- To select more than one rule to enable, disable, or delete, click the checkbox for the rules, or the checkbox in the header, then perform the action.

**Step 7** Click **Save**.

You can now go to **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

## Customizing NAT Rules for Multiple Devices

Because the NAT policy is shared, you can assign a given policy to more than one device. However, you can configure at most one auto NAT rule for a given object. Thus, if you want to configure different translations

for an object based on the specific device doing the translation, you need to carefully configure the interface objects (security zones or interface groups) and define network object overrides for the translated address.

The interface objects determine on which devices a rule gets configured. The network object overrides determine what IP addresses are used by a given device for that object.

Consider the following scenario:

- FTD-A and FTD-B have inside networks 192.168.1.0/24 attached to the interface named “inside.”
- On FTD-A, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.100.10.10 - 10.100.10.200 range when going to the “outside” interface.
- On FTD-B, you want to translate all 192.168.1.0/24 addresses to a NAT pool in the 10.200.10.10 - 10.200.10.200 range when going to the “outside” interface.

To accomplish the above, you would do the following. Although this example rule is for dynamic auto NAT, you can generalize the technique for any type of NAT rule.

## Procedure

- 
- Step 1** Create the security zones for the inside and outside interfaces.
- a) Choose **Objects > Object Management**.
  - b) Select **Interface Objects** from the table of contents and click **Add > Security Zone**. (You can use interface groups instead of zones.)
  - c) Configure the inside zone properties.
    - **Name**—Enter a name, for example, **inside-zone**.
    - **Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.
    - **Selected Interfaces**—Add the FTD-A/inside and FTD-B/inside interfaces to the selected list.
  - d) Click **Save**.
  - e) Click **Add > Security Zone** and define the outside zone properties.
    - **Name**—Enter a name, for example, **outside-zone**.
    - **Interface Type**—Select **Routed** for routed-mode devices, **Switched** for transparent mode.
    - **Selected Interfaces**—Add the FTD-A/outside and FTD-B/outside interfaces to the selected list.
  - f) Click **Save**.
- Step 2** Create the network object for the original inside network on the Object Management page.
- a) Select **Network** from the table of contents and click **Add Network > Add Object**.
  - b) Configure the inside network properties.
    - **Name**—Enter a name, for example, **inside-network**.
    - **Network**—Enter the network address, for example, **192.168.1.0/24**.
  - c) Click **Save**.
- Step 3** Create the network object for the translated NAT pool and define overrides.

- a) Click **Add Network > Add Object**.
- b) Configure the NAT pool properties for FTD-A.
  - **Name**—Enter a name, for example, **NAT-pool**.
  - **Network**—Enter the range of addresses to include in the pool for FTD-A, for example, **10.100.10.10-10.100.10.200**.
- c) Select **Allow Overrides**.
- d) Click the **Overrides** heading to open the list of object overrides.
- e) Click **Add** to open the Add Object Override dialog box.
- f) Select FTD-B and **Add** it to the Selected Devices list.
- g) Click **Override** and change **Network** to **10.200.10.10-10.200.10.200**
- h) Click **Add** to add the override to the device.

By defining an override for FTD-B, whenever the system configures this object on FTD-B, it will use the override value instead of the value defined in the original object.

- i) Click **Save**.

#### Step 4

Configure the NAT rule.

- a) Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Dynamic.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside-zone.
  - **Destination Interface Objects** = outside-zone.

#### Note

The interface objects control on which devices the rule is configured. Because in this example the zones contain interfaces for FTD-A and FTD-B only, even if the NAT policy were assigned to additional devices, the rule would be deployed to those 2 devices only.

- e) On **Translation**, configure the following:
  - **Original Source** = inside-network object.
  - **Translated Source > Address**= NAT-pool object.
- f) Click **Save**.

You now have a single rule that will be interpreted differently for FTD-A and FTD-B, providing unique translations for the inside networks protected by each firewall.

## Searching and Filtering the NAT Rule Table

You can search and filter the NAT rule table to help you find rules that you need to modify or view. When you filter the table, only matching rules are shown. Note that although the rule numbers change to be sequentially 1, 2, and so forth, filtering does not change the actual rule number or the rule's location in the table relative to hidden rules. Filtering simply changes what you can see to help you locate rules that interest you.

When editing the NAT policy, you can use the fields above the table to do the following types of search/filter:

- **Filter by Device**—Click **Filter by Device**, then select the devices whose rules you want to see and click **OK**. Whether a rule applies to a device is determined by the rule's interface constraints. If you specify a security zone or interface group for either the source or destination interface, the rule applies to a device if at least one interface for the device is in the zone or group. If a NAT rule applies to any source and any destination interface, then it applies to all devices.

If you also do a text or multiple-attribute search, the results are constrained to the selected devices.

To remove this filter, click **Filter by Device** and deselect the devices, or select **All**, and click **OK**.

- **Simple Text Search**—In the **Filter** box, type a string and press Enter. The string is compared to all values in the rules. For example, if you enter “network-object-1,” which is the name of a network object, you would get rules that use the object in source, destination, and PAT pool attributes.

For network and port objects, the string is also compared to the contents of the objects used in the rule. For example, if a PAT pool object includes the range 10.100.10.3-10.100.10.100, searching on either 10.100.10.3 or 10.100.10.100 (or a partial 10.100.10) will include rules that use that PAT pool object. However, the match must be exact: searching on 10.100.10.5 will not match this PAT pool object, even though the IP address is within the object's IP address range.

To remove the filter, click the **x** on the right side of the Filter box.

- **Multiple-Attribute Search**—If a simple text search gives you too many hits, you can configure multiple values for the search. Click in the **Filter** box to open the list of attributes, then select or enter strings for the attributes you intend to search and click the **Filter** button. These attributes are the same as the ones you would configure within a NAT rule. The attributes are AND'ed, so filtered results include only those rules that match all attributes you configured.

- For binary attributes, such as the rule state (enabled/disabled), whether a PAT pool is configured (enabled/disabled), the direction of the rule (uni/bi), or rule type (static/dynamic), simply check or uncheck the boxes as appropriate. Select both boxes if you do not care about the attribute value. If you deselect both boxes, no rules will match the filter.
- For string attributes, type a full or partial string relevant to that attribute. These will be object names, either for security zones/interface groups, network objects, or port objects. It can also be the network or port object contents, which are matched the same way they are for simple text searches.

To remove the filter, click the **x** on the right side of the Filter box, or click in the Filter box to open the drop-down list, and click the Clear button.

## Enabling, Disabling, or Deleting Multiple Rules

You can enable or disable manual NAT rules, or delete any NAT rule, one by one. You can also select multiple rules and apply changes to all of them at once. Because enable/disable applies to manual NAT only, if you select a mix of rule types, you can delete them only.

Note that when you enable or disable rules, it does not matter if you select some rules that were already enabled or disabled. For example, enabling an already enabled rule simply leaves the rule enabled.

### Procedure

---

**Step 1** Select **Devices > NAT** , and edit a threat defense NAT policy.

**Step 2** (Optional.) Filter the NAT rules to locate the ones you want to change.

Filtering is especially useful if you have a large NAT policy. For example, you could search on disabled rules to find ones that need to be enabled.

**Step 3** Select the rules you want to change.

- Click the checkbox in the left column of the rule to select (or deselect) individual rules.
- Click the checkbox in the table header to select all the rules on the currently displayed page.

Your selection is preserved as you go from page to page. However, in practice, it makes most sense to perform your actions on the rules selected on a page before going to the next page.

**Step 4** Perform the desired action. When selecting multiple rules, you are asked to confirm the action.

Note that these actions are also available on the right-click menu.

- To enable all rules, click **Select Bulk Action > Enable**.
  - To disable all rules, click **Select Bulk Action > Disable**.
  - To delete all rules, click **Select Bulk Action > Delete**.
- 

## Dynamic NAT

The following topics explain dynamic NAT and how to configure it.

### About Dynamic NAT

Dynamic NAT translates a group of real addresses to a pool of mapped addresses that are routable on the destination network. The mapped pool typically includes fewer addresses than the real group. When a host you want to translate accesses the destination network, NAT assigns the host an IP address from the mapped pool. The translation is created only when the real host initiates the connection. The translation is in place only for the duration of the connection, and a given user does not keep the same IP address after the translation times out. Users on the destination network, therefore, cannot initiate a reliable connection to a host that uses dynamic NAT, even if the connection is allowed by an access rule.

---

**Note** For the duration of the translation, a remote host can initiate a connection to the translated host if an access rule allows it. Because the address is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule. A successful connection from a remote host can reset the idle timer for the connection.

---

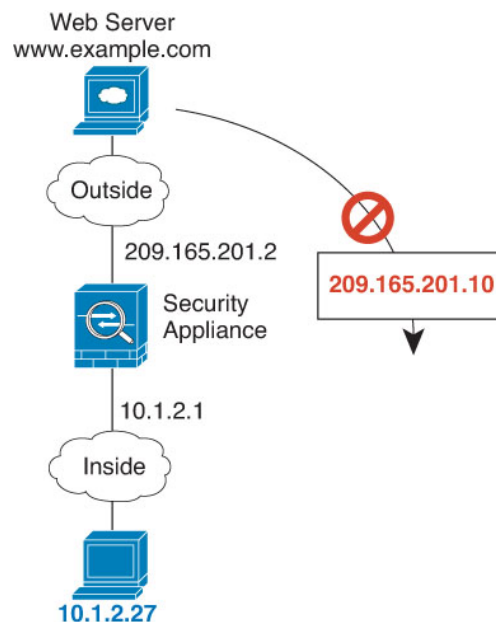

The following figure shows a typical dynamic NAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back.

**Figure 366: Dynamic NAT**

The following figure shows a remote host attempting to initiate a connection to a mapped address. This address is not currently in the translation table; therefore, the packet is dropped.

**Figure 367: Remote Host Attempts to Initiate a Connection to a Mapped Address**

## Dynamic NAT Disadvantages and Advantages

Dynamic NAT has these disadvantages:

- If the mapped pool has fewer addresses than the real group, you could run out of addresses if the amount of traffic is more than expected.

Use PAT or a PAT fall-back method if this event occurs often because PAT provides over 64,000 translations using ports of a single address.

- You have to use a large number of routable addresses in the mapped pool, and routable addresses may not be available in large quantities.

The advantage of dynamic NAT is that some protocols cannot use PAT. PAT does not work with the following:

- IP protocols that do not have a port to overload, such as GRE version 0.
- Some multimedia applications that have a data stream on one port, the control path on another port, and are not open standard.

## Configure Dynamic Auto NAT

Use dynamic auto NAT rules to translate addresses to different IP addresses that are routable on the destination network.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Dynamic**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The network object or group that contains the mapped addresses.

**Step 6** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1003](#).
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

## Configure Dynamic Manual NAT

Use dynamic manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic NAT translates addresses to different IP addresses that are routable on the destination network.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—This can be a network object or group, but it cannot include a subnet. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.

You can also create network objects or groups for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

### Procedure

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** (On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object or group that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The network object or group that contains the mapped addresses.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the destination service ports for service translation: **Original Destination Port**, **Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- (For source translation only.) **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1003](#).
- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

---

## Dynamic PAT

The following topics describe dynamic PAT.

### About Dynamic PAT

Dynamic PAT translates multiple real addresses to a single mapped IP address by translating the real address and source port to the mapped address and a unique port.

Each connection requires a separate translation session because the source port differs for each connection. For example, 10.1.1.1:1025 requires a separate translation from 10.1.1.1:1026.

The following figure shows a typical dynamic PAT scenario. Only real hosts can create a NAT session, and responding traffic is allowed back. The mapped address is the same for each translation, but the port is dynamically assigned.

Figure 368: Dynamic PAT

For the duration of the translation, a remote host on the destination network can initiate a connection to the translated host if an access rule allows it. Because the port address (both real and mapped) is unpredictable, a connection to the host is unlikely. Nevertheless, in this case you can rely on the security of the access rule.

After the connection expires, the port translation also expires.

**Note** We recommend that you use different PAT pools for each interface. If you use the same pool for multiple interfaces, especially if you use it for "any" interface, the pool can be quickly exhausted, with no ports available for new translations.

## Dynamic PAT Disadvantages and Advantages

Dynamic PAT lets you use a single mapped address, thus conserving routable addresses. You can even use the Firewall Threat Defense device interface IP address as the PAT address.

You cannot use dynamic PAT for IPv6 (NAT66) when translating between interfaces in the same bridge group. This restriction does not apply when the interfaces are members of different bridge groups, or between a bridge group member and a standard routed interface.

Dynamic PAT does not work with some multimedia applications that have a data stream that is different from the control path. For more information, see [NAT Support for Inspected Protocols, on page 906](#).

Dynamic PAT might also create a large number of connections appearing to come from a single IP address, and servers might interpret the traffic as a DoS attack. You can configure a PAT pool of addresses and use a round-robin assignment of PAT addresses to mitigate this situation.

## PAT Pool Object Guidelines

When creating network objects for a PAT pool, follow these guidelines.

### For a PAT pool

- Ports are mapped to an available port in the 1024 to 65535 range. You can optionally include the reserved ports, those below 1024, to make the entire port range available for translations.

When operating in a cluster, blocks of 512 ports per address are allocated to the members of the cluster, and mappings are made within these port blocks. If you also enable block allocation, the ports are distributed according to the block allocation size, whose default is also 512. If you change the cluster unit limit (the size of the cluster), ensure that you clear xlates or reboot the devices so that PAT pools can be appropriately reallocated to the cluster units.

- If you enable block allocation for a PAT pool, port blocks are allocated in the 1024-65535 range only. Thus, if an application requires a low port number (1-1023), it might not work. For example, an application requesting port 22 (SSH) will get a mapped port within the range of 1024-65535 and within the block allocated to the host.
- If you use the same PAT pool object in two separate rules, then be sure to specify the same options for each rule. For example, if one rule specifies extended PAT, then the other rule must also specify extended PAT.
- If a host has an existing connection, then subsequent connections from that host use the same PAT IP address. If no ports are available, this can prevent the connection. Use the round robin option to avoid this problem.
- For best performance, limit the number of IP addresses within a PAT pool to 10,000.

#### For extended PAT for a PAT pool

- Many application inspections do not support extended PAT.
- If you enable extended PAT for a dynamic PAT rule, then you cannot also use an address in the PAT pool as the PAT address in a separate static NAT with port translation rule. For example, if the PAT pool includes 10.1.1.1, then you cannot create a static NAT-with-port-translation rule using 10.1.1.1 as the PAT address.
- If you use a PAT pool and specify an interface for fallback, you cannot specify extended PAT.
- For VoIP deployments that use ICE or TURN, do not use extended PAT. ICE and TURN rely on the PAT binding to be the same for all destinations.
- You cannot use extended PAT on units in a cluster.
- Extended PAT increases memory usage on the device.

#### For round robin for a PAT pool

- If a host has an existing connection, then subsequent connections from that host will use the same PAT IP address if ports are available. However, this “stickiness” does not survive a failover. If the device fails over, then subsequent connections from a host might not use the initial IP address.
- IP address “stickiness” is also impacted if you mix PAT pool/round robin rules with interface PAT rules on the same interface. For any given interface, choose either a PAT pool or interface PAT; do not create competing PAT rules.
- Round robin, especially when combined with extended PAT, can consume a large amount of memory. Because NAT pools are created for every mapped protocol/IP address/port range, round robin results in a large number of concurrent NAT pools, which use memory. Extended PAT results in an even larger number of concurrent NAT pools.

## Configure Dynamic Auto PAT

Use dynamic auto PAT rules to translate addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

**Before you begin**

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—You have the following options to specify the PAT address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object.
  - **Single PAT address**—Create a network object containing a single host.
  - **PAT pool**—Create a network object that includes a range, or create a network object group that contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.

**Procedure**

---

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Dynamic**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty.

**Step 6** If you are using a PAT pool, select the **PAT Pool** page and do the following:

- a) Select **Enable PAT pool**.
- b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.

You can alternatively select **Destination Interface IP**, which is another way to implement interface PAT.

- c) (Optional) Select the following options as needed:

- **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
- **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
- **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. (Pre-6.7) When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option. For the Firewall Threat Defense devices running version 6.7 or higher, the flat port range is always configured, whether you select the option or not. You can still select the **Include Reserved Ports** option for these systems, and that setting is honored.
- **Block Allocation**—To enable port block allocation. For carrier-grade or large-scale PAT, you can allocate a block of ports for each host, rather than have NAT allocate one port translation at a time. If you allocate a block of ports, subsequent connections from the host use new randomly selected ports within the block. If necessary, additional blocks are allocated if the host has active connections for all ports in the original block. Port blocks are allocated in the 1024-65535 range only. Port block allocation is compatible with round robin, but you cannot use it with the extended PAT or flat port range options. You also cannot use interface PAT fallback.

**Step 7** (Optional.) On **Advanced**, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address or PAT pool.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

**Step 8** Click **Save** to add the rule.

**Step 9** Click **Save** on the NAT page to save your changes.

## Configure Dynamic Manual PAT

Use dynamic manual PAT rules when auto PAT does not meet your needs. For example, if you want to do different translations based on the destination. Dynamic PAT translates addresses to unique IP address/port combinations, rather than to multiple IP addresses only. You can translate to a single address (either the destination interface's address or another address), or use a PAT pool of addresses to provide a larger number of possible translations.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the PAT address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object.
  - **Single PAT address**—Create a network object containing a single host.
  - **PAT pool**—Create a network object that includes a range, or create a network object group that contains hosts, ranges, or both. You cannot include subnets.

You can also create network objects or groups for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule.

For dynamic NAT, you can also perform port translation on the destination. In the Object Manager, ensure that there are port objects you can use for the **Original Destination Port** and **Translated Destination Port**. If you specify the source port, it will be ignored.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Dynamic**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** (On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object or group that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Skip the step for configuring a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Skip the step for configuring a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the destination service ports for service translation: **Original Destination Port, Translated Destination Port**.

Dynamic NAT does not support port translation, so leave the **Original Source Port** and **Translated Source Port** fields empty. However, because the destination translation is always static, you can perform port translation for the destination port.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

**Step 8**

If you are using a PAT pool, select the **PAT Pool** page and do the following:

- a) Select **Enable PAT pool**.
- b) Select the network object group that contains the addresses for the pool in the **PAT > Address** field.

You can alternatively select **Destination Interface IP**, which is another way to implement interface PAT.

- c) (Optional) Select the following options as needed:

- **Use Round Robin Allocation**—To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.
- **Extended PAT Table**—To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.
- **Flat Port Range, Include Reserved Ports**—To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. (Pre-6.7) When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option. For the Firewall Threat Defense devices running version 6.7 or higher, the flat port range is always configured, whether you select the option or not. You can still select the **Include Reserved Ports** option for these systems, and that setting is honored.
- **Block Allocation**—To enable port block allocation. For carrier-grade or large-scale PAT, you can allocate a block of ports for each host, rather than have NAT allocate one port translation at a time. If you allocate a block of ports, subsequent connections from the host use new randomly selected ports within the block. If necessary, additional blocks are allocated if the host has active connections for all ports in the original block. Port blocks are allocated in the 1024-65535 range only. Port block allocation is compatible with round robin, but you cannot use it with the extended PAT or flat port range options. You also cannot use interface PAT fallback.

**Step 9**

(Optional.) On **Advanced**, select the desired options:

- **Fallthrough to Interface PAT (Destination Interface)**—Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.

- Step 10** Click **Save** to add the rule.
- Step 11** Click **Save** on the NAT page to save your changes.

---

## Configure PAT with Port Block Allocation

For carrier-grade or large-scale PAT, you can allocate a block of ports for each host, rather than have NAT allocate one port translation at a time (see RFC 6888). If you allocate a block of ports, subsequent connections from the host use new randomly-selected ports within the block. If necessary, additional blocks are allocated if the host has active connections for all ports in the original block. Blocks are freed when the last xlate that uses a port in the block is removed.

The main reason for allocating port blocks is reduced logging. The port block allocation is logged, connections are logged, but xlates created within the port block are not logged. On the other hand, this makes log analysis more difficult.

Port blocks are allocated in the 1024-65535 range only. There are separate blocks for TCP, UDP, and ICMP connections, and these blocks can overlap. Thus, if an application requires a low port number (1-1023), it might not work. For example, an application requesting port 22 (SSH) will get a mapped port within the range of 1024-65535 and within the block allocated to the host. You can create a separate NAT rule that does not use block allocation for applications that use low port numbers; for twice NAT, ensure the rule comes before the block allocation rule.

### Before you begin

Usage notes for NAT rules:

- You can include the **Use Round Robin Allocation** option, but you cannot include the options for extending PAT uniqueness, using a flat range, including the reserved ports, or falling through to interface PAT. Other source/destination address and port information is also allowed.
- As with all NAT changes, if you replace an existing rule, you must clear xlates related to the replaced rule to have the new rule take effect. You can clear them explicitly or simply wait for them to time out. However, when operating in a cluster, you must reload the cluster so that the units can distribute blocks correctly.

---

#### Note

If you are switching between a regular PAT and block allocation PAT rule, for object NAT, you must first delete the rule, then clear xlates. You can then create the new object NAT rule. Otherwise, you will see `pat-port-block-state-mismatch` drops in the **show asp drop** output.

- 
- For a given PAT pool, you must specify (or not specify) block allocation for all rules that use the pool. You cannot allocate blocks in one rule and not in another. PAT pools that overlap also cannot mix block allocation settings. You also cannot overlap static NAT with port translation rules with the pool.

### Procedure

---

- Step 1** (Optional.) Configure global PAT port block allocation settings.

There are a few global settings that control port block allocation. If you want to change the defaults for these options, you must configure a FlexConfig object and add it to your FlexConfig policy.

- a) Select **Objects > Object Management > FlexConfig > FlexConfig Object** and create a new object.
- b) Configure the block allocation size, which is the number of ports in each block.

**xlate block-allocation size** *value*

The range is 32-4096. The default is 512. Use the “no” form to return to the default.

If you do not use the default, ensure that the size you choose divides evenly into 64,512 (the number of ports in the 1024-65535 range). Otherwise, there will be ports that cannot be used. For example, if you specify 100, there will be 12 unused ports.

- c) Configure the maximum blocks that can be allocated per host.

**xlate block-allocation maximum-per-host** *number*

The limit is per protocol, so a limit of 4 means at most 4 UDP blocks, 4 TCP blocks, and 4 ICMP blocks per host. The range is 1-8, the default is 4. Use the “no” form to return to the default.

- d) (Optional.) Enable interim syslog generation.

**xlate block-allocation pba-interim-logging** *seconds*

By default, the system generates syslog messages during port block creation and deletion. If you enable interim logging, the system generates the following message at the interval you specify. The messages report all active port blocks allocated at that time, including the protocol (ICMP, TCP, UDP) and source and destination interface and IP address, and the port block. You can specify an interval from 21600-604800 seconds (6 hours to 7 days).

%ASA-6-305017: Pba-interim-logging: Active *protocol* block of ports for translation from *real\_interface:real\_host\_ip* to *mapped\_interface:mapped\_ip\_address/start\_port\_num-end\_port\_num*

**Example:**

The following example sets the block allocation size to 64, the per-host maximum to 8, and enables interim logging every 6 hours.

```
xlate block-allocation size 64
xlate block-allocation maximum-per-host 8
xlate block-allocation pba-interim-logging 21600
```

- e) Select the following options in the FlexConfig object:
  - **Deployment = Everytime**
  - **Type = Append**
- f) Click **Save** to create the FlexConfig object.
- g) Select **Devices > FlexConfig**, and create or edit the FlexConfig policy that is assigned to the devices that need to have these settings adjusted.
- h) Select your object in the available objects list and click > to move it to the selected objects list.
- i) Click **Save**.

You can click **Preview Config**, select one of the target devices, and verify that the xlate commands appear correctly.

**Step 2** Add NAT rules that use PAT pool port block allocation.

- a) Select **Devices > NAT** and add or edit the threat defense NAT policy.
- b) Add or edit a NAT rule and configure at least the following options.
  - **Type = Dynamic**
  - In **Translation > Original Source**, select the object that defines the source address.
  - On **PAT Pool**, configure the following options:
    - Select **Enable PAT Pool**
    - In **PAT > Address**, select a network object or group that defines the pat pool.
    - Select the **Block Allocation** option.
- c) Save your changes to the rule and to the NAT policy.

## Static NAT

The following topics explain static NAT and how to implement it.

### About Static NAT

Static NAT creates a fixed translation of a real address to a mapped address. Because the mapped address is the same for each consecutive connection, static NAT allows bidirectional connection initiation, both to and from the host (if an access rule exists that allows it). With dynamic NAT and PAT, on the other hand, each host uses a different address or port for each subsequent translation, so bidirectional initiation is not supported.

The following figure shows a typical static NAT scenario. The translation is always active so both real and remote hosts can initiate connections.

**Figure 369: Static NAT**

**Note** You can disable bidirectionality if desired.

### Static NAT with Port Translation

Static NAT with port translation lets you specify a real and mapped protocol and port.

When you specify the port with static NAT, you can choose to map the port and/or the IP address to the same value or to a different value.

The following figure shows a typical static NAT with port translation scenario showing both a port that is mapped to itself and a port that is mapped to a different value; the IP address is mapped to a different value in both cases. The translation is always active so both translated and remote hosts can initiate connections.

**Figure 370: Typical Static NAT with Port Translation Scenario**

Static NAT-with-port-translation rules limit access to the destination IP address for the specified port only. If you try to access the destination IP address on a different port not covered by a NAT rule, then the connection is blocked. In addition, for manual NAT, traffic that does not match the source IP address of the NAT rule will be dropped if it matches the destination IP address, regardless of the destination port. Therefore, you must add additional rules for all other traffic allowed to the destination IP address. For example, you can configure a static NAT rule for the IP address, without port specification, and place it after the port translation rule.

**Note** For applications that require application inspection for secondary channels (for example, FTP and VoIP), NAT automatically translates the secondary ports.

Following are some other uses of static NAT with port translation.

#### Static NAT with Identity Port Translation

You can simplify external access to internal resources. For example, if you have three separate servers that provide services on different ports (such as FTP, HTTP, and SMTP), you can give external users a single IP address to access those services. You can then configure static NAT with identity port translation to map the single external IP address to the correct IP addresses of the real servers based on the port they are trying to access. You do not need to change the port, because the servers are using the standard ones (21, 80, and 25 respectively).

#### Static NAT with Port Translation for Non-Standard Ports

You can also use static NAT with port translation to translate a well-known port to a non-standard port or vice versa. For example, if inside web servers use port 8080, you can allow outside users to connect to port 80, and then undo translation to the original port 8080. Similarly, to provide extra security, you can tell web users to connect to non-standard port 6785, and then undo translation to port 80.

#### Static Interface NAT with Port Translation

You can configure static NAT to map a real address to an interface address/port combination. For example, if you want to redirect Telnet access for the device's outside interface to an inside host, then you can map the inside host IP address/port 23 to the outside interface address/port 23.

### One-to-Many Static NAT

Typically, you configure static NAT with a one-to-one mapping. However, in some cases, you might want to configure a single real address to several mapped addresses (one-to-many). When you configure one-to-many

static NAT, when the real host initiates traffic, it always uses the first mapped address. However, for traffic initiated to the host, you can initiate traffic to any of the mapped addresses, and they will be untranslated to the single real address.

The following figure shows a typical one-to-many static NAT scenario. Because initiation by the real host always uses the first mapped address, the translation of real host IP/first mapped IP is technically the only bidirectional translation.

**Figure 371: One-to-Many Static NAT**

For example, you have a load balancer at 10.1.2.27. Depending on the URL requested, it redirects traffic to the correct web server.

**Figure 372: One-to-Many Static NAT Example**

## Other Mapping Scenarios (Not Recommended)

NAT has the flexibility to allow any kind of static mapping scenario: one-to-one, one-to-many, but also few-to-many, many-to-few, and many-to-one mappings. We recommend using only one-to-one or one-to-many mappings. These other mapping options might result in unintended consequences.

Functionally, few-to-many is the same as one-to-many; but because the configuration is more complicated and the actual mappings may not be obvious at a glance, we recommend creating a one-to-many configuration for each real address that requires it. For example, for a few-to-many scenario, the few real addresses are mapped to the many mapped addresses in order (A to 1, B to 2, C to 3). When all real addresses are mapped, the next mapped address is mapped to the first real address, and so on until all mapped addresses are mapped (A to 4, B to 5, C to 6). This results in multiple mapped addresses for each real address. Just like a one-to-many configuration, only the first mappings are bidirectional; subsequent mappings allow traffic to be initiated *to* the real host, but all traffic *from* the real host uses only the first mapped address for the source.

The following figure shows a typical few-to-many static NAT scenario.

**Figure 373: Few-to-Many Static NAT**

For a many-to-few or many-to-one configuration, where you have more real addresses than mapped addresses, you run out of mapped addresses before you run out of real addresses. Only the mappings between the lowest real IP addresses and the mapped pool result in bidirectional initiation. The remaining higher real addresses can initiate traffic, but traffic cannot be initiated to them (returning traffic for a connection is directed to the correct real address because of the unique 5-tuple (source IP, destination IP, source port, destination port, protocol) for the connection).

**Note** Many-to-few or many-to-one NAT is not PAT. If two real hosts use the same source port number and go to the same outside server and the same TCP destination port, and both hosts are translated to the same IP address, then both connections will be reset because of an address conflict (the 5-tuple is not unique).

The following figure shows a typical many-to-few static NAT scenario.

**Figure 374: Many-to-Few Static NAT**

Instead of using a static rule this way, we suggest that you create a one-to-one rule for the traffic that needs bidirectional initiation, and then create a dynamic rule for the rest of your addresses.

## Configure Static Auto NAT

Use static auto NAT rules to translate addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, ranges, or subnets. A group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Static**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- (Optional.) **Original Port, Translated Port**—If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary.

**Step 6** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1003](#). This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

**Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

## Configure Static Manual NAT

Use static manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Static NAT translates addresses to different IP addresses that are routable on the destination network. You can also do port translation with the static NAT rule.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—You have the following options to specify the translated address:
  - **Destination Interface**—To use the destination interface address, you do not need a network object. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
  - **Address**—Create a network object or group containing hosts, range, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.

You can also create network objects or groups for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports.

### Procedure

---

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic

exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

### Step 5

(On the **Translation** page.) Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object or group that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

### Step 6

Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

### Step 7

(Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1003](#). This option is not available if you are doing port translation.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Net to Net Mapping**—For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

## Identity NAT

You might have a NAT configuration in which you need to translate an IP address to itself. For example, if you create a broad rule that applies NAT to every network, but want to exclude one network from NAT, you can create a static NAT rule to translate an address to itself.

The following figure shows a typical identity NAT scenario.

Figure 375: Identity NAT

The following topics explain how to configure identity NAT.

## Configure Identity Auto NAT

Use static identity auto NAT rules to prevent the translation of an address. That is, to translate the address to itself.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Alternatively, you can create the objects while defining the NAT rule. The objects must meet the following requirements:

- **Original Source**—This must be a network object (not a group), and it can be a host, range, or subnet.
- **Translated Source**—A network object or group with the exact same contents as the original source object. You can use the same object.

### Procedure

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

- **NAT Rule**—Select **Auto NAT Rule**.
- **Type**—Select **Static**.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** On **Translation**, configure the following options:

- **Original Source**—The network object that contains the addresses you are translating.
- **Translated Source**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

Do not configure the **Original Port** and **Translated Port** options for identity NAT.

**Step 6** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Do not configure this option for identity NAT.
- **Net to Net Mapping**—Do not configure this option for identity NAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

**Step 7** Click **Save** to add the rule.

**Step 8** Click **Save** on the NAT page to save your changes.

---

## Configure Identity Manual NAT

Use static identity manual NAT rules when auto NAT does not meet your needs. For example, if you want to do different translations based on the destination. Use static identity NAT rules to prevent the translation of an address. That is, to translate the address to itself.

### Before you begin

Select **Objects > Object Management** and create the network objects or groups needed in the rule. Groups cannot contain both IPv4 and IPv6 addresses; they must contain one type only. Alternatively, you can create the objects while defining the NAT rule. The objects must also meet the following requirements:

- **Original Source**—This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can skip this step and specify **Any** in the rule.
- **Translated Source**—The same object or group as the original source. Optionally, you can select a different object that has the exact same contents.

You can also create network objects or groups for the **Original Destination** and **Translated Destination** if you are configuring a static translation for those addresses in the rule. If you want to configure destination static interface NAT with port translation only, you can skip adding an object for the destination mapped addresses and specify the interface in the rule.

You can also perform port translation on the source, destination, or both. In the Object Manager, ensure that there are port objects you can use for the original and translated ports. You can use the same object for identity NAT.

## Procedure

**Step 1** Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

**Step 2** Do one of the following:

- Click the **Add Rule** button to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The right click menu also has options to cut, copy, paste, insert, and delete rules.

**Step 3** Configure the basic rule options:

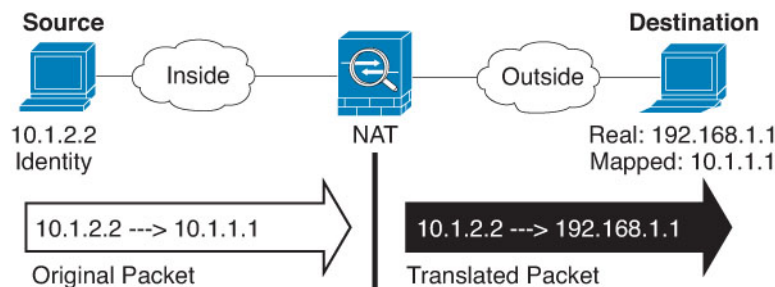

- **NAT Rule**—Select **Manual NAT Rule**.
- **Type**—Select **Static**. This setting only applies to the source address. If you define a translation for the destination address, the translation is always static.
- **Enable**—Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page.
- **Insert**—Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

**Step 4** On **Interface Objects**, configure the following options:

- **Source Interface Objects, Destination Interface Objects**—(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

**Step 5** Identify the original packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear in the original packet.

See the following figure for an example of the original packet vs. the translated packet where you perform identity NAT on the inside host but translate the outside host.

- **Original Source**—The network object or group that contains the addresses you are translating.
- **Original Destination**—(Optional.) The network object or group that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If

you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Interface Object** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

**Step 6** Identify the translated packet addresses, either IPv4 or IPv6; namely, the packet addresses as they appear on the destination interface network. You can translate between IPv4 and IPv6 if desired.

- **Translated Source**—The same object or group as the original source. Optionally, you can select a different object that has the exact same contents.
- **Translated Destination**—(Optional.) The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

**Step 7** (Optional.) Identify the source or destination service ports for service translation.

If you are configuring static NAT with port translation, you can translate ports for the source, destination, or both. For example, you can translate between TCP/80 and TCP/8080.

NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

- **Original Source Port, Translated Source Port**—Defines a port translation for the source address.
- **Original Destination Port, Translated Destination Port**—Defines a port translation for the destination address.

**Step 8** (Optional.) On **Advanced**, select the desired options:

- **Translate DNS replies that match this rule**—Do not configure this option for identity NAT.
- **IPv6**—Whether to use the IPv6 address of the destination interface for interface PAT.
- **Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.
- **Perform Route Lookup for Destination Interface**— If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.
- **Unidirectional**—Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

**Step 9** Click **Save** to add the rule.

**Step 10** Click **Save** on the NAT page to save your changes.

## NAT Rule Properties for Firewall Threat Defense

Use Network Address Translation (NAT) rules to translate IP addresses to other IP addresses. You would typically use NAT rules to convert private addresses to publicly routable addresses. The translation can be from one address to another, or you can use Port Address Translation (PAT) to translate many addresses to one or a few addresses, using port numbers to distinguish among the source addresses.

NAT rules include the following basic properties. The properties are the same for auto NAT and manual NAT rules except where indicated.

### NAT Type

Whether you want to configure a **Manual NAT Rule** or an **Auto NAT Rule**. Auto NAT translates the source address only, and you cannot make different translations based on the destination address. Because auto NAT is more simple to configure, use it unless you need the added features of manual NAT. For more information on the differences, see [Auto NAT and Manual NAT, on page 899](#).

### Type

Whether the translation rule is **Dynamic** or **Static**. Dynamic translation automatically chooses the mapped address from a pool of addresses, or an address/port combination when implementing PAT. Use static translation if you want to precisely define the mapped address/port.

### Enable (Manual NAT only.)

Whether you want the rule to be active. You can later activate or deactivate the rule using the right-click menu on the rules page. You cannot disable auto NAT rules.

### Insert (Manual NAT only.)

Where you want to add the rule. You can insert it in a category (before or after auto NAT rules), or above or below the rule number you specify.

### Description (Optional. Manual NAT only.)

A description of the purpose of the rule.

The following topics describe the tabs for the NAT rules properties.

## Interface Objects NAT Properties

Interface objects (security zones or interface groups) define the interfaces to which a NAT rule applies. In routed mode, you can use the default "any" for both source and destination to apply to all interfaces of all assigned devices. However, you typically want to select specific source and destination interfaces.

### Notes

- The concept of "any" interface does not apply to bridge group member interfaces. When you specify "any" interface, all bridge group member interfaces are excluded. Thus, to apply NAT to bridge group members, you must specify the member interface. You cannot configure NAT for the Bridge Virtual Interface (BVI) itself, you can configure NAT for member interfaces only.  
  
If you select interface objects, a NAT rule will be configured on an assigned device only if the device has interfaces included in all selected objects. For example, if you select both source and destination security zones, both zones must contain one or more interface for a given device.
- If more than one interface in an interface object exists on a given device, identical rules are created for each interface. This can become an issue for static NAT rules that include destination translation. Because NAT rules are applied based on first hit rule, only the rule created for the first interface configured for

the object matches traffic. When configuring static NAT with destination translation, use interface objects that include at most one interface per device assigned to the NAT policy to ensure you are getting the desired results.

### Source Interface Objects, Destination Interface Objects

(Required for bridge group member interfaces.) The interface objects (security zones or interface groups) that identify the interfaces where this NAT rule applies. **Source** is the object containing the real interface, the one through which the traffic enters the device. **Destination** is the object containing the mapped interface, the one through which traffic exits the device. By default, the rule applies to all interfaces (**Any**) except for bridge group member interfaces.

## Translation Properties for Auto NAT

Use the **Translation** options to define the source addresses and the mapped translated addresses. The following properties apply to auto NAT only.

### Original Source (Always required.)

The network object that contains the addresses you are translating. This must be a network object (not a group), and it can be a host, range, or subnet.

You cannot create auto NAT rules for the system-defined any-ipv4 or any-ipv6 objects.

### Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.
- **Dynamic PAT**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.

- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

#### Original Port, Translated Port (Static NAT only.)

If you need to translate a TCP or UDP port, select the protocol in **Original Port**, and type the original and translated port numbers. For example, you can translate TCP/80 to 8080 if necessary. Do not configure these options for identity NAT.

## Translation Properties for Manual NAT

Use the **Translation** options to define the source addresses and the mapped translated addresses. The following properties apply to manual NAT only. All are optional except as indicated.

#### Original Source (Always required.)

The network object or group that contains the addresses you are translating. This can be a network object or group, and it can contain a host, range, or subnet. If you want to translate all original source traffic, you can specify **Any** in the rule.

#### Translated Source (Usually required.)

The mapped addresses, the ones to which you are translating. What you select here depends on the type of translation rule you are defining.

- **Dynamic NAT**—The network object or group that contains the mapped addresses. This can be a network object or group, but it cannot include a subnet. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only. If a group contains both ranges and host IP addresses, then the ranges are used for dynamic NAT, and then the host IP addresses are used as a PAT fallback.
- **Dynamic PAT**—One of the following:
  - (Interface PAT.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on **Advanced**. Do not configure a PAT pool.
  - To use a single address other than the destination interface address, select the host network object you created for this purpose. Do not configure a PAT pool.
  - To use a PAT pool, leave **Translated Source** empty. Select the PAT pool object on **PAT Pool**.
- **Static NAT**—One of the following:
  - To use a set group of addresses, select **Address** and the network object or group that contains the mapped addresses. The object or group can contain hosts, ranges, or subnets. Typically, you configure the same number of mapped addresses as real addresses for a one-to-one mapping. You can, however, have a mismatched number of addresses.
  - (Static interface NAT with port translation.) To use the address of the destination interface, select **Destination Interface IP**. You must also select a specific destination interface object. To use the IPv6 address of the interface, you must also select the **IPv6** option on the **Advanced** tab. This configures static interface NAT with port translation: the source address/port is translated to the interface's address and the same port number.
- **Identity NAT**—The same object as the original source. Optionally, you can select a different object that has the exact same contents.

### Original Destination

The network object or group that contains the addresses of the destinations. If you leave this blank, the source address translation applies regardless of destination. If you do specify the destination address, you can configure a static translation for that address or just use identity NAT for it.

You can select **Source Interface IP** to base the original destination on the source interface (which cannot be Any). If you select this option, you must also select a translated destination object. To implement a static interface NAT with port translation for the destination addresses, select this option and also select the appropriate port objects for the destination ports.

### Translated Destination

The network object or group that contains the destination addresses used in the translated packet. If you selected an object for **Original Destination**, you can set up identity NAT (that is, no translation) by selecting the same object.

You can use a network object that specifies a fully-qualified domain name as the translated destination; for more information, see [FQDN Destination Guidelines, on page 908](#).

### Original Source Port, Translated Source Port, Original Destination Port, Translated Destination Port

The port objects that define the source and destination services for the original and translated packets. You can translate the ports, or select the same object to make the rule sensitive to the service without translating the ports. Keep the following rules in mind when configuring services:

- (Dynamic NAT or PAT.) You cannot do translation on the **Original Source Port** and **Translated Source Port**. You can do translation on the destination port only.
- NAT only supports TCP or UDP. When translating a port, be sure the protocols in the real and mapped service objects are identical (both TCP or both UDP). For identity NAT, you can use the same service object for both the real and mapped ports.

## PAT Pool NAT Properties

When you configure dynamic NAT, you can define a pool of addresses to use for Port Address Translation using the properties on the **PAT Pool** tab.

### Enable PAT Pool

Select this option to configure a pool of addresses for PAT.

### PAT

The addresses to use for the PAT pool, one of the following:

- **Address**—The object that defines the PAT pool addresses, either a network object that includes a range, or a network object group that contains hosts, ranges, or both. You cannot include subnets. The group cannot contain both IPv4 and IPv6 addresses; it must contain one type only.
- **Destination Interface IP**—Indicates that you want to use the destination interface as the PAT address. For this option, you must select a specific **Destination Interface Object**; you cannot use **Any** as the destination interface. This is another way to implement interface PAT.

### Round Robin

To assign addresses/ports in a round-robin fashion. By default without round robin, all ports for a PAT address will be allocated before the next PAT address is used. The round-robin method assigns one

address/port from each PAT address in the pool before returning to use the first address again, and then the second address, and so on.

### Extended PAT Table

To use extended PAT. Extended PAT uses 65535 ports per *service*, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. You cannot use this option with interface PAT or interface PAT fallback.

### Flat Port Range; Include Reserved Ports

To use the 1024 to 65535 port range as a single flat range when allocating TCP/UDP ports. (Pre-6.7) When choosing the mapped port number for a translation, PAT uses the real source port number if it is available. However, without this option, if the real port is *not* available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also check the **Include Reserved Ports** option. For the Firewall Threat Defense devices running version 6.7 or higher, the flat port range is always configured, whether you select the option or not. You can still select the **Include Reserved Ports** option for these systems, and that setting is honored.

### Block Allocation

To enable port block allocation. For carrier-grade or large-scale PAT, you can allocate a block of ports for each host, rather than have NAT allocate one port translation at a time. If you allocate a block of ports, subsequent connections from the host use new randomly selected ports within the block. If necessary, additional blocks are allocated if the host has active connections for all ports in the original block. Port blocks are allocated in the 1024-65535 range only. Port block allocation is compatible with round robin, but you cannot use it with the extended PAT or flat port range options. You also cannot use interface PAT fallback.

## Advanced NAT Properties

When you configure NAT, you can configure properties that provide specialized services in the **Advanced** options. All of these properties are optional: configure them only if you need the service.

### Translate DNS replies that match this rule

Whether to translate the IP address in DNS replies. For DNS replies traversing from a mapped interface to a real interface, the Address (the IPv4 A or IPv6 AAAA) record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the record is rewritten from the real value to the mapped value. This option is used in specific circumstances, and is sometimes needed for NAT64/46 translation, where the rewrite also converts between A and AAAA records. For more information, see [Rewriting DNS Queries and Responses Using NAT, on page 1003](#). This option is not available if you are doing port translation in a static NAT rule.

### Fallthrough to Interface PAT (Destination Interface) (Dynamic NAT only.)

Whether to use the IP address of the destination interface as a backup method when the other mapped addresses are already allocated (interface PAT fallback). This option is available only if you select a destination interface that is not a member of a bridge group. To use the IPv6 address of the interface, also check the **IPv6** option. You cannot select this option if you already configured interface PAT as the translated address. You also cannot select the option if you configure a PAT pool.

## IPv6

Whether to use the IPv6 address of the destination interface for interface PAT.

### Net to Net Mapping (Static NAT only.)

For NAT 46, select this option to translate the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used. For a one-to-one translation, you must use this option.

### Do not proxy ARP on Destination Interface (Static NAT only.)

Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router. Normally for identity NAT, proxy ARP is not required, and in some cases can cause connectivity issues.

### Perform Route Lookup for Destination Interface (Static Identity NAT only. Routed mode only.)

If you select source and destination interfaces when selecting the same object for original and translated source address, you can select this option to have the system determine the destination interface based on the routing table rather than using the destination interface configured in the NAT rule.

### Unidirectional (Manual NAT only, static NAT only.)

Select this option to prevent the destination addresses from initiating traffic to the source addresses. The unidirectional option is mainly useful for testing purposes and might not work with all protocols. For example, SIP requires protocol inspection to translate SIP headers using NAT, but this will not occur if you make the translation unidirectional.

# Translating IPv6 Networks

In cases where you need to pass traffic between IPv6-only and IPv4-only networks, you need to use NAT to convert between the address types. Even with two IPv6 networks, you might want to hide internal addresses from the outside network.

You can use the following translation types with IPv6 networks:

- NAT64, NAT46—Translates IPv6 packets into IPv4 and vice versa. You need to define two policies, one for the IPv6 to IPv4 translation, and one for the IPv4 to IPv6 translation. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

---

**Note** NAT46 supports static mappings only.

---

- NAT66—Translates IPv6 packets to a different IPv6 address. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

**Note** NAT64 and NAT 46 are possible on standard routed interfaces only. NAT66 is possible on both routed and bridge group member interfaces.

## NAT64/46: Translating IPv6 Addresses to IPv4

When traffic goes from an IPv6 network to an IPv4-only network, you need to convert the IPv6 address to IPv4, and return traffic from IPv4 to IPv6. You need to define two address pools, an IPv4 address pool to bind IPv6 addresses in the IPv4 network, and an IPv6 address pool to bind IPv4 addresses in the IPv6 network.

- The IPv4 address pool for the NAT64 rule is normally small and typically might not have enough addresses to map one-to-one with the IPv6 client addresses. Dynamic PAT might more easily meet the possible large number of IPv6 client addresses compared to dynamic or static NAT.
- The IPv6 address pool for the NAT46 rule can be equal to or larger than the number of IPv4 addresses to be mapped. This allows each IPv4 address to be mapped to a different IPv6 address. NAT46 supports static mappings only, so you cannot use dynamic PAT.

You need to define two policies, one for the source IPv6 network, and one for the destination IPv4 network. Although you can accomplish this with a single manual NAT rule, if the DNS server is on the external network, you probably need to rewrite the DNS response. Because you cannot enable DNS rewrite on a manual NAT rule when you specify a destination, creating two auto NAT rules is the better solution.

### NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet

Following is a straight-forward example where you have an inside IPv6-only network, and you want to convert to IPv4 for traffic sent to the Internet. This example assumes you do not need DNS translation, so you can perform both the NAT64 and NAT46 translations in a single manual NAT rule.

In this example, you translate the inside IPv6 network to IPv4 using dynamic interface PAT with the IP address of the outside interface. Outside IPv4 traffic is statically translated to addresses on the 2001:db8::/96 network, allowing transmission on the inside network.

## Procedure

**Step 1** Create the network object that defines the inside IPv6 network.

- a) Choose **Objects > Object Management**.
- b) Select **Network** from the table of contents and click **Add Network > Add Object**.
- c) Define the inside IPv6 network.

Name the network object (for example, inside\_v6) and enter the network address, 2001:db8::/96.

### New Network Object

Name

inside\_v6

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

2001:db8::/96

☐ Allow Overrides

- d) Click **Save**.

**Step 2** Create the manual NAT rule to translate the IPv6 network to IPv4 and back again.

- a) Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.

- d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside.
- **Destination Interface Objects** = outside.

- e) On **Translation**, configure the following:

- **Original Source** = inside\_v6 network object.
- **Translated Source** = **Destination Interface IP**.
- **Original Destination** = inside\_v6 network object.

- **Translated Destination** = any-ipv4 network object.

### Add NAT Rule

Insert:

In Category ▼ NAT Rules Before ▼

Type:

Dynamic ▼

☒ Enable

Description:

Interface Objects **Translation** PAT Pool Advanced

Original Packet	Translated Packet
Original Source:*	Translated Source:
inside_v6 <span>▼</span> +	Destination Interface IP <span>▼</span>
Original Destination:	<i>The values selected for Destination Interface Objects in 'Interface Objects' tab will be used</i>
Address <span>▼</span>	
inside_v6 <span>▼</span> +	Translated Destination:
	any-ipv4 <span>▼</span> +

- f) Click **OK**.

With this rule, any traffic from the 2001:db8::/96 subnet on the inside interface going to the outside interface gets a NAT64 PAT translation using the IPv4 address of the outside interface. Conversely, any IPv4 address on the outside network coming to the inside interface is translated to an address on the 2001:db8::/96 network using the embedded IPv4 address method.

- g) Click **Save** on the NAT rules page.

## NAT64/46 Example: Inside IPv6 Network with Outside IPv4 Internet and DNS Translation

Following is a typical example where you have an inside IPv6-only network, but there are some IPv4-only services on the outside Internet that internal users need.

In this example, you translate the inside IPv6 network to IPv4 using dynamic interface PAT with the IP address of the outside interface. Outside IPv4 traffic is statically translated to addresses on the 2001:db8::/96 network, allowing transmission on the inside network. You enable DNS rewrite on the NAT46 rule, so that replies from the external DNS server can be converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

Following is a typical sequence for a web request where a client at 2001:DB8::100 on the internal IPv6 network tries to open [www.example.com](http://www.example.com).

1. The client's computer sends a DNS request to the DNS server at 2001:DB8::D1A5:CA81. The NAT rules make the following translations to the source and destination in the DNS request:
  - 2001:DB8::100 to a unique port on 209.165.201.1 (The NAT64 interface PAT rule.)
  - 2001:DB8::D1A5:CA81 to 209.165.202.129 (The NAT46 rule. D1A5:CA81 is the IPv6 equivalent of 209.165.202.129.)
2. The DNS server responds with an A record indicating that [www.example.com](http://www.example.com) is at 209.165.200.225. The NAT46 rule, with DNS rewrite enabled, converts the A record to the IPv6-equivalent AAAA record, and translates 209.165.200.225 to 2001:db8:D1A5:C8E1 in the AAAA record. In addition, the source and destination addresses in the DNS response are untranslated:
  - 209.165.202.129 to 2001:DB8::D1A5:CA81
  - 209.165.201.1 to 2001:db8::100
3. The IPv6 client now has the IP address of the web server, and makes an HTTP request to [www.example.com](http://www.example.com) at 2001:db8:D1A5:C8E1. (D1A5:C8E1 is the IPv6 equivalent of 209.165.200.225.) The source and destination of the HTTP request are translated:
  - 2001:DB8::100 to a unique port on 209.156.101.54 (The NAT64 interface PAT rule.)
  - 2001:db8:D1A5:C8E1 to 209.165.200.225 (The NAT46 rule.)

The following procedure explains how to configure this example.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create the network objects that define the inside IPv6 and outside IPv4 networks.

- a) Choose **Objects > Object Management**.
- b) Select **Network** from the table of contents and click **Add Network > Add Object**.
- c) Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8::/96`.

#### New Network Object

Name

`inside_v6`

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

`2001:db8::/96`

☐ Allow Overrides

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the outside IPv4 network.

Name the network object (for example, `outside_v4_any`) and enter the network address `0.0.0.0/0`.

## New Network Object

Name

outside\_v4\_any

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

0.0.0.0/0

☐ Allow Overrides

f) Click **Save**.

**Step 2** Configure the NAT64 dynamic PAT rule for the inside IPv6 network.

**Step 3** Configure the static NAT46 rule for the outside IPv4 network.

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = outside.
- **Destination Interface Objects** = inside.

d) On **Translation**, configure the following:

- **Original Source** = outside\_v4\_any network object.
- **Translated Source > Address** = inside\_v6 network object.

e) On **Advanced**, select **Translate DNS replies that match this rule**.

## Add NAT Rule

f) Click **OK**.

With this rule, any IPv4 address on the outside network coming to the inside interface is translated to an address on the 2001:db8::/96 network using the embedded IPv4 address method. In addition, DNS responses are converted from A (IPv4) to AAAA (IPv6) records, and the addresses converted from IPv4 to IPv6.

## NAT66: Translating IPv6 Addresses to Different IPv6 Addresses

When going from an IPv6 network to another IPv6 network, you can translate the addresses to different IPv6 addresses on the outside network. We recommend using static NAT. Although you can use dynamic NAT or PAT, IPv6 addresses are in such large supply, you do not have to use dynamic NAT.

Because you are not translating between different address types, you need a single rule for NAT66 translations. You can easily model these rules using auto NAT. However, if you do not want to allow returning traffic, you can make the static NAT rule unidirectional using manual NAT only.

### NAT66 Example, Static Translation between Networks

You can configure a static translation between IPv6 address pools using auto NAT. The following example explains how to convert inside addresses on the 2001:db8:122:2091::/96 network to outside addresses on the 2001:db8:122:2999::/96 network.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create the network objects that define the inside IPv6 and outside IPv6 NAT networks.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the inside IPv6 network.  
Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8:122:2091::/96`.

## New Network Object

Name

inside\_v6

Description

Network

☐ Host
 ☐ Range
 ☒ Network
 ☐ FQDN

2001:db8:122:2091::/96

☐ Allow Overrides

- d) Click **Save**.
- e) Click **Add Network** > **Add Object** and define the outside IPv6 NAT network.

Name the network object (for example, outside\_nat\_v6) and enter the network address 2001:db8:122:2999::/96.

## New Network Object

Name

outside\_nat\_v6

Description

Network

☐ Host
 ☐ Range
 ☒ Network
 ☐ FQDN

2001:db8:122:2999::/96

☐ Allow Overrides

- f) Click **Save**.

**Step 2**

Configure the static NAT rule for the inside IPv6 network.

- Select **Devices** > **NAT** and create or edit the Firewall Threat Defense NAT policy.
- Click **Add Rule**.
- Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.

- d) On **Interface Objects**, configure the following:
- **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:
- **Original Source** = inside\_v6 network object.
  - **Translated Source > Address** = outside\_nat\_v6 network object.

### Add NAT Rule

- f) Click **OK**.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a static NAT66 translation to an address on the 2001:db8:122:2999::/96 network.

## NAT66 Example, Simple IPv6 Interface PAT

A simple approach for implementing NAT66 is to dynamically assign internal addresses to different ports on the outside interface IPv6 address.

When you configure an interface PAT rule for NAT66, all the global addresses that are configured on that interface are used for PAT mapping. Link-local or site-local addresses for the interface are not used for PAT.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create the network object that defines the inside IPv6 network.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the inside IPv6 network.

Name the network object (for example, `inside_v6`) and enter the network address, `2001:db8:122:2091::/96`.

## New Network Object

Name

inside\_v6

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

2001:db8:122:2091::/96

☐ Allow Overrides

d) Click **Save**.

### Step 2

Configure the dynamic PAT rule for the inside IPv6 network.

- a) Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.
- b) Click **Add Rule**.
- c) Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Dynamic.
- d) On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- e) On **Translation**, configure the following:

- **Original Source** = inside\_v6 network object.
- **Translated Source** = **Destination Interface IP**.

f) On **Advanced**, select **IPv6**, which indicates that the IPv6 address of the destination interface should be used.

## Add NAT Rule

NAT Rule:

Type:

☒ Enable

Interface Objects   Translation   PAT Pool   Advanced

Original Packet

Original Source:\*  
 +

Original Port:

Translated Packet

Translated Source:

*The values selected for Destination Interface Objects in 'Interface Objects' tab will be used*

g) Click **OK**.

With this rule, any traffic from the 2001:db8:122:2091::/96 subnet on the inside interface going to the outside interface gets a NAT66 PAT translation to one of the IPv6 global addresses configured for the outside interface.

# Monitoring NAT

To monitor and troubleshoot NAT connections, log into the device CLI and use the following commands.

- **show nat** displays the NAT rules and per-rule hit counts. There are additional keywords to show other aspects of NAT.
- **show xlate** displays the actual NAT translations that are currently active.
- **clear xlate** lets you remove an active NAT translation. You might need to remove active translations if you alter NAT rules, because existing connections continue to use the old translation slot until the

connection ends. Clearing a translation allows the system to build a new translation for a client on the client's next connection attempt based on your new rules.

## Examples for NAT

The following topics provide examples for configuring NAT on Threat Defense devices.

### Providing Access to an Inside Web Server (Static Auto NAT)

The following example performs static NAT for an inside web server. The real address is on a private network, so a public address is required. Static NAT is necessary so hosts can initiate traffic to the web server at a fixed address.

**Figure 376: Static NAT for an Inside Web Server**

#### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

#### Procedure

- Step 1** Create the network objects that define the server's private and public host addresses.
- Choose **Objects > Object Management**.

- b) Select **Network** from the table of contents and click **Add Network > Add Object**.
- c) Define the web server's private address.

Name the network object (for example, WebServerPrivate) and enter the real host IP address, 10.1.2.27.

### New Network Object

- f) Click **Save**.

**Step 3** Click **Save** on the NAT rule page.

## Dynamic Auto NAT for Inside Hosts and Static NAT for an Outside Web Server

The following example configures dynamic NAT for inside users on a private network when they access the outside. Also, when inside users connect to an outside web server, that web server address is translated to an address that appears to be on the inside network.

**Figure 377: Dynamic NAT for Inside, Static NAT for Outside Web Server**

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the dynamic NAT pool to which you want to translate the inside addresses.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the dynamic NAT pool.

Name the network object (for example, myNATpool) and enter the network range 209.165.201.20-209.165.201.30.

New Network Object

## Inside Load Balancer with Multiple Mapped Addresses (Static Auto NAT, One-to-Many)

The following example shows an inside load balancer that is translated to multiple IP addresses. When an outside host accesses one of the mapped IP addresses, it is untranslated to the single load balancer address. Depending on the URL requested, it redirects traffic to the correct web server.

*Figure 378: Static NAT with One-to-Many for an Inside Load Balancer*

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the web server. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create a network object for the addresses to which you want to map the load balancer.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the addresses.

Name the network object (for example, myPublicIPs) and enter the network range 209.165.201.3-209.165.201.5.

New Network Object

Name  
myPublicIPs

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
 209.165.201.3-209.165.201.5

☐ Allow Overrides

d) Click **Save**.

## Step 2

Create a network object for the load balancer.

- Click **Add Network > Add Object**.
- Name the network object (for example, myLBHost), enter the host address 10.1.2.27.

New Network Object

Name  
myLBHost

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
 10.1.2.27

☐ Allow Overrides

c) Click **Save**.

## Step 3

Configure static NAT for the load balancer.

- Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

- Click **Add NAT Rule > Add Auto NAT**.
- Configure the following properties:

- **Type** = Static.
- **Source Interface** = inside.
- **Destination Interface** = outside.

- **Original Source** = myLBHost network object.
- **Translated Source > Address**= myPublicIPs network group.

## Add NAT Rule

The screenshot shows the 'Add NAT Rule' configuration interface. At the top, the 'Type' is set to 'Static' and 'Enable' is checked. The 'Translated By' field contains 'barbosa-fptd-5512'. Below this, 'Source Interface' is set to 'inside' and 'Destination Interface' is set to 'outside'. There are three tabs: 'General', 'PAT Pool', and 'Advance'. The 'General' tab is active. It is divided into two sections: 'Original Packet' and 'Translated Packet'. In the 'Original Packet' section, 'Original Source' is set to 'myLBHost' (with a green plus icon) and 'Original Port' is set to 'TCP'. In the 'Translated Packet' section, 'Translated Source' is set to 'Address' (which points to 'myPublicIPs') and 'Translated Port' is empty.

d) Click **Save**.

**Step 4**

Configure static NAT for the load balancer.

- Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.
- Click **Add Rule**.
- Configure the following properties:
  - **NAT Rule** = Auto NAT Rule.
  - **Type** = Static.
- On **Interface Objects**, configure the following:
  - **Source Interface Objects** = inside.
  - **Destination Interface Objects** = outside.
- On **Translation**, configure the following:
  - **Original Source** = myLBHost network object.
  - **Translated Source > Address**= myPublicIPs network group.

## Add NAT Rule

f) Click **Save**.

**Step 5** Click **Save** on the NAT rule page.

## Single Address for FTP, HTTP, and SMTP (Static Auto NAT-with-Port-Translation)

The following static NAT-with-port-translation example provides a single address for remote users to access FTP, HTTP, and SMTP. These servers are actually different devices on the real network, but for each server, you can specify static NAT-with-port-translation rules that use the same mapped IP address, but different ports.

Figure 379: Static NAT-with-Port-Translation

**Before you begin**

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

**Procedure****Step 1**

Create a network object for the FTP server.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Name the network object (for example, FTPserver), and enter the real IP address for the FTP server, 10.1.2.27.

New Network Object

Name  
FTPserver

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
10.1.2.27

☒ Allow Overrides

d) Click **Save**.

## Step 2

Create a network object for the HTTP server.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, HTTPserver), enter the host address 10.1.2.28.

New Network Object

Name  
HTTPserver

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
10.1.2.28

☒ Allow Overrides

c) Click **Save**.

## Step 3

Create a network object for the SMTP server.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, SMTPserver), enter the host address 10.1.2.29.

New Network Object

Name  
SMTPserver

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
10.1.2.29

☒ Allow Overrides

c) Click **Save**.

## Step 4

Create a network object for the public IP address used for the three servers.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, ServerPublicIP) and enter the host address 209.165.201.3.

New Network Object

Name  
ServerPublicIP

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
 209.165.201.3

☐ Allow Overrides

c) Click **Save**.

## Step 5

Configure static NAT with port translation for the FTP server, mapping the FTP port to itself.

a) Select **Devices > Device Management** and edit the Threat Defense device on which you are defining the rule. Select **NAT**.

Ensure that you are currently in the same leaf domain that includes the device, if you are using domains.

b) Click **Add NAT Rule > Add Auto NAT**.

c) Configure the following properties:

- **Type** = Static.
- **Source Interface** = inside.
- **Destination Interface** = outside.
- **Original Source** = FTPserver network object.
- **Translated Source > Address** = ServerPublicIP network object.
- **Original Port > TCP** = 21.
- **Translated Port** = 21.

### Add NAT Rule

Type: **Static** ☒ Enable Translated By: barbosa-fptd-5512

Source Interface: **inside** Destination Interface: **outside**

**General** PAT Pool Advance

**Original Packet**

Original Source:\* **FTPserver**

Original Port: **TCP** **21**

**Translated Packet**

## Different Translation Depending on the Destination (Dynamic Manual PAT)

The following figure shows a host on the 10.1.2.0/24 network accessing two different servers. When the host accesses the server at 209.165.201.11, the real address is translated to 209.165.202.129:port. When the host accesses the server at 209.165.200.225, the real address is translated to 209.165.202.130:port.

Figure 380: Manual NAT with Different Destination Addresses

**Before you begin**

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **dmz**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

**Procedure****Step 1**

Create a network object for the inside network.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Name the network object (for example, myInsideNetwork), and enter the real network address, 10.1.2.0/24.

New Network Object

Name  
myInsideNetwork

Description

Network  
☐ Host
 ☐ Range
 ☒ Network
 ☐ FQDN

10.1.2.0/24

☐ Allow Overrides

- Click **Save**.

**Step 2**

Create a network object for the DMZ network 1.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, DMZnetwork1) and enter the network address 209.165.201.0/27 (subnet mask of 255.255.255.224).

New Network Object

Name  
DMZnetwork1

Description

Network  
☐ Host ☐ Range ☒ Network ☐ FQDN

209.165.201.0/27

☒ Allow Overrides

- c) Click **Save**.

**Step 3**

Create a network object for the PAT address for DMZ network 1.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, PATAddress1) and enter the host address 209.165.202.129.

New Network Object

Name  
PATAddress1

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN

209.165.202.129

☐ Allow Overrides

- c) Click **Save**.

**Step 4**

Create a network object for the DMZ network 2.

- a) Click **Add Network > Add Object**.
- b) Name the network object (for example, DMZnetwork2) and enter the network address 209.165.200.224/27 (subnet mask of 255.255.255.224).

New Network Object

## Different Translation Depending on the Destination Address and Port (Dynamic Manual PAT)

The following figure shows the use of source and destination ports. The host on the 10.1.2.0/24 network accesses a single host for both web services and Telnet services. When the host accesses the server for Telnet services, the real address is translated to 209.165.202.129:*port*. When the host accesses the same server for web services, the real address is translated to 209.165.202.130:*port*.

Figure 381: Manual NAT with Different Destination Ports

**Before you begin**

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device that protects the servers. In this example, we will assume the interface objects are security zones named **inside** and **dmz**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

**Procedure**

**Step 1** Create a network object for the inside network.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Name the network object (for example, myInsideNetwork) and enter the real network address, 10.1.2.0/24.

e) Click **Save**.

**Step 9** Click **Save** on the NAT rule page.

## NAT and Site-to-Site VPN

When you create a policy-based site-to-site VPN using the management center VPN wizard (**Device > Site To Site**), you can select the NAT Exempt option to create the rules automatically. You can view the NAT exemptions for a device in the NAT policy page (**Device > NAT > NAT Exemptions**). If you do not want to configure NAT Exempt in the VPN wizard, you can use the following procedure for NAT exemption.

The following figure shows a site-to-site tunnel connecting the Boulder and San Jose offices. For traffic that you want to go to the Internet (for example from 10.1.1.6 in Boulder to www.example.com), you need a public IP address provided by NAT to access the Internet. The below example uses interface PAT rules. However, for traffic that you want to go over the VPN tunnel (for example from 10.1.1.6 in Boulder to 10.2.2.78 in San Jose), you do not want to perform NAT; you need to exempt that traffic by creating an identity NAT rule. Identity NAT simply translates an address to the same address.

Figure 382: Interface PAT and Identity NAT for Site-to-Site VPN

The following example explains the configuration for Firewall1 (Boulder).

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the devices in the VPN. In this example, we will assume the interface objects are security zones named **inside-boulder** and **outside-boulder** for the Firewall1 (Boulder) interfaces. To configure interface objects, select **Objects > Object Management**, then select **Interfaces**.

### Procedure

**Step 1** Create the objects to define the various networks.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Identify the Boulder inside network.

Name the network object (for example, boulder-network) and enter the network address, 10.1.1.0/24.

### New Network Object

Name

boulder-network

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

10.1.1.0/24

☐ Allow Overrides

d) Click **Save**.

e) Click **Add Network** > **Add Object** and define the inside San Jose network.

Name the network object (for example, sanjose-network) and enter the network address 10.2.2.0/24.

### New Network Object

Name

sanjose-network

Description

Network

☐ Host ☐ Range ☒ Network ☐ FQDN

10.2.2.0/24

☐ Allow Overrides

f) Click **Save**.

## Step 2

Configure manual identity NAT for the Boulder network when going over the VPN to San Jose on Firewall1 (Boulder).

a) Select **Devices** > **NAT** and create or edit the Firewall Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.

- **Type** = Static.

d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside-boulder.
- **Destination Interface Objects** = outside-boulder.

e) On **Translation**, configure the following:

- **Original Source** = boulder-network object.
- **Translated Source > Address** = boulder-network object.
- **Original Destination > Address** = sanjose-network object.
- **Translated Destination** = sanjose-network object.

**Note**

Because you do not want to translate the destination address, you need to configure identity NAT for it by specifying the same address for the original and translated destination addresses. Leave all of the port fields blank. This rule configures identity NAT for both source and destination.

f) On **Advanced**, select **Do not proxy ARP on Destination interface**.

## Add NAT Rule

Manual NAT Rule

Address

Original Destination:

Address

Translated Destination:

boulder-network
+

sanjose-network
+

sanjose-network
+

g) Click **Save**.

**Step 3**

Configure manual dynamic interface PAT when going to the Internet for the inside Boulder network on Firewall1 (Boulder).

a) Click **Add Rule**.

b) Configure the following properties:

- **NAT Rule** = Manual NAT Rule.
- **Type** = Dynamic.
- **Insert Rule** = any position after the first rule. Because this rule will apply to any destination address, the rule that uses sanjose-network as the destination must come before this rule, or the sanjose-network rule will never be matched. The default is to place new manual NAT rules at the end of the "NAT Rules Before Auto NAT" section.

c) On **Interface Objects**, configure the following:

- **Source Interface Objects** = inside-boulder.
- **Destination Interface Objects** = outside-boulder.

d) On **Translation**, configure the following:

- **Original Source** = boulder-network object.
- **Translated Source** = **Destination Interface IP**. This option configures interface PAT using the interface contained in the destination interface object.
- **Original Destination > Address** = any (leave blank).
- **Translated Destination** = any (leave blank).

## Add NAT Rule

NAT Rule:  
 Manual NAT Rule

Insert:  
 In Category NAT Rules Before

Type:

☒ Enable

Description:

Interface Objects Translation PAT Pool Advanced

Original Packet Translated Packet

Original Source:\*  
 boulder-network +

Original Destination:  
 Address

Translated Source:  
 Destination Interface IP

The values selected for Destination Interface Objects in 'Interface Objects' tab will be used

e) Click **Save**.

**Step 4** If you are also managing Firewall2 (San Jose), you can configure similar rules for that device.

- The manual identity NAT rule would be for sanjose-network when the destination is boulder-network. Create new interface objects for the Firewall2 inside and outside networks.
- The manual dynamic interface PAT rule would be for sanjose-network when the destination is "any."

## Rewriting DNS Queries and Responses Using NAT

You might need to configure the Firewall Threat Defense device to modify DNS replies by replacing the address in the reply with an address that matches the NAT configuration. You can configure DNS modification when you configure each translation rule. DNS modification is also known as DNS doctoring.

This feature rewrites the address in DNS queries and replies that match a NAT rule (for example, the A record for IPv4, the AAAA record for IPv6, or the PTR record for reverse DNS queries). For DNS replies traversing from a mapped interface to any other interface, the record is rewritten from the mapped value to the real value. Inversely, for DNS replies traversing from any interface to a mapped interface, the record is rewritten from the real value to the mapped value. This feature works with NAT44, NAT 66, NAT46, and NAT64.

Following are the main circumstances when you would need to configure DNS rewrite on a NAT rule.

- The rule is NAT64 or NAT46, and the DNS server is on the outside network. You need DNS rewrite to convert between DNS A records (for IPv4) and AAAA records (for IPv6).
- The DNS server is on the outside, clients are on the inside, and some of the fully-qualified domain names that the clients use resolve to other inside hosts.
- The DNS server is on the inside and responds with private IP addresses, clients are on the outside, and the clients access fully-qualified domain names that point to servers that are hosted on the inside.

### DNS Rewrite Limitations

Following are some limitations with DNS rewrite:

- DNS rewrite is not applicable for PAT because multiple PAT rules are applicable for each A or AAAA record, and the PAT rule to use is ambiguous.
- If you configure a manual NAT rule, you cannot configure DNS modification if you specify the destination address as well as the source address. These kinds of rules can potentially have a different translation for a single address when going to A vs. B. Therefore, they can not accurately match the IP address inside the DNS reply to the correct NAT rule; the DNS reply does not contain information about which source/destination address combination was in the packet that prompted the DNS request.
- You must enable DNS application inspection with DNS NAT rewrite enabled for NAT rules to rewrite DNS queries and responses. By default, DNS inspection with DNS NAT rewrite enabled is globally applied, so you probably do not need to change the inspection configuration.
- DNS rewrite is actually done on the xlate entry, not the NAT rule. Thus, if there is no xlate for a dynamic rule, rewrite cannot be done correctly. The same problem does not occur for static NAT.
- DNS rewrite does not rewrite DNS Dynamic Update messages (opcode 5).

The following topics provide examples of DNS rewrite in NAT rules.

## DNS64 Reply Modification

The following figure shows an FTP server and DNS server on the outside IPv4 network. The system has a static translation for the outside server. In this case, when an inside IPv6 user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.200.225.

Because you want inside users to use the mapped address for ftp.cisco.com (2001:DB8::D1A5:C8E1, where D1A5:C8E1 is the IPv6 equivalent of 209.165.200.225) you need to configure DNS reply modification for the static translation. This example also includes a static NAT translation for the DNS server, and a PAT rule for the inside IPv6 hosts.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

**Step 1** Create the network objects for the FTP server, DNS server, inside network, and PAT pool.

- Choose **Objects > Object Management**.
- Select **Network** from the table of contents and click **Add Network > Add Object**.
- Define the real FTP server address.

Name the network object (for example, ftp\_server) and enter the host address, 209.165.200.225.

### New Network Object

Name

ftp\_server

Description

Network

☒ Host ☐ Range ☐ Network ☐ FQDN

209.165.200.225

☐ Allow Overrides

- d) Click **Save**.
- e) Click **Add Network > Add Object** and define the FTP server's translated IPv6 address.  
Name the network object (for example, ftp\_server\_v6) and enter the host address, 2001:DB8::D1A5:C8E1.

### New Network Object

Name

ftp\_server\_v6

Description

Network

☒ Host ☐ Range ☐ Network ☐ FQDN

2001:DB8::D1A5:C8E1

☐ Allow Overrides

- f) Click **Save**.
- g) Click **Add Network > Add Object** and define the DNS server's real address.  
Name the network object (for example, dns\_server) and enter the host address, 209.165.201.15.

### New Network Object

Name

dns\_server

Description

Network

☒ Host ☐ Range ☐ Network ☐ FQDN

209.165.201.15

☐ Allow Overrides

h) Click **Save**.

i) Click **Add Network > Add Object** and define the DNS server's translated IPv6 address.

Name the network object (for example, dns\_server\_v6) and enter the host address, 2001:DB8::D1A5:C90F (where D1A5:C90F is the IPv6 equivalent of 209.165.201.15).

### New Network Object

Name

dns\_server\_v6

Description

☒ Host ☐ Range ☐ Network ☐ FQDN

2001:DB8::D1A5:C90F

☐ Allow Overrides

j) Click **Save**.

k) Click **Add Network > Add Object** and define the inside IPv6 network.

Name the network object (for example, inside\_v6) and enter the network address, 2001:DB8::/96.

New Network Object

Name  
inside\_v6

Description

Network  
☐ Host ☐ Range ☒ Network ☐ FQDN  
 2001:DB8::/96

☐ Allow Overrides

l) Click **Save**.

m) Click **Add Network > Add Object** and define the IPv4 PAT pool for the inside IPv6 network.

Name the network object (for example, ipv4\_pool) and enter the range 209.165.200.230-209.165.200.235.

New Network Object

Name  
ipv4\_pool

Description

Network  
☒ Host ☐ Range ☐ Network ☐ FQDN  
 209.165.200.230-209.165.200.235

☐ Allow Overrides

n) Click **Save**.

## Step 2

Configure the static NAT rule with DNS modification for the FTP server.

a) Select **Devices > NAT** and create or edit the Firewall Threat Defense NAT policy.

b) Click **Add Rule**.

c) Configure the following properties:

- **NAT Rule** = Auto NAT Rule.
- **Type** = Static.

d) On **Interface Objects**, configure the following:

- **Source Interface Objects** = outside.
- **Destination Interface Objects** = inside.

e) On **Translation**, configure the following:

- **Original Source** = ftp\_server network object.
- **Translated Source > Address** = ftp\_server\_v6 network object.

## DNS Reply Modification, DNS Server on Outside

The following figure shows a DNS server that is accessible from the outside interface. A server, ftp.cisco.com, is on the inside interface. You configure NAT to statically translate the ftp.cisco.com real address (10.1.3.14) to a mapped address (209.165.201.10) that is visible on the outside network.

In this case, you want to enable DNS reply modification on this static rule so that inside users who have access to ftp.cisco.com using the real address receive the real address from the DNS server, and not the mapped address.

When an inside host sends a DNS request for the address of ftp.cisco.com, the DNS server replies with the mapped address (209.165.201.10). The system refers to the static rule for the inside server and translates the address inside the DNS reply to 10.1.3.14. If you do not enable DNS reply modification, then the inside host attempts to send traffic to 209.165.201.10 instead of accessing ftp.cisco.com directly.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create the network objects for the FTP server.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the real FTP server address.

Name the network object (for example, ftp\_server) and enter the host address, 10.1.3.14.

### New Network Object

## DNS Reply Modification, DNS Server on Host Network

The following figure shows an FTP server and DNS server on the outside. The system has a static translation for the outside server. In this case, when an inside user requests the address for ftp.cisco.com from the DNS server, the DNS server responds with the real address, 209.165.20.10. Because you want inside users to use the mapped address for ftp.cisco.com (10.1.2.56) you need to configure DNS reply modification for the static translation.

### Before you begin

Ensure that you have interface objects (security zones or interface groups) that contain the interfaces for the device. In this example, we will assume the interface objects are security zones named **inside** and **outside**. To configure interface objects, select **Objects > Object Management**, then select **Interface**.

### Procedure

- Step 1** Create the network objects for the FTP server.
- Choose **Objects > Object Management**.
  - Select **Network** from the table of contents and click **Add Network > Add Object**.
  - Define the real FTP server address.
- Name the network object (for example, `ftp_server`) and enter the host address, `209.165.201.10`.

# History for Firewall Threat Defense NAT

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Creation of network groups while editing NAT rules.	7.2.6 7.4.1	Any	You can create network groups in addition to network objects when you are editing a NAT rule.  This feature is not supported in Version 7.3.x or 7.4.0.
Ability to enable, disable, or delete more than one NAT rule at a time.	7.2	Any	You can select multiple NAT rules and enable, disable, or delete them all at the same time. Enable and disable apply to manual NAT rules only, whereas delete applies to any NAT rule.
Manual NAT support for fully-qualified domain name (FQDN) objects as the translated destination.	7.1	Any	You can use an FQDN network object, such as one specifying www.example.com, as the translated destination address in manual NAT rules. The system configures the rule based on the IP address returned from the DNS server.
Changes to PAT address allocation in clustering. The PAT pool <b>Flat Port Range</b> option is now enabled by default and it is not configurable.	6.7	Any	<p>The way PAT addresses are distributed to the members of a cluster is changed. Previously, addresses were distributed to the members of the cluster, so your PAT pool would need a minimum of one address per cluster member. Now, the control unit instead divides each PAT pool address into equal-sized port blocks and distributes them across cluster members. Each member has port blocks for the same PAT addresses. Thus, you can reduce the size of the PAT pool, even to as few as one IP address, depending on the amount of connections you typically need to PAT. Port blocks are allocated in 512-port blocks from the 1024-65535 range. You can optionally include the reserved ports, 1-1023, in this block allocation when you configure PAT pool rules. For example, in a 4-node cluster, each node gets 32 blocks with which it will be able to handle 16384 connections per PAT pool IP address compared to a single node handling all 65535 connections per PAT pool IP address.</p> <p>As part of this change, PAT pools for all systems, whether standalone or operating in a cluster, now use a flat port range of 1023 - 65535. Previously, you could optionally use a flat range by including the <b>Flat Port Range</b> option in a PAT pool rule. The <b>Flat Port Range</b> option is now ignored: the PAT pool is now always flat. You can optionally select the <b>Include Reserved Ports</b> option to include the 1 - 1023 port range within the PAT pool.</p> <p>Note that if you configure port block allocation (the <b>Block Allocation</b> PAT pool option), your block allocation size is used rather than the default 512-port block. In addition, you cannot configure extended PAT for a PAT pool for systems in a cluster.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Ability to search and filter the Firewall Threat Defense NAT rule table.	6.7	Any	<p>You can now search for rules in Firewall Threat Defense NAT policies to help you find rules based on IP addresses, ports, object names, and so forth. Search results include partial matches. Searching on criteria filters the rule table so only matching rules are displayed.</p> <p>We added a search field above the rule table when you edit Firewall Threat Defense NAT policies.</p>
Carrier grade NAT enhancements.	6.5	Any	<p>For carrier-grade or large-scale PAT, you can allocate a block of ports for each host, rather than have NAT allocate one port translation at a time (see RFC 6888).</p> <p>New/modified screens: We added the <b>Block Allocation</b> option to the NAT PAT Pool tab for Firewall Threat Defense NAT rules.</p>
Support for network range objects in NAT for Firewall Threat Defense.	6.1.0	Any	You can now use network range objects in Firewall Threat Defense NAT rules where appropriate.
Network Address Translation (NAT) for Firewall Threat Defense.	6.0.1	Any	<p>The NAT policy for Firewall Threat Defense was added.</p> <p>New/modified screens: Threat Defense was added as a type of NAT policy to the <b>Devices &gt; NAT</b> page.</p>

## CHAPTER 22

# Alarms for the Cisco ISA 3000

You can configure the alarm system on a Cisco ISA 3000 device to alert you when undesirable conditions occur.

- [About Alarms, on page 1021](#)
- [Defaults for Alarms, on page 1023](#)
- [Requirements and Prerequisites for Alarms, on page 1024](#)
- [Configure the Alarms for the ISA 3000, on page 1024](#)
- [Monitoring Alarms, on page 1032](#)
- [History for Alarms, on page 1033](#)

## About Alarms

You can configure the ISA 3000 to issue alarms for a variety of conditions. If any conditions do not match the configured settings, the system triggers an alarm, which is reported by way of LEDs, syslog messages, SNMP traps, and through external devices connected to the alarm output interface. By default, triggered alarms issue syslog messages only.

You can configure the alarm system to monitor the following:

- Power supply.
- Primary and secondary temperature sensors.
- Alarm input interfaces.

The ISA 3000 has internal sensors plus two alarm input interfaces and one alarm output interface. You can connect external sensors, such as door sensors, to the alarm inputs. You can connect external alarm devices, such as buzzers or lights, to the alarm output interface.

The alarm output interface is a relay mechanism. Depending on the alarm conditions, the relay is either energized or de-energized. When it is energized, any device connected to the interface is activated. A de-energized relay results in the inactive state of any connected devices. The relay remains in an energized state as long as alarms are triggered.

For information about connecting external sensors and the alarm relay, see [Cisco ISA 3000 Industrial Security Appliance Hardware Installation Guide](#).

## Alarm Input Interfaces

You can connect the alarm input interfaces (or contacts) to external sensors, such as one that detects if a door is open.

Each alarm input interface has a corresponding LED. These LEDs convey the alarm status of each alarm input. You can configure the trigger and severity for each alarm input. In addition to the LED, you can configure the contact to trigger the output relay (to activate an external alarm), to send syslog messages, and to send SNMP traps.

The following table explains the statuses of the LEDs in response to alarm conditions for the alarm inputs. It also explains the behavior for the output relay, syslog messages, and SNMP traps, if you enable these responses to the alarm input.

Alarm Status	LED	Output Relay	Syslog	SNMP Trap
Alarm not configured	Off	—	—	—
No alarms triggered	Solid green	—	—	—
Alarm activated	Minor alarm—solid red Major alarm—flashing red	Relay energized	Syslog generated	SNMP trap sent
Alarm end	Solid green	Relay de-energized	Syslog generated	—

## Alarm Output Interface

You can connect an external alarm, such as a buzzer or light, to the alarm output interface.

The alarm output interface functions as a relay and also has a corresponding LED, which conveys the alarm status of an external sensor connected to the input interface, and internal sensors such as the dual power supply and temperature sensors. You configure which alarms should activate the output relay, if any.

The following table explains the statuses of the LEDs and output relay in response to alarm conditions. It also explains the behavior for syslog messages, and SNMP traps, if you enable these responses to the alarm.

Alarm Status	LED	Output Relay	Syslog	SNMP Trap
Alarm not configured	Off	—	—	—
No alarms triggered	Solid green	—	—	—
Alarm activated	Solid red	Relay energized	Syslog generated	SNMP trap sent
Alarm end	Solid green	Relay de-energized	Syslog generated	—

## Syslog Alarms

By default, the system sends syslog messages when any alarm is triggered. You can disable syslog messaging if you do not want the messages.

For syslog alarms to work, you must also enable diagnostic logging. Choose **Interface** **Devices** > **Platform Settings**, add or edit a Threat Defense platform settings policy that is assigned to the device, and configure destinations and settings on the **Syslog** page. For example, you can configure a syslog server, console logging, or internal buffer logging.

Without enabling a destination for diagnostic logging, the alarm system has nowhere to send syslog messages.

## SNMP Alarms

You can optionally configure the alarms to send SNMP traps to your SNMP server. For SNMP trap alarms to work, you must also configure SNMP settings.

Choose **Devices** > **Platform Settings**, add or edit a Threat Defense platform settings policy that is assigned to the device, and enable SNMP and configure settings on the **SNMP** page.

## Defaults for Alarms

The following table specifies the defaults for alarm input interfaces (contacts), redundant power supply, and temperature.

	Alarm	Trigger	Severity	SNMP Trap	Output Relay	Syslog Message
Alarm Contact 1	Enabled	Closed State	Minor	Disabled	Disabled	Enabled
Alarm Contact 2	Enabled	Closed State	Minor	Disabled	Disabled	Enabled
Redundant Power Supply (when enabled)	Enabled	—	—	Disabled	Disabled	Enabled
Temperature	Enabled for the primary temperature alarm (default values of 92°C and -40°C for the high and low thresholds respectively)  Disabled for the secondary alarm.	—	—	Enabled for primary temperature alarm	Enabled for primary temperature alarm	Enabled for primary temperature alarm

## User Roles

Admin

# Configure the Alarms for the ISA 3000

You use FlexConfig to configure alarms for the ISA 3000. The following topics explain how to configure the different types of alarms.

## Configure Alarm Input Contacts

If you connect the alarm input contacts (interfaces) to external sensors, you can configure the contacts to issue alarms based on the input from the sensor. In fact, the contacts are enabled by default to send syslog messages if the contact is closed, that is, if the electrical current stops flowing through the contact. You need to configure the contact only if the defaults do not meet your requirements.

The alarm contacts are numbered 1 and 2, so you need to understand how you have wired the physical pins to configure the correct settings. You configure the contacts separately.

### Procedure

#### Step 1

Create the FlexConfig object to configure the alarm input contacts.

- a) Choose **Objects > Object Management > FlexConfig > FlexConfig Object**.
- b) Click **Add FlexConfig Object**, configure the following properties, and click **Save**.
  - **Name**—The object name. For example, `Configure_Alarm_Contacts`.
  - **Deployment**—Select **Everytime**. You want this configuration to be sent in every deployment to ensure it remains configured.
  - **Type**—Keep the default, **Append**. The commands are sent to the device after the commands for directly-supported features.
  - **Object body**—In the object body, type the commands needed to configure the alarm contacts. The following steps explain the commands.
- c) Configure a description for the alarm contact.

**alarm contact {1 | 2} description *string***

For example, to set the description of contact 1 to "Door Open," enter the following:

```
alarm contact 1 description Door Open
```

- d) Configure the severity for the alarm contact.

**alarm contact {1 | 2 | any} severity {major | minor | none}**

Instead of configuring one contact, you can specify **any** to change the severity for all contacts. The severity controls the behavior of the LED associated with the contact.

- **major**—The LED blinks red.
- **minor**—The LED is solid red. This is the default.
- **none**—The LED is off.

For example, to set the severity of contact 1 to Major, enter the following:

```
alarm contact 1 severity major
```

- e) Configure the trigger for the alarm contact.

**alarm contact {1 | 2 | any} trigger {open | closed}**

Instead of configuring one contact, you can specify **any** to change the trigger for all contacts. The trigger determines the electrical condition that signals an alert.

- **open**—The normal condition for the contact is closed, that is, the electrical current is running through the contact. An alert is triggered if the contact becomes open, that is, the electrical current stops flowing.
- **closed**—The normal condition for the contact is open, that is, the electrical current does not run through the contact. An alert is triggered if the contact becomes closed, that is, the electrical current starts running through the contact. This is the default.

For example, you connect a door sensor to alarm input contact 1, and its normal state has no electrical current flowing through the alarm contact (it is open). If the door is opened, the contact is closed and electrical current flows through the alarm contact. You would set the alarm trigger to closed so that the alarm goes off when the electrical current starts flowing.

```
alarm contact 1 trigger closed
```

- f) Configure the actions to take when the alarm contact is triggered.

**alarm facility input-alarm {1 | 2} {relay | syslog | notifies}**

You can configure more than one action. For example, you can configure the device to activate the external alarm, send syslog messages, and also send SNMP traps.

- **relay**—Energize the alarm output relay, which activates the external alarm that you attached to it, such as a buzzer or a flashing light. The output LED also goes red.
- **syslog**—Send a syslog message. This option is enabled by default.
- **notifies**—Send an SNMP trap.

For example, to enable all actions for the alarm input contact 1, enter the following:

```
alarm facility input-alarm 1 relay
alarm facility input-alarm 1 syslog
alarm facility input-alarm 1 notifies
```

- g) Verify that the object body contains the commands you want.

For example, if your template includes all of the command examples shown in this procedure, the object body would have the following commands:

```
alarm contact 1 description Door Open
alarm contact 1 severity major
alarm contact 1 trigger closed
alarm facility input-alarm 1 relay
alarm facility input-alarm 1 syslog
alarm facility input-alarm 1 notifies
```

The object body should look similar to the following:

- h) Click **Save**.

**Step 2** Create the FlexConfig policy and assign it to the devices.

- Choose **Devices > FlexConfig**.
- Either click **New Policy**, or if an existing FlexConfig policy should be assigned to (or is already assigned to) the target devices, simply edit that policy.

When creating a new policy, assign the target devices to the policy in the dialog box where you name the policy.

- Select the alarm contact FlexConfig object in the **User Defined** folder in the table of contents and click **>** to add it to the policy.

The object should be added to the **Selected Appended FlexConfigs** list.

Selected Appended FlexConfigs	
#	Name
1	Configure_Alarm_Contacts

- Click **Save**.
- If you have not yet assigned all the targeted devices to the policy, click the **Policy Assignments** link below Save and make the assignments now.
- Click **Preview Config**, and in the Preview dialog box, select one of the assigned devices.

The system generates a preview of the configuration CLI that will be sent to the device. Verify that the commands generated from the FlexConfig object look correct. These will be shown at the end of the

preview. Note that you will also see commands generated from other changes you have made to managed features. For the alarm contact commands, you should see something similar to the following:

```
###Flex-config Appended CLI ###
alarm contact 1 description Door Open
alarm contact 1 severity major
alarm contact 1 trigger closed
alarm facility input-alarm 1 relay
alarm facility input-alarm 1 syslog
alarm facility input-alarm 1 notifies
```

**Step 3** Deploy your changes.

Because you assigned a FlexConfig policy to the devices, you will always get a deployment warning, which is meant to caution you about the use of FlexConfig. Click **Proceed** to continue with the deployment.

After the deployment completes, you can check the deployment history and view the transcript for the deployment. This is especially valuable if the deployment fails. See [Verify the Deployed Configuration, on page 2508](#).

## Configure Power Supply Alarms

The ISA 3000 has two power supplies. By default, the system operates in single-power mode. However, you can configure the system to operate in dual mode, where the second power supply automatically provides power if the primary power supply fails. When you enable dual-mode, the power supply alarm is automatically enabled to send syslog alerts, but you can disable the alert altogether, or also enable SNMP traps or the alarm hardware relay.

The following procedure explains how to enable dual mode, and how to configure the power supply alarms.

### Procedure

**Step 1** Create the FlexConfig object to configure the power supply alarm.

- a) Choose **Objects > Object Management > FlexConfig > FlexConfig Object**.
- b) Click **Add FlexConfig Object**, configure the following properties, and click **Save**.
  - **Name**—The object name. For example, Power\_Supply\_Alarms.
  - **Deployment**—Select **Everytime**. You want this configuration to be sent in every deployment to ensure it remains configured.
  - **Type**—Keep the default, **Append**. The commands are sent to the device after the commands for directly-supported features.
  - **Object body**—In the object body, type the commands needed to configure the power supply alarms. The following steps explain the commands.
- c) Enable dual power supply mode.

**power-supply dual**

For example:

```
power-supply dual
```

- d) Configure the actions to take when the power supply alarm is triggered.

**alarm facility power-supply rps {relay | syslog | notifies | disable}**

You can configure more than one action. For example, you can configure the device to activate the external alarm, send syslog messages, and also send SNMP traps.

- **relay**—Energize the alarm output relay, which activates the external alarm that you attached to it, such as a buzzer or a flashing light. The output LED also goes red.
- **syslog**—Send a syslog message. This option is enabled by default.
- **notifies**—Send an SNMP trap.
- **disable**—Disable the power supply alarm. Any other actions configured for the power supply alarm are inoperable.

For example, to enable all actions for the power supply alarm, enter the following:

```
alarm facility power-supply rps relay
alarm facility power-supply rps syslog
alarm facility power-supply rps notifies
```

- e) Verify that the object body contains the commands you want.

For example, if your template includes all of the command examples shown in this procedure, the object body would have the following commands:

```
power-supply dual
alarm facility power-supply rps relay
alarm facility power-supply rps syslog
alarm facility power-supply rps notifies
```

The object body should look similar to the following:

The screenshot shows a configuration interface with a text area containing the following commands:

```
power-supply dual
alarm facility power-supply rps relay
alarm facility power-supply rps syslog
alarm facility power-supply rps notifies
```

At the top of the interface, there are two dropdown menus: "Deployment:" set to "Everytime" and "Type:" set to "Append".

- f) Click **Save**.

## Step 2 Create the FlexConfig policy and assign it to the devices.

- Choose **Devices > FlexConfig**.
- Either click **New Policy**, or if an existing FlexConfig policy should be assigned to (or is already assigned to) the target devices, simply edit that policy.

When creating a new policy, assign the target devices to the policy in the dialog box where you name the policy.

- Select the power supply alarm FlexConfig object in the **User Defined** folder in the table of contents and click **>** to add it to the policy.

The object should be added to the **Selected Appended FlexConfigs** list.

Selected Append FlexConfigs	
#	Name
1	Power_Supply_Alarms

- d) Click **Save**.
- e) If you have not yet assigned all the targeted devices to the policy, click the **Policy Assignments** link below Save and make the assignments now.
- f) Click **Preview Config**, and in the Preview dialog box, select one of the assigned devices.

The system generates a preview of the configuration CLI that will be sent to the device. Verify that the commands generated from the FlexConfig object look correct. These will be shown at the end of the preview. Note that you will also see commands generated from other changes you have made to managed features. For the power supply alarm commands, you should see something similar to the following:

```
###Flex-config Appended CLI ###
power-supply dual
alarm facility power-supply rps relay
alarm facility power-supply rps syslog
alarm facility power-supply rps notifies
```

### Step 3 Deploy your changes.

Because you assigned a FlexConfig policy to the devices, you will always get a deployment warning, which is meant to caution you about the use of FlexConfig. Click **Proceed** to continue with the deployment.

After the deployment completes, you can check the deployment history and view the transcript for the deployment. This is especially valuable if the deployment fails. See [Verify the Deployed Configuration, on page 2508](#).

## Configure Temperature Alarms

You can configure alarms based on the temperature of the CPU card in the device.

You can set a primary and secondary temperature range. If the temperature drops below the low threshold, or exceeds the high threshold, the alarm is triggered.

The primary temperature alarm is enabled by default for all alarm actions: output relay, syslog, and SNMP. The default settings for the primary temperature range is -40°C to 92°C.

The secondary temperature alarm is disabled by default. You can set the secondary temperature within the range -35°C to 85°C.

Because the secondary temperature range is more restrictive than the primary range, if you set either the secondary low or high temperature, that setting disables the corresponding primary setting, even if you configure non-default values for the primary setting. You cannot enable two separate high and two separate low temperature alarms.

Thus, in practice, you should configure the primary only, or the secondary only, setting for high and low.

## Procedure

**Step 1** Create the FlexConfig object to configure the temperature alarms.

- a) Choose **Objects > Object Management > FlexConfig > FlexConfig Object**.
- b) Click **Add FlexConfig Object**, configure the following properties, and click **Save**.
  - **Name**—The object name. For example, `Configure_Temperature_Alarms`.
  - **Deployment**—Select **Everytime**. You want this configuration to be sent in every deployment to ensure it remains configured.
  - **Type**—Keep the default, **Append**. The commands are sent to the device after the commands for directly-supported features.
  - **Object body**—In the object body, type the commands needed to configure the temperature alarms. The following steps explain the commands.

- c) Configure the acceptable temperature range.

**alarm facility temperature {primary | secondary} {low | high} temperature**

The temperature is in Celsius. The allowed range for the primary alarm is -40 to 92, which is also the default range. The allowed range for the secondary alarm is -35 to 85. The low value must be lower than the high value.

For example, to set a more restrictive temperature range of -20 to 80, which falls within the allowed range for the secondary alarm, configure the secondary alarm as follows:

```
alarm facility temperature secondary low -20
alarm facility temperature secondary high 80
```

- d) Configure the actions to take when the temperature alarm is triggered.

**alarm facility temperature {primary | secondary} {relay | syslog | notifies}**

You can configure more than one action. For example, you can configure the device to activate the external alarm, send syslog messages, and also send SNMP traps.

- **relay**—Energize the alarm output relay, which activates the external alarm that you attached to it, such as a buzzer or a flashing light. The output LED also goes red.
- **syslog**—Send a syslog message.
- **notifies**—Send an SNMP trap.

For example, to enable all actions for the secondary temperature alarm, enter the following:

```
alarm facility temperature secondary relay
alarm facility temperature secondary syslog
alarm facility temperature secondary notifies
```

- e) Verify that the object body contains the commands you want.

For example, if your template includes all of the command examples shown in this procedure, the object body would have the following commands:

```
alarm facility temperature secondary low -20
alarm facility temperature secondary high 80
alarm facility temperature secondary relay
alarm facility temperature secondary syslog
alarm facility temperature secondary notifies
```

The object body should look similar to the following:

The screenshot shows a configuration window with a toolbar at the top containing an 'Insert' dropdown, a configuration icon, a 'Deployment:' dropdown set to 'Everytime', and a 'Type:' dropdown set to 'Append'. Below the toolbar is a text area containing the following configuration commands:

```
alarm facility temperature secondary low -20
alarm facility temperature secondary high 80
alarm facility temperature secondary relay
alarm facility temperature secondary syslog
alarm facility temperature secondary notifies
```

- f) Click **Save**.

**Step 2** Create the FlexConfig policy and assign it to the devices.

- Choose **Devices > FlexConfig**.
- Either click **New Policy**, or if an existing FlexConfig policy should be assigned to (or is already assigned to) the target devices, simply edit that policy.

When creating a new policy, assign the target devices to the policy in the dialog box where you name the policy.

- Select the temperature alarms FlexConfig object in the **User Defined** folder in the table of contents and click > to add it to the policy.

The object should be added to the **Selected Appended FlexConfigs** list.

#	Name
1	Configure_Temperature_Alarms

- Click **Save**.
- If you have not yet assigned all the targeted devices to the policy, click the **Policy Assignments** link below Save and make the assignments now.
- Click **Preview Config**, and in the Preview dialog box, select one of the assigned devices.

The system generates a preview of the configuration CLI that will be sent to the device. Verify that the commands generated from the FlexConfig object look correct. These will be shown at the end of the preview. Note that you will also see commands generated from other changes you have made to managed features. For the temperature alarms commands, you should see something similar to the following:

```
###Flex-config Appended CLI ###
alarm facility temperature secondary low -20
alarm facility temperature secondary high 80
alarm facility temperature secondary relay
alarm facility temperature secondary syslog
alarm facility temperature secondary notifies
```

**Step 3** Deploy your changes.

Because you assigned a FlexConfig policy to the devices, you will always get a deployment warning, which is meant to caution you about the use of FlexConfig. Click **Proceed** to continue with the deployment.

After the deployment completes, you can check the deployment history and view the transcript for the deployment. This is especially valuable if the deployment fails. See [Verify the Deployed Configuration, on page 2508](#).

---

## Monitoring Alarms

The following topics explain how to monitor and manage alarms.

### Monitoring Alarm Status

You can use the following commands in the CLI to monitor alarms.

- **show alarm settings**

Shows the current configuration for each possible alarm.

- **show environment alarm-contact**

Shows information about the physical status of the input alarm contacts.

- **show facility-alarm relay**

Shows information about the alarms that have triggered the output relay.

- **show facility-alarm status [info | major | minor]**

Shows information on all alarms that have been triggered. You can limit the view by filtering on **major** or **minor** status. The **info** keyword provides the same output as using no keyword.

### Monitoring Syslog Messages for Alarms

Depending on the type of alarms you configure, you might see the following syslog messages.

#### Dual Power Supply Alarms

- %FTD-1-735005: Power Supply Unit Redundancy OK
- %FTD-1-735006: Power Supply Unit Redundancy Lost

#### Temperature Alarms

In these alarms, *Celsius* is replaced by the temperature detected on the device, in Celsius.

- %FTD-6-806001: Primary alarm CPU temperature is High *Celsius*
- %FTD-6-806002: Primary alarm for CPU high temperature is cleared
- %FTD-6-806003: Primary alarm CPU temperature is Low *Celsius*
- %FTD-6-806004: Primary alarm for CPU Low temperature is cleared

- %FTD-6-806005: Secondary alarm CPU temperature is High *Celsius*
- %FTD-6-806006: Secondary alarm for CPU high temperature is cleared
- %FTD-6-806007: Secondary alarm CPU temperature is Low *Celsius*
- %FTD-6-806008: Secondary alarm for CPU Low temperature is cleared

### Alarm Input Contact Alarms

In these alarms, *description* is the description for the contact that you configured.

- %FTD-6-806009: Alarm asserted for ALARM\_IN\_1 *alarm\_1\_description*
- %FTD-6-806010: Alarm cleared for ALARM\_IN\_1 *alarm\_1\_description*
- %FTD-6-806011: Alarm asserted for ALARM\_IN\_2 *alarm\_2\_description*
- %FTD-6-806012: Alarm cleared for ALARM\_IN\_2 *alarm\_2\_description*

## Turning Off the External Alarm

If you are using an external alarm that is attached to the alarm output, and the alarm is triggered, you can turn off the external alarm from the device CLI using the **clear facility-alarm output** command. This command de-energizes the output pin and also turns off the output LED.

## History for Alarms

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Description
Alarms for the Cisco ISA 3000 series.	6.7	Any	Configuring alarms for the Cisco ISA 3000 series was validated using FlexConfig. You should be able to configure the alarms in older releases that support FlexConfig, except for the dual power supply alarms.  Supported platforms: Secure Firewall Threat Defense on the ISA 3000.

## CHAPTER 23

# Static and Default Routes

This chapter describes how to configure static and default routes on the Firewall Threat Defense.

- [About Static and Default Routes, on page 1037](#)
- [Requirements and Prerequisites for Static Routes, on page 1039](#)
- [Guidelines for Static and Default Routes, on page 1040](#)
- [Add a Static Route, on page 1040](#)
- [Reference for Routing, on page 1042](#)

## About Static and Default Routes

To route traffic to a non-connected host or network, you must define a route to the host or network, either using static or dynamic routing. Generally, you must configure at least one static route: a default route for all traffic that is not routed by other means to a default network gateway, typically the next hop router.

## Default Route

The simplest option is to configure a default static route to send all traffic to an upstream router, relying on the router to route the traffic for you. A default route identifies the gateway IP address to which the Firewall Threat Defense device sends all IP packets for which it does not have a learned or static route. A default static route is simply a static route with 0.0.0.0/0 (IPv4) or ::/0 (IPv6) as the destination IP address.

You should always define a default route.

The Firewall Threat Defense has separate routing tables for data interfaces and for management-only interfaces (including the special Linux Management interface). You can only add a default route for the data routing table. The Firewall Threat Defense automatically adds a default route in the management-only routing table that sends traffic to the Linux Management interface, where a separate route lookup occurs in the Linux routing table. You can add static routes to the Linux routing table that can be used by Management using the Firewall Threat Defense CLI **configure network static-routes** command.

**Note** The *default* Linux route is set with the **configure network ipv4** or **configure network ipv6** command.

## Static Routes

You might want to use static routes in the following cases:

- Your networks use an unsupported router discovery protocol.
- Your network is small and you can easily manage static routes.
- You do not want the traffic or CPU overhead associated with routing protocols.
- In some cases, a default route is not enough. The default gateway might not be able to reach the destination network, so you must also configure more specific static routes. For example, if the default gateway is outside, then the default route cannot direct traffic to any inside networks that are not directly connected to the Firewall Threat Defense device.
- You are using a feature that does not support dynamic routing protocols.
- Virtual routers use static routes to create route leaks. Route leaks enable flow of traffic from an interface of a virtual router to another interface in another virtual router. For more information, see [Interconnecting Virtual Routers, on page 1057](#).

## Route to null0 Interface to Drop Unwanted Traffic

Access rules let you filter packets based on the information contained in their headers. A static route to the null0 interface is a complementary solution to access rules. You can use a null0 route to forward unwanted or undesirable traffic so the traffic is dropped.

Static null0 routes have a favorable performance profile. You can also use static null0 routes to prevent routing loops. BGP can leverage the static null0 route for Remotely Triggered Black Hole routing.

## Route Priorities

- Routes that identify a specific destination take precedence over the default route.
- When multiple routes exist to the same destination (either static or dynamic), then the administrative distance for the route determines priority. Static routes are set to 1, so they typically are the highest priority routes.
- When you have multiple static routes to the same destination with the same administrative distance, see [Equal-Cost Multi-Path \(ECMP\) Routing, on page 1050](#).
- For traffic emerging from a tunnel with the Tunneled option, this route overrides any other configured or learned default routes.

## Transparent Firewall Mode and Bridge Group Routes

For traffic that originates on the Firewall Threat Defense device and is destined through a bridge group member interface for a non-directly connected network, you need to configure either a default route or static routes so the Firewall Threat Defense device knows out of which bridge group member interface to send traffic. Traffic that originates on the Firewall Threat Defense device might include communications to a syslog server or SNMP server. If you have servers that cannot all be reached through a single default route, then you must configure static routes. For transparent mode, you cannot specify the BVI as the gateway interface; only

member interfaces can be used. For bridge groups in routed mode, you must specify the BVI in a static route; you cannot specify a member interface. See [MAC Address vs. Route Lookups, on page 214](#) for more information.

## Static Route Tracking

One of the problems with static routes is that there is no inherent mechanism for determining if the route is up or down. They remain in the routing table even if the next hop gateway becomes unavailable. Static routes are only removed from the routing table if the associated interface on the Firewall Threat Defense device goes down.

The static route tracking feature provides a method for tracking the availability of a static route and installing a backup route if the primary route should fail. For example, you can define a default route to an ISP gateway and a backup default route to a secondary ISP in case the primary ISP becomes unavailable.

The Firewall Threat Defense device implements static route tracking by associating a static route with a monitoring target host on the destination network that the Firewall Threat Defense device monitors using ICMP echo requests. If an echo reply is not received within a specified time period, the host is considered down, and the associated route is removed from the routing table. An untracked backup route with a higher metric is used in place of the removed route.

When selecting a monitoring target, you need to make sure that it can respond to ICMP echo requests. The target can be any network object that you choose, but you should consider using the following:

- The ISP gateway (for dual ISP support) address
- The next hop gateway address (if you are concerned about the availability of the gateway)
- A server on the target network, such as a syslog server, that the Firewall Threat Defense device needs to communicate with
- A persistent network object on the destination network

---

**Note** A PC that may be shut down at night is not a good choice.

---

You can configure static route tracking for statically defined routes or default routes obtained through DHCP or PPPoE. You can only enable PPPoE clients on multiple interfaces with route tracking configured.

## Requirements and Prerequisites for Static Routes

### Model Support

Threat Defense

### Supported Domains

Any

### User Roles

Admin

Network Admin

# Guidelines for Static and Default Routes

## Firewall Mode and Bridge Groups

- In transparent mode, static routes must use the bridge group member interface as the gateway; you cannot specify the BVI.
- In routed mode, you must specify the BVI as the gateway; you cannot specify the member interface.
- Static route tracking is not supported for bridge group member interfaces or on the BVI.

## Supported Network Address

- Static route tracking is not supported for IPv6.
- The Firewall Threat Defense does not support Class E routing, so a Class E network is not routable in static routes.

## Clustering

- In clustering, static route tracking is only supported on the control node.

## Network Object Group

You cannot use a range of network objects or a network object group having a range of IP addresses in a static route.

## ASP and RIB Route Entries

All routes and its distance installed on the device are captured in the ASP routing table. This is common for all static and dynamic routing protocols. Only the best distance route is captured in the RIB table.

# Add a Static Route

A static route defines where to send traffic for specific destination networks. You should at a minimum define a default route. A default route is simply a static route with 0.0.0.0/0 as the destination IP address.

To configure routes for redundant manager access data interfaces, see [Configure a Redundant Manager Access Data Interface, on page 81](#).

## Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> , and edit the Firewall Threat Defense device. |
| <b>Step 2</b> | Click <b>Routing</b> .  |

- Step 3** (May be required) From the virtual routers drop-down list, select the virtual router for which you are configuring a static route.
- Step 4** Select **Static Route**.
- Step 5** Click **Add Routes**.
- Step 6** Click **IPv4** or **IPv6** depending on the type of static route that you are adding.
- Step 7** Choose the **Interface** to which this static route applies.
- For transparent mode, choose a bridge group member interface name. For routed mode with bridge groups, you can choose either the bridge group member interface for the BVI name. To “black hole” unwanted traffic, choose the **Null0** interface.
- For a device using virtual routing, you can select an interface that belongs to another virtual router. You can create such a static route if you want to leak traffic from this virtual router into the other virtual router. For more information, see [Interconnecting Virtual Routers, on page 1057](#).
- Step 8** In the **Available Network** list, choose the destination network.
- To define a default route, create an object with the address 0.0.0.0/0 and select it here.
- Note**  
Although you can create and choose a Network Object Group containing a range of IP addresses, the Firewall Management Center does not support using ranges in static routes.
- Step 9** In the **Gateway** or **IPv6 Gateway** field, enter or choose the gateway router that is the next hop for this route. You can provide an IP address or a Networks/Hosts object.
- When you are using static-route configuration for virtual routers to leak routes, do not specify the next hop gateway.
- Step 10** In the **Metric** field, enter the number of hops to the destination network. Valid values range from 1 to 255; the default value is 1.
- The metric is a measurement of the “expense” of a route, based on the number of hops (hop count) to the network on which a specific host resides. Hop count is the number of networks that a network packet must traverse, including the destination network, before it reaches its final destination. The metric is used to compare routes among different routing protocols. The default administrative distance for static routes is 1, giving it precedence over routes discovered by dynamic routing protocols but not directly connected routes. The default administrative distance for routes discovered by OSPF is 110. If a static route has the same administrative distance as a dynamic route, the static route takes precedence. Connected routes always take precedence over static or dynamically discovered routes.
- Step 11** (Optional) For a default route, click the **Tunneled** checkbox to define a separate default route for VPN traffic.
- You can define a separate default route for VPN traffic if you want your VPN traffic to use a different default route than your non VPN traffic. For example, traffic incoming from VPN connections can be easily directed towards internal networks, while traffic from internal networks can be directed towards the outside. When you create a default route with the tunneled option, all traffic from a tunnel terminating on the device that cannot be routed using learned or static routes, is sent to this route. You can configure only one default tunneled gateway per device. ECMP for tunneled traffic is not supported.
- Step 12** (IPv4 static route only) To monitor route availability, enter or choose the name of an SLA (service level agreement) Monitor object that defines the monitoring policy, in the **Route Tracking** field.
- See [SLA Monitor, on page 1321](#).

**Step 13** Click **Ok**.

---

## Reference for Routing

This section describes underlying concepts of how routing behaves within the Firewall Threat Defense.

### Path Determination

Routing protocols use metrics to evaluate what path will be the best for a packet to travel. A metric is a standard of measurement, such as path bandwidth, that is used by routing algorithms to determine the optimal path to a destination. To aid the process of path determination, routing algorithms initialize and maintain routing tables, which include route information. Route information varies depending on the routing algorithm used.

Routing algorithms fill routing tables with a variety of information. Destination or next hop associations tell a router that a particular destination can be reached optimally by sending the packet to a particular router representing the next hop on the way to the final destination. When a router receives an incoming packet, it checks the destination address and attempts to associate this address with a next hop.

Routing tables also can include other information, such as data about the desirability of a path. Routers compare metrics to determine optimal routes, and these metrics differ depending on the design of the routing algorithm used.

Routers communicate with one another and maintain their routing tables through the transmission of a variety of messages. The routing update message is one such message that generally consists of all or a portion of a routing table. By analyzing routing updates from all other routers, a router can build a detailed picture of network topology. A link-state advertisement, another example of a message sent between routers, informs other routers of the state of the sender links. Link information also can be used to build a complete picture of network topology to enable routers to determine optimal routes to network destinations.

### Supported Route Types

There are several route types that a router can use. The Firewall Threat Defense device uses the following route types:

- Static Versus Dynamic
- Single-Path Versus Multipath
- Flat Versus Hierarchical
- Link-State Versus Distance Vector

### Static Versus Dynamic

Static routing algorithms are actually table mappings established by the network administrator. These mappings do not change unless the network administrator alters them. Algorithms that use static routes are simple to design and work well in environments where network traffic is relatively predictable and where network design is relatively simple.

Because static routing systems cannot react to network changes, they generally are considered unsuitable for large, constantly changing networks. Most of the dominant routing algorithms are dynamic routing algorithms, which adjust to changing network circumstances by analyzing incoming routing update messages. If the message indicates that a network change has occurred, the routing software recalculates routes and sends out new routing update messages. These messages permeate the network, stimulating routers to rerun their algorithms and change their routing tables accordingly.

Dynamic routing algorithms can be supplemented with static routes where appropriate. A router of last resort (a default route for a router to which all unroutable packets are sent), for example, can be designated to act as a repository for all unroutable packets, ensuring that all messages are at least handled in some way.

## Single-Path Versus Multipath

Some sophisticated routing protocols support multiple paths to the same destination. Unlike single-path algorithms, these multipath algorithms permit traffic multiplexing over multiple lines. The advantages of multipath algorithms are substantially better throughput and reliability, which is generally called load sharing.

## Flat Versus Hierarchical

Some routing algorithms operate in a flat space, while others use routing hierarchies. In a flat routing system, the routers are peers of all others. In a hierarchical routing system, some routers form what amounts to a routing backbone. Packets from non-backbone routers travel to the backbone routers, where they are sent through the backbone until they reach the general area of the destination. At this point, they travel from the last backbone router through one or more non-backbone routers to the final destination.

Routing systems often designate logical groups of nodes, called domains, autonomous systems, or areas. In hierarchical systems, some routers in a domain can communicate with routers in other domains, while others can communicate only with routers within their domain. In very large networks, additional hierarchical levels may exist, with routers at the highest hierarchical level forming the routing backbone.

The primary advantage of hierarchical routing is that it mimics the organization of most companies and therefore supports their traffic patterns well. Most network communication occurs within small company groups (domains). Because intradomain routers need to know only about other routers within their domain, their routing algorithms can be simplified, and, depending on the routing algorithm being used, routing update traffic can be reduced accordingly.

## Link-State Versus Distance Vector

Link-state algorithms (also known as shortest path first algorithms) flood routing information to all nodes in the internetwork. Each router, however, sends only the portion of the routing table that describes the state of its own links. In link-state algorithms, each router builds a picture of the entire network in its routing tables. Distance vector algorithms (also known as Bellman-Ford algorithms) call for each router to send all or some portion of its routing table, but only to its neighbors. In essence, link-state algorithms send small updates everywhere, while distance vector algorithms send larger updates only to neighboring routers. Distance vector algorithms know only about their neighbors. Typically, link-state algorithms are used in conjunction with OSPF routing protocols.

## Supported Internet Protocols for Routing

The Firewall Threat Defense device supports several Internet protocols for routing. Each protocol is briefly described in this section.

- Enhanced Interior Gateway Routing Protocol (EIGRP)

EIGRP is a Cisco proprietary protocol that provides compatibility and seamless interoperation with IGRP routers. An automatic-redistribution mechanism allows IGRP routes to be imported into Enhanced IGRP, and vice versa, so it is possible to add Enhanced IGRP gradually into an existing IGRP network.

- Open Shortest Path First (OSPF)

OSPF is a routing protocol developed for Internet Protocol (IP) networks by the interior gateway protocol (IGP) working group of the Internet Engineering Task Force (IETF). OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area includes an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

- Routing Information Protocol (RIP)

RIP is a distance-vector protocol that uses hop count as its metric. RIP is widely used for routing traffic in the global Internet and is an interior gateway protocol (IGP), which means that it performs routing within a single autonomous system.

- Border Gateway Protocol (BGP)

BGP is an interautonomous system routing protocol. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP). Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

## Routing Table

The Firewall Threat Defense uses separate routing tables for data traffic (through-the-device) and for management traffic (from-the-device). This section describes how the routing tables work. For information about the management routing table, see also [Routing Table for Management Traffic, on page 1049](#).

## How the Routing Table Is Populated

The Firewall Threat Defense routing table can be populated by statically defined routes, directly connected routes, and routes discovered by the dynamic routing protocols. Because the Firewall Threat Defense device can run multiple routing protocols in addition to having static and connected routes in the routing table, it is possible that the same route is discovered or entered in more than one manner. When two routes to the same destination are put into the routing table, the one that remains in the routing table is determined as follows:

- If the two routes have different network prefix lengths (network masks), then both routes are considered unique and are entered into the routing table. The packet forwarding logic then determines which of the two to use.

For example, if the RIP and OSPF processes discovered the following routes:

- RIP: 192.168.32.0/24
- OSPF: 192.168.32.0/19

Even though OSPF routes have the better administrative distance, both routes are installed in the routing table because each of these routes has a different prefix length (subnet mask). They are considered different destinations and the packet forwarding logic determines which route to use.

- If the Firewall Threat Defense device learns about multiple paths to the same destination from a single routing protocol, such as RIP, the route with the better metric (as determined by the routing protocol) is entered into the routing table.

Metrics are values associated with specific routes, ranking them from most preferred to least preferred. The parameters used to determine the metrics differ for different routing protocols. The path with the lowest metric is selected as the optimal path and installed in the routing table. If there are multiple paths to the same destination with equal metrics, load balancing is done on these equal cost paths.

- If the Firewall Threat Defense device learns about a destination from more than one routing protocol, the administrative distances of the routes are compared, and the routes with lower administrative distance are entered into the routing table.

### Administrative Distances for Routes

You can change the administrative distances for routes discovered by or redistributed into a routing protocol. If two routes from two different routing protocols have the same administrative distance, then the route with the lower *default* administrative distance is entered into the routing table. In the case of EIGRP and OSPF routes, if the EIGRP route and the OSPF route have the same administrative distance, then the EIGRP route is chosen by default.

Administrative distance is a route parameter that the Firewall Threat Defense device uses to select the best path when there are two or more different routes to the same destination from two different routing protocols. Because the routing protocols have metrics based on algorithms that are different from the other protocols, it is not always possible to determine the best path for two routes to the same destination that were generated by different routing protocols.

Each routing protocol is prioritized using an administrative distance value. The following table shows the default administrative distance values for the routing protocols supported by the Firewall Threat Defense device.

**Table 67: Default Administrative Distance for Supported Routing Protocols**

Route Source	Default Administrative Distance
Connected interface	0
VPN route	1
Static route	1
EIGRP Summary Route	5
External BGP	20
Internal EIGRP	90
OSPF	110
IS-IS	115
RIP	120
EIGRP external route	170
Internal and local BGP	200

Route Source	Default Administrative Distance
Unknown	255

The smaller the administrative distance value, the more preference is given to the protocol. For example, if the Firewall Threat Defense device receives a route to a certain network from both an OSPF routing process (default administrative distance - 110) and a RIP routing process (default administrative distance - 120), the Firewall Threat Defense device chooses the OSPF route because OSPF has a higher preference. In this case, the router adds the OSPF version of the route to the routing table.

A VPN advertised route (V-Route/RRI) is equivalent to a static route with the default administrative distance 1. But it has a higher preference as with the network mask 255.255.255.255.

In this example, if the source of the OSPF-derived route was lost (for example, due to a power shutdown), the Firewall Threat Defense device would then use the RIP-derived route until the OSPF-derived route reappears.

The administrative distance is a local setting. For example, if you change the administrative distance of routes obtained through OSPF, that change would only affect the routing table for the Firewall Threat Defense device on which the command was entered. The administrative distance is not advertised in routing updates.

Administrative distance does not affect the routing process. The routing processes only advertise the routes that have been discovered by the routing process or redistributed into the routing process. For example, the RIP routing process advertises RIP routes, even if routes discovered by the OSPF routing process are used in the routing table.

## Backup Dynamic and Floating Static Routes

A backup route is registered when the initial attempt to install the route in the routing table fails because another route was installed instead. If the route that was installed in the routing table fails, the routing table maintenance process calls each routing protocol process that has registered a backup route and requests them to reinstall the route in the routing table. If there are multiple protocols with registered backup routes for the failed route, the preferred route is chosen based on administrative distance.

Because of this process, you can create floating static routes that are installed in the routing table when the route discovered by a dynamic routing protocol fails. A floating static route is simply a static route configured with a greater administrative distance than the dynamic routing protocols running on the Firewall Threat Defense device. When the corresponding route discovered by a dynamic routing process fails, the static route is installed in the routing table.

## How Forwarding Decisions Are Made

Forwarding decisions are made as follows:

- If the destination does not match an entry in the routing table, the packet is forwarded through the interface specified for the default route. If a default route has not been configured, the packet is discarded.
- If the destination matches a single entry in the routing table, the packet is forwarded through the interface associated with that route.
- If the destination matches more than one entry in the routing table, then the packet is forwarded out of the interface associated with the route that has the longer network prefix length.

For example, a packet destined for 192.168.32.1 arrives on an interface with the following routes in the routing table:

- 192.168.32.0/24 gateway 10.1.1.2
- 192.168.32.0/19 gateway 10.1.1.3

In this case, a packet destined to 192.168.32.1 is directed toward 10.1.1.2, because 192.168.32.1 falls within the 192.168.32.0/24 network. It also falls within the other route in the routing table, but 192.168.32.0/24 has the longest prefix within the routing table (24 bits versus 19 bits). Longer prefixes are always preferred over shorter ones when forwarding a packet.

---

**Note** Existing connections continue to use their established interfaces even if a new similar connection would result in different behavior due to a change in routes.

---

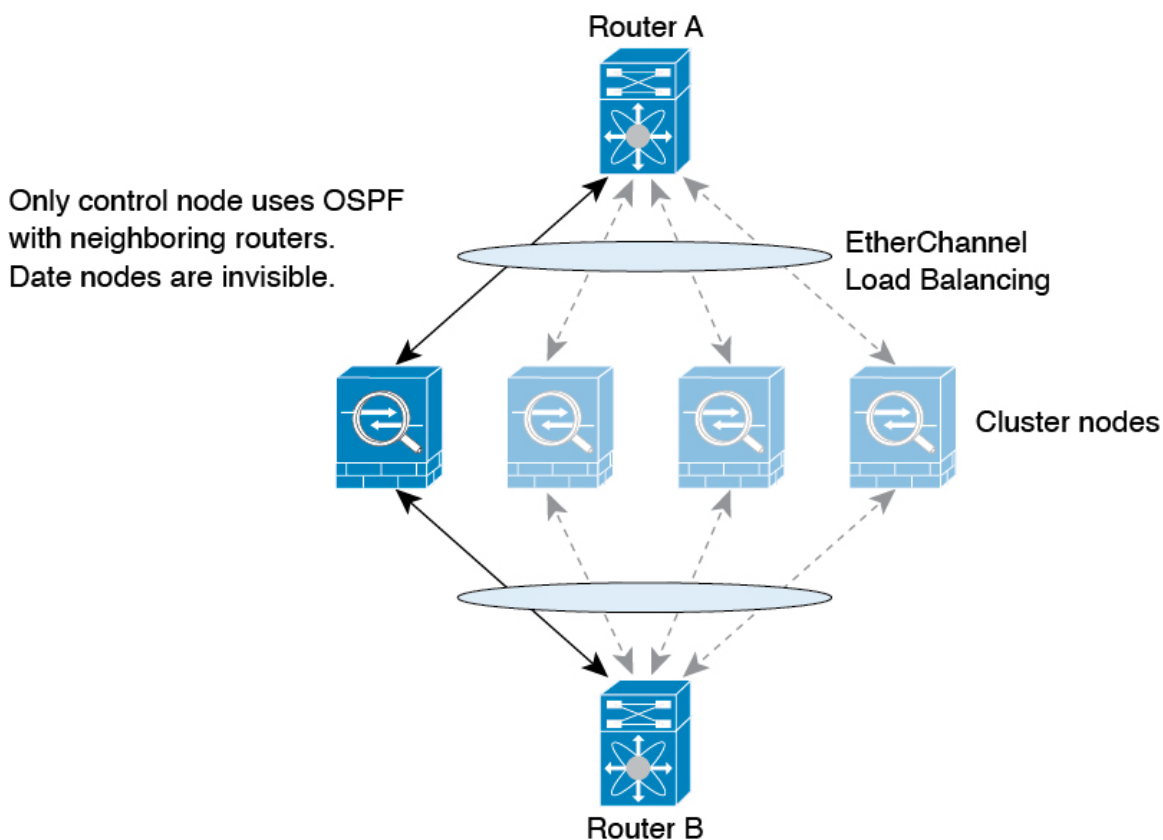

## Dynamic Routing and High Availability

Dynamic routes are synchronized on the standby unit when the routing table changes on the active unit. This means that all additions, deletions, or changes on the active unit are immediately propagated to the standby unit. If the standby unit becomes active in an active/standby ready High Availability pair, it will already have an identical routing table as that of the former active unit because routes are synchronized as a part of the High Availability bulk synchronization and continuous replication processes.

## Dynamic Routing in Clustering

The routing process only runs on the control node, and routes are learned through the control node and replicated to data nodes. If a routing packet arrives at a data node, it is redirected to the control node.

Figure 383: Dynamic Routing in Spanned EtherChannel Mode

After the data node learn the routes from the control node, each node makes forwarding decisions independently.

The OSPF LSA database is not synchronized from the control node to data nodes. If there is a control node switchover, the neighboring router will detect a restart; the switchover is not transparent. The OSPF process picks an IP address as its router ID. Although not required, you can assign a static router ID to ensure a consistent router ID is used across the cluster. See the OSPF Non-Stop Forwarding feature to address the interruption.

## Dynamic Routing in Individual Interface Mode

In Individual interface mode, each node runs the routing protocol as a standalone router, and routes are learned by each node independently.

Figure 384: Dynamic Routing in Individual Interface Mode

In the above diagram, Router A learns that there are 4 equal-cost paths to Router B, each through a node. ECMP is used to load balance traffic between the 4 paths. Each node picks a different router ID when talking to external routers.

You must configure a cluster pool for the router ID so that each node has a separate router ID.

EIGRP does not form neighbor relationships with cluster peers in individual interface mode.

**Note** If the cluster has multiple adjacencies to the same router for redundancy purposes, asymmetric routing can lead to unacceptable traffic loss. To avoid asymmetric routing, group all of these node interfaces into the same traffic zone. See [Create an ECMP Zone, on page 1111](#).

## Routing Table for Management Traffic

The Firewall Threat Defense device includes the following routing tables for from-the-device management traffic:

- Linux Management routing table—Special management traffic sourced from the Management interface such as Firewall Management Center communication, the licensing communication, and database updates always uses the Linux Management routing table.

- **Data routing table**—All from-the-device traffic (as well as all through traffic) uses the data routing table by default. All regular data interfaces are part of this routing table. Most services let you choose a specific interface, so only routes associated with that interface are used.
- **Management-only routing table**—The Management interface and all data interfaces that you set to management-only are part of this routing table. To send from-the-device traffic from any of these interfaces, you must choose a specific management-only interface when you configure the service. An exception is for DNS lookups and ICMP (ping and traceroute): in these cases, the Firewall Threat Defense will use data and then fall back to management automatically if a route is not found. You can add static routes for management-only interfaces, but not for the special Management interface. The Firewall Threat Defense device automatically adds a default route for Management that forwards traffic to Linux, where a separate route lookup occurs in the Linux routing table. You can add static routes to the Linux routing table that can be used by Management using the Firewall Threat Defense CLI **configure network static-routes** command.

**Note** The *default* Linux route is set with the **configure network ipv4** or **configure network ipv6** command.

**Note** For devices that have not yet merged the Management and legacy Diagnostic interfaces, see refer to pre-7.3 versions of this guide.

## Equal-Cost Multi-Path (ECMP) Routing

The Firewall Threat Defense device supports Equal-Cost Multi-Path (ECMP) routing.

You can have up to 8 equal cost static or dynamic routes per interface. For example, you can configure multiple default routes on the outside interface that specify different gateways.

```
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.2
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.3
route for 0.0.0.0 0.0.0.0 through outside to 10.1.1.4
```

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses, incoming interface, protocol, source and destination ports.

### ECMP Across Multiple Interfaces Using Traffic Zones

If you configure traffic zones to contain a group of interfaces, you can have up to 8 equal cost static or dynamic routes across up to 8 interfaces within each zone. For example, you can configure multiple default routes across three interfaces in the zone:

```
route for 0.0.0.0 0.0.0.0 through outside1 to 10.1.1.2
route for 0.0.0.0 0.0.0.0 through outside2 to 10.2.1.2
route for 0.0.0.0 0.0.0.0 through outside3 to 10.3.1.2
```

Similarly, your dynamic routing protocol can automatically configure equal cost routes. The Firewall Threat Defense device load-balances traffic across the interfaces with a more robust load balancing mechanism.

When a route is lost, the device seamlessly moves the flow to a different route.

## About Route Maps

Route maps are used when redistributing routes into an OSPF, RIP, EIGRP or BGP routing process. They are also used when generating a default route into an OSPF routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process.

Route maps have many features in common with widely known ACLs. These are some of the traits common to both:

- They are an ordered sequence of individual statements, and each has a permit or deny result. Evaluation of an ACL or a route map consists of a list scan, in a predetermined order, and an evaluation of the criteria of each statement that matches. A list scan is aborted once the first statement match is found and an action associated with the statement match is performed.
- They are generic mechanisms. Criteria matches and match interpretation are dictated by the way that they are applied and the feature that uses them. The same route map applied to different features might be interpreted differently.

These are some of the differences between route maps and ACLs:

- Route maps are more flexible than ACLs and can verify routes based on criteria which ACLs can not verify. For example, a route map can verify if the type of route is internal.
- Each ACL ends with an implicit deny statement, by design convention. If the end of a route map is reached during matching attempts, the result depends on the specific application of the route map. Route maps that are applied to *redistribution* behave the same way as ACLs: if the route does not match any clause in a route map then the route redistribution is denied, as if the route map contained a deny statement at the end.

## Permit and Deny Clauses

Route maps can have permit and deny clauses. The deny clause rejects route matches from redistribution. You can use an ACL as the matching criterion in the route map. Because ACLs also have permit and deny clauses, the following rules apply when a packet matches the ACL:

- ACL permit + route map permit: routes are redistributed.
- ACL permit + route map deny: routes are not redistributed.
- ACL deny + route map permit or deny: the route map clause is not matched, and the next route-map clause is evaluated.

## Match and Set Clause Values

Each route map clause has two types of values:

- A match value selects routes to which this clause should be applied.
- A set value modifies information that will be redistributed into the target protocol.

For each route that is being redistributed, the router first evaluates the match criteria of a clause in the route map. If the match criteria succeeds, then the route is redistributed or rejected as dictated by the permit or deny

clause, and some of its attributes might be modified by the values set from the set commands. If the match criteria fail, then this clause is not applicable to the route, and the software proceeds to evaluate the route against the next clause in the route map. Scanning of the route map continues until a clause is found that matches the route or until the end of the route map is reached.

A match or set value in each clause can be missed or repeated several times, if one of these conditions exists:

- If several match entries are present in a clause, all must succeed for a given route in order for that route to match the clause (in other words, the logical AND algorithm is applied for multiple match commands).
- If a match entry refers to several objects in one entry, either of them should match (the logical OR algorithm is applied).
- If a match entry is not present, all routes match the clause.
- If a set entry is not present in a route map permit clause, then the route is redistributed without modification of its current attributes.

---

**Note** Do not configure a set entry in a route map deny clause because the deny clause prohibits route redistribution—there is no information to modify.

---

A route map clause without a match or set entry does perform an action. An empty permit clause allows a redistribution of the remaining routes without modification. An empty deny clause does not allow a redistribution of other routes (this is the default action if a route map is completely scanned, but no explicit match is found).

## CHAPTER 24

# Virtual Routers

This chapter describes underlying concepts about virtual routers and on how virtual routing behaves within the Secure Firewall Threat Defense.

- [About Virtual Routers and Virtual Routing and Forwarding \(VRF\), on page 1053](#)
- [Maximum Number of Virtual Routers By Device Model, on page 1060](#)
- [Requirements and Prerequisites for Virtual Routers, on page 1061](#)

- [Configuration Examples for Virtual Routers, on page 1068](#)
- [History for Virtual Routers, on page 1106](#)

## About Virtual Routers and Virtual Routing and Forwarding (VRF)

You can create multiple virtual routers to maintain separate routing tables for groups of interfaces. Because each virtual router has its own routing table, you can provide clean separation in the traffic flowing through the device.

Thus, you can provide support to two or more distinct customers over a common set of networking equipment. You can also use virtual routers to provide more separation for elements of your own network, for example, by isolating a development network from your general purpose corporate network.

Virtual routers implement the “light” version of Virtual Routing and Forwarding, or VRF-Lite, which does not support Multiprotocol Extensions for BGP (MBGP).

When you create a virtual router, you assign interfaces to the router. You can assign a given interface to one, and only one, virtual router. You would then define static routes, and configure routing protocols such as OSPF or BGP, for each virtual router. You would also configure separate routing processes over your entire network, so that routing tables on all participating devices are using the same per-virtual-router routing process and tables. Using virtual routers, you create logically-separated networks over the same physical network to ensure the privacy of the traffic that runs through each virtual router.

Because the routing tables are separate, you can use the same, or overlapping, address spaces across the virtual routers. For example, you could use the 192.168.1.0/24 address space for two separate virtual routers, supported by two separate physical interfaces.

Note that there are separate management and data routing tables per virtual router. For example, if you assign a management-only interface to a virtual router, then the routing table for that interface is separate from the data interfaces assigned to the virtual router.

## About Virtual Routers and Dynamic VTI

### Virtual Routers and Dynamic VTI

You can create virtual routers, associate dynamic VTIs with these virtual routers, and extend the capabilities of dynamic VTIs in your network. You can associate dynamic VTIs either with global or user-defined virtual routers. You can assign a dynamic VTI to only one virtual router.

A virtual router associated with:

- A dynamic VTI is called an Indoor VRF (IVRF).
- A tunnel source interface is known as Front Door VRF (FVRF).

A dynamic VTI and its corresponding protected network interface must be part of the same virtual router. You must map the borrow IP interface and the dynamic VTI to the same virtual router. A tunnel source interface can be part of multiple virtual routers.

To configure virtual routers using dynamic VTI for a route-based site-to-site VPN, see [How to Configure a Virtual Router with Dynamic VTI, on page 1054](#).

For more information about a configuration example, see [How to Secure Traffic from Networks with Multiple Virtual Routers over a Site-to-Site VPN with Dynamic VTI, on page 1086](#)

## How to Configure a Virtual Router with Dynamic VTI

To configure a virtual router with dynamic VTI for a route-based site-to-site VPN in the management center:

Step	Do This	More Information
1	Create a route-based site-to-site VPN with a dynamic VTI interface on the hub and static VTI(s) on the spoke(s).	<a href="#">Create a Route-based Site-to-Site VPN, on page 1418</a>
2	Create a virtual router.	<a href="#">Create a Virtual Router, on page 1064</a>
3	Assign the interfaces to the virtual router.	<a href="#">Configure a Virtual Router, on page 1065</a>
4	Configure routing policies for the hub and spoke.	<a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a>
5	Configure access control policies for the hub and spoke.	<a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a>

## Applications of Virtual Routers

You can use virtual routers to isolate network on shared resources and/or to isolate networks with common security policy. Thus, virtual routers help you to achieve:

- Traffic separation for customers through dedicated routing tables for each customer or for different departments.
- Common security policy management for different departments or networks.
- Shared internet access for different departments or network.

## Global and User-Defined Virtual Routers

### Global Virtual Routers

For a device with virtual routing capability, system creates a global virtual router by default. The system assigns all interfaces in your network to the global virtual router. A routed interface can belong to either a user-defined virtual router or a global virtual router. When you upgrade Firewall Threat Defense to a version which has virtual router capability, all its existing routing configuration becomes part of the global virtual router.

### User-Defined Virtual Routers

A user-defined virtual router is the one defined by you. You can create more than one virtual router on a device. However, anytime, an interface can be assigned to only one user-defined virtual router. While some of the device features are supported on user-defined virtual routers, few of the features are supported only on the global virtual routers. User-defined virtual routers support route-based site-to-site VPN (static VTI) (static and dynamic VTI).

### Supported Features and Monitoring Policies

You can configure the following features on the global virtual router only:

- OSPFv3
- RIP
- EIGRP
- IS-IS
- Multicast Routing
- Policy Based Routing (PBR)

ISIS and PBR are supported through Flex Config in Firewall Management Center (see [Predefined FlexConfig Objects, on page 2488](#)). Configure only global virtual router interfaces for these features.

DHCP server auto-configuration uses WINS/DNS server that is learned from an interface. This interface can only be a global virtual router interface.

You can configure the following features separately for each user-defined virtual router:

- Static routes and their SLA monitors
- OSPFv2
- BGPv4/v6
- Integrated Routing and Bridging (IRB)

- SNMP

Following features are used by the system when querying or communicating with the remote system (from-the-box traffic). These features use interfaces in the global virtual router only. That means, if you configure an interface for the feature, it must belong to the global virtual router. As a rule, anytime, if the system must look up a route to reach an external server for its own management purposes, it does the route lookup in the global virtual router.

- DNS server when used to resolve fully qualified names used in access control rules, or for resolving names for the **ping** command. If you specify **any** as the interface for a DNS server, the system considers interfaces in the global virtual router only.
- AAA server or identity realm when used with VPN. You can configure VPN on interfaces in the global virtual router only. Thus, the external AAA servers that are used for VPN, such as Active Directory, must be reachable through an interface in the global virtual router.

## Configuring Policies to be Virtual-Router-Aware

When you create a virtual router, the routing table for that virtual router is automatically separated from the global virtual router or any other virtual router. However, security policies are not automatically virtual-router-aware.

For example, if you write an access control rule that applies to “any” source or destination security zone, then the rule will apply to all interfaces across all virtual routers. This might in fact be exactly what you want. For example, all of your customers might want to block access to the same list of objectionable URL categories.

But, if you need to apply a policy to one of the virtual routers but not others, you need to create security zones that contain interfaces from that single virtual router only. Then, use the virtual-router-constrained security zones in the source and destination criteria of the security policy.

By using security zones whose memberships are constrained to the interfaces assigned to a single virtual router, you can write virtual-router-aware rules in the following policies:

- Access control policy.
- Intrusion and file policies.
- SSL decryption policy.
- Identity policy and user-to-IP address mappings. If you use overlapping address spaces in virtual routers, ensure that you create separate realms for each virtual router and apply them correctly in the identity policy rules.

If you use overlapping address spaces in your virtual routers, you should use security zones to ensure that the right policies get applied. For example, if you use the 192.168.1.0/24 address space in two separate virtual routers, an access control rule that simply specifies the 192.168.1.0/24 network will apply to traffic in both virtual routers. If that is not the desired outcome, you can limit the application of the rule by also specifying the source/destination security zones for just one of the virtual routers.

# Interconnecting Virtual Routers

## Static and Dynamic Route Leaking

You can configure the device to route traffic between virtual routers. This process of route leaking can be done manually by setting up static routes or dynamically through BGP settings.

### Static Route Leaking

You can configure static routes to route traffic between virtual routers.

For example, if you have the outside interface in the global virtual router, you can set up static default routes in each of the other virtual routers to send traffic to the outside interface. Then, any traffic that cannot be routed within a given virtual router gets sent to the global router for subsequent routing.

Static routes between virtual routers are known as route leaks, because you are leaking traffic to a different virtual router. When you are leaking routes, say, VR1 routes to VR2, you can initiate connections from VR2 to VR1 only. For traffic to flow from VR1 to VR2, you must configure the reverse route. When you create a static route to an interface in another virtual router, you do not need to specify a gateway address. Simply select the destination interface.

For inter-virtual-router routes, the system does destination interface look-up in the source virtual router. Then, it looks up the MAC address of the next hop in the destination virtual router. Thus, the destination virtual router must have either a dynamic (learned) or static route for the selected interface for the destination address.

Configuring NAT rules that use source and destination interfaces in different virtual routers can also allow traffic to route between virtual routers. If you do not select the option for NAT to do a route lookup, the rule will simply send traffic out the destination interface with a NATed address whenever destination translation happens. However, the destination virtual router should have a route for the translated destination IP address so that next-hop lookup can succeed.

Though NAT rule leaks traffic from one virtual router to another, to ensure correct routing, we recommend that you configure a static route leak between these virtual routers for the translated traffic. Without the route leak, sometimes the rule may not match the traffic you expect it to match, and the translation may not be applied.

Virtual routing does not support a cascading or chain of route leaks. For example, assume that your Firewall Threat Defense has VR1, VR2, and VR3 virtual routers; VR3 is directly connected to a network - 10.1.1.0/24. Now, assume you configure a route leak in VR1 for network 10.1.1.0/24 through interface in VR2 and in VR2 define a route leak for 10.1.1.0/24 through VR3. This chain of route leaks will not allow traffic to hop from VR1 to VR2 and then exit from VR3. In case of route leaks, the route lookups first determine egress interface from input Virtual Router's routing table and then looks at the output of Virtual Router's routing table for next hop lookup. From both the lookups, egress interface should match. In our example, the egress interfaces will not be the same and hence the traffic does not pass through.

Use static inter VRF route with caution when the destination network is not a direct-connected subnet of the upstream (outgoing) VR. For example, assume two VRs - VR1 and VR2. While VR1 handles the outgoing traffic which gets the default route from its external peer through BGP or any dynamic routing protocol, and VR2 handles the incoming traffic which is configured with static inter VRF default route with VR1 as the next-hop. When VR1 loses the default route from its peer, VR2 will not be able to detect that its upstream (outgoing) VR lost the default route and the traffic is still sent toward VR1 which will eventually get dropped without notifications. In this scenario, we recommend that you configure VR2 with dynamic route leak through BGP.

### Dynamic Route Leaking Using BGP

You can implement an inter-virtual-router route leak by exporting routes from a source virtual router (say VR1) to the source BGP table using route target extended community and then importing the same route target extended community from the source BGP table into the destination BGP table, which in turn is used by the destination virtual router (say, VR2). You can use the route maps for filtering the routes. The routes of global virtual router can also be leaked to user-defined virtual routers and vice versa. The BGP inter-virtual-router route leaking supports both ipv4 and ipv6 prefixes.

For details on configuring BGP route leaking, see [Configure BGP Route Import/Export Settings, on page 1181](#).

### BGP Route Leaking Guidelines

- Ensure that all the routes required for recursion are imported and present in the routing table of the ingress virtual router.
- ECMP is supported per virtual router. Hence, do not configure an ECMP across different virtual routers. The overlapping prefixes imported from different virtual routers cannot form an ECMP. That is, when you attempt to import routes with overlapping addresses from two different virtual routers to other virtual routers (a global virtual router or an user-defined virtual router), only one route (as per BGP best path algorithm, the first route that was advertised) is imported to the respective virtual routing table. For example, if a network 10.10.0.0/24, connected to VR1 is advertised through BGP to a global virtual router first, and later another network with the same address 10.10.0.0/24, connected to VR2 is also advertised through BGP to global virtual router, only the VR1 network route is imported to the global virtual routing table.
- OSPFv3 is not supported on user-defined virtual routers. Hence, do not configure BGPv6 to leak OSPFv3 user-defined virtual routers to global virtual router. However, you can configure BGPv6 to leak OSPFv3 global virtual router routes to user-defined virtual router through redistribution.
- It is recommended to keep VTI interface, protected internal interfaces (loopback interface if supported for VTI) to be part of same virtual router to prevent the need for route leak.

## Overlapping IP Addresses

Virtual router creates multiple instances of routing tables that are independent, thereby, the same or overlapping IP addresses can be used without conflicts. Firewall Threat Defense allows the same network to be part of two or more virtual routers. This involves multiple policies to be applied at the interface or at the virtual router level.

Other than few exceptions, the routing functions and most of the NGFW and IPS capability does not get impacted by the overlapping IP addresses. The following section describes the features that have limitations with overlapping IP addresses and the suggestions or recommendations to overcome them.

### Limitations with Overlapping IP Addresses

When using an overlapping IP address in multiple virtual routers, to ensure proper application of the policy, you have to modify policies or rules for some of the features. Such features require you to use more specific interface either by splitting existing security zone or using new interface group as the need be.

Following features need modification for its proper functioning with an overlapping IP address:

- Network Map—Modify the network discovery policy to exclude some overlapping IP segments to ensure that there is no overlapping IP address being mapped.

- Identity Policy—The identity feed source cannot differentiate among virtual routers; to overcome this limitation, map overlapping address spaces or virtual routers in different realms.

For the following features, you need to apply rules on specific interfaces to ensure that different policies are applied on overlapping IP segments:

- Access Policy
- Prefilter Policy
- QoS/Rate Limit
- SSL Policy

### Unsupported Features with Overlapping IP Addresses

- ISE SGT-based Rule in AC Policy—The static security group tag (SGT) to IP address mappings downloaded from Cisco Identity Services Engine (ISE) are not virtual-router-aware. Set up separate ISE systems per virtual router if you need to create different SGT mappings per virtual router. This is not necessary if you intend to map the same IP addresses to the same SGT number in each virtual router.
- Overlapping DHCP server pools are not supported across virtual routers.
- Events and Analytics—Many of the Firewall Management Center analytics are dependent on network map and identity mappings which cannot differentiate if the same IP address belongs to two different end hosts. Hence, these analytics are not accurate when there are overlapping IP segments existing in same device but different virtual routers.

## Configuring SNMP on User-Defined Virtual Routers

In addition to supporting SNMP on the management interface and Global virtual router data interfaces, Secure Firewall Threat Defense now allows you to configure SNMP host on user-defined virtual routers.

Configuring an SNMP host on user-defined virtual routers includes the following process:

1. [Configure device interfaces.](#)
2. [Configure virtual router on an interface.](#)
3. [Configure SNMP hosts on a virtual router interface.](#)

---

**Note** SNMP is not virtual router-aware. Hence, while configuring SNMP server on the user-defined virtual router, ensure that the network address is not an [overlapping IP address](#).

---

4. [Deploy configurations to Secure Firewall Threat Defense.](#) On successful deployment, the-SNMP polling and traps are sent to the Network Management Station through the virtual router interface.

## Maximum Number of Virtual Routers By Device Model

The maximum number of virtual routers you can create depends on the device model. The following table provides the maximum limits. You can double-check on your system by entering the **show vrf counters** command, which shows the maximum number of user-defined virtual routers for that platform not including the global virtual router. The numbers in the table below include user and global routers. For the Firepower 4100/9300, these numbers apply to native mode.

For platforms that support multi-instance capability, such as the Firepower 4100/9300, determine the maximum number of virtual routers per container instance by dividing the maximum virtual routers by the number of cores on the device, and then multiplying by the number of cores assigned to the instance, rounding down to the nearest whole number. For example, if the platform supports a maximum of 100 virtual routers, and it has 70 cores, then each core would support a maximum of 1.43 virtual routers (rounded). Thus, an instance assigned 6 cores would support 8.58 virtual routers, which rounds down to 8, and an instance assigned 10 cores would support 14.3 virtual routers (rounding down, 14).

Device Model	Maximum Virtual Routers
Firepower 1010	5
Firepower 1120	5
Firepower 1140	10
Firepower 1150	10
Firepower 2110	10
Firepower 2120	20
Firepower 2130	30
Firepower 2140	40
Secure Firewall 3105	10
Secure Firewall 3110	15
Secure Firewall 3120	25
Secure Firewall 3130	50
Secure Firewall 3140	100
Firepower 4112	60
Firepower 4115	80
Firepower 4125	100
Firepower 4145	100
Secure Firewall 4215	100

Device Model	Maximum Virtual Routers
Secure Firewall 4225	100
Secure Firewall 4245	100
Firepower 9300 appliance, all models	100
Firewall Threat Defense Virtual, all platforms	30
ISA 3000	10

## Guidelines and Limitations for Virtual Routers

**Firewall Mode Guidelines**

Virtual routers are supported on routed firewall mode only.

**Interface Guidelines**

- You can assign an interface to only one virtual router.
- A virtual router can have any number of interfaces that are assigned to it.
- You can assign only routed interfaces with logical names and VTIs to a user-defined virtual router.
- If you want to change a virtual router interface to a non-routed mode, remove the interface from the virtual router, and then change its mode.

- You can assign an interface to a virtual router, either from a global virtual router or from another user-defined virtual router.
- The following interfaces cannot be assigned to an user-defined virtual router:
  - Members of EtherChannel.
  - Members of Redundant interfaces.
  - Members of BVI.
- VTI is a route-based VPN. So, when the tunnel is established, the traffic that uses VTI for encryption must be controlled through routing. Static routing, as well as dynamic routing with BGP, OSPFv2/v3, or EIGRP is supported.
- You cannot use interfaces that belong to user-defined virtual routers in policy-based site-to-site or remote access VPNs.
- A dynamic VTI and its corresponding protected network interface must be part of the same virtual router.
- You must map the borrow IP interface and the dynamic VTI to the same virtual router.
- User-defined virtual routers support only BGPv4/v6 and OSPFv2 routing protocols.
- A tunnel source interface can be in a different user-defined virtual router than that associated with the dynamic VTI.
- If a route using the interface that is being moved or its virtual router is deleted, exist in source or destination virtual router table, remove the routes before the interface movement or virtual router deletion.
- As separate routing tables are maintained for each virtual router, when an interface is moved from one virtual router to another virtual router, be it global or user-defined, the system removes the IP address configured on the interface temporarily. All existing connections on the interface are terminated. Thus, moving interfaces between virtual routers have drastic effect on the network traffic. Hence take precautionary measures before you move interfaces.

### Global Virtual Router Guidelines

- The interfaces which are named and not part of other virtual routers, are part of the global virtual router.
- You cannot remove routed interfaces from global virtual router.
- You cannot modify global virtual router.
- Generally, after configuring interfaces, if you un-register and register back to same or another Firewall Management Center, interface configuration is imported back from device. With virtual router support, there is a restriction—the IP address for only global virtual router interfaces is retained.

### Clustering Guidelines

- When the control unit link fails due to failure of its interfaces, the unit removes all leaked routes of its interfaces from the global routing table and propagates the inactive connected and static routes to other units of the cluster. This results in removal of those leaked routes from the routing table in other units. These removal takes place prior to another unit becoming a new control unit, which takes approximately 500 ms. When another unit becomes the new control unit, these routes are learned and added back to the

routing tables through BGP convergence. Thus, till the convergence time, approximately one minute, the leaked routes are not available for the routing events to take place.

- When a control role change occurs in a cluster, the leaked routes learnt through BGP is updated with the best ECMP path. However, the non-best ECMP path is removed from the cluster routing table only after the BGP reconvergence timer elapses, that is 210 seconds. Thus, till the BGP reconvergence timer elapse, the old, non-best ECMP path persist as preferred route for routing events.

### Additional Guidelines

- While configuring BGP for virtual routers, you can redistribute the routes belonging to different protocols within the same virtual routers. For example, OSPF VR2 routes cannot be imported into BGP VR1. You can only redistribute OSPF VR2 into BGP VR2, and then configure a route leak between BGP VR2 and BGP VR1.
- You cannot use IPv6 ACL for filtering the routes in the route map. Only prefix list is supported.
- Security Intelligence Policy—The Security Intelligence policy is not virtual-router-aware. If you add an IP address, URL, or DNS name to the block list, it is blocked for all virtual routers. This limitation is applicable on the interface having security zones.
- NAT Rules—Do not mix interfaces in NAT rules. In virtual routing, if the specified source and destination interface objects (interface groups or security zones) have interfaces that belong to different virtual routers, the NAT rule diverts traffic from one virtual router through another virtual router. The NAT does the route lookup in the virtual router table for the inbound interface only. If necessary, define static routes in the source virtual router for the destination interface. If you leave the interface as **any**, the rule applies to all interfaces regardless of virtual router membership.
- DHCP Relay—Interconnecting virtual routers for DHCP relay is not supported. For example, if DHCP relay client is enabled on VR1 interface and DHCP relay server is enabled on VR2 interface, the DHCP requests will not be forwarded outside of VR2 interface.
- Recreating a deleted virtual router—When you recreate a virtual router that was deleted less than 10 seconds earlier, an error message appears stating that deletion of the virtual router is in progress. If you want to recreate a deleted virtual router successively, use a different name for the new virtual router.

## Modifications to the Firewall Management Center Web Interface - Routing Page

Devices earlier to the Firewall Threat Defense 6.6 and few device models are not supported with virtual routing capability. The Firewall Management Center web interface displays the same Routing page of the Firewall Management Center 6.5 or earlier version for such non supported devices. To know the supported devices and platform for virtual routing, see [Supported Device Models](#).

You can configure virtual routers in the routing page of a supported device:

1. Navigate to **Devices > Device Management** and edit the virtual-router-aware device.
2. Click **Routing** to enter the virtual routers page.

For devices using virtual routing, the left pane of the Routing page displays the following:

- **Manage Virtual Routers**—allows you to create and manage virtual routers.
- List of virtual routing protocols—lists routing protocols that you can configure for the virtual routers.
- **General Settings**—allows you to configure BGP general settings that are applicable for all the virtual routers. Select the **Enable BGP** check box in order to define other BGP settings. To configure other BGP settings for a virtual router, navigate to **BGP** in the virtual routing protocols .

## Manage Virtual Routers

When you click **Manage Virtual Routers** on the Virtual Routers pane, the Manage Virtual Routers page appears. This page displays the existing virtual routers on the device and the associated interfaces. In this page, you can **Add Virtual Router** (+) to the device. You can also **Edit** (✎) and **Delete** (🗑) user-defined virtual routers. You cannot edit or remove a global virtual router. You can only **View** (🔍) the details of a global virtual router.

## Create a Virtual Router

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
  - Step 2** Click **Routing**.
  - Step 3** Click **Manage Virtual Routers**.
  - Step 4** Click **Add Virtual Router** (+).
  - Step 5** In the Add Virtual Router box, enter a name and description for the virtual router.

#### Note

If you are creating a virtual router that was deleted less than 10 seconds earlier, an error message appears stating that deletion of the virtual router is in progress. If you want to create a deleted virtual router successively, use a different name for the new virtual router.

- Step 6** Click **Ok**.
- The Routing page appears, displaying the newly created virtual router page.
- 

### What to do next

- [Configure a Virtual Router](#).

## Configure a Virtual Router

You can assign interfaces to a user-defined virtual router and configure the routing policies for the device. Though you cannot manually add or remove interfaces for a global virtual router, you can configure the routing policies for the device interfaces.

### Before you begin

- To configure routing policies for a user-defined virtual router, add a router. See [Create a Virtual Router, on page 1064](#).
- All routing configuration settings of a non-virtual routing capable device are also available for a global virtual router. For information on the settings, see [Routing Settings](#).
- Only limited routing protocols are supported for a user-defined virtual router.

### Procedure

**Step 1** From the **Devices > Device Management** page, edit the virtual-router supported device. Navigate to **Routing**. For information on the modifications to the routing page, see [Modifications to the Firewall Management Center Web Interface - Routing Page, on page 1063](#).

**Step 2** From the drop-down list, select the desired virtual router.

**Step 3** In the **Virtual Router Properties** page, you can modify the description.

**Step 4** To add interfaces, select the interface under the **Available Interfaces** box, and then click **Add**.

Remember the following:

- Only interfaces with a logical name are listed under the **Available Interfaces** box. You can edit the interface and provide a logical name in **Interfaces**. Remember to save the changes for the settings to take effect.
- Only interfaces of global virtual routers are available for assigning; the **Available Interfaces** box lists only interfaces that are not assigned to any other user-defined virtual routers. You can assign physical interfaces, subinterfaces, redundant interfaces, bridge groups, VTIs, and EtherChannels to a virtual router, but not their member interfaces. Because the member interfaces cannot be named, they cannot be used in virtual routing.

You can assign the diagnostic interface to the global virtual router only.

**Step 5** To save the settings, click **Save**.

**Step 6** To configure the routing policy for the virtual router, click the respective names to open the corresponding settings page:

- **OSPF**—Only OSPFv2 is supported on the user-defined virtual router. All other settings for OSPFv2 are as applicable as for a non-virtual-router-aware interface, except that **Interface** allows you to select only the interfaces of the virtual router that you are configuring. You can define the OSPFv3 and OSPFv2 routing policies for a global virtual router. For information on the OSPF settings, see [OSPF, on page 1125](#).
- **RIP**—You can configure RIP routing policies only for a global virtual router. For information on RIP settings, see [RIP, on page 1185](#).
- **BGP**—This page displays the BGP general settings that you have configured in **Settings**:

- You cannot modify any of those general settings on this page, except for the router ID settings. You can override the router ID settings that were defined in the **Settings** page by editing them on this page.
- To configure other BGP IPv4 or IPv6 settings, you must enable the BGP option in **BGP** page under **General Settings**.
- BGP configuration for both IPv4 and IPv6 address family are supported for global router and the user-defined virtual router.

For information on configuring BGP settings, see [BGP, on page 1165](#).

- **Static Route**—Use this setting to define where to send traffic for a specific destination network. You can also use this setting to create an inter-virtual-router static route. You can create a leak of connected or static route by using the interfaces of user-defined or global virtual routers. **FMC prefixes** to an interface to indicate that it is belonging to another virtual router and can be used for a route leak. For the route leak to be successful, do not specify next hop gateway.

The Static Route table displays the virtual router whose interface is used for a route leak in the **Leaked from Virtual Router** column. If it is not a route leak, the column displays N/A.

Irrespective of which virtual router the static route belongs, a Null0 interface is listed along with the interfaces of the same virtual router to which the static route belongs.

For information on static route settings, see [Static and Default Routes, on page 1037](#).

- **Multicast**—You can configure multicast routing policies only for a global virtual router. For information on multicast settings, see [Multicast, on page 1191](#).

**Step 7** To save the settings, click **Save**.

---

#### What to do next

- [Modify a virtual router](#).
- [Remove a virtual router](#).

## Modify a Virtual Router

You can modify the description and other routing policies of a virtual router.

#### Procedure

---

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Click **Routing**.

**Step 3** Click **Manage Virtual Routers**.

All virtual routers along with the assigned interfaces are displayed in the **Virtual Routers** page.

**Step 4** To modify a virtual router, click **Edit** (✎) against the desired virtual router.

**Note**

You cannot modify the general settings of the global virtual router. Hence, edit is not available for the global router; instead a **View** (🔍) is provided to view the settings.

**Step 5** To save the changes, click **Save**.

---

**What to do next**

- [Remove a virtual router](#).

## Remove Virtual Routers

**Before you begin**

- You cannot delete the Global virtual router. Hence, the delete option is not available for the Global virtual router.
- You can remove multiple virtual routers at a time.
- All the routing policies of the deleted virtual router are also deleted.
- All the interfaces of the deleted virtual router move to the global virtual router.
- If there are any restrictions on the movement of interfaces, such as overlapping IPs, route conflicts, and so on, you can remove the router only after resolving the conflicts.

**Procedure**

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **Manage Virtual Routers**.
- All virtual routers along with the mapped interfaces are displayed in the **Virtual Routers** page.
- Step 4** To remove a virtual router, click **Delete** (🗑️) against the desired virtual router.
- Step 5** To remove multiple routers, holding the CTRL key, click the virtual routers that you want to delete. Right-click, and then click **Delete**.
- Step 6** To save the changes, click **Save**.
- 

## Monitoring Virtual Routers

To monitor and troubleshoot virtual routers, log into the device CLI and use the following commands:

- **show vrf**: Displays the details of the virtual routers and their associated interfaces.
- **show route vrf <vrf\_name>**: Displays the routing details of a virtual router.

- **show run router bgp all**: Displays the BGP routing details of all virtual router.
- **show run router bgp vrf <vrf\_name>**: Displays the BGP routing details of a virtual router.
- **show crypto ipsec sa/show crypto ikev2 sa**: Displays the details of the tunnel and the associated virtual router.
- You can monitor the tunnels in the Site-to-site monitoring dashboard (**Overview > Site to Site VPN**).

In the **Tunnel Status** widget, hover over a topology, click View  and click **Packet Tracer** to view and troubleshoot the threat defense VPN tunnels.

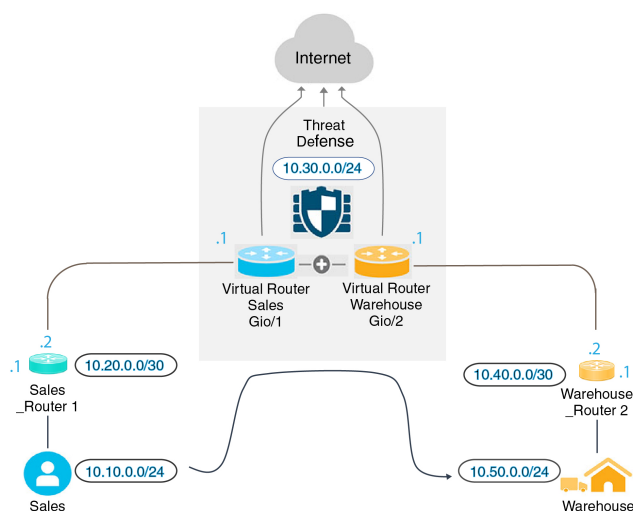

## Configuration Examples for Virtual Routers

### How to Route to a Distant Server through Virtual Routers

In virtual routing, you can create multiple virtual routers to maintain separate routing tables for groups of interfaces, thereby achieve network separation. In some scenarios, you may need to access a server that is reachable only through a separate virtual router. This example provides the procedure that interconnects virtual routers to reach to a host that is multiple hops away.

Consider an example, where a member of the sales department of a garment company wants to look up at the stock maintained by the warehousing department of its factory unit. In a virtual routing environment, you need to leak route between virtual routers where destination (warehousing department) is multiple hops away from sales department. This route leaking is done by adding multihop route leak, where, you configure a static route in Sales virtual router(source) to an interface in Warehouse virtual router (destination). As the destination network is multi-hop away, you also need to configure the Warehouse virtual router with the route to the destination network, namely 10.50.0.0/24.

**Figure 385: Interconnecting Two Virtual Routers - An Example**

### Before you begin

This example assumes that you have already configured Sales\_Router1 to route traffic from 10.20.0.1/30 interface to 10.50.0.5/24.

### Procedure

- 
- Step 1** Configure the inside interface (Gi0/1) of the device to be assigned to Sales virtual router:
- Choose **Devices > Device Management**, click the device name, and click **Interfaces**.
  - Edit the Gi0/1 interface:
    - **Name**—For this example, VR-Sales.
    - Select the **Enabled** checkbox.
    - In **IPv4**, for **IP Type**, choose **Use Static IP**.
    - **IP Address**—Enter 10.30.0.1/24.
  - Click **Ok**.
  - Click **Save**.
- Step 2** Configure the inside interface (Gi0/2) of the device to be assigned to Warehouse virtual router:
- Choose **Devices > Device Management**, click the device name, and click **Interfaces**.
  - Edit the Gi0/2 interface:
    - **Name**—For this example, VR-Warehouse.
    - Select the **Enabled** checkbox.
    - In **IPv4**, for **IP Type**, choose **Use Static IP**.
    - **IP Address**—Leave it blank. The system does not allow you to configure interfaces with same IP address (10.30.0.1/24), as you are yet to create user-defined virtual routers.
  - Click **Ok**.
  - Click **Save**.
- Step 3** Create Sales and Warehouse virtual routers and assign their interfaces:
- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
  - Choose **Routing > Manage Virtual Routers**.
  - Click **Add Virtual Router** and create Sales.
  - Click **Add Virtual Router** and create Warehouse.
  - Select Sales from virtual router drop-down, in **Virtual Router Properties**, add VR-Sales as **Selected Interface** and save.
  - Select Warehouse from virtual router drop-down, in **Virtual Router Properties**, add VR-Warehouse as **Selected Interface** and save.
- Step 4** Revisit the VR-Warehouse interface configuration:
- Choose **Devices > Device Management**, click the device name, and click **Interfaces**.

- b) Click **Edit** against VR-Warehouse interface. Specify the IP Address as 10.30.0.1/24. The system now allows you to configure with same IP address of VR-Sales, because the interfaces are separately assigned to two different virtual routers.
- c) Click **Ok**.
- d) Click **Save**.

**Step 5** Create network objects for the warehouse server—10.50.0.0/24, and for the warehouse gateway— 10.40.0.2/30:

- a) Choose **Objects > Object Management**.
- b) Choose **Add Network > Add Object**:
  - **Name**—For this example, Warehouse-Server.
  - **Network**—Click Network and enter 10.50.0.0/24.
- c) Click **Save**.
- d) Choose **Add Network > Add Object**:
  - **Name**—For this example, Warehouse-Gateway.
  - **Network**—Click Host and enter 10.40.0.2.

- e) Click **Save**.

**Step 6** Define the route leak in Sales that points to the VR-Warehouse interface:

- a) Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- b) Choose **Routing**.
- c) Choose Sales virtual router from the drop-down, and then click **Static Route**.
- d) Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select VR-Warehouse.
  - **Network**—Select the Warehouse-Server object.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, do not select the gateway.

**Add Static Route Configuration**

c) Click **Ok**.

d) Click **Save**.

**Step 8** Configure access control rule that allows access to the warehouse server. For creating the access control rule, you need to create security zones. Use **Objects > Object Management > Interface**. Choose **Add > Security Zone** and create security zones for VR-Sales and VR-Warehouse; for Warehouse-Server network object, create a Warehouse-Server interface group (Choose **Add > Interface Group**).

**Step 9** Choose **Policies > Access Control heading > Access Control** and configure an access control rule to allow traffic from the source interfaces in the Sales virtual router to the destination interfaces in the Warehouse virtual router for the destination Warehouse-Server network object.

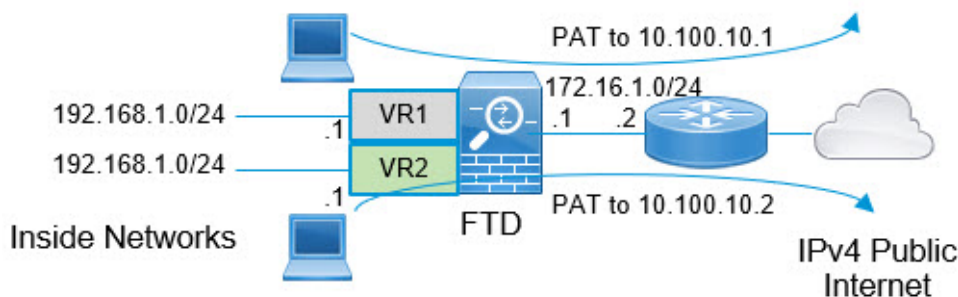

For example, if the interfaces in Sales are in the Sales-Zone security zone, and those in Warehouse are in the Warehouse-Zone security zone, the access control rule would look similar to the following:

SalesWarehouse														Analyze Hit Counts	Save

## How to Provide Internet Access with Overlapping Address Spaces

When using virtual routers, you can have the same network address for interfaces that reside in separate routers. However, because the IP addresses routed in these separate virtual routers are the same, apply NAT/PAT rules for each interface with separate NAT/PAT pools to ensure that return traffic goes to the correct destination. This example provides the procedure to configure the virtual routers and NAT/PAT rules to manage the overlapping address spaces.

For example, interfaces vr1-inside and vr2-inside on Firewall Threat Defense is defined to use the IP address 192.168.1.1/24, managing endpoints on their segment in the 192.168.1.0/24 network. To allow Internet access from two virtual routers that use the same address space, you need to apply NAT rules separately to the interfaces within each virtual router, ideally using separate NAT or PAT pools. You could use PAT to translate the source addresses in VR1 to 10.100.10.1, and for those in VR2, to 10.100.10.2. The following illustration shows this setup, where the Internet-facing outside interface is part of the global router. You must define the NAT/PAT rules with the source interface (vr1-inside and vr2-inside) explicitly selected—using “any” as the source interface makes it impossible for the system to identify the correct source because the same IP address could exist on two different interfaces.

### Note

Even if you have some interfaces within virtual routers that does not use overlapping address spaces, define the NAT rule with the source interface to make troubleshooting easier, and to ensure a cleaner separation between traffic from the virtual routers that is Internet-bound.

### Procedure

#### Step 1

Configure the inside interface of the device for VR1:

- a) Choose **Devices > Device Management**, click the device name, and then click **Interfaces**.
- b) Edit the interfaces that you want to assign to VR1:
  - **Name**—For this example, vr1-inside.
  - Select the **Enabled** checkbox.
  - In **IPv4**, for **IP Type**, choose **Use Static IP**.
  - **IP Address**—Enter 192.168.1.1/24.
- c) Click **Ok**.
- d) Click **Save**.

**Step 2**

Configure the inside interface of the device for VR2:

- a) Choose **Devices > Device Management**, click the device name, and then click **Interfaces**.
- b) Edit the interfaces that you want to assign to VR2:
  - **Name**—For this example, vr2-inside.
  - Select the **Enabled** checkbox.
  - In **IPV4**, for **IP Type**, choose **Use Static IP**.
  - **IP Address**—Leave it blank. The system does not allow you to configure interfaces with same IP address, as you are yet to create user-defined virtual routers.
- c) Click **Ok**.
- d) Click **Save**.

**Step 3**

Configure VR1 and the static default route leak to the outside interface:

- a) Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- b) Choose **Routing > Manage Virtual Routers**. Click **Add Virtual Router** and create VR1.
- c) For VR1, in **Virtual Router Properties**, assign vr1-inside and save.
- d) Click **Static Route**.
- e) Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the outside interface of the global router.
  - **Network**—Select the any-ipv4 object. This network is the default route for any traffic that cannot be routed within VR1.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, do not provide a Gateway.

#### Step 4

Configure VR2 and the static default route leak to the outside interface:

- a) Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- b) Choose **Routing > Manage Virtual Routers**. Click **Add Virtual Router** and create VR2.
- c) For VR2, in **Virtual Router Properties**, assign vr2-inside and save.
- d) Click **Static Route**.
- e) Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the outside interface of the global router.
  - **Network**—Select the any-ipv4 object. This network is the default route for any traffic that cannot be routed within VR2.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, do not select the Gateway.

- f) Click **Ok**.
- g) Click **Save**.

#### Step 5

Configure IPv4 static default route, namely 172.16.1.2 on the outside interface of the global router:

- a) Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- b) Choose **Routing** and edit global router properties.
- c) Click **Static Route**.
- d) Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the outside interface of the global router.
  - **Network**—Select the any-ipv4 object. This will be the default route for any IPv4 traffic.
  - **Gateway**—If already created, select the host name from the drop-down. If the object is not yet created, click **Add** and define the host object for the IP address of the gateway at the other end of the network link on the outside interface, in this example, 172.16.1.2. After you create the object, select it in the Gateway field.

**Add Static Route Configuration**

Type: ☒ IPv4 ☐ IPv6

- e) Click **Ok**.
- f) Click **Save**.

**Step 6** Revisit the vr2-inside interface configuration:

- a) Choose **Devices > Device Management**, click the device name, and then click **Interfaces**.
- b) Click **Edit** against vr2-inside interface. Specify the IP Address as 192.168.1.1/24. The system now allows you to configure with same IP address of vr1-inside, because the interfaces are separately assigned to two different virtual routers.
- c) Click **Ok**.
- d) Click **Save**.

**Step 7** Create the NAT rule to PAT inside to outside traffic of VR1 to 10.100.10.1.

- a) Choose **Devices > NAT**.
- b) Click **New Policy > Threat Defense NAT**.
- c) Enter InsideOutsideNATRule as the NAT policy name, and select the Firewall Threat Defense device. Click **Save**.
- d) In InsideOutsideNATRule page, click **Add Rule** and define the following:

- **NAT Rule**—Select Manual NAT Rule.
- **Type**—Select Dynamic.
- **Insert**—Above, if any dynamic NAT rule exists.
- Click **Enabled**.
- In **Interface Objects**, select vr1-interface object and click **Add to Source** (If the object is not available, create one in **Objects > Object Management > Interface**), and select outside as **Add to Destination**.
- In **Translation**, for **Original Source**, select any-ipv4. For **Translated Source**, click **Add** and define host object VR1-PAT-Pool with 10.100.10.1. Select VR1-PAT-Pool as shown in the figure below:

NAT Rule: Manual NAT Rule

Insert: In Category NAT Rules Before

Type: Static

☒ Enable

Translated Destination Port: +

Cancel OK

- Click **Ok**.
- Click **Save**.

## Step 8

Add NAT rule to PAT inside to outside traffic of VR2 to 10.100.10.2.

- Choose **Devices > NAT**.
- Edit InsideOutsideNATRule to define the VR2 NAT rule:
  - **NAT Rule**—Select Manual NAT Rule.
  - **Type**—Select Dynamic.
  - **Insert**—Above, if any dynamic NAT rule exists.
  - Click **Enabled**.
  - In **Interface Objects**, select vr2-interface object and click **Add to Source** (If the object is not available, create one in **System (⚙️) > Configuration > Management Interfaces**), and select outside as **Add to Destination**.

- In **Translation**, for **Original Source**, select any-ipv4. For **Translated Source**, click **Add** and define host object VR2-PAT-Pool with 10.100.10.2. Select VR2-PAT-Pool as shown in the figure below:

NAT Rule:  
Manual NAT Rule

Cancel OK

c) Click **Ok**.

d) Click **Save**.

### Step 9

To configure the access control policy that allows traffic from the vr1-inside and vr2-inside interfaces to the outside interface, you need to create security zones. Use **Objects > Object Management > Interface**. Choose **Add > Security Zone** and create security zones for vr1-inside, vr2-inside, and outside interfaces.

### Step 10

Choose **Policies > Access Control heading > Access Control** and configure an access control rule to allow traffic from vr1-inside-zone and vr2- inside-zone to outside-zone.

Assuming that you create zones named after the interfaces, a basic rule that allows all traffic to flow to the Internet will look like the following. You can apply other parameters to this access control policy:

## How to Allow RA VPN Access to Internal Networks in Virtual Routing

On virtual routing-enabled devices, RA VPN is supported only on global virtual router interfaces. This example provides the procedure that allows your Secure Client user to connect to user-defined virtual router networks.

In the following example, the RA VPN (Secure Client) user connects to the outside interface of Firewall Threat Defense at 172.16.3.1, and is given an IP address within the pool of 192.168.80.0/24. The user can access the inside network of only the global virtual router. To allow traffic flow through the network of the user-defined virtual router VR1, namely 192.168.1.0/24, leak the route by configuring the static routes on global and VR1.

### Before you begin

This example assumes that you have already configured the RA VPN, defined the virtual routers, and configured and assigned the interfaces to the appropriate virtual routers.

### Procedure

#### Step 1

Configure route leak from Global virtual router to the user-defined VR1:

- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Click **Routing**. By default, the Global routing properties page appears.
- Click **Static Route**.
- Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the VR1 inside interface.
  - **Network**—Select the VR1 virtual router network object. You can create one using the **Add Object** option.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, does not select the gateway.

**Add Static Route Configuration**

The configured static route allows endpoints on the 192.168.1.0/24 network (VR1) to initiate connections to Secure Client assigned IP addresses in the VPN pool.

e) Click **Ok**.

### What to do next

If RA VPN address pool and the IP addresses in the user-defined virtual router overlap, you must also use static NAT rules on the IP addresses to enable proper routing. Alternatively, you can change your RA VPN address pool so that there is no overlap.

## How to Secure Traffic from Networks in Multiple Virtual Routers over a Site-to-Site VPN

On virtual routing-enabled devices, Site-to-Site VPN is supported only on global virtual router interfaces. You cannot configure it on an interface that belongs to a user-defined virtual router. This example provides the procedure that allows you to secure the connections from or to networks hosted within user-defined virtual routers over the site-to-site VPN. You also need to update the site-to-site VPN connection to include the user-defined virtual routing networks.

Let us consider a scenario, where, a site-to-site VPN is configured between a branch office network to a company headquarters network; the Firewall Threat Defense in the branch office having virtual routers. In this case, the site-to-site VPN is defined on the outside interface of the branch office at 172.16.3.1. This VPN includes the inside network 192.168.2.0/24 without extra configuration, because the inside interface is also part of the global virtual router. But, to provide site-to-site VPN services to the 192.168.1.0/24 network, which is part of the VR1 virtual router, you must leak the route by configuring the static routes on global and VR1, and add the VR1 network to the site-to-site VPN configuration.

### Before you begin

This example assumes that you have already configured the site-to-site VPN between the 192.168.2.0/24 local network and the 172.16.20.0/24 external network, defined the virtual routers, and configured and assigned the interfaces to the appropriate virtual routers.

### Procedure

- Step 1** Configure route leak from the Global virtual router to the user-defined VR1:
- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
  - Click **Routing**. By default, the Global routing properties page appears.
  - Click **Static Route**.
  - Click **Add Route**. In **Add Static Route Configuration**, specify the following:
    - Interface**—Select the VR1 inside interface.
    - Network**—Select the VR1 virtual router network object. You can create one using the **Add Object** option.
    - Gateway**—Leave it blank. When leaking a route into another virtual router, do not select the gateway.

**Add Static Route Configuration**

This static route allows endpoints on the 192.168.1.0/24 network (VR1) to initiate connections that will traverse the site-to-site VPN tunnel. For this example, the remote endpoint that is protecting the 172.16.20.0/24 network.

e) Click **Ok**.

### Step 3

Add the 192.168.1.0/24 network to the site-to-site VPN connection profile:

- Choose **Devices > VPN > Site to Site**, and edit the VPN Topology.
- In **Endpoints**, edit Node A endpoint.
- In **Edit Endpoint**, in the **Protected Networks** field, click **Add New Network Object**.
- Add the VR1 network object with 192.168.1.0 network:

e) Click **Ok** and save the configuration.

## How to Secure Traffic from Networks with Multiple Virtual Routers over a Site-to-Site VPN with Dynamic VTI

ISPs have different segmented networks for different customers. You can create virtual routers, associate dynamic VTIs with these virtual routers, and extend the capabilities of dynamic VTIs in your network. You can associate dynamic VTIs either with global or user-defined virtual routers. A single threat defense device can act as a dynamic VTI hub with a global or one or more user-defined virtual routers. Each user-defined virtual router can be one customer network.

Let us consider an example where route-based site-to-site VPNs are configured between two company headquarter networks and their two branch office networks. The ISP's threat defense, a dynamic VTI hub, manages the two company headquarter networks with two user-defined virtual routers: VRF green and VRF red. The dynamic VTI hub establishes a site-to-site VPN between:

- Customer 1 (VRF green) and Branch 1 (SVTI spoke 1)
- Customer 2 (VRF red) and Branch 2 (SVT2 spoke 2)

**Figure 386: Site-to-Site VPNs with Multiple Virtual Routers and Dynamic VTI**

This example illustrates how to configure networks with multiple virtual routers over a site-to-site VPN with dynamic VTI.

## Procedure

- 
- Step 1** Configure a dynamic VTI interface on the hub.
- Choose **Devices > Device Management** and edit the threat defense device.
  - Choose **Add Interfaces > Virtual Tunnel Interface**.
  - Select the **Tunnel Type** as **Dynamic**.
  - Specify the interface name as DVTI1 and configure all the parameters for the dynamic VTI.
  - Click **Save**
  - Repeat steps 1a - e to configure the second dynamic VTI on the hub, DVTI2.
- Step 2** Configure static VTI on spoke 1.
- Choose **Devices > Device Management** and edit the threat defense device.
  - Choose **Add Interfaces > Virtual Tunnel Interface**.
  - Select the **Tunnel Type** as **Static**.
  - Specify the interface name as SVTI spoke-1 and configure all the parameters for the static VTI.
  - Click **Save**
  - Repeat steps 2a - e to configure the static VTI on spoke 2: SVTI spoke-2.
- Step 3** Configure a route-based site-to-site VPN between hub and SVTI spoke 1.
- Choose **Devices > VPN > Site to Site** and click + **Site To Site VPN**.
  - Enter a name for the VPN topology in the **Topology Name** field.
  - Choose **Route Based (VTI)** and select **Hub and Spoke** as the network topology.
  - Click the **Endpoints** tab.
  - Configure the hub and the spoke (DVTI1 and SVTI spoke-1) and their routing policies.
  - Configure the **IKE**, **IPsec**, and **Advanced** options for the VPN, if required.
  - Click **Save**.

- h) Repeat steps 3a - g to configure the second route-based site-to-site VPN topology between hub (DVTI2) and SVTI spoke 2.

**Step 4** Configure the two virtual routers.

- a) Choose **Devices > Device Management** and edit the threat defense device.
- b) Click **Routing**.
- c) Click **Manage Virtual Routers**.
- d) Click **Add Virtual Router**.

Specify the name as VRF green and provide a description for the virtual router.

- e) Repeat steps 4a - d to configure VRF red.

**Step 5** Assign all the interfaces to the virtual routers.

- a) From the drop-down list, select the virtual router.
- b) In the **Virtual Router Properties** page, select the interfaces listed under the **Available Interfaces** box.

Assign the dynamic VTI interface along with the other interfaces.

- c) Click **Add**.

**Step 6** Repeat steps 5a - c for VRF red.

**Step 7** Configure the routing policy for the virtual router.

- a) From the drop-down list, select the virtual router.
- b) Click **Static Route** or one of the dynamic routing protocols.
- c) Configure the routing parameters.
- d) Click **Save**.

---

**What to do next**

Select the hub and spoke devices and click **Deploy**. After the deployment, you can monitor the VPN tunnels in the Site-to site monitoring dashboard (**Overview > Dashboards > Site to Site VPN**).

You can also use the commands listed in [Monitoring Virtual Routers, on page 1067](#) to view and troubleshoot the virtual router.

## How to Route Traffic between Two Overlapping Network Host in Virtual Routing

You can configure hosts on the virtual routers that have same network address. If the hosts want to communicate, you can configure twice NAT. This example provides the procedure to configure the NAT rules to manage the overlapping network host.

In the following example, two hosts Host A and Host B belong to different virtual routers: VRG (interface vrg-inside), VRB (interface vrb-inside) respectively with the same subnet 10.1.1.0/24. For both the hosts to communicate, create a NAT policy where, VRG-Host interface object would use a mapped NAT address - 20.1.1.1, and VRB-Host interface object would use a mapped NAT address - 30.1.1.1. Thus, Host A uses 30.1.1.1 to communicate to Host B; Host B uses 20.1.1.1 to reach Host A.

### Before you begin

This example assumes that you have already configured:

- vrg-inside and vrb-inside interfaces are associated with virtual routers: VRG and VRB respectively and vrg-inside and vrb-inside interfaces configured with same subnet address (say, 10.1.1.0/24).
- Interfaces zones VRG-Inf, VRB-Inf created with vrg-inside and vrb-inside interfaces respectively.
- Host A in VRG with vrg-inside as default gateway; Host B in VRB with vrb-inside as default gateway.

### Procedure

- Step 1** Create the NAT rule to handle traffic from Host A to Host B. Choose **Devices > NAT**.
- Step 2** Click **New Policy > Threat Defense NAT**.
- Step 3** Enter a NAT policy name, and select the Firewall Threat Defense device. Click **Save**.
- Step 4** In the NAT page, click **Add Rule** and define the following:
  - **NAT Rule**—Select Manual NAT Rule.
  - **Type**—Select Static.
  - **Insert**—Select Above, if any NAT rule exists.
  - Click **Enabled**.
  - In **Interface Objects**, select VRG-Inf object and click **Add to Source** (If the object isn't available, create one in **Objects > Object Management > Interface**), and select VRB-Inf object and click **Add to Destination**.
  - In **Translation**, select the following:
    - **Original Source**, select vrg-inside.
    - **Original Destination**, click **Add** and define object VRB-Mapped-Host with 30.1.1.1. Select VRB-Mapped-Host.

- **Translated Source**, click **Add** and define object, VRG-Mapped-Host with 20.1.1.1. Select VRG-Mapped-Host.
- **Translated Destination**, select vrb-inside as shown in the following figure:

Add NAT Rule ?

When you deploy the configuration, a warning message appears:

Validation Messages: 

1 total | 0 errors | 1 warning | 0 infos

**ManualNat64Rule: Host2Host**

Warning: [ManualNatRule 1] The NAT rule has source and destination interfaces belonging to different Virtual Routers, the traffic will be able to leak between Virtual Routers without explicit route leak configuration whenever destination translation happens. If you intent to apply this NAT rule even when destination translation is not happening, create a static route leak explicitly. The rule involves interfaces from [VRG] to [VRB]

## How to Manage Overlapping Segments in Routed Firewall Mode with BVI Interfaces

You can deploy single Firewall Threat Defense between multiple overlapping networks transparently and/or deploy the firewall between the hosts of same network. To achieve this deployment, configure BVI per virtual router. The procedure to configure the BVIs in virtual router is explained here.

BVI is a virtual interface within a router that acts like a normal routed interface. It does not support bridging, but represents the comparable bridge group to routed interfaces within the router. All the packets coming in or going out of these bridged interfaces, pass through the BVI interface. The interface number of the BVI is the number of the bridge group that the virtual interface represents.

In the following example, BVI-G is configured in VRG and Bridge Group 1 is the routed interface for interfaces G0/1 and G0/2. Similarly, BVI-B is configured in VRB and Bridge Group 2 is the routed interface for interfaces G0/3 and G0/4. Consider that both BVIs have the same IP subnet address, say 10.10.10.5/24. Because of virtual routers, the network is isolated on the shared resources.

## Procedure

**Step 1** Choose **Devices > Device Management**. Edit the required device.

**Step 2** In **Interfaces**, choose **Add Interfaces > Bridge Group Interface**.

a) Enter the following details for BVI-G:

- **Name**—For this example, BVI-G.
- **Bridge Group ID**—For this example, 1.
- **Available Interface**—Select the interfaces.
- In **IPv4**, for **IP Type**, choose **Use Static IP**.
- **IP Address**—Enter 10.10.10.5/24.

Add Bridge Group Interface 1

Interfaces IPv4 IPv6

General Settings

BGP

Virtual Router Properties

These are the basic details of this virtual router.

VRF Name:  
VRG

Description:

Select Interface:

Q Search

Available Interface\*:

- BVI-G**
- BVI-B
- vrg-inside

Add

Selected Interfaces

- BVI-G

- e) Click **Save**.

**Step 4**

Create virtual router, say VRB, and select BVI-B as its network:

- a) Choose **Devices > Device Management**.
- b) Edit the device, and choose **Routing > Manage Virtual Routers**.
- c) Click **Add Virtual Router**. Enter a name for the virtual router and click **Ok**.

- d) In **Virtual Routing Properties**, select **BVI-B** and click **Add**.

The screenshot shows the 'Virtual Router Properties' configuration page in the Cisco Secure Firewall Management Center. The left sidebar has a 'Manage Virtual Routers' section with a dropdown menu showing 'VRB'. Below this are sections for 'Virtual Router Properties', 'OSPF', 'BGP', 'IPv4', and 'Static Route'. The 'General Settings' section is expanded, showing 'BGP'. The main content area is titled 'Virtual Router Properties' and includes a subtitle 'These are the basic details of this virtual router.' Below this are fields for 'VRF Name' (set to 'VRB'), 'Description', and 'Select Interface'. The 'Available Interfaces' list shows 'BVI-B' and 'vrg-inside'. The 'Selected Interfaces' list shows 'BVI-B'.

- e) Click **Save**.

### Step 5

Revisit the BVI-B configuration:

- Choose **Devices** > **Device Management**, edit the device and click **Interfaces**.
- Click **Edit** against BVI-B interface. Specify the IP Address as 10.10.10.5/24. The system now allows you to configure with same IP address of BVI-G, because the interfaces are separately assigned to two different virtual routers.
- Click **Ok**.
- Click **Save**.

If you want to enable inter-BVI communication, use an external router as default gateway. In overlapping BVI scenarios, as in this example, use twice NAT external router as gateway to establish inter-BVI traffic. When configuring NAT for the members of a bridge group, you specify the member interface. You cannot configure NAT for the bridge group interface (BVI) itself. When doing NAT between bridge group member interfaces, you must specify the real and mapped addresses. You cannot specify “any” as the interface.

## How to Configure User Authentication with Overlapping Networks

In virtual routing, you can configure multiple virtual routers with overlapping IP and overlapping users. In the example, VRG, and VRB are the virtual routers with overlapping IP - 192.168.1.1/24. The users on two different domains are also on overlapping network IP 192.168.1.20. For VRG and VRB users to access the shared server 172.16.10.X, leak routes to the global virtual router. Use source NAT to handle the overlapping IP. For controlling the access from VRG and VRB users, you must set user authentication in Firewall Management Center. Firewall Management Center uses realms, Active Directories, Identity source, and Identity rules and policies for authenticating user identity. Because Firewall Threat Defense does not have direct role in authenticating users, user access is managed only through the access control policy. For controlling traffic from the overlapping users, use Identity policy and rules to create access control policy.

### Before you begin

This example assumes that you have:

- Two AD servers for the VRG and VRB users.
- ISE with the two AD servers added.

### Procedure

#### Step 1

Configure the inside interface of the device for VRG:

- Choose **Devices > Device Management**, click the device name, and then click **Interfaces**.
- Edit the interfaces that you want to assign to VRG:
  - **Name**—For this example, VRG-inside.
  - Select the **Enabled** checkbox.
  - In **IPv4**, for **IP Type**, choose **Use Static IP**.
  - **IP Address**—Enter 192.168.1.1/24.
- Click **Ok**.
- Click **Save**.

