	Default	Maximum
Active unit loses power, hardware goes down, or the software reloads or crashes. When any of these occur, the monitored interfaces or failover link do not receives any hello message.	800 milliseconds	15 seconds	45 seconds
Active unit interface physical link down.	500 milliseconds	5 seconds	15 seconds
Active unit interface up, but connection problem causes interface testing.	5 seconds	25 seconds	75 seconds

## About Active/Standby Failover

Active/Standby failover lets you use a standby Firewall Threat Defense device to take over the functionality of a failed unit. When the active unit fails, the standby unit becomes the active unit.

### Primary/Secondary Roles and Active/Standby Status

When setting up Active/Standby failover, you configure one unit to be primary and the other to be secondary. During configuration, the primary unit's policies are synchronized to the secondary unit. At this point, the two units act as a single device for device and policy configuration. However, for events, dashboards, reports and health monitoring, they continue to display as separate devices.

The main differences between the two units in a failover pair are related to which unit is active and which unit is standby, namely which IP addresses to use and which unit actively passes traffic.

However, a few differences exist between the units based on which unit is primary (as specified in the configuration) and which unit is secondary:

- The primary unit always becomes the active unit if both units start up at the same time (and are of equal operational health).
- The primary unit MAC addresses are always coupled with the active IP addresses. The exception to this rule occurs when the secondary unit becomes active and cannot obtain the primary unit MAC addresses over the failover link. In this case, the secondary unit MAC addresses are used.

### Active Unit Determination at Startup

The active unit is determined by the following:

- If a unit boots and detects a peer already running as active, it becomes the standby unit.
- If a unit boots and does not detect a peer, it becomes the active unit.
- If both units boot simultaneously, then the primary unit becomes the active unit, and the secondary unit becomes the standby unit.

### Failover Events

In Active/Standby failover, failover occurs on a unit basis.

The following table shows the failover action for each failure event. For each failure event, the table shows the failover policy (failover or no failover), the action taken by the active unit, the action taken by the standby unit, and any special notes about the failover condition and actions.

**Table 28: Failover Events**

Failure Event	Policy	Active Unit Action	Standby Unit Action	Notes
Active unit failed (power or hardware)	Failover	n/a	Become active Mark active as failed	No hello messages are received on any monitored interface or the failover link.
Formerly active unit recovers	No failover	Become standby	No action	None.

Failure Event	Policy	Active Unit Action	Standby Unit Action	Notes
Standby unit failed (power or hardware)	No failover	Mark standby as failed	n/a	When the standby unit is marked as failed, then the active unit does not attempt to fail over, even if the interface failure threshold is surpassed.
Failover link failed during operation	No failover	Mark failover link as failed	Mark failover link as failed	You should restore the failover link as soon as possible because the unit cannot fail over to the standby unit while the failover link is down.
Failover link failed at startup	No failover	Become active Mark failover link as failed	Become active Mark failover link as failed	If the failover link is down at startup, both units become active.
State link failed	No failover	No action	No action	State information becomes out of date, and sessions are terminated if a failover occurs.
Interface failure on active unit above threshold	Failover	Mark active as failed	Become active	None.
Interface failure on standby unit above threshold	No failover	No action	Mark standby as failed	When the standby unit is marked as failed, then the active unit does not attempt to fail over even if the interface failure threshold is surpassed.

## Config-Sync Optimization

When a device reboots or rejoins following a suspend or resume high availability, the joining device clears its running configuration. The active device then sends its entire configuration to the joining device for a full configuration synchronization. If the active device has a large configuration, this process can take several minutes.

The configuration sync optimization functionality enables comparing the configuration of the joining device and the active device by exchanging configuration hash values. If the hash computed on both active and joining devices match, the joining device skips full configuration synchronization and rejoins the high availability configuration. This functionality ensures faster peering and reduces maintenance window and upgrade time.

### Guidelines and Limitations of Config-Sync Optimization

- The configuration sync optimization functionality is enabled by default.
- Firewall Threat Defense multiple context mode supports configuration sync optimization by sharing the context order during full configuration synchronization, allowing comparison of context order during subsequent node-rejoin.

- If you configure passphrase and failover IPsec key, then configuration sync optimization is not effective as the hash value computed in the active and standby devices differs.
- If you configure the device with dynamic ACL or SNMPv3, configuration sync optimization is not effective.
- Active device synchronizes full configuration with flapping LAN links as default behavior. During failover flaps between active and standby devices, configuration sync optimization is not triggered and devices perform a full configuration synchronization.
- Configuration sync optimization gets triggered when the high availability configuration recovers from an interruption or loss of network communication between the active and standby devices.

### Monitoring Config-Sync Optimization

When configuration sync optimization functionality is enabled, syslog messages are generated displaying whether the hash values computed on the active and joining unit match, does not match, or if the operation timeout expires. The syslog message also displays the time elapsed, from the time of sending the hash request to the time of getting and comparing the hash response.

---

**Note** The Configuration State in **show failover state** command displays the config sync state status during HA joining. This state does not reflect the later config deployments or changes, and replication on device until a resync has been initiated.

## Guidelines for High Availability

### Model Support

- Firepower 1010:
  - You should not use the switch port functionality when using High Availability. Because the switch ports operate in hardware, they continue to pass traffic on both the active *and* the standby units.

High Availability is designed to prevent traffic from passing through the standby unit, but this feature does not extend to switch ports. In a normal High Availability network setup, active switch ports on both units will lead to network loops. We suggest that you use external switches for any switching capability. Note that VLAN interfaces can be monitored by failover, while switch ports cannot. Though Firewall Management Center allows you to configure switch ports / VLAN interfaces in HA, it may lead to misconfiguration due to network loops when connecting to external switches.

- You can only use a firewall interface as the failover link.
- Firepower 9300—Intra-chassis High Availability is not supported.
- The Firewall Threat Defense Virtual on public cloud networks such as Microsoft Azure and Amazon Web Services are not supported with High Availability because Layer 2 connectivity is required.

### Additional Guidelines

- When the active unit fails over to the standby unit, the connected switch port running Spanning Tree Protocol (STP) can go into a blocking state for 30 to 50 seconds when it senses the topology change. To avoid traffic loss while the port is in a blocking state, you can enable the STP PortFast feature on the switch:

#### **interface *interface\_id* spanning-tree portfast**

This workaround applies to switches connected to both routed mode and bridge group interfaces. The PortFast feature immediately transitions the port into STP forwarding mode upon linkup. The port still participates in STP. So if the port is to be a part of the loop, the port eventually transitions into STP blocking mode.

- Configuring port security on the switches connected to the Firewall Threat Defense device failover pair can cause communication problems when a failover event occurs. This problem occurs when a secure MAC address configured or learned on one secure port moves to another secure port, a violation is flagged by the switch port security feature.
- For Active/Standby High Availability and a VPN IPsec tunnel, you cannot monitor both the active and standby units using SNMP over the VPN tunnel. The standby unit does not have an active VPN tunnel, and will drop traffic destined for the NMS. You can instead use SNMPv3 with encryption so the IPsec tunnel is not required.
- Both the peer devices go into unknown state and high-availability configuration fails if you run `clish` in any of the peer devices while creating a High Availability pair.
- Immediately after failover, the source address of syslog messages will be the failover interface address for a few seconds.
- For better convergence (during a failover), you must shut down the interfaces on a HA pair that are not associated with any configuration or instance.
- If you configure failover encryption in evaluation mode, the systems use DES for the encryption. If you then register the devices using an export-compliant account, the devices will use AES after a reboot. Thus, if a system reboots for any reason, including after installing an upgrade, the peers will be unable to communicate and both units will become the active unit. We recommend that you do not configure encryption until after you register the devices. If you do configure this in evaluation mode, we recommend you remove the encryption before registering the devices.

- When using SNMPv3 with failover, if you replace a failover unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.
- The device does not share SNMP client engine data with its peer.
- If you have a very large number of access control and NAT rules, the size of the configuration can prevent efficient configuration replication, resulting in the standby unit taking an excessively long time to reach standby ready state. This can also impact your ability to connect to the standby unit during replication through the console or SSH session. To enhance configuration replication performance, enable transactional commit for both access rules and NAT, using the **asp rule-engine transactional-commit access-group** and **asp rule-engine transactional-commit nat** commands.
- A unit in a High Availability pair transitioning to the standby role synchronizes its clock with the active unit.

Example:

```
firepower#show clock
01:00:52 UTC Mar 1 2022

...
01:01:18 UTC Mar 1 2022 <===== Incorrect (previous) clock
Cold Standby              Sync Config              Detected an Active mate

19:38:21 UTC Apr 9 2022 <===== Updated clock
Sync Config              Sync File System              Detected an Active mate
...
firepower/sec/stby#show clock
19:38:40 UTC Apr 9 2022
```

- The units in High Availability do not dynamically synchronize the clock. Here are some examples of events when synchronization takes place:
  - A new High Availability pair is created.
  - High Availability is broken and re-created.
  - Communication over the failover link was disrupted and reestablished.
  - Failover status was manually changed at the CLI using the **no failover/failover** or **configure high-availability suspend/resume** (Firewall Threat Defense) commands.
- Enabling High Availability forces all routes to be deleted and are re-added after the High Availability progression changes to the Active state. You could experience connection loss during this phase.
- If you replace the primary unit, then when you re-create high-availability, you should set the replacement unit as the *secondary* unit so that the configurations are replicated from the former secondary unit to the replacement unit. If you set the replacement unit as primary, you will accidentally overwrite the configuration that is present on the operational unit.
- Deploying Firepower 1100 and 2100 devices in high availability with hundreds of interfaces configured on them can result in increased delay in the failover time (seconds).
- In the High Availability configuration, short-lived connections, usually using port 53, are closed quickly and never transferred or synchronized from Active to Standby, so there might be a difference in the number of connections on both High Availability devices. This is expected behavior for short-lived connections. You can try to compare the connections that are long-lived ( for example, more than 30-60 seconds).

- In the High Availability configuration, embryonic connections—connection requests that have not yet completed the three-way handshake process—are closed quickly and not synchronized between the active and standby devices. This design ensures HA system efficiency and security. For this reason, there might be a difference in the number of connections on both High Availability devices, which is to be expected.
- If the failover LAN link is not connected back-to-back and instead connected through one or more switches, a failure within the intermediate path can cause the active unit to lose connectivity with the standby unit, resulting in inconsistent active/standby states. Although this does not impact High Availability functionality, it is recommended to check and recover the failover-link path between the active and standby units.

When the failover LAN link is down, it is not recommended to deploy any configuration, as it may not be replicated to the peer unit.

- See the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#) and review your Firewall Threat Defense Virtual device configurations for high availability.
- In transparent mode, if you have problems with the active unit losing the MAC address of the hot-standby router (HSRP), create a static mapping for the MAC address.
- UCAPL or CC compliance mode cannot be changed if the threat defense device is in high availability. Modify the compliance mode before forming the high availability pair.

## Add a High Availability Pair

When establishing an Active/Standby high-availability pair, you designate one of the devices as primary and the other as secondary. The Firewall Management Center deploys a merged configuration to the paired devices. If there is a conflict, the primary device setting is used.

In a multidomain deployment, devices in a high-availability pair must belong to the same domain.

### Note

The failover link and the stateful failover link are in a private IP space and are only used for communication between peers in a high-availability pair. After high availability is established, selected interface links and encryption settings cannot be modified without breaking the high-availability pair and reconfiguring it.

### Caution

Creating or breaking a high-availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information. The system warns you that continuing to create a high-availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

### Before you begin

Confirm that both devices:

- Are the same model.
- Have the same number and type of interfaces.

- Are in the same domain and group.
- Have normal health status and are running the same software.
- Are either in routed or transparent mode.

---

**Note** Only routed mode is supported for manager access on a data interface.

---

- Have the same NTP configuration. See [Time Synchronization, on page 883](#).
- Are fully deployed with no uncommitted changes.
- Do not have DHCP or PPPoE configured on any interfaces.
- For manager access on a data interface:
  - Use the same data interface on both devices for manager access.
  - Redundant manager access data interface is not supported.
  - You cannot use DHCP; only a static IP address is supported. Features that rely on DHCP cannot be used, including DDNS and zero-touch provisioning.

---

**Note** If you use zero-touch provisioning to register the device, when you use the outside interface for manager access, it uses DHCP by default. Before you can enable high availability, you need to change the IP address to a static address. See [Change the Device IP Address, on page 87](#). Alternatively, you can use the Management interface instead; DHCP is supported on Management with high availability.

---

- Have different static IP addresses in the same subnet.
- Use the same manager configuration (**configure manager add** command) to ensure that the connectivity is the same.
- You cannot use the data interface as the failover or state link.

---

**Note** The high availability formation is possible between the two Firewall Threat Defense devices when the certificate available on the primary device is not present on the secondary device. When high availability is formed, the certificate will be synched on the secondary device.

---

## Procedure

- 
- Step 1** Add both devices to the Firewall Management Center according to [Register With the Management Center, on page 29](#).
- Step 2** Choose **Devices > Device Management**.

- Step 3** From the **Add** drop-down menu, choose **High Availability**.
- Step 4** Enter a display **Name** for the high-availability pair.
- Step 5** Under **Device Type**, choose **Firepower Threat Defense**.
- Step 6** Choose the **Primary Peer** device for the high-availability pair.
- Step 7** Choose the **Secondary Peer** device for the high-availability pair.
- Step 8** Click **Continue**.
- Step 9** Under **LAN Failover Link**, choose an **Interface** with enough bandwidth to reserve for failover communications.

**Note**

Only interfaces that do not have a logical name and do not belong to a security zone, will be listed in the **Interface** drop-down in the **Add High Availability Pair** dialog.

- Step 10** Type any identifying **Logical Name**.
- Step 11** Type a **Primary IP** address for the failover link on the active unit.
- This address should be on an unused subnet.

**Note**

169.254.1.0/24 and fd00:0:0::\*:/64 are internally used subnets and cannot be used for the failover or state links.

- Step 12** Optionally, choose **Use IPv6 Address**.
- Step 13** Type a **Secondary IP** address for the failover link on the standby unit. This IP address must be in the same subnet as the primary IP address.
- Step 14** If IPv4 addresses are used, type a **Subnet Mask** that applies to both the primary and secondary IP addresses.
- Step 15** Optionally, under **Stateful Failover Link**, choose the same **Interface**, or choose a different interface and enter the high availability configuration information.

**Note**

169.254.1.0/24 and fd00:0:0::\*:/64 are internally used subnets and cannot be used for the failover or state links.

- Step 16** Optionally, choose **Enabled** and choose the **Key Generation** method for IPsec Encryption between the failover links.
- Step 17** Click **OK**. This process takes a few minutes as the process synchronizes system data.

---

**What to do next**

Back up the devices. You can use the backup to quickly replace the devices when they fail and to restore the high availability service without being delinked from the Firewall Management Center. For more information, see [Cisco Secure Firewall Management Center Administration Guide](#).

## Configure Optional High Availability Parameters

You can view the initial High Availability Configuration on the Firewall Management Center. You cannot edit these settings without breaking the high availability pair and then re-establishing it.

You can edit the Failover Trigger Criteria to improve failover results. Interface Monitoring allows you to determine which interfaces are better suited for failover.

## Configure Standby IP Addresses and Interface Monitoring

For each interface, set a standby IP address. Although recommended, the standby address is not required. Without a standby IP address, the active unit cannot perform network tests to check the standby interface health; it can only track the link state.

By default, monitoring is enabled on all physical interfaces, for the Firepower 1010 all VLAN interfaces, with logical names configured. You might want to exclude interfaces attached to less critical networks from affecting your failover policy. Firepower 1010 switch ports are not eligible for interface monitoring.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the **Edit** (✎).
- Step 3** Click the **High Availability** tab.
- Step 4** In the **Monitored Interfaces** area, click the **Edit** (✎) next to the interface you want to edit.
- Step 5** Check the **Monitor this interface for failures** check box.
- Step 6** On the **IPv4** tab, enter the **Standby IP Address**.  
This address must be a free address on the same network as the active IP address.
- Step 7** If you configured the IPv6 address manually, on the **IPv6** tab, click the **Edit** (✎) next to the active IP address, enter the **Standby IP Address**, and click **OK**.  
This address must be a free address on the same network as the active IP address. For autogenerated and **Enforce EUI 64** addresses, the standby address is automatically generated.
- Step 8** Click **OK**.
- 

## Edit High Availability Failover Criteria

You can customize failover criteria based on your network deployment.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click the **Edit** (✎).
- Step 3** Choose **High Availability**.
- Step 4** Next to **Failover Trigger Criteria**, click the **Edit** (✎).

**Step 5** Under **Interface Failure Threshold**, choose the number or percentage of interfaces that must fail before the device fails over.

**Step 6** Under **Hello packet Intervals**, choose how often hello packets are sent over the failover link.

**Note**

If you use remote access VPN on the Firepower 2100, use the default hello packet intervals. Otherwise, you might see high CPU usage that can cause a failover to occur.

**Step 7** Click **OK**.

---

## Configure Virtual MAC Addresses

You can configure active and standby MAC addresses for failover using the following methods in the Secure Firewall Management Center:

- From the **Advanced** tab on the **Edit Interface** page during interface configuration; see [Configure the MAC Address, on page 764](#).
- From the **Add Interface MAC Address** dialog-box which is accessed from the **High Availability** page; see this procedure.

**Note** To configure the MAC address in both primary and secondary units (so that the MAC address is transferred to all sub-interfaces to both the high-availability units), the recommended approach is to use the **Interfaces** tab to replicate the MAC addresses on sub-interfaces over both active and standby high-availability units.

---

If you configure active and standby MAC addresses in both locations, the addresses defined during interface configuration take precedence for failover.

You can minimize loss of traffic during failover by designating active and standby MAC addresses to the physical interface. This feature offers redundancy against IP address mapping for failover.

### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).
- Step 3** Click **High Availability**.
- Step 4** Click the **Add** (+) icon next to Interface MAC Addresses.
- Step 5** Choose a **Physical Interface**.
- Step 6** Enter the **Active Interface Mac Address**.
- Step 7** Enter the **Standby Interface Mac Address**.
- Step 8** Click **OK**.

**Note**

For detailed information, see [Task 2](#), steps from 10 to 14 in [Configure FTD High Availability on Firepower Appliances](#).

## Manage High Availability

This section describes how to manage High Availability units after you enable High Availability, including how to change the High Availability setup and how to force failover from one unit to another.

### Switch the Active Peer in the Firewall Threat Defense High Availability Pair

After you establish the Firewall Threat Defense high availability pair, you can manually switch the active and standby units, effectively forcing failover for reasons such as persistent fault or health events on the current active unit. Both units should be fully deployed before you complete this procedure.

**Before you begin**

[Refresh Node Status for a Single Firewall Threat Defense High Availability Pair](#), on page 368. This ensures that the status on the Firewall Threat Defense high availability device pair is in sync with the status on the Firewall Management Center.

**Procedure**

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> .  |
| <b>Step 2</b> | Next to the high availability pair where you want to change the active peer, click the <b>Switch Active Peer</b> .  |
| <b>Step 3</b> | You can: <ul style="list-style-type: none"><li>• Click <b>Yes</b> to immediately make the standby device the active device in the high availability pair.</li><li>• Click <b>No</b> to cancel and return to the Device Management page.</li></ul> |
- 

### Refresh Node Status for a Single Firewall Threat Defense High Availability Pair

Whenever active or standby devices in the Firewall Threat Defense high availability pair are rebooted, the Firewall Management Center may not display accurate high availability status for either device. This is because when the device reboots, the high availability status is immediately updated on the device and its corresponding event is sent to the Firewall Management Center. However, the status may not be updated on the Firewall Management Center because the communication between the device and the Firewall Management Center is yet to be established.

Communication failures or weak communication channels between the Firewall Management Center and devices may result in out of sync data. When you switch the active and standby devices in a high availability pair, the change may not be reflected in the Firewall Management Center even after a significant time duration.

In these scenarios, you can refresh the high availability node status to obtain accurate information about the active and standby device in a high availability pair.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> .  |
| <b>Step 2</b> | Next to the high availability pair where you want to refresh the node status, click the <b>Refresh HA Node Status</b> . |
| <b>Step 3</b> | Click <b>Yes</b> to refresh the node status.  |
- 

## Suspend and Resume High Availability

You can suspend a unit in a high-availability pair, which is useful when:

- Both units are in an active-active situation, and fixing the communication on the failover link does not correct the problem.
- You want to troubleshoot an active or standby unit and do not want the units to fail over during that time.

When you suspend high availability, the currently active device remains active, handling all user connections. However, failover criteria are no longer monitored, and the system will never fail over to the now pseudo-standby device.

When using a data interface for manager access, the management connection will be broken until after you resume.

The key difference between suspending high availability and breaking high availability is that on a suspended high-availability device, the high-availability configuration is retained. When you break high availability, the configuration is erased. Thus, you have the option to resume high availability on a suspended system, which enables the existing configuration and makes the two devices function as a failover pair again.

To suspend high availability, use the **configure high-availability suspend** command.

```
> configure high-availability suspend
Please ensure that no deployment operation is in progress before suspending
high-availability.
Please enter 'YES' to continue if there is no deployment operation in
progress and 'NO' if you wish to abort: YES
Successfully suspended high-availability.
```

If you suspend high availability from the active unit, the configuration is suspended on both the active and standby units. The standby unit interface configuration is also erased. If you suspend it from the standby unit, it is suspended on the standby unit only, but the active unit will not attempt to fail over to a suspended unit.

To resume failover, use the **configure high-availability resume** command.

```
> configure high-availability resume
Successfully resumed high-availability.
```

You can resume a unit only if it is in Suspended state. The unit will negotiate active/standby status with the peer unit.

**Note** Suspending high availability is a temporary state. If you reload a unit, it resumes the high-availability configuration automatically and negotiates the active/standby state with the peer.

## Replace a Unit in Firewall Threat Defense High Availability Pair

To replace a failed unit in the Firewall Threat Defense high availability pair using a backup file, see *Restoring Firewall Management Centers and Managed Devices* in the [Cisco Secure Firewall Management Center Administration Guide](#).

If you do not have a backup of the failed device, you must break high availability. Then, register the replacement device to the Secure Firewall Management Center and reestablish high availability. The process varies depending on whether the device is primary or secondary:

- [Replace a Primary Firewall Threat Defense HA Unit with no Backup, on page 370](#)
- [Replace a Secondary Firewall Threat Defense HA Unit with no Backup, on page 371](#)

### Replace a Primary Firewall Threat Defense HA Unit with no Backup

Follow the steps below to replace a failed primary unit in the Firewall Threat Defense high availability pair. Failing to follow these steps can overwrite the existing high availability configuration.

**Caution** Creating or breaking the Firewall Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

**Caution** Never move a disk from sensor or Firewall Management Center to another device without reimaging the disk. This is an unsupported configuration and can cause breakage in functionality.

#### Procedure

**Step 1** Choose **Force Break** to separate the high availability pair; see [Break a High Availability Pair, on page 371](#).

**Note**

The break operation removes all the configuration related to HA from Firewall Threat Defense and Firewall Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.

- Step 2** Unregister the failed primary Firewall Threat Defense device from the Firewall Management Center; see [Delete \(Unregister\) a Device from the Firewall Management Center, on page 47](#).
- Step 3** Register the replacement Firewall Threat Defense to the Firewall Management Center; see [Register With the Management Center, on page 29](#).
- Step 4** Configure high availability, using the existing secondary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a High Availability Pair, on page 363](#).

## Replace a Secondary Firewall Threat Defense HA Unit with no Backup

Follow the steps below to replace a failed secondary unit in the Firewall Threat Defense high availability pair.

### Caution

Creating or breaking the Firewall Threat Defense high availability pair immediately restarts the Snort process on the primary and secondary devices, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information. The system warns you that continuing to create a high availability pair restarts the Snort process on the primary and secondary devices and allows you to cancel.

### Procedure

- Step 1** Choose **Force Break** to separate the high availability pair; see [Break a High Availability Pair, on page 371](#).  
**Note**  
The break operation removes all the configuration related to HA from Firewall Threat Defense and Firewall Management Center, and you need to recreate it manually later. To successfully configure the same HA pair, ensure that you save the IPs, MAC addresses, and monitoring configuration of all the interfaces/subinterfaces prior to executing the HA break operation.
- Step 2** Unregister the secondary Firewall Threat Defense device from the Firewall Management Center; see [Delete \(Unregister\) a Device from the Firewall Management Center, on page 47](#).
- Step 3** Register the replacement Firewall Threat Defense to the Firewall Management Center; see [Register With the Management Center, on page 29](#).
- Step 4** Configure high availability, using the existing primary/active unit as the primary device and the replacement device as the secondary/standby device during registration; see [Add a High Availability Pair, on page 363](#).

## Break a High Availability Pair

When you break a high-availability pair, the high-availability configuration is removed from both units.

**When using the Management interface for manager access:** The active unit remains up and passing traffic. The standby unit interface configuration is erased.

**When using a data interface for manager access:** See the following details.

- The active unit remains up and passing traffic.
- The standby unit data interfaces are shut down except for the manager access interface, which remains up using the standby IP address so it can maintain the management connection.
- In a remote branch deployment setup, all standby unit data interfaces that are assigned with a logical name are shut down except for the manager access interface, which remains up to maintain the management connection.
- If the primary unit is in the standby state:
  - The IP addresses for manager access are swapped permanently in the Firewall Management Center configuration: the primary unit uses the standby IP address, and the secondary unit uses the active IP address.
  - If the Firewall Management Center initiated the management connection, and you specified a hostname for the device, then you need to update the DNS server so the swapped IP addresses are associated with the correct hostnames.
  - Breaking high availability causes a deployment to the standby unit. If the management connection is not yet reestablished because of the swapped IP addresses, the deployment may fail. In this case, you will need to manually trigger the deployment later (after the management connection is established). Be sure to complete the standby deployment before deploying changes to the active unit.

Policies that were not deployed to the active unit prior to the break operation continue to remain un-deployed after the break operation is complete. Deploy the policies on the standalone device after the break operation is complete.

#### Note

- When IPsec is enabled on high availability interfaces on the Firewall Threat Defense device, the device cannot prioritize the encrypted packets into the high-priority receive queue. As a result, during high-volume data traffic scenarios, attempts to break high availability may fail as the device cannot efficiently manage and prioritize the large number of encrypted connections. To view the device's resource usage and the maximum throughput, use the `show resource usage` command.
- If you cannot reach the high-availability pair using the Firewall Management Center, connect to the CLI on each device and enter **configure high-availability disable** to manually break high availability. See also [Delete \(Unregister\) a High Availability Pair and Register to a New Firewall Management Center, on page 373](#).

#### Caution

Breaking the Firewall Threat Defense high-availability pair immediately restarts the Snort process on the primary and secondary units, temporarily interrupting traffic inspection on both devices. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information.

### Before you begin

- [Refresh Node Status for a Single Firewall Threat Defense High Availability Pair](#), on page 368. This ensures that the status on the high-availability pair is in sync with the status on the Firewall Management Center.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the high-availability pair you want to break, click **More** (⋮) and choose **Break**.
- Step 3** If the standby peer does not respond, check **Force Break**.
- Step 4** Click **Yes**.

The Break operation removes the high-availability configuration from the active and standby units.

A FlexConfig policy deployed on the active unit may show a deployment failure after the break high-availability operation. You must alter and re-deploy the FlexConfig policy on the active unit.

---

### What to do next

If you are using a FlexConfig policy on the active unit, alter and re-deploy the FlexConfig policy to eliminate deployment errors.

---

**Note** After you break high availability, the Firewall Threat Defense device that was operating as the active unit will still have the standby unit's IP address listed in its configuration. To resolve this, do an additional deployment on the formerly active Firewall Threat Defense device to remove the standby unit's IP address from its configuration.

---

## Delete (Unregister) a High Availability Pair and Register to a New Firewall Management Center

You can unregister the pair from the Firewall Management Center, which keeps the High Availability pair intact. You might want to unregister the pair if you want to register it to a new Firewall Management Center or if the Firewall Management Center can no longer reach the pair.

Unregistering a High Availability pair:

- Severs all communication between the Firewall Management Center and the pair.
- Removes the pair from the **Device Management** page.
- Returns the pair to local time management if the pair's platform settings policy is configured to receive time from the Firewall Management Center using NTP.
- Leaves the configuration intact, so the pair continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the pair again to the same or a different Firewall Management Center causes the configuration to be removed, so the pair will stop processing traffic at that point; the High Availability configuration remains intact so you can add the pair as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

- This procedure requires CLI access to the primary unit.

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Next to the High Availability pair you want to unregister, click **More** (⋮) and choose **Delete**.

**Step 3** Click **Yes**. The device High Availability pair is unregistered.

**Step 4** You can register the pair to a new (or the same) Firewall Management Center by adding the primary unit as a new device.

- a) Determine the primary unit by connecting to the CLI on one unit, and entering the **show failover** command.

The first line of the output shows whether this unit is Primary or Secondary.

```
> show failover
Failover unit Primary
Failover LAN Interface: failover GigabitEthernet0/2 (up)
Reconnect timeout 0:00:00
Unit Poll frequency 1 seconds, holdtime 15 seconds
Failover On
```

[...]

- b) At the primary unit's CLI, identify the new Firewall Management Center using the **configure manager add** command. See [Modify Firewall Threat Defense Management Interfaces at the CLI, on page 87](#).
- c) Choose **Devices > Device Management**, and then click **Add > Device**.

You only need to add the primary unit as a device, and the Firewall Management Center will discover the secondary unit.

## Monitoring High Availability

This section lets you monitor the High Availability status.

### View Failover History

You can view the failover history of both high availability devices in a single view. The history displays in chronological order and includes the reason for any failover.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).
  - Step 3** Choose **Summary**.
  - Step 4** Under General, click **View** (👁).
- 

## View Stateful Failover Statistics

You can view the stateful failover link statistics of both the primary and secondary devices in the high availability pair.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**.
  - Step 2** Next to the device high-availability pair you want to edit, click **Edit** (✎).
  - Step 3** Choose **High Availability**.
  - Step 4** Under Stateful Failover Link, click **View** (👁).
  - Step 5** Choose a device to view statistics.
- 

## Troubleshoot Configuration Sync Failure

When forming a failover pair, the joining unit clears its running configuration and replicates the entire configuration from the active unit. Upon completing full configuration sync, the joining unit assumes the standby ready role and establishes the failover pair. After the unit joins the failover pair, any configuration change on the active unit are also replicated on the standby unit to keep both the units synchronized.

If the standby unit fails to replicate any configuration change commands, it reports configuration sync failure and exit the high availability by disabling failover. This section describes steps for identifying and troubleshooting configuration sync failure error reported by the standby unit.

To view the configuration sync errors or stats, you can use the following CLI commands through an SSH session or the Threat Defense CLI:

- **show failover config-sync errors all** to display all configuration synchronization errors related to failover.
- **show failover config-sync stats all** to view statistics regarding failover configuration synchronization.

To re-enable high availability:

- Re-enable failover by executing the **failover reset** command on the active unit.

- If re-enabling the failover is not successful, delete or update the configuration change that the standby unit failed to replicate, and then re-enable the failover.

## History for High Availability

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
High availability support for the manager access data interface	7.4	7.4	You can now use a data interface for manager access with Firewall Threat Defense high availability.
Unregistering a high-availability pair now allows you to re-register without breaking the pair	7.3	Any	When you delete (unregister) a high-availability pair, you no longer have to manually break the pair at the CLI and re-register standalone devices. You can now add the primary unit to a new Firewall Management Center, and the standby unit will be discovered automatically. Re-registering the pair will still erase the configuration, and your policies will need to be re-applied.
Policy rollback support for high availability	7.2	Any	The <b>configure policy rollback</b> command is supported for high availability.
Config-Sync Optimization feature for faster HA peering	7.2	Any	The Config-Sync Optimization feature enables comparing the configuration of the joining unit and the active unit by exchanging config-hash values. If the hash computed on both active and joining units match, the joining unit skips full config-sync and rejoin the HA. This feature enables faster HA peering and reduces maintenance window and upgrade time.
Improvements to the upgrade workflow for clustered and high-availability devices	7.1	Any	<p>We made the following improvements to the upgrade workflow for clustered and high-availability devices:</p> <ul style="list-style-type: none"> <li>• The upgrade wizard now correctly displays clustered and high-availability units as groups, rather than as individual devices. The system can identify, report, and preemptively require fixes for group-related issues you might have. For example, you cannot upgrade a cluster on the Firepower 4100/9300 if you have made unsynced changes on Firepower Chassis Manager.</li> <li>• We improved the speed and efficiency of copying upgrade packages to clusters and high-availability pairs. Previously, the FMC copied the package to each group member sequentially. Now, group members can get the package from each other as part of their normal sync process.</li> <li>• You can now specify the upgrade order of data units in a cluster. The control unit always upgrades last.</li> </ul>
Clearing routes in a high-availability group or cluster.	7.1	Any	In previous releases, the <b>clear route</b> command cleared the routing table on the unit only. Now, when operating in a high-availability group or cluster, the command is available on the active or control unit only, and clears the routing table on all units in the group or cluster.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
FTD High Availability Hardening	6.2.3	Any	<p>Version 6.2.3 introduces the following features for FTD devices in high availability:</p> <ul style="list-style-type: none"><li>• Whenever active or standby FTD devices in a high-availability pair restart, the FMC may not display accurate high-availability status for either managed device. However, the status may not upgrade on the FMC because the communication between the device and the FMC is not established yet. The <b>Refresh Node Status</b> option on the <b>Devices &gt; Device Management</b> page allows you to refresh the high-availability unit status to obtain accurate information about the active and standby device in a high-availability pair.</li><li>• The <b>Devices &gt; Device Management</b> page of the FMC UI has a new <b>Switch Active Peer</b> icon.</li><li>• Version 6.2.3 includes a new REST API object, <b>Device High Availability Pair Services</b>, that contains four functions:<ul style="list-style-type: none"><li>• <b>DELETE</b> ftddevicehapairs</li><li>• <b>PUT</b> ftddevicehapairs</li><li>• <b>POST</b> ftddevicehapairs</li><li>• <b>GET</b> ftddevicehapairs</li></ul></li></ul>

## CHAPTER 10

# Clustering for the Secure Firewall 3100/4200

Clustering lets you group multiple Firewall Threat Defense units together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

**Note** Some features are not supported when using clustering. See [Unsupported Features with Clustering, on page 425](#).

- [About Clustering for the Secure Firewall 3100/4200, on page 379](#)
- [Licenses for Clustering, on page 381](#)
- [Requirements and Prerequisites for Clustering, on page 381](#)
- [Guidelines for Clustering, on page 382](#)
- [Configure Clustering, on page 386](#)
- [Manage Cluster Nodes, on page 406](#)
- [Monitoring the Cluster, on page 416](#)
- [Troubleshooting the Cluster, on page 421](#)
- [Examples for Clustering, on page 423](#)
- [Reference for Clustering, on page 425](#)
- [History for Clustering, on page 437](#)

## About Clustering for the Secure Firewall 3100/4200

This section describes the clustering architecture and how it works.

### How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single unit. To act as a cluster, the firewalls need the following infrastructure:

- Isolated, high-speed backplane network for intra-cluster communication, known as the *cluster control link*.
- Management access to each firewall for configuration and monitoring.

When you place the cluster in your network, the upstream and downstream routers need to be able to load-balance the data coming to and from the cluster using Spanned EtherChannels. Interfaces on multiple members of the cluster are grouped into a single EtherChannel; the EtherChannel performs load balancing between units.

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Cluster Interfaces

You can configure data interfaces as Spanned EtherChannels. See [About Cluster Interfaces, on page 386](#) for more information.

You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces).

---

**Note** Individual interfaces are not supported, with the exception of a management interface.

---

## Cluster Control Link

Each unit must dedicate at least one hardware interface as the cluster control link. See [Cluster Control Link, on page 386](#) for more information.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

# Licenses for Clustering

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the Firewall Management Center, you can specify the feature licenses you want to use for the cluster. Before you create the cluster, it doesn't matter which licenses are assigned to the data nodes; the license settings for the control node are replicated to each of the data nodes. You can modify licenses for the cluster by clicking **Edit Licenses** in **System** (⚙) > **Licenses** > **Smart Licenses** or choosing **Devices** > **Device Management**, clicking **Edit** (✎) for the cluster, and then in the **Cluster** > **License** area, clicking **Edit** (✎).

**Note**

If you add the cluster before the Firewall Management Center is licensed (and running in Evaluation mode), then when you license the Firewall Management Center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

## Requirements and Prerequisites for Clustering

### Model Requirements

- Secure Firewall 3100—Maximum 8 units
- Secure Firewall 4200—Maximum 8 units

### User Roles

- Admin
- Access Admin
- Network Admin

### Hardware and Software Requirements

All units in a cluster:

- Must be the same model.
- Must include the same interfaces.
- The Firewall Management Center access must be from the Management interface; data interface management is not supported.
- Must run the identical software except at the time of an image upgrade. Hitless upgrade is supported.
- Must be in the same firewall mode, routed or transparent.

- Must be in the same domain.
- Must be in the same group.
- Must not have any deployment pending or in progress.
- The control node must not have any unsupported features configured (see [Unsupported Features with Clustering, on page 425](#)).
- Data nodes must not have any VPN configured. The control node can have site-to-site VPN configured.

### Switch Requirements

- Be sure to complete the switch configuration before you configure clustering. Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. By default, the cluster control link MTU is set to 100 bytes higher than the data interfaces. If the switches have an MTU mismatch, the cluster formation will fail.

## Guidelines for Clustering

### Firewall Mode

The firewall mode must match on all units.

### High Availability

High Availability is not supported with clustering.

### IPv6

The cluster control link is only supported using IPv4.

### Switches

- Make sure connected switches match the MTU for both cluster data interfaces and the cluster control link interface. You should configure the cluster control link interface MTU to be at least 100 bytes higher than the data interface MTU, so make sure to configure the cluster control link connecting switch appropriately. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. In addition, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
- For Cisco IOS XR systems, if you want to set a non-default MTU, set the IOS XR interface MTU to be 14 bytes higher than the cluster device MTU. Otherwise, OSPF adjacency peering attempts may fail unless the **mtu-ignore** option is used. Note that the cluster device MTU should match the IOS XR *IPv4* MTU. This adjustment is not required for Cisco Catalyst and Cisco Nexus switches.
- On the switch(es) for the cluster control link interfaces, you can optionally enable Spanning Tree PortFast on the switch ports connected to the cluster unit to speed up the join process for new units.
- On the switch, we recommend that you use one of the following EtherChannel load-balancing algorithms: **source-dest-ip** or **src-dst-mixed-ip-port** (see the Cisco Nexus OS and Cisco IOS-XE **port-channel**

**load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the devices in a cluster.

- If you change the load-balancing algorithm of the EtherChannel on the switch, the EtherChannel interface on the switch temporarily stops forwarding traffic, and the Spanning Tree Protocol restarts. There will be a delay before traffic starts flowing again.
- Switches on the cluster control link path should not verify the L4 checksum. Redirected traffic over the cluster control link does not have a correct L4 checksum. Switches that verify the L4 checksum could cause traffic to be dropped.
- Port-channel bundling downtime should not exceed the configured keepalive interval.
- On Supervisor 2T EtherChannels, the default hash distribution algorithm is adaptive. To avoid asymmetric traffic in a VSS design, change the hash algorithm on the port-channel connected to the cluster device to fixed:

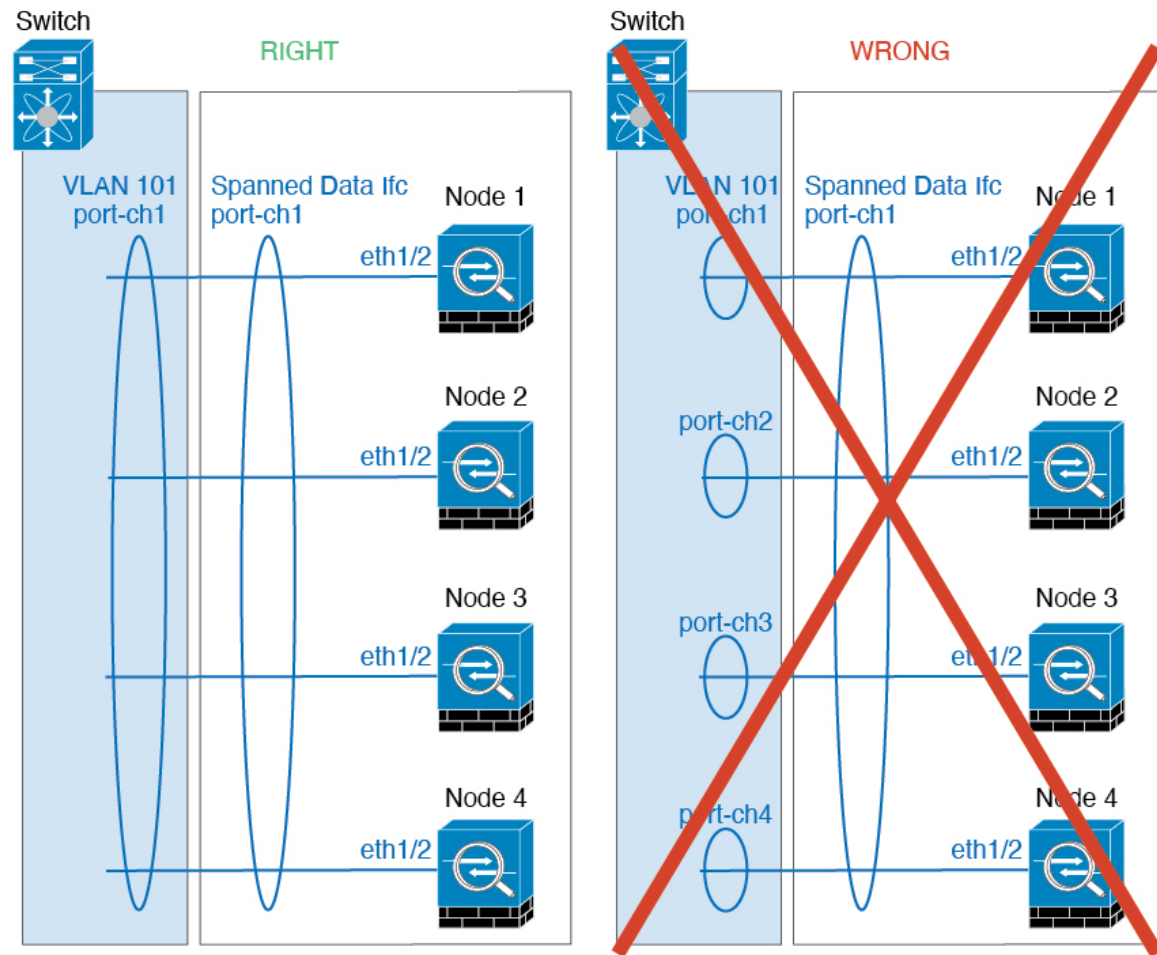

```
router(config)# port-channel id hash-distribution fixed
```

Do not change the algorithm globally; you may want to take advantage of the adaptive algorithm for the VSS peer link.

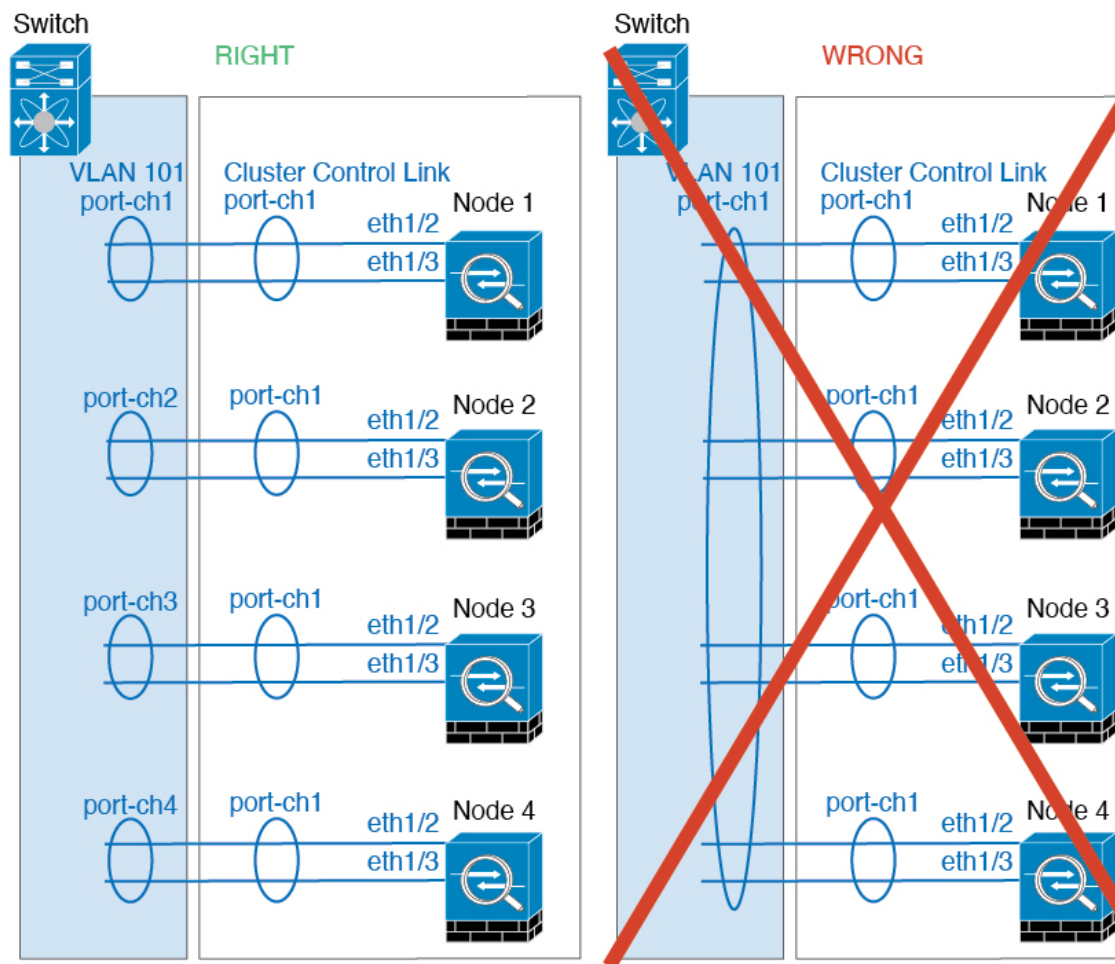

- You should disable the LACP Graceful Convergence feature on all cluster-facing EtherChannel interfaces for Cisco Nexus switches.

### EtherChannels

- In Catalyst 3750-X Cisco IOS software versions earlier than 15.1(1)S2, the cluster unit did not support connecting an EtherChannel to a switch stack. With default switch settings, if the cluster unit EtherChannel is connected cross stack, and if the control unit switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- Spanned vs. Device-Local EtherChannel Configuration—Be sure to configure the switch appropriately for Spanned EtherChannels vs. Device-local EtherChannels.
  - Spanned EtherChannels—For cluster unit *Spanned* EtherChannels, which span across all members of the cluster, the interfaces are combined into a single EtherChannel on the switch. Make sure each interface is in the same channel group on the switch.

- **Device-local EtherChannels**—For cluster unit *Device-local* EtherChannels including any EtherChannels configured for the cluster control link, be sure to configure discrete EtherChannels on the switch; do not combine multiple cluster unit EtherChannels into one EtherChannel on the switch.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Firewall Threat Defense or the switch, adding an additional switch to form a VSS or vPC) you should disable the health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- If you use a Windows 2003 server connected to a Spanned EtherChannel, when the syslog server port is down and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the ASA cluster. These messages can result in some units of the ASA cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a

new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Clustering

To add a cluster to the Firewall Management Center, add each node to the Firewall Management Center as a standalone unit, configure interfaces on the unit you want to make the control node, and then form the cluster.

## About Cluster Interfaces

You can configure data interfaces as Spanned EtherChannels.

You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces).

Each unit must also dedicate at least one hardware interface as the cluster control link.

## Cluster Control Link

Each unit must dedicate at least one hardware interface as the cluster control link. We recommend using an EtherChannel for the cluster control link if available.

### Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.
- Connection ownership queries and data packet forwarding.

## Cluster Control Link Interfaces and Network

You can use any physical interface or EtherChannel for the cluster control link. You cannot use a VLAN subinterface as the cluster control link. You also cannot use the Management interface.

Each cluster control link has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

**Note** For a 2-member cluster, do not directly-connect the cluster control link from one node to the other node. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit. If you need to directly-connect the units (for testing purposes, for example), then you should configure and enable the cluster control link interface on both nodes before you form the cluster.

## Size the Cluster Control Link

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

**Note** If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

## Cluster Control Link Redundancy

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS), Virtual Port Channel (vPC), StackWise, or StackWise Virtual environment. All links in the EtherChannel are active. When the switch is part of a redundant system, then you can connect firewall interfaces within the same EtherChannel to separate switches in the redundant system. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.

### Cluster Control Link Reliability

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

### Spanned EtherChannels

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel.

For regular firewall interfaces: A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface.

The EtherChannel inherently provides load balancing as part of basic operation.

### Guidelines for Maximum Throughput

To achieve maximum throughput, we recommend the following:

- Use a load-balancing hash algorithm that is “symmetric,” meaning that packets from both directions will have the same hash and will be sent to the same Firewall Threat Defense in the Spanned EtherChannel. We recommend using the source and destination IP address (the default) or the source and destination port as the hashing algorithm.
- Use the same type of line cards when connecting the Firewall Threat Defenses to the switch so that hashing algorithms applied to all packets are the same.

### Load Balancing

The EtherChannel link is selected using a proprietary hash algorithm, based on source or destination IP addresses and TCP and UDP port numbers.

**Note** On the switch, we recommend that you use one of the following algorithms: **source-dest-ip** or **source-dest-ip-port** (see the Cisco Nexus OS or Cisco IOS **port-channel load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the nodes in a cluster.

The number of links in the EtherChannel affects load balancing.

Symmetric load balancing is not always possible. If you configure NAT, then forward and return packets will have different IP addresses and/or ports. Return traffic will be sent to a different unit based on the hash, and the cluster will have to redirect most returning traffic to the correct unit.

### **EtherChannel Redundancy**

The EtherChannel has built-in redundancy. It monitors the line protocol status of all links. If one link fails, traffic is re-balanced between remaining links. If all links in the EtherChannel fail on a particular unit, but other units are still active, then the unit is removed from the cluster.

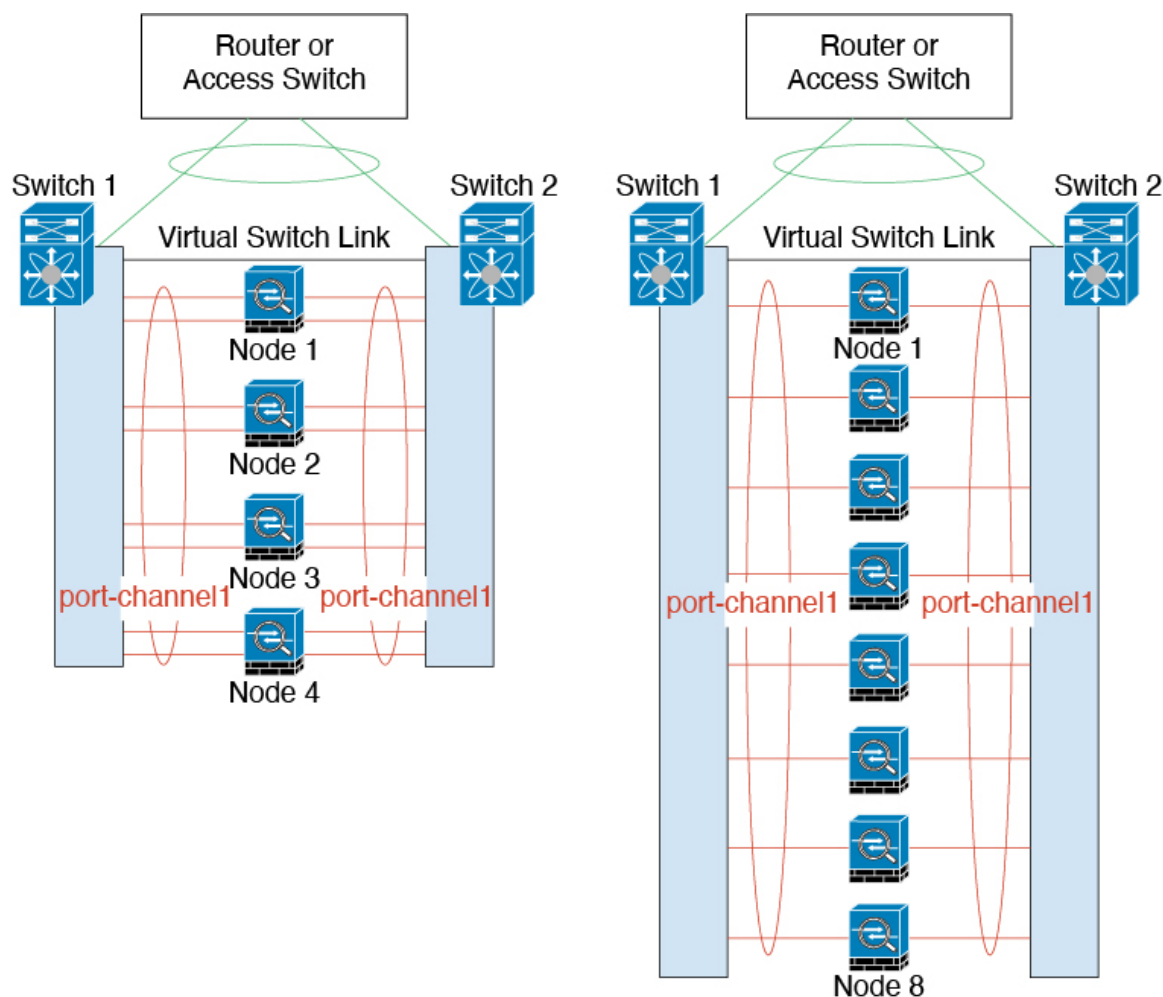

### **Connecting to a Redundant Switch System**

You can include multiple interfaces per Firewall Threat Defense in the Spanned EtherChannel. Multiple interfaces per Firewall Threat Defense are especially useful for connecting to both switches in a VSS, vPC, StackWise, or StackWise Virtual system.

Depending on your switches, you can configure up to 32 active links in the spanned EtherChannel. This feature requires both switches in the vPC to support EtherChannels with 16 active links each (for example the Cisco Nexus 7000 with F2-Series 10 Gigabit Ethernet Module).

For switches that support 8 active links in the EtherChannel, you can configure up to 16 active links in the spanned EtherChannel when connecting to two switches in a redundant system.

The following figure shows a 16-active-link spanned EtherChannel in a 4-node cluster and an 8-node cluster.

## Cable and Add Devices to the Firewall Management Center

Before configuring clustering, you need to prepare your devices. In particular, the cluster will not come up unless all nodes can communicate over the cluster control link. Therefore, before you form the cluster, the cluster control link must be ready to go.

### Procedure

**Step 1** Cable the cluster control link network, management network, and data networks.

**Step 2** Configure the upstream and downstream equipment.

- a) For the cluster control link network, set the MTU to be at least 100 bytes higher than the data interface MTU.

By default, the data interface MTU is 1500 bytes, so the cluster control link MTU on the cluster node will be set to 1600 bytes. If you use higher MTUs on your data interfaces, increase the cluster control link MTU on connecting switches accordingly.

- b) Configure cluster control link interfaces on upstream and downstream equipment, including for an optional EtherChannel.

See [Cluster Control Link Interfaces and Network](#), on page 387 for cluster control link requirements.

- c) Configure data interfaces on upstream and downstream equipment, including Spanned EtherChannels.

See [About Cluster Interfaces](#), on page 386 for information about how to cable Spanned EtherChannels.

**Step 3** Add each node to the Firewall Management Center as a standalone device in the same domain and group.

See [Add a Device Using a Registration Key](#), on page 29. You can create a cluster with a single device, and then add more nodes later. The initial settings (licensing, access control policy) that you set when you add a device will be inherited by all cluster nodes from the control node. You will choose the control node when forming the cluster.

**Step 4** Enable the cluster control link on the device you want to be the control node.

When you add the other nodes, they will inherit the cluster control link configuration.

**Note**

Do *not* configure the name or IP addressing for the cluster control link. The MTU of the cluster control link interface is automatically set to 100 bytes more than the highest data interface MTU when you form the cluster, so you do not need to set it now. However, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation. If the MTU is set in this range when you add the cluster, we recommend returning to the **Interfaces** page and manually increasing it above 8362.

- a) On the device you want to be the control node, choose **Devices > Device Management**, and click **Edit** (✎).
- b) Click **Interfaces**.
- c) Enable the interface. If you are going to use an EtherChannel for the cluster control link, enable all members. See [Enable the Physical Interface and Configure Ethernet Settings](#), on page 662.

*Figure 179: Enable the Cluster Control Link Interface*

The screenshot shows the 'Edit Physical Interface' configuration page. At the top, there are four tabs: 'General', 'IPv4', 'IPv6', and 'Path Monitoring'. The 'General' tab is active. Below the tabs, there is a 'Name:' label followed by an empty text input field. Below the input field, there is a checkbox labeled 'Enabled' which is checked. This checkbox and its label are highlighted with a red rectangular box.

- d) (Optional) Add an EtherChannel. See [Configure an EtherChannel](#), on page 670.

We recommend using the On mode for cluster control link member interfaces to reduce unnecessary traffic on the cluster control link (Active mode is the default). The cluster control link does not need the overhead of LACP traffic because it is an isolated, stable network. **Note:** We recommend setting *data* EtherChannels to Active mode.

- e) Click **Save** and then **Deploy** to deploy the interface changes to the control node.

# Create a Cluster

Form a cluster from one or more devices in the Firewall Management Center.

## Procedure

**Step 1** Choose **Devices > Device Management**, and then choose **Add > Cluster**.

The **Add Cluster Wizard** appears.

**Figure 180: Add Cluster Wizard**

Add Cluster Wizard

1 Configuration — 2 Summary

▲ Create a cluster for supported models. Note: For the Firepower 4100/9300, use the Add Device option.

[Add a data node](#)

[Remove](#)

**Step 2** Specify a **Cluster Name** and an authentication **Cluster Key** for control traffic.

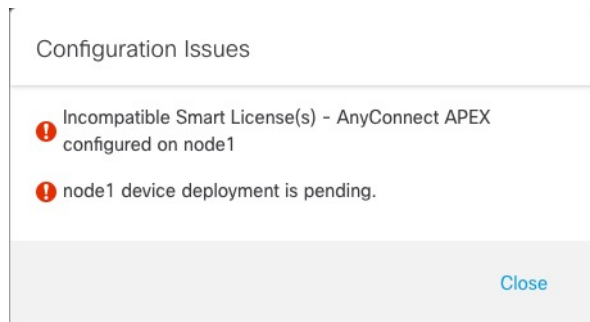

- **Cluster Name**—An ASCII string from 1 to 38 characters.
- **Cluster Key**—An ASCII string from 1 to 63 characters. The **Cluster Key** value is used to generate the encryption key. This encryption does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

**Step 3** For the **Control Node**, set the following:

- **Node**—Choose the device that you want to be the control node initially. When the Firewall Management Center forms the cluster, it will add this node to the cluster first so it will be the control node.

### Note

If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation. For example:

**Figure 181: Configuration Issues**

To resolve the above issues, remove the unsupported VPN license and deploy pending configuration changes to the device.

- **Cluster Control Link Network**—Specify an IPv4 subnet; IPv6 is not supported for this interface. Specify a **24**, **25**, **26**, or **27** subnet.
- **Cluster Control Link**—Choose the physical interface or EtherChannel you want to use for the cluster control link.

**Note**

The MTU of the cluster control link interface is automatically set to 100 bytes more than the highest data interface MTU; by default, the MTU is 1600 bytes. We do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation. If the MTU is set in this range when you add the cluster, we recommend increasing the MTU above 8362 on the **Devices > Device Management > Interfaces** page.

Make sure you configure switches connected to the cluster control link to the correct (higher) MTU; otherwise, cluster formation will fail.

- **Cluster Control Link IPv4 Address**—This field will be auto-populated with the first address on the cluster control link network. You can edit the host address if desired.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority. Even if you set the priority to be lower than other nodes, this node will still be the control node when the cluster is first formed.
- **Site ID**—(FlexConfig feature) Enter the site ID for this node between 1 and 8. A value of 0 disables inter-site clustering. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.

**Step 4** For **Data Nodes (Optional)**, click **Add a data node** to add a node to the cluster.

You can form the cluster with only the control node for faster cluster formation, or you can add all nodes now. Set the following for each data node:

- **Node**—Choose the device that you want to add.

**Note**

If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation.

- **Cluster Control Link IPv4 Address**—This field will be auto-populated with the next address on the cluster control link network. You can edit the host address if desired.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority.
- **Site ID**—(FlexConfig feature) Enter the site ID for this node between 1 and 8. A value of 0 disables inter-site clustering. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.

**Step 5** Click **Continue**. Review the **Summary**, and then click **Save**.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster nodes.

**Figure 182: Cluster Management**

Node	IP Address	Role	Version	Actions	Base, Threat (2 more...)	Default AC Policy
172.16.0.50(Control) Snort 3	172.16.0.50 - Transparent	Firewall 3120 Threat Defense	7.1.0	Manage	Base, Threat (2 more...)	Default AC Policy
172.16.0.51 Snort 3	172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	N/A	Base, Threat (2 more...)	Default AC Policy

A node that is currently registering shows the loading icon.

**Figure 183: Node Registration**

Node	IP Address	Role
172.16.0.50(Control) Snort 3	172.16.0.50 - Transparent	
172.16.0.51 Snort 3	172.16.0.51 - Transparent	

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**. The Firewall Management Center updates the Cluster Registration task as each node registers.

Task	Status	Description	Time
10.10.1.12	Success	Deployment to device successful.	1m 54s
10.10.1.13	Success	Deployment to device successful.	1m 3s
TD_Cluster	Success	Deployment to device successful.	35s

**Step 6** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 7** On the **Devices > Device Management > Cluster** screen, you see **General** and other settings for the cluster.

**Figure 184: Cluster Settings**

## Configure Interfaces

Configure data interfaces as Spanned EtherChannels.

### Procedure

**Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.

**Step 2** Click **Interfaces**.

**Step 3** Configure Spanned EtherChannel data interfaces.

- Configure one or more EtherChannels. See [Configure an EtherChannel, on page 670](#).

You can include one or more member interfaces in the EtherChannel. Because this EtherChannel is spanned across all of the nodes, you only need one member interface per node; however, for greater throughput and redundancy, multiple members are recommended.

- (Optional) For regular firewall interfaces, configure VLAN subinterfaces on the EtherChannel. The rest of this procedure applies to the subinterfaces. See [Add a Subinterface, on page 720](#).

- c) Click **Edit** (✎) for the EtherChannel interface.
- d) Configure the name and other parameters. For regular firewall interfaces, see [Configure Routed Mode Interfaces, on page 738](#) or, for transparent mode, [Configure Bridge Group Interfaces, on page 743](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 775](#).
  - If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. By default, the cluster control link MTU is 1600 bytes. If you want to increase the MTU of data interfaces, first increase the cluster control link MTU. Note that we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
  - For routed mode, DHCP, PPPoE, IPv6 autoconfig and manual link-local addresses are not supported. For point-to-point connections, you can specify a 31-bit subnet mask (255.255.255.254). In this case, no IP addresses are reserved for the network or broadcast addresses.
- e) Set a unique, manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a unique MAC address not currently in use on your network for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.
- f) Click **OK**. Repeat the above steps for other data interfaces.

**Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 188: Cluster Health Monitor Settings

Cluster Health Monitor Settings			
<b>Timeouts</b>			
Hold Time			3 s
Interface Debounce Time			9000 ms
<b>Monitored Interfaces</b>			
Service Application			Enabled
Unmonitored Interfaces			None
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

Table 29: Cluster Health Monitor Settings Section Table Fields

Field	Description
<b>Timeouts</b>	
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.

Field	Description
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Short and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

Figure 189: Disable the System Health Check

Edit Cluster Health Monitor Settings

Health Check ☐ ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6**

Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7**

Customize the auto-rejoin cluster settings after a health check failure.

**Figure 190: Configure Auto-Rejoin Settings**

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 191: Configure Monitored Interfaces**

- GigabitEthernet0/6
- GigabitEthernet0/7
- Diagnostic0/0

Add

Unmonitored Interfaces ⓘ

☒ Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Manage Cluster Nodes

After you deploy the cluster, you can change the configuration and manage cluster nodes.

### Add a New Cluster Node

You can add one or more new cluster nodes to an existing cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster, and choose **Add Nodes**.

*Figure 192: Add Nodes*

The **Manage Cluster Wizard** appears.

**Step 2** From the **Node** menu, choose a device, adjust the IP address, priority, and Site ID if desired.

*Figure 193: Manage Cluster Wizard*

Manage Cluster Wizard

1 Configuration — 2 Summary

Cluster Name\*

ftdcluster

Cluster Key

\*\*\*\*\*

\*\*\*\*\*

Control Node

You can form the cluster with just the control node to reduce formation time.

Node\* 172.16.0.50 Cluster Control Link Network\* 10.10.10.0 / 24 (254 addresses) ▾

Cluster Control Link\* Ethernet1/7 Cluster Control Link IPv4 Address\* 10.10.10.1 Priority\* 1 Site ID 0

Data Nodes (Optional)

Data node hardware needs to match the control node hardware.

Node\* 172.16.0.51 Cluster Control Link IPv4 Address\* 10.10.10.2 Priority\* 2 Site ID 0

Node\* Type device name Cluster Control Link IPv4 Address\* 10.10.10.3 Priority\* 3 Site ID 0 Remove

Add a data node

**Step 3** To add additional nodes, click **Add a data node**.

**Step 4** Click **Continue**. Review the **Summary**, and then click **Save**

The node that is currently registering shows the loading icon.

**Figure 194: Node Registration**

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**.

## Break a Node

You can remove a node from the cluster so that it becomes a standalone device. You cannot break the control node unless you break the entire cluster. The data node has its configuration erased.

### Procedure

- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the node you want to break, and choose **Break Node**.

**Figure 195: Break a Node**

You can optionally break one or more nodes from the cluster More menu by choosing **Break Nodes**.

- Step 2** You are prompted to confirm the break; click **Yes**.

**Figure 196: Confirm Break**

You can monitor the cluster node break by clicking the **Notifications** icon and choosing **Tasks**.

## Break the Cluster

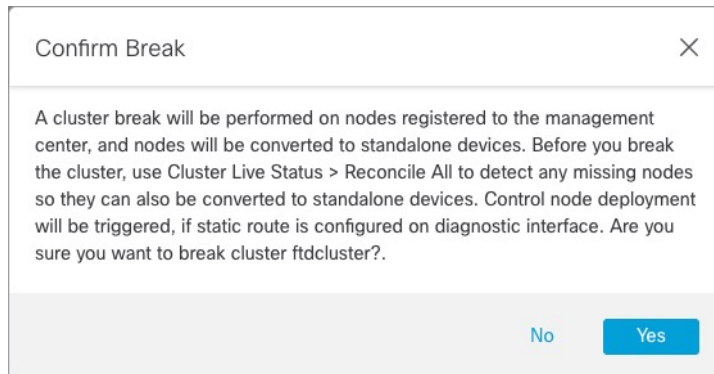

You can break the cluster and convert all nodes to standalone devices. The control node retains the interface and security policy configuration, while data nodes have their configuration erased.

### Procedure

- Step 1** Make sure all cluster nodes are being managed by the Firewall Management Center by reconciling nodes. See [Reconcile Cluster Nodes, on page 413](#).
- Step 2** Choose **Devices > Device Management**, click **More** (⋮) for the cluster, and choose **Break Cluster**.

**Figure 197: Break Cluster**

- Step 3** You are prompted to break the cluster; click **Yes**.

**Figure 198: Confirm Break**

You can monitor the cluster break by clicking the **Notifications** icon and choosing **Tasks**.

## Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the Firewall Management Center device list. When a node becomes inactive, all data interfaces are shut down.

### Procedure

- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click **More** (⋮), and choose **Disable Node Clustering**.

**Figure 199: Disable Clustering**

If you disable clustering on the control node, one of the data nodes will become the new control node. Note that for centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node. You cannot disable clustering on the control node if it is the only node in the cluster.

- Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
- Step 3** To reenabling clustering, see [Rejoin the Cluster, on page 411](#).

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster. See [Rejoining the Cluster, on page 432](#) for more information about why a node can be removed from a cluster.

### Procedure

---

- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click **More** (⋮), and choose **Enable Node Clustering**.
- Step 2** Confirm that you want to enable clustering on the unit.
- 

## Change the Control Node

### Caution

The best method to change the control node is to disable clustering on the control node, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control node, use the procedure in this section. Note that for centralized features, if you force a control node change using either method, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

To change the control node, perform the following steps.

### Procedure

---

- Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management More** (⋮) **Cluster Live Status**.

Figure 200: Cluster Status

Cluster Status
?

Overall Status: Cluster has all nodes in sync

Nodes details (2)
Refresh
Reconcile All

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span>Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021
Close

- Step 2** For the unit you want to become the control unit, choose **More** **Change Role to Control**.
- Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.

## Edit the Cluster Configuration

You can edit the cluster configuration. If you change the cluster key, cluster control link interface, or cluster control link network, the cluster will be broken and reformed automatically. Until the cluster is reformed, you may experience traffic disruption. If you change the cluster control link IP address for a node, node priority, or site ID, only the affected nodes are broken and readadded to the cluster.

### Procedure

- Step 1** Choose **Devices > Device Management**, click **More** for the cluster, and choose **Edit Configuration**.

Figure 201: Edit Configuration

The **Manage Cluster Wizard** appears.

**Step 2** Update the cluster configuration.

Figure 202: Manage Cluster Wizard

 The screenshot shows the 'Manage Cluster Wizard' interface. It has two tabs: 'Configuration' (active) and 'Summary'. A warning message at the top states: 'Editing the cluster bootstrap configuration results in disabling clustering temporarily. This operation may result in traffic disruption, and you should perform bootstrap changes during the maintenance window.' The form contains the following fields:
 

- Cluster Name\***: ftd\_cluster
- Cluster Key**: Two masked input fields (indicated by red boxes).
- Control Node**:
  - Node\***: 172.16.0.51
  - Cluster Control Link\***: Ethernet1/7 (indicated by a red box).
- Data Nodes (Optional)**:
  - Node\***: 172.16.0.50
- Cluster-level changes** (indicated by a red box):
  - Cluster Control Link Network\***: 10.10.10.0 / 24 (254 addresses)
- Node-level changes** (indicated by a green box):
 

Cluster Control Link IPv4 Address*	Priority*	Site ID
10.10.10.2	2	0
10.10.10.1	1	0

If the cluster control link is an EtherChannel, you can edit the interface membership and LACP configuration by clicking **Edit** (✎) next to the interface drop-down menu.

**Step 3** Click **Continue**. Review the **Summary**, and then click **Save**

## Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the Firewall Management Center. For example, a data node might fail to register if the Firewall Management Center is occupied with certain processes, or if there is a network issue.

## Procedure

- Step 1** Choose **Devices > Device Management More** (⋮) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.

*Figure 203: Cluster Live Status*

- Step 2** Click **Reconcile All**.

*Figure 204: Reconcile All*

Cluster Status ?

---

Overall Status: ✔ Cluster has all nodes in sync

For more information about the cluster status, see [Monitoring the Cluster](#), on page 416.

## Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center

You can unregister the cluster from the Firewall Management Center, which keeps the cluster intact. You might want to unregister the cluster if you want to add the cluster to a new Firewall Management Center.

You can also unregister a node from the Firewall Management Center without breaking the node from the cluster. Although the node is not visible in the Firewall Management Center, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot unregister the current control node. You might want to unregister the node if it is no longer reachable from the Firewall Management Center, but you still want to keep it as part of the cluster while you troubleshoot management connectivity.

Unregistering a cluster:

- Severs all communication between the Firewall Management Center and the cluster.
- Removes the cluster from the **Device Management** page.
- Returns the cluster to local time management if the cluster's platform settings policy is configured to receive time from the Firewall Management Center using NTP.
- Leaves the configuration intact, so the cluster continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the cluster again to the same or a different Firewall Management Center causes the configuration to be removed, so the cluster will stop processing traffic at that point; the cluster configuration remains intact so you can add the cluster as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

This procedure requires CLI access to one of the nodes.

### Procedure

- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster or node, and choose **Delete**.

*Figure 205: Delete Cluster or Node*

- Step 2** You are prompted to delete the cluster or node; click **Yes**.

- Step 3** You can register the cluster to a new (or the same) Firewall Management Center by adding one of the cluster members as a new device.

You only need to add one of the cluster nodes as a device, and the rest of the cluster nodes will be discovered.

- Connect to one cluster node's CLI, and identify the new Firewall Management Center using the **configure manager add** command. See [Modify Firewall Threat Defense Management Interfaces at the CLI](#), on page 87.
- Choose **Devices > Device Management**, and then click **Add > Device**.

**Step 4** To re-add an unregistered node, see [Reconcile Cluster Nodes](#), on page 413.

## Monitoring the Cluster

You can monitor the cluster in the Firewall Management Center and at the Firewall Threat Defense CLI.

- Cluster Status** dialog box, which is available from the **Devices > Device Management More** (⋮) icon or from the **Devices > Device Management > Cluster** page **General** area **Cluster Live Status** link.

**Figure 206: Cluster Status**

Cluster Status

Overall Status: Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

	Status	Device Name	Unit Name	Chassis URL

>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.**—The node is registered with the Firewall Management Center.
- Pending Registration**—The node is part of the cluster, but has not yet registered with the Firewall Management Center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled**—The node is registered with the Firewall Management Center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.

- **Joining cluster...**—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the Firewall Management Center.

For each node, you can view the **Summary** or the **History**.

**Figure 207: Node Summary**

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a Firewall Threat Defense is the control node of a cluster, the Firewall Management Center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the Firewall Management Center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the Firewall Management Center.

### Procedure

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- Load Distribution — Traffic and packet distribution across the cluster nodes.
- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range. The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

**Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
- CPU — CPU utilization, including the CPU usage by process and by physical cores.
- Memory — Device memory utilization, including data plane and Snort memory usage.
- Interfaces — Interface status and aggregate traffic statistics.
- Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
- Snort — Statistics that are related to the Snort process.
- ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

**Step 8** Click the plus sign **Add New Dashboard**(+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 30: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number

Metric	Description	Format
Packets	Packet distribution count in the cluster for every second.	number

## Troubleshooting the Cluster

You can use the **CCL Ping** tool to make sure the cluster control link is operating correctly. You can also use the following tools that are available for devices and clusters:

- Troubleshooting files—If a node fails to join the cluster, a troubleshooting file is automatically generated. You can also generate and download troubleshooting files from the **Devices > Device Management > Cluster > General** area. See [Generate Troubleshooting Files, on page 69](#).

You can also generate files from the **Device Management** page by clicking **More** (ⓘ) and choosing **Troubleshoot Files**.

- CLI output—From the **Devices > Device Management > Cluster > General** area, you can view a set of pre-defined CLI outputs that can help you troubleshoot the cluster. The following commands are automatically run for the cluster:

- **show running-config cluster**
- **show cluster info**
- **show cluster info health**
- **show cluster info transport cp**
- **show version**
- **show asp drop**
- **show counters**
- **show arp**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**
- **show interface *ccl\_interface***
- **ping *ccl\_ip* size *ccl\_mtu* repeat 2**
- **show nve**
- **show route**
- **show tech-support**

You can also enter any **show** command in the Command field. See [View CLI Output, on page 71](#) for more information.

## Perform a Ping on the Cluster Control Link

You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.

### Procedure

**Step 1** Choose **Devices > Device Management**, click the **More** (⋮) icon next to the cluster, and choose **Cluster Live Status**.

*Figure 209: Cluster Status*

Cluster Status

Overall Status: Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span>Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

**Step 2** Expand one of the nodes, and click **CCL Ping**.

**Figure 210: CCL Ping**

Cluster Status ?

---

Overall Status: ❌ Clustering is disabled for 1 node(s)

Nodes details (3) Refresh Reconcile All

Status	Device Name	Unit Name	Chassis URL
In Sync.	10.10.43.21	Control	10.10.43.21
<div> <span>Summary</span> <span>History</span> <span style="border: 2px solid red;">CCL Ping</span> </div> <p>ping 10.10.3.2 size 1654            Sending 5, 1654-byte ICMP Echos to 10.10.3.2, timeout is 2 seconds:            ??????            Success rate is 0 percent (0/5)</p>			
> Clustering is disabled	10.10.43.22	10.10.43.22	N/A

Dated: 18:38:41 | 01 Mar 2023 Close

The node sends a ping on the cluster control link to every other node using a packet size that matches the maximum MTU.

## Examples for Clustering

These examples include examples for typical deployments.

## Firewall on a Stick

Data traffic from different security domains are associated with different VLANs, for example, VLAN 10 for the inside network and VLAN 20 for the outside network. Each has a single physical port connected to the external switch or router. Trunking is enabled so that all packets on the physical link are 802.1q encapsulated. This is the firewall between VLAN 10 and VLAN 20.

When using Spanned EtherChannels, all data links are grouped into one EtherChannel on the switch side. If the becomes unavailable, the switch will rebalance traffic between the remaining units.

## Traffic Segregation

You may prefer physical separation of traffic between the inside and outside network.

As shown in the diagram above, there is one Spanned EtherChannel on the left side that connects to the inside switch, and the other on the right side to outside switch. You can also create VLAN subinterfaces on each EtherChannel if desired.

## Reference for Clustering

This section includes more information about how clustering operates.

## Firewall Threat Defense Features and Clustering

Some Firewall Threat Defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

## Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Firewall Management Center UCAPL/CC mode
- DHCP client, server, and proxy. DHCP relay is supported.

## Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- The following application inspections:
  - DCERPC
  - ESMTTP
  - NetBIOS
  - PPTP
  - RSH
  - SQLNET

- SUNRPC
  - TFTP
  - XDMCP
- 
- Static route monitoring
  - Site-to-site VPN
  - IGMP multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
  - PIM multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
  - Dynamic routing

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## Multicast Routing in Individual Interface Mode

In Individual interface mode, units do not act independently with multicast. All data and routing packets are processed and forwarded by the control unit, thus avoiding packet replication.

## NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different Firewall Threat Defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the Firewall Threat Defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- PAT with Port Block Allocation—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.

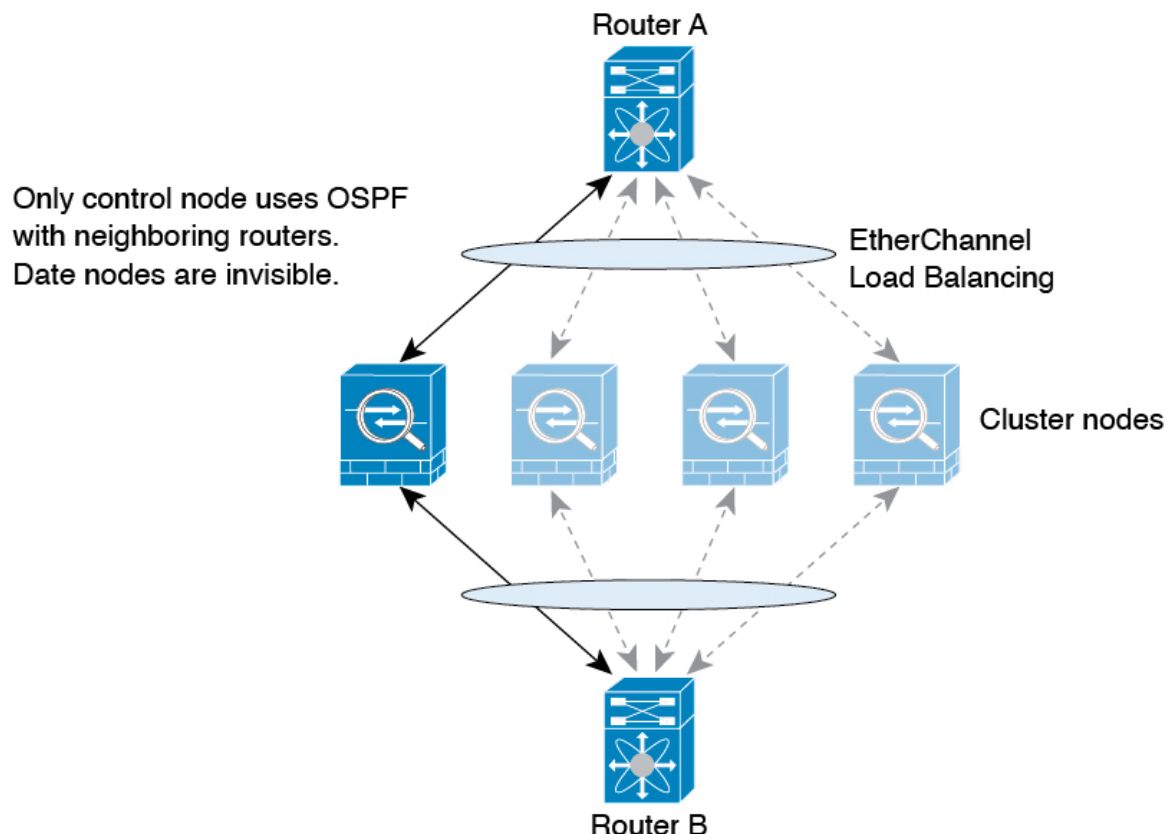

- Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
- On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
- When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- NAT pool address distribution for dynamic PAT—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- No extended PAT—Extended PAT is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP

- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## Dynamic Routing

The routing process only runs on the control node, and routes are learned through the control node and replicated to data nodes. If a routing packet arrives at a data node, it is redirected to the control node.

*Figure 211: Dynamic Routing in Spanned EtherChannel Mode*

After the data node learn the routes from the control node, each node makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control node to data nodes. If there is a control node switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## Cisco TrustSec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## VPN and Clustering

Site-to-site VPN is a centralized feature; only the control node supports VPN connections.

---

**Note** Remote access VPN is not supported with clustering.

---

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

When you connect a VPN tunnel to a Spanned EtherChannel address, connections are automatically forwarded to the control node.

VPN-related keys and certificates are replicated to all nodes.

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

---

**Note** You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

## High Availability Within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

### Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

See [Control Node Election, on page 431](#) for more information.

## Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

- **Spanned EtherChannel**—Uses cluster Link Aggregation Control Protocol (cLACP). Each node monitors the link status and the cLACP protocol messages to determine if the port is still active in the EtherChannel. The status is reported to the control node.

When you enable health monitoring, all physical interfaces (including the main EtherChannel) are monitored by default; you can optionally disable monitoring per interface. Only named interfaces can be monitored. For example, the named EtherChannel must fail to be considered failed, which means all member ports of an EtherChannel must fail to trigger cluster removal.

A node is removed from the cluster if its monitored interfaces fail. The amount of time before the Firewall Threat Defense removes a member from the cluster depends on whether the node is an established member or is joining the cluster. If the interface is down on an established member, then the Firewall Threat Defense removes the member after 9 seconds. The Firewall Threat Defense does not monitor interfaces for the first 90 seconds that a node joins the cluster. Interface status changes during this time will not cause the Firewall Threat Defense to be removed from the cluster. For non-EtherChannels, the node is removed after 500 ms, regardless of the member state.

## Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The Firewall Threat Defense automatically tries to rejoin the cluster, depending on the failure event.

---

**Note** When the Firewall Threat Defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

---

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- **Failed cluster control link when initially joining**—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- **Failed cluster control link after joining the cluster**—The Firewall Threat Defense automatically tries to rejoin every 5 minutes, indefinitely.
- **Failed data interface**—The Firewall Threat Defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the Firewall Threat Defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- **Failed node**—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means

the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The Firewall Threat Defense application attempts to rejoin the cluster every 5 seconds.

- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from Firewall Management Center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 31: Features Replicated Across the Cluster**

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—
SNMP Engine ID	No	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- Owner—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.

- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

---

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

---

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new

connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

### Port Address Translation Connections

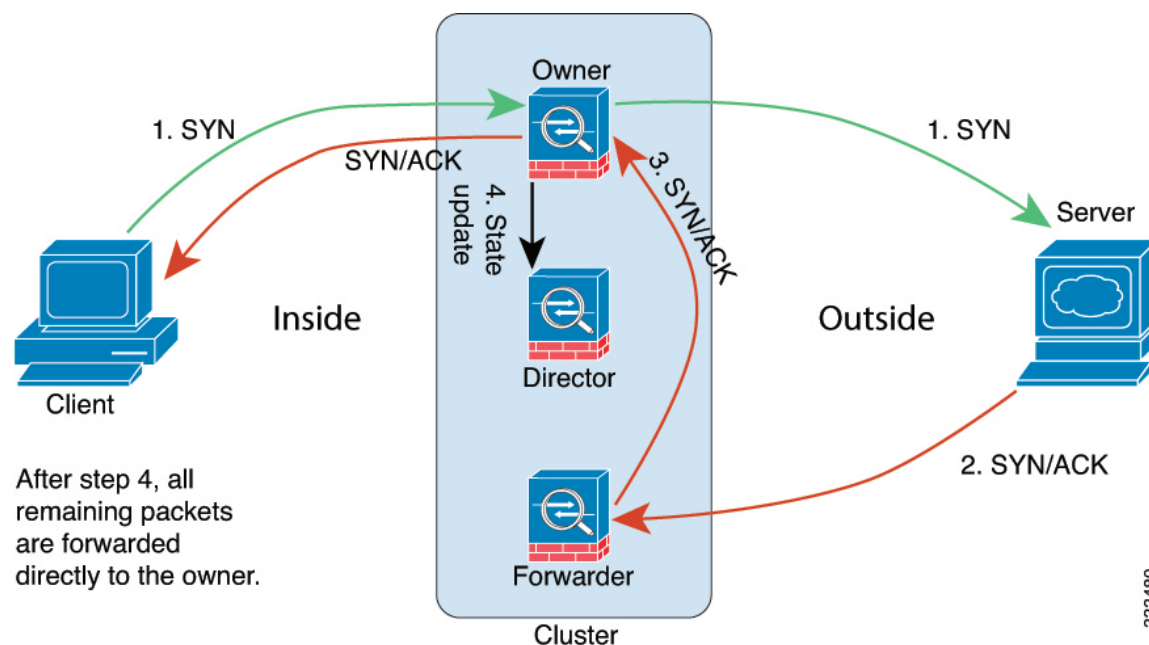

## New Connection Ownership

Traffic redirection is not supported in this release. When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. All the subsequent packets for the same connection should arrive the same node. If any connection packets arrive at a different node, they will be dropped. If a reverse flow arrives at a different node, it will be dropped as well. For centralized features, if the connections do not arrive on the control node, they will be dropped.

By default, AWS GWLB uses 5-tuple to maintain flow stickiness. It is recommended to enable 2-tuple or 3-tuple stickiness on AWS GWLB to ensure the same flows are sent to the same node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different Firewall Threat Defense (based on the load balancing method). This Firewall Threat Defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.

5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

### 1. Figure 212: ICMP and UDP Data Flow

The first UDP packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.

7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

## History for Clustering

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster control link ping tool.	7.2.6 7.4.1	Any	<p>You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; More &gt; Cluster Live Status.</b></p> <p>Version restrictions: Not supported with Firewall Management Center Version 7.3.x or 7.4.0.</p>
Troubleshooting file generation and download available from Device and Cluster pages.	7.4.1	7.4.1	<p>You can generate and download troubleshooting files for each device on the Device page and also for all cluster nodes on the Cluster page. For a cluster, you can download all files as a single compressed file. You can also include cluster logs for the cluster for cluster nodes. You can alternatively trigger file generation from the <b>Devices &gt; Device Management &gt; More &gt; Troubleshoot Files</b> menu.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; General</b></li> <li>• <b>Devices &gt; Device Management &gt; Cluster &gt; General</b></li> </ul>
Automatic generation of a troubleshooting file on a node when it fails to join the cluster.	7.4.1	7.4.1	<p>If a node fails to join the cluster, a troubleshooting file is automatically generated for the node. You can download the file from <b>Tasks</b> or from the <b>Cluster</b> page.</p>
View CLI output for a device or device cluster.	7.4.1	Any	<p>You can view a set of pre-defined CLI outputs that can help you troubleshoot the device or cluster. You can also enter any <b>show</b> command and see the output.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; General</b></p>
Clustering for the Secure Firewall 4200	7.4.0	7.4.0	<p>The Secure Firewall 4200 supports Spanned EtherChannel clustering for up to 8 nodes.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster health monitor settings	7.3.0	Any	<p>You can now edit cluster health monitor settings.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; Cluster Health Monitor Settings</b></p> <p><b>Note</b> If you previously configured these settings using FlexConfig, be sure to remove the FlexConfig configuration before you deploy. Otherwise the FlexConfig configuration will overwrite the management center configuration.</p>
Cluster health monitor dashboard	7.3.0	Any	<p>You can now view cluster health on the cluster health monitor dashboard.</p> <p>New/modified screens: <b>System &gt; Health &gt; Monitor</b></p>
Automatic configuration of the cluster control link MTU	7.2.0	7.2.0	<p>The MTU of the cluster control link interface is now automatically set to 100 bytes more than the highest data interface MTU; by default, the MTU is 1600 bytes.</p>
Clustering for the Secure Firewall 3100	7.1.0	7.1.0	<p>The Secure Firewall 3100 supports Spanned EtherChannel clustering for up to 8 nodes.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Add Cluster</b></li> <li>• <b>Devices &gt; Device Management &gt; More</b> menu</li> <li>• <b>Devices &gt; Device Management &gt; Cluster</b></li> </ul> <p>Supported platforms: Secure Firewall 3100</p>

## CHAPTER 11

# Clustering for Threat Defense Virtual in a Private Cloud

Clustering lets you group multiple Firewall Threat Defense Virtuals together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. You can deploy Firewall Threat Defense Virtual clusters in a private cloud using VMware and KVM. Only routed firewall mode is supported.

**Note** Some features are not supported when using clustering. See [Unsupported Features and Clustering](#), on page 477.

- [About Threat Defense Virtual Clustering in the Private Cloud](#), on page 439
- [Licenses for Threat Defense Virtual Clustering](#), on page 443

- [Reference for Clustering](#), on page 477
- [History for Threat Defense Virtual Clustering in a Private Cloud](#), on page 489

## About Threat Defense Virtual Clustering in the Private Cloud

This section describes the clustering architecture and how it works.

### How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single device. To act as a cluster, the firewalls need the following infrastructure:

- Isolated network for intra-cluster communication, known as the *cluster control link*, using VXLAN interfaces. VXLANs, which act as Layer 2 virtual networks over Layer 3 physical networks, let the Firewall Threat Defense Virtual send broadcast/multicast messages over the cluster control link.

- Management access to each firewall for configuration and monitoring. The Firewall Threat Defense Virtual deployment includes a Management 0/0 interface that you will use to manage the cluster nodes.

When you place the cluster in your network, the upstream and downstream routers need to be able to load-balance the data coming to and from the cluster using Layer 3 Individual interfaces and one of the following methods:

- Policy-Based Routing—The upstream and downstream routers perform load balancing between nodes using route maps and ACLs.
- Equal-Cost Multi-Path Routing—The upstream and downstream routers perform load balancing between nodes using equal cost static or dynamic routes.

---

**Note** Layer 2 Spanned EtherChannels are not supported.

---

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Individual Interfaces

You can configure cluster interfaces as *Individual interfaces*.

Individual interfaces are normal routed interfaces, each with their own *Local IP address* used for routing. The *Main cluster IP address* for each interface is a fixed address that always belongs to the control node. When the control node changes, the Main cluster IP address moves to the new control node, so management of the cluster continues seamlessly.

IPS-only interfaces (inline sets and passive interfaces) are not supported as Individual interfaces.

Because interface configuration must be configured only on the control node, you configure a pool of IP addresses to be used for a given interface on the cluster nodes, including one for the control node.

Load balancing must be configured separately on the upstream switch.

**Note** Layer 2 Spanned EtherChannels are not supported.

## Policy-Based Routing

When using Individual interfaces, each Firewall Threat Defense interface maintains its own IP address and MAC address. One method of load balancing is Policy-Based Routing (PBR).

We recommend this method if you are already using PBR, and want to take advantage of your existing infrastructure.

PBR makes routing decisions based on a route map and ACL. You must manually divide traffic between all Firewall Threat Defenses in a cluster. Because PBR is static, it may not achieve the optimum load balancing result at all times. To achieve the best performance, we recommend that you configure the PBR policy so that forward and return packets of a connection are directed to the same Firewall Threat Defense. For example, if you have a Cisco router, redundancy can be achieved by using Cisco IOS PBR with Object Tracking. Cisco IOS Object Tracking monitors each Firewall Threat Defense using ICMP ping. PBR can then enable or disable route maps based on reachability of a particular Firewall Threat Defense. See the following URLs for more details:

<http://www.cisco.com/c/en/us/solutions/data-center-virtualization/intelligent-traffic-director/index.html>

[http://www.cisco.com/en/US/products/ps6599/products\\_white\\_paper09186a00800a4409.shtml](http://www.cisco.com/en/US/products/ps6599/products_white_paper09186a00800a4409.shtml)

## Equal-Cost Multi-Path Routing

When using Individual interfaces, each Firewall Threat Defense interface maintains its own IP address and MAC address. One method of load balancing is Equal-Cost Multi-Path (ECMP) routing.

We recommend this method if you are already using ECMP, and want to take advantage of your existing infrastructure.

ECMP routing can forward packets over multiple “best paths” that tie for top place in the routing metric. Like EtherChannel, a hash of source and destination IP addresses and/or source and destination ports can be used to send a packet to one of the next hops. If you use static routes for ECMP routing, then the Firewall Threat Defense failure can cause problems; the route continues to be used, and traffic to the failed Firewall Threat Defense will be lost. If you use static routes, be sure to use a static route monitoring feature such as Object Tracking. We recommend using dynamic routing protocols to add and remove routes, in which case, you must configure each Firewall Threat Defense to participate in dynamic routing.

## Cluster Control Link

Each node must dedicate one interface as a VXLAN (VTEP) interface for the cluster control link. For more information about VXLAN, see [Configure VXLAN Interfaces, on page 730](#).

### VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

### VTEP Source Interface

The VTEP source interface is a regular Firewall Threat Defense Virtual interface with which you plan to associate the VNI interface. You can configure one VTEP source interface to act as the cluster control link. The source interface is reserved for cluster control link use only. Each VTEP source interface has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

### VNI Interface

A VNI interface is similar to a VLAN interface: it is a virtual interface that keeps network traffic separated on a given physical interface by using tagging. You can only configure one VNI interface. Each VNI interface has an IP address on the same subnet.

### Peer VTEPs

Unlike regular VXLAN for data interfaces, which allows a single VTEP peer, The Firewall Threat Defense Virtual clustering allows you to configure multiple peers.

## Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.
- Connection ownership queries and data packet forwarding.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

## Licenses for Threat Defense Virtual Clustering

Each Firewall Threat Defense Virtual cluster node requires the same performance tier license. We recommend using the same number of CPUs and memory for all members, or else performance will be limited on all nodes to match the least capable member. The throughput level will be replicated from the control node to each data node so they match.

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the Firewall Management Center, you can specify the feature licenses you want to use for the cluster. Before you create the cluster, it doesn't matter which licenses are assigned to the data nodes; the license settings for the control node are replicated to each of the data nodes. You can modify licenses for the cluster by clicking **Edit Licenses** in **System** (⚙️) > **Licenses** > **Smart Licenses** or choosing **Devices** > **Device Management**, clicking **Edit** (✎) for the cluster, and then in the **Cluster** > **License** area, clicking **Edit** (✎).

---

**Note**

If you add the cluster before the Firewall Management Center is licensed (and running in Evaluation mode), then when you license the Firewall Management Center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

# Requirements and Prerequisites for Threat Defense Virtual Clustering

## Model Requirements

- FTDv5, FTDv10, FTDv20, FTDv30, FTDv50, FTDv100
- VMware or KVM
- A maximum of 16 nodes in a cluster in a 4x4 configuration is supported. You can set up a maximum of four hosts with a maximum of four threat defense virtual instances in each host.

## User Roles

- Admin
- Access Admin
- Network Admin

## Hardware and Software Requirements

All units in a cluster:

- Must have jumbo frame reservation enabled for the cluster control link. Do this in the Day 0 configuration when you deploy the Firewall Threat Defense Virtual by setting `"DeploymentType": "Cluster"`. Otherwise, you must restart each node to enable jumbo frames after the cluster has formed and is healthy.
- (KVM only) Must use CPU hard partitioning (CPU pinning) for all VMs on the KVM host.
- Must be the same performance tier. We recommend using the same number of CPUs and memory for all nodes, or performance will be limited on all nodes to match the least capable node.
- Must use the management interface for Firewall Management Center communications. Data interface management is not supported.
- Must run the same version, except during upgrade. Hitless upgrade is supported.
- Must be in the same domain.
- Must be in the same group.
- Must not have any deployment pending or in progress.
- Must not have any unsupported features configured on the control node: [Unsupported Features and Clustering, on page 477](#).
- Must not have VPN configured on the data nodes. The control node can have site-to-site VPN configured.

## Firewall Management Center Requirements

Make sure the Firewall Management Center NTP server is set to a reliable server that is reachable by all cluster nodes to ensure proper clock sync. By default, the device uses the same NTP server as the Firewall Management

Center. If the time is not set to be the same on all cluster nodes, they can be removed automatically from the cluster.

### Switch Requirements

Be sure to complete the switch configuration before you configure clustering. Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. By default, the cluster control link MTU is set to 154 bytes higher than the data interfaces. If the switches have an MTU mismatch, the cluster formation will fail.

## Guidelines for Threat Defense Virtual Clustering

### High Availability

High Availability is not supported with clustering.

### IPv6

The cluster control link is only supported using IPv4.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Firewall Threat Defense Virtual, adding an additional switch to form a VSS or vPC, configuring IP addresses or interface flap on the cluster) you should disable the health check feature and also disable interface monitoring for the interfaces that are affected by the topology changes. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.
- We do not support VXLANs for data interfaces; only the cluster control link supports VXLAN.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.

- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Threat Defense Virtual Clustering

To configure clustering after you deploy your Firewall Threat Defense Virtuals, perform the following tasks.

### Add Nodes to the Management Center

Before configuring clustering, deploy each cluster node, then add the devices as standalone units on the Firewall Management Center.

#### Procedure

- 
- Step 1** Deploy each cluster node according the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#). All units in a cluster:
- Must have jumbo frame reservation enabled for the cluster control link. Do this in the Day 0 configuration when you deploy the Firewall Threat Defense Virtual by setting `"DeploymentType": "Cluster"`. Otherwise, you must restart each node to enable jumbo frames after the cluster has formed and is healthy.
  - (KVM only) Must use CPU hard partitioning (CPU pinning) for all VMs on the KVM host.
- Step 2** Add each node to the Firewall Management Center as a standalone device in the same domain and group. See [Add a Device Using a Registration Key, on page 29](#). You can create a cluster with a single device, and then add more nodes later. The initial settings (licensing, access control policy) that you set when you add a device will be inherited by all cluster nodes from the control node. You will choose the control node when forming the cluster.
- 

### Create a Cluster

Form a cluster from one or more devices in the Firewall Management Center.

#### Before you begin

Some features are not compatible with clustering, so you should wait to perform configuration until after you enable clustering. Some features will block cluster creation if they are already configured. For example, do not configure any IP addresses on interfaces, or unsupported interface types such as BVIs.

#### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and then choose **Add > Cluster**. The **Add Cluster Wizard** appears.

Figure 213: Add Cluster Wizard

Add Cluster Wizard

1 Configuration — 2 Summary

▲ Create a cluster for supported models. Note: For the Firepower 4100/9300/AWS/Azure/GCP, use the Add Device option.

Cluster Name\*

cluster1

Cluster Key

....

....

Control Node

You can form the cluster with just the control node to reduce formation time.

Node\*

node1

VXLAN Network Identifier (VNI) Network\*

10.10.1.0 / 27 (30 addresses)

Virtual Tunnel Endpoint (VTEP) Network\*

209.165.200.224 / 27 (30 addresses)

Cluster Control Link\*

GigabitEthernet0/7

VTEP IPv4 Address\*

209.165.200.225

Priority\*

1

Data Nodes (Optional)

Data node hardware needs to match the control node hardware.

[Add a data node](#)

**Step 2** Specify a **Cluster Name** and an authentication **Cluster Key** for control traffic.

- **Cluster Name**—An ASCII string from 1 to 38 characters.
- **Cluster Key**—An ASCII string from 1 to 63 characters. The **Cluster Key** value is used to generate the encryption key. This encryption does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

**Step 3** For the **Control Node**, set the following:

- **Node**—Choose the device that you want to be the control node initially. When the Firewall Management Center forms the cluster, it will add this node to the cluster first so it will be the control node.

#### Note

If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation. For example:

Figure 214: Configuration Issues

Configuration Issues

❗ Incompatible Smart License(s) - AnyConnect APEX configured on node1

❗ node1 device deployment is pending.

Close

To resolve the above issues, remove the unsupported VPN license and deploy pending configuration changes to the device.

- **VXLAN Network Identifier (VNI) Network**—Specify an IPv4 subnet for the VNI network; IPv6 is not supported for this network. Specify a **24**, **25**, **26**, or **27** subnet. An IP address will be auto-assigned to each node on this network. The VNI network is the encrypted virtual network that runs on top of the physical VTEP network.
- **Cluster Control Link**—Choose the physical interface you want to use for the cluster control link.
- **Virtual Tunnel Endpoint (VTEP) Network**—Specify an IPv4 subnet for the physical interface network; IPv6 is not supported for this network. The VTEP network is a different network than the VNI network, and it is used for the physical cluster control link.
- **VTEP IPv4 Address**—This field will be auto-populated with the first address on the VTEP network.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority. Even if you set the priority to be lower than other nodes, this node will still be the control node when the cluster is first formed.

