Element	Description
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
AVP DataType	You can configure this only if the data type of the AVP is supported. For example, you can specify an IP address for AVP that have the address data type. Following are the specific syntax of the value option for the supported data types • Address—Specify the IPv4 or IPv6 address to match. For example, 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A • Diameter Identity, Diameter URI, Octet String, UTF8tString—Use regular expression or regular expression class objects to match these data types. • Enumerated—Specify a range of numbers in the Begin Range and End Range fields. The range is 0 - 4294967295. • Float32: decimal point representation with 8 digit precision • Float64: decimal point representation with 16 digit precision • Integer32: -2147483647 to 2147483647 • Integer64: -9223372036854775807 to 9223372036854775807 • Unsigned32: 0 to 4294967295 • Unsigned64: 0 to 18446744073709551615 • Time— Specify the start and end dates and time. Both are required. Time is in 24-hour format. **Note** You can create and add custom AVPs to new Diameter applications.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.

Create and Add Custom AVPs

Use the Add AVP dialog boxes to create and add custom AVPs. These can be registered with the IETF and added to new Diameter applications.

Note Cisco Security Manager does not allow you to edit a custom AVP object, once created.However the Device Override option allows you to edit the custom AVP for a particular device. If you want to change any parameter in the custom AVP object, you have to remove the custom AVP reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with the required values and refer it back in the diameter building block and deploy it again.

Navigation Path

When creating a custom AVP, in the Policy Object Manager, from the Add Match Criterion dialog box for Diameter, select **AVP in the Criterion**, then select **Begin Value and right click in the AVP Maps Selector dialog box to Add AVP.**

Field Reference

Table 252: Add AVP Dialog Boxes

Element	Description
Name	The name of the custom AVP. A maximum of 32 characters is allowed. **Note** At least one character of the name must be an alphabet.
Description	A description of the AVP. A maximum of 80 characters is allowed.
AVP Code	Set a value for the AVP Code (256- 4294967295), that belongs to the specific vendor code address space.
DataType	You can configure this only if the data type of the AVP is supported. For example, you can specify an IP address for AVP that have the address data type. Following are the specific syntax of the value option for the supported data types • Address—Specify the IPv4 or IPv6 address to match. For example, 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A • Diameter Identity, Diameter URI, Octet String, UTF8tString—Use regular expression or regular expression class objects to match these data types. • Enumerated—Specify a range of numbers in the Begin Range and End Range fields. The range is 0 - 4294967295. • Float32: decimal point representation with 8 digit precision • Float64: decimal point representation with 16 digit precision • Integer32: -2147483647 to 2147483647 • Integer64: -9223372036854775807 to 9223372036854775807 • Unsigned32: 0 to 4294967295 • Unsigned64: 0 to 18446744073709551615 • Time— Specify the start and end dates and time. Both are required. Time is in 24-hour format.

Element	Description
Vendor ID	Specify the ID number of the vendor, from 0-4294967295 in the Vendor ID field. For example, the 3GPP vendor ID is 10415, the IETF is 0.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Create and Add TLS Proxy Objects

If a Diameter application uses encrypted data over TCP, inspection cannot see inside the packets to implement your message filtering rules. Thus, if you create filtering rules, and you want them to also apply to encrypted TCP traffic, you must configure a TLS proxy. You also need a proxy if you want strict protocol enforcement on encrypted traffic. This configuration does not apply to SCTP/DTLS traffic.

The TLS proxy acts as a man-in-the-middle. It decrypts traffic, inspects it, then encrypts it again and sends it to the intended destination. Thus, both sides of the connection, the Diameter server and Diameter client, must trust the ASA, and all parties must have the required certificates. You must have a good understanding of digital certificates to implement TLS proxy.

Note The TLS proxy feature is supported in multi-context devices for version ASA 9.7.1 and later.

You have the following options for configuring TLS proxy for Diameter inspection:

- Full TLS proxy—Encrypt traffic between the ASA and Diameter clients and the ASA and Diameter server. You have the following options for establishing the trust relationship with the server:
  - Use a static proxy client trustpoint. The ASA presents the same certificate for every Diameter client when communicating with the Diameter server. Because all clients look the same, the Diameter server cannot provide differential services per client. On the other hand, this option is faster than the LDC method.
  - Use local dynamic certificates (LDC). With this option, the ASA presents unique certificates per Diameter client when communicating with the Diameter server. This method gives the Diameter server better visibility into client traffic, which makes it possible to provide differential services based on client characteristics.
- TLS offload—Encrypt traffic between the ASA and Diameter client, but use a clear-text connection between the ASA and Diameter server. This option is viable if the Diameter server is in the same data center as the ASA, where you are certain that the traffic between the devices will not leave the protected area. Using TLS offload can improve performance, because it reduces the amount of encryption processing required. It should be the fastest of the options. The Diameter server can apply differential services based on client IP address only.

Navigation Path

Select **Manage > Policy Objects**, then select **TLS Proxy** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object.**

Field Reference

Table 253: Add TLS Proxy Dialog Boxes

Element	Description
Name	The name of the TLS Proxy object. A maximum of 63 characters is allowed. **Note** At least one character of the name must be an alphabet.
Description	A description of the TLS Proxy object.
Server Configuration	
Server Proxy Certificate	Click Select to import the CA certificate that is used to sign the Diameter client's certificate into an ASA trustpoint. This step specifies the proxy trustpoint certificate to be presented during TLS handshake. The trustpoint could be self-signed or issued by a third party. This allows the ASA to trust the Diameter clients.
Enable client authentication during TLS proxy handshake	Select to require the ASA to present a certificate and authenticate the TLS client during TLS handshake.
Encryption (Optional)	Beginning with 4.14, Cisco Security Manager allows you to configure cipher suites, when TLS Proxy is used as server. This field defines the cipher suites to be announced/matched during the TLS handshake. Select the Hashing algorithms, which are needed for encryption of data, from the Available Members List and add them to Selected Members list. **Note** Beginning from 4.19, Cisco Security Manager displays activity validation error message if you configure TLS proxy with NULL SHA1 in SSL cipher for ASA 9.12(1) devices.
Client Configuration	
Configure the proxy client to use clear text to communicate with the remote TCP server	Select proxy client to use clear text, if encryption is not needed.
Specify the proxy certificate for the TLS client. The client proxy certificate could either be self-signed, enrolled with a CA or issued by a third party.	Select to specify Client Proxy Certificate. Alternately, click Select to import the CA certificate for the TLS client.

Element	Description
Specify the internal Certificate Authority to sign the local dynamic certificates for phones. This local CA can be self-signed certificate with proxy-ldc-issuer enabled or you may use embedded Local CA Server to issue LDC to phones.	Select to specify Local Dynamic Certificate Issuer. Alternately, click Select to import the CA certificate, which could serve as Local Dynamic certificate (LDC) issuer
Local Dynamic Certificate Key Pair	
Key Pair Name	Specifies the RSA key pair to be used by the client or server's dynamic certificates. The key pair must have been generated with the "crypto key generate" command. The keypair must exist on the device before deployment.
Encryption (Optional)	Defines the cipher suites to be announced/matched during the TLS handshake. For client proxy (the proxy acts as a TLS client to the server), the user-defined cipher suites replace the original ones from the Hello message for asymmetric encryption method between the two TLS legs. Select the Hashing algorithms, which are needed for encryption of data, from the Available Members List and add them to Selected Members list. **Note** From ASA version 9.7.1, the Cisco Security Manager supports TLS1.2 new cipher suites— aes256-sha384 and aes128-sha256.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Editing TLS Proxy Object

Cisco Security Manager does not allow you to edit a TLS proxy object, once created. However, the Device Override option allows you to edit the TLS proxy object for a particular device.

If you want to change any parameter in the TLS proxy object, you have to remove the TLS proxy reference from the diameter building block (if it is referred), deploy to the device (if it is present in the device) and re-create the object with a new name, with the required values and refer it back in the diameter building block and deploy it again.

To edit a TLS proxy in class-map, execute the following deployment procedure:

1. Remove the relevant class map with existing TLS proxy server from the device by navigating to Platform > Service Policy > Rules.
2. Deploy the relevant class map with new TLS proxy server to the device by navigating to Platform > Service Policy > Rules.

Configuring LISP Maps

The Locator ID Separation Protocol (LISP) is a network architecture and protocol. LISP replaces a single IP address with two numbering spaces—Routing Locators (RLOCs), which are topologically assigned to network attachment points and used for routing and forwarding of packets through the network; and Endpoint Identifiers (EIDs), which are assigned independently from the network topology and used for numbering devices, and are aggregated along administrative boundaries.

LISP defines functions for mapping between the two numbering spaces and encapsulating traffic originated by devices using non-routable EIDs for transport across a network infrastructure that routes and forwards using RLOCs. LISP provides a set of functions for devices to exchange information that is used to map non-routable EIDs to routable RLOCs.

When considering the deployment of ACLs with LISP, the following aspects are important.

- LISP encapsulation utilizes a UDP header just prior to the LISP header for all packets to distinguish between two distinct packet groups: LISP control plane packets, which utilize a UDP destination port of 4342, and LISP data plane packets, which utilize a UDP destination port of 4341. ACLs may need to consider this distinction between these two groups of packets.
- LISP is an encapsulation protocol and, because ACLs only filter based on Layer 3 and Layer 4 header information, ACLs may need to be applied at a specific point or at several different points within the packet forwarding and LISP encapsulation process in order to implement a site security policy. The application point and direction of the ACL will dictate whether EID namespace or RLOC namespace is used within the ACL itself. Packets can be filtered using EID namespace just prior to LISP encapsulation or just after LISP decapsulation; packets can be filtered using RLOC namespace just after LISP encapsulation or just prior to LISP decapsulation.

You can use the Add and Edit LISP Map dialog boxes to filter traffic based on EID access-list and validation key. Filtering lets you fine-tune the traffic you allow on your network.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > LISP** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 254: Add and Edit LISP Map Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Allowed Eid access-list	Enables you to select a unified access list building block.
Validation key	Specify an unencrypted clear text password.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring M3UA Maps

MTP3 User Adaptation (M3UA) is a client/server protocol that provides a gateway to the SS7 network for IP-based applications that interface with the SS7 Message Transfer Part 3 (MTP3) layer. M3UA makes it possible to run the SS7 User Parts (such as ISUP) over an IP network. M3UA is defined in RFC 4666.

M3UA uses SCTP as the transport layer. SCTP port 2905 is the expected port, although you can configure the signaling gateways to use a different port.

The MTP3 layer provides networking functions such as routing and node addressing, but uses point codes to identify nodes. The M3UA layer exchanges Originating Point Codes (OPC) and Destination Point Codes (DPC). This is similar to how IP uses IP addresses to identify nodes.

M3UA inspection provides limited protocol conformance. You can optionally apply access policy based on point codes or Service Indicators (SI). You can also apply rate limiting based on message class and type.

M3UA Protocol Conformance

M3UA inspection provides the following limited protocol enforcement. Inspection drops and logs packets that do not meet requirements.

- Common message header. Inspection validates all fields in the common header.
  - Version 1 only.
  - Message length must be correct.
  - Message type class with a reserved value is not allowed.

- Invalid message ID within the message class is not allowed.

- Payload data message.
  - Only one parameter of a given type is allowed.
  - Data messages on SCTP stream 0 are not allowed.

M3UA Inspection Limitations

M3UA inspection has the following limitations.

- NAT is not supported for IP addresses embedded in M3UA data.
- Segmented M3UA messages will not be inspected and are likely to be dropped.
- SCTP does not support multi-homing or multi-streaming. If you need to support multi-homed flows you need to create access lists to allow them.
- Stateful failover is not supported for call flows and messages. Any failure occurring during a call flow might cause packets to be dropped and calls to be disconnected.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > M3UA** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 255: Add and Edit M3UA Map Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
SS7 Variant	Select the SS7 variant that will be used in your network for M3UA inspection.This option determines the valid format for point codes. After you configure the option and deploy an M3UA policy, you cannot change it unless you first remove the policy. The default SS7 variant is ITU.

Element	Description
Enable M3UA Application Server Process (ASP) State Validation	Select to perform application server process (ASP) state validation. The system maintains the ASP states of M3UA sessions and allows or drops ASP messages based on the validation result. If you do not enable strict ASP state validation, all ASP messages are forwarded uninspected.
Enforce Timeout	
Endpoint	Enter the idle timeout to remove statistics for an M3UA endpoint, in the hh:mm:ss format. To have no timeout, specify 0. The default is 30 minutes (00:30:00).
Session	Enter the idle timeout to remove an M3UA session if you enable strict ASP state validation, in hh:mm:ss format. To have no timeout, specify 0. The default value is 30 minutes (00:30:00). When this timeout is disabled, the system cannot remove stale sessions.
M3UA Message Tag Validation Specify, whether to check and validate the content of certain fields for the specified message type. Messages that fail validation are dropped. Validation differs by message type. Select the messages you want to validate.	
Destination User Part Unavailable (DUPU)	The User/Cause field must be present, and it must contain only valid cause and user codes.
Error	All mandatory fields must be present and must contain only allowed values. Each error message must contain the required fields for that error code.
Notify	The status type and status information fields must contain allowed values only.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see M3UA Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 876). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

M3UA Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Match Condition and Action dialog boxes to define the match criterion, value, and action directly in a M3UA policy map.

The fields on this dialog box change based on the criterion you select while creating a policy map.

Navigation Path

When creating a M3UA policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit M3UA Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring M3UA Maps , on page 873.

Related Topics

- Understanding Map Objects , on page 308

Field Reference

Table 256: M3UA Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Criterion	Specifies which criterion of SCTP traffic to match - Message, DPC, OPC, or Service Indicator.
Message criterion	Matches the M3UA message class and type. The possible values for message class ID and its corresponding message ID are detailed here. Refer to the M3UA RFCs and documentation for detailed information about these messages. • class ID 0 (Management Messages)- message ID 0-1 • class ID 1(Transfer Messages)- message ID 1 • class ID 2(SS7 Signaling Network Management Messages)- message ID 1-6 • class ID 3(ASP State Maintenance Messages)-message ID 1-6 • class ID 4(ASP Traffic Maintenance Messages)- message ID 1-4 • class ID 9(Routing Key Management Messages)- message ID 1-4

Element	Description
DPC criterion	Matches the destination point code in the data message. Point code is in the zone-region-sp format, where the possible values for each element depend on the SS7 variant.
OPC criterion	Matches the originating point code in the data message, that is, the traffic source. Point code is in zone-region-sp format, where the possible values for each element depend on the SS7 variant: • ITU—Point codes are 14 bit in 3-8-3 format. The value ranges are [0-7]-[0-255]-[0-7]. • ANSI—Point codes are 24 bit in 8-8-8 format. The value ranges are [0-255]-[0-255]-[0-255]. • Japan—Point codes are 16 bit in 5-4-7 format. The value ranges are [0-31]-[0-15]-[0-127]. • China—Point codes are 24 bit in 8-8-8 format. The value ranges are [0-255]-[0-255]-[0-255].
Service Indicator criterion	Matches the service indicator number, 0-15. The available service indicators are listed in the variables section. Consult M3UA RFCs and documentation for detailed information about these service indicators • 0—Signaling Network Management Messages • 1—Signaling Network Testing and Maintenance Messages • 2—Signaling Network Testing and Maintenance Special Messages • 3—SCCP • 4—Telephone User Part • 5—ISDN User Part • 6—Data User Part (call and circuit-related messages) • 7—Data User Part (facility registration and cancellation messages) • 8—Reserved for MTP Testing User Part • 9—Broadband ISDN User Part • 10—Satellite ISDN User Part • 11—Reserved • 12—AAL type 2 Signaling • 13—Bearer Independent Call Control • 14—Gateway Control Protocol • 15—Reserved

Element	Description
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action	The action you want the device to take for traffic that matches the defined criteria. • Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped. • Drop Packet and Log— Same as drop packet and additionally send a system log message. • Rate Limit— Limit the rate of messages. This option is available when the message criterion is selected.

Configuring Regular Expression Groups

Use the Add and Edit Regular Expression Groups dialog boxes to define regular expression groups, which contain multiple regular expressions. Groups make it possible for you to create modular regular expressions and group them in multiple ways for various uses. The objects can be used in some inspection class maps and inspection policy maps.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Regular Expressions Groups** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Related Topics

- Creating Policy Objects , on page 237

Field Reference

Table 257: Add and Edit Regular Expression Class Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.

Element	Description
Regular Expressions	The Regular Expression policy objects that include the expressions you want to include in the group. Enter the name of the objects or click **Select** to select them from a list or to create a new object.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add/Edit Regular Expressions

Use the Add and Edit Regular Expression dialog boxes to define regular expressions for use in class and policy inspection maps or in regular expression group policy objects. Regular expressions are also used in remote access SSL VPN client settings.

A regular expression matches text strings either literally as an exact string or by using metacharacters so you can match multiple variants of a text string. You can use regular expressions in various type of class and policy inspection maps to match various target items, for example, the content of certain application traffic such as the body text inside an HTTP packet.

Navigation Path

- Select **Manage** > **Policy Objects**, then select **Maps** > **Regular Expressions** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.
- From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Secure Client Image** button for the Secure Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see Configuring SSL VPN Secure Client Settings (ASA), on page 1391. On the Add Secure Client Image dialog box, click **Select** to open the Regular Expressions Selector dialog box. To add a new regular expression, click the **Add (+)** button on the Regular Expressions Selector dialog box.

Table 258: Add and Edit Regular Expression Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Value	The regular expression, up to 100 characters in length. For information on the metacharacters you can use to build regular expressions, see Metacharacters Used to Build Regular Expressions , on page 880.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Metacharacters Used to Build Regular Expressions

The following table explains the metacharacters you can use to build regular expressions in the Add and Edit Regular Expression dialog boxes (see Add/Edit Regular Expressions , on page 879).

Keep the following tips in mind when creating regular expressions:

- If you enter any metacharacters in your text string that you want to be used literally, add the backslash (\) escape character before them. For example, “example\.com”.
- If you want to match upper and lower case characters, enter text in both upper- and lowercase. For example, “cats” is entered as “[cC][aA][tT][sS]”.

Table 259: Metacharacters Used to Build Regular Expressions

Character	Description	Notes
.	Dot	Matches any single character. For example, d.g matches dog, dag, dtg, and any word that contains those characters, such as doggonnit.
(exp)	Subexpression	A subexpression segregates characters from surrounding characters, so that you can use other metacharacters on the subexpression. For example, d(o|a)g matches dog and dag, but do|ag matches do and ag. A subexpression can also be used with repeat quantifiers to differentiate the characters meant for repetition. For example, ab(xy){3}z matches abxyxyxyz.

Character	Description	Notes
|	Alternation	Matches either expression it separates. For example, dog|cat matches dog or cat.
?	Question mark	A quantifier that indicates that there are 0 or 1 of the previous expression. For example, lo?se matches lse or lose.
*	Asterisk	A quantifier that indicates that there are 0, 1 or any number of the previous expression. For example, lo*se matches lse, lose, loose, etc.
+	Plus	A quantifier that indicates that there is at least 1 of the previous expression. For example, lo+se matches lose and loose, but not lse.
{x}	Repeat Quantifier	Repeat exactly x times. For example, ab(xy){3}z matches abxyxyxyz.
	Minimum repeat quantifier	Repeat at least x times. For example, ab(xy){2,}z matches abxyxyz, abxyxyxyz, etc.
[abc]	Character class	Matches any character in the brackets. For example, [abc] matches a, b, or c.
[^abc]	Negated character class	Matches a single character that is not contained within the brackets. For example, [^abc] matches any character other than a, b, or c. [^A-Z] matches any single character that is not an uppercase letter.
[a-c]	Character range class	Matches any character in the range. [a-z] matches any lowercase letter. You can mix characters and ranges: [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z]. The dash (-) character is literal only if it is the last or the first character within the brackets: [abc-] or [-abc].
“”	Quotation marks	Preserves trailing or leading spaces in the string. For example, “ test” preserves the leading space when it looks for a match.
^	Caret	Specifies the beginning of a line.
\	Escape character	When used with a metacharacter, matches a literal character. For example, \[matches the left square bracket.
char	Character	When character is not a metacharacter, matches the literal character.
\r	Carriage return	Matches a carriage return 0x0d.
\n	Newline	Matches a new line 0x0a.
\t	Tab	Matches a tab 0x09.
\f	Formfeed	Matches a form feed 0x0c.
\xNN	Escaped hexadecimal number	Matches an ASCII character using hexadecimal (exactly two digits).

Character	Description	Notes
\NNN	Escaped octal number	Matches an ASCII character as octal (exactly three digits). For example, the character 040 represents a space.

Configuring Settings for Inspection Rules for IOS Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

If you configure inspection rules, you can also configure inspection settings to change the default settings for some global inspection parameters for IOS devices. Most of the inspection settings relate to preventing or mitigating Denial of Service (DoS) attacks. The default settings for most of these options are appropriate for most networks, so configure this policy only if you need to adjust one or more settings. If you do not change a setting, it is not configured on the device (the default remains configured).

To open the Inspection settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Inspection** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Inspection** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Inspection**.

The following table explains the available inspection settings.

Table 260: Inspection Page

Element	Description
Global Timeout Values	
TCP Establish Timeout (seconds)	How long to wait for a TCP session to reach the established state before dropping the session, in seconds, from 1-2147483. The default is 30.
FIN Wait Time (seconds)	How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds, from 1-2147483. The FIN-exchange occurs when the TCP session is ready to close. The default is 5.
TCP Idle Time (seconds)	How long to maintain a TCP session while there is no activity in the session, in seconds, from 1-2147483. The default is 3600 (one hour).

Element	Description
UDP Idle Time (seconds)	How long to maintain a UDP session while there is no activity in the session, in seconds, from 1-2147483. The default is 30. When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet. If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.
DNS Timeout (seconds)	The length of time for which a DNS lookup session is managed while there is no activity, in seconds, from 1-2147483. The default is 5.
SYN Flooding DoS Attack Thresholds	
Maximum 1 Minute Connection Rate - low Maximum 1 Minute Connection Rate - high	The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. Possible values are from 1-2147483647 per minute. The default is 400 for low and 500 for high.
Maximum Incomplete Sessions Stop Threshold Maximum Incomplete Sessions Start Threshold	The number of existing half-open sessions that will cause the software to start and stop deleting half-open sessions. Ensure that you enter a lower number in the stop field than you enter in the start field. Possible values are from 1-2147483647. The default is 400 for low and 500 for high.
Thresholds per Host	
Max Sessions Per Host	The number of half-open TCP sessions with the same host destination address that can exist at a time before the software starts deleting half-open sessions to the host. Possible values are 1-4294967295. The default is 50. A large number of half-open sessions can indicate there is a Denial of Service attack against the host.
Max Sessions Blocking Interval (min)	If the maximum sessions per host threshold is reached, the blocking time to apply to help mitigate the potential TCP host-specific denial-of-service (DoS) attack. Possible values are 0-35791 minutes. The default is 0. • If the blocking time value is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host above the maximum session limit. This ensures that the number of half-open sessions to a given host will never exceed the threshold. • If the blocking time value is greater than 0, the software deletes all existing half-open sessions for the host, then blocks all new connection requests to the host. The software will continue to block all new connection requests until the block-time expires.

Element	Description
Other	
Session Hash Table Size (buckets)	The size of the hash table in terms of buckets. Possible values for the hash table are 1024, 2048, 4096, and 8192. The default is 1024. You should increase the hash table size when the total number of sessions running through the device is approximately twice the current hash size; decrease the hash table size when the total number of sessions is reduced to approximately half the current hash size. Essentially, try to maintain a 1:1 ratio between the number of sessions and the size of the hash table.
Enable Alert Messages	Whether to generate stateful packet inspection alert messages on the console.
Enable Audit Trail Messages	Whether audit trail messages are logged to the syslog server or router.
Permit DHCP Passthrough (Transparent Firewall)	Whether to permit a transparent firewall to forward DHCP packets across the bridge without inspection. Permitting DHCP passthrough overrides an ACL for DHCP packets, so DHCP packets are forwarded even if the ACL is configured to deny all IP packets. Thus, clients on one side of the bridge can get an IP address from a DHCP server on the opposite side of the bridge.
Block Non-SYN Packets	Whether to drop TCP packets that do not belong to an established session. These are TCP packets that do not initiate sessions, that is, the SYN bit is not set in them.
Log Dropped Packets	Whether to create log messages for dropped packets to specify the reason for dropping them.

CHAPTER 18

Managing Firewall Web Filter Rules

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

How you configure web filter rules is different depending on whether the device uses ASA, PIX or FWSM software as opposed to Cisco IOS Software.

The following topics help you work with web filter rules:

Understanding Web Filter Rules

Web filter rules policies define policies for allowing or preventing web traffic based on the requested URL or the applet content of the traffic. For ASA, PIX, and FWSM devices, you can also filter FTP and HTTPS traffic.

Web, or URL, filtering allows you to control which web sites and web content your users have access to. For example, you might consider some types of content to create a hostile work environment for the people in your organization (for example, web sites that provide pornography). You might consider some web sites to be unsafe and a source of potential viral applications. Using web filter rules, you can block access to these objectionable or unsafe sites.

To filter web requests, you should install an external web filtering server, either Websense or SmartFilter (N2H2). For ASA, PIX, and FWSM devices, these external servers are required for URL, FTP, or HTTPS filtering. For IOS devices, you can also use these servers, but additionally you can create local lists of allowed (always allowed) or blocked (always denied) URLs. You configure the filtering servers in the web filter settings policy; see Configuring Settings for Web Filter Servers , on page 900.

Tip For IOS devices, you have the option of configuring web filtering using zone-based firewall rules instead of web filter rules, which allows you the additional option of using Trend Micro web filtering servers. For more information, see Managing Zone-based Firewall Rules, on page 931.

Beside filtering requests based on URL, you can do some applet filtering, stripping out ActiveX or Java applets. You might want to do this to prevent applet downloads from sites you otherwise want to allow if you do not fully trust the site. You can configure your rules to block these applets from specific sites while allowing them from trusted sites.

The policies and procedures for configuring web filter rules differs based on the device type. See the following topics for more information:

- Configuring Web Filter Rules for ASA, PIX, and FWSM Devices , on page 886
- Configuring Web Filter Rules for IOS Devices , on page 895

Configuring Web Filter Rules for ASA, PIX, and FWSM Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Web filter rules policies for ASA, PIX, and FWSM devices define how you want to handle HTTP, FTP, and HTTPS traffic. You can also filter ActiveX and Java applets. Web filter rules permit or deny traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web or FTP site, or you can strip out ActiveX or Java applets from untrusted sources.

To configure web filtering rules for ASA, PIX, and FWSM devices:

1. Configure the rules that identify traffic that should be subject to filtering, and the traffic that should be exempt from filtering rules (see below for the procedure).
2. Configure web filter settings to identify the URL filtering server and other settings. For more information, see Configuring Settings for Web Filter Servers , on page 900.

Related Topics

- Understanding Web Filter Rules , on page 885
- Using Sections to Organize Rules Tables , on page 618
- Adding and Removing Rules , on page 606
- Editing Rules , on page 607
- Enabling and Disabling Rules , on page 618
- Moving Rules and the Importance of Rule Order , on page 617
- Understanding Networks/Hosts Objects , on page 310
- Understanding and Specifying Services and Service and Port List Objects , on page 331

Step 1 Do one of the following to open the Web Filter Rules Page (ASA/PIX/FWSM) , on page 887:

- Device view—Select **Firewall** > **Web Filter Rules** from the Policy selector.

- Policy view—Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type select. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes , on page 890.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Editing Rules , on page 607.

Step 3 Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes , on page 890.

- Filtering and Type—Whether you are creating a rule that identifies traffic to be filtered (Filter) or exempted from an existing filter rule (Filter Except), and the type of filtering to be done:
  - URL—To filter traffic based on web address.
  - HTTPS—To filter web traffic to secure sites. This does not include SSL VPN traffic.
  - FTP—To filter FTP traffic.
  - ActiveX or Java—To remove ActiveX or Java applets. These options delete all entities within applet or object tags, so you might remove more than just ActiveX or Java applets.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “any” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see Specifying IP Addresses During Policy Definition , on page 318.
- Service—Primarily defines the port that should be monitored. You must specify some type of TCP service. Typically, you would use the pre-defined services HTTP, HTTPS, or FTP, which should be the same as the type of filtering you are performing, but you can specify any TCP port on your network that might contain the traffic to be filtered.
- Options—The options you want to include, if any. The main options of interest are whether you want to allow traffic if the filtering servers are unavailable, and whether you want to truncate long URLs or URLs that have parameters. Truncating URLs that have parameters is typically a good idea, because if you are going to drop a URL, it is not normally because of a parameter value.