#### Step 2

Configure the inside interface of the device for VRB:

- Choose **Devices > Device Management > Interfaces**.
- Edit the interfaces that you want to assign to VRB:
  - **Name**—For this example, VRB-inside.

- Select the **Enabled** checkbox.
- In **IPv4**, for **IP Type**, choose **Use Static IP**.
- **IP Address**—Leave it blank. The system doesn't allow you to configure interfaces with same IP address, as you're yet to create user-defined virtual routers.

- Click **Ok**.
- Click **Save**.

**Step 3**

Configure VRG and the static default route leak to the inside interface of the Global router for the VRG users to access the common server 172.16.10.1:

- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Choose **Routing > Manage Virtual Routers**. Click **Add Virtual Router** and create VRG.
- For VRG, in **Virtual Router Properties**, assign VRG-inside and save.

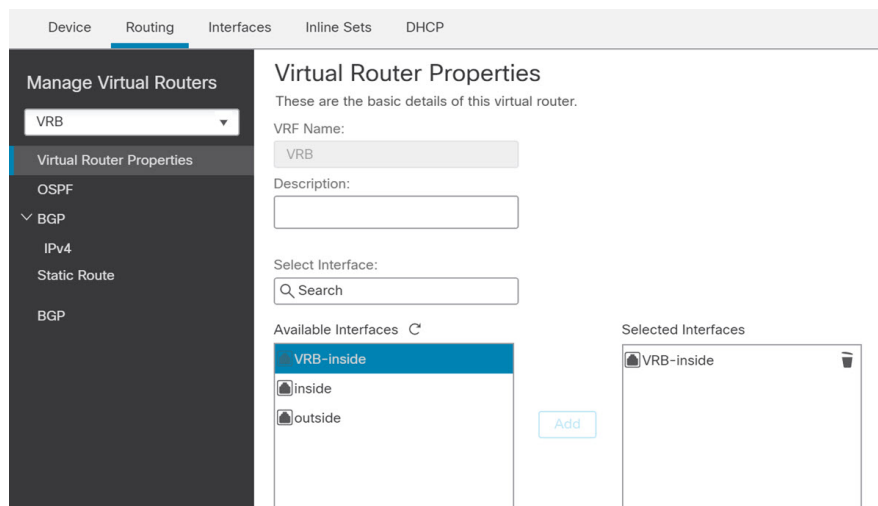

The screenshot shows the 'Virtual Router Properties' configuration page in the Cisco Secure Firewall Management Center. The left sidebar has tabs for 'Device', 'Routing', 'Interfaces', 'Inline Sets', and 'DHCP'. Under 'Routing', there is a 'Manage Virtual Routers' section with a dropdown menu showing 'VRG'. Below this are 'Virtual Router Properties' (selected), 'OSPF', 'BGP', 'IPv4', and 'Static Route'. Under 'General Settings', 'BGP' is listed. The main content area is titled 'Virtual Router Properties' and contains the following fields: 'VRF Name' (set to 'VRG'), 'Description' (empty), and 'Select Interface' (with a search bar). Below these are two columns: 'Available Interfaces' and 'Selected Interfaces'. In 'Available Interfaces', 'VRG-inside' is highlighted. In 'Selected Interfaces', 'VRG-inside' is listed. An 'Add' button is located between the two columns.

- Click **Static Route**.
- Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the inside interface of the global router.
  - **Network**—Select the any-ipv4 object.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, do not select a gateway.
- Click **Ok**.
- Click **Save**.

**Step 4**

Configure VRB and the static default route leak to the inside interface of the Global router for the VRB users to access the shared server 172.16.10.x:

- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Choose **Routing > Manage Virtual Routers**. Click **Add Virtual Router** and create VRB.
- For VRB, in **Virtual Router Properties**, assign VRB-inside and save.

- d) Click **Static Route**.
- e) Click **Add Route**. In **Add Static Route Configuration**, specify the following:
  - **Interface**—Select the inside interface of the global router.
  - **Network**—Select the any-ipv4 object.
  - **Gateway**—Leave it blank. When leaking a route into another virtual router, do not select a gateway.
- f) Click **Ok**.
- g) Click **Save**.

**Step 5** Revisit the VRB-inside interface configuration:

- a) Choose **Devices > Device Management > Interfaces**.
- b) Click **Edit** against VRB-inside interface. Specify the IP Address as 192.168.1.1/24. The system now allows you to configure with the same IP address as that of VRG-inside, because the interfaces are separately assigned to two different virtual routers.
- c) Click **Ok**.
- d) Click **Save**.

**Step 6** Add NAT rules for the source objects VRG and VRB. Click **Devices > NAT**.

**Step 7** Click **New Policy > Threat Defense NAT**.

**Step 8** Enter a NAT policy name, and select the Firewall Threat Defense device. Click **Save**.

**Step 9** In the NAT page, click **Add Rule** and define the following source NAT for VRG:

- **NAT Rule**—Select Manual NAT Rule.
- **Type**—Select Static.
- **Insert**—Select Above, if any NAT rule exists.
- Click **Enabled**.
- In **Interface Objects**, select VRG-Inside object and click **Add to Source** (If the object is not available, create one in **Object > Object Management > Interface**), and select Global-Inside object and click **Add to Destination**.
- In **Translation**, select the following:

- **Original Source**, select VRG-Users.
- **Translated Source**, click **Add** and define object, VRG-NAT with 10.1.1.1. Select VRG-NAT as shown in the following figure:

**Step 10** Click **Ok**.

**Step 11** In the NAT page, click **Add Rule** and define the following source NAT for VRB:

- **NAT Rule**—Select Manual NAT Rule.
- **Type**—Select Static.
- **Insert**—Select Above, if any NAT rule exists.
- Click **Enabled**.
- In **Interface Objects**, select VRB-Inside object and click **Add to Source** (If the object is not available, create one in **Object > Object Management > Interface**), and select Global-Inside object and click **Add to Destination**.
- In **Translation**, select the following:
  - **Original Source**, select VRB-Users.
  - **Translated Source**, click **Add** and define object, VRB-NAT with 20.1.1.1. Select VRB-NAT as shown in the following figure:

Add NAT Rule

NAT Rule:  
Manual NAT Rule

Insert:  
In Category NAT Rules Before

Type:

**Step 12** Click **Save**.

The NAT rule looks like this:

Rules

[Filter by Device](#)

					Original Packet			Translated Packet			
#	Direction	Type	Source Interface	Destination Interface	Original Sources	Original Destinations	Original Services	Translated Sources	Translated Destinations	Translated Services	Options
NAT Rules Before											
1		St...	any	any	 VRG-Users			 VRG-NAT			Dns:false
2		St...	any	any	 VRB-Users			 VRB-NAT			Dns:false
Auto NAT Rules											

**Step 13** Add the two unique AD servers in Firewall Management Center one for each VRG and VRB users—choose **System > Integration > Realms**.

**Step 14** Click **New Realm** and complete the fields. For detailed information on the fields, see [Realm Fields, on page 2285](#).

**Step 15** For controlling the access from VRG and VRB users, define 2 Active Directories, see [Realm Directory and Synchronize fields, on page 2289](#)see [Create an LDAP Realm or an Active Directory Realm and Realm Directory, on page 2275](#)

**Step 16** Add ISE in Firewall Management Center—choose **System > Integration > Identity Sources**.

**Step 17** Click **Identity Services Engine** and complete the fields. For detailed information on the fields, see [How to Configure ISE/ISE-PIC for User Control Using a Realm, on page 2321](#).

**Step 18** Create Identity policy, rules, and then define access control policy for controlling access of overlapping users from VRG and VRB.

## How to Interconnect Virtual Routers using BGP

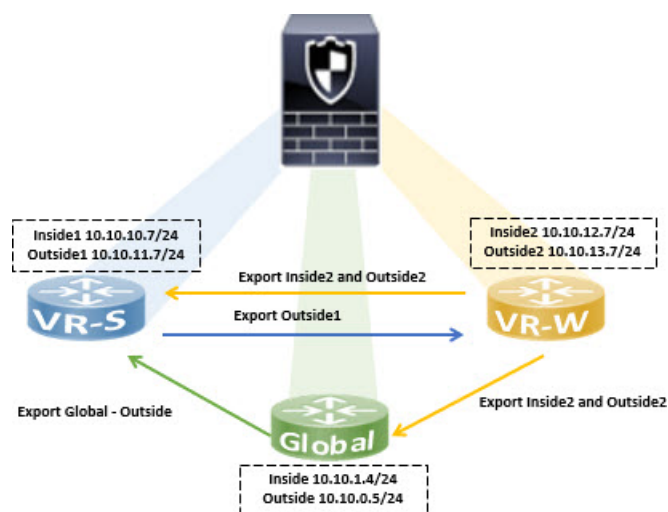

You can now configure BGP settings on a device to leak the routes among virtual routers (Global and user-defined virtual routers). The route target of the source virtual router is exported to the BGP table, which, in turn is imported to the destination virtual router. The route map is used to share the Global virtual routes with the user-defined virtual routers and vice versa. Note that all import or export of the routes to the BGP table is configured at the user-defined virtual router, including the Global virtual routes.

Consider the firewall device of a factory is configured with the following virtual routers and interfaces:

- Global virtual router is configured with Inside (10.10.1.4/24) and Outside (10.10.0.5/24)
- VR-S (Sales) virtual router is configured with Inside1 (10.10.10.7/24) and Outside1 (10.10.11.7/24)
- VR-W (Warehouse) virtual router is configured with Inside2 (10.10.12.7/24) and Outside2 (10.10.13.7/24)

Assume that you want the routes of warehouse (VR-W) to be leaked with sales (VR-S) and Global, and the outside interface routes of VR-S to VR-W. Similarly, you want the outside interface routes of the Global router to be leaked to sales (VR-S). This example demonstrates the BGP configuration procedure to achieve interconnecting the routers:

**Figure 387: Interconnect Virtual Routers using BGP Settings**

### Before you begin

- [Create the virtual routers](#)—VR-S and VR-W.
- Enable BGP and for each virtual router [Configure BGP for redistribution of connected routes](#).

### Procedure

#### Step 1

Configure VR-W to export its routes tagging them with a route target to VR-S:

- Choose **Devices > Device Management**, edit device, and then click the **Routing** tab.
- From the virtual router drop-down, select VR-W.

- c) Click **BGP > IPv4 > Route Import/Export**.
- d) To leak the VR-W routes to VR-S, tag the routes with a route target, so that the VR-W routes are exported to its BGP table with the route target marked on them. In the **Route Targets Export** field, enter a value, say, *200:200*. Click **Add**:

The screenshot shows the 'Manage Virtual Routers' configuration page for 'VR-W'. The left sidebar has a menu with 'Virtual Router Properties', 'ECMP', 'OSPF', 'BGP', and 'IPv4'. The 'BGP' section is expanded, and 'IPv4' is selected. The main area has tabs for 'General', 'Neighbor', 'Add Aggregate Address', 'Filtering', 'Networks', 'Redistribution', and 'Route Import/Export'. The 'Route Targets Export' field is set to '200:200'.

- e) From the virtual router drop-down, select VR-S.
- f) Click **BGP > IPv4 > Route Import/Export**.
- g) To receive the leaked routes from VR-W, configure the Import Route Target to import the VR-W routes that are marked with the route target from the (peer or redistributed) BGP table. In the **Route Targets Import** field, enter the same route target value that you had configured for VR-W, *200:200*. Click **Add**.

The screenshot shows the 'Manage Virtual Routers' configuration page for 'VR-S'. The left sidebar has a menu with 'Virtual Router Properties', 'ECMP', 'OSPF', 'BGP', and 'IPv4'. The 'BGP' section is expanded, and 'IPv4' is selected. The main area has tabs for 'General', 'Neighbor', 'Add Aggregate Address', 'Filtering', 'Networks', 'Redistribution', and 'Route Import/Export'. The 'Route Targets Import' field is set to '200:200'.

#### Note

If you want to conditionalize routes to be leaked from VR-W, you can specify the match criteria in the route map object, and choose it in the **User Virtual Router Export Route Map**. Similarly, if you want to conditionalize the routes to be imported to VR-S from the BGP table, you can use the **User Virtual Router Import Route Map**. This procedure is explained in Step 3.

## Step 2

Configure VR-W to export its routes to the Global virtual router:

- a) You need to create a route map that would allow the VR-W routes to be exported to the Global routing table. Choose **Objects > Object Management > Route Map**.
- b) Click **Add Route Map**, give a name, say *Export-to-Global*, and then click **Add**.
- c) Specify a **Sequence Number**, say 1, and then choose Allow from the **Redistribution** drop-down list:

New Route Map Object ?

Name  
Export-to-Global

▼ Entries (1) Add

Sequence No ▲	Redistribution
1	➔ Allow <span>✎</span> <span>🗑</span>

Allow Overrides  
☐

Cancel Save

d) Click **Save**.

In this example, all the VR-W routes are leaked to the Global routing table. Hence, no match criteria is configured for the route map.

- e) Navigate to the **Routing** tab of the device, and select VR-W. Click **BGP > IPv4 > Route Import/Export**.  
 f) From the **Global Virtual Router Export Route Map** drop-down list, choose Export-to-Global:

Enable IPv4: ☒

AS Number 100

General Neighbor Add Aggregate Address Filtering Networks Redistribution Route

Route Targets Import:

ASN:nn (or) ASN:nn,ASN:nn,ASN:nn Add

User Virtual Router

ASN:nn (or) ASN:nn,ASN:nn,ASN:nn Add

200:200

User Virtual Router

Export Route Map: --select--

Global Virtual Router

Export Route Map: Export-to-Global Export-to-Global

**Step 3** To leak only the Outside1 routes of VR-S to VR-W:

- a) From the virtual router drop-down, select VR-S.  
 b) Click **BGP > IPv4 > Route Import/Export**.  
 c) To leak the VR-S routes to VR-W, tag the routes with a route target, so that the VR-S routes are exported to its BGP table with the route target marked on them. In the **Route Targets Export** field, enter a value, say, *100:100*. Click **Add**.

- d) From the virtual router drop-down, select VR-W, and choose **BGP > IPv4 > Route Import/Export**.
- e) To receive the leaked routes from VR-S, configure the Import Route Target to import the VR-S routes that are marked with the route target from the (peer or redistributed) BGP table. In the **Route Targets Import** field, enter the VR-S route target value, *100:100*. Click **Add**.
- f) Now, you need to conditionalize that only the Outside1 routes of VR-S to be leaked to VR-W. Choose **Objects > Object Management > Prefix List > IPv4 Prefix List**.
- g) Click **Add IPv4 Prefix List**, give a name, say *VRS-Outside1-Only*, and then click **Add**.
- h) Specify a **Sequence Number**, say 1, and then choose Allow from the **Redistribution** drop-down list.
- i) Enter the IP Address (first two octets) of the VR-S Outside1 interface.
- j) Click **Save**.
- k) Create a route map with the match clause with the prefix list. Click **Route Map**. Click **Add Route Map**, give a name, say *Import-from-VRS*, and then click **Add**.
- l) Specify a **Sequence Number**, say 1, and then choose Allow from the **Redistribution** drop-down list.
- m) In the **Match Clause** tab, click **IPv4**. Under **Address** tab, click **Prefix List**.
- n) Under **Available IPv4 Prefix List**, select *VRS-Outside1-Only*, and then click **Add**.
- o) Click **Save**.
- p) Navigate to the **Routing** tab of the device, and select VR-W. Click **BGP > IPv4 > Route Import/Export**.
- q) From the **Global Virtual Router Import Route Map** drop-down list, choose *Import-from-VRS*:

The screenshot shows the configuration page for Virtual Router VR-W. The left sidebar shows the navigation menu with 'BGP' selected. The main content area has tabs for 'General', 'Neighbor', 'Add Aggregate Address', 'Filtering', 'Networks', 'Redistribution', and 'Route Import/Export'. The 'Route Targets Import' section has a text input field containing '100:100' and an 'Add' button. Below this is a 'User Virtual Router' section with an 'Import Route Map' dropdown menu showing 'Import-from-VRS'. The 'Global Virtual Router' section has an 'Export Route Map' dropdown menu showing 'Export-to-Global'.

#### Step 4 Configure VR-S to import the Outside routes of Global virtual router:

##### Note

To leak routes to or from a Global virtual router, you must configure the source or destination user defined virtual router respectively. Thus, in this example, VR-S is the destination router that imports the routes from Outside interface of the Global virtual router.

- a) Choose **Objects > Object Management > Prefix List > IPv4 Prefix List**.
- b) Click **Add IPv4 Prefix List**, give a name, say *Global-Outside-Only*, and then click **Add**.
- c) Specify a **Sequence Number**, say 1, and then choose Allow from the **Redistribution** drop-down list.

- d) Enter the IP Address (first two octets) of the Global Outside interface:

Add Prefix List Entry ?

Action:

Sequence No:  
  
Range: 1-4294967295

IP Addresses: (Limit 250) Address:  
  
Format: ipaddr/len (len<=32)

Min Prefix Length:  
  
Range: 1 - 32

Max Prefix Length:  
  
Range: 1 - 32

- e) Click **Save**.
- f) Click **Route Map**. Click **Add Route Map**, give a name, say *Import-from-Global*, and then click **Add**.
- g) Specify a **Sequence Number**, say 1, and then choose **Allow** from the **Redistribution** drop-down list.
- h) In the **Match Clause** tab, click **IPv4**. Under **Address** tab, click **Prefix List**.
- i) Under **Available IPv4 Prefix List**, select **Global-Outside-Only**, and then click **Add**:

Add Route Map Entry

Sequence No:

Redistribution:

Match Clauses    Set Clauses

Security Zones	Address (2)	Next Hop (0)	Route Source (0)

## History for Virtual Routers

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Virtual routing with dynamic VTI.	7.4	7.4	<p>You can now configure a virtual router with a dynamic VTI for a route-based site-to-site VPN.</p> <p>New/modified screens: <b>Devices &gt; Device management &gt; Edit Device &gt; Routing &gt; Virtual Router Properties &gt; Dynamic VTI interfaces under Available Interfaces</b></p> <p>Platform restrictions: Supported only on native mode standalone or high availability devices. Not supported for container instances or clustered devices.</p>
Virtual router support for the ISA 3000.	7.0	7.0	You can configure up to 10 virtual routers on the ISA 3000.
SNMP support on user-defined virtual routers	7.0	7.0	You can now configure SNMP on user-defined virtual routers.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Bulk removal of virtual routers.	6.7	6.6	<p>You can remove multiple virtual routers from threat defense at a time.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Routing &gt; Manage Virtual Routers</b></p>
Virtual routers and VRF-Lite for threat defense.	6.6	6.6	<p>You can now create multiple virtual routers to maintain separate routing tables for groups of interfaces. Because each virtual router has its own routing table, you can provide clean separation in the traffic flowing through the device. Virtual routers implement the “light” version of Virtual Routing and Forwarding, or VRF-Lite, which does not support Multiprotocol Extensions for BGP (MBGP). The maximum number of virtual routers you can create ranges from five to 100, and depends on the device model..</p> <p>New/modified screens: <b>Devices &gt; Device Management</b> edit device <b>Routing</b> tab</p> <p>New/modified CLI commands: .</p> <ul style="list-style-type: none"> <li>• <b>show vrf</b></li> <li>• Added the <code>[vrf name   all]</code> keyword set to these CLI commands, and changed the output to indicate virtual router information where applicable: <b>clear ospf</b>, <b>clear route</b>, <b>ping</b>, <b>show asp table routing</b>, <b>show bgp</b>, <b>show ipv6 route</b>, <b>show ospf</b>, <b>show route</b>, <b>show snort counters</b></li> </ul> <p>Platform restrictions: Not supported on the Firepower 1010 and ISA 3000.</p>

## CHAPTER 25

# ECMP

This chapter describes the procedure to configure Equal Cost Multi-Path (ECMP) routing that routing protocols use to load balance the network traffic.

- [About ECMP, on page 1109](#)
- [Guidelines and Limitations for ECMP, on page 1109](#)
- [Manage ECMP Page, on page 1110](#)
- [Create an ECMP Zone, on page 1111](#)
- [Configure an Equal Cost Static Route, on page 1112](#)
- [Modify an ECMP Zone, on page 1113](#)
- [Remove an ECMP Zone, on page 1113](#)
- [Configuration Example for ECMP, on page 1114](#)
- [History for ECMP in Secure Firewall Threat Defense, on page 1117](#)

## About ECMP

The Firewall Threat Defense device supports Equal-Cost Multi-Path (ECMP) routing. You can configure traffic zones per virtual router to contain a group of interfaces. You can have up to 8 equal cost static or dynamic routes across up to 8 interfaces within each zone. For example, you can configure multiple default routes across three interfaces in the zone:

```
route for 0.0.0.0 0.0.0.0 through outside1 to 10.1.1.2
route for 0.0.0.0 0.0.0.0 through outside2 to 10.2.1.2
route for 0.0.0.0 0.0.0.0 through outside3 to 10.3.1.2
```

## Guidelines and Limitations for ECMP

### Firewall Mode Guidelines

ECMP zones are supported on routed firewall mode only.

### Interface Guidelines

dVTI and Loopback interfaces are not supported.

### Additional Guidelines

- A device can have a maximum of 256 ECMP zones.
- You can associate only 8 interfaces per ECMP zone.
- An interface can be a member of only one ECMP zone.
- You cannot remove an interface that is associated with an equal cost static route from the ECMP zone.
- You cannot delete an ECMP zone if its interface has equal cost static routes associated with it.
- Only routed interfaces can be associated with an ECMP zone.
- The following interfaces cannot be associated with an ECMP zone:
  - BVI interface.
  - Member interfaces in an EtherChannel.
  - Failover or state link interface.
  - Management-only or management-access interfaces.
  - Cluster control link interface.
  - VNIs.
  - VLAN interfaces.
  - Interfaces in a remote access VPN configuration with SSL enabled.
- DHCP Relay is not supported on interfaces in an ECMP zone.
- Dual ISP/WAN Firewall Threat Defense Deployment—Create a single ECMP zone for the primary and secondary data interfaces. This configuration enables creation of static routes for both the interfaces with same metric values.
- The Firewall Threat Defense does not support ECMP with NAT in IPsec sessions—a standard IPsec virtual private network (VPN) tunnel does not work with NAT points in the delivery path of IPsec packets.

## Manage ECMP Page

When you click **ECMP** on the Routing pane, the ECMP page appears corresponding to the virtual router. This page displays the existing ECMP zones with the associated interfaces of the virtual router. In this page, you can Add an ECMP zone to the virtual router. You can also **Edit** (✎) and **Delete** (🗑) ECMP.

You can perform the following:

- [Create an ECMP Zone, on page 1111](#)
- [Configure an Equal Cost Static Route, on page 1112](#)
- [Modify an ECMP Zone, on page 1113](#)
- [Remove an ECMP Zone, on page 1113](#)

# Create an ECMP Zone

ECMP zones are created per virtual router. Thus, only the interfaces of the virtual router where the ECMP is being created can be associated with the ECMP.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** From the virtual router drop-down, select the virtual router in which you want to create the ECMP zone.
- You can create ECMP zones in global virtual router and user-defined virtual routers. For information on creating virtual routers, see [Create a Virtual Router, on page 1064](#).
- Step 4** Click **ECMP**.
- Step 5** Click **Add**.
- Step 6** In the **Add ECMP** box, enter a name for the ECMP zone.
- Note**  
The ECMP name must be unique for the routed device.
- Step 7** To associate interfaces, select the interface under the **Available Interfaces** box, and then click **Add**.
- Remember the following:
- Only interfaces belonging to the virtual router are available for assigning.
  - Only interfaces with a logical name are listed under the **Available Interfaces** box. You can edit the interface and provide a logical name in **Interfaces**. Remember to save the changes for the settings to take effect.
- Step 8** Click **OK**.
- The ECMP page now displays the newly created ECMP.
- Step 9** Click **Save** and **Deploy** the configuration.
- 

You can associate the ECMP zone interfaces with equal cost static route by defining them with same destination and metric value, but with different gateway.

## What to do next

- [Configure an Equal Cost Static Route, on page 1112](#)
- [Modify an ECMP Zone, on page 1113](#)
- [Remove an ECMP Zone, on page 1113](#)

# Configure an Equal Cost Static Route

Smart License	Classic License	Supported Devices	Supported Domains	Access
Any	N/A	Firewall Threat Defense and Firewall Threat Defense Virtual	Any	Admin/Network Admin/Security Approver

You can assign interfaces of a virtual router, both global and user-defined, to an ECMP zone for the device.

## Before you begin

- To configure an equal cost static route for an interface, ensure to associate it with an ECMP zone. See [Create an ECMP Zone, on page 1111](#).
- All routing configuration settings of a non-VRF capable device are also available for a global virtual router.
- You cannot define a static route for interfaces with same destination and metric without associating the interfaces with an ECMP zone.

## Procedure

- 
- Step 1** From the **Devices > Device Management** page, edit the Firewall Threat Defense device. Click the **Routing** tab.
- Step 2** From the drop-down list, select the virtual router whose interfaces are associated with an ECMP zone.
- Step 3** To configure the equal cost static route for the interfaces, click **Static Route**.
- Step 4** Either click **Add Route** to add a new route, or click **Edit** (✎) for an existing route.
- Step 5** From the **Interface** drop-down, select the interface belonging to the virtual router and an ECMP zone.
- Step 6** Select the destination network from the **Available Networks** box and click **Add**.
- Step 7** Enter a gateway for the network.
- Step 8** Enter a metric value. It can be a number that ranges between 1 and 254.
- Step 9** To save the settings, click **Save**.
- Step 10** To configure equal cost static routing, repeat the steps to configure the static route for another interface in the same ECMP zone with the same destination network and metric value. Remember to provide a different gateway.
- 

## What to do next

- [Modify an ECMP Zone, on page 1113](#)
- [Remove an ECMP Zone, on page 1113](#)

# Modify an ECMP Zone

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **ECMP**.
- ECMP zones with its associated interfaces are displayed in the **ECMP** page.
- Step 4** To modify an ECMP, click **Edit** (✎) against the desired ECMP. In the **Edit ECMP** box, you can do the following:
- **ECMP Name**—Ensure that the changed name is unique for the device.
  - **Interfaces**—You can add or remove interfaces. You cannot include an interface that is already associated with another ECMP. In addition, you cannot remove the interface that is associated with an equal cost static route.
- Step 5** Click **OK**.
- Step 6** To save the changes, click **Save**.
- 

## What to do next

- [Configure an Equal Cost Static Route, on page 1112](#)
- [Remove an ECMP Zone, on page 1113](#)

# Remove an ECMP Zone

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** Click **ECMP**.
- ECMP zones with its associated interfaces are displayed in the **ECMP** page.
- Step 4** To remove an ECMP zone, click **Delete** (🗑) against the ECMP zone.
- You cannot delete the ECMP zone if any of its interfaces are associated with an equal cost static route.
- Step 5** Click **Delete** in the confirmation message.

**Step 6** To save the changes, click **Save**.

## Configuration Example for ECMP

This example demonstrates how to use Firewall Management Center to configure ECMP zones on Firewall Threat Defense such that the traffic flowing through the device is handled efficiently. With ECMP configured, Firewall Threat Defense maintains the routing table per zone basis, and hence it makes it possible to re-route the packets in the best possible routes. Thus, ECMP supports asymmetric routing, load balancing, and handles lost traffic seamlessly. In this example, R4 records the two paths to reach the external file server.

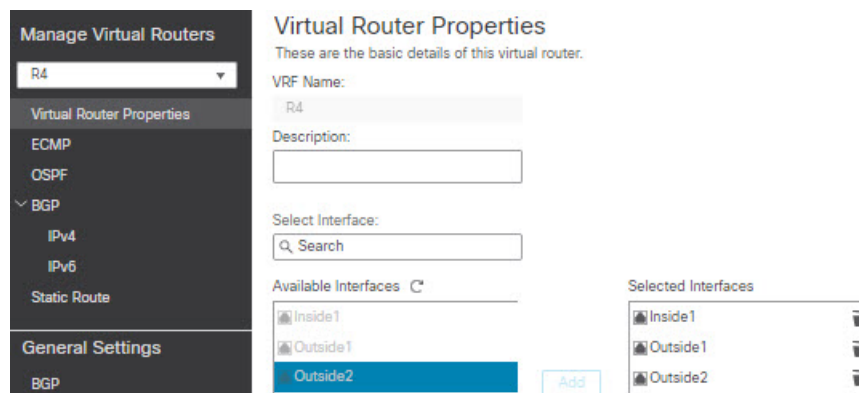

**Figure 388: Configuration Example for ECMP**

### Procedure

**Step 1** Create virtual router—R4 with *Inside1*, *Outside1*, and *Outside2* interfaces:

**Figure 389: Configuring R4 Virtual Router**

**Step 2** Create ECMP zones:

- a) In the **Routing** tab, choose R4 user defined virtual router, and then click **ECMP**.

- b) Click **Add**.
- c) Enter the ECMP name and from the **Available Interfaces** list, choose *Outside1* and *Outside2*:

**Figure 390: Creating ECMP Zone**

Add ECMP

Name

ECMP-R4

Associate Interfaces with ECMP

You can add interfaces to this ECMP by clicking on Add button. ECMP can have up to 8 interfaces associated with it. All the interfaces in the ECMP must have a name and security level as this ECMP.

Available Interfaces

Inside1

Add

Selected Interfaces

Outside1

Outside2

Cancel OK

- d) Click **Ok**, and then **Save**.

### Step 3

Create static routes for the zone interfaces:

- a) In the **Routing** tab, click **Static Route**.
- b) From the **Interface** drop-down list, select *Outside1*.
- c) Under **Available Network**, choose any-ipv4 and click **Add**.
- d) Specify the next-hop address in the **Gateway** field, 10.1.1.2:

**Figure 391: Configuring Static Route for Outside1**

**Add Static Route Configuration**

Type: ☒ IPv4 ☐ IPv6

Interface\*: Outside1

(Interface starting with this icon signifies it is available for route leak)

Available Network Q Search Add

- any-ipv4
- IPv4-Benchmark-Tests
- IPv4-Link-Local
- IPv4-Multicast
- IPv4-Private-10.0.0.0-8
- IPv4-Private-172.16.0.0-11

Selected Network

any-ipv4

Gateway\* 10.1.1.2 +

Metric: 1

(1 - 254)

Tunneled: ☐ (Used only for default Route)

Route Tracking:  +

Cancel OK

- e) Configure the static route for Outside2, repeating from Step 3b to Step 3d. Ensure to specify same metric, but different gateways for the static routes:

**Figure 392: Configured Static Routes of ECMP Zone Interfaces**

+ Add Route

Network	Interface	Leaked from Virtual Router	Gateway	Tunneled	Metric	Tracked	
IPv4 Routes							
any-ipv4	Outside1		10.1.1.2	false	1		
any-ipv4	Outside2		10.1.3.2	false	1		
IPv6 Routes							

#### Step 4 Save and Deploy.

The network packets to reach its destination, R3, follows R4>R1>R3 or R4>R2>R3, based on the ECMP algorithm. If R1>R3 route is lost, the traffic flows through R2 without any packet drops. Similarly, the response from R3 can be received by *Outside2* though the packet was sent from *Outside1*. In addition, when the network traffic is heavy, R4 distributes them between the two routes and thus balances the load.

## History for ECMP in Secure Firewall Threat Defense

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
ECMP support as Routing Policy	7.1	Any	Secure Firewall Threat Defense was supporting ECMP routing through FlexConfig policies. From this release, you can group interfaces in to traffic zones and configure ECMP routing in Secure Firewall Management Center.  New/modified screens: <b>Devices &gt; Device Management &gt; Routing &gt; ECMP</b>

## CHAPTER 26

# Bidirectional Forwarding Detection Routing

This chapter describes how to configure Firewall Threat Defense to use the Bidirectional Forwarding Detection (BFD) routing protocol.

- [About BFD Routing, on page 1119](#)
- [Guidelines for BFD Routing, on page 1119](#)
- [Configure BFD, on page 1121](#)
- [History for BFD Routing, on page 1123](#)

## About BFD Routing

BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols. BFD operates in a unicast, point-to-point mode on top of any data protocol being forwarded between two systems. Packets are carried in the payload of the encapsulating protocol appropriate for the media and the network.

BFD provides a consistent failure detection method for network administrators in addition to fast forwarding path failure detection. Because the network administrator can use BFD to detect forwarding path failures at a uniform rate, rather than the variable rates for different routing protocol hello mechanisms, network profiling and planning are easier and reconvergence time is consistent and predictable.

## Guidelines for BFD Routing

### Context Mode Guidelines

BFD is supported on all Firewall Threat Defense platforms. It is supported in multi-instance mode.

### Firewall Mode Guidelines

Supported in routed firewall mode and not in transparent mode.

### Failover and Cluster Guidelines

- BFD is not supported on failover interfaces.
- In clustering, BFD is supported only on the control node.

### Routing and Protocol Guidelines

- OSPFv2, OSPFv3, IS-IS, BGP IPv4, and BGP IPv6 protocol are supported.

**Note** For optimal routing, do not configure BFD when BGP graceful restart for NSF is configured on the device.

For BFD support on IS-IS, using FlexConfig CLI configure BFD on IS-IS interfaces (Physical Interfaces, Sub-Interfaces, Port-Channels only):

```
For IPv6
###Flex-config Appended CLI###

router isis
 net 11.1111.0000.0000.0001.00
exit
interface GigabitEthernet x/x
 ipv6 router isis
  isis ipv6 bfd
exit

For IPv4
###Flex-config Appended CLI###

router isis
 net 11.1111.0000.0000.0001.00
exit
interface GigabitEthernet x/x
 isis
  isis bfd
exit
```

EIGRP protocol is not supported.

- BFD for static routes is not supported. You can configure BFD on interfaces that belong only to virtual routers.
- Only named interfaces are supported.
- BFD on BVI, VTI, and loopback interfaces are not supported.

### Single-hop Guidelines

- Echo mode is disabled by default. You can enable echo mode on single-hop only.
- Echo mode is not supported for IPv6.
- Use only a single-hop template to configure a single-hop policy.
- Authentication of the single-hop template is optional.
- You cannot configure multiple BFDs on the same interface.

### Multi-hop Guidelines

- Do not configure the source IP address also as the destination IP address.
- Source and destination address should have same IP type—IPv4 or IPv6.

- Only network objects of host or network type are allowed.
- Use only a multi-hop template to configure a multi-hop policy.
- Authentication is mandatory for the multi-hop template.

### Upgrade Guidelines

When you upgrade to version 7.3 and when the previous version has any FlexConfig BFD policies, the management center displays a warning message during deployment. However, it does not stop the deployment process. After post-upgrade deployment, to manage the BFD policies from the UI ( **Device (Edit) > Routing > BFD** ), you must configure BFD policies in the **Device (Edit) > Routing > BFD** page and remove the configuration from the FlexConfig policy for the device.

## Configure BFD

This section describes how to enable and configure the BFD routing policy on your system.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Create <a href="#">BFD Template</a> , on page 1256.   |
| <b>Step 2</b> | <a href="#">Configure BFD Policies</a> , on page 1121.  |
| <b>Step 3</b> | Configure BFD support in the BGP neighbor settings; see, <a href="#">Step 12</a> , on page 1174 |
- 

## Configure BFD Policies

You can bind a BFD template to an interface belonging to a virtual router, or to a source and destination address pair.

### Before you begin

- BFD policy is configurable only on interfaces that belong to virtual routers. See [Configure interfaces to a virtual router](#).

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | From the <b>Devices &gt; Device Management</b> page, edit the virtual-router supported device. Navigate to <b>Routing</b> . |
| <b>Step 2</b> | From the drop-down list, select the desired virtual router, and then click <b>BFD</b> .                                     |
| <b>Step 3</b> | To configure a BFD on the interface, click the <b>Single-Hop</b> tab or <b>Multi-Hop</b> tab.                               |

### Note

For a single-hop policy, the BFD template is configured on an interface; for a multi-hop policy, the BFD template is configured on a source and destination address pair.

**Step 4** Click **Add**. To modify the configured BFD policy, click **Edit** (✎).

**Note**

When you edit the interface mapping with BFD template to replace it with a new BFD template, the Firewall Management Center uses a **no** command to remove the template mapping from interface and applies the new template to the interface which causes a BFD flap which may also lead to an OSPFv2, OSPFv3, or BGP flap. However, if the BFD intervals are higher, the BFD flap might not occur. Alternatively, to avoid the flapping, you can delete the existing BFD template mapping; deploy the interface, and then add the new BFD template to the interface and deploy the configuration.

- See [Configure Single-Hop BFD Policies, on page 1122](#).
- See [Configure Multi-Hop BFD Policies, on page 1122](#).

---

## Configure Single-Hop BFD Policies

You can configure a single-hop BFD policy only on an interface that is belonging to a virtual router.

**Before you begin**

- [Create single-hop BFD templates](#). You cannot configure single-hop BFD policy on interfaces using a multi-hop template.

**Procedure**

---

**Step 1** In the **Single-Hop** tab, click **Add** or **Edit**.

**Step 2** In the **Add BFD Single-Hop** dialog box, configure the following:

- a) In the **Interface** drop-down list, interfaces belonging to virtual routers are listed. Select the interface you want to configure with the BFD policy.
- b) In the **Template Name** drop-down list, single-hop templates are listed. Select the template that you want to apply.

If you have not created a single-hop template, use **Add** (+) and [create a single-hop BFD template](#).

**Step 3** Click **OK** and **Save** the configuration.

---

## Configure Multi-Hop BFD Policies

You can configure multi-hop BFD policy on a source and destination address pair.

**Before you begin**

- [Create multi-hop BFD templates](#). You cannot configure multi-hop BFD policy using a single-hop template.

## Procedure

### Step 1

In the **Add BFD Multi-Hop** dialog box, configure the following:

- Click the BFD source address type—**IPv4** or **IPv6** radio button.
- In the **Source Address** drop-down list, network objects are listed. Select the source address that you want to configure for the BFD policy. You cannot choose *any-ipv4* or *any-ipv6*.

If you have not created the required network object, use **Add (+)** and create a host/network object.

#### Note

The created network object's IP type should match with the selected source IP type.

- In the **Destination Address** drop-down list, network objects are listed. Select the destination address that you want to configure for the BFD. You cannot choose *any-ipv4* or *any-ipv6*.

If you have not created the required network object, use **Add (+)** and create a host/network object.

#### Note

The created network object's IP type should match with the selected source IP type.

#### Attention

Do not select the network object that has the same IP address as that of the source address.

- In the **Template Name** drop-down list, multi-hop templates are listed. Select the template that you want to apply on the BFD policy.

If you have not created a multi-hop template, use **Add (+)** and [create a multi-hop BFD template](#).

### Step 2

Click **OK** and **Save** the configuration.

The multi-hop map (table view) is displayed on the **Multi-Hop** tab page.

## History for BFD Routing

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
BFD support for IS-IS	7.4	7.4	You can configure BFD on IS-IS interfaces using FlexConfig CLI.
BFD support for OSPF	7.4	7.4	<p>You can enable BFD on OSPFv2 and OSPFv3 interfaces.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li><b>Configuration &gt; Device Setup &gt; Routing &gt; OSPFv2</b></li> <li><b>Configuration &gt; Device Setup &gt; Routing &gt; OSPFv3</b></li> </ul>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
BFD configuration	7.4	7.4	<p>In the previous releases, BFD was configurable on threat defense only through FlexConfig. FlexConfig no longer supports BFD configuration. You can now configure BFD policies for threat defense in the management center UI. In threat defense, BFD is supported only on the BGP protocol.</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Routing &gt; BFD.</b></p>

## OSPF

This chapter describes how to configure the Firewall Threat Defense to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

- [OSPF, on page 1125](#)
- [Requirements and Prerequisites for OSPF, on page 1128](#)
- [Guidelines for OSPF, on page 1128](#)
- [Configure OSPFv2, on page 1131](#)
- [Configure OSPFv3, on page 1143](#)
- [History for OSPF, on page 1153](#)

## OSPF

This chapter describes how to configure the Firewall Threat Defense to route data, perform authentication, and redistribute routing information using the Open Shortest Path First (OSPF) routing protocol.

## About OSPF

OSPF is an interior gateway routing protocol that uses link states rather than distance vectors for path selection. OSPF propagates link-state advertisements rather than routing table updates. Because only LSAs are exchanged instead of the entire routing tables, OSPF networks converge more quickly than RIP networks.

OSPF uses a link-state algorithm to build and calculate the shortest path to all known destinations. Each router in an OSPF area contains an identical link-state database, which is a list of each of the router usable interfaces and reachable neighbors.

The advantages of OSPF over RIP include the following:

- OSPF link-state database updates are sent less frequently than RIP updates, and the link-state database is updated instantly, rather than gradually, as stale information is timed out.
- Routing decisions are based on cost, which is an indication of the overhead required to send packets across a certain interface. The Firewall Threat Defense device calculates the cost of an interface based on link bandwidth rather than the number of hops to the destination. The cost can be configured to specify preferred paths.

The disadvantage of shortest path first algorithms is that they require a lot of CPU cycles and memory.

The Firewall Threat Defense device can run two processes of OSPF protocol simultaneously on different sets of interfaces. You might want to run two processes if you have interfaces that use the same IP addresses (NAT allows these interfaces to coexist, but OSPF does not allow overlapping addresses). Or you might want to run one process on the inside and another on the outside, and redistribute a subset of routes between the two processes. Similarly, you might need to segregate private addresses from public addresses.

You can redistribute routes into an OSPF routing process from another OSPF routing process, a RIP routing process, or from static and connected routes configured on OSPF-enabled interfaces.

The Firewall Threat Defense device supports the following OSPF features:

- Intra-area, inter-area, and external (Type I and Type II) routes.
- Virtual links.
- LSA flooding.
- Authentication to OSPF packets (both password and MD5 authentication).
- Configuring the Firewall Threat Defense device as a designated router or a designated backup router. The Firewall Threat Defense device also can be set up as an ABR.
- Stub areas and not-so-stubby areas.
- Area boundary router Type 3 LSA filtering.

OSPF supports MD5 and clear text neighbor authentication. Authentication should be used with all routing protocols when possible because route redistribution between OSPF and other protocols (such as RIP) can potentially be used by attackers to subvert routing information.

If NAT is used, if OSPF is operating on public and private areas, and if address filtering is required, then you need to run two OSPF processes—one process for the public areas and one for the private areas.

A router that has interfaces in multiple areas is called an Area Border Router (ABR). A router that acts as a gateway to redistribute traffic between routers using OSPF and routers using other routing protocols is called an Autonomous System Boundary Router (ASBR).

An ABR uses LSAs to send information about available routes to other OSPF routers. Using ABR Type 3 LSA filtering, you can have separate private and public areas with the ASA acting as an ABR. Type 3 LSAs (inter-area routes) can be filtered from one area to other, which allows you to use NAT and OSPF together without advertising private networks.

---

**Note** Only Type 3 LSAs can be filtered. If you configure the Firewall Threat Defense device as an ASBR in a private network, it will send Type 5 LSAs describing private networks, which will get flooded to the entire AS, including public areas.

---

If NAT is employed but OSPF is only running in public areas, then routes to public networks can be redistributed inside the private network, either as default or Type 5 AS external LSAs. However, you need to configure static routes for the private networks protected by the Firewall Threat Defense device. Also, you should not mix public and private networks on the same Firewall Threat Defense device interface.

You can have two OSPF routing processes, one RIP routing process, and one EIGRP routing process running on the Firewall Threat Defense device at the same time.

## OSPF Support for Fast Hello Packets

The OSPF Support for Fast Hello Packets feature provides a way to configure the sending of hello packets in intervals less than one second. Such a configuration would result in faster convergence in an Open Shortest Path First (OSPF) network.

### Prerequisites for OSPF Support for Fast Hello Packets

OSPF must be configured in the network already or configured at the same time as the OSPF Support for Fast Hello Packets feature.

### OSPF Hello Interval and Dead Interval

OSPF hello packets are packets that an OSPF process sends to its OSPF neighbors to maintain connectivity with those neighbors. The hello packets are sent at a configurable interval (in seconds). The defaults are 10 seconds for an Ethernet link and 30 seconds for a non broadcast link. Hello packets include a list of all neighbors for which a hello packet has been received within the dead interval. The dead interval is also a configurable interval (in seconds), and defaults to four times the value of the hello interval. The value of all hello intervals must be the same within a network. Likewise, the value of all dead intervals must be the same within a network.

These two intervals work together to maintain connectivity by indicating that the link is operational. If a router does not receive a hello packet from a neighbor within the dead interval, it will declare that neighbor to be down.

### OSPF Fast Hello Packets

OSPF fast hello packets refer to hello packets being sent at intervals of less than 1 second. To understand fast hello packets, you should already understand the relationship between OSPF hello packets and the dead interval. See [OSPF Hello Interval and Dead Interval, on page 1127](#).

OSPF fast hello packets are achieved by using the `ospf dead-interval` command. The dead interval is set to 1 second, and the hello-multiplier value is set to the number of hello packets you want sent during that 1 second, thus providing subsecond or "fast" hello packets.

When fast hello packets are configured on the interface, the hello interval advertised in the hello packets that are sent out this interface is set to 0. The hello interval in the hello packets received over this interface is ignored.

The dead interval must be consistent on a segment, whether it is set to 1 second (for fast hello packets) or set to any other value. The hello multiplier need not be the same for the entire segment as long as at least one hello packet is sent within the dead interval.

### Benefits of OSPF Fast Hello Packets

The benefit of the OSPF Fast Hello Packets feature is that your OSPF network will experience faster convergence time than it would without fast hello packets. This feature allows you to detect lost neighbors within 1 second. It is especially useful in LAN segments, where neighbor loss might not be detected by the Open System Interconnection (OSI) physical layer and data-link layer.

## Implementation Differences Between OSPFv2 and OSPFv3

OSPFv3 is not backward compatible with OSPFv2. To use OSPF to route both IPv4 and IPv6 traffic, you must run both OSPFv2 and OSPFv3 at the same time. They coexist with each other, but do not interact with each other.

The additional features that OSPFv3 provides include the following:

- Protocol processing per link.
- Removal of addressing semantics.
- Addition of flooding scope.
- Support for multiple instances per link.
- Use of the IPv6 link-local address for neighbor discovery and other features.
- LSAs expressed as prefix and prefix length.
- Addition of two LSA types.
- Handling of unknown LSA types.
- Authentication support using the IPsec ESP standard for OSPFv3 routing protocol traffic, as specified by RFC-4552.

## Requirements and Prerequisites for OSPF

### Model Support

Threat Defense

Firewall Threat Defense Virtual

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Guidelines for OSPF

### Firewall Mode Guidelines

OSPF supports routed firewall mode only. OSPF does not support transparent firewall mode.

### High Availability Guidelines

OSPFv2 and OSPFv3 support Stateful High Availability.

### IPv6 Guidelines

- OSPFv2 does not support IPv6.
- OSPFv3 supports IPv6.
- OSPFv3 uses IPv6 for authentication.
- The Firewall Threat Defense device installs OSPFv3 routes into the IPv6 RIB, provided it is the best route.

### OSPFv3 Hello Packets and GRE

Typically, OSPF traffic does not pass through GRE tunnel. When OSPFv3 on IPv6 is encapsulated inside GRE, the IPv6 header validation for security check such as Multicast Destination fails. The packet is dropped due to the implicit security check validation, as this packet has destination IPv6 multicast.

You may define a pre-filter rule to bypass GRE traffic. However, with pre-filter rule, inner packets would not be interrogated by the inspection engine.

### Clustering Guidelines

- OSPFv3 encryption is not supported. An error message appears if you try to configure OSPFv3 encryption in a clustering environment.
- In Spanned interface mode, dynamic routing is not supported on management-only interfaces.
- In Individual interface mode, make sure that you establish the control and data units as either OSPFv2 or OSPFv3 neighbors.
- In Individual interface mode, OSPFv2 adjacencies can only be established between two contexts on a shared interface on the control unit. Configuring static neighbors is supported only on point-to-point-links; therefore, only one neighbor statement is allowed on an interface.
- When a control role change occurs in the cluster, the following behavior occurs:
  - In spanned interface mode, the router process is active only on the control unit and is in a suspended state on the data units. Each cluster unit has the same router ID because the configuration has been synchronized from the control unit. As a result, a neighboring router does not notice any change in the router ID of the cluster during a role change.
  - In individual interface mode, the router process is active on all the individual cluster units. Each cluster unit chooses its own distinct router ID from the configured cluster pool. A control role change in the cluster does not change the routing topology in any way.

### Multiprotocol Label Switching (MPLS) and OSPF Guidelines

When a MPLS-configured router sends Link State (LS) update packets containing opaque Type-10 link-state advertisements (LSAs) that include an MPLS header, authentication fails and the appliance silently drops the update packets, rather than acknowledging them. Eventually the peer router will terminate the neighbor relationship because it has not received any acknowledgments.

Make sure that non-stop forwarding (NSF) is disabled on the appliance to ensure that the neighbor relationship remains stable:

- Navigate to the **Non Stop Forwarding** page in Firewall Management Center(**Devices > Device Management (select the desired device) > Routing > OSPF > Advanced > Non Stop Forwarding** ).

Ensure the **Non Stop Forwarding Capability** boxes are not checked.

**Note** The Firepower 4100/9300 models may have high latency when using MPLS because they lack load balancing across multiple receiving queues.

### Bidirectional and Forwarding Detection (BFD) and OSPF Guidelines

- You can enable BFD on OSPFv2 and OSPFv3 interfaces (Physical Interfaces, Sub-Interfaces, and Port-Channels).
- BFD is not supported on VTI Tunnels, DVTI Tunnels, Loopback, Switchport, VNI, VTEP, and IRB interfaces.

### Route Redistribution Guidelines

- Redistribution of route maps with IPv4 prefix list on OSPFv2 is supported. However, redistribution of route maps with IPv6 prefix list on OSPFv3 is not supported. Use an access list in the route map on OSPF for redistribution.
- When OSPF is configured on a device that is a part of EIGRP network or vice versa, ensure that OSPF-router is configured to tag the route (EIGRP does not support route tag yet).

When redistributing OSPF into EIGRP and EIGRP into OSPF, a routing loop occurs when there is an outage on one of the links, interfaces, or even when the route originator is down. To prevent the redistribution of routes from one domain back into the same domain, a router can tag a route that belongs to a domain while it is redistributing, and those routes can be filtered on the remote router based on the same tag. Because the routes will not be installed into the routing table, they will not be redistributed back into the same domain.

### Additional Guidelines

- OSPFv2 and OSPFv3 support multiple instances on an interface.
- OSPFv3 supports encryption through ESP headers in a non-clustered environment.
- OSPFv3 supports Non-Payload Encryption.
- OSPFv2 supports Cisco NSF Graceful Restart and IETF NSF Graceful Restart mechanisms as defined in RFCs 4811, 4812 & 3623 respectively.
- OSPFv3 supports Graceful Restart mechanism as defined in RFC 5187.
- There is a limit to the number of intra area (type 1) routes that can be distributed. For these routes, a single type-1 LSA contains all prefixes. Because the system has a limit of 35 KB for packet size, 3000 routes result in a packet that exceeds the limit. Consider 2900 type 1 routes to be the maximum number supported.

- For a device using virtual routing, you can configure OSPFv2 and OSPFv3 for a global virtual router. However, you can configure only OSPFv2 for a user-defined virtual router.
- To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.
- OSPFv3 drops the LS update if the packet size exceeds 8190. As a result, the neighbourship is terminated. Hence, configure the switch with the “ospfv3 mtu-ignore” command to avoid neighbourship termination.

## Configure OSPFv2

This section describes the tasks involved in configuring an OSPFv2 routing process. For a device using virtual routing, you can configure OSPFv2 for global as well as for user-defined virtual routers.

## Configure OSPF Areas, Ranges, and Virtual Links

You can configure several OSPF area parameters, which include setting authentication, defining stub areas, and assigning specific costs to the default summary route. You can enable up to two OSPF process instances. Each OSPF process has its own associated areas and networks. Authentication provides password-based protection against unauthorized access to an area.

Stub areas are areas into which information on external routes is not sent. Instead, there is a default external route generated by the ABR into the stub area for destinations outside the autonomous system. To take advantage of the OSPF stub area support, default routing must be used in the stub area.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> , and edit the Firewall Threat Defense device.  |
| <b>Step 2</b> | Click <b>Routing</b> .   |
| <b>Step 3</b> | (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.   |
| <b>Step 4</b> | Click <b>OSPF</b> .  |
| <b>Step 5</b> | Check the check box of <b>Process 1</b> . You can enable up to two OSPF process instances for each context/virtual router. You must choose an OSPF process to be able to configure the Area parameters.<br><br>If the device is using virtual routing, the ID fields display the unique process IDs generated for the chosen virtual router. |
| <b>Step 6</b> | Choose the <b>OSPF Role</b> from the drop-down list, and enter a description for it in the next field. The options are Internal, ABR, ASBR, and ABR & ASBR. See <a href="#">About OSPF, on page 1125</a> for a description of the OSPF roles.  |
| <b>Step 7</b> | Select <b>Area &gt; Add</b> .<br><br>You can click <b>Edit</b> (  ) , or use the right-click menu to cut, copy, past, insert, and delete areas.   |
| <b>Step 8</b> | Configure the following area options for each OSPF process: <ul style="list-style-type: none"><li>• <b>OSPF Process</b>—Choose the process ID. For a device using virtual routing, the drop-down lists the unique process IDs generated for the selected virtual router.</li></ul>   |

- **Area ID**—Designation of the area for which routes are to be summarized.
- **Area Type**—Choose one of the following:
  - **Normal**—(Default) Standard OSPF area.
  - **Stub**—A stub area does not have any routers or areas beyond it. Stub areas prevent Autonomous System (AS) External LSAs (Type 5 LSAs) from being flooded into the stub area. When you create a stub area, you can prevent summary LSAs (Types 3 and 4) from being flooded into the area by NOT checking the **Summary Stub** check box.
  - **NSSA**—Makes the area a not-so-stubby area (NSSA). NSSAs accept Type 7 LSAs. You can disable route redistribution by NOT checking the **Redistribute** check box and checking the **Default Information Originate** check box. You can prevent summary LSAs from being flooded into the area by NOT checking the **Summary NSSA** check box.
- **Metric Value**—The metric used for generating the default route. The default value is 10. Valid metric values range from 0 through 16777214.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
- **Available Network**—Choose one of the available networks and click **Add**, or click **Add (+)** to add a new network object. See [Network, on page 1281](#) for the procedure for adding networks.
- **Authentication**—Choose the OSPF authentication:
  - **None**—(Default) Disables OSPF area authentication.
  - **Password**—Provides a clear text password for area authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication.
- **Default Cost**—The default cost for the OSPF area, which is used to determine the shortest paths to the destination. Valid values range from 0 through 65535. The default value is 1.

**Step 9** Click **OK** to save the area configuration.

**Step 10** Select **Range > Add**.

- Choose one of the available networks and whether to advertise, or,
- Click **Add (+)** to add a new network object. See [Network, on page 1281](#) for the procedure for adding networks.

**Step 11** Click **OK** to save the range configuration.

**Step 12** Select **Virtual Link**, click **Add (+)**, and configure the following options for each OSPF process:

- **Peer Router**—Choose the IP address of the peer router. To add a new peer router, click **Add (+)**. See [Network, on page 1281](#) for the procedure for adding networks.
- **Hello Interval**—The time in seconds between the hello packets sent on an interface. The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all

routers and access servers on a specific network. Valid values range from 1 through 65535. The default is 10.

The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 through 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

- **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 through 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The dead interval is an unsigned integer. The default is four times the hello interval, or 40 seconds. The value must be the same for all routers and access servers that are attached to a common network. Valid values range from 1 through 65535.

- **Authentication**—Choose the OSPF virtual link authentication from the following:

- **None**—(Default) Disables virtual link area authentication.
- **Area Authentication**—Enables area authentication using MD5. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
- **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
- **MD5**—Allows MD5 authentication. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.

**Note**

Ensure to enter only numbers as the MD5 key ID.

- **Key Chain**—Allows key chain authentication. Click **Add**, and create the key chain, and then click **Save**. For detailed procedure, see [Creating Key Chain Objects, on page 1279](#). Use the same authentication type (MD5 or Key Chain) and key ID for the peers to establish a successful adjacency.

**Step 13** Click **OK** to save the virtual link configuration.

**Step 14** Click **Save** on the Routing page to save your changes.

---

### What to do next

Continue with [Configure OSPF Redistribution](#).

## Configure OSPF Redistribution

The Firewall Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by EIGRP, RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
  - Step 2** Click **Routing**.
  - Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.
  - Step 4** Click **OSPF**.
  - Step 5** From **OSPF Role** drop-down, choose role .
  - Step 6** Click **Redistribution > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.

- Step 7** Configure the following redistribution options for each OSPF process:
    - **OSPF Process**—Choose the process ID. For a device using virtual routing, this drop-down list displays the unique process IDs generated for the selected virtual router.
    - **Route Type**—Choose one of the following types:
      - **Static**—Redistributes static routes to the OSPF routing process.
      - **Connected**—Redistributes connected routes (routes established automatically by virtue of having the IP address enabled on the interface) to the OSPF routing process. Connected routes are redistributed as external to the device. You can select whether to use subnets under the Optional list.
      - **OSPF**—Redistributes routes from another OSPF routing process, for example, internal, external 1 and 2, NSSA external 1 and 2, or whether to use subnets. You can select these options under the Optional list.
      - **BGP**—Redistribute routes from the BGP routing process. Add the AS number and whether to use subnets.
      - **RIP**—Redistributes routes from the RIP routing process. You can select whether to use subnets under the Optional list.
- Note**  
As a user-defined virtual router does not support RIP, you cannot redistribute routes from RIP.
- **EIGRP**—Redistribute routes from the EIGRP routing process. Add the AS number and whether to use subnets.
  - **Metric Value**—Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.

When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
- **Tag Value**—Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.
- **RouteMap**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking **Add** (+). See [Configure Route Map Entry](#) to add a new route map.

**Step 8** Click **OK** to save the redistribution configuration.

**Step 9** Click **Save** on the Routing page to save your changes.

---

#### What to do next

Continue with [Configure OSPF Inter-Area Filtering, on page 1135](#).

## Configure OSPF Inter-Area Filtering

ABR type 3 LSA filtering extends the capability of an ABR that is running OSPF to filter type 3 LSAs between different OSPF areas. Once a prefix list is configured, only the specified prefixes are sent from one OSPF area to another OSPF area. All other prefixes are restricted to their OSPF area. You can apply this type of area filtering to traffic going into or coming out of an OSPF area, or to both the incoming and outgoing traffic for that area.

When multiple entries of a prefix list match a given prefix, the entry with the lowest sequence number is used. For efficiency, you may want to put the most common matches or denials near the top of the list by manually assigning them a lower sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.

#### Procedure

---

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.
- Step 4** Click **OSPF**.
- Step 5** Select **InterArea > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete inter-areas.

**Step 6**

Configure the following inter-area filtering options for each OSPF process:

- **OSPF Process**—For a device using virtual routing, the drop-down lists the unique process IDs generated for the selected virtual router.
- **Area ID**—The area for which routes are to be summarized.
- **PrefixList**—The name of the prefix. To add a new prefix list object, see Step 5.
- **Traffic Direction**—Inbound or outbound. Choose Inbound to filter LSAs coming into an OSPF area, or Outbound to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.

**Step 7**

Click **Add** (+), and enter a name for the new prefix list, and whether to allow overrides.

You must configure a prefix list before you can configure a prefix rule.

**Step 8**

Click **Add** to configure prefix rules, and configure the following parameters:

- **Action**—Select **Block** or **Allow** for the redistribution access.
- **Sequence No**—The routing sequence number. By default, sequence numbers are automatically generated in increments of 5, beginning with 5.
- **IP Address**—Specify the prefix number in the format of IP address/mask length.
- **Min Prefix Length**—(Optional) The minimum prefix length.
- **Max Prefix Length**—(Optional) The maximum prefix length.

**Step 9**

Click **OK** to save the inter-area filtering configuration.

**Step 10**

Click **Save** on the Routing page to save your changes.

**What to do next**

Continue with [Configure OSPF Filter Rules, on page 1136](#).

## Configure OSPF Filter Rules

You can configure ABR Type 3 LSA filters for each OSPF process. ABR Type 3 LSA filters allow only specified prefixes to be sent from one area to another area and restrict all other prefixes. You can apply this type of area filtering out of a specific OSPF area, into a specific OSPF area, or into and out of the same OSPF area at the same time. OSPF ABR Type 3 LSA filtering improves your control of route distribution between OSPF areas.

**Procedure****Step 1**

Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

- Step 2** Click **Routing**.
- Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.
- Step 4** Click **OSPF**.
- Step 5** Select **Filter Rule > Add**.
- You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete filter rules.
- Step 6** Configure the following filter rule options for each OSPF process:
- **OSPF Process**—For a device using virtual routing, the drop-down lists the unique process IDs generated for the selected virtual router.
  - **Access List**—The access list for this OSPF process. To add a new standard access list object, click **Add** (+) and see [Configure Standard ACL Objects, on page 1254](#).
  - **Traffic Direction**—Choose In or Out for the traffic direction being filtered. Choose In to filter LSAs coming into an OSPF area, or Out to filter LSAs coming out of an OSPF area. If you are editing an existing filter entry, you cannot modify this setting.
  - **Interface**—The interface for this filter rule.
- Step 7** Click **OK** to save the filter rule configuration.
- Step 8** Click **Save** on the Routing page to save your changes.
- 

#### What to do next

Continue with [Configure OSPF Summary Addresses, on page 1137](#).

## Configure OSPF Summary Addresses

When routes from other protocols are redistributed into OSPF, each route is advertised individually in an external LSA. However, you can configure the Firewall Threat Defense device to advertise a single route for all the redistributed routes that are included for a specified network address and mask. This configuration decreases the size of the OSPF link-state database. Routes that match the specified IP address mask pair can be suppressed. The tag value can be used as a match value for controlling redistribution through route maps.

Routes learned from other routing protocols can be summarized. The metric used to advertise the summary is the smallest metric of all the more specific routes. Summary routes help reduce the size of the routing table.

Using summary routes for OSPF causes an OSPF ASBR to advertise one external route as an aggregate for all redistributed routes that are covered by the address. Only routes from other routing protocols that are being redistributed into OSPF can be summarized.

#### Procedure

---

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.

**Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.

**Step 4** Click **OSPF**.

**Step 5** Select **Summary Address > Add**.

You can click **Edit** (✎) to edit, or use the right-click menu to cut, copy, past, insert, and delete summary addresses.

**Step 6** Configure the following summary address options for each OSPF process:

- **OSPF Process**—For a device using virtual routing, the drop-down lists the unique process IDs generated for the selected virtual router.
- **Available Network**—The IP address of the summary address. Select one from the Available networks list and click **Add**, or to add a new network, click **Add** (+). See [Network, on page 1281](#) for the procedure for adding networks.
- **Tag**—A 32-bit decimal value that is attached to each external route. This value is not used by OSPF itself, but may be used to communicate information between ASBRs.
- **Advertise**—**Advertises** the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

**Step 7** Click **OK** to save the summary address configuration.

**Step 8** Click **Save** on the Routing page to save your changes.

---

### What to do next

Continue with [Configure OSPF Interfaces and Neighbors, on page 1138](#).

## Configure OSPF Interfaces and Neighbors

You can change some interface-specific OSPFv2 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval, the dead interval, and the authentication key. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

You need to define static OSPFv2 neighbors to advertise OSPFv2 routes over a point-to-point, non-broadcast network. This feature lets you broadcast OSPFv2 advertisements across an existing VPN connection without having to encapsulate the advertisements in a GRE tunnel.

### Procedure

---

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Click **Routing**.

**Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.

**Step 4** Click **OSPF**.

**Step 5** Select **Interface** > **Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 6** Configure the following Interface options for each OSPF process:

- **Interface**—The interface you are configuring.

**Note**

If the device is using virtual routing, this drop-down list displays only those interfaces that belong to the router.

- **Default Cost**—The cost of sending a packet through the interface. The default value is 10.

- **Priority**—The designated router for a network. Valid values range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router. This setting does not apply to interfaces that are configured as point-to-point interfaces.

- **MTU Ignore**—OSPF checks whether neighbors are using the same MTU on a common interface. This check is performed when neighbors exchange DBD packets. If the receiving MTU in the DBD packet is higher than the IP MTU configured on the incoming interface, OSPF adjacency is not established.

- **Database Filter**—Use this setting to filter the outgoing LSA interface during synchronization and flooding. By default, OSPF floods new LSAs over all interfaces in the same area, except the interface on which the LSA arrives. In a fully meshed topology, this flooding can waste bandwidth and lead to excessive link and CPU usage. Checking this check box prevents OSPF flooding of the LSA on the selected interface.

- **Hello Interval**—Specifies the interval, in seconds, between hello packets sent on an interface. Valid values range 1–8192 seconds. The default value is 10 seconds.

The smaller the hello interval, the faster topological changes are detected, but more traffic is sent on the interface. This value must be the same for all routers and access servers on a specific interface.

- **Transmit Delay**—Estimated time in seconds to send an LSA packet on the interface. Valid values range 1–65535 seconds. The default is 1 second.

LSAs in the update packet have their ages increased by the amount specified by this field before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range 1–65535.
- **Hello Multiplier**—Specifies the number of Hello packets to be sent per second. Valid values are 3–20.
- **Point-to-Point**—Lets you transmit OSPF routes over VPN tunnels.
- **Authentication**—Choose the OSPF interface authentication from the following:
  - **None**—(Default) Disables interface authentication.
  - **Area Authentication**—Enables interface authentication using MD5. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.
  - **Password**—Provides a clear text password for virtual link authentication, which is not recommended where security is a concern.
  - **MD5**—Allows MD5 authentication. Click **Add**, and enter the key ID, key, confirm the key, and then click **OK**.

**Note**  
Ensure to enter only numbers as the MD5 key ID.

- **Key Chain**—Allows key chain authentication. Click **Add**, and create the key chain, and then click **Save**. For detailed procedure, see [Creating Key Chain Objects, on page 1279](#). Use the same authentication type (MD5 or Key Chain) and key ID for the peers to establish a successful adjacency.
- **Enable BFD**—Allows you to enable BFD on this interface.
- **Enter Password**—The password you configure if you choose Password as the type of authentication.
- **Confirm Password**—Confirm the password that you chose.

**Step 7** Select **Neighbor > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 8** Configure the following parameters for each OSPF process:

- **OSPF Process**—Choose 1 or 2.
- **Neighbor**—Choose one of the neighbors in the drop-down list, or click **Add** (+) to add a new neighbor; enter the name, description, network, whether to allow overrides, and then click **Save**.
- **Interface**—Choose the interface associated with the neighbor.

**Step 9** Click **OK** to save the neighbor configuration.

**Step 10** Click **Save** on the Routing page to save your changes.

## Configure OSPF Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, an LSA timer, and graceful restarts.

## Graceful Restarts

The Firewall Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv2 by using either using NSF Cisco (RFC 4811 and RFC 4812) or NSF IETF (RFC 3623).

**Note** NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click **Routing**.
- Step 3** (For a virtual-router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring OSPF.
- Step 4** Click **OSPF > Advanced**.
- Step 5** Select **General**, and configure the following:
- **Router ID**—Choose Automatic or IP Address (appears for non-cluster and a cluster in spanned etherchannel mode) or Cluster Pool (appears for a cluster in individual interface mode) for the router ID. If you choose IP address, enter the IP address in the adjacent field. If you choose Cluster Pool, choose the IPv4 cluster pool value in the adjacent drop-down field. For information on creating the cluster pool address, see [Address Pools, on page 1255](#).
  - **Ignore LSA MOSPF**—Suppresses syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.
  - **RFC 1583 Compatible**—Configures RFC 1583 compatibility as the method used to calculate summary route costs. Routing loops can occur with RFC 1583 compatibility enabled. Disable it to prevent routing loops. All OSPF routers in an OSPF routing domain should have RFC compatibility set identically.
  - **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.

By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

- **Log Adjacency Changes**—Causes the Firewall Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
- **Log Adjacency Change Details**—Causes the Firewall Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.
- **Administrative Route Distance**—Allows you to modify the settings that were used to configure administrative route distances for **inter-area**, **intra-area**, and **external** IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.
- **LSA Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.
- **Enable Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPF routing domain and configure the following options:
  - **Always advertise the default route**—Ensures that the default route is always advertised.
  - **Metric Value**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
  - **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
  - **RouteMap**—Choose the routing process that generates the default route if the route map is satisfied or click **Add (+)** to add a new one. See [Configure Route Map Entry](#) to add a new route map.

**Step 6** Click **OK** to save the general configuration.

**Step 7** Select **Non Stop Forwarding**, and configure Cisco NSF graceful restart for OSPFv2, for an NSF-capable or NSF-aware device:

**Note**

There are two graceful restart mechanisms for OSPFv2, Cisco NSF and IETF NSF. Only one of these graceful restart mechanisms can be configured at a time for an OSPF instance. An NSF-aware device can be configured as both Cisco NSF helper and IETF NSF helper but a NSF-capable device can be configured in either Cisco NSF or IETF NSF mode at a time for an OSPF instance.

- a) Check the **Enable Cisco Non Stop Forwarding Capability** check box.
- b) (Optional) Check the **Cancel NSF restart when non-NSF-aware neighboring networking devices are detected** check box if required.
- c) (Optional) Make sure the **Enable Cisco Non Stop Forwarding Helper** mode check box is unchecked to disable the helper mode on an NSF-aware device.

**Step 8** Configure IETF NSF Graceful Restart for OSPFv2, for an NSF-capable or NSF-aware device:

- a) Check the **Enable IETF Non Stop Forwarding Capability** check box.
- b) In the **Length of graceful restart interval (seconds)** field, enter the restart interval in seconds. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.

- c) (Optional) Make sure the **Enable IETF nonstop forwarding (NSF) for helper mode** check box is unchecked to disable the IETF NSF helper mode on an NSF-aware device.
- d) **Enable Strict Link State advertisement checking**—When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.
- e) **Enable IETF Non Stop Forwarding**—Enables non stop forwarding, which allows for the forwarding of data packets to continue along known routes while the routing protocol information is being restored following a switchover. OSPF uses extensions to the OSPF protocol to recover its state from neighboring OSPF devices. For the recovery to work, the neighbors must support the NSF protocol extensions and be willing to act as "helpers" to the device that is restarting. The neighbors must also continue forwarding data traffic to the device that is restarting while protocol state recovery takes place.

## Configure OSPFv3

This section describes the tasks involved in configuring an OSPFv3 routing process. For a device using virtual routing, you can configure OSPFv3 only for its global virtual router and not for its user-defined virtual router.

### Configure OSPFv3 Areas, Route Summaries, and Virtual Links

To enable OSPFv3, you need to create an OSPFv3 routing process, create an area for OSPFv3, enable an interface for OSPFv3, and then redistribute the route into the targeted OSPFv3 routing process.

#### Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Select **Routing > OSPFv3**.
- Step 3** By default **Enable Process 1** is selected. You can enable up to two OSPF process instances.
- Step 4** Chose the OSPFv3 role from the drop-down list, and enter a description for it. The options are Internal, ABR, ASBR, and ABR and ASBR. See [About OSPF, on page 1125](#) for descriptions of the OSPFv3 roles.
- Step 5** Select **Area > Add**.  
  
You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.
- Step 6** Select **General**, and configure the following options for each OSPF process:
  - **Area ID**—The area for which routes are to be summarized.
  - **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
  - **Type**—Specifies Normal, NSSA, or Stub. If you select Normal, there are no other parameters to configure. If you select Stub, you can choose to send summary LSAs in the area. If you select NSSA, you can configure the next three options:
    - **Allow Sending summary LSA into this area**—Allows the sending of summary LSAs into the area.

- **Imports routes to normal and NSSA area**—Allows redistribution to import routes to normal and not to stubby areas.
- **Defaults information originate**—Generates a default external route into an OSPFv3 routing domain.
- **Metric**—Metric used for generating the default route. The default value is 10. Valid metric values range from 0 to 16777214.
- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.

**Step 7** Click **OK** to save the general configuration.

**Step 8** (Not applicable for Internal OSPFv3 Role) Select **Route Summary > Add Route Summary**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete route summaries.

**Step 9** Configure the following route summary options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix. To add a new network object, click **Add** (+). See [Network, on page 1281](#) for the procedure for adding networks.
- **Cost**—The metric or cost for the summary route, which is used during OSPF SPF calculations to determine the shortest paths to the destination. Valid values range from 0 to 16777215.
- **Advertise**—Advertises the summary route. Uncheck this check box to suppress routes that fall under the summary address. By default, this check box is checked.

**Step 10** Click **OK** to save the route summary configuration.

**Step 11** (Not applicable for Internal OSPFv3 Role) Select **Virtual Link**, click **Add Virtual Link**, and configure the following options for each OSPF process:

- **Peer RouterID**—Choose the IP address of the peer router. To add a new network object, click **Add** (+). See [Network, on page 1281](#) for the procedure for adding networks.
- **TTL Security**—Enables TTL security check. The value for the hop-count is a number from 1 to 254. The default is 1.

OSPF sends outgoing packets with an IP header Time to Live (TTL) value of 255 and discards incoming packets that have TTL values less than a configurable threshold. Because each device that forwards an IP packet decrements the TTL, packets received via a direct (one-hop) connection have a value of 255. Packets that cross two hops have a value of 254, and so on. The receive threshold is configured in terms of the maximum number of hops that a packet may have traveled.

- **Dead Interval**—The time in seconds that hello packets are not seen before a neighbor indicates that the router is down. The default is four times the hello interval, or 40 seconds. Valid values range from 1 to 65535.

The dead interval is an unsigned integer. The value must be the same for all routers and access servers that are attached to a common network.

- **Hello Interval**—The time in seconds between the hello packets sent on an interface. Valid values range from 1 to 65535. The default is 10.

The hello interval is an unsigned integer that is to be advertised in the hello packets. The value must be the same for all routers and access servers on a specific network. The smaller the hello interval, the faster topological changes are detected, but the more traffic is sent on the interface.

- **Retransmit Interval**—The time in seconds between LSA retransmissions for adjacencies that belong to the interface. The retransmit interval is the expected round-trip delay between any two routers on the attached network. The value must be greater than the expected round-trip delay, and can range from 1 to 65535. The default is 5.

When a router sends an LSA to its neighbor, it keeps the LSA until it receives the acknowledgment message. If the router receives no acknowledgment, it resends the LSA. Be conservative when setting this value, or needless retransmission can result. The value should be larger for serial lines and virtual links.

- **Transmit Delay**—The estimated time in seconds that is required to send an LSA packet on the interface. The integer value must be greater than zero. Valid values range from 1 to 8192. The default is 1.

LSAs in the update packet have their own ages incremented by this amount before transmission. If the delay is not added before transmission over a link, the time in which the LSA propagates over the link is not considered. The value assigned should take into account the transmission and propagation delays for the interface. This setting has more significance on very low-speed links.

**Step 12** Click **OK** to save the virtual link configuration.

**Step 13** Click **Save** on the Router page to save your changes.

#### What to do next

Continue with [Configure OSPFv3 Redistribution](#).

## Configure OSPFv3 Redistribution

The Secure Firewall Threat Defense device can control the redistribution of routes between the OSPF routing processes. The rules for redistributing routes from one routing process into an OSPF routing process are displayed. You can redistribute routes discovered by EIGRP, RIP and BGP into the OSPF routing process. You can also redistribute static and connected routes into the OSPF routing process.

#### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Select **Routing > OSPF**.

**Step 3** Select **Redistribution**, and click **Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 4** Configure the following redistribution options for each OSPF process:

- **Source Protocol**—The source protocol from which routes are being redistributed. The supported protocols are connected, OSPF, Static, EIGRP, and BGP. If you choose OSPF, you must enter the Process ID in the **Process ID** field. If you choose BGP, you must add the AS number in the **AS Number** field.

- **Metric** —Metric value for the routes being distributed. The default value is 10. Valid values range from 0 to 16777214.

When redistributing from one OSPF process to another OSPF process on the same device, the metric will be carried through from one process to the other if no metric value is specified. When redistributing other processes to an OSPF process, the default metric is 20 when no metric value is specified.

- **Metric Type**—The metric type is the external link type that is associated with the default route that is advertised into the OSPF routing domain. The available options are 1 for a Type 1 external route or 2 for a Type 2 external route.
- **Tag** —Tag specifies the 32-bit decimal value attached to each external route that is not used by OSPF itself, but which may be used to communicate information between ASBRs. If none is specified, then the remote autonomous system number is used for routes from BGP and EGP. For other protocols, zero is used. Valid values are from 0 to 4294967295.
- **Route Map**—Checks for filtering the importing of routes from the source routing protocol to the current routing protocol. If this parameter is not specified, all routes are redistributed. If this parameter is specified, but no route map tags are listed, no routes are imported. Or you can add a new route map by clicking **Add** (+). See [Route Map](#), on page 1306 for the procedure to add a new route map.
- **Process ID**—The OSPF process ID, either 1 or 2.

**Note**

The Process ID is enabled the OSPFv3 process is redistributing a route learned by another OSPFv3 process.

- **Match**—Enables OSPF routes to be redistributed into other routing domains:
  - **Internal** for routes that are internal to a specific autonomous system.
  - **External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 1 external routes.
  - **External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 as Type 2 external routes.
  - **NSSA External 1** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 1 external routes.
  - **NSSA External 2** for routes that are external to the autonomous system, but are imported into OSPFv3 in an NSSA for IPv6 as Type 2 external routes.

**Step 5** Click **OK** to save the redistribution configuration.

**Step 6** Click **Save** on the Routing page to save your changes.

---

**What to do next**

Continue with [Configure OSPFv3 Summary Prefixes](#), on page 1147.

## Configure OSPFv3 Summary Prefixes

You can configure the Firewall Threat Defense device to advertise routes that match a specified IPv6 prefix and mask pair.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Select **Routing > OSPFv3**.

**Step 3** Select **Summary Prefix > Add**.

You can click **Edit** (✎), or use the right-click menu to cut, copy, past, insert, and delete summary prefixes.

**Step 4** Configure the following summary prefix options for each OSPF process:

- **IPv6 Prefix/Length**—The IPv6 prefix and prefix length label. Select one from the list or click **Add** (+) to add a new network object. See [Network, on page 1281](#) for the procedure for adding networks.
- **Advertise**— Advertises routes that match the specified prefix and mask pair. Uncheck this check box to suppress routes that match the specified prefix and mask pair.
- (Optional) **Tag**—A value that you can use as a match value for controlling redistribution through route maps.

**Step 5** Click **OK** to save the summary prefix configuration.

**Step 6** Click **Save** on the Routing page to save your changes.

### What to do next

Continue with [Configure OSPFv3 Interfaces, Authentication, and Neighbors, on page 1147](#).

## Configure OSPFv3 Interfaces, Authentication, and Neighbors

You can change certain interface-specific OSPFv3 parameters, if necessary. You are not required to change any of these parameters, but the following interface parameters must be consistent across all routers in an attached network: the hello interval and the dead interval. If you configure any of these parameters, be sure that the configurations for all routers on your network have compatible values.

For a successful implementation of OSPFv3 authentication with Nexus switches, ensure that you have the compatible version of the switch, for example, Nexus 3000, 7000, and 9000 series switches.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Select **Routing > OSPFv3**.

**Step 3** Select **Interface > Add**.

You can click **Edit** to edit, or use the right-click menu to cut, copy, past, insert, and delete areas.

**Step 4**

Configure the following interface options for each OSPFv3 process:

- **Interface**—The interface you are configuring.
- **Enable OSPFv3**—Enables OSPFv3.
- **OSPF Process**—Choose 1 or 2.
- **Area**—The area ID for this process.
- **Instance**—Specifies the area instance ID to be assigned to the interface. An interface can have only one OSPFv3 area. You can use the same area on multiple interfaces, and each interface can use a different area instance ID.

**Step 5**

Select **Properties**, and configuring the following options for each OSPFv3 process:

- **Filter Outgoing Link Status Advertisements**—Filters outgoing LSAs to an OSPFv3 interface. All outgoing LSAs are flooded to the interface by default.
- **Disable MTU mismatch detection**—Disables the OSPF MTU mismatch detection when DBD packets are received. OSPF MTU mismatch detection is enabled by default.
- **Flood Reduction**—Changes normal LSAs into Do Not Age LSAs, so that they don't get flooded every 3600 seconds across areas.

OSPF LSAs are refreshed every 3600 seconds. In large OSPF networks, this can lead to large amounts of unnecessary LSA flooding from area to area.

- **Point-to-Point Network**—Lets you transmit OSPF routes over VPN tunnels. When an interface is configured as point-to-point, non-broadcast, the following restrictions apply:
  - You can define only one neighbor for the interface.
  - You need to manually configure the neighbor.
  - You need to define a static route pointing to the crypto endpoint.
  - If OSPF over a tunnel is running on the interface, regular OSPF with an upstream router cannot be run on the same interface.
  - You should bind the crypto map to the interface before specifying the OSPF neighbor to ensure that the OSPF updates are passed through the VPN tunnel. If you bind the crypto map to the interface after specifying the OSPF neighbor, use the **clear local-host all** command to clear OSPF connections so that the OSPF adjacencies can be established over the VPN tunnel.
- **Broadcast**— Specifies that the interface is a broadcast interface. By default, this check box is checked for Ethernet interfaces. Uncheck this check box to designate the interface as a point-to-point, nonbroadcast interface. Specifying an interface as point-to-point, nonbroadcast lets you transmit OSPF routes over VPN tunnels.
- **Cost**—Specifies the cost of sending a packet on the interface. Valid values for this setting range from 0 to 255. The default value is 1. Entering 0 for this setting makes the router ineligible to become the designated router or backup designated router. This setting does not apply to interfaces that are configured as point-to-point, nonbroadcast interfaces.

When two routers connect to a network, both attempt to become the designated router. The device with the higher router priority becomes the designated router. If there is a tie, the router with the higher router ID becomes the designated router.

- **Priority**—Determines the designated router for a network. Valid values range from 0 to 255.
- **Dead Interval**—Time period in seconds for which hello packets must not be seen before neighbors indicate that the router is down. The value must be the same for all nodes on the network and can range from 1 to 65535.
- **Hello Interval**—Time period in seconds between OSPF packets that the router will send before adjacency is established with a neighbor. Once the routing device detects an active neighbor, the hello packet interval changes from the time specified in the poll interval to the time specified in the hello interval. Valid values range from 1 to 65535 seconds.
- **Retransmit Interval**—Time in seconds between LSA retransmissions for adjacencies that belong to the interface. The time must be greater than the expected round-trip delay between any two routers on the attached network. Valid values range from 1 to 65535 seconds. The default is 5 seconds.
- **Transmit Delay**—Estimated time in seconds to send a link-state update packet on the interface. Valid values range from 1 to 65535 seconds. The default is 1 second.
- **Enable BFD**—Allows you to enable BFD on this interface.

**Step 6** Click **OK** to save the properties configuration.

**Step 7** Select **Authentication**, and configure the following options for each OSPFv3 process:

- **Type**—Type of authentication. The available options are Area, Interface, and None. The None option indicates that no authentication is used.
- **Security Parameters Index**—A number from 256 to 4294967295. Configure this if you chose Interface as the type.
- **Authentication**—Type of authentication algorithm. Supported values are SHA-1 and MD5. Configure this if you chose Interface as the type.
- **Authentication Key**—When MD5 authentication is used, the key must be 32 hexadecimal digits (16 bytes) long. When SHA-1 authentication is used, the key must be 40 hexadecimal digits (20 bytes) long.
- **Encrypt Authentication Key**—Enables encryption of the authentication key.
- **Include Encryption**—Enables encryption.
- **Encryption Algorithm**—Type of encryption algorithm. Supported value is DES. The NULL entry indicates no encryption. Configure this if you chose **Include Encryption**.
- **Encryption Key**—Enter the encryption key. Configure this if you chose **Include Encryption**.
- **Encrypt Key**—Enables the key to be encrypted.

**Step 8** Click **OK** to save the authentication configuration.

**Step 9** Select **Neighbor**, click **Add**, and configure the following options for each OSPFv3 process:

- **Link Local Address**—The IPv6 address of the static neighbor.
- **Cost**—Enables cost. Enter the cost in the **Cost** field, and check the **Filter Outgoing Link State Advertisements** if you want to advertise.

- (Optional) **Poll Interval**—Enables the poll interval. Enter the **Priority** level and the **Poll Interval** in seconds.

**Step 10** Click **Add** to add the neighbor.

**Step 11** Click **OK** to save the Interface configuration.

## Configure OSPFv3 Advanced Properties

The Advanced Properties allows you to configure options, such as syslog message generation, administrative route distances, passive OSPFv3 routing, LSA timers, and graceful restarts.

### Graceful Restarts

The Firewall Threat Defense device may experience some known failure situations that should not affect packet forwarding across the switching platform. The Non-Stop Forwarding (NSF) capability allows data forwarding to continue along known routes, while the routing protocol information is being restored. This capability is useful when there is a scheduled hitless software upgrade. You can configure graceful restart on OSPFv3 using graceful-restart (RFC 5187).

**Note** NSF capability is also useful in HA mode and clustering.

Configuring the NSF graceful-restart feature involves two steps; configuring capabilities and configuring a device as NSF-capable or NSF-aware. A NSF-capable device can indicate its own restart activities to neighbors and a NSF-aware device can help a restarting neighbor.

A device can be configured as NSF-capable or NSF-aware, depending on some conditions:

- A device can be configured as NSF-aware irrespective of the mode in which it is.
- A device has to be in either Failover or Spanned Etherchannel (L2) cluster mode to be configured as NSF-capable.
- For a device to be either NSF-aware or NSF-capable, it should be configured with the capability of handling opaque Link State Advertisements (LSAs)/ Link Local Signaling (LLS) block as required.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > OSPFv3 > Advanced**.

**Step 3** For **Router ID**, choose Automatic or IP Address (appears for non-cluster and a cluster in spanned etherchannel mode) or Cluster Pool (appears for a cluster in individual interface mode). If you choose IP Address, enter the IPv6 address in the **IP Address** field. If you choose Cluster Pool, choose the IPv6 cluster pool value from the **Cluster Pool** down-down field. For information on creating the cluster pool address, see [Address Pools, on page 1255](#).

**Step 4** Check the **Ignore LSA MOSPF** check box if you want to suppress syslog messages when the route receives unsupported LSA Type 6 multicast OSPF (MOSPF) packets.

**Step 5** Select **General**, and configure the following:

- **Adjacency Changes**—Defines the adjacency changes that cause syslog messages to be sent.

By default, a syslog message is generated when an OSPF neighbor goes up or down. You can configure the router to send a syslog message when an OSPF neighbor goes down and also a syslog for each state.

- **Adjacency Changes**—Causes the Firewall Threat Defense device to send a syslog message whenever an OSPF neighbor goes up or down. This setting is checked by default.
- **Include Details**—Causes the Firewall Threat Defense device to send a syslog message whenever any state change occurs, not just when a neighbor goes up or down. This setting is unchecked by default.
- **Administrative Route Distances**—Allows you to modify the settings that were used to configure administrative route distances for inter-area, intra-area, and external IPv6 routes. The administrative route distance is an integer from 1 to 254. The default is 110.
- **Default Information Originate**—Check the **Enable** check box to generate a default external route into an OSPFv3 routing domain and configure the following options:
  - **Always Advertise**—Will always advertise the default route whether or not one exists.
  - **Metric**—Metric used for generating the default route. Valid metric values range from 0 to 16777214. The default value is 10.
  - **Metric Type**—The external link type that is associated with the default route that is advertised into the OSPFv3 routing domain. Valid values are 1 (Type 1 external route) and 2 (Type 2 external route). The default is Type 2 external route.
  - **Route Map**—Choose the routing process that generates the default route if the route map is satisfied or click **Add** (+) to add a new one. See [Route Map, on page 1306](#) to add a new route map.

**Step 6** Click **OK** to save the general configuration.

**Step 7** Select **Passive Interface**, select the interfaces on which you want to enable passive OSPFv3 routing from the Available Interfaces list, and click **Add** to move them to the Selected Interfaces list.

Passive routing assists in controlling the advertisement of OSPFv3 routing information and disables the sending and receiving of OSPFv3 routing updates on an interface.

**Step 8** Click **OK** to save the passive interface configuration.

**Step 9** Select **Timer**, and configure the following LSA pacing and SPF calculation timers:

- **Arrival**—Specifies the minimum delay in milliseconds that must pass between acceptance of the same LSA arriving from neighbors. The range is from 0 to 6000,000 milliseconds. The default is 1000 milliseconds.
- **Flood Pacing**—Specifies the time in milliseconds at which LSAs in the flooding queue are paced in between updates. The configurable range is from 5 to 100 milliseconds. The default value is 33 milliseconds.
- **Group Pacing**—Specifies the interval in seconds at which LSAs are collected into a group and refreshed, check summed, or aged. Valid values range from 10 to 1800. The default value is 240.
- **Retransmission Pacing**—Specifies the time in milliseconds at which LSAs in the retransmission queue are paced. The configurable range is from 5 to 200 milliseconds. The default value is 66 milliseconds.

- **LSA Throttle**—Specifies the delay in milliseconds to generate the first occurrence of the LSA. The default value is 0 millisecond. The minimum specifies the minimum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds. The maximum specifies the maximum delay in milliseconds to originate the same LSA. The default value is 5000 milliseconds.

**Note**

For LSA throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

- **SPF Throttle**—Specifies the delay in milliseconds to receive a change to the SPF calculation. The default value is 5000 milliseconds. The minimum specifies the delay in milliseconds between the first and second SPF calculations. The default value is 10000 milliseconds. The maximum specifies the maximum wait time in milliseconds for SPF calculations. The default value is 10000 milliseconds.

**Note**

For SPF throttling, if the minimum or maximum time is less than the first occurrence value, then OSPFv3 automatically corrects to the first occurrence value. Similarly, if the maximum delay specified is less than the minimum delay, then OSPFv3 automatically corrects to the minimum delay value.

- Step 10** Click **OK** to save the LSA timer configuration.
- Step 11** Select **Non Stop Forwarding**, and check the **Enable graceful-restart helper** check box. This is checked by default. Uncheck this to disable the graceful-restart helper mode on an NSF-aware device.
- Step 12** Check the **Enable link state advertisement** check box to enable strict link state advertisement checking.
- When enabled, it indicates that the helper router will terminate the process of restarting the router if it detects that there is a change to a LSA that would be flooded to the restarting router, or if there is a changed LSA on the retransmission list of the restarting router when the graceful restart process is initiated.
- Step 13** Check the **Enable graceful-restart (Use when Spanned Cluster or Failover Configured)** and enter the graceful-restart interval in seconds. The range is 1-1800. The default value is 120 seconds. For a restart interval below 30 seconds, graceful restart will be terminated.
- Step 14** Click **OK** to save the graceful restart configuration.
- Step 15** Click **Save** on the Routing page to save your changes.
-

# History for OSPF

Table 68: Feature History for OSPF

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details

## CHAPTER 28

# EIGRP

This section describes how to configure the Firewall Threat Defense to route data, perform authentication, and redistribute routing information using the Enhanced Interior Gateway Routing Protocol (EIGRP).

- [About EIGRP Routing, on page 1155](#)
- [Requirements and Prerequisites for EIGRP, on page 1156](#)
- [Guidelines and Limitations of EIGRP Routing, on page 1156](#)
- [Configure EIGRP, on page 1158](#)
- [History for EIGRP, on page 1164](#)

## About EIGRP Routing

Enhanced Interior Gateway Routing Protocol (EIGRP), developed by Cisco, is an enhanced version of IGRP. Unlike IGRP and RIP, EIGRP does not send out periodic route updates. EIGRP updates are sent out only when the network topology changes. Key capabilities that distinguish EIGRP from other routing protocols include fast convergence, support for variable-length subnet mask, support for partial updates, and support for multiple network layer protocols.

A router running EIGRP stores all the neighbor routing tables so that it can quickly adapt to alternate routes. If no appropriate route exists, EIGRP queries its neighbors to discover an alternate route. These queries are propagated until an alternate route is found. EIGRP support for the variable-length subnet masks allows routes to be automatically summarized on a network boundary. Additionally, EIGRP can be configured to summarize any bit boundary at any interface.

EIGRP does not make periodic updates. Instead, it sends partial updates when the metric for a route changes. Propagation of partial updates is automatically bounded such that only those routers that need the information are updated. As a result of these two capabilities, EIGRP consumes significantly less bandwidth than IGRP.

To dynamically learn of other routers on directly attached networks, threat defense uses neighbor discovery. EIGRP routers send out multicast hello packets to announce their presence on the network. When the EIGRP device receives a hello packet from a new neighbor, it sends its topology table to the neighbor with an initialization bit set. When the neighbor receives the topology update with the initialization bit set, the neighbor sends its topology table back to the device.

The hello packets are sent out as multicast messages. No response is expected for a hello message. Statically defined neighbors is an exception to this rule. If you manually configure a neighbor, hello messages, routing updates, and acknowledgments are sent as unicast messages.

Once this neighbor relationship is established, routing updates are not exchanged unless there is a change in the network topology. The neighbor relationship is maintained through the hello packets. Each hello packet

received from a neighbor includes a hold time. Hold time is the time within which threat defense can expect to receive a hello packet from that neighbor. If the device does not receive a hello packet from that neighbor within the hold time advertised by that neighbor, the device considers that neighbor to be unavailable.

EIGRP uses neighbor discovery/recovery, Reliable Transport Protocol (RTP), and Diffusing Update Algorithm (DUAL) for route computations. DUAL saves all routes to a destination in the topology table, and not just the least-cost route. The least-cost route is inserted into the routing table. The other routes remain in the topology table. If the main route fails, another route is chosen from the feasible successors. A successor is a neighboring router that is used for packet forwarding that has a least-cost path to a destination. A feasibility calculation ensures that the path is not part of a routing loop.

If a feasible successor is not found in the topology table, a route recomputation takes place. During route recomputation, DUAL queries the EIGRP neighbors for a route. The query is propagated to successive neighbors. If a feasible successor is not found, an unreachable message is returned.

During route recomputation, DUAL marks the route as active. By default, threat defense waits for three minutes to receive a response from its neighbors. If the device does not receive a response from a neighbor, the route is marked as stuck-in-active. All routes in the topology table that point to the unresponsive neighbor as a feasibility successor are removed.

## Requirements and Prerequisites for EIGRP

### Model Support

Threat Defense

Firewall Threat Defense Virtual

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Guidelines and Limitations of EIGRP Routing

### Firewall Mode Guidelines

Supported on routed firewall mode only.

### Device Guidelines

- Only one EIGRP process is allowed per device.
- EIGRP can be configured through management center UI on Firewall Threat Defense 6.6 and higher versions.

### Interface Guidelines

- Only routed interfaces with logical names and with an IP address can be associated with an EIGRP routing process.
- Only interfaces belonging to the global virtual router can be part of EIGRP. EIGRP can learn, filter, and redistribute routes across routing protocols in global virtual router.
- Supports physical, EtherChannel, redundant, subinterfaces only. However, the members of EtherChannel interfaces are not supported.
- BVI and VNI cannot be part of EIGRP.
- A passive interface cannot be configured as a neighbor interface.

### IP Address and Network Objects Support

- Only IPv4 address is supported.
- Range, FQDN, and wildcard mask are not supported.
- Only Standard access list objects are supported.

### Redistribution Guidelines

- BGP, OSPF, and RIP in the global virtual router can redistribute to EIGRP.
- EIGRP can redistribute to BGP, OSPF, RIP, Static, and Connected in the global virtual router.
- When EIGRP is configured on a device that is a part of OSPF network or vice versa, ensure that OSPF-router is configured to tag the route (EIGRP does not support route tag).

When redistributing EIGRP into OSPF and OSPF into EIGRP, a routing loop occurs when there is an outage on one of the links, interfaces, or even when the route originator is down. To prevent the redistribution of routes from one domain back into the same domain, a router can tag a route that belongs to a domain while it is redistributing, and those routes can be filtered on the remote router based on the same tag. Because the routes will not be installed into the routing table, they will not be redistributed back into the same domain.

### Deployment Process Guidelines

When you want to change the existing AS number of a deployed EIGRP configuration, you must disable the EIGRP and deploy it. This step will clear the deployed EIGRP configuration on the threat defense. Next, recreate the EIGRP configurations with a new AS number and then deploy it. Thus, this process prevents any deployment failures owing to the same EIGRP configuration being deployed on the threat defense.

### Upgrade Guidelines

When you upgrade to version 7.2 and later when the previous version has any FlexConfig EIGRP policies, the management center displays a warning message during deployment. However, it does not stop the deployment process. However, after deployment, to manage the EIGRP policies from the UI (**Device (Edit) > Routing > EIGRP**), you must redo the configuration in the **Device (Edit) > Routing > EIGRP** page and remove the configuration from FlexConfig. To automate creation of the policies in the UI, Firewall Management Center provides an option to migrate the policies from FlexConfig to the UI. For more details, see [Migrating FlexConfig Policies, on page 2518](#).

# Configure EIGRP

You can enable and configure EIGRP on the firewall device in the **Routing** tab.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Click the **Routing** tab.
- Step 3** Under Global, click **EIGRP**.
- Step 4** Check the **Enable EIGRP** check box to enable the EIGRP routing process.
- Step 5** In the **AS Number** field, enter the autonomous system (AS) number for the EIGRP process. The AS number includes multiple autonomous numbers. The AS number can be from 1 to 65535 and is a uniquely assigned value that identifies each network on the Internet.
- Step 6** To configure other EIGRP properties, see the following topics:
- a. [Configure EIGRP Settings, on page 1158.](#)
  - b. [Configure EIGRP Neighbors Settings, on page 1159.](#)
  - c. [Configure EIGRP Filter Rules Settings, on page 1159.](#)
  - d. [Configure EIGRP Redistribution Settings, on page 1160.](#)
  - e. [Configure EIGRP Summary Address Settings, on page 1161.](#)
  - f. [Configure EIGRP Interfaces Settings, on page 1162.](#)
  - g. [Configure EIGRP Advanced Settings, on page 1162.](#)
- 

## Configure EIGRP Settings

### Procedure

- 
- Step 1** On the **EIGRP** page, click the **Setup** tab.
- Step 2** Check the **Auto Summary** check box to enable EIGRP to summarize network number boundaries.
- Note**  
Enabling Auto Summary can cause routing problems if you have noncontiguous networks.
- Step 3** In the **Available Networks/Hosts** box, click the networks or hosts that should participate in the EIGRP routing process, and then click **Add**. To add a new network object, click **Add (+)**. See [Network, on page 1281](#) for the procedure for adding networks.
- Step 4** To configure passive interfaces, check the **Passive Interface** check box. In EIGRP, a passive interface does not send or receive routing updates.

- a) To specify selective interfaces as passive, click the **Selected Interface** radio button. In the **Available Interfaces** box, select the interfaces, and click **Add**.
- b) To specify all interfaces as passive, click the **All Interfaces** radio button.

**Step 5** Click **Ok** and **Save** the settings.

---

## Configure EIGRP Neighbors Settings

You can define static neighbors for the EIGRP process. When you define an EIGRP neighbor, hello packets are unicast to that neighbor.

### Procedure

---

- Step 1** On the **EIGRP** page, click the **Neighbors** tab.
  - Step 2** Click **Add**.
  - Step 3** From the **Interface** drop-down, choose the interface through which the neighbor is available.
  - Step 4** From the **Neighbor** drop-down, choose the IP address of the static neighbor. To add the network object, click **Add (+)**. See [Network, on page 1281](#) for the procedure for adding network objects.
  - Step 5** Click **Ok** and **Save** the settings.
- 

## Configure EIGRP Filter Rules Settings

You can configure route filtering rules for the EIGRP routing process. Filter rules allow you to control the routes that are accepted or advertised by the EIGRP routing process.

### Procedure

---

- Step 1** On the **EIGRP** page, click the **Filter Rules** tab.
- Step 2** Click **Add (+)**.
- Step 3** In the **Add Filter Rules** dialog box, from the **Filter Direction** drop-down, choose the direction for the rule:
  - Inbound—The rule filters default route information from incoming EIGRP routing updates.
  - Outbound—The rule filters default route information from outgoing EIGRP routing updates.
- Step 4** To select the interface to which the filtering rule applies, click the **Interface** radio button, and from the drop-down, select the interface.

#### Note

You cannot apply EIGRP filtering rules on VTI interfaces.

- Step 5** To select the protocol to which the filtering rule applies, click the **Protocol** radio button and from the drop-down, select the protocol—BGP, RIP, Static, Connected, or OSPF. For BGP and OSPF protocols, you can specify the relevant Process ID.
- Step 6** From the **Access List** drop-down, choose the access list. The list defines the networks that are to be received and that are to be suppressed in routing updates. To add a new standard access list object, click **Add (+)** and see [Configure Standard ACL Objects, on page 1254](#) for the detailed procedure.
- Step 7** Click **Ok** and **Save** the settings.
- 

## Configure EIGRP Redistribution Settings

You can define the rules for redistributing routes from other routing protocols to the EIGRP routing process.

### Procedure

---

- Step 1** On the **EIGRP** page, click the **Redistribution** tab.
- Step 2** Click **Add (+)**.
- Step 3** In the **Add Redistribution** dialog box, from the **Protocol** drop-down, choose the source protocol from which the routes are being redistributed:
- BGP—Redistributes routes discovered by the BGP routing process to EIGRP.
  - RIP—Redistributes routes discovered by the RIP routing process to EIGRP.
  - Static—Redistributes static routes to the EIGRP routing process. Static routes that fall within the scope of a network statement are automatically redistributed to EIGRP; you do not need to define a redistribution rule for them. However, when redistributing static routes that point to VTI interfaces in EIGRP, you must specify the metric. For static routes pointing to other types of interfaces, specifying the metric is not required.
  - Connected—Redistributes connected routes (routes established automatically by virtue of having IP address enabled on the interface) to the EIGRP routing process. Connected routes that fall within the scope of a network statement are automatically redistributed to EIGRP; you do not need to define a redistribution rule for them.
  - OSPF—Redistributes routes discovered by the OSPF routing process to EIGRP. If you choose this protocol, the Match options on this dialog box become available under **Optional OSPF Redistribution**:
    - Internal—Routes that are internal to a specific AS.
    - External1—Routes that are external to the AS and imported into OSPF as a Type 1 external route.
    - External2—Routes that are external to the AS and imported into the selected process as a Type 2 external route.
    - Nsaa-External1—Not-So-Stubby Area (NSSA) routes that are external to the AS and imported into the selected process as Type 1 external routes.
    - Nsaa-External2—(NSSA) routes that are external to the AS and imported into the selected process as Type 2 external routes.

**Note**

These options are not available when redistributing static, connected, RIP, or BGP routes.

- Step 4** Under **Optional Metrics** enter the relevant values:
- **Bandwidth**—The minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.
  - **Delay Time**—The routing delay in tens of microseconds. Valid values range from 0 to 4294967295.
  - **Reliability** —The likelihood of successful packet transmission is expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.
  - **Loading**— The effective bandwidth of the route. Valid values range from 1 to 255. 255 indicates 100 percent loading.
  - **MTU**—The smallest permissible value for the maximum transmission unit of the path. Valid values range from 1 to 65535.
- Step 5** From the **Route Map** drop-down, choose the route map object to apply to the redistribution entry. To create a new route map object, click **Add** (+). See [Configure Route Map Entry](#) for the procedure to add a new route map.
- Step 6** Click **Ok** and **Save** the settings.
- 

## Configure EIGRP Summary Address Settings

You can configure summary addresses for each interface. You need to manually define summary addresses if you want to create summary addresses that do not occur at a network boundary, or if you want to use summary addresses on threat defense with automatic route summarization disabled. If more specific routes are available in the routing table, EIGRP advertises the summary address with a metric equal to the minimum of all the more specific routes.

### Procedure

- 
- Step 1** On the **EIGRP** page, click the **Summary Address** tab.
- Step 2** Click **Add**.
- Step 3** From the **Interface** drop-down, choose the interface from which the summary address is advertised.
- Step 4** From the **Network** drop-down, choose the network object with specific IP address and network mask to be summarized. To add a new network, click **Add** (+). See [Network, on page 1281](#) for the procedure for adding networks.
- Step 5** In the **Administrative Distance** field, enter the administrative distance of the summary route. Valid values range from 1 to 255.
- Step 6** Click **Ok** and **Save** the settings.
-

## Configure EIGRP Interfaces Settings

You can configure interface-specific EIGRP routing properties in the Interfaces tab.

### Procedure

- 
- Step 1** On the **EIGRP** page, click the **Interfaces** tab.
- Step 2** Click **Add (+)**.
- Step 3** From the **Interface** drop-down, choose the name of the interface to which the configuration applies.
- Step 4** In the **Hello Interval** field, enter the interval, in seconds, between EIGRP hello packets that are sent on an interface. Valid values range from 1 to 65535. The default value is 5 seconds.
- Step 5** In the **Hold Time** field, enter the hold time that is advertised by the device in EIGRP hello packets. Valid values range from 3 to 65535. The default value is 15 seconds.
- Step 6** To enable EIGRP split-horizon on the interface, click the **Split Horizon** check box.
- Step 7** In the **Delay Time** field, enter the delay time in tens of microseconds. Valid values are from 1 to 16777215. This option is not supported for devices in multi-context mode.
- Step 8** Specify values for the Authentication properties:
- **Enable MD5 Authentication**—Check the check box to use MD5 hash algorithm for authentication of EIGRP packets.
  - **Key Type**—From the drop-down, select any one of the following key type:
    - **None**—To indicate that no authentication is required.
    - **Unencrypted**—To indicate that the key string to be used is a clear text password for authentication.
    - **Encrypted**—To indicate that the key string to be used is an encrypted password for authentication.
    - **Auth Key**—To indicate that the key string to be used is an EIGRP authentication key.
  - **Key ID**—The ID of the key that is used to authenticate EIGRP updates. Enter a numerical key identifier. Valid values range from 0 to 255.
  - **Key**—An alphanumeric character string of up to 17 characters. For an encrypted authentication type, this field should have a minimum of 17 characters.
  - **Confirm Key**—Re-enter the key.
- Step 9** Click **Ok** and **Save** the settings.
- 

## Configure EIGRP Advanced Settings

You can configure EIGRP advanced settings such as the router ID, stub routing, and adjacency changes.

## Procedure

**Step 1** On the **EIGRP** page, click the **Advanced** tab.

**Step 2** Under **Default Route Information**, you can specify the sending and receiving of default route information in EIGRP updates.

- (Appears for non-cluster and cluster in spanned etherchannel mode) **Router ID (IP Address)**—Enter the ID used to identify the originating router for external routes. If an external route is received with the local router ID, the route is discarded. To prevent this issue, specify a global address for the router ID. An unique value should be configured for each EIGRP router.
- (Appears only for a cluster in individual interface mode) **IPv4 Address Pool**—Select the relevant cluster pool value (IPv4 address pool object). To create the address pool, see [Address Pools, on page 1255](#).
- **Accept Default Route Info**—Check the check box to configure EIGRP to accept exterior default routing information.
  - **Access List**—From the **Access List** drop-down, specify a standard access list that defines the networks that are allowed and the networks that are not when receiving default route information.  
To add a new standard access list object, click **Add (+)** and see [Configure Standard ACL Objects, on page 1254](#) for the detailed procedure.
- **Send Default Route Info**—Check the check box to configure EIGRP to advertise exterior default routing information.
  - **Access List**—From the **Access List** drop-down, specify a standard access list that defines the networks that are allowed and the networks that are not when sending default route information.  
To add a new standard access list object, click **Add (+)** and see [Configure Standard ACL Objects, on page 1254](#) for the detailed procedure.

**Step 3** Under **Administrative Distance**, specify:

- **Internal Distance**—Administrative distance for EIGRP internal routes. Internal routes are those that are learned from another entity within the same autonomous system. Valid values range from 1 to 255. The default value is 90.
- **External Distance**—Administrative distance for EIGRP external routes. External routes are those for which the best path is learned from a neighbor external to the autonomous system. Valid values range from 1 to 255. The default value is 170.

**Step 4** Under **Adjacency Changes**, specify:

- **Log Neighbor Changes**—Click the check box to enable the logging of EIGRP neighbor adjacency changes.
- **Log Neighbor Warnings**—Click the check box to enable the logging of EIGRP neighbor warning messages.
- (Optional) Enter the time interval (in seconds) between repeated neighbor warning messages. Valid values range from 1 to 65535. Repeated warnings are not logged if they occur during this interval.

**Step 5** Under **Stub**, to enable the device as an EIGRP stub routing process, click one or more of the following EIGRP stub routing processes check boxes:

- **Receive only**—Configures the EIGRP stub routing process to receive route information from the neighbor routers but not send route information to the neighbors. If this option is selected, you cannot select any of the other stub routing options.
- **Connected**—Advertises connected routes.
- **Redistributed**—Advertises redistributed routes.
- **Static**—Advertises static routes.
- **Summary**—Advertises summary routes.

**Step 6** Under **Default Metrics**, define the default metrics for routes redistributed to the EIGRP routing process:

- **Bandwidth**—the minimum bandwidth of the route in kilobits per second. Valid values range from 1 to 4294967295.
- **Delay Time**—the route delay in tens of microseconds. Valid values range from 0 to 4294967295.
- **Reliability**—the likelihood of successful packet transmission expressed as a number 0 through 255. The value 255 indicates 100 percent reliability; 0 means no reliability.
- **Loading**—the effective bandwidth of the route. Valid values range from 1 to 255; 255 indicates 100 percent loading.
- **MTU**—the smallest allowed value for the maximum transmission unit of the path. Valid values range from 1 to 65535.

## History for EIGRP

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
EIGRP configuration	7.2	Any	In the previous releases, EIGRP was configurable on threat defense only through FlexConfig. FlexConfig no longer supports EIGRP configuration. You can now configure EIGRP settings for threat defense in the management center UI. New/modified screens: <b>Devices &gt; Device Management &gt; Routing &gt; EIGRP</b> .

## CHAPTER 29

# BGP

---

This section describes how to configure the Firewall Threat Defense to route data, perform authentication, and redistribute routing information using the Border Gateway Protocol (BGP).

- [About BGP, on page 1165](#)
- [Requirements and Prerequisites for BGP, on page 1168](#)
- [Guidelines for BGP, on page 1168](#)
- [Configure BGP, on page 1169](#)
- [History for BGP, on page 1183](#)

## About BGP

BGP is an inter and intra autonomous system routing protocol. An autonomous system is a network or group of networks under a common administration and with common routing policies. BGP is used to exchange routing information for the Internet and is the protocol used between Internet service providers (ISP).

## Routing Table Changes

BGP neighbors exchange full routing information when the TCP connection between neighbors is first established. When changes to the routing table are detected, the BGP routers send to their neighbors only those routes that have changed. BGP routers do not send periodic routing updates, and BGP routing updates advertise only the optimal path to a destination network.

---

**Note**

AS loop detection is done by scanning the full AS path (as specified in the AS\_PATH attribute), and checking that the AS number of the local system does not appear in the AS path. By default, EBGP advertises the learned routes to the same peer to prevent additional CPU cycles on the device in performing loop checks and to avoid delays in the existing outgoing update tasks.

---

Routes learned via BGP have properties that are used to determine the best route to a destination, when multiple paths exist to a particular destination. These properties are referred to as BGP attributes and are used in the route selection process:

- **Weight**—This is a Cisco-defined attribute that is local to a router. The weight attribute is not advertised to neighboring routers. If the router learns about more than one route to the same destination, the route with the highest weight is preferred.

- **Local preference**—The local preference attribute is used to select an exit point from the local AS. Unlike the weight attribute, the local preference attribute is propagated throughout the local AS. If there are multiple exit points from the AS, the exit point with the highest local preference attribute is used as an exit point for a specific route.
- **Multi-exit discriminator**—The multi-exit discriminator (MED) or metric attribute is used as a suggestion to an external AS regarding the preferred route into the AS that is advertising the metric. It is referred to as a suggestion because the external AS that is receiving the MEDs may also be using other BGP attributes for route selection. The route with the lower MED metric is preferred.
- **Origin**—The origin attribute indicates how BGP learned about a particular route. The origin attribute can have one of three possible values and is used in route selection.
  - **IGP**—The route is interior to the originating AS. This value is set when the network router configuration command is used to inject the route into BGP.
  - **EGP**—The route is learned via the Exterior Border Gateway Protocol (EBGP).
  - **Incomplete**—The origin of the route is unknown or learned in some other way. An origin of incomplete occurs when a route is redistributed into BGP.
- **AS\_path**—When a route advertisement passes through an autonomous system, the AS number is added to an ordered list of AS numbers that the route advertisement has traversed. Only the route with the shortest AS\_path list is installed in the IP routing table.
- **Next hop**—The EBGP next-hop attribute is the IP address that is used to reach the advertising router. For EBGP peers, the next-hop address is the IP address of the connection between the peers. For IBGP, the EBGP next-hop address is carried into the local AS. However, when the next hop is in the same subnet as the peering address of the eBGP peer, the next hop is not modified. This behavior is referred to as the third party next hop.

Use the **next-hop-self** command when redistributing VPN-advertised routes to iBGP peers to ensure that the routes are redistributed with the correct next hop IP.

- **Community**—The community attribute provides a way of grouping destinations, called communities, to which routing decisions (such as acceptance, preference, and redistribution) can be applied. Route maps are used to set the community attribute. The predefined community attributes are as follows:
  - **no-export**—Do not advertise this route to EBGP peers.
  - **no-advertise**—Do not advertise this route to any peer.
  - **internet**—Advertise this route to the Internet community; all routers in the network belong to it.

## When to Use BGP

Customer networks, such as universities and corporations, usually employ an Interior Gateway Protocol (IGP) such as OSPF for the exchange of routing information within their networks. Customers connect to ISPs, and ISPs use BGP to exchange customer and ISP routes. When BGP is used between autonomous systems (AS), the protocol is referred to as External BGP (EBGP). If a service provider is using BGP to exchange routes within an AS, then the protocol is referred to as Interior BGP (IBGP).

BGP can also be used for carrying routing information for IPv6 prefix over IPv6 networks.

## BGP Path Selection

BGP may receive multiple advertisements for the same route from different sources. BGP selects only one path as the best path. When this path is selected, BGP puts the selected path in the IP routing table and propagates the path to its neighbors. BGP uses the following criteria, in the order presented, to select a path for a destination:

- If the path specifies a next hop that is inaccessible, drop the update.
- Prefer the path with the largest weight.
- If the weights are the same, prefer the path with the largest local preference.
- If the local preferences are the same, prefer the path that was originated by BGP running on this router.
- If no route was originated, prefer the route that has the shortest AS\_path.
- If all paths have the same AS\_path length, prefer the path with the lowest origin type (where IGP is lower than EGP, and EGP is lower than incomplete).
- If the origin codes are the same, prefer the path with the lowest MED attribute.
- If the paths have the same MED, prefer the external path over the internal path.
- If the paths are still the same, prefer the path through the closest IGP neighbor.
- Determine if multiple paths require installation in the routing table for [BGP Multipath, on page 1167](#).
- If both paths are external, prefer the path that was received first (the oldest one).
- Prefer the path with the lowest IP address, as specified by the BGP router ID.
- If the originator or router ID is the same for multiple paths, prefer the path with the minimum cluster list length.
- Prefer the path that comes from the lowest neighbor address.

## BGP Multipath

BGP Multipath allows installation into the IP routing table of multiple equal-cost BGP paths to the same destination prefix. Traffic to the destination prefix is then shared across all installed paths.

These paths are installed in the table together with the best path for load-sharing. BGP Multipath does not affect best-path selection. For example, a router still designates one of the paths as the best path, according to the algorithm, and advertises this best path to its BGP peers.

In order to be candidates for multipath, paths to the same destination need to have these characteristics equal to the best-path characteristics:

- Weight
- Local preference
- AS-PATH length
- Origin code
- Multi Exit Discriminator (MED)
- One of these:

- Neighboring AS or sub-AS (before the addition of the BGP Multipaths)
- AS-PATH (after the addition of the BGP Multipaths)

Some BGP Multipath features put additional requirements on multipath candidates:

- The path should be learned from an external or confederation-external neighbor (eBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric.

These are the additional requirements for internal BGP (iBGP) multipath candidates:

- The path should be learned from an internal neighbor (iBGP).
- The IGP metric to the BGP next hop should be equal to the best-path IGP metric, unless the router is configured for unequal-cost iBGP multipath.

BGP inserts up to  $n$  most recently received paths from multipath candidates into the IP routing table, where  $n$  is the number of routes to install to the routing table, as specified when you configure BGP Multipath. The default value, when multipath is disabled, is 1.

For unequal-cost load balancing, you can also use BGP Link Bandwidth.

**Note**

The equivalent next-hop-self is performed on the best path that is selected among eBGP multipaths before it is forwarded to internal peers.

## Requirements and Prerequisites for BGP

### Model Support

Threat Defense

Firewall Threat Defense Virtual

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Guidelines for BGP

### Firewall Mode Guidelines

Does not support transparent firewall mode. BGP is supported only in routed mode.

### IPv6 Guidelines

Supports IPv6.

### Additional Guidelines

- For BGP, the next hop IP address for the routes is the network IP address and not 0.0.0.0.
- The system does not add route entry for the IP address received over PPPoE in the CP route table. BGP always looks into CP route table for initiating the TCP session, hence BGP does not form TCP session. Thus, BGP over PPPoE is not supported.
- BGP is not supported on management-only or BVI interfaces.
- To avoid adjacency flaps due to route updates being dropped if the route update is larger than the minimum MTU on the link, ensure that you configure the same MTU on the interfaces on both sides of the link.
- BGP with PATH MTU (PMTU) can cause adjacency flaps if MTU discovery fails, especially with ECMP routing. Hence, be cautious while using BGP, PMTU, and ECMP as packet drops can occur if MTU discovery fails due to any reason.
- The BGP table of the member unit is not synchronized with the control unit table. Only its routing table is synchronized with the control unit routing table.
- When you configure a route-based site-to-site VPN using static or dynamic VTI interfaces, ensure that the value of the TTL hop is more than one if you use BGP as the routing protocol.

## Configure BGP

To configure BGP, see the following topics:

### Procedure

- 
- |  |  |
|--|--|
| <b>Step 1</b>  | <a href="#">Configure BGP Basic Settings, on page 1170</a>               |
| <b>Step 2</b>  | <a href="#">Configure BGP General Settings, on page 1172</a>             |
| <b>Step 3</b>  | <a href="#">Configure BGP Neighbor Settings, on page 1173</a>            |
| <b>Step 4</b>  | <a href="#">Configure BGP Aggregate Address Settings, on page 1177</a>   |
| <b>Step 5</b>  | <a href="#">Configure BGPv4 Filtering Settings, on page 1178</a>         |
| <b>Note</b><br>The Filtering section is applicable only to IPv4 settings |  |
| <b>Step 6</b>  | <a href="#">Configure BGP Network Settings, on page 1179</a>             |

-

## Configure BGP Basic Settings

You can set many basic settings for BGP.

For a device using virtual routing, the basic settings described in this section must be configured in the **BGP** page under **General Settings**. For more information, see [Modifications to the Firewall Management Center Web Interface - Routing Page, on page 1063](#).

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Select **Routing**.
- Step 3** (For a virtual-router-aware device) Under **General Settings**, click **BGP**.
- Step 4** Check the **Enable BGP** check box to enable the BGP routing process.
- Step 5** In the **AS Number** field, enter the autonomous system (AS) number for the BGP process. The AS number internally includes multiple autonomous numbers. The AS number can be from 1 to 4294967295 or from 1.0 to 65535.65535. The AS number is a uniquely assigned value, that identifies each network on the Internet.
- Step 6** In the **Router ID** drop-down list, choose Automatic or Manual (appears for non-cluster and a cluster in spanned etherchannel mode) or Cluster Pool (appears for a cluster in individual interface mode). If you choose Automatic, the highest-level IP address on the Firewall Threat Defense device is used as the router ID. If you choose Manual, enter the IP address in the **IP Address** field. If you choose Cluster Pool, enter the cluster pool value in the **Cluster Pool** field. For information on creating the cluster pool address, see [Address Pools, on page 1255](#).
- Step 7** To use a fixed router ID, choose Manual and enter an IPv4 address in the **IP Address** field. The default value is Automatic. For a virtual router-aware device, you can override the router ID settings in the **Virtual Routers > BGP** page.
- Step 8** (Optional) Edit the various BGP settings, starting with **General**. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network. Click **Edit** (✎) to edit the settings in the group:
- Enter a **Scanning Interval** for BGP routers for next-hop validation. Valid values are from 5 to 60 seconds. The default value is 60.
  - Enter the **Number of AS numbers in AS\_PATH attribute**. An AS\_PATH attribute is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Valid values are between 1 and 254. The default value is None.
  - Check the **Log Neighbor Changes** check box to enable logging of BGP neighbor changes (up or down) and resets. This helps in troubleshooting network connectivity problems and measuring network stability. This is enabled by default.
  - Check the **Use TCP Path MTU Discovery** check box to use the Path MTU determining technique to determine the maximum transmission unit (MTU) size on the network path between two IP hosts. This avoids IP fragmentation. This is enabled by default.
  - Check the **Reset session upon Failover** check box to reset the external BGP session immediately upon link failure. This is enabled by default.
  - Check the **Enforce that the first AS is peer's AS for EBGp routes** check box to discard incoming updates received from external BGP peers that do not list their AS number as the first segment in the AS\_PATH attribute. This prevents a mis-configured or unauthorized peer from misdirecting traffic by advertising a route as if it was sourced from another autonomous system. This is enabled by default.

- g) Check the **Use dot notation for AS number** check box to split the full binary 4-byte AS number into two words of 16 bits each, separated by a dot. AS numbers from 0-65535 are represented as decimal numbers and AS numbers larger than 65535 are represented using the dot notation. This is disabled by default.
- h) Click **OK**.

**Step 9**

(Optional) Edit the **Best Path Selection** section:

- a) Enter a value for **Default Local Preference** between 0 and 4294967295. The default value is 100. Higher values indicate higher preference. This preference is sent to all routers and access servers in the local autonomous system.
- b) Check the **Allow comparing MED from different neighbors** check box to allow the comparison of Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. This is disabled by default.
- c) Check the **Compare Router ID for identical EBGp paths** check box to compare similar paths received from external BGP peers during the best path selection process and switch the best path to the route with the lowest router ID. This is disabled by default.
- d) Check the **Pick the best MED path among paths advertised from the neighboring AS** check box to enable MED comparison among paths learned from confederation peers. The comparison between MEDs is made only if no external autonomous systems are there in the path. This is disabled by default.
- e) Check the **Treat missing MED as the least preferred one** check box to consider the missing MED attribute as having a value of infinity, making the path the least desirable; therefore, a path with a missing MED is least preferred. This is disabled by default.
- f) Click **OK**.

**Step 10**

(Optional) Edit the **Neighbor Timers** section:

- a) Enter the time interval for which the BGP neighbor remains active after not sending a keepalive message in the **Keep alive interval** field. At the end of this keepalive interval, the BGP peer is declared dead, if no messages are sent. The default value is 60 seconds.
- b) Enter the time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Hold time** field. The default value is 180 seconds. Specify a value from 0 to 65535.
- c) (Optional) Enter the minimum time interval for which the BGP neighbor remains active while a BGP connection is being initiated and configured in the **Min Hold time** field. Specify a value from 3 to 65535.

**Note**

A hold time of less than 20 seconds increases the possibility of peer flapping.

- d) Click **OK**.

**Step 11**

In the **Next Hop** section, optionally select the **Enable address tracking** check box to enable BGP next hop address tracking and enter the **Delay Interval** between checks on updated next-hop routes installed in the routing table. Click **OK**.

**Note**

The **Next Hop** section is applicable only to IPv4 settings.

**Step 12**

(Optional) Edit the **Graceful Restart** section:

**Note**

This section is available only when the Firewall Threat Defense device is in failover or spanned cluster mode. This is done so that there is no drop in packets in the traffic flow, when one of the devices in the failover setup fails.

- a) Check the **Enable Graceful Restart** checkbox to enable Firewall Threat Defense peers to avoid a routing flap following a switchover.
- b) Specify the time duration that Firewall Threat Defense peers will wait to delete stale routes before a BGP open message is received in the **Restart Time** field. The default value is 120 seconds. Valid values are between 1 and 3600 seconds.
- c) Enter the time duration that the Firewall Threat Defense will wait before deleting stale routes after an end of record (EOR) message is received from the restarting Firewall Threat Defense in the **Stalepath Time** field. The default value is 360 seconds. Valid values are between 1 and 3600 seconds.
- d) Click **OK**.

**Step 13** Click **Save**.

**Step 14** To view the BGP basic settings, from the virtual routers drop-down, select the desired router, and then click **BGP**.

This page displays the basic settings that are configured in the **Settings** page. You can edit the router ID settings on this page.

**Step 15** To edit the router ID settings, modify the IP address in the **IP Address** fields. The modified value overrides the router ID settings that were configured in the **BGP** page under **General Settings**.

## Configure BGP General Settings

Configure Route maps, Administrative Route Distances, Synchronization, Next-hop, and packet forwarding. The defaults for these settings are appropriate in most cases, but you can adjust them to fit the needs of your network.

### Procedure

**Step 1** On the **Device Management** page, click **Routing**.

**Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, select the virtual router for which you are configuring BGP.

**Step 3** Choose **BGP > IPv4** or **IPv6**.

**Step 4** Click **General**.

**Step 5** In **General**, update the following sections:

- a) In the **Settings** section, enter or select a **Route Map** object and click **OK**.

#### Note

The **Route Map** field is applicable only to IPv4 settings.

- b) In the **Administrative Route Distances** section, update the following as required, and click **OK**:

- **External** — Enter the administrative distance for external BGP routes. Routes are external when learned from an external autonomous system. The range of values for this argument are from 1 to 255. The default value is 20.
- **Internal** — Enter administrative distance for internal BGP routes. Routes are internal when learned from peer in the local autonomous system. The range of values for this argument are from 1 to 255. The default value is 200.

- **Local** — Enter administrative distance for local BGP routes. Local routes are those networks listed with a network router show command, often as back doors, for the router or for the networks that is being redistributed from another process. The range of values for this argument are from 1 to 255. The default value is 200.

c) In the **Routes and Synchronization** section, update the following as required, and click **OK**:

- (Optional) **Generate default routes** — Check the check box of this option to configure default-information originate.
- (Optional) **Summarize subnet routes into network-level routes** — Check the check box of this to configure automatic summarization of subnet routes into network-level routes. This check box is applicable only to IPv4 settings.
- (Optional) **Advertise inactive routes** — Check the check box of this to advertise routes that are not installed in the routing information base (RIB).
- (Optional) **Synchronize between BGP and IGP system** — Check the check box of this to enable synchronization between BGP and your Interior Gateway Protocol (IGP) system. Usually, a BGP speaker does not advertise a route to an external neighbor unless that route is local or exists in the IGP. This feature allows routers and access servers within an autonomous system to have the route before BGP makes it available to other autonomous systems.
- (Optional) **Redistribute IBGP into IGP** — Check the check box of this to configure iBGP redistribution into an interior gateway protocol (IGP), such as OSPF.

d) In the **Forward Packets over Multiple Paths** section, update the following as required and click **OK**:

- (Optional) **Number of Paths** — Enter the maximum number of Border Gateway Protocol routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.
- (Optional) **IBGP Number of Paths** — Enter the maximum number of parallel internal Border Gateway Protocol (iBGP) routes that can be installed in a routing table. The range of values are from 1 to 8. The default value is 1.

**Step 6** Click **Save**.

## Configure BGP Neighbor Settings

A BGP router must connect with each of its peers before exchanging updates. These peers are called BGP neighbors. Perform this procedure to define BGP IPv4 or IPv6 neighbors and neighbor settings.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | On the Device Management page, click <b>Routing</b> .   |
| <b>Step 2</b> | (For a virtual router-aware device) From the virtual routers drop-down list, choose the virtual router for which you are configuring BGP. |
| <b>Step 3</b> | Choose <b>BGP &gt; IPv4</b> or <b>IPv6</b> .  |
| <b>Step 4</b> | Click <b>Neighbor</b> .   |

**Step 5** Click **Add** to define BGP neighbors and neighbor settings.

**Step 6** Enter the BGP neighbor **IP address**. This IP address is added to the BGP neighbor table. When you are configuring BGP IPv6 on static VTI, enter the virtual tunnel IP address of the neighbor.

**Step 7** Choose the BGP neighbor **Interface**.

**Note**

The **Interface** field is only applicable to IPv6 settings.

**Step 8** Enter the autonomous system to which the BGP neighbor belongs, in the **Remote AS** field.

**Step 9** Check the **Enabled address** check box to enable communication with this BGP neighbor. Further neighbor settings will be configured only if the Enabled address check box is selected.

**Step 10** (Optional) Check the **Shutdown administratively** check box to disable a neighbor or peer group.

**Step 11** (Optional) Check the **Configure graceful restart (failover / spanned mode)** check box to enable configuration of the BGP graceful restart capability for this neighbor. After selecting this option, you must check the **Enable graceful restart** check box to specify whether graceful restart should be enabled or disabled for this neighbor.

**Note**

- The graceful restart is enabled only when the device is in HA mode or when L2 cluster (all nodes from the same network) is configured.
- The graceful restart option for BGPv6 is enabled only on Firewall Threat Defense Version 7.3+.
- If you configure graceful restart only at General Settings and not at BGP IPv6, the global General Settings configuration persist.
- If you configure graceful restart at General Settings and also at BGP IPv6, the global General Settings configuration is overridden by the BGP IPv6 configuration settings.

**Step 12** (Optional) To enable configuration of the BFD support for BGP, from the **BFD Fallover** drop-down list, choose the BFD type—single-hop, multi-hop, or auto-detect-hop. This selection registers the BGP neighbor to receive forwarding path detection failure messages from BFD. Choose None if you do not want to have BFD support.

**Step 13** (Optional) Enter a **Description** for the BGP neighbor.

**Step 14** (Optional) From the **Update Sourcedrop**-down list, choose an interface to source the BGP packets.

You can choose a loopback address as this interface to overcome path failures. You can also choose any physical, port-channel, or a sub-interface.

**Step 15** (Optional) In **Filtering Routes**, use access lists, route maps, prefix lists and AS path filters as required, to distribute BGP Neighbor information. Update the following sections:

- a) Choose or select the appropriate incoming or outgoing **Access List** to distribute BGP neighbor information.

**Note**

Access lists are only applicable to IPv4 settings.

- b) Choose or select the appropriate incoming or outgoing **Route Maps** to apply a route map to incoming or outgoing routes.
- c) Choose or select the appropriate incoming or outgoing **Prefix List** to distribute BGP neighbor information.
- d) Choose or select the appropriate incoming or outgoing **AS path filter** to distribute BGP neighbor information.

- e) Check the check box of **Limit the number of prefixes allowed from the neighbor** to control the number of prefixes that can be received from a neighbor.
  - Enter the maximum number of prefixes allowed from a specific neighbor in the **Maximum Prefixes** field.
  - Enter the percentage (of maximum) at which the router starts to generate a warning message in the **Threshold Level** field. Valid values are integers between 1 and 100. The default value is 75.
- f) Check the **Control prefixes received from the peer** check box to specify additional controls for the prefixes received from a peer. Do one of the following
  - Check the **Terminate peering when prefix limit is exceeded** check box to stop the BGP neighbor when the prefix limit is reached. Specify the interval after which the BGP neighbor will restart in the **Restart interval** field.
  - Check the **Give only warning message when prefix limit is exceeded** check box to generate a log message when the maximum prefix limit is exceeded. Here, the BGP neighbor will not be terminated.
- g) Click **OK**.

**Step 16**

(Optional) In **Routes**, specify miscellaneous Neighbor route parameter. Proceed to update the following:

- a) Enter the minimum interval (in seconds) between the sending of BGP routing updates in the **Advertisement Interval** field. Valid values are between 1 and 600.
- b) Check the **Remove private AS numbers from outbound routing updates** check box to exclude the private AS numbers from being advertised on outbound routes.
- c) Check the **Generate default routes** check box to allow the local router to send the default route 0.0.0.0 to a neighbor to use as a default route. Enter or Select the route map that allows the route 0.0.0.0 to be injected conditionally in the **Route map** field.
- d) To add conditionally advertised routes, click Add Row +. In the Add Advertised Route dialog box, do the following:
  1. Add or choose a route map in the **Advertise Map** field, that will be advertised if the conditions of the exist map or the non-exist map are met.
  2. Click **Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.
  3. Click **Non-Exist Map** and choose a route map from the Route Map Object Selector. This route map is compared with the routes in the BGP table, to determine whether the advertise map route is advertised.
  4. Click **OK**.

**Step 17**

In **Timers**, check the **Set timers for the BGP peer** check box to set the keepalive frequency, hold time and minimum hold time

- **Keep alive interval**—Enter the frequency (in seconds) with which Firewall Threat Defense sends keepalive messages to the neighbor. Valid values are between 0 and 65535. The default value is 60 seconds.
- **Hold time**—Enter the interval (in seconds) after not receiving a keepalive message that Firewall Threat Defense declares a peer dead. Valid values are between 0 and 65535. The default value is 180 seconds.

- **Min hold time**—(Optional) Enter the minimum interval (in seconds) after not receiving a keepalive message that Firewall Threat Defense declares a peer dead. Valid values are between 3 and 65535. The default value is 3 seconds.

**Note**

A hold time of less than 20 seconds increases the possibility of peer flapping.

**Step 18** In **Advanced**, update the following:

- (Optional) Check the **Enable Authentication** check box to enable MD5 authentication on a TCP connection between two BGP peers.
  - Choose an encryption type from the **Enable Encryption** drop-down list.
  - Enter a password in the **Password** field. Reenter the password in the **Confirm Password** field. The password is case-sensitive and can be up to 25 characters long when the service password-encryption command is enabled and up to 81 characters long when the service password-encryption command is not enabled. The string can contain any alphanumeric characters, including spaces.

**Note**

You cannot specify a password in the format number-space-anything. The space after the number can cause authentication to fail.

- (Optional) Select the **Send Community attribute to this neighbor** check box to specify that communities attributes should be sent to the BGP neighbor
- (Optional) Select the **Use FTD as next hop for this neighbor** check box to configure the router as the next-hop for a BGP speaking neighbor or peer group.
- Select the **Disable Connection Verification** check box to disable the connection verification process for eBGP peering sessions that are reachable by a single hop but are configured on a loopback interface or otherwise configured with a non-directly connected IP address. When deselected (default), a BGP routing process will verify the connection of single-hop eBGP peering session (TTL=254) to determine if the eBGP peer is directly connected to the same network segment by default. If the peer is not directly connected to same network segment, connection verification will prevent the peering session from being established.
- Select **Allow connections with neighbor that is not directly connected** to accept and attempt BGP connections to external peers residing on networks that are not directly connected. (Optional) Enter the time-to-live in the **TTL hops** field. Valid values are between 1 and 255. Alternately, select **Limited number of TTL hops to neighbor**, to secure a BGP peering session. Enter the maximum number of hops that separate eBGP peers in the **TTL hops** field. Valid values are between 1 and 254.
- (Optional) Select the **Use TCP MTU path discovery** check box to enable a TCP transport session for a BGP session.
- Choose the TCP connection mode from the **TCP Transport Mode** drop-down list. Options are Default, Active, or Passive.
- (Optional) Enter a **Weight** for the BGP neighbor connection.
- Select the **BGP Version** that Firewall Threat Defense will accept from the drop-down list. The version can be set to 4-Only to force the software to use only Version 4 with the specified neighbor. The default is to use Version 4 and dynamically negotiate down to Version 2 if requested.

**Step 19** Update **Migration**, only if AS migration is considered.**Note**

The AS migration customization should be removed after transition has been completed.

- a) (Optional) Check the **Customize the AS number for routes received from the neighbor** check box to customize the AS\_PATH attribute for routes received from an eBGP neighbor.
- b) Enter the local autonomous system number in the **Local AS number** field. Valid values are any valid autonomous system number from 1 to 4294967295 or 1.0 to 65535.65535.
- c) (Optional) Check the **Do not prepend local AS number to routes received from neighbor** check box to prevent the local AS number from being prepended to any routes received from eBGP peer.
- d) (Optional) Check the **Replace real AS number with local AS number in routes received from neighbor** check box to replace the real autonomous system number with the local autonomous system number in the eBGP updates. The autonomous system number from the local BGP routing process is not prepended.
- e) (Optional) Check the **Accept either real AS number or local AS number in routes received from neighbor** check box to configure the eBGP neighbor to establish a peering session using the real autonomous system number (from the local BGP routing process) or by using the local autonomous system number.

**Step 20** Click **OK**.

**Step 21** Click **Save**.

## Configure BGP Aggregate Address Settings

BGP neighbors store and exchange routing information and the amount of routing information increases as more BGP speakers are configured. Route aggregation is the process of combining the attributes of several different routes so that only a single route is advertised. Aggregate prefixes use the classless interdomain routing (CIDR) principle to combine contiguous networks into one classless set of IP addresses that can be summarized in routing tables. As a result fewer routes need to be advertised. Use the Add/Edit Aggregate Address dialog box to define the aggregation of specific routes into one route.

### Procedure

- Step 1** When editing the Firewall Threat Defense device, click **Routing**.
- Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.
- Step 3** Choose **BGP > IPv4** or **IPv6**.
- Step 4** Click **Add Aggregate Address**.
- Step 5** Enter a value for the aggregate timer (in seconds) in the **Aggregate Timer** field. Valid values are 0 or any value between 6 and 60. The default value is 30.
- Step 6** Click (+) **Add** and update the **Add Aggregate Address** dialog box:
  - a) **Network** — Enter an IPv4 address or select the desired network/hosts objects.
  - b) **Attribute Map** — (Optional) Enter or select the route map used to set the attribute of the aggregate route.
  - c) **Advertise Map** — (Optional) Enter or select the route map used to select the routes to create AS\_SET origin communities.
  - d) **Suppress Map** — (Optional) Enter or select the route map used to select the routes to be suppressed.
  - e) **Generate AS set path Information** — (Optional) Check the check box to enable generation of autonomous system set path information.

- f) **Filter all routes from updates** — (Optional) Check the check box to filter all more-specific routes from updates.
  - g) Click **OK**.
- 

#### What to do next

- For BGPv4 settings, proceed to [Configure BGPv4 Filtering Settings, on page 1178](#).
- For BGPv6 settings, proceed to [Configure BGP Network Settings, on page 1179](#).

## Configure BGPv4 Filtering Settings

Filtering settings are used to filter routes or networks received in incoming BGP updates. Filtering is used to restrict routing information that the router learns or advertises.

#### Before you begin

Filtering is only applicable for a BGP IPv4 routing policy.

#### Procedure

---

- Step 1** On the Device Management page, click **Routing**.
  - Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.
  - Step 3** Choose **BGP > IPv4**.
  - Step 4** Click **Filtering**.
- Note**  
The **Filtering** field is applicable only to IPV4 settings.
- Step 5** Click (+) **Add** and update the **Add Filter** dialog box:
    - a) **Access List**— Choose an access control list that defines which networks are to be received and which are to be suppressed in routing updates.
    - b) **Direction**— (Optional) Choose a direction that specifies if the filter should be applied to inbound updates or outbound updates.
    - c) **Protocol**— (Optional) Choose the routing process for which you want to filter: None, BGP, Connected, OSPF, RIP, or Static.
    - d) **Process ID**— (Optional) Enter the process ID for the OSPF routing protocol.
    - e) Click **OK**.
  - Step 6** Click **Save**.
-

## Configure BGP Network Settings

Network settings are used to add networks that will be advertised by the BGP routing process and route maps that will be examined to filter the networks to be advertised.

### Procedure

- 
- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.
- Step 3** Choose **BGP > IPv4** or **IPv6**.
- Step 4** Click **Networks**.
- Step 5** Click **Add** and update the **Add Networks** dialog box:
- a) **Network**— Choose the network to be advertised by the BGP routing processes.
- Note**  
For a network prefix to be advertised, a route to the device must exist on the routing table.
- To add a new network object, see [Creating Network Objects, on page 1283](#).
- b) (Optional) **Route Map**— Enter or choose a route map that should be examined to filter the networks to be advertised. If not specified, all networks are redistributed. To add a new route map object, see [Route Map, on page 1306](#).
  - c) Click **OK**.
- Step 6** Click **Save**.
- 

## Configure BGP Redistribution Settings

Redistribution settings allow you to define the conditions for redistributing routes from another routing domain into BGP.

### Procedure

- 
- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.
- Step 3** Choose **BGP > IPv4** or **IPv6**.
- Step 4** Click **Redistribution**.
- Step 5** Click **Add** and update the **Add Redistribution** dialog:
- a) **Source Protocol**— Select the protocol from which you want to redistribute routes into the BGP domain from the Source Protocol drop-down list.
- Note**  
User-defined virtual routers does not support redistributing traffic from RIP.

- b) **Process ID**— Enter the identifier for the selected source protocol. Applies to the OSPF protocol. For devices using virtual routing, this drop-down lists the process ID assigned for the virtual router for which you are configuring the BGP settings.
- c) **Metric**— (Optional) Enter a metric for the redistributed route.
- d) **Route Map**— Enter or select a route map that should be examined to filter the networks to be redistributed. If not specified, all networks are redistributed. To create a new route map object, click **Add (+)**. See [Configure Route Map Entry](#) for the procedure to add a new route map.
- e) **Match**— The conditions used for redistributing routes from one routing protocol to another. The routes must match the selected condition to be redistributed. You can choose one or more of the following match conditions. These options are enabled only when OSPF is chosen as the Source Protocol.
  - Internal
  - External 1
  - External 2
  - NSSA External 1
  - NSSA External 2
- f) Click **OK**.

## Configure BGP Route Injection Settings

Route injection settings allow you to define the routes to be conditionally injected into the BGP routing table.

### Procedure

- Step 1** On the **Device Management** page, click **Routing**.
- Step 2** (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.
- Step 3** Choose **BGP > IPv4** or **IPv6**.
- Step 4** Click **Route Injection**.
- Step 5** Click **Add** and update the **Add Route Injection** dialog box:
  - a) **Inject Map**— Enter or select the route map that specifies the prefixes to inject into the local BGP routing table. To create a new route map object, click **Add (+)**. For the procedure to add a new route map, see [Configure Route Map Entry](#).
  - b) **Exist Map**— Enter or select the route map containing the prefixes that the BGP speaker will track.
  - c) **Injected routes will inherit the attributes of the aggregate route**— Check this box to configure the injected route to inherit attributes of the aggregate route.
  - d) Click **OK**.
- Step 6** Click **Save**.

## Configure BGP Route Import/Export Settings

In BGP, you can implement an inter-virtual-router route leak by importing or exporting routes using the route target extended community of the destination and source virtual routers respectively. You can use a route map to filter the desired route targets instead of leaking the entire routing table. You can also leak the routes of global virtual router to user-defined virtual routers and vice versa.

- You can configure BGP to leak routes between two user-defined virtual routers using the route target extended communities:
  - Tag the routes with the route targets from the source virtual router using route target export.
  - Import the routes that are matching the route targets in to the destination virtual router using route target import.
  - Optionally, you can filter routes from source virtual router or to destination virtual router using export or import route maps respectively. You can configure route map with match extended community list for filtering the routes. Similarly, you can configure route map with set extended community route targets to tag the routes with the route target extended community.
- To import routes from the global virtual router to a user-defined virtual router, specify the IPv4/IPv6 route map in Global Virtual Router Import Route Map to import to the user-defined virtual router.
- To export routes from a user-defined virtual router to the global virtual router, in addition to exporting the route targets, you can also specify the Global Virtual Router Export Route Map to export from the user-defined virtual router.

The BGP inter-virtual-router route leaking supports both ipv4 and ipv6 prefixes.

### Before you begin

- [Create virtual routers](#).
- [Enable BGP on the virtual router](#).
- [Configure BGP, on page 1169](#).

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | On the Device Management page, click <b>Routing</b> .   |
| <b>Step 2</b> | (For a virtual-router-aware device) From the virtual routers drop-down, choose the virtual router for which you are configuring BGP.  |
| <b>Step 3</b> | Choose <b>BGP &gt; IPv4</b> or <b>IPv6</b> .  |
| <b>Step 4</b> | (Supported only for only virtual routers) Click <b>Route Import/Export</b> .  |
| <b>Step 5</b> | In the <b>Route Targets Import</b> field, enter the route target extended community that you want to match for the routes to be imported. On deployment, the routes of the destination virtual router that matches this value is imported to the source virtual router's BGP table. |

### Note

- The route target must be in **ASN:nn** format.

- You can enter multiple route targets as comma separated values.
- This value can range from 0:1 to 65534:65535.

**Step 6**

In the **Route Targets Export** field, enter the route target extended community to tag the source virtual router's routes with the route target value. On deployment, the routes of the source virtual router are tagged with this value.

**Note**

- The route target must be in **ASN:nn** format.
- You can enter multiple route targets as comma separated values.
- This value can range from 0:1 to 65534:65535.

**Step 7**

Route maps help you to narrow down the routes to be shared instead of leaking the entire routing table. Route map filtering is applied on the list of routes that are obtained with the specified route target values:

- a) (Optional) Under **User Virtual Router**, choose the route map from the **Import Route Map** drop-down list to filter the routes at the destination virtual router.

**Note**

The user virtual router import route map is effective only when the route targets import is configured.

- b) (Optional) Under **User Virtual Router**, choose the route map from the **Export Route Map** drop-down list to filter the routes at the source virtual router before the routes are exported to other virtual routers.

**Note**

You can use the match and set clauses in the route map with the route target extended community lists for filtering based on other criteria or tagging the routes with the route target community values. For more information, see [Route Map, on page 1306](#).

**Step 8**

To share the routes between a user-defined virtual router and global virtual router, specify the route map under the **Global Virtual Router**:

- a) To leak the global virtual router routes to the user-defined virtual router, select the route map from the **Import Route Map** drop-down list. The IPv4 or IPv6 route map is imported to the user-defined virtual router.
- b) To leak the user-defined virtual router routes to the global virtual router, select the route map from the **Export Route Map** drop-down list. The IPv4 or IPv6 route map is exported to the global virtual router.

**Note**

You must specify the route targets for export apart from specifying the route map.

**Note**

You can use the match clause of the route map object to filter the routes for leaking. For more information, see [Route Map, on page 1306](#).

**Step 9**

Follow the procedure ( [Step 3](#) to [Step 8](#) ) to configure relevant BGP route import and export settings for other virtual routers as well.

**Step 10**

Click **Save** and **Deploy**.

---

When the packets flow into the ingress virtual router, BGP imports the routes from the destination virtual routers that have the matching route target value and if a route map is also configured, the routes are further filtered and used to identify the best path routes for routing the packets.

## History for BGP

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Graceful restart support on BGPv6	7.4	Any	You can configure graceful restart on BGPv6 for Secure Firewall Threat Defense version 7.3 and later. New/modified screens: <b>Routing &gt; BGP &gt; IPv6 &gt; Add/Edit Neighbor</b> .
Loopback interface support for BGP	7.4	Any	You can use a loopback interface for BGP. New/modified screens: <b>Routing &gt; BGP &gt; IPv4 or IPv6 &gt; Add/Edit Neighbor</b> .
BGP configuration to interconnect virtual routers	7.1	Any	You can configure BGP settings to dynamically leak routes among user-defined virtual routers, and between global virtual router and user-defined virtual routers. The import and export routes feature was introduced to exchange routes among the virtual routers by tagging them with route targets and optionally, filtering the matched routes with route maps. This BGP feature is accessible only when you select a user-defined virtual router. New/modified screens: For a selected user-defined virtual router, <b>Devices &gt; Device Management &gt; Routing &gt; BGPv4/v6 &gt; Route Import/Export</b> tab.
BGPv6 support for user-defined virtual routers	7.1	Any	Secure Firewall Threat Defense now supports configuring BGPv6 on user-defined virtual routers. New/modified screens: For a selected user-defined virtual router, <b>Devices &gt; Device Management &gt; Routing &gt; BGPv6</b> page.

## CHAPTER 30

# RIP

This chapter describes how to configure the Firewall Threat Defense to route data, perform authentication, and redistribute routing information, using the Routing Information Protocol (RIP). For a device using virtual routing, you can configure RIP only for its global virtual router and not for its user-defined virtual router.

- [About RIP, on page 1185](#)
- [Requirements and Prerequisites for RIP, on page 1187](#)
- [Guidelines for RIP, on page 1187](#)
- [Configure RIP, on page 1188](#)

## About RIP

The Routing Information Protocol, or RIP, as it is more commonly called, is one of the most enduring of all routing protocols. RIP has four basic components: routing update process, RIP routing metrics, routing stability, and routing timers. Devices that support RIP send routing-update messages at regular intervals and when the network topology changes. These RIP packets include information about the networks that the devices can reach, as well as the number of routers or gateways that a packet must travel through to reach the destination address. RIP generates more traffic than OSPF, but is easier to configure.

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection. When RIP is enabled on an interface, the interface exchanges RIP broadcasts with neighboring devices to dynamically learn about and advertise routes.

The Secure Firewall Threat Defense device supports both RIP Version 1 and RIP Version 2. RIP Version 1 does not send the subnet mask with the routing update. RIP Version 2 sends the subnet mask with the routing update and supports variable-length subnet masks. Additionally, RIP Version 2 supports neighbor authentication when routing updates are exchanged. This authentication ensures that the Secure Firewall Threat Defense device receives reliable routing information from a trusted source.

RIP has advantages over static routes because the initial configuration is simple, and you do not need to update the configuration when the topology changes. The disadvantage to RIP is that there is more network and processing overhead than in static routing.

## Routing Update Process

RIP sends routing-update messages at regular intervals and when the network topology changes. When a router receives a routing update that includes changes to an entry, it updates its routing table to reflect the new route. The metric value for the path is increased by 1, and the sender is indicated as the next hop. RIP

routers maintain only the best route (the route with the lowest metric value) to a destination. After updating its routing table, the router immediately begins transmitting routing updates to inform other network routers of the change. These updates are sent independently of the regularly scheduled updates that RIP routers send.

## RIP Routing Metric

RIP uses a single routing metric (hop count) to measure the distance between the source and a destination network. Each hop in a path from source to destination is assigned a hop count value, which is typically 1. When a router receives a routing update that contains a new or changed destination network entry, the router adds 1 to the metric value indicated in the update and enters the network in the routing table. The IP address of the sender is used as the next hop.

## RIP Stability Features

RIP prevents routing loops from continuing indefinitely by implementing a limit on the number of hops allowed in a path from the source to a destination. The maximum number of hops in a path is 15. If a router receives a routing update that contains a new or changed entry, and if increasing the metric value by 1 causes the metric to be infinity (that is, 16), the network destination is considered unreachable. The downside of this stability feature is that it limits the maximum diameter of a RIP network to less than 16 hops.

RIP includes a number of other stability features that are common to many routing protocols. These features are designed to provide stability despite potentially rapid changes in network topology. For example, RIP implements the split horizon and hold-down mechanisms to prevent incorrect routing information from being propagated.

## RIP Timers

RIP uses numerous timers to regulate its performance. Following are the timer stages for RIP:

- **Update**—The routing-update timer is the interval between periodic routing updates. This is how often the device sends routing updates. Generally, it is set to 30 seconds, with a small random amount of time added whenever the timer is reset. This is done to help prevent congestion, which could result from all routers simultaneously attempting to update their neighbors.
- **Invalid**—Each routing table entry has a route-timeout timer associated with it. This is the number of seconds since the device received the last valid update. When the route-timeout timer expires, the route is marked invalid but is retained in the table until the route-flush timer expires. Once this timer expires, the route goes into holddown. The default is 180 seconds (3 minutes).
- **Holddown**—The holddown period is the number of seconds the system waits before accepting any new updates for the route that is in holddown (that is, routes that have been marked invalid). The default is 180 seconds (3 minutes).
- **Flush**—The route-flush timer is the number of seconds since the system received the last valid update until the route is discarded and removed from the routing table. The default is 240 seconds (4 minutes).

As an example, when the interface on an adjacent router goes down, the system no longer receives routing updates from the adjacent router. At this time, the Invalid and Flush timers start increasing. In the first 180 seconds, nothing will happen. After 180 seconds, the invalid timer expires, making the route invalid, and the Holddown timer starts and holds the route for another 60 seconds. If there is still no update regarding the interface status on the adjacent router (that is, it is still down), then the route enters into the Flush state where in total the system has waited for 240 seconds from the last update (180 seconds for the Invalid timer and 60

seconds for Holddown timer), and the system flushes the route. Even if the adjacent routers interface comes up immediately, the system does not accept a routing update until the Holddown timer completes the remaining 120 seconds.

## Requirements and Prerequisites for RIP

### Model Support

Threat Defense

Firewall Threat Defense Virtual

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Guidelines for RIP

### IPv6 Guidelines

Does not support IPv6.

### Additional Guidelines

The following information applies to RIP Version 2 only:

- If using neighbor authentication, the authentication key and key ID must be the same on all neighbor devices that provide RIP Version 2 updates to the interface.
- With RIP Version 2, the Secure Firewall Threat Defense device transmits and receives default route updates using the multicast address 224.0.0.9. In passive mode, it receives route updates at that address.
- When RIP Version 2 is configured on an interface, the multicast address 224.0.0.9 is registered on that interface. When a RIP Version 2 configuration is removed from an interface, that multicast address is unregistered.

### Limitations

- The Secure Firewall Threat Defense device cannot pass RIP updates between interfaces.
- RIP Version 1 does not support variable-length subnet masks.
- RIP has a maximum hop count of 15. A route with a hop count greater than 15 is considered unreachable.
- RIP convergence is relatively slow compared to other routing protocols.

- You can only enable a single RIP process on the Secure Firewall Threat Defense device.

## Configure RIP

RIP is a distance-vector routing protocol that uses hop count as the metric for path selection.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Select **Routing**.
- Step 3** Select **RIP** from the table of contents.
- Step 4** Check the **Enable RIP** check box to configure the RIP settings.
- Step 5** Choose the RIP versions for sending and receiving RIP updates from the **RIP Version** drop-down list.
- Step 6** (Optional) Check the **Generate Default Route** check box to generate a default route for distribution, based on the route map that you specify.
- Specify a route map name to use for generating default routes, in the **Route Map** field.  
The default route 0.0.0.0/0 is generated for distribution over a certain interface, when the route map, specified in the **Route Map** field, is present.
- Step 7** When Send and Receive Version 2 is the chosen RIP Version, the **Enable Auto Summary** option is available. When the **Enable Auto Summary** check box is checked, automatic route summarization is enabled. Disable automatic summarization if you must perform routing between disconnected subnets. When automatic summarization is disabled, subnets are advertised.
- Note**  
RIP Version 1 always uses automatic summarization—you cannot disable it.
- Step 8** Click **Networks**. Define one or more networks for RIP routing. Enter IP address(es), or enter or select the desired Network/Hosts objects. There is no limit to the number of networks you can add to the security appliance configuration. Any interface that belongs to a network defined by this command, will participate in the RIP routing process. The RIP routing updates will be sent and received only through interfaces on the specified networks. Also, if the network of an interface is not specified, the interface will not be advertised in any RIP updates.
- Note**  
RIP only supports IPv4 objects.
- Step 9** (Optional) Click **Passive Interface**. Use this option to specify passive interfaces on the appliance, and by extension the active interfaces. The device listens for RIP routing broadcasts on passive interfaces, using that information to populate its routing tables, but does not broadcast routing updates on passive interfaces. Interfaces that are not designated as passive, receive and send updates.
- Step 10** Click **Redistribution** to manage redistribution routes. These are the routes that are being redistributed from other routing processes into the RIP routing process.
- Click **Add** to specify redistribution routes.
  - Choose the routing protocol to redistribute into the RIP routing process, in the **Protocol** drop-down list.

**Note**

For the OSPF protocol, specify a process ID. Similarly, specify an AS path for BGP. When you choose the Connected option in the **Protocol** drop-down list, you can redistribute, directly connected networks into the RIP routing process.

- c) (Optional) If you are redistributing OSPF routes into the RIP routing process, you can select specific types of OSPF routes to redistribute in the **Match** drop-down list. Ctrl-click to select multiple types:
- **Internal** – Routes internal to the autonomous system (AS) are redistributed.
  - **External 1** – Type 1 routes external to the AS are redistributed.
  - **External 2** – Type 2 routes external to the AS are redistributed.
  - **NSSA External 1** – Type 1 routes external to a not-so-stubby area (NSSA) are redistributed.
  - **NSSA External 2** – Type 2 routes external to an NSSA are redistributed.

**Note**

The default is match Internal, External 1, and External 2

- d) Select the RIP metric type to apply to the redistributed routes in the **Metric** drop-down list. The two choices are:
- **Transparent** – Use the current route metric
  - **Specified Value** – Assign a specific metric value. Enter a specific value from 0-16, in the **Metric Value** field.
  - **None** – No metric is specified. Do not use any metric value, to apply to redistributed routes.

**Note**

None option is applicable only for Static and Connected protocols.

- e) (Optional) Enter the name of a route map that must be satisfied, in the **Route Map** field before the route can be redistributed into the RIP routing process. Routes are redistributed only if IP address matches an allow statement in the route map address list. To create a new route map object, click **Add (+)**. See [Configure Route Map Entry](#) for the procedure to add a new route map.
- f) Click **OK**.

**Step 11**

(Optional) Click **Filtering** to manage filters for the RIP policy. In this section, filters are used to prevent routing updates through an interface, control the advertising of routes in routing updates, control the processing of routing updates and filtering sources of routing updates.

- a) Click **Add** to add RIP filters.
- b) Select the type of traffic to be filtered - Inbound or Outbound in the **Traffic Direction** field.

**Note**

If traffic direction is inbound, you can only define an Interface filter.

- c) Specify whether the filter is based on an Interface or a Route, by selecting appropriate in the **Filter On** field. If you click **Interface**, enter or choose the name of the interface on which routing updates are to be filtered. If you click **Route**, choose the route type:
- **Static** – Only static routes are filtered.
  - **Connected** – Only connected routes are filtered.

- **OSPF** – Only OSPFv2 routes discovered by the specified OSPF process are filtered. Enter the Process ID of the OSPF process to be filtered.
- **BGP** – Only BGPv4 routes discovered by the specified BGP process are filtered. Enter the AS path of the BGP process to be filtered.

- d) In the **Access List** field, enter or choose the name of one or more access control lists (ACLs) that define the networks to be allowed or removed from RIP route advertisements. To add a new standard access list object, click **Add** (+) and see [Configure Standard ACL Objects, on page 1254](#).
- e) Click **OK**.

**Step 12**

(Optional) Click **Broadcast** to add or edit interface configurations. Using Broadcast, you can override the global RIP versions to send or receive per interface. You can also define the authentication parameters per interface if you want to implement authentication to ensure valid RIP updates.

- a) Click **Add** to add interface configurations.
- b) Enter or choose an interface defined on this appliance in the **Interface** field.
- c) In the Send option, select the appropriate boxes to specify sending updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Send versions specified .
- d) In the Receive option, select the appropriate boxes to specify accepting updates using the RIP **Version 1**, **Version 2**, or both. These options let you override, for the specified interface, the global Receive versions specified .
- e) Select the **Authentication** used on this interface for RIP broadcasts.
- **None** – No authentication
  - **MD5** – Employ MD5
  - **Clear Text** – Employ clear-text authentication

If you choose MD5 or Clear Text, you must also provide the following authentication parameters.

- **Key ID** – The ID of the authentication key. Valid values are from 0 to 255.
- **Key** – The key used by the chosen authentication method. Can contain up to 16 characters
- **Confirm** – Enter the authentication key again, to confirm

- f) Click **OK**.
-

# CHAPTER 31

## Multicast

This chapter describes how to configure the Secure Firewall Threat Defense device to use the multicast routing protocol.

- [About Multicast Routing, on page 1191](#)
- [Requirements and Prerequisites for Multicast Routing, on page 1195](#)
- [Guidelines for Multicast Routing, on page 1195](#)
- [Configure IGMP Features, on page 1196](#)
- [Configure PIM Features, on page 1201](#)
- [Configure Multicast Routes, on page 1207](#)
- [Configure Multicast Boundary Filters, on page 1208](#)

## About Multicast Routing

Multicast routing is a bandwidth-conserving technology that reduces traffic by simultaneously delivering a single stream of information to thousands of corporate recipients and homes. Applications that take advantage of multicast routing include videoconferencing, corporate communications, distance learning, and distribution of software, stock quotes, and news.

Multicast routing protocols deliver source traffic to multiple receivers without adding any additional burden on the source or the receivers while using the least network bandwidth of any competing technology. Multicast packets are replicated in the network by Firewall Threat Defense device enabled with Protocol Independent Multicast (PIM) and other supporting multicast protocols, which results in the most efficient delivery of data to multiple receivers possible.

The Firewall Threat Defense device supports both stub multicast routing and PIM multicast routing. However, you cannot configure both concurrently on a single Firewall Threat Defense device.

---

**Note** The UDP and non-UDP transports are both supported for multicast routing. However, the non-UDP transport has no FastPath optimization.

---

## IGMP Protocol

IP hosts use the Internet Group Management Protocol (IGMP) to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast

group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

IGMP uses group addresses (Class D IP address) as group identifiers. Host group address can be in the range of 224.0.0.0 to 239.255.255.255. The address 224.0.0.0 is never assigned to any group. The address 224.0.0.1 is assigned to all systems on a subnet. The address 224.0.0.2 is assigned to all routers on a subnet.

---

**Note** When you enable multicast routing on the Firewall Threat Defense device, IGMP Version 2 is automatically enabled on all interfaces.

---

### Query Messages to Multicast Groups

The Firewall Threat Defense device sends query messages to discover which multicast groups have members on the networks attached to the interfaces. Members respond with IGMP report messages indicating that they want to receive multicast packets for specific groups. Query messages are addressed to the all-systems multicast group, which has an address of 224.0.0.1, with a time-to-live value of 1.

These messages are sent periodically to refresh the membership information stored on the Firewall Threat Defense device. If the Firewall Threat Defense device discovers that there are no local members of a multicast group still attached to an interface, it stops forwarding multicast packets for that group to the attached network, and it sends a prune message back to the source of the packets.

By default, the PIM designated router on the subnet is responsible for sending the query messages. By default, they are sent once every 125 seconds.

When changing the query response time, by default, the maximum query response time advertised in IGMP queries is 10 seconds. If the Firewall Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.

## Stub Multicast Routing

Stub multicast routing provides dynamic host registration and facilitates multicast routing. When configured for stub multicast routing, the Firewall Threat Defense device acts as an IGMP proxy agent. Instead of fully participating in multicast routing, the Firewall Threat Defense device forwards IGMP messages to an upstream multicast router, which sets up delivery of the multicast data. When configured for stub multicast routing, the Firewall Threat Defense device cannot be configured for PIM sparse or bidirectional mode. You must enable PIM on the interfaces participating in IGMP stub multicast routing.

The Firewall Threat Defense device supports both PIM-SM and bidirectional PIM. PIM-SM is a multicast routing protocol that uses the underlying unicast routing information base or a separate multicast-capable routing information base. It builds unidirectional shared trees rooted at a single Rendezvous Point (RP) per multicast group and optionally creates shortest-path trees per multicast source.

## PIM Multicast Routing

Bidirectional PIM is a variant of PIM-SM that builds bidirectional shared trees connecting multicast sources and receivers. Bidirectional trees are built using a Designated Forwarder (DF) election process operating on each link of the multicast topology. With the assistance of the DF, multicast data is forwarded from sources to the Rendezvous Point (RP), and therefore along the shared tree to receivers, without requiring source-specific state. The DF election takes place during RP discovery and provides a default route to the RP.

**Note** If the Firewall Threat Defense device is the PIM RP, use the untranslated outside address of the Firewall Threat Defense device as the RP address.

## PIM Source Specific Multicast Support

The Firewall Threat Defense device does not support PIM Source Specific Multicast (SSM) functionality and related configuration. However, the Firewall Threat Defense device allows SSM-related packets to pass through unless it is placed as a last-hop router.

SSM is classified as a data delivery mechanism for one-to-many applications such as IPTV. The SSM model uses a concept of "channels" denoted by an (S,G) pair, where S is a source address and G is an SSM destination address. Subscribing to a channel is achieved by using a group management protocol such as IGMPv3. SSM enables a receiving client, once it has learned about a particular multicast source, to receive multicast streams directly from the source rather than receiving it from a shared Rendezvous Point (RP). Access control mechanisms are introduced within SSM providing a security enhancement not available with current sparse or sparse-dense mode implementations.

PIM-SSM differs from PIM-SM in that it does not use an RP or shared trees. Instead, information on source addresses for a multicast group is provided by the receivers through the local receivership protocol (IGMPv3) and is used to directly build source-specific trees.

## Multicast Bidirectional PIM

Multicast bidirectional PIM is useful for networks that have many sources and receivers talking to each other simultaneously and where each participant can become both the source and receiver of multicast traffic, such as in videoconferencing, Webex meetings, and group chat. When PIM bidirectional mode is used, the RP only creates the (\*,G) entry for the shared tree. There is no (S,G) entry. This conserves resources on the RP because state tables for each (S,G) entry are not maintained.

In PIM sparse mode, traffic only flows down the shared tree. In PIM bidirectional mode, traffic flows up and down the shared tree.

PIM bidirectional mode also does not use the PIM register/register-stop mechanism to register sources to the RP. Each source can begin sending to the source at any time. When the multicast packets arrive at the RP, they are forwarded down the shared tree (if there are receivers) or dropped (when there are no receivers). However, there is no way for the RP to tell the source to stop sending multicast traffic.

Design-wise you must think about where to place the RP in your network because it should be somewhere in the middle between the sources and receivers in the network.

PIM bidirectional mode has no Reverse Path Forwarding (RPF) check. Instead it uses the concept of a Designated Forwarder (DF) to prevent loops. This DF is the only router on the segment that is allowed to send multicast traffic to the RP. If there is only one router per segment that forwards multicast traffic, there will be no loops. The DF is chosen using the following mechanism:

- The router with the lowest metric to the RP is the DF.
- If the metric is equal, then the router with the highest IP address becomes the DF.

## PIM Bootstrap Router (BSR)

PIM Bootstrap Router (BSR) is a dynamic Rendezvous Point (RP) selection model that uses candidate routers for RP function and for relaying the RP information for a group. The RP function includes RP discovery and provides a default route to the RP. It does this by configuring a set of devices as candidate BSRs (C-BSR) which participate in a BSR election process to choose a BSR amongst themselves. Once the BSR is chosen, devices that are configured as candidate Rendezvous Points (C-RP) start sending their group mapping to the elected BSR. The BSR then distributes the group-to-RP mapping information to all the other devices down the multicast tree through BSR messages that travel from PIM router to PIM router on a per-hop basis.

This feature provides a means of dynamically learning RPs, which is very essential in large complex networks where an RP can periodically go down and come up.

### PIM Bootstrap Router (BSR) Terminology

The following terms are frequently referenced in the PIM BSR configuration:

- **Bootstrap Router (BSR)** — A BSR advertises Rendezvous Point (RP) information to other routers with PIM on a hop-by-hop basis. Among multiple Candidate-BSRs, a single BSR is chosen after an election process. The primary purpose of this Bootstrap router is to collect all Candidate-RP (C-RP) announcements in to a database called the RP-set and to periodically send this out to all other routers in the network as BSR messages (every 60 seconds).
- **Bootstrap Router (BSR) messages** — BSR messages are multicast to the All-PIM-Routers group with a TTL of 1. All PIM neighbors that receive these messages retransmit them (again with a TTL of 1) out of all interfaces except the one in which the messages were received. BSR messages contain the RP-set and the IP address of the currently active BSR. This is how C-RPs know where to unicast their C-RP messages.
- **Candidate Bootstrap Router (C-BSR)** — A device that is configured as a candidate-BSR participates in the BSR election mechanism. A C-BSR with highest priority is elected as the BSR. The highest IP address of the C-BSR is used as a tiebreaker. The BSR election process is preemptive, for example if a new C-BSR with a higher priority comes up, it triggers a new election process.
- **Candidate Rendezvous Point (C-RP)** — An RP acts as a meeting place for sources and receivers of multicast data. A device that is configured as a C-RP periodically advertises the multicast group mapping information directly to the elected BSR through unicast. These messages contain the Group-range, C-RP address, and a hold time. The IP address of the current BSR is learned from the periodic BSR messages that are received by all routers in the network. In this way, the BSR learns about possible RPs that are currently up and reachable.

---

**Note** The Firewall Threat Defense device does not act as a C-RP, even though the C-RP is a mandatory requirement for BSR traffic. Only routers can act as a C-RP. So, for BSR testing functionality, you must add routers to the topology.

---

- **BSR Election Mechanism** — Each C-BSR originates Bootstrap messages (BSMs) that contain a BSR Priority field. Routers within the domain flood the BSMs throughout the domain. A C-BSR that hears about a higher-priority C-BSR than itself suppresses its sending of further BSMs for some period of time. The single remaining C-BSR becomes the elected BSR, and its BSMs inform all the other routers in the domain that it is the elected BSR.

## Multicast Group Concept

Multicast is based on the concept of a group. An arbitrary group of receivers expresses an interest in receiving a particular data stream. This group does not have any physical or geographical boundaries—the hosts can be located anywhere on the Internet. Hosts that are interested in receiving data flowing to a particular group must join the group using IGMP. Hosts must be a member of the group to receive the data stream.

## Multicast Addresses

Multicast addresses specify an arbitrary group of IP hosts that have joined the group and want to receive traffic sent to this group.

## Clustering

Multicast routing supports clustering. In Spanned EtherChannel clustering, the control unit sends all multicast routing packets and data packets until fast-path forwarding is established. After fast-path forwarding is established, data units may forward multicast data packets. All data flows are full flows. Stub forwarding flows are also supported. Because only one unit receives multicast packets in Spanned EtherChannel clustering, redirection to the control unit is common.

## Requirements and Prerequisites for Multicast Routing

### Model Support

Threat Defense

Firewall Threat Defense Virtual

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Guidelines for Multicast Routing

### Firewall Mode

Supported only in routed firewall mode. Transparent firewall mode is not supported.

### IPv6

Does not support IPv6.

### Multicast Group

The range of addresses between 224.0.0.0 and 224.0.0.255 is reserved for the use of routing protocols and other topology discovery or maintenance protocols, such as gateway discovery and group membership reporting. Hence, Internet multicast routing from address range 224.0.0/24 is not supported; IGMP group is not created when enabling multicast routing for the reserved addresses.

### Clustering

In clustering, for IGMP and PIM, this feature is only supported on the primary unit.

### Additional Guidelines

- You must configure an access control or prefilter rule on the inbound security zone to allow traffic to the multicast host, such as 224.1.2.3. However, you cannot specify a destination security zone for the rule, or it cannot be applied to multicast connections during initial connection validation.
- You cannot disable an interface with PIM configured on it. If you have configured PIM on the interface (see [Configure PIM Protocol, on page 1201](#)), disabling the multicast routing and PIM does not remove the PIM configuration. You must remove (delete) the PIM configuration to disable the interface.
- PIM/IGMP Multicast routing is not supported on interfaces in a traffic zone.
- Do not configure Firewall Threat Defense to simultaneously be a Rendezvous Point (RP) and a First Hop Router.
- HSRP standby IP address does not participate in PIM neighborship. Thus, if the RP router IP is routed through a HSRP standby IP address, the multicast routing does not work in Firewall Threat Defense. Hence for the multicast traffic to pass through successfully, ensure that the route for the RP address is not the HSRP standby IP address, instead, configure the route address to an interface IP address.
- For a device using virtual routing, you can configure multicast only for its global virtual router and not for its user-defined virtual router.

## Configure IGMP Features

IP hosts use IGMP to report their group memberships to directly-connected multicast routers. IGMP is used to dynamically register individual hosts in a multicast group on a particular LAN. Hosts identify group memberships by sending IGMP messages to their local multicast router. Under IGMP, routers listen to IGMP messages and periodically send out queries to discover which groups are active or inactive on a particular subnet.

This section describes how to configure optional IGMP settings on a per-interface basis.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | <a href="#">Enable Multicast Routing, on page 1197.</a>     |
| <b>Step 2</b> | <a href="#">Configure IGMP Protocol, on page 1197.</a>      |
| <b>Step 3</b> | <a href="#">Configure IGMP Access Groups, on page 1199.</a> |
| <b>Step 4</b> | <a href="#">Configure IGMP Static Groups, on page 1199.</a> |

**Step 5** [Configure IGMP Join Groups, on page 1200.](#)

---

## Enable Multicast Routing

Enabling multicast routing on the Firewall Threat Defense device, enables IGMP and PIM on all interfaces by default. IGMP is used to learn whether members of a group are present on directly attached subnets. Hosts join multicast groups by sending IGMP report messages. PIM is used to maintain forwarding tables to forward multicast datagrams.

**Note** Only the UDP transport layer is supported for multicast routing.

---

The following list shows the maximum number of entries for specific multicast tables. Once these limits are reached, any new entries are discarded.

- MFIB—30,000
- IGMP Groups—30,000
- PIM Routes—72,000

### Procedure

---

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** Check the **Enable Multicast Routing** check box.

Checking this check box enables IP multicast routing on the device. Unchecking this check box disables IP multicast routing. By default, multicast is disabled. Enabling multicast routing enables multicast on all interfaces.

You can disable multicast on a per-interface basis. This is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the Firewall Threat Defense device from sending host query messages on that interface.

---

## Configure IGMP Protocol

You can configure IGMP parameters per interface, such as the forward interface, query messages, and time intervals.

### Procedure

---

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** On **Protocol**, click **Add** or **Edit**.

Use the **Add IGMP parameters** dialog box to add new IGMP parameters to the Firewall Threat Defense device. Use the **Edit IGMP parameters** dialog box to change existing parameters.

**Step 4** Configure the following options:

- **Interface**—From the drop-down list, choose the interface for which you want to configure IGMP protocol.
- **Enable IGMP**—Check the check box to enable IGMP.

**Note**

Disabling IGMP on specific interfaces is useful if you know that there are no multicast hosts on a specific interface and you want to prevent the device from sending host query messages on that interface.

- **Forward Interface**—From the drop-down list, choose the specific interface from which you want to forward IGMP messages.

This configures the Secure Firewall Threat Defense device to act as an IGMP proxy agent and forward IGMP messages from hosts connected on one interface to an upstream multicast router on another interface.

- **Version**—Choose IGMP Version 1 or 2.

By default, the Firewall Threat Defense device runs IGMP Version 2, which enables several additional features.

**Note**

All multicast routers on a subnet must support the same version of IGMP. The Firewall Threat Defense device does not automatically detect Version 1 routers and switch to Version 1. However, you can have a mix of IGMP Version 1 and 2 hosts on the subnet; the Firewall Threat Defense device running IGMP Version 2 works correctly when IGMP Version 1 hosts are present.

- **Query Interval**—The interval in seconds at which the designated router sends IGMP host-query messages. The range is 1 to 3600. The default is 125.

**Note**

If the Firewall Threat Defense device does not hear a query message on an interface for the specified timeout value, then the device becomes the designated router and starts sending the query messages.

- **Response Time**—The interval in seconds before the Firewall Threat Defense device deletes the group. The range is 1 to 25. The default is 10.

If the Firewall Threat Defense device does not receive a response to a host query within this amount of time, it deletes the group.

- **Group Limit**—The maximum number of hosts that can join on an interface. The range is 1 to 500. The default is 500.

You can limit the number of IGMP states resulting from IGMP membership reports on a per-interface basis. Membership reports exceeding the configured limits are not entered in the IGMP cache, and traffic for the excess membership reports is not forwarded.

- **Query Timeout**—The period of time in seconds before which the Firewall Threat Defense device takes over as the requester for the interface after the previous requester has stopped. The range is 60 to 300. The default is 255.

- Step 5** Click **OK** to save the IGMP protocol configuration.
- 

## Configure IGMP Access Groups

You can control access to multicast groups by using access control lists.

### Procedure

---

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > Access Group**.
- Step 3** On **Access Group**, click **Add** or **Edit**.
- Use the **Add IGMP Access Group parameters** dialog box to add new IGMP access groups to the Access Group table. Use the **Edit IGMP Access Group parameters** dialog box to change existing parameters.
- Step 4** Configure the following options:
- From the **Interface** drop-down list, choose the interface with which the access group is associated. You cannot change the associated interface when you are editing an existing access group.
  - Click one of the following:
    - **Standard Access List**— From the **Standard Access List** drop-down list, choose the standard ACL or click **Add (+)** to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.
    - **Extended Access List**—From the **Extended Access List** drop-down list, choose the extended ACL or click **Add (+)** to create a new extended ACL. See [Configure Extended ACL Objects, on page 1251](#) for the procedure.
- Step 5** Click **OK** to save the access group configuration.
- 

## Configure IGMP Static Groups

Sometimes a group member cannot report its membership in the group or there may be no members of a group on the network segment, but you still want multicast traffic for that group to be sent to that network segment. You can have multicast traffic for that group sent to the segment by configuring a statically joined IGMP group. With this method, the Firewall Threat Defense device does not accept the packets itself, but only forwards them. Therefore, this method allows fast switching. The outgoing interface appears in the IGMP cache, but this interface is not a member of the multicast group.

### Procedure

---

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** On **Static Group**, click **Add** or **Edit**.

Use the **Add IGMP Static Group parameters** dialog box to statically assign a multicast group to an interface. Use the **Edit IGMP Static Group parameters** dialog box to change existing static group assignments.

**Note**

The IGMP Static Group enables PIM to send *Join* requests towards the sources or towards the Rendezvous Point (RP), provided, the firewall with this command is the PIM Designated Router (DR) on that interface where the command is applied.

**Step 4** Configure the following options:

- From the **Interface** drop-down list, choose the interface to which you want to statically assign a multicast group. If you are editing an existing entry, you cannot change the value.
- From the **Multicast Groups** drop-down list, choose the multicast group to which you want to assign the interface, or click **Add (+)** to create a new multicast group. See [Creating Network Objects](#) for the procedure.

**Step 5** Click **OK** to save the static group configuration.

## Configure IGMP Join Groups

You can configure an interface to be a member of a multicast group. Configuring the Firewall Threat Defense device to join a multicast group causes upstream routers to maintain multicast routing table information for that group and keep the paths for that group active.

**Note** See [Configure IGMP Static Groups, on page 1199](#) if you want to forward multicast packets for a specific group to an interface without the Firewall Threat Defense device accepting those packets as part of the group.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > IGMP**.

**Step 3** On **Join Group**, click **Add** or **Edit**.

Use the **Add IGMP Join Group parameters** dialog box to configure the Firewall Threat Defense device to be a member of a multicast group. Use the **Edit IGMP Join Group parameters** dialog box to change existing parameters.

**Note**

The IGMP Join Group enables PIM to send *Join* requests towards the sources or towards the Rendezvous Point (RP), provided, the firewall with this command is the PIM Designated Router (DR) on that interface where the command is applied.

**Step 4** Configure the following options:

- From the **Interface** drop-down list, choose the interface you want to be a member of a multicast group. If you are editing an existing entry, you cannot change the value.
- From the **Join Group** drop-down list, choose the multicast group to which you want to assign the interface, or click **Plus** to create a new multicast group. See [Creating Network Objects](#) for the procedure.

## Configure PIM Features

Routers use PIM to maintain forwarding tables to use for forwarding multicast diagrams. When you enable multicast routing on the Secure Firewall Threat Defense device, PIM and IGMP are automatically enabled on all interfaces.

**Note** PIM is not supported with PAT. The PIM protocol does not use ports, and PAT only works with protocols that use ports.

This section describes how to configure optional PIM settings.

### Procedure

- Step 1** [Configure PIM Protocol, on page 1201.](#)
- Step 2** [Configure PIM Neighbor Filters, on page 1202.](#)
- Step 3** [Configure PIM Bidirectional Neighbor Filters, on page 1203.](#)
- Step 4** [Configure PIM Rendezvous Points, on page 1204.](#)
- Step 5** [Configure PIM Route Trees, on page 1205.](#)
- Step 6** [Configure PIM Request Filters, on page 1205.](#)
- Step 7** [Configure Multicast Boundary Filters, on page 1208.](#)

## Configure PIM Protocol

You can enable or disable PIM on a specific interface.

You can also configure the Designated Router (DR) priority. The DR is responsible for sending PIM register, join, and prune messages to the RP. When there is more than one multicast router on a network segment, choosing the DR is based on the DR priority. If multiple devices have the same DR priority, then the device with the highest IP address becomes the DR. By default, the Firewall Threat Defense device has a DR priority of 1.

Router query messages are used to choose the PIM DR. The PIM DR is responsible for sending router query messages. By default, router query messages are sent every 30 seconds. Additionally, every 60 seconds, the Firewall Threat Defense device sends PIM join or prune messages.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > PIM**.
- Step 3** On **Protocol**, click **Add** or **Edit**.
- Use the **Add PIM parameters** dialog box to add new PIM parameters to the interface. Use the **Edit PIM parameters** dialog box to change existing parameters.
- Step 4** Configure the following options:
- **Interface**—From the drop-down list, select the interface for which you want to configure PIM protocol.
  - **Enable PIM**—Check the check box to enable PIM.
  - **DR Priority**—The value for the DR for the selected interface. The router with the highest DR priority on the subnet becomes the designated router. Valid values range from 0 to 4294967294. The default DR priority is 1. Setting this value to 0 makes the Firewall Threat Defense device interface ineligible to become the designated router.
  - **Hello Interval**—The interval in seconds at which the interface sends PIM hello messages. The range is 1 to 3600. The default is 30.
  - **Join Prune Interval**—The interval in seconds at which the interface sends PIM join and prune advertisements. The range is 10 to 600. The default is 60.
- Step 5** Click **OK** to save the PIM protocol configuration.
- 

## Configure PIM Neighbor Filters

You can define the routers that can become PIM neighbors. By filtering the routers that can become PIM neighbors, you can do the following:

- Prevent unauthorized routers from becoming PIM neighbors.
- Prevent attached stub routers from participating in PIM.

## Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > PIM**.
- Step 3** On **Neighbor Filter**, click **Add** or **Edit**.
- Use the **Add PIM Neighbor Filter** dialog box to add new PIM neighbor filters to the interface. Use the **Edit PIM Neighbor Filter** dialog box to change existing parameters.
- Step 4** Configure the following options:

- From the **Interface** drop-down list, choose the interface to which you want to add a PIM neighbor filter.
- **Standard Access List**— From the **Standard Access List** drop-down list, choose a standard ACL or click **Add** (+) to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.

**Note**

Choosing **Allow** on the **Add Standard Access List Entry** dialog box lets the multicast group advertisements pass through the interface. Choosing **Block** prevents the specified multicast group advertisements from passing through the interface. When a multicast boundary is configured on an interface, all multicast traffic is prevented from passing through the interface unless permitted with a neighbor filter entry.

**Step 5** Click **OK** to save the PIM neighbor filter configuration.

---

## Configure PIM Bidirectional Neighbor Filters

A PIM bidirectional neighbor filter is an ACL that defines the neighbor devices that can participate in the Designated Forwarder (DF) election. If a PIM bidirectional neighbor filter is not configured for an interface, there are no restrictions. If a PIM bidirectional neighbor filter is configured, only those neighbors permitted by the ACL can participate in the DF election process.

Bidirectional PIM allows multicast routers to keep reduced state information. All of the multicast routers in a segment must be bidirectionally enabled to elect a DF.

When a PIM bidirectional neighbor filter is enabled, the routers that are permitted by the ACL are considered to be bidirectionally capable. Therefore, the following is true:

- If a permitted neighbor does not support bidirectional mode, then the DF election does not occur.
- If a denied neighbor supports bidirectional mode, then the DF election does not occur.
- If a denied neighbor does not support bidirectional mode, the DF election can occur.

**Procedure**

---

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Multicast Routing > PIM**.

**Step 3** On **Bidirectional Neighbor Filter**, click **Add** or **Edit**.

Use the **Add PIM Bidirectional Neighbor Filter** dialog box to create ACL entries for the PIM bidirectional neighbor filter ACL. Use the **Edit PIM Bidirectional Neighbor Filter** dialog box to change existing parameters.

**Step 4** Configure the following options:

- From the **Interface** drop-down list, select the interface to which you want to configure the PIM bidirectional neighbor filter ACL entry.

- **Standard Access List**— From the **Standard Access List** drop-down list, select a standard ACL or click **Add** (+) to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.

**Note**

Choosing **Allow** on the **Add Standard Access List Entry** dialog box lets the specified devices participate in the DR election process. Choosing **Block** prevents the specified devices from participating in the DR election process.

**Step 5** Click **OK** to save the PIM bidirectional neighbor filter configuration.

## Configure PIM Rendezvous Points

You can configure the Firewall Threat Defense device to serve as a RP to more than one group. The group range specified in the ACL determines the PIM RP group mapping. If an ACL is not specified, then the RP for the group is applied to the entire multicast group range (224.0.0.0/4). See [Multicast Bidirectional PIM, on page 1193](#) for more information about bidirectional PIM.

The following restrictions apply to RPs:

- You cannot use the same RP address twice.
- You cannot specify All Groups for more than one RP.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > PIM**.

**Step 3** On **Rendezvous Points**, click **Add** or **Edit**.

Use the **Add Rendezvous Point** dialog box to create a new entry to the Rendezvous Point table. Use the **Edit Rendezvous Point** dialog box to change existing parameters.

**Step 4** Configure the following options:

- From the **Rendezvous Point IP address** drop-down list, choose the IP address that you want to add as an RP or click **Add** (+) to create a new network object. See [Creating Network Objects](#) for the procedure.
- Check the **Use bi-directional forwarding** check box if the specified multicast groups are to operate in bidirectional mode. In bidirectional mode, if the Firewall Threat Defense device receives a multicast packet and has no directly connected members or PIM neighbors present, it sends a prune message back to the source.
- Click **Use this RP for all Multicast Groups** to use the specified RP for all multicast groups on the interface.
- Click the **Use this RP for all Multicast Groups as specified below** to designate the multicast groups to use with the specified RP and then from the **Standard Access List** drop-down list, choose a standard

ACL or click **Add (+)** to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.

**Step 5** Click **OK** to save the rendezvous point configuration.

## Configure PIM Route Trees

By default, PIM leaf routers join the shortest-path tree immediately after the first packet arrives from a new source. This method reduces delay, but requires more memory than the shared tree. You can configure whether or not the Firewall Threat Defense device should join the shortest-path tree or use the shared tree, either for all multicast groups or only for specific multicast addresses.

The shortest-path tree is used for any group that is not specified in the Multicast Groups table. The Multicast Groups table displays the multicast groups to use with the shared tree. The table entries are processed from the top down. You can create an entry that includes a range of multicast groups, but excludes specific groups within that range by placing deny rules for the specific groups at the top of the table and the permit rule for the range of multicast groups below the deny statements.

**Note** This behavior is known as Shortest Path Switchover (SPT). We recommend that you always use the Shared Tree option.

### Procedure

- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > PIM**.
- Step 3** On **Route Tree**, select the path for the route tree:
- Click **Shortest Path** to use the shortest-path tree for all multicast groups.
  - Click **Shared Tree** to use the shared tree for all multicast groups.
  - Click **Shared tree for below mentioned group** to designate the groups specified in the Multicast Groups table, and then from the **Standard Access List** drop-down list, select a standard ACL or click **Add (+)** to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.
- Step 4** Click **OK** to save the route tree configuration.

## Configure PIM Request Filters

When the Firewall Threat Defense device is acting as an RP, you can restrict specific multicast sources from registering with it to prevent unauthorized sources from registering with the RP. You can define the multicast sources from which the Firewall Threat Defense device will accept PIM register messages.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > PIM**.
- Step 3** On **Request Filter**, define the multicast sources that are allowed to register with the Firewall Threat Defense device when it acts as an RP:
- From the **Filter PIM register messages using:** drop-down list select **None**, **Access List**, or **Route Map**.
  - If you choose **Access List** from the drop-down list, select an extended ACL or click **Add (+)** to create a new extended ACL. See [Configure Extended ACL Objects, on page 1251](#) for the procedure.
- Note**  
In the **Add Extended Access List Entry** dialog box, select **Allow** from the drop-down list to create a rule that allows the specified source of the specified multicast traffic to register with the Firewall Threat Defense device, or select **Block** to create a rule that prevents the specified source of the specified multicast traffic from registering with the device.
- If you choose **Route Map**, select a route map from the **Route Map** drop-down list, or click **Add (+)** to create a new route map. See [Creating Network Objects](#) for the procedure.
- Step 4** Click **OK** to save the request filter configuration.
- 

## Configure the Secure Firewall Threat Defense Device as a Candidate Bootstrap Router

You can configure the Firewall Threat Defense device as a candidate BSR.

### Procedure

- 
- Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- Step 2** Choose **Routing > Multicast Routing > PIM**.
- Step 3** On **Bootstrap Router**, check the **Configure this FTD as a Candidate Bootstrap Router (C-BSR)** check box to perform the C-BSR setup.
- From the **Interface** drop-down list, select the interface on the Firewall Threat Defense device from which the BSR address is derived to make it a candidate.  
  
This interface must be enabled with PIM.
  - In the **Hash mask length** field, enter the length of a mask (32 bits maximum) that is to be ANDed with the group address before the hash function is called. All groups with the same seed hash (correspond) to the same RP. For example, if this value is 24, only the first 24 bits of the group addresses matter. This fact allows you to get one RP for multiple groups. The range is 0 to 32.

- c) In the **Priority** field, enter the priority of the candidate BSR. The BSR with the larger priority is preferred. If the priority values are the same, the router with the larger IP address is the BSR. The range is 0 to 255. The default value is 0.

**Step 4** (Optional) Click **Add (+)** to select an interface on which no PIM BSR messages will be sent or received in the **Configure this FTD as a Border Bootstrap Router (BSR)** section.

- From the **Interface** drop-down list, select the interface on which no PIM BSR messages will be sent or received.

RP or BSR advertisements are filtered effectively isolating two domains of RP information exchange.

- Check the **Enable Border BSR** check box to enable BSR.

**Step 5** Click **OK** to save the bootstrap router configuration.

## Configure Multicast Routes

Configuring static multicast routes lets you separate multicast traffic from unicast traffic. For example, when a path between a source and destination does not support multicast routing, the solution is to configure two multicast devices with a GRE tunnel between them and to send the multicast packets over the tunnel.

When using PIM, the Firewall Threat Defense device expects to receive packets on the same interface where it sends unicast packets back to the source. In some cases, such as bypassing a route that does not support multicast routing, you may want unicast packets to take one path and multicast packets to take another.