**Step 4** For **Data Nodes (Optional)**, click **Add a data node** to add a node to the cluster.

You can form the cluster with only the control node for faster cluster formation, or you can add all nodes now. Set the following for each data node:

- **Node**—Choose the device that you want to add.

**Note**

If you see an **Error** (❗) icon next to the node name, click the icon to view configuration issues. You must cancel cluster formation, resolve the issues, and then return to cluster formation.

- **VTEP IPv4 Address**—This field will be auto-populated with the next address on the VTEP network.
- **Priority**—Set the priority of this node for control node elections. The priority is between 1 and 100, where 1 is the highest priority.

**Step 5** Click **Continue**. Review the **Summary**, and then click **Save**.

The cluster bootstrap configuration is saved to the cluster nodes. The bootstrap configuration includes the VXLAN interface used for the cluster control link.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster nodes.

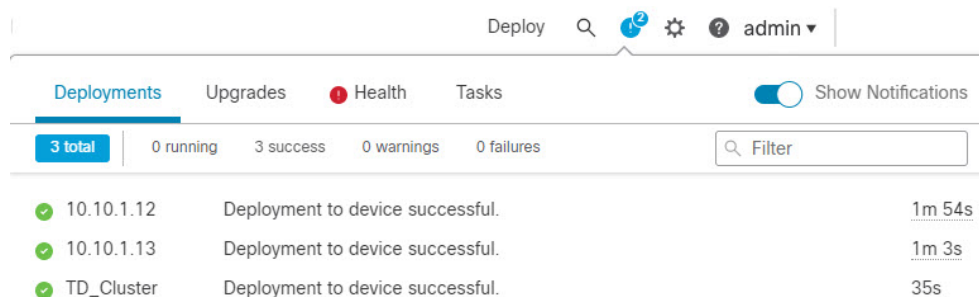

**Figure 215: Cluster Management**

<div> <span>▼</span> <span>ftdcluster (2)</span> <span>Cluster</span> <span>✎</span> <span>⋮</span> </div>						
<div> <span>●</span> <span>172.16.0.50(Control)</span> <span>Snort 3</span> </div> <div>172.16.0.50 - Routed</div>	FTDv for VMware	7.2.0	Manage	Base, Threat (2 more...)	Default AC Policy	⋮
<div> <span>▲</span> <span>172.16.0.51</span> <span>Snort 3</span> </div> <div>172.16.0.51 - Routed</div>	FTDv for VMware	7.2.0	N/A	Base, Threat (2 more...)	Default AC Policy	⋮

A node that is currently registering shows the loading icon.

**Figure 216: Node Registration**

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**. The Firewall Management Center updates the Cluster Registration task as each node registers.

**Step 6** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 7** On the **Devices > Device Management > Cluster** screen, you see **General** and other settings for the cluster.

### Step 9

If you deployed your cluster nodes without enabling jumbo-frame reservation, then restart all cluster nodes to enable jumbo frames, which are required for the cluster control link. See [Shut Down or Restart the Device, on page 48](#).

If you previously enabled jumbo-frame reservation, you can skip this step.

Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead (100 bytes) and VXLAN overhead (54 bytes). When you create the cluster, the MTU is set to 154 bytes higher than the highest data interface MTU (1654 by default). If you later increase the data interface MTU, be sure to also increase the cluster control link MTU. For example, because the maximum MTU is 9198 bytes, then the highest data interface MTU can be 9044, while the cluster control link can be set to 9198. See [Configure the MTU, on page 763](#).

#### Note

Make sure you configure switches connected to the cluster control link to the correct (higher) MTU; otherwise, cluster formation will fail.

## Configure Interfaces

This section describes how to configure interfaces to be Individual interfaces compatible with clustering. Individual interfaces are normal routed interfaces, each with their own IP address taken from a pool of IP addresses. The Main cluster IP address is a fixed address for the cluster that always belongs to the current control node. All data interfaces must be Individual interfaces.

---

**Note** You cannot use subinterfaces.

---

### Procedure

- 
- Step 1** Choose **Objects > Object Management > Address Pools** to add an IPv4 and/or IPv6 address pool. See [Address Pools, on page 1255](#).
- Include at least as many addresses as there are units in the cluster. The Virtual IP address is not a part of this pool, but needs to be on the same network. You cannot determine the exact Local address assigned to each unit in advance.
- Step 2** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.
- Step 3** Click **Interfaces**, and then click **Edit** (✎) for a data interface.
- Step 4** On the **IPv4**, enter the **IP Address** and mask. This IP address is a fixed address for the cluster, and always belongs to the current control unit.
- Step 5** From the **IPv4 Address Pool** drop-down list, choose the address pool you created.
- Note**  
If you want to manually assign a MAC address to this interface, you need to create a **mac-address pool** using FlexConfig.
- Step 6** On **IPv6 > Basic**, from the **IPv6 Address Pool** drop-down list, choose the address pool you created.
- Step 7** Configure other interface settings as normal.
- Step 8** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

Figure 221: Cluster Health Monitor Settings

Cluster Health Monitor Settings			
<b>Timeouts</b>			
Hold Time			3 s
Interface Debounce Time			9000 ms
<b>Monitored Interfaces</b>			
Service Application			Enabled
Unmonitored Interfaces			None
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

Table 32: Cluster Health Monitor Settings Section Table Fields

Field	Description
<b>Timeouts</b>	
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.

Field	Description
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Short and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

Figure 222: Disable the System Health Check

Edit Cluster Health Monitor Settings

Health Check ☐ ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6**

Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7**

Customize the auto-rejoin cluster settings after a health check failure.

Figure 223: Configure Auto-Rejoin Settings

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 224: Configure Monitored Interfaces**

Add

Unmonitored Interfaces ⓘ

☒ Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9** Click **Save**.

**Step 10** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Manage Cluster Nodes

.

### Add a New Cluster Node

You can add one or more new cluster nodes to an existing cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, click the **More** (⋮) for the cluster, and choose **Add Nodes**.

*Figure 225: Add Nodes*

The **Manage Cluster Wizard** appears.

**Step 2** From the **Node** menu, choose a device, and adjust the IP address and priority if desired.

*Figure 226: Manage Cluster Wizard*

 A screenshot of the 'Manage Cluster Wizard' Configuration step. The wizard has two tabs: 'Configuration' (active) and 'Summary'. The form contains the following fields:
 

- Cluster Name\***: cluster1
- Cluster Key**: Two masked input fields (\*\*\*\*\*).
- Control Node**:
  - Text: "You can form the cluster with just the control node to reduce formation time."
  - Node\***: node1 (dropdown)
- VXLAN Network Identifier (VNI) Network\***: 10.10.1.0 / 27 (30 addresses) (dropdown)
- Virtual Tunnel Endpoint (VTEP) Network\***: 209.165.200.224 / 27 (30 addresses) (dropdown)
- Cluster Control Link\***: GigabitEthernet0/7 (dropdown)
- VTEP IPv4 Address\***: 209.165.200.225
- Priority\***: 1
- Data Nodes (Optional)**:
  - Text: "Data node hardware needs to match the control node hardware."
  - Node\***: Type device name (dropdown, highlighted with a red box)
  - VTEP IPv4 Address\***: 209.165.200.226
  - Priority\***: 2
  - Remove** button
  - Add a data node** link

**Step 3** To add additional nodes, click **Add a data node**.

**Step 4** Click **Continue**. Review the **Summary**, and then click **Save**

The node that is currently registering shows the loading icon.

Figure 227: Node Registration

You can monitor cluster node registration by clicking the **Notifications** icon and choosing **Tasks**.

## Break a Node

You can remove a node from the cluster so that it becomes a standalone device. You cannot break the control node unless you break the entire cluster. The data node has its configuration erased.

### Procedure

- Step 1** Choose **Devices > Device Management**, click the **More** (⋮) for the node you want to break, and choose **Break Node**.

Figure 228: Break a Node

You can optionally break one or more nodes from the cluster More menu by choosing **Break Nodes**.

- Step 2** You are prompted to confirm the break; click **Yes**.

**Figure 229: Confirm Break**

You can monitor the cluster node break by clicking the **Notifications** icon and choosing **Tasks**.

## Break the Cluster

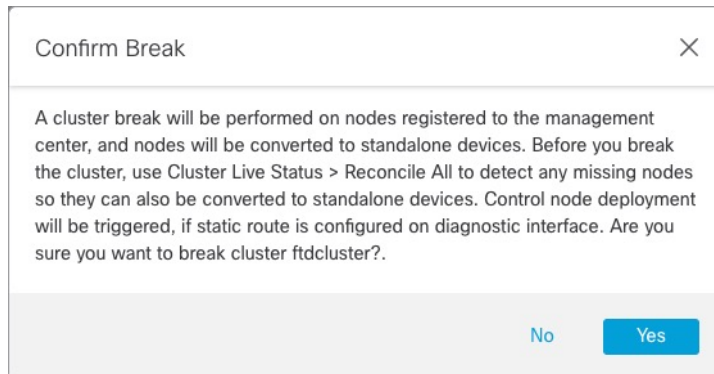

You can break the cluster and convert all nodes to standalone devices. The control node retains the interface and security policy configuration, while data nodes have their configuration erased.

### Procedure

- Step 1** Make sure all cluster nodes are being managed by the Firewall Management Center by reconciling nodes. See [Reconcile Cluster Nodes, on page 467](#).
- Step 2** Choose **Devices > Device Management**, click the **More** (⋮) for the cluster, and choose **Break Cluster**.

**Figure 230: Break Cluster**

- Step 3** You are prompted to break the cluster; click **Yes**.

**Figure 231: Confirm Break**

You can monitor the cluster break by clicking the **Notifications** icon and choosing **Tasks**.

## Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the Firewall Management Center device list. When a node becomes inactive, all data interfaces are shut down.

### Procedure

- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click the **More** (⋮), and choose **Disable Node Clustering**.

**Figure 232: Disable Clustering**

If you disable clustering on the control node, one of the data nodes will become the new control node. Note that for centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node. You cannot disable clustering on the control node if it is the only node in the cluster.

- Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
- Step 3** To reenabling clustering, see [Rejoin the Cluster, on page 465](#).

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster. See [Rejoining the Cluster, on page 484](#) for more information about why a node can be removed from a cluster.

### Procedure

---

- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click the **More** (⋮), and choose **Enable Node Clustering**.
- Step 2** Confirm that you want to enable clustering on the node.
- 

## Change the Control Node

### Caution

The best method to change the control node is to disable clustering on the control node, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control node, use the procedure in this section. Note that for centralized features, if you force a control node change using either method, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

To change the control node, perform the following steps.

### Procedure

---

- Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management More** (⋮) > **Cluster Live Status**.

Figure 233: Cluster Status

Cluster Status

Overall Status: Cluster has all nodes in sync

Nodes details (2)

Refresh

Reconcile All

Enter node name

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <b>Control</b>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021

Close

**Step 2** For the unit you want to become the control unit, choose **More** (⋮) > **Change Role to Control**.

**Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.

## Edit the Cluster Configuration

You can edit the cluster configuration. If you change any values other than the VTEP IP address for a node or node priority, the cluster will be broken and reformed automatically. Until the cluster is reformed, you may experience traffic disruption. If you change the VTEP IP address for a node or node priority, only the affected nodes are broken and readadded to the cluster.

### Procedure

**Step 1** Choose **Devices** > **Device Management**, click the **More** (⋮) for the cluster, and choose **Edit Configuration**.

Figure 234: Edit Configuration

The **Manage Cluster Wizard** appears.

**Step 2** Update the cluster configuration.

Figure 235: Manage Cluster Wizard

 The screenshot shows the 'Manage Cluster Wizard' in the 'Configuration' step. It includes a warning about disabling clustering temporarily. The form contains fields for Cluster Name, Cluster Key, Control Node, and Data Nodes. Red boxes highlight the Cluster Key and Control Node sections, labeled 'Cluster-level changes'. A green box highlights the Data Nodes section, labeled 'Node-level changes'.
 

Manage Cluster Wizard

1 Configuration — 2 Summary

⚠ Editing the cluster bootstrap configuration results in disabling clustering temporarily. This operation may result in traffic disruption, and you should perform bootstrap changes during the maintenance window.

**Step 3** Click **Continue**. Review the **Summary**, and then click **Save**

## Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the Firewall Management Center. For example, a data node might fail to register if the Firewall Management Center is occupied with certain processes, or if there is a network issue.

## Procedure

- Step 1** Choose **Devices > Device Management More** (⋮) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.

*Figure 236: Cluster Live Status*

- Step 2** Click **Reconcile All**.

For more information about the cluster status, see [Monitoring the Cluster](#), on page 470.

## Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center

You can unregister the cluster from the Firewall Management Center, which keeps the cluster intact. You might want to unregister the cluster if you want to add the cluster to a new Firewall Management Center.

You can also unregister a node from the Firewall Management Center without breaking the node from the cluster. Although the node is not visible in the Firewall Management Center, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot unregister the current control node. You might want to unregister the node if it is no longer reachable from the Firewall Management Center, but you still want to keep it as part of the cluster while you troubleshoot management connectivity.

Unregistering a cluster:

- Severs all communication between the Firewall Management Center and the cluster.
- Removes the cluster from the **Device Management** page.
- Returns the cluster to local time management if the cluster's platform settings policy is configured to receive time from the Firewall Management Center using NTP.
- Leaves the configuration intact, so the cluster continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the cluster again to the same or a different Firewall Management Center causes the configuration to be removed, so the cluster will stop processing traffic at that point; the cluster configuration remains intact so you can add the cluster as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

This procedure requires CLI access to one of the nodes.

### Procedure

- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster or node, and choose **Delete**.

*Figure 238: Delete Cluster or Node*

- Step 2** You are prompted to delete the cluster or node; click **Yes**.

- Step 3** You can register the cluster to a new (or the same) Firewall Management Center by adding one of the cluster members as a new device.

- Connect to one cluster node's CLI, and identify the new Firewall Management Center using the **configure manager add** command. See [Modify Threat Defense Management Interfaces at the CLI](#).
- Choose **Devices > Device Management**, and then click **Add Device**.

You only need to add one of the cluster nodes as a device, and the rest of the cluster nodes will be discovered.

**Step 4** To re-add a deleted node, see [Reconcile Cluster Nodes, on page 467](#).

## Monitoring the Cluster

You can monitor the cluster in the Firewall Management Center and at the Firewall Threat Defense CLI.

- Cluster Status** dialog box, which is available from the **Devices > Device Management More** (⋮) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

**Figure 239: Cluster Status**

Cluster Status

Overall Status: Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.**—The node is registered with the Firewall Management Center.
- Pending Registration**—The node is part of the cluster, but has not yet registered with the Firewall Management Center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled**—The node is registered with the Firewall Management Center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.

- **Joining cluster...**—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the Firewall Management Center.

For each node, you can view the **Summary** or the **History**.

**Figure 240: Node Summary**

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a Firewall Threat Defense is the control node of a cluster, the Firewall Management Center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the Firewall Management Center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the Firewall Management Center.

### Procedure

**Step 1** Choose **System** (⚙️) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- Load Distribution — Traffic and packet distribution across the cluster nodes.
- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range. The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

**Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
- CPU — CPU utilization, including the CPU usage by process and by physical cores.
- Memory — Device memory utilization, including data plane and Snort memory usage.
- Interfaces — Interface status and aggregate traffic statistics.
- Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
- Snort — Statistics that are related to the Snort process.
- ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

**Step 8** Click the plus sign **Add New Dashboard**(+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 33: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number

Metric	Description	Format
Packets	Packet distribution count in the cluster for every second.	number

## Troubleshooting the Cluster

You can use the **CCL Ping** tool to make sure the cluster control link is operating correctly. You can also use the following tools that are available for devices and clusters:

- Troubleshooting files—If a node fails to join the cluster, a troubleshooting file is automatically generated. You can also generate and download troubleshooting files from the **Devices > Device Management > Cluster > General** area. See [Generate Troubleshooting Files, on page 69](#).

You can also generate files from the **Device Management** page by clicking **More** (ⓘ) and choosing **Troubleshoot Files**.

- CLI output—From the **Devices > Device Management > Cluster > General** area, you can view a set of pre-defined CLI outputs that can help you troubleshoot the cluster. The following commands are automatically run for the cluster:

- **show running-config cluster**
- **show cluster info**
- **show cluster info health**
- **show cluster info transport cp**
- **show version**
- **show asp drop**
- **show counters**
- **show arp**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**
- **show interface *ccl\_interface***
- **ping *ccl\_ip* size *ccl\_mtu* repeat 2**
- **show nve**
- **show route**
- **show tech-support**

You can also enter any **show** command in the Command field. See [View CLI Output, on page 71](#) for more information.

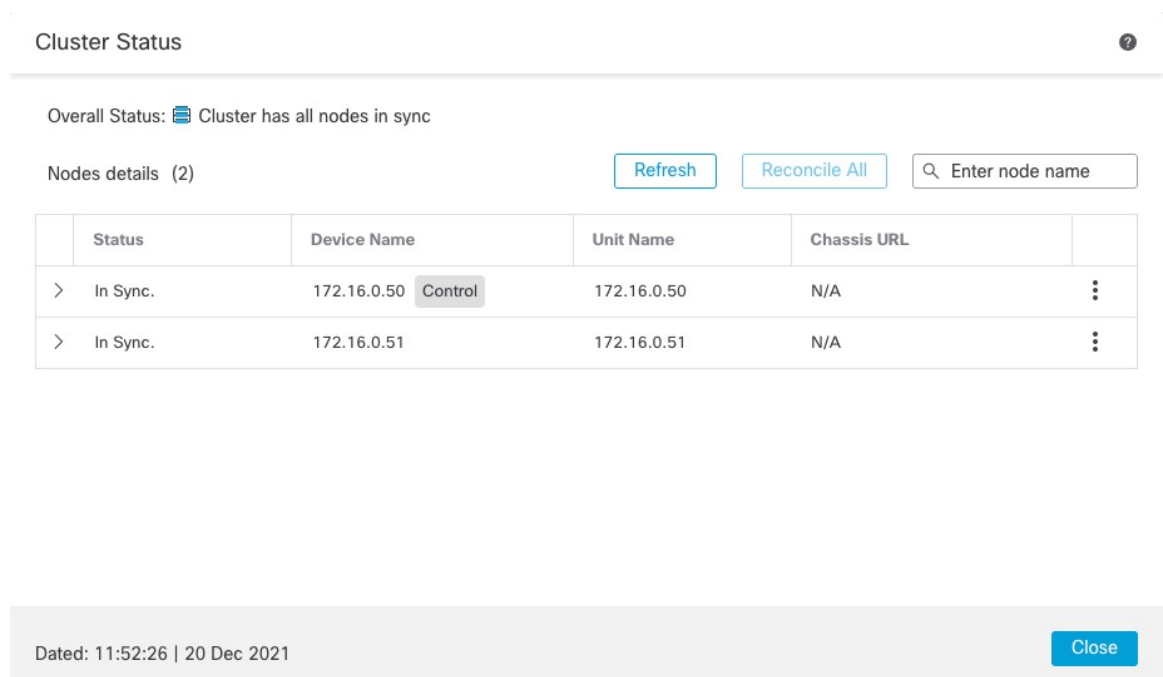

## Perform a Ping on the Cluster Control Link

You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.

### Procedure

- Step 1** Choose **Devices > Device Management**, click the **More** (⋮) icon next to the cluster, and choose **Cluster Live Status**.

**Figure 242: Cluster Status**

Cluster Status

Overall Status:  Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span>Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

- Step 2** Expand one of the nodes, and click **CCL Ping**.

Figure 243: CCL Ping

Cluster Status ?

Overall Status: Clustering is disabled for 1 node(s)

Nodes details (3) Refresh Reconcile All

Status	Device Name	Unit Name	Chassis URL
In Sync.	10.10.43.21	Control	10.10.43.21
Clustering is disabled	10.10.43.22		N/A

Summary History **CCL Ping**

ping 10.10.3.2 size 1654  
 Sending 5, 1654-byte ICMP Echos to 10.10.3.2, timeout is 2 seconds:  
 ??????  
 Success rate is 0 percent (0/5)

Dated: 18:38:41 | 01 Mar 2023 Close

The node sends a ping on the cluster control link to every other node using a packet size that matches the maximum MTU.

## Reference for Clustering

This section includes more information about how clustering operates.

## Threat Defense Features and Clustering

Some Firewall Threat Defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

## Unsupported Features and Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

### Note

To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.

- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Firewall Management Center UCAPL/CC mode
- DHCP client, server, and proxy. DHCP relay is supported.

## Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- The following application inspections:
  - DCERPC
  - ESMTP
  - NetBIOS
  - PPTP
  - RSH
  - SQLNET
  - SUNRPC
  - TFTP
  - XDMCP
- Static route monitoring

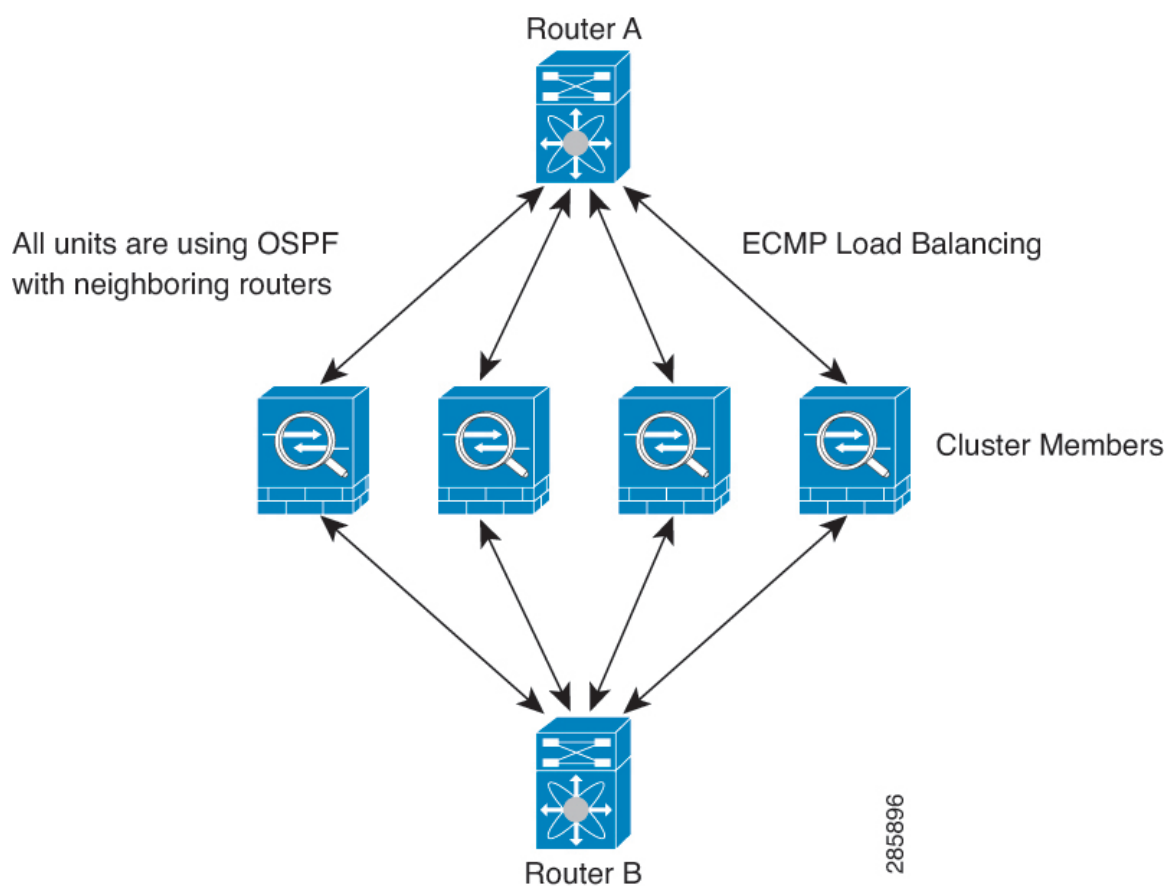

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## Dynamic Routing and Clustering

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

**Figure 244: Dynamic Routing in Individual Interface Mode**

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the

idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different Firewall Threat Defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the Firewall Threat Defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- **No Proxy ARP**—For Individual interfaces, a proxy ARP reply is never sent for mapped addresses. This prevents the adjacent router from maintaining a peer relationship with an ASA that may no longer be in the cluster. The upstream router needs a static route or PBR with Object Tracking for the mapped addresses that points to the Main cluster IP address.
- **No interface PAT on an Individual interface**—Interface PAT is not supported for Individual interfaces.
- **PAT with Port Block Allocation**—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- **NAT pool address distribution for dynamic PAT**—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- **Reusing a PAT pool in multiple rules**—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able

to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.

- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- No extended PAT—Extended PAT is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## Cisco Trustsec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## VPN and Clustering

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

For connections to an Individual interface when using PBR or ECMP, you must always connect to the Main cluster IP address, not a Local address.

VPN-related keys and certificates are replicated to all nodes.

---

**Note** Remote access VPN is not supported with clustering.

---

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

**Note**

You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

## High Availability within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

### Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

### Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

All physical interfaces are monitored; only named interfaces can be monitored. You can optionally disable monitoring per interface.

A node is removed from the cluster if its monitored interfaces fail. The node is removed after 500 ms.

### Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The Firewall Threat Defense automatically tries to rejoin the cluster, depending on the failure event.

**Note**

When the Firewall Threat Defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The Firewall Threat Defense automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The Firewall Threat Defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the Firewall Threat Defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed node—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The Firewall Threat Defense application attempts to rejoin the cluster every 5 seconds.
- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from Firewall Management Center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 34: Features Replicated Across the Cluster**

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—

Traffic	State Support	Notes
SNMP Engine ID	No	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.
- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner.

A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

---

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

---

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

#### Port Address Translation Connections

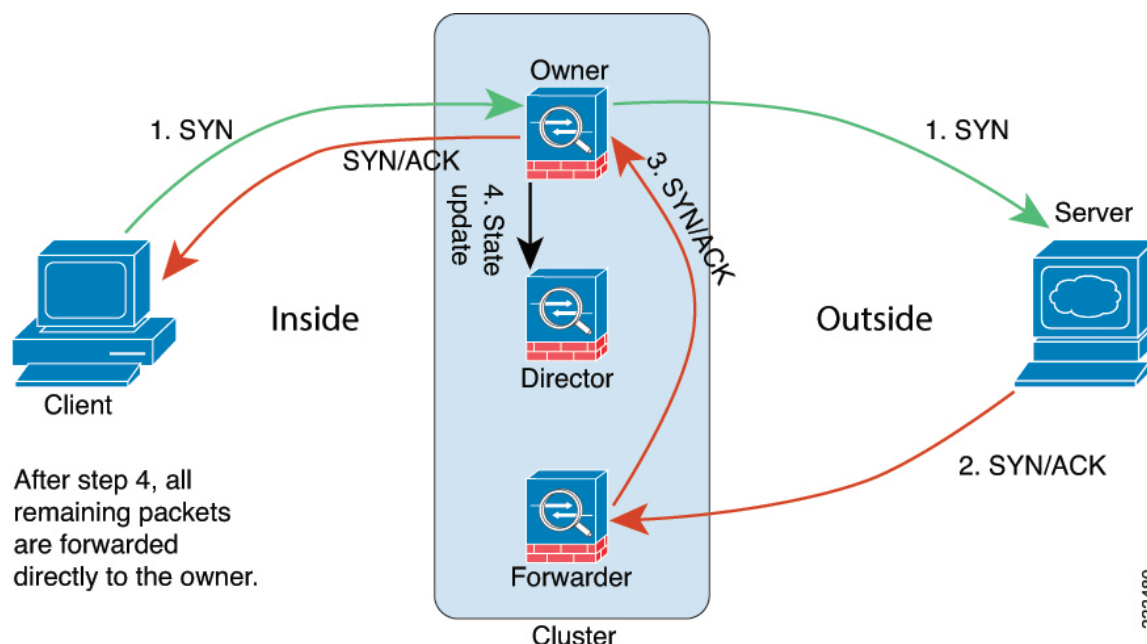

## New Connection Ownership

Traffic redirection is not supported in this release. When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. All the subsequent packets for the same connection should arrive the same node. If any connection packets arrive at a different node, they will be dropped. If a reverse flow arrives at a different node, it will be dropped as well. For centralized features, if the connections do not arrive on the control node, they will be dropped.

By default, AWS GWLB uses 5-tuple to maintain flow stickiness. It is recommended to enable 2-tuple or 3-tuple stickiness on AWS GWLB to ensure the same flows are sent to the same node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

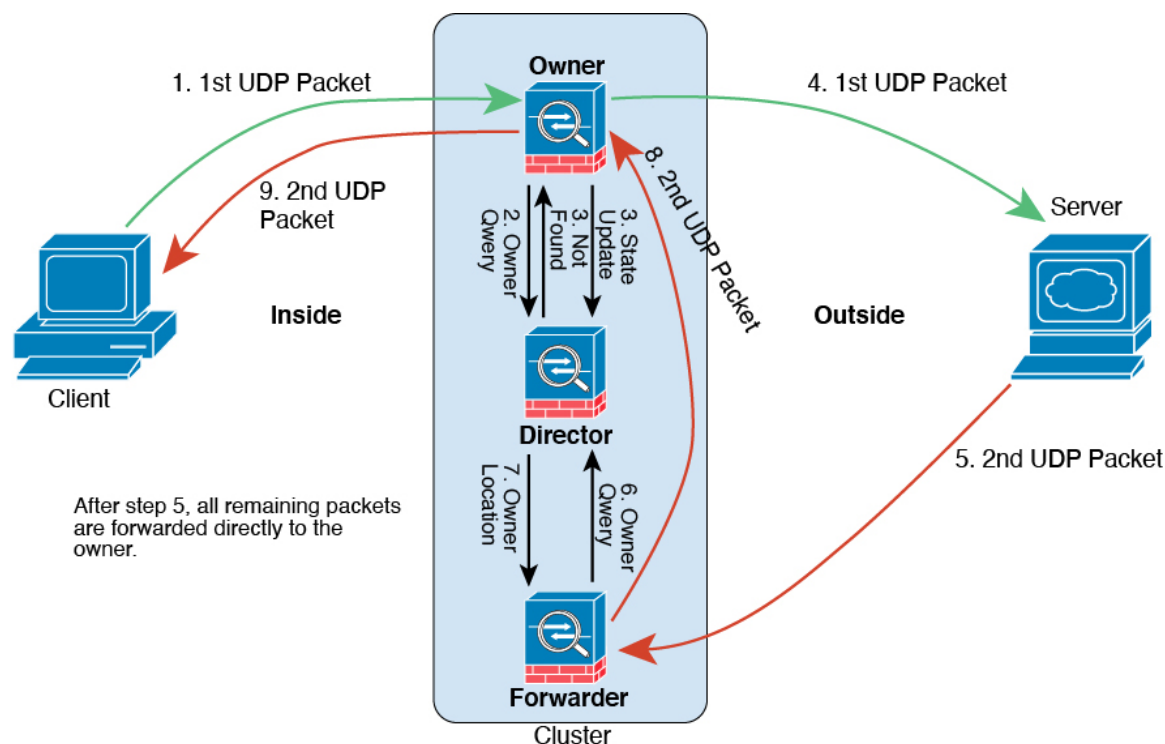

1. The SYN packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different Firewall Threat Defense (based on the load balancing method). This Firewall Threat Defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. Figure 245: ICMP and UDP Data Flow

The first UDP packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

# History for Threat Defense Virtual Clustering in a Private Cloud

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Clustering for the Firewall Threat Defense Virtual on VMware and KVM	7.4.1	7.4.1	The Firewall Threat Defense Virtual now supports individual interface clustering for up to 16 nodes on VMware and KVM.
Cluster control link ping tool.	7.2.6/7.4.1	Any	<p>You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; More &gt; Cluster Live Status</b>.</p> <p>Version restrictions: Not supported with Firewall Management Center Version 7.3.x or 7.4.0.</p>
Troubleshooting file generation and download available from Device and Cluster pages.	7.4.1	7.4.1	<p>You can generate and download troubleshooting files for each device on the Device page and also for all cluster nodes on the Cluster page. For a cluster, you can download all files as a single compressed file. You can also include cluster logs for the cluster for cluster nodes. You can alternatively trigger file generation from the <b>Devices &gt; Device Management &gt; More &gt; Troubleshoot Files</b> menu.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; General</b></li> <li>• <b>Devices &gt; Device Management &gt; Cluster &gt; General</b></li> </ul>
Automatic generation of a troubleshooting file on a node when it fails to join the cluster.	7.4.1	7.4.1	If a node fails to join the cluster, a troubleshooting file is automatically generated for the node. You can download the file from <b>Tasks</b> or from the <b>Cluster</b> page.
View CLI output for a device or device cluster.	7.4.1	Any	<p>You can view a set of pre-defined CLI outputs that can help you troubleshoot the device or cluster. You can also enter any <b>show</b> command and see the output.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; General</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster health monitor settings	7.3.0	Any	<p>You can now edit cluster health monitor settings.</p> <p>New/Modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; Cluster Health Monitor Settings</b></p> <p><b>Note</b> If you previously configured these settings using FlexConfig, be sure to remove the FlexConfig configuration before you deploy. Otherwise the FlexConfig configuration will overwrite the management center configuration.</p>
Cluster health monitor dashboard	7.3.0	Any	<p>You can now view cluster health on the cluster health monitor dashboard.</p> <p>New/Modified screens: <b>System &gt; Health &gt; Monitor</b></p>

## CHAPTER 12

# Clustering for Threat Defense Virtual in a Public Cloud

Clustering lets you group multiple Firewall Threat Defense Virtuals together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. You can deploy Firewall Threat Defense Virtual clusters in a public cloud using the following public cloud platforms:

- Amazon Web Services (AWS)
- Microsoft Azure
- Google Cloud Platform (GCP)

Currently, only routed firewall mode is supported.

**Note** Some features are not supported when using clustering. See [Unsupported Features and Clustering](#), on page 569.

# About Threat Defense Virtual Clustering in the Public Cloud

This section describes the clustering architecture and how it works.

## How the Cluster Fits into Your Network

The cluster consists of multiple firewalls acting as a single device. To act as a cluster, the firewalls need the following infrastructure:

- Isolated network for intra-cluster communication, known as the *cluster control link*, using VXLAN interfaces. VXLANs, which act as Layer 2 virtual networks over Layer 3 physical networks, let the Firewall Threat Defense Virtual send broadcast/multicast messages over the cluster control link.
- Load Balancer(s)—For external load balancing, you have the following options depending on your public cloud:

- AWS Gateway Load Balancer

The AWS Gateway Load Balancer combines a transparent network gateway and a load balancer that distributes traffic and scales virtual appliances on demand. The Firewall Threat Defense Virtual supports the Gateway Load Balancer centralized control plane with a distributed data plane (Gateway Load Balancer endpoint) using a Geneve interface single-arm proxy.

- Azure Gateway Load Balancer

In an Azure service chain, Firewall Threat Defense Virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The Firewall Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

- Native GCP load balancers, internal and external

- Equal-Cost Multi-Path Routing (ECMP) using inside and outside routers such as Cisco Cloud Services Router

ECMP routing can forward packets over multiple “best paths” that tie for top place in the routing metric. Like EtherChannel, a hash of source and destination IP addresses and/or source and destination ports can be used to send a packet to one of the next hops. If you use static routes for ECMP routing, then the Firewall Threat Defense failure can cause problems; the route continues to be used, and traffic to the failed Firewall Threat Defense will be lost. If you use static routes, be sure to use a static route monitoring feature such as Object Tracking. We recommend using dynamic routing protocols to add and remove routes, in which case, you must configure each Firewall Threat Defense to participate in dynamic routing.

**Note**

Layer 2 Spanned EtherChannels are not supported for load balancing.

## Individual Interfaces

You can configure cluster interfaces as *Individual interfaces*.

Individual interfaces are normal routed interfaces, each with their own local IP address. The IP address for the interface will be configured automatically via DHCP. Static IP configuration is not supported.

## Control and Data Node Roles

One member of the cluster is the control node. If multiple cluster nodes come online at the same time, the control node is determined by the priority setting; the priority is set between 1 and 100, where 1 is the highest priority. All other members are data nodes. When you first create the cluster, you specify which node you want to be the control node, and it will become the control node simply because it is the first node added to the cluster.

All nodes in the cluster share the same configuration. The node that you initially specify as the control node will overwrite the configuration on the data nodes when they join the cluster, so you only need to perform initial configuration on the control node before you form the cluster.

Some features do not scale in a cluster, and the control node handles all traffic for those features.

## Cluster Control Link

Each node must dedicate one interface as a VXLAN (VTEP) interface for the cluster control link. For more information about VXLAN, see [Configure VXLAN Interfaces, on page 730](#).

### VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

### VTEP Source Interface

The VTEP source interface is a regular Firewall Threat Defense Virtual interface with which you plan to associate the VNI interface. You can configure one VTEP source interface to act as the cluster control link. The source interface is reserved for cluster control link use only. Each VTEP source interface has an IP address on the same subnet. This subnet should be isolated from all other traffic, and should include only the cluster control link interfaces.

### VNI Interface

A VNI interface is similar to a VLAN interface: it is a virtual interface that keeps network traffic separated on a given physical interface by using tagging. You can only configure one VNI interface. Each VNI interface has an IP address on the same subnet.

### Peer VTEPs

Unlike regular VXLAN for data interfaces, which allows a single VTEP peer, The Firewall Threat Defense Virtual clustering allows you to configure multiple peers.

## Cluster Control Link Traffic Overview

Cluster control link traffic includes both control and data traffic.

Control traffic includes:

- Control node election.
- Configuration replication.
- Health monitoring.

Data traffic includes:

- State replication.
- Connection ownership queries and data packet forwarding.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Management Network

You must manage each node using the Management interface; management from a data interface is not supported with clustering.

## Licenses for Threat Defense Virtual Clustering

Each Firewall Threat Defense Virtual cluster node requires the same performance tier license. We recommend using the same number of CPUs and memory for all members, or else performance will be limited on all nodes to match the least capable member. The throughput level will be replicated from the control node to each data node so they match.

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add the control node to the Firewall Management Center, you can specify the feature licenses you want to use for the cluster. You can modify licenses for the cluster in the **Devices > Device Management > Cluster > License** area.

---

**Note**

If you add the cluster before the Firewall Management Center is licensed (and running in Evaluation mode), then when you license the Firewall Management Center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

---

# Requirements and Prerequisites for Threat Defense Virtual Clustering

## Model Requirements

- FTDv5, FTDv10, FTDv20, FTDv30, FTDv50, FTDv100

**Note** FTDv5 and FTDv10 do not support Amazon Web Services (AWS) Gateway Load Balancer (GWLB) and Azure GWLB.

- The following public cloud services:
  - Amazon Web Services (AWS)
  - Microsoft Azure
  - Google Cloud Platform (GCP)
- Maximum 16 nodes

See also the general requirements for the Firewall Threat Defense Virtual in the [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#).

## User Roles

- Admin
- Access Admin
- Network Admin

## Hardware and Software Requirements

All units in a cluster:

- Must be in the same performance tier. We recommend using the same number of CPUs and memory for all nodes, or else performance will be limited on all nodes to match the least capable node.
- The Firewall Management Center access must be from the Management interface; data interface management is not supported.
- Must run the identical software except at the time of an image upgrade. Hitless upgrade is supported.
- All units in a cluster must be deployed in the same availability zone.
- Cluster control link interfaces of all units must be in the same subnet.

## MTU

Make sure the ports connected to the cluster control link have the correct (higher) MTU configured. If there is an MTU mismatch, the cluster formation will fail.

The cluster control link MTU should be 154 bytes higher than the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead (100 bytes) plus VXLAN overhead (54 bytes).

For AWS with GWLB, the data interface uses Geneve encapsulation. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. You should set the source interface MTU to be the network MTU + 306 bytes. So for the standard 1500 MTU network path, the source interface MTU should be 1806, and the cluster control link MTU should be +154, 1960.

For Azure with GWLB, the data interface uses VXLAN encapsulation. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. You should set the cluster control link MTU to be the source interface MTU + 80 bytes.

The following table shows the default values for the cluster control link MTU and the data interface MTU.

**Note** We do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.

**Table 35: Default MTU**

Public Cloud	Cluster Control Link MTU	Data Interface MTU
AWS with GWLB	1980	1826
AWS	1654	1500
Azure with GWLB	1454	1374
Azure	1454	1300
GCP	1554	1400

# Guidelines for Threat Defense Virtual Clustering

## High Availability

High Availability is not supported with clustering.

## IPv6

The cluster control link is only supported using IPv4.

## Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Firewall Threat Defense or the switch, adding an additional switch to

form a VSS or vPC or VNet) you should disable the health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the interface health check feature.

- When adding a node to an existing cluster, or when reloading a node, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang your connection; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- Do not power off a node without first disabling clustering on the node.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new node. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.
- Dynamic scaling is not supported.
- If you are using Secure Firewall versions 7.2 or 7.3, Stateful Target Failover is not supported when you deploy the cluster on AWS.
- Perform a global deployment after the completion of each maintenance window.
- Ensure that you do not remove more than one device at a time from the auto scale group (AWS) / instance group (GCP) / scale set (Azure). We also recommend that you run the **cluster disable** command on the device before removing the device from the auto scale group (AWS) / instance group (GCP) / scale set (Azure).
- If you want to disable data nodes and the control node in a cluster, we recommend that you disable the data nodes before disabling the control node. If a control node is disabled while there are other data nodes in the cluster, one of the data nodes has to be promoted to be the control node. Note that the role change could disturb the cluster.
- In the customized day 0 configuration scripts given in this guide, you can change the IP addresses as per your requirement, provide custom interface names, and change the sequence of the CCL-Link interface.
- If you experience CCL instability issues, such as intermittent ping failures, after deploying a Threat Defense Virtual cluster on a cloud platform, we recommend that you address the reasons that are causing CCL instability. Also, you can increase the hold time as a temporary workaround to mitigate CCL instability issues to a certain extent. For more information on how to change the hold time, see [Edit Cluster Health Monitor Settings](#).
- When you are configuring your security firewall rule or security group for the Management Center virtual, you must include both Private and Public IP addresses of the Firewall Threat Defense Virtual in the Source IP address range. Also, ensure to specify the Private and Public IP addresses of the Firewall Management Center Virtual in the security firewall rule or security group of the Firewall Threat Defense Virtual. This is important to ensure proper registration of nodes during clustering deployment.

### Defaults for Clustering

- The cLACP system ID is auto-generated, and the system priority is 1 by default.
- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is unlimited attempts every 5 minutes.

- The cluster auto-rejoin feature for a failed data interface is 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Deploy the Cluster in AWS

To deploy a cluster in AWS, you can either manually deploy or use CloudFormation templates to deploy a stack. You can use the cluster with AWS Gateway Load Balancer, or with a non-native load-balancer such as the Cisco Cloud Services Router.

### AWS Gateway Load Balancer and Geneve Single-Arm Proxy

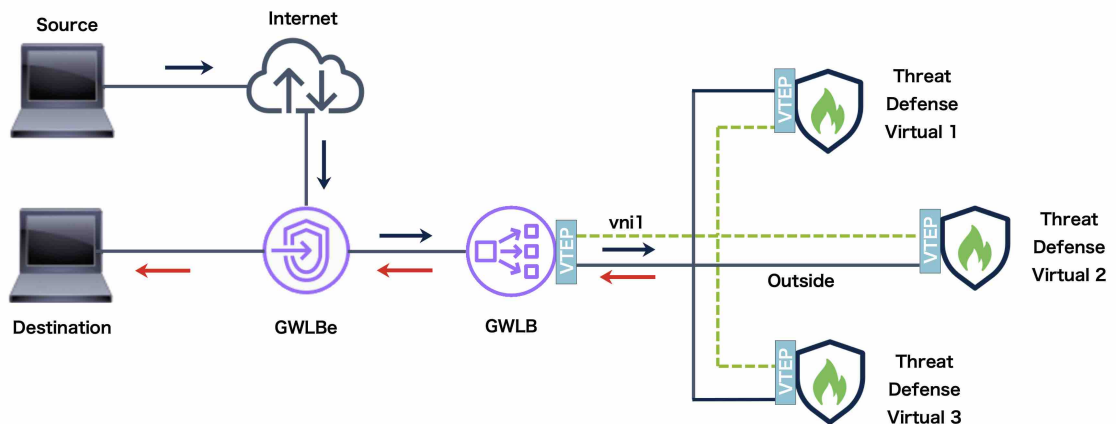

**Note** This use case is the only currently supported use case for Geneve interfaces.

The AWS Gateway Load Balancer combines a transparent network gateway and a load balancer that distributes traffic and scales virtual appliances on demand. The Threat Defense Virtual supports the Gateway Load Balancer centralized control plane with a distributed data plane (Gateway Load Balancer endpoint). The following figure shows traffic forwarded to the Gateway Load Balancer from the Gateway Load Balancer endpoint. The Gateway Load Balancer balances traffic among multiple Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the Gateway Load Balancer (U-turn traffic). The Gateway Load Balancer then sends the traffic back to the Gateway Load Balancer endpoint and to the destination.

**Note** Transport Layer Security (TLS) Server Identity Discovery is not supported with Geneve single-arm setup on AWS.

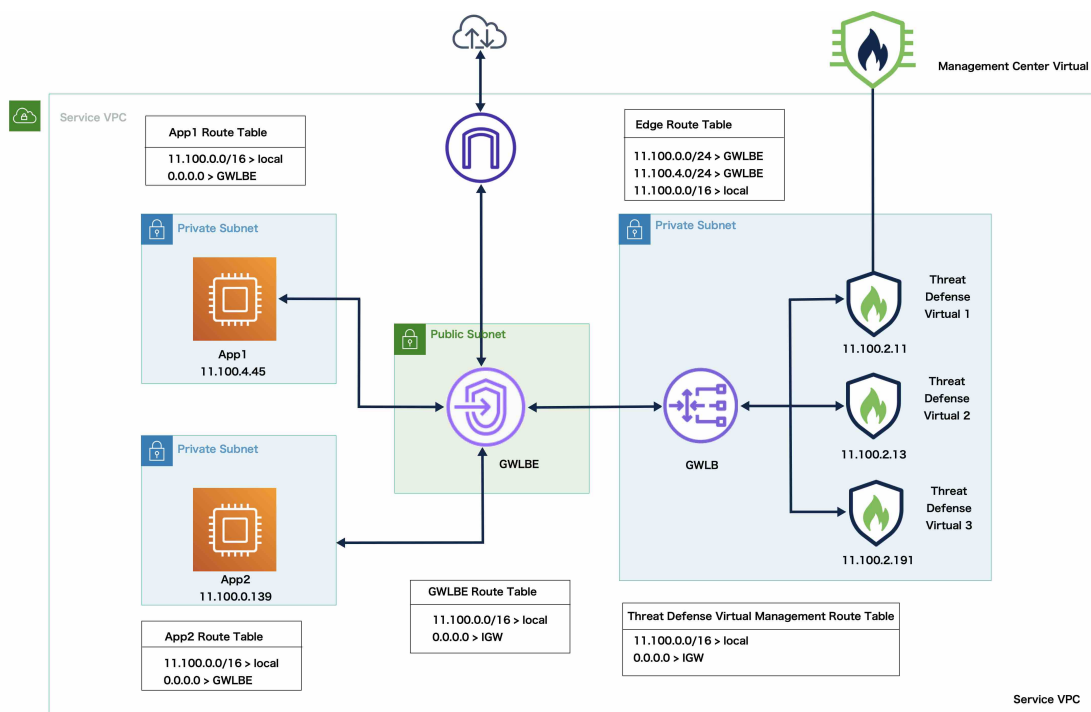

**Figure 246: Geneve Single-Arm Proxy**

## Sample Topology

The topology given below depicts both inbound and outbound traffic flow. There are three Threat Defense Virtual instances in the cluster that is connected to a GWLB. A Management Center Virtual instance is used to manage the cluster.

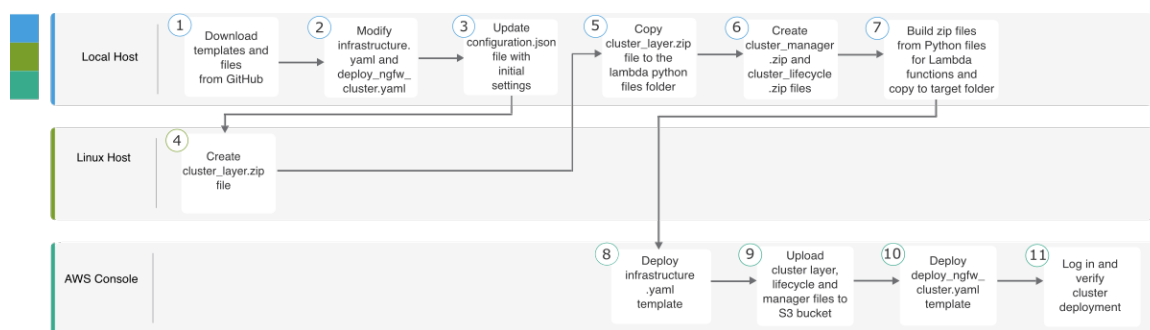

Inbound traffic from the internet goes to the GWLB endpoint which then transmits the traffic to the GWLB. Traffic is then forwarded to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM, App1 /App2.

Outbound traffic from App1/App2 is transmitted to the GWLB endpoint which then sends it out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster on AWS

### Template-based Deployment

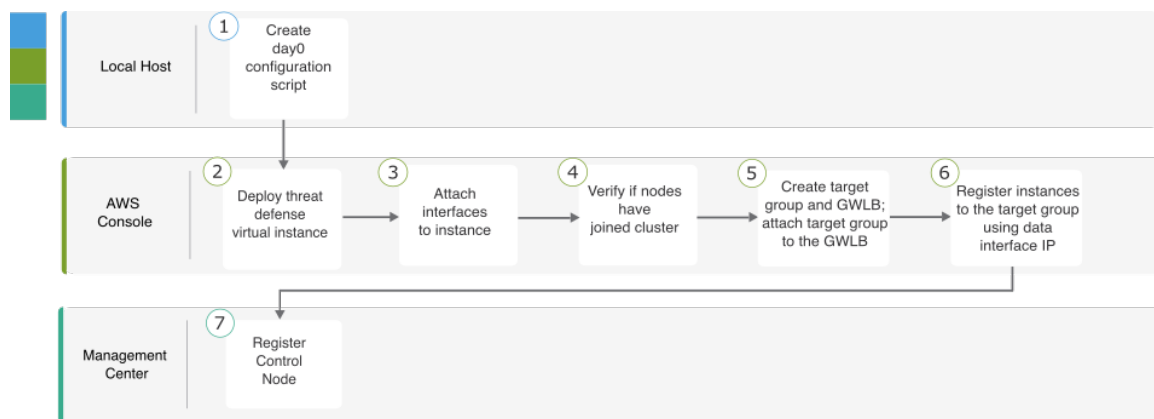

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster on AWS.

	Workspace	Steps
①	Local Host	Clone the repository from GitHub
②	Local Host	Modify <i>infrastructure.yaml</i> and <i>deploy_ngfw_cluster.yaml</i> templates.
③	Local Host	Update the <i>Configuration.json</i> file with FMC object names.
④	Linux Host	Create <i>cluster_layer.zip</i> file.
⑤	Local Host	Copy <i>cluster_layer.zip</i> file to the Lambda python files folder.
⑥	Local Host	Create <i>cluster_manager.zip</i> , <i>custom_metrics_publisher.zip</i> , and <i>cluster_lifecycle.zip</i> files.
⑦	Local Host	Build zip files from Python files for Lambda functions and copy to target folder.
⑧	AWS Console	Deploy <i>infrastructure.yaml</i> template.
⑨	AWS Console	Upload <i>cluster_layer.zip</i> , <i>cluster_lifecycle.zip</i> , <i>custom_metrics_publisher.zip</i> , and <i>cluster_manager.zip</i> to the S3 bucket.
⑩	AWS Console	Deploy <i>deploy_ngfw_cluster.yaml</i> template.
⑪	AWS Console	Log in and verify cluster deployment.

### Manual Deployment

The following flowchart illustrates the workflow for manual deployment of the Threat Defense Virtual cluster on AWS.

	Workspace	Steps
1	Local Host	Create day 0 configuration script.
2	AWS Console	Deploy Threat Defense Virtual instance.
3	AWS Console	Attach interfaces to instance.
4	AWS Console	Verify if nodes have joined cluster.
5	AWS Console	Create target group and GWLB; attach target group to the GWLB.
6	AWS Console	Register instances with the target group using data interface IP.
7	Management Center	Register control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, default values, allowed values, and description, given in the template.

- [infrastructure.yaml](#) – Template for infrastructure deployment.
- [deploy\\_ngfw\\_cluster.yaml](#) – Template for cluster deployment.

### Note

Ensure that you check the list of supported AWS instance types before deploying cluster nodes. This list is found in the *deploy\_ngfw\_cluster.yaml* template, under allowed values for the parameter InstanceType.

# Deploy the Stack in AWS Using a CloudFormation Template

Deploy the stack in AWS using the customized CloudFormation template.

## Before you begin

- You need an Amazon Linux virtual machine with Python 3.
- To allow the cluster to auto-register with the Firewall Management Center, you need to create *two* users with administrative privileges on the Firewall Management Center that can use the REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the Firewall Management Center that matches the name of the policy that you specified in `Configuration.json`.

## Procedure

### Step 1

Prepare the template.

- Clone the GitHub repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/aws>.
- Modify `infrastructure.yaml` and `deploy_ngfw_cluster.yaml` with the required parameters.
- Modify `cluster/aws/lambda-python-files/Configuration.json` with initial settings.

For example:

```
{
  "licenseCaps": ["BASE", "MALWARE", "THREAT"],
  "performanceTier": "FTDv50",
  "fmcIpforDeviceReg": "DONTRESOLVE",
  "RegistrationId": "cisco",
  "NatId": "cisco",
  "fmcAccessPolicyName": "AWS-ACL"
}
```

- Keep the `fmcIpforDeviceReg` setting as `DONTRESOLVE`.
- The `fmcAccessPolicyName` needs to match an access policy on the Firewall Management Center.

### Note

FTDv5 and FTDv10 tiers are not supported.

- Create a file named `cluster_layer.zip` to provide essential Python libraries to Lambda functions.

We recommend to use the Amazon Linux with Python 3.9 installed to create the `cluster_layer.zip` file.

### Note

If you need an Amazon Linux environment, you can create an EC2 instance using Amazon Linux 2023 AMI or use AWS Cloudshell, which runs the latest version of Amazon Linux.

For creating the `cluster-layer.zip` file, you need to first create `requirements.txt` file that consists of the python library package details and then run the shell script.

1. Create the `requirements.txt` file by specifying the python package details.

The following is the sample package details that you provide in the **requirements.txt** file:

```
$ cat requirements.txt
pycryptodome
paramiko
requests
scp
jsonschema
cffi
zip
importlib-metadata
```

**2. Run the following shell script to create **cluster\_layer.zip** file.**

```
$ pip3 install --platform manylinux2014_x86_64
--target=./python/lib/python3.9/site-packages
--implementation cp --python-version 3.9 --only-binary=:all:
--upgrade -r requirements.txt
$ zip -r cluster_layer.zip ./python
```

**Note**

If you encounter a dependency conflict error during installation, such as urllib3 or cryptography, it is recommended that you include the conflicting packages along with their recommended versions in the **requirements.txt** file. After that, you can run the installation again to resolve the conflict.

- e) Copy the resulting **cluster\_layer.zip** file to the lambda python files folder - `cluster/aws/lambda-python-files`.
- f) Create the **cluster\_layer.zip**, **custom\_metrics\_publisher.zip**, **cluster\_manger.zip** and **lifecycle\_ftdv.zip** files.

A **make.py** file can be found in the cloned repository (`cluster/aws/make.py`). This will zip the python files into a Zip file and copy to a target folder.

**python3 make.py build**

**Note**

If you are using a private IP address for the Management Center Virtual registration, then make sure that you set `USE_PUBLIC_IP_FOR_FMC_CONN` to `False` in the `cisco-ftdv/cluster/aws/lambda-python-files/constant.py` file.

**Step 2**

Deploy **infrastructure.yaml** and note the output values for cluster deployment. Before deploying the infrastructure stack, it is important to identify the AWS region and the availability zones that will be used. Each AWS region has a different set of availability zones and VPC infrastructure, therefore it is essential to select the correct region and availability zones for your deployment.

- a) On the AWS Console, go to **CloudFormation** and click **Create stack**; select **With new resources(standard)**.
- b) Select **Upload a template file**, click **Choose file**, and select **infrastructure.yaml** from the target folder.
- c) Click **Next** and provide the required information.

Parameter	Allowed Values/Type	Description
ClusterName	String	Enter unique Cluster name.
ClusterNumber	Number	Enter unique Cluster number.
VpcCidr	String	Enter the CIDR block for a new VPC

Parameter	Allowed Values/Type	Description
NoOfAZs	Number	Select 2 or 3 Availability Zones (AZs) for releases 7.6.0 and above; for lower releases, Select 1AZ.  Management, Inside, Outside and CCL subnets will be distributed across the chosen AZs accordingly.
ListOfAZs	List	Select Availability Zones (Count should match with Number of Availability Zones)
MgmtSubnetNames	CommaDelimitedList	Management subnets name (With Internet GW as Route)
MgmtSubnetCidrs	CommaDelimitedList	Management subnets Cidr list
InsideSubnetNames	CommaDelimitedList	Inside subnets name (With Private Route)
InsideSubnetCidrs	CommaDelimitedList	Inside subnets Cidr list
CCLSubnetNames	CommaDelimitedList	Enter CCL subnet name
CCLSubnetCidrs	CommaDelimitedList	Enter CCL subnet CIDR
LambdaAZs	List	Select 2 Availability Zones for Lambda
LambdaSubnetNames	CommaDelimitedList	Enter Lambda Subnets name (With NAT GW as Route), for Lambda Functions
LambdaSubnetCidrs	CommaDelimitedList	Enter Lambda Subnet CIDRs

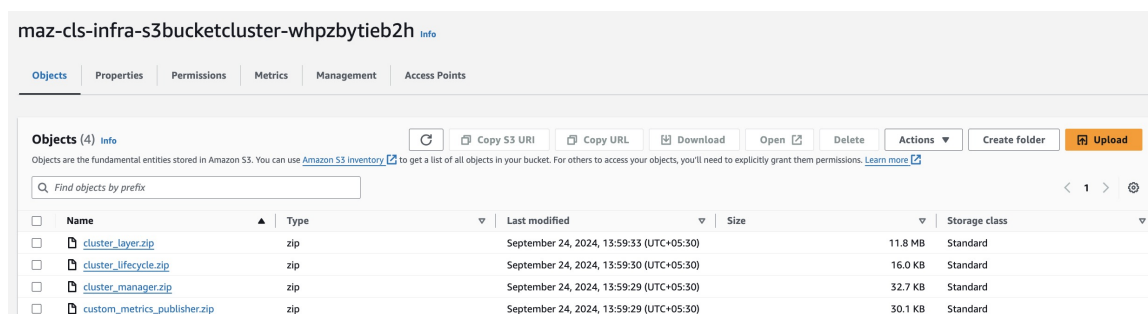

- d) Enter a unique **Cluster Name** and **Cluster Number** for the cluster.
- e) Select the availability zone from the **Availability Zone** list. This field lists only availability zones based on the AWS region that you select for deploying the infrastructure stack using the ClusterFormation template.
- f) Click **Next**, then **Create stack**.
- g) After the deployment is complete, go to **Outputs** and note the S3 **BucketName**.

Figure 247: Output of *infrastructure.yaml*

Outputs (13)				
<input type="text" value="Search outputs"/>				
Key	Value	Description	Export name	
BucketName	maz-cla-infra-s3bucketcluster-whpzbytieb2h	Name of the Amazon S3 bucket	-	
BucketUrl	<a href="http://maz-cla-infra-s3bucketcluster-whpzbytieb2h.s3-website-us-east-1.amazonaws.com">http://maz-cla-infra-s3bucketcluster-whpzbytieb2h.s3-website-us-east-1.amazonaws.com</a>	URL of S3 Bucket Static Website	-	
CCLSubnetIds	subnet-0bc04e2cc9e53e5c0,subnet-0d7d046a0fca25615,subnet-03ef42bf527551569	List of CCL subnet IDs (comma seperated)	-	
EIPforNATgw	3.218.44.132	EIP reserved for NAT GW	-	
FmcInstanceSGID	sg-076880aa64df2db5c	Security Group ID for FMC if user would like to launch in this VPC itself	-	
InInterfaceSGId	sg-06ed933d6624fe51b	Security Group ID for Inside Interfaces	-	
InsideSubnetIds	subnet-03d12cab8ee0eafff,subnet-0be9158b0970aebab,subnet-0b53c96fceb7c1f4d	List of Inside subnet IDs (comma seperated)	-	
InstanceSGId	sg-0680b74be473186aa	Security Group ID for Instances Management Interface	-	
LambdaSecurityGroupId	sg-057da2a9954e0d204	Security Group ID for Lambda Functions	-	
LambdaSubnetIds	subnet-03439803d989e6bdf,subnet-087488a9d6ffc95cd	List of lambda subnet IDs (comma seperated)	-	
ListOfAZs	us-east-1a,us-east-1b,us-east-1c	Availability zones for NGFWv instances	-	
MgmtSubnetIds	subnet-06f0bbbd3f207a504,subnet-0c339dc43688cddc9,subnet-0a67629632a655de7	List of Mangement subnet IDs (comma seperated)	-	
VpcName	vpc-09c2b0ad995e2fb24	Name of the VPC created	-	

**Step 3** Upload **cluster\_layer.zip**, **cluster\_manager.zip**, **custom\_metrics\_publisher.zip**, and **cluster\_lifecycle.zip** to the S3 bucket created by **infrastructure.yaml**.

Figure 248: S3 Bucket

**Note**

Make sure that the Elastic IP address of the Lambda NAT Gateway is added to the security group associated with the Management Center Virtual.

**Step 4**

Deploy **deploy\_ngfw\_cluster.yaml**.

- Go to **CloudFormation** and click on **Create stack**; select **With new resources(standard)**.
- Select **Upload a template file**, click **Choose file**, and select **deploy\_ngfw\_cluster.yaml** from the target folder.
- Click **Next** and provide the required information.
- Provide the following cluster and infrastructure configuration information.

Parameter	Allowed Values/Type	Description
<b>Cluster Configuration</b>		
ClusterGrpNamePrefix	String	This is the cluster name Prefix. The cluster number will be added as a suffix.
ClusterNumber	String	This is the cluster number. This will be suffixed to the cluster name (msa-ftdv-infra). For example, if this value is <b>1</b> , the group name will be <i>msa-ftdv-infra-1</i> .  It should be at least 1 digit, but not more than 3 digits. Default: 1.
ClusterSize	Numbers	This is the total number of Firewall Threat Defense Virtual nodes in a cluster.  Minimum: 1 Maximum: 16
<b>Infrastructure Details</b>		
NoOfAZs	String	This is the total number of availability zones into which Firewall Threat Defense Virtual is deployed. (The number of availability zones varies from a Minimum 1 to Maximum 3 depending on a region).  The subnet will be created in these availability zones.

Parameter	Allowed Values/Type	Description
		<p>The availability zones available in this list is based on the region selected for deploying the cluster.</p> <p><b>Note</b> Management, Inside, and Cluster Control Link (CCL) subnets are created across three availability zones based on this parameters.</p>
AZ	String	<p>The availability zone list is based on the region you plan to deploy.</p> <p>In Availability Zone list, select the valid availability zone (1 availability zone or 2 availability zones or 3 availability zones).</p> <p>Count should match with the value of Number of Availability Zones parameter.</p>
NotifyEmailID	String	<p>Email address to which cluster events email will be sent. You must accept a subscription email request to receive this email notification.</p> <p>Example: admin@company.com</p>
VpcId	String	<p>The VPC ID for the cluster group.</p> <p>Type: AWS::EC2::VPC::Id</p>
S3BktName	String	<p>The S3 Bucket that contains the uploaded Lambda zip files. You must specify correct bucket name.</p>
MgmtSubnetIds	List	<p>Enter only <i>one</i> subnet per availability zone.</p> <p>If you select multiple subnets from a same availability zone, then selecting an incorrect subnet may cause issues while deploying the Firewall Threat Defense Virtual instances.</p> <p>Type: List&lt;AWS::EC2::Subnet::Id&gt;</p>
InsideSubnetIds	List	<p>Enter at least <i>one</i> subnet per availability zone.</p> <p>If multiple subnets from the same Availability Zone are selected, then selecting an incorrect subnet may cause issues while deploying the Firewall Threat Defense Virtual instances.</p> <p>Type: List&lt;AWS::EC2::Subnet::Id&gt;</p>
LambdaSubnets	List	<p>Enter at least <i>two</i> subnet for the Lambda functions. The <i>two</i> subnets you enter must have a NAT gateway to enable the Lambda functions to communicate with AWS services, which are public DNS.</p> <p>Type: List&lt;AWS::EC2::Subnet::Id&gt;</p>

Parameter	Allowed Values/Type	Description
CCLSubnetIds	String	Enter at least <i>one</i> subnet per availability zone.  If multiple subnets from the same Availability Zone are selected, then selecting an incorrect subnet may cause issues while deploying the Firewall Threat Defense Virtual instances.  Type: List<AWS::EC2::Subnet::Id>
CCLSubnetRanges	String	Enter IP addresses range of CCL subnets for different availability zones.  Exclude first 4 reserved IP addresses. IP address pool for Cluster Control Link (CCL).  IP address is allocated to the CCL interfaces of the Firewall Threat Defense Virtual instance from CCL IP address pool.
MgmtInterfaceSG	List	Select security group ID for the Firewall Threat Defense Virtual instances.  Type: List<AWS::EC2::SecurityGroup::Id>
InsideInterfaceSG	List	Select security group ID for the inside interface of Firewall Threat Defense Virtual instances.  Type: List<AWS::EC2::SecurityGroup::Id>
LambdaSG	List	Select a security group for the Lambda functions.  Ensure outbound connections is set to <b>ANYWHERE</b> .  Type: List<AWS::EC2::SecurityGroup::Id>
CCLInterfaceSG	List	Select a security group ID for CCL interface of the Firewall Threat Defense Virtual instances.
<b>GWLB Configuration</b>		
DeployGWLBE	String	Click <b>Yes</b> to deploy the GWLB endpoint.  By default, the value is set to <b>No</b> .
VpcIdLBE	String	Enter VPC to deploy Gateway Load Balancer Endpoint.  <b>Note</b> Do not enter any value in this field if you are not deploying the GWLB endpoint.
GWLBSubnetId	String	Enter only one subnet ID.  <b>Note</b> Do not enter any value in this field if you are not deploying the GWLB endpoint.

Parameter	Allowed Values/Type	Description
		Ensure that the subnet belongs to the correct VPC, and the availability zones that you have specified.
TargetFailover	String	<p>Enable Target Failover support when a target fails or deregisters. (By default, the value of this parameter is set to <b>rebalance</b>).</p> <ul style="list-style-type: none"> <li>• <b>no_rebalance</b>: Directs existing flows to failed targets and new flows to healthy targets, ensuring backward compatibility.</li> <li>• <b>rebalance</b>: Redistributes existing flows while ensuring that new flows go to healthy targets.</li> </ul> <p><i>rebalance</i> is supported from Firewall Threat Defense Virtual Version 7.4.1 and later.</p>
TgHealthPort	String	<p>Enter Health Check Port for GWLB.</p> <p><b>Note</b> By default, this port must not be used for traffic.</p> <p>Ensure the value you provide is a valid TCP port. Default: 8080</p>
<b>Cisco NGFWv Instance Configuration</b>		
InstanceType	String	<p>Cisco Firewall Threat Defense Virtual EC2 instance type.</p> <p>Ensure that the AWS Region supports Instance Type you select.</p> <p>By default, <b>c5.xlarge</b> is selected.</p>
LicenseType	String	<p>Choose Cisco Firewall Threat Defense Virtual EC2 instance license type. Ensure that the AMI ID that you enter in <b>AMI-ID</b> parameter is of the same licensing type.</p> <p>By default, <b>BYOL</b> is selected.</p>
AssignPublicIP	String	<p>Set the value as <b>true</b> to assign a public IP address for Firewall Threat Defense Virtual from the AWS IP address pool.</p>
AmiID	String	<p>Choose the correct AMI ID as per the region, version, and license type (BYOL or PAYG).</p> <p>Firewall Threat Defense Virtual 7.2 and later support clustering, and Firewall Threat Defense Virtual Version 7.6 and later support the autoscaling and multiple availability zone enhancements.</p>

Parameter	Allowed Values/Type	Description
		Type: AWS::EC2::Image::Id
ngfwPassword	String	<p>Firewall Threat Defense Virtual instance password.</p> <p>All Firewall Threat Defense Virtual instances come up with a default password, which is in the Userdata field of the Launch Template (Cluster Group).</p> <p>The password is activated after Firewall Threat Defense Virtual is accessible.</p> <p>Minimum length must be 8 characters. The password can either be a plain text password or a KMS encrypted password.</p>
KmsArn	String	<p>Enter ARN of an existing KMS (AWS KMS key to encrypt at rest).</p> <p>If you specify a value in this field, then the Firewall Threat Defense Virtual instance's <b>admin</b> password must be an encrypted password.</p> <p>Example of generating an encrypted password: <code>"aws kms encrypt --key-id &lt;KMS ARN&gt; --plaintext &lt;password&gt;"</code></p> <p>The password encryption must be done using only the specified ARN.</p>
<b>FMC Automation Configuration</b>		
fmcDeviceGrpName	String	Enter a unique name for the cluster group in management center.
fmcPublishMetrics	String	<p>Select <b>true</b> to create a Lambda Function to poll management center and publish specific device group metrics to AWS CloudWatch.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> <li>• true</li> <li>• false</li> </ul> <p>By default, the value is set to <b>true</b>.</p>
fmcMetricsUsername	String	<p>Enter a unique internal user name for polling memory metrics from management center.</p> <p>The user must have privileges of <b>Network Admin</b> and <b>Maintenance User</b> or more .</p>
fmcMetricsPassword	String	Enter the password.

Parameter	Allowed Values/Type	Description
		<p>If you have mentioned KMS Master Key ARN parameter, ensure to provide an encrypted password.</p> <p>Ensure to enter the correct password because entering incorrect password may result in failure of metrics collection.</p>
fmcServer	String	<p>The IP address can be an external IP address or the IP address reachable in Firewall Threat Defense Virtual management subnet in the VPC.</p> <p>Minimum length: 7</p> <p>Maximum length:15</p>
fmcOperationsUsername	String	<p>Provide a unique internal user name for Firewall Management Center Virtual for CloudWatch.</p> <p>The user must have <b>Administrator</b> privileges.</p>
fmcOperationsPassword	String	<p>Enter the password.</p> <p>If you have mentioned KMS Master Key ARN parameter, ensure to provide an encrypted password.</p>
<b>Scaling Configuration</b>		
CpuThresholds	CommaDelimitedList	<p>(Optional) Specifying non-zero lower and upper thresholds will create scale policies. If (0,0) is selected, no CPU scaling alarm or policies will be created. Evaluation points and data points are at default or recommended values.</p> <p>By default, <b>Autoscale</b> is enabled in this template. Autoscale can be disabled after deployment.</p>
MemoryThresholds	CommaDelimitedList	<p>Specifying non-zero lower and upper threshold will create scale policies. If (0,0) is selected, no memory scaling alarm or policies will be created. Evaluation points and data points are at default or recommended values.</p>

- e) Click **Next**, then **Create stack**.

The Lambda functions manage the rest of the process, and the Firewall Threat Defense Virtuals will automatically register with the Firewall Management Center.

**Figure 249: Deployed Resources**

The status changes from **CREATE\_IN\_PROGRESS** to **CREATE COMPLETE** indicating successful deployment.

**Step 5** Verify the cluster deployment by logging into any one of the nodes and using the **show cluster info** command.

**Figure 250: Cluster Nodes**

## Deploy the Cluster in AWS Manually

To deploy the cluster manually, prepare the day 0 configuration, deploy each node, and then add the control node to the Firewall Management Center.

### Create the Day0 Configuration for AWS

You can use either a fixed configuration or a customized configuration. We recommend using the fixed configuration.

#### Create the Day0 Configuration With a Fixed Configuration for AWS

The fixed configuration will auto-generate the cluster bootstrap configuration.

##### Single Availability Zone - Day0 Configuration with a fixed configuration for AWS

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name",
    [For Gateway Load Balancer] "Geneve": "{Yes | No}",
    [For Gateway Load Balancer] "HealthProbePort": "port"
  }
}
```

For example:

```
{
  "AdminPassword": "Sup3rnatural",
  "Hostname": "ciscoftdv",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "10.5.90.4 10.5.90.30",
    "ClusterGroupName": "ftdv-cluster",
    "Geneve": "Yes",
    "HealthProbePort": "7777"
  }
}
```

For the **CclSubnetRange** variable, specify a range of IP addresses starting from x.x.x.4. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start (*ip\_address\_start*) and end (*ip\_address\_end*) IP addresses given below.

**Table 36: Examples of Start and End IP addresses**

CIDR	Start IP Address	End IP Address
10.1.1.0/27	10.1.1.4	10.1.1.30
10.1.1.32/27	10.1.1.36	10.1.1.62

CIDR	Start IP Address	End IP Address
10.1.1.64/27	10.1.1.68	10.1.1.94
10.1.1.96/27	10.1.1.100	10.1.1.126
10.1.1.128/27	10.1.1.132	10.1.1.158
10.1.1.160/27	10.1.1.164	10.1.1.190
10.1.1.192/27	10.1.1.196	10.1.1.222
10.1.1.224/27	10.1.1.228	10.1.1.254
10.1.1.0/24	10.1.1.4	10.1.1.254

## Deploy Cluster Nodes

Deploy the cluster nodes so they form a cluster.

### Procedure

- Step 1** Deploy the Threat Defense Virtual instance by using the cluster day 0 configuration with the required number of interfaces - four interfaces if you are using Gateway Load Balancer (GWLB), or five interfaces if you are using non-native load balancer. To do this, in the **Configure Instance Details > Advanced Details** section, paste the cluster day 0 configuration.

#### Note

Ensure that you attach interfaces to the instances in the order given below.

- AWS Gateway Load Balancer - four interfaces - management, diagnostic, inside, and cluster control link.
- Non-native load balancers - five interfaces - management, diagnostic, inside, outside, and cluster control link.

For more information on deploying Threat Defense Virtual on AWS, see [Deploy the Threat Defense Virtual on AWS](#).

- Step 2** Repeat Step 1 to deploy the required number of additional nodes.
- Step 3** Use the **show cluster info** command on the Threat Defense Virtual console to verify if all nodes have successfully joined the cluster.
- Step 4** Configure the AWS Gateway Load Balancer.
- Create a target group and GWLB.
  - Attach the target group to the GWLB.

#### Note

Ensure that you configure the GWLB to use the correct security group, listener configuration, and health check settings.

- Register the data interface (inside interface) with the Target Group using IP addresses.

For more information, see [Create a Gateway Load Balancer](#).

- Step 5** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 546.

## Configure Target Failover for Secure Firewall Threat Defense Virtual Clustering with GWLB in AWS

Threat Defense Virtual clustering in AWS utilizes the Gateway Load Balancer (GWLB) to balance and forward network packets for inspection to a designated Threat Defense Virtual node. The GWLB is designed to continue sending network packets to the target node in the event of a failover or deregistration of that node.

The Target Failover feature in AWS enables GWLB to redirect network packets to a healthy target node in the event of node deregistration during planned maintenance or a target node failure. It takes advantage of the cluster's stateful failover.

In AWS, you can configure Target Failover through the AWS Elastic Load Balancing (ELB) API or AWS console.

**Note** If a target node fails while the GWLB routes traffic using certain protocols such as SSH, SCP, CURL, and so on, then there may be a delay in redirecting traffic to a healthy target. This delay is due to rebalancing and rerouting of traffic flow.

In AWS, you can configure Target Failover through the AWS ELB API or AWS console.

- **AWS API** - In the AWS ELB API - *modify-target-group-attributes* you can define the flow handling behavior by modifying the following two new parameters.
  - **target\_failover.on\_unhealthy** - It defines how the GWLB handles the network flow when the target becomes unhealthy.
  - **target\_failover.on\_deregistration** - It defines how the GWLB handles the network flow when the target is deregistered.

The following command shows the sample API parameter configuration of defining these two parameters.

```
aws elbv2 modify-target-group-attributes \
--target-group-arn arn:aws:elasticloadbalancing:us-east-1:123456789012:targetgroup/tg-123456789012 \
--attributes \
Key=target_failover.on_unhealthy, Value=rebalance[no_rebalance] \
Key=target_failover.on_deregistration, Value=rebalance[no_rebalance]
```

For more information, refer [TargetGroupAttribute](#) in the AWS documentation.

- **AWS Console** – In the EC2 console, you can enable the Target Failover option on the Target Group page by configuring the following options.
  - Edit Target Groups Attributes
  - Enable Target Failover
  - Verify Rebalance Flows

For more information about how to enable Target Failover, see [Enable Target Failover for Secure Firewall Threat Defense Virtual Clustering in AWS, on page 517](#).

## Enable Target Failover for Secure Firewall Threat Defense Virtual Clustering in AWS

The data interface of Firewall Threat Defense Virtual is registered to a target group of GWLB in AWS. In the Firewall Threat Defense Virtual clustering, each instance is associated with a Target Group. The GWLB load balances and sends the traffic to this healthy instance identified or registered as a target node in the target group.

### Before you begin

You must have deployed the cluster in AWS either by manual method or using CloudFormation templates.

If you are deploying a cluster using a CloudFormation template, you can also enable the **Target Failover** parameter by assigning the **rebalance** attribute that is available under **GWLB Configuration** section of the cluster deployment file, `deploy_ftdv_clustering.yaml`. In the template, by default, the value is set to **rebalance** for this parameter. However, the default value for this parameter is set to **no\_rebalance** on the AWS console.

Where,

- **no\_rebalance** - GWLB continues to send the network flow to the failed or deregistered target.
- **rebalance** - GWLB sends the network flow to another healthy target when the existing target is failed or deregistered.

For information on deploying stack in AWS, see:

- [Deploy the Cluster in AWS Manually](#)
- [Deploy the Stack in AWS Using a CloudFormation Template](#)

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | On the AWS Console, go to <b>Services &gt; EC2</b>   |
| <b>Step 2</b> | Click <b>Target Groups</b> to view the target groups page.   |
| <b>Step 3</b> | Select the target group to which the Firewall Threat Defense Virtual data interface IPs are registered. The target group details page is displayed, where you can enable the Target failover attributes.                                   |
| <b>Step 4</b> | Go to the <b>Attributes</b> menu.  |
| <b>Step 5</b> | Click <b>Edit</b> to edit the attributes.  |
| <b>Step 6</b> | Toggle the <b>Rebalance flows</b> slider button to the right to enable target failover to configure GWLB to rebalance and forward the existing network packets to a healthy target node in the event of target failover or deregistration. |
-

## Deploy the Cluster in Azure

You can use the cluster with the Azure Gateway Load Balancer (GWLB), or with a non-native load-balancer. To deploy a cluster in Azure, use Azure Resource Manager (ARM) templates to deploy a Virtual Machine Scale Set.

### Sample Topology for GWLB-based Cluster Deployment

*Figure 252: Inbound Traffic Use Case and Topology with GWLB*

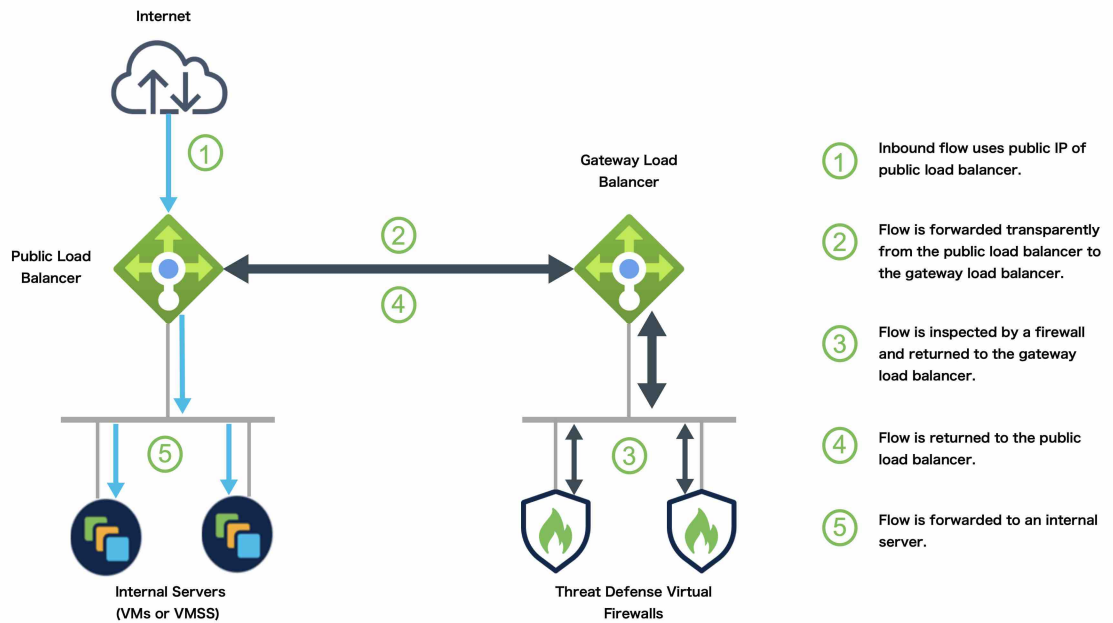

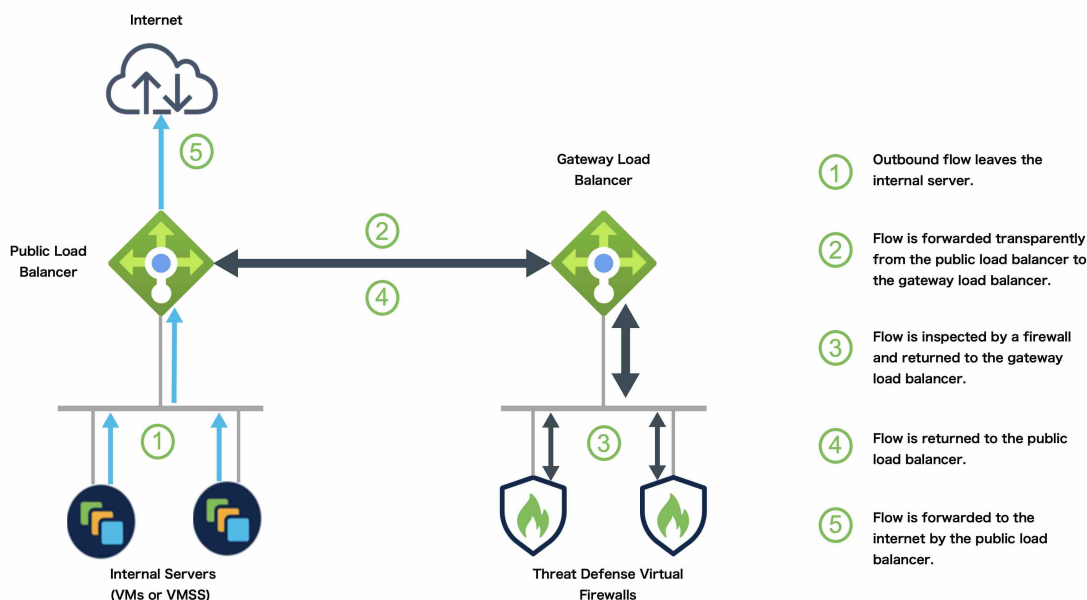

Figure 253: Outbound Traffic Use Case and Topology with GWLB

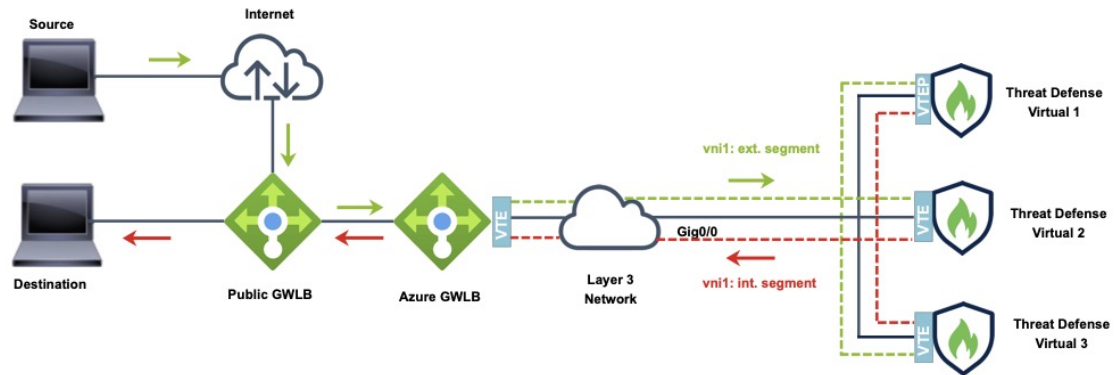

## Azure Gateway Load Balancer and Paired Proxy

In an Azure service chain, Threat Defense Virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

The following figure shows traffic forwarded to the Azure Gateway Load Balancer from the Public Gateway Load Balancer on the external VXLAN segment. The Gateway Load Balancer balances traffic among multiple Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the Gateway Load Balancer on the internal VXLAN segment. The Azure Gateway Load Balancer then sends the traffic back to the Public Gateway Load Balancer and to the destination.

Figure 254: Azure Gateway Load Balancer with Paired Proxy

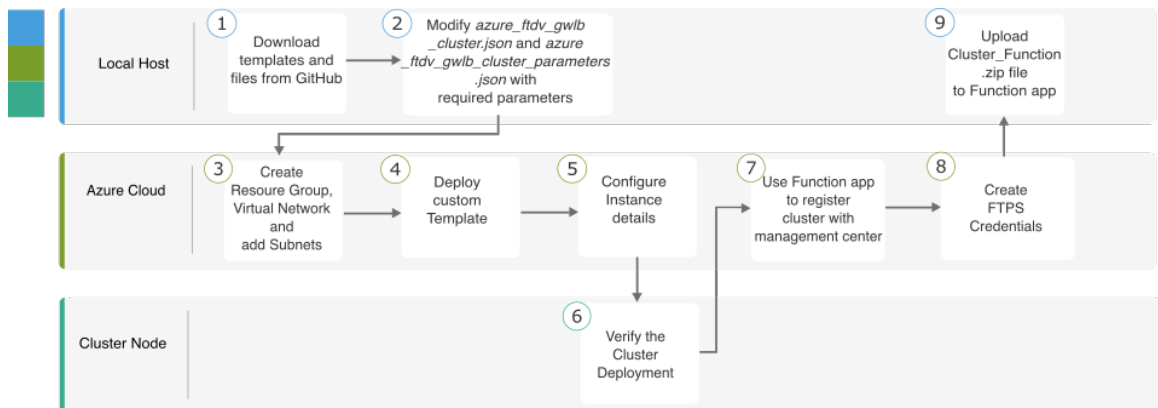

Traffic flow between GWLB to GWLB (Geneve Single-Arm Proxy) in Azure

## End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with GWLB

### Template-based Deployment

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster in Azure with GWLB.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Modify <code>azure_ftdv_gwlb_cluster.json</code> and <code>azure_ftdv_gwlb_cluster_parameters.json</code> with the required parameters.
3	Azure Cloud	Create the resource group, virtual network, and subnets.

	Workspace	Steps
④	Azure Cloud	Deploy custom template.
⑤	Azure Cloud	Configure instance details.
⑥	Cluster Node	Verify cluster deployment.
⑦	Azure Cloud	Use the Function app to register the cluster with the Management Center.
⑧	Azure Cloud	Create FTPS credentials.
⑨	Local Host	Upload <i>Cluster_Function.zip</i> file to the Function app.

### Manual Deployment

The following flowchart illustrates the workflow of manual deployment of Threat Defense Virtual cluster in Azure with GWLB.

	Workspace	Steps
①	Local Host	Create a VMSS from the Marketplace image.
②	Local Host	Attach interfaces.
③	Local Host	Add day 0 configuration in the customData field.
④	Local Host	Update scaling instance count.
⑤	Local Host	Configure GWLB.
⑥	Management Center	Add control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

From Secure Firewall version 7.4.1, you can deploy the cluster without the diagnostic interface. To deploy the cluster with only the Outside, Inside, Management, and CCL interfaces, use the withoutDiagnostic templates - [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster\\_parameters.json](#) and [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster.json](#) files.

Templates to deploy **with Diagnostic** Interface:

- [azure\\_ftdv\\_gwlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Firewall Threat Defense Virtual cluster with GWLB.
- [azure\\_ftdv\\_gwlb\\_cluster.json](#) – Template to deploy Firewall Threat Defense Virtual cluster with GWLB.

Templates to deploy **without Diagnostic** Interface:

- [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Firewall Threat Defense Virtual cluster with GWLB deployment without Diagnostic interface.
- [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster.json](#) – Template to deploy Firewall Threat Defense Virtual cluster with GWLB without Diagnostic interface.

## Prerequisites

- To allow the cluster to auto-register to the management center, create a user with Network Admin & Maintenance User privileges on the management center. Users with these privileges can use REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the management center that matches the name of the policy that you will specify during template deployment.
- Ensure that the Management Center Virtual is licensed appropriately.
- Perform the steps given below after the cluster is added to the Management Center Virtual:
  1. Configure platform settings with the health check port number in the Management Center. For more information on configuring this, see [Platform Settings](#).
  2. Create a static route for data traffic. For more information on creating a static route, see [Add a Static Route](#).

Sample static route configuration:

```
Network: any-ipv4
Interface: vxlan_tunnel
Leaked from Virtual Router: Global
Gateway: vxlan_tunnel_gw
Tunneled: false
Metric: 2
```

**Note** *vxlان\_tunnel\_gw* is the data subnet's gateway IP address.

## Deploy Cluster on Azure with GWLB Using an Azure Resource Manager Template

Deploy the Virtual Machine Scale Set for Azure GWLB using the customized Azure Resource Manager (ARM) template.

### Procedure

#### Step 1

Prepare the template.

- Clone the github repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/azure>.
- Modify *azure\_ftdv\_gwlb\_cluster.json* and *azure\_ftdv\_gwlb\_cluster\_parameters.json* with the required parameters.

OR

Modify withoutDiagnostic templates, *azure\_withoutDiagnostic\_ftdv\_gwlb\_cluster\_parameters.json* and *azure\_withoutDiagnostic\_ftdv\_gwlb\_cluster.json*, with the required parameter for deploying cluster without the diagnostic interface.

#### Step 2

Log into the Azure Portal: <https://portal.azure.com>.

#### Step 3

Create a Resource Group.

- In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
- Choose the required **Region**.

#### Step 4

Create a virtual network with 4 subnets: Management, Diagnostic, Outside, and Cluster Control Link (CCL).

From Secure Firewall version 7.4.1, you can deploy the cluster without the diagnostic interface. To deploy the cluster with only the Outside, Inside, Management, and CCL interfaces, use the withoutDiagnostic templates - [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster\\_parameters.json](#) and [azure\\_withoutDiagnostic\\_ftdv\\_gwlb\\_cluster.json](#) files.

- Create the virtual network.

- In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
- Choose the required **Region**. Click **Next: IP addresses**.

In the **IP Addresses** tab, click **Add subnet** and add the following subnets – Management, Diagnostic, Data, and Cluster Control Link.

If you are deploying the Firewall Threat Defense Virtual 7.4.1 cluster without a Diagnostic interface, then you must skip the Diagnostic subnet creation.

- Add the subnets.

#### Step 5

Deploy the custom template.

- a) Click **Create** > **Template deployment (deploy using custom templates)**.
- b) Click **Build your own template in the editor**.
- c) Click **Load File**, and upload **azure\_ftdv\_gwlb\_cluster.json** or **azure\_withoutDiagnostic\_ftdv\_gwlb\_cluster.json**, if you have opted for without diagnostic interface deployment.
- d) Click **Save**.

**Step 6** Configure the Instance details.

- a) Enter the required values and then click **Review + create**.
- b) Click **Create** after the validation is passed.

**Step 7** After the instance is running, verify the cluster deployment by logging into any one of the nodes and entering the **show cluster info** command.

*Figure 255: show cluster info*

```
> show cluster info
Cluster gwlb-cluster-template-with-AN: On
Interface mode: individual
Cluster Member Limit : 16
This is "12" in state CONTROL_NODE
ID      : 0
Version : 99.19(1)180
Serial No.: 9AKGFV8VH4G
CCL IP   : 10.1.1.12
CCL MAC  : 000d.3a55.5470
Module   : NGFWv
Resource : 8 cores / 28160 MB RAM
Last join : 11:13:24 UTC Sep 5 2022
Last leave: N/A
```

**Step 8** In the Azure Portal, click the Function app to register the cluster with the Firewall Management Center.

**Note**

If you do not want to use the Function app, you can alternatively register the control node to the Firewall Management Center directly by using **Add > Device** (not **Add > Cluster**). The rest of the cluster nodes will register automatically.

**Step 9** Create FTPS Credentials by clicking **Deployment Center > FTPS credentials > User scope > Configure Username and Password**, and then click **Save**.

**Step 10** Upload the Cluster\_Function.zip file to the Function app by executing the following **curl** command in the local terminal.

```
curl -X POST -u username --data-binary @"Cluster_Function.zip" https://
Function_App_Name.scm.azurewebsites.net/api/zipdeploy
```

**Note**

The **curl** command might take few minutes (~2 to 3 minutes) to complete command execution.

The function will be uploaded to the Function app. The function will start, and you can see the logs in the storage account's outqueue. The device registration with the Management Center will be initiated.

Figure 256: Functions

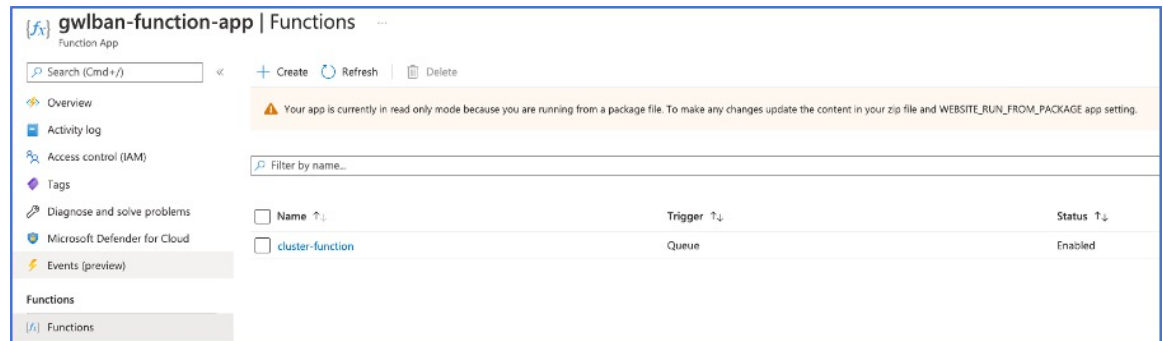

Figure 257: Queues

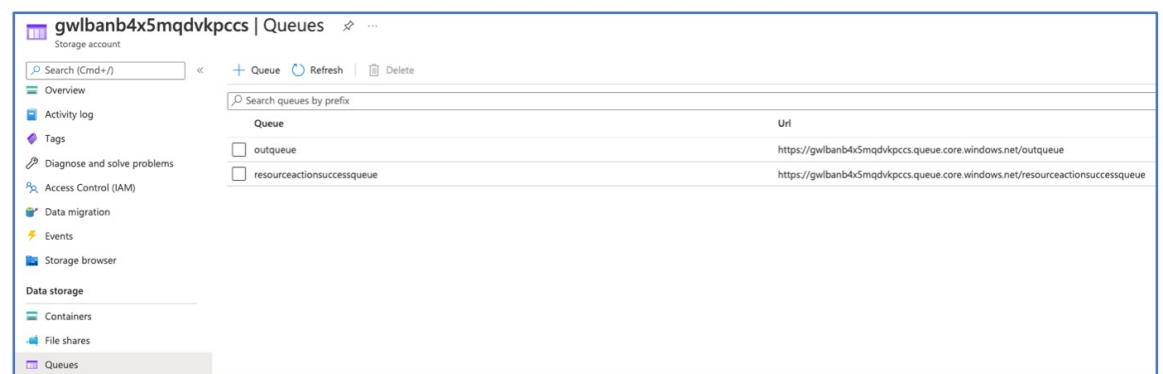

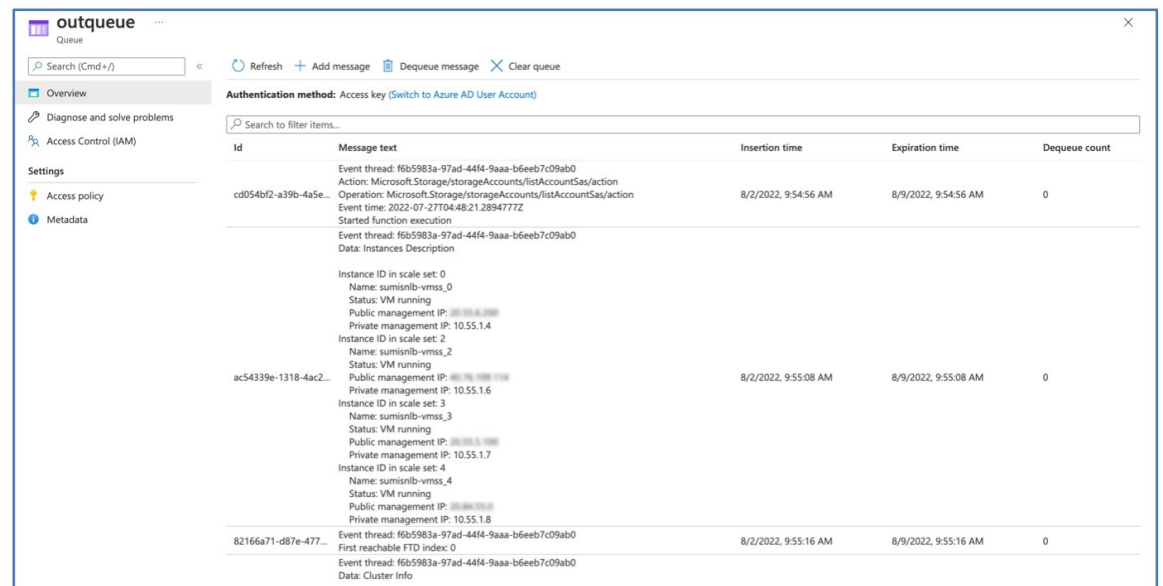

Figure 258: Outqueue

## Sample Topology for NLB-based Cluster Deployment

This topology depicts both inbound and outbound traffic flow. The Threat Defense Virtual cluster is sandwiched between the internal and external load balancers. A Management Center Virtual instance is used to manage the cluster.

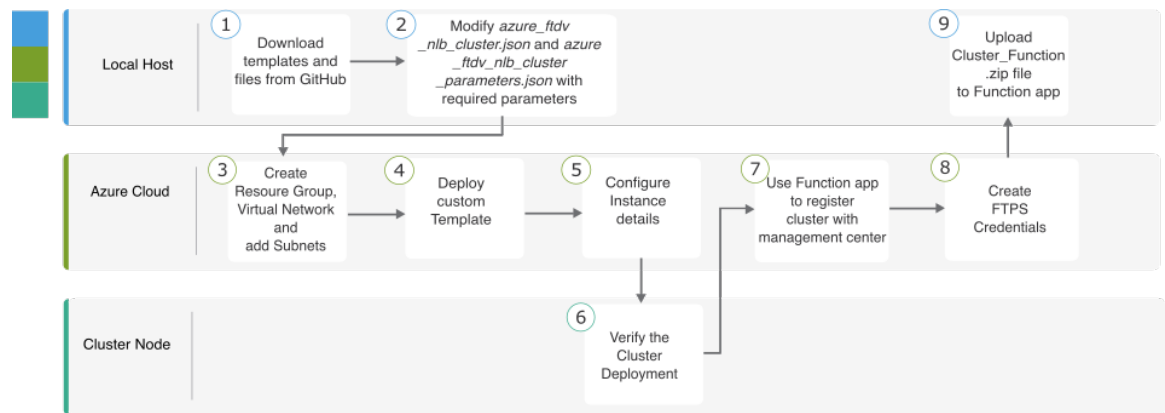

Inbound traffic from the internet goes to the external load balancer which then transmits the traffic to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM.

Outbound traffic from the application VM is transmitted to the internal load balancer. Traffic is then forwarded to the Threat Defense Virtual cluster and then sent out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster in Azure with NLB

### Template-based Deployment

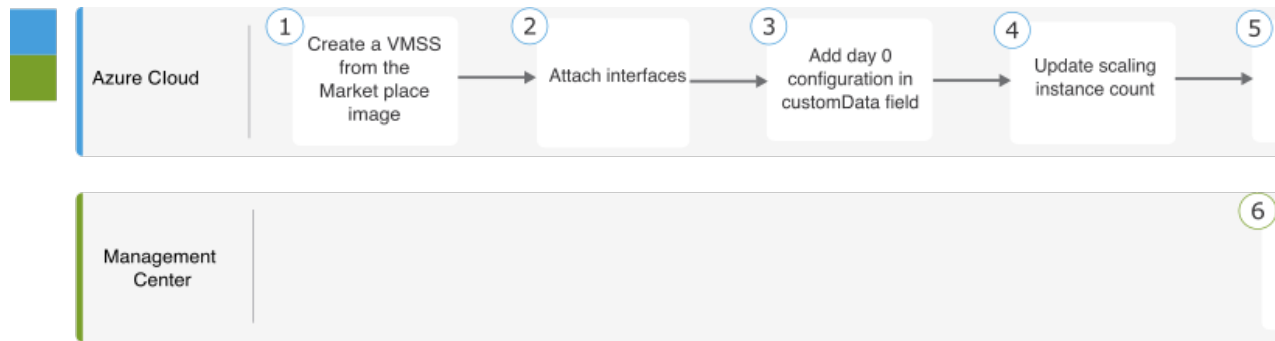

The following flowchart illustrates the workflow of template-based deployment of Threat Defense Virtual cluster in Azure with NLB.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Modify <i>azure_ftdv_nlb_cluster.json</i> and <i>azure_ftdv_nlb_cluster_parameters.json</i> with the required parameters.
3	Azure Cloud	Create the resource group, virtual network, and subnets.
4	Azure Cloud	Deploy custom template.
5	Azure Cloud	Configure instance details.
6	Cluster Node	Verify cluster deployment.
7	Azure Cloud	Use the Function app to register the cluster with the Management Center.
8	Azure Cloud	Create FTPS credentials.
9	Local Host	Upload <i>Cluster_Function.zip</i> file to the Function app.

### Manual Deployment

The following flowchart illustrates the workflow of manual deployment of Threat Defense Virtual cluster in Azure with NLB.

	Workspace	Steps
1	Local Host	Create a VMSS from the Marketplace image.
2	Local Host	Attach interfaces.
3	Local Host	Add day 0 configuration in the customData field.
4	Local Host	Update scaling instance count.
5	Local Host	Configure NLB.
6	Management Center	Add control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

From Secure Firewall version 7.4.1, you can deploy the cluster without the diagnostic interface. To deploy the cluster with only the Outside, Inside, Management, and CCL interfaces, use the withoutDiagnostic templates - [azure\\_withoutDiagnostic\\_ftdv\\_nlb\\_cluster\\_parameters.json](#) and [azure\\_withoutDiagnostic\\_ftdv\\_nlb\\_cluster.json](#) files.

Templates to deploy **with Diagnostic** Interface:

- [azure\\_ftdv\\_nlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Threat Defense Virtual cluster with NLB.
- [azure\\_ftdv\\_nlb\\_cluster.json](#) – Template to deploy Threat Defense Virtual cluster with NLB.

Templates to deploy **without Diagnostic** Interface:

- [azure\\_withoutDiagnostic\\_ftdv\\_nlb\\_cluster\\_parameters.json](#) – Template to enter parameters for the Firewall Threat Defense Virtual cluster with NLB deployment without Diagnostic interface.
- [azure\\_withoutDiagnostic\\_ftdv\\_nlb\\_cluster.json](#) – Template to deploy Firewall Threat Defense Virtual cluster with NLB without Diagnostic interface.

## Prerequisites

- To allow the cluster to auto-register with the Management Center, create a user with Network Admin & Maintenance User privileges on the Management Center. Users with these privileges can use REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the Management Center that matches the name of the policy that you will specify during template deployment.
- Ensure that the Management Center Virtual is licensed appropriately.
- After the cluster is added to the Management Center Virtual:
  1. Configure platform settings with the health check port number in the Management Center. For more information on configuring this, see [Platform Settings](#).
  2. Create static routes for traffic from outside and inside interfaces. For more information on creating a static route, see [Add a Static Route](#).

Sample static route configuration for the outside interface:

```
Network: any-ipv4
Interface: outside
Leaked from Virtual Router: Global
Gateway: ftdv-cluster-outside
Tunneled: false
Metric: 10
```

---

**Note** *ftdv-cluster-outside* is the outside subnet's gateway IP address.

---

Sample static route configuration for the inside interface:

```
Network: any-ipv4
Interface: inside
Leaked from Virtual Router: Global
Gateway: ftdv-cluster-inside-gw
Tunneled: false
Metric: 11
```

---

**Note** *ftdv-cluster-inside-gw* is the inside subnet's gateway IP address.

---

3. Configure NAT rule for data traffic. For more information on configuring NAT rules, see [Network Address Translation](#).

## Deploy Cluster on Azure with NLB Using an Azure Resource Manager Template

Deploy the cluster for Azure NLB using the customized Azure Resource Manager (ARM) template.

## Procedure

### Step 1

Prepare the template.

- a) Clone the github repository to your local folder. See <https://github.com/CiscoDevNet/cisco-ftdv/tree/master/cluster/azure>.
- b) Modify *azure\_ftdv\_nlb\_cluster.json* and *azure\_ftdv\_nlb\_cluster\_parameters.json* with the required parameters.

Modify withoutDiagnostic templates, *azure\_withoutDiagnostic\_ftdv\_nlb\_cluster\_parameters.json* and *azure\_withoutDiagnostic\_ftdv\_nlb\_cluster.json*, with the required parameter for deploying cluster without the diagnostic interface.

### Step 2

Log into the Azure Portal: <https://portal.azure.com>.

### Step 3

Create a Resource Group.

- a) In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
- b) Choose the required **Region**.

### Step 4

Create a virtual network with 5 subnets: Management, Diagnostic, Inside, Outside, and Cluster Control Link.

From Secure Firewall version 7.4.1, you can deploy the cluster without the diagnostic interface. To deploy the cluster with only the Outside, Inside, Management, and Cluster Control Link interfaces, use the withoutDiagnostic templates - *azure\_withoutDiagnostic\_ftdv\_nlb\_cluster\_parameters.json* and *azure\_withoutDiagnostic\_ftdv\_nlb\_cluster.json* files.

- a) Create the virtual network.
  1. In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
  2. b) Choose the required **Region**. Click **Next: IP addresses**.

- b) Add the subnets.

In the **IP Addresses** tab, click **Add subnet** and add the following subnets – Management, Diagnostic, Inside, Outside, and Cluster Control Link.

If you are deploying the Firewall Threat Defense Virtual 7.4.1 cluster without a Diagnostic interface, then you must skip the Diagnostic subnet creation.

### Step 5

Deploy the custom template.

- a) Click **Create > Template deployment (deploy using custom templates)**.
- b) Click **Build your own template in the editor**.
- c) Click **Load File**, and upload *azure\_ftdv\_nlb\_cluster.json* or *azure\_withoutDiagnostic\_ftdv\_nlb\_cluster.json*, if you have opted for without diagnostic interface deployment.
- d) Click **Save**.

### Step 6

Configure the instance details.

- a) Enter the required values and then click **Review + create**.

#### Note

For the cluster control link starting and ending addresses, specify only as many addresses as you need (up to 16). A larger range can affect performance.

b) Click **Create** after the validation is passed.

### Step 7

After the instance is running, verify the cluster deployment by logging into any one of the nodes and using the **show cluster info** command.

*Figure 259: show cluster info*

```
> show cluster info
Cluster gwlb-cluster-template-with-AN: On
Interface mode: individual
Cluster Member Limit : 16
This is "12" in state CONTROL_NODE
ID       : 0
Version  : 99.19(1)180
Serial No.: 9AKGFV8VH4G
CCL IP   : 10.1.1.12
CCL MAC  : 000d.3a55.5470
Module   : NGFWv
Resource : 8 cores / 28160 MB RAM
Last join : 11:13:24 UTC Sep 5 2022
Last leave: N/A
```

### Step 8

In the Azure Portal, click the Function app to register the cluster to the Firewall Management Center.

#### Note

If you do not want to use the Function app, you can alternatively register the control node with the Management Center directly by using **Add > Device** (not **Add > Cluster**). The rest of the cluster nodes will register automatically.

### Step 9

Create FTPS Credentials by clicking **Deployment Center > FTPS credentials > User scope > Configure Username and Password**, and then click **Save**.

### Step 10

Upload the Cluster\_Function.zip file to the Function app by executing the following **curl** command in the local terminal.