Click **OK** when you are finished defining your rule.

Step 4 If you did not select the desired row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Order is not as important for web filtering rules, however, because filter except rules always create exceptions to the related filter rule, whether they come before or after the filter rule. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

Web Filter Rules Page (ASA/PIX/FWSM)

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Web Filter Rules page for ASA, PIX, and FWSM devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic, you can configure rules to apply server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. You must configure a web filtering server for your URL, FTP, or HTTPS filter rules to be deployed. For more information, see Web Filter Settings Page , on page 901.

Tip Rules cannot overlap. For example, if you create two rules with the same, or overlapping, source, destination, and service, you cannot deploy them. Also, you should order any filter-except rules below the filter rule to which they are creating an exemption.

Navigation Path

To access the Web Filter Rules page for ASA, PIX, and FWSM devices, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Web Filter Rules (PIX/FWSM/ASA)** from the Policy Type selector. Create a new policy or select an existing one.
- (

  Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Policies > Web Filter Rules**.

Field Reference

Table 261: Web Filter Rules Page (ASA, PIX, FWSM)

Element	Description
No.	The ordered rule number.
Source Destination	The source and destination addresses for the rule. The "any" address does not restrict the rule to specific hosts, networks, or interfaces. These addresses are IP addresses for hosts or networks, network/host objects, interfaces, or interface roles. Multiple entries are displayed as separate subfields within the table cell. See Understanding Networks/Hosts Objects , on page 310.
Service	The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed as separate subfields within the table cell. See Understanding and Specifying Services and Service and Port List Objects , on page 331.
Type	The type of filtering action for the rule, either filtering the identified traffic, or exempting the identified traffic from filtering (Filter Except). For a full explanation, see Edit Web Filter Type Dialog Box , on page 893.
Options	Additional configuration options for the selected protocol, if any. For detailed descriptions, see Edit Web Filter Options Dialog Box , on page 894.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	The description of the rule, if any.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Query	Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See Generating Policy Query Reports , on page 627
Find and Replace button (binoculars icon)	Click this button to search for various types of items within the table and to optionally replace them. See Finding and Replacing Items in Rules Tables , on page 614.
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope or section. For more information, see Moving Rules and the Importance of Rule Order , on page 617.
Add Row button	Click this button to add a rule to the table after the selected row using the Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes , on page 890. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see Adding and Removing Rules , on page 606.

Element	Description
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells. For more information, see Editing Rules , on page 607.
Delete Row button	Click this button to delete the selected rule.

Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Add and Edit PIX/ASA/FWSM Web Filter Rule dialog boxes to configuring web filtering rules for these types of devices.

Navigation Path

From the Web Filter Rules Page (ASA/PIX/FWSM) , on page 887, click the **Add Row** button or select a row and click the **Edit Row** button.

Related Topics

- Understanding Web Filter Rules , on page 885
- Configuring Settings for Web Filter Servers , on page 900

Field Reference

Table 262: Add and Edit PIX/ASA/FWSM Web Filter Rule Dialog Boxes

Element	Description
Enable Rule	Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see Enabling and Disabling Rules , on page 618.
Filtering	The type of rule you are defining: • Filter—The rule filters the identified type of traffic between source and destination. • Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.

Element	Description
Type	The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the Web Filter Settings Page , on page 901. • URL—HTTP traffic. Filtering is done using an external filtering server. • HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server. • Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed. • ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed. • FTP—FTP traffic. Filtering is done using an external filtering server.
Sources Destinations	The source or destination of the traffic. You can enter more than one value by separating the items with commas. You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see Specifying IP Addresses During Policy Definition , on page 318. • Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list. • Host IP address, for example, 10.10.10.100. • Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0. • A range of IP addresses, for example, 10.10.10.100-10.10.10.200. • An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).

Element	Description
Services	The services that define the port number of the traffic to act on. You can enter more than one value by separating the items with commas. The service must use TCP. Your specification defines the port that you want filtered (the service name has no meaning). For example, if you want to filter port 80, use the HTTP service object. If HTTP traffic on your network uses a different port, specify TCP/port number (for example, TCP/8080). You can enter TCP by itself to filter all ports. You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.
Allow traffic if URL Filter Server unavailable (URL, FTP, HTTPS only)	Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.
Block connection to HTTP Proxy Server (URL only)	Whether to prevent users from connecting to an HTTP proxy server.
Truncate CGI request by removing CGI parameters (URL only)	When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.
Block outbound requests if absolute FTP path is not provided (FTP only)	Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.
Long URL (URL only)	How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the **Truncate CGI request by removing CGI parameters** option to handle those URLs. For other long URLs, select from the following options: • Drop—Drop the long URL request. • Truncate—Truncate the URL request to only the hostname or IP address portion of the URL. • Deny—Deny the URL request.

Element	Description
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	An optional description of the rule (up to 1024 characters).

Edit Web Filter Type Dialog Box

Use the Edit Web Filter Type dialog box to edit the type of filtering to be done by a web filter rule for ASA, PIX, and FWSM devices.

Navigation Path

Right-click the Type cell in a web filter rule for ASA/PIX/FWSM (on the Web Filter Rules Page (ASA/PIX/FWSM) , on page 887) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

Field Reference

Table 263: Edit Web Filter Type Dialog Box

Element	Description
Filtering	The type of rule you are defining: • Filter—The rule filters the identified type of traffic between source and destination. • Filter Except—The rule creates an exemption to a filter rule. The identified traffic between the source and destination is not filtered.
Type	The type of traffic that should be filtered (or exempted from filtering) for this rule. For filtering that uses an external server, consult the documentation for your version of the server to determine if it supports that type of filtering. Configure the filtering server on the Web Filter Settings Page , on page 901. • URL—HTTP traffic. Filtering is done using an external filtering server. • HTTPS—HTTPS traffic. This does not include traffic associated with an SSL VPN. Filtering is done using an external filtering server. • Java—Remove Java applets from HTTP traffic if they are identified on applet tags. The rule does not remove Java applets from SSL VPN traffic. If the applet tag spans packets, or the code in the tags is larger than the MTU, the Java applet is not removed. • ActiveX—Remove ActiveX or Java applets from HTTP traffic. The rule removes any item within object or applet tags, which might also remove images and multimedia objects. The rule might not remove applets from SSL VPN traffic. If the object tag spans packets, or the code in the tags is larger than the MTU, the object is not removed. • FTP—FTP traffic. Filtering is done using an external filtering server.

Edit Web Filter Options Dialog Box

Use the Edit Web Filter Options dialog box to edit the filtering options defined for a web filter rule for ASA, PIX, and FWSM devices.

The options displayed on this dialog box differ depending on the type of filtering configured for the rule. For some types, there are no options and the dialog box is empty. The reference table below includes all possible options.

Navigation Path

Right-click the Options cell in a web filter rule for ASA/PIX/FWSM (on the Web Filter Rules Page (ASA/PIX/FWSM) , on page 887) and select **Edit Web Filter Type**. You can edit the type for one row at a time.

Field Reference

Table 264: Edit Web Filter Options Dialog Box

Element	Description
Allow traffic if URL Filter Server unavailable (URL, FTP, HTTPS only)	Whether to permit unfiltered traffic on outbound connections if all of the URL filtering servers are unavailable. If you do not select this option, all affected outbound traffic (HTTP, FTP, or HTTPS) is blocked until at least one filtering server becomes available.
Block connection to HTTP Proxy Server (URL only)	Whether to prevent users from connecting to an HTTP proxy server.
Truncate CGI request by removing CGI parameters (URL only)	When a URL has a parameter list starting with a question mark (?), such as a CGI script, whether to truncate the URL sent to the filtering server by removing all characters after and including the question mark.
Block outbound requests if absolute FTP path is not provided (FTP only)	Whether to prevent interactive FTP sessions that do not provide the entire directory path when the user tries to change directories.
Long URL (URL only)	How to handle URLs that are longer than the maximum allowed by the filtering server: 4 KB for Websense, 3 KB for Smartfilter (N2H2). Many times, long URLs are due to parameter lists, and you can use the **Truncate CGI request by removing CGI parameters** option to handle those URLs. For other long URLs, select from the following options: • Drop—Drop the long URL request. • Truncate—Truncate the URL request to only the hostname or IP address portion of the URL. • Deny—Deny the URL request.

Configuring Web Filter Rules for IOS Devices

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Web filter rules policies for IOS devices define how you want to handle HTTP traffic. The web filter rules are a type of inspection rule that permits or denies traffic based on the Universal Resource Locator (URL) address in the web request. If you allow HTTP traffic on an interface in your access rules, you can subsequently deny (or drop) traffic if it is directed at an objectionable web site.

To configure web filtering rules for IOS devices:

1. Configure the interfaces that should filter web traffic (see below for the procedure).
2. Configure the local web filtering list to identify web sites that should always be permitted or denied (see below for the procedure).
3. Configure web filter settings to identify the URL filtering server and other settings. For more information, see Configuring Settings for Web Filter Servers , on page 900.

Tip You can also configure web filtering as a zone based firewall rule. For more information, see Adding Zone-Based Firewall Rules , on page 942.

Related Topics

- Understanding Web Filter Rules , on page 885
- Understanding Interface Role Objects , on page 303
- Understanding Networks/Hosts Objects , on page 310

Step 1 Do one of the following to open the Web Filter Rules Page (IOS) , on page 896:

- Device view—Select **Firewall** > **Web Filter Rules** from the Policy selector.
- Policy view—Select **Firewall** > **Web Filter Rules (IOS)** from the Policy Type select. Select an existing policy or create a new one.

Step 2 Configure the interfaces on which you will filter HTTP traffic. Create rules for each interface on which you will enable filtering:

a) Select the Web Filter Rules tab if it is not already selected and do one of the following to open the IOS Web Filter Rule and Applet Scanner Dialog Box , on page 898:

- To create a new rule, right-click inside the work area and select **Add Row**.
- To edit an existing rule, right-click the rule and select **Edit Row**.

b) Identify the interface for which this rule applies. You can either enter the interface name or click **Select** to select it or an interface role from the list. Also configure the following:

- Traffic direction with respect to the interface—Typically, you want to select **In** so that undesired traffic is dropped before the device spends more time processing the packet.
- J

  ava applet scanning—If you enable web filtering on an interface, Java applets are inspected, which can affect performance. Typically, you want to enable Java applet scanning so that you can identify permitted and denied sources and avoid the scanning of denied applets. If you want to configure both permitted and denied sources for an interface, you must configure two rules for the interface.

c) Click **OK** to add the rule to the web filtering rules table.

Step 3 (Optional) Configure the list of exclusive domains, which define the local filtering list. This list is applied before web requests are sent to the external web filtering server (defined on the Web Filter Settings Page , on page 901). If you know there are web sites that you will always permit (such as your organization's web site) or deny, configure them in the local list. Configure as many rules as needed to define the complete list.

a) Click the **Exclusive Domains** tab and do one of the following to open the IOS Web Filter Exclusive Domain Name Dialog Box , on page 899.

- To create a new rule, right-click inside the work area and select **Add Row**.
- To edit an existing rule, right-click the rule and select **Edit Row**.

b) Select whether you are permitting or denying the specified domains, and enter the domain names or host IP addresses. You can enter either full domain names (the names of specific web sites) or partial names (for entire domains you want to treat the same way).

c) Click **OK** to add your exclusive domain rule to the policy.

Web Filter Rules Page (IOS)

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Web Filter Rules page for IOS devices to configure web, or URL, filtering rules. Web filtering is a type of HTTP inspection. If your access rules allow HTTP traffic on an interface, you can configure rules to apply local and server-based web filtering to prevent users from accessing undesirable web servers.

When you configure web filter rules, also configure web filter settings in the **Firewall > Settings > Web Filter** policy. The settings identify the web filtering server and contain other settings that control the overall functioning of the policy. For example, you can use the settings policy to allow all web traffic if the filtering server becomes unavailable. For more information, see Web Filter Settings Page , on page 901.

Tip You can also configure web filtering as a zone based firewall rule. For more information, see Zone-based Firewall Rules Page , on page 989.

Navigation Path

To access the Web Filter Rules page for IOS devices, do one of the following:

- (Device view) Select an IOS device and select **Firewall** > **Web Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall** > **Web Filter Rules (IOS)** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click an IOS device and select **Edit Firewall Policies** > **Web Filter Rules**.

Field Reference

Table 265: Web Filter Rules Page (IOS)

Element	Description
Web Filter Rules tab	The URL filtering rules defined for the policy. Each rule shows the interface on which it is defined, whether the rule is applied to incoming or outgoing traffic, and the permitted or denied Java applet sources if Java applet scanning is enabled. You might have more than one rule for an interface if you configure both a permit and deny list for Java applet scanning. • To add a rule, click the Add Row button and fill in the IOS Web Filter Rule and Applet Scanner Dialog Box , on page 898. • To edit a rule, select it and click the Edit Row button. • To delete a rule, select it and click the Delete Row button.
Exclusive Domains tab	The local web filter list. This list is checked before web requests are sent to the filtering server and applies to all interfaces on which you configure web filtering. If you know there are specific domains that you will always allow (such as your organization's own domain name), or disallow, you can list them here. By configuring a local filter list, you can improve performance because the device does not need to wait for a response from the filtering server. • To add a domain, click the Add Row button and fill in the IOS Web Filter Exclusive Domain Name Dialog Box , on page 899. • To edit a domain, select it and click the Edit Row button. • To delete a domain, select it and click the Delete Row button.

IOS Web Filter Rule and Applet Scanner Dialog Box

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Rule and Applet Scanner dialog box to create web filtering rules for IOS devices.

Navigation Path

To open this dialog box, select the Web Filter Rules tab on the Web Filter Rules Page (IOS) , on page 896, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

Related Topics

- Configuring Web Filter Rules for IOS Devices , on page 895

Field Reference

Table 266: IOS Web Filter Rule and Applet Scanner Dialog Box

Element	Description
Enable Web Filtering	Whether to enable the web filtering rule.
Interface	The interface or interface role to which the rule is assigned. Enter the name of the interface or the interface role, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See Understanding Interface Role Objects , on page 303.
Traffic Direction	The direction of the traffic to which this rule applies: • In—Packets entering an interface. • Out—Packets exiting an interface.
Java Applet Scanning Enable Java Applet Scanner	If you select **Enable Java Applet Scanning**, the device checks for the presence of Java applets in HTTP traffic coming from web servers to internal hosts. If a Java applet is present and the web server (applet source) is in the list of permitted sources, the Java applet is left unmodified in the HTTP traffic. Otherwise, the Java applets are removed from HTTP pages. **Tip** When you enable web filtering, Java applets are inspected, which can affect performance. By enabling the Java applet scanner, you can identify a list of permitted or denied sources and avoid inspection for those applets. Even if you do not want to deny any sources, enable scanning and permit the **any** source.

Element	Description
Permit Traffic Applet Sources	The list of permitted or denied source addresses for Java applets. To configure a list of permitted or denied sources: • Select either **Permit from Specified Sources** or **Deny from Specified Sources**. If you want to create both a permit and deny list, create two separate web filter rules. If you do not configure a permit list, all sources are denied. • Enter the list of permitted or denied addresses in the **Applet Sources** field. The list can include host IP addresses, network addresses, address ranges, or network/host objects, but cannot include domain names. Separate multiple addresses with commas. For more information on entering addresses, see Specifying IP Addresses During Policy Definition , on page 318.

IOS Web Filter Exclusive Domain Name Dialog Box

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the IOS Web Filter Exclusive Domain Name dialog box to configure local web filtering rules for IOS devices. You can create a list of permitted or denied domain names or IP addresses. The device checks this list before forwarding web requests to your web filtering server.

Using local filtering saves the wait time for getting a response from the server when a user requests a web site that you know you will either always permit or always deny.

Navigation Path

To open this dialog box, select the Exclusive Domains tab on the Web Filter Rules Page (IOS) , on page 896, click **Add Row** to create a new rule, or select a row and click **Edit Row** to edit an existing rule.

Related Topics

- Configuring Web Filter Rules for IOS Devices , on page 895>

Field Reference

Table 267: IOS Web Filter Exclusive Domain Name Dialog Box

Element	Description
Traffic	Whether you want to permit access to the listed web sites or deny access to them.

Element	Description
Domain Name	The domain names or host IP addresses of web sites that you are permitting or denying. Separate multiple entries with commas. For domain names, you can enter a full or partial name. For example, cisco.com covers all web servers on the cisco.com domain, whereas www.cisco.com specifies only the www web server.

Configuring Settings for Web Filter Servers

Use the Web Filter settings policy to configure the web filter servers and other settings to use with your web filter rules policy. You can use Websense or Smartfilter (N2H2) filtering servers, or no external servers (for IOS devices).

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

Tip These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

Related Topics

- Understanding Web Filter Rules , on page 885
- Configuring Web Filter Rules for ASA, PIX, and FWSM Devices , on page 886
- Configuring Web Filter Rules for IOS Devices , on page 895

Step 1 Do one of the following to open the Web Filter Settings Page , on page 901:

- (Device view) Select **Firewall** > **Settings** > **Web Filter** from the Policy selector.
- (Policy view) Select **Firewall** > **Settings** > **Web Filter** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the type of web filtering server you use in the **Web Filter Server Type** field, and then add the servers to the table of web filtering servers. If you have more than one server, add them in priority order; the first server in the list is the primary server.

- To add a server, click the Add Row button and fill in the Web Filter Server Configuration Dialog Box , on page 904.
- To edit a server, select it and click the Edit Row button.
- To delete a server, select it and click the Delete Row button.

Step 3 The bottom half of the settings policy includes device-specific options that you can also configure. For specific information on each setting, see Web Filter Settings Page , on page 901. The following is an overview of the settings:

- IOS devices—The most interesting setting is **Allow Traffic when Servers Unreachable**, which determines whether you allow any web connections if the filtering servers are unavailable. If you do not select this option, all web traffic is cut off if the servers go offline for any reason.

The remaining settings configure logging and cache size options.

- ASA, PIX, FWSM devices—These options configure the cache size and buffer limits used with the filtering servers. You can also control whether the cached responses include both source and destination (if you have different filtering policies per user) or destination only (one policy for all), as configured in the filtering server.

Web Filter Settings Page

Use the Web Filter settings page to configure the web filter servers and other settings to use with your web filter rules policy.

You must install and configure the web filter servers as directed by the documentation for the server before configuring and deploying this policy. Security Manager cannot confirm that the servers exist or that they are configured correctly.

Tip These settings work only with the web filter rules policy. The web servers you configure here are not used with zone based firewall rules policies that configure web content filtering.

Navigation Path

To access the Web Filter settings page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Web Filter** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Web Filter** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > Web Filter**.

Related Topics

- Configuring Web Filter Rules for IOS Devices , on page 895

Field Reference

Table 268: Web Filter Page

Element	Description
Web Filter Server Type	The type of web filter server you are using: • None—You are not using web filter servers. • Websense—You use Websense servers. • Secure Computing SmartFilter/N2H2—You use Smartfilter servers. If you select this option, you can specify the server port to use for communication in the **Port** field. **Tip** If you change this setting, you are prompted to remove the existing list of servers from the table. Clicking **Yes** does not clear the table. The prompt is to remind you that the list might contain the wrong type of servers.
Web Filter Servers table	The servers that the device should use for web filtering. Enter the servers in priority order; the device uses the first one in the list until it fails to respond, and moves to the next server in the list until it gets a response. If you select None for filter type, this list is ignored. • To add a server, click the **Add Row** button and fill in the Web Filter Server Configuration Dialog Box , on page 904. • To edit a server, select it and click the **Edit Row** button. • To delete a server, select it and click the **Delete Row** button.
IOS Specific Settings	
Allow Traffic when Servers Unreachable	Whether the device should allow web traffic if the web filter servers are not responding. If you do not select this option, all web access is prevented until the servers come back online. If you allow web traffic when the servers are down, the web requests are not filtered and access to all web servers is allowed.
Enable Alerts	Whether to generate stateful packet inspection alert messages on the console.
Enable Audit Trail	Whether audit trail messages are logged to the syslog server or router.
Enable Web Filter Server Logging	Whether to send system messages to the URL filtering server for logging. The device sends a log request immediately after the URL lookup request. The log request contains the URL, hostname, source IP address, and the destination IP address. The server records the log request into its own log server so you can view this information as necessary.
Cache Size	The maximum number of destination IP addresses (and their authorization status) that can be cached in the device. The default value is 5000. When the cache reaches 80% full, the device starts removing older inactive entries.

Element	Description
Maximum Requests	The maximum number of outstanding requests that can exist at any given time. If the specified number is exceeded, new requests are dropped. The default is 1000.
Packet Buffer	The maximum number of HTTP responses that can be stored in the packet buffer of the device while it waits for the web filter server to allow or deny the request. The device drops responses when the maximum is reached. The default (and maximum) value is 200. When users make web requests, the device simultaneously sends the request to the web site and to the web filtering server. If the response from the web site is received before the server provides a permit or deny response, the device keeps the request in the packet buffer until it gets a response from the server. The response is removed from the buffer when the server responds or if the device determines that the server is unavailable and you also selected **Allow Traffic when Servers Unreachable**.
PIX/ASA/FWSM Specific Settings	
Cache Match Criteria	How to cache web requests: • Source and Destination—Cache entries are based on both the address initiating the request and the destination web address. Select this mode if users do not share the same filtering policy on the filtering server. • Destination—Cache entries are based on the destination web address. Select this mode if all users share the same filtering policy on the filtering server.
URL Buffer Memory (ASA 7.2+, PIX 7.2+ only.)	The size of the URL buffer memory pool in KB. Values are 2 to 10240.
Maximum Allowed URL Size (ASA 7.2+, PIX 7.2+ only.)	The maximum allowed URL size in KB for each URL being buffered. The possible values differ depending on server type: • Websense—From 2 to 4. • Smartfilter (N2H2)—2 or 3.
Cache Size	The size of the cache, in KB, for storing responses from the filtering server. Values are 1 to 128. Caching stores URL access privileges in memory on the security appliance. When a host requests a connection, the security appliance first looks in the URL cache for matching access privileges instead of forwarding the request to the Websense server.
URL Block Buffer Limit	The size of the buffer for storing web server responses while waiting for a filtering decision from the filtering server. The values are 1 to 128, which specifies the number of 1550-byte blocks.

Web Filter Server Configuration Dialog Box

Use the Web Filter Server Configuration dialog box to configure the external web filter servers you want to use with your Web Filter Rules policies. You can configure Websense or Smartfilter (N2H2) servers.

Navigation Path

From the Web Filter Settings Page , on page 901, click **Add Row** beneath the Web Filter Servers table, or select a row and click **Edit Row**.

Related Topics

- Configuring Settings for Web Filter Servers , on page 900

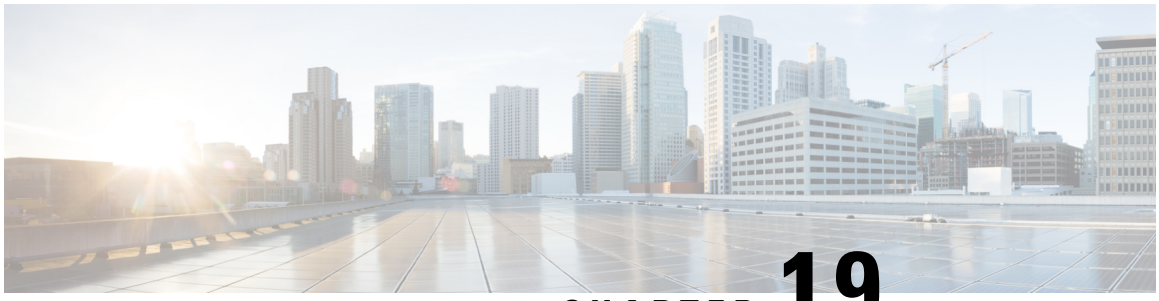
Table 269: Web Filter Server Configuration Dialog Box

Element	Description
Common	
IP Address	The IP address of the web filter server.
Timeout	The length of time, in seconds, that the device will wait for a response from the web filter server. The default is 5 seconds. If the request times out, the device tries the next server, if you configure more than one.
PIX/ASA/FWSM Specific Settings	
Interface	The network interface where the authentication server resides, for example, FastEthernet0. If not specified, the default is inside. Enter the name of the interface or the interface role that identifies it, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list.
Protocol	The protocol to use when communicating with the web filtering server. Select the option for which the server is configured: • TCP (version 1) • TCP version 4 • UDP version 4
Connection Number	(Optional) The maximum number of TCP connections allowed between the device and the server.
IOS Specific Settings	
Retransmit	The number of times the device will retransmit a request when the server does not respond. The default value is two times.

Element	Description
Port	The port number that the server listens on. The default port is 15868.



CHAPTER 19

Managing Firewall Botnet Traffic Filter Rules

Malware is malicious software that is installed on an unknowing host. Malware that attempts network activity such as sending private data (passwords, credit card numbers, key strokes, or proprietary data) can be detected by the Botnet Traffic Filter when the malware starts a connection to a known bad IP address. The Botnet Traffic Filter checks incoming and outgoing connections against a dynamic database of known bad domain names and IP addresses, and then logs any suspicious activity.

You can also supplement the Cisco dynamic database with blocked addresses of your choosing by adding them to a static block list; if the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allowed list. Addresses in the allowed list still generate syslog messages, but because you are only targeting blocked syslog messages, they are informational. If you do not want to use the Cisco dynamic database at all, because of internal requirements, you can use the static block list alone if you can identify all the malware sites that you want to target.

This chapter covers the following sections:

Understanding Botnet Traffic Filtering

Botnet Traffic Filter Address Categories

Addresses monitored by the Botnet Traffic Filter include:

- **Known malware addresses**—These addresses are on the blocked list identified by the dynamic database and the static block list.
- **Known allowed addresses**—These addresses are on the allowed list. To be allowed, an address must be blocked by the dynamic database and also identified by the static allowed list.
- **Ambiguous addresses**—These addresses are associated with multiple domain names, but not all of these domain names are on the block list. These addresses are on the graylist.
- **Unlisted addresses**—These addresses are unknown, and not included on any list.

Botnet Traffic Filter Actions for Known Addresses

You can configure the Botnet Traffic Filter to log suspicious activity, and you can optionally configure it to block suspicious traffic automatically.

Unlisted addresses do not generate any syslog messages, but addresses on the block list, allowed list, and graylist generate syslog messages differentiated by type.

Botnet Traffic Filter Databases

The Botnet Traffic Filter uses two databases for known addresses. You can use both databases together, or you can disable use of the dynamic database and use the static database alone. This section includes the following topics:

- Information About the Dynamic Database
- Information About the Static Database

Information About the Dynamic Database

The Botnet Traffic Filter can receive periodic updates for the dynamic database from the Cisco update server. This database lists thousands of known bad domain names and IP addresses.

The security appliance uses the dynamic database as follows:

1. When the domain name in a DNS reply matches a name in the dynamic database, the Botnet Traffic Filter adds the name and IP address to the DNS reverse lookup cache.
2. When the infected host starts a connection to the IP address of the malware site, the security appliance sends a syslog message informing you of the suspicious activity.
3. In some cases, the IP address itself is supplied in the dynamic database, and the Botnet Traffic Filter logs any traffic to that IP address without having to inspect DNS requests.

Note To use the database, be sure to configure a domain name server for the security appliance so that it can access the URL. To use the domain names in the dynamic database, you need to enable DNS packet inspection with Botnet Traffic Filter snooping; the security appliance looks inside the DNS packets for the domain name and associated IP address.

Information About the Static Database

You can manually enter domain names or IP addresses (host or subnet) that you want to tag as bad names in a block list. You can also enter names or IP addresses in an allowed list, so that names or addresses that appear on both the allowed list and the dynamic block list are identified only as allowed list addresses in syslog messages and reports.

You can alternatively enable DNS packet inspection with Botnet Traffic Filter snooping. With DNS snooping, when an infected host sends a DNS request for a name on the static database, the security appliance looks inside the DNS packets for the domain name and associated IP address and adds the name and IP address to the DNS reverse lookup cache.

Related Topics

- Task Flow for Configuring the Botnet Traffic Filter , on page 909
- Botnet Traffic Filter Rules Page , on page 915

Task Flow for Configuring the Botnet Traffic Filter

To configure the Botnet Traffic Filter, follow these steps:

Step 1 Enable use of a DNS server.

This procedure enables security appliance use of a DNS server. In multiple context mode, enable DNS per context.

For more information, see DNS Page , on page 2015

Step 2 Enable use of the dynamic database.