Static multicast routes are not advertised or redistributed.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > Multicast Routes > Add or Edit**.

Use the **Add Multicast Route Configuration** dialog box to add a new multicast route to the Firewall Threat Defense device. Use the **Edit Multicast Route Configuration** dialog box to change an existing multicast route.

**Step 3** From the **Source Network** drop-down box, choose an existing network or click **Add (+)** to add a new one. See [Creating Network Objects](#) for the procedure.

**Step 4** To configure an interface to forward the route, click **Interface** and configure the following options:

- From the **Source Interface** drop-down list, choose the incoming interface for the multicast route.
- From the **Output Interface/Dense** drop-down list, choose the destination interface that the route is forwarded through.
- In the **Distance** field, enter the distance of the multicast route. The range is 0 to 255.

**Step 5** To configure an RPF address to forward the route, click **Address** and configure the following options:

- In the **RPF Address** field, enter the IP address for the multicast route.
- In the **Distance** field, enter the distance of the multicast route. The range is 0 to 255.

**Step 6** Click **OK** to save the multicast routes configuration.

## Configure Multicast Boundary Filters

Address scoping defines domain boundary filters so that domains with RPs that have the same IP address do not leak into each other. Scoping is performed on the subnet boundaries within large domains and on the boundaries between the domain and the Internet.

You can set up an administratively scoped boundary filter on an interface for multicast group addresses. IANA has designated the multicast address range from 239.0.0.0 to 239.255.255.255 as the administratively scoped addresses. This range of addresses can be reused in domains administered by different organizations. The addresses would be considered local, not globally unique.

A standard ACL defines the range of affected addresses. When a boundary filter is set up, no multicast data packets are allowed to flow across the boundary from either direction. The boundary filter allows the same multicast group address to be reused in different administrative domains.

You can configure, examine, and filter Auto-RP discovery and announcement messages at the administratively scoped boundary. Any Auto-RP group range announcements from the Auto-RP packets that are denied by the boundary ACL are removed. An Auto-RP group range announcement is permitted and passed by the boundary filter only if all addresses in the Auto-RP group range are permitted by the boundary ACL. If any address is not permitted, the entire group range is filtered and removed from the Auto-RP message before the Auto-RP message is forwarded.

### Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Choose **Routing > Multicast Routing > Multicast Boundary Filter**, and then click **Add** or **Edit**.

Use the **Add Multicast Boundary Filter** dialog box to add new multicast boundary filters to the device. Use the **Edit Multicast Boundary Filter** dialog box to change existing parameters.

You can configure a multicast boundary for administratively scoped multicast addresses. A multicast boundary restricts multicast data packet flows and enables reuse of the same multicast group address in different administrative domains. When a multicast boundary is defined on an interface, only the multicast traffic permitted by the filter ACL passes through the interface.

**Step 3** From the **Interface** drop-down list, choose the interface for which you are configuring the multicast boundary filter ACL.

**Step 4** From the **Standard Access List** drop-down list, choose the standard ACL you want to use, or click **Add** (+) to create a new standard ACL. See [Configure Standard ACL Objects, on page 1254](#) for the procedure.

**Step 5** Check the **Remove any Auto-RP group range announcement from the Auto-RP packets that are denied by the boundary** check box to filter Auto-RP messages from sources denied by the boundary ACL. If this check box is not checked, all Auto-RP messages are passed.

**Step 6** Click **OK** to save the multicast boundary filter configuration.

---

## CHAPTER 32

# Policy Based Routing

This chapter describes how to configure Firewall Threat Defense to support policy based routing (PBR) through Firewall Management Center's Policy based Routing page. The following sections describe policy based routing, guidelines for PBR, and configuration for PBR.

- [About Policy Based Routing, on page 1211](#)
- [Guidelines and Limitations for Policy Based Routing, on page 1213](#)
- [Path Monitoring, on page 1214](#)
- [Configure Policy-Based Routing Policy, on page 1217](#)
- [Configuration Example for Policy Based Routing, on page 1220](#)
- [Configuration Example for PBR with Path Monitoring, on page 1226](#)
- [History for Policy Based Routing, on page 1228](#)

## About Policy Based Routing

In traditional routing, packets are routed based on the destination IP address. However, it is difficult to change the routing of specific traffic in a destination-based routing system. Policy Based Routing (PBR) gives you more control over routing by extending and complementing the existing mechanisms provided by routing protocols.

PBR allows you to set the IP precedence. It also allows you to specify a path for certain traffic, such as priority traffic over a high-cost link. With PBR, you can define routing that is based on criteria other than destination network such as source port, destination address, destination port, protocol, applications, or a combination of these objects.

You can use PBR to classify the network traffic based on applications, username, group membership, and security group association. This routing method is applicable in scenarios where, numerous devices access applications and data in a large network deployment. Traditionally, large deployments have topologies that backhaul all the network traffic to a hub as encrypted traffic in a route-based VPN. These topologies often result in issues such as packet latency, reduced bandwidth, and packet drop. Overcoming these issues involves high-cost complex deployments and management.

PBR policy enables you to securely breakout traffic for specified applications. You can configure PBR policy in the Secure Firewall Management Center user interface to allow the applications to be directly accessed.

### Why Use Policy Based Routing

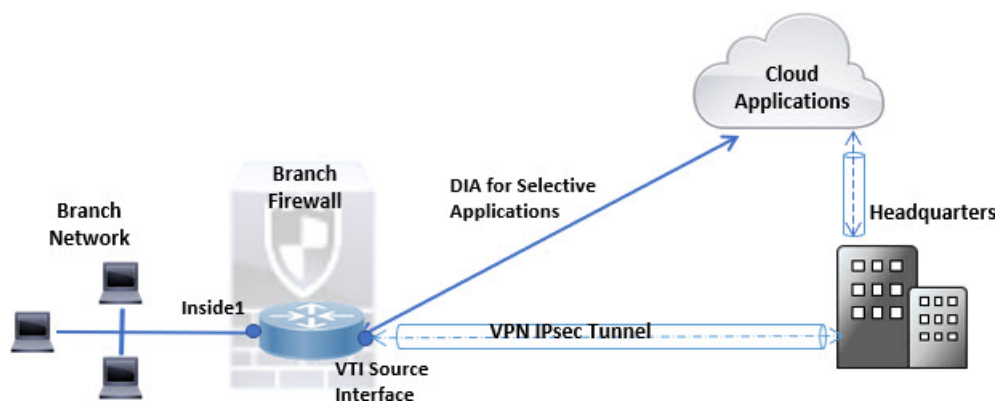

Consider a company that has two links between locations: one a high-bandwidth, low-delay expensive link, and the other a low-bandwidth, higher-delay, less-expensive link. While using traditional routing protocols,

the higher-bandwidth link gets most, if not all, of the traffic sent across it based on the metric savings obtained by the bandwidth, delay, or both (using EIGRP or OSPF) characteristics of the link. With PBR, you can route higher priority traffic over the high-bandwidth/low-delay link, while sending all other traffic over the low-bandwidth/high-delay link.

Following are a few scenarios where you can use Policy Based Routing:

### Direct Internet Access

In this topology, application traffic from the branch office can be routed directly to the internet instead of through the VPN tunnel connecting to the headquarters. The branch Firewall Threat Defense is configured with an internet exit point and the PBR policy is applied on the ingress interface (*Inside 1*) to identify the traffic based on the applications, user identity (username and group membership), and Security Group Tag (security group association) defined in the ACL. Correspondingly, the traffic is forwarded through the egress interfaces directly to the internet or to the IPsec VPN tunnel.

### Equal-Access and Source-Sensitive Routing

In this topology, traffic from the HR and Mgmt networks can be configured to go through ISP1 and traffic from Eng network can be configured to go through ISP2. Thus, policy based routing enables the network administrators to provide equal-access and source-sensitive routing, as shown here.

### Load Sharing

In addition to the dynamic load-sharing capabilities offered by ECMP load balancing, network administrators can now implement policies to distribute traffic among multiple paths based on the traffic characteristics.

As an example, in the topology depicted in the Equal-Access Source Sensitive Routing scenario, an administrator can configure policy based routing to route the traffic from HR network through ISP1 and traffic from Eng network through ISP2 and thus share the load.

# Guidelines and Limitations for Policy Based Routing

## Firewall Mode Guidelines

PBR is supported only on routed firewall mode.

## Device Guidelines

- PBR through Firewall Management Center's Policy Based Routing page is supported only from Version 7.1+ on both the Firewall Management Center and the device.
- When you upgrade Firewall Management Center or Firewall Threat Defense to version 7.1 and higher, the PBR configuration in the device is removed. You must configure PBR again using the Policy Based Routing page. If the managed device is lower than version 7.1, you must configure PBR again using FlexConfig with deploy option set to "every time."
- Configuring application, user identity, and Security Group Tag (SGT) based PBR policy on cluster devices is not supported.

## Interface Guidelines

- Only routed interfaces and non management-only interfaces belonging to the Global virtual router can be configured as ingress or egress interface.
- PBR is not supported on user-defined virtual routers.
- Only interfaces that have a logical name can be defined in the policy.
- Static VTIs can be configured only as egress interfaces.
- Before proceeding with configuration, ensure that the ingress and egress traffic of each session flows through the same ISP-facing interface to avoid unexpected behavior caused by asymmetric routing, specifically when NAT and VPN are in use.

## IPv6 Support

PBR supports IPv6.

## Application-Based PBR and DNS Configuration

- Application-based PBR uses DNS snooping for application detection. Application detection succeeds only if the DNS requests pass through Firewall Threat Defense in a clear-text format; the DNS traffic is not encrypted.
- You must configure trusted DNS servers.

For more information on configuring DNS servers, see [DNS, on page 831](#).

## PBR Policies Not Applied for Output Route Look-up

Policy Based Routing is an ingress-only feature; that is, it is applied only to the first packet of a new incoming connection, at which time the egress interface for the forward leg of the connection is selected. Note that PBR

will not be triggered if the incoming packet belongs to an existing connection, or if NAT is applied and NAT chooses the egress interface.

### PBR Policies Not Applied for Embryonic Traffic

**Note** An embryonic connection is where the necessary handshake between source and destination has not been made.

When a new internal interface is added and a new VPN policy is created using a unique address pool, PBR is applied to the outside interface matching the source of the new client pool. Thus, PBR sends traffic from the client to the next hop on the new interface. However, PBR is not involved in the return traffic from a host that has not yet established a connection with the new internal interface routes to the client. Thus, the return traffic from the host to the VPN client, specifically, the VPN client response is dropped as there is no valid route. You must configure a weighted static route with a higher metric on the internal interface.

### HTTP-based Path Monitoring Guidelines

- HTTP-based path monitoring is supported on physical, port-channel, subinterfaces, and static tunnel interfaces. It is not supported on cluster devices.
- HTTP uses only IPv4 to ping the applications. IPv4 metrics are applied for routing and forwarding the IPv4 and IPv6 traffic.
- HTTP-based application monitoring is enabled by default Secure Firewall Management Center. However, when you upgrade from previous versions, this option is not enabled by default. You must manually enable it.

### Additional Guidelines

- All existing configuration restrictions and limitations of route map will be carried forward.
- While defining the ACL for the policy match criteria, you can select multiple applications from a list of predefined applications to form an Access Control Entry (ACE). In Firewall Threat Defense, the predefined applications are stored as Network Service objects and the group of applications as Network Service Groups (NSG). You can create a maximum of 1024 such NSGs. The application or network service group is detected through first-packet classification. Currently, you cannot add to or modify the predefined applications list.
- Unicast Reverse Path Forwarding (uRPF) validates the source IP address of packets received on an interface against the routing table and not against the PBR route map. When uRPF is enabled, packets received on an interface through PBR are dropped as they are without the specific route entry. Hence, when using PBR, ensure to disable uRPF.

## Path Monitoring

PBR uses either static cost or path monitoring (dynamic metrics) to route its traffic.

Path monitoring, when configured on interfaces, derive metrics such as round trip time (RTT), jitter, mean opinion score (MOS), and packet loss per interface. These metrics are used to determine the best path for routing PBR traffic.

### ICMP-based Path Monitoring

The metrics on the interfaces are collected dynamically using ICMP probe messages to the interface's default gateway or a specified remote peer.

### HTTP-based Path Monitoring

Path monitoring computes flexible metrics for multiple remote peers per interface. To monitor and determine best path for multiple applications through a policy on a branch firewall, HTTP is preferred over ICMP for the following reasons:

- HTTP-ping can derive the performance metrics of the path up to the application layer of the server, where the application is hosted.
- The need to change the firewall configuration whenever the application server IP address is changed is removed as the application domain is tracked instead of the IP address.

---

**Note** You can configure both ICMP and HTTP on the same interface. If the destination in the policy matches to any of the domain IP, the corresponding metrics are used. If the destination does not match to any of the configured domains, the metrics from the ICMP are used by PBR to select the outgoing interface.

---

### Default Monitoring Timers

For metric collection and monitoring, the following timers are used:

- The interface monitor average interval is 30 seconds. This interval indicates the frequency to which the probes average.
- The interface monitor update interval is 30 seconds. This interval indicates the frequency at which the average of the collected values are calculated and made available for PBR to determine the best routing path.
- The interface monitor probe interval by ICMP is one second. This interval indicates the frequency at which an ICMP ping is sent.
- The application monitor probe interval by HTTP is 10 seconds. This interval indicates the frequency at which an HTTP ping is sent. Path monitoring uses the last 30 samples of HTTP ping for calculating the average metrics.

---

**Note** You cannot configure or modify the interval for any of these timers.

---

### PBR and Path Monitoring

Typically, in PBR, traffic is forwarded through egress interfaces based on the priority value (interface cost) configured on them. From management center version 7.2, PBR uses IP-based path monitoring to collect the

performance metrics (RTT, jitter, packet-lost, and MOS) of the egress interfaces. PBR uses the metrics to determine the best path (egress interface) for forwarding the traffic. Path monitoring periodically notifies PBR about the monitored interface whose metric got changed. PBR retrieves the latest metric values for the monitored interfaces from the path monitoring database and updates the data path.

Path monitoring functions only with dynamic metrics, and only if the RTT, jitter, packet-lost, or MOS variables are set on the interfaces. Path monitoring does not function with static metrics—interface cost (cost set in interface).

You must enable path monitoring for the interface and configure the monitoring type. The PBR policy page allows you to specify the desired metric for path determination. See [Configure Policy-Based Routing Policy, on page 1217](#).

### PBR and HTTP-based Path Monitoring

From management center version 7.4, PBR can be configured to use HTTP-based path monitoring to collect the performance metrics of the application domains and not just one destination IP address. Path monitoring does not commence monitoring immediately after HTTP-based application monitoring is configured. It starts monitoring only when a DNS entry is snooped for a domain. With the information on the resolved IP for the domain, it sends and receives the HTTP request and response respectively. When DNS resolves multiple IP addresses for a single domain, the first resolved IP address will be used for probing and monitoring the application. It continues to monitor till the IP address changes or the HTTP-based path monitoring is disabled.

Based on the HTTP request and response durations, path monitoring computes the performance metrics for the application. The collected metrics are forwarded to PBR periodically, for making the routing and forwarding decision for the traffic arising from the configured ingress interface. If traffic arrives before the path monitoring could send its metrics to PBR, the traffic flow follows path chosen by the routing table. For the subsequent traffic flows that arrive after path monitoring metrics are available, PBR applies its routing decision based on the metrics and forwards the traffic.

---

**Note** Based on the Network Service Groups in the match ACL of the policy, you can apply PBR for multiple domains having multiple IP addresses.

---

In HTTP-based path monitoring of applications, the management center associates the applications/NSGs to the egress interface only when the PBR configuration meets the following criteria:

- The match ACL contains the monitored applications.
- The PBR policy is configured with any one of the following interface ordering values (metric type):
  - Minimal Jitter
  - Maximum Mean Opinion Score
  - Minimal Round-Trip Time
  - Minimal Packet Loss

## Configure Path Monitoring Settings

The PBR policy relies on flexible metrics, such as round trip time (RTT), jitter, mean opinion score (MOS), and packet loss of the interfaces to identify the best routing path for its traffic. Path monitoring collects these

metrics on the specified interfaces. On the **Interfaces** page, you can configure interfaces with settings for path monitoring to send the ICMP probes or HTTP pings for metrics collection.

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click **Edit** (✎) for the interface you want to edit.
- Step 3** Click the **Path Monitoring** tab.
- Step 4** To configure ICMP based monitoring of the interface, click the **Enable IP based Monitoring** check box.
- Step 5** From the **Monitoring Type** drop-down list, select the relevant option:
- **Auto**—Sends ICMP probes to the IPv4 default gateway of the interface. If the IPv4 gateway does not exist, path monitoring sends the probes to the IPv6 default gateway of the interface.
  - **Peer IPv4**—Sends ICMP probes to the specified peer IPv4 address (next-hop IP) for monitoring. If you select this option, enter the IPv4 address in the **Peer IP To Monitor** field.
  - **Peer IPv6**—Sends ICMP probes to the specified peer IPv6 address (next-hop IP) for monitoring. If you select this option, enter the IPv6 address in the **Peer IP To Monitor** field.
  - **Auto IPv4**—Sends ICMP probes to the default IPv4 gateway of the interface.
  - **Auto IPv6**—Send ICMP probes to the default IPv6 gateway of the interface.
- Note**
- The Auto options are not available for VTI interfaces. You must specify the peer address.
  - Only one next-hop is monitored to a destination. That is, you cannot specify more than one peer address to monitor for an interface.
- Step 6** By default, the **Enable HTTP based Application Monitoring** check box is selected. All applications selected for path monitoring in the match ACL of the PBR policy are listed, provided this interface is configured as the egress interface in the policy. To disable the HTTP-based monitoring of the interface, clear the check box.
- Step 7** Click **Ok**, and to save the settings, click **Save**.
- 

## Configure Policy-Based Routing Policy

You can configure the PBR policy on the Policy Based Routing page by specifying the ingress interfaces, match criteria (Extended Access Control List), and egress interfaces.

### Before you begin

To use the path monitoring metrics for configuring the traffic forwarding priority over egress interfaces, you must configure the path monitoring settings for the interfaces. See [Configure Path Monitoring Settings, on page 1216](#).

## Procedure

**Step 1** Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.

**Step 2** Click **Routing**.

**Step 3** Click **Policy Based Routing**.

The Policy Based Routing page displays the configured policy. The grid displays the list of ingress interfaces and a combination of the policy-based route access list, and egress interfaces.

**Step 4** To configure the policy, click **Add**.

**Step 5** In the **Add Policy Based Route** dialog box, select the **Ingress Interface** from the drop-down list.

### Note

Only interfaces that have logical names and that belong to a global virtual router are listed in the drop-down. However, you cannot configure a VLAN interface with a logical name as the source (ingress) interface.

**Step 6** To specify the match criteria and the forward action in the policy, click **Add**.

**Step 7** In the **Add Forwarding Actions** dialog box, do the following:

- a) From the **Match ACL** drop-down, choose the extended access control list object. You can predefine the ACL object (see [Configure Extended ACL Objects, on page 1251](#)) or click the **Add (+)** icon to create the object. In the **New Extended Access List Object** box, enter a name, click **Add** to open the **Add Extended Access List Entry** dialog box, where you can define the network, port, user identity, SGT, or application match criteria for the PBR policy.

### Note

You can either have destination address or application/user identity/SGT defined in an ACE.

To selectively apply PBR on the incoming interface, you can define *Block* criteria in the ACE. When the traffic matches the block rule of the ACE, the traffic is forwarded to the egress interface based on the routing table.

- b) From the **Send To** drop-down list:
  - To select the configured interfaces, choose **Egress Interfaces**.
  - To specify the IPv4/IPv6 next hop addresses, choose **IP Address**. Proceed to [Step 7.e, on page 1219](#)
- c) If you have selected **Egress Interfaces**, from the **Interface Ordering** drop-down, choose the relevant option:
  - By **Interface Priority**—The traffic is forwarded based on the priority of the interfaces. Traffic is routed to the interface with the least priority value first. When the interface is not available, the traffic is then forwarded to the interface with the next lowest priority value. For example, let us assume that *Gig0/1*, *Gig0/2*, and *Gig0/3* are configured with priority values *0*, *1*, and *2* respectively. The traffic is forwarded to *Gig0/1*. If *Gig0/1* becomes unavailable, the traffic is then forwarded to *Gig0/2*.

### Note

To configure the priority for the interfaces, click **Configure Interface Priority** on the Policy Based Routing page. In the dialog box, provide the priority number against the interfaces, and then click **Save**. You can also configure the priority for an interface in the [Interface Settings](#).

When the priority value is the same for all the interfaces, the traffic is balanced among the interfaces.

- By **Order**—The traffic is forwarded based on the sequence of the interfaces specified here. For example, let us assume that *Gig0/1*, *Gig0/2*, and *Gig0/3* are selected in the following order, *Gig0/2*, *Gig0/3*, *Gig0/1*. The traffic is forwarded to *Gig0/2* first, then to *Gig0/3*, irrespective of their priority values.
- By **Minimal Jitter**—The traffic is forwarded to the interface that has the lowest jitter value. You need to enable Path Monitoring on the interfaces for PBR to obtain the jitter values.
- By **Maximum Mean Opinion Score**—The traffic is forwarded to the interface that has the maximum mean opinion score (MOS). You need to enable Path Monitoring on the interfaces for PBR to obtain the MOS values.
- By **Minimal Round Trip Time**—The traffic is forwarded to the interface that has the minimal round trip time (RTT). You need to enable Path Monitoring on the interfaces for PBR to obtain the RTT values.
- By **Minimal Packet Loss**—The traffic is forwarded to the interface that has the minimal packet loss. You need to enable Path Monitoring on the interfaces for PBR to obtain the packet loss values.

- d) In the **Available Interfaces** box, all the interfaces with their priority values are listed. From the list of interfaces, click the **Add (+)** button to add to the selected egress interfaces. Proceed to Step 7.k, on page 1220

**Note**

The route to the selected interface must be present in the routing table.

- e) If you have selected **IP Address**, enter the IP addresses separated by commas in the **IPv4 Addresses** or **IPv6 Addresses** fields. The traffic is forwarded as per the sequence of the specified IP addresses.

**Note**

When multiple next-hop IP addresses are provided, the traffic is forwarded as per the sequence of the specified IP addresses until a valid routable next-hop IP address is found. The configured next-hops should be directly connected.

- f) From the **Don't Fragment** drop-down list, select Yes, No, or None. If the DF (Don't Fragment) flag is set to *Yes*, the intermediate routers never perform fragmentation of a packet.
- g) To specify the current interface as the default for forwarding, check the **Default Interface** check box.
- h) The **IPv4 Settings** and **IPv6 Settings** tab enables you to specify the recursive and default settings:

**Note**

For a route-map, you can only specify either IPv4 or IPv6 next-hop settings.

- **Recursive**—The route map configuration is applied only when the specified next-hop address and the default next-hop address are found on a directly connected subnet. However, you could use the recursive option, where the next-hop address need not be directly connected. Here, a recursive lookup is performed on the next-hop address, and matching traffic is forwarded to the next-hop used by that route entry according to the current routing path of the router.
- **Default**—If the normal route lookup fails to match traffic, the traffic is forwarded to this specified next-hop IP address.

- i) Check the **Peer Address** check box to use the next-hop address as the peer address.

**Note**

You cannot configure a route map with both default next-hop address and peer address.

- j) For IPv4 settings, you can check whether the next IPv4 hops of a route map are available under **Verify Availability**—click the **Add** (+) button and add the next-hop IP address entries:

- **IP Address**—Enter the next hop IP address.
- **Sequence**—Entries are assessed in order using the sequence number. Ensure that no duplicate sequence numbers are entered. The valid range is 1 to 65535.
- **Track**—Enter a valid ID. The valid range is 1 to 255.

- k) Click **Save**.

**Step 8** To save the policy, click **Save** and **Deploy**.

---

The Firewall Threat Defense uses ACLs to match traffic and perform routing actions on the traffic. Typically, you configure a route map that specifies an ACL against which traffic is matched, and then you specify one or more actions for that traffic. With the use of path monitoring, PBR can now select the best egress interface for routing the traffic. Finally, you associate the route map with an interface on which you want to apply PBR on all incoming traffic.

## Add Path Monitoring Dashboard

To view the path monitoring metrics, you must add the path monitoring dashboard to the Health Monitoring page of the device.

### Procedure

- 
- Step 1** Choose **System** (⚙) > **Health** > **Monitor**.
  - Step 2** Select the device, and click **Add New Dashboard**.
  - Step 3** Enter a name for the custom dashboard.
  - Step 4** In the **Metrics** area, click the **Add from Predefined Correlations** button.
  - Step 5** From the list, click **Interface - Path Metrics**.

By default, all the four metrics are selected for displaying as portlets in the dashboard with an additional metric field. You can exclude any of them by clicking **Delete** (🗑).

- Step 6** Click **Add Dashboard**.
- 

## Configuration Example for Policy Based Routing

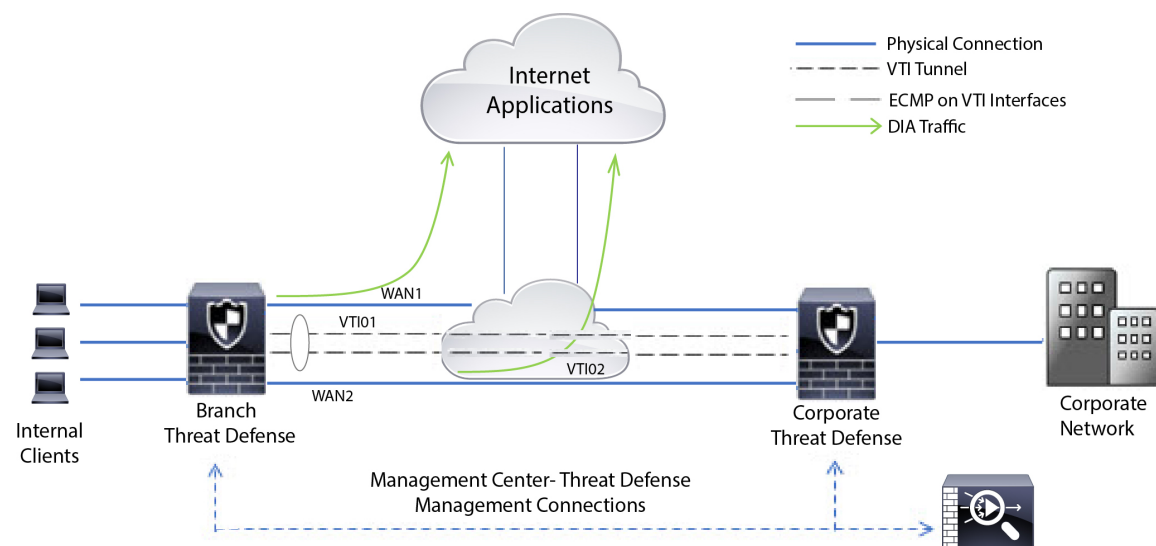

Consider a typical corporate network scenario where all the branch network traffic passes through a route-based VPN of the corporate network and diverges to the extranet, when required. Accessing the web-based applications

that address day-to-day operations through the corporate network results in huge network expansion and maintenance costs. This example illustrates the PBR configuration procedure for direct internet access.

The following figure depicts the topology of a corporate network. The branch network is connected to the corporate network through a route-based VPN. Traditionally, the corporate Firewall Threat Defense is configured to handle both the internal and external traffic of the branch office. With the PBR policy, the branch Firewall Threat Defense is configured with a policy that routes specific traffic to the WAN network instead of the virtual tunnels. The rest of the traffic flows through the route-based VPN, as usual.

This example also illustrates the configuring of the WAN and the VTI interfaces with ECMP zones to achieve load balancing.

**Figure 393: Configuring Policy Based Routing on Branch Firewall Threat Defense in Firewall Management Center**

### Before you begin

This example assumes that you have already configured WAN and VTI interfaces for the branch Firewall Threat Defense in Firewall Management Center.

### Procedure

- Step 1** Configure policy based routing for the branch Firewall Threat Defense, select the ingress interfaces:
- Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
  - Choose **Routing > Policy Based Routing**, and on the **Policy Based Routing** page, click **Add**.
  - In the **Add Policy Based Route** dialog box, select the interfaces (say, *Inside 1*, and *Inside 2*) from the **Ingress Interface** drop-down list.
- Step 2** Specify the match criteria:
- Click **Add**.
  - To define the match criteria, click the **Add (+)** button.
  - In **New Extended Access List Object**, enter the name for the ACL (say, *DIA-FTD-Branch*), and click **Add**.

- d) In the **Add Extended Access List Entry** dialog box, choose the required web-based applications from the **Application** tab:

**Figure 394: Applications Tab**

Add Extended Access List Entry

- e) Click **Save**.
- f) Select *DIA-FTD-Branch* from the **Match ACL** drop-down list.

**Step 3**

Specify the egress interfaces:

- a) From the **Send To** and **Interface Ordering** drop-down lists, choose Egress Interfaces, and Interface Priority respectively.
- b) Under **Available Interfaces**, click the button against the respective interface names to add *WAN1* and *WAN2*:

**Figure 396: Configuring Policy Based Routing**

Add Forwarding Actions

Match ACL:\* DIA-TD-Branch

Send To:\* Egress Interfaces

Interface Ordering:\* By Priority

Cancel Save

- c) Click **Save**.

**Step 4** Interface priority configuration:

You can set the priority value for the interfaces either in the **Edit Physical Interface** page, or in the **Policy Based Routing** page (**Configure Interface Priority**). In this example, the Edit Physical Interface method is described.

- Choose **Devices > Device Management**, and edit the branch Firewall Threat Defense.
- Set the priority for the interfaces. Click **Edit** against the interface and enter the priority value:

**Figure 397: Setting Interface Priority**

**Edit Physical Interface**

(0 - 65535)

Propagate Security Group Tag: ☐

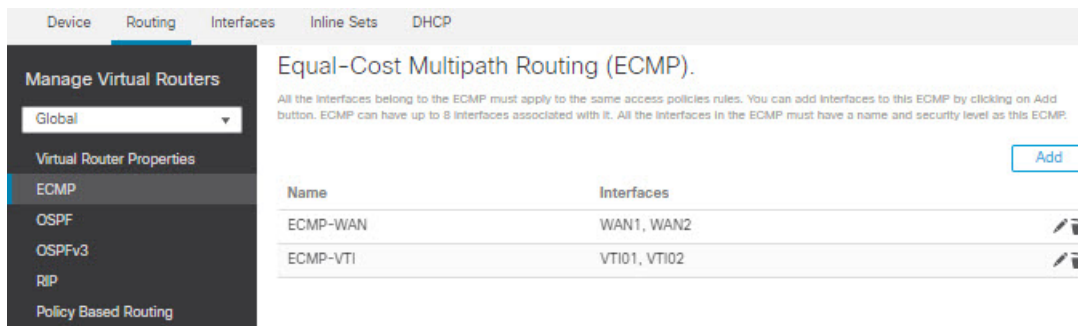

Cancel OK

- Click **Ok** and **Save**.

**Step 5** Create ECMP zones for load balancing:

- In the **Routing** page, click **ECMP**.
- To associate interfaces to the ECMP zone, click **Add**.
- Select *WAN1* and *WAN 2* and create an ECMP zone—*ECMP-WAN*. Similarly, add *VTI01* and *VTI02* and create an ECMP zone—*ECMP-VTI*.

Figure 398: Associating Interfaces with ECMP Zone

**Step 6** Configure static routes for the zone interfaces for load balancing:

- In the **Routing** page, click **Static Route**.
- Click **Add** and specify the static routes for *WAN1*, *WAN2*, *VTI01*, and *VTI02*. Ensure that you specify the same metric value for the interfaces belonging to the same ECMP zones ([Step 5](#)):

Figure 399: Configuring Static Routes for ECMP Zone Interfaces

+ Add Route							
Network	Interface	Leaked from Virtual Router	Gateway	Tunneled	Metric	Tracked	
IPv4 Routes							
any-ipv4	VTI02	Global	192.168.102.21	false	1		
any-ipv4	VTI01	Global	192.168.101.21	false	1		
any-ipv4	WAN2	Global	10.10.1.65	false	10		
any-ipv4	WAN1	Global	10.10.1.33	false	10		

#### Note

Ensure that the zone interfaces have the same destination address and metric, but different gateway addresses.

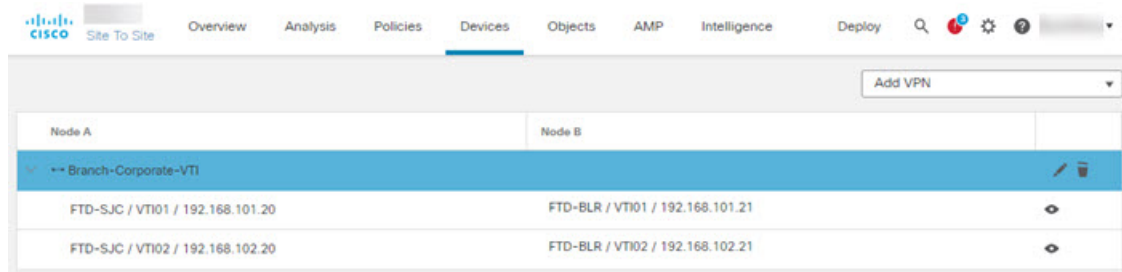

**Step 7** Configure trusted DNS on the WAN objects of the branch Firewall Threat Defense to ensure secured flow of traffic to the internet:

- Choose **Devices > Platform Settings**, and create a DNS policy on the branch Firewall Threat Defense.
- To specify the trusted DNS, **Edit** the policy and click **DNS**.
- To specify the DNS servers for the DNS resolution to be used by WAN objects, in the **DNS Settings** tab, provide the DNS server group details and select WAN from the interface objects.
- Use the **Trusted DNS Servers** tab to provide specific DNS servers that you trust for the DNS resolution.

**Step 8** Save and Deploy.

Any *YouTube* related access requests from the branch inside network *INSIDE1* or *INSIDE2* are routed to *WAN1* or *WAN2* as they would match the *DIA-FTD-Branch* ACL. Any other request, say *google.com*, are routed through *VTI01* or *VTI02* as configured in the Site to Site VPN Settings.

Figure 400: Site to Site VPN Settings

With the ECMP configured, the network traffic is seamlessly balanced.

## Configuration Example for PBR with Path Monitoring

This example details the configuration of PBR with path monitoring for the following applications with flexible metrics:

- Audio or video sensitive applications (example, WebEx Meetings) with Jitter.
- Cloud-based application (example, Office365) with RTT.
- Network-based access control (with a specific source and destination) with Packet Loss.

### Before you begin

1. This example assumes that you are aware of the basic configuration steps for PBR.
2. You have configured ingress and egress interfaces with logical names. In this example, the ingress interface is named *Inside1*, and egress interfaces are named *ISP01*, *ISP02*, and *ISP03*.

### Procedure

#### Step 1 Path monitoring configuration on interfaces *ISP01*, *ISP02*, and *ISP03*:

For the metrics collection on the egress interfaces, you must enable and configure path monitoring on them.

- a) Choose **Devices > Device Management**, and edit Firewall Threat Defense.
- b) Under the **Interfaces** tab, edit the interface (in our example, *ISP01*)
- c) Click the **Path Monitoring** tab, select the **Enable Path Monitoring** check box, and then specify the monitoring type (see [Configure Path Monitoring Settings, on page 1216](#)).
- d) Click **Ok** and **Save**.
- e) Repeat the same steps and configure the path monitoring settings for *ISP02* and *ISP03*.

#### Step 2 Configure policy-based routing for a branch in an organization Firewall Threat Defense, select the ingress interfaces:

- a) Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
- b) Choose **Routing > Policy Based Routing**, and on the **Policy Based Routing** page, click **Add**.
- c) In the **Add Policy Based Route** dialog box, select *Inside 1* from the **Ingress Interface** drop-down list.

**Step 3** Specify the match criteria:

- a) Click **Add**.
- b) To define the match criteria, click the **Add** (+) button.
- c) In **New Extended Access List Object**, enter the name for the ACL (example, *PBR-WebEx*), and click **Add**.
- d) In the **Add Extended Access List Entry** dialog box, choose the required web-based applications (example, WebEx Meetings) from the **Application** tab.

**Remember**

On Firewall Threat Defense, the application group in an ACL is configured as a network service group and each of the applications as a network service object.

- e) Click **Save**.
- f) Select *PBR-WebEx* from the **Match ACL** drop-down list.

**Step 4** Specify the egress interfaces:

- a) From the **Send To** drop-down list, choose Egress Interfaces.
- b) From the **Interface Ordering** drop-down list, choose By Minimal Jitter.
- c) Under **Available Interfaces**, click the **Right Arrow** (➤) button against the respective interface names to add *ISP01*, *ISP02*, and *ISP03*.
- d) Click **Save**.

**Step 5** Repeat Step 2 and Step 3 to create PBRs for the same interface (*Inside1*) to route Office365 and network-based access control traffic:

- a) Create a match criteria object, example *PBR-Office365*, and select the Office365 application from the **Application** tab.
- b) From the **Interface Ordering** drop-down list, choose By Minimal Round Trip Time.
- c) Specify the egress interfaces *ISP01*, *ISP02*, and *ISP03*, and click **Save**.
- d) Now, create a match criteria object, example *PBR-networks*, and specify the source and destination interface in the **Network** tab.
- e) From the **Interface Ordering** drop-down list, choose By Minimal Packet Loss.
- f) Specify the egress interfaces *ISP01*, *ISP02*, and *ISP03*, and click **Save**.

**Step 6** **Save and Deploy.****Step 7** To view path monitoring metrics, choose **Devices** > **Device Management**, and from **More** (≡) click **Health Monitor**. To view the metric details for the interfaces of the device, you must add the path metrics dashboard. For details, see [Add Path Monitoring Dashboard](#), on page 1220.

---

The WebEx, Office365, and networks-based ACL traffic are forwarded through the best route derived from the metrics value collected on *ISP01*, *ISP02*, and *ISP03*.

# History for Policy Based Routing

Table 69:

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Identity and SGT based PBR Policy	7.4.0	7.4.0	<p>You can now classify the network traffic based on users and user groups, and SGTs in PBR policies. You can select the identity and SGT objects while defining the extended ACLs for the PBR policies.</p> <p>New/modified screens: New tabs added in the extended access list object for configuring the policy based routing policy: <b>Objects &gt; Object Management &gt; Access Control Lists &gt; Add Extended</b> page, <b>Users</b> and <b>Security Group Tag</b>.</p>
HTTP based Path Monitoring	7.4.0	7.2.0	<p>PBR can now use the performance metrics (RTT, jitter, packet-lost, and MOS) collected by path monitoring through HTTP client on the application domain rather than the metrics on a specific destination IP. HTTP-based application monitoring option is enabled by default for the interface. You can configure a PBR policy with match ACL having the monitored applications and desired metric type for path determination.</p> <p>New/modified screens: New option in Interfaces page for enabling path monitoring: <b>Devices &gt; Device Management &gt; Edit Interfaces &gt; Path Monitoring &gt; Enable HTTP based Application Monitoring</b> check box.</p>
Dual WAN/ISP Threat Defense Management Support	7.3.0	7.3.0	<p>On a dual WAN-enabled threat defense, a single data interface was configured to communicate with the management center. Now, support to configure a secondary data interface is provided so that the communication channel is sustained when the primary data interface fails. The management center autoconfigures PBR to route the SF-Tunnel traffic from the <i>tapnlp</i> (internal) interface to one of the available data interfaces based on the priority and SLA metric.</p>
Next-hop settings for PBR route map	7.3.0	7.1.0	<p>You can configure the next-hops for the PBR route-map while enabling packet forwarding actions.</p> <p>New/modified screens: New fields in Add/Edit Forwarding Actions page for configuring egress interfaces: <b>Device Management &gt; Routing &gt; Policy Based Routing &gt; Add Forwarding Actions</b> page.</p>
PBR and Path Monitoring	7.2.0	7.2.0	<p>PBR uses path monitoring to collect the performance metrics (RTT, jitter, packet-lost, and MOS) of the egress interfaces. You must enable path monitoring for the interface and configure the monitoring type. You can configure a PBR policy with the desired metric for path determination.</p> <p>New/modified screens: New tab in Interfaces page for enabling path monitoring: <b>Devices &gt; Device Management &gt; Edit Interfaces &gt; Path Monitoring</b> tab.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Configure policy based routing from the FMC web interface.	7.1.0	7.1.0	<p><b>Upgrade impact. Redo FlexConfigs after upgrade.</b></p> <p>You can now configure policy based routing (PBR) from the FMC web interface. This allows you to classify network traffic based on applications and to implement direct internet access (DIA) to send traffic to the internet from a branch deployment. You can define a PBR policy and configure it on ingress interfaces, specifying match criteria and egress interfaces. Network traffic that matches the access control policy is forwarded through the egress interface based on priority or the order as configured in the policy.</p> <p>This feature requires Version 7.1+ on both the FMC and the device. When you upgrade the FMC to Version 7.1+, existing policy based routing FlexConfigs are removed. After you upgrade your devices to Version 7.1+, redo your policy based routing configurations in the FMC web interface. For devices that you do not upgrade to Version 7.1+, redo the FlexConfigs and configure them to deploy "every time."</p> <p>New/modified screens: <b>Devices &gt; Device Management &gt; Routing &gt; Policy Based Routing</b></p>

- [History for Object Management, on page 1360](#)

## Introduction to Objects

For increased flexibility and web interface ease-of-use, the system uses named *objects*, which are reusable configurations that associate a name with a value. When you want to use that value, use the named object instead. The system supports object use in various places in the web interface, including many policies and rules, event searches, reports, dashboards, and so on. The system provides many predefined objects that represent frequently used configurations.

Use the object manager to create and manage objects. Many configurations that use objects also allow you to create objects on the fly, as needed. You can also use the object manager to:

- View the policies, settings, and other objects where a network, port, VLAN, or URL object is used; see [Viewing Objects and Their Usage, on page 1240](#).
- Group objects to reference multiple objects with a single configuration; see [Object Groups, on page 1241](#).
- Override object values for selected devices; see [Object Overrides, on page 1243](#).

After you edit an object used in an active policy, you must redeploy the changed configuration for your changes to take effect. You cannot delete an object that is in use by an active policy.

**Note** An object is configured on a managed device if, and only if, the object is used in a policy that is assigned to that device. If you remove an object from all policies assigned to a given device, the object is also removed from the device configuration on the next deployment, and subsequent changes to the object are not reflected in the device configuration.

### Object Types

The following table lists the objects you can create in the system, and indicates whether each object type can be grouped or configured to allow overrides.

Object Type	Groupable?	Allows Overrides?
Network	yes	yes
Port	yes	yes
Interface: <ul style="list-style-type: none"><li>• Security Zone</li><li>• Interface Group</li></ul>	no	no
Tunnel Zone	no	no
Application Filter	no	no

Object Type	Groupable?	Allows Overrides?
VLAN Tag	yes	yes
External Attribute: Security Group Tag (SGT) and Dynamic Object	no	no
URL	yes	yes
Geolocation	no	no
Time Range	no	no
Variable Set	no	no
Security Intelligence: Network, DNS, and URL lists and feeds	no	no
Sinkhole	no	no
File List	no	no
Cipher Suite List	no	no
Distinguished Name	yes	no
Public Key Infrastructure (PKI): <ul style="list-style-type: none"> <li>• Internal and Trusted CA</li> <li>• Internal and External Certs</li> </ul>	yes	no
Key Chain	no	yes
DNS Server Group	no	no
SLA Monitor	no	no
Prefix List: IPv4 and IPv6	no	yes
Route Map	no	yes
Access List: Standard and Extended	no	yes
AS Path	no	yes
Community List	no	yes
Policy List	no	yes
FlexConfig: Text and FlexConfig objects	no	yes

### Objects and Multitenancy

In a multidomain deployment, you can create objects in Global and descendant domains with the exception of Security Group Tag (SGT) objects, which you can create only in the Global domain. The system displays

objects created in the current domain, which you can edit. It also displays objects created in ancestor domains, which you cannot edit, with the exception of security zones and interface groups.

---

**Note** Because security zones and interface groups are tied to device interfaces, which you configure at the leaf level, administrators in descendant domains can view and edit and groups created in ancestor domains. Subdomain users can add and delete interfaces from ancestor zones and groups, but cannot delete or rename the zones/groups.

---

Object names must be unique within the domain hierarchy. The system may identify a conflict with the name of an object you cannot view in your current domain.

For objects that support grouping, you can group objects in the current domain with objects inherited from ancestor domains.

Object overrides allow you to define device-specific or domain-specific values for certain types of object, including network, port, VLAN tag, and URL. In a multidomain deployment, you can define a default value for an object in an ancestor domain, but allow administrators in descendant domains to add override values for that object.

## The Object Manager

You can use the object manager to create and manage objects and object groups.

The object manager displays 20 objects or groups per page. If you have more than 20 of any type of object or group, use the navigation links at the bottom of the page to view additional pages. You can also go to a specific page or click **Refresh** (🔄) to refresh your view.

By default, the page lists objects and groups alphabetically by name. You can filter the objects on the page by name or value.

## Importing Objects

Objects can be imported from a comma-separated values file. Up to 1000 objects can be imported in one attempt. The contents of the comma-separated values file should follow a specific format. The format is different for each object type. Only a few types of objects can be imported. See the following table to know the supported object types and the corresponding rules.

Object Type	Rules
Individual object	<ul style="list-style-type: none"><li>• The column header must be mentioned in capital letters.</li><li>• The file must have the following columns headers:<ul style="list-style-type: none"><li>• NAME</li><li>• DN</li></ul></li><li>• Both NAME and DN column entries are mandatory to import an entry.</li><li>• You can import individual objects directly into an existing distinguished name object group.</li></ul>
Network object	<ul style="list-style-type: none"><li>• The column header must be mentioned in capital letters.</li><li>• The file must have the following columns headers:<ul style="list-style-type: none"><li>• NAME</li><li>• DESCRIPTION</li><li>• TYPE</li><li>• VALUE</li><li>• LOOKUP</li></ul></li><li>• The NAME and VALUE column entries are mandatory to import an entry of host, range, or network object type.</li><li>• For an FQDN object, the TYPE column entry must mention 'fqdn,' and the LOOKUP column entry must be specified as 'ipv4,' 'ipv6,' or 'ipv4_ipv6.'</li><li>• If no content is provided in the LOOKUP column entry for the FQDN object, then the object is saved with the ipv4_ipv6 field value.</li></ul>

Object Type	Rules
Port	<ul style="list-style-type: none"> <li>• The column header must be mentioned in capital letters.</li> <li>• The file must have the following columns headers: <ul style="list-style-type: none"> <li>• NAME</li> <li>• PROTOCOL</li> <li>• PORT</li> <li>• ICMPCODE</li> <li>• ICMPTYPE</li> </ul> </li> <li>• The NAME column entry is mandatory.</li> <li>• For 'tcp' and 'udp' protocol types, the PORT column entry is mandatory.</li> <li>• For 'icmp' and 'icmp6' protocol types, the ICMPCODE and ICMPTYPE column entries are mandatory.</li> </ul>
URL	<ul style="list-style-type: none"> <li>• The column header must be mentioned in capital letters.</li> <li>• The file must have the following columns headers: <ul style="list-style-type: none"> <li>• NAME</li> <li>• DESCRIPTION</li> <li>• URL</li> </ul> </li> <li>• The NAME and URL column entries are mandatory to import an entry.</li> </ul>
VLAN Tag	<ul style="list-style-type: none"> <li>• The column header must be mentioned in capital letters.</li> <li>• The file must have the following columns headers: <ul style="list-style-type: none"> <li>• NAME</li> <li>• DESCRIPTION</li> <li>• TAG</li> </ul> </li> <li>• The NAME and TAG column entries are mandatory to import an entry.</li> </ul>

## Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose one of the following object types from the left pane:

- **Distinguished Name > Individual Objects >**
- **Network Object**
- **Port**
- **URL**
- **VLAN Tag**

**Step 3** Choose **Import Object** from the **Add [Object Type]** drop-down list.

**Note**

If you have selected **Individual Objects** in the previous step, click **Import**.

**Step 4** Click **Browse**.

**Step 5** Locate and select the comma-separated file on your system.

**Step 6** Click **Open**.

**Note**

While importing **Distinguished Name** objects, you can optionally check the **Add imported Distinguished Name objects to the below object group** check box and select the group name from the drop-down box to import the objects directly to an existing distinguished name object group.

**Step 7** Click **Import**.

## Editing Objects

### Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose an object type from the list; see [Introduction to Objects, on page 1234](#).

**Step 3** Click **Edit** (✎) next to the object you want to edit.

If **View** (👁) appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

**Step 4** Modify the object settings as desired.

**Step 5** If you are editing a variable set, manage the variables in the set; see [Managing Variables, on page 1338](#).

**Step 6** For objects that can be configured to allow overrides:

- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#). You can change this setting only for objects that belong to the current domain.
- If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 1245](#).

**Step 7** Click **Save**.

- Step 8** If you are editing a variable set, and that set is in use by an access control policy, click **Yes** to confirm that you want to save your changes.
- 

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Viewing Objects and Their Usage

You can view usage details of objects on the Object Management page. Firewall Management Center provides this functionality for many object types. However, some object types are not supported.

#### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose one of the following supported object types:
- Access List > Extended
  - Access List > Standard
  - AS Path
  - Community List
  - Interface
  - Network
  - Policy List
  - Port
  - Prefix List > IPv4 Prefix List
  - Prefix List > IPv6 Prefix List
  - Route Map
  - SLA Monitor
  - URL
  - VLAN Tag
- Step 3** Click the **Find Usage** () icon next to the object.

The Object Usage window displays a list of all the policies, objects, and other settings where the object is in use. Click any of the listed items to know more about the object usage. For policies and some other settings where the object is used, you can click the corresponding links to visit the respective UI pages.

---

## Filtering Objects or Object Groups

### Procedure

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Enter your filter criteria in the **Filter** field.

The page updates as you type to display matching items.

You can use the following wildcards:

- The asterisk (\*) matches zero or more occurrences of a character.
- The caret (^) matches content at the beginning of a string.
- The dollar sign (\$) matches content at the end of a string.

**Step 3** Check the **Show Unused Object** check box to view the objects and the object groups that are unused anywhere in the system.

#### Note

- In case an object is a part of an unused object group, the object is considered as used. However, the unused object group is displayed when the **Show Unused Object** check box is checked.
  - The **Show Unused Object** check box is available only for network, port, URL and VLAN tag object types.
- 

## Object Groups

Grouping objects allows you to reference multiple objects with a single configuration. The system allows you to use objects and object groups interchangeably in the web interface. For example, anywhere you would use a port object, you can also use a port object group.

You can group network, port, VLAN tag, URL, and PKI objects. Network object groups can be nested, that is, you can add a network object group to another network object group up to 10 levels.

Objects and object groups of the same type cannot have the same name.

When you edit an object group used in a policy (for example, a network object group used in an access control policy), you must re-deploy the changed configuration for your changes to take effect.

Deleting a group does not delete the objects in the group, just their association with each other. Additionally, you cannot delete a group that is in use in an active policy. For example, you cannot delete a VLAN tag group that you are using in a VLAN condition in a saved access control policy.

## Grouping Reusable Objects

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** If the object type you want to group is **Network**, **Port**, **URL**, or **VLAN Tag**:
- Choose the object type from the list of object types.
  - Choose **Add Group** from the **Add [Object Type]** drop-down list.
- Step 3** If the object type you want to group is **Distinguished Name**:
- Expand the **Distinguished Name** node.
  - Choose **Object Groups**.
  - Click **Add Distinguished Name Group**.
- Step 4** If the object type you want to group is **PKI**:
- Expand the **PKI** node.
  - Choose one of the following:
    - **Internal CA Groups**
    - **Trusted CA Groups**
    - **Internal Cert Groups**
    - **External Cert Groups**
  - Click **Add [Object Type] Group**.
- Step 5** Enter a unique **Name**.
- Step 6** Choose one or more objects from the list, and click **Add**.
- You can also:
- Use the filter field **Search** (🔍) to search for existing objects to include, which updates as you type to display matching items. Click **Reload** (🔄) above the search field or click **Clear** (✕) in the search field to clear the search string.
  - Click **Add** (+) to create objects on the fly if no existing objects meet your needs.
- Step 7** Optionally for **Network**, **Port**, **URL**, and **VLAN Tag** groups:
- Enter a **Description**.
  - Check the **Allow Overrides** check box to allow overrides for this object group; see [Allowing Object Overrides, on page 1244](#).

**Step 8** Click **Save**.

---

#### What to do next

- If an active policy references your object group, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Object Overrides

An object override allows you to define an alternate value for an object, which the system uses for the devices you specify.

You can create an object whose definition works for most devices, and then use overrides to specify modifications to the object for the few devices that need different definitions. You can also create an object that needs to be overridden for all devices, but its use allows you to create a single policy for all devices. Object overrides allow you to create a smaller set of shared policies for use across devices without giving up the ability to alter policies when needed for individual devices.

For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access control policy with a rule that includes a network object called Departmental Network. By allowing overrides for this object, you can then create overrides on each relevant device that specifies the actual network where that device is connected.

You can target an object override to a specific domain. In this case, the system uses the object override value for all devices in the targeted domain unless you override it at the device level.

From the object manager, you can choose an object that can be overridden and define a list of device-level or domain-level overrides for that object.

You can use object overrides with the following object types only:

- Network
- Port
- VLAN tag
- URL
- SLA Monitor
- Prefix List
- Route Map
- Access List
- AS Path
- Community List
- Policy List
- Cert Enrollment (PKI)
- Key Chain

If you can override an object, the **Override** column appears for the object type in the object manager. Possible values for this column include:

- Green checkmark — indicates that you can create overrides for the object and no overrides have been added yet
- Red X — indicates that you cannot create overrides for the object
- Number — represents a count of the overrides that have been added to that object (for example, "2" indicates two overrides have been added)

## Managing Object Overrides

### Procedure

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose from the list of object types; see [Introduction to Objects, on page 1234](#).

**Step 3** Click **Edit** () next to the object you want to edit.

If **View** () appears instead, the object belongs to an ancestor domain and has been configured not to allow overrides, or you do not have permission to modify the object.

**Step 4** Manage the object overrides:

- Add—Add object overrides; see [Adding Object Overrides, on page 1245](#).
  - Allow—Allow object overrides; see [Allowing Object Overrides, on page 1244](#).
  - Delete—In the object editor, click **Delete** () next to the override you want to remove.
  - Edit—Edit object overrides; see [Editing Object Overrides, on page 1245](#).
- 

## Allowing Object Overrides

### Procedure

---

**Step 1** In the object editor, check the **Allow Overrides** check box.

**Step 2** Click **Save**.

---

### What to do next

Add object override values; see [Adding Object Overrides, on page 1245](#).

## Adding Object Overrides

### Before you begin

Allow object overrides; see [Allowing Object Overrides, on page 1244](#).

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | In the object editor, expand the <b>Override</b> section.   |
| <b>Step 2</b> | Click <b>Add</b> .  |
| <b>Step 3</b> | On <b>Targets</b> , choose domains or devices in the <b>Available Devices and Domains</b> list and click <b>Add</b> . |
| <b>Step 4</b> | On the Override tab, enter a <b>Name</b> .  |
| <b>Step 5</b> | Optionally, enter a <b>Description</b> .  |
| <b>Step 6</b> | Enter an override value.  |

### Example:

For a network object, enter a network value.

- |               |                     |
|---------------|---------------------|
| <b>Step 7</b> | Click <b>Add</b> .  |
| <b>Step 8</b> | Click <b>Save</b> . |
- 

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Editing Object Overrides

You can modify the description and the value of an existing override, but you cannot modify the existing target list. Instead, you must add a new override with new targets, which replaces the existing override.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | In the object editor, expand the <b>Override</b> section.      |
| <b>Step 2</b> | Click <b>Edit</b> (✎) next to the override you want to modify. |
| <b>Step 3</b> | Optionally, modify the <b>Description</b> .                    |
| <b>Step 4</b> | Modify the override value.                                     |
| <b>Step 5</b> | Click <b>Save</b> to save the override.                        |
| <b>Step 6</b> | Click <b>Save</b> to save the object.                          |
-

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# AAA Server

Add reusable AAA server objects.

## Add a RADIUS Server Group

RADIUS Server Group objects contain one or more references to RADIUS servers. These servers are used to authenticate users logging in through Remote Access VPN connections.

You can use this object with Firewall Threat Defense devices.

**Before you begin**

---

**Note** You cannot override RADIUS Server Group Objects.

---

**Procedure**

- 
- Step 1** Select **Objects > Object Management > AAA Server > RADIUS Server Group**.
- All currently configured RADIUS Server Group objects will be listed. Use the filter to narrow down the list.
- Step 2** Choose and edit a listed RADIUS Server Group object, or add a new one.
- See [RADIUS Server Options, on page 1248](#) and [RADIUS Server Group Options, on page 1246](#) to configure this object.
- Step 3** Click **Save**
- 

## RADIUS Server Group Options

**Navigation Path**

**Objects > Object Management > AAA Server > RADIUS Server Group.** Choose and edit a configured RADIUS Server Group object or add a new one.

**Fields**

- **Name** and **Description**—Enter a name and optionally, a description to identify this RADIUS Server Group object.

- **Group Accounting Mode**—The method for sending accounting messages to the RADIUS servers in the group. Choose **Single**, accounting messages are sent to a single server in the group, this is the default. Or, **Multiple**, accounting messages are sent to all servers in the group simultaneously.
- **Retry Interval**—The interval between attempts to contact the RADIUS servers. Values range from 1 to 10 seconds.
- **Realms**(Optional)—Specify or select the Active Directory (AD) realm this RADIUS server group is associated with. This realm is then selected in identity policies to access the associated RADIUS server group when determining the VPN authentication identity source for a traffic flow. This realm effectively provides a bridge from the identity policy to this Radius server group. If no realm is associated with this RADIUS server group, the RADIUS server group cannot be reached to determine the VPN authentication identity source for a traffic flow in an identity policy.

**Note** This field is mandatory if you use remote access VPN with User Identity and RADIUS as the identity source.

- **Enable authorize only**—If this RADIUS server group is not being used for authentication, but is being used for authorization or accounting, check this field to enable authorize-only mode for the RADIUS server group.

Authorize only mode eliminates the need of including the RADIUS server password in the Access-Request. Thus, the password, configured for the individual RADIUS servers, is ignored.

- **Enable interim account update and Interval**—Enables the generation of RADIUS interim-accounting-update messages in order to inform the RADIUS server of newly assigned IP addresses. Set the length, in hours, of the interval between periodic accounting updates in the Interval field. The valid range is 1 to 120 and the default value is 24.
- **Enable Dynamic Authorization and Port**— Enables the RADIUS dynamic authorization or change of authorization (CoA) services for this RADIUS server group. Specify the listening port for RADIUS CoA requests in the **Port** field. The valid range is 1024 to 65535 and the default value is 1700. Once defined, the corresponding RADIUS server group will be registered for CoA notification and it listens to the port for the CoA policy updates from the Cisco Identity Services Engine (ISE).
- **Merge Downloadable ACL with Cisco AV Pair ACL**—Enables merging a downloadable access control list (dACL) with a Cisco attribute-value (AV) pair ACL.

A downloadable ACL defines and updates access control lists in CiscoISE and allows ACL download to all the applicable controllers. For more information about using dACLs in Cisco ISE, see the chapter on Segmentation, section on authorization policies, in the [Cisco ISE Administrator Guide](#).

A Cisco AV pair ACL can be utilized to define specific authentication, authorization, and accounting elements for each individual session. For more information about using dACLs in Cisco ISE, see the chapter on Segmentation, section on authorization profile settings, in the [Cisco ISE Administrator Guide](#).

If you select **Merge Downloadable ACL with Cisco AV Pair ACL**, you can choose the following options:

- **After Cisco AV Pair ACL** means the downloadable ACL entries should be placed after the Cisco AV pair entries.
- **Before Cisco AV Pair ACL** means the downloadable ACL entries should be placed before the Cisco AV pair entries.

- **RADIUS Servers**—See [RADIUS Server Options, on page 1248](#).

### Related Topics

[Add a RADIUS Server Group](#), on page 1246

## RADIUS Server Options

### Navigation Path

**Objects > Object Management > AAA Server > RADIUS Server Group**. Choose and edit a listed RADIUS Server Group object or add a new one. Then, in the RADIUS Server Group dialog, choose and edit a listed RADIUS Server or add a new one.

### Fields

- **IP Address/Hostname**—The network object that identifies the hostname or IP address of the RADIUS server to which authentication requests will be sent. You may only select one, to add additional servers, add additional RADIUS Server to the RADIUS Server Group list.

---

**Note** The device now supports IPv6 IP addresses for RADIUS authentication.

---

- **Authentication Port**—The port on which RADIUS authentication and authorization are performed. The default is 1812.
- **Key** and **Confirm Key**— The shared secret that is used to encrypt data between the managed device (client) and the RADIUS server.  
The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted.  
The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field.
- **Accounting Port**—The port on which RADIUS accounting is performed. The default is 1813.
- **Timeout**— Session timeout for authentication.

---

**Note** The timeout value must be 60 seconds or more for RADIUS two factor authentication. The default timeout value is 10 seconds.

---

- **Connect Using** —Establishes connectivity from the device to a RADIUS server using a route lookup or using a specific interface.
  - Click the **Routing** radio button to use the routing table.
  - Click the **Specific Interface** radio button and choose a security zone/interface group or the Management interface (the default) from the drop-down list. If you want to use Management, you must choose it specifically; it is not available when using a route lookup. You cannot specify any other management-only interface as the RADIUS source. You can also choose a loopback interface group.

- **Redirect ACL**—Select the redirect ACL from the list or add a new one.

**Note**

This is the name of the ACL defined in the device to decide the traffic to be redirected. The Redirect ACL name here must be the same as the *redirect-acl* name in ISE server. When you configure the ACL object, ensure that you select Block action for ISE and DNS servers, and Allow action for the rest of the servers.

## Add a Single Sign-on Server

**Before you begin**

Obtain the following from your SAML identity provider:

- Identity Provider Entity ID URL
- Sign-in URL
- Sign-out URL
- Identity provider certificate and enroll the certificate in Firewall Threat Defense using the Firewall Management Center web interface (**Devices > Certificates**)

For more information, see [Configuring a SAML Single Sign-On Authentication](#), on page 1541.

**Procedure**

**Step 1** Choose **Objects > Object Management > AAA Server > Single Sign-on Server**.

**Step 2** Click **Add Single Sign-on Server** and provide the following details:

- **Name**—The name of the SAML single sign-on server object.
- **Identity Provider Entity ID**—The URL that is defined in SAML IdP to identify a service provider uniquely.  
The URL for a page that serves a metadata XML that describes how the SAML Issuer is going to respond to requests.
- **SSO URL**—The URL for signing into the SAML identity provider server.
- **Logout URL**—The URL for signing out of the SAML identity provider server.
- **Base URL**—URL that will redirect the user back to Firewall Threat Defense once the identity provider authentication is done. This is the URL of the access interface configured for the Firewall Threat Defense remote access VPN.

- **Identity Provider Certificate**—Certificate of the IdP enrolled into the Firewall Threat Defense to verify the messages signed by the IdP.

Choose an identify provider certificate from the list or click **Add** to create a new certificate enrollment object.

For more information, see [Managing Firewall Threat Defense Certificates, on page 1366](#).

You must enroll all of the Microsoft Azure registered application CA certificates as Trustpoints on the Firewall Threat Defense. The Microsoft Azure SAML identity provider is configured on Firewall Threat Defense for the initial application. All connection profiles are mapped to the configured MS Azure SAML identity provider. For each of the MS Azure applications (other than the default), you can choose the required trustpoint(CA certificate) in the connection profile configuration of the remote access VPN.

For details, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

- **Service Provider Certificate**—Firewall Threat Defense certificate, which will be used to sign the requests and build circle of trust with IdP.

If you have not enrolled internal Firewall Threat Defense certificates, click + to add and enroll a certificate. For more information, see [Managing Firewall Threat Defense Certificates, on page 1366](#).

- **Request Signature**—Select the encryption algorithm to sign the SAML single sign-on requests.

The signatures are listed from weakest to strongest: SHA1,SHA256, SHA384, SHA512. Select None to disable encryption.

- **Request Timeout**—Specify the SAML assertion validity duration for the users to complete the single sign-on request. The SAML IdP has two time outs: *NotBefore* and *NotOnOrAfter*. The Firewall Threat Defense validates if its current time is within the time range of (lower limit) *NotBefore* and (upper limit) the smaller of *NotBefore* plus *timeout* and *NotOnOrAfter*. Thus, if you set a timeout longer than the IdP's *NotOnOrAfter* timeout, the specified timeout is ignored and the *NotOnOrAfter* timeout is selected. If the sum of the specified timeout and the *NotBefore* timeout is less than the *NotOnOrAfter* time, Firewall Threat Defense timeout overrides the timeout.

The timeout range is 1-7200 seconds; the default is 300 seconds.

- **Enable IdP only accessible on Internal Network**—Select this option if the SAML IdP resides on the internal network. Firewall Threat Defense acts as a gateway and establishes communication between the users and IdP using an anonymous webvpn session.

- **Request IdP re-authentication on Login**—Select this option to authenticate user at each login even if the previous IdP session is valid.

- **Allow Overrides**—Select this check box to allow overrides for this single sign-on server object.

**Step 3** Click **Save**.

---

## Access List

An access list object, also known as an access control list (ACL), selects the traffic to which a service will apply. You use these objects when configuring particular features, such as route maps, for Firewall Threat

Defense devices. Traffic identified as allowed by the ACL is provided the service, whereas “blocked” traffic is excluded from the service. Excluding traffic from a service does not necessarily mean that it is dropped altogether.

You can configure the following types of ACL:

- **Extended**—Identifies traffic based on source and destination address and ports. Supports IPv4 and IPv6 addresses, which you can mix in a given rule.
- **Standard**—Identifies traffic based on destination address only. Supports IPv4 only.

An ACL is composed of one or more access control entry (ACE), or rule. The order of ACEs is important. When the ACL is evaluated to determine if a packet matches an “allowed” ACE, the packet is tested against each ACE in the order in which the entries are listed. After a match is found, no more ACEs are checked. For example, if you want to “allow” 10.100.10.1, but “block” the rest of 10.100.10.0/24, the allow entry must come before the block entry. In general, place more specific rules at the top of an ACL.

Packets that do not match an “allow” entry are considered to be blocked.

The following topics explain how to configure ACL objects.

## Configure Extended ACL Objects

Use extended ACL objects when you want to match traffic based on source and destination addresses, protocol and port, application group or if the traffic is IPv6.

### Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **Objects > Object Management > Access List > Extended** from the table of contents.
- Step 2** Do one of the following:
- Click **Add Extended Access List** to create a new object.
  - Click **Edit** (✎) to edit an existing object.
- Step 3** In the New Extended Access List Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:
- Do one of the following:
    - Click **Add** to create a new entry.
    - Click **Edit** (✎) to edit an existing entry.
  - Select the **Action**, whether to Allow (match) or Block (not match) the traffic criteria.

#### Note

The **Logging**, **Log Level**, and **Log Interval** options are used for access rules only (ACLs attached to interfaces or applied globally). Because ACL objects are not used for access rules, leave these values at their defaults.

- Configure the source and destination addresses on the **Network** tab using any of the following techniques:

- Select the desired network objects or groups from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. You can mix IPv4 and IPv6 addresses.
- Type an address in the edit box below the source or destination list and click **Add**. You can specify a single host address (such as 10.100.10.5 or 2001:DB8::0DB8:800:200C:417A), or a subnet (in 10.100.10.0/24 or 10.100.10.0 255.255.255.0 format, or for IPv6, 2001:DB8:0:CD30::/60).

d) Click the **Port** tab and configure the service using any of the following techniques.

- Select the desired port objects from the Available list and click **Add to Source** or **Add to Destination**. You can create new objects by clicking the + button above the list. The object can specify TCP/UDP ports, ICMP/ICMPv6 message types, or other protocols (including “any”). However, the source port, which you typically would leave empty, accepts TCP/UDP only. You cannot select port groups.

For TCP/UDP, note that you must use the same protocol in both the source and destination fields, if you specify both. For example, you cannot specify a UDP source port and a TCP destination port.

- Type or select a port or protocol in the edit box below the source or destination list and click **Add**.

#### Note

To get an entry that applies to all IP traffic, select a destination port object that specifies “all” protocols.

e) Click the **Application** tab and choose the applications that are to be grouped for the direct internet access policy.

#### Important

- You cannot configure applications for cluster devices. Hence, this tab is not applicable for cluster devices.
- Use extended ACL with applications only in policy-based routing. Do not use it in other policies as its behavior is unknown and not supported. Ensure migration of the realm/ISE configuration for policy-based routing that uses User Identity and SGT in extended ACL.

#### Note

- The **Available Applications** list displays a fixed set of pre-defined applications. This list is a subset of the applications that are available on the Access Control policy as only they can be detected by their first packet (FQDN end-points resolved to IP addresses and port). The application definitions are updated through the VDB updates and are pushed to Firewall Threat Defense during subsequent deployments.
- User-defined custom applications or group of applications are not supported.
- Currently, Firewall Management Center neither supports user-defined custom applications or group of applications nor allows you to modify the pre-defined applications list.
- You can use the filter options provided under the **Application Filters** to refine this list.

f) Click the **Users** tab and choose the users, user groups, or both that are to be classified for the Policy Based Routing (PBR).

#### Important

Use extended ACL with users, user groups, or both only for Policy Based Routing. Do not use it in other policies as its behavior is unknown and not supported.

**Note**

- The **Available Realms** list displays the configured active directory/LDAP realms. For information on creation of realm and managing them, see [Create an LDAP Realm or an Active Directory Realm and Realm Directory, on page 2275](#) and [Manage a Realm, on page 2304](#) respectively.

**Note**

Local realms and Azure AD realms are not supported.

- The **Available Users** list displays the downloaded users and user groups of the selected AD/LDAP realms. To download the users, user groups, or both, navigate to **Integrations > Other Integrations > Realms**, and then click **Download** against the relevant active directory/LDAP realms.

**Note**

Threat defense can support a maximum of 512 user groups and 64000 user-IP mappings.

- The user to IP mapping and user group membership information are updated and pushed to the Firewall Threat Defense from the Firewall Management Center during the user login or logouts, and changes in the group memberships.

- g) Click the **Security Group Tag** tab and choose the source SGT tags to be classified for the direct internet access policy.

**Important**

Use extended ACL with SGTs only for Policy Based Routing. Do not use it in other policies as its behavior is unknown and not supported.

**Note**

- The **Available Security Group Tags** list displays the configured security group tags. You can choose to use the ISE SGTs or create custom SGTs.
- To use ISE SGTs, ensure that ISE is integrated with Firewall Management Center with **Session Directory Topic** and **SXP Topic** subscribed.

**Note**

The supported ISE versions are 3.2, 3.1, 3.0, and 2.7 patch 2+.

- For information on creating custom SGTs, see [Creating Security Group Tag Objects, on page 1272](#).

- h) Select the required application, and click **Add to Rule**.

**Note**

- Do not configure destination networks and applications in the extended ACL object.
- The selected applications (Network Service objects) in each of the access control entries, form a Network Service Group (NSG) and this group is deployed on the Firewall Threat Defense. The NSG is used in direct internet access to classify traffic based on the match with the selected application group.

- i) Click **Add** to add the entry to the object.
- j) If necessary, click and drag the entry to move it up or down in the rule order to the desired location.

Repeat the process to create or edit additional entries in the object.

- Step 4** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 5** Click **Save**.
- 

## Configure Standard ACL Objects

Use standard ACL objects when you want to match traffic based on destination IPv4 address only. Otherwise, use extended ACLs.

### Procedure

---

- Step 1** Select **Objects > Object Management** and choose **Objects > Object Management > Access List > Standard** from the table of contents.
- Step 2** Do one of the following:
- Click **Add Standard Access List** to create a new object.
  - Click **Edit** (✎) to edit an existing object.
- Step 3** In the New Standard Access List Object dialog box, enter a name for the object (no spaces allowed), and configure the access control entries:
- Do one of the following:
    - Click **Add** to create a new entry.
    - Click **Edit** (✎) to edit an existing entry.
  - For each access control entry, configure the following properties:
    - **Action**—Whether to Allow (match) or Block (not match) the traffic criteria.
    - **Network**—Add the IPv4 network objects or groups that identify the destination of the traffic.
  - Click **Add** to add the entry to the object.
  - If necessary, click and drag the entry to move it up or down in the rule order to the desired location.
- Repeat the process to create or edit additional entries in the object.
- Step 4** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 5** Click **Save**.
-

# Address Pools

You can configure IP address pools for both IPv4 and IPv6 that can be used for clustering or for VPN remote access profiles.

## Procedure

- 
- Step 1** Select **Objects > Object Management > Address Pools**.
- Step 2** Click **IPv4 Pools** and then **Add IPv4 Pools**, and configure the following fields.
- **Name**—Enter the name of the address pool. It can be up to 64 characters
  - **Description**—Add an optional description for this pool.
  - **IP Address**—Enter a range of addresses available in the pool. Use dotted decimal notation and a dash between the beginning and the end address, for example: 10.10.147.100-10.10.147.177.
  - **Mask**—Identifies the subnet on which this IP address pool resides.
  - **Allow Overrides**—Check this check box to enable object overrides. Click the expand arrow to show the **Overrides** table. You can add a new override by clicking **Add**. See [Object Overrides, on page 1243](#) for more information.
- Step 3** Click **Save**.
- Step 4** Click **IPv6 Pools** and then **Add IPv6 Pools**, and configure the following fields.
- **Name**—Enter the name of the address pool. It can be up to 64 characters
  - **Description**—Add an optional description for this pool.
  - **IPv6 Address**—Enter the first IP address available in the configured pool and the prefix length in bits. For example: 2001:DB8::1/64.
  - **Number of Addresses**—Identifies the number of IPv6 addresses, starting at the Starting IP Address, that are in the pool.
  - **Allow Overrides**—Check this check box to enable overrides. Click the expand arrow to show the **Overrides** table. You can add a new override by clicking **Add**. See [Object Overrides, on page 1243](#) for more information.
- Step 5** Click **Save**.
- 

# Application Filters

System-provided application filters help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. In the object manager, you can create and manage reusable user-defined application filters based on combinations of the system-provided

filters, or on custom combinations of applications. For detailed information, see [Application Rule Conditions, on page 821](#).

## AS Path

An AS Path is a mandatory attribute to set up BGP. It is a sequence of AS numbers through which a network can be accessed. An AS-PATH is a sequence of intermediate AS numbers between source and destination routers that form a directed route for packets to travel. Neighboring autonomous systems (ASes ) use BGP to exchange and update messages about how to reach different AS prefixes. After each router makes a new local decision on the best route to a destination, it will send that route, or path information, along with the accompanying distance metrics and path attributes, to each of its peers. As this information travels through the network, each router along the path prepends its unique AS number to a list of ASes in the BGP message. This list is the route's AS-PATH. An AS-PATH along with an AS prefix, provides a specific handle for a one-way transit route through the network. Use the [Configure AS Path](#) page to create, copy and edit autonomous system (AS) path policy objects. You can create AS path objects to use when you are configuring route maps, policy maps, or BGP Neighbor Filtering. An AS path filter allows you to filter the routing update message by using regular expressions.

You can use this object with Firewall Threat Defense devices.

### Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **AS Path** from the table of contents.
  - Step 2** Click **Add AS Path**.
  - Step 3** Enter a name for the AS Path object in the **Name** field. Valid values are between 1 and 500.
  - Step 4** Click **Add** on the **New AS Path Object** window.
    - a) Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
    - b) Specify the regular expression that defines the AS path filter in the **Regular Expression** field.
    - c) Click **Add**.
  - Step 5** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
  - Step 6** Click **Save**.
- 

## BFD Template

The BFD template specifies a set of BFD interval values. BFD interval values as configured in the BFD template are not specific to a single interface. You can also configure authentication for single-hop and multi-hop sessions. Echo mode is disabled by default. You can enable Echo mode on single-hop only.

### Procedure

- 
- Step 1** Choose **Objects > Object Management > BFD Template**.

**Step 2** Click **Add BFD Template** or **Edit**.

**Note**

If you are editing a template, you cannot modify its name and type.

**Step 3** On the **Template** tab, configure the following:

- **Template Name**—The name of this BFD template. You must assign a name in order to configure the rest of the parameters in the template. The template name cannot have spaces and cannot have only numbers.
- **Type**—Click the **Single-Hop** or **Multi-Hop** radio button.
- **Enable Echo**—(Optional) Enables Echo for the single-hop template.

If the Echo function is not negotiated, BFD control packets are sent at a high rate to meet the detection time. If the Echo function is negotiated, BFD control packets are sent at a slower, negotiated rate and self-directed echo packets are sent at a high rate. We recommend that you use Echo mode, if possible.

**Step 4** On the **Interval** tab, configure the following:

- a) From the **Interval Type** drop-down list, select **Microseconds** or **Milliseconds**.
- b) In the **Multiplier** field, enter the value to be used for computing the hold down time. This value indicates the number of consecutive BFD control packets that must be missed from a BFD peer before BFD declares that the peer is unavailable and the Layer 3 BFD peer is informed of the failure. The range is 3 to 50. The default is 3.
- c) In the **Minimum Transmit** field, enter the minimum transmit interval capability. The range is 50 to 999 milliseconds or 50000 to 999000 microseconds.
- d) In the **Minimum Receive** field, enter the minimum receive interval capability. The range is 50 to 999 milliseconds or 50000 to 999000 microseconds.

**Step 5** On the **Authentication** tab, configure the following:

- **Authentication Type**—Select **NONE**, **md5**, **meticulous-sha-1**, **meticulous-md5**, or **sha-1** from the drop-down list.
- **Encrypted Password**—(Optional) Enables encryption of the authentication password.
- **Password**—The authentication password that must be sent and received in the packets using the routing protocol being authenticated. The valid value is a string containing 1 to 29 uppercase and lowercase alphanumeric characters, except that the first character CANNOT be a digit or a digit followed by a whitespace. For example, '1password' or '0 password' is invalid.
- **Key ID**—The shared key ID that matches the key value. The range is 0 to 255.

**Step 6** Click **OK**.

**Step 7** Click **Apply** to save the BFD template configuration.

## Cipher Suite List

A cipher suite list is an object comprised of several cipher suites. Each predefined cipher suite value represents a cipher suite used to negotiate an SSL- or TLS-encrypted session. You can use cipher suites and cipher suite

lists in SSL rules to control encrypted traffic based on whether the client and server negotiated the SSL session using that cipher suite. If you add a cipher suite list to an SSL rule, SSL sessions negotiated with any of the cipher suites in the list match the rule.

**Note** Although you can use cipher suites in the web interface in the same places as cipher suite lists, you cannot add, modify, or delete cipher suites.

## Creating Cipher Suite Lists

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Cipher Suite List** from the list of object types.
- Step 3** Click **Add Cipher Suites**.
- Step 4** Enter a **Name**.
- Step 5** Choose one or more cipher suites from the **Available Ciphers** list.
- Step 6** Click **Add**.
- Step 7** Optionally, click **Delete** (  ) next to any cipher suites in the **Selected Ciphers** list that you want to remove.
- Step 8** Click **Save**.

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Community List

A Community is an optional transitive BGP attribute. A community is a group of destinations that share some common attribute. It is used for route tagging. The BGP community attribute is a numerical value that can be assigned to a specific prefix and advertised to other neighbors. Communities can be used to mark a set of prefixes that share a common attribute. Upstream providers can use these markers to apply a common routing policy such as filtering or assigning a specific local preference or modifying other attributes. Use the Configure Community Lists page to create, copy and edit community list policy objects. You can create community list objects to use when you are configuring route maps or policy maps. You can use community lists to create groups of communities to use in a match clause of a route map. The community list is an ordered list of matching statements. Destinations are matched against the rules until a match is found.

You can use this object with Firewall Threat Defense devices.

## Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **Community List** from the table of contents.
- Step 2** Click **Add Community List**.
- Step 3** In the **Name** field, specify a name for the community list object.
- Step 4** Click **Add** on the **New Community List Object** window.
- Step 5** Select the **Standard** radio button to indicate the community rule type.
- Standard community lists are used to specify well-known communities and community numbers.
- Note**  
You cannot have entries using Standard and entries using Expanded community rule types in the same Community List object.
- Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
  - In the **Communities** field, specify a community number. Valid values can be from 1 to 4294967295 or from 0:1 to 65534:65535.
  - Select the appropriate **Route Type**.
    - Internet** — Select to specify the Internet well-known community. Routes with this community are advertised to all peers (internal and external).
    - No Advertise** — Select to specify the no-advertise well-known community. Routes with this community are not advertised to any peer (internal or external).
    - No Export** — Select to specify the no-export well-known community. Routes with this community are advertised to only peers in the same autonomous system or to only other sub-autonomous systems within a confederation. These routes are not advertised to external peers.
- Step 6** Select the **Expanded** radio button to indicate the community rule type.
- Expanded community lists are used to filter communities using a regular expression. Regular expressions are used to specify patterns to match COMMUNITIES attributes.
- Select the Allow or Block options from the **Action** drop-down list to indicate redistribution access.
  - Specify the regular expression in the **Expressions** field.
- Step 7** Click **Add**.
- Step 8** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 9** Click **Save**.
- 

## Extended Community

An extended community is a larger group of destinations that share some common attribute. The BGP extended community list has attributes that can be used to mark a set of prefixes that share a common attribute. These markers are used in the match clause of a route map to filter the routes for implementing route leaks among virtual routers. You can also define policy list objects with the extended community list for filtering. The extended community list is an ordered list of matching statements. Routes are matched against the rules until

a match is found with the specified route target (standard) or regular expression (expanded). Use the Extended Community page to create and edit extended community list policy objects.

**Note** The extended community lists are applicable only for configuring import or export of routes.

You can use this object with Firewall Threat Defense devices.

## Procedure

**Step 1** Select **Objects > Object Management** and choose **Community List > Extended Community** from the table of contents.

**Step 2** Click **Add Extended Community List**.

**Step 3** In the **Name** field, specify a name for the extended community list object. The length of the name cannot exceed 80 characters.

**Step 4** Select the extended community rule type:

- Click the **Standard** radio button to specify one or more route targets.
- Click the **Expanded** radio button to specify regular expressions.

### Note

You cannot have entries using Standard and Expanded extended community rule type in the same Extended Community List object.

**Step 5** Click **Add**.

**Step 6** If you have selected **Standard** as the extended community rule type, specify the following:

a) In the **Sequence No** field, enter the order in which you want the rule to be executed.

The sequence number must be unique in the list.

b) From the **Action** drop-down list, if you want to permit routes that have matching route target that is specified here, select **Allow**; if you want to deny routes that have matching route target that is specified here, select **Block**.

c) In the **Route Target** field, specify a route target.

- You can add a single route target or a set of route targets separated by commas in a single entry. For example, *1:2,1:4,1:6*.
- Valid values can be from 1:1 to 65534:65535.
- You can have a maximum of 8 route targets in an entry.
- You cannot have redundant route target set across multiple entries. For example, say you want to configure *seq1* with *1:200,100:100,1:300* route targets, and *seq2* with *1:300,100:100,1:200* route targets. This results in redundant route target set and cannot be deployed.

**Step 7** If you have selected **Expanded** as the extended community rule type, specify the following:

a) In the **Sequence No** field, enter the order in which you want the rule to be executed.

The sequence number must be unique in the list.

- b) From the **Action** drop-down list, if you want to permit routes that have matching regular expression that is specified here, select **Allow**; if you want to deny routes that have matching regular expression that is specified here, select **Block**.
- c) Specify the regular expression in the **Expressions** field.
  - You can add a single route target or a set of route targets separated by a space in a single entry. For example, `^((16) / (18)):(.)$`.
  - You can add a maximum of 16 regular expressions to an entry.
  - You cannot have redundant regular expression set across multiple entries. For example, say you want to configure *seq1* with `^((16) / (18)):(.)$ ^4_[0-9]*$` route targets, and *seq2* with `^4_[0-9]*$ ^((16) / (18)):(.)$` route targets. This results in redundant regular expression set and cannot be deployed.

For details on BGP regular expressions, see [here](#).

**Step 8** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).

**Step 9** Click **Save**.

---

The extended community list can be referenced in the match clause of the Route Map object or Policy List object:

- In the Route Map object, the name of the extended community list is displayed in the **Add Route Map Entry > Match Clause > BGP > Community List > Add Extended Community List** dialog. For more details on configuring BGP settings in a route map, see [Route Map, on page 1306](#).
- In the Policy List object, the name of the extended community list is displayed in the **Add Policy List > Community Rule > Add Extended Community List** dialog. For more details on configuring BGP settings in a policy list, see [Policy List, on page 1301](#).

## DHCP IPv6 Pool

For clients that use Stateless Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature ([Enable the IPv6 Prefix Delegation Client, on page 750](#)), you can configure the Firewall Threat Defense to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the Firewall Threat Defense by defining a DHCP IPv6 Pool and assigning it to the DHCPv6 server. The Firewall Threat Defense only accepts IR packets and does not assign addresses to the clients. You will configure the client to generate its own IPv6 address by enabling IPv6 autoconfiguration on the client. Enabling stateless autoconfiguration on a client configures IPv6 addresses based on prefixes received in Router Advertisement messages; in other words, based on the prefix that the Firewall Threat Defense received using Prefix Delegation.

To add a pool, see [Create the DHCP IPv6 Pool, on page 796](#).

## Distinguished Name

Each distinguished name object represents the [distinguished name](#) for a public key certificate's subject or issuer. You can use distinguished name objects and groups in TLS/SSL rules to control encrypted traffic based

on whether the client and server negotiated the TLS/SSL session using a server certificate with the distinguished name as subject or issuer.

(A *distinguished name group* is a named collection of existing distinguished name objects.)

The distinguished name can consist of country code, common name, organization, and organizational unit, but typically consists of a common name only. For example, the common name in the certificate for `https://www.cisco.com` is `cisco.com`. (However, it's not always this simple; [Distinguished Name \(DN\) Rule Conditions, on page 2192](#) shows how to find common names.) The certificate can contain multiple Subject Alternative Names (SANs) you can use as DNs in a rule condition. For detailed information about SANs, see [RFC 5280, section 4.2.1.6](#).

The format of a distinguished name object that references a common name is `CN=name`. If you add a DN rule condition without `CN=`, the system prepends `CN=` before saving the object.

As discussed further in [Distinguished Name \(DN\) Rule Conditions, on page 2192](#), the system uses [Server Name Indication \(SNI\)](#) to match the DN in the TLS/SSL rule whenever possible.

You can also add a distinguished name with one of each of the attributes listed in the following table, separated by commas.

**Table 70: Distinguished name attributes**

Attribute	Description	Allowed Values
C	Country Code	two alphabetic characters
CN	Common Name	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces
O	Organization	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces
OU	Organizational Unit	up to 64 alphanumeric, backslash (/), hyphen (-), quotation ("), or asterisk (*) characters, or spaces

### Important notes about DN rule conditions

- The first time the system detects an encrypted session to a new server, DN data is not available for ClientHello processing, which *might* result in an undecrypted first session.

If the server requests TLS 1.3, the setting for TLS server identity discovery can help by making sure the server certificate is known before making decryption policy decisions. For more information, see [Access Control Policy Advanced Settings, on page 1626](#).

- You *cannot* configure a distinguished name condition if you also choose the **Decrypt - Known Key** action. Because that action requires you to choose a server certificate to decrypt traffic, the certificate already matches the traffic.

### Wildcard examples

You can define one or more asterisks (\*) as wildcards in an attribute. In a common name attribute, you can define one or more asterisks per domain name label. wildcards match only in that label, but you can define multiple labels with wildcards. See the following table for examples.

Table 71: Common Name attribute wildcard examples

Attribute	Matches	Does Not Match
CN=*ample.com	example.com	mail.example.com example.text.com ampleexam.com
CN=exam*.com	example.com	mail.example.com example.text.com ampleexam.com
CN=*xamp*.com	example.com	mail.example.com example.text.com ampleexam.com
CN=*.example.com	mail.example.com	www.myhost.example.com example.com example.text.com ampleexam.com

**Note** The DN object CN=amp.cisco.com would *not* match a CN like CN=auth.amp.cisco.com, which is why we recommend wildcards in these cases.

For more information and examples, see [Distinguished Name \(DN\) Rule Conditions](#), on page 2192.

#### Related Topics

[Distinguished Name \(DN\) Rule Conditions](#), on page 2192

## Creating Distinguished Name Objects

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Distinguished Name** node, and choose **Individual Objects**.
- Step 3** Click **Add Distinguished Name**.
- Step 4** Enter a **Name**.
- Step 5** In the **DN** field, enter a value for the distinguished name or common name. You have the following options:
  - If you add a distinguished name, you can include one of each attribute listed in [Distinguished Name](#), on page 1261 separated by commas.
  - If you add a common name, you can include multiple labels and wild cards.

**Step 6** Click **Save**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## DNS Server Group

Domain Name System (DNS) servers resolve fully-qualified domain names (FQDN), such as `www.example.com`, to IP addresses.

### Creating DNS Server Group Objects

#### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Click **DNS Server Group** from the network objects list.
- Step 3** Click **Add DNS Server Group**.
- Step 4** Enter a **Name**.
- Step 5** Optionally, enter the **Default Domain** that will be used to append to the host names that are not fully-qualified. This setting is only used for the default server group.
- Step 6** The default **Timeout** and **Retries** values are pre-populated. Change these values if necessary.
- Retries—The number of times, from 0 to 10, to retry the list of DNS servers when the system does not receive a response. The default is 2.
  - Timeout—The number of seconds, from 1 to 30, to wait before trying the next DNS server. The default is 2 seconds. Each time the system retries the list of servers, this timeout doubles.
- Step 7** Enter the **DNS Servers** that will be a part of this group, either in IPv4 or IPv6 format as comma separated entries.
- A maximum of 6 DNS servers can belong to one group.
- Step 8** Click **Save**.
- 

#### What to do next

The DNS servers configured in the DNS server group should be assigned to interface objects in the DNS platform settings. For more information, see [DNS, on page 831](#).

# External Attributes

## Dynamic Objects

A *dynamic object* is an object that specifies one or many IP addresses retrieved either using REST API calls or using the Cisco Secure Dynamic Attributes Connector, which is capable of updating IP addresses from cloud sources. These dynamic objects can be used in access control rules without the need to deploy dynamic changes to the objects.

**Note** Unlike most other objects, dynamic objects do not have to be deployed to managed devices to take effect. Just add dynamic objects to the **Dynamic Attributes** tab of the rule and then deploy the rule; the object values are automatically updated on the managed device as soon as possible after being pushed by the Cisco Secure Dynamic Attributes Connector.

There are the following kinds of dynamic objects:

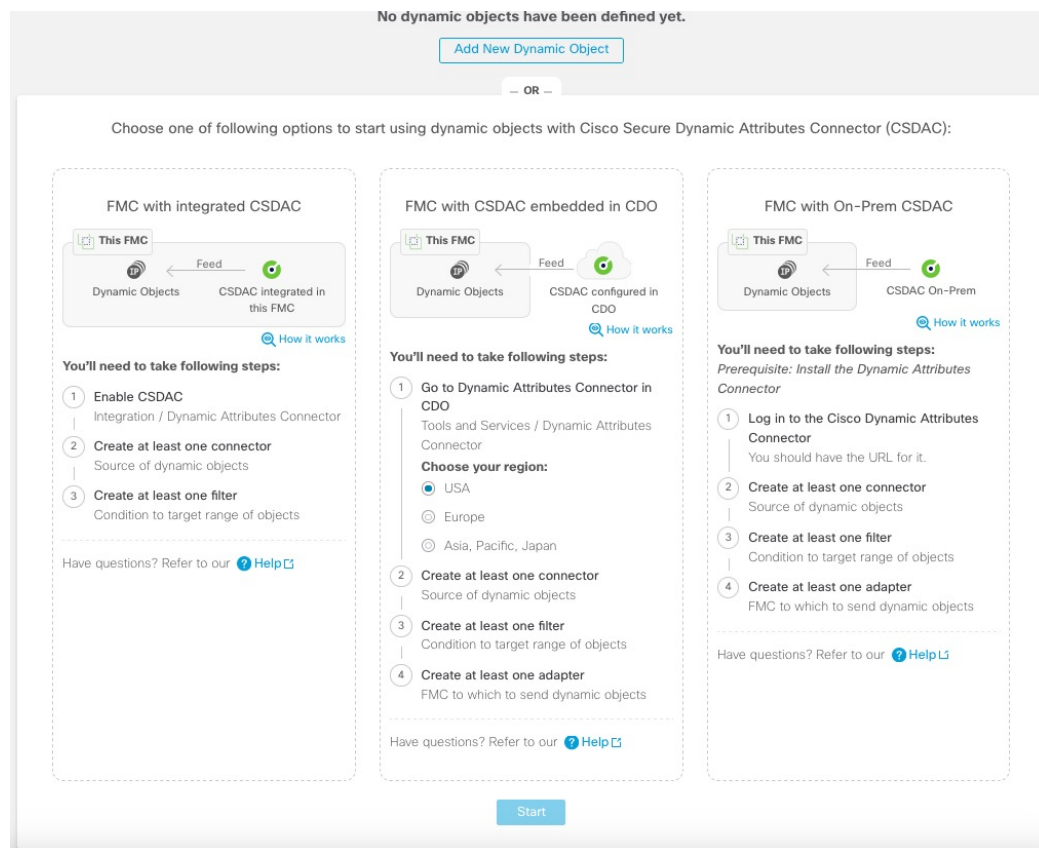

- Dynamic objects created using the dynamic attributes connector are pushed to the Firewall Management Center as soon as they're created and are updated at a regular interval.
- API-created dynamic objects:
  - Are IP addresses, with or without or classless inter-domain routing (CIDR), that can be used in access control rules much like a network object.
  - Do not support fully-qualified domain names or address ranges.
  - Must be updated using an API.

For more information about API-created dynamic objects, see [About API-Created Dynamic Objects, on page 1270](#).

## Create Dynamic Objects for the First Time

The page available at **Objects > Object Management > External Attributes > Dynamic Object** is displayed as follows if you have not configured any dynamic objects yet.

If you have already created some dynamic objects, see [Work With Dynamic Objects, on page 1269](#).

To use this page:

- Click the section that represents how you plan to deploy the dynamic attributes connector.
- Click **How it works** to see a diagram and get more help with that type of deployment.

The following topics provide more information.

- [Create Dynamic Objects with the Embedded Cisco Secure Dynamic Attributes Connector, on page 1267](#)
- [Create Dynamic Objects with Cisco Defense Orchestrator, on page 1268](#)
- [Create Dynamic Objects with the On-Premises Cisco Secure Dynamic Attributes Connector, on page 1269](#)
- Click **Start** to open the relevant application as follows:
  - If you clicked the **FMC with Integrated CSDAC** method, **Start** takes you to **Objects > Object Management > External Attributes > Dynamic Object** where you can enable and configure the Cisco Secure Dynamic Attributes Connector.

For more information, see [Enable the Cisco Secure Dynamic Attributes Connector, on page 1674](#).

- If you clicked the **FMC with CSDAC embedded in CDO** method, **Start** starts Cisco Defense Orchestrator.

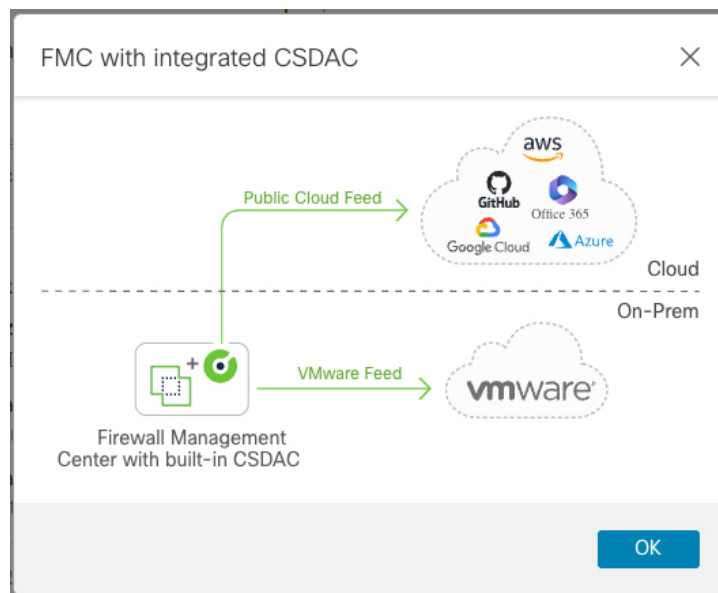

For more information, see the guide titled [Managing Firewall Threat Defense with Cloud-delivered Firewall Management Center in Cisco Defense Orchestrator](#).

- If you clicked the **FMC with On-Prem CSDAC** method, **Start** enables you to download the Cisco Secure Dynamic Attributes Connector if you have not done so already.

For more information, see the [Cisco Secure Dynamic Attributes Connector Configuration Guide](#).

## Create Dynamic Objects with the Embedded Cisco Secure Dynamic Attributes Connector

The following page is displayed if you indicated you're configuring the Cisco Secure Dynamic Attributes Connector provided with this Secure Firewall Management Center. This Secure Firewall Management Center already has the Cisco Secure Dynamic Attributes Connector integrated with it (**Integration** > **Dynamic Attributes Connector**).

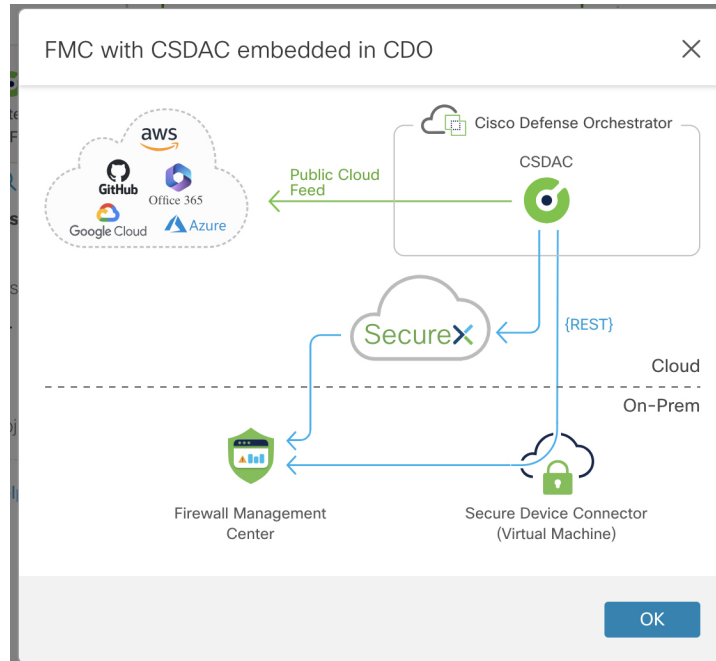

To use this type of deployment:

1. Enable the Cisco Secure Dynamic Attributes Connector as discussed in [Enable the Cisco Secure Dynamic Attributes Connector, on page 1674](#).
2. Configure connectors, which retrieve IP addresses from cloud services.  
For more information, see [Create a Connector, on page 1684](#).
3. Configure dynamic attributes filters, which determine what IP addresses to send to the management center.  
For more information, see [Create Dynamic Attributes Filters, on page 1702](#).
4. View your dynamic objects at **Objects > Object Management > External Attributes > Dynamic Object**.
5. Use dynamic objects in access control rules (**Policies > Access Control heading > Access Control**, then click the **Dynamic Attributes** tab).

## Create Dynamic Objects with Cisco Defense Orchestrator

The following page is displayed if you indicated you're configuring the Cisco Secure Dynamic Attributes Connector provided with Cisco Defense Orchestrator.

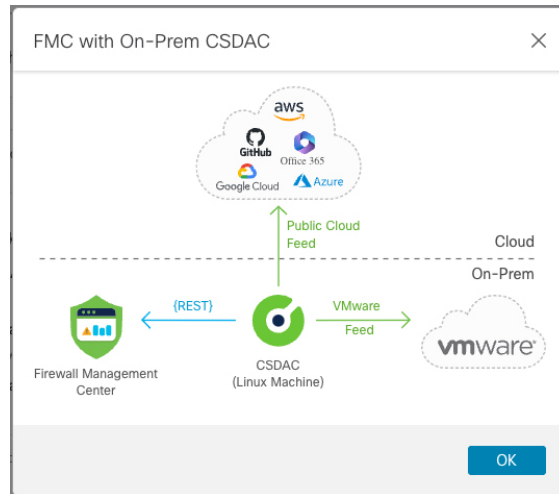

The preceding diagram has details about configuring Cisco Defense Orchestrator that are not discussed in this guide. For more detailed information, see [Secure Device Connector \(SDC\)](#) or [SecureX and CDO](#).

To use this type of deployment:

1. Configure connectors, which retrieve IP addresses from cloud services.  
For more information, see [Create a Connector](#), on page 1684.
2. Configure dynamic attributes filters, which determine what IP addresses to send to the management center.  
For more information, see [Create Dynamic Attributes Filters](#), on page 1702.
3. Configure adapters, which send IP addresses to a Secure Firewall Management Center or Cloud-Delivered Firewall Management Center.  
For more information, see the section on creating adapters in the [Managing Firewall Threat Defense with Cloud-Delivered Firewall Management Center in Cisco Defense Orchestrator](#).
4. Log in to the Secure Firewall Management Center you defined as an adapter.  
If the Secure Firewall Management Center is managed by Cisco Defense Orchestrator, click and choose **Cloud-Delivered FMC**.
5. View your dynamic objects at **Objects > Object Management > External Attributes > Dynamic Object**.
6. Use dynamic objects in access control rules (**Policies > Access Control heading > Access Control**, then click the **Dynamic Attributes** tab).

## Create Dynamic Objects with the On-Premises Cisco Secure Dynamic Attributes Connector

The following page is displayed if you indicated you're configuring the on-premises Cisco Secure Dynamic Attributes Connector to send dynamic objects to a Secure Firewall Management Center or Cloud-Delivered Firewall Management Center.

To use this type of deployment:

1. Install the Cisco Secure Dynamic Attributes Connector on a supported Linux virtual machine.
2. Configure connectors, which retrieve IP addresses from cloud services.  
For more information, see the section on creating connectors in the [Cisco Secure Dynamic Attributes Connector Configuration Guide](#).
3. Configure adapters, which send IP addresses to a Secure Firewall Management Center or Cloud-Delivered Firewall Management Center.  
For more information, see the section on creating adapters in the [Cisco Secure Dynamic Attributes Connector Configuration Guide](#).
4. Configure dynamic attributes filters, which determine what IP addresses to send to the management center.  
For more information, see the section on configuring dynamic attributes filters in the [Cisco Secure Dynamic Attributes Connector Configuration Guide](#).
5. View your dynamic objects at **Objects > Object Management > External Attributes > Dynamic Object**.
6. Use dynamic objects in access control rules (**Policies > Access Control heading > Access Control**, then click the **Dynamic Attributes** tab).

For more information, see the [Cisco Secure Dynamic Attributes Connector Configuration Guide](#).

## Work With Dynamic Objects

The page available at **Objects > Object Management > External Attributes > Dynamic Object** is displayed similar to the following if you have already configured some dynamic objects.

Name	Description	Last Updated	Number of Mapped IPs
o365_Common		21 Jun 23 09:44 AM	34
o365_Exchange		21 Jun 23 09:44 AM	34
o365_SharePoint		21 Jun 23 09:44 AM	9
o365_Skype		21 Jun 23 09:44 AM	12

This page displays information about each dynamic object and enables you to view or download IP addresses associated with that object. For more information, see [Dynamic Object Mappings, on page 1270](#).

## Dynamic Object Mappings

If you configured dynamic objects either using the API or using the dynamic attributes connector, your connectors send IPs matching dynamic attributes filters to the Firewall Management Center at regular intervals.

To view or download a current list of these IP addresses, click **Show Mapped IDs** as the following figure shows.

Name	Description	Last Updated	Number of Mapped IPs
o365_Common		06 Mar 23 08:2...	50
o365_Exchange		06 Mar 23 08:2...	34
o365_SharePoint		06 Mar 23 08:2...	9
o365_Skype		06 Mar 23 08:2...	12

IP addresses are added dynamically with time so you should consider doing this on a regular basis, especially if your access control rules are not behaving as expected.

### Related topics

- [About API-Created Dynamic Objects, on page 1270](#)
- [About the Cisco Secure Dynamic Attributes Connector, on page 1671](#)

## About API-Created Dynamic Objects

A *dynamic object* is an object that specifies one or many IP addresses retrieved either using REST API calls or using the Cisco Secure Dynamic Attributes Connector, which is capable of updating IP addresses from cloud sources. These dynamic objects can be used in access control rules without the need to deploy dynamic changes to the objects.

For more information about the dynamic attributes connector, see the *Cisco Secure Dynamic Attributes Configuration Guide* ([link to guide](#)).

Differences between dynamic objects and network objects follow:

- Dynamic objects created using the dynamic attributes connector are pushed to the Firewall Management Center as soon as they're created and are updated at a regular interval.
- API-created dynamic objects:
  - Are IP addresses, with or without or classless inter-domain routing (CIDR), that can be used in access control rules much like a network object.
  - Do not support fully-qualified domain names or address ranges.

- Must be updated using an API.

### Related Topics

[Add or Edit an API-Created Dynamic Object](#), on page 1271

## Add or Edit an API-Created Dynamic Object

This procedure discusses how to add or edit a *dynamic object*, which is a group of IP addresses using the API, with or without or classless inter-domain routing (*CIDR*), that can be used in access control rules much like a network object.

**Note** This procedure is not necessary if you use the Cisco Secure Dynamic Attributes Connector because it automatically creates dynamic objects for you.

### Before you begin

Consult the *Firepower Management Center REST API Quick Start Guide* for information about using the object services REST API to populate the IP object with an address. Dynamic objects do not require deployment.

### Procedure

- Step 1** Click **Objects > Object Management**.
- Step 2** Click **External Attributes > Dynamic Objects**.
- Step 3** Click **Add Dynamic Object** or **Edit** (.
- Step 4** Enter a **Name** for the object and an optional **Description**.
- Step 5** From the **Type** list, click **IP**.

### What to do next

If necessary, update the dynamic object using the API. Deployment is not required.

## Security Group Tag

A Security Group Tag (SGT) object specifies a single SGT value. You can use SGT objects in rules to control traffic with SGT attributes that were **not** assigned by Cisco ISE. You cannot group or override SGT objects.

### Related Topics

[Autotransition from Custom SGTs to ISE SGTs](#)  
[Custom SGT Conditions](#)  
[ISE SGT vs Custom SGT Rule Conditions](#)

## Creating Security Group Tag Objects

You can create these objects in the global domain only. To use the object on Classic devices, you must have the Control license. For Smart Licensed devices, any license will do.

### Before you begin

- Disable ISE/ISE-PIC connections. You cannot create custom SGT objects if you use ISE/ISE-PIC as an identity source.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Click <b>Objects &gt; Object Management</b> .              |
| <b>Step 2</b> | Click <b>External Attributes &gt; Security Group Tag</b> . |
| <b>Step 3</b> | Click <b>Add Security Group Tag</b> .                      |
| <b>Step 4</b> | Enter a <b>Name</b> .                                      |
| <b>Step 5</b> | Optionally, enter a <b>Description</b> .                   |
| <b>Step 6</b> | In the <b>Tag</b> field, enter a single SGT.               |
| <b>Step 7</b> | Click <b>Save</b> .  |
- 

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## File List

If you use malware defense, and the AMP cloud incorrectly identifies a file's disposition, you can add the file to a *file list* to better detect the file in the future. These files are specified using SHA-256 hash values. Each file list can contain up to 10000 unique SHA-256 values.

There are two predefined categories of file lists:

### Clean List

If you add a file to this list, the system treats it as if the AMP cloud assigned a clean disposition.

### Custom Detection List

If you add a file to this list, the system treats it as if the AMP cloud assigned a malware disposition.

Because you manually specify the blocking behavior for the files included in these lists, the system does not query the AMP cloud for these files' dispositions. You must configure a rule in the file policy with either a **Malware Cloud Lookup** or **Block Malware** action and a matching file type to calculate a file's SHA value.

**Caution**

Do **not** include malware on the clean list. The clean list overrides both the AMP cloud and the custom detection list.

## Source Files for File Lists

You can add multiple SHA-256 values to a file list by uploading a comma-separated value (CSV) source file containing a list of SHA-256 values and descriptions. The Firewall Management Center validates the contents and populates the file list with valid SHA-256 values.

The source file must be a simple text file with a .csv file name extension. Any header must start with a pound sign (#); it is treated as a comment and not uploaded. Each entry should contain a single SHA-256 value followed by a description and end with either the LF or CR+LF Newline character. The system ignores any additional information in the entry.

Note the following:

- Deleting a source file from the file list also removes all associated SHA-256 hashes from the file list.
- You cannot upload multiple files to a file list if the successful source file upload results in the file list containing more than 10000 distinct SHA-256 values.
- The system truncates descriptions exceeding 256 characters to the first 256 characters on upload. If the description contains commas, you must use an escape character (\,). If no description is included, the source file name is used instead.
- All non-duplicate SHA-256 values are added to the file list. If a file list contains a SHA-256 value, and you upload a source file containing that value, the newly uploaded value does not modify the existing SHA-256 value. When viewing captured files, file events, or malware events related to the SHA-256 value, any threat name or description is derived from the individual SHA-256 value.
- The system does not upload invalid SHA-256 values in a source file.
- If multiple uploaded source files contain an entry for the same SHA-256 value, the system uses the most recent value.
- If a source file contains multiple entries for the same SHA-256 value, the system uses the last one.
- You cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.
- The number of entries associated with a source file refers to the number of distinct SHA-256 values. If you delete a source file from a file list, the total number of SHA-256 entries the file list contains decreases by the number of valid entries in the source file.

## Adding Individual SHA-256 Values to File Lists

You must have the Malware Defense license for this procedure.

You can submit a file's SHA-256 value to add it to a file list. You cannot add duplicate SHA-256 values.

**Before you begin**

- Right-click a file or malware event from the event view, choose **Show Full Text** in the context menu, and copy the full SHA-256 value for pasting into the file list.

**Procedure**

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **File List** from the list of object types.
- Step 3** Click **Edit** (✎) next to the clean list or custom detection list where you want to add a file.
- If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
- Step 4** Choose `Enter SHA Value` from the **Add by** drop-down list.
- Step 5** Enter a description of the source file in the **Description** field.
- Step 6** Enter or paste the file's entire value in the **SHA-256** field. The system does not support matching partial values.
- Step 7** Click **Add**.
- Step 8** Click **Save**.
- 

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

---

**Note** After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

---

## Uploading Individual Files to File Lists

You must have the Malware Defense license for this procedure.

If you have a copy of the file you want to add to a file list, you can upload the file to the Secure Firewall Management Center for analysis; the system calculates the file's SHA-256 value and adds the file to the list. The system does not enforce a limit on the size of files for SHA-256 calculation.

**Procedure**

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **File List** from the list of object types.
- Step 3** Click **Edit** (✎) next to the clean list or custom detection list where you want to add a file.

If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

- Step 4** From the **Add by** drop-down list, choose **Calculate SHA**.
- Step 5** Optionally, enter a description of the file in the **Description** field. If you do not enter a description, the file name is used for the description on upload.
- Step 6** Click **Browse**, and choose a file to upload.
- Step 7** Click **Calculate and Add SHA**.
- Step 8** Click **Save**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

---

**Note** After you deploy configuration changes, the system no longer queries the AMP cloud for files on the list.

---

## Uploading Source Files to File Lists

You must have the Malware Defense license for this procedure.

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
  - Step 2** Click **File List**.
  - Step 3** Click **Edit** (✎) next to the file list where you want to add values from a source file.  
  
If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
  - Step 4** In the **Add by** drop-down list, choose `List of SHAs`.
  - Step 5** Optionally, enter a description of the source file in the **Description** field. If you do not enter a description, the system uses the file name.
  - Step 6** Click **Browse** to browse to the source file, then click **Upload and Add List**.
  - Step 7** Click **Save**.
- 

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

---

**Note** After you deploy the policies, the system no longer queries the AMP cloud for files on the list.

---

## Editing SHA-256 Values in File Lists

You must have the Malware Defense license for this procedure.

You can edit or delete individual SHA-256 values on a file list. Note that you cannot directly edit a source file within the object manager. To make changes, you must first modify your source file directly, delete the copy on the system, then upload the modified source file.

### Procedure

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Click **File List**.

**Step 3** Click **Edit** (✎) next to the clean list or custom detection list where you want to modify a file.

If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** You can:

- Click **Edit** (✎) next to the SHA-256 value you want to change, and modify the **SHA-256** or **Description** values as desired.
- Click **Delete** (🗑) next to the SHA-256 value you want to delete.

**Step 5** Click **Save** to update the file entry in the list.

**Step 6** Click **Save** to save the file list.

---

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

---

**Note** After configuration changes are deployed, the system no longer queries the AMP cloud for files on the list.

---

## Downloading Source Files from File Lists

You must have the Malware Defense license for this procedure.

## Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **File List** from the list of object types.
- Step 3** Click **Edit** (✎) next to the clean list or custom detection list where you want to download a source file.
- If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
- Step 4** Next to the source file you want to download, click **View** (👁).
- Step 5** Click **Download SHA List** and follow the prompts to save the source file.
- Step 6** Click **Close**.
- 

# FlexConfig

Use FlexConfig policy objects in FlexConfig policies to provide customized configuration of features on Firewall Threat Defense devices that you cannot otherwise configure using Secure Firewall Management Center. For more information on FlexConfig policies, see [FlexConfig Policy Overview, on page 2477](#).

You can configure the following types of objects for FlexConfig.

## Text Objects

Text objects define free-form text strings that you use as variables in a FlexConfig object. These objects can have single values or be a list of multiple values.

There are several predefined text objects that are used in the predefined FlexConfig objects. If you use the associated FlexConfig object, you simply need to edit the contents of the text object to customize how the FlexConfig object configures a given device. When editing a predefined object, it is in general a better option to create device overrides for each device you are configuring, rather than directly change the default values of these objects. This helps avoid unintended consequences if another user wants to use the same FlexConfig object for a different set of devices.

For information on configuring text objects, see [Configure FlexConfig Text Objects, on page 2504](#).

## FlexConfig Objects

FlexConfig Objects include device configuration commands, variables, and scripting language instructions. During configuration deployment, these instructions are processed to create a sequence of configuration commands with customized parameters to configure specific features on the target devices.

These instructions are either configured before (prepended) the system configures features defined in regular Firewall Management Center policies and settings, or after (appended). Any FlexConfig that depends on Secure Firewall Management Center-configured objects (for example, a network object) must be appended to the configuration deployment, or the needed objects would not be configured before the FlexConfig needed to refer to the objects.

For more information on configuring FlexConfig objects, see [Configure FlexConfig Objects, on page 2500](#).

# Geolocation

Each geolocation object you configure represents one or more countries or continents that the system has identified as the source or destination of traffic on your monitored network. You can use geolocation objects in various places in the system's web interface, including access control policies, SSL policies, remote access VPN, and event searches. For example, you could write an access control rule that blocks traffic to or from certain countries.

To ensure that you are using up-to-date information to filter your network traffic, Cisco strongly recommends that you regularly update your Geolocation Database (GeoDB).

## Creating Geolocation Objects

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .  |
| <b>Step 2</b> | Choose <b>Geolocation</b> from the list of object types.  |
| <b>Step 3</b> | Click <b>Add Geolocation</b> .  |
| <b>Step 4</b> | Enter a <b>Name</b> .   |
| <b>Step 5</b> | Check the check boxes for the countries and continents you want to include in your geolocation object. Checking a continent chooses all countries within that continent, as well as any countries that GeoDB updates may add under that continent in the future. Unchecking any country under a continent unchecks the continent. You can choose any combination of countries and continents. |
| <b>Step 6</b> | Click <b>Save</b> .   |
- 

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Interface

Each interface can be assigned to a *security zone* and/or *interface group*. You then apply your security policy based on zones or groups. For example, you can assign the "inside" interface to the "inside" zone; and the "outside" interface to the "outside" zone. You can configure your access control policy to enable traffic to go from inside to outside, but not from outside to inside, for example. Some policies only support security zones, while other policies support zones and groups.

For more information about interface objects, see [Security Zones and Interface Groups, on page 659](#).

To add interface objects, see [Create Security Zone and Interface Group Objects, on page 661](#).

# Key Chain

To enhance data security and protection of devices, rotating keys for authenticating IGP peers that have a duration of 180 days or less is introduced. The rotating keys prevent any malicious user from guessing the keys used for routing protocol authentication and thereby protecting the network from advertising incorrect routes and redirecting traffic. Changing the keys frequently reduces the risk of them eventually being guessed. When configuring authentication for routing protocols that provide key chains, configure the keys in a key chain to have overlapping lifetimes. This helps to prevent loss of key-secured communication due to absence of an active key. The rotating keys are applicable only for OSPFv2 protocol. If the key lifetime expires and no active keys are found, OSPF uses the last valid key to maintain the adjacency with peers.

---

**Note** Only MD5 cryptographic algorithm is used for authentication.

---

## Lifetime of a Key

To maintain stable communications, each device stores key chain authentication keys and uses more than one key for a feature at the same time. Based on the send and accept lifetimes of a key, key chain management provides a secured mechanism to handle key rollover. The device uses the lifetimes of keys to determine which keys in a key chain are active.

Each key in a key chain has two lifetimes:

- Accept lifetime—The time interval within which the device accepts the key during key exchange with another device.
- Send lifetime—The time interval within which the device sends the key during key exchange with another device.

During a key send lifetime, the device sends routing update packets with the key. The device does not accept communication from other devices when the key sent is not within the accept lifetime of the key on the device.

If lifetimes are not configured then it is equivalent to configuring MD5 authentication key without timelines.

## Key Selection

- When key chain has more than one valid key, OSPF selects the key that has the maximum life time.
- Key having an infinite lifetime is preferred.
- If keys have the same lifetime, then key with the higher key ID is preferred.

# Creating Key Chain Objects

## Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .         |
| <b>Step 2</b> | Choose <b>Key Chain</b> from the list of object types. |

**Step 3** Click **Add Key Chain**.

**Step 4** In the Add Key Chain Object dialog box, enter a name for the key chain in the **Name** field.

The name must start with an underscore or alphabet, followed by alphanumeric characters or special characters ( -, \_ , + , . ).

**Step 5** To add a key to the key chain, click **Add**.

**Step 6** Specify the key identifier in the **Key ID** field.

The key id value can be between 0 and 255. Use the value 0 only when you want to signal an invalid key.

**Step 7** The **Algorithm** field and the **Crypto Encryption Type** field displays the supported algorithm and the encryption type, namely MD5 and Plain Text respectively.

**Step 8** Enter the password in the **Crypto Key String** field, and re-enter the password in the **Confirm Crypto Key String** field.

- The password can be of a maximum length of 80 characters.
- The passwords cannot be a single digit nor those starting with a digit followed by a white space. For example, "0 pass" or "1" are invalid.

**Step 9** To set the time interval for a device to accept/send the key during key exchange with another device, provide the lifetime values in the **Accept Lifetime** and **Send Lifetime** fields:

**Note**

The Date Time values default to UTC timezones.

The end time can be the duration, the absolute time when the accept/send lifetime ends, or never expires. The default end time is DateTime.

Following are the validation rules for the start and end values:

- Start lifetime cannot be null when the end lifetime is specified.
- The start lifetime for accept or send lifetime must be earlier than the respective end lifetime.

**Step 10** Click **Add**.

Repeat steps 5 to 10 to create keys. Create a minimum of two keys for a key chain with overlapping lifetimes. This helps to prevent loss of key-secured communication due to absence of an active key.

**Step 11** Manage overrides for the object:

- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 1245](#).

**Step 12** Click **Save**.

---

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Network

A network object represents one or more IP addresses. You can use network objects and groups in various places, including access control policies, network variables, identity rules, network discovery rules, event searches, reports, identity policies, and so on.

When you configure an option that requires a network object, the list is automatically filtered to show only those objects that are valid for the option. For example, some options require host objects, while other options require subnets.

A network object can be one of the following types:

## Host

A single IP address.

IPv4 example:

209.165.200.225

IPv6 example:

2001:DB8::0DB8:800:200C:417A or 2001:DB8:0:0:0DB8:800:200C:417A

## Range

A range of IP addresses.

IPv4 example:

209.165.200.225–209.165.200.250

IPv6 example:

2001:db8:0:cd30::1–2001:db8:0:cd30::1000

## Network

An address block, also known as a subnet.

IPv4 example:

209.165.200.224/27

IPv6 example:

2001:DB8:0:CD30::/60

---

**Note** Security Intelligence ignores IP address blocks using a /0 netmask.

---

## FQDN

A single fully-qualified domain name (FQDN). You can limit FQDN resolution to IPv4 address only, IPv6 address only, or both IPv4 and IPv6 addresses. FQDNs must begin and end with a digit or letter. Only letters, digits, and hyphens are allowed as internal characters in an FQDN.

For example:

www.example.com

**Note** You can use FQDN objects in access control rules and prefilter rules, or manual NAT rules, only. The rules match the IP address obtained for the FQDN through a DNS lookup. To use an FQDN network object, ensure you have configured the DNS server settings in [DNS Server Group, on page 1264](#) and the DNS platform settings in [DNS, on page 831](#).

You *cannot* use FQDN network objects in identity rules.

### Group

A group of network objects or other network object groups. You can create nested groups by adding one network object group to another network object group. You can nest up to 10 levels of groups.

**Note** You can add up to 100 network literals in a network object. Additionally, each nested network object group can contain a maximum of 100 network literals.

## Network Wildcard Mask

You can create and manage wildcard mask objects from the Object Management page.

You can create network objects with expanded subnet IP address. The existing network object is extended to support both Network and Network Wildcard object. The network object using wildcard mask is listed as **Network Wildcard** against the **Type** column in the network object listing page.

A wildcard mask is an IP address that is a discontinuous mask of bits. You can use contiguous masks to create standard network objects and discontinuous masks for wildcard network objects.

Example IP Address	Network Wildcard?	Object Type
192.0.0.0/8	No	Network
10.10.0.0/255.255.0.0	No	Network
10.10.0.10/255.255.0.255	Yes	Network Wildcard
72.0.240.10/255.255.240.255	Yes	Network Wildcard

**Note** Network wildcard object and object group, which contains network wildcard objects, are allowed only while configuring the following policies:

- Prefilter policy
- Access control policy
- NAT policy

### Guidelines and Limitations

- To create network wildcard objects, in the Firewall Management Center UI, choose **Objects > Object Management > Network** and click **Add Network** and then **Add Object**. Select the **Network** option and enter the value as expanded subnet mask. Example: 10.0.10.10/255.255.0.255.
- Object override, group object support, group object override, wildcard literals, and wildcard object import are supported.
- The network wildcard object is supported only for IPv4 addresses.
- The network wildcard object is supported from Firewall Management Center and Firewall Threat Defense 7.1 version onwards.
- Network wildcard objects are supported only for Snort-3.

## Creating Network Objects

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .   |
| <b>Step 2</b> | Choose <b>Network</b> from the list of object types.   |
| <b>Step 3</b> | Choose <b>Add Object</b> from the <b>Add Network</b> drop-down menu.   |
| <b>Step 4</b> | Alternatively, you can clone an existing network object and edit the parameters to create a new network object. Click the <b>Clone</b> icon on the existing network object that you want to clone. |
| <b>Step 5</b> | Enter a <b>Name</b> .  |
| <b>Step 6</b> | Optionally, enter a <b>Description</b> .   |
| <b>Step 7</b> | In the <b>Network</b> field, select the required option and enter an appropriate value; see <a href="#">Network, on page 1281</a> .  |

#### Note

You can add up to 100 network literals in a network object. Additionally, each nested network object group can contain a maximum of 100 network literals.

- |                |   |
|----------------|---|
| <b>Step 8</b>  | (FQDN objects only) Select the DNS resolution from the <b>Lookup</b> drop-down menu to determine whether you want the IPv4, IPv6, or both IPv4 and IPv6 addresses associated with the FQDN.   |
| <b>Step 9</b>  | Manage overrides for the object: <ul style="list-style-type: none"><li>• If you want to allow overrides for this object, check the <b>Allow Overrides</b> check box; see <a href="#">Allowing Object Overrides, on page 1244</a>.</li><li>• If you want to add override values to this object, expand the Override section and click <b>Add</b>; see <a href="#">Adding Object Overrides, on page 1245</a>.</li></ul> |
| <b>Step 10</b> | Click <b>Save</b> .   |
- 

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Importing Network Objects

For details on importing network objects, see [Importing Objects, on page 1236](#).

## PKI

### PKI Objects for SSL Application

PKI objects represent the public key certificates and paired private keys required to support your deployment. Internal and trusted CA objects consist of certificate authority (CA) certificates; internal CA objects also contain the private key paired with the certificate. Internal and external certificate objects consist of server certificates; internal certificate objects also contain the private key paired with the certificate.

If you use trusted certificate authority objects and internal certificate objects to configure a connection to ISE/ISE-PIC, you can use ISE/ISE-PIC as an identity source.

If you use internal certificate objects to configure captive portal, the system can authenticate the identity of your captive portal device when connecting to users' web browsers.

If you use trusted certificate authority objects to configure realms, you can configure secure connections to LDAP or AD servers.

If you use PKI objects in SSL rules, you can match traffic encrypted with:

- the certificate in an external certificate object
- a certificate either signed by the CA in a trusted CA object, or within the CA's chain of trust

If you use PKI objects in SSL rules, you can decrypt:

- outgoing traffic by re-signing the server certificate with an internal CA object
- incoming traffic using the known private key in an internal certificate object

You can manually input certificate and key information, upload a file containing that information, or in some cases, generate a new CA certificate and private key.

When you view a list of PKI objects in the object manager, the system displays the certificate's Subject distinguished name as the object value. Hover your pointer over the value to view the full certificate Subject distinguished name. To view other certificate details, edit the PKI object.

**Note** The Firewall Management Center and managed devices encrypt all private keys stored in internal CA objects and internal certificate objects with a randomly generated key before saving them. If you upload private keys that are password protected, the appliance decrypts the key using the user-supplied password, then reencrypts it with the randomly generated key before saving it.

### PKI Objects for Certificate Enrollment

A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. These activities occur in your Private Key Infrastructure (PKI).

The certificate enrollment object may also include certificate revocation information. For more information on PKI, digital certificates, and certificate enrollment see [PKI Infrastructure and Digital Certificates](#), on page 1385.

## Internal Certificate Authority Objects

Each internal certificate authority (CA) object you configure represents the CA public key certificate of a CA your organization controls. The object consists of the object name, CA certificate, and paired private key. You can use internal CA objects and groups in SSL rules to decrypt outgoing encrypted traffic by re-signing the server certificate with the internal CA.

**Note** If you reference an internal CA object in a **Decrypt - Resign** SSL rule and the rule matches an encrypted session, the user's browser may warn that the certificate is not trusted while negotiating the SSL handshake. To avoid this, add the internal CA object certificate to either the client or domain list of trusted root certificates.

You can create an internal CA object in the following ways:

- import an existing RSA-based or elliptic curve-based CA certificate and private key
- generate a new self-signed RSA-based CA certificate and private key
- generate an unsigned RSA-based CA certificate and private key. You must submit a certificate signing request (CSR) to another CA to sign the certificate before using the internal CA object.

After you create an internal CA object containing a signed certificate, you can download the CA certificate and private key. The system encrypts downloaded certificates and private keys with a user-provided password.

Whether system-generated or user-created, you can modify the internal CA object name, but cannot modify other object properties.

You cannot delete an internal CA object that is in use. Additionally, after you edit an internal CA object used in an SSL policy, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

## CA Certificate and Private Key Import

You can configure an internal CA object by importing an X.509 v3 CA certificate and private key. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the private key file is password-protected, you can supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

**Note** If you configure a rule with the **Decrypt - Resign** action, the rule matches traffic based on the referenced internal CA certificate's encryption algorithm type, in addition to any configured rule conditions. You must upload an elliptic curve-based CA certificate to decrypt outgoing traffic encrypted with an elliptic curve-based algorithm, for example.

## Importing a CA Certificate and Private Key

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Import CA**.
- Step 4** Enter a **Name**.
- Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.
- Step 6** Above the **Key** field, click **Browse** to upload a DER or PEM-encoded paired private key file.
- Step 7** If the uploaded file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 8** Click **Save**.

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes](#), on page 183.

## Generating a New CA Certificate and Private Key

You can configure an internal CA object by providing identification information to generate a self-signed RSA-based CA certificate and private key.

The generated CA certificate is valid for ten years. The Valid From date is a week before generation.

### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Generate CA**.
- Step 4** Enter a **Name**.
- Step 5** Enter the identification attributes.

**Step 6** Click **Generate self-signed CA**.

---

## New Signed Certificates

You can configure an internal CA object by obtaining a signed certificate from a CA. This involves two steps:

- Provide identification information to configure the internal CA object. This generates an unsigned certificate and paired private key, and creates a certificate signing request (CSR) to a CA you specify.
- After the CA issues the signed certificate, upload it to the internal CA object, replacing the unsigned certificate.

You can only reference an internal CA object in an SSL rule if it contains a signed certificate.

## Creating an Unsigned CA Certificate and CSR

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Generate CA**.
- Step 4** Enter a **Name**.
- Step 5** Enter the identification attributes.
- Step 6** Click **Generate CSR**.
- Step 7** Copy the CSR to submit to a CA.
- Step 8** Click **OK**.
- 

### What to do next

- You must upload a signed certificate issued by a CA as described in [Uploading a Signed Certificate Issued in Response to a CSR, on page 1287](#)

## Uploading a Signed Certificate Issued in Response to a CSR

Once uploaded, the signed certificate can be referenced in SSL rules.

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Click **Edit** (✎) next to the CA object containing the unsigned certificate awaiting the CSR.
- Step 4** Click **Install Certificate**.

- Step 5** Click **Browse** to upload a DER or PEM-encoded X.509 v3 CA certificate file.
- Step 6** If the uploaded file is password protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 7** Click **Save** to upload a signed certificate to the CA object.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## CA Certificate and Private Key Downloads

You can back up or transfer a CA certificate and paired private key by downloading a file containing the certificate and key information from an internal CA object.

---

**Caution** Always store downloaded key information in a secure location.

---

The system encrypts the private key stored in an internal CA object with a randomly generated key before saving it to disk. If you download a certificate and private key from an internal CA object, the system first decrypts the information before creating a file containing the certificate and private key information. You must then provide a password the system uses to encrypt the downloaded file.

---

**Caution** Private keys downloaded as part of a system backup are decrypted, then stored in the unencrypted backup file.

---

## Downloading a CA Certificate and Private Key

You can download CA certificates for both the current domain and ancestor domains.

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Internal CAs**.
- Step 3** Next to the internal CA object whose certificate and private key you want to download, click **Edit** (✎).
- Step 4** Click **Download**.
- Step 5** Enter an encryption password in the **Password** and **Confirm Password** fields.
- Step 6** Click **OK**.
-

## Trusted Certificate Authority Objects

Each trusted certificate authority (CA) object you configure represents a CA public key certificate belonging to a trusted CA. The object consists of the object name and CA public key certificate. You can use external CA objects and groups in:

- your SSL policy to control traffic encrypted with a certificate signed either by the trusted CA, or any CA within the chain of trust.
- your realm configurations to establish secure connections to LDAP or AD servers.
- your ISE/ISE-PIC connection. Select trusted certificate authority objects for the **pxGrid Server CA** and **MNT Server CA** fields.

After you create the trusted CA object, you can modify the name and add certificate revocation lists (CRL), but cannot modify other object properties. There is no limit on the number of CRLs you can add to an object. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

---

**Note** Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

---

You cannot delete a trusted CA object that is in use. Additionally, after you edit a trusted CA object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

## Trusted CA Object

You can configure an external CA object by uploading an X.509 v3 CA certificate. You can upload a file encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate is encoded in the PEM format, you can also copy and paste the information.

You can upload a CA certificate only if the file contains proper certificate information; the system validates the certificate before saving the object.

## Adding a Trusted CA Object

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .                                   |
| <b>Step 2</b> | Expand the <b>PKI</b> node, and choose <b>Trusted CAs</b> .                      |
| <b>Step 3</b> | Click <b>Add Trusted CAs</b> .   |
| <b>Step 4</b> | Enter a <b>Name</b> .  |
| <b>Step 5</b> | Click <b>Browse</b> to upload a DER or PEM-encoded X.509 v3 CA certificate file. |

- Step 6** If the file is password-protected, check the **Encrypted, and the password is:** check box, and enter the password.
- Step 7** Click **Save**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Certificate Revocation Lists in Trusted CA Objects

You can upload CRLs to a trusted CA object. If you reference that trusted CA object in an SSL policy, you can control encrypted traffic based on whether the CA that issued the session encryption certificate subsequently revoked the certificate. You can upload files encoded in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

After you add the CRL, you can view the list of revoked certificates. If you want to modify a CRL you have uploaded to an object, you must delete the object and recreate it.

You can upload only files that contain a proper CRL. There is no limit to the number of CRLs you can add to a trusted CA object. However, you must save the object each time you upload a CRL, before adding another CRL.

---

**Note** Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

---

## Adding a Certificate Revocation List to a Trusted CA Object

---

**Note** Adding a CRL to an object has no effect when the object is used in your ISE/ISE-PIC integration configuration.

---

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **Trusted CAs**.
- Step 3** Click **Edit** (✎) next to a trusted CA object.
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** Click **Add CRL** to upload a DER or PEM-encoded CRL file.

**Step 5** Click **OK**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## External Certificate Objects

Each external certificate object you configure represents a server public key certificate that does not belong to your organization. The object consists of the object name and certificate. You can use external certificate objects and groups in SSL rules to control traffic encrypted with the server certificate. For example, you can upload a self-signed server certificate that you trust, but cannot verify with a trusted CA certificate.

You can configure an external certificate object by uploading an X.509 v3 server certificate. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

You can upload only files that contains proper server certificate information; the system validates the file before saving the object. If the certificate is encoded in the PEM format, you can also copy and paste the information.

## Adding External Certificate Objects

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **PKI** node, and choose **External Certs**.
- Step 3** Click **Add External Cert**.
- Step 4** Enter a **Name**.
- Step 5** Above the **Certificate Data** field, click **Browse** to upload a DER or PEM-encoded X.509 v3 server certificate file.
- Step 6** Click **Save**.
- 

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Internal Certificate Objects

Each internal certificate object you configure represents a server public key certificate belonging to your organization. The object consists of the object name, public key certificate, and paired private key. You can use internal certificate objects and groups in:

- your SSL rules to decrypt traffic incoming to one of your organization's servers using the known private key.
- your ISE/ISE-PIC connection. Select an internal certificate object for the **MC Server Certificate** field.
- your captive portal configuration to authenticate the identity of your captive portal device when connecting to users' web browsers. Select an internal certificate object for the **Server Certificate** field.

You can configure an internal certificate object by uploading an X.509 v3 RSA-based or elliptic curve-based server certificate and paired private key. You can upload a file in one of the following supported formats:

- Distinguished Encoding Rules (DER)
- Privacy-enhanced Electronic Mail (PEM)

If the file is password-protected, you must supply the decryption password. If the certificate and key are encoded in the PEM format, you can also copy and paste the information.

You can upload only files that contain proper certificate or key information, and that are paired with each other. The system validates the pair before saving the object.

After you create the internal certificate object, you can modify the name, but cannot modify other object properties.

You cannot delete an internal certificate object that is in use. Additionally, after you edit an internal certificate object that is in use, the associated access control policy goes out-of-date. You must re-deploy the access control policy for your changes to take effect.

## Adding Internal Certificate Objects

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .  |
| <b>Step 2</b> | Expand the <b>PKI</b> node, and choose <b>Internal Certs</b> .  |
| <b>Step 3</b> | Click <b>Add Internal Cert</b> .  |
| <b>Step 4</b> | Enter a <b>Name</b> .   |
| <b>Step 5</b> | Above the <b>Certificate Data</b> field, click <b>Browse</b> to upload a DER or PEM-encoded X.509 v3 server certificate file.               |
| <b>Step 6</b> | Above the <b>Key</b> field, or click <b>Browse</b> to upload a DER or PEM-encoded paired private key file.                                  |
| <b>Step 7</b> | If the uploaded private key file is password-protected, check the <b>Encrypted, and the password is:</b> check box, and enter the password. |
| <b>Step 8</b> | Click <b>Save</b> .   |
-

## Certificate Enrollment Objects

Trustpoints let you manage and track CAs and certificates. A trustpoint is a representation of a CA or identity pair. A trustpoint includes the identity of the CA, CA-specific configuration parameters, and an association with one, enrolled identity certificate.

A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. These activities occur in your Private Key Infrastructure (PKI).

The certificate enrollment object may also include certificate revocation information. For more information on PKI, digital certificates, and certificate enrollment see [PKI Infrastructure and Digital Certificates](#), on page 1385.

### How to Use Certificate Enrollment Objects

Certificate Enrollment Objects are used to enroll your managed devices into your PKI infrastructure, and create trustpoints (CA objects) on devices that support VPN connections by doing the following:

1. Define parameters for CA authentication and enrollment in a Certificate Enrollment Object. Specify shared parameters and use the override facility to specify unique object settings for different devices.
2. Associate and install this object on each managed device that requires the identity certificate. On the device, it becomes a *trustpoint*.

When a certificate enrollment object is associated with and then installed on a device, the process of certificate enrollment starts immediately. The process is automatic for self-signed, SCEP, EST, and PKCS12 file enrollment types, meaning it does not require any additional administrator action. Manual certificate enrollment requires extra administrator action.

3. Specify the created trustpoint in your VPN configuration.

### Managing Certificate Enrollment Objects

To manage certificate enrollment objects, go to **Objects > Object Management > PKI > Cert Enrollment**. The following information is shown:

- Existing certificate enrollment objects are listed in the **Name** column.

Use the search field (the magnifying glass) to filter the list.

- The enrollment type of each object is shown in the **Type** column. The following enrollment methods can be used:
  - **Self Signed**—The managed device generates its own self signed root certificate.
  - **EST**—Enrollment over Secure Transport is used by the device to obtain an identity certificate from the CA.
  - **SCEP**—(Default) Simple Certificate Enrollment Protocol (SCEP) is used by the device to obtain an identity certificate from the CA.
  - **Manual**—The process of enrolling is carried out manually by the administrator.
  - **PKCS12 File**—Import a PKCS12 file on a Threat Defense managed device that supports VPN connectivity. A PKCS#12, or PFX or P12 file holds the server certificate, any intermediate certificates, and the private key in one encrypted file. Enter the **Passphrase** value for decryption.

- The **Override** column indicates whether the object allows overrides (a green check mark) or not (a red X). If a number is displayed, it is the number of overrides in place.

Use the Override option to customize the object settings for each device that is part of the VPN configuration. Overriding makes each device's trustpoint details unique. Typically the Common Name or Subject is overridden for each device in the VPN configuration.

See [Object Overrides, on page 1243](#) for details and procedures on overriding objects of any type.

- **Edit** a previously created certificate enrollment object by clicking on the edit icon (a pencil). Editing can only be done if the enrollment object is not associated with any managed devices. Refer to the adding instructions for editing a certificate enrollment object. Failed enrollment objects can be edited.
- **Delete** a previously created certificate enrollment object by clicking on the delete icon (a trash can). You cannot delete a certificate enrollment object if it is associated with any managed device.

Press  **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog and configure a Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#). Then install the certificate on each managed, headend device.

## Adding Certificate Enrollment Objects

You can use these objects with Firewall Threat Defense devices. You must have Admin or Network Admin privileges to do this task.

### Procedure

- 
- Step 1** Open the **Add Cert Enrollment** dialog:
- Directly from Object Management: In the **Objects > Object Management > PKI > Cert Enrollment** from the navigation pane, and press **Add Cert Enrollment**.
  - While configuring a managed device: In the **Devices > Certificates** screen, choose **Add Add > Add New Certificate** and click  for the **Certificate Enrollment** field.
- Step 2** Enter the **Name**, and optionally, a **Description** of this enrollment object.
- When enrollment is complete, this name is the name of the trustpoint on the managed devices with which it is associated.
- Step 3** Click the **CA Information** tab.
- Step 4** Choose the **Enrollment Type**.
- **Self-Signed Certificate**—The managed device, acting as a CA, generates its own self-signed root certificate. No other information is needed in this pane.

**Note**

When enrolling a self-signed certificate you must specify the Common Name (CN) in the certificate parameters.

- **EST**—Enrollment over Secure Transport protocol. Specify the EST information. See [Certificate Enrollment Object EST Options, on page 1296](#).
- **SCEP**—(Default) Simple Certificate Enrollment Protocol. Specify the SCEP information. See [Certificate Enrollment Object SCEP Options, on page 1297](#).
- **Manual**

- **CA Only**—Check this check box to create only the CA certificate from the selected CA. An identity certificate will not be created for this certificate.

If you do not select this check box, a CA certificate is not mandatory. You can generate the CSR without having a CA certificate and obtain the identity certificate.

- **CA Certificate**—Paste the CA certificate in the PEM format in the box. You can also obtain a CA certificate by copying it from another device.

You can leave this box empty if you choose to generate a CSR without the CA certificate.

- **PKCS12 File**—Import a PKCS12 file on a Firewall Threat Defense managed device that supports VPN connectivity. A PKCS#12, or PFX, file holds a server certificate, intermediate certificates, and a private key in one encrypted file. Enter the **Passphrase** value for decryption.

**Step 5** **Skip Check for CA flag in basic constraints of the CA Certificate**—Check this check box if you want to skip checking the basic constraints extension and the CA flag in a trustpoint certificate.

**Step 6** **Validation Usage**—Choose from the options to validate the certificate during a VPN connection:

- **IPsec Client**—Validate an IPsec client certificate for a site-to-site VPN connection.
- **SSL Client**—Validate an SSL client certificate during a remote access VPN connection attempt.
- **SSL Server**—Select to validate an SSL server certificate, like as a Cisco Umbrella server certificate.

**Step 7** (Optional) Click the **Certificate Parameters** tab and specify the certificate contents. See [Certificate Enrollment Object Certificate Parameters, on page 1298](#).

This information is placed in the certificate and is readable by any party who receives the certificate from the router.

**Step 8** (Optional) Click the **Key** tab and specify the Key information. See [Certificate Enrollment Object Key Options, on page 1299](#).

**Step 9** (Optional) Click the **Revocation** tab, and specify the revocation options: See [Certificate Enrollment Object Revocation Options, on page 1300](#).

**Step 10** **Allow Overrides** of this object if desired.

Whenever you modify the PKCS12 certificate enrollment object to permit overrides, you must update the **Passphrase** for the certificate on the device where it is overridden.

See [Object Overrides, on page 1243](#) for a full description of object overrides.

**Step 11** Click **Save**.

**What to do next**

Associate and install the enrollment object on a device to create a trustpoint on that device.

[Installing a Certificate Using a PKCS12 File](#), on page 1372

## Add Certificate Enrollment

**Procedure**

**Step 1** Enter the **Name**.

**Step 2** Paste the certificate information in the **IdP Certificate** field in PEM format.

**Note**

If the certificate is dependent on a root or intermediate certificate, you must install the dependant certificates. See [Certificates](#), on page 1365.

**Step 3** Click **Save**.

## Certificate Enrollment Object EST Options

**Secure Firewall Management Center Navigation Path**

**Objects > Object Management > PKI > Cert Enrollment**. Click (+) **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog, and select the **CA Information** tab.

**Fields**

**Enrollment Type**—set to **EST**.

**Note**

- EST enrollment type does not support EdDSA key.
- EST's ability to auto-enroll a device when its certificate expires is not supported.

**Enrollment URL**—The URL of the CA server to which devices should attempt to enroll.

Use an HTTPS URL in the form of **https://CA\_name:port**, where *CA\_name* is the host DNS name or IP address of the CA server. The *port* number is mandatory.

**Username**—The username to access the CA server.

**Password / Confirm Password**—The password to access the CA server.

**Fingerprint**—When retrieving the CA certificate using EST, you may enter the fingerprint for the CA server. Using the fingerprint to verify the authenticity of the CA server's certificate helps prevent an unauthorized party from substituting a fake certificate in place of the real one. Enter the **Fingerprint** for the CA server in hexadecimal format. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. Obtain the CA's fingerprint by contacting the server directly.

**Source Interface**—The interface that interacts with the CA server. By default, the diagnostic interface is displayed. To configure a data interface as the source interface, choose the respective security zone or interface group object.

**Ignore EST Server Certificate Validations**—The EST server certificate validation is done by default. Check the check box if you want to ignore Firewall Threat Defense validating EST server certificate.

## Certificate Enrollment Object SCEP Options

### Secure Firewall Management Center Navigation Path

**Objects > Object Management > PKI > Cert Enrollment**. Click  **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog, and select the **CA Information** tab.

### Fields

**Enrollment Type**—set to **SCEP**.

**Enrollment URL**—The URL of the CA server to which devices should attempt to enroll.

Use an HTTP URL in the form of **http://CA\_name:port**, where CA\_name is the host DNS name or IP address of the CA server. The port number is mandatory.

---

**Note** If the SCEP Server is referred with hostname/FQDN, configure DNS Server using FlexConfig object.

---

If the CA cgi-bin script location at the CA is not the default (/cgi-bin/pkiclient.exe), you must also include the nonstandard script location in the URL, in the form of **http://CA\_name:port/script\_location**, where script\_location is the full path to the CA scripts.

**Challenge Password / Confirm Password**—The password used by the CA server to validate the identity of the device. You can obtain the password by contacting the CA server directly or by entering the following address in a web browser: **http://URLHostName/certsrv/mscep/mscep.dll**. The password is good for 60 minutes from the time you obtain it from the CA server. Therefore, it is important that you deploy the password as soon as possible after you create it.

**Retry Period**—The interval between certificate request attempts, in minutes. Value can be 1 to 60 minutes. The default is 1 minute.

**Retry Count**—The number of retries that should be made if no certificate is issued upon the first request. Value can be 1 to 100. The default is 10.

**CA Certificate Source**—Specify how the CA certificate will be obtained.

- **Retrieve Using SCEP** (Default, and only supported option)—Retrieve the certificate from the CA server using the Simple Certificate Enrollment Process (SCEP). Using SCEP requires a connection between your device and the CA server. Ensure there is a route from your device to the CA server before beginning the enrollment process.

**Fingerprint**—When retrieving the CA certificate using SCEP, you may enter the fingerprint for the CA server. Using the fingerprint to verify the authenticity of the CA server's certificate helps prevent an unauthorized party from substituting a fake certificate in place of the real one. Enter the **Fingerprint** for the CA server in hexadecimal format. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. Obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: `http://<URLHostName>/certsrv/mscep/mscep.dll`.

## Certificate Enrollment Object Certificate Parameters

Specify additional information in certificate requests sent to the CA server. This information is placed in the certificate and can be viewed by any party who receives the certificate from the router.

### Secure Firewall Management Center Navigation Path

**Objects > Object Management > PKI > Cert Enrollment**. Press  **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog, and select the **Certificate Parameters** tab.

### Fields

Enter all information using the standard LDAP X.500 format.

- **Include FQDN**—Whether to include the device's fully qualified domain name (FQDN) in the certificate request. Choices are:
  - **Use Device Hostname as FQDN**
  - **Don't use FQDN in certificate**
  - **Custom FQDN**—Select this and then specify it in the **Custom FQDN** field that displays.
- **Include Device's IP Address**—The interface whose IP address is included in the certificate request.
- **Common Name (CN)**—The X.500 common name to include in the certificate.

---

**Note** When enrolling a self-signed certificate you must specify the Common Name (CN) in the certificate parameters.

---

- **Organization Unit (OU)**—The name of the organization unit (for example, a department name) to include in the certificate.
- **Organization (O)**—The organization or company name to include in the certificate.
- **Locality (L)**—The locality to include in the certificate.
- **State (ST)**—The state or province to include in the certificate.
- **County Code (C)**—The country to include in the certificate. These codes conform to ISO 3166 country abbreviations, for example "US" for the United States of America.
- **Email (E)**—The email address to include in the certificate.
- **Include Device's Serial Number**—Whether to include the serial number of the device in the certificate. The CA uses the serial number to either authenticate certificates or to later associate a certificate with a particular device. If you are in doubt, include the serial number, as it is useful for debugging purposes.

## Certificate Enrollment Object Key Options

### Secure Firewall Management Center Navigation Path

**Objects > Object Management > PKI > Cert Enrollment** . Press  **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog, and select the **Key** tab.

#### Fields

- **Key Type**—RSA, ECDSA, EdDSA.

#### Note

- For EST enrollment type, do not select EdDSA key as it is not supported.
- EdDSA is supported only in Site-to-Site VPN topologies.
- EdDSA is not supported as an identity certificate for the Remote Access VPN.

- **Key Name**—If the key pair you want to associate with the certificate already exists, this field specifies the name of that key pair. If the key pair does not exist, this field specifies the name to assign to the key pair that will be generated during enrollment. If you do not specify a name, the fully qualified domain name (FQDN) key pair is used instead.
- **Key Size**—If the key pair does not exist, defines the desired key size (modulus), in bits. The recommended size is 2048 bits. The larger the modulus size, the more secure the key. However, keys with larger modulus sizes take longer to generate (a minute or more when larger than 512 bits) and longer to process when exchanged.

#### Important

- On Firewall Management Center and Firewall Threat Defense Versions 7.0 and higher, you cannot enroll certificates with RSA key sizes smaller than 2048 bits and keys using SHA-1 with the RSA Encryption algorithm. However, you can use [PKI Enrollment of Certificates with Weak-Crypto](#) to allow certificates that use SHA-1 with RSA Encryption algorithm and smaller key size.
- You cannot generate RSA keys with sizes smaller than 2048 bits for Firewall Threat Defense 7.0, even when you enable the weak-crypto option.
- **Advanced Settings**—Select **Ignore IPsec Key Usage** if you do not want to validate values in the key usage and extended key usage extensions of IPsec remote client certificates. You can suppress key usage checking on IPsec client certificates. By default this option is not enabled.

**Note** For site-to-site VPN connection, if you use a Windows Certificate Authority (CA), the default Application Policies extension is **IP security IKE intermediate**. If you are using this default setting, you must select the **Ignore IPsec Key Usage** option for the object you select. Otherwise, the endpoints cannot complete the site-to-site VPN connection.

## PKI Enrollment of Certificates with Weak-Crypto

SHA-1 hashing signature algorithm, and RSA key sizes that are smaller than 2048 bits for certification are not supported on Firewall Management Center and Firewall Threat Defense Version 7.0 and higher. You cannot enroll certificates with RSA key sizes that are smaller than 2048 bits.

To override these restrictions on Firewall Management Center 7.0 managing Firewall Threat Defenses running Versions lesser than 7.0, you can use the enable weak-crypto option on the Firewall Threat Defense. We do not recommend you to permit weak-crypto keys, because, such keys are not as secure as the ones with higher key sizes.

**Note** Firewall Threat Defense 7.0 or higher does not support generating RSA keys with sizes smaller than 2048 bits even when you permit weak-crypto.

To enable weak-crypto on the device, navigate to the **Devices > Certificates** page. Click the **Enable Weak-Crypto** (🔒) button provided against the Firewall Threat Defense device. When the weak-crypto option is enabled, the button changes to 🔓. By default, the weak-crypto option is disabled.

**Note** When a certificate enrollment fails due to weak cipher usage, the Firewall Management Center displays a warning message prompting you to enable the weak-crypto option. Similarly, when you turn on the enable weak-crypto button, the Firewall Management Center displays a warning message before enabling weak-crypto configuration on the device.

### Upgrading Earlier Versions to Firewall Threat Defense 7.0

When you are upgrading to Firewall Threat Defense 7.0, the existing certificate configurations are retained. However, if those certificates have RSA keys smaller than 2048 bits and use SHA-1 encryption algorithm, they cannot be used to establish VPN connections. You must either procure a certificate with RSA key sizes bigger than 2048 bits or enable the permit weak-crypto option for VPN connections.

## Certificate Enrollment Object Revocation Options

Specify whether to check the revocation status of a certificate by choosing and configuring the method. Revocation checking is off by default, neither method (CRL or OCSP) is checked.

### Secure Firewall Management Center Navigation Path

**Objects > Object Management > PKI > Cert Enrollment** . Press (+) **Add Cert Enrollment** to open the **Add Cert Enrollment** dialog, and select the **Revocation** tab.

## Fields

- **Enable Certificate Revocation Lists**—Check to enable CRL checking.
  - **Use CRL distribution point from the certificate**—Check to obtain the revocation lists distribution URL from the certificate.
  - **Use static URL configured**—Check this to add a static, pre-defined distribution URL for revocation lists. Then add the URLs.

**CRL Server URLs**—The URL of the LDAP server from which the CRL can be downloaded.

URLs must start with **http://**. Include a port number in the URL. Enclose IPv6 addresses in square brackets, for example: *http://[0:0:0:0:0:18:0a01:7c16]*.

- **Enable Online Certificate Status Protocol (OCSP)**—Check to enable OCSP checking.

**OCSP Server URL**—The URL of the OCSP server checking for revocation if you require OCSP checks.

URLs must start with **http://**. Enclose IPv6 addresses in square brackets, for example: *http://[0:0:0:0:0:18:0a01:7c16]*.

- **Consider the certificate valid if revocation information cannot be reached**—Checked by default. Uncheck if you do not want to allow this.

# Policy List

Use the Configure Policy List page to create, copy, and edit policy list policy objects. You can create policy list objects to use when you are configuring route maps. When a policy list is referenced within a route map, all of the match statements within the policy list are evaluated and processed. Two or more policy lists can be configured with a route map. A policy list can also coexist with any other preexisting match and set statements that are configured within the same route map but outside of the policy list. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.

You can use this object with Firewall Threat Defense devices.

## Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **Policy List** from the table of contents.
  - Step 2** Click **Add Policy List**.
  - Step 3** Enter a name for the policy list object in the **Name** field. Object names are not case-sensitive.
  - Step 4** Select whether to allow or block access for matching conditions from the **Action** drop-down list.
  - Step 5** Click the **Interface** tab to distribute routes that have their next hop out of one of the interfaces specified.  
  
In the **Zones/Interfaces** list, add the zones that contain the interfaces through which the device communicates with the management station. For interfaces not in a zone, you can type the interface name into the field below the **Selected Zone/Interface** list and click **Add**. The host will be configured on a device only if the device includes the selected interfaces or zones.
  - Step 6** Click the **Address** tab to redistribute any routes that have a destination address that is permitted by a standard access list or prefix list.

Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.

- Step 7** Click the **Next Hop** tab to redistribute any routes that have a next hop router address passed by one of the access lists or prefix lists specified.
- Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.
- Step 8** Click the **Route Source** tab to redistribute routes that have been advertised by routers and access servers at the address specified by the access lists or prefix list.
- Choose whether to use an **Access List** or **Prefix List** for matching and then enter or select the Standard Access List Objects or Prefix list objects you want to use for matching.
- Step 9** Click the **AS Path** tab to match a BGP autonomous system path. If you specify more than one AS path, then the route can match either AS path.
- Step 10** Click the **Community Rule** tab to enable matching of the BGP community or extended community with the specified community list objects or the extended community list objects respectively. If you specify more than one rule, the routes are verified against the rules until a matching permit or deny is met.
- To specify a community list to the rule, click **Edit** (✎) given in the **Selected Community List** field. The community lists appear under **Available Community List**. Select the required list, click **Add**, and then click **Ok**.  
  
To enable matching the BGP community exactly with the specified community, check the **Match the specified community exactly** check box.
  - To add the extended community list, click **Edit** (✎) given in the **Selected Extended Community List** field. The extended community lists appear under the **Available Extended Community List**. Select the required list, click **Add**, and then click **Ok**.
- Note**  
The extended community lists are applicable only for configuring import or export of routes.
- Step 11** Click the **Metric & tag** tab to match the metric and security group tag of a route.
- Enter the metric values to use for matching in the **Metric** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.
  - Enter the tag values to use for matching in the **Tag** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
- Step 12** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 13** Click **Save**.
- 

## Port

Port objects represent different protocols in slightly different ways:

### TCP and UDP

A port object represents the transport layer protocol, with the protocol number in parentheses, plus an optional associated port or port range. For example: `TCP (6) / 22`.

### ICMP and ICMPv6 (IPv6-ICMP)

A port object represents the Internet layer protocol plus an optional type and code. For example:

`ICMP (1) : 3 : 3`.

You can restrict an ICMP or IPV6-ICMP port object by type and, if applicable, code. For more information on ICMP types and codes, see:

- <http://www.iana.org/assignments/icmp-parameters/icmp-parameters.xml>
- <http://www.iana.org/assignments/icmpv6-parameters/icmpv6-parameters.xml>

### Other

A port object can represent other protocols that do not use ports.

The system provides default port objects for well-known ports. You cannot modify or delete these default objects. You can create custom port objects in addition to the default objects.

You can use port objects and groups in various places in the system's web interface, including access control policies, identity rules, network discovery rules, port variables, and event searches. For example, if your organization uses a custom client that uses a specific range of ports and causes the system to generate excessive and misleading events, you can configure your network discovery policy to exclude monitoring those ports.

When using port objects, observe the following guidelines:

- You cannot add any protocol other than TCP or UDP for source port conditions in access control rules. Also, you cannot mix transport protocols when setting both source and destination port conditions in a rule.
- If you add an unsupported protocol to a port object group used in a source port condition, the rule where it is used does not take affect on the managed device when the configuration is deployed.
- If you create a port object containing both TCP and UDP ports, then add it as a source port condition in a rule, you cannot add a destination port, and vice versa.

## Creating Port Objects

### Procedure

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Port** from the list of object types.

**Step 3** Choose **Add Object** from the **Add Port** drop-down list.

Alternatively, you can clone an existing port object and edit the parameters to create a new port object. Click the **Clone** icon on the existing port object that you want to clone.

**Step 4** Enter a **Name**.

**Step 5** Choose a **Protocol**.

- Step 6** Depending on the protocol you chose, constrain by **Port**, or choose an ICMP **Type** and **Code**.  
You can enter ports from **1** to **65535**. Use a hyphen to specify a port range. You must constrain the object by port if you chose to match **All** protocols, using the **Other** drop-down list.
- Step 7** Manage overrides for the object:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
  - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 1245](#).
- Step 8** Click **Save**.
- 

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Importing Port Objects

For details on importing port objects, see [Importing Objects, on page 1236](#).

## Prefix List

You can create prefix list objects for IPv4 and IPv6 to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

## Configure IPv6 Prefix List

Use the Configure IPv6 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering.

You can use this object with Firewall Threat Defense devices.

#### Procedure

---

- Step 1** Select **Objects > Object Management** and choose **Prefix Lists > IPv6 Prefix List** from the table of contents.
- Step 2** Click **Add Prefix List**.
- Step 3** Enter a name for the prefix list object in the **Name** field on the **New Prefix List Object** window.
- Step 4** Click **Add** on the **New Prefix List Object** window.
- Step 5** Select the appropriate action, Allow or Block from the **Action** drop-down list, to indicate the redistribution access.
- Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the **Sequence No.** field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.

- Step 7** Specify the IPv6 address in the IP address/mask length format in the **IP address** field. The mask length must be a valid value between 1-128.
- Step 8** Enter the minimum prefix length in the **Minimum Prefix Length** field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.
- Step 9** Enter the maximum prefix length in the **Maximum Prefix Length** field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.
- Step 10** Click **Add**.
- Step 11** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 12** Click **Save**.
- 

## Configure IPv4 Prefix List

Use the Configure IPv4 Prefix list page to create, copy and edit prefix list objects. You can create prefix list objects to use when you are configuring route maps, policy maps, OSPF Filtering, or BGP Neighbor Filtering. You can use this object with Firewall Threat Defense devices.

### Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **Prefix Lists > IPv4 Prefix List** from the table of contents.
- Step 2** Click **Add Prefix List**.
- Step 3** Enter a name for the prefix list object in the **Name** field on the **New Prefix List Object** window.
- Step 4** Click **Add**.
- Step 5** Select the appropriate action, Allow or Block from the **Action** drop-down list, to indicate the redistribution access.
- Step 6** Enter a unique number that indicates the position a new prefix list entry will have in the list of prefix list entries already configured for this object, in the **Sequence No.** field. If left blank, the sequence number will default to five more than the largest sequence number currently in use.
- Step 7** Specify the IPv4 address in the IP address/mask length format in the **IP address** field. The mask length must be a valid value between 1- 32.
- Step 8** Enter the minimum prefix length in the **Minimum Prefix Length** field. The value must be greater than the mask length and less than or equal to the Maximum Prefix Length, if specified.
- Step 9** Enter the maximum prefix length in the **Maximum Prefix Length** field. The value must be greater than or equal to the Minimum Prefix Length, if present, or greater than the mask length if the Minimum Prefix Length is not specified.
- Step 10** Click **Add**.
- Step 11** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- Step 12** Click **Save**.
-

# Route Map

Route maps are used when redistributing routes into any routing process. They are also used when generating a default route into routing process. A route map defines which of the routes from the specified routing protocol are allowed to be redistributed into the target routing process. Configure a route map, to create a new route map entry for a Route Map object or to edit an existing one.

You can use this object with Firewall Threat Defense devices.

## Before you begin

A Route Map may use one or more of these objects; it is not mandatory to add all these objects. Create and use any of these objects as required, to configure your route map.

- Add ACLs.
- Add Prefix Lists.
- Add AS Path.
- Add Community Lists.
- Add Extended Community Lists.

---

**Note** The extended community lists are applicable only for configuring import or export of routes.

---

- Add Policy Lists.

## Procedure

- 
- Step 1** Select **Objects > Object Management** and choose **Route Map** from the table of contents.
- Step 2** Click **Add Route Map**.
- Step 3** Click **Add** on the **New Route Map Object** window.
- Step 4** In the **Sequence No.** field, enter a number, from 0 through 65535, that indicates the position a new route map entry has in the list of route maps entries already configured for this route map object.
- Note**  
We recommend that you number clauses in intervals of at least 10 to reserve numbering space in case you want to insert clauses in the future.
- Step 5** Select the appropriate action, Allow or Block, from the **Redistribution** drop-down list, to indicate the redistribution access.
- Step 6** Click the **Match Clauses** tab to match (routes/traffic) based on the following criteria, which you select in the table of contents:
- **Security Zones** —Match traffic based on the (ingress/egress) interfaces. You can select zones and add them, or type in interface names and add them.

- **IPv4** — Match IPv4 (routes/traffic) based on the following criteria; select the tab to define the criteria.
  - a. Click the **Address** tab to match routes based on the route address. For IPv4 addresses, choose whether to use an Access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  - b. Click the **Next Hop** tab to match routes based on the next hop address of a route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
  - c. Click the **Route Source** tab to match routes based on the advertising source address of the route. For IPv4 addresses, choose whether to use an access list or Prefix list for matching from the drop-down list and then enter or select the ACL objects or Prefix list objects you want to use for matching.
- **IPv6** —Match IPv6 (routes/traffic) based on the route address, next-hop address or advertising source address of route.
- **BGP** —Match BGP (routes/traffic) based on the following criteria; select the tab to define the criteria.
  - a. Click the **AS Path** tab to enable matching the BGP autonomous system path access list with the specified path access list. If you specify more than one path access list, then the route can match either path access list.
  - b. Click the **Community List** tab to enable matching of the BGP community or extended community with the specified community list objects or the extended community list objects respectively.
    - To specify a community list to the rule, click **Edit** (✎) given in the **Selected Community List** field. The community lists appears under **Available Community List**. Select the required list, click **Add**, and then click **Ok**. For information on how to create community list objects, see [Community List, on page 1258](#)
    - To add the extended community list, click **Edit** (✎) given in the **Selected Extended Community List** field. The extended community lists appears under the **Available Extended Community List**. Select the required list, click **Add**, and then click **Ok**. For information on how to create extended community list objects, see [Extended Community, on page 1259](#).

To enable matching the BGP community exactly with the specified community list objects, check the **Match the specified community exactly** check box. This option is not applicable for the extended community list.

**Note**

If you specify more than one rule, the routes are verified against the rules until a matching permit or deny condition is met. Any route that does not match at least one Match community will not be advertised for outbound route maps.

  - c. Click the **Policy List** tab to configure a route map to evaluate and process a BGP policy. When multiple policy lists perform matching within a route map entry, all policy lists match on the incoming attribute only.
- **Others** —Match routes or traffic based on the following criteria.
  - a. Enter the metric values to use for matching in the **Metric Route Value** field, to enable matching the metric of a route. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified metric. The metric values can range from 0 to 4294967295.

- b. Enter the tag values to use for matching in the **Tag Values** field. You can enter multiple values separated by commas. This setting allows you to match any routes that have a specified security group tag. The tag values can range from 0 to 4294967295.
- c. Check the appropriate **Route Type** option to enable matching of the route type. Valid route types are External1, External2, Internal, Local, NSSA-External1, and NSSA-External2. You can choose more than one route type from the list.

**Step 7**

Click the **Set Clauses** tab to set routes/traffic based on the following criteria, which you select in the table of contents:

- **Metric Values**—Set either Bandwidth, all of the values or none of the values.
  - a. Enter a metric value or bandwidth in Kbits per second in the **Bandwidth** field. Valid values are an integer value in the range from 0 to 4294967295.
  - b. Select to specify the type of metric for the destination routing protocol, from the **Metric Type** drop-down list. Valid values are : internal, type-1, or type-2.
- **BGP Clauses** —Set BGP routes based on the following criteria; select the tab to define the criteria.
  - a. Click the **AS Path** tab to modify an autonomous system path for BGP routes.
    - 1. Enter an AS path number in the **Prepend AS Path** field to prepend an arbitrary autonomous system path string to BGP routes. Usually the local AS number is prepended multiple times, increasing the autonomous system path length. If you specify more than one AS path number then the route can prepend either AS number.
    - 2. Enter an AS path number in the **Prepend Last AS to AS Path** field to prepend the AS path with the last AS number. Enter a value for the AS number from 1 to 10.
    - 3. Check the **Convert route tag into AS path** check box to convert the tag of a route into an autonomous system path.
  - b. Click the **Community List** tab to set the community attributes:
 

Under **Specific Community**:

    - 1. Click the **None** radio button, to remove the community attribute from the prefixes that pass the route map.
    - 2. Click the **Specific Community** radio button, to enter a community number, if applicable. Valid values are from 1 to 4294967295.
    - 3. Check the **Add to existing communities** check box, to add the community to the already existing communities.
    - 4. Select the **Internet**, **No-Advertise**, or **No-Export** check-boxes to use one of the well-known communities.

Under **Specific Extended Community**, in the **Route Target** field, enter the route target number in *ASN:nn* format:

    - You can enter values that ranges from 1:1 to 65534:65535.

You can add a single route target or a set of route targets separated by commas in a single entry. For example, *1:2,1:4,1:6*.

- You can have a maximum of 8 route targets in an entry.
  - You cannot have redundant route target entries across route maps.
- c. Click the **Others** tab to set additional attributes.
1. Check the **Set Automatic Tag** check-box to automatically compute the tag value.
  2. Enter a preference value for the autonomous system path in the **Set Local Preference** field. Enter a value between 0 and 4294967295.
  3. Enter a BGP weight for the routing table in the **Set Weight** field. Enter a value between 0 and 65535.
  4. Select to specify the BGP origin code. Valid values are **Local IGP** Local IGP and **Incomplete**.
  5. In the IPv4 Settings section, specify a next hop IPv4 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv4 address then the packets can output at either IP address.  
Select to specify an IPv4 prefix list in the **Prefix List** drop-down list.
  6. In the IPv6 Settings section, specify a next hop IPv6 address of the next hop to which packets are output. It need not be an adjacent router. If you specify more than one IPv6 address, then the packets can output at any of the IP addresses.  
Select to specify an IPv6 prefix in the **Prefix List** drop-down list.

**Step 8** Click **Add**.

**Step 9** If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).

**Step 10** Click **Save**.

## Security Intelligence

Security Intelligence functionality requires the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

Security Intelligence *lists* and *feeds* are collections of IP addresses, domain names, and URLs that you can use to quickly filter traffic that matches an entry on a list or feed.

- A list is a static collection that you manage manually.
- A feed is a dynamic collection that updates on an interval over HTTP or HTTPS.

Security Intelligence lists/feeds are grouped into:

- DNS (Domain names )
- Network (IP addresses)
- URLs

### System-Provided Feeds

Cisco provides the following feeds as Security Intelligence objects:

- Security Intelligence feeds updated regularly with the latest threat intelligence from Talos:
  - Cisco-DNS-and-URL-Intelligence-Feed (under DNS Lists and Feeds)
  - Cisco-Intelligence-Feed (for IP addresses, under Network Lists and Feeds)

You cannot delete the system-provided feeds, but you can change the frequency of (or disable) their updates.

- Cisco-TID-Feed (under Network Lists and Feeds)

This feed is not used in the Security Intelligence tab of the access control policy.

Instead, you must enable and configure Secure Firewall Threat Intelligence Director to use this feed, which is a collection of TID observables data.

Use this object to set how frequently this data is published to TID elements.

For more information, see [Secure Firewall Threat Intelligence Director, on page 2687](#).

### Predefined Lists: Global Block Lists and Global Do Not Block Lists

The system ships with predefined global Block lists and Do Not Block lists for domains (DNS), IP addresses (Networks), and URLs.

These lists are empty until you populate them. To build these lists, see [Global and Domain Security Intelligence Lists, on page 1311](#).

By default, access control and DNS policies use these lists as part of Security Intelligence.

### Custom Feeds

You can use third-party feeds, or use a custom internal feed to easily maintain an enterprise-wide Block list in a large deployment with multiple Secure Firewall Management Center appliances.

See [Custom Security Intelligence Feeds, on page 1317](#).

### Custom Lists

Custom lists can augment and fine-tune feeds and the Global lists.

See [Custom Security Intelligence Lists, on page 1318](#).

### Where Security Intelligence Lists and Feeds Are Used

- IP address and address blocks—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence.
- Domain Names—Use Block and Do Not Block lists in DNS policies, as part of Security Intelligence.
- URLs—Use Block and Do Not Block lists in access control policies, as part of Security Intelligence. You can also use URL lists in access control and QoS rules, whose analysis and traffic handling phases occur after Security Intelligence.

## How to Modify Security Intelligence Objects

To add or delete entries on a Block list, Do Not Block list, feed, or sinkhole object:

Object Type	Edit Capabilities	Requires Redeploy After Edit?
Custom Block and Do Not Block lists	Upload new and replacement lists using the object manager.	No
Default (but custom-populated) Block lists and Do Not Block lists: Global, descendant, and domain-specific	Add entries using the context menu or delete entries using the object manager.	No
System-provided Intelligence Feeds	Disable or change update frequency using the object manager.	No
Custom feeds	Fully modify using the object manager.	No
Sinkhole	Fully modify using the object manager.	Yes

## Global and Domain Security Intelligence Lists

The Firewall Management Center includes Global Block and Do-Not-Block lists, which enable you to use Security Intelligence to consistently block specific connections or exempt certain connections from being blocked, allowing them to be evaluated by other threat detection processes you have configured.

For example, if you notice a set of routable IP addresses in intrusion events associated with exploit attempts, you can immediately block those IP addresses. Although it may take a few minutes for your changes to propagate, you do not have to redeploy.

By default, Access control and DNS policies use these Global lists, which apply to all security zones. You can opt not to use these lists on a per-policy basis.

### Note

These options apply to Security Intelligence only. Security Intelligence cannot block traffic that has already been fastpathed. Similarly, adding an item to a Security Intelligence Do Not Block list does not automatically trust or fastpath matching traffic. For more information, see [About Security Intelligence, on page 1747](#).

## Security Intelligence Lists and Multitenancy

Multitenancy adds:

- Domain lists—Block or Do Not Block lists whose contents apply to a particular subdomain only. The Global lists are Domain lists for the Global domain.
- Descendant Domain lists—Block or Do Not Block lists that aggregate the Domain lists of the current domain's descendants.

## Domain Lists

In addition to being able to access (but not edit) the Global lists, each subdomain has its own named lists, the contents of which apply only to that subdomain. For example, a subdomain named Company A owns:

- Domain Block list - Company A and Domain Do Not Block list - Company A
- Domain Block list for DNS - Company A, Domain Do Not Block list for DNS - Company A
- Domain Block list for URL - Company A, Domain Do Not Block list for URL - Company A

Any administrator at or above the current domain can populate these lists. You can use the context menu to add an item to the Block or Do Not Block list in the current and all descendant domains. However, only an administrator in the associated domain can remove an item from a Domain list.

For example, a Global administrator could choose to add the same IP address to the Block list in the Global domain and Company A's domain, but not add it to the Block list in Company B's domain. This action would add the same IP address to:

- Global Block list (where it can be removed only by Global administrators)
- Domain Block list - Company A (where it can be removed only by Company A administrators)

## Descendant Domain Lists

A Descendant Domain list is a Do Not Block list or Block list that aggregates the Domain lists of the current domain's descendants. Leaf domains do not have Descendant Domain lists.

Descendant Domain lists are useful because a higher-level domain administrator can enforce general Security Intelligence settings, while still allowing subdomain users to add items to a Block or Do Not Block list in their own deployment.

For example, the Global domain has the following Descendant Domain lists:

- Descendant Block lists - Global, Descendant Do Not Block lists - Global
- Descendant Block lists for DNS - Global, Descendant Do Not Block lists for DNS - Global
- Descendant Block lists for URL - Global, Descendant Do Not Block lists for URL - Global

---

**Note** Descendant Domain lists do not appear in the object manager because they are symbolic aggregations, not hand-populated lists. They appear where you can use them: in access control and DNS policies.

---

## Add Entries to Global Security Intelligence Lists

When reviewing events and dashboards, you can instantly block future traffic involving IP addresses, domains, and URLs that appear in those events by adding them to a predefined Block list.

Similarly, if Security Intelligence is blocking traffic that you want evaluated by threat detection processes subsequent to Security Intelligence blocking, you can add IP addresses, domains, and URLs from events to a predefined Do Not Block list.

Traffic is evaluated against entries on these lists during the Security Intelligence phase of threat detection.

For more information about these lists, see [Global and Domain Security Intelligence Lists, on page 1311](#).

### Before you begin

Because adding an entry to a Security Intelligence list affects access control, you must have one of the following user roles:

- Administrator
- A combination of roles: Network Admin or Access Admin, plus Security Analyst and Security Approver
- A custom role with both Modify Access Control Policy and Deploy Configuration to Devices permissions

If appropriate, verify that these lists are used in the policies in which you expect them to be used.

### Procedure

**Step 1** Navigate to an event that includes an IP address, domain, or URL that you want to always block using Security Intelligence, or exempt from Security Intelligence blocking.

**Step 2** Right-click the IP address, domain, or URL and choose the appropriate option:

Item Type	Context Menu Option
IP address	Add IP to Block List Add IP to Do-Not-Block List These options add the IP address to the respective lists for Networks.
URL	Add URL to Global Block List for URL Add URL to Global Do-Not-Block List for URL
Domain of a URL in the URL field	Add Domain to Global Block List for URL Add Domain to Global Do-Not-Block List for URL
Domain in the DNS Query field	Add Domain to Global Block List for DNS Add Domain to Global Do-Not-Block List for DNS

### What to do next

You do NOT need to redeploy for these changes to take effect.

If you want to delete an item from a list, see [Delete Entries from Global Security Intelligence Lists, on page 1313](#).

## Delete Entries from Global Security Intelligence Lists

**Note** To add entries to these lists, see [Add Entries to Global Security Intelligence Lists, on page 1312](#).

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Click **Security Intelligence**.
- Step 3** Click the appropriate option:
- **Network Lists and Feeds** (for IP addresses)
  - **DNS Lists and Feeds** (for domain names)
  - **URL Lists and Feeds**
- Step 4** Click the pencil beside the Global Block or Global Do-Not-Block list.
- Step 5** Click the trash button beside the entry to delete.
- 

## List and Feed Updates for Security Intelligence

List and feed updates replace the existing list or feed file with the contents of the new file. Contents of existing and new files are not merged.

If the system downloads a corrupt feed or a feed with no recognizable entries, the system continues using the old feed data (unless it is the first download). However, if the system can recognize even one entry in the feed, it uses the entries it can recognize.

By default, each feed updates the Management Center every two hours; you can modify this frequency. Any updates the Management Center receives are passed immediately to managed devices. In addition, managed devices poll the Firewall Management Center every 30 minutes for changes. You cannot modify this frequency.

To modify feed update intervals, see [Changing the Update Frequency for Security Intelligence Feeds, on page 1314](#).

## Changing the Update Frequency for Security Intelligence Feeds

You can specify the intervals at which the Firewall Management Center updates Security Intelligence Feeds.

For details about feed updates, see [List and Feed Updates for Security Intelligence, on page 1314](#).

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose the feed type whose frequency you want to change.
- The system-provided URL feed is combined with the domain feed under **DNS Lists and Feeds**.
- Step 3** Next to the feed you want to update, click **Edit** (✎).
- If **View** (👁) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.

**Step 4** Edit the **Update Frequency**.

**Step 5** Click **Save**.

## Custom Security Intelligence Lists and Feeds

### Custom Lists and Feeds: Requirements

#### List and Feed Formatting

Each list or feed must be a simple text file no larger than 500MB. List files must have the .txt extension. Include one entry or comment per line: one IP address, one URL, one domain name.

**Tip** The number of entries you can include is limited by the maximum size of the file. For example, a URL list with no comments and an average URL length of 100 characters (including Punycode or percent Unicode representations and newlines) can contain more than 5.24 million entries.

In a DNS list entry, you can specify an asterisk (\*) wildcard character for a domain label. All labels match the wildcard. For example, an entry of `www.example.*` matches both `www.example.com` and `www.example.co`.

If you add comment lines within the source file, they must start with the pound (#) character. If you upload a source file with comments, the system removes your comments during upload. Source files you download contain all your entries without your comments.

#### Feed Requirements

When you configure a feed, you specify its location using a URL; the URL cannot be Punycode-encoded.

For feed update intervals of 30 minutes or less, you must specify an MD5 URL. This prevents frequent downloads of unchanged feeds. If your feed server does not provide an MD5 URL, you must use a download interval of at least 30 minutes.

If you use an MD5 checksum, the checksum must be stored in a simple text file with only the checksum. Comments are not supported.

### URL Lists and Feeds: URL Syntax and Matching Criteria

Security Intelligence URL lists and feeds, including custom lists and feeds and entries in the global Block list and Do Not Block list, can include the following, which have the matching behavior as described:

- Hostnames

For example, `www.example.com`.

- URLs

`example.com` matches `example.com` and all subdomains, including `www.example.com`, `eu.example.com`, `example.com/abc`, and `www.example.com/def` -- but NOT `example.co.uk` or `examplexyz.com` or `example.com.malicious-site.com`

When a URL feed or list includes a single entry, every URL that ends with those domains is identified and blocked.

**Example:** When the following URL feed—**www.netflix.com, www.amazon.\*, org, edu, www.hulu.\*** is added to the global Block List, the following contents are blocked: <http://www.amazon.in>, <http://www.rajiv.org/>, <http://www.edu.edu/>, <http://www.edu.org/>, <http://org.org/> and <http://edu.edu>.

You can also include an entire URL path, such as

**<https://www.cisco.com/c/en/us/products/security/firewalls/index.html>**

**Note** You can create a custom URL, Network, and DNS feeds, wherein, you can add the username and password inside the URL itself, for example:

**<https://admin:password@server.domain.com/list.txt>**

However, if your password contain special characters such as a colon (:) or an at sign (@), the transmission would fail. Ensure that your password does not have any special characters. Alternatively, you could use an encoded password in the URL.

- A slash at the end of a URL to specify an exact match

**example.com/** matches ONLY **example.com**; it does NOT match **www.example.com** or any other URL.

- A wildcard (\*) to represent any domain in a URL

An asterisk can represent a complete domain string separated by dots, but not a partial domain string, and not any part of the URL following the first slash.

Valid examples:

- **\*.example.com**
- **www.\*.com**
- **example.\***

(This will match **example.com** and **example.org** and **example.de**, for example, but NOT **example.co.uk**)

- **\*.example.\***
- **example.\***

Invalid examples:

- **example\*.com**
- **example.com/\***

- IP addresses (IPv4)

For IPv6 addresses, or to use ranges or CIDR notation, use the Security Intelligence Network object.

You can include one or more wildcards representing an octet, for example **10.10.10.\*** or **10.10.\*.\***.

See also [Custom Security Intelligence Lists](#), on page 1318.

## Custom Security Intelligence Feeds

Custom or third-party Security Intelligence feeds allow you to augment the system-provided Intelligence Feeds with other regularly-updated reputable Block lists and Do Not Block lists on the Internet. You can also set up an internal feed, which is useful if you want to update multiple Secure Firewall Management Center appliances in your deployment using one source list.

**Note** You cannot add address blocks to Block or Do Not Block lists using a /0 netmask in a Security Intelligence feed. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of `any` for the **Source Networks** and **Destination Networks**.

You also can configure the system to use an MD5 checksum to determine whether to download an updated feed. If the checksum has not changed since the last time the system downloaded the feed, the system does not need to re-download it. You may want to use MD5 checksums for internal feeds, especially if they are large.

**Note** The system does **not** perform peer SSL certificate verification when downloading custom feeds, nor does the system support the use of certificate bundles or self-signed certificates to verify the remote peer.

If you want strict control over when the system updates a feed from the Internet, you can disable automatic updates for that feed. However, automatic updates ensure the most up-to-date, relevant data.

Manually updating Security Intelligence feeds updates all feeds, including the Intelligence Feeds.

See complete requirements at [Custom Lists and Feeds: Requirements, on page 1315](#).

### Creating Security Intelligence Feeds

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

#### Procedure

- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose a feed type you want to add.
- Step 3** Click the option appropriate to the feed type you chose above:
  - **Add Network Lists and Feeds** (for IP addresses)
  - **Add DNS Lists and Feeds**
  - **Add URL Lists and Feeds**
- Step 4** Enter a **Name** for the feed.
- Step 5** Choose **Feed** from the **Type** drop-down list.
- Step 6** Enter a **Feed URL**.
- Step 7** Enter an **MD5 URL**.

This is used to determine whether the feed contents have changed since the last update, so the system does not download unchanged feeds.

MD5 URL is required for update intervals shorter than 30 minutes.

If your feed server does not provide an MD5 URL, you must choose an interval of at least 30 minutes.

**Step 8** Choose an **Update Frequency**.

**Step 9** Click **Save**.

Unless you disabled feed updates, the system attempts to download and verify the feed.

---

## Manually Updating Security Intelligence Feeds

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

### Before you begin

At least one device must already be added to the management center.

### Procedure

---

**Step 1** Choose **Objects > Object Management**.

**Step 2** Expand the **Security Intelligence** node, then choose a feed type.

**Step 3** Click **Update Feeds**, then confirm.

**Step 4** Click **OK**.

---

After the Secure Firewall Management Center downloads and verifies the feed updates, it communicates any changes to its managed devices. Your deployment begins filtering traffic using the updated feeds.

## Custom Security Intelligence Lists

Security Intelligence lists are simple static lists of IP addresses and address blocks, URLs, or domain names that you manually upload to the system. Custom lists are useful if you want to augment and fine-tune feeds or one of the global lists, for a single Secure Firewall Management Center's managed devices.

For example, if a reputable feed improperly blocks your access to vital resources but is overall useful to your organization, you can create a custom Do Not Block list that contains only the improperly classified IP addresses, rather than removing the IP address feed object from the access control policy's Block list.

**Note** You cannot add address blocks to a Block or Do Not Block list using a /0 netmask in a Security Intelligence list. If you want to monitor or block all traffic targeted by a policy, use an access control rule with the **Monitor** or **Block** rule action, respectively, and a default value of `any` for the **Source Networks** and **Destination Networks**.

---

Regarding list entry formatting, note the following:

- Netmasks for address blocks can be integers from 0 to 32 or 0 to 128, for IPv4 and IPv6, respectively.
- Unicode in domain names must be encoded in Punycode format, and are case insensitive.
- Characters in domain names are case-insensitive.
- Unicode in URLs should be encoded in percent-encoding format.
- Characters in URL subdirectories are case-sensitive.
- List entries that start with the pound sign (#) are treated as comments.
- See additional formatting requirements at [Custom Lists and Feeds: Requirements, on page 1315](#).

Regarding matching list entries, note the following:

- The system matches sub-level domains if a higher-level domain exists in a URL or DNS list. For example, if you add `example.com` to a DNS list, the system matches both `www.example.com` and `test.example.com`.
- The system does not perform DNS lookups (forward or reverse) on DNS or URL list entries. For example, if you add `http://192.168.0.2` to a URL list, and it resolves to `http://www.example.com`, the system only matches `http://192.168.0.2`, not `http://www.example.com`.

## Uploading New Security Intelligence Lists to the Secure Firewall Management Center

To modify a Security Intelligence list, you must make your changes to the source file and upload a new copy. You cannot modify the file's contents using the web interface. If you do not have access to the source file, download a copy from the system.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Objects &gt; Object Management</b> .  |
| <b>Step 2</b> | Expand the <b>Security Intelligence</b> node, then choose a list type.  |
| <b>Step 3</b> | Click the option appropriate to the list you chose above: <ul style="list-style-type: none"><li>• <b>Add Network Lists and Feeds</b> (for IP addresses)</li><li>• <b>Add DNS Lists and Feeds</b></li><li>• <b>Add URL Lists and Feeds</b></li></ul> |
| <b>Step 4</b> | Enter a <b>Name</b> .   |
| <b>Step 5</b> | From the <b>Type</b> drop-down list, choose <b>List</b> .   |
| <b>Step 6</b> | Click <b>Browse</b> to browse to the list <code>.txt</code> file, then click <b>Upload</b> .  |
| <b>Step 7</b> | Click <b>Save</b> .   |
- 

### What to do next

You do not need to redeploy these changes to take effect. If you want to delete an entry from the list, see [Delete Entries from Global Security Intelligence Lists, on page 1313](#).

## Updating Security Intelligence Lists

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Expand the **Security Intelligence** node, then choose a list type.
- Step 3** Next to the list you want to update, click **Edit** (✎).
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** If you need a copy of the list to edit, click **Download**, then follow your browser's prompts to save the list as a text file.
- Step 5** Make changes to the list as necessary.
- Step 6** On the Security Intelligence pop-up window, click **Browse** to browse to the modified list, then click **Upload**.
- Step 7** Click **Save**.
- 

### What to do next

You do not need to redeploy these changes to take effect. If you want to delete an entry from the list, see [Delete Entries from Global Security Intelligence Lists, on page 1313](#).

## Sinkhole

A sinkhole object represents either a DNS server that gives non-routable addresses for all domain names within the sinkhole, or an IP address that does not resolve to a server. You can reference the sinkhole object within a DNS policy rule to redirect matching traffic to the sinkhole. You must assign the object both an IPv4 address and an IPv6 address.

## Creating Sinkhole Objects

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Sinkhole** from the list of object types.
- Step 3** Click **Add Sinkhole**.
- Step 4** Enter a **Name**.
- Step 5** Enter the **IPv4 Address** and **IPv6 Address** of your sinkhole.
- Step 6** You have the following options:

- If you want to redirect traffic to a sinkhole server, choose **Log Connections to Sinkhole**.
- If you want to redirect traffic to a non-resolving IP address, choose **Block and Log Connections to Sinkhole**.

- Step 7** If you want to assign an Indication of Compromise (IoC) type to your sinkhole, choose one from the **Type** drop-down.
- Step 8** Click **Save**.
- 

## SLA Monitor

Each Internet Protocol Service Level Agreement (SLA) monitor defines a connectivity policy to a monitored address and tracks the availability of a route to the address. The route is periodically checked for availability by sending ICMP echo requests and waiting for the response. If the requests time out, the route is removed from the routing table and replaced with a backup route. SLA monitoring jobs start immediately after deployment and continue to run unless you remove the SLA monitor from the device configuration (that is, they do not age out). The Internet Protocol Service Level Agreement (SLA) Monitor Object is used in the Route Tracking field of an IPv4 Static Route Policy. IPv6 routes do not have the option to use SLA monitor via route tracking.

You can use these objects with Firewall Threat Defense devices.

### Procedure

---

- Step 1** Select **Objects > Object Management** and choose **SLA Monitor** from the table of contents.
- Step 2** Click **Add SLA Monitor**.
- Step 3** Enter a name for the object in the **Name** field.
- Step 4** (Optional) Enter a description for the object in the **Description** field.
- Step 5** Enter the frequency of ICMP echo request transmissions, in seconds, in the **Frequency** field. Valid values range from 1 to 604800 seconds (7 days). The default is 60 seconds.
- Note**  
The frequency cannot be less than the timeout value; you must convert frequency to milliseconds to compare the values.
- Step 6** Enter the ID number of the SLA operation in the **SLA Monitor ID** field. Values range from 1 to 2147483647. You can create a maximum of 2000 SLA operations on a device. Each ID number must be unique to the policy and the device configuration.
- Step 7** Enter the amount of time that must pass after an ICMP echo request before a rising threshold is declared, in milliseconds, in the **Threshold** field. Valid values range from 0 to 2147483647 milliseconds. The default is 5000 milliseconds. The threshold value is used only to indicate events that exceed the defined value. You can use these events to evaluate the proper timeout value. It is not a direct indicator of the reachability of the monitored address.
- Note**  
The threshold value should not exceed the timeout value.

**Step 8** Enter the amount of time that the SLA operation waits for a response to the ICMP echo requests, in milliseconds, in the **Timeout** field. Values range from 0 to 604800000 milliseconds (7 days). The default is 5000 milliseconds. If a response is not received from the monitored address within the amount of time defined in this field, the static route is removed from the routing table and replaced by the backup route.

**Note**

The timeout value cannot exceed the frequency value (adjust the frequency value to milliseconds to compare the numbers).

**Step 9** Enter the size of the ICMP request packet payload, in bytes, in the **Data Size** field. Values range from 0 to 16384 bytes. The default is 28 bytes, which creates a total ICMP packet of 64 bytes. Do not set this value higher than the maximum allowed by the protocol or the Path Maximum Transmission Unit (PMTU). For purposes of reachability, you might need to increase the default data size to detect PMTU changes between the source and the target. A low PMTU can affect session performance and, if detected, might indicate that the secondary path should be used.

**Step 10** Enter a value for type of service (ToS) defined in the IP header of the ICMP request packet in the **ToS** field. Values range from 0 to 255. The default is 0. This field contains information such as delay, precedence, reliability, and so on. It can be used by other devices on the network for policy routing and features such as committed access rate.