```
curl -X POST -u username --data-binary @"Cluster_Function.zip" https://
Function_App_Name.scm.azurewebsites.net/api/zipdeploy
```

#### Note

The **curl** command might take a few minutes (~2 to 3 minutes) to complete command execution.

The function will be uploaded to the Function app. The function will start, and you can see the logs in the storage account's outqueue. The device registration with the Management Center will be initiated.

## Deploy the Cluster in Azure Manually

To deploy the cluster manually, prepare the day0 configuration, deploy each node, and then add the control node to the Firewall Management Center.

### Create the Day0 Configuration for Azure

You can use either a fixed configuration or a customized configuration.

#### Create the Day0 Configuration With a Fixed Configuration for Azure

The fixed configuration will auto-generate the cluster bootstrap configuration.

```

"Cluster": {
  "CclSubnetRange": "ip_address_start ip_address_end",
  "ClusterGroupName": "cluster_name",
  "HealthProbePort": "port_number",
  "GatewayLoadBalancerIP": "ip_address",
  "EncapsulationType": "vxlan",
  "InternalPort": "internal_port_number",
  "ExternalPort": "external_port_number",
  "InternalSegId": "internal_segment_id",
  "ExternalSegId": "external_segment_id"
}

```

### Example

A sample day 0 configuration is given below.

```

"Cluster": {
  "CclSubnetRange": "10.45.3.4 10.45.3.30",           //mandatory user input
  "ClusterGroupName": "ngfwv-cluster",               //mandatory user input
  "HealthProbePort": "7777",                         //mandatory user input
  "GatewayLoadBalancerIP": "10.45.2.4",              //mandatory user input
  "EncapsulationType": "vxlan",
  "InternalPort": "2000",
  "ExternalPort": "2001",
  "InternalSegId": "800",
  "ExternalSegId": "801"
}

```

**Note** If you are copying and pasting the configuration given above, ensure that you remove **//mandatory user input** from the configuration

For the Azure health check settings, be sure to specify the **HealthProbePort** you set here.

For the **CclSubnetRange** variable, specify a range of IP addresses starting from x.x.x.4. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start and end IP addresses are given below.

**Table 37: Examples of Start and End IP addresses**

CIDR	Start IP Address	End IP Address
10.1.1.0/27	10.1.1.4	10.1.1.30
10.1.1.32/27	10.1.1.36	10.1.1.62
10.1.1.64/27	10.1.1.68	10.1.1.94
10.1.1.96/27	10.1.1.100	10.1.1.126
10.1.1.128/27	10.1.1.132	10.1.1.158
10.1.1.160/27	10.1.1.164	10.1.1.190
10.1.1.192/27	10.1.1.196	10.1.1.222
10.1.1.224/27	10.1.1.228	10.1.1.254

## Create the Day0 Configuration With a Customized Configuration for Azure

You can enter the entire cluster bootstrap configuration using commands.

```
"Cluster": {  
  "CclSubnetRange": "ip_address_start ip_address_end",  
  "ClusterGroupName": "cluster_name",  
  "HealthProbePort": "port_number",  
  "GatewayLoadBalancerIP": "ip_address",  
  "EncapsulationType": "vxlan",  
  "InternalPort": "internal_port_number",  
  "ExternalPort": "external_port_number",  
  "InternalSegId": "internal_segment_id",  
  "ExternalSegId": "external_segment_id"  
}
```

## Deploy Cluster Nodes Manually - GWLB-based Deployment

Deploy the cluster nodes so they form a cluster.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Log into the Azure Portal: <a href="https://portal.azure.com">https://portal.azure.com</a>  |
| <b>Step 2</b> | Create a Resource Group.<br><br>a. In the <b>Basics</b> tab, choose the <b>Subscription</b> and <b>Resource Group</b> from the drop-down lists.<br><br>b. Choose the required <b>Region</b> .   |
| <b>Step 3</b> | Create a Virtual Network with the necessary subnets: Management, Data and Cluster Control Link (CCL).<br><br><b>Note</b><br>Configure the CCL with the smallest subnet mask as required. Wider subnets can impact performance.<br>See the Azure document for creating the Virtual Network and subnet: <a href="https://learn.microsoft.com/en-us/azure/virtual-network/quickstart-create-virtual-network?tabs=portal">https://learn.microsoft.com/en-us/azure/virtual-network/quickstart-create-virtual-network?tabs=portal</a> |
| <b>Step 4</b> | Go to the Marketplace and search for <b>Cisco Secure Firewall Threat Defense Virtual – BYOL and PAYG</b> and click <b>Create</b> .  |
| <b>Step 5</b> | Fill the required details and choose <b>Yes</b> for <b>Is this VM going to be part of Cluster?</b>  |

Is this VM going to be part of Cluster? \*

☐ No

☒ Yes (provide day0 cluster configuration)

 Day0 cluster config must be provided in required format. For Azure, only cluster related configuration is required and you can provide it in either of the following formats: "Cluster": {...} OR "run\_config": {...}. Please refer to the documentation for more details.

Day0 cluster configuration \* 

Paste the following cluster-related configuration in the text box.

```
"Cluster": {
  "CclSubnetRange": "ip_address_start ip_address_end", //mandatory user input
  "ClusterGroupName": "cluster_name", //mandatory user input
  "HealthProbePort": "port_number", //mandatory user input
  "GatewayLoadBalancerIP": "ip_address", //mandatory user input
  "EncapsulationType": "vxlan",
  "InternalPort": "internal_port_number",
  "ExternalPort": "external_port_number",
  "InternalSegId": "internal_segment_id",
  "ExternalSegId": "external_segment_id"
}
```

**Step 6** Click **Next** and select the **Virtual Network & Subnets**.

Ensure **GigabitEthernet 0/1 subnet** is configured with the CCL subnet.

**Step 7** Click **Review + create**. Wait until the Threat Defense Virtual deployment is completed.

**Step 8** Connect to the Threat Defense Virtual device and execute **show cluster info** to confirm the cluster formation is successful.

```
> show cluster info
Cluster ngfwv-cluster: On
  Interface mode: individual
Cluster Member Limit : 16
  This is "4" in state CONTROL_NODE
    ID      : 0
    Version : 9.23(1)
    Serial No.: 9AC1VMGJKAQ
    CCL IP   : 1.1.1.4
    CCL MAC  : 6045.bda8.e07b
    Module   : NGFWv
    Resource : 4 cores / 14336 MB RAM
    Last join : 05:22:55 UTC Jul 14 2025
    Last leave: N/A
Other members in the cluster:
  There is no other unit in the cluster
>
```

**Step 9** Configure the Azure Gateway Load Balancer. See [Auto Scale with Azure Gateway Load Balancer Use Case](#) for more information.

- Step 10** Add the control node to the Firewall Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 546.

## Deploy Cluster Nodes Manually - NLB-based Deployment

Deploy the cluster nodes so they form a cluster.

### Procedure

- Step 1** Log into the Azure Portal: <https://portal.azure.com>
- Step 2** Create a Resource Group.
- In the **Basics** tab, choose the **Subscription** and **Resource Group** from the drop-down lists.
  - Choose the required **Region**.
- Step 3** Create a Virtual Network with the necessary subnets: Management, Inside, Outside and Cluster Control Link (CCL).
- Note**  
Configure the CCL with the smallest subnet mask as required. Wider subnets can impact performance.  
See the Azure document for creating the Virtual Network and subnet: <https://learn.microsoft.com/en-us/azure/virtual-network/quickstart-create-virtual-network?tabs=portal>
- Step 4** Go to the Marketplace and search for **Cisco Secure Firewall Threat Defense Virtual – BYOL and PAYG** and click **Create**.
- Step 5** Fill the required details and choose **Yes** for **Is this VM going to be part of Cluster?**

Is this VM going to be part of Cluster? \*

☐ No

☒ Yes (provide day0 cluster configuration)

 Day0 cluster config must be provided in required format. For Azure, only cluster related configuration is required and you can provide it in either of the following formats: "Cluster": [...] OR "run\_config": [...]. Please refer to the documentation for more details.

Day0 cluster configuration \* 

Paste the following cluster-related configuration in the text box.

```
"Cluster": {
  "CclSubnetRange": "ip_address_start ip_address_end", //mandatory user input
  "ClusterGroupName": "cluster_name" //mandatory user input
}
```

- Step 6** Click **Next** and select the **Virtual Network & Subnets**.

If the diagnostic interface is enabled, user can attach maximum of four interfaces while deploying the Threat Defense Virtual VM. If the diagnostic is disabled, user can attach maximum of three interfaces while deploying the Threat Defense Virtual instance. So, the user must attach the extra interface for the cluster related communication after deploying the Threat Defense Virtual VM.

- Step 7** Click **Review + create**. Wait until the Threat Defense Virtual deployment is completed.
- Step 8** Power off the Threat Defense Virtual VM.
- Step 9** Create a new interface using the CCL subnet and attach it to the Threat Defense Virtual VM. See the Azure document to create and attach new interface to the existing VM: <https://learn.microsoft.com/en-us/azure/virtual-network/virtual-network-network-interface-vm>
- Step 10** Power On the Threat Defense Virtual VM.
- Step 11** Connect to the Threat Defense Virtual device and execute **show cluster info** to confirm the cluster formation is successful.

```
> show cluster info
Cluster ngfwv-cluster: On
  Interface mode: individual
Cluster Member Limit : 16
  This is "4" in state CONTROL_NODE
    ID      : 0
    Version : 9.23(1)
    Serial No.: 9AC1VMGJKAQ
    CCL IP   : 1.1.1.4
    CCL MAC  : 6045.bda8.e07b
    Module   : NGFWv
    Resource : 4 cores / 14336 MB RAM
    Last join : 05:22:55 UTC Jul 14 2025
    Last leave: N/A
Other members in the cluster:
  There is no other unit in the cluster
>
```

- Step 12** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\)](#), on page 546.

## Troubleshooting Cluster Deployment in Azure

- Issue: No traffic flow

Troubleshooting:

- Check if the health probe status of the Threat Defense Virtual instances deployed with a GWLB is healthy.
- If the Threat Defense Virtual instance's health probe status is unhealthy-
  - Check if the static route is configured in the Management Center Virtual.
  - Check if the default gateway is the data subnet's gateway IP.
  - Check if the Threat Defense Virtual instance is receiving health probe traffic.
  - Check if the access list configured in the Management Center Virtual allows health probe traffic.

- Issue: Cluster is not formed

Troubleshooting:

- Check the IP address of the nve-only cluster interface. Ensure that you can ping the nve-only cluster interface of other nodes.
- Check the IP address of the nve-only cluster interfaces are part of the object group.
- Ensure that the NVE interface is configured with the object group .
- Ensure that the cluster interface in the cluster group has the right VNI interface. This VNI interface has the NVE with the corresponding object group.
- Ensure that the nodes are pingable from each other. Since each node has its own cluster interface IP, these should be pingable from each other.
- Check if the CCL Subnet's Start and End Address mentioned during template deployment is correct. The start address should begin with the first available IP address in the subnet. For example, if the subnet is 192.168.1.0/24. The start address should be 192.168.1.4 (the three IP addresses at the start are reserved by Azure).
- Check if the Management Center Virtual has a valid license.

- Issue: Role-related error while deploying resources again in the same resource group.

Troubleshooting: Remove the roles given below by using the following commands on the terminal.

Error message:

```
"error": {
  "code": "RoleAssignmentUpdateNotPermitted",
  "message": "Tenant ID, application ID, principal ID, and scope are not allowed to be updated."}
```

- **az role assignment delete --resource-group <Resource Group Name> --role "Storage Queue Data Contributor"**
- **az role assignment delete --resource-group <Resource Group Name> --role "Contributor"**

## Deploy the Cluster in GCP

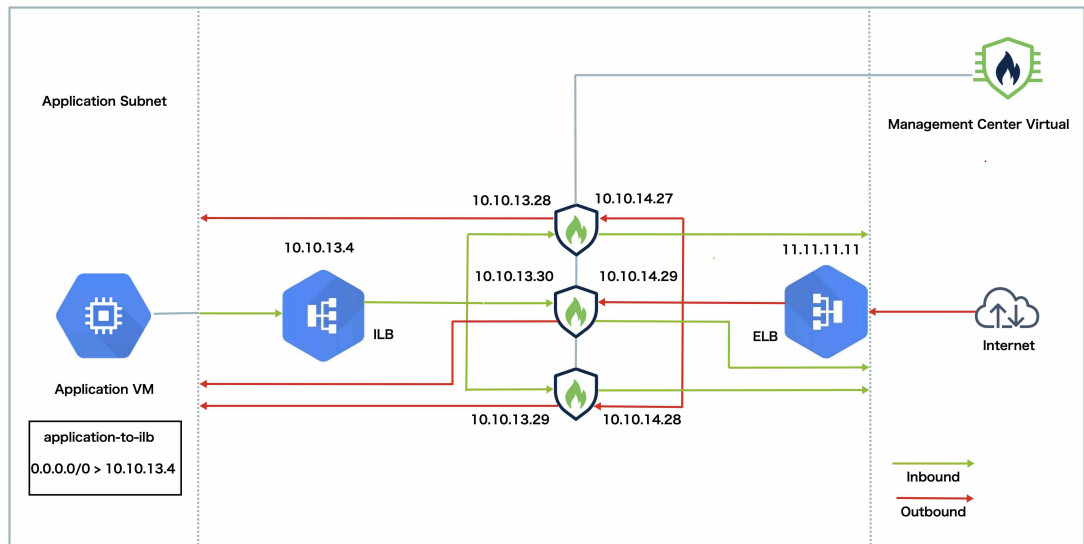

To deploy a cluster in GCP, you can either manually deploy or use an instance template to deploy an instance group. You can use the cluster with native GCP load-balancers, or non-native load balancers such as the Cisco Cloud Services Router.

### Note

Outbound traffic requires interface NAT and is limited to 64K connections.

## Sample Topology

This topology depicts both inbound and outbound traffic flow. The Threat Defense Virtual cluster is sandwiched between the internal and external load balancers. A Management Center Virtual instance is used to manage the cluster.

Inbound traffic from the internet goes to the external load balancer which then transmits the traffic to the Threat Defense Virtual cluster. After the traffic has been inspected by a Threat Defense Virtual instance in the cluster, it is forwarded to the application VM.

Outbound traffic from the application VM is transmitted to the internal load balancer. Traffic is then forwarded to the Threat Defense Virtual cluster and then sent out to the internet.

## End-to-End Process for Deploying Threat Defense Virtual Cluster in GCP

### Template-based Deployment

The following flowchart illustrates the workflow for template-based deployment of the Threat Defense Virtual cluster on GCP.

	Workspace	Steps
1	Local Host	Download templates and files from GitHub.
2	Local Host	Edit template parameters.

	Workspace	Steps
3	Google Cloud Platform	Create GCP bucket.
4	Local Host	Create Google Cloud function source archive file <i>ftdv_cluster_function.zip</i> .
5	Google Cloud Platform	Upload the Google function source archive file.
6	Google Cloud Platform	Deploy <i>infrastructure.yaml</i> .
7	Google Cloud Platform	If private IP addresses are used, create VPC connector.
8	Google Cloud Platform	If external IP addresses are used, set <i>deployWithExternalIP</i> to <i>True</i> in <i>cluster_function_infra.yaml</i> .
9	Google Cloud Platform	Deploy cluster function infrastructure template.
10	Google Cloud Platform	Deploy cluster.

### Manual Deployment

The following flowchart illustrates the workflow for manual deployment of the Threat Defense Virtual cluster on GCP.

	Workspace	Steps
1	Local Host	Create day 0 configuration script.
2	Google Cloud Platform	Create instance template using day 0 configuration.
3	Google Cloud Platform	Configure the interfaces.
4	Google Cloud Platform	Create instance group and attach instance template.

	Workspace	Steps
5	Google Cloud Platform	Create NLB and attach to instance group.
6	Google Cloud Platform	Create firewall rules for NLB.
7	Management Center	Create access rules for health check traffic.
8	Management Center	Add control node.

## Templates

The templates given below are available in GitHub. The parameter values are self-explanatory with the parameter names, and values, given in the template.

- Cluster deployment template for East-West traffic - [deploy\\_ngfw\\_cluster.yaml](#)
- Cluster deployment template for North-South traffic - [deploy\\_ngfw\\_cluster.yaml](#)

## Deploy the Instance Group in GCP Using an Instance Template

Deploy the instance group in GCP using an instance template.

### Before you begin

- Use Google Cloud Shell for deployment. Alternatively, you can use Google SDK on any macOS/Linux/Windows machine.
- To allow the cluster to auto-register with the Management Center, you need to create a user with administrative privileges on the Management Center that can use the REST API. See the [Cisco Secure Firewall Management Center Administration Guide](#).
- Add an access policy in the Management Center that matches the name of the policy that you specified in *cluster\_function\_infra.yaml*.

### Procedure

- 
- Step 1** Download the templates from [GitHub](#) to your local folder.
- Step 2** Edit **infrastructure.yaml**, **cluster\_function\_infra.yaml** and **deploy\_ngfw\_cluster.yaml** with the required *resourceNamePrefix* parameter (for example, ngfwvcls) and other required user inputs.
- From Secure Firewall version 7.4.1, you can deploy the cluster without the diagnostic interface. To deploy the cluster with only the Outside, Inside, Management, and CCL interfaces, set the *withDiagnostic* variable to **False** in both the **infrastructure.yaml** and the **deploy\_ngfw\_cluster.yaml** files.
- Note that there is a **deploy\_ngfw\_cluster.yaml** file in both the **east-west** and **north-south** folders in GitHub. Download the appropriate template as per your traffic flow requirement.

- Step 3** Create a bucket using Google Cloud Shell to upload the Google cloud function source archive file *ftdv\_cluster\_function.zip*.
- ```
gsutil mb --pap enforced gs://resourceNamePrefix-ftdv-cluster-bucket/
```
- Ensure that the *resourceNamePrefix* variable here matches the *resourceNamePrefix* variable that you specified in **cluster\_function\_infra.yaml**.
- Step 4** Create an archive file for the cluster infrastructure.
- Example:**
- ```
zip -j ftdv_cluster_function.zip ./cluster-function/*
```
- Step 5** Upload the Google source archive that you created earlier.
- ```
gsutil cp ftdv_cluster_function.zip gs://resourceNamePrefix-ftdv-cluster-bucket/
```
- Step 6** Deploy infrastructure for the cluster.
- ```
gcloud deployment-manager deployments create cluster_name --config infrastructure.yaml
```
- Step 7** If you are using private IP addresses, perform the steps given below:
- Launch and set up the Management Center Virtual with a Threat Defense Virtual management VPC.
  - Create a VPC connector to connect the Google Cloud functions with the Threat Defense Virtual management VPC.
- ```
gcloud compute networks vpc-access connectors create vpc-connector-name --region us-central1 --subnet resourceNamePrefix-ftdv-mgmt-subnet28
```
- Step 8** If the Management Center is remote from the Threat Defense Virtual, and the Threat Defense Virtual needs an external IP address, ensure that you set **deployWithExternalIP** to **True** in **cluster\_function\_infra.yaml**.
- Step 9** Deploy the cluster function infrastructure.
- ```
gcloud deployment-manager deployments create cluster_name --config cluster_function_infra.yaml
```
- Step 10** Deploy the cluster.
- For North-South topology deployment:

```
gcloud deployment-manager deployments create cluster_name --config north-south/deploy_ngfw_cluster.yaml
```
  - For East-West topology deployment:

```
gcloud deployment-manager deployments create cluster_name --config east-west/deploy_ngfw_cluster.yaml
```

## Deploy the Cluster in GCP Manually

To deploy the cluster manually, prepare the day0 configuration, deploy each node, and then add the control node to the Firewall Management Center.

## Create the Day0 Configuration for GCP

You can use either a fixed configuration or a customized configuration.

### Create the Day0 Configuration With a Fixed Configuration for GCP

The fixed configuration will auto-generate the cluster bootstrap configuration.

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Diagnostic": "OFF",          //Optional user input from version 7.4.1 - use
to deploy cluster without Diagnostic interface
  "Cluster": {
    "CclSubnetRange": "ip_address_start ip_address_end",
    "ClusterGroupName": "cluster_name"
  }
}
```

For example:

```
{
  "AdminPassword": "DeanWlnche$ter",
  "Hostname": "ciscoftdv",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "Cluster": {
    "CclSubnetRange": "10.10.55.2 10.10.55.253",    //mandatory user input
    "ClusterGroupName": "ftdv-cluster"             //mandatory user input
  }
}
```

**Note** If you are copying and pasting the configuration given above, ensure that you remove **//mandatory user input** from the configuration.

For the **CclSubnetRange** variable, note that you cannot use the first two IP addresses and the last two IP addresses in the subnet. See [Reserved IP addresses in IPv4 subnets](#) for more information. Ensure that you have at least 16 available IP addresses for clustering. Some examples of start and end IP addresses are given below.

**Table 38: Examples of Start and End IP addresses**

CIDR	Start IP Address	End IP Address
10.1.1.0/27	10.1.1.2	10.1.1.29
10.1.1.32/27	10.1.1.34	10.1.1.61
10.1.1.64/27	10.1.1.66	10.1.1.93
10.1.1.96/27	10.1.1.98	10.1.1.125
10.1.1.128/27	10.1.1.130	10.1.1.157
10.1.1.160/27	10.1.1.162	10.1.1.189

CIDR	Start IP Address	End IP Address
10.1.1.192/27	10.1.1.194	10.1.1.221
10.1.1.224/27	10.1.1.226	10.1.1.253
10.1.1.0/24	10.1.1.2	10.1.1.253

### Create the Day0 Configuration With a Customized Configuration for GCP

You can enter the entire cluster bootstrap configuration using commands.

```
{
  "AdminPassword": "password",
  "Hostname": "hostname",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "run_config": [comma_separated_threat_defense_configuration]
}
```

The following example creates a configuration with Management, Inside, and Outside interfaces, and a VXLAN interface for the cluster control link. Note the values in bold that need to be unique per node.

```
{
  "AdminPassword": "Wlnch3sterBr0s",
  "Hostname": "ftdv1",
  "FirewallMode": "Routed",
  "ManageLocally": "No",
  "run_config": [
    "cluster interface-mode individual force",
    "interface Management0/0",
    "management-only",
    "nameif management",
    "ip address dhcp",
    "interface GigabitEthernet0/0",
    "no shutdown",
    "nameif outside",
    "ip address dhcp",
    "interface GigabitEthernet0/1",
    "no shutdown",
    "nameif inside",

```

**Note** For the cluster control link network object, specify only as many addresses as you need (up to 16). A larger range can affect performance.

## Deploy Cluster Nodes Manually

Deploy the cluster nodes so they form a cluster. For clustering on GCP, you cannot use the 4 vCPU machine type. The 4 vCPU machine type only supports four interfaces, and five are needed. Use a machine type that supports five interfaces, such as c2-standard-8.

### Procedure

- Step 1** Create an instance template using the day 0 configuration (in the **Metadata > Startup Script** section) with 5 interfaces: outside, inside, management, diagnostic, and cluster control link.  
See [Cisco Secure Firewall Threat Defense Virtual Getting Started Guide](#).
- Step 2** Create an instance group, and attach the instance template.
- Step 3** Create GCP network load balancers (internal and external), and attach the instance group.
- Step 4** For GCP network load balancers, allow health checks in your security policy on the Management Center. See [Allow Health Checks for GCP Network Load Balancers, on page 544](#).
- Step 5** Add the control node to the Management Center. See [Add the Cluster to the Management Center \(Manual Deployment\), on page 546](#).

## Allow Health Checks for GCP Network Load Balancers

Google Cloud provides health checks to determine if backends respond to traffic.

See <https://cloud.google.com/load-balancing/docs/health-checks> to create firewall rules for network load balancers. Then in the Firewall Management Center, create access rules to allow the health check traffic. See <https://cloud.google.com/load-balancing/docs/health-check-concepts> for the required network ranges. See [Access Control Rules, on page 1641](#).

You also need to configure dynamic manual NAT rules to redirect the health check traffic to the Google metadata server at 169.254.169.254. See [Configure Dynamic Manual NAT, on page 921](#).

You can set up a route for GCP health checks across all interfaces that are used to configure their health probes. You can achieve this by creating a route with a higher metric on interfaces where a route for GCP health checks is not already available.

## North-South NAT Rules Sample Configuration

```
nat (inside,outside) source dynamic GCP-HC ILB-SOUTH destination static ILB-SOUTH METADATA
nat (outside,outside) source dynamic GCP-HC ELB-NORTH destination static ELB-NORTH METADATA
```

```

### North-South and East-West Traffic Routing Configuration Sample

```
route outside 0.0.0.0 0.0.0.0 <Outside_Gateway> 1
route inside 35.191.0.0 255.255.0.0 <Inside_Gateway> 1
route inside 130.211.0.0 255.255.252.0 <Inside_Gateway> 1
route inside 209.85.152.0 255.255.252.0 <Inside_Gateway> 1
route inside 209.85.204.0 255.255.252.0 <Inside_Gateway> 1
```

If a default route is not available, then policy-based routing can be used to route the traffic for health checks.

## Add the Cluster to the Management Center (Manual Deployment)

Use this procedure to add the cluster to the Firewall Management Center if you manually deployed the cluster. If you used a template, the cluster will auto-register on the Firewall Management Center.

Add one of the cluster units as a new device to the Firewall Management Center; the Firewall Management Center auto-detects all other cluster members.

### Before you begin

- All cluster units must be in a successfully-formed cluster prior to adding the cluster to the Firewall Management Center. You should also check which unit is the control unit. Use the Firewall Threat Defense **show cluster info** command.

### Procedure

- 
- Step 1** In the Firewall Management Center, choose **Devices > Device Management**, and then choose **Add > Add Device** to add the control unit using the unit's management IP address.

Figure 260: Add Device

Add Device

☐ CDO Managed Device

Host:†

Display Name:

Registration Key: \*

Group:

Access Control Policy: \*

Smart Licensing  
Note: All virtual Firewall Threat Defense devices require a performance tier license. Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. Click [here](#) for information about the Firewall Threat Defense performance-tiered licensing. Until you choose a tier, your Firewall Threat Defense virtual defaults to the FTDv50 selection.

Performance Tier (only for Firewall Threat Defense virtual 7.0 and above):

☒ Malware  
☒ Threat  
☒ URL Filtering

Advanced  
Unique NAT ID: †

☒ Transfer Packets

- a) In the **Host** field, enter the IP address or hostname of the control unit.

We recommend adding the control unit for the best performance, but you can add any unit of the cluster.

If you used a NAT ID during device setup, you may not need to enter this field. For more information, see [NAT Environments](#), on page 7.

- b) In the **Display Name** field, enter a name for the control unit as you want it to display in the Firewall Management Center.

This display name is not for the cluster; it is only for the control unit you are adding. You can later change the name of other cluster members and the cluster display name.

- c) In the **Registration Key** field, enter the same registration key that you used during device setup. The registration key is a one-time-use shared secret.
- d) (Optional) Add the device to a device **Group**.
- e) Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.  
If you create a new policy, you create a basic policy only. You can later customize the policy as needed.

**New Policy**

Name:

Description:

Select Base Policy:

Default Action:  
☒ Block all traffic  
☐ Intrusion Prevention  
☐ Network Discovery

Snort3: ☐

- f) Choose licenses to apply to the device.
- g) If you used a NAT ID during device setup, expand the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field.
- h) Check the **Transfer Packets** check box to allow the device to transfer packets to the Firewall Management Center.

This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the Firewall Management Center for inspection. If you disable it, only event information will be sent to the Firewall Management Center but packet data is not sent.

- i) Click **Register**.

The Firewall Management Center identifies and registers the control unit, and then registers all data units. If the control unit does not successfully register, then the cluster is not added. A registration failure can occur if the cluster was not up, or because of other connectivity issues. In this case, we recommend that you try re-adding the cluster unit.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster units.

**Figure 261: Cluster Management**

<div> <span>ftdcluster (2)</span> <span>Cluster</span> </div>

<div> <span>172.16.0.51</span> <span>Snort 3</span> </div>	<div> <span>172.16.0.51</span> <span>- Routed</span> </div>	FTDv for VMware	7.2.0	N/A	Base, Threat (2 more...)	Default AC Policy

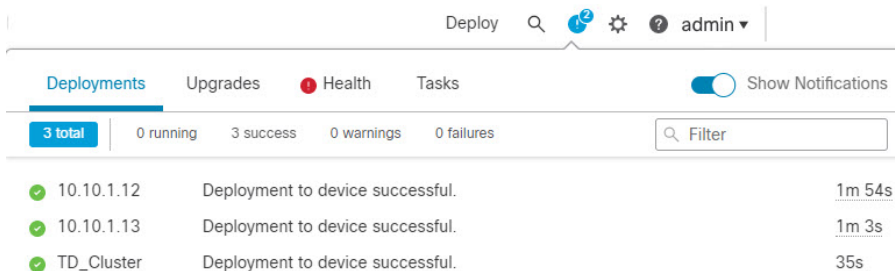

A unit that is currently registering shows the loading icon.

Figure 262: Node Registration

**Note**

GCP prioritizes nodes with public IP address during cluster node discovery. To ensure the Firewall Threat Defense Virtual cluster registers with the management center virtual using the private IP address, you must first disable the public IP address on the Firewall Threat Defense Virtual cluster node. This allows GCP node discovery to proceed using the private IP address for registration node with the management center virtual.

You can monitor cluster unit registration by clicking the **Notifications** icon and choosing **Tasks**. The Firewall Management Center updates the Cluster Registration task as each unit registers. If any units fail to register, see [Reconcile Cluster Nodes, on page 558](#).

**Step 2** Configure device-specific settings by clicking the **Edit** (✎) for the cluster.

Most configuration can be applied to the cluster as a whole, and not nodes in the cluster. For example, you can change the display name per node, but you can only configure interfaces for the whole cluster.

**Step 3** On the **Devices > Device Management > Cluster** screen, you see **General**, **License**, **System**, and **Health** settings.

See the following cluster-specific items:

- **General > Name**—Change the cluster display name by clicking the **Edit** (✎).

Cluster	Device	Routing	Interfaces	Inline Sets	DHCP	VTEP
<div>General </div> <div> Name:  TD_Cluster </div> <div> Transfer Packets: Yes </div> <div> Status:  </div> <div> Control: 10.10.1.13 </div> <div> Cluster Live Status: <a href="#">View</a> </div>						

Then set the **Name** field.

## Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

**Figure 264: Cluster Health Monitor Settings**

Cluster Health Monitor Settings 			
<b>Timeouts</b>			
Hold Time	3 s		
Interface Debounce Time	9000 ms		
<b>Monitored Interfaces</b>			
Service Application	Enabled		
Unmonitored Interfaces	None		
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

**Table 39: Cluster Health Monitor Settings Section Table Fields**

Field	Description
<b>Timeouts</b>	
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.

Field	Description
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Short and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider .

**Figure 265: Disable the System Health Check**

Edit Cluster Health Monitor Settings

Health Check ☐ ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

- Step 6** Configure the hold time and interface debounce time.
  - **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.

- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7**

Customize the auto-rejoin cluster settings after a health check failure.

**Figure 266: Configure Auto-Rejoin Settings**

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

- Step 8** Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 267: Configure Monitored Interfaces**

Unmonitored Interfaces ⓘ

☒ Enable Service Application Monitoring

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

- Step 9** Click **Save**.

- Step 10** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Manage Cluster Nodes

## Disable Clustering

You may want to deactivate a node in preparation for deleting the node, or temporarily for maintenance. This procedure is meant to temporarily deactivate a node; the node will still appear in the Firewall Management Center device list. When a node becomes inactive, all data interfaces are shut down.

**Note** Do not power off the node without first disabling clustering.

### Procedure

- Step 1** For the unit you want to disable, choose **Devices > Device Management**, click the **More** (⋮), and choose **Disable Node Clustering**.
- Step 2** Confirm that you want to disable clustering on the node.  
The node will show **(Disabled)** next to its name in the **Devices > Device Management** list.
- Step 3** To reenabling clustering, see [Rejoin the Cluster, on page 558](#).

## Rejoin the Cluster

If a node was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster. See [Rejoining the Cluster, on page 575](#) for more information about why a node can be removed from a cluster.

### Procedure

- Step 1** For the unit you want to reactivate, choose **Devices > Device Management**, click the **More** (⋮), and choose **Enable Node Clustering**.
- Step 2** Confirm that you want to enable clustering on the node.

## Reconcile Cluster Nodes

If a cluster node fails to register, you can reconcile the cluster membership from the device to the Firewall Management Center. For example, a data node might fail to register if the Firewall Management Center is occupied with certain processes, or if there is a network issue.

## Procedure

**Step 1** Choose **Devices > Device Management More** (⚙️) for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.

**Step 2** Click **Reconcile All**.

*Figure 268: Reconcile All*

>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

For more information about the cluster status, see [Monitoring the Cluster, on page 560](#).

## Delete (Unregister) the Cluster or Nodes and Register to a New Firewall Management Center

You can unregister the cluster from the Firewall Management Center, which keeps the cluster intact. You might want to unregister the cluster if you want to add the cluster to a new Firewall Management Center.

You can also unregister a node from the Firewall Management Center without breaking the node from the cluster. Although the node is not visible in the Firewall Management Center, it is still part of the cluster, and it will continue to pass traffic and could even become the control node. You cannot unregister the current control node. You might want to unregister the node if it is no longer reachable from the Firewall Management Center, but you still want to keep it as part of the cluster while you troubleshoot management connectivity.

Unregistering a cluster:

- Severs all communication between the Firewall Management Center and the cluster.

- Removes the cluster from the **Device Management** page.
- Returns the cluster to local time management if the cluster's platform settings policy is configured to receive time from the Firewall Management Center using NTP.
- Leaves the configuration intact, so the cluster continues to process traffic.

Policies, such as NAT and VPN, ACLs, and the interface configurations remain intact.

Registering the cluster again to the same or a different Firewall Management Center causes the configuration to be removed, so the cluster will stop processing traffic at that point; the cluster configuration remains intact so you can add the cluster as a whole. You can choose an access control policy at registration, but you will have to re-apply other policies after registration and then deploy the configuration before it will process traffic again.

### Before you begin

This procedure requires CLI access to one of the nodes.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, click **More** (⋮) for the cluster or node, and choose **Delete**.
- Step 2** You are prompted to delete the cluster or node; click **Yes**.
- Step 3** You can register the cluster to a new (or the same) Firewall Management Center by adding one of the cluster members as a new device.
- You only need to add one of the cluster nodes as a device, and the rest of the cluster nodes will be discovered.
- Connect to one cluster node's CLI, and identify the new Firewall Management Center using the **configure manager add** command.
  - Choose **Devices > Device Management**, and then click **Add Device**.
- Step 4** To re-add a deleted node, see [Reconcile Cluster Nodes, on page 558](#).
- 

## Monitoring the Cluster

You can monitor the cluster in the Firewall Management Center and at the Firewall Threat Defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management More** (⋮) icon or from the **Devices > Device Management > Cluster** page > **General** area > **Cluster Live Status** link.

Figure 269: Cluster Status

The Control node has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- In Sync.—The node is registered with the Firewall Management Center.
- Pending Registration—The node is part of the cluster, but has not yet registered with the Firewall Management Center. If a node fails to register, you can retry registration by clicking **Reconcile All**.
- Clustering is disabled—The node is registered with the Firewall Management Center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the node from the cluster.
- Joining cluster...—The node is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the Firewall Management Center.

For each node, you can view the **Summary** or the **History**.

Figure 270: Node Summary

- **System** (⚙️) > **Tasks** page.

The **Tasks** page shows updates of the Cluster Registration task as each node registers.

- **Devices** > **Device Management** *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member nodes, including the control node shown with its role next to the IP address. For nodes that are still registering, you can see the loading icon.

- **show cluster** {**access-list** [*acl\_name*] | **conn** [count] | **cpu** [usage] | **history** | **interface-mode** | **memory** | **resource usage** | **service-policy** | **traffic** | **xlate count**}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [**auto-join** | **clients** | **conn-distribution** | **flow-mobility counters** | **goid** [*options*] | **health** | **incompatible-config** | **loadbalance** | **old-members** | **packet-distribution** | **trace** [*options*] | **transport** { **asp** | **cp** }]

To view cluster information, use the **show cluster info** command.

# Cluster Health Monitor Dashboard

## Cluster Health Monitor

When a Firewall Threat Defense is the control node of a cluster, the Firewall Management Center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- Overview dashboard—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the Firewall Management Center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- Load Distribution dashboard—Displays load distribution across the cluster nodes in two widgets:
  - The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
  - The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the Firewall Management Center.

### Procedure

**Step 1** Choose **System** (⚙) > **Health** > **Monitor**.

Use the Monitoring navigation pane to access node-specific health monitors.

**Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.

**Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
- Load Distribution — Traffic and packet distribution across the cluster nodes.
- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range.

The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

- Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
  - CPU — CPU utilization, including the CPU usage by process and by physical cores.
  - Memory — Device memory utilization, including data plane and Snort memory usage.
  - Interfaces — Interface status and aggregate traffic statistics.
  - Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
  - Snort — Statistics that are related to the Snort process.
  - ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

- Step 8** Click the plus sign **Add New Dashboard**(+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 40: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number

Metric	Description	Format
Packets	Packet distribution count in the cluster for every second.	number

## Troubleshooting the Cluster

You can use the **CCL Ping** tool to make sure the cluster control link is operating correctly. You can also use the following tools that are available for devices and clusters:

- Troubleshooting files—If a node fails to join the cluster, a troubleshooting file is automatically generated. You can also generate and download troubleshooting files from the **Devices > Device Management > Cluster > General** area. See [Generate Troubleshooting Files, on page 69](#).

You can also generate files from the **Device Management** page by clicking **More** (⋮) and choosing **Troubleshoot Files**.

- CLI output—From the **Devices > Device Management > Cluster > General** area, you can view a set of pre-defined CLI outputs that can help you troubleshoot the cluster. The following commands are automatically run for the cluster:

- **show running-config cluster**
- **show cluster info**
- **show cluster info health**
- **show cluster info transport cp**
- **show version**
- **show asp drop**
- **show counters**
- **show arp**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**
- **show interface *ccl\_interface***
- **ping *ccl\_ip* size *ccl\_mtu* repeat 2**
- **show nve**
- **show route**
- **show tech-support**

You can also enter any **show** command in the Command field. See [View CLI Output, on page 71](#) for more information.

## Perform a Ping on the Cluster Control Link

You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.

### Procedure

- Step 1** Choose **Devices > Device Management**, click the **More** (⋮) icon next to the cluster, and choose **Cluster Live Status**.

*Figure 272: Cluster Status*

Cluster Status

Overall Status: Cluster has all nodes in sync

Nodes details (2) [Refresh](#) [Reconcile All](#)

>	In Sync.	172.16.0.50 <a href="#">Control</a>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 [Close](#)

- Step 2** Expand one of the nodes, and click **CCL Ping**.

Figure 273: CCL Ping

Cluster Status ?

Overall Status: ❌ Clustering is disabled for 1 node(s)

Nodes details (3) Refresh Reconcile All

Status	Device Name	Unit Name	Chassis URL
In Sync.	10.10.43.21	Control	10.10.43.21
Clustering is disabled	10.10.43.22		N/A

Summary History **CCL Ping**

ping 10.10.3.2 size 1654  
 Sending 5, 1654-byte ICMP Echos to 10.10.3.2, timeout is 2 seconds:  
 ?????  
 Success rate is 0 percent (0/5)

Dated: 18:38:41 | 01 Mar 2023 Close

The node sends a ping on the cluster control link to every other node using a packet size that matches the maximum MTU.

## Upgrading the Cluster

Perform the following steps to upgrade a Firewall Threat Defense Virtual cluster:

### Before you begin

- Before you upgrade a cluster in the public cloud, copy the target version image to your cloud image repository and update the image ID in the cluster deployment template (we actually recommend replacing the existing template with a modified copy). This ensures that after the upgrade, new instances — for example, instances launched during cluster scaling — will use the correct version. If the marketplace does not have the image you need, such as when the cluster has been patched, create a custom image from a snapshot of a standalone Firewall Threat Defense Virtual instance running the correct version, with no instance-specific (day 0) configurations.
- For Firewall Threat Defense Virtual for AWS, suspend the HealthCheck and ReplaceUnhealthy processes before autoscaled cluster upgrade. This ensures that instances are not terminated by the Auto Scaling group during the post-upgrade reboot. You can resume the suspended processes afterwards. For instructions, see the Amazon EC2 Auto Scaling user guide: [Suspend and resume Amazon EC2 Auto Scaling processes](#).

## Procedure

- 
- Step 1** Upload the target image version to the cloud image storage.
- Step 2** Update the cloud instance template of the cluster with the updated target image version.
- a) Create a copy of the instance template with the target image version.
  - b) Attach the newly created template to cluster instance group.
- Step 3** Upload the target image version upgrade package to the Firewall Management Center.
- Step 4** Perform readiness check on the cluster that you want to upgrade.
- Step 5** After successful readiness check, initiate installation of upgrade package.
- Step 6** The Firewall Management Center upgrades the cluster nodes one at a time.
- Step 7** The Firewall Management Center displays a notification after successful upgrade of the cluster.
- There is no change in the serial number and UUID of the instance after the upgrade.
- 

# Reference for Clustering

This section includes more information about how clustering operates.

## Threat Defense Features and Clustering

Some Firewall Threat Defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

## Unsupported Features and Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Firewall Management Center UCAPL/CC mode

## Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- The following application inspections:

- DCERPC
- ESMTP
- NetBIOS
- PPTP
- RSH
- SQLNET
- SUNRPC
- TFTP
- XDMCP

- Static route monitoring

## Cisco Trustsec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## Connection Settings and Clustering

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the

cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## Dynamic Routing and Clustering

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

**Figure 274: Dynamic Routing in Individual Interface Mode**

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## NAT and Clustering

For NAT usage, see the following limitations.

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different Firewall Threat Defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the Firewall Threat Defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- **No Proxy ARP**—For Individual interfaces, a proxy ARP reply is never sent for mapped addresses. This prevents the adjacent router from maintaining a peer relationship with an ASA that may no longer be in the cluster. The upstream router needs a static route or PBR with Object Tracking for the mapped addresses that points to the Main cluster IP address.
- **PAT with Port Block Allocation**—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- **NAT pool address distribution for dynamic PAT**—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.
- **Reusing a PAT pool in multiple rules**—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- **No round-robin**—Round-robin for a PAT pool is not supported with clustering.
- **No extended PAT**—Extended PAT is not supported with clustering.

- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## VPN and Clustering

Site-to-site VPN is a centralized feature; only the control node supports VPN connections.

---

**Note** Remote access VPN is not supported with clustering.

---

VPN functionality is limited to the control node and does not take advantage of the cluster high availability capabilities. If the control node fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control node is elected, you must reestablish the VPN connections.

For connections to an Individual interface when using PBR or ECMP, you must always connect to the Main cluster IP address, not a Local address.

VPN-related keys and certificates are replicated to all nodes.

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, if your model can handle approximately 10 Gbps of traffic when running alone, then for a cluster of 8 units, the maximum combined throughput will be approximately 80% of 80 Gbps (8 units x 10 Gbps): 64 Gbps.

## Control Node Election

Nodes of the cluster communicate over the cluster control link to elect a control node as follows:

1. When you enable clustering for a node (or when it first starts up with clustering already enabled), it broadcasts an election request every 3 seconds.
2. Any other nodes with a higher priority respond to the election request; the priority is set between 1 and 100, where 1 is the highest priority.
3. If after 45 seconds, a node does not receive a response from another node with a higher priority, then it becomes the control node.

---

**Note** If multiple nodes tie for the highest priority, the cluster node name and then the serial number is used to determine the control node.

---

4. If a node later joins the cluster with a higher priority, it does not automatically become the control node; the existing control node always remains as the control node unless it stops responding, at which point a new control node is elected.
5. In a "split brain" scenario when there are temporarily multiple control nodes, then the node with highest priority retains the role while the other nodes return to data node roles.

---

**Note** You can manually force a node to become the control node. For centralized features, if you force a control node change, then all connections are dropped, and you have to re-establish the connections on the new control node.

---

## High Availability within the Cluster

Clustering provides high availability by monitoring node and interface health and by replicating connection states between nodes.

### Node Health Monitoring

Each node periodically sends a broadcast heartbeat packet over the cluster control link. If the control node does not receive any heartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining nodes.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role.

### Interface Monitoring

Each node monitors the link status of all named hardware interfaces in use, and reports status changes to the control node.

All physical interfaces are monitored; only named interfaces can be monitored. You can optionally disable monitoring per interface.

A node is removed from the cluster if its monitored interfaces fail. The node is removed after 500 ms.

### Status After Failure

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The Firewall Threat Defense automatically tries to rejoin the cluster, depending on the failure event.

**Note**

When the Firewall Threat Defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

### Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The Firewall Threat Defense automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The Firewall Threat Defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the Firewall Threat

Defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.

- **Failed node**—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The Firewall Threat Defense application attempts to rejoin the cluster every 5 seconds.
- **Internal error**—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- **Failed configuration deployment**—If you deploy a new configuration from Firewall Management Center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 41: Features Replicated Across the Cluster**

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—
SNMP Engine ID	No	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.
- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

**Note**

We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be

load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

### Port Address Translation Connections

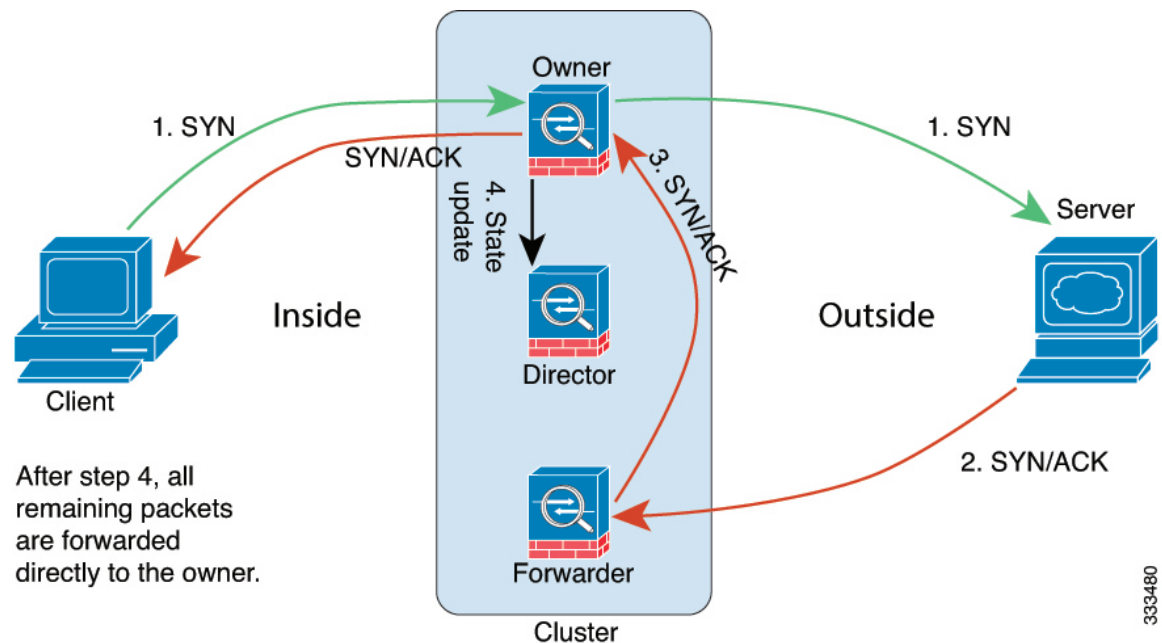

## New Connection Ownership

Traffic redirection is not supported in this release. When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. All the subsequent packets for the same connection should arrive the same node. If any connection packets arrive at a different node, they will be dropped. If a reverse flow arrives at a different node, it will be dropped as well. For centralized features, if the connections do not arrive on the control node, they will be dropped.

By default, AWS GWLB uses 5-tuple to maintain flow stickiness. It is recommended to enable 2-tuple or 3-tuple stickiness on AWS GWLB to ensure the same flows are sent to the same node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

1. The SYN packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different Firewall Threat Defense (based on the load balancing method). This Firewall Threat Defense is the forwarder.

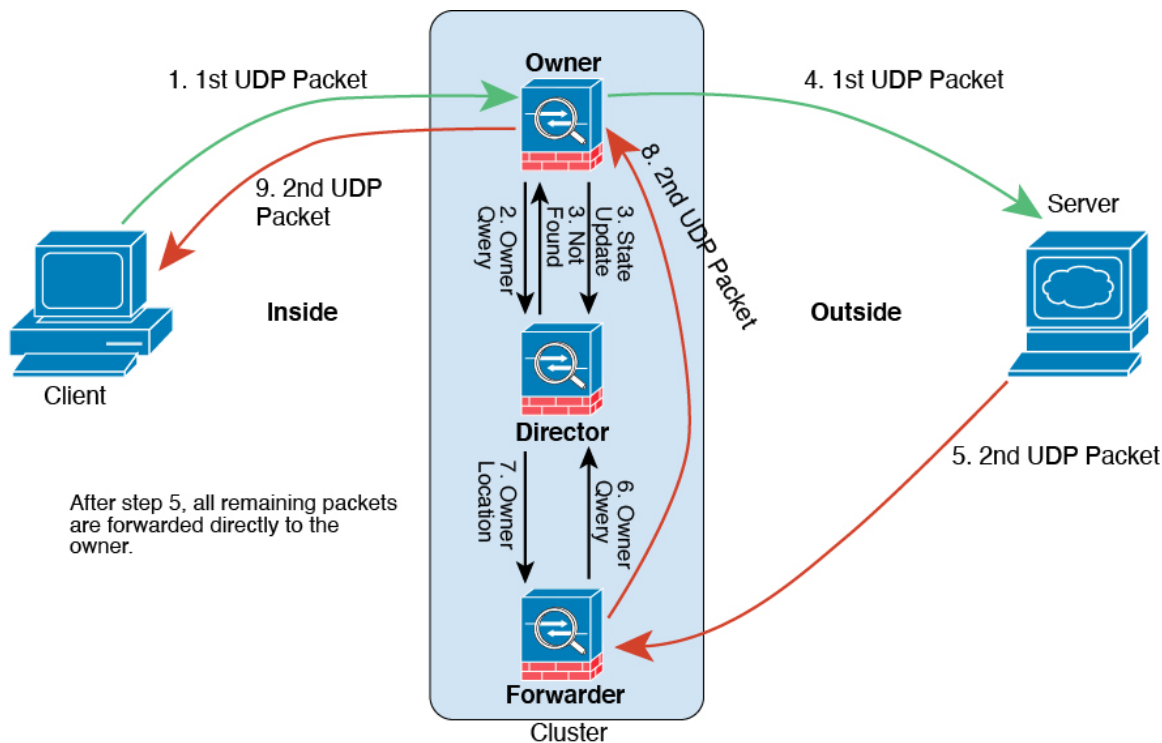

3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. *Figure 275: ICMP and UDP Data Flow*

The first UDP packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.

5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

## History for Threat Defense Virtual Clustering in the Public Cloud

Table 42:

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster control link ping tool.	7.2.6/7.4.1	Any	<p>You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. ## CHAPTER 13

# Clustering for the Firepower 4100/9300

Clustering lets you group multiple Firewall Threat Defense nodes together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices.

**Note** Some features are not supported when using clustering. See [Unsupported Features with Clustering, on page 637](#).

## About Clustering on the Firepower 4100/9300 Chassis

When you deploy a cluster on the Firepower 4100/9300 chassis, it does the following:

- For native instance clustering: Creates a *cluster-control link* (by default, port-channel 48) for node-to-node communication.

For multi-instance clustering: You should pre-configure subinterfaces on one or more cluster-type EtherChannels; each instance needs its own cluster control link.

For a cluster isolated to security modules within one Firepower 9300 chassis, this link utilizes the Firepower 9300 backplane for cluster communications.

For clustering with multiple chassis, you need to manually assign physical interface(s) to this EtherChannel for communications between chassis.

- Creates the cluster bootstrap configuration within the application.

When you deploy the cluster, the chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

- Assigns data interfaces to the cluster as *Spanned* interfaces.

For a cluster isolated to security modules within one Firepower 9300 chassis, spanned interfaces are not limited to EtherChannels, like it is for clustering with multiple chassis. The Firepower 9300 supervisor uses EtherChannel technology internally to load-balance traffic to multiple modules on a shared interface, so any data interface type works for Spanned mode. For clustering with multiple chassis, you must use Spanned EtherChannels for all data interfaces.

---

**Note** Individual interfaces are not supported, with the exception of a management interface.

---

- Assigns a management interface to all units in the cluster.

See the following sections for more information about clustering.

## Bootstrap Configuration

When you deploy the cluster, the Firepower 4100/9300 chassis supervisor pushes a minimal bootstrap configuration to each unit that includes the cluster name, cluster control link interface, and other cluster settings.

## Cluster Members

Cluster members work together to accomplish the sharing of the security policy and traffic flows.

One member of the cluster is the **control** unit. The control unit is determined automatically. All other members are **data** units.

You must perform all configuration on the control unit only; the configuration is then replicated to the data units.

Some features do not scale in a cluster, and the control unit handles all traffic for those features. .

## Cluster Control Link

For native instance clustering: The cluster control link is automatically created using the Port-channel 48 interface.

For multi-instance clustering: You should pre-configure subinterfaces on one or more cluster-type EtherChannels; each instance needs its own cluster control link.

For a cluster isolated to security modules within one Firepower 9300 chassis, this interface has no member interfaces. This Cluster type EtherChannel utilizes the Firepower 9300 backplane for cluster communications. For clustering with multiple chassis, you must add one or more interfaces to the EtherChannel.

For a cluster with two chassis, do not directly connect the cluster control link from one chassis to the other chassis. If you directly connect the interfaces, then when one unit fails, the cluster control link fails, and thus

the remaining healthy unit fails. If you connect the cluster control link through a switch, then the cluster control link remains up for the healthy unit.

Cluster control link traffic includes both control and data traffic.

## Size the Cluster Control Link

If possible, you should size the cluster control link to match the expected throughput of each chassis so the cluster control link can handle the worst-case scenarios.

Cluster control link traffic is comprised mainly of state update and forwarded packets. The amount of traffic at any given time on the cluster control link varies. The amount of forwarded traffic depends on the load-balancing efficacy or whether there is a lot of traffic for centralized features. For example:

- NAT results in poor load balancing of connections, and the need to rebalance all returning traffic to the correct units.
- When membership changes, the cluster needs to rebalance a large number of connections, thus temporarily using a large amount of cluster control link bandwidth.

A higher-bandwidth cluster control link helps the cluster to converge faster when there are membership changes and prevents throughput bottlenecks.

**Note** If your cluster has large amounts of asymmetric (rebalanced) traffic, then you should increase the cluster control link size.

## Cluster Control Link Redundancy

The following diagram shows how to use an EtherChannel as a cluster control link in a Virtual Switching System (VSS), Virtual Port Channel (vPC), StackWise, or StackWise Virtual environment. All links in the EtherChannel are active. When the switch is part of a redundant system, then you can connect firewall interfaces within the same EtherChannel to separate switches in the redundant system. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch. Note that this EtherChannel is device-local, not a Spanned EtherChannel.

## Cluster Control Link Reliability for Inter-Chassis Clustering

To ensure cluster control link functionality, be sure the round-trip time (RTT) between units is less than 20 ms. This maximum latency enhances compatibility with cluster members installed at different geographical sites. To check your latency, perform a ping on the cluster control link between units.

The cluster control link must be reliable, with no out-of-order or dropped packets; for example, for inter-site deployment, you should use a dedicated link.

## Cluster Control Link Network

The Firepower 4100/9300 chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: `127.2.chassis_id.slot_id`. For multi-instance clusters, which typically use different VLAN subinterfaces of the same EtherChannel, the same IP address can be used for different clusters because of VLAN separation. The cluster control link network cannot include any routers between units; only Layer 2 switching is allowed.

## Management Network

We recommend connecting all units to a single management network. This network is separate from the cluster control link.

## Management Interface

You must assign a Management type interface to the cluster. This interface is a special individual interface as opposed to a Spanned interface. The management interface lets you connect directly to each unit. This Management logical interface is separate from the other interfaces on the device. It is used to set up and register the device to the Secure Firewall Management Center. It uses its own local authentication, IP address, and static routing. Each cluster member uses a separate IP address on the management network that you set as part of the bootstrap configuration.

## Cluster Interfaces

For a cluster isolated to security modules within one Firepower 9300 chassis, you can assign both physical interfaces or EtherChannels (also known as port channels) to the cluster. Interfaces assigned to the cluster are Spanned interfaces that load-balance traffic across all members of the cluster.

For clustering with multiple chassis, you can only assign data EtherChannels to the cluster. These Spanned EtherChannels include the same member interfaces on each chassis; on the upstream switch, all of these interfaces are included in a single EtherChannel, so the switch does not know that it is connected to multiple devices.

You can use regular firewall interfaces or IPS-only interfaces (inline sets or passive interfaces).

Individual interfaces are not supported, with the exception of a management interface.

## Spanned EtherChannels

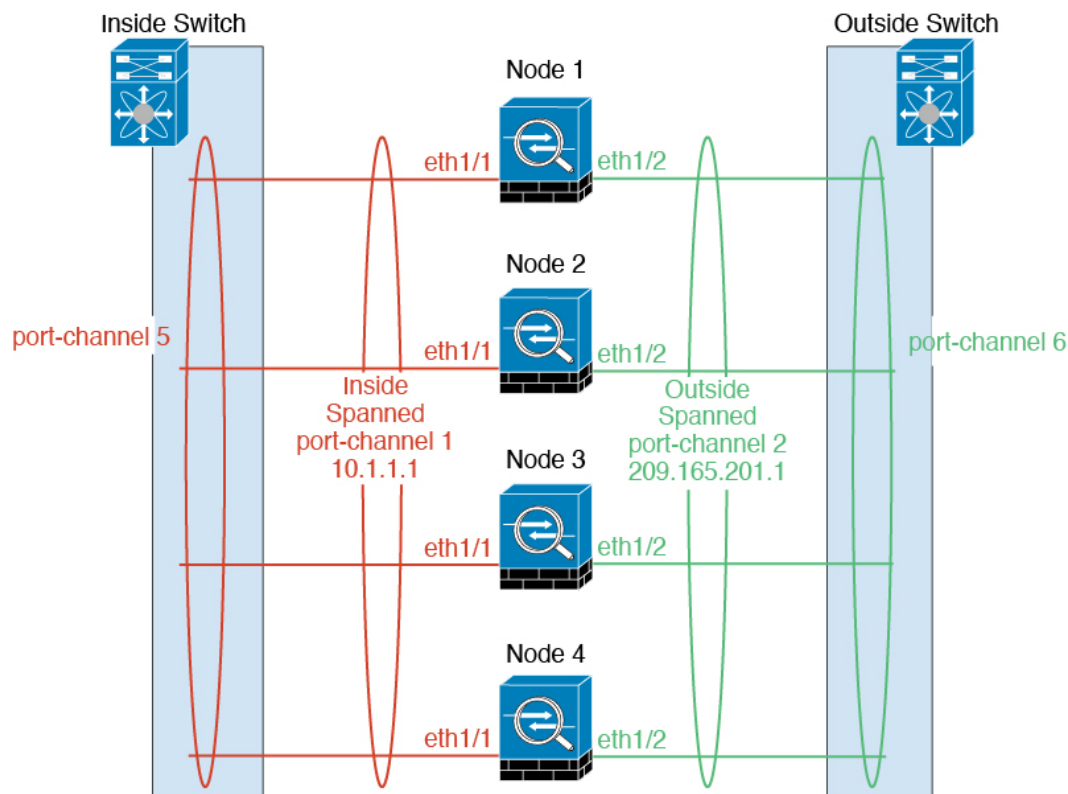

You can group one or more interfaces per chassis into an EtherChannel that spans all chassis in the cluster. The EtherChannel aggregates the traffic across all the available active interfaces in the channel.

For regular firewall interfaces: A Spanned EtherChannel can be configured in both routed and transparent firewall modes. In routed mode, the EtherChannel is configured as a routed interface with a single IP address. In transparent mode, the IP address is assigned to the BVI, not to the bridge group member interface.

The EtherChannel inherently provides load balancing as part of basic operation.

For multi-instance clusters, each cluster requires dedicated data EtherChannels; you cannot use shared interfaces or VLAN subinterfaces.

## Connecting to a Redundant Switch System

We recommend connecting EtherChannels to a redundant switch system such as a VSS, vPC, StackWise, or StackWise Virtual system to provide redundancy for your interfaces.

## Configuration Replication

All nodes in the cluster share a single configuration. You can only make configuration changes on the control node (with the exception of the bootstrap configuration), and changes are automatically synced to all other nodes in the cluster.

## Licenses for Clustering

You assign feature licenses to the cluster as a whole, not to individual nodes. However, each node of the cluster consumes a separate license for each feature. The clustering feature itself does not require any licenses.

When you add a cluster node to the Firewall Management Center, you can specify the feature licenses you want to use for the cluster. You can modify licenses for the cluster in the **Devices > Device Management > Cluster > License** area.

**Note** If you add the cluster before the Firewall Management Center is licensed (and running in Evaluation mode), then when you license the Firewall Management Center, you can experience traffic disruption when you deploy policy changes to the cluster. Changing to licensed mode causes all data units to leave the cluster and then rejoin.

## Requirements and Prerequisites for Clustering

### Cluster Model Support

The Threat Defense supports clustering on the following models:

- Firepower 9300— You can include up to 16 nodes in the cluster. For example, you can use 1 module in 16 chassis, or 2 modules in 8 chassis, or any combination that provides a maximum of 16 modules. Supports clustering with multiple chassis and clustering isolated to security modules within one chassis.
- Firepower 4100—Supported for up to 16 nodes using clustering with multiple chassis.

### User Roles

- Admin
- Access Admin
- Network Admin

### Clustering Hardware and Software Requirements

All chassis in a cluster:

- Native instance clustering—For the Firepower 4100: All chassis must be the same model. For the Firepower 9300: All security modules must be the same type. For example, if you use clustering, all modules in the Firepower 9300 must be SM-40s. You can have different quantities of installed security modules in each chassis, although all modules present in the chassis must belong to the cluster including any empty slots.
- Container instance clustering—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

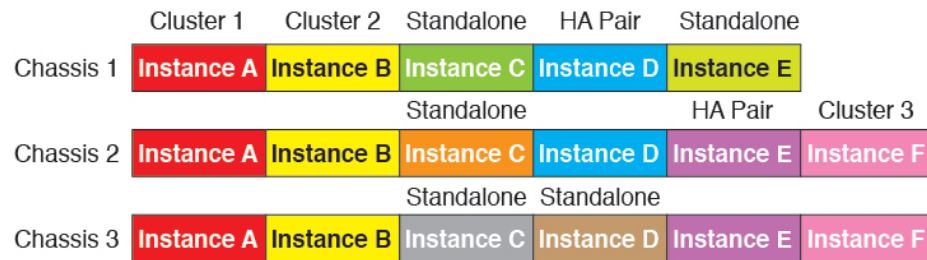

- Must run the identical FXOS and application software except at the time of an image upgrade. Mismatched software versions can lead to poor performance, so be sure to upgrade all nodes in the same maintenance window.
- Must include the same interface configuration for interfaces you assign to the cluster, such as the same Management interface, EtherChannels, active interfaces, speed and duplex, and so on. You can use different network module types on the chassis as long as the capacity matches for the same interface IDs and interfaces can successfully bundle in the same spanned EtherChannel. Note that all data interfaces must be EtherChannels in clusters with multiple chassis. If you change the interfaces in FXOS after you enable clustering (by adding or removing interface modules, or configuring EtherChannels, for example), then perform the same changes on each chassis, starting with the data nodes, and ending with the control node.
- Must use the same NTP server. For Firewall Threat Defense, the Firewall Management Center must also use the same NTP server. Do not set the time manually.

### Multi-Instance Clustering Requirements

- No intra-security-module/engine clustering—For a given cluster, you can only use a single container instance per security module/engine. You cannot add 2 container instances to the same cluster if they are running on the same module.

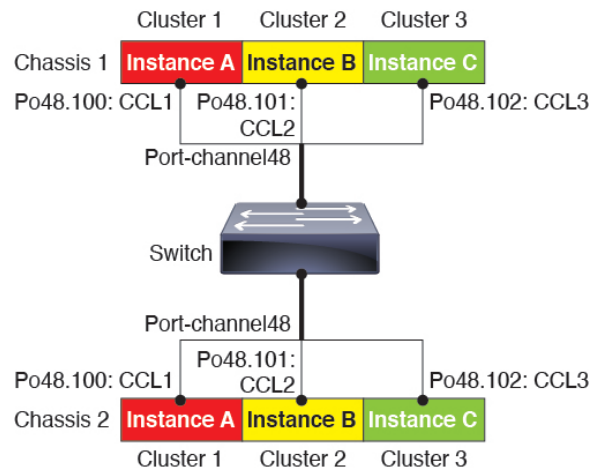

- Mix and match clusters and standalone instances—Not all container instances on a security module/engine need to belong to a cluster. You can use some instances as standalone or High Availability nodes. You can also create multiple clusters using separate instances on the same security module/engine.

- All 3 modules in a Firepower 9300 must belong to the cluster—For the Firepower 9300, a cluster requires a single container instance on all 3 modules. You cannot create a cluster using instances on module 1 and 2, and then use a native instance on module 3, or example.

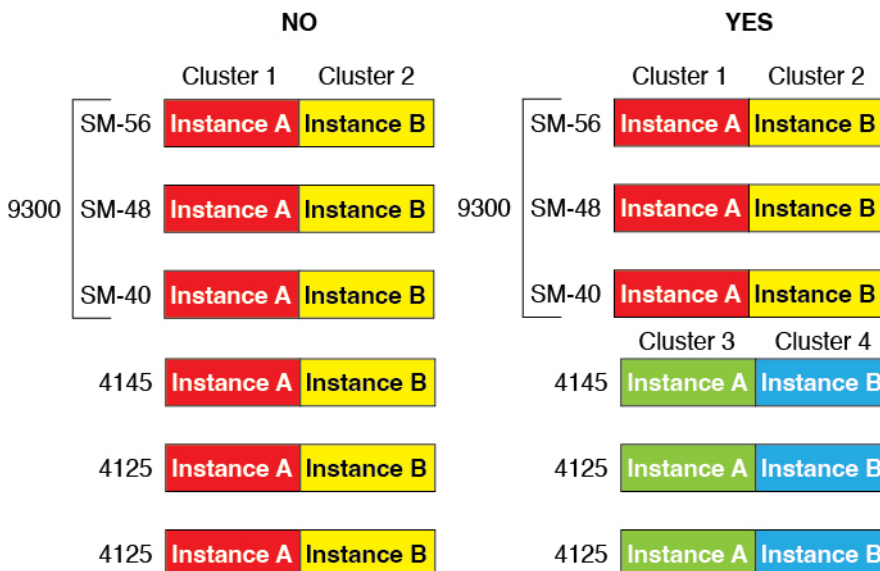

- Match resource profiles—We recommend that each node in the cluster use the same resource profile attributes; however, mismatched resources are allowed when changing cluster nodes to a different resource profile, or when using different models.
- Dedicated cluster control link—For clusters with multiple chassis, each cluster needs a dedicated cluster control link. For example, each cluster can use a separate subinterface on the same cluster-type EtherChannel, or use separate EtherChannels.

- No shared interfaces—Shared-type interfaces are not supported with clustering. However, the same Management and Eventing interfaces can be used by multiple clusters.
- No subinterfaces—A multi-instance cluster cannot use FXOS-defined VLAN subinterfaces. An exception is made for the cluster control link, which can use a subinterface of the Cluster EtherChannel.
- Mix chassis models—We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300

security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster. For example, you can create a cluster using an instance on a Firepower 9300 SM-56, SM-48, and SM-40. Or you can create a cluster on a Firepower 4145 and a 4125.

- Maximum 6 nodes—You can use up to six container instances in a cluster.

### Switch Requirements

- Be sure to complete the switch configuration and successfully connect all the EtherChannels from the chassis to the switch(es) before you configure clustering on the Firepower 4100/9300 chassis.
- For supported switch characteristics, see [Cisco FXOS Compatibility](#).

## Clustering Guidelines and Limitations

### Switches for Clustering

- Make sure connected switches match the MTU for both cluster data interfaces and the cluster control link interface. You should configure the cluster control link interface MTU to be at least 100 bytes higher than the data interface MTU, so make sure to configure the cluster control link connecting switch appropriately. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. In addition, we do not recommend setting the cluster control link MTU between 2561 and 8362; due to block pool handling, this MTU size is not optimal for system operation.
- For Cisco IOS XR systems, if you want to set a non-default MTU, set the IOS XR interface MTU to be 14 bytes higher than the cluster device MTU. Otherwise, OSPF adjacency peering attempts may fail unless the **mtu-ignore** option is used. Note that the cluster device MTU should match the IOS XR *IPv4* MTU. This adjustment is not required for Cisco Catalyst and Cisco Nexus switches.

- On the switch(es) for the cluster control link interfaces, you can optionally enable Spanning Tree PortFast on the switch ports connected to the cluster unit to speed up the join process for new units.
- On the switch, we recommend that you use one of the following EtherChannel load-balancing algorithms: **source-dest-ip** or **src-dst-mixed-ip-port** (see the Cisco Nexus OS and Cisco IOS-XE **port-channel load-balance** command). Do not use a **vlan** keyword in the load-balance algorithm because it can cause unevenly distributed traffic to the devices in a cluster.
- If you change the load-balancing algorithm of the EtherChannel on the switch, the EtherChannel interface on the switch temporarily stops forwarding traffic, and the Spanning Tree Protocol restarts. There will be a delay before traffic starts flowing again.
- Switches on the cluster control link path should not verify the L4 checksum. Redirected traffic over the cluster control link does not have a correct L4 checksum. Switches that verify the L4 checksum could cause traffic to be dropped.
- Port-channel bundling downtime should not exceed the configured keepalive interval.
- On Supervisor 2T EtherChannels, the default hash distribution algorithm is adaptive. To avoid asymmetric traffic in a VSS design, change the hash algorithm on the port-channel connected to the cluster device to fixed:

```
router(config)# port-channel id hash-distribution fixed
```

Do not change the algorithm globally; you may want to take advantage of the adaptive algorithm for the VSS peer link.

- Firepower 4100/9300 clusters support LACP graceful convergence. So you can leave LACP graceful convergence enabled on connected Cisco Nexus switches.
- When you see slow bundling of a Spanned EtherChannel on the switch, you can enable LACP rate fast for an individual interface on the switch. FXOS EtherChannels have the LACP rate set to fast by default. Note that some switches, such as the Nexus series, do not support LACP rate fast when performing in-service software upgrades (ISSUs), so we do not recommend using ISSUs with clustering.

### EtherChannels for Clustering

- In Catalyst 3750-X Cisco IOS software versions earlier than 15.1(1)S2, the cluster unit did not support connecting an EtherChannel to a switch stack. With default switch settings, if the cluster unit EtherChannel is connected cross stack, and if the control unit switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- Spanned vs. Device-Local EtherChannel Configuration—Be sure to configure the switch appropriately for Spanned EtherChannels vs. Device-local EtherChannels.
  - Spanned EtherChannels—For cluster unit *Spanned* EtherChannels, which span across all members of the cluster, the interfaces are combined into a single EtherChannel on the switch. Make sure each interface is in the same channel group on the switch.

- **Device-local EtherChannels**—For cluster unit *Device-local* EtherChannels including any EtherChannels configured for the cluster control link, be sure to configure discrete EtherChannels on the switch; do not combine multiple cluster unit EtherChannels into one EtherChannel on the switch.

### Additional Guidelines

- When significant topology changes occur (such as adding or removing an EtherChannel interface, enabling or disabling an interface on the Firepower 4100/9300 chassis or the switch, adding an additional switch to form a VSS, vPC, StackWise, or StackWise Virtual) you should disable the health check feature, and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all units, you can re-enable the health check feature.
- When adding a unit to an existing cluster, or when reloading a unit, there will be a temporary, limited packet/connection drop; this is expected behavior. In some cases, the dropped packets can hang connections; for example, dropping a FIN/ACK packet for an FTP connection will make the FTP client hang. In this case, you need to reestablish the FTP connection.
- If you use a Windows 2003 server connected to a Spanned EtherChannel interface, when the syslog server port is down, and the server does not throttle ICMP error messages, then large numbers of ICMP messages are sent back to the cluster. These messages can result in some units of the cluster experiencing high CPU, which can affect performance. We recommend that you throttle ICMP error messages.
- We recommend connecting EtherChannels to a VSS, vPC, StackWise, or StackWise Virtual for redundancy.

- Within a chassis, you cannot cluster some security modules and run other security modules in standalone mode; you must include all security modules in the cluster.
- For decrypted TLS/SSL connections, the decryption states are not synchronized, and if the connection owner fails, then decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

#### Defaults

- The cluster health check feature is enabled by default with the holdtime of 3 seconds. Interface health monitoring is enabled on all interfaces by default.
- The cluster auto-rejoin feature for a failed cluster control link is set to unlimited attempts every 5 minutes.
- The cluster auto-rejoin feature for a failed data interface is set to 3 attempts every 5 minutes, with the increasing interval set to 2.
- Connection replication delay of 5 seconds is enabled by default for HTTP traffic.

## Configure Clustering

You can easily deploy the cluster from the Firepower 4100/9300 supervisor. All initial configuration is automatically generated for each unit. You can then add the units to the Firewall Management Center and group them into a cluster.

### FXOS: Add a Firewall Threat Defense Cluster

In native mode: You can add a cluster to a single Firepower 9300 chassis that is isolated to security modules within the chassis, or you can use multiple chassis.

In multi-instance mode: You can add one or more clusters to a single Firepower 9300 chassis that are isolated to security modules within the chassis (you must include an instance on each module), or add one or more clusters on multiple chassis.

For clusters on multiple chassis, you must configure each chassis separately. Add the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

### Create a Firewall Threat Defense Cluster

You can easily deploy the cluster from the Firepower 4100/9300 chassis supervisor. All initial configuration is automatically generated for each unit.

For clustering on multiple chassis, you must configure each chassis separately. Deploy the cluster on one chassis; you can then copy the bootstrap configuration from the first chassis to the next chassis for ease of deployment.

In a Firepower 9300 chassis, you must enable clustering for all 3 module slots, or for container instances, a container instance in each slot, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

### Before you begin

- Download the application image you want to use for the logical device from Cisco.com, and then upload that image to the Firepower 4100/9300 chassis.
- For container instances, if you do not want to use the default profile, add a resource profile according to [Add a Resource Profile for Container Instances, on page 261](#).
- For container instances, before you can install a container instance for the first time, you must reinitialize the security module/engine so that the disk has the correct formatting. Choose **Security Modules** or **Security Engine**, and click the Reinitialize icon (⚙️). An existing logical device will be deleted and then reinstalled as a new device, losing any local application configuration. If you are replacing a native instance with container instances, you will need to delete the native instance in any case. You cannot automatically migrate a native instance to a container instance.
- Gather the following information:
  - Management interface ID, IP addresses, and network mask
  - Gateway IP address
  - Firewall Management Center IP address and/or NAT ID of your choosing
  - DNS server IP address
  - Firewall Threat Defense hostname and domain name

### Procedure

#### Step 1

Configure interfaces.

- a) Add at least one Data type interface or EtherChannel (also known as a port-channel) before you deploy the cluster. See [Add an EtherChannel \(Port Channel\), on page 257](#) or [Configure a Physical Interface, on page 256](#).

For clustering on multiple chassis, all data interfaces must be Spanned EtherChannels with at least one member interface. Add the same EtherChannels on each chassis. Combine the member interfaces from all cluster units into a single EtherChannel on the switch. See [Clustering Guidelines and Limitations, on page 591](#) for more information about EtherChannels.

For multi-instance clustering, you cannot use FXOS-defined VLAN subinterfaces or data-sharing interfaces in the cluster. Only application-defined subinterfaces are supported. See [FXOS Interfaces vs. Application Interfaces, on page 224](#) for more information.

- b) Add a Management type interface or EtherChannel. See [Add an EtherChannel \(Port Channel\), on page 257](#) or [Configure a Physical Interface, on page 256](#).

The management interface is required. Note that this management interface is not the same as the chassis management interface that is used only for chassis management (in FXOS, you might see the chassis management interface displayed as MGMT, management0, or other similar names).

For clustering on multiple chassis, add the same Management interface on each chassis.

For multi-instance clustering, you can share the same management interface across multiple clusters on the same chassis, or with standalone instances.

- c) For clustering on multiple chassis, add a member interface to the cluster control link EtherChannel (by default, port-channel 48). See [Add an EtherChannel \(Port Channel\), on page 257](#).

Do not add a member interface for a cluster isolated to security modules within one Firepower 9300 chassis. If you add a member, the chassis assumes this cluster will be using multiple chassis, and will only allow you to use Spanned EtherChannels, for example.

On the **Interfaces** tab, the port-channel 48 cluster type interface shows the **Operation State** as **failed** if it does not include any member interfaces. For a cluster isolated to security modules within one Firepower 9300 chassis, this EtherChannel does not require any member interfaces, and you can ignore this Operational State.

Add the same member interfaces on each chassis. The cluster control link is a device-local EtherChannel on each chassis. Use separate EtherChannels on the switch per device. See [Clustering Guidelines and Limitations, on page 591](#) for more information about EtherChannels.

For multi-instance clustering, you can create additional Cluster type EtherChannels. Unlike the Management interface, the cluster control link is *not* sharable across multiple devices, so you will need a Cluster interface for each cluster. However, we recommend using VLAN subinterfaces instead of multiple EtherChannels; see the next step to add a VLAN subinterface to the Cluster interface.

- d) For multi-instance clustering, add VLAN subinterfaces to the cluster EtherChannel so you have a subinterface for each cluster. See [Add a VLAN Subinterface for Container Instances, on page 259](#).

If you add subinterfaces to a Cluster interface, you cannot use that interface for a native cluster.

- e) (Optional) Add an eventing interface. See [Add an EtherChannel \(Port Channel\), on page 257](#) or [Configure a Physical Interface, on page 256](#).

This interface is a secondary management interface for the Firewall Threat Defense devices. To use this interface, you must configure its IP address and other parameters at the Firewall Threat Defense CLI. For example, you can separate management traffic from events (such as web events). See the **configure network** commands in the Firewall Threat Defense command reference.

For clustering on multiple chassis, add the same eventing interface on each chassis.

## Step 2

Choose **Logical Devices**.

## Step 3

Click **Add > Cluster**, and set the following parameters:

**Figure 276: Native Cluster**

**Add Cluster**

I want to: Create New Cluster

Device Name: cluster1

Template: Cisco Secure Firewall Threat Defense

Image Version: 7.3.0.1676

Instance Type: Native

OK Cancel

Figure 277: Multi-Instance Cluster

- a) Choose **I want to:** > **Create New Cluster**
- b) Provide a **Device Name**.

This name is used internally by the chassis supervisor to configure management settings and to assign interfaces; it is not the device name used in the application configuration.

- c) For the **Template**, choose **Cisco Firepower Threat Defense**.
- d) Choose the **Image Version**.
- e) For the **Instance Type**, choose either **Native** or **Container**.

A native instance uses all of the resources (CPU, RAM, and disk space) of the security module/engine, so you can only install one native instance. A container instance uses a subset of resources of the security module/engine, so you can install multiple container instances.

- f) (Container Instance only) For the **Resource Type**, choose one of the resource profiles from the drop-down list.

For the Firepower 9300, this profile will be applied to each instance on each security module. You can set different profiles per security module later in this procedure; for example, if you are using different security module types, and you want to use more CPUs on a lower-end model. We recommend choosing the correct profile before you create the cluster. If you need to create a new profile, cancel out of the cluster creation, and add one using [Add a Resource Profile for Container Instances, on page 261](#).

#### Note

If you assign a different profile to instances in an established cluster, which allows mismatched profiles, then apply the new profile on the data nodes first; after they reboot and come back up, you can apply the new profile to the control node.

- g) Click **OK**.

You see the Provisioning - *device name* window.

**Step 4** Choose the interfaces you want to assign to this cluster.

For native mode clustering: All valid interfaces are assigned by default. If you defined multiple Cluster type interfaces, deselect all but one.

For multi-instance clustering: Choose each data interface you want to assign to the cluster, and also choose the Cluster type port-channel or port-channel subinterface.

**Step 5** Click the device icon in the center of the screen.

A dialog box appears where you can configure initial bootstrap settings. These settings are meant for initial deployment only, or for disaster recovery. For normal operation, you can later change most values in the application CLI configuration.

**Step 6** On the **Cluster Information** page, complete the following.

**Figure 278: Native Cluster**

Cisco Secure Firewall Threat Defense - Bootstrap Configuration

Cluster Information | Interface Information | Settings | Agreement

**Security Module**  
Security Module - 1, Security Module - 2, Security Module - 3

**Interface Information**  
Chassis ID: 1  
Site ID: 1  
Cluster Key: \*\*\*\*  
Confirm Cluster Key: \*\*\*\*  
Cluster Group Name: cluster1  
Management Interface: Ethernet1/4  
CCL Subnet IP: Eg:x.x.0.0

OK Cancel

**Figure 279: Multi-Instance Cluster**

Cisco Secure Firewall Threat Defense - Bootstrap Configuration

Cluster Information | Interface Information | Settings | Agreement

**Resource Profile Selection**  
Security Module 1: (72 Cores Available) Default-Small  
Security Module 2: (46 Cores Available) Default-Small  
Security Module 3: Default-Small

**Interface Information**  
Chassis ID: 1  
Site ID: 1  
Cluster Key: \*\*\*\*  
Confirm Cluster Key: \*\*\*\*  
Cluster Group Name: mi-cluster-1  
Management Interface: Ethernet1/4  
CCL Subnet IP: Eg:x.x.0.0

OK Cancel

- a) (Container Instance for the Firepower 9300 only) In the **Security Module (SM) and Resource Profile Selection** area, you can set a different resource profile per module; for example, if you are using different security module types, and you want to use more CPUs on a lower-end model.
- b) For clustering on multiple chassis, in the **Chassis ID** field, enter a chassis ID. Each chassis in the cluster must use a unique ID.

This field only appears if you added a member interface to cluster control link Port-Channel 48.

- c) For inter-site clustering, in the **Site ID** field, enter the site ID for this chassis between 1 and 8. FlexConfig feature. Additional inter-site cluster customizations to enhance redundancy and stability, such as director

localization, site redundancy, and cluster flow mobility, are only configurable using the Firewall Management Center FlexConfig feature.

- d) In the **Cluster Key** field, configure an authentication key for control traffic on the cluster control link.

The shared secret is an ASCII string from 1 to 63 characters. The shared secret is used to generate the key. This option does not affect datapath traffic, including connection state update and forwarded packets, which are always sent in the clear.

- e) Set the **Cluster Group Name**, which is the cluster group name in the logical device configuration.

The name must be an ASCII string from 1 to 38 characters.

**Important**

From 2.4.1, spaces in cluster group name will be considered as special characters and may result in error while deploying the logical devices. To avoid this issue, you must rename the cluster group name without a space.

- f) Choose the **Management Interface**.

This interface is used to manage the logical device. This interface is separate from the chassis management port.

If you assign a Hardware Bypass-capable interface as the Management interface, you see a warning message to make sure your assignment is intentional.

- g) (Optional) Set the **CCL Subnet IP** as *a.b.0.0*.

By default, the cluster control link uses the 127.2.0.0/16 network. However, some networking deployments do not allow 127.2.0.0/16 traffic to pass. In this case, specify any /16 network address on a unique network for the cluster, except for loopback (127.0.0.0/8), multicast (224.0.0.0/4), and internal (169.254.0.0/16) addresses. If you set the value to 0.0.0.0, then the default network is used.

The chassis auto-generates the cluster control link interface IP address for each unit based on the chassis ID and slot ID: *a.b.chassis\_id.slot\_id*.

**Step 7**

On the **Settings** page, complete the following.

## Cisco Secure Firewall Threat Defense - Bootstrap Configuration

Cluster Information   Interface Information   Settings   Agreement

Management type of application instance:	FMC
Search domains:	cisco.com
Firewall Mode:	Routed
DNS Servers:	10.89.5.67
Fully Qualified Hostname:	td2.cisco.com
Password:	.....
Confirm Password:	.....
Registration Key:	....
Confirm Registration Key:	....
CDO Onboard:	
Confirm CDO Onboard:	
Firepower Management Center IP:	10.89.5.35
Firepower Management Center NAT ID:	test
Eventing Interface:	

OK Cancel

- In the **Registration Key** field, enter the key to be shared between the Firewall Management Center and the cluster members during registration.  
You can choose any text string for this key between 1 and 37 characters; you will enter the same key on the Firewall Management Center when you add the Firewall Threat Defense.
- Enter a **Password** for the Firewall Threat Defense admin user for CLI access.
- In the **Firepower Management Center IP** field, enter the IP address of the managing Firewall Management Center. If you do not know the Firewall Management Center IP address, leave this field blank and enter a passphrase in the **Firepower Management Center NAT ID** field.
- (Optional) For a container instance, **Permit Expert mode from FTD SSH sessions**: **Yes** or **No**. Expert Mode provides Firewall Threat Defense shell access for advanced troubleshooting.

If you choose **Yes** for this option, then users who access the container instance directly from an SSH session can enter Expert Mode. If you choose **No**, then only users who access the container instance from the FXOS CLI can enter Expert Mode. We recommend choosing **No** to increase isolation between instances.

Use Expert Mode only if a documented procedure tells you it is required, or if the Cisco Technical Assistance Center asks you to use it. To enter this mode, use the **expert** command in the Firewall Threat Defense CLI.

- e) (Optional) In the **Search Domains** field, enter a comma-separated list of search domains for the management network.
- f) (Optional) From the **Firewall Mode** drop-down list, choose **Transparent** or **Routed**.

In routed mode, the Firewall Threat Defense is considered to be a router hop in the network. Each interface that you want to route between is on a different subnet. A transparent firewall, on the other hand, is a Layer 2 firewall that acts like a “bump in the wire,” or a “stealth firewall,” and is not seen as a router hop to connected devices.

The firewall mode is only set at initial deployment. If you re-apply the bootstrap settings, this setting is not used.

- g) (Optional) In the **DNS Servers** field, enter a comma-separated list of DNS servers.

The Firewall Threat Defense uses DNS if you specify a hostname for the Firewall Management Center, for example.

- h) (Optional) In the **Firepower Management Center NAT ID** field, enter a passphrase that you will also enter on the Firewall Management Center when you add the cluster as a new device.

Normally, you need both IP addresses (along with a registration key) for both routing purposes and for authentication: the Firewall Management Center specifies the device IP address, and the device specifies the Firewall Management Center IP address. However, if you only know one of the IP addresses, which is the minimum requirement for routing purposes, then you must also specify a unique NAT ID on both sides of the connection to establish trust for the initial communication and to look up the correct registration key. You can specify any text string as the NAT ID, from 1 to 37 characters. The Firewall Management Center and device use the registration key and NAT ID (instead of IP addresses) to authenticate and authorize for initial registration.

- i) (Optional) In the **Fully Qualified Hostname** field, enter a fully qualified name for the Firewall Threat Defense device.

Valid characters are the letters from a to z, the digits from 0 to 9, the dot (.), and the hyphen (-); maximum number of characters is 253.

- j) (Optional) From the **Eventing Interface** drop-down list, choose the interface on which events should be sent. If not specified, the management interface will be used.

To specify a separate interface to use for events, you must configure an interface as a *firepower-eventing* interface. If you assign a Hardware Bypass-capable interface as the Eventing interface, you see a warning message to make sure your assignment is intentional.

## Step 8

On the **Interface Information** page, configure a management IP address for each security module in the cluster. Select the type of address from the **Address Type** drop-down list and then complete the following for each security module.

### Note

You must set the IP address for all 3 module slots in a chassis, even if you do not have a module installed. If you do not configure all 3 modules, the cluster will not come up.

Cisco Secure Firewall Threat Defense - Bootstrap Configuration

Cluster Information **Interface Information** Settings Agreement

Address Type: IPv4 only

**Security Module 1**

Management IP: 10.89.5.20

Network Mask: 255.255.255.192

Gateway: 10.89.5.1

**Security Module 2**

Management IP: 10.89.5.21

Network Mask: 255.255.255.192

Gateway: 10.89.5.1

**Security Module 3**

Management IP: 10.89.5.22

Network Mask: 255.255.255.192

Gateway: 10.89.5.1

OK Cancel

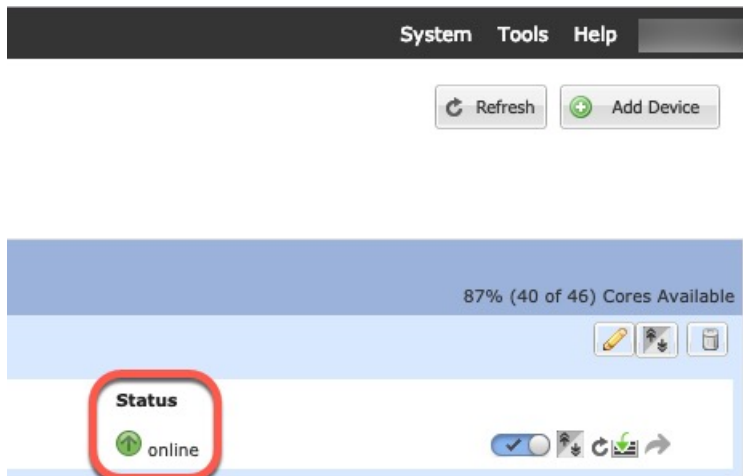

- In the **Management IP** field, configure an IP address.  
Specify a unique IP address on the same network for each module.
- Enter a **Network Mask** or **Prefix Length**.
- Enter a **Network Gateway** address.

**Step 9** On the **Agreement** tab, read and accept the end user license agreement (EULA).

**Step 10** Click **OK** to close the configuration dialog box.

**Step 11** Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for the status of the new logical device. When the logical device shows its **Status** as **online**, you can add the remaining cluster chassis, or for a cluster isolated to security modules within one Firepower 9300 chassis, start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

**Step 12**

For clustering on multiple chassis, add the next chassis to the cluster:

- a) On the first chassis of the Firewall Chassis Manager, click the **Show Configuration icon** at the top right; copy the displayed cluster configuration.
- b) Connect to the Firewall Chassis Manager on the next chassis, and add a logical device according to this procedure.
- c) Choose **I want to: > Join an Existing Cluster**.
- d) Click **OK**.
- e) In the **Copy Cluster Details** box, paste in the cluster configuration from the first chassis, and click **OK**.
- f) Click the device icon in the center of the screen. The cluster information is mostly pre-filled, but you must change the following settings:

- **Chassis ID**—Enter a unique chassis ID.
- **Site ID**—For inter-site clustering, enter the site ID for this chassis between 1 and 8. Additional inter-site cluster customizations to enhance redundancy and stability, such as director localization, site redundancy, and cluster flow mobility, are only configurable using the Firewall Management Center FlexConfig feature.
- **Cluster Key**—(Not prefilled) Enter the same cluster key.
- **Management IP**—Change the management address for each module to be a unique IP address on the same network as the other cluster members.

Click **OK**.

- g) Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for each cluster member for the status of the new logical device. When the logical device for each cluster member shows its **Status** as **online**, you can start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

**Step 13**

Add the control unit to the Firewall Management Center using the management IP address.

All cluster units must be in a successfully-formed cluster on FXOS prior to adding them to Firewall Management Center.

The Firewall Management Center then automatically detects the data units.

## Add More Cluster Nodes

Add or replace the Firewall Threat Defense cluster node in an existing cluster. When you add a new cluster node in FXOS, the Firewall Management Center adds the node automatically.

**Note** The FXOS steps in this procedure only apply to adding a new *chassis*; if you are adding a new module to a Firepower 9300 where clustering is already enabled, the module will be added automatically.

### Before you begin

- In the case of a replacement, you must delete the old cluster node from the Firewall Management Center. When you replace it with a new node, it is considered to be a new device on the Firewall Management Center.
- The interface configuration must be the same on the new chassis. You can export and import FXOS chassis configuration to make this process easier.

### Procedure

**Step 1** If you previously upgraded the Firewall Threat Defense image using the Firewall Management Center, perform the following steps *on each chassis in the cluster*.

When you upgraded from the Firewall Management Center, the startup version in the FXOS configuration was not updated, and the standalone package was not installed on the chassis. Both of these items need to be set manually so the new node can join the cluster using the correct image version.

**Note**

If you only applied a patch release, you can skip this step. Cisco does not provide standalone packages for patches.

- Install the running Firewall Threat Defense image on the chassis using the **System > Updates** page.
- Click **Logical Devices** and click the Set Version icon (⚙️). For a Firepower 9300 with multiple modules, set the version for each module.

The **Startup Version** shows the original package you deployed with. The **Current Version** shows the version you upgraded to.

- In the **New Version** drop-down menu, choose the version that you uploaded. This version should match the **Current Version** displayed, and will set the startup version to match the new version.
- On the new chassis, make sure the new image package is installed.

**Step 2** On an existing cluster chassis Firewall Chassis Manager, click **Logical Devices**.

**Step 3** Click the **Show Configuration icon** at the top right; copy the displayed cluster configuration.

**Step 4** Connect to the Firewall Chassis Manager on the new chassis, and click **Add > Cluster**.

**Step 5** For the **Device Name**, provide a name for the logical device.

- Step 6** Click **OK**.
- Step 7** In the **Copy Cluster Details** box, paste in the cluster configuration from the first chassis, and click **OK**.
- Step 8** Click the device icon in the center of the screen. The cluster information is partly pre-filled, but you must fill in the following settings:

**Figure 280: Cluster Information**

Cisco Secure Firewall Threat Defense - Bootstrap Configuration

- **Chassis ID**—Enter a *unique* chassis ID.

- **Site ID**—For inter-site clustering, enter the site ID for this chassis between 1 and 8. This feature is only configurable using the Firewall Management Center FlexConfig feature.
- **Cluster Key**—Enter the *same* cluster key.
- **Management IP**—Change the management address for each module to be a *unique* IP address on the same network as the other cluster members.
- **Fully Qualified Hostname**—Enter the *same* hostname.
- **Password**—Enter the *same* password.
- **Registration Key**—Enter the *same* registration key.

Click **OK**.

**Step 9** Click **Save**.

The chassis deploys the logical device by downloading the specified software version and pushing the bootstrap configuration and management interface settings to the application instance. Check the **Logical Devices** page for each cluster member for the status of the new logical device. When the logical device for each cluster member shows its **Status** as **online**, you can start configuring the cluster in the application. You may see the "Security module not responding" status as part of the process; this status is normal and is temporary.

## Firewall Management Center: Add a Cluster

Add one of the cluster units as a new device to the Secure Firewall Management Center; the Firewall Management Center auto-detects all other cluster members.

### Before you begin

- All cluster units must be in a successfully-formed cluster on FXOS prior to adding the cluster to the Firewall Management Center. You should also check which unit is the control unit. Refer to the Firewall Chassis Manager **Logical Devices** screen or use the Firewall Threat Defense **show cluster info** command.

## Procedure

- Step 1** In the Firewall Management Center, choose **Devices > Device Management**, and then choose **Add > Add Device** to add the control unit using the unit's management IP address you assigned when you deployed the cluster.

**Figure 283: Add Device**

**Add Device** ?

☐ CDO Managed Device

Host:†

Display Name:

Registration Key:\*\br/>

Group:

Access Control Policy:\*\br/>

**Smart Licensing**  
 Note: All virtual Firewall Threat Defense devices require a performance tier license. Make sure your Smart Licensing account contains the available licenses you need. It's important to choose the tier that matches the license you have in your account. Click [here](#) for information about the Firewall Threat Defense performance-tiered licensing. Until you choose a tier, your Firewall Threat Defense virtual defaults to the FTDv50 selection.

Performance Tier (only for Firewall Threat Defense virtual 7.0 and above):

☒ Malware  
☒ Threat  
☒ URL Filtering

**Advanced**  
 Unique NAT ID:†

☒ Transfer Packets

- a) In the **Host** field, enter the IP address or hostname of the control unit.
- We recommend adding the control unit for the best performance, but you can add any unit of the cluster.

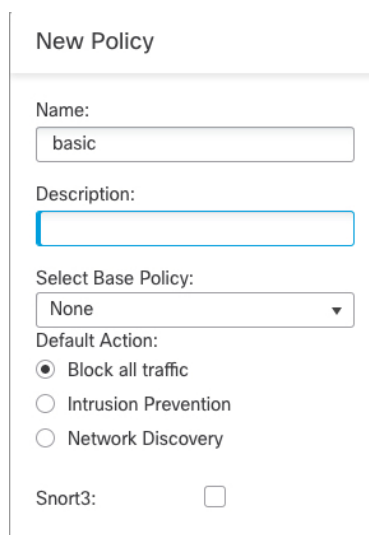

If you used a NAT ID during device setup, you may not need to enter this field. For more information, see [NAT Environments, on page 7](#).

- b) In the **Display Name** field, enter a name for the control unit as you want it to display in the Firewall Management Center.

This display name is not for the cluster; it is only for the control unit you are adding. You can later change the name of other cluster members and the cluster display name.

- c) In the **Registration Key** field, enter the same registration key that you used when you deployed the cluster in FXOS. The registration key is a one-time-use shared secret.
- d) (Optional) Add the device to a device **Group**.
- e) Choose an initial **Access Control Policy** to deploy to the device upon registration, or create a new policy.

If you create a new policy, you create a basic policy only. You can later customize the policy as needed.

**New Policy**

Name:

Description:

Select Base Policy:

Default Action:  
☒ Block all traffic  
☐ Intrusion Prevention  
☐ Network Discovery

Snort3: ☐

- f) Choose licenses to apply to the device.
- g) If you used a NAT ID during device setup, expand the **Advanced** section and enter the same NAT ID in the **Unique NAT ID** field.
- h) Check the **Transfer Packets** check box to allow the device to transfer packets to the Firewall Management Center.

This option is enabled by default. When events like IPS or Snort are triggered with this option enabled, the device sends event metadata information and packet data to the Firewall Management Center for inspection. If you disable it, only event information will be sent to the Firewall Management Center but packet data is not sent.

- i) Click **Register**.

The Firewall Management Center identifies and registers the control unit, and then registers all data units. If the control unit does not successfully register, then the cluster is not added. A registration failure can occur if the cluster was not up on the chassis, or because of other connectivity issues. In this case, we recommend that you try re-adding the cluster unit.

The cluster name shows on the **Devices > Device Management** page; expand the cluster to see the cluster units.

<input type="checkbox"/>	Name	Model	Vers...	Chassis	Licenses	Access Control Policy	Auto RollBack	
<input type="checkbox"/>	Ungrouped (2)							
<input type="checkbox"/>	10.10.1.12 10.10.1.12 - Routed	FTDv for VMware	7.3.0	N/A	Essentials	wfx_automation1		
<input type="checkbox"/>	TD_Cluster (1) Cluster							
<input type="checkbox"/>	10.10.1.13(Control) 10.10.1.13 - Routed	FTDv for VMware	7.3.0	N/A	Essentials	wfx_automation1	N/A	

A unit that is currently registering shows the loading icon.

<input type="checkbox"/>	TD_Cluster (1) Cluster							
<input type="checkbox"/>	10.10.1.13(Control) 10.10.1.13 - Routed	FTDv for VMware	7.3.0	N/A	Essentials	wfx_automation1	N/A	

You can monitor cluster unit registration by clicking the **Notifications** icon and choosing **Tasks**. The Firewall Management Center updates the Cluster Registration task as each unit registers. If any units fail to register, see [Reconcile Cluster Members](#), on page 628.

Deploy					admin ▾
Deployments	Upgrades	Health	Tasks	Show Notifications	
3 total	0 running	3 success	0 warnings	0 failures	Filter
	10.10.1.12	Deployment to device successful.			1m 54s
	10.10.1.13	Deployment to device successful.			1m 3s
	TD_Cluster	Deployment to device successful.			35s

**Step 2** Configure device-specific settings by clicking the **Edit** () for the cluster.

Most configuration can be applied to the cluster as a whole, and not member units in the cluster. For example, you can change the display name per unit, but you can only configure interfaces for the whole cluster.

**Step 3** On the **Devices > Device Management > Cluster** screen, you see **General**, **License**, **System**, and **Health** settings.

- **Management > Host**—If you change the management IP address in the device configuration, you must match the new address in the Firewall Management Center so that it can reach the device on the network; edit the **Host** address in the **Management** area.

Management	
Host:	10.89.5.20
Status:	✓

## Firewall Management Center: Configure Cluster, Data Interfaces

This procedure configures basic parameters for each data interface that you assigned to the cluster when you deployed it in FXOS. For clustering on multiple chassis, data interfaces are always Spanned EtherChannel

interfaces. For the cluster control link interface for a cluster isolated to security modules within one Firepower 9300 chassis, you must increase the MTU from the default.

**Note** When using Spanned EtherChannels for clustering on multiple chassis, the port-channel interface will not come up until clustering is fully enabled. This requirement prevents traffic from being forwarded to a unit that is not an active unit in the cluster.

## Procedure

**Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) next to the cluster.

**Step 2** Click **Interfaces**.

**Step 3** Configure the cluster control link.

For clustering on multiple chassis, set the cluster control link MTU to be at least 100 bytes higher than the highest MTU of the data interfaces. Because the cluster control link traffic includes data packet forwarding, the cluster control link needs to accommodate the entire size of a data packet plus cluster traffic overhead. We suggest setting the MTU to the maximum of 9184; the minimum value is 1400 bytes. For example, because the maximum MTU is 9184, then the highest data interface MTU can be 9084, while the cluster control link can be set to 9184.

For native clusters: The cluster control link interface is Port-Channel48 by default. If you don't know which interface is the cluster control link, check the FXOS configuration for chassis for the Cluster-type interface assigned to the cluster.

- a) Click **Edit** (✎) for the cluster control link interface.
- b) On the **General** page, in the **MTU** field, enter a value between 1400 and 9184 but not between 2561 and 8362. Due to block pool handling, this MTU size is not optimal for system operation. We suggest using the maximum, 9184.
- c) Click **OK**.

**Step 4** Configure data interfaces.

- a) (Optional) For regular firewall interfaces, configure VLAN subinterfaces on the data interface. The rest of this procedure applies to the subinterfaces. See [Add a Subinterface, on page 720](#).
- b) Click **Edit** (✎) for the data interface.
- c) Configure the name and other parameters. For regular firewall interfaces, see [Configure Routed Mode Interfaces, on page 738](#) or, for transparent mode, [Configure Bridge Group Interfaces, on page 743](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 775](#).

### Note

If the cluster control link interface MTU is not at least 100 bytes higher than the data interface MTU, you will see an error that you must reduce the MTU of the data interface. See, [Step 3, on page 616](#) to increase the cluster control link MTU, after which you can continue configuring the data interfaces.

- d) For clustering on multiple chassis, set a unique, manual global MAC address for the EtherChannel. Click **Advanced**, and in the **Active Mac Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

Do not set the **Standby Mac Address**; it is ignored.

You must configure a unique MAC address not currently in use on your network for a Spanned EtherChannel to avoid potential network connectivity problems. With a manually-configured MAC address, the MAC address stays with the current control unit. If you do not configure a MAC address, then if the control unit changes, the new control unit uses a new MAC address for the interface, which can cause a temporary network outage.

- e) Click **OK**. Repeat the above steps for other data interfaces.

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Firewall Management Center: Configure Cluster Health Monitor Settings

The **Cluster Health Monitor Settings** section of the **Cluster** page displays the settings described in the table below.

**Figure 285: Cluster Health Monitor Settings**

Cluster Health Monitor Settings			
<b>Timeouts</b>			
Hold Time			3 s
Interface Debounce Time			9000 ms
<b>Monitored Interfaces</b>			
Service Application			Enabled
Unmonitored Interfaces			None
<b>Auto-Rejoin Settings</b>			
	Attempts	Interval Between Attempts	Interval Variation
Cluster Interface	-1	5	1
Data Interface	3	5	2
System	3	5	2

**Table 43: Cluster Health Monitor Settings Section Table Fields**

Field	Description
Timeouts	

Field	Description
Hold Time	Between .3 and 45 seconds; The default is 3 seconds. To determine node system health, the cluster nodes send heartbeat messages on the cluster control link to other nodes. If a node does not receive any heartbeat messages from a peer node within the hold time period, the peer node is considered unresponsive or dead.
Interface Debounce Time	Between 300 and 9000 ms. The default is 500 ms. The interface debounce time is the amount of time before the node considers an interface to be failed, and the node is removed from the cluster.
<b>Monitored Interfaces</b>	The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster.
Service Application	Shows whether the Snort and disk-full processes are monitored.
Unmonitored Interfaces	Shows unmonitored interfaces.
<b>Auto-Rejoin Settings</b>	
Cluster Interface	Shows the auto-rejoin settings after a cluster control link failure.
<i>Attempts</i>	Between -1 and 65535. The default is -1 (unlimited). Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 1x the interval duration. Defines if the interval duration increases at each attempt.
Data Interfaces	Shows the auto-rejoin settings after a data interface failure.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.
System	Shows the auto-rejoin settings after internal errors. Internal failures include: application sync timeout; inconsistent application statuses; and so on.
<i>Attempts</i>	Between -1 and 65535. The default is 3. Sets the number of rejoin attempts.
<i>Interval Between Attempts</i>	Between 2 and 60. The default is 5 minutes. Defines the interval duration in minutes between rejoin attempts.

Field	Description
<i>Interval Variation</i>	Between 1 and 3. The default is 2x the interval duration. Defines if the interval duration increases at each attempt.

**Note** If you disable the system health check, fields that do not apply when the system health check is disabled will not show.

You can change these settings from this section.

You can monitor any port-channel ID, single physical interface ID, as well as the Snort and disk-full processes. Health monitoring is not performed on VLAN subinterfaces or virtual interfaces such as VNIs or BVIs. You cannot configure monitoring for the cluster control link; it is always monitored.

## Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Next to the cluster you want to modify, click **Edit** (✎).
- Step 3** Click **Cluster**.
- Step 4** In the **Cluster Health Monitor Settings** section, click **Edit** (✎).
- Step 5** Disable the system health check by clicking the **Health Check** slider.

**Figure 286: Disable the System Health Check**

Edit Cluster Health Monitor Settings

Health Check ☐ ⓘ

▼ Timeouts

Hold Time  Range: 0.3 to 45 seconds

Interface Debounce Time  Range: 300 to 9000 milliseconds

> Auto-Rejoin Settings

> Monitored Interfaces

Reset to Defaults Cancel Save

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 6** Configure the hold time and interface debounce time.

- **Hold Time**—Set the hold time to determine the amount of time between node heartbeat status messages, between .3 and 45 seconds; The default is 3 seconds.
- **Interface Debounce Time**—Set the debounce time between 300 and 9000 ms. The default is 500 ms. Lower values allow for faster detection of interface failures. Note that configuring a lower debounce time increases the chances of false-positives. When an interface status update occurs, the node waits the number of milliseconds specified before marking the interface as failed, and the node is removed from the cluster. In the case of an EtherChannel that transitions from a down state to an up state (for example, the switch reloaded, or the switch enabled an EtherChannel), a longer debounce time can prevent the interface from appearing to be failed on a cluster node just because another cluster node was faster at bundling the ports.

**Step 7** Customize the auto-rejoin cluster settings after a health check failure.**Figure 287: Configure Auto-Rejoin Settings**

▼ Auto-Rejoin Settings

---

**Cluster Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**Data Interface**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

**System**

Attempts  Range: 0-65535 (-1 for unlimited number of attempts)

Interval Between Attempts  Range: 2-60 minutes between rejoin attempts

Interval Variation  Range: 1-3. Defines if the interval duration increases. 1 (no change); 2 (2 x the previous duration), or 3 (3 x the previous duration).

Set the following values for the **Cluster Interface**, **Data Interface**, and **System** (internal failures include: application sync timeout; inconsistent application statuses; and so on):

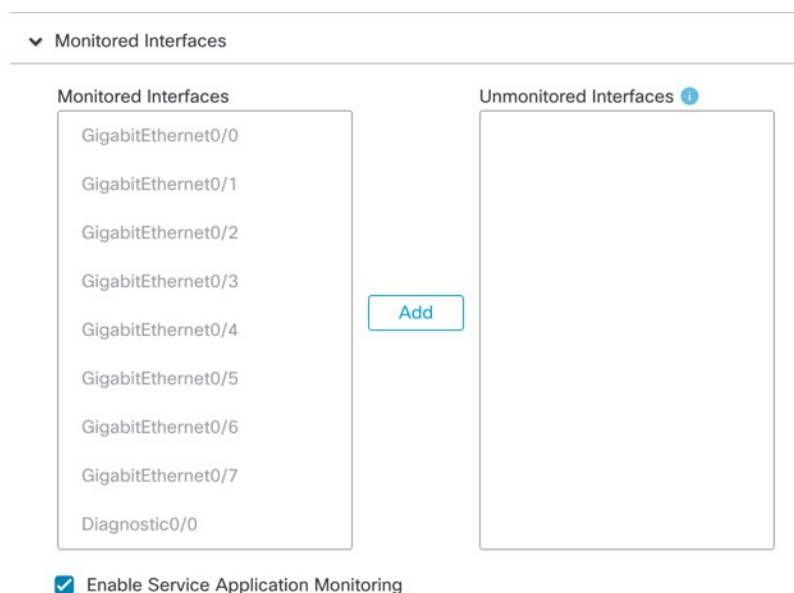

- **Attempts**—Sets the number of rejoin attempts, between -1 and 65535. **0** disables auto-rejoining. The default for the **Cluster Interface** is -1 (unlimited). The default for the **Data Interface** and **System** is 3.
- **Interval Between Attempts**—Defines the interval duration in minutes between rejoin attempts, between 2 and 60. The default value is 5 minutes. The maximum total time that the node attempts to rejoin the cluster is limited to 14400 minutes (10 days) from the time of last failure.
- **Interval Variation**—Defines if the interval duration increases. Set the value between 1 and 3: **1** (no change); **2** (2 x the previous duration), or **3** (3 x the previous duration). For example, if you set the interval duration to 5 minutes, and set the variation to 2, then the first attempt is after 5 minutes; the 2nd attempt

is 10 minutes (2 x 5); the 3rd attempt 20 minutes (2 x 10), and so on. The default value is **1** for the **Cluster Interface** and **2** for the **Data Interface** and **System**.

**Step 8**

Configure monitored interfaces by moving interfaces in the **Monitored Interfaces** or **Unmonitored Interfaces** window. You can also check or uncheck **Enable Service Application Monitoring** to enable or disable monitoring of the Snort and disk-full processes.

**Figure 288: Configure Monitored Interfaces**

The interface health check monitors for link failures. If all physical ports for a given logical interface fail on a particular node, but there are active ports under the same logical interface on other nodes, then the node is removed from the cluster. The amount of time before the node removes a member from the cluster depends on the type of interface and whether the node is an established node or is joining the cluster. Health check is enabled by default for all interfaces and for the Snort and disk-full processes.

You might want to disable health monitoring of non-essential interfaces.

When any topology changes occur (such as adding or removing a data interface, enabling or disabling an interface on the node or the switch, or adding an additional switch to form a VSS or vPC or VNet) you should disable the system health check feature and also disable interface monitoring for the disabled interfaces. When the topology change is complete, and the configuration change is synced to all nodes, you can re-enable the system health check feature and monitored interfaces.

**Step 9**

Click **Save**.

**Step 10**

Deploy configuration changes; see [Deploy Configuration Changes](#), on page 183.

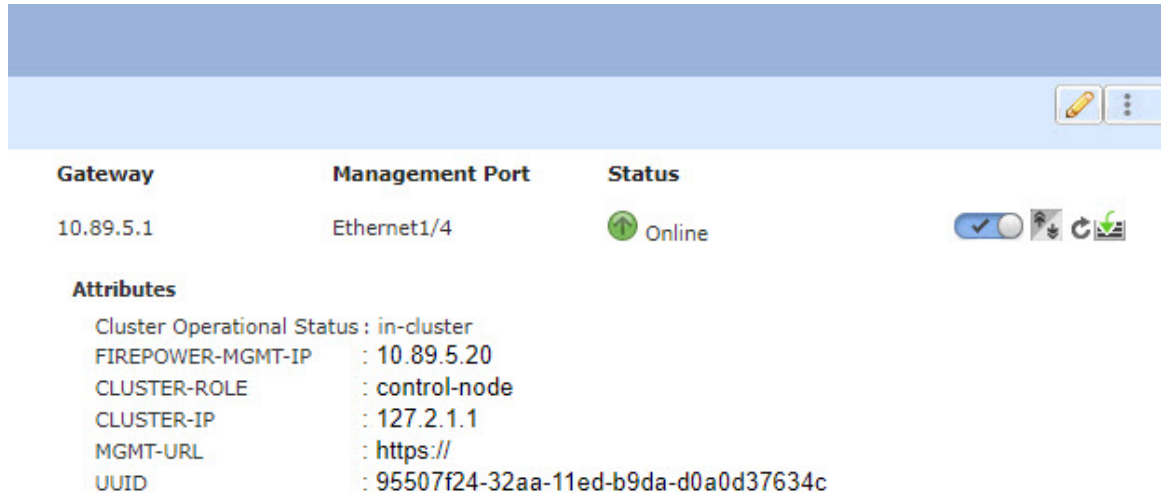

## FXOS: Remove a Cluster Node

The following sections describe how to remove nodes temporarily or permanently from the cluster.

### Temporary Removal

A cluster node will be automatically removed from the cluster due to a hardware or network failure, for example. This removal is temporary until the conditions are rectified, and it can rejoin the cluster. You can also manually disable clustering.

To check whether a device is currently in the cluster, check the cluster status on the Firewall Chassis Manager **Logical Devices** page:

Gateway	Management Port	Status
10.89.5.1	Ethernet1/4	Online

**Attributes**

Cluster Operational Status : in-cluster  
 FIREPOWER-MGMT-IP : 10.89.5.20  
 CLUSTER-ROLE : control-node  
 CLUSTER-IP : 127.2.1.1  
 MGMT-URL : https://  
 UUID : 95507f24-32aa-11ed-b9da-d0a0d37634c

For Firewall Threat Defense using the Firewall Management Center, you should leave the device in the Firewall Management Center device list so that it can resume full functionality after you reenable clustering.

- Disable clustering in the application—You can disable clustering using the application CLI. Enter the **cluster remove unit** *name* command to remove any node other than the one you are logged into. The bootstrap configuration remains intact, as well as the last configuration synced from the control node, so you can later re-add the node without losing your configuration. If you enter this command on a data node to remove the control node, a new control node is elected.

When a device becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, re-enable clustering. The Management interface remains up using the IP address the node received from the bootstrap configuration. However if you reload, and the node is still inactive in the cluster, the Management interface is disabled.

To reenable clustering, on the Firewall Threat Defense enter **cluster enable**.

- Disable the application instance—In the Firewall Chassis Manager on the **Logical Devices** page, click the **Slider enabled** (). You can later reenable it using the **Slider disabled** ().
- Shut down the security module/engine—In the Firewall Chassis Manager on the **Security Module/Engine** page, click the **Power Off icon**.
- Shut down the chassis—In the Firewall Chassis Manager on the **Overview** page, click the **Shut Down icon**.

### Permanent Removal

You can permanently remove a cluster node using the following methods.

For Firewall Threat Defense using the Firewall Management Center, be sure to remove the node from the Firewall Management Center device list after you disable clustering on the chassis.

- Delete the logical device—In the Firewall Chassis Manager on the **Logical Devices** page, click the **Delete** (🗑️). You can then deploy a standalone logical device, a new cluster, or even add a new logical device to the same cluster.
- Remove the chassis or security module from service—If you remove a device from service, you can add replacement hardware as a new node of the cluster.

## Firewall Management Center: Manage Cluster Members

After you deploy the cluster, you can change the configuration and manage cluster members.

### Add a New Cluster Member

When you add a new cluster member in FXOS, the Secure Firewall Management Center adds the member automatically.

#### Before you begin

- Make sure the interface configuration is the same on the replacement unit as for the other chassis.

#### Procedure

- 
- Step 1** Add the new unit to the cluster in FXOS. See the [FXOS configuration guide](#).
- Wait for the new unit to be added to the cluster. Refer to the Firewall Chassis Manager **Logical Devices** screen or use the Firewall Threat Defense **show cluster info** command to view cluster status.
- Step 2** The new cluster member is added automatically. To monitor the registration of the replacement unit, view the following:
- **Cluster Status** dialog box (which is available from the **Devices > Device Management More** (ⓘ) icon or from the **Devices > Device Management > Cluster** tab > **General** area > **Cluster Live Status** link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the Firewall Management Center attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking **Reconcile**.
  - **System status > Tasks**—The Firewall Management Center shows all registration events and failures.
  - **Devices > Device Management**—When you expand the cluster on the devices listing page, you can see when a unit is registering when it has the loading icon to the left.
-

## Replace a Cluster Member

You can replace a cluster member in an existing cluster. The Firewall Management Center auto-detects the replacement unit. However, you must manually delete the old cluster member in the Firewall Management Center. This procedure also applies to a unit that was reinitialized; in this case, although the hardware remains the same, it appears to be a new member.

### Before you begin

- Make sure the interface configuration is the same on the replacement unit as for other chassis.

### Procedure

- Step 1** For a new chassis, if possible, backup and restore the configuration from the old chassis in FXOS. If you are replacing a module in a Firepower 9300, you do not need to perform these steps. If you do not have a backup FXOS configuration from the old chassis, first perform the steps in [Add a New Cluster Member, on page 623](#). For information about all of the below steps, see the [FXOS configuration guide](#).
- Use the configuration export feature to export an XML file containing logical device and platform configuration settings for your Firepower 4100/9300 chassis.
  - Import the configuration file to the replacement chassis.
  - Accept the license agreement.
  - If necessary, upgrade the logical device application instance version to match the rest of the cluster.

- Step 2** In the Firewall Management Center for the old unit, choose **Devices > Device Management** **More (⋮)** > **Delete**.

- Step 3** Confirm that you want to delete the unit. The unit is removed from the cluster and from the Firewall Management Center devices list.

- Step 4** The new or reinitialized cluster member is added automatically. To monitor the registration of the replacement unit, view the following:

- **Cluster Status** dialog box (**Devices > Device Management More (⋮)** icon or **Devices > Device Management > Cluster** page **General** area **Cluster Live Status** link)—A unit that is joining the cluster on the chassis shows "Joining cluster..." After it joins the cluster, the Firewall Management Center attempts to register it, and the status changes to "Available for Registration". After it completes registration, the status changes to "In Sync." If the registration fails, the unit will stay at "Available for Registration". In this case, force a re-registration by clicking **Reconcile All**.

- **System** (⚙️) > **Tasks**—The Firewall Management Center shows all registration events and failures.
- **Devices** > **Device Management**—When you expand the cluster on the devices listing page, you can see when a unit is registering when it has the loading icon to the left.

## Deactivate a Member

You may want to deactivate a member in preparation for deleting the unit, or temporarily for maintenance. This procedure is meant to temporarily deactivate a member; the unit will still appear in the Firewall Management Center device list.

### Note

When a unit becomes inactive, all data interfaces are shut down; only the Management interface can send and receive traffic. To resume traffic flow, reenable clustering. The Management interface remains up using the IP address the unit received from the bootstrap configuration. However if you reload, and the unit is still inactive in the cluster, the management interface is disabled. You must use the console for any further configuration.

### Procedure

- Step 1** For the unit you want to deactivate, choose **Devices** > **Device Management More** (⋮) **Disable Clustering**.

You can also deactivate a unit from the **Cluster Status** dialog box (**Devices** > **Device Management More** (⋮) **Cluster Live Status**).

- Step 2** Confirm that you want to disable clustering on the unit.

The unit will show **(Disabled)** next to its name in the **Devices** > **Device Management** list.

**Step 3** To reenable clustering, see [Rejoin the Cluster, on page 626](#).

## Rejoin the Cluster

If a unit was removed from the cluster, for example for a failed interface or if you manually disabled clustering, you must manually rejoin the cluster. Make sure the failure is resolved before you try to rejoin the cluster. See [Rejoining the Cluster, on page 644](#) for more information about why a unit can be removed from a cluster.

### Procedure

**Step 1** For the unit you want to reactivate, choose **Devices > Device Management More** (⋮) > **Enable Clustering**.

You can also reactivate a unit from the **Cluster Status** dialog box (**Devices > Device Management More** (⋮) > **Cluster Live Status**).

**Step 2** Confirm that you want to enable clustering on the unit.

## Delete (Unregister) a Data Node

If you need to permanently remove a cluster node (for example, if you remove a module on the Firepower 9300, or remove a chassis), then you should unregister it from the Firewall Management Center.

Do not unregister the node if it is still a healthy part of the cluster, or if you only want to disable the node temporarily. To remove it permanently from the cluster in FXOS, see [FXOS: Remove a Cluster Node, on page 621](#). If you unregister it from the Firewall Management Center, and it is still part of the cluster, it will continue to pass traffic, and could even become the control node—a control node that the Firewall Management Center can no longer manage.

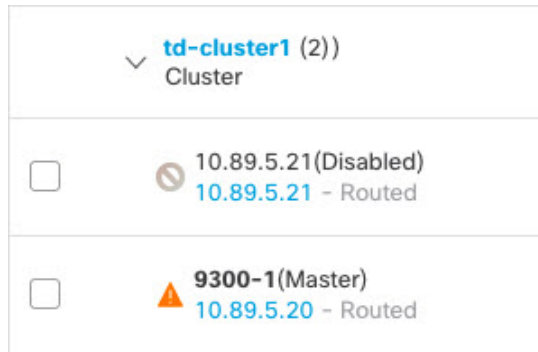

### Before you begin

To manually deactivate the node, see [Deactivate a Member, on page 625](#). Before you unregister a node, the node must be inactive, either manually or because of a health failure.

### Procedure

**Step 1** Make sure the node is ready to be unregistered from the Firewall Management Center. On **Devices > Device Management**, make sure the node shows **(Disabled)**.

You can also view each node's status on the **Cluster Status** dialog box available from **More** (⋮). If the status is stale, click **Reconcile All** on the **Cluster Status** dialog box to force an update.

**Step 2** In the Firewall Management Center for the data node you want to delete, choose **Devices > Device Management** **More** (⋮) > **Delete**.

**Step 3** Confirm that you want to delete the node.

The node is removed from the cluster and from the Firewall Management Center devices list.

## Change the Control Unit

### Caution

The best method to change the control unit is to disable clustering on the control unit, wait for a new control election, and then re-enable clustering. If you must specify the *exact* unit you want to become the control unit, use the procedure in this section. Note that for centralized features, if you force a control unit change, then all connections are dropped, and you have to re-establish the connections on the new control unit.

To change the control unit, perform the following steps.

### Procedure

**Step 1** Open the **Cluster Status** dialog box by choosing **Devices > Device Management** **More** (⋮) **Cluster Live Status**.

You can also access the **Cluster Status** dialog box from **Devices > Device Management > Cluster** page **General** area **Cluster Live Status** link.

- Step 2** For the unit you want to become the control unit, choose **More (⚙)** **Change Role to Control**.
- Step 3** You are prompted to confirm the role change. Check the checkbox, and click **OK**.
- 

## Reconcile Cluster Members

If a cluster member fails to register, you can reconcile the cluster membership from the chassis to the Secure Firewall Management Center. For example, a data unit might fail to register if the Firewall Management Center is occupied with certain processes, or if there is a network issue.

### Procedure

---

- Step 1** Choose **Devices > Device Management More (⚙)** for the cluster, and then choose **Cluster Live Status** to open the **Cluster Status** dialog box.
- You can also open the **Cluster Status** dialog box from the **Devices > Device Management** page **General** area **Cluster Live Status** link.
- Step 2** Click **Reconcile All**.
- For more information about the cluster status, see [Firewall Management Center: Monitoring the Cluster](#), on page 628.
- 

## Firewall Management Center: Monitoring the Cluster

You can monitor the cluster in Secure Firewall Management Center and at the Firewall Threat Defense CLI.

- **Cluster Status** dialog box, which is available from the **Devices > Device Management More (⚙)** icon or from the **Devices > Device Management > Cluster** page **General** area **Cluster Live Status** link.

### Cluster Status ?

Overall Status:  Clustering is disabled for 1 node(s)

Dated: 08:56:56 | 09 Sep 2022 [Close](#)

The Control unit has a graphic indicator identifying its role.

Cluster member **Status** includes the following states:

- **In Sync.**—The unit is registered with the Firewall Management Center.
- **Pending Registration**—The unit is part of the cluster, but has not yet registered with the Firewall Management Center. If a unit fails to register, you can retry registration by clicking **Reconcile All**.
- **Clustering is disabled**—The unit is registered with the Firewall Management Center, but is an inactive member of the cluster. The clustering configuration remains intact if you intend to later re-enable it, or you can delete the unit from the cluster.
- **Joining cluster...**—The unit is joining the cluster on the chassis, but has not completed joining. After it joins, it will register with the Firewall Management Center.

For each unit, you can view the **Summary** or the **History**.

For each unit from the **More** (⋮) menu, you can perform the following status changes:

- **Disable Clustering**
- **Enable Clustering**

- **Change Role to Control**

- **System (⚙️)Tasks** page.

The **Tasks** page shows updates of the Cluster Registration task as each unit registers.

- **Devices > Device Management** > *cluster\_name*.

When you expand the cluster on the devices listing page, you can see all member units, including the control unit shown with its role next to the IP address. For units that are still registering, you can see the loading icon.

- **show cluster** {*access-list [acl\_name]* | *conn [count]* | *cpu [usage]* | *history* | *interface-mode* | *memory* | *resource usage* | *service-policy* | *traffic* | *xlate count*}

To view aggregated data for the entire cluster or other information, use the **show cluster** command.

- **show cluster info** [*auto-join* | *clients* | *conn-distribution* | *flow-mobility counters* | *goid [options]* | *health* | *incompatible-config* | *loadbalance* | *old-members* | *packet-distribution* | *trace [options]* | *transport { asp | cp }*]

To view cluster information, use the **show cluster info** command.

## Cluster Health Monitor Dashboard

### Cluster Health Monitor

When a Firewall Threat Defense is the control node of a cluster, the Firewall Management Center collects various metrics periodically from the device metric data collector. The cluster health monitor is comprised of the following components:

- **Overview dashboard**—Displays information about the cluster topology, cluster statistics, and metric charts:
  - The topology section displays a cluster's live status, the health of individual threat defense, threat defense node type (control node or data node), and the status of the device. The status of the device could be *Disabled* (when the device leaves the cluster), *Added out of box* (in a public cloud cluster, the additional nodes that do not belong to the Firewall Management Center), or *Normal* (ideal state of the node).
  - The cluster statistics section displays current metrics of the cluster with respect to the CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.

---

**Note** The CPU and memory metrics display the individual average of the data plane and snort usage.

---

- The metric charts, namely, CPU Usage, Memory Usage, Throughput, and Connections, diagrammatically display the statistics of the cluster over the specified time period.
- **Load Distribution dashboard**—Displays load distribution across the cluster nodes in two widgets:

- The Distribution widget displays the average packet and connection distribution over the time range across the cluster nodes. This data depicts how the load is being distributed by the nodes. Using this widget, you can easily identify any abnormalities in the load distribution and rectify it.
- The Node Statistics widget displays the node level metrics in table format. It displays metric data on CPU usage, memory usage, input rate, output rate, active connections, and NAT translations across the cluster nodes. This table view enables you to correlate data and easily identify any discrepancies.
- Member Performance dashboard—Displays current metrics of the cluster nodes. You can use the selector to filter the nodes and view the details of a specific node. The metric data include CPU usage, memory usage, input rate, output rate, active connections, and NAT translations.
- CCL dashboard—Displays, graphically, the cluster control link data namely, the input, and output rate.
- Troubleshooting and Links — Provides convenient links to frequently used troubleshooting topics and procedures.
- Time range—An adjustable time window to constrain the information that appears in the various cluster metrics dashboards and widgets.
- Custom Dashboard—Displays data on both cluster-wide metrics and node-level metrics. However, node selection only applies for the threat defense metrics and not for the entire cluster to which the node belongs.

## Viewing Cluster Health

You must be an Admin, Maintenance, or Security Analyst user to perform this procedure.

The cluster health monitor provides a detailed view of the health status of a cluster and its nodes. This cluster health monitor provides health status and trends of the cluster in an array of dashboards.

### Before you begin

- Ensure you have created a cluster from one or more devices in the Firewall Management Center.

### Procedure

- 
- Step 1** Choose **System** (⚙️) > **Health** > **Monitor**.  
Use the Monitoring navigation pane to access node-specific health monitors.
- Step 2** In the device list, click **Expand** (➤) and **Collapse** (▼) to expand and collapse the list of managed cluster devices.
- Step 3** To view the cluster health statistics, click on the cluster name. The cluster monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:
- Overview — Highlights key metrics from the other predefined dashboards, including its nodes, CPU, memory, input and output rates, connection statistics, and NAT translation information.
  - Load Distribution — Traffic and packet distribution across the cluster nodes.

- Member Performance — Node-level statistics on CPU usage, memory usage, input throughput, output throughput, active connection, and NAT translation.
- CCL — Interface status and aggregate traffic statistics.

You can navigate through the various metrics dashboards by clicking on the labels. For a comprehensive list of the supported cluster metrics, see [Cisco Secure Firewall Threat Defense Health Metrics](#).

**Step 4** You can configure the time range from the drop-down in the upper-right corner. The time range can reflect a period as short as the last hour (the default) or as long as two weeks. Select **Custom** from the drop-down to configure a custom start and end date.

Click the refresh icon to set auto refresh to 5 minutes or to toggle off auto refresh.

**Step 5** Click on deployment icon for a deployment overlay on the trend graph, with respect to the selected time range. The deployment icon indicates the number of deployments during the selected time-range. A vertical band indicates the deployment start and end time. For multiple deployments, multiple bands/lines appear. Click on the icon on top of the dotted line to view the deployment details.

**Step 6** (For node-specific health monitor) View the **Health Alerts** for the node in the alert notification at the top of page, directly to the right of the device name.

Hover your pointer over the **Health Alerts** to view the health summary of the node. The popup window shows a truncated summary of the top five health alerts. Click on the popup to open a detailed view of the health alert summary.

**Step 7** (For node-specific health monitor) The device monitor reports health and performance metrics in several predefined dashboards by default. The metrics dashboards include:

- Overview — Highlights key metrics from the other predefined dashboards, including CPU, memory, interfaces, connection statistics; plus disk usage and critical process information.
- CPU — CPU utilization, including the CPU usage by process and by physical cores.
- Memory — Device memory utilization, including data plane and Snort memory usage.
- Interfaces — Interface status and aggregate traffic statistics.
- Connections — Connection statistics (such as elephant flows, active connections, peak connections, and so on) and NAT translation counts.
- Snort — Statistics that are related to the Snort process.
- ASP drops — Statistics related to the dropped packets against various reasons.

You can navigate through the various metrics dashboards by clicking on the labels. See [Cisco Secure Firewall Threat Defense Health Metrics](#) for a comprehensive list of the supported device metrics.

**Step 8** Click the plus sign **Add New Dashboard**(+) in the upper right corner of the health monitor to create a custom dashboard by building your own variable set from the available metric groups.

For cluster-wide dashboard, choose Cluster metric group, and then choose the metric.

## Cluster Metrics

The cluster health monitor tracks statistics that are related to a cluster and its nodes, and aggregate of load distribution, performance, and CCL traffic statistics.

**Table 44: Cluster Metrics**

Metric	Description	Format
CPU	Average of CPU metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Memory	Average of memory metrics on the nodes of a cluster (individually for data plane and snort).	percentage
Data Throughput	Incoming and outgoing data traffic statistics for a cluster.	bytes
CCL Throughput	Incoming and outgoing CCL traffic statistics for a cluster.	bytes
Connections	Count of active connections in a cluster.	number
NAT Translations	Count of NAT translations for a cluster.	number
Distribution	Connection distribution count in the cluster for every second.	number
Packets	Packet distribution count in the cluster for every second.	number

## Firewall Management Center: Troubleshooting the Cluster

You can use the **CCL Ping** tool to make sure the cluster control link is operating correctly. You can also use the following tools that are available for devices and clusters:

- Troubleshooting files—If a node fails to join the cluster, a troubleshooting file is automatically generated. You can also generate and download troubleshooting files from the **Devices > Device Management > Cluster > General** area. See [Generate Troubleshooting Files, on page 69](#).

You can also generate files from the **Device Management** page by clicking **More** (⋮) and choosing **Troubleshoot Files**.

- CLI output—From the **Devices > Device Management > Cluster > General** area, you can view a set of pre-defined CLI outputs that can help you troubleshoot the cluster. The following commands are automatically run for the cluster:
  - **show running-config cluster**
  - **show cluster info**
  - **show cluster info health**
  - **show cluster info transport cp**

- **show version**
- **show asp drop**
- **show counters**
- **show arp**
- **show int ip brief**
- **show blocks**
- **show cpu detailed**
- **show interface *ccl\_interface***
- **ping *ccl\_ip* size *ccl\_mtu* repeat 2**
- **show nve**
- **show route**
- **show tech-support**

You can also enter any **show** command in the Command field. See [View CLI Output, on page 71](#) for more information.

## Perform a Ping on the Cluster Control Link

You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, click the **More** (ⓘ) icon next to the cluster, and choose **Cluster Live Status**.

**Figure 289: Cluster Status**

Cluster Status ?

Overall Status: Cluster has all nodes in sync

Nodes details (2) Refresh Reconcile All Enter node name

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	172.16.0.50 <span>Control</span>	172.16.0.50	N/A	⋮
>	In Sync.	172.16.0.51	172.16.0.51	N/A	⋮

Dated: 11:52:26 | 20 Dec 2021 Close

**Step 2** Expand one of the nodes, and click **CCL Ping**.

**Figure 290: CCL Ping**

Cluster Status ?

Overall Status: Clustering is disabled for 1 node(s)

Nodes details (3) Refresh Reconcile All Enter node name

	Status	Device Name	Unit Name	Chassis URL	
>	In Sync.	10.10.43.21 <span>Control</span>	10.10.43.21	N/A	⋮
<div> <span>Summary</span> <span>History</span> <span>CCL Ping</span> </div> <p>ping 10.10.3.2 size 1654            Sending 5, 1654-byte ICMP Echos to 10.10.3.2, timeout is 2 seconds:            ??????            Success rate is 0 percent (0/5)</p>					
>	Clustering is disabled	10.10.43.22	10.10.43.22	N/A	⋮

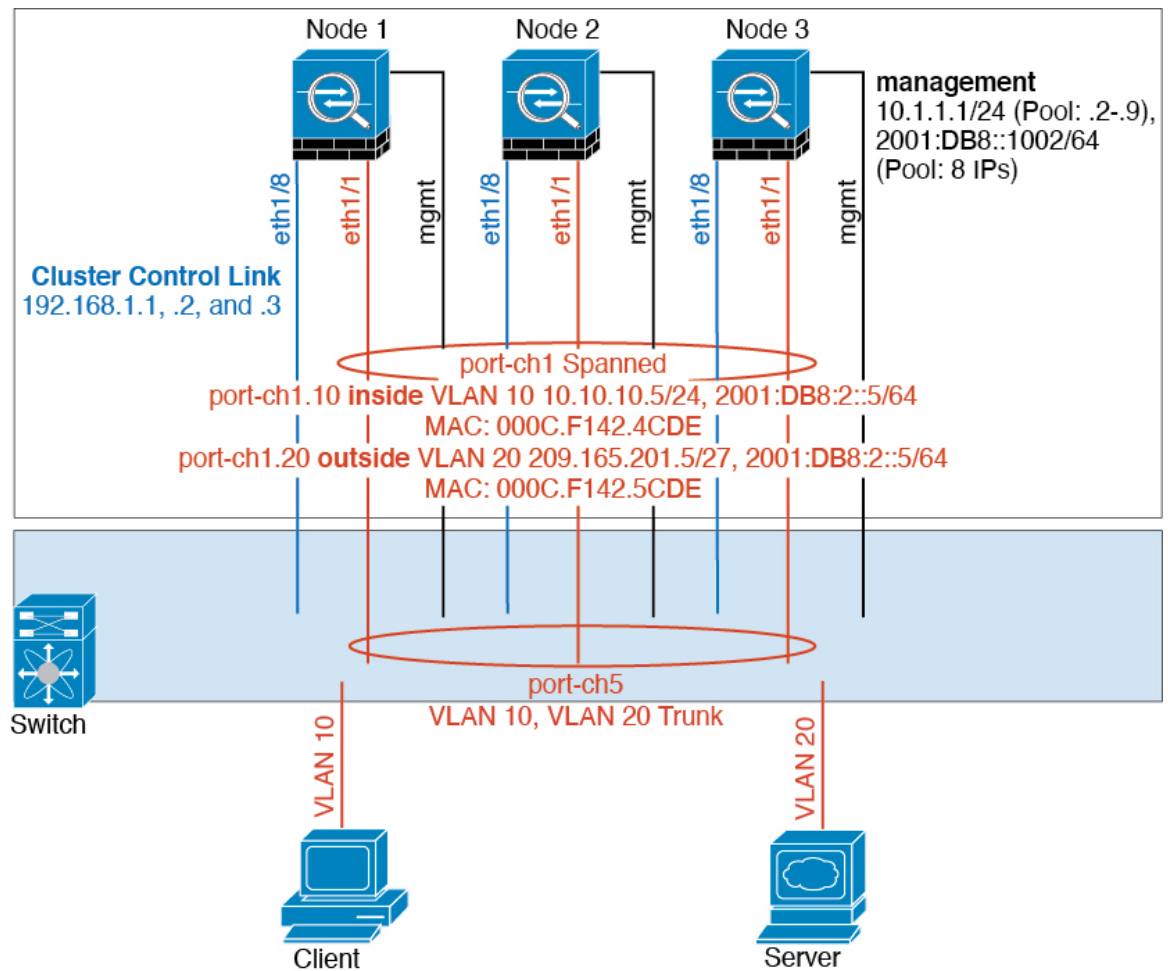

Dated: 18:38:41 | 01 Mar 2023 Close

The node sends a ping on the cluster control link to every other node using a packet size that matches the maximum MTU.

## Examples for Clustering

These examples include typical deployments.

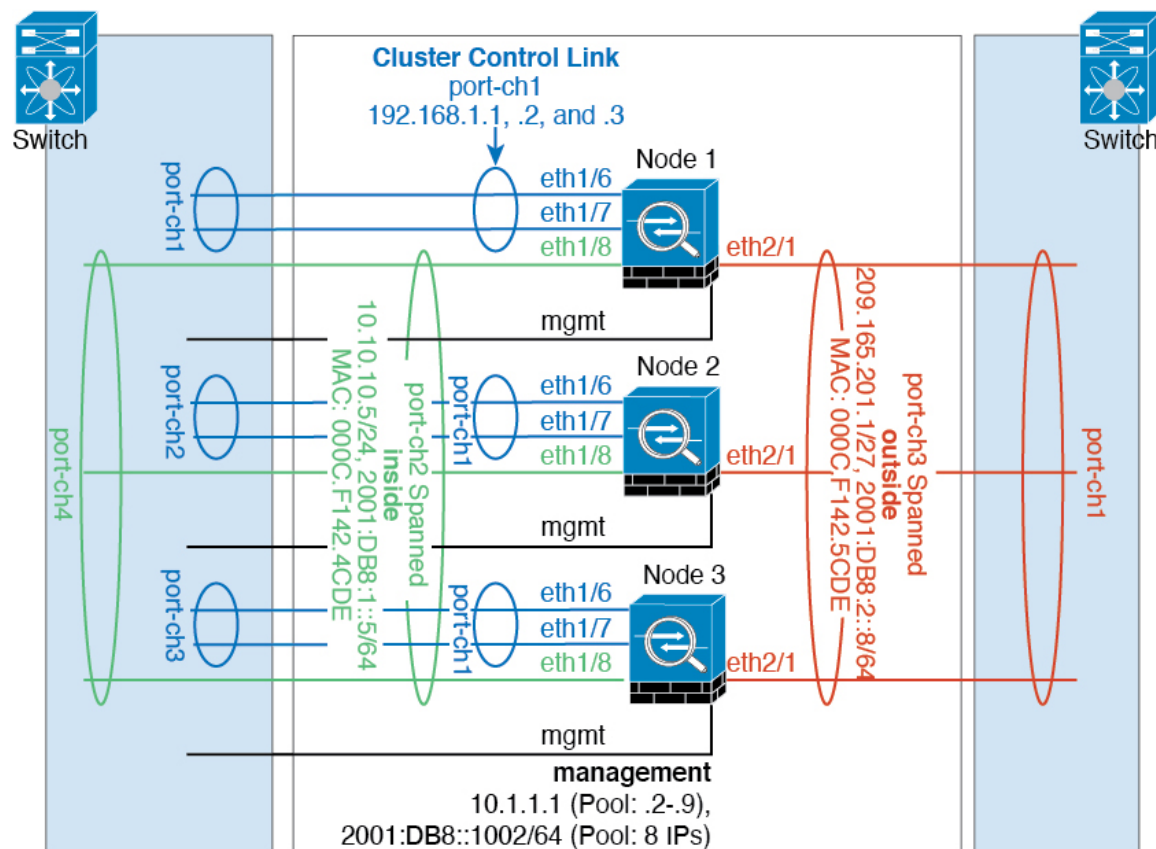

### Firewall on a Stick

Data traffic from different security domains are associated with different VLANs, for example, VLAN 10 for the inside network and VLAN 20 for the outside network. Each has a single physical port connected to the external switch or router. Trunking is enabled so that all packets on the physical link are 802.1q encapsulated. This is the firewall between VLAN 10 and VLAN 20.

When using Spanned EtherChannels, all data links are grouped into one EtherChannel on the switch side. If the becomes unavailable, the switch will rebalance traffic between the remaining units.

## Traffic Segregation

You may prefer physical separation of traffic between the inside and outside network.

As shown in the diagram above, there is one Spanned EtherChannel on the left side that connects to the inside switch, and the other on the right side to outside switch. You can also create VLAN subinterfaces on each EtherChannel if desired.

## Reference for Clustering

This section includes more information about how clustering operates.

## Firewall Threat Defense Features and Clustering

Some Firewall Threat Defense features are not supported with clustering, and some are only supported on the control unit. Other features might have caveats for proper usage.

## Unsupported Features with Clustering

These features cannot be configured with clustering enabled, and the commands will be rejected.

**Note** To view FlexConfig features that are also not supported with clustering, for example WCCP inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- Remote access VPN (SSL VPN and IPsec VPN)
- DHCP client, server, and proxy. DHCP relay is supported.
- Virtual Tunnel Interfaces (VTIs)
- High Availability
- Integrated Routing and Bridging
- Firewall Management Center UCAPL/CC mode
- DHCP client, server, and proxy. DHCP relay is supported.

## Centralized Features for Clustering

The following features are only supported on the control node, and are not scaled for the cluster.

**Note** Traffic for centralized features is forwarded from member nodes to the control node over the cluster control link.

If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control nodes before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control node.

For centralized features, if the control node fails, all connections are dropped, and you have to re-establish the connections on the new control node.

**Note** To view FlexConfig features that are also centralized with clustering, for example RADIUS inspection, see the [ASA general operations configuration guide](#). FlexConfig lets you configure many ASA features that are not present in the Firewall Management Center GUI. See [FlexConfig Policies, on page 2477](#).

- The following application inspections:
  - DCERPC
  - ESMTTP
  - NetBIOS
  - PPTP
  - RSH
  - SQLNET

- SUNRPC
- TFTP
- XDMCP
- Static route monitoring
- Site-to-site VPN
- IGMP multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- PIM multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- Dynamic routing

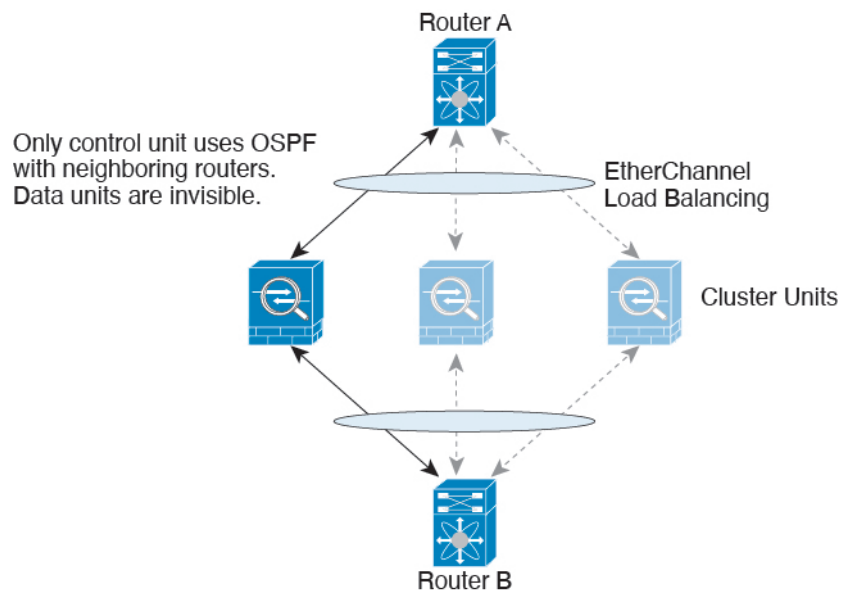

## Connection Settings

Connection limits are enforced cluster-wide. Each node has an estimate of the cluster-wide counter values based on broadcast messages. Due to efficiency considerations, the configured connection limit across the cluster might not be enforced exactly at the limit number. Each node may overestimate or underestimate the cluster-wide counter value at any given time. However, the information will get updated over time in a load-balanced cluster.

## Dynamic Routing and Clustering

The routing process only runs on the control unit, and routes are learned through the control unit and replicated to secondaries. If a routing packet arrives at a data unit, it is redirected to the control unit.

**Figure 291: Dynamic Routing**

After the data units learn the routes from the control unit, each unit makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control unit to data units. If there is a control unit switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

## FTP and Clustering

- If FTP data channel and control channel flows are owned by different cluster members, then the data channel owner will periodically send idle timeout updates to the control channel owner and update the idle timeout value. However, if the control flow owner is reloaded, and the control flow is re-hosted, the parent/child flow relationship will not longer be maintained; the control flow idle timeout will not be updated.

## Multicast Routing and Clustering

The control unit handles all multicast routing packets and data packets until fast-path forwarding is established. After the connection is established, each data unit can forward multicast data packets.

## NAT and Clustering

NAT can affect the overall throughput of the cluster. Inbound and outbound NAT packets can be sent to different Firewall Threat Defenses in the cluster, because the load balancing algorithm relies on IP addresses and ports, and NAT causes inbound and outbound packets to have different IP addresses and/or ports. When a packet arrives at the Firewall Threat Defense that is not the NAT owner, it is forwarded over the cluster control link to the owner, causing large amounts of traffic on the cluster control link. Note that the receiving node does not create a forwarding flow to the owner, because the NAT owner may not end up creating a connection for the packet depending on the results of security and policy checks.

If you still want to use NAT in clustering, then consider the following guidelines:

- PAT with Port Block Allocation—See the following guidelines for this feature:
  - Maximum-per-host limit is not a cluster-wide limit, and is enforced on each node individually. Thus, in a 3-node cluster with the maximum-per-host limit configured as 1, if the traffic from a host is load-balanced across all 3 nodes, then it can get allocated 3 blocks with 1 in each node.
  - Port blocks created on the backup node from the backup pools are not accounted for when enforcing the maximum-per-host limit.
  - On-the-fly PAT rule modifications, where the PAT pool is modified with a completely new range of IP addresses, will result in xlate backup creation failures for the xlate backup requests that were still in transit while the new pool became effective. This behavior is not specific to the port block allocation feature, and is a transient PAT pool issue seen only in cluster deployments where the pool is distributed and traffic is load-balanced across the cluster nodes.
  - When operating in a cluster, you cannot simply change the block allocation size. The new size is effective only after you reload each device in the cluster. To avoid having to reload each device, we recommend that you delete all block allocation rules and clear all xlates related to those rules. You can then change the block size and recreate the block allocation rules.
- NAT pool address distribution for dynamic PAT—When you configure a PAT pool, the cluster divides each IP address in the pool into port blocks. By default, each block is 512 ports, but if you configure port block allocation rules, your block setting is used instead. These blocks are distributed evenly among the

nodes in the cluster, so that each node has one or more blocks for each IP address in the PAT pool. Thus, you could have as few as one IP address in a PAT pool for a cluster, if that is sufficient for the number of PAT'ed connections you expect. Port blocks cover the 1024-65535 port range, unless you configure the option to include the reserved ports, 1-1023, on the PAT pool NAT rule.

- Reusing a PAT pool in multiple rules—To use the same PAT pool in multiple rules, you must be careful about the interface selection in the rules. You must either use specific interfaces in all rules, or "any" in all rules. You cannot mix specific interfaces and "any" across the rules, or the system might not be able to match return traffic to the right node in the cluster. Using unique PAT pools per rule is the most reliable option.
- No round-robin—Round-robin for a PAT pool is not supported with clustering.
- No extended PAT—Extended PAT is not supported with clustering.
- Dynamic NAT xlates managed by the control node—The control node maintains and replicates the xlate table to data nodes. When a data node receives a connection that requires dynamic NAT, and the xlate is not in the table, it requests the xlate from the control node. The data node owns the connection.
- Stale xlates—The xlate idle time on the connection owner does not get updated. Thus, the idle time might exceed the idle timeout. An idle timer value higher than the configured timeout with a refcnt of 0 is an indication of a stale xlate.
- No static PAT for the following inspections—
  - FTP
  - RSH
  - SQLNET
  - TFTP
  - XDMCP
  - SIP
- If you have an extremely large number of NAT rules, over ten thousand, you should enable the transactional commit model using the **asp rule-engine transactional-commit nat** command in the device CLI. Otherwise, the node might not be able to join the cluster.

## SIP Inspection and Clustering

A control flow can be created on any node (due to load balancing); its child data flows must reside on the same node.

## SNMP and Clustering

You should always use the Local address, and not the Main cluster IP address for SNMP polling. If the SNMP agent polls the Main cluster IP address, if a new control node is elected, the poll to the new control node will fail.

When using SNMPv3 with clustering, if you add a new cluster node after the initial cluster formation, then SNMPv3 users are not replicated to the new node. You must remove the users, and re-add them, and then redeploy your configuration to force the users to replicate to the new node.

## Syslog and Clustering

- Each node in the cluster generates its own syslog messages. You can configure logging so that each node uses either the same or a different device ID in the syslog message header field. For example, the hostname configuration is replicated and shared by all nodes in the cluster. If you configure logging to use the hostname as the device ID, syslog messages generated by all nodes look as if they come from a single node. If you configure logging to use the local-node name that is assigned in the cluster bootstrap configuration as the device ID, syslog messages look as if they come from different nodes.

## TLS/SSL Connections and Clustering

The decryption states of TLS/SSL connections are not synchronized, and if the connection owner fails, then the decrypted connections will be reset. New connections will need to be established to a new unit. Connections that are not decrypted (they match a do-not-decrypt rule) are not affected and are replicated correctly.

## Cisco TrustSec and Clustering

Only the control node learns security group tag (SGT) information. The control node then populates the SGT to data nodes, and data nodes can make a match decision for SGT based on the security policy.

## VPN and Clustering

Site-to-site VPN is a centralized feature; only the control unit supports VPN connections.

---

**Note** Remote access VPN is not supported with clustering.

---

VPN functionality is limited to the control unit and does not take advantage of the cluster high availability capabilities. If the control unit fails, all existing VPN connections are lost, and VPN users will see a disruption in service. When a new control unit is elected, you must reestablish the VPN connections.

When you connect a VPN tunnel to a Spanned interface address, connections are automatically forwarded to the control unit.

VPN-related keys and certificates are replicated to all units.

## Performance Scaling Factor

When you combine multiple units into a cluster, you can expect the total cluster performance to be approximately 80% of the maximum combined throughput.

For example, for TCP throughput, the Firepower 9300 with 3 SM-40 modules can handle approximately 135 Gbps of real world firewall traffic when running alone. For 2 chassis, the maximum combined throughput will be approximately 80% of 270 Gbps (2 chassis x 135 Gbps): 216 Gbps.

## Control Unit Election

Members of the cluster communicate over the cluster control link to elect a control unit as follows:

1. When you deploy the cluster, each unit broadcasts an election request every 3 seconds.

2. Any other units with a higher priority respond to the election request; the priority is set when you deploy the cluster and is not configurable.
3. If after 45 seconds, a unit does not receive a response from another unit with a higher priority, then it becomes the control unit.

---

**Note** If multiple units tie for the highest priority, the cluster unit name and then the serial number is used to determine the control unit.

---

4. If a unit later joins the cluster with a higher priority, it does not automatically become the control unit; the existing control unit always remains as the control unit unless it stops responding, at which point a new control unit is elected.
5. In a "split brain" scenario when there are temporarily multiple control units, then the unit with highest priority retains the role while the other units return to data unit roles.

---

**Note** You can manually force a unit to become the control unit. For centralized features, if you force a control unit change, then all connections are dropped, and you have to re-establish the connections on the new control unit.

---

## High Availability Within the Cluster

Clustering provides high availability by monitoring chassis, unit, and interface health and by replicating connection states between units.

### Chassis-Application Monitoring

Chassis-application health monitoring is always enabled. The Firepower 4100/9300 chassis supervisor checks the Firewall Threat Defense application periodically (every second). If the Firewall Threat Defense device is up and cannot communicate with the Firepower 4100/9300 chassis supervisor for 3 seconds, the Firewall Threat Defense device generates a syslog message and leaves the cluster.

If the Firepower 4100/9300 chassis supervisor cannot communicate with the application after 45 seconds, it reloads the Firewall Threat Defense device. If the Firewall Threat Defense device cannot communicate with the supervisor, it removes itself from the cluster.

### Unit Health Monitoring

Each unit periodically sends a broadcast keepaliveheartbeat packet over the cluster control link. If the control node does not receive any keepaliveheartbeat packets or other packets from a data node within the configurable timeout period, then the control node removes the data node from the cluster. If the data nodes do not receive packets from the control node, then a new control node is elected from the remaining node.

If nodes cannot reach each other over the cluster control link because of a network failure and not because a node has actually failed, then the cluster may go into a "split brain" scenario where isolated data nodes will elect their own control nodes. For example, if a router fails between two cluster locations, then the original control node at location 1 will remove the location 2 data nodes from the cluster. Meanwhile, the nodes at location 2 will elect their own control node and form their own cluster. Note that asymmetric traffic may fail

in this scenario. After the cluster control link is restored, then the control node that has the higher priority will keep the control node's role. See [Control Unit Election, on page 642](#) for more information.

## Interface Monitoring

Each node monitors the link status of all hardware interfaces in use, and reports status changes to the control node. For clustering on multiple chassis, Spanned EtherChannels use the cluster Link Aggregation Control Protocol (cLACP). Each chassis monitors the link status and the cLACP protocol messages to determine if the port is still active in the EtherChannel, and informs the Firewall Threat Defense application if the interface is down. When you enable health monitoring, all physical interfaces are monitored by default (including the main EtherChannel for EtherChannel interfaces). Only named interfaces that are in an Up state can be monitored. For example, all member ports of an EtherChannel must fail before a *named* EtherChannel is removed from the cluster. You can optionally disable monitoring per interface.

If a monitored interface fails on a particular node, but it is active on other nodes, then the node is removed from the cluster. The amount of time before the Firewall Threat Defense device removes a node from the cluster depends on whether the node is an established member or is joining the cluster. The Firewall Threat Defense device does not monitor interfaces for the first 90 seconds that a node joins the cluster. Interface status changes during this time will not cause the Firewall Threat Defense device to be removed from the cluster. For an established member, the node is removed after 500 ms.

For clustering on multiple chassis, if you add or delete an EtherChannel from the cluster, interface health-monitoring is suspended for 95 seconds to ensure that you have time to make the changes on each chassis.

## Decorator Application Monitoring

When you install a decorator application on an interface, such as the Radware DefensePro application, then both the Firewall Threat Defense device and the decorator application must be operational to remain in the cluster. The unit does not join the cluster until both applications are operational. Once in the cluster, the unit monitors the decorator application health every 3 seconds. If the decorator application is down, the unit is removed from the cluster.

## Status After Failure

When a node in the cluster fails, the connections hosted by that node are seamlessly transferred to other nodes; state information for traffic flows is shared over the control node's cluster control link.

If the control node fails, then another member of the cluster with the highest priority (lowest number) becomes the control node.

The Firewall Threat Defense automatically tries to rejoin the cluster, depending on the failure event.

---

**Note** When the Firewall Threat Defense becomes inactive and fails to automatically rejoin the cluster, all data interfaces are shut down; only the Management interface can send and receive traffic.

---

## Rejoining the Cluster

After a cluster member is removed from the cluster, how it can rejoin the cluster depends on why it was removed:

- Failed cluster control link when initially joining—After you resolve the problem with the cluster control link, you must manually rejoin the cluster by re-enabling clustering.
- Failed cluster control link after joining the cluster—The Firewall Threat Defense automatically tries to rejoin every 5 minutes, indefinitely.
- Failed data interface—The Firewall Threat Defense automatically tries to rejoin at 5 minutes, then at 10 minutes, and finally at 20 minutes. If the join is not successful after 20 minutes, then the Firewall Threat Defense application disables clustering. After you resolve the problem with the data interface, you have to manually enable clustering.
- Failed node—If the node was removed from the cluster because of a node health check failure, then rejoining the cluster depends on the source of the failure. For example, a temporary power failure means the node will rejoin the cluster when it starts up again as long as the cluster control link is up. The Firewall Threat Defense application attempts to rejoin the cluster every 5 seconds.
- Internal error—Internal failures include: application sync timeout; inconsistent application statuses; and so on.
- Failed configuration deployment—If you deploy a new configuration from Firewall Management Center, and the deployment fails on some cluster members but succeeds on others, then the nodes that failed are removed from the cluster. You must manually rejoin the cluster by re-enabling clustering. If the deployment fails on the control node, then the deployment is rolled back, and no members are removed. If the deployment fails on all data nodes, then the deployment is rolled back, and no members are removed.
- Failed Chassis-Application Communication—When the Firewall Threat Defense application detects that the chassis-application health has recovered, it tries to rejoin the cluster automatically.

## Data Path Connection State Replication

Every connection has one owner and at least one backup owner in the cluster. The backup owner does not take over the connection in the event of a failure; instead, it stores TCP/UDP state information, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner is usually also the director.

Some traffic requires state information above the TCP or UDP layer. See the following table for clustering support or lack of support for this kind of traffic.

**Table 45: Features Replicated Across the Cluster**

Traffic	State Support	Notes
Up time	Yes	Keeps track of the system up time.
ARP Table	Yes	—
MAC address table	Yes	—
User Identity	Yes	—
IPv6 Neighbor database	Yes	—
Dynamic routing	Yes	—
SNMP Engine ID	No	—

## How the Cluster Manages Connections

Connections can be load-balanced to multiple nodes of the cluster. Connection roles determine how connections are handled in both normal operation and in a high availability situation.

### Connection Roles

See the following roles defined for each connection:

- **Owner**—Usually, the node that initially receives the connection. The owner maintains the TCP state and processes packets. A connection has only one owner. If the original owner fails, then when new nodes receive packets from the connection, the director chooses a new owner from those nodes.
- **Backup owner**—The node that stores TCP/UDP state information received from the owner, so that the connection can be seamlessly transferred to a new owner in case of a failure. The backup owner does not take over the connection in the event of a failure. If the owner becomes unavailable, then the first node to receive packets from the connection (based on load balancing) contacts the backup owner for the relevant state information so it can become the new owner.

As long as the director (see below) is not the same node as the owner, then the director is also the backup owner. If the owner chooses itself as the director, then a separate backup owner is chosen.

For clustering on the Firepower 9300, which can include up to 3 cluster nodes in one chassis, if the backup owner is on the same chassis as the owner, then an additional backup owner will be chosen from another chassis to protect flows from a chassis failure.

- **Director**—The node that handles owner lookup requests from forwarders. When the owner receives a new connection, it chooses a director based on a hash of the source/destination IP address and ports (see below for ICMP hash details), and sends a message to the director to register the new connection. If packets arrive at any node other than the owner, the node queries the director about which node is the owner so it can forward the packets. A connection has only one director. If a director fails, the owner chooses a new director.

As long as the director is not the same node as the owner, then the director is also the backup owner (see above). If the owner chooses itself as the director, then a separate backup owner is chosen.

ICMP/ICMPv6 hash details:

- For Echo packets, the source port is the ICMP identifier, and the destination port is 0.
  - For Reply packets, the source port is 0, and the destination port is the ICMP identifier.
  - For other packets, both source and destination ports are 0.
- **Forwarder**—A node that forwards packets to the owner. If a forwarder receives a packet for a connection it does not own, it queries the director for the owner, and then establishes a flow to the owner for any other packets it receives for this connection. The director can also be a forwarder. Note that if a forwarder receives the SYN-ACK packet, it can derive the owner directly from a SYN cookie in the packet, so it does not need to query the director. (If you disable TCP sequence randomization, the SYN cookie is not used; a query to the director is required.) For short-lived flows such as DNS and ICMP, instead of querying, the forwarder immediately sends the packet to the director, which then sends them to the owner. A connection can have multiple forwarders; the most efficient throughput is achieved by a good load-balancing method where there are no forwarders and all packets of a connection are received by the owner.

**Note** We do not recommend disabling TCP sequence randomization when using clustering. There is a small chance that some TCP sessions won't be established, because the SYN/ACK packet might be dropped.

- **Fragment Owner**—For fragmented packets, cluster nodes that receive a fragment determine a fragment owner using a hash of the fragment source IP address, destination IP address, and the packet ID. All fragments are then forwarded to the fragment owner over the cluster control link. Fragments may be load-balanced to different cluster nodes, because only the first fragment includes the 5-tuple used in the switch load balance hash. Other fragments do not contain the source and destination ports and may be load-balanced to other cluster nodes. The fragment owner temporarily reassembles the packet so it can determine the director based on a hash of the source/destination IP address and ports. If it is a new connection, the fragment owner will register to be the connection owner. If it is an existing connection, the fragment owner forwards all fragments to the provided connection owner over the cluster control link. The connection owner will then reassemble all fragments.

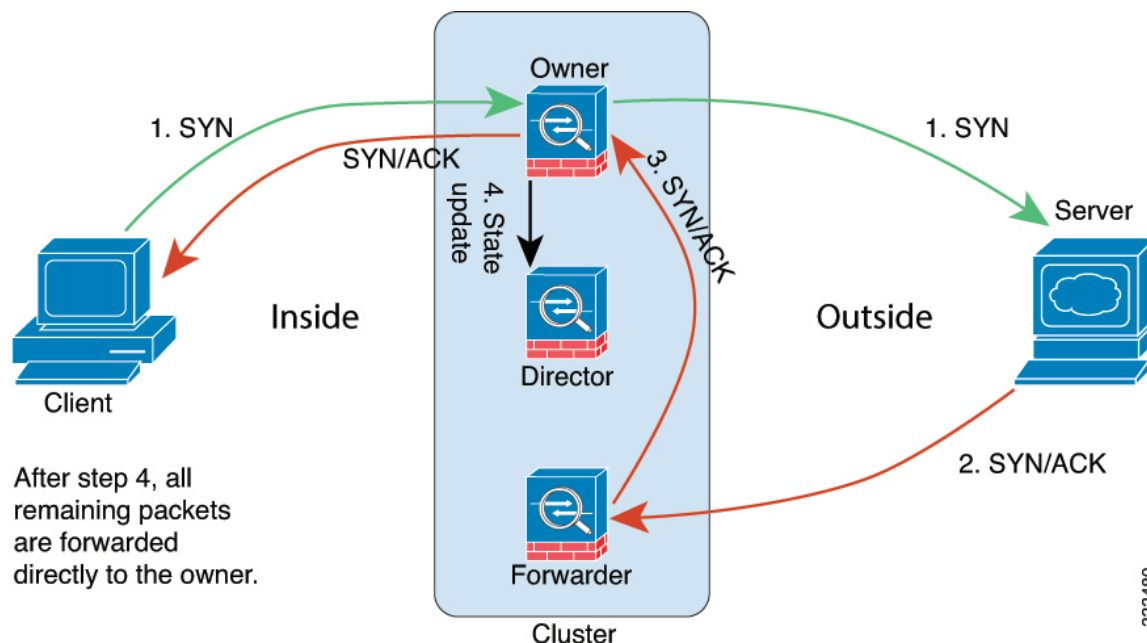

### Port Address Translation Connections

## New Connection Ownership

When a new connection is directed to a node of the cluster via load balancing, that node owns both directions of the connection. If any connection packets arrive at a different node, they are forwarded to the owner node over the cluster control link. If a reverse flow arrives at a different node, it is redirected back to the original node.

## Sample Data Flow for TCP

The following example shows the establishment of a new connection.

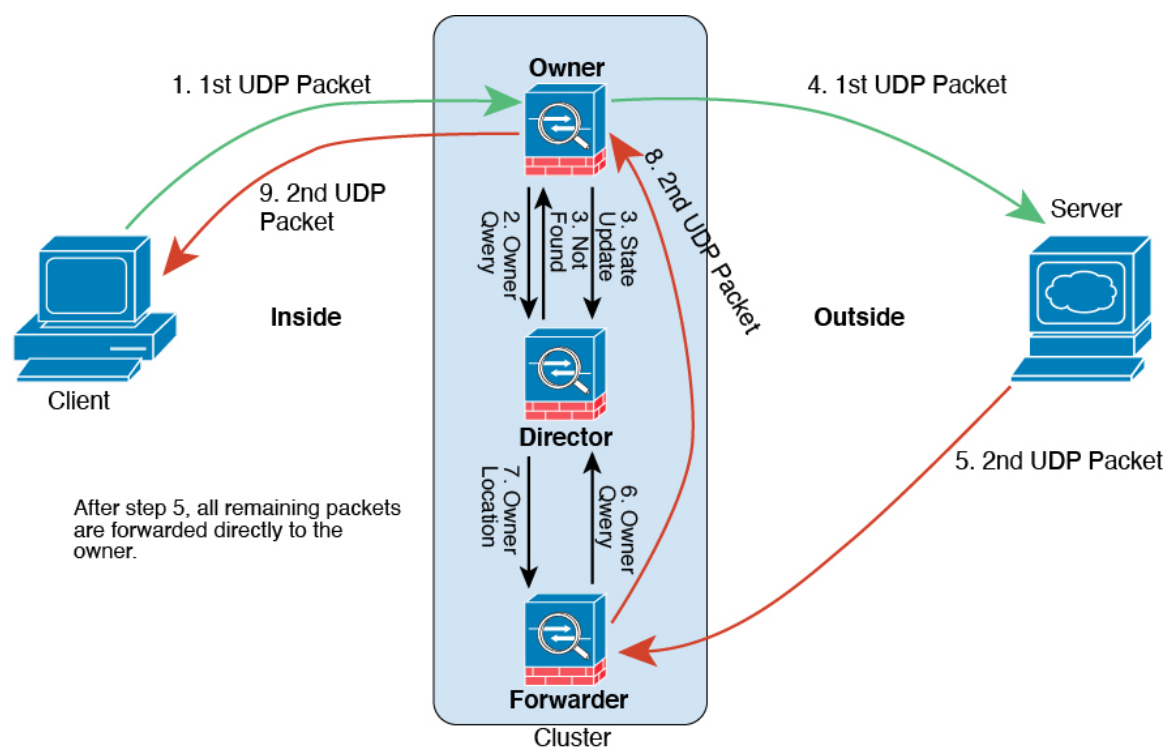

333480

1. The SYN packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method), which becomes the owner. The owner creates a flow, encodes owner information into a SYN cookie, and forwards the packet to the server.
2. The SYN-ACK packet originates from the server and is delivered to a different Firewall Threat Defense (based on the load balancing method). This Firewall Threat Defense is the forwarder.
3. Because the forwarder does not own the connection, it decodes owner information from the SYN cookie, creates a forwarding flow to the owner, and forwards the SYN-ACK to the owner.
4. The owner sends a state update to the director, and forwards the SYN-ACK to the client.
5. The director receives the state update from the owner, creates a flow to the owner, and records the TCP state information as well as the owner. The director acts as the backup owner for the connection.
6. Any subsequent packets delivered to the forwarder will be forwarded to the owner.
7. If packets are delivered to any additional nodes, it will query the director for the owner and establish a flow.
8. Any state change for the flow results in a state update from the owner to the director.

## Sample Data Flow for ICMP and UDP

The following example shows the establishment of a new connection.

1. *Figure 292: ICMP and UDP Data Flow*

The first UDP packet originates from the client and is delivered to one Firewall Threat Defense (based on the load balancing method).

2. The node that received the first packet queries the director node that is chosen based on a hash of the source/destination IP address and ports.
3. The director finds no existing flow, creates a director flow and forwards the packet back to the previous node. In other words, the director has elected an owner for this flow.
4. The owner creates the flow, sends a state update to the director, and forwards the packet to the server.
5. The second UDP packet originates from the server and is delivered to the forwarder.
6. The forwarder queries the director for ownership information. For short-lived flows such as DNS, instead of querying, the forwarder immediately sends the packet to the director, which then sends it to the owner.
7. The director replies to the forwarder with ownership information.
8. The forwarder creates a forwarding flow to record owner information and forwards the packet to the owner.
9. The owner forwards the packet to the client.

## History for Clustering

Table 46:

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cluster control link ping tool.	7.2.6/7.4.1	Any	<p>You can check to make sure all the cluster nodes can reach each other over the cluster control link by performing a ping. One major cause for the failure of a node to join the cluster is an incorrect cluster control link configuration; for example, the cluster control link MTU may be set higher than the connecting switch MTUs.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; More &gt; Cluster Live Status.</b></p> <p>Version restrictions: Not supported with Firewall Management Center Version 7.3.x or 7.4.0.</p>
Troubleshooting file generation and download available from Device and Cluster pages.	7.4.1	7.4.1	<p>You can generate and download troubleshooting files for each device on the Device page and also for all cluster nodes on the Cluster page. For a cluster, you can download all files as a single compressed file. You can also include cluster logs for the cluster for cluster nodes. You can alternatively trigger file generation from the <b>Devices &gt; Device Management &gt; More &gt; Troubleshoot Files</b> menu.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; General</b></li> <li>• <b>Devices &gt; Device Management &gt; Cluster &gt; General</b></li> </ul>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
View CLI output for a device or device cluster.	7.4.1	Any	You can view a set of pre-defined CLI outputs that can help you troubleshoot the device or cluster. You can also enter any <b>show</b> command and see the output. New/modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; General</b>
Cluster health monitor settings.	7.3.0	Any	You can now edit cluster health monitor settings. New/Modified screens: <b>Devices &gt; Device Management &gt; Cluster &gt; Cluster Health Monitor Settings</b>  <b>Note</b> If you previously configured these settings using FlexConfig, be sure to remove the FlexConfig configuration before you deploy. Otherwise the FlexConfig configuration will overwrite the management center configuration.
Cluster health monitor dashboard.	7.3.0	Any	You can now view cluster health on the cluster health monitor dashboard. New/Modified screens: <b>System &gt; Health &gt; Monitor</b>
Support for 16-node clusters.	7.2.0	7.2.0	You can now configure 16 node clusters for the Firepower 4100/9300. Previously, the maximum was 6 units. New/Modified screens: none. Supported platforms: Firepower 4100/9300
Cluster deployment for firewall changes completes faster.	7.1.0	7.1.0	Cluster deployment for firewall changes now completes faster. New/Modified screens: none.
Improved PAT port block allocation for clustering.	7.0.0	7.0.0	The improved PAT port block allocation ensures that the control unit keeps ports in reserve for joining nodes, and proactively reclaims unused ports. To best optimize the allocation, you can set the maximum nodes you plan to have in the cluster using the <b>cluster-member-limit</b> command using FlexConfig. The control unit can then allocate port blocks to the planned number of nodes, and it will not have to reserve ports for extra nodes you don't plan to use. The default is 16 nodes. You can also monitor syslog 747046 to ensure that there are enough ports available for a new node. New/Modified commands: <b>cluster-member-limit</b> (FlexConfig), <b>show nat pool cluster [summary]</b> , <b>show nat pool ip detail</b>
Cluster deployment for Snort changes completes faster, and fails faster when there is an event.	6.7.0	6.7.0	Cluster deployment for Snort changes now completes faster. Also, when a cluster has an event that causes a Firewall Management Center deployment to fail, the failure now occurs more quickly. New/Modified screens: none.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Improved cluster management.	6.7.0	6.7.0	<p>Firewall Management Center has improved cluster management functionality that formerly you could only accomplish using the CLI, including:</p> <ul style="list-style-type: none"> <li>• Enable and disable cluster units</li> <li>• Show cluster status from the Device Management page, including History and Summary per unit</li> <li>• Change the role to the control unit</li> </ul> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; More</b> menu</li> <li>• <b>Devices &gt; Device Management &gt; Cluster &gt; General</b> area &gt; <b>Cluster Live Status</b> link <b>Cluster Status</b></li> </ul> <p>Supported platforms: Firepower 4100/9300</p>
Multi-instance clustering.	6.6.0	6.6.0	<p>You can now create a cluster using container instances. On the Firepower 9300, you must include one container instance on each module in the cluster. You cannot add more than one container instance to the cluster per security engine/module. We recommend that you use the same security module or chassis model for each cluster instance. However, you can mix and match container instances on different Firepower 9300 security module types or Firepower 4100 models in the same cluster if required. You cannot mix Firepower 9300 and 4100 instances in the same cluster.</p> <p>New/Modified FXOS commands: <b>set port-type cluster</b></p> <p>New/modified Firepower Chassis Manager screens:</p> <ul style="list-style-type: none"> <li>• <b>Logical Devices &gt; Add Cluster</b></li> <li>• <b>Interfaces &gt; All Interfaces &gt; Add New</b> drop-down menu <b>Subinterface Type</b> field</li> </ul> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>
Configuration sync to data units in parallel.	6.6.0	6.6.0	<p>The control unit now syncs configuration changes with data units in parallel by default. Formerly, synching occurred sequentially.</p> <p>New/Modified screens: none.</p>
Messages for cluster join failure or eviction added to <b>show cluster history</b> .	6.6.0	6.6.0	<p>New messages were added to the <b>show cluster history</b> command for when a cluster unit either fails to join the cluster or leaves the cluster.</p> <p>New/Modified commands: <b>show cluster history</b></p> <p>New/Modified screens: none.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Initiator and responder information for Dead Connection Detection (DCD), and DCD support in a cluster.	6.5.0	6.5.0	<p>If you enable Dead Connection Detection (DCD), you can use the <b>show conn detail</b> command to get information about the initiator and responder. Dead Connection Detection allows you to maintain an inactive connection, and the <b>show conn</b> output tells you how often the endpoints have been probed. In addition, DCD is now supported in a cluster.</p> <p>New/Modified commands: <b>show conn</b> (output only).</p> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>
Adding clusters is easier.	6.3.0	6.3.0	<p>You can now add any unit of a cluster to the Firewall Management Center, and the other cluster units are detected automatically. Formerly, you had to add each cluster unit as a separate device, and then group them into a cluster. Adding a cluster unit is also now automatic. Note that you must delete a unit manually.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Add</b> drop-down menu <b>Device &gt; Add Device</b> dialog box</p> <p><b>Devices &gt; Device Management &gt; Cluster</b> tab <b>General</b> area <b>Cluster Registration Status</b> <b>Current Cluster Summary</b> link <b>Cluster Status</b> dialog box</p> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>
Support for site-to-site VPN with clustering as a centralized feature.	6.2.3.3	6.2.3.3	<p>You can now configure site-to-site VPN with clustering. Site-to-site VPN is a centralized feature; only the control unit supports VPN connections.</p> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>
Automatically rejoin the cluster after an internal failure.	6.2.3	6.2.3	<p>Formerly, many internal error conditions caused a cluster unit to be removed from the cluster, and you were required to manually rejoin the cluster after resolving the issue. Now, a unit will attempt to rejoin the cluster automatically at the following intervals: 5 minutes, 10 minutes, and then 20 minutes. Internal failures include: application sync timeout; inconsistent application statuses; and so on.</p> <p>New/Modified command: <b>show cluster info auto-join</b></p> <p>No modified screens.</p> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Clustering on multiple chassis for 6 modules; Firepower 4100 support.	6.2.0	6.2.0	<p>With FXOS 2.1.1, you can now enable clustering on multiple chassis of the Firepower 9300 and 4100. For the Firepower 9300, you can include up to 6 modules. For example, you can use 1 module in 6 chassis, or 2 modules in 3 chassis, or any combination that provides a maximum of 6 modules. For the Firepower 4100, you can include up to 6 chassis.</p> <p><b>Note</b> Inter-site clustering is also supported. However, customizations to enhance redundancy and stability, such as site-specific MAC and IP addresses, director localization, site redundancy, and cluster flow mobility, are only configurable using the FlexConfig feature.</p> <p>No modified screens.</p> <p>Supported platforms: Firewall Threat Defense on the Firepower 4100/9300</p>
Clustering on multiple modules with one Firepower 9300 chassis.	6.0.1	6.0.1	<p>You can cluster up to 3 security modules within the Firepower 9300 chassis. All modules in the chassis must belong to the cluster.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Add &gt; Add Cluster</b></p> <p><b>Devices &gt; Device Management &gt; Cluster</b></p> <p>Supported platforms: Firewall Threat Defense on the Firepower 9300</p>

## CHAPTER 14

# Interface Overview

---

The Firewall Threat Defense device includes data interfaces that you can configure in different modes, as well as a management interface.

- [Management Interface, on page 657](#)
- [Interface Mode and Types, on page 658](#)
- [Security Zones and Interface Groups, on page 659](#)
- [Auto-MDI/MDIX Feature, on page 660](#)
- [Redundant Interfaces \(Deprecated\), on page 661](#)
- [Default Settings for Interfaces, on page 661](#)
- [Create Security Zone and Interface Group Objects, on page 661](#)
- [Enable the Physical Interface and Configure Ethernet Settings, on page 662](#)
- [Configure EtherChannel Interfaces, on page 665](#)
- [Sync Interface Changes with the Firewall Management Center, on page 673](#)
- [Manage the Network Module for the Secure Firewall 3100/4200, on page 676](#)
- [Merge the Management and Diagnostic Interfaces, on page 690](#)
- [History for Interfaces, on page 698](#)

## Management Interface

In Version 7.3 and earlier, the physical management interface is shared between the Diagnostic logical interface and the Management logical interface. In Version 7.4 and later, the Diagnostic interface is merged with Management for a simplified user experience.

## Management Interface

The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firewall Management Center. It uses its own IP address and static routing. You can configure its settings at the CLI using the **configure network** command. You can also view its status on the **Devices > Device Management** page. If you change the IP address at the CLI after you add it to the Firewall Management Center, you can match the IP address in the Secure Firewall Management Center in the **Devices > Device Management** area.

You can alternatively manage the Firewall Threat Defense using a data interface instead of the Management interface.

## Diagnostic Interface

For new devices using 7.4 and later, you cannot use the legacy Diagnostic interface. Only the merged Management interface is available.

If you upgraded to 7.4 or later, and you did not have any configuration for the Diagnostic interface, then the interfaces will merge automatically.

If you upgraded to 7.4 or later, and you have configuration for the Diagnostic interface, then you have the choice to merge the interfaces manually, or you can continue to use the separate Diagnostic interface. Note that support for the Diagnostic interface will be removed in a later release, so you should plan to merge the interfaces as soon as possible. To manually merge the Management and Diagnostic interfaces, see [Merge the Management and Diagnostic Interfaces, on page 690](#). Configurations that prevent an automatic merge include the following:

- A data interface named "management"—This name is reserved for use with the merged Management interface.
- IP Address on Diagnostic
- DNS enabled on Diagnostic
- Syslog, SNMP, RADIUS or AD (for remote access VPN) source interface is Diagnostic
- RADIUS or AD (for remote access VPN) with no source interface specified, and there is at least one interface configured as management-only (including Diagnostic)—The default route lookup for these services has changed from the management-only routing table to the data routing table, with no fallback to management. Therefore, you cannot use a management-only interface other than Management.
- Static routes on Diagnostic
- Dynamic routing on Diagnostic
- HTTP server on Diagnostic
- ICMP on Diagnostic
- DDNS for Diagnostic
- FlexConfig using Diagnostic

For more information about how the legacy Diagnostic interface operates, see the 7.3 version of this guide.

## Interface Mode and Types

You can deploy Firewall Threat Defense interfaces in two modes: Regular firewall mode and IPS-only mode. You can include both firewall and IPS-only interfaces on the same device.

### Regular Firewall Mode

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See [Transparent or Routed Firewall Mode, on page 209](#) for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (routed and transparent firewall mode)—You can group together multiple interfaces on a network, and the Firewall Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. In routed mode, the Firewall Threat Defense device routes between BVIs and regular routed interfaces. In transparent mode, each bridge group is separate and cannot communicate with each other.

### IPS-Only Mode

You can configure your device in either a passive or inline IPS deployment. In a passive deployment, you deploy the system out-of-band from the flow of network traffic. In an inline deployment, you configure the system transparently on a network segment by binding two interfaces together.

## Security Zones and Interface Groups

Each interface can be assigned to a *security zone* and/or *interface group*. You then apply your security policy based on zones or groups. For example, you can assign the "inside" interface on one or more devices to the "inside" zone; and the "outside" interfaces to the "outside" zone. You can then configure your access control policy to enable traffic to go from the inside zone to the outside zone for every device using the same zones.

To view the interfaces that belong to each object, choose **Objects > Object Management** and click **Interface**. This page lists the security zones and interface groups configured on your managed devices. You can expand each interface object to view the type of interfaces in each interface object.

**Note** Policies that apply to **any** zone (a global policy) apply to interfaces in zones as well as any interfaces that are not assigned to a zone.

**Note** The Management interface does not belong to a zone or interface group.

### Security Zones Vs. Interface Groups

There are two types of interface objects:

- Security zones—An interface can belong to only one security zone.
- Interface groups—An interface can belong to multiple interface groups (and to one security zone).

You can use interface groups in NAT policies, prefilter policies, and QoS policies, as well as features that let you specify the interface name directly, such as Syslog servers or DNS servers.

Some policies only support security zones, while other policies support zones and groups. Unless you need the functionality an interface group provides, you should default to using security zones because security zones are supported for all features.

You cannot change an existing security zone to an interface group or vice-versa; instead you must create a new interface object.

**Note** Although tunnel zones are not interface objects, you can use them in place of security zones in certain configurations; see [Tunnel Zones and Prefiltering, on page 1790](#).

### Interface Object Types

See the following interface object types:

- Passive—For IPS-only passive or ERSPAN interfaces.
- Inline—For IPS-only inline set interfaces.
- Switched—For regular firewall bridge group interfaces.
- Routed—For regular firewall routed interfaces.
- ASA—(Security zones only) For legacy ASA FirePOWER device interfaces.
- Management—(Interface groups only) For management-only interfaces.
- Loopback—(Interface groups only) For loopback interfaces.

All interfaces in an interface object must be of the same type. After you create an interface object, you cannot change the type of interfaces it contains.

### Interface Names

Note that the interface (or zone name) itself does not provide any default behavior in regards to the security policy. We recommend using names that are self-describing to avoid mistakes in future configuration. A good name signifies a logical segment or traffic specification, for example:

- Names of internal interfaces—InsideV110, InsideV160, InsideV195
- Names of DMZ interfaces—DMZV11, DMZV12, DMZV-TEST
- Names of external interfaces—Outside-ASN78, Outside-ASN91

## Auto-MDI/MDIX Feature

For RJ-45 interfaces, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. For Gigabit Ethernet, when the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

## Redundant Interfaces (Deprecated)

Redundant interfaces were supported for the ASA 5500-X platforms only. We don't recommend configuring them for other platforms.

## Default Settings for Interfaces

This section lists default settings for interfaces.

### Default State of Interfaces

The default state of an interface depends on the type.

- Physical interfaces—Disabled. The exception is the Management interface that is enabled for initial setup. Physical interfaces includes switch ports.
- VLAN subinterfaces—Enabled. However, for traffic to pass through the subinterface, the physical interface must also be enabled.
- EtherChannel port-channel interfaces (ISA 3000)—Enabled. However, for traffic to pass through the EtherChannel, the channel group physical interfaces must also be enabled.
- EtherChannel port-channel interfaces (Firepower and Secure Firewall models)—Disabled.

---

**Note** For the Firepower 4100/9300, you can administratively enable and disable interfaces in both the chassis and in the Firewall Management Center. For an interface to be operational, the interface must be enabled in both operating systems. Because the interface state is controlled independently, you may have a mismatch between the chassis and Firewall Management Center.

---

### Default Speed and Duplex

By default, the speed and duplex for copper (RJ-45) interfaces are set to auto-negotiate.

By default, the speed and duplex for fiber (SFP) interfaces are set to the maximum speed, with auto-negotiation enabled.

For the Secure Firewall 3100/4200, the speed is set to detect the installed SFP speed.

## Create Security Zone and Interface Group Objects

Add security zones and interface groups to which you can assign device interfaces.

---

**Tip** You can create empty interface objects and add interfaces to them later. To add an interface, the interface must have a name. You can also create security zones (but not interface groups) while configuring interfaces.

---

**Before you begin**

Understand the usage requirements and restrictions for each type of interface object. See [Security Zones and Interface Groups, on page 659](#).

**Procedure**

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Interface** from the list of object types.
- Step 3** Click **Add > Security Zone** or **Add > Interface Group**.
- Step 4** Enter a **Name**.
- Do not use the same name as a network or port object. These object names are deployed to the device, and duplicate names result in a failed deployment.
- Step 5** Choose an **Interface Type**.
- Step 6** (Optional) From the **Device > Interfaces** drop-down list, choose a device that contains interfaces you want to add.
- You do not need to assign interfaces on this screen; you can instead assign interfaces to the zone or group when you configure the interface.
- Step 7** Click **Save**.
- 

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Enable the Physical Interface and Configure Ethernet Settings

This section describes how to:

- Enable the physical interface. By default, physical interfaces are disabled (with the exception of the Management interface).
- Set a specific speed and duplex. By default, speed and duplex are set to Auto.

This procedure only covers a small subset of Interface settings. Refrain from setting other parameters at this point. For example, you cannot name an interface that you want to use as part of an EtherChannel interface.

---

**Note** For the Firepower 4100/9300, you configure basic interface settings in FXOS. See [Configure a Physical Interface, on page 256](#) for more information.

---

**Note** For Firepower 1010 switch ports, see [Configure Firepower 1010 Switch Ports, on page 701](#).

You can also click the **Virtual Tunnels** tab to view details of dynamic and static VTIs of route-based VPNs on the device. For more information, see [View Virtual Tunnel Information, on page 1434](#).

### Before you begin

If you changed the physical interfaces on the device after you added it to the Firewall Management Center, you need to refresh the interface listing by clicking **Sync Interfaces from device** on the top left of **Interfaces**. For the Secure Firewall 3100/4200, which supports hot swapping, see [Manage the Network Module for the Secure Firewall 3100/4200, on page 676](#) before you change interfaces on a device.

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
  - Step 2** Click **Edit** (✎) for the interface you want to edit.
  - Step 3** Enable the interface by checking the **Enabled** check box.
  - Step 4** (Optional) Add a description in the **Description** field.  
The description can be up to 200 characters on a single line, without carriage returns.
  - Step 5** (Optional) Set the duplex and speed by clicking **Hardware Configuration > Speed**.
    - **Duplex**—Choose **Full** or **Half**. SFP interfaces only support **Full** duplex.
    - **Speed**—Choose a speed (varies depending on the model). (Secure Firewall 3100/4200 only) Choose **Detect SFP** to detect the speed of the installed SFP module and use the appropriate speed. Duplex is always Full, and auto-negotiation is always enabled. This option is useful if you later change the network module to a different model, and want the speed to update automatically.
- Note**  
You cannot modify the speed of a HA or a Cluster Control Link interface.
- **Auto-negotiation**—Set the interface to negotiate the speed, link status, and flow control.
  - **Forward Error Correction Mode**—(Secure Firewall 3100/4200 only) For 25 Gbps and higher interfaces, enable Forward Error Correction (FEC). For an EtherChannel member interface, you must configure FEC before you add it to the EtherChannel. The setting chosen when you use **Auto** depends on the transceiver type and whether the interface is fixed (built-in) or on a network module.

**Table 47: Default FEC for Auto Setting**

Transceiver Type	Fixed Port Default FEC (Ethernet 1/9 through 1/16)	Network Module Default FEC
25G-SR	Clause 74 FC-FEC	Clause 108 RS-FEC
25G-LR	Clause 74 FC-FEC	Clause 108 RS-FEC

Transceiver Type	Fixed Port Default FEC (Ethernet 1/9 through 1/16)	Network Module Default FEC
10/25G-CSR	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-AOCxM	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-CU2.5/3M	Auto-Negotiate	Auto-Negotiate
25G-CU4/5M	Auto-Negotiate	Auto-Negotiate
25/50/100G	Clause 91 RS-FEC	Clause 91 RS-FEC

**Step 6** (Optional) (Firepower 1100/2100, Secure Firewall 3100/4200) Enable Link Layer Discovery Protocol (LLDP) by clicking **Hardware Configuration > Network Connectivity**.

- **Enable LLDP Receive**—Enables the firewall to receive LLDP packets from its peers.
- **Enable LLDP Transmit**—Enables the firewall to send LLDP packets to its peers.

**Step 7** (Optional) (Secure Firewall 3100/4200) Enable pause (XOFF) frames for flow control by clicking **Hardware Configuration > Network Connectivity**, and checking **Flow Control Send**.

Flow control enables connected Ethernet ports to control traffic rates during congestion by allowing congested nodes to pause link operation at the other end. If the threat defense port experiences congestion (exhaustion of queuing resources on the internal switch) and cannot receive any more traffic, it notifies the other port by sending a pause frame to stop sending until the condition clears. Upon receipt of a pause frame, the sending device stops sending any data packets, which prevents any loss of data packets during the congestion period.

**Note**

The Firewall Threat Defense supports transmitting pause frames so that the remote peer can rate-control the traffic.

However, receiving of pause frames is not supported.

The internal switch has a global pool of 8000 buffers of 250 bytes each, and the switch allocates buffers dynamically to each port. A pause frame is sent out every interface with flowcontrol enabled when the buffer usage exceeds the global high-water mark (2 MB (8000 buffers)); and a pause frame is sent out of a particular interface when its buffer exceeds the port high-water mark (.3125 MB (1250 buffers)). After a pause is sent, an XON frame can be sent when the buffer usage is reduced below the low-water mark (1.25 MB globally (5000 buffers); .25 MB per port (1000 buffers)). The link partner can resume traffic after receiving an XON frame.

Only flow control frames defined in 802.3x are supported. Priority-based flow control is not supported.

**Step 8** In the **Mode** drop-down list, choose one of the following:.

- **None**—Choose this setting for regular firewall interfaces and inline sets. The mode will automatically be changed to Routed, Switched, or Inline based on further configuration.
- **Passive**—Choose this setting for passive IPS-only interfaces.
- **Ersipan**—Choose this setting for ERSPAN passive IPS-only interfaces.

**Step 9** In the **Priority** field, enter a number ranging from 0–65535.

This value is used in the policy based routing configuration. The priority is used to determine how you want to distribute the traffic across multiple egress interfaces.

**Step 10** Click **OK**.

**Step 11** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Step 12** Continue configuring interfaces.

- [Regular Firewall Interfaces, on page 701](#)
- [Inline Sets and Passive Interfaces, on page 775](#)

## Configure EtherChannel Interfaces

This section tells how to configure EtherChannel interfaces.

**Note** For the Firepower 4100/9300, you configure EtherChannels in FXOS. See [Add an EtherChannel \(Port Channel\), on page 257](#) for more information.

---

## About EtherChannels

This section describes EtherChannels.

### About EtherChannels

An 802.3ad EtherChannel is a logical interface (called a port-channel interface) consisting of a bundle of individual Ethernet links (a channel group) so that you increase the bandwidth for a single network. A port channel interface is used in the same way as a physical interface when you configure interface-related features.

You can configure up to 48 EtherChannels, depending on how many interfaces your model supports.

### Channel Group Interfaces

Each channel group can have up to 8 active interfaces, except for the ISA 3000, which supports 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.

All interfaces in the channel group must be the same type and speed. The first interface added to the channel group determines the correct type and speed.

The EtherChannel aggregates the traffic across all the available active interfaces in the channel. The interface is selected using a proprietary hash algorithm, based on source or destination MAC addresses, IP addresses, TCP and UDP port numbers and VLAN numbers.

## Connecting to an EtherChannel on Another Device

The device to which you connect the Firewall Threat Defense EtherChannel must also support 802.3ad EtherChannels; for example, you can connect to the Catalyst 6500 switch or the Cisco Nexus 7000.

When the switch is part of a Virtual Switching System (VSS) or Virtual Port Channel (vPC), then you can connect Firewall Threat Defense interfaces within the same EtherChannel to separate switches in the VSS/vPC. The switch interfaces are members of the same EtherChannel port-channel interface, because the separate switches act like a single switch.

**Figure 293: Connecting to a VSS/vPC**

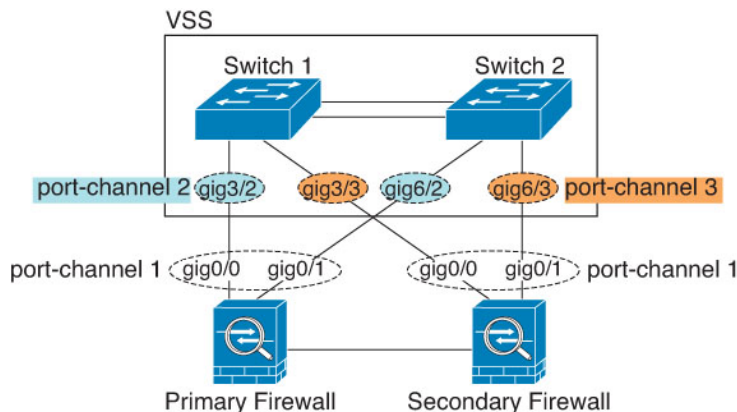

**Note** If the Firewall Threat Defense device is in transparent firewall mode, and you place the Firewall Threat Defense device between two sets of VSS/vPC switches, then be sure to disable Unidirectional Link Detection (UDLD) on any switch ports connected to the Firewall Threat Defense device with an EtherChannel. If you enable UDLD, then a switch port may receive UDLD packets sourced from both switches in the other VSS/vPC pair. The receiving switch will place the receiving interface in a down state with the reason "UDLD Neighbor mismatch".

If you use the Firewall Threat Defense device in an Active/Standby failover deployment, then you need to create separate EtherChannels on the switches in the VSS/vPC, one for each Firewall Threat Defense device. On each Firewall Threat Defense device, a single EtherChannel connects to both switches. Even if you could group all switch interfaces into a single EtherChannel connecting to both Firewall Threat Defense devices (in this case, the EtherChannel will not be established because of the separate Firewall Threat Defense system IDs), a single EtherChannel would not be desirable because you do not want traffic sent to the standby Firewall Threat Defense device.

Figure 294: Active/Standby Failover and VSS/vPC

## Link Aggregation Control Protocol

The Link Aggregation Control Protocol (LACP) aggregates interfaces by exchanging the Link Aggregation Control Protocol Data Units (LACPDU)s between two network devices.

You can configure each physical interface in an EtherChannel to be:

- **Active**—Sends and receives LACP updates. An active EtherChannel can establish connectivity with either an active or a passive EtherChannel. You should use the active mode unless you need to minimize the amount of LACP traffic.
- **Passive**—Receives LACP updates. A passive EtherChannel can only establish connectivity with an active EtherChannel. Not supported on hardware models.
- **On**—The EtherChannel is always on, and LACP is not used. An “on” EtherChannel can only establish a connection with another “on” EtherChannel.

LACP coordinates the automatic addition and deletion of links to the EtherChannel without user intervention. It also handles misconfigurations and checks that both ends of member interfaces are connected to the correct channel group. “On” mode cannot use standby interfaces in the channel group when an interface goes down, and the connectivity and configurations are not checked.

## Load Balancing

The Firewall Threat Defense device distributes packets to the interfaces in the EtherChannel by hashing the source and destination IP address of the packet (this criteria is configurable). The resulting hash is divided by the number of active links in a modulo operation where the resulting remainder determines which interface owns the flow. All packets with a  $hash\_value \bmod active\_links$  result of 0 go to the first interface in the EtherChannel, packets with a result of 1 go to the second interface, packets with a result of 2 go to the third interface, and so on. For example, if you have 15 active links, then the modulo operation provides values from 0 to 14. For 6 active links, the values are 0 to 5, and so on.

If an active interface goes down and is not replaced by a standby interface, then traffic is rebalanced between the remaining links. The failure is masked from both Spanning Tree at Layer 2 and the routing table at Layer 3, so the switchover is transparent to other network devices.

## EtherChannel MAC Address

All interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links.

### Firepower and Secure Firewall Hardware

The port-channel interface uses the MAC address of the internal interface Internal-Data 0/1. Alternatively you can manually configure a MAC address for the port-channel interface. All EtherChannel interfaces on a chassis use the same MAC address, so be aware that if you use SNMP polling, for example, multiple interfaces will have the same MAC address.

---

**Note** Member interfaces only use the Internal-Data 0/1 MAC address after a reboot. Prior to rebooting, the member interface uses its own MAC address. If you add a new member interface after a reboot, you will have to perform another reboot to update its MAC address.

---

## Guidelines for EtherChannels

### Bridge Group

In routed mode, Firewall Management Center-defined EtherChannels are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.

### High Availability

- When you use an EtherChannel interface as a High Availability link, it must be pre-configured on both units in the High Availability pair; you cannot configure it on the primary unit and expect it to replicate to the secondary unit because *the High Availability link itself is required for replication*.
- If you use an EtherChannel interface for the state link, no special configuration is required; the configuration can replicate from the primary unit as normal. For the Firepower 4100/9300 chassis, all interfaces, including EtherChannels, need to be pre-configured on both units.
- You can monitor EtherChannel interfaces for High Availability. When an active member interface fails over to a standby interface, this activity does not cause the EtherChannel interface to appear to be failed when being monitored for device-level High Availability. Only when all physical interfaces fail does the EtherChannel interface appear to be failed (for an EtherChannel interface, the number of member interfaces allowed to fail is configurable).
- If you use an EtherChannel interface for a High Availability or state link, then to prevent out-of-order packets, only one interface in the EtherChannel is used. If that interface fails, then the next interface in the EtherChannel is used. You cannot alter the EtherChannel configuration while it is in use as a High Availability link. To alter the configuration, you need to temporarily disable High Availability, which prevents High Availability from occurring for the duration.

### Model Support

- You cannot add EtherChannels in the Firewall Management Center for the Firepower 4100/9300 or the Firewall Threat Defense Virtual. The Firepower 4100/9300 supports EtherChannels, but you must perform all hardware configuration of EtherChannels in FXOS on the chassis.
- You cannot use Firepower 1010 switch ports or VLAN interfaces in EtherChannels.

### General EtherChannel Guidelines

- You can configure up to 48 EtherChannels, depending on how many interfaces are available on your model.
- Each channel group can have up to 8 active interfaces, except for the ISA 3000, which supports 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same media type and speed capacity. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, except for the Secure Firewall 3100/4200, which supports different interface capacities as long as the speed is set to Detect SFP; in this case the lowest common speed is used.
- The device to which you connect the Firewall Threat Defense EtherChannel must also support 802.3ad EtherChannels.
- The Firewall Threat Defense device does not support LACPDU s that are VLAN-tagged. If you enable native VLAN tagging on the neighboring switch using the Cisco IOS **vlan dot1Q tag native** command, then the Firewall Threat Defense device will drop the tagged LACPDUs. Be sure to disable native VLAN tagging on the neighboring switch.
- The LACP rate depends on the model. When you set the rate (normal or fast), the device requests that rate from the connecting switch. In return, the device will send at the rate requested by the connecting switch. We recommend that you set the same rate on both sides.
  - Firepower 4100/9300—The LACP rate is set to fast by default in FXOS, but you can configure it as normal (also known as slow).
  - Secure Firewall 3100/4200—The LACP rate is set to normal (slow) by default, but you can configure it as fast on the device.
  - All other models—The LACP rate set to normal (also known as slow), and it is not configurable, which means the device will always request a slow rate from the connecting switch. We recommend setting the rate on the switch to slow, so both sides send LACP messages at the same rate.
- In Cisco IOS software versions earlier than 15.1(1)S2, Firewall Threat Defense did not support connecting an EtherChannel to a switch stack. With default switch settings, if the Firewall Threat Defense EtherChannel is connected cross stack, and if the primary switch is powered down, then the EtherChannel connected to the remaining switch will not come up. To improve compatibility, set the **stack-mac persistent timer** command to a large enough value to account for reload time; for example, 8 minutes or 0 for indefinite. Or, you can upgrade to more a more stable switch software version, such as 15.1(1)S2.
- All the Firewall Threat Defense configuration refers to the logical EtherChannel interface instead of the member physical interfaces.

# Configure an EtherChannel

This section describes how to create an EtherChannel port-channel interface, assign interfaces to the EtherChannel, and customize the EtherChannel.

## Guidelines

- You can configure up to 48 EtherChannels, depending on the number of interfaces for your model.
- Each channel group can have up to 8 active interfaces, except for the ISA 3000, which supports 16 active interfaces. For switches that support only 8 active interfaces, you can assign up to 16 interfaces to a channel group: while only 8 interfaces can be active, the remaining interfaces can act as standby links in case of interface failure.
- All interfaces in the channel group must be the same media type and speed capacity. The media type can be either RJ-45 or SFP; SFPs of different types (copper and fiber) can be mixed. You cannot mix interface capacities (for example 1GB and 10GB interfaces) by setting the speed to be lower on the larger-capacity interface, except for the Secure Firewall 3100/4200, which supports different interface capacities as long as the speed is set to Detect SFP; in this case the lowest common speed is used.

**Note** For the Firepower 4100/9300, you configure EtherChannels in FXOS. See [Add an EtherChannel \(Port Channel\), on page 257](#) for more information.

## Before you begin

- You cannot add a physical interface to the channel group if you configured a name for it. You must first remove the name.

**Note** If you are using a physical interface already in your configuration, removing the name will clear any configuration that refers to the interface.

## Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Enable the member interfaces according to [Enable the Physical Interface and Configure Ethernet Settings, on page 662](#).
- Step 3** Click **Add Interfaces > Ether Channel Interface**.
- Step 4** On the **General** tab, set the **Ether Channel ID** to a number between 1 and 48 (1 and 8 for the Firepower 1010).

**Figure 295: Add EtherChannel Interface**

**Add Ether Channel Interface**

General IPv4 IPv6 Hardware Configuration Path Monitoring Advanced

Name:

☒ Enabled  
☐ Management Only

Description:

Security Zone:

MTU:   
(64 - 9198)

Priority:  (0 - 65535)

Propagate Security Group Tag: ☐

Ether Channel ID \*:

Cancel OK

- Step 5** In the **Available Interfaces** area, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members.
- Make sure all interfaces are the same type and speed capability.

Figure 296: Available Interfaces

**Step 6**

(Optional) Click the **Advanced** tab to customize the EtherChannel. Set the following parameters on the **Information** sub-tab:

Figure 297: Advanced

- (ISA 3000 only) **Load Balancing**—Select the criteria used to load balance the packets across the group channel interfaces. By default, the Firewall Threat Defense device balances the packet load on interfaces according to the source and destination IP address of the packet. If you want to change the properties on which the packet is categorized, choose a different set of criteria. For example, if your traffic is biased heavily towards the same source and destination IP addresses, then the traffic assignment to interfaces in the EtherChannel will be unbalanced. Changing to a different algorithm can result in more evenly distributed traffic. For more information about load balancing, see [Load Balancing, on page 667](#).
- **LACP Mode**—Choose Active, Passive, or On. We recommend using Active mode (the default). Passive mode is only available for the ISA 3000 only.
- (Secure Firewall 3100/4200 only) **LACP Rate**—Choose Default, Normal, or Fast. The default is Normal (also known as slow). Sets the LACP data unit receive rate for a physical interface in the channel group. We recommend that you set the same rate on both sides.

- (ISA 3000 only) **Active Physical Interface: Range**—From the left drop-down list, choose the minimum number of active interfaces required for the EtherChannel to be active, between 1 and 16. The default is 1. From the right drop-down list, choose the maximum number of active interfaces allowed in the EtherChannel, between 1 and 16. The default is 16. If your switch does not support 16 active interfaces, be sure to set this command to 8 or fewer.
- **Active Mac Address**—Set a manual MAC address if desired. The mac\_address is in H.H.H format, where H is a 16-bit hexadecimal digit. For example, the MAC address 00-0C-F1-42-4C-DE is entered as 000C.F142.4CDE.

**Step 7** Click the **Hardware Configuration** tab and set the Duplex and Speed for all member interfaces.

**Step 8** Click **OK**.

**Step 9** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Step 10** (Optional) For regular firewall interfaces, add a VLAN subinterface. See [Add a Subinterface, on page 720](#).

**Step 11** For regular firewall interfaces, configure the routed or transparent mode interface parameters: [Configure Routed Mode Interfaces, on page 738](#) or [Configure Bridge Group Interfaces, on page 743](#). For IPS-only interfaces, see [Inline Sets and Passive Interfaces, on page 775](#).

## Sync Interface Changes with the Firewall Management Center

Interface changes on the device can cause the Firewall Management Center and the device to get out of sync. The Firewall Management Center can detect interface changes by one of the following methods:

- Event sent from the device
- Sync when you deploy from the Firewall Management Center

If the Firewall Management Center detects interface changes when it attempts to deploy, the deployment will fail. You must first accept the interface changes.

- Manual sync

There are two types of interface changes performed outside of Firewall Management Center that need to be synched:

- Addition or deletion of physical interfaces—Adding a new interface, or deleting an unused interface has minimal impact on the Firewall Threat Defense configuration. However, deleting an interface that is used in your security policy will impact the configuration. Interfaces can be referenced directly in many places in the Firewall Threat Defense configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected. You can also edit the membership of an allocated EtherChannel without affecting the logical device or requiring a sync on the Firewall Management Center.

When the Firewall Management Center detects changes, the **Interface** page shows status (removed, changed, or added) to the left of each interface.

- Firewall Management Center access interface changes—If you configure a data interface for managing management center using the **configure network management-data-interface** command, you must manually make matching configuration changes in management center and then acknowledge the changes. These interface changes cannot be made automatically.

This procedure describes how to manually sync interface changes if required and how to acknowledge the detected changes. If interface changes are temporary, you should not save the changes in the Firewall Management Center; you should wait until the device is stable, and then re-sync.

### Before you begin

- User Roles:
  - Admin
  - Access Admin
  - Network Admin

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** If required, click **Sync Device** on the top left of **Interfaces**.
- Step 3** After the changes are detected, see the following steps.

#### Addition or Deletion of Physical Interfaces

- You will see a red banner on **Interfaces** indicating that the interface configuration has changed. Click the **Click to know more** link to view the interface changes.
- Click **Validate Changes** to make sure your policy will still work with the interface changes.  
If there are any errors, you need to change your policy and rerun the validation.
- Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices.

#### FMC Access Interface Changes

- You will see a yellow banner in the top right of the **Device** page indicating that the Firewall Management Center access configuration has changed. Click the **View details** link to view the interface changes.

The **FMC Access - Configuration Details** dialog box opens.

- b) Take note of all highlighted configurations, especially the pink highlighted ones. You need to match any values on the Firewall Threat Defense by manually configuring them on the Firewall Management Center.

For example, the pink highlights below show configuration that exists on the Firewall Threat Defense but not yet on the Firewall Management Center.

**FMC Access - Configuration Details** ? x

FMC Access configuration on device have been updated outside of FMC. Review the differences and update FMC values accordingly.

Acknowledge Close

- c) Click **Acknowledge**.

We recommend that you do not click **Acknowledge** until you have finished the Firewall Management Center configuration, and are ready to deploy. Clicking **Acknowledge** removes the block on deployment. The next time you deploy, the Firewall Management Center configuration will overwrite any remaining conflicting settings on the Firewall Threat Defense. It is your responsibility to manually fix the configuration in the Firewall Management Center before you re-deploy.

- d) You can now go to **Deploy > Deployment** and deploy the policy to assigned devices.

## Manage the Network Module for the Secure Firewall 3100/4200

If you install a network module before you first power on the device, no action is required; the network module is enabled and ready for use.

To view physical interface details for the device, and to manage the network module, open the **Chassis Operations** page. From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit. The **Chassis Operations** page opens for the device.

**Figure 298: Chassis Operations**

172.16.0.51 (Chassis Operations)

Click **Refresh** to refresh interface status. Click **Sync Modules** if you made a hardware change on the device that you need to detect.

If you need to make changes to your network module installation after initial bootup, then see the following procedures.

## Configure Breakout Ports

You can configure 10GB breakout ports for each 40GB or higher interface. This procedure tells you how to break out and rejoin the ports. Breakout ports can be used just like any other physical Ethernet port, including being added to EtherChannels.

Changes are immediate; you do not need to deploy to the device. After you break or rejoin, you cannot roll back to the previous interface state.

### Before you begin

- You must use a supported breakout cable. See the hardware installation guide for more information.
- The interface cannot be in use for the following before breaking or rejoining:
  - Failover link
  - Cluster control link
  - Have a subinterface
  - EtherChannel member
  - BVI member
  - Manager access interface
- Breaking or rejoining an interface that is used directly in your security policy can impact the configuration; however, the action is not blocked.

### Procedure

- Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit; network module changes are replicated to all nodes.

**Figure 299: Manage Chassis**

<input type="checkbox"/>	Name	Model	Version	Chassis
<input type="checkbox"/>	Ungrouped (2)			
<input type="checkbox"/>	172.16.0.51 <b>Snort 3</b> 172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	<a href="#">Manage</a>

The **Chassis Operations** page opens for the device (in multi-instance mode, this page is called **Chassis Manager**). This page shows physical interface details for the device.

**Step 2** Break out 10GB ports from a 40GB or higher interface.

- a) click **Break** (🔪) to the right of the interface.

Click **Yes** on the confirmation dialog box. If the interface is in use, you will see an error message. You must resolve any use cases before you can retry the breakout.

For example, to break out the Ethernet2/1 40GB interface, the resulting child interfaces will be identified as Ethernet2/1/1, Ethernet2/1/2, Ethernet2/1/3, and Ethernet2/1/4.

On the interfaces graphic, a port that is broken out has this appearance:

**Figure 300: Breakout Ports**

- b) Click the link in the message at the top of the screen to go to the **Interfaces** page to save the interface changes.

**Figure 301: Go to Interface Page**

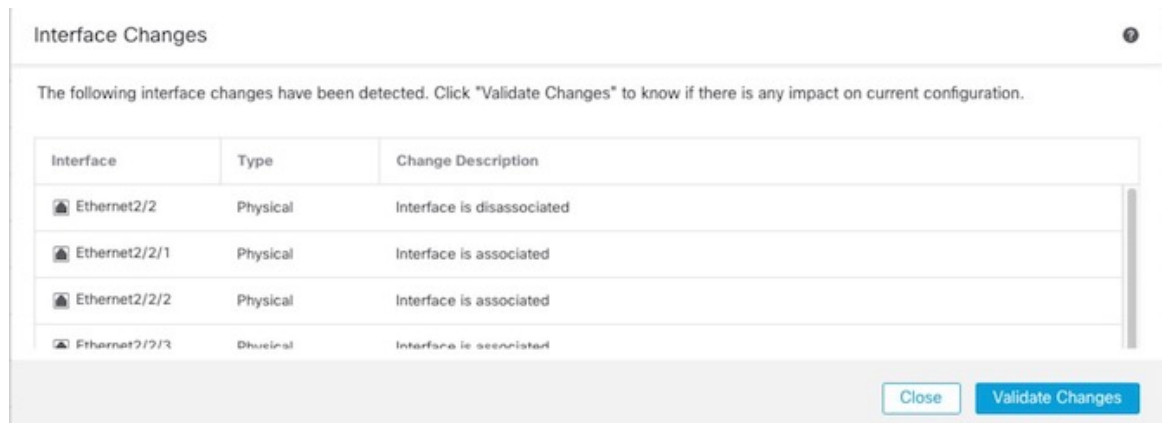

⚠ This device has configuration changes that were performed directly on the device. Visit [Interface page in device details](#)

- c) At the top of the **Interfaces** page, click **Click to know more**. The **Interface Changes** dialog box opens.

**Figure 302: View Interface Changes**

Interface configuration has changed on device. [Click to know more.](#)

**Figure 303: Interface Changes**

- d) Click **Validate Changes** to make sure your policy will still work with the interface changes.

If there are any errors, you need to change your policy and rerun the validation.

Replacing the parent interface that is used in your security policy can impact the configuration. Interfaces can be referenced directly in many places in the configuration, including access rules, NAT, SSL, identity

rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected.

- e) Click **Close** to return to the **Interfaces** page.
- f) Click **Save** to save the interface changes to the firewall.
- g) If you had to change any configuration, go to **Deploy > Deployment** and deploy the policy.

You do not need to deploy just to save the breakout port changes.

### Step 3 Rejoin breakout ports.

You must rejoin all child ports for the interface.

- a) Click **Join** (🔗) to the right of the interface.  
Click **Yes** on the confirmation dialog box. If any child ports are in use, you will see an error message. You must resolve any use cases before you can retry the rejoin.
- b) Click the link in the message at the top of the screen to go to the **Interfaces** page to save the interface changes.

**Figure 304: Go to Interface Page**

▲ This device has configuration changes that were performed directly on the device. Visit [Interface page in device details](#)

- c) At the top of the **Interfaces** page, click **Click to know more**. The **Interface Changes** dialog box opens.

**Figure 305: View Interface Changes**

Interface configuration has changed on device. [Click to know more.](#)

**Figure 306: Interface Changes**

Interface Changes

The following interface changes have been detected. Click "Validate Changes" to know if there is any impact on current configuration.

Interface	Type	Change Description
🔗 Ethernet2/2	Physical	Interface is disassociated
🔗 Ethernet2/2/1	Physical	Interface is associated
🔗 Ethernet2/2/2	Physical	Interface is associated
🔗 Ethernet2/2/3	Physical	Interface is associated

Close

Validate Changes

- d) Click **Validate Changes** to make sure your policy will still work with the interface changes.

If there are any errors, you need to change your policy and rerun the validation.

Replacing the child interfaces that are used in your security policy can impact the configuration. Interfaces can be referenced directly in many places in the configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected.

- e) Click **Close** to return to the **Interfaces** page.
- f) Click **Save** to save the interface changes to the firewall.
- g) If you had to change any configuration, go to **Deploy > Deployment** and deploy the policy.

You do not need to deploy just to save the breakout port changes.

## Add a Network Module

To add a network module to a firewall after initial bootup, perform the following steps. Adding a new module requires a reboot.

### Procedure

- Step 1** Install the network module according to the hardware installation guide.  
For clustering or High Availability, install the network module on all nodes.
- Step 2** Reboot the firewall; see [Shut Down or Restart the Device, on page 48](#).  
For clustering or High Availability, reboot the data nodes/standby unit first, and wait for them to come back up. Then you can change the control node (see [Change the Control Node, on page 411](#)) or active unit (see [Switch the Active Peer in the Firewall Threat Defense High Availability Pair, on page 368](#)), and reboot the former control node/active unit.
- Step 3** From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit; network module changes are replicated to all nodes.

*Figure 307: Manage Chassis*

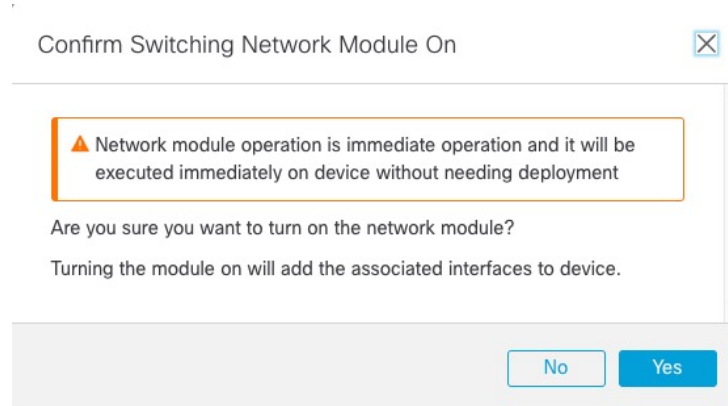

<input type="checkbox"/>	Name	Model	Version	Chassis
<input type="checkbox"/>	Ungrouped (2)			
<input type="checkbox"/>	<div>172.16.0.51 Snort 3</div> <div>172.16.0.51 ~ Transparent</div>	Firewall 3120 Threat Defense	7.1.0	<a href="#">Manage</a>

The **Chassis Operations** page opens for the device. This page shows physical interface details for the device.

- Step 4** Click **Sync Modules** to update the page with the new network module details.
- Step 5** On the interfaces graphic, click the slider () to enable the network module.

**Figure 308: Enable the Network Module**

**Step 6** You are prompted to confirm that you want to turn the network module on. Click **Yes**.

**Figure 309: Confirm Enable**

**Step 7** You see a message at the top of the screen; click the link to go to the **Interfaces** page to save the interface changes.

**Figure 310: Go to Interface Page**

▲ This device has configuration changes that were performed directly on the device. Visit [Interface page in device details](#)

**Step 8** (Optional) At the top of the **Interfaces** page, you see a message that the interface configuration has changed. You can click **Click to know more** to open the **Interface Changes** dialog box to view the changes.

**Figure 311: View Interface Changes**

Interface configuration has changed on device. [Click to know more.](#)

**Figure 312: Interface Changes**

Interface Changes ?

The following interface changes have been detected. Click "Validate Changes" to know if there is any impact on current configuration.

Interface	Type	Change Description
Ethernet2/1	Physical	Interface is associated
Ethernet2/2	Physical	Interface is associated
Ethernet2/5	Physical	Interface is associated
Ethernet2/6	Physical	Interface is associated
Ethernet2/7	Physical	Interface is associated
Ethernet2/8	Physical	Interface is associated

Close
Validate Changes

Click **Close** to return to the **Interfaces** page. (Because you are adding a new module, there shouldn't be any configuration impact, so you do not need to click **Validate Changes**.)

**Step 9** Click **Save** to save the interface changes to the firewall.

## Hot Swap the Network Module

You can hot swap a network module for a new module of the same type without having to reboot. However, you must shut down the current module to remove it safely. This procedure describes how to shut down the old module, install a new module, and enable it.

For clustering or High Availability, you can only perform chassis operations on the control node/active unit. You cannot disable a network module if the cluster control link/failover link is on the module.

### Before you begin

#### Procedure

**Step 1** For clustering or High Availability, perform the following steps.

- **Clustering**—Ensure the unit you want to perform the hot swap on is a data node (see [Change the Control Node, on page 411](#)); then break the node so it is no longer in the cluster. See [Break a Node, on page 408](#).

You will add the node back to the cluster after you perform the hot swap. Alternatively, you can perform all operations on the control node, and the network module changes will sync to all data nodes. However, you will lose use of those interfaces on all nodes during the hot swap.

- **High Availability**—To avoid failing over when you disable the network module:
  - If the failover link is on the network module, you must break High Availability. See [Break a High Availability Pair, on page 371](#). Disabling the network module with an active failover link is not allowed.

- Disable interface monitoring for interfaces on the network module. See [Configure Standby IP Addresses and Interface Monitoring](#), on page 366.

**Step 2** From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit; network module changes are replicated to all nodes.

**Figure 313: Manage Chassis**

<input type="checkbox"/>	Name	Model	Version	Chassis
<input type="checkbox"/>	Un grouped (2)			
<input type="checkbox"/>	172.16.0.51 Snort 3 172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	<a href="#">Manage</a>

The **Chassis Operations** page opens for the device. This page shows physical interface details for the device.

**Step 3** On the interfaces graphic, click the slider (  ) to disable the network module.

**Figure 314: Disable the Network Module**

Do not save any changes on the **Interfaces** page. Because you are replacing the network module, you do not want to disrupt any existing configuration.

**Step 4** You are prompted to confirm that you want to turn the network module off. Click **Yes**.

**Figure 315: Confirm Disable**

**Step 5** On the device, remove the old network module and replace it with the new network module according to the hardware installation guide.

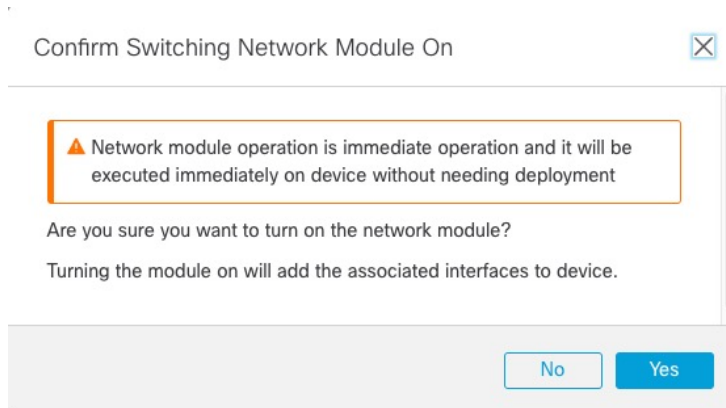

**Step 6** In the Firewall Management Center, enable the new module by clicking the slider (  ).

*Figure 316: Enable the Network Module*

**Step 7** You are prompted to confirm that you want to turn the network module on. Click **Yes**.

*Figure 317: Confirm Enable*

**Step 8** For clustering or High Availability, perform the following steps.

- **Clustering**—Add the node back to the cluster. See [Add a New Cluster Node, on page 406](#).
- **High Availability**—
  - If you broke High Availability, then reform High Availability. See [Add a High Availability Pair, on page 363](#).
  - Reenable interface monitoring for interfaces on the network module. See [Configure Standby IP Addresses and Interface Monitoring, on page 366](#).

## Replace the Network Module with a Different Type

If you replace a network module with a different type, then a reboot is required. If the new module has fewer interfaces than the old module, you will have to manually remove any configuration related to interfaces that will no longer be present.

For clustering or High Availability, you can only perform chassis operations on the control node/active unit.

### Before you begin

For High Availability, you cannot disable a network module if the failover link is on the module. You will have to break High Availability (see [Break a High Availability Pair, on page 371](#)), which means you will have downtime when you reboot the active unit. After the units finish rebooting, you can reform High Availability.

### Procedure

#### Step 1

For clustering or High Availability, perform the following steps.

- **Clustering**—To avoid downtime, you can break each node one at a time so it is no longer in the cluster while you perform the network module replacement. See [Break a Node, on page 408](#).

You will add the node back to the cluster after you perform the replacement.

- **High Availability**—To avoid failing over when you replace the network module, disable interface monitoring for interfaces on the network module. See [Configure Standby IP Addresses and Interface Monitoring, on page 366](#).

#### Step 2

From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit; network module changes are replicated to all nodes.

**Figure 318: Manage Chassis**

<input type="checkbox"/>	Name	Model	Version	Chassis
<input type="checkbox"/>	Ungrouped (2)			
<input type="checkbox"/>	172.16.0.51 Snort 3 172.16.0.51 - Transparent	Firewall 3120 Threat Defense	7.1.0	<a href="#">Manage</a>

The **Chassis Operations** page opens for the device. This page shows physical interface details for the device.

#### Step 3

On the interfaces graphic, click the slider () to disable the network module.

**Figure 319: Disable the Network Module**

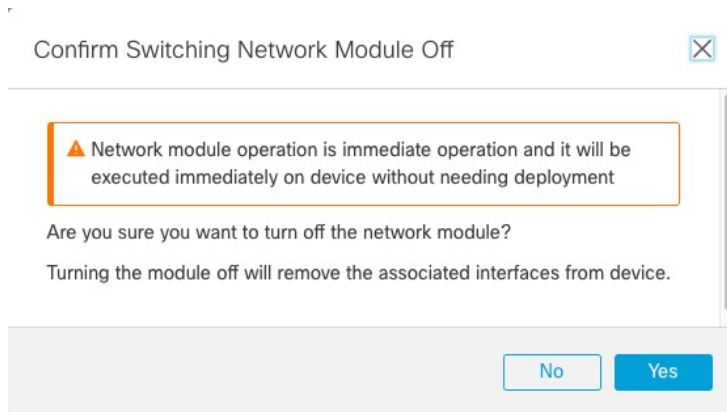

Do not save any changes on the **Interfaces** page. Because you are replacing the network module, you do not want to disrupt any existing configuration.

#### Step 4

You are prompted to confirm that you want to turn the network module off. Click **Yes**.

Figure 320: Confirm Disable

**Step 5** On the device, remove the old network module and replace it with the new network module according to the hardware installation guide.

**Step 6** Reboot the firewall; see [Shut Down or Restart the Device, on page 48](#).

For clustering or High Availability, reboot the data nodes/standby unit first, and wait for them to come back up. Then you can change the control node (see [Change the Control Node, on page 411](#)) or active unit (see [Switch the Active Peer in the Firewall Threat Defense High Availability Pair, on page 368](#)), and reboot the former control node/active unit.

**Step 7** In the Firewall Management Center, click **Sync Modules** to update the page with the new network module details.

**Step 8** Enable the new module by clicking the slider (  ).

Figure 321: Enable the Network Module

**Step 9** You are prompted to confirm that you want to turn the network module on. Click **Yes**.

**Figure 322: Confirm Enable**

**Step 10** Click the link in the message at the top of the screen to go to the **Interfaces** page to save the interface changes.

**Figure 323: Go to Interface Page**

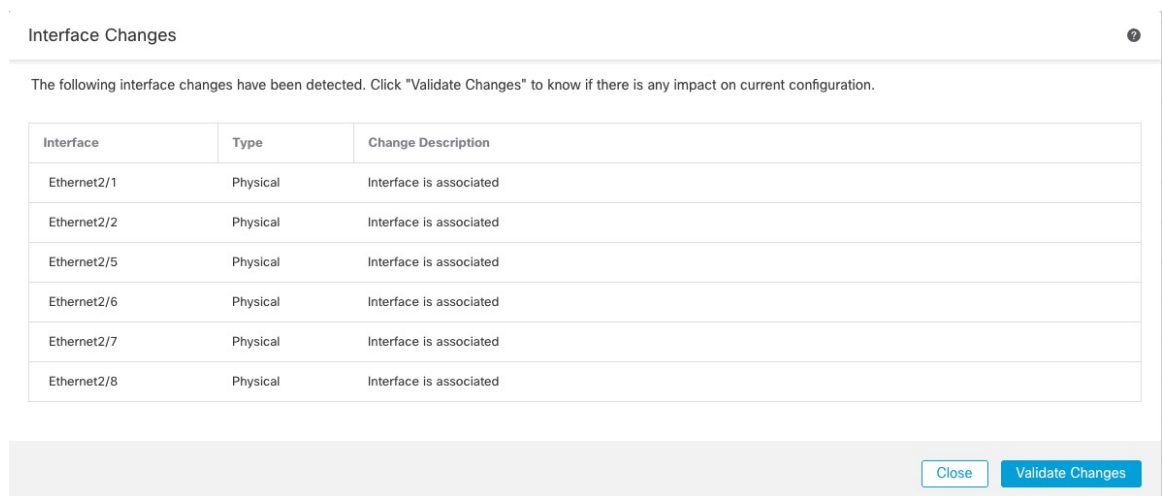

▲ This device has configuration changes that were performed directly on the device. Visit [Interface page](#) in device details

**Step 11** If the network module has *fewer* interfaces:

a) At the top of the **Interfaces** page, click **Click to know more**. The **Interface Changes** dialog box opens.

**Figure 324: View Interface Changes**

Interface configuration has changed on device. [Click to know more.](#)

**Figure 325: Interface Changes**

b) Click **Validate Changes** to make sure your policy will still work with the interface changes.  
If there are any errors, you need to change your policy and rerun the validation.

Deleting an interface that is used in your security policy can impact the configuration. Interfaces can be referenced directly in many places in the configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected.

c) Click **Close** to return to the **Interfaces** page.

**Step 12** To change the interface speed, see [Enable the Physical Interface and Configure Ethernet Settings, on page 662](#).

The default speed is set to Detect SFP, which detects the correct speed from the SFP installed. You only need to fix the speed if you manually set the speed to a particular value and you now need a new speed.

**Step 13** Click **Save** to save the interface changes to the firewall.

**Step 14** If you had to change any configuration, go to **Deploy > Deployment** and deploy the policy.

You do not need to deploy just to save the network module changes.

**Step 15** For clustering or High Availability, perform the following steps.

- **Clustering**—Add the node back to the cluster. See [Add a New Cluster Node, on page 406](#).
- **High Availability**—Reenable interface monitoring for interfaces on the network module. See [Configure Standby IP Addresses and Interface Monitoring, on page 366](#).

## Remove the Network Module

If you want to permanently remove the network module, follow these steps. Removing a network module requires a reboot.

For clustering or High Availability, you can only perform chassis operations on the control node/active unit.

### Before you begin

For clustering or High Availability, make sure the cluster/failover link is not on the network module.

### Procedure

**Step 1** From **Devices > Device Management**, click **Manage** in the **Chassis** column. For clustering or High Availability, this option is only available for the control node/active unit; network module changes are replicated to all nodes.

**Figure 326: Manage Chassis**

<input type="checkbox"/>	Name	Model	Version	Chassis
<input type="checkbox"/>	Ungrouped (2)			
<input type="checkbox"/>	172.16.0.51 <small>Snort 3</small> 172.16.0.51 ~ Transparent	Firewall 3120 Threat Defense	7.1.0	<b>Manage</b>

The **Chassis Operations** page opens for the device. This page shows physical interface details for the device.

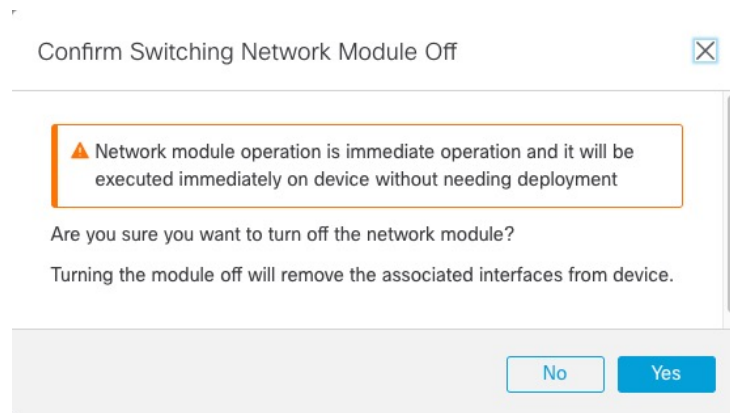

**Step 2** On the interfaces graphic, click the slider (  ) to disable the network module.

**Figure 327: Disable the Network Module**

**Step 3** You are prompted to confirm that you want to turn the network module off. Click **Yes**.

**Figure 328: Confirm Disable**

**Step 4** You see a message at the top of the screen; click the link to go to the **Interfaces** page to save the interface changes.

**Figure 329: Go to Interface Page**

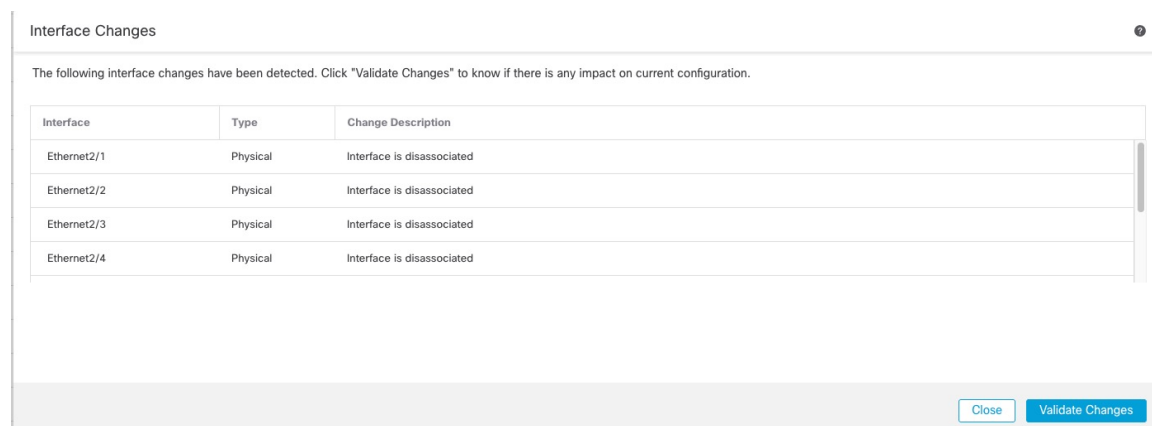

▲ This device has configuration changes that were performed directly on the device. Visit [Interface page in device details](#)

**Step 5** At the top of the **Interfaces** page, you see a message that the interface configuration has changed.

**Figure 330: View Interface Changes**

Interface configuration has changed on device. [Click to know more.](#)

a) Click **Click to know more** to open the **Interface Changes** dialog box to view the changes.

**Figure 331: Interface Changes**

- b) Click **Validate Changes** to make sure your policy will still work with the interface changes.

If there are any errors, you need to change your policy and rerun the validation.

Deleting an interface that is used in your security policy can impact the configuration. Interfaces can be referenced directly in many places in the configuration, including access rules, NAT, SSL, identity rules, VPN, DHCP server, and so on. Deleting an interface will delete any configuration associated with that interface. Policies that refer to security zones are not affected.

- c) Click **Close** to return to the **Interfaces** page.

**Step 6** Click **Save** to save the interface changes to the firewall.

**Step 7** If you had to change any configuration, go to **Deploy > Deployment** and deploy the policy.

**Step 8** Reboot the firewall; see [Shut Down or Restart the Device, on page 48](#).

For clustering or High Availability, reboot the data nodes/standby unit first, and wait for them to come back up. Then you can change the control node (see [Change the Control Node, on page 411](#)) or active unit (see [Switch the Active Peer in the Firewall Threat Defense High Availability Pair, on page 368](#)), and reboot the former control node/active unit.

## Merge the Management and Diagnostic Interfaces

Firewall Threat Defense 7.4 and later supports a merged Management and Diagnostic interface. If you have any configuration using the Diagnostic interface, then the interfaces will not be merged automatically, and you will need to perform the following procedure. This procedure requires you to acknowledge configuration changes, and in some cases, manually fix the configuration.

The Backup/Restore and Firewall Management Center configuration rollback functions save and restore the merged state, either non-merged or merged. For example, if you merge the interfaces, and then restore an old non-merged configuration, then the restored configuration will be in a non-merged state.

The following table shows the available configuration on the legacy Diagnostic interface, and how the merge is completed.

Table 48: Firewall Management Center Merged Management Interface Support

Legacy Diagnostic Interface Configuration	Merge Behavior	Supported on Management?
Interfaces		The "management" interface is now shown in read-only mode on the <b>Interfaces</b> page.
<ul style="list-style-type: none"> <li>IP address</li> </ul>	Manual removal required.	<p>The current Management IP address is used instead.</p> <p>For High Availability and clustering, the Management interface does not support a standby IP address or IP address pool; each unit has its own IP address that is maintained across failovers. Therefore, you cannot use a single management IP address to communicate with the current active/control unit.</p> <p>Set at the CLI using the <b>configure network ipv4</b> or <b>configure network ipv6</b> command.</p>
<ul style="list-style-type: none"> <li>"diagnostic" name</li> </ul>	<p>Automatically changed to "management".</p> <p><b>Note</b> No other interfaces can be named "management". You must change the name to proceed with the merge.</p>	Changed to "management".
Static Routes	Manual removal required.	<p><b>No support.</b></p> <p>The Management interface has a separate Linux routing table from the data interfaces. The Firewall Threat Defense actually has two "data" routing tables: for data interfaces and for management-only interfaces (which used to include Diagnostic, but also includes any interfaces you set to management-only). Depending on the traffic type, the Firewall Threat Defense checks one routing table, and then falls back to the other routing table. This route lookup no longer includes the Diagnostic interface, and does not include the Linux routing table for Management. See <a href="#">Routing Table for Management Traffic, on page 1049</a> for more information.</p> <p>You can add static routes for the Linux routing table at the CLI using the <b>configure network static-routes</b> command</p> <p><b>Note</b> The <i>default</i> route is set with the <b>configure network ipv4</b> or <b>configure network ipv6</b> command.</p>
Dynamic Routing	Manual removal required.	<b>No support.</b>
HTTP server	No change.	<p><b>No support.</b></p> <p>This setting will no longer work on the merged device, but it is not removed from the Platform Settings. Platform Settings can be used for multiple devices, some of which may not yet be merged.</p>

Legacy Diagnostic Interface Configuration	Merge Behavior	Supported on Management?
ICMP	No change.	<b>No support.</b> This setting will no longer work on the merged device, but it is not removed from the Platform Settings. Platform Settings can be used for multiple devices, some of which may not yet be merged.
Syslog Server	Automatically moved to Management interface.	Yes. The syslog server configuration already has the option to send syslogs out of the Management interface (starting in 6.3). If you had specifically chosen the Diagnostic interface for syslogs, it will be moved to use Management. <b>Note</b> If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices. <b>Note</b> The merged Management interface does not support Secure Syslogs.
SMTP	No change.	<b>No support.</b> The Firewall Threat Defense checks the data routing table only for the SMTP server, so you cannot use the Management interface or any other management-only interfaces. See <a href="#">Routing Table for Management Traffic, on page 1049</a> for more information.
SNMP	Automatically moved to Management interface.	Yes. The SNMP host configuration already has the option to allow SNMP hosts on the Management interface (starting in 6.3). If you had specifically chosen the Diagnostic interface for SNMP, it will be moved to use Management. <b>Note</b> If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices.
RADIUS server	Automatically moved to Management interface.	Yes. If you had specifically chosen the Diagnostic interface, it will be moved to use Management. <b>Note</b> If you specified a route lookup to find the source interface, then the Firewall Threat Defense will no longer be able to send traffic out of a management-only interface; you must explicitly select Management as the source interface. Other management-only interfaces cannot be used.

Legacy Diagnostic Interface Configuration	Merge Behavior	Supported on Management?
AD server	Automatically moved to Management interface.	<p>Yes.</p> <p>If you had specifically chosen the Diagnostic interface, it will be moved to use Management.</p> <p><b>Note</b></p> <p>If you specified a route lookup to find the source interface, then the Firewall Threat Defense will no longer be able to send traffic out of a management-only interface; you must explicitly select Management as the source interface. Other management-only interfaces cannot be used.</p>
DDNS	Manual removal required.	<b>No support.</b>
DHCP server	Manual removal required.	<b>No support.</b>
DNS server	Automatically moved to Management interface.	<p>Yes.</p> <p>If you checked the <b>Enable DNS Lookup via diagnostic interface also</b> check box, then it will be moved to use Management. There is a routing lookup change when you do not choose any interfaces or check the <b>Enable DNS Lookup via diagnostic/management interface also</b> check box: the Firewall Threat Defense uses the data routing table only, and does not fall back to using the management-only routing table. Therefore, you cannot use a management-only interface for DNS other than the Management interface.</p> <p><b>Note</b></p> <p>The Management interface also has a separate DNS lookup setting for its management traffic only. Set at the CLI using the <b>configure network dns</b> command.</p>
FlexConfig	Manual removal required.	<b>No support.</b>

### Before you begin

- To view the current mode of the device, enter the **show management-interface convergence** command at the Firewall Threat Defense CLI. The following output shows that the Management interfaces are merged:

```
> show management-interface convergence
management-interface convergence
>
```

The following output shows that the Management interfaces are not merged:

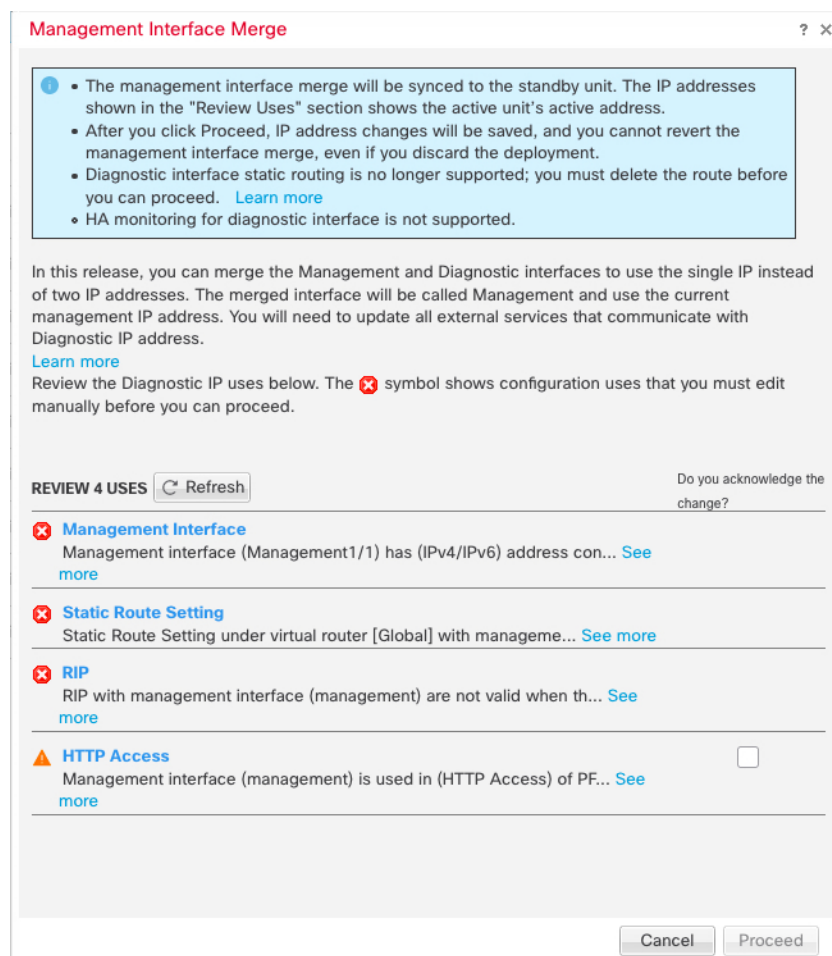

```
> show management-interface convergence
no management-interface convergence
>
```

- For High Availability pairs and clusters, perform this task on the active/control unit. The merged configuration will be replicated automatically to the standby/data units.

## Procedure

- Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) for your Firewall Threat Defense. The **Interfaces** page is selected by default. .
- Step 2** Edit the Diagnostic interface, and remove the IP address.
- You cannot complete the merge until after you have removed the Diagnostic IP address.
- Step 3** Click **Management Interface Merge** in the **Management Interface action needed** area.

The **Management Interface Merge** dialog box shows all the occurrences of the Diagnostic interface in the configuration. For any occurrences that require you to manually remove or change the configuration, they will appear with a warning icon. Platform Settings that will no longer work on your device are marked with a caution icon and require your acknowledgement.

- Step 4** If you need to manually remove or change any listed configurations, do the following.

- a) Click **Cancel** to close the **Management Interface Merge** dialog box.
- b) Navigate to the feature area. You can then delete the item, or choose a data interface instead.
- c) Reopen the **Management Interface Merge** dialog box.

There should no longer be any warnings.

**Step 5** For each configuration caution, click the box in **Do you acknowledge the change?** column, and then click **Proceed**.

**Management Interface Merge** ? x

- The management interface merge will be synced to the standby unit. The IP addresses shown in the "Review Uses" section shows the active unit's active address.
- After you click Proceed, IP address changes will be saved, and you cannot revert the management interface merge, even if you discard the deployment.
- Diagnostic interface static routing is no longer supported; you must delete the route before you can proceed. [Learn more](#)
- HA monitoring for diagnostic interface is not supported.

In this release, you can merge the Management and Diagnostic interfaces to use the single IP instead of two IP addresses. The merged interface will be called Management and use the current management IP address. You will need to update all external services that communicate with Diagnostic IP address.  
[Learn more](#)

Review the Diagnostic IP uses below. The symbol shows configuration uses that you must edit manually before you can proceed.

REVIEW 2 USES	Do you acknowledge the change?
<b>HTTP Access</b> Management interface (management) is used in (HTTP Access) of PF... <a href="#">See more</a>	<input checked="" type="checkbox"/>
<b>ICMP Access</b> Management interface (management) is used in (ICMP Access) of PF... <a href="#">See more</a>	<input checked="" type="checkbox"/>

Cancel Proceed

After the configuration is merged, you see a success banner:

The Management interface merge was saved and is ready to be deployed.  
 Note that you cannot undo the configuration changes related to merge; you must manually reconfigure the Diagnostic interface and related configuration.

**Step 6** Deploy the new merged configuration.

#### Caution

After you deploy the merged configuration, you can unmerge the interfaces from Firewall Management Center; however the Diagnostic interface will have to be reconfigured manually. See [Unmerge the Management Interface, on page 696](#). Also, if you restore a configuration that is unmerged, or roll back to an unmerged configuration, then the device will revert to that unmerged configuration.

After the merge, the Management interface is shown on the **Interfaces** page, although it is read-only.

- Step 7** After the merge, if you had any external services that communicated with the Diagnostic interface, you need to change their configuration to use the Management interface IP address.

For example:

- SNMP client
- RADIUS server—RADIUS servers often verify the IP address for incoming traffic, so you need to change that IP address to the Management address. Moreover, for a High Availability pair, you need to allow both the primary and secondary Management IP addresses; the Diagnostic interface used to support a single "floating" IP address that stayed with the active unit, but Management does not support that functionality.

---

## Unmerge the Management Interface

The Firewall Threat Defense 7.4 and later supports a merged Management and Diagnostic interface. If you need to unmerge your interfaces, perform this procedure. We recommend using unmerged mode temporarily while you migrate your network to a merged mode deployment. Separate Management and Diagnostic interfaces may not be supported in all future releases.

Unmerging the interfaces does not restore your original Diagnostic configuration (if you upgraded and then merged your interfaces). You will need to reconfigure the Diagnostic interface manually. Also, the Management interface will now be named "management"; you cannot rename it "diagnostic."

Alternatively, if you used the Backup function to save an old unmerged configuration, you can restore that configuration or you can use the or Firewall Management Center configuration rollback feature, and the device will be in an unmerged state with the Diagnostic configuration intact.

### Before you begin

- To view the current mode of the device, enter the **show management-interface convergence** command at the Firewall Threat Defense CLI. The following output shows that the Management interfaces are merged:

```
> show management-interface convergence
management-interface convergence
>
```

The following output shows that the Management interfaces are not merged:

```
> show management-interface convergence
no management-interface convergence
>
```

- For High Availability pairs and clusters, perform this task on the active/control unit. The merged configuration will be replicated automatically to the standby/data units.

## Procedure

**Step 1** Choose **Devices > Device Management**, and click **Edit** (✎) for your Firewall Threat Defense. The **Interfaces** page is selected by default. .

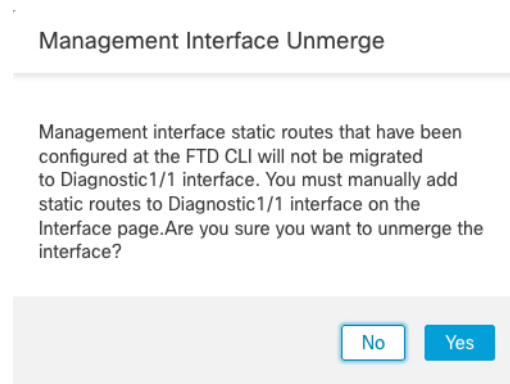

**Step 2** For the Management interface, click **Unmerge Management Interface** (↺).

*Figure 332: Management Interface Selection*

**Step 3** Click **Yes** to confirm that you want to unmerge the interface.

*Figure 333: Unmerge Confirmation*

**Step 4** Deploy the new unmerged configuration.

### Note

If you restore a configuration that is merged, or roll back to a merged configuration, then the device will revert to that merged configuration.

After the merge, the Management interface is no longer shown on the **Interfaces** page.

# History for Interfaces

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Loopback and Management type interface group objects	7.4.0	7.4.0	<p>You can now create interface group objects that include only management-only interfaces or only loopback interfaces. You can then use these groups for management features such as DNS servers, HTTP access, or SSH. Loopback groups are supported for any feature that supports loopback interfaces. Note that DNS does not support management interfaces.</p> <p>New/Modified screens: <b>Objects &gt; Object Management &gt; Interface &gt; Add &gt; Interface Group</b></p>
Merged Management and Diagnostic interfaces	7.4.0	7.4.0	<p>For new devices using 7.4 and later, you cannot use the legacy Diagnostic interface. Only the merged Management interface is available. If you upgraded to 7.4 or later, and you did not have any configuration for the Diagnostic interface, then the interfaces will merge automatically.</p> <p>If you upgraded to 7.4 or later, and you have configuration for the Diagnostic interface, then you have the choice to merge the interfaces manually, or you can continue to use the separate Diagnostic interface. Note that support for the Diagnostic interface will be removed in a later release, so you should plan to merge the interfaces as soon as possible.</p> <p>Merged mode also changes the behavior of AAA traffic to use the data routing table by default. The management-only routing table can now only be used if you specify the management-only interface (including Management) in the configuration.</p> <p>New/Modified screens: <b>Devices &gt; Device Management &gt; Interfaces</b></p> <p>New/Modified commands: <b>show management-interface convergence</b></p>
Default Forward Error Correction (FEC) on Secure Firewall 3100 fixed ports changed to Clause 108 RS-FEC from Clause 74 FC-FEC for 25 GB+ SR, CSR, and LR transceivers	7.2.4	7.2.4	<p>When you set the FEC to Auto on the Secure Firewall 3100 fixed ports, the default type is now set to Clause 108 RS-FEC instead of Clause 74 FC-FEC for 25 GB+ SR, CSR, and LR transceivers.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
LLDP support for the Firepower 2100, Secure Firewall 3100	7.2.0	7.2.0	<p>You can enable Link Layer Discovery Protocol (LLDP) for Firepower 2100 and Secure Firewall 3100 interfaces.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Interfaces &gt; Hardware Configuration &gt; Network Connectivity</b></p> <p>New/Modified commands: <b>show lldp status, show lldp neighbors, show lldp statistics</b></p>
Pause Frames for Flow Control for the Secure Firewall 3100	7.2.0	7.2.0	<p>If you have a traffic burst, dropped packets can occur if the burst exceeds the buffering capacity of the FIFO buffer on the NIC and the receive ring buffers. Enabling pause frames for flow control can alleviate this issue.</p> <p>New/Modified screens: <b>Devices &gt; Device Management &gt; Interfaces &gt; Hardware Configuration &gt; Network Connectivity</b></p>
Support for hot swapping the network module for the Secure Firewall 3100	7.1.0	7.1.0	<p>You can add or remove the network module on the Secure Firewall 3100 while the firewall is powered up. To replace a module with another module of the same type, you do not need to reboot. After initial bootup, adding a module, permanently removing a module, or replacing a module with a new type requires a reboot.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Chassis Operations</b></p>

## Configure Firepower 1010 Switch Ports

You can configure each Firepower 1010 interface to run as a regular firewall interface or as a Layer 2 hardware switch port. This section includes tasks for starting your switch port configuration, including enabling or

disabling the switch mode and creating VLAN interfaces and assigning them to switch ports. This section also describes how to customize Power over Ethernet (PoE) on supported interfaces.

## About Switch Ports

This section describes the switch ports of Firepower 1010, and .

### Understanding Switch Ports and Interfaces

#### Ports and Interfaces

For each physical 1010 interface, you can set its operation as a firewall interface or as a switch port. See the following information about physical interface and port types as well as logical VLAN interfaces to which you assign switch ports:

- **Physical firewall interface**—In routed mode, these interfaces forward traffic between networks at Layer 3, using the configured security policy to apply firewall and VPN services. In transparent mode, these interfaces are bridge group members that forward traffic between the interfaces on the same network at Layer 2, using the configured security policy to apply firewall services. In routed mode, you can also use Integrated Routing and Bridging with some interfaces as bridge group members and others as Layer 3 interfaces. By default, the Ethernet 1/1 interface is configured as a firewall interface. You can also configure these interfaces to be IPS-only (inline sets and passive interfaces).
- **Physical switch port**—Switch ports forward traffic at Layer 2, using the switching function in hardware. Switch ports on the same VLAN can communicate with each other using hardware switching, and traffic is not subject to the Firewall Threat Defense security policy. Access ports accept only untagged traffic, and you can assign them to a single VLAN. Trunk ports accept untagged and tagged traffic, and can belong to more than one VLAN. By default, Ethernet 1/2 through 1/8 are configured as access switch ports on VLAN 1. You cannot configure the Management interface as a switch port.
- **Logical VLAN interface**—These interfaces operate the same as physical firewall interfaces, with the exception being that you cannot create subinterfaces, IPS-only interfaces (inline sets and passive interfaces), or EtherChannel interfaces. When a switch port needs to communicate with another network, then the Firewall Threat Defense device applies the security policy to the VLAN interface and routes to another logical VLAN interface or firewall interface. You can even use Integrated Routing and Bridging with VLAN interfaces as bridge group members. Traffic between switch ports on the same VLAN are not subject to the Firewall Threat Defense security policy, but traffic between VLANs in a bridge group are subject to the security policy, so you may choose to layer bridge groups and switch ports to enforce the security policy between certain segments.

#### Power Over Ethernet

PoE is available on Ethernet 1/7 and Ethernet 1/8 using IEEE 802.3af (PoE) and 802.3at (PoE+) up to 30 watts per port.

---

**Note** PoE is not supported on the 1010E.

---

PoE+ uses Link Layer Discovery Protocol (LLDP) to negotiate the power level. Power is only supplied when needed.

If you shut down the interface, then you disable power to the device.

## Auto-MDI/MDIX Feature

For all switch ports, the default auto-negotiation setting also includes the Auto-MDI/MDIX feature. Auto-MDI/MDIX eliminates the need for crossover cabling by performing an internal crossover when a straight cable is detected during the auto-negotiation phase. Either the speed or duplex must be set to auto-negotiate to enable Auto-MDI/MDIX for the interface. If you explicitly set both the speed and duplex to a fixed value, thus disabling auto-negotiation for both settings, then Auto-MDI/MDIX is also disabled. When the speed and duplex are set to 1000 and full, then the interface always auto-negotiates; therefore Auto-MDI/MDIX is always enabled and you cannot disable it.

## Guidelines and Limitations for Switch Ports

### High Availability and Clustering

- No cluster support.
- You should not use the switch port functionality when using High Availability. Because the switch ports operate in hardware, they continue to pass traffic on both the active *and* the standby units. High Availability is designed to prevent traffic from passing through the standby unit, but this feature does not extend to switch ports. In a normal High Availability network setup, active switch ports on both units will lead to network loops. We suggest that you use external switches for any switching capability. Note that VLAN interfaces can be monitored by failover, while switch ports cannot. Theoretically, you can put a single switch port on a VLAN and successfully use High Availability, but a simpler setup is to use physical firewall interfaces instead.
- You can only use a firewall interface as the failover link.

### Logical VLAN Interfaces (SVIs)

- You can create up to 60 VLAN interfaces.
- If you also use VLAN subinterfaces on a firewall interface, you cannot use the same VLAN ID as for a logical VLAN interface.
- MAC Addresses:
  - Routed firewall mode—All VLAN interfaces share a MAC address. Ensure that any connected switches can support this scenario. If the connected switches require unique MAC addresses, you can manually assign MAC addresses. See [Configure the MAC Address, on page 764](#).
  - Transparent firewall mode—Each VLAN interface has a unique MAC address. You can override the generated MAC addresses if desired by manually assigning MAC addresses. See [Configure the MAC Address, on page 764](#).

### Bridge Groups

You cannot mix logical VLAN interfaces and physical firewall interfaces in the same bridge group.

### VLAN Interface and Switch Port Unsupported Features

VLAN interfaces and switch ports do not support:

- Dynamic routing
- Multicast routing
- Equal-Cost Multi-Path routing (ECMP)
- Inline sets or Passive interfaces
- EtherChannels—Switch ports cannot be part of an EtherChannel. PoE is also not supported on a port in an EtherChannel.
- Failover and state link
- Security group tagging (SGT)

### Other Guidelines and Limitations

- You can configure a maximum of 60 named interfaces on the Firepower 1010.
- You cannot configure the Management interface as a switch port.

### Default Settings

- Ethernet 1/1 is a firewall interface.
- Ethernet 1/2 through Ethernet 1/8 are switch ports assigned to VLAN 1.
- Default Speed and Duplex—By default, the speed and duplex are set to auto-negotiate.

## Configure Switch Ports and Power Over Ethernet

To configure switch ports and PoE, complete the following tasks.

### Enable or Disable Switch Port Mode

You can set each interface independently to be either a firewall interface or a switch port. By default, Ethernet 1/1 is a firewall interface, and the remaining Ethernet interfaces are configured as switch ports.

#### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Set the switch port mode by clicking the slider in the **SwitchPort** column so it shows as **Slider enabled** () or **Slider disabled** (.
- By default, switch ports are set to access mode in VLAN 1. You must manually add a logical VLAN 1 interface (or whichever VLAN you set for these switch ports) for traffic to be routed and to participate in the Firewall

Threat Defense security policy (see [Configure a VLAN Interface, on page 705](#)). You cannot set the Management interface to switch port mode. When you change the switch port mode, all unsupported configuration is removed:

In addition, the interface is disabled if it was already enabled. Be sure to reenable the interface.

---

## Configure a VLAN Interface

This section describes how to configure VLAN interfaces for use with associated switch ports. By default, switch ports are assigned to VLAN1; however, you must manually add the logical VLAN1 interface (or whichever VLAN you set for these switch ports) for traffic to be routed and to participate in the Firewall Threat Defense security policy.

### Procedure

---

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Add Interfaces > VLAN Interface**.
- Step 3** On **General**, set the following VLAN-specific parameters:

Add VLAN Interface

General
IPv4
IPv6
Advanced

Name:

☒ Enabled

Description:

Mode:

Security Zone:

MTU:  
  
(64 - 9198)

Priority:  
 (0 - 65535)

VLAN ID \*:  
  
(1 - 4070)

Disable Forwarding  
on Interface Vlan:

Associated Interface	Port Mode
No records to display	

Cancel
OK

If you are editing an existing VLAN interface, the **Associated Interface** table shows switch ports on this VLAN.

- Set the **VLAN ID**, between 1 and 4070, excluding IDs in the range 3968 to 4047, which are reserved for internal use.

You cannot change the VLAN ID after you save the interface; the VLAN ID is both the VLAN tag used, and the interface ID in your configuration.

- (Optional) Choose a VLAN ID for **Disable Forwarding on Interface VLAN** to disable forwarding to another VLAN.

For example, you have one VLAN assigned to the outside for internet access, one VLAN assigned to an inside business network, and a third VLAN assigned to your home network. The home network does not need to access the business network, so you can disable forwarding on the home VLAN; the business network can access the home network, but the home network cannot access the business network.

- Step 4** To complete the interface configuration, see one of the following procedures:
- [Configure Routed Mode Interfaces, on page 738](#)
  - [Configure General Bridge Group Member Interface Parameters, on page 743](#)

**Step 5** Click **OK**.

**Step 6** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure Switch Ports as Access Ports

To assign a switch port to a single VLAN, configure it as an access port. Access ports accept only untagged traffic. By default, Ethernet 1/2 through Ethernet 1/8 switch ports are enabled and assigned to VLAN 1.

**Note** The device does not support Spanning Tree Protocol for loop detection in the network. Therefore you must ensure that any connection with the Firewall Threat Defense does not end up in a network loop.

---

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.

Figure 334: Edit Physical Interface

**Edit Physical Interface**

General Hardware Configuration

Interface ID:  
Ethernet1/2

☐ Enabled

Description:

Port Mode:  
Access ▼

VLAN ID:  
  
(1 - 4070)

Protected:  
☐

**Step 3** Enable the interface by checking the **Enabled** check box.

**Step 4** (Optional) Add a description in the **Description** field.

The description can be up to 200 characters on a single line, without carriage returns.

**Step 5** Set the **Port Mode** to **Access**.

**Step 6** In the **VLAN ID** field, set the VLAN for this switch port, between 1 and 4070.

The default VLAN ID is 1.

**Step 7** (Optional) Check the **Protected** check box to set this switch port as protected, so you can prevent the switch port from communicating with other protected switch ports on the same VLAN.

You might want to prevent switch ports from communicating with each other if: the devices on those switch ports are primarily accessed from other VLANs; you do not need to allow intra-VLAN access; and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three web servers, you can isolate the web servers from each other if you enable **Protected** on each switch port. The inside and outside networks can both communicate with all three web servers, and vice versa, but the web servers cannot communicate with each other.

**Step 8** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.

**Figure 335: Hardware Configuration**

The screenshot shows the 'Edit Physical Interface' configuration window. The 'Hardware Configuration' tab is selected. Under the 'Speed' section, the 'Duplex' dropdown is set to 'full' and the 'Speed' dropdown is set to '1gbps'. The 'Auto-negotiation' checkbox is checked.

Check the **Auto-negotiation** check box (the default) to auto-detect the speed and duplex. If you uncheck it, you can set the speed and duplex manually:

- **Duplex**—Choose **Full** or **Half**.
- **Speed**—Choose **10mbps**, **100mbps**, or **1gbps**.

**Step 9** Click **OK**.

**Step 10** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Switch Ports as Trunk Ports

This procedure describes how to create a trunk port that can carry multiple VLANs using 802.1Q tagging. Trunk ports accept untagged and tagged traffic. Traffic on allowed VLANs pass through the trunk port unchanged.

When the trunk receives untagged traffic, it tags it to the native VLAN ID so that the Firewall Threat Defense device can forward the traffic to the correct switch ports, or can route it to another firewall interface. When the Firewall Threat Defense device sends native VLAN ID traffic out of the trunk port, it removes the VLAN tag. Be sure to set the same native VLAN on the trunk port on the other switch so that the untagged traffic will be tagged to the same VLAN.

### Procedure

**Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

**Step 2** Click **Edit** (✎) for the interface you want to edit.

**Figure 336: Set Trunk Port Mode**

Edit Physical Interface

General Hardware Configuration

Interface ID:  
Ethernet1/2

☐ Enabled

Description:

Port Mode:  
Trunk ▼

Native VLAN ID:  
1  
(1 - 4070)

Allowed VLAN IDs:  
100,200,300  
(1 - 4070)

Protected:  
☐

**Step 3** Enable the interface by checking the **Enabled** check box.

**Step 4** (Optional) Add a description in the **Description** field.

The description can be up to 200 characters on a single line, without carriage returns.

**Step 5** Set the **Port Mode** to **Trunk**.

**Step 6** In the **Native VLAN ID** field, set the native VLAN for this switch port, between 1 and 4070.

The default native VLAN ID is 1.

Each port can only have one native VLAN, but every port can have either the same or a different native VLAN.

**Step 7** In the **Allowed VLAN IDs** field, enter the VLANs for this trunk port between 1 and 4070.

You can identify up to 20 IDs in one of the following ways:

- A single number (n)
- A range (n-x)
- Numbers and ranges separated by commas, for example:

5,7-10,13,45-100

You can enter spaces instead of commas.

If you include the native VLAN in this field, it is ignored; the trunk port always removes the VLAN tagging when sending native VLAN traffic out of the port. Moreover, it will not receive traffic that still has native VLAN tagging.

**Step 8** (Optional) Check the **Protected** check box to set this switch port as protected, so you can prevent the switch port from communicating with other protected switch ports on the same VLAN.

You might want to prevent switch ports from communicating with each other if: the devices on those switch ports are primarily accessed from other VLANs; you do not need to allow intra-VLAN access; and you want to isolate the devices from each other in case of infection or other security breach. For example, if you have a DMZ that hosts three web servers, you can isolate the web servers from each other if you enable **Protected** on each switch port. The inside and outside networks can both communicate with all three web servers, and vice versa, but the web servers cannot communicate with each other.

**Step 9** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.

The screenshot shows a window titled "Edit Physical Interface" with a "Hardware Configuration" tab selected. Under "Duplex:", the dropdown menu is set to "auto". Under "Speed:", the dropdown menu is also set to "auto". The "Auto-negotiation:" checkbox is checked with a blue square. At the bottom right, there are "OK" and "Cancel" buttons.

Check the **Auto-negotiation** check box (the default) to auto-detect the speed and duplex. If you uncheck it, you can set the speed and duplex manually:

- **Duplex**—Choose **Full** or **Half**.
- **Speed**—Choose **10mbps**, **100mbps**, or **1gbps**.

**Step 10** Click **OK**.

**Step 11** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Power Over Ethernet

Power over Ethernet (PoE) ports provide power for devices such as IP phones or wireless access points. PoE is enabled by default. This procedure describes how to disable and enable PoE and how to set optional parameters.

### Procedure

**Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

**Step 2** Click **Edit** (✎) for Ethernet1/7 or 1/8.

**Step 3** Click **PoE**.

*Figure 337: PoE*

Edit Physical Interface

General PoE Hardware Configuration

Enable PoE: ☒

Auto Negotiate ☒

Consumption Wattage:  (4000 - 30000)mW

**Step 4** Check the **Enable PoE** check box.

PoE is enabled by default.

**Step 5** Choose autonegotiation or manual power.

- **Auto Negotiate Consumption Wattage**—Delivers power automatically to the powered device using a wattage appropriate to the class of the powered device. The firewall uses LLDP to further negotiate the correct wattage. When you connect a device of a certain class, it will be provisioned up to the maximum for that class in case it ever needs to use more power. For example, if you add a class 4 device that requests 12.95W, it will be allocated 30W even if it doesn't currently use all that power. Some devices can renegotiate power needs. If you know your device needs less power than is allocated, you can instead set the **Consumption Wattage** manually to free up the power for other devices.
- **Consumption Wattage**—Uncheck the **Auto Negotiate Consumption Wattage** check box to set the manual wattage to manually specify the wattage in milliwatts, from 4000 to 30000. Use this option if you want to set the watts manually and disable LLDP negotiation. For manual allocation, the class will show in **show power inline** output as **n/a** because the class is not used to decide the power consumption.

View the current PoE status using the **show power inline** command.

**Step 6** Click **OK**.

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Loopback Interfaces

This section tells how to configure loopback interfaces.

### About Loopback Interfaces

A loopback interface is a software-only interface that emulates a physical interface. This interface is reachable on IPv4 and IPv6 through multiple physical interfaces. The loopback interface helps to overcome path failures;

it is accessible from any physical interface, so if one goes down, you can access the loopback interface from another.

Loopback interfaces can be used for:

- AAA
- BGP
- DNS
- HTTP
- ICMP
- IPsec flow offload—Secure Firewall 3100 and 4200 only
- NetFlow
- SNMP
- SSH
- Static and dynamic VTI tunnels
- Syslog

The Firewall Threat Defense can distribute the loopback address using dynamic routing protocols, or you can configure a static route on the peer device to reach the loopback IP address through one of the Firewall Threat Defense's physical interfaces. You cannot configure a static route on the Firewall Threat Defense that specifies the loopback interface.

#### Related Topics

[Guidelines and Limitations for Loopback Interfaces](#), on page 713

[Configure a Loopback Interface](#), on page 713

## Guidelines and Limitations for Loopback Interfaces

### Firewall Mode

- Supported in routed mode only.

### High Availability and Clustering

- No clustering support.

### Additional Guidelines and Limitations

- TCP sequence randomization is always disabled for traffic from the physical interface to the loopback interface.

## Configure a Loopback Interface

To add a loopback interface for a device:

## Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** From the **Add Interfaces** drop-down list, choose **Loopback Interface**.
- Step 3** In the **General** tab, configure the following parameters:
- Name**—Enter a name for the loopback interface.
  - Enabled**—Check the check box to enable the loopback interface.
  - Loopback ID**—Enter the loopback ID between 1 to 1024.
  - Description**—Enter a description for the loopback interface.
- Step 4** Configure the routed mode interface parameters. See [Configure Routed Mode Interfaces, on page 738](#).
- 

# Rate-Limit Traffic to the Loopback Interface

## Before you begin

You should rate-limit traffic going to the loopback interface IP address to prevent excessive load on the system. You can add a connection limit rule to the global service policy.

## Procedure

- 
- Step 1** Create an extended access list identifying traffic to the loopback interface IP address(es).
- Choose **Objects > Object Management > Access List > Extended**.
  - Click **Add Extended Access List** to create a new ACL.
  - In the **New Extended Access List Object** dialog box, enter a name for the ACL (no spaces allowed), and click **Add** to create a new entry.

**Figure 338: Name ACL and Add Entry**

New Extended Access List Object

☒ Global

☐ Select Interface Objects

**Step 7** In the **Traffic Flow** step, select the extended access list object you created in [Step 1, on page 714](#), and then click **Next**.

Figure 345: Choose Extended Access List

Threat Defense Service Policy

1 Interface Object — 2 Traffic Flow —

Extended Access List:

rate-limiting

**Step 8** In the **Connection Setting** step, set the **Connections** limits.

Figure 346: Set Connection Limits

Threat Defense Service Policy

1 Interface Object — 2 Traffic Flow — 3 Connection Setting

☐ Enable TCP State Bypass ☒ Randomize TCP Sequence Number ☐ Enable Decrement TTL

Connections:	Maximum TCP & UDP 24	Maximum Embryonic 12
Connections Per Client:	Maximum TCP & UDP 0	Maximum Embryonic 0

Set the **Maximum TCP & UDP** connections to the expected number of connections for the loopback interface, and the **Maximum Embryonic** connections to a lower number. For example, you can set it to 5/2, or 10/5, or 1024/512, depending on the expected loopback interface sessions you need.

Setting the embryonic connection limit enables TCP Intercept, which protects the system from a DoS attack perpetrated by flooding an interface with TCP SYN packets.

- Step 9** Click **Finish** to save your changes.
- Step 10** Click **OK**.
- Step 11** Click **Save** on the **Advanced Settings** window.
- Step 12** You can now deploy the changes to the affected devices.

## Configure VLAN Subinterfaces and 802.1Q Trunking

VLAN subinterfaces let you divide a physical, redundant, or EtherChannel interface into multiple logical interfaces that are tagged with different VLAN IDs. An interface with one or more VLAN subinterfaces is automatically configured as an 802.1Q trunk. Because VLANs let you keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or devices.

## Guidelines and Limitations for VLAN Subinterfaces

### Model Support

- Firepower 1010—VLAN subinterfaces are not supported on switch ports or VLAN interfaces.

### High Availability and Clustering

You cannot use a subinterface for the failover or state link or for the cluster control link. The exception is for multi-instance mode: you can use a *chassis*-defined subinterface for these links.

### Additional Guidelines

- Preventing untagged packets on the physical interface—If you use subinterfaces, you typically do not also want the physical interface to pass traffic, because the physical interface passes untagged packets. This property is also true for the active physical interface in a redundant interface pair and for EtherChannel links. Because the physical, redundant, or EtherChannel interface must be enabled for the subinterface to pass traffic, ensure that the physical, redundant, or EtherChannel interface does not pass traffic by not configuring a name for the interface. If you want to let the physical, redundant, or EtherChannel interface pass untagged packets, you can configure the name as usual.
- You cannot configure subinterfaces on the Management interface, either the dedicated Management interface configured at the CLI nor a data interface used for manager access.
- All subinterfaces on the same parent interface must be either bridge group members or routed interfaces; you cannot mix and match.
- The Firewall Threat Defense does not support the Dynamic Trunking Protocol (DTP), so you must configure the connected switch port to trunk unconditionally.
- You might want to assign unique MAC addresses to subinterfaces defined on the Firewall Threat Defense, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the Firewall Threat Defense.

**Note** If you manually assign a MAC address, be sure to assign MAC addresses to all subinterfaces on the same physical interface to avoid unexpected behavior and outages.

## Maximum Number of VLAN Subinterfaces by Device Model

The device model limits the maximum number of VLAN subinterfaces that you can configure. Note that you can configure subinterfaces on data interfaces only, you cannot configure them on the management interface.

The following table explains the limits for each device model.

Model	Maximum VLAN Subinterfaces
Firepower 1010	60
Firepower 1120	512
Firepower 1140, 1150	1024
Firepower 2100	1024
Secure Firewall 3100, 4200	1024
Firepower 4100	1024
Firepower 9300	1024

Model	Maximum VLAN Subinterfaces
Firewall Threat Defense Virtual	50
ISA 3000	100

## Add a Subinterface

Add one or more subinterfaces to a physical, redundant, or port-channel interface.

For the Firepower 4100/9300, you can configure subinterfaces in FXOS for use with container instances; see [Add a VLAN Subinterface for Container Instances, on page 259](#). These subinterfaces appear in the Firewall Management Center interface list. You can also add subinterfaces in Firewall Management Center, but only on parent interfaces that do not already have subinterfaces defined in FXOS.

**Note** The parent physical interface passes untagged packets. You may not want to pass untagged packets, so be sure not to include the parent interface in your security policy.

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Enable the parent interface according to [Enable the Physical Interface and Configure Ethernet Settings, on page 662](#).
- Step 3** Click **Add Interfaces > Sub Interface**.
- Step 4** On **General**, set the following parameters:

**Figure 347: Add Subinterface**

**Add Sub Interface**

General IPv4 IPv6 Path Monitoring Advanced

Name:  
inside-100

☒ Enabled  
☐ Management Only

Description:

Security Zone:  
inside\_zone

MTU:  
1500  
(64 - 9198)

Priority:  
0  
(0 - 65535)

Propagate Security Group Tag: ☐

Interface \*:  
Ethernet1/1

☒ Enabled

Sub-Interface ID \*:  
100  
(1 - 4294967295)

VLAN ID:  
100  
(1 - 4094)

Cancel OK

- Interface**—Choose the physical, redundant, or port-channel interface to which you want to add the subinterface.
- Sub-Interface ID**—Enter the subinterface ID as an integer between 1 and 4294967295. The number of subinterfaces allowed depends on your platform. You cannot change the ID after you set it.
- VLAN ID**—Enter the VLAN ID between 1 and 4094 that will be used to tag the packets on this subinterface.

This VLAN ID must be unique.

**Step 5** Click **OK**.

**Step 6** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

- Step 7** Configure the routed or transparent mode interface parameters. See [Configure Routed Mode Interfaces, on page 738](#) or [Configure Bridge Group Interfaces, on page 743](#).
- 

## Configure VXLAN Interfaces

This chapter tells how to configure Virtual eXtensible LAN (VXLAN) interfaces. VXLAN interfaces act as Layer 2 virtual networks over Layer 3 physical networks to stretch Layer 2 networks.

### About VXLAN Interfaces

VXLAN provides the same Ethernet Layer 2 network services as VLAN does, but with greater extensibility and flexibility. Compared to VLAN, VXLAN offers the following benefits:

- Flexible placement of multitenant segments throughout the data center.
- Higher scalability to address more Layer 2 segments: up to 16 million VXLAN segments.

This section describes how VXLAN works. For detailed information about VXLAN, see RFC 7348. For detailed information about Geneve, see RFC 8926.

### Encapsulation

The Firewall Threat Defense supports two types of VXLAN encapsulation:

- **VXLAN (all models)**—VXLAN uses MAC Address-in-User Datagram Protocol (MAC-in-UDP) encapsulation. The original Layer 2 frame has a VXLAN header added and is then placed in a UDP-IP packet.
- **Geneve (Firewall Threat Defense Virtual only)**—Geneve has a flexible inner header that is not limited to the MAC address. Geneve encapsulation is required for transparent routing of packets between an Amazon Web Services (AWS) Gateway Load Balancer and appliances, and for sending extra information.

### VXLAN Tunnel Endpoint

VXLAN tunnel endpoint (VTEP) devices perform VXLAN encapsulation and decapsulation. Each VTEP has two interface types: one or more virtual interfaces called VXLAN Network Identifier (VNI) interfaces to which you apply your security policy, and a regular interface called the VTEP source interface that tunnels the VNI interfaces between VTEPs. The VTEP source interface is attached to the transport IP network for VTEP-to-VTEP communication.

The following figure shows two Firewall Threat Defenses and Virtual Server 2 acting as VTEPs across a Layer 3 network, extending the VNI 1, 2, and 3 networks between sites. The Firewall Threat Defenses act as bridges or gateways between VXLAN and non-VXLAN networks.

The underlying IP network between VTEPs is independent of the VXLAN overlay. Encapsulated packets are routed based on the outer IP address header, which has the initiating VTEP as the source IP address and the terminating VTEP as the destination IP address. For VXLAN encapsulation: The destination IP address can be a multicast group when the remote VTEP is not known. With Geneve, the Firewall Threat Defense only supports static peers. The destination port for VXLAN is UDP port 4789 by default (user configurable). The destination port for Geneve is 6081.

## VTEP Source Interface

The VTEP source interface is a regular interface (physical, EtherChannel, or even VLAN) with which you plan to associate all VNI interfaces. You can configure one VTEP source interface per Firewall Threat Defense Virtual. Because you can only configure one VTEP source interface, you cannot configure both VXLAN and Geneve interfaces on the same device. There is an exception for Firewall Threat Defense Virtual clustering on AWS or Azure, where you can have two VTEP source interfaces: a VXLAN interface is used for the cluster control link, and a Geneve (AWS) or VXLAN (Azure) interface can be used for the Gateway Load Balancer.

The VTEP source interface can be devoted wholly to VXLAN traffic, although it is not restricted to that use. If desired, you can use the interface for regular traffic and apply a security policy to the interface for that traffic. For VXLAN traffic, however, all security policy must be applied to the VNI interfaces. The VTEP interface serves as a physical port only.

In transparent firewall mode, the VTEP source interface is not part of a BVI, and you do configure an IP address for it, similar to the way the management interface is treated.

## VNI Interfaces

VNI interfaces are similar to VLAN interfaces: they are virtual interfaces that keep network traffic separated on a given physical interface by using tagging. You apply your security policy directly to each VNI interface.

You can only add one VTEP interface, and all VNI interfaces are associated with the same VTEP interface. There is an exception for Firewall Threat Defense Virtual clustering on AWS or Azure. For AWS clustering, you can have two VTEP source interfaces: a VXLAN interface is used for the cluster control link, and a Geneve interface can be used for the AWS Gateway Load Balancer. For Azure clustering, you can have two VTEP source interfaces: a VXLAN interface is used for the cluster control link, and a second VXLAN interface can be used for the Azure Gateway Load Balancer.

## VXLAN Packet Processing

### VXLAN

Traffic entering and exiting the VTEP source interface is subject to VXLAN processing, specifically encapsulation or decapsulation.

Encapsulation processing includes the following tasks:

- The VTEP source interface encapsulates the inner MAC frame with the VXLAN header.
- The UDP checksum field is set to zero.
- The Outer frame source IP is set to the VTEP interface IP.
- The Outer frame destination IP is decided by a remote VTEP IP lookup.

Decapsulation; the Firewall Threat Defense only decapsulates a VXLAN packet if:

- It is a UDP packet with the destination port set to 4789 (this value is user configurable).
- The ingress interface is the VTEP source interface.
- The ingress interface IP address is the same as the destination IP address.
- The VXLAN packet format is compliant with the standard.

### Geneve

Traffic entering and exiting the VTEP source interface is subject to Geneve processing, specifically encapsulation or decapsulation.

Encapsulation processing includes the following tasks:

- The VTEP source interface encapsulates the inner MAC frame with the Geneve header.
- The UDP checksum field is set to zero.
- The Outer frame source IP is set to the VTEP interface IP.
- The Outer frame destination IP is set the peer IP address that you configured.

Decapsulation; the Firewall Threat Defense only decapsulates a Geneve packet if:

- It is a UDP packet with the destination port set to 6081 (this value is user configurable).
- The ingress interface is the VTEP source interface.
- The ingress interface IP address is the same as the destination IP address.
- The Geneve packet format is compliant with the standard.

## Peer VTEPs

When the Firewall Threat Defense sends a packet to a device behind a peer VTEP, the Firewall Threat Defense needs two important pieces of information:

- The destination MAC address of the remote device

- The destination IP address of the peer VTEP

The Firewall Threat Defense maintains a mapping of destination MAC addresses to remote VTEP IP addresses for the VNI interfaces.

### VXLAN Peer

There are two ways in which the Firewall Threat Defense can find this information:

- A single peer VTEP IP address can be statically configured on the Firewall Threat Defense.

For IPv4: The Firewall Threat Defense then sends a VXLAN-encapsulated ARP broadcast to the VTEP to learn the end node MAC address.

For IPv6: The Firewall Threat Defense then sends an IPv6 Neighbor Solicitation message to the IPv6 solicited-node multicast address. The peer VTEP responds with an IPv6 Neighbor Advertisement message with its link-local address.

- A group of peer VTEP IP addresses can be statically configured on the Firewall Threat Defense.

For IPv4: The Firewall Threat Defense then sends a VXLAN-encapsulated ARP broadcast to the VTEP to learn the end node MAC addresses.

For IPv6: The Firewall Threat Defense then sends an IPv6 Neighbor Solicitation message to the IPv6 solicited-node multicast address. The peer VTEP responds with an IPv6 Neighbor Advertisement message with its link-local address.

- A multicast group can be configured on each VNI interface (or on the VTEP as a whole).

For IPv4: The Firewall Threat Defense sends a VXLAN-encapsulated ARP broadcast packet within an IP multicast packet through the VTEP source interface. The response to this ARP request enables the Firewall Threat Defense to learn both the remote VTEP IP address along with the destination MAC address of the remote end node.

For IPv6: The Firewall Threat Defense sends a Multicast Listener Discovery (MLD) Report message through the VTEP source interface to indicate that the Firewall Threat Defense is listening on the VTEP interface for the multicast address traffic.

This option is not supported with Geneve.

### Geneve Peer

The Firewall Threat Defense Virtual only supports statically defined peers. You can define the Firewall Threat Defense Virtual peer IP address on the AWS Gateway Load Balancer. Because the Firewall Threat Defense Virtual never initiates traffic to the Gateway Load Balancer, you do not also have to specify the Gateway Load Balancer IP address on the Firewall Threat Defense Virtual; it learns the peer IP address when it receives Geneve traffic. Multicast groups are not supported with Geneve.

## VXLAN Use Cases

This section describes the use cases for implementing VXLAN on the Firewall Threat Defense.

### VXLAN Bridge or Gateway Overview

Each Firewall Threat Defense VTEP acts as a bridge or gateway between end nodes such as VMs, servers, and PCs and the VXLAN overlay network. For incoming frames received with VXLAN encapsulation over the VTEP source interface, the Firewall Threat Defense strips out the VXLAN header and forwards it to a

physical interface connected to a non-VXLAN network based on the destination MAC address of the inner Ethernet frame.

The Firewall Threat Defense always processes VXLAN packets; it does not just forward VXLAN packets untouched between two other VTEPs.

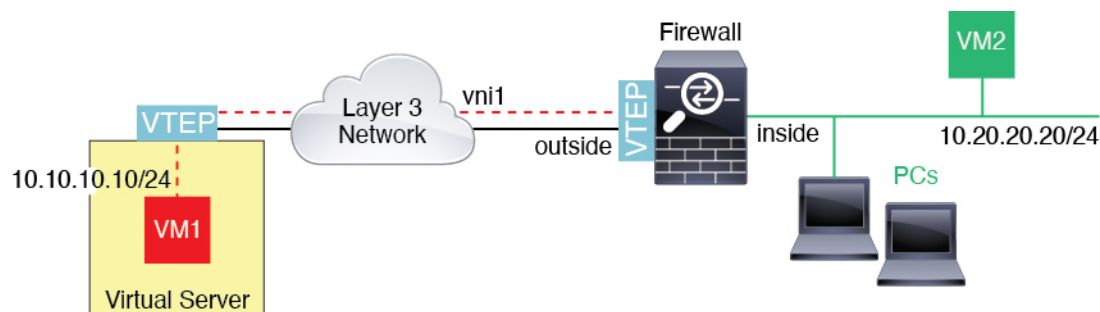

## VXLAN Bridge

When you use a bridge group (transparent firewall mode, or optionally routed mode), the Firewall Threat Defense can serve as a VXLAN bridge between a (remote) VXLAN segment and a local segment where both are in the same network. In this case, one member of the bridge group is a regular interface while the other member is a VNI interface.

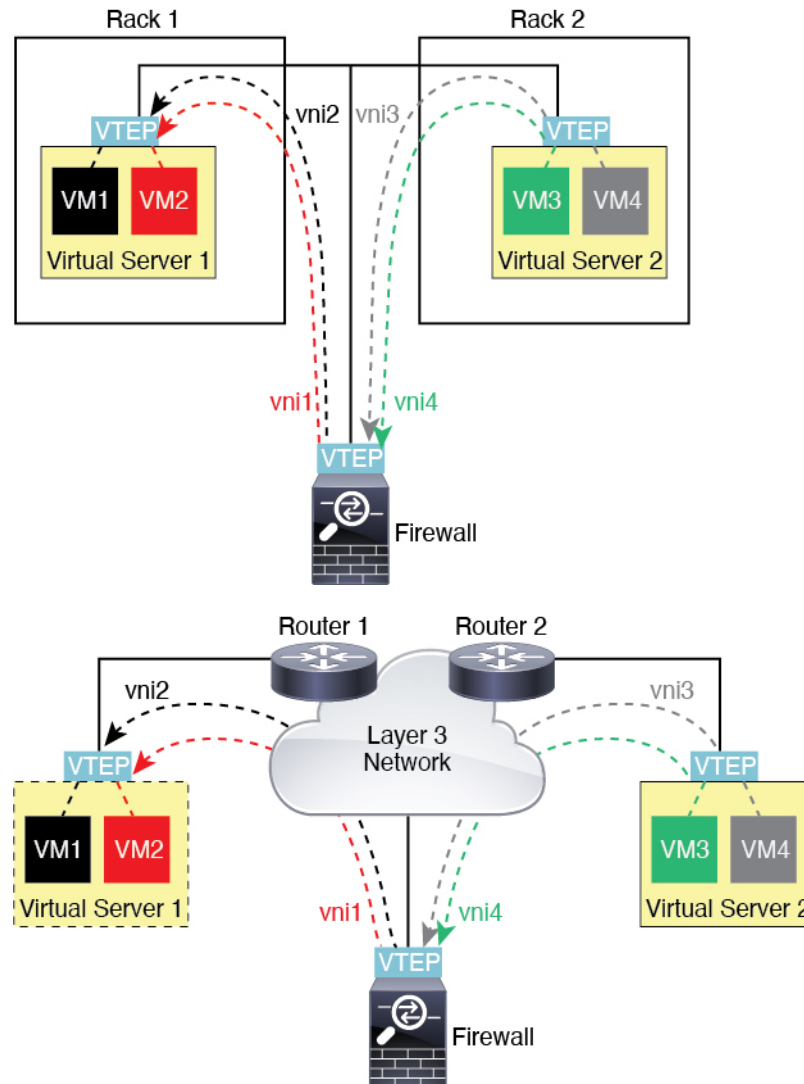

## VXLAN Gateway (Routed Mode)

The Firewall Threat Defense can serve as a router between VXLAN and non-VXLAN domains, connecting devices on different networks.

## Router Between VXLAN Domains

With a VXLAN-stretched Layer 2 domain, a VM can point to an Firewall Threat Defense as its gateway while the Firewall Threat Defense is not on the same rack, or even when the Firewall Threat Defense is far away over the Layer 3 network.

See the following notes about this scenario:

1. For packets from VM3 to VM1, the destination MAC address is the Firewall Threat Defense MAC address, because the Firewall Threat Defense is the default gateway.
2. The VTEP source interface on Virtual Server 2 receives packets from VM3, then encapsulates the packets with VNI 3's VXLAN tag and sends them to the Firewall Threat Defense.
3. When the Firewall Threat Defense receives the packets, it decapsulates the packets to get the inner frames.
4. The Firewall Threat Defense uses the inner frames for route lookup, then finds that the destination is on VNI 2. If it does not already have a mapping for VM1, the Firewall Threat Defense sends an encapsulated ARP broadcast on the multicast group IP on VNI 2.

**Note** The Firewall Threat Defense must use dynamic VTEP peer discovery because it has multiple VTEP peers in this scenario.

5. The Firewall Threat Defense encapsulates the packets again with the VXLAN tag for VNI 2 and sends the packets to Virtual Server 1. Before encapsulation, the Firewall Threat Defense changes the inner frame destination MAC address to be the MAC of VM1 (multicast-encapsulated ARP might be needed for the Firewall Threat Defense to learn the VM1 MAC address).
6. When Virtual Server 1 receives the VXLAN packets, it decapsulates the packets and delivers the inner frames to VM1.

## Geneve Single-Arm Proxy

**Note** This use case is the only currently supported use case for Geneve interfaces.

The AWS Gateway Load Balancer combines a transparent network gateway and a load balancer that distributes traffic and scales virtual appliances on demand. The Firewall Threat Defense Virtual supports the Gateway Load Balancer centralized control plane with a distributed data plane (Gateway Load Balancer endpoint). The following figure shows traffic forwarded to the Gateway Load Balancer from the Gateway Load Balancer endpoint. The Gateway Load Balancer balances traffic among multiple Firewall Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the Gateway Load Balancer (U-turn traffic). The Gateway Load Balancer then sends the traffic back to the Gateway Load Balancer endpoint and to the destination.

**Figure 348: Geneve Single-Arm Proxy**

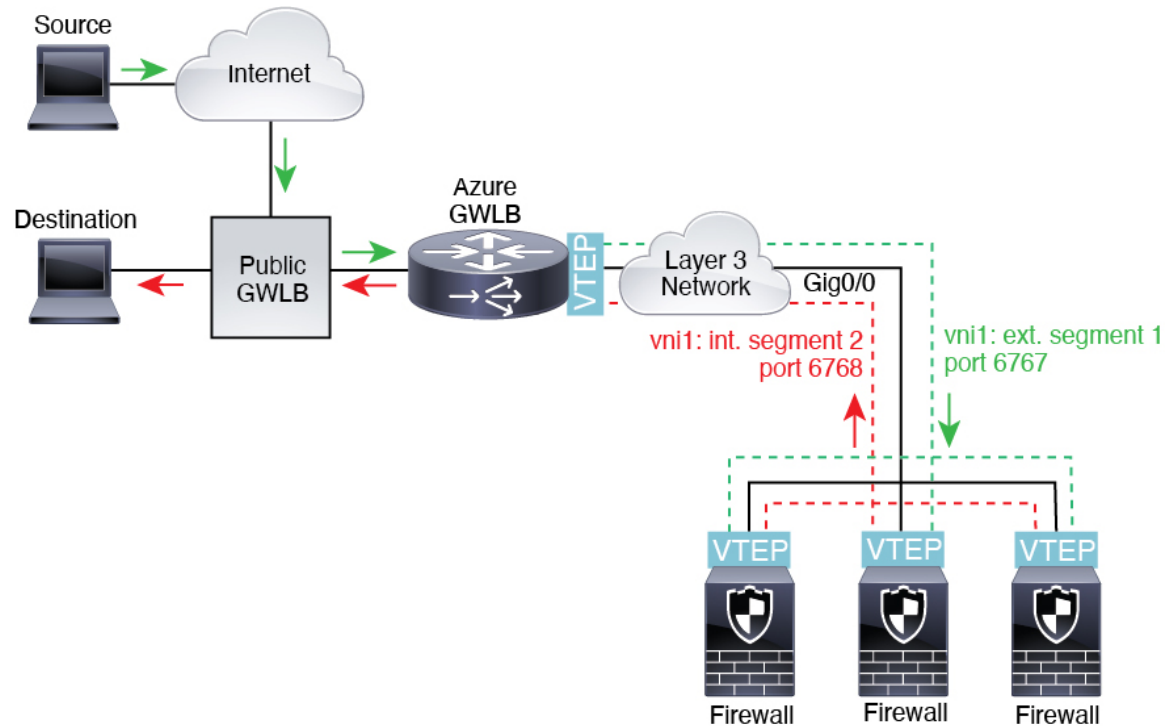

## Azure Gateway Load Balancer and Paired Proxy

In an Azure service chain, Firewall Threat Defense Virtuals act as a transparent gateway that can intercept packets between the internet and the customer service. The Firewall Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.

The following figure shows traffic forwarded to the Azure Gateway Load Balancer from the Public Gateway Load Balancer on the external VXLAN segment. The Gateway Load Balancer balances traffic among multiple Firewall Threat Defense Virtuals, which inspect the traffic before either dropping it or sending it back to the

Gateway Load Balancer on the internal VXLAN segment. The Azure Gateway Load Balancer then sends the traffic back to the Public Gateway Load Balancer and to the destination.

**Figure 349: Azure Gateway Load Balancer with Paired Proxy**

## Requirements and Prerequisites for VXLAN Interfaces

### Model Requirements

- VXLAN encapsulation is supported on all models.
- Geneve encapsulation is supported for the following models:
  - Firewall Threat Defense Virtual in Amazon Web Services (AWS)
- VXLAN in *paired proxy mode* is supported for the following models:
  - Firewall Threat Defense Virtual in Azure
- Firepower 1010 switch ports and VLAN interfaces are not supported as VTEP interfaces.

## Guidelines for VXLAN Interfaces

### Firewall Mode

- Geneve interfaces are only supported in routed firewall mode.

- Paired proxy VXLAN interfaces are only supported in routed firewall mode.

### IPv6

- The VNI interface supports both IPv4 and IPv6 traffic.
- For VXLAN encapsulation, the VTEP source interface supports both IPv4 and IPv6. The Firewall Threat Defense Virtual cluster control link VTEP source interface only supports IPv4.

For Geneve, the VTEP source interface only supports IPv4.

### Clustering

- Clustering does not support VXLAN in Individual Interface mode except for the cluster control link (Firewall Threat Defense Virtual only). Only Spanned EtherChannel mode supports VXLAN.

An exception is made for AWS, which can use an additional Geneve interface for use with the GWLB and for Azure, which can use an additional paired proxy VXLAN interface for use with the GWLB.

### Routing

- Only static routing or Policy Based Routing is supported on the VNI interface; dynamic routing protocols are not supported.

### VPN

You cannot configure the VTEP source interface for VPN or use it as a VTI.

### MTU

- VXLAN encapsulation—If the source interface MTU is less than 1554 bytes for IPv4 or 1574 bytes for IPv6, then the Firewall Threat Defense automatically raises the MTU to 1554 bytes or 1574 bytes. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. If the MTU used by other devices is larger, then you should set the source interface MTU to be the network MTU + 54 bytes for IPv4 or +64 bytes for IPv6. For the Firewall Threat Defense Virtual, this MTU requires a restart to enable jumbo frame reservation.
- Geneve encapsulation—If the source interface MTU is less than 1806 bytes, then the Firewall Threat Defense automatically raises the MTU to 1806 bytes. In this case, the entire Ethernet datagram is being encapsulated, so the new packet is larger and requires a larger MTU. If the MTU used by other devices is larger, then you should set the source interface MTU to be the network MTU + 306 bytes. This MTU requires a restart to enable jumbo frame reservation.

## Configure VXLAN or Geneve Interfaces

You can configure either VXLAN or Geneve interfaces.

### Configure VXLAN Interfaces

To configure VXLAN, perform the following steps.

**Note** You can configure either VXLAN or Geneve (Firewall Threat Defense Virtual only). For Geneve interfaces, see [Configure Geneve Interfaces, on page 733](#).

**Note** For Azure GWLB, the VXLAN interface is configured when you deploy the VM using the ARM template. You can use this section to change your configuration.

1. [Configure the VTEP Source Interface, on page 731](#).
2. [Configure the VNI Interface, on page 732](#).
3. (Azure GWLB) [Allow Gateway Load Balancer Health Checks, on page 735](#).

## Configure the VTEP Source Interface

You can configure one VTEP source interface per Firewall Threat Defense device. The VTEP is defined as a Network Virtualization Endpoint (NVE). VXLAN is the default encapsulation type. An exception is made for clustering on the Firewall Threat Defense Virtual in Azure, where you can use one VTEP source interface for the cluster control link and a second one for the data interface connected to the Azure GWLB.

### Procedure

- Step 1** If you want to specify a group of peer VTEPs, add a network object with the peer IP addresses. See [Creating Network Objects, on page 1283](#).
- Step 2** Choose **Devices > Device Management**.
- Step 3** Click **Edit** (✎) next to the device on which you want to configure VXLAN.
- Step 4** (Optional) Specify that the source interface is NVE-only.  
  
This setting is optional for routed mode where this setting restricts traffic to VXLAN and common management traffic only on this interface. This setting is automatically enabled for transparent firewall mode.
  - a) Click **Interfaces**.
  - b) Click **Edit** (✎) for the VTEP source interface.
  - c) On the **General** page, check the check box of **NVE Only**.
- Step 5** Click **VTEP** if it is not already displaying.
- Step 6** Check **Enable NVE**.
- Step 7** Click **Add VTEP**.
- Step 8** For the **Encapsulation Type**, choose **VxLAN**.  
  
For AWS, you can choose between **VxLAN** and **Geneve**. Other platforms have **VxLAN** chosen automatically.
- Step 9** Enter the value for the **Encapsulation port** within the specified range.  
  
The default value is 4789.
- Step 10** Select the **VTEP Source Interface**.

Select from the list of available physical interfaces present on the device. If the source interface MTU is less than 1554 bytes for IPv4 or 1574 bytes for IPv6, then the Firewall Management Center automatically raises the MTU to 1554 bytes or 1574 bytes.

- Step 11** Select the **Neighbor Address**. The available options are:
- **None**—No neighbor address is specified.
  - **Peer VTEP**—Specify a peer VTEP address.
  - **Peer Group**—Specify a network object with the peer IP addresses.
  - **Default Multicast**—Specify a default multicast group for all associated VNI interfaces. If you do not configure the multicast group per VNI interface, then this group is used. If you configure a group at the VNI interface level, then that group overrides this setting.
- Step 12** Click **OK**.
- Step 13** Click **Save**.
- Step 14** Configure the routed interface parameters. See [Configure Routed Mode Interfaces](#).

## Configure the VNI Interface

Add a VNI interface, associate it with the VTEP source interface, and configure basic interface parameters.

For the Firewall Threat Defense Virtual in Azure, you can configure either a regular VXLAN interface, or you can configure a paired proxy mode VXLAN interface for use with the Azure GWLB. Paired proxy mode is the only supported mode with clustering.

### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** (✎) next to the device on which you want to configure VXLAN.
- Step 3** Click **Interfaces**.
- Step 4** Click **Add Interfaces**, and then choose **VNI Interface**.
- Step 5** Enter the interface **Name** and **Description**.
- Step 6** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
- Step 7** Enter a value for the **Priority** field within the specified range. By default, 0 is selected.
- Step 8** Enter a value for the **VNI ID** between 1 and 10000.
- This ID is only an internal interface identifier.
- Step 9** (Paired Proxy VXLAN for Azure GWLB) Enable proxy paired mode and set the required parameters.
- a) Check **Proxy Paired**.
  - b) Set the **Internal Port** between 1024 and 65535.
  - c) Set the **Internal Segment ID** between 1 and 16777215.
  - d) Set the **External Port** between 1024 and 65535.
  - e) Set the **External Segment ID** between 1 and 16777215.

- Step 10** (Regular VXLAN) Enter a value for the **VNI Segment ID** between 1 and 16777215.  
The segment ID is used for VXLAN tagging.
- Step 11** Enter the **Multicast Group IP Address**.  
If you do not set the multicast group for the VNI interface, the default group from the VTEP source interface configuration is used, if available. If you manually set a VTEP peer IP for the VTEP source interface, you cannot specify a multicast group for the VNI interface.
- Step 12** Check **NVE Mapped to VTEP Interface**.  
This option associates this interface with the VTEP source interface.
- Step 13** Click **OK**.
- Step 14** Click **Save** to save the interface configuration.
- Step 15** Configure the routed or transparent interface parameters. See [Configure Routed and Transparent Mode Interfaces, on page 735](#).
- 

## Configure Geneve Interfaces

To configure Geneve interfaces for Firewall Threat Defense Virtual, perform the following steps.

**Note** You can configure either VXLAN or Geneve. For information about VXLAN interfaces, see [Configure VXLAN Interfaces, on page 730](#).

---

1. [Configure the VTEP Source Interface, on page 733](#).
2. [Configure the VNI, on page 734](#).
3. [Allow Gateway Load Balancer Health Checks, on page 735](#).

### Configure the VTEP Source Interface

You can configure one VTEP source interface per Firewall Threat Defense Virtual device. The VTEP is defined as a Network Virtualization Endpoint (NVE).

#### Procedure

---

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **Edit** (✎) next to the device on which you want to configure Geneve.
- Step 3** Click **VTEP**.
- Step 4** Check **Enable NVE**.
- Step 5** Click **Add VTEP**.
- Step 6** For the **Encapsulation Type**, choose **Geneve**.
- Step 7** Enter the value for the **Encapsulation port** within the specified range.

We do not recommend changing the Geneve port; AWS requires a port of 6081.

**Step 8** Select the **VTEP Source Interface**.

You can select from the list of available physical interfaces present on the device. If the source interface MTU is less than 1806 bytes, then the Firewall Management Center automatically raises the MTU to 1806 bytes.

**Step 9** Click **OK**.

**Step 10** Click **Save**.

**Step 11** Configure the routed interface parameters. See [Configure Routed Mode Interfaces](#).

## Configure the VNI

Add a VNI, associate it with (VTEP) source interface, and configure basic interface parameters.

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Click **Edit** (✎) next to the device on which you want to configure Geneve.

**Step 3** Click **Interfaces**.

**Step 4** Click **Add Interfaces**, and then choose **VNI Interface**.

**Step 5** In the **Name** and **Description** fields, provide relevant information.

**Step 6** In the **VNI ID** field, enter a value between 1 and 10000.

#### Note

This ID is only an internal interface identifier.

**Step 7** Check the **Enable Proxy** check box.

#### Note

When the AWS proxy is enabled on the VNI interface of your device, configuring NAT is not allowed.

This option enables single-arm proxy, and allows traffic to exit the same interface it entered (U-turn traffic). If you later edit the interface, you cannot disable single-arm proxy. To do that, you need to delete the existing interface and create a new VNI interface.

This option is only available for a Geneve VTEP.

**Step 8** Select **NVE Mapped to VTEP Interface**.

This option associates this interface with the VTEP source interface.

**Step 9** Click **OK**.

**Step 10** Click **Save**.

### What to do next

Configure the routed interface parameters. See [Configure Routed Mode Interfaces](#).

## Allow Gateway Load Balancer Health Checks

The AWS or Azure GWLB requires appliances to answer a health check properly. The GWLB will only send traffic to appliances that are considered healthy. You must configure the Firewall Threat Defense Virtual to respond to an SSH, HTTP, or HTTPS health check.

Configure one of the following methods.

### Procedure

---

**Step 1** Configure SSH. See [Configure Secure Shell](#)

Allow SSH from the GWLB IP address. The GWLB will attempt to establish a connection to the Firewall Threat Defense Virtual, and the Firewall Threat Defense Virtual's prompt to log in is taken as proof of health. An SSH login attempt will time out after 1 minute. You will need to configure a longer health check interval on the GWLB to accommodate this timeout.

**Step 2** Configure HTTP(S) Redirection Using Static Interface NAT with Port Translation.

You can configure the Firewall Threat Defense Virtual to redirect health checks to a metadata HTTP(S) server. For HTTP(S) health checks, the HTTP(S) server must reply to the GWLB with a status code in the range 200 to 399. Because the Firewall Threat Defense Virtual has limits on the number of simultaneous management connections, you may choose to offload the health check to an external server.

Static interface NAT with port translation lets you redirect a connection to a port (such as port 80) to a different IP address. For example, translate an HTTP packet from the GWLB with a destination of the Firewall Threat Defense Virtual outside interface so that it appears to be from the Firewall Threat Defense Virtual outside interface with a destination of the HTTP server. The Firewall Threat Defense Virtual then forwards the packet to the mapped destination address. The HTTP server responds to the Firewall Threat Defense Virtual outside interface, and then the Firewall Threat Defense Virtual forwards the response back to the GWLB. You need an access rule that allows traffic from the GWLB to the HTTP server.

- a) Permit HTTP(S) traffic on the outside interface from the GWLB network in an access rule. See [Access Control Rules, on page 1641](#).
  - b) For HTTP(S), translate the source GWLB IP address to the Firewall Threat Defense Virtual outside interface IP address; then translate the destination of the outside interface IP address to the HTTP(S) server IP address. See [Configure Static Manual NAT, on page 938](#).
- 

## Configure Routed and Transparent Mode Interfaces

This section includes tasks to complete the regular interface configuration for all models in routed or transparent firewall mode.

### About Routed and Transparent Mode Interfaces

Firewall mode interfaces subject traffic to firewall functions such as maintaining flows, tracking flow states at both IP and TCP layers, IP defragmentation, and TCP normalization. You can also optionally configure IPS functions for this traffic according to your security policy.

The types of firewall interfaces you can configure depends on the firewall mode set for the device: routed or transparent mode. See [Transparent or Routed Firewall Mode, on page 209](#) for more information.

- Routed mode interfaces (routed firewall mode only)—Each interface that you want to route between is on a different subnet.
- Bridge group interfaces (routed and transparent firewall mode)—You can group together multiple interfaces on a network, and the Firewall Threat Defense device uses bridging techniques to pass traffic between the interfaces. Each bridge group includes a Bridge Virtual Interface (BVI) to which you assign an IP address on the network. In routed mode, the Firewall Threat Defense device routes between BVIs and regular routed interfaces. In transparent mode, each bridge group is separate and cannot communicate with each other.

## Dual IP Stack (IPv4 and IPv6)

The Firewall Threat Defense device supports both IPv6 and IPv4 addresses on an interface. Make sure you configure a default route for both IPv4 and IPv6.

## 31-Bit Subnet Mask

For routed interfaces, you can configure an IP address on a 31-bit subnet for point-to-point connections. The 31-bit subnet includes only 2 addresses; normally, the first and last address in the subnet is reserved for the network and broadcast, so a 2-address subnet is not usable. However, if you have a point-to-point connection and do not need network or broadcast addresses, a 31-bit subnet is a useful way to preserve addresses in IPv4. For example, the failover link between 2 Firewall Threat Defenses only requires 2 addresses; any packet that is transmitted by one end of the link is always received by the other, and broadcasting is unnecessary. You can also have a directly-connected management station running SNMP or Syslog.

### 31-Bit Subnet and Clustering

You can use a 31-bit subnet mask for cluster interfaces, excluding the management interface and the Cluster Control Link.

### 31-Bit Subnet and Failover

For failover, when you use a 31-bit subnet for the Firewall Threat Defense interface IP address, you cannot configure a standby IP address for the interface because there are not enough addresses. Normally, an interface for failover should have a standby IP address so the active unit can perform interface tests to ensure standby interface health. Without a standby IP address, the Firewall Threat Defense cannot perform any network tests; only the link state can be tracked.

For the failover and optional separate state link, which are point-to-point connections, you can also use a 31-bit subnet.

### 31-Bit Subnet and Management

If you have a directly-connected management station, you can use a point-to-point connection for SSH or HTTP on the Firewall Threat Defense, or for SNMP or Syslog on the management station.

### 31-Bit Subnet Unsupported Features

The following features do not support the 31-Bit subnet:

- BVI interfaces for bridge groups—The bridge group requires at least 3 host addresses: the BVI, and two hosts connected to two bridge group member interfaces. you must use a /29 subnet or smaller.

- Multicast Routing

## Guidelines and Limitations for Routed and Transparent Mode Interfaces

### High Availability, Clustering, and Multi-Instance

- Do not configure failover links with the procedures in this chapter. See the High Availability chapter for more information.
- For cluster interfaces, see the clustering chapter for requirements.
- For multi-instance mode, shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode).
- When you use High Availability, you must set the IP address and standby address for data interfaces manually; DHCP and PPPoE are not supported. Set the standby IP addresses on the **Devices > Device Management > High Availability** tab in the **Monitored Interfaces** area. See the High Availability chapter for more information.

### IPv6

- IPv6 is supported on all interfaces.
- You can only configure IPv6 addresses manually in transparent mode.
- The Firewall Threat Defense device does not support IPv6 anycast addresses.
- DHCPv6 and prefix delegation options are not supported with transparent mode, clustering, or High Availability.

### Model Guidelines

- For the Firewall Threat Defense Virtual on VMware with bridged ixgbevf interfaces, bridge groups are not supported.
- For the Firepower 2100 series, bridge groups are not supported in routed mode.

### Transparent Mode and Bridge Group Guidelines

- You can create up to 250 bridge groups, with 64 interfaces per bridge group.
- Each directly-connected network must be on the same subnet.
- The Firewall Threat Defense device does not support traffic on secondary networks; only traffic on the same network as the BVI IP address is supported.
- An IP address for the BVI is required for each bridge group for to-the-device and from-the-device management traffic, as well as for data traffic to pass through the Firewall Threat Defense device. For IPv4 traffic, specify an IPv4 address. For IPv6 traffic, specify an IPv6 address.
- You can only configure IPv6 addresses manually.
- The BVI IP address must be on the same subnet as the connected network. You cannot set the subnet to a host subnet (255.255.255.255).

- Management interfaces are not supported as bridge group members.
- For multi-instance mode, shared interfaces are not supported for bridge group member interfaces (in transparent mode or routed mode).
- For the Firewall Threat Defense Virtual on VMware with bridged ixgbevf interfaces, transparent mode is not supported, and bridge groups are not supported in routed mode.
- For the Firepower 2100 series, bridge groups are not supported in routed mode.
- For the Firepower 1010, you cannot mix logical VLAN interfaces and physical firewall interfaces in the same bridge group.
- For the Firepower 4100/9300, data-sharing interfaces are not supported as bridge group members.
- In transparent mode, you must use at least 1 bridge group; data interfaces must belong to a bridge group.
- In transparent mode, do not specify the BVI IP address as the default gateway for connected devices; devices need to specify the router on the other side of the Firewall Threat Defense as the default gateway.
- In transparent mode, the *default* route, which is required to provide a return path for management traffic, is only applied to management traffic from one bridge group network. This is because the default route specifies an interface in the bridge group as well as the router IP address on the bridge group network, and you can only define one default route. If you have management traffic from more than one bridge group network, you need to specify a regular static route that identifies the network from which you expect management traffic.
- Transparent mode is not supported on threat defense virtual instances deployed on Amazon Web Services, Microsoft Azure, Google Cloud Platform, and Oracle Cloud Infrastructure.
- In routed mode, to route between bridge groups and other routed interfaces, you must name the BVI.
- In routed mode, Firewall Threat Defense-defined EtherChannel interfaces are not supported as bridge group members. EtherChannels on the Firepower 4100/9300 can be bridge group members.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the Firewall Threat Defense when using bridge group members. If there are two neighbors on either side of the Firewall Threat Defense running BFD, then the Firewall Threat Defense will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.

### Additional Guidelines and Requirements

- The Firewall Threat Defense supports only one 802.1Q header in a packet and does not support multiple headers (known as Q-in-Q support) for firewall interfaces. **Note:** For inline sets and passive interfaces, the FTD supports Q-in-Q up to two 802.1Q headers in a packet, with the exception of the Firepower 4100/9300, which only supports one 802.1Q header.
- Interface problems, such as frequent up/down status changes, can prevent the floating connection timer from applying correctly to the connections going through the interface. If you have problems with an interface's status, consider clearing all connections after the status becomes stable to clear invalid connections.

## Configure Routed Mode Interfaces

This procedure describes how to set the name, security zone, and IPv4 address.

---

**Note** Not all fields are supported for all interface types.

---

### Before you begin

- **Firepower 4100/9300**

1. [Configure a Physical Interface, on page 256](#)
  2. (Optional) Configure any special interfaces.
    - [Add an EtherChannel \(Port Channel\), on page 257](#)
    - [Add a VLAN Subinterface for Container Instances, on page 259](#) in FXOS
    - [Configure a Loopback Interface, on page 713](#)
    - [Add a Subinterface, on page 720](#) in Firewall Management Center
    - [Configure VXLAN Interfaces, on page 730](#)
- (Optional) **All other models:**
    - [Configure an EtherChannel, on page 670](#)
    - [Configure a Loopback Interface, on page 713](#)
    - [Add a Subinterface, on page 720](#)
    - [Configure VXLAN Interfaces, on page 730](#)
    - Firewall Threat Defense Virtual on AWS: [Configure Geneve Interfaces, on page 733](#)
    - Firepower 1010: [Configure a VLAN Interface, on page 705](#)

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Select <b>Devices &gt; Device Management</b> and click <b>Edit</b> (✎) for your Firewall Threat Defense device. The <b>Interfaces</b> page is selected by default. |
| <b>Step 2</b> | Click <b>Edit</b> (✎) for the interface you want to edit.  |
| <b>Step 3</b> | In the <b>Name</b> field, enter a name up to 48 characters in length.<br><br>You cannot start the name with the phrase "cluster". It is reserved for internal use. |
| <b>Step 4</b> | Enable the interface by checking the <b>Enabled</b> check box.   |
| <b>Step 5</b> | (Optional) Set this interface to <b>Management Only</b> to limit traffic to management traffic; through-the-box traffic is not allowed.                            |
| <b>Step 6</b> | (Optional) Add a description in the <b>Description</b> field.<br><br>The description can be up to 200 characters on a single line, without carriage returns.       |

- Step 7** In the **Mode** drop-down list, choose **None**.
- Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types.
- Step 8** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
- The routed interface is a Routed-type interface, and can only belong to Routed-type zones.
- Step 9** See [Configure the MTU, on page 763](#) for information about the **MTU**.
- Step 10** In the **Priority** field, enter a number ranging from 0–65535.
- This value is used in the policy based routing configuration. The priority is used to determine how you want to route the traffic across multiple egress interfaces. For more information, see [Configure Policy-Based Routing Policy, on page 1217](#).
- Step 11** Click the **IPv4** tab. To set the IP address, use one of the following options from the **IP Type** drop-down list.
- High Availability, clustering, and loopback interfaces only support static IP address configuration; DHCP and PPPoE are not supported.
- **Use Static IP**—Enter the IP address and subnet mask. For point-to-point connections, you can specify a 31-bit subnet mask (255.255.255.254 or /31). In this case, no IP addresses are reserved for the network or broadcast addresses. You cannot set the standby IP address in this case. For High Availability, you can only use a static IP address. Set the standby IP address on the **Devices > Device Management** page, click **High Availability** in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
  - **Use DHCP**—Configure the following optional parameters:
    - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.
    - **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.
  - **Use PPPoE**—If the interface is connected to a DSL, cable modem, or other connection to your ISP, and your ISP uses PPPoE to provide your IP address, configure the following parameters:
    - **VPDN Group Name**—Specify a group name of your choice to represent this connection.
    - **PPPoE User Name**—Specify the username provided by your ISP.
    - **PPPoE Password/Confirm Password**—Specify and confirm the password provided by your ISP.
    - **PPP Authentication**—Choose **PAP**, **CHAP**, or **MSCHAP**.

PAP passes a cleartext username and password during authentication and is not secure. With CHAP, the client returns the encrypted [challenge plus password], with a cleartext username in response to the server challenge. CHAP is more secure than PAP, but it does not encrypt data. MSCHAP is similar to CHAP but is more secure because the server stores and compares only encrypted passwords rather than cleartext passwords as in CHAP. MSCHAP also generates a key for data encryption by MPPE.

    - **PPPoE route metric**—Assign an administrative distance to the learned route. Valid values are from 1 to 255. By default, the administrative distance for the learned routes is 1.
    - **Enable Route Settings**—To manually configure the PPPoE IP address, check this box and then enter the **IP Address**.

If you select the **Enable Route Settings** check box and leave the **IP Address** blank, the **ip address pppoe setroute** command is applied as shown in this example:

```
interface GigabitEthernet0/2
nameif inside2_pppoe
cts manual
    propagate sgt preserve-untag
    policy static sgt disabled trusted
security-level 0
pppoe client vpdn group test
pppoe client route distance 10
ip address pppoe setroute
```

- **Store Username and Password in Flash**—Stores the username and password in flash memory.

The Firewall Threat Defense device stores the username and password in a special location of NVRAM.

**Step 12** (Optional) See [Configure IPv6 Addressing, on page 747](#) to configure IPv6 addressing on the **IPv6** tab.

**Step 13** (Optional) See [Configure the MAC Address, on page 764](#) to manually configure the MAC address on the **Advanced** tab.

**Step 14** (Optional) Set the duplex and speed by clicking **Hardware Configuration > Speed**.

- **Duplex**—Choose **Full** or **Half**. SFP interfaces only support **Full** duplex.
- **Speed**—Choose a speed (varies depending on the model). (Secure Firewall 3100/4200 only) Choose **Detect SFP** to detect the speed of the installed SFP module and use the appropriate speed. Duplex is always Full, and auto-negotiation is always enabled. This option is useful if you later change the network module to a different model, and want the speed to update automatically.

**Note**

You cannot modify the speed of a HA or a Cluster Control Link interface.

- **Auto-negotiation**—Set the interface to negotiate the speed, link status, and flow control.
- **Forward Error Correction Mode**—(Secure Firewall 3100/4200 only) For 25 Gbps and higher interfaces, enable Forward Error Correction (FEC). For an EtherChannel member interface, you must configure FEC before you add it to the EtherChannel. The setting chosen when you use **Auto** depends on the transceiver type and whether the interface is fixed (built-in) or on a network module.

**Table 49: Default FEC for Auto Setting**

Transceiver Type	Fixed Port Default FEC (Ethernet 1/9 through 1/16)	Network Module Default FEC
25G-SR	Clause 74 FC-FEC	Clause 108 RS-FEC
25G-LR	Clause 74 FC-FEC	Clause 108 RS-FEC
10/25G-CSR	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-AOCxM	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-CU2.5/3M	Auto-Negotiate	Auto-Negotiate
25G-CU4/5M	Auto-Negotiate	Auto-Negotiate

Transceiver Type	Fixed Port Default FEC (Ethernet 1/9 through 1/16)	Network Module Default FEC
25/50/100G	Clause 91 RS-FEC	Clause 91 RS-FEC

**Step 15** (Optional) Enable Firewall Management Center manager access on a data interface on the **Manager Access** page.

You can enable manager access from a data interface when you first setup the Firewall Threat Defense. If you want to enable or disable manager access after you added the Firewall Threat Defense to the Firewall Management Center, see:

- Enable manager access: [Change the Manager Access Interface from Management to Data, on page 104](#)

**Note**

You cannot enable manager access unless you first initiate the manager interface migration from Management to a data interface. After you initiate the migration, you can enable manager access on the **Manager Access** page and save the configuration successfully.

- Disable manager access: [Change the Manager Access Interface from Data to Management, on page 108](#)

If you want to change the manager access interface from one data interface to another data interface, you must disable manager access on the original data interface, but do not disable the interface itself yet; the original data interface must be used to perform the deployment. If you want to use the same IP address on the new manager access interface, you can delete or change the IP configuration on the original interface; this change should not affect the deployment. If you use a different IP address for the new interface, then also change the device IP address shown in the Firewall Management Center; see [Update the Hostname or IP Address in the Firewall Management Center, on page 97](#). Be sure to also update related configuration to use the new interface such as static routes, DDNS, and DNS settings.

Manager access from a data interface has the following limitations:

- You can only enable manager access on a physical, data interface. You cannot use a subinterface or EtherChannel, nor can you create a subinterface on the manager access interface. You can also use the Firewall Management Center to enable manager access on a single secondary interface for redundancy.
- This interface cannot be management-only.
- Routed firewall mode only, using a routed interface.
- PPPoE is not supported. If your ISP requires PPPoE, you will have to put a router with PPPoE support between the Firewall Threat Defense and the WAN modem.
- The interface must be in the global VRF only.
- SSH is not enabled by default for data interfaces, so you will have to enable SSH later using the Firewall Management Center. Because the Management interface gateway will be changed to be the data interfaces, you also cannot SSH to the Management interface from a remote network unless you add a static route for the Management interface using the **configure network static-routes** command. For Firewall Threat Defense Virtual on Amazon Web Services, a console port is not available, so you should maintain your SSH access to the Management interface: add a static route for Management before you continue with your configuration. Alternatively, be sure to finish all CLI configuration (including the **configure manager add** command) before you configure the data interface for manager access and you are disconnected.
- You cannot use separate management and event-only interfaces.

- Clustering is not supported. You must use the Management interface in this case.

**Figure 350: Manager Access**

Cancel OK

- Check **Enable management on this interface for the manager** to use this data interface for management instead of the dedicated Management interface.
- (Optional) In the **Allowed Management Networks** box, add the networks from which you want to allow manager access. By default, any networks are allowed.

**Step 16** Click **OK**.

**Step 17** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Bridge Group Interfaces

A bridge group is a group of interfaces that the Secure Firewall Threat Defense device bridges instead of routes. Bridge groups are supported in both transparent and routed firewall mode. For more information about bridge groups, see [About Bridge Groups, on page 211](#).

To configure bridge groups and associated interfaces, perform these steps.

### Configure General Bridge Group Member Interface Parameters

This procedure describes how to set the name and security zone for each bridge group member interface. The same bridge group can include different types of interfaces: physical interfaces, VLAN subinterfaces, Firepower 1010 VLAN interfaces, EtherChannels, and redundant interfaces. The Management interface is not supported. In routed mode, EtherChannels are not supported. For the Firepower 4100/9300, data-sharing type interfaces are not supported.

**Before you begin**• **Firepower 4100/9300**

1. [Configure a Physical Interface, on page 256](#)
2. (Optional) Configure any special interfaces.
  - [Add an EtherChannel \(Port Channel\), on page 257](#)
  - [Add a VLAN Subinterface for Container Instances, on page 259](#) in FXOS
  - [Add a Subinterface, on page 720](#) in Firewall Management Center

• (Optional) **All other models:**

- [Configure an EtherChannel, on page 670](#)
- [Add a Subinterface, on page 720](#)
- Firepower 1010: [Configure a VLAN Interface, on page 705](#)

**Procedure**

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** In the **Name** field, enter a name up to 48 characters in length.  
You cannot start the name with the phrase "cluster". It is reserved for internal use.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** (Optional) Set this interface to **Management Only** to limit traffic to management traffic; through-the-box traffic is not allowed.
- Step 6** (Optional) Add a description in the **Description** field.  
The description can be up to 200 characters on a single line, without carriage returns.
- Step 7** In the **Mode** drop-down list, choose **None**.  
Regular firewall interfaces have the mode set to None. The other modes are for IPS-only interface types. After you assign this interface to a bridge group, the mode will show as **Switched**.
- Step 8** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.  
The bridge group member interface is a Switched-type interface, and can only belong to Switched-type zones. Do not configure any IP address settings for this interface. You will set the IP address for the Bridge Virtual Interface (BVI) only. Note that the BVI does not belong to a zone, and you cannot apply access control policies to the BVI.
- Step 9** See [Configure the MTU, on page 763](#) for information about the **MTU**.
- Step 10** (Optional) Set the duplex and speed by clicking **Hardware Configuration > Speed**.

- **Duplex**—Choose **Full** or **Half**. SFP interfaces only support **Full** duplex.
- **Speed**—Choose a speed (varies depending on the model). (Secure Firewall 3100/4200 only) Choose **Detect SFP** to detect the speed of the installed SFP module and use the appropriate speed. Duplex is always Full, and auto-negotiation is always enabled. This option is useful if you later change the network module to a different model, and want the speed to update automatically.

**Note**

You cannot modify the speed of a HA or a Cluster Control Link interface.

- **Auto-negotiation**—Set the interface to negotiate the speed, link status, and flow control.
- **Forward Error Correction Mode**—(Secure Firewall 3100/4200 only) For 25 Gbps and higher interfaces, enable Forward Error Correction (FEC). For an EtherChannel member interface, you must configure FEC before you add it to the EtherChannel. The setting chosen when you use **Auto** depends on the transceiver type and whether the interface is fixed (built-in) or on a network module.

*Table 50: Default FEC for Auto Setting*

Transceiver Type	Fixed Port Default FEC (Ethernet 1/9 through 1/16)	Network Module Default FEC
25G-SR	Clause 74 FC-FEC	Clause 108 RS-FEC
25G-LR	Clause 74 FC-FEC	Clause 108 RS-FEC
10/25G-CSR	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-AOCxM	Clause 74 FC-FEC	Clause 74 FC-FEC
25G-CU2.5/3M	Auto-Negotiate	Auto-Negotiate
25G-CU4/5M	Auto-Negotiate	Auto-Negotiate
25/50/100G	Clause 91 RS-FEC	Clause 91 RS-FEC

- Step 11** (Optional) See [Configure IPv6 Addressing, on page 747](#) to configure IPv6 addressing on the **IPv6** tab.
- Step 12** (Optional) See [Configure the MAC Address, on page 764](#) to manually configure the MAC address on the **Advanced** tab.
- Step 13** Click **OK**.
- Step 14** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure the Bridge Virtual Interface (BVI)

Each bridge group requires a BVI for which you configure an IP address. The Firewall Threat Defense uses this IP address as the source address for packets originating from the bridge group. The BVI IP address must be on the same subnet as the connected network. For IPv4 traffic, the BVI IP address is required to pass any traffic. For IPv6 traffic, you must, at a minimum, configure the link-local addresses to pass traffic, but a global

management address is recommended for full functionality, including remote management and other management operations.

For routed mode, if you provide a name for the BVI, then the BVI participates in routing. Without a name, the bridge group remains isolated as in transparent firewall mode.

### Before you begin

You cannot add the BVI to a security zone; therefore, you cannot apply Access Control policies to the BVI. You must apply your policy to the bridge group member interfaces based on their zones.

## Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Choose **Add Interfaces > Bridge Group Interface**.
- Step 3** (Routed Mode) In the **Name** field, enter a name up to 48 characters in length.
- You must name the BVI if you want to route traffic outside the bridge group members, for example, to the outside interface or to members of other bridge groups. The name is not case-sensitive.
- Step 4** In the **Bridge Group ID** field, enter the bridge group ID between 1 and 250.
- Step 5** In the **Description** field, enter a description for this bridge group.
- Step 6** On the **Interfaces** tab, click an interface and then click **Add** to move it to the **Selected Interfaces** area. Repeat for all interfaces that you want to make members of the bridge group.
- Step 7** (Transparent Mode) Click the **IPv4** tab. In the **IP Address** field, enter the IPv4 address and subnet mask.
- Do not assign a host address (/32 or 255.255.255.255) to the BVI. Also, do not use other subnets that contain fewer than 3 host addresses (one each for the upstream router, downstream router, and transparent firewall) such as a /30 subnet (255.255.255.252). The Firewall Threat Defense device drops all ARP packets to or from the first and last addresses in a subnet. For example, if you use a /30 subnet and assign a reserved address from that subnet to the upstream router, then the Firewall Threat Defense device drops the ARP request from the downstream router to the upstream router.
- For High Availability, set the standby IP address on the **Devices > Device Management** page, click the **High Availability** tab in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
- Step 8** (Routed Mode) Click the **IPv4** tab. To set the IP address, use one of the following options from the **IP Type** drop-down list.
- High Availability and clustering interfaces only support static IP address configuration; DHCP is not supported.
- **Use Static IP**—Enter the IP address and subnet mask. For High Availability, you can only use a static IP address. Set the standby IP address on the **Devices > Device Management**, click the **High Availability** tab in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.
  - **Use DHCP**—Configure the following optional parameters:
    - **Obtain default route using DHCP**—Obtains the default route from the DHCP server.

- **DHCP route metric**—Assigns an administrative distance to the learned route, between 1 and 255. The default administrative distance for the learned routes is 1.

- Step 9** (Optional) See [Configure IPv6 Addressing, on page 747](#) to configure IPv6 addressing.
- Step 10** (Optional) See [Add a Static ARP Entry, on page 765](#) and [Add a Static MAC Address and Disable MAC Learning for a Bridge Group, on page 766](#) (for transparent mode only) to configure the **ARP** and **MAC** settings.
- Step 11** Click **OK**.
- Step 12** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure IPv6 Addressing

This section describes how to configure IPv6 addressing in routed and transparent mode.

### About IPv6

This section includes information about IPv6.

#### IPv6 Addressing

You can configure two types of unicast addresses for IPv6:

- **Global**—The global address is a public address that you can use on the public network. For a bridge group, this address needs to be configured for the BVI, and not per member interface. You can also configure a global IPv6 address for the management interface in transparent mode.
- **Link-local**—The link-local address is a private address that you can only use on the directly-connected network. Routers do not forward packets using link-local addresses; they are only for communication on a particular physical network segment. They can be used for address configuration or for the Neighbor Discovery functions such as address resolution. In a bridge group, only member interfaces have link-local addresses; the BVI does not have a link-local address.

At a minimum, you need to configure a link-local address for IPv6 to operate. If you configure a global address, a link-local address is automatically configured on the interface, so you do not also need to specifically configure a link-local address. For bridge group member interfaces, when you configure the global address on the BVI, the Firewall Threat Defense device automatically generates link-local addresses for member interfaces. If you do not configure a global address, then you need to configure the link-local address, either automatically or manually.

#### Modified EUI-64 Interface IDs

RFC 3513: Internet Protocol Version 6 (IPv6) Addressing Architecture requires that the interface identifier portion of all unicast IPv6 addresses, except those that start with binary value 000, be 64 bits long and be constructed in Modified EUI-64 format. The Firewall Threat Defense device can enforce this requirement for hosts attached to the local link.

When this feature is enabled on an interface, the source addresses of IPv6 packets received on that interface are verified against the source MAC addresses to ensure that the interface identifiers use the Modified EUI-64

format. If the IPv6 packets do not use the Modified EUI-64 format for the interface identifier, the packets are dropped and the following system log message is generated:

```
325003: EUI-64 source address check failed.
```

The address format verification is only performed when a flow is created. Packets from an existing flow are not checked. Additionally, the address verification can only be performed for hosts on the local link.

## Configure the IPv6 Prefix Delegation Client

The Firewall Threat Defense can act as a DHCPv6 Prefix Delegation client so that the client interface, for example the outside interface connected to a cable modem, can receive one or more IPv6 prefixes that the Firewall Threat Defense can then subnet and assign to its inside interfaces.

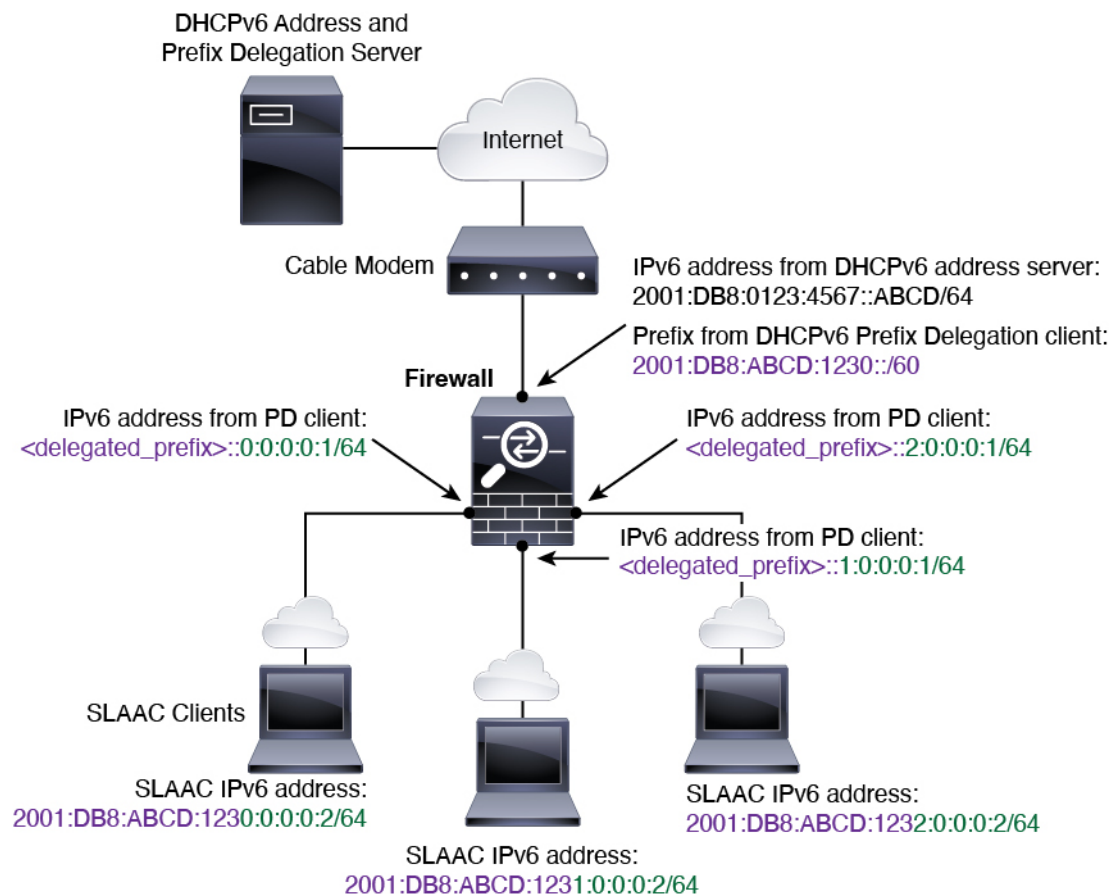

### About IPv6 Prefix Delegation

The Firewall Threat Defense can act as a DHCPv6 Prefix Delegation client so that the client interface, for example the outside interface connected to a cable modem, can receive one or more IPv6 prefixes that the Firewall Threat Defense can then subnet and assign to its inside interfaces. Hosts connected to the inside interfaces can then use Stateless Address Auto Configuration (SLAAC) to obtain global IPv6 addresses. Note that the inside Firewall Threat Defense interfaces do not in turn act as Prefix Delegation servers; the Firewall Threat Defense can only provide global IP addresses to SLAAC clients. For example, if a router is connected to the Firewall Threat Defense, it can act as a SLAAC client to obtain its IP address. But if you want to use a subnet of the delegated prefix for the networks behind the router, you must manually configure those addresses on the router's inside interfaces.

The Firewall Threat Defense includes a light DHCPv6 server so the Firewall Threat Defense can provide information such as the DNS server and domain name to SLAAC clients when they send Information Request (IR) packets to the Firewall Threat Defense. The Firewall Threat Defense only accepts IR packets, and does not assign addresses to the clients. You will configure the client to generate its own IPv6 address by enabling IPv6 autoconfiguration on the client. Enabling stateless autoconfiguration on a client configures IPv6 addresses based on prefixes received in Router Advertisement messages; in other words, based on the prefix that the Firewall Threat Defense received using Prefix Delegation.

### IPv6 Prefix Delegation /64 Subnet Example

The following example shows the Firewall Threat Defense receiving an IP address on the outside interface using the DHCPv6 address client. It also gets a delegated prefix using the DHCPv6 Prefix Delegation client. The Firewall Threat Defense subnets the delegated prefix into /64 networks and assigns global IPv6 addresses to its inside interfaces dynamically using the delegated prefix plus a manually configured subnet (::0, ::1, or ::2) and IPv6 address (0:0:0:1) per interface. SLAAC clients connected to those inside interfaces obtain IPv6 addresses on each /64 subnet.

### IPv6 Prefix Delegation /62 Subnet Example

The following example shows the Firewall Threat Defense subnetting the prefix into 4 /62 subnets: 2001:DB8:ABCD:1230::/62, 2001:DB8:ABCD:1234::/62, 2001:DB8:ABCD:1238::/62, and 2001:DB8:ABCD:123C::/62. The Firewall Threat Defense uses one of 4 available /64 subnets on 2001:DB8:ABCD:1230::/62 for its inside network (::0). You can then manually use additional /62 subnets for downstream routers. The router shown uses 3 of 4 available /64 subnets on 2001:DB8:ABCD:1234::/62 for its inside interfaces (::4, ::5, and ::6). In this case, the inside router interfaces cannot dynamically obtain the delegated prefix, so you need to view the delegated prefix on the Firewall Threat Defense, and then use that prefix for your router configuration. Usually, ISPs delegate the same prefix to a given client when the lease expires, but if the Firewall Threat Defense receives a new prefix, you will have to modify the router configuration to use the new prefix. The DHCP unique identifier (DUID) is persistent across reboots.

## Enable the IPv6 Prefix Delegation Client

Enable the DHCPv6 Prefix Delegation client on one or more interfaces. The Firewall Threat Defense obtains one or more IPv6 prefixes that it can subnet and assign to inside networks. Typically, the interface on which you enable the prefix delegation client obtains its IP address using the DHCPv6 address client; only other Firewall Threat Defense interfaces use addresses derived from the delegated prefix.

This feature is only supported in routed mode. This feature is not supported in clustering or High Availability.

### Before you begin

When you use Prefix Delegation, you must set the Firewall Threat Defense IPv6 neighbor discovery router advertisement interval to be much lower than the preferred lifetime of the prefix assigned by the DHCPv6 Server to prevent IPv6 traffic interruption. For example, if the DHCPv6 server sets the preferred Prefix Delegation lifetime to 300 seconds, you should set the Firewall Threat Defense RA interval to be 150 seconds. To set the preferred lifetime, use the **show ipv6 general-prefix** command. To set the Firewall Threat Defense RA interval, see [Configure IPv6 Neighbor Discovery, on page 756](#); the default is 200 seconds.

## Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click the **IPv6** page, and then click **DHCP**.
- Step 4** Click **Client PD Prefix Name** and enter a name for this prefix.

*Figure 351: Enable the Prefix Delegation Client*

☒ Client PD Prefix Name  
 Outside-Prefix

Client PD Hint Prefixes

Add

2001:DB8:ABCD:1230::/60 ✕

The name can be up to 200 characters.

- Step 5** (Optional) Enter the prefix and prefix length in the **Client PD Hint Prefixes** field to provide one or more hints to the DHCP server about the delegated prefix you want to receive, then click **Add**.  
  
Typically you want to request a particular prefix length, such as `::/60`, or if you have received a particular prefix before and want to ensure you get it again when the lease expires, you can enter the whole prefix as the hint. If you enter multiple hints (different prefixes or lengths), then it is up to the DHCP server which hint to honor, or whether to honor the hint at all.
- Step 6** Click **OK**.
- Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure a Global IPv6 Address

To configure a global IPv6 address for any routed mode interface and for the transparent or routed mode BVI, perform the following steps.

**Note** Configuring the global address automatically configures the link-local address, so you do not need to configure it separately. For bridge groups, configuring the global address on the BVI automatically configures link-local addresses on all member interfaces.

For subinterfaces defined on the Firewall Threat Defense, we recommend that you also set the MAC address manually, because they use the same burned-in MAC address of the parent interface. IPv6 link-local addresses are generated based on the MAC address, so assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the Firewall Threat Defense. See [Configure the MAC Address, on page 764](#).

### Before you begin

For IPv6 neighbor discovery for bridge groups, you must explicitly allow Neighbor Solicitation (ICMPv6 type 135) and Neighbor Advertisement (ICMPv6 type 136) packets through the Firewall Threat Defense bridge group member interfaces using a bidirectional access rule.

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click the **IPv6** page.
- For routed mode, the **Basic** page is selected by default. For transparent mode, the **Address** page is selected by default.
- Step 4** (Optional) On the **Basic** page, check **Enable IPv6**.
- Use this option if you want to only configure the link-local addresses. Otherwise, configuring an IPv6 address enabled IPv6 processing automatically.
- Step 5** Configure the global IPv6 address using one of the following methods.
- For failover and clustering, and for loopback interfaces, you must set the IP address manually. For clustering, manually configuring the link-local address is also not supported.
- (Routed interface) Stateless autoconfiguration—Check the **Autoconfiguration** check box.
- Enabling stateless autoconfiguration on the interface configures IPv6 addresses based upon prefixes received in Router Advertisement messages. A link-local address, based on the Modified EUI-64 interface ID, is automatically generated for the interface when stateless autoconfiguration is enabled.
- Although RFC 4862 specifies that hosts configured for stateless autoconfiguration do not send Router Advertisement messages, the Firewall Threat Defense device does send Router Advertisement messages in this case. Click the **Settings** tab and click the **IPv6** tab and then uncheck the **Enable RA** check box to suppress messages.
- Manual configuration—To manually configure a global IPv6 address:
    - a. Click the **Address** page, and click (+) **Add Address**.

The **Add Address** dialog box appears.

- b. In the **Address** field, enter either a full global IPv6 address, including the interface ID, or enter the IPv6 prefix, along with the IPv6 prefix length. (Routed Mode) If you only enter the prefix, then be sure to check the **Enforce EUI 64** check box to generate the interface ID using the Modified EUI-64 format. For example, 2001:0DB8::BA98:0:3210/48 (full address) or 2001:0DB8::/48 (prefix, with EUI 64 checked).

For High Availability (if you did not set **Enforce EUI 64**), set the standby IP address on the **Devices > Device Management** page, click **High Availability** in the **Monitored Interfaces** area. If you do not set the standby IP address, the active unit cannot monitor the standby interface using network tests; it can only track the link state.

- (Routed interface) Obtain an address using DHCPv6—To use DHCPv6:

**Figure 352: Enable the DHCPv6 Client**

The screenshot shows the 'Edit Physical Interface' configuration window. The 'IPv6' tab is selected, and within it, the 'DHCP' sub-tab is active. Two checkboxes are visible and checked: 'Enable DHCP Client' and 'Enable default route using DHCP'. There are also unchecked checkboxes for 'Enable' and 'Enable' to the right of the checked ones.

- a. Click the **DHCP** page.
  - b. Check the check box of **Enable DHCP Client**.
  - c. (Optional) Check the check box of **Enable default route using DHCP** to obtain a default route from Router Advertisements.
- (Routed interface) Use a delegated prefix—To assign an IPv6 address using the delegated prefix:  
This feature requires the Firewall Threat Defense to have the DHCPv6 Prefix Delegation client enabled *on a different interface*. See [Enable the IPv6 Prefix Delegation Client, on page 750](#).
- a. Click the **DHCP** page.
  - b. Click (+).

Figure 353: Use a Delegated Prefix

Edit Physical Interface

General IPv4 **IPv6** Path Monitoring Hardware Configuration Manager Access Adva

Basic Address **Prefixes** Settings DHCP

Prefix Name	Prefix Length
No records to display	

+ Add

- c. Enter the IPv6 address and **Prefix Length**.

Typically, the delegated prefix will be /60 or smaller so you can subnet to multiple /64 networks. /64 is the supported subnet length if you want to support SLAAC for connected clients. You should specify an address that completes the /60 subnet, for example ::1:0:0:1. Enter :: before the address in case the prefix is smaller than /60. For example, if the delegated prefix is 2001:DB8:1234:5670::/60, then the global IP address assigned to this interface is 2001:DB8:1234:5671::1/64. The prefix that is advertised in router advertisements is 2001:DB8:1234:5671::/64. In this example, if the prefix is smaller than /60, the remaining bits of the prefix will be 0's as indicated by the leading ::. For example, if the prefix is 2001:DB8:1234::/48, then the IPv6 address will be 2001:DB8:1234::1:0:0:1/64.

- d. Click **OK**.

Figure 354: Prefix Delegation Table

+ Add

Prefix Name	Prefix Length
Outside-Prefix	::1:0:0:1/64

- e. Optionally enable the DHCPv6 stateless server on this interface (see [Enable the DHCPv6 Stateless Server, on page 799](#)). If you do so, we recommend that you also check the **Enable DHCP for non-address config** option.

## Step 6

For Routed interfaces, you can optionally set the following values on the **Basic** page:

- To enforce the use of Modified EUI-64 format interface identifiers in IPv6 addresses on a local link, check the **Enforce EUI-64** check box.
- To manually set the link-local address, enter an address in the **Link-Local address** field.

A link-local address should start with FE8, FE9, FEA, or FEB, for example fe80::20d:88ff:feec:6a82. If you do not want to configure a global address, and only need to configure a link-local address, you have the option of manually defining the link-local address. Note that we recommend automatically assigning the link-local address based on the Modified EUI-64 format. For example, if other devices enforce the use of the Modified EUI-64 format, then a manually-assigned link-local address may cause packets to be dropped.

Clustering does not support manual link-local addresses.

**Step 7** For Routed interfaces, you can optionally set the following values on the **DHCP** page:

- Check the **Enable DHCP for address config** check box to set the Managed Address Config flag in the IPv6 router advertisement packet.

This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain addresses, in addition to the derived stateless autoconfiguration address.

- Check the **Enable DHCP for non-address config** check box to set the Other Address Config flag in the IPv6 router advertisement packet.

This flag in IPv6 router advertisements informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain additional information from DHCPv6, such as the DNS server address. Use this option when using the DHCPv6 stateless server with DHCPv6 prefix delegation.

**Step 8** For Routed interfaces, see [Configure IPv6 Neighbor Discovery, on page 756](#) to configure settings on the **Prefixes** and **Settings** pages. For BVI interfaces, see the following parameters on the **Settings** page:

- **DAD attempts**—The maximum number of DAD attempts, between 1 and 600. Set the value to 0 to disable duplicate address detection (DAD) processing. This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses. 1 attempt is the default.
- **NS Interval**—The interval between IPv6 neighbor solicitation retransmissions on an interface, between 1000 and 3600000 ms. The default value is 1000 ms.
- **Reachable Time**—The amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred, between 0 and 3600000 ms. The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value. The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

**Step 9** Click **OK**.

**Step 10** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure IPv6 Neighbor Discovery

The IPv6 neighbor discovery process uses ICMPv6 messages and solicited-node multicast addresses to determine the link-layer address of a neighbor on the same network (local link), verify the readability of a neighbor, and keep track of neighboring routers.

Nodes (hosts) use neighbor discovery to determine the link-layer addresses for neighbors known to reside on attached links and to quickly purge cached values that become invalid. Hosts also use neighbor discovery to find neighboring routers that are willing to forward packets on their behalf. In addition, nodes use the protocol to actively keep track of which neighbors are reachable and which are not, and to detect changed link-layer addresses. When a router or the path to a router fails, a host actively searches for functioning alternates.

### Before you begin

Supported in Routed mode only. For IPv6 neighbor settings supported in transparent mode, see [Configure a Global IPv6 Address, on page 751](#).

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click **IPv6**, and then **Prefixes**.
- Step 4** (Optional) To configure which IPv6 prefixes are included in IPv6 router advertisements, perform the following steps:
- Click (+) **Add Prefix**.
  - In the **Address** field, enter the IPv6 address with the prefix length or check the **Default** check box to use the default prefix.
  - (Optional) Uncheck the **Advertisement** check box to indicate that the IPv6 prefix is not advertised. For the **Default** prefix, this setting only applies to on-link prefixes. Off-link prefixes will still be advertised unless you uncheck **Advertisement** for a specific off-link prefix.
  - Check the **Off Link** check box to indicate that the specified prefix is assigned to the link. Nodes sending traffic to addresses that contain the specified prefix consider the destination to be locally reachable on the link. This prefix should not be used for on-link determination.
  - To use the specified prefix for autoconfiguration, check the **Autoconfiguration** check box.
  - For the **Prefix Lifetime**, click **Duration** or **Expiration Date**.
    - **Duration**—Enter a **Preferred Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being valid. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default is 2592000 (30 days). Enter a **Valid Lifetime** for the prefix in seconds. This setting is the amount of time that the specified IPv6 prefix is advertised as being preferred. The maximum value represents infinity. Valid values are from 0 to 4294967295. The default setting is 604800 (seven days). Alternatively, check the **Infinite** check box to set an unlimited duration.
    - **Expiration Date**—Choose a **Valid** and **Preferred** date and time.
  - Click **OK**.

**Step 5** Click **Settings**.

**Step 6** (Optional) Set the maximum number of **DAD attempts**, between 1 and 600. 1 attempt is the default. Set the value to 0 to disable duplicate address detection (DAD) processing.

This setting configures the number of consecutive neighbor solicitation messages that are sent on an interface while DAD is performed on IPv6 addresses.

During the stateless autoconfiguration process, Duplicate Address Detection verifies the uniqueness of new unicast IPv6 addresses before the addresses are assigned to interfaces.

When a duplicate address is identified, the state of the address is set to DUPLICATE, the address is not used, and the following error message is generated:

```
325002: Duplicate address ipv6_address/MAC_address on interface
```

If the duplicate address is the link-local address of the interface, the processing of IPv6 packets is disabled on the interface. If the duplicate address is a global address, the address is not used.

**Step 7** (Optional) Configure the interval between IPv6 neighbor solicitation retransmissions in the **NS Interval** field, between 1000 and 3600000 ms.

The default value is 1000 ms.

Neighbor solicitation messages (ICMPv6 Type 135) are sent on the local link by nodes attempting to discover the link-layer addresses of other nodes on the local link. After receiving a neighbor solicitation message, the destination node replies by sending a neighbor advertisement message (ICMPv6 Type 136) on the local link.

After the source node receives the neighbor advertisement, the source node and destination node can communicate. Neighbor solicitation messages are also used to verify the reachability of a neighbor after the link-layer address of a neighbor is identified. When a node wants to verify the reachability of a neighbor, the destination address in a neighbor solicitation message is the unicast address of the neighbor.

Neighbor advertisement messages are also sent when there is a change in the link-layer address of a node on a local link.

**Step 8** (Optional) Configure the amount of time that a remote IPv6 node is considered reachable after a reachability confirmation event has occurred in the **Reachable Time** field, between 0 and 3600000 ms.

The default value is 0 ms. When 0 is used for the value, the reachable time is sent as undetermined. It is up to the receiving devices to set and track the reachable time value.

The neighbor reachable time enables detecting unavailable neighbors. Shorter configured times enable detecting unavailable neighbors more quickly, however, shorter times consume more IPv6 network bandwidth and processing resources in all IPv6 network devices. Very short configured times are not recommended in normal IPv6 operation.

**Step 9** (Optional) To suppress the router advertisement transmissions, uncheck the **Enable RA** check box. If you enable router advertisement transmissions, you can set the RA lifetime and interval.

Router advertisement messages (ICMPv6 Type 134) are automatically sent in response to router solicitation messages (ICMPv6 Type 133). Router solicitation messages are sent by hosts at system startup so that the host can immediately autoconfigure without needing to wait for the next scheduled router advertisement message.

You may want to disable these messages on any interface for which you do not want the Firewall Threat Defense to supply the IPv6 prefix (for example, the outside interface).

- **RA Lifetime**—Configure the router lifetime value in IPv6 router advertisements, between 0 and 9000 seconds.

The default is 1800 seconds.

- **RA Interval**—Configure the interval between IPv6 router advertisement transmissions, between 3 and 1800 seconds.

The default is 200 seconds.

To prevent synchronization with other IPv6 nodes, the firewall randomly adjusts the value that you set (jitter).

**Step 10** Click **OK**.

**Step 11** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Configure Advanced Interface Settings

This section describes how to configure MAC addresses for regular firewall mode interfaces, how to set the maximum transmission unit (MTU), and how to set other advanced parameters.

### About Advanced Interface Configuration

This section describes advanced interface settings.

#### About MAC Addresses

You can manually assign MAC addresses to override the default. For container instances, the FXOS chassis automatically generates unique MAC addresses for all interfaces.

**Note** You might want to assign unique MAC addresses to subinterfaces defined on the Firewall Threat Defense, because they use the same burned-in MAC address of the parent interface. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the Firewall Threat Defense device.

**Note** For container instances, even if you are not sharing a subinterface, if you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

## Default MAC Addresses

### For native instances:

Default MAC address assignments depend on the type of interface.

- Physical interfaces—The physical interface uses the burned-in MAC address.
- VLAN interfaces (Firepower 1010)—Routed firewall mode: All VLAN interfaces share a MAC address. Ensure that any connected switches can support this scenario. If the connected switches require unique MAC addresses, you can manually assign MAC addresses. See [Configure the MAC Address, on page 764](#).  
  
Transparent firewall mode: Each VLAN interface has a unique MAC address. You can override the generated MAC addresses if desired by manually assigning MAC addresses. See [Configure the MAC Address, on page 764](#).
- EtherChannels (Firepower Models)—For an EtherChannel, all interfaces that are part of the channel group share the same MAC address. This feature makes the EtherChannel transparent to network applications and users, because they only see the one logical connection; they have no knowledge of the individual links. The port-channel interface uses a unique MAC address from a pool; interface membership does not affect the MAC address.
- EtherChannels (ASA Models)—The port-channel interface uses the lowest-numbered channel group interface MAC address as the port-channel MAC address. Alternatively you can configure a MAC address for the port-channel interface. We recommend configuring a unique MAC address in case the group channel interface membership changes. If you remove the interface that was providing the port-channel MAC address, then the port-channel MAC address changes to the next lowest numbered interface, thus causing traffic disruption.
- Subinterfaces (Firewall Threat Defense-defined)—All subinterfaces of a physical interface use the same burned-in MAC address. You might want to assign unique MAC addresses to subinterfaces. For example, your service provider might perform access control based on the MAC address. Also, because IPv6 link-local addresses are generated based on the MAC address, assigning unique MAC addresses to subinterfaces allows for unique IPv6 link-local addresses, which can avoid traffic disruption in certain instances on the Firewall Threat Defense.

### For container instances:

- MAC addresses for all interfaces are taken from a MAC address pool. For subinterfaces, if you decide to manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification. See [Automatic MAC Addresses for Container Instance Interfaces, on page 243](#).

## About the MTU

The MTU specifies the maximum frame *payload* size that the Firewall Threat Defense device can transmit on a given Ethernet interface. The MTU value is the frame size *without* Ethernet headers, VLAN tagging, or other overhead. For example, when you set the MTU to 1500, the expected frame size is 1518 bytes including the headers, or 1522 when using VLAN. Do not set the MTU value higher to accommodate these headers.

For Geneve, the entire Ethernet datagram is being encapsulated, so the new IP packet is larger and requires a larger MTU: you should set the Firewall Threat Defense device VTEP source interface MTU to be the network MTU + 306 bytes.

## Path MTU Discovery

The Firewall Threat Defense device supports Path MTU Discovery (as defined in RFC 1191), which lets all devices in a network path between two hosts coordinate the MTU so they can standardize on the lowest MTU in the path.

## Default MTU

The default MTU on the Firewall Threat Defense device is 1500 bytes. This value does not include the 18-22 bytes for the Ethernet header, VLAN tagging, or other overhead.

## MTU and Fragmentation

For IPv4, if an outgoing IP packet is larger than the specified MTU, it is fragmented into 2 or more frames. Fragments are reassembled at the destination (and sometimes at intermediate hops), and fragmentation can cause performance degradation. For IPv6, packets are typically not allowed to be fragmented at all. Therefore, your IP packets should fit within the MTU size to avoid fragmentation.

For TCP packets, the endpoints typically use their MTU to determine the TCP maximum segment size (MTU - 40, for example). If additional TCP headers are added along the way, for example for site-to-site VPN tunnels, then the TCP MSS might need to be adjusted down by the tunneling entity. See [About the TCP MSS, on page 760](#).

For UDP or ICMP, the application should take the MTU into account to avoid fragmentation.

---

**Note** The Firewall Threat Defense device can receive frames larger than the configured MTU as long as there is room in memory.

---

## MTU and Jumbo Frames

A larger MTU lets you send larger packets. Larger packets might be more efficient for your network. See the following guidelines:

- Matching MTUs on the traffic path—We recommend that you set the MTU on all Firewall Threat Defense interfaces and other device interfaces along the traffic path to be the same. Matching MTUs prevents intermediate devices from fragmenting the packets.
- Accommodating jumbo frames—You can set the MTU 9000 bytes or higher when you enable jumbo frames. The maximum depends on the model.

## About the TCP MSS

The TCP maximum segment size (MSS) is the size of the TCP payload *before* any TCP and IP headers are added. UDP packets are not affected. The client and the server exchange TCP MSS values during the three-way handshake when establishing the connection.

You can set the TCP MSS on the Firewall Threat Defense device for through traffic using the Sysopt\_Basic object in FlexConfig; see [FlexConfig Policies, on page 2477](#); by default, the maximum TCP MSS is set to 1380 bytes. This setting is useful when the Firewall Threat Defense device needs to add to the size of the packet for IPsec VPN encapsulation. However, for non-IPsec endpoints, you should disable the maximum TCP MSS on the Firewall Threat Defense device.

If you set a maximum TCP MSS, if either endpoint of a connection requests a TCP MSS that is larger than the value set on the Firewall Threat Defense device, then the Firewall Threat Defense device overwrites the TCP MSS in the request packet with the Firewall Threat Defense device maximum. If the host or server does not request a TCP MSS, then the Firewall Threat Defense device assumes the RFC 793-default value of 536 bytes (IPv4) or 1220 bytes (IPv6), but does not modify the packet. For example, you leave the default MTU as 1500 bytes. A host requests an MSS of 1500 minus the TCP and IP header length, which sets the MSS to 1460. If the Firewall Threat Defense device maximum TCP MSS is 1380 (the default), then the Firewall Threat Defense device changes the MSS value in the TCP request packet to 1380. The server then sends packets with 1380-byte payloads. The Firewall Threat Defense device can then add up to 120 bytes of headers to the packet and still fit in the MTU size of 1500.

You can also configure the minimum TCP MSS; if a host or server requests a very small TCP MSS, the Firewall Threat Defense device can adjust the value up. By default, the minimum TCP MSS is not enabled.

For to-the-box traffic, including for SSL VPN connections, this setting does not apply. The Firewall Threat Defense device uses the MTU to derive the TCP MSS: MTU - 40 (IPv4) or MTU - 60 (IPv6).

## Default TCP MSS

By default, the maximum TCP MSS on the Firewall Threat Defense device is 1380 bytes. This default accommodates IPv4 IPsec VPN connections where the headers can equal up to 120 bytes; this value fits within the default MTU of 1500 bytes.

## Suggested Maximum TCP MSS Setting

The default TCP MSS assumes the Firewall Threat Defense device acts as an IPv4 IPsec VPN endpoint and has an MTU of 1500. When the Firewall Threat Defense device acts as an IPv4 IPsec VPN endpoint, it needs to accommodate up to 120 bytes for TCP and IP headers.

If you change the MTU value, use IPv6, or do not use the Firewall Threat Defense device as an IPsec VPN endpoint, then you should change the TCP MSS setting using the Sysopt\_Basic object in FlexConfig.

---

**Note** Even if you explicitly set an MSS, if a component such as TLS/SSL decryption or server discovery needs a particular MSS, it will set that MSS based on the interface MTU and ignore your MSS setting.

---

See the following guidelines:

- Normal traffic—Disable the TCP MSS limit and accept the value established between connection endpoints. Because connection endpoints typically derive the TCP MSS from the MTU, non-IPsec packets usually fit this TCP MSS.
- IPv4 IPsec endpoint traffic—Set the maximum TCP MSS to the MTU - 120. For example, if you use jumbo frames and set the MTU to 9000, then you need to set the TCP MSS to 8880 to take advantage of the new MTU.
- IPv6 IPsec endpoint traffic—Set the maximum TCP MSS to the MTU - 140.

## ARP Inspection for Bridge Group Traffic

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the Firewall Threat Defense device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the Firewall Threat Defense device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the Firewall Threat Defense device to either forward the packet out all interfaces (flood), or to drop the packet.

---

**Note** The dedicated Management interface never floods packets even if this parameter is set to flood.

---

## MAC Address Table

When you use bridge groups, the Firewall Threat Defense learns and builds a MAC address table in a similar way as a normal bridge or switch: when a device sends a packet through the bridge group, the Firewall Threat Defense adds the MAC address to its table. The table associates the MAC address with the source interface so that the Firewall Threat Defense knows to send any packets addressed to the device out the correct interface. Because traffic between bridge group members is subject to the Firewall Threat Defense security policy, if the destination MAC address of a packet is not in the table, the Firewall Threat Defense does not flood the original packet on all interfaces as a normal bridge does. Instead, it generates the following packets for directly-connected devices or for remote devices:

- Packets for directly-connected devices—The Firewall Threat Defense generates an ARP request for the destination IP address, so that it can learn which interface receives the ARP response.
- Packets for remote devices—The Firewall Threat Defense generates a ping to the destination IP address so that it can learn which interface receives the ping reply.

The original packet is dropped.

## Default Settings

- If you enable ARP inspection, the default setting is to flood non-matching packets.
- The default timeout value for dynamic MAC address table entries is 5 minutes.
- By default, each interface automatically learns the MAC addresses of entering traffic, and the Firewall Threat Defense device adds corresponding entries to the MAC address table.

**Note**

Secure Firewall Threat Defense device generates a reset packet to reset a connection that is denied by a stateful inspection engine. Here, the destination MAC address of the packet is not determined based on the ARP table lookup but instead it is taken directly from the packets (connections) that are being denied.

## Guidelines for ARP Inspection and the MAC Address Table

- ARP inspection is only supported for bridge groups.
- MAC address table configuration is only supported for bridge groups.

## Configure the MTU

Customize the MTU on the interface, for example, to allow jumbo frames.

For the ISA 3000 and the Firewall Threat Defense Virtual: Changing the MTU above 1500 bytes automatically enables jumbo-frame reservation. You must restart the system before you can use jumbo frames. For the Firewall Threat Defense Virtual that supports clustering, you can enable jumbo-frame reservation in the Day0 configuration, so in that case, you do not need to restart. After you restart, you cannot disable jumbo-frame reservation. An exception is for the Firewall Threat Defense Virtual, where you can disable jumbo-frame reservation in the Day0 configuration, if supported. If you use an interface in an inline set, the MTU setting is not used. However, the jumbo-frame reservation setting *is* relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo-frame reservation, you must set the MTU of *any* interface above 1500 bytes.

Jumbo frames are enabled by default on other platforms.

**Caution**

Changing the highest MTU value on the device for a data interface restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Inspection is interrupted on all data interfaces, not just the interface you modified. Whether this interruption drops traffic or passes it without further inspection depends on the model of the managed device and the interface type. This caution does not apply to management-only interfaces. See [Snort Restart Traffic Behavior](#), on page 178 for more information.

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** On the **General** tab, set the **MTU**. The minimum and maximum depends on your platform.  
The default is 1500 bytes.
- Step 4** Click **OK**.

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**Step 6** For the ISA 3000 and the Firewall Threat Defense Virtual, if you set the MTU above 1500 bytes, restart the system to enable jumbo-frame reservation. See [Shut Down or Restart the Device, on page 48](#).

## Configure the MAC Address

You might need to manually assign a MAC address. You can also set the Active and Standby MAC addresses on the **Devices > Device Management** window by choosing **High Availability** from the **Add** drop-down list. If you set the MAC address for an interface on both screens, the addresses on the **Interfaces > Advanced** tab take precedence.

**Note** For container instances, even if you are not sharing a subinterface, if you manually configure MAC addresses, make sure you use unique MAC addresses for all subinterfaces on the same parent interface to ensure proper classification.

### Procedure

**Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

**Step 2** Click **Edit** (✎) for the interface you want to edit.

**Step 3** Click the **Advanced** tab.  
The **Information** tab is selected.

**Step 4** Set the active and standby MAC addresses.

- a) In the **Active MAC Address** field, enter a MAC address in H.H.H format, where H is a 16-bit hexadecimal digit.

For example, the MAC address 00-0C-F1-42-4C-DE would be entered as 000C.F142.4CDE. The MAC address must not have the multicast bit set, that is, the second hexadecimal digit from the left cannot be an odd number.

- b) In the **Standby MAC Address** field, enter a MAC address for use with High Availability.

If the active unit fails over and the standby unit becomes active, the new active unit starts using the active MAC addresses to minimize network disruption, while the old active unit uses the standby address.

**Step 5** Click **OK**.

**Step 6** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Add a Static ARP Entry

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection (see [ARP Inspection, on page 829](#)). ARP inspection compares ARP packets with *static* ARP entries in the ARP table.

For routed interfaces, you can enter static ARP entries, but normally dynamic entries are sufficient. For routed interfaces, the ARP table is used to deliver packets to directly-connected hosts. Although senders identify a packet destination by an IP address, the actual delivery of the packet on Ethernet relies on the Ethernet MAC address. When a router or host wants to deliver a packet on a directly connected network, it sends an ARP request asking for the MAC address associated with the IP address, and then delivers the packet to the MAC address according to the ARP response. The host or router keeps an ARP table so it does not have to send ARP requests for every packet it needs to deliver. The ARP table is dynamically updated whenever ARP responses are sent on the network, and if an entry is not used for a period of time, it times out. If an entry is incorrect (for example, the MAC address changes for a given IP address), the entry needs to time out before it can be updated with the new information.

For transparent mode, the Firewall Threat Defense only uses dynamic ARP entries in the ARP table for traffic to and from the Firewall Threat Defense device, such as management traffic.

### Before you begin

This screen is only available for named interfaces.

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
  - Step 2** Click **Edit** (✎) for the interface you want to edit.
  - Step 3** Click the **Advanced** tab, and then click the **ARP** tab (called **ARP and MAC** for transparent mode).
  - Step 4** Click (+) **Add ARP Config**.  
The **Add ARP Config** dialog box appears.
  - Step 5** In the **IP Address** field, enter the IP address of the host.
  - Step 6** In the **MAC Address** field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b.
  - Step 7** To perform proxy ARP for this address, check the **Enable Alias** check box.  
  
If the Firewall Threat Defense device receives an ARP request for the specified IP address, then it responds with the specified MAC address.
  - Step 8** Click **OK**, and then click **OK** again to exit the Advanced settings.
  - Step 9** Click **Save**.  
  
You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
-

## Add a Static MAC Address and Disable MAC Learning for a Bridge Group

Normally, MAC addresses are added to the MAC address table dynamically as traffic from a particular MAC address enters an interface. You can disable MAC address learning; however, unless you statically add MAC addresses to the table, no traffic can pass through the Firewall Threat Defense device. You can also add static MAC addresses to the MAC address table. One benefit to adding static entries is to guard against MAC spoofing. If a client with the same MAC address as a static entry attempts to send traffic to an interface that does not match the static entry, then the Firewall Threat Defense device drops the traffic and generates a system message. When you add a static ARP entry (see [Add a Static ARP Entry, on page 765](#)), a static MAC address entry is automatically added to the MAC address table.

### Before you begin

This screen is only available for named BVIs in transparent mode.

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
  - Step 2** Click **Edit** (✎) for the interface you want to edit.
  - Step 3** Click the **Advanced** tab, and then click the **ARP and MAC** tab.
  - Step 4** (Optional) Disable MAC learning by unchecking the **Enable MAC Learning** check box.
  - Step 5** To add a static MAC address, click **Add MAC Config**.  
The **Add MAC Config** dialog box appears.
  - Step 6** In the **MAC Address** field, enter the MAC address of the host; for example, 00e0.1e4e.3d8b. Click **OK**.
  - Step 7** Click **OK** to exit the Advanced settings.
  - Step 8** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Set Security Configuration Parameters

This section describes how to prevent IP spoofing, allow full fragment reassembly, and override the default fragment setting set for at the device level in **Platform Settings**.

### Anti-Spoofing

This section lets you enable Unicast Reverse Path Forwarding on an interface. Unicast RPF guards against IP spoofing (a packet uses an incorrect source IP address to obscure its true source) by ensuring that all packets have a source IP address that matches the correct source interface according to the routing table.

Normally, the Firewall Threat Defense device only looks at the destination address when determining where to forward the packet. Unicast RPF instructs the device to also look at the source address; this is why it is called Reverse Path Forwarding. For any traffic that you want to allow through the Firewall Threat Defense device, the device routing table must include a route back to the source address. See RFC 2267 for more information.

For outside traffic, for example, the Firewall Threat Defense device can use the default route to satisfy the Unicast RPF protection. If traffic enters from an outside interface, and the source address is not known to the routing table, the device uses the default route to correctly identify the outside interface as the source interface.

If traffic enters the outside interface from an address that is known to the routing table, but is associated with the inside interface, then the Firewall Threat Defense device drops the packet. Similarly, if traffic enters the inside interface from an unknown source address, the device drops the packet because the matching route (the default route) indicates the outside interface.

Unicast RPF is implemented as follows:

- ICMP packets have no session, so each packet is checked.
- UDP and TCP have sessions, so the initial packet requires a reverse route lookup. Subsequent packets arriving during the session are checked using an existing state maintained as part of the session. Non-initial packets are checked to ensure they arrived on the same interface used by the initial packet.

### Fragment per Packet

By default, the Firewall Threat Defense device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments through the Firewall Threat Defense device. Fragmented packets are often used as DoS attacks.

### Fragment Reassembly

The Firewall Threat Defense device performs the following fragment reassembly processes:

- IP fragments are collected until a fragment set is formed or until a timeout interval has elapsed.
- If a fragment set is formed, integrity checks are performed on the set. These checks include no overlapping, no tail overflow, and no chain overflow.
- IP fragments that terminate at the Firewall Threat Defense device are always fully reassembled.
- If **Full Fragment Reassembly** is disabled (the default), the fragment set is forwarded to the transport layer for further processing.
- If **Full Fragment Reassembly** is enabled, the fragment set is first coalesced into a single IP packet. The single IP packet is then forwarded to the transport layer for further processing.

### Before you begin

This screen is only available for named interfaces.

## Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Select <b>Devices &gt; Device Management</b> and click <b>Edit</b> (✎) for your Firewall Threat Defense device. The <b>Interfaces</b> page is selected by default. |
| <b>Step 2</b> | Click <b>Edit</b> (✎) for the interface you want to edit.  |
| <b>Step 3</b> | Click the <b>Advanced</b> tab, and then click the <b>Security Configuration</b> tab.   |
| <b>Step 4</b> | To enable Unicast Reverse Path Forwarding, check the <b>Enable Anti Spoofing</b> check box.  |

- Step 5** To enable full fragment reassembly, check the **Allow Full Fragment Reassembly** check box.
- Step 6** To change the number of fragments allowed per packet, check the **Override Default Fragment Setting** check box, and set the following values:
- **Size**—Set the maximum number of packets that can be in the IP reassembly database waiting for reassembly. The default is 200. Set this value to 1 to disable fragments.
  - **Chain**—Set the maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets.
  - **Timeout**—Set the maximum number of seconds to wait for an entire fragmented packet to arrive. The timer starts after the first fragment of a packet arrives. If all fragments of the packet do not arrive by the number of seconds specified, all fragments of the packet that were already received will be discarded. The default is 5 seconds.
- Step 7** Click **OK**.
- Step 8** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## History for Regular Firewall Interfaces

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
VXLAN VTEP IPv6 support	7.4	Any	<p>You can now specify an IPv6 address for the VXLAN VTEP interface. IPv6 is not supported for the threat defense virtual cluster control link or for Geneve encapsulation.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Edit &gt; VTEP &gt; Add VTEP</b></li> <li>• <b>Devices &gt; Device Management &gt; Edit &gt; Interfaces &gt; Add Interfaces &gt; VNI Interface</b></li> </ul> <p>Requires Firewall Threat Defense version 7.4.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Loopback interface support for BGP and management traffic	7.4	Any	<p>You can use a loopback interface for:</p> <ul style="list-style-type: none"> <li>• AAA</li> <li>• BGP</li> <li>• DNS</li> <li>• HTTP</li> <li>• ICMP</li> <li>• IPsec Flow Offload</li> <li>• NetFlow</li> <li>• SNMP</li> <li>• SSH</li> <li>• Syslog</li> </ul> <p>Requires Firewall Threat Defense version 7.4.</p>
Loopback interface support for VTI	7.3	Any	<p>You can now add a loopback interface. The loopback interface helps to overcome path failures. If an interface goes down, you can access all interfaces through the IP address assigned to the loopback interface. For VTI, in addition to setting a loopback interface as the source interface, support has also been added to inherit the IP address from a loopback interface instead of a statically configured IP address.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Interfaces &gt; Add Interfaces &gt; Add Loopback Interface</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
IPv6 DHCP	7.3	Any	<p>The Firewall Threat Defense now supports the following features for IPv6 addressing:</p> <ul style="list-style-type: none"> <li>• DHCPv6 Address client—The Firewall Threat Defense obtains an IPv6 global address and optional default route from the DHCPv6 server.</li> <li>• DHCPv6 Prefix Delegation client—The Firewall Threat Defense obtains delegated prefix(es) from a DHCPv6 server. The Firewall Threat Defense can then use these prefixes to configure other Firewall Threat Defense interface addresses so that Stateless Address Auto Configuration (SLAAC) clients can autoconfigure IPv6 addresses on the same network.</li> <li>• BGP router advertisement for delegated prefixes</li> <li>• DHCPv6 stateless server—The Firewall Threat Defense provides other information such as the domain name to SLAAC clients when they send Information Request (IR) packets to the Firewall Threat Defense. The Firewall Threat Defense only accepts IR packets, and does not assign addresses to the clients.</li> </ul> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Add/Edit Interfaces &gt; IPv6 &gt; DHCP</b></li> <li>• <b>Objects &gt; Object Management &gt; DHCP IPv6 Pool</b></li> </ul> <p>New/Modified commands: <b>show bgp ipv6 unicast, show ipv6 dhcp, show ipv6 general-prefix</b></p>
Paired proxy VXLAN for the Firewall Threat Defense Virtual for the Azure Gateway Load Balancer	7.3	Any	<p>You can configure a paired proxy mode VXLAN interface for the Firewall Threat Defense Virtual in Azure for use with the Azure Gateway Load Balancer (GWLB). The Firewall Threat Defense Virtual defines an external interface and an internal interface on a single NIC by utilizing VXLAN segments in a paired proxy.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Interfaces &gt; Add Interfaces &gt; VNI Interface</b></li> </ul> <p>Supported platforms: Firewall Threat Defense Virtual in Azure</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
VXLAN support	7.2	Any	<p>VXLAN encapsulation support was added.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; VTEP</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Interfaces &gt; Add Interfaces &gt; VNI Interface</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Interfaces</b> edit physical interface &gt; <b>General</b></li> </ul> <p>Supported platforms: All.</p>
Geneve support for the Firewall Threat Defense Virtual	7.1	Any	<p>Geneve encapsulation support was added for the Firewall Threat Defense Virtual to support single-arm proxy for the Amazon Web Services (AWS) Gateway Load Balancer. The AWS Gateway Load Balancer combines a transparent network gateway (with a single entry and exit point for all traffic) and a load balancer that distributes traffic and scales Firewall Threat Defense Virtual to match the traffic demand.</p> <p>This feature requires Snort 3.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Device &gt; VTEP</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Interfaces &gt; Add Interfaces &gt; VNI Interface</b></li> <li>• <b>Devices &gt; Device Management &gt; Device &gt; Interfaces</b> edit physical interface &gt; <b>General</b></li> </ul> <p>Supported platforms: Firewall Threat Defense Virtual in AWS</p>
31-bit Subnet Mask	7.0	Any	<p>For routed interfaces, you can configure an IP address on a 31-bit subnet for point-to-point connections. The 31-bit subnet includes only 2 addresses; normally, the first and last address in the subnet is reserved for the network and broadcast, so a 2-address subnet is not usable. However, if you have a point-to-point connection and do not need network or broadcast addresses, a 31-bit subnet is a useful way to preserve addresses in IPv4. For example, the failover link between 2 FTDs only requires 2 addresses; any packet that is transmitted by one end of the link is always received by the other, and broadcasting is unnecessary. You can also have a directly-connected management station running SNMP or Syslog. This feature is not supported for BVIs for bridge groups or with multicast routing.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Interfaces</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Synchronization between the Firewall Threat Defense operational link state and the physical link state for the Firepower 4100/9300	6.7	Any	<p>The Firepower 4100/9300 chassis can now synchronize the Firewall Threat Defense operational link state with the physical link state for data interfaces. Currently, interfaces will be in an Up state as long as the FXOS admin state is up and the physical link state is up. The Firewall Threat Defense application interface admin state is not considered. Without synchronization from Firewall Threat Defense, data interfaces can be in an Up state physically before the Firewall Threat Defense application has completely come online, for example, or can stay Up for a period of time after you initiate an Firewall Threat Defense shutdown. For inline sets, this state mismatch can result in dropped packets because external routers may start sending traffic to the Firewall Threat Defense before the Firewall Threat Defense can handle it. This feature is disabled by default, and can be enabled per logical device in FXOS.</p> <p><b>Note</b> This feature is not supported for clustering, container instances, or Firewall Threat Defense with a Radware vDP decorator. It is also not supported for ASA.</p> <p>New/Modified Firepower Chassis Manager screens: <b>Logical Devices &gt; Enable Link State</b></p> <p>New/Modified FXOS commands: <b>set link-state-sync enabled, show interface expand detail</b></p> <p>Supported platforms: Firepower 4100/9300</p>
Firepower 1010 hardware switch support	6.5	Any	<p>The Firepower 1010 supports setting each Ethernet interface to be a switch port or a firewall interface.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces</b></li> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Edit Physical Interface</b></li> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Add VLAN Interface</b></li> </ul>
Firepower 1010 PoE+ support on Ethernet 1/7 and Ethernet 1/8	6.5	Any	<p>The Firepower 1010 supports Power over Ethernet+ (PoE+) on Ethernet 1/7 and Ethernet 1/8 when they are configured as switch ports.</p> <p>New/Modified screens:</p> <p><b>Devices &gt; Device Management &gt; Interfaces &gt; Edit Physical Interface &gt; PoE</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
VLAN subinterfaces for use with container instances	6.3.0	Any	<p>To provide flexible physical interface use, you can create VLAN subinterfaces in FXOS and also share interfaces between multiple instances.</p> <p>New/Modified Secure Firewall Management Center screens:</p> <p><b>Devices &gt; Device Management &gt; Edit icon &gt; Interfaces</b> tab</p> <p>New/Modified Secure Firewall Chassis Manager screens:</p> <p><b>Interfaces &gt; All Interfaces &gt; Add New</b> drop-down menu <b>Subinterface</b></p> <p>New/Modified FXOS commands: <b>create subinterface, set vlan, show interface, show subinterface</b></p> <p>Supported platforms: Firepower 4100/9300</p>
Data-sharing interfaces for container instances	6.3.0	Any	<p>To provide flexible physical interface use, you can share interfaces between multiple instances.</p> <p>New/Modified Secure Firewall Chassis Manager screens:</p> <p><b>Interfaces &gt; All Interfaces &gt; Type</b></p> <p>New/Modified FXOS commands: <b>set port-type data-sharing, show interface</b></p> <p>Supported platforms: Firepower 4100/9300</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Integrated Routing and Bridging	6.2.0	Any	<p>Integrated Routing and Bridging provides the ability to route between a bridge group and a routed interface. A bridge group is a group of interfaces that the Firewall Threat Defense bridges instead of routes. The Firewall Threat Defense is not a true bridge in that the Firewall Threat Defense continues to act as a firewall: access control between interfaces is controlled, and all of the usual firewall checks are in place. Previously, you could only configure bridge groups in transparent firewall mode, where you cannot route between bridge groups. This feature lets you configure bridge groups in routed firewall mode, and to route between bridge groups and between a bridge group and a routed interface. The bridge group participates in routing by using a Bridge Virtual Interface (BVI) to act as a gateway for the bridge group. Integrated Routing and Bridging provides an alternative to using an external Layer 2 switch if you have extra interfaces on the Firewall Threat Defense to assign to the bridge group. In routed mode, the BVI can be a named interface and can participate separately from member interfaces in some features, such as access rules and DHCP server.</p> <p>The following features that are supported in transparent mode are not supported in routed mode: clustering. The following features are also not supported on BVIs: dynamic routing and multicast routing.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Edit Physical Interface</b></li> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Add Interfaces &gt; Bridge Group Interface</b></li> </ul> <p>Supported platforms: All except for the Firepower 2100 and the Firewall Threat Defense Virtual</p>

## CHAPTER 16

# Inline Sets and Passive Interfaces

You can configure IPS-only passive interfaces, passive ERSPAN interfaces, and inline sets.

- [About IPS Interfaces, on page 775](#)
- [Requirements and Prerequisites for Inline Sets, on page 779](#)
- [Guidelines for Inline Sets and Passive Interfaces, on page 780](#)
- [Configure a Passive Interface, on page 782](#)
- [Configure an Inline Set, on page 783](#)
- [History for Inline Sets and Passive Interfaces, on page 787](#)

## About IPS Interfaces

IPS interfaces include passive interfaces, passive ERSPAN interfaces, and inline sets. IPS-only mode interfaces bypass many firewall checks and only support IPS security policy (Snort). You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

IPS-only mode interfaces bypass many firewall checks and only support IPS security policy (Snort). You might want to implement IPS-only interfaces if you have a separate firewall protecting these interfaces and do not want the overhead of firewall functions.

**Note** The firewall mode only affects regular firewall interfaces, and not IPS-only interfaces such as inline sets or passive interfaces. IPS-only interfaces can be used in both firewall modes.

## Inline Sets

An inline set acts like a bump on the wire, and binds one or more interface pairs together to slot into an existing network. This function allows the Firewall Threat Defense to be installed in any network environment without the configuration of adjacent network devices. Inline interfaces receive all traffic unconditionally, but all traffic received on these interfaces is retransmitted out of the other interface in the inline pair unless explicitly dropped. When you have multiple inline pairs in an inline set, traffic can only pass between the interfaces in the pair; it can't pass between interfaces in different pairs.

With tap mode, the Firewall Threat Defense is deployed inline, but the network traffic flow is undisturbed. Instead, the Firewall Threat Defense makes a copy of each packet so that it can analyze the packets. Note that

rules of these types do generate intrusion events when they are triggered, and the table view of intrusion events indicates that the triggering packets would have dropped in an inline deployment. There are benefits to using tap mode with FTDs that are deployed inline. For example, you can set up the cabling between the Firewall Threat Defense and the network as if the Firewall Threat Defense were inline and analyze the kinds of intrusion events the Firewall Threat Defense generates. Based on the results, you can modify your intrusion policy and add the drop rules that best protect your network without impacting its efficiency. When you are ready to deploy the Firewall Threat Defense inline, you can disable tap mode and begin dropping suspicious traffic without having to reconfigure the cabling between the Firewall Threat Defense and the network.

---

**Note** Tap mode *significantly* impacts Firewall Threat Defense performance, depending on the traffic.

---

---

**Note** Inline sets might be familiar to you as "transparent inline sets," but the inline interface type is unrelated to the transparent firewall mode or the firewall-type interfaces.

---

## Multiple Inline Pairs and Asynchronous Routing

You can configure the interfaces to route traffic between a host on your network and external hosts through different inline pairs, depending on whether the traffic is inbound or outbound. This is an *asynchronous routing* configuration. If you deploy asynchronous routing, but you include only one inline pair in an inline set, the device might not correctly analyze your network traffic because it might see only half of the traffic.

Adding multiple inline pairs to the same inline set lets the system identify the inbound and outbound traffic as part of the same traffic flow. For passive interfaces only, you can also achieve this by including the interface pairs in the same security zone.

**Figure 355: Asynchronous Routing**

**Note** If you assign multiple inline pairs to a single inline set, but you experience issues with duplicate traffic, you might need to reassign your inline pairs to separate inline sets or modify your security zones.

If fragments of a packet are received on different interface pairs, they are not reassembled and get dropped. Make sure all the fragments of the packet are received and sent on the same interface pair.

## Passive Interfaces

Passive interfaces monitor traffic flowing across a network using a switch SPAN or mirror port. The SPAN or mirror port allows for traffic to be copied from other ports on the switch. This function provides the system visibility within the network without being in the flow of network traffic. When you configure the Firewall Threat Defense in a passive deployment, the Firewall Threat Defense cannot take certain actions such as blocking or shaping traffic. Passive interfaces receive all traffic unconditionally, and no traffic received on these interfaces is retransmitted. Encapsulated remote switched port analyzer (ERSPAN) interfaces allow you to monitor traffic from source ports distributed over multiple switches, and uses GRE to encapsulate the traffic. ERSPAN interfaces are only allowed when the Firewall Threat Defense is in routed firewall mode.

**Note** Using SR-IOV interfaces as passive interfaces on NGFWv is not supported on some Intel network adapters (such as Intel X710 or 82599) using SR-IOV drivers due to a promiscuous mode restriction. In such cases, use a network adapter that supports this functionality. See [Intel Ethernet Products](#) for more information on Intel network adapters.

## About Hardware Bypass for Inline Sets

For certain interface modules on the supported models (see [Requirements and Prerequisites for Inline Sets, on page 779](#)), you can enable the Hardware Bypass feature. Hardware Bypass ensures that traffic continues to flow between an inline interface pair during a power outage. This feature can be used to maintain network connectivity in the case of software or hardware failures.

### Hardware Bypass Triggers

Hardware Bypass can be triggered in the following scenarios:

- Firewall Threat Defense crash
- Firewall Threat Defense reboot
- Security Module reboot
- Chassis crash
- Chassis reboot
- Manual trigger
- Chassis power loss
- Security Module power loss

---

**Note** Hardware bypass is intended for unplanned/unexpected failure scenarios, and is not automatically triggered during planned software upgrades. Hardware bypass only engages at the end of a planned upgrade process, when the Firewall Threat Defense application reboots.

---

### Hardware Bypass Switchover

When switching from normal operation to hardware bypass or from hardware bypass back to normal operation, traffic may be interrupted for several seconds. A number of factors can affect the length of the interruption; for example, copper port auto-negotiation; behavior of the optical link partner such as how it handles link faults and de-bounce timing; spanning tree protocol convergence; dynamic routing protocol convergence; and so on. During this time, you may experience dropped connections.

You may also experience dropped connections due to application identification errors when analyzing connections midstream after the return to normal operations.

### Snort Fail Open vs. Hardware Bypass

For inline sets other than those in tap mode, you can use the Snort Fail Open option to either drop traffic or allow traffic to pass without inspection when the Snort process is busy or down. Snort Fail Open is supported on all inline sets except those in tap mode, not just on interfaces that support Hardware Bypass.

The Hardware Bypass functionality allows traffic to flow during a hardware failure, including a complete power outage, and certain limited software failures. A software failure that triggers Snort Fail Open does not trigger a Hardware Bypass.

## Hardware Bypass Status

If the system has power, then the Bypass LED indicates the Hardware Bypass status. See the Firepower chassis hardware installation guide for LED descriptions.

# Requirements and Prerequisites for Inline Sets

### User Roles

- Admin
- Access Admin
- Network Admin

### Hardware Bypass Support

The Firewall Threat Defense supports Hardware Bypass for interface pairs on specific network modules on the following models:

- Firepower 2130 and 2140
- Secure Firewall 3100
- Firepower 4100
- Secure Firewall 4200
- Firepower 9300

**Note** The ISA 3000 has a separate implementation for Hardware Bypass, which you can enable using FlexConfig only (see [FlexConfig Policies, on page 2477](#)). Do not use this chapter to configure ISA 3000 Hardware Bypass.

**Note** You can use Hardware Bypass interfaces as regular interfaces without the Hardware Bypass feature enabled.

The supported Hardware Bypass network modules for these models include:

- Firepower 2130 and 2140:
  - Firepower 6-port 1G SX FTW Network Module single-wide (FPR2K-NM-6X1SX-F)
  - Firepower 6-port 10G SR FTW Network Module single-wide (FPR2K-NM-6X10SR-F)
  - Firepower 6-port 10G LR FTW Network Module single-wide (FPR2K-NM-6X10LR-F)
- Secure Firewall 3100:
  - 6-port 1G SFP Fail-to-Wire Network Module, SX (multimode) (FPR3K-XNM-6X1SXF)
  - 6-port 10G SFP Fail-to-Wire Network Module, SR (multimode) (FPR3K-XNM-6X10SRF)

- 6-port 10G SFP Fail-to-Wire Network Module, LR (single mode) (FPR3K-XNM-6X10LRF)
- 6-port 25G SFP Fail-to-Wire Network Module, SR (multimode) (FPR3K-XNM-X25SRF)
- 6-port 25G Fail-to-Wire Network Module, LR (single mode) (FPR3K-XNM-6X25LRF)
- 8-port 1G Copper Fail-to-Wire Network Module, RJ45 (copper) (FPR3K-XNM-8X1GF)
- Secure Firewall 4200:
  - 6-port 1G SFP Fail-to-Wire Network Module, SX (multimode) (FPR4K-XNM-6X1SXF)
  - 6-port 10G SFP Fail-to-Wire Network Module, SR (multimode) (FPR4K-XNM-6X10SRF)
  - 6-port 10G SFP Fail-to-Wire Network Module, LR (single mode) (FPR4K-XNM-6X10LRF)
  - 6-port 25G SFP Fail-to-Wire Network Module, SR (multimode) (FPR4K-XNM-X25SRF)
  - 6-port 25G Fail-to-Wire Network Module, LR (single mode) (FPR4K-XNM-6X25LRF)
  - 8-port 1G Copper Fail-to-Wire Network Module, RJ45 (copper) (FPR4K-XNM-8X1GF)
- Firepower 4100:
  - Firepower 6-port 1G SX FTW Network Module single-wide (FPR4K-NM-6X1SX-F)
  - Firepower 6-port 10G SR FTW Network Module single-wide (FPR4K-NM-6X10SR-F)
  - Firepower 6-port 10G LR FTW Network Module single-wide (FPR4K-NM-6X10LR-F)
  - Firepower 2-port 40G SR FTW Network Module single-wide (FPR4K-NM-2X40G-F)
  - Firepower 8-port 1G Copper FTW Network Module single-wide (FPR-NM-8X1G-F)
- Firepower 9300:
  - Firepower 6-port 10G SR FTW Network Module single-wide (FPR9K-NM-6X10SR-F)
  - Firepower 6-port 10G LR FTW Network Module single-wide (FPR9K-NM-6X10LR-F)
  - Firepower 2-port 40G SR FTW Network Module single-wide (FPR9K-NM-2X40G-F)

Hardware Bypass can only use the following port pairs:

- 1 & 2
- 3 & 4
- 5 & 6
- 7 & 8

## Guidelines for Inline Sets and Passive Interfaces

### Firewall Mode

- ERSPAN interfaces are only allowed when the device is in routed firewall mode.

## Clustering

- Link State Propagation for an inline set is not supported with clustering.

## Multi-Instance Mode

- Multi-instance shared interfaces are not supported. You must use an unshared interface.
- Multi-instance chassis-defined subinterfaces are not supported. You must use a physical interface or EtherChannel.

## General Guidelines

- Inline sets and passive interfaces support physical interfaces and EtherChannels only, and cannot use VLANs or other virtual interfaces, including multi-instance chassis-defined subinterfaces.
- Since IPS interfaces do not support regular firewall protections, the IPS security policy (Snort) requires that traffic flows pass through the same Firewall Threat Defense so that all traffic can be inspected.
- Bidirectional Forwarding Detection (BFD) echo packets are not allowed through the Firewall Threat Defense when using inline sets. If there are two neighbors on either side of the Firewall Threat Defense running BFD, then the Firewall Threat Defense will drop BFD echo packets because they have the same source and destination IP address and appear to be part of a LAND attack.
- For inline sets and passive interfaces, the Firewall Threat Defense supports up to two 802.1Q headers in a packet (also known as Q-in-Q support), with the exception of the Firepower 4100/9300, which only supports one 802.1Q header. **Note:** Firewall-type interfaces do not support Q-in-Q, and only support one 802.1Q header.

## Hardware Bypass Guidelines

- Hardware Bypass ports are supported only for inline sets.
- Hardware Bypass ports cannot be part of an EtherChannel.
- Hardware Bypass is not supported in high availability mode.
- Hardware Bypass ports are supported with intra-chassis clustering on the Firepower 9300. Ports are placed in Hardware Bypass mode when the last unit in the chassis fails. Inter-chassis clustering is not supported, because inter-chassis clustering only supports Spanned EtherChannels; Hardware Bypass ports cannot be part of an EtherChannel.
- If all modules in an intra-chassis cluster on the Firepower 9300 fail, then Hardware Bypass is triggered on the final unit, and traffic continues to pass. When units come back up, Hardware Bypass returns to standby mode. However, when you use rules that match application traffic, those connections may be dropped and need to be reestablished. Connections are dropped because state information is not retained on the cluster unit, and the unit cannot identify the traffic as belonging to an allowed application. To avoid a traffic drop, use a port-based rule instead of an application-based rule, if appropriate for your deployment.
- You can use Hardware Bypass interfaces as regular interfaces without the Hardware Bypass feature enabled.

### Unsupported Firewall Features on IPS Interfaces

- DHCP server
- DHCP relay
- DHCP client
- TCP Intercept
- Routing
- NAT
- VPN
- Application inspection
- QoS
- NetFlow
- VXLAN

## Configure a Passive Interface

This section describes how to:

- Enable the interface. By default, interfaces are disabled.
- Set the interface mode to Passive or ERSPAN. For ERSPAN interfaces, you will set the ERSPAN parameters and the IP address.
- Change the MTU. By default, the MTU is set to 1500 bytes. For more information about the MTU, see [About the MTU, on page 759](#).
- Set a specific speed and duplex (if available). By default, speed and duplex are set to Auto.

**Note** For the Secure Firewall Threat Defense on the FXOS chassis, you configure basic interface settings on the Firepower 4100/9300. See [Configure a Physical Interface, on page 256](#) for more information.

### Before you begin

- If you are using EtherChannels, add them according to [Configure an EtherChannel, on page 670](#).

### Procedure

- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** In the **Mode** drop-down list, choose **Passive** or **Ersparn**.
- Step 4** Enable the interface by checking the **Enabled** check box.
- Step 5** In the **Name** field, enter a name up to 48 characters in length.
- Step 6** From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.
- Step 7** (Optional) Add a description in the **Description** field.  
The description can be up to 200 characters on a single line, without carriage returns.
- Step 8** (Optional) On **General**, set the **MTU** between 64 and 9198 bytes; for the Secure Firewall Threat Defense Virtual and Secure Firewall Threat Defense on the FXOS chassis, the maximum is 9000 bytes.  
The default is 1500 bytes.
- Step 9** For ERSPAN interfaces, set the following parameters:
- **Flow Id**—Configure the ID used by the source and destination sessions to identify the ERSPAN traffic, between 1 and 1023. This ID must also be entered in the ERSPAN destination session configuration.
  - **Source IP**—Configure the IP address used as the source of the ERSPAN traffic.
- Step 10** For ERSPAN interfaces, set the IPv4 address and mask on **IPv4**.
- Step 11** (Optional) Set the duplex and speed by clicking **Hardware Configuration**.  
The exact speed and duplex options depend on your hardware.
- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default.
  - **Speed**—Choose **10**, **100**, **1000**, or **Auto**. Auto is the default.
- Step 12** Click **OK**.
- Step 13** Click **Save**.  
You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure an Inline Set

This section enables and names two physical interfaces or EtherChannels per inline pair that you can add to an inline set. You can add multiple inline pairs per inline set. You can also optionally enable Hardware Bypass for supported inline pairs.

**Note** For the Firepower 4100/9300, you configure basic interface settings in FXOS on the chassis. See [Configure a Physical Interface, on page 256](#) for more information.

**Before you begin**

- If you are using EtherChannels, add them according to [Configure an EtherChannel, on page 670](#).
- We recommend that you set STP PortFast for STP-enabled switches that connect to the Firewall Threat Defense inline pair interfaces. This setting is especially useful for Hardware Bypass configurations and can reduce bypass times.

**Procedure**

**Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

**Step 2** For each interface in the inline pair, name the interface and enable it. You can also configure other hardware settings. Be sure to match the hardware settings for each interface in the inline pair. You can configure multiple pairs of interfaces.

- a) Click **Edit** (✎) for the interface you want to edit.
- b) In the **Name** field, enter a name up to 48 characters in length.
- c) Enable the interface by checking the **Enabled** check box.
- d) (Optional) Add a description in the **Description** field.

The description can be up to 200 characters on a single line, without carriage returns.

- e) Leave the **Mode** as **None**.

After you add this interface to an inline set, this field will show Inline for the mode.

- f) Do not set the security zone yet; you must set it after you create the inline set later in this procedure.
- g) (Optional) Set the duplex and speed by clicking **Hardware Configuration**.

The exact speed and duplex options depend on your hardware.

- **Duplex**—Choose **Full**, **Half**, or **Auto**. Auto is the default.
- **Speed**—Choose **10**, **100**, **1000**, or **Auto**. Auto is the default.

- h) Click **OK**.

Do not set any other settings for this interface.

**Step 3** Click **Inline Sets**.

**Step 4** Click **Add Inline Set**.

Figure 356: Add Inline Set

The screenshot shows the 'Add Inline Set' dialog box with the 'General' tab active. The 'Name\*' field is empty. The 'MTU\*' field contains '1500'. The 'Bypass' dropdown menu is open, showing three options: 'Disabled' (highlighted), 'Standby', and 'Bypass-Force'. Below the dropdown are two empty boxes labeled 'Available Interface Pairs' and 'Selected Interface Pair'. At the bottom right are 'Cancel' and 'OK' buttons.

The **Add Inline Set** dialog box appears with **General** selected.

**Step 5** In the **Name** field, enter a name for the set.

**Step 6** (Optional) Change the **MTU** to enable jumbo frames.

For inline sets, the MTU setting is not used. However, the jumbo frame setting *is* relevant to inline sets; jumbo frames enable the inline interfaces to receive packets up to 9000 bytes. To enable jumbo frames, you must set the MTU of *any* interface on the device above 1500 bytes.

**Step 7** Configure Hardware Bypass.

a) For the **Bypass** mode, choose one of the following options:

- **Disabled**—Set Hardware Bypass to disabled for interfaces where Hardware Bypass is supported, or use interfaces where Hardware Bypass is not supported.
- **Standby**—Set Hardware Bypass to the standby state on supported interfaces. Only pairs of Hardware Bypass interfaces are shown. In the standby state, the interfaces remain in normal operation until there is a trigger event.
- **Bypass-Force**—Manually forces the interface pair to go into a bypass state. **Inline Sets** shows **Yes** for any interface pairs that are in Bypass-Force mode.

b) In the **Available Interfaces Pairs** area, click a pair and then click **Add** to move it to the **Selected Interface Pair** area.

All possible pairings between named and enabled interfaces with the mode set to None show in this area.

**Step 8** (Optional) Click **Advanced** to set the following optional parameters:

- **Tap Mode**—Set to inline tap mode.

Note that you cannot enable this option and strict TCP enforcement on the same inline set.

**Note**

If you need to enable or disable the Tap mode, you should do so during a maintenance window. Changing the mode while the device is passing traffic can cause traffic disruption.

**Note**

Tap mode *significantly* impacts the Firewall Threat Defense performance, depending on the traffic.

- **Propagate Link State**—Configure link state propagation.

Link state propagation automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down. When the downed interface comes back up, the second interface automatically comes back up, also. In other words, if the link state of one interface changes, the device senses the change and updates the link state of the other interface to match it. Note that devices require up to 4 seconds to propagate link state changes. Link state propagation is especially useful in resilient network environments where routers are configured to reroute traffic automatically around network devices that are in a failure state.

**Note**

Do not enable **Propagate Link State** when using clustering.

- **Snort Fail Open**—Enable or disable either or both of the **Busy** and **Down** options if you want new and existing traffic to pass without inspection (enabled) or drop (disabled) when the Snort process is busy or down.

By default, traffic passes without inspection when the Snort process is down, and drops when it is busy.

When the Snort process is:

- **Busy**—It cannot process traffic fast enough because traffic buffers are full, indicating that there is more traffic than the device can handle, or because of other software resource issues.
- **Down**—It is restarting because you deployed a configuration that requires it to restart. See [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#).

When the Snort process is down and comes back up, it inspects *new* connections. To prevent false positives and false negatives, it does not inspect existing connections on inline, routed, or transparent interfaces because initial session information might have been lost while it was down.

**Note**

When Snort fails open, features that rely on the Snort process do not function. These include application control and deep inspection. The system performs only basic access control using simple, easily determined transport and network layer characteristics.

**Note**

The **Strict TCP Enforcement** option is not supported.

**Step 9**

Set the security zone for each interface.

- a) Click **Interfaces**.
- b) Click **Edit** (✎) for the member interface.
- c) From the **Security Zone** drop-down list, choose a security zone or add a new one by clicking **New**.

You can only set the zone after you add the interface to the inline set; adding it to an inline set configures the mode to Inline and lets you choose inline-type security zones.

d) Click **OK**.

#### Step 10

Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## History for Inline Sets and Passive Interfaces

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Synchronization between the Firewall Threat Defense operational link state and the physical link state for the Firepower 4100/9300	6.7	Any	<p>The Firepower 4100/9300 chassis can now synchronize the Firewall Threat Defense operational link state with the physical link state for data interfaces. Currently, interfaces will be in an Up state as long as the FXOS admin state is up and the physical link state is up. The Firewall Threat Defense application interface admin state is not considered. Without synchronization from Firewall Threat Defense, data interfaces can be in an Up state physically before the Firewall Threat Defense application has completely come online, for example, or can stay Up for a period of time after you initiate a shutdown. For inline sets, this state mismatch can result in dropped packets because external routers may start sending traffic to the Firewall Threat Defense before the Firewall Threat Defense can handle it. This feature is disabled by default, and can be enabled per logical device in FXOS.</p> <p><b>Note</b> This feature is not supported for clustering, container instances, or Firewall Threat Defense with a Radware vDP decorator. It is also not supported for ASA.</p> <p>New/Modified Firepower Chassis Manager screens: <b>Logical Devices &gt; Enable Link State</b></p> <p>New/Modified FXOS commands: <b>set link-state-sync enabled, show interface expand detail</b></p> <p>Supported platforms: Firepower 4100/9300</p>

Inline set link state propagation support for the Firewall Threat Defense	6.1.0	Any	<p>When you configure an inline set in the Firewall Threat Defense application and enable link state propagation, the Firewall Threat Defense sends inline set membership to the FXOS chassis. Link state propagation means that the chassis automatically brings down the second interface in the inline interface pair when one of the interfaces in an inline set goes down.</p> <p>New/Modified FXOS commands: <b>show fault  grep link-down, show interface detail</b></p>

## CHAPTER 17

# DHCP and DDNS

The following topics explain DHCP and DDNS services and how to configure them on Threat Defense devices.

- [About DHCP and DDNS Services, on page 791](#)
- [Requirements and Prerequisites for DHCP and DDNS, on page 793](#)
- [Guidelines for DHCP and DDNS Services, on page 793](#)
- [Configure the DHCPv4 Server, on page 795](#)
- [Configure the DHCPv6 Stateless Server, on page 796](#)
- [Configure the DHCP Relay Agent, on page 801](#)
- [Configure Dynamic DNS, on page 802](#)
- [History for DHCP and DDNS, on page 808](#)

## About DHCP and DDNS Services

The following topics describe the DHCP server, DHCP relay agent, and DDNS update.

### About the DHCPv4 Server

DHCP provides network configuration parameters, such as IP addresses, to DHCP clients. The Firewall Threat Defense device can provide a DHCP server to DHCP clients attached to Firewall Threat Defense device interfaces. The DHCP server provides network configuration parameters directly to DHCP clients.

An IPv4 DHCP client uses a broadcast rather than a multicast address to reach the server. The DHCP client listens for messages on UDP port 68; the DHCP server listens for messages on UDP port 67.

### DHCP Options

DHCP provides a framework for passing configuration information to hosts on a TCP/IP network. The configuration parameters are carried in tagged items that are stored in the Options field of the DHCP message and the data are also called options. Vendor information is also stored in Options, and all of the vendor information extensions can be used as DHCP options.

For example, Cisco IP Phones download their configuration from a TFTP server. When a Cisco IP Phone starts, if it does not have both the IP address and TFTP server IP address preconfigured, it sends a request with option 150 or 66 to the DHCP server to obtain this information.

- DHCP option 150 provides the IP addresses of a list of TFTP servers.

- DHCP option 66 gives the IP address or the hostname of a single TFTP server.
- DHCP option 3 sets the default route.

A single request might include both options 150 and 66. In this case, the DHCP server provides values for both options in the response if they are already configured on the Firewall Threat Defense.

You can use advanced DHCP options to provide DNS, WINS, and domain name parameters to DHCP clients; DHCP option 15 is used for the DNS domain suffix. You can also use the DHCP automatic configuration setting to obtain these values or define them manually. When you use more than one method to define this information, it is passed to DHCP clients in the following sequence:

1. Manually configured settings.
2. Advanced DHCP options settings.
3. DHCP automatic configuration settings.

For example, you can manually define the domain name that you want the DHCP clients to receive and then enable DHCP automatic configuration. Although DHCP automatic configuration discovers the domain together with the DNS and WINS servers, the manually defined domain name is passed to DHCP clients with the discovered DNS and WINS server names, because the domain name discovered by the DHCP automatic configuration process is superseded by the manually defined domain name.

## About the DHCPv6 Stateless Server

For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature ([Enable the IPv6 Prefix Delegation Client, on page 750](#)), you can configure the Firewall Threat Defense to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the Firewall Threat Defense by defining a DHCP IPv6 Pool and assigning it to the DHCPv6 server. The Firewall Threat Defense only accepts IR packets and does not assign addresses to the clients. You will configure the client to generate its own IPv6 address by enabling IPv6 autoconfiguration on the client. Enabling stateless autoconfiguration on a client configures IPv6 addresses based on prefixes received in Router Advertisement messages; in other words, based on the prefix that the Firewall Threat Defense received using Prefix Delegation.

## About the DHCP Relay Agent

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firewall Threat Defense device because it does not forward broadcast traffic. The DHCP relay agent lets you configure the interface of the Firewall Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another device.

# Guidelines for DHCP and DDNS Services

This section includes guidelines and limitations that you should check before configuring DHCP and DDNS services.

## Firewall Mode

- DHCP Relay is not supported in transparent firewall mode or in routed mode on the BVI or bridge group member interface.
- DHCP Server is supported in transparent firewall mode on a bridge group member interface. In routed mode, the DHCP server is supported on the BVI interface, not the bridge group member interface. The BVI must have a name for the DHCP server to operate.
- DDNS is not supported in transparent firewall mode or in routed mode on the BVI or bridge group member interface.
- DHCPv6 stateless server is not supported in transparent firewall mode or in routed mode on the BVI or bridge group member interface.

## Clustering

- DHCPv6 stateless server is not supported with clustering.

## IPv6

Supports IPv6 for DHCP stateless server and DHCP Relay.

## DHCPv4 Server

- The maximum available DHCP pool is 256 addresses.
- You can configure a DHCP server on any interface with a name and IP address, such as a physical interface, a subinterface, or a BVI in routed mode.

- You can configure only one DHCP server on each interface. Each interface can have its own pool of addresses to use. However the other DHCP settings, such as DNS servers, domain name, options, ping timeout, and WINS servers, are configured globally and used by the DHCP server on all interfaces.
- You cannot configure an interface as a DHCP client if that interface also has DHCP server enabled; you must use a static IP address.
- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.
- The Firewall Threat Defense does not support DHCP clients behind DHCP relay servers; the client must be directly connected to the Firewall Threat Defense.
- The DHCP server does not support BOOTP requests.

### DHCPv6 Server

The DHCPv6 Stateless server cannot be configured on an interface where the DHCPv6 address, Prefix Delegation client, or DHCPv6 relay is configured.

### DHCP Relay

- You can configure a maximum of 10 DHCPv4 relay servers per virtual router, global (VRF) and interface-specific servers combined, with a maximum of 4 servers per interface.
- You can configure a maximum of 10 DHCPv6 relay servers per virtual router. Interface-specific servers for IPv6 are not supported.
- You cannot configure both a DHCP server and DHCP relay on the same device, even if you want to enable them on different interfaces; you can only configure one type of service.
- DHCP relay services are not available in transparent firewall mode or in routed mode on the BVI or bridge group member interface. You can, however, allow DHCP traffic through using an access rule. To allow DHCP requests and replies through the Firewall Threat Defense, you need to configure two access rules, one that allows DHCP requests from the inside interface to the outside (UDP destination port 67), and one that allows the replies from the server in the other direction (UDP destination port 68).
- For IPv4, clients must be directly-connected to the Firewall Threat Defense and cannot send requests through another relay agent or a router. For IPv6, the Firewall Threat Defense supports packets from another relay server.
- The DHCP clients must be on different interfaces from the DHCP servers to which the Firewall Threat Defense relays requests.
- You cannot enable DHCP Relay on an interface in a traffic zone.

### DDNS Service

The firewall's DDNS supports only DynDNS service. Hence, ensure that the DDNS is configured with update URL in the following syntax:

**https://username:password@provider-domain/path?hostname=<h>&myip=<a>.**

# Configure the DHCPv4 Server

See the following steps to configure a DHCPv4 server.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Select **DHCP > DHCP Server**.
- Step 3** Configure the following DHCP server options:
- **Ping Timeout**—The amount of time in milliseconds that Firewall Threat Defense device waits to time out a DHCP ping attempt. Valid values range from 10 to 10000 milliseconds. The default value is 50 milliseconds.  
  
To avoid address conflicts, the Firewall Threat Defense device sends two ICMP ping packets to an address before assigning that address to a DHCP client.
  - **Lease Length**—The amount of time in seconds that the client may use its allocated IP address before the lease expires. Valid values range from 300 to 1048575 seconds. The default value is 3600 seconds (1 hour).
  - (Routed mode) **Auto-configuration**—Enables DHCP auto configuration on the Firewall Threat Defense device. Auto-configuration enables the DHCP server to provide the DHCP clients with the DNS server, domain name, and WINS server information obtained from a DHCP client running on the specified interface. Otherwise, you can disable auto configuration and add the values yourself in Step 4.
  - (Routed mode) **Interface**—Specifies the interface to be used for auto configuration. For a device with virtual routing capability, this interface can only be a global virtual router interface.
- Step 4** To override auto-configured settings, do the following:
- Enter the domain name of the interface. For example, your device may be in the Your\_Company domain.
  - From the drop-down list, choose the DNS servers (primary and secondary) configured for the interface. To add a new DNS server, see [Creating Network Objects, on page 1283](#).
  - From the drop-down list, choose the WINS servers (primary and secondary) configured for the interface. To add a new WINS server, see [Creating Network Objects, on page 1283](#).
- Step 5** Select **Server**, click **Add**, and configure the following options:
- **Interface**—Choose the interface from the drop-down list. In transparent mode, specify a named bridge group member interface. In routed mode, specify a named routed interface or a named BVI; do not specify the bridge group member interface. Note that each bridge group member interface for the BVI must also be named for the DHCP server to operate.
  - **Address Pool**—The range of IP addresses from lowest to highest that is used by the DHCP server. The range of IP addresses must be on the same subnet as the selected interface and cannot include the IP address of the interface itself.
  - **Enable DHCP Server**—Enables the DHCP server on the selected interface.

**Step 6** Click **OK** to save the DHCP server configuration.

**Step 7** (Optional) Select **Advanced**, click **Add**, and specify the type of information you want the option to return to the DHCP client:

- **Option Code**—The Firewall Threat Defense device supports the DHCP options listed in RFC 2132, RFC 2562, and RFC 5510 to send information. All DHCP options (1 through 255) are supported except for 1, 12, 50–54, 58–59, 61, 67, and 82. See [About the DHCPv4 Server, on page 791](#) for more information on DHCP option codes.

**Note**

The Firewall Threat Defense device does not verify that the option type and value that you provide match the expected type and value for the option code, as defined in RFC 2132. For more information about option codes and their associated types and expected values, see RFC 2132.

- **Type**—DHCP option type. Available options include **IP**, **ASCII**, and **HEX**. If you chose IP, you must add IP addresses in the IP Address fields. If you chose ASCII, you must add the ASCII value in the ASCII field. If you chose HEX, you must add the HEX value in the HEX field.
- **IP Address 1** and **IP Address 2**—The IP address(es) to be returned with this option code. To add a new IP address, see [Creating Network Objects, on page 1283](#).
- **ASCII**—The ASCII value that is returned to the DHCP client. The string cannot include spaces.
- **HEX**—The HEX value that is returned to the DHCP client. The string must have an even number of digits and no spaces. You do not need to use a 0x prefix.

**Step 8** Click **OK** to save the option code configuration.

**Step 9** Click **Save** on the DHCP page to save your changes.

**Step 10** To view DHCP bindings, use the following command.

**show dhcpd binding**

**Example:**