This procedure enables database updates from the Cisco update server, and also enables use of the downloaded dynamic database by the security appliance. Disallowing use of the downloaded database is useful in multiple context mode so you can configure use of the database on a per-context basis.

For more information, see Configuring the Dynamic Database , on page 910

Step 3 (Optional) Add static entries to the database.

This procedure lets you augment the dynamic database with domain names or IP addresses that you want to block or allow. You might want to use the static database instead of the dynamic database if you do not want to download the dynamic database over the Internet.

For more information, see Adding Entries to the Static Database , on page 911

Step 4 Enable DNS snooping.

This procedure enables inspection of DNS packets, compares the domain name with those in the dynamic database or the static database (when a DNS server for the security appliance is unavailable), and adds the name and IP address to the DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.

For more information, see Enabling DNS Snooping , on page 912

Step 5 Enable traffic classification and actions for the Botnet Traffic Filter.

This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic or drops that traffic.

For more information, see Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913

Step 6 Monitor and Mitigate Botnet Activity.

After configuring the Botnet Traffic Filter on a device, the device will begin generating syslog messages to notify you of botnet activity. You should verify the syslog configuration on the device so that messages are appropriately logged and that notifications are sent as needed. As malicious traffic is identified, you will need to perform necessary actions to stop such traffic and to clean any infected computers that are generating the malicious traffic.

For more information, see the following references:

a. Configuring Logging Policies on Firewall Devices, on page 2031

b. Monitoring and Mitigating Botnet Activity , on page 2738

c. Understanding Firewall Summary Botnet Reports , on page 2762

Configuring the Dynamic Database

This procedure enables database updates, and also enables use of the downloaded dynamic database by the security appliance.

In multiple context mode, you enable downloading of the dynamic database on the System context so that it is available to all security contexts. You can then decide, on a per-context basis, whether to enable use of the dynamic database or not.

By default, downloading and using the dynamic database is disabled.

Related Topics

- Dynamic Blocklist Configuration Tab , on page 916
- Understanding Botnet Traffic Filtering , on page 907
- Task Flow for Configuring the Botnet Traffic Filter , on page 909
- Adding Entries to the Static Database , on page 911
- Enabling DNS Snooping , on page 912
- Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913
- Botnet Traffic Filter Rules Page , on page 915

Before You Begin

Enable security appliance use of a DNS server (see DNS Page , on page 2015). In multiple context mode, enable DNS per context.

Step 1 Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

Note For devices in multiple context mode, you enable downloading of the dynamic database on the System context and enable use of the dynamic database on each security context, as needed.

This opens the Botnet Traffic Filter Rules Page , on page 915.

Step 2 On the Dynamic Blocklist Configuration tab, select **Enable Dynamic Blocklist From Server** to enable downloading of the dynamic database.

Note In multiple context mode, you enable downloading of the dynamic database on the System context.

This setting enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour.

Step 3 (Multiple context mode only) Click **Save** to save the changes to the System context. Then change to the context where you want to configure the Botnet Traffic Filter, select **Firewall > Botnet Traffic Filter Rules** for that context, and then proceed to Step 4, on page 911.

Step 4 On the Dynamic Blocklist Configuration tab, select **Use Dynamic Blocklist** to enable use of the dynamic database.

Note In multiple context mode, these settings are disabled on the System context.

Adding Entries to the Static Database

The static database lets you augment the dynamic database with domain names, IP addresses, or network addresses that you want to block or allow. For more information, see Understanding Botnet Traffic Filtering , on page 907.

Related Topics

- Permitlist/Blocklist Tab , on page 921
- Device Permitlist or Device Blocklist Dialog Box , on page 921
- Understanding Botnet Traffic Filtering , on page 907
- Task Flow for Configuring the Botnet Traffic Filter , on page 909
- Configuring the Dynamic Database , on page 910
- Enabling DNS Snooping , on page 912
- Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913
- Botnet Traffic Filter Rules Page , on page 915

Before You Begin

- Enable security appliance use of a DNS server (see DNS Page , on page 2015). In multiple context mode, enable DNS per context.

Step 1 Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

Note For devices in multiple context mode, you configure the static database on the security context.

This opens the Botnet Traffic Filter Rules Page , on page 915

Step 2 On the Permitlist / Blocklist tab, click the **Add Rows** button that corresponds with the type of entry you are adding (Permitlist or Blocklist).

This opens the Device Permitlist or Device Blocklist Dialog Box , on page 921.

Step 3 In the Domain or IP Address field, enter one or more domain names, IP addresses, and IP address/netmasks. Enter multiple entries separated by commas or on separate lines. You can enter up to 1000 entries for each type.

Step 4 Click **OK**.

Enabling DNS Snooping

This procedure enables inspection of DNS packets and enables Botnet Traffic Filter snooping, which compares the domain name with those on the dynamic database or static database, and adds the name and IP address to the Botnet Traffic Filter DNS reverse lookup cache. This cache is then used by the Botnet Traffic Filter logging function when connections are made to the suspicious address.

The default configuration for DNS inspection inspects all UDP DNS traffic on all interfaces, and does not have Botnet Traffic Filter snooping enabled. We suggest that you enable Botnet Traffic Filter snooping only on interfaces where external DNS requests are going. Enabling Botnet Traffic Filter snooping on all UDP DNS traffic, including that going to an internal DNS server, creates unnecessary load on the security appliance.

Note TCP DNS traffic is not supported.

Related Topics

- Configure DNS Dialog Box , on page 784
- Understanding Botnet Traffic Filtering , on page 907
- Task Flow for Configuring the Botnet Traffic Filter , on page 909
- Configuring the Dynamic Database , on page 910
- Adding Entries to the Static Database , on page 911
- Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913
- Botnet Traffic Filter Rules Page , on page 915

Step 1 You must first configure DNS inspection for traffic that you want to snoop using the Botnet Traffic Filter. See Managing Firewall Inspection Rules, on page 767.

Step 2 While defining a new inspection rule or editing an existing inspection rule, select DNS as the protocol you want to inspect.

The Configure button to the right of the Selected Protocol field becomes active.

Step 3 Click **Configure**.

This opens the Configure DNS Dialog Box , on page 784.

Step 4 To enable DNS snooping, select **Enable Dynamic Filter Snooping**.

Step 5 Click **OK**.

Enabling Traffic Classification and Actions for the Botnet Traffic Filter

This procedure enables the Botnet Traffic Filter, which compares the source and destination IP address in each initial connection packet to the IP addresses in the dynamic database, static database, DNS reverse lookup cache, and DNS host cache, and sends a syslog message for any matching traffic. The Botnet Traffic Filter can also drop the connection when matching traffic is encountered. For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

The DNS snooping is enabled separately (see Enabling DNS Snooping , on page 912). Typically, for maximum use of the Botnet Traffic Filter, you need to enable DNS snooping, but you can use Botnet Traffic Filter logging independently if desired. Without DNS snooping for the dynamic database, the Botnet Traffic Filter uses only the static database entries, plus any IP addresses in the dynamic database; domain names in the dynamic database are not used.

What You Need To Know About Botnet Traffic Classification ACLs

When you configure the enable and drop rules, you have the option of specifying an extended ACL policy object to limit the traffic to which Botnet Traffic Filtering will be applied. If you do not specify an ACL object, filtering is done for all traffic: this is equivalent to specifying an ACL with the single rule permit IP any any.

If you want to specify an ACL so that filtering is performed on less than all traffic, keep the following in mind:

- Permit rules identify the traffic that is subject to Botnet Traffic Filtering. In drop rules, permit entries identify the traffic that the ASA is allowed to drop.
- Deny rules identify the traffic that should not be subject to filtering. The Botnet Traffic Filter ignores traffic that matches deny entries.
- The ACL that you select for drop rules should be a subset of the ACL used in the enable rules for the interface. For traffic to be dropped, there must not only be a permit rule in the drop rule's ACL, the traffic must also fall under a permit rule in the enable rule's ACL. This is because the drop rule is not considered until traffic permitted in an enable rule has first been identified as blocked.

We recommend enabling the Botnet Traffic Filter on all traffic on the Internet-facing interface, and enabling dropping of traffic with a severity of moderate and higher.

Related Topics

- Traffic Classification Tab , on page 917
- BTF Enable Rules Editor , on page 918
- BTF Drop Rules Editor , on page 919
- Understanding Botnet Traffic Filtering , on page 907
- Task Flow for Configuring the Botnet Traffic Filter , on page 909
- Configuring the Dynamic Database , on page 910
- Adding Entries to the Static Database , on page 911
- Enabling DNS Snooping , on page 912
- Botnet Traffic Filter Rules Page , on page 915

Step 1 Do one of the following:

- (Device view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.

Note For devices in multiple context mode, you configure traffic classification on the security context.

This opens the Botnet Traffic Filter Rules Page , on page 915.

Step 2 To enable the Botnet Traffic Filter on specified traffic, follow these steps:

a) On the Traffic Classification tab, click **Add Row** under the Enable Rules table.

This opens the BTF Enable Rules Editor , on page 918.

b) In the Interfaces field, specify the interface or interfaces on which you want to enable the Botnet Traffic Filter. Normally, you want to enable the Internet-facing interface only. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see Understanding Interface Role Objects , on page 303).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

c) Do one of the following to identify the traffic that you want to monitor:

- To monitor all traffic, leave the ACL field blank.
- To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see Creating Access Control List Objects , on page 283.

Note You can specify only one enable rule per interface.

d) Click **OK**.

The BTF Enable Rules Editor closes and the rule is added to the Enable Rules table.

Step 3 To automatically drop malware traffic, follow these steps:

Note You must enable the Botnet Traffic Filter for the traffic you want to automatically drop before creating a drop rule for that traffic.

a) On the Traffic Classification tab, click **Add Row** under the Drop Rules table.

This opens the BTF Drop Rules Editor , on page 919.

b) In the Interfaces field, specify the interface or interfaces on which you want to drop traffic. There must be a corresponding enable rule for the interface. To select the interfaces or interface role objects using the Interfaces Selector, click **Select** (see Understanding Interface Role Objects , on page 303).

You can configure a global classification that applies to all interfaces by selecting the All Interfaces role object (selected by default). If you configure an interface-specific classification, the settings for that interface overrides the global setting.

c) Do one of the following to identify the traffic that you want to drop:

- To monitor all traffic, leave the ACL field blank.
- To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see Creating Access Control List Objects , on page 283.

d) In the Threat Level area, choose one of the following options to drop traffic specific threat levels. The default level is a range between Moderate and Very High.

Note We highly recommend using the default setting unless you have strong reasons for changing the setting.

- Value—Specify the threat level you want to drop.
- Range—Specify a range of threat levels.

Note Static block list entries are always designated with a Very High threat level.

e) Click **OK**.

The BTF Drop Rules Editor closes and the rule is added to the Drop Rules table.

Step 4 To add more rules, repeat steps 2 and 3, as required. When finished adding rules, click **Save** to save your changes.

Step 5 To treat graylisted traffic as block listed traffic for action purposes, on the Dynamic Blocklist Configuration tab, check the **Treat Ambiguous traffic as Blocklist** check box.

If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.

Botnet Traffic Filter Rules Page

You can use the Botnet Traffic Filter Rules page to define rules for identifying malicious traffic passing through your ASA security device.

The Botnet Traffic Filter Rules page is divided into three sections:

- Dynamic Blocklist Configuration Tab , on page 916
- Traffic Classification Tab , on page 917
- Permitlist/Blocklist Tab , on page 921

Navigation Path

To access the Botnet Traffic Filter Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Botnet Traffic Filter Rules** from the Policy selector.
- (Policy view) Select **Firewall > Botnet Traffic Filter Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Botnet Traffic Filter Rules**.

Related Topics

Field Reference

Table 270: Dynamic Blocklist Configuration Tab

Element	Description
Enable Dynamic Blocklist From Server	Enables downloading of the dynamic database from the Cisco update server. If you do not have a database already installed on the security appliance, it downloads the database after approximately 2 minutes. The update server determines how often the security appliance polls the server for future updates, typically every hour. **Note** If the device is in multiple context mode, configure this option on the System context for that device.
Use Dynamic Blocklist	Enables use of the dynamic database for the Botnet Traffic Filter. **Note** In multiple context mode, you configure use of the database on a per-context basis.
Treat Ambiguous traffic as Blocklist	When selected, graylisted traffic will be treated as block listed traffic for action purposes. If you do not enable this option, graylisted traffic will not be dropped if you configure a drop rule for that traffic.

Traffic Classification Tab

Use the Traffic Classification tab to view or to configure the traffic classification definitions for a device or shared policy and to identify malicious traffic that you want automatically dropped. Traffic classification definitions (enable rules) consist of an interface or interface role with an associated ACL that identifies the traffic that is monitored by the Botnet Traffic Filter. You can configure settings for specific interfaces or for interface roles. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override any settings defined for an interface role.

For a particular interface, you can specify only one enable rule that identifies the traffic that is subject to Botnet Traffic Filtering; however, you can specify multiple drop rules to identify traffic that should be dropped by the Botnet Traffic Filter.

Note We highly recommend configuring Dynamic Filter Snooping for proper functioning of the Botnet Traffic Filter. When in Device view, Cisco Security Manager provides a link at the bottom of the Traffic Classification tab that will take you directly to the Inspection Rules page so that you can enable Dynamic Filter Snooping. For more information, see Enabling DNS Snooping , on page 912.

The columns in the tables summarize the settings for an entry and are explained in BTF Enable Rules Editor , on page 918and BTF Drop Rules Editor , on page 919.

To configure traffic classification and actions:

- Click the **Add Row** button to add an interface or interface role to the table, and fill in the BTF Enable Rules Editor , on page 918 or BTF Drop Rules Editor , on page 919.

- Select an entry and click the **Edit Row** button to edit an existing entry.
- Select an entry and click the **Delete Row** button to delete it.

Navigation Path

From the Botnet Traffic Filter Rules Page , on page 915, click the **Traffic Classification** tab.

- Device Permitlist or Device Blocklist Dialog Box , on page 921
- Configure DNS Dialog Box , on page 784

BTF Enable Rules Editor

Use the BTF Enable Rules Editor to specify the interfaces on which you want to enable the Botnet Traffic Filter and to identify the traffic that you want to monitor. You can specify only one enable rule per interface.

Navigation Path

To access the BTF Enable Rules Editor, right-click inside the work area of the Enable Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

Field Reference

Table 271: BTF Enable Rules Editor

Element	Description
Interfaces	The interfaces or interface roles on which you want to enable the Botnet Traffic Filter. Enter the name of the interface or the interface role, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override the global settings. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See Understanding Interface Role Objects , on page 303.
ACL	Specifies the access-list to use for identifying the traffic that you want to monitor. If you do not specify an access list, by default you monitor all traffic. To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see Creating Access Control List Objects , on page 283.

BTF Drop Rules Editor

Use the BTF Drop Rules Editor to identify malware traffic that you want to automatically drop. You can specify multiple drop rules per interface.

Navigation Path

To access the BTF Drop Rules Editor, right-click inside the work area of the Drop Rules table on the Traffic Classification tab and then select **Add Row**, or right-click an existing entry and select **Edit Row**.

Field Reference

Table 272: BTF Drop Rules Editor

Element	Description
Interfaces	The interfaces or interface roles on which you want to enable the Botnet Traffic Filter. Enter the name of the interface or the interface role, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can use the All Interfaces role object to enable botnet filtering globally (selected by default). If you configure an interface-specific classification, the settings for that interface override the global settings. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See Understanding Interface Role Objects , on page 303.
ACL	Specifies the access-list to use for identifying the traffic that you want to monitor. If you do not specify an access list, by default you monitor all traffic. To specify the traffic that you want to monitor, click **Select** to the right of the ACL field to select an Access Control List object that identifies the traffic that you want to monitor. For example, you might want to monitor all port 80 traffic on the outside interface. For more information about Access Control List objects, see Creating Access Control List Objects , on page 283.

Threat Level	The Threat Level fields identify the threat level of malicious traffic that you want dropped. The default level is a range between Moderate and Very High.
	Note We highly recommend using the default setting unless you have strong reasons for changing the setting.
	• Value—Specify the threat level you want to drop.
	  • Very-low
	  • Low
	  • Moderate
	  • High
	  • Very-high
	• Range—Specify a range of threat levels.
	Note Static blocked list entries are always designated with a Very High threat level.

Permitlist/Blocklist Tab

Use the Permitlist/Blocklist tab to view or to configure the static database entries for a device or shared policy. The Device Blocklist contains domain names or IP addresses of malicious or undesirable sites. You can use the static block list to supplement the Cisco dynamic database, or you can use the static block list alone if you can identify all the malware sites that you want to target.

The Device Permitlist contains domain names or IP addresses of sites that are deemed to be acceptable. If the dynamic database includes blocked addresses that you think should not be blocked, you can manually enter them into a static allowed list. Static allowed list entries take precedence over entries in the static block list and the Cisco dynamic database. Addresses in the allowed list still generate syslog messages, but because you are only targeting blocked syslog messages, they are informational.

To configure the static database:

- Click the **Add Row** button to define static database entries using the Device Permitlist or Device Blocklist Dialog Box , on page 921.
- Select an entry and click the **Edit Row** button to edit an existing entry.

Timesaver Select an entry and press **F2** or double-click on an entry in the Device Permitlist or Device Blocklist to edit that entry in place.

- Select an entry and click the **Delete Row** button to delete it.

Navigation Path

From the Botnet Traffic Filter Rules Page , on page 915, click the **Permitlist/Blocklist** tab.

- Traffic Classification Tab , on page 917

Device Permitlist or Device Blocklist Dialog Box

Use the Device Permitlist or Device Blocklist dialog box to manually define domain names or IP addresses that you want to add to the allowed lists (safe) or blocked lists (malicious). You can use the static block list to supplement the Cisco dynamic database or you can use the static block list alone if you can identify all the malware sites that you want to target. Names or addresses that appear on both the allowed list and the dynamic blocked list are identified only as allowed list addresses in syslog messages and reports.

Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either added to the allowed list or blocked list. You can also enter host IP addresses. Use a comma or new line to separate multiple entries.

Navigation Path

From the Permitlist/Blocklist Tab , on page 921, click the **Add Rows** button beneath the Device Permitlist or Device Blocklist tables, or select an entry and click the **Edit Row** button.

CHAPTER 20

Working with ScanSafe Web Security

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Invoking ScanSafe Web Security from Security Manager, you can define policies and settings in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features. The following table details the scope of support for scanning and AAA policy types.

Supported Type	Example
Content Scan Settings	Primary server IP, secondary server IP, server timeouts
Content Scan Policies	Global allow list policies Include/exclude user groups, default user configuration, default user group configuration Interfaces that must have content scanning enabled

Supported Type	Example
AAA Server Settings	Identity policy object used in http-basic and NTLM policy Http-basic and NTLM related timeouts Order of occurrence for proxy, http-basic, and NTLM LDAP server and LDAP attribute map configuration for IOS **Note** Radius and TACAS servers are also supported. Per interface AAA list
AAA Policies	Http-basic and NTLM admission rule support (authentication methods) now join the previously available Auth-Proxy method

Security Manager does not support the following features:

- PAM configuration when inspect or ZBF rules for http/https are not present
- Auth-proxy using LDAP on older IOS versions. (That is, only IOS versions that support ScanSafe Web Security)
- Identity policy with auth-proxy as AAA method. (Support only for NTLM and http-basic.)
- Validation of Virtual Template number for identity policy creation
- Validation of the Secure Trust Point for LDAP server
- Inheritance of content scanning rules
- AD browsing of user groups and users
- Tool support for newer policies (such as policy query)
- Control tag policy

For more information on the ScanSafe Web Security product, go to http://www.cisco.com/en/US/partner/products/ps11720/index.html

This chapter covers the following sections:

Configuring ScanSafe Web Security

Use the ScanSafe Web Security Settings page to define the settings for the default user group. As with other settings policies, you can share the default user group policy settings.

Related Topics

- ScanSafe Web Security Page, on page 926
- ScanSafe Web Security Settings Page , on page 929
- Add and Edit Default User Groups Dialog Box, on page 928
- AAA Rules Page , on page 693

Note All steps are shown as performed from the Policy view.

To configure ScanSafe Web Security, perform the following steps:

Step 1 From the Policy Types selector, select **Firewall** > **ScanSafe Web Security**.

The ScanSafe Web Security page appears with the Interfaces tab selected.

Step 2 Enable those interfaces by which web requests are to be forwarded to the ScanSafe Web Security server by selecting them from the list in the **Available Interfaces** column and moving them to the **Selected Interfaces** column.

Step 3 Select the **Permitlisting Regular Expressions** tab.

Step 4 Select the **Notify Tower** checkbox to send notifications to the ScanSafe Web Security server regarding the allowed list. It is applicable to all allowed lists except that which is IP-based.

(ScanSafe Web Security receives a warning when no regular expression is specified for allowed list.)

Step 5 In the HTTP Host area specify the regular expressions to be allowed (using regular expression matching) by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.

Step 6 In the HTTP User Agent area specify the regular expressions to be allowed by selecting them from the list in the **Available Regular Expressions** column and moving them to the **Selected Regular Expressions** column.

Step 7 Select the **Permitlisting ACLs** tab.

Step 8 Specify the type of ACLs to operate upon by selecting either **Extended** or **Standard** from the Type list.

Step 9 Specify the ACLs to add to the allowed list by selecting them from the list in the column on the left and moving them to the **Selected items** column.

Step 10 Select the **User Groups** tab.

Tip You can use the User Groups page to define user groups, specify both the default user and default user group, and to include or exclude user groups. You can also edit or delete entries in all three of these lists.

Step 11 Specify a default user by entering the user name in the **Default User** field (optional).

Step 12 Specify a default user group by entering the user group name in the **Default User Group** field.

Step 13 Include a user group by selecting the interface and then adding the user group to the Include list.

Step 14 Exclude a user group by selecting the interface and then adding the user group to the Exclude list.

Step 15 Select **Policy** > **Firewall** > **Settings** > **ScanSafe Web Security** from the policy selector.

Step 16 With the **Details** tab selected, specify the Primary ScanSafe Server by entering the following values:

- IP Address/Name
- HTTP Port (default 8080)

- HTTPS Port (default 8080)

Step 17 With the **Details** tab selected, specify the Secondary ScanSafe Server by entering the following values:

- IP Address/Name (only a valid IP address or FQDN).
- HTTP Port (default 8080)
- HTTPS Port (default 8080)

Step 18 Specify the **Server Timeout** period in seconds (default 300).

Step 19 Specify the **Session Idle Timeout** period in seconds (default 300).

Step 20 Specify the source address by doing *one* of the following:

- Click the **IP Address** button and then enter the IP address.
- Click the **Interface** button, and then click the **Select** button and browse the Interface Selector to select an interface.

Note A valid source IP or interface must be one of the interfaces on which ScanSafe Web Security is enabled (on the Firewall > ScanSafe Web Security page > Interface tab.

Step 21 Enter the **License** and select the checkbox if it is encrypted.

Tip If Encrypted is not selected, the value entered must be 32 hexadecimal characters.

Step 22 If desired, select the **Enable Logging** checkbox.

ScanSafe Web Security Page

Security Manager provides integration with ScanSafe Web Security. ScanSafe Web Security is a cloud-based SaaS (Security as a Service) function that makes available its web security data centers at various locations worldwide. When ScanSafe Web Security is integrated with a router, selected HTTP and HTTPS traffic is redirected to ScanSafe Cloud for content scanning and for malware detection by other means. Also, you can use ScanSafe Web Security to provide differentiated services to particular users, user groups, and IPs.

Using ScanSafe Web Security in Security Manager, you can define settings and policies in the following areas:

- Content scanning settings
- Content scanning policies
- AAA server settings
- AAA policies

With ScanSafe Web Security integration in Security Manager you can copy and share most policies and framework-based policy features.

Navigation Path

(Policy view) Select Firewall and open Settings from the Policy Type selector. Then click ScanSafe Web Security to open the ScanSafe Web Security Settings Page.

Note Configuration of the ScanSafe Web Security policies and settings is also possible by way of the Map view.

Related Topics

Field Reference

Element	Description
Interfaces Tab	
—Filter	Details on using filters in Security Manager are found at Filtering Tables , on page 50.
Interfaces	This tab allows you to select interfaces and Security Manager-defined interface roles on which web requests will be forwarded to the ScanSafe Web Security server for content scanning.
—Available Interfaces	Interfaces that are available to be selected for ScanSafe Web Security.
—Selected Interfaces	Interfaces selected must be facing the WAN on which hosts' requests for web services are forwarded to ScanSafe Web Security server
-	-
Permitlisting Regular Expressions Tab	
—Notify Tower	This checkbox, when selected, specifies that the ScanSafe Web Security tower must be notified regarding the allowed listing. It is applicable to all ACL-based allowed listing variants except IP-based allowed listing. The default behavior is that the notification is not sent.
—Available Regular Expressions (HTTP Host)	Lists the regular expressions available and considered for delivery to the ScanSafe Web Security server.
——Filter (HTTP Host)	Enables the administrator to filter allowed regular expressions sent to ScanSafe Web Security server by specifying include and exclude user group list. It operates on a match-all or match-any basis.
—Selected Regular Expressions (HTTP Host)	A host that matches the selected regular expressions is added to the allowed list, and is not redirected to the ScanSafe Web Security server.
—Available Regular Expressions (HTTP User Agent)	An agent that matches the available regular expressions is added to the allowed list, and is not redirected to the ScanSafe Web Security server.

Element	Description
—Selected Regular Expressions (HTTP User Agent)	When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.
Permitlisting ACLs Tab	
—ACL Type	Specifies the type of ACL Allowed Listing, either standard or extended. **Note** Standard ACLs used for allowed listing are discovered as extended ACLs. A prefix of "CSM_EXT_" is added to the ACL name. Standard ACls are converted to extended ACLs as extended ACLs are complete and recommended
—Selected ACLS	When configured, only regular expressions that are in the Selected Regular Expressions list are sent to ScanSafe Cloud.
User Groups Tab	
—Default User	A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all users in a branch office (for example).
—Default User Group	A global name that is sent to the ScanSafe Web Security server when there is no content-scan-session specific user name. Use it when you want the same content scan policy for all user groups in a branch office (for example).
—Interface Specific Default User Groups	Lists default user group for each interface.
—Include/Exclude	You can use the Include and Exclude lists to specify the particular user groups to be included or excluded.

Add and Edit Default User Groups Dialog Box

Use the Default User Groups dialog box to specify the default user group for a particular interface.

For details on these ScanSafe Web Security server configuration settings, see the ScanSafe Web Security Settings Page , on page 929.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

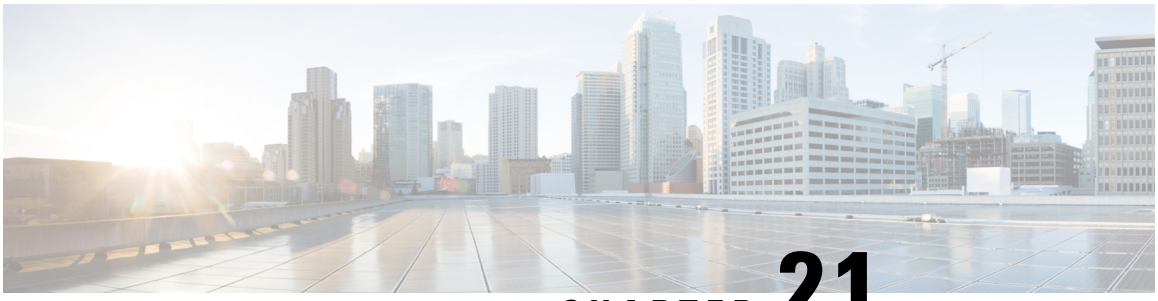
Field Reference

Table 273: ScanSafe Web Security Settings

Element	Description	Usage
IP Address|Name (Primary ScanSafe Server)	The primary FQDN or IP address of the server configured to operate ScanSafe Web Security.	Both
HTTP Port (Primary ScanSafe Server)	Default primary port for proxied HTTP traffic (default=8080).	Both
HTTPS Port (Primary ScanSafe Server)	Default primary port for proxied HTTPS traffic (default=8080).	Both
IP Address/Name (Backup ScanSafe Server)	The secondary FQDN or IP address of the server configured to operate ScanSafe Web Security.	Both
HTTP Port (Backup ScanSafe Server)	Default secondary port for proxied HTTP traffic (default=8080).	Both
HTTPS Port (Secondary ScanSafe Server)	Default secondary port for proxied HTTPS traffic (default=8080).	Both

Element	Description	Usage
Server Timeout	Polling timeout when checking the availability of the ScanSafe Web Security server.	IOS Only
Session Idle Timeout	Inactivity timeout of the ScanSafe Web Security server (default=300 seconds). Used to remove the session if it is found inactive.	IOS Only
On Failure	Determines the action to be taken (Drop all Traffic or Allow All Traffic) when both primary and secondary ScanSafe Web Security servers are found inactive.	IOS Only
IP Address (Source Address)	IP address from which a packet to the ScanSafe Web Security server originates from the router.	IOS Only
Interface (Source Address)	Interface address from which a packet to the ScanSafe Web Security server originates from the router.	IOS Only
License	The license sent to the ScanSafe Web Security server (32 hexadecimal characters).	Both
Encrypted	When selected, enables the encryption. ASA does not accept encrypted license text to be configured.	IOS Only
Enable Logging Checkbox	Enables IOS syslogs (default=not enabled).	IOS Only
Public Key File	Name of the public key file	ASA Only
Connection Retry Count	Number of times that the system should retry connecting.	ASA Only



CHAPTER 21

Managing Zone-based Firewall Rules

The Zone-based Firewall feature (also known as Zone-based Policy Firewall) allows unidirectional application of IOS firewall policies between groups of interfaces known as "zones." That is, interfaces are assigned to zones, and firewall rules are applied to specific types of traffic moving in one direction between the zones. Beginning with 4.16, Cisco Security Manager allows sub-interfaces to be assigned to zones. Zone-based firewalls enforce a secure inter-zone policy by default, meaning traffic cannot pass between security zones until an explicit policy allowing that traffic is defined.