**Step 11** Enter the number of packets that are sent in the **Number of Packets** field. Values range from 1 to 100. The default is 1 packet.

**Note**

Increase the default number of packets if you are concerned that packet loss might falsely cause the Secure Firewall Threat Defense device to believe that the monitored address cannot be reached.

**Step 12** Enter the IP address that is being monitored for availability by the SLA operation, in the **Monitored Address** field.

**Step 13** The **Available Zones** list displays both zones and interface groups. In the **Zones/Interfaces** list, add the zones or interface groups that contain the interfaces through which the device communicates with the management station. To specify a single interface, you need to create a zone or the interface groups for the interface; see [Create Security Zone and Interface Group Objects, on page 661](#). The host will be configured on a device only if the device includes the selected interfaces or zones.

**Step 14** Click **Save**.

## Time Range

Use time range objects to define time periods that you will use to determine when rules apply.

**Note** Time-based ACLs is supported in Snort 3 also from Firewall Management Center 7.0 onwards.

## Creating Time Range Objects

If you want a policy to apply only during a specified time range, create a time range object, then specify that object in the policy. Note that this object works on Firewall Threat Defense devices only.

You can specify time range objects only in policy types listed at the bottom of this topic.

**Note** The timezone represents the device's local time and is used **ONLY** for applying the time ranges in rules in the policies that support the time ranges. The timezone does not change the configured time of the device. To verify the configuration, in the Firewall Threat Defense CLI, use the **show time-range timezone** and **show time** commands (see the [Cisco Secure Firewall Threat Defense Command Reference](#) guide). In addition, the timezone of a chassis overrides the management center timezone.

### Before you begin

Time ranges are applied based on the time zone associated with the device that processes the traffic. By default, this is UTC. To change the time zone associated with a device, go to **Devices > Platform Settings**.

### Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Time Range** from the list of object types.

**Step 3** Click **Add Time Range**.

**Step 4** Enter values.

Observe the following guidelines:

- If you see a red error box around the object name you have entered, mouse over the **Name** field to see naming restrictions.
- All times are in UTC, unless you specify a time zone for the device in **Device > Platform Settings**.
- Enter times using a 24-hour clock. For example, enter 1:30 PM as 13:30.
- To specify a single continuous range, such as typical weekend hours (Fridays at 5pm through Mondays at 8am, including evenings and nights), choose Range Type **Range**.
- To specify part of multiple days, such as Monday through Friday from 8am to 5pm (excluding evenings, nights, and early mornings every day), choose Range Type **Daily Interval**.
- You can specify up to 28 time periods in a single object.
- To specify multiple noncontiguous times of day or different hours for different days, create multiple recurring intervals. For example, to apply a policy at all times other than standard working hours, create a single time range object with the following two recurring intervals:
  - A Daily Interval for Monday through Friday from 5pm through 8am, and
  - A Range recurring interval for Friday at 5pm through Monday at 8am.

**Step 5** Click **Save**.

**What to do next**

Configure time ranges in any of the following:

- Access control rules
- Prefilter rules
- Tunnel rules
- VPN group policy

In a VPN group policy object, specify the time range object using the **Access Hours** field. For details, see [Configure Group Policy Objects, on page 1346](#) and [Group Policy Advanced Options, on page 1352](#).

## Time Zone

To specify a local time zone for a managed device, create a time zone object and specify it in the device platform settings policy assigned to the device.

This device local time is used **ONLY** for applying time ranges in rules in policies that support time ranges, such as access control, prefilter, and VPN Group policies. If you do not assign a time zone to a device, UTC is used by default when applying time ranges in these policies. No other functionality in the system uses the time zone specified in a time zone object.

Time zone objects are supported only for Firewall Threat Defense devices.

---

**Note** Time-based ACLs is supported in Snort 3 also from Firewall Management Center 7.0 onwards.

---

## Tunnel Zone

A *tunnel zone* represents certain types of plaintext, passthrough tunnels that you explicitly tag for special analysis. A tunnel zone is not an interface object, even though you can use it as an interface constraint in some configurations.

For detailed information, see [Tunnel Zones and Prefiltering, on page 1790](#).

## URL

---

**Important** For best practices for using this and similar options in Security Intelligence configurations and for URL rules in access control and QoS policies, see [Manual URL Filtering Options, on page 1734](#).

---

A URL object defines a single URL or IP address, whereas a URL group object can define more than one URL or address. You can use URL objects and groups in various places in the system's web interface, including access control policies and event searches.

When creating URL objects, keep the following points in mind:

- If you do not include a path (that is, there are no / characters in the URL), the match is based on the server's hostname only. If you include one or more / character, the entire URL string is used for a substring match. Then, a URL is considered a match if any of the following are true:
  - The string is at the beginning of the URL.
  - The string follows a dot.
  - The string contains a dot in the beginning.
  - The string follows the :// characters.

For example, ign.com matches ign.com or www.ign.com, but not versign.com.

---

**Note** We recommend that you do not use manual URL filtering to block or allow individual web pages or parts of sites (that is, URL strings with / characters), as servers can be reorganized and pages moved to new paths.

---

- The system disregards the encryption protocol (HTTP vs HTTPS). In other words, if you block a website, both HTTP and HTTPS traffic to that website is blocked, unless you use an application condition to target a specific protocol. When creating a URL object, you do not need to specify the protocol when creating an object. For example, use example.com rather than http://example.com.
- If you plan to use a URL object to match HTTPS traffic in an access control rule, create the object using the subject common name in the public key certificate used to encrypt the traffic. Also, the system disregards subdomains within the subject common name, so do not include subdomain information. For example, use example.com rather than www.example.com.

However, please understand that the subject common name in the certificate might be completely unrelated to a web site's domain name. For example, the subject common name in the certificate for youtube.com is \*.google.com (this of course might change at any time). You will get more consistent results if you use the SSL Decryption policy to decrypt HTTPS traffic so that URL filtering rules work on decrypted traffic.

---

**Note** URL objects will not match HTTPS traffic if the browser resumes a TLS session because the certificate information is no longer available. Thus, even if you carefully configure the URL object, you might get inconsistent results for HTTPS connections.

---

## Creating URL Objects

### Procedure

- 
- Step 1** Choose **Objects > Object Management**.

- Step 2** Choose **URL** from the list of object types.
- Step 3** Choose **Add Object** from the **Add URL** drop-down list.
- Step 4** Enter a **Name**.
- Step 5** Optionally, enter a **Description**.
- Step 6** Enter the **URL** or IP address.
- Step 7** Manage overrides for the object:
- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
  - If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 1245](#).
- Step 8** Click **Save**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Variable Set

Variables represent values commonly used in intrusion rules to identify source and destination IP addresses and ports. You can also use variables in intrusion policies to represent IP addresses in rule suppressions, adaptive profile updates, and dynamic rule states.

---

**Tip** Preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.

---

You use variable sets to manage, customize, and group your variables. You can use the default variable set provided by the system or create your own custom sets. Within any set you can modify predefined default variables and add and modify user-defined variables.

Most of the shared object rules and standard text rules that the system provides use predefined default variables to define networks and port numbers. For example, the majority of the rules use the variable `$HOME_NET` to specify the protected network and the variable `$EXTERNAL_NET` to specify the unprotected (or outside) network. In addition, specialized rules often use other predefined variables. For example, rules that detect exploits against web servers use the `$HTTP_SERVERS` and `$HTTP_PORTS` variables.

Rules are more effective when variables more accurately reflect your network environment. At a minimum, you should modify default variables in the default set. By ensuring that a variable such as `$HOME_NET` correctly defines your network and `$HTTP_SERVERS` includes all web servers on your network, processing is optimized and all relevant systems are monitored for suspicious activity.

To use your variables, you link variable sets to intrusion policies associated with access control rules or with the default action of an access control policy. By default, the default variable set is linked to all intrusion policies used by access control policies.

Adding a variable to any set adds it to all sets; that is, each variable set is a collection of all variables currently configured on your system. Within any variable set, you can add user-defined variables and customize the value of any variable.

Initially, the system provides a single, default variable set comprised of predefined default values. Each variable in the default set is initially set to its default value, which for a predefined variable is the value set by the Talos Intelligence Group and provided in rule updates.

Although you can leave predefined default variables configured to their default values, Cisco recommends that you modify a subset of predefined variables.

You could work with variables only in the default set, but in many cases you can benefit most by adding one or more custom sets, configuring different variable values in different sets, and perhaps even adding new variables.

When using multiple sets, it is important to remember that the *current value* of any variable in the default set determines the *default value* of the variable in all other sets.

When you select **Variable Sets** on the Object Manager page, the object manager lists the default variable set and any custom sets you created.

On a freshly installed system, the default variable set is comprised only of the default variables predefined by Cisco.

Each variable set includes the default variables provided by the system and all custom variables you have added from any variable set. Note that you can edit the default set, but you cannot rename or delete the default set.

**Caution**

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

[Managing Variable Sets](#), on page 1337

## Variable Sets in Intrusion Policies

By default, the system links the default variable set to all intrusion policies used in an access control policy. When you deploy an access control policy that uses an intrusion policy, intrusion rules that you have enabled in the intrusion policy use the variable values in the linked variable set.

When you modify a custom variable set used by an intrusion policy in an access control policy, the system reflects the status for that policy as out-of-date on the Access Control Policy page. You must re-deploy the access control policy to implement changes in your variable set. When you modify the default set, the system reflects the status of all access control policies that use intrusion policies as out-of-date, and you must re-deploy all access control policies to implement your changes.

## Variables

Variables belong to one of the following categories:

## Default Variables

Variables provided by the system. You cannot rename or delete a default variable, and you cannot change its default value. However, you can create a customized version of a default variable.

## Customized Variables

Variables you create. These variables can include:

- *customized default variables*

When you edit the value for a default variable, the system moves the variable from the Default Variables area to the Customized Variables area. Because variable values in the default set determine the default values of variables in custom sets, customizing a default variable in the default set modifies the default value of the variable in all other sets.

- *user-defined variables*

You can add and delete your own variables, customize their values within different variable sets, and reset customized variables to their default values. When you reset a user-defined variable, it remains in the Customized Variables area.

User-defined variables can be one of the following types:

- *network* variables specify the IP addresses of hosts in your network traffic.
- *port* variables specify TCP or UDP ports in network traffic, including the value `any` for either type.

For example, if you create custom standard text rules, you might also want to add your own user-defined variables to more accurately reflect your traffic or as shortcuts to simplify the rule creation process. Alternatively, if you create a rule that you want to inspect traffic in the “demilitarized zone” (or DMZ) only, you can create a variable named `$DMZ` whose value lists the server IP addresses that are exposed. You can then use the `$DMZ` variable in any rule written for this zone.

## Advanced Variables

Variables provided by the system under specific conditions. These variables have a very limited deployment.

## Predefined Default Variables

By default, the system provides a single default variable set, which is comprised of predefined default variables. The Talos Intelligence Group uses rule updates to provide new and updated intrusion rules and other intrusion policy elements, including default variables.

Because many intrusion rules provided by the system use predefined default variables, you should set appropriate values for these variables. Depending on how you use variable sets to identify traffic on your network, you can modify the values for these default variables in any or all variable sets.

**Caution**

Importing an access control or an intrusion policy overwrites existing default variables in the default variable set with the imported default variables. If your existing default variable set contains a custom variable not present in the imported default variable set, the unique variable is preserved.

The following table describes the variables provided by the system and indicates which variables you typically would modify. For assistance determining how to tailor variables to your network, contact Professional Services or Support.

**Table 72: System-Provided Variables**

Variable Name	Description	Modify?
\$AIM_SERVERS	Defines known AOL Instant Messenger (AIM) servers, and is used in chat-based rules and rules that look for AIM exploits.	Not required.
\$DNS_SERVERS	Defines Domain Name Service (DNS) servers. If you create a rule that affects DNS servers specifically, you can use the \$DNS_SERVERS variable as a destination or source IP address.	Not required in current rule set.
\$EXTERNAL_NET	Defines the network that the system views as the unprotected network, and is used in many rules to define the external network.	Yes, you should adequately define \$HOME_NET and then exclude \$HOME_NET as the value for \$EXTERNAL_NET.
\$FILE_DATA_PORTS	Defines non-encrypted ports used in intrusion rules that detect files in a network stream.	Not required.
\$FTP_PORTS	Defines the ports of FTP servers on your network, and is used for FTP server exploit rules.	Yes, if your FTP servers use ports other than the default ports (you can view the default ports in the web interface).
\$GTP_PORTS	Defines the data channel ports where the packet decoder extracts the payload inside a GTP (General Packet Radio Service [GPRS] Tunneling Protocol) PDU.	Not required.
\$HOME_NET	Defines the network that the associated intrusion policy monitors, and is used in many rules to define the internal network.	Yes, to include the IP addresses for your internal network.
\$HTTP_PORTS	Defines the ports of web servers on your network, and is used for web server exploit rules.	Yes, if your web servers use ports other than the default ports (you can view the default ports in the web interface).
\$HTTP_SERVERS	Defines the web servers on your network. Used in web server exploit rules.	Yes, if you run HTTP servers.
\$ORACLE_PORTS	Defines Oracle database server ports on your network, and is used in rules that scan for attacks on Oracle databases.	Yes, if you run Oracle servers.
\$SHELLCODE_PORTS	Defines the ports you want the system to scan for shell code exploits, and is used in rules that detect exploits that use shell code.	Not required.
\$SIP_PORTS	Defines the ports of SIP servers on your network, and is used for SIP exploit rules.	Not required.

Variable Name	Description	Modify?
<code>\$SIP_SERVERS</code>	Defines SIP servers on your network, and is used in rules that address SIP-targeted exploits.	Yes, if you run SIP servers, you should adequately define <code>\$HOME_NET</code> and then include <code>\$HOME_NET</code> as the value for <code>\$SIP_SERVERS</code> .
<code>\$SMTP_SERVERS</code>	Defines SMTP servers on your network, and is used in rules that address exploits that target mail servers.	Yes, if you run SMTP servers.
<code>\$SNMP_SERVERS</code>	Defines SNMP servers on your network, and is used in rules that scan for attacks on SNMP servers.	Yes, if you run SNMP servers.
<code>\$SNORT_BPF</code>	Identifies a legacy advanced variable that appears only when it existed on your system in a software release before Version 5.3.0 that you subsequently upgraded to Version 5.3.0 or greater.	No, you can only view or delete this variable. You cannot edit it or recover it after deleting it.
<code>\$SQL_SERVERS</code>	Defines database servers on your network, and is used in rules that address database-targeted exploits.	Yes, if you run SQL servers.
<code>\$SSH_PORTS</code>	Defines the ports of SSH servers on your network, and is used for SSH server exploit rules.	Yes, if your SSH servers use ports other than the default port (you can view the default ports in the web interface).
<code>\$SSH_SERVERS</code>	Defines SSH servers on your network, and is used in rules that address SSH-targeted exploits.	Yes, if you run SSH servers, you should adequately define <code>\$HOME_NET</code> and then include <code>\$HOME_NET</code> as the value for <code>\$SSH_SERVERS</code> .
<code>\$TELNET_SERVERS</code>	Defines known Telnet servers on your network, and is used in rules that address Telnet server-targeted exploits.	Yes, if you run Telnet servers.
<code>\$USER_CONF</code>	Provides a general tool that allows you to configure one or more features not otherwise available via the web interface.  Conflicting or duplicate <code>\$USER_CONF</code> configurations will halt the system.	No, only as instructed in a feature description or with the guidance of Support.

## Network Variables

Network variables represent IP addresses you can use in intrusion rules that you enable in an intrusion policy and in intrusion policy rule suppressions, dynamic rule states, and adaptive profile updates. Network variables differ from network objects and network object groups in that network variables are specific to intrusion policies and intrusion rules, whereas you can use network objects and groups to represent IP addresses in various places in the system's web interface, including access control policies, network variables, intrusion rules, network discovery rules, event searches, reports, and so on.

You can use network variables in the following configurations to specify the IP addresses of hosts on your network:

- intrusion rules—Intrusion rule **Source IPs** and **Destination IPs** header fields allow you to restrict packet inspection to the packets originating from or destined to specific IP addresses.

- **suppressions**—The **Network** field in source or destination intrusion rule suppressions allows you to suppress intrusion event notifications when a specific IP address or range of IP addresses triggers an intrusion rule or preprocessor.
- **dynamic rule states**—The **Network** field in source or destination dynamic rule states allows you to detect when too many matches for an intrusion rule or preprocessor rule occur in a given time period.
- **adaptive profile updates**—When you enable adaptive profile updates, the adaptive profiles **Networks** field identifies hosts where you want to improve reassembly of packet fragments and TCP streams in passive deployments.

When you use variables in the fields identified in this section, the variable set you link to an intrusion policy determines the variable values in the network traffic handled by an access control policy that uses the intrusion policy.

You can add any combination of the following network configurations to a variable:

- any combination of network variables, network objects, and network object groups that you select from the list of available networks
- individual network objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables
- literal, single IP addresses or address blocks

You can list multiple literal IP addresses and address blocks by adding each individually. You can list IPv4 and IPv6 addresses and address blocks alone or in any combination. When specifying IPv6 addresses, you can use any addressing convention defined in RFC 4291.

The default value for included networks in any variable you add is the word **any**, which indicates any IPv4 or IPv6 address. The default value for excluded networks is **none**, which indicates no network. You can also specify the address **::** in a literal value to indicate any IPv6 address in the list of included networks, or no IPv6 addresses in the list of exclusions.

Adding networks to the excluded list negates the specified addresses and address blocks. That is, you can match any IP address with the exception of the excluded IP address or address blocks.

For example, excluding the literal address **192.168.1.1** specifies any IP address other than 192.168.1.1, and excluding **2001:db8:ca2e::fa4c** specifies any IP address other than 2001:db8:ca2e::fa4c.

You can exclude any combination of networks using literal or available networks. For example, excluding the literal values **192.168.1.1** and **192.168.1.5** *includes* any IP address other than 192.168.1.1 or 192.168.1.5. That is, the system interprets this as “**not** 192.168.1.1 **and not** 192.168.1.5,” which matches any IP address other than those listed between brackets.

Note the following points when adding or editing network variables:

- You cannot logically exclude the value **any** which, if excluded, would indicate no address. For example, you cannot add a variable with the value **any** to the list of excluded networks.
- Network variables identify traffic for the specified intrusion rule and intrusion policy features. Note that preprocessor rules can trigger events regardless of the hosts defined by network variables used in intrusion rules.
- Excluded values must resolve to a subset of included values. For example, you cannot include the address block 192.168.5.0/24 and exclude 192.168.6.0/24.

## Port Variables

Port variables represent TCP and UDP ports you can use in the **Source Port** and **Destination Port** header fields in intrusion rules that you enable in an intrusion policy. Port variables differ from port objects and port object groups in that port variables are specific to intrusion rules. You can create port objects for protocols other than TCP and UDP, and you can use port objects in various places in the system's web interface, including port variables, access control policies, network discovery rules, and event searches.

You can use port variables in the intrusion rule **Source Port** and **Destination Port** header fields to restrict packet inspection to packets originating from or destined to specific TCP or UDP ports.

When you use variables in these fields, the variable set you link to the intrusion policy associated with an access control rule or policy determines the values for these variables in the network traffic where you deploy the access control policy.

You can add any combination of the following port configurations to a variable:

- any combination of port variables and port objects that you select from the list of available ports

Note that the list of available ports does not display port object groups, and you cannot add these to variables.

- individual port objects that you add from the New Variable or Edit Variable page, and can then add to your variable and to other existing and future variables

Only TCP and UDP ports, including the value `any` for either type, are valid variable values. If you use the new or edit variables page to add a valid port object that is not a valid variable value, the object is added to the system but is not displayed in the list of available objects. When you use the object manager to edit a port object that is used in a variable, you can only change its value to a valid variable value.

- single, literal port values and port ranges

You must separate port ranges with a dash (-). Port ranges indicated with a colon (:) are supported for backward compatibility, but you cannot use a colon in port variables that you create.

You can list multiple literal port values and ranges by adding each individually in any combination.

Note the following points when adding or editing port variables:

- The default value for included ports in any variable you add is the word `any`, which indicates any port or port range. The default value for excluded ports is `none`, which indicates no ports.

---

**Tip** To create a variable with the value `any`, name and save the variable without adding a specific value.

---

- You cannot logically exclude the value `any` which, if excluded, would indicate no ports. For example, you cannot save a variable set when you add a variable with the value `any` to the list of excluded ports.
- Adding ports to the excluded list negates the specified ports and port ranges. That is, you can match any port with the exception of the excluded ports or port ranges.
- Excluded values must resolve to a subset of included values. For example, you cannot include the port range 10-50 and exclude port 60.

## Advanced Variables

Advanced variables allow you to configure features that you cannot otherwise configure via the web interface. The system currently provides only one advanced variable, the USER\_CONF variable.

### USER\_CONF

USER\_CONF provides a general tool that allows you to configure one or more features not otherwise available via the web interface.

**Caution**

Do **not** use the advanced variable USER\_CONF to configure an intrusion policy feature unless you are instructed to do so in the feature description or by Support. Conflicting or duplicate configurations will halt the system.

When editing USER\_CONF, you can type up to 4096 total characters on a single line; the line wraps automatically. You can include any number of valid instructions or lines until you reach the 8192 maximum character length for a variable or a physical limit such as disk space. Use the backslash (\) line continuation character after any complete argument in a command directive.

Resetting USER\_CONF empties it.

## Variable Reset

You can reset a variable to its default value on the variable set new or edit variables page. The following table summarizes the basic principles of resetting variables.

**Table 73: Variable Reset Values**

Resetting this variable type...	In this set type...	Resets it to...
default	default	the rule update value
user-defined	default	any
default or user-defined	custom	the current default set value (modified or unmodified)

Resetting a variable in a custom set simply resets it to the current value for that variable in the default set.

Conversely, resetting or modifying the value of a variable in the default set always updates the default value of that variable in all custom sets. When the reset icon is grayed out, indicating that you cannot reset the variable, this means that the variable has no customized value in that set. Unless you have customized the value for a variable in a custom set, a change to the variable in the default set updates the value used in any intrusion policy where you have linked the variable set.

**Note**

It is good practice when you modify a variable in the default set to assess how the change affects any intrusion policy that uses the variable in a linked custom set, especially when you have not customized the variable value in the custom set.

You can hover your pointer over the **Reset icon** in a variable set to see the reset value. When the customized value and the reset value are the same, this indicates one of the following:

- you are in the custom or default set where you added the variable with the value `any`
- you are in the custom set where you added the variable with an explicit value and elected to use the configured value as the default value

## Adding Variables to Sets

Adding a variable to a variable set adds it to all other sets. When you add a variable from a custom set, you must choose whether to use the configured value as the customized value in the default set:

- **If you use the configured value** (for example, `192.168.0.0/16`), the variable is added to the default set using the configured value as a customized value with a default value of `any`. Because the current value in the default set determines the default value in other sets, the initial, default value in other custom sets is the configured value (which in the example is `192.168.0.0/16`).
- **If you do not use the configured value**, the variable is added to the default set using only the default value `any` and, consequently, the initial, default value in other custom sets is `any`.

### Example: Adding User-Defined Variables to Default Sets

The following diagram illustrates set interactions when you add the user-defined variable `Var1` to the default set with the value `192.168.1.0/24`.

You can customize the value of `Var1` in any set. In Custom Set 2 where `Var1` has not been customized, its value is `192.168.1.0/24`. In Custom Set 1 the customized value `192.168.2.0/24` of `Var1` overrides the default value. Resetting a user-defined variable in the default set resets its default value to `any` in all sets.

It is important to note in this example that, if you do not update `Var1` in Custom Set 2, further customizing or resetting `Var1` in the default set consequently updates the current, default value of `Var1` in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

Although not shown in the example, note that interactions between sets are the same for user-defined variables and default variables except that resetting a default variable in the default set resets it to the value configured by Cisco in the current rule update.

### Example: Adding User-Defined Variables to Custom Sets

The next two examples illustrate variable set interactions when you add a user-defined variable to a custom set. When you save the new variable, you are prompted whether to use the configured value as the default value for other sets. In the following example, you elect **to use** the configured value.

Note that, except for the origin of `Var1` from Custom Set 1, this example is identical to the example above where you added `Var1` to the default set. Adding the customized value 192.168.1.0/24 for `Var1` to Custom Set 1 copies the value to the default set as a customized value with a default value of `any`. Thereafter, `Var1` values and interactions are the same as if you had added `Var1` to the default set. As with the previous example, keep in mind that further customizing or resetting `Var1` in the default set consequently updates the current, default value of `Var1` in Custom Set 2, thereby affecting any intrusion policy linked to the variable set.

In the next example, you add `Var1` with the value 192.168.1.0/24 to Custom Set 1 as in the previous example, but you elect **not to use** the configured value of `Var1` as the default value in other sets.

This approach adds `Var1` to all sets with a default value of `any`. After adding `Var1`, you can customize its value in any set. An advantage of this approach is that, by not initially customizing `Var1` in the default set, you decrease your risk of customizing the value in the default set and thus inadvertently changing the current value in a set such as Custom Set 2 where you have not customized `Var1`.

## Nesting Variables

You can nest variables so long as the nesting is not circular. Nested, negated variables are not supported.

### Valid Nested Variables

In this example, `SMTP_SERVERS`, `HTTP_SERVERS`, and `OTHER_SERVERS` are valid nested variables.

Variable	Type	Included Networks	Excluded Networks
<code>SMTP_SERVERS</code>	customized default	10.1.1.1	—
<code>HTTP_SERVERS</code>	customized default	10.1.1.2	—
<code>OTHER_SERVERS</code>	user-defined	10.2.2.0/24	—
<code>HOME_NET</code>	customized default	10.1.1.0/24 OTHER_SERVERS	SMTP_SERVERS HTTP_SERVERS

### An Invalid Nested Variable

In this example, HOME\_NET is an invalid nested variable because the nesting of HOME\_NET is circular; that is, the definition of OTHER\_SERVERS includes HOME\_NET, so you would be nesting HOME\_NET in itself.

Variable	Type	Included Networks	Excluded Networks
SMTP_SERVERS	customized default	10.1.1.1	—
HTTP_SERVERS	customized default	10.1.1.2	—
OTHER_SERVERS	user-defined	10.2.2.0/24 HOME_NET	—
HOME_NET	customized default	10.1.1.0/24 OTHER_SERVERS	SMTP_SERVERS HTTP_SERVERS

### An Unsupported Nested, Negated Variable

Because nested, negated variables are not supported, you cannot use the variable NONCORE\_NET as shown in this example to represent IP addresses that are outside of your protected networks.

Variable	Type	Included Networks	Excluded Networks
HOME_NET	customized default	10.1.0.0/16 10.2.0.0/16 10.3.0.0/16	—
EXTERNAL_NET	customized default	—	HOME_NET
DMZ_NET	user-defined	10.4.0.0/16	—
NOT_DMZ_NET	user-defined	—	DMZ_NET
NONCORE_NET	user-defined	EXTERNAL_NET NOT_DMZ_NET	—

### Alternative to an Unsupported Nested, Negated Variable

As an alternative to the example above, you could represent IP addresses that are outside of your protected networks by creating the variable NONCORE\_NET as shown in this example.

Variable	Type	Included Networks	Excluded Networks
HOME_NET	customized default	10.1.0.0/16 10.2.0.0/16 10.3.0.0/16	—
DMZ_NET	user-defined	10.4.0.0/16	—
NONCORE_NET	user-defined	—	HOME_NET DMZ_NET

## Managing Variable Sets

To use variable sets, you must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

### Procedure

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **Variable Set** from the list of object types.

**Step 3** Manage your variable sets:

- **Add** — If you want to add a custom variable set, click **Add Variable Set**; see [Creating Variable Sets, on page 1338](#).
- **Delete** — If you want to delete a custom variable set, click **Delete** (🗑) next to the variable set, then click **Yes**. You cannot delete the default variable set or variable sets belonging to ancestor domains.

#### Note

Variables created in a variable set you delete are not deleted or otherwise affected in other sets.

- **Edit** — If you want to edit a variable set, click **Edit** (✎) next to the variable set you want to modify; see [Editing Objects, on page 1239](#).
- **Filter** — If you want to filter variable sets by name, begin entering a name; as you type, the page refreshes to display matching names. If you want to clear name filtering, click **Clear** (✕) in the filter field.
- **Manage Variables** — To manage the variables included in variable sets, see [Managing Variables, on page 1338](#).

## Creating Variable Sets

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
  - Step 2** Choose **Variable Set** from the list of object types.
  - Step 3** Click **Add Variable Set**.
  - Step 4** Enter a **Name**.
  - Step 5** Optionally, enter a **Description**.
  - Step 6** Manage the variables in the set; see [Managing Variables, on page 1338](#).
  - Step 7** Click **Save**.
- 

### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Managing Variables

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

### Procedure

---

- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Variable Set** from the list of object types.
- Step 3** Click **Edit** () next to the variable set you want to edit.  
  
If **View** () appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 4** Manage your variables:
  - Display — If you want to display the complete value for a variable, hover your pointer over the value in the **Value** column next to the variable.
  - Add — If you want to add a variable, click **Add**; see [Adding Variables, on page 1339](#).
  - Delete — Click **Delete** () next to the variable. If you have saved the variable set since adding the variable, click **Yes** to confirm that you want to delete the variable.

You *cannot* delete the following:

- default variables
- user-defined variables that are used by intrusion rules or other variables

- variables belonging to ancestor domains
- Edit — Click **Edit** (✎) next to the variable you want to edit; see [Editing Variables, on page 1340](#).
- Reset — If you want to reset a modified variable to its default value, click **Reset** next to a modified variable. If reset is dimmed, one of the following is true:
  - The current value is already the default value.
  - The configuration belongs to an ancestor domain.

**Tip**

Hover your pointer over an active reset to display the default value.

**Step 5** Click **Save** to save the variable set. If the variable set is in use by an access control policy, click **Yes** to confirm that you want to save your changes.

Because the current value in the default set determines the default value in all other sets, modifying or resetting a variable in the default set changes the current value in other sets where you have not customized the default value.

---

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Adding Variables

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

**Procedure**

---

**Step 1** In the variable set editor, click **Add**.

**Step 2** Enter a unique variable **Name**.

**Step 3** From the **Type** drop-down list, choose either **Network** or **Port**.

**Step 4** Specify values for the variable:

- If you want to move items from the list of available networks or ports to the list of included or excluded items, you can choose one or more items and then drag and drop, or click **Include** or **Exclude**.

**Tip**

If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.

- Enter a single literal value, then click **Add**. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

- If you want to remove an item from the included or excluded lists, click **Delete** (  ) next to the item.

**Note**

The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

- Step 5** Click **Save** to save the variable. If you are adding a new variable from a custom set, you have the following options:
- Click **Yes** to add the variable using the configured value as the customized value in the default set and, consequently, the default value in other custom sets.
  - Click **No** to add the variable as the default value of `any` in the default set and, consequently, in other custom sets.
- Step 6** Click **Save** to save the variable set. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.
- 

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Editing Variables

You must have the IPS license (for Firewall Threat Defense devices) or the Protection license (all other device types).

You can edit both custom and default variables.

You cannot change the **Name** or **Type** values in an existing variable.

**Procedure**

- 
- Step 1** In the variable set editor, click **Edit** (  ) next to the variable you want to modify.
- If **View** (  ) appears instead, the object belongs to an ancestor domain, or you do not have permission to modify the object.
- Step 2** Modify the variable:
- If you want to move items from the list of available networks or ports to the list of included or excluded items, you can select one or more items and then drag and drop, or click **Include** or **Exclude**.
- Tip**  
If addresses or ports in the included and excluded lists for a network or port variable overlap, excluded addresses or ports take precedence.
- Enter a single literal value, then click **Add**. For network variables, you can enter a single IP address or address block. For port variables you can add a single port or port range, separating the upper and lower values with a hyphen (-). Repeat this step as needed to enter multiple literal values.

- If you want to remove an item from the included or excluded lists, click **Delete** (  ) next to the item.

**Note**

The list of items to include or exclude can be comprised of any combination of literal strings and existing variables, objects, and network object groups in the case of network variables.

**Step 3** Click **Save** to save the variable.

**Step 4** Click **Save** to save the variable set. If the variable set is in use by an access control policy, click **Yes** to confirm that you want to save your changes. Your changes are saved, and any access control policy the variable set is linked to displays an out-of-date status.

---

**What to do next**

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## VLAN Tag

Each VLAN tag object you configure represents a VLAN tag or range of tags.

You can group VLAN tag objects. Groups represent multiple objects; using a range of VLAN tags in a single object is not considered a group in this sense.

You can use VLAN tag objects and groups in various places in the system's web interface, including rules and event searches. For example, you could write an access control rule that applies only to a specific VLAN.

## Creating VLAN Tag Objects

---

**Procedure**

**Step 1** Choose **Objects > Object Management**.

**Step 2** Choose **VLAN Tag** from the list of object types.

**Step 3** Choose **Add Object** from the **Add VLAN Tag** drop-down list.

**Step 4** Enter a **Name**.

**Step 5** Enter a **Description**.

**Step 6** Enter a value in the **VLAN Tag** field. Use a hyphen to specify a range of VLAN tags.

**Step 7** Manage overrides for the object:

- If you want to allow overrides for this object, check the **Allow Overrides** check box; see [Allowing Object Overrides, on page 1244](#).
- If you want to add override values to this object, expand the Override section and click **Add**; see [Adding Object Overrides, on page 1245](#).

**Step 8** Click **Save**.

---

#### What to do next

- If an active policy references your object, deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## VPN

You can use the following VPN objects on Firewall Threat Defense devices. To use these objects, you must have Admin privileges, and your Smart License account must satisfy export controls. You can configure these objects in leaf domains only.

## Certificate Map Objects

Certificate Map objects are a named set of certificate matching rules. These objects are used to provide an association between a received certificate and a Remote Access VPN connection profile. Connection Profiles and Certificate Map objects are both part of a remote access VPN policy. If a received certificate matches the rules contained in the certificate map, the connection is "mapped", or associated with the specified connection profile. The rules are in priority order, they are matched in the order they are shown in the UI. The matching ends when the first rule within the Certificate Map object results in a match.

#### Navigation

**Objects > Object Management > VPN > Certificate Map**

#### Fields

- **Name**—Identify this object so it can be referred to from other configurations, such as Remote Access VPN.
- **Mapping Criteria**—Specify the contents of the certificate to evaluate. If the certificate satisfies these rules, the user will be mapped to the connection profile containing this object.
  - **Field**—Select the field for the matching rule according to the Subject or the Issuer of the client certificate.  
  
If the **Field** is set to *Alternative Subject* or *Extended Key Usage* the Component will be frozen as *Whole Field*
  - **Component**—Select the component of the client certificate to use for the matching rule.

#### Note

**SER (Serial Number) component** - Ensure you specify the serial number for the Subject field. The certificate map only matches with a serial number attribute in the subject name.

- **Operator**—Select the operator for the matching rule as follows:

- **Equals**—The certificate component must match the entered value. If they do not match exactly, the connection is denied.
  - **Contains**—The certificate component must contain the entered value. If the component does not contain the value, the connection is denied.
  - **Does Not Equal**—The certificate component cannot equal the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client country value equals US, then the connection is denied.
  - **Does Not Contain**—The certificate component cannot contain the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client country value contains US, the connection is denied.
- **Value**—The value of the matching rule. The value entered is associated with the selected component and operator.

#### Related Topics

[Configure Certificate Maps](#), on page 1496

## Secure Client Custom Attributes Objects

Custom attributes are used by the Secure Client to configure features such as Per App VPN, Allow or defer upgrade, and Dynamic split tunneling. A custom attribute has a type and a named value. The type of the attribute is defined first, then one or more named values of this type can be defined. You can create the Secure Client custom attributes objects using the Firewall Management Center, add the objects to a group policy and associate the group policy with a remote access VPN to enable the features for the VPN clients.

Firewall Threat Defense supports the following features using the custom attribute objects:

- **Per App VPN**—The Per App VPN feature helps identify an app and tunnel only applications allowed by the Firewall Threat Defense administrator over the VPN.
- **Allow or defer upgrade**—Deferred Upgrade allows the Secure Client user to delay download of the Secure Client upgrade. When a client update is available, you can configure the attributes for Secure Client to open a dialog asking the user if they would like to update, or to defer the upgrade.
- **Dynamic Split Tunneling**—With dynamic split tunneling, you can provision policies that either include or exclude IP addresses or networks from the VPN tunnel. Dynamic split tunneling is configured by creating a custom attribute and adding it to a group policy.

For step-by-step instructions to configure Secure Client custom attributes, see [Add Secure Client Custom Attributes Objects](#), on page 1344 and

For details about the specific custom attributes to configure for a feature, see the *Cisco Secure Client (including AnyConnect) Administrator Guide* for the Secure Client release you are using.

[Group Policy Secure Client Options](#), on page 1349

## Add Secure Client Custom Attributes Objects

### Before you begin

Ensure that you have done the following before adding a custom attribute object for Per App VPN:

- Per App VPN must be properly configured via MDM and each device must be enrolled to the MDM server
- Create a base64 encoded string for each app using the Cisco Secure Client Enterprise Application Selector Tool.
  1. Download the Cisco Secure Client Enterprise Application Selector Tool from [here](#).
  2. Open the Application Selection Tool and select the mobile platform from the drop-down menu located on the upper left.
  3. Add rule by entering Friendly name and App ID; rest of the fields are optional.
  4. On the menu bar, click on **Policy**. The encoded base65 rule is displayed in its encoded format.
  5. Select and copy the policy string, and save it to use later when you create the Secure Client Custom Attributes object.

### Procedure

---

**Step 1** Choose **Objects > Object Management > VPN > Custom Attribute**.

**Step 2** Click **Secure Client Custom Attribute**.

**Step 3** Enter a **Name** and optionally a **Description** for the attribute.

**Step 4** Select an attribute from the **Secure Client Attribute** drop-down list:

- **Per App VPN** — Select this option and specify the base64 encoded string in the **Attribute Value** box.
- **Allow Defer Update**—Select one of the following options and specify the required information to allow or defer Secure Client update:
  - **Show the prompt until user takes action**—Display the prompt to the VPN user until the user chooses to allow or defer the VPN client update.
  - **Show the prompt until times out**—Choose this option to display the prompt for a specified duration and specify the duration in the **Timeout** box.
  - **Do not show the prompt and take automatic action**—Choose this option to automatically allow or defer the VPN update.
  - **Default Action**—Select the default action to be taken when the user does not respond, or when you want to configure an automatic action without the user's intervention. You can choose to update the Secure Client or postpone the update.
  - **Minimum Version**—Specify the minimum Secure Client version to be present on the client system to allow or defer the update.

- **Dynamic Split Tunneling**—Select this option to include or exclude IP addresses or networks from the VPN tunnel.
  - **Include domains**—Specify domain names that will be included in the remote access VPN tunnel.
  - **Exclude domains**—Specify domain names that will be excluded from the remote access VPN tunnel.

**Step 5** Select the **Allow Overrides** check box to allow object overrides.

**Step 6** Click **Save**.  
The custom attributes object is added to the list.

---

### What to do next

Associate the custom attributes with a group policy. See [Add Custom Attributes to a Group Policy, on page 1345](#).

## Add Custom Attributes to a Group Policy

You must associate Secure Client custom attributes with a group policy to use them for remote access VPN connections. You

### Procedure

---

**Step 1** Select **Objects > Object Management > VPN > Group Policy**.

**Step 2** Add a new group policy or edit an existing group policy.

**Step 3** Click **Secure Client > Custom Attributes**.

**Step 4** Click **Add**.

**Step 5** Select the **Secure Client Attribute**: Per App VPN, Allow Defer Update, or Dynamic Split Tunneling.

**Step 6** Select a **Custom Attribute Object** from the list.

#### Note

Click Add (+) to create a new custom attribute object for the selected Secure Client attribute. You can also create a custom attribute object at **Objects > Object Management > VPN > Custom Attribute**. See [Add Secure Client Custom Attributes Objects, on page 1344](#).

**Step 7** Click **Add** to save the attributes to the group policy and then click **Save** to save the changes to the group policy.

---

### Related Topics

[Group Policy Secure Client Options, on page 1349](#)

## Firewall Threat Defense Group Policy Objects

A group policy is a set of attribute and value pairs, stored in a group policy object, that define the remote access VPN experience. For example, in the group policy object, you configure general attributes such as addresses, protocols, and connection settings.

The group policy applied to a user is determined when the VPN tunnel is being established. The RADIUS authorization server assigns the group policy, or it is obtained from the current connection profile.

**Note** There is no group policy attribute inheritance on the Firewall Threat Defense. A group policy object is used, in its entirety, for a user. The group policy object identified by the AAA server upon login is used, or, if that is not specified, the default group policy configured for the VPN connection is used. The provided default group policy can be set to your default values, but will only be used if it is assigned to a connection profile and no other group policy has been identified for the user.

To use group objects, you must have one of these Secure Client licenses associated with your Smart License account with Export-Controlled Features enabled:

- Secure Client VPN Only
- Secure Client Advantage
- Secure Client Premier

### Related Topics

[Configure Group Policy Objects](#), on page 1346

## Configure Group Policy Objects

See [Firewall Threat Defense Group Policy Objects](#), on page 1346.

### Procedure

- 
- Step 1** Choose **Objects > Object Management > VPN > Group Policy**.
- Previously configured policies are listed including the system default. Depending on your level of access, you may edit, view, or delete a group policy.
- Step 2** Click **Add Group Policy** or choose a current policy to edit.
- Step 3** Enter a **Name** and optionally a **Description** for this policy.
- The name can be up to 64 characters, spaces are allowed. The description can be up to 1,024 characters.
- Step 4** Specify the **General** parameters for this Group Policy as described in [Group Policy General Options](#), on page 1347.
- Step 5** Specify the **Secure Client** parameters for this Group Policy as described in [Group Policy Secure Client Options](#), on page 1349.
- Step 6** Specify the **Advanced** parameters for this Group Policy as described in [Group Policy Advanced Options](#), on page 1352.
- Step 7** Click **Save**.

The new Group Policy is added to the list.

---

### What to do next

Add the group policy object to a remote access VPN connection profile.

## Group Policy General Options

### Navigation Path

**Objects > Object Management > VPN > Group Policy**, Click **Add Group Policy** or choose a current policy to edit., then select the **General** tab.

### VPN Protocols Fields

Specify the types of Remote Access VPN tunnels that can be used when applying this group policy. **SSL** or **IPsec IKEv2**.

### IP Address Pools

Specifies the IPv4 address assignment that is applied based on address pools that are specific to user-groups in Remote Access VPN. For Remote Access VPN, you can assign IP address from specific address pools for identified user groups using RADIUS/ISE for authorization. You can seamlessly perform policy enforcement for user or user groups in systems which are not identity-aware, by configuring particular Group Policy as RADIUS Authorization attribute (GroupPolicy/Class), for a particular user group. For example, you have to select a specific address pool for contractors and policy enforcement using those addresses to allow restricted access to internal network.

The order of preference that Firewall Threat Defense device assigns the IPv4 Address Pools to the clients:

1. RADIUS attribute for IPv4Address Pool
2. RADIUS attribute for Group Policy
3. Address Pool in Group Policy mapped to a Connection Profile
4. IPv4Address Pool in Connection Profile

Some limitations around using IP address pools in Group Policy:

- IPv6 address pool is not supported.
- Maximum of six IPv4 address pools can be configured in a Group Policy.
- Deployment failures are seen when address pools in use are modified. You must logoff all the users before making any changes to the address pools.
- When address pools are renamed or overlapping address pools are configured, deployment could fail. You must deploy the changes by removing the old address pool and later deploying the changed address pool.

Some troubleshooting commands :

- `show ip local pool <address-pool-name>`
- `show vpn-sessiondb detail anyconnect`

- `vpn-sessiondb loggoff all noconfirm`

### Banner Fields

Specifies the banner text to present to users at login. The length can be up to 491 characters. There is no default value. The IPsec VPN client supports full HTML for the banner, however, the Secure Client supports only partial HTML. To ensure that the banner displays properly to remote users, use the /n tag for IPsec clients, and the <BR> tag for SSL clients.

### DNS/WINS Fields

Domain Naming System (DNS) and Windows Internet Naming System (WINS) servers. Used for Secure Client name resolution.

- **Primary DNS Server** and **Secondary DNS Server**—Choose or create a Network Object which defines the IPv4 or IPv6 addresses of the DNS servers you want this group to use.
- **Primary WINS Server** and **Secondary WINS Server**—Choose or create a Network Object containing the IP addresses of the WINS servers you want this group to use.
- **DHCP Network Scope**—Choose or create a Network Object containing a routable IPv4 address on the same subnet as the desired pool, but not within the pool. The DHCP server determines which subnet this IP address belongs to and assigns an IP address from that pool. If not set properly, deployment of the VPN policy fails.

If you configure DHCP servers for the address pool in the connection profile, the DHCP scope identifies the subnets to use for the pool for this group. The DHCP server must also have addresses in the same subnet identified by the scope. The scope allows you to select a subset of the address pools defined in the DHCP server to use for this specific group.

If you do not define a network scope, the DHCP server assigns IP addresses in the order of the address pools configured. It goes through the pools until it identifies an unassigned address.

We recommend using the IP address of an interface whenever possible for routing purposes. For example, if the pool is 10.100.10.2-10.100.10.254, and the interface address is 10.100.10.1/24, use 10.100.10.1 as the DHCP scope. Do not use the network number. You can use DHCP for IPv4 addressing only. If the address you choose is not an interface address, you might need to create a static route for the scope address.

LINK-SELECTION (RFC 3527) and SUBNET-SELECTION (RFC 3011) are currently not supported.

- **Default Domain**—Name of the default domain. Specify a top-level domain, for example, example.com.

### Split Tunneling Fields

Split tunneling directs some network traffic through the VPN tunnel (encrypted) and the remaining network traffic outside the VPN tunnel (unencrypted or “in the clear”).

- **IPv4 Split Tunneling / IPv6 Split Tunneling**—By default, split tunneling is not enabled. For both IPv4 and IPv6 it is set to **Allow all traffic over tunnel**. Left as is, all traffic from the endpoint goes over the VPN connection.

To configure split tunneling, choose the **Tunnel networks specified below** or **Exclude networks specified below** policy. Then configure an access control list for that policy.

- **Split Tunnel Network List Type**—Choose the type of Access List you are using. Then choose or create a **Standard Access List** or **Extended Access List**. See [Access List](#), on page 1250 for details.

**Note** From Version 7.4, the **Standard Access List** option is disabled by default. Use the **Extended Access List** option to add an access list.

- **DNS Request Split Tunneling**—Also known as Split DNS. Configure the DNS behavior expected in your environment.

By default, split DNS is not enabled and set to **Send DNS request as per split tunnel policy**. Choosing **Always send DNS request over tunnel** forces all DNS requests to be sent over the tunnel to the private network.

To configure split DNS, choose **Send only specified domains over tunnel**, and enter the list of domain names in the **Domain List** field. These requests are resolved through the split tunnel to the private network. All other names are resolved using the public DNS server. Enter up to ten entries in the list of domains, separated by commas. The entire string can be no longer than 491 characters.

#### Related Topics

[Configure Group Policy Objects](#), on page 1346

## Group Policy Secure Client Options

These specifications apply to the operation of the Secure Client VPN.

#### Navigation

**Objects > Object Management > VPN > Group Policy**. Click **Add Group Policy** or choose a current policy to edit. Then select the **Secure Client** tab.

#### Profile Fields

**Profile**—Choose or create a file object containing the Secure Client Profile. See [File Objects](#), on page 1358 for object creation details.

The Secure Client Profile is a group of configuration parameters stored in an XML file. The Secure Client software uses it to configure the connection entries that appear in the client's user interface. These parameters (XML tags) also configure settings to enable more Secure Client features.

Use the GUI-based Secure Client Profile Editor, an independent configuration tool, to create the Secure Client Profile. See the *Secure Client Profile Editor* chapter in the appropriate release of the [Cisco Secure Client \(including AnyConnect\) Administrator Guide](#) for details.

#### Management Profile Fields

A Management VPN Tunnel provides connectivity to the corporate network whenever the endpoint is powered up, even if end-user does not connect over VPN.

**Management VPN Profile**—The Management Profile file contains settings for enabling and establishing Management VPN Tunnel on endpoint.

The Standalone Management VPN Tunnel profile editor can be used to create a new profile file or modify an existing file. You can download the profile editor from [Cisco Software Download Center](#).

For more information about adding a profile file, see [File Objects, on page 1358](#).

### Client Modules Fields

Cisco Secure Client VPN Only offers enhanced security through various built-in modules. These modules provide services such as web security, network visibility into endpoint flows, and off-network roaming protection. Each client module includes a client profile that includes a group of custom configurations as per your requirement.

The following Secure Client modules are optional and you can configure these modules to be downloaded when a VPN user downloads Secure Client:

- **AMP Enabler**—Deploys advanced malware protection (AMP) for endpoints.
- **DART**—Captures a snapshot of system logs and other diagnostic information, which can be sent to the Cisco TAC for troubleshooting.
- **ISE Posture**—Uses the OPSWAT library to perform posture checks to assess an endpoint's compliance.
- **Network Access Manager**—Provides 802.1X (Layer 2) and device authentication for access to both wired and wireless networks.
- **Network Visibility**—Enhances the enterprise administrator's ability to do capacity and service planning, auditing, compliance, and security analytics.
- **Start Before Login**—Forces the user to connect to the enterprise infrastructure over a VPN connection before logging on to Windows by starting Secure Client before the Windows login dialog box appears.
- **Umbrella Roaming Security**—Provides DNS-layer security when no VPN is active.
- **Web Security**—Analyzes the elements of a web page, allows acceptable content, and blocks malicious or unacceptable content based on a defined security policy.

Click **Add** and select the following for each client module:

- **Client Module**—Select the Secure Client module from the list.
- **Profile to download**—Choose or create a file object containing the Secure Client Profile. See [File Objects, on page 1358](#) for object creation details.
- **Enable module download**—Select to enable endpoints to download the client module along with the profile. If not selected, the endpoints can download only the client profile.

Use the GUI-based Secure Client Profile Editor, an independent configuration tool to create a client profile for each module. Download the Secure Client Profile Editor from [Cisco Software Download Center](#). See the *Secure Client Profile Editor* chapter in the appropriate release of the [Cisco Secure Client \(including AnyConnect\)](#) for details.

### SSL Settings Fields

- **SSL Compression**—Whether to enable data compression, and if so, the method of data compression to use, Deflate, or LZS. SSL Compression is Disabled by default.  
  
Data compression speeds up transmission rates, but also increases the memory requirement and CPU usage for each user session. Therefore, decreasing the overall throughput of the security appliance.
- **DTLS Compression**—Whether to compress Datagram Transport Layer Security (DTLS) connections for this group using LZS or not. DTLS Compression is Disabled by default.

- **MTU Size**—The maximum transmission unit (MTU) size for SSL VPN connections established by the Cisco Secure Client VPN Only. Default is 1406 Bytes, valid range is 576 to 1462 Bytes.
  - **Ignore DF Bit**—Whether to ignore the Don't Fragment (DF) bit in packets that need fragmentation. Allows the forced fragmentation of packets that have the DF bit set, allowing them to pass through the tunnel.

### Connection Settings Fields

- **Enable Keepalive Messages between Secure Client and VPN gateway.** And its **Interval** setting.—Whether to exchange keepalive messages between peers to demonstrate that they are available to send and receive data in the tunnel. Default is enabled. Keepalive messages transmit at set intervals. If enabled, enter the time interval (in seconds) that the remote client waits between sending IKE keepalive packets. The default interval is 20 seconds, the valid range is 15 to 600 seconds.
- **Enable Dead Peer Detection on ....** And their **Interval** settings.—Dead Peer Detection (DPD) ensures that the VPN secure gateway or the VPN client quickly detects when the peer is no longer responding, and the connection has failed. Default is enabled for both the gateway and the client. DPD messages transmit at set intervals. If enabled, enter the time interval (in seconds) that the remote client waits between sending DPD messages. The default interval is 30 seconds, the valid range is 5 to 3600 seconds.
- **Enable Client Bypass Protocol**—Allows you to configure how the secure gateway manages IPv4 traffic (when it is expecting only IPv6 traffic), or how it manages IPv6 traffic (when it is expecting only IPv4 traffic).

When the Secure Client makes a VPN connection to the headend, the headend assigns it an IPv4, IPv6, or both an IPv4 and IPv6 address. If the headend assigns the Secure Client connection only an IPv4 address or only an IPv6 address, you can configure the Client Bypass Protocol to drop network traffic for which the headend did not assign an IP address (default, disabled, not checked), or allow that traffic to bypass the headend and be sent from the client unencrypted or “in the clear” (enabled, checked).

For example, assume that the secure gateway assigns only an IPv4 address to the Secure Client connection and the endpoint is dual-stacked. When the endpoint attempts to reach an IPv6 address, if Client Bypass Protocol is disabled, the IPv6 traffic is dropped; however, if Client Bypass Protocol is enabled, the IPv6 traffic is sent from the client in the clear.

- **SSL rekey**—Enables the client to rekey the connection, renegotiating the crypto keys and initialization vectors, increasing the security of the connection. This is disabled by default. When enabled, the renegotiation can be done at a specified interval and rekey the existing tunnel or create a new tunnel by setting the following fields:
  - **Method**—Available when SSL rekey is enabled. Create a **New Tunnel** (default), or renegotiate, the **Existing Tunnel's** specifications.
  - **Interval**—Available when SSL rekey is enabled. Set to a default of 4 minutes with a range of 4-10080 minutes (1 week).
- **Client Firewall Rules**—Use the Client Firewall Rules to configure firewall settings for the VPN client's platform. Rules are based on criteria such as source address, destination address, and protocol. Extended Access Control List building block objects are used to define the traffic filter criteria. Choose or create an Extended ACL for this group policy. Define a **Private Network Rule** to control data flowing to the private network, a **Public Network Rule** to control data flowing “in the clear”, outside of the established VPN tunnel, or both.

**Note** Ensure that the ACL contains only TCP/UDP/ICMP/IP ports and source network as any, any-ipv4 or any-ipv6.

Only VPN clients running Microsoft Windows can use these firewall settings.

### Custom Attributes Fields

This section lists the Secure Client Custom attributes that are used by the Secure Client to configure features such as Per App VPN, Allow or defer upgrade, and Dynamic split tunneling. Click **Add** to add custom attributes to the group policy.

1. Select the **Secure Client Attribute**: Per App VPN, Allow Defer Update, or Dynamic Split Tunneling.
2. Select a **Custom Attribute Object** from the list.

**Note** Click Add (+) to create a new custom attribute object for the selected Secure Client attribute. You can also create a custom attribute object at **Objects > Object Management > VPN > Custom Attribute**. See [Add Secure Client Custom Attributes Objects, on page 1344](#).

3. Click **Add** to save the attributes to the group policy and then click **Save** to save the changes to the group policy.

### Related Topics

[Configure Group Policy Objects](#), on page 1346

## Group Policy Advanced Options

### Navigation Path

**Objects > Object Management > VPN > Group Policy**, Click **Add Group Policy** or choose a current policy to edit., then select the **Advanced** tab.

### Traffic Filter Fields

- **Access List Filter**—Filters consist of rules that determine whether to allow or block tunneled data packets coming through the VPN connection. Rules are based on criteria such as source address, destination address, and protocol. Note that the VPN filter applies to initial connections only. It does not apply to secondary connections, such as a SIP media connection, that are opened due to the action of application inspection. Extended Access Control List building block objects are used to define the traffic filter criteria. Choose or create a new Extended ACL for this group policy.
- **Restrict VPN to VLAN**—Also called “VLAN mapping,” this parameter specifies the egress VLAN interface for sessions to which this group policy applies. The ASA forwards all traffic from this group to the selected VLAN.

Use this attribute to assign a VLAN to the group policy to simplify access control. Assigning a value to this attribute is an alternative to using ACLs to filter traffic on a session. In addition to the default value

(Unrestricted), the drop-down list shows only the VLANs that are configured in this ASA. Allowed values range from 1 to 4094.

### Session Settings Fields

- **Access Hours**—Choose or create a time range object. This object specifies the range of time this group policy is available to be applied to a remote access user. See [Time Range, on page 1322](#) for details.
- **Simultaneous Logins Per User**—Specifies the maximum number of simultaneous logins allowed for a user. The default value is 3. The minimum value is 0, which disables login and prevents user access. Allowing several simultaneous connections may compromise security and affect performance.
- **Maximum Connection Time / Alert Interval**—Specifies the maximum user connection time in minutes. At the end of this time, the system stops the connection. The minimum is 1 minute). The Alert interval specifies the interval of time before maximum connection time is reached to display a message to the user.
- **Idle Timeout / Alert Interval**—Specifies this user's idle timeout period in minutes. If there is no communication activity on the user connection in this period, the system stops the connection. The minimum time is 1 minute. The default is 30 minutes. The Alert interval specifies the interval of time before idle time is reached to display a message to the user.

## Firewall Threat Defense IPsec Proposals

IPsec Proposals (or Transform Sets) are used when configuring VPN topologies. During the IPsec security association negotiation with ISAKMP, the peers agree to use a particular proposal to protect a particular data flow. The proposal must be the same for both peers.

There are separate IPsec proposal objects based on the IKE version, IKEv1, or IKEv2:

- When you create an IKEv1 IPsec Proposal (Transform Set) object, you select the mode in which IPsec operates, and define the required encryption and authentication types. You can select single options for the algorithms. If you want to support multiple combinations in a VPN, create multiple IKEv1 IPsec Proposal objects.
- When you create an IKEv2 IPsec Proposal object, you can select all of the encryption and Hash Algorithms allowed in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

The Encapsulating Security Protocol (ESP) is used for both IKEv1 and IKEv2 IPsec Proposals. It provides authentication, encryption, and antireplay services. ESP is IP protocol type 50.

---

**Note** We recommend using both encryption and authentication on IPsec tunnels.

---

## Configure IKEv1 IPsec Proposal Objects

### Procedure

- 
- Step 1** Choose **Objects > Object Management** and then **VPN > IPsec IKEv1 Proposal** from the table of contents. Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may **Edit** () , **View** () , or **Delete** () a Proposal.
- Step 2** Choose **Add IPsec IKEv1 Proposal** to create a new Proposal.
- Step 3** Enter a **Name** for this Proposal  
The name of the policy object. A maximum of 128 characters is allowed.
- Step 4** Enter a **Description** for this Proposal.  
A description of the policy object. A maximum of 1024 characters is allowed.
- Step 5** Choose the **ESP Encryption** method. The Encapsulating Security Protocol (ESP) encryption algorithm for this Proposal.  
For IKEv1, select one of the options. When deciding which encryption and Hash Algorithms to use for the IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN. For a full explanation of the options, see [Deciding Which Encryption Algorithm to Use, on page 1382](#).
- Step 6** Select an option for **ESP Hash**.  
For a full explanation of the options, see [Deciding Which Hash Algorithms to Use, on page 1383](#).
- Step 7** Click **Save**  
The new Proposal is added to the list.
- 

## Configure IKEv2 IPsec Proposal Objects

### Procedure

- 
- Step 1** Choose **Objects > Object Management** and then **VPN > IKEv2 IPsec Proposal** from the table of contents. Previously configured Proposals are listed including system defined defaults. Depending on your level of access, you may **Edit** () , **View** () , or **Delete** () a Proposal.
- Step 2** Choose **Add IKEv2 IPsec Proposal** to create a new proposal.
- Step 3** Enter a **Name** for this proposal.  
The name of the policy object. A maximum of 128 characters is allowed.
- Step 4** Enter a **Description** for this proposal.  
A description of the policy object. A maximum of 1024 characters is allowed.

- Step 5** Choose the **ESP Hash** method, the hash or integrity algorithm to use in the proposal for authentication.

**Note**

Firewall Threat Defense does not support IPsec tunnels with NULL encryption. Make sure that you do not choose NULL encryption for IPsec IKEv2 proposal.

For IKEv2, select all the options you want to support for **ESP Hash**. For a full explanation of the options, see [Deciding Which Hash Algorithms to Use, on page 1383](#).

- Step 6** Choose the **ESP Encryption** method. The Encapsulating Security Protocol (ESP) encryption algorithm for this proposal.

For IKEv2, click Select to open a dialog box where you can select all of the options you want to support. When deciding which encryption and Hash Algorithms to use for the IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN. For a full explanation of the options, see [Deciding Which Encryption Algorithm to Use, on page 1382](#).

- Step 7** Click **Save**  
The new proposal is added to the list.
- 

## Firewall Threat Defense IKE Policies

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs). The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. An IKE proposal is a set of algorithms that two peers use to secure the negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters are used to protect subsequent IKE negotiations.

For IKEv1, IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies to ensure that at least one policy matches a remote peer's policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups in one policy. Since peers choose during the Phase 1 negotiation, this makes it possible to create a single IKE proposal, but consider multiple, different proposals to give higher priority to your most desired options. For IKEv2, the policy object does not specify authentication, other policies must define the authentication requirements.

An IKE policy is required when you configure a site-to-site IPsec VPN. For more information, see [VPN, on page 1375](#).

## Configure IKEv1 Policy Objects

Use the IKEv1 Policy page to create, delete, or edit an IKEv1 policy object. These policy objects contain the parameters required for IKEv1 policies.

### Procedure

---

- Step 1** Choose **Objects > Object Management** and then **VPN > IKEv1 Policy** from the table of contents.

Previously configured policies are listed including system defined defaults. Depending on your level of access, you may **Edit** (✎), **View** (👁), or **Delete** (🗑) a proposal.

**Step 2** (Optional) Choose **Add IKEv1 Policy** to create a new policy object.

**Step 3** Enter a **Name** for this policy. A maximum of 128 characters is allowed.

**Step 4** (Optional) Enter a **Description** for this proposal. A maximum of 1,024 characters is allowed.

**Step 5** Enter the **Priority** value of the IKE policy.

The priority value determines the order of the IKE policy compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority. Valid values range from 1 to 65,535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

**Step 6** Choose the **Encryption** method.

When deciding which encryption and Hash Algorithms to use for the IKEv1 policy, your choice is limited to algorithms supported by the peer devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For IKEv1, select one of the options. For a full explanation of the options, see [Deciding Which Encryption Algorithm to Use, on page 1382](#).

**Step 7** Choose the **Hash** Algorithm that creates a Message Digest, which is used to ensure message integrity.

When deciding which encryption and Hash Algorithms to use for the IKEv1 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. For a full explanation of the options, see [Deciding Which Hash Algorithms to Use, on page 1383](#).

**Step 8** Set the **Diffie-Hellman Group**.

The Diffie-Hellman group to use for encryption. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the group that you want to allow in the VPN. For a full explanation of the options, see [Deciding Which Diffie-Hellman Modulus Group to Use, on page 1384](#).

**Step 9** Set the **Lifetime** of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.

When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

**Step 10** Set the **Authentication Method** to use between the two peers.

- **Preshared Key**—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established.
- **Certificate**—When you use Certificates as the authentication method for VPN connections, peers obtain digital certificates from a CA server in your PKI infrastructure, and trade them to authenticate each other.

#### Note

In a VPN topology that supports IKEv1, the **Authentication Method** specified in the chosen IKEv1 Policy object becomes the default in the IKEv1 **Authentication Type** setting. These values must match, otherwise, your configuration will error.

- Step 11** Click **Save**  
The new IKEv1 policy is added to the list.
- 

## Configure IKEv2 Policy Objects

Use the IKEv2 policy dialog box to create, delete, and edit an IKEv2 policy object. These policy objects contain the parameters required for IKEv2 policies.

### Procedure

---

- Step 1** Choose **Objects > Object Management** and then **VPN > IKEv2 Policy** from the table of contents. Previously configured policies are listed including system defined defaults. Depending on your level of access, you may **Edit** (✎), **View** (👁), or **Delete** (🗑) a policy.
- Step 2** Choose **Add IKEv2 Policy** to create a new policy.
- Step 3** Enter a **Name** for this policy.  
The name of the policy object. A maximum of 128 characters is allowed.
- Step 4** Enter a **Description** for this policy.  
A description of the policy object. A maximum of 1024 characters is allowed.
- Step 5** Enter the **Priority**.  
The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, it tries to use the parameters defined in the next lowest priority policy. Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Management Center assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.
- Step 6** Set the **Lifetime** of the security association (SA), in seconds. You can specify a value from 120 to 2,147,483,647 seconds. The default is 86400.  
When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.
- Step 7** Choose the **Integrity Algorithms** portion of the Hash Algorithm used in the IKE policy. The Hash Algorithm creates a Message Digest, which is used to ensure message integrity.  
When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see [Deciding Which Hash Algorithms to Use, on page 1383](#).

- Step 8** Choose the **Encryption Algorithm** used to establish the Phase 1 SA for protecting Phase 2 negotiations.
- When deciding which encryption and Hash Algorithms to use for the IKEv2 proposal, your choice is limited to algorithms supported by the managed devices. For an extranet device in the VPN topology, you must choose the algorithm that matches both peers. Select all the algorithms that you want to allow in the VPN. For a full explanation of the options, see [Deciding Which Encryption Algorithm to Use, on page 1382](#).
- Step 9** Choose the **PRF Algorithm**.
- The pseudorandom function (PRF) portion of the Hash Algorithm used in the IKE policy. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Select all of the algorithms that you want to allow in the VPN. For a full explanation of the options, see [Deciding Which Hash Algorithms to Use, on page 1383](#).
- Step 10** Choose a **Diffie-Hellman Group** for encryption.
- A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the groups that you want to allow in the VPN. For a full explanation of the options, see [Deciding Which Diffie-Hellman Modulus Group to Use, on page 1384](#).
- Step 11** Click **Save**
- If a valid combination of choices has been selected the new IKEv2 policy is added to the list. If not, errors are displayed and you must make changes accordingly to successfully save this policy.
- 

## Secure Client Customization

You can now customize Secure Client and deploy these customizations to the VPN headend. The threat defense distributes these customizations to the endpoint when an end user connects from the Secure Client.

Secure Client Customization objects represent files used to customize Secure Client. The following are the supported Secure Client customizations:

- GUI text and messages
- Icons and images
- Scripts
- Binaries
- Custom Installer Transforms
- Localized Installer Transforms

For more information about configuring these Secure Client customizations, see [Customize Cisco Secure Client, on page 1507](#).

## File Objects

Use the Add and Edit File Object dialog boxes to create, and edit file objects. File objects represent files used in configurations, typically for remote access VPN policies. They can contain Secure Client Profile and Secure Client Image files.

Profiles are also created for each AnyConnect module and Secure Client Management VPN using independent profile editors and deployed to administrator-defined end user requirements and authentication policies on endpoints as part of Secure Client, and they make the preconfigured network profiles available to end users.

When you create a file object, the Firewall Management Center makes a copy of the file in its repository. These files are backed up whenever you create a backup of the database, and they are restored if you restore the database. When copying a file to the management center platform to be used in a file object, do not copy the file directly to the file repository.

When you deploy configurations that specify a file object, the associated file is downloaded to the device in the appropriate directory.

You can click one of the following options against each file:

- **Download** —Click to download the Secure Client file.
- **Edit** —Modify the file object details.
- **Delete** —Delete the Secure Client file object. When you delete a file object, the associated file is not deleted from the file repository, only the object is deleted.

### Navigation Path

**Objects > Object Management > VPN > Secure Client File.**

### Fields

- **Name**—Enter the name of the file to identify the file object; you can add up to 128 characters.
- **File Name**—Click **Browse** to select the file. The file name and full path of the file are added when you select the file.
- **File Type**—Choose the file type corresponding to the file you have selected. The following file types are available:
  - **Secure Client Image**—Select this type when you add the Secure Client image you have downloaded from the [Cisco Software Download Center](#).  
You can associate any new or additional Secure Client images to the remote access VPN policy. You can also unassociate the unsupported or end of life client packages that are no longer required.
  - **Secure Client VPN Profile**—Choose this type for the Secure Client VPN profile file.  
The profile file is created using the GUI-based Secure Client Profile Editor, an independent configuration tool. See the *Secure Client Profile Editor* chapter in the appropriate release of the [Cisco Secure Client \(including AnyConnect\) User Guide](#) for details.
  - **Secure Client Management VPN Profile**—Select this type when you add a profile file for the Secure Client management VPN tunnel.  
Download the Secure Client **VPN Management Tunnel Standalone Profile Editor** from [Cisco Software Download Center](#) if you have not done already and create a profile with required settings for the Secure Client management VPN tunnel.
  - **AMP Enabler Service Profile**—The profile is used for the Secure Client AMP Enabler. The AMP Enabler along with this profile is pushed to the endpoints from Firewall Threat Defense when a remote access VPN user connects to the VPN.

- **Feedback Profile**—You can add a Customer Experience Feedback profile and select this type to receive information about the features and modules customers have enabled and use.
- **ISE Posture Profile**—Choose this option if you are adding a profile file for the Secure Client ISE Posture module.
- **NAM Service Profile**—Configure and add the NAM profile file using the Network Access Manager profile editor.
- **Network Visibility Service Profile**—Profile file for Secure Client Network Visibility module. You can create the profile using the NVM profile editor.
- **Umbrella Roaming Security Profile**—You must select this file type if you are deploying the Umbrella Roaming Security module using the .json file created using the profile editor.
- **Web Security Service Profile**—Select this file type when you add a profile file for the Web security module.
- **Secure Firewall Posture Package**—Select this file type when you add a Secure Firewall Posture Package file. This file is used while configuring a Dynamic Access Policy (DAP) to collect information about the operating system, anti-virus, anti-spyware, and firewall software installed on the endpoints.
- **Secure Client External Browser Package**—This file type is for selecting an external browser package file for SAML single sign-on web authentication.

You can add an the package file when a new version of the external package file is available.

For more information, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

- **Description**—Add an optional description.

## History for Object Management

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Merged ACL and AV ACL	7.4.1	Any	<p>New/modified screens: <b>Objects &gt; &gt; Object Management &gt; RADIUS Server Group &gt; Add RADIUS Server Group &gt; Merge Downloadable ACL with Cisco AV Pair ACL</b></p> <p>New CLI commands:</p> <ul style="list-style-type: none"> <li>• <b>sh run aaa-server aaa-server ISE-Server protocol radius merge-dacl after-avpair</b></li> <li>• <b>sh run aaa-server aaa-server ISE-Server protocol radius merge-dacl before-avpair</b></li> </ul>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Secure Client Customization	Any	7.4	You can now customize Secure Client and deploy these customizations to the VPN headend. The threat defense distributes these customizations to the endpoint when an end user connects from the Secure Client.
IPv6 support for CRL and OCSP urls	Any	7.4	You can now configure IPv6 OCSP and CRL URLs.
Loopback and Management type interface group objects	Any	7.4	<p>You can now create interface group objects that include only management-only interfaces or only loopback interfaces. You can then use these groups for management features such as DNS servers, HTTP access, or SSH. Loopback groups are supported for any feature that supports loopback interfaces. Note that DNS does not support management interfaces.</p> <p>New/Modified screens: <b>Objects &gt; Object Management &gt; Interface &gt; Add &gt; Interface Group</b></p>
Loopback interface support for AAA	Any	7.4	<p>You can use a loopback interface group for configuring a RADIUS server.</p> <p>New/Modified screens: <b>Objects &gt; Object Management &gt; AAA Server &gt; RADIUS Server Group</b></p>
Clone network and port objects	Any	7.4	You can now clone network and port objects. In the object manager ( <b>Objects &gt; Object Management</b> ), click the new <b>Clone</b> icon next to a port or network object. You can then change the new object's properties and save it using a new name.
DHCP IPv6 Pool	Any	7.3	<p>The Firewall Threat Defense now supports a light DHCPv6 stateless server when using the DHCPv6 Prefix Delegation client. The Firewall Threat Defense provides other information such as the domain name to SLAAC clients when they send Information Request (IR) packets to the Firewall Threat Defense. The Firewall Threat Defense only accepts IR packets and does not assign addresses to the clients.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Interfaces &gt; Add/Edit Interfaces &gt; IPv6 &gt; DHCP</b></li> <li>• <b>Objects &gt; Object Management &gt; DHCP IPv6 Pool</b></li> </ul> <p>New/Modified commands: <b>show ipv6 dhcp</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
BFD Template	Any	7.3	<p>In the previous releases, BFD was configurable on threat defense only through FlexConfig. FlexConfig no longer supports BFD configuration. You can now configure BFD policies for threat defense in the management center UI. Hence, the BFD Template object was introduced.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Devices &gt; Device Management &gt; Routing &gt; BFD.</b></li> <li>• <b>Objects &gt; Object Management &gt; BFD Template</b></li> </ul>
New Applications tab for policy based routing	Any	7.1	<p>A new tab for selecting the applications for configuring direct internet access policy (policy based routing) was introduced in the extended access list object.</p> <p>New/Modified Screens: New option to select applications when configuring <b>Object &gt; Object Management &gt; Access List &gt; Extended</b> page.</p> <p>Supported platforms: Secure Firewall Management Center</p>
New Extended Community List object and	Any	7.1	<p>Extended community list object was introduced to be used in policy list and route map objects. The extended community list object is applicable only for importing or exporting routes in BGP route leaking support for virtual routers.</p> <p>New/Modified Screens: New object for configuring policy list and route maps <b>Object &gt; Object Management &gt; Community list &gt; Extended Community</b> page.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Enhancements to Policy List object and Route Map object	Any	7.1	<p>Options to select the newly introduced Extended Community List objects in policy list and route maps.</p> <p>New/Modified Screens: New options for configuring policy list and route maps <b>Object &gt; Object Management &gt; Policy List &gt; Community rule</b> tab, and <b>Object &gt; Object Management &gt; Route Map &gt; BGP &gt; Community List</b> tab.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Time-based ACL support for Snort 3	Any	7.0	<p>Time-based rules in access control and prefilter policies are supported in Snort 3 as well.</p> <p>Supported platforms: Firewall Threat Defense</p>
EST for certificate enrollment	Any	7.0	<p>Support for Enrollment over Secure Transport for certificate enrollment was provided.</p> <p>New/Modified Screens: New enrollment options when configuring <b>Objects &gt; PKI &gt; Cert Enrollment &gt; CA Information</b> tab.</p> <p>Supported platforms: Secure Firewall Management Center</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Support for EdDSA certificate type	Any	7.0	<p>A new certificate key type- EdDSA was added with key size 256.</p> <p>New/Modified Screens: New certificate key options when configuring <b>Objects &gt; PKI &gt; Cert Enrollment &gt; Key</b> tab.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Restrictions on ciphers and key sizes	Any	7.0	<p>Certificates having SHA-1 with RSA Encryption signature algorithm, and RSA key sizes smaller than 2048 bits are not supported. To override these restrictions on existing certificates, you can enable the weak-crypto option on Firewall Threat Defense. However, you cannot generate RSA keys with sizes smaller than 2048 bits.</p> <p>New/Modified Screens: New toggle button when configuring <b>Devices &gt; Certificates</b>.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Security Intelligence feed options	Any	6.7	<p>New update frequency options (5 and 15 minutes) for custom Security Intelligence feeds.</p> <p>Update frequencies of less than 30 minutes require an MD5 URL, to prevent unnecessary downloads if the feed has not changed.</p> <p>New/Modified Screens: New frequency choices when configuring <b>Security Intelligence &gt; Network Lists and Feeds</b>.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Bulk upload of objects using a comma-separated-values (csv) file	Any	6.7	<p>Objects can be imported from a comma-separated-values file. Up to 1000 objects can be imported in one attempt.</p> <p>New/Modified Screens: The following object types have a new <b>Import Object</b> option in the <b>Add [Object Type]</b> drop-down list.</p> <ul style="list-style-type: none"> <li>• <b>Distinguished Name &gt; Individual Objects</b></li> <li>• <b>Network Object</b></li> <li>• <b>Port</b></li> <li>• <b>URL</b></li> <li>• <b>VLAN Tag</b></li> </ul> <p>Supported platforms: Secure Firewall Management Center</p>
See the policies in which interface objects are used	Any	6.6	<p>See the policies in which interface objects are used.</p> <p>New/Modified Screens: The <b>Interface</b> object page in <b>Object &gt; Object management</b> has a new <b>Find</b> button.</p> <p>Supported platforms: Secure Firewall Management Center</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Time zone objects introduced	Any	6.6	<p>You can assign time zones to Firewall Threat Defense devices, for use when applying time-based policies.</p> <p>New/Modified Screens: New <b>Time Zone Object</b> in <b>Object &gt; Object management</b>.</p> <p>Supported platforms: Secure Firewall Management Center</p>
Time-based objects can now be used in access control and prefilter policies	Any	6.6	<p>Use time range objects in conjunction with new time zone objects for applying time-based rules in access control and prefilter policies.</p> <p>You can specify an absolute or recurring time or time range for a rule to be applied. The rule is applied based on the time zone of the device that processes the traffic.</p>
View Object Details from prefilter rule page	Any	6.6	<p>Feature introduced: Option to view details for an object or object group when viewing prefilter rules.</p> <p>New options: Right-clicking a value in any of the following columns in the prefilter rule list offers options to view object details: Source Networks, Destination Networks, Source Port, Destination Port, and VLAN Tag.</p> <p>Supported platforms: Secure Firewall Management Center</p>

## Requirements and Prerequisites for Certificates

### Supported Domains

Any

### User Roles

Admin

Network Admin

## Secure Firewall Threat Defense VPN Certificate Guidelines and Limitations

- When a PKI enrollment object is associated with and then installed on a device, the certificate enrollment process starts immediately. The process is automatic for self-signed and SCEP enrollment types; it does not require any additional administrator's action. Manual certificate enrollment requires administrator's action.
- When the certificate enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your VPN Authentication Method.

- Firewall Threat Defense devices support certificate enrollment using Microsoft Certificate Authority(CA) Service, and CA Services provided on Cisco Adaptive Security Appliances(ASA) and Cisco IOS Router.
- Firewall Threat Defense devices cannot be configured as a certificate authority (CA).

#### Guidelines for Certificate Management Across Domains and Devices

- Certificate enrollment can be done in a child or parent domain.
- When enrollment is done from a parent domain, the certificate enrollment object also needs to be in the same domain. If the trustpoint on a device is overridden in the child domain, the overridden value will be deployed on the device.
- When the certificate enrollment is done on a device in a leaf domain, the enrollment will be visible to the parent domain or another child domain. Also, adding additional certificates is possible.
- When a leaf domain is deleted, certificate enrollments on the contained devices will be automatically removed.
- Once a device has certificates enrolled in one domain, it will be allowed to be enrolled in any other domain. The certificates can be added in the other domain.
- When you move a device from one domain to another, the certificates also get moved accordingly. You will receive an alert to delete the enrollments on these devices.

## Managing Firewall Threat Defense Certificates

See [PKI Infrastructure and Digital Certificates](#) , on page 1385 for an introduction to Digital Certificates.

See [Certificate Enrollment Objects](#), on page 1293 for a description of the objects used to enroll and obtain certificates on managed devices.

### Procedure

---

#### Step 1 Select **Devices** > **Certificates**.

You can see the following columns for each device listed on this screen:

- **Name**—Lists the devices that already have trustpoints associated with them. Expand the device to see the list of associated trustpoints.
- **Domain**—Displays the certificates that are enrolled in a specific domain.
- **Enrollment Type**—Displays the type of enrollment used for a trustpoint.
- **Status**—Provides the status of the **CA Certificate** and **Identity Certificate**. You can view the certificate contents, when *Available*, by clicking the magnifying glass.

When you view the CA certificate information, you can view the hierarchy of all the certifying authorities, which issued your CA certificate. If the enrollment fails, click status to view the failure message.

- Click **Enable weak-crypto** on the right to enable weak cipher usage in certificates. When you click the toggle button, you get a warning to confirm before enabling weak ciphers. Click **Yes** to enable weak ciphers.

**Note**

When a certificate enrollment fails due to weak cipher usage, you get a prompt to enable the weak cipher. You can choose to enable weak cipher when you need to use weak encryption.

- The additional column lists icons to perform the following tasks:
  - **Export Certificate**—Click to export and download a copy of the certificate. You can choose to export the PKCS12 (Complete Certificate Chain) or the PEM (Identity Certificate Only) format. You must provide a pass phrase to export a PKCS12 certificate format to import the file later.
  - **Re-enroll certificate**—Re-enroll an existing certificate.
  - **Refresh certificate status**—Refresh a certificate to synchronize the device certificate status to the Firewall Management Center.
  - **Delete certificate**—Delete all the associated certificates for a trustpoint.

**Step 2** Choose (+) **Add** to associate and install an enrollment object on a device.

When a certificate enrollment object is associated with and then installed on a device, the process of certificate enrollment starts immediately. The process is automatic for self-signed and SCEP enrollment types, meaning it does not require any additional administrator action. Manual certificate enrollment requires extra administrator action.

**Note**

The certificate enrollment on a device does not block the user interface and the enrollment process gets executed in the background, enabling the user to perform certificate enrollment on other devices in parallel. The progress of these parallel operations can be monitored on the same user interface. The respective icons display the certificate enrollment status.

## Automatically Update CA Bundles

You can set the management center to automatically update the CA certificates through CLI commands. By default, the CA certificates are automatically updated when you install or upgrade to version 7.0.5.

**Note**

In an IPv6-only deployment, the automatic update of CA certificates may fail, because, some of the Cisco servers do not support IPv6. In such cases, force update the CA certificates using the **configure cert-update run-now force** command.

## Procedure

**Step 1** Log into the FMC CLI using SSH, or, if virtual, open the VM console.

**Step 2** You can verify whether the CA certificates in the local system are the latest or not:

### **configure cert-update test**

This command compares the CA bundle on the local system with the latest CA bundle (from the Cisco server). If the CA bundle is up to date, no connection check is executed and the test result is displayed as the one below:

#### **Example:**

```
> configure cert-update test
Test succeeded, certs can safely be updated or are already up to date.
```

If the CA bundle is out of date, the connection check is executed on the downloaded CA bundle and the test result is displayed.

#### **Example:**

When the connection check fails:

```
> configure cert-update test
Test failed, not able to fully connect.
```

#### **Example:**

When the connection check succeeds, or the CA bundle is already up to date:

```
> configure cert-update test
Test succeeded, certs can safely be updated or are already up to date.
```

**Step 3** (Optional) To instantly update the CA bundles:

### **configure cert-update run-now**

#### **Example:**

```
>configure cert-update run-now
Certs have been replaced or was already up to date.
```

When you execute this command, the CA certificates (from the Cisco server) are verified for SSL connectivity. If the SSL connectivity check fails for even one of the Cisco servers, the process is terminated.

#### **Example:**

```
> configure cert-update run-now
Certs failed some connection checks.
```

To proceed with the update despite connection failures, use the **force** keyword.

#### **Example:**

```
> configure cert-update run-now force
```

Certs failed some connection checks, but replace has been forced.

**Step 4** If you do not want the CA bundles to be automatically updated, disable the configuration:

**configure cert-update auto-update disable**

**Example:**

```
> configure cert-update auto-update disable
Autoupdate is disabled
```

**Step 5** To re-enable the automatic update of CA bundles:

**configure cert-update auto-update enable**

**Example:**

```
> configure cert-update auto-update enable
Autoupdate is enabled and set for every day at 12:18 UTC
```

When you enable the automatic update on the CA certificates, the update process is executed daily at a system-defined time.

**Step 6** (Optional) View the status of automatic update of CA certificates:

**show cert-update**

**Example:**

```
> show cert-update
Autoupdate is enabled and set for every day at 09:34 UTC
CA bundle was last modified 'Thu Sep 15 16:12:35 2022'
```

---

## Installing a Certificate Using Self-Signed Enrollment

### Procedure

---

**Step 1** On the **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.

**Step 2** Choose a device from the **Device** drop-down list.

**Step 3** Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the type Self-Signed from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#).

**Step 4** Press **Add** to start the Self Signed, automatic, enrollment process.

For self signed enrollment type trustpoints, the **CA Certificate** status will always be displayed, since the managed device is acting as its own CA and does not need a CA certificate to generate its own Identity Certificate.

The **Identity Certificate** will go from InProgress to Available as the device creates its own self signed identity certificate.

**Step 5** Click the magnifying glass to view the self-signed Identity Certificate created for this device.

#### What to do next

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method

## Installing a Certificate using EST Enrollment

#### Before you begin

**Note** Using EST enrollment establishes a direct connection between the managed device and the CA server. So be sure your device is connected to the CA server before beginning the enrollment process.

**Note** EST's ability to auto-enroll a device when its certificate expires is not supported.

#### Procedure

**Step 1** On the **Devices > Certificates** screen, click **Add** to open the **Add New Certificate** dialog.

**Step 2** Choose a device from the **Device** drop-down list.

**Step 3** Associate a certificate enrollment object with this device in one of the following ways:

- Choose the EST certificate enrollment object from the **Cert Enrollment** drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#).

**Step 4** Click **Add** to enroll the certificate on the device.

The **Identity Certificate** will go from InProgress to Available as the device obtains its identity certificate using EST from the specified CA. Sometimes, a manual refresh might be required to obtain the identity certificate.

**Step 5** Click the magnifying glass to view the Identity Certificate created and installed on this device.

# Installing a Certificate Using SCEP Enrollment

## Before you begin

**Note** Using SCEP enrollment establishes a direct connection between the managed device and the CA server. So be sure your device is connected to the CA server before beginning the enrollment process.

## Procedure

- 
- Step 1** On the **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.
- Step 2** Choose a device from the **Device** drop-down list.
- Step 3** Associate a certificate enrollment object with this device in one of the following ways:
- Choose a Certificate Enrollment Object of the type SCEP from the drop-down list.
  - Click (+), to add a new Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#).
- Step 4** Press **Add**, to start the automatic enrollment process.
- For SCEP enrollment type trustpoints, the **CA Certificate** status will transition from InProgress to Available as the CA Certificate is obtained from the CA server and installed on the device.
- The **Identity Certificate** will go from InProgress to Available as the device obtains its identity certificate using SCEP from the specified CA. Sometimes, a manual refresh might be required to obtain the identity certificate.
- Step 5** Click the magnifying glass to view the Identity Certificate created and installed on this device.
- 

## What to do next

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method

# Installing a Certificate Using Manual Enrollment

## Procedure

- 
- Step 1** On the **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.
- Step 2** Choose a device from the **Device** drop-down list.
- Step 3** Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the type Manual from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#).

**Step 4** Press **Add** to start the enrollment process.

**Step 5** Execute the appropriate activity with your PKI CA Server to obtain an identity certificate.

- Click **Identity Certificate** warning to view and copy the CSR.
- Execute the appropriate activity with your PKI CA Server to obtain an identity certificate using this CSR.

This activity is completely independent of the Secure Firewall Management Center or the managed device. When complete, you will have an Identity Certificate for the managed device. You can place it in a file.

- To finish the manual process, install the obtained identity certificate onto the managed device.

Return to the Secure Firewall Management Center dialog and select **Browse Identity Certificate** to choose the identity certificate file.

**Note**

Ensure not to choose a binary certificate (PKCS12, DER, and alike) file because Firewall Threat Defense does not support them.

**Step 6** Select **Import** to import the Identity Certificate.

The Identity Certificate status will be `Available` when the import complete.

**Step 7** Click the magnifying glass to view the **Identity Certificate** for this device.

---

**What to do next**

When enrollment is complete, a trustpoint exists on the device with the same name as the certificate enrollment object. Use this trustpoint in the configuration of your Site to Site and Remote Access VPN Authentication Method

## Installing a Certificate Using a PKCS12 File

### Procedure

---

**Step 1** Go to **Devices > Certificates** screen, choose **Add** to open the **Add New Certificate** dialog.

**Step 2** Choose a pre-configured managed device from the **Device** drop down list.

**Step 3** Associate a certificate enrollment object with this device in one of the following ways:

- Choose a Certificate Enrollment Object of the PKCS type from the drop-down list.
- Click (+), to add a new Certificate Enrollment Object, see [Adding Certificate Enrollment Objects, on page 1294](#).

**Step 4** Press **Add**.

The CA Certificate and Identity Certificate status will go from `In Progress` to `Available` as it installs the PKCS12 file on the device.

**Note**

When you upload the PKCS12 file for the first time, the file is stored in Firewall Management Center as part of the CertEnrollment object. For any failed enrollments due to a wrong passphrase or failed deployment, retry enrolling the PKCS12 certificate without uploading the file again. Also, whenever you modify the certificate enrollment object to permit overrides, you must update the **Passphrase** for the certificate for a successful enrollment. A PKCS12 file size should not be larger than 24K.

- Step 5** Once Available, click the magnifying glass to view the Identity Certificate for this device.

**What to do next**

The certificate (trustpoint) on the managed device is named the same as the PKCS#12 file. Use this certificate in your VPN authentication configuration.

## Troubleshooting Firewall Threat Defense Certificates

See [Secure Firewall Threat Defense VPN Certificate Guidelines and Limitations, on page 1365](#) to determine if variations in your certificate enrollment environment may be causing a problem. Then consider the following:

- Ensure there is a route to the CA Server from the device.

If the CA Server's host name is given in the Enrollment Object, use Flex Config to configure DNS appropriately to reach the server. Alternatively, use the IP Address of the CA Server.

- If you are using a Microsoft 2012 CA Server, the default IPsec Template is not accepted by the managed device and must be changed.

To configure a working template, follow these steps as you use MS CA documentation as a reference.

1. Duplicate the IPsec (Offline Request) template.
2. In **Extensions > Application policies**, select *IP security end system*, instead of the *IP security IKE intermediate*.
3. Set the permissions and the template name.
4. Add the new template and change the registry settings to reflect the new template name.

- On the Firewall Management Center, you might receive the following health alert related to the Firewall Threat Defense device:

Code - F0853; Description - default Keyring's certificate is invalid, reason: expired

**Solution:** In such cases, use the following command to regenerate the default certificate in CLISH CLI:

```
> system support regenerate-security-keyring default
```

- A red cross appears in the CA certificate status with the following error:

Fail to configure CA certificate

**Solution:** See [Troubleshoot Certificate Error on FMC](#).

- To check the list of the certificates in a .pfx file, use tools such as `certutil` or `openssl`. You can see the whole chain with ID certificate, SubCA certificate, and CA certificate (if any).

- `certutil -dump cert.pfx`
- `openssl pkcs12 -info -in cert.pfx`

- The following error appears:

Identity certificate import required

**Solution:** See [Troubleshoot Certificate Error "Identity certificate import required" on FMC](#).

## History for Certificates

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Support for OCSP and CRL IPv6 URL	7.4	Any	You can now add IPv6 OCSP and CRL URLs for certificate authentication (revocation checking). The IPv6 addresses must be enclosed in square brackets.
Enhancements to Manual Enrollment	6.7	Any	You can now create only a CA certificate without an identity certificate. You can also generate a CSR without a CA certificate and obtain an identity certificate from the CA.
PKCS CA Chain	6.7	Any	You can view and manage the chain of certifying authorities (CAs) issuing your certificates. You can also export a copy of the certificates.

## CHAPTER 35

# VPN Overview

A virtual private network (VPN) connection establishes a secure tunnel between endpoints over a public network such as the Internet.

This chapter applies to Remote Access and Site-to-site VPNs on Secure Firewall Threat Defense devices. It describes the Internet Protocol Security (IPsec), the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and SSL standards that are used to build site-to-site and remote access VPNs.

- [VPN Topology Options, on page 1387](#)

## VPN Types

The Firewall Management Center supports the following types of VPN connections:

- Remote Access VPNs on Firewall Threat Defense devices.

Remote access VPNs are secure, encrypted connections, or tunnels, between remote users and your company's private network. The connection consists of a VPN endpoint device, which is a workstation or mobile device with VPN client capabilities, and a VPN headend device, or secure gateway, at the edge of the corporate private network.

Secure Firewall Threat Defense devices can be configured to support Remote Access VPNs over SSL or IPsec IKEv2 by the Firewall Management Center. Functioning as secure gateways in this capacity, they authenticate remote users, authorize access, and encrypt data to provide secure connections to your network. No other types of appliances, managed by the Firewall Management Center, support Remote Access VPN connections.

Secure Firewall Threat Defense secure gateways support the Secure Client full tunnel client. This client is required to provide secure SSL IPsec IKEv2 connections for remote users. This client gives remote users the benefits of a client without the need for network administrators to install and configure clients

on remote computers since it can be deployed to the client platform upon connectivity. It is the only client supported on endpoint devices.

- Site-to-site VPNs on Firewall Threat Defense devices.

A site-to-site VPN connects networks in different geographic locations. You can create site-to-site IPsec connections between managed devices, and between managed devices and other Cisco or third-party peers that comply with all relevant standards. These peers can have any mix of inside and outside IPv4 and IPv6 addresses. Site-to-site tunnels are built using the Internet Protocol Security (IPsec) protocol suite and IKEv1 or IKEv2. After the VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel.

## VPN Basics

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secure connections between remote users and private corporate networks. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

- Negotiate tunnel parameters.
- Establish tunnels.
- Authenticate users and data.
- Manage security keys.
- Encrypt and decrypt data.
- Manage data transfer across the tunnel.
- Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from the private network, encapsulate them, create a tunnel, and send them to the other end of the tunnel where they are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

After the site-to-site VPN connection is established, the hosts behind the local gateway can connect to the hosts behind the remote gateway through the secure VPN tunnel. A connection consists of the IP addresses and hostnames of the two gateways, the subnets behind them, and the method the two gateways use to authenticate to each other.

**Hubs**—Devices that enable secure VPN connectivity to and from one or more remote branch devices or spokes. Hubs also act as a gateway for spokes to communicate with each other.

**Spokes**—Devices that connect over VPN to a hub to securely access the corporate resources behind the hub. Spokes communicate with each other through the hub.

## Internet Key Exchange (IKE)

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE policy is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE policies contain a single set of algorithms and a modulus group. Unlike IKEv1, in an IKEv2 policy, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. It is possible to create a single IKE policy, although you might want different policies to give higher priority to your most desired options. For site-to-site VPNs, you can create an IKE policy. IKEv1 and IKEv2 each support a maximum of 20 IKE policies, each with a different set of values. Assign a unique priority to each policy that you create. The lower the priority number, the higher the priority.

To define an IKE policy, specify:

- A unique priority (1 to 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy.
- A Hashed Message Authentication Codes (HMAC) method (called integrity algorithm in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit.
- For IKEv2, a separate pseudorandom function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm.
- A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys.
- An authentication method, to ensure the identity of the peers.
- A limit to the time the device uses an encryption key before replacing it.

When IKE negotiation begins, the peer that starts the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order. A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—From the remote peer policy—Applies. By default, the Secure Firewall Management Center deploys an IKEv1 policy at the lowest priority for all VPN endpoints to ensure a successful negotiation.

## IPsec

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms.

An IPsec Proposal policy defines the settings required for IPsec tunnels. An IPsec proposal is a collection of one or more crypto-maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including:

- A proposal (or transform set) is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a proposal that is the same at both peers. When it is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN. There are separate IPsec proposals for IKEv1 and IKEv2. In IKEv1 proposals (or transform sets), for each parameter, you set one value. For IKEv2 proposals, you can configure multiple encryption and integration algorithms for a single proposal.
- A crypto map, combines all components required to set up IPsec security associations (SA), including IPsec rules, proposals, remote peers, and other parameters that are necessary to define an IPsec SA. When two peers try to establish an SA, they must each have at least one compatible crypto map entry.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to start an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto-policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer's identity. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer's requirements.

Dynamic crypto map policies are applicable to both hub-and-spoke and point-to-point VPN topologies. To apply dynamic crypto map policies, specify a dynamic IP address for one of the peers in the topology and ensure that the dynamic crypto-map is enabled on this topology. Note that in a full mesh VPN topology, you can apply only static crypto map policies.

**Note**

Simultaneous IKEv2 dynamic crypto map is not supported for the same interface for both remote access and site-to-site VPNs on Firewall Threat Defense.

## VPN Packet Flow

On a Firewall Threat Defense device, by default no traffic is allowed to pass through access-control without explicit permission. VPN tunnel traffic as well, is not relayed to the endpoints until it has passed through Snort. Incoming tunnel packets are decrypted before being sent to the Snort process. Snort processes outgoing packets before encryption.

Access Control identifying the protected networks for each endpoint node of a VPN tunnel determines which traffic is allowed to pass through the Firewall Threat Defense device and reach the endpoints. For Remote Access VPN traffic, a Group Policy filter or an Access Control rule must be configured to permit VPN traffic flow.

In addition, the system does not send tunnel traffic to the public source when the tunnel is down.

# IPsec Flow Offload

You can configure supporting device models to use IPsec flow offload. After the initial setup of an IPsec site-to-site VPN or remote access VPN security association (SA), IPsec connections are offloaded to the field-programmable gate array (FPGA) in the device, which should improve device performance.

Offloaded operations specifically relate to the pre-decryption and decryption processing on ingress, and the pre-encryption and encryption processing on egress. The system software handles the inner flow to apply your security policies.

IPsec flow offload is enabled by default, and applies to the following device types:

- Secure Firewall 3100
- Secure Firewall 4200

IPsec flow offload is also used when the device's VTI loopback interface is enabled.

## Limitations for IPsec Flow Offload

The following IPsec flows are not offloaded:

- IKEv1 tunnels. Only IKEv2 tunnels will be offloaded. IKEv2 supports stronger ciphers.
- Flows that have volume-based rekeying configured.
- Flows that have compression configured.
- Transport mode flows. Only tunnel mode flows will be offloaded.
- AH format. Only ESP/NAT-T format will be supported.
- Flows that have post-fragmentation configured.
- Flows that have anti-replay window size other than 64bit and anti-replay is not disabled.
- Flows that have firewall filter enabled.
- Mult-instance mode.

## Configure IPsec Flow Offload

IPsec flow offload is enabled by default on hardware platforms that support the feature. To change the configuration, use FlexConfig to implement the **flow-offload-ipsec** command. See the ASA command reference for detailed information about the command.

# VPN Licensing

There is no specific licensing for enabling Secure Firewall Threat Defense VPN, it is available by default.

The Firewall Management Center determines whether to allow or block the usage of strong crypto on the Firewall Threat Defense device based on attributes provided by the smart licensing server.

This is controlled by whether you selected the option to allow export-controlled functionality on the device when you registered with the Cisco Smart License Manager. If you are using the evaluation license, or you did not enable export-controlled functionality, you cannot use strong encryption.

If you have created your VPN configurations with an evaluation license, and upgrade your license from evaluation to smart license with export-controlled functionality, check, and update your encryption algorithms for stronger encryption and for the VPNs to work properly. DES-based encryptions are no longer supported.

## How Secure Should a VPN Connection Be?

Because a VPN tunnel typically traverses a public network, most likely the Internet, you need to encrypt the connection to protect the traffic. You define the encryption and other security techniques to apply using IKE policies and IPsec proposals.

If your device license allows you to apply strong encryption, there is a wide range of encryption and hash algorithms, and Diffie-Hellman groups, from which to choose. However, as a general rule, the stronger the encryption that you apply to the tunnel, the worse the system performance. Find a balance between security and performance that provides sufficient protection without compromising efficiency.

We cannot provide specific guidance on which options to choose. If you operate within a larger corporation or other organization, there might already be defined standards that you need to meet. If not, take the time to research the options.

The following topics explain the available options.

## Complying with Security Certification Requirements

Many VPN settings have options that allow you to comply with various security certification standards. Review your certification requirements and the available options to plan your VPN configuration.

## Deciding Which Encryption Algorithm to Use

When deciding which encryption algorithms to use for the IKE policy or IPsec proposal, your choice is limited to algorithms supported by the devices in the VPN.

For IKEv2, you can configure multiple encryption algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

For IPsec proposals, the algorithm is used by the Encapsulating Security Protocol (ESP), which provides authentication, encryption, and anti-replay services. ESP is IP protocol type 50. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-.

If your device license qualifies for strong encryption, you can choose from the following encryption algorithms. If you are not qualified for strong encryption, you can select DES only.

---

**Note**

If you are qualified for strong encryption, before upgrading from the evaluation license to a smart license, check and update your encryption algorithms for stronger encryption so that the VPN configuration works properly. Choose AES-based algorithms. DES is not supported if you are registered using an account that supports strong encryption. After registration, you cannot deploy changes until you remove all uses of DES.

---

- **AES-GCM**—(IKEv2 only.) Advanced Encryption Standard in Galois/Counter Mode is a block cipher mode of operation providing confidentiality and data-origin authentication, and provides greater security than AES. AES-GCM offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance. GCM is a mode of AES that is required to support NSA Suite B. NSA Suite B is a set of cryptographic algorithms that devices must support to meet federal standards for cryptographic strength. .
- **AES**—Advanced Encryption Standard is a symmetric cipher algorithm that provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192-, and 256-bit keys. A longer key provides higher security but a reduction in performance.
- **DES**—Data Encryption Standard, which encrypts using 56-bit keys, is a symmetric secret-key block algorithm. If your license account does not meet the requirements for export controls, this is your only option.
- **Null, ESP-Null**—Do not use. A null encryption algorithm provides authentication without encryption. This is typically used for testing purposes only. However, it does not work at all on many platforms, including virtual and the Firepower 2100.

## Deciding Which Hash Algorithms to Use

In IKE policies, the hash algorithm creates a message digest, which is used to ensure message integrity. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

In IPsec proposals, the hash algorithm is used by the Encapsulating Security Protocol (ESP) for authentication. In IKEv2 IPsec Proposals, this is called the integrity hash. In IKEv1 IPsec proposals, the algorithm name is prefixed with ESP-, and there is also an -HMAC suffix (which stands for “hash method authentication code”).

For IKEv2, you can configure multiple hash algorithms. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

You can choose from the following hash algorithms.

- **SHA (Secure Hash Algorithm)**—Standard SHA (SHA1) produces a 160-bit digest.

The following SHA-2 options, which are even more secure, are available for IKEv2 configurations. Choose one of these if you want to implement the NSA Suite B cryptography specification.

- **SHA256**—Specifies the Secure Hash Algorithm SHA 2 with the 256-bit digest.
- **SHA384**—Specifies the Secure Hash Algorithm SHA 2 with the 384-bit digest.
- **SHA512**—Specifies the Secure Hash Algorithm SHA 2 with the 512-bit digest.
- **Null or None (NULL, ESP-NONE)**—(IPsec Proposals only.) A null Hash Algorithm; this is typically used for testing purposes only. However, you should choose the null integrity algorithm if you select one of the AES-GCM options as the encryption algorithm. Even if you choose a non-null option, the integrity hash is ignored for these encryption standards.

## Deciding Which Diffie-Hellman Modulus Group to Use

You can use the following Diffie-Hellman key derivation algorithms to generate IPsec security association (SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires more processing time. You must have a matching modulus group on both peers.

If you select AES encryption, to support the large key sizes required by AES, you should use Diffie-Hellman (DH) Group 5 or higher. IKEv1 policies do not support all of the groups listed below.

To implement the NSA Suite B cryptography specification, use IKEv2 and select one of the elliptic curve Diffie-Hellman (ECDH) options: 19, 20, or 21. Elliptic curve options and groups that use 2048-bit modulus are less exposed to attacks such as Logjam.

For IKEv2, you can configure multiple groups. The system orders the settings from the most secure to the least secure and negotiates with the peer using that order. For IKEv1, you can select a single option only.

- 14—Diffie-Hellman Group 14: 2048-bit modular exponential (MODP) group. Considered good protection for 192-bit keys.
- 15—Diffie-Hellman Group 15: 3072-bit MODP group.
- 16—Diffie-Hellman Group 16: 4096-bit MODP group.
- 19—Diffie-Hellman Group 19: National Institute of Standards and Technology (NIST) 256-bit elliptic curve modulo a prime (ECP) group.
- 20—Diffie-Hellman Group 20: NIST 384-bit ECP group.
- 21—Diffie-Hellman Group 21: NIST 521-bit ECP group.
- 31—Diffie-Hellman Group 31: Curve25519 256-bit EC Group.

## Deciding Which Authentication Method to Use

Preshared keys and digital certificates are the methods of authentication available for VPNs.

Site-to-site, IKEv1 and IKEv2 VPN connections can use both options.

Remote Access, which uses SSL and IPsec IKEv2 only, supports digital certificate authentication only.

Preshared keys allow for a secret key to be shared between two peers and used by IKE during the authentication phase. The same shared key must be configured at each peer or the IKE SA cannot be established.

Digital certificates use RSA key pairs to sign and encrypt IKE key management messages. Certificates provide non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When using this authentication method, you need a Public Key Infrastructure (PKI) defined where peers can obtain digital certificates from a Certification Authority (CA). CAs manage certificate requests and issue certificates to participating network devices providing centralized key management for all of the participating devices.

Preshared keys do not scale well, using a CA improves the manageability and scalability of your IPsec network. With a CA, you do not need to configure keys between all encrypting devices. Instead, each participating device is registered with the CA, and requests a certificate from the CA. Each device that has its own certificate and the public key of the CA can authenticate every other device within a given CA's domain.

## Pre-shared Keys

Pre-shared key enables you to share a secret key between two peers. IKE uses the key in the authentication phase. You must configure the same shared key on each peer, or the IKE SA cannot be established.

To configure the pre-shared keys, choose whether you want to use a manual or automatically generated key, and then specify the key in the IKEv1/IKEv2 options. Then, when you deploy your configuration, the key is configured on all devices in the topology.

## PKI Infrastructure and Digital Certificates

### Public Key Infrastructure

A PKI provides centralized key management for participating network devices. It is a defined set of policies, procedures, and roles that support *public key cryptography* by generating, verifying, and revoking *public key certificates* commonly known as *digital certificates*.

In public key cryptography, each endpoint of a connection has a key pair consisting of both a public and a private key. The key pairs are used by the VPN endpoints to sign and encrypt messages. The keys act as complements, and anything encrypted with one of the keys can be decrypted with the other, securing the data flowing over the connection.

Generate a general purpose RSA, ECDSA, or EDDSA key pair, used for both signing and encryption, or you generate separate key pairs for each purpose. Separate signing and encryption keys help to reduce exposure of the keys. SSL uses a key for encryption but not signing, however, IKE uses a key for signing but not encryption. By using separate keys for each, exposure of the keys is minimized.

### Digital Certificates or Identify Certificates

When you use Digital Certificates as the authentication method for VPN connections, peers are configured to obtain digital certificates from a Certificate Authority (CA). CAs are trusted authorities that “sign” certificates to verify their authenticity, thereby guaranteeing the identity of the device or user.

CA servers manage public CA certificate requests and issue certificates to participating network devices as part of a Public Key Infrastructure (PKI), this activity is called Certificate Enrollment. These digital certificates, also called identity certificates contain:

- The digital identification of the owner for authentication, such as name, serial number, company, department, or IP address.
- A public key needed to send and receive encrypted data to the certificate owner.
- The secure digital signature of a CA.

Certificates also provide non-repudiation of communication between two peers, meaning that it they prove that the communication actually took place.

### Certificate Enrollment

Using a PKI improves the manageability and scalability of your VPN since you do not have to configure pre-shared keys between all the encrypting devices. Instead, you individually *enroll* each participating device with a CA server, which is explicitly trusted to validate identities and create an identity certificate for the device. When this has been accomplished, each participating peer sends their identity certificate to the other peer to validate their identities and establish encrypted sessions with the public keys contained in the certificates. See [Certificate Enrollment Objects, on page 1293](#) for details on enrolling Firewall Threat Defense devices.

### Certificate Authority Certificates

In order to validate a peer's certificate, each participating device must retrieve the CA's certificate from the server. A CA certificate is used to sign other certificates. It is self-signed and called a root certificate. This certificate contains the public key of the CA, used to decrypt and validate the CA's digital signature and the contents of the received peer's certificate. The CA certificate may be obtained by:

- Using the Simple Certificate Enrollment Protocol (SCEP) or Enrollment over Secure Transport (EST) to retrieve the CA's certificate from the CA server
- Manually copying the CA's certificate from another participating device

### Trustpoints

Once enrollment is complete, a trustpoint is created on the managed device. It is the object representation of a CA and associated certificates. A trustpoint includes the identity of the CA, CA-specific parameters, and an association with a single enrolled identity certificate.

### PKCS#12 File

A PKCS#12, or PFX, file holds the server certificate, any intermediate certificates, and the private key in one encrypted file. This type of file may be imported directly into a device to create a trustpoint.

### Revocation Checking

A CA may also revoke certificates for peers that no longer participate in your network. Revoked certificates are either managed by an Online Certificate Status Protocol (OCSP) server or are listed in a certificate revocation list (CRL) stored on an LDAP server. A peer may check these before accepting a certificate from another peer.

## Removed or Deprecated Hash Algorithms, Encryption Algorithms, and Diffie-Hellman Modulus Groups

Support has been removed for less secure ciphers. We recommend that you update your VPN configuration before you upgrade to Firewall Threat Defense 6.70 to supported DH and encryption algorithms to ensure the VPN works correctly.

Update your IKE proposals and IPSec policies to match the ones supported in Firewall Threat Defense 6.70 and then deploy the configuration changes.

The following less secure ciphers have been removed or deprecated in Firewall Threat Defense 6.70 onwards:

- **Diffie-Hellman GROUP 5** is deprecated for IKEv1 and IKEv2.
- Diffie-Hellman groups 2 and 24 have been removed.
- **Encryption algorithms:** 3DES, AES-GMAC, AES-GMAC-192, AES-GMAC-256 have been removed.

**Note** DES continues to be supported in evaluation mode or for users who do not satisfy export controls for strong encryption.

NULL is removed in IKEv2 policy, but supported in both IKEv1 and IKEv2 IPsec transform-sets.

## VPN Topology Options

When you create a new VPN topology you must, at minimum, give it a unique name, specify a topology type, and select the IKE version. You can select from three types of topologies, each containing a group of VPN tunnels:

- Point-to-point (PTP) topologies establish a VPN tunnel between two endpoints.
- Hub and Spoke topologies establish a group of VPN tunnels connecting a hub endpoint to a group of spoke endpoints.
- Full Mesh topologies establish a group of VPN tunnels among a set of endpoints.

Define a pre-shared key for VPN authentication manually or automatically, there is no default key. When choosing automatic, the Secure Firewall Management Center generates a pre-shared key and assigns it to all the nodes in the topology.

### Point-to-Point VPN Topology

In a point-to-point VPN topology, two endpoints communicate directly with each other. You configure the two endpoints as peer devices, and either device can start the secured connection.

The following diagram displays a typical point-to-point VPN topology.

### Hub and Spoke VPN Topology

In a Hub and Spoke VPN topology, a central endpoint (hub node) connects with multiple remote endpoints (spoke nodes). Each connection between the hub node and an individual spoke endpoint is a separate VPN tunnel. The hosts behind any of the spoke nodes can communicate with each other through the hub node.

The Hub and Spoke topology commonly represent a VPN that connects an organization's main and branch office locations using secure connections over the Internet or other third-party network. These deployments

provide all employees with controlled access to the organization's network. Typically, the hub node is located at the main office. Spoke nodes are located at branch offices and start most of the traffic.

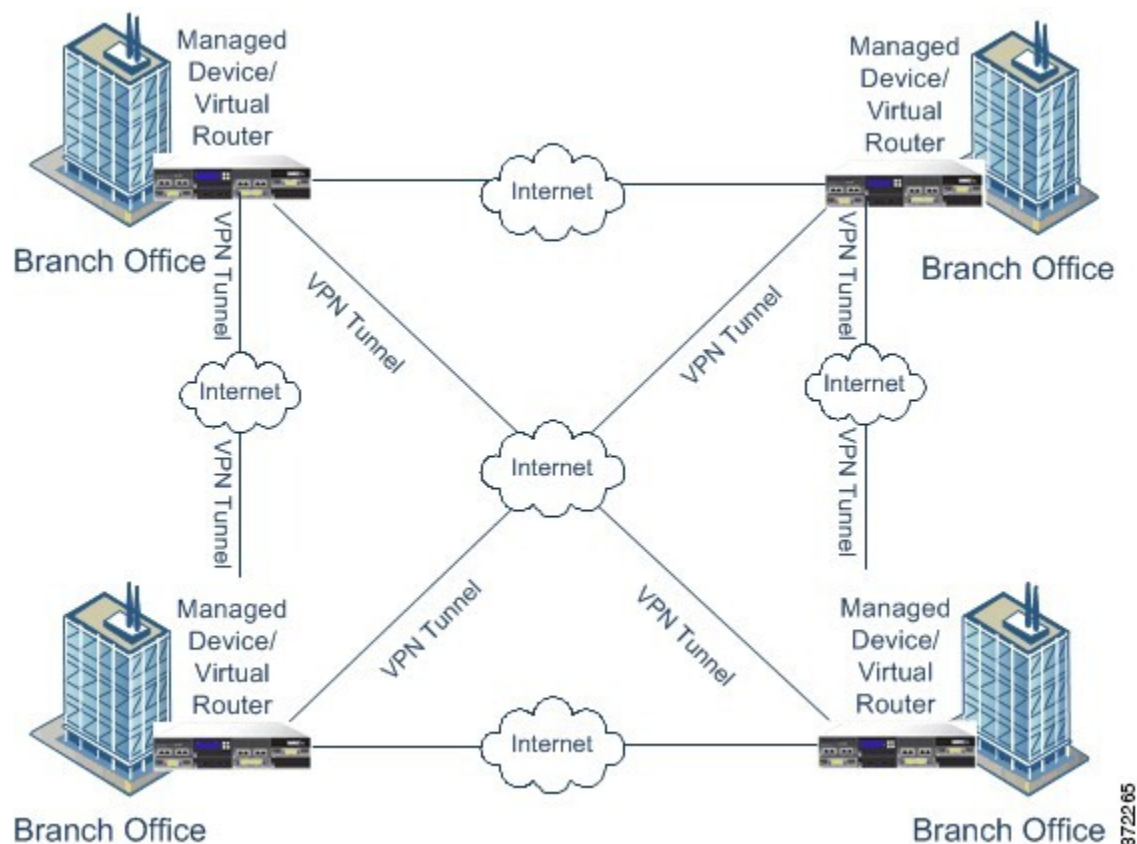

The following diagram displays a typical Hub and Spoke VPN topology.

## Full Mesh VPN Topology

In a Full Mesh VPN topology, all endpoints can communicate with every other endpoint by an individual VPN tunnel. This topology offers redundancy so that when one endpoint fails, the remaining endpoints can still communicate with each other. It commonly represents a VPN that connects a group of decentralized branch office locations. The number of VPN-enabled managed devices you deploy in this configuration depends on the level of redundancy you require.

The following diagram displays a typical Full Mesh VPN topology.

372265

## Implicit Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- **Partial mesh**—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are used in peripheral networks that connect to a fully meshed backbone.
- **Tiered hub-and-spoke**—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.
- **Joined hub-and-spoke**—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.

## About Site-to-Site VPN

Secure Firewall Threat Defense site-to-site VPN supports the following features:

- Both IPsec IKEv1 & IKEv2 protocols.
- Certificates and automatic or manual preshared keys for authentication.
- IPv4 & IPv6. All combinations of inside and outside are supported.
- IPsec IKEv2 Site-to-Site VPN topologies provide configuration settings to comply with security certifications.
- Static and dynamic Interfaces.
- HA environments for both Firewall Management Center and Firewall Threat Defense.

- VPN alerts when the tunnel goes down.
- Tunnel statistics available using the Firewall Threat Defense Unified CLI.
- IKEv1 and IKEv2 back-up peer configuration for point-to-point extranet and hub-and-spoke VPNs.
- Extranet device as hub in 'Hub and Spokes' deployments.
- Dynamic IP address for a managed endpoint pairing with extranet device in 'Point to Point' deployments.
- Dynamic IP address for extranet device as an endpoint.
- Hub as extranet in 'Hub and Spokes' deployments.

### VPN Topology

To create a new site-to-site VPN topology you must, specify a unique name, a topology type, choose the IKE version that is used for IPsec IKEv1 or IKEv2, or both. Also, determine your authentication method. Once configured, you deploy the topology to Firewall Threat Defense devices. The Secure Firewall Management Center configures site-to-site VPNs on Firewall Threat Defense devices only.

You can select from three types of topologies, containing one or more VPN tunnels:

- Point-to-point (PTP) deployments establish a VPN tunnel between two endpoints.
- Hub and Spoke deployments establish a group of VPN tunnels connecting a hub endpoint to a group of spoke nodes.
- Full Mesh deployments establish a group of VPN tunnels among a set of endpoints.

### IPsec and IKE

In the Secure Firewall Management Center, site-to-site VPNs are configured based on IKE policies and IPsec proposals that are assigned to VPN topologies. Policies and proposals are sets of parameters that define the characteristics of a site-to-site VPN, such as the security protocols and algorithms that are used to secure traffic in an IPsec tunnel. Several policy types may be required to define a full configuration image that can be assigned to a VPN topology.

### Authentication

For authentication of VPN connections, configure a preshared key in the topology, or a trustpoint on each device. Preshared keys allow for a secret key, used during the IKE authentication phase, to be shared between two peers. A trustpoint includes the identity of the CA, CA-specific parameters, and an association with a single enrolled identity certificate.

### Extranet Devices

Each topology type can include extranet devices, devices that you don't manage in Firewall Management Center. These include:

- Cisco devices that Secure Firewall Management Center supports, but for which your organization isn't responsible. Such as spokes in networks managed by other organizations within your company, or a connection to a service provider or partner's network.
- Non-Cisco devices. You can't use Secure Firewall Management Center to create and deploy configurations to non-Cisco devices.

Add non-Cisco devices, or Cisco devices not managed by the Secure Firewall Management Center, to a VPN topology as "Extranet" devices. Also specify the IP address of each remote device.

## Secure Firewall Threat Defense Site-to-site VPN Guidelines and Limitations

- Site-to-site VPN supports ECMP zone interfaces.
- You must configure all nodes in a topology with either crypto ACL or a protected network. You cannot configure a topology with crypto ACL on one node and protected network on another.
- You can configure a VPN connection across domains by using an extranet peer for the endpoint not in the current domain.
- You can backup Firewall Threat Defense VPNs using the Firewall Management Center backup.
- IKEv1 does not support CC/UCAPL-compliant devices. We recommend that you use IKEv2 for these devices.
- You cannot move a VPN topology between domains.
- VPN does not support network objects with a 'range' option.
- Firewall Threat Defense VPNs do not currently support PDF export and policy comparison.
- There is no per-tunnel or per-device edit option for Firewall Threat Defense VPNs, you can edit only the whole topology.
- The Firewall Management Center does not verify the device interface address verification for transport mode when you select a crypto ACL.
- There is no support for automatic mirror ACE generation. Mirror ACE generation for the peer is a manual process on either side.
- With crypto ACL, the Firewall Management Center supports only point to point VPN and does not support tunnel health events.
- Whenever IKE ports 500/4500 are in use or when there are some active PAT translations, you cannot configure a site-to-site VPN on the same ports as it fails to start the service on those ports.
- Tunnel status is not updated in realtime, but at an interval of five minutes in the Firewall Management Center.
- You cannot use the character " (double quote) as part of pre-shared keys. If you have used " in a pre-shared key, ensure that you change the character.
- In a site-to-site VPN configuration with two devices managed by the same Firewall Management Center, you cannot configure the devices as backup peers. You must configure one of peer devices in the topology as an extranet device.
- Configure unique local IKE identity for all tunnels across all your VPN topologies.

## Types of Site-to-Site VPN Topologies

Site-to-Site VPN Topology	Description	More Information
Route-Based VPN	Configure secure traffic dynamically between peers in a network based on routing over Virtual Tunnel Interfaces (VTIs).	<a href="#">Create a Route-based Site-to-Site VPN, on page 1418</a>
Policy-Based VPN	Configure secure traffic between peers in a network based on a static policy using protected networks.	<a href="#">Configure a Policy-based Site-to-Site VPN, on page 1396</a>
SASE Topology	Configure an IPsec IKEv2 tunnel from a threat defense device to an Umbrella Secure Internet Gateway (SIG). This tunnel forwards all internet-bound traffic to the Umbrella SIG for inspection and filtering.	<a href="#">Configure a SASE Tunnel for Umbrella, on page 1439</a>

## Requirements and Prerequisites for Site-to-Site VPN

### Model Support

Threat Defense

### Supported Domains

Leaf

### User Roles

Admin

### Supported Interfaces

Topology Type	Interface Type
Policy-Based	<ul style="list-style-type: none"><li>• Physical interfaces<ul style="list-style-type: none"><li>• Non-management</li><li>• Interface Mode must be either Routed or None</li></ul></li><li>• Subinterface interfaces</li><li>• Redundant interfaces</li><li>• Etherchannel interfaces</li><li>• VLAN interfaces</li></ul>
Route-Based	Static Virtual Tunnel Interfaces

## Manage Site-to-Site VPNs

The Site-to-Site VPN page provides a snapshot of site-to-site VPN tunnels. You can view the status of the tunnels and filter the tunnels based on the device, topology, or tunnel type. The page lists 20 topologies per page and you can navigate between pages to view more topology details. You can click individual VPN topologies to expand and view details of the endpoints.

### Before you begin

For certificate authentication of your site-to-site VPNs, you must prepare the devices by allocating trustpoints as described in [Certificates, on page 1365](#).

### Procedure

Select **Devices > VPN > Site To Site** to manage your Firewall Threat Defense site-to-site VPN configurations and deployments.

The page lists the site-to-site VPNs topologies and indicates the status of tunnels using color codes:

- **Active (Green)**—There is an active IPsec Tunnel.
- **Unknown (Amber)**—No tunnel establishment event has been received from the device yet.
- **Down (Red)**—There are no active IPsec tunnels.
- **Deployment Pending**—Topology has not been deployed on the device yet.

Choose from the following:

- **Refresh**—View the updated status of the VPNs.
- **Add**—Create new policy based or route-based Site to Site VPNs.

- **Edit**—Modify the settings of an existing VPN topology.

**Note**

You cannot edit the topology type after you initially save it. To change the topology type, delete the topology and create a new one.

Two users shouldn't edit the same topology simultaneously; however, the web interface doesn't prevent simultaneous editing.

- **Delete**—To delete a VPN deployment, click **Delete** (🗑️).
- **Deploy**—Choose **Deploy** > **Deployment**; see [Deploy Configuration Changes, on page 183](#).

**Note**

Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

## Configure a Policy-based Site-to-Site VPN

### Procedure

- 
- Step 1** Choose **Devices** > **Site To Site**. Then click + **Site To Site VPN**, or edit a listed VPN topology.
- Step 2** Enter a unique **Topology Name**. We recommend naming your topology to indicate that it is a Firewall Threat Defense VPN, and its topology type.
- Step 3** Click the **Policy Based (Crypto Map)** radio button.
- Step 4** Choose the **Network Topology** for this VPN.
- Step 5** Choose the IKE versions to use during IKE negotiations. Check the **IKEv1** or **IKEv2** check box. Default is IKEv2. Select either or both options as appropriate; select IKEv1 if any device in the topology doesn't support IKEv2.
- You can also configure a backup peer for point-to-point extranet VPNs. For more information, see [Firewall Threat Defense VPN Endpoint Options, on page 1397](#).
- Step 6** Required: Add Endpoints for this VPN deployment by clicking **Add** (+) for each node in the topology. Configure each endpoint field as described in [Firewall Threat Defense VPN Endpoint Options, on page 1397](#).
- For Point to point, configure **Node A** and **Node B**.
  - For Hub and Spoke, configure a **Hub Node** and **Spoke Nodes**
  - For Full Mesh, configure multiple **Nodes**
- Step 7** (Optional) Specify non-default IKE options for this deployment as described in [Firewall Threat Defense VPN IKE Options, on page 1401](#)

- Step 8** (Optional) Specify non-default IPsec options for this deployment as described in [Firewall Threat Defense VPN IPsec Options, on page 1403](#)
- Step 9** (Optional) Specify non-default Advanced options for this deployment as described in [Firewall Threat Defense Advanced Site-to-site VPN Deployment Options, on page 1406](#).
- Step 10** Click **Save**.  
The endpoints are added to your configuration.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

**Note** Some VPN settings are validated only during deployment. Be sure to verify that your deployment was successful.

If you get an alert that your VPN tunnel is inactive even when the VPN session is up, follow the VPN troubleshooting instructions to verify and ensure that your VPN is active. For more information, see [VPN Monitoring and Troubleshooting, on page 1573](#) and [VPN Troubleshooting, on page 1582](#).

---

## Firewall Threat Defense VPN Endpoint Options

### Navigation Path

**Devices > Site To Site**. Then click + **Site To Site VPN**, or edit a listed VPN topology. Click the **Endpoints** tab.

### Fields

#### Device

Choose an endpoint node for your deployment:

- A Firewall Threat Defense device managed by this Firewall Management Center
- A Firewall Threat Defense high availability container managed by this Firewall Management Center
- An **Extranet** device, any device (Cisco or third party) not managed by this Firewall Management Center.

#### Device Name

For extranet devices only, provide a name for this device. We recommend naming it such that it is identifiable as an unmanaged device.

#### Interface

If you chose a managed device as your endpoint, choose an interface on that managed device.

For 'Point to Point' deployments, you can also configure an endpoint with dynamic interface. An endpoint with a dynamic interface can pair only with an extranet device and can't pair with an endpoint, which has a managed device.

You can configure device interfaces at **Devices > Device ManagementAdd/Edit device > Interfaces**.

### IP Address

- If you choose an extranet device, a device **not** managed by the Firewall Management Center, specify an IP address for the endpoint.

For an extranet device, select **Static** and specify an IP address or select **Dynamic** to allow dynamic extranet devices.

- If you chose a managed device as an endpoint, choose a single IPv4 address or multiple IPv6 addresses from the drop-down list. These IP addresses are already assigned to this interface on the managed device.
- All endpoints in a topology must have the same IP addressing scheme. IPv4 tunnels can carry IPv6 traffic and vice versa. The Protected Networks define which addressing scheme the tunneled traffic uses.
- If the managed device is a high-availability container, choose from a list of interfaces.

### This IP is Private

Check the check box if the endpoint resides behind a firewall with network address translation (NAT).

**Note** Use this option only when the peer is managed by the same Firewall Management Center and don't use this option if the peer is an extranet device.

### Public IP address

If you checked the **This IP is Private** check box, specify a public IP address for the firewall. If the endpoint is a responder, specify this value.

### Connection Type

Specify the allowed negotiation as bidirectional, answer-only, or originate-only. Supported combinations for the connection type are:

**Table 74: Connection Type Supported Combinations**

Remote Node	Central Node
Originate-Only	Answer-Only
Bi-Directional	Answer-Only
Bi-Directional	Bi-Directional

### Certificate Map

Choose a preconfigured certificate map object, or click **Add** (+) to add a certificate map object. The certificate map defines what information is necessary in the received client certificate to be valid for VPN connectivity. See [Certificate Map Objects, on page 1342](#) for details.

## Protected Networks

### Caution

Hub and Spoke topology—To avoid traffic drop for a dynamic crypto map, ensure that you don't select the protected network *any* for both the endpoints.

If the protected network is configured as *any*, on both the endpoints, the crypto ACL that works upon the tunnel is not generated.

Defines the networks that are protected by this VPN endpoint. Select the networks by selecting the list of Subnet/IP Address that define the networks that are protected by this endpoint. Click **Add (+)** to select from available Network Objects or add new Network Objects. See [Creating Network Objects, on page 1283](#). Access control lists are generated from the choices made here.

- **Subnet/IP Address (Network)**—VPN endpoints can't have the same IP address and protected networks in a VPN endpoint pair cannot overlap. If protected networks for an endpoint contain IPv4 or IPv6 entries, the other endpoint's protected network must have at least one entry of the same type (IPv4 or IPv6). If it doesn't, the other endpoint's IP address must be of the same type and not overlap with the entries in the protected network. (Use /32 CIDR address blocks for IPv4 and /128 CIDR address blocks for IPv6.) If both of these checks fail, the endpoint pair is invalid.

### Note

By default, **Reverse Route Injection is enabled** is enabled in Firewall Management Center.

**Subnet/IP Address (Network)** remains the default selection.

When you've selected Protected Networks as *Any* and observe default route traffic being dropped, disable the Reverse Route Injection. Choose **VPN Site to Site > edit a VPN > IPsec > Enable Reverse Route Injection**. Deploy the configuration changes to remove set reverse-route (Reverse Route Injection) from the crypto map configuration and remove the VPN-advertised reverse route that causes the reverse tunnel traffic to be dropped.

- **Access List (Extended)**—An extended access list provides the capability to control the type of traffic that will be accepted by this endpoint, like GRE or OSPF traffic. Traffic may be restricted either by address or port. Click **Add (+)** to add access control list objects.

### Note

Access Control List is supported only in the point to point topology.

## Enable NAT Traversal

Check this check box to allow seamless communication between the peer Firewall Threat Defense devices when there are NAT devices between these devices. For hub and spoke topologies, this option is available only for the spoke. You can uncheck this check box to disable this feature for an endpoint. This parameter is a per peer setting for an endpoint within a topology.

To view or configure the global NAT Traversal (NAT-T) setting, in the **Add/Edit VPN Topology** dialog box:

1. Click the **Advanced** tab.
2. In the left navigation pane, click **Tunnel**.
3. Under **NAT Settings**, the **Keepalive Messages Traversal** is a global setting that enables NAT-T for all endpoints within a topology.

### Exempt VPN traffic from network address translation

Check this check box to exempt the VPN traffic from the Network Address Translation (NAT) rules.

If you do not exempt the VPN traffic from the NAT rules, the traffic gets dropped or is not routed through the VPN tunnel to the remote device. After you enable this option, you can view the NAT exemptions for the device in the NAT policy page (**Device > NAT > NAT Exemptions**).

### Inside interfaces directly connected to the internal network

Specify the security zone or interface group for the inside interface(s) where the protected networks reside. By default, the inside interface is any.

Click + to configure one or more interfaces from a security zone or an interface group that can map to one or more inside interfaces. Ensure that the interface type of the security zone or an interface group is Routed.

### Advanced Settings

**Enable Dynamic Reverse Route Injection**—Reverse Route Injection (RRI) enables routes to be automatically inserted into the routing process, for the networks and hosts protected by a remote tunnel endpoint. Dynamic RRI routes are created only upon the successful establishment of IPsec security associations (SA's).

#### Note

- Dynamic RRI is supported only on IKEv2, and not supported on IKEv1 or IKEv1 + IKEv2.
- Dynamic RRI isn't supported on originate-only peer, Full Mesh topology, and Extranet peer.
- In Point-to-Point, only one peer can have dynamic RRI enabled.
- Between Hub and Spoke, only one of the endpoints can have dynamic RRI enabled.
- Dynamic RRI cannot be combined with a dynamic crypto map.

**Send Local Identity to Peers**—Select this option to send local identity information to the peer device. Select one of the following **Local Identity Configuration** from the list and configure the local identity:

- **IP address**—Use the IP address of the interface for the identity.
- **Auto**—Use the IP address for pre-shared key and Cert DN for certificate-based connections.
- **Email ID**—Specify the email ID to use for the identity. The email ID can be up to 127 characters.
- **Hostname**—Use the fully qualified hostname.
- **Key ID**—Specify the key-id to use for the identity. The key ID must be fewer than 65 characters.

The local identity is used to configure a unique identity per IKEv2 tunnel, instead of a global identity for all the tunnels. The unique identity allows Firewall Threat Defense to have multiple IPsec tunnels behind a NAT to connect to the Cisco Umbrella Secure Internet Gateway (SIG).

For information about configuring a unique tunnel ID on Umbrella, see **Cisco Umbrella SIG User Guide**.

**VPN Filter**—Select an extended access list from the list or click **Add** to create a new extended access list object to filter the site-to-site VPN traffic.

The VPN filter provides more security and filters site-to-site VPN data using an extended access list. The extended access list object selected for the VPN filter lets you filter pre-encrypted traffic before entering the VPN tunnel and decrypted traffic that exits a VPN tunnel. The **sysopt permit-vpn** option, when enabled, would bypass the access control policy rules for the traffic coming from the VPN tunnel. When the **sysopt permit-vpn** option is enabled, the VPN filter helps in identifying and filtering the site-to-site VPN traffic.

**Note** The VPN filter is supported only on Point to Point, and Hub and Spoke topologies. It isn't supported on Mesh topology.

For Hub and Spoke topology, you can choose to override the hub VPN filter on the spoke endpoints in case a different VPN filter needs to be enabled on a specific tunnel.

Select the **Override VPN Filter on the Hub** option to override the hub VPN filter on the spokes. Select the **Remote VPN Filter** extended access list object or create an access list to override.

**Note** For an extranet device as a spoke, only the **Override VPN filter on the Hub** option is available.

For more information about sysopt permit-VPN, see [Firewall Threat Defense Advanced Site-to-site VPN Tunnel Options, on page 1408](#).

## Firewall Threat Defense VPN IKE Options

For the versions of IKE you have chosen for this topology, specify the **IKEv1/IKEv2 Settings**.

**Note** Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

### Navigation Path

**Devices > Site To Site**. Then click + **Site To Site VPN**, or edit a listed VPN topology. Click the **IKE** tab.

### Fields

#### Policy

Choose the required IKEv1 or IKEv2 policy objects from the predefined list or create new objects to use. You can choose multiple IKEv1 and IKEv2 policies. IKEv1 and IKEv2 support a maximum of 20 IKE policies, each with a different set of values. Assign a unique priority to each policy that you create. The lower the priority number, the higher the priority.

We recommend that you do not use values such as 10, 20 and so on because the default IKEv2 policy for remote access VPN can have these values as its priority value. Before deployment, verify that the priority values of the IKE policies (site-to-site and remote access VPN) do not conflict.

For details, see [Firewall Threat Defense IKE Policies, on page 1355](#)

### Authentication Type

Site-to-site VPN supports two authentication methods, pre-shared key and certificate. For an explanation of the two methods, see [Deciding Which Authentication Method to Use, on page 1384](#).

#### Note

In a VPN topology that supports IKEv1, the **Authentication Method** specified in the chosen IKEv1 Policy object becomes the default in the IKEv1 **Authentication Type** setting. These values must match, otherwise, your configuration will error.

- **Pre-shared Automatic Key**—The Firewall Management Center automatically defines the pre-shared key for this VPN. Specify the **Pre-shared Key Length**, the number of characters in the key, 1-27.

The character " (double quote) isn't supported as part of pre-shared keys. If you've used " in a pre-shared key, ensure that you change the character after you upgrade to Secure Firewall Threat Defense 6.30 or higher.

- **Pre-shared Manual Key**—Manually assign the pre-shared key for this VPN. Specify the **Key** and then reenter the same to **Confirm Key**.

When you choose this option for IKEv2, the **Enforce hex-based pre-shared key only** check box appears, check if desired. If enforced, you must enter a valid hex value for the key, an even number of 2-256 characters, using numerals 0-9, or A-F.

- **Certificate**—When you use certificates as the authentication method for VPN connections, peers obtain digital certificates from a CA server in your PKI infrastructure, and trade them to authenticate each other.

In the **Certificate** field, select a preconfigured certificate enrollment object. This enrollment object generates a trustpoint with the same name on the managed device. The certificate enrollment object should be associated with and installed on the device, post which the enrollment process is complete, and then a trustpoint is created.

A trustpoint is a representation of a CA or identity pair. A trustpoint includes the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate.

Before you select this option, note the following:

- Ensure you've enrolled a certificate enrollment object on all the endpoints in the topology—A certificate enrollment object contains the Certification Authority (CA) server information and enrollment parameters that are required for creating Certificate Signing Requests (CSRs) and obtaining Identity Certificates from the specified CA. Certificate Enrollment Objects are used to enroll your managed devices into your PKI infrastructure, and create trustpoints (CA objects) on devices that support VPN connections. For instructions on creating a certificate enrollment object, see [Adding Certificate Enrollment Objects, on page 1294](#), and for instructions on enrolling the object on the endpoints see one of the following as applicable:

- [Installing a Certificate Using Self-Signed Enrollment , on page 1369](#)
- [Installing a Certificate using EST Enrollment, on page 1370](#)
- [Installing a Certificate Using SCEP Enrollment, on page 1371](#)
- [Installing a Certificate Using Manual Enrollment, on page 1371](#)
- [Installing a Certificate Using a PKCS12 File, on page 1372](#)

**Note** For a site-to-site VPN topology, ensure that the same certificate enrollment object is enrolled in all the endpoints in the topology. For further details, see the table below.

- Refer the following table to understand the enrollment requirement for different scenarios. Some of the scenarios require you to override the certificate enrollment object for specific devices. See [Managing Object Overrides, on page 1244](#) to understand how to override objects.

Certificate Enrollment Types	Device identity certificate for all endpoints is from the same CA		Device identity certificate for all endpoints is from different CAs
	Device-specific parameters are NOT specified in the certificate enrollment object	Device-specific parameters are specified in the certificate enrollment object	
Manual	No override required	Override required	Override required
EST	No override required	Override required	Override required
SCEP	No override required	Override required	Override required
PKCS	Override required	Override required	Override required
Self-signed	Not applicable	Not applicable	Not applicable

- Understand the VPN certificate limitations mentioned in [Secure Firewall Threat Defense VPN Certificate Guidelines and Limitations, on page 1365](#).

**Note** If you use a Windows Certificate Authority (CA), the default application policies extension is **IP security IKE intermediate**. If you use this default setting, you must select the **Ignore IPsec Key Usage** option in the Advanced Settings section on the **Key** tab in the **PKI Certificate Enrollment** dialog box for the object you select. Otherwise, the endpoints can't complete the site-to-site VPN connection.

## Firewall Threat Defense VPN IPsec Options

**Note** Settings in this dialog apply to the entire topology, all tunnels, and all managed devices.

Configure the basic parameters for a point-to-point topology in a route-based VPN as described in [Configure Endpoints for a Point to Point Topology](#) and click the **IPsec** tab.

### Crypto-Map Type

A crypto map combines all the components required to set up IPsec security associations (SA). When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The IPsec security negotiation uses the proposals defined in the crypto map entry to protect the data flows specified by that crypto map's IPsec rules. Choose static or dynamic for this deployment's crypto-map:

- **Static**—Use a static crypto map in a point-to-point or full mesh VPN topology.
- **Dynamic**—Dynamic crypto-maps essentially create a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer's requirements.

Dynamic crypto map policies are applicable to both hub-and-spoke and point-to-point VPN topologies. To apply these policies, specify a dynamic IP address for one of the peers in the topology and ensure that the dynamic crypto-map is enabled on this topology. In a full mesh VPN topology, you can apply only static crypto map policies.

### IPsec Mode

For IPsec IKEv2 only, specify the encapsulation mode for applying ESP encryption and authentication to the tunnel. This determines what part of the original IP packet has ESP applied.

- **Tunnel mode**—(default) Encapsulation mode is set to tunnel mode. Tunnel mode applies ESP encryption and authentication to the entire original IP packet (IP header and data), hiding the ultimate source and destination addresses and becoming the payload in a new IP packet.

The major advantage of tunnel mode is that you don't need to modify the end systems to receive the benefits of IPsec. This mode allows a network device, such as a router, to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source router encrypts packets and forwards them along the IPsec tunnel. The destination router decrypts the original IP datagram and forwards it onto the destination system. Tunnel mode also protects against traffic analysis; with tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

- **Transport preferred**—Encapsulation mode is set to transport mode with an option to fall back to tunnel mode if the peer doesn't support it. In transport mode only the IP payload is encrypted, and the original IP headers are left intact. Therefore, the admin must select a protected network that matches the VPN interface IP address.

This mode has the advantages of adding only a few bytes to each packet and allowing devices on the public network to see the final source and destination of the packet. With transport mode, you can enable special processing (for example, QoS) on the intermediate network based on the information in the IP header. However, the layer 4 header is encrypted, which limits examination of the packet.

- **Transport required**—Encapsulation mode is set to transport mode only, falling back to tunnel mode is allowed. If the endpoints can't successfully negotiate transport mode, due to one endpoint not supporting it, the VPN connection is not made.

### Proposals

Click **Edit** (✎) to specify the proposals for your chosen IKEv1 or IKEv2 method. Select from the available **IKEv1 IPsec Proposals** or **IKEv2 IPsec Proposals** objects, or create and then select a new one. See [Configure IKEv1 IPsec Proposal Objects, on page 1354](#) and [Configure IKEv2 IPsec Proposal Objects, on page 1354](#) for details.

### Enable Security Association (SA) Strength Enforcement

Enabling this option ensures that the encryption algorithm used by the child IPsec SA isn't stronger (in terms of the number of bits in the key) than the parent IKE SA.

### Enable Reverse Route Injection

Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint.

### Enable Perfect Forward Secrecy

Whether to use Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. The unique session key protects the exchange from subsequent decryption, even if the entire exchange was recorded and the attacker has obtained the preshared or private keys used by the endpoint devices. If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the Modulus Group list.

### Modulus Group

The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. For a full explanation of the options, see [Deciding Which Diffie-Hellman Modulus Group to Use, on page 1384](#).

### Lifetime Duration

The number of seconds a security association exists before expiring. The default is 28,800 seconds.

### Lifetime Size

The volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before it expires. The default is 4,608,000 kilobytes. Infinite data isn't allowed.

### ESPv3 Settings

#### Validate incoming ICMP error messages

Choose whether to validate ICMP error messages received through an IPsec tunnel and destined for an interior host on the private network.

#### Enable 'Do Not Fragment' Policy

Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header.

#### Policy

- Copy DF bit—Maintains the DF bit.
- Clear DF bit—Ignores the DF bit.
- Set DF bit—Sets and uses the DF bit.

### Enable Traffic Flow Confidentiality (TFC) Packets

Enable dummy TFC packets that mask the traffic profile which traverses the tunnel. Use the **Burst**, **Payload Size**, and **Timeout** parameters to generate random length packets at random intervals across the specified SA.

#### Note

You can enable dummy Traffic Flow Confidentiality (TFC) packets at random lengths and intervals on an IPsec security association (SA). You must have an IKEv2 IPsec proposal set before enabling TFC.

Enabling TFC packets prevents the VPN tunnel from being idle. Thus the VPN idle timeout configured in the group policy doesn't work as expected when you enable the TFC packets.

# Firewall Threat Defense Advanced Site-to-site VPN Deployment Options

The following sections describe the advanced options you can specify in your site-to-site VPN deployment. These settings apply to the entire topology, all tunnels, and all managed devices.

## Firewall Threat Defense VPN Advanced IKE Options

### Advanced > IKE > ISAKMP Settings

#### IKE Keepalive

Enable or disables IKE Keepalives. You can set this option to `EnableInfinite` so that the device never starts the keepalive monitoring itself.

#### Threshold

Specifies the IKE keep alive confidence interval. This interval is the number of seconds allowing a peer to idle before beginning keepalive monitoring. The minimum and default interval is 10 seconds; the maximum interval is 3600 seconds.

#### Retry Interval

Specifies number of seconds to wait between IKE keep alive retries. The default is 2 seconds, the maximum is 10 seconds.

#### Identity Sent to Peers:

Choose the identity that the peers will use to identify themselves during IKE negotiations:

- **autoOrDN**(default)—Determines IKE negotiation by connection type: IP address for preshared key, or Cert DN for certificate authentication (not supported).
- **ipAddress**—Uses the IP addresses of the hosts exchanging ISAKMP identity information.
- **hostname**—Uses the fully qualified domain name of the hosts exchanging ISAKMP identity information. This name comprises the hostname and the domain name.

---

**Note** Enable or disable this option for all your VPN connections.

---

#### Peer Identity Validation

During IKE tunnel establishment, the peer provides its identity: either an IP address, a Fully Qualified Domain Name (FQDN), or a Distinguished Name (DN). It also presents a certificate, which contains none, some, or all of these fields.

If IKE peer identity validation is enabled, the Firewall Threat Defense compares the peer's identity to the respective field in the certificate to see if the information matches. If the information matches, then the peer's identity is validated and the Firewall Threat Defense establishes the tunnel. If the information does not match, the tunnel is not established.

- **Do not check**—Firewall Threat Defense does not validate the peer identity.
- **Required**—Firewall Threat Defense validates the peer identity.
- **If supported by cert**—Firewall Threat Defense validates the peer identity only if the peer provides a certificate.

**Enable Aggressive Mode**

Select this negotiation method for exchanging key information if the IP address isn't known and DNS resolution might not be available on the devices. Negotiation is based on hostname and domain name.

**Enable Notification on Tunnel Disconnect**

Allows an administrator to enable or disable the sending of an IKE notification to the peer when an inbound packet that is received on an SA does not match the traffic selectors for that SA. This notification is disabled by default.

**Advanced > IKE > IKEv2 Security Association (SA) Settings**

More session controls are available for IKE v2 that limit the number of open SAs. By default, there's no limit to the number of open SAs.

**Cookie Challenge**

Whether to send cookie challenges to peer devices in response to SA initiate packets, which can help thwart denial of service (DoS) attacks. The default is to use cookie challenges when 50% of the available SAs are in negotiation. Select one of these options:

- Custom
- Never (default)
- Always

**Threshold to Challenge Incoming Cookies**

The percentage of the total allowed SAs that are in-negotiation. This triggers cookie challenges for any future SA negotiations. The range is zero to 100%.

**Number of SAs Allowed in Negotiation**

Limits the maximum number of SAs that can be in negotiation at any time. If used with Cookie Challenge, configure the cookie challenge threshold lower than this limit for an effective cross-check.

**Maximum number of SAs Allowed**

Limits the number of allowed IKEv2 connections. Default is unlimited.

**Enable Notification on Tunnel Disconnect**

Allows an administrator to enable or disable the sending of an IKE notification to the peer when an inbound packet that is received on an SA doesn't match the traffic selectors for that SA. Sending this notification is disabled by default.

## Firewall Threat Defense VPN Advanced IPsec Options

**Advanced > IPsec > IPsec Settings****Enable Fragmentation Before Encryption**

This option lets traffic travel across NAT devices that don't support IP fragmentation. It doesn't impede the operation of NAT devices that do support IP fragmentation.

**Path Maximum Transmission Unit Aging**

Check to enable Path Maximum Transmission Unit (PMTU) Aging, the interval to reset the PMTU of a Security Association (SA).

**Value Reset Interval**

Enter the number of minutes at which the PMTU value of an SA is reset to its original value. Valid range is 10 to 30 minutes, default is unlimited.

## Firewall Threat Defense Advanced Site-to-site VPN Tunnel Options

### Navigation Path

**Devices > Site To Site**, then click + **Site To Site VPN**, or edit a listed VPN Topology. Click the **Advanced** tab, and select **Tunnel** in the navigation pane.

**Advanced > Tunnel**

### Tunnel Options

Only available for Hub and Spoke, and Full Mesh topologies. This section doesn't appear for Point to Point configurations.

- **Enable Spoke to Spoke Connectivity through Hub**—Disabled by default. Choosing this field enables the devices on each end of the spokes to extend their connection through the hub node to the other device.

### NAT Settings

- **Keepalive Messages Traversal** —Enabled by default. This parameter is a global setting that enables NAT-T for all endpoints within a topology. Check this check box to enable keepalive messages for NAT traversal. NAT traversal keepalive is used for the transmission of keepalive messages when there's a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow.

NAT traversal allows seamless communication between the peer Firewall Threat Defense devices when there are NAT devices between these devices. For hub and spoke topologies, this option is available only for the spoke.

If you select this option, configure the **Interval**, in seconds, between the keepalive signals sent between the spoke and the middle device to indicate that the session is active. The value can be from 5 to 3600 seconds. The default is 20 seconds. You can disable this feature for an endpoint in a topology when you add it using the VPN wizard (**Enable NAT Traversal** check box in the **Add Endpoint** dialog box).

### Access Control for VPN Traffic

**Bypass Access Control policy for decrypted traffic (sysopt permit-vpn)**—By default, the Firewall Threat Defense applies access control policy inspection on the decrypted traffic. Enable this option to bypass the ACL inspection. The Firewall Threat Defense still applies the VPN Filter ACL and authorization ACL downloaded from the AAA server to the VPN traffic.

Enable or disable the option for all your VPN connections. If you disable this option, ensure that the traffic is allowed by the access control policy or prefilter policy.

---

**Note** For route-based VPNs, **sysopt permit-vpn** does not work. You must always create access control rules to allow route-based VPN traffic.

---

### Certificate Map Settings

- **Use the certificate map configured in the Endpoints to determine the tunnel**—If this option is enabled (checked), the tunnel is determined by matching the contents of the received certificate to the certificate map objects configured in the endpoint nodes.
- **Use the certificate OU field to determine the tunnel**—Indicates that if a node isn't determined based on the configured mapping (the above option) if selected, then use the value of the organizational unit (OU) in the subject distinguished name (DN) of the received certificate to determine the tunnel.
- **Use the IKE identity to determine the tunnel**—Indicates that if a node isn't determined based on a rule matching or taken from the OU (the above options) if selected, then the certificate-based IKE sessions are mapped to a tunnel based on the content of the phase1 IKE ID.
- **Use the peer IP address to determine the tunnel**—Indicates that if a tunnel isn't determined based on a rule matching or taken from the OU or IKE ID methods (the above options) if selected, then use the established peer IP address.

## About Virtual Tunnel Interfaces

Firewall Management Center supports a routable logical interface called the Virtual Tunnel Interface (VTI). VTIs do not require a static mapping of IPsec sessions to a physical interface. The IPsec tunnel endpoint is associated with a virtual interface. You can use these interfaces like other interfaces and apply static and dynamic routing policies.

As an alternative to policy-based VPN, you can create a VPN tunnel between peers using VTIs. VTIs support route-based VPN with IPsec profiles attached to the end of each tunnel. VTIs use static or dynamic routes. The device encrypts or decrypts the traffic from or to the tunnel interface and forwards it according to the routing table. Deployments become easier, and having VTI which supports route-based VPN with dynamic routing protocol also satisfies many requirements of a virtual private cloud. Firewall Management Center enables you to easily migrate from crypto-map based VPN configuration to VTI-based VPN.

You can configure route-based VPN with static or dynamic VTI using the site-to-site VPN wizard. Traffic is encrypted using static route, BGP, OSPFv2/v3, or EIGRP.

You can create a routed security zone, add VTI interfaces to it, and define access control rules for the decrypted traffic control over the VTI tunnel.

You can create VTI-based VPNs between:

- Two Firewall Threat Defense devices.
- A Firewall Threat Defense and public cloud.
- One Firewall Threat Defense and another Firewall Threat Defense with service provider redundancy.
- A Firewall Threat Defense and any other device with VTI interfaces.
- A Firewall Threat Defense and another device with policy-based VPN configuration.

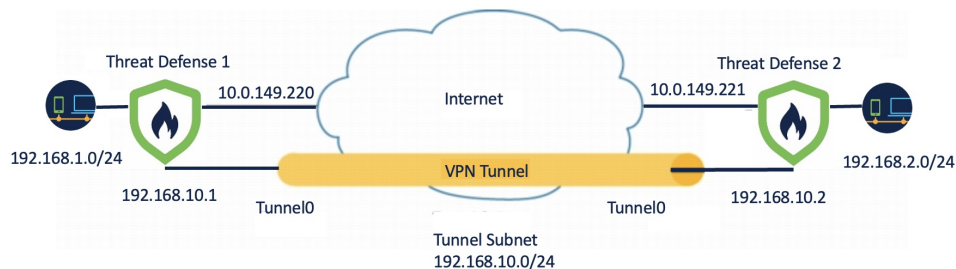

There are two types of VTI interfaces: static VTI and dynamic VTI.

For more information, see [Static VTI, on page 1410](#) and [Dynamic VTI, on page 1411](#).

## Static VTI

Static VTI uses tunnel interfaces to create a tunnel that is always-on between two sites. You must define a physical interface as a tunnel source for a static VTI. You can associate a maximum of 1024 VTIs per device. To create a static VTI interface in the management center, see [Add a VTI Interface, on page 1417](#).

The figure below shows a VPN topology using static VTIs.

On Threat Defense 1:

- Static VTI IP address is 192.168.10.1
- Tunnel source is 10.0.149.220
- Tunnel destination is 10.0.149.221

On Threat Defense 2:

- Static VTI IP address is 192.168.10.2
- Tunnel source is 10.0.149.221
- Tunnel destination is 10.0.149.220

### Benefits

- Minimizes and simplifies configuration.  
You do not have to track all remote subnets for a crypto map access list, and configure complex access lists or crypto maps.
- Provides a routable interface.  
Supports IP routing protocols such as BGP, EIGRP, and OSPFv2/v3, and static routes.
- Supports backup VPN tunnels
- Supports load balancing using ECMP.
- Supports virtual routers.
- Provides differential access control for VPN traffic.

You can configure a VTI with a security zone and use it in an AC policy. This configuration:

- Allows you to classify and differentiate VPN traffic from clear-text traffic and permit VPN traffic selectively.
- Provides differential access-control for VPN traffic across different VPN tunnels.

## Dynamic VTI

Dynamic VTI uses a virtual template for dynamic instantiation and management of IPsec interfaces. The virtual template dynamically generates a unique virtual access interface for each VPN session. Dynamic VTI supports multiple IPsec security associations and accepts multiple IPsec selectors proposed by the spoke.

### Benefits

- Minimizes and simplifies configuration.

You do not have to configure complex access lists or crypto maps.

- Simplifies management.

- Easily manage peer configuration for large enterprise hub and spoke deployments.
- Use only one dynamic VTI for multiple spokes, instead of configuring one static VTI per spoke.

- Provides a routable interface.

Supports IP routing protocols such as BGP, EIGRP, and OSPFv2/v3, and static routes.

- Simplifies scaling

Addition of new spokes does not require any additional VPN configuration on the hub. You may need to update NAT and routing configurations depending upon the setup.

- Support for backup VPN tunnels.

- Supports dynamic spokes.

You do not have to update the hub configuration for spoke's DHCP IP address changes.

- Conserves IP addresses.

- Uses the IP unnumbered interface functionality to borrow the IP address from another physical or loopback interface.
- All virtual access interfaces associated to a dynamic VTI use the same IP address.

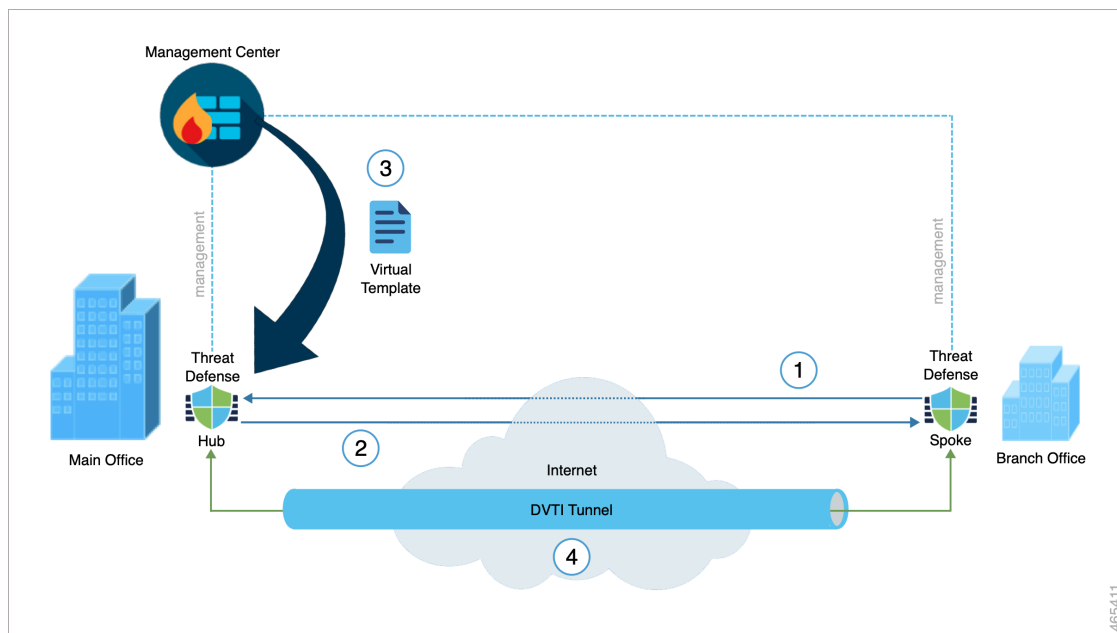

- Supports virtual routers.

- Provides differential access control for VPN traffic.

You can configure a VTI with a security zone and use it in an AC policy. This configuration:

- Allows you to classify and differentiate VPN traffic from clear-text traffic and permit VPN traffic selectively.
- Provides differential access-control for VPN traffic across different VPN tunnels.

## How Does the Firewall Management Center Create a Dynamic VTI Tunnel for a VPN Session

When a spoke initiates a tunnel request with the hub:

1. The spoke initiates an IKE exchange with the hub for a VPN connection.
2. The hub authenticates the spoke.
3. The Firewall Management Center assigns a dynamic virtual template on the hub for the spoke.

The virtual template dynamically generates a virtual access interface on the hub. This interface is unique for the VPN session with the spoke.

4. The hub establishes a dynamic VTI tunnel with the spoke using the virtual access interface.
  - a. The hub and spoke exchange traffic over the tunnel using:
    - Specific traffic proposed by the spokes over IKE exchanges.
    - BGP/OSPF/EIRGP protocols over the IPsec tunnel.
  - b. After the VPN session ends, the tunnel disconnects and the hub deletes the corresponding virtual access interface.

To create a dynamic VTI interface in the Firewall Management Center, see [Add a VTI Interface, on page 1417](#).

To configure a route-based site-to-site VPN using dynamic VTI, see [Configure Dynamic VTI for a Route-based Site-to-Site VPN, on page 1431](#).

### Virtual Routers and Dynamic VTI

You can create virtual routers, associate dynamic VTIs with these virtual routers, and extend the capabilities of dynamic VTIs in your network. You can associate dynamic VTIs either with global or user-defined virtual routers. You can assign a dynamic VTI to only one virtual router.

A virtual router associated with:

- A dynamic VTI is called an Indoor VRF (IVRF).
- A tunnel source interface is known as Front Door VRF (FVRF).

A dynamic VTI and its corresponding protected network interface must be part of the same virtual router. You must map the borrow IP interface and the dynamic VTI to the same virtual router. A tunnel source interface can be part of multiple virtual routers.

To configure virtual routers using dynamic VTI for a route-based site-to-site VPN, see [How to Configure a Virtual Router with Dynamic VTI, on page 1054](#).

For more information about a configuration example, see [How to Secure Traffic from Networks with Multiple Virtual Routers over a Site-to-Site VPN with Dynamic VTI, on page 1086](#)

## Guidelines and Limitations for Virtual Tunnel Interfaces

### IPv6 Support

- VTI supports IPv6.
- You can use an IPv6 address for the tunnel source interface and use the same address as the tunnel endpoint.
- The Firewall Management Center supports the following combinations of VTI IP (or internal networks IP version) over public IP versions:
  - IPv6 over IPv6
  - IPv4 over IPv6
  - IPv4 over IPv4
  - IPv6 over IPv4
- VTI supports static and dynamic IPv6 addresses as the tunnel source and destination.
- The tunnel source interface can have IPv6 addresses and you can specify the tunnel endpoint address. If you don't specify the address, by default, the Firewall Threat Defense uses the first IPv6 global address in the list as the tunnel endpoint.

### BGP IPv6 Support

VTI supports IPv6 BGP.

### EIGRP IPv4 Support

VTI supports IPv4 EIGRP.

### OSPFv2 and OSPFv3 IPv6/IPv4 Support

VTI supports IPv4 and IPv6 OSPF.

### ECMP Support

- Configure the spokes' static VTIs in an ECMP zone to load balance the application traffic. If you do not configure the ECMP zone, the remaining paths act as backup paths when the primary path goes down.

### Multi-instance and Clustering

- VTI is supported in multi-instance.
- VTIs aren't supported with clustering.

### Firewall Mode

VTI is supported in routed mode only.

### Limitations for Static VTI

- Only 20 unique IPSec profiles are supported.
- In route-based routing, you can configure VTI only as an egress interface.

### Limitations for Dynamic VTI

- Dynamic VTI does not support:
  - ECMP
  - VRF in multi-instance
  - Clustering
  - IKEv1
  - QoS
- If a spoke has a dynamic IP address and a hub has a dynamic VTI behind a NAT, the tunnel status will be unknown.
- For a dynamic extranet, when multiple spokes establish a connection, the site-to-site monitoring dashboard does not show the individual tunnels.
- If you configure a hub with dynamic VTI behind NAT with dynamic spokes, the VPN monitoring data will not be accurate.

### General Configuration Guidelines for Static and Dynamic VTI

- If you use dynamic crypto maps and dynamic VTIs in your site-to-site VPNs, only the dynamic VTI tunnels will come up. This behaviour occurs because both the crypto maps and dynamic VTIs try to use the default tunnel group.

We recommend that you do one of the following:

- Migrate your site-to-site VPNs to dynamic VTIs.
- Use static crypto maps with their own tunnel-groups.

- VTIs are only configurable in IPsec mode.
- Dynamic VTI supports only the hub and spoke topology in the management center.
- Dynamic VTI supports only threat defense devices from version 7.3.
- We recommend that you configure only a single hub for a route-based hub and spoke topology. To configure a topology with multiple hubs for a set of spokes, with one hub as the backup hub, configure multiple topologies with a single hub and the same set of spokes. For more information, see [Configure Multiple Hubs in a Route-based VPN, on page 1425](#).
- You can use static, BGP, EIGRP IPv4, OSPFv2/v3 routes for traffic using the tunnel interface.
- In an HA configuration with dynamic routing, the standby device cannot access the known subnets through the VTI tunnels as these tunnels are created with the active IP address.
- You can configure a maximum of 1024 static and dynamic VTIs on a device. While calculating the VTI count, consider the following:
  - Include nameif subinterfaces to derive the total number of VTIs that can be configured on the device.
  - You can't configure nameif on the member interfaces of a portchannel. Therefore, the tunnel count is reduced by the count of actual main portchannel interfaces alone and not any of its member interfaces.
  - The VTI count on a platform is limited to the number of VLANs configurable on that platform. For example, Firepower 1120 supports 512 VLANs, the tunnel count is 512 *minus* the number of physical interfaces configured.
- If you're configuring more than 400 VTIs on a device in a high-availability setup, you must configure 45 seconds as the unit holdtime for the Firewall Threat Defense HA.
- The MTU for VTIs is automatically set, according to the underlying physical interface.
- For dynamic VTI, the virtual access interface inherits the MTU from the configured tunnel source interface. If you don't specify the tunnel source interface, the virtual access interface inherits the MTU from the source interface from which the threat defense accepts the VPN session request.
- Static VTI supports IKE versions v1, v2, and uses IPsec for sending and receiving data between the tunnel's source and destination.
- Dynamic VTI supports only IKE version v2, and uses IPsec for sending and receiving data between the tunnel's source and destination.
- For static and dynamic VTI, ensure that you don't use the borrow IP interface as the tunnel source IP address for any VTI interface.
- When you configure a route-based site-to-site VPN using static or dynamic VTI interfaces, ensure that the value of the TTL hop is more than one if you use BGP.
- If NAT has to be applied, the IKE and ESP packets are encapsulated in the UDP header.
- IKE and IPsec security associations are re-keyed continuously regardless of data traffic in the tunnel. This ensures that VTI tunnels are always up.
- Tunnel group name must match what the peer sends as its IKEv1 or IKEv2 identity.

- For IKEv1 in LAN-to-LAN tunnel groups, you can use names which aren't IP addresses, if the tunnel authentication method is digital certificates and/or the peer is configured to use aggressive mode.
- VTI and crypto map configurations can coexist on the same physical interface, if the peer address configured in the crypto map and the tunnel destination for the VTI are different.
- By default, all traffic sent through a VTI is encrypted.
- Access rules can be applied on a VTI interface to control traffic through VTI.
- You can associate VTI interfaces with ECMP zones and configure ECMP static routes to achieve the following:
  - Load balancing (Active/Active VTIs)—Connection can flow over any of the parallel VTI tunnels.
  - Seamless connection migration—When a VTI tunnel becomes unreachable, the flows are seamlessly migrated to another VTI interface that is configured in the same zone.
  - Asymmetric routing—Forward traffic flow through one VTI interface and configure the reverse traffic flow through another VTI interface.

For information on configuring ECMP, see [Configure an Equal Cost Static Route, on page 1112](#).

- For route-based VPNs, Bypass Access Control policy for decrypted traffic (**sysopt connection permit-vpn**) does not work. You must always create access control rules to allow route-based VPN traffic.
- Ensure that you remove unused transform sets from route-based IKE VPN configurations. If you have unused transform sets, the VPN tunnels may not come up and encapsulation and decapsulation will not happen. Use `show run crypto` and `show vpn-sessiondb detail 121` commands to view the transform sets.

### Backup VTI Guidelines and Limitations

- Flow resiliency across tunnel failovers isn't supported. For example, the clear text TCP connection gets lost after a tunnel failover, and you need to reinitiate any FTP transfer that took place during the failover.
- Certificate authentication isn't supported in backup VTI.

### Guidelines for Dynamic VTI and Virtual Routers

- A dynamic VTI and its corresponding protected network interface must be part of the same virtual router.
- You must map the borrow IP interface and the dynamic VTI to the same virtual router.
- User-defined virtual routers support only BGPv4/v6 and OSPFv2 routing protocols.
- A tunnel source interface can be in a different user-defined virtual router than that associated with the dynamic VTI.

[Guidelines and Limitations for Loopback Interfaces](#), on page 713

[Create a Route-based Site-to-Site VPN](#), on page 1418

# Add a VTI Interface

For configuring a route-based site-to-site VPN, you must create a VTI interface on the devices at both the nodes of the VTI tunnel.

When you specify the tunnel type as dynamic and configure the related parameters, the Firewall Management Center generates a dynamic virtual template. The virtual template dynamically generates the virtual access interface that is unique for each VPN session.

## Before you begin

Configure a loopback interface for redundancy of static and dynamic VTI VPN tunnels. For more information, see [Configure a Loopback Interface, on page 713](#).

For a Secure Firewall 3100 or Secure Firewall 4200 device, IPsec flow offload is also used when the device's VTI loopback interface is enabled.

## Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Devices &gt; Device Management</b> .   |
| <b>Step 2</b> | Click the <b>Edit</b> icon next to the device on which you want to create a VTI interface.   |
| <b>Step 3</b> | Choose <b>Add Interfaces &gt; Virtual Tunnel Interface</b> .   |
| <b>Step 4</b> | Select the <b>Tunnel Type</b> as <b>Static</b> or <b>Dynamic</b> .   |
| <b>Step 5</b> | Enter the name and description for the interface. By default, the interface is enabled.<br>Ensure that you specify a name that is not longer than 28 characters.   |
| <b>Step 6</b> | (Optional) Choose a security zone from the <b>Security Zone</b> drop-down list to add the static VTI or dynamic VTI interface to that zone.<br><br>If you want to perform traffic inspection based on a security zone, add the VTI interface to the security zone and configure an access control (AC) rule. To permit the VPN traffic over the tunnel, you need to add an AC rule with this security zone as the source zone.             |
| <b>Step 7</b> | In the <b>Priority</b> field, enter the priority to load balance the traffic across multiple VTIs.<br><br>The range is from 0 to 65535. The lowest number has the highest priority. This option is not applicable for dynamic VTI.   |
| <b>Step 8</b> | Depending on the tunnel type, do one of the following: <ul style="list-style-type: none"><li>• For a dynamic VTI, enter a unique ID in the range of 1 to 10413 in the <b>Template ID</b> field.</li><li>• For a static VTI, enter a unique tunnel ID in the range of 0 to 10413 in the <b>Tunnel ID</b> field.</li></ul>   |
| <b>Step 9</b> | (Optional for dynamic VTI) Choose the tunnel source interface from the <b>Tunnel Source</b> drop-down list.<br><br>The VPN tunnel terminates at this interface, a physical or loopback interface. Choose the IP address of the interface from the drop-down list. You can select the IP address irrespective of the IPsec tunnel mode. In case of multiple IPv6 addresses, select the address that you want to use as the tunnel endpoint. |

- Step 10** Under **IPSec Tunnel Mode**, click the **IPv4** or **IPv6** radio button to specify the traffic type over the IPsec tunnel.
- Step 11** Under **IP Address**:
- **Configure IP**: Enter the IPv4 or IPv6 address for the static VTI interface. You cannot configure an IP address for a dynamic VTI interface. Use the **Borrow IP** field for the dynamic VTI interface.
  - **Borrow IP (IP unnumbered)**: Choose a physical or loopback interface from the drop-down list, the VTI interface inherits this IP address.
- Ensure that you use an IP address different from the tunnel source IP address. You can use this option for a static or dynamic VTI interface.
- Click Add  to configure a loopback interface. The loopback interface helps to overcome path failures. If an interface goes down, you can access all interfaces through the IP address assigned to the loopback interface.
- Step 12** Click **OK**.
- Step 13** Click **Save**.

## Create a Route-based Site-to-Site VPN

You can configure a route-based site-to-site VPN for the following two topologies:

- **Point to Point** : Configure VTIs on both nodes of the tunnel and use the wizard to configure the VPN.
- **Hub and Spoke**: Configure VTIs on the hub and the spokes. Configure the hub with a dynamic VTI and spokes with static VTIs.

You can configure an extranet device as the hub and managed devices as spokes. You can configure multiple hubs and spokes, and also configure backup hubs and spokes.

- For extranet hubs and spokes, you can configure multiple IPs as backup.
- For managed spokes, you can configure a backup static VTI interface along with the primary VTI interface.

For more information on VTI, see [About Virtual Tunnel Interfaces, on page 1409](#).

**Note** All references to VTI stands for static VTI and dynamic VTI, unless mentioned.

### Procedure

- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **+ Site To Site VPN**.
- Step 3** Enter a name for the VPN topology in the **Topology Name** field.
- Step 4** Choose **Route Based (VTI)** and do one of the following:

- Select **Point to Point** as the network topology. To configure endpoints for a route-based **Point to Point** topology, see [Configure Endpoints for a Point to Point Topology, on page 1419](#).
- Select **Hub and Spoke** as the network topology. To configure endpoints for a route-based **Hub and Spoke** topology, see [Configure Endpoints for a Hub and Spoke Topology, on page 1422](#).

- Step 5** (Optional) Specify the **IKE** options for the deployment as described in [Firewall Threat Defense VPN IKE Options, on page 1401](#).
- Step 6** (Optional) Specify the **IPsec** options for the deployment as described in [Firewall Threat Defense VPN IPsec Options, on page 1403](#).
- Step 7** (Optional) Specify the **Advanced** options for the deployment as described in [Firewall Threat Defense Advanced Site-to-site VPN Deployment Options, on page 1406](#).
- Step 8** Click **Save**.

---

### What to do next

After you configure VTI interfaces and VTI tunnel on both the devices, you must configure:

- A routing policy to route the VTI traffic between the devices over the VTI tunnel. For more information, see [Configure Routing and AC Policies for VTI, on page 1431](#).
- An access control rule to allow encrypted traffic. Choose **Policies > Access Control**.

## Configure Endpoints for a Point to Point Topology

Configure the following parameters to configure endpoints for a route-based site-to-site VPN for the **Point to Point** topology nodes:

### Before you begin

Configure the basic parameters for a point-to-point topology in a route-based VPN as described in [Create a Route-based Site-to-Site VPN, on page 1418](#) and click the **Endpoints** tab.

### Procedure

- 
- Step 1** Under **Node A**, in the **Device** drop-down menu, select the name of the registered device (Firewall Threat Defense) or extranet as the first endpoint of your VTI tunnel.
- For an extranet peer, specify the following parameters:
- a. Specify the name of the device.
  - b. Enter the primary IP address in the **Endpoint IP address** field. If you configure a backup VTI, add a comma and, specify the backup IP address.
  - c. Click **OK**.

After configuring the above parameters for the extranet hub, specify the pre-shared key for the extranet in the **IKE** tab.

**Note**

The AWS VPC has **AES-GCM-NUL-SSH-LATEST** as the default policy. If the remote peer connects to AWS VPC, select **AES-GCM-NUL-SSH-LATEST** from the **Policy** drop-down list to establish the VPN connection without changing the default value in AWS.

**Step 2** For a registered device, you can specify the VTI interface for Node A from the **Virtual Tunnel Interface** drop-down list.

The selected tunnel interface is the source interface for Node A and the tunnel destination for Node B.

If you want to create a new interface on Node A, click the Add + icon and configure the fields as described in [Add a VTI Interface, on page 1417](#).

If you want to edit the configuration of an existing VTI, select the VTI in the **Virtual Tunnel Interface** drop-down field and click **Edit VTI**.

**Step 3** If your Node A device is behind a NAT device, check the **Tunnel Source IP is Private** check box. In the **Tunnel Source Public IP Address** field, enter the tunnel source public IP address.

**Step 4** **Send Local Identity to Peers**—Select this option to send local identity information to the peer device. Select one of the following **Local Identity Configuration** from the list and configure the local identity:

- **IP address**—Use the IP address of the interface for the identity.
- **Auto**—Use the IP address for pre-shared key and Cert DN for certificate-based connections.
- **Email ID**—Specify the email ID to use for the identity. The email ID can be up to 127 characters.
- **Hostname**—Use the fully qualified hostname.
- **Key ID**—Specify the key-id to use for the identity. The key ID must be fewer than 65 characters.

The local identity is used to configure a unique identity per IKEv2 tunnel, instead of a global identity for all the tunnels. The unique identity allows Firewall Threat Defense to have multiple IPsec tunnels behind a NAT to connect to a Cisco Umbrella Secure Internet Gateway (SIG).

For information about configuring a unique tunnel ID on Umbrella, see **Cisco Umbrella SIG User Guide**.

**Step 5** (Optional) Click **Add Backup VTI** to specify an extra VTI as the backup interface and configure the parameters.

**Note**

Ensure that both peers of the topology do not have the same tunnel source for the backup VTI. A device cannot have two VTIs with the same tunnel source and tunnel destination; hence, configure a unique tunnel source and tunnel destination combination.

Though the virtual tunnel interface is specified under Backup VTI, the routing configuration determines which tunnel to be used as primary or backup.

**Step 6** Under **Additional Configuration**, do the following:

- To route traffic to the VTI, click **Routing Policy**. Firewall Management Center displays the **Devices > Routing** page.  
You can configure the Static, BGP, OSPF v2/v3, or EIGRP routing for the VPN traffic.
- To permit VPN traffic, click **AC Policy**. Firewall Management Center displays the access control policy page of the device. Proceed to add an allow/block rule specifying the security zone of the VTI. If you

configure a backup VTI, ensure to include the backup tunnel to the same security zone as that of the primary VTI. No specific settings are required for the backup VTI in the AC policy page.

- Step 7** Expand **Advance Settings** to configure additional configurations for the device. For more information, see [Advanced Configurations for a Point to Point Topology in a Route-based VPN, on page 1421](#).
- Step 8** Repeat the above procedure for Node B.
- Step 9** Click **OK**.

#### What to do next

- (Optional) Specify the **IKE** options for the deployment as described in [Firewall Threat Defense VPN IKE Options, on page 1401](#).
- (Optional) Specify the **IPsec** options for the deployment as described in [Firewall Threat Defense VPN IPsec Options, on page 1403](#).
- (Optional) Specify the **Advanced** options for the deployment as described in [Firewall Threat Defense Advanced Site-to-site VPN Deployment Options, on page 1406](#).
- Click **Save**.
- To route traffic to the VTI, choose **Devices > Device Management**, edit the threat defense device and click the **Routing** tab.

You can configure the static routes, or use BGP, OSPF v2/v3, or EIGRP for routing the VPN traffic.

- To permit VPN traffic, choose **Policies > Access Control**. Add a rule specifying the security zone of the VTI. For a backup VTI, ensure that you include the backup VTI in the same security zone as that of the primary VTI.

## Advanced Configurations for a Point to Point Topology in a Route-based VPN

Configure the following advanced configurations for a point-to-point topology in a route-based VPN:

#### Before you begin

Configure the basic parameters for a point-to-point topology in a route-based VPN as described in [Configure Endpoints for a Point to Point Topology, on page 1419](#) and expand **Advance Settings**.

#### Procedure

- Step 1** Check the **Send Virtual Tunnel Interface IP to the peers** check box to send the VTI IP address to the peer device.
- Step 2** Check the **Allow incoming IKEv2 routes from the peers** check box to allow incoming IKEv2 routes from the spokes and peers.
- Step 3** Choose one of the following from the **Connection Type** drop-down list:
- Answer Only:** The device can only respond when a peer device initiates a connection, it can't initiate any connection.

**Bidirectional:** The device can initiate or respond to a connection. This is the default option.

## Configure Endpoints for a Hub and Spoke Topology

You can create a route-based site-to-site VPN using dynamic VTI only for hub and spoke topologies. The hub can use only a dynamic VTI and the spokes can use only static VTI interfaces. You can also configure an extranet device as a hub.

Configure the following parameters to configure endpoints for a route-based site-to-site VPN for the **Hub and Spoke** topology nodes:

### Before you begin

Configure the basic parameters for a hub and spoke topology in a route-based VPN as described in [Create a Route-based Site-to-Site VPN, on page 1418](#) and click the **Endpoints** tab.

### Procedure

#### Step 1

Under **Hub Nodes**:

- a) Click Add **+** to configure the hub node in the **Add Endpoint** dialog box.
- b) Choose a hub from the **Device** drop-down list.

For an extranet hub, specify the following parameters:

1. Enter the name of the device.
2. Enter the primary IP address. If you configure a backup VTI, add a comma, and then specify the backup IP address.
3. Click **OK**.

After configuring the above parameters for the extranet hub, specify the pre-shared key for the extranet in the **IKE** tab.

#### Note

The AWS VPC has **AES-GCM-NUL-~~SH~~A-LATEST** as the default policy. If the remote peer connects to AWS VPC, select **AES-GCM-NUL-~~SH~~A-LATEST** from the **Policy** drop-down list to establish the VPN connection without changing the default value in AWS.

- c) Choose a dynamic VTI from the **Dynamic Virtual Tunnel Interface** drop-down list.

Tunnel source configuration is mandatory for a dynamic VTI as the management center needs this information to determine the tunnel destination of the spoke.

Click Add **+** to add a new dynamic VTI. We recommend that you configure the Borrow IP for the dynamic interface from a loopback interface.

If you want to edit an existing dynamic VTI, select the interface, and click **Edit VTI**.

- d) (Optional) If your endpoint device is behind a NAT device, check the **Tunnel Source IP is Private** check box and configure the tunnel source IP address in the **Tunnel Source Public IP Address** field.

- e) Click **Routing Policy** to configure the routing policy for the hub.
- f) Click **AC Policy** to configure the access control policy.
- g) Expand **Advance Settings** to configure additional configurations on the hub. For more information, see [Advanced Configurations for Hub and Spokes in a Route-based VPN, on page 1424](#).
- h) Click **OK**.

**Step 2**

Under **Spoke Nodes**:

- a) Click Add **+** to configure the spoke in the **Add Endpoint** dialog box.
- b) Choose a spoke from the **Device** drop-down list.

For an extranet spoke, specify the following parameters:

1. Enter the name of the device.
2. Under **Endpoint IP Address**, choose one of the following:
  - **Static**: Enter the IP address of the device, and the backup IP address, if required.
  - **Dynamic**: Choose this option to dynamically assign the IP addresses for the extranet spokes.
3. Click **OK**.

- c) Choose a static VTI from the **Static Virtual Tunnel Interface** drop-down list.

Click Add **+** to add a new static VTI. Tunnel IP of the static VTI is auto populated, ensure that this IP address is unique for the spoke.

If you want to edit an existing static VTI, select the interface, and click **Edit VTI**.

- d) (Optional) If your endpoint device is behind a NAT device, check the **Tunnel Source IP is Private** check box. The management center needs the tunnel source interface address to configure the tunnel destination IP address on the spokes. In the **Tunnel Source Public IP Address** field, enter the tunnel source public IP address.
- e) (Optional) **Send Local Identity to Peers**—Check this check box to send the local identity information to the peer device. Choose one of the following parameters from the **Local Identity Configuration** drop-down list and configure the local identity:
  - **IP address**—Use the IP address of the interface for the identity.
  - **Auto**—Use the IP address for pre-shared key and Cert DN for certificate-based connections.
  - **Email ID**—Specify the email ID to use for the identity. The email ID can be up to 127 characters.
  - **Hostname**—Use the fully qualified hostname.
  - **Key ID**—Specify the key-id to use for the identity. The key ID must be less than 65 characters.

The local identity is used to configure a unique identity per IKEv2 tunnel, instead of a global identity for all the tunnels. The unique identity allows Firewall Threat Defense to have multiple IPsec tunnels behind a NAT to connect to the Cisco Umbrella Secure internet Gateway (SIG).

For more information about configuring a unique tunnel ID on Umbrella, see *Cisco Umbrella SIG User Guide*.

- f) (Optional) Click **Add Backup VTI** to specify an extra VTI interface as the backup interface.

**Note**

Ensure that both peers of the topology do not have backup VTI configured on the same tunnel source. For instance, if Peer A is having two VTIs (primary and a backup) configured with a single tunnel source interface, say, 10.10.10.1/30, then Peer B also can't have its 2 VTIs with a single tunnel source IP, say 20.20.20.1/30.

Though the virtual tunnel interface is specified under backup VTI, the routing configuration determines which tunnel to be used as primary or backup.

- g) Click **Routing Policy** to configure the routing policy for the spoke.
- h) Click **AC Policy** to configure the access control policy.
- i) Expand **Advance Settings** to configure additional configurations on the spoke. For more information, see [Advanced Configurations for Hub and Spokes in a Route-based VPN, on page 1424](#).
- j) Click **OK**.

---

### What to do next

- (Optional) Specify the **IKE** options for the deployment as described in [Firewall Threat Defense VPN IKE Options, on page 1401](#).
- (Optional) Specify the **IPsec** options for the deployment as described in [Firewall Threat Defense VPN IPsec Options, on page 1403](#).
- (Optional) Specify the **Advanced** options for the deployment as described in [Firewall Threat Defense Advanced Site-to-site VPN Deployment Options, on page 1406](#).
- Click **Save**.

## Advanced Configurations for Hub and Spokes in a Route-based VPN

Configure the following advanced configurations for a hub and spoke in a route-based VPN:

### Before you begin

Configure the basic parameters for a hub and spoke in a route-based VPN as described in [Configure Endpoints for a Hub and Spoke Topology, on page 1422](#) and expand **Advance Settings**.

### Procedure

- 
- Step 1** Check the **Send Virtual Tunnel Interface IP to the peers** check box to send the VTI IP address to the peer device.  
  
For a hub, you must check this check box if you use BGP as the routing protocol. This configuration ensures that the loopback IP address is shared in the BGP routing table.  
  
For a spoke, this option is enabled by default.
  - Step 2** Add the **Protected Networks** to define the networks protected by the VPN endpoint. Click Add + to select a protected network.  
  
For a hub, configure the protected networks behind the hub. This information and the spoke's protected network generate the spoke access list.

You cannot create a static route for a virtual access interface on a hub with dynamic VTI. The hub creates and deletes these interfaces dynamically during tunnel establishment and termination.

For a spoke, configure the spoke's protected network.

To enable static routing for the spokes, after you configure the endpoints for your topology, click the **IPsec** tab and check the **Enable Reverse Route Injection** check box.

You do not need this option if you use BGP, OSPF, or EIGRP.

**Step 3** Check the **Allow incoming IKEv2 routes from the peers** check box to allow incoming IKEv2 routes from the spokes and peers.

For a hub: During an IKE exchange, the hub advertises the dynamically created virtual access interfaces to the spokes, and the spokes advertise their VTI IP addresses to the hub.

For a spoke: By default, this option is enabled.

**Step 4** In the **Connection Type** drop-down list, choose one of the following:

**Answer Only:** The device can only respond when a peer device initiates a connection, it can't initiate any connection.

**Bidirectional:** The device can initiate or respond to a connection. This is the default option.

---

## Configure Multiple Hubs in a Route-based VPN

You can configure a topology with multiple hubs for a set of spokes. With one hub as the backup hub, you can configure multiple topologies with a single hub and the same set of spokes.

In the following example, there are two hubs connected to the same set of spokes. Hub 1 is the primary hub and Hub 2 is the secondary hub. To configure this network in the Firewall Management Center, you must configure two route-based hub and spoke topologies:

- Topology 1: Hub 1 connected to spoke 1 and spoke 2.
- Topology 2: Hub 2 connected to spoke 1 and spoke 2.

To configure topology 1:

## Procedure

- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **+ Site To Site VPN**.
- Step 3** Enter a name for the VPN topology in the **Topology Name** field.
- Step 4** Choose **Route Based (VTI)** and do one of the following:
  - Select **Point to Point** as the network topology. To configure endpoints for a route-based **Point to Point** topology, see [Configure Endpoints for a Point to Point Topology, on page 1419](#).
  - Select **Hub and Spoke** as the network topology. To configure endpoints for a route-based **Hub and Spoke** topology, see [Configure Endpoints for a Hub and Spoke Topology, on page 1422](#).
- Step 5** Configure the IKE version.
- Step 6** Click the **Endpoints** tab.
- Step 7** Under **Hub Nodes**:
  - a) Click Add **+** to add the hub.
  - b) Choose Hub 1 from the **Device** drop-down list.
  - c) Choose a dynamic VTI from the **Dynamic Virtual Tunnel Interface** drop-down list or click Add **+** to add a new dynamic VTI.
 

We recommend that you configure the Borrow IP for the dynamic interface from a loopback interface.
  - d) (Optional) If your endpoint device is behind a NAT device, check the **Tunnel Source IP is Private** check box and configure the tunnel source IP address in the **Tunnel Source Public IP Address** field.
  - e) Click **Routing Policy** to configure the routing policy for the hub. You can configure dynamic routing using BGP.

- f) Expand **Advance Settings**. You can configure the following advanced settings for the hub to enable IKEv2 routing, which can be used if you do not use dynamic routing.
  - (Optional) Check the **Send Virtual Tunnel Interface IP to the peers** check box.
  - Check the **Allow incoming IKEv2 routes from the peers** check box for the hub to accept routes from the spokes and update the routing table.
  - Choose **Connection Type** as Bidirectional from the drop-down list.
- g) Click **OK**.

**Step 8** Under **Spoke Nodes**:

- a) Click Add **+** to add a spoke.
- b) Choose Spoke 1 from the **Device** drop-down list.
- c) Choose SVTI-1 as the static VTI for the spoke from the **Static Virtual Tunnel Interface** drop-down list or click Add **+** to add a new static VTI.

Choose the outside interface as the tunnel source of SVTI-1. Tunnel IP of SVTI-1 is autopopulated, ensure that this IP address is unique for spoke 1 across peers in both the topologies.

- d) Expand **Advance Settings**. If you do not use dynamic routing, you can configure these settings to enable IKEv2 routing for the spoke.
  - Check the **Send Virtual Tunnel Interface IP to the peers** check box to send the VTI IP address to the peer device.
  - Check the **Allow incoming IKEv2 routes from the peers** check box to allow incoming IKEv2 routes from the peers.
  - Choose **Connection Type** as Bidirectional from the drop-down list.
- e) Click **OK**.
- f) Repeat steps 5a to 5e to add spoke 2. Configure SVTI-1 as the static VTI of spoke 2.

**Step 9** Configure the IKE and IPsec parameters as required or use the default values.

---

**What to do next**

1. Configure topology 2 with hub 2, spoke 1, and spoke 2.  
Configure SVTI-2 as the static VTI of spoke 1 and SVTI-2 as the static VTI of spoke 2 (refer the above illustration). Tunnel source for SVTI-2 should be the same outside interface.
2. For each spoke, configure the routing policy. For more information, see [Configure Routing for Multiple Hubs in a Route-based VPN, on page 1427](#).
3. Verify the configuration and tunnel statuses. For more information, see [Verify the Multiple Hubs Configuration in a Route-based VPN, on page 1429](#).

## Configure Routing for Multiple Hubs in a Route-based VPN

The following procedure explains how to configure dynamic routing on the hub and spokes, and configure Policy Based Routing on the spokes.

### Before you begin

Configure topology 1 and 2 as explained in [Configure Multiple Hubs in a Route-based VPN, on page 1425](#).

### Procedure

**Step 1** Configure dynamic routing for the hub using BGP.

- a) Choose **Device > Device Management > Routing**.
- b) On the left pane, choose **General Settings > BGP**.
- c) Check the **Enable BGP** check box and enter the **AS number**.

You can configure the other fields as per your requirement.

- d) Click **Save**.
- e) On the left pane, choose **BGP > IPv4**.
- f) Check the **Enable IPv4** check box.
- g) Click the **Neighbor** tab, click **Add** and configure the parameters.

1. **IP Address**: Enter the tunnel interface IP address of Spoke 1.

2. **Remote AS**: AS number of Spoke 1.

3. Check the **Enabled Address** check box.

4. Click **OK**.

Repeat the above steps to add Spoke 2 as a neighbor.

- h) Click **Save**.
- i) Click the **Networks** tab and click **Add** to advertise the network behind the hub to the peers.

**Step 2** Configure dynamic routing for the spokes using BGP.

The BGP configuration for the spokes is similar to that of the hub except for the following differences:

- Configure Hub 1 and Hub 2 as the neighbors for both the spokes and use the tunnel interface IP address of the hubs.
- When you configure networks, use the network behind each spoke.

**Step 3** Configure Policy Based Routing on the spokes.

- a) On the left pane, choose **Policy Based Routing** and click **Add**.
- b) Choose the **Ingress Interface** from the drop-down list.
- c) Click **Add** to configure a Match ACL.

For example, for spoke 1, source network is 192.168.20.0/24 and destination network is 192.168.10.0/24.

- d) Choose Egress Interfaces from the **Send to** drop-down list.
- e) Choose Order from the **Interface Ordering** drop-down list.
- f) Select the SVTI-1 and SVTI-2 interfaces as the egress interfaces.
- g) Click **Save**.

If you want to use the hubs as a load-balancing pair, you must configure ECMP.

**Step 4** Deploy the configurations on the hub and spokes.

#### What to do next

Verify the configurations and tunnel statuses. For more information, see [Verify the Multiple Hubs Configuration in a Route-based VPN, on page 1429](#).

## Verify the Multiple Hubs Configuration in a Route-based VPN

To verify the multiple hub configurations and the tunnel statuses:

- After the deployment, check the tunnel status in the dashboards.
- Use Packet Tracer from the Site-to-site monitoring dashboard to verify the selected path of the traffic (hub 1 or hub 2).
- Use the following show commands for each endpoint to verify the configurations:
  - **show run route-map**
  - **show run access-list**
  - **show route-map**
  - **show route**

## Route Traffic Through a Backup VTI Tunnel

Secure Firewall Threat Defense supports the configuration of a backup tunnel for the route-based (VTI) VPN. When the primary VTI is unable to route the traffic, the traffic in the VPN is tunneled through the backup VTI.