```
> show dhcpd binding
IP Address Client-id Lease Expiration Type
10.0.1.100 0100.a0c9.868e.43 84985 seconds automatic
```

## Configure the DHCPv6 Stateless Server

For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature, you can configure the Firewall Threat Defense to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the Firewall Threat Defense.

## Create the DHCP IPv6 Pool

Create a DHCP IPv6 Pool for use with the DHCPv6 server. The DHCPv6 server provides information such as the DNS server or domain name when they clients send Information Request (IR) packets to the Firewall Threat Defense. The DHCP IPv6 Pool defines the parameters to sent in IR messages.

This feature is only supported in routed mode. This feature is not supported in clustering or High Availability.

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **DHCP IPv6 Pool** from the list of object types.
- Step 3** Click **Add** (+).
- Step 4** Configure the **DNS Server** and **Domain Name**.

You can either manually define the values and click **Add**, or you can check **Import** to use one or more parameters that the Firewall Threat Defense obtained from the DHCPv6 server on the Prefix Delegation client interface. You can mix and match manually-configured parameters with imported parameters; however, you cannot configure the same parameter manually and also use **Import**.

**Figure 357: Manually Define Values**

Add DHCP IPv6 Pool

DNS Server Add

Domain Name Add

☒ Import ☒ Import

**Step 5** Define **Other Server Options**.

You can define the domain name and IP address for the following servers:

- NIS
- NISP
- SIP
- SNTTP

- a) Click **Add** (+).

Figure 359: Other Server Options

Other Server Options

+

- b) Choose the server type under **Option**, and either manually define the **Domain Name** and **Address**, or check **Import**.

☒ Import

Cancel Save

**Import** uses one or more parameters that the Firewall Threat Defense obtained from the DHCPv6 server on the Prefix Delegation client interface. You can mix and match manually-configured parameters with imported parameters; however, you cannot configure the same parameter manually and also use **Import**.

- c) Click **Save**.
- d) Repeat for each server type.

**Step 6** Click **Save**.

**Step 7** Use this pool with the DHCPv6 server. See [Enable the DHCPv6 Stateless Server, on page 799](#).

## Enable the DHCPv6 Stateless Server

For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature ([Enable the IPv6 Prefix Delegation Client, on page 750](#)), you can configure the Firewall Threat Defense to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the Firewall Threat Defense. The Firewall Threat Defense only accepts IR packets and does not assign addresses to the clients. You will configure the client to generate its own IPv6 address by enabling IPv6 autoconfiguration on the client. Enabling stateless autoconfiguration on a client configures IPv6 addresses

based on prefixes received in Router Advertisement messages; in other words, based on the prefix that the Firewall Threat Defense received using Prefix Delegation.

This feature is only supported in routed mode. This feature is not supported in clustering or High Availability.

### Before you begin

Add a DHCP IPv6 Pool object. See [Create the DHCP IPv6 Pool, on page 796](#). This object defines the server parameters included in the IR messages.

### Procedure

**Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.

**Step 2** Click **Edit** (✎) for the interface you want to edit.

**Step 3** Click the **IPv6** page, and then click **DHCP**.

**Step 4** Click **DHCP Server Pool**, and choose the object you created earlier.

*Figure 361: Enable the DHCPv6 Server*

The screenshot shows the 'Edit Physical Interface' configuration page. The 'IPv6' tab is selected, and the 'DHCP' sub-tab is active. The 'DHCP' section contains the following options:

- ☐ Enable DHCP Client
- ☐ Enable default route using DHCP
- ☐ Enable DHCP for address config
- ☒ Enable DHCP for non-address config
- ☒ DHCP Server pool (with a dropdown menu showing 'pool1')
- ☐ Client PD Prefix Name

**Step 5** Check **Enable DHCP for non-address config** to inform SLAAC clients about the DHCPv6 server.

This flag informs IPv6 autoconfiguration clients that they should use DHCPv6 to obtain additional information from DHCPv6, such as the DNS server address.

**Step 6** Click **OK**.

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

# Configure the DHCP Relay Agent

You can configure a DHCP relay agent to forward DHCP requests received on an interface to one or more DHCP servers. DHCP clients use UDP broadcasts to send their initial DHCPDISCOVER messages because they do not have information about the network to which they are attached. If the client is on a network segment that does not include a server, UDP broadcasts normally are not forwarded by the Firewall Threat Defense device because it does not forward broadcast traffic.

You can remedy this situation by configuring the interface of the Firewall Threat Defense device that is receiving the broadcasts to forward DHCP requests to a DHCP server on another interface.

---

**Note** DHCP Relay is not supported in transparent firewall mode.

---

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Select **DHCP > DHCP Relay**.
- Step 3** In the **IPv4 Relay Timeout** and **IPv6 Relay Timeout** fields, enter the amount of time in seconds that the Firewall Threat Defense device waits to time out the DHCP relay agent. Valid values range from 1 to 3600 seconds. The default value is 60 seconds.
- The timeout is for address negotiation through the local DHCP Relay agent.
- Step 4** (Optional) Check **Trust All Information** to set all client interfaces as trusted.
- You can configure interfaces as trusted interfaces to preserve DHCP Option 82. DHCP Option 82 is used by downstream switches and routers for DHCP snooping and IP Source Guard. Normally, if the Firewall Threat Defense DHCP relay agent receives a DHCP packet with Option 82 already set, but the giaddr field (which specifies the DHCP relay agent address that is set by the relay agent before it forwards the packet to the server) is set to 0, then the Firewall Threat Defense will drop that packet by default. You can preserve Option 82 and forward the packet by identifying an interface as a trusted interface.
- Step 5** On **DHCP Relay Agent**, click **Add**, and configure the following options:
- **Interface**—The interface connected to the DHCP clients.
  - **Enable IPv4 Relay**—Enables IPv4 DHCP Relay for this interface.
  - **Set Route**—(For IPv4) Changes the default gateway address in the DHCP message from the server to that of the Firewall Threat Defense device interface that is closest to the DHCP client, which relayed the original DHCP request. This action allows the client to set its default route to point to the Firewall Threat Defense device even if the DHCP server specifies a different router. If there is no default router option in the packet, the Firewall Threat Defense device adds one containing the interface address.
  - **Enable IPv6 Relay**—Enables IPv6 DHCP Relay for this interface.
- Step 6** Click **OK** to save the DHCP relay agent changes.
- Step 7** On **DHCP Servers**, click **Add**, and configure the following options:

Add the IPv4 and IPv6 server addresses as separate entries, even if they belong to the same server.

- **Server**—The IP address of the DHCP server. Chose an IP address from the drop-down list. To add a new one, see [Creating Network Objects, on page 1283](#)
- **Interface**—The interface to which the specified DHCP server is attached. The DHCP Relay agent and the DHCP server cannot be configured on the same interface.

**Step 8** Click **OK** to save the DHCP server changes.

**Step 9** Click **Save** on the DHCP page to save your changes.

---

## Configure Dynamic DNS

When an interface uses DHCP IP addressing, the assigned IP address can change when the DHCP lease is renewed. When the interface needs to be reachable using a fully qualified domain name (FQDN), the IP address change can cause the DNS server resource records (RRs) to become stale. Dynamic DNS (DDNS) provides a mechanism to update DNS RRs whenever the IP address or hostname changes. You can also use DDNS for static or PPPoE IP addressing.

DDNS updates the following RRs on the DNS server: the A RR includes the name-to-IP address mapping, while the PTR RR maps addresses to names.

The Firewall Threat Defense supports the following DDNS update methods:

- **Standard DDNS**—The standard DDNS update method is defined by RFC 2136.

With this method, the Firewall Threat Defense and the DHCP server use DNS requests to update the DNS RRs. The Firewall Threat Defense or DHCP server sends a DNS request to its local DNS server for information about the hostname and, based on the response, determines the main DNS server that owns the RRs. The Firewall Threat Defense or DHCP server then sends an update request directly to the main DNS server. See the following typical scenarios.

- The Firewall Threat Defense updates the A RR, and the DHCP server updates the PTR RR.

Typically, the Firewall Threat Defense "owns" the A RR, while the DHCP server "owns" the PTR RR, so both entities need to request updates separately. When the IP address or hostname changes, the Firewall Threat Defense sends a DHCP request (including the FQDN option) to the DHCP server to inform it that it needs to request a PTR RR update.

- The DHCP server updates both the A and PTR RR.

Use this scenario if the Firewall Threat Defense does not have the authority to update the A RR. When the IP address or hostname changes, the Firewall Threat Defense sends a DHCP request (including the FQDN option) to the DHCP server to inform it that it needs to request an A and PTR RR update.

You can configure different ownership depending on your security needs and the requirements of the main DNS server. For example, for a static address, the Firewall Threat Defense should own the updates for both records.

- **Web**—The Web update method uses the DynDNS Remote API specification (<https://help.dyn.com/remote-access-api/>).

With this method when the IP address or hostname changes, the Firewall Threat Defense sends an HTTP request directly to a DNS provider with which you have an account.

**Note** For devices that were registered using zero-touch provisioning from the outside interface, DDNS is automatically enabled using the "fmcOnly" method, which is similar to the Web method. This method is only available for zero-touch provisioning devices. You can edit some options for this method using this screen, or delete the method and configure a different one. For more information about zero-touch provisioning, see [Add a Device Using the Serial Number \(Zero-Touch Provisioning\)](#), on page 34.

The **DDNS** page also supports setting DHCP server settings relating to DDNS.

**Note** DDNS is not supported on the BVI or bridge group member interfaces.

### Before you begin

- Configure a DNS server group on **Objects > Object Management > DNS Server Group**, and then enable the group for the interface on **Devices > Platform Settings**, create or edit a Threat Defense policy and click **DNS**. See [DNS](#), on page 831.
- Configure the device hostname. You can configure the hostname when you perform the Firewall Threat Defense initial setup, or by using the **configure network hostname** command. If you do not specify the hostname per interface, then the device hostname is used.

### Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **DHCP > DDNS**.
- Step 3** Standard DDNS method: Configure a DDNS update method to enable DNS requests from the Firewall Threat Defense.

You do not need to configure a DDNS update method if the DHCP server will perform all requests.

- a) On **DDNS Update Methods**, click **Add**.
- b) Set the **Method Name**.
- c) Click **DDNS**.
- d) (Optional) Configure the **Update Interval** between DNS requests. By default when all values are set to 0, update requests are sent whenever the IP address or hostname changes. To send requests regularly, set the **Days** (0-364), **Hours**, **Minutes**, and **Seconds**.
- e) Set the **Update Records** you want the Firewall Threat Defense to update.

This setting only affects the records you want to update directly from the Firewall Threat Defense; to determine the records you want the DHCP server to update, configure the DHCP client settings per interface or globally. See, [Step 5](#), on page 804.

- **Not Defined**—Disables DNS updates from the Firewall Threat Defense.

- **Both A and PTR Records**—Sets the Firewall Threat Defense to update both A and PTR RRs. Use this option for static or PPPoE IP addressing.
- **A Records**—Sets the Firewall Threat Defense to update the A RR only. Use this option if you want the DHCP server to update the PTR RR.

- Click **OK**.
- Assign this method to the interface in [Step 5, on page 804](#).

**Step 4** Web method: Configure a DDNS update method to enable HTTP update requests from the Firewall Threat Defense.

- On **DDNS Update Methods**, click **Add**.
- Set the **Method Name**.
- Click **Web**.
- Set the **Web Update Type** to update IPv4, IPv6, or both types of addresses.
- Set the **Web URL**. Specify the update URL. Check with your DNS provider for the URL required.

Use the following syntax:

**`https://username:password@provider-domain/path?hostname=<h>&myip=<a>`**

**Example:**

**`https://jcrichon:pa$$w0rd17@domains.example.com/nic/update?hostname=<h>&myip=<a>`**

- (Optional) Configure the **Update Interval** between DNS requests. By default when all values are set to 0, update requests are sent whenever the IP address or hostname changes. To send requests regularly, set the **Days** (0-364), **Hours**, **Minutes**, and **Seconds**.
- Click **OK**.
- Assign this method to the interface in [Step 5, on page 804](#).
- The web type method for DDNS also requires you to identify the DDNS server root CA to validate the DDNS server certificate for the HTTPS connection. See, [Step 9, on page 806](#).

**Step 5** Configure interface settings for DDNS, including setting the update method, DHCP client settings, and the hostname for this interface.

- On **DDNS Interface Settings**, click **Add**.
- Choose the **Interface** from the drop-down list.
- Choose the **Method Name** that you created on the **DDNS Update Methods** page.

(Standard DDNS method) You do not need to assign a method if you want the DHCP server to perform all updates.

- Set the **Host Name** for this interface.

If you do not set the hostname, the device hostname is used. If you do not specify an FQDN, then the default domain from the DNS server group is appended (for static or PPPoE IP addressing) or the domain name from the DHCP server is appended (for DHCP IP addressing).

- Standard DDNS method: Configure the **DHCP Client requests DHCP server to update requests** to determine which records you want the DHCP server to update.

The Firewall Threat Defense sends DHCP client requests to the DHCP server. Note that the DHCP server must also be configured to support DDNS. The server can be configured to honor the client requests, or it can override the client (in which case, it will reply to the client so the client does not also try to perform updates that the server is performing).

For static or PPPoE IP addressing, these settings are ignored.

**Note**

You can also set these values globally for all interfaces on the **DDNS** page. The per-interface settings take precedence over the global settings.

- **Not Selected**—Disables DDNS requests to the DHCP server. Even if the client does not request DDNS updates, the DHCP server can be configured to send updates anyway.
- **No Update**—Requests the DHCP server not to perform updates. This setting works in conjunction with a DDNS update method with **Both A and PTR Records** enabled.
- **Only PTR**—Requests that the DHCP server perform the PTR RR update. This setting works in conjunction with a DDNS update method with **A Records** enabled.
- **Both A and PTR Records**—Requests that the DHCP server perform both A and PTR RR updates. This setting does not require a DDNS update method to be associated with the interface.

f) Click **OK**.

**Note**

The **Dynamic DNS Update** settings relate to DHCP server settings when you enable a DHCP server on the Firewall Threat Defense. See, [Step 6, on page 805](#) for more information.

**Step 6**

If you enable the DHCP server on an Firewall Threat Defense, you can configure DHCP server settings for DDNS.

To enable the DHCP server, see [Configure the DHCPv4 Server, on page 795](#)). You can configure the server behavior when DHCP clients use the standard DDNS update method. If the server performs any updates, then if the client lease expires (and is not renewed), the server will request that the DNS server remove the RRs for which it was responsible.

- a) You can configure server settings globally or per interface. For global settings, see the main **DDNS** page. For per-interface settings, see the **DDNS Interface Settings** page. Interface settings take precedence over global settings.
- b) Configure which DNS RRs you want the DHCP server to update under **Dynamic DNS Update**.
  - **Not Selected**—DDNS updates are disabled, even if the client requests them.
  - **Only PTR**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will only update the PTR RR. Otherwise, the server will update RRs that the client requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.
  - **Both A and PTR Records**—Enables DDNS updates. If you enable the **Override DHCP Client Requests** setting, then the server will update both the A and PTR RRs. Otherwise, the server will update RRs that the client requests. If the client does not send an update request with the FQDN option, the server will request an update for both A and PTR RRs using the hostname discovered in DHCP option 12.
- c) To override the update actions requested by the DHCP client, check **Override DHCP Client Requests**.

The server will reply to the client that the request was overridden, so the client does not also try to perform updates that the server is performing.

- Step 7** (Optional) Configure general DHCP client settings. These settings are not related to DDNS, but are related to how the DHCP client behaves.
- On the **DDNS** page, check **Enable DHCP Client Broadcast** to request that the DHCP server broadcast the DHCP reply (DHCP option 1).
  - To force a MAC address to be stored inside a DHCP request packet for option 61 instead of the default internally generated string, on **DDNS > DHCP Client ID Interface**, choose the interface from the **Available Interfaces** list, and then click **Add** to move it to the **Selected Interfaces** list.
- Some ISPs expect option 61 to be the interface MAC address. If the MAC address is not included in the DHCP request packet, then an IP address will not be assigned. This setting does not directly relate to DDNS, but is a general DHCP client setting.

**Step 8** Click **Save** on the Device page to save your changes.

**Step 9** The Web method for DDNS also requires you to identify the DDNS server root CA to validate the DDNS server certificate for the HTTPS connection.

The following example shows how to add a DDNS server's CA as a trustpoint.

- Obtain the DDNS server CA certificate. This procedure shows a manual import using PEM format, but you can also use PKCS12.
- In Firewall Management Center, choose **Devices > Certificates**, and click **Add**.
- Select a **Device**, and click **Add** (+).

**Add New Certificate**

Add a new certificate to the device using cert enrollment object which is used to generate CA and identify certificate.

Device\*:

## CHAPTER 18

# SNMP for the Firepower 1000/2100

This chapter describes how to configure SNMP for the Firepower 1000/2100.

- [About SNMP for the Firepower 1000/2100, on page 809](#)
- [Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100, on page 809](#)
- [Creating an SNMP Trap for Firepower 1000/2100, on page 811](#)
- [Creating an SNMP User for Firepower 1000/2100, on page 812](#)

## About SNMP for the Firepower 1000/2100

The Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

The SNMP framework consists of three parts:

- An SNMP manager—The system used to control and monitor the activities of network devices using SNMP.
- An SNMP agent—The software component within the Firepower 1000/2100 chassis that maintains the data for the Firepower chassis and reports the data, as needed, to the SNMP manager. The Firepower chassis includes the agent and a collection of MIBs. To enable the SNMP agent and create the relationship between the manager and agent, enable and configure SNMP in the Firewall Management Center.
- A managed information base (MIB)—The collection of managed objects on the SNMP agent.

The Firepower 1000/2100 chassis supports SNMPv1, SNMPv2c and SNMPv3. Both SNMPv1 and SNMPv2c use a community-based form of security.

## Enabling SNMP and Configuring SNMP Properties for Firepower 1000/2100

### Note

This procedure only applies to the Firepower 1000/2100.

## Procedure

**Step 1** Choose **Devices** > **Device Management**.

**Step 2** Click **SNMP**.

**Step 3** Complete the following fields:

Name	Description
<b>Admin State</b> check box	Whether SNMP is enabled or disabled. Enable this service only if your system includes integration with an SNMP server.
<b>Port</b> field	The port on which the Firepower chassis communicates with the SNMP host. You cannot change the default port.
<b>Community</b> field	<p>The default SNMPv1 or v2 community name or SNMP v3 username and password that the Firepower chassis includes on any trap messages it sends to the SNMP host.</p> <p>Enter a valid community string for SNMPv1 and SNMPv2:</p> <ul style="list-style-type: none"> <li>Alphanumeric string between 1 and 32 characters and special characters ! (exclamation), - (hyphen), ~ (tilde), &amp;&amp; (double ampersand), [ ] (square brackets), ^ (carat), ' (single quote), " (double quotes), and &lt; &gt; (angle brackets).</li> <li>Do not use @ (at sign), \ (backslash), ? (question mark) or an empty space.</li> <li>The string can also be in ASCII characters ranging 0x21 to 0x7E inclusive, excluding HTML interjection vectors, namely single quote ('), double quotes ("), and angle brackets (&lt; &gt;).</li> </ul> <p>Enter a valid username and password for SNMPv3:</p> <ul style="list-style-type: none"> <li>Username can be alphanumeric string and can include @ (at sign), \ (backslash), . (period), _ (underscore), and - (hyphen).</li> <li>The password restrictions are same as the community string restrictions.</li> </ul> <p>Note that if the <b>Community</b> field is already set, the text to the right of the empty field reads <b>Set: Yes</b>. If the <b>Community</b> field is not yet populated with a value, the text to the right of the empty field reads <b>Set: No</b>.</p>
<b>System Admin Name</b> field	<p>The contact person responsible for the SNMP implementation.</p> <p>Enter a string of up to 255 characters, such as an email address or a name and telephone number.</p>
<b>Location</b> field	<p>The location of the host on which the SNMP agent (server) runs.</p> <p>Enter an alphanumeric string up to 510 characters.</p>

**Step 4** Click **Save**.

#### What to do next

Create SNMP traps and users.

## Creating an SNMP Trap for Firepower 1000/2100

**Note** This procedure only applies to the Firepower 1000/2100.

#### Procedure

- Step 1** Choose **Devices > Device Management**.
- Step 2** Click **SNMP**.
- Step 3** In the **SNMP Traps Configuration** area, click **Add**.
- Step 4** In the **SNMP Trap Configuration** dialog box, complete the following fields:

Name	Description
<b>Host Name</b> field	The hostname or IP address of the SNMP host to which the Firepower chassis should send the trap.
<b>Community</b> field	The SNMP v1 or v2 community name or the SNMP v3 username the Firepower chassis includes when it sends the trap to the SNMP host. This must be the same as the community or username that is configured for the SNMP service.  Enter an alphanumeric string between 1 and 32 characters. Do not use @ (at sign), \ (backslash), " (double quote), ? (question mark) or an empty space.
<b>Port</b> field	The port on which the Firepower chassis communicates with the SNMP host for the trap.  Enter an integer between 1 and 65535.
<b>Version</b> field	The SNMP version and model used for the trap. This can be one of the following: <ul style="list-style-type: none"><li>• <b>V1</b></li><li>• <b>V2</b></li><li>• <b>V3</b></li></ul>

Name	Description
Type field	<p>If you select <b>V2</b> or <b>V3</b> for the version, the type of trap to send. This can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Traps</b></li> <li>• <b>Informs</b></li> </ul>
Privilege field	<p>If you select <b>V3</b> for the version, the privilege associated with the trap. This can be one of the following:</p> <ul style="list-style-type: none"> <li>• <b>Auth</b>—Authentication but no encryption</li> <li>• <b>Noauth</b>—No authentication or encryption</li> <li>• <b>Priv</b>—Authentication and encryption</li> </ul>

**Step 5** Click **OK** to close the **SNMP Trap Configuration** dialog box.

**Step 6** Click **Save**.

## Creating an SNMP User for Firepower 1000/2100

**Note** This procedure only applies to the Firepower 1000/2100.

### Procedure

**Step 1** Choose **Devices > Device Management**.

**Step 2** Click **SNMP**.

**Step 3** In the **SNMP Users Configuration** area, click **Add**.

**Step 4** In the **SNMP User Configuration** dialog box, complete the following fields:

Name	Description
Username field	<p>The username assigned to the SNMP user.</p> <p>Enter up to 32 letters or numbers. The name must begin with a letter and you can also specify _ (underscore), . (period), @ (at sign), and - (hyphen).</p>
Auth Algorithm Type field	The authorization type: <b>SHA</b> .

Name	Description
Use AES-128 checkbox	If checked, this user uses AES-128 encryption.  <b>Note</b> SNMPv3 does not support DES. If you leave the AES-128 box unchecked, no privacy encryption will be done and any configured privacy password will have no effect.
Authentication Password field	The password for the user.
Confirm field	The password again for confirmation purposes.
Encryption Password field	The privacy password for the user.
Confirm field	The privacy password again for confirmation purposes.

**Step 5** Click **OK** to close the **SNMP User Configuration** dialog box.

**Step 6** Click **Save**.

---

## CHAPTER 19

# Quality of Service

The following topics describe how to use the Quality of Service (QoS) feature to police network traffic using Firewall Threat Defense devices:

- [Introduction to QoS, on page 815](#)
- [About QoS Policies, on page 815](#)
- [Requirements and Prerequisites for QoS, on page 816](#)
- [Rate Limiting with QoS Policies, on page 816](#)
- [History for QoS, on page 825](#)

## Introduction to QoS

Quality of Service, or QoS, rate limits (polices) network traffic that is allowed or trusted by access control. The system does not rate limit traffic that was fastpathed.

Though QoS is supported only on the routed interfaces of Firewall Threat Defense devices, it is not supported on site-to-site VPN and VTI interfaces.

### Logging Rate-Limited Connections

There are no logging configurations for QoS. A connection can be rate limited without being logged, and you cannot log a connection simply because it was rate limited. To view QoS information in connection events, you must independently log the ends of the appropriate connections to the Firewall Management Center database. See *Other Connections You Can Log* in the [Cisco Secure Firewall Management Center Administration Guide](#) for more information.

Connection events for rate-limited connections contain information on how much traffic was dropped, and which QoS configurations limited the traffic. You can view this information in event views (workflows), dashboards, and reports.

## About QoS Policies

QoS policies deployed to managed devices govern rate limiting. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

The system matches traffic to QoS rules in the order you specify. The system rate limits traffic according to the first rule where all rule conditions match the traffic. Traffic that does not match any of the rules is not rate limited.

**Note** The total number of rules including QoS rules on the device cannot exceed 255. When this threshold is reached, a deployment warning message is displayed. You need to reduce the number of rules for a successful deployment.

You must constrain QoS rules by source or destination (routed) interfaces. The system enforces rate limiting *independently* on *each* of those interfaces; you cannot specify an aggregate rate limit for a set of interfaces.

QoS rules can also rate limit traffic by other network characteristics, as well as contextual information such as application, URL, user identity, and custom Security Group Tags (SGTs).

You can rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

**Note** QoS is not subordinate to a main access control configuration; you configure QoS independently. However, the access control and QoS policies deployed to the same device share identity configurations; see [Associating Other Policies with Access Control](#), on page 1631.

## Requirements and Prerequisites for QoS

### Model Support

Threat Defense

### Supported Domains

Any

### User Roles

Admin

Access Admin

Network Admin

## Rate Limiting with QoS Policies

To perform policy-based rate limiting, configure and deploy QoS policies to managed devices. Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

### Procedure

- 
- Step 1** Choose **Devices > QoS**.
- Step 2** Click **New Policy** to create a new QoS policy and, optionally, assign target devices; see [Creating a QoS Policy, on page 817](#).
- You can also **Copy** (📋) or **Edit** (✎) an existing policy.
- Step 3** Configure QoS rules; see [Configuring QoS Rules, on page 818](#) and [QoS Rule Conditions, on page 820](#).
- The Rules in the QoS policy editor lists each rule in evaluation order, and displays a summary of the rule conditions and rate limiting configurations. A right-click menu provides rule management options, including moving, enabling, and disabling.
- Helpful in larger deployments, you can **Filter by Device** to display only the rules that affect a specific device or group of devices. You can also search for and within rules; the system matches text you enter in the **Search Rules** field to rule names and condition values, including objects and object groups.
- Note**
- Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. Icons represent comments, warnings, and errors. If issues exist, click **Show Warnings** to display a list. For more information, see [Best Practices for Access Control Rules, on page 1608](#).
- Step 4** Click **Policy Assignments** to identify the managed devices targeted by the policy; see [Setting Target Devices for a QoS Policy, on page 818](#).
- If you identified target devices during policy creation, verify your choices.
- Step 5** Save the QoS policy.
- Step 6** Because this feature must allow some packets to pass, you must configure your system to examine those packets. See [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 2526](#) and [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 2526](#).
- Step 7** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).
- 

## Creating a QoS Policy

A new QoS policy with no rules performs no rate limiting.

### Procedure

- 
- Step 1** Choose **Devices > QoS**.
- Step 2** Click **New Policy**.
- Step 3** Enter a **Name** and, optionally, a **Description**.

**Step 4** (Optional) Choose the **Available Devices** where you want to deploy the policy, then click **Add to Policy**, or drag and drop to the **Selected Devices**. To narrow the devices that appear, type a search string in the **Search** field.

You must assign devices before you deploy the policy.

**Step 5** Click **Save**.

---

#### What to do next

- Configure and deploy the QoS policy; see [Rate Limiting with QoS Policies, on page 816](#).

## Setting Target Devices for a QoS Policy

Each QoS policy can target multiple devices; each device can have one deployed QoS policy at a time.

#### Procedure

---

**Step 1** In the QoS policy editor, click **Policy Assignments**.

**Step 2** Build your target list:

- Add—Choose one or more **Available Devices**, then click **Add to Policy** or drag and drop into the list of **Selected Devices**.
- Delete—Click **Delete** () next to a single device, or choose multiple devices, right-click, then choose **Delete Selected**.
- Search—Enter a search string in the search field. Click **Clear** () to clear the search.

**Step 3** Click **OK** to save policy assignments.

**Step 4** Click **Save** to save the policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Configuring QoS Rules

When you create or edit a rule, use the upper portion of the rule editor to configure general rule properties. Use the lower portion of the rule editor to configure rule conditions and comments.

#### Procedure

---

**Step 1** On Rules of the QoS policy editor:

- Add Rule—Click **Add Rule**.
- Edit Rule—Click **Edit** (✎).

**Step 2** Enter a **Name**.

**Step 3** Configure rule components:

- Enabled—Specify whether the rule is **Enabled**.
- Apply QoS On—Choose the interfaces you want to rate limit, either **Interfaces in Destination Interface Objects** or **Interfaces in Source Interface Objects**. Your choice must correspond with a populated interface constraint (not **any**).
- Traffic Limit Per Interface—Enter a **Download Limit** and an **Upload Limit** in Mbits/sec. The default value of **Unlimited** prevent matching traffic from being rate limited in that direction.
- Conditions—Click the corresponding condition you want to add. You must configure a source or destination interface condition, corresponding to your choice for **Apply QoS On**.
- Comments—Click **Comments**. To add a comment click **New Comment**, enter a comment, and click **OK**. You can edit or delete this comment until you save the rule.

For detailed information on rule components, see [QoS Rule Components, on page 819](#).

**Step 4** Save the rule.

**Step 5** In the policy editor, set the rule position. Click and drag or use the right-click menu to cut and paste.

Rules are numbered starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic. Proper rule order reduces the resources required to process network traffic and prevents rule preemption.

**Step 6** Click **Save** to save the policy.

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

### Related Topics

[Best Practices for Access Control Rules, on page 1608](#)

## QoS Rule Components

### State (Enabled/Disabled)

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

### Interfaces (Apply QoS On)

You cannot save a QoS rule that rate limits all traffic. For each QoS rule, you must apply QoS on either:

- Interfaces in Source Interface Objects—Rate limits traffic through the rule's source interfaces. If you choose this option, you must add at least one source interface constraint (cannot be **any**).
- Interfaces in Destination Interface Objects—Rate limits traffic through the rule's destination interfaces. If you choose this option, you must add at least one destination interface constraint (cannot be **any**).

### Traffic Limit Per Interface

A QoS rule enforces rate limiting *independently* on *each* of the interfaces you specify with the Apply QoS On option. You cannot specify an aggregate rate limit for a set of interfaces.

You can rate limit traffic by Mbits per second. The default value of **Unlimited** prevents matching traffic from being rate limited.

You can rate limit download and upload traffic independently. The system determines download and upload directions based on the connection initiator.

If you specify a limit greater than the maximum throughput of an interface, the system does not rate limit matching traffic. Maximum throughput may be affected by an interface's hardware configuration, which you specify in each device's properties (**Devices** > **Device Management**).

### Conditions

Conditions specify the specific traffic the rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule. Each condition type has its own tab in the rule editor. For more information, see [QoS Rule Conditions, on page 820](#).

### Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

In the policy editor, the system displays how many comments a rule has. In the rule editor, use the Comments tab to view existing comments and add new ones.

## QoS Rule Conditions

Conditions specify the specific traffic the rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule. Each condition type has its own tab in the rule editor. You can rate limit traffic using:

See one of the following sections for more information.

### Related Topics

[User Rule Conditions, on page 821](#)

[Application Rule Conditions, on page 821](#)

[Port Rule Conditions, on page 823](#)

[URL Rule Conditions, on page 824](#)

[Custom SGT Rule Conditions, on page 824](#)

## Interface Rule Conditions

Interface rule conditions control traffic by its source and destination interfaces.

Depending on the rule type and the devices in your deployment, you can use predefined *interface objects* called *security zones* or *interface groups* to build interface conditions. Interface objects segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices; see [Interface, on page 1278](#). QoS rules can be applied only on routed interfaces.

**Tip** Constraining rules by interface is one of the best ways to improve system performance. If a rule excludes all of a device's interfaces, that rule does not affect that device's performance.

## Network Rule Conditions

Networks control or decrypt traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

**Note** You *cannot* use FDQN network objects in identity rules.

## User Rule Conditions

Matches traffic based the user who initiates the connection, or the group to which the user belongs. For example, you could configure a Block rule to prohibit anyone in the Finance group from accessing a network resource.

You can configure user rule conditions for users in Microsoft Active Directory realms only.

In addition to configuring users and groups for configured realms, you can set policies for the following Special Identities users:

- Failed Authentication: User that failed authentication with the captive portal.
- Guest: Users configured as guest users in the captive portal.
- No Authentication Required: Users that match an identity **No Authentication Required** rule action.
- Unknown: Users that cannot be identified; for example, users that are not downloaded by a configured realm.

For access control rules only, you must first associate an identity policy with the access control policy as discussed in [Associating Other Policies with Access Control, on page 1631](#).

## Application Rule Conditions

When the system analyzes IP traffic, it can identify and classify the commonly used applications on your network. This discovery-based *application awareness* is the basis for *application control*—the ability to control application traffic.

System-provided *application filters* help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. You can create reuseable user-defined filters based on combinations of the system-provided filters, or on custom combinations of applications.

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. For more information about application detectors, see [Application Detector Fundamentals, on page 2434](#).

You can use both application filters and individually specified applications to ensure complete coverage. However, understand the following note before you order your access control rules.

### Benefits of Application Filters

Application filters help you quickly configure application control. For example, you can easily use system-provided filters to create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the system blocks the session.

Using application filters simplifies policy creation and administration. It assures you that the system controls application traffic as expected. Because Cisco frequently updates and adds application detectors via system and vulnerability database (VDB) updates, you can ensure that the system uses up-to-date detectors to monitor application traffic. You can also create your own detectors and assign characteristics to the applications they detect, automatically adding them to existing filters.

### Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

**Table 51: Application Characteristics**

Characteristic	Description	Example
Type	Application protocols represent communications between hosts. Clients represent software running on a host. Web applications represent the content or requested URL for HTTP traffic.	HTTP and SSH are application protocols. Web browsers and email clients are clients. MPEG video and Facebook are web applications.
Risk	The likelihood that the application is being used for purposes that might be against your organization's security policy.	Peer-to-peer applications tend to have a very high risk.
Business Relevance	The likelihood that the application is being used within the context of your organization's business operations, as opposed to recreationally.	Gaming applications tend to have a very low business relevance.
Category	A general classification for the application that describes its most essential function. Each application belongs to at least one category.	Facebook is in the social networking category.
Tag	Additional information about the application. Applications can have any number of tags, including none.	Video streaming web applications often are tagged high bandwidth and displays ads.

### Related Topics

[Best Practices for Configuring Application Control, on page 1605](#)

## Port Rule Conditions

Port conditions allow you to control traffic by its source and destination ports.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

### Best Practices for Port-Based Rules

Specifying ports is the traditional way to target applications. However, applications can be configured to use unique ports to bypass access control blocks. Thus, whenever possible, use application filtering criteria rather than port criteria to target traffic.

Application filtering is also recommended for applications, like Firewall Threat Defense, that open separate channels dynamically for control vs. data flow. Using port-based access control rules can prevent these kinds of applications from performing correctly, and could result in blocking desirable connections.

### Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as source port conditions in a single access control rule.

## Port, Protocol, and ICMP Code Rule Conditions

Port conditions match traffic based on the source and destination ports. Depending on the rule type, “port” can represent any of the following:

- TCP and UDP—You can control TCP and UDP traffic based on the port. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.
- ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.
- Protocol—You can control traffic using other protocols that do not use ports.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

### Best Practices for Port-Based Rules

Specifying ports is the traditional way to target applications. However, applications can be configured to use unique ports to bypass access control blocks. Thus, whenever possible, use application filtering criteria rather than port criteria to target traffic. Note that application filtering is not available in prefilter rules.

Application filtering is also recommended for applications, like FTP, that open separate channels dynamically for control vs. data flow. Using port-based access control rules can prevent these kinds of applications from performing correctly, and could result in blocking desirable connections.

### Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as destination port conditions in a single access control rule.

### Matching Non-TCP Traffic with Port Conditions

You can match non-port-based protocols. By default, if you do not specify a port condition, you are matching IP traffic. Although you can configure port conditions to match non-TCP traffic, there are some restrictions:

- Access control rules—For Classic devices, you can match GRE-encapsulated traffic with an access control rule by using the GRE (47) protocol as a destination port condition. To a GRE-constrained rule, you can add only network-based conditions: zone, IP address, port, and VLAN tag. Also, the system uses outer headers to match **all** traffic in access control policies with GRE-constrained rules. For Firewall Threat Defense devices, use tunnel rules in the prefilter policy to control GRE-encapsulated traffic.
- Decryption rules—These rules support TCP port conditions only.
- ICMP echo—A destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129 only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

## URL Rule Conditions

Use URL conditions to control the websites that users on your network can access.

For complete information, see [About URL Filtering with Category and Reputation, on page 1720](#).

## Custom SGT Rule Conditions

If you do not configure ISE/ISE-PIC as an identity source, you can control traffic using Security Group Tags (SGTs) that were **not** assigned by ISE. SGTs specify the privileges of traffic sources within a trusted network.

*Custom* SGT rule conditions use manually created SGT objects to filter traffic, rather than ISE SGTs obtained from the system's connection to an ISE server. These manually created SGT objects correspond to the SGT attributes on the traffic you want to control. Controlling traffic using custom SGTs is not considered user control.

## ISE SGT vs Custom SGT Rule Conditions

Some rules allow you to control traffic based on assigned SGT. Depending on the rule type and your identity source configuration, you can use either ISE-assigned SGTs or custom SGTs to match traffic with assigned SGT attributes.

---

**Note** If you use ISE SGTs to match traffic, even if a packet does not have an assigned SGT attribute, the packet still matches an ISE SGT rule if the SGT associated with the packet's source IP address is known in ISE.

---

Condition Type	Requires	SGTs Listed in Rule Editor
ISE SGT	ISE identity source	SGTs obtained by querying the ISE server, with automatically updated metadata
Custom SGT	No ISE/ISE-PIC identity source	Static SGT objects you create

## Autotransition from Custom SGTs to ISE SGTs

If you create rules that match custom SGTs, then configure ISE/ISE-PIC as an identity source, the system:

- Disables **Security Group Tag** options in the object manager. Although the system retains existing SGT objects, you cannot modify them or add new ones.
- Retains existing rules with custom SGT conditions. However, these rules do not match traffic. You also cannot add additional custom SGT criteria to existing rules, or create new rules with custom SGT conditions.

If you configure ISE, Cisco recommends that you delete or disable existing rules with custom SGT conditions. Instead, use ISE attribute conditions to match traffic with SGT attributes.

## History for QoS

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Deprecated: priority-queue with FlexConfig.	7.2.5	7.2.5	FlexConfig was used to configure priority-queue in threat defense. This command was removed.
Ability to specify handling of URLs having unknown reputation.	6.7.0	Any	For details, see <a href="#">History for URL Filtering, on page 1744</a> . New/modified screens: QoS rule editor
Rate limit increased.	6.2.1	Any	Raised the maximum rate limit from 1,000 Mbps to 100,000 Mbps. New/modified screens: QoS rule editor
Custom SGT and original client network filtering.	6.2.1	Any	Rate limit traffic using custom Security Group Tags (SGTs) and original client network information (XFF, True-Client-IP, or custom-defined HTTP headers). New/modified screens: QoS rule editor
QoS (rate limiting) introduced.	6.1.0	Any	FTD can rate limit (police) network traffic that is allowed or trusted by access control. New/modified screens: <b>Devices &gt; QoS</b>

## CHAPTER 20

# Platform Settings

Platform settings for Firewall Threat Defense devices configure a range of unrelated features whose values you might want to share among several devices. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

**Note** In 7.4 and later, the Management and Diagnostic interfaces are merged. If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices (7.3 and earlier, and some upgraded 7.4 devices).

# Introduction to Platform Settings

A platform settings policy is a shared set of features or parameters that define the aspects of a managed device that are likely to be similar to other managed devices in your deployment, such as time settings and external authentication.

A shared policy makes it possible to configure multiple managed devices at once, which provides consistency in your deployment and streamlines your management efforts. Any changes to a platform settings policy affects all the managed devices where you applied the policy. Even if you want different settings per device, you must create a shared policy and apply it to the desired device.

For example, your organization's security policies may require that your appliances have a "No Unauthorized Use" message when a user logs in. With platform settings, you can set the login banner once in a platform settings policy.

You can also benefit from having multiple platform settings policies on a single Firewall Management Center. For example, if you have different mail relay hosts that you use under different circumstances or if you want to test different access lists, you can create several platform settings policies and switch between them, rather than editing a single policy.

## Requirements and Prerequisites for Platform Settings Policies

### Supported Domains

Any

### User Roles

Admin

Access Admin

Network Admin

## Manage Platform Settings Policies

Use the **Platform Settings** page (**Devices > Platform Settings**) to manage platform settings policies. This page indicates the type of device for each policy. The **Status** column shows the device targets for the policy.

### Procedure

**Step 1** Choose **Devices > Platform Settings**.

**Step 2** For an existing policy, you can **Copy** () , **Edit** () , or **Delete** () the policy.

### Caution

You should not delete a policy that is the last-deployed policy on any of its target devices, even if it is out of date. Before you delete the policy completely, it is good practice to deploy a different policy to those targets.

- Step 3** To create a new policy, click **New Policy**.
- Choose a device type from the drop-down list:
    - **Firepower Settings** to create a shared policy for managed Classic devices.
    - **Threat Defense Settings** to create a shared policy for managed Firewall Threat Defense devices.
    - **Chassis Platform Settings** to create a shared policy for managed Firewall Threat Defense chassis in multi-instance mode.
  - Enter a **Name** for the new policy and optionally, a **Description**.
  - Optionally, choose the **Available Devices** or **Available Chassis** where you want to apply the policy and click **Add** (or drag and drop) to add the selected devices. You can enter a search string in the **Search** field to narrow the list of devices.
  - Click **Save**.

The system creates the policy and opens it for editing.

- Step 4** To change the target devices for a policy, click **Edit** (✎) next to the platform settings policy that you want to edit.
- Click **Policy Assignment**.
  - To assign a device, high-availability pair, or device group to the policy, select it in the **Available Devices** or **Available Chassis** list and click **Add**. You can also drag and drop.
  - To remove a device assignment, click **Delete** (🗑) next to a device, high-availability pair, or device group in the **Selected Devices** or **Selected Chassis** list.
  - Click **OK**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Chassis Platform Settings

Chassis Platform Settings apply to multiple-instance mode chassis. For details on these settings, see [Configure Chassis Platform Settings, on page 321](#).

## ARP Inspection

By default, all ARP packets are allowed between bridge group members. You can control the flow of ARP packets by enabling ARP inspection.

ARP inspection prevents malicious users from impersonating other hosts or routers (known as ARP spoofing). ARP spoofing can enable a “man-in-the-middle” attack. For example, a host sends an ARP request to the gateway router; the gateway router responds with the gateway router MAC address. The attacker, however, sends another ARP response to the host with the attacker MAC address instead of the router MAC address. The attacker can now intercept all the host traffic before forwarding it on to the router.

ARP inspection ensures that an attacker cannot send an ARP response with the attacker MAC address, so long as the correct MAC address and the associated IP address are in the static ARP table.

When you enable ARP inspection, the Firewall Threat Defense device compares the MAC address, IP address, and source interface in all ARP packets to static entries in the ARP table, and takes the following actions:

- If the IP address, MAC address, and source interface match an ARP entry, the packet is passed through.
- If there is a mismatch between the MAC address, the IP address, or the interface, then the Firewall Threat Defense device drops the packet.
- If the ARP packet does not match any entries in the static ARP table, then you can set the Firewall Threat Defense device to either forward the packet out all interfaces (flood), or to drop the packet.

**Note** The dedicated Management interface never floods packets even if this parameter is set to flood.

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **ARP Inspection**.

**Step 3** Add entries to the ARP inspection table.

- Click **Add** to create a new entry, or click **Edit** if the entry already exists.
- Select the desired options.
  - **Inspect Enabled**—To perform ARP inspection on the selected interfaces and zones.
  - **Flood Enabled**—Whether to flood ARP requests that do not match static ARP entries out all interfaces other than the originating interface or the dedicated management interface. This is the default behavior.  
  
If you do not elect to flood ARP requests, then only those requests that exactly match static ARP entries are allowed.
  - **Security Zones**—Add the zones that contain the interfaces on which to perform the selected actions. The zones must be switched zones. For interfaces not in a zone, you can type the interface name into the field below the Selected Security Zone list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
- Click **OK**.

**Step 4** Add static ARP entries according to [Add a Static ARP Entry, on page 765](#).

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

# Banner

You can configure messages to show users when they connect to the device command line interface (CLI).

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Banner**.

**Step 3** Configure the banner.

Following are some tips and requirements for banners.

- Only ASCII characters are allowed. You can use line returns (press Enter), but you cannot use tabs.
- You can dynamically add the hostname or domain name of the device by including the variables **\$(hostname)** or **\$(domain)**.
- Although there is no absolute length restriction on banners, Telnet or SSH sessions will close if there is not enough system memory available to process the banner messages.
- From a security perspective, it is important that your banner discourage unauthorized access. Do not use the words "welcome" or "please," as they appear to invite intruders in. The following banner sets the correct tone for unauthorized access:

```
You have logged in to a secure device.  
If you are not authorized to access this device,  
log out immediately or risk criminal charges.
```

**Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

# DNS

The Domain Name System (DNS) servers are used to resolve hostnames to IP addresses. There are two DNS server settings that apply to different types of traffic: data and special management traffic. Data traffic includes any services that use FQDNs for which a DNS lookup is necessary, such as access control rules and remote access VPN. Special management traffic includes traffic originating on the Management interface such as configuration and database updates. This procedure only applies to *data* DNS servers. For *management* DNS settings, see the CLI **configure network dns servers** and **configure network dns searchdomains** commands.

To determine the correct interface for DNS server communications, the managed device uses a routing lookup, but which routing table is used depends on the interfaces for which you enable DNS. See the interface settings below for more information.

You can optionally configure multiple DNS server groups and use them to resolve different DNS domains. For example, you could have a catch-all default group that uses public DNS servers, for use with connections to the Internet. You could then configure a separate group to use internal DNS servers for internal traffic, for example, any connection to a machine in the example.com domain. Thus, connections to an FQDN using your organization's domain name would be resolved using your internal DNS servers, whereas connections to public servers use external DNS servers. These resolutions are used by any feature that uses data DNS resolution, such as NAT and access control rules.

You can configure trusted DNS services for DNS snooping using the Trusted DNS Servers tab. DNS snooping is used to map the application domains to IPs in order to detect the application on the first packet. Apart from configuring the trusted DNS servers, you can include the already configured servers in DNS group, DHCP pool, DHCP relay and DHCP client as trusted DNS servers.

**Note** For an application-based PBR, you must configure trusted DNS servers. You must also ensure that the DNS traffic passes through Firewall Threat Defense in a clear-text format (encrypted DNS is not supported) so that domains can be resolved to detect applications.

### Before you begin

- Ensure you have created one or more DNS server groups. For more information, see [Creating DNS Server Group Objects, on page 1264](#).
- Ensure you have created interface objects to connect to the DNS servers.
- Ensure that the managed device has appropriate static or dynamic routes to access the DNS servers.

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit a Threat Defense policy.
- Step 2** Click **DNS**.
- Step 3** Click the **DNS Settings** tab.
- Step 4** Check **Enable DNS name resolution by device**.
- Step 5** Configure the DNS server groups.
- Do any of the following in the DNS server group list:
    - To add a group to the list, click **Add**. You cannot add another group once there are 30 filter domains configured within the existing list of server groups.
    - To edit the settings for a group, click **Edit** (✎) next to the group.
    - To remove a group, click **Delete** (🗑) next to the group. Removing a group does not delete the DNS server group object, it simply removes it from this list.
  - When adding or editing a group, configure the following settings, then click **OK**:
    - **Select DNS Group**—Select an existing DNS server group object, or click + to create a new one.

- **Make as default**—Select this option to make this group the default group. Any DNS resolution request that does not match the filters for other groups will be resolved using the servers in this group.
- **Filter Domains**—For non-default groups only, a comma-separated list of domain names, such as example.com,example2.com. Do not include spaces.

The group will be used for DNS resolutions for these domains only. You can enter a maximum of 30 separate domains across all groups added to this DNS platform settings policy. Each name can be a maximum of 127 characters.

Note that these filter domains are not related to the default domain name for the group. The filter list can be different from the default domain.

### Step 6

(Optional) Enter the **Expiry Entry Timer** and **Poll Timer** values in minutes.

These options apply to FQDNs that are specified in network objects only. These do not apply to FQDNs used in other features.

- **Expire Entry Timer** specifies the minimum time-to-live (TTL) for the DNS entry, in minutes. If the expiration timer is longer than the entry's TTL, the TTL is increased to the expire entry time value. If the TTL is longer than the expiration timer, the expire entry time value is ignored: no additional time is added to the TTL in this case. Upon expiration, the entry is removed from the DNS lookup table. Removing an entry requires that the table be recompiled, so frequent removals can increase the processing load on the device. Because some DNS entries can have very short TTL (as short as three seconds), you can use this setting to virtually extend the TTL. The default is 1 minute (that is, the minimum TTL for all resolutions is 1 minute). The range is 1 to 65535 minutes.

Note that for systems running 7.0 or earlier, the expiration time is actually added to the TTL: it does not specify a minimum value.

- **Poll Timer** specifies the time limit after which the device queries the DNS server to resolve the FQDN that was defined in a network object. An FQDN is resolved periodically either when the poll timer has expired, or when the TTL of the resolved IP entry has expired, whichever occurs first.

### Step 7

Enable DNS lookups on all interfaces or on specific interfaces. These choices also affect which routing tables are used.

Note that enabling DNS lookups on an interface is not the same as specifying the source interface for lookups. The Firewall Threat Defense always uses a route lookup to determine the source interface. Management-only interfaces other than the dedicated Management interface cannot be used.

- No interfaces selected—Enables DNS lookups on all interfaces. The Firewall Threat Defense checks the data routing table only.
- Specific interfaces selected but not the **Enable DNS Lookup via diagnostic/management interface also** option—Enables DNS lookups on the specified interfaces. The Firewall Threat Defense checks the data routing table only.
- Specific interfaces selected plus the **Enable DNS Lookup via diagnostic/management interface also** option—Enables DNS lookups on the specified interfaces and the Management interface. The Firewall Threat Defense checks the data routing table, and if no route is found, falls back to the management-only routing table.
- Only the **Enable DNS Lookup via diagnostic/management interface also** option—Enables DNS lookups on Management. The Firewall Threat Defense checks only the management-only routing table.

- Step 8** To configure the trusted DNS servers, click the **Trusted DNS Servers** tab.
- Step 9** By default, the existing DNS servers that are configured in DHCP pool, DHCP relay, DHCP client, or DNS server group are included as trusted DNS servers. If you want to exclude any of them, uncheck the appropriate check boxes.
- Step 10** To add trusted DNS servers, under **Specify DNS Servers**, click **Edit**.
- Step 11** In the **Select DNS Servers** dialog box, either choose a host object as the trusted DNS server or directly specify the IP address of the trusted DNS server:
- To choose existing host objects, under **Available Host Objects**, select the required host object and click **Add** to include it to **Selected DNS Servers**. For information on adding the host objects, see [Creating Network Objects, on page 1283](#).
  - To directly provide the IP address (IPv4 or IPv6) of the trusted DNS server, enter the address in the given text field, and click **Add** to include it to **Selected DNS Servers**.
  - Click **Save**. The added DNS servers are displayed in the **Trusted DNS Servers** page.
- Note**  
You can configure a maximum of 12 DNS servers per policy.
- Step 12** (Optional) To search for a DNS server that was added, using either the host name or the IP address, use the search field under **Specify DNS Servers**.
- Step 13** Click **Save**.

---

### What to do next

To use FQDN objects for access control rules, create an FQDN network object which can then be assigned to an access control rule. For instructions see, [Creating Network Objects, on page 1283](#).

## External Authentication

---

**Note** You must have administrator privileges to perform this task.

---

When you enable external authentication for management users, the Firewall Threat Defense verifies the user credentials with an LDAP or RADIUS server as specified in an external authentication object.

### Sharing External Authentication Objects

External authentication objects can be used by the Firewall Management Center and Firewall Threat Defense devices. You can share the same object between the Firewall Management Center and devices, or create separate objects. Note that the Firewall Threat Defense supports defining users on the RADIUS server, while the Firewall Management Center requires you to predefine the user list in the external authentication object. You can choose to use the predefined list method for the Firewall Threat Defense, but if you want to define users on the RADIUS server, you must create separate objects for the Firewall Threat Defense and the Firewall Management Center.

**Note** The timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-30 seconds for LDAP, and 1-300 seconds for RADIUS). If you set the timeout to a higher value, the Firewall Threat Defense external authentication configuration will not work.

### Assigning External Authentication Objects to Devices

For the Firewall Management Center, enable the external authentication objects directly on **System (⚙️) > Users > External Authentication**; this setting only affects Firewall Management Center usage, and it does not need to be enabled for managed device usage. For Firewall Threat Defense devices, you must enable the external authentication object in the platform settings that you deploy to the devices, and you can only activate one external authentication object per policy. An LDAP object with CAC authentication enabled cannot also be used for CLI access. Be sure that both the Firewall Threat Defense and the Firewall Management Center can reach the LDAP server, even if you are not sharing the object. The Firewall Management Center is essential to retrieving the user list and downloading it to the device.

### Firewall Threat Defense Supported Fields

Only a subset of fields in the external authentication object are used for Firewall Threat Defense SSH access. If you fill in additional fields, they are ignored. If you also use this object for the Firewall Management Center, those fields will be used. This procedure only covers the supported fields for the Firewall Threat Defense. For other fields, see *Configure External Authentication for the Firewall Management Center* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Username

Username must be Linux-valid usernames and be lower-case only, using alphanumeric characters plus period (.) or hyphen (-). Other special characters such as at sign (@) and slash (/) are not supported. You cannot add the **admin** user for external authentication. You can only add external users (as part of the External Authentication object) in the Firewall Management Center; you cannot add them at the CLI. Note that internal users can only be added at the CLI, not in the Firewall Management Center.

If you previously configured the same username for an internal user using the **configure user add** command, the Firewall Threat Defense first checks the password against the internal user, and if that fails, it checks the AAA server. Note that you cannot later add an internal user with the same name as an external user; only pre-existing internal users are supported. For users defined on the RADIUS server, be sure to set the privilege level to be the same as any internal users; otherwise you cannot log in using the external user password.

### Privilege Level

LDAP users always have Config privileges. RADIUS users can be defined as either Config or Basic users.

### Before you begin

- SSH access is enabled by default on the management interface. To enable SSH access on data interfaces, see [SSH Access, on page 845](#).
- Inform RADIUS users of the following behavior to set their expectations appropriately:
  - The first time an external user logs in, Firewall Threat Defense creates the required structures but cannot simultaneously create the user session. The user simply needs to authenticate again to start the session. The user will see a message similar to the following: "New external username identified. Please log in again to start a session."

- If the user's Service-Type attribute is not defined or incorrectly configured in the RADIUS server, and when using the RADIUS-defined users for authentication, the user will see a message similar to the following: "Your username is not defined with a service type that is valid for this system. You are not authorized to access the system?".

In some cases, the SSH clients close the CLI window on an unsuccessful SSH connection, even before displaying the failure message. Hence, ensure that the user's Service-Type attribute is correctly defined in the RADIUS server.

- Similarly, if the user's Service-Type authorization was changed since the last login, the user will need to re-authenticate. The user will see a message similar to the following: "Your authorization privilege has changed. Please log in again to start a session."

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Click **External Authentication**.

**Step 3** Click the **Manage External Authentication Server** link.

You can also open the External Authentication screen by clicking **System > Users > External Authentication**.

**Step 4** Configure an LDAP Authentication Object.

- Click **Add External Authentication Object**.
- Set the **Authentication Method** to **LDAP**.
- Enter a **Name** and optional **Description**.
- Choose a **Server Type** from the drop-down list.
- For the **Primary Server**, enter a **Host Name/IP Address**.

### Note

If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

- (Optional) Change the **Port** from the default.
- (Optional) Enter the **Backup Sever** parameters.
- Enter **LDAP-Specific Parameters**.

- **Base DN**—Enter the base distinguished name for the LDAP directory you want to access. For example, to authenticate names in the Security organization at the Example company, enter `ou=security,dc=example,dc=com`. Alternatively click **Fetch DNs**, and choose the appropriate base distinguished name from the drop-down list.
- (Optional) **Base Filter**—For example, if the user objects in a directory tree have a `physicalDeliveryOfficeName` attribute and users in the New York office have an attribute value of `NewYork` for that attribute, to retrieve only users in the New York office, enter `(physicalDeliveryOfficeName=NewYork)`.
- **User Name**—Enter a distinguished name for a user who has sufficient credentials to browse the LDAP server. For example, if you are connecting to an OpenLDAP server where user objects have a `uid` attribute, and the object for the administrator in the Security division at our example company

has a `uid` value of `NetworkAdmin`, you might enter  
`uid=NetworkAdmin,ou=security,dc=example,dc=com.`

- **Password and Confirm Password**—Enter and confirm the password for the user.
- (Optional) **Show Advanced Options**—Configure the following advanced options.

- **Encryption**—Click **None**, **TLS**, or **SSL**.

**Note**

If you change the encryption method after specifying a port, you reset the port to the default value for that method. For **None** or **TLS**, the port resets to the default value of 389. If you choose **SSL** encryption, the port resets to 636.

- **SSL Certificate Upload Path**—For **SSL** or **TLS** encryption, you must choose a certificate by clicking **Choose File**.
- (Not Used) **User Name Template**—Not used by the Firewall Threat Defense.
- **Timeout**—Enter the number of seconds before rolling over to the backup connection between 1 and 30. The default is 30.

**Note**

The timeout range is different for the Firewall Threat Defense and the Firewall Management Center, so if you share an object, be sure not to exceed the Firewall Threat Defense's smaller timeout range (1-30 seconds). If you set the timeout to a higher value, the Firewall Threat Defense external authentication configuration will not work.

- i) (Optional) Set the **CLI Access Attribute** if you want to use a shell access attribute other than the user distinguished type. For example, on a Microsoft Active Directory Server, use the `sAMAccountName` shell access attribute to retrieve shell access users by typing `sAMAccountName` in the **CLI Access Attribute** field.
- j) Set the **CLI Access Filter**.

Choose one of the following methods:

- To use the same filter you specified when configuring authentication settings, choose **Same as Base Filter**.
- To retrieve administrative user entries based on attribute value, enter the attribute name, a comparison operator, and the attribute value you want to use as a filter, enclosed in parentheses. For example, if all network administrators have a `manager` attribute which has an attribute value of `shell`, you can set a base filter of `(manager=shell)`.

The names on the LDAP server must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

- k) Click **Save**.

**Step 5**

For LDAP, if you later add or delete users on the LDAP server, you must refresh the user list and redeploy the Platform Settings.

- a) Choose **System** (⚙️) > **Users** > **External Authentication**.
- b) Click **Refresh** (↻️) next to the LDAP server.

If the user list changed, you will see a message advising you to deploy configuration changes for your device. The Firepower Threat Defense Platform Settings will also show that it is "Out-of-Date on *x* targeted devices."

- c) Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

**Step 6**

Configure a RADIUS Authentication Object.

- a) Define users on the RADIUS server using the Service-Type attribute.

The following are supported values for the Service-Type attribute:

- Administrator (6)—Provides Config access authorization to the CLI. These users can use all commands in the CLI.
- NAS Prompt (7) or any level other than 6—Provides Basic access authorization to the CLI. These users can use read-only commands, such as **show** commands, for monitoring and troubleshooting purposes.

The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

Alternatively, you can predefine users in the external authentication object (see [Step 6.j, on page 839](#)). To use the same RADIUS server for the Firewall Threat Defense and Firewall Management Center while using the Service-Type attribute method for the Firewall Threat Defense, create two external authentication objects that identify the same RADIUS server: one object includes the predefined **CLI Access Filter** users (for use with the Firewall Management Center), and the other object leaves the **CLI Access Filter** empty (for use with Firewall Threat Defenses).

- b) In Firewall Management Center, click **Add External Authentication Object**.
- c) Set the **Authentication Method** to **RADIUS**.
- d) Enter a **Name** and optional **Description**.
- e) For the **Primary Server**, enter a **Host Name/IP Address**.

**Note**

If you are using a certificate to connect via TLS or SSL, the host name in the certificate must match the host name used in this field. In addition, IPv6 addresses are not supported for encrypted connections.

- f) (Optional) Change the **Port** from the default.
- g) Enter a **RADIUS Secret Key**.
- h) (Optional) Enter the **Backup Server** parameters.
- i) Enter **RADIUS-Specific Parameters**.
  - **Timeout (Seconds)**—Enter the number of seconds before rolling over to the backup connection. The default is 30.

- **Retries**—Enter the number of times the primary server connection should be tried before rolling over to the backup connection. The default is 3.

- j) (Optional) Instead of using RADIUS-defined users, under **CLI Access Filter**, enter a comma-separated list of usernames in the **Administrator CLI Access User List** field. For example, enter **jchrichton, aerynsun, rygel**.

You may want to use the **CLI Access Filter** method for Firewall Threat Defense so you can use the same external authentication object with Firewall Threat Defense and other platform types. Note that if you want to use RADIUS-defined users, you must leave the **CLI Access Filter** empty.

Make sure that these usernames match usernames on the RADIUS server. The names must be Linux-valid usernames:

- Maximum 32 alphanumeric characters, plus hyphen (-) and underscore (\_)
- All lowercase
- Cannot start with hyphen (-); cannot be all numbers; cannot include a period (.), at sign (@), or slash (/)

**Note**

If you want to only define users on the RADIUS server, you must leave this section empty.

- k) Click **Save**.

**Step 7** Return to **System** (⚙) > **Users** > **External Authentication**.

**Step 8** Click **Refresh** (↻) to view any newly-added objects.

For LDAP when you specify SSL or TLS encryption, you must upload a certificate for the connection; otherwise, the server will not be listed on this window.

**Step 9** Click **Slider enabled** (🔘) next to the External Authentication object you want to use. You can only enable one object.

**Step 10** Click **Save**.

**Step 11** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Fragment Settings

By default, the Firewall Threat Defense device allows up to 24 fragments per IP packet, and up to 200 fragments awaiting reassembly. You might need to let fragments on your network if you have an application that routinely fragments packets, such as NFS over UDP. However, if you do not have an application that fragments traffic, we recommend that you do not allow fragments by setting **Chain** to 1. Fragmented packets are often used as Denial of Service (DoS) attacks.

**Note** These settings establish the defaults for devices assigned this policy. You can override these settings for specific interfaces on a device by selecting **Override Default Fragment Setting** in the interface configuration. When you edit an interface, you can find the option on **Advanced > Security Configuration**. Select **Devices > Device Management**, edit a Firewall Threat Defense device, and select **Interfaces** to edit interface properties..

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **Fragment Settings**.
- Step 3** Configure the following options. Click **Reset to Defaults** if you want to use the default settings.
- **Size (Block)**—The maximum number of packet fragments from all connections collectively that can be waiting for reassembly. The default is 200 fragments.
  - **Chain (Fragment)**—The maximum number of packets into which a full IP packet can be fragmented. The default is 24 packets. Set this option to 1 to disallow fragments.
  - **Timeout (Sec)**—The maximum number of seconds to wait for an entire fragmented packet to arrive. The default is 5 seconds. If all fragments are not received within this time, all fragments are discarded.
- Step 4** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## HTTP Access

You can enable the HTTPS server to provide a health check mechanism for a cloud load balancer, for example, for the Firewall Threat Defense Virtual on AWS using an Application Load Balancer.

Other uses for HTTPs on the Firewall Threat Defense are not supported; for example, the Firewall Threat Defense does not have a web interface for configuration in this management mode.

This configuration only applies to data interfaces, including any you have configured as management-only. It does not apply to the dedicated Management interface. The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firewall Management Center. It has a separate IP address and static routing.

To use HTTPS, you do not need an access rule allowing the host IP address. You only need to configure HTTPS access according to this section.

You can only use HTTPS to a reachable interface; if your HTTPS host is located on the outside interface, you can only initiate a management connection directly to the outside interface.

### Before you begin

- You cannot configure both HTTPS and AnyConnect VPN module of Cisco Secure Client on the same interface for the same TCP port. For example, if you configure remote access SSL VPN on the outside

interface, you cannot also open the outside interface for HTTPS connections on port 443. If you must configure both features on the same interface, use different ports. For example, open HTTPS on port 4443.

- You need network objects that define the hosts or networks you will allow to make HTTPS connections to the device. You can add objects as part of the procedure, but if you want to use object groups to identify a group of IP addresses, ensure that the groups needed in the rules already exist. Select **Objects > Object Management** to configure objects.

**Note** You cannot use the system-provided **any** network object group. Instead, use **any-ipv4** or **any-ipv6**.

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **HTTP Access**.

**Step 3** Check the **Enable HTTP Server** check box to enable the HTTP server.

**Step 4** (Optional) Change the HTTP port. The default is 443.

**Step 5** Identify the interfaces and IP addresses that allow HTTP connections.

Use this table to limit which interfaces will accept HTTP connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

- Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- Configure the rule properties:

- **IP Address**—The network object or group that identifies the hosts or networks you are allowing to make HTTP connections. Choose an object from the drop-down menu, or click + to add a new network object.
- **Available Zones/Interfaces**—Add the zones that contain the interfaces to which you will allow HTTP connections. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zones/Interfaces** list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.

- Click **OK**.

**Step 6** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## ICMP Access

By default, you can send ICMP packets to any interface using either IPv4 or IPv6, with these exceptions:

- The Firewall Threat Defense does not respond to ICMP echo requests directed to a broadcast address.
- The Firewall Threat Defense only responds to ICMP traffic sent to the interface that traffic comes in on; you cannot send ICMP traffic through an interface to a far interface.

To protect the device from attacks, you can use ICMP rules to limit ICMP access to interfaces to particular hosts, networks, or ICMP types. ICMP rules function like access rules, where the rules are ordered, and the first rule that matches a packet defines the action.

If you configure any ICMP rule for an interface, an implicit deny ICMP rule is added to the end of the ICMP rule list, changing the default behavior. Thus, if you want to simply deny a few message types, you must include a permit any rule at the end of the ICMP rule list to allow the remaining message types.

We recommend that you always grant permission for the ICMP unreachable message type (type 3). Denying ICMP unreachable messages disables ICMP path MTU discovery, which can halt IPsec and PPTP traffic. Additionally ICMP packets in IPv6 are used in the IPv6 neighbor discovery process.

### Before you begin

Ensure that the objects needed in the rules already exist. Select **Objects > Object Management** to configure objects. You need network objects or groups that define the desired hosts or networks, and port objects that define the ICMP message types you want to control.

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **ICMP Access**.
- Step 3** Configure ICMP rules.
- a) Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
  - b) Configure the rule properties:
    - **Action**—Whether to permit (allow) or deny (drop) matching traffic.
    - **ICMP Service**—The port object that identifies the ICMP message type.
    - **Network**—The network object or group that identifies the hosts or networks whose access you are controlling.
    - **Available Zones/Interfaces**—Add the zones that contain the interfaces that you are protecting. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zones/Interfaces** list and click **Add**. These rules will be applied to a device only if the device includes the selected interfaces or zones.
  - c) Click **OK**.
- Step 4** (Optional.) Set rate limits on ICMPv4 Unreachable messages.
- **Rate Limit**—Sets the rate limit of unreachable messages, between 1 and 100 messages per second. The default is 1 message per second.
  - **Burst Size**—Sets the burst rate, between 1 and 10. The system sends this number of replies, but subsequent replies are not sent until the rate limit is reached.

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## NetFlow

The NetFlow feature enables you to collect IP network traffic information as it enters or exits an interface. The collected traffic information is sent as collected records to a NetFlow Collector server or NetFlow Analyzer. You can analyze the data from NetFlow and determine information, such as source and destination of traffic, class of service, traffic pattern, bandwidth usage, type of traffic, traffic volume, and the causes of the congestion.

With the native NetFlow configuration support, the traffic information collection that was enabled through syslogs flow exports has to be disabled.

The NetFlow provides the option to configure the flow exporter and collectors along with flow event types that must be monitored.

### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **NetFlow**.

**Step 3** Enable the **Enable Flow Export** toggle to enable NetFlow data export.

**Step 4** Configure the general NetFlow parameters that controls the frequency of events pushed to the collector.

- a) **Active Refresh Interval**—For active connections, specify the time interval (in minutes) between flow-update events.
- b) **Delay Flow Create**—Specify the delay (in seconds) before sending a flow-create event. If you do not enter any value, there is no delay and the flow-create event is exported as soon as the flow is created.
- c) **Template Timeout Rate**—Specify the time interval (in minutes) at which the template records are sent to the collectors.

**Step 5** Click **Add Collector** to configure the collector. See [Add Collector in NetFlow, on page 844](#).

**Step 6** Click **Add Traffic Class** to configure the traffic class. See [Add Traffic Class to NetFlow, on page 844](#).

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Add Collector in NetFlow

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Choose **NetFlow**.
- Step 3** Enable the **Enable Flow Export** toggle to enable NetFlow data export.
- Step 4** Click **Add Collector** to configure the collector. You can configure a maximum of five collectors.
- Step 5** From the **Host** dropdown list, choose the collector host IP address (IPv4 only) of the NetFlow event collector or server to which the NetFlow packets must be sent. Alternatively, you can click the (+) icon to create a new network host.
- Step 6** In the **Port** field, enter the UDP port on the collector to which the NetFlow packets must be sent.
- Step 7** From **Available Interfaces or Interface Groups**, choose the interface or interface group through which the collector must be reached. You can choose multiple interfaces or interface groups. The Interface Group object can contain only one interface for a given device. A collector can be reached only through one interface. The object can include a virtual-router-aware interface.
- You can click the (+) icon to create a new interface group.
- Step 8** Click **Add** to add the interfaces you chose.
- Step 9** You can also enter the interface name and click **Add** to add the interface.
- Step 10** Click **OK**.
- 

## Add Traffic Class to NetFlow

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **NetFlow**.
- Step 3** Enable the **Enable Flow Export** toggle to enable NetFlow data export.
- Step 4** Click **Add Traffic Class** to configure the traffic class.
- Step 5** In the **Name** field, enter the name of the traffic class that must match the NetFlow events.
- Step 6** In the **Type** field, choose the traffic class to filter the type of traffic you want to capture:
- **Default**—The traffic class that is matched if none of the traffic classes matches the traffic.
  - **Access List**—The specific traffic class that must match the traffic captured for the NetFlow events.
- Step 7** If you chose **Access List** as the **Type**, then you must choose the access list object from the **Access List Object** dropdown list.

### Note

You can also click the (+) icon to create a new extended access list object. See [Configure Extended ACL Objects, on page 1251](#).

- Step 8** In **Event Types**, check the checkboxes for the different NetFlow events that you want to capture and send to the collectors.
- Step 9** Click **OK**.
- 

## SSH Access

If you enabled Firewall Management Center access on a data interface, such as outside, you should enable SSH on that interface using this procedure. This section describes how to enable SSH connections to one or more *data* interfaces on the Firewall Threat Defense.

The Firewall Threat Defense uses the CiscoSSH stack, which is based on OpenSSH. CiscoSSH supports FIPS compliance and regular updates, including updates from Cisco and the open source community.

**Note** SSH is enabled by default on the Management interface; however, this screen does not affect Management SSH access.

---

The Management interface is separate from the other interfaces on the device. It is used to set up and register the device to the Firewall Management Center. SSH for data interfaces shares the internal and external user list with SSH for the Management interface. Other settings are configured separately: for data interfaces, enable SSH and access lists using this screen; SSH traffic for data interfaces uses the regular routing configuration, and not any static routes configured at setup or at the CLI.

For the Management interface, to configure an SSH access list, see the **configure ssh-access-list** command in the [Cisco Secure Firewall Threat Defense Command Reference](#). To configure a static route, see the **configure network static-routes** command. By default, you configure the default route through the Management interface at initial setup.

To use SSH, you do not also need an access rule allowing the host IP address. You only need to configure SSH access according to this section.

You can SSH only to a reachable interface (including an interface in a user-defined virtual router); if your SSH host is located on the outside interface, you can only initiate a management connection directly to the outside interface. When you enable SSH in a user-defined virtual router, and you want VPN users to access SSH, be sure to terminate the VPN on the same virtual router. If the VPN is terminated on another virtual router, then you must configure route leaks between the virtual routers.

SSH supports the following ciphers and key exchange:

- Encryption—aes128-cbc, aes192-cbc, aes256-cbc, aes128-ctr, aes192-ctr, aes256-ctr
- Integrity—hmac-sha2-256
- Key exchange—dh-group14-sha256

---

**Note** After you make three consecutive failed attempts to log into the CLI using SSH, the device terminates the SSH connection.

---

### Before you begin

- You can configure SSH internal users at the CLI using the **configure user add** command; see [Add an Internal User at the CLI, on page 141](#). By default, there is an **admin** user for which you configured the password during initial setup. You can also configure external users on LDAP or RADIUS by configuring **External Authentication** in platform settings. See [External Authentication, on page 834](#).
- You need network objects that define the hosts or networks you will allow to make SSH connections to the device. You can add objects as part of the procedure, but if you want to use object groups to identify a group of IP addresses, ensure that the groups needed in the rules already exist. Select **Objects > Object Management** to configure objects.

---

**Note** You cannot use the system-provided **any** network object. Instead, use **any-ipv4** or **any-ipv6**.

---

### Procedure

---

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **SSH Access**.

**Step 3** Identify the interfaces and IP addresses that allow SSH connections.

Use this table to limit which interfaces will accept SSH connections, and the IP addresses of the clients who are allowed to make those connections. You can use network addresses rather than individual IP addresses.

- Click **Add** to add a new rule, or click **Edit** to edit an existing rule.
- Configure the rule properties:
  - **IP Address**—The network object or group that identifies the hosts or networks you are allowing to make SSH connections. Choose an object from the drop-down menu, or click + to add a new network object.
  - **Available Zones/Interfaces**—Add the zones that contain the interfaces to which you will allow SSH connections. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zones/Interfaces** list and click **Add**. You can also add loopback interfaces and virtual-router-aware interfaces. These rules will be applied to a device only if the device includes the selected interfaces or zones.
- Click **OK**.

**Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## SMTP Server

You must identify an SMTP server if you configure email alerts in the Syslog settings. The source email address you configure for Syslog must be a valid account on the SMTP servers.

### Before you begin

Ensure that the network objects that define the host address of the primary and secondary SMTP servers exist. Select **Objects > Object Management** to define the objects. Alternatively, you can create the objects while editing the policy.

### Procedure

---

- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Click **SMTP Server**.
- Step 3** Select the network objects that identify the **Primary Server IP Address** and optionally, the **Secondary Server IP Address**.
- Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## SNMP

Simple Network Management Protocol (SNMP) defines a standard way for network management stations running on PCs or workstations to monitor the health and status of many types of devices, including switches, routers, and security appliances. You can use the SNMP page to configure a firewall device for monitoring by SNMP management stations.

The Simple Network Management Protocol (SNMP) enables monitoring of network devices from a central location. Cisco security appliances support network monitoring using SNMP versions 1, 2c, and 3, as well as traps and SNMP read access; SNMP write access is not supported.

SNMPv3 supports read-only users and encryption with DES (deprecated), 3DES, AES256, AES192, and AES128.

**Note** The DES option has been deprecated. If your deployment includes SNMP v3 users using DES encryption that were created using a version previous to 6.5, you can continue to use those users for Firewall Threat Defenses running versions 6.6 and previous. However, you cannot edit those users and retain DES encryption, or create new users with DES encryption. If your Firewall Management Center manages any Firewall Threat Defenses running Versions 7.0+, deploying a platform settings policy that uses DES encryption to those Firewall Threat Defenses will fail.

**Note** SNMP configuration supports Routed and Diagnostic interface only.

**Note** To create an alert to an external SNMP server, access **Policies > Actions > Alerts**

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **SNMP**.

**Step 3** Enable SNMP and configure basic options.

- **Enable SNMP Servers**—Whether to provide SNMP information to the configured SNMP hosts. You can deselect this option to disable SNMP monitoring while retaining the configuration information.
- **Read Community String, Confirm**—Enter the password used by a SNMP management station when sending requests to the Firewall Threat Defense device. The SNMP community string is a shared secret among the SNMP management stations and the network nodes being managed. The security device uses the password to determine if the incoming SNMP request is valid. The password is a case-sensitive alphanumeric string of up to 32 characters; spaces and special characters are not permitted.
- **System Administrator Name**—Enter the name of the device administrator or other contact person. This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
- **Location**—Enter the location of this security device (for example, Building 42, Sector 54). This string is case-sensitive and can be up to 127 characters. Spaces are accepted, but multiple spaces are shortened to a single space.
- **Port**—Enter the UDP port on which incoming requests will be accepted. The default is 161.

**Step 4** (SNMPv3 only.) [Add SNMPv3 Users, on page 854.](#)

**Step 5** [Add SNMP Hosts, on page 857.](#)

**Step 6** [Configure SNMP Traps, on page 859.](#)

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## About SNMP

SNMP is an application-layer protocol that facilitates the exchange of management information between network devices and is part of the TCP/IP protocol suite. Firewall Threat Defense provides support for network monitoring using SNMP Versions 1, 2c, and 3, and support the use of all three versions simultaneously. The SNMP agent running on the Firewall Threat Defense interface lets you monitor the network devices through network management systems (NMSes), such as HP OpenView. Firewall Threat Defense supports SNMP read-only access through issuance of a GET request. SNMP write access is not allowed, so you cannot make changes with SNMP. In addition, the SNMP SET request is not supported.

You can configure the Firewall Threat Defense to send traps, which are unsolicited messages from the managed device to the management station for certain events (event notifications) to an NMS, or you can use the NMS to browse the Management Information Bases (MIBs) on the security devices. MIBs are a collection of definitions, and the Firewall Threat Defense maintain a database of values for each definition. Browsing a MIB means issuing a series of GET-NEXT or GET-BULK requests of the MIB tree from the NMS to determine values.

An SNMP agent notifies the designated management stations if events occur that are predefined to require a notification, for example, when a link in the network goes up or down. The notification it sends includes an SNMP OID, which identifies itself to the management stations. The agent also replies when a management station asks for information.

## SNMP Terminology

The following table lists the terms that are commonly used when working with SNMP.

**Table 52: SNMP Terminology**

Term	Description
Agent	The SNMP server running on the Secure Firewall Threat Defense. The SNMP agent has the following features: <ul style="list-style-type: none"> <li>• Responds to requests for information and actions from the network management station.</li> <li>• Controls access to its Management Information Base, the collection of objects that the SNMP manager can view or change.</li> <li>• Does not allow SET operations.</li> </ul>
Browsing	Monitoring the health of a device from the network management station by polling required information from the SNMP agent on the device. This activity may include issuing a series of GET-NEXT or GET-BULK requests of the MIB tree from the network management station to determine values.
Management Information Bases (MIBs)	Standardized data structures for collecting information about packets, connections, buffers, failovers, and so on. MIBs are defined by the product, protocols, and hardware standards used by most network devices. SNMP network management stations can browse MIBs and request specific data or events be sent as they occur.
Network management stations (NMSs)	The PCs or workstations set up to monitor SNMP events and manage devices.
Object identifier (OID)	The system that identifies a device to its NMS and indicates to users the source of information monitored and displayed.

Term	Description
Trap	<p>Predefined events that generate a message from the SNMP agent to the NMS. Events include alarm conditions such as linkup, linkdown, coldstart, warmstart, authentication, or syslog messages.</p> <p><b>coldStart</b>—The coldStart trap occurs when the SNMP agent starts after the SNMP configuration. This trap also occurs when the agent starts after a system reboot.</p> <p><b>Note</b> For cluster and HA nodes, post a reload, if the interfaces reboot time exceeds 5 minutes (preset threshold), the trap is dropped. When the cluster and HA nodes have rebooted successfully, all other traps are sent as expected.</p> <p>The <b>snmp-server enable traps snmp coldstart</b> command is used to enable and disable transmission of these traps.</p>

## MIBs and Traps

MIBs are either standard or enterprise-specific. Standard MIBs are created by the IETF and documented in various RFCs. A trap reports significant events occurring on a network device, most often errors or failures. SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. SNMP traps are compiled into the ASA software.

If needed, you can also download RFCs, standard MIBs, and standard traps from the following locations:

<http://www.ietf.org/>

Browse the SNMP Object Navigator to look up Cisco MIBs, traps, and OIDs from the following location:

<https://snmp.cloudapps.cisco.com/Support/SNMP/do/BrowseOID.do?local=en>

In addition, download Cisco OIDs by FTP from the following location:

<ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>

## Supported Tables and Objects in MIBs

The following sections list the supported tables and objects for the specified MIBs.

### Remote Access VPN Polling

**Table 53: CISCO-REMOTE-ACCESS-MONITOR-MIB**

Counter	OID	Description
Active Sessions	crasNumSessions (1.3.6.1.4.1.9.9.392.1.3.1)	The number of currently active sessions.
Users	crasNumUsers (1.3.6.1.4.1.9.9.392.1.3.3)	The number of users who have active sessions.
Peak Sessions	crasNumPeakSessions (1.3.6.1.4.1.9.9.392.1.3.41)	The number of peak RA sessions since system up.

**Site-to-Site VPN Tunnel Polling****Table 54: CISCO-REMOTE-ACCESS-MONITOR-MIB**

Counter	OID	Description
LAN to LAN Sessions	crasL2LNumSessions (1.3.6.1.4.1.9.9.392.1.3.29)	The number of currently active LAN to LAN sessions.
Peak LAN to LAN Sessions	crasL2LPeakConcurrentSessions (1.3.6.1.4.1.9.9.392.1.3.31)	The number of peak concurrent LAN to LAN sessions since the system is up.

**Connection Polling****Table 55: CISCO-FIREWALL-MIB**

Counter	OID	Description
Active Connections	cfwConnectionActive (1.3.6.1.4.1.9.9.147.1.2.2.2.1.3.40.6)	The number of connections currently in use by the entire firewall.
Peak Connections	cfwConnectionPeak (1.3.6.1.4.1.9.9.147.1.2.2.2.1.3.40.7)	The highest number of connections in use at any one time since system startup.
Connections Per Second	cfwConnectionPerSecond (1.3.6.1.4.1.9.9.147.1.2.2.3)	The current connections per second rate on the firewall.
Peak Connections Per Second	cfwConnectionPerSecondPeak (1.3.6.1.4.1.9.9.147.1.2.2.4)	The highest number of connections per second on the firewall since system startup.

**NAT Translation Polling****Table 56: CISCO-NAT-EXT-MIB**

Counter	OID	Description
Active Translations	cneAddrTranslationNumActive (1.3.6.1.4.1.9.9.532.1.1.1.1)	The total number of address translation entries that are currently available in the NAT device. This indicates the aggregate of the translation entries created from both the static and dynamic address translation mechanisms.
Peak Active Translations	cneAddrTranslationNumPeak (1.3.6.1.4.1.9.9.532.1.1.1.2)	The maximum number of address translation entries that are active at any one time since the system startup. This indicates the high watermark of address translation entries that are active at any one time since the system startup.  This object includes the translation entries created from both the static and dynamic address translation mechanisms.

**Routing Table Entries Polling****Table 57: IP-FORWARD-MIB**

Counter	OID	Description
Active Translations	inetCidrRouteNumber (1.3.6.1.2.1.4.24.6)	The total number of current inetCidrRouteTable entries that valid.

**Interface Duplex Status Polling****Table 58: CISCO-IF-EXTENSION-MIB**

Counter	OID	Description
Duplex Status	cieIfDuplexCfgStatus (1.3.6.1.4.1.9.9.276.1.1.2.1.20)	This object specifies the configured duplex status on the given interface.
Detected Duplex Status	cieIfDuplexDetectStatus (1.3.6.1.4.1.9.9.276.1.1.2.1.21)	This object specifies the detected duplex status on the given interface.

**Snort 3 Intrusion Event Rate Polling****Table 59: CISCO-UNIFIED-FIREWALL-MIB**

Counter	OID	Description
Snort 3 Intrusion Event Rate	cufwAaicIntrusionEvtRate (1.3.6.1.4.1.9.9.491.1.5.3.2.1)	The rate at which intrusion events were recorded by Snort on this firewall averaged over the last 300 seconds.

**BGP Peer-Flap Trap Notification****Table 60: BGP4-MIB**

Counter	OID	Description
BGP Peer-flap	bgpBackwardTransition (1.3.6.1.4.1.9.9.491.1.5.3.2.1)	The BGPBackwardTransition Event is generated when the BGP FSM moves from a higher numbered state to a lower numbered state.

**CPU Utilization Polling****Table 61: CISCO-PROCESS-MIB**

Counter	OID	Description
CPU Total Utilization	cpmCPUTotal1minRev (1.3.6.1.4.1.9.9.109.1.1.1.7.1)	Total system CPU utilization for the last one minute.

Counter	OID	Description
Individual CPU Core Utilization	Associated parameters and values of cpmCPUTotal1minRev 1.3.6.1.4.1.9.9.109.1.1.1.7.2 to 1.3.6.1.4.1.9.9.109.1.1.1.7.(n+1)	Individual CPU core utilization values for the last one minute, where 'n' represents the number of cores.  Examples: <ul style="list-style-type: none"> <li>• 36141991091.1.1.1.7(n+2) - Aggregate system CPU utilization % (This value is same as the system cpu usage from 36141991091.1.1.1.7.1 in single context mode).</li> <li>• 36141991091.1.1.1.7(n+3) - Snort average CPU utilization % (total aggregate value of all snort instances)</li> <li>• 36141991091.1.1.1.7(n+4) - System process average % (average of "Sysproc" cores)</li> </ul>

**Note** The SNMP OIDs 1.3.6.1.2.1.25.3.3 and 1.3.6.1.2.1.25.3.4 pertaining to CPU monitoring (hrProcessorTable and hrNetworkTable) were removed on ASA FirePOWER. You can view and monitor the CPU health details of the device only through its device manager.

In ENTITY-MIB, two new vendor OIDs were added for the dual EPM 2X100G and 4X200G cards of Secure Firewall 4200 for slot 2 and slot 3—cevFPRNM4X200Gng and cevFPRNM2X100Gng.

## Add SNMPv3 Users

**Note** You create users for SNMPv3 only. These steps are not applicable for SNMPv1 or SNMPv2c.

Note that SNMPv3 only supports read-only users.

SNMP users have a specified username, an authentication password, an encryption password, and authentication and encryption algorithms to use.

**Note** When using SNMPv3 with clustering or High Availability, if you add a new cluster unit after the initial cluster formation or you replace a High Availability unit, then SNMPv3 users are not replicated to the new unit. You must remove the users, re-add them, and then redeploy your configuration to force the users to replicate to the new unit.

#### Authentication algorithm options

For a successful SNMPv3 user authentication, the authentication key size should be equal to or larger than the encryption key size. For example, a user authentication using SHA-1 with AES256 fails, whereas authentication using SHA256 with AES256 succeeds.

The authentication algorithm options are MD5 (deprecated, pre-6.5 only), SHA, SHA224, SHA256, and SHA384.

**Note** The MD5 option has been deprecated. If your deployment includes SNMP v3 users using the MD5 authentication algorithm that were created using a version previous to 6.5, you can continue to use those users for FTDs running versions 6.7 and previous. However, you cannot edit those users and retain the MD5 authentication algorithm, or create new users with the MD5 authentication algorithm. If your management center manages any threat defenses running Versions 7.0+, deploying a platform settings policy that uses the MD5 authentication algorithm to those threat defenses will fail.

The encryption algorithm options are DES (deprecated, pre-6.5 only), 3DES, AES256, AES192, and AES128.

**Note** The DES option has been deprecated. If your deployment includes SNMP v3 users using DES encryption that were created using a version previous to 6.5, you can continue to use those users for threat defenses running versions 6.7 and previous. However, you cannot edit those users and retain DES encryption, or create new users with DES encryption. If your management center manages any threat defenses running Versions 7.0+, deploying a platform settings policy that uses DES encryption to those threat defenses will fail.

#### Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Click **SNMP > Users**.
- Step 3** Click **Add**.
- Step 4** Select the security level for the user from the **Security Level** drop-down list.
  - **Auth**—Authentication but No Privacy, which means that messages are authenticated.
  - **No Auth**—No Authentication and No Privacy, which means that no security is applied to messages.
  - **Priv**—Authentication and Privacy, which means that messages are authenticated and encrypted.
- Step 5** Enter the name of the SNMP user in the **Username** field. Usernames must be 32 characters or less.
- Step 6** Select the type of password, you want to use in the **Encryption Password Type** drop-down list.

- **Clear text**—The Firewall Threat Defense device will still encrypt the password when deploying to the device.
- **Encrypted**—The Firewall Threat Defense device will directly deploy the encrypted password.

**Step 7** In the **Auth Algorithm Type** drop-down list, select the type of authentication you want to use: SHA, SHA224, SHA256, or SHA384.

**Note**

The MD5 option has been deprecated. If your deployment includes SNMP v3 users using the MD5 authentication algorithm that were created using a version previous to 6.5, you can continue to use those users for FTDs running versions 6.7 and previous. However, you cannot edit those users and retain the MD5 authentication algorithm, or create new users with the MD5 authentication algorithm. If your Firewall Management Center manages any Firewall Threat Defenses running Versions 7.0+, deploying a platform settings policy that uses the MD5 authentication algorithm to those Firewall Threat Defenses will fail.

**Step 8** In the **Authentication Password** field, enter the password to use for authentication. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values.

**Note**

The length of the password will depend on the authentication algorithm selected. For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

**Step 9** In the **Encryption Type** drop-down list, select the type of encryption you want to use: AES128, AES192, AES256, 3DES.

**Note**

To use AES or 3DES encryption, you must have the appropriate license installed on the device.

**Note**

The DES option has been deprecated. If your deployment includes SNMP v3 users using DES encryption that were created using a version previous to 6.5, you can continue to use those users for Firewall Threat Defenses running versions 6.7 and previous. However, you cannot edit those users and retain DES encryption, or create new users with DES encryption. If your Firewall Management Center manages any Firewall Threat Defenses running Versions 7.0+, deploying a platform settings policy that uses DES encryption to those Firewall Threat Defenses will fail.

**Step 10** Enter the password to use for encryption in the **Encryption Password** field. If you selected Encrypted as the Encrypt Password Type, the password must be formatted as xx:xx:xx..., where xx are hexadecimal values. For encrypted passwords, the length of the password depends on the encryption type selected. The password sizes are as follows (where each xx is one octal):

- AES 128 requires 16 octals
- AES 192 requires 24 octals
- AES 256 requires 32 octals
- 3DES requires 32 octals
- DES can be any size

**Note**

For all passwords, the length must be 256 characters or less.

If you selected Clear Text as the Encrypt Password Type, repeat the password in the **Confirm** field.

**Step 11** Click **OK**.

**Step 12** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Add SNMP Hosts

Use Host to add or edit entries in the SNMP Hosts table on the SNMP page. These entries represent SNMP management stations allowed to access the Firewall Threat Defense device.

You can add up to 8192 hosts. However, only 128 of this number can be for traps.

**Note** In 7.4 and later, the Management and Diagnostic interfaces are merged. If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices (7.3 and earlier, and some upgraded 7.4 FTDs).

### Before you begin

Ensure that the network objects that define the SNMP management stations exist. Select **Device > Object Management** to configure network objects.

**Note** The supported network objects include IPv6 hosts, IPv4 hosts, IPv4 range and IPv4 subnet addresses.

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Click **SNMP > Hosts**.

**Step 3** Click **Add**.

**Step 4** In the **IP Address** field, either enter a valid IPv6 or IPv4 host or select the network object that defines the SNMP management station's host address.

The IP address can be an IPv6 host, IPv4 host, IPv4 range or IPv4 subnet.

**Step 5** Select the appropriate SNMP version from the **SNMP version** drop-down list.

**Step 6** (SNMPv3 only.) Select the username of the SNMP user that you configured from the **User Name** drop-down list.

**Note**

You can associate up to 23 SNMP users per SNMP host.

**Step 7** (SNMPv1, 2c only.) In the **Read Community String** field, enter the community string that you have already configured, for read access to the device. Re-enter the string to confirm it.

**Note**

This string is required, only if the string used with this SNMP station is different from the one already defined in the **Enable SNMP Server** section.

**Step 8** Select the type of communication between the device and the SNMP management station. You can select both types.

- **Poll**—The management station periodically requests information from the device.
- **Trap**—The device sends trap events to the management station as they occur.

**Note**

When the SNMP host IP address is either an IPv4 range or an IPv4 subnet, you can configure either **Poll** or **Trap**, not both.

**Step 9** In the **Port** field, enter a UDP port number for the SNMP host. The default value is 162. The valid range is 1 to 65535.

**Step 10** Select the interface type for communication between the device and the SNMP management station under the **Reachable By** options. You can select either the device's Management interface or an available security zone/named interface.

- **Device Management Interface**—Communication between the device and the SNMP management station occurs over the Management interface.
  - When you choose this interface for SNMPv3 polling, all configured SNMPv3 users are allowed to poll and are not restricted to the user chosen in [Step 6, on page 857](#). Here, SNMPv1 and SNMPv2c are not allowed from an SNMPv3 host.
  - When you choose this interface for SNMPv1 and SNMPv2c polling, the polling is not restricted at all to the version selected in [Step 5, on page 857](#).
- **Security Zones or Named Interface**—Communication between the device and the SNMP management station occurs over a security zone or interface.
  - Search for zones in the **Available Zones** field.
  - Add the zones that contain the interfaces through which the device communicates with the management station to the **Selected Zone/Interface** field. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. You can also choose a loopback interface and virtual-router-aware interfaces. The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 11** Click **OK**.

**Step 12** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure SNMP Traps

Use SNMP Traps to configure SNMP traps (event notifications) for the Firewall Threat Defense device. Traps are different from browsing; they are unsolicited “comments” from the Firewall Threat Defense device to the management station for certain events, such as linkup, linkdown, and syslog event generated. An SNMP object ID (OID) for the device appears in SNMP event traps sent from the device.

Some traps are not applicable to certain hardware models. These traps will be ignored if you apply the policy to one of these models. For example, not all models have field-replaceable units, so the **Field Replaceable Unit Insert/Delete** trap will not be configured on those models.

SNMP traps are defined in either standard or enterprise-specific MIBs. Standard traps are created by the IETF and documented in various RFCs. SNMP traps are compiled into the Firewall Threat Defense software.

If needed, you can download RFCs, standard MIBs, and standard traps from the following location:

<http://www.ietf.org/>

Browse the complete list of Cisco MIBs, traps, and OIDs from the following location:

[SNMP Object Navigator](#)

In addition, download Cisco OIDs by FTP from the following location:

<ftp://ftp.cisco.com/pub/mibs/oid/oid.tar.gz>

### Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Click **SNMP > SNMP Traps** to configure SNMP traps (event notifications) for the Firewall Threat Defense device.
- Step 3** Select the appropriate Enable Traps options. You can select either or both options.
- a) Check **Enable All SNMP Traps** to quickly select all traps in the subsequent four sections.
  - b) Check **Enable All Syslog Traps** to enable transmission of trap-related syslog messages.

#### Note

SNMP traps are of higher priority than other notification messages from the Firewall Threat Defense as they are expected to be near real-time. When you enable all SNMP or syslog traps, it is possible for the SNMP process to consume excess resources in the agent and in the network, causing the system to hang. If you notice system delays, unfinished requests, or timeouts, you can selectively enable SNMP and syslog traps. You can also limit the rate at which syslog messages are generated by severity level or message ID. For example, all syslog message IDs that begin with the digits 212 are associated with the SNMP class; see [Limit the Rate of Syslog Message Generation, on page 877](#).

- Step 4** The event-notification traps in the **Standard** section are enabled by default for an existing policy:
- **Authentication** – Unauthorized SNMP access. This authentication failure occurs for packets with an incorrect community string.
  - **Link Up** – One of the device’s communication links has become available (it has “come up”), as indicated in the notification.
  - **Link Down** – One of the device’s communication links has failed, as indicated in the notification.

- **Cold Start** – The device is reinitializing itself such that its configuration or the protocol entity implementation may be altered.
- **Warm Start** – The device is reinitializing itself such that its configuration and the protocol entity implementation is unaltered.

**Step 5** Select the desired event-notification traps in the **Entity MIB** section:

- **Field Replaceable Unit Insert** – A Field Replaceable Unit (FRU) has been inserted, as indicated. (FRUs include assemblies such as power supplies, fans, processor modules, interface modules, etc.)
- **Field Replaceable Unit Delete** – A Field Replaceable Unit (FRU) has been removed, as indicated in the notification
- **Configuration Change** – There has been a hardware change, as indicated in the notification

**Step 6** Select the desired event-notification traps in the **Resource** section:

- **Connection Limit Reached** – This trap indicates that a connection attempt was rejected because the configured connections limit has been reached.

**Step 7** Select the desired event-notification traps in the **Other** section:

- **NAT Packet Discard** – This notification is generated when IP packets are discarded by the NAT function. Available Network Address Translation addresses or ports have fallen below configured threshold.
- **CPU Rising Threshold** – This notification is generated when rising CPU utilization exceeds a predefined threshold for a configured period of time. Check this option to enable CPU rising threshold notifications:
  - **Percentage** – The default value is 70 percent for the high threshold notification; the range is between 10 and 94 percent. The critical threshold is hardcoded at 95 percent.
  - **Period** – The default monitoring period is 1 minute; the range is between 1 and 60 minutes.
- **Memory Rising Threshold** – This notification is generated when rising memory utilization exceeds a predefined threshold, thus reducing available memory. Check this option to enable memory rising threshold notifications:
  - **Percentage** – The default value is 70 percent for the high threshold notification; the range is between 50 and 95 percent.
- **Failover** – This notification is generated when there is a change in the failover state as reported by the CISCO-UNIFIED-FIREWALL-MIB.
- **Cluster** – This notification is generated when there is a change in the cluster health as reported by the CISCO-UNIFIED-FIREWALL-MIB.
- **Peer Flap** – This notification is generated when there is BGP route flapping, a situation in which BGP systems send an excessive number of update messages to advertise network reachability information.

**Step 8** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

# SSL

**Note** You must have administrator privileges and be in a leaf domain to perform this task.

You must make sure that you are running a fully licensed version of the Secure Firewall Management Center. The SSL Settings will be disabled if you are running Secure Firewall Management Center in evaluation mode. Additionally, the SSL Settings will be disabled when the licensed Secure Firewall Management Center version does not meet the export-compliance criteria. If you are using Remote Access VPN with SSL, your Smart Account must have the strong-crypto features enabled. For more information, see *License Types and Restrictions* in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Procedure

- Step 1** Select **Devices > Platform Settings** and create or edit a Firewall Threat Defense policy.
- Step 2** Select **SSL**.
- Step 3** Add entries to the **Add SSL Configuration** table.
  - a) Click **Add** to create a new entry, or click **Edit** if the entry already exists.
  - b) Select the required security configurations from the drop-down list .
    - **Protocol Version**—Specifies the TLS protocols to be used while establishing remote access VPN sessions.
    - **Security Level**—Indicates the kind of security positioning you would like to set up for the SSL.
- Step 4** Select the **Available Algorithms** based on the protocol version that you select and click **Add** to include them for the selected protocol. For more information, see [About SSL Settings, on page 861](#).

The algorithms are listed based on the protocol version that you select. Each security protocol identifies unique algorithm for setting up the security level.
- Step 5** Click **OK** to save the changes.

## What to do next

Select **Deploy > Deployment** and click **Deploy** to deploy the policy to the assigned devices.

## About SSL Settings

The Firewall Threat Defense device uses the Secure Sockets Layer (SSL) protocol and Transport Layer Security (TLS) to support secure message transmission for Remote Access VPN connection from remote clients. The SSL Settings window lets you configure SSL versions and encryption algorithms that will be negotiated and used for message transmission during remote VPN access over SSL.

**Note** Though you configure Firewall Management Center and Firewall Threat Defense to operate in a security certifications (UCAPL, CC, or FIPS) compliance mode, the Firewall Management Center allows configuration of unsupported ciphers. For example, in a FIPS enabled mode, management center allows configuring DH Group 5 which is not FIPS-compliant. However, VPN tunnel does not negotiate due to the non-compliant cipher usage.

Configure the SSL Settings at the following location:

**Devices > Platform Settings**, and then click **SSL**.

### Fields

**Minimum SSL Version as Server**—Specify the minimum SSL/TLS protocol version that the Firewall Threat Defense device uses when acting as a server. For example, when it functions as a Remote Access VPN Gateway.

**TLS Version**—Select one of the following TLS versions from the drop-down list:

TLS V1	Accepts SSLv2 client hellos and negotiates TLSv1 (or greater).
TLSV1.1	Accepts SSLv2 client hellos and negotiates TLSv1.1 (or greater).
TLSV1.2	Accepts SSLv2 client hellos and negotiates TLSv1.2 (or greater).
TLSV1.3	Accepts SSLv2 client hellos and negotiates TLSv1.3 (or greater).

**Note** TLS 1.3 in remote access VPN requires Cisco Secure Client, Version 5.0 and above.

**DTLS Version**—Select the DTLS versions from the drop-down list, based on the selected TLS version. By default, DTLSv1 is configured on Firewall Threat Defense devices, you can choose the DTLS version as per your requirement.

**Note** Ensure that the TLS protocol version is higher than or equal to the DTLS protocol version selected. TLS protocol versions support the following DTLS versions:

TLS V1	DTLSv1
TLSV1.1	DTLSv1
TLSV1.2	DTLSv1, DTLSv1.2
TLSV1.3	DTLSv1, DTLSv1.2

**Diffie-Hellman Group**—Choose a group from the drop-down list. Available options are Group1 - 768-bit modulus, Group2 - 1024-bit modulus, Group5 - 1536-bit modulus, Group14 - 2048-bit modulus, 224-bit prime order, and Group24 - 2048-bit modulus, 256-bit prime order. The default is Group1.

**Elliptical Curve Diffie-Hellman Group**—Choose a group from the drop-down list. Available options are Group19 - 256-bit EC, Group20 - 384-bit EC, and Group21 - 521-bit EC. The default value is Group19.

TLSv1.2 adds support for the following ciphers:

- ECDHE-ECDSA-AES256-GCM-SHA384
- ECDHE-RSA-AES256-GCM-SHA384
- DHE-RSA-AES256-GCM-SHA384
- AES256-GCM-SHA384
- ECDHE-ECDSA-AES256-SHA384
- ECDHE-RSA-AES256-SHA384
- ECDHE-ECDSA-AES128-GCM-SHA256
- ECDHE-RSA-AES128-GCM-SHA256
- DHE-RSA-AES128-GCM-SHA256
- RSA-AES128-GCM-SHA256
- ECDHE-ECDSA-AES128-SHA256
- ECDHE-RSA-AES128-SHA256

---

**Note** ECDSA and DHE ciphers are the highest priority.

---

TLSv1.3 adds support for the following ciphers:

- TLS\_AES\_128\_GCM\_SHA256
- TLS\_CHACHA20\_POLY1305\_SHA256
- TLS\_AES\_256\_GCM\_SHA384

The SSL configuration table can be used to specify the protocol version, security level, and Cipher algorithms that you want to support on the Secure Firewall Threat Defense devices.

**Protocol Version**—Lists the protocol version that the Secure Firewall Threat Defense device supports and uses for SSL connections. Available protocol versions are:

- Default
- TLSV1
- TLSV1.1
- TLSV1.2
- TLSV1.3
- DTLSv1
- DTLSv1.2

**Security Level**—Lists the cipher security levels that Firewall Threat Defense device supports and uses for SSL connections.

If you have Firewall Threat Defense devices with evaluation license, the security level is Low by default. With Firewall Threat Defense smart license, the default security level is High. You can choose one of the following options to configure the required security level:

- **All** includes all ciphers, including NULL-SHA.
- **Low** includes all ciphers, except NULL-SHA.
- **Medium** includes all ciphers, except NULL-SHA, DES-CBC-SHA, RC4-SHA, and RC4-MD5 (this is the default).
- **Fips** includes all FIPS-compliant ciphers, except NULL-SHA, DES-CBC-SHA, RC4-MD5, RC4-SHA, and DES-CBC3-SHA, TLS\_CHACHA20\_POLY1305\_SHA256.
- **High** includes only AES-256 with SHA-2 ciphers and applies to TLS version 1.2 and the *default* version.
- **Custom** includes one or more ciphers that you specify in the Cipher algorithms/custom string box. This option provides you with full control of the cipher suite using OpenSSL cipher definition strings.

**Cipher Algorithms/Custom String**—Lists the cipher algorithms that the Firewall Threat Defense device supports and uses for SSL connections. For more information about ciphers using OpenSSL, see <https://www.openssl.org/docs/apps/ciphers.html>

Ciphers supported by TLSv1.2 only

ECDHE-ECDSA-AES256-GCM-SHA384
ECDHE-RSA-AES256-GCM-SHA384
DHE-RSA-AES256-GCM-SHA384
AES256-GCM-SHA384
ECDHE-ECDSA-AES256-SHA384
ECDHE-RSA-AES256-SHA384
DHE-RSA-AES256-SHA256
AES256-SHA256
ECDHE-ECDSA-AES128-GCM-SHA256
ECDHE-RSA-AES128-GCM-SHA256
DHE-RSA-AES128-GCM-SHA256
AES128-GCM-SHA256
ECDHE-ECDSA-AES128-SHA256
ECDHE-RSA-AES128-SHA256
DHE-RSA-AES128-SHA256

AES128-SHA256
---------------

**Note** ECDSA and DHE ciphers are the highest priority.

Ciphers not supported by TLSv1.1 or TLSv1.2

RC4-SHA
---------

RC4-MD5
---------

DES-CBC-SHA
-------------

NULL-SHA
----------

## Syslog

You can enable system logging (syslog) for Firewall Threat Defense devices. Logging information can help you identify and isolate network or device configuration problems. You can also send some security events to a syslog server. The following topics explain logging and how to configure it.

## About Syslog

System logging is a method of collecting messages from devices to a server running a syslog daemon. Logging to a central syslog server helps in aggregation of logs and alerts. Cisco devices can send their log messages to a UNIX-style syslog service. A syslog service accepts messages and stores them in files, or prints them according to a simple configuration file. This form of logging provides protected long-term storage for logs. Logs are useful both in routine troubleshooting and in incident handling.

**Table 62: System Logs for Secure Firewall Threat Defense**

Logs Related To	Details	Configure In
Device and system health, network configuration	This syslog configuration generates messages for features running on the data plane, that is, features that are defined in the CLI configuration that you can view with the <b>show running-config</b> command. This includes features such as routing, VPN, data interfaces, DHCP server, NAT, and so forth. Data plane syslog messages are numbered, and they are the same as those generated by devices running ASA software. However, Secure Firewall Threat Defense does not necessarily generate every message type that is available for ASA Software. For information on these messages, see <i>Cisco Secure Firewall Threat Defense Syslog Messages</i> at <a href="https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_fptd_syslog_guide.html">https://www.cisco.com/c/en/us/td/docs/security/firepower/Syslogs/b_fptd_syslog_guide.html</a> . This configuration is explained in the following topics.	<b>Platform Settings</b>

Logs Related To	Details	Configure In
Security events	This syslog configuration generates alerts for file and malware, connection, Security Intelligence, and intrusion events. For details, see <i>About Sending Syslog Messages for Security Events</i> and subtopics in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> .	<b>Platform Settings</b> and the <b>Logging</b> in an access control policy
(All devices) Policies, rules, and events	This syslog configuration generates alerts for access control rules, intrusion rules, and other advanced services as described in <i>Configurations Supporting Alert Responses</i> in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> . These messages are not numbered. For information on configuring this type of syslog, see <i>Creating a Syslog Alert Response</i> in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> .	<b>Alert Responses</b> and the <b>Logging</b> in an access control policy

You can configure more than one syslog server, and control the messages and events sent to each server. You can also configure different destinations, such as console, email, internal buffer, and so forth.

## Severity Levels

The following table lists the syslog message severity levels.

**Table 63: Syslog Message Severity Levels**

Level Number	Severity Level	Description
0	<b>emergencies</b>	System is unusable.
1	<b>alert</b>	Immediate action is needed.
2	<b>critical</b>	Critical conditions.
3	<b>error</b>	Error conditions.
4	<b>warning</b>	Warning conditions.
5	<b>notification</b>	Normal but significant conditions.
6	<b>informational</b>	Informational messages only.
7	<b>debugging</b>	Debugging messages only.  Log at this level only temporarily, when debugging issues. This log level can potentially generate so many messages that system performance can be affected.

**Note** ASA and Firewall Threat Defense do not generate syslog messages with a severity level of zero (emergencies).

## Syslog Message Filtering

You can filter generated syslog messages so that only certain syslog messages are sent to a particular output destination. For example, you could configure the Firewall Threat Defense device to send all syslog messages to one output destination and to send a subset of those syslog messages to a different output destination.

Specifically, you can direct syslog messages to an output destination according to the following criteria:

- Syslog message ID number  
(This does not apply to syslog messages for security events such as connection and intrusion events.)
- Syslog message severity level
- Syslog message class (equivalent to a functional area)  
(This does not apply to syslog messages for security events such as connection and intrusion events.)

You customize these criteria by creating a message list that you can specify when you set the output destination. Alternatively, you can configure the Firewall Threat Defense device to send a particular message class to each type of output destination independently of the message list.

(Message lists do not apply to syslog messages for security events such as connection and intrusion events.)

## Syslog Message Classes

---

**Note** This topic does not apply to messages for security events (connection, intrusion, etc.).

---

You can use syslog message classes in two ways:

- Specify an output location for an entire category of syslog messages.
- Create a message list that specifies the message class.

The syslog message class provides a method of categorizing syslog messages by type, equivalent to a feature or function of the device. For example, the rip class denotes RIP routing.

All syslog messages in a particular class share the same initial three digits in their syslog message ID numbers. For example, all syslog message IDs that begin with the digits 611 are associated with the vpnc (VPN client) class. Syslog messages associated with the VPN client feature range from 611101 to 611323.

In addition, most of the ISAKMP syslog messages have a common set of prepended objects to help identify the tunnel. These objects precede the descriptive text of a syslog message when available. If the object is not known at the time that the syslog message is generated, the specific heading = value combination does not appear.

The objects are prefixed as follows:

Group = *groupname*, Username = *user*, IP = *IP\_address*

Where the group is the tunnel-group, the username is the username from the local database or AAA server, and the IP address is the public IP address of the remote access client or Layer 2 peer.

The following table lists the message classes and the range of message IDs in each class.

**Table 64: Syslog Message Classes and Associated Message ID Numbers**

<b>Class</b>	<b>Definition</b>	<b>Syslog Message ID Numbers</b>
access-list*	Access Lists	106
application-firewall*	Application Firewall	415
auth	User Authentication	109, 113
botnet-traffic-filtering*	Botnet Traffic Filtering	338
bridge	Transparent Firewall	110, 220
ca	PKI Certification Authority	717
card-management*	Card Management	323
citrix	Citrix Client	723
clustering*	Clustering	747
config	Command Interface	111, 112, 208, 308
csd	Secure Desktop	724
cts	Cisco TrustSec	776
dap	Dynamic Access Policies	734
eap, eapoudp	EAP or EAPoUDP for Network Admission Control	333, 334
egrp	EIGRP Routing	336
email	E-mail Proxy	719
environment-monitoring*	Environment Monitoring	735
ha	Failover	101, 102, 103, 104, 105, 210, 311, 709
identity-based-firewall*	Identity-based Firewall	746
ids	Intrusion Detection System	400, 733
ikev2-toolkit*	IKEv2 Toolkit	750, 751, 752
ip	IP Stack	209, 215, 313, 317, 408
ipaa	IP Address Assignment	735
ips	Intrusion Protection System	400, 401, 420
ipv6*	IPv6	325
licensing*	Licensing	444

Class	Definition	Syslog Message ID Numbers
mdm-proxy	MDM Proxy	802
nac	Network Admission Control	731, 732
nacpolicy	NAC Policy	731
nacsettings	NAC Settings to apply NAC Policy	732
nat-and-pat*	NAT and PAT	305
network-access-point*	Network Access Point	713
np	Network Processor	319
np-ssl*	NP SSL	725
ospf	OSPF Routing	318, 409, 503, 613
password-encryption*	Password Encryption	742
phone-proxy*	Phone Proxy	337
rip	RIP Routing	107, 312
rm	Resource Manager	321
scansafe*	ScanSafe	775
session	User Session	106, 108, 201, 202, 204, 302, 303, 304, 305, 314, 405, 406, 407, 500, 502, 607, 608, 609, 616, 620, 703, 710
smart-call-home*	Smart Call Home	120
snmp	SNMP	212
ssl	SSL Stack	725
svc	SSL VPN Client	722
sys	System	199, 211, 214, 216, 306, 307, 315, 414, 604, 605, 606, 610, 612, 614, 615, 701, 711, 741
tag-switching	Service Tag Switching	779
threat-detection*	Threat Detection	733
transactional-rule-engine-tre*	Transactional Rule Engine	780
uc-ims*	UC-IMS	339
vm	VLAN Mapping	730

Class	Definition	Syslog Message ID Numbers
vpdn	PPTP and L2TP Sessions	213, 403, 603
vpn	IKE and IPsec	316, 320, 402, 404, 501, 602, 702, 713, 714, 715
vpnc	VPN Client	611
vpnfo	VPN Failover	720
vpnlb	VPN Load Balancing	718
vxlan*	VXLAN	778
webfo	WebVPN Failover	721
webvpn	WebVPN and Secure Client	716

\*These classes are provisioned in the management center web interface to facilitate creation of event lists. These classes are not displayed on the device console.

## Guidelines for Logging

This section includes guidelines and limitations that you should review before configuring logging.

### IPv6 Guidelines

- IPv6 is supported. Syslogs can be sent using TCP or UDP.
- Ensure that the interface configured for sending syslogs is enabled, IPv6 capable, and the syslog server is reachable through the designated interface.
- Secure logging over IPv6 is not supported.

### Additional Guidelines

- Do not configure Firewall Management Center as a primary syslog server. The Firewall Management Center can log some syslogs. However, it does not have adequate storage provision to accommodate voluminous information from connection events for every sensor, especially when multiple sensors are used and all send syslogs.
- The syslog server must run a server program called syslogd. Windows provides a syslog server as part of its operating system.
- The syslog server operates based on the syslog-ng process of the firewall system. Do not use external configuration files, like the *scwx.conf* file from SecureWorks. Such files are not compatible with the device. Using them will lead to parsing error and eventually the syslog-ng process will fail.
- To view logs generated by the Firewall Threat Defense device, you must specify a logging output destination. If you enable logging without specifying a logging output destination, the Firewall Threat Defense device generates messages but does not save them to a location from which you can view them. You must specify each different logging output destination separately.

- If you use TCP as the transport protocol, the system opens 4 connections to the syslog server to ensure that messages are not lost. If you are using the syslog server to collect messages from a very large number of devices, and the combined connection overhead is too much for the server, use UDP instead.
- It is not possible to have two different lists or classes being assigned to different syslog servers or same locations.
- You can configure up to 16 syslog servers.
- The syslog server should be reachable through the Firewall Threat Defense device. You should configure the device to deny ICMP unreachable messages on the interface through which the syslog server is reachable and to send syslogs to the same server. Make sure that you have enabled logging for all severity levels. To prevent the syslog server from crashing, suppress the generation of syslogs 313001, 313004, and 313005.
- The number of UDP connections for syslog is directly related to the number of CPUs on the hardware platform and the number of syslog servers you configure. At any point in time, there can be as many UDP syslog connections as there are CPUs times the number of configured syslog servers. This is the expected behavior. Note that the global UDP connection idle timeout applies to these sessions, and the default is 2 minutes. You can adjust that setting if you want to close these session more quickly, but the timeout applies to all UDP connections, not just syslog.
- When the Firewall Threat Defense device sends syslogs via TCP, the connection takes about one minute to initiate after the syslogd service restarts.
- When the TCP logging host goes down, it takes approximately 6 minutes to change its connection status from *Connected* to *Not connected*. Logging relies on TCP to detect the channel state; until then, logging sends the logs through the channel. During this time, when you execute the **show log**, the output would display the TCP logging host as connected. Once the TCP channel is closed, the TCP logging host state is updated to *Not connected*.

## Configure Syslog Logging for Firewall Threat Defense Devices

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

To configure syslog settings, perform the following steps:

### Before you begin

See requirements in [Guidelines for Logging, on page 870](#).

### Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Click **Syslog** from the table of contents.

- Step 3** Click **Logging Setup** to enable logging, specify FTP Server settings, and specify Flash usage. For more information, see [Enable Logging and Configure Basic Settings, on page 872](#)
- Step 4** Click **Logging Destinations** to enable logging to specific destinations and to specify filtering on message severity level, event class, or on a custom event list. For more information, see [Enable Logging Destinations, on page 874](#)
- You must enable a logging destination to see messages at that destination.
- Step 5** Click **E-mail Setup** to specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages. For more information, see [Send Syslog Messages to an E-mail Address, on page 875](#)
- Step 6** Click **Events List** to define a custom event list that includes an event class, a severity level, and an event ID. For more information, see [Create a Custom Event List, on page 876](#)
- Step 7** Click **Rate Limit** to specify the volume of messages being sent to all configured destinations and define the message severity level to which you want to assign rate limits. For more information, see [Limit the Rate of Syslog Message Generation, on page 877](#)
- Step 8** Click **Syslog Settings** to specify the logging facility, enable the inclusion of a time stamp, and enable other settings to set up a server as a syslog destination. For more information, see [Configure Syslog Settings, on page 878](#)
- Step 9** Click **Syslog Servers** to specify the IP address, protocol used, format, and security zone for the syslog server that is designated as a logging destination. For more information, see [Configure a Syslog Server, on page 879](#).

## Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages

"Security events" include connection, Security Intelligence, intrusion, and file and malware events.

Some of the syslog settings configured on the **Syslog** page (**Devices > Platform Settings**, edit Threat Defense Policy, and then click **Syslog**) and its tabs apply to syslog messages for security events, but most apply only to messages for events related to system health and networking.

The following settings apply to syslog messages for security events:

- **Logging Setup** tab:
  - **Send syslogs in EMBLEM format**
- **Syslog Settings** tab:
  - **Enable Timestamp on Syslog Messages**
  - **Timestamp Format**
  - **Enable Syslog Device ID**
- **Syslog Servers** tab:
  - All options on the **Add Syslog Server** form (and the list of configured servers).

## Enable Logging and Configure Basic Settings

Enable logging and configure the basic settings for the system to generate syslog messages for data plane events. You can also set up archiving on flash or an FTP server as a storage location when the local buffer

becomes full. You can manipulate logging data after it is saved. For example, you could specify actions to be executed when certain types of syslog messages are logged, extract data from the log and save the records to another file for reporting, or track statistics using a site-specific script.

The following procedure explains some of the basic syslog settings.

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages](#), on page 872.

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Syslog > Logging Setup**.

**Step 3** Enable logging and configure basic logging settings.

- **Enable Logging**—Turns on the data plane system logging for the Firewall Threat Defense device.
- **Enable Logging on the Failover Standby Unit**—Turns on logging for the standby for the Firewall Threat Defense device, if available.
- **Send syslogs in EMBLEM format**—Enables EMBLEM format logging for every logging destination. If you enable EMBLEM, you must use the UDP protocol to publish syslog messages; EMBLEM is not compatible with TCP.

The EMBLEM syslog format is a Cisco-specific convention that is built upon the RFC 3164 and RFC 5424 standards. Hence, when EMBLEM is enabled, the syslog message prints colon (:) after <PRI> field in contrast to the RFC 5424 format.

### Note

Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in Firewall Management Center, if you want to display the PRI value in the syslog messages of the managed Firewall Threat Defense device, ensure to enable the EMBLEM format. Also, the device ID does not appear in EMBLEM-formatted syslog messages.

- **Send debug messages as syslogs**—Redirects all the debug trace output to the syslog. The syslog message does not appear in the console if this option is enabled. Therefore, to see debug messages, you must enable logging at the console and configure it as the destination for the debug syslog message number and logging level. The syslog message number used is 711001. The default logging level for this syslog is debug.
- **Memory Size of Internal Buffer**—Specify the size of the internal buffer to which syslog messages are saved if the logging buffer is enabled. When the buffer fills up, it is overwritten. The default is 4096 bytes. The range is 4096 to 52428800.

**Step 4** (Optional) Configure the syslog message logging to the Firewall Management Center.

- a) Enable VPN logging by checking the **Enable Logging to Secure Firewall Management Center** check box.
- b) Choose the syslog severity level for the logging messages from the **Logging Level** drop-down list.
  - The logging level for the VPN messages is set to **errors** by default.

VPN troubleshooting syslogs can add excessive load on the Firewall Management Center. Hence, enable this option with caution. Also, when you configure a device with site-to-site or remote access VPN, it automatically enables sending VPN syslogs to the management center by default. We recommend that you limit the logging level to **error** and above to restrict the excessive flow of syslogs to the Firewall Management Center, especially in case of RAVPN, where multiple devices are involved.

For information on the levels, see [Severity Levels, on page 866](#).

- Step 5** (Optional) Configure an FTP server if you want to save log buffer contents to the server before the buffer is overwritten. Specify the FTP Server information.
- **FTP Server Buffer Wrap**—To save the buffer contents to the FTP server before it is overwritten, check this box and enter the necessary destination information in the following fields. To remove the FTP configuration, deselect this option.
  - **IP Address**—Select the host network object that contains the IP address of the FTP server.
  - **User Name**—Enter the username to use when connecting to the FTP server.
  - **Path**—Enter the path, relative to the FTP root, where the buffer contents should be saved.
  - **Password/ Confirm**—Enter and confirm the password used to authenticate the username to the FTP server.
- Step 6** (Optional) Specify Flash size if you want to save log buffer contents to flash before the buffer is overwritten.
- **Flash**—To save the buffer contents to the flash memory before it is overwritten, check this box.
  - **Maximum flash to be used by logging (KB)**—Specify the maximum space to be used in the flash memory for logging (in kilobytes). The range is 4-8044176 kilobytes.
  - **Minimum free space to be preserved (KB)**—Specifies the minimum free space to be preserved in flash memory (in KB). The range is 0-8044176 kilobytes.
- Step 7** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Enable Logging Destinations

You must enable a logging destination to see messages at that destination. When enabling a destination, you must also specify the message filter for the destination.

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

### Procedure

- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

- Step 2** Select **Syslog > Logging Destinations**.
- Step 3** Click **Add** to enable a destination and apply a logging filter, or edit an existing destination.
- Step 4** In the **Logging Destinations** dialog box, select a destination and configure the filter to use for a destination:
- Choose the destination you are enabling in the **Logging Destination** drop-down list. You can create one filter per destination: Console, E-Mail, Internal buffer, SNMP trap, SSH Sessions, and Syslog servers.
- Note**  
Console and SSH session logging works in the diagnostic CLI only. Enter **system support diagnostic-cli**.
- In **Event Class**, choose the filter that will apply to all classes not listed in the table.  
You can configure these filters:
    - **Filter on severity** —Select the severity level. Messages at this level or higher are sent to the destination
    - **Use Event List** —Select the event list that defines the filter. You create these lists on the **Event Lists** page.
    - **Disable Logging** —Prevents messages from being sent to this destination.
  - If you want to create filters per event class, click **Add** to create a new filter, or edit an existing filter, and select the event class and severity level to limit messages in that class. Click **OK** to save the filter.  
For an explanation of the event classes, see [Syslog Message Classes, on page 867](#).
  - Click **OK**.
- Step 5** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Send Syslog Messages to an E-mail Address

You can set up a list of recipients for syslog messages to be sent as e-mails.

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

### Before you begin

- Configure an SMTP server on the SMTP Server platform settings page
- [Enable Logging and Configure Basic Settings, on page 872](#)
- [Setup Email as the Logging Destination](#)

## Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **Syslog > Email Setup**.
- Step 3** Specify the e-mail address that is used as the source address for syslog messages that are sent as e-mail messages.
- Step 4** Click **Add** to enter a new e-mail address recipient of the specified syslog messages.
- Step 5** Choose the severity level of the syslog messages that are sent to the recipient from the drop-down list.
- The syslog message severity filter used for the destination e-mail address causes messages of the specified severity level and higher to be sent. For information on the levels, see [Severity Levels, on page 866](#).
- Step 6** Click **OK**.
- Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Create a Custom Event List

An event list is a custom filter you can apply to a logging destination to control which messages are sent to the destination. Normally, you filter messages for a destination based on severity only, but you can use an event list to fine-tune which messages are sent based on a combination of event class, severity, and message identifier (ID).

Creating a custom event list is a two-step process. You create a custom list in the **Event Lists**, and then use the event list to define the logging filter for the various types of destination, in the **Logging Destinations**.

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

---

## Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **Syslog > Events List**.
- Step 3** Configure an event list.
- Click **Add** to add a new list, or edit an existing list.
  - Enter a name for the event list in the **Name** field. Spaces are not allowed.
  - To identify messages based on severity or event class, select the **Severity/Event Class** tab and add or edit entries.

For information on the available classes see [Syslog Message Classes, on page 867](#).

For information on the levels, see [Severity Levels, on page 866](#).

Certain event classes are not applicable for the device in transparent mode. If such options are configured then they will be bypassed and not deployed.

- d) To identify messages specifically by message ID, select the **Message ID** and add or edit the IDs.

You can enter a range of IDs using a hyphen, for example, 100000-200000. IDs are six digits. For information on how the initial three digits map to features, see [Syslog Message Classes, on page 867](#).

For specific message numbers, see [Cisco ASA Series Syslog Messages](#).

- e) Click **OK** to save the event list.

**Step 4** Click **Logging Destinations** and add or edit the destination that should use the filter.

See [Enable Logging Destinations, on page 874](#).

**Step 5** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Limit the Rate of Syslog Message Generation

You can limit the rate at which syslog messages are generated by severity level or message ID. You can specify individual limits for each logging level and each Syslog message ID. If the settings conflict, the Syslog message ID limits take precedence.

**Tip** If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), most Firewall Threat Defense platform settings do not apply to these messages. See [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Syslog > Rate Limit**.

**Step 3** To limit message generation by severity level, click **Logging Level > Add** and configure the following options:

- **Logging Level**—The severity level you are rate limiting. For information on the levels, see [Severity Levels, on page 866](#).
- **Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.
- **Interval**—The number of seconds before the rate limit counter resets.

**Step 4** Click **OK**.

**Step 5** To limit message generation by syslog message ID, click **Syslog Level > Add** and configure the following options:

- **Syslog ID**—The syslog message ID you are rate limiting. For specific message numbers, see [Cisco ASA Series Syslog Messages](#).
- **Number of messages**—The maximum number of messages of the specified type allowed in the specified time period.
- **Interval**—The number of seconds before the rate limit counter resets.

**Step 6** Click **OK**.

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Configure Syslog Settings

You can configure general syslog settings to set the facility code to be included in syslog messages that are sent to syslog servers, specify whether a timestamp is included in each message, specify the device ID to include in messages, view and modify the severity levels for messages, and disable the generation of specific messages.

If you are configuring devices to send syslog messages about security events (such as connection and intrusion events), some settings on this page do not apply to these messages. See *Threat Defense Platform Settings That Apply to Security Event Syslog Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Syslog > Syslog Settings**.

**Step 3** Select a system log facility for syslog servers to use as a basis to file messages in the **Facility** drop-down list.

The default is LOCAL4(20), which is what most UNIX systems expect. However, because your network devices share available facilities, you might need to change this value for system logs.

Facility values are not typically relevant for security events. If you need to include Facility values in messages, see *Facility in Security Event Syslog Messages* in the [Cisco Secure Firewall Management Center Administration Guide](#).

**Step 4** Select the **Enable timestamp on each syslog message** check box to include the date and time a message was generated in the syslog message.

**Step 5** Select the **Timestamp Format** for the syslog message:

- The Legacy (MMM dd yyyy HH:mm:ss) format is the default format for syslog messages.

When this timestamp format is selected, the messages do not indicate the time zone, which is always UTC.

- RFC 5424 (yyyy-MM-ddTHH:mm:ssZ) uses the ISO 8601 timestamp format as specified in the RFC 5424 syslog format.

If you select the RFC 5424 format, a “Z” is appended to the end of each timestamp to indicate that the timestamp uses the UTC time zone.

- Step 6** If you want to add a device identifier to syslog messages (which is placed at the beginning of the message), check the **Enable Syslog Device ID** check box and then select the type of ID.
- **Interface**—To use the IP address of the selected interface, regardless of the interface through which the appliance sends the message. Select the security zone that identifies the interface. The zone must map to a single interface.
  - **User Defined ID**—To use a text string (up to 16 characters) of your choice.
  - **Host Name**—To use the hostname of the device.
- Step 7** Use the Syslog Message table to alter the default settings for specific syslog messages. You need to configure rules in this table only if you want to change the default settings. You can change the severity assigned to a message, or you can disable the generation of a message.
- By default, Netflow is enabled and the entries are shown in the table.
- a) To suppress syslog messages that are redundant because of Netflow, select **Netflow Equivalent Syslogs**. This adds the messages to the table as suppressed messages.
- Note**  
If any of these syslog equivalents are already in the table, your existing rules are not overwritten.
- b) To add a rule, click **Add**.
- c) You select the message number whose configuration you want to change, from the **Syslog ID** drop down list and then select the new severity level from the **Logging Level** drop down list, or select **Suppressed** to disable the generation of the message. Typically, you would not change the severity level and disable the message, but you can make changes to both fields if desired.
- d) Click **OK** to add the rule to the table.
- Step 8** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Configure a Syslog Server

To configure a syslog server to handle messages generated from your system, perform the following steps.

If you want this syslog server to receive security events such as connection and intrusion events, see also [Firewall Threat Defense Platform Settings That Apply to Security Event Syslog Messages, on page 872](#).

---

**Note** In 7.4 and later, the Management and Diagnostic interfaces are merged. If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and unmerged devices (7.3 and earlier, and some upgraded 7.4 Firewall Threat Defenses).

---

**Before you begin**

- See requirements in [Guidelines for Logging, on page 870](#).
- Make sure your devices can reach your syslog collector on the network.

**Procedure**

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **Syslog > Syslog Server**.
- Step 3** Check the **Allow user traffic to pass when TCP syslog server is down (Recommended)** check box, to allow traffic if any syslog server that is using the TCP protocol is down.

**Note**

- This option is enabled by default. Unless required, we recommend that you allow connections through the threat defense device when the external TCP syslog server is unreachable by the device.
- When the **Allow user traffic to pass when TCP syslog server is down** option is disabled in Firewall Management Center version 6.2.x or earlier, it persists to be in the Disable state even after upgrading to version 6.3 or later. Ensure that you manually enable it.
- With this option disabled, and when more than one TCP syslog server is configured in the device, the user traffic is allowed to pass if at least one of the servers is reachable by the threat defense device. Thus, the disabled option is applied only when none of the TCP syslog servers configured in the device are reachable. The device generates the following syslog that describes the root cause of the denied traffic through the device:

```
%FTD-3-414003: TCP Syslog Server intf : IP_Address /port not responding. New connections
are denied based on logging permit-hostdown policy
```

- Step 4** In the **Message queue size (messages)** field, enter a size of the queue for storing syslog messages on the security appliance when the syslog server is busy. The minimum is 1 message. The default is 512. Specify 0 to allow an unlimited number of messages to be queued (subject to available block memory).

When the messages exceed the configured queue size, they are dropped and result in missing syslog. To determine the ideal queue size, you need to identify the available block memory. Use the **show blocks** command to know the current memory utilization. For more information on the command and its attributes, see *Cisco Secure Firewall ASA Series Command Reference Guide*. For further assistance, contact Cisco TAC.

- Step 5** Click **Add** to add a new syslog server.
- In the **IP Address** drop-down list, select a network host object that contains the IP address of the syslog server.
  - Choose the protocol (either TCP or UDP) and enter the port number for communications between the Firewall Threat Defense device and the syslog server.
- UDP is faster and uses less resources on the device than TCP.
- The default port for UDP is 514. You must manually configure port 1470 for TCP. Valid non-default port values for either protocol are 1025 through 65535.
- Check the **Log messages in Cisco EMBLEM format (UDP only)** check box to specify whether to log messages in Cisco EMBLEM format (available only if UDP is selected as the protocol).

The EMBLEM syslog format is a Cisco-specific convention that is built upon the RFC 3164 and RFC 5424 standards. Hence, when EMBLEM is enabled, the syslog message prints colon (:) after <PRI> field.

**Note**

Syslog messages in RFC5424 format, typically displays the priority value (PRI). However, in Firewall Management Center, only when you enable logging in Cisco EMBLEM format, the PRI value in the syslog messages of the managed Firewall Threat Defense is displayed. Also, the device ID does not appear in EMBLEM-formatted syslog messages.

- d) Check the **Enable Secure Syslog** check box to encrypt the connection between the device and server using SSL/TLS over TCP.

**Note**

You must select TCP as the protocol and its port value ranging between 1025 and 65535 to use this option. You must also upload the certificate required to communicate with the syslog server on the **Devices > Certificates** page. Finally, upload the certificate from the Firewall Threat Defense device to the syslog server to complete the secure relationship and allow it to decrypt the traffic. The **Enable Secure Syslog** option is not supported on the device Management interface.

- e) Select **Device Management Interface** or **Security Zones or Named Interfaces** to communicate with the syslog server.

- **Device Management Interface:** Send syslogs out of the Management interface. We recommend that you use this option when configuring syslog on Snort events.

**Note**

The **Device Management Interface** option does not support the **Enable Secure Syslog** option.

- **Security Zones or Named Interfaces:** Select the interfaces from the list of **Available Zones** and click **Add**. You can also add virtual-router-aware interfaces.

**Important**

The Firewall Threat Defense data plane (Lina) syslog messages cannot be sent out through the diagnostic interface. Configure other interfaces or the Management interface (Br1/Management0) to send out the data plane syslog messages.

- f) Click **OK**.

**Step 6**

Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Timeouts

You can set the global idle timeout durations for the connection and translation slots of various protocols. If the slot has not been used for the idle time specified, the resource is returned to the free pool.

You can also set a time out for console sessions with the device.

## Procedure

**Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Timeouts**.

**Step 3** Configure the timeouts you want to change.

For any given setting, select **Custom** to define your own value, **Default** to return to the system default value. In most cases, the maximum timeout is 1193 hours.

You can disable some timeouts by selecting **Disable**.

- **Console Timeout**—The idle time until a connection to the console is closed, range is 0 or 5 to 1440 minutes. The default is 0, which means the session does not time out. If you change the value, existing console sessions use the old timeout value. The new value applies to new connections only.
- **Translation Slot (xlate)**—The idle time until a NAT translation slot is freed. This duration must be at least 1 minute. The default is 3 hours.
- **Connection (Conn)**—The idle time until a connection slot is freed. This duration must be at least 5 minutes. The default is 1 hour.
- **Half-Closed**—The idle time until a TCP half-closed connection closes. A connection is considered half-closed if both the FIN and FIN-ACK have been seen. If only the FIN has been seen, the regular connection timeout applies. The minimum is 30 seconds. The default is 10 minutes.
- **UDP**—The idle time until a UDP connection closes. This duration must be at least 1 minute. The default is 2 minutes.
- **ICMP**—The idle time after which general ICMP states are closed. The default (and minimum) is 2 seconds.
- **RPC/Sun RPC**—The idle time until a SunRPC slot is freed. This duration must be at least 1 minute. The default is 10 minutes.

In a Sun RPC-based connection, when the parent connection is deleted or timed-out, a new child connection may not be considered as a part of the parent-child connection, and thereby the new connection could be evaluated as per the policy or rules set in the system. After the parent connection has timed-out the existing child connections are valid only until the timeout value set is reached.

- **H.225**—The idle time until an H.225 signaling connection closes. The default is 1 hour. To close a connection immediately after all calls are cleared, a timeout of 1 second (0:0:1) is recommended.
- **H.323**—The idle time after which H.245 (TCP) and H.323 (UDP) media connections close. The default (and minimum) is 5 minutes. Because the same connection flag is set on both H.245 and H.323 media connections, the H.245 (TCP) connection shares the idle timeout with the H.323 (RTP and RTCP) media connection.
- **SIP**—The idle time until a SIP signaling port connection closes. This duration must be at least 5 minutes. The default is 30 minutes.
- **SIP Media**—The idle time until a SIP media port connection closes. This duration must be at least 1 minute. The default is 2 minutes. The SIP media timer is used for SIP RTP/RTCP with SIP UDP media packets, instead of the UDP inactivity timeout.

- **SIP Disconnect**—The idle time after which SIP session is deleted if the 200 OK is not received for a CANCEL or a BYE message, between 0:0:1 and 0:10:0. The default is 2 minutes (0:2:0).
- **SIP Invite**—The idle time after which pinholes for PROVISIONAL responses and media xlates will be closed, between 0:1:0 and 00:30:0. The default is 3 minutes (0:3:0).
- **SIP Provisional Media**—The timeout value for SIP provisional media connections, between 1 and 30 minutes. The default is 2 minutes.
- **Floating Connection**—When multiple routes exist to a network with different metrics, the system uses the one with the best metric at the time of connection creation. If a better route becomes available, then this timeout lets connections be closed so a connection can be reestablished to use the better route. The default is 0 (the connection never times out). To make it possible to use better routes, set the timeout to a value between 0:0:30 and 1193:0:0. This timer does not apply to connections through virtual tunnel interfaces (VTI). If a connection through a VTI gets stuck, you must manually clear it.
- **Xlate PAT**—The idle time until a PAT translation slot is freed, between 0:0:30 and 0:5:0. The default is 30 seconds. You may want to increase the timeout if upstream routers reject new connections using a freed PAT port because the previous connection might still be open on the upstream device.
- **TCP Proxy Reassembly**—The idle timeout after which buffered packets waiting for reassembly are dropped, between 0:0:10 and 1193:0:0. The default is 1 minute (0:1:0).
- **ARP Timeout**—The number of seconds between ARP table rebuilds, from 60 to 4294967. The default is 14,400 seconds (4 hours).

**Step 4** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Time Synchronization

Use a Network Time Protocol (NTP) server to synchronize the clock settings on your devices. We recommend you configure all Firewall Threat Defenses managed by a Firewall Management Center to use the same NTP server as the Firewall Management Center. The Firewall Threat Defense gets its time directly from the configured NTP server. If the Firewall Threat Defense's configured NTP servers are not reachable for any reason, it synchronizes its time with the Firewall Management Center.

The device supports NTPv4.

**Note** If you are deploying Firewall Threat Defense on the Firepower 4100/9300 chassis, you must configure NTP on the Firepower 4100/9300 chassis so that Smart Licensing will work properly and to ensure proper timestamps on device registrations. You should use the same NTP server for the Firepower 4100/9300 chassis and the Firewall Management Center.

**Before you begin**

- If your organization has one or more NTP servers that your Firewall Threat Defense can reach, use the same NTP server or servers for your devices that you have configured for Time Synchronization on the **System** (⚙️) > **Configuration** page on your Firewall Management Center.
- If you selected **Use the authenticated NTP server only** when configuring NTP server or servers for the Firewall Management Center, for your devices use only the NTP server or servers that are configured to authenticate with the Firewall Management Center. (The managed devices will use the same NTP servers as the Firewall Management Center, but their NTP connections will not use authentication.)
- If your device cannot reach an NTP server or your organization does not have one, you must use the **Via NTP from Defense Center** option as discussed in the following procedure.

**Procedure**

---

**Step 1** Choose **Devices** > **Platform Settings** and create or edit the Firewall Threat Defense policy.

**Step 2** Select **Time Synchronization**.

**Step 3** Configure one of the following clock options:

- **Via NTP from Defense Center**—(Default). The managed device gets time from the NTP servers you configured for the Firewall Management Center (except for authenticated NTP servers) and synchronizes time with those servers directly. However, if any of the following are true, the managed device synchronizes time from the Firewall Management Center:
  - The Firewall Management Center's NTP servers are not reachable by the device.
  - The Firewall Management Center has no unauthenticated servers.
- **Via NTP from**—If your Firewall Management Center is using NTP servers on the network, select this option and enter the fully-qualified DNS name (such as ntp.example.com), or IPv4 or IPv6 address, of the same NTP servers you specified in **System** (⚙️) > **Configuration** > **Time Synchronization**. If the NTP servers are not reachable, the Firewall Management Center acts as an NTP server.

When multiple NTP servers are configured, the device uses the NTP server that is deemed appropriate based on the criteria defined in RFC. Thus, the status of "Being used" for a specific NTP server indicates that the server is currently used by the device.

**Step 4** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Time Zone

By default, the system uses the UTC time zone. To designate a different time zone for a device, use this procedure.

The time zone you specify will be used only for time-based policy application in policies that support this functionality.

**Note** Time-based ACLs is supported in Snort 3 also from Firewall Management Center 7.0 onwards.

### Procedure

- 
- Step 1** Select **Devices > Platform Settings** and create or edit an Firewall Threat Defense policy.  
You can also create time zone objects from the **Objects > Object Management > Time Zone** page.
- Step 2** Create a new time zone object by clicking +.
- Step 3** Select the time zone.
- Step 4** Click **Save**.
- 

### What to do next

- Create time range objects, select applicable time ranges in access control and prefilter rules, and assign the parent policies to devices associated with the correct time zone.
- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## UCAPL/CC Compliance

For more information about this setting and how to enable it for the Firewall Management Center, see the [Cisco Secure Firewall Management Center Administration Guide](#).

**Caution** After you enable this setting, you cannot disable it. If you need to take the appliance out of CC or UCAPL mode, you must reimage.

### Before you begin

- Secure Firewall Threat Defense devices cannot use an evaluation license; your Smart Software Manager account must be enabled for export-controlled features.
- Secure Firewall Threat Defense devices must be deployed in routed mode.
- You must be an Admin user to perform this task.
- Security certifications compliance mode cannot be changed if the Firewall Threat Defense device is in high availability. Modify the security certifications compliance mode before forming the high availability pair.

## Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Click **UCAPL/CC Compliance**.
- Step 3** To *permanently* enable security certifications compliance on the appliance, you have two choices:
- To enable security certifications compliance in Common Criteria mode, choose **CC** from the drop-down list.
  - To enable security certifications compliance in Unified Capabilities Approved Products List mode, choose **UCAPL** from the drop-down list.
- Step 4** Click **Save**.
- You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

# Performance Profile

The performance profile determines how the CPU cores on the device are assigned to two of the main system processes: the data plane (Lina) and Snort. The data plane handles VPN connections, routing, and other basic layer 3/4 processing. Snort provides advanced inspection, including intrusion and malware prevention, URL filtering, application filtering, and other features that require deep packet inspection.

If you use a balance of basic and advanced features, do not change the performance profile. The system is designed to provide a balanced assignment of cores to these processes. The assignment differs based on the hardware model.

However, if you use the device primarily for VPN, or for intrusion and other advanced inspection, you can skew the performance profile so that more cores are assigned to the more heavily used features. This might improve system performance.

## Before you begin

- These settings apply to systems running release 7.3+ only.
- Performance profile is supported on the following device types:
  - Firepower 4100/9300
  - Secure Firewall 3100/4200 (7.4+)
  - Secure Firewall Threat Defense Virtual
- Changing the performance profile is not supported on units in a cluster or high-availability group, or those configured for multi-instance. Deployment is blocked if you assign the profile to anything but standalone devices.
- The minimum number for core allocation is 2. Cores are assigned in even numbers based on the selected performance profile.

## Procedure

- 
- Step 1** Choose **Devices > Platform Settings** and create or edit the Firewall Threat Defense policy.
- Step 2** Select **Performance Profile**.
- Step 3** Select a profile:
- **Default**—This is the recommended setting and is the best option if you configure both VPN and intrusion inspection.
  - **VPN Heavy with prefilter fastpath**—If you primarily use the device as a VPN endpoint or headend, and you configure rules in the prefilter policy to fastpath VPN traffic, you can choose this option to assign the majority of CPU cores to the data plane. The allocation is 90% data plane, 10% Snort.
  - **VPN Heavy with inspection**—If you primarily use the device as a VPN endpoint or headend, but do not use the prefilter policy to fastpath VPN traffic, you can choose this option to assign the majority of CPU cores to the data plane. This option assumes that you leave intrusion inspection, URL filtering, and other advanced functions that use Snort, to a different device in the network. The allocation is 60% data plane, 40% Snort.
  - **IPS Heavy**—If you do not configure VPN, but you do use the device for intrusion prevention, you can choose this option to assign the majority of CPU core to the Snort process. The allocation is 30% data plane, 70% Snort.
- Step 4** Click **Save**.
- Step 5** Deploy the policy.
- Step 6** After deployment completes, you must reboot each affected device so that the new core assignments can be made.
- 

## History for Platform Settings

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Device management services supported on user-defined VRF interfaces.	7.4.1	7.4.1	Device management services configured in the Firewall Threat Defense platform settings (NetFlow, SSH access, SNMP hosts, syslog servers) are now supported on user-defined Virtual Routing and Forwarding (VRF) interfaces.  Platform restrictions: Not supported with container instances or clustered devices.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Chassis platform settings for the Secure Firewall 3100.	7.4.1	7.4.1	<p>New platform settings for multi-instance chassis on the Secure Firewall 3100.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Platform Settings &gt; Add &gt; Chassis Platform Settings</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Edit &gt; Chassis Platform Settings &gt; DNS</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Edit &gt; Chassis Platform Settings &gt; SSH</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Edit &gt; Chassis Platform Settings &gt; Time Synchronization</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Edit &gt; Chassis Platform Settings &gt; Time Zones</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Edit &gt; Chassis Platform Settings &gt; Syslog</b></li> </ul> <p>Supported platforms: Secure Firewall 3100</p>
Performance profile support for the Secure Firewall 3100/4200.	7.4.0	7.4.0	<p>The performance profile settings available in the platform settings policy now apply to Secure Firewall 3100/4200 devices.</p>
Loopback interface support for DNS, HTTP, ICMP, NetFlow, SNMP and SSH.	7.4.0	7.4.0	<p>You can create a loopback interface and use it for:</p> <ul style="list-style-type: none"> <li>• DNS</li> <li>• HTTP</li> <li>• ICMP</li> <li>• NetFlow</li> <li>• SNMP</li> <li>• SSH</li> </ul> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Platform Settings &gt; DNS &gt; DNS Settings</b></li> <li>• <b>Devices &gt; Platform Settings &gt; HTTP Access &gt; Add</b></li> <li>• <b>Devices &gt; Platform Settings &gt; ICMP Access &gt; Add</b></li> <li>• <b>Devices &gt; Platform Settings &gt; Network flow &gt; Add Collector</b></li> <li>• <b>Devices &gt; Platform Settings &gt; SNMP &gt; Hosts &gt; Add</b></li> <li>• <b>Devices &gt; Platform Settings &gt; SSH Access &gt; Add</b></li> </ul>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Merged Management and Diagnostic interfaces.	7.4.0	7.4.0	<p>For new devices using 7.4 and later, you cannot use the legacy Diagnostic interface. Only the merged Management interface is available. If you upgraded to 7.4 or later, and you did not have any configuration for the Diagnostic interface, then the interfaces will merge automatically.</p> <p>If you upgraded to 7.4 or later, and you have configuration for the Diagnostic interface, then you have the choice to merge the interfaces manually, or you can continue to use the separate Diagnostic interface. Note that support for the Diagnostic interface will be removed in a later release, so you should plan to merge the interfaces as soon as possible.</p> <p>Merged mode also changes the behavior of AAA traffic to use the data routing table by default. The management-only routing table can now only be used if you specify the management-only interface (including Management) in the configuration.</p> <p>For platform settings, this means:</p> <ul style="list-style-type: none"> <li>• You can no longer enable HTTP, ICMP, or SMTP for Diagnostic.</li> <li>• For SNMP, you can allow hosts on Management instead of Diagnostic.</li> <li>• For Syslog servers, you can reach them on Management instead of Diagnostic.</li> <li>• If Platform Settings for syslog servers or SNMP hosts specify the Diagnostic interface by name, then you must use separate Platform Settings policies for merged and non-merged devices.</li> <li>• DNS lookups no longer fall back to the management-only routing table if you do not specify interfaces.</li> </ul> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces</b></li> </ul> <p>New/modified commands: <b>show management-interface convergence</b></p>
Performance profile for CPU core allocation.	7.3.0	7.3.0	<p>You can adjust the percentage of system cores assigned to the data plane and Snort to adjust system performance. The adjustment is based on your relative use of VPN and intrusion policies. If you use both, leave the core allocation to the default values. If you use the system primarily for VPN (without applying intrusion policies), or as an IPS (with no VPN configuration), you can skew the core allocation to the data plane (for VPN) or Snort (for intrusion inspection).</p> <p>We added the <b>Performance Profile</b> page to the platform settings policy.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
TLS 1.3 in Remote Access VPN.	7.3.0	7.3.0	<p>You can now use TLS 1.3 to encrypt remote access VPN connections.</p> <p>Use threat defense platform settings to specify that the device must use TLS 1.3 protocol when acting as a remote access VPN server.</p> <p>TLS 1.3 adds support for the following ciphers:</p> <ul style="list-style-type: none"> <li>• TLS_AES_128_GCM_SHA256</li> <li>• TLS_CHACHA20_POLY1305_SHA256</li> <li>• TLS_AES_256_GCM_SHA384</li> </ul> <p>This feature requires Cisco Secure Client, Version 5.0 and above.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; New Policy &gt; Add/Edit Threat Defense Settings &gt; SSL &gt; TLS version</b></p>
Multiple DNS server groups for resolving DNS requests.	7.2.0	7.2.0	<p>You can configure multiple DNS groups for the resolution of DNS requests from client systems. You can use these DNS server groups to resolve requests for different DNS domains. For example, you could have a catch-all default group that uses public DNS servers, for use with connections to the Internet. You could then configure a separate group to use internal DNS servers for internal traffic, for example, any connection to a machine in the example.com domain. Thus, connections to an FQDN using your organization's domain name would be resolved using your internal DNS servers, whereas connections to public servers use external DNS servers.</p> <p>We changed the <b>Platform Settings &gt; DNS</b> page.</p>
Network object support for HTTP, ICMP, and SSH platform settings.	7.1.0	7.1.0	<p>You can now use network object groups that contain network objects for hosts or networks when configuring the IP addresses in the Threat Defense Platform Settings policy.</p> <p>Supported platforms: Firewall Threat Defense</p>
Support to specify trusted DNS servers.	7.1.0	7.1.0	<p>The option to specify DNS servers that you can trust for address resolution while using direct internet access was introduced.</p> <p>We added a tab for configuring the trusted DNS servers when configuring direct internet access: <b>Devices &gt; Platform Settings &gt; DNS &gt; Trusted DNS Servers</b>.</p> <p>Supported platforms: Firewall Threat Defense</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Platform settings using the MD5 authentication algorithm or DES encryption for SNMPv3 users can not be deployed to Firewall Threat Defense devices running Versions 7.0+.	7.0.0	7.0.0	<p>The MD5 authentication algorithm and DES encryption for SNMPv3 users on Firewall Threat Defense were deprecated in Version 6.5. If your deployment includes SNMPv3 users using the MD5 authentication algorithm or DES encryption that were created using Version 6.4 or earlier, you can continue to use those users for Firewall Threat Defense devices running Version 6.7 or earlier. However, you cannot edit those users and retain the MD5 or DES settings, and you cannot create new users with the MD5 or DES settings. If your Firewall Management Center manages any Firewall Threat Defenses running Versions 7.0+, deploying a platform settings policy with SNMP v3 users using the MD5 authentication algorithm or DES encryption to those Firewall Threat Defenses will fail.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SNMP &gt; Hosts</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Specify SHA224 or SHA384 for SNMPv3 users' authorization algorithm.	7.0.0	7.0.0	<p>You can now select SHA224 or SHA384 for SNMPv3 users' authorization algorithm.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SNMP &gt; Users</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Specify time zone for device.	6.6.0	6.6.0	<p>Specify a local time zone for a managed device, for use in time-based policy application.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; Time Zone</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Specify the Management interface for SNMP communication.	6.6.0	6.6.0	<p>You can now select the Management interface for communication between the device and the SNMP management station.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SNMP &gt; Hosts</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Specify SHA256 for SNMPv3 users' authorization algorithm.	6.6.0	6.6.0	<p>You can now select SHA256 for SNMPv3 users' authorization algorithm.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SNMP &gt; Users</b></p> <p>Supported platforms: Firewall Threat Defense</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
DES encryption and the MD5 authentication algorithm for SNMPv3 users on Firewall Threat Defense have been deprecated.	6.5.0	Any	<p>We recommend that you not use the MD5 authentication algorithm or DES encryption for SNMPv3 users on Firewall Threat Defense devices, as these options have been deprecated. If your deployment includes SNMPv3 users using the MD5 authentication algorithm or DES encryption that were created using a Version 6.4 or earlier, you can continue to use those users. However, you cannot edit those users and retain the MD5 or DES settings, and you cannot create new users with the MD5 or DES settings.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SNMP &gt; Users</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Allow user traffic to pass when TCP syslog server is down.	6.3.0	6.3.0	<p>We recommend that you allow connections through the threat defense device when the external TCP syslog server is unreachable by the device. The <b>Allow user traffic to pass when TCP syslog server is down (Recommended to be enabled)</b> option in the Platform Settings is Enabled by default.</p>
Limit number of SSH login failures.	6.3.0	6.3.0	<p>When a user accesses any device via SSH and fails three successive login attempts, the device terminates the SSH session.</p>
External authentication added for SSH.	6.2.3	6.2.3	<p>You can now configure external authentication for SSH access to the Firewall Threat Defense using LDAP or RADIUS.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; External Authentication</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Support for UC/APPL compliance mode.	6.2.1	6.2.1	<p>You can enable security certifications compliance in CC mode or UCAPL mode. Enabling security certifications compliance does not guarantee strict compliance with all requirements of the security mode selected. For more information on hardening procedures, refer to the guidelines for this product provided by the certifying entity.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; UC/APPL Compliance</b></p> <p>Supported platforms: Any device</p>
SSL settings for remote access VPN.	6.2.1	6.2.1	<p>The Firewall Threat Defense device uses the Secure Sockets Layer (SSL) protocol and Transport Layer Security (TLS) to support secure message transmission for Remote Access VPN connection from remote clients. You can configure SSL versions and encryption algorithms that will be negotiated and used for message transmission during remote VPN access over SSL.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; SSL</b></p> <p>Supported platforms: Firewall Threat Defense</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
External authentication for SSH and HTML removed.	6.1.0	6.1.0	<p>Due to changes to support converged management access, only local users are supported for SSH and HTML to data interfaces. Also, you can no longer SSH to the logical Diagnostic interface; instead you can SSH to the logical Management interface (which shares the same physical port). Previously, only external authentication was supported for SSH and HTML access to Diagnostic and data interfaces, while only local users were supported to the Management interface.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings &gt; External Authentication</b></p> <p>Supported platforms: Firewall Threat Defense</p>
Firepower Threat Defense support.	6.0.1	6.0.1	<p>This feature was introduced.</p> <p>New/modified screens: <b>Devices &gt; Platform Settings</b></p> <p>Supported platforms: Firewall Threat Defense</p>

## CHAPTER 21

# Network Address Translation

The following topics explain Network Address Translation (NAT) and how to configure it on Firewall Threat Defense devices.

- [Why Use NAT?, on page 895](#)
- [NAT Basics, on page 896](#)
- [Requirements and Prerequisites for NAT Policies, on page 905](#)
- [Guidelines for NAT, on page 905](#)
- [Manage NAT Policies, on page 911](#)
- [Configure NAT for Threat Defense, on page 913](#)
- [Translating IPv6 Networks, on page 951](#)
- [Monitoring NAT, on page 964](#)
- [Examples for NAT, on page 965](#)
- [History for Firewall Threat Defense NAT, on page 1018](#)

## Why Use NAT?

Each computer and device within an IP network is assigned a unique IP address that identifies the host. Because of a shortage of public IPv4 addresses, most of these IP addresses are private, not routable anywhere outside of the private company network. RFC 1918 defines the private IP addresses you can use internally that should not be advertised:

- 10.0.0.0 through 10.255.255.255
- 172.16.0.0 through 172.31.255.255
- 192.168.0.0 through 192.168.255.255

One of the main functions of NAT is to enable private IP networks to connect to the Internet. NAT replaces a private IP address with a public IP address, translating the private addresses in the internal private network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses because it can be configured to advertise at a minimum only one public address for the entire network to the outside world.

Other functions of NAT include:

- Security—Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions—Overlapping IP addresses are not a problem when you use NAT.

- Flexibility—You can change internal IP addressing schemes without affecting the public addresses available externally; for example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.
- Translating between IPv4 and IPv6 (Routed mode only) —If you want to connect an IPv6 network to an IPv4 network, NAT lets you translate between the two types of addresses.

**Note**

NAT is not required. If you do not configure NAT for a given set of traffic, that traffic will not be translated, but will have all of the security policies applied as normal.

## NAT Basics

The following topics explain some of the basics of NAT.

## NAT Terminology

This document uses the following terminology:

- Real address/host/network/interface—The real address is the address that is defined on the host, before it is translated. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the inside network would be the “real” network. Note that you can translate any network connected to the device, not just an inside network. Therefore if you configure NAT to translate outside addresses, “real” can refer to the outside network when it accesses the inside network.
- Mapped address/host/network/interface—The mapped address is the address that the real address is translated to. In a typical NAT scenario where you want to translate the inside network when it accesses the outside, the outside network would be the “mapped” network.

**Note**

During address translation, IP addresses configured for the device interfaces are not translated.

- Bidirectional initiation—Static NAT allows connections to be initiated *bidirectionally*, meaning both to the host and from the host.
- Source and destination NAT—For any given packet, both the source and destination IP addresses are compared to the NAT rules, and one or both can be translated/untranslated. For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address.

## NAT Types

You can implement NAT using the following methods:

- **Dynamic NAT**—A group of real IP addresses are mapped to a (usually smaller) group of mapped IP addresses, on a first come, first served basis. Only the real host can initiate traffic. See [Dynamic NAT, on page 918](#).
- **Dynamic Port Address Translation (PAT)**—A group of real IP addresses are mapped to a single IP address using a unique source port of that IP address. See [Dynamic PAT, on page 923](#).
- **Static NAT**—A consistent mapping between a real and mapped IP address. Allows bidirectional traffic initiation. See [Static NAT, on page 933](#).
- **Identity NAT**—A real address is statically translated to itself, essentially bypassing NAT. You might want to configure NAT this way when you want to translate a large group of addresses, but then want to exempt a smaller subset of addresses. See [Identity NAT, on page 941](#).

## NAT in Routed and Transparent Mode

You can configure NAT in both routed and transparent firewall mode. You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes. The following sections describe typical usage for each firewall mode.

### NAT in Routed Mode

The following figure shows a typical NAT example in routed mode, with a private network on the inside.

**Figure 362: NAT Example: Routed Mode**

1. When the inside host at 10.1.2.27 sends a packet to a web server, the real source address of the packet, 10.1.2.27, is translated to a mapped address, 209.165.201.10.
2. When the server responds, it sends the response to the mapped address, 209.165.201.10, and the Firewall Threat Defense device receives the packet because the Firewall Threat Defense device performs proxy ARP to claim the packet.

3. The Firewall Threat Defense device then changes the translation of the mapped address, 209.165.201.10, back to the real address, 10.1.1.27, before sending it to the host.

## NAT in Transparent Mode or Within a Bridge Group

Using NAT in transparent mode eliminates the need for the upstream or downstream routers to perform NAT for their networks. It can perform a similar function within a bridge group in routed mode.

NAT in transparent mode, or in routed mode between members of the same bridge group, has the following requirements and limitations:

- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the Firewall Threat Defense sends an ARP request to a host on the other side of the Firewall Threat Defense, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.
- Translating between IPv4 and IPv6 networks is not supported. Translating between two IPv6 networks, or between two IPv4 networks is supported.

The following figure shows a typical NAT scenario in transparent mode, with the same network on the inside and outside interfaces. The transparent firewall in this scenario is performing the NAT service so that the upstream router does not have to perform NAT.

**Figure 363: NAT Example: Transparent Mode**

1. When the inside host at 10.1.1.75 sends a packet to a web server, the real source address of the packet, 10.1.1.75, is changed to a mapped address, 209.165.201.15.

2. When the server responds, it sends the response to the mapped address, 209.165.201.15, and the Firewall Threat Defense receives the packet because the upstream router includes this mapped network in a static route directed to the Firewall Threat Defense management IP address.
3. The Firewall Threat Defense then undoes the translation of the mapped address, 209.165.201.15, back to the real address, 10.1.1.1.75. Because the real address is directly-connected, the Firewall Threat Defense sends it directly to the host.
4. For host 192.168.1.2, the same process occurs, except for returning traffic, the Firewall Threat Defense looks up the route in its routing table and sends the packet to the downstream router at 10.1.1.3 based on the Firewall Threat Defense static route for 192.168.1.0/24.

## Auto NAT and Manual NAT

You can implement address translation in two ways: *auto NAT* and *manual NAT*.

We recommend using auto NAT unless you need the extra features that manual NAT provides. It is easier to configure auto NAT, and it might be more reliable for applications such as Voice over IP (VoIP). (For VoIP, you might see a failure in the translation of indirect addresses that do not belong to either of the objects used in the rule.)

### Auto NAT

All NAT rules that are configured as a parameter of a network object are considered to be *auto NAT* rules. This is a quick and easy way to configure NAT for a network object. You cannot create these rules for a group object, however.

Although these rules are configured as part of the object itself, you cannot see the NAT configuration in the object definition through the object manager.

When a packet enters an interface, both the source and destination IP addresses are checked against the auto NAT rules. The source and destination address in the packet can be translated by separate rules if separate matches are made. These rules are not tied to each other; different combinations of rules can be used depending on the traffic.

Because the rules are never paired, you cannot specify that sourceA/destinationA should have a different translation than sourceA/destinationB. Use manual NAT for that kind of functionality, where you can identify the source and destination address in a single rule.

### Manual NAT

Manual NAT lets you identify both the source and destination address in a single rule. Specifying both the source and destination addresses lets you specify that sourceA/destinationA can have a different translation than sourceA/destinationB.

**Note**

For static NAT, the rule is bidirectional, so be aware that “source” and “destination” are used in commands and descriptions throughout this guide even though a given connection might originate at the “destination” address. For example, if you configure static NAT with port address translation, and specify the source address as a Telnet server, and you want all traffic going to that Telnet server to have the port translated from 2323 to 23, then you must specify the *source* ports to be translated (real: 23, mapped: 2323). You specify the source ports because you specified the Telnet server address as the source address.

The destination address is optional. If you specify the destination address, you can either map it to itself (identity NAT), or you can map it to a different address. The destination mapping is always a static mapping.

## Comparing Auto NAT and Manual NAT

The main differences between these two NAT types are:

- How you define the real address.
  - Auto NAT—The NAT rule becomes a parameter for a network object. The network object IP address serves as the original (real) address.
  - Manual NAT—You identify a network object or network object group for both the real and mapped addresses. In this case, NAT is not a parameter of the network object; the network object or group is a parameter of the NAT configuration. The ability to use a network object *group* for the real address means that manual NAT is more scalable.
- How source and destination NAT is implemented.
  - Auto NAT—Each rule can apply to either the source or destination of a packet. So two rules might be used, one for the source IP address, and one for the destination IP address. These two rules cannot be tied together to enforce a specific translation for a source/destination combination.
  - Manual NAT—A single rule translates both the source and destination. A packet matches one rule only, and further rules are not checked. Even if you do not configure the optional destination address, a matching packet still matches one manual NAT rule only. The source and destination are tied together, so you can enforce different translations depending on the source/destination combination. For example, sourceA/destinationA can have a different translation than sourceA/destinationB.
- Order of NAT Rules.
  - Auto NAT—Automatically ordered in the NAT table.
  - Manual NAT—Manually ordered in the NAT table (before or after auto NAT rules).

## NAT Rule Order

Auto NAT and manual NAT rules are stored in a single table that is divided into three sections. Section 1 rules are applied first, then section 2, and finally section 3, until a match is found. For example, if a match is found in section 1, sections 2 and 3 are not evaluated. The following table shows the order of rules within each section.

**Note** There is also a Section 0, which contains any NAT rules that the system creates for its own use. These rules have priority over all others. The system automatically creates these rules and clears xlates as needed. You cannot add, edit, or modify rules in Section 0.

Table 65: NAT Rule Table

Table Section	Rule Type	Order of Rules within the Section
Section 1	Manual NAT	<p>Applied on a first match basis, in the order they appear in the configuration. Because the first match is applied, you must ensure that specific rules come before more general rules, or the specific rules might not be applied as desired. By default, manual NAT rules are added to section 1.</p> <p>By "specific rules first," we mean:</p> <ul style="list-style-type: none"> <li>• Static rules should come before dynamic rules.</li> <li>• Rules that include destination translation should come before rules with source translation only.</li> </ul> <p>If you cannot eliminate overlapping rules, where more than one rule might apply based on the source or destination address, be especially careful to follow these recommendations.</p>
Section 2	Auto NAT	<p>If a match in section 1 is not found, section 2 rules are applied in the following order:</p> <ol style="list-style-type: none"> <li>1. Static rules.</li> <li>2. Dynamic rules.</li> </ol> <p><b>Within each rule type, the following ordering guidelines are used:</b></p> <ol style="list-style-type: none"> <li>1. Quantity of real IP addresses—From smallest to largest. For example, an object with one address will be assessed before an object with 10 addresses.</li> <li>2. For quantities that are the same, then the IP address number is used, from lowest to highest. For example, 10.1.1.0 is assessed before 11.1.1.0.</li> <li>3. If the same IP address is used, then the name of the network object is used, in alphabetical order. For example, abracadabra is assessed before catwoman.</li> </ol>
Section 3	Manual NAT	<p>If a match is still not found, section 3 rules are applied on a first match basis, in the order they appear in the configuration. This section should contain your most general rules. You must also ensure that any specific rules in this section come before general rules that would otherwise apply.</p>

For section 2 rules, for example, you have the following IP addresses defined within network objects:

- 192.168.1.0/24 (static)
- 192.168.1.0/24 (dynamic)
- 10.1.1.0/24 (static)

- 192.168.1.1/32 (static)
- 172.16.1.0/24 (dynamic) (object def)
- 172.16.1.0/24 (dynamic) (object abc)

The resultant ordering would be:

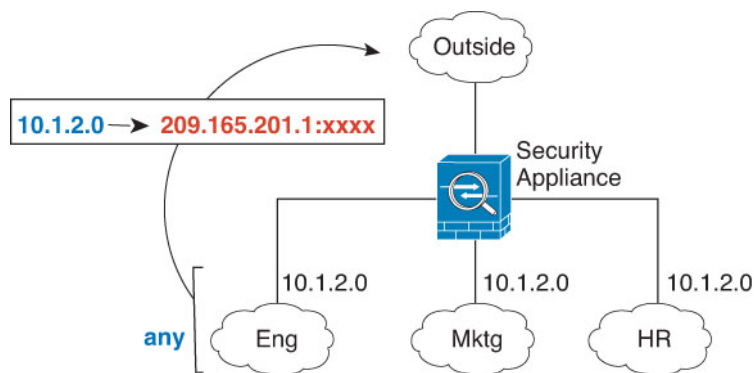

- 192.168.1.1/32 (static)
- 10.1.1.0/24 (static)
- 192.168.1.0/24 (static)
- 172.16.1.0/24 (dynamic) (object abc)
- 172.16.1.0/24 (dynamic) (object def)
- 192.168.1.0/24 (dynamic)

## NAT Interfaces

Except for bridge group member interfaces, you can configure a NAT rule to apply to any interface (in other words, all interfaces), or you can identify specific real and mapped interfaces. You can also specify any interface for the real address, and a specific interface for the mapped address, or vice versa.

For example, you might want to specify any interface for the real address and specify the outside interface for the mapped address if you use the same private addresses on multiple interfaces, and you want to translate them all to the same global pool when accessing the outside.

**Figure 364: Specifying Any Interface**

However, the concept of “any” interface does not apply to bridge group member interfaces. When you specify “any” interface, all bridge group member interfaces are excluded. Thus, to apply NAT to bridge group members, you must specify the member interface. This could result in many similar rules where only one interface is different. You cannot configure NAT for the Bridge Virtual Interface (BVI) itself, you can configure NAT for member interfaces only.

**Note** You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes. When specifying interfaces, you do so indirectly by selecting the interface object that contains the interface.

## NAT Exemption

When internet edge devices have a site-to-site VPN configured on an interface and also have NAT rules for that interface, you must exempt the VPN traffic from the NAT rules. If you do not exempt the VPN traffic from NAT translation, the traffic gets dropped or is not routed through the VPN tunnel to the remote peer.

NAT exemption allows you to exclude traffic from being translated by NAT rules. When you create a policy-based site-to-site VPN using the Firewall Management Center VPN wizard, you can select the **NAT Exempt** option to create the rules automatically (**Device > Site To Site**). By default, this option is enabled. You can view the NAT exemptions for a device in the NAT policy page (**Devices > NAT**), and then click **NAT Exemptions**.

The Firewall Management Center supports NAT exemption for all policy-based site-to-site VPN topology types. For more information, see [Configure a Policy-based Site-to-Site VPN, on page 1396](#).

Consider the following example, which shows a site-to-site VPN tunnel connecting Site A and Site B. For traffic that must go to the Internet, NAT translates the private IPs to a public IP address to access the Internet. For traffic that must go over the VPN tunnel, you must configure NAT exemption for the device in the VPN wizard.

**Figure 365: Site-to-site VPN Topology with NAT Exemption**

Note that when you upgrade from versions earlier than 7.4, if you have enabled NAT exemption, Firewall Management Center will disable this option. You must enable this option in the policy-based site-to-site VPN wizard.

## Configuring Routing for NAT

The Firewall Threat Defense device needs to be the destination for any packets sent to the translated (mapped) address.

When sending packets, the device uses the destination interface if you specify one, or a routing table lookup if you do not, to determine the egress interface. For identity NAT, you have the option to use a route lookup even if you specify a destination interface.

The type of routing configuration needed depends on the type of mapped address, as explained in the following topics.

## Addresses on the Same Network as the Mapped Interface

If you use addresses on the same network as the destination (mapped) interface, the Firewall Threat Defense device uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the Firewall Threat Defense device does not have to be the gateway for any additional networks. This solution is ideal if the outside network contains an adequate number of free addresses, a consideration if you are using a 1:1 translation like dynamic NAT or static NAT. Dynamic PAT greatly extends the number of translations you can use with a small number of addresses, so even if the available addresses on the outside network is small, this method can be used. For PAT, you can even use the IP address of the mapped interface.

**Note** If you configure the mapped interface to be any interface, and you specify a mapped address on the same network as one of the mapped interfaces, then if an ARP request for that mapped address comes in on a *different* interface, then you need to manually configure an ARP entry for that network on the ingress interface, specifying its MAC address. Typically, if you specify any interface for the mapped interface, then you use a unique network for the mapped addresses, so this situation would not occur. Configure the ARP table in the ingress interface's **Advanced** settings.

## Addresses on a Unique Network

If you need more addresses than are available on the destination (mapped) interface network, you can identify addresses on a different subnet. The upstream router needs a static route for the mapped addresses that points to the Firewall Threat Defense device.

Alternatively for routed mode, you can configure a static route on the Firewall Threat Defense device for the mapped addresses using any IP address on the destination network as the gateway, and then redistribute the route using your routing protocol. For example, if you use NAT for the inside network (10.1.1.0/24) and use the mapped IP address 209.165.201.5, then you can configure a static route for 209.165.201.5 255.255.255.255 (host address) to the 10.1.1.99 gateway that can be redistributed.

For transparent mode, if the real host is directly-connected, configure the static route on the upstream router to point to the Firewall Threat Defense device: specify the bridge group IP address. For remote hosts in transparent mode, in the static route on the upstream router, you can alternatively specify the downstream router IP address.

## The Same Address as the Real Address (Identity NAT)

The default behavior for identity NAT has proxy ARP enabled, matching other static NAT rules. You can disable proxy ARP if desired. You can also disable proxy ARP for regular static NAT if desired, in which case you need to be sure to have proper routes on the upstream router.

Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues. For example, if you configure a broad identity NAT rule for “any” IP address, then leaving proxy ARP enabled can cause problems for hosts on the network directly connected to the mapped interface. In this case, when a host on the mapped network wants to communicate with another host on the same network, then the address in the ARP request matches the NAT rule (which matches “any” address). The Firewall Threat Defense device will then proxy ARP for the address, even though the packet is not actually destined for the Firewall Threat Defense device. (Note that this problem occurs even if you have a manual NAT rule; although the NAT rule must match both the source and destination addresses, the proxy ARP decision is made only on the “source” address). If the Firewall Threat Defense device ARP response is received before the actual host ARP response, then traffic will be mistakenly sent to the Firewall Threat Defense device.

## Guidelines for NAT

The following topics provide detailed guidelines for implementing NAT.

### Firewall Mode Guidelines for NAT

NAT is supported in routed and transparent firewall mode.

However, configuring NAT on bridge group member interfaces (interfaces that are part of a Bridge Group Virtual Interface, or BVI) has the following restrictions:

- When configuring NAT for the members of a bridge group, you specify the member interface. You cannot configure NAT for the bridge group interface (BVI) itself.
- When doing NAT between bridge group member interfaces, you must specify the real and mapped addresses. You cannot specify “any” as the interface.
- You cannot configure interface PAT when the mapped address is a bridge group member interface, because there is no IP address attached to the interface.
- You cannot translate between IPv4 and IPv6 networks (NAT64/46) when the source and destination interfaces are members of the same bridge group. Static NAT/PAT 44/66, dynamic NAT44/66, and dynamic PAT44 are the only allowed methods; dynamic PAT66 is not supported. However, you can do NAT64/46 between members of different bridge groups, or between a bridge group member (source) and standard routed interface (destination).

---

**Note**

You cannot configure NAT for interfaces operating in inline, inline tap, or passive modes.

---

### IPv6 NAT Guidelines

NAT supports IPv6 with the following guidelines and restrictions.

- For standard routed mode interfaces, you can also translate between IPv4 and IPv6.

- You cannot translate between IPv4 and IPv6 for interfaces that are members of the same bridge group. You can translate between two IPv6 or two IPv4 networks only. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.
- You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.
- For static NAT, you can specify an IPv6 subnet up to /64. Larger subnets are not supported.
- When using FTP with NAT46, when an IPv4 FTP client connects to an IPv6 FTP server, the client must use either the extended passive mode (EPSV) or extended port mode (EPRT); PASV and PORT commands are not supported with IPv6.

## IPv6 NAT Best Practices

You can use NAT to translate between IPv6 networks, and also to translate between IPv4 and IPv6 networks (routed mode only). We recommend the following best practices:

- NAT66 (IPv6-to-IPv6)—We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only).
- NAT46 (IPv4-to-IPv6)—We recommend using static NAT. Because the IPv6 address space is so much larger than the IPv4 address space, you can easily accommodate a static translation. If you do not want to allow returning traffic, you can make the static NAT rule unidirectional (manual NAT only). When translating to an IPv6 subnet (/96 or lower), the resulting mapped address is by default an IPv4-embedded IPv6 address, where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For example, if the IPv6 prefix is a /96 prefix, then the IPv4 address is appended in the last 32-bits of the address. For example, if you map 192.168.1.0/24 to 201b::0/96, then 192.168.1.4 will be mapped to 201b::0.192.168.1.4 (shown with mixed notation). If the prefix is smaller, such as /64, then the IPv4 address is appended after the prefix, and a suffix of 0s is appended after the IPv4 address. You can also optionally translate the addresses net-to-net, where the first IPv4 address maps to the first IPv6 address, the second to the second, and so on.
- NAT64 (IPv6-to-IPv4)—You may not have enough IPv4 addresses to accommodate the number of IPv6 addresses. We recommend using a dynamic PAT pool to provide a large number of IPv4 translations.

## NAT Support for Inspected Protocols

Some application layer protocols that open secondary connections, or that embedded IP addresses in packets, are inspected to provide the following services:

- Pinhole creation—Some application protocols open secondary TCP or UDP connections either on standard or negotiated ports. Inspection opens pinholes for these secondary ports so that you do not need to create access control rules to allow them.
- NAT rewrite—Protocols such as FTP embed IP addresses and ports for the secondary connections in packet data as part of the protocol. If there is NAT translation involved for either of the endpoints, the inspection engines rewrite the packet data to reflect the NAT translation of the embedded addresses and ports. The secondary connections would not work without NAT rewrite.

- Protocol enforcement—Some inspections enforce some degree of conformance to the RFCs for the inspected protocol.

The following table lists the inspected protocols that apply NAT rewrite and their NAT limitations. Keep these limitations in mind when writing NAT rules that include these protocols. Inspected protocols not listed here do not apply NAT rewrite. These inspections include GTP, HTTP, IMAP, POP, SMTP, SSH, and SSL.

**Note** NAT rewrite is supported on the listed ports only. For some of these protocols, you can extend inspection to other ports using Network Analysis Policies, but NAT rewrite is not extended to those ports. This includes DCERPC, DNS, FTP, and Sun RPC inspection. If you use these protocols on non-standard ports, do not use NAT on the connections.

**Table 66: NAT Supported Application Inspection**

Application	Inspected Protocol, Port	NAT Limitations	Pinholes Created
DCERPC	TCP/135	No NAT64.	Yes
DNS over UDP	UDP/53	No NAT support is available for name resolution through WINS.	No
ESMTP	TCP/25	No NAT64.	No
FTP	TCP/21	(Clustering) No static PAT.	Yes
H.323 H.225 (Call signaling) H.323 RAS	TCP/1720 UDP/1718 For RAS, UDP/1718-1719	(Clustering) No static PAT. No extended PAT. No NAT64.	Yes
ICMP ICMP Error	ICMP (ICMP traffic directed to a device interface is never inspected.)	No limitations.	No
IP Options	RSVP	No NAT64.	No
NetBIOS Name Server over IP	UDP/137, 138 (Source ports)	No extended PAT. No NAT64.	No
RSH	TCP/514	No PAT. No NAT64. (Clustering) No static PAT.	Yes
RTSP	TCP/554 (No handling for HTTP cloaking.)	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes

Application	Inspected Protocol, Port	NAT Limitations	Pinholes Created
SIP	TCP/5060 UDP/5060	No extended PAT. No NAT64 or NAT46. (Clustering) No static PAT.	Yes
Skinny (SCCP)	TCP/2000	No extended PAT. No NAT64, NAT46, or NAT66. (Clustering) No static PAT.	Yes
SQL*Net (versions 1, 2)	TCP/1521	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes
Sun RPC	TCP/111 UDP/111	No extended PAT. No NAT64.	Yes
TFTP	UDP/69	No NAT64. (Clustering) No static PAT. Payload IP addresses are not translated.	Yes
XDMCP	UDP/177	No extended PAT. No NAT64. (Clustering) No static PAT.	Yes

## FQDN Destination Guidelines

You can specify the translated (mapped) destination in a manual NAT rule using a fully-qualified domain name (FQDN) network object instead of an IP address. For example, you can create a rule based on traffic that is destined for the `www.example.com` web server.

When using an FQDN, the system obtains the DNS resolution and writes the NAT rule based on the returned address. If you are using multiple DNS server groups, the filter domains are honored and the address is requested from the appropriate group based on the filters. If more than one address is obtained from the DNS server, the address used is based on the following:

- If there is an address on the same subnet as the specified interface, that address is used. If there isn't one on the same subnet, the first address returned is used.
- The IP type for the translated source and translated destination must match. For example, if the translated source address is IPv6, the FQDN object must specify IPv6 as the address type. If the translated source is IPv4, the FQDN object can specify IPv4 or both IPv4 and IPv6. In this case, an IPv4 address is selected.

You cannot include an FQDN object in a network group that is used for manual NAT destination. In NAT, an FQDN object must be used alone, as only a single destination host makes sense for this type of NAT rule.

If the FQDN cannot be resolved to an IP address, the rule is not functional until a DNS resolution is obtained.

## Additional Guidelines for NAT

- NAT rules apply to through the device traffic only, they do not apply to traffic initiated by the device, such as a RADIUS authentication.
- For interfaces that are members of a bridge group, you write NAT rules for the member interfaces. You cannot write NAT rules for the Bridge Virtual Interface (BVI) itself.
- You cannot write NAT rules for a Virtual Tunnel Interface (VTI), which are used in site-to-site VPN. Writing rules for the VTI's source interface will not apply NAT to the VPN tunnel. To write NAT rules that will apply to VPN traffic tunneled on a VTI, you must use "any" as the interface; you cannot explicitly specify interface names.
- (Auto NAT only.) You can only define a single NAT rule for a given object; if you want to configure multiple NAT rules for an object, you need to create multiple objects with different names that specify the same IP address.
- If a VPN is defined on an interface, inbound ESP traffic on the interface is not subject to the NAT rules. The system allows the ESP traffic for established VPN tunnels only, dropping traffic not associated with an existing tunnel. This restriction applies to ESP and UDP ports 500 and 4500.
- If you define a site-to-site VPN on a device that is behind a device that is applying dynamic PAT, so that UDP ports 500 and 4500 are not the ones actually used, you must initiate the connection from the device that is behind the PAT device. The responder cannot initiate the security association (SA) because it does not know the correct port numbers.
- If you change the NAT configuration, and you do not want to wait for existing translations to time out before the new NAT configuration is used, you can clear the translation table using the **clear xlate** command in the device CLI. However, clearing the translation table disconnects all current connections that use translations.

If you create a new NAT rule that should apply to an existing connection (such as a VPN tunnel), you need to use **clear conn** to end the connection. Then, the attempt to re-establish the connection should hit the NAT rule and the connection should be NAT'ed correctly.

### Note

If you remove a dynamic NAT or PAT rule, and then add a new rule with mapped addresses that overlap the addresses in the removed rule, then the new rule will not be used until all connections associated with the removed rule time out or are cleared using the **clear xlate** or **clear conn** commands. This safeguard ensures that the same address is not assigned to multiple hosts.

- You cannot use an object group with both IPv4 and IPv6 addresses; the object group must include only one type of address.
- A network object used in NAT cannot include more than 131,838 IP addresses, either explicitly or implied in a range of addresses or a subnet. Break up the address space into smaller ranges and write separate rules for the smaller objects.
- (Manual NAT only.) When using **any** as the source address in a NAT rule, the definition of "any" traffic (IPv4 vs. IPv6) depends on the rule. Before the Firewall Threat Defense device performs NAT on a packet, the packet must be IPv6-to-IPv6 or IPv4-to-IPv4; with this prerequisite, the Firewall Threat Defense device can determine the value of **any** in a NAT rule. For example, if you configure a rule from "any" to an IPv6 server, and that server was mapped from an IPv4 address, then **any** means "any IPv6

traffic.” If you configure a rule from “any” to “any,” and you map the source to the interface IPv4 address, then **any** means “any IPv4 traffic” because the mapped interface address implies that the destination is also IPv4.

- You can use the same mapped object or group in multiple NAT rules.
- The mapped IP address pool cannot include:
  - The mapped interface IP address. If you specify “any” interface for the rule, then all interface IP addresses are disallowed. For interface PAT (routed mode only), specify the interface name instead of the interface address.
  - The failover interface IP address.
  - (Transparent mode.) The management IP address.
  - (Dynamic NAT.) The standby interface IP address when VPN is enabled.
- Avoid using overlapping addresses in static and dynamic NAT policies. For example, with overlapping addresses, a PPTP connection can fail to get established if the secondary connection for PPTP hits the static instead of dynamic xlate.
- You cannot use overlapping addresses in the source address of a NAT rule and a remote access VPN address pool.
- If you specify a destination interface in a rule, then that interface is used as the egress interface rather than looking up the route in the routing table. However, for identity NAT, you have the option to use a route lookup instead.
- If you use PAT on Sun RPC traffic, which is used to connect to NFS servers, be aware that the NFS server might reject connections if the PAT'ed port is above 1024. The default configuration of NFS servers is to reject connections from ports higher than 1024. The error is typically "Permission Denied." Mapping ports above 1024 happens if you do not select the option to include the reserved ports (1-1023) in the port range of a PAT pool. You can avoid this problem by changing the NFS server configuration to allow all port numbers.
- NAT applies to through traffic only. Traffic generated by the system is not subject to NAT.
- Do not name a network object or group pat-pool, using any combination of upper- or lower-case letters.
- The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.
- You cannot use NAT on the internal payload of Protocol Independent Multicast (PIM) registers.
- (Manual NAT) When writing NAT rules for a dual ISP interface setup (primary and backup interfaces using service level agreements in the routing configuration), do not specify destination criteria in the rule. Ensure the rule for the primary interface comes before the rule for the backup interface. This allows the device to choose the correct NAT destination interface based on the current routing state when the primary ISP is unavailable. If you specify destination objects, the NAT rule will always select the primary interface for the otherwise duplicate rules.
- If you get the ASP drop reason nat-no-xlate-to-pat-pool for traffic that should not match the NAT rules defined for the interface, configure identity NAT rules for the affected traffic so the traffic can pass untranslated.

- If you configure NAT for GRE tunnel endpoints, you must disable keepalives on the endpoints or the tunnel cannot be established. The endpoints send keepalives to the original addresses.
- DHCP and BOOTP share ports UDP/67-68. Because BOOTP is obsolete, writing NAT rules for the bootps port can cause port allocation problems when also running DHCP. Consider using DHCP relay instead for transmitting DHCP requests between network segments.

## Manage NAT Policies

Network Address Translation (NAT) converts the IP address of an incoming packet to a different address in the outgoing packet. One of the main functions of NAT is to enable private IP networks to connect to the Internet. NAT replaces a private IP address with a public IP address, translating the private addresses in the internal private network into routable addresses that can be used on the public Internet. NAT keeps track of the translations, also known as xlates, to ensure that return traffic is directed to the correct untranslated host address.

### Procedure

---

**Step 1** Choose **Devices > NAT**.

**Step 2** Manage your NAT policies:

- Create—Click **New Policy** and select **Threat Defense NAT**. See [Creating NAT Policies, on page 912](#).
- Copy—Click **Copy** (📋) next to the policy you want to copy. You are prompted to give the copy a new, unique name. The copy includes all policy rules and configurations, but does not include device assignments.
- Report—Click **Report** (📄) for the policy. You are prompted to save the PDF report, which includes policy attributes, device assignments, rules, and object usage information.
- Edit—Click **Edit** (✎) next to the policy you want to edit. See [Configure NAT for Threat Defense, on page 913](#).
- Delete—Click **Delete** (🗑) next to the policy you want to delete, then click **OK**. When prompted whether to continue, you are also informed if another user has unsaved changes in the policy.

#### Caution

After you have deployed a NAT policy to a managed device, you cannot delete the policy from the device. Instead, you must deploy a NAT policy with no rules to remove the NAT rules already present on the managed device. You also cannot delete a policy that is the last deployed policy on any of its target devices, even if it is out of date. Before you can delete the policy completely, you must deploy a different policy to those targets.

---

## Creating NAT Policies

When you create a new NAT policy you must, at minimum, give it a unique name. Although you are not required to identify policy targets at policy creation time, you must perform this step before you can deploy the policy. If you apply a NAT policy with no rules to a device, the system removes all NAT rules from that device.

### Procedure

---

- Step 1** Choose **Devices > NAT**.
- Step 2** Click **New Policy** and from the drop-down list, choose **Threat Defense NAT** for Firewall Threat Defense devices.
- Firepower NAT** is for older devices that are not covered in this document.
- Step 3** Enter a unique **Name**.
- Step 4** Optionally, enter a **Description**.
- Step 5** Choose the devices where you want to deploy the policy:
- Choose a device in the **Available Devices** list, and click **Add to Policy**.
  - Click and drag a device from the **Available Devices** list to the **Selected Devices** list.
  - Remove a device from the **Selected Devices** list by clicking **Delete** (  ) next to the device.
- Step 6** Click **Save**.
- 

## Configuring NAT Policy Targets

You can identify the managed devices you want to target with your policy while creating or editing a policy. You can search a list of available devices and high-availability pairs, and add them to a list of selected devices.

### Procedure

---

- Step 1** Choose **Devices > NAT**.
- Step 2** Click **Edit** (  ) next to the NAT policy you want to modify.
- If **View** (  ) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Click **Policy Assignments**.
- Step 4** Do any of the following:
- To assign a device, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add to Policy**. You can also drag and drop.
  - To remove a device assignment, click **Delete** (  ) next to a device, high-availability pair, or device group in the **Selected Devices** list.

**Step 5** Click **OK**.

---

## Configure NAT for Threat Defense

Network address translation can be very complex. We recommend that you keep your rules as simple as possible to avoid translation problems and difficult troubleshooting situations. Careful planning before you implement NAT is critical. The following procedure provides the basic approach.

The NAT policy is a shared policy. You assign the policy to devices that should have similar NAT rules.

Whether a given rule in the policy applies to an assigned device is determined by the interface objects (security zones or interface groups) used in the rule. If the interface objects include one or more interface for the device, the rule is deployed to the device. Thus, you can configure rules that apply to subsets of devices within a single shared policy by carefully designing your interface objects. Rules that apply to “any” interface object are deployed to all devices.

If you change the type of an interface to a type that is not valid for use with a NAT policy that targets a device with that interface, the policy labels the interface as deleted. Click **Save** in the NAT policy to automatically remove the interface from the policy.

You can configure multiple NAT policies if groups of your devices require significantly different rules.

### Procedure

---

**Step 1** Select **Devices > NAT**.

- Click **New Policy > Threat Defense NAT** to create a new policy. Give the policy a name, optionally assign devices to it, and click **Save**.

You can change device assignments later by editing the policy and clicking **Policy Assignments**.

- Click **Edit** (✎) to edit an existing threat defense NAT policy. Note that the page also shows Firepower NAT policies, which are not used by Firewall Threat Defense devices.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 2** Decide what kinds of rules you need.

You can create dynamic NAT, dynamic PAT, static NAT, and identity NAT rules. For an overview, see [NAT Types, on page 896](#).

**Step 3** Decide which rules should be implemented as manual or auto NAT.

For a comparison of these two implementation options, see [Auto NAT and Manual NAT, on page 899](#).

**Step 4** Decide which rules should be custom per device.

Because you can assign a NAT policy to multiple devices, you can configure a single rule on many devices. However, you might have rules that should be interpreted differently by each device, or some rules that should apply to a subset of devices only.

Use interface objects to control on which devices a rule is configured. Then, use object overrides on network objects to customize the addresses used per device.

For detailed information, see [Customizing NAT Rules for Multiple Devices, on page 914](#).

**Step 5** Create the rules as explained in the following sections.

- [Dynamic NAT, on page 918](#)
- [Dynamic PAT, on page 923](#)
- [Static NAT, on page 933](#)
- [Identity NAT, on page 941](#)

**Step 6** Manage the NAT policy and rules.

You can do the following to manage the policy and its rules.

- To edit the policy name or description, click in those fields, type in your changes, and click outside the fields.
- To view only those rules that apply to a specific device, click **Filter by Device** and select the desired device. A rule applies to a device if it uses an interface object that includes an interface on the device.
- To view any warnings or errors in the policy, click **Show Warnings**, then choose a **Device**. Warnings and errors mark configurations that could adversely affect traffic flow or prevent the policy from deploying.
- To change the devices to which the policy is assigned, click the **Policy Assignments** link and modify the selected devices list as desired.
- To change whether a rule is enabled or disabled, right click the rule and select the desired option from the **State** command. You can temporarily disable a rule without deleting it using these controls.
- To add a rule, click the **Add Rule** button.
- To edit a rule, click **Edit** (✎) for the rule.
- To delete a rule, click **Delete** (🗑) for the rule.
- To change the number of rules displayed on the page, use the **Rows Per Page** drop-down list.