The "zone" itself is an abstraction—multiple interfaces with the same or similar security requirements that can be logically grouped together. For example, router interfaces Ethernet 0/0 and Ethernet 0/1 might be connected to the local LAN. When viewed from a firewall perspective, these two interfaces are similar in that they represent the internal network, and they can be grouped into a single zone for the purposes of firewall configuration. Then you can specify firewall policies between that and other zones. These inter-zone policies offer considerable flexibility and granularity, so different inspection policies can be applied to multiple host groups connected to the same router interface.

Note The zone-based firewall feature is supported on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.

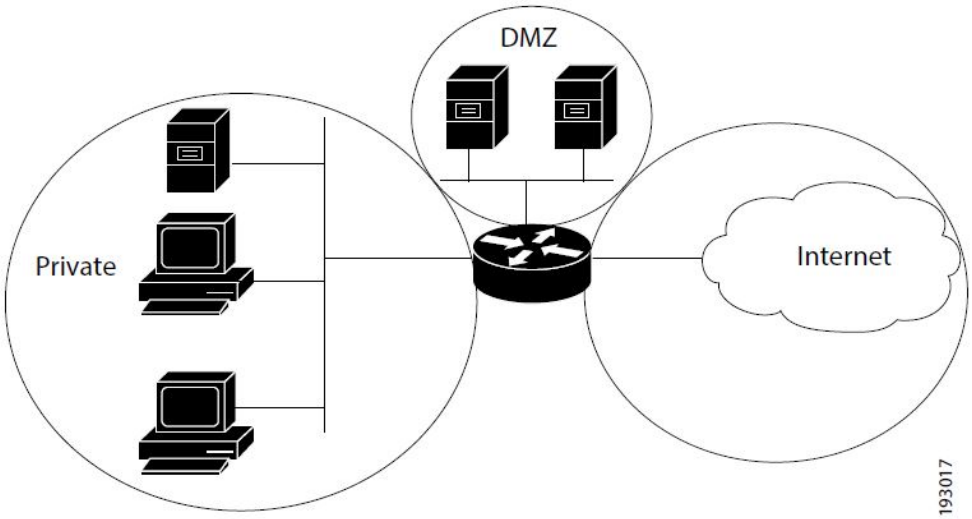
A Simple Example

A security zone should be configured for each region of similar security within the network, so that all interfaces assigned to the same zone are protected with a similar level of security. For example, consider an access router with three interfaces:

- One interface is connected to the public Internet
- One interface is connected to a private LAN that must not be accessible from the public Internet
- One interface is connected to an Internet-service "demilitarized zone" (DMZ), where a Web server,

Domain Name System (DNS) server, and e-mail server must have access to the public Internet. Each interface in this network would be assigned to its own zone, as shown in the following figure.

Figure 27: Basic Security Zone Topology



This example configuration typically would have three main policies (sets of rules) defining:

- Private zone connectivity to the Internet
- Private zone connectivity to DMZ hosts
- Internet zone connectivity to DMZ hosts

Zone-based firewalls impose a prohibitive default security posture. In other words, for example, unless the DMZ hosts are specifically allowed access to other networks, those networks are protected against any undesired connections from the DMZ hosts. Similarly, unless access is specifically provided for Internet hosts to access the Private zone directly, the Private zone hosts are safe from unwanted access by Internet hosts.

In this simple example, each zone has only one member interface. If an additional interface is added to the Private zone, for example, the hosts connected to that new interface can immediately pass traffic to all hosts connected to the existing interface in the zone. Additionally, traffic to hosts in other zones is immediately controlled by existing Private zone policies.

In a more realistic example, you might allow varied access from the public Internet to specific hosts in the DMZ, and varied application-use policies for hosts in the protected LAN.

This chapter contains the following topics:

Understanding the Zone-based Firewall Rules

Zones establish the security borders of your network. A zone defines a boundary where traffic is subjected to inspection or filtering as it crosses to another region of your network. The default zone-based firewall policy between zones is "deny all." Thus, if no zone-based firewall rules are explicitly configured, all traffic moving between all zones is blocked.

Zone-based firewall rules apply specific actions—Drop, Pass, Inspect, and Content Filter—to various types of unidirectional traffic between pairs of zones. The direction of the traffic is determined by specifying a source and destination zone as part of each rule.

Logging

Zone-based firewall rules offer syslog, alert, and audit-trail logging options. Most messages are logged to the router console unless a syslog server is configured. See Logging on Cisco IOS Routers , on page 2515 for information about configuring syslog logging.

Important Points

Please note the following points regarding zones and zone-based firewall rules:

- Zone-based firewall rules are supported only on IOS devices running 12.4(6)T or later, and ASR devices running 12.2(33) or later.
- If a zone-based firewall rule and an IOS Inspection rule use the same interface, an error results.

The zone-based firewall model and the earlier interface-based inspection rules model are not mutually exclusive on the router, but they cannot be combined on any given interface. That is, an interface cannot be configured as a member of a security zone if it is configured with Inspection rules. Further, configuring a router to use both models at the same time is not recommended.

- An interface can be assigned to only one security zone, but zones can include multiple interfaces. If an interface is assigned to more than one zone, an error results.
- All traffic to and from a given interface is implicitly blocked when the interface is assigned to a zone (except traffic to and from other interfaces in the same zone, and traffic to any interface on the router). Thus, to permit traffic to and from a zone-member interface, one or more rules allowing or inspecting traffic must be configured between that zone and any other zone.
- Traffic is implicitly allowed to flow between interfaces that are members of the same zone. However, you can define rules that require inspection of traffic between same-zone members.

- The “Self” zone is a default zone that defines the router itself as a separate security zone, which you can specify as either the source or destination zone. The Self zone is the only exception to the default “deny all” policy. All traffic to any router interface is allowed until explicitly denied.

A zone-based firewall rule that includes the Self zone applies to local traffic—that is, traffic directed to the router, or to traffic generated by the router; it does not apply to traffic through the router. See The Self Zone , on page 935 for more information.

- The Inspect action is not allowed in rules that apply to the Self zone.
- The Pass action permits traffic in one direction only. You must explicitly define rules for return traffic. However, with the Inspect action, return traffic is automatically allowed for established connections.
- Traffic cannot flow between a zone-member interface and any interface that is not a zone member.
- Interfaces that have not been assigned to a zone can still function as classical router ports and might still have other types of firewall rules configured on them.

However, if an interface is not part of your zone-based firewall policy, it might still be necessary to add that interface to a zone and configure a “pass all” policy (sort of a “dummy policy”) between that zone and any other zone to which inter-zone traffic flow is desired.

- Access-control list (ACL) rules applied on interfaces that are also zone members are processed before the zone rules are applied. Therefore, to continue using both rule types, it may be necessary to relax the interface ACLs to ensure certain traffic flows are processed by the zone-based rules.
- All interfaces in a zone must belong to the same Virtual Routing and Forwarding (VRF) instance. Zone-based rules can be configured between zones whose member interfaces are in separate VRFs. However, if traffic cannot flow between these VRFs, these rules will never be executed. See Zones and VRF-aware Firewalls , on page 936 for more information.
- Zones are defined using Interface Role objects. If you change the definition of an interface role that you are using for a zone, you are changing the zone, which can affect existing traffic flows. In addition, if you use wildcards in the interface role to specify an interface name pattern, be aware that interfaces may automatically be added to the zone when you create new interfaces on the router.
- If zone-based firewall rules contain conflicting zone information, the first rule defined in the table takes precedence. Rules that do not reference valid zones are not deployed and an activity validation warning is shown.
- Empty zones result in activity validation errors for certain devices; refer to the following restriction lists.
- Source and destination zones cannot be the same for certain devices; refer to the following restriction lists.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

The Self Zone

The router itself is defined as a separate security zone, with the fixed name **Self**, and since IOS firewalls support examination of traffic (TCP, UDP and H.323 only) that terminates or originates on the router (together known as “local” traffic), incoming and outgoing router traffic can be subject to rules in the same way as routed inter-zone traffic.

When an interface is assigned to a zone, the hosts connected to that interface are included in that zone. By default, traffic is allowed to flow between interfaces that are members of the same zone, while a default “deny-all” policy is applied to traffic moving between zones.

However, traffic flowing directly between other zones and the router’s IP interfaces (the Self zone) is implicitly allowed. This ensures that connectivity to the router’s management interfaces is maintained when a zone firewall configuration is applied to the router.

This also means that traffic flowing to and from the IP addresses of the router’s interfaces is not initially controlled by zone policies. If you wish to control traffic moving between the router interfaces and other zones, you must apply rules that block or allow this local traffic.

When configuring the rules for the Self zone, consider the following:

- All IP addresses configured on the router belong to the Self zone, regardless of interface zone membership.
- Traffic to and from the Self zone is unrestricted until you configure explicit rules to the contrary.

That is, when you configure a zone-based firewall rule that includes the Self zone, traffic between the Self zone and the other zone is immediately restricted in both directions. For example, if you define a rule affecting traffic from the “Private” zone to the Self zone, the router cannot originate any traffic to the Private zone until you define one or more rules for Self to Private.

Traffic between the router itself and other zones that are not included in the Self-zone rules remains unaffected.

- The Inspect action is not allowed in rules that apply to the Self zone.

When configuring restrictions on inbound Self-zone traffic, consider the necessary outbound traffic (including the routing and network management protocols). For example, if you restrict inbound traffic from a zone to the router itself, the routing protocols could stop working on all interfaces belonging to that zone.

Using VPNs with Zone-based Firewall Policies

Recent enhancements to the IP Security (IPsec) VPN implementation simplify firewall policy configuration for VPN connectivity. IPSec Virtual Tunnel Interface (VTI) and GRE+IPSec allow the confinement of VPN site-to-site and client connections to a specific security zone by placing the tunnel interfaces in that security zone. Connections can be isolated in a VPN DMZ if connectivity must be limited by a specific policy. Or, if VPN connectivity is implicitly trusted, VPN connections can be placed in the same security zone as the trusted inside network.

To configure the router to use zone-based firewall rules with dynamic VPNs (those which dynamically create Tunnel/Loopback/Virtual interfaces):

- Define a zone specifically for the VPN interfaces.
- Enter this zone in the **VPN Zone** field on the VPN tab of the Zone Based Firewall Page , on page 981.
- Create zone-based firewall rules to allow the VPN traffic, as appropriate.

If non-VTI IPsec is employed, you must exercise caution when you configure a zone-based firewall policy for VPN. The zone policy must specifically allow access to protected hosts by remote VPN hosts or clients if they are in a different zone than the ingress interface for encrypted VPN traffic. This access policy must be configured by including an access control list (ACL) enumerating the source IP addresses of the VPN clients, and the destination IP addresses of all protected hosts the VPN clients are allowed to reach. If the access policy is not properly configured, the policy could expose vulnerable hosts to hostile traffic.

Refer to this white paper on cisco.com "Using VPN with Zone-Based Policy Firewall" for further discussion of these topics.

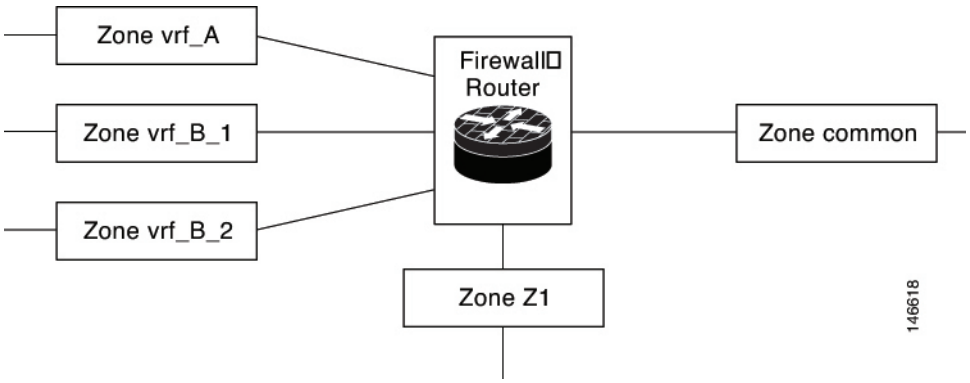
Zones and VRF-aware Firewalls

Cisco IOS firewalls are VRF-aware (Virtual Routing and Forwarding), providing management of IP address overlap across different VRFs, separate thresholds and timeouts for VRFs, and so forth. For application of zone-based firewall rules, all interfaces in a zone must belong to the same VRF.

When multiple VRFs are configured on a router and one interface provides common services to all the VRFs (for example, Internet service), you should place that interface in a separate zone. You can then define policies between the common zone and other zones. (There can be one or more zones per VRF.)

You can configure rules between two zones that contain different VRFs, as shown in the following illustration.

Figure 28: Zones and VRF



In this illustration:

- The interface providing common services is a member of the zone “common.”
- All of VRF A is in a single zone, “vrf_A.”
- VRF B, which has multiple interfaces, is partitioned into two zones “vrf_B_1” and “vrf_B_2.”
- Zone Z1 does not have VRF interfaces.

Based on this configuration:

- You can specify policies between each of these zones and the common zone. Additionally, you can specify polices between each of the zones vrf_A, vrf_B_n and Z1 if VRF route export is configured and the traffic patterns make sense.
- You can configure a policy between zones vrf_A and vrf_B_1, but be sure that traffic can flow between them.
- You do not need to specify the global thresholds and timers on a per-VRF basis. Instead, parameters are supplied to the Inspect action through a parameter map.

Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules

When you create a zone-based firewall rule, you must specify two execution-related settings: Permit/Deny and an Action (Drop, Pass, Inspect, or Content Filter). To obtain the results you want, you must clearly understand the relationship between these two parameters:

- **Permit/Deny**—The Permit/Deny setting appears to correspond to Permit/Deny in an access control list (ACL) entry. However, in zone-based firewall rules, unlike in standard access rules, these keywords do not permit or deny traffic. Instead, they specify whether you want to apply an Action to the traffic flow defined by the Source, Destination, and Services fields, and they affect processing of related class maps.

- **Permit** – Applies the specified Action to traffic that matches the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the Action is further limited to those protocols.)

Tip: Essentially all of your zone-based rules should be Permit rules. This is the easiest configuration to understand—it means you are identifying the traffic to which you want the chosen Action applied.

- • **Deny** – Exempts the traffic defined by the Source, Destination, and Services fields. (If protocols are listed in the Protocols table, the exemption is further limited to those protocols.) In other words, treat the traffic as not matching the rule. Instead, evaluate subsequent class maps (which are not the same as zone rules) for the zone pair and look for a subsequent map that matches the traffic. If no subsequent map matches the traffic, apply the default rule to the traffic (see Changing the Default Drop Behavior , on page 979).

It is important to understand that there is not a one-to-one relationship between zone rules and class maps. Therefore, you cannot determine just by looking at the rules table how the rules will be converted to class maps. You must preview the configuration to see which subsequent rules might be applied to traffic that matches your Deny rule. (To preview the configuration, save your changes and select **Tools > Preview Configuration**. For more information, see Previewing Configurations , on page 424).

In general, you might use a Deny rule to exempt a specific IP address within a subnet from a Permit rule you want to apply to the subnet in general; for example, exempting 10.100.10.1 from a rule applying to 10.100.10.0/24. However, it is much easier to create a Permit rule for the specific IP address and apply a desired Action, and ensure that the rule is listed above the general rule in the zone-based rules table.

If you decide to use Deny rules, be sure to also read Troubleshooting Zone-based Rules and Configurations , on page 985.

- **Action**—The Action parameters define what happens to traffic that matches a Permit rule. These parameters are ignored for Deny rules, except to determine to which class map the rule is added.

When you create a Permit rule, traffic that matches the Source, Destination, Services, and Protocol fields is processed according to the Action you choose: drop the traffic (and optionally log it), pass the traffic (and optionally log it), inspect the traffic, or apply content filtering (for Web traffic only).

When you inspect traffic for some protocols, or perform content filtering, you have the option of specifying a policy map to use for deep inspection. The deep inspection policy map also specifies actions based on the deeper characteristics of the traffic. This additional inspection applies to packets that meet the requirements of the class map to which the assigned policy map refers. Packets that do not match the deep inspection class map are allowed. Thus, deep inspection might reset TCP connections if the policy map specifies that action.

The following table illustrates the relationship between Permit/Deny and the chosen Action in a zone-based firewall rule. The table uses the TCP service as an example, but the general explanation applies to the IP service as well. The result applies only to the From and To zones specified in the rule.

Table 274: Relationship Between Permit/Deny and Action in Zone-based Rules

Permit / Deny	Service	Rule Action	Protocol	Result
Permit	TCP	Pass	(None)	Pass all TCP traffic.

Permit / Deny	Service	Rule Action	Protocol	Result
Deny	TCP	Pass	(None)	Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Pass action is ignored.
Permit	TCP	Drop	(None)	Drop all TCP traffic.
Deny	TCP	Drop	(None)	Skip the rule and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Drop action is ignored.
Permit	TCP	Pass	DNS	Only DNS traffic passes. Other TCP traffic is handled by subsequent rules.
Permit	TCP	Drop	DNS	DNS traffic is dropped. Other TCP traffic is handled by subsequent rules.
Deny	TCP	Pass	DNS	Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Pass action is ignored.
Deny	TCP	Drop	DNS	Skip the rule for DNS traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Drop action is ignored.
Permit	TCP	Inspect	HTTP	Allow and inspect HTTP traffic. If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations).
Deny	TCP	Inspect	HTTP	Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Inspect action is ignored. **Tip** If subsequent rules, or the class default, pass the traffic without inspection, you need to create a Permit/Pass rule in the other direction (or an access rule) to allow return traffic for the HTTP connection. If your intention is to prohibit HTTP connections, create a Permit/Drop rule instead of a Deny/Inspect rule.

Permit / Deny	Service	Rule Action	Protocol	Result
Permit	TCP	Content Filter	HTTP	Allow and inspect HTTP traffic, and apply URL filtering maps to selectively permit or deny Web connections based on the Web sites requested. If you specify a policy map for deep inspection, the action from the policy map is applied to any packets that match deep inspection parameters (for example, reset the connection for protocol violations). Thus, traffic can be dropped either because the Web site is added to the block list, or because the HTTP packets violate your deep inspection rules.
Deny	TCP	Content Filter	HTTP	Skip the rule for HTTP traffic and evaluate the next class map. Either a subsequent class map with a Permit rule is applied, or the class default rule is applied. The Content Filter action is ignored. **Tip** This type of rule can exempt the specified source/destination from content filtering if no subsequent class maps drop the traffic or apply content filtering. However, if you want to allow HTTP connections for this traffic, you must create a Permit/Inspect rule for the traffic.

Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules

When you create a zone-based firewall rule, there are two seemingly similar parameters which help identify the characteristics of the target traffic: Services and Protocols. The entries in these fields can provide very similar information, but it is used differently when constructing zone-based firewall policies in the device configuration. This section describes the recommended uses of these fields.

- **Services** – The Services field is used to define traffic protocol(s) in an access control list (ACL) entry. Along with the Sources and Destinations specified, this ACL entry is used by a class map to define the traffic to which you want to apply a policy. However, unlike in standard access rules, the Services information is not the primary means of identifying the traffic protocol. It is required only because ACLs must have a service designation for each entry.

In general, you can leave the default entry (IP) in the Services field for all of your zone-based firewall rules, using the Protocol table to identify specific protocols that you want to Drop, Pass, or Inspect.

If you do elect to specify a Service other than IP, ensure that your selection does not conflict with any protocols listed in the Protocol table. For example, do not specify UDP in the Services field, and then list a TCP-based protocol in the table. In general, for a given rule, if you specify a specific service in the Services field, do not enter any protocols in the Protocol table.

- **Protocol** – The Protocol table, in the Action area of the Add and Edit Zone Based Rule dialog boxes, is used to select one or more protocols, add custom port application mappings (if you specify non-default ports), and apply deep inspection policy maps. You can specify very specific protocols, such as DNS, general protocols such as TCP and UDP, and even custom protocols that identify ports you use for special applications.

As a general rule, leave Services set to IP and use the Protocol table to identify the protocols (which are also services) for all of your zone-based rules for the Drop, Pass, and Inspect actions. (The Content Filter action automatically uses the HTTP protocol, which you can configure but not change.) Following this approach will create a configuration that is as "clean" and easy to interpret (and troubleshoot) as possible.

For more detailed information on how these fields are used when generating device configurations, see Troubleshooting Zone-based Rules and Configurations , on page 985.

General Recommendations for Zone-based Firewall Rules

Zone-based firewall rules allow a wide variety of configurations. You can quickly generate a set of rules that will be very complex and difficult to analyze, because you can use the zone-based rules in place of the standard access rules, inspection rules, and Web filter rules.

When defining zone-based rules, strive to keep them as simple and straightforward as possible. Consider the following recommendations for helping to maintain simplicity in your zone-based firewall policy:

- Only use **Permit** rules. The chosen Action determines what happens to matched traffic, and **Deny** rules are difficult to analyze. For more information, see Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules , on page 937.
- The **Drop** and **Pass** rules are equivalent to standard interface access rules, but are applied to the specified zone pair. You can use either the Services field or the Protocol table to identify the type of traffic, but we recommend using the Protocol table exclusively. To drop traffic, specify **Permit** with the Action **Drop**.
- You do not need to first pass traffic before inspecting it. For example, if you want to allow HTTP traffic between zones, you need only a single Permit/Inspect rule; you do not need to first create a Permit/Pass rule. If you do use Pass rules, note that you must also create a Pass rule in the return direction if you want to allow returning traffic. In practice, you generally can avoid creating Pass rules, using only Inspect rules.
- You can use Permit/Pass and Permit/Drop rules to perform the same functions as standard access rules. Thus, you can eliminate your access rules policy and use only zone-based firewall rules.

However, because there are several tools available for analyzing interface access rules, and Security Manager allows you to use the same interface roles in zone-base rules and access rules, you might find it more convenient to create your Pass/Drop policies (which are Permit/Deny in standard access rules) in the access rules table instead of the zone rules table. Use the zone rules table primarily for zone-based Inspection and Content Filter rules.

- Use sections to organize the rules for each zone pair. Sections make it easy for you to see all of the rules for a pair, which can be critical if your rules have sequential dependencies. For more information on working with sections, see Using Sections to Organize Rules Tables , on page 618.

Developing and Applying Zone-based Firewall Rules

The following is a general overview of how to develop and apply zone-based firewall rules to your network.

- Consider your network, and its sub-networks, in terms of security zones—think about the security requirements of the various zones. As a general guideline, group router interfaces that are similar when viewed from a security perspective.
- Determine the types of traffic to be examined as it travels from one zone to another, decide how each type is to be examined and handled.
- Define zone-based firewall rules that implement these decisions. This process may include some or all of the following procedures, which you can perform prior to defining the rules themselves, or which you can perform as necessary during rule definition:
  - Define the zones by creating named Interface Role objects, assigning the appropriate interfaces and interface patterns to them.
  - Define/edit Port Application Mapping (PAM) settings for specific Layer 4 protocols and ports, and optionally specific networks and hosts.
  - Configure Deep Packet Inspection (DPI) policies for Layer 7 protocols—HTTP, IMAP, instant messaging (IM), and peer-to-peer (P2P).
  - Configure Protocol Info parameter maps; these define DNS servers that interact with the IM applications.
  - Configure Inspect parameter maps that define connection, timeout, and other settings for the Inspect action.
  - Define WebFilter parameter or policy maps for URL-based content filtering.

The following topics provide additional information about these procedures:

- Understanding Map Objects , on page 308
- Configuring Content Filtering Maps for Zone-based Firewall Policies , on page 966
- Configuring Inspection Maps for Zone-based Firewall Policies , on page 945

Adding Zone-Based Firewall Rules

This procedure explains how to configure a zone-based firewall rule in Security Manager.

Related Topics

- Understanding the Zone-based Firewall Rules , on page 933
- Configuring Settings for Zone-based Firewall Rules , on page 980
- Understanding Map Objects , on page 308
- Enabling and Disabling Rules , on page 618
- Adding and Removing Rules , on page 606

- Moving Rules and the Importance of Rule Order , on page 617

Step 1 Access the Zone-based Firewall Rules Page , on page 989 as follows:

- (Device view) Select an IOS router and then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
- (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Click the Add Row button below the rules table, or right-click anywhere inside the table, and choose **Add Row** to open the Add Zone Based Firewall Rule dialog box.

Refer to Adding and Editing Zone-based Firewall Rules , on page 992 for a complete description of this dialog box.

Step 3 Define the base Traffic flow for this rule.

Note Together, the Permit/Deny, Sources, Destinations, and Services options can be thought of as defining a simple access rule that can be enhanced by the application of in-depth Action-related policies, and restricted to a specific direction between a specific pair of zones.

a) Choose whether to Permit or Deny further processing of traffic that matches this rule. See Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules , on page 937 for more information.

b) Optionally, provide Source and Destination hosts/networks or Security Groups (IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+ only).

By default, the traffic definition encompasses packets from “any” source, to “any” destination. You can use these fields to refine this base traffic definition by providing one or more source and destination hosts/networks. (See Understanding Networks/Hosts Objects , on page 310 and Understanding Networks/Hosts Objects , on page 310 for more information.)

c) Specify one or more Services (protocols) that indicate the type of traffic; for example, IP, TCP, etc.

You can provide more than one Service; however, IP generally stands alone. (See Understanding and Specifying Services and Service and Port List Objects , on page 331.)

d) Provide the From Zone; that is, the only zone from which matched traffic can originate.

e) Provide the To Zone; that is, the only zone to which matched traffic can flow.

Refer to Understanding Interface Role Objects , on page 303 for more information about zone/interface objects.

Note Together, the From Zone and the To Zone constitute what is sometimes referred to as a “zone-pair.”

f) Click the Advanced button to add a time range, or to apply a packet-fragment or an established-connection restriction to this zone-based firewall rule.

See Zone-based Firewall Rule: Advanced Options Dialog Box , on page 996 for more information about these options.

Step 4 Specify the actions to be applied to traffic matching this definition by choosing a base Action, and supplying additional parameters as necessary.

a) Choose a base Action:

- **Drop** – Matching traffic is silently dropped; no notification of the drop is sent to the originating host.
- **Drop and Log** – Matching traffic is dropped and a syslog message generated; no notification of the drop is sent to the originating host.
- **Pass** – Traffic is forwarded. This action is unidirectional; Pass allows traffic in only the specified direction.

- **Pass and Log** – Traffic is forwarded and a syslog message generated.

Note The Pass actions do not track the state of connections or sessions within the traffic. Pass only allows the traffic in one direction. A corresponding rule must be defined to allow return traffic. The Pass actions are useful for protocols such as IPSec ESP, IPSec AH, ISAKMP, and other inherently secure protocols with predictable behavior. However, most application traffic is better handled in the zone-based firewall rules with the Inspect action.

- **Inspect** – This option offers state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted.

Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit the Port Application Mapping (PAM) settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols.

- **Content Filter** – Lets you configure HTTP content inspection (URL filtering) based on a WebFilter parameter map, or a WebFilter policy map. This action is generally equivalent to a Web Filter rule; however, zone-based firewall rules support additional advanced options, such as HTTP deep packet inspection (DPI).