You can deploy the backup VTI tunnel in the following scenarios:

- Both peers having service provider redundancy backup.  
In this case, there are two physical interfaces, acting as the tunnel sources for the two VTIs of the peers.
- Only one of the peers having service provider redundancy backup.  
In this case, there's an interface backup on only one side of the peer and on the other end, there is only one tunnel source interface.

Step	Do This	More Info
1	Review the guidelines and limitations.	<a href="#">Guidelines and Limitations for Virtual Tunnel Interfaces, on page 1413</a>
2	Create the VTI interface.	<a href="#">Add a VTI Interface, on page 1417</a>

Step	Do This	More Info
3	In the <b>Add Endpoint</b> dialog box of the <b>Create New VPN Topology</b> wizard, click <b>Add Backup VTI</b> to configure the respective backup interface for each peer.	<ul style="list-style-type: none"> <li>• <a href="#">Configure Endpoints for a Point to Point Topology, on page 1419</a></li> <li>• <a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a></li> </ul>
4	Configure the routing policy.	<ul style="list-style-type: none"> <li>• Choose <b>Devices &gt; Device Management</b>, and edit the threat defense device.</li> <li>• Click <b>Routing</b>.</li> </ul>
5	Configure the access control policy.	<ul style="list-style-type: none"> <li>• Choose <b>Policies &gt; Access Control</b>.</li> </ul>

### Guidelines for Configuring a Backup VTI Tunnel

- For an extranet peer, you can specify the tunnel source IP address of the backup interface and configure the tunnel destination IP on the managed peer.

You can specify the backup peer IP address in the **Endpoint IP Address** field of the **Create New VPN Topology** wizard.

Create New VPN Topology

Topology Name:\*  
VTI\_VPN1

☐ Policy Based (Crypto Map) ☒ Route Based (VTI)

Network Topology:  
 Point to Point  Hub and Spoke  Full Mesh

IKE Version:\* ☐ IKEv1 ☒ IKEv2

Endpoints   IKE   IPsec   Advanced

Node A

Device:\*  
Extranet ▼

Device Name\*:

Endpoint IP Address\*:  
 Primary IP\*, [Backup Peer IPs]

- After you configure the backup interfaces, configure the routing policy and access control policy for routing traffic.

Though primary and backup VTIs are always available, traffic flows only through the tunnel that is configured in the routing policy. For detailed information, see [Configure Routing and AC Policies for VTI, on page 1431](#).

- When you configure a backup VTI, ensure that you include the backup tunnel to the same security zone as that of the primary VTI. No specific settings are required for the backup VTI in the AC policy page.
- If you configure a static route for the backup tunnel, configure a static route with a different metric to handle the failover of the traffic flow over the backup tunnel.

## Configure Dynamic VTI for a Route-based Site-to-Site VPN

To configure dynamic VTI for a route-based site-to-site VPN in the management center:

Step	Do This	More Information
1	Create a dynamic VTI interface on the hub.	<a href="#">Add a VTI Interface, on page 1417</a>
2	Create static VTI interfaces on the spokes.	<a href="#">Add a VTI Interface, on page 1417</a>
3	Create a route-based site-to-site VPN.	<a href="#">Create a Route-based Site-to-Site VPN, on page 1418</a>
4	Configure the routing policy and the access control policy.	<a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a>

## How to Configure a Virtual Router with Dynamic VTI

To configure a virtual router with dynamic VTI for a route-based site-to-site VPN in the management center:

Step	Do This	More Information
1	Create a route-based site-to-site VPN with a dynamic VTI interface on the hub and static VTI(s) on the spoke(s).	<a href="#">Create a Route-based Site-to-Site VPN, on page 1418</a>
2	Create a virtual router.	<a href="#">Create a Virtual Router, on page 1064</a>
3	Assign the interfaces to the virtual router.	<a href="#">Configure a Virtual Router, on page 1065</a>
4	Configure routing policies for the hub and spoke.	<a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a>
5	Configure access control policies for the hub and spoke.	<a href="#">Configure Endpoints for a Hub and Spoke Topology, on page 1422</a>

## Configure Routing and AC Policies for VTI

After you configure VTI interfaces and the VTI tunnel on both the devices, you must configure:

- A routing policy to route VTI traffic between the devices over the VTI tunnel.
- An access control rule to allow encrypted traffic.

### Routing Configuration for VTI

For the VTI interfaces, you can configure static route or routing protocols such as BGP, EIGRP, OSPF/OSPFv3.

1. Choose **Devices > Device Management**, and edit the Firewall Threat Defense device.
2. Click **Routing**.
3. Configure static route, or BGP, EIGRP, OSPF/OSPFv3.

Routing	Parameters	More Information
Static Route	<ul style="list-style-type: none"> <li>• <b>Interface</b>—Select the VTI interface. For a backup tunnel, select the backup VTI interface.</li> <li>• <b>Selected Network</b>—Remote peer's protected network.</li> <li>• <b>Gateway</b>—Remote peer's tunnel interface IP address. For a backup tunnel, select the remote peer's backup tunnel interface IP address.</li> <li>• <b>Metric</b>—For a backup tunnel, configure a different metric to handle the failover of the traffic flow over the backup tunnel.</li> </ul>	<a href="#">Add a Static Route, on page 1040</a>
BGP	<ul style="list-style-type: none"> <li>• Under <b>General Settings &gt; BGP</b>, enable BGP, provide the AS number of the local device, and add Router ID (if you choose Manual).</li> <li>• Under <b>BGP</b>, enable IPv4/IPv6 and click the <b>Neighbor</b> tab to configure the neighbors. <ul style="list-style-type: none"> <li>• <b>IP Address</b>—Remote peer's VTI interface IP address. For a backup tunnel, add a neighbor with the remote peer's backup VTI interface IP address.</li> <li>• <b>Remote AS</b>—Remote peer's AS number.</li> </ul> </li> <li>• Click the <b>Redistribution</b> tab, select the <b>Source Protocol</b> as Connected to enable connected route redistribution.</li> </ul>	<a href="#">Configure BGP, on page 1169</a>

Routing	Parameters	More Information
EIGRP	<ul style="list-style-type: none"> <li>• Enable EIGRP, provide the AS number of the local device, and select the networks or hosts that participate in the EIGRP routing process.</li> <li>• Click the <b>Neighbors</b> tab and define the static neighbors for the EIGRP process.</li> <li>• To advertise summary addresses from a VTI interface, click the <b>Summary Address</b> tab, choose the VTI interface from the <b>Interface</b> drop-down. From the <b>Network</b> drop-down, choose the network to be summarized.</li> <li>• Click the <b>Interfaces</b> tab to configure the interface-specific EIGRP routing properties for the VTI interface.</li> </ul> <p>To enable EIGRP split-horizon on the interface, check the <b>Split Horizon</b> check box. You can also configure the <b>Hold Time</b> that is advertised by the device in the EIGRP hello packets.</p>	<a href="#">Configure EIGRP, on page 1158</a>
OSPF	<ul style="list-style-type: none"> <li>• Check the <b>Process 1</b> check box, and choose the OSPF role.</li> <li>• Click the <b>Interface</b> tab and choose a VTI interface.</li> </ul>	<a href="#">Configure OSPFv2, on page 1131</a>
OSPFv3	<ul style="list-style-type: none"> <li>• Check the <b>Process 1</b> and <b>Enable Process 1</b> check boxes, and choose the OSPFv3 role.</li> <li>• Click the <b>Interface</b> tab and choose a VTI interface.</li> </ul>	<a href="#">Configure OSPFv3, on page 1143</a>

### AC Policy Rule

Add an access control rule to the access control policy on the device to allow encrypted traffic between the VTI tunnels with the following settings:

1. Create the rule with the Allow action.

2. Select the VTI security zone of the local device as the source zone and the VTI security zone of the remote peer as the destination zone.
3. Select the VTI security zone of the remote peer as the source zone and the VTI security zone of the local device as the destination zone.

For more information about configuring an access control rule, see [Create and Edit Access Control Rules, on page 1651](#).

## View Virtual Tunnel Information

You can view details of dynamic and static VTIs of route-based VPNs on the device. For every VPN topology, you can also view details of all the dynamically generated virtual access interfaces associated with each dynamic VTI.

### Before you begin

- For static VTIs: Firewall Threat Defense Version 7.0 and later
- For dynamic VTIs: Firewall Threat Defense Version 7.3 and later

### Procedure

- 
- Step 1** Select **Devices > Device Management** and click **Edit** (✎) for your Firewall Threat Defense device. The **Interfaces** page is selected by default.
- Step 2** Click the **Virtual Tunnels** tab.
- For each VTI, you can view details such as name, IP address, IPsec mode, tunnel source interface details, topology, and remote peer IP. You can also view if path monitoring is enabled for each interface.
- 

## Deploy a SASE Tunnel on Umbrella

Cisco Umbrella is Cisco's cloud-based Secure Internet Gateway (SIG) platform that provides multiple levels of defense against internet-based threats. Umbrella integrates secure web gateway, DNS-layer security, and cloud access security broker (CASB) functionality to protect your systems against threats.

You can establish an IPsec IKEv2 tunnel from a threat defense device to Umbrella using the management center. This tunnel forwards all internet-bound traffic to the Umbrella SIG for inspection and filtering. This solution provides centralized security management so that network administrators don't have to separately manage the security settings of each branch.

To directly configure and deploy Umbrella tunnels from a threat defense device, you can create a SASE topology using a simple wizard. SASE topology is a new type of site-to-site VPN topology that supports:

- Static VTI-based site-to-site VPN.

- Hub and spoke topology, where Umbrella is the hub and the managed threat defense devices are the spokes.
- Pre-shared key based authentication.
- Firewall Threat Defense deployed in HA mode.
- Multi-instance: In a multi-instance deployment, you can integrate only one Umbrella account.

For high availability, you can configure two tunnels from a threat defense device and use the second tunnel as the backup tunnel. Ensure that you configure different local tunnel IDs for each tunnel.

For ease of configuration, the management center configures the default IPsec and IKEv2 policies.

Default IKEv2 policy configuration:

- Integrity Algorithm: NULL
- Encryption Algorithm: AES-GCM-256
- PRF Algorithm: SHA-256
- DH Group: 19, 20

Default IKEv2 IPsec policy configuration:

- ESP Hash: SHA-256
- ESP Encryption: AES-GCM-256

#### Related Topics

[How to Deploy a SASE Tunnel on Umbrella](#), on page 1436

## Guidelines and Limitations for Configuring SASE Tunnels on Umbrella

SASE topology supports:

- Only PSK-based authentication
- IKEv2
- High availability

#### General Configuration Guidelines

- The Firewall Management Center does not discover tunnels created directly on Umbrella or by other applications.
- You can add only devices managed by the Firewall Management Center as endpoints for the SASE topology. You cannot add extranet devices.

For high availability pairs, the HA pair names appear in the endpoint list.

- When you delete a tunnel from the Firewall Management Center and if it is unable to delete the tunnel from Umbrella, you must manually delete it by logging into Umbrella.
- You cannot edit or delete a SASE topology if the deployment to Umbrella is in progress. You can view the tunnel deployment status in the:
  - Cisco Umbrella Configuration dialog box of the wizard
  - Notifications page under the Deployments and Tasks tabs
  - Site to Site VPN Monitoring dashboard
- If you check the **Deploy configuration on threat defense nodes** check box in the wizard, the Umbrella SASE topology configuration is deployed on the Firewall Threat Defense only after the tunnels are deployed on Umbrella.  
 The Firewall Management Center requires the local tunnel ID to deploy the Umbrella configuration on the Firewall Threat Defense. Umbrella generates the complete tunnel ID (*<prefix>@<umbrella generated ID>-umbrella.com*) only after the Firewall Management Center deploys the tunnel on Umbrella.
- The Firewall Management Center does not recognize topologies with the Umbrella data center as an extranet hub, created before version 7.3, as SASE topologies. You must create new SASE topologies in version 7.3 and delete the existing topology.
- After a Firewall Threat Defense HA switchover, the SASE topology will not appear in the site-to-site monitoring/VPN summary dashboard. We recommend that you bring the tunnel down using the **vpn-sessiondb logoff index** command and bring it up using packet tracer.

### Limitations

SASE topology does not support:

- Clustering
- Certificate-based authentication
- IKEv1

## How to Deploy a SASE Tunnel on Umbrella

This section provides instructions to deploy a SASE tunnel on Umbrella from a Firewall Threat Defense device using the Firewall Management Center.

Step	Do This	More Info
1	Review the guidelines and limitations.	<a href="#">Guidelines and Limitations for Configuring SASE Tunnels on Umbrella, on page 1435</a>
2	Ensure that you meet the prerequisites.	<a href="#">Prerequisites for Configuring Umbrella SASE Tunnels, on page 1437</a>

Step	Do This	More Info
3	Configure Cisco Umbrella connection settings.	<ul style="list-style-type: none"> <li>• <a href="#">Configure Cisco Umbrella Connection Settings</a></li> <li>• <a href="#">Map Management Center Umbrella Parameters and Cisco Umbrella API Keys, on page 1437</a></li> </ul>
4	Configure a SASE tunnel on Umbrella.	<a href="#">Configure a SASE Tunnel for Umbrella, on page 1439</a>
5	View the status of the SASE tunnel.	<a href="#">View SASE Tunnel Status, on page 1440</a>

## Prerequisites for Configuring Umbrella SASE Tunnels

- You must have a Cisco Umbrella Secure Internet Gateway (SIG) Essentials subscription.
- You must enable your Smart License account with the export-controlled features to deploy tunnels on Umbrella from the Firewall Management Center. If this license is not enabled, you can only create a SASE topology. You cannot deploy tunnels on Umbrella.
- You must establish an account with Cisco Umbrella at <https://umbrella.cisco.com>, log into Umbrella at <http://login.umbrella.com>, and obtain the required information to establish connection to Cisco Umbrella.
- You must register Cisco Umbrella with the Firewall Management Center and configure the management key and the management secret in the Cisco Umbrella Connection Settings. The management center requires the management key and management secret to fetch the datacenter details from the Cisco Umbrella cloud. You must also configure the Organization ID, Network Device Key, Network Device Secret, and the Legacy Network Device Token in the Cisco Umbrella Connection Settings.

For more information, see:

- [Configure Cisco Umbrella Connection Settings](#)
- [Map Management Center Umbrella Parameters and Cisco Umbrella API Keys, on page 1437](#)
- Ensure that Umbrella data center is reachable from the Firewall Threat Defense.
- You can deploy a tunnel only between Cisco Umbrella and a Firewall Threat Defense version 7.1.0 and later.

## Map Management Center Umbrella Parameters and Cisco Umbrella API Keys

To register the Cisco Umbrella with the Firewall Management Center and configure the Umbrella parameters in the Firewall Management Center, you must:

1. Log in to Cisco Umbrella.
2. Choose **Admin > API Keys > Legacy Keys**.
3. Generate and copy the required API keys.
4. Use the API keys to configure the Cisco Umbrella connection parameters in the Firewall Management Center.

The figure below shows the parameters that you must configure in the Cisco Umbrella Connection in the Firewall Management Center. DNSCrypt Public Key is an optional parameter.

#### Cisco Umbrella Connection

## Configure a SASE Tunnel for Umbrella

### Before you begin

Ensure that you review the prerequisites and guidelines in [Prerequisites for Configuring Umbrella SASE Tunnels, on page 1437](#) and [Guidelines and Limitations for Configuring SASE Tunnels on Umbrella, on page 1435](#).

### Procedure

- 
- Step 1** Choose **Devices > VPN > Site to Site**.
- Step 2** Click **+ SASE Topology**.
- Step 3** Enter a unique **Topology Name**.
- Step 4** **Pre-shared Key**: This key is auto-generated according to the Umbrella PSK requirements. For a single topology, the pre-shared key is common for all threat defense spokes and Umbrella.
- The device and Umbrella share this secret key, and IKEv2 uses it for authentication. If you want to configure this key, it must be between 16 and 64 characters in length, include at least one uppercase letter, one lowercase letter, one numeral, and have no special characters. Each topology must have a unique pre-shared key. If a topology has multiple tunnels, all the tunnels have the same pre-shared key.
- Step 5** Choose a data center from the **Umbrella Data center** drop-down list. (Configure routing on the Firewall Threat Defense to ensure reachability of the umbrella DC from the Firewall Threat Defense.)
- Step 6** Click **Add** to add a Firewall Threat Defense node.
- Choose a Firewall Threat Defense from the **Device** drop-down list.
- Only devices managed by the Firewall Management Center appear in the list. For high availability pairs, the HA pair names appear in the endpoint list.
- Choose a static VTI interface from the **VPN Interface** drop-down list.
- To create a new static VTI interface, click **Add +**. The **Add Virtual Tunnel Interface** dialog box appears with the following pre-populated default configurations.
- Tunnel Type is static.
  - Name is `<tunnel_source interface logical name>+ static_vti +<tunnel ID>`. For example, `outside_static_vti_2`.
  - Tunnel ID is auto-populated with a unique ID.
  - Tunnel Source Interface is auto-populated with an interface with an 'outside' prefix.
  - IPsec tunnel mode is IPv4.
  - IP address is from the 169.254.x.x/30 private IP address range.

- c) Enter a prefix for the local tunnel ID in the **Local Tunnel ID** field.

The prefix can have a minimum of eight characters and a maximum of 100 characters. Umbrella generates the complete tunnel ID (*<prefix>@<umbrella generated ID>-umbrella.com*) after the management center deploys the tunnel on Umbrella. The management center then retrieves and updates the complete tunnel ID and deploys it on the threat defense device. Each tunnel has a unique local tunnel ID.

- d) Click **Save** to add the endpoint device to the topology.

You can add multiple endpoints in a SASE topology.

**Step 7** Click **Next** to view the summary of the Umbrella SASE tunnel configuration.

- **Endpoints** pane: Displays the summary of the configured endpoints.
- **Encryption Settings** pane: Displays the default IKEv2 policies and IKEv2 IPsec transform sets for the topology.

**Step 8** Check the **Deploy configuration on threat defense nodes** check box to trigger deployment of the network tunnels to the threat defense. This deployment occurs after the tunnels are deployed on Umbrella. Local tunnel ID is required for the threat defense deployment.

**Step 9** Click **Save**.

This action:

- a. Saves the topology in the management center.
- b. Triggers deployment of the network tunnels to the Umbrella.
- c. Triggers deployment of the network tunnels to the threat defense devices, if the option is enabled. This action commits and deploys all the updated configurations and policies, including non-VPN policies, since the last deployment on the device.
- d. Opens the **Cisco Umbrella Configuration** window and displays the status of the tunnel deployment on Umbrella. For more details, see [View SASE Tunnel Status, on page 1440](#).

---

### What to do next

For the interesting traffic intended to flow through the SASE tunnel, configure a PBR policy with a specific match criteria to send the traffic through the VTI interface.

Ensure that you configure a PBR policy for each endpoint of the SASE topology.

## View SASE Tunnel Status

### Procedure

**Step 1** Choose **Devices > VPN > Site To Site**.

**Step 2** Click **+ SASE Topology**.

**Step 3** Enter a unique **Topology Name**, **Pre-shared Key**, choose a data center, add a device, and click **Next**.

**Step 4** View the summary of the Umbrella SASE Tunnel configuration and click **Save**. The **Cisco Umbrella Configuration** window appears.

You can view the topology details such as name, data center, data center IP address, start, and end time of the tunnel deployment.

You can view the deployment status of the tunnels on Umbrella. The different tunnel deployment statuses are:

- Pending: The management center hasn't pushed the configuration to Umbrella.
- Success: The management center successfully configured a tunnel on Umbrella.
- In Progress: The management center is deploying the tunnel on Umbrella.
- Failure: The management center couldn't configure a tunnel on Umbrella.

If the status appears as pending, or failure, use the transcript to troubleshoot the tunnel creation. Click the **Transcript** button to view the transcript details such as the APIs, request payload, and the response received from Umbrella.

**Step 5** Click **Umbrella Dashboard** to view the network tunnels in Cisco Umbrella.

**Step 6** View the Umbrella tunnel deployment status in:

- The **Notifications** page under the **Deployments** and **Tasks** tabs.

The screenshot displays the Cisco Umbrella interface. At the top, there are tabs for 'Deployments', 'Upgrades', 'Health' (with a red indicator), and 'Tasks' (which is selected). To the right of the tabs is a 'Show Notifications' toggle switch, which is turned on. Below the tabs, there is a summary bar showing '20+ total' in a blue box, followed by counts for '0 waiting', '0 running', '0 retrying', '20+ success', and '0 failures'. A search bar with the placeholder 'Filter' is also present. The main content area lists two notifications, both with green checkmark icons. Each notification reads: 'Umbrella Tunnel Deployment' followed by 'Umbrella Tunnel deployment for Site to Site VPN vpn-MumbaiUmbrella has succeeded'. The first notification has a '2s' timer and a close button (X), and the second has a '3s' timer and a close button (X).

- The **Site to Site VPN dashboard (Overview > Dashboards > Site to Site VPN)**.

The dashboard provides a summary of the site to site VPN topologies including the Umbrella SASE topologies. You can view the tunnels between the peer devices and the status of each tunnel. You can also troubleshoot any problems with the tunnel deployment using CLI commands and packet tracer.

## Monitoring the Site-to-Site VPNs

The Secure Firewall Management Center provides a snapshot of the site-to-site VPN tunnels, including SASE topology tunnels, to determine the status of the site-to-site VPN tunnels. You can view the list of tunnels between peer devices and the status of each tunnel: Active, Inactive, or No Active Data. You can filter the data in the table according to the topology, device, and status. The table in the monitoring dashboard presents live data and you can configure to refresh the data at a specified interval. The table shows the peer-to-peer, hub and spoke, and full mesh topologies for crypto map-based VPNs. The tunnel information also contains the data for the route-based VPNs or Virtual Tunnel Interfaces (VTIs).

You can use this data to:

- Identify problematic VPN tunnels and troubleshoot.
- Verify connectivity between the site to site VPN peers devices.
- Monitor the health of the VPN tunnels to provide uninterrupted VPN connectivity between sites.

For information about configuring crypto-map based site to site VPNs, see [Configure a Policy-based Site-to-Site VPN, on page 1396](#).

For information about VTIs, see [About Virtual Tunnel Interfaces, on page 1409](#).

For information about Firewall Threat Defense VPN monitoring and troubleshooting, see [VPN Monitoring and Troubleshooting, on page 1573](#).

### Guidelines and Limitations

- The table shows the list of site-to-site , including SASE topology, VPNs that are deployed. It does not show the tunnels that are created and not deployed.
- The table does not show the information about the backup tunnels of policy-based VPNs and backup VTIs.
- For cluster deployments, the table does not show director change in real-time data. It shows only the director information that existed when the VPN was deployed. The director change reflects in the table only after the tunnel AM redeployed after the change.

### Site-to-site VPN Monitoring Dashboard

Choose **Overview > Dashboards > Site to Site VPN** to open the site to site monitoring dashboard.

The site-to-site VPN monitoring dashboard displays the following widgets for the site-to-site VPN tunnels:

- **Tunnel Status**—A table listing the tunnel status of the site-to-site VPNs , including the SASE tunnels for Umbrella, configured using the Firewall Management Center
- **Tunnel Summary**—Aggregated status of the tunnels in a donut graph.
- **Topology**—Status of tunnels summarized by topology.

### Status of VPN Tunnels

The site-to-site monitoring dashboard lists the VPN tunnels in the following states:

- **Inactive**—A policy-based (crypto map-based) VPN tunnel is inactive if all the IPsec tunnels are down. A VTI or and SASE topology VPN tunnel is down if the tunnel encounters any configuration or connectivity issues.
- **Active**—In the Firewall Management Center, policy-based site-to-site VPNs are configured based on IKE policies and IPsec proposals that are assigned to VPN topologies. A policy-based VPN tunnel is in the Active state if the Firewall Management Center identifies interesting traffic through the tunnel after the deployment. An IKE tunnel is up only if a minimum of one IPsec tunnel is up.

Route-based VPN (VTI) and SASE topology VPN tunnels do not require interesting traffic to be in the Active state. They are in the Active state if they are configured and deployed without errors.

- **No Active Data**—Policy-based and SASE topology VPN tunnels remain in the No Active Data state until there is a traffic flow event through the tunnel for the first time. The No Active Data state also lists the policy-based and route-based VPNs that have been deployed with errors.

### Important Notes About Tunnel Statuses in the Firewall Management Center

- The VPN statuses in the Firewall Management Center are event-based. The Firewall Management Center does not initiate status updates. Hence, there might be mismatches between the tunnel statuses in the dashboard and the Firewall Threat Defense. You can view the correct status in the **CLI Details** tab of the **Tunnel Status** widget.
- When a Firewall Threat Defense switches over to a secondary Firewall Threat Defense, there is a mismatch between the status of the VPN tunnels in the Firewall Management Center and the Firewall Threat Defense. When the device switches back to the primary device, the correct tunnel status appears.
- The Firewall Management Center does not update the tunnel status of Firewall Threat Defense devices earlier than 7.3 after the devices reboot. We recommend that you bring the tunnel down using the command **vpn-sessiondb logoff index** and bring it up using the packet tracer.

### Tunnel Status

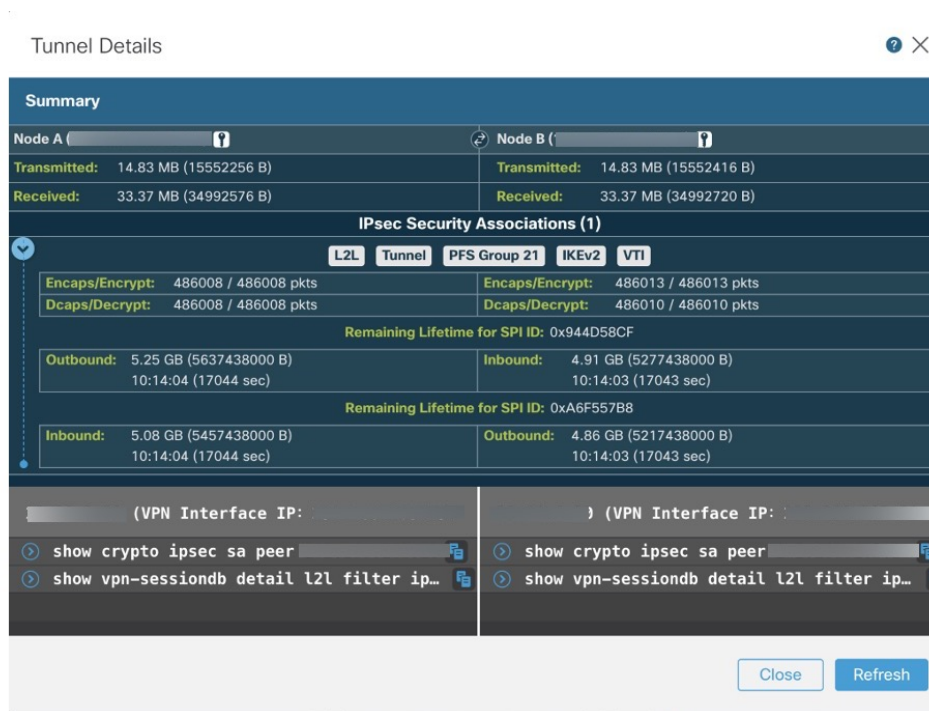

This table lists the site-to-site VPNs, including SASE topology VPN, configured using the Firewall Management Center. Hover over a topology and click **View** (👁) to view the following details about the topology:

- **General**—Displays more information about the nodes such as IP address and interface name.
- **CLI Details**—Displays the CLI outputs for the following commands:
  - **show crypto ipsec sa peer** *<node A/B\_ip\_address>*: Displays the IPsec SAs built between Node A and B.
  - **show vpn-sessiondb l2l filter ipaddress** *<node A/B\_ip\_address>*: Displays information about VPN sessions.

For an extranet device, no command output appears.

Important details about the IKE and IPsec sessions, derived from the above command outputs, appear in a summarized, and user-friendly format. You can view the details of both nodes at a time. The icon next to the node name specifies the authentication type: preshared key or client certificate. The details include IKE statistics per tunnel and IPsec SA statistics as shown below:

Figure 401: Tunnel Status &gt; View &gt; CLI Details

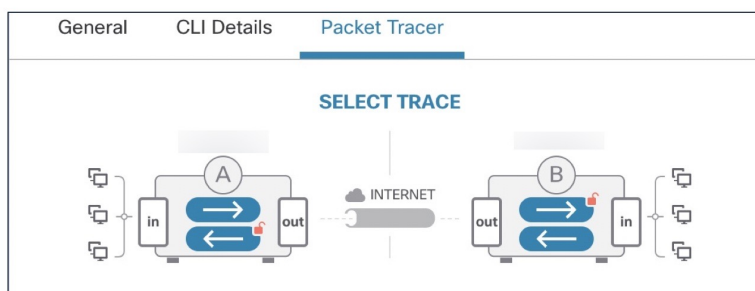

- **Packet Tracer**—Use packet tracer to troubleshoot the threat defense VPN tunnels.

### Packet Tracer

Packet tracer allows you to troubleshoot VPN tunnels between two threat defense devices. You can check if the VPN connection between device A and device B is up. This tool injects a packet into the device and tracks the packet flow from the ingress to the egress ports. The tool simulates traffic after you configure the ingress interfaces of the devices along with the protected networks. Packet tracer evaluates the packet against modules such as flow and route lookups, ACLs, protocol inspection, NAT, and QoS.

Figure 402: Packet Tracer

For each device, the tool runs an encrypted trace and a decrypted trace (packet is treated as decrypted VPN traffic). You can run four different traces between the ingress and egress ports of the devices. Click the individual encrypt and decrypt options to enable or disable the trace.

When you run the trace, the tool executes the trace sequentially in the following order:

1. Encrypted trace of A.
2. Decrypted trace of B.
3. Encrypted trace of B.
4. Decrypted trace of A.

After the trace completes, you can view the output of the trace with the results of each module.

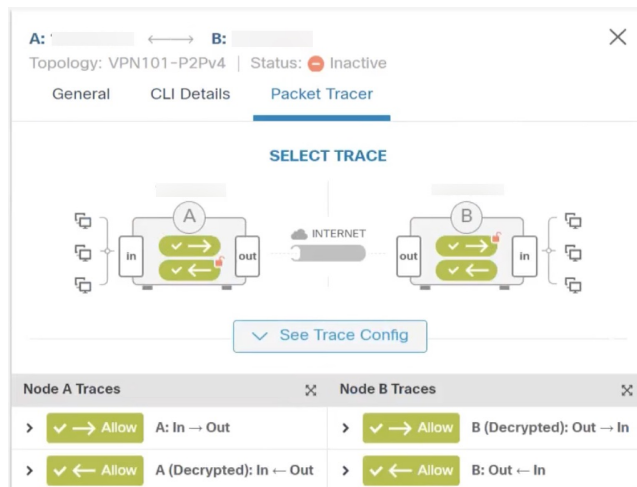

**Note** You cannot run a decrypt trace for route-based (VTI-based) VPNs.

To run the Packet Tracer:

1. Click **See Detailed Config** to view the VPN interface name, VPN interface IP address, VTI interface name, and the VTI Interface IP address.
2. (Optional) Choose a protocol from the **Protocol** drop-down list. You can choose ICMP/8/0, TCP, or UDP. ICMP/8/0 is the default option. If you choose ICMP/8/0, 8 indicates the ICMP type as Echo Request and 0 indicates the ICMP code. If you choose TCP or UDP, choose the destination port from the **Destination Port** drop-down list. The range is from 0 to 65535.
3. Choose the ingress interface for both the devices on which to trace the packet from the **Ingress Interface** drop-down lists.
4. Enter an IP address from the same subnet as the ingress interface in the **Protected Network IP Address** fields.
5. Click **Trace Now**.

After you initiate the trace, you can view if the trace is successful or not for each module. If the tunnel is down, the path appears in red. If the tunnel is up, the path appears in green. If a tunnel is down, click **Re-trace** to run the tool again. For a crypto-map based VPN, when the tunnel is inactive with no interesting traffic, the initial trace can be red. Click **Re-trace** to run the trace again.

**Figure 403: Packet Tracer after a Successful Trace**

**Extranet Nodes:** You can initiate a packet trace for VPN tunnels with one node as an extranet. For an extranet node, you cannot choose the ingress interface. The remaining steps for the packet trace are the same. You can't run trace on the extranet side.

For example, if Node A is a managed threat defense and Node B is an extranet:

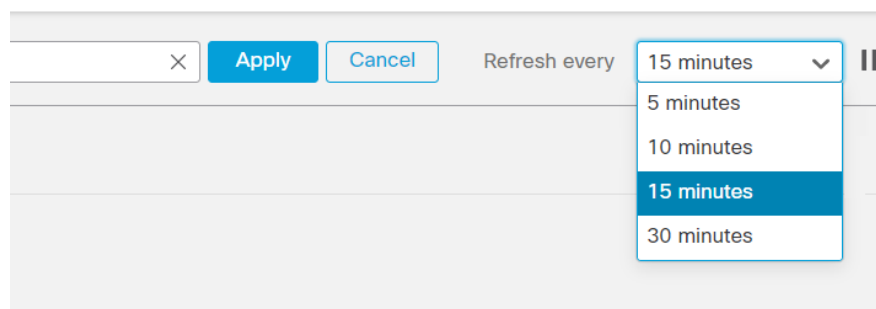

- Configure the ingress interface for node A.
- Configure the protected network for Node A and B.
- Click **Trace Now**. The traces appear for Node A and not for Node B.

### Automatic Data Refresh

The site to site VPN data in the table refreshes periodically. You can configure the refresh interval of the VPN monitoring data at a specific interval or turn the automatic data refresh off.

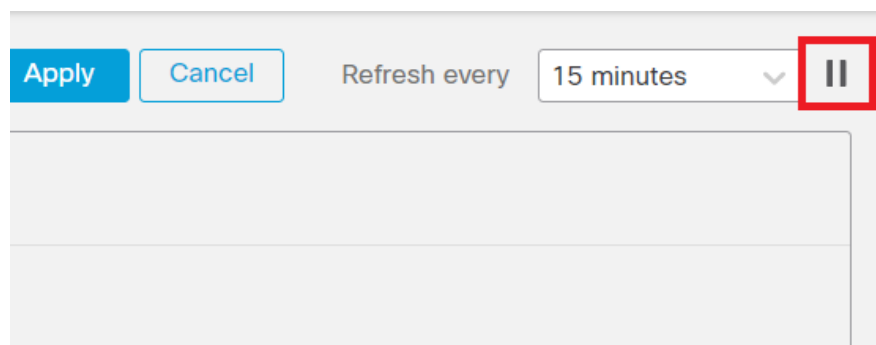

Click the **Refresh** interval drop-down to select from the available intervals to refresh the data in the table.

**Figure 404: Refresh the Tunnel Data**

Click **Pause** to stop the automatic data refresh for as long as you want. You can click the same button to resume refreshing the tunnel data.

**Figure 405: Pause the Periodic Data Refresh**

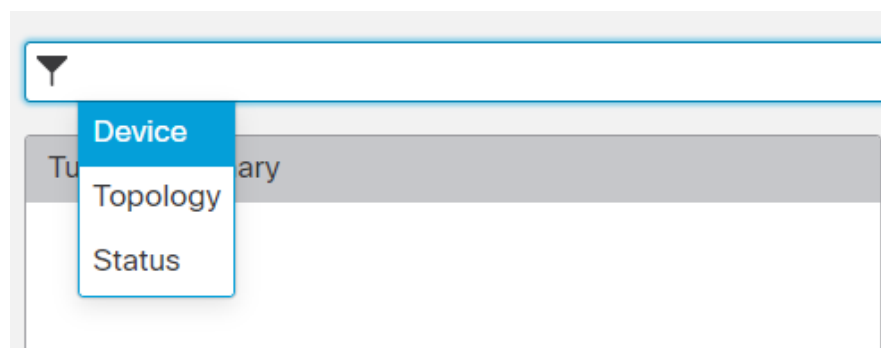

### Filter and Sort the Site to Site VPN Monitoring Data

You can filter and view the data in the VPN monitoring table by topology, device, and status.

For example, you can view the tunnels that are in the Down state in a specific topology.

Click within the filter box to choose the filter criteria and then specify the values to filter.

**Figure 406: Filter the Tunnel Data**

You can use multiple filtering criteria to view the data based on your requirement.

For example, you can choose to view only the tunnels that are in the Up and Down states, and ignore the ones in the Unknown state.

**Figure 407: Example: Filter Tunnel Data**

**Sort the data**—To sort the data by a column, click the column heading.

## History for Site-to-Site VPN

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
View Virtual Tunnel Information	7.4.1	Any	You can view details of dynamic and static VTIs of route-based VPNs on the device. For every VPN topology, you can also view details of all the virtual access interfaces of the dynamic VTIs.  New/Modified screens: <b>Device &gt; Device Management &gt; Edit a device &gt; Interfaces</b> and click the <b>Virtual Tunnels</b> tab.
IPsec flow offload	7.4	Any	IPsec flow offload is automatically enabled on the VTI loopback interface on Secure Firewall 3100 and Secure Firewall 4200 devices.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Umbrella SASE Topology	7.3	Any	You can configure an Umbrella SASE topology and deploy IPsec IKEv2 tunnels between a threat defense device and Umbrella. This tunnel forwards all internet-bound traffic to the Umbrella Secure Internet Gateway (SIG) for inspection and filtering.
Support for Dynamic Virtual Tunnel Interface	7.3	Any	You can create a dynamic VTI and use it to configure a route-based site-to-site VPN in a hub and spoke topology.
EIGRP IPv4 support for VTI	7.3	Any	Static and dynamic VTI interfaces support EIGRP IPv4 routing protocol.
OSPFv2/v3 IPv4/v6 support for VTI	7.3	Any	Static and dynamic VTI interfaces support OSPFv2/v3 IPv4/v6 routing protocol.
Packet Tracer in Site to Site VPN Monitoring Dashboard	7.3	Any	Use the packet tracer tool in the site-to-site VPN monitoring dashboard to troubleshoot the threat defense VPN tunnels.  New/Modified screens: <b>Overview &gt; Dashboards &gt; Site to Site VPN</b>
Remote Access VPN Dashboard	7.3	Any	Use the Remote Access VPN dashboard to monitor real-time data from active remote access VPN sessions on the devices.  New/Modified screens: <b>Overview &gt; Dashboards &gt; Site to Site VPNRemote Access VPN</b>
IPsec flow offload	7.2	Any	On the Secure Firewall 3100, IPsec flows are offloaded by default. After the initial setup of an IPsec site-to-site VPN or remote access VPN security association (SA), IPsec connections are offloaded to the field-programmable gate array (FPGA) in the device, which should improve device performance.  You can change the configuration using FlexConfig and the <b>flow-offload-ipsec</b> command.
Site-to-Site VPN Filter	7.1	Any	You can control site-to-site VPN traffic by using an access control policy.
Local tunnel ID support	7.1	Any	For each endpoint on a site-to-site VPN, you can configure a unique tunnel ID to be shared with the peers.
Multiple IKE Policy Support	7.1	Any	You can add multiple IKEv1 and IKEv2 policy objects for each endpoint.
Site-to-Site VPN Monitoring Dashboard	7.1	Any	Use the Site-to-Site VPN Monitoring dashboard to view and monitor the status of site-to-site VPN tunnels.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Backup virtual tunnel interfaces (VTI) for route-based site-to-site VPN.	7.0	Any	<p>When you configure a site-to-site VPN that uses virtual tunnel interfaces, you can select a backup VTI for the tunnel. Specifying a backup VTI provides resiliency, so that if the primary connection goes down, the backup connection might still be functional. For example, you could point the primary VTI to the endpoint of one service provider, and the backup VTI to the endpoint of a different service provider.</p> <p>You can add a backup VTI in the site-to-site VPN wizard by selecting route-based as the VPN type for a point-to-point connection.</p>
Enhance the number of VTI from 100 per interface to 1024 per device	7.0	Any	Support for maximum number of VTIs is enhanced from 100 per physical interface to 1024 VTIs per device.
IPv6 Support	7.0	Any	You can configure IPv6 addressed VTIs. While only static IPv6 address is supported as the tunnel source and destination, IPv6 BGP isn't supported over VTI.
Removal and deprecation of weak ciphers	6.7	Any	<p>Support has been removed for less secure ciphers. We recommend that you update your VPN configuration before you upgrade to Firewall Threat Defense 6.70 to supported DH and encryption algorithms to ensure the VPN works correctly.</p> <p>Update your IKE proposals and IPSec policies to match the ones supported in Firewall Threat Defense 6.70 and then deploy the configuration changes.</p> <p>The following less secure ciphers have been removed or deprecated in Firewall Threat Defense 6.70 onwards:</p> <ul style="list-style-type: none"> <li>• <b>Diffie-Hellman GROUP 5</b> is deprecated for IKEv1 and removed for IKEv2</li> <li>• Diffie-Hellman groups 2 and 24 have been removed.</li> <li>• <b>Encryption algorithms:</b> 3DES, AES-GMAC, AES-GMAC-192, AES-GMAC-256 have been removed.</li> </ul> <p><b>Note</b>  <b>DES</b> is supported in evaluation mode or for users who do not satisfy export controls for strong encryption.</p> <p><b>NULL</b> is removed in IKEv2 policy, but supported in both IKEv1 and IKEv2 IPsec transform-sets.</p>
Dynamic RRI support	6.7	Any	Dynamic Reverse Route Injection is supported with IKEv2 based static crypto maps.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Backup peer for site-to-site VPN	6.6	Any	<p>You can use the Firewall Management Center to add a backup peer to a site-to-site VPN connection. For example, if you have two ISPs, you can configure the VPN connection to fail over to the backup ISP if the connection to the first ISP becomes unavailable.</p> <p>New/modified pages:</p> <p><b>Devices &gt; VPN &gt; Site to Site.</b> When adding or editing a point to point or hub and spoke FTD VPN topology to add an endpoint, the <b>IP Address</b> field supports comma-separated backup peers.</p>

## CHAPTER 37

# Remote Access VPN

Remote Access virtual private network (VPN) allows individual users to connect to your network from a remote location using a computer or other supported devices connected to the Internet. This allows mobile workers to connect from their home networks or a public Wi-Fi network, for example.

The following topics explain how to configure remote access VPN for your network.

- [Remote Access VPN Overview, on page 1451](#)
- [License Requirements for Remote Access VPN, on page 1457](#)
- [Requirements and Prerequisites for Remote Access VPN, on page 1457](#)
- [Guidelines and Limitations for Remote Access VPNs, on page 1458](#)
- [Configuring a New Remote Access VPN Connection, on page 1461](#)
- [Create a Copy of an Existing Remote Access VPN Policy, on page 1471](#)
- [Set Target Devices for a Remote Access VPN Policy, on page 1471](#)
- [Associate Local Realm with Remote Access VPN Policy, on page 1472](#)
- [Additional Remote Access VPN Configurations, on page 1472](#)
- [Customizing Remote Access VPN AAA Settings, on page 1523](#)
- [Advanced Secure Client Configurations, on page 1544](#)
- [Remote Access VPN Examples, on page 1552](#)
- [History for Remote Access VPNs, on page 1557](#)

## Remote Access VPN Overview

Secure Firewall Threat Defense provides secure gateway capabilities that support remote access SSL and IPsec-IKEv2 VPNs. The full tunnel client, Secure Client, provides secure SSL and IPsec-IKEv2 connections to the security gateway for remote users. When the client negotiates an SSL VPN connection with Firewall Threat Defense, it connects using Transport Layer Security (TLS) or Datagram Transport Layer Security (DTLS)

Secure Client is the only client supported on endpoint devices for remote VPN connectivity to Firewall Threat Defense devices. The client gives remote users the benefits of an SSL or IPsec-IKEv2 VPN client without the need for network administrators to install and configure clients on remote computers. The Secure Client for Windows, Mac, and Linux is deployed from the secure gateway upon connectivity. The Secure Client apps for Apple iOS and Android devices are installed from the platform app store.

Use the Remote Access VPN policy wizard to set up SSL and IPsec-IKEv2 remote access VPNs with basic capabilities. Then, enhance the policy configuration as you want and deploy it to your Firewall Threat Defense secure gateway devices.

## Remote Access VPN Features

The following table describes the features of Secure Firewall Threat Defense remote access VPN:

**Table 76: Remote access VPN features**

	Description
Secure Firewall Threat Defense remote access VPN features	<ul style="list-style-type: none"><li>• SSL and IPsec-IKEv2 remote access using the Secure Client.</li><li>• Secure Firewall Management Center supports all combinations such as IPv6 over an IPv4 tunnel.</li><li>• Configuration support on both Firewall Management Center and Firewall Device Manager. Device-specific overrides.</li><li>• Support for both Secure Firewall Management Center and Firewall Threat Defense HA environments.</li><li>• Support for multiple interfaces and multiple AAA servers.</li><li>• Rapid Threat Containment support using RADIUS CoA or RADIUS dynamic authorization.</li><li>• Support for DTLS v1.2 protocol with Cisco Secure Client version 4.7 or higher.</li><li>• Secure Client modules support for additional security services for remote access VPN connections.</li><li>• VPN load balancing.</li></ul>

	Description
AAA features	<ul style="list-style-type: none"><li>• Server authentication using self-signed or CA-signed identity certificates.</li><li>• AAA username and password-based remote authentication using RADIUS server or LDAP or AD.</li><li>• RADIUS group and user authorization attributes, and RADIUS accounting.</li><li>• Double authentication support using an additional AAA server for secondary authentication.</li><li>• NGFW Access Control integration using VPN Identity.</li><li>• LDAP or AD authorization attributes using Secure Firewall Management Center web interface.</li><li>• Support for single sign-on using SAML 2.0.</li><li>• Support for multiple identity provider trustpoints with Microsoft Azure that can have multiple applications for the same Entity ID, but a unique identity certificate.</li></ul>
VPN tunneling features	<ul style="list-style-type: none"><li>• Address assignment.</li><li>• Split tunneling.</li><li>• Split DNS.</li><li>• Client Firewall ACLs.</li><li>• Session Timeouts for maximum connect and idle time.</li></ul>
Remote access VPN monitoring features	<ul style="list-style-type: none"><li>• New VPN Dashboard Widget showing VPN users by various characteristics such as duration and client application.</li><li>• Remote access VPN events including authentication information such as username and OS platform.</li><li>• Tunnel statistics available using the Firewall Threat Defense Unified CLI.</li></ul>

## Secure Client Components

### Secure Client Deployment

Your remote access VPN policy can include the Secure Client Image and the Secure Client Profile for distribution to connecting endpoints. Or, the client software can be distributed using other methods. See the *Deploy Cisco Secure Client* chapter in the [Cisco Secure Client \(including AnyConnect\) Administrator Guide, Release 5](#).

Without a previously installed client, remote users enter the IP address in their browser of an interface configured to accept SSL or IPsec-IKEv2 VPN connections. Unless the security appliance is configured to redirect http:// requests to https://, remote users must enter the URL in the form https://address. After the user enters the URL, the browser connects to that interface and displays the login screen.

After a user logs in, if the secure gateway identifies the user as requiring the VPN client, it downloads the client that matches the operating system of the remote computer. After downloading, the client installs and configures itself, establishes a secure connection, and either remains or uninstalls itself (depending on the security appliance configuration) when the connection stops. In the case of a previously installed client, after login, the Firewall Threat Defense security gateway examines the client version and upgrades it as necessary.

### Secure Client Operation

When the client negotiates a connection with the security appliance, the client connects using Transport Layer Security (TLS), and optionally, Datagram Transport Layer Security (DTLS). DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.

When an IPsec-IKEv2 VPN client initiates a connection to the secure gateway, negotiation consists of authenticating the device through Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth). The group profile is pushed to the VPN client and an IPsec security association (SA) is created to complete the VPN.

### Secure Client Profile and Editor

The Secure Client Profile is a group of configuration parameters, stored in an XML file that the VPN client uses to configure its operation and appearance. These parameters (XML tags) include the names and addresses of host computers and settings to enable more client features.

You can configure a profile using the Secure Client Profile Editor. This editor is a convenient GUI-based configuration tool that is available as part of the Secure Client software package. It is an independent program that you run outside of the Firewall Management Center.

## Remote Access VPN Authentication

### Remote Access VPN Server Authentication

Secure Firewall Threat Defense secure gateways always use certificates to identify and authenticate themselves to the VPN client endpoint.

While you use the Remote Access VPN Policy Wizard, you can enroll the selected certificate on the targeted Firewall Threat Defense device. In the wizard, under **Access & Certificate** phase, select “Enroll the selected certificate object on the target devices” option. The certificate enrollment gets automatically initiated on the specified devices. As you complete the remote access VPN policy configuration, you can view the status of

the enrolled certificate under the device certificate homepage. The status provides a clear standing as to whether the certificate enrollment was successful or not. Your remote access VPN policy configuration is now fully completed and ready for deployment.

Obtaining a certificate for the secure gateway, also known as PKI enrollment, is explained in [Certificates, on page 1365](#). This chapter contains a full description of configuring, enrolling, and maintaining gateway certificates.

### Remote Access VPN Client AAA

For both SSL and IPsec-IKEv2, remote user authentication is done using usernames and passwords only, certificates only, or both.

---

**Note** If you are using client certificates in your deployment, they must be added to your client's platform independent of the Secure Firewall Threat Defense or Secure Firewall Management Center. Facilities such as SCEP or CA Services are not provided to populate your clients with certificates.

---

AAA servers enable managed devices acting as secure gateways to determine who a user is (authentication), what the user is permitted to do (authorization), and what the user did (accounting). Some examples of the AAA servers are RADIUS, LDAP/AD, TACACS+, and Kerberos. For Remote Access VPN on Firewall Threat Defense devices, AD, LDAP, and RADIUS AAA servers are supported for authentication.

Refer to the section [Understanding Policy Enforcement of Permissions and Attributes](#) to understand more about remote access VPN authorization.

Before you add or edit the remote access VPN policy, you must configure the Realm and RADIUS server groups you want to specify. For more information, see [Create an LDAP Realm or an Active Directory Realm and Realm Directory, on page 2275](#) and [Add a RADIUS Server Group, on page 1246](#).

Without DNS configured, the device cannot resolve AAA server names, named URLs, and CA Servers with FQDN or Hostnames, it can only resolve IP addresses.

The login information provided by a remote user is validated by an LDAP or AD realm or a RADIUS server group. These entities are integrated with the Secure Firewall Threat Defense secure gateway.

---

**Note** If users authenticate with remote access VPN using Active Directory as the authentication source, users must log in using their username; the format `domain\username` or `username@domain` fails. (Active Directory refers to this username as the *logon name* or sometimes as `sAMAccountName`.) For more information, see [User Naming Attributes](#) on MSDN.

If you use RADIUS to authenticate, users can log in with any of the preceding formats.

---

Once authenticated via a VPN connection, the remote user takes on a *VPN Identity*. This VPN Identity is used by *identity policies* on the Secure Firewall Threat Defense secure gateway to recognize and filter network traffic belonging to that remote user.

Identity policies are associated with access control policies, which determine who has access to network resources. It is in this way that the remote user blocked or allowed to access your network resources.

For more information, see the [About Identity Policies, on page 2363](#) and [Access Control Policies, on page 1615](#) sections.

### Related Topics

[Configure AAA Settings for Remote Access VPN](#), on page 1475

## Understanding Policy Enforcement of Permissions and Attributes

The Secure Firewall Threat Defense device supports applying user authorization attributes (also called user entitlements or permissions) to VPN connections from an external authentication server and/or authorization AAA server (RADIUS) or from a group policy on the Firewall Threat Defense device. If the Firewall Threat Defense device receives attributes from the external AAA server that conflicts with those configured on the group policy, then attributes from the AAA server always take the precedence.

The Firewall Threat Defense device applies attributes in the following order:

1. **User attributes on the external AAA server**—The server returns these attributes after successful user authentication and/or authorization.
2. **Group policy configured on the Firepower Threat Defense device**—If a RADIUS server returns the value of the RADIUS Class attribute IETF-Class-25 (OU= group-policy) for the user, the Firewall Threat Defense device places the user in the group policy of the same name and enforces any attributes in the group policy that are not returned by the server.
3. **Group policy assigned by the Connection Profile (also known as Tunnel Group)**—The Connection Profile has the preliminary settings for the connection, and includes a default group policy applied to the user before authentication.

#### Note

The Firewall Threat Defense device does not support inheriting system default attributes from the default group policy, *DfltGrpPolicy*. The attributes on the group policy assigned to the connection profile are used for the user session, if they are not overridden by user attributes or the group policy from the AAA server as indicated above.

### Related Topics

[Configure AAA Settings for Remote Access VPN](#), on page 1475

## Understanding AAA Server Connectivity

LDAP, AD, and RADIUS AAA servers must be reachable from the Firewall Threat Defense device for your intended purposes: user-identity handling only, VPN authentication only, or both activities. AAA servers are used in remote access VPN for the following activities:

- **User-identity handling**— the servers must be reachable over the Management interface.

On the Firewall Threat Defense, the Management interface has a separate routing process and configuration from data interfaces.

- **VPN authentication**—the servers must be reachable over a data interface or the Management interface.

To use the Management interface, you must explicitly select Management as the source interface. Other management-only interfaces cannot be used.

To use the same AAA servers for both activities, we recommend specifying the Management interface as the source interface.

For more information about various interfaces, see [Regular Firewall Interfaces](#), on page 701.

After deployment, use the following CLI commands to monitor and troubleshoot AAA server connectivity from the Firewall Threat Defense device:

- **show aaa-server** to display AAA server statistics.
- **show network** and **show network-static-routes** to view the Management interface default route and static routes.
- **show route** to view data traffic routing table entries.
- **ping system** and **traceroute system** to verify the path to the AAA server through the Management interface.
- **ping interface** *ifname* and **traceroute** *destination* to verify the path to the AAA server through the data interfaces.
- **test aaa-server authentication** and **test aaa-server authorization** to test authentication and authorization on the AAA server.
- **clear aaa-server statistics** *groupname* or **clear aaa-server statistics protocol** *protocol* to clear AAA server statistics by group or protocol.
- **aaa-server** *groupname* **active host** *hostname* to activate a failed AAA server, or **aaa-server** *groupname* **fail host** *hostname* to fail a AAA server.
- **debug ldap level**, **debug aaa authentication**, **debug aaa authorization**, and **debug aaa accounting**.

## License Requirements for Remote Access VPN

### Threat Defense License

Firewall Threat Defense remote access VPN requires Strong Encryption and one of the following licenses for Secure Client:

- Secure Client Advantage
- Secure Client Premier
- Secure Client VPN Only

## Requirements and Prerequisites for Remote Access VPN

### Model Support

Threat Defense

### Supported Domains

Any

## User Roles

Admin

# Guidelines and Limitations for Remote Access VPNs

## Remote Access VPN Policy Configuration

- You can add a new remote access VPN policy only by using the wizard. You must proceed through the entire wizard to create a new policy; the policy will not be saved if you cancel before completing the wizard.
- Two users must **not** edit a remote access VPN policy at the same time; however, the web interface does not prevent simultaneous editing. If this occurs, the last saved configuration persists.
- Moving a Secure Firewall Threat Defense device from one domain to another domain is not possible if remote access VPN policy is assigned to that device.
- Remote access VPN does not support SSL while using ECMP. We recommend that you use IPsec-IKEv2.
- Firepower 9300 and 4100 series in cluster mode do not support remote access VPN configuration.
- Remote access VPN connectivity could fail if there is a misconfigured Firewall Threat Defense NAT rule.
- If you are using DHCP to provide IP addresses to the client, and the client cannot obtain an address, check the NAT rules. Any NAT rule that applies to the RA VPN network should include the route lookup option. Route lookup can help ensure the DHCP requests are sent to the DHCP server through an appropriate interface.
- Whenever IKE ports 500/4500 or SSL port 443 is in use or when there are some PAT translations that are active, the Secure Client IPsec-IKEv2 or SSL remote access VPN cannot be configured on the same port as it fails to start the service on those ports. These ports must not be used on the Firewall Threat Defense device before configuring remote access VPN policy.
- While configuring remote access VPNs using the wizard, you can create in-line certificate enrollment objects, but you cannot use them to install the identity certificate. Certificate enrollment objects are used for generating the identity certificate on the Firewall Threat Defense device being configured as the remote access VPN gateway. Install the identity certificate on the device before deploying the remote access VPN policy to the device.

For more information about how to install the identity certificate based on the certificate enrollment object, see [The Object Manager, on page 1236](#).

- The ECMP zone interfaces can be used in remote access VPN with IPsec enabled.
- The ECMP zone interfaces cannot be used in remote access VPN with SSL enabled. Deployment of remote access VPN (SSL enabled) configuration fails if all the remote access VPN interfaces that belong to security zones or interface groups also belong to one or more ECMP zones. However, if only some of the remote access VPN interfaces belonging to the security zones or interface groups also belongs to one or more ECMP zones, deployment of the remote access VPN configuration succeeds excluding those interfaces.
- After you change the remote access VPN policy configurations, re-deploy the changes to the Firewall Threat Defense devices. The time it takes to deploy configuration changes depends on multiple factors

such as complexity of the policies and rules, type and volume of configurations you send to the device, and memory and device model. Before deploying remote access VPN policy changes, review the [Best Practices for Deploying Configuration Changes, on page 182](#).

- Issuing commands such as **curl** against the RA VPN headend is not directly supported, and might not have desirable results. For example, the headend does not respond to HTTP HEAD requests.
- Firewall Threat Defense does not accept remote access VPN sessions if the third-party client sends a null user agent.
- You can configure browser proxy using FlexConfig.
- When **Bypass Access Control policy for decrypted traffic** is disabled on a Firewall Threat Defense and ISE issues a DACL, traffic is first matched against the ACP: if permitted, it proceeds to DACL checking; if denied, it bypasses DACL matching.

### Concurrent VPN Sessions Capacity Planning (Firewall Threat Defense Virtual Models)

The maximum concurrent VPN sessions are governed by the installed Firewall Threat Defense Virtual smart-licensed entitlement tier, and enforced via a rate limiter. There is a maximum limit to the number of concurrent remote access VPN sessions allowed on a device based on the licensed device model. This limit is designed so that system performance does not degrade to unacceptable levels. Use these limits for capacity planning.

Device Model	Maximum Concurrent Remote Access VPN Sessions
Firewall Threat Defense Virtual5	50
Firewall Threat Defense Virtual10	250
Firewall Threat Defense Virtual20	250
Firewall Threat Defense Virtual30	250
Firewall Threat Defense Virtual50	750
Firewall Threat Defense Virtual100	10,000

### Concurrent VPN Sessions Capacity Planning (Hardware Models)

The maximum concurrent VPN sessions are governed by platform-specific limits and have no dependency on the license. There is a maximum limit to the number of concurrent remote access VPN sessions allowed on a device based on the device model. This limit is designed so that system performance does not degrade to unacceptable levels. Use these limits for capacity planning.

Device Model	Maximum Concurrent Remote Access VPN Sessions
Firepower 1010	75
Firepower 1120	150
Firepower 1140	400
Firepower 2110	1500

Device Model	Maximum Concurrent Remote Access VPN Sessions
Firepower 2120	3500
Firepower 2130	7500
Firepower 2140	10,000
Secure Firewall 3110	3000
Secure Firewall 3120	6000
Secure Firewall 3130	15,000
Secure Firewall 3140	20,000
Firepower 4100, all models	10,000
Firepower 9300 appliance, all models	20,000
ISA 3000	25

For capacity of other hardware models, contact your sales representative.

**Note** The Firewall Threat Defense device denies the VPN connections once the maximum session limit per platform is reached. The connection is denied with a syslog message. Refer the syslog messages %ASA-4-113029 and %ASA-4-113038 in the syslog messaging guide. For more information, see [Cisco Secure Firewall ASA Series Syslog Messages](#).

### Controlling Cipher Usage for VPN

To prevent use of ciphers greater than DES, pre-deployment checks are available at the following locations in the Firewall Management Center:

**Devices > Platform Settings**, click **Edit** and then **SSL**.

**Devices > VPN > Remote Access > Edit > Advanced > IPsec**.

For more information about SSL settings and IPsec, see [SSL](#), on page 861 and [Configure Remote Access VPN IPsec/IKEv2 Parameters](#), on page 1506.

### Authentication, Authorization, and Accounting

Configure DNS on each device in the topology in to use remote access VPN. Without DNS, the device cannot resolve AAA server names, named URLs, and CA Servers with FQDN or Hostnames; it can only resolve IP addresses.

You can configure DNS using the **Platform Settings**. For more information, see [DNS](#), on page 831 and [DNS Server Group](#), on page 1264.

### Client Certificates

If you are using client certificates in your deployment, they must be added to your client's platform independent of the Secure Firewall Threat Defense or Secure Firewall Management Center. Facilities such as SCEP or CA Services are not provided to populate your clients with certificates.

### Unsupported Features of Secure Client

The only supported VPN client is the Cisco Secure Client. No other clients or native VPNs are supported. Clientless VPN is not supported for VPN connectivity; it is only used to deploy the Secure Client using a web browser.

**Note** Using multiple Secure Client packages on Firewall Threat Defense devices can increase memory usage and affect the device's performance. We recommend that you do not use multiple Secure Client packages on low-end threat defense devices to avoid continuous reboots because of memory exhaustion.

The following Secure Client features are not supported when connecting to a Firewall Threat Defense secure gateway:

- TACACS, Kerberos (KCD Authentication and RSA SDI), and SDI.

## Configuring a New Remote Access VPN Connection

This section provides instructions to configure a new remote access VPN policy with Secure Firewall Threat Defense devices as VPN gateways and Cisco Secure Client as the VPN client.

Step	Do This	More Info
1	Review the guidelines and prerequisites.	<a href="#">Guidelines and Limitations for Remote Access VPNs</a> , on page 1458 <a href="#">Prerequisites for Configuring Remote Access VPN</a> , on page 1462
2	Create a new remote access VPN policy using the wizard.	<a href="#">Create a New Remote Access VPN Policy</a> , on page 1462
3	Update the access control policy deployed on the device.	<a href="#">Update the Access Control Policy on the Secure Firewall Threat Defense Device</a> , on page 1465
4	(Optional) Configure a NAT exemption rule if NAT is configured on the device.	<a href="#">(Optional) Configure NAT Exemption</a> , on page 1466
5	Configure DNS.	<a href="#">Configure DNS</a> , on page 1467
6	Add Secure Client Profile.	<a href="#">Add Secure Client Profile XML File</a> , on page 1467
7	Deploy the remote access VPN policy.	<a href="#">Deploy Configuration Changes</a> , on page 183
8	(Optional) Verify the remote access VPN policy configuration.	<a href="#">Verify the Configuration</a> , on page 1470

## Prerequisites for Configuring Remote Access VPN

- Deploy Secure Firewall Threat Defense devices and configure Secure Firewall Management Center to manage the device with required licenses with export-controlled features enabled. For more information, see [VPN Licensing, on page 1381](#).
- Configure the certificate enrollment object that is used to obtain the identity certificate for each Firewall Threat Defense device that act as a remote access VPN gateway.
- Configure any AD or LDAP realms being used by remote access VPN policies.
- During migration of FTD with remote access VPN, the realm (LDAP, AD or even local) used in remote access VPN should be preconfigured on cdFMC before you migrate the remote access VPN.
- Ensure that the AAA Server is reachable from the Firewall Threat Defense device for the remote access VPN configuration to work. Configure routing (at **Devices > Device Management**, click **Edit Device** and then **Routing**) to ensure connectivity to the AAA servers.

For remote access VPN double authentication, ensure that both the primary and secondary authentication servers are reachable from the Firewall Threat Defense device for the double authentication configuration to work.

- Purchase and enable one of the following Cisco Secure Client licenses: Secure Client Advantage, Secure Client Premier, or Secure Client VPN Only to enable the Firewall Threat Defense remote access VPN.
- Download the latest Secure Client image files from [Cisco Software Download Center](#).

On your Secure Firewall Management Center web interface, go to **Objects > Object Management > VPN > Secure Client File** and add the new Secure Client image files.

- Create a security zone or interface group that contains the network interfaces that users will access for VPN connections. See [Interface, on page 1278](#).
- Download the Secure Client Profile Editor from [Cisco Software Download Center](#) to create the Secure Client profile. You can use the standalone profile editor to create a new or modify an existing Secure Client profile.

## Create a New Remote Access VPN Policy

The Remote Access VPN Policy Wizard guides you to quickly and easily set up remote access VPNs with basic capabilities. You can further enhance the policy configuration by specifying additional attributes as you want and deploy it to your Secure Firewall Threat Defense secure gateway devices.

### Before you begin

- Ensure that you complete all the prerequisites listed in [Prerequisites for Configuring Remote Access VPN, on page 1462](#).

### Procedure

#### Step 1

Choose **Devices > VPN > Remote Access**.

**Step 2** Click **Add** to create a new remote access VPN policy with basic policy configuration, using the Remote Access VPN Policy wizard.

You must proceed through the entire wizard to create a new policy; the policy is not saved if you cancel before you complete the wizard.

**Step 3** Select the target devices and protocols.

The Firewall Threat Defense devices that you select here functions as your remote access VPN gateways for the VPN client users.

You can select Firewall Threat Defense devices when you create a remote access VPN policy or change them later. See [Set Target Devices for a Remote Access VPN Policy, on page 1471](#).

You can select **SSL** or **IPSec-IKEv2**, or both the VPN protocols. Firewall Threat Defense supports both the protocols to establish secure connections over a public network through VPN tunnels.

**Note**

Firewall Threat Defense does not support IPSec tunnels with NULL encryption. If you have selected IPSec-IKEv2, make sure that you do not choose NULL encryption for IPSec IKEv2 proposal. See [Configure IKEv2 IPsec Proposal Objects, on page 1354](#).

For SSL settings, see [SSL, on page 861](#).

**Step 4** Click **Next**.

**Step 5** Configure the **Connection Profile** and **Group Policy** settings.

A connection profile specifies a set of parameters that define how the remote users connect to the VPN device. The parameters include settings and attributes for authentication, address assignments to VPN clients, and group policies. Firewall Threat Defense device provides a default connection profile named *DefaultWEBVPNGroup* when you configure a remote access VPN policy.

For more information, see [Configure Connection Profile Settings, on page 1472](#).

**Step 6** Configure the **Authentication, Authorization & Accounting** settings.

For information about configuring,

- AAA settings, see [Configure AAA Settings for Remote Access VPN, on page 1475](#)
- LDAP attribute maps, see [Configuring LDAP Attribute Mapping, on page 1497](#)
- SAML 2.0 single sign-on authentication, see [Configuring a SAML Single Sign-On Authentication, on page 1541](#)

**Step 7** Configure the **Client Address Assignment** settings.

Client IP address can be assigned from AAA server, DHCP server and IP address pools. When multiple options are selected, IP address assignment is done in the order of AAA server, DHCP server, and IP address pool. Assignment of client IP addresses from the AAA server is supported only for realm and RADIUS authorization. Ensure that realm or RADIUS server is configured to provide client IP address.

**Step 8** Configure the **Group Policy** settings.

A group policy is a set of attribute and value pairs, stored in a group policy object, that define the remote access VPN experience for VPN users. You configure attributes such as user authorization profile, IP addresses, Secure Client settings, VLAN mapping, and user session settings and so on using the group policy. The

RADIUS authorization server assigns the group policy, or it is obtained from the current connection profile. For more information, see [Configuring Group Policies, on page 1496](#).

**Step 9** Click **Next**.

**Step 10** Select the **Secure Client Image** that the VPN users will use to connect to the remote access VPN.

The Secure Client provides secure SSL or IPSec (IKEv2) connections to the Secure Firewall Threat Defense device for remote users with full VPN profiling to corporate resources. After the remote access VPN policy is deployed on the Firewall Threat Defense device, VPN users can enter the IP address of the configured device interface in their browser to download and install the Secure Client.

For information about configuring the client profile and client modules, see [Group Policy Secure Client Options, on page 1349](#).

**Step 11** Click **Next**.

**Step 12** Configure **Network Interface for Incoming VPN Access**.

Interface objects segment your network to help you manage and classify traffic flow. A security zone object simply groups interfaces. These groups may span multiple devices; you can also configure multiple zones interface objects on a single device. There are two types of interface objects:

- Security zones—An interface can belong to only one security zone.
- Interface groups—An interface can belong to multiple interface groups (and to one security zone).

(Optional) Check the **Enable DTLS on member interfaces** check box, if required. DTLS is applicable only for SSL protocol.

**Step 13** Configure **Device Certificates**.

Device certificate (also called Identity certificate) identifies the VPN gateway to the remote access clients. Select a certificate which is used to authenticate the VPN gateway. From the **Certificate Enrollment** drop-down list, choose a certificate or click + to add a certificate to authenticate the VPN gateway.

**Step 14** Configure **Access Control for VPN Traffic**.

By default, all decrypted traffic in the VPN tunnel is subjected to the Access Control Policy. Check the **Bypass Access Control policy for decrypted traffic (sysopt permit-vpn)** check box to bypass decrypted traffic from the Access Control Policy. This option bypasses the Access Control Policy inspection, but VPN filter ACL and authorization ACL downloaded from AAA server are still applied to VPN traffic.

**Note**

If you select this option, you need not update the access control policy for remote access VPN as specified in [Update the Access Control Policy on the Secure Firewall Threat Defense Device, on page 1465](#).

**Step 15** Click **Next**.

**Step 16** View the **Summary** of the remote access VPN policy configuration.

The Summary page displays all the remote access VPN settings you have configured so far and provides links to the additional configurations that need to be performed before deploying the remote access VPN policy on the selected devices.

Click **Back** to make changes to the configuration, if required.

**Step 17** Click **Finish** to complete the basic configuration for the remote access VPN policy.

When you complete the Remote Access VPN Policy Wizard, the policy listing page appears. Later, set up DNS configuration, configure access control for VPN users, and enable NAT exemption (if necessary) to complete a basic remote access VPN Policy configuration.

---

### What to do next

Use the Remote Access VPN dashboard (**Overview > Dashboards > Remote Access VPN**) to monitor real-time data from active remote access VPN sessions on the devices. You can quickly determine problems related to user sessions and mitigate the problems for your network and users. For more information, see [Remote Access VPN Dashboard, on page 1573](#).

## Update the Access Control Policy on the Secure Firewall Threat Defense Device

Before deploying the remote access VPN policy, you must update the access control policy on the targeted Secure Firewall Threat Defense device with a rule that allows VPN traffic. The rule must allow all traffic coming in from the outside interface, with source as the defined VPN pool networks and destination as the corporate network.

### Note

If you have selected the **Bypass Access Control policy for decrypted traffic (sysopt permit-vpn)** option on the Access Interface tab, you need not update the access control policy for remote access VPN.

Enable or disable the option for all your VPN connections. If you disable this option, make sure that the traffic is allowed by the access control policy or pre-filter policy.

For more information, see [Configure Access Interfaces for Remote Access VPN, on page 1491](#).

---

### Before you begin

Complete the remote access VPN policy configuration using the Remote Access VPN Policy wizard.

### Procedure

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Policies > Access Control**.
  - Step 2** Click **Edit** on the access control policy that you want to update.
  - Step 3** Click **Add Rule** to add a new rule.
  - Step 4** Specify the **Name** for the rule and select **Enabled**.
  - Step 5** Select the **Action**, **Allow** or **Trust**.
  - Step 6** Select the following on the **Zones** tab:
    - a) Select the outside zone from Available Zones and click **Add to Source**.
    - b) Select the inside zone from Available Zones and click **Add to Destination**.
  - Step 7** Select the following on the **Networks** tab:

- a) Select the inside network (inside interface and/or a corporate network) from Available networks and click **Add to Destination**.
- b) Select the VPN address pool network from **Available Networks** and click **Add to Source Networks**.

**Step 8** Configure other required access control rule settings and click **Add**.

**Step 9** Save the rule and access control policy.

## (Optional) Configure NAT Exemption

NAT exemption exempts addresses from translation and allows both translated and remote hosts to initiate connections with your protected hosts. Like identity NAT, you do not limit translation for a host on specific interfaces; you must use NAT exemption for connections through all interfaces. However, NAT exemption enables you to specify the real and destination addresses when determining the real addresses to translate (similar to policy NAT). Use static identity NAT to consider ports in the access list.

When you configure static identity NAT for remote access or site-to-site VPN, you must configure NAT with the route lookup option. Without route lookup, the Firewall Threat Defense sends traffic out of the interface specified in the NAT command, regardless of what the routing table says. For example, you do not want the Firewall Threat Defense to send the DHCP scope traffic through an incorrect interface; it will never return to the interface IP address. The route lookup option lets the Firewall Threat Defense send, or intercept, the traffic directly on the interface IP address instead of through the interface. For traffic from the VPN client to a host on the inside network, the route lookup option will still result in the correct egress interface (inside), so normal traffic flow is not affected.

### Before you begin

Check if NAT is configured on the targeted devices where remote access VPN policy is deployed. If NAT is enabled on the targeted devices, you must define a NAT policy to exempt VPN traffic.

### Procedure

**Step 1** On your Secure Firewall Management Center web interface, click **Devices > NAT**.

**Step 2** Select a NAT policy to update or click **New Policy > Threat Defense NAT** to create a NAT policy with a NAT rule to allow connections through all interfaces.

**Step 3** Click **Add Rule** to add a NAT rule.

**Step 4** On the Add NAT Rule window, select the following:

- a) Select the NAT Rule as **Manual NAT Rule**.
- b) Select the Type as **Static**.
- c) Click **Interface Objects** and select the Source and destination interface objects.

### Note

This interface object must be the same as the interface selected in the remote access VPN policy.

For more information, see [Configure Access Interfaces for Remote Access VPN, on page 1491](#).

- a) Click **Translation** and select the source and destination networks:

- **Original Source** and **Translated Source**

- **Original Destination** and **Translated Destination**

**Step 5** On the Advanced tab, select **Do not proxy ARP on Destination Interface**.

**Do not proxy ARP on Destination Interface**—Disables proxy ARP for incoming packets to the mapped IP addresses. If you use addresses on the same network as the mapped interface, the system uses proxy ARP to answer any ARP requests for the mapped addresses, thus intercepting traffic destined for a mapped address. This solution simplifies routing because the device does not have to be the gateway for any additional networks. You can disable proxy ARP if desired, in which case you need to be sure to have proper routes on the upstream router.

**Step 6** Click **OK**.

---

## Configure DNS

Configure DNS on each Firewall Threat Defense device in order to use remote access VPN. Without DNS, the devices cannot resolve AAA server names, named URLs, and CA Servers with FQDN or Hostnames. It can only resolve IP addresses.

### Procedure

---

- Step 1** Configure DNS server details and domain-lookup interfaces using the Platform Settings. For more information, see [DNS, on page 831](#) and [DNS Server Group, on page 1264](#).
- Step 2** Configure split-tunnel in group policy to allow DNS traffic through remote access VPN tunnel if the DNS server is reachable through VNP network. For more information, see [Configure Group Policy Objects, on page 1346](#).
- 

## Add Secure Client Profile XML File

The Secure Client Profile is a group of configuration parameters stored in an XML file that the client uses to configure its operation and appearance. These parameters (XML tags) include the names and addresses of host computers and settings to enable more client features.

You can create the Secure Client Profile using the Secure Client Profile Editor, a GUI-based configuration tool that is available as part of the Secure Client software package. It is an independent program that you run outside of the Firewall Management Center. For more information about Secure Client Profile Editor, see [Cisco Secure Client \(including AnyConnect\) Administrator Guide](#).

### Before you begin

A Secure Firewall Threat Defense remote access VPN policy requires assignment of the Secure Client Profile to the VPN clients. You can attach the client profile to a group policy.

Download the Secure Client Profile Editor from [Cisco Software Download Center](#).

### Procedure

- 
- Step 1** Choose **Devices > Remote Access**.
- Step 2** Click **Edit** on the remote access VPN policy which you want to update.
- Step 3** Click **Edit** on the connection profile to which you want to add the Secure Client profile.
- Step 4** Click **Edit Group Policy**. If you choose to add a new group policy, click **Add**.
- Step 5** Choose **Secure Client > Profile**.
- Step 6** Choose a profile from the **Client Profile** drop-down list. If you choose to add a new client profile, click **Add** and do the following:
- Specify the profile **Name**.
  - Click **Browse** and select the Secure Client Profile XML file.
- Note**  
For two-factor authentication, make sure that the timeout is set to 60 seconds or more in the Secure Client profile.
- Click **Save**.
- Step 7** Save your changes.
- 

## (Optional) Configure Split Tunneling

Split tunnel allows VPN connectivity to a remote network across a secure tunnel and also to a network outside VPN tunnel. Configure split tunneling if you want to allow your VPN users to access an outside network while they remain connected to the remote access VPN. To configure a split-tunnel list, you must create a Standard Access List or Extended Access List.

For more information, see [Configuring Group Policies, on page 1496](#).

### Procedure

- 
- Step 1** Choose **Devices > Remote Access**.
- Step 2** Click **Edit** on the remote access VPN policy for which you want to configure split tunneling.
- Step 3** Click **Edit** on the required connection profile.
- Step 4** Click **Add** to add a group policy or click **Edit Group Policy**.
- Step 5** Choose **General > Split Tunneling**.
- Step 6** From the **IPv4 Split Tunneling** or **IPv6 Split Tunneling** list, select **Exclude networks specified below** and then select the networks that you want to exclude from VPN traffic.
- The default setting allows all traffic over the VPN tunnel.
- Step 7** Click **Standard Access List** or **Extended Access List**, and select an access list from the drop-down or add a new one.
- Step 8** If you choose to add a new standard or extended access list, do the following:

- a) Specify the **Name** for the new access list and click **Add**.
- b) Choose **Allow** from the **Action** drop-down.
- c) Select the network traffic that you want to allow over the VPN tunnel and click **Add**.

**Step 9** Save your changes.

---

#### Related Topics

[Access List](#), on page 1250

## (Optional) Configure Dynamic Split Tunneling

Dynamic split tunneling allows you to fine-tune split tunneling based on DNS domain names. You can configure domains that must be included or excluded in the remote access VPN tunnel. Excluded domains are not blocked. Instead, traffic to those domains is kept outside the VPN tunnel. For example, you could send traffic to Cisco WebEx on the public Internet, thus freeing bandwidth in your VPN tunnel for traffic that is targeted to servers within your protected network. For more information about configuring this feature, see [Configure AnyConnect Dynamic Split Tunnel on FTD Managed by FMC](#).

#### Before you begin

You can configure this feature using the Firewall Management Center and Firewall Threat Defense from versions 7.0 or later. If you have an older version of the Firewall Management Center, you can configure it using FlexConfig as instructed in the [Advanced AnyConnect VPN Deployments for Firepower Threat Defense with FMC](#).

#### Procedure

- 
- Step 1** Configure the group policy to use Dynamic Split Tunnel.
- a) Choose **Devices > Remote Access**.
  - b) Click **Edit** on the remote access VPN policy for which you want to configure dynamic split tunneling.
  - c) Click **Edit** on the required connection profile.
  - d) Click **Edit Group Policy**.
- Step 2** Configure the Secure Client custom attribute in the **Add/Edit Group Policy** dialog box.
- a) Click the Secure Client tab.
  - b) Click **Custom Attributes** and click +.
  - c) Choose **Dynamic Split Tunneling** from the **Secure Client Attribute** drop-down list.
  - d) Click + to create a new custom attribute object.
  - e) Enter the name for the custom attribute object.
  - f) **Include domains**—Specify domain names that will be included in the remote access VPN tunnel.  
  
You can include domains in the tunnel that will be excluded based on IP addresses.
  - g) **Exclude domains**—Specify domain names that will be excluded from the remote access VPN.  
  
Excluded domains are not blocked, traffic to these domains is kept outside the VPN tunnel.
  - h) Click **Save**.
  - i) Click **Add**.

- Step 3** Verify the configured custom attribute and click **Save** to save the group policy.
- Step 4** Click **Save** to save the connection profile.
- Step 5** Click **Save** to save the remote access VPN policy.

---

#### What to do next

1. Deploy the configuration to Firewall Threat Defense.
2. Verify the configured dynamic split tunnel configuration on the Firewall Threat Defense and the Secure Client. For more information, see [Verify Dynamic Split Tunneling Configuration, on page 1470](#).

## Verify Dynamic Split Tunneling Configuration

### On the Firewall Threat Defense

Use the following commands to verify the dynamic split tunneling configuration:

- **show running-config webvpn**
- **show running-config anyconnect-custom-data**
- **show running-config group-policy** *<group-policy-name>*

### On the Secure Client

Click the Statistics (  ) icon and choose **VPN > Statistics**. You can confirm the domains under the Dynamic Split Exclusion/Inclusion category.

## Verify the Configuration

### Procedure

- 
- Step 1** Open a web browser on a machine on the outside network.
- Step 2** Enter the URL of the Firewall Threat Defense remote access VPN gateway device.
- Step 3** Enter the username and password when prompted, and click **Logon**.
- Note**  
Connection to the VPN establishes automatically if you install Secure Client on the system.
- The VPN prompts you to download Secure Client if Secure Client is not installed.
- Step 4** Download Secure Client if it is not installed and connect to the VPN.  
The Secure Client installs itself. On successful authentication, you establish connection to the Secure Firewall Threat Defense remote access VPN gateway. The remote access VPN enforces the applicable identity or QoS policy according to your VPN policy configuration.
-

## Create a Copy of an Existing Remote Access VPN Policy

You can copy an existing remote access VPN policy to create a new one with all the settings, including the connection profiles and access interfaces. You can then assign devices to the new policy and deploy the VPN on the assigned devices as required.

**Note** Users with read-only permission for remote access VPN cannot create copy of the VPN. Users with read-only privileges in the domain can copy the remote access VPNs.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Click **Copy** on the policy that you want to copy.
  - Step 3** Specify a **Name** for the new remote access VPN.
  - Step 4** Click **OK**.
- 

### What to do next

To assign devices to the new policy, see [Set Target Devices for a Remote Access VPN Policy, on page 1471](#).

## Set Target Devices for a Remote Access VPN Policy

After you create remote access VPN policy, you can assign the policy to threat defense devices.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Click **Edit** (✎) next to the remote access VPN policy that you want to edit.
  - Step 3** Click **Policy Assignments**.
  - Step 4** Do any of the following:
    - To assign a device, high-availability pair, or device group to the policy, select it in the **Available Devices** list and click **Add**. You can also drag and drop the available devices to select.
    - To remove a device assignment, click **Delete** (🗑) next to a device, high-availability pair, or device group in the **Selected Devices** list.
  - Step 5** Click **OK**.

**Step 6** Click **Save**.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Associate Local Realm with Remote Access VPN Policy

You can associate local realm to remote access VPN policy to enable local user authentication.

For information about creating and managing realms, see [Manage a Realm, on page 2304](#).

For information about configuring local user authentication for remote access VPNs, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

**Procedure**

---

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Click **Edit** (✎) next to the remote access VPN policy that you want to edit.
- Step 3** Click the link next to **Local Realm**.
- Step 4** Select the **Local Realm Server** from the list, or click **Add** to add a new local realm.
- Step 5** Click **OK**.
- Step 6** Click **Save**.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Additional Remote Access VPN Configurations

### Configure Connection Profile Settings

Remote Access VPN policy contains the connection profiles targeted for specific devices. These policies pertain to creating the tunnel itself, such as, how AAA is accomplished, and how addresses are assigned (DHCP or Address Pools) to VPN clients. They also include user attributes, which are identified in group policies configured on the Firewall Threat Defense device or obtained from a AAA server. A device also provides a default connection profile named *DefaultWEBVPNGroup*. The connection profile that is configured using the wizard appears in the list.

If you decide to grant different rights to different groups of VPN users, then you can add specific connection profiles for each of the user groups and maintain multiple connection profiles in your remote access VPN policy.

## Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.
  - Step 3** Select a **Connection Profile** and click **Edit**.
  - Step 4** (Optional) If you choose to add new connection profile, click **Add**.
  - Step 5** Configure IP Addresses for VPN Clients.  
[Configure IP Addresses for VPN Clients, on page 1473](#)
  - Step 6** (Optional) Update AAA Settings for remote access VPNs.  
[Configure AAA Settings for Remote Access VPN, on page 1475](#)
  - Step 7** (Optional) Create or update Aliases.  
[Create or Update Aliases for a Connection Profile, on page 1490](#)
  - Step 8** Save your changes.
- 

## Configure IP Addresses for VPN Clients

Client address assignment allows you to assign IP addresses for the remote access VPN users.

You can assign IP Address for remote VPN clients from the local IP address pools, DHCP Servers, and AAA servers. The AAA servers are assigned first, followed by others. Configure the **Client Address Assignment** policy in the **Advanced** tab to define the assignment criteria. The IP pools defined in this connection profile will only be used if no IP pools are defined in group policy associated with the connection profile, or the system default group policy **DfltGrpPolicy**.

**IPv4 Address Pools**—SSL VPN clients receive new IP addresses when they connect to the Firewall Threat Defense device. Address pools define a range of addresses that remote clients can receive. You can add a maximum of six pools for IPv4 and IPv6 addresses each.

---

**Note** You can use the IP address from the existing IP pools in the Firewall Management Center or create a new pool using the **Add** option. Also, you can create an IP pool in Firewall Management Center using the **Objects > Object Management > Address Pools** path. For more information, see [Address Pools, on page 1255](#).

---

## Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.  
Existing remote access policies are listed.
  - Step 2** Select a remote access VPN policy and click the edit icon.
  - Step 3** Select the connection profile that you want to update and click the edit icon.
  - Step 4** Under the **Client Address Assignment** tab, do the following:
  - Step 5** Click + next to **Address Pools**:

- a) Click + next to **Address Pools** to add IP addresses, and select **IPv4** or **IPv6** to add the corresponding address pool. Select the IP address pool from **Available Pools** and click **Add**.

**Note**

If you share your remote access VPN policy among multiple Secure Firewall Threat Defense devices, bear in mind that all devices share the same address pool unless you use device-level object overrides to replace the global definition with a unique address pool for each device. Unique address pools are required to avoid overlapping addresses in cases where the devices are not using NAT.

- b) Click + next to **Available Pools** in the **Address Pools** window to add a new IPv4 or IPv6 address pool. When you choose the IPv4 pool, provide a starting and ending IP address. When you choose to include a new IPv6 address pool, enter **Number of Addresses** in the range 1-16384. Select the **Allow Overrides** option to avoid conflicts with IP address when objects are shared across many devices. For more information, see [Address Pools, on page 1255](#).
- c) Click **OK**.

If you plan to edit the IP address pools, we recommend that you perform the following steps during a maintenance window:

1. Unassign the device from the remote access VPN.
2. Select the device and click **Deploy**.  
This deployment removes all the remote access VPN configurations from the device, terminates the remote access VPN sessions, the sessions are not reestablished.
3. Click the edit icon next to the IP address pools to edit it, edit any other remote access VPN configurations, if required, on the Firewall Management Center.
4. Assign the device to the updated remote access VPN policy.
5. Deploy the configurations on the device.

The remote access VPN clients can connect to the device after the maintenance window.

**Step 6** Click + next to **DHCP Servers** to add DHCP servers:

**Note**

The DHCP server address can be configured only with IPv4 address.

- a) Specify the name and DHCP (Dynamic Host Configuration Protocol) server address as network objects. Click **Add** to choose the server from the object list. Click **Delete** to delete a DHCP server.
- b) Click **Add** in the **New Objects** page to add a new network object. Enter the new object name, description, network, and select the **Allow Overrides** option as applicable. For more information, see [Creating Network Objects, on page 1283](#) and [Allowing Object Overrides, on page 1244](#).
- c) Click **OK**.

**Step 7** Click **Save**.

---

**Related Topics**

[Configure Connection Profile Settings, on page 1472](#)

## Configure AAA Settings for Remote Access VPN

### Before you begin

- Ensure that the required machine and user certificates are deployed on the endpoints. For information about Firewall Threat Defense certificates, see [Managing Firewall Threat Defense Certificates, on page 1366](#).
- Configure Secure Client profiles with required certificates. For more information, see *Cisco Secure Client (including AnyConnect) Administrator Guide*.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.
- Step 3** Select a connection profile to update AAA settings, click **Edit > AAA**.
- Step 4** Select the following for **Authentication**:

- **Authentication Method**—Determines how a user is identified before being allowed access to the network and network services. It controls access by requiring valid user credentials, which are typically a username and password. It may also include the certificate from the client. Supported authentication methods are **AAA only**, **Client Certificate only**, and **AAA + Client Certificate**.

When you select the **Authentication Method** as:

- **AAA Only**—If you select the **Authentication Server** as **RADIUS**, by default, the Authorization Server has the same value. Select the **Accounting Server** from the drop-down list. Whenever you select **AD** and **LDAP** from the Authentication Server drop-down list, you must select the **Authorization Server** and **Accounting Server** manually.
- **SAML**—Each user is authenticated using the SAML single sign-on server. For more information, see [Single Sign-On Authentication with SAML 2.0, on page 1539](#).

**Override Identity Provider Certificate**—Select to override the primary identity provider certificate of the SAML provider with an IdP certificate specific to a connection profile or SAML application. Select the IdP certificate from the drop-down.

Microsoft Azure can support multiple applications for the same entity ID. Each application (mapped to a different connection profile) requires a unique certificate. If you want to retain an existing entity ID for the single-sign-on object in current connection profile and use a different IdP certificate, you can select this option.

This enables support for multiple SAML applications per Microsoft Azure SAML identity provider.

The primary identity certificate is configured in the single sign-on server object.

For information about configuring a single sign-on server object, see [Add a Single Sign-on Server, on page 1249](#).

Choose your **SAML Login Experience** to configure a browser for SAML web authentication:

- **VPN client embedded browser**—Choose this option to use the browser embedded with the VPN client for web authentication. The authentication applies to the VPN connection only.

- **Default OS Browser**—Choose this option to configure the operating system that default or native browser that supports WebAuthN (FIDO2 standard for web authentication). This option enables single sign-on(SSO) support for web authentication methods such as biometric authentication.

The default browser requires an external browser package for web authentication. The package Default-External-Browser-Package is configured by default. You can change the default external browser package by editing a remote access VPN policy and selecting the file under **Advanced > Secure Client Images > Package File**.

You can also add a new package file by selecting. **Objects > Object Management > VPN > Secure Client File > Add Secure Client File**.

- **Client Certificate Only**—Each user is authenticated with a client certificate. The client certificate must be configured on VPN client endpoints. By default, the user name is derived from the client certificate fields CN and OU. If the user name is specified in other fields in the client certificate, use 'Primary' and 'Secondary' field to map appropriate fields.

Select **Enable multiple certificate authentication** to authenticate the VPN client using the machine and user certificates.

If have enabled multiple certificate authentication, you can select one of the following certificates to map the username and authenticate the VPN user:

- **First Certificate**—Select this option to map the username from the machine certificate sent from the VPN client.
- **Second Certificate**—Select this option to map the username from the user certificate sent from the client.

#### Note

If you do not enable multiple certificate authentication, the user certificate (second certificate) is used for authentication by default.

If you select the **Map specific field** option, which includes the username from the client certificate, the **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively. If you select the **Use entire DN as username** option, the system automatically retrieves the user identity. A distinguished name (DN) is a unique identification, made up of individual fields used as the identifier when matching users to a connection profile. DN rules are used for enhanced certificate authentication.

The primary and Secondary fields pertaining to the **Map specific field** option contain these common values:

- C (Country)
- CN (Common Name)
- DNQ (DN Qualifier)
- EA (Email Address)
- GENQ (Generational Qualifier)
- GN (Given Name)
- I (Initial)

- L (Locality)
- N (Name)
- O (Organisation)
- OU (Organisational Unit)
- SER (Serial Number)
- SN (Surname)
- SP (State Province)
- T (Title)
- UID (User ID)
- UPN (User Principal Name)

- **Client Certificate & AAA**— Each user is authenticated with both a client certificate and AAA server. Select the required certificate and AAA configurations for authentication.

Whichever authentication method you choose, select or deselect **Allow connection only if user exists in authorization database**.

- **Client Certificate & SAML**— Each user is authenticated with both a client certificate and SAML server. Select the required certificate and SAML configurations for authentication.

- **Allow connection only if username from certificate and SAML are the same**—Select to allow VPN connection only if the username from the certificate matches the SAML single sign-on username.
- **Use username from client certificate for Authorization**—When you choose the option to pick username from client certificate for authorization, you must configure the fields to pick from the client certificate.

You can choose to map a specific field as the username or use the entire distinguished name (DN) for authorization:

- **Map specific field**— Select to include the username from the client certificate; the **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively.
- **Use entire DN as username**— The system automatically retrieves the user identity for authorization.

You can also create a Dynamic Access Policy (DAP) to match user-specific SAML assertion attributes or username to DAP certificate attributes. See [Configure AAA Criteria Settings for DAP](#), on page 1564.

- **Authentication Server**—Authentication is the way a user is identified before being allowed access to the network and network services. Authentication requires valid user credentials, a certificate, or both. You can use authentication alone, or with authorization and accounting.

Select an authentication server from the list if you have added a server already or else create an authentication server:

- **LOCAL**—Use a local database from the Firewall Threat Defense for user authentication. To configure local authentication, Firewall Threat Defense must be Version 7.0 and later.
  - **Local Realm**—Select a local realm or click **Add** to configure a realm. See [Create an LDAP Realm or an Active Directory Realm and Realm Directory](#), on page 2275.
- **Realm**—Configure an LDAP or AD realm. See [Create an LDAP Realm or an Active Directory Realm and Realm Directory](#), on page 2275.
- **RADIUS Server Group**—Add a RADIUS server group object with RADIUS servers. See [Add a RADIUS Server Group](#), on page 1246.
- **Single Sign-On Server**—Create a single sign-on server object for SAML authentication. See [Add a Single Sign-on Server](#), on page 1249.

**Fallback to LOCAL Authentication**— The user is authenticated using the local database and the VPN tunnel can be established even if the AAA server group is unavailable, provided that the local database is configured.

- **Use secondary authentication** — Secondary authentication is configured in addition to primary authentication to provide additional security for VPN sessions. Secondary authentication is applicable only to **AAA only** and **Client Certificate & AAA** authentication methods.

Secondary authentication is an optional feature that requires a VPN user to enter two sets of username and password on the Secure Client login screen. You can also configure to pre-fill the secondary username from the authentication server or client certificate. Remote access VPN authentication is granted only if both primary and secondary authentications are successful. VPN authentication is denied if any one of the authentication servers is not reachable or one authentication fails.

You must configure a secondary authentication server group (AAA server) for the second username and password before configuring secondary authentication. For example, you can set the primary authentication server to an LDAP or Active Directory realm and the secondary authentication to a RADIUS server.

#### Note

By default, secondary authentication is not required.

**Authentication Server**— Secondary authentication server to provide secondary username and password for VPN users.

- **Fallback to LOCAL Authentication**— This user is authenticated using the local database and the VPN tunnel can be established even if the AAA server group is unavailable, provided that the local database is configured.

Select the following under **Username for secondary authentication**:

- **Prompt**: Prompts the users to enter the username and password while logging on to VPN gateway.
- **Use primary authentication username**: The username is taken from the primary authentication server for both primary and secondary authentication; you must enter two passwords.
- **Map username from client certificate**: Prefills the secondary username from the client certificate.

If you have enabled multiple certificate authentication, you can select one of the following certificates:

- **First Certificate**— Select this option to map the username from the machine certificate sent from the VPN client.

- **Second Certificate**— Select this option to map the username from the user certificate sent from the client.
- If you select **Map specific field** option, which includes the username from the client certificate. The **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively. If you select the **Use entire DN (Distinguished Name) as username** option, the system automatically retrieves the user identity.  
See **Authentication Method** descriptions for more information about primary and secondary field mapping.
- **Prefill username from certificate on user login window:** Prefills the secondary username from the client certificate when the user connects via Secure Client.
  - **Hide username in login window:** The secondary username is pre-filled from the client certificate, but hidden to the user so that the user does not modify the pre-filled username.
- **Use secondary username for VPN session:** The secondary username is used for reporting user activity during a VPN session.

**Step 5** Select the following for **Authorization**:

- **Authorization Server**—After authentication is complete, authorization controls the services and commands available to each authenticated user. Authorization works by assembling a set of attributes that describe what the user is authorized to perform, their actual capabilities, and restrictions. When you do not use authorization, authentication alone provides the same access to all authenticated users. Authorization requires authentication.

To know more about how remote access VPN authorization works, see [Understanding Policy Enforcement of Permissions and Attributes, on page 1456](#).

When a RADIUS Server is configured for user authorization in the connection profile, the remote access VPN system administrator can configure multiple authorization attributes for users or user-groups. The authorization attributes that are configured on the RADIUS server can be specific for a user or a user-group. Once users are authenticated, these specific authorization attributes are pushed to the Firewall Threat Defense device.

**Note**

The AAA server attributes obtained from the authorization server override the attribute values that may have been previously configured on the group policy or the connection profile.

- Check **Allow connection only if user exists in authorization database** if desired.

When enabled, the system checks the username of the client must exist in the authorization database to allow a successful connection. If the username does not exist in the authorization database, then the connection is denied.

- When you select a realm as the Authorization Server, you must configure an LDAP attribute map. You can choose a single server for authentication and authorization or a different servers. Click **Configure LDAP Attribute Map** to add LDAP attribute maps for authorization.

**Note**

Firewall Threat Defense does not support SAML Identity Provider as the Authorization server. If the Active Directory behind the SAML Identity Provider is reachable via Firewall Management Center and Firewall Threat Defense, you can configure authorization following these steps:

- Add realm for the AD Server. See [Create an LDAP Realm or an Active Directory Realm and Realm Directory](#), on page 2275.
- Select the realm object as the Authorization Server in remote access VPN connection profile.
- Configure LDAP attribute map for the selected realm.

For information about configuring LDAP attribute maps, see [Configuring LDAP Attribute Mapping](#), on page 1497.

**Step 6** Select the following for **Accounting**:

- **Accounting Server**—Accounting is used to track the services that users are accessing and the amount of network resources they are consuming. When AAA accounting is activated, the network access server reports user activity to the RADIUS server. Accounting information includes when sessions start and stop, usernames, the number of bytes that pass through the device for each session, the services used, and the duration of each session. This data can then be analyzed for network management, client billing, or auditing. You can use accounting alone or together with authentication and authorization.

Specify the RADIUS Server Group object that will be used to account for the remote access VPN session.

**Step 7** Select the following **Advanced Settings**:

- **Strip Realm from username**—Select to remove the realm from the username before passing the username on to the AAA server. For example, if you select this option and provide *domain\username*, the domain is stripped off from the username and sent to AAA server for authentication. By default this option is unchecked.
- **Strip Group from username**—Select to remove the group name from the username before passing the username on to the AAA server. By default this option is unchecked.

**Note**

A realm is an administrative domain. Enabling these options allows the authentication to be based on the username alone. You can enable any combination of these options. However, you must select both check boxes if your server cannot parse delimiters.

- **Password Management**—Enable managing the password for the remote access VPN users. Select to notify ahead of the password expiry or on the day the password expires.

**Step 8** Click **Save**.

## RADIUS Server Attributes for Secure Firewall Threat Defense

The Firewall Threat Defense device supports applying user authorization attributes (also called user entitlements or permissions) to VPN connections from the external RADIUS server that are configured for authentication and/or authorization in the remote access VPN policy.

**Note** Secure Firewall Threat Defense devices support attributes with vendor ID 3076.

The following user authorization attributes are sent to the Firewall Threat Defense device from the RADIUS server.

- RADIUS attributes 146 and 150 are sent from Firewall Threat Defense devices to the RADIUS server for authentication and authorization requests.
- All three (146, 150, and 151) attributes are sent from Firewall Threat Defense devices to the RADIUS server for accounting start, interim-update, and stop requests.

**Table 77: RADIUS Attributes Sent from Secure Firewall Threat Defense to RADIUS Server**

Attribute	Attribute Number	Syntax, Type	Single or Multi-valued	Description or Value
Connection Profile Name or Tunnel Group Name	146	String	Single	1-253 characters
Client Type	150	Integer	Single	2 = Secure Client SSL VPN, 6 = Secure Client IPsec VPN (IKEv2)
Session Type	151	Integer	Single	1 = Secure Client SSL VPN, 2 = Secure Client IPsec VPN (IKEv2)

**Table 78: Supported RADIUS Authorization Attributes**

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
Access-Hours	Y	1	String	Single	Name of the time range, for example, Business Hours
Access-List-Inbound	Y	86	String	Single	Both of the Access-List attributes take the name of an access control list (ACL) that is configured on the Firewall Threat Defense device. Create these ACLs using the Smart CLI Access List object type (select <b>Device &gt; Advanced Configuration &gt; Smart CLI &gt; Objects</b> ).  These ACLs control traffic flow in the inbound direction (traffic entering the Firewall Threat Defense device) and the outbound direction (traffic leaving the Firewall Threat Defense device).
Access-List-Outbound	Y	87	String	Single	
Address-Pools	Y	217	String	Single	The name of a network object defined on the Firewall Threat Defense device that identifies a subnet that can be used as the address pool for clients connecting to a remote access VPN. Define the network object on the <b>Objects</b> page and then associate the network object with a group policy or a connection profile.

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
Allow-Network-Extension-Mode	Y	64	Boolean	Single	0 = Disabled 1 = Enabled
Authenticated-User-Idle-Timeout	Y	50	Integer	Single	1-35791394 minutes
Authorization-DN-Field	Y	67	String	Single	Possible values: UID, OU, O, CN, L, SP, C, EA, GN, SN, I, GENQ, DNQ, SER, use-entire-name
Authorization-Required		66	Integer	Single	0 = No 1 = Yes
Authorization-Type	Y	65	Integer	Single	0 = None 1 = RADIUS 2 = LDAP
Banner1	Y	15	String	Single	Banner string to display for Cisco VPN remote sessions: IPsec IKEv1, Secure Client SSL-TLS/DTLS/IKEv2, and Clientless SSL
Banner2	Y	36	String	Single	Banner string to display for Cisco VPN remote sessions: IPsec IKEv1, Secure Client SSL-TLS/DTLS/IKEv2, and Clientless SSL. The string is concatenated to the Banner1 string, if configured.
Cisco-IP-Phone-Bypass	Y	51	Integer	Single	0 = Disabled 1 = Enabled
Cisco-LEAP-Bypass	Y	75	Integer	Single	0 = Disabled 1 = Enabled
Client Type	Y	150	Integer	Single	1 = Cisco VPN Client (IKEv1) 2 = Secure Client VPN 3 = Clientless SSL VPN 4 = Cut-Through-L2TP/IPsec SSL VPN 6 = Secure Client IPsec (IKEv2)
Client-Type-Version-Limiting	Y	77	String	Single	IPsec VPN version number string
DHCP-Network-Scope	Y	61	String	Single	IP Address
Extended-Authentication-On-Rekey	Y	122	Integer	Single	0 = Disabled 1 = Enabled
Framed-Interface-Id	Y	96	String	Single	Assigned IPv6 interface ID. Combines with Framed-IPv6-Prefix to create a complete assigned address. For example: Framed-Interface-ID=1:1 combined with Framed-IPv6-Prefix=2001:0db8::/64 gives the assigned IP address 2001:0db8::1:1:1:1.
Framed-IPv6-Prefix	Y	97	String	Single	Assigned IPv6 prefix and length. Combines with Framed-Interface-Id to create a complete assigned address. For example: prefix 2001:0db8::/64 combined with Framed-Interface-Id=1:1:1:1 gives the IP address 2001:0db8::1:1:1:1. You can use this attribute to assign an IP address without using Framed-Interface-Id by assigning the full IPv6 address with prefix length, for example, Framed-IPv6-Prefix=2001:0db8::1:1:1:1.

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
Group-Policy	Y	25	String	Single	Sets the group policy for the remote access V You can use one of the following formats: <ul style="list-style-type: none"> <li>• <i>group policy name</i></li> <li>• <i>OU=group policy name</i></li> <li>• <i>OU=group policy name;</i></li> </ul>
IE-Proxy-Bypass-Local		83	Integer	Single	0 = None 1 = Local
IE-Proxy-Exception-List		82	String	Single	New line (\n) separated list of DNS domains
IE-Proxy-PAC-URL	Y	133	String	Single	PAC address string
IE-Proxy-Server		80	String	Single	IP address
IE-Proxy-Server-Policy		81	Integer	Single	1 = No Modify 2 = No Proxy 3 = Auto detect Concentrator Setting
IKE-KeepAlive-Confidence-Interval	Y	68	Integer	Single	10-300 seconds
IKE-Keepalive-Retry-Interval	Y	84	Integer	Single	2-10 seconds
IKE-Keep-Alives	Y	41	Boolean	Single	0 = Disabled 1 = Enabled
Intercept-DHCP-Configure-Msg	Y	62	Boolean	Single	0 = Disabled 1 = Enabled
IPsec-Allow-Passwd-Store	Y	16	Boolean	Single	0 = Disabled 1 = Enabled
IPsec-Authentication		13	Integer	Single	0 = None 1 = RADIUS 2 = LDAP (authorization) = NT Domain 4 = SDI 5 = Internal 6 = RADIUS Expiry 7 = Kerberos/Active Directory
IPsec-Auth-On-Rekey	Y	42	Boolean	Single	0 = Disabled 1 = Enabled
IPsec-Backup-Server-List	Y	60	String	Single	Server Addresses (space delimited)
IPsec-Backup-Servers	Y	59	String	Single	1 = Use Client-Configured list 2 = Disable and list 3 = Use Backup Server list
IPsec-Client-Firewall-Filter-Name		57	String	Single	Specifies the name of the filter to be pushed as firewall policy
IPsec-Client-Firewall-Filter-Optional	Y	58	Integer	Single	0 = Required 1 = Optional
IPsec-Default-Domain	Y	28	String	Single	Specifies the single default domain name to client (1-255 characters).
IPsec-IKE-Peer-ID-Check	Y	40	Integer	Single	1 = Required 2 = If supported by peer certifi not check

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi- Valued	Description or Value
IPsec-IP-Compression	Y	39	Integer	Single	0 = Disabled 1 = Enabled
IPsec-Mode-Config	Y	31	Boolean	Single	0 = Disabled 1 = Enabled
IPsec-Over-UDP	Y	34	Boolean	Single	0 = Disabled 1 = Enabled
IPsec-Over-UDP-Port	Y	35	Integer	Single	4001- 49151. The default is 10000.
IPsec-Required-Client-Firewall-Capability	Y	56	Integer	Single	0 = None 1 = Policy defined by remote FW Are-You-There (AYT) 2 = Policy pushed CPP 4 = Policy pushed from server
IPsec-Sec-Association		12	String	Single	Name of the security association
IPsec-Split-DNS-Names	Y	29	String	Single	Specifies the list of secondary domain names to the client (1-255 characters).
IPsec-Split-Tunneling-Policy	Y	55	Integer	Single	0 = No split tunneling 1 = Split tunneling 2 = Local access permitted
IPsec-Split-Tunnel-List	Y	27	String	Single	Specifies the name of the network or ACL that defines the split tunnel inclusion list.
IPsec-Tunnel-Type	Y	30	Integer	Single	1 = LAN-to-LAN 2 = Remote access
IPsec-User-Group-Lock		33	Boolean	Single	0 = Disabled 1 = Enabled
IPv6-Address-Pools	Y	218	String	Single	Name of IP local pool-IPv6
IPv6-VPN-Filter	Y	219	String	Single	ACL value
L2TP-Encryption		21	Integer	Single	Bitmap: 1 = Encryption required 2 = 40 bits 4 = 128 bits 8 = Stateless-Req 15 = 40/128-Encr/Stateless-Req
L2TP-MPPC-Compression		38	Integer	Single	0 = Disabled 1 = Enabled
Member-Of	Y	145	String	Single	Comma-delimited string, for example:  Engineering, Sales  An administrative attribute that can be used in device access policies. It does not set a group policy.
MS-Client-Subnet-Mask	Y	63	Boolean	Single	An IP address
NAC-Default-ACL		92	String		ACL
NAC-Enable		89	Integer	Single	0 = No 1 = Yes
NAC-Revalidation-Timer		91	Integer	Single	300-86400 seconds
NAC-Settings	Y	141	String	Single	Name of the NAC policy

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
NAC-Status-Query-Timer		90	Integer	Single	30-1800 seconds
Perfect-Forward-Secrecy-Enable	Y	88	Boolean	Single	0 = No 1 = Yes
PPTP-Encryption		20	Integer	Single	Bitmap: 1 = Encryption required 2 = 40 bits 8 = Stateless-Required 15 = 40/128-Encr/Stat
PPTP-MPPC-Compression		37	Integer	Single	0 = Disabled 1 = Enabled
Primary-DNS	Y	5	String	Single	An IP address
Primary-WINS	Y	7	String	Single	An IP address
Privilege-Level	Y	220	Integer	Single	An integer between 0 and 15.
Required-Client-Firewall-Vendor-Code	Y	45	Integer	Single	1 = Cisco Systems (with Cisco Integrated Client) 3 = Zone Labs 4 = Sygate 5 = Cisco (with Cisco Intrusion Prevention Security Agent)
Required-Client-Firewall-Description	Y	47	String	Single	String
Required-Client-Firewall-Product-Code	Y	46	Integer	Single	Cisco Systems Products: 1 = Cisco Intrusion Prevention Security Agent Integrated Client (CIC) Zone Labs Products: 1 = Zone Alarm 2 = Zone 3 = Zone Labs Integrity NetworkICE Product: 1 = BlackIce Defender Sygate Products: 1 = Personal Firewall 2 = Personal Firewall Pro 3 = Security Agent
Required-Individual-User-Auth	Y	49	Integer	Single	0 = Disabled 1 = Enabled
Require-HW-Client-Auth	Y	48	Boolean	Single	0 = Disabled 1 = Enabled
Secondary-DNS	Y	6	String	Single	An IP address
Secondary-WINS	Y	8	String	Single	An IP address
SEP-Card-Assignment		9	Integer	Single	Not used
Session Subtype	Y	152	Integer	Single	0 = None 1 = Clientless 2 = Client 3 = Clientless Session Subtype applies only when the Session Subtype (151) attribute has the following values: 1, 2

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi- Valued	Description or Value
Session Type	Y	151	Integer	Single	0 = None 1 = Secure Client SSL VPN 2 = Secure Clientless SSL VPN 3 = Clientless SSL VPN 4 = Clientless Email Proxy 5 = Cisco VPN Client (IKEv1) 6 = IKEv1 LAN-LAN 7 = IKEv2 LAN-LAN 8 = VPN Load Balancing
Simultaneous-Logins	Y	2	Integer	Single	0-2147483647
Smart-Tunnel	Y	136	String	Single	Name of a Smart Tunnel
Smart-Tunnel-Auto	Y	138	Integer	Single	0 = Disabled 1 = Enabled 2 = AutoStart
Smart-Tunnel-Auto-Signon-Enable	Y	139	String	Single	Name of a Smart Tunnel Auto Signon list appended to the domain name
Strip-Realm	Y	135	Boolean	Single	0 = Disabled 1 = Enabled
SVC-Ask	Y	131	String	Single	0 = Disabled 1 = Enabled 3 = Enable default server 4 = Enable default clientless (2 and 4 not used)
SVC-Ask-Timeout	Y	132	Integer	Single	5-120 seconds
SVC-DPD-Interval-Client	Y	108	Integer	Single	0 = Off 5-3600 seconds
SVC-DPD-Interval-Gateway	Y	109	Integer	Single	0 = Off) 5-3600 seconds
SVC-DTLS	Y	123	Integer	Single	0 = False 1 = True
SVC-Keepalive	Y	107	Integer	Single	0 = Off 15-600 seconds
SVC-Modules	Y	127	String	Single	String (name of a module)
SVC-MTU	Y	125	Integer	Single	MTU value 256-1406 in bytes
SVC-Profiles	Y	128	String	Single	String (name of a profile)
SVC-Rekey-Time	Y	110	Integer	Single	0 = Disabled 1-10080 minutes
Tunnel Group Name	Y	146	String	Single	1-253 characters
Tunnel-Group-Lock	Y	85	String	Single	Name of the tunnel group or "none"
Tunneling-Protocols	Y	11	Integer	Single	1 = PPTP 2 = L2TP 4 = IPsec (IKEv1) 8 = L2TP over IPsec 16 = WebVPN 32 = SVC 64 = IPsec (IKEv2) 8 and 16 are mutually exclusive. 0 - 11, 16 - 27, 32 - 43, 48 - 63 are legal values.
Use-Client-Address		17	Boolean	Single	0 = Disabled 1 = Enabled
VLAN	Y	140	Integer	Single	0-4094
WebVPN-Access-List	Y	73	String	Single	Access-List name

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
WebVPN ACL	Y	73	String	Single	Name of a WebVPN ACL on the device
WebVPN-ActiveX-Relay	Y	137	Integer	Single	0 = Disabled Otherwise = Enabled
WebVPN-Apply-ACL	Y	102	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-Auto-HTTP-Signon	Y	124	String	Single	Reserved
WebVPN-Citrix-Metaframe-Enable	Y	101	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-Content-Filter-Parameters	Y	69	Integer	Single	1 = Java ActiveX 2 = Java Script 4 = Image 8 = All in images
WebVPN-Customization	Y	113	String	Single	Name of the customization
WebVPN-Default-Homepage	Y	76	String	Single	A URL such as http://example-example.com
WebVPN-Deny-Message	Y	116	String	Single	Valid string (up to 500 characters)
WebVPN-Download_Max-Size	Y	157	Integer	Single	0x7fffffff
WebVPN-File-Access-Enable	Y	94	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-File-Server-Browsing-Enable	Y	96	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-File-Server-Entry-Enable	Y	95	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-Group-based-HTTP/HTTPS-Proxy-Exception-List	Y	78	String	Single	Comma-separated DNS/IP with an optional v (for example *.cisco.com, 192.168.1.*, wwwir
WebVPN-Hidden-Shares	Y	126	Integer	Single	0 = None 1 = Visible
WebVPN-Home-Page-Use-Smart-Tunnel	Y	228	Boolean	Single	Enabled if clientless home page is to be rendered via Smart Tunnel.
WebVPN-HTML-Filter	Y	69	Bitmap	Single	1 = Java ActiveX 2 = Scripts 4 = Image 8 = All
WebVPN-HTTP-Compression	Y	120	Integer	Single	0 = Off 1 = Deflate Compression
WebVPN-HTTP-Proxy-IP-Address	Y	74	String	Single	Comma-separated DNS/IP:port, with http= c prefix (for example http=10.10.10.10:80, https=11.11.11.11:443)
WebVPN-Idle-Timeout-Alert-Interval	Y	148	Integer	Single	0-30. 0 = Disabled.
WebVPN-Keepalive-Ignore	Y	121	Integer	Single	0-900
WebVPN-Macro-Substitution	Y	223	String	Single	Unbounded.
WebVPN-Macro-Substitution	Y	224	String	Single	Unbounded.
WebVPN-Port-Forwarding-Enable	Y	97	Integer	Single	0 = Disabled 1 = Enabled

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi- Valued	Description or Value
WebVPN-Port-Forwarding-Exchange-Proxy-Enable	Y	98	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-Port-Forwarding-HTTP-Proxy	Y	99	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-Port-Forwarding-List	Y	72	String	Single	Port forwarding list name
WebVPN-Port-Forwarding-Name	Y	79	String	Single	String name (example, “Corporate-Apps”). This text replaces the default string, “Application A” on the clientless portal home page.
WebVPN-Post-Max-Size	Y	159	Integer	Single	0x7ffffff
WebVPN-Session-Timeout-Alert-Interval	Y	149	Integer	Single	0-30. 0 = Disabled.
WebVPN Smart-Card-Removal-Disconnect	Y	225	Boolean	Single	0 = Disabled 1 = Enabled
WebVPN-Smart-Tunnel	Y	136	String	Single	Name of a Smart Tunnel
WebVPN-Smart-Tunnel-Auto-Sign-On	Y	139	String	Single	Name of a Smart Tunnel auto sign-on list appended to the domain name
WebVPN-Smart-Tunnel-Auto-Start	Y	138	Integer	Single	0 = Disabled 1 = Enabled 2 = Auto Start
WebVPN-Smart-Tunnel-Tunnel-Policy	Y	227	String	Single	One of “e networkname,” “i networkname,” or “a networkname” is the name of a Smart Tunnel network. e indicates the tunnel excluded, i indicates the tunnel specified, and a indicates all tunnels.
WebVPN-SSL-VPN-Client-Enable	Y	103	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-SSL-VPN-Client-Keep- Installation	Y	105	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-SSL-VPN-Client-Required	Y	104	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-SSO-Server-Name	Y	114	String	Single	Valid string
WebVPN-Storage-Key	Y	162	String	Single	
WebVPN-Storage-Objects	Y	161	String	Single	
WebVPN-SVC-Keepalive-Frequency	Y	107	Integer	Single	15-600 seconds, 0=Off
WebVPN-SVC-Client-DPD-Frequency	Y	108	Integer	Single	5-3600 seconds, 0=Off
WebVPN-SVC-DTLS-Enable	Y	123	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-SVC-DTLS-MTU	Y	125	Integer	Single	MTU value is from 256-1406 bytes.
WebVPN-SVC-Gateway-DPD-Frequency	Y	109	Integer	Single	5-3600 seconds, 0=Off
WebVPN-SVC-Rekey-Time	Y	110	Integer	Single	4-10080 minutes, 0=Off

Attribute Name	Firewall Threat Defense	Attr. No.	Syntax/Type	Single or Multi-Valued	Description or Value
WebVPN-SVC-Rekey-Method	Y	111	Integer	Single	0 (Off), 1 (SSL), 2 (New Tunnel)
WebVPN-SVC-Compression	Y	112	Integer	Single	0 (Off), 1 (Deflate Compression)
WebVPN-UNIX-Group-ID (GID)	Y	222	Integer	Single	Valid UNIX group IDs
WebVPN-UNIX-User-ID (UIDs)	Y	221	Integer	Single	Valid UNIX user IDs
WebVPN-Upload-Max-Size	Y	158	Integer	Single	0x7fffffff
WebVPN-URL-Entry-Enable	Y	93	Integer	Single	0 = Disabled 1 = Enabled
WebVPN-URL-List	Y	71	String	Single	URL list name
WebVPN-User-Storage	Y	160	String	Single	
WebVPN-VDI	Y	163	String	Single	List of settings

Table 79: RADIUS Attributes Sent to Secure Firewall Threat Defense

Attribute	Attribute Number	Syntax, Type	Single or Multi-valued	Description or Value
Address-Pools	217	String	Single	The name of a network object defined on the Firewall Threat Defense device that identifies a subnet, which will be used as the address pool for clients connecting to the remote access VPN. Define the network object on the <b>Objects</b> page.
Banner1	15	String	Single	The banner to display when the user logs in.
Banner2	36	String	Single	The second part of the banner to display when the user logs in. Banner2 is appended to Banner1.
Downloadable ACLs	Cisco-AV-Pair	merge-dacl {before-avpair   after-avpair}		Supported via Cisco-AV-Pair configuration.
Filter ACLs	86, 87	String	Single	Filter ACLs are referred to by ACL name in the RADIUS server. It requires the ACL configuration to be already present on the Firewall Threat Defense device, so that it can be used during RADIUS authorization.  86=Access-List-Inbound 87=Access-List-Outbound

Attribute	Attribute Number	Syntax, Type	Single or Multi-valued	Description or Value
Group-Policy	25	String	Single	The group policy to use in the connection. You must create the group policy on the remote access VPN <b>Group Policy</b> page. You can use one of the following formats: <ul style="list-style-type: none"> <li>• <i>group policy name</i></li> <li>• <i>OU=group policy name</i></li> <li>• <i>OU=group policy name;</i></li> </ul>
Simultaneous-Logins	2	Integer	Single	The number of separate simultaneous connections the user is allowed to establish, 0 - 2147483647.
VLAN	140	Integer	Single	The VLAN on which to confine the user's connection, 0 - 4094. You must also configure this VLAN on a subinterface on the Firewall Threat Defense device.

You must set the values of the IE-Proxy-Server-Method attribute returned from ISE to one of the following:

- IE\_PROXY\_METHOD\_PACFILE: 8
- IE\_PROXY\_METHOD\_PACFILE\_AND\_AUTODETECT: 11
- IE\_PROXY\_METHOD\_PACFILE\_AND\_USE\_SERVER: 12
- IE\_PROXY\_METHOD\_PACFILE\_AND\_AUTODETECT\_AND\_USE\_SERVER: 15

Firewall Threat Defense will deliver a proxy setting only if one of the above values is used for the IE-Proxy-Server-Method attribute.

## Create or Update Aliases for a Connection Profile

Aliases contain alternate names or URLs for a specific connection profile. Remote access VPN administrators can enable or disable the Alias names and Alias URLs. VPN users can choose an Alias name when they connect to the Secure Firewall Threat Defense device. Aliases names for all connections configured on this device can be turned on or off for display. You can also configure the list of Alias URLs, which your endpoints can select while initiating the remote access VPN connection. If users connect using the Alias URL, system will automatically log them using the connection profile that matches the Alias URL.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Click **Edit** on the policy that you want to modify.
  - Step 3** Click **Edit** on the connection profile for which you want to create or update aliases.
  - Step 4** Click **Aliases**.
  - Step 5** To add an Alias name, do the following:

- a) Click **Add** under **Alias Names**.
- b) Specify the **Alias Name**.
- c) Select the **Enabled** check box in each window to enable the aliases.
- d) Click **OK**.

**Step 6** To add an Alias URL, do the following:

- a) Click **Add** under **URL Alias**.
- b) Select the **Alias URL** from the list or create a new URL object. For more information see [Creating URL Objects, on page 1325](#).
- c) Select the **Enabled** check box in each window to enable the aliases.
- d) Click **OK**.

**Step 7** Save your changes.

---

#### Related Topics

[Configure Connection Profile Settings](#), on page 1472

## Configure Access Interfaces for Remote Access VPN

The **Access Interface** table lists the interface groups and security zones that contain the device interfaces. These are configured for remote access SSL or IPsec IKEv2 VPN connections. The table displays the name of each interface group or security-zone, the interface trustpoints used by the interface, and whether Datagram Transport Layer Security (DTLS) is enabled.

### Procedure

---

**Step 1** Choose **Devices > VPN > Remote Access**.

**Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.

**Step 3** Click the **Access Interface** tab.

**Step 4** To add an access interface, click + and specify values for the following in the **Add Access Interface** dialog box:

- a) **Access Interface**—Select the interface group or security zone to which the interface belongs.  
The interface group or security zone must be a Routed type. Other interface types are not supported for remote access VPN connectivity.
- b) Associate the **Protocol** object with the access interface by selecting the following options:
  - **Enable IPSet-IKEv2**—Select this option to enable **IKEv2** settings.
  - **Enable SSL**—Select this option to enable **SSL** settings.
  - Select **Enable Datagram Transport Layer Security**.

When selected, it enables Datagram Transport Layer Security (DTLS) on the interface and allows the AnyConnect VPN module of Cisco Secure Client to establish an SSL VPN connection using two simultaneous tunnels—an SSL tunnel and a DTLS tunnel.

Enabling DTLS avoids the latency and bandwidth problems associated with certain SSL connections and improves the performance of real-time applications that are sensitive to packet delays.

To configure SSL settings, and TLS and DTLS versions, see [About SSL Settings, on page 861](#).

To configure SSL settings for the AnyConnect VPN module of Cisco Secure Client, see [Group Policy Secure Client Options, on page 1349](#).

- Select the **Configure Interface Specific Identity Certificate** check box and select **Interface Identity Certificate** from the drop-down list.

If you do not select the Interface Identity Certificate, the **Trustpoint** will be used by default.

If you do not select the Interface Identity Certificate or Trustpoint, the **SSL Global Identity Certificate** will be used by default.

- c) Click **OK** to save the changes.

**Step 5** Select the following under **Access Settings**:

- **Allow Users to select connection profile while logging in**—If you have multiple connection profiles, check this check box to allow user to select the correct connection profile during login. You must select this option for **IPsec-IKEv2** VPNs.
- **Enable HTTP-only VPN Cookies**—Check this check box to enable HTTP-only VPN cookies.

**Step 6** Use the following options to configure **SSL Settings**:

- **Web Access Port Number**—The port to use for VPN sessions. The default port is 443.
- **DTLS Port Number**—The UDP port to use for DTLS connections. The default port is 443.
- **SSL Global Identity Certificate**— The selected **SSL Global Identity Certificate** will be used for all the associated interfaces if the **Interface Specific Identity Certificate** is not provided.

**Step 7** For **IPsec-IKEv2 Settings**, select the **IKEv2 Identity Certificate** from the list or add an identity certificate.

**Step 8** Under the **Access Control for VPN Traffic** section, select the following option if you want to bypass access control policy:

- **Bypass Access Control policy for decrypted traffic (sysopt permit-vpn)** — Decrypted traffic is subjected to Access Control Policy inspection by default. Enabling the Bypass Access Control policy for decrypted traffic option bypasses the ACL inspection, but VPN Filter ACL and authorization ACL downloaded from AAA server are still applied to VPN traffic.

**Note**

If you select this option, you need not update the access control policy for remote access VPN as specified in [Update the Access Control Policy on the Secure Firewall Threat Defense Device, on page 1465](#).

**Step 9** Click **Save** to save the access interface changes.

# Configure Advanced Options for Remote Access VPN

## Cisco Secure Client Image

### Secure Client Image

The Secure Client provides secure SSL or IPsec (IKEv2) connections to the Firewall Threat Defense device for remote users with full VPN profiling to corporate resources. Without a previously-installed client, remote users can enter the IP address of an interface configured to accept clientless VPN connections in their browser to download and install the Secure Client. The Firewall Threat Defense device downloads the client that matches the operating system of the remote computer. After downloading, the client installs and establishes a secure connection. In case of a previously installed client, when the user authenticates, the Firewall Threat Defense device, examines the version of the client, and upgrades the client if necessary.

The Remote Access VPN administrator associates any new or additional Secure Client images to the VPN policy. The administrator can unassociate the unsupported or end of life client packages that are no longer required.

The Secure Firewall Management Center determines the type of operating system by using the file package name. If the user renamed the file without indicating the operating system information, the valid operating system type must be selected from the list box.

Download the Secure Client image file by visiting [Cisco Software Download Center](#).

### Related Topics

### Adding a Secure Client Image to the Secure Firewall Management Center

You can upload the Secure Client image to the Secure Firewall Management Center by using the **Secure Client File** object. For more information, see [File Objects, on page 1358](#). For more information about the client image, see [Cisco Secure Client Image, on page 1493](#).

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Devices &gt; Remote Access</b> , choose and edit a listed remote access policy, then choose the <b>Advanced</b> tab.   |
| <b>Step 2</b> | Click <b>Add</b> to add a Secure Client image.   |
| <b>Step 3</b> | Click <b>Add</b> in the <b>Available Secure Client Images</b> portion of the <b>Secure Client Images</b> dialog.   |
| <b>Step 4</b> | Enter the <b>Name</b> and <b>Description</b> (optional) for the available Secure Client Image.   |
| <b>Step 5</b> | Click <b>Browse</b> , locate and select the client image that you want to upload.  |
| <b>Step 6</b> | Click <b>Save</b> to upload the image to the Firewall Management Center.<br><br>When you upload the client image to the Secure Firewall Management Center, the operating system information for the image appears automatically. |
| <b>Step 7</b> | To change the order of client images, Click <b>Show Re-order buttons</b> and move the client image up or down.   |
- 

### Related Topics

[Cisco Secure Client Image](#), on page 1493

## Update Secure Client Image for Remote Access VPN Clients

When new Secure Client updates are available in [Cisco Software Download Center](#), you can download the packages manually and add them to the remote access VPN policy so that the new client packages are upgraded on the VPN client systems according to their operating systems.

### Before you begin

Instructions in this section help you update new Secure Client images to remote access VPN clients connecting to Secure Firewall Threat Defense VPN gateway. Ensure that the following configurations are complete before updating your Secure Client images:

- Download the latest Secure Client image files from [Cisco Software Download Center](#).
- On your Secure Firewall Management Center web interface, go to **Objects > Object Management > VPN > Secure Client File** and add the new Secure Client image files.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | On your Secure Firewall Management Center web interface, choose <b>Devices &gt; VPN &gt; Remote Access</b> .   |
| <b>Step 2</b> | Click <b>Edit</b> on the remote access VPN policy that you want to update.   |
| <b>Step 3</b> | Click <b>Advanced &gt; Secure Client Image &gt; Add</b> .  |
| <b>Step 4</b> | Select a client image file from <b>Available Secure Client Images</b> and click <b>Add</b> .<br>If the required client image is not listed, click <b>Add</b> to browse and upload an image.  |
| <b>Step 5</b> | Click <b>OK</b> .  |
| <b>Step 6</b> | Save the remote access VPN policy.<br>After the remote access VPN policy changes are deployed, the new Secure Client images are updated on the Secure Firewall Threat Defense device that is configured as the remote access VPN gateway. When a new VPN user connects to the VPN gateway, the user gets the new Secure Client image to download depending on the operating system of the client system. For existing VPN users, the Secure Client image gets updated in their next VPN session. |
- 

## Add a Cisco Secure Client External Browser Package to the Secure Firewall Management Center

If you have the Secure Client external browser package image on your local disk, use this procedure to upload the same to the Secure Firewall Management Center. After you upload the external browser package, you can update the external browser package for your remote access VPN connections.

You can upload the external browser package file to the Secure Firewall Management Center by using the **Secure Client File** object. For more information, see [File Objects, on page 1358](#).

### Points to Remember

- Only one external browser package can be added to the Firewall Threat Defense device.
- After the external browser package is added to the Firewall Management Center, the browser is pushed to the Firewall Threat Defense only after the external browser is enabled in the remote access VPN configuration.

## Procedure

- Step 1** On the Secure Firewall Management Center web interface, choose **Devices > Remote Access**, choose and edit a listed remote access policy, then choose the **Advanced** tab.
- Step 2** Click **Add** in the **Secure Client External Browser Package** portion of the **Secure Client Images** page.
- Step 3** Enter the **Name** and **Description** for the Secure Client package.
- Step 4** Click **Browse** and locate the external browser package file to upload.
- Step 5** Click **Save** to upload the image to the Secure Firewall Management Center.

### Note

If you want to update the remote access VPN connection with an existing external browser package, select the file from the **Package File** drop-down.

- Step 6** Save the remote access VPN policy.

[Cisco Secure Client Image](#), on page 1493

## Remote Access VPN Address Assignment Policy

The Firewall Threat Defense device can use an IPv4 or IPv6 policy for assigning IP addresses to Remote Access VPN clients. If you configure more than one address assignment method, the Firewall Threat Defense device tries each of the options until it finds an IP address.

### IPv4 or IPv6 Policy

You can use the IPv4 or IPv6 policy to address an IP address to remote access VPN clients. You must try with the IPv4 policy to begin and later followed by IPv6 policy.

- **Use Authorization Server**—Retrieves the address from an external authorization server on a per-user basis. If you are using an authorization server that has IP address configured, we recommend using this method. Address assignment is supported by RADIUS-based authorization server only. It is not supported for AD/LDAP. This method is available for both IPv4 and IPv6 assignment policies.
- **Use DHCP**—Obtains IP addresses from a DHCP server configured in a connection profile. You can also define the range of IP addresses that the DHCP server can use by configuring DHCP network scope in the group policy. If you use DHCP, configure the server in the **Objects > Object Management > Network** pane. This method is available for IPv4 assignment policies.

For more information about DHCP network scope configuration, see [Group Policy General Options, on page 1347](#).

- **Use an internal address pool**—Internally configured address pools are the easiest method of address pool assignment to configure. If you use this method, create the IP address pools in the **Objects > Object Management > Address Pools** pane and select the same in the connection profile. This method is available for both IPv4 and IPv6 assignment policies.
- **Allow reuse an IP address so many minutes after it is released**—Delays the reuse of an IP address after its return to the address pool. Adding a delay helps to prevent problems firewalls can experience when an IP address is reassigned quickly. By default, the delay is set to zero. If you want to extend the

delay, enter the number of minutes in the range of 0–480 to delay the IP address reassignment. This configurable element is available for IPv4 assignment policies.

#### Related Topics

[Configure Connection Profile Settings](#), on page 1472

[Remote Access VPN Authentication](#), on page 1454

## Configure Certificate Maps

Certificate maps let you define rules matching a user certificate to a connection profile based on the contents of the certificate fields. Certificate maps provide certificate authentication on secure gateways.

The rules or the certificate maps are defined in [Certificate Map Objects](#), on page 1342.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.
- Step 3** Choose **Advanced > Certificate Maps**.
- Step 4** Select the following options from the **General Settings for Connection Profile Mapping** pane:
- Selections are priority-based, matching continues down the list of options when the first selection does not match. Matching is complete when the rules are satisfied. If the rules are not satisfied, the default connection profile listed at the bottom of this page is used for the connection. Select any, or all of the following options to establish authentication and to determine which connection profile (tunnel group) must be mapped to the client.
- **Use Group URL if Group URL and Certificate Map match different Connection profiles**
  - **Use the configured rules to match a certificate to a Connection Profile**—Enable this to use the rules defined in the Connection Profile Maps.
- Note**  
Configuring a certificate mapping implies certificate-based authentication. The remote user will be prompted for a client certificate regardless of the configured authentication method.
- Step 5** Under the **Certificate to Connection Profile Mapping** section, click **Add Mapping** to create certificate to connection profile mapping for this policy.
- a) Choose or create a **Certificate Map Name** object.
  - b) Select the **Connection Profile** that want to use if the rules in the certificate map object are satisfied.
  - c) Click **OK** to create the mapping.
- Step 6** Click **Save**.
- 

## Configuring Group Policies

A group policy is a set of attribute and value pairs, stored in a group policy object, that define the remote access VPN experience. For example, in the group policy object, you configure general attributes such as addresses, protocols, and connection settings.

The group policy applied to a user is determined when the VPN tunnel is being established. The RADIUS authorization server assigns the group policy, or it is obtained from the current connection profile.

**Note** There is no group policy attribute inheritance on the Firewall Threat Defense. A group policy object is used, in its entirety, for a user. The group policy object identified by the AAA server upon login is used, or, if that is not specified, the default group policy configured for the VPN connection is used. The provided default group policy can be set to your default values, but will only be used if it is assigned to a connection profile and no other group policy has been identified for the user.

### Procedure

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.
- Step 3** Choose **Advanced > Group Policies > Add**.
- Step 4** Select group policies from the **Available Group Policy** list and click **Add**. You can select one or more group policies to associate with this remote access VPN policy.
- Step 5** Click **OK** to complete the group policy selection.
- Step 6** Save your changes.

### Related Topics

[Configure Group Policy Objects](#), on page 1346

## Configuring LDAP Attribute Mapping

An LDAP attribute name maps LDAP user or group attribute name to a Cisco-understandable name. The attribute map equates attributes that exist in the Active Directory (AD) or LDAP server with Cisco attribute names. You can map any standard LDAP attribute to a well-known vendor specific attribute (VSA). You can map one or more LDAP attributes to one or more Cisco LDAP attributes. When the AD or LDAP server returns authentication to the Firewall Threat Defense device during remote access VPN connection establishment, the Firewall Threat Defense device can use the information to adjust how the Secure Client completes the connection.

When you want to provide VPN users with different access permissions or VPN content, you can configure different VPN policies on the VPN server and assign these policy-sets to each user based on their credentials. You can achieve this in Firewall Threat Defense by configuring LDAP authorization, with LDAP attribute maps. In order to use LDAP to assign a group policy to a user, you must configure a map that maps an LDAP attribute.

An LDAP attribute map consists of three components:

- **Realm**—Specifies the name for the LDAP attribute map; the name is generated based on the selected realm.
- **Attribute Name Map**—Maps the LDAP user or group attribute name to Cisco-understandable name.
- **Attribute Value Map**—Maps value in the LDAP user or group attribute to the value of a Cisco attribute for the selected name mapping.

The group policies that are used in an LDAP attribute map get added to the list of group policies in the remote access VPN configuration. Removing a group policy from the remote access VPN configuration also removes the associated LDAP attribute mapping.

In versions 6.4 to 6.6, you can configure LDAP attribute maps only using FlexConfig. For more information, see [Configure AnyConnect Modules and Profiles Using FlexConfig](#).

In versions 7.0 and later, you can use the following procedure:

### Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Select an existing remote access VPN policy in the list and click the corresponding **Edit** icon.
  - Step 3** Click **Advanced > LDAP Attribute Mapping**.
  - Step 4** Click **Add**.
  - Step 5** On the Configure LDAP Attribute Map page, select a **Realm** to configure the attribute map.
  - Step 6** Click **Add**.

You can configure multiple attribute maps. Each attribute map requires that you configure a name map and value maps.

#### Note

Ensure that you follow these guidelines while creating an LDAP attribute map:

- Configure at least one mapping for an LDAP attribute; multiple mappings with the same LDAP attribute name is not allowed.
  - Configure a minimum of one name map to create an LDAP attribute map.
  - You can remove any LDAP attribute map if the attribute map is not associated with any connection profile in the remote access VPN configuration.
  - Use the correct spelling and capitalization in the LDAP attribute map for **both** the Cisco and LDAP attribute names and values.
- a) Specify the **LDAP Attribute Name** and then select the required **Cisco Attribute Name** from the list.
  - b) Click **Add Value Map** and Specify the **LDAP Attribute Value** and **Cisco Attribute Value**.
- Repeat this step to add more value maps.

- Step 7** Click **OK** to complete LDAP attribute map configuration.
  - Step 8** Click **Save** to save the changes to the LDAP attribute mapping.
- 

### Example

For a detailed example, see [Configure RA VPN with LDAP Authentication and Authorization for FTD](#).

## Configuring VPN Load Balancing

### About VPN Load Balancing

VPN load balancing in Firewall Threat Defense allows you group two or more devices logically and distribute remote access VPN sessions among the devices equally. VPN load balancing shares Secure Client VPN sessions among the devices in a load balancing group.

VPN load balancing is based on simple distribution of traffic without taking into account throughput or other factors. A VPN load-balancing group consists of two or more Firewall Threat Defense devices. One device acts as the director, and the other devices are member devices. Devices in a group do not need to be of the exact same type, or have identical software versions or configurations. Any Firewall Threat Defense device that supports remote access VPN can participate in a load balancing group. Firewall Threat Defense supports VPN load balancing with Secure Client SAML authentication.

All active devices in a VPN load-balancing group carry session loads. VPN load balancing directs traffic to the least-loaded device in the group, distributing the load among all devices. It makes efficient use of system resources and provides increased performance and high availability.

### Components of VPN Load Balancing

Following are the components of VPN load balancing:

- **Load-balancing group**—A virtual group of two or more Firewall Threat Defense devices to share the VPN sessions.

A VPN load-balancing group can consist of Firewall Threat Defense devices of the same release or of mixed releases; but the device must support remote access VPN configuration.

See [Configure Group Settings for VPN Load Balancing, on page 1500](#) and [Configure Additional Settings for Load Balancing, on page 1501](#).

- **Director**—One device from the group acts a director. It distributes the load among other members in the group and participate is serving the VPN sessions.

The director monitors all devices in the group, keeps track of how loaded each device is, and distributes the session load accordingly. The role of director is not tied to a physical device; it can shift among devices. For example, if the current director fails, one of the member devices in the group takes over that role and immediately becomes the new director.

- **Members**—Devices other than the director in a group are called members. They participate in load balancing and share the remote access VPN connections.

[Configure Settings for Participating Devices, on page 1501](#).

### Prerequisites for VPN Load Balancing

- **Certificates**—Firewall Threat Defense's certificate must contain the IP addresses or FQDN of the director and members to which the connection is redirected. Or else, the certificate will be deemed untrusted. The certificate must use Subject Alternate Name (SAN) or wildcard certificate
- **Group URL**—Add the group URL for VPN load-balancing group IP address to the connection profiles. Specify a group URL to eliminate the need for the user to select a group at login.

- **IP Address Pool**—Choose unique IP address pool for member devices, and override the IP pool in Firewall Management Center for each of the member devices.
- Devices that are behind Network Address Translation (NAT) can also be part of a load balancing group.

### Guidelines and Limitations for VPN Load Balancing

- VPN load balancing is disabled by default. You must explicitly enable VPN load balancing.
- Only the Firewall Threat Defense devices that are co-located can be added to a load-balancing group.
- A load-balancing group must have a minimum of two Firewall Threat Defense devices.
- Devices in Firewall Threat Defense high availability can participate in a load-balancing group.
- Devices that are behind Network Address Translation (NAT) can also be part of a load balancing group.
- When a member or a director device goes down, remote access VPN connections that are served by that device will be dropped. You must initiate the VPN connection again.
- Identity certificate on each device must have Subject Alternate Name (SAN) or wildcard.

### Configure Group Settings for VPN Load Balancing

You can enable VPN load balancing and configure group settings that are applicable to all the members of the load-balancing group. When you create the group, you can configure participation settings for load balancing.

#### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Devices &gt; VPN &gt; Remote Access</b> .   |
| <b>Step 2</b> | Click <b>Edit</b> on the remote access VPN policy that you want to update.  |
| <b>Step 3</b> | Click <b>Advanced &gt; Load Balancing</b> .   |
| <b>Step 4</b> | Click the <b>Enable Load balancing between member devices</b> toggle button to enable load balancing. The <b>Edit Group Configuration</b> page opens. Group parameters apply to all devices under the load-balancing group.   |
| <b>Step 5</b> | Specify the <b>Group IPv4 Address</b> and <b>Group IPv6 Address</b> as applicable.<br><br>The IP address that you specify here is for the entire load-balancing group and the director opens this IP address for incoming VPN connections.                            |
| <b>Step 6</b> | Select the <b>Communication Interface</b> for the load-balancing group. Click <b>Add</b> to add an interface group or security zone.<br><br>Communication interface is a private interface through which the director and members share information about their load. |
| <b>Step 7</b> | Enter the <b>UDP Port</b> for communication between the director and members in a group. The default port is 9023.  |
| <b>Step 8</b> | Enable the <b>IPsec Encryption</b> toggle button to activate IPsec encryption for the communication between the director and members.   |

Enabling the encryption establishes an IPsec tunnel between the director and members using a pre-shared key.

When you upgrade or downgrade Firewall Threat Defense devices with the **IPsec Encryption** option enabled, ensure there is no configuration mismatch between the Firewall Management Center and the Firewall Threat Defense to prevent deployment failures.

- Step 9** Enter **Encryption Key** for IPsec encryption and confirm the encryption key.  
**Step 10** Click **OK**.
- 

## Configure Additional Settings for Load Balancing

The additional settings for VPN load balancing include FQDN and IKEv2 redirection.

### Procedure

---

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Click **Edit** on the remote access VPN policy that you want to update.
- Step 3** Click **Advanced > Load Balancing**.
- Step 4** Turn on the **Enable Load balancing between member devices** toggle button to enable load balancing if not done already.
- Step 5** Click **Settings**.
- Step 6** Turn on the **Send FQDN to peer devices instead of IP** toggle button to enable redirection using a fully qualified domain name.
- By default, Firewall Threat Defense sends only IP addresses in VPN load balancing redirection to a client.
- Step 7** Select one of the **IKEv2 Redirect** phases:
- **Redirect during SA authentication**
  - **Redirect during SA initialization**
- Step 8** Click **OK**.
- Step 9** Save your changes.
- 

## Configure Settings for Participating Devices

The device participation settings determine how the devices share load in VPN load balancing. Configure a participating device by enabling VPN load balancing on the device and defining device-specific properties. These values vary from device to device. You can provide a priority number for the devices participating in load balancing. A higher priority number gives the device a better chance to become the director over other devices. But you cannot select a device to be the director of the group.

## Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Click **Edit** next to the remote access VPN policy that you want to modify.
- Step 3** Click **Advanced > Load Balancing**.
- Step 4** Turn on the **Enable Load balancing between member devices** toggle button to enable load balancing if you have not enabled already.
- Step 5** Configure **Device Participation** settings:
- The **Device Participation** section lists all the target devices of the selected remote access VPN configuration. You can configure these devices to share the load of the incoming VPN sessions.
- Turn on the **Load Balancing** toggle button to enable load balancing for a device and then click **Edit**.
  - Enter the device **Priority**.  
By default, the device priority is set to 5. You can choose a number from 1 through 10.
  - Specify the **IPv4 NAT** or **IPv6 NAT** address for VPN interface IP address if the device is behind NAT.
  - Click **OK**.
- Step 6** Click **Save** to save the remote access VPN policy settings.
- 

## Configuring IPsec Settings for Remote Access VPNs

The IPsec settings are applicable only if you selected IPsec as the VPN protocol while configuring your remote access VPN policy. If not, you can enable IKEv2 using the Edit Access Interface dialog box. See [Configure Access Interfaces for Remote Access VPN, on page 1491](#) for more information.

## Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** From the list of available VPN policies, select the policy for which you want to modify the settings.
- Step 3** Click **Advanced**.
- The list of IPsec settings appears in a navigation pane on the left of the screen.
- Step 4** Use the navigation pane to edit the following IPsec options:
- Crypto Maps**—The Crypto Maps page lists the interface groups on which IKEv2 protocol is enabled. Crypto Maps are auto generated for the interfaces on which IKEv2 protocol is enabled. To edit a Crypto Map, see [Configure Remote Access VPN Crypto Maps, on page 1503](#). You can add or remove interface groups to the selected VPN policy in **Access Interface**. See [Configure Access Interfaces for Remote Access VPN, on page 1491](#) for more information.
  - IKE Policy**—The IKE Policy page lists all the IKE policy objects applicable for the selected VPN policy when Secure Client endpoints connect using the IPsec protocol. See [IKE Policies in Remote Access VPNs, on page 1505](#) for more information. To add a new IKE policy, see [Configure IKEv2 Policy Objects, on page 1357](#). Firewall Threat Defense supports only Secure Client IKEv2 clients. Third-party standard IKEv2 clients are not supported.

- c) **IPsec/IKEv2 Parameters**—The IPsec/IKEv2 Parameters page enables you to modify the IKEv2 session settings, IKEv2 Security Association settings, IPsec settings, and NAT Transparency settings. See [Configure Remote Access VPN IPsec/IKEv2 Parameters, on page 1506](#) for more information.

**Step 5** Click **Save**.

## Configure Remote Access VPN Crypto Maps

Crypto maps are automatically generated for the interfaces on which IPsec-IKEv2 protocol has been enabled. You can add or remove interface groups to the selected VPN policy in **Access Interface**. See [Configure Access Interfaces for Remote Access VPN, on page 1491](#) for more information.

### Procedure

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** From the list of available VPN policies, select the policy for which you want to modify the settings.
- Step 3** Click the **Advanced > Crypto Maps**, and select a row in the table and click **Edit** to edit the Crypto map options.
- Step 4** Select **IKEv2 IPsec Proposals** and select the transform sets to specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel.
- Step 5** Select **Enable Reverse Route Injection** to enable static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint.
- Step 6** Select **Enable Client Services** and specify the port number.

The Client Services Server provides HTTPS (SSL) access to allow the Secure Client Downloader to receive software upgrades, profiles, localization and customization files, CSD, SCEP, and other file downloads required by the client. If you select this option, specify the client services port number. If you do not enable the Client Services Server, users will not be able to download any of these files that the Secure Client might need.

#### Note

You can use the same port that you use for SSL VPN running on the same device. Even if you have an SSL VPN configured, you must select this option to enable file downloads over SSL for IPsec-IKEv2 clients.

- Step 7** Select **Enable Perfect Forward Secrecy** and select the **Modulus group**.

Use Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. The unique session key protects the exchange from subsequent decryption, even if the entire exchange was recorded and the attacker has obtained the preshared or private keys used by the endpoint devices. If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the **Modulus Group** list.

Modulus group is the Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Select the modulus group that you want to allow in the remote access VPN configuration:

- 1—Diffie-Hellman Group 1 (768-bit modulus).
- 2—Diffie-Hellman Group 2 (1024-bit modulus).

- 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or higher).
- 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys).
- 19—Diffie-Hellman Group 19 (256-bit elliptical curve field size).
- 20—Diffie-Hellman Group 20 (384-bit elliptical curve field size).
- 21—Diffie-Hellman Group 21 (521-bit elliptical curve field size).
- 24—Diffie-Hellman Group 24 (2048-bit modulus and 256-bit prime order subgroup).

**Step 8** Specify the **Lifetime Duration (seconds)**.

The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. Generally, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes.

You can specify a value from 120 to 2147483647 seconds. The default is 28800 seconds.

**Step 9** Specify the **Lifetime Size (kbytes)**.

The volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before it expires.

You can specify a value from 10 to 2147483647 kbytes. The default is 4,608,000 kilobytes. No specification allows infinite data.

**Step 10** Select the following **ESPv3 Settings**:

- **Validate incoming ICMP error messages**—Choose whether to validate ICMP error messages received through an IPsec tunnel and destined for an interior host on the private network.
- **Enable 'Do Not Fragment' Policy**—Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header, and select one of the following from the **Policy** list:
  - Copy—Maintains the DF bit.
  - Clear—Ignores the DF bit.
  - Set—Sets and uses the DF bit.
- Select **Enable Traffic Flow Confidentiality (TFC) Packets**— Enable dummy TFC packets that mask the traffic profile which traverses the tunnel. Use the **Burst**, **Payload Size**, and **Timeout** parameters to generate random length packets at random intervals across the specified SA.

**Note**

Enabling traffic flow confidentiality (TFC) packets prevents the VPN tunnel from being idle. Thus the VPN idle timeout configured in the group policy does not work as expected when you enable the TFC packets. See [Group Policy Advanced Options, on page 1352](#).

- Burst—Specify a value from 1 to 16 bytes.
- Payload Size—Specify a value from 64 to 1024 bytes.
- Timeout—Specify a value from 10 to 60 seconds.

**Step 11** Click **OK**.

---

**Related Topics**

[Interface](#), on page 1278

**IKE Policies in Remote Access VPNs**

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs). The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. An IKE proposal is a set of algorithms that two peers use to secure the negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters are used to protect subsequent IKE negotiations.

---

**Note** Firewall Threat Defense supports only IKEv2 for remote access VPNs.

---

Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups in one policy. Since peers choose during the Phase 1 negotiation, this makes it possible to create a single IKE proposal, but consider creating multiple, different proposals to give higher priority to your most desired options. For IKEv2, the policy object does not specify authentication, other policies must define the authentication requirements.

An IKE policy is required when you configure a remote access IPsec VPN.

**Configuring Remote Access VPN IKE Policies**

The IKE Policy table specifies all the IKE policy objects applicable for the selected VPN configuration when Secure Client endpoints connect using the IPsec protocol. For more information, see [IKE Policies in Remote Access VPNs, on page 1505](#).

---

**Note** Firewall Threat Defense supports only IKEv2 for remote access VPNs.

---

**Procedure**

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** From the list of available VPN policies, select the policy for which you want to modify the settings.
- Step 3** Click **Advanced > IKE Policy**.
- Step 4** Click **Add** to select from the available IKEv2 policies, or add a new IKEv2 policy and specify the following:
- **Name**—Name of the IKEv2 policy.
  - **Description**—Optional description of the IKEv2 policy
  - **Priority**—The priority value determines the order of the IKE policy compared by the two negotiating peers when attempting to find a common security association (SA).

- **Lifetime**—Lifetime of the security association (SA), in seconds
- **Integrity**—The Integrity Algorithms portion of the Hash Algorithm used in the IKEv2 policy.
- **Encryption**—The Encryption Algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations.
- **PRF Hash**—The pseudorandom function (PRF) portion of the Hash Algorithm used in the IKE policy. In IKEv2, you can specify different algorithms for these elements.
- **DH Group**—The Diffie-Hellman group used for encryption.

**Step 5** Click **Save**.

## Configure Remote Access VPN IPsec/IKEv2 Parameters

### Procedure

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** From the list of available VPN policies, select the policy for which you want to modify the settings.
- Step 3** Click **Advanced > IPsec > IPsec/IKEv2 Parameters**.
- Step 4** Select the following for **IKEv2 Session Settings**:
- **Identity Sent to Peers**—Choose the identity that the peers will use to identify themselves during IKE negotiations:
    - **Auto**—Determines the IKE negotiation by connection type: IP address for preshared key, or Cert DN for certificate authentication (not supported).
    - **IP address**—Uses the IP addresses of the hosts exchanging ISAKMP identity information.
    - **Hostname**—Uses the fully qualified domain name (FQDN) of the hosts exchanging ISAKMP identity information. This name comprises the hostname and the domain name.
  - **Enable Notification on Tunnel Disconnect**—Allows an administrator to enable or disable the sending of an IKE notification to the peer when an inbound packet that is received on an SA does not match the traffic selectors for that SA. Sending this notification is disabled by default.
  - **Do not allow device reboot until all sessions are terminated**—Check to enable waiting for all active sessions to voluntarily terminate before the system reboots. This is disabled by default.
- Step 5** Select the following for **IKEv2 Security Association (SA) Settings**:
- **Cookie Challenge**—Whether to send cookie challenges to peer devices in response to SA initiated packets, which can help thwart denial of service (DoS) attacks. The default is to use cookie challenges when 50% of the available SAs are in negotiation. Select one of these options:
    - **Custom**—Specify **Threshold to Challenge Incoming Cookies**, the percentage of the total allowed SAs that are in-negotiation. This triggers cookie challenges for any future SA negotiations. The range is zero to 100%. The default is 50%.
    - **Always**—Select to send cookie challenges to peer devices always.

- **Never**— Select to never send cookie challenges to peer devices.
- **Number of SAs Allowed in Negotiation**—Limits the maximum number of SAs that can be in negotiation at any time. If used with Cookie Challenge, configure the cookie challenge threshold lower than this limit for an effective cross-check. The default is 100 %.
- **Maximum number of SAs Allowed**—Limits the number of allowed IKEv2 connections.

**Step 6** Select the following for **IPsec Settings**:

- **Enable Fragmentation Before Encryption**—This option lets traffic travel across NAT devices that do not support IP fragmentation. It does not impede the operation of NAT devices that do support IP fragmentation.
- **Path Maximum Transmission Unit Aging**—Check to enable PMTU (Path Maximum Transmission Unit) Aging, the interval to Reset PMTU of an SA (Security Association).
- **Value Reset Interval**—Enter the number of minutes at which the PMTU value of an SA (Security Association) is reset to its original value. Valid range is 10 to 30 minutes, default is unlimited.

**Step 7** Select the following for **NAT Settings**:

- **Keepalive Messages Traversal**—Select whether to enable NAT keepalive message traversal. NAT traversal keepalive is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow. If you select this option, configure the interval, in seconds, between the keepalive signals sent between the spoke and the middle device to indicate that the session is active. The value can be from 10 to 3600 seconds. The default is 20 seconds.
- **Interval**—Sets the NAT keepalive interval, from 10 to 3600 seconds. The default is 20 seconds.

**Step 8** Click **Save**.

## Customize Cisco Secure Client

You can configure the Secure Client customizations using the management center and deploy them to the VPN headend. The threat defense device distributes these customizations to the endpoint when a user connects from the Secure Client. Administrators can customize the following elements at the endpoint:

**Table 80: Secure Client Customizations Available in Management Center**

Customization	Description	More Info
GUI text and messages	Customize or localize Secure Client GUI text and informational/error messages.	<a href="#">Customize and Localize Secure Client GUI Text and Messages, on page 1510</a>
Icons and images	Customize the logo, images, or icons of the Secure Client GUI.	<a href="#">Customize Secure Client Icons and Images, on page 1511</a>

Customization	Description	More Info
Scripts	Deploy scripts on the endpoint devices when a client establishes or disconnects a VPN session.	<a href="#">Deploy Scripts on Endpoint Devices Using Secure Client, on page 1512</a>
Binaries	Deploy custom applications using Secure Client APIs.	<a href="#">Deploy Custom Applications Using Cisco Secure Client APIs, on page 1514</a>
Custom Installer Transforms	Customize the Secure Client installer.	<a href="#">Customize the Secure Client Installer, on page 1515</a>
Localized Installer Transforms	Localize the Secure Client installer.	<a href="#">Localize the Client Installer, on page 1515</a>

## Guidelines and Limitations for Secure Client Customizations

### Guidelines

- Ensure that you import the xml file to the object defined as `DfltCustomization`. When you import the customization object, the Firewall Management Center checks the XML code for validity.

For example:

```
hostname# import webvpn customization DfltCustomization
disk0:/csm/defaultcustomizationwebvpn.xml
```

- Add the Windows Cisco Secure Client headend deployment package to the remote access VPN policy before deploying customization commands. This package must be included when supporting Windows, MacOS, or Linux clients.

### General Limitations

- If there are any customizations earlier than 7.4 configured directly on the threat defense using the CLI, the management center removes these customizations during deployment.
- No clustering support.

Table 81: Limitations for Secure Client Customizations

Customization	Limitations
GUI Text and Message Customizations	<ul style="list-style-type: none"> <li>You must restart Secure Client before you use this customization.</li> <li>No support for right-to-left languages.</li> <li>Some strings are truncated in the GUI due to hardcoded field lengths.</li> <li>Some messages are hardcoded in the client. For example: <ul style="list-style-type: none"> <li>Status messages (during an update)</li> <li>Untrusted server messages</li> <li>Deferred update messages</li> </ul> </li> <li>Localization is version-specific.</li> </ul> <p>If an Administrator created a translation table based on a template of an old Secure Client version, the new messages do not appear to the remote users. The Administrator must merge the latest template with the translation table so that the table has the new messages. You can use third-party tools like Get text to perform the merge.</p>
Icons and Images Customizations	<ul style="list-style-type: none"> <li>You must restart Secure Client before you use this customization.</li> <li>The customization object names must match the Secure Client GUI filenames. File names are different for each operating system and are case-sensitive. For more information about the filenames, extensions, and sizes for each OS, see the <a href="#">Cisco Secure Client Administrator Guide</a>.</li> <li>Images do not appear properly if the image size is not correct. The management center or the threat defense device does not verify the image size.</li> <li>MacOS does not support customization of Secure Client images and icons.</li> </ul>
Deploy Customized Scripts	<ul style="list-style-type: none"> <li>Secure Client runs only one OnConnect and one OnDisconnect script; however, these scripts may launch other scripts.</li> <li>Scripts can only execute functions that the user has the right to invoke.</li> <li>You cannot launch the OnConnect script from the Start Before Logon (SBL) GUI.</li> </ul>
Deploy Custom Applications Using Cisco Secure Client APIs (Binaries)	<ul style="list-style-type: none"> <li>After you use this customization, if you deploy an updated version of the Secure Client on the management center, the client will download the update and replace your custom UI.</li> </ul>

Customization	Limitations
Customize the Client Installer	<ul style="list-style-type: none"> <li>This customization is available only for Windows.</li> </ul>

## Customize and Localize Secure Client GUI Text and Messages

You can customize the Secure Client GUI text and the informational/error messages. You also can customize the GUI text and all messages to appear in a preferred language.

### Customize GUI Text and Messages

To customize the GUI text or messages, you can edit the messages in the message file. You can update the messages to include more details in the error messages. For example:

- Modify any label in the login dialog box such as **Password** to **Domain Password**.
- Add your support contact details in the error messages.

### Localize GUI Text and Messages

Threat defense devices use translation tables to translate the labels and user messages displayed in the Secure Client. When a user connects to the remote access VPN, the Secure Client identifies the locale set on the endpoint and downloads the translation file. Threat defense devices support 128 locales. By default, Secure Client is installed in English.

- For Cisco Secure Client 5.0, the default localization files for various languages are part of the application.
- For AnyConnect Clients 4.x, you can download the localization files for a few languages from Cisco.com and upload them to the management center.

## How to Customize Secure Client GUI Text and Messages

### Before you begin

Configure one or more remote access VPN policies.

### Procedure

- 
- Step 1** Get the base template or translation file either from the Secure Client package or from Cisco.com. For example, AnyConnect.po.
  - Step 2** Use a text editor to add the translations or customize the labels or messages.
  - Step 3** Update the **msgstr** string corresponding to each **msgid**.
  - Step 4** Save the file.
  - Step 5** Create a new Secure Client Customization object.
    - a) Choose **Objects > Object Management > VPN > Secure Client Customization**.
    - b) Click **Add Secure Client Customization**.
    - c) Enter the name and description for the customization.
    - d) From the **Customization Type** drop-down list, choose **GUI Text and Messages**.
    - e) From the **Language** drop-down list, choose a language for which you are adding the translation.

f) Click **Browse** and select the translation file. The supported file extensions are .po, .mo, and .txt.

**Step 6** Add the customization to the remote access VPN policy.

- a) Choose **Devices > Remote Access**.
- b) Click the edit icon of the remote access VPN policy.
- c) Click **Advanced > Secure Client Customizations > Localization**.
- d) Click + to select the translation file.
- e) Click **Add**.
- f) Click **OK**.

**Step 7** Click **Save**.

**Step 8** Choose **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

---

### What to do next

Verify the Secure Client customizations. For more information, see [Verify Secure Client Customizations, on page 1516](#).

## Customize Secure Client Icons and Images

You can customize the logo, images, and icons of the Secure Client GUI using the management center.

To customize the logo, images, and icons of the Secure Client GUI, you must create a Secure Client customization object in the management center. The name of this customization object must match the Secure Client GUI filename. File names are different for each operating system and are case-sensitive. For more information about the filenames, extensions, and sizes for each OS, see the [Cisco Secure Client Administrator Guide](#).

For example, if you want to replace the corporate logo for Windows clients, you must create a customization object with the name as company\_logo and add this customization object to the remote access VPN policy. If you use a different name for the customization object, the Secure Client installer does not change the component. However, if you deploy your own executable to customize the GUI, the customization object can have any name.

Location of all images files:

- Windows: %PROGRAMFILES%\Cisco\Cisco Secure Client\res\
- Linux: /opt/cisco/secure client/pixmaps
- macOS: Not supported

### How to Customize Secure Client Images and Icons

#### Before you begin

Configure one or more remote access VPN policies.

## Procedure

- 
- Step 1** Create the icons or images using the correct extensions, and sizes.
- Images do not appear properly if the image size is not correct. The management center or the threat defense device does not verify the image size.
- For more information about the filenames, extensions, and sizes, see the [Cisco Secure Client Administrator Guide](#).
- Step 2** Create a new Secure Client Customization object.
- Choose **Objects > Object Management > VPN > Secure Client Customization**.
  - Click **Add Secure Client Customization**.
  - Enter the name and description for the customization object.
- Ensure that the customization object name matches the Secure Client GUI filenames. For more information about the filenames, see the [Cisco Secure Client Administrator Guide](#).
- From the **Customization Type** drop-down list, choose **Icon and Images**.
  - From the **Platform** drop-down list, choose a platform.
  - Click **Browse** and select the file. The supported file extensions are .png, .ico, and .jpeg.
  - Repeat the steps from 2a - f to add multiple icons and images.
- Step 3** Add the customization object to the remote access VPN policy.
- Choose **Devices > Remote Access**.
  - Click the edit icon of the remote access VPN policy.
  - Click **Advanced > Secure Client Customizations > Icons and Images**.
  - Click + to select the file.
  - Click **Add**.
  - Click **OK**.
- Step 4** Click **Save**.
- Step 5** Choose **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## What to do next

Verify the Secure Client customizations. For more information, see [Verify Secure Client Customizations, on page 1516](#).

## Deploy Scripts on Endpoint Devices Using Secure Client

Secure Client lets you download and run scripts when the following events occur:

- Establishment of a new client VPN session with the threat defense. The script triggered by this event is an OnConnect script because it requires this filename prefix. Reconnection of the VPN session does not trigger this script.
- Disconnection of a client VPN session with the threat defense. The script triggered by this event is an OnDisconnect script because it requires this filename prefix.

These scripts run asynchronously and do not delay the connection establishment or disconnection. They can be of any extension and must be executable on the endpoint. Secure Client identifies the OnConnect and OnDisconnect scripts by the filename. It looks for a file whose name begins with OnConnect or OnDisconnect regardless of the file extension.

Some examples of this feature are:

- Refresh the group policy upon VPN connection.
- Mount a network drive upon a VPN connection.
- Unmount a network drive upon a VPN disconnection.

To enable scripts, check the **Enable Scripting** option in the VPN profile. By default, the client does not launch scripts. The client does not require the script to be written in a specific language. It requires an application that can run the script to be installed on the client computer. For the client to launch the script, the script must run from the command line.

Secure Client can only launch scripts after the user logs in and establishes a VPN session. You cannot launch the OnConnect script from the Start Before Logon (SBL) GUI. You must check the **Enable Post SBL On Connect Script** option in the VPN profile to trigger the scripts once the user logs in. Secure Client is a 32-bit application. When the scripts run on a 64-bit Windows version, they use the 32-bit version of cmd.exe.

### *How to Add Customized Scripts for Secure Client*

#### **Before you begin**

1. Configure a remote access VPN.
2. Enable scripting in the VPN profile.
3. Add the VPN profile to the remote access VPN group policy.

#### **Procedure**

- 
- Step 1** Create OnConnect and OnDisconnect scripts for a platform.
- Step 2** Create a new Secure Client Customization object.
- a) Choose **Objects > Object Management > VPN > Secure Client Customization**.
  - b) Click **Add Secure Client Customization**.
  - c) Enter the name and description for the customization.
  - d) From the **Customization Type** drop-down list, choose **Scripts**.
  - e) From the **Platform** drop-down list, choose a platform.
  - f) Select one of the following:
    - **On Connect**: To select an OnConnect script.
    - **On Disconnect**: To select an OnDisconnect script.
  - g) Click **Browse** and select the script you want to execute on the endpoint.
- Step 3** Add the customization to the remote access VPN policy.
- a) Choose **Devices > Remote Access**.

- b) Click the edit icon of the remote access VPN policy.
- c) Click **Advanced > Secure Client Customizations > Localization**.
- d) Click + to select the translation file.
- e) Click **Add**.
- f) Click **OK**.

**Step 4** Click **Save**.

**Step 5** Choose **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

### What to do next

Verify the Secure Client customizations. For more information, see [Verify Secure Client Customizations, on page 1516](#).

## Deploy Custom Applications Using Cisco Secure Client APIs

For Windows, Linux, or MacOS machines, you can create and deploy a custom client that uses the Secure Client APIs. You can use this client binary file to replace the Secure Client GUI or CLI binary files.

Your executable can call any resource files such as logo images that you import to the management center. When you deploy your own executable, you can use any filenames for your resource files.

The following table lists the filenames of the client executable files for the different operating systems:

**Table 82: Filenames of the Secure Client Executable Files**

Client OS	Client GUI File	Client CLI File
Windows	vpnui.exe	vpncli.exe
Linux	vpnui	vpn
MacOS	Not supported by the management center deployment. However, you can deploy an executable for the macOS that replaces the client GUI using other means, such as Altiris Agent.	vpn

### How to Deploy Custom Applications Using Cisco Secure Client API

#### Before you begin

Configure one or more remote access VPN policies.

#### Procedure

**Step 1** Create the custom application using the Cisco Secure Client APIs.

**Step 2** Create a new Secure Client Customization object.

- a) Choose **Objects > Object Management > VPN > Secure Client Customization**.

- b) Click **Add Secure Client Customization**.
- c) Enter the name and description for the customization.
- d) From the **Customization Type** drop-down list, choose **Binary**.
- e) From the **Platform** drop-down list, choose a platform.
- f) Click **Browse** and select the custom application.

**Step 3** Add the customization to the remote access VPN policy.

- a) Choose **Devices > Remote Access**.
- b) Click the edit icon of the remote access VPN policy.
- c) Click **Advanced > Secure Client Customizations > Binaries**.
- d) Click + to select the translation file.
- e) Click **Add**.
- f) Click **OK**.

**Step 4** Click **Save**.

**Step 5** Choose **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.

## Customize the Secure Client Installer

You can customize the Secure Client GUI by creating a custom transform that deploys with the client installer program. You can import the transform to the management center and deploy it to the threat defense device. The threat defense deploys this transform to the endpoint using the client installer program.

**Note** This customization is available only for Windows.

## Localize the Client Installer

You can translate the messages displayed by the Cisco Secure Client installer. The management center uses a transform to translate the messages displayed by the installer. The transform alters the installation but leaves the original security-signed MSI intact. These transforms only translate the installer screens and do not translate the client GUI screens.

Every release of Cisco Secure Client includes a localized transform that administrators can upload to the management center whenever they upload Cisco Secure Client packages with new software. If you use our localization transform, ensure that you update them with the latest release from Cisco.com whenever you upload a new Cisco Secure Client package.

## How to Customize or Localize the Client Installer

### Before you begin

Configure one or more remote access VPN policies.

### Procedure

**Step 1** Create a customized or localized transform.

- Step 2** Create a new Secure Client Customization object.
- Choose **Objects > Object Management > VPN > Secure Client Customization**.
  - Click **Add Secure Client Customization**.
  - Enter the name and description for the customization.
  - From the **Customization Type** drop-down list, choose **Customized Installer Transform** or **Localized Installer Transform**.
  - From the **Platform** drop-down list, choose a platform.
  - Click **Browse** and select the transform.
- Step 3** Add the customization to the remote access VPN policy.
- Choose **Devices > Remote Access**.
  - Click the edit icon of the remote access VPN policy.
  - Click **Advanced > Secure Client Customizations > Custom Installer Transforms** or **Localized Installer Transforms**.
  - Click **+** to select the transform.
  - Click **Add**.
  - Click **OK**.
- Step 4** Click **Save**.
- Step 5** Choose **Deploy > Deployment** and deploy the policy to assigned devices. The changes are not active until you deploy them.
- 

## Verify Secure Client Customizations

### Validate the Deployment

After the deployment is complete, validate the deployment in the management center. Click the **Transcript Details** (📄) icon to verify the commands generated for the customizations.

### Examples

- The example below shows the transcript details of a GUI text and messages customization: Secure Client en\_us localization with customized prompts.

```
import webvpn translation-table AnyConnect language en-us disk0:/AnyConnect_en-us.po
```

- The example below shows the transcript details of customized icons and images: customization of the Secure Client logo to ABC logo.

```
import webvpn AnyConnect-customization type resource platform win name company_logo.png
disk0:/company_logo.png
```

- The example below shows the transcript details of the customized OnConnect and OnDisconnect scripts. The On connect script mounts the network drive and the On disconnect script unmounts the network drive.

```
import webvpn AnyConnect-customization type binary platform win name
scripts_OnConnect_mount.bat disk0:/mount.bat
import webvpn AnyConnect-customization type binary platform win name
scripts_OnDisconnect_unmount.bat disk0:/unmount.bat
```

### Verify Customizations Using Threat Defense Commands

Use the following commands on the threat defense to verify the customizations:

- **show import webvpn translation-table detailed:** Shows the available translation tables.

```
HQ-FTD# show import webvpn translation-table detailed
Translation Tables' Templates:
  AnyConnect          ia4DaAXNSv15pZboQRGJcs9KMXy=
  customization
Translation Tables:
  fr      customization      BWwodsOt1PbvDvYOp8hLb3W7a64=
  ja      customization      lNvUk1+qTLNZyNrBcApMQPHnm1M=
  ru      customization      UqyKyUAcjR+xtGUtdiIFnoIiW5U=
```

- **show import webvpn AnyConnect-customization detailed:** Shows the details of the Secure Client customizations.

```
HQ-FTD# show import webvpn AnyConnect-customization detailed
OEM resources for AnyConnect client:
linux-64/binary/scripts_OnConnect_conn.sh      w6+n7z80D/8AR+ul2f7DvTmcDTw=
linux-64/binary/scripts_OnDisconnect_discon.sh  jx5LJC2XBEmEkGeww59CAkszvni=
linux-64/resource/company-logo.png             GsfBDroqGSQEEwuBDS/3DJNVv88=
win/binary/scripts_OnConnect_mount.bat         dzjfsLYYft/XM1PlzskK1+Wv1bw=
win/binary/scripts_OnDisconnect_unmount.bat     k6x1KhF1l2IRyJu08+sdYXgKNgM=
win/resource/company_logo.png                  cmEvxwqvtaS+Pz/6sb9n3NZudS4=
```

### Verify Customizations in Secure Client

- In Secure Client, click the **Message History** tab to verify that the customizations are downloaded.
- Use the DART tool to view the client-side diagnostics.

**Table 83: Verifying the Customizations in Secure Client**

Customization	Verification
GUI text and message customizations	<ul style="list-style-type: none"> <li>• Verify if Secure Client has the language localization or customized files in the following locations:             <ul style="list-style-type: none"> <li>• Windows: %ProgramData%\Cisco\Cisco AnyConnect Secure Mobility Client\110n\&lt;language-code&gt;\LC_MESSAGES (AnyConnect versions 4.9 and earlier)</li> <li>• Windows: %ProgramData%\Cisco\Cisco Secure Client\110n\&lt;language-code&gt;\LC_MESSAGES (Secure Client versions 5.0 and later)</li> <li>• For Mac OS and Linux:                 <pre>/opt/cisco/anyconnect/110n/&lt;LANGUAGE-CODE&gt;/LC_MESSAGES</pre> </li> </ul> </li> <li>• Verify the contents of the localized or customized file and confirm if they have the customized or localized strings. For example: AnyConnect.mo</li> </ul>

Customization	Verification

## Configure Secure Client Management VPN Tunnel

A management VPN tunnel provides connectivity to the corporate network whenever a client system is powered up, without the VPN users having to connect to the VPN. This helps organizations keep their endpoints up-to-date with software patches and updates. Management tunnel disconnects when the user-initiated VPN tunnel is established.

This section provides information about configuring Secure Client management VPN tunnel on Firewall Threat Defense. Configuring the Secure Client management tunnel on Firewall Threat Defense using the Firewall Management Center web interface requires the following settings:

- A **Connection profile** with certificate-based authentication and a group URL.
- **Secure Client management VPN profile file**, configured a server with group URL and backup servers if required.
- A **Group policy** with the management VPN profile, split tunneling with explicitly included networks, client bypass protocol, and no banner.

For detailed instructions on configuring the Secure Client Management VPN tunnel, see [Configuring Secure Client Management VPN Tunnel on Firewall Threat Defense](#), on page 1519.

## Requirements and Prerequisites for Secure Client Management VPN Tunnel

### Software and Configuration Requirements

Ensure that you have the following before you configure the Secure Client Management tunnel on using the Firewall Threat Defense using the Firewall Management Center web interface:

- Ensure that you are using Firewall Threat Defense and Firewall Management Center versions 6.7.0 or above.
- Download the Secure ClientSecure Client VPN Webdeploy package 4.7 or above and upload it to Firewall Threat Defense remote access VPN.
- Ensure that the certificate authentication is configured in the connection profile.
- Ensure that no banner is configured in the group policy.
- Check the split tunneling configuration in the management tunnel-group policy.

### Certificate Requirements

- Firewall Threat Defense must have a valid identity certificate for remote access VPN and the root certificate from the local certifying authority (CA) must be present on the Firewall Threat Defense.
- Endpoints connecting to the management VPN tunnel must have a valid identity certificate.
- CA certificate for Firewall Threat Defense's identity certificate must be installed on the endpoints and the CA certificate for the endpoints must be installed on the Firewall Threat Defense.
- The identity certificate issued by the same local CA must be present in the Machine store.  
Certificate Store (For Windows) and/or in System Keychain (For macOS).

## Limitations of Secure Client Management VPN Tunnel

- Secure Client Management VPN Tunnel supports only certificate authentication, it does not support AAA-based authentication.
- Public or private proxy settings are not supported.
- Secure Client upgrade and AnyConnect module download are not supported when the management VPN tunnel is connected.

## Configuring Secure Client Management VPN Tunnel on Firewall Threat Defense

### Procedure

---

**Step 1** Create a remote access VPN policy configuration using the wizard:

For information about configuring a remote access VPN, see [Configuring a New Remote Access VPN Connection, on page 1461](#).

**Step 2** Configure connection profile settings for management VPN tunnel:

**Note**

It is advisable to create a new connection profile to be used only for Secure Client management VPN tunnel.

- a) Edit the remote access VPN policy you have created.
- b) Select and edit the connection profile that will be used for management VPN tunnel.
- c) Click **AAA > Authentication Method** and select **Client Certificate Only**. Configure the authorization and accounting settings as required.
- d) Click the **Aliases** tab of the connection profile.
- e) Click **Add (+)** under URL Aliases and **URL Alias** for the connection profile.
- f) Click **Enabled** to enable the URL.
- g) Click **OK** and then click **Save** to save the connection profile settings.

For more information about connection profile settings, see [Configure Connection Profile Settings, on page 1472](#).

**Step 3 Create a management tunnel profile using the Secure Client profile editor:**

- a) Download the Secure Client **VPN Management Tunnel Standalone Profile Editor** from [Cisco Software Download Center](#) if you have not done already.
- b) Create a management tunnel profile with the required settings for your VPN users and save the file.
- c) Configure a server in the Server List with the group URL you have configured in the connection profile.

For information about creating a management profile using the Profile Editor, see the [Cisco Secure Client \(including AnyConnect\) Administrator Guide](#).

**Step 4 Create a management tunnel object:**

- a) On your Secure Firewall Management Center web interface, navigate to **Object > Object Management > VPN > Secure Client File**.
- b) Click **Add Secure Client File**.
- c) Specify the **Name** for the Secure Client file.
- d) Click **Browse** and select the management tunnel profile file you have saved.
- e) Click the **File Type** drop-down and select **Secure Client Management VPN Profile**.
- f) Click **Save**.

**Note**

You can also create the management tunnel object when you create or update Secure Client settings for a group policy. See [Group Policy Secure Client Options, on page 1349](#).

**Step 5 Associate a management profile with a group policy and configure group policy settings:**

You must add the management VPN profile to the group policy associated with the connection profile used for the management tunnel VPN connection. When the user connects, the management VPN profile is downloaded along with the user VPN profile already mapped to the group policy, enabling the management VPN tunnel feature.

**Caution**

**No Banner:** Check and ensure that no banner is configured in the group policy settings. You can check the banner settings under **Group Policy > General Settings > Banner**.

- a) Edit the connect profile you have created for management VPN tunnel.
- b) Click **Edit Group Policy > Secure Client > Management Profile**.
- c) Click the **Management VPN Profile** drop-down and select the management profile file object you have created.

**Note**

You can also click + and add a new Secure Client Management VPN Profile object.

- d) Click **Save**.

**Step 6 Configure split tunneling in group policy:**

- a) Click **Edit Group Policy > General > Split Tunneling**.
- b) From the IPv4 or IPv6 split tunneling drop-down, select **Tunnel networks specified below**.
- c) Select the Split Tunnel Network List Type: **Standard Access List** or **Extended Access List**, and then select the required access list to allow the traffic over the management VPN tunnel.
- d) Click **Save** to save the split tunnel settings.

**Secure Client Custom Attribute**

Secure Client Management VPN tunnel requires split include tunneling configuration by default. If you are configuring Secure Client custom attribute in the group policy to deploy the management VPN tunnel with split tunneling to tunnel all, you can do so using FlexConfig because Firewall Management Center 6.7 web interface does not support Secure Client custom attribute.

The following is an example command for Secure Client custom attribute:

```
webvpn
 anyconnect-custom-attr ManagementTunnelAllAllowed description ManagementTunnelAllAllowed
 anyconnect-custom-data ManagementTunnelAllAllowed true true
 group-policy MGMT_Tunnel attributes
  anyconnect-custom ManagementTunnelAllAllowed value true
```

**Step 7 Deploy, verify, and monitor the remote access VPN policy:**

- a) Deploy the management VPN tunnel configuration to Firewall Threat Defense.

**Note**

Client systems must connect to the Firewall Threat Defense remote access VPN once to download the management tunnel VPN profile to the client machines.

- b) You can verify the Secure Client management VPN tunnel at **Secure Mobility Client > VPN > Statistics**.  
You can also check the management VPN session details on the Firewall Threat Defense command prompt using the **show vpn-sessiondb anyconnect** command.
- c) On your Firewall Management Center web interface, click **Analysis** to view the management tunnel session information.

## Multiple Certificate Authentication

Multiple certificate based authentication gives the ability to have the Firewall Threat Defense validate the machine or device certificate, to ensure the device is a corporate-issued device, in addition to authenticating the user's identity certificate to allow VPN access using the Secure Client during SSL or IKEv2 EAP phase.

The multiple certificates option allows certificate authentication of both the machine and user via certificates. Without this option, you could only do certificate authentication of either machine or the user, but not both.

## Guidelines and Limitations of Multiple Certificate Authentication

**Note** When you configure multiple certificate authentication, ensure that you set the value of **AutomaticCertSelection** to true in the Cisco Secure Client Profile settings.

- Multiple certificate authentication currently limits the number of certificates to two.
- Secure Client must indicate support for multiple certificate authentication. If that is not the case then the gateway uses one of the legacy authentication methods or fails the connection. Secure Client version 4.4.04030 or later supports Multi-Certificate based authentication.
- Secure Client supports only RSA-based certificates.
- Only SHA256, SHA384, and SHA512 based certificate are supported during the Secure Client aggregate authentication.
- Certificate authentication cannot be combined with SAML authentication.

## Configuring Multiple Certificate Authentication

### Before you begin

Before you configure multiple certificate authentication, ensure that you have configured the certificate enrollment object that is used to obtain the identity certificate for each Firewall Threat Defense device. For more information, see [Certificate Map Objects, on page 1342](#).

### Procedure

**Step 1** Choose **Devices > VPN > Remote Access**.

**Step 2** Select the remote access VPN policy and click **Edit**.

#### Note

If you have not configured a remote access VPN, click **Add** to create a new remote access VPN policy.

**Step 3** Select and **Edit** a connection profile to configure multiple certificate authentication.

**Step 4** Click **AAA** settings and select **Authentication Method > Client Certificate Only** or **Client Certificate & AAA**.

#### Note

Select the **Authentication Server** if you have selected the Client Certificate & AAA authentication method

**Step 5** Select the **Enable multiple certificate authentication** checkbox.

**Step 6** Choose one of the certificates to **Map username from client certificate**:

- **First Certificate**— Select this option to map the username from the machine certificate sent from the VPN client.

- **Second Certificate**— Select this option to map the username from the user certificate sent from the client.

The username sent from the client is used as the VPN session username when certificate only authentication is enabled. When AAA and certificate authentication is enabled, VPN session username will be based on prefill option.

**Note**

If you select the **Map specific field** option, which includes the username from the client certificate, the **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively.

If you select the **Use entire DN (Distinguished Name) as username** option, the system automatically retrieves the user identity. A distinguished name (DN) is a unique identification, made up of individual fields that can be used as the identifier when matching users to a connection profile DN rules are used for enhanced certificate authentication.

If you have selected the Client Certificate & AAA authentication, select the **Prefill username from certificate on user login window** option to prefill the secondary username from the client certificate when the user connects via AnyConnect VPN module of Cisco Secure Client.

- **Hide username in login window:** The secondary username is pre-filled from the client certificate, but hidden to the user so that the user does not modify the pre-filled username.

**Step 7** Configure the required AAA settings and connection profile settings for the remote access VPN.

**Step 8** Save the connection profile and remote access VPN configuration and deploy it on your Firewall Threat Defense device.

---

[Configure AAA Settings for Remote Access VPN](#), on page 1475

## Customizing Remote Access VPN AAA Settings

This section provides information about customizing your AAA preferences for remote access VPNs. For more information, see [Configure AAA Settings for Remote Access VPN](#), on page 1475.

### Authenticate VPN Users via Client Certificates

You can configure remote access VPN authentication using client certificate when you create a new remote access VPN policy using the wizard or by editing the policy later.

**Before you begin**

Configure the certificate enrollment object that is used to obtain the identity certificate for each Firewall Threat Defense device that acts as a VPN gateway.

## Procedure

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > VPN > Remote Access**.
- Step 2** Select a remote access policy and click **Edit**; or click **Add** to create a new remote access VPN policy.
- Step 3** For a new remote access VPN policy, configure the authentication while selecting connection profile settings. For an existing configuration, select the connection profile that includes the client profile, and click **Edit**.
- Step 4** Click **AAA > Authentication Method > Client Certificate Only**.

With this authentication method, the user is authenticated using a client certificate. You must configure the client certificate on VPN client endpoints. By default, the user name is derived from client certificate fields CN and OU respectively. If the user name is specified in other fields in the client certificate, use 'Primary' and 'Secondary' field to map appropriate fields.

If you select **Map specific field** option, which includes the username from the client certificate. The **Primary** and **Secondary** fields display the following default values, respectively: **CN (Common Name)** and **OU (Organisational Unit)**. If you select the **Use entire DN as username** option, the system automatically retrieves the user identity. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a connection profile. DN rules are used for enhanced certificate authentication.

- Primary and Secondary fields pertaining to the **Map specific field** option contain these common values:

- C (Country)
- CN (Common Name)
- DNQ (DN Qualifier)
- EA (Email Address)
- GENQ (Generational Qualifier)
- GN (Given Name)
- I (Initial)
- L (Locality)
- N (Name)
- O (Organisation)
- OU (Organisational Unit)
- SER (Serial Number)
- SN (Surname)
- SP (State Province)
- T (Title)
- UID (User ID)
- UPN (User Principal Name)

- Whichever authentication method you choose, select or deselect **Allow connection only if user exists in authorization database**.

For more information, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

**Step 5** Save your changes.

---

#### Related Topics

- [Adding Certificate Enrollment Objects](#), on page 1294

## Configure VPN User Authentication via Client Certificate and AAA Server

When you configure remote access VPN authentication to use both client certificate and authentication server, VPN client authentication is done using both the client certificate validation and AAA server.

#### Before you begin

- Configure the certificate enrollment object that you use to obtain the identity certificate for each Firewall Threat Defense device that acts as a VPN gateway.
- Configure the RADIUS server group object and any AD or LDAP realms to use in the remote access VPN policy configuration.
- Ensure that the AAA Server is reachable from the Secure Firewall Threat Defense device for the remote access VPN configuration to work.

#### Procedure

---

- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > Remote Access**.
- Step 2** Click **Edit** on the remote access VPN policy for which you want to update the authentication or click **Add** to create new one.
- Step 3** If you choose to create new remote access VPN policy, configure the authentication while selecting connection profile settings. For an existing configuration, select the connection profile that includes the client profile, and click **Edit**.
- Step 4** Go to **AAA** and from the **Authentication Method** drop-down, choose **Client Certificate & AAA**.
- When you select the **Authentication Method** as:
    - Client Certificate & AAA**—Both types of authentication are done.
      - **AAA**—If you select the **Authentication Server** as **RADIUS**, by default, the Authorization Server has the same value. Select the **Accounting Server** from the drop-down list. Whenever you select **AD** and **LDAP** from the Authentication Server drop-down list, you must manually select the **Authorization Server** and **Accounting Server** respectively.
      - **Client Certificate**—Authenticates the user with client certificate. You must configure client certificate on the VPN client endpoints. By default, the username is derived from client certificate fields **CN** & **OU** respectively. If you use any other field in the client profile to specify the username, use **Primary Field** and **Secondary Field** to map appropriate fields.

If you select **Map specific field** option, which includes the username from the client certificate. The **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively. If you select the **Use entire DN as username** option, the system automatically retrieves the user identity. A distinguished name (DN) is a unique identification, made up of individual fields that can be used as the identifier when matching users to a connection profile. DN rules are used for enhanced certificate authentication.

Primary and Secondary fields pertaining to the **Map specific field** option contains these common values:

- C (Country)
  - CN (Common Name)
  - DNQ (DN Qualifier)
  - EA (Email Address)
  - GENQ (Generational Qualifier)
  - GN (Given Name)
  - I (Initial)
  - L (Locality)
  - N (Name)
  - O (Organisation)
  - OU (Organisational Unit)
  - SER (Serial Number)
  - SN (Surname)
  - SP (State Province)
  - T (Title)
  - UID (User ID)
  - UPN (User Principal Name)
- Whichever authentication method you choose, select or deselect **Allow connection only if user exists in authorization database**.

For more information, see [Configure AAA Settings for Remote Access VPN](#), on page 1475.

**Step 5** Save your changes.

## Manage Password Changes over VPN Sessions

Password management allows remote access VPN policy administrator to configure the notification settings for the remote access VPN users on their password expiry. Password management is available in AAA settings with authentication methods AAA Only and Client Certificate & AAA. For more information, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

### Procedure

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > Remote Access**.
  - Step 2** Click **Edit** on the remote access VPN policy that you want to update.
  - Step 3** Click **Edit** on the connection profile that includes AAA settings.
  - Step 4** Choose **AAA > Advanced Settings >**.
  - Step 5** Check the **Enable Password Management** check-box and select one of the following:
    - Notify User - days ahead of password expiry and specify the number of days in the box.
    - Notify user on the day of password expiration.
  - Step 6** Save your changes.

---

[Configure Connection Profile Settings](#), on page 1472

## Send Accounting Records to the RADIUS Server

Accounting records in remote access VPN help the VPN administrator track the services that users access and the amount of network resources that they consume. Accounting information includes when user session start and stop, username, the number of bytes that pass through the device for each session, the service used, and the duration of each session.

You can use accounting alone or together with authentication and authorization. When you activate AAA accounting, the network access server reports the user activity to the configured accounting server. You can configure a RADIUS server as the accounting server so that the Firewall Management Center sends all the user activity information to the RADIUS server.

---

**Note** You can use the same RADIUS server or separate RADIUS servers for authentication, authorization, and accounting in remote access VPN AAA settings.

---

### Before you begin

- Configure a RADIUS group object with RADIUS servers to receive authentication requests or accounting records. For more information, see [RADIUS Server Group Options, on page 1246](#).

- Ensure that the RADIUS server is reachable from the Firewall Threat Defense device. Configure routing on your Secure Firewall Management Center at **Devices > Device Management > Edit Device > Routing** to ensure connectivity to the RADIUS server.

### Procedure

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > Remote Access**.
- Step 2** Click **Edit** on the remote access policy for which you want to configure RADIUS server, or create new remote access VPN policy.
- Step 3** Click **Edit** on the connection profile that includes AAA settings and choose **AAA**.
- Step 4** Select the RADIUS server from the **Accounting Server** drop-down.
- Step 5** Save your changes.
-

## Delegating Group Policy Selection to Authorization Server

The group policy applied to a user is determined when the VPN tunnel is being established. You can select a group policy for a connection profile while creating a remote access VPN policy using the wizard or update the connection policy for connection profiles later. However, you can configure the AAA (RADIUS) server to assign the group policy or it is obtained from the current connection profile. If the Firewall Threat Defense device receives attributes from the external AAA server that conflicts with those configured on the connection profile, then attributes from the AAA server always take the precedence.

