## About MITRE ATT&CK Framework

The MITRE ATT&CK Framework is a comprehensive knowledge base that outlines the tactics, techniques, and procedures (TTPs) used by threat actors to compromise systems. It organizes these TTPs into matrices for different operating systems and platforms, mapping each attack stage (tactics) to specific methods (techniques). Each technique includes information about execution, procedures, defenses, detections, and real-world examples.

---

**Note** See <https://attack.mitre.org> for additional information about MITRE ATT&CK.

---

The management center uses the MITRE ATT&CK Framework to enhance threat detection and response, incorporating the following capabilities:

- Intrusion events include TTPs, allowing administrators to manage traffic with greater granularity by grouping rules according to vulnerability type, target system, or threat category.
- Select malware events use TTPs, enhancing the ability to detect and respond to threats.
- Unified and Classic Event Viewers display tactics, techniques, attack lifecycle graphs, and contextual enrichments from the Talos taxonomy. These enrichments include MITRE tags and a hierarchical view of associated tactics, techniques, and sub-techniques. You can also filter events using MITRE identifiers.

## Benefits of MITRE Framework

- MITRE Tactics, Techniques, and Procedures (TTPs) are added to intrusion events, which enable administrators to act on traffic, based on the MITRE ATT&CK framework. This enables administrators to view and handle traffic with more granularity, and group rules by vulnerability type, target system, or threat category.
- You can organize intrusion rules according to the MITRE ATT&CK framework. This allows you to customize policies according to specific attacker tactics and techniques.

## Sample Business Scenario for MITRE Network

A large corporate network uses Snort 3 as its primary intrusion detection and prevention system. In a rapidly evolving threat landscape, adoption of robust network security measures is necessary and important. Network administrators need to know if the configured policies are finding traffic of interest and if they are tracking a known attack group. For example, you may want to know if adversaries are attempting to take advantage of a weakness in your systems or applications in order to cause unanticipated behavior. The weakness in the system can be a bug, a glitch, or a design vulnerability. The applications may be websites, databases, standard services, such as Server Message Block (SMB) or Secure Shell (SSH), network device administration and management protocols or applications, such as web servers and related services.

The insights provided by the MITRE framework provides administrators with a more precise opportunity to specify protection for specific assets and protect their network from specific threat groups.

## Prerequisites for MITRE Framework

- You must be running Secure Firewall Management Center and Secure Firewall Threat Defence Version 7.3.0 or later with Snort 3.
- You must have at least one intrusion policy. See [Create a Custom Snort 3 Intrusion Policy](#).

## View and Edit Your Snort 3 Intrusion Policy

### Procedure

---

- Step 1** Choose **Policies > Intrusion**.
- Step 2** Ensure that the **Intrusion Policies** tab is chosen.
- Step 3** Click **Snort 3 Version** next to the intrusion policy that you want to view or edit.
- Step 4** Close the Snort helper guide that is displayed.
- Step 5** Click the **Group Overrides** layer.

This layer lists all the categories of rule groups in an hierarchical structure. You can drill down to the last leaf rule group under each rule group.

Policies  
< / Intrusion MITRE\_IPS Used by: No Access Control Policy

**MITRE / ATT&CK Framework / Enterprise / Initial Access / Exploit Public-Facing Application** (T1190) Security Level i Exclude

Adversaries may attempt to take advantage of a weakness in an Internet-facing computer or program using software, data, or commands in order to cause unintended or unanticipated behavior. The weakness in the system can be a bug, a glitch, or a design vulnerability. These applications are often

**Step 14** Click **View Rules in Rule Overrides** to view the different rules, rule details, rule actions, and so on, for the different rules. You can change the rule actions for one or multiple rules in the **Rule Overrides** layer.

This group does not contain any children.

0 Groups / Group contains 11972 rules

[View Rules in Rule Overrides](#)

### Step 15

Click the **Recommendations** layer and then click **Start** to start using Cisco-recommended rules. You can use the intrusion rule recommendations to target the vulnerabilities that are associated with the host assets detected in the network. For more information, see [Generate New Secure Firewall Recommendations in Snort 3](#).

Base Policy → Group Overrides → **Recommendations** Not in use → Rule Overrides | Summary

[...Open All](#)

**What to do next**

Deploy your intrusion policy to detect and log events that are triggered by the Snort rules. See [Deploy Configuration Changes](#).