The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data.

b) For any Action except Content Filter, you can select and edit the specific traffic Protocol(s) to be considered:

Click Select next to the Protocol table to open the Protocol Selector Dialog Box , on page 997 . Select one or more protocols and click >> to move them to the Selected Protocol list. You can edit the Port Application Mapping (PAM) settings for the selected protocols; see Configure Protocol Dialog Box , on page 998 for more information.

The Instant Messaging and Stun-ice protocols also allow selection of Protocol Info parameter maps. Further, when Inspect is the chosen Action, some protocols allow selection of deep-inspection policy maps.

See Configuring Inspection Maps for Zone-based Firewall Policies , on page 945, and Configuring Protocol Info Parameter Maps , on page 963 for more information.

Note It is not necessary to specify protocols for the Drop, Drop and Log, Pass, and Pass and Log actions. You can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters.

c) When the chosen Action is Content Filter, configure the URL filtering:

1. Click Configure next to the Protocol field to customize the HTTP PAM settings, and to apply an HTTP deep-inspection policy map. See the Configure Protocol Dialog Box , on page 998 for more information
2. Select either WebFilter Parameter Map, or WebFilter Policy Map, and enter or Select the name of the appropriate WebFilter map. See Configuring Content Filtering Maps for Zone-based Firewall Policies , on page 966 for more information.

d) When the chosen Action is Inspect or Content Filter, you can enter or Select the name of an Inspect Parameter map to apply a customized set of connection, timeout, and other settings. See Configuring Inspect Parameter Maps , on page 960 for more information.

Step 5 (Optional) Enter a description to help you identify the rule.

Step 6 (Optional) Under Category, select a category to help you identify this rule in the rules table. See Using Category Objects , on page 241.

Step 7 Click **OK** to close the Add Zone Based Firewall Rule dialog box and return to the Zone Based Firewall Rules table.

The new rule is listed in the table.

Configuring Inspection Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to inspect traffic by choosing Inspect as the Action for the rule. You can then select the specific protocols to inspect.

For some protocols, you can select policy maps to perform deep inspection on packets that match your criteria. You can configure these maps from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**). In addition to policy maps, there are some parameter maps you can configure for inspection.

- For protocols that allow deep inspection, you can select a related policy map, which in turn incorporates class maps that define match conditions for the targeted traffic. To create these policy maps in the Policy Object Manager, select one of the available map types (which are listed in the following table) from the **Maps > Policy Maps > Inspect** folder, and review the detailed usage information in Configuring Policy Maps for Zone-Based Firewall Policies , on page 964.

For information on creating class maps for use in your deep-inspection policy maps, see the references to the match criterion dialog boxes in the following table, as well as the topic Configuring Class Maps for Zone-Based Firewall Policies , on page 947. These class map are found in the **Maps > Class Maps > Inspect** folder in the Policy Object Manager.

- When Inspect (or Content Filter) is the chosen Action, you can also apply an Inspect Parameters map in the Adding and Editing Zone-based Firewall Rules , on page 992. Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you must create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters** and review the detailed usage information in Configuring Inspect Parameter Maps , on page 960.

Table 275: Policy Objects for Zone-based Firewall Inspection Rules

Protocol	Minimum IOS Software Version	Policy Map	Class Map	Parameter Map	Description and Match Criteria Reference
Instant Messaging: AOL, ICQ, MSN Messenger, Windows Messenger, Yahoo Messenger	12.4(9)T	IM (Zone based IOS)	AOL ICQ MSN Messenger Windows Messenger Yahoo Messenger	Protocol Info	Inspect traffic based on the type of service (text-chat or any other). See Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes , on page 950. You must also select a Protocol Info parameter map to define the DNS servers used by the traffic you are inspecting. See Configuring Protocol Info Parameter Maps , on page 963.
Peer-to-peer (P2P): eDonkey, FastTrack, Gnutella, Kazaa2	12.4(9)T	P2P	eDonkey FastTrack Gnutella Kazaa2	None	Inspect traffic based on file name. See Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes , on page 950.
H.323	12.4(6)T	H.323 (IOS)	H.323 (IOS)	None	Inspect traffic based on the H.323 message type. See H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes , on page 951.
HTTP	12.4(6)T	HTTP (Zone based IOS)	HTTP (IOS)	None	Inspect traffic based on a wide variety of criteria including the content of the header or body, port misuse, and whether the traffic includes a Java applet. See HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes , on page 952.
IMAP (Internet Message Access Protocol) POP3 (Post Office Protocol 3)	12.4(6)T	IMAP POP3	IMAP POP3	None	Inspect traffic based on invalid commands or clear-text logins. See IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes , on page 954.
SIP (Session Initiation Protocol)	12.4(6)T	SIP (IOS)	SIP (IOS)	None	Inspect traffic based on a wide variety of criteria. See SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes , on page 954.
SMTP (Simple Mail Transfer Protocol)	12.4(6)T	SMTP	SMTP	None	Inspect traffic based on data length. See SMTP Class Maps Add or Edit Match Criterion Dialog Boxes , on page 956.

Protocol	Minimum IOS Software Version	Policy Map	Class Map	Parameter Map	Description and Match Criteria Reference
Stun-ice	12.4(9)T	None	None	Protocol Info	You must select a Protocol Info parameter map to define the DNS servers used by the traffic you are inspecting. See Configuring Protocol Info Parameter Maps , on page 963.
Sun RPC (Remote Procedure Call)	12.4(6)T	Sun RPC	Sun RPC	None	Inspect traffic based on the RPC protocol number. See Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes , on page 959.
SCTP (Stream Control Transmission Protocol)	12.4(6)T	SCTP	None	None	Inspect traffic based on PPID match criterion. See SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 862.
Diameter protocol	12.4(6)T	Diameter	Diameter	None	Inspect traffic based on application ID, command codes, and AVP. See Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 865.
LISP (Locator and ID Separation Protocol)	12.4(6)T	LISP	None	None	Inspect traffic based on application ID, command codes, and AVP.

Configuring Class Maps for Zone-Based Firewall Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring zone-based firewall rules for devices running Cisco IOS Software, you can create class maps for the following purposes:

- For 12.4(6)T and higher, you can create classes for the inspection of the following types of traffic: H.323, HTTP, IMAP, POP3, SIP, SMTP, and Sun RPC. You can create classes for web filtering using the following class types: Local, N2H2 (SmartFilter), and WebSense. See the following topics for information on the match criteria:
  - H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes , on page 951
  - HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes , on page 952
  - IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes , on page 954
  - SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes , on page 954
  - SMTP Class Maps Add or Edit Match Criterion Dialog Boxes , on page 956
  - Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes , on page 959
  - Local Web Filter Class Add or Edit Match Criterion Dialog Boxes , on page 959
  - N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes , on page 960
- For 12.4(9)T and higher, you can create classes for the inspection of the following types of traffic: AOL, eDonkey, FastTrack, Gnutella, ICQ, Kazaa2, MSN Messenger, Windows Messenger, and Yahoo Messenger. See the following topics for information on the match criteria:
  - Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes , on page 950
  - Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes , on page 950
- For 12.4(20)T and higher, you can create classes for web filtering using the Trend policy object. Match criteria for Trend Content Filter class maps is described in the table below.

Navigation Path

Select **Manage > Policy Objects**, then select any zone-based class map object in the folders in the **Maps > Class Maps** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

Field Reference

Table 276: Add or Edit Class Maps Dialog Boxes for Zone-Based Firewall Policies

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Match table Match Type (Except for Trend Content Filter class maps.)	The Match table lists the criteria included in the class map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion and the criterion and value that is inspected. The name of the table indicates whether every one of the criteria must be met for the traffic to match the class (Match All), or whether matching any of the listed criteria is sufficient (Match Any). For the HTTP (IOS) and SMTP classes, you can choose whether to match all or any. When using a Match All table, if you add more than one criteria, ensure that you are not defining a set of characteristics that no traffic can match. **Tip** Match All works for devices running Cisco IOS Software version 12.4(20)T or later only. • To add a criterion, click the Add button and fill in the Match Criterion dialog box. For more information, see the topics referenced above. • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.
Trend Content Filter Match Criteria	The match criteria for Trend Content Filter class maps differs from that of all other class maps. Instead of adding items to a table, you simply select the items you want from a list. Select the Enable checkbox for any of the Trend-Micro classifications on the following tabs. Traffic matches the class if it matches any of your selections. • Productivity Categories—Matches the traffic to the category to which the URL belongs. For example, you can target traffic associated with gambling or pornography. • Security Ratings—Matches the traffic to the security rating assigned to it by Trend-Micro. For example, you can target adware, which is traffic associated with advertising. See the Trend-Micro documentation for specific information on these categories or security classifications.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Zone-based Firewall IM Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various instant messenger (IM) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can define a match for the following types of traffic:

- Any—Any type of traffic from the application except text chat traffic.
- Text-chat—Text chat traffic.

Navigation Path

From the Add or Edit Class Maps dialog boxes for AOL, ICQ, MSN Messenger, Windows Messenger, or Yahoo Messenger classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Related Topics

Zone-based Firewall P2P Application Class Maps: Add or Edit Match Condition Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the various peer-to-peer (P2P) application classes used with zone-based firewall policies to define a match criterion and value for the class map.

Navigation Path

From the Add or Edit Class Maps dialog boxes for eDonkey, FastTrack, Gnutella, or Kazaa2 classes, right-click inside the table and select **Add Row**, or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Related Topics

- Understanding Map Objects , on page 308

- Understanding the Zone-based Firewall Rules , on page 933

Field Reference

Table 277: Zone-based Firewall P2P Application Class Maps Add or Edit Match Condition Dialog Boxes

Element	Description
Criterion	Choose which criterion to match: • File Transfer – Matches file-transfer traffic. • Search Filename – Matches the names of files for which the user is searching. You can use this criterion to block users from searching for particular files using eDonkey. • Text Chat – Matches eDonkey text chat traffic.
Type	Specifies that the map includes traffic that matches the criterion.
File Name	The name of the file associated with the traffic. You can use regular expressions to specify a name pattern. For information on the metacharacters you can use to build regular expressions, see Metacharacters Used to Build Regular Expressions , on page 880. **Tip** eDonkey does not require a file name.

H.323 (IOS) Class Maps Add or Edit Match Criterion Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the H.323 (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map. You can match traffic based on the H.323 protocol message type. Select the message that you want to match.

Navigation Path

From the Add or Edit Class Maps dialog boxes for the H.323 (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the HTTP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Request/Response Body Length, Request Body Length, Response Body Length—Specifies that the body length of the request, response, or both, is less than or greater than the specified number. This allows you to set a minimum or maximum message length.
- Request/Response Body, Request Body, Response Body—Applies a regular expression to match the body of the request, response, or both.
- Request/Response Header, Request Header, Response Header—You can match a regular expression against the header, test for repeated fields, check the content type, or check the total length or number of records in the header.
- Request/Response Protocol Violation—Matches non-compliant HTTP traffic.
- Request Argument, Request URI—Matches the length or content (with a regular expression) of the argument (parameters) or uniform resource identifier (URI) in a request message.
- Request Port Misuse—Matches the misuse of ports by certain types of applications.
- Response Body Java Applet—Matches Java applets in an HTTP connection.
- Response Header Status Line—Applies a regular expression to match the content of the status line in the header.

Navigation Path

From the Add or Edit Class Maps dialog boxes for the HTTP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Field Reference

Table 278: HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes

Element	Description
Criterion	Specifies which criterion of HTTP traffic to match. The criteria are described above.
Type	Specifies that the map includes traffic that matches the criterion.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Less Than Length	The minimum length in bytes of the evaluated field. The criterion matches if the length is less than the specified number.
Greater Than Length	The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.
Header Option	The type of header record. If you do not select a record type, the count or expression is applied to all records in the header. If you select a record type, those selections are applied only to the records of the selected type. If you select content type or transfer encoding, you can make additional selections related to those types.
Request Method	The request method you want to match.
Value (Content Type)	If you select content-type in the Header Option field, you can select these types: • Mismatch—Verifies the content-type of the response message against the accept field value of the request message. • Unknown—The content type is not known. Select Unknown when you want to evaluate the item against all known MIME types. • Violation—The content-type definition and the content type of the actual body do not match.
Encoding Type	If you select transfer encoding in the Header Option field, you can select these types: • All—All of the transfer encoding types. • Chunked—The message body is transferred as a series of chunks; each chunk contains its own size indicator. • Compress—The message body is transferred using UNIX file compression. • Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951). • GZIP—The message body is transferred using GNU zip (RFC 1952). • Identity—No transfer encoding is performed.

Element	Description
Greater Than Count	The maximum number of records allowed in the header. If you select a specific header option, the count applies to those types of records. If you do not select a specific header option, the count applies to the total number of records in the header without regard to type.
Regular Expression	The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object.
Port Misuse	The type of request port misuse you want to match. Your options are: • Any—Any of the listed types of misuse. • IM—Instant messaging protocol applications subject to inspection. • P2P—Peer-to-peer protocol applications subject to inspection. • Tunneling—Tunneling applications subject to inspection: HTTPPort/HTTPHost.

IMAP and POP3 Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Internet Message Access Protocol (IMAP) and Post Office Protocol 3 (POP3) classes used with zone-based firewall policies to define a match criterion and value for the class map.

You can select the following criteria to identify matching traffic:

- Invalid Command—Matches commands that are not valid on a POP3 server or IMAP connection.
- Login Clear Text—Matches non-secure logins, where the password is being provided in clear text.

Navigation Path

From the Add or Edit Class Maps dialog boxes for the IMAP or POP3 classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Add or Edit Match Criterion dialog boxes for the SIP (IOS) class used with zone-based firewall policies to define a match criterion and value for the class map.

The fields on this dialog box change based on the criterion you select.

Navigation Path

From the Add or Edit Class Maps dialog boxes for the SIP (IOS) class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Related Topics

Field Reference

Table 279: SIP (IOS) Class Add or Edit Match Criterion Dialog Boxes

Element	Description
Criterion	Specifies which criterion of traffic to match. You can select from the following: • Protocol Violation—Matches traffic that violates the protocol. • Request/Response Header Options—Matches a regular expression against the selected request or response header field. • Request Options—Matches the request method or matches a regular expression against the selected request header field. • Response Options—Matches a regular expression against the selected response header field or status message.
Type	Specifies that the map includes traffic that matches the criterion.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Header	The type of header in the request or response message. The regular expression is matched against the content of headers of the selected type.

Element	Description
Method	The request method you want to inspect: • ack—Acknowledges that the previous message is valid and accepted. • bye—Signifies the intention to terminate a call. • cancel—Terminates any pending request. • info—Communicates mid-session signaling information along the signaling path for the call. • invite—Sets up a call. • message—Sends an instant message. • notify—Informs subscribers of state changes. • options—Queries the capabilities of another user agent or a proxy server. • prack—Provides reliable transfer of provisional response messages. • refer—Indicates that the recipient should contact a third party using the contact information provided in the request. • register—Includes a contact address to which SIP requests for the address-of-record should be forwarded. • subscribe—Requests notification of an event or set of events at a later time. • update—Permits a client to update parameters of a session but has no impact on the state of a dialog.
Status	The regular expression is matched against the status line in the response.
Regular Expression	The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object.

SMTP Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the SMTP classes used with zone-based firewall policies to define a match criterion and value for the class map.

Tip Only the Data Length criterion is available for routers running Cisco IOS Software lower than 12.4(20)T.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Data Length—Specifies that the data length of the traffic is greater than the specified number. You can match the data length of the traffic to determine if the data transferred in an SMTP connection exceeds the specified length in bytes. By default, inspection keeps data length below 20.
- Body Regular Expression—Applies a regular expression to match the content types and content encoding types for text and HTML in the body of an e-mail message. Only text or HTML that uses 7-bit or 8-bit

encoding is checked. The regular expression cannot be scanned in messages that use another encoding type (such as base64 or zip files).

- Command Line Length—Specifies that the length of the ESMTP command line not be greater than the specified number. Use this to thwart Denial of Service (DoS) attacks.
- Command Verb—Limits inspection to the selected SMTP or ESMTP command. If you configure inspection for SMTP, all commands are inspected unless you limit them.
- Header Length—Specifies that the length of the SMTP header is greater than the specified number. Use this to thwart DoS attacks by limiting the possible size of the header.
- Header Regular Expression—Applies a regular expression to match the content of the header of an e-mail message. For example, you can use this to test for particular patterns in the subject, from, or to fields.
- Mime Content-Type Regular Expression—Applies a regular expression to match the Multipurpose Internet Message Exchange (MIME) content type of an e-mail attachment. Use this to prevent the transmission of undesired types of attachments.
- Mime Encoding—Specifies the MIME encoding type for e-mail attachments that you want to inspect. You can use this to identify unknown or non-standard encodings to restrict their transmission.
- Recipient Address—Applies a regular expression to match the recipient of an e-mail message in the SMTP RCPT command. Use this to search for a non-existent recipient, which might help you identify the source of spam.
- Recipient Count—Specifies that the number of recipients for an e-mail message cannot be greater than the specified number. Use this to prevent spammers from sending e-mails to a large number of users.
- Recipient Invalid Count—Specifies that the number of invalid recipients for an e-mail message cannot be greater than the specified number. Use this prevent spammers from sending e-mails to a large number common names, where they are fishing for real addresses. SMTP typically replies with a “no such address” message when an address is invalid; by putting a limit on the number of invalid addresses, you can prevent these replies to spammers.
- Reply EHLO—Specifies the service extension parameter in an EHLO server reply. Use this to prevent a client from using a particular service extension.
- Sender Address—Applies a regular expression to match the sender of an e-mail message. Use this to block specific senders, such as known spammers, from sending e-mail messages through the device.

Navigation Path

From the Add or Edit Class Maps dialog boxes for SMTP classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Related Topics

Field Reference

Table 280: SMTP Class Add or Edit Match Criterion Dialog Boxes

Element	Description
Criterion	Specifies which criterion of SMTP traffic to match. The criteria are described above.
Type	Specifies that the map includes traffic that matches the criterion.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Greater Than Length	The maximum length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number.
Greater Than Count	The maximum number of recipients or invalid recipients allowed in the e-mail message. The criterion matches if the number is greater than the specified number.
Verb Option User Defined Format (For the Command Verb criterion.)	The SMTP or ESMTP command that you want to inspect. If you select User Defined, you must enter the text string that corresponds to a word in the body of the e-mail message. The word cannot include spaces or special characters; only alphanumeric characters.
Service Extension Parameter User Defined Format (For the Reply EHLO criterion.	The service extension parameter of an EHLO server reply that you want to inspect. Select one of the well-known parameters, or select User Defined to specify a private extension in the User Defined Format field.
Encoding Format User Defined Format	The MIME encoding format for which you want to test. Encoding types are: • 7-bit—ASCII encoding. • 8-bit—Used for the exchange of e-mail messages containing octets outside the 7-bit ASCII range. • base64—Encodes binary data by treating it numerically and translating it into a base 64 representation. • quoted-printable-Encoding that uses printable characters to transmit 8-bit data over a 7-bit data path. • binary—Encodes using only 0 and 1. • unknown—Encoding type is not known. • x-uuencode-Nonstandard encoding. • user defined—An encoding type you define. If you select User Defined, you must enter the text string that defines the encoding type you are looking for.

Element	Description
Regular Expression	The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object.

Sun RPC Class Maps Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the Sun Remote Procedure Call (RPC) classes used with zone-based firewall policies to define a match criterion and value for the class map. You can enter the RPC protocol number that you want to match. See the Sun RPC documentation for information about protocol numbers.

Navigation Path

From the Add or Edit Class Maps dialog boxes for Sun RPC classes, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Field Reference

Table 281: Local Web Filter Class Add or Edit Match Criterion Dialog Boxes

Element	Description
Criterion	Specifies which criterion of traffic to match. You can select from the following: • Server Domain—Matches traffic based on the name of the server. The URLF Glob parameter map you select should specify server domain names such as *.cisco.com or www.cisco.com. • URL Keyword—Matches traffic based on keywords in the URLs. A key word is any complete string that occurs between / characters in a URL. For example, in the URL segment www.cisco.com/en/US, en and US are examples of keywords.
Type	Specifies that the map includes traffic that matches the criterion.
URLF Glob Parameter Map	The URLF Glob parameter map object that defines the URL patterns that you want to match. Ensure that the object you select has the appropriate content for the type of matching you selected. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new object.

N2H2 and Websense Class Add or Edit Match Criterion Dialog Boxes

Use the Add or Edit Match Criterion dialog boxes for the N2H2 (SmartFilter) and Websense web filter classes to define a match criterion and value for the class map. The only match criterion available is to match any response from the SmartFilter or Websense server.

Navigation Path

From the Add or Edit Class Maps dialog boxes for the N2H2 or Websense web filter class, right-click inside the table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Related Topics

Configuring Inspect Parameter Maps

Use the Add and Edit Inspect Parameter Map dialog boxes to define a parameter map for inspection for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect or Content Filter, you can select an inspect parameter map to define connection, timeout, and other settings for the inspection action. If you do not select an inspect parameter map for a zone-based firewall rule, the system uses default values for these settings.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Parameter Maps** > **Inspect** > **Inspect Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 282: Add or Edit Inspect Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
DNS Timeout	The length of time, in seconds, for which a DNS lookup session is managed while there is no activity.
ICMP Timeout	The length of time, in seconds, for which an inactive ICMP (Internet Control Message Protocol) session is maintained.
Max Incomplete Low Max Incomplete High	The number of existing half-open sessions that will cause the software to start (at the high threshold) and stop (at the low threshold) deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field, for example, 400 and 500. The default is unlimited half-open sessions.
One Minute Low One Minute High	The number of new unestablished sessions that causes the system to start and stop deleting half-open sessions. Ensure that you enter a lower number in the Low field than you enter in the High field. The default is unlimited.
Max Sessions	The maximum number of inspection sessions on a zone pair, for example, 200. The default is unlimited.
TCP FINWAIT Timeout	How long to maintain TCP session state information after the firewall detects a FIN-exchange, in seconds. The FIN-exchange occurs when the TCP session is ready to close.
TCP SYNWAIT Timeout	How long to wait for a TCP session to reach the established state before dropping the session, in seconds.
TCP Idle Timeout	How long to maintain a TCP session while there is no activity in the session, in seconds.

Element	Description
TCP Max Incomplete Hosts TCP Max Incomplete Block Time	The threshold and blocking time (in minutes) for TCP host-specific denial-of-service (DoS) detection and prevention. The maximum incomplete hosts is the number of half-open TCP sessions with the same host destination address that can simultaneously exist before the software starts deleting half-open sessions to that host. An unusually high number of half-open sessions with the same destination host address could indicate that a DoS attack is being launched against the host. When the threshold is exceeded, half-open sessions are dropped based on the maximum incomplete block time: • If the block time is 0, the software deletes the oldest existing half-open session for the host for every new connection request to the host. This ensures that the number of half-open sessions to a given host never exceeds the threshold. • If the block time is greater than 0, the software deletes all existing half-open sessions for the host and then blocks all new connection requests to the host. The software continues to block all new connection requests until the block time expires. The software sends syslog messages whenever the specified threshold is exceeded and when blocking of connection initiations to a host starts or ends.
UDP Idle Timeout	How long to maintain a UDP session while there is no activity in the session, in seconds. When the software detects a valid UDP packet, the software establishes state information for a new UDP session. Because UDP is a connectionless service, there are no actual sessions, so the software approximates sessions by examining the information in the packet and determining if the packet is similar to other UDP packets (for example, it has similar source or destination addresses) and if the packet was detected soon after another similar UDP packet. If the software detects no UDP packets for the UDP session for the period of time defined by the UDP idle timeout, the software will not continue to manage state information for the session.
Enable Alert	Whether to generate stateful packet inspection alert messages on the console.
Enable Audit Trail	Whether audit trail messages are logged to the syslog server or router.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring Protocol Info Parameter Maps

Use the Add and Edit Protocol Info Parameter Map dialog boxes to define a parameter map for the inspection of Instant Messaging (IM) applications or the Stun-ice protocol for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Inspect, you must select a protocol info parameter map when you configure any of these applications: AOL, ICQ, MSN Messenger, Windows Messenger, Yahoo Messenger, Stun-ice. The protocol info parameter map defines the DNS servers that interact with these applications, which helps the instant messenger application engine to recognize the instant messenger traffic and to enforce the configured policy for that instant messenger application.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Inspect > Protocol Info Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 283: Add or Edit Protocol Info Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
DNS Server Table	The DNS servers for which traffic will be permitted (and inspected) or denied. • To add servers, click the Add button and fill in the Add Server dialog box (see Add or Edit DNS Server for Protocol Info Parameters Dialog Box , on page 964). • To edit a server, select it and click the Edit button. • To delete a server, select it and click the Delete button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit DNS Server for Protocol Info Parameters Dialog Box

Use the Add or Edit DNS Server dialog box to identify DNS servers for which traffic will be permitted (and inspected) or denied. These servers are defined in a Protocol Info parameter map for use with the inspection of protocols that require them in a zone-based firewall policy.

You can identify a server using any of these types:

- Server Name—The name of the DNS server. You can use an asterisk (*) as a wildcard character to match one or more characters. For example, if you want to identify all DNS servers on the cisco.com domain, you can specify *.cisco.com.
- IP Address—The IP address of a single DNS server.
- IP Address Range—A range of IP addresses identifying any DNS server within the start and end addresses.

Navigation Path

From the Add or Edit Protocol Info Parameter Map dialog boxes, click the **Add** button beneath the server table, or select a server and click the **Edit** button. See Configuring Protocol Info Parameter Maps , on page 963.

Configuring Policy Maps for Zone-Based Firewall Policies

Use the Add and Edit Policy Map dialog boxes for zone-based firewall policies to define the match criterion and values for an inspection map used in a zone-based firewall policy for a Cisco IOS router. You can create policy inspection maps for H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC inspection, and the name of the dialog box indicates the type of map you are creating.

When defining the inspection map, you select class maps of the same type and define the action to take for matching traffic. You can configure the required class maps before creating the policy maps or while you are creating them.

Navigation Path

Select **Manage > Policy Objects**, then any of the following items in the **Maps > Policy Maps > Inspect** folder in the table of contents: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, and Sun RPC. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 284: Add or Edit Policy Maps Dialog Boxes for Zone-Based Firewall Policies

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Match All table	The Match All table lists class maps included in the policy map, and the action to take for traffic that matches the class. For traffic to match this class, all criteria defined in the selected class maps must be met. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies , on page 965). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies

Use the Add or Edit Match Condition and Action dialog boxes for zone-based firewall and web filter policies to select the class maps for inspection and to define the action to take for traffic that matches the class. This dialog box is used for the following types of policy maps: H.323 (IOS), HTTP (Zone based IOS), IM (Zone based IOS), IMAP, P2P, POP3, SIP (IOS), SMTP, Sun RPC, Web Filter.

The fields on this dialog box differ slightly depending on the type of policy map you are defining.

Navigation Path

From the Add or Edit Policy Maps dialog boxes for Zone-Based Firewall Policies, right-click inside the match table and select **Add Row** or right-click a row and select **Edit Row**. See Configuring Policy Maps for Zone-Based Firewall Policies , on page 964.

Field Reference

Table 285: Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall Policies

Element	Description
Match Type	Indicates that you are selecting a class map. You must define class maps when creating policy maps for zone-based firewall policies.
Class Map P2P, IM, and Web Filter class map types.	The name of the class map for the type of policy map you are creating. Click **Select** to select the map from a list or to create a new class map object. For P2P, IM, and Web Filter policy maps, you must also select the type of policy map you are creating. For example, in a P2P map you must select between eDonkey, FastTrack, Gnutella, and Kazaa2. In an IM (Zone Based IOS) map, you must select between AOL, MSN Messenger, Yahoo Messenger, Windows Messenger, and ICQ. In a Web Filter map, you must select between Local, N2H2, WebSense, and Trend.
Action	The action you want the device to take for traffic that matches the selected class.

Configuring Content Filtering Maps for Zone-based Firewall Policies

When you configure zone-based firewall policies for a router, you can define rules to filter Web content by choosing Content Filter as the Action for the rule.

To filter Web content, you must configure certain map objects, which you can do from the policy object selector dialog box while defining the rule, or at any time in the Policy Object Manager window (select **Manage > Policy Objects**).

The type of maps required depends on the technique you are using to filter content, and on the Cisco IOS software version you are using. You can filter content based on URL lists defined locally on the device, or you can use external filtering servers such as SmartFilter (N2H2), Websense, or Trend Micro.

Tip If you use an external server, you must have set up and configured the server appropriately based on the documentation for the type of server you select. If you use Trend Micro servers, you must specify the server details, and register the product and download certificates, on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See Zone-based Firewall Rules Page , on page 989.