You can configure ISE or the RADIUS Server to set the Authorization Profile for a user or user-group by sending IETF RADIUS Attribute 25 and map to the corresponding group policy name. You can configure specific group policy to a user or user group to push a Downloadable ACL, set a banner, Restrict VLAN, and configure the advanced option of applying an SGT to the session. These attributes are applied to all users that are part of that group when the VPN connection is established.

For more information, see the Configure Standard Authorization Policies section of [Cisco Identity Services Engine Administrator Guide](#) and [RADIUS Server Attributes for Secure Firewall Threat Defense](#), on page 1480.

**Figure 408: Remote Access VPN Group Policy Selection by AAA Server****Related Topics**

[Configure Group Policy Objects](#), on page 1346

[Configure Connection Profile Settings](#), on page 1472

## Override the Selection of Group Policy or Other Attributes by the Authorization Server

When a remote access VPN user connects to the VPN, the group policy and other attributes configured in the connection profile are assigned to the user. However, the remote access VPN system administrator can delegate the selection of group policy and other attributes to the authorization server by configuring ISE or the RADIUS Server to set the Authorization Profile for a user or user-group. Once users are authenticated, these specific authorization attributes are pushed to the Firewall Threat Defense device.

**Before you begin**

Ensure that you configure a remote access VPN policy with RADIUS as the authentication server.

**Procedure**

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > VPN > Remote Access**.
  - Step 2** Select a remote access policy and click **Edit**.
  - Step 3** Select RADIUS or ISE as the authorization server if not configured already.
  - Step 4** Select **AdvancedGroup Policies** and add the required group policy. For detailed information about a group policy object, see [Configure Group Policy Objects](#), on page 1346.

You can map only one group policy to a connection profile; but you can create multiple group policies in a remote access VPN policy. These group policies can be referenced in ISE or the RADIUS server and configured to override the group policy configured in the connection profile by assigning the authorization attributes in the authorization server.

**Step 5** Deploy the configuration on the target Firewall Threat Defense device.

**Step 6** On the authorization server, create an Authorization Profile with RADIUS attributes for IP address and downloadable ACLs.

When the group policy is configured in the authorization server selected for remote access VPN, the group policy overrides the group policy configured in the connection profile for the remote access VPN user after the user is authenticated.

---

#### Related Topics

[Configure Group Policy Objects](#), on page 1346

## Deny VPN Access to a User Group

When you do not want an authenticated user or user group to be able to use VPN, you can configure a group policy to deny VPN access. You can configure a group policy in a remote access VPN policy and reference it in the ISE or RADIUS server configuration for authorization.

#### Before you begin

Ensure that you have configured remote access VPN using the Remote Access Policy wizard and configured authentication settings for the remote access VPN policy.

#### Procedure

---

**Step 1** On your Secure Firewall Management Center web interface, choose **Devices > VPN > Remote Access**.

**Step 2** Select a remote access policy and click **Edit**.

**Step 3** Select **AdvancedGroup Policies**.

**Step 4** Select a group policy and click **Edit** or add a new group policy.

**Step 5** Select **AdvancedSession Settings** and set **Simultaneous Login Per User** to 0 (zero).  
This stops the user or user group from connecting to the VPN even once.

**Step 6** Click **Save** to save the group policy and then save the remote access VPN configuration.

**Step 7** Configure ISE or the RADIUS server to set the Authorization Profile for that user/user-group to send IETF RADIUS Attribute 25 and map to the corresponding group policy name.

**Step 8** Configure the ISE or RADIUS server as the authorization server in the remote access VPN policy.

**Step 9** Save and deploy the remote access VPN policy.

---

## Restrict Connection Profile Selection for a User Group

When you want to enforce a single connection profile on a user or user group, you can choose to disable the connection profile so that the group alias or URLs are not available for the users to select when they connect using the AnyConnect VPN module of Cisco Secure Client.

For example, if your organization wants to use specific configurations for different VPN user groups such as mobile users, corporate-issued laptop users, or personal laptop users, you can configure connection a profile specific to each of these user groups and apply the appropriate connection profile when the user connects to the VPN.

The AnyConnect VPN module of Cisco Secure Client, by default, shows a list of the connection profiles ( by connection profile name, alias, or alias URL) configured in Firewall Management Center and deployed on Firewall Threat Defense. If custom connection profiles are not configured, AnyConnect VPN module of Cisco Secure Client shows the *DefaultWEBVPNGroup* connection profile. Use the following procedure to enforce a single connection profile for a user group.

### Before you begin

- On your Secure Firewall Management Center web interface, configure remote access VPN using the remote access VPN policy wizard with Authentication Method as 'Client Certificate Only' or 'Client Certificate + AAA'. Choose the username fields from the certificate.
- Configure ISE or RADIUS server for authorization and associate the group policy with the authorization server.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | On your Secure Firewall Management Center web interface, choose <b>Devices &gt; VPN &gt; Remote Access</b> .   |
| <b>Step 2</b> | Select a remote access policy and click <b>Edit</b> .  |
| <b>Step 3</b> | Select <b>Access Interfaces</b> and disable <b>Allow users to select connection profile while logging in</b> . |
| <b>Step 4</b> | Click <b>Advanced Certificate Maps</b> .   |
| <b>Step 5</b> | Select <b>Use the configured rules to match a certificate to a Connection Profile</b> .                        |
| <b>Step 6</b> | Select the <b>Certificate Map Name</b> or click the <b>Add</b> icon to add a certificate rule.                 |
| <b>Step 7</b> | Select the <b>Connection Profile</b> , and click <b>Ok</b> .   |
- With this configuration, when a user connects from the AnyConnect VPN module of Cisco Secure Client, the user will have the mapped connection profile and will be authenticated to use the VPN.
-

## Update the Secure Client Profile for Remote Access VPN Clients

Secure Client Profile is an XML file that contains an administrator-defined end user requirements and authentication policies to be deployed on a VPN client system as part of Secure Client. It makes the preconfigured network profiles available to end users.

You can use the GUI-based Secure Client Profile Editor, an independent configuration tool, to create them. The standalone profile editor can be used to create a new or modify existing Secure Client profile. You can download the profile editor from [Cisco Software Download Center](#).

See the Secure Client Profile Editor chapter in the appropriate release of the [Cisco Secure Client \(including AnyConnect\) Administrator Guide](#) for details.

### Before you begin

- Ensure that you have configured remote access VPN using the Remote Access Policy wizard and deployed the configuration on Firewall Threat Defense device. See [Create a New Remote Access VPN Policy](#), on page 1462.
- On your Secure Firewall Management Center web interface, go to **Objects > Object Management > VPN > Secure Client File** and add the new Secure Client image.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | On your Secure Firewall Management Center web interface, choose <b>Devices &gt; VPN &gt; Remote Access</b> . |
| <b>Step 2</b> | Select a remote access VPN policy and click <b>Edit</b> .  |
| <b>Step 3</b> | Select the connection profile that includes the client profile to be edited, and click <b>Edit</b> .         |
| <b>Step 4</b> | Click <b>Edit Group Policy &gt; Secure Client &gt; Profiles</b> .  |
| <b>Step 5</b> | Select the client profile XML file from the list or click <b>Add</b> to add a new client profile.            |
| <b>Step 6</b> | Save the group policy, connection profile, and then the remote access VPN policy.                            |
| <b>Step 7</b> | Deploy the changes.  |
- Changes to the client profile will be updated on the VPN clients when they connect to the remote access VPN gateway.
-

## RADIUS Dynamic Authorization

Secure Firewall Threat Defense has the capability to use RADIUS servers for user authorization of VPN remote access and firewall cut-through-proxy sessions using dynamic access control lists (ACLs) or ACL names per user. To implement dynamic ACLs for dynamic authorization or RADIUS Change of Authorization (RADIUS CoA), you must configure the RADIUS server to support them. When the user tries to authenticate, the RADIUS server sends a downloadable ACL or ACL name to the Firewall Threat Defense. Access to a given service is either permitted or denied by the ACL. Secure Firewall Threat Defense deletes the ACL when the authentication session expires.

### Related Topics

## Configuring RADIUS Dynamic Authorization

### Before you begin:

- Only one interface can be configured in the security zone or interface group if it is referred in a RADIUS Server.
- A dynamic authorization enabled RADIUS server requires Secure Firewall Threat Defense 6.3 or later for the dynamic authorization to work.
- Interface selection in RADIUS server is not supported on Secure Firewall Threat Defense 6.2.3 or earlier versions. The interface option will be ignored during deployment.
- Firewall Threat Defense posture VPN does not support group policy change through dynamic authorization or RADIUS change of authorization (CoA).

**Table 84: Procedure**

	Do This	More Info
Step 1	Log on to your Secure Firewall Management Center web interface.	
Step 2	Configure a RADIUS server object with dynamic authorization.	<a href="#">RADIUS Server Group Options, on page 1246</a>
Step 3	Configure a route to ISE server through an interface enabled for change of authorization (CoA) to establish connectivity from Firewall Threat Defense to RADIUS server through routing or a specific interface.	<a href="#">RADIUS Server Group Options, on page 1246</a>
Step 4	Configure a remote access VPN policy and select the RADIUS server group object that you have created with dynamic authorization.	<a href="#">Create a New Remote Access VPN Policy, on page 1462</a>
Step 5	Configure the DNS server details and domain-lookup interfaces using the Platform Settings.	<a href="#">Configure DNS, on page 1467</a> <a href="#">DNS Server Group, on page 1264</a>
Step 6	Configure a split-tunnel in group policy to allow DNS traffic through Remote Access VPN tunnel if the DNS server is reachable through VNP network.	<a href="#">Configure Group Policy Objects, on page 1346</a>
Step 7	Deploy the configuration changes.	<a href="#">Deploy Configuration Changes, on page 183</a>

## Two-Factor Authentication

You can configure two-factor authentication for the remote access VPN. With two-factor authentication, the user must supply a username and static password, plus an additional item such as an RSA token or a passcode. Two-factor authentication differs from using a second authentication source in that two-factor is configured on a single authentication source, with the relationship to the RSA server tied to the primary authentication source.

Secure Firewall Threat Defense supports RSA tokens and Duo Push authentication requests to Duo Mobile for the second factor in conjunction with any RADIUS or AD server as the first factor in the two-factor authentication process.

### Configuring RSA Two-Factor Authentication

#### About this task:

You can configure the RADIUS or AD server as the authentication agent in the RSA server, and use the server in Secure Firewall Management Center as the primary authentication source in the remote access VPN.

When using this approach, the user must authenticate using a username that is configured in the RADIUS or AD server, and concatenate the password with the one-time temporary RSA token, separating the password and token with a comma: *password,token*.

In this configuration, it is typical to use a separate RADIUS server (such as one supplied in Cisco ISE) to provide authorization services. You would configure the second RADIUS server as the authorization and, optionally, accounting server.

#### Before you begin:

Ensure that the following configurations are complete before configuring RADIUS two-factor authentication on Secure Firewall Threat Defense:

#### On the RSA Server

- Configure RADIUS or Active Directory server as an authentication agent.
- Generate and download the configuration (*sdconf.rec*) file.
- Create a token profile, assign the token to the user, and distribute the token to the user. Download and install the token on the remote access VPN client system.

For more information, see [RSA SecureID Suite documentation](#).

#### On the ISE Server

- Import the configuration (*sdconf.rec*) file generated on the RSA server.
- Add the RSA server as the external identity source and specify the shared secret.

**Table 85: Procedure**

	Do This	More Info
Step 1	Log on to your Secure Firewall Management Center web interface.	

	Do This	More Info
Step 2	Create a RADIUS server group.	<a href="#">RADIUS Server Group Options, on page 1246</a>
Step 3	Create a RADIUS Server object within the new RADIUS server group, with RADIUS or AD server as the host and with a timeout of 60 seconds or more.	<a href="#">RADIUS Server Group Options, on page 1246</a> <b>Note</b> The RADIUS or AD server must be the same server that is configured as the authentication agent in RSA server. For two-factor authentication, make sure that the timeout is updated to 60 seconds or more in the Secure Client Profile XML file as well.
Step 4	Configure a new remote access VPN policy using the wizard or edit an existing remote access VPN policy.	<a href="#">Create a New Remote Access VPN Policy, on page 1462</a>
Step 5	Select RADIUS as the authentication server and then select the newly-created RADIUS server group as the authentication server.	<a href="#">Configure AAA Settings for Remote Access VPN, on page 1475</a>
Step 7	Deploy the configuration changes.	<a href="#">Deploy Configuration Changes, on page 183</a>

## Configuring Duo Two-Factor Authentication

### About this task:

You can configure the Duo RADIUS server as the primary authentication source. This approach uses the Duo RADIUS Authentication Proxy. (You cannot use a direct connection with the Duo Cloud Service over LDAPS.)

For the detailed steps to configure Duo, see <https://duo.com/docs/cisco-firepower>.

You would then configure Duo to forward authentication requests directed to the proxy server to use another RADIUS server, or an AD server, as the first authentication factor, and the Duo Cloud Service as the second factor.

When using this approach, the user must authenticate using a username that is configured on both the Duo Cloud or web server, and the associated RADIUS server. The user must enter the password configured in the RADIUS server, followed by one of the following Duo codes:

- **Duo-passcode.** For example, *my-password,123456*.
- **push.** For example, *my-password,push*. Use **push** to tell Duo to send a push authentication to the Duo Mobile app, which the user must have already installed and registered.
- **sms.** For example, *my-password,sms*. Use **sms** to tell Duo to send an SMS message with a new batch of passcodes to the user's mobile device. The user's authentication attempt will fail when using **sms**. The user must then re-authenticate and enter the new passcode as the secondary factor.
- **phone.** For example, *my-password,phone*. Use **phone** to authenticate using phone callback.

For more information on login options with examples, see <https://guide.duo.com/anyconnect>.

**Before you begin:**

Before configuring two-factor authentication with Duo Authentication Proxy on Firewall Threat Defense, ensure that you complete the following configurations:

- Configure a working primary authentication (RADIUS or AD) for your remote access VPN users before you begin to deploy Duo.
- Install Duo proxy service on a Windows or Linux machine within your network to integrate Duo with Secure Firewall Threat Defense remote access VPN. This Duo proxy server also acts as a RADIUS server.

Download and install the most recent Duo authentication proxy from the following location:

- **Windows:** <https://dl.duosecurity.com/duoauthproxy-latest.exe>
- **Linux:** <https://dl.duosecurity.com/duoauthproxy-latest-src.tgz>
- Verify the checksum at <https://duo.com/docs/checksums#duo-authentication-proxy>.
- Configure Duo authentication file `authproxy.cfg`. Follow instructions on the <https://duo.com/docs/cisco-firepower#configure-the-proxy> page to configure the authentication configuration settings.  
The `authproxy.cfg` configuration file must contain the details for RADIUS or ISE server, Firewall Threat Defense device, Duo proxy server details, Integration Key, Secret key, and API host details.
- Ensure that you have the right API host information in the `authproxy.cfg` file.
- Configure other required settings such as secondary authentication factor in the newly installed Duo proxy server at **Duo Security Server > Duo Admin Panel > Applications > CISCO RADIUS VPN**.

**Table 86: Procedure**

	Do This	More Info
Step 1	Log on to your Secure Firewall Management Center web interface.	
Step 2	Create a RADIUS server group.	<a href="#">RADIUS Server Group Options, on page 1246</a>
Step 3	Create a RADIUS Server object within the new RADIUS server group with Duo proxy server as the host with a timeout of 60 seconds or more.	<a href="#">RADIUS Server Options, on page 1248</a> <b>Note</b> For two-factor authentication, make sure that the timeout is updated to 60 seconds or more in the Secure Client Profile XML file as well.
Step 4	Configure a new remote access VPN policy using the wizard or edit an existing remote access VPN policy.	<a href="#">Create a New Remote Access VPN Policy, on page 1462</a>
Step 5	Select RADIUS as the authentication server and then select the RADIUS server group created with the Duo proxy server as the authentication server.	<a href="#">Configure AAA Settings for Remote Access VPN, on page 1475</a>

	Do This	More Info
Step 7	Deploy the configuration changes.	<a href="#">Deploy Configuration Changes, on page 183</a>

## Secondary Authentication

Secondary authentication or double authentication in Secure Firewall Threat Defense adds an additional layer of security to remote access VPN connections by using two different authentication servers. With secondary authentication enabled, the Secure Client VPN users must provide two sets of credentials to login to the VPN gateway.

Secure Firewall Threat Defense remote access VPN supports secondary authentication in AAA Only and Client Certificate & AAA authentication methods.

**Figure 409: Remote Access VPN Secondary or Double Authentication**

### Related Topics

[Configure Remote Access VPN Secondary Authentication](#), on page 1537

## Configure Remote Access VPN Secondary Authentication

When remote access VPN authentication is configured to use both client certificate and authentication sever, VPN client authentication is done using both the client certificate validation and AAA server.

### Before you begin

- Configure two authentication (AAA) servers— the primary and secondary authentication servers, and required identity certificates. The authentication servers can be RADIUS server, and AD or LDAP realms.
- Ensure that the AAA servers are reachable from the Secure Firewall Threat Defense device for the remote access VPN configuration to work. Configure routing (at **Devices > Device Management > Edit Device > Routing**) to ensure connectivity to the AAA servers.

### Procedure

- 
- Step 1** On your Secure Firewall Management Center web interface, choose **Devices > VPN > Remote Access** .
- Step 2** Select a remote access policy and click **Edit**; or click **Add** to create a new remote access VPN policy.
- Step 3** For a new remote access VPN policy, configure the authentication while selecting connection profile settings. For an existing configuration, select the connection profile that includes the client profile, and click **Edit**.
- Step 4** Click **AAA > Authentication Method, AAA or Client Certificate & AAA**.

- When you select the **Authentication Method** as:

**Client Certificate & AAA**—Authentication is done using both client certificate and AAA server.

- **AAA**—If you select the **Authentication Server** as **RADIUS**, by default, the Authorization Server has the same value. Select the **Accounting Server** from the drop-down list. Whenever you select **AD** and **LDAP** from the Authentication Server drop-down list, you must manually select the **Authorization Server** and **Accounting Server** respectively.
- Whichever authentication method you choose, select or deselect **Allow connection only if user exists in authorization database**.
- **Use secondary authentication** — Secondary authentication is configured in addition to primary authentication to provide additional security for VPN sessions. Secondary authentication is applicable only to **AAA only** and **Client Certificate & AAA** authentication methods.

Secondary authentication is an optional feature that requires a VPN user to enter two sets of username and password on the Secure Client login screen. You can also configure to pre-fill the secondary username from the authentication server or client certificate. Remote access VPN authentication is granted only if both primary and secondary authentications are successful. VPN authentication is denied if any one of the authentication servers is not reachable or one authentication fails.

You must configure a secondary authentication server group (AAA server) for the second username and password before configuring secondary authentication. For example, you can set the primary authentication server to an LDAP or Active Directory realm and the secondary authentication to a RADIUS server.

#### Note

By default, secondary authentication is not required.

**Authentication Server**— Secondary authentication server to provide secondary username and password for VPN users.

Select the following under **Username for secondary authentication**:

- **Prompt**: Prompts the users to enter the username and password while logging on to VPN gateway.

- **Use primary authentication username:** The username is taken from the primary authentication server for both primary and secondary authentication; you must enter two passwords.
- **Map username from client certificate:** Prefills the secondary username from the client certificate.
  - If you select **Map specific field** option, which includes the username from the client certificate. The **Primary** and **Secondary** fields display default values: **CN (Common Name)** and **OU (Organisational Unit)** respectively. If you select the **Use entire DN (Distinguished Name) as username** option, the system automatically retrieves the user identity.  
  
See **Authentication Method** descriptions for more information about primary and secondary field mapping.
- **Prefill username from certificate on user login window:** Prefills the secondary username from the client certificate when the user connects via Secure Client.
  - **Hide username in login window:** The secondary username is pre-filled from the client certificate, but hidden to the user so that the user does not modify the pre-filled username.
- **Use secondary username for VPN session:** The secondary username is used for reporting user activity during a VPN session.

For more information, see [Configure AAA Settings for Remote Access VPN, on page 1475](#).

## Single Sign-On Authentication with SAML 2.0

### About SAML Single Sign-On Authentication

Security Assertion Markup Language (SAML) is an open standard for logging users into applications using their sessions in another context. Organizations already know the identity of users when users log in to their Active Directory (AD) domain or the intranet. They use this identity information to log in users to other applications, such as web-based applications using SAML. Individual applications do not need to store credentials and users do not have to remember and manage different sets of credentials for individual applications. SAML single sign-on (SSO) works by transferring the user's identity from one place (the identity provider) to another (the service provider).

### SAML Single Sign-On with Secure Firewall Threat Defense

The Secure Firewall Threat Defense device supports SAML 2.0 single sign-on (SSO) authentication for remote access VPN connections using the Secure Client. You need the following to configure SAML 2.0 SSO on Secure Firewall Threat Defense:

- **Identity Provider (IdP)**—The Duo Access Gateway acts as the identity provider to perform user authentication and issues assertions.
- **Service Provider (SP)**—The Firewall Threat Defense device acts as the service provider and obtains the authentication assertion from the identity provider.
- **VPN Client**—The Secure Client performs SAML 2.0 authentication via the embedded browser.

## Guidelines and Limitations for SAML 2.0

- Firewall Threat Defense supports the following signatures for SAML authentication:
  - SHA1 with RSA and HMAC
  - SHA2 with RSA and HMAC
- Firewall Threat Defense supports SAML 2.0 Redirect-POST binding , which is supported by all SAML IdPs.
- The Firewall Threat Defense functions as a SAML SP only. It cannot act as an Identity Provider in gateway mode or peer mode.
- You can enforce an access policy on a SAML-authenticated user if you have an associated identity policy with an AD realm matching the SAML domain. However, it does not work for Azure AD SAML because it requires additional mapping from the tenant ID of the Azure AD to an associated realm ID on the threat defense device.
- Having SAML authentication attributes available in DAP evaluation (similar to RADIUS attributes sent in RADIUS auth response from AAA server) is not supported. Firewall Threat Defense supports SAML enabled group policy on DAP policy; however, you cannot check the username attribute while using SAML authentication, because the username attribute is masked by the SAML Identity provider.
- Firewall Threat Defense administrators need to ensure clock synchronization between the Firewall Threat Defense and the SAML IdP for proper handling of authentication assertions and proper timeout behavior.
- Firewall Threat Defense administrators have the responsibility to maintain a valid signing certificate on both Firewall Threat Defense and IdP considering the following:
  - The IdP signing certificate is mandatory when configuring an IdP on the Firewall Threat Defense.
  - The Firewall Threat Defense does not do a revocation check on the signing certificate received from the IdP.
- In SAML assertions, there are NotBefore and NotOnOrAfter conditions. The Firewall Threat Defense SAML configured timeout interacts with these conditions as follows:
  - Timeout overrides NotOnOrAfter if the sum of NotBefore and timeout is earlier than NotOnOrAfter.
  - If NotBefore + timeout is later than NotOnOrAfter, then NotOnOrAfter takes effect.
  - If the NotBefore attribute is absent, the Firewall Threat Defense denies the login request. If the NotOnOrAfter attribute is absent and SAML timeout is not set, Firewall Threat Defense denies the login request.
- Firewall Threat Defense does not work with Duo in a deployment using an internal SAML, which forces the Firewall Threat Defense to proxy for the client to authenticate, due to the FQDN change that occurs during challenge/response for Two-factor authentication (push, code, password).
- When using SAML with Secure Client, follow these guidelines:
  - Untrusted server certificates are not allowed in the embedded browser.
  - The embedded browser SAML integration is not supported in CLI or SBL modes.
  - SAML authentication established in a web browser is not shared with Secure Client and vice versa.

- Depending on the configuration, various methods are used when connecting to the headend with the embedded browser. For example, while Secure Client might prefer an IPv4 connection over an IPv6 connection, the embedded browser might prefer IPv6, or vice versa. Similarly, Secure Client may fall back to no proxy after trying proxy and getting a failure, while the embedded browser may stop navigation after trying proxy and getting a failure.
- You must synchronize your Firewall Threat Defense's Network Time Protocol (NTP) server with the IdP NTP server in order to use the SAML feature.
- You cannot access internal servers with SSO after logging in using an internal IdP.
- The SAML IdP NameID attribute determines the user's username and is used for authorization, accounting, and VPN session database.
- SAML does not support Start Before Logon (SBL).
- Multiple attributes received with a SAML assertion are not supported.
- A firewall uses the Identity Provider Entity ID as the SAML object name from the single sign-on server object created in the Firewall Management Center (**Objects > Object Management > AAA Server > Single Sign-on Server**). Hence, you cannot use multiple SAML objects with the same Identity Provider Entity ID on a single firewall.

## Configuring a SAML Single Sign-On Authentication

### Before you begin

Ensure that you have done the following before you configure SAML single sign-on with Firewall Threat Defense remote access VPN:

- Create an account with Duo.
- Download and install the Duo Access Gateway.
- Obtain the following from your SAML identity provider (Duo).
  - Identity Provider Entity ID URL
  - Sign-in URL
  - Sign-out URL
  - Identity provider certificate
- Create a SAML single sign-on server object. For more information, see [Add a Single Sign-on Server, on page 1249](#).

#### Note

You can create a single sign-on server object in the **Connection Profile** settings when you create a new policy using the Remote Access VPN policy Wizard.

## Procedure

- 
- Step 1** Choose **Devices > VPN > Remote Access**.
  - Step 2** Click **Edit** next to the remote access VPN policy for which you want to configure SAML authentication. If you want to create a new policy, click **Add**.
  - Step 3** Click **Edit** on the connection profile that you want to modify.
  - Step 4** Choose **AAA** settings and select **SAML** from the **Authentication Method** drop-down.
  - Step 5** Choose the required SAML single sign-on server as the **Authentication Server**.
  - Step 6** Configure the required settings for the remote access VPN.
  - Step 7** Save and deploy the remote access VPN policy on your Firewall Threat Defense device.
- 

## Related Topics

[Configure AAA Settings for Remote Access VPN](#), on page 1475

# Configuring SAML Authorization

## About SAML Authorization

SAML authorization supports user attributes delivered in SAML assertions within the AAA and Dynamic Access Policy (DAP) frameworks. You can configure the SAML assertion attributes on the Identity Provider as name-value pairs which then parses as strings. The attributes received are made available to DAP so that they can be used when defining selection criteria within a DAP record. The SAML assertion *cisco\_group\_policy* is used to determine the Group Policy to be applied to the VPN session.

## Dynamic Access Policy Attribute Representation

In the DAP table, the DAP attributes are represented in the following format:

```
aaa.saml.name = "value"
```

Example, *aaa.saml.department = "finance"*

This attribute can be used in DAP selection as follows:

```
<attr>
<name>aaa.saml.department</name>
<value>finance</value>
<operation>EQ</operation>
</attr>
```

## Multi-Valued Attributes

Multi-valued attributes are also supported in DAP and the DAP table is indexed :

```
aaa.saml.name.1 = "value"
aaa.saml.name.2 = "value"
```

## Active Directory memberOf Attributes

The Active Directory (AD) memberOf attribute receives a special processing that is consistent with the way it is handled through an LDAP query.

Group names are represented by the CN attribute of the DN.

Example Attributes received from the authorization server:

```
memberOf = "CN=FTD-VPN-Group,OU=Users,OU=TechspotUsers,DC=techspot,DC=us"
memberOf = "CN=Domain Admins,OU=Users,DC=techspot,DC=us"
```

Dynamic Access Policy attributes:

```
aaa.saml.memberOf.1 = "FTD-VPN-Group"
aaa.saml.memberOf.2 = "Domain Admins"
```

### Interpretation of the cisco\_group\_policy Attribute

A group-policy can be specified by a SAML assertion attribute. When an attribute "cisco\_group\_policy" is received by the Firewall Threat Defense, the corresponding value is used to select the connection group-policy

## Configure SAML Authorization

### Before you begin

Ensure that you have configured a single sign-on server like DUO and completed the required Identity Provider (IdP) and Service Provider (SP) settings.

For more information, see [Single Sign-On Authentication with SAML 2.0, on page 1539](#).

### Procedure

- 
- Step 1** Configure a single sign-on server object if not configured already.
- Choose **Object > Object Management > AAA Server > Single Sign-on Server**
  - Click **Add Single Sign-on Server**.
  - Enter the single sign-on server details and click **Save**.
- For more information, see [Add a Single Sign-on Server, on page 1249](#).
- Step 2** Configure SAML authentication in the remote access VPN connection profile.
- Choose **Devices > Remote Access**.
  - Click **Edit** on the remote access VPN policy for which you want to configure SAML authorization or create a new policy.
  - Edit the required connection profile and select **AAA**.
  - Select the single sign-on server object from the **Authentication Server** drop-down.
  - Save the remote access VPN configuration.
- Step 3** Match a SAML criteria in DAP policy.
- Select **Devices > Dynamic Access Policy**.
  - Create a new DAP or edit an existing one.
  - Create a DAP record or edit an existing record.
  - Click **AAA Criteria > SAML Criteria > Add SAML Criteria**.
  - Create a SAML criteria based on the SAML assertions returned by the SSO server.
- Step 4** Deploy the remote access VPN configuration.
-

# Advanced Secure Client Configurations

## Configure Secure Client Modules on a Firewall Threat Defense

Secure Client can integrate with various Cisco endpoint security solutions and offer enhanced security using different Secure Client modules.

You can use the managed headend Firewall Threat Defense to distribute and manage Secure Client modules to the endpoints. When a user connects to the Firewall Threat Defense, it downloads and installs Secure Client and the required modules on the endpoint.

In version 6.7 and later, you can use the headend Firewall Threat Defense, managed by a Firewall Management Center, to distribute and manage Secure Client modules to the endpoints. These modules then integrate with the corresponding Cisco endpoint security solution.

In versions 6.4 to 6.6, you can enable these modules and profiles on a Firewall Threat Defense using FlexConfig. For more information, see [Configure AnyConnect Modules and Profiles Using FlexConfig](#).

**Benefits**

If you use a Firewall Threat Defense to distribute and manage Secure Client modules to the endpoints, you can easily perform the following tasks:

- Distribute and manage Secure Client modules and profiles on each endpoint.
- Upgrade Secure Client on each endpoint.

## Types of Secure Client Modules

**AMP Enabler**

Use this module to deploy Secure Endpoint, on endpoints. The module pushes Secure Endpoint to endpoints from a server hosted locally within the enterprise. This module provides an additional security agent that detects potential malware threats in the network, removes these threats, and protects the enterprise.

In Cisco Secure Client 5.0, AMP Enabler is only for macOS. Cisco Secure Client for Windows offers full integration with Cisco Secure Endpoint.

**ISE Posture**

Use this module to perform endpoint posture checks such as antivirus, antispyware, operating system and so on using Cisco Identity Services Engine (ISE) and assess the endpoint's compliance. ISE provides next generation identity and access control policy. ISE Posture performs a client-side evaluation. The client receives the posture requirement policy from the headend, performs the posture data collection, compares the results against the policy, and sends the assessment results back to the headend.

### Network Visibility

Use this module to monitor the endpoint application usage using the Network visibility module. You can uncover potential behavior anomalies and make informed network design decisions. It enhances the enterprise administrator's ability to do capacity and service planning, auditing, compliance, and security analytics. You can share the usage data with NetFlow analysis tools such as Cisco Stealthwatch.

### Umbrella Roaming Security

Use this module for a DNS-layer security using the Cisco Umbrella Roaming Security service. Cisco Umbrella provides content filtering, multiple policies, robust reporting, active directory integration, and much more.

### Web Security

Use this module to enable Cisco Secure Web Appliance (SWA), powered by Cisco Talos. This module protects the endpoint by blocking risky sites and testing unknown sites before allowing users to access them. It can deploy web security either through the on-prem WSA or the cloud-based Cisco Cloud Web Security. This module is not part of the AnyConnect package from release 4.5 and in Secure Client 5.0.

### Network Access Manager

This module provides a secure layer 2 network and performs device authentication to access wired and wireless networks. Network Access Manager manages user and device identity and the network access protocols required for secure access.

Network Access Manager is not supported on macOS or Linux.

### Start Before Login

Start Before Login (SBL) allows users to establish their VPN connection to the enterprise infrastructure before logging onto Windows. After the SBL module installation, you must enable SBL in the Secure Client VPN profile and add it to the remote access VPN group policy.

### DART

Diagnostics and Reporting Tool (DART) collates system logs and other diagnostic information to troubleshoot AnyConnect installation and connection problems. You can send this data to Cisco TAC for troubleshooting.

By default, DART is not enabled in new RA VPN group policies for 6.7 and later versions. In 6.6 and earlier versions, DART is enabled by default.

### Feedback

The customer experience feedback (CEF) module provides information about which features and modules you use and have enabled. This information gives an insight into the user experience so that Cisco can continue to improve the quality, reliability, performance, and user experience of the Cisco Secure Client. Secure Client does not download the Feedback module to the endpoint. The feedback data is sent to the Cisco Feedback Server.

## Prerequisites for Configuring Secure Client Modules

- Configure the associated products depending on the module that you are going to use.
- Download the following Secure Client-related packages from [Cisco Software Download Center](#) to your local host.

- Cisco Secure Client Headend Deployment Package for the required platforms.

This package is for the headend and contains all the Secure Client modules. For Windows, the filename is cisco-secure-client-win-5.0.03076-webdeploy-k9.pkg.

- Profile Editor: Create profiles for the modules that require profiles.

Secure Client needs a Secure Client profile for some of the modules. A profile contains configurations to enable the modules and connect to the corresponding security services. The profile editor supports only Windows.

The following table lists if the modules require a client profile:

Secure Client Module	Requires a Client Profile
AMP Enabler	Yes
ISE Posture	Yes
Network Access Manager	Yes
Network Visibility Module	Yes
Umbrella Roaming Secure Module	Yes
Feedback	Yes
Web Security	Yes
DART	No
Start Before Login	No

- Licensing
  - You need one of the following Secure Client licenses: Secure Client Premier, Secure Client Advantage, or Secure Client VPN Only
  - Your Firewall Management Center Essentials license must allow export-controlled functionality. Choose **System > Licenses > Smart Licenses** to verify this functionality in the management center.

## Guidelines for Configuring Secure Client Modules

- All Secure Client modules are supported from AnyConnect 4.8 and later, and Secure Client 5.0.
- Different modules support profiles with different file extensions. The following table lists the modules and the supported file extensions of their profiles:

**Table 87: Supported File Extensions of Profiles**

Module	File Extension
AMP Enabler	*.xml, *.asp
Feedback	*.xml

Module	File Extension
ISE Posture	*.xml, *.isp
Network Access Manager	*.xml, *.nsp
Network Visibility	*.xml, *.nvmsp
Umbrella Roaming Security	*.xml, *.json
Web Security	*.xml, *.wsp, *.wso

- You can add only one entry per client module. You can edit or delete an entry for a module.
- If you plan to use ISE posture and Network Access Manager modules on a Windows OS, you must install Network Access Manager before you use the ISE Posture module.
- If you enable the Umbrella Roaming Security module, ensure that you disable the **Always send DNS requests over tunnel** option under split tunnelling in the VPN group policy.
- If you want to use SBL, then you must enable SBL in the Secure Client VPN profile.

## Install Secure Client Modules using a Firewall Threat Defense

### Before you begin

Ensure that you review the [Prerequisites for Configuring Secure Client Modules, on page 1545](#) and [Guidelines for Configuring Secure Client Modules, on page 1546](#) topics.

### Procedure

- 
- Step 1** The administrator creates profiles, if needed, for the required Secure Client modules.
- Step 2** The administrator uses the Firewall Management Center to:
- Configure the modules and add the profiles in the remote access VPN group policy.
  - Deploy the configuration on the Firewall Threat Defense.
- Step 3** The user uses Secure Client to initiate a VPN connection to the Firewall Threat Defense.
- Step 4** The Firewall Threat Defense authenticates the user.
- Step 5** The Secure Client checks for updates.
- Step 6** The Firewall Threat Defense distributes the Secure Client modules and the profiles on the endpoint.
- 

### What to do next

[Configure a Remote Access VPN Group Policy with Secure Client Modules, on page 1548.](#)

## Configure a Remote Access VPN Group Policy with Secure Client Modules

To install and update the Secure Client modules on the endpoint using a Firewall Threat Defense managed by a Firewall Management Center, you must update the remote access VPN group policy with the Secure Client module configurations.

### Before you begin

Ensure that you have configured a remote access VPN policy in the Firewall Management Center.

### Procedure

- 
- |                |  |
|----------------|--|
| <b>Step 1</b>  | Choose <b>Devices &gt; Remote Access</b> .   |
| <b>Step 2</b>  | Select a remote access VPN policy and click <b>Edit</b> .  |
| <b>Step 3</b>  | Select a connection profile and click <b>Edit</b> .  |
| <b>Step 4</b>  | Click <b>Edit Group Policy</b> .   |
| <b>Step 5</b>  | Click the <b>Secure Client</b> tab.  |
| <b>Step 6</b>  | Click <b>Client Modules</b> .  |
| <b>Step 7</b>  | Click <b>+</b> .   |
| <b>Step 8</b>  | Choose a module from the <b>Client Module</b> drop-down list.  |
| <b>Step 9</b>  | Choose a profile for the module from the <b>Profile to download</b> drop-down list or click <b>+</b> to add a profile. |
| <b>Step 10</b> | Check the <b>Enable module download</b> check box to download the module on the endpoint.                              |
| <b>Step 11</b> | Click <b>Add</b> .   |
| <b>Step 12</b> | Repeat steps 7 to 11 if you want to add more modules.  |
| <b>Step 13</b> | Click <b>Save</b> .  |
- 

### What to do next

1. Deploy the configuration on the threat defense.
2. Launch the Secure Client, select the VPN profile, and connect to the VPN. Secure Client installs the configured modules on it.
3. Verify the configuration. For more information, see [Verify Secure Client Modules Configuration, on page 1548](#).

## Verify Secure Client Modules Configuration

### On the Firewall Threat Defense

Use the following commands on the Firewall Threat Defense to view the profiles and the Secure Client modules configuration:

- **show disk0:-** View the profiles and their configuration.
- **show run webvpn -** View details of the Secure Client configurations.

- **show run group-policy <ravpn\_group\_policy\_name>** - View details of the RA VPN group policy for Secure Client.
- **show vpn-sessiondb anyconnect** - View details of the active Secure Client VPN sessions.

### On the Endpoint

1. Use the Secure Client to establish a VPN connection to the Firewall Threat Defense.
2. Verify if the configured modules are downloaded and installed as part of the Secure Client.
3. Verify if the configured profiles, if any, are available in the locations documented in [Profile Locations for all Operating Systems](#).

### On the Firewall Management Center

You can monitor remote access VPN active sessions on the Firewall Management Center using the Remote Access VPN dashboard (**Overview > Remote Access VPN**). You can quickly determine problems related to user sessions and mitigate the problems for your network and users.

## Configure Application-Based (Per App VPN) Remote Access VPN on Mobile Devices

When you use Secure Client to establish a VPN connection from a mobile device, all the traffic including the traffic from personal applications is routed through the VPN.

For mobile devices that run on Android or iOS, you can restrict the applications that use the VPN tunnel. This application-based remote access VPN is called Per App VPN. To use Per App VPN, you must install and configure a third-party Mobile Device Manager (MDM) application. You must define the list of approved applications that can be used over the VPN tunnel in the MDM. You can enable Per App VPN on the Firewall Threat Defense headend so that your MDM can apply your policies on mobile devices.

### Benefits

Benefits of restricting the remote access VPN to approved applications include:

- Performance—Limits VPN traffic over the corporate network and frees up resources of the VPN headend.
- Protection—Protects the corporate VPN tunnel from unapproved malicious applications on the mobile device.

## Prerequisites and Licensing for Configuring Per App VPN Tunnels

### Prerequisites

- Install and configure a third-party Mobile Device Manager (MDM).

You must configure the applications that will be allowed in the VPN in the MDM itself, not on the Firewall Threat Defense headend device.

- Download the Cisco AnyConnect Enterprise Application Selector from [Cisco Software Download Center](#). You need this tool to define the Per App VPN policy.

### Licensing

- Secure Client Premier, or Secure Client Advantage.
- Essentials license must allow export-controlled functionality.

To verify this functionality in the Firewall Management Center, choose **System > Licenses > Smart Licenses**.

## Determine the Application IDs for Mobile Applications

Before configuring the Firewall Threat Defense headend to allow application-based VPN from mobile devices, you must determine which applications should be allowed in the tunnel.

We strongly recommend that you configure the per-app policy in the MDM on the user's mobile device. This simplifies the headend configuration. If you decide to configure the list of allowed applications on the headend, you must determine the application IDs for each application on each type of endpoint.

The application ID, called the bundle ID in iOS, is a reverse DNS name. You can use an asterisk as a wildcard. For example, `*.*` indicates all applications, `com.cisco.*` indicates all Cisco applications.

To determine the application IDs:

- **Android**—Go to Google Play in a web browser and select the Apps category. Click (or hover over) an application that you want to allow, then look at the URL. The app id is in the URL, on the **id=** parameter. For example, the following URL is for Facebook Messenger, so the app id is `com.facebook.orca`.

`https://play.google.com/store/apps/details?id=com.facebook.orca`

For applications that are not available through Google Play, such as your own applications, download a package name viewer application to extract the app ID. There are many of these applications available, one of them should provide what you need, but Cisco does not endorse any of them.

- **iOS**—There is no straight-forward way to get the bundle ID. Following is one way to find it:
  1. Use a desktop web browser such as Chrome to search for the application name.
  2. In the search results, look for the link to download the app from the Apple App Store. For example, Facebook Messenger would be similar to:

`https://apps.apple.com/us/app/messenger/id454638411`

3. Copy the number after the **id** string. In this example, **454638411**.
4. Open a new browser window, and add the number to the end of the following URL:

`https://itunes.apple.com/lookup?id=`

For this example: `https://itunes.apple.com/lookup?id=454638411`

5. You will be prompted to download a text file, usually named `1.txt`. Download the file.
6. Open the file in a text editor such as WordPad, and search for `bundleId`. For example:
 

```
"bundleId": "com.facebook.Messenger",
```

In this example, the bundle ID is `com.facebook.Messenger`. Use this as the app ID.

Once you have your list of application IDs, you can configure the policy as explained in .

## Configure Application-Based VPN Tunnels

After you install and configure your MDM software, you can enable Per App VPN on the Firewall Threat Defense headend device. Once enabled on the headend, your MDM software will control which applications are tunneled over the VPN to the corporate network.

### Before you begin

- Ensure that you have a remote access VPN policy in the Firewall Management Center.
- Configure Per App VPN using MDM and enroll each device to the MDM server.
- Download the Cisco AnyConnect Enterprise Application Selector.

### Procedure

- 
- Step 1** Use the Cisco AnyConnect Enterprise Application Selector to define the Per App VPN policy. We recommend that you create a simple **Allow All** policy, and define the allowed applications in the MDM. However, you can specify a list of applications to allow and control the list from the headend. If you want to include specific applications, create a separate rule for each application, using a unique name and the application's app ID. For more information on getting the app IDs, see [Determine the Application IDs for Mobile Apps](#).
- To create an **Allow All** policy that supports both Android and iOS platforms using the AnyConnect Enterprise Application Selector:
- a) Choose **Android** from the drop-down list as the platform type and configure the following options:
    - **Friendly Name**—Enter a name for the policy. For example, Allow\_All.
    - **App ID**—Enter \*.\* to match all possible applications.
    - Leave the other options.
  - b) Choose **iOS** from the drop-down list as the platform type and configure the following options:
    - **Friendly Name**—Enter a name for the policy. For example, Allow\_All.
    - **App ID**—Enter \*.\* to match all possible applications.
    - Leave the other options.
  - c) Choose **Policy > View Policy** to get the base64 encoded string for the policy.

This string contains an encrypted XML file that allows the Firewall Threat Defense to see the policies. Copy this value. You need this string when you configure Per App VPN on the Firewall Threat Defense.
- Step 2** Use the Firewall Management Center to enable the Per App on the Firewall Threat Defense headend device.
- a) Choose **Devices > Remote Access**.
  - b) Select a remote access VPN policy and click **Edit**.
  - c) Select a connection profile and click **Edit**.
  - d) Click **Edit Group Policy**.
  - e) Click the **Secure Client** tab.

- f) Click **Custom Attributes** and click +.
- g) Choose **Per App VPN** from the **Secure Client Attribute** drop-down list.
- h) Choose an object from the **Custom Attribute Object** drop-down list or click + to add an object.

When you add a new custom attribute object for Per App VPN, enter the name, description, and the base64 encoded policy string from the Cisco AnyConnect Enterprise Application Selector.

- i) Click **Save**.
- j) Click **Add** and click **Save**.

**Step 3** Deploy your changes on the Firewall Management Center.

---

#### What to do next

1. Launch the Secure Client, select the VPN profile, and connect to the VPN.
2. Verify the configuration. For more information, see [Verify Per App Configuration, on page 1552](#).

## Verify Per App Configuration

#### On the Firewall Threat Defense

Use the following commands on the Firewall Threat Defense to view the Per App configuration:

- **show run webvpn**
- **show run group-policy <ravpn\_group\_policy\_name>**
- **show run anyconnect-custom-data**

#### On the Endpoint

After the endpoint establishes a VPN connection with the Firewall Threat Defense:

1. Click the **Statistics** icon of the Secure Client.
2. **Tunnel Mode** will be “Application Tunnel” instead of “Tunnel All Traffic.”
3. **Tunneled Apps** will list the applications you enabled for tunneling in the MDM.

## Remote Access VPN Examples

### How to Limit Secure Client Bandwidth Per User

This section provides instructions to limit the maximum bandwidth that the VPN users consume when they connect using the Secure Client to Secure Firewall Threat Defense remote access VPN gateway. You can limit the maximum bandwidth by using a Quality of service (QoS) policy in Firewall Threat Defense, to ensure that a single user or group or users do not take over the entire resource. This configuration lets you give priority to critical traffic, prevent bandwidth hogging, and manage the network. If a When traffic exceeds the maximum rate, the Firewall Threat Defense drops the excess traffic.

Step	Do This	More Info
1	Create and set up a realm.	<a href="#">Create an LDAP Realm or an Active Directory Realm and Realm Directory, on page 2275</a>
2	Create a QoS policy and QoS rule for the user or group available in the newly created realm.	<ul style="list-style-type: none"> <li>• See <a href="#">Creating a QoS Policy, on page 817</a> to create a QoS policy.</li> <li>• See <a href="#">Configuring QoS Rules, on page 818</a> to create a QoS rule.</li> </ul>
3	Configure remote access VPN policy and select the newly created realm for user authentication.	<a href="#">Create a New Remote Access VPN Policy, on page 1462</a>
4	Deploy the remote access VPN policy.	<a href="#">Deploy Configuration Changes, on page 183</a>

## How to Use VPN Identity for User-Id Based Access Control Rules

Step	Do This	More Info
1	Create and set up a realm.	<a href="#">Create an LDAP Realm or an Active Directory Realm and Realm Directory, on page 2275.</a>
2	Create an identity policy and add an identity rule.	<ul style="list-style-type: none"> <li>• See <a href="#">Create an Identity Policy, on page 2365</a> to create an identity policy.</li> <li>• See <a href="#">Create an Identity Rule, on page 2373</a> to create an identity rule.</li> </ul>
3	Associate the identity policy with an access control policy.	<a href="#">Associating Other Policies with Access Control, on page 1631</a>
4	Configure remote access VPN policy and select the newly created realm for user authentication.	<a href="#">Create a New Remote Access VPN Policy, on page 1462</a>
5	Deploy the remote access VPN policy.	<a href="#">Deploy Configuration Changes, on page 183</a>

## Configure Firewall Threat Defense Multiple Certificate Authentication

### Multiple Certificate-based Authentication

Multiple certificate-based authentication allows the Firewall Threat Defense to validate the machine or device certificate. Multiple certificates can be enabled for certificate-based authentication in the remote access VPN connection profile. It can be combined with AAA authentication. The multiple certificates option in the remote access VPN connection profile allows certificate authentication of both the machine and user via certificates. This ensures that the device is a corporate-issued device, in addition to authenticating the user's identity certificate to allow RA VPN access. The administrator can choose if the username for the session should be taken from the machine certificate or user certificate.

When multiple certificate-based authentication is configured, two certificates are obtained from the VPN client:

- **First Certificate**—Machine certificate to authenticate the endpoint.
- **Second Certificate**—User certificate to authenticate the VPN user.

For detailed information about Firewall Threat Defense certificates, see [Managing Firewall Threat Defense Certificates, on page 1366](#).

### Limitations

- Multiple certificate authentication currently limits the number of certificates to two.
- Secure Client supports only RSA-based certificates.
- Only SHA256, SHA384, and SHA512 based certificates are supported during the Secure Client aggregate authentication.
- Certificate authentication cannot be combined with SAML authentication.

### Pre-fill Username from Certificate

The Pre-fill username option allows a field from the certificates to be parsed and used for subsequent AAA authentication (primary and secondary). When two certificates are used for authentication, the Administrator can choose the certificate from which the username should be derived for the prefill functionality. By default, username for prefill is retrieved from the User certificate (second certificate received from Secure Client). The prefilled username is used as the VPN session username when the Certificate Only authentication method is enabled. When AAA and certificate authentication is enabled, VPN session username will be based on the pre-fill option.

### Configure Multiple Certificate Authentication for Remote Access VPN

1. On your Secure Firewall Management Center web interface, choose **Devices > VPN > Remote Access**.
2. Edit an existing remote access policy, or create a new one and then edit.  
See [Create a New Remote Access VPN Policy, on page 1462](#).
3. Select the connection profile to configure multiple certificate authentication, and click **Edit**.  
See [Configure Connection Profile Settings, on page 1472](#).
4. Choose **AAA**, and then select an **Authentication Method**:

Figure 410:

**Edit Connection Profile**

Connection Profile:\*

Group Policy:\*  +  
[Edit Group Policy](#)

Client Address Assignment   **AAA**   Aliases

**Authentication**

Authentication Method:   
☐ Enable multiple certificate authentication

Authentication Server:   
☐ Fallback to LOCAL Authentication

▼ **Map username from client certificate**  
 Certificate to choose:

☒ Map specific field

Primary Field:       Secondary Field:

☐ Use entire DN (Distinguished Name) as username

☐ Prefill username from certificate on user login window

☐ Hide username in login window

- **Client Certificate Only**—User is authenticated using client certificate. Client certificate must be configured on VPN client endpoints. By default, the username is derived from client certificate fields CN & OU respectively. In case, the username is specified in other fields in the client certificate, use 'Primary' and 'Secondary' field to map appropriate fields.
- **Client Certificate & AAA**—User is authenticated using both the types of authentication, AAA and client certificate.

5. Select **Enable multiple certificate authentication**.
6. Select **Map username from client certificate** and select a certificate from the **Certificate to choose** drop-down to choose the username for the VPN session from the machine certificate or user certificate.
  - **First Certificate**—Map the username from the Machine Certificate.
  - **Second Certificate**—Map the username from the User certificate to authenticate the VPN user.

7. Configure the required connection profile settings and remote access VPN settings.
8. Save the connection profile and remote access VPN policy. Deploy the remote access VPN on Firewall Threat Defense.

For information about remote access VPN AAA settings, see [Configure AAA Settings for Remote Access VPN](#), on page 1475.

### Certificate Configuration in DAP

You can also configure certificate criteria attributes in a DAP record. The user and machine certificate received from the VPN client during multiple-certificate authentication is loaded into dynamic access policy (DAP) to allow policies to be configured based on the field of the certificate. You can make policy decisions based on the fields of a certificate used to authenticate that connection attempt.

1. Choose **Devices > Dynamic Access Policy**.
2. Edit an existing DAP policy or create a new one and then edit the policy.
3. Choose an existing DAP record, or create a new one and then edit the record.
4. Select **Endpoint Criteria > Certificate**.
5. Select the Match Criteria **All** or **Any**.
6. Click **Add** to add certificate attributes.

**Figure 411:**

The screenshot shows a 'Certificate Criteria' dialog box with a close button (X) in the top right corner. The dialog contains the following fields and options:

- Certificate:** Two radio buttons, 'Cert1' (selected) and 'Cert2'.
- Subject:** A dropdown menu showing 'Issuer' and a text input field containing 'finCA SHA'.
- Issuer:** A dropdown menu showing 'Name' and a text input field containing 'Finance CA'.
- Subject Alternate Name:** A dropdown menu showing 'User Principal Name' and a text input field containing 'Finance Group Cert'.
- Serial Number:** A text input field containing '0x04C11DB7'.
- Certificate Store:** Three radio buttons, 'None', 'Machine' (selected), and 'User'.

At the bottom right of the dialog are two buttons: 'Cancel' and 'Save'.

7. Select the certificate, **Cert1** or **Cert2**.
8. Select the **Subject** and specify the certificate subject value.

9. Select the **Issuer** and specify the certificate issuer name.
10. Select the **Subject Alternate Name** and specify the alternate name for the subject.
11. Specify the **Serial Number**.
12. Select the **Certificate Store**: None, Machine, or User.  
This option adds a condition to check for the store from which the certificate is picked on the endpoint.
13. Click **Save** to complete the certificate criteria settings.  
Configure the required DAP record settings and then associate the DAP with the remote access VPN.

For more information about DAP, see [Dynamic Access Policies](#) , on page 1561.

## History for Remote Access VPNs

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
IPsec flow offload on the VTI loopback interface	7.4	Any	On the Secure Firewall 3100 and Secure Firewall 4200 devices, IPsec flow offload is enabled automatically on the VTI loopback interface.
Secure Client Customizations	7.4	Any	<p>You can configure Secure Client customizations and deploy them to the VPN headend. The threat defense distributes these customizations to the endpoint when a user connects from the Secure Client:</p> <ul style="list-style-type: none"> <li>• GUI text and messages</li> <li>• Icons and images</li> <li>• Scripts</li> <li>• Binaries</li> <li>• Customized Installer Transforms</li> <li>• Localized Installer Transforms</li> </ul> <p>New/Modified Screens:</p> <ul style="list-style-type: none"> <li>• <b>Objects &gt; Object Management &gt; VPN &gt; Secure Client Customization</b></li> <li>• <b>Devices &gt; Remote Access &gt; Advanced &gt; Secure Client Customization</b></li> </ul>
WAN Summary Dashboard	7.4	Any	<p>The WAN Summary dashboard provides a snapshot of your WAN devices and their interfaces.</p> <p>New/Modified Screen:</p> <p><b>Overview &gt; Dashboard &gt; WAN Summary</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
SAML with Certificate Support	7.2	Any	We have updated the remote access VPN configuration wizard to support user authentication with Certificate and SAML. You can configure a remote access VPN to authenticate machine or user certificate before a SAML authentication is initiated.
IPsec flow offload.	7.2	Any	On the Secure Firewall 3100, IPsec flows are offloaded by default. After the initial setup of an IPsec site-to-site VPN or remote access VPN security association (SA), IPsec connections are offloaded to the field-programmable gate array (FPGA) in the device, which should improve device performance.  You can change the configuration using FlexConfig and the <b>flow-offload-ipsec</b> command.
Multiple IDP trustpoint support	7.1	Any	Secure Firewall Management Center supports multiple identity provider trustpoints with Microsoft Azure that can have multiple applications for the same Entity ID, but a unique identity certificate.
AnyConnect VPN SAML External Browser	7.1	Any	You can now configure AnyConnect VPN SAML External Browser to enable additional authentication choices, such as password less authentication, WebAuthN, FIDO, SSO, U2F, and an improved SAML experience due to the persistence of cookies. When you use SAML as the primary authentication method for a remote access VPN connection profile, you can elect to have the AnyConnect client use the client's local browser instead of the AnyConnect embedded browser to perform the web authentication. This option enables single sign-on (SSO) between your VPN authentication and other corporate logins. Also choose this option if you want to support web authentication methods, such as biometric authentication and Yubikeys, that cannot be performed in the embedded browser.  We updated the remote access VPN connection profile wizard to allow you to configure the <b>SAML Login Experience</b> .
Multi-Certificate Authentication	7.0	Any	Secure Firewall Management Center now supports multiple certificate-based authentication for Firewall Threat Defense to validate the machine or device certificate, to ensure that the device is a corporate-issued device in addition to authenticating the user's identity certificate to allow VPN access using AnyConnect client.
VPN Load balancing	7.0	Any	VPN load balancing logically group two or more devices and distributes remote access VPN sessions among the grouped devices equally without considering throughput and other traffic parameters.
AnyConnect Custom Attributes	7.0	Any	Secure Firewall Management Center now supported AnyConnect custom attributes and provides an infrastructure to configure the AnyConnect client feature without adding hard-coded support for these features on Firewall Threat Defense.

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Local User Authentication	7.0	Any	You can now configure and manage users locally on Firewall Threat Defense using the Secure Firewall Management Center web interface, and configure the local users for primary and secondary remote access VPN authentication.
Selective Policy Deployment	7.0	Any	You can now choose to include or exclude changes to remote access VPN and site-to-site VPN configurations during the deployment.
Support for AnyConnect Modules Configuration	6.7	Any	Secure Firewall Management Center now supports configuring AnyConnect modules and profiles for additional security.
Support for LDAP Authorization	6.7	Any	You can configure LDAP authorization for remote access VPN using the Secure Firewall Management Center.
SAML single sign-on support for remote access VPN	6.7	Any	You can configure a SAML 2.0 server as the single sign-on authentication server for remote access VPNs.
AnyConnect Management VPN tunnel support	6.7	Any	Firewall Threat Defense remote access VPN supports configuring AnyConnect Management VPN tunnel that allows VPN connectivity to endpoints when the corporate endpoints are powered on, without the VPN users connecting to the VPN.
Support for Datagram Transport Layer Security (DTLS) 1.2	6.6	Any	DTLS 1.2 is now part of the default SSL cipher group and it can be configured along with TLS 1.2.

## CHAPTER 38

# Dynamic Access Policies

Dynamic access policies (DAP) enable you to configure authorization that addresses the dynamics of VPN environments. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. These attributes address issues of multiple group membership and endpoint security.

- [About Secure Firewall Threat Defense Dynamic Access Policy, on page 1561](#)
- [Prerequisites for Dynamic Access Policy , on page 1563](#)
- [Guidelines and Limitations for Dynamic Access Policies, on page 1563](#)
- [Configure a Dynamic Access Policy \(DAP\), on page 1563](#)
- [Associate Dynamic Access Policy with Remote Access VPN, on page 1571](#)
- [History for Dynamic Access Policy, on page 1572](#)

## About Secure Firewall Threat Defense Dynamic Access Policy

VPN gateways operate in dynamic environments. Multiple variables can affect each VPN connection. For example, intranet configurations that frequently change, the various roles each user inhabits within an organization, and log in attempts from remote access sites with different configurations and levels of security. The task of authorizing users is much more complicated in a VPN environment than it is in a network with a static configuration.

You can create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. These attributes address issues of multiple group memberships and endpoint security. The Firewall Threat Defense grants access to a particular user for a particular session according to the policies you define. The Firewall Threat Defense device generates a DAP during user authentication by selecting or aggregating attributes from one or more DAP records. The device then selects these DAP records based on the endpoint security information of the remote device and AAA authorization information for the authenticated user. Then the device applies the DAP record to the user tunnel or session.

## Hierarchy of Policy Enforcement of Permissions and Attributes in Firewall Threat Defense

The Firewall Threat Defense device supports applying user authorization attributes, also called user entitlements or permissions, to VPN connections. The attributes are applied from a DAP on the Firewall Threat Defense, external authentication server and/or authorization AAA server (RADIUS) or from a group policy on the Firewall Threat Defense device.

If the Firewall Threat Defense device receives attributes from all sources, the device evaluates, merges, and applies the attributes to the user policy. If there are conflicts between attributes coming from the DAP, the AAA server, or the group policy, the attributes from the DAP always take precedence.

The Firewall Threat Defense device applies attributes in the following order:

**Figure 412: Policy Enforcement Flow**

1. **DAP attributes on the FTD**—The DAP attributes take precedence over all others.
2. **User attributes on the external AAA server**—The server returns these attributes after successful user authentication and/or authorization.
3. **Group policy configured on the FTD** —If a RADIUS server returns the value of the RADIUS Class attribute IETF-Class-25 (OU= group-policy) for the user, the Firewall Threat Defense device places the user in the group policy of the same name and enforces any attributes in the group policy that are not returned by the server.
4. **Group policy assigned by the Connection Profile (also known as Tunnel Group)**—The Connection Profile has the preliminary settings for the connection, and includes a default group policy that is applied to the user before authentication.

**Note**

The Firewall Threat Defense device does not support inheriting system default attributes from the default group policy, *DfltGrpPolicy*. For the user session, the device uses the attributes on the group policy that you assign to the connection profile, unless the user attributes or the group policy from the AAA server overrides them.

## Prerequisites for Dynamic Access Policy

Licensing:

- Firewall Threat Defense must have at least one of the following Secure Client licenses:
  - Secure Client Premier
  - Secure Client Advantage
  - Secure Client VPN Only
- The Firewall Threat Defense Essentials license must allow export-controlled functionality.

## Guidelines and Limitations for Dynamic Access Policies

- Matching of AAA attributes in a DAP will work only if a AAA server is configured to return the correct attributes when authenticating or authorizing a remote access VPN session.
- Minimum Secure Client and Secure Firewall Posture package version supported for DAP is 4.6. But it is highly recommended to use the latest version of Secure Client.
- DAP does not support clustering or multi-instance mode.
- DAP condition with an assigned IPv4 or IPv6 address does not work for local authentication.

## Configure a Dynamic Access Policy (DAP)

### Create a Dynamic Access Policy

#### Before you begin

Ensure that you have the Secure Firewall Posture package before you configure the dynamic access policy. You can add the Secure Firewall Posture file at **Objects > Object Management > VPN > Secure Client File**.

#### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | Choose <b>Devices &gt; VPN &gt; Dynamic Access Policy</b> , and click <b>Create Dynamic Access Policy</b> . |
| <b>Step 2</b> | Specify the <b>Name</b> for the DAP policy and an optional <b>Description</b> .                             |
| <b>Step 3</b> | Choose the <b>HostScan Package</b> from the drop-down list.   |
| <b>Step 4</b> | Click <b>Save</b> .   |
-

**What to do next**

To configure DAP record, see [Create Dynamic Access Policy Record](#)

## Create a Dynamic Access Policy Record

A dynamic access policy (DAP) can contain multiple DAP records, where you configure user and endpoint attributes. You can prioritize the DAP records within a DAP so that the Firewall Threat Defense can select and sequence the required criteria when a user attempts VPN connection.

**Procedure**

- 
- |                |   |
|----------------|---|
| <b>Step 1</b>  | Choose <b>Devices &gt; VPN &gt; Dynamic Access Policy</b> .   |
| <b>Step 2</b>  | Edit an existing dynamic access policy or click <b>Create Dynamic Access Policy</b> to create a new one and then edit the policy.   |
| <b>Step 3</b>  | Click <b>Create DAP Record</b> .  |
| <b>Step 4</b>  | Click the <b>General</b> tab.   |
| <b>Step 5</b>  | Specify the <b>Name</b> for the DAP record.   |
| <b>Step 6</b>  | Enter the <b>Priority</b> for the DAP record.<br><br>The lower the number, the higher the priority.   |
| <b>Step 7</b>  | Select one of the following actions to take when a DAP record matches: <ul style="list-style-type: none"> <li>• <b>Continue</b>—Applies access policy attributes to the session. If any, the next DAP record (next policy line with less priority) is then evaluated.</li> <li>• <b>Terminate</b>—Terminates the session.</li> <li>• <b>Quarantine</b>—Quarantines the connection.</li> </ul> |
| <b>Step 8</b>  | Check the <b>Display User Message on Criterion Match</b> check-box and add the user message.<br><br>The Firewall Threat Defense displays this message to the user when the DAP record matches.  |
| <b>Step 9</b>  | Check the <b>Apply a Network ACL on Traffic</b> check box and select the access control list from the drop-down.  |
| <b>Step 10</b> | Check the <b>Apply one or more Secure Client Custom Attributes</b> check box and select the custom attributes object from the drop-down.  |
| <b>Step 11</b> | Click <b>Save</b> .   |
- 

## Configure AAA Criteria Settings for DAP

DAP complements AAA services by providing a limited set of authorization attributes that can override the attributes that AAA provides. The Firewall Threat Defense select DAP records based on the AAA authorization information for the user and posture assessment information for the session. The Firewall Threat Defense can choose multiple DAP records depending on this information, which it then aggregates to create DAP authorization attributes.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Dynamic Access Policy**.
- Step 2** Edit an existing DAP policy or create a new one and then edit the policy.
- Step 3** Select a DAP record or create a new one, and edit the DAP record.
- Step 4** Click **AAA Criteria**.
- Step 5** Select one of the **Match criteria between sections**.
- Any—Matches any of the criteria.
  - All—Matches all the criteria.
  - None—Matches none of the set criteria.
- Step 6** Click **Add** to add the required **Cisco VPN Criteria**.
- Cisco VPN criteria include attributes for group policy, assigned IPv4 address, assigned IPv6 address, connection profile, username, username 2, and SCEP required.
- a) Select an attribute and specify the **Value**.
  - b) Click **Add another criteria** to add more criteria.
  - c) Click **Save**.
- SCEP Required
- Step 7** Select **LDAP Criteria**, **RADIUS Criteria**, or **SAML Criteria** and specify the **Attribute ID** and **Value**.
- Step 8** Click **Save**.
- 

## Configure Endpoint Attribute Selection Criteria in DAP

Endpoint attributes contain information about the endpoint system environment, posture assessment results, and applications. The Firewall Threat Defense dynamically generates a collection of endpoint attributes during session establishment and stores these attributes in a database that is associated with the session. Each DAP record specifies the endpoint selection attributes that must be satisfied for the Firewall Threat Defense to choose it for a session. The Firewall Threat Defense selects only DAP records that satisfy every condition configured.

### Procedure

- 
- Step 1** Choose **Devices > VPN > Dynamic Access Policy**, and click **Create Dynamic Access Policy**.
- Step 2** Edit a DAP policy and then DAP record.
- Note**  
Create a DAP policy and DAP record if not done already.
- Step 3** Click **Endpoint Criteria** and configure the following endpoint criteria attributes:

**Note**

You can create multiple instances of each type of endpoint attribute. There is no limit for the number of endpoint attributes for each DAP record.

- [Add an Anti-Malware Endpoint Attribute to a DAP](#)
- [Add a Device Endpoint Attribute to a DAP](#)
- [Add Secure Client Endpoint Attributes to a DAP, on page 1567](#)
- [Add a NAC Endpoint Attribute to a DAP](#)
- [Add an Application Attribute to a DAP](#)
- [Add a Personal Firewall Endpoint Attribute to a DAP](#)
- [Add an Operating System Endpoint Attribute to a DAP](#)
- [Add a Process Endpoint Attribute to a DAP](#)
- [Add a Registry Endpoint Attribute to a DAP](#)
- [Add a File Endpoint Attribute to a DAP](#)
- [Add Multiple Certificate Authentication Attributes to DAP](#)

**Step 4** Click **Save**.

---

## Add an Anti-Malware Endpoint Attribute to a DAP

### Procedure

---

- Step 1** Edit a DAP record and select **Endpoint Criteria > Anti-Malware**.
- Step 2** Select the Match Criteria **All** or **Any**.
- Step 3** Click **Add** to add anti-malware attributes.
- Step 4** Click **Installed** to indicate whether the selected endpoint attribute and its accompanying qualifiers are installed or not installed.
- Step 5** Choose **Enabled** or **Disabled** to activate or deactivate real-time malware scanning.
- Step 6** Select the name of the anti-malware **Vendor** from the list.
- Step 7** Select the anti-malware **Product Description**.
- Step 8** Choose the **Version** of the anti-malware product.
- Step 9** Specify the number of days since the **Last Update**.
- You can indicate that an anti-malware update must occur in less than (<) or more than (>) the number of days you specify.
- Step 10** Click **Save**.
-

## Add a Device Endpoint Attribute to a DAP

### Procedure

- 
- Step 1** Edit a DAP record and choose **Endpoint Criteria > Device**.
- Step 2** Select the Match Criteria **All** or **Any**.
- Step 3** Click **Add** and select the **=** or **≠** operator to check the attribute to be equal to or not equal to the value you enter for the following attributes:
- **Host Name**—Hostname of the device you are testing for. Use the computer's host name only, not the fully qualified domain name (FQDN).
  - **MAC Address**—MAC address of the network interface card you are testing for. The address must be in the format xxxx.xxxx.xxxx where x is a hexadecimal character.
  - **BIOS Serial Number**—BIOS serial number value of the device you are testing for. The number format is manufacturer-specific.
  - **Port Number**—Listening port number of the device.
  - **Secure Desktop Version**—Version of the Host Scan image running on the endpoint.
  - **OPSWAT Version**—The OPSWAT client version.
  - **Privacy Protection**—None, Cache cleaner, Secure Desktop.
  - **TCP/UDP Port Number**—TCP or UDP port in the listening state that you are testing for.
- Step 4** Click **Save**.
- 

## Add Secure Client Endpoint Attributes to a DAP

### Procedure

- 
- Step 1** Edit a DAP record and select **Endpoint Criteria > Secure Client**.
- Step 2** Select the Match Criteria **All** or **Any**.
- Step 3** Click **Add** and select the **=** or **≠** operator to check the attribute to be equal to or not equal to the value you enter.
- Step 4** Select the **Client Version** and **Platform**.
- Step 5** Select the **Platform Version**, and specify the **Device Type** and **Device Unique ID**.
- Step 6** Add the **MAC Addresses** the MAC Address Pool.

#### Note

The MAC Address must be in the format XX-XX-XX-XX-XX-XX, where each X is a hexadecimal character. You can click **Add another MAC Address** to add more addresses.

**Step 7** Click **Save**.

---

## Add NAC Endpoint Attributes to a DAP

### Procedure

---

- Step 1** Edit a DAP record and select **Endpoint Criteria > NAC**.
  - Step 2** Select the Match Criteria **All** or **Any**.
  - Step 3** Click **Add** to add NAC attributes.
  - Step 4** Set the operator to be equal to **=** or not equal to **≠** the posture token string. Enter the posture token string in the **Posture Status** box.
  - Step 5** Click **Save**.
- 

## Add an Application Attribute to a DAP

### Procedure

---

- Step 1** Edit a DAP record and select **Endpoint Criteria > Application**.
  - Step 2** Select the Match Criteria **All** or **Any**.
  - Step 3** Click **Add** to add application attributes.
  - Step 4** Choose equals (**=**) or does not equal (**≠**) and specify the **Client Type** to indicate the type of remote access connection.
  - Step 5** Click **Save**.
- 

## Add a Personal Firewall Endpoint Attribute to a DAP

### Procedure

---

- Step 1** Edit a DAP record and select **Endpoint Criteria > Personal Firewall**.
- Step 2** Select the Match Criteria **All** or **Any**.
- Step 3** Click **Add** to add personal firewall attributes.
- Step 4** Click **Installed** to indicate whether the personal firewall endpoint attribute and its accompanying qualifiers (fields below the Name/Operation/Value column) are installed or not installed.
- Step 5** Choose **Enabled** or **Disabled** to activate or deactivate firewall protection.
- Step 6** Select the name of the firewall **Vendor** from the list.
- Step 7** Select the firewall **Product Description**.
- Step 8** Select the equals (**=**) or does not equal (**≠**) operator and choose the **Version** of the personal firewall product.

**Step 9** Click **Save**.

---

## Add an Operating System Endpoint Attribute to a DAP

### Procedure

---

- Step 1** Edit a DAP record and select **Endpoint Criteria > Operating System**.
  - Step 2** Select the Match Criteria **All** or **Any**.
  - Step 3** Click **Add** to add endpoint attributes.
  - Step 4** Select the equals ( = ) or does not equal ( ≠ ) operator and then select the **Operating System**.
  - Step 5** Select the equals ( = ) or does not equal ( ≠ ) operator and then specify the operating system **Version**.
  - Step 6** Click **Save**.
- 

## Add a Process Endpoint Attribute to a DAP

### Procedure

---

- Step 1** Edit a DAP record.
  - Step 2** Click the **Endpoint Criteria** tab.
  - Step 3** Click **Process**.
  - Step 4** Select the **Match Criteria** as **All** or **Any**.
  - Step 5** Click + to add the process attributes.
  - Step 6** Select **Exists** or **Does not exist**.
  - Step 7** Specify the **Process Name**.
  - Step 8** Click **Save**.
- 

## Add a Registry Endpoint Attribute to a DAP

Scanning for registry endpoint attributes applies to Windows operating systems only.

### Before you begin

Before configuring a Registry endpoint attribute, define the registry key for which you want to scan in the Host Scan window for Cisco Secure Desktop.

### Procedure

---

- Step 1** Edit a DAP record.

- Step 2** Click the **Endpoint Criteria** tab.
  - Step 3** Click **Registry**.
  - Step 4** Select the **Match Criteria** as **All** or **Any**.
  - Step 5** Click + to add registry attributes.
  - Step 6** Select the **Entry Path** for the registry and specify the path.
  - Step 7** Choose the existence of the registry, **Exists** or **Does not exist**.
  - Step 8** Select the registry **Type** from the list.
  - Step 9** Select the equals (=) or does not equal (≠) operator and enter the **Value** of the registry key.
  - Step 10** Select **Case insensitive** to disregard the case of the registry entry while scanning.
  - Step 11** Click **Save**.
- 

## Add a File Endpoint Attribute to a DAP

### Procedure

- Step 1** Edit a DAP record.
  - Step 2** Click the **Endpoint Criteria** tab.
  - Step 3** Click **File**.
  - Step 4** Select the Match Criteria **All** or **Any**.
  - Step 5** Click + to add file attributes.
  - Step 6** Specify the **File Path**.
  - Step 7** Choose **Exists** or **Does not exist** to indicate the presence of the file.
  - Step 8** Select less than (<) or greater than (>) and specify the **Last Modified** days for the file.
  - Step 9** Select the equal to (=) or not equal to ≠ operator and enter the **Checksum**.
  - Step 10** Click **Save**.
- 

## Add Certificate Authentication Attributes to a DAP

You can index each certificate to allow referencing to any of the received certificates, by the configured rules. Based on these certificate fields, you can configure DAP rules to allow or disallow connection attempts.

### Procedure

- Step 1** Edit a DAP record and select **Endpoint Criteria > Certificate**.
- Step 2** Select the Match Criteria **All** or **Any**.
- Step 3** Click **Add** to add certificate attributes.
- Step 4** Select the certificate **Cert1** or **Cert2**.
- Step 5** Select the **Subject** and specify the subject value.

- Step 6** Select the **Issuer** and specify the issuer value.
- Step 7** Select the **Subject Alternate Name** and specify the subject value.
- Step 8** Specify the **Serial Number**.
- Step 9** Choose the **Certificate Store**: None, Machine, or User.  
The VPN client sends the certificate store information.
- Step 10** Click **Save**.
- 

## Configure Advanced Settings for DAP

You can use the **Advanced** tab for adding selection criteria other than what is possible in the AAA and endpoint attribute areas. For example, while you can configure the Firewall Threat Defense to use AAA attributes that satisfy any, all, or none of the specified criteria, the endpoint attributes are cumulative, and must satisfy all. To let the security appliance employ one endpoint attribute or another, you must create appropriate logical expressions in Lua and enter them here.

### Procedure

---

- Step 1** Choose **Devices > VPN > Dynamic Access Policy**.
- Step 2** Edit a DAP policy and then edit a DAP record.
- Note**  
Create a DAP policy and DAP record if not done already.
- Step 3** Click the **Advanced** tab.
- Step 4** Select **AND** or **OR** as the match criteria to use in the DAP configuration.
- Step 5** Add the Lua script in the **Lua script for advanced attribute matching** field.
- Step 6** Click **Save**.
- 

## Associate Dynamic Access Policy with Remote Access VPN

You can associate Dynamic Access Policy (DAP) with remote access VPN policy for the dynamic access policy attributes to match during VPN session authentication and authorization. You can then deploy the remote access VPN on the Firewall Threat Defense.

### Procedure

---

- Step 1** Choose **Devices > VPN > Remote Access**.
- Step 2** Click **Edit** next to the remote access VPN policy to which you want to associate dynamic access policy.
- Step 3** Click the link in remote access VPN to select the dynamic access policy.

- Step 4** Select the policy from the **Dynamic Access Policy** drop-down or click **Create a new Dynamic Access Policy** to configure a new dynamic access policy.
- Step 5** Click **OK**.
- Step 6** Click **Save** to save the remote access VPN policy.

---

When the remote access VPN user tries to connect, the VPN checks the configured dynamic access policy records and attributes. VPN creates a dynamic access policy based on the matching dynamic access policy records and takes appropriate action on the VPN session.

## History for Dynamic Access Policy

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Dynamic Access Policy	7.0	Any	The feature was introduced.

## CHAPTER 39

# VPN Monitoring and Troubleshooting

This chapter describes Firewall Threat Defense VPN monitoring tools, parameters, and statistics information as well as troubleshooting.

- [Site-to-Site VPN Summary Page](#), on page 1573
- [Remote Access VPN Dashboard](#), on page 1573
- [SD-WAN Summary Dashboard](#), on page 1575
- [VPN Session and User Information](#), on page 1580
- [Site to Site VPN Connection Event Monitoring](#), on page 1580
- [VPN Troubleshooting](#), on page 1582

## Site-to-Site VPN Summary Page

You can use the Site-to-Site VPN Summary page to see consolidated information about VPN users, including the current status of users, device types, client applications, user geolocation information, and duration of connections. You can view details of the configured VPN topologies such as VPN interfaces, tunnel status, and so on.

For all VPN topologies, you can edit or delete the topology using the edit and delete buttons. For SASE topology VPNs, you have options to deploy, edit and delete any topology.

## Remote Access VPN Dashboard

Remote Access Virtual Private Network (RA VPN) allows remote users to securely connect to your network. The RA VPN dashboard allows you to monitor real-time data from active RA VPN sessions on the devices. You can quickly determine problems related to user sessions and mitigate the problems for your network and users.

RA VPN dashboard (**Overview > Dashboards > Remote Access VPN**) provides a snapshot of the active RA VPN sessions on the threat defense devices managed by the Firewall Management Center.

The dashboard has the following widgets:

- Active Sessions (Tabular View)
- Active Sessions (Map view)
- Sessions

- Device Identity Certificates

### Active Sessions (Tabular View)

This widget provides a tabular view of the active RA VPN users connected. You can view details of the active RA VPN sessions such as username, assigned IP, public IP, login time, VPN gateway (threat defense device), client application, client operating system, connection profile, and group policy. You can use the filter to narrow down your search based on the different criteria. You can also perform the following actions on the individual sessions:

- Terminate a session of a specific user.
- Terminate all sessions of a specific user connected to a specific VPN gateway.
- Terminate all sessions that are connected to a specific VPN gateway.

If a client device supports dual address stack and the RA VPN configuration on the Firewall Threat Defense device allows IPv4 and IPv6 address pools, when a client establishes an RA VPN session with the headend device, it assigns an IPv4 and an IPv6 address to the client's tunnel interface. The RA VPN session has two IP addresses, an IPv4 and an IPv6 address on the threat defense device. The Firewall Management Center shows two sessions for the same user, one with an IPv4 address and another with an IPv6 address, and the session count is two.

Hence, even when there is only a single RA VPN session from a user as per **show vpn-sessiondb l2l filter ipaddress** command on the device, the Firewall Management Center shows two different sessions.

### Active Sessions (Map View)

This widget shows an interactive heat map to visualize the location of the users connected through RA VPN sessions on the devices.

- Countries that have user sessions appear in shades of blue.
- Legend of the map provides a scale that indicates the correlation between the number of sessions in a country and the shade of blue for the country.
- Hover the mouse pointer over the map to view the country name and the total number of active user sessions.
- Zoom in, zoom out, and reset options are available.

### Sessions

This widget allows you to monitor real-time data from active RA VPN sessions on the devices. You can filter and view the distribution of active RA VPN sessions according to:

- Device: Displays the number of sessions per device.
- Encryption Type: Displays the number of Secure Client SSL or IPsec sessions.
- Secure Client Version: Displays the sessions per Secure Client version.
- Operating System: Displays the sessions per operating systems. For example, Windows, Linux, Mac, Mobile OS, and so on.
- Connection Profile: Displays the sessions per connection profile.

### Device Identity Certificates

This widget provides information about the identity certificate expiry of the RA VPN gateways. You can view expired certificates and certificates that are due for expiry within a month. Click **View Details** to view the certificates in the **Device > Certificates** page.

## SD-WAN Summary Dashboard

The SD-WAN Summary dashboard (**Overview > Dashboards > SD-WAN Summary**) provides a snapshot of your WAN devices and their interfaces. This dashboard helps you to:

- Identify issues with the underlay and overlay (VPN) topologies.
- Troubleshoot VPN issues using the existing **Health Monitoring**, **Device Management**, and **Site-to-Site Monitoring** pages.
- Monitor application performance metrics of WAN interfaces. The threat defense steers application traffic based on these metrics.

A WAN device must meet one of the following criteria:

- The device must be a VPN peer.
- The device must have WAN interface.

A WAN interface must meet one of the following criteria:

- The interface has IP address-based path monitoring enabled on it.
- The interface has a Policy Based Routing (PBR) policy with at least one application configured to monitor it.

For more information about PBR policy and path monitoring, see [Policy Based Routing, on page 1211](#).

Click **Uplink Decisions** to view the **VPN Troubleshooting** page. You can view syslogs with ID: 880001. These syslogs show the threat defense interfaces through which it steers traffic based on the configured PBR policy.

To view the above syslogs and to view the data on this dashboard, ensure that you review [Prerequisites for Using SD-WAN Summary Dashboard, on page 1575](#).

For clusters, this dashboard displays application performance metrics of only the control node and not the data nodes.

## Prerequisites for Using SD-WAN Summary Dashboard

- You must be an Admin, Security Analyst, or Maintenance user to view this dashboard.
- Threat defense devices must be Version 7.2 or later.
- Enable IP-based path monitoring and HTTP-based application monitoring on the WAN interfaces.
  1. Choose **Devices > Device Management**.
  2. Click the edit icon adjacent to the device that you want to edit.

3. Click the edit icon adjacent to the interface that you want to edit.
4. Click the **Path Monitoring** tab.
5. Check the **Enable IP based Monitoring** check box.
6. Check the **Enable HTTP based Application Monitoring** check box.
7. Click **OK**.

- Configure a PBR policy with at least one application configured to monitor it:

1. Choose **Devices > Device Management**.
2. Click the edit icon adjacent to the device that you want to edit.
3. Click **Routing**.
4. In the left pane, click **Policy Based Routing**.
5. Click **Add**.
6. From the **Ingress Interface** drop-down list, choose an interface.
7. Click **Add** to configure a forwarding action.
8. Configure the parameters.
9. Click **Save**.

- To view the application performance metrics for the WAN interfaces, you must:

- Threat defense devices must be Version 7.4.1.
- Enable data collection from the SD-WAN module in the health policy.
  1. Choose **System (⚙️) > Health > Policy**.
  2. Click the **Edit health policy** icon.
  3. In the **Health Modules** tab, under **SD-WAN**, click the **SD-WAN Monitoring** toggle button.

- Configure applications for the PBR policies.

1. Choose **Objects > Object Management > Access List > Extended**.
2. Click the edit icon adjacent to the access list and add the applications for the PBR policy.

- Configure the forwarding action for the policy with one of the four application metrics.

1. Choose **Devices > Device Management**.
2. Click the edit icon adjacent to the device that you want to edit.
3. Click **Routing**.
4. In the left pane, click **Policy Based Routing**.
5. Click the edit icon adjacent to the policy that you want to edit.

6. In the **Edit Policy Based Route** dialog box, click the edit icon adjacent to the corresponding ACL.
7. In the **Edit Forwarding Actions** dialog box, from the **Interface Ordering** drop-down list, choose one of the following options:
  - **Minimal Jitter**
  - **Maximum Mean Opinion Score**
  - **Minimal Round-Trip Time**
  - **Minimal Packet Loss**

If you choose **Interface Priority** or **Order**, application monitoring is not enabled on the interface.

- Configure ECMP on the WAN interfaces:
  1. Choose **Devices > Device Management**.
  2. Click the edit icon adjacent to the device that you want to edit.
  3. Click **Routing**.
  4. In the left pane, click **ECMP**.
  5. Click **Add** and specify a name for the ECMP zone.
  6. Click **Add** to move interfaces from **Available Interfaces** to **Selected Interfaces**.
  7. Click **OK**.
- Ensure that traffic passes through the interface.
- Enable DNS inspection on each WAN device so that the threat defense device can do DNS snooping, and configure the trusted DNS servers:
  1. Choose **Devices > Platform Settings**.
  2. Click the edit icon adjacent to the threat defense policy that you want to edit.
  3. In the left pane, click **DNS**.
  4. Click the **DNS Settings** tab.
  5. Check the **Enable DNS name resolution by device** check box.
  6. Click the **Trusted DNS Servers** tab.
  7. Do one of the following:
    - Click the **Trust Any DNS server** toggle button.
    - Under **Specify DNS Servers**, click **Edit** to add trusted DNS servers.
- To view syslogs when you click **Uplink Decisions**, you must:
  - Choose **Devices > Platform Settings** and create or edit a threat defense policy.
  - In the left pane, click **Syslog**.

- Click the **Logging Setup** tab.
- Check the **Enable Logging** check box to turn on the data plane system logging for the threat defense device.
- Click the **All Logs** radio button to enable logging of all the troubleshooting syslog messages.  
or  
Click the **VPN Logs** radio button to enable logging of only the VPN troubleshooting messages.
- Click **Save**.

## Monitor WAN Devices and Interfaces Using the SD-WAN Summary Dashboard

The SD-WAN Summary dashboard has the following widgets under the **Overview** tab:

- [Top Applications, on page 1578](#)
- [WAN Connectivity, on page 1578](#)
- [VPN Topology, on page 1579](#)
- [Interface Throughput, on page 1579](#)
- [Device Inventory, on page 1579](#)
- [WAN Device Health, on page 1579](#)

### Top Applications

This widget displays the top 10 applications ranked according to throughput.

You can choose a time range for the widget data from the **Show Last** drop-down list. The range is 15 minutes to two weeks.

### WAN Connectivity

This widget provides a summary of the WAN interfaces statuses. It shows the number of WAN interfaces that are in the **Online**, **Offline** or **No Data** states. Note that you cannot monitor subinterfaces using this widget.

Click **View All Interfaces** to view more details about the interfaces in the health monitor page.

If a WAN interface is in the **Offline** or **No Data** state, you can troubleshoot it from the health monitor page:

1. In the **Monitoring** pane, expand **Devices**.
2. Click the corresponding WAN device to view the device-specific health details.
3. Click the **Interface** tab to view the interface status and aggregate traffic statistics for a specific time.

Alternatively, you can click **View System & Troubleshoot Details**. The health monitor page is displayed with all the necessary details.

### VPN Topology

This widget provides a summary of the site-to-site VPN tunnel statuses. It shows the number of **Active**, **Inactive**, and **No Active Data** VPN tunnels.

Click **View All Connections** to view the VPN tunnel details in the **Site-to-site VPN Monitoring** dashboard.

If the tunnels are in the **Inactive** or **No Active Data** state, you can troubleshoot using the **Site-to-site VPN Monitoring** dashboard. In the **Tunnel Status** widget, hover your cursor over a topology, click **View** (👁) and do one of the following:

- Click the **CLI Details** tab to view the details of the VPN tunnels.
- Click the **Packet Tracer** tab to use the packet tracer tool for the topology.

### Interface Throughput

This widget monitors the average throughput of the WAN interfaces during the chosen time period.

The interface throughput is classified into four bands. These details aid in cost planning and resourcing. You can choose a time range for the widget data from the **Show Last** drop-down list. The range is from 15 minutes to two weeks.

Click **View Health Monitoring** to view more details about the interface in the health monitor page.

### Device Inventory

This widget lists all the managed WAN devices and groups them according to the model.

Click **View Device Management** to view more details about the device in the **Device Management** page.

### WAN Device Health

This widget displays the device count according to the health of the WAN devices. You can view the number of devices with errors, warnings, or those that are in **Disabled** state.

Click **View Health Monitoring** to view the alarms, and quickly identify, isolate, and resolve issues.

If the health of a device is affected, you can troubleshoot it from the health monitor page.

1. In the **Monitoring** pane, expand **Devices**.
2. Click the corresponding WAN device to view the device-specific health details.
3. Click **View System & Troubleshoot Details**. The health monitor page is displayed with all the necessary details.

A device can be in **Disabled** state for multiple reasons, including the following:

- Management interface is disabled.
- Device is powered off.
- Device is being upgraded.

## Monitor Application Performance Metrics of WAN Interfaces Using the SD-WAN Summary Dashboard

Under the **Application Monitoring** tab, you can select a WAN device and view the application performance metrics for the corresponding WAN interfaces. These metrics include Jitter, Round Trip Time (RTT), Mean Opinion Score (MOS), and Packet Loss.

By default, the metrics data is refreshed every 5 minutes. You can change the refresh time; the range is from 5 to 30 minutes. You can view the metrics in tabular and graphical formats. For each WAN interface, the latest metric value appears in the table. For graphical data, you can choose a time interval of up to 24 hours to view the metrics data for the corresponding WAN interfaces.

## VPN Session and User Information

The system generates events that communicate the details of user activity on your network, including VPN-related activity. The system monitoring capabilities enable you to determine quickly whether remote access VPN problems exist and where they exist. You can then apply this knowledge and use your network management tools to reduce or eliminate problems for your network and users. Optionally, you can log out remote access VPN users as needed.

### Viewing Remote Access VPN Active Sessions

**Analysis > Users > Active Sessions**

Lets you view the currently logged-in VPN users at any given point in time with supporting information such as the user name, login duration, authentication type, assigned/public IP address, device details, client version, endpoint information, throughput, bandwidth consumed group policy, tunnel group and so on. The system allows you to filter current user information, log users out, and delete users from the summary list.

**Note** If you configure your VPN in a high-availability deployment, the device name displayed against active VPN sessions can be the primary or secondary device that identified the user session.

### Viewing Remote Access VPN User Activity

**Analysis > Users heading > User Activity**

Lets you view the details of user activity on your network. The system logs historical events and includes VPN-related information such as connection profile information, IP address, geolocation information, connection duration, throughput, and device information.

## Site to Site VPN Connection Event Monitoring

The site-to-site VPN connection event allows you to know if the VPN encrypts or do not encrypts the connection and helps you to troubleshoot connectivity issues, especially in multi-hop VPN deployments. The event

dashboard of the Firewall Management Center displays the IP address of the VPN peer (peer's IKE address) which encrypts or decrypts the traffic and displays the VPN action as follows:

- If the connection is decrypted by the VPN, the column **Decrypt Peer** displays the IP address of the peer's address from where the flow was received and displays **Decrypt** as the VPN action.
- If the connection is encrypted by the VPN, the column **Encrypt Peer** displays the IP address of the VPN peer to which the flow is sent and displays **Encrypt** as the VPN action.
- If the VPN server cascades the connection, it gets decrypted on one tunnel and gets re-encrypted on another tunnel. In this case, both **Encrypt Peer** and **Decrypt Peer** IP addresses get appears in the event. The column **VPN Action** displays **VPN Routing** as the action to indicate that the connection transit through the VPN server.

If you enable the bypass Access Control Policy for decrypted traffic (sysopt permit-vpn) option, the system bypasses the Access Control Policy and do not log events for decrypted traffic. This option is disabled by default and all decrypted traffic in the VPN tunnel undergoes ACL inspection.

## View Site to Site VPN Connection Events

Access the connection event viewer of the Firewall Management Center to know if the VPN encrypts or do not encrypts the connection traffic and to retrieve the VPN peer details.

### Before you begin

Ensure that you enable logging of connection events at the beginning of connection and at the end of connection in the access control rule.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Choose <b>Analysis &gt; Connections</b> .  |
| <b>Step 2</b> | Go to <b>Table View of Connection Events</b> tab.  |
| <b>Step 3</b> | In the table view of events, multiple fields are hidden by default. To change the fields that appear, click the <b>x</b> icon in any column name to display a field chooser. |
| <b>Step 4</b> | Choose the following columns: <ul style="list-style-type: none"><li>• Decrypt Peer</li><li>• Encrypt Peer</li><li>• VPN Action</li></ul>                                     |
| <b>Step 5</b> | Click <b>Apply</b> .   |
- See *Connection and Security-Related Connection Events* in the [Secure Firewall Management Center Administration Guide](#) for more information on the connection events.
-

# VPN Troubleshooting

This section describes VPN troubleshooting tools and debug information.

## System Messages

The Message Center is the place to start your troubleshooting. This feature allows you to view messages that are continually generated about system activities and status. To open the Message Center, click **System Status**, located to the immediate right of the **Deploy** button in the main menu.

## VPN System Logs

You can enable logging of VPN troubleshoot syslog for Firewall Threat Defense devices. Logging information can help you identify and isolate network or device configuration problems. When you enable VPN logging, the Firewall Threat Defense devices send VPN syslogs to the Firewall Management Center.

All VPN syslogs appear with a default severity level **errors** or a higher severity (unless changed). You can manage the VPN logging through Firewall Threat Defense platform settings. You can adjust the message severity level by editing the **VPN Logging Settings** in the Firewall Threat Defense platform settings policy for targeted devices. See [Configure Syslog Logging for Firewall Threat Defense Devices, on page 871](#) for details on enabling VPN logging, configuring syslog servers, and viewing the system logs.

From the Troubleshooting Logs table (**Devices > Troubleshoot > Troubleshooting Logs**), you can view and analyze the VPN syslog messages to identify and isolate issues with your network and device configuration.

We recommend that you set the logging level of the VPN logs as level 3 (Errors). Setting the VPN logging level to level 4 and above (Warnings, Notifications, Informational or Debugging) could overload the Firewall Management Center.

---

**Note** When you configure a device with site-to-site or remote access VPN, it automatically enables sending VPN syslogs to the Firewall Management Center by default.

---

## Debug Commands

This section explains how you use debug commands to help you diagnose and resolve VPN-related problems. The commands described here are not exhaustive, this section include commands according to their usefulness in assisting you to diagnose VPN-related problems.

### Usage Guidelines

Because debugging output is assigned high priority in the CPU process, it can render the system unusable. For this reason, use **debug** commands only to troubleshoot specific problems or during troubleshooting sessions with the Cisco Technical Assistance Center (TAC). Moreover, it is best to use **debug** commands during periods of lower network traffic and fewer users. Debugging during these periods decreases the likelihood that increased **debug** command processing overhead will affect system use.

You can view debug output in a CLI session only. Output is directly available when connected to the Console port, or when in the diagnostic CLI (enter **system support diagnostic-cli**). You can also view output from the regular Firepower Threat Defense CLI using the **show console-output** command.

To show debugging messages for a given feature, use the **debug** command. To disable the display of debug messages, use the **no** form of this command. Use **no debug all** to turn off all debugging commands.

**debug** *feature* [*subfeature*] [*level*]  
**no debug** *feature* [*subfeature*]

<b>Syntax Description</b>	<i>feature</i> Specifies the feature for which you want to enable debugging. To see the available features, use the <b>debug ?</b> command for CLI help.
	<i>subfeature</i> (Optional) Depending on the feature, you can enable debug messages for one or more subfeatures. Use ? to see the available subfeatures.
	<i>level</i> (Optional) Specifies the debugging level. Use ? to see the available levels.

**Command Default** The default debugging level is 1.

### Example

With multiple sessions running on remote access VPN, troubleshooting can be difficult, given the size of the logs. You can use the **debug webvpn condition** command to set up filters to target your debug process more precisely.

**debug webvpn condition** {*group name* | **p-ipaddress** *ip\_address* [{*subnet subnet\_mask* | *prefix length*}] | **reset** | *user name*}

Where:

- **group** *name* filters on a group policy (not a tunnel group or connection profile).
- **p-ipaddress** *ip\_address* [{*subnet subnet\_mask* | *prefix length*}] filters on the public IP address of the client. The subnet mask (for IPv4) or prefix (for IPv6) is optional.
- **reset** resets all filters. You can use the **no debug webvpn condition** command to turn off a specific filter.
- **user** *name* filters by username.

If you configure more than one condition, the conditions are conjoined (ANDed), so that debugs appear only if all conditions are met.

After setting up the condition filter, use the base **debug webvpn** command to turn on the debug. Setting the conditions alone does not enable the debug. Use the **show debug** and **show webvpn debug-condition** commands to view the current state of debugging.

The following shows an example of enabling a conditional debug on the user jdoe.

```
firepower# debug webvpn condition user jdoe

firepower# show webvpn debug-condition
INFO: Webvpn conditional debug is turned ON
INFO: User name filters:
INFO: jdoe

firepower# debug webvpn
INFO: debug webvpn enabled at level 1.
```

```
firepower# show debug
debug webvpn enabled at level 1
INFO: Webvpn conditional debug is turned ON
INFO: User name filters:
INFO: jdoe
```

## Related Commands

Command	Description
<b>show debug</b>	Shows the currently active debug settings.
<b>undebug</b>	Disables debugging for a feature. This command is a synonym for <b>no debug</b> .

## debug aaa

See the following commands for debugging configurations or authentication, authorization, and accounting (AAA) settings.

**debug aaa** [*accounting* | *authentication* | *authorization* | *common* | *internal* | *shim* | *url-redirect*]

## Syntax Description

<i>aaa</i>	Enables debugging for AAA. Use ? to see the available subfeatures.
<i>accounting</i>	(Optional) Enables AAA accounting debugging.
<i>authentication</i>	(Optional) Enables AAA authentication debugging.
<i>authorization</i>	(Optional) Enables AAA authorization debugging.
<i>common</i>	(Optional) Specifies the AAA common debug level. Use ? to see the available levels.
<i>internal</i>	(Optional) Enables AAA internal debugging.
<i>shim</i>	(Optional) Specifies the AAA shim debug level. Use ? to see the available levels.
<i>url-redirect</i>	(Optional) Enables AAA url-redirect debugging.

## Command Default

The default debugging level is 1.

## Related Commands

Command	Description
<b>show debug aaa</b>	Shows the currently active debug settings for AAA.
<b>undebug aaa</b>	Disables debugging for AAA. This command is a synonym for <b>no debug aaa</b> .

## debug crypto

See the following commands for debugging configurations or settings associated with crypto.

**debug crypto** [*ca* | *condition* | *engine* | *ike-common* | *ikev1* | *ikev2* | *ipsec* | *ss-apic*]

<b>Syntax Description</b>	<i>crypto</i>	Enables debugging for <i>crypto</i> . Use ? to see the available subfeatures.
	<i>ca</i>	(Optional) Specifies the PKI debug levels. Use ? to see the available subfeatures.
	<i>condition</i>	(Optional) Specifies the IPsec/ISAKMP debug filters. Use ? to see the available filters.
	<i>engine</i>	(Optional) Specifies the crypto engine debug levels. Use ? to see the available levels.
	<i>ike-common</i>	(Optional) Specifies the IKE common debug levels. Use ? to see the available levels.
	<i>ikev1</i>	(Optional) Specifies the IKE version 1 debug levels. Use ? to see the available levels.
	<i>ikev2</i>	(Optional) Specifies the IKE version 2 debug levels. Use ? to see the available levels.
	<i>ipsec</i>	(Optional) Specifies the IPsec debug levels. Use ? to see the available levels.
	<i>condition</i>	(Optional) Specifies the Crypto Secure Socket API debug levels. Use ? to see the available levels.
	<i>vpnclient</i>	(Optional) Specifies the EasyVPN client debug levels. Use ? to see the available levels.

**Command Default** The default debugging level is 1.

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show debug crypto</b>	Shows the currently active debug settings for crypto.
	<b>undebg crypto</b>	Disables debugging for crypto. This command is a synonym for <b>no debug crypto</b> .

## debug crypto ca

See the following commands for debugging configurations or settings associated with crypto ca.

**debug crypto ca** [*cluster* | *messages* | *periodic-authentication* | *scep-proxy* | *transactions* | *trustpool*] [*1-255*]

<b>Syntax Description</b>	<i>crypto ca</i>	Enables debugging for <i>crypto ca</i> . Use ? to see the available subfeatures.
	<i>cluster</i>	(Optional) Specifies the PKI cluster debug level. Use ? to see the available levels.
	<i>cmp</i>	(Optional) Specifies the CMP transactions debug level. Use ? to see the available levels.
	<i>messages</i>	(Optional) Specifies the PKI Input/Output message debug level. Use ? to see the available levels.

<i>periodic-authentication</i>	(Optional) Specifies the PKI periodic-authentication debug level. Use ? to see the available levels.
<i>scep-proxy</i>	(Optional) Specifies the SCEP proxy debug level. Use ? to see the available levels.
<i>server</i>	(Optional) Specifies the local CA server debug level. Use ? to see the available levels.
<i>transactions</i>	(Optional) Specifies the PKI transaction debug level. Use ? to see the available levels.
<i>trustpool</i>	(Optional) Specifies the trustpool debug level. Use ? to see the available levels.
<i>1-255</i>	(Optional) Specifies the debugging level.

**Command Default**

The default debugging level is 1.

**Related Commands**

Command	Description
<b>show debug crypto ca</b>	Shows the currently active debug settings for crypto ca.
<b>undebug</b>	Disables debugging for crypto ca. This command is a synonym for <b>no debug crypto ca</b> .

**debug crypto ikev1**

See the following commands for debugging configurations or settings associated with Internet Key Exchange version 1 (IKEv1).

**debug** *crypto ikev1* [*timers*] [*1-255*]

**Syntax Description**

<i>ikev1</i>	Enables debugging for <i>ikev1</i> . Use ? to see the available subfeatures.
<i>timers</i>	(Optional) Enables debugging for IKEv1 timers.
<i>1-255</i>	(Optional) Specifies the debugging level.

**Command Default**

The default debugging level is 1.

**Related Commands**

Command	Description
<b>show debug crypto ikev1</b>	Shows the currently active debug settings for IKEv1.
<b>undebug crypto ikev1</b>	Disables debugging for IKEv1. This command is a synonym for <b>no debug crypto ikev1</b> .

**debug crypto ikev2**

See the following commands for debugging configurations or settings associated with Internet Key Exchange version 2 (IKEv2).

**debug** *crypto ikev2* [*ha* | *platform* | *protocol* | *timers*]

<b>Syntax Description</b>	<i>ikev2</i>	Enables debugging <i>ikev2</i> . Use ? to see the available subfeatures.
	<i>ha</i>	(Optional) Specifies the IKEv2 HA debug level. Use ? to see the available levels.
	<i>platform</i>	(Optional) Specifies the IKEv2 platform debug level. Use ? to see the available levels.
	<i>protocol</i>	(Optional) Specifies the IKEv2 protocol debug level. Use ? to see the available levels.
	<i>timers</i>	(Optional) Enables debugging for IKEv2 timers.

**Command Default** The default debugging level is 1.

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show debug crypto ikev2</b>	Shows the currently active debug settings for IKEv2.
	<b>undebugcrypto ikev2</b>	Disables debugging for IKEv2. This command is a synonym for <b>no debug crypto ikev2</b> .

## debug crypto ipsec

See the following commands for debugging configurations or settings associated with IPsec.

**debug** *crypto ipsec* [1-255]

<b>Syntax Description</b>	<i>ipsec</i>	Enables debugging for <i>ipsec</i> . Use ? to see the available subfeatures.
	1-255	(Optional) Specifies the debugging level.

**Command Default** The default debugging level is 1.

<b>Related Commands</b>	<b>Command</b>	<b>Description</b>
	<b>show debug crypto ipsec</b>	Shows the currently active debug settings for IPsec.
	<b>undebugcrypto ipsec</b>	Disables debugging for IPsec. This command is a synonym for <b>no debug crypto ipsec</b> .

## debug ldap

See the following commands for debugging configurations or settings associated with LDAP (Lightweight Directory Access Protocol).

**debug** *ldap* [1-255]

<b>Syntax Description</b>	<i>ldap</i>	Enables debugging for LDAP. Use ? to see the available subfeatures.
---------------------------	-------------	---

<i>1-255</i>	(Optional) Specifies the debugging level.
--------------	---

**Command Default**

The default debugging level is 1.

**Related Commands**

Command	Description
<b>show debug ldap</b>	Shows the currently active debug settings for LDAP.
<b>undebugldap</b>	Disables debugging for LDAP. This command is a synonym for <b>no debug ldap</b> .

## debug ssl

See the following commands for debugging configurations or settings associated with SSL sessions.

**debug ssl** [*cipher* | *device*] [*1-255*]

**Syntax Description**

<i>ssl</i>	Enables debugging for SSL. Use ? to see the available subfeatures.
<i>cipher</i>	(Optional) Specifies the SSL cipher debug level. Use ? to see the available levels.
<i>device</i>	(Optional) Specifies the SSL device debug level. Use ? to see the available levels.
<i>1-255</i>	(Optional) Specifies the debugging level.

**Command Default**

The default debugging level is 1.

**Related Commands**

Command	Description
<b>show debug ssl</b>	Shows the currently active debug settings for SSL.
<b>undebug ssl</b>	Disables debugging for SSL. This command is a synonym for <b>no debug ssl</b> .

## debug webvpn

See the following commands for debugging configurations or settings associated with WebVPN.

**debug webvpn** [*anyconnect* | *chunk* | *cifs* | *citrix* | *compression* | *condition* | *cstp-auth* | *customization* | *failover* | *html* | *javascript* | *kcd* | *listener* | *mus* | *nfs* | *request* | *response* | *saml* | *session* | *task* | *transformation* | *url* | *util* | *xml*]

**Syntax Description**

<i>webvpn</i>	Enables debugging for WebVPN. Use ? to see the available subfeatures.
<i>anyconnect</i>	(Optional) Specifies the WebVPN Secure Client debug level. Use ? to see the available levels.
<i>chunk</i>	(Optional) Specifies the WebVPN chunk debug level. Use ? to see the available levels.
<i>cifs</i>	(Optional) Specifies the WebVPN CIFS debug level. Use ? to see the available levels.

<i>citrix</i>	(Optional) Specifies the WebVPN Citrix debug level. Use ? to see the available levels.
<i>compression</i>	(Optional) Specifies the WebVPN compression debug level. Use ? to see the available levels.
<i>condition</i>	(Optional) Specifies the WebVPN filter conditions debug level. Use ? to see the available levels.
<i>cstp-auth</i>	(Optional) Specifies the WebVPN CSTEP authentication debug level. Use ? to see the available levels.
<i>customization</i>	(Optional) Specifies the WebVPN customization debug level. Use ? to see the available levels.
<i>failover</i>	(Optional) Specifies the WebVPN failover debug level. Use ? to see the available levels.
<i>html</i>	(Optional) Specifies the WebVPN HTML debug level. Use ? to see the available levels.
<i>javascript</i>	(Optional) Specifies the WebVPN Javascript debug level. Use ? to see the available levels.
<i>kcd</i>	(Optional) Specifies the WebVPN KCD debug level. Use ? to see the available levels.
<i>listener</i>	(Optional) Specifies the WebVPN listener debug level. Use ? to see the available levels.
<i>mus</i>	(Optional) Specifies the WebVPN MUS debug level. Use ? to see the available levels.
<i>nfs</i>	(Optional) Specifies the WebVPN NFS debug level. Use ? to see the available levels.
<i>request</i>	(Optional) Specifies the WebVPN request debug level. Use ? to see the available levels.
<i>response</i>	(Optional) Specifies the WebVPN response debug level. Use ? to see the available levels.
<i>saml</i>	(Optional) Specifies the WebVPN SAML debug level. Use ? to see the available levels.
<i>session</i>	(Optional) Specifies the WebVPN session debug level. Use ? to see the available levels.
<i>task</i>	(Optional) Specifies the WebVPN task debug level. Use ? to see the available levels.
<i>transformation</i>	(Optional) Specifies the WebVPN transformation debug level. Use ? to see the available levels.

<i>url</i>	(Optional) Specifies the WebVPN URL debug level. Use ? to see the available levels.
<i>util</i>	(Optional) Specifies the WebVPN utility debug level. Use ? to see the available levels.
<i>xml</i>	(Optional) Specifies the WebVPN XML debug level. Use ? to see the available levels.

**Command Default**

The default debugging level is 1.

**Related Commands**

Command	Description
<b>show debug webvpn</b>	Shows the currently active debug settings for WebVPN.
<b>undebbug webvpn</b>	Disables debugging for WebVPN. This command is a synonym for <b>no debug webvpn</b> .

## Introduction to Access Control

Access control is a hierarchical policy-based feature that allows you to specify, inspect, and log (non-fast-pathed) network traffic.

Each managed device can be assigned to one access control policy. The data that the policy's assigned (also known as targeted) devices collect about your network traffic can be used to filter and control that traffic based on:

- simple, easily determined transport and network layer characteristics: source and destination, port, protocol, and so on
- the latest contextual information on the traffic, including characteristics such as reputation, risk, business relevance, application used, or URL visited
- realm, user, user group, or ISE attribute
- custom Security Group Tag (SGT)
- characteristics of encrypted traffic; you can also decrypt this traffic for further analysis
- whether unencrypted or decrypted traffic contains a prohibited file, detected malware, or intrusion attempt
- time and day (on supported devices)

Each type of traffic inspection and control occurs where it makes the most sense for maximum flexibility and performance. For example, reputation-based blocking uses simple source and destination data, so it can block prohibited traffic early in the process. In contrast, detecting and blocking intrusions and exploits is a last-line defense.

# Introduction to Rules

Rules in various policy types (access control, SSL, identity, and so on) exert granular control over network traffic. The system evaluates traffic against rules in the order that you specify, using a first-match algorithm.

Although these rules might include other configurations that are not consistent across policies, they share many basic characteristics and configuration mechanics, including:

- **Conditions:** Rule conditions specify the traffic that each rule handles. You can configure each rule with multiple conditions. Traffic must match all conditions to match the rule.
- **Action:** A rule's action determines how the system handles matching traffic. Note that even if a rule does not have an **Action** list you can choose from, the rule still has an associated action. For example, a custom network analysis rule uses a network analysis policy as its "action." As another example, QoS rules do not have an explicit action because all QoS rules do the same thing: rate limit traffic.
- **Position:** A rule's position determines its evaluation order. When using a policy to evaluate traffic, the system matches traffic to rules in the order you specify. Usually, the system handles traffic according to the first rule where all the rule's conditions match the traffic. (Monitor rules, which are designed to track and log, are an exception.) Proper rule order reduces the resources required to process network traffic, and prevents rule preemption.
- **Category:** To organize some rule types, you can create custom rule categories in each parent policy.
- **Logging:** For many rules, logging settings govern whether and how the system logs connections handled by the rule. Some rules (such as identity and network analysis rules) do not include logging settings because the rules neither determine the final disposition of connections, nor are they specifically designed to log connections. As another example, QoS rules do not include logging settings; you cannot log a connection simply because it was rate limited.
- **Comments:** For some rule types, each time you save changes, you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

---

**Tip** A right-click menu in many policy editors provides shortcuts to many rule management options, including editing, deleting, moving, enabling, and disabling.

---

For more information, see the chapter that discusses the rules you're interested in (for example, access control rules).

## Related Topics

- [Configuring Application Conditions and Filters](#), on page 1657
- [Best Practices for Application Control](#), on page 1602

## Filtering Rules by Device

Some policy editors allow you to filter your rule view by affected devices.

The system uses a rule's interface constraints to determine if the rule affects a device. If you constrain a rule by interface (security zone or interface group condition), the device where that interface is located is affected by that rule. Rules with no interface constraint apply to any interface, and therefore every device.

QoS rules are always constrained by interface.

**Note** The following procedure does not apply to the access control policy. To see the rules that apply to a specific device or set of devices in the access control policy, click the filter icon and select the devices.

### Procedure

- Step 1** In the policy editor, click **Rules**, then click **Filter by Device**.  
A list of targeted devices and device groups appears.
- Step 2** Check one or more check boxes to display only the rules that apply to those devices or groups. Or, check **All** to reset and display all of the rules.
- Tip**  
Hover your pointer over a rule criterion to see its value. If the criterion represents an object with device-specific overrides, the system displays the override value when you filter the rules list by only that device. If the criterion represents an object with domain-specific overrides, the system displays the override value when you filter the rules list by devices in that domain.
- Step 3** Click **OK**.

## Rule and Other Policy Warnings

Policy and rule editors use icons to mark configurations that could adversely affect traffic analysis and flow. Depending on the issue, the system may warn you when you deploy or prevent you from deploying entirely.

**Tip** Hover your pointer over an icon to read the warning, error, or informational text.

**Table 88: Policy Error Icons**

Icon	Description	Example
<b>Errors (✖)</b>	If a rule or configuration has an error, you cannot deploy until you correct the issue, even if you disable any affected rules.	A rule that performs category and reputation-based URL filtering is valid until you assign a device that does not have a URL Filtering license. At that point, an error icon appears next to the rule, and you cannot deploy until you edit or delete the rule, unassign the device, or enable the license.

Icon	Description	Example
<b>Warning</b> (⚠)	<p>You can deploy a policy that displays rule or other warnings. However, misconfigurations marked with warnings have no effect.</p> <p>If you disable a rule with a warning, the warning icon disappears. It reappears if you enable the rule without correcting the underlying issue.</p>	<p>Preempted rules or rules that cannot match traffic due to misconfiguration have no effect. This includes conditions using empty object groups, application filters that match no applications, excluded LDAP users, invalid ports, and so on.</p> <p>However, if a warning icon marks a licensing error or model mismatch, you cannot deploy until you correct the issue.</p>
<b>Information</b> (i)	Information icons convey helpful information about configurations that may affect the flow of traffic. These issues do not prevent you from deploying.	The system might skip matching the first few packets of a connection against some rules, until the system identifies the application or web traffic in that connection. This allows connections to be established so that applications and HTTP requests can be identified.
<b>Rule Conflict</b> (⚡)	When you enable rule conflict analysis, this icon appears in the rule table for rules that have conflicts.	Conflicts include redundant rules, redundant objects, and shadowed rules. Redundant and shadowed rules do not match traffic because previous rules would already match the criteria. Redundant objects make your rules unnecessarily complex.

## Access Control Policy Default Action

A newly created access control policy directs its assigned devices to handle all traffic using its *default action*.

In a simple access control policy, the default action specifies how a device handles all traffic. In a more complex policy, the default action handles traffic that:

- is not trusted by Intelligent Application Bypass
- is not on a Security Intelligence Block list
- is not blocked by SSL inspection (encrypted traffic only)
- matches none of the rules in the policy (except Monitor rules, which match and log—but do not handle or inspect—traffic)

The access control policy default action can block or trust traffic without further inspection, or inspect traffic for intrusions and discovery data.

**Note** You **cannot** perform file or malware inspection on traffic handled by the default action. Logging for connections handled by the default action is initially disabled, though you can enable it.

If you are using policy inheritance, the default action for the lowest-level descendant determines final traffic handling. Although an access control policy can inherit its default action from its base policy, you cannot enforce this inheritance.

The following table describes the types of inspection you can perform on traffic handled by each default action.

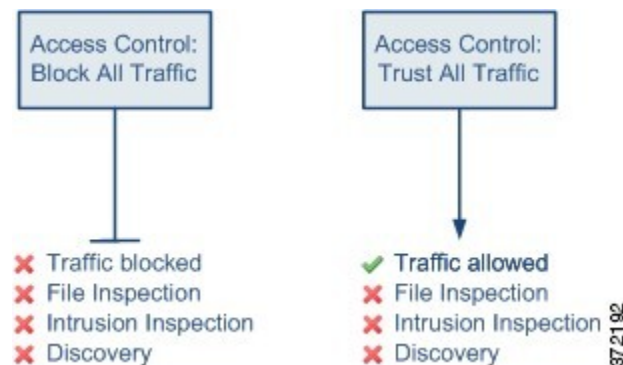

**Table 89: Access Control Policy Default Actions**

Default Action	Effect on Traffic	Inspection Type and Policy
Access Control: Block All Traffic	block without further inspection	none
Access Control: Trust All Traffic	trust (allow to its final destination without further inspection)	none
Intrusion Prevention	allow, as long as it is passed by the intrusion policy you specify	intrusion, using the specified intrusion policy and associated variable set, and discovery, using the network discovery policy
Network Discovery Only	allow	discovery only, using the network discovery policy
Inherit from base policy	defined in base policy	defined in base policy

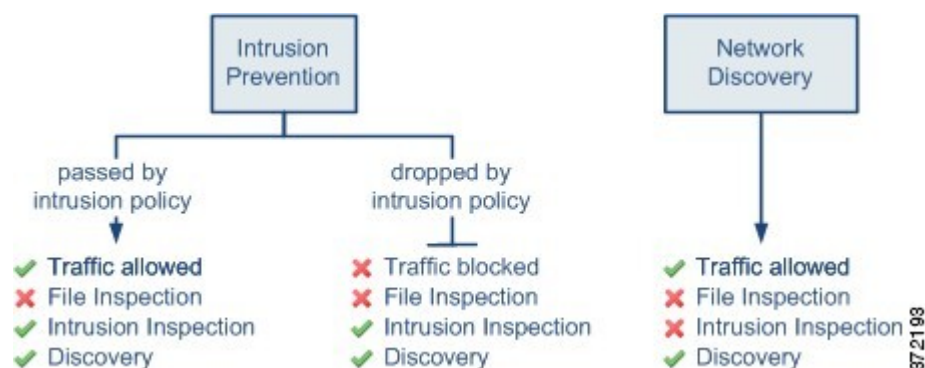

The following diagram illustrates the table.

The following diagrams illustrate the **Block All Traffic** and **Trust All Traffic** default actions.

The following diagrams illustrate the **Intrusion Prevention** and **Network Discovery Only** default actions.

372193

**Tip** The purpose of **Network Discovery Only** is to improve performance in a discovery-only deployment. Different configurations can disable discovery if you are only interested in intrusion detection and prevention.

## Deep Inspection Using File and Intrusion Policies

Deep inspection uses intrusion and file policies as the last line of defense before traffic is allowed to its destination.

- *Intrusion policies* govern the system's intrusion prevention capabilities.

For complete information, see [Intrusion Detection and Prevention, on page 1863](#).

- *File policies* govern the system's file control and malware defense capabilities.

For complete information, see [Network Malware Protection and File Policies, on page 2089](#).

Access control occurs before deep inspection; access control rules and the access control default action determine which traffic is inspected by intrusion and file policies.

By associating an intrusion or file policy with an access control rule, you are telling the system that before it passes traffic that matches the access control rule's conditions, you first want to inspect the traffic with an intrusion policy, a file policy, or both.

In an access control policy, you can associate one intrusion policy with each Allow and Interactive Block rule, as well as with the default action. Every unique **pair** of intrusion policy and variable set counts as one policy.

To associate intrusion and file policies with an access control rule, see:

- [Access Control Rule Configuration to Perform Intrusion Prevention, on page 1888](#)
- [Configuring an Access Control Rule to Perform Malware Protection, on page 2097](#)

**Note** By default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

## Access Control Traffic Handling with Intrusion and File Policies

The following diagram shows the flow of traffic in an inline intrusion prevention and malware defense deployment, as governed by an access control policy that contains four different types of access control rules and a default action.

In the scenario above, the first three access control rules in the policy—Monitor, Trust, and Block—cannot inspect matching traffic. Monitor rules track and log but do not inspect network traffic, so the system continues to match traffic against additional rules to determine whether to permit or deny it. (However, see an important exception and caveat at [Access Control Rule Monitor Action, on page 1646](#).) Trust and Block rules handle matching traffic without further inspection of any kind, while traffic that does not match continues to the next access control rule.

The fourth and final rule in the policy, an Allow rule, invokes various other policies to inspect and handle matching traffic, in the following order:

- **Discovery: Network Discovery Policy**—First, the network discovery policy inspects traffic for discovery data. Discovery is passive analysis and does not affect the flow of traffic. Although you do not explicitly enable discovery, you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy.
- **malware defense and File Control: File Policy**—After traffic is inspected by discovery, the system can inspect it for prohibited files and malware. malware defense detects and optionally blocks malware in many types of files, including PDFs, Microsoft Office documents, and others. If your organization wants to block not only the transmission of malware files, but all files of a specific type (regardless of whether the files contain malware), *file control* allows you to monitor network traffic for transmissions of specific file types, then either block or allow the file.
- **Intrusion Prevention: Intrusion Policy**—After file inspection, the system can inspect traffic for intrusions and exploits. An intrusion policy examines decoded packets for attacks based on patterns, and can block or alter malicious traffic. Intrusion policies are paired with *variable sets*, which allow you to use named values to accurately reflect your network environment.

- **Destination**—Traffic that passes all the checks described above passes to its destination.

An Interactive Block rule (not shown in the diagram) has the same inspection options as an Allow rule. This is so you can inspect traffic for malicious content when a user bypasses a blocked website by clicking through a warning page.

Traffic that does not match any access control rules in the policy with an action other than Monitor is handled by the default action. In this scenario, the default action is an Intrusion Prevention action, which allows traffic to its final destination as long as it is passed by the intrusion policy you specify. In a different deployment, you might have a default action that trusts or blocks all traffic without further inspection. Note that the system can inspect traffic allowed by the default action for discovery data and intrusions, but not prohibited files or malware. You **cannot** associate a file policy with the access control default action.

**Note** Sometimes, when a connection is analyzed by an access control policy, the system must process the first few packets in that connection, **allowing them to pass**, before it can decide which access control rule (if any) will handle the traffic. However, so these packets do not reach their destination uninspected, you can specify an intrusion policy (in the Advanced settings for the access control policy) to inspect these packets and generate intrusion events.

## File and Intrusion Inspection Order

In your access control policy, you can associate multiple Allow and Interactive Block rules with different intrusion and file policies to match inspection profiles to various types of traffic.

**Note** Traffic allowed by an Intrusion Prevention or Network Discovery Only default action can be inspected for discovery data and intrusions, but cannot be inspected for prohibited files or malware. You **cannot** associate a file policy with the access control default action.

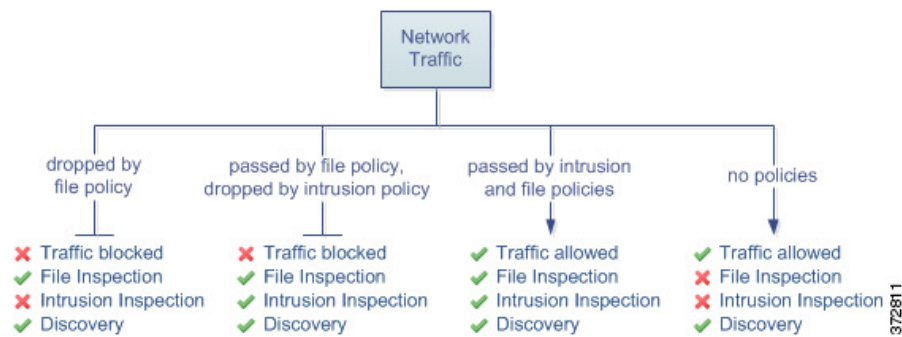

You do not have to perform both file and intrusion inspection in the same rule. For a connection matching an Allow or Interactive Block rule:

- without a file policy, traffic flow is determined by the intrusion policy
- without an intrusion policy, traffic flow is determined by the file policy
- without either, allowed traffic is inspected by network discovery only

**Tip** The system does not perform any kind of inspection on trusted traffic. Although configuring an Allow rule with neither an intrusion nor file policy passes traffic like a Trust rule, Allow rules let you perform discovery on matching traffic.

The diagram below illustrates the types of inspection you can perform on traffic that meets the conditions of either an Allow or user-bypassed Interactive Block access control rule. For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with a single access control rule.

For any single connection handled by an access control rule, file inspection occurs before intrusion inspection. That is, the system does not inspect files blocked by a file policy for intrusions. Within file inspection, simple blocking by type takes precedence over malware inspection and blocking.

For example, consider a scenario where you normally want to allow certain network traffic as defined in an access control rule. However, as a precaution, you want to block the download of executable files, examine downloaded PDFs for malware and block any instances you find, and perform intrusion inspection on the traffic.

You create an access control policy with a rule that matches the characteristics of the traffic you want to provisionally allow, and associate it with both an intrusion policy and a file policy. The file policy blocks the download of all executables, and also inspects and blocks PDFs containing malware:

- First, the system blocks the download of all executables, based on simple type matching specified in the file policy. Because they are immediately blocked, these files are subject to neither malware nor intrusion inspection.
- Next, the system performs malware cloud lookups for PDFs downloaded to a host on your network. Any PDFs with a malware disposition are blocked, and are not subject to intrusion inspection.
- Finally, the system uses the intrusion policy associated with the access control rule to inspect any remaining traffic, including files not blocked by the file policy.

**Note** Until a file is detected and blocked in a session, packets from the session may be subject to intrusion inspection.

## Access Control Policy Inheritance

You can nest access control policies, where each policy inherits the rules and settings from an ancestor (or *base*) policy. You can enforce this inheritance, or allow lower-level policies to override their ancestors.

Access control uses a hierarchical policy-based implementation. Just as you create a domain hierarchy, you can create a corresponding hierarchy of access control policies. A *descendant*, or *child*, access control policy inherits rules and settings from its direct *parent*, or *base*, policy. That base policy may have its own parent policy from which it inherits rules and settings, and so on.

An access control policy's rules are nested between its parent policy's Mandatory and Default rule sections. This implementation enforces Mandatory rules from ancestor policies, but allows the current policy to write rules that preempt Default rules from ancestor policies.

You can lock the following settings to enforce them in all descendant policies. Descendant policies can override unlocked settings.

- Security Intelligence — connections that are allowed or blocked based on the latest reputation intelligence for IP addresses, URLs, and domain names.
- HTTP Response pages — Displaying a custom or system-provided response page when you block a user's website request.
- Advanced settings — Specifying associated subpolicies, network analysis settings, performance settings, and other general options.

When using policy inheritance, the default action for the lowest-level descendant determines final traffic handling. Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

### Policy Inheritance and Multitenancy

Access control's hierarchical policy-based implementation complements multitenancy.

In a typical multidomain deployment, access control policy hierarchy corresponds to domain structure, and you apply the lowest-level access control policy to managed devices. This implementation allows selective access control enforcement at a higher domain level, while lower-level domain administrators can tailor deployment-specific settings. (You must use roles, not policy inheritance and enforcement alone, to restrict administrators in descendant domains.)

For example, as a Global domain administrator for your organization, you can create an access control policy at the Global level. You can then require that all your devices, which are divided into subdomain by function, use that Global-level policy as a base policy.

When subdomain administrators log into the Secure Firewall Management Center to configure access control, they can deploy the Global-level policy as-is. Or, they can create and deploy a descendant access control policy within the boundaries of the Global-level policy.

#### Note

Although the most useful implementation of access control inheritance and enforcement complements multitenancy, you can create a hierarchy of access control policies within a single domain. You can also assign and deploy access control policies at any level.

## Best Practices for Application Control

The following topics discuss our recommended best practices for controlling applications with access control rules.

## Recommendations for Application Control

Keep in mind the following guidelines and limitations for application control:

### Ensuring that Adaptive Profiling is Enabled

If adaptive profiling is not enabled (its default state), access control rules cannot perform application control.

### Automatically Enabling Application Detectors

If no detector is enabled for an application you want to detect, the system automatically enables all system-provided detectors for the application. If none exist, the system enables the most recently modified user-defined detector for the application.

### Configure Your Policy to Examine the Packets That Must Pass Before an Application Is Identified

The system cannot perform application control, including Intelligent Application Bypass (IAB) and rate limiting, before *both* of the following occur:

- A monitored connection is established between a client and server
- The system identifies the application in the session

This identification should occur in 3 to 5 packets, or after the server certificate exchange in the SSL handshake if the traffic is encrypted.

**Important!** To ensure that your system examines these initial packets, see [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 2526](#).

If early traffic matches all other criteria but application identification is incomplete, the system allows the packet to pass and the connection to be established (or the SSL handshake to complete). After the system completes its identification, the system applies the appropriate action to the remaining session traffic.

**Note** A server must adhere to the protocol requirements of an application for the system to be able to recognize it. For example, if you have a server that sends a keep-alive packet rather than an ACK when an ACK is expected, that application might not be identified, and the connection will not match the application-based rule. Instead, it will be handled by another matching rule or the default action. This might mean that connections you want to allow can be denied instead. If you run into this problem, and you cannot fix the server to follow the protocol standards, you need to write a non-application-based rule to cover traffic for that server, for example, by matching the IP address and port number.

### Create Separate Rules for URL and Application Filtering

Create separate rules for URL and application filtering whenever possible, because combining application and URL criteria can lead to unexpected results, especially for encrypted traffic.

Rules that include both application and URL criteria should come after application-only or URL-only rules, unless the application+URL rule is acting as an exception to a more general application-only or URL-only rule.

### URL Rules Before Application and Other Rules

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

## Application Control for Encrypted and Decrypted Traffic

The system can identify and filter encrypted and decrypted traffic:

- Encrypted traffic—The system can detect application traffic encrypted with StartTLS, including SMTPS, POPS, FTPS, TelnetS, and IMAPS. In addition, it can identify certain encrypted applications based on the Server Name Indication in the TLS ClientHello message, or the subject distinguished name value from the server certificate. These applications are tagged `SSL Protocol`; in an SSL rule, you can choose only these applications. Applications without this tag can only be detected in unencrypted or decrypted traffic.
- Decrypted traffic—The system assigns the `decrypted traffic` tag to applications that the system can detect in decrypted traffic only, not encrypted or unencrypted.

## TLS Server Identity Discovery and Application Control

The latest version of the Transport Layer Security (TLS) protocol 1.3, defined by [RFC 8446](#), is the preferred protocol for many web servers to provide secure communications. Because the TLS 1.3 protocol encrypts the server's certificate for additional security, and the certificate is needed to match application and URL filtering criteria in access control rules, the Firepower System provides a way to extract the server certificate *without* decrypting the entire packet.

We strongly recommend enabling it for any traffic you want to match on application or URL criteria, especially if you want to perform deep inspection of that traffic. A decryption policy is not required because *traffic is not decrypted* in the process of extracting the server certificate.

For more information, see [Access Control Policy Advanced Settings, on page 1626](#).

## Exempting Applications from Active Authorization

In an identity policy, you can exempt certain applications from active authentication, allowing traffic to continue to access control. These applications are tagged `User-Agent Exclusion`. In an identity rule, you can choose only these applications.

## Handling Application Traffic Packets Without Payloads

When performing access control, the system applies the default policy action to packets that do not have a payload in a connection where an application is identified.

## Handling Referred Application Traffic

To handle traffic referred by a web server, such as advertisement traffic, match the referred application rather than the referring application.

## Controlling Application Traffic That Uses Multiple Protocols (Skype, Zoho)

Some applications use multiple protocols. To control their traffic, make sure your access control policy covers all relevant options. For example:

- Skype—To control Skype traffic, choose the **Skype** tag from the **Application Filters** list rather than selecting individual applications. This ensures that the system can detect and control all Skype traffic the same way.
- Zoho—To control Zoho mail, choose *both* **Zoho** and **Zoho mail** from the Available Application list.

### Search Engines Supported for Content Restriction Features

The system supports Safe Search filtering for specific search engines only. The system assigns the `safesearch_supported` tag to application traffic from these search engines.

### Controlling Evasive Application Traffic

See [Application-Specific Notes and Limitations](#), on page 1607.

## Best Practices for Configuring Application Control

We recommend controlling applications' access to the network as follows:

- To allow or block application access from a less secure network to a more secure network: Use **Port** (Selected Destination Port) conditions on the access control rule  
For example, allow ICMP traffic from the internet (less secure) to an internal network (more secure.)
- To allow or block applications being accessed by user groups: Use **Application** conditions on the access control rule  
For example, block Facebook from being accessed by members of the Contractors group

#### Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

The following table provides an example of how to set up your access control rules:

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application uses a port (for example, SSH)	Your choice ( <b>Allow</b> in this example)	Destination zones or networks using the outside interface	Any	Do not set	Available Ports : <b>SSH</b>  Add to <b>Selected Destination Ports</b>	Any	Use only with ISE/ISE-PIC.	Any

Type of control	Action	Zones, Networks, VLAN Tags	Users	Applications	Ports	URLs	SGT/ISE Attributes	Inspection, Logging, Comments
Application from more secure to less secure network when application does not use a port (for example, ICMP)	Your choice ( <b>Allow</b> in this example)	Destination zones or networks using the outside interface	Any	Do not set	Selected Destination Ports <b>Protocol: ICMP</b> <b>Type: Any</b>	Do not set	Use only with ISE/ISE-PIC.	Any
Application access by a user group	Your choice ( <b>Block</b> in this example)	Your choice	Choose a user group (Contractors group in this example)	Choose the name of the application ( <b>Facebook</b> in this example)	Do not set	Do not set	Use only with ISE/ISE-PIC.	Your choice

## Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

**Table 90: Application Characteristics**

Characteristic	Description	Example
Type	Application protocols represent communications between hosts.  Clients represent software running on a host.  Web applications represent the content or requested URL for HTTP traffic.	HTTP and SSH are application protocols.  Web browsers and email clients are clients.  MPEG video and Facebook are web applications.
Risk	The likelihood that the application is being used for purposes that might be against your organization's security policy.	Peer-to-peer applications tend to have a very high risk.
Business Relevance	The likelihood that the application is being used within the context of your organization's business operations, as opposed to recreationally.	Gaming applications tend to have a very low business relevance.
Category	A general classification for the application that describes its most essential function. Each application belongs to at least one category.	Facebook is in the social networking category.

Characteristic	Description	Example
Tag	Additional information about the application. Applications can have any number of tags, including none.	Video streaming web applications often are tagged high bandwidth and displays ads.

## Application-Specific Notes and Limitations

- Office 365 Admin Portal:

Limitation: If the access policy has logging enabled at the beginning as well as at the end, the first packet will be detected as Office 365 and the end of connection will be detected as Office 365 Admin Portal. This should not affect blocking.

- Skype:

See [Recommendations for Application Control, on page 1602](#)

- GoToMeeting

In order to fully detect GoToMeeting, your rule must include all of the following applications:

- GoToMeeting
- Citrix Online
- Citrix GoToMeeting Platform
- LogMeIn
- STUN

- Zoho:

See [Recommendations for Application Control, on page 1602](#)

- Evasive applications such as Bittorrent, Tor, Psiphon, and Ultrasurf:

For evasive applications, only the highest-confidence scenarios are detected by default. If you need to take action on this traffic (such as block or implement QoS), it may be necessary to configure more aggressive detection with better effectiveness. To do this, contact TAC to review your configurations as these changes may result in false positives.

- WeChat:

It is not possible to selectively block WeChat Media if you allow WeChat.

- RDP (Remote Desktop Protocol):

If allowing the RDP application does not allow file transfers, ensure that the rule for RDP includes both the TCP and UDP port 3389. RDP file transfer uses UDP.

# Best Practices for Access Control Rules

Properly configuring and ordering rules is essential to building an effective deployment. The following topics summarize rule performance guidelines.

**Note** When you deploy configuration changes, the system evaluates all rules together and creates an expanded set of criteria that assigned devices use to evaluate network traffic. If these criteria exceed the resources (physical memory, processors, and so on) of a device, you cannot deploy to that device.

## General Best Practices for Access Control

Review the following requirements and general best practices:

- Use a prefilter policy to provide early blocking for unwanted traffic, and to fastpath traffic that does not benefit from access control inspection. For more information, see [Best Practices for Fastpath Prefiltering, on page 1782](#).
- Although you can configure the system without licensing your deployment, many features require that you enable the appropriate licenses before you deploy.
- Access control rules are deployed as access control lists on the device. To minimize the number of access control entries created per access control rule, and improve overall performance, enable object group search for each device. Object group search is a device setting, not an access control policy setting, so you must edit each device to ensure the feature is enabled. For more information, see [Configure Object Group Search, on page 125](#).
- When you deploy an access control policy, its rules are not applied to existing connections. Traffic on an existing connection is not bound by the new policy that is deployed. In addition, the policy hit count is incremented only for the first packet of a connection that matches a policy. Thus, the traffic on an existing connection that could match a policy is omitted from the hit count. To have the policy rules effectively applied, clear the existing connections sessions, and then deploy the policy.
- Whenever possible, combine multiple network objects into a single object group. The system automatically creates an object group (during deployment) when you select more than one object (for source or destination separately). Selecting existing groups can avoid object group duplication and reduce the potential impact on CPU usage when there are a large number of duplicate objects.
- For the system to affect traffic, you must deploy relevant configurations to managed devices using routed, switched, or transparent interfaces, or inline interface pairs.

Sometimes, the system prevents you from deploying inline configurations to passively deployed devices, including inline devices in tap mode.

In other cases, the policy may deploy successfully, but attempting to block or alter traffic using passively deployed devices can have unexpected results. For example, the system may report multiple beginning-of-connection events for each blocked connection, because blocked connections are not blocked in passive deployments.

- Certain features, including URL filtering, application detection, rate limiting, and Intelligent Application Bypass, must allow some packets to pass in order for the system to identify the traffic.

To prevent these packets from reaching their destination uninspected, see [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 2526](#) and [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 2526](#).

- You cannot perform file or malware inspection on traffic handled by the access control policy's default action.
- Some features are only available on certain device models. Warning icons and confirmation dialog boxes designate unsupported features.
- If you will use syslog or store events externally, avoid special characters in object names such as policy and rule names. Object names should not contain special characters, such as commas, that the receiving application may use as separators.
- Logging for connections handled by the default action is initially disabled, though you can enable it.
- Best practices for creating, ordering, and implementing access control rules are detailed in [Best Practices for Access Control Rules, on page 1608](#) and subtopics.

## Best Practices for Ordering Rules

General guidelines:

- In general, place top-priority rules that must apply to all traffic near the top of the policy.
- Specific rules should come before general rules, especially when the specific rules are exceptions to general rules.  
Otherwise, traffic will match the general rule first and never hit the applicable specific rule.
- Rules that drop traffic based on layer-3/4 criteria only (such as IP address, security zone, and port number) should come as early as possible. Rules based on these criteria do not require inspection to identify matching connections.
- Whenever possible, put specific drop rules near the top of the policy. This ensures the earliest possible decision on undesirable traffic.
- URL filtering, application-based, and geolocation-based rules and others that require inspection should come after rules that drop traffic based on layer-3/4 criteria only (such as IP address, security zone, and port number), but before rules that specify file and intrusion policies.
- Put URL filtering rules above application rules, and follow application rules with micro-application rules and Common Industrial Protocol (CIP) sub-classification application filtering rules.
- Rules that specify file policies and intrusion policies should come at the bottom of the rule order. These rules require resource-intensive deep inspection, and you should eliminate as many threats as possible using less-intensive methods first, for performance reasons, in order to minimize the number of potential threats that require deep inspection.
- Always order rules to suit your organization's needs.

Exceptions and additions to the above guidelines are noted in the sections below.

## Rule Preemption

Rule preemption occurs when a rule will never match traffic because a rule earlier in the evaluation order matches the traffic first. A rule's conditions govern whether it preempts other rules. In the following example, the second rule cannot block Admin traffic because the first rule allows it:

Access Control Rule 1: allow Admin users

Access Control Rule 2: block Admin users

Any type of rule condition can preempt a subsequent rule. The VLAN range in the first SSL rule includes the VLAN in the second rule, so the first rule preempts the second:

SSL Rule 1: do not decrypt VLAN 22-33

SSL Rule 2: block VLAN 27

In the following example, Rule 1 matches any VLAN because no VLANs are configured, so Rule 1 preempts Rule 2, which attempts to match VLAN 2:

Access Control Rule 1: allow Source Network 10.4.0.0/16

Access Control Rule 2: allow Source Network 10.4.0.0/16, VLAN 2

A rule also preempts an identical subsequent rule where all configured conditions are the same:

QoS Rule 1: rate limit VLAN 1 URL www.netflix.com

QoS Rule 2: rate limit VLAN 1 URL www.netflix.com

A subsequent rule would not be preempted if any condition is different:

QoS Rule 1: rate limit VLAN 1 URL www.netflix.com

QoS Rule 2: rate limit VLAN 2 URL www.netflix.com

### Example: Ordering SSL Rules to Avoid Preemption

Consider a scenario where a trusted CA (Good CA) mistakenly issued a CA certificate to a malicious entity (Bad CA), but has not yet revoked that certificate. You want to use an SSL policy to block traffic encrypted with certificates issued by the untrusted CA, but otherwise allow traffic within the trusted CA's chain of trust. After you upload the CA certificates and all intermediate CA certificates, configure an SSL policy with rules in the following order:

SSL Rule 1: Block issuer CN=www.badca.com

SSL Rule 2: Do not decrypt issuer CN=www.goodca.com

If you reverse the rules, you first match all traffic trusted by Good CA, including traffic trusted by Bad CA. Because no traffic ever matches the subsequent Bad CA rule, malicious traffic may be allowed instead of blocked.

## Rule Actions and Rule Order

A rule's action determines how the system handles matching traffic. Improve performance by placing rules that do not perform or ensure further traffic handling before the resource-intensive rules that do. Then, the system can divert traffic that it might otherwise have inspected.

The following examples show how you might order rules in various policies, given a set of rules where none is more critical and preemption is not an issue.

If your rules include application conditions, also see [Best Practices for Configuring Application Control, on page 1605](#).

### Optimum Order: Decryption Rules

Not only does decryption require resources, but so does further analysis of the decrypted traffic. Place rules that decrypt traffic last.

**Note** Certain managed devices support encrypting and decrypting TLS/SSL traffic in hardware, which significantly improves performance. For more information, see [TLS Crypto Acceleration, on page 2147](#).

1. Monitor—Rules that log matching connections, but take no other action on traffic.
2. Block, Block with reset—Rules that block traffic without further inspection.
3. Do not decrypt—Rules that do not decrypt encrypted traffic, passing the encrypted session to access control rules. The payloads of these sessions are not subject to deep inspection.
4. Decrypt - Known Key—Rules that decrypt incoming traffic with a known private key.
5. Decrypt - Resign—Rules that decrypt outgoing traffic by re-signing the server certificate.

### Optimum Order: Access Control Rules

Intrusion, file, and malware inspection requires resources, especially if you use multiple custom intrusion policies and variable sets. Place access control rules that invoke deep inspection last.

1. Monitor—Rules that log matching connections, but take no other action on traffic. (However, see the important exception and caveat at [Access Control Rule Monitor Action, on page 1646](#).)
2. Trust, Block, Block with reset—Rules that handle traffic without further inspection. Note that trusted traffic is subject to authentication requirements imposed by an identity policy, and to rate limiting.
3. Allow, Interactive Block (no deep inspection)—Rules that do not inspect traffic further, but allow discovery. Note that allowed traffic is subject to authentication requirements imposed by an identity policy, and to rate limiting.
4. Allow, Interactive Block (deep inspection)—Rules associated with file or intrusion policies that perform deep inspection for prohibited files, malware, and exploits.

## Application Rule Order

Rules with application conditions are more likely to match traffic if you move them to a lower order in your list of rules.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

For more information and an example, see [Best Practices for Configuring Application Control, on page 1605](#) and [Recommendations for Application Control, on page 1602](#).

## URL Rule Order

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

If you configure exceptions to a rule, put the exception above the other rule.

## Best Practices for Simplifying and Focusing Rules

### Simplify: Do Not Overconfigure

Minimize individual rule criteria. Use as few individual elements in rule conditions as possible. For example, in network conditions use IP address blocks rather than individual IP addresses.

If one condition is enough to match the traffic you want to handle, do not use two. Using conditions that are redundant can greatly expand the deployed configuration, which can lead to problems in device performance, and unexpected device behavior in a cluster and high-availability unit re-join. For example:

- Use security zones that represent multiple interfaces carefully. If you specify source and destination networks as conditions, and these are enough to match the traffic you are targeting, then specifying a security zone is not required.
- If you want to match a set of internal interfaces to ANY destination on the Internet (for example), then simply use a source security zone that includes your internal interfaces. No network or destination interface criteria are needed.

Combining elements into objects does **not** improve performance. For example, using a network object that contains 50 individual IP addresses gives you only an organizational—not a performance—benefit over including those IP addresses in the condition individually.

For recommendations related to application detection, see [Best Practices for Configuring Application Control, on page 1605](#).

### Focus: Narrowly Constrain Resource-Intensive Rules, Especially by Interface

As much as possible, use rule conditions to narrowly define the traffic handled by resource-intensive rules. Focused rules are also important because rules with broad conditions can match many different types of traffic, and can preempt later, more specific rules. Examples of resource-intensive rules include:

- TLS/SSL rules that decrypt traffic—Not only the decryption, but further analysis of the decrypted traffic, requires resources. Narrow focus, and where possible, block or choose not to decrypt encrypted traffic.  
Certain Firewall Threat Defense models perform TLS/SSL encryption and decryption in hardware, which improves performance significantly. For more information, see [TLS Crypto Acceleration, on page 2147](#).
- Access control rules that invoke deep inspection—Intrusion, file, and malware inspection requires resources, especially if you use multiple custom intrusion policies and variable sets. Make sure you only invoke deep inspection where required.

For maximum performance benefit, constrain rules by interface. If a rule excludes all of a device's interfaces, that rule does not affect that device's performance.

## Maximum Number of Access Control Rules and Intrusion Policies

The maximum number of access control rules or intrusion policies that are supported by a device depends on many factors, including policy complexity, physical memory, and the number of processors on the device.

If you exceed the maximum supported by a device, you cannot deploy the access control policy and you must reevaluate.

Guidelines for intrusion policies:

- In an access control policy, you can associate one intrusion policy with each Allow and Interactive Block rule, as well as with the default action. Every unique **pair** of intrusion policy and variable set counts as one policy.
- You may want to consolidate intrusion policies or variable sets so you can associate a single intrusion policy-variable set pair with multiple access control rules. On some devices you may find you can use only a single variable set for all your intrusion policies, or even a single intrusion policy-variable set pair for the whole device.

## CHAPTER 41

# Access Control Policies

---

The following topics describe how to work with access control policies:

- [Access Control Policy Components, on page 1615](#)
- [System-Created Access Control Policies, on page 1616](#)
- [Requirements and Prerequisites for Access Control Policies, on page 1616](#)
- [Managing Access Control Policies, on page 1617](#)
- [History for Access Control Policies, on page 1637](#)

## Access Control Policy Components

Following are the main elements of an access control policy.

### Name and Description

Each access control policy must have a unique name. A description is optional.

### Inheritance Settings

Policy inheritance allows you to create a hierarchy of access control policies. A parent (or *base*) policy defines and enforces default settings for its descendants.

A policy's inheritance settings allow you to select its base policy. You can also lock settings in the current policy to force any descendants to inherit them. Descendant policies can override unlocked settings.

### Policy Assignment

Each access control policy identifies the devices that use it. Each device can be targeted by only one access control policy.

### Rules

Access control rules provide a granular method of handling network traffic. Rules in an access control policy are numbered, starting at 1, including rules inherited from ancestor policies. The system matches traffic to access control rules in top-down order by ascending rule number.

Usually, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic. Conditions can be simple or complex, and their use often depends on certain licenses.

### Default Action

The default action determines how the system handles and logs traffic that is not handled by any other access control configuration. The default action can block or trust all traffic without further inspection, or inspect traffic for intrusions and discovery data.

Although an access control policy can inherit its default action from an ancestor policy, you cannot enforce this inheritance.

### Security Intelligence

Security Intelligence is a first line of defense against malicious internet content. This feature allows you to block connections based on the latest IP address, URL, and domain name reputation intelligence. To ensure continual access to vital resources, you can override Block list entries with custom Do Not Block list entries.

### HTTP Responses

When the system blocks a user's website request, you can either display a generic system-provided response page, or a custom page. You can also display a page that warns users, but also allows them to continue to the originally requested site.

### Logging

Settings for access control policy logging allow you to configure default syslog destinations for the current access control policy. The settings are applicable to the access control policy and all the included SSL, prefilter, and intrusion policies unless the syslog destination settings are explicitly overridden with custom settings in included rules and policies.

### Advanced Access Control Options

Advanced access control policy settings typically require little or no modification. Often, the default settings are appropriate. Advanced settings you can modify include traffic preprocessing, SSL inspection, identity, and various performance options.

## System-Created Access Control Policies

Depending on your devices' initial configurations, system-provided policies can include:

- Default Access Control—Blocks all traffic without further inspection.
- Default Intrusion Prevention—Allows all traffic, but also inspects with the Balanced Security and Connectivity intrusion policy and default intrusion variable set.
- Default Network Discovery—Allows all traffic while inspecting it for discovery data but not intrusions or exploits.

## Requirements and Prerequisites for Access Control Policies

### Model Support

Any

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin
- You can define custom user roles to differentiate between the intrusion configuration in access control policy and rules and the rest of the access control policy and rules. Using these permissions, you can separate the responsibilities of your network administration team and your intrusion administration teams. The existing pre-defined user roles that included the Modify Access Control Policy permission support all sub-permissions; you need to create your own custom roles if you want to apply granular permissions. The granular permissions are:
  - **Policies > Access Control > Access Control Policy > Modify Access Control Policy > Modify Threat Configuration** allows the selection of intrusion policy, variable set, and file policy in a rule, the configuration of the advanced options for Network Analysis and Intrusion Policies, the configuration of the Security Intelligence policy for the access control policy, and intrusion actions in the policy default action. If a user has this option only, the user can modify no other part of the policy or rule.
  - **Modify Remaining Access Control Policy Configuration** controls the ability to edit all other aspects of the policy.

## Managing Access Control Policies

You can edit system-provided access control policies and create custom access control policies.

### Procedure

---

**Step 1** Choose **Policies > Access Control heading > Access Control**.

At the top of the page, there are convenient links to some related features: Object management, Intrusion policies, Network Analysis policies, DNS policies, and policy Import/Export.

**Step 2** Manage access control policies:

- Create—Click **New Policy**; see [Creating a Basic Access Control Policy, on page 1618](#).
- Inheritance—Click **Plus** next to a policy with descendants to expand your view of the policy's hierarchy.
- Edit—Click **Edit** (); see [Editing an Access Control Policy, on page 1619](#)
- Delete—Click **Delete** (). You must remove any device assignments before deleting a policy.
- Copy—Click **Copy** (). Device assignments are not retained in the copy.

- **Report**—Click **Report** (📄).. The report is generated as a background process. Go to the message/notifications center and look in the Tasks list. When the report is finished, you can download it from the notification.
- Lock or unlock a policy—See [Locking an Access Control Policy, on page 1621](#).

## Creating a Basic Access Control Policy

When you create a new access control policy, it contains default actions and settings. After creating the policy, you are immediately placed in an edit session so that you can adjust the policy to suit your requirements.

### Procedure

**Step 1** Choose **Policies > Access Control heading > Access Control**.

**Step 2** Click **New Policy**.

**Step 3** Enter a unique **Name** and, optionally, a **Description**.

**Step 4** Optionally, choose a base policy.

If an access control policy is enforced on your domain, this step is not optional. You must choose the enforced policy or one of its descendants as the base policy.

If you select a base policy, the base policy defines the default action and you cannot select a new one in this dialog box. Logging for connections handled by the default action depends on the base policy.

**Step 5** When you do not select a base policy, specify the initial **Default Action**:

- **Block all traffic** creates a policy with the **Access Control: Block All Traffic** default action.
- **Intrusion Prevention** creates a policy with the **Intrusion Prevention: Balanced Security and Connectivity** default action, associated with the default intrusion variable set.
- **Network Discovery** creates a policy with the **Network Discovery Only** default action.

When you select a default action, logging of connections handled by the default action is initially disabled. You can enable it later when you edit the policy.

#### Tip

If you want to trust all traffic by default, or if you chose a base policy and do not want to inherit the default action, you can change the default action later.

**Step 6** Optionally, choose the devices to assign to the policy. To narrow the devices that appear, enter a search string. If you want to deploy this policy immediately, you must perform this step.

**Step 7** Click **Save**.

The new policy opens for edit. You can add rules to it and make other changes as needed. See [Editing an Access Control Policy, on page 1619](#).

## Editing an Access Control Policy

When you edit an access control policy, you should lock it to ensure that your changes do not get overridden by another person who might edit it simultaneously.

You can only edit access control policies that were created in the current domain. Also, you cannot edit settings that are locked by an ancestor access control policy.

To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

**Note** If you do not lock the policy, consider the following: Only one person should edit a policy at a time, using a single browser window. Although more than one user can edit an access control policy at a time, when one user saves changes, all changes made by the other users are immediately deleted and these users are moved out of edit mode and back to the access control policy listing page. These other users must start again.

### Procedure

**Step 1** Choose **Policies > Access Control heading > Access Control**.

**Step 2** Click **Edit** (✎) next to the access control policy you want to edit.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.

**Step 3** Edit your access control policy.

#### Tip

You can operate on multiple rules at one time by selecting their checkboxes in the left column, then selecting the action you want to perform from the **Select Action** drop-down list next to the search box. Bulk editing is available for enabling and disabling, copying, cloning, moving, deleting, and editing rules, or viewing hit counts or related events.

You can change the following settings or perform these actions:

- Name and Description—Click **Edit** (✎) next to the name, make your changes, and click **Save**.
- Default Action—Choose a value from the **Default Action** drop-down list.
- Default Action Settings—Click **Cog** (⚙), make your changes, and click **OK**. You can configure settings for logging, the location of an external syslog server or SNMP trap server, and the variable set associated with an intrusion prevention default action.
- Associated Policies—To edit or change policies in the packet flow, click the policy type in the packet flow representation below the policy name. You can select the **Prefilter Rules**, **Decryption**, **Security Intelligence**, and **Identity** policies. When necessary, click **Access Control** to return to the access control rules.
- Policy Assignment—To identify the managed devices targeted by this policy, or enforce this policy in a subdomain, click the **Targeted: x devices** link.

- **Rules**—To manage access control rules, and to inspect and block malicious traffic using intrusion and file policies, click **Add Rule**, or right-click an existing rule and select **Edit** or another appropriate action. The actions are also available from the **More** (⋮) button for each rule. See [Create and Edit Access Control Rules, on page 1651](#).
- **Layout**—Use the **Grid/Table View** icon above the list of rules to change the layout. Grid view provides color-coded objects in an easy-to-see layout. Table view provides a summary list so that you can see more rules at once. You can freely switch views without impacting the rules.
- **Columns (Table view only)**—Click the **Show/Hide Columns** icon above the list of rules to select which information to show in the table. Click **Hide Empty Columns** to quickly remove all columns that have no information, that is, you are not using those conditions in any rule. Click **Revert to Default** to undo all of your customizations.
- **Analyze rule logic**. You can select the following options from the **Analyze** menu to examine the logic of your rules:
  - **Hit Count**—To view statistics on how many connections matched each rule.
  - **Enable/Disable Rule Conflicts**—Select whether you want to see information on whether rules interfere with each other.
  - **Show Rule Conflicts**—See whether you have redundant or shadowed rules. These conflicts could prevent certain rules from ever being matched by connections, meaning either that you need to fix the match criteria, move the rule, or simply delete the rule.
  - **Show Warnings**—See whether there are rules with configuration issues that you need to address.
- **Additional Settings**—To change additional settings for the policy, select one of the following options from the **More** drop-down arrow at the end of the packet flow line.
  - **Advanced Settings**—To set preprocessing, SSL inspection, identity, performance, and other advanced options. See [Access Control Policy Advanced Settings, on page 1626](#).
  - **HTTP Responses**—To specify what the user sees in a browser when the system blocks a website request. See [Choosing HTTP Response Pages, on page 1736](#).
  - **Inheritance Settings**—To change the base access control policy for this policy, and to enforce this policy's settings in its descendant policies. See [Choosing a Base Access Control Policy, on page 1622](#) and [Locking Settings in Descendant Access Control Policies, on page 1623](#).
  - **Logging**—To set the default logging options for the policy.

#### Step 4 Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Locking an Access Control Policy

You can lock an access control policy to prevent other administrators from editing it. Locking the policy ensures that your changes will not be invalidated if another administrator edits the policy and saves changes before you save your changes. Without locking, if multiple administrators edit the policy simultaneously, the first person who saves changes wins, and all other users have their changes erased.

The lock is for the access control policy itself. The lock does not apply to objects used in the policy. For example, another user can edit a network object that is used in a locked access control policy. Your lock remains in place until you explicitly unlock the policy, so you can log out and come back to your edits later.

When locked, other administrators have read-only access to the policy. However, other administrators can assign a locked policy to a managed device.

### Before you begin

Any user role that has permission to modify the access control policy has permission to lock it, and to unlock a policy that was locked by another user.

However, the ability to unlock a policy that was locked by another administrator is controlled by the following permission: **Policies > Access Control > Access Control Policy > Modify Access Control Policy > Override Access Control Policy Lock**.

If you are using custom roles, your organization might have limited your unlocking abilities by not assigning this permission. Without this permission, only the administrator who locks a policy can unlock it.

### Procedure

---

**Step 1** Choose **Policies > Access Control heading > Access Control**.

**Step 2** Click **Edit** (✎) next to the access control policy you want to lock or unlock.

The **Lock Status** column shows whether a policy is already locked, and if so, who locked it. An empty cell indicates that the policy is not locked.

If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration. Or, it is locked by another user.

**Step 3** Click the lock icon next to the policy name to lock or unlock the policy.

If the policy inherits settings from a parent policy, you must choose one of the following options when you click the lock icon.

- **Lock/Unlock This Policy**—The locking or unlocking is for this policy only.
  - **Lock/Unlock This Policy and Parents in the Hierarchy**—This policy and all parent policies are locked or unlocked. If a parent policy is already locked by another administrator, you will see a message and you will not be able to lock that parent policy. When unlocking policies, if you have the Override Access Control Policy Lock permission, all parent policies are unlocked even if they were locked by other users.
-

## Managing Access Control Policy Inheritance

Inheritance relates to using another policy as a base policy for an access control policy. This allows you to use one policy to define some baseline characteristics that can be applied to multiple policies. To understand how inheritance works, see [Access Control Policy Inheritance, on page 1601](#).

### Procedure

- 
- Step 1** Edit the access control policy whose inheritance settings you want to change; see [Editing an Access Control Policy, on page 1619](#).
- Step 2** Manage policy inheritance:
- **Change Base Policy** — To change the base access control policy for this policy, select **Inheritance Settings** from the **More** drop-down arrow at the end of the packet flow line and proceed as described in [Choosing a Base Access Control Policy, on page 1622](#).
  - **Lock Settings in Descendants** — To enforce this policy's settings in its descendant policies, select **Inheritance Settings** from the **More** drop-down arrow at the end of the packet flow line and proceed as described in [Locking Settings in Descendant Access Control Policies, on page 1623](#).
  - **Required in Domains** — To enforce this policy in a subdomain, click the **Targeted: x devices** link and proceed as described in [Requiring an Access Control Policy in a Domain, on page 1624](#).
  - **Inherit Settings from Base Policy** — To inherit settings from a base access control policy, click **Security Intelligence**, or select **HTTP Responses** or **Advanced Settings** from the drop-down arrow at the end of the packet flow line, and proceed as directed in [Inheriting Access Control Policy Settings from the Base Policy, on page 1623](#).
- 

## Choosing a Base Access Control Policy

You can use one access control policy as the base (parent) for another. By default, a child policy inherits its settings from its base policy, though you can change unlocked settings.

When you change the base policy for the current access control policy, the system updates the current policy with any locked settings from the new base policy.

### Procedure

- 
- Step 1** In the access control policy editor, select **Inheritance Settings** from the **More** drop-down arrow at the end of the packet flow line.
- Step 2** Choose a policy from the **Select Base Policy** drop-down list.
- Step 3** Click **Save**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Inheriting Access Control Policy Settings from the Base Policy

A new child policy inherits many settings from its base policy. If these settings are unlocked in the base policy, you can override them.

If you later reinherit the settings from the base policy, the system displays the base policy's settings and dims the controls. However, the system saves the overrides you made, and restores them if you disable inheritance again.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | In the access control policy editor, click <b>Security Intelligence</b> , or select <b>HTTP Responses</b> or <b>Advanced Settings</b> from the <b>More</b> drop-down arrow at the end of the packet flow line                           |
| <b>Step 2</b> | Check the <b>Inherit from base policy</b> check box for each setting you want to inherit.<br><br>If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. |
| <b>Step 3</b> | Click <b>Save</b> .   |
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Locking Settings in Descendant Access Control Policies

Lock a setting in an access control policy to enforce the setting in all descendant policies. Descendant policies can override unlocked settings.

When you lock settings, the system saves overrides already made in descendant policies so that the overrides can be restored if you unlock settings again.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | In the access control policy editor, select <b>Inheritance Settings</b> from the <b>More</b> drop-down arrow at the end of the packet flow line.  |
| <b>Step 2</b> | In the Child Policy Inheritance Settings area, check the settings you want to lock.<br><br>If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. |
| <b>Step 3</b> | Click <b>OK</b> to save the inheritance settings.   |
| <b>Step 4</b> | Click <b>Save</b> to save the access control policy.  |
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Requiring an Access Control Policy in a Domain

You can require that every device in a domain use the same base access control policy or one of its descendant policies. This procedure is relevant in a multi-domain deployment only.

### Procedure

- 
- Step 1** In the access control policy editor, click the **Targeted: x devices** link.
- Step 2** Click **Required on Domains**.
- Step 3** Build your domain list:
- **Add** — Select the domains where you want to enforce the current access control policy, then click **Add** or drag and drop into the list of selected domains.
  - **Delete** — Click **Delete** (  ) next to a leaf domain, or right-click an ancestor domain and choose **Delete Selected**.
  - **Search** — Type a search string in the search field. Click **Clear** (  ) to clear the search.
- Step 4** Click **OK** to save the domain enforcement settings.
- Step 5** Click **Save** to save the access control policy.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Assigning Devices to an Access Control Policy

An access control policy specifies the devices that use it. Each device can be assigned to only one access control policy.

### Procedure

- 
- Step 1** In the access control policy editor, click the **Targeted: x devices** link.
- Step 2** Build your target list:
- **Add** — Select one or more **Available Devices**, then click **Add to Policy** or drag and drop into the list of **Selected Devices**.
  - **Delete** — Click **Delete** (  ) next to a single device, or select multiple devices, right-click, then choose **Delete Selected**.
  - **Search** — Type a search string in the search field. Click **Clear** (  ) to clear the search.
- Under **Impacted Devices**, the system lists the devices whose assigned access control policies are children of the current policy. Any change to the current policy affects these devices.
- Step 3** Click **OK** to save your targeted device settings.

**Step 4** Click **Save** to save the access control policy.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Logging Settings for Access Control Policies

To configure logging settings for an access control policy, select **Logging** from the **More** drop-down arrow at the end of the packet flow line.

You can configure default syslog destinations and syslog alert for the access control policy. The settings are applicable to the access control policy and all the included SSL/TLS decryption, prefilter, and intrusion policies unless the syslog destination settings are explicitly overridden with custom settings in included rules and policies.

Logging for connections handled by the default action is initially disabled.

IPS and File and Malware Settings are effective only after you have selected an option at the top of the page for sending syslog messages generally.

#### Default Syslog Settings

- **Send using specific syslog alert**—If you select this option, the events are sent based on the selected syslog alert as configured using the instructions in *Creating a Syslog Alert Response* in the [Cisco Secure Firewall Management Center Administration Guide](#). You can select the syslog alert from the list or add one by specifying the name, logging host, port, facility, and severity. For more information, see *Facilities and Severities for Intrusion Syslog Alerts* in the [Cisco Secure Firewall Management Center Administration Guide](#). This option is applicable to all devices.

When using this option, the system sends syslog messages to the server using the Management interface. Ensure there is a route from the Management interface to the syslog server, or messages will not arrive at the server.

- **Use the syslog settings configured in the Threat Defense Platform Settings policy deployed on the device**—If you select this option and select the severity, connection or intrusion events are sent with the selected severity to syslog collectors configured in Platform Settings. Using this option, you can unify the syslog configuration by configuring it in Platform Settings and reusing the settings in access control policy. Severity selected in this section is applied to all connection and intrusion events. The default severity is ALERT.

This option is applicable only to Secure Firewall Threat Defense devices 6.3 and later.

#### IPS Settings

- **Send Syslog messages for IPS events**—Send IPS events as syslog messages. The defaults set above are used unless you override them.
- **Show/Hide Overrides**—If you want to use the default syslog destination and severity, leaves these options empty. Otherwise, you can set a different syslog server destination for IPS events, and change the severity of the events.

### File and Malware Settings

- **Send Syslog messages for File and Malware events**—Send file and malware events as syslog messages. The defaults set above are used unless you override them.
- **Show/Hide Overrides**—If you want to use the default syslog destination and severity, leave these options empty. Otherwise, you can set a different syslog server destination for file and malware events, and change the severity of the events.

## Access Control Policy Advanced Settings

To configure advanced settings for an access control policy, select **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line.

Advanced access control policy settings typically require little or no modification. The default settings are appropriate for most deployments. Note that many of the advanced preprocessing and performance options in access control policies may be modified by rule updates as described in *Update Intrusion Rules* in the [Cisco Secure Firewall Management Center Administration Guide](#).

If **View** (👁) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings.

**Caution** See [Configurations that Restart the Snort Process When Deployed or Activated, on page 180](#) for a list of advanced setting modifications that restart the Snort process, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information.

### Inheriting Settings from a Parent Policy

If the access control policy has a base policy, you can elect to inherit settings from the base policy. Select **Inherit from base policy** for each setting group where you want to use the parent policy's settings. If inheritance has been configured so that these settings are locked, you cannot configure unique settings for the policy, these settings are read-only.

If you are allowed to configure unique settings for the policy, you must deselect **Inherit from base policy** to make your edits.

### General Settings

Option	Description
<b>Maximum URL characters to store in connection events</b>	<p>To customize the number of characters you store for each URL requested by your users. See <i>Limiting Logging of Long URLs</i> in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> for more information.</p> <p>To customize the length of time before you re-block a website after a user bypasses an initial block, see <a href="#">Setting the User Bypass Timeout for a Blocked Website, on page 1738</a>.</p>

Option	Description
<b>Allow an Interactive Block to bypass blocking for (seconds)</b>	See <a href="#">Setting the User Bypass Timeout for a Blocked Website, on page 1738</a> .
<b>Retry URL cache miss lookup</b>	<p>The first time the system encounters a URL that does not have a locally stored category and reputation, it looks up that URL in the cloud and adds the result to the local data store, for faster processing of that URL in the future.</p> <p>This setting determines what the system does when it needs to look up a URL's category and reputation in the cloud.</p> <p>By default, this setting is enabled: The system momentarily delays the traffic while it checks the cloud for the URL's reputation and category, and uses the cloud verdict to handle the traffic.</p> <p>If you disable this setting: When the system encounters a URL that is not in its local cache, the traffic is immediately passed and handled according to the rules configured for Uncategorized and reputationless traffic.</p> <p>In passive deployments, the system does not retry the lookup, as it cannot hold packets.</p>
<b>Enable Threat Intelligence Director</b>	Disable this option to stop publishing TID data to your configured devices.
<b>Enable reputation enforcement on DNS traffic</b>	This option is enabled by default, for improved URL filtering performance and efficacy. For details and additional instructions, see <a href="#">DNS Filtering: Identify URL Reputation and Category During DNS Lookup</a> , on page 1732 and subtopics.
<b>Inspect traffic during policy apply</b>	<p>To inspect traffic when you deploy configuration changes unless specific configurations require restarting the Snort process, ensure that <b>Inspect traffic during policy apply</b> is set to its default value (enabled).</p> <p>When this option is enabled, resource demands could result in a small number of packets dropping without inspection. Additionally, deploying some configurations restarts the Snort process, which interrupts traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See <a href="#">Snort Restart Scenarios, on page 176</a> for more information.</p>

### Associated Policies

Use advanced settings to associate subpolicies (decryption, identity, prefilter) with access control; see [Associating Other Policies with Access Control, on page 1631](#).

### TLS Server Identity Discovery

The latest version of the Transport Layer Security (TLS) protocol 1.3, defined by [RFC 8446](#), is the preferred protocol for many web servers to provide secure communications. Because the TLS 1.3 protocol encrypts the server's certificate for additional security, and the certificate is needed to match application and URL filtering

criteria in access control rules, the Firepower System provides a way to extract the server certificate *without* decrypting the entire packet.

You can enable this feature, referred to as *TLS server identity discovery*, when you configure advanced settings for an access control policy. Certain features are not supported, such as STARTTLS traffic, the HTTP CONNECT method, and in a network where another device is already decrypting traffic.

If you enable this option, we recommend you also enable the decryption policy's advanced TLS adaptive server identity probe option as well. Together, these options enable more efficient decryption of TLS 1.3 traffic. For more information, see [TLS 1.3 Decryption Best Practices, on page 2170](#).

When a new connection starts that will be affected by TLS server identity discovery, the Firewall Threat Defense holds the original ClientHello packet to determine the identity of the server to which it connects before continuing. The Firewall Threat Defense device sends a specialized connection from the Firewall Threat Defense to the server. The server's response includes the server certificate, the specialized connection is terminated, and the original connection is evaluated as required by the access control policy.

TLS server identity discovery prioritizes the certificate's Common Name (CN) over the [Server Name Indication \(SNI\)](#).

To enable TLS server identity discovery, click the **Advanced** tab, click **Edit** (✎) for the setting, and select **Early application detection and URL categorization**.

### TLS Server Identity Discovery ?

☒ Early application detection and URL categorization

We recommend that you enable early application detection and server identity. Since TLS 1.3 certificates are encrypted, for traffic encrypted with TLS to match access rules that use application or URL filtering, the system must decrypt it. The setting decrypts the certificate only; the connection remains encrypted. Enabling this option is sufficient to decrypt TLS 1.3 certificates; you do not need to create a corresponding SSL decryption rule.

[Revert to Defaults](#)[Cancel](#)[OK](#)

We strongly recommend enabling it for any traffic you want to match on application or URL criteria, especially if you want to perform deep inspection of that traffic. A decryption policy is not required because *traffic is not decrypted* in the process of extracting the server certificate.

**Note**

- TLS server identity discovery *cannot* be used with any of the following:
  - STARTTLS traffic
  - The HTTP CONNECT method
  - Traffic that is already being decrypted by another device on the network
- Because the certificate is decrypted, TLS server identity discovery can reduce performance depending on the hardware platform.
- TLS server identity discovery is not supported in inline tap mode or passive mode deployments.
- Enabling TLS server identity discovery is not supported on any Secure Firewall Threat Defense Virtual deployed to AWS. If you have any such managed devices managed by the Secure Firewall Management Center, the connection event **PROBE\_FLOW\_DROP\_BYPASS\_PROXY** increments every time the device attempts to extract the server certificate.
- TLS Server Identity Discovery also operates on TLS 1.2 sessions.

**Network Analysis and Intrusion Policies**

Advanced network analysis and intrusion policy settings allow you to:

- Specify the intrusion policy and associated variable set that are used to inspect packets that must pass before the system can determine exactly how to inspect that traffic.
- Change the access control policy's default network analysis policy, which governs many preprocessing options.
- Use custom network analysis rules and network analysis policies to tailor preprocessing options to specific security zones, networks, and VLANs.

For more information, see [Advanced Access Control Settings for Network Analysis and Intrusion Policies, on page 2525](#).

**Threat Defense Service Policy**

You can use the Threat Defense Service Policy to apply services to specific traffic classes. For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications. This policy applies to Firewall Threat Defense devices only, and will be ignored for any other device type. The service policy rules are applied after the access control rules. For more information, see [Service Policies, on page 1799](#).

**File and Malware Settings**

[Tuning File and Malware Inspection Performance and Storage, on page 2124](#) provides information on performance options for file control and malware defense.

### Portscan Threat Detection

Portscan detector is a threat detection mechanism designed to help you detect and prevent portscan activity in all types of traffic to protect networks from eventual attacks. Portscan traffic can be detected efficiently in both allowed and denied traffic. For more information, see [Threat Detection, on page 1817](#).

### Elephant Flow Settings

Elephant flows are large, long duration, and fast flows that can cause duress for Snort cores. There are two actions that can be applied on elephant flows to reduce system stress, CPU hogging, packet drops, and so on. These actions are:

- **Bypass any or all applications**—This action bypasses flow from Snort inspection.
- **Throttle**—This action applies dynamic rate limit policy (10% reduction) on elephant flows.

For more information, see the Elephant Flow Detection chapter in the [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).

### Intelligent Application Bypass Settings

Intelligent Application Bypass (IAB) is an expert-level configuration that specifies applications to bypass or test for bypass if traffic exceeds a combination of inspection performance and flow thresholds. For more information, see [Intelligent Application Bypass, on page 1827](#).

### Transport/Network Layer Preprocessor Settings

Advanced transport and network preprocessor settings apply globally to all networks, zones, and VLANs where you deploy your access control policy.

- **Ignore the VLAN header when tracking connections**—Different VLAN tags in traffic traveling in different directions for the same connection can affect traffic reassembly and rule processing. For example, traffic for the same connection could be transmitted over VLAN A and be received over VLAN B. Select this option to configure the system to ignore the VLAN header so packets can be correctly processed for your deployment.
- **Maximum Active Responses**—For a TCP connection that triggers a preprocessor/intrusion rule that is configured to provide an active response, the maximum number of active responses per TCP connection. When additional traffic occurs on a connection where an active response has been initiated, and the traffic occurs more than **Minimum Response Seconds** after a previous active response, the system sends another active response unless the specified maximum has been reached. A setting of 0 disables additional active responses triggered active response rules.
- **Minimum Response Seconds**—Until **Maximum Active Responses** occur, specifies the number of seconds to wait before any additional traffic on a connection where the system has initiated an active response results in a subsequent active response.
- **Session Termination Logging Threshold**—Do not modify this option unless instructed to do so by Cisco Technical Support. This option specifies for the number of bytes that result in a logged message when the session terminates and the specified number was exceeded. Changing the option can affect system performance.

### Detection Enhancement Settings

Detection Enhancement Settings determine whether adaptive profiles are used for application detection and intrusion rules in the access control policy. Typically, the system uses the static settings in your network analysis policy to preprocess and analyze traffic. With adaptive profile updates, the system can adapt processing behavior using host information either detected by network discovery or imported from a third party.

To enable Adaptive Profiles in Snort 3, you must select both the **Enable** and **Enable Profile Updates** options.

- **Enable**—You must enable adaptive profiling (its default state) for access control rules to perform application and file control, including malware protection (AMP), and for intrusion rules to use service metadata.
- **Enable Profile Updates**—Profile updates, like the target-based profiles you can configure manually in a network analysis policy, help to defragment IP packets and reassemble streams in the same way as the operating system on the target host. The intrusion rules engine then analyzes the data in the same format as that used by the destination host. Profile updates also compare metadata in an intrusion rule to host information to determine whether a rule should apply for a particular host.
- **Adaptive Profiles – Attribute Update Interval**—When profile updates are enabled, you can control how frequently in minutes network map data is synced from the management center to its managed devices. The system uses the data to determine what profiles should be used when processing traffic. Increasing the value for this option can improve performance in a large network.
- **Adaptive Profiles – Networks**—Optionally, when profile updates are enabled, you can improve performance by constraining profile updates to a comma-separated list of IP addresses, address blocks, and network variables. If you use a network variable, the system uses the variable's value in the variable set linked to the default intrusion policy for your access control policy. For example, you could enter: 192.168.1.101, 192.168.4.0/24, \$HOME\_NET. IPv4 and IPv6 are supported.

The default value (0.0.0.0/0) applies adaptive profile updates to all networks.

### Performance Settings and Latency-Based Performance Settings

[About Intrusion Prevention Performance Tuning, on page 2073](#) provides information on improving the performance of your system as it analyzes traffic for attempted intrusions.

For information specific to latency-based performance settings, see [Packet and Intrusion Rule Latency Threshold Configuration, on page 2078](#).

### Encrypted Visibility Engine

For details about this feature, see the Encrypted Visibility Engine chapter in the [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).

## Associating Other Policies with Access Control

The easiest way to associate the major policy's to an access control policy is by clicking the policy's link in the packet flow shown at the topic of the access control policy. You can quickly select the associated policy. Alternatively, you can use the policy's advanced settings to associate the policy, as described in this topic. These policies include the following:

- **Prefilter policy**—Performs early traffic handling using limited network (layer 4) outer-header criteria.
- **Decryption policy**—Monitors, decrypts, blocks, or allows application layer protocol traffic encrypted with Secure Socket Layer (SSL) or Transport Layer Security (TLS).

**Caution**

*Snort 2 only.* Adding or removing an SSL policy restarts the Snort process when you deploy configuration changes, temporarily interrupting traffic inspection. Whether traffic drops during this interruption or passes without further inspection depends on how the assigned device handles traffic. See [Snort Restart Traffic Behavior, on page 178](#) for more information.

- Identity policy—Performs user identification based on the realm and authentication method associated with the traffic.

**Before you begin**

Before associating an SSL policy with an access control policy, review the information about TLS server identity discovery in [Access Control Policy Advanced Settings, on page 1626](#).

**Procedure**

- 
- Step 1** In the access control policy editor, select **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line.
- Step 2** Click **Edit** (✎) in the appropriate Policy Settings area.
- If **View** (👁) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 3** Choose a policy from the drop-down list.
- If you choose a user-created policy, you can click edit that appears to edit the policy.
- Step 4** Click **OK**.
- Step 5** Click **Save** to save the access control policy.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Viewing Rule Hit Counts

Hit count indicates the number of times a policy rule or default action has been matched to a connection. The hit count is incremented only for the first packet of a connection that matches a rule. You can use this information to identify the efficacy of your rules. Hit count information is available only for access control and prefilter rules applied to Firewall Threat Defense devices.

**Note**

- The count persists through reboots and upgrades.
- Counts are maintained by each unit in an HA pair or cluster separately.
- You will not be able to derive the hit count information from a device when deployment or a task is in progress on the device.
- You can also see rule hit count information in the device CLI using the **show rule hits** command.
- If you have accessed the Hit Count page from the Access Control Policy page, you will not be able to view or edit prefilter rules and vice-versa.
- Hit counts are not available for rules that use the Monitor action.

**Before you begin**

If you use custom user roles, ensure that the roles include the following privileges:

- View Device, to see the hit counts.
- Modify Device, to refresh the hit counts.

**Procedure**

- 
- Step 1** In the access control policy or prefilter policy editor, click **Analyze > Rule Hit Counts** on the top-right of the page.
- Step 2** On the Hit Count page, select the device from the **Select a device** drop-down list.
- If it is not the first time that you are generating hit counts for this device, the last fetched hit count information appears next to the drop-down box. Also, verify the **Last Deployed** time to confirm recent policy changes.
- Step 3** If necessary, click **Refresh** (↻) to obtain current hit count data from the selected device.
- In the prefilter policy, you might need to click **Fetch Current Hit Count** to get initial hit count data.
- You cannot refresh the hit count while deployment to the device is in progress.
- Step 4** View and analyze the data.
- You can do the following:
- Click **Prefilter** or **Access Control** to switch between the hit counts for these policies.
  - Search for a specific rule by entering a search string in **Filter** box.
  - Broadly limit the list to **Hit Rules** or **Never Hit Rules** by selecting these options in the **Filter by** field. When viewing hit rules, you can further limit the list by selecting a time range in the **In Last** field (for example, in the last 1 day).
  - (When viewed from the access control policy.) Clear the hit counts for one or more rule by selecting the checkbox for the rule, then clicking **Clear Hit Counts**. When confirming the action, choose **Clear and**

**Reload** to refresh the hit count data. You can clear hit counts for up to 500 rules at a time. You cannot undo clearing hit counts.

**Note**

Click the checkbox in the table header to select all rules visible in the list. To select a range of rules, select the first rule's checkbox, then Shift+click the last rule's checkbox; all rules in between are also selected.

- (When viewed from the access control policy.) You can do the following with individual rules:
  - Edit the rule by clicking **Edit** from the **More** (⋮) menu.
  - Delete the rule from the policy by clicking **Delete** from the **More** (⋮) menu.
  - Enable or disable the rule by clicking **Enable/Disable Rule** from the **More** (⋮) menu.
  - Clear the hit count (reset it to zero) for the rule by clicking **Clear Hit Count** from the **More** (⋮) menu. You cannot undo this action.
- (When viewed from the prefilter policy.) Change the displayed columns by clicking **Cog** (⚙) and selecting the columns to show.
- (When viewed from the prefilter policy.) Click on a rule name to edit it, or click **View** (👁) in the last column to view the rule details. Clicking on the rule name highlights it in the policy page where you can edit it.
- (When viewed from the prefilter policy.) Clear the hit count information (reset it to zero) for a rule by right-clicking the rule and selecting **Clear Hit Count**. You can select multiple rules by using Ctrl+click. You cannot undo this action.
- Generate a comma-separated values report of the details on the page by clicking **Generate CSV** on the bottom-left of the page.

**Step 5** Click **Close** to return to the policy page.

## Analyzing Rule Conflicts and Warnings

You can view warnings and information about rule conflicts to examine the logic of your access control policy and to identify rules that need changes. When rules overlap, you can end up with unnecessary rules in the policy, and these rules will never be matched to traffic. The analysis can help you delete unnecessary rules, or identify rules that should be moved or modified so they enforce the desired policy.

Policy warnings and errors point out things that you should understand and perhaps address to ensure that your rules provide the desired services.

Rule conflict analysis identifies the following types of problem:

- **Object Overlap**—An element in a field of a rule is a subset of one or more elements in the same field of the rule. For example, the source field might include a network object for 10.1.1.0/24, and another object for the host 10.1.1.1. Because 10.1.1.1 is within the network covered by 10.1.1.0/24, the object for 10.1.1.1 is redundant and can be deleted, simplifying the rule and saving device memory.

- **Redundant Rule**—Two rules apply the same action to the same type of traffic and removing the base rule would not change the ultimate result. For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant and you can delete it.
- **Shadowed Rule**—This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules is the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.

### Before you begin

When doing the analysis:

- Only the first conflict for a given rule is identified. Once you fix the problem, the rule might be identified as having a conflict with another rule in the table. However, a rule might have multiple warnings or errors.
- Rule conflict analysis considers source/destination security zone, network, VLAN, and service/port match conditions and action only. It does not consider other match criteria, so an apparently redundant rule might not be completely redundant.
- FQDN network objects cannot be analyzed for conflict, because the IP address of an FQDN cannot be known prior to DNS lookup.
- Disabled rules are ignored.
- Time range attributes are ignored. Rules for different time periods might be marked as redundant when they are not actually redundant for the time ranges.
- Icons for warnings and errors, and rule conflicts when you enable the feature, are shown in the rules table. For a reference to the icons, see [Rule and Other Policy Warnings, on page 1595](#).

### Procedure

---

**Step 1** Choose **Policy > Access Control** and edit an access control policy.

**Step 2** Do one of the following to open the rule conflicts and warnings dialog box:

- To view rule conflicts, click the **Analyze** drop-down and click **Enable Rule Conflicts**. When the analysis completes, you see a summary of the conflicts at the top of the page. Then, click **Show Rule Conflicts** from the same menu to see the specific results.

You must re-enable rule conflict detection each time you open the policy or make a change and save the policy.

- To view rule warnings and errors, click **Analyze > Show Rule Warnings**.

After you make a change to the policy, you can refresh the results by clicking the reload icon next to the Analyze button.

- To view policy warnings, click **Analyze > Show Policy Warnings**.

- If you are finished viewing rule conflicts, click **Analyze > Disable Rule Conflicts**.

**Step 3** In the rule conflicts and warnings dialog box:

- Warnings and Errors are shown on a separate tab from Rule Conflicts.
- Each tab contains sub-tabs to let you examine individual types of problems, such as redundant vs. shadowed or warnings vs. errors. You can also search for an item.
- **More** (⚙) next to each rule name provides shortcuts to edit, disable, or delete the rule.

**Step 4** Click **Close** when finished.

---

## Searching for Rules

You can use search to help you find rules, especially when you have a large number of them.

When you search for an IP address in the source or destination network (but not as a simple text search), the system returns rules that will match the address. This includes not only exact matches, but also subnet matches. For example, searching for 10.1.1.1 will include rules for 10.1.1.0/24.

### Procedure

---

**Step 1** When editing an access control policy, build the search string by clicking in the **Search** box.

- For a simple text string search, type the string. The search returns rules that have that string in any column. You cannot do a string search in conjunction with a tag search, such as combining a string search with a Source Networks search.
- To search on a specific column, start typing the name of the column until the system prompts you with the full name, such as Source Networks, or select the name from the list of searchable fields. When you select the search tag, you can then enter the search string for that tag. For example, **Source Networks 10.1.1.1**.
- When entering multiple values, separate the values with commas.
- After your first search, clicking in the search box prompts you with recent searches and tags. You can quickly repeat a search by selecting it, or build similar searches by selecting previous searches or tags and building on them.
- When building a search string with multiple tags, do not include spaces between the tags.
- When you select a tag, you are prompted with values that appear in those columns. Select the values you want to search for.
- You can quickly filter based on some common features by clicking the filter icon to the left of the search box and selecting to show rules with any combination of the following: Allow, Block, Monitor, Intrusion Policy, Time Range, Conflicts, Warnings, Errors, Disabled rules.
- To see the rules that apply to a specific device or set of devices, click the filter icon and select the devices. Rules apply to a device if they use security zones that contain at least one interface on the device, or if they do not include security zones.

- Step 2** With your cursor at the end of the search string in the search box, press Enter.
- The rules that satisfy the search string are highlighted and non-matching rules are hidden. You can deselect **Show Only Matching Rules** to see the entire table, with the highlighted rules within the table. This lets you see the surrounding rules.
- Beside the Show Only Matching Rules checkbox is a summary of the total number of rules in the policy compared to the number that match the search string.
- Step 3** To close the search and return to the unfiltered and unhighlighted table, click the **X** at the right of the search box. You can also put your cursor at the end of the search string and press the Esc key.

## History for Access Control Policies

Table 91:

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Granular permissions for modifying access control policies and rules.	7.4.0	Any	<p>You can define custom user roles to differentiate between the intrusion configuration in access control policies and rules and the rest of the access control policy and rules. Using these permissions, you can separate the responsibilities of your network administration team and your intrusion administration teams.</p> <p>When defining user roles, you can select the <b>Policies &gt; Access Control &gt; Access Control Policy &gt; Modify Access Control Policy &gt; Modify Threat Configuration</b> option to allow the selection of intrusion policy, variable set, and file policy in a rule, the configuration of the advanced options for Network Analysis and Intrusion Policies, the configuration of the Security Intelligence policy for the access control policy, and intrusion actions in the policy default action. You can use the <b>Modify Remaining Access Control Policy Configuration</b> to control the ability to edit all other aspects of the policy. The existing pre-defined user roles that included the Modify Access Control Policy permission continue to support all sub-permissions; you need to create your own custom roles if you want to apply granular permissions.</p>
New access control policy user interface and rule conflict analysis.	7.3.0	Any	<p>The access control policy user interface introduced in 7.2 is now the default interface. You can also enable rule conflict analysis to help identify redundant rules and objects, and shadowed rules that cannot be matched due to previous rules in the policy.</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Access control policy locking.	7.2.0	Any	<p>You can lock an access control policy to prevent other administrators from editing it. Locking the policy ensures that your changes will not be invalidated if another administrator edits the policy and saves changes before you save your changes. Any user who has permission to modify the access control policy has permission to lock it.</p> <p>We added an icon to lock or unlock a policy next to the policy name while editing the policy. In addition, there is a new permission to allow users to unlock policies locked by other administrators: <b>Override Access Control Policy Lock</b>. This permission is enabled by default in the Administrator, Access Admin, and Network Admin roles.</p>
Rule hit counts persist over reboot.	7.2.0	Any	<p>Rebooting a managed device no longer resets access control rule hit counts to zero. Hit counts are reset only if you actively clear the counters. In addition, counts are maintained by each unit in an HA pair or cluster separately. You can use the <b>show rule hits</b> command to see cumulative counters across the HA pair or cluster, or see the counts per node.</p> <p>We modified the following device CLI command: <b>show rule hits</b>.</p>
Usability improvements for the access control policy.	7.2.0	Any	<p>There is a new user interface available for the access control policy. You can continue to use the legacy user interface, or you can try out the new user interface. The new interface has both a table and a grid view for the rules list, the ability to show or hide columns, enhanced search, infinite scroll, a clearer view of the packet flow related to policies associated with the access control policy, and a simplified add/edit dialog box for creating rules. You can freely switch back and forth between the legacy and new user interfaces while editing an access control policy.</p>
DNS filtering	7.0.0 6.7.0 (experimental)	Any	<p>If URL filtering is enabled and configured, a new option to enhance category and reputation filtering efficacy is enabled by default for each new access control policy.</p> <p>For more information, see <a href="#">DNS Filtering: Identify URL Reputation and Category During DNS Lookup</a>, on page 1732 and subtopics.</p> <p>The Advanced tab of access control policy has a new option under General Settings: <b>Enable reputation enforcement on DNS traffic</b>.</p>
TLS server identity discovery	6.7.0	Any	<p>Enable access control policies to evaluate URL and application conditions when a client connects to a TLS 1.3-enabled server. ## CHAPTER 42

# Access Control Rules

---

The following topics describe how to configure access control rules:

- [Introduction to Access Control Rules, on page 1641](#)
- [Requirements and Prerequisites for Access Control Rules, on page 1649](#)
- [Guidelines and Limitations for Access Control Rules, on page 1650](#)
- [Managing Access Control Rules, on page 1651](#)
- [Examples for Access Control Rules, on page 1664](#)
- [History for Access Control Rules, on page 1669](#)

## Introduction to Access Control Rules

Within an access control policy, *access control rules* provide a granular method of handling network traffic across multiple managed devices.

---

**Note** Security Intelligence filtering, decryption, user identification, and some decoding and preprocessing occur before access control rules evaluate network traffic.

---

The system matches traffic to access control rules in the order you specify. In most cases, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic.

Each rule also has an *action*, which determines whether you monitor, trust, block, or allow matching traffic. When you allow traffic, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

The following scenario summarizes the ways that traffic can be evaluated by access control rules in an inline, intrusion prevention deployment.

In this scenario, traffic is evaluated as follows:

- **Rule 1: Monitor** evaluates traffic first. Monitor rules track and log network traffic. The system continues to match traffic against additional rules to determine whether to permit or deny it. (However, see an important exception and caveat at [Access Control Rule Monitor Action, on page 1646](#).)
- **Rule 2: Trust** evaluates traffic next. Matching traffic is allowed to pass to its destination without further inspection, though it is still subject to identity requirements and rate limiting. Traffic that does not match continues to the next rule.
- **Rule 3: Block** evaluates traffic third. Matching traffic is blocked without further inspection. Traffic that does not match continues to the final rule.
- **Rule 4: Allow** is the final rule. For this rule, matching traffic is allowed; however, prohibited files, malware, intrusions, and exploits within that traffic are detected and blocked. Remaining non-prohibited, non-malicious traffic is allowed to its destination, though it is still subject to identity requirements and rate limiting. You can configure Allow rules that perform only file inspection, or only intrusion inspection, or neither.
- **Default Action** handles all traffic that does not match any of the rules. In this scenario, the default action performs intrusion prevention before allowing non-malicious traffic to pass. In a different deployment, you might have a default action that trusts or blocks all traffic, without further inspection. (You cannot perform file or malware inspection on traffic handled by the default action.)