## View Intrusion Events

You can view the MITRE ATT&CK techniques and rule groups in the intrusion events on the **Classic Event Viewer** and **Unified Event Viewer** pages. Talos provides mappings from Snort rules (GID:SID) to MITRE ATT&CK techniques and rule groups. These mappings are installed as part of the Lightweight Security Package (LSP).

**Procedure**

**Step 1** Click **Analysis** and select **Events** under **Intrusions**.

**Step 2** Click the **Table View of Events** tab.

**Events By Priority and Classification** [\(switch workflow\)](#)

No Search Constraints [\(Edit Search\)](#) 2025-01-12 13:30:29 - 2025-01-12 14:45:19 Expanding

Drilldown of Event, Priority, and Classification **Table View of Events** Packets

Jump to...

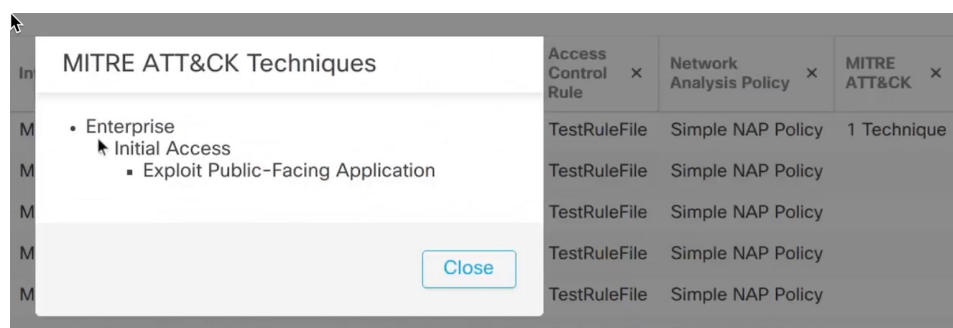

<input type="checkbox"/>	Time	Priority	Impact	Inline Result	Reason	Source IP	Source Country	Destination IP
<input type="checkbox"/>	2025-01-12 14:43:19	low	Potentially Vulnerable	Alert		fe80::ffff:ffff:ffff:ffff		ff02::1

<input type="checkbox"/>	2025-01-12 14:41:14	low	Potentially Vulnerable	Alert		fe80::ffff:ffff:ffff:ffff		ff02::1

**Step 3** Under **MITRE ATT&CK**, you can see the techniques for an intrusion event. Click **1 Technique** to view the MITRE ATT&CK techniques.

Access Control Policy	Access Control Rule	Network Analysis Policy	MITRE ATT&CK	Rule Group
AC_with_security_intelligence_file_file	TestRuleFile	Simple NAP Policy	1 Technique	1 Group
AC_with_security_intelligence_file_file	TestRuleFile	Simple NAP Policy		1 Group
AC_with_security_intelligence_file_file	TestRuleFile	Simple NAP Policy		1 Group
AC_with_security_intelligence_file_file	TestRuleFile	Simple NAP Policy		1 Group

In this example, **Exploit Public-Facing Application** is the technique.

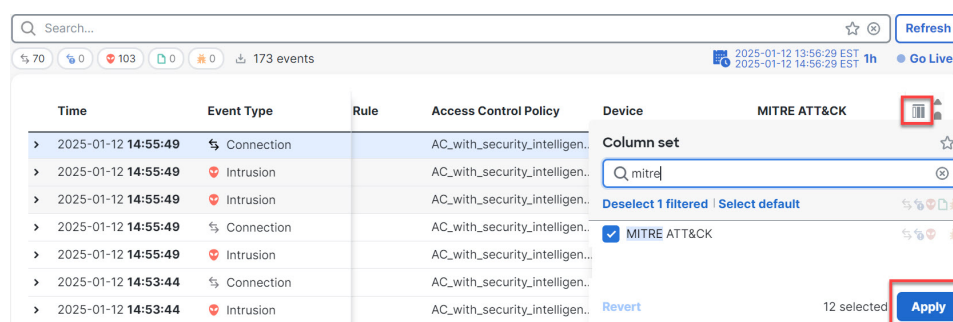

**Step 4** Click **Close**.

**Step 5** Click **Analysis** and select **Unified Events**.

**Step 6** If not enabled, click the column selector icon to enable the **MITRE ATT&CK** and **Rule Group** columns.

**Step 7** In this example, the intrusion event is triggered by an event that is mapped to one rule group. Click **1 Group** under the **Rule Group** column.

**Step 8** You can view **Protocol**, which is the parent rule group, and the DNS rule group under it. Choose **Protocol** > **DNS** to search for all the intrusion events that have at least one rule group that is .

The search results are displayed.