The following are requirements for the map objects used with zone-based content filtering:

- For devices running releases below 12.4(20)T, you must create a URL Filter parameter map. In the Policy Object Manager, select **Maps > Parameter Maps > Web Filter > URL Filter**, and review the detailed usage information in Configuring URL Filter Parameter Maps , on page 973.
  - To perform local filtering on the router using lists of allowed (part of allow list) and denied (part of block list) hosts, create the lists on the Local Filtering tab. Any Web access request is first compared to these lists before the request is sent on to an external filtering server (if you have configured one). These lists contain either complete domain names (such as www.cisco.com), or partial names (such as cisco.com), but they do not include paths or page names, and you cannot use wildcards.
  - To use a SmartFilter (N2H2) or Websense server, configure the type of server you are using and its address information on the External Filter tab. You can also configure other settings that control communication with the server. You cannot configure a Trend Micro server using the URL Filter parameter map.
- For devices running release 12.4(20)T and later, the preferred approach is to use a Web Filter policy map. Although Web Filter policy maps are more complex, they provide added flexibility, and they let you access Trend Micro filtering servers. In the Policy Object Manager, select **Maps > Policy Maps > Web Filter > Web Filter**, and review the detailed usage information in Configuring Web Filter Maps , on page 978.

A Web Filter policy map incorporates other types of maps. To create the policy map, you will need one or more of these other types of maps:

- • Parameter maps – On the Parameters tab of the Add and Edit Web Filter Map dialog boxes, you can select parameter maps for the various types of Web filtering if you do not want to use the default settings. If you are using SmartFilter (N2H2) or Websense, you need to select a parameter map because the map identifies those servers. For Local and Trend Micro filtering, parameter maps configure some general settings, the most interesting of which is whether to display a message or Web page when a URL is blocked. In the Policy Object Manager, you can find parameter maps for Local, N2H2, Trend, and Websense in the **Maps > Parameter Maps > Web Filter** folder. For detailed usage information, see Configuring Local Web Filter Parameter Maps , on page 968, Configuring N2H2 or WebSense Parameter Maps , on page 970, or Configuring Trend Parameter Maps , on page 972.

Note You configure Trend Micro server information on the Content Filtering tab of the Zone Based Firewall page (select Firewall > Settings > Zone Based Firewall). See Zone-based Firewall Rules Page , on page 989.

- • Class maps for match conditions – These class maps define the type of traffic you want to target and specify the action to be taken. You select a type of filtering (Local, SmartFilter/N2H2, Websense, or Trend Micro), specify the class map that identifies the targeted traffic, and choose an action (such as Allow, Reset, etc.) to be taken for that traffic. In the Policy Object Manager, you can find class maps for Local, N2H2, Trend, and Websense in the **Maps > Class Maps > Web Filter** folder.

These class-map configurations depend on the type of filtering:

Local Filtering – The Local WebFilter class map is a list of one or more URLF Glob parameter maps that specify either domain names or URL keywords that you want to target. A URL keyword is any text string

delineated by forward-slash (/) characters in a URL. These class maps help you define allowed (part of allow list) and denied (part of block list) URL lists for a WebFilter policy—create separate maps for each list. For detailed usage information, see Configuring Class Maps for Zone-Based Firewall Policies , on page 947, Local Web Filter Class Add or Edit Match Criterion Dialog Boxes , on page 959, and Configuring URLF Glob Parameter Maps , on page 976.

SmartFilter (N2H2) or Websense Filtering—The class maps for N2H2 and Websense define any server response as the matching criterion. For detailed usage information, see Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Trend Micro Filtering – The Trend class map lets you select various Productivity Categories and Security Ratings, as defined by Trend Micro, that you want to target. For detailed usage information, see Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Besides the maps used to define content filtering, you can also configure the following maps for content filter rules:

- Inspect Parameters maps – Zone-based firewall inspection includes several general settings, all of which have default values that are appropriate for most networks. If you want to adjust any of these settings, you can create an Inspect Parameters map. In the Policy Object Manager, select **Maps > Parameter Maps > Inspect > Inspect Parameters**, and review the detailed usage information in Configuring Inspect Parameter Maps , on page 960.
- HTTP policy map – If you want to use deep inspection on the individual HTTP packets in addition to Web filtering, you can configure an HTTP policy map by clicking **Configure** next to the Protocol field in the Action section of the Adding and Editing Zone-based Firewall Rules , on page 992. The HTTP policy map incorporates HTTP class maps that define the type of traffic you want to match and then defines the action to take. For example, you can target traffic that includes Java applets. In the Policy Object Manager, select **Maps > Policy Maps > Inspect > HTTP (Zone Based IOS)**, and review the detailed usage information in Configuring Policy Maps for Zone-Based Firewall Policies , on page 964, HTTP (IOS) Class Add or Edit Match Criterion Dialog Boxes , on page 952, and Configuring Class Maps for Zone-Based Firewall Policies , on page 947.

Configuring Local Web Filter Parameter Maps

Use the Add and Edit Local Parameter Map dialog boxes to define a parameter map for local web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Local web filter parameter map (when you select Local for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see Configuring Web Filter Maps , on page 978.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Parameter Maps** > **Web Filter** > **Local** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 286: Add or Edit Local Web Filter Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Enable Alert	Whether to generate stateful packet inspection alert messages on the console.
Enable Allow Mode	Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.
Block Page	The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: • None—The user is not presented with any information. • Message—The user is presented with the text message you enter in the edit box. • Redirect URL—The user is redirected to the URL you enter in the edit box.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring N2H2 or WebSense Parameter Maps

Use the Add and Edit N2H2 or Websense Parameter Map dialog boxes to define a parameter map for Smartfilter (N2H2) or Websense web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates an N2H2 or Websense web filter parameter map (when you select N2H2 or Websense for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see Configuring Web Filter Maps , on page 978.

Navigation Path

Select **Manage > Policy Objects**, then select N2H2 or WebSense from the **Maps > Parameter Maps > Web Filter** folder in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Table 287: Add or Edit N2H2 or WebSense Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
URL Filtering Server Table	The list of URL filtering servers and their attributes. • To add servers, click the Add button and fill in the Add External Filter dialog box (see Add or Edit External Filter Dialog Box , on page 972). • To edit a server, select it and click the Edit button. • To delete a server, select it and click the Delete button.
Enable Alert	Whether to generate stateful packet inspection alert messages on the console.
Enable Allow Mode	Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.

Element	Description
Block Page	The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: • None—The user is not presented with any information. • Message—The user is presented with the text message you enter in the edit box. • Redirect URL—The user is redirected to the URL you enter in the edit box.
Source Interface	The interface whose IP address should be used as the source IP address when a TCP connection is established between the system and the URL filtering server.
Maximum Cache Entries	The maximum number of entries to store in the categorization cache. The default is 5000.
Cache Life Time	How long, in hours, an entry remains in the cache table. The default is 24.
Maximum Requests	The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.
Maximum Responses	The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.
Truncate Hostname Truncate Script Parameters	Whether to truncate the URLs: • If you do not select an option, URLs are not truncated. • If you select Hostname, URLs are truncated at the end of the domain name. • If you select Script Parameters, URLs are truncated at the left-most question mark in the URL. **Tip** Although you can select both options, it is illogical to do so.
Enable Server Log	Whether to send information about HTTP requests to the URL filtering server's log server. The information includes the URL, the hostname, the source IP address, and the destination IP address.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241F.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit External Filter Dialog Box

Use the Add or Edit External Filter dialog box to add a URL filtering server to an N2H2, Websense, or URL Filter parameter map policy object.

Navigation Path

Click the **Add** button beneath the server table, or select a server and click the **Edit** button, from any of the following dialog boxes:

- Add or Edit N2H2 or WebSense Parameter Map dialog boxes. See Configuring N2H2 or WebSense Parameter Maps , on page 970.
- Add or Edit URL Filter Parameter Map dialog boxes. See Configuring URL Filter Parameter Maps , on page 973.

Field Reference

Table 288: Add or Edit External Filter Dialog Box

Element	Description
Server	The fully-qualified domain name or IP address of the URL filtering server.
Port	The port that is listening for requests.
Retransmission Count	The number of times the router retransmits the lookup request when a response is not received from the server. The range is from 1 to 10.
Timeout	The number of seconds that the router waits for a response from the server. The range is from 1 to 300.
Outside	Whether the server is outside the network.

Configuring Trend Parameter Maps

Use the Add and Edit Trend Parameter Map dialog boxes to define a parameter map for Trend Micro web filtering for zone-based firewall policies on routers. If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map that incorporates a Trend web filter parameter map (when you select Trend for the parameter type on the Parameter tab). For more information about Web Filter policy maps, see Configuring Web Filter Maps , on page 978.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > Trend** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 289: Add or Edit Trend Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Enable Allow Mode	Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.
Block Page	The web page you want to present to the user if the user attempts to access a page that you block. You can select from the following: • None—The user is not presented with any information. • Message—The user is presented with the text message you enter in the edit box. • Redirect URL—The user is redirected to the URL you enter in the edit box.
Maximum Requests	The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.
Maximum Responses	The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.
Truncate Hostname	Whether to truncate URLs at the end of the domain name.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring URL Filter Parameter Maps

Use the Add and Edit URL Filter Parameter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a URL Filter parameter map to define web filtering parameters and match criteria. However, if the router is running Cisco IOS Software release 12.4(20)T or later, the recommended approach is to configure a Web Filter policy map along with parameter and class maps for the appropriate server type (local, N2H2, Trend, or Websense). For more information, see Configuring Web Filter Maps , on page 978.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URL Filter** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Table 290: Add or Edit URL Filter Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Local Filtering Tab The fields on this tab define the properties for local URL filtering.	
Permitlisted and Blocklisted Domains tables	These tables define the domain names for which the software will not contact the external URL filtering server. Domain names on the allowed list are always allowed. Domain names on the blocked list are always blocked. Use these lists to identify entire domains that you want to allow without restriction (such as your company's web site) or block completely (such as pornography sites). Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses. • To add a domain name, click the Add button and fill in the Add Server dialog box (see Add or Edit URL Domain Name Dialog Box for URL Filter Parameters , on page 976). • To edit a domain name, select it and click the Edit button. • To delete a domain name, select it and click the Delete button.
Enable Alert	Whether to generate stateful packet inspection alert messages on the console.

Element	Description
Enable Audit Trail	Whether to log URL information to the syslog server or router.
Enable Allow Mode	Whether to allow or block URL requests when the URL filtering process does not have connectivity to a URL filtering database. When allow-mode is on, all unmatched URL requests are allowed; when off, all unmatched URL requests are blocked.
External Filtering Tab The fields on this tab define the properties for an external URL filtering server.	
Server Type Server Table	The type of external URL filtering server you are configuring, either SmartFilter (N2H2) or Websense. • To add servers, click the Add button and fill in the Add External Filter dialog box (see Add or Edit External Filter Dialog Box , on page 972). • To edit a server, select it and click the Edit button. • To delete a server, select it and click the Delete button.
Source Interface	The interface whose IP address should be used as the source IP address when a TCP connection is established between the system and the URL filtering server.
Maximum Cache Entries	The maximum number of entries to store in the categorization cache. The default is 5000.
Maximum Requests	The maximum number of pending requests. The range is from 1 to 2147483647. The default is 1000.
Maximum Responses	The maximum number of HTTP responses that can be buffered. The range is from 0 and 20000. The default is 200.
Truncate Hostname Truncate Script Parameters	Whether to truncate the URLs: • If you do not select an option, URLs are not truncated. • If you select Hostname, URLs are truncated at the end of the domain name. • If you select Script Parameters, URLs are truncated at the left-most question mark in the URL. Do not select any truncate options for devices running software releases lower than 12.4(15)T or you will receive a validation error. **Tip** Although you can select both options, it is illogical to do so.
Enable Server Log	Whether to send information about HTTP requests to the URL filtering server's log server. The information includes the URL, the hostname, the source IP address, and the destination IP address.
Additional Fields	

Element	Description
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit URL Domain Name Dialog Box for URL Filter Parameters

Use the Add URL Domain Name dialog box to add web site domain names to the allow lists (allowed) or block lists (not allowed).

Domain names can be complete (including the host name, such as www.cisco.com), or partial (such as cisco.com). For partial names, all web site hosts on that domain are either permitted or denied. You can also enter host IP addresses.

Navigation Path

From the Add or Edit URL Filter Parameter Map dialog boxes, click the **Add** button beneath the allow list or block list tables, or select a name and click the **Edit** button. See Configuring URL Filter Parameter Maps , on page 973.

Configuring URLF Glob Parameter Maps

Use the Add and Edit URLF Glob Parameter Map dialog boxes to define a parameter map for the inspection of URLs in a Local web filter class map.

A single URLF Glob should contain only segments of URLs that you want to block or allow. Your goal is to create class maps of allowed or block listed URLs. You can then define Local web filter policy maps to allow or block the identified URLs.

A single URLF Glob must also be limited to one of these types of URL segments:

- Strings that appear in the server name of a URL, which includes the name of the server and the domain name of the network. For example, www.cisco.com.
- Strings that appear in URL keywords, which are the strings that appear between / characters in a URL, or which are the file names. For example, in the URL segment www.cisco.com/en/US/, both en and US are keywords. The file name in a URL, such as index.html, is also considered a keyword.

You cannot use the characters /, {, }, and ? in a URLF glob.

To match a server name or URL keyword, the string in the URL must match exactly the string included in the URLF glob unless you use wildcard metacharacters to specify a variable string pattern. You can use the following metacharacters for pattern matching for either server names or URL keywords:

- * (Asterisk). Matches any sequence of zero or more characters. For example, *.edu matches all servers in the education domain, and you could use hack* to block www.example.com/hacksite/123.html.

- [abc] (Character class). Matches any character in the brackets. The character matching is case sensitive. For example, [abc] matches a, b, or c, but not A, B, or C. Thus, you could use www.[ey]xample.com to block both www.example.com and www.yxample.com.
- [a-c] (Character range class). Matches any character in the range. The character matching is case sensitive. [a-z] matches any lowercase letter. You can mix characters and ranges; for example, [abcq-z] matches a, b, c, q, r, s, t, u, v, w, x, y, z, and so does [a-cq-z].The dash (-) character is literal only if it is the last or the first character within the brackets, [abc-] or [-abc].
- [0-9] (Numerical range class). Matches any number in the brackets. For example [0-9] matches 0, 1, 2, 3, 4, 5, 6, 7, 8, or 9. Thus, you can use www.example[0-9][0-9].com to block www.example01.com, www.example33.com, and www.example99.com (and so forth).

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Parameter Maps > Web Filter > URLF Glob Parameters** in the table of contents. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 291: Add or Edit URLF Glob Parameter Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.

Value	The server domains or keywords for the URLs you are targeting. Enter only one type of glob: either all server domains, or all URL keywords, but not a mixture of both.
	If you include more than one entry, separate the entries with new lines. For example, the following entries identify all government or education web servers:
	`*.gov`
	`*.edu`

Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring Web Filter Maps

Use the Add and Edit Web Filter Map dialog boxes to define the parameters and match criterion and values for an inspection map used in a zone-based firewall policy for a router.

If you configure the action of a zone-based firewall policy rule as Content Filter, you can select a Web Filter policy map to define web filtering parameters and match criteria. You can select Web Filter policy maps only for routers running Cisco IOS Software release 12.4(20)T and later. If you are configuring zone-based firewalls for routers running Cisco IOS Software release 12.4(6)T up to 12.4(20)T, you must configure a URL Filter parameter map instead of a Web Filter policy map. For more information, see Configuring URL Filter Parameter Maps , on page 973.

You can configure a mix of local and server-based web filtering. To do this, you should select a parameter map appropriate for the type of server you are using, and for the match criteria, an appropriate mix of local and server class maps. Do not mix class and parameter maps for different types of servers.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Web Filter > Web Filter** from the Object Type selector. Right-click inside the table and select **New Object** or right-click a row and select **Edit Object**.

Table 292: Add and Edit FTP Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	

Element	Description
Parameter Type Parameter Map	The type of parameter map to include in the Web Filter policy map. Select None if you do not want to select a parameter map. If you select a specific parameter type, enter the name of the parameter map in the **Parameter Map** field. Click **Select** to select the map from a list or to create a new parameter map object.
Match Condition and Action Tab The Match All table lists class maps included in the policy map, and the action to take for traffic that matches the class. For traffic to match this class, all criteria defined in the selected class maps must be met. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see Add or Edit Match Condition and Action Dialog Boxes for Zone-Based Firewall and Web Filter Policies , on page 965). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Changing the Default Drop Behavior

By default, all traffic between zones is dropped unless explicitly allowed. However, you can change this default behavior, as described in this section.

Security Manager converts the parameters—including class, parameter, and policy maps—that you supply for zone-based firewall rules into a series of IOS commands that the router will recognize. These are the so-called "CLI" (command line interface) configuration commands, which you can preview in separate window by choosing Tools > Preview Configuration. See Previewing Configurations , on page 424 for more information. In addition, the section, Troubleshooting Zone-based Rules and Configurations , on page 985, discusses an example of zone-based firewall CLI commands.

For the purposes of this discussion, the most interesting of these commands is **policy-map**, which is used to apply your zone policy for each pair of zones. That is, for any given zone-pair, all rules defining traffic (classes) and actions are applied within one policy-map. Further, Security Manager appends the current **class-default** class to the end of each policy-map's class list to capture any packets not processed by a zone rule.

The default class-default is drop—appending this class to each policy-map is how the implicit dropping of traffic between zones is accomplished. However, as mentioned, you can change this default behavior for any

zone-pair. For example, you might elect to pass all unmatched traffic, or you might change the default to drop and log so you can determine what traffic is not being matched by your existing rules.

Note The only options for the default behavior are Drop, Drop and Log, Pass, and Pass and Log.

If you want the default policy to continue to drop packets, you do not have to do anything in Security Manager. This rule is generated automatically. If you do want to change the default behavior for a zone-pair, you must provide a **Permit any any IP** rule (that is, Match: Permit; Sources: any; Destinations: any; Services: IP in the Adding and Editing Zone-based Firewall Rules , on page 992), with **Drop and Log**, **Pass**, or **Pass and Log** as the chosen Action. You must also ensure that this rule appears last in the list of rules for a zone pair. Security Manager interprets this as the intended class-default rule.

If your zone-based rules table includes a large number of rules, it might be difficult to ensure that this rule comes after all other rules for a zone pair. Here are a couple of techniques you can use to alleviate this:

- Use sections to organize the table, with one section per zone-pair. This will make it easier for you to order the rules for a zone-pair, as well as ensuring that the class-default rule comes last. For more information on working with sections, see Using Sections to Organize Rules Tables , on page 618.
- Create a shared zone-based rules policy that includes the class-default rule in the Default scope, and inherit this rule in the device's local zone-based rule policy. For more information on inheritance and creating shared policies, see Inheriting or Uninheriting Rules , on page 213 and Creating a New Shared Policy , on page 221.

Configuring Settings for Zone-based Firewall Rules

Use the Zone Based Firewall settings page to: identify unreferenced zones; specify a zone for VPN interfaces; enable or disable WAAS support; maintain Trend Micro server and certificate information; and specify global Log settings.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

Related Topics

- Zone Based Firewall Page , on page 981
- Understanding the Zone-based Firewall Rules , on page 933

Step 1 Access the Zone Based Firewall Page , on page 981 as follows:

- (Device view) Select an IOS device and then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 (Optional) On the Zones tab: add, edit and delete unreferenced zones.

The Zones tab lists all unreferenced zones defined on the device; that is, zones without any associated interfaces, rules or policies. Unreferenced zones are usually found and listed during device discovery, but you also can create named, “empty” zones here.

Step 3 (Optional) On the VPN tab, supply the name of the zone specifically set up for VPN traffic.

This zone ensures that dynamic VPN traffic can be processed by the zone-based firewall rules on this router. See Using VPNs with Zone-based Firewall Policies , on page 936 for more information.

Step 4 (Optional) On the WAAS tab, select Enable WAAS to enable Wide Area Application Services interoperability.

If this option is not enabled, packets being optimized by a WAAS device may be dropped because WAAS increases the TCP packet sequence number during the TCP handshake. This behavior may be viewed as a possible attack by the IOS device.

Step 5 (Optional) On the Content Filter Settings tab, provide server settings for Trend Micro-based content filtering.

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

For more information, see Zone Based Firewall Page - Content Filter Tab , on page 983.

Step 6 (Optional) On the Global Parameters (ASR) tab, you can configure global, logging-related settings specific to ASR devices:

- Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information.
- Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30.
- Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent.
- Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.

Zone Based Firewall Page

Use the Zone Based Firewall page to configure and identify unreferenced zones, specify a VPN zone, enable or disable WAAS support, maintain Trend Micro server and certificate information, and specify global Log settings on supported ASR devices.

The following tabs are described in the table on this page:

- **Zones**
- **VPN**
- **WAAS**

- **Global Parameters (ASR)**

The **Content Filtering** tab is detailed in Zone Based Firewall Page - Content Filter Tab , on page 983.

Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

Field Reference

Table 293: Zone Based Firewall Page

Element	Description
Zones tab	This tab displays the Zones table, which lists unreferenced zones; that is zones without any associated interfaces, rules or policies. Unreferenced zones are usually found and listed during device discovery, but you also can create named, “empty” zones here. The Zones table lists the following information for each unreferenced zone: • Zone – The name of the Zone/Interface Role. • Content – Any interfaces assigned to the zone. • Description – Any user-provided comments about the zone. To add a zone to this table, click the Add Row button and provide a Zone name in the Zone dialog box.
VPN tab	This tab presents the VPN Zone field; a zone entry in this field ensures that dynamic VPN traffic can be processed by the zone-based firewall rules on this router. See Using VPNs with Zone-based Firewall Policies , on page 936 for more information about this zone. Enter or Select the zone through which VPN traffic will pass.

Element	Description
WAAS tab	This tab presents the Enable WAAS check box. Select this option to enable Wide Area Application Services interoperability. If this option is not enabled, packets being optimized by a WAAS device may be dropped because WAAS increases the TCP packet sequence number during the TCP handshake. This behavior may be viewed as a possible attack by the IOS device.
Content Filtering tab	This tab displays server settings and certificate links for Trend Micro-based content filtering. For more information, see Zone Based Firewall Page - Content Filter Tab , on page 983.
Global Parameters (ASR) tab	This tab displays global, logging-related settings specific to ASR devices. Configure these settings as follows: • Log Dropped Packets – Select this option to log all packets dropped by the device; syslog logging must be enabled to view the information. • Log Flow export timeout rate – NetFlow logs are created after a flow either expires or is timed out, and it is important to put a time limit on how long a flow can be active before expiring. This value is maximum number of minutes a flow can remain active before it is expired. The value can be any integer from 1 to 3600; the default is 30. • Log Flow export destination IP – The IP address or host name of the NetFlow collector to which flow data is to be sent. • Log Flow export destination port – The UDP port monitored by the NetFlow collector for flow data.

Zone Based Firewall Page - Content Filter Tab

To use Trend Micro-based content filtering, you must configure contact information for the Trend Micro server on this tab of the Zone Based Firewall page. This tab also provides links to Trend Micro registration and certificate download. You must have an active subscription with Trend Micro to utilize this form of content filtering, and you must download and install a valid subscription certificate on this IOS device.

Navigation Path

To access the Zone Based Firewall page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector.
- (Map view) Right-click a device and choose **Edit Firewall Settings > Zone Based Firewall**.

Table 294: Zone Based Firewall Page - Content Filter Tab

Element	Description
Trend Micro Server Settings	
Cache-entry-lifetime (hrs)	How long, in hours, a look-up request to the Trend Micro server remains in the router's local URL cache table. The allowed range is 0 to 120; the default value is 24.
Cache-size (KBytes)	The maximum amount of memory to be used by the router's local URL cache. The allowed range is 0 to 120,000 KB; the default value is 250.
Server	The fully-qualified domain name or IP address of the Trend Micro URL filtering server.
HTTP Port	The port the Trend Micro server is listening to for HTTP requests. The default is 80.
HTTPS Port	The port the Trend Micro server is listening to for HTTPS requests. The default is 443.
Retransmission Count	The number of times the router retransmits a look-up request when a response is not received from the server. The range is 1 to 10.
Retransmission Timeout	The number of seconds that the router waits for a response from the server. The range is 1 to 300.
Alert	Whether stateful packet inspection messages are copied to the syslog.
Trend Micro Server Certificate Download Links	
Link to download certificates	Opens the page for installing Trusted Authority Certificates on Cisco IOS Routers for Trend URL Filtering Support.
Link for product registration	Opens the page for Product License Registration. You must enter the Product Authorization Key and register the router.

Zone Dialog Box

Use the Add and Edit Zone dialog boxes to add and edit unreferenced zones—zones without any associated interfaces, rules or policies.

Navigation Path

To access the Add and Edit Zone dialog boxes, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Zone Based Firewall** from the Device selector. Right-click inside the Zones table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Policy view) Select **Firewall > Settings > Zone Based Firewall** from the Policy selector. Right-click inside the table, then select **Add Row**, or right-click a line item, then select **Edit Row**.
- (Map view) Right-click a device and select **Edit Firewall Policies > Settings > Zone Based Firewall Rules**.

Enter a zone name in the Zone field, or click **Select** to choose one from the Interfaces Selector dialog box.

Troubleshooting Zone-based Rules and Configurations

Zone-based firewall rules are powerful, but also complex. Using zone rules, you can replace access rules, inspection rules, and Web filter rules with a single type of firewall rule. Because zone-based firewall rules can perform so many possible actions, the configuration generated from them uses many different types of configuration commands, including structures for access control lists (ACLs), class maps, and policy maps. There is no one-to-one correspondence between a zone-based firewall rule and a line in the configuration (unlike access rules, for example).

To illustrate this complexity, this topic describes the relationship between zone-based firewall rules and the configuration generated from them. You do not need to know any of the information in this topic to create and deploy zone-based firewall rules. However, if you are familiar with the CLI (command line interface), or if you find that your rules are generating undesired results, this information can help you understand and troubleshoot zone-based firewall rules.

Consider the set of rules shown in the following illustration. These rules form a policy for a single zone pair, affecting traffic moving from the Inside zone to the Outside zone. This is traffic from your internal network going to the Internet. The rules define the following actions:

- Drop all traffic from the 10.100.10.0/24 and 10.100.11.0/24 networks.
- Drop all FTP and FTPS traffic from the 10.100.12.0/24 network.
- Drop all peer-to-peer traffic from any network.
- Inspect (and allow) all FTP/FTPS traffic (except for that from 10.100.12.0/24, which is already dropped).
- Inspect all HTTP traffic using an additional deep-inspection policy map.
- And finally, perform generic inspection of all remaining TCP/UDP traffic.

Figure 29: Example of Zone-based Rules for a Zone Pair

When you deploy these rules, Security Manager generates the following configuration. The bold letters are added for reference in the explanation that follows the configuration.

A.

```
class-map type inspect http match-any HTTPcmap

!
```

The following list explains how the rules in Security Manager are converted to device-configuration commands, to aid your understanding of the relationship between the two. The list numbering corresponds to the rule numbers from the rules table in Security Manager (see the previous illustration):

1. This rule drops all traffic from the 10.100.10.0/24 network. The Permit, Source, Destination, and Service fields are used to create the first access control entry (ACE) in the ACL named CSM_ZBF_CMAP_ACL_1 defined in (K). This ACL is referenced from the class map CSM_ZBF_CLASS_MAP_1 defined in (C), which then defines the first drop rule in the policy map CSM_ZBF_POLICY_MAP_1, defined in (I).

The policy map (I) is used to define the zone service policy in (J). Because this policy map is how all of the rules are assigned to the zone pair, (J) is not mentioned again.