Traffic you allow, whether with an access control rule or the default action, is automatically eligible for inspection for host, application, and user data by the network discovery policy. You do not explicitly enable discovery, although you can enhance or disable it. However, allowing traffic does not automatically guarantee discovery data collection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

Note that access control rules handle encrypted traffic when your decryption configuration allows it to pass, or if you do not configure decryption. However, some access control rule conditions require unencrypted traffic, so encrypted traffic may match fewer rules. Also, by default, the system disables intrusion and file inspection of encrypted payloads. This helps reduce false positives and improve performance when an encrypted connection matches an access control rule that has intrusion and file inspection configured.

## Access Control Rule Management

The rules table of the access control policy editor allows you to add, edit, categorize, search, filter, move, enable, disable, delete, and otherwise manage access control rules in the current policy.

Properly creating and ordering access control rules is a complex task, but one that is essential to building an effective deployment. If you do not plan your policy carefully, rules can preempt other rules, require additional licenses, or contain invalid configurations. To help ensure that the system handles traffic as you expect, the access control policy interface has a robust warning and error feedback system for rules.

Use the search bar to filter the list of access control policy rules. You can deselect the **Show Only Matching Rules** option to see all rules. Matched rules are highlighted.

For each access control rule, the policy editor displays its name, a summary of its conditions, the rule action, and icons that communicate the rule's inspection options or status. These icons represent:

- **Time Range Option** (🕒)
- **Intrusion policy** (🛡️)
- **File policy** (📁)
- **Logging** (📋)
- **Warning** (⚠️)
- **Errors** (❌)
- **Rule Conflict** (⚡)

Disabled rules are dimmed and marked (disabled) after the rule name.

To create or edit a rule, use the access control rule editor.

—You can:

- Configure the rule name and select its placement in the upper portion of the editor.
- Switch to editing a different rule by selecting its row above or below the editor.
- Use the left-hand list to select the rule action, and apply intrusion policies and variable sets, file policies, and time range, and to set logging options.
- Use the options next to the rule name to select the rule action, and apply intrusion policies and variable sets, file policies, and time range, and to set logging options.
- Use the **Sources** and **Destinations and Applications** columns to add matching criteria. You can add options from the All list, or move to different tabs to more easily find the type of option you want, such as security zone or networks.
- Add comments to the rule at the bottom of the editor.

# Access Control Rule Components

In addition to its unique name, each access control rule has the following basic components:

## State

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

## Position

Rules in an access control policy are numbered, starting at 1. If you are using policy inheritance, rule 1 is the first rule in the outermost policy. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

Rules can also belong to a section and a category, which are organizational only and do not affect rule position. Rule position goes across sections and categories.

## Section and Category

To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize access control rules, you can create custom rule categories inside the Mandatory and Default sections.

If you are using policy inheritance, the current policy's rules are nested between its parent policy's Mandatory and Default sections.

## Conditions

Conditions specify the specific traffic the rule handles. Conditions can be simple or complex; their use often depends on license.

Traffic must meet all of the conditions specified in a rule. For example, if the Application condition specifies HTTP but not HTTPS, the URL category and reputation conditions will not apply to HTTPS traffic.

## Applicable Time

You can specify days and times during which a rule is applicable.

## Action

A rule's action determines how the system handles matching traffic. You can monitor, trust, block, or allow (with or without further inspection) matching traffic. The system does not perform deep inspection on trusted, blocked, or encrypted traffic.

## Inspection

Deep inspection options govern how the system inspects and blocks malicious traffic you would otherwise allow. When you allow traffic with a rule, you can specify that the system first inspect it with intrusion or file policies to block any exploits, malware, or prohibited files before they reach your assets or exit your network.

## Logging

A rule's logging settings govern the records the system keeps of the traffic it handles. You can keep a record of traffic that matches a rule. In general, you can log sessions at the beginning or end of a connection, or both. You can log connections to the database, as well as to the system log (syslog) or to an SNMP trap server.

## Comments

Each time you save changes to an access control rule, you can add comments.

[Access Control Rule Comments](#)

# Access Control Rule Order

Rules in an access control policy are numbered, starting at 1. The system matches traffic to access control rules in top-down order by ascending rule number.

In most cases, the system handles network traffic according to the *first* access control rule where *all* the rule's conditions match the traffic. Except for Monitor rules, the system does not continue to evaluate traffic against additional, lower-priority rules after that traffic matches a rule.

To help you organize access control rules, every access control policy has two system-provided rule sections, Mandatory and Default. To further organize, you can create custom rule categories inside the Mandatory or Default sections. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

If you use policy inheritance, the current policy's rules are nested between its parent policy's Mandatory and Default rule sections. Rule 1 is the first rule in the outermost policy, not the current policy, and the system assigns rule numbers across policies, sections, and categories.

Any predefined user role that allows you to modify access control policies also allows you to move and modify access control rules within and among rules categories. You can, however, create custom roles that restrict users from moving and modifying rules. Any user who is allowed to modify access control policies can add rules to custom categories and modify rules in them without restriction.

### Caution

Failure to set up your access control rules properly can have unexpected results, including traffic being allowed that should be blocked. In general, application control rules should be lower in your access control list because it takes longer for those rules to match than rules based on IP address, for example.

Access control rules that use *specific* conditions (such as networks and IP addresses) should be ordered *before* rules that use general conditions (such as applications). If you're familiar with the Open Systems Interconnect (OSI) model, use similar numbering in concept. Rules with conditions for layers 1, 2, and 3 (physical, data link, and network) should be ordered first in your access control rules. Conditions for layers 5, 6, and 7 (session, presentation, and application) should be ordered later in your access control rules. For more information about the OSI model, see this [Wikipedia article](#).

**Tip** Proper access control rule order reduces the resources required to process network traffic, and prevents rule preemption. Although the rules you create are unique to every organization and deployment, there are a few general guidelines to follow when ordering rules that can optimize performance while still addressing your needs.

#### Related Topics

[Best Practices for Ordering Rules](#), on page 1609

## Access Control Rule Actions

Every access control rule has an *action* that determines how the system handles and logs matching traffic. You can monitor, trust, block, or allow (with or without further inspection).

The access control policy's *default action* handles traffic that does not meet the conditions of any access control rule with an action other than Monitor.

### Access Control Rule Monitor Action

The **Monitor** action is not designed to permit or deny traffic. Rather, its primary purpose is to force connection logging, regardless of how matching traffic is eventually handled.

If a connection matches a Monitor rule, the next non-Monitor rule that the connection matches should determine traffic handling and any further inspection. If there are no additional matching rules, the system should use the default action.

There is an exception, however. If a Monitor rule contains layer 7 conditions—such as an application condition—the system *allows early packets to pass* and the connection to be established (or the SSL handshake to complete). This occurs even if the connection should be blocked by a subsequent rule; this is because these early packets *are not evaluated against subsequent rules*. So that these packets do not reach their destination completely uninspected, you can specify an intrusion policy for this purpose in the access control policy's Advanced settings; see [Inspection of Packets That Pass Before Traffic Is Identified](#), on page 2526. After the system completes its layer 7 identification, it applies the appropriate action to the remaining session traffic.

**Caution** As a best practice, *avoid placing layer 7 conditions on broadly-defined monitor rules high in your rule priority order*, to prevent inadvertently allowing traffic into your network. Also, if locally bound traffic matches a Monitor rule in a Layer 3 deployment, that traffic may bypass inspection. To ensure inspection of the traffic, enable **Inspect Local Router Traffic** in the advanced device settings for the managed device routing the traffic.

### Access Control Rule Trust Action

The **Trust** action allows traffic to pass without deep inspection or network discovery. Trusted traffic is still subject to identity requirements and rate limiting.

**Note**

- Some protocols, such as FTP and SIP, use secondary channels, which the system opens through the process of inspection. In some cases, trusted traffic can bypass all inspection, and these secondary channels cannot be opened properly. If you run into this problem, change the trust rule to **Allow**.
- For trust rules with logging options disabled, end-of-flow events are still generated in the system. However, the events are not visible on the event pages.
- Because access control rules are evaluated after other policies, such as decryption, trusting a connection does not necessarily mean it will be fast-pathed with no inspection. For example, if a connection matches both a decryption rule that requires decryption, and a trust access control rule, the connection is decrypted and inspected as needed, prior to being allowed by the trust rule. Trust simply means no additional inspection, such as intrusion inspection, will be applied. If your intention is to allow a connection uninspected, either use the prefilter policy to fast path the connection, or ensure that no other policy applies inspection services to the connection.

## Access Control Rule Blocking Actions

The **Block** and **Block with reset** actions deny traffic without further inspection of any kind.

Block with reset rules reset the connection, with the exception of web requests met with an *HTTP response page*. This is because the response page, which you configure to appear when the system blocks web requests, cannot display if the connection is immediately reset.

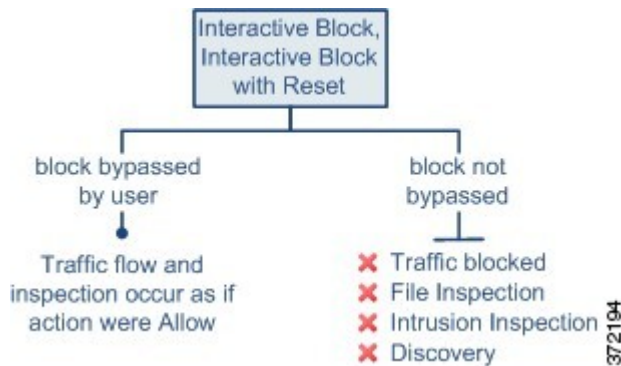

For more information, see [Configure HTTP Response Pages, on page 1735](#).

**Related Topics**

[Configure HTTP Response Pages, on page 1735](#)

## Access Control Rule Interactive Blocking Actions

The **Interactive Block** and **Interactive Block with reset** actions give web users a choice to continue to their intended destinations.

If a user bypasses the block, the rule mimics an allow rule. Therefore, you can associate interactive block rules with file and intrusion policies, and matching traffic is also eligible for network discovery.

If a user does not (or cannot) bypass the block, the rule mimics a block rule. Matching traffic is denied without further inspection.

Note that if you enable interactive blocking, you cannot reset *all* blocked connections. This is because the response page cannot display if the connection is immediately reset. Use the **Interactive Block with reset** action to (non-interactively) block-with-reset all non-web traffic, while still enabling interactive blocking for web requests.

For more information, see [Configure HTTP Response Pages, on page 1735](#).

### Related Topics

[Decryption Rule Blocking Actions, on page 2206](#)

## Access Control Rule Allow Action

The **Allow** action allows matching traffic to pass, though it is still subject to identity requirements and rate limiting.

Optionally, you can use deep inspection to further inspect and block unencrypted or decrypted traffic before it reaches its destination:

- You can use an intrusion policy to analyze network traffic according to intrusion detection and prevention configurations, and drop offending packets depending on the configuration.
- You can perform file control using a file policy. File control allows you to detect and block your users from uploading (sending) or downloading (receiving) files of specific types over specific application protocols.
- You can perform network-based advanced malware protection (AMP), also using a file policy. malware defense can inspect files for malware, and block detected malware depending on the configuration.

The following diagram illustrates the types of inspection performed on traffic that meets the conditions of an Allow rule (or a user-bypassed Interactive Block rule. Notice that file inspection occurs before intrusion inspection; blocked files are not inspected for intrusion-related exploits.

For simplicity, the diagram displays traffic flow for situations where both (or neither) an intrusion and a file policy are associated with an access control rule. You can, however, configure one without the other. Without a file policy, traffic flow is determined by the intrusion policy; without an intrusion policy, traffic flow is determined by the file policy.

Regardless of whether the traffic is inspected or dropped by an intrusion or file policy, the system can inspect it using network discovery. However, allowing traffic does not automatically guarantee discovery inspection. The system performs discovery only for connections involving IP addresses that are explicitly monitored by your network discovery policy; additionally, application discovery is limited for encrypted sessions.

## Requirements and Prerequisites for Access Control Rules

### Model Support

Any

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin
- You can define custom user roles to differentiate between the intrusion configuration in access control policy and rules and the rest of the access control policy and rules. Using these permissions, you can separate the responsibilities of your network administration team and your intrusion administration teams. The existing pre-defined user roles that included the Modify Access Control Policy permission support all sub-permissions; you need to create your own custom roles if you want to apply granular permissions. The granular permissions are:
  - **Policies > Access Control > Access Control Policy > Modify Access Control Policy > Modify Threat Configuration** allows the selection of intrusion policy, variable set, and file policy in a rule, the configuration of the advanced options for Network Analysis and Intrusion Policies, the configuration of the Security Intelligence policy for the access control policy, and intrusion actions

in the policy default action. If a user has this option only, the user can modify no other part of the policy or rule.

- **Modify Remaining Access Control Policy Configuration** controls the ability to edit all other aspects of the policy.

## Guidelines and Limitations for Access Control Rules

- There is a limit of 1000 rules that can be shown at a time on the current page. Thus, if you have a very large number of rules, such as 3000 rules within a single category, actions like selecting all rules in a category and deleting them does not delete all of the rules. You might need to select/delete rules again to delete all the rules that you are targeting.
- If you edit an access control rule that is actively in use, the changes do not apply to established connections at deploy-time. The updated rule is used to match against future connections. However, if the system is actively inspecting a connection (for example, with an intrusion policy), it *will* apply changed matching or action criteria to existing connections.

For Firewall Threat Defense, you can ensure that your changes apply to all current connections by using the Firewall Threat Defense **clear conn** CLI command to end established connections. Note that you should only do this if it is acceptable to end those connections, on the assumption that the sources for the connections will then attempt to reestablish the connection and thus be matched appropriately against the new rule.

- VLAN tags in access rules only apply to inline sets; they cannot be used in access rules applied to firewall interfaces.
- To use fully-qualified domain name (FQDN) network objects as source or destination criteria, you must also configure DNS for the data interfaces in the platform settings policy. The system does not use the management DNS server setting to do lookups for FQDN objects used in access control rules.

Note that controlling access by FQDN is a best-effort mechanism. Consider the following points:

- Whenever possible, use Security Intelligence or URL filtering instead of FQDN rules.
- Because DNS replies can be spoofed, only use fully trusted internal DNS servers.
- Some FQDNs, especially for very popular servers, can have hundreds if not thousands of IP addresses, and these can frequently change. Because the system uses cached DNS lookup results, users might get addresses that are not yet in the cache, and their connections will not match the FQDN rule. Rules that use FQDN network objects function effectively only for names that resolve to fewer than 100 addresses.

We recommend that you do not create network object rules for an FQDN that resolves to more than 100 addresses, as the likelihood of the address in a connection being one that has been resolved and available in the DNS cache on the device is low. For these cases, use a URL-based rule instead of an FQDN network object rule.

- For popular FQDNs, different DNS servers can return a different set of IP addresses. Thus, if your users use a different DNS server than the one you configure, FQDN-based access control rules might not apply to all IP addresses for the site that are used by your clients, and you will not get the intended results for your rules.

- Some FQDN DNS entries have very short time to live (TTL) values. This can result in frequent recompilation of the lookup table, which can impact overall system performance.
- If more than 8 FQDNs resolve to the same IP address, the system cannot reliably match traffic to the rules for those FQDN. At most 8 FQDNs per IP address can be handled.
- The maximum objects per match criteria per access control rule is 200. For example, you can have up to 200 network objects in a single access control rule.

## Managing Access Control Rules

The following topics explain how to manage access control rules.

### Adding an Access Control Rule Category

You can divide an access control policy's Mandatory and Default rule sections into custom categories. After you create a category, you cannot move it, although you can delete it, rename it, and move rules into, out of, within, and around it. The system assigns rule numbers across sections and categories.

#### Procedure

---

**Step 1** In the access control policy editor, click **Add Category**.

**Tip**

If your policy already contains rules, you can click a blank area in the row for an existing rule to set the position of the new category before you add it. You can also right-click an existing rule and select **Insert new category**.

**Step 2** Enter a **Name**.

**Step 3** From the **Insert** drop-down list, choose where you want to add the category:

- To insert a category below all existing categories in a section, choose **into Mandatory** or **into Default**.
- To insert a category above an existing category, choose **above category**, then choose a category.
- To insert a category above or below an access control rule, choose **above rule** or **below rule**, then enter an existing rule number.

**Step 4** Click **Apply**.

**Step 5** Click **Save** to save the policy.

---

### Create and Edit Access Control Rules

Use access control rules to apply actions to specific traffic classes. Rules allow you to selectively allow desirable traffic and drop unwanted traffic.

## Procedure

- Step 1** In the access control policy editor, you have the following options:
- To add a new rule, click **Add Rule**.
  - To edit an existing rule, click **Edit** (✎).
  - To start with a copy of an existing rule, select one of the following commands from the **More** (⋮) menu.
    - **Copy Rule**, to copy the rule to the clipboard, so you can use the **Paste Above/Below** commands to place it anywhere in the same policy.
    - **Clone Rule**, to create the copy immediately below the duplicated rule.
  - To edit multiple rules, use the checkboxes to select multiple rules, then select **Edit** or another action from the **Select Action** list next to the search box.
  - To do inline editing, where you change the configuration of an object in a rule condition, right-click the value and choose **Edit**. You can also use the right-click menu to remove a item, add it to the filter, or copy the text or value.

If **View** (👁) appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.

**Step 2** If this is a new rule, enter a **Name**.

**Step 3** Configure the rule components.

If you are bulk-editing multiple rules, only a subset of options are available.

- **Position**—Specify the rule position; see [Access Control Rule Order, on page 1645](#).
- **Action**—Choose a rule **Action**; see [Access Control Rule Actions, on page 1646](#).
- **Deep Inspection**—(Optional.) For Allow and Interactive Block rules, select options for **Intrusion Policy**, **Variable Set**, and **File Policy**. You can apply intrusion and file policies independently; you do not need to configure both.
- **Time Range**—(Optional.) For Firewall Threat Defense devices, choose the days and times when the rule is applicable. If you do not choose an option, the rule is always active. For details, see [Creating Time Range Objects, on page 1322](#).
- **Logging**—Click **Logging** to specify options for connection logging and SNMP traps. See *Best Practices for Connection Logging* in the [Cisco Secure Firewall Management Center Administration Guide](#) for more information.
- **Conditions**—Select the objects you want to add or either source or destination, then click either **Add to Sources** or **Add to Destinations and Applications** to add matching conditions for connections. You can click a tab to restrict the list of available objects, for example, to Networks, Security Zones, Applications, and so forth. However, the sources and destination column always show all selected objects regardless of the tab you are on. See [Access Control Rule Conditions, on page 1653](#) for more information.
- **Comments**—Open the comments list at the bottom of the dialog box, enter your comment, and click **Post** to add a comment.

**Step 4** Click **Add** or **Apply** to save the rule.

**Step 5** Click **Save** to save the policy.

---

### What to do next

If you will deploy time-based rules, specify the time zone of the device to which the policy is assigned. See [Time Zone, on page 884](#).

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

### Related Topics

[Best Practices for Access Control Rules](#), on page 1608

## Access Control Rule Conditions

Rule conditions define the characteristics of the connections you want to target with each rule. Use the conditions precisely to fine-tune the rule to apply to all, and only, the traffic that should be handled by the rule. The following topics explain the match conditions that you can use.

### Security/Tunnel Zone Rule Conditions

You can use security zones and tunnel zones to select traffic for a rule.

Security zones segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices. Tunnel zones allow you to identify tunneled traffic, such as GRE, that should be handled as a tunnel rather than apply access control rules to the encapsulated connections within the tunnel.

You can use security zones to control traffic by its source and destination interfaces. If you add both source and destination zones to a zone condition, matching traffic must originate from an interface in one of the source zones and leave through an interface in one of the destination zones for it to match the rule. Just as all interfaces in a security zone must be of the same type (all inline, passive, switched, or routed), all zones used in a zone condition must be of the same type. Because devices deployed passively do not transmit traffic, you cannot use a zone with passive interfaces as a destination zone.

When using tunnel zones, ensure that you have matching rules in the prefilter policy to associate tunneled traffic with the zone. Then, you can select the tunnel zone as a source zone in a rule; tunnel zones cannot be destinations. If you do not have prefilter rules to rezone the tunnels into the tunnel zone, an access control rule for the tunnel will never apply to any connections. You can specify destination security zones to target tunnels that leave the device through specific interfaces.

### Security Zone Considerations

Consider the following when deciding on security zone criteria:

- Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.
- Access control rules generate ACL entries (ACEs) in the device configuration to provide early processing and drops whenever possible. If you specify security zones in rules, ACEs are created for each interface in the zone, which can greatly increase the size of the ACL. Excessively large ACLs generated from access control rules can impact system performance.

## Network Rule Conditions

Network rule conditions are the network objects or geographical locations that define the network addresses or locations of the traffic.

- To match traffic from an IP address or geographical location, add the criteria to the Sources list.
- To match traffic to an IP address or geographical location, add the criteria to the Destinations list.
- If you add both source and destination network conditions to a rule, matching traffic must originate from one of the specified IP addresses and be destined for one of the destination IP addresses.

When you add this criteria, you select from the following tabs:

- **Network**—Select the network objects or groups that define the source or destination IP addresses for the traffic you want to control.

Whenever possible, combine multiple network objects into a single object group. The system automatically creates an object group (during deployment) when you select more than one object (for source or destination separately). Selecting existing groups can avoid object group duplication and reduce the potential impact on CPU usage when there are a large number of duplicate objects.

You can use objects that define the address using the fully-qualified domain name (FQDN); the address is determined through a DNS lookup. However, FQDN objects are not supported in the following sections in access control policies: Original Client networks, SGT/ISE attributes, Network Analysis And Intrusion policy, Security Intelligence, Threat Detection, Elephant Flow Settings.

- **Geolocation**—Select the geographical location to control traffic based on its source or destination country or continent. Selecting a continent selects all countries within the continent. Besides selecting geographical location directly in the rule, you can also select a geolocation object that you created to define the location. Using geographical location, you could easily restrict access to a particular country without needing to know all of the potential IP addresses used there.

---

**Note** To ensure that you are using up-to-date geographical location data to filter your traffic, Cisco strongly recommends that you regularly update the geolocation database (GeoDB).

---

## Original Client in Network Conditions (Filtering Proxied Traffic)

For some rules, you can handle proxied traffic based on the originating client. Use a source network condition to specify proxy servers, then add an original client constraint to specify original client IP addresses. The system uses a packet's X-Forwarded-For (XFF), True-Client-IP, or custom-defined HTTP header field to determine original client IP.

Traffic matches the rule if the proxy's IP address matches the rule's source network constraint, **and** the original client's IP address matches the rule's original client constraint. For example, to allow traffic from a specific original client address, but only if it uses a specific proxy, create three access control rules:

Access Control Rule 1: Blocks proxied traffic from a specific IP address (209.165.201.1)

Source Networks: 209.165.201.1

Original Client Networks: none/any

Action: Block

Access Control Rule 2: Allows proxied traffic from the same IP address, but only if the proxy server for that traffic is one you choose (209.165.200.225 or 209.165.200.238)

Source Networks: 209.165.200.225 and 209.165.200.238

Original Client Networks: 209.165.201.1

Action: Allow

Access Control Rule 3: Blocks proxied traffic from the same IP address if it uses any other proxy server.

Source Networks: any

Original Client Networks: 209.165.201.1

Action: Block

## VLAN Tags Rule Conditions

**Note** VLAN tags in access rules only apply to inline sets. Access rules with VLAN tags do not match traffic on firewall interfaces.

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic, with the exception of the prefilter policy, which uses the outermost VLAN tag in its rules.

Note the following Q-in-Q support:

- Firewall Threat Defense on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).
- Firewall Threat Defense on all other models:
  - Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
  - Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

In a cluster, if you encounter problems with VLAN matching, edit the access control policy advanced options, Transport/Network Preprocessor Settings, and select the **Ignore the VLAN header when tracking connections** option.

## User Rule Conditions

Matches traffic based the user who initiates the connection, or the group to which the user belongs. For example, you could configure a Block rule to prohibit anyone in the Finance group from accessing a network resource.

You can configure user rule conditions for users in Microsoft Active Directory realms only.

In addition to configuring users and groups for configured realms, you can set policies for the following Special Identities users:

- Failed Authentication: User that failed authentication with the captive portal.
- Guest: Users configured as guest users in the captive portal.

- No Authentication Required: Users that match an identity **No Authentication Required** rule action.
- Unknown: Users that cannot be identified; for example, users that are not downloaded by a configured realm.

For access control rules only, you must first associate an identity policy with the access control policy as discussed in [Associating Other Policies with Access Control, on page 1631](#).

## Application Rule Conditions

When the system analyzes IP traffic, it can identify and classify the commonly used applications on your network. This discovery-based *application awareness* is the basis for *application control*—the ability to control application traffic.

System-provided *application filters* help you perform application control by organizing applications according to basic characteristics: type, risk, business relevance, category, and tags. You can create reusable user-defined filters based on combinations of the system-provided filters, or on custom combinations of applications.

At least one detector must be enabled for each application rule condition in the policy. If no detector is enabled for an application, the system automatically enables all system-provided detectors for the application; if none exist, the system enables the most recently modified user-defined detector for the application. For more information about application detectors, see [Application Detector Fundamentals, on page 2434](#).

You can use both application filters and individually specified applications to ensure complete coverage. However, understand the following note before you order your access control rules.

### Benefits of Application Filters

Application filters help you quickly configure application control. For example, you can easily use system-provided filters to create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the system blocks the session.

Using application filters simplifies policy creation and administration. It assures you that the system controls application traffic as expected. Because Cisco frequently updates and adds application detectors via system and vulnerability database (VDB) updates, you can ensure that the system uses up-to-date detectors to monitor application traffic. You can also create your own detectors and assign characteristics to the applications they detect, automatically adding them to existing filters.

### Application Characteristics

The system characterizes each application that it detects using the criteria described in the following table. Use these characteristics as application filters.

**Table 92: Application Characteristics**

Characteristic	Description	Example
Type	Application protocols represent communications between hosts. Clients represent software running on a host. Web applications represent the content or requested URL for HTTP traffic.	HTTP and SSH are application protocols. Web browsers and email clients are clients. MPEG video and Facebook are web applications.
Risk	The likelihood that the application is being used for purposes that might be against your organization's security policy.	Peer-to-peer applications tend to have a very high risk.

Characteristic	Description	Example
Business Relevance	The likelihood that the application is being used within the context of your organization's business operations, as opposed to recreationally.	Gaming applications tend to have a very low business relevance.
Category	A general classification for the application that describes its most essential function. Each application belongs to at least one category.	Facebook is in the social networking category.
Tag	Additional information about the application. Applications can have any number of tags, including none.	Video streaming web applications often are tagged high bandwidth and displays ads.

### Related Topics

[Best Practices for Configuring Application Control](#), on page 1605

### Configuring Application Conditions and Filters

To build an application condition or filter, choose the applications whose traffic you want to control from a list of available applications. Optionally (and recommended), constrain the available applications using filters. You can use filters and individually specified applications in the same condition.

### Before you begin

- Adaptive profiling must be enabled (its default state) as described in [Configuring Adaptive Profiles](#), on page 2682 for access control rules to perform application control.

### Procedure

- 
- Step 1** Invoke the rule or configuration editor:
- Access control, decryption, QoS rule condition—In the rule editor, click **Applications**.
  - Identity rule condition—In the rule editor, click **Realms & Settings** and enable active authentication; see [Create an Identity Rule](#), on page 2373.
  - Application filter—On the Application Filters page of the object manager, add or edit an application filter. Provide a unique **Name** for the filter.
  - Intelligent Application Bypass (IAB)—In the access control policy editor, click **Advanced**, edit IAB settings, then click **Bypassable Applications and Filters**.
- Step 2** Find and choose the applications you want to add from the **Available Applications** list.
- To constrain the applications displayed in **Available Applications**, choose one or more **Application Filters** or search for individual applications.
- Tip**
- Click **Information** (i) next to an application to display summary information and internet search links. **Unlock** marks applications that the system can identify only in decrypted traffic.

When you choose filters, singly or in combination, the Available Applications list updates to display only the applications that meet your criteria. You can choose system-provided filters in combination, but not user-defined filters.

- Multiple filters for the same characteristic (risk, business relevance, and so on)—Application traffic must match only one of the filters. For example, if you choose both the medium and high-risk filters, the Available Applications list displays all medium and high-risk applications.
- Filters for different application characteristics—Application traffic must match both filter types. For example, if you choose both the high-risk and low business relevance filters, the Available Applications list displays only applications that meet both criteria.

**Step 3** Click **Add Application** or **Add to Rule**, or drag and drop.

**Tip**

Before you add more filters and applications, click **Clear Filters** to clear your current choices.

**Step 4** Save or continue editing the rule or configuration.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Port, Protocol, and ICMP Code Rule Conditions

Port conditions match traffic based on the source and destination ports. Depending on the rule type, “port” can represent any of the following:

- TCP and UDP—You can control TCP and UDP traffic based on the port. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.
- ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.
- Protocol—You can control traffic using other protocols that do not use ports.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

### Best Practices for Port-Based Rules

Specifying ports is the traditional way to target applications. However, applications can be configured to use unique ports to bypass access control blocks. Thus, whenever possible, use application filtering criteria rather than port criteria to target traffic. Note that application filtering is not available in prefilter rules.

Application filtering is also recommended for applications, like FTP, that open separate channels dynamically for control vs. data flow. Using port-based access control rules can prevent these kinds of applications from performing correctly, and could result in blocking desirable connections.

### Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as destination port conditions in a single access control rule.

### Matching Non-TCP Traffic with Port Conditions

You can match non-port-based protocols. By default, if you do not specify a port condition, you are matching IP traffic. Although you can configure port conditions to match non-TCP traffic, there are some restrictions:

- Access control rules—For Classic devices, you can match GRE-encapsulated traffic with an access control rule by using the GRE (47) protocol as a destination port condition. To a GRE-constrained rule, you can add only network-based conditions: zone, IP address, port, and VLAN tag. Also, the system uses outer headers to match **all** traffic in access control policies with GRE-constrained rules. For Firewall Threat Defense devices, use tunnel rules in the prefilter policy to control GRE-encapsulated traffic.
- Decryption rules—These rules support TCP port conditions only.
- ICMP echo—A destination ICMP port with the type set to 0 or a destination ICMPv6 port with the type set to 129 only matches unsolicited echo replies. ICMP echo replies sent in response to ICMP echo requests are ignored. For a rule to match on any ICMP echo, use ICMP type 8 or ICMPv6 type 128.

## URL Rule Conditions

Use URL conditions to control the websites that users on your network can access.

For complete information, see [About URL Filtering with Category and Reputation, on page 1720](#).

## Dynamic Attributes Rule Conditions

Dynamic attributes include the following:

- (Source or destination.) Dynamic objects (such as from the Cisco Secure Dynamic Attributes Connector)  
The dynamic attributes connector enables you to collect data (such as networks and IP addresses) from cloud providers and send it to the Secure Firewall Management Center so it can be used in access control rules.  
For more information about the dynamic attributes connector, see [About the Cisco Secure Dynamic Attributes Connector, on page 1671](#).
- (Source only.) Location IP objects, defined by Cisco ISE
- (Source only.) Device type objects, defined by Cisco ISE (also referred to as endpoint profile objects)

Dynamic attributes can be used as source criteria and destination criteria in access control rules. Use the following guidelines:

- Objects of different types are ANDd together
- Objects of a similar type are ORd together

For example, if you choose source destination criteria SGT 1, SGT 2, and device type 1; the rule is matched if device type 1 is detected on either SGT 1 or SGT 2. As another example, if you select both a security group tag, and a dynamic object that lists IP addresses, the rule matches if traffic with the tag originates from (or is destined to) one of those IP addresses.

## Time and Day Rule Conditions

You can specify a continuous time range or a recurring time period.

For example, a rule can apply only during weekday working hours, or every weekend, or during a holiday shutdown period.

Time-based rules are applied based on the local time of the device that processes the traffic.

Time-based rules are supported only on Firewall Threat Defense devices. If you assign a policy with a time-based rule to a different type of device, the time restriction associated with the rule is ignored on that device. You will see warnings in this case.

## Enabling and Disabling Access Control Rules

When you create an access control rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in an access control policy, disabled rules are grayed out, although you can still modify them.

You can also enable or disable an access control rule using the rule editor.

### Procedure

- 
- Step 1** In the access control policy editor, right-click the rule and choose a rule state.
- If **View** (👁) appears next to a rule instead, the rule belongs to an ancestor policy, or you do not have permission to modify the rule.
- Step 2** Click **Save**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Copying Access Control Rules from One Access Control Policy to Another

You can copy access control rules from one access control policy to another. You can copy the rules either to the **Default** section or the **Mandatory** section of the access control policy.

All the settings of the copied rules, except the comments, are retained in the pasted version.

## Procedure

- 
- Step 1** Do one of the following:
- To copy a single rule, right-click the rule and select **Copy to Different Policy**.
  - To copy multiple rules, select their checkboxes, then select **Copy to Different Policy** from the **Select Bulk Action** menu.
- Step 2** Select the destination access control policy from the **Access Policy** drop-down list.
- Step 3** From the **Place Rules** drop-down list, choose where you want to position the copied rules. You can place them at the bottom of either the Mandatory or Default sections.
- Step 4** Click **Copy**.
- 

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Moving Access Control Rules to a Prefilter Policy

You can move access control rules from an access control policy to the associated non-default prefilter policy.

You must first apply a user-defined prefilter policy to the access control policy. The access control rules cannot be moved to the default prefilter policy because the default prefilter policy cannot have rules.

## Before you begin

Note the following conditions before you proceed:

- When moving an access control rule to a prefilter policy the layer 7 (L7) parameters in the access control rule cannot be moved. The L7 parameters are dropped during the operation.
- The comments in the access control rule configuration are lost after moving the rule. However, a new comment is added in the moved rule mentioning the source access control policy.
- You cannot move access control rules with **Monitor** set as the **Action** parameter.
- The **Action** parameter in the access control rule is changed to a suitable action in the prefilter rule when moved. To know what each action in the access control rule maps to, see the following table:

Action in the access control rule	Action in the prefilter rule
Allow	Analyze
Block	Block
Block with reset	Block
Interactive Block	Block

Action in the access control rule	Action in the prefilter rule
Interactive Block with reset	Block
Trust	Fastpath

- Similarly, based on the action configured in the access control rule, the logging configuration is set to an appropriate setting after the rule is moved, as mentioned in the following table.

Action in the access control rule	Enabled Logging configurations in the prefilter rule
Allow	None of the check boxes are checked.
Block	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>
Block with reset	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>
Interactive Block	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>
Interactive Block with reset	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>
Trust	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Log at End of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>

- While moving rules from the source policy, if another user modifies those rules, you will see get a message. You may continue with the process after refreshing the page.

### Procedure

- 
- Step 1** Do one of the following:
- To move a single rule, right-click the rule and select **Move to Prefilter Policy**.
  - To move multiple rules, select their checkboxes, then select **Move to Prefilter Policy** from the **Select Bulk Action** menu.
- Step 2** From the **Place Rules** drop-down list, choose where you want to position the moved rules:
- To position as the last set of rules, choose **At the bottom**.
  - To position as the first set of rules, choose **At the top**.
- Step 3** Click **Move**.
- 

### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Positioning an Access Control Rule

You can move an existing rule within an access control policy, or insert new rules in a desired location. When you add or move a rule to a category, the system places it last in the category.

### Before you begin

Review rule order guidelines in [Best Practices for Access Control Rules, on page 1608](#).

### Procedure

- 
- Step 1** Do one of the following:
- New rule—Insert a new rule by hovering over the line between the existing rules, and clicking **Add Rule**. The location is selected in the **Insert** box in the Add Rule dialog box; you can select a different rule to adjust the location. You can also select **Add Rule Above** or **Add Rule Below** from the right-click menu.
  - Existing rules when viewing the rule table—Click and drag the rule to the new position.
  - Existing rules when viewing the rule table—Right-click a single rule and select **Reposition Rule**. To move multiple rules as a group, select their checkboxes, then select **Reposition Rules** from the **Select Bulk Action** menu.
  - Existing rule when editing the rule—Click the **Reposition Rule** icon next to the rule name.

- Step 2** Choose where you want to move or insert the rule:
- Choose **into Mandatory** or **into Default**.
  - Choose a **into Category**, then choose the category.
  - Choose **above rule** or **below rule**, then select the rule.
- Step 3** Click **Move** or **Confirm**, and save the rule if you are editing it.
- Step 4** Click **Save** to save the policy.
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Adding Comments to an Access Control Rule

When you create or edit an access control rule, you can add a comment. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change. You can display a list of all comments for a rule along with the user who added each comment and the date the comment was added.

When you save a rule, all comments made since the last save become read-only.

To search access control rule comments, use the "Search Rules" bar on the rule listing page.

#### Procedure

- 
- Step 1** In the access control rule editor, click **Comments**.
- Step 2** Enter your comment and click **Add Comment**. You can edit or delete this comment until you save the rule.
- Step 3** Save the rule.
- 

## Examples for Access Control Rules

The following topics provide examples of access control rules.

### How to Control Access Using Security Zones

Consider a deployment where you want hosts to have unrestricted access to the internet, but you nevertheless want to protect them by inspecting incoming traffic for intrusions and malware.

First, create two security zones: Internal and External. Then, assign interface pairs on one or more devices to those zones, with one interface in each pair in the Internal zone and one in the External zone. Hosts connected to the network on the Internal side represent your protected assets.

**Note** You are not required to group all internal (or external) interfaces into a single zone. Choose the grouping that makes sense for your deployment and security policies.

Then, configure an access control rule with a destination zone condition set to Internal. This simple rule matches traffic that leaves the device from any interface in the Internal zone. To inspect matching traffic for intrusions and malware, choose a rule action of **Allow**, then associate the rule with an intrusion and a file policy.

## How to Control Application Usage

The Web has become the ubiquitous platform for application delivery in the enterprise, whether that is browser based application platforms, or rich media applications that use web protocols as the transport in and out of enterprise networks.

Firewall Threat Defense inspects connections to determine the application being used. This makes it possible to write access control rules targeted at applications, rather than just targeting specific TCP/UDP ports. Thus, you can selectively block or allow web-based applications even though they use the same port.

Although you can select specific applications to allow or block, you can also write rules based on type, category, tag, risk, or business relevance. For example, you could create an access control rule that identifies and blocks all high risk, low business relevance applications. If a user attempts to use one of those applications, the session is blocked.

Cisco frequently updates and adds additional application detectors via system and vulnerability database (VDB) updates. Thus, a rule blocking high risk applications can automatically apply to new applications without you having to update the rule manually.

In this use case, we will block any application that belongs to the **anonymizer/proxy** category.

### Procedure

**Step 1** Choose **Policies > Access Control heading > Access Control** and edit the access control policy.

**Step 2** Click **Add Rule** and configure the rule for application control.

- a) Give the rule a meaningful name, such as Block\_Anonymizers.
- b) Select **Block** for **Action**.

Name:

Action:  Block

- c) Assuming that you have configured zones, and want this rule to apply to traffic going from the inside to outside, select the **Zones** tab, and choose your inside zone as the source zone, and the outside zone as the destination zone.
- d) Click the **Applications** tab, select the applications to match, and click **Add Application**.

As you select criteria, such as category and risk level, the list to the right of the criteria updates to show exactly which applications match the criteria. The rule you are writing applies to these applications.

**Look at this list carefully.** For example, you might be tempted to block all very high risk applications. However, as of this writing, TFPT is classified as very high risk. Most organizations would not want to

block this application. Take the time to experiment with various filter criteria to see which applications match your selections. Keep in mind that these lists can change with every VDB update.

For purposes of this example, select anonymizers/proxies from the Categories list and add it to Destinations and Applications. The match criteria should now look like the following graphic.

Selected Sources: 1		Selected Destinations and Applications: 2	
<i>Collapse All</i>	<i>Remove All</i>	<i>Collapse All</i>	<i>Remove All</i>
<div>ZONE</div> <div>▼ 1 object</div> <div>inside-zone</div>		<div>ZONE</div> <div>▼ 1 object</div> <div>outside-zone</div>	
		<div>APP</div> <div>▼ 1 object</div> <div>Categories: anonymizer/proxy</div>	

- e) Click **Logging** next to the rule action, and enable logging at the start of the connection. You can select a syslog server if you use one.

You must enable logging to get information about any connections blocked by this rule.

#### Note

To optimize performance, log either the beginning or the end of any connection, but not both. See [Cisco Secure Firewall Management Center Administration Guide](#) for more information.

- Step 3** Move the rule so that it comes after any rules that use protocol and port criteria only, but that would not allow traffic that should be blocked by the application rule.

Matching applications requires Snort inspection. Because Snort inspection is not needed by rules that use protocol and port only, you can improve system performance by grouping these simple rules at the top of the access control policy as much as possible.

- Step 4** Deploy the changes.

You can use the application rule hit counts and analysis dashboards to see how this rule is performing and how often users try these applications.

## How to Block Threats

You can implement next generation Intrusion Prevention System (IPS) filtering by adding intrusion policies to your access control rules. Intrusion policies analyze network traffic, comparing the traffic contents against known threats. If a connection matches a threat you are monitoring, the system drops the connection, thus preventing the attack.

All other traffic handling occurs before network traffic is examined for intrusions. By associating an intrusion policy with an access control rule, you are telling the system that before it passes traffic that matches the access control rule's conditions, you first want to inspect the traffic with an intrusion policy.

You can configure intrusion policies on rules that **allow** traffic only. Inspection is not performed on rules set to **trust** or **block** traffic. In addition, you can configure an intrusion policy as the default action if you do not want to use a simple block.

Besides inspecting traffic that you allow for potential intrusions, you can use the Security Intelligence policy to preemptively block all traffic to or from known bad IP addresses, or to known bad URLs.

This example adds an intrusion policy that allows the internal 192.168.1.0/24 network to go outside, and assumes you already have block rules to selectively eliminate unwanted connections, while also adding a Security Intelligence policy to do pre-emptive blocking.

### Before you begin

You must apply the IPS license to any managed device that uses this rule.

This example assumes you have already created security zones for inside and outside interfaces, and the network object for the inside network.

## Procedure

**Step 1** Create the access control rule that applies the intrusion policy.

- a) While editing the access control policy, click **Add Rule**.
- b) Give the rule a meaningful name, such as `Inside_Outside`, and ensure the rule action is **Allow**.

Name:  Action:  Allow

- c) For **Intrusion Policy**, select **Balanced Security and Connectivity**. You can either accept the default variable set or select your own if you want to customize it.

The **Balanced Security and Connectivity** policy is appropriate for most networks. It provides a good intrusion defense without being overly aggressive, which has the potential of dropping traffic that you might not want to be dropped. If you determine that too much traffic is getting dropped, you can ease up on intrusion inspection by selecting the **Connectivity over Security** policy.

If you need to be aggressive about security, try the **Security over Connectivity** policy. The **Maximum Detection** policy offers even more emphasis on network infrastructure security with the potential for even greater operational impact.

If you create your own custom policy, you can select that one instead.

A discussion of variable sets is beyond the scope of this example. Please read the chapters on intrusion policy for detailed information about variable sets and custom policies.

 Intrusion Policy:      

- d) Select the **Zones** tab, and add your inside security zone to the source criteria, and outside zone to the destination criteria.
- e) Select the **Networks** tab, and add the network object that defines your inside network to the source criteria.

The match criteria should look similar to the following:

Selected Sources: 2		Selected Destinations and Applications: 1	
<i>Collapse All</i>	<i>Remove All</i>	<i>Collapse All</i>	<i>Remove All</i>
<div>ZONE</div> <div>▼ 1 object</div> <div>inside-zone</div>		<div>ZONE</div> <div>▼ 1 object</div> <div>outside-zone</div>	
<div>NET</div> <div>▼ 1 object</div> <div>Inside-Network</div>			

- f) Click **Logging** and enable logging at the beginning or end of the connection, or both, as desired.
- g) Click **Apply** to save the rule, and then **Save** to save the updated policy.
- h) Move the rule to the appropriate location in the access control policy.

## Step 2 Configure the Security Intelligence policy to preemptively drop connections with known bad hosts and sites.

By using Security Intelligence to block connections with hosts or sites that are known to be threats, you save your system the time needed to do deep packet inspection to identify threats in each connection. Security Intelligence provides an early block of undesirable traffic, leaving more system time to handle the traffic you really care about.

- a) While editing the access control policy, click the **Security Intelligence** link in the packet path.  
 The link includes two policies: the DNS policy at the top, and the Security Intelligence (Network and URL) at the bottom. In this example, we are configuring the Network and URL lists. By default, these lists already include the global block and do not block lists, but these lists are empty by default until you add items to them.
- b) With **Networks** selected and the **Any** security zone selected, scroll down in the list until you get to the global lists, and the first Security Intelligence category (probably Attackers). Click Attackers, then scroll to the end of the categories (probably Tor\_exit\_node), and Shift+Click to select all of the categories. Click **Add To Block List**.
- c) Select the **URL** tab, and **Any** security zone, and use Shift+Click to select URL versions of the same categories. Click **Add To Block List**.
- d) Click **Save** to save the policy.
- e) As necessary, you can add network and URL objects to the block or do not block lists.

The **Do Not Block** lists are not real "allow" lists. They are exception lists. If an address or URL in the exception list also appears in the blocked list, the connection for the address or URL is allowed to pass on to the access control policy. This way, you can block a feed, but if you later find that a desirable address or site is being blocked, you can use the exception list to override that block without needing to remove the feed entirely. Keep in mind that these connections are subsequently evaluated by access control, and if configured, an intrusion policy. Thus, if any connections do contain threats, they can be identified and blocked during intrusion inspection.

Use the events and dashboards to determine what traffic is actually being dropped by the policy, and whether you need to add addresses or URLs to the **Do Not Block** lists.

## Step 3 Deploy your changes.

# History for Access Control Rules

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Maximum objects per match criteria per access control rule is 200.	7.3	Any	<p>Previously, you could have a maximum of 50 objects per match criteria in a single access control rule. For example, you could have up to 50 network objects in a single access control rule. The limit is now 200 objects per match criteria in a single rule.</p> <p>We updated the access control policy to allow the increased object limit.</p>
Search for access control rule comments	6.7	Any	<p>The <b>Search Rules</b> bar now offers the option to search for comments.</p> <p>New/modified pages: Access control rules page, <b>Search Rules</b> text entry field.</p> <p>Supported platforms: Firewall Management Center</p>
Copy or move rules between access control and prefilter policies	6.7	Any	<p>You can copy access control rules from one access control policy to another. You can also move access control rules from an access control policy to the associated prefilter policy.</p> <p>New/modified pages: Access control policy page; the right-click menu for the selected rules provides additional options to copy and move.</p> <p>Supported platforms: Firewall Management Center</p>
Bulk edit of certain settings in access control rules	6.6	Any	<p>In the list of rules in a policy, shift-click or control-click to select multiple rules, then right-click and choose an option. Example bulk operations: You can enable or disable the rules, select a rule action, and edit most inspection and logging settings.</p> <p>New/modified pages: Access control rules page.</p> <p>Supported platforms: Firewall Management Center</p>
Enhanced searching on configured rules	6.6	Any	<p>Enhanced searching on configured rules.</p> <p>New/modified pages: Access control rules page.</p> <p>Supported platforms: Firewall Management Center</p>
Time ranges for rule application	6.6	Any	<p>Ability to specify an absolute or recurring time or time range for a rule to be applied. The rule is applied based on the time zone of the device that processes the traffic.</p> <p>New/modified pages:</p> <ul style="list-style-type: none"> <li>• A new option on the access control Add Rule page.</li> <li>• A related new option on the <b>Devices &gt; Platform Settings &gt; Threat Defense</b> page to specify time zones for managed devices.</li> </ul> <p>Supported platforms: Firewall Threat Defense devices only</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
View object details from access control rule pages	pre-6.6	Any	<p>To see information about an object in a list of rules or from the rule configuration dialog, right-click the object.</p> <p>New/modified pages: <b>Policies &gt; Access Control &gt; Access control</b>, and <b>Add Rule</b> page.</p> <p>Supported platforms: Firewall Management Center</p>

## CHAPTER 43

# Cisco Secure Dynamic Attributes Connector

The following topics discuss how to configure and use the Cisco Secure Dynamic Attributes Connector.

- [About the Cisco Secure Dynamic Attributes Connector, on page 1671](#)
- [System Requirements for the Cisco Secure Dynamic Attributes Connector, on page 1674](#)
- [Enable the Cisco Secure Dynamic Attributes Connector, on page 1674](#)

- [Internet Access Requirements, on page 1717](#)
- [History for the Cisco Secure Dynamic Attributes Connector, on page 1718](#)

## About the Cisco Secure Dynamic Attributes Connector

The dynamic attributes connector enables your access control policy to adapt in real time to the changes in public and private cloud workloads and business-critical software-as-a-service (SaaS) applications. It simplifies policy management by keeping rules up to date without tedious manual updates and policy deployment. Customers require policy rules to be defined based on non-network constructs such as VM name or security group, so that firewall policy is persistent even when the IP address or VLAN changes.

### Supported connectors

We currently support:

**Table 93: List of supported connectors by Cisco Secure Dynamic Attributes Connector version and platform**

CSDAC version/platform	AWS	AWS Security Groups	AWS Service Tags	Azure	Azure Service Tags	Cisco APIC	Cisco Cyber Vision	Cisco Multicloud Defense	Generic text	GitHub	Google Cloud	Microsoft Office 365	vCenter	Webex	Zoom
Version 1.1 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	No	No	Yes	Yes	No	No
Version 2.0 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	No	Yes	Yes	Yes	No	No
Version 2.2 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	Yes	Yes	Yes	Yes	No	No
Version 2.3 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	Yes	Yes	Yes	Yes	Yes	Yes

Cloud-delivered (Cisco Defense Orchestrator)	Yes	No	No	Yes	Yes	No	No	Yes	No	Yes	Yes	Yes	No	No	No
Secure Firewall Management Center 7.4.1	Yes	No	No	Yes	Yes	No	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes

## How It Works

This topic discusses the architecture of the Cisco Secure Dynamic Attributes Connector.

The following figure shows how the system functions at a high level.

- The system supports certain public cloud providers.  
This topic discusses supported *connectors* (which are the connections to those providers).
- The dynamic attributes connector is provided with Secure Firewall Management Center.

#### Related topics

- [Enable the Cisco Secure Dynamic Attributes Connector, on page 1674](#)
- [About the Dashboard, on page 1677](#)

## History for the Cisco Secure Dynamic Attributes Connector

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cisco Secure Dynamic Attributes Connector	7.4.0	7.4.0	<p>This feature is introduced.</p> <p>The Cisco Secure Dynamic Attributes Connector is now included in the Secure Firewall Management Center. You can use the dynamic attributes connector to get IP addresses from cloud-based platforms such as Microsoft Azure in access control rules without having to deploy to managed devices.</p> <p>More information:</p> <ul style="list-style-type: none"> <li>• The dynamic attributes connector included with this product: <a href="#">About the Cisco Secure Dynamic Attributes Connector, on page 1671</a></li> <li>• The standalone dynamic attributes connector: <a href="#">Cisco Secure Dynamic Attributes Connector Configuration Guide</a></li> </ul> <p>New/modified screen: <b>Integration &gt; Dynamic Attributes Connector</b></p>

## System Requirements for the Cisco Secure Dynamic Attributes Connector

The Cisco Secure Dynamic Attributes Connector has the following memory requirements:

FMCv: Amount of RAM	Secure Firewall Management Center hardware model	Maximum number of (connectors + Azure AD realms)
At least 32 GB	Firepower 1000, Firepower 1600, vFMC	10
At least 64 GB	Firepower 2500, Firepower 2600, vFMC 300	20
At least 128 GB	Firepower 4500, Firepower 4600	30

The preceding limits apply to both virtual machines and physical machines.

The system prevents you from exceeding these limits to avoid deployment issues.

## Enable the Cisco Secure Dynamic Attributes Connector

This task discusses how to enable the Cisco Secure Dynamic Attributes Connector in the Secure Firewall Management Center. The dynamic attributes connector is an integration that enables objects from cloud networking products to be used in Firewall Management Center access control rules.

## Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Log in to the Secure Firewall Management Center if you have not done so already. |
| <b>Step 2</b> | Click <b>Integration &gt; Dynamic Attributes Connector</b> .                     |
| <b>Step 3</b> | Slide to <b>Enabled</b> .  |
| <b>Step 4</b> | Messages are displayed while the dynamic attributes connector is enabled.        |
- In the event of errors, try again. If errors persist, contact Cisco TAC.
- 

## Configure Networks and Subnets for Docker Containers

The Cisco Secure Dynamic Attributes Connector uses Docker containers to retrieve connector data in the Secure Firewall Management Center. To avoid conflicts with the Secure Firewall Management Center management interface and other IP addresses used in your network, you can optionally use the command discussed in this section to change Docker IP addresses and ranges.

### About Docker networks

The Docker daemon is used by the dynamic attributes connector requires the following networks:

- `docker0` which is used internally by the Docker daemon.
- A series of IPv6 networks named `vethnumber`.  
These are internal bridge networks used by the dynamic attributes connector.
- Docker bridge networks used by dynamic attributes connector connectors named `br-number`.

Before you enable the dynamic attributes connector, there is only one Docker interface, named `docker0`, set to 172.18.0.1/16 (for a Secure Firewall Management Center Virtual; on-premises managers use different IP address ranges). The table in the Examples section provides details.

### Change Docker networks and subnets

First enable the dynamic attributes connector as discussed in [Enable the Cisco Secure Dynamic Attributes Connector, on page 1674](#).

To change Docker networks and subnets, run `/usr/local/sf/bin/change_docker_subnet.sh -b CIDR-network -s address-pool-size` as a user with `root` privileges where:

- `-b CIDR-network` sets a network base address pool in CIDR notation.
- `-s address-pool-size` sets a netmask for the network base address. You can use this option to limit the number of addresses in a base address range in the event the network range overlaps existing network ranges; in particular, we recommend certain `-s` values for Secure Firewall Management Center models to make sure you don't exceed the available RAM in the machine. (Docker containers are used by dynamic attributes connector connectors and those limits are shown in [System Requirements for the Cisco Secure Dynamic Attributes Connector, on page 1674](#).)

**Important** The networks you assign to Docker must be in an internal network range and must *not* conflict with networks used by the Secure Firewall Management Center or by other devices in your internal network.

### Examples

The following table shows examples.

Secure Firewall Management Center model	Recommended -s value	Sample -b value	Cisco Secure Dynamic Attributes Connector container addresses used
Firepower 1000, Firepower 1600, vFMC	27 (netmask 255.255.255.224)	172.19.0.0/16	30 IP addresses  docker0: 172.19.0.1  Bridge networks <i>br-number</i> gateway 172.19.0.33 with subnet 172.19.0.32/27  Connectors created in networks like 172.19.0.38/27, 172.19.0.39/27, and so on
Firepower 2500, Firepower 2600, vFMC 300	26 (netmask 255.255.255.192)	192.168.0.0/16	62 IP addresses  docker0: 192.168.1.1  Bridge networks <i>br-number</i> gateway 192.168.1.65 with subnet 192.168.1.64/26  Connectors created in networks like 192.168.1.71/26, 192.168.1.72/26, and so on
Firepower 4500, Firepower 4600	25 (netmask 255.255.255.128)	192.168.0.0/16	126 IP addresses  docker0: 192.168.1.1  Bridge networks <i>br-number</i> gateway 192.168.1.129 with subnet 192.168.1.128/25  Connectors created in networks like 192.168.1.136/25, 192.168.1.135/25, and so on

For reference, the complete commands follow:

```
sudo /usr/local/sf/bin/change_docker_subnet.sh -b 172.19.0.0/16 -s 27
sudo /usr/local/sf/bin/change_docker_subnet.sh -b 192.168.0.0/16 -s 26
sudo /usr/local/sf/bin/change_docker_subnet.sh -b 192.168.0.0/16 -s 25
```

### Verify the networks

To verify your network settings, enter `sudo docker network inspect muster-net`. The command results are displayed in JSON format.

## Troubleshoot

Following are some solutions to common errors you might encounter using this command.

**Error:** Pull subnet value can not be greater than size

**Solution:** Change the value of `-s` so it is less than the CIDR network value.

For example,

*INCORRECT:* `sudo /usr/local/sf/bin/change_docker_subnet.sh -b 172.19.0.0/16 -s 8`

*CORRECT:* `sudo /usr/local/sf/bin/change_docker_subnet.sh -b 172.19.0.0/16 -s 20`

**Error:** After running the command, the Docker networks are wrong.

**Solution:** Restart the Docker daemon: `sudo systemctl restart docker`

**Error:** Cannot connect to the Docker daemon at unix:///var/run/docker.sock. Is the docker daemon running?

**Solution:** Restart Docker: `systemctl restart docker`

**Error:** Input can't be empty

The `-s` parameter is required.

**Error:** Pull size - 32 - can not be greater than 32 or less than 0

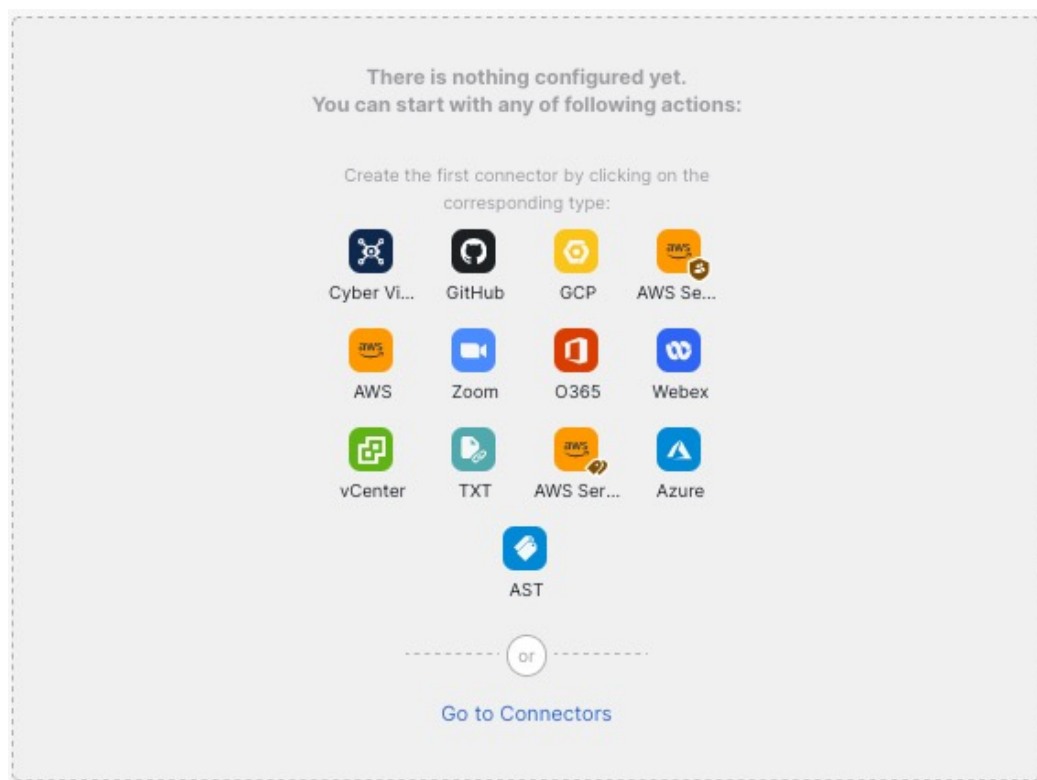

**Solution:** Change the value of `-s` so it is greater than 0 and less than 32.

## About the Dashboard

To access the Cisco Secure Dynamic Attributes Connector Dashboard, log in to the Secure Firewall Manager and click **Integration > Dynamic Attributes Connector** at the top of the page.

If the Cisco Secure Dynamic Attributes Connector is not enabled, move the slider to enable it. This process could take several minutes to complete.

The Cisco Secure Dynamic Attributes Connector Dashboard page displays the status of your connectors, adapters, and filters at a glance. Following is an example of the Dashboard of an unconfigured system:

Among the things you can do with the Dashboard are:

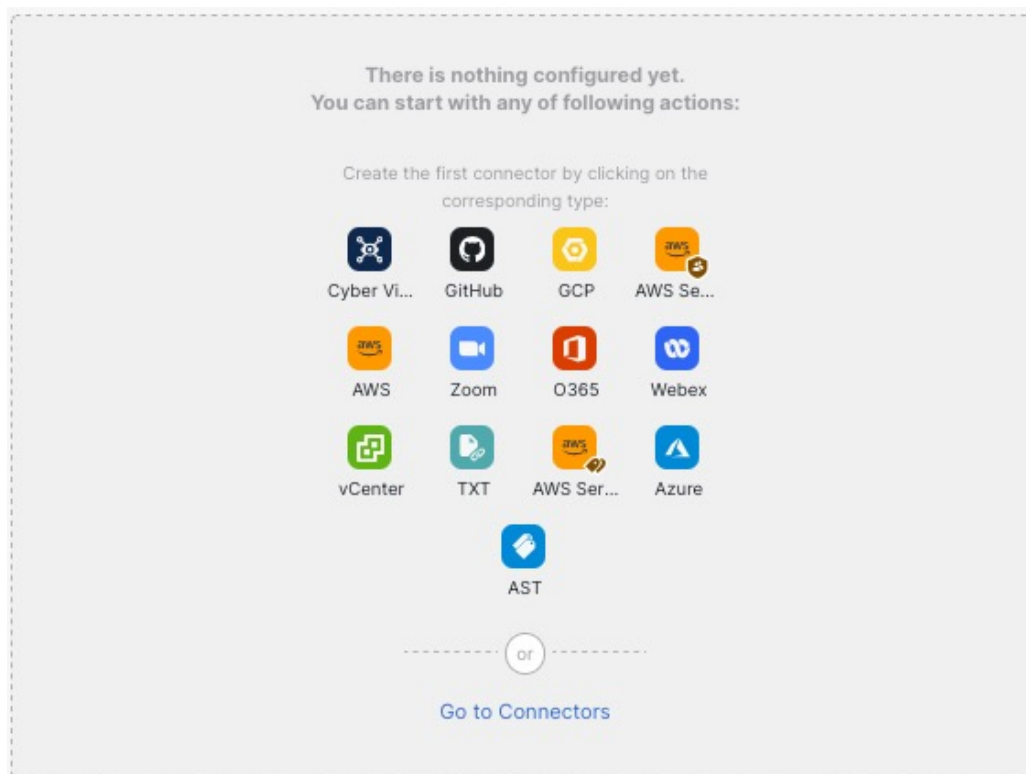

- Add, edit, and delete connectors and dynamic attributes filters.
- See how connectors and dynamic attributes filters are related to each other.
- View warnings and errors.

#### Related Topics

- [Dashboard of an Unconfigured System, on page 1678](#)
- [Dashboard of a Configured System, on page 1679](#)
- [Add, Edit, or Delete Connectors, on page 1681](#)
- [Add, Edit, or Delete Dynamic Attributes Filters, on page 1682](#)

## Dashboard of an Unconfigured System

Sample Cisco Secure Dynamic Attributes Connector Dashboard page of an unconfigured system:

The Dashboard initially displays all the types of connectors you can configure for your system. You can do any of the following:

- Hover the mouse pointer over a connector and click  to create a new one.
- Click **Go to Connectors** to add, edit, or delete connectors (good for creating, editing, or deleting multiple connectors at the same time).

For more information, see [Create a Connector, on page 1684](#).

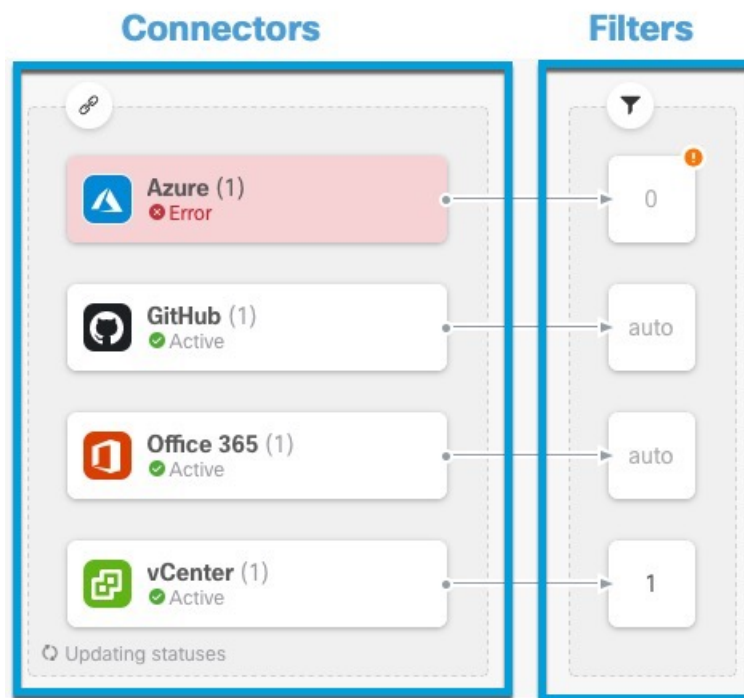

#### Related Topics:

- [Dashboard of a Configured System, on page 1679](#)
- [Add, Edit, or Delete Connectors, on page 1681](#)
- [Add, Edit, or Delete Dynamic Attributes Filters, on page 1682](#)

## Dashboard of a Configured System

Sample Cisco Secure Dynamic Attributes Connector Dashboard page of a configured system:

Click an area in the figure to learn more about it or click one of the links following the figure.

1 [Create a Connector, on page 1684](#)

2 [Create Dynamic Attributes Filters, on page 1702](#)

The Dashboard shows the following (from left to right):

Connectors column	Filters column
<p>List of connectors with a number indicating how many of each type are configured. Connectors collect dynamic attributes that could be sent to the Secure Firewall Manager. Dynamic attributes filters specify what data is sent.</p> <p>Click  to view more information about all configured connectors. You can also click the name of a connector to add, edit, or delete connectors; or to view detailed information about them. For more information, see <a href="#">Add, Edit, or Delete Connectors, on page 1681</a>.</p>	<p>List of dynamic attributes filters associated with each connector with a number indicating how many of each filter are associated with a connector.</p> <p>Click  to view more information about all configured filters. You can also click the name of a filter to add, edit, or delete filters; or to view detailed information about them. For more information, see <a href="#">Add, Edit, or Delete Dynamic Attributes Filters, on page 1682</a>.</p>

**Note** Some connectors, such as Outlook 365 and Azure Service tags, automatically pull available dynamic objects without the need for a dynamic attributes filters. Those connectors display **Auto** in the column.

The Dashboard indicates whether or not an object is available. The Dashboard page is refreshed every 15 seconds but you can click **Refresh** () at the top of the page at any time to refresh immediately. If issues persist, check your network connection.

**Related Topics:**

- [Add, Edit, or Delete Connectors, on page 1681](#)
- [Add, Edit, or Delete Dynamic Attributes Filters, on page 1682](#)

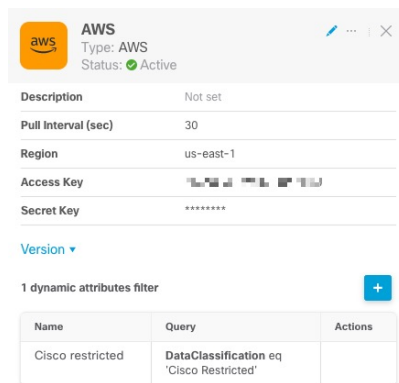

## Add, Edit, or Delete Connectors

The Dashboard enables you to view or edit connectors. You can click the name of a connector to view all

instances of that connector or you can click  for the following additional options:

- **Go to Connectors** to view all connectors at the same time; you can add, edit, and delete connectors from there.
- **Add Connector** > *type* to add a connector of the indicated type.

Click any connector in the connectors column (  ) to display more information about it; an example follows:

Name	Query	Actions
Cisco restricted	DataClassification eq 'Cisco Restricted'	

You have the following options:

- Click the Edit icon (  ) to edit this connector.
- Click the More icon (  ) for additional options.
- Click  to close the panel.
- Click **Version** to display the version of the . You can optionally copy the version to the clipboard if necessary for [Cisco TAC](#).

The table at the bottom of the panel enables you to add dynamic attributes filters; or to edit or dynamic attributes connector delete connectors. A sample follows:

1 dynamic attributes filter

Name	Query	Actions
Cisco restricted	DataClassification eq 'Cisco Restricted'	 

Click the Add icon () to add a dynamic attributes filter for this connector. For more information, see [Create Dynamic Attributes Filters, on page 1702](#).

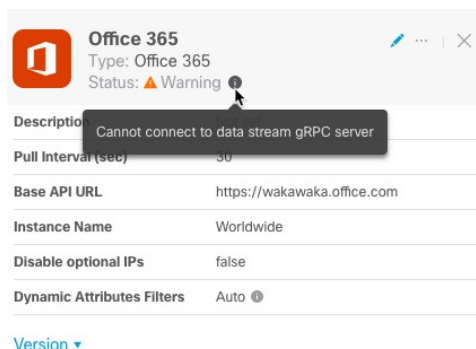

Hover the mouse pointer over the Actions column to either edit or delete the indicated connector.

### View error information

To view error information for a connector:

1. On the Dashboard, click the name of the connector that is displaying the error.
2. In the right pane, click **Information** ()

An example follows.

3. To resolve this issue, edit the connector settings as discussed in [Create an Office 365 Connector, on page 1696](#).
4. If you cannot resolve the issue, click **Version** and copy the version to a text file.
5. Provide all of this information to [Cisco TAC](#).

## Add, Edit, or Delete Dynamic Attributes Filters

The Dashboard enables you to add, edit, or delete dynamic attributes filters. You can click the name of a filter

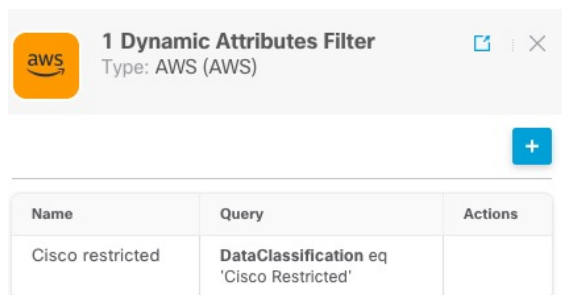

to view all instances of that filter or you can click  for the following additional options:

- **Go to Dynamic Attributes Filters** to view all configured dynamic attributes filters. You can add, edit, or delete dynamic attributes filters from there.
- **Add Dynamic Attributes Filters** to add a filter.

For more information about adding dynamic attributes filters, see [Create Dynamic Attributes Filters, on page 1702](#).

An example follows:

Name	Query	Actions
Cisco restricted	DataClassification eq 'Cisco Restricted'	

**Note** Some connectors, such as Outlook 365 and Azure Service tags, automatically pull available dynamic objects without the need for a dynamic attributes filters. Those connectors display **Auto** in the  column.

You have the following options:

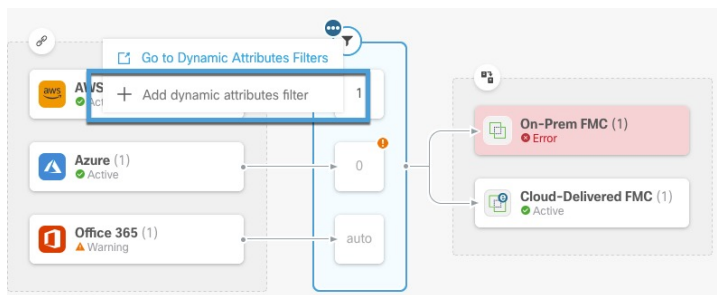

- Click a filter instance to view summary information about dynamic attributes filters associated with a connector.

- Click the Add icon () to add a new dynamic attributes filter.

For more information, see [Create Dynamic Attributes Filters, on page 1702](#).

- Click  in the filters column () indicates the indicated connector has no associated dynamic attributes filters. Without associated filters, the connector can send nothing to Firewall Management Center.

One way to resolve the issue is to click  in the filters column and click **Add Dynamic Attributes Filter**. A sample follows.

- Click  to add, edit, or delete filters.

- Click  to close the panel.

# Create a Connector

A *connector* is an interface with a cloud service. The connector retrieves network information from the cloud service so the network information can be used in policies on the Secure Firewall Management Center.

We support the following:

**Table 94: List of supported connectors by Cisco Secure Dynamic Attributes Connector version and platform**

CSDAC version/platform	AWS	AWS Security Groups	AWS Service Tags	Azure	Azure Service Tags	Cisco APIC	Cisco Cyber Vision	Cisco Multicloud Defense	Generic text	GitHub	Google Cloud	Microsoft Office 365	vCenter	Webex	Zoom
Version 1.1 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	No	No	Yes	Yes	No	No
Version 2.0 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	No	Yes	Yes	Yes	No	No
Version 2.2 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	Yes	Yes	Yes	Yes	No	No
Version 2.3 (on-premises)	Yes	No	No	Yes	Yes	No	No	No	No	Yes	Yes	Yes	Yes	Yes	Yes
Version 3.0 (on-premises)	Yes	Yes	Yes	Yes	Yes	No	Yes	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Version 3.1 (on-premises)	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes
Cloud-delivered (Cisco Defense Orchestrator)	Yes	No	No	Yes	Yes	No	No	Yes	No	Yes	Yes	Yes	No	No	No
Secure Firewall Management Center 7.4.1	Yes	No	No	Yes	Yes	No	No	No	Yes	Yes	Yes	Yes	Yes	Yes	Yes

## Amazon Web Services Connector—About User Permissions and Imported Data

The Cisco Secure Dynamic Attributes Connector imports dynamic attributes from AWS to Secure Firewall Management Center for use in policies.

### Dynamic attributes imported

We import the following dynamic attributes from AWS:

- *Tags*, user-defined key-value pairs you can use to organize your AWS EC2 resources.  
For more information, see [Tag your EC2 Resources](#) in the AWS documentation
- *IP addresses* of virtual machines in AWS.

### Minimum permissions required

The Cisco Secure Dynamic Attributes Connector requires a user at minimum with a policy that permits `ec2:DescribeTags`, `ec2:DescribeVpcs`, and `ec2:DescribeInstances` to be able to import dynamic attributes.

## Create an AWS User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector

This task discusses how to set up a service account with minimum permissions to send dynamic attributes to Secure Firewall Management Center. For a list of these attributes, see [Amazon Web Services Connector—About User Permissions and Imported Data](#), on page 1684.

### Before you begin

You must already have set up your Amazon Web Services (AWS) account. For more information about doing that, see [this article](#) in the AWS documentation.

### Procedure

- Step 1** Log in to the AWS console as a user with the admin role.
  - Step 2** From the Dashboard, click **Security, Identity & Compliance > IAM**.
  - Step 3** Click **Access Management > Users**.
  - Step 4** Click **Add Users**.
  - Step 5** In the **User Name** field, enter a name to identify the user.
  - Step 6** Click **Access Key - Programmatic Access**.
  - Step 7** At the Set permissions page, click **Next** without granting the user access to anything. You can grant user access later.
  - Step 8** Add tags to the user if desired.
  - Step 9** Click **Create User**.
  - Step 10** Click **Download .csv** to download the user's key to your computer.
- Note**  
This is the only opportunity you have to retrieve the user's key.
- Step 11** Click **Close**.
  - Step 12** At the Identity and Access Management (IAM) page in the left column, click **Access Management > Policies**.
  - Step 13** Click **Create Policy**.
  - Step 14** On the Create Policy page, click **JSON**.

#### Add user

1 2 3 4 5

#### Set permissions

 Add user to group

 Copy permissions from existing user

 Attach existing policies directly

Create policy

- Step 15** Enter the following policy in the field:

```
{
  "Version": "2012-10-17",
  "Statement": [
    {
      "Effect": "Allow",
      "Action": [
        "ec2:DescribeTags",
        "ec2:DescribeInstances",
        "ec2:DescribeVpcs"
      ],
      "Resource": "*"
    }
  ]
}
```

- Step 16** Click **Next**.
- Step 17** Click **Review**.
- Step 18** On the Review Policy page, enter the requested information and click **Create Policy**.
- Step 19** On the Policies page, enter all or part of the policy name in the search field and press Enter.
- Step 20** Click the policy you just created.
- Step 21** Click **Actions > Attach**.
- Step 22** If necessary, enter all or part of the user name in the search field and press Enter.
- Step 23** Click **Attach Policy**.

---

### What to do next

[Create an AWS Connector, on page 1686.](#)

## Create an AWS Connector

This task discusses how to configure a connector that sends data from AWS to the Secure Firewall Management Center for use in policies.

### Before you begin

Create a user with at least the privileges discussed in [Create an AWS User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector, on page 1685](#).

### Procedure

---

- Step 1** Log in to the Secure Firewall Management Center.
- Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.
- Step 3** Do any of the following:
- Add a new connector: click Add icon () , then click the name of the connector.
  - Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.
- Step 4** Enter the following information.

Value	Description
Name	(Required.) Enter a name to uniquely identify this connector.
Description	Optional description.
Pull Interval	(Default 30 seconds.) Interval at which IP mappings are retrieved from AWS.
Region	(Required.) Enter your AWS region code.
Access Key	(Required.) Enter your access key.
Secret Key	(Required.) Enter your secret key.

**Step 5** Click **Save**.

**Step 6** Make sure **Ok** is displayed in the Status column.

## Azure Connector—About User Permissions and Imported Data

The Cisco Secure Dynamic Attributes Connector imports dynamic attributes from Azure to Secure Firewall Management Center for use in policies.

### Dynamic attributes imported

We import the following dynamic attributes from Azure:

- *Tags*, key-value pairs associated with resources, resource groups, and subscriptions.  
For more information, see [this page](#) in the Microsoft documentation.
- *IP addresses* of virtual machines in Azure.

### Minimum permissions required

The Cisco Secure Dynamic Attributes Connector requires a user at minimum with the **Reader** permission to be able to import dynamic attributes.

## Create an Azure User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector

This task discusses how to set up a service account with minimum permissions to send dynamic attributes to Secure Firewall Management Center. For a list of these attributes, see [Azure Connector—About User Permissions and Imported Data, on page 1687](#).

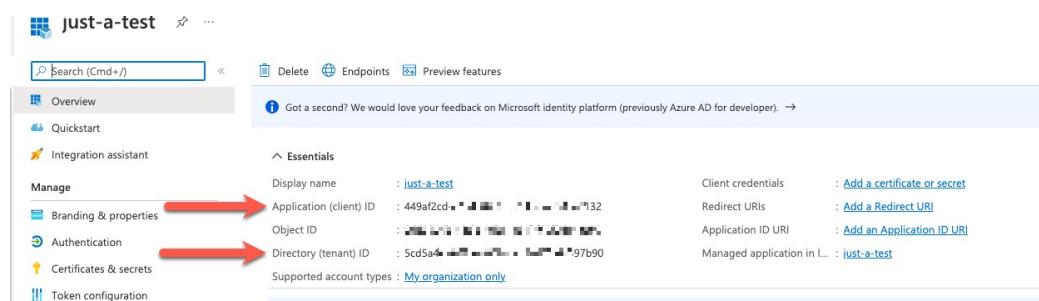

### Before you begin

You must already have a Microsoft Azure account. To set one up, see [this page](#) on the Azure documentation site.

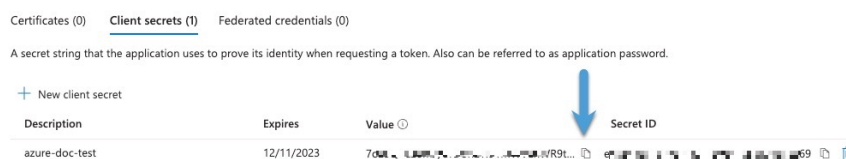

## Procedure

- Step 1** Log in to the [Azure Portal](#) as the owner of the subscription.
- Step 2** Click **Azure Active Directory**.
- Step 3** Find the instance of Azure Active Directory for the application you want to set up.
- Step 4** Click **Add > App registration**.
- Step 5** In the **Name** field, enter a name to identify this application.
- Step 6** Enter other information on this page as required by your organization.
- Step 7** Click **Register**.
- Step 8** On the next page, write down or copy the Client ID (also referred to as *application ID*) and the tenant ID (also referred to as the *directory ID*).

A sample follows.

- Step 9** Next to Client Credentials, click **Add a certificate or secret**.
- Step 10** Click **New Client Secret**.
- Step 11** Enter the requested information and click **Add**.
- Step 12** Copy the value of the **Value** field to the clipboard. This value, *and not the Secret ID*, is the client secret.

- Step 13** Go back to the main Azure Portal page and click **Subscriptions**.
- Step 14** Click the name of your subscription.
- Step 15** Copy the subscription ID to the clipboard.

- Step 16** Click **Access Control (IAM)**.
- Step 17** Click **Add > Add role assignment**.
- Step 18** Click **Reader** and click **Next**.
- Step 19** Click **Select Members**.
- Step 20** On the right side of the page, click the name of the app you registered and click **Select**.

The screenshot shows the 'Add role assignment' page in the Azure portal. The 'Members' tab is selected, showing 'Selected role' as 'Reader' and 'Assign access to' as 'User, group, or service principal'. The 'Members' section is empty, with a '+ Select members' link. A 'Select members' dialog is open on the right, showing a search bar with 'just' entered and a message 'No users, groups, or service principals found.' Below the search bar, a 'Selected members' section shows a card for 'just-a-test' with a 'Remove' link. At the bottom of the dialog, a blue 'Select' button is highlighted with a red box, next to a 'Close' button. The main page has buttons for 'Review + assign', 'Previous', and 'Next' at the bottom.

- Step 21** Click **Review + Assign** and follow the prompts to complete the action.

### What to do next

See [Create an Azure Connector](#), on page 1689.

## Create an Azure Connector

This task discusses how to create a connector to send data from Azure to Secure Firewall Management Center for use in policies.

### Before you begin

Create an Azure user with at least the privileges discussed in [Create an Azure User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector](#), on page 1687.

### Procedure

- Step 1** Log in to the Secure Firewall Management Center.
- Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.
- Step 3** Do any of the following:
- Add a new connector: click Add icon (  ), then click the name of the connector.
  - Edit or delete a connector: Click **More** (  ), then click **Edit** or **Delete** at the end of the row.

- Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from Azure.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>Subscription Id</b>	(Required.) Enter your Azure subscription ID.
<b>Tenant Id</b>	(Required.) Enter your tenant ID.
<b>Client Id</b>	(Required.) Enter your client ID.
<b>Client Secret</b>	(Required.) Enter your client secret.

- Step 5** Click **Save**.
- Step 6** Make sure **Ok** is displayed in the Status column.

## Create an Azure Service Tags Connector

This topic discusses how to create a connector for Azure service tags to the Secure Firewall Management Center for use in policies. The IP addresses associated with these tags are updated every week by Microsoft.

For more information, see [Virtual network service tags on Microsoft TechNet](#).

## Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration** > **Dynamic Attributes Connector** > **Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon (  ), then click the name of the connector.
- Edit or delete a connector: Click **More** (  ), then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from Azure. The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>Subscription Id</b>	(Required.) Enter your Azure subscription ID.
<b>Tenant Id</b>	(Required.) Enter your tenant ID.
<b>Client Id</b>	(Required.) Enter your client ID.
<b>Client Secret</b>	(Required.) Enter your client secret.

**Step 5** Click **Save**.

**Step 6** Make sure **Ok** is displayed in the Status column.

## Create a Generic Text Connector

This task discusses how to create an ad hoc list of IP addresses you maintain manually and retrieve at an interval you select (30 seconds by default). You can update the list of addresses anytime you want.

### Before you begin

Create text files with IP addresses and put it on a web server that is accessible from the Secure Firewall Management Center . IP addresses can include CIDR notation. The text file must have only one IP address per line.

For example, you might have a list of IP addresses for an "allow list" in access control rules and another list of IP addresses for a "block list" in access control rules.

You can specify up to 10,000 IP addresses per text file.

**Note** Do not include a scheme (**http://** or **https://**) in your IP addresses.

## Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon () , then click the name of the connector.
- Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information:

Item	Description
<b>Name</b>	Enter a name to identify the connector.
<b>Description</b>	(Optional.) Enter a description
<b>Pull Interval</b>	Change the frequency, in seconds, at which the dynamic attributes connector retrieves IP addresses from the text file. The default is 30 seconds.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>URLs</b>	Enter each URL from which to retrieve IP addresses, one URL per line.
<b>Add another URL</b>	(Optional.) Click the link to add more URLs to an existing list.
<b>Certificate</b>	(Optional.) If a certificate chain is required for a secure connection to the web server, you have the following options: <ul style="list-style-type: none"> <li>• Click <b>Get Certificate &gt; Fetch</b> to automatically fetch the certificate or, if that is not possible, get the certificate manually as discussed in <a href="#">Manually Get a Certificate Authority (CA) Chain, on page 1705</a>.</li> <li>• Click <b>Get Certificate &gt; Browse from file</b> to upload a certificate chain you downloaded previously.</li> </ul>

**Step 5** Click **Test** and make sure the test succeeds before you save the connector.

**Step 6** Click **Save**.

**Step 7** Make sure **Ok** is displayed in the Status column.

## Create a GitHub Connector

This section discusses how to create a GitHub connector that sends data to the Secure Firewall Management Center for use in policies. The IP addresses associated with these tags are maintained by GitHub. You do not have to create a dynamic attributes filters.

For more information, see [About GitHub's IP addresses](#).

**Note** Do not change the URL because doing so will fail to retrieve any IP addresses.

### Procedure

- Step 1** Log in to the Secure Firewall Management Center.
- Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.
- Step 3** Do any of the following:
  - Add a new connector: click Add icon (  ), then click the name of the connector.
  - Edit or delete a connector: Click **More** (  ), then click **Edit** or **Delete** at the end of the row.
- Step 4** Enter a **Name** and an optional description.
- Step 5** (Optional.) In the **Pull Interval** field, change the frequency, in seconds, at which the dynamic attributes connector retrieves IP addresses from GitHub. The default is 21,600 seconds (6 hours).
- Step 6** Click **Save**.
- Step 7** Make sure **Ok** is displayed in the Status column.

## Google Cloud Connector—About User Permissions and Imported Data

The Cisco Secure Dynamic Attributes Connector imports dynamic attributes from Google Cloud to Secure Firewall Management Center for use in policies.

### Dynamic attributes imported

We import the following dynamic attributes from Google Cloud:

- *Labels*, key-value pairs you can use to organize your Google Cloud resources.  
For more information, see [Creating and Managing Labels](#) in the Google Cloud documentation.
- *Network tags*, key-value pairs associated with an organization, folder, or project.  
For more information, see [Creating and Managing Tags](#) in the Google Cloud documentation.

- *IP addresses* of virtual machines in Google Cloud.

### Minimum permissions required

The Cisco Secure Dynamic Attributes Connector requires a user at minimum with the **Basic > Viewer** permission to be able to import dynamic attributes.

## Create a Google Cloud User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector

This task discusses how to set up a service account with minimum permissions to send dynamic attributes to Secure Firewall Management Center. For a list of these attributes, see [Google Cloud Connector—About User Permissions and Imported Data, on page 1693](#).

### Before you begin

You must already have set up your Google Cloud account. For more information about doing that, see [Setting Up Your Environment](#) in the Google Cloud documentation.

### Procedure

- 
- Step 1** Log in to your Google Cloud account as a user with the owner role.
- Step 2** Click **IAM & Admin > Service Accounts > Create Service Account**.
- Step 3** Enter the following information:
- **Service account name:** A name to identify this account; for example, **CSDAC**.
  - **Service account ID:** Should be populated with a unique value after you enter the service account name.
  - **Service account description:** Enter an optional description.
- For more information about service accounts, see [Understanding Service Accounts](#) in the Google Cloud documentation.
- Step 4** Click **Create and Continue**.
- Step 5** Follow the prompts on your screen until the Grant users access to this service account section is displayed.
- Step 6** Grant the user the **Basic > Viewer** role.
- Step 7** Click **Done**.
- A list of service accounts is displayed.
- Step 8** Click **More** (⋮) at the end of the row of the service account you created.
- Step 9** Click **Manage Keys**.
- Step 10** Click **Add Key > Create New Key**.

**Step 11** Click **JSON**.

**Step 12** Click **Create**.

The JSON key is downloaded to your computer.

**Step 13** Keep the key handy when you configure the GCP connector.

### What to do next

See [Create a Google Cloud Connector](#), on page 1695.

## Create a Google Cloud Connector

### Before you begin

Have your Google Cloud JSON-formatted service account data ready; it's required to set up the connector.

### Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration** > **Dynamic Attributes Connector** > **Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon (  ), then click the name of the connector.
- Edit or delete a connector: Click **More** (  ), then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.

Value	Description
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from AWS.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>GCP region</b>	(Required.) Enter the GCP region in which your Google Cloud is located. For more information, see <a href="#">Regions and Zones</a> in the Google Cloud documentation.
<b>Service account</b>	Paste the JSON code for your Google Cloud service account.

**Step 5** Click **Save**.

**Step 6** Make sure **Ok** is displayed in the Status column.

## Create an Office 365 Connector

This task discusses how to create a connector for Office 365 tags to send data to the Secure Firewall Management Center for use in policies. The IP addresses associated with these tags are updated every week by Microsoft. You do not have to create a dynamic attributes filter to use the data.

For more information, see [Office 365 URLs and IP address ranges](#) on docs.microsoft.com.

### Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon () , then click the name of the connector.
- Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from Azure.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.

Value	Description
Base API URL	(Required.) Enter the URL from which to retrieve Office 365 information, if it's different from the default. For more information, see <a href="#">Office 365 IP Address and URL web service</a> on the Microsoft documentation site.
Instance name	(Required.) From the list, click an instance name. For more information, see <a href="#">Office 365 IP Address and URL web service</a> on the Microsoft documentation site.
Disable optional IPs	(Required.) Enter <b>true</b> or <b>false</b> .

**Step 5** Click **Save**.

**Step 6** Make sure **Ok** is displayed in the Status column.

## vCenter Connector—About User Permissions and Imported Data

The Cisco Secure Dynamic Attributes Connector imports dynamic attributes from vCenter to Secure Firewall Management Center for use in policies.

### Dynamic attributes imported

We import the following dynamic attributes from vCenter:

- *Operating system*
- *MAC address*
- *IP addresses*
- *NSX tags*

### Minimum permissions required

The Cisco Secure Dynamic Attributes Connector requires a user at minimum with the **Read Only** permission to be able to import dynamic attributes.

## Create a vCenter User with Minimal Permissions for the Cisco Secure Dynamic Attributes Connector

This task discusses how to set up a service account with minimum permissions to send dynamic attributes to Secure Firewall Management Center. For a list of these attributes, see [vCenter Connector—About User Permissions and Imported Data](#), on page 1697.

### Before you begin

You must already have set up your vCenter Server account. For more information about doing that, see [About vCenter Server Installation and Setup](#) in the vCenter documentation.

## Procedure

- Step 1** Log into vCenter as an administrator.
- Step 2** Click **Menu > Administration**.
- Step 3** In the left pane, click **Single Sign On > Users and Groups**.
- Step 4** From the **Domain** list, click the name of a domain to add the user.
- Step 5** Click **Add User**.
- Step 6** Enter the requested information and click **Add**.
- Step 7** In the left pane, click **Access Control > Global Permissions**.
- Step 8** Click **Add**(+).
- Step 9** From the **User** field, click the name of the vCenter domain in which you created the user.
- Step 10** In the search field, enter part of the user's name.
- Step 11** From the **Role** list, click **Read-only**.
- Step 12** Select the **Propagate to children** check box.

Add Permission | Global Permission Root

User vsphere.local

Q just-a-test

Role Read-only

☒ Propagate to children

CANCEL OK

- Step 13** Click **OK**.

## What to do next

See [Create a vCenter Connector, on page 1698](#).

## Create a vCenter Connector

This task discusses how to create a connector for VMware vCenter to send data to the Secure Firewall Management Center for use in policies.

### Before you begin

If you use non-trusted certificates to communicate with vCenter, see [Manually Get a Certificate Authority \(CA\) Chain, on page 1705](#).

## Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration** > **Dynamic Attributes Connector** > **Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon () , then click the name of the connector.
- Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Enter an optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from vCenter.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>Host</b>	(Required.) Enter any of the following: <ul style="list-style-type: none"> <li>• vCenter's fully qualified host name</li> <li>• vCenter's IP address</li> <li>• (Optional.) A port</li> </ul> <p><i>Do not</i> enter a scheme (such as <b>https://</b>) or trailing slash. For example, <b>myvcenter.example.com</b> or <b>192.0.2.100:9090</b></p>
<b>User</b>	(Required.) Enter the user name of a user with the Read-only role at minimum. User names are case-sensitive.
<b>Password</b>	(Required.) Enter the user's password.
<b>NSX IP</b>	If you use vCenter Network Security Visualization (NSX), enter its IP address.
<b>NSX User</b>	Enter the user name of an NSX user with the Auditor role at minimum.
<b>NSX Type</b>	Enter <b>NSX-T</b> .
<b>NSX Password</b>	Enter the NSX user's password.

Value	Description
<b>vCenter Certificate</b>	<p>You have the following options:</p> <ul style="list-style-type: none"> <li>• Paste the certificate authority (CA) chain you got as discussed in <a href="#">Manually Get a Certificate Authority (CA) Chain, on page 1705</a>.</li> <li>• Click <b>Fetch</b> to automatically fetch the certificate or, if that is not possible, get the certificate manually as discussed in <a href="#">Manually Get a Certificate Authority (CA) Chain, on page 1705</a>.</li> <li>• Click <b>Get Certificate</b> &gt; <b>Fetch</b> to automatically fetch the certificate or, if that is not possible, get the certificate manually as discussed in <a href="#">Manually Get a Certificate Authority (CA) Chain, on page 1705</a>.</li> <li>• Click <b>Get Certificate</b> &gt; <b>Browse from file</b> to upload a certificate chain you downloaded previously.</li> </ul>

Following is an example of successfully fetching a certificate chain:

**Add FMC Adapter**

**Name\*** Certificate chain was successfully fetched. Here are certificate details (priority order descending):

**Description** > firepower - 1 certificate

**Domain** > firepower - 1 certificate

**IP\***

**Port\***

**User\***

**Password\***

**Secondary IP**

**Secondary Port**

**Secondary User**

**Secondary Password**

**FMC Server Certificate\*** Updated 3IN CERTIFICATE-----

Expanding the certificate CA chain at the top of the dialog box displays the certificates similar to the following.

Certificate chain was successfully fetched. Here are certificate details (priority order descending):

> firepower - 1 certificate

> firepower - 1 certificate

If it's not possible to fetch the certificate this way, you can get the certificate chain manually as discussed in [Manually Get a Certificate Authority \(CA\) Chain, on page 1705](#).

**Step 5** Click **Save**.

---

## Create a Webex Connector

This section discusses how to create a Webex connector that sends data to the Secure Firewall Management Center for use in policies. The IP addresses associated with these tags are maintained by Webex. You do not have to create a dynamic attributes filters.

For more information, see [Port Reference for Webex Calling](#).

### Procedure

---

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon () , then click the name of the connector.
- Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from Webex.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>Provider Reserved IPs</b>	(Required.) (Required.) Slide to enabled to retrieve any reserved IP addresses.

**Step 5** Click **Test** and make sure the test succeeds before you save the connector.

**Step 6** Click **Save**.

**Step 7** Make sure **Ok** is displayed in the Status column.

---

## Create a Zoom Connector

This section discusses how to create a Zoom connector that sends data to the Secure Firewall Management Center for use in policies. The IP addresses associated with these tags are maintained by Zoom. You do not have to create a dynamic attributes filters.

For more information, see [Zoom network firewall or proxy server settings](#).

### Procedure

**Step 1** Log in to the Secure Firewall Management Center.

**Step 2** Click **Integration > Dynamic Attributes Connector > Connectors**.

**Step 3** Do any of the following:

- Add a new connector: click Add icon () , then click the name of the connector.
- Edit or delete a connector: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Value	Description
<b>Name</b>	(Required.) Enter a name to uniquely identify this connector.
<b>Description</b>	Optional description.
<b>Pull Interval</b>	(Default 30 seconds.) Interval at which IP mappings are retrieved from Zoom.  The minimum value for <b>Pull Interval</b> is 1 second. You can set the maximum to any value you want. We recommend against setting the minimum to a low value because it can generate a lot of traffic, and, when applicable, can result in your being billed for the traffic.
<b>Provider Reserved IPs</b>	(Required.) Slide to enabled to retrieve any reserved IP addresses.

**Step 5** Click **Test** and make sure the test succeeds before you save the connector.

**Step 6** Click **Save**.

**Step 7** Make sure **Ok** is displayed in the Status column.

## Create Dynamic Attributes Filters

Dynamic attributes filters that you define using the Cisco Secure Dynamic Attributes Connector are exposed in the Secure Firewall Management Center as dynamic objects that can be used in access control policies. For example, restrict access to an AWS server for the Finance Department to only members of the Finance group defined in Microsoft Active Directory.

**Note** You cannot create dynamic attributes filters for Generic Text, Office 365, Azure Service Tags, Webex, or Zoom. These types of cloud objects provide their own IP addresses.

For more information about access control rules, see [Create Access Control Rules Using Dynamic Attributes Filters, on page 1709](#).

### Before you begin

[Create a Connector, on page 1684](#)

### Procedure

**Step 1** Log in to Secure Firewall Management Center.

**Step 2** Click **Integration > Dynamic Attributes Connector**.

**Step 3** Click **Dynamic Attributes Filters**.

- Add a new filter: click **Add** (.
- Edit or delete a filter: Click **More** () , then click **Edit** or **Delete** at the end of the row.

**Step 4** Enter the following information.

Item	Description
Name	Unique name to identify the dynamic filter (as a dynamic object) in a policy and in the Secure Firewall Management Center Object Manager ( <b>External Attributes &gt; Dynamic Object</b> ).
Connector	From the list, click the name of a connector to use.
Query	Click Add  .

**Step 5** To add or edit a query, enter the following information.

Item	Description
Key	Click a key from the list. Keys are fetched from the connector.
Operation	Click one of the following: <ul style="list-style-type: none"> <li>• <b>Equals</b> to exactly match the key to the value.</li> <li>• <b>Contains</b> to match the key to the value if any part of the value matches.</li> </ul>

Item	Description
Values	Click either <b>Any</b> or <b>All</b> and click one or more values from the list. Click <b>Add another value</b> to add values to your query.

**Step 6** Click **Show Preview** to display a list of networks or IP addresses returned by your query.

**Step 7** When you're finished, click **Save**.

**Step 8** (Optional.) Verify the dynamic object in the Secure Firewall Management Center .

- Log in to the Secure Firewall Management Center as a user with the Network Admin role at minimum.
- Click **Objects > Object Management**.
- In the left pane, click **External Attributes > Dynamic Object**.

The dynamic attribute query you created should be displayed as a dynamic object.

## Dynamic Attribute Filter Examples

This topic provides some examples of setting up dynamic attribute filters.

### Examples: vCenter

The following example shows one criterion: a VLAN.

Edit Dynamic Attribute Filter

Name\*  Connector\*

Query\* +

Type	Op.	Value
<input type="radio"/> all network	eq	<input type="radio"/> any myVLAN

[Show Preview](#) Cancel Save

The following example shows three criteria that are joined with OR: the query matches any of three hosts.

Add Dynamic Attribute Filter

Name\*  Connector\*

Query\* +

Type	Op.	Value
<input type="radio"/> all host	eq	<input type="radio"/> any host-2868
		host-2869
		host-3780

[Show Preview](#) Cancel Save

**Example: Azure**

The following example shows one criterion: a server tagged as a Finance app.

Add Dynamic Attribute Filter

Name*		Connector*	
Azure Finance		Azure	
Query*			
Type	Op.	Value	
all Finance	eq	any App	

> Show Preview

Cancel Save

**Example: AWS**

The following example shows one criterion: a FinanceApp with a value of 1.

Add Dynamic Attribute Filter

Name*		Connector*	
AWS		AWS	
Query*			
Type	Op.	Value	
all FinanceApp	eq	any 1	

> Show Preview

Cancel Save

## Manually Get a Certificate Authority (CA) Chain

In the event you cannot automatically fetch the certificate authority chain, use one of the following browser-specific procedures to get a certificate chain used to connect securely to vCenter or Firewall Management Center.

The *certificate chain* is the root certificate and all subordinate certificates.

You can optionally use one of these procedures to connect to the following:

- vCenter or NSX
- Firewall Management Center

**Get a Certificate Chain—Mac (Chrome and Firefox)**

Use this procedure to get a certificate chain using the Chrome and Firefox browsers on Mac OS.

1. Open a Terminal window.
2. Enter the following command.

```
security verify-cert -P url[:port]
```

where *url* is the URL (including scheme) to vCenter or Firewall Management Center. For example:

```
security verify-cert -P https://myvcenter.example.com
```

If you access vCenter or Firewall Management Center using NAT or PAT, you can add a port as follows:

```
security verify-cert -P https://myvcenter.example.com:12345
```

3. Save the entire certificate chain to a plaintext file.
  - *Include* all -----BEGIN CERTIFICATE----- and -----END CERTIFICATE----- delimiters.
  - *Exclude* any extraneous text (for example, the name of the certificate and any text contained in angle brackets (< and >)) as well as the angle brackets themselves.
4. Repeat these tasks for vCenter Firewall Management Center.

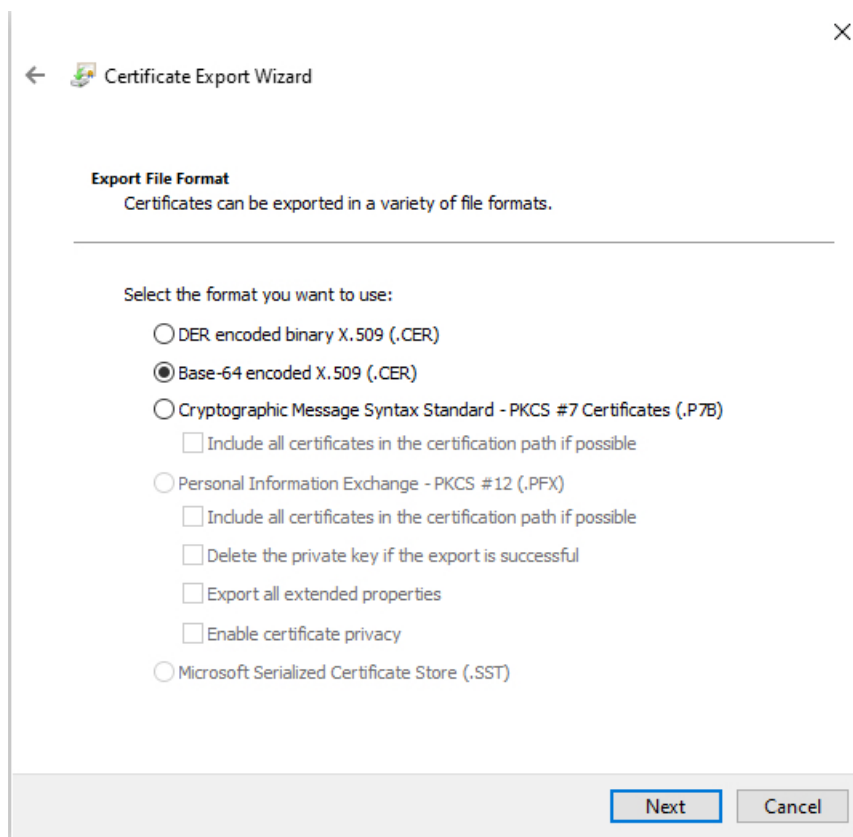

### Get a Certificate Chain—Windows Chrome

Use this procedure to get a certificate chain using the Chrome browser on Windows.

1. Log in to vCenter or Firewall Management Center using Chrome.
2. In the browser address bar, click the lock to the left of the host name.
3. Click **Certificate**.
4. Click the **Certification Path** tab.
5. Click the top (that is, first) certificate in the chain.
6. Click **View Certificate**.
7. Click the **Details** tab.
8. Click **Copy to File**.
9. Follow the prompts to create a CER-formatted certificate file that includes the entire certificate chain.

When you're prompted to choose an export file format, click **Base 64-Encoded X.509 (.CER)** as the following figure shows.

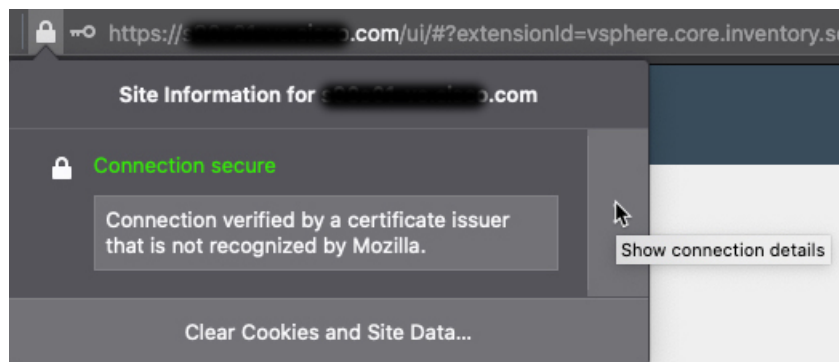

10. Follow the prompts to complete the export.
11. Open the certificate in a text editor.
12. Repeat the process for all certificates in the chain.  
You must paste each certificate in the text editor in order, first to last.
13. Repeat these tasks for vCenter or Firewall Management Center.

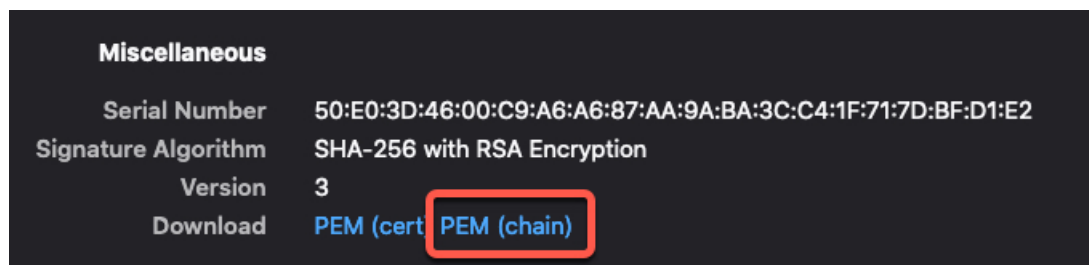

#### Get a Certificate Chain—Windows Firefox

Use the following procedure to get a certificate chain for the Firefox browser on either Windows or Mac OS.

1. Log in to vCenter or Firewall Management Center. using Firefox.
2. Click the lock to the left of the host name.
3. Click the right arrow (**Show connection details**). The following figure shows an example.

4. Click **More Information**.
5. Click **View Certificate**.
6. If the resulting dialog box has tab pages, click the tab page corresponding to the top-level CA.
7. Scroll to the Miscellaneous section.
8. Click **PEM (chain)** in the Download row. The following figure shows an example.

9. Save the file.
10. Repeat these tasks for vCenter or Firewall Management Center.

## Use Dynamic Objects in Access Control Policies

The dynamic attributes connector enables you to configure dynamic filters, seen in the Secure Firewall Management Center as dynamic objects, in access control rules.

### About Dynamic Objects in Access Control Rules

A *dynamic object* is automatically pushed from the dynamic attributes connector to the Secure Firewall Manager after you create connectors and save a dynamic attributes filter on the connector.

You can use these dynamic objects on the access control rule's **Dynamic Attributes** tab page, similarly to the way you used Security Group Tags (SGTs). You can add dynamic objects as source or destination attributes; for example, in an access control block rule, you can add a Finance dynamic object as a destination attribute to block access to Finance servers by whatever objects match the other criteria in the rule.

---

**Note** You cannot create dynamic attributes filters for Generic Text, Office 365, Azure Service Tags, Webex, or Zoom. These types of cloud objects provide their own IP addresses.

---

## Dynamic Attributes Rule Conditions

Dynamic attributes include the following:

- (Source or destination.) Dynamic objects (such as from the Cisco Secure Dynamic Attributes Connector)

The dynamic attributes connector enables you to collect data (such as networks and IP addresses) from cloud providers and send it to the Secure Firewall Management Center so it can be used in access control rules.

For more information about the dynamic attributes connector, see [About the Cisco Secure Dynamic Attributes Connector, on page 1671](#).

- (Source only.) Location IP objects, defined by Cisco ISE
- (Source only.) Device type objects, defined by Cisco ISE (also referred to as endpoint profile objects)

Dynamic attributes can be used as source criteria and destination criteria in access control rules. Use the following guidelines:

- Objects of different types are ANDd together
- Objects of a similar type are ORd together

For example, if you choose source destination criteria SGT 1, SGT 2, and device type 1; the rule is matched if device type 1 is detected on either SGT 1 or SGT 2. As another example, if you select both a security group tag, and a dynamic object that lists IP addresses, the rule matches if traffic with the tag originates from (or is destined to) one of those IP addresses.

## Create Access Control Rules Using Dynamic Attributes Filters

This topic discusses how to create access control rules using dynamic objects (these dynamic objects are named after the dynamic attributes filters you created previously).

### Before you begin

Create dynamic attributes filters as discussed in [Create Dynamic Attributes Filters, on page 1702](#).

---

**Note** You cannot create dynamic attributes filters for Generic Text, Office 365, Azure Service Tags, Webex, or Zoom. These types of cloud objects provide their own IP addresses.

---

## Procedure

- Step 1** Log in to the Secure Firewall Management Center
- Step 2** Click **Policies > Access Control heading > Access Control**.
- Step 3** Click **Edit** (✎) next to an access control policy.
- Step 4** Click **Add Rule**.
- Step 5** Click the **Dynamic Attributes** tab.
- Step 6** In the Available Attributes section, from the list, click **Dynamic Objects**.

The following figure shows an example.

The screenshot shows the 'Add Rule' configuration page. At the top, there are fields for 'Name', 'Enabled' (checked), 'Insert' (set to 'into Mandatory'), 'Action' (set to 'Allow'), and 'Time Range' (set to 'None'). Below these are tabs for 'Zones', 'Networks', 'VLAN Tags', 'Users', 'Applications', 'Ports', 'URLs', 'Dynamic Attributes' (selected), 'Inspection', 'Logging', and 'Comments'. The 'Dynamic Attributes' tab is active, showing a search bar and a list of 'Available Attributes'. The list includes 'Dynamic Objects' and 'FinanceNetwork'. There are 'Add to Source' and 'Add to Destination' buttons next to the list. Below the list are two empty boxes for 'Selected Source Attributes (0)' and 'Selected Destination Attributes (0)'. At the bottom right, there are 'Cancel' and 'Add' buttons.

The preceding example shows a dynamic object named `APIC Dynamic Attribute` that corresponds to the dynamic attribute filter created in the Cisco Secure Dynamic Attributes Connector.

- Step 7** Add the desired object to source or destination attributes.
- Step 8** Add other conditions to the rule if desired.

## What to do next

See [Dynamic Attributes Rule Conditions](#), on page 1709.

# Disable the Cisco Secure Dynamic Attributes Connector

If you no longer wish to collect dynamic objects from cloud sources, you can disable the Cisco Secure Dynamic Attributes Connector in the Secure Firewall Management Center as discussed in the following task.

## Procedure

- Step 1** Log in to the Secure Firewall Management Center if you have not done so already.
- Step 2** Click **Integration > Dynamic Attributes Connector**.
- Step 3** Slide to **Disabled**.

# Troubleshoot Using the Command Line

To assist you with advanced troubleshooting and working with Cisco TAC, we provide the following troubleshooting tools. To use these tools, log in as any user to the Ubuntu host on which the dynamic attributes connector is running.

## Check container status

To check the status of the dynamic attributes connector Docker containers, enter the following commands:

```
cd /usr/local/sf/csdac
sudo ./muster-cli status
```

Sample output follows:

```
===== CORE SERVICES =====
=====
```

Name	Command	State	Ports
muster-bee	/bin/sh -c /app/bee	Up	
127.0.0.1:15050->50050/tcp	50443/tcp		
muster-envoy	/docker-entrypoint.sh runs ...	Up	127.0.0.1:6443->8443/tcp
muster-local-fmc-adapter	./docker-entrypoint.sh run ...	Up	
muster-ui-backend	./docker-entrypoint.sh run ...	Up	50031/tcp
muster-user-analysis	./docker-entrypoint.sh run ...	Up	50070/tcp

```
===== CONNECTORS AND ADAPTERS =====
=====
```

Name	Command	State	Ports
muster-connector-o365.1.muster	./docker-entrypoint.sh run ...	Up	50070/tcp

## Stop, start, or restart the Cisco Secure Dynamic Attributes Connector Docker containers

If the `./muster-cli status` indicates containers are down or to restart containers in the event of issues, you can enter the following commands:

Stop and restart:

```
cd ~/csdac/app
sudo ./muster-cli stop
sudo ./muster-cli start
```

Start only:

```
cd ~/csdac/app
sudo ./muster-cli start
```

### Enable application debug logging and generate troubleshoot files

If advised to do so by Cisco TAC, enable debug logging and generate troubleshoot files as follows:

```
cd ~/csdac/app
sudo ./muster-cli debug-on
sudo ./muster-cli ts-gen
```

The troubleshoot file name is **ts-bundle-timestamp.tar** and is created in the same directory.

The following table shows the location of troubleshoot files and logs in the troubleshoot file.

Location	What it contains
<b>/csdac/app/ts-bundle-timestamp/info</b>	etcd database contents
<b>/csdac/app/ts-bundle-timestamp/logs</b>	Container log files
<b>/csdac/app/ts-bundle-timestamp/status.log</b>	Container status, versions, and image status

### Enable debugging for a container

You can optionally enable debugging for individual containers if you first get the name of the container as follows:

```
cd /usr/local/sf/csdac
sudo ./muster-cli versions
```

Sample output follows:

```
CSDAC version: 1.0.0
CONTAINERS VERSIONS
CONTAINER | APP VERSION | COMMIT
=====
```

muster-bee	fmc7.4-13	
944d50c6c384567693d6ecc5a31420de57f6ce2f		
muster-envoy	fmc7.4-25	
5e5f6d83164a4acbef5b106aa39e2e3f68fa738f		
muster-local-fmc-adapter	fmc7.4-17	
c5902f818baa8e27d7c0b8027490dcacc28c0168		
muster-ui-backend	fmc7.4-64	
165a1f5f0d763aa75829a30b5ffbddf0012682b6		
muster-user-analysis	fmc7.4-43	
63cd64e29a92599908c3eb684d91e9f685d8c740		
muster-connector-o365.1.muster	fmc7.4-8	
28f075d315c8867f667b828970c9fbad35fa89cc		

To enable debugging for the Office 365 connector, for example, enter the following command.

```
sudo ./muster-cli container-debug-on muster-connector-o365.1.muster
```

To disable debugging for that connector, enter the following command.

```
sudo ./muster-cli container-debug-off muster-connector-o365.1.muster
```

### Verify dynamic objects on the Secure Firewall Management Center

To verify your connectors are creating objects on the Secure Firewall Management Center, you can use the following command on the Secure Firewall Management Center as an administrator:

```
sudo tail -f /var/opt/CSCOpX/MDC/log/operation/usmsharedsvcs.log
```

**Example:** Successful object creation

```

## Troubleshoot Using the Firewall Management Center

This task discusses how to generate troubleshoot files for the Secure Firewall Management Center.

**Before you begin**

For complete details about troubleshooting, see the troubleshooting chapter in the [Cisco Secure Firewall Management Center Administration Guide](#).

**Procedure**

- 
- Step 1** Log in to the Secure Firewall Management Center.
  - Step 2** Click **System** (⚙️) > **Health** > **Monitor**.
  - Step 3** In the left pane, click **Firewall Management Center**.
  - Step 4** At the top, click **System & Troubleshooting Details**.
  - Step 5** Click **Generate Troubleshooting Files**.
  - Step 6** Provide the files to Cisco TAC or to your Beta coordinator.
- 

## Manually Get a Certificate Authority (CA) Chain

In the event you cannot automatically fetch the certificate authority chain, use one of the following browser-specific procedures to get a certificate chain used to connect securely to vCenter or Firewall Management Center.

The *certificate chain* is the root certificate and all subordinate certificates.

You can optionally use one of these procedures to connect to the following:

- vCenter or NSX
- Firewall Management Center

### Get a Certificate Chain—Mac (Chrome and Firefox)

Use this procedure to get a certificate chain using the Chrome and Firefox browsers on Mac OS.

1. Open a Terminal window.

2. Enter the following command.

```
security verify-cert -P url[:port]
```

where *url* is the URL (including scheme) to vCenter or Firewall Management Center. For example:

```
security verify-cert -P https://myvcenter.example.com
```

If you access vCenter or Firewall Management Center using NAT or PAT, you can add a port as follows:

```
security verify-cert -P https://myvcenter.example.com:12345
```

3. Save the entire certificate chain to a plaintext file.

- *Include* all -----BEGIN CERTIFICATE----- and -----END CERTIFICATE----- delimiters.
- *Exclude* any extraneous text (for example, the name of the certificate and any text contained in angle brackets (< and >)) as well as the angle brackets themselves.

4. Repeat these tasks for vCenter Firewall Management Center.

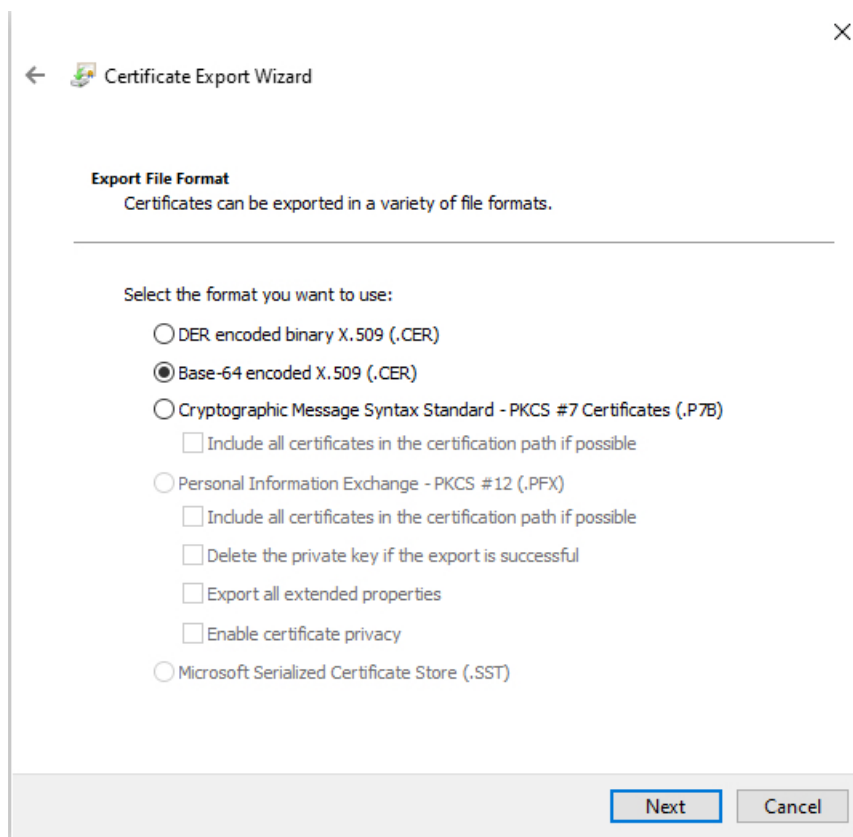

### Get a Certificate Chain—Windows Chrome

Use this procedure to get a certificate chain using the Chrome browser on Windows.

1. Log in to vCenter or Firewall Management Center using Chrome.
2. In the browser address bar, click the lock to the left of the host name.
3. Click **Certificate**.
4. Click the **Certification Path** tab.
5. Click the top (that is, first) certificate in the chain.
6. Click **View Certificate**.
7. Click the **Details** tab.
8. Click **Copy to File**.
9. Follow the prompts to create a CER-formatted certificate file that includes the entire certificate chain.

When you're prompted to choose an export file format, click **Base 64-Encoded X.509 (.CER)** as the following figure shows.

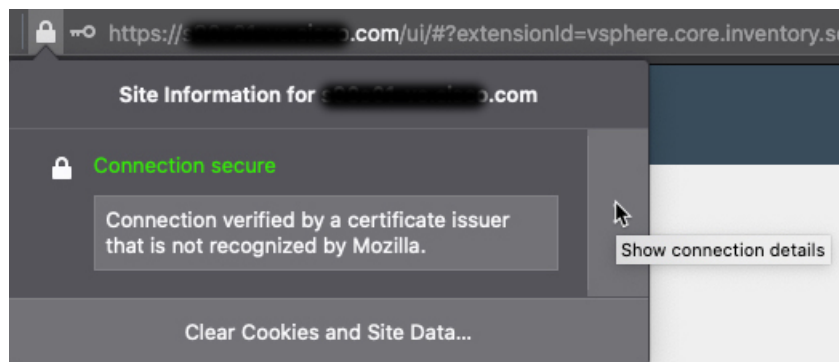

10. Follow the prompts to complete the export.
11. Open the certificate in a text editor.
12. Repeat the process for all certificates in the chain.  
You must paste each certificate in the text editor in order, first to last.
13. Repeat these tasks for vCenter or Firewall Management Center.

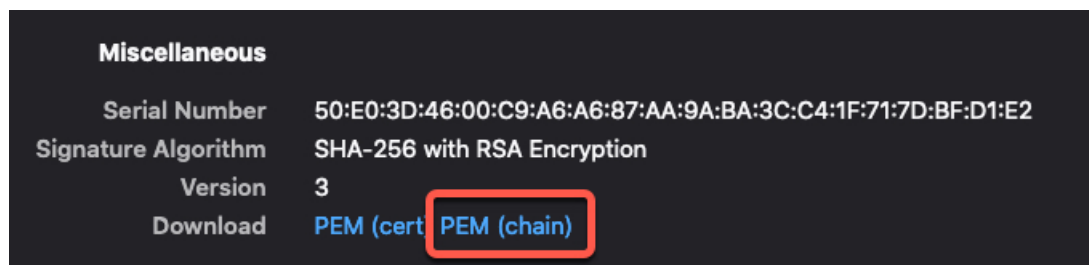

### Get a Certificate Chain—Windows Firefox

Use the following procedure to get a certificate chain for the Firefox browser on either Windows or Mac OS.

1. Log in to vCenter or Firewall Management Center. using Firefox.
2. Click the lock to the left of the host name.
3. Click the right arrow (**Show connection details**). The following figure shows an example.

4. Click **More Information**.
5. Click **View Certificate**.
6. If the resulting dialog box has tab pages, click the tab page corresponding to the top-level CA.
7. Scroll to the Miscellaneous section.
8. Click **PEM (chain)** in the Download row. The following figure shows an example.

9. Save the file.
10. Repeat these tasks for vCenter or Firewall Management Center.

## Security Requirements

To safeguard the Cisco Secure Dynamic Attributes Connector, you should install it on a protected internal network. Although the dynamic attributes connector is configured to have only the necessary services and ports available, you must make sure that attacks cannot reach it.

If the dynamic attributes connector and the Secure Firewall Management Center reside on the same network, you can connect the Secure Firewall Management Center to the same protected internal network as the dynamic attributes connector.

Regardless of how you deploy your appliances, inter-system communication is encrypted. However, you must still take steps to ensure that communications between appliances cannot be interrupted, blocked, or tampered with; for example, with a distributed denial of service (DDoS) or man-in-the-middle attack.

# Internet Access Requirements

By default, the dynamic attributes connector is configured to communicate with the Firepower System over the internet using HTTPS on port 443/tcp (HTTPS). If you do not want the dynamic attributes connector to have direct access to the internet, you can configure a proxy server.

The following information informs you of the URLs the dynamic attributes connector use to communicate with the Secure Firewall Management Center and with external servers.

**Table 95: Cisco Secure Dynamic Attributes Connector access requirements**

URL	Reason
<a href="https://fmc-ip/api/fmc_platform/v1/auth/generatetoken">https://fmc-ip/api/fmc_platform/v1/auth/generatetoken</a>	Authentication
<a href="https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects">https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects</a>	GET and POST dynamic objects
<a href="https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects/object-id/mappings?action=add">https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects/object-id/mappings?action=add</a>	Add mappings
<a href="https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects/object-id/mappings?action=remove">https://fmc-ip/api/fmc_config/v1/domain/domain-id/object/dynamicobjects/object-id/mappings?action=remove</a>	Remove mappings

**Table 96: Cisco Secure Dynamic Attributes Connector vCenter access requirements**

URL	Reason
<a href="https://vcenter-ip/rest/com/vmware/cis/session">https://vcenter-ip/rest/com/vmware/cis/session</a>	Authentication
<a href="https://vcenter-ip/rest/vcenter/vm">https://vcenter-ip/rest/vcenter/vm</a>	Get VM information
<a href="https://nsx-ip/api/v1/fabric/virtual-machines/vm-id">https://nsx-ip/api/v1/fabric/virtual-machines/vm-id</a>	Get NSX-T tag associated with the virtual machine

## Migration from DockerHub to Amazon ECR

Docker images for the Cisco Secure Dynamic Attributes Connector are being migrated from [Docker Hub](#) to [Amazon Elastic Container Registry](#) (Amazon ECR).

To use the new field packages, you must allow access through your firewall or proxy to all of the following URLs:

- <https://public.ecr.aws>
- <https://csdac-cosign.s3.us-west-1.amazonaws.com>

### Cisco Secure Dynamic Attributes Connector Azure access requirements

The dynamic attributes connector calls built-in SDK methods to get instance information. These methods internally call <https://login.microsoft.com> (for authentication) and <https://management.azure.com> (to get instance information).

## History for the Cisco Secure Dynamic Attributes Connector

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Cisco Secure Dynamic Attributes Connector	7.4.0	7.4.0	<p>This feature is introduced.</p> <p>The Cisco Secure Dynamic Attributes Connector is now included in the Secure Firewall Management Center. You can use the dynamic attributes connector to get IP addresses from cloud-based platforms such as Microsoft Azure in access control rules without having to deploy to managed devices.</p> <p>More information:</p> <ul style="list-style-type: none"> <li>• The dynamic attributes connector included with this product: <a href="#">About the Cisco Secure Dynamic Attributes Connector, on page 1671</a></li> <li>• The standalone dynamic attributes connector: <a href="#">Cisco Secure Dynamic Attributes Connector Configuration Guide</a></li> </ul> <p>New/modified screen: <b>Integration &gt; Dynamic Attributes Connector</b></p>

## CHAPTER 44

# URL Filtering

---

You can implement URL filtering using access control rules.

- [URL Filtering Overview, on page 1719](#)
- [Best Practices for URL Filtering, on page 1721](#)
- [License Requirements for URL Filtering, on page 1726](#)
- [Requirements and Prerequisites for URL Filtering, on page 1726](#)
- [How to Configure URL Filtering with Category and Reputation, on page 1727](#)
- [Manual URL Filtering, on page 1733](#)
- [Configure HTTP Response Pages, on page 1735](#)
- [Configure URL Filtering Health Monitors, on page 1739](#)
- [Dispute URL Category and Reputation, on page 1739](#)
- [If the URL Category Set Changes, Take Action, on page 1740](#)
- [Troubleshoot URL Filtering, on page 1741](#)
- [History for URL Filtering, on page 1744](#)

## URL Filtering Overview

Use the URL filtering feature to control the websites that users on your network can access:

- **Category and reputation-based URL filtering**—With a URL Filtering license, you can control access to websites based on the URL's general classification (category) and risk level (reputation). This is the recommended option.
- **Manual URL filtering**—With any license, you can manually specify individual URLs, groups of URLs, and URL lists and feeds to achieve granular, custom control over web traffic. For more information, see [Manual URL Filtering, on page 1733](#).

See also [Security Intelligence, on page 1747](#), a similar but different feature for blocking malicious URLs, domains, and IP addresses.

The URL filtering feature is applicable only when you use a web browser to browse websites via the HTTP/HTTPS protocol. For other applications, you must use an FQDN-based access control rule instead of URL filtering. See [Access Control Rules](#) for more information.

## About URL Filtering with Category and Reputation

With a URL Filtering license, you can control access to websites based on the category and reputation of requested URLs:

- **Category**—A general classification for the URL. For example, ebay.com belongs to the Auctions category, and monster.com belongs to the Job Search category.

A URL can belong to more than one category.

- **Reputation**—How likely the URL is to be used for purposes that might be against your organization's security policy. Reputations range from Unknown risk (level 0) or Untrusted (level 1) to Trusted (level 5). Reputation is determined by the hostname, e.g. all pages on www.cisco.com are considered to have the same reputation.

### Benefits of Category and Reputation-Based URL Filtering

URL categories and reputations help you quickly configure URL filtering. For example, you can use access control to block untrusted URLs in the Hacking category. Or, you can use QoS to rate limit traffic from sites in the Streaming Video category. There are also categories for types of threats, such as a Spyware and Adware category.

Using category and reputation data simplifies policy creation and administration. It grants you assurance that the system controls web traffic as expected. Because Cisco continually updates its threat intelligence with new URLs, as well as new categories and risks for existing URLs, the system uses up-to-date information to filter requested URLs. Sites that (for example) represent security threats, or that serve undesirable content, may appear and disappear faster than you can update and deploy new policies.

Some examples of how the system can adapt include:

- If an access control rule blocks all gaming sites, as new domains get registered and classified as Games, the system can block those sites automatically. Similarly, if a QoS rule rate limits all streaming video sites, the system can automatically limit traffic to new Streaming Video sites.
- If an access control rule blocks all malware sites and a shopping page gets infected with malware, the system can recategorize the URL from Shopping to Malware Sites and block that site.
- If an access control rule blocks untrusted social networking sites and somebody posts a link on their profile page that contains links to malicious payloads, the system can change the reputation of that page from Favorable to Untrusted and block it.

### Limitations of category-based filtering in decryption policy Do Not Decrypt rules

You can optionally choose to include categories in your decryption policies. These categories, also referred to as *URL filtering*, are updated by the Cisco Talos intelligence group. Updates are based on machine learning and human analysis according to content that is retrievable from the website destination and sometimes from its hosting and registration information. Categorization is *not* based on the declared company vertical, intent, or security.

#### Note

Don't confuse URL filtering with application detection, which relies on reading some of the packet from a website to determine more specifically what it is (for example, Facebook Message or Salesforce). For more information, see [Best Practices for Configuring Application Control, on page 1605](#).

For more information, see [Use Categories in URL Filtering, on page 1725](#).

## URL Category and Reputation Descriptions

### Category Descriptions

A description of each URL category is available from <https://www.talosintelligence.com/categories>.

Be sure to click **Threat Categories** to see those categories.

### Reputation Level Descriptions

Go to [Web reputation levels](#).

## URL Filtering Data from the Cisco Cloud

Adding a URL Filtering license automatically enables the URL filtering feature. This allows traffic handling based on a website's general classification, or *category*, and risk level, or *reputation*.

By default, when users browse to an URL whose category and reputation is not in a local cache of previously accessed websites, the system submits it to the cloud for threat intelligence evaluation and adds the result to the cache.

Optionally, you can use a local URL dataset of categories and reputations, which can make web browsing faster. When you enable (or re-enable) URL filtering, the Firewall Management Center automatically queries Cisco for URL data and pushes the dataset to managed devices. Then, when users browse to an URL, the system checks the local dataset and the cache for category and reputation information before submitting it to the cloud for threat intelligence evaluation. To see your options for using the local dataset, including how to disable individual cloud lookups altogether, see [URL Filtering Options, on page 1728](#).

Automatic updates of URL data is enabled by default; we strongly recommend you do not disable these updates.

The set of URL categories may change periodically. When you receive a change notification, review your URL filtering configurations to make sure traffic is handled as expected. For more information, see [If the URL Category Set Changes, Take Action, on page 1740](#).

## Best Practices for URL Filtering

Keep in mind the following guidelines and limitations for URL filtering:

### Filter by Category and Reputation

Follow the instructions in [How to Configure URL Filtering with Category and Reputation, on page 1727](#).

### Configure Your Policy to Inspect Packets That Must Pass Before a URL Can Be Identified

The system cannot filter URLs before:

- A monitored connection is established between a client and server.
- The system identifies the DNS, HTTP or HTTPS application in the session.

- The system identifies the requested domain or URL (for encrypted sessions, from a non-encrypted domain name, the ClientHello message or the server certificate).

This identification should occur within 3 to 5 packets, or after the server certificate exchange in the TLS/SSL handshake if the traffic is encrypted.

**Important!** To ensure that your system examines these initial packets that would otherwise pass, see [Inspection of Packets That Pass Before Traffic Is Identified, on page 2526](#) and subtopics.

If early traffic matches all other rule conditions but identification is incomplete, the system allows the packet to pass and the connection to be established (or the TLS/SSL handshake to complete). After the system completes its identification, the system applies the appropriate rule action to the remaining session traffic.

### Block Threat Categories

Be sure that your policies specifically address Threat categories, which identify known malicious sites. Do this in addition to blocking sites with poor reputations.

For example, to protect your network from malicious sites, you must block all Threat categories. Additionally, Talos recommends that you block only sites with Poor category. You can block questionable reputations if you have an aggressive security posture, but this may result in a higher amount of false positives.

For specifics, see **Threat Categories** at the URL in [URL Category and Reputation Descriptions, on page 1721](#).

### URL Conditions and Rule Order

- Position URL rules after all other rules that *must* be hit.
- URLs can belong to more than one category. It is possible to want to allow one category of websites and block another—whether explicitly or by relying on the default action. In this case, make sure you create and order URL rules so you get the desired effect, depending on whether the allow or the block should take precedence.

For additional guidelines for rules, see the following topics: [Best Practices for Access Control Rules, on page 1608](#).

### Uncategorized or Reputationless URLs

When you build a URL rule, you first choose the category you want to match. If you explicitly choose **Uncategorized** URLs, you cannot further constrain by reputation.

Uncategorized URLs with Untrusted reputation are handled by the **Malicious Sites** category. If you want to block uncategorized sites with any other reputation level (such as Questionable), you must block all uncategorized sites.

After selecting a category and a reputation level, you can optionally select **Apply to unknown reputation**. For example, you can create a rule that applies to sites with Untrusted, Questionable, and unknown reputations.

You cannot manually assign categories and reputations to URLs, but in access control and QoS policies, you can manually block specific URLs. See [Manual URL Filtering, on page 1733](#). See also [Dispute URL Category and Reputation, on page 1739](#).

### URL Filtering for Encrypted Web Traffic

When performing URL filtering on encrypted web traffic, the system:

- (If DNS filtering is enabled) Checks to see if the system has previously seen the originating domain or the domain is in the local reputation database, and if so, takes action based on the reputation and category of the domain. Otherwise, the system processes the traffic based on your configurations for encrypted traffic, even if **Retry URL cache miss lookup** is enabled in the access control policy's advanced settings.
- Disregards the encryption protocol; a rule matches both HTTPS and HTTP traffic if the rule has a URL condition but not an application condition that specifies the protocol.
- Does not use URL lists. You must use URL objects and groups instead.
- Matches HTTPS traffic based on the subject common name in the public key certificate used to encrypt the traffic, and also evaluates the reputation of any other URLs presented at any time during the transaction, including the post-decryption HTTP URL.
- Disregards subdomains within the subject common name.
- Does not display an HTTP response page for encrypted connections blocked by access control rules (or any other configuration); see [Limitations to HTTP Response Pages, on page 1735](#).

### URL Filtering and TLS Server Identity Discovery

The latest version of the Transport Layer Security (TLS) protocol 1.3, defined by [RFC 8446](#), is the preferred protocol for many web servers to provide secure communications. Because the TLS 1.3 protocol encrypts the server's certificate for additional security, and the certificate is needed to match application and URL filtering criteria in access control rules, the Firepower System provides a way to extract the server certificate *without* decrypting the entire packet.

Access control policy advanced settings offer an **Early application detection and URL categorization** option for TLS Server Identity Discovery.

We strongly recommend enabling it for any traffic you want to match on application or URL criteria, especially if you want to perform deep inspection of that traffic. A decryption policy is not required because *traffic is not decrypted* in the process of extracting the server certificate.

#### Note

- TLS server identity discovery *cannot* be used with any of the following:
  - STARTTLS traffic
  - The HTTP CONNECT method
  - Traffic that is already being decrypted by another device on the network
- Because the certificate is decrypted, TLS server identity discovery can reduce performance depending on the hardware platform.
- TLS server identity discovery is not supported in inline tap mode or passive mode deployments.
- Enabling TLS server identity discovery is not supported on any Secure Firewall Threat Defense Virtual deployed to AWS. If you have any such managed devices managed by the Secure Firewall Management Center, the connection event **PROBE\_FLOW\_DROP\_BYPASS\_PROXY** increments every time the device attempts to extract the server certificate.
- TLS Server Identity Discovery also operates on TLS 1.2 sessions.

For more information, see [Access Control Policy Advanced Settings, on page 1626](#).

## HTTP/2

The system can extract HTTP/2 URLs from TLS certificates, but not from a payload.

### Manual URL Filtering

- Specify URLs using a custom Security Intelligence list or feed object. Do not use a URL object or directly enter a URL into the rule. For details, see [Manual URL Filtering Options, on page 1734](#).
- If you manually filter specific URLs using URL objects or by entering URLs directly into the rule, carefully consider other traffic that might be affected. To determine whether network traffic matches a URL condition, the system performs a simple substring match. If the requested URL matches any part of the string, the URLs are considered to match.
- If you use manual URL filtering to create exceptions to other rules, position the specific rule with the exceptions above the general rule that would otherwise apply.

### Search Query Parameters in URLs

The system does not use search query parameters in the URL to match URL conditions. For example, consider a scenario where you block all shopping traffic. In that case, using a web search to search for amazon.com is not blocked, but browsing to amazon.com is.

### URL Filtering in High Availability Deployments

For guidelines for URL filtering with Firepower Management Centers in high availability, see *URL Filtering and Security Intelligence* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Memory Limitations for Selected Device Models

- Device models with less memory store less URL data locally, and the system may therefore check the cloud more frequently to determine category and reputation for sites that are not in the local database.

Lower-memory devices include:

- Firepower 1010
- Firewall Threat Defense Virtual with 8 GB of RAM

## Filtering HTTPS Traffic

To filter encrypted traffic, the system determines the requested URL based on information passed during the TLS/SSL handshake: the subject common name in the public key certificate used to encrypt the traffic.

HTTPS filtering, unlike HTTP filtering, disregards subdomains within the subject common name. Do not include subdomain information when manually filtering HTTPS URLs in access control or QoS policies. For example, use example.com rather than www.example.com.

**Tip** In an decryption policies, you can handle and decrypt traffic to specific URLs by defining a distinguished name decryption policy rule condition. The common name attribute in a certificate's subject distinguished name contains the site's URL. Decrypting HTTPS traffic allows access control rules to evaluate the decrypted session, which improves URL filtering.

### Controlling Traffic by Encryption Protocol

The system disregards the encryption protocol (HTTP vs HTTPS) when performing URL filtering in access control or QoS policies. This occurs for both manual and reputation-based URL conditions. In other words, URL filtering treats traffic to the following websites identically:

- <http://example.com/>
- <https://example.com/>

To configure a rule that matches only HTTP or HTTPS traffic, add an application condition to the rule. For example, you could allow HTTPS access to a site while disallowing HTTP access by constructing two access control rules, each with an application and URL condition.

The first rule allows HTTPS traffic to the website:

Action: Allow  
Application: HTTPS  
URL: example.com

The second rule blocks HTTP access to the same website:

Action: Block  
Application: HTTP  
URL: example.com

## Use Categories in URL Filtering

### Limitations of categories in Do Not Decrypt rules

You can optionally choose to include categories in your decryption policies. These categories, also referred to as *URL filtering*, are updated by the Cisco Talos intelligence group. Updates are based on machine learning and human analysis according to content that is retrievable from the website destination and sometimes from its hosting and registration information. Categorization is *not* based on the declared company vertical, intent, or security. While we strive to continuously update and improve URL filtering categories, it is not an exact science. Some websites are not categorized at all and it's possible some websites might be improperly categorized.

Avoid overusing categories in do not decrypt rules to avoid decrypting traffic without a reason; for example, the Health and Medicine category includes the [WebMD](#) website, which does not threaten patient privacy.

Following is a sample decryption policy that can prevent decryption for websites in the Health and Medicine categories but allows decryption for [WebMD](#) and everything else. General information about decryption rules can be found in [Guidelines for Using TLS/SSL Decryption, on page 2174](#).

## How to Configure URL Filtering with Category and Reputation

	Do This	More Information
Step 1	Ensure that you have the correct licenses.	Assign the URL Filtering license to each managed device that will filter URLs.
Step 2	Ensure that your Firewall Management Center can communicate with the cloud to obtain URL filtering data.	<i>Internet Access Requirements</i> and <i>Communication Port Requirements</i> in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> .
Step 3	Understand limitations and guidelines and take any necessary actions.	<a href="#">Best Practices for URL Filtering, on page 1721</a>
Step 4	Enable the URL Filtering feature.	<a href="#">Enable URL Filtering Using Category and Reputation, on page 1728</a>
Step 5	Configure rules to filter URLs by category and reputation.	<a href="#">Configuring URL Conditions, on page 1730</a> For the best protection against malicious sites, you must block sites by reputation AND block URLs in all Threat categories. (Optional) <a href="#">Supplement or Selectively Override Category and Reputation-Based URL Filtering, on page 1734</a>
Step 6	(Optional) Allow users to bypass a website block by clicking through a warning page.	<a href="#">Configure HTTP Response Pages, on page 1735</a>
Step 7	Order your rules so that traffic hits key rules first.	<a href="#">URL Rule Order, on page 1612</a>

	Do This	More Information
Step 8	(Optional) Modify advanced options related to URL filtering.	<p>Generally, use the defaults unless you have a specific reason to change them.</p> <p>For information about advanced options, including the following, see <a href="#">Access Control Policy Advanced Settings, on page 1626</a>.</p> <ul style="list-style-type: none"> <li>• <b>Maximum URL characters to store in connection events</b></li> <li>• <b>Allow an Interactive Block to bypass blocking for (seconds)</b></li> <li>• <b>Retry URL cache miss lookup</b></li> <li>• <b>Enable reputation enforcement on DNS traffic</b></li> </ul>
Step 9	Deploy your changes.	<a href="#">Deploy Configuration Changes, on page 183</a>
Step 10	Ensure that your system receives future URL data updates as expected	<a href="#">Configure URL Filtering Health Monitors, on page 1739</a>
Step 11	Be sure you have enabled other features that protect your network from malicious sites	See <a href="#">Security Intelligence, on page 1747</a> .

## Enable URL Filtering Using Category and Reputation

You must be an Admin user to perform this task.

### Before you begin

Complete prerequisites described in [How to Configure URL Filtering with Category and Reputation, on page 1727](#).

### Procedure

- 
- Step 1** Choose **Integration > Other Integrations > Cloud Services**.
- Step 2** Configure [URL Filtering Options, on page 1728](#).
- Step 3** Click **Save**.
- 

## URL Filtering Options

Adding a URL Filtering license automatically enables the URL filtering feature. This allows traffic handling based on a website's general classification, or *category*, and risk level, or *reputation*.

Although by default the system is configured to submit all URLs to the cloud for threat intelligence evaluation, using a local dataset of category and reputation data can make web browsing faster. When you enable (or re-enable) URL filtering, the Firewall Management Center automatically queries Cisco for URL data and pushes the dataset to managed devices. This process may take some time.

If you use SSL rules to handle encrypted traffic, also see [Decryption Rule Guidelines and Limitations, on page 2174](#).

### Enable Automatic Updates

If you **Enable Automatic Updates** (the default), the Firewall Management Center checks the cloud every 30 minutes for updates. If you need strict control over when the system contacts external resources, disable automatic updates and instead create a recurring task using the scheduler. See *Automated URL Filtering Updates Using a Scheduled Task* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Update Now

Click **Update Now** to perform a one-time, on-demand URL data update. You cannot start an on-demand update if an update is already in progress. Although daily updates tend to be small, if it has been more than five days since your last update, new URL data may take up to 20 minutes to download, depending on your bandwidth. Then, it may take up to 30 minutes to perform the update itself.

### URL Query Source

You can choose how the system assigns a category and reputation to the URLs that your users browse to. You can choose:

- **Local Database Only:** Uses the local dataset only. Use this option if you do not want to submit your uncategorized URLs (category and reputation not in the local dataset) to Cisco, for example, for privacy reasons. However, note that connections to uncategorized URLs do *not* match rules with category or reputation-based URL conditions. You cannot assign categories or reputations to URLs manually.
- **Local Database and Cisco Cloud:** Uses the local dataset when possible, which can make web browsing faster. When users browse to an URL whose category and reputation is not in the local dataset or a cache of previously accessed websites, the system submits it to the cloud for threat intelligence evaluation and adds the result to the cache.
- **Cisco Cloud Only** (default): Does not use the local dataset. When users browse to an URL whose category and reputation is not in a local cache of previously accessed websites, the system submits it to the cloud for threat intelligence evaluation and adds the result to the cache. This option guarantees the most up-to-date category and reputation information.

This option requires threat defense Version 7.3. If you enable this option, devices running earlier versions will use the **Local Database and Cisco Cloud** option.

### Cached URLs Expire

This setting is not relevant if you chose **Local Database Only** as your URL query source.

Caching category and reputation data makes web browsing faster. By default, cached data for URLs never expires, for fastest performance.

To minimize instances of URLs matching on stale data, you can set URLs in the cache to expire. For greater accuracy and currency of threat data, choose a shorter expiration time. A cached URL refreshes *after* the first

time a user on the network accesses it after the specified time has passed. The first user does not see the refreshed result, but the next user who visits this URL does see the refreshed result.

## Configuring URL Conditions

Protect your network by controlling access to sites based on URL category and reputation.

### Before you begin

#### Attention

As a prerequisite, ensure that you create at least a Monitor rule at the top of your access control policy, containing Category or Reputation parameters. This is essential to see ANY category or reputation data for ANY URLs that hit the particular access control policy.

If there is no rule in the access control policy with the category or reputation parameters configured, the **Connection Events** page in the management center shows no data for Category or Reputation for any URL traffic that hits the access control policy.

### Procedure

**Step 1** In the rule editor, click the following for URL conditions:

- Access control or QoS—Click **URLs**.
- SSL—Click **Category**.

**Step 2** Find and choose the URL categories that you want to control:

In an access control or QoS rule, click **Category**.

For effective protection from malicious sites, you must block URLs in all Threat categories. Additionally, Talos recommends that you block only sites with Poor category. You can block questionable reputations if you have an aggressive security posture, but this may result in a higher amount of false positives. For a list of Threat categories, see [URL Category and Reputation Descriptions, on page 1721](#).

Be sure to click the arrows at the bottom of the list to see all available categories.

**Step 3** (Optional) Constrain URL categories by choosing a **Reputation**.

Note that if you explicitly match **Uncategorized** URLs, you cannot further constrain by reputation. Choosing a reputation level also includes other reputations either more or less severe than the level you choose, depending on the rule action:

- Includes less severe reputations—If the rule allows or trusts web traffic. For example, if you configure an access control rule to allow Favorable (level 4), it also automatically allows Trusted (level 5) sites.
- Includes more severe reputations—If the rule rate limits, decrypts, blocks, or monitors web traffic. For example, if you configure an access control rule to block Questionable sites (level 2), it also blocks Untrusted (level 1) sites.

If you change the rule action, the system automatically changes the reputation levels in URL conditions.

Optionally, select **Apply to unknown reputation**.

- Step 4** Click **Add URL** or **Add to Rule**, or drag and drop.
- Step 5** (Optional) To choose predefined URL objects, or URL lists and feeds in an access control or QoS rule, click **URL**, select the objects, and add them to the destination.
- These objects implement manual URL filtering rather than category-based filtering.
- Step 6** Save or continue editing the rule.

### Example: URL Condition in an Access Control Rule

The following graphic shows the URL condition for an access control rule that blocks all malware sites, all untrusted sites, and all social networking sites with a reputation level of Neutral or worse.

The following table summarizes how you build the condition.

Blocked URL	Category	Reputation
Malware sites, regardless of reputation	Malware Sites	Any
Any untrusted URL (level 1)	Any	1 - Untrusted
Social networking sites with a reputation level of Neutral or worse (levels 1 through 3)	Social Network	3 - Neutral

## Rules with URL Conditions

The following table lists rules that support URL conditions, and the types of filtering that each rule type supports.

Rule Type	Supports Category and Reputation Filtering?	Supports Manual Filtering?
Access control	Yes	Yes
Decryption policy	Yes	No; use distinguished name conditions instead
QoS	Yes	Yes

To use URL filtering in a decryption policy that has **Do Not Decrypt** rule conditions, see [Use Categories in URL Filtering, on page 1725](#).

## URL Rule Order

For the most effective URL matching, place rules that include URL conditions before other rules, particularly if the URL rules are block rules and the other rules meet both of the following criteria:

- They include application conditions.
- The traffic to be inspected is encrypted.

If you configure exceptions to a rule, put the exception above the other rule.

## DNS Filtering: Identify URL Reputation and Category During DNS Lookup

The **Enable reputation enforcement on DNS traffic** option is enabled by default on the **Advanced** tab of each new access control policy. This option slightly modifies URL filtering behavior and is applicable only when URL filtering is enabled and configured.

When this option is enabled:

- The system evaluates domain category and reputation early in URL transactions, when the browser looks up the domain name to get the IP address
- Category and reputation of encrypted traffic can often be determined without decryption

If DNS filtering cannot determine the URL of encrypted traffic, that traffic is processed using your configurations for encrypted traffic.

## Enable DNS Filtering to Identify URLs During Domain Lookup

DNS filtering is enabled by default in new access control policies. However, additional configurations may be required in order for this setting to take effect.

### Before you begin

- URL filtering using category and reputation must be licensed, enabled, and configured.  
(DNS filtering does not use the following settings in the URLs tab: URL groups, URL objects, URL lists and feeds, and URLs entered into the "Enter URL" text box.)
- See limitations at [DNS Filtering Limitations, on page 1733](#).

### Procedure

- 
- Step 1** In your access control policy's advanced settings, select **Enable reputation enforcement on DNS traffic**.
- Step 2** In the same policy, for each access control rule that has URL category and reputation blocking configured:
- Application conditions—If the application condition is anything other than **any** (or empty), add **DNS** to that list. Other DNS-related options are not relevant for this purpose.
  - Port condition—If the port/protocol condition is anything other than **any** (or empty), add **DNS\_over\_TCP** and **DNS\_over\_UDP**.

**Step 3** Save your changes.

---

#### What to do next

If you are done making changes: [Deploy Configuration Changes, on page 183](#).

## DNS Filtering Limitations

Traffic that matches rules having action **Block with reset**, **Interactive Block**, or **Interactive Block with reset** will be treated as if the rule action were **Block**.

End users trying to access a blocked URL will experience this as an unexplained inability to connect to their page; the connection will spin and then time out.

## DNS Filtering and Events

Connection events generated by DNS filtering are logged using the following fields: DNS Query, URL Category, URL Reputation, and Destination Port. The DNS Query field holds the domain name; the URL field will be blank for DNS filtering matches. The Destination Port will be 53.

Also:

- When the access control rule action is **Allow** or **Trust**, two connection events will be generated for the same traffic, one for DNS filtering (with the **DNS Query** field populated) and one for URL filtering (with the **URL** field populated).
- The first time the system encounters a particular URL, you will see two events for that single session: One event showing uncategorized/reputationless for the DNS Query, and one event showing the actual category and reputation for the URL, which were retrieved during the DNS Query and applied to the session while processing using standard URL filtering.

## Manual URL Filtering

In access control and QoS rules, you can supplement or selectively override category and reputation-based URL filtering by manually filtering individual URLs, groups of URLs, or URL lists and feeds.

Examples:

- You might use access control to block a category of websites that are not appropriate for your organization. However, if the category contains a website that is appropriate, and to which you want to provide access, you can create a manual Allow rule for that site and place it before the Block rule for the category.
- If you prefer not to use category-based URL filtering, you can manually permit or block a URL or a group of URLs by creating an Allow or Block rule within an access control policy. You can perform this type of URL filtering without a special license.

Manual URL filtering is not supported in SSL rules; instead, use distinguished name conditions.

#### Caution

Depending on how you implement manual URL filtering, URL matching may not be what you intend. See [Manual URL Filtering Options, on page 1734](#).

---

## Manual URL Filtering Options

There are several ways to specify URLs for manual URL filtering:

Option	Description
<b>(Best practice)</b>  Use custom Security Intelligence URL list or feed objects.	This is the recommended method for manual URL filtering.  You can create a new list or feed, or choose an existing one in an access control or QoS rule.  For more information, see <a href="#">Custom Security Intelligence Lists and Feeds, on page 1315</a> and subtopics.
Use URL objects, individually or as groups. URL objects are described at <a href="#">URL, on page 1324</a> .  Or  Enter URLs directly into the access control rule. (The <b>Enter URL</b> option on the rule page in the web interface.)	If you do not include a path (that is, there are no / characters in the URL), the match is based on the server's hostname only. If you include one or more / character, the entire URL string is used for a substring match. Then, a URL is considered a match if any of the following are true: <ul style="list-style-type: none"> <li>• The string is at the beginning of the URL.</li> <li>• The string follows a dot.</li> <li>• The string contains a dot in the beginning.</li> <li>• The string follows the :// characters.</li> </ul> For example, ign.com matches ign.com or www.ign.com, but not versign.com.  <b>Note</b> We recommend that you do not use manual URL filtering to block or allow individual web pages or parts of sites (that is, URL strings with / characters), as servers can be reorganized and pages moved to new paths.  The <b>Enter URL</b> option does not support wildcards.

## Supplement or Selectively Override Category and Reputation-Based URL Filtering

In access control or QoS rules, you can use Security Intelligence URL lists and feeds to supplement, or to specify exceptions to, your category and reputation-based URL filtering rules.

**Important!** If the list or feed you are configuring in this procedure contains exceptions to category- or reputation-based rules, put this rule above those rules in the rule order.

In SSL rules, use distinguished name conditions to configure parallel behavior.

### Before you begin

- Configure URL filtering using category and reputation. See [Configuring URL Conditions, on page 1730](#).
- Understand important best practices for manual URL filtering. See [Best Practices for URL Filtering, on page 1721](#) and [Manual URL Filtering Options, on page 1734](#).

- Configure one or more Security Intelligence objects (lists or feeds) containing the URLs that you want to use for manual filtering. See [Custom Security Intelligence Lists and Feeds, on page 1315](#).

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | Navigate to the access control or QoS policy in which you will define the rule.  |
| <b>Step 2</b> | Create or edit the rule in which you will add the new condition: <ul style="list-style-type: none"><li>• If you are supplementing a category- or reputation-based URL filtering rule, edit the existing rule.</li><li>• If you are overriding or creating exceptions to a category- or reputation-based URL filtering rule, create a new rule.</li></ul> |
| <b>Step 3</b> | Select the list or feed you created as the destination URL criteria.   |
| <b>Step 4</b> | Save the rule.   |
- 

## Configure HTTP Response Pages

As part of access control, you can configure an *HTTP response page* to display when the system blocks web requests, using either access control rules or the access control policy default action.

The response page displayed depends on how you block the session:

- **Block Response Page:** Overrides the default browser or server page that explains that the connection was denied.
- **Interactive Block Response Page:** Warns users, but also allows them to click a button (or refresh the page) to load the originally requested site. Users may have to refresh after bypassing the response page to load page elements that did not load.

If you do not choose a response page, the system blocks sessions without interaction or explanation.

## Limitations to HTTP Response Pages

- The system displays a response page only for unencrypted or decrypted HTTP/HTTPS connections blocked (or interactively blocked) either by access control rules or by the access control policy default action. The system does not display a response page for connections that are blocked by any other policy or mechanism.
- The system cannot display a response page if the connection is reset (RST packet sent). If you enable response pages, the system prioritizes that configuration. Even if you choose **Block with reset** or **Interactive Block with reset** as the rule action, the system displays the response page and does not reset matching web connections. To ensure that blocked web connections are reset, you must disable response pages.

Note that all non-web traffic that matches the rule *is* blocked with reset.

- The system does not display a response page for encrypted connections that are blocked by access control rules (or any other configuration). Access control rules evaluate encrypted connections if you did not configure an SSL policy, or your SSL policy passes encrypted traffic.

For example, the system cannot decrypt HTTP/2 or SPDY sessions. If web traffic encrypted using one of these protocols reaches access control rule evaluation, the system does not display a response page if the session is blocked.

However, the system does display a response page for connections that are decrypted by the SSL policy, then blocked (or interactively blocked) either by access control rules or by the access control policy default action. In these cases, the system encrypts the response page and sends it at the end of the reencrypted SSL stream.

- The system does not display a response page when web traffic is blocked because of a promoted access control rule (an early-placed blocking rule with only simple network conditions).
- If a URL is entered without specifying "http" or "https", and the browser initiates the connection on port 80, and the user clicks through a response page, and the connection is subsequently redirected to port 443, the user will not see a second interactive response page because the response to this URL is already cached.
- The system does not display a response page when web traffic is blocked before the system identifies the requested URL; see [Best Practices for URL Filtering, on page 1721](#).
- The system does not display a response page if the block URL access control rule is configured after the allow application rule.

## Requirements and Prerequisites for HTTP Response Pages

### Model Support

Any

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin

## Choosing HTTP Response Pages

Reliable display of HTTP response pages depends on your network configuration, traffic loads, and size of the page. Smaller pages are more likely to display successfully.

## Procedure

- Step 1** In the access control policy editor, select **HTTP Responses** from the **More** drop-down arrow at the end of the packet flow line.
- If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 2** Choose the **Block Response Page** and **Interactive Block Response Page**:
- System-provided—Displays a generic response. Click **View** (👁) to view the code for this page.
  - Custom—Create a custom response page. A pop-up window appears, prepopulated with system-provided code that you can replace or modify by clicking **Edit** (✎). A counter shows how many characters you have used.
  - None—Disables the response page and blocks sessions without interaction or explanation. To quickly disable interactive blocking for the whole access control policy, choose this option.
- Step 3** Click **Save** to save the policy.

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Configure Interactive Blocking with HTTP Response Pages

When you configure interactive blocking, users can load an originally requested site after reading a warning. Users may have to refresh after bypassing the response page to load page elements that did not load.

**Tip** To quickly disable interactive blocking for the whole access control policy, display neither the system-provided page nor a custom page. The system then blocks all connections without interaction.

If a user does not bypass an interactive block, matching traffic is denied without further inspection. If a user bypasses an interactive block, the access control rule allows the traffic, although the traffic may still be subject to deep inspection and blocking.

By default, a user bypass is in effect for 10 minutes (600 seconds) without displaying the warning page on subsequent visits. You can set the duration to as long as a year, or you can force the user to bypass the block every time. This limit applies to every Interactive Block rule in the policy. You cannot set the limit per rule.

Logging options for interactively blocked traffic are identical to those in allowed traffic, but if a user does not bypass the interactive block, the system can log only beginning-of-connection events. When the system initially warns the user, it marks any logged beginning-of-connection event with the `Interactive Block` or `Interactive Block with reset` action. If the user bypasses the block, additional connection events logged for the session have an action of `Allow`.

## Configuring Interactive Blocking

The following procedure explains how to allow users to bypass URL filtering rules.

### Procedure

- 
- Step 1** As part of access control, configure an access control rule that matches web traffic; see [Create and Edit Access Control Rules](#), on page 1651:
- Action—Set the rule action to **Interactive Block** or **Interactive Block with reset**; see [Access Control Rule Interactive Blocking Actions](#), on page 1648.
  - Conditions—Use URL conditions to specify the web traffic to interactively block; see [URL Conditions \(URL Filtering\)](#).
  - Logging—Assume users will bypass the block and choose logging options accordingly; see *Logging for Allowed Connections* in the [Cisco Secure Firewall Management Center Administration Guide](#).
  - Inspection—Assume users will bypass the block and choose deep inspection options accordingly; see [Access Control Overview](#), on page 1593.
- Step 2** (Optional) In the access control policy **HTTP Responses**, choose a custom interactive-block HTTP response page; see [Choosing HTTP Response Pages](#), on page 1736.
- Step 3** (Optional) In access control policy **Advanced** settings, change the user bypass timeout; see [Setting the User Bypass Timeout for a Blocked Website](#), on page 1738.
- After a user bypasses a block, the system allows the user to browse to that page without warning until the timeout period elapses.
- Step 4** Save the access control policy.
- Step 5** Deploy configuration changes; see [Deploy Configuration Changes](#), on page 183.
- 

## Setting the User Bypass Timeout for a Blocked Website

The following procedure explains how to set the time allowed for browsing after the user bypasses a URL filtering block. After the timeout expires, the user must bypass the block again.

### Procedure

- 
- Step 1** Click **Policies > Access Control heading > Access Control** and edit the policy.
- Step 2** Select **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line.
- Step 3** Click **Edit** (✎) next to General Settings.
- If **View** (👁) appears instead, settings are inherited from an ancestor policy, or you do not have permission to modify the settings. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.
- Step 4** In the **Allow an Interactive Block to bypass blocking for (seconds)** field, enter the number of seconds that must elapse before the user bypass expires.
- Setting this value to 0 means the interactive block response is displayed once and the user bypass never expires.

- Step 5** Click **OK**.
- Step 6** Click **Save** to save the policy.

---

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Configure URL Filtering Health Monitors

The following health policies alert if the system has problems obtaining or updating URL category and reputation data.

- URL Filtering Monitor
- Threat Data Updates on Device

To ensure that these are configured the way you want them, see *Health Modules* and *Configuring Health Monitoring* in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Dispute URL Category and Reputation

If you disagree with a category or reputation assigned by Talos, you can submit a request for re-evaluation.

**Before you begin**

You will need your Cisco account credentials.

**Procedure**

- 
- Step 1** In the Firewall Management Center web interface, do one of the following:

Location of Dispute Option	Path to Dispute Option
Cloud Services configuration page	a. Navigate to the <b>Integration &gt; Other Integrations &gt; Cloud Services</b> page. b. Select <b>Dispute URL categories and reputations</b> .
Manual URL Lookup page	a. Navigate to the manual URL Lookup page: <b>Analysis &gt; Advanced &gt; URL</b> . b. Look up the URL in question. c. To see <b>Dispute</b> at the end of the table row, hover over the relevant entry in the list of results, then click dispute.

Location of Dispute Option	Path to Dispute Option
URL Connection Event	a. Navigate to any page under the <b>Analysis &gt; Connections</b> menu that has a table that includes URLs.  b. Right-click an item in the <b>URL Category</b> or <b>URL Reputation</b> column (show hidden columns if needed) and select an option.

The Talos web site opens in a separate browser window.

- Step 2** Sign in to the Talos site with your Cisco credentials.
- Step 3** Review the information and follow the instructions on the Talos page.
- Step 4** Look for information on the Talos site about how submitted disputes are handled and what response to expect, if any.

The dispute process is independent of Firepower products.

## If the URL Category Set Changes, Take Action

The set of URL Filtering categories may occasionally change, in order to accommodate new web trends and evolving usage patterns.

These changes affect both policies and events.

Shortly before URL category changes are scheduled to occur, and after they occur, you will see alerts in the list of rules in any access control, SSL, and QoS policy that is affected by the changes, and on URL or Category in rules that you edit.

You should take action when you see these alerts.

**Note** Updates to the URL category set as described in this topic are distinct from the changes that simply add new URLs to existing categories or re-classify misclassified URLs. This topic does not apply to category changes for individual URLs.

### Procedure

- Step 1** If you see an alert beside a rule in an access control policy, hover over the alert to see details.
- Step 2** If the alert mentions changes to URL categories, edit the rule to see further details.
- Step 3** Hover over the URL or Category in the rule dialog to see general information about the type of changes.
- Step 4** If you see an alert beside a category, click the alert to view details.
- Step 5** If you see a "More information" link in the description of a change, click it to view information about the category on the Talos web site.

Alternately, see a list and descriptions all categories at the link in [URL Category and Reputation Descriptions, on page 1721](#).

**Step 6** Depending on the type of change, take appropriate action:

Type of Category Change	What The System Will Do	What You Should Do
Existing category will soon be deprecated	Nothing yet. You have a few weeks to change affected rules.  If you do not take action in that time, the system eventually will not be able to redeploy the policy.	Remove this category from all rules that include it. If there is a similar new category, consider using that category instead.
New category is added	By default, the system does not use newly added categories.	Consider creating new rules for the new category.
Existing category is deleted	The category will appear in the rule in strikethrough text (that is, with a line through the category name.)	You must delete the obsolete category from the rule before you can deploy the policy.

**Step 7** Check your SSL rules (Category) for these changes and take action as needed.

**Step 8** Check your QoS rules (URL) for these changes and take action as needed.

#### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## URL Category and Reputation Changes: Effect on Events

- When URL categories change, events that the system processed before the category change will be associated with their original category names and will be labeled with **Legacy**. Events that the system processed after the category change will be associated with the new categories.

Older, legacy events will age out of the system over time.

- If a URL does not have a reputation at the time it was processed, the URL Reputation column in the event viewer will be empty.

## Troubleshoot URL Filtering

### Expected URL Category is Missing from the Categories List

The URL filtering feature uses a different set of categories than the Security Intelligence feature; the category that you expect to see may be a Security Intelligence category. To see those categories, look at the **URLs** tab on the **Security Intelligence** tab in an access control policy.

### Initial Packets Are Passing Uninspected

See [Inspection of Packets That Pass Before Traffic Is Identified](#), on page 2526 and subtopics.

See also [DNS Filtering: Identify URL Reputation and Category During DNS Lookup](#), on page 1732.

### Health alert: "URL Filtering registration failure"

Verify that your Firewall Management Center and any proxies can connect to the Cisco cloud. You may need information about URL Filtering and URL categories in the following topics: *Internet Access Requirements* and *Communication Port Requirements* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### How can I find the category and reputation of a particular URL?

Do a manual lookup. See *Finding URL Category and Reputation* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Error when attempting a manual lookup: "Cloud Lookup Failure for <URL>"

Make sure the feature is properly enabled. See the prerequisites in *Finding URL Category and Reputation* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### URL appears to be incorrectly handled based on its URL category and reputation

**Problem:** The system does not handle the URL correctly based on its URL category and reputation.

#### Solutions:

- Verify that the URL category and reputation associated with the URL are what you think they are. See *Finding URL Category and Reputation* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- The following issues may be addressed by settings described in [URL Filtering Options](#), on page 1728, accessible using [Enable URL Filtering Using Category and Reputation](#), on page 1728.
  - The URL cache may hold stale information. See information about the **Cached URLs Expire** setting in [URL Filtering Options](#), on page 1728.
  - The local data set may not be updated with current information from the cloud. See information about the **Enable Automatic Updates** setting in [URL Filtering Options](#), on page 1728.
  - The system may be configured to *not* check the cloud for current data. See information about the **Query Cisco cloud for unknown URLs** setting in [URL Filtering Options](#), on page 1728.
- Your access control policy may be configured to pass traffic to the URL without checking the cloud. See information about the **Retry URL cache miss lookup** setting in [Access Control Policy Advanced Settings](#), on page 1626.
- See also [Best Practices for URL Filtering](#), on page 1721.
- If the URL is processed using an SSL rule, see [Decryption Rule Guidelines and Limitations](#), on page 2174 and [Decryption Policy Rule Order](#).
- Verify that the URL is being handled using the access control rule that you think it is being handled by, and that the rule does what you think it does. Consider rule order.

- Verify that the local URL category and reputation database on the Firewall Management Center is successfully being updated from the cloud and that managed devices are successfully being updated from the Firewall Management Center.

Status of these processes are reported in the Health Monitor, in the **URL Filtering Monitor** module and the **Threat Data Updates on Devices** module. For details, see *Health* in the [Cisco Secure Firewall Management Center Administration Guide](#).

If you want to immediately update the local URL category and reputation database, go to **Integration > Other Integrations > Cloud Services**, then click **Update Now** in the **URL Filtering** area. For more information, see [URL Filtering Options, on page 1728](#).

### A URL category or reputation is not correct

For access control or QoS rules: Use manual filtering, paying careful attention to rule order. See [Manual URL Filtering, on page 1733](#) and [Configuring URL Conditions, on page 1730](#).

For SSL rules: Manual filtering is not supported. Instead, use distinguished name conditions.

See also [Dispute URL Category and Reputation, on page 1739](#).

### Web pages are slow to load

There is a tradeoff between security and performance. Some options:

- Consider modifying the **Cached URLs Expire** setting. Choose **Integration > Other Integrations > Cloud Services**. For information, see [URL Filtering Options, on page 1728](#).
- Consider deselecting the **Retry URL cache miss lookup** setting in [Access Control Policy Advanced Settings, on page 1626](#).

### Events Do Not Include URL Category and Reputation

- Make sure you have included applicable URL rules in an access control policy, the rules are active, and the policies have been deployed to the relevant devices.
- URL category and reputation do not appear in an event if the connection is processed before it matches a URL rule.
- The rule that handles the connection must be configured for URL category and reputation.
- Even if you have configured URL categories in the Categories tab in an SSL rule, you must also configure the URLs tab in a rule in your access control policy.

### DNS Filtering is not working

Make sure you have completed all prerequisites and steps in [Enable DNS Filtering to Identify URLs During Domain Lookup, on page 1732](#).

### An End User Tries to Access a Blocked URL and the Page Just Spins and Times Out

When DNS Filtering is enabled and end users access a URL that is blocked, the page will spin but not load. End users are not notified that the page is blocked. This is currently a limitation when DNS filtering is enabled.

See [DNS Filtering Limitations, on page 1733](#).

### Events Include URL Category and Reputation but URL Field is Blank

If the DNS Query field is populated and the URL field is empty, this is expected when the DNS filtering feature is enabled.

See [DNS Filtering and Events, on page 1733](#).

### Multiple Events are Generated for a Single Transaction

A single web transaction sometimes generates two connection events, one for DNS filtering and one for URL filtering. This is expected when DNS filtering is enabled and:

- the access control rule action for the traffic is Allow or Trust.
- the system encounters a URL for the first time.

See [DNS Filtering and Events, on page 1733](#).

## History for URL Filtering

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
New URL category	New in release 7.0 timeframe, applies to all releases	Any	New URL category: Private IP address For details, see <a href="https://talosintelligence.com">Talosintelligence.com</a>
DNS filtering	7.0 6.7 (Beta)	Any	A new option in the advanced settings for each access control policy allows earlier filtering of web traffic by category and reputation.  This feature is enabled by default on new installations.  Supported Platforms: Firewall Management Center and managed devices at any supported version.
Ability to specify handling for sites with unknown reputation	6.7	Any	You can now specify handling for URLs with unknown reputation.  Modified screens: URL rules in access control policies and QoS policies, and category rules in SSL policies, include a new checkbox for this purpose below the reputation selection area.  Supported Platforms: All

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
<p>New and changed URL categories</p> <p>New names for reputation levels</p>	6.5	Any	<p>The following changes apply to URL rules in access control and QoS policies and to Category rules in SSL policies:</p> <p>The set of URL categories has changed. There are now two "pages" of categories from which to select when you create a URL rule.</p> <p>The name associated with each reputation level has changed.</p> <p>For descriptions of the new categories and reputation names, see <a href="#">URL Category and Reputation Descriptions, on page 1721</a>.</p> <p>For complete details specific to upgrades, see also the Release Notes and upgrade instructions for version 6.5.</p> <p>If there are future category set changes, your rules will display icons to alert you.</p> <p>Modified screens: URL rules in access control policies, SSL policies, and QoS policies; event data related to URL categories.</p> <p>Supported Platforms: Firewall Management Center and devices running release 6.5.</p>
Minor change to classic device licensing	6.5	Any	<p>For devices that use classic licenses, URL filtering will not be enabled until the device is registered to the Firewall Management Center and a URL Filtering license is assigned to the device.</p> <p>Supported Platforms: NGIPSv and ASA with FirePOWER Services devices.</p>
Addresses for retrieving URL data from the Cisco cloud have changed	6.5	Any	See the URL Filtering row in <i>Internet Access Requirements</i> in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a> .
Opportunity to dispute an assigned URL Category	6.5	Any	<p>If you disagree with the category that the system assigns to a URL, you can submit a request to change the category.</p> <p>New/Modified screens:</p> <ul style="list-style-type: none"> <li>• New menu option when right-clicking a URL category or reputation in tables of connection events under the <b>Analysis</b> menu.</li> <li>• New button on the URL Lookups page (<b>Analysis &gt; Advanced &gt; URL</b>). (Hover your pointer over the URL to display the button.)</li> <li>• New option on the <b>System &gt; Integration &gt; Cloud Services</b> page</li> </ul> <p>Supported platforms: All</p>
The <b>Cisco CSI</b> tab is renamed to <b>Cloud Services</b>	6.4	Any	<p>Modified screens and navigation: <b>System &gt; Integration &gt; Cisco CSI</b> is now <b>System &gt; Integration &gt; Cloud Services</b></p> <p>Supported platforms: Firewall Management Center</p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Moved URL Filtering information from various locations to this new URL Filtering chapter	6.3	Any	Moved information about configuring cloud communications for URL Filtering to the new URL Filtering chapter. Moved certain other URL Filtering information from other locations to this chapter. Made related changes to the structure of the Cisco CSI topics in the chapter.
New option: Cached URLs Expire	6.3	Any	Use this new control to balance performance with freshness of URL category and reputation data in order to minimize instances of URLs matching on stale data.  Modified screens: <b>System &gt; Integration &gt; Cisco CSI</b> .  Supported Platforms: All.
Changed menu path	6.3	Any	The path to the manual URL Lookup page has changed from <b>Analysis &gt; Lookup &gt; URL</b> to <b>Analysis &gt; Advanced &gt; URL</b> .

## CHAPTER 45

# Security Intelligence

---

The following topics provide an overview of Security Intelligence, including use of lists for blocking and allowing traffic and basic configuration.

- [About Security Intelligence, on page 1747](#)
- [Best Practices for Security Intelligence, on page 1748](#)
- [License Requirements for Security Intelligence, on page 1748](#)
- [Requirements and Prerequisites for Security Intelligence, on page 1749](#)
- [Security Intelligence Sources, on page 1749](#)
- [Configure Security Intelligence, on page 1750](#)
- [Security Intelligence Monitoring, on page 1756](#)
- [Override Security Intelligence Blocking, on page 1757](#)
- [Troubleshooting Security Intelligence, on page 1757](#)
- [History for Security Intelligence Block Listing, on page 1758](#)

## About Security Intelligence

As an early line of defense against malicious internet content, Security Intelligence uses reputation intelligence to quickly block connections to or from IP addresses, URLs, and domain names. This is called *Security Intelligence block listing*.

Security Intelligence is an early phase of access control, before the system performs more resource-intensive evaluation. Using a Block list improves performance by quickly excluding traffic that does not require inspection.

---

**Note** You cannot use a Block list to block fastpathed traffic. Prefilter evaluation occurs before Security Intelligence filtering. Fastpathed traffic bypasses all further evaluation, including Security Intelligence.

---

Although you can configure custom Block lists, Cisco provides access to regularly updated intelligence feeds. Sites representing security threats such as malware, spam, botnets, and phishing appear and disappear faster than you can update and deploy custom configurations.

You can refine Security Intelligence Block listing with Do Not Block lists and monitor-only Block lists. These mechanisms exempt traffic from being blocked by a Block list, but do **not** automatically trust or fastpath matching traffic. Traffic added to a Do Not Block list or monitored at the Security Intelligence stage is intentionally subject to further analysis with the rest of access control.

**Note** The Security Intelligence configuration that includes detection signatures or malware URLs might lead to false threat alerts when the Firewall Threat Defense troubleshoot files are scanned.

#### Related Topics

[Security Intelligence](#), on page 1309

## Best Practices for Security Intelligence

- Configure your access control policies to block threats detected by Cisco-provided Security Intelligence feeds. See [Configuration Example: Security Intelligence Blocking](#), on page 1755.
- If you want to supplement the Cisco-provided Security Intelligence feeds with custom threat data, or manually block emerging threats:
  - For IP addresses, use custom Security Intelligence lists and feeds, or Network objects or groups. To create these, see [Security Intelligence](#), on page 1309 and [Network](#), on page 1281, and their subtopics. To use them for Security Intelligence, see [Configure Security Intelligence](#), on page 1750. Network objects used in Security Intelligence policy require an IPS license.
  - For URLs and domains, use custom Security Intelligence lists and feeds, *not* objects or groups. See details at [Manual URL Filtering Options](#), on page 1734.
  - You can also add entries to a Block list from events. See [Global and Domain Security Intelligence Lists](#), on page 1311.
- To test new feeds, or for passive deployments, set the action from block to monitor only. See [Security Intelligence Monitoring](#), on page 1756.
- If you need to exclude specific sites or addresses from Security Intelligence blocking, see [Override Security Intelligence Blocking](#), on page 1757.
- If your Firepower deployment is integrated with Cisco XDR and you use custom Security Intelligence lists and feeds, be sure to update Security Services Exchange with these lists and feeds. For details, see instructions for configuring auto-promotion of events in the Security Services Exchange online help. For general information about this integration, see *Enable SecureX Integration* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- System-provided Security Intelligence categories may change over time and without notification; you should plan to check periodically for changes, and modify your policies accordingly.
- You should also configure URL filtering, a separate feature with separate licensing requirements, for further protection against malicious sites. See [URL Filtering](#), on page 1719.

## License Requirements for Security Intelligence

### Threat Defense License

IPS

**Classic License**

Protection

# Requirements and Prerequisites for Security Intelligence

**Model Support**

Any

**Supported Domains**

Any

**User Roles**

- Admin
- Access Admin
- Network Admin

**Important**

You must apply the Network Discovery policy on the device for a successful application of the SI policy.

## Security Intelligence Sources

- System-provided feeds

Cisco provides access to regularly updated intelligence feeds for domains, URLs and IP addresses. For more information, see [Security Intelligence, on page 1309](#).

If you see a feed with "TID" in the name, this feed is *not* used by Security Intelligence. Instead, this feed is used by the feature described in [Secure Firewall Threat Intelligence Director, on page 2687](#).

- Third-party feeds

Optionally, supplement Cisco-provided feeds with third-party reputation feeds, which are dynamic lists that the Secure Firewall Management Center downloads from the internet on a regular basis. See [Custom Security Intelligence Feeds, on page 1317](#).

- Custom Block lists or feeds (or objects or groups)

Block specific IP addresses, URLs, or domain names using a manually-created list or feed (for IP addresses, you can also use network objects or groups.)

For example, if you become aware of malicious sites or addresses that are not yet blocked by a feed, add these sites to a custom Security Intelligence list and add this custom list to the Block list in the Security Intelligence tab of your access control policy, as described in [Custom Security Intelligence Lists, on page 1318](#) and [Configure Security Intelligence, on page 1750](#).

For IP addresses, you can optionally use network objects rather than lists or feeds for this purpose; for information, see [Network, on page 1281](#). (For URLs, using lists and feeds is strongly recommended over other methods.)

- Custom Do Not Block lists or feeds

Override Security Intelligence blocking for specific sites or addresses. See [Override Security Intelligence Blocking, on page 1757](#).

- Global Block lists (one each for Network, URL and DNS)

While reviewing events, you can immediately add an event's IP address, URL, or domain to the applicable Global Block List so that Security Intelligence will handle future traffic from that source. See [Global and Domain Security Intelligence Lists, on page 1311](#).

- Global Do Not Block lists (one each for Network, URL and DNS)

While reviewing events, you can immediately add an event's IP address, URL, or domain to the applicable Global Do Not Block List if you do not want Security Intelligence to block future traffic from that source. See [Global and Domain Security Intelligence Lists, on page 1311](#).

## Configure Security Intelligence

Each access control policy has Security Intelligence options. You can add network objects, URL objects and lists, and Security Intelligence feeds and lists to a Block list or Do Not Block list, and constrain any of these by security zone. You can also associate a DNS policy with your access control policy, and add domain names to a Block or Do Not Block list.

The number of objects in the Do Not Block lists plus the number in the Block lists cannot exceed 125 network objects, or 32767 URL objects and lists.

### Before you begin

- Tip: For guidance on minimum configuration recommendations, see also [Configuration Example: Security Intelligence Blocking, on page 1755](#).
- To ensure that all options are available to select, add at least one managed device to your management center.
- In passive deployments, or if you want to set Security Intelligence filtering to monitor-only, enable logging; see *Logging Connections with Security Intelligence* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- Configure a DNS policy to take Security Intelligence action for domains. For more information, see [DNS Policies, on page 1759](#).

### Procedure

- Step 1** In the access control policy editor, click **Security Intelligence**.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 2** You have the following options:

- Click **Networks** to add network objects (IP addresses).

**Note**

Network objects used in a Security Intelligence policy require a IPS license.

- Click **URLs** to add URL objects.

**Step 3** Find the **Available Objects** you want to add to the Block or Do Not Block list. You have the following options:

- Search the available objects by typing in the **Search by name or value** field. Clear the search string by clicking **Reload** (↻) or **Clear** (✕).
- If no existing list or feed meets your needs, click **Add** (+), select **New Network List** or **New URL List**, and proceed as described in [Creating Security Intelligence Feeds, on page 1317](#) or [Uploading New Security Intelligence Lists to the Secure Firewall Management Center, on page 1319](#).
- If no existing object meets your needs, click **Add** (+), select **New Network Object** or **New URL Object**, and proceed as described in [Creating Network Objects, on page 1283](#).

Security Intelligence ignores IP address blocks using a /0 netmask.

**Step 4** Choose one or more **Available Objects** to add.

**Step 5** (Optional) Choose an **Available Zone** to constrain the selected objects by zone.

You cannot constrain system-provided Security Intelligence lists by zone.

**Note**

The **Any** zone for an SI list applies only to interfaces that are part of a security zone. However, an exception is that if a device does not have any interfaces associated with a security zone, then the **Any** zone will match any interface.

For example, if you have five interfaces on a device and none of them are associated with a security zone, any SI list that is assigned to the **Any** zone will be inspected against traffic on ALL interfaces on the device. If you add one interface to a security zone on that device, it effectively would remove SI inspection on the other four interfaces, where the zone is set to **Any** for an SI list. If you add the other four interfaces to a security zone, they will be evaluated by the SI list attached to the **Any** zone.

**Step 6** Click **Add to Do Not Block list** or **Add to Block list**, or click and drag the selected objects to either list.

To remove an object from a Block or Do Not Block list, click **Delete** (🗑️). To remove multiple objects, choose the objects and right-click to **Delete Selected**.

**Step 7** (Optional) Set objects on the Block list to monitor-only by right-clicking the object under **Block List**, then choosing **Monitor-only (do not block)**.

You cannot set system-provided global Security Intelligence lists to monitor only.

**Step 8** Choose a DNS policy from the **DNS Policy** drop-down list.

**Step 9** Click **Save**.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

**Related Topics**

- [Security Intelligence](#), on page 1309
- [Snort Restart Scenarios](#), on page 176

## Security Intelligence Options

Use the Security Intelligence tab in the access control policy editor to configure network (IP address) and URL Security Intelligence, and to associate the access control policy with a DNS policy in which you have configured Security Intelligence for domains.

**Available Objects**

Available objects include:

- Security Intelligence categories populated by the system-provided feed.  
For details, see [Security Intelligence Categories, on page 1753](#).
- System-provided Global Block and Do Not Block lists.  
For descriptions, see [Security Intelligence Sources, on page 1749](#).
- Security Intelligence lists and feeds that you create under Object > Object Management > Security Intelligence.  
For descriptions, see [Security Intelligence Sources, on page 1749](#).
- Network and URL objects and groups that are configured on the respective pages under Object > Object Management. These are different from the Security Intelligence objects in the previous bullet.  
For details about network objects, see [Network, on page 1281](#). (For URLs, use Security Intelligence lists or feeds rather than objects or groups.)

**Available Zones**

Except for the system-provided Global lists, you can constrain Security Intelligence filtering by zone.

For example, to improve performance, you might want to target enforcement to specific zones rather than all interfaces. As a more specific example, you can block spam only for a security zone that handles email traffic.

To enforce Security Intelligence filtering for an object on multiple zones, you must add the object to the Block or Do Not Block list separately for each zone.

**DNS Policy**

In order to match DNS traffic using Security Intelligence, you must select a DNS policy for your Security Intelligence configuration.

Using Block or Do Not Block lists, or monitoring traffic based on a DNS list or feed, also requires that you:

- Configure DNS Security Intelligence lists and feeds. See [Security Intelligence, on page 1309](#).
- Create a DNS policy. See [Creating Basic DNS Policies, on page 1762](#) for more information.

- Configure DNS rules that reference your DNS lists or feeds. See [Creating and Editing DNS Rules, on page 1764](#) for more information.
- Because you deploy the DNS policy as part of your access control policy, you must associate both policies. See [DNS Policy Deploy, on page 1772](#) for more information.

### Do Not Block List

See [Override Security Intelligence Blocking, on page 1757](#).

To select all objects in the list, right-click an object.

### Block List

See [Configuration Example: Security Intelligence Blocking, on page 1755](#) and other topics in this chapter.

For explanations of the visual indicators in the Block list, see [Block List Icons, on page 1755](#).

To select all objects in the list, right-click an object.

### Logging

Security Intelligence logging, enabled by default, logs all blocked and monitored connections handled by an access control policy's assigned devices. However, the system does not log Do Not Block list matches; logging of connections on the Do Not Block list depends on their eventual disposition. Logging must be enabled for connections on the Block list before you can set objects on that list to monitor-only.

To enable, disable, or view logging settings, right-click an object in the Block list.

### Related Topics

[Global and Domain Security Intelligence Lists, on page 1311](#)

[Security Intelligence Lists and Multitenancy, on page 1311](#)

## Security Intelligence Categories

Security Intelligence categories are determined by the system-provided feeds described in [Security Intelligence, on page 1309](#).

These categories are used in the following locations:

- The Networks sub-tab on the Security Intelligence tab of an access control policy
- The URLs sub-tab beside the Networks tab on the Security Intelligence tab of an access control policy
- In a DNS policy on the DNS tab in the DNS rule configuration page
- In events generated when traffic matches Block or Monitor configurations in the above locations

#### Note

If your organization is using Secure Firewall Threat Intelligence Director: When viewing events, you may see categories that indicate that the action was taken by TID, such as TID URL Block.

Categories are updated by Talos from the cloud, and this list may change independently of Firepower releases.

Table 97: Cisco Talos Intelligence Group (Talos) Feed Categories

Security Intelligence Category	Description
Attackers	Active scanners and hosts known for outbound malicious activity
Banking_fraud	Sites that engage in fraudulent activities that relate to electronic banking
Bogon	Bogon networks and unallocated IP addresses
Bots	Sites that host binary malware droppers
CnC	Sites that host command-and-control servers for botnets
Cryptomining	Hosts providing remote access to pools and wallets for the purpose of mining cryptocurrency
Dga	Malware algorithms used to generate a large number of domain names acting as rendezvous points with their command-and-control servers
Exploitkit	Software kits designed to identify software vulnerabilities in clients
High_risk	Domains and hostnames that match against the OpenDNS predictive security algorithms from security graph
Ioc	Hosts that have been observed to engage in Indicators of Compromise (IOC)
Link_sharing	Websites that share copyrighted files without permission
Malicious	Sites exhibiting malicious behavior that do not necessarily fit into another, more granular, threat category
Malware	Sites that host malware binaries or exploit kits
Newly_seen	Domains that have recently been registered, or not yet seen via telemetry.  <b>Attention</b> Currently, this category does not have any active feed and is reserved for future use.
Open_proxy	Open proxies that allow anonymous web browsing
Open_relay	Open mail relays that are known to be used for spam
Phishing	Sites that host phishing pages
Response	IP addresses and URLs that are actively participating in malicious or suspicious activity
Spam	Mail hosts that are known for sending spam
Spyware	Sites that are known to contain, serve, or support spyware and adware activities
Suspicious	Files that appear to be suspicious and have characteristics that resemble known malware

Security Intelligence Category	Description
Tor_exit_node	Hosts known to offer exit node services for the Tor Anonymizer network

## Block List Icons

The following visual indicators may appear in the Block list on the Security Intelligence tab in an access control policy:

Icon or Visual Indicator	Description
<b>Block</b> (🚫)	The object is set to block.
<b>Monitor</b> (👁️)	The object is set to monitor-only. See <a href="#">Security Intelligence Monitoring, on page 1756</a>
An object is displayed in strikethrough text	The same object is also on the Do Not Block list, which overrides the block.

## Configuration Example: Security Intelligence Blocking

Configure your access control policy to block all threats detectable by the system's regularly updated Security Intelligence feeds.

The number of objects in the Block lists plus the number in the Do Not Block lists cannot exceed 125 network objects, or 32767 URL objects and lists.

### Before you begin

- To ensure that all options are available to select, add at least one managed device to your management center.
- Configure a DNS policy to block all Security Intelligence threat categories for domains. For more information, see [DNS Policies, on page 1759](#).
- If you have, or will have, custom lists of entities to block, create a Security Intelligence object of each type (URLs, DNS, Networks.) See [Security Intelligence, on page 1309](#).

### Procedure

**Step 1** Click **Policies > Access Control heading > Access Control**.

**Step 2** Create a new access control policy or edit an existing policy.

**Step 3** In the access control policy editor, click **Security Intelligence**.

If the controls are dimmed, settings are inherited from an ancestor policy, or you do not have permission to modify the configuration. If the configuration is unlocked, uncheck **Inherit from base policy** to enable editing.

**Step 4** Click **Networks** to add blocking criteria for IP addresses.

- a) Scroll down in the Networks list and select all of the threat categories listed below the Global lists.
- b) If applicable, select the security zones for which you want to block these threats.
- c) Click **Add to Block List**.
- d) If you have created custom lists or feeds with addresses to block, add those to the Block List using the same steps as above.

**Step 5** Click **URLs** to add blocking criteria for URLs, and repeat the steps you followed for Networks.

**Step 6** Choose a DNS policy from the **DNS Policy** drop-down list; see [DNS Policy Overview, on page 1759](#).

**Step 7** Click **Save**.

---

### What to do next

- Enable logging for these connections; see *Logging Connections with Security Intelligence* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).
- For additional protection, configure URL filtering to block malicious URLs. See [URL Filtering, on page 1719](#).

## Security Intelligence Monitoring

Monitoring logs connection events for traffic that would have been blocked by Security Intelligence, but does not block the traffic. Monitoring is especially useful for:

- Testing feeds before you implement them.

Consider a scenario where you want to test a third-party feed before you implement blocking using that feed. When you set the feed to monitor-only, the system allows connections that would have been blocked to be further analyzed by the system, but also logs a record of each of those connections for your evaluation.

- Passive deployments, to optimize performance.

Managed devices that are deployed passively cannot affect traffic flow; there is no advantage to configuring the system to block traffic. Additionally, because blocked connections are not actually blocked in passive deployments, the system may report multiple beginning-of-connection events for each blocked connection.

---

**Note** If configured, Secure Firewall Threat Intelligence Director may impact the action taken (Monitor or Block.) For more information, see [Threat Intelligence Director-Firewall Management Center Action Prioritization, on page 2709](#).

---

### To Configure Security Intelligence Monitoring:

After you configure Security Intelligence blocking following the instructions in [Configuration Example: Security Intelligence Blocking, on page 1755](#), right-click each applicable object in the Block list and choose **Monitor-only**. You cannot set system-provided Security Intelligence lists to monitor only.

# Override Security Intelligence Blocking

Optionally, you can use Do Not Block lists to exempt specific domains, URLs, or IP addresses from being blocked by Security Intelligence lists or feeds.

For example, you can:

- Override the occasional false-positive block in a reputable Security Intelligence feed
- Inspect specific traffic in depth instead of blocking it early based on reputation
- Exempt otherwise-restricted transactions based on zone from Security Intelligence blocking

For example, you can add an improperly classified URL to a Do Not Block list, but then restrict the Do Not Block list object using a security zone used by those in your organization who need to access those URLs. That way, only those with a business need can access the URLs on the Do Not Block list.

**Note**

Entries on a Do Not Block list are simply exemptions from the block list. Any connection that passes the Security Intelligence policy is subject to the access control rules. Thus, an entry in the Do Not Block list can subsequently be blocked by an access control rule or intrusion policy. Your Do Not Block entries should always be exemptions from your block lists.

## Procedure

- 
- Step 1** Option 1: Add an IP address, URL, or domain from an event to the Global Do Not Block List. See [Global and Domain Security Intelligence Lists, on page 1311](#).
- Step 2** Option 2: Use a custom Security Intelligence list or feed.
- a) Create the custom Security Intelligence list or feed. See [Custom Security Intelligence Lists, on page 1318](#) or [Creating Security Intelligence Feeds, on page 1317](#).
  - b) For IP addresses (Networks) and URLs: Edit your access control policy, click the Security Intelligence tab, then click the custom list or feed in the Networks or URLs sub-tab, then click **Add to Do Not Block List**.
  - c) Save your changes.
  - d) For domains (DNS): See the "DNS Policy" section in the [Security Intelligence Options, on page 1752](#) topic.
  - e) Deploy your changes.
- 

# Troubleshooting Security Intelligence

See the following topics for troubleshooting Security Intelligence.

## Security Intelligence Categories Are Missing from the Available Options List

**Symptoms:** On the Security Intelligence tab of the access control policy, Security Intelligence categories (such as CnC or Exploitkit) are not displayed in the Networks tab under Available Options.

**Cause:**

- These categories do not appear until you have added at least one managed device to your management center. You must add a device in order to pull all TALOS feeds.
- The URL filtering feature uses a different set of categories than the Security Intelligence feature; the category that you expect to see may be a URL filtering category. To see URL filtering categories, look at the **URLs** tab in an access control rule.

## History for Security Intelligence Block Listing

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
New Security Intelligence categories	All	Any	<p>Talos has added the following new Security Intelligence categories:</p> <ul style="list-style-type: none"> <li>• banking_fraud</li> <li>• ioc</li> <li>• high_risk</li> <li>• link_sharing</li> <li>• malicious</li> <li>• newly_seen</li> <li>• spyware</li> </ul> <p>You should update your access control and DNS policies to address the new categories, and check periodically for future changes.</p> <p>New/modified pages: Security Intelligence tab, Networks and URLs sub-tabs; DNS rules in DNS policies</p> <p>Supported platforms: Firewall Management Center</p>

## CHAPTER 46

# DNS Policies

The following topics explain DNS policies, DNS rules, and how to deploy DNS policies to managed devices.

- [DNS Policy Overview, on page 1759](#)
- [Cisco Umbrella DNS Policies, on page 1760](#)
- [DNS Policy Components, on page 1760](#)
- [License Requirements for DNS Policies, on page 1761](#)
- [Requirements and Prerequisites for DNS Policies, on page 1761](#)
- [Managing DNS and Umbrella DNS Policies, on page 1762](#)
- [DNS Rules, on page 1764](#)
- [How to Create DNS Rules, on page 1769](#)
- [DNS Policy Deploy, on page 1772](#)
- [Cisco Umbrella DNS Policies, on page 1772](#)

## DNS Policy Overview

DNS-based Security Intelligence allows you to block traffic based on the domain name requested by a client, using a Security Intelligence Block list. Cisco provides domain name intelligence you can use to filter your traffic; you can also configure custom lists and feeds of domain names tailored to your deployment.

Traffic on a DNS policy Block list is immediately blocked and therefore is not subject to any further inspection—not for intrusions, exploits, malware, and so on, but also not for network discovery. You can use a Security Intelligence Do Not Block list to override a Block list and force access control rule evaluation, and, recommended in passive deployments, you can use a “monitor-only” setting for Security Intelligence filtering. This allows the system to analyze connections that would have been blocked by a Block list, but also logs the match to the Block list and generates an end-of-connection Security Intelligence event.

**Note** DNS-based Security Intelligence may not work as intended for a domain name unless the DNS server deletes a domain cache entry due to expiration, or a client’s DNS cache or the local DNS server’s cache is cleared or expires.

You configure DNS-based Security Intelligence using a DNS policy and associated DNS rules. To deploy it to your devices, you must associate your DNS policy with an access control policy, then deploy your configuration to managed devices.

# Cisco Umbrella DNS Policies

Cisco Umbrella DNS Connection in the management center helps to redirect DNS queries to Cisco Umbrella. This allows Cisco Umbrella to validate requests, allow or block them based on the domain names, and apply DNS-based security policy on the request. If you use Cisco Umbrella, you must configure the Cisco Umbrella Connection (**Integration > Other Integrations > Cloud Services > Cisco Umbrella Connection**) to redirect DNS queries to Cisco Umbrella.

The Umbrella Connector is part of the system's DNS inspection. If your existing DNS inspection policy map decides to block or drop a request based on your DNS inspection settings, the request is not forwarded to Cisco Umbrella. Thus, you have two lines of protection:

- Your local DNS inspection policy
- Your Cisco Umbrella cloud-based policy

When redirecting DNS lookup requests to Cisco Umbrella, the Umbrella Connector adds an EDNS (Extension mechanisms for DNS) record. An EDNS record includes the device identifier information, organization ID, and client IP address. Your cloud-based policy can use those criteria to control access in addition to the reputation of the FQDN. You can also elect to encrypt the DNS request using DNSCrypt to ensure the privacy of usernames and internal IP addresses.

To redirect DNS requests from the management center to Cisco Umbrella:

1. Configure the Cisco Umbrella connection settings.
2. Create and configure an Umbrella DNS policy.
3. Associate the Umbrella DNS policy with an access control policy.
4. Deploy the changes.

For detailed information about how to set up the Umbrella DNS Connector in the management center, see [Configuring the Umbrella DNS Connector for Cisco Secure Firewall Management Center](#).

## DNS Policy Components

A DNS policy allows you to block connections based on domain name, using a Block list, or exempt such connections from this type of blocking using a Do Not Block list. The following list describes the configurations you can change after creating a DNS policy.

### Name and Description

Each DNS policy must have a unique name. A description is optional.

### Rules

Rules provide a granular method of handling network traffic based on the domain name. Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number.

When you create a DNS policy, the system populates it with a default Global Do-Not-Block List for DNS rule and a default Global Block List for DNS rule. Both rules are fixed to the first position in their respective categories. You cannot modify these rules, but you can disable them.

**Note**

If multitenancy is enabled for your Firewall Management Center, the system is organized into a hierarchy of domains, including ancestor and descendant domains. These domains are distinct and separate from the domain names used in DNS management.

A descendant list contains the domains on the Block or Do Not Block lists of system subdomain users. From an ancestor domain, you cannot view the contents of descendant lists. If you do not want subdomain users to add domains to a Block or Do Not Block list:

- disable the descendant list rules, and
- enforce Security Intelligence using the access control policy inheritance settings

The system evaluates rules in the following order:

- Global Do-Not-Block List for DNS rule (if enabled)
- Descendant DNS Do-Not-Block Lists rule (if enabled)
- Rules with a Do Not Block action
- Global Block List for DNS rule (if enabled)
- Descendant DNS Block Lists rule (if enabled)
- Rules with an action other than Do Not Block

Usually, the system handles DN-based network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic. If no DNS rules match the traffic, the system continues evaluating the traffic based on the associated access control policy's rules. DNS rule conditions can be simple or complex.

## License Requirements for DNS Policies

**Threat Defense License**

IPS

**Classic License**

Protection

## Requirements and Prerequisites for DNS Policies

**Model Support**

Any

**Supported Domains**

Any

### User Roles

- Admin
- Access Admin
- Network Admin

#### Important

You must apply the Network Discovery policy on the device for a successful DNS validation on the traffic.

## Managing DNS and Umbrella DNS Policies

Use the DNS Policy page (**Policies > Access Control heading > DNS**) to manage custom DNS and Umbrella DNS policies.

In addition to custom policies that you create, the system provides the Default DNS Policy and Default Umbrella DNS Policy. The default DNS policy uses the default Block list and Do Not Block list. You can edit and use this system-provided custom policies.

### Procedure

**Step 1** Choose **Policies > Access Control heading > DNS**.

**Step 2** Manage your DNS policy:

- Compare—To compare DNS policies, click **Compare Policies** and proceed as described in [Compare Policies, on page 201](#).
- Copy—To copy a DNS policy, click **Copy** ( ) and proceed as described in [Editing DNS Policies, on page 1763](#).
- Create—To create a new Umbrella DNS policy, click **New Policy > Umbrella DNS Policy** and proceed as described in [Create an Umbrella DNS Policy, on page 1775](#).
- Delete—To delete a DNS or Umbrella DNS policy, click **Delete** ( ), then confirm you want to delete the policy.
- Edit—To modify an existing DNS policy, click **Edit** ( ) and proceed as described in [Editing DNS Policies, on page 1763](#). To modify an existing Umbrella DNS policy, click **Edit** ( ) and proceed as described in [Edit Umbrella DNS Policies and Rules, on page 1775](#).

## Creating Basic DNS Policies

When you create a new DNS policy, it contains default settings. You must then edit it to customize the behavior.

### Procedure

- 
- Step 1** Choose **Policies > Access Control heading > DNS**.
- Step 2** Click **Add DNS Policy > DNS Policy**.
- Step 3** Give the policy a unique **Name** and, optionally, a **Description**.
- Step 4** Click **Save**.
- 

### What to do next

Configure the policy. See [Editing DNS Policies, on page 1763](#).

## Editing DNS Policies

Only one person should edit a DNS policy at a time, using a single browser window. If multiple users attempt to save the same policy, only the first set of saved changes are retained.

To protect the privacy of your session, after thirty minutes of inactivity on the policy editor, a warning appears. After sixty minutes, the system discards your changes.

### Procedure

- 
- Step 1** Choose **Policies > Access Control heading > DNS**.
- Step 2** Click **Edit** (✎) next to the DNS policy you want to edit.
- If **View** (👁) appears instead, the configuration belongs to an ancestor domain, or you do not have permission to modify the configuration.
- Step 3** Edit your DNS policy:
- Name and Description—To change the name or description, click the field and type the new information.
  - Rules—To add, categorize, enable, disable, or otherwise manage DNS rules, click **Rules** and proceed as described in [Creating and Editing DNS Rules, on page 1764](#).
- Step 4** Click **Save**.
- 

### What to do next

- Optionally, further configure the new policy as described in *Logging Connections with Security Intelligence* in the [Cisco Secure Firewall Management Center Administration Guide](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# DNS Rules

DNS rules handle traffic based on the domain name requested by a host. As part of Security Intelligence, this evaluation happens after any traffic decryption, and before access control evaluation.

The system matches traffic to DNS rules in the order you specify. In most cases, the system handles network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic.

In addition to its unique name, each DNS rule has the following basic components:

## State

By default, rules are enabled. If you disable a rule, the system does not use it to evaluate network traffic, and stops generating warnings and errors for that rule.

## Position

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. With the exception of Monitor rules, the first rule that traffic matches is the rule that handles that traffic.

## Conditions

Conditions specify the specific traffic the rule handles. A DNS rule must contain a DNS feed or list condition, and can also match traffic by security zone, network, or VLAN.

## Action

A rule's action determines how the system handles matching traffic:

- Traffic with a **Do Not Block** action is allowed, subject to further access control inspection.
- Monitored traffic is subject to further evaluation by remaining rules on the DNS Block list. If the traffic does not match a DNS Block list rule, it is inspected with access control rules. The system logs a Security Intelligence event for the traffic.
- Traffic on a Block list is dropped without further inspection. You can also return a Domain Not Found response, or redirect the DNS query to a sinkhole server.

## Related Topics

[About Security Intelligence](#), on page 1747

# Creating and Editing DNS Rules

In a DNS policy, you can add up to a total of 32767 DNS lists to the Block list and Do Not Block list rules; that is, the number of lists in the DNS policy cannot exceed 32767.

## Procedure

---

**Step 1** In the DNS policy editor, you have the following options:

- To add a new rule, click **Add DNS Rule**.
- To edit an existing rule, click **Edit** (✎).

**Step 2** Enter a **Name**.

**Step 3** Configure the rule components, or accept the defaults:

- Action—Choose a rule **Action**; see [DNS Rule Actions, on page 1766](#).
- Conditions—Configure the rule's conditions; see [DNS Rule Conditions, on page 1767](#).
- Enabled—Specify whether the rule is **Enabled**.

**Step 4** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## DNS Rule Management

The **Rules** tab of the DNS policy editor allows you to add, edit, move, enable, disable, delete, and otherwise manage DNS rules within your policy.

For each rule, the policy editor displays its name, a summary of its conditions, and the rule action. Other icons represent **Warning** (⚠), **Error** (✖), and other important **Information** (i). Disabled rules are dimmed and marked (disabled) beneath the rule name.

### Enabling and Disabling DNS Rules

When you create a DNS rule, it is enabled by default. If you disable a rule, the system does not use it to evaluate network traffic and stops generating warnings and errors for that rule. When viewing the list of rules in a DNS policy, disabled rules are dimmed, although you can still modify them. Note that you can also enable or disable a DNS rule using the DNS rule editor.

#### Procedure

---

**Step 1** In the DNS policy editor, right-click the rule and choose a rule state.

**Step 2** Click **Save**.

---

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## DNS Rule Order Evaluation

Rules in a DNS policy are numbered, starting at 1. The system matches traffic to DNS rules in top-down order by ascending rule number. In most cases, the system handles network traffic according to the *first* DNS rule where *all* the rule's conditions match the traffic:

- For Monitor rules, the system logs the traffic, then continues evaluating traffic against lower-priority DNS Block list rules.
- For non-Monitor rules, the system does **not** continue to evaluate traffic against additional, lower-priority DNS rules after that traffic matches a rule.

Note the following regarding rule order:

- The Global Do-Not-Block List for DNS is always first, and takes precedence over all other rules.
- The Do-Not-Block List section precedes the Block List section; Do-Not-Block List rules always take precedence over other rules.
- The Global Block List for DNS is always first in the Block List section, and takes precedence over all other Monitor and Block list rules.
- The Block List section contains Monitor and Block list rules.
- When you first create a DNS rule, the system positions it last in the Do-Not-Block List section if you assign a **Do Not Block** action, or last in the Block List section if you assign any other action.

You can drag and drop rules to reorder them.

## DNS Rule Actions

Every DNS rule has an *action* that determines the following for matching traffic:

- handling—foremost, the rule action governs whether the system will block, not block, or monitor traffic that matches the rule's conditions, based on a Block or Do Not Block list
- logging—the rule action determines when and how you can log details about matching traffic

If configured, TID also impacts action prioritization. For more information, see [Threat Intelligence Director-Firewall Management Center Action Prioritization, on page 2709](#).

### Do Not Block Action

The **Do Not Block** action allows traffic to pass to the next phase of inspection, which is access control rules.

The system does not log Do Not Block list matches. Logging of these connections depends on their eventual disposition.

### Monitor Action

The **Monitor** action is designed to force connection logging; matching traffic is neither immediately allowed nor blocked. Rather, traffic is matched against additional rules to determine whether to permit or deny it. The first non-Monitor DNS rule matched determines whether the system blocks the traffic. If there are no additional matching rules, the traffic is subject to access control evaluation.

For connections monitored by a DNS policy, the system logs end-of-connection Security Intelligence and connection events to the Firewall Management Center database.

### Block Actions

These actions block traffic without further inspection of any kind:

- The **Drop** action drops the traffic.
- The **Domain Not Found** action returns a non-existent internet domain response to the DNS query, which prevents the client from resolving the DNS request.
- The **Sinkhole** action returns a sinkhole object's IPv4 or IPv6 address in response to the DNS query (A and AAAA records only). The sinkhole server can log, or log and block, follow-on connections to the IP address. If you configure a **Sinkhole** action, you must also configure a sinkhole object.

For a connection blocked based on the **Drop** or **Domain Not Found** actions, the system logs beginning-of-connection Security Intelligence and connection events. Because blocked traffic is immediately denied without further inspection, there is no unique end of connection to log.

For a connection blocked based on the **Sinkhole** action, logging depends on the sinkhole object configuration. If you configure your sinkhole object to only log sinkhole connections, the system logs end-of-connection connection events for the follow-on connection. If you configure your sinkhole object to log and block sinkhole connections, the system logs beginning-of-connection connection events for the follow-on connection, then blocks that connection.

## DNS Rule Conditions

A DNS rule's conditions identify the type of traffic that rule handles. Conditions can be simple or complex. You must define a DNS feed or list condition within a DNS rule. You can also optionally control traffic by security zone, network, or VLAN.

When adding conditions to a DNS rule:

- If you do not configure a particular condition for a rule, the system does not match traffic based on that criterion.
- You can configure multiple conditions per rule. Traffic must match **all** the conditions in the rule for the rule to apply to traffic. For example, a rule with a DNS feed or list condition and network condition but no VLAN tag condition evaluates traffic based on the domain name and source or destination, regardless of any VLAN tagging in the session.
- For each condition in a rule, you can add up to 50 criteria. Traffic that matches **any** of a condition's criteria satisfies the condition. For example, you can use a single rule to block traffic based on up to 50 DNS lists and feeds.

The following topics explain DNS rule conditions in more detail.

## Security Zone Rule Conditions

Security zones segment your network to help you manage, classify, and decrypt traffic flow by grouping interfaces across multiple devices.

Security zones control or decrypt traffic by its source and destination security zones. If you add both source and destination zones to a zone condition, matching traffic must originate from an interface in one of the source zones and leave through an interface in one of the destination zones.

Just as all interfaces in a zone must be of the same type (all inline, passive, switched, or routed), all zones used in a zone condition must be of the same type. Because devices deployed passively do not transmit traffic, you cannot use a zone with passive interfaces as a destination zone.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

**Tip** Constraining rules by zone is one of the best ways to improve system performance. If a rule does not apply to traffic through any of device's interfaces, that rule does not affect that device's performance.

## Security Zone Conditions and Multitenancy

In a multidomain deployment, a zone created in an ancestor domain can contain interfaces that reside on devices in different domains. When you configure a zone condition in an descendant domain, your configurations apply to only the interfaces you can see.

## Network Rule Conditions

Networks control or decrypt traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

**Note** You *cannot* use FDQN network objects in identity rules.

## VLAN Tags Rule Conditions

**Note** VLAN tags in access rules only apply to inline sets. Access rules with VLAN tags do not match traffic on firewall interfaces.

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic, with the exception of the prefilter policy, which uses the outermost VLAN tag in its rules.

Note the following Q-in-Q support:

- Firewall Threat Defense on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).

- Firewall Threat Defense on all other models:
  - Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
  - Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

In a cluster, if you encounter problems with VLAN matching, edit the access control policy advanced options, Transport/Network Preprocessor Settings, and select the **Ignore the VLAN header when tracking connections** option.

## DNS Policy Rule Conditions

DNS conditions in DNS rules allow you to control traffic if a DNS list, feed, or category contains the domain name requested by the client. You must define a DNS condition in a DNS rule.

Regardless of whether you add a global or custom Block or Do Not Block list to a DNS condition, the system applies the configured rule action to the traffic. For example, if you add the Global Do Not Block List to a rule, and configure a **Drop** action, the system blocks all traffic that should have been allowed to pass to the next phase of inspection.

## How to Create DNS Rules

The following topics discuss how to create DNS rules.

## Controlling Traffic Based on DNS and Security Zone

Zone conditions in DNS rules allow you to control traffic by its source security zone. A *security zone* is a grouping of one or more interfaces, which may be located across multiple devices.

### Procedure

- 
- |               |  |
|---------------|--|
| <b>Step 1</b> | In the DNS rule editor, click <b>Zones</b> .   |
| <b>Step 2</b> | Find and select the zones you want to add from the <b>Available Zones</b> . To search for zones to add, click the <b>Search by name</b> prompt above the <b>Available Zones</b> list, then type a zone name. The list updates as you type to display matching zones. |
| <b>Step 3</b> | Click to select a zone, or right-click and then select <b>Select All</b> .   |
| <b>Step 4</b> | Click <b>Add to Source</b> , or drag and drop.   |
| <b>Step 5</b> | Click the <b>DNS</b> tab and add the lists or feeds that include the DNS names you are controlling. For more information, see <a href="#">Controlling Traffic Based on DNS List or Feed, on page 1771</a> .  |
| <b>Step 6</b> | Save or continue editing the rule.   |
-

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Controlling Traffic Based on DNS and Network

Network conditions in DNS rules allow you to control traffic by its source IP address. You can explicitly specify the source IP addresses for the traffic you want to control.

**Procedure**

- 
- Step 1** In the DNS rule editor, click **Networks**.
- Step 2** Find and select the networks you want to add from the **Available Networks**, as follows:
- To add a network object on the fly, which you can then add to the condition, click **Add (+)** above the **Available Networks** list and proceed as described in [Creating Network Objects, on page 1283](#).
  - To search for network objects to add, click the **Search by name or value** prompt above the **Available Networks** list, then type an object name or the value of one of the object's components. The list updates as you type to display matching objects.
- Step 3** Click **Add to Source**, or drag and drop.
- Step 4** Add any source IP addresses or address blocks that you want to specify manually. Click the **Enter an IP address** prompt below the **Source Networks** list; then type an IP address or address block and click **Add**.
- Step 5** Click the **DNS** tab and add the lists or feeds that include the DNS names you are controlling. For more information, see [Controlling Traffic Based on DNS List or Feed, on page 1771](#).
- Step 6** Save or continue editing the rule.
- 

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Controlling Traffic Based on DNS and VLAN

VLAN conditions in DNS rules allow you to control VLAN-tagged traffic. The system uses the innermost VLAN tag to identify a packet by VLAN.

When you build a VLAN-based DNS rule condition, you can manually specify VLAN tags. Alternately, you can configure VLAN conditions with VLAN tag *objects*, which are reusable and associate a name with one or more VLAN tags.

**Procedure**

- 
- Step 1** In the DNS rule editor, select **VLAN Tags**.

- Step 2** Find and select the VLANs you want to add from the **Available VLAN Tags**, as follows:
- To add a VLAN tag object on the fly, which you can then add to the condition, click **Add (+)** above the **Available VLAN Tags** list and proceed as described in [Creating VLAN Tag Objects, on page 1341](#).
  - To search for VLAN tag objects and groups to add, click the **Search by name or value** prompt above the **Available VLAN Tags** list, then type either the name of the object, or the value of a VLAN tag in the object. The list updates as you type to display matching objects.
- Step 3** Click **Add to Rule**, or drag and drop.
- Step 4** Add any VLAN tags that you want to specify manually. Click the **Enter a VLAN Tag** prompt below the **Selected VLAN Tags** list; then type a VLAN tag or range and click **Add**. You can specify any VLAN tag from 1 to 4094; use a hyphen to specify a range of VLAN tags.
- Step 5** Click the **DNS** tab and add the lists or feeds that include the DNS names you are controlling. For more information, see [Controlling Traffic Based on DNS List or Feed, on page 1771](#).
- Step 6** Save or continue editing the rule.
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Controlling Traffic Based on DNS List or Feed

### Procedure

---

- Step 1** In the DNS rule editor, click **DNS**.
- Step 2** Find and select the DNS lists and feeds you want to add from the **DNS Lists and Feeds**, as follows:
- To add a DNS list or feed on the fly, which you can then add to the condition, click **Add (+)** above the **DNS Lists and Feeds** list and proceed as described in [Creating Security Intelligence Feeds, on page 1317](#).
  - To search for DNS lists, feeds, or categories to add, click the **Search by name or value** prompt above the **DNS Lists and Feeds** list, then type an object name or the value of one of the object's components. The list updates as you type to display matching objects.
  - For descriptions of the system-provided threat categories, see [Security Intelligence Categories, on page 1753](#).
- Step 3** Click **Add to Rule**, or drag and drop.
- Step 4** Save or continue editing the rule.
- 

#### What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# DNS Policy Deploy

After you finish updating your DNS policy configuration, you must deploy it as part of access control configuration.

- Associate your DNS policy with an access control policy, as described in [Configure Security Intelligence, on page 1750](#).
- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Cisco Umbrella DNS Policies

Cisco Umbrella DNS Connection in the management center helps to redirect DNS queries to Cisco Umbrella. This allows Cisco Umbrella to validate requests, allow or block them based on the domain names, and apply DNS-based security policy on the request. If you use Cisco Umbrella, you must configure the Cisco Umbrella Connection (**Integration > Other Integrations > Cloud Services > Cisco Umbrella Connection**) to redirect DNS queries to Cisco Umbrella.

The Umbrella Connector is part of the system's DNS inspection. If your existing DNS inspection policy map decides to block or drop a request based on your DNS inspection settings, the request is not forwarded to Cisco Umbrella. Thus, you have two lines of protection:

- Your local DNS inspection policy
- Your Cisco Umbrella cloud-based policy

When redirecting DNS lookup requests to Cisco Umbrella, the Umbrella Connector adds an EDNS (Extension mechanisms for DNS) record. An EDNS record includes the device identifier information, organization ID, and client IP address. Your cloud-based policy can use those criteria to control access in addition to the reputation of the FQDN. You can also elect to encrypt the DNS request using DNSCrypt to ensure the privacy of usernames and internal IP addresses.

To redirect DNS requests from the management center to Cisco Umbrella:

1. Configure the Cisco Umbrella connection settings.
2. Create and configure an Umbrella DNS policy.
3. Associate the Umbrella DNS policy with an access control policy.
4. Deploy the changes.

For detailed information about how to set up the Umbrella DNS Connector in the management center, see [Configuring the Umbrella DNS Connector for Cisco Secure Firewall Management Center](#).

## How to Redirect DNS Requests to Cisco Umbrella

This section provides instructions to redirect DNS requests from the device to Cisco Umbrella using the Firewall Management Center.

Step	Do This	More Info
1	Ensure that you meet the prerequisites.	<a href="#">Prerequisites for Configuring the Umbrella DNS Connector, on page 1773</a>
2	Configure the Cisco Umbrella connection settings.	<a href="#">Configure Cisco Umbrella Connection Settings, on page 1774</a>
3	Create an Umbrella DNS policy	<a href="#">Create an Umbrella DNS Policy, on page 1775</a>
4	Configure the Umbrella DNS policy	<a href="#">Edit Umbrella DNS Policies and Rules, on page 1775</a>
5	Associate the Umbrella DNS policy with an access control policy	<a href="#">Associate the Umbrella DNS Policy with an Access Control Policy, on page 1776</a>

## Prerequisites for Configuring the Umbrella DNS Connector

**Table 98: Minimum Supported Platforms**

Product	Version
Secure Firewall Threat Defense	6.6 and above
Secure Firewall Management Center	7.2 and above

- Establish an account with Cisco Umbrella at <https://umbrella.cisco.com>, and log into Umbrella at <http://login.umbrella.com>.
- Import the CA certificate from the Cisco Umbrella server to the Firewall Management Center. In Cisco Umbrella, choose **Deployments > Configuration > Root Certificate** and download the certificate.

You must import the root certificate to establish the HTTPS connection with the Cisco Umbrella registration server. The certificate needs to be trusted for SSL server validation, which is a non-default option in the Firewall Management Center. Copy and paste the following certificate for the device in the Firewall Management Center (**Devices > Certificates**).