1. This rule drops all traffic from the 10.100.11.0/24 network. This rule is combined with rule 1 by adding an ACE to the ACL defined in (K). The rest of the configuration is identical to rule 1. Thus, rules 1 and 2 essentially become a single rule in the device configuration.
2. This rule drops all FTP/FTPS traffic from the 10.100.10.12/24 network. The Permit, Source, Destination, and Service fields are used to create the ACL named CSM_ZBF_CMAP_ACL_2 defined in (L). The Protocol table generates the class map CSM_ZBF_CMAP_PLMAP_1 defined in (D), which specifies the FTP and FTPS protocols. The ACL and FTP/FTPS class map are then used in a new class map, CSM_ZBF_CLASS_MAP_2 defined in (E), which completes the characterization of the traffic based on the combination of source and protocol. Finally, (E) is referenced in the policy map (I) as the second rule.
3. This rule drops peer-to-peer traffic from any source that uses any of these protocols: Bittorrent, eDonkey, FastTrack, ICQ, or Kazaa2. This rule prevents any of your internal servers from being used as a file-sharing source for these services. Because the rule applies to all sources and destinations for the default IP service, no ACL is required. Instead, the configuration starts with the class map CSM_ZBF_CLASS_MAP_3 defined in (F). This class map is referenced by the third drop rule in the policy map (I).
4. This rule inspects FTP/FTPS traffic from any source to any destination, which means these services are allowed. Note that rule 3, because it comes above rule 5, already drops FTP/FTPS traffic from the 10.100.12.0/24 network, so the combination of these rules means that FTP/FTPS traffic is inspected for all sources except 10.100.12.0/24. Because the Protocol table specifies the same protocols as it does for rule 3, no new class map is needed. Instead, the policy map (I) simply refers to the class map (D) as the fourth class type, but this time with the Inspect action.
5. This rule inspects HTTP traffic and applies a deep-inspection policy map named HTTPpmap. The HTTPpmap policy map (B) defines the action to take when traffic matches the criteria defined in the class map HTTPcmap (A). These maps specify that any HTTP connection that violates the HTTP protocol, or that misuses ports, should be reset (dropped) and a syslog entry generated. (Protocol violation and port misuse can characterize Denial of Service attacks.) The combination of (A) and (B) define the deep-inspection rules for this policy.

An additional class map, CSM_ZBF_CLASS_MAP_4, is needed to specify the HTTP protocol (G). Then, the fifth class type rule in the policy map (I) refers to class map (G) for inspection, and the service-policy command refers to the policy map (B) for deep inspection.

1. This rule provides generic inspection on TCP/UDP traffic, allowing and inspecting the remaining TCP/UDP traffic from the internal network to the Internet and back. The class map CSM_ZBF_CLASS_MAP_5 defined in (H) is generated from the Protocols table. This class map then becomes the next-to-last rule in the policy map (I).
2. Finally, there is an automatic rule, which appears as the final class-default rule in the policy map (I). This rule drops any traffic that does not match one of the class maps referenced in the policy map (I). For example, ICMP traffic from the internal network to the Internet will not be allowed. For information on configuring a different class-default rule, see Changing the Default Drop Behavior , on page 979.

Zone-based Firewall Rules Page

Zone-based firewall rules provide unidirectional application of firewall policies between groups of interfaces known as “zones.” That is, interfaces are assigned to zones, and specific inspection policies are applied to traffic moving between zones in one direction or the other.

A zone defines a boundary where traffic is subjected to specific restrictions as it crosses into another region of your network. The default zone-based firewall policy between zones is **deny all**. Thus, if no policy is explicitly configured, all traffic between zones is blocked.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

The Zone Based Firewall Rules page displays a list of currently configured zone-based firewall rules, and lets you add, edit and delete rules.

Tip Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see Enabling and Disabling Rules , on page 618.

Navigation Path

To access the Zone Based Firewall Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Zone Based Firewall Rules** from the Policy selector.
- (Policy view) Select **Firewall > Zone Based Firewall Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Zone Based Firewall Rules**.

Field Reference

Table 295: Zone Based Firewall Rules Page

Element	Description
No.	This number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.
Permit	Indicates whether the rule permits or denies traffic. • Permit – Shown as a green check mark. • Deny – Shown as a red circle with a slash.
Sources	The sources of traffic for this rule; can be networks or security groups. Multiple entries are displayed on separate lines within the table cell. • Network – The network, host, or IP address objects and definitions that are defined as the sources for this rule. The "All-Address" objects do not restrict the rule to specific hosts or networks. See Understanding Networks/Hosts Objects , on page 310 and Specifying IP Addresses During Policy Definition , on page 318 for additional information about these definitions. **Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.

Element	Description
Destinations	The destinations of traffic for this rule; can be networks or security groups. Multiple entries are displayed on separate lines within the table cell. • Network – The network, host, or IP address objects and definitions that are defined as the destinations for this rule. The "All-Address" objects do not restrict the rule to specific hosts or networks. See Understanding Networks/Hosts Objects , on page 310 and Specifying IP Addresses During Policy Definition , on page 318 for additional information about these definitions. **Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.
Service	The services that define the types of traffic matched by this rule. Services are defined by objects that specify protocol and port information. See Understanding and Specifying Services and Service and Port List Objects , on page 331 for more information.
From Zone	This rule applies only to traffic originating from this zone.
To Zone	This rule applies only to traffic destined for this zone.
Inspected Protocol	The protocol(s) on which the rule performs the chosen Action.
Action	Identifies how matched protocols are processed: • Drop – Matched traffic is silently dropped. The default action for all traffic. • Drop and Log – Matched traffic is logged and dropped. • Pass – The router forwards matched traffic from the source zone to the destination zone. • Pass and Log – Traffic is logged and forwarded. • Inspect – State-based traffic control; Inspect can provide application inspection and control for certain protocols, based on Port to Application Mapping (PAM). • Content Filter – HTTP content inspection based on a WebFilter parameter map, or a WebFilter policy map. **Note** The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.
Options	The Inspect Parameter map assigned to this rule; available only with Inspect and Content Filter actions.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Description	The description of this rule, if provided. A maximum of 1024 characters is allowed.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Query button	To run policy queries, which can help you evaluate your rules and identify ineffective rules that you can delete. See Generating Policy Query Reports , on page 627.
Find and Replace button (binoculars icon)	Searches for values in rules tables, such as IP addresses and policy object names, to facilitate locating and making changes to rules in tables. See Finding and Replacing Items in Rules Tables , on page 614.
Up button	Moves the selected rule up one row in the table.
Down button	Moves the selected rule down one row in the table.
Add button	Opens the Add Zone-based Firewall Rule dialog box, where you can create a new rule.
Edit button	Used to edit the selected rule in the table; opens the Edit Zone-based Firewall Rule dialog box.
Delete button	Deletes the selected rule from the table.

Adding and Editing Zone-based Firewall Rules

Use the Add and Edit Zone based Firewall Rule dialog boxes to add and edit zone-based firewall rules on Cisco IOS and ASR devices.

Navigation Path

From the Zone-based Firewall Rules Page , on page 989, click the **Add Row** button, or select a row and click the **Edit Row** button.

Field Reference

Table 296: Add and Edit Zone based Firewall Rule Dialog Boxes

Element	Description
Enable Rule	When selected, the rule is enabled on the device after the configuration is generated and deployed. Deselect this option to disable the rule without deleting it.
Traffic	Define the traffic flow to which this rule is applied.
Match	Choose whether to Permit or Deny matched traffic. See Understanding the Relationship Between Permit/Deny and Action in Zone-based Firewall Rules , on page 937 for additional information about this option.
Sources	Provide traffic sources for this rule; can be networks or security groups. You can enter values, enter object names, or select objects for one or more of the following types of sources: **Note** Enter more than one value in any of these fields by separating the items with commas. • Network – You can specify various network, host, and IP address definitions, either individually or as objects. The "All-Address" objects do not restrict the rule to specific hosts or networks. See Understanding Networks/Hosts Objects , on page 310 and Specifying IP Addresses During Policy Definition , on page 318 for additional information about these definitions. **Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.

Element	Description
Destinations	Provide traffic destinations for this rule; can be networks or security groups. You can enter values, enter object names, or select objects for one or more of the following types of sources: **Note** Enter more than one value in any of these fields by separating the items with commas. • Network – You can specify various network, host, and IP address definitions, either individually or as objects. The "All-Address" objects do not restrict the rule to specific hosts or networks. See Understanding Networks/Hosts Objects , on page 310 and Specifying IP Addresses During Policy Definition , on page 318 for additional information about these definitions. **Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.
Services	Specify the services that define the type of traffic to matched by this rule. You can enter any combination of service objects and service types (which are typically a protocol and port combination), separated by commas. See Understanding the Relationship Between Services and Protocols in Zone-based Firewall Rules , on page 940 for additional information about this option. If you type in a service, you are prompted as you type with valid values. You also can click Select to select services from a list. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.
From Zone To Zone	Basic zone-based firewall rules are unidirectional; that is, they define a traffic flow that moves in only one direction between two zones. Enter or select the zone from which traffic flows can originate for this rule, and enter or select the zone to which traffic can flow.
Advanced button	Opens the Advanced Options dialog box where you can select time-range options. See Zone-based Firewall Rule: Advanced Options Dialog Box , on page 996.
Action	The action applied to traffic that matches this rule. Choose the desired Action:

Element	Description
Action: Drop, Drop and Log, Pass, Pass and Log	• **Drop** – Silently drops all packets for the specified Services. The default action for all traffic. • **Drop and Log** – Matched traffic is logged and dropped. • **Pass** – The router forwards matched packets from the From Zone to the To Zone. Return traffic is not recognized, so you have to specify additional rules for return traffic. This option is useful only for protocols such as IPsec-encrypted traffic. • **Pass and Log** – Traffic is logged and forwarded. For any of these Actions, you can select one or more protocols to be matched by clicking the **Select** button next to the Protocol table to open the Protocol Selector Dialog Box , on page 997. However, this is not necessary; you can leave the Protocol table empty and pass or drop traffic based on the Sources, Destinations, and Services parameters; in effect, these are standard access rules. The Protocol Selector dialog box also provides access to the Configure Protocol Dialog Box , on page 998, where you can edit the Port Application Mapping (PAM) parameters for the selected protocol. **Note** The Log options generate system-log messages; you must ensure that syslog logging is configured to capture these messages.
Action: Inspect	**Inspect** provides state-based traffic control—the device maintains connection or session information for TCP and UDP traffic, meaning return traffic in reply to connection requests is permitted. Choose this option to apply packet inspection based on your selected Layer 4 (TCP, UDP) and Layer 7 (HTTP, IMAP, instant messaging, and peer-to-peer) protocols. You also can edit PAM settings for the selected protocols, and you can set up deep packet inspection (DPI) and provide additional protocol-related information for the Layer 7 protocols. See Configuring Inspection Maps for Zone-based Firewall Policies , on page 945 for more information. 1. You can select one or more protocols for inspection by clicking the **Select** button next to the Protocol table to open the Protocol Selector Dialog Box , on page 997. 2. The Protocol Selector dialog box also provides access to the Configure Protocol Dialog Box , on page 998, where you can create custom protocols, and edit the PAM and DPI parameters for the selected protocol. 3. **Inspect Parameters** – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see Configuring Inspect Parameter Maps , on page 960 for more information. If you do not specify an Inspect Parameters map, the default settings are used.

Element	Description
Action: Content Filter	**Content Filter** provides URL filtering based on a supplied parameter or policy map. The router intercepts HTTP requests, performs protocol-related inspection, and optionally contacts a third-party server to determine whether the requests should be allowed or blocked. You can provide a WebFilter parameter map, which defines filtering based on local URL lists, as well as information from an external SmartFilter (previously N2H2) or Websense server. Alternately, you can provide a WebFilter policy map that accesses Local, N2H2, Websense, or Trend Micro filtering data. 1. When **Content Filter** is the chosen Action, HTTP is the specified Protocol. You can click Configure to open the Configure Protocol Dialog Box , on page 998, where you can edit the HTTP PAM settings, and apply an HTTP DPI map. 2. Select **WebFilter Parameter Map**, or **WebFilter Policy Map**, and supply the name of an appropriate map. You can click the appropriate Select button to select the map from a list; you also can create new maps from the selection-list dialog box. See Configuring Content Filtering Maps for Zone-based Firewall Policies , on page 966 for information about configuring these maps. 3. **Inspect Parameters** – You can apply a customized set of connection, timeout, and other settings by entering the name of an Inspect Parameter map in this field, or you can click Select to select one from a list. You also can create new Inspect Parameter maps from the selection-list dialog box; see Configuring Inspect Parameter Maps , on page 960 for more information. If you do not specify an Inspect Parameters map, the default settings are used.
Description	(Optional) You can enter a description of up to 1024 characters to help you identify the rule when viewing the rules table.
Category	(Optional) You can assign a category to the rule, to help you organize and identify rules and objects. See Using Category Objects , on page 241.

Zone-based Firewall Rule: Advanced Options Dialog Box

Use the Zone-Based Firewall Rule Advanced Options dialog box to apply specific time-range information to a zone-based firewall rule.

Navigation Path

In the Traffic section of the Add or Edit Zone based Firewall Rule dialog box, click the **Advanced** button.

Related Topics

- Adding and Editing Zone-based Firewall Rules , on page 992
- Understanding the Zone-based Firewall Rules , on page 933

Field Reference

Table 297: Advanced Options Dialog Box

Element	Description
Time Range	This feature lets you define time periods during which this zone-based firewall rule is active. If you do not specify a time range, the rule is immediately and always active. Enter the name of a time-range object, or click **Select** to choose one from a list in the Time Ranges Selector dialog box. You can create and edit time-range objects from this dialog box. For more information, see Configuring Time Range Objects , on page 301.
Options	This feature lets you apply an initial-packet-fragment or an established-connection restriction to this zone-based firewall rule. Choose one of the following options: • **None**—No packet-fragment or established-connection restrictions are applied. • **Fragment** – If chosen, the rule is applied to non-initial packet fragments; the fragment is either permitted or denied accordingly. The white paper, "Access Control Lists and IP Fragments", provides additional information that is also relevant to zone-based firewall rules. • **Established** – For the TCP protocol only; requires an established connection. A match occurs if the TCP datagram has the ACK or RST control bits set. The non-matching case is that of the initial TCP datagram to form a connection.

Protocol Selector Dialog Box

Use the Protocol Selector dialog box to specify one or more communication protocols as part of the definition of traffic for a zone-based firewall rule.

The Protocol Selector dialog box also provides access to the Configure Protocol dialog box, which you can use to create custom protocols and edit Port Application Mapping (PAM) parameters for existing protocols. The Configure Protocol dialog box is also where you select Deep Inspection policy maps, and Protocol Info parameter maps, for certain protocols. See Configure Protocol Dialog Box , on page 998 for more information.

Navigation Path

The Protocol Selector dialog box can be accessed from the Add and Edit Zone based Firewall Rule dialog boxes (described in Adding and Editing Zone-based Firewall Rules , on page 992). In either dialog box, choose any Action except Content Filter and then click the Select button next to the Protocol table.

You can also open the Protocol Selector dialog box by right-clicking the Inspected Protocol column for any entry in the Zone Based Firewall Rules table, and then choosing Edit Protocols.

Related Topics

- Understanding the Zone-based Firewall Rules , on page 933
- Adding and Editing Zone-based Firewall Rules , on page 992
- Selecting Objects for Policies , on page 230
- Configure Protocol Dialog Box , on page 998

Table 298: Protocol Selector Dialog Box

Element	Description
Available Protocols	A list of protocols that can be selected for a zone-based firewall rule. **Tip** You can create a custom protocol by clicking the Create button below the Selected Protocols column, opening the Configure Protocol Dialog Box , on page 998.
Selected Protocols	The list of protocols you have selected for this zone-based firewall rule. **Tip** You can edit Port Application Mapping (PAM) settings for the protocol highlighted in the Selected Protocols column: click the Edit button below the Selected Protocols column to open the Configure Protocol Dialog Box , on page 998.
>> button	Moves the highlighted protocols from the Available Protocols column to the Selected Protocols column. You can select multiple protocols using the standard Shift-click and Ctrl+click functions.
<< button	Moves the highlighted protocols from the Selected Protocols column back to the Available Protocols column. You can select multiple protocols using the standard Shift-click and Ctrl+click functions.

Configure Protocol Dialog Box

Packet inspection can be configured in zone-based firewall rules by the selection of specific protocol objects, which define Port Application Mapping (PAM) parameters (Layer 4 protocols and ports, and optionally specific networks and hosts). A Layer 7 (HTTP, IMAP, Instant Messaging, and peer-to-peer) protocol can also include a deep-packet inspection policy specific to that protocol. Refer to Adding and Editing Zone-based Firewall Rules , on page 992 for information about selecting protocols during zone-based firewall rule definition.

The Configure Protocol dialog box is used to edit existing protocol definitions, and to create custom definitions, for use with zone-based firewall rules. For example, if a protocol does not use its default ports for some or all networks, you can configure different port mappings.

Navigation Path

The Configure Protocol dialog box is accessed from the Protocol Selector Dialog Box , on page 997, as follows:

- Click the Create (+) button below the Selected Protocols list to create a new protocol.
- Select a protocol in the Selected Protocols list, and click the Edit (pencil) button to edit that protocol.

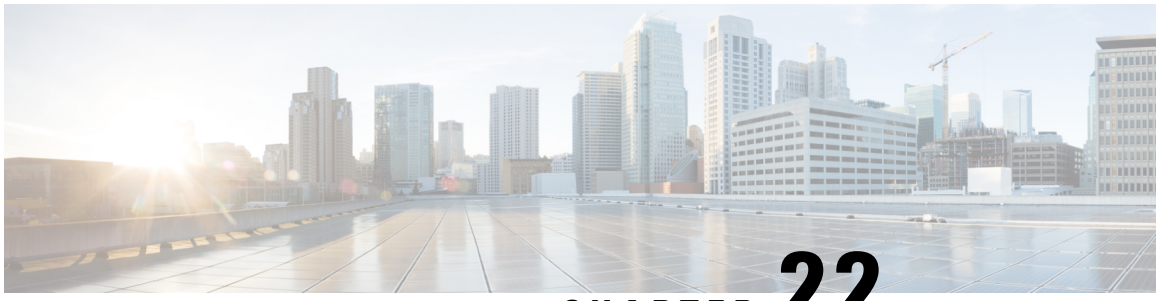
Related Topics

- Understanding the Zone-based Firewall Rules , on page 933
- Adding Zone-Based Firewall Rules , on page 942
- Protocol Selector Dialog Box , on page 997

Table 299: Configure Protocol Dialog Box

Element	Description
Protocol Name	The name of the selected protocol. If you are creating a custom protocol, you can enter a name of up to 19 characters. Custom protocol names must begin with **user-**.
Enable Signature	This option is available only when editing the peer-to-peer (eDonkey, FastTrack, Gnutella, Kazaa2) protocols. Enabling this option means Network-based Application Recognition (NBAR) heuristics will be applied to the traffic to detect "telltales" that signify specific P2P application activity. These telltales includes port-hopping and other changes in application behavior to avoid traffic detection. **Note** This level of traffic inspection comes at the price of increased CPU utilization and reduced network throughput capability.
Deep Inspection	This option is available only when editing the H.323, HTTP, IM (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC protocols, and **Inspect** is the chosen Action for the zone-based firewall rule. Enter or Select the name of the Inspect policy map to be used with the selected protocol. See Configuring Inspection Maps for Zone-based Firewall Policies , on page 945 for more information about these policy maps.
Protocol Info	This option is available only when editing the Instant Messaging (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger) and Stun-ice protocols. Enter or Select the name of the Protocol Info parameter map to be used with the selected protocol. These parameter maps define the DNS servers that interact with these applications, which helps the Instant Messaging (IM) application engine recognize the IM traffic and enforce the configured policy for that IM application. See Configuring Protocol Info Parameter Maps , on page 963 for more information about these parameter maps.
Port Application Mapping	These options let you customize the Port Application Mapping (PAM) parameters for the selected protocol.
Protocol	Select the transport protocol(s) for this mapping: • TCP/UDP • TCP • UDP
Ports	Enter any combination of a single port number, multiple port numbers, or a range of ports (for example, 60000-60005). Separate multiple entries with commas. Do not specify a range that overlaps already mapped ports.

Element	Description
Networks	If this protocol/port mapping is only for specific networks or hosts, enter the names or IP addresses of the networks or hosts, or the names of the network/host objects. You can click Select to open the Networks/Hosts Selector. Separate multiple entries with commas.



CHAPTER 22

Managing Traffic Zones

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

Non-Zoned Behavior

The Adaptive Security Algorithm takes into consideration the state of a packet when deciding to permit or deny the traffic. One of the enforced parameters for the flow is that traffic enters and exits the same interface. Any traffic for an existing flow that enters a different interface is dropped by the ASA.

Traffic zones let you group multiple interfaces together so that traffic entering or exiting any interface in the zone fulfills the Adaptive Security Algorithm security checks.

Why Use Zones?

Asymmetric Routing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to asymmetric routing on the destination network, return traffic arrived from ISP 2 on the Outside2 interface.

Non-Zoned Problem: The ASA maintains the connection tables on a per-interface basis. When the returning traffic arrives at Outside2, it will not match the connection table and will be dropped.

Zoned Solution: The ASA maintains connection tables on a per-zone basis. If you group Outside1 and Outside2 into a zone, then when the returning traffic arrives at Outside2, it will match the per-zone connection table, and the connection will be allowed.

Lost Route

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. Due to a lost or moved route between Outside1 and ISP 1, traffic needs to take a different route through ISP 2.

Non-Zoned Problem: The connection between the inside and outside host will be deleted; a new connection must be established using a new next-best route. For UDP, the new route will be used after a single packet drop, but for TCP, a new connection has to be reestablished.

Zoned Solution: The ASA detects the lost route and switches the flow to the new path through ISP 2. Traffic will be seamlessly forwarded without any packet drops.

Load Balancing

In the following scenario, a connection was established between an inside host and an outside host through ISP 1 on the Outside1 interface. A second connection was established through an equal cost route through ISP 2 on Outside2.

Non-Zoned Problem: Load-balancing across interfaces is not possible; you can only load-balance with equal cost routes on one interface.

Zoned Solution: The ASA load-balances connections across up to eight equal cost routes on all the interfaces in the zone.

Related Topics

- Why Use Zones? , on page 1001
- ECMP Routing , on page 1002
- Understanding Traffic Zones , on page 1004
- Prerequisites for Traffic Zones , on page 1005
- Guidelines for Traffic Zones , on page 1006
- Configuring Traffic Zones , on page 1007

ECMP Routing

The ASA supports Equal-Cost Multi-Path (ECMP) routing.

Non-Zoned ECMP Support

Without zones, you can have up to three equal cost static or dynamic routes per interface. For example, you can configure three default routes on the outside interface that specify different gateways:

route outside 0 0 10.1.1.2

route outside 0 0 10.1.1.3

route outside 0 0 10.1.1.4

In this case, traffic is load-balanced on the outside interface between 10.1.1.2, 10.1.1.3, and 10.1.1.4. Traffic is distributed among the specified gateways based on an algorithm that hashes the source and destination IP addresses.

ECMP is not supported across multiple interfaces, so you cannot define a route to the same destination on a different interface. The following route is disallowed when configured with any of the routes above:

route outside2 0 0 10.2.1.1

Zoned ECMP Support

With zones, you can have up to 8 equal cost static or dynamic routes across up to 8 interfaces within a zone. For example, you can configure three default routes across three interfaces in the zone:

route outside1 0 0 10.1.1.2

route outside2 0 0 10.2.1.2

route outside3 0 0 10.3.1.2

Similarly, your dynamic routing protocol can automatically configure equal cost routes. The ASA load-balances traffic across the interfaces with a more robust load balancing mechanism.

When a route is lost, the ASA seamlessly moves the flow to a different route.

How Connections Are Load-Balanced

The ASA load balances connections across equal cost routes using a hash made from the packet 6-tuple (source and destination IP address, source and destination port, protocol, and ingress interface). Unless the route is lost, a connection will stay on the chosen interface for its duration.

Packets within a connection are not load-balanced across routes; a connection uses a single route unless that route is lost.

The ASA does not consider the interface bandwidth or other parameters when load balancing. You should make sure all interfaces within the same zone have the same characteristics such as MTU, bandwidth, and so on.

The load-balancing algorithm is not user configurable.

Falling Back to a Route in Another Zone

When a route is lost on an interface, if there are no other routes available within the zone, then the ASA will use a route from a different interface/zone. If this backup route is used, then you may experience packet drops as with non-zoned routing support.

Related Topics

- ECMP Routing , on page 1002
- Understanding Traffic Zones , on page 1004
- Prerequisites for Traffic Zones , on page 1005>
- Guidelines for Traffic Zones , on page 1006

Understanding Traffic Zones

Interface-Based Security Policy

Zones allow traffic to and from any interface in the zone, but the security policy itself (access rules, NAT, and so on) is still applied per interface, not per zone. If you configure the same security policy for all interfaces within the zone, then you can successfully implement ECMP and load balancing for that traffic. For more information about required parallel interface configuration, see Prerequisites for Traffic Zones , on page 1005.

Supported Services for Traffic Zones

The following services are supported with zones:

- Access Rules
- NAT
- Service Rules, except for QoS traffic policing.
- Routing

You can also configure to- and from-the-box services (see below), although full zoned support is not available.

Do not configure other services (such as VPN or Botnet Traffic Filter) for interfaces in a traffic zone; they may not function or scale as expected.

Note For detailed information about how to configure the security policy, see Prerequisites for Traffic Zones , on page 1005.

Security Levels

The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level. To change the security level for interfaces in a zone, you must remove all but one interface, and then change the security levels, and re-add the interfaces.

Primary and Current Interface for the Flow

Each connection flow is built based on the initial ingress and egress interfaces. These interfaces are the *primary* interfaces.

If a new egress interface is used because of route changes or asymmetric routing, then the new interfaces are the *current* interfaces.

Joining or Leaving a Zone

When you assign an interface to a zone, any connections on that interface are deleted. The connections must be reestablished.

If you remove an interface from a zone, any connections that have the interface as the primary interface are deleted. The connections must be reestablished. If the interface is the current interface, the ASA moves the connections back to the primary interface. The zone route table is also refreshed.

To- and From-the-Box Traffic

- You cannot add management-only or management-access interfaces to a zone.
- For management traffic on regular interfaces in a zone, only asymmetric routing on existing flows is supported; there is no ECMP support.
- You can configure a management service on only one zone interface, but to take advantage of asymmetric routing support, you need to configure it on all interfaces. Even when the configurations are parallel on all interfaces, ECMP is not supported.
- The ASA supports the following to- and from-the-box services in a zone:
  - Telnet
  - SSH
  - HTTPS
  - SNMP
  - Syslog
  - BGP

Overlapping IP Addresses Within a Zone

For non-zoned interfaces, the ASA supports overlapping IP address networks on interfaces so long as you configure NAT properly. However, overlapping networks are not supported on interfaces in the same zone.

Related Topics

- Why Use Zones? , on page 1001
- Understanding Traffic Zones , on page 1004
- Prerequisites for Traffic Zones , on page 1005
- Guidelines for Traffic Zones , on page 1006
- Configuring Traffic Zones , on page 1007

Prerequisites for Traffic Zones

- Configure all interface parameters including the name, IP address, and security level. Note that the security level must match for all interfaces in the zone. You should plan to group together like interfaces in terms of bandwidth and other Layer 2 properties.
- Configure the following services to match on all zone interfaces:
  - Access Rules—Apply the same access rule to all zone member interfaces, or use a global access rule.
  - NAT—Configure the same NAT policy on all member interfaces of the zone or use a global NAT rule.

Interface PAT is not supported.

Note When you use interface-specific NAT and PAT pools, the ASA cannot switch connections over in case of the original interface failure.If you use interface-specific PAT pools, multiple connections from the same host might load-balance to different interfaces and use different mapped IP addresses. Internet services that use multiple concurrent connections may not work correctly in this case.

- Service Rules—Use the global service policy, or assign the same policy to each interface in a zone.

QoS traffic policing is not supported.

Note For VoIP inspections, zone load balancing can cause increased out-of-order packets. This situation can occur because later packets might reach the ASA before earlier packets that take a different path. Symptoms of out-of-order packets include:–Higher memory utilization at intermediate nodes (firewall and IDS) and the receiving end nodes if queuing is used.–Poor video or voice quality.To mitigate these effects, we recommend that you use IP addresses only for load distribution for VoIP traffic.

- Configure routing with ECMP zone capabilities in mind.

Related Topics

- Why Use Zones? , on page 1001
- ECMP Routing , on page 1002
- Understanding Traffic Zones , on page 1004
- Guidelines for Traffic Zones , on page 1006
- Configuring Traffic Zones , on page 1007

Guidelines for Traffic Zones

Firewall Mode

Supported in routed firewall mode only. Does not support transparent firewall mode.

Failover

- You cannot add the failover or state link to a zone.
- In Active/Active failover mode, you can assign an interface in each context to an asymmetrical routing (ASR) group. This service allows traffic returning on a similar interface on the peer unit to be restored to the original unit. You cannot configure both ASR groups and traffic zones within a context. If you configure a zone in a context, none of the context interfaces can be part of an ASR group.
- Only the primary interfaces for each connection are replicated to the standby unit; current interfaces are not replicated. If the standby unit becomes active, it will assign a new current interface if necessary.