```

When you add the certificate in the management center, ensure that you check the **CA Only** check box.

- Install the certificate on the device.
- Obtain the following data from Umbrella:
  - Organization ID
  - Network Device Key
  - Network Device Secret
  - Legacy Network Device Token
- Ensure that the Firewall Management Center is connected to the internet.
- Ensure that the base license with the export-controlled feature option is enabled in the Firewall Management Center.
- Ensure that the DNS server is configured to resolve api.opendns.com.
- Ensure that the Firewall Management Center can resolve management.api.umbrella.com for policy configuration.
- Configure the Firewall Threat Defense route to api.opendns.com.

## Configure Cisco Umbrella Connection Settings

The Cisco Umbrella Connection settings define the token that is needed to register the device with Cisco Umbrella.

### Before you begin

Establish an account with Cisco Umbrella <https://umbrella.cisco.com>, and then log into Umbrella at <https://dashboard.umbrella.com> and obtain the required information to establish connection to Cisco Umbrella.

### Procedure

**Step 1** Choose **Integration > Other Integrations > Cloud Services > Cisco Umbrella Connection**.

**Step 2** Obtain the following details and add them to the **General** settings:

- **Organization ID**—A unique number that identifies your organization on Cisco Umbrella. Every Umbrella organization is a separate instance of Umbrella and has its own dashboard. Organizations are identified by their name and their organization ID (Org ID).
- **Network Device Key**—The key to fetch umbrella policy from Cisco Umbrella.
- **Network Device Secret**—The secret to fetch umbrella policy from Cisco Umbrella.
- **Legacy Network Device Token**—An Umbrella Legacy Network Devices API token is issued through the Cisco Umbrella dashboard. Umbrella requires the API token to register a network device.

- Step 3** Under **Advanced**, configure the following optional settings:
- **DNSCrypt Public Key**—DNSCrypt authenticates and encrypts the DNS queries between the endpoint and the DNS server. To enable DNSCrypt, you can configure the DNSCrypt public key for certificate verification. The key is a 32-byte hexadecimal value and is preconfigured to B735:1140:206F:225d:3E2B:d822:D7FD:691e:A1C3:3cc8:D666:8d0c:BE04:bfab:CA43:FB79, which is the public key of the Umbrella Anycast servers.
  - **Management Key**—A key to fetch datacenter details from Umbrella cloud for VPN policy.
  - **Management Secret**—A secret used to fetch datacenters from Umbrella cloud for VPN.
- Step 4** Click **Test Connection**—Test if the Cisco Umbrella Cloud is reachable from the Firewall Management Center. When you provide the required organization ID and network device details, the umbrella connection is created.
- Step 5** Click **Save**.
- 

## Create an Umbrella DNS Policy

### Procedure

- 
- Step 1** Choose **Policies > Access Control heading > DNS**.
- Step 2** Click **Add DNS Policy > Umbrella DNS Policy**.
- Step 3** Give the policy a unique **Name** and, optionally, a **Description**.
- Step 4** Click **Save**.
- 

### What to do next

Configure the policy. See [Edit Umbrella DNS Policies and Rules, on page 1775](#).

## Edit Umbrella DNS Policies and Rules

### Procedure

- 
- Step 1** Choose **Policies > Access Control heading > DNS**.
- Step 2** In the DNS Policy page, select the Umbrella DNS policy that you want to edit and click **Edit** (✎).

### Refresh the Umbrella Protection Policy

If you want to get the latest Umbrella Protection Policy from Cisco Umbrella, click the **Refresh** icon next to **Umbrella Protection Policy Last Updated**.

To configure or modify Umbrella Connection settings for the Management Center, go to **Integration > Other Integrations > Cloud Services > Cisco Umbrella Connection**.

**Step 3** In the Umbrella DNS policy editor, select the Umbrella DNS rule and click **Edit** (✎).

**Step 4** Configure the rule components, or accept the defaults:

- **Umbrella Protection Policy**—Specify the name of the Cisco Umbrella policy to apply to the device.
- **Bypass Domain**—Specify the name of the local domains for which DNS requests should bypass Cisco Umbrella and instead go directly to the configured DNS servers.  
  
For example, you can have your internal DNS server resolve all names for the organization's domain name on the assumption that all internal connections are allowed.
- **DNSCrypt**— Enable DNSCrypt to encrypt connections between the device and Cisco Umbrella.  
  
Enabling DNSCrypt starts the key-exchange thread with the Umbrella resolver. The key-exchange thread performs the handshake with the resolver every hour and updates the device with a new secret key. As DNSCrypt uses UDP/443, you must ensure that the class map used for DNS inspection includes that port. Note that the default inspection class already includes UDP/443 for DNS inspection.
- **Idle Timeout**—Configure the idle timeout after which a connection from a client to the Umbrella server will be removed if there is no response from the server.

**Step 5** Click **Save**.

---

#### What to do next

Associate the Umbrella DNS policy with an access control policy. For more information, see [Associate the Umbrella DNS Policy with an Access Control Policy, on page 1776](#).

## Associate the Umbrella DNS Policy with an Access Control Policy

Before you deploy the Umbrella DNS policy on the device, you must associate it with an access control policy.

#### Procedure

---

**Step 1** Choose **Policies > Access Control** and select the access policy to edit.

**Step 2** Select **Security Intelligence**.

**Step 3** From the **Umbrella DNS Policy** drop-down list, select the Umbrella DNS policy.

**Step 4** Click **Save**.

---

#### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## CHAPTER 47

# Prefiltering and Prefilter Policies

- [About Prefiltering, on page 1777](#)
- [Best Practices for Fastpath Prefiltering, on page 1782](#)
- [Best Practices for Encapsulated Traffic Handling , on page 1782](#)
- [Requirements and Prerequisites for Prefilter Policies, on page 1783](#)
- [Configure Prefiltering, on page 1784](#)
- [Tunnel Zones and Prefiltering, on page 1790](#)
- [Moving Prefilter Rules to an Access Control Policy, on page 1793](#)
- [Prefilter Policy Hit Counts, on page 1795](#)
- [Large Flow Offloads, on page 1795](#)
- [History for Prefiltering, on page 1798](#)

## About Prefiltering

Prefiltering is the first phase of access control, before the system performs more resource-intensive evaluation. Prefiltering is simple, fast, and early. Prefiltering uses limited outer-header criteria to quickly handle traffic. Compare this to subsequent evaluation, which uses inner headers and has more robust inspection capabilities.

Configure prefiltering to:

- **Improve performance**— The sooner you exclude traffic that does not require inspection, the better. You can fastpath or block certain types of plaintext, passthrough tunnels based on their outer encapsulation headers, without inspecting their encapsulated connections. You can also fastpath or block any other connections that benefit from early handling.
- **Tailor deep inspection to encapsulated traffic**—You can rezone certain types of tunnels so that you can later handle their encapsulated connections using the same inspection criteria. Rezoning is necessary because after prefiltering, access control uses inner headers.

## About Prefilter Policies

Prefiltering is a policy-based feature. To assign it to a device, you assign it to the access control policy that is assigned to the device.

### Policy Components: Rules and Default Action

In a prefilter policy, *tunnel rules*, *prefilter rules*, and a *default action* handle network traffic:

- Tunnel and prefilter rules—First, rules in a prefilter policy handle traffic in the order you specify. Tunnel rules match specific tunnels only and support rezoning. Prefilter rules have a wider range of constraints and do not support rezoning. For more information, see [Tunnel vs Prefilter Rules, on page 1778](#).
- Default action (tunnels only)—If a tunnel does not match any rules, the default action handles it. The default action can block these tunnels, or continue access control on their individual encapsulated connections. You cannot rezone tunnels with the default action.

There is no default action for nonencapsulated traffic. If a nonencapsulated connection does not match any prefilter rules, the system continues with access control.

### Connection Logging

You can log connections fastpathed and blocked by the prefilter policy. See *Other Connections You Can Log* in the [Cisco Secure Firewall Management Center Administration Guide](#) for more information.

Connection events contain information on whether and how logged connections—including entire tunnels—were prefiltered. You can view this information in event views (workflows), dashboards, and reports, and use it as correlation criteria. Keep in mind that because fastpathed and blocked connections are not subject to deep inspection, associated connection events contain limited information.

### Default Prefilter Policy

Every access control policy has an associated prefilter policy.

The system uses a default policy if you do not configure custom prefiltering. Initially, this system-provided policy passes all traffic to the next phase of access control. You can change the policy's default action and configure its logging options, but you cannot add rules to it or delete it.

### Prefilter Policy Inheritance and Multitenancy

Access control uses a hierarchical implementation that complements multitenancy. Along with other advanced settings, you can lock a prefilter policy association, enforcing that association in all descendant access control policies. For more information, see [Access Control Policy Inheritance, on page 1601](#).

## Tunnel vs Prefilter Rules

Whether you configure a tunnel or prefilter rule depends on the specific type of traffic you want to match and the actions or further analysis you want to perform.

Characteristic	Tunnel Rules	Prefilter Rules
Primary function	Quickly fastpath, block, or rezone plaintext, passthrough tunnels.	Quickly fastpath or block any other connection that benefits from early handling.
Encapsulation and port/protocol criteria	Encapsulation conditions match only plaintext tunnels over selected protocols, listed in <a href="#">Encapsulation Rule Conditions, on page 1789</a> .	Port conditions can use a wider range of port and protocol constraints than tunnel rules; see <a href="#">Port, Protocol, and ICMP Code Rule Conditions, on page 823</a> .

Characteristic	Tunnel Rules	Prefilter Rules
Network criteria	Tunnel endpoint conditions constrain the endpoints of the tunnels you want to handle; see <a href="#">Network Rule Conditions, on page 821</a> .	Network conditions constrain the source and destination hosts in each connection; see <a href="#">Network Rule Conditions, on page 821</a> .
Direction	Bidirectional or unidirectional (configurable).  Tunnel rules are bidirectional by default, so they can handle all traffic between tunnel endpoints.	Unidirectional only (nonconfigurable).  Prefilter rules match source-to-destination traffic only. Return traffic for allowed connections is also permitted.
Rezone sessions for further analysis	Supported, using tunnel zones; see <a href="#">Tunnel Zones and Prefiltering, on page 1790</a> .	Not supported.

## Prefiltering vs Access Control

Prefilter and access control policies both allow you to block and trust traffic, though the prefiltering "trust" functionality is called "fastpathing" because it skips more inspection. The following table explains this and other differences between prefiltering and access control, to help you decide whether to configure custom prefiltering.

If you do not configure custom prefiltering, you can only approximate—not replicate—prefilter functionality with early-placed Block and Trust rules in the access control policy.

Characteristic	Prefiltering	Access Control	For more information, see...
Primary function	Quickly fastpath or block certain types of plaintext, passthrough tunnels (see <a href="#">Encapsulation Rule Conditions, on page 1789</a> ), or tailor subsequent inspection to their encapsulated traffic.  Fastpath or block any other connections that benefit from early handling.	Inspect and control all network traffic, using simple or complex criteria, including contextual information and deep inspection results.	<a href="#">About Prefiltering, on page 1777</a>
Implementation	Prefilter policy.  The prefilter policy is invoked by the access control policy.	Access control policy.  The access control policy is a main configuration. In addition to invoking subpolicies, access control policies have their own rules.	<a href="#">About Prefilter Policies, on page 1777</a> <a href="#">Associating Other Policies with Access Control, on page 1631</a>

Characteristic	Prefiltering	Access Control	For more information, see...
Sequence within access control	First. The system matches traffic to prefilter criteria before all other access control configurations. Thus, fast-pathing in a prefilter policy skips many other policies and inspections.	Last. Other policies that might inspect a connection, including Security Intelligence and Description, are applied before access control rules are evaluated.	—
Rule actions	Fewer. You can stop further inspection (Fastpath and Block) or allow further analysis with the rest of access control (Analyze).	More. Access control rules have a larger variety of actions, including monitoring, deep inspection, block with reset, and interactive blocking.	<a href="#">Tunnel and Prefilter Rule Components, on page 1785</a> <a href="#">Access Control Rule Actions, on page 1646</a>
Bypass capability	Fastpath rule action. Fastpathing traffic in the prefilter stage bypasses all further inspection and handling, including: <ul style="list-style-type: none"> <li>• Security Intelligence</li> <li>• authentication requirements imposed by an identity policy</li> <li>• SSL decryption</li> <li>• access control rules</li> <li>• deep inspection of packet payloads</li> <li>• discovery</li> <li>• rate limiting</li> </ul>	Trust rule action. Traffic trusted by access control rules is only exempt from intrusion inspection and discovery. If another policy that requires inspection is applied to a connection that is eventually trusted, the connection is inspected anyway.  Trust really just means you are not applying intrusion or file policies to the connection.	<a href="#">Introduction to Access Control Rules, on page 1641</a>
Rule criteria	Limited. Rules in the prefilter policy use simple network criteria: IP address, VLAN tag, port, and protocol.  For tunnels, tunnel endpoint conditions specify the IP address of the routed interfaces of the network devices on either side of the tunnel.	Robust. Access control rules use network criteria, but also user, application, requested URL, and other contextual information available in packet payloads.  Network conditions specify the IP address of source and destination hosts.	<a href="#">Tunnel vs Prefilter Rules, on page 1778</a> <a href="#">Prefilter Rule Conditions, on page 1787</a> <a href="#">Tunnel Rule Conditions, on page 1789</a>

Characteristic	Prefiltering	Access Control	For more information, see...
IP headers used (tunnel handling)	Outermost. Using outer headers allows you to handle entire plaintext, passthrough tunnels.  For nonencapsulated traffic, prefiltering still uses "outer" headers—which in this case are the only headers.	Innermost possible.  For a nonencrypted tunnel, access control acts on its individual encapsulated connections, not the tunnel as a whole.	<a href="#">Passthrough Tunnels and Access Control, on page 1781</a>
Rezone encapsulated connections for further analysis	Rezones tunneled traffic.  Tunnel zones allow you to tailor subsequent inspection to prefiltered, encapsulated traffic.	Uses tunnel zones.  Access control uses the tunnel zones you assign during prefiltering.	<a href="#">Tunnel Zones and Prefiltering, on page 1790</a>
Connection logging	Fastpathed and blocked traffic only. Allowed connections may still be logged by other configurations.	Any connection.	<i>Other Connections You Can Log in the <a href="#">Cisco Secure Firewall Management Center Administration Guide</a></i>
Supported devices	Secure Firewall Threat Defense only.	All.	—

## Passthrough Tunnels and Access Control

Plaintext (nonencrypted) tunnels can encapsulate multiple connections, often flowing between discontinuous networks. These tunnels are especially useful for routing custom protocols over IP networks, IPv6 traffic over IPv4 networks, and so on.

An outer *encapsulation header* specifies the source and destination IP addresses of the *tunnel endpoints*—the routed interfaces of the network devices on either side of the tunnel. Inner *payload headers* specify the source and destination IP addresses of the encapsulated connections' actual endpoints.

Often, network security devices handle plaintext tunnels as *passthrough* traffic. That is, the device is not one of the tunnel endpoints. Instead, it is deployed between the tunnel endpoints and monitors the traffic flowing between them.

Some network security devices enforce security policies using outer IP headers. Even for plaintext tunnels, these devices have no control over or insight into individual encapsulated connections and their payloads.

By contrast, the system leverages access control as follows:

- Outer header evaluation—First, prefiltering uses outer headers to handle traffic. You can block or fastpath entire plaintext, passthrough tunnels at this stage.
- Inner header evaluation—Next, the rest of access control (and other features such as QoS) use the innermost detectable level of headers to ensure the most granular level of inspection and handling possible.

If a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections at this stage. You must *rezone* a tunnel (see [Tunnel Zones and Prefiltering, on page 1790](#)) to act on all its encapsulated connections.

Access control has no insight into encrypted passthrough tunnels. For example, access control rules see a passthrough VPN tunnel as one connection. The system handles the entire tunnel using only the information in its outer, encapsulation header.

## Best Practices for Fastpath Prefiltering

When you use the fastpath action in a prefilter rule, the matching traffic bypasses inspection and is simply transmitted through the device. Use this action for traffic that you can trust and that would not benefit from any of the security features available.

The following types of traffic are ideal for fastpathing. For example, you could configure the rules to fastpath any traffic from or to the IP addresses of the endpoints or servers. You can further limit the rule based on ports used.

- VPN traffic that is going through the device. That is, the device is not an endpoint in the VPN topology.
- SQL traffic between trusted endpoints on the internal network.
- Scanner traffic. Scanner probes can create a lot of false-positive responses from intrusion policies.
- Voice/video.
- Backups.
- Management traffic (sftunnel) that traverses Firewall Threat Defense devices. Performing deep inspection on management traffic (using access control policies) can cause issues. You can prefilter based on port TCP/8305 between the management center and managed devices.

## Best Practices for Encapsulated Traffic Handling

This topic discusses guidelines for the following types of encapsulated traffic:

- Generic Routing Encapsulation (GRE)
- Point-to-Point Protocol (PPTP)
- IPinIP
- IPv6inIP
- Teredo

### GRE Tunnel Limitations

GRE tunnel processing is limited to IPv4 and IPv6 passenger flows. Other protocols, such as PPTP and WCCP, are not supported within the GRE tunnel.

### Understand Snort version support for your managed devices

The inspection engine used by managed devices is known as Snort. Snort 3 supports more features than Snort 2. To understand how these affect managed devices on your network, you must know:

- Which versions of Snort your device supports.

Snort version support can be found in the section on bundled components in the *Cisco Firepower Compatibility Guide*.

- How the Firewall Management Center and Firewall Threat Defense software support Snort 2 and Snort 3

Limitations of Snort 2 and Snort 3 can be found in the *Feature Limitations of Snort 3 for Firewall Management Center-Managed Firewall Threat Defense* topic in the [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).

### GRE v1 and PPTP bypass outer flow processing

GRE v1 (sometimes referred to as *stateful GRE*) and PPTP traffic bypass outer flow processing.

Passenger flow processing is supported for IPv6inIP and Teredo but the following limitations apply:

- Sessions are over a single tunnel that is not load-balanced
- There is no HA or clustering replication
- Primary and secondary flow relationships are not maintained
- Prefilter policy white and black lists are not supported

### GRE v0 sequence number field must be optional

All endpoints sending traffic on the network must send GREv0 traffic with the sequence number field as optional; otherwise, the sequence number field is removed. RFC 1701 and RFC 2784 both specify the sequence field as optional.

### How tunnels work with interfaces

Prefilter and access control policy rules are applied to all tunnel types on routed, transparent, inline-set, inline-tap, and passive interfaces.

### References

For more information about the GRE and PPTP protocols, see the following:

- [RFC 1701](#), [RFC 2784](#), and [RFC 2890](#) (GRE protocol v0)
- [RFC 2637](#) (PPTP and GRE protocol v1)

## Requirements and Prerequisites for Prefilter Policies

### Model Support

Threat Defense

### Supported Domains

Any

**User Roles**

- Admin
- Access Admin
- Network Admin

## Configure Prefiltering

To perform custom prefiltering, configure prefilter policies and assign the policies to access control policies. It is through the access control policy that prefilter policies get assigned to managed devices.

Only one person should edit a policy at a time, using a single browser window. If multiple users save the same policy, the last saved changes are retained. For your convenience, the system displays information on who (if anyone) is currently editing each policy. To protect the privacy of your session, a warning appears after 30 minutes of inactivity on the policy editor. After 60 minutes, the system discards your changes.

**Procedure**

**Step 1** Choose **Policies > Access Control heading > Prefilter**.

**Step 2** Click **New Policy** to create a custom prefilter policy.

A new prefilter policy has no rules and a default action of Analyze all tunnel traffic. It performs no logging or tunnel rezoning. You can also **Copy** (📋) or **Edit** (✎) an existing policy.

**Step 3** Configure the prefilter policy's default action and its logging options.

- Default action—Choose a default action for supported plaintext, passthrough tunnels: **Analyze all tunnel traffic** (with access control) or **Block all tunnel traffic**.
- Default action logging—Click **Logging** (🔍) next to the default action; see *Logging Connections with a Policy Default Action* in the [Cisco Secure Firewall Management Center Administration Guide](#). You can configure default action logging for blocked tunnels only.

**Step 4** Configure tunnel and prefilter rules.

In a custom prefilter policy, you can use both kinds of rule, in any order. Create rules depending on the specific type of traffic you want to match and the actions or further analysis you want to perform; see [Tunnel vs Prefilter Rules, on page 1778](#).

**Caution**

Exercise caution when using tunnel rules to assign tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. For more information, see [Tunnel Zones and Prefiltering, on page 1790](#).

For detailed information on configuring rule components, see [Tunnel and Prefilter Rule Components, on page 1785](#).

**Step 5** Evaluate rule order. To move a rule, click and drag or use the right-click menu to cut and paste.

Properly creating and ordering rules is a complex task, but one that is essential to building an effective deployment. If you do not plan carefully, rules can preempt other rules or contain invalid configurations. For more information, see [Best Practices for Access Control Rules, on page 1608](#).

- Step 6** Save the prefilter policy.
- Step 7** For configurations that support tunnel zone constraints, appropriately handle rezoned tunnels. Match connections in rezoned tunnels by using tunnel zones as source zone constraints.
- Step 8** Associate the prefilter policy with the access control policy deployed to your managed devices. See [Associating Other Policies with Access Control, on page 1631](#).
- Step 9** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

**Note**

When you deploy a prefilter policy, its rules are not applied on the existing tunnel sessions. Hence, traffic on an existing connection is not bound by the new policy that is deployed. In addition, the policy hit count is incremented only for the first packet of a connection that matches a policy. Thus, the traffic on an existing connection that could match a policy is omitted from the hit count. To have the policy rules effectively applied, clear the existing tunnel sessions, and then deploy the policy.

---

**What to do next**

If you will deploy time-based rules, specify the time zone of the device to which the policy is assigned. See [Time Zone, on page 884](#).

## Tunnel and Prefilter Rule Components

**State (Enabled/Disabled)**

By default, rules are enabled. If you disable a rule, the system does not use it and stops generating warnings and errors for that rule.

**Position**

Rules are numbered, starting at 1. The system matches traffic to rules in top-down order by ascending rule number. The first rule that traffic matches is the rule that handles that traffic, regardless of rule type (tunnel vs prefilter).

**Action**

A rule's action determines how the system handles and logs matching traffic:

- **Fastpath**—Exempts matching traffic from all further inspection and control, including access control, identity requirements, and rate limiting. Fastpathing a tunnel fastpaths all encapsulated connections.
- **Block**—Blocks matching traffic without further inspection of any kind. Blocking a tunnel blocks all encapsulated connections.

- **Analyze**—Allows traffic to continue to be analyzed by the rest of access control, using inner headers. If passed by access control and any related deep inspection, this traffic may also be rate limited. For tunnel rules, enables rezoning with the Assign Tunnel Zone option.

**Note** For a prefilter rule with action as **Fastpath** and logging options disabled, you will observe that the end-of-flow events are still generated in the system. The events are not visible on the management center event pages.

### Direction (Tunnel Rules Only)

A tunnel rule's direction determines how the system source and destination criteria:

- **Match tunnels only from source (unidirectional)**—Match source-to-destination traffic only. Matching traffic must originate from one of the specified source interfaces or tunnel endpoints, and leave through one of the destination interfaces or tunnel endpoints. Return traffic for allowed connections is also permitted.
- **Match tunnels from source and destination (bidirectional)**—Match both source-to-destination traffic and destination-to-source traffic. The effect is identical to writing two unidirectional rules, one the mirror of the other.

Prefilter rules are always unidirectional.

### Assign Tunnel Zone (Tunnel Rules Only)

In a tunnel rule, assigning a tunnel zone (whether existing or created on the fly), *rezones* matching tunnels. Rezoning requires the Analyze action.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections. For more information, see [Tunnel Zones and Prefiltering, on page 1790](#).

**Caution** Exercise caution when assigning tunnel zones. Connections in rezoned tunnels may not match security zone constraints in later evaluation. See [Using Tunnel Zones, on page 1790](#) for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

### Conditions

Conditions specify the specific traffic the rule handles. Traffic must match all a rule's conditions to match the rule. Each condition type has its own tab in the rule editor.

You can prefilter traffic using the following *outer-header* constraints. You must constrain tunnel rules by encapsulation protocol.

- **Interface**—[Interface Rule Conditions, on page 820](#)
- **Network (prefilter rule)/Tunnel Endpoints (tunnel rule)**—[Network Rule Conditions, on page 821](#)
- **VLAN**—[VLAN Tags Rule Conditions, on page 1655](#)

- Ports (prefilter rule)/Encapsulation and Ports (tunnel rule)—[Port Rule Conditions for Prefilter Rules, on page 1788](#) or [Encapsulation Rule Conditions, on page 1789](#)
- Time Range—[Time and Day Rule Conditions, on page 1660](#)

### Logging

A rule's logging settings govern the records the system keeps of the traffic it handles.

In tunnel and prefilter rules, you can log fastpathed and blocked traffic (the Fastpath and Block actions). For traffic subject to further analysis (the Analyze action), logging in the prefilter policy is disabled, although matching connections may still be logged by other configurations. Logging is performed on inner flows, not on the encapsulating flow. For more information, see *Logging Connections with Tunnel and Prefilter Rules* in the [Cisco Secure Firewall Management Center Administration Guide](#).

### Comments

Each time you save changes to a rule you can add comments. For example, you might summarize the overall configuration for the benefit of other users, or note when you change a rule and the reason for the change.

You cannot edit or delete these comments after you save the rule.

### Related Topics

[Best Practices for Access Control Rules, on page 1608](#)

## Prefilter Rule Conditions

Rule conditions enable you to fine-tune your prefilter policy to target the networks you want to control. See one of the following sections for more information.

### Interface Rule Conditions

Interface rule conditions control traffic by its source and destination interfaces.

Depending on the rule type and the devices in your deployment, you can use predefined *interface objects* called *security zones* or *interface groups* to build interface conditions. Interface objects segment your network to help you manage and classify traffic flow by grouping interfaces across multiple devices; see [Interface, on page 1278](#). QoS rules can be applied only on routed interfaces.

---

**Tip** Constraining rules by interface is one of the best ways to improve system performance. If a rule excludes all of a device's interfaces, that rule does not affect that device's performance.

---

### Network Rule Conditions

Networks control or decrypt traffic by its source and destination IP address, using inner headers. Tunnel rules, which use outer headers, have tunnel endpoint conditions instead of network conditions.

You can use predefined objects to build network conditions, or manually specify individual IP addresses or address blocks.

Minimize the number of matching criteria whenever possible, especially those for security zones, network objects, and port objects. When you specify multiple criteria, the system must match against *every* combination of the contents of the criteria you specify.

---

**Note** You *cannot* use FDQN network objects in identity rules.

---

## VLAN Tags Rule Conditions

---

**Note** VLAN tags in access rules only apply to inline sets. Access rules with VLAN tags do not match traffic on firewall interfaces.

---

VLAN rule conditions control VLAN-tagged traffic, including Q-in-Q (stacked VLAN) traffic. The system uses the innermost VLAN tag to filter VLAN traffic, with the exception of the prefilter policy, which uses the outermost VLAN tag in its rules.

Note the following Q-in-Q support:

- Firewall Threat Defense on Firepower 4100/9300—Does not support Q-in-Q (supports only one VLAN tag).
- Firewall Threat Defense on all other models:
  - Inline sets and passive interfaces—Supports Q-in-Q, up to 2 VLAN tags.
  - Firewall interfaces—Does not support Q-in-Q (supports only one VLAN tag).

You can use predefined objects to build VLAN conditions, or manually enter any VLAN tag from 1 to 4094. Use a hyphen to specify a range of VLAN tags.

In a cluster, if you encounter problems with VLAN matching, edit the access control policy advanced options, Transport/Network Preprocessor Settings, and select the **Ignore the VLAN header when tracking connections** option.

## Port Rule Conditions for Prefilter Rules

Port conditions match traffic based on the source and destination ports. Depending on the rule type, “port” can represent any of the following:

- TCP and UDP—You can control TCP and UDP traffic based on the port. The system represents this configuration using the protocol number in parentheses, plus an optional associated port or port range. For example: TCP(6)/22.
- ICMP—You can control ICMP and ICMPv6 (IPv6-ICMP) traffic based on its internet layer protocol plus an optional type and code. For example: ICMP(1):3:3.
- Protocol—You can control traffic using other protocols that do not use ports.

### Using Source and Destination Port Constraints

If you add both source and destination port constraints, you can only add ports that share a single transport protocol (TCP or UDP). For example, if you add DNS over TCP as a source port, you can add Yahoo Messenger Voice Chat (TCP) as a destination port but not Yahoo Messenger Voice Chat (UDP).

If you add only source ports or only destination ports, you can add ports that use different transport protocols. For example, you can add both DNS over TCP and DNS over UDP as destination port conditions in a single access control rule.

### Matching Non-TCP Traffic with Port Conditions

You can match non-port-based protocols. By default, if you do not specify a port condition, you are matching IP traffic. Although you can configure port conditions to match other protocols in prefilter rules, you should use tunnel rules instead when matching GRE, IP in IP, IPv6 in IP, and Torpedo Port 3544.

## Time and Day Rule Conditions

You can specify a continuous time range or a recurring time period.

For example, a rule can apply only during weekday working hours, or every weekend, or during a holiday shutdown period.

Time-based rules are applied based on the local time of the device that processes the traffic.

Time-based rules are supported only on Firewall Threat Defense devices. If you assign a policy with a time-based rule to a different type of device, the time restriction associated with the rule is ignored on that device. You will see warnings in this case.

## Tunnel Rule Conditions

Rule conditions enable you to fine-tune your tunnel policy to target the networks you want to control. For tunnel rules, you can use the following conditions:

- **Interface Objects**—The security zones or interface groups that define the device interfaces through which the connections pass. See [Interface Rule Conditions, on page 820](#).
- **Tunnel Endpoints**—The network objects that define the source and destination IP addresses of the tunnel.
- **VLAN Tags**—The outermost VLAN tag in the tunnel. See [VLAN Tags Rule Conditions, on page 1655](#).
- **Encapsulation and Ports**—The encapsulation protocol of the tunnel. See [Encapsulation Rule Conditions, on page 1789](#).
- **Time Range**—The days and times when the rule is active. If you do not specify a time range, the rule is always active. See [Time and Day Rule Conditions, on page 1660](#).

## Encapsulation Rule Conditions

Encapsulation conditions are specific to tunnel rules.

These conditions control certain types of plaintext, passthrough tunnels by their encapsulation protocol. You must choose at least one protocol to match before you can save the rule. You can choose:

- GRE (47)

- IP-in-IP (4)
- IPv6-in-IP (41)
- Teredo (UDP (17)/3455)

## Tunnel Zones and Prefiltering

Tunnel zones allow you to use prefiltering to tailor subsequent traffic handling to encapsulated connections.

A special mechanism is required because usually, the system handles traffic using the innermost detectable level of headers. This ensures the most granular level of inspection possible. But it also means that if a passthrough tunnel is not encrypted, the system acts on its individual encapsulated connections; see [Passthrough Tunnels and Access Control](#), on page 1781.

Tunnel zones solve this problem. During the first phase of access control (prefiltering) you can use outer headers to identify certain types of plaintext, passthrough tunnels. Then, you can *rezone* those tunnels by assigning a custom *tunnel zone*.

Rezoning a tunnel allows other configurations—such as access control rules—to recognize all the tunnel's encapsulated connections as belonging together. By using a tunnel's assigned tunnel zone as an interface constraint, you can tailor inspection to its encapsulated connections.

Despite its name, a tunnel zone is not a security zone. A tunnel zone does not represent a set of interfaces. It is more accurate to think of a tunnel zone as a tag that, in some cases, replaces the security zone associated with an encapsulated connection.

---

**Caution** For configurations that support tunnel zone constraints, connections in rezoned tunnels do **not** match security zone constraints. For example, after you rezone a tunnel, access control rules can match its encapsulated connections with their newly assigned *tunnel zone*, but not with any original *security zone*.

---

See [Using Tunnel Zones](#), on page 1790 for a brief walkthrough of a tunnel zone implementation, and a discussion of the implications of rezoning without explicitly handling rezoned traffic.

### Configurations Supporting Tunnel Zone Constraints

Only access control rules support tunnel zone constraints.

No other configurations support tunnel zone constraints. For example, you cannot use QoS to rate limit a plaintext tunnel as a whole; you can only rate limit its individual encapsulated sessions.

## Using Tunnel Zones

This example procedure summarizes how you might rezone GRE tunnels for further analysis, using tunnel zones. You can adapt the concepts described in this example to other scenarios where you need to tailor traffic inspection to connections encapsulated in plaintext, passthrough tunnels.

Consider a situation where your organization's internal traffic flows through the Trusted security zone. The Trusted security zone represents a set of interfaces across multiple managed devices deployed in various locations. Your organization's security policy requires that you allow internal traffic after deep inspection for exploits and malware.

Internal traffic sometimes includes plaintext, passthrough, GRE tunnels between particular endpoints. Because the traffic profile of this encapsulated traffic is different from your "normal" interoffice activity—perhaps it is known and benign—you can limit inspection of certain encapsulated connections while still complying with your security policy.

In this example, after you deploy configuration changes:

- Plaintext, passthrough, GRE-encapsulated tunnels detected in the Trusted zone have their individual encapsulated connections evaluated by one set of intrusion and file policies.
- All other traffic in the Trusted zone is evaluated with a different set of intrusion and file policies.

You accomplish this task by *rezoning* GRE tunnels. Rezoning ensures that access control associates GRE-encapsulated connections with a custom *tunnel* zone, rather than their original Trusted *security* zone. Rezoning is required due to the way access control handles encapsulated traffic; see [Passthrough Tunnels and Access Control](#), on page 1781 and [Tunnel Zones and Prefiltering](#), on page 1790.

## Procedure

- Step 1** Configure custom intrusion and file policies that tailor deep inspection to encapsulated traffic, and another set of intrusion and file policies tailored to nonencapsulated traffic.
- Step 2** Configure custom prefiltering to rezone GRE tunnels flowing through the Trusted security zone.
- Create a custom prefilter policy and associate it with access control. In that custom prefilter policy, create a tunnel rule (in this example, **GRE\_tunnel\_rezone**) and a corresponding tunnel zone (**GRE\_tunnel**). For more information, see [Configure Prefiltering](#), on page 1784.

**Table 99: GRE\_tunnel\_rezone Tunnel Rule**

Rule Component	Description
Interface object condition	Match internal-only tunnels by using the Trusted security zone as both a Source Interface Object and Destination Interface Object constraint.
Tunnel endpoint condition	Specify the source and destination endpoints for the GRE tunnels used in your organization.  Tunnel rules are bidirectional by default. If you do not change the <b>Match tunnels from...</b> option, it does not matter which endpoints you specify as source and which as destination.
Encapsulation condition	Match GRE traffic.
Assign Tunnel Zone	Create the <b>GRE_tunnel</b> tunnel zone, and assign it to tunnels that match the rule.
Action	Analyze (with the rest of access control).

- Step 3** Configure access control to handle connections in rezoned tunnels.
- In the access control policy deployed to your managed devices, configure a rule (in this example, **GRE\_inspection**) that handles the traffic you rezoned. For more information, see [Create and Edit Access Control Rules](#), on page 1651.

**Table 100: GRE\_inspection Access Control Rule**

Rule Component	Description
Security zone condition	Match rezoned tunnels by using the GRE_tunnel security zone as a Source Zone constraint.
Action	Allow, with deep inspection enabled.  Choose the file and intrusion policies tailored to inspect encapsulated internal traffic.

**Caution**

If you skip this step, the rezoned connections may match **any** access control rule not constrained by security zone. If the rezoned connections do not match any access control rules, they are handled by the access control policy default action. Make sure this is your intent.

- Step 4** Configure access control to handle nonencapsulated connections flowing through the Trusted security zone.
- In the same access control policy, configure a rule (in this example, **internal\_default\_inspection**) that handles non-rezoned traffic in the Trusted security zone.

**Table 101: internal\_default\_inspection Access Control Rule**

Rule Component	Description
Security zone condition	Match non-rezoned internal-only traffic by using the Trusted security zone as both a Source Zone and Destination Zone constraint.
Action	Allow, with deep inspection enabled.  Choose the file and intrusion policies tailored to inspect nonencapsulated internal traffic.

- Step 5** Evaluate the position of the new access control rules relative to preexisting rules. Change rule order if necessary.
- If you place the two new access control rules next to each other, it does not matter which you place first. Because you rezoned GRE tunnels, the two rules cannot preempt each other.
- Step 6** Save all changed configurations.

**What to do next**

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Creating Tunnel Zones

The following procedure explains how to create a tunnel zone in the object manager. You can also create zones when editing a tunnel rule.

## Procedure

- 
- Step 1** Choose **Objects > Object Management**.
- Step 2** Choose **Tunnel Zone** from the list of object types.
- Step 3** Click **Add Tunnel Zone**.
- Step 4** Enter a **Name** and, optionally, a **Description**.
- Step 5** Click **Save**.
- 

## What to do next

- Assign tunnel zones to plaintext, passthrough tunnels as part of custom prefiltering; see [Configure Prefiltering, on page 1784](#).

# Moving Prefilter Rules to an Access Control Policy

You can move prefilter rules from a prefilter policy to the associated access control policy.

## Before you begin

Note the following conditions before you proceed:

- Only prefilter rules can be moved to an access control policy. Tunnel rules cannot be moved.
- The prefilter rules can be moved only to the associated access control policy.
- The prefilter rules with configured interface groups cannot be moved.
- The **Action** parameter in the prefilter rule is changed to a suitable action in the access control rule when moved. To know what each action in the prefilter rule maps to, see the following table:

Action in the prefilter rule	Action in the access control rule
Analyze	Allow
Block	Block
Fastpath	Trust

- Similarly, based on the action configured in the prefilter rule, the logging configuration is set to an appropriate setting after the rule is moved, as mentioned in the following table.

Action in the prefilter rule	Enabled Logging configurations in the access control rule
Analyze	None of the log settings are enabled.

Action in the prefilter rule	Enabled Logging configurations in the access control rule
Block	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>
Fastpath	<ul style="list-style-type: none"> <li>• Log at Beginning of Connection</li> <li>• Log at End of Connection</li> <li>• Event Viewer</li> <li>• Syslog Server</li> <li>• SNMP Trap</li> </ul>

- The comments in the prefilter rule configuration are lost after moving the rule. However, a new comment is added in the moved rule mentioning the source prefilter policy.
- While moving rules from the source policy, if another user modifies those rules, the Firewall Management Center displays a message. You may continue with the process after refreshing the page.

## Procedure

---

**Step 1** In the prefilter policy editor, select the rules that you want to move with a left-click on your mouse.

**Tip**

To select multiple rules, use the Ctrl (Control) key on your keyboard.

**Step 2** Right-click the selected rules and choose **Move to another policy**.

**Step 3** Select the destination access control policy from the **Access Policy** drop-down list.

**Step 4** From the **Place Rules** drop-down list, choose where you want to position the moved rules:

- To position as the last set of rules in the **Default** section, choose **At the bottom (within the Default section)**.
- To position as the first set of rules in the **Mandatory** section, choose **At the top (within the Mandatory section)**.

**Step 5** Click **Move**.

---

## What to do next

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

# Prefilter Policy Hit Counts

Hit count indicates the number of times a policy rule has triggered for a matching connection.

For complete information on viewing prefilter policy hit counts, see [Viewing Rule Hit Counts, on page 1632](#).

## Large Flow Offloads

On the 3100/, 4100/4200/, 9300, certain traffic that you configure to be fastpathed by a prefilter policy is handled by the hardware (specifically, in the NIC), not by your Firewall Threat Defense software. Offloading these connection flows results in higher throughput and lower latency, especially for data-intensive applications such as large file transfers. This feature is especially useful for data centers. This is called *static flow offload*.

In addition, by default, Firewall Threat Defense devices offload flows based on other criteria, including trust. This is called *dynamic flow offload*. Dynamic flow offload is not supported on the Secure Firewall 3100.

Offloaded flows continue to receive limited stateful inspection, such as basic TCP flag and option checking. The system can selectively escalate packets to the firewall system for further processing if necessary.

Examples of applications that can benefit from offloading large flows are:

- High Performance Computing (HPC) Research sites, where the Firewall Threat Defense device is deployed between storage and high compute stations. When one research site backs up using FTP file transfer or file sync over NFS, the large amount of data traffic affects all connections. Offloading FTP file transfer and file sync over NFS reduces the impact on other traffic.
- High Frequency Trading (HFT), where the Firewall Threat Defense device is deployed between workstations and the Exchange, mainly for compliance purposes. Security is usually not a concern, but latency is a major concern.

The following flows can be offloaded:

- (Static flow offload only.) Connections that are fastpathed by the prefilter policy.
- Standard or 802.1Q tagged Ethernet frames only.
- (Dynamic flow offload only):
  - Inspected flows that the inspection engine decides no longer need inspection. These flows include:
    - Flows handled by access control rules that apply the Trust action and are based on security zone, source and destination network and port matching only.
    - TLS/SSL flows that are not selected for decryption using a decryption policy.
    - Flows that are trusted by the Intelligent Application Bypass (IAB) policy either explicitly or due to exceeding flow bypass thresholds.
    - Flows that match file or intrusion policies that result in trusting the flow.
    - Any allowed flow that no longer needs to be inspected.
  - The following IPS preprocessor inspected flows:
    - SSH and SMTP.

- FTP preprocessor secondary connections.
- Session Initiation Protocol (SIP) preprocessor secondary connections.
- Intrusion rules that use keywords (also referred to as *options*)

**Important** For details, exceptions, and limitations to the above, see [Flow Offload Limitations, on page 1796](#).

### Use Static Flow Offload

To offload eligible traffic to hardware, create a prefilter policy rule that applies the **Fastpath** action. Use prefilter rules for TCP/UDP, and tunnel rules for GRE.

(Not recommended.) To disable static flow offload and as a by-product, dynamic flow-offload, use FlexConfig to run the **no flow-offload enable** command. For information about this command, see the *Cisco ASA Series Command Reference*, available from <https://www.cisco.com/c/en/us/support/security/adaptive-security-appliance-asa-software/products-command-reference-list.html>.

### Use Dynamic Flow Offload

Dynamic flow offload is enabled by default.

To disable dynamic offload:

**configure flow-offload dynamic whitelist disable**

To re-enable dynamic offload:

**configure flow-offload dynamic whitelist enable**

Note that dynamic offload occurs only if static flow offload is enabled, regardless of whether prefiltering is configured.

## Flow Offload Limitations

Not all flows can be offloaded. Even after offload, a flow can be removed from being offloaded under certain conditions. Following are some of the limitations:

### Device Limitations

The feature is supported on the following devices:

- Secure Firewall 3100
- Secure Firewall 4200
- Firepower 4100/9300

### Flows that cannot be offloaded

The following types of flows cannot be offloaded.

- Any flows that do not use IPv4 addressing, such as IPv6 addressing.
- Flows for any protocol other than TCP, UDP, and GRE.

---

**Note** PPTP GRE connections cannot be offloaded.

---

- Flows on interfaces configured in passive, inline, or inline tap mode. Routed and switched interfaces are the only types supported.
- (Secure Firewall 3100/4200.) Offload based on inner header for tunnelled flows.
- (Secure Firewall 3100.) Multi-instance offload.
- Flows that require inspection by Snort or other inspection engines. In some cases, such as FTP, the secondary data channel can be offloaded although the control channel cannot be offloaded.
- IPsec and TLS/DTLS VPN connections that terminate on the device.
- Flows that require encryption or decryption. For example, connections decrypted due to a decryption policy.
- Multicast flows in routed mode. They are supported in transparent mode if there are only two member interfaces in a bridge group.
- TCP Intercept flows.
- TCP state bypass flows. You cannot configure flow offload and TCP state bypass on the same traffic.
- Flows tagged with security groups.
- Reverse flows that are forwarded from a different cluster node, in the case of asymmetric flows in a cluster.
- Centralized flows in a cluster, if the flow owner is not the control unit.
- Flows that include IP options cannot be dynamically offloaded.

#### Additional Limitations

- Flow offload and Dead Connection Detection (DCD) are not compatible. Do not configure DCD on connections that can be offloaded.
- If more than one flow that matches flow offload conditions are queued to be offloaded at the same time to the same location on the hardware, only the first flow is offloaded. The other flows are processed normally. This is called a *collision*. Use the **show flow-offload flow** command in the CLI to display statistics for this situation.
- Dynamic flow offload disables all TCP normalizer checks.
- Although offloaded flows pass through FXOS interfaces, statistics for these flows do not appear on the logical device interface. Thus, logical device interface counters and packet rates do not reflect offloaded flows.

#### Dynamic flow offload not supported on certain devices

Dynamic flow offload is not supported on the Secure Firewall 3100/4200.

### Conditions for reversing offload

After a flow is offloaded, packets within the flow are returned to the Firewall Threat Defense for further processing if they meet the following conditions:

- They include TCP options other than Timestamp.
- They are fragmented.
- They are subject to Equal-Cost Multi-Path (ECMP) routing, and ingress packets move from one interface to another.

## History for Prefiltering

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Moving prefilter rules to an access control policy	6.7	Any	<p>You can move prefilter rules from a prefilter policy to the associated access control policy.</p> <p>New/modified pages: In the prefilter policy page, the right-click menu for the selected rules provides a new <b>Move to another policy</b> option.</p> <p>Supported platforms: Firewall Management Center</p>
Time-based rules	6.6	Any	<p>Ability to apply prefilter and tunnel rules depending on the date and time, as determined by the time zone of the Firewall Threat Defense device.</p> <p>See description in <a href="#">History for Access Control Rules, on page 1669</a>.</p>
View Object Details from prefilter rule page	6.6	Any	<p>Feature introduced: Option to view details for an object or object group when viewing prefilter rules.</p> <p>New options: Right-clicking a value in any of the following columns in the prefilter rule list offers an option to view object details: Source Networks, Destination Networks, Source Port, Destination Port, and VLAN Tag.</p> <p>Supported platforms: Secure Firewall Management Center</p>

## CHAPTER 48

# Service Policies

You can use Threat Defense Service Policies to apply services to specific traffic classes. For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications. A service policy consists of multiple actions or rules applied to an interface or applied globally.

- [About Threat Defense Service Policies, on page 1799](#)
- [Requirements and Prerequisites for Service Policies, on page 1801](#)
- [Guidelines and Limitations for Service Policies, on page 1801](#)
- [Configure Threat Defense Service Policies, on page 1802](#)
- [Examples for Service Policy Rules, on page 1810](#)
- [Monitoring Service Policies, on page 1815](#)
- [History for Threat Defense Service Policy, on page 1816](#)

## About Threat Defense Service Policies

You can use Threat Defense Service Policies to apply services to specific traffic classes. With service policies, you are not limited to applying the same services to all connections that enter the device or a given interface.

A traffic class is a combination of the interface and an extended access control list (ACL). The ACL “allow” rules determine which connections are part of the class. Any “denied” traffic in the ACL simply does not have the service applied to it: these connections are not actually dropped. You can use IP addresses and TCP/UDP ports to identify matching connections as precisely as you require.

There are two types of traffic class:

- **Interface-based rules**—If you specify a security zone or interface group in a service policy rule, the rule applies to the ACL “allowed” traffic that goes through any interface that is part of the interface objects.  
  
For a given feature, interface-based rules applied to the ingress interface always take precedence over global rules: if an ingress interface-based rule applies to a connection, any matching global rule is ignored. If no ingress interface or global rule applies, then an interface service rule on the egress interface is applied.
- **Global rules**—These rules apply to all interfaces. If an interface-based rule does not apply to a connection, the global rules are checked and applied to any connections that the ACL “allows.” If none apply, then the connections proceed without any services applied.

A given connection can match only one traffic class, either interface-based or global, for a given feature. There should be at most one rule for a given interface object/traffic flow combination.

Service policy rules are applied after access control rules. These services are configured only for connections you are allowing.

## How Service Policies Relate to FlexConfig and Other Features

Prior to version 6.3(0), you could configure connection-related service rules using the `TCP_Embryonic_Conn_Limit` and `TCP_Embryonic_Conn_Timeout` pre-defined FlexConfig objects. You should remove those objects and redo your rules using the Threat Defense Service Policy. If you created any custom FlexConfig objects to implement any of these connection-related features (that is, **set connection** commands), you should also remove those objects and implement the features through the service policy.

Because connection-related service policy features are treated as a separate feature group from other service-rule implemented features, you should not run into problems with overlapping traffic classes. However, please be mindful when configuring the following:

- QoS Policy rules are implemented using the service policy CLI. These rules are applied before connection-based service policy rules. However, both QoS and connection settings can be applied to the same or overlapping traffic classes.
- You can use FlexConfig policies to implement customized application inspections and NetFlow. Use the **show running-config** command to examine the CLI that already configures service rules, including the **policy-map**, **class-map**, and **service-policy** commands. Netflow and application inspection are compatible with QoS and connection settings, but you need to understand the existing configuration before implementing FlexConfig. Connection settings are applied before application inspections and Netflow.

---

**Note** Traffic classes that are created from the Threat Defense Service Policy are named **class\_map\_ACLname**, where *ACLname* is the name of the extended ACL object used in the service policy rule.

---

## What Are Connection Settings?

Connection settings comprise a variety of features related to managing traffic connections, such as a TCP flow through the Firewall Threat Defense. Some features are named components that you would configure to supply specific services.

Connection settings include the following:

- **Global timeouts for various protocols**—All global timeouts have default values, so you need to change them only if you are experiencing premature connection loss. You configure global timeouts in the Firepower Threat Defense Platform policy. Select **Devices > Platform Settings**.
- **Connection timeouts per traffic class**—You can override the global timeouts for specific types of traffic using service policies. All traffic class timeouts have default values, so you do not have to set them.
- **Connection limits and TCP Intercept**—By default, there are no limits on how many connections can go through (or to) the Firewall Threat Defense. You can set limits on particular traffic classes using service policy rules to protect servers from denial of service (DoS) attacks. Particularly, you can set limits on embryonic connections (those that have not finished the TCP handshake), which protects against SYN

flooding attacks. When embryonic limits are exceeded, the TCP Intercept component gets involved to proxy connections and ensure that attacks are throttled.

- **Dead Connection Detection (DCD)**—If you have persistent connections that are valid but often idle, so that they get closed because they exceed idle timeout settings, you can enable Dead Connection Detection to identify idle but valid connections and keep them alive (by resetting their idle timers). Whenever idle times are exceeded, DCD probes both sides of the connection to see if both sides agree the connection is valid. The **show service-policy** command output includes counters to show the amount of activity from DCD. You can use the **show conn detail** command to get information about the initiator and responder and how often each has sent probes.
- **TCP sequence randomization**—Each TCP connection has two initial sequence numbers (ISN): one generated by the client and one generated by the server. By default, the Firewall Threat Defense randomizes the ISN of the TCP SYN passing in both the inbound and outbound directions. Randomization prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session. However, TCP sequence randomization effectively breaks TCP SACK (Selective Acknowledgement), as the sequence numbers the client sees are different from what the server sees. You can disable randomization per traffic class if desired.
- **TCP Normalization**—The TCP Normalizer protects against abnormal packets. You can configure how some types of packet abnormalities are handled by traffic class. You can configure TCP Normalization using the FlexConfig policy.
- **TCP State Bypass**—You can bypass TCP state checking if you use asymmetrical routing in your network.

Access Admin

Network Admin

## Guidelines and Limitations for Service Policies

- Service policies apply to routed or switch interfaces only, in either routed or transparent mode. They do not apply to inline set or passive interfaces.
- You can have at most 25 traffic classes for a given interface or the global policy. Specifically, this means that you cannot have more than 25 service policy rules for the global policy for a given security zone or interface group. However, for interfaces, because the same interface can appear in both a security zone

and interface group, be aware that the actual limitation is based on the interfaces, and not the zone/group. Thus, you might be prevented from having 25 rules per zone/group based on the membership of your zones/groups.

- You can have at most one rule for a given interface object/traffic flow combination.
- When you make service policy changes to the configuration, all new connections use the new service policy. Existing connections continue to use the policy that was configured at the time of the connection establishment. If you want all connections to immediately use the new policy, you need to disconnect the current connections so they can reconnect using the new policy. From an SSH or Console CLI session, enter the **clear conn** or **clear local-host** commands.

## Configure Threat Defense Service Policies

You can use Threat Defense Service Policies to apply services to specific traffic classes. For example, you can use a service policy to create a timeout configuration that is specific to a particular TCP application, as opposed to one that applies to all TCP applications. A service policy consists of multiple actions or rules applied to an interface or applied globally.

### Procedure

- 
- Step 1** Choose **Policies > Access Control heading > Access Control**, and click **Edit** (✎) for the access control policy whose Threat Defense Service Policy you want to edit.
- Step 2** Click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line.
- Step 3** Click **Edit** (✎) in the **Threat Defense Service Policy** group.
- A dialog box opens that shows the existing policy. The policy consists of an ordered list of rules, separated between global rules (which apply to all interfaces) and interface-based rules. The table shows the interface object and extended access control list name (which combined defines the traffic class for the rule), and the services applied.
- Step 4** Do any of the following:
- Click **Add Rule** to create a new rule. See [Configure a Service Policy Rule, on page 1803](#).
  - Click **Edit** (✎) to edit an existing rule. See [Configure a Service Policy Rule, on page 1803](#).
  - Click **Delete** (🗑) to delete a rule.
  - Click a rule and drag it to a new location to move it. You cannot drag rules between the interface and global lists, instead you must edit the rule to change the interface/global setting. The first rule in the list that matches a connection is applied to the connection.
- Step 5** Click **OK** when you are finished editing the policy.
- Step 6** Click **Save** on **Advanced** window. The changes are not saved until you click save.
-

## Configure a Service Policy Rule

Configure service policy rules to apply services to specific traffic classes.

### Before you begin

Go to **Objects > Object Management > Access List > Extended** and create an the extended access list that defines the traffic to which the rule applies. The rule is applied to any connections that match Allow rules in the extended access list. Define the ACL rules precisely, so that your service policy rule applies to only the traffic that requires the service.

If you are creating an interface-based rule, you must also have configured the interfaces on the assigned devices and added them to security zones or interface groups.

### Procedure

**Step 1** If you are not already in the Threat Defense Service Policy dialog box, choose **Policies > Access Control heading > Access Control**, edit the access control policy, select **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line, then edit the **Threat Defense Service Policy**.

**Step 2** Do any of the following:

- Click **Add Rule** to create a new rule.
- Click **Edit** (✎) to edit an existing rule.

The service policy rule wizard opens to step you through the process of configuring the rule.

**Step 3** In the **Interface Object** step, select the option that defines the interfaces that will use the policy.

- **Apply Globally**—Select this option to create a global rule, which applies to all interfaces.
- **Select Interface Objects**—Select this option to create an interface-based rule. Then, select the security zones or interface objects that contain the desired interfaces, and click > to move them to the **Next** selected list. The service policy rule will be configured on each interface contained in the selected objects; it is not configured on the zone/group itself.

Click when the interface criteria is complete.

**Step 4** In the **Traffic Flow** step, select the extended ACL object that defines the connections to which the rule applies, then click **Next**.

**Step 5** In the **Connection Setting** step, configure the services to apply to this traffic class.

- **Enable TCP State Bypass** (TCP connections only)—Implement TCP State Bypass. Connections subject to TCP State Bypass are not inspected by any inspection engines, and they bypass all TCP state checking and TCP normalization. For detailed information, see [Bypass TCP State Checks for Asymmetrical Routing \(TCP State Bypass\)](#), on page 1805.

#### Note

Use TCP State Bypass for troubleshooting purposes or when asymmetric routing cannot be resolved. This feature disables multiple security features, which can cause a high number of connections if you do not implement it properly with a narrowly-defined traffic class.

- **Randomize TCP Sequence Number** (TCP connections only)—Whether to enable or disable TCP sequence number randomization. Randomization is enabled by default. For more information, see [Disable TCP Sequence Randomization, on page 1809](#).
- **Enable Decrement TTL** (TCP connections only)—Decrement the time-to-live (TTL) on packets that match the class. If you decrement time to live, packets with a TTL of 1 will be dropped, but a connection will be opened for the session on the assumption that the connection might contain packets with a greater TTL. Note that some packets, such as OSPF hello packets, are sent with TTL = 1, so decrementing time to live can have unexpected consequences.

**Note**

If you want the Firewall Threat Defense device to appear on traceroutes, you must configure the decrement TTL option and also set the ICMP unreachable rate limit in the platform settings policy. See [Make the Firewall Threat Defense Device Appear on Traceroutes, on page 1813](#).

- **Connections**—Limits for the number of connections allowed for the entire class. You can configure these options:
  - **Maximum TCP and UDP** (TCP/UDP connections only)—The maximum number of simultaneous connections that are allowed, between 0 and 2000000, for the entire class. For TCP, this count applies to established connections only. The default is 0, which allows unlimited connections. Because the limit is applied to a class, one attacking host can consume all the connections and leave none for the rest of the hosts that are matched to the class. Set the per-client limit to ameliorate this problem.
  - **Maximum Embryonic** (TCP connections only)—The maximum number of simultaneous embryonic TCP connections (those that have not finished the TCP handshake) allowed, between 0 and 2000000. The default is 0, which allows unlimited connections. By setting a non-zero limit, you enable TCP Intercept, which protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. Also set the per-client options to protect against SYN flooding. For more information, see [Protect Servers from a SYN Flood DoS Attack \(TCP Intercept\), on page 1810](#).
- **Connections Per Client**—Limits for the number of connections allowed for a given client (source IP address). You can configure these options:
  - **Maximum TCP and UDP** (TCP/UDP connections only)—The maximum number of simultaneous connections allowed per client, between 0 and 2000000. For TCP, this includes established, half-open (embryonic), and half-closed connections. The default is 0, which allows unlimited connections. This option restricts the maximum number of simultaneous connections that are allowed for each host that is matched to the class.
  - **Maximum Embryonic** (TCP connections only)—The maximum number of simultaneous embryonic TCP connections allowed per client, between 0 and 2000000. The default is 0, which allows unlimited connections. For more information, see [Protect Servers from a SYN Flood DoS Attack \(TCP Intercept\), on page 1810](#).
- **Connections Syn Cookie MSS**—The server maximum segment size (MSS) for SYN-cookie generation for embryonic connections upon reaching the embryonic connections limit, from 48 to 65535. The default is 1380. This setting is meaningful only if you configure **Maximum Embryonic** for connections or per-client, or both.
- **Connections Timeout**—The timeout settings to apply to the traffic class. These timeouts override the global timeouts defined in the platform settings policy. You can configure the following:

- **Embryonic** (TCP connections only)—The timeout period until a TCP embryonic (half-open) connection is closed, between 0:0:5 and 1193:00:00. The default is 0:0:30.
- **Half Closed** (TCP connections only)—The idle timeout period until a half-closed connection is closed, between 0:0:30 and 1193:0:0. The default is 0:10:0. Half-closed connections are not affected by Dead Connection Detection (DCD). Also, the system does not send a reset when taking down half-closed connections.
- **Idle** (TCP, UDP, ICMP, IP connections)—The idle timeout period after which an established connection of any protocol closes, between 0:0:1 and 1193:0:0. The default is 1:0:0, unless you select the TCP State Bypass option, where the default is 0:2:0.
- **Reset Connection Upon Timeout** (TCP connections only)—Whether to send a TCP RST packet to both end systems after idle connections are removed.
- **Detect Dead Connections** (TCP connections only)—Whether to enable Dead Connection Detection (DCD). Before expiring an idle connection, the system probes the end hosts to determine if the connection is valid. If both hosts respond, the connection is preserved, otherwise the connection is freed. When operating in transparent firewall mode, you must configure static routes for the endpoints. You cannot configure DCD on connections that are also offloaded, so do not configure DCD on connections you are fast-pathing in the prefilter policy. Use the **show conn detail** command in the Firewall Threat Defense CLI to track how many DCD probes have been sent by the initiator and responder.

Configure the following options:

- **Detection Timeout**—The time duration in hh:mm:ss format to wait after each unresponsive DCD probe before sending another probe, between 0:0:1 and 24:0:0. The default is 0:0:15.

For systems that are operating in a cluster or high-availability configuration, we recommend that you do not set the interval to less than one minute (0:1:0). If the connection needs to be moved between systems, the changes required take longer than 30 seconds, and the connection might be deleted before the change is accomplished.

- **Detection Retries**—The number of consecutive failed retries for DCD before declaring the connection dead, from 1 to 255. The default is 5.

**Step 6** Click **Finish** to save your changes.

The rule is added to the bottom of the appropriate list, either Interfaces or Global. Global rules are matched in top-down order. Rules in the Interfaces list are matched in top down order for each interface object. Place rules for narrowly-defined traffic classes above broader rules, to ensure the right services get applied. You can move rules within each list by using drag and drop. You cannot move rules between lists.

## Bypass TCP State Checks for Asymmetrical Routing (TCP State Bypass)

If you have an asymmetrical routing environment in your network, where the outbound and inbound flow for a given connection can go through two different Firewall Threat Defense devices, you need to implement TCP State Bypass on the affected traffic.

However, TCP State Bypass weakens the security of your network, so you should apply bypass on very specific, limited traffic classes.

The following topics explain the problem and solution in more detail.

## The Asymmetrical Routing Problem

By default, all traffic that goes through the Firewall Threat Defense is inspected using the Adaptive Security Algorithm and is either allowed through or dropped based on the security policy. The Firewall Threat Defense maximizes the firewall performance by checking the state of each packet (new connection or established connection) and assigning it to either the session management path (a new connection SYN packet), the fast path (an established connection), or the control plane path (advanced inspection).

TCP packets that match existing connections in the fast path can pass through the Firewall Threat Defense without rechecking every aspect of the security policy. This feature maximizes performance. However, the method of establishing the session in the fast path using the SYN packet, and the checks that occur in the fast path (such as TCP sequence number), can stand in the way of asymmetrical routing solutions: both the outbound and inbound flow of a connection must pass through the same Firewall Threat Defense device.

For example, a new connection goes to Security Appliance 1. The SYN packet goes through the session management path, and an entry for the connection is added to the fast path table. If subsequent packets of this connection go through Security Appliance 1, then the packets match the entry in the fast path, and are passed through. But if subsequent packets go to Security Appliance 2, where there was not a SYN packet that went through the session management path, then there is no entry in the fast path for the connection, and the packets are dropped. The following figure shows an asymmetric routing example where the outbound traffic goes through a different Firewall Threat Defense than the inbound traffic:

**Figure 413: Asymmetric Routing**

If you have asymmetric routing configured on upstream routers, and traffic alternates between two Firewall Threat Defense devices, then you can configure TCP state bypass for specific traffic. TCP state bypass alters the way sessions are established in the fast path and disables the fast path checks. This feature treats TCP traffic much as it treats a UDP connection: when a non-SYN packet matching the specified networks enters the Firewall Threat Defense device, and there is not a fast path entry, then the packet goes through the session management path to establish the connection in the fast path. Once in the fast path, the traffic bypasses the fast path checks.

## Guidelines and Limitations for TCP State Bypass

### TCP State Bypass Unsupported Features

The following features are not supported when you use TCP state bypass:

- Application inspection—Inspection requires both inbound and outbound traffic to go through the same Firewall Threat Defense, so inspection is not applied to TCP state bypass traffic.
- Snort inspection—Inspection requires both inbound and outbound traffic to go through the same device. However, Snort inspection is not automatically bypassed for TCP state bypass traffic. You must also configure a prefilter fastpath rule for the same traffic class for which you configure TCP state bypass. Otherwise, packets might be dropped unexpectedly because the TCP Normalizer is also not engaged.
- TCP Intercept, maximum embryonic connection limit, TCP sequence number randomization—The Firewall Threat Defense does not keep track of the state of the connection, so these features are not applied.
- TCP normalization—The TCP normalizer is disabled.
- Stateful failover.
- TLS server identity discovery cannot be used with TCP state bypass on an inline or inline tap interface.

### TCP State Bypass NAT Guidelines

Because the translation session is established separately for each Firewall Threat Defense, be sure to configure static NAT on both devices for TCP state bypass traffic. If you use dynamic NAT, the address chosen for the session on Device 1 will differ from the address chosen for the session on Device 2.

## Configure TCP State Bypass

To bypass TCP state checking in asymmetrical routing environments, carefully define a traffic class that applies to the affected hosts or networks only, then enable TCP State Bypass on the traffic class using a service policy. You must also configure a corresponding prefilter fastpath policy for the same traffic to ensure the traffic also bypasses inspection.

Because bypass reduces the security of the network, limit its application as much as possible.

### Procedure

---

**Step 1** Create the extended ACL that defines the traffic class.

For example, to define a traffic class for TCP traffic from 10.1.1.1 to 10.2.2.2, do the following:

- a) Choose **Objects > Object Management**.
- b) Choose **Access List > Extended** from the table of contents.
- c) Click **Add Extended Access List**.
- d) Enter a **Name** for the object, for example, bypass.
- e) Click **Add** to add a rule.
- f) Keep **Allow** for the action.

- g) Enter 10.1.1.1 beneath the **Source** list and click **Add**, and 10.2.2.2 beneath the **Destination** list, and click **Add**.
- h) Click **Port**, select **TCP (6)** beneath the **Selected Source Ports** list, and click **Add**. Do not enter a port number, simply add TCP as the protocol, which will cover all ports.
- i) Click **Add** on the Extended Access List Entry dialog box to add the rule to the ACL.
- j) Click **Save** on the Extended Access List Object dialog box to save the ACL object.

## Step 2 Configure the TCP state bypass service policy rule.

For example, to configure TCP state bypass for this traffic class globally, do the following:

- a) Choose **Policies > Access Control heading > Access Control**, and edit the policy assigned to the devices that require this service.
- b) Click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line, and click **Edit (✎)** for the **Threat Defense Service Policy**.
- c) Click **Add Rule**.
- d) Select **Apply Globally > Next**.
- e) Select the extended ACL object you created for this rule and click **Next**.
- f) Select **Enable TCP State Bypass**.
- g) (Optional.) Adjust the **Idle** timeout for bypassed connections. The default is 2 minutes.
- h) Click **Finish** to add the rule. If necessary, drag and drop the rule to the desired position in the service policy.
- i) Click **OK** to save the changes to the service policy.
- j) Click **Save** on **Advanced** to save the changes to the access control policy.

## Step 3 Configure a prefilter fastpath rule for the traffic class.

You cannot use the ACL object in the prefilter rule, so you need to recreate the traffic class either directly in the prefilter rule, or by first creating network objects that define the class.

The following procedure assumes that you already have a prefilter policy attached to the access control policy. If you have not created a prefilter policy yet, go to **Policies > Prefilter** and first create the policy. You can then follow this procedure to attach it to the access control policy and create the rule.

Keeping with our example, this procedure creates a fastpath rule for TCP traffic from 10.1.1.1 to 10.2.2.2.

- a) Choose **Policies > Access Control heading > Access Control**, and edit the policy that has the TCP bypass service policy rule.
- b) Click the link for the **Prefilter Policy**, which is to the left immediately under the policy description.
- c) In the Prefilter Policy dialog box, select the policy to assign to the device if the correct one is not already selected. Do not click OK yet.

Because you cannot add rules to the default prefilter policy, you must choose a custom policy.

- d) In the Prefilter Policy dialog box, click the **Edit (✎)**. This action opens a new browser window where you can edit the policy.
- e) Click **Add Prefilter Rule** and configure a rule with the following properties.
  - **Name**—Any name that you find meaningful will do, such as TCPBypass.
  - **Action**—Select **Fastpath**.
  - **Interface Objects**—If you configured TCP state bypass as a global rule, leave the default, any, for both source and destination. If you created an interface-based rule, select the same interface objects you used for rule in the **Source Interface Objects** list, and keep any as the destination.

- **Networks**—Add 10.1.1.1 to the **Source Networks** list, and 10.2.2.2 to the **Destination Networks** list. You can either use network objects or manually add the addresses.
- **Ports**—Under **Selected Source Ports**, select TCP(6), **do not enter a port**, and click **Add**. This will apply the rule to all (and only) TCP traffic, regardless of TCP port number.

- f) Click **Add** to add the rule to the prefilter policy.
- g) Click **Save** to save your changes to the prefilter policy.

You can now close the prefilter edit window and return to the access control policy edit window.

- h) In the access control policy edit window, the Prefilter Policy dialog box should still be open. Click **OK** to save your changes to the prefilter policy assignment.
- i) Click **Save** on the access control policy to save the changed prefilter policy assignment, if you changed it.

You can now deploy the changes to the affected devices.

---

## Disable TCP Sequence Randomization

Each TCP connection has two initial sequence numbers (ISN): one generated by the client and one generated by the server. The Firewall Threat Defense device randomizes the ISN of the TCP SYN passing in both the inbound and outbound directions.

Randomizing the ISN of the protected host prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session. However, TCP sequence randomization effectively breaks TCP SACK (Selective Acknowledgement), as the sequence numbers the client sees are different from what the server sees.

You can disable TCP initial sequence number randomization if necessary, for example, because data is getting scrambled. Following are some situations where you might want to disable randomization.

- If another in-line firewall is also randomizing the initial sequence numbers, there is no need for both firewalls to be performing this action, even though this action does not affect the traffic.
- If you use eBGP multi-hop through the device, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum.
- If you use a WAAS device that requires the Firewall Threat Defense device not to randomize the sequence numbers of connections.
- If you enable hardware bypass for the ISA 3000, and TCP connections are dropped when the ISA 3000 is no longer part of the data path.

### Procedure

---

**Step 1** Create the extended ACL that defines the traffic class.

For example, to define a traffic class for TCP traffic from any host to 10.2.2.2, do the following:

- a) Choose **Objects > Object Management**.

- b) Choose **Access List > Extended** from the table of contents.
- c) Click **Add Extended Access List**.
- d) Enter a **Name** for the object, for example, preserve-sq-no.
- e) Click **Add** to add a rule.
- f) Keep **Allow** for the action.
- g) Leave the **Source** list empty, enter 10.2.2.2 beneath the **Destination** list, and click **Add**.
- h) Click **Port**, select **TCP (6)** beneath the **Selected Source Ports** list, and click **Add**. Do not enter a port number, simply add TCP as the protocol, which will cover all ports.
- i) Click **Add** on the Extended Access List Entry dialog box to add the rule to the ACL.
- j) Click **Save** on the Extended Access List Object dialog box to save the ACL object.

**Step 2**

Configure the service policy rule that disables TCP sequence number randomization.

For example, to disable randomization for this traffic class globally, do the following:

- a) Choose **Policies > Access Control heading > Access Control**, and edit the policy assigned to the devices that require this service.
- b) Click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line, and click **Edit** (✎) for the **Threat Defense Service Policy**.
- c) Click **Add Rule**.
- d) Select **Apply Globally > Next**.
- e) Select the extended ACL object you created for this rule and click **Next**.
- f) Deselect **Randomize TCP Sequence Number**.
- g) (Optional.) Adjust the other connection options as needed.
- h) Click **Finish** to add the rule. If necessary, drag and drop the rule to the desired position in the service policy.
- i) Click **OK** to save the changes to the service policy.
- j) Click **Save** on **Advanced** to save the changes to the access control policy.

You can now deploy the changes to the affected devices.

## Examples for Service Policy Rules

The following topics provide examples of service policy rules.

### Protect Servers from a SYN Flood DoS Attack (TCP Intercept)

A SYN-flooding denial of service (DoS) attack occurs when an attacker sends a series of SYN packets to a host. These packets usually originate from spoofed IP addresses. The constant flood of SYN packets keeps the server SYN queue full, which prevents it from servicing connection requests from legitimate users.

You can limit the number of embryonic connections to help prevent SYN flooding attacks. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination.

When the embryonic connection threshold of a connection is crossed, the Firewall Threat Defense acts as a proxy for the server and generates a SYN-ACK response to the client SYN request using the SYN cookie method, so that the connection is not added to the SYN queue of the targeted host. The SYN cookie is the initial sequence number returned in the SYN-ACK that is constructed from MSS, time stamp, and a

mathematical hash of other items to essentially create a secret. If the Firewall Threat Defense receives an ACK back from the client with the correct sequence number and within the valid time window, it can then authenticate that the client is real and allow the connection to the server. The component that performs the proxy is called TCP Intercept.

Setting connection limits can protect a server from a SYN flood attack. You can optionally enable TCP Intercept statistics and monitor the results of your policy. The following procedure explains the end-to-end process.

### Before you begin

- Ensure that you set the embryonic connection limit lower than the TCP SYN backlog queue on the server that you want to protect. Otherwise, valid clients can no longer access the server during a SYN attack. To determine reasonable values for embryonic limits, carefully analyze the capacity of the server, the network, and server usage.
- Depending on the number of CPU cores on your Secure Firewall Threat Defense device model, the maximum concurrent and embryonic connections can exceed the configured numbers due to the way each core manages connections. In the worst case scenario, the device allows up to  $n-1$  extra connections and embryonic connections, where  $n$  is the number of cores. For example, if your model has 4 cores, if you configure 6 concurrent connections and 4 embryonic connections, you could have an additional 3 of each type. To determine the number of cores for your model, enter the **show cpu core** command in the device CLI.

### Procedure

- 
- Step 1** Create the extended ACL that defines the traffic class, which is the list of servers you want to protect. For example, to define a traffic class to protect the web servers with the IP addresses 10.1.1.5 and 10.1.1.6:
- a) Choose **Objects > Object Management**.
  - b) Choose **Access List > Extended** from the table of contents.
  - c) Click **Add Extended Access List**.
  - d) Enter a **Name** for the object, for example, protected-servers.
  - e) Click **Add** to add a rule.
  - f) Keep **Allow** for the action.
  - g) Leave the **Source** list empty, enter 10.1.1.5 beneath the **Destination** list, and click **Add**.
  - h) Also enter 10.1.1.6 beneath the **Destination** list and click **Add**.
  - i) Click **Port**, select **HTTP** in the available ports list, and click **Add to Destination**. If your server also support HTTPS connections, also add that port.
  - j) Click **Add** on the Extended Access List Entry dialog box to add the rule to the ACL.
  - k) Click **Save** on the Extended Access List Object dialog box to save the ACL object.
- Step 2** Configure the service policy rule that sets embryonic connection limits. For example, to set the total concurrent embryonic limit to 1000 connections, and the per-client limit to 50 connections, do the following:
- a) Choose **Policies > Access Control heading > Access Control**, and edit the policy assigned to the devices that require this service.

- b) Click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line, and click **Edit** (✎) for the **Threat Defense Service Policy**.
- c) Click **Add Rule**.
- d) Select **Apply Globally > Next**.
- e) Select the extended ACL object you created for this rule and click **Next**.
- f) Enter 1000 for **Connections > Maximum Embryonic**.
- g) Enter 50 for **Connections Per Client > Maximum Embryonic**.
- h) (Optional.) Adjust the other connection options as needed.
- i) Click **Finish** to add the rule. If necessary, drag and drop the rule to the desired position in the service policy.
- j) Click **OK** to save the changes to the service policy.
- k) Click **Save** on **Advanced** to save the changes to the access control policy.

**Step 3**

(Optional.) Configure the rates for TCP Intercept statistics.

TCP Intercept uses the following options to determine the rate for collecting statistics. All options have default values, so if these rates suit your needs, you can skip this step.

- **Rate Interval**—The size of the history monitoring window, between 1 and 1440 minutes. The default is 30 minutes. During this interval, the system samples the number of attacks 30 times.
- **Burst Rate**—The threshold for syslog message generation, between 25 and 2147483647. The default is 400 per second. When the burst rate is exceeded, the device generates syslog message 733104.
- **Average Rate**—The average rate threshold for syslog message generation, between 25 and 2147483647. The default is 200 per second. When the average rate is exceeded, the device generates syslog message 733105.

If you want to adjust these options, do the following:

- a) Choose **Objects > Object Management**.
- b) Choose **FlexConfig > Text Object**.
- c) Click **Edit** (✎) for the threat\_defense\_statistics system-defined object.
- d) Although you can directly change the values, the recommended approach is to open the **Override** section and click **Add** to create a device override.
- e) Select the devices to which you will assign the service policy (through the access control policy assignment) and click **Add** to move them to the selected list.
- f) Click **Override**.
- g) The object must have 3 entries, so click **Count** as needed until you get 3.
- h) Enter the values you need, in order from 1-3, as rate interval, burst rate, and average rate. Consult the object description to verify you enter the values in the right order.
- i) Click **Add** in the Object Override dialog box.
- j) Click **Save** in the Edit Text Object dialog box.

**Step 4**

Enable TCP Intercept statistics.

You must configure a FlexConfig policy to enable TCP Intercept statistics.

- a) Choose **Devices > FlexConfig**.
- b) If you already have a policy assigned to the devices, edit it. Otherwise, create a new policy and assign it to the affected devices.
- c) Select the **Threat\_Detection\_Configure** object in the **Available FlexConfig** list and click >>. The object is added to the **Selected Append FlexConfigs** list.

- d) Click **Save**.
- e) (Optional.) You can verify that you have the right settings by clicking **Preview Config** and selecting one of the devices.

The system generates the CLI commands that will be written to the device during the next deployment. These commands will include those needed for the service policy as well as those needed for threat detection statistics. Scroll to the bottom of the preview to see the appended CLI. The TCP Intercept statistics command should look something like the following, if you use the default values (line break added for clarity):

```
###Flex-config Appended CLI ###

threat-detection statistics tcp-intercept rate-interval 30
burst-rate 400 average-rate 200
```

**Step 5** You can now deploy the changes to the affected devices.

**Step 6** Monitor the TCP Intercept statistics from the device CLI using the following commands:

- **show threat-detection statistics top tcp-intercept [all | detail]**—View the top 10 protected servers under attack. The **all** keyword shows the history data of all the traced servers. The **detail** keyword shows history sampling data. The system samples the number of attacks 30 times during the rate interval, so for the default 30 minute period, statistics are collected every 60 seconds.

**Note**

You can use the **shun** command to block attacking host IP addresses. To remove the block, use the **no shun** command.

- **clear threat-detection statistics tcp-intercept**—Erases TCP Intercept statistics.

**Example:**

```
hostname(config)# show threat-detection statistics top tcp-intercept
Top 10 protected servers under attack (sorted by average rate)
Monitoring window size: 30 mins    Sampling interval: 30 secs
<Rank> <Server IP:Port> <Interface> <Ave Rate> <Cur Rate> <Total> <Source IP (Last Attack
Time)>
-----
1    10.1.1.5:80 inside 1249 9503 2249245 <various> Last: 10.0.0.3 (0 secs ago)
2    10.1.1.6:80 inside 10 10 6080 10.0.0.200 (0 secs ago)
```

## Make the Firewall Threat Defense Device Appear on Traceroutes

By default, the Firewall Threat Defense device does not appear on traceroutes as a hop. To make it appear, you need to decrement the time-to-live on packets that pass through the device, and increase the rate limit on ICMP unreachable messages. To accomplish this, you must configure a service policy rule and adjust the ICMP platform settings policy.

**Note** If you decrement time to live, packets with a TTL of 1 will be dropped, but a connection will be opened for the session on the assumption that the connection might contain packets with a greater TTL. Note that some packets, such as OSPF hello packets, are sent with TTL = 1, so decrementing time to live can have unexpected consequences. Keep these considerations in mind when defining your traffic class.

## Procedure

**Step 1** Create the extended ACL that defines the traffic class for which to enable traceroute reporting.  
For example, to define a traffic class for all addresses, but excluding OSPF traffic, do the following:

- a) Choose **Objects > Object Management**.
- b) Choose **Access List > Extended** from the table of contents.
- c) Click **Add Extended Access List**.
- d) Enter a **Name** for the object, for example, traceroute-enabled.
- e) Click **Add** to add a rule to exclude OSPF.
- f) Change the action to **Block**, click **Port**, select **OSPF/IGP (89)** as the protocol beneath the **Destination Ports** list, and click **Add** to add the protocol to the selected list.
- g) Click **Add** on the Extended Access List Entry dialog box to add the OSPF rule to the ACL.
- h) Click **Add** to add a rule to include all other connections.
- i) Keep **Allow** for the action, and leave both the Source and Destination lists empty.
- j) Click **Add** on the Extended Access List Entry dialog box to add the rule to the ACL.

Ensure that the OSPF deny rule is above the Allow Any rule. Drag and drop to move the rules if necessary.

- k) Click **Save** on the Extended Access List Object dialog box to save the ACL object.

**Step 2** Configure the service policy rule that decrements the time-to-live value.

For example, to decrement time-to-live globally, do the following:

- a) Choose **Policies > Access Control heading > Access Control**, and edit the policy assigned to the devices that require this service.
- b) Click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line, and click **Edit** (✎) for the **Threat Defense Service Policy**.
- c) Click **Add Rule**.
- d) Select **Apply Globally** and click **Next**.
- e) Select the extended ACL object you created for this rule and click **Next**.
- f) Select **Enable Decrement TTL**.
- g) (Optional.) Adjust the other connection options as needed.
- h) Click **Finish** to add the rule. If necessary, drag and drop the rule to the desired position in the service policy.
- i) Click **OK** to save the changes to the service policy.
- j) Click **Save** on **Advanced** to save the changes to the access control policy.

You can now deploy the changes to the affected devices.

**Step 3** Increase the rate limit on ICMP unreachable messages.

- a) Choose **Devices > Platform Settings**.
- b) If you already have a policy assigned to the devices, edit it. Otherwise, create a new Threat Defense platform settings policy and assign it to the affected devices.
- c) Select **ICMP** from the table of contents.
- d) Increase the **Rate Limit**, for example, to 50. You might also want to increase the **Burst Size**, for example, to 10, to ensure enough responses are generated within the rate limit.

You can leave the ICMP rules table empty, it is not related to this task.

- e) Click **Save**.

**Step 4** You can now deploy the changes to the affected devices.

## Monitoring Service Policies

You can monitor service-policy related information using the device CLI. Following are some useful commands.

- **show conn [detail]**

Shows connection information. Detailed information uses flags to indicate special connection characteristics. For example, the “b” flag indicates traffic subject to TCP State Bypass.

When you use the **detail** keyword, you can see information about Dead Connection Detection (DCD) probing, which shows how often the connection was probed by the initiator and responder. For example, the connection details for a DCD-enabled connection would look like the following:

```
TCP dmz: 10.5.4.11/5555 inside: 10.5.4.10/40299,
  flags UO , idle 1s, uptime 32m10s, timeout 1m0s, bytes 11828,
cluster sent/rcvd bytes 0/0, owners (0,255)
  Traffic received at interface dmz
    Locally received: 0 (0 byte/s)
  Traffic received at interface inside
    Locally received: 11828 (6 byte/s)
  Initiator: 10.5.4.10, Responder: 10.5.4.11
  DCD probes sent: Initiator 5, Responder 5
```

- **show service-policy**

Shows service policy statistics, including Dead Connection Detection (DCD) statistics.

- **show threat-detection statistics top tcp-intercept [all | detail]**

View the top 10 protected servers under attack. The **all** keyword shows the history data of all the traced servers. The **detail** keyword shows history sampling data. The system samples the number of attacks 30 times during the rate interval, so for the default 30 minute period, statistics are collected every 60 seconds.

## History for Threat Defense Service Policy

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Description
Threat Defense Service Policy.	6.3	Any	<p>You can now configure a Threat Defense Service Policy as part of your access control policy advanced options. You can use Threat Defense Service Policies to apply services to specific traffic classes. Features supported include TCP State Bypass, randomizing TCP sequence numbers, decrementing the time-to-live (TTL) value on packets, Dead Connection Detection, setting a limit on the maximum number of connections and embryonic connections per traffic class and per client, and timeouts for embryonic, half closed, and idle connections.</p> <p>New screen: <b>Policies &gt; Access Control &gt; Access Control, Advanced tab, Threat Defense Service Policy.</b></p> <p>Supported platforms: Secure Firewall Threat Defense</p>
Initiator and responder information for Dead Connection Detection (DCD), and DCD support in a cluster.	6.5	Any	<p>If you enable Dead Connection Detection (DCD), you can use the <b>show conn detail</b> command to get information about the initiator and responder. Dead Connection Detection allows you to maintain an inactive connection, and the <b>show conn</b> output tells you how often the endpoints have been probed. In addition, DCD is now supported in a cluster.</p> <p>New/Modified commands: <b>show conn</b> (output only).</p> <p>Supported platforms: Secure Firewall Threat Defense</p>
Configure the maximum segment size (MSS) for embryonic connections.	7.1	Any	<p>You can configure a service policy to set the server maximum segment size (MSS) for SYN-cookie generation for embryonic connections upon reaching the embryonic connections limit. This is meaningful for service policies where you are also setting embryonic connection maximums.</p> <p>New or changed screens: <b>Connection Settings</b> in the Add/Edit Service Policy wizard.</p>

## CHAPTER 49

# Threat Detection

Threat Detection's portscan detector is a mechanism designed to help you detect and prevent portscan activity in all types of traffic to protect networks from eventual attacks. Portscan traffic can be detected efficiently in both allowed and denied traffic.

Portscan is a form of network reconnaissance that is often used by attackers as a prelude to an attack. In a portscan, an attacker determines the types of network protocols or services a host supports and sends specially crafted packets to a targeted host. By examining the packets that the host responds with, the attacker can often determine which ports are open on the host and, either directly or by inference, which application protocols are running on these ports.

- [Portscan Detection and Prevention](#), on page 1817
- [Best Practices for Portscan Prevention](#), on page 1819
- [Requirements and Prerequisites for Threat Detection](#), on page 1820
- [Guidelines and Limitations for Threat Detection](#), on page 1820
- [Configure Portscan Detection and Prevention](#), on page 1821
- [Monitoring Threat Detection](#), on page 1823
- [History for Threat Detection](#), on page 1825

## Portscan Detection and Prevention

Use Threat Detection to identify port scan activity. You can use the system to detect port scans and issue events when they are found. Optionally, you can configure the system to prevent port scans by automatically blocking scanners. When preventing port scans, the system sends you events and also blocks the attacker for a duration period that you set.

## Pre-Defined Sensitivity Levels for Portscan Detection

When configuring detection settings, you select from the following pre-defined sensitivity levels. Except for Custom, each level has pre-set values for each protocol for the number of ports (TCP/UDP), protocols (IP), or hosts (TCP/UDP/IP/ICMP) that must be scanned within a set time interval (in seconds). Also, all types of scan/sweep are enabled.

**Note** When counting ports/protocols, Threat Detection increments the number if the port/protocol in the current packet differs from the previous packet. For example, if you have an application that opens connections in 10 set ports randomly, the total number of ports scanned could mount so quickly that your port number will be exceeded within the interval. The system does not count unique ports only.

Exceeding the number within the interval can indicate a scanning attack. Portscan events are generated only when the port/protocol/host numbers are exceeded for the moving time interval window.

- **Low**—This level uses the shortest time window for portscan detection, coupled with high counts for port/protocol/host. Thus, you should see portscan events for the most aggressive scanners only. Select this sensitivity level to suppress false positives, but remember that some types of portscans (slow scans, filtered scans) might be missed. For more detail on how low sensitivity detection works, see [Detection in the Low Sensitivity Level, on page 1819](#).
  - **Interval (TCP/UDP/IP/ICMP)**—60 seconds.
  - **TCP/UDP portscan Number of Ports**—120.
  - **TCP/UDP portsweep Number of Hosts**—180.
  - **IP protocol scan Number of Protocols**—30.
  - **IP protocol sweep Number of Hosts**—25.
  - **ICMP host sweep Number of Hosts**—50.
- **Medium**—This level uses moderate values for both the interval and port/protocol/host counts. However, very active hosts such as network address translators and proxies might generate false positives. Add such hosts to the ignore scanner list. This is the default sensitivity level and a good place to start.
  - **Interval (TCP/UDP/IP/ICMP)**—90 seconds.
  - **TCP/UDP portscan Number of Ports**—90.
  - **TCP/UDP portsweep Number of Hosts**—150.
  - **IP protocol scan Number of Protocols**—15.
  - **IP protocol sweep Number of Hosts**—20.
  - **ICMP host sweep Number of Hosts**—30.
- **High**—This level uses a much longer time window for portscan detection, coupled with lower counts for port/protocol/host. With this level, you are most likely to see events for even the least aggressive port scans/sweeps, so you are more likely to notice all attackers. On the other hand, this level would likely result in the most portscan events issued, and potentially the highest number of false positives.
  - **Interval (TCP/UDP/IP/ICMP)**—600 seconds (10 minutes).
  - **TCP/UDP portscan Number of Ports**—60.
  - **TCP/UDP portsweep Number of Hosts**—100.
  - **IP protocol scan Number of Protocols**—10.
  - **IP protocol sweep Number of Hosts**—10.

- **ICMP host sweep Number of Hosts**—20.
- **Custom**—If you want to configure any setting differently than one of the pre-defined sensitivity levels, or disable a particular type of scan/sweep, the level automatically switches to custom. If you want to adjust the options, first select the level that most closely matches what you want, then edit the values as appropriate.

## Detection in the Low Sensitivity Level

If you select the low sensitivity level, the system tracks negative responses for TCP, UDP, and ICMP initial packets. Only if the number of unsuccessful connections is more than the rejection threshold (10% in low sensitivity) and the port/IP protocol count is more than the configured threshold, is an alert triggered. This mitigates false positives.

Rejection threshold applies to low sensitivity (or equivalent custom settings) only; it does not apply to other sensitivity levels or their custom equivalents.

If there is a mix of allowed and blocked traffic, the number of rejected ports or hosts is calculated based on the difference between allowed and blocked traffic. In the case of only blocked traffic, the rejection threshold is not considered.

These criteria are not used for UDP/ICMP connections on interfaces configured in inline sets.

For example, in low sensitivity mode, the port count threshold is 120. Thus, the rejection count threshold is 10% of 120, which is 12. Following are examples of how the system would issue portscan events under this configuration:

- An attacker initiates connections with 131 ports of the target and the target positively acknowledges all the initiations. Port count = 131, which is greater than the threshold, but a portscan alert is not triggered because there are no negative acknowledgements.
- An attacker initiates connections with 131 ports of the target and the target positively acknowledges 121 initiations and negatively acknowledges 10 initiations. Port count = 131, which is greater than the threshold, but reject port count = 10, which is lesser than the rejection threshold. Therefore, a portscan alert is not triggered.
- An attacker initiates connections with 134 ports of the target and the target positively acknowledges 121 initiations and negatively acknowledges 13 initiations. Port count = 134, which is greater than the threshold, reject port count = 13 is also higher than the rejection threshold. Therefore a portscan alert is triggered.

## Best Practices for Portscan Prevention

Portscan prevention mode can result in unintended traffic outage. In Prevention mode, hosts are blocked from further scanning of networks on all protocols for the configured duration. Review the detection and prevention parameters carefully to ensure legitimate traffic is not blocked.

Before configuring portscan in Prevention mode, we strongly recommend the following:

1. Start using portscan in Detection mode.
2. Observe the generated portscan events.

3. Tune the Sensitivity level, and Monitored networks, Ignore Scanner list, and Ignore Target list. If a pre-defined sensitivity level does not work well for your situation, configure custom settings as needed.
4. Repeat the process until false positives are eliminated and the event rate represents an accurate picture of port scanning in your network. Ensure that you are comfortable with blocking the remaining identified scanners.

## Requirements and Prerequisites for Threat Detection

### Model Support

Threat Defense running version 7.2+ and Snort 3.

### Supported Domains

Any

### User Roles

Admin

Access Admin

Network Admin

## Guidelines and Limitations for Threat Detection

- Threat detection requires Snort 3. The managed device must be at version 7.2 or higher. For Snort 2, or devices at versions lower than 7.2, you can configure port scan through the NAP policy. Note that the Threat Detection feature is not the same as the port scan feature in the NAP policy. If there are non-Snort 3/version 7.2+ devices assigned to the access control policy, the Threat Detection settings will not be deployed to those unsupported devices.
- If you configure port scan in the NAP policy on a device running 7.1 or lower, that configuration is not translated to the Threat Detection feature on upgrade to 7.2. You must manually configure Threat Detection. Although the NAP and Threat Detection portscan options are similar, they do not match one-to-one.
- If you configure Threat Detection, any port scan configuration in the NAP policy is ignored and not configured on the devices that support Threat Detection.
- The NAP port scan feature for Snort 3 is always ignored for version 7.2+ devices. To configure port scanning, you must use the Threat Defense settings.
- Threat detection works on traffic that passes through the device only. It does not work on traffic directed to the device.
- In a high availability setup, port scanning statistics are not synchronized to the standby unit. However, blocked hosts are synchronized and continue to be blocked until the duration period expires in case of a failover.

- (Devices running Threat Defense versions 7.2-7.7). For nodes in a cluster, detection and prevention happen on the individual cluster node. That is, if node B detects and blocks traffic from a host, node A will not be aware of that action because port scan statistics are not synchronized across cluster nodes.
- For inline sets, or for interfaces that are configured to be part of an Equal-Cost Multipath (ECMP) traffic zone, detection and prevention are done at the zone level. Portscan statistics for a host are accumulated across all interfaces of a zone. Similarly, when a host crosses configured thresholds, it is blocked across all interfaces of the corresponding zone.
- Although the portscan events generated by the Threat Detection feature are the same as the ones Snort issues for port scan, you do not need to enable port scanning intrusion rules to get the events. Threat Detection works regardless of your intrusion policy implementation.

## Configure Portscan Detection and Prevention

Portscan is a form of network reconnaissance that is often used by attackers as a prelude to an attack. In a portscan, an attacker determines the types of network protocols or services a host supports and sends specially crafted packets to a targeted host. By examining the packets that the host responds with, the attacker can often determine which ports are open on the host and, either directly or by inference, which application protocols are running on these ports.

You can enable Threat Detection to watch for port scanning activity and optionally, automatically block scanners for a period of time.

### Before you begin

FQDN, Wildcard mask, any, any-ipv4, and any-ipv6 network objects are not supported for portscan configuration. These objects are not shown in the **Monitor**, **Ignore Scanner**, **Ignore Target**, and **Exclude** fields.

### Procedure

- 
- |               |   |
|---------------|---|
| <b>Step 1</b> | In the access control policy editor, click <b>Advanced Settings</b> from the <b>More</b> drop-down arrow at the end of the packet flow line. Then, click <b>Edit</b> (✎) next to <b>Threat Detection</b> .  |
| <b>Step 2</b> | In the <b>Threat Detection</b> window, select the <b>Portscan mode</b> : <ul style="list-style-type: none"><li>• <b>Disable</b>—Turn off Threat Detection. This is the default mode. You can click <b>Revert to Defaults</b> to return to this unconfigured state.</li><li>• <b>Detection</b>—Perform portscan detection, but alert on problems only. Do not take action against potential attackers. We suggest you use this mode initially until you fine-tune the Threat Detection settings to avoid excessive false positives.</li><li>• <b>Prevention</b>—Perform portscan detection and actively block identified scanners, that is, hosts that are performing the port scan.</li></ul> |
| <b>Step 3</b> | Configure the <b>Traffic Selection</b> options.   |

The traffic selection options determine which networks are monitored, the type of connections monitored, and whether any scanners or target hosts should be exempted from the monitored networks. By default, the system monitors permitted connections on all networks.

- **Detection On Traffic**—Select the types of connection that will be monitored for portscan activity: **Permitted**, **Denied**, or **All** traffic. The default is **Permitted**.
- **Monitor**—Select the network objects that define the networks to monitor for portscan or sweep activity. The default is any network, IPv4 or IPv6. Use this option to limit scanning to untrusted networks.
- **Ignore Scanner**—Select the network objects that define the hosts or networks, from within the range of the monitored networks, that should be ignored. For example, if you have set up your own scanner to test your network, you can exempt the address of your scanner to avoid unnecessary reporting on the address. Do not include addresses that are outside the monitored networks, as these addresses are already ignored.
- **Ignore Target**—Select the network objects that define the hosts or networks that should be ignored as targets, that is, victims of a portscan or sweep.

**Step 4** Click the **Configuration** tab and select the scanning sensitivity level.

The pre-defined sensitivity levels, **Low**, **Medium**, and **High**, set the port scanning options to values that are increasingly aggressive. For example, if you select Low, you would expect to see fewer port scanning events, and you could potentially miss attackers more easily than if you selected Medium or High. On the other hand, if you select High, you might see more events and also potentially more false positives. The default level is Medium. For more information on these levels, see [Pre-Defined Sensitivity Levels for Portscan Detection, on page 1817](#).

As you select the levels, you can see the related values within the protocol sections: **TCP**, **UDP**, **IP**, and **ICMP**. If you change any of the preset values, or disable a type of scan, the sensitivity mode automatically changes to **Custom**.

Within each protocol section, the options are:

- **Interval**—The time range, in seconds, within which the configured values for portscan or portsweep are exceeded. For example, if you select 90 seconds, and 60 as the number of TCP portscan ports, a scanner would need to try 60 ports on a host within 90 seconds for it to be considered a portscan. The system generates events only if the number of ports, protocols, or hosts (for a portsweep) are exceeded within the specified interval.  
  
You can specify a range between 30-600 seconds. The longer the period, the more likely a host might be identified as a scanner.
- **Portscan (TCP/UDP)**—Select whether to monitor for port scanning against single hosts, and specify the number of ports that must be scanned within the interval to count as a portscan attack. The allowed range is 1-256.
- **Portsweep (TCP/UDP)**—Select whether to monitor for port sweeping against multiple hosts, and specify the number of hosts that must be scanned for a given port within the interval to count as a portsweep attack. The allowed range is 1-256.
- **Protocol Scan (IP)**—Select whether to monitor for protocol scanning against single hosts, and specify the number of protocols that must be scanned within the interval to count as a protocol scan attack. The allowed range is 1-255.

- **Protocol Sweep (IP)**—Select whether to monitor for protocol sweeping against multiple hosts, and specify the number of hosts that must be scanned for a given protocol within the interval to count as a protocol sweep attack. The allowed range is 1-256.
- **Hostsweep (ICMP)**—Select whether to monitor for ICMP host sweeping against multiple hosts, and specify the number of hosts that must be scanned within the interval to count as a hostsweep attack. The allowed range is 1-256.

**Step 5** If you selected prevention mode, click the **Prevention** tab and configure the options.

In Prevention mode, hosts are automatically blocked from further scanning of networks on all protocols for the configured duration. Review the detection and prevention parameters carefully to ensure legitimate traffic is not blocked.

- **Exclude**—Select the network objects that define the hosts or networks, from within the range of the monitored networks, that should be excluded from automatic blocking. Even if these hosts violate your scanning detection parameters, the system will not block them.
- **Duration**—How long, in seconds, automatically blocked scanner hosts should be prevented from sending traffic of any kind through the device. After the duration period ends, the hosts are automatically cleared and can again send traffic through the device. The allowed range is 600-2592000 seconds. The default is 3600 seconds (1 hour).

If you need to manually unblock a host, SSH to the firewall that is blocking the host and use the **clear threat-detection portscan attacker** command.

**Step 6** Click **OK** to save the Threat Detection settings.

**Step 7** Click **Save** to save the access control policy.

---

### What to do next

Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## Monitoring Threat Detection

The following topics explain how to monitor portscan activity

### Viewing Portscan Alerts

Portscan activity is alerted through the existing portscan-specific intrusion events. Intrusion events with Generator ID (GID) 122 and Snort ID from SIDs 1 through 27 are generated. For these events, the (*port\_scan*) string is prepended in the event messages. The events include packet information along with packet data containing the statistics that triggered the alert.

To see portscan events, go to **Analysis > Intrusion > Events**.

Portscan issues these events regardless of your intrusion policy or NAP configuration. Events are issued only when scanners exceed the number of configured ports/protocols/hosts for the various types of scan or sweep within the configured time interval for the associated protocol. A port scan from one host generates one event

per set interval as soon as the threshold is met. If the same host initiates a new port scan during the same interval, no event is reported.

The following table shows the possible events.

**Table 102: Portscan Events**

Portscan Type	Intrusion Event
TCP Regular, Decoy, Distributed Scan	122:1 (port_scan) TCP portscan
TCP Portsweep	122:3 (port_scan) TCP portsweep
TCP Distributed Scan	122:4 (port_scan) TCP distributed portscan
IP Regular, Decoy, Distributed Protocol Scan n	122:9 (port_scan) IP protocol scan
IP Protocol Sweep	122:11 (port_scan) IP protocol sweep
IP Distributed Scan	122:12 (port_scan) IP distributed protocol scan
UDP Regular, Decoy, Distributed Scan	122:17 (port_scan) UDP portscan
UDP Portsweep	122:19 (port_scan) UDP portsweep
UDP Distributed Scan	122:20 (port_scan) UDP distributed portscan
ICMP Sweep	122:25 (port_scan) ICMP sweep
Portscan Block	122:100 (port_scan) host blocked due to portscan activity

## Monitoring Portscan on the Firewall

To monitor portscan, log into the device CLI and use the following commands.

- **show threat-detection portscan** [attacker | target | shun]

Shows the IP addresses of scanners, those that have been shunned (blocked), and hosts that have been targeted by scans or sweeps.

- **show threat-detection portscan statistics** [host [ipv4\_address | ipv6\_address]] [protocol {tcp | udp | ip | icmp}]

Shows statistics related to the portscan system. You can specify host, protocol, or host and protocol to filter the output to the desired information.

- **clear threat-detection portscan** [attacker | target | shun] [ipv4\_address mask | ipv6\_address/prefix]

Manually unblocks scanners (attackers) or identified targets. Enter the command without parameters to clear all attackers, targets, or shunned hosts.

- **clear threat-detection portscan statistics** [host [ipv4\_address | ipv6\_address]] [protocol {tcp | udp | ip | icmp}]

Erases statistics related to portscan, so that you can more clearly see the current state of scanning through this device. Enter the command without parameters to clear all statistics. Alternatively, specify a host, protocol, or host and protocol, to limit the reset to the specified items.

## Unblocking A Host

If you configure Threat Detection in prevention mode, and the system blocks a host that you know is not an attacker, you can manually unblock the host before host is automatically unblocked when the duration period expires.

To manually unblock the host, log into the device CLI where the host is blocked and enter the **clear threat-detection portscan attacker** command. For example:

```
> clear threat-detection portscan attacker 10.2.0.100 255.255.255.255
1 tracker object deleted and 1 shun entry removed
```

Consider adding the host IP to the Exclude list in the prevention configuration.

## History for Threat Detection

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Description
Improved detection in low sensitivity.	7.4	7.4	The method for identifying port scans and sweeps has been improved when operating in low sensitivity level. Changes are automatic; there are no new configuration settings.
Improved portscan detection.	7.2	7.2 running Snort 3	<p>With an improved portscan detector, you can easily configure the system to detect or prevent portscans. You can refine the networks you want to protect, set the sensitivity, and so on. For devices running Snort 2 and for devices running Version 7.1 and earlier, continue to use the network analysis policy for portscan detection.</p> <p>New/modified screens: We added <b>Threat Detection</b> to the access control policy's Advanced tab.</p> <p>New/Modified commands: <b>clear threat-detection portscan</b>, <b>show threat-detection portscan</b>.</p>

## CHAPTER 50

# Intelligent Application Bypass

The following topics describe how to configure access control policies to use Intelligent Application Bypass (IAB)

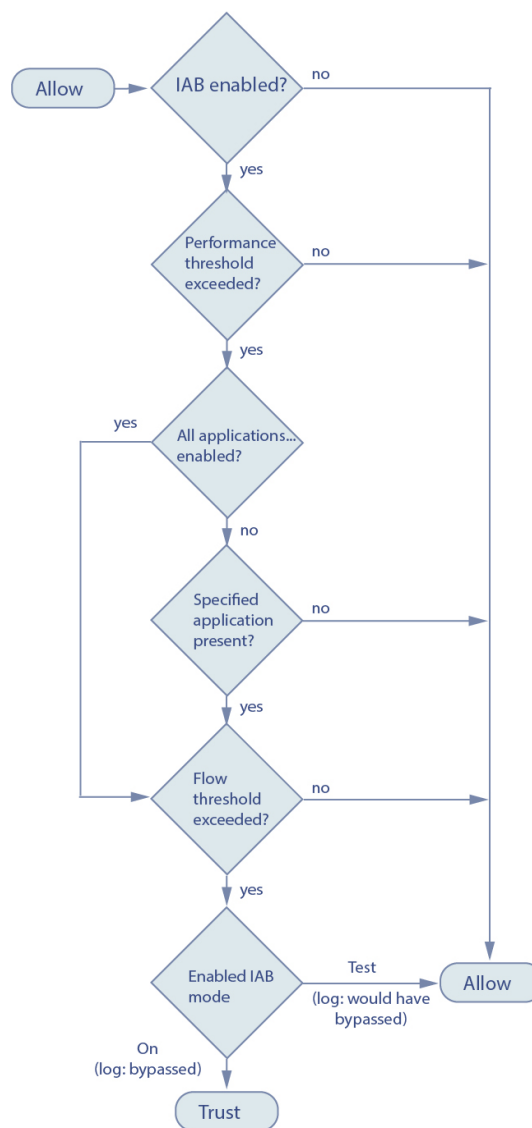

- [Introduction to IAB, on page 1827](#)
- [IAB Options, on page 1828](#)
- [Requirements and Prerequisites for Intelligent Application Bypass, on page 1830](#)
- [Configuring Intelligent Application Bypass, on page 1830](#)
- [IAB Logging and Analysis, on page 1831](#)

## Introduction to IAB

IAB identifies applications that you trust to traverse your network without further inspection if performance and flow thresholds are exceeded. For example, if a nightly backup significantly impacts system performance, you can configure thresholds that, if exceeded, trust traffic generated by your backup application. Optionally, you can configure IAB so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type.

The system implements IAB on traffic allowed by access control rules or the access control policy's default action, before the traffic is subject to deep inspection. A test mode allows you to determine whether thresholds are exceeded and, if so, to identify the application flows that would have been bypassed if you had actually enabled IAB (called *bypass mode*).

The following graphic illustrates the IAB decision-making process:

## IAB Options

### State

Enables or disables IAB.

### Performance Sample Interval

Specifies the time in seconds between IAB performance sampling scans, during which the system collects system performance metrics for comparison to IAB performance thresholds. A value of **0** disables IAB.

### Bypassable Applications and Filters

This feature provides two mutually exclusive options:

**Applications/Filters**

Provides an editor where you can specify bypassable applications and sets of applications (filters). See [Application Rule Conditions](#), on page 821.

**All applications including unidentified applications**

When an inspection performance threshold is exceeded, trusts all traffic that exceeds any flow bypass threshold, regardless of the application type.

**Performance and Flow Thresholds**

You must configure at least one inspection performance threshold and one flow bypass threshold. When a performance threshold is exceeded, the system examines flow thresholds and, if one threshold is exceeded, trusts the specified traffic. If you enable more than one of either, only one of each must be exceeded.

**Inspection performance thresholds** provide intrusion inspection performance limits that, if exceeded, trigger the inspection of flow thresholds. IAB does not use inspection performance thresholds set to 0. You can configure one or more of the following inspection performance thresholds:

**Drop Percentage**

Average packets dropped as a percentage of total packets, when packets are dropped because of performance overloads caused by expensive intrusion rules, file policies, decompression, and so on. This does not refer to packets dropped by normal configurations such as intrusion rules. Note that specifying an integer greater than 1 activates IAB when the specified percentage of packets is dropped. When you specify 1, any percentage from 0 through 1 activates IAB. This allows a small number of packets to activate IAB.

**Processor Utilization Percentage**

Average percentage of processor resources used.

**Packet Latency**

Average packet latency in microseconds.

**Flow Rate**

The rate at which the system processes flows, measured as the number of flows per second. Note that this option configures IAB to measure flow *rate*, not flow *count*.

**Flow bypass thresholds** provide flow limits that, if exceeded, trigger IAB to trust bypassable application traffic in bypass mode or allow application traffic subject to further inspection in test mode. IAB does not use flow bypass thresholds set to 0. You can configure one or more of the following flow bypass thresholds:

**Bytes per Flow**

The maximum number of kilobytes a flow can include.

**Packets per Flow**

The maximum number of packets a flow can include.

**Flow Duration**

The maximum number of seconds a flow can remain open.

**Flow Velocity**

The maximum transfer rate in kilobytes per second.

# Requirements and Prerequisites for Intelligent Application Bypass

## Model Support

Any

## Supported Domains

Any

## User Roles

- Admin
- Access Admin
- Network Admin

## Configuring Intelligent Application Bypass

### Caution

Not all deployments require IAB, and those that do might use it in a limited fashion. Do not enable IAB unless you have expert knowledge of your network traffic, especially application traffic, and system performance, including the causes of predictable performance issues. Before you run IAB in bypass mode, make sure that trusting the specified traffic does not expose you to risk.

### Before you begin

For Classic devices, you must have the Control license.

### Procedure

- Step 1** In the access control policy editor, click **Advanced Settings** from the **More** drop-down arrow at the end of the packet flow line. Then, click **Edit** (✎) next to **Intelligent Application Bypass Settings**.
- Step 2** Configure IAB options:
  - **State**—Turn IAB **Off** or **On**, or enable IAB in **Test** mode.
  - **Performance Sample Interval**—Enter the time in seconds between IAB performance-sampling scans. If you enable IAB, even in test mode, enter a non-zero value. Entering **0** disables IAB.
  - **Bypassable Applications and Filters**—Choose from:
    - Click the number of bypassed applications and filters and specify the applications whose traffic you want to bypass; see [Configuring Application Conditions and Filters](#), on page 1657.

- Click **All applications including unidentified applications** so that, when an inspection performance threshold is exceeded, IAB trusts all traffic that exceeds any flow bypass threshold, regardless of the application type.

- **Inspection Performance Thresholds**—Click **Configure** and enter at least one threshold value.
- **Flow Bypass Thresholds**—Click **Configure** and enter at least one threshold value.

You must specify at least one inspection performance threshold and one flow bypass threshold; both must be exceeded for IAB to trust traffic. If you enter more than one threshold of each type, only one of each type must be exceeded. For detailed information, see [IAB Options, on page 1828](#).

**Step 3** Click **OK** to save IAB settings.

**Step 4** Click **Save** to save the policy.

---

### What to do next

- Because some packets must be allowed to pass before an application can be detected, you must configure your system to examine those packets.

See [Best Practices for Handling Packets That Pass Before Traffic Identification, on page 2526](#) and [Specify a Policy to Handle Packets That Pass Before Traffic Identification, on page 2526](#).

- Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## IAB Logging and Analysis

IAB forces an end-of-connection event that logs bypassed flows and flows that would have been bypassed, regardless of whether you have enabled connection logging. Connection events indicate flows that are bypassed in bypass mode or that would have been bypassed in test mode. Custom dashboard widgets and reports based on connection events can display long-term statistics for bypassed and would-have-bypassed flows.

### IAB Connection Events

#### Action

When **Reason** includes `Intelligent App Bypass`:

##### **Allow -**

indicates that the applied IAB configuration was in test mode and traffic for the application specified by **Application Protocol** remains available for inspection.

##### **Trust -**

indicates that the applied IAB configuration was in bypass mode and traffic for the application specified by **Application Protocol** has been trusted to traverse the network without further inspection.

#### Reason

`Intelligent App Bypass` indicates that IAB triggered the event in bypass or test mode.

#### Application Protocol

This field displays the application protocol that triggered the event.

### Example

In the following truncated graphic, some fields are omitted. The graphic shows the **Action**, **Reason**, and **Application Protocol** fields for two connection events resulting from different IAB settings in two separate access control policies.

For the first event, the `Trust` action indicates that IAB was enabled in bypass mode and Bonjour protocol traffic was trusted to pass without further inspection.

For the second event, the `Allow` action indicates that IAB was enabled in test mode, so Ubuntu Update Manager traffic was subject to further inspection but would have been bypassed if IAB had been in bypass mode.

Action X	Reason X	Application X Protocol
<a href="#">Trust</a>	<a href="#">Intelligent App Bypass</a>	<a href="#">Bonjour</a>
<a href="#">Allow</a>	<a href="#">Intelligent App Bypass</a>	<a href="#">Ubuntu Update Manager</a>

404483

### Example

In the following truncated graphic, some fields are omitted. The flow in the second event was both bypassed (**Action:** `Trust`; **Reason:** `Intelligent App Bypass`) and inspected by an intrusion rule set (**Reason:** `Intrusion Monitor`). The `Intrusion Monitor` reason indicates that an intrusion rule set to **Generate Events** detected but did not block an exploit during the connection. In the example, this happened before the application was detected. After the application was detected, IAB recognized the application as bypassable and trusted the flow.

Last Packet X	Action X	Reason X	Application X Protocol
<a href="#">2015-06-12 10:53:09</a>	<a href="#">Trust</a>	<a href="#">Intelligent App Bypass</a>	<a href="#">Skype Probe</a>
<a href="#">2015-06-12 10:53:08</a>	<a href="#">Trust</a>	<a href="#">Intelligent App Bypass, Intrusion Monitor</a>	<a href="#">HTTP</a>

404541

### IAB Custom Dashboard Widgets

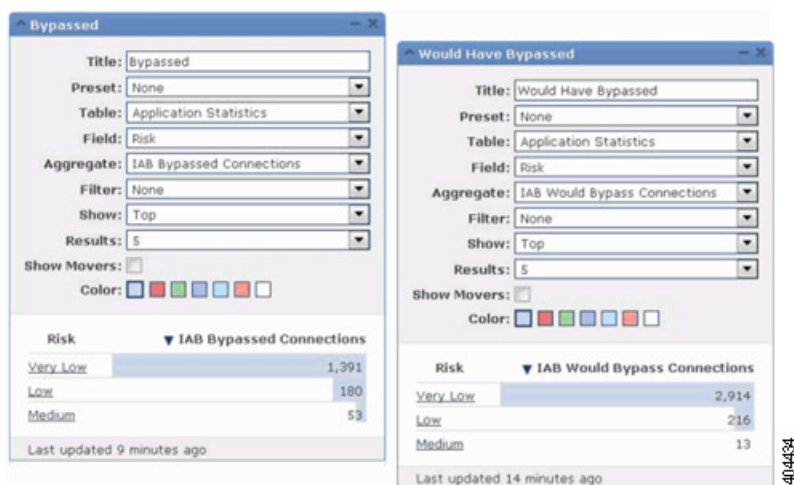

You can create a Custom Analysis dashboard widget to display long-term IAB statistics based on connection events. Specify the following when creating the widget:

- **Preset:** None
- **Table:** Application Statistics
- **Field:** any
- **Aggregate:** either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections
- **Filter:** any

## Examples

In the following Custom Analysis dashboard widget examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.
- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.

## IAB Custom Reports

You can create a custom report to display long-term IAB statistics based on connection events. Specify the following when creating the report:

- **Table:** Application Statistics
- **Preset:** None
- **Filter:** any
- **X-Axis:** any
- **Y-Axis:** either of:
  - IAB Bypassed Connections
  - IAB Would Bypass Connections

## Examples

The following graphic shows two abbreviated report examples:

- The *Bypassed* example shows statistics for application traffic bypassed because the applications were specified as bypassable and IAB was enabled in bypass mode in the deployed access control policy.
- The *Would Have Bypassed* example shows statistics for application traffic that would have been bypassed because the applications were specified as bypassable and IAB was enabled in test mode in the deployed access control policy.

## CHAPTER 51

# Content Restriction

The following topics describe how to configure access control policies to use content restriction features:

- [About Content Restriction, on page 1835](#)
- [Requirements and Prerequisites for Content Restriction, on page 1836](#)
- [Guidelines and Limitations for Content Restriction, on page 1837](#)
- [Using Access Control Rules to Enforce Content Restriction, on page 1837](#)
- [Using a DNS Sinkhole to Enforce Content Restriction, on page 1838](#)

## About Content Restriction

Major search engines and content delivery services provide features that allow you to restrict search results and website content. For example, schools use content restriction features to comply with the Children's Internet Protection Act (CIPA).

When implemented by search engines and content delivery services, you can enforce content restriction features only for individual browsers or users. The system allows you to extend these features to your entire network.

The system allows you to enforce:

- *Safe Search*—Supported in many major search engines, this service filters out explicit and adult-oriented content that business, government, and education environments classify as objectionable. The system does not restrict a user's ability to access the home pages for supported search engines.

You can use two methods to configure the system to enforce these features:

### Method: Access Control Rules

Content restriction features communicate the restricted status of a search or content query via an element in the request URI, an associated cookie, or a custom HTTP header element. You can configure access control rules to modify these elements as the system processes traffic.

### Method: DNS Sinkhole

For Google searches, you can configure the system to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes filters for Safe Search.

The table below describes the differences between these enforcement methods.

Table 103: Comparison of Content Restriction Methods

Attribute	Method: Access Control Rules	Method: DNS Sinkhole
Supported devices	Any	Secure Firewall Threat Defense only
Search engines supported	Any tagged <code>safesearch</code> supported in the <b>Applications</b> tab of the rule editor	Google only
YouTube Restricted Mode supported	Yes	Yes
SSL policy required	Yes	No
Hosts must be using IPv4	No	Yes
Connection event logging	Yes	Yes

When determining which method to use, consider the following limitations:

- The access control rules method requires an SSL policy, which impacts performance.
- The Google SafeSearch VIP supports IPv4 traffic only. If you configure a DNS sinkhole to manage Google searches, any hosts on the affected network must be using IPv4.

The system logs different values for the **Reason** field in connection events, depending on the method:

- Access Control Rules—Content Restriction
- DNS Sinkhole—DNS Block

## Requirements and Prerequisites for Content Restriction

### Model Support

Any, or as indicated in the procedure.

### Supported Domains

Any

### User Roles

- Admin
- Access Admin
- Network Admin

# Guidelines and Limitations for Content Restriction

- Safe search is supported by Snort 2 only.
- YouTube and Google do not support the YouTubeEDU feature that was implemented in access control rules. Please remove any access control rules that configure YouTubeEDU as they are not truly functional. You can also remove associated decryption rules.

## Using Access Control Rules to Enforce Content Restriction

The following procedure explains how to configure access control rules to restrict content.”

**Note** When safe search is enabled in an access control rule, inline normalization is enabled automatically.

### Procedure

- 
- Step 1** Create a decryption policy.
- Step 2** Add rules for handling Safe Search traffic:
- Choose **Decrypt - Resign** as the **Action** for the rules.
  - In **Applications**, add selections to the **Selected Applications and Filters** list:
    - Safe Search—Add the `Category: search engine` filter.
- Step 3** Set rule positions for the rules you added. Click and drag, or use the right-click menu to cut and paste.
- Step 4** Create or edit an access control policy, and associate the decryption policy with the access control policy. For more information, see [Associating Other Policies with Access Control, on page 1631](#).
- Step 5** In the access control policy, add rules for handling Safe Search traffic:
- Choose **Allow** as the **Action** for the rules.
  - In **Applications**, click the icon for **Safe search** (🔒) and set related options.
    - [Safe Search Options for Access Control Rules, on page 1838](#)
  - In **Applications**, refine application selections in the **Selected Applications and Filters** list.
 

In most cases, enabling Safe Search populates the **Selected Applications and Filters** list with the appropriate values. The system does not automatically populate the list if a Safe Search application is already present in the list when you enable the feature. If applications do not populate as expected, manually add them as follows:

    - Safe Search—Add the `Category: search engine` filter.

For more information, see [Configuring Application Conditions and Filters, on page 1657](#).

- Step 6** Set rule positions for the access control rules you added. Click and drag, or use the right-click menu to cut and paste.
  - Step 7** Configure the HTTP response page that the system displays when it blocks restricted content; see [Choosing HTTP Response Pages, on page 1736](#).
  - Step 8** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).
- 

## Safe Search Options for Access Control Rules

The system supports Safe Search filtering for specific search engines only. For a list of supported search engines, see applications tagged `safesearch supported` in the **Applications** tab of the access control rule editor. For a list of unsupported search engines, see applications tagged `safesearch unsupported`.

When enabling Safe Search for an access control rule, set the following parameters:

### Enable Safe Search

Enables Safe Search filtering for traffic that matches this rule.

### Unsupported Search Traffic

Specifies the action you want the system to take when it processes traffic from unsupported search engines. If you choose **Block** or **Block with Reset**, you must also configure the HTTP response page that the system displays when it blocks restricted content; see [Choosing HTTP Response Pages, on page 1736](#).

## Using a DNS Sinkhole to Enforce Content Restriction

Typically, a DNS sinkhole directs traffic away from a particular target. This procedure describes how to configure a DNS sinkhole to redirect traffic to the Google SafeSearch Virtual IP Address (VIP), which imposes content filters on Google and YouTube search results.

Because Google SafeSearch uses a single IPv4 address for the VIP, hosts must use IPv4 addressing.

**Caution** If your network includes proxy servers, this content restriction method is not effective unless you position your Firewall Threat Defense devices between the proxy servers and the Internet.

---

This procedure enforces content restriction for Google searches only. It does not apply to any other search engine.

### Before you begin

This procedure applies to Firewall Threat Defense only, and requires the IPS license.

### Procedure

---

- Step 1** Obtain a list of supported Google domains via the following URL: [https://www.google.com/supported\\_domains](https://www.google.com/supported_domains).

**Step 2** Create a custom DNS list on your local computer, and add the following entries:

- To enforce Google SafeSearch, add an entry for each supported Google domain.
- To enforce YouTube Restricted Mode, add a "youtube.com" entry.

The custom DNS list must be in text file (.txt) format. Each line of the text file must specify an individual domain name, stripped of any leading periods. For example, the supported domain ".google.com" must appear as "google.com".

**Step 3** Upload the custom DNS list to the Firewall Management Center; see [Uploading New Security Intelligence Lists to the Secure Firewall Management Center, on page 1319](#).

**Step 4** Determine the IPv4 address for the Google SafeSearch VIP. For example, run `nslookup` on `forcesafesearch.google.com`.

**Step 5** Create a sinkhole object for the SafeSearch VIP; see [Creating Sinkhole Objects, on page 1320](#).

Use the following values for this object:

- IPv4 Address—Enter the SafeSearch VIP address.
- IPv6 Address—Enter the IPv6 loopback address (`::1`).
- Log Connections to Sinkhole—Click Log Connections.
- Type—Choose **None**.

**Step 6** Create a basic DNS policy; see [Creating Basic DNS Policies, on page 1762](#).

**Step 7** Add a DNS rule for the sinkhole; see [Creating and Editing DNS Rules, on page 1764](#).

For this rule:

- Check the **Enabled** check box.
- Choose `sinkhole` from the **Action** drop-down list.
- Choose the sinkhole object you created from the **Sinkhole** drop-down list.
- Add the custom DNS list you created to the **Selected Items** list on **DNS**.
- (Optional) Choose a network in **Networks** to limit content restriction to specific users. For example, if you want to limit content restriction to student users, assign students to a different subnet than faculty, and specify that subnet in this rule.

**Step 8** Associate the DNS policy with an access control policy; see [Associating Other Policies with Access Control, on page 1631](#).

**Step 9** Deploy configuration changes; see [Deploy Configuration Changes, on page 183](#).

## CHAPTER 52

# Zero Trust Access

---

The following topics provide more information about Clientless Zero Trust Access, Universal Zero Trust Network Access; and how to configure and deploy them.

- [Zero Trust Access, on page 1841](#)
- [History for Zero Trust Access, on page 1855](#)

## Zero Trust Access

Zero Trust Access is based on Zero Trust Network Access (ZTNA) principles. ZTNA is a zero trust security model that eliminates implicit trust. The model grants the least privilege access after verifying the user, the context of the request, and after analyzing the risk if access is granted.

Zero Trust Access enables you to authenticate and authorize access to protected web based resources and applications from inside (on-premises) or outside (remote) the network using an external Security Assertion Markup Language (SAML) identity provider (IdP) policy.

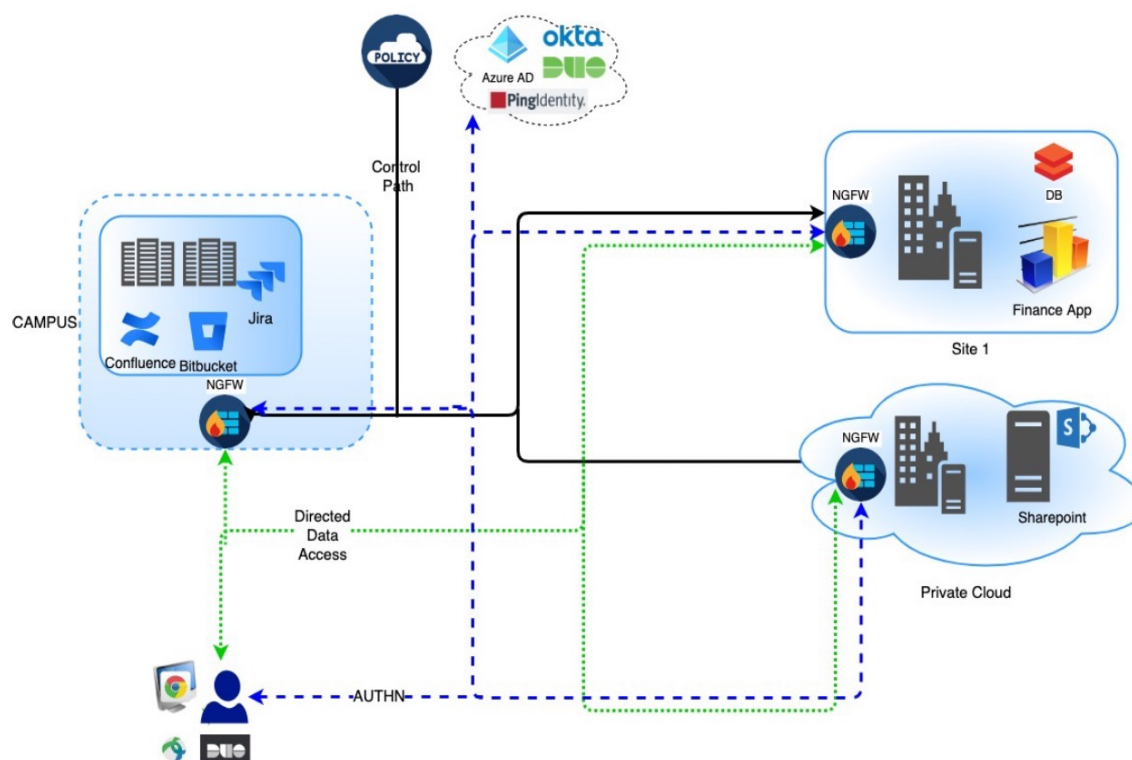

The features are:

- Supports multiple SAML-based identity providers such as Duo, Azure Active Directory (Azure AD), Okta, and other identity providers.
- Client applications such as Cisco Secure Client are not required on the endpoint (client devices) for secure access.
- Access and authentication is through the browser.
- Supports only TLS web applications.
- Client device posture is supported through agents such as Duo Health, using which the posture of the device can be evaluated against a policy in Duo, and access can be provided based on the same. The same functionality can be performed in conjunction with third-party identity providers that support posture evaluation with their agents such as Okta or PingID.
- Supports HTTP-Redirect SAML binding.
- Supports application groups that make it easier to enable zero trust access protection on a set of applications.
- Leverages threat defense intrusion and malware protection on zero trust application traffic.

You can use the Secure Firewall Management Center web interface to create a Zero Trust Application Policy that allows you to define private applications and assign threat policies to them. The policy is application specific where the administrator decides the inspection levels based on the threat perception for that application.

## How Threat Defense Works with Zero Trust Access

Figure 414: Threat Defense Deployment

1. Using a browser, a remote or on-prem user sends a HTTPS request to connect to an application from an endpoint.
2. The HTTPS request is intercepted by the firewall that protects the application.
3. The firewall redirects the user to application's configured IdP for authentication.

**Note** In the figure, each firewall protects a set of web applications. The user can directly access the applications behind the firewall after authentication and authorization.

4. After the authentication and authorization process is complete, the firewall allows the user to access the application.

## Why Use Zero Trust Access?

Zero Trust Access leverages the existing deployment of threat defense as an enforcement point to application access. It allows for segmented access to a private application with per application authorization and per application tunnel for remote and on-premises users.

The feature hides the network from users and allows users to only access applications they are authorized for. Authorization for one application in the network does not give an implicit authorization for other applications on the network, thereby reducing the attack surface significantly. In other words, every access to an application must be explicitly authorized.

Adding the zero trust access functionality to threat defense enables migration to a more secure access model without having to install or manage yet another device in the network.

The feature is easy to manage as it does not require a client and is per application access.

## Components of a Zero Trust Access Configuration

A new configuration consists of a Zero Trust Application Policy, Application Group, and Applications.

- **Zero Trust Application Policy**— Consists of application groups, and grouped or ungrouped applications. Security Zones and Security Controls settings are associated at a global level for all the ungrouped applications and group of applications.

A global port pool is assigned to the policy, by default. A unique port is automatically assigned from this pool to each private application that is configured.

Zero Trust Application policy consists of application groups, and grouped or ungrouped applications.

- **Application Groups**—Consists of a logical group of applications that share SAML authentication settings and can optionally share Security Zones and Security Controls settings.

Application Groups inherit the Security Zones and Security Controls settings from the global policy and can override the values.

When an Application Group is created, the same SAML IdP configuration can be used for authenticating multiple applications. Applications that are part of an Application Group inherit the Application Group's SAML configuration. This eliminates the need to configure the SAML settings for each application. After the Application Group is created, new applications can be added to it without configuring the IdP for it.

When an end user tries to access an Application that is part of group, the user is authenticated to the Application Group for the first time. When the user tries to access other applications that are part of the same Application Group, the user is provided access without being redirected again to the IdP for authentication. This prevents overloading the IdP with requests for application access and optimizes the usage of the IdP if a limit is enabled.

- **Applications**—There are two types:
  - **Ungrouped Applications**— Are standalone applications. SAML settings must be configured for every application. The applications inherit the Security Zones and Security Controls settings from the global policy and can be overridden by the application.
  - **Grouped Applications**— Are multiple applications that are grouped under an Application Group. The SAML settings are inherited from the Application Group and cannot be overridden. However, the Security Zones and Security Controls settings can be overridden for each application.

The following certificates are required for the configuration:

- **Identity Certificate**—This certificate is used by Firewall Threat Defense to masquerade as the applications. Firewall Threat Defense behaves as a SAML Service Provider (SP). This certificate must be a wildcard or Subject Alternative Name (SAN) certificate that matches the FQDN of the private applications. It is a common certificate for all applications protected by Firewall Threat Defense.
- **IdP Certificate**—The IdP provides a certificate for each defined Application or Application Group. This certificate must be configured so that Firewall Threat Defense can verify the IDP's signature on incoming SAML assertions.

**Note** IdP certificates are commonly included within the metadata file; otherwise, users are required to have the IdP certificate readily available during the configuration of applications.

- **Application Certificate**—The encrypted traffic from user to the application is decrypted by Firewall Threat Defense using this certificate for the purpose of inspection.

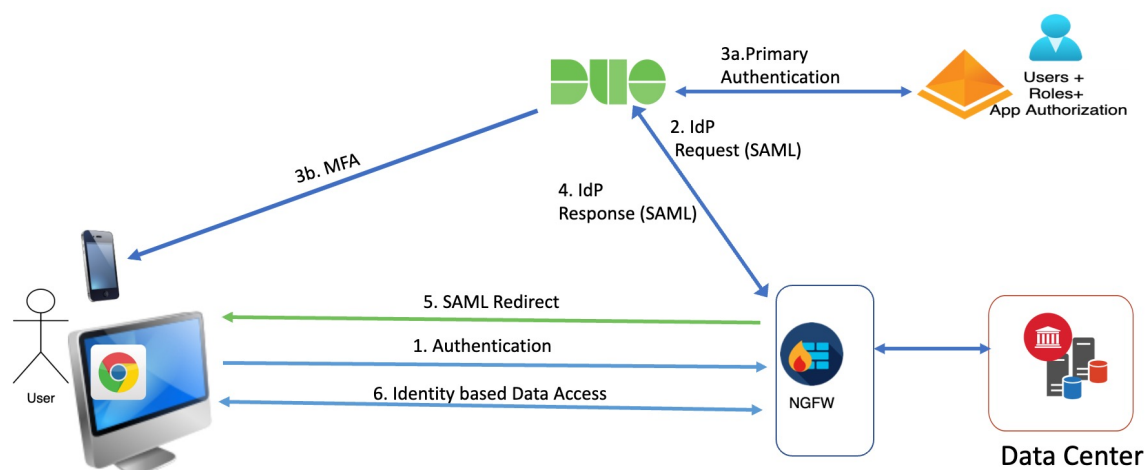

**Note** This certificate is required to verify the cookies in the header to authorize connections, even if we are not conducting an IPS/Malware inspection.

## Zero Trust Access Workflow

This figure depicts the Zero Trust Access workflow.

**Figure 415: Zero Trust Access Workflow**

The workflow is as follows:

1. User types the application URL in the browser.
  - If the HTTPS request is valid, the user is redirected to the mapped port (Step 6).

- If the HTTPS request is invalid, the user is sent for authentication per application (Step 2).
- 2. The user is redirected to the configured identity provider (IdP).
- 3.
  - a. The user is redirected to the configured primary authentication source.
  - b. The user is challenged with the configured secondary multi-factor authentication, if any.
- 4. The IdP sends a SAML response to threat defense. The user ID and other necessary parameters are retrieved from the SAML response through the browser.
- 5. The user is redirected to the application.
- 6. The user is allowed access to the application after validation is successful.

## Limitations for Zero Trust Network Access

- Supports only TLS-enabled web applications. All traffic must be decrypted.
- Supports only SAML identity providers.
- Supports IPv6; however, you can use only homogeneous network address translations (NAT) scenarios such as NAT66 and NAT44.  
NAT64, and NAT46 scenarios are not supported.

- Zero trust network access is available on Firewall Threat Defense only if Snort 3 is enabled.
- By default, the Firewall Threat Defense device uses port 443 for secure communications. Because this is the same port used by TLS-enabled applications likely to be configured for zero trust network access, you must change the device's HTTP server port.

Go to **Devices > Platform Settings**, then edit the Threat Defense Settings policy for the device, click **HTTP Access**, select the **Enable HTTP Server** check box, and enter a port other than 443 in the field. When you're finished, click **Save** in the upper right corner of the page.

The following figure shows an example.

The screenshot shows the 'Threat Defense Settings Policy' configuration page. On the left is a sidebar with a list of settings: ARP Inspection, Banner, DNS, External Authentication, Fragment Settings, HTTP Access (which is highlighted), and ICMP Access. The main content area has a header 'Enter Description'. Below this, there is a section for 'HTTP Access' which includes a checked checkbox for 'Enable HTTP Server' and a 'Port' input field containing the value '450'. A note below the port field states 'Please don't use 80 or 1443'. At the bottom of this section is an 'Interface' input field.

- All hyperlinks in protected web applications must have a relative path and are not supported on individual mode clusters.

- Protected web applications running on a virtual host or behind internal load balancers must use the same external and internal URL.
- Not supported on applications with strict HTTP Host Header validation enabled.
- If the application server hosts multiple applications and serves content based on the Server Name Indication (SNI) header in the TLS Client Hello, the external URL of the zero trust application configuration must match the SNI of that specific application.

## Prerequisites for Zero Trust Application Policy

Prerequisite Type	Description
Licensing	<ul style="list-style-type: none"> <li>• Smart license account with export-controlled features</li> <li>• (Optional) IPS and Threat licenses—It is required if security controls are used.</li> </ul>
Configurations	<p>Create a wildcard or Subject Alternative Name (SAN) certificate that matches the FQDN of private applications. For more information, see <a href="#">Adding Certificate Enrollment Objects, on page 1294</a>.</p> <p>Create a security zone through which access to private applications are regulated. For more information, see <a href="#">Create Security Zone and Interface Group Objects, on page 661</a>.</p>

## Manage Zero Trust Application Policies

You can create, edit, and delete zero trust application policies.

### Procedure

- 
- Step 1** Choose **Policies > Zero Trust Application**
- Step 2** Manage the zero trust access policies:
- Create—Click **New Policy**. See [Create a Zero Trust Application Policy, on page 1847](#)
  - Edit—Click **Edit** (). See [Edit a Zero Trust Application Policy, on page 1852](#)
  - Report—Click **Report** (.
  - Delete—Click **Delete** (.
- Step 3** Click **Save**.
-

**What to do next**

Ensure that there are no warnings before you deploy the configuration to threat defense. To deploy configuration changes, see Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Create a Zero Trust Application Policy

This task configures a Zero Trust Application Policy.

**Before you begin**

Ensure that you complete all the prerequisites listed in [Prerequisites for Zero Trust Application Policy](#), on page 1846.

**Procedure**

- 
- Step 1** Choose **Policies > Zero Trust Application**.
- Step 2** Click **Add Policy**.
- Step 3** In the **General** section, enter the policy name in the **Name** field. The description field is optional.
- Step 4** Enter a domain name in the **Domain Name** field.
- Ensure that the domain name is added to the DNS. The domain name resolves to the Firewall Threat Defense gateway interface from where the application is accessed. The domain name is used to generate the ACS URL for all private applications in an Application Group.
- Step 5** Choose an existing certificate from the **Identity Certificate** drop-down list.
- Click the **Add (+)** icon to configure a certificate enrollment object. For more information, see [Adding Certificate Enrollment Objects](#), on page 1294.
- Step 6** Choose a security zone from the **Security Zones** drop-down list.
- Click the **Add (+)** icon to add a new security zone.
- To add security zones, see [Create Security Zone and Interface Group Objects](#), on page 661.
- Step 7** In the **Global Port Pool** section, a default port range is displayed. Modify, if required. Port values range from 1024 to 65535. A unique port from this pool is assigned to each private application.
- Note**  
This port range should avoid any conflicts with the existing NAT range.
- Step 8** (Optional) In the **Security Controls** section, you can add an Intrusion or Malware and File policy:
- **Intrusion Policy**—Choose a default policy from the drop-down list or click the **Add (+)** icon to create a new custom intrusion policy. For more information, see [Creating a Custom Snort 3 Intrusion Policy](#) topic in the latest version of the [Cisco Secure Firewall Management Center Snort 3 Configuration Guide](#).
  - **Variable Set**—Choose a default variable set from the drop-down list or click the **Add (+)** icon to create a new variable set. For more information, see [Creating Variable Sets](#), on page 1338.

**Note**

To use variable sets, you must have the Secure Firewall Threat Defense IPS license for your managed devices.

- **Malware and File Policy**—Choose an existing policy from the drop-down list. Click the **Add** (+) icon to create a new malware and file policy. For more information, see [Managing File Policies, on page 2112](#).

**Step 9** Click **Save** to save the policy.

**What to do next**

1. Create an Application Group. See [Create an Application Group, on page 1848](#).
2. Create an Application. See [Create an Application, on page 1849](#).
3. Associate a Zero Trust Application Policy with a device. See [Set Targeted Devices for Zero Trust Access Policy, on page 1851](#)
4. Deploy configuration changes. See Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Create an Application Group

**Before you begin**

[Create a Zero Trust Application Policy, on page 1847](#)

**Procedure**

- 
- Step 1** Click **Add Application Group**.
- Step 2** In the **Application Group** section, type the name in the **Name** field and click **Next**.
- Step 3** In the **SAML Service Provider (SP) Metadata** section, the data is dynamically generated. Copy the values of the **Entity ID** and **Assertion Consumer Service (ACS) URL** fields or click **Download SP Metadata** to download this data in XML format for adding it to the IdP. Click **Next**.
- Step 4** In the **SAML Identity Provider (IdP) Metadata** section, add the metadata using any one of the methods:
- **XML File Upload**—Choose a file or drag and drop the XML file.  
The details of the **Entity ID**, **Single Sign-On URL**, and **IdP Certificate** are displayed.
  - **Manual Configuration**—Perform these steps:
    - **Entity ID**—Enter the URL that is defined in the SAML IdP to identify a service provider uniquely.
    - **Single Sign-On URL**—Enter the URL for signing into the SAML identity provider server.
    - **IdP Certificate**—Choose the certificate of the IdP enrolled in threat defense to verify the messages signed by the IdP.

Click the **Add** (+) icon to configure a new certificate enrollment object. For more information, see [Add Certificate Enrollment, on page 1296](#).

- **Configure Later**—In the event you do not have the IdP metadata, you can configure it later.

Click **Next**.

- Step 5** In the **Re-authentication Interval** section, enter the value in the **Timeout Interval** field and click **Next**.  
The re-authentication interval allows you to provide a value that determines when a user must authenticate again.
- Step 6** In the **Security Zones and Security Controls** section, the security zones and threat settings are inherited from the parent policy. You can override these settings. Click **Next**.
- Step 7** Review the configuration summary. Click **Edit** to modify the details in any of the sections. Click **Finish**.
- Step 8** Click **Save**.

The Application Group is created and is displayed on the Zero Trust Application page.

---

#### What to do next

1. [Create an Application, on page 1849](#).
2. Deploy configuration changes. See Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Create an Application

Use this task to create a Grouped or Ungrouped Application.

#### Before you begin

1. [Create a Zero Trust Application Policy, on page 1847](#).
2. [Create an Application Group, on page 1848](#) (required only for Grouped Applications).

#### Procedure

- 
- Step 1** Choose **Policies > Zero Trust Application**
- Step 2** Choose the policy.
- Step 3** Click **Add Application**.
- Step 4** In the **Application Settings** section, complete the following fields.
- **Application Name**—Enter the application name.
  - **External URL**—Enter the URL that is used by the user to access the application.

- **Application URL**—By default, the external URL is used as the Application URL. Uncheck the **Use External URL as Application URL** check box to specify a different URL.

If Threat Defense uses an internal DNS, the Application URL must match an entry within that DNS to ensure it resolves to the application.

- **Application Certificate**—Choose the certificate for the private application. Click the **Add (+)** icon to configure an internal certificate object. For more information, see [Adding Internal Certificate Objects, on page 1292](#).

- **IPv4 Source Translation**—Choose the source network for NAT from the list. Click **Add (+)** to create a network object. For more information, see [Network, on page 1281](#).

This Network Object or Object Group is used to translate a public network source IPv4 address of an incoming request to a routable IPv4 address inside the corporate network.

**Note**

Only object or object groups of type Host or Range are supported.

- **Application Group**—Choose the Application Group from the drop-down list. See [Create an Application Group, on page 1848](#).

**Note**

This field is not applicable for an ungrouped application.

**Step 5** Click **Next**.

**Step 6** Depending on the type of application:

- For a Grouped Application, the **SAML Service Provider (SP) Metadata**, **SAML Identity Provider (IdP) Metadata**, and **Re-authentication Interval** are inherited from the Application Group and do not need to be configured by the user.
- For an Ungrouped Application, perform these steps:
  - a. In the **SAML Service Provider (SP) Metadata** section, the data is dynamically generated. Copy the **Entity ID**, **Assertion Consumer Service (ACS) URL** of the IdP, or click **Download SP Metadata** to download this data in XML format for adding it to the IdP. Click **Next**.
  - b. In the **SAML Identity Provider (IdP) Metadata** section, add the metadata using any one of the methods:

- **XML File Upload**—Choose a file or drag and drop the XML file.

The details of the **Entity ID**, **Single Sign-On URL**, and **IdP Certificate** are displayed.

- **Manual Configuration**—Perform these steps:

- **Entity ID**—Enter the URL that is defined in the SAML IdP to identify a service provider uniquely.
- **Single Sign-On URL**—Enter the URL for signing into the SAML identity provider server.
- **IdP Certificate**—Choose the certificate of the IdP enrolled in threat defense to verify the messages signed by the IdP.

Click the **Add (+)** icon to configure a new certificate enrollment object. For more information, see [Add Certificate Enrollment, on page 1296](#).

- **Configure Later**—If you do not have the IdP metadata, you can configure it later.

Click **Next**.

- c. In the **Re-authentication Interval** section, enter the value in the **Timeout Interval** field and click **Next**. The reauthentication interval allows you to provide a value that determines when a user must authenticate again.

**Step 7** In the **Security Zones and Security Controls** section, the security zones and threat settings are inherited from the parent policy or application group. You can override these settings. Click **Next**.

**Step 8** Review the configuration summary. Click **Edit** to modify the details in any of the sections. Click **Finish**.

**Step 9** Click **Save**.

The application is listed on the Zero Trust Application page and enabled by default.

---

#### What to do next

1. [Set Targeted Devices for Zero Trust Access Policy, on page 1851.](#)
2. Deploy configuration changes. See Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Set Targeted Devices for Zero Trust Access Policy

Each Zero Trust Application policy can target multiple devices; each device can have one deployed policy at a time.

#### Before you begin

1. [Create a Zero Trust Application Policy, on page 1847.](#)
2. [Create an Application Group, on page 1848.](#)
3. [Create an Application, on page 1849.](#)

#### Procedure

---

**Step 1** Choose **Policies > Zero Trust Application**

**Step 2** Choose the policy.

**Step 3** Click **Targeted Devices**.

**Step 4** Choose the devices where you want to deploy the policy using any one of the methods:

- Choose a device in the **Available Devices** list and click >> or the **Add** (+) icon.
- To remove a device from the **Selected Devices** list, choose a device and click << or the **Delete** (🗑) icon.

**Step 5** Click **Apply** to save policy assignments.

**Step 6** Click **Save** to save the policy.

---

### What to do next

Deploy configuration changes. See Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Edit a Zero Trust Application Policy

You can edit the settings of a Zero Trust Application Policy, Application Group, or Application.

### Procedure

---

**Step 1** Choose **Policies > Zero Trust Application**

**Step 2** Click **Edit** (✎) next to the Zero Trust Application Policy you want to edit.

**Step 3** Edit your Zero Trust Application Policy.

You can change the following settings or perform these actions:

- Name and Description—Click **Edit** (✎) next to the policy name, make your changes, and click **Apply**.
- To modify the policy settings:
  - Click **Settings**
  - Modify the settings as required.

#### Important

Editing the domain name for the SAML ACS URL interrupts application access.

- Click **Save**.
- To modify the Application Group settings:
  - Click **Applications**.
  - Click **Edit** (✎) next to the Application Group you want to edit.
  - In each section, click **Edit** to modify the settings, as required

#### Important

Editing the Application Group name interrupts application access.

- Click **Apply** after you modify the settings in a section.
- Click **Finish**.
- Click **Save**.
- To modify the Application settings:

- Click **Applications**.
- Click **Edit** (✎) next to the Application you want to edit.
- In each section, click **Edit** to modify the settings, as required.

**Important**

Editing the Application name interrupts application access.

- Click **Apply** after you modify the settings in a section.
  - Click **Finish**.
  - Click **Save**.
- To enable, disable, or delete multiple Applications, choose the Applications, click the required bulk action, and click **Save**.

**Note**

These actions are also available in the right-click menu.

- To enable all Applications, click **Bulk Actions > Enable**.
  - To disable all Applications, click **Bulk Actions > Disable**.
  - To delete all Applications, click **Bulk Actions > Delete**.
- Click **Return to Zero Trust Application** to return to the policy page.

---

**What to do next**

Deploy configuration changes. See Deploy Configuration Changes in the [Cisco Secure Firewall Management Center Administration Guide](#).

## Monitor Zero Trust Sessions

**Connection Events**

After a Zero Trust Application Policy is deployed, new fields are available. To add the fields to the table view:

1. Choose **Analysis > Connections**.
2. Click the **Table View of Connection Events** tab.
3. In the table view of events, multiple fields are hidden by default. To change the fields that are displayed, click the **x** icon in any column name to display a field selector.
4. Select the following fields:
  - **Authentication Source**
  - **Zero Trust Application**
  - **Zero Trust Application Group**

- **Zero Trust Application Policy**

5. Click **Apply**.

See Connection and Security-Related Connection Events in the [Secure Firewall Management Center Administration Guide](#) for more information on the connection events.

### Zero Trust Dashboard

The Zero Trust dashboard allows you to monitor real-time data from active zero trust sessions on the devices.

The Zero Trust dashboard provides a summary of the top zero trust applications and zero trust users that are managed by the management center. Choose **Overview > Dashboards > Zero Trust** to access the dashboard.

The dashboard has the following widgets:

- Top Zero Trust Applications
- Top Zero Trust Users

### CLI Commands

Log in to the device CLI and use the following commands:

CLI Command	Description
<b>show running-config zero-trust</b>	To view the running configuration for a zero trust configuration.
<b>show zero-trust</b>	To display the run-time zero trust statistics and session information.
<b>show cluster zero-trust</b>	To display the summary of zero trust statistics across nodes in a cluster.
<b>clear zero-trust</b>	To clear zero trust sessions and statistics.
<b>show counters protocol zero_trust</b>	To view the counters that are hit for zero trust flow.

### Diagnostics Tool

The diagnostics tool facilitates the troubleshooting process by detecting possible issues with zero trust configurations. The diagnostics can be classified into two types:

- **Application-specific diagnostics** are used to detect issues such as:
  - DNS-related issues
  - Misconfigurations such as socket not open, and issues with classification and NAT rules.
  - Issues with deployment of zero trust policy or SSL rules
  - Issues with source NAT issues and exhaustion of PAT pool
- **General diagnostics** are used to detect issues such as:
  - Strong cipher license not enabled

- Invalid application certificate
- SAML-related issues
- Home agent and cluster bulk sync issues

To run the diagnostic tool:

1. Click Diagnostics (  ) next to the zero trust application that you want to troubleshoot. The **Diagnostics** dialog box appears.
2. Choose the device from the **Select Device** drop-down list and click **Run**. A report is generated in the **Reports** tab after the diagnostic process is complete.
3. To view, copy, or download the logs, click the **Logs** tab.

## History for Zero Trust Access

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Zero trust access enhancements.	7.4.1	7.4.1 with Snort 3	<p>Management center now includes the following zero trust access enhancements:</p> <ul style="list-style-type: none"> <li>• You can configure source NAT for an application. The configured network object or object group translates the incoming request's public network source IP address to a routable IP address inside the application network.</li> <li>• You can troubleshoot the zero trust configuration issues using the diagnostics tool.</li> </ul> <p>New/modified screens: <b>Policies &gt; Access Control &gt; Zero Trust Application</b></p> <p>New/modified CLI commands: <b>show running-config zero-trust, show zero-trust statistics</b></p>

Feature	Minimum Firewall Management Center	Minimum Firewall Threat Defense	Details
Clientless zero-trust access.	7.4.0	7.4.0 with Snort 3	<p>Zero Trust Access allows you to authenticate and authorize access to protected web based resources, applications, or data from inside (on-premises) or outside (remote) the network using an external SAML Identity Provider (IdP) policy.</p> <p>The configuration consists of a Zero Trust Application Policy (ZTAP), Application Group, and Applications.</p> <p>New/modified screens:</p> <ul style="list-style-type: none"> <li>• <b>Policies &gt; Zero Trust Application</b></li> <li>• <b>Analysis &gt; Connections &gt; Events</b></li> <li>• <b>Overview &gt; Dashboard &gt; Zero Trust</b></li> </ul> <p>New/modified CLI commands:</p> <ul style="list-style-type: none"> <li>• <b>show running-config zero-trust application</b></li> <li>• <b>show running-config zero-trust application-group</b></li> <li>• <b>show zero-trust sessions</b></li> <li>• <b>show zero-trust statistics</b></li> <li>• <b>show cluster zero-trust statistics</b></li> <li>• <b>clear zero-trust sessions application</b></li> <li>• <b>clear zero-trust sessions user</b></li> <li>• <b>clear zero-trust statistics</b></li> </ul>

# PART **VIII**

## **SD-WAN**

- [SD-WAN Capabilities, on page 1859](#)

## CHAPTER 53

# SD-WAN Capabilities

This chapter describes the SD-WAN capabilities supported in the management center.

- [Overview of SD-WAN Capabilities, on page 1859](#)
- [Features, on page 1860](#)
- [Use Cases for SD-WAN Capabilities, on page 1861](#)

## Overview of SD-WAN Capabilities

Software-Defined WAN (SD-WAN) solutions replace traditional WAN routers and are agnostic to WAN transport technologies. SD-WAN provides dynamic, policy-based, application path selection across multiple WAN connections and supports service chaining for additional services such as WAN optimization and firewalls.

As organizations expand their operations across multiple branch locations, ensuring secure and streamlined connectivity becomes paramount. Deploying a secure branch network infrastructure involves complex configurations, which can be time-consuming and prone to configuration errors if not handled properly. However, organizations can overcome these challenges by leveraging the Cisco Secure Firewall Management Center (management center) and the Cisco Secure Firewall Threat Defense (threat defense) devices for a simplified and secure branch deployment.

In this guide, we explore the concept of simplifying secure branch deployment using a robust firewall solution. By integrating a secure firewall as a foundational component of the branch network architecture, organizations can establish a strong security baseline while simplifying the deployment process. This approach enables organizations to enforce unified security policies, optimize traffic routing, and ensure resilient connectivity.

Some of the SD-WAN capabilities supported on the Cisco Secure Firewall are:

- **Simplified management:**
  - SASE: Umbrella auto tunnel deployment
  - Dynamic VTI (DVTI) hub spoke topology simplification
- **Application awareness:**
  - Direct Internet Access (DIA) for public cloud and guest user
  - Policy based routing (PBR) using applications as a match criteria
  - Local tunnel ID support for Umbrella

- **Increased usable bandwidth:**
  - ECMP support for load balancing across multiple ISPs and VTIs
  - Application-based load balancing using PBR
- **High availability with near zero network downtime:**
  - Dual ISP configuration
  - Optimal path selection based on application-based interface monitoring.
- **Secure Elastic Connectivity:**
  - Route-based (VTI) VPN tunnels between headquarters (hub) and branches (spokes)
  - IPv4 and IPv6 BGP, IPv4 and IPv6 OSPF, and IPv4 EIGRP over VTI
  - DVTI hubs that support spokes with static or dynamic IP

## Features

The following table lists some commonly used SD-WAN features:

Feature	Introduced in	More Information
Application monitoring using SD-WAN Summary dashboard	Release 7.4.1	<a href="#">SD-WAN Summary Dashboard, on page 1575</a>
SD-WAN Summary Dashboard	Release 7.4	<a href="#">SD-WAN Summary Dashboard, on page 1575</a>
Policy-based routing with user identity and SGTs	Release 7.4	<a href="#">Policy Based Routing, on page 1211</a>
Policy-based routing using HTTP path monitoring	Release 7.4	<a href="#">Policy Based Routing, on page 1211</a>
Loopback interface support for VTIs	Release 7.3	<a href="#">About Loopback Interfaces, on page 712</a>
Support for dynamic VTI (DVTI) with site-to-site VPN	Release 7.3	<a href="#">Dynamic VTI, on page 1411</a>
Umbrella auto tunnel	Release 7.3	<a href="#">Deploy a SASE Tunnel on Umbrella, on page 1434</a>
Support for IPv4 and IPv6 BGP, IPv4 and IPv6 OSPF, and IPv4 EIGRP for VTIs	Release 7.3	<a href="#">BGP, on page 1165</a> <a href="#">OSPF, on page 1125</a> <a href="#">EIGRP, on page 1155</a>
Route-based site-to-site VPN with hub and spoke topology	Release 7.2	<a href="#">Create a Route-based Site-to-Site VPN, on page 1418</a>

Feature	Introduced in	More Information
Policy-based routing with path monitoring	Release 7.2	<a href="#">Policy Based Routing, on page 1211</a>
Site to Site VPN Monitoring Dashboard	Release 7.1	<a href="#">Monitoring the Site-to-Site VPNs, on page 1441</a>
Direct Internet Access/Policy Based Routing	Release 7.1	<a href="#">Policy Based Routing, on page 1211</a>
Equal-Cost-Multi-Path (ECMP) zone with WAN interfaces	Release 7.1	<a href="#">ECMP, on page 1109</a>
ECMP zone with VTI interfaces	Release 7.1	<a href="#">ECMP, on page 1109</a>
Backup VTI for route-based site-to-site VPN	Release 7.0	<a href="#">Route Traffic Through a Backup VTI Tunnel, on page 1429</a>
Support for static VTI (SVTI) with site-to-site VPN	Release 6.7	<a href="#">Static VTI, on page 1410</a>

## CHAPTER 54

# Network Analysis and Intrusion Policies Overview

---

The following topics provide an overview of the Snort inspection engine, and the network analysis and intrusion policies:

- [Network Analysis and Intrusion Policy Basics, on page 1865](#)
- [How Policies Examine Traffic For Intrusions, on page 1867](#)
- [System-Provided and Custom Network Analysis and Intrusion Policies, on page 1871](#)
- [License Requirements for Network Analysis and Intrusion Policies, on page 1878](#)
- [Requirements and Prerequisites for Network Analysis and Intrusion Policies, on page 1878](#)
- [Guidelines and Limitations for Network Analysis and Intrusion Policies, on page 1878](#)
- [The Navigation Panel: Network Analysis and Intrusion Policies, on page 1879](#)
- [Conflicts and Changes: Network Analysis and Intrusion Policies, on page 1880](#)

## Network Analysis and Intrusion Policy Basics

Network analysis and intrusion policies work together as part of the system's intrusion detection and prevention feature.

- The term *intrusion detection* generally refers to the process of passively monitoring and analyzing network traffic for potential intrusions and storing attack data for security analysis. This is sometimes referred to as "IDS."
- The term *intrusion prevention* includes the concept of intrusion detection, but adds the ability to block or alter malicious traffic as it travels across your network. This is sometimes referred to as "IPS."

### Note

- You must configure Network Analysis Policy (NAP) in **Prevention** mode if you are using Snort 3 and SSL decryption or TLS Server Identity. The SSL functionality does not work when Snort 3 NAP is in detection mode.
- We strongly recommend that your intrusion policy (IPS) and network analysis policy (NAP) have the same settings. If IPS is in detection mode, set the NAP in detection mode, and conversely as well.

In an intrusion prevention deployment, when the system examines packets:

- A **network analysis policy** governs how traffic is *decoded* and *preprocessed* so it can be further evaluated, especially for anomalous traffic that might signal an intrusion attempt.
- An **intrusion policy** uses *intrusion and preprocessor rules* (sometimes referred to collectively as *intrusion rules*) to examine the decoded packets for attacks based on patterns. Intrusion policies are paired with *variable sets*, which allow you to use named values to accurately reflect your network environment.

Both network analysis and intrusion policies are invoked by a parent access control policy, but at different times. As the system analyzes traffic, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (additional preprocessing and intrusion rules) phase. Together, network analysis and intrusion policies provide broad and deep packet inspection. They can help you detect, alert on, and protect against network traffic that could threaten the availability, integrity, and confidentiality of hosts and their data.

The system is delivered with several similarly named network analysis and intrusion policies (for example, Balanced Security and Connectivity) that complement and work with each other. By using system-provided policies, you can take advantage of the experience of the Talos Intelligence Group. For these policies, Talos sets intrusion and preprocessor rule states, as well as provides the initial configurations for preprocessors and other advanced settings.

You can also create custom network analysis and intrusion policies. You can tune settings in custom policies to inspect traffic in the way that matters most to you so that you can improve both the performance of your managed devices and your ability to respond effectively to the events they generate.

You create, edit, save, and manage network analysis and intrusion policies using similar policy editors in the web interface. When you are editing either type of policy, a navigation panel appears on the left side of the web interface; the right side displays various configuration pages.

#### Attention

**Detection mode deprecation:** From management center Version 7.4.0, for a network analysis policy (NAP), the **Detection** inspection mode is deprecated and will be removed in an upcoming release.

The **Detection** mode was intended to be used as a test mode so that you can enable inspections and see how they behave in your network before setting it to drop traffic, that is, to show traffic that would be dropped.

This behavior is improved where all inspector drops are controlled by the rule state, and you can set each one to generate events. This is done to test them before configuring the rule state to drop traffic. As we now have granular control over traffic drops in Snort 3, the **Detection** mode only adds more complexity to the product and is not needed, so the detection mode is deprecated.

If you change a NAP in **Detection** mode to **Prevention**, the NAP that processes the traffic of intrusion events and have the result "will be dropped" will now be "dropped" and the corresponding traffic will drop the traffic from these events. This is applicable for rules whose GIDs are not 1 or 3. GIDs 1 and 3 are text/compiled rules (typically provided by Talos or from your custom/imported rules) and all other GIDs are inspections for anomalies. These are more uncommon rules to trigger in a network. Changing to **Prevention** mode is unlikely to have any impact on the traffic. You need to just disable the intrusion rule that is applicable for the dropped traffic and set it to just generate or disable.

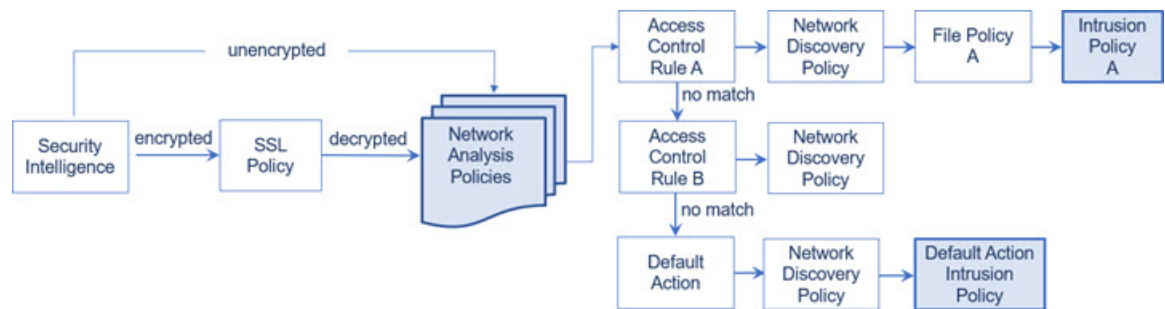

We recommend you choose **Prevention** as the inspection mode, but if you choose **Prevention**, you cannot revert to **Detection** mode.

## How Policies Examine Traffic For Intrusions

When the system analyzes traffic as part of your access control deployment, the network analysis (decoding and preprocessing) phase occurs before and separately from the intrusion prevention (intrusion rules and advanced settings) phase.

The following diagram shows, in a simplified fashion, the order of traffic analysis in an inline, intrusion prevention and malware defense deployment. It illustrates how the access control policy invokes other policies to examine traffic, and in which order those policies are invoked. The network analysis and intrusion policy selection phases are highlighted.