Clustering

You cannot add the cluster control link to a zone.

Additional Guidelines

- You can create a maximum of 256 zones.
- You can only add physical interfaces to a zone.
- An interface can be a member of only one zone.
- You can include up to 8 interfaces per zone.
- The first interface that you add to a zone determines the security level of the zone. All additional interfaces must have the same security level.
- For ECMP, you can add up to 8 equal cost routes per zone, across all zone interfaces. You can also configure multiple routes on a single interface as part of the 8 route limit.

Related Topics

- Why Use Zones? , on page 1001
- ECMP Routing , on page 1002
- Understanding Traffic Zones , on page 1004
- Prerequisites for Traffic Zones , on page 1005
- Configuring Traffic Zones , on page 1007

Configuring Traffic Zones

You can assign multiple interfaces to a traffic zone, which lets traffic from an existing flow exit or enter the ASA on any interface within the zone. This capability allows Equal-Cost Multi-Path (ECMP) routing on the ASA as well as external load balancing of traffic to the ASA across multiple interfaces.

Related Topics

- Understanding Interface Role Objects , on page 303
- Why Use Zones? , on page 1001
- ECMP Routing , on page 1002
- Understanding Traffic Zones , on page 1004
- Prerequisites for Traffic Zones , on page 1005
- Guidelines for Traffic Zones , on page 1006

Step 1 Do one of the following:

- (Device view) Select **Firewall** > **Settings** > **Zone** from the Policy selector.

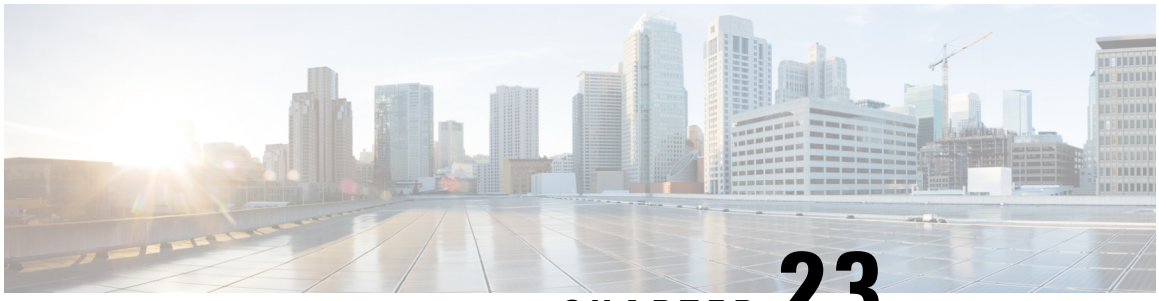
- (Policy view) Select **Firewall** > **Settings** > **Zone** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Click the **Add Row** button beneath the Zone table to open the Zone dialog box.

Step 3 Enter the name of an interface role that identifies the interfaces that belong to the traffic zone you are configuring and then click **OK**. For more information about interface role object, see Understanding Interface Role Objects , on page 303.

Tip You can click Select to select the interface role from a list of interface role objects or to define a new interface role object.

Step 4 Click **Save** to save the changes.



CHAPTER 23

Managing Transaparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet.

This chapter contains the following topics:

Configuring Transparent Firewall Rules

Transparent firewall rules are access control rules for non-IP layer 2 traffic. You can use these rules to permit or drop traffic based on the Ethertype value in the layer-2 packet. These rules create Ethertype access control lists on the device. With transparent rules, you can control the flow of non-IP traffic across the device. (To control IP traffic, use access rules; see Understanding Access Rules , on page 717.)

Transparent firewalls are devices that you place within a single subnet to control traffic flow across a bridge. They allow you to insert a firewall on a subnet without renumbering your networks.

You can configure transparent rules only on the following types of interfaces:

- **IOS 12.3(7)T or later devices**—On layer-3 interfaces that are part of a bridge group:
  - Configure the interfaces you want to bridge as layer 3 in the **Interfaces > Interfaces** policy.
  - Configure a bridge group with two or more layer 3 interfaces in the **Platform > Device Admin > Bridging** policy (see Bridging on Cisco IOS Routers , on page 2407and Defining Bridge Groups , on page 2408).
  - Create a bridge group virtual interface (BVI) using the same number as the bridge group (see Bridge-Group Virtual Interfaces , on page 2408). For example, if you create bridge group 12, create BVI12.
- **ASA, PIX 7.0+, FWSM devices**—On any interface when the device is running in transparent mode. If you are using multiple contexts, configure the rules on the individual security contexts.

There are several other bridging policies that you can configure in the **Platform > Bridging** policy group including: ARP table and ARP inspection, MAC table and the ability to disable MAC learning, and the ability to configure a management IP address so that you can remotely manage the device. For more detail about transparent firewalls, see Configuring Bridging Policies on Firewall Devices, on page 1889 and Interfaces in Routed and Transparent Modes , on page 1807.

Tip On ASA, PIX, and FWSM in transparent mode, you must configure access rules to allow any IP traffic to pass through the device. Transparent rules control layer 2 non-IP traffic only.

Also, see NAT in Transparent Mode , on page 1032 for information about using network address translation on security devices.

You can also configure other types of firewall rules on these interfaces. The other types of rules apply to layer-3 and higher traffic.

Tip If you configure any transparent rule, an implicit **deny all** rule is added at the end of the rule list for each interface. You must ensure that you permit all desired traffic. You might want to include a **permit any** (for ASA/PIX/FWSM devices) or **permit 0x0000 0xFFFF** (for IOS devices) rule as the final rule in the table if your desire is simply to deny specific types of traffic, rather than permitting only specific types of traffic.

Related Topics

- Adding and Removing Rules , on page 606
- Editing Rules , on page 607
- Enabling and Disabling Rules , on page 618

Step 1 Do one of the following to open the Transparent Rules Page , on page 1011:

- (Device view) Select **Firewall** > **Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall** > **Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add and Edit Transparent Firewall Rule Dialog Boxes , on page 1013.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Editing Rules , on page 607.

Step 3 Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see Add and Edit Transparent Firewall Rule Dialog Boxes , on page 1013.

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Interfaces—The interface or interface role for which you are configuring the rule.
- The direction of traffic to which this rule should apply (in or out). The default is in.
- EtherType—The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic. For a list of codes, see RFC 1700 at https://www.ietf.org/rfc/rfc1700.txt and search for “Ether Type.” For ASA/PIX/FWSM, you can select a keyword to identify some EtherTypes. For ASA/PIX/FWSM, the code must be 0x0600 at minimum.
- Mask—For rules applied to IOS devices, you must also specify a mask to apply to the EtherType. Use 0xFFFF to have the EtherType interpreted literally.

If you want to create a single rule to apply to a group of EtherTypes, convert the EtherTypes to binary and calculate an appropriate mask where 1 means to interpret the EtherType literally, and 0 means that any value should be allowed in the position. You must then convert your mask into hexadecimal.

Click **OK** when you are finished defining your rule.

Step 4 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

Step 5 (IOS devices only) If you are configuring transparent rules on an IOS device, you can forward DHCP traffic across the bridge without inspection. To configure this, select the **Firewall > Settings > Inspection** policy and select the **Permit DHCP Passthrough (Transparent Firewall)** option. This setting is not supported on all IOS versions, so carefully inspect validation results to see if it will be configured on your device.

Transparent Rules Page

Use the Transparent Rules page to control access for non-IP layer-2 traffic. (To control IP traffic access, use access rules; see Understanding Access Rules , on page 717.)

Transparent rules are limited to transparent firewalls, which are ASA, PIX 7.0+, and FWSM devices running in transparent mode, or layer-3 interfaces that are part of a bridge group on IOS 12.3(7)T+ devices. When deployed, transparent rules become Ethertype access control lists.

Configure the same rules on all bridged interfaces to allow traffic to pass both ways through the device.

For more detailed information about configuring transparent firewalls and the device requirements for deploying these rules, see Configuring Transparent Firewall Rules , on page 1009.

Tip Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see Enabling and Disabling Rules , on page 618.

Navigation Path

To access Transparent Rules, do one of the following:

- (Device view) Select **Firewall > Transparent Rules** from the Policy selector for a supported device type.
- (Policy view) Select **Firewall > Transparent Rules** from the Policy Type selector. Select an existing policy or create a new one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Transparent Rules**.

Field Reference

Table 300: Transparent Rules Page

Element	Description
No.	The ordered rule number.
Permit	Whether a rule permits or denies traffic based on the conditions set: • Permit—Shown as a green check mark. • Deny—Shown as a red circle with slash.
EtherType	The Ethernet packet type, which is the EtherType value in the packet. This can be a hexadecimal code or a keyword.
Mask	The 16-bit hexadecimal mask for the EtherType (for IOS devices only). A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).
Interface	The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See Understanding Interface Role Objects , on page 303.
Dir.	The direction of the traffic to which this rule applies: • In—Packets entering the interface. • Out—Packets exiting the interface.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	The description of the rule, if any.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope or section. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

Element	Description
Add Row button	Click this button to add a rule to the table after the selected row using the Add and Edit Transparent Firewall Rule Dialog Boxes , on page 1013. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see Adding and Removing Rules , on page 606.
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells. For more information, see Editing Rules , on page 607.
Delete Row button	Click this button to delete the selected rule.

Add and Edit Transparent Firewall Rule Dialog Boxes

Use the Add and Edit Transparent Firewall Rule dialog boxes to add and edit transparent firewall rules, which are configured as EtherType access control lists on the device. Before you configure transparent rules, read Configuring Transparent Firewall Rules , on page 1009.

Navigation Path

From the Transparent Rules Page , on page 1011, click the **Add Row** button or select a row and click the **Edit Row** button.

Field Reference

Table 301: Add and Edit Transparent Firewall Rule Dialog Boxes

Element	Description
Enable Rule	Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see Enabling and Disabling Rules , on page 618.
Action	Whether the rule permits or denies traffic based on the conditions you define.

Element	Description
Interfaces	The interfaces or interface roles to which the rule is assigned. You must select only bridged, transparent interfaces (for more specific information, see Configuring Transparent Firewall Rules , on page 1009). Enter the name of the interface or the interface role, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See Understanding Interface Role Objects , on page 303.
Traffic Direction	The direction of the traffic to which this rule applies: • In—Packets entering an interface. • Out—Packets exiting an interface.

EtherType	The hexadecimal code or keyword (for ASA/PIX/FWSM only) that identifies the traffic based on the EtherType value in the packet. Enter or select the following:
	• The hexadecimal EtherType value. For a list of codes, see RFC 1700 at http://www.ietf.org/rfc/rfc1700.txt "Ether Type."
	  • IOS devices—You can enter any value from 0x0000 to 0xFFFF.
	  • ASA/PIX/FWSM devices—The value must be 0x0600 or later.
	• For ASA/PIX/FWSM devices, you can also select these keywords:
	  • bpdu—Spanning Tree Bridge Protocol Data Units
	  • ipx—Internet Packet Exchange
	  • mpls-unicast—Multi-Protocol Label Switching, unicast.
	  • mpls-multicast—MPLS multicast.
	  • isis—IS-IS pass-through
	  • any—Any packet regardless of EtherType.
	  • eii-ipx
	  • raw-ipx
	
	Tip The keyword "isis" in the list above refers to IS-IS pass-through support, which is new in Security Manager 4.4. "IS-IS pass-through support" means that IS-IS traffic can flow through the ASA in transparent mode.
	
	Note Beginning from 4.16, the ethertype dsap CLI is used to interpret the installed ACEs—regardless of whether it was created with ether type bpdu, ipx, or isis—in ether type dsap format. This feature is supported for ASA 9.9(1) and later devices.

Element	Description
Wildcard Mask (IOS)	The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted. A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	An optional description of the rule (up to 1024 characters).

Edit Transparent EtherType Dialog Box

Use the Edit Transparent EtherType dialog box to edit the EtherType in a transparent firewall rule. Enter the hexadecimal code that identifies the traffic. For ASA/PIX/FWSM devices, you can also select the keyword for some types of traffic. For a list of codes, see RFC 1700 at http://www.ietf.org/rfc/rfc1700.txt and search for "Ether Type." For a more detailed description of EtherType, see Add and Edit Transparent Firewall Rule Dialog Boxes , on page 1013.

For more information, see Configuring Transparent Firewall Rules , on page 1009.

Navigation Path

Right-click the EtherType cell in a transparent rule (on the Transparent Rules Page , on page 1011 and select **Edit EtherType**. You can edit the EtherType for one row at a time.

Edit Transparent Mask Dialog Box

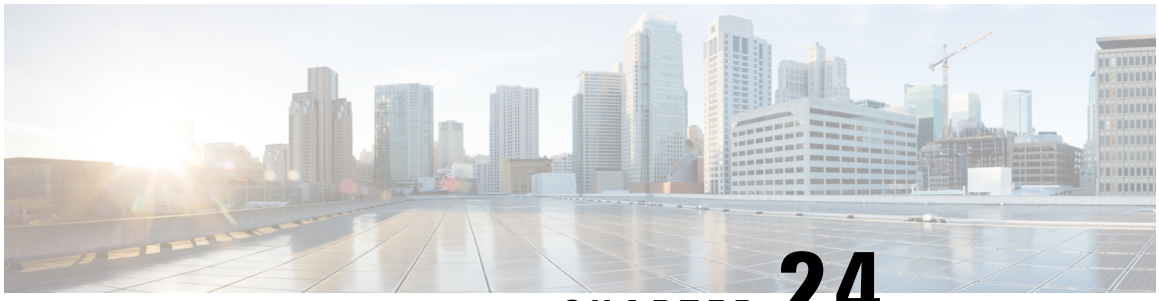
Use the Edit Transparent Mask dialog box to edit the mask in a transparent firewall rule for an IOS device. The mask is a 16-bit hexadecimal number that determines how the EtherType code is interpreted.

A mask of 0xFFFF indicates the EtherType is literal. Any other mask indicates the corresponding bits in the EtherType to ignore. You must convert the hexadecimal number to binary to fully interpret the mask (binary 1 means interpret the corresponding EtherType value literally, 0 means allow any value at that position).

For more information, see Configuring Transparent Firewall Rules , on page 1009.

Navigation Path

Right-click the Mask cell in a transparent rule (on the Transparent Rules Page , on page 1011) and select **Edit Mask**. You can edit the mask for one row at a time.



CHAPTER 24

Configuring Network Address Translation

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSM, and IPS, it does not support any enhancements.

These topics provide conceptual information about network address translation (NAT) in general, and about translation types and various implementations:

Understanding Network Address Translation

Address translation substitutes the real address in a packet with a mapped address that is routable on the destination network. As part of the process, the device also records the substitution in a translation database; these records are known as “xlate” entries. The appropriate xlate entry must exist to allow address translation on return packets—the substitution of the original real address for the mapped address; this procedure is sometimes referred to as “untranslation.” Thus, network address translation (NAT) actually consists of two steps: the translation of a real address into a mapped address, and the reverse translation for returning traffic.

One of the main functions of NAT is to enable private IP networks to connect to the Internet. Network address translation replaces a private IP address with a public IP address, translating the private addresses in the internal network into legal, routable addresses that can be used on the public Internet. In this way, NAT conserves public addresses; for example, NAT rules can be configured to utilize only one public address for the entire network in communications with the outside world.

Other functions of NAT include:

- Security – Keeping internal IP addresses hidden discourages direct attacks.
- IP routing solutions – Overlapping IP addresses are not a problem.
- Flexibility – You can change internal IP addressing schemes without affecting the public addresses available externally. For example, for a server accessible to the Internet, you can maintain a fixed IP address for Internet use, but internally, you can change the server address.

Cisco devices support both NAT, which provides a globally unique address for each outbound host session, and Port Address Translation (PAT), which provides the same single address combined with a unique port number, for up to 64,000 simultaneous outbound or inbound host sessions. The global addresses used for NAT come from a pool of addresses specifically designated for address translation. The unique global address that is used for PAT can be either one global address, or the IP address of a given interface.

The device translates an address when an existing NAT rule matches the specific traffic. If no NAT rule matches, processing for the packet continues. The exception is when you enable NAT control. NAT control requires that packets traversing from a higher security interface (inside) to a lower security interface (outside) match a NAT rule, or processing for the packet stops.

Cisco devices can perform NAT or PAT on both inbound and outbound connections. This ability to translate inbound addresses is called "Outside NAT" because addresses on the outside, or less secure, interface are translated to a usable inside IP address. Just as when you translate outbound traffic, you may choose dynamic NAT, static NAT, dynamic PAT, or static PAT. If necessary, you can use outside NAT together with inside NAT to translate the both source and destination IP addresses of a packet.

Note In this document, all types of translation are generally referred to as NAT; see Types of Address Translation , on page 1019 for descriptions of the various types. When describing NAT, the terms inside and outside represent the security relationship between any two interfaces. The higher security level is inside and the lower security level is outside.

The release of ASA version 8.3 provides a simplified, interface-independent approach to configuring network address translation, as compared to earlier ASA versions and other devices. See About "Simplified" NAT on ASA 8.3+ Devices , on page 1020 for more information.

Types of Address Translation

The following table briefly describes the various types of address translation.

Table 302: Types of Address Translation

Static NAT	Fixed translation of real source addresses to specific mapped addresses—each source address is always translated to the same mapped address, regardless of IP protocol and port number.
Static PAT	Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. That is, each source address/port is always translated to the same mapped address/port.
Policy Static NAT	Fixed translation of real source addresses to specific mapped addresses. Destination networks/hosts are also specified, and the service is always IP.
Policy Static PAT	Fixed translation of real source addresses with specific TCP or UDP port numbers, to specific mapped addresses and ports. Destination networks/hosts and services are also specified.
Dynamic NAT	Dynamic translation of real source addresses to mapped addresses obtained from a pool of shared addresses. Each source address can be mapped to any available address in the pool.
Dynamic PAT	Translation of real source addresses to a single mapped address; singularity is provided by dynamic translation of related port numbers. That is, each real address/port combination is translated to the same mapped address, but assigned a unique port. This is sometimes referred to as "overloading."
Policy Dynamic NAT	Dynamic translation of specific source-address/destination-address/service combinations on a given interface, using a pool of shared addresses. Translation direction—outbound or inbound—is also specified.

Identity NAT	The specified address is translated to itself—that is, it is effectively not translated; applies to outbound connections only. Identity NAT is a particular type of Static NAT.
NAT Exempt	Translation is bypassed for specified source/destination address combinations; connections can be initiated in both the outbound and inbound directions.

Note While certain of these types do not apply to ASA 8.3 and later devices, the ASA 8.3+ devices do provide a Dynamic NAT and PAT option, which is Dynamic NAT with a Dynamic PAT back-up feature.

About “Simplified” NAT on ASA 8.3+ Devices

The release of ASA version 8.3 provides a simplified approach to configuring network address translation (NAT), as compared to earlier ASA versions and other devices. Configuration of NAT was simplified by replacing the earlier flow-based scheme with an “original packet” to “translated packet” approach.

All NAT rules on the device—static NAT, dynamic PAT, and dynamic NAT—are presented in a single table, and essentially the same dialog box is used to configure all NAT rules. The NAT rules are interface independent (that is, interfaces are optional), meaning the rules are independent of security levels also.

NAT rules are no longer dependent on security levels. A global address space consisting of all interfaces is available, and is specified using the keyword “any.” All Interface fields default to **any**, so unless a specific interface is provided, the rule is applicable to all interfaces.

Network Object NAT

You also can define NAT properties on Host, Address Range, and Network objects, such that corresponding NAT rules are applied automatically to the designated security device. Using these objects means you need enter the necessary IP addresses, services, ports, and optional interfaces only once. These automatically generated, object-based rules are referred to as “Network Object NAT” rules. Note that these rules cannot be created or deleted from the rules table; you must edit the appropriate objects in the Policy Object Manager. You can, however, edit these rules from the rules table after they have been defined for the network object. For more information, see Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062.

Note Network Object NAT rules are not displayed in the Translation Rules table in Policy View because these rules are device-specific.

The NAT Table

As mentioned, all NAT rules on a device are presented in a single table, which is divided into three sections: a “manual” section, the Network Object NAT rules section, and another manual-rules section. You can add, edit and order rules in both manual sections; the Network Object NAT rules are added and ordered automatically, and as mentioned, to edit these rules you must edit the related objects.

The NAT rules in the table are applied on a top-down, first-match basis. That is, a packet is translated only when it matches a NAT rule, and as soon as a match is made, regardless of its location or section, NAT rule processing stops.

You can use this table to organize and manage the manual rules—you can insert rules in any order, and you can re-order them. The two sections of manual rules are provided to let you order manual rules both before and after the automatic object rules.

Network Object NAT rules are automatically ordered such that static rules appear before dynamic rules. These two types are each further ordered as follows:

- Fewest number of IP addresses – Rules for objects with one IP address are listed before those for objects with two addresses, which are before those with three addresses, and so on.
- IP address numbers – For objects having the same number of IP addresses, the rules are arranged such that the IP addresses themselves are in numerical order, from lower to higher. For example, 10.1.1.1 rules are listed before 11.1.1.1 rules.
- Object names – If the IP address is the same, the rules are ordered by alphabetizing the object names.

And remember, translation is based on the first matching rule.

Destination Translation

With manual static rules, in addition to source address translation, you also can configure destination address translation. Source and destination translation are defined at the same time, in the same dialog box. Again, while source translation can be static or dynamic, destination translation is always static, and is only available with manual rules.

Bi-directional or Twice NAT

When creating a manual static rule, you can select the "Bi-directional" option, which will produce an entry in the rules table that actually represents two static NAT rules, encompassing both translation directions. That is, a static rule is created for the specified source/translated address pairing, along with a mirror rule for the translated address/source pairing.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

This is sometimes referred to as "Twice NAT" because only one look-up is required to fetch and process what is in effect two rules.

Many-to-one Addressing

Generally, static NAT rules are configured with one-to-one address mapping. However, you can now define static NAT rules in which many IP addresses map to a few or one IP address. Functionally, many-to-few is the same as many-to-one, but because the configuration is more complicated, we recommend creating a many-to-one rule for each address as needed.

Many-to-one addressing might be useful, for example, in a situation where a range of public IP addresses is used to reach a load balancer which redirects requests to an internal network.

NAT Policies on Cisco IOS Routers

You can configure NAT policies on a Cisco IOS router from the following tabs on the NAT policy page:

- NAT Page: Interface Specification , on page 1022
- NAT Static Rule Dialog Boxes , on page 1024
- NAT Page: Dynamic Rules , on page 1027
- NAT Page: Timeouts , on page 1030

Network Address Translation (NAT) converts private, internal LAN addresses into globally routable IP addresses. NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

For more information, see Understanding Network Address Translation , on page 1017.

Navigation Path

- (Device view) Select **NAT** from the Policy selector.
- (Policy view) Select **NAT (Router)** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or create a new one.

NAT Page: Interface Specification

Before creating NAT rules, you must define the “direction” of the traffic to be translated by specifying the Inside and Outside interfaces. Inside interfaces typically connect to a LAN that the router serves. Outside interfaces typically connect to your organization’s WAN or to the Internet. You must designate at least one Inside interface and one Outside interface to enable the router to perform network address translation.

The Inside and Outside designations are used when interpreting translation rules: addresses connected to the Inside interface are translated to addresses on the Outside interface. After these interfaces are defined, they are used in all static and dynamic NAT translation rules.

Use the Interface Specification tab of the NAT policy page to specify the Inside and Outside interfaces.

Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Interface Specification** tab.
- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Interface Specification** tab.

Defining the Inside and Outside Interfaces

In the **NAT Inside Interfaces** and **NAT Outside Interfaces** fields, enter or Select the names of the interfaces or interface roles for the Inside and Outside interfaces, respectively. Separate multiple names or roles with commas (for example, Ethernet1/1, Ethernet1/2). Note that you cannot enter the same name in both fields.

NAT Page: Static Rules

You define a static NAT rule by specifying a local address that must be translated, as well as the global address to which it is translated. This is a static or fixed mapping—the local address is always translated to the same global address.

You can define static NAT rules that translate the addresses of single hosts, as well as static rules that translate multiple addresses in a subnet. When multiple local addresses must use the same global address, you must define the necessary port redirection information, which defines a different port for each local address using the global address.

Note We strongly recommend that you do not perform NAT on traffic that will be transmitted over a VPN. Translating addresses on this traffic causes it to be sent out unencrypted instead of encrypted over the VPN.

The procedure for creating a static rule depends on whether the address being translated represents a port, a single host, or an entire subnet:

- You define a **static NAT rule for a single host** by entering the original address to translate and the global address to which it is translated. The global address may be taken from an interface on the device.
- You define a **static NAT rule for a subnet** by entering one of the addresses in the subnet (including the subnet mask) as the original address, and one of the global addresses that you want to use as the translated address. The router configures the remaining addresses based on the subnet mask you provide.
- You define a **static NAT rule for a port** by entering the original IP address and the global address to which it should be translated. The global address may be taken from an interface on the device. In addition, you must select the protocol used by the port, as well as the local and global port numbers.

The Add Static NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to NAT Static Rule Dialog Boxes , on page 1024 for descriptions of the fields displayed in the table on this page.

Before You Begin

- Define the inside and outside interfaces used for NAT. See NAT Page: Interface Specification , on page 1022.

Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Static Rules** tab.

- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Static Rules** tab.

Field Reference

Table 303: Add/Edit NAT Static Rule Dialog Boxes

Element	Description
Static Rule Type	The type of local address to be translated by this static rule: • Static Host – A single host requiring static address translation. • Static Network – A subnet requiring static address translation. • Static Port – A single port requiring static address translation. If you select this option, you must define the Port Redirection parameters.

Element	Description
Original Address	An IP address, or the name of a network/host object representing the address(es) to be translated. You can enter or Select the object name. Network/host objects are logical collections of IP addresses that represent networks, hosts, or both. See Understanding Networks/Hosts Objects , on page 310 for more information. **Note** Do not enter a local address belonging to this router, as it could cause Security Manager management traffic to be translated. Translating this traffic will cause a loss of communication between the router and Security Manager.
Translated Address	Use the options in this section of the dialog box to specify the address(es) to which the Original Address(es) are translated: • **Specify IP** – Select this option to specify an IP address, or the name of a network/host object that provides the translated address(es). Add an IP address, or the name of a network/host object, in the **Translated IP/Network** field. You can enter or Select the object name. • **Use Interface IP** – Select this option to specify that the IP address assigned to a particular interface be used as the translated address. Enter or Select the name of the desired **Interface**. (This is typically the interface from which translated packets leave the router.) **Note** This option is not available when Static Network is the chosen rule type. Only one static rule may be defined per interface.
Port Redirection	These parameters specify port information for the address translations. Port address translation lets you to use the same public IP address for multiple devices as long as the port specified for each device is different. **Note** These parameters are available only when Static Port is the chosen rule type. **Redirect Port** – When Static Port is chosen as the rule type, this box is automatically checked; it cannot be changed. Enter the appropriate information in the following fields: • **Protocol** – The communications protocol used for these ports: TCP or UDP. • **Local Port** – The port number on the source network. Valid values range from 1 to 65535. • **Global Port** – The port number on the destination network that the router is to use for this translation. Valid values range from 1 to 65535.

Element	Description
Advanced	This section contains optional, advanced translation options. **Note** The Advanced options are available only when the Specify IP option is the selected method for defining the translated address(es). • No Alias – When selected, disables automatic aliasing for the global IP address translation. If the NAT pool used as an inside global pool consists of addresses on an attached subnet, an alias is generated for that address so that the router can answer Address Resolution Protocol (ARP) requests for those addresses. When deselected, global address aliases are permitted. • No Payload – When selected, prohibits an embedded address or port in the payload from being translated. The payload option performs NAT between devices on overlapping networks that share the same IP address. When an outside device sends a DNS query to reach an inside device, the local address inside the payload of the DNS reply is translated to a global address according to the relevant NAT rule. You can disable this feature by selecting the No Payload option. Otherwise, embedded addresses and ports in the payload may be translated. See Disabling the Payload Option for Overlapping Networks , on page 1026 for more information. • Create Extended Translation Entry – When checked, extended translation entries (addresses and ports) are created in the translation table. This lets you associate multiple global addresses with a single local address. This is the default. When this option is deselected, simple translation entries are created, allowing association of a single global address with the local address. **Note** This option is not available when Static Port is the chosen rule type.

Disabling the Payload Option for Overlapping Networks

Overlapping networks result when you assign an IP address to a device on your network that is already legally owned and assigned to a different device on the Internet or outside network. Overlapping networks can also result after the merger of two companies using RFC 1918 IP addresses in their networks. These two networks need to communicate, preferably without your having to re-address all their devices.

This communication is achieved as follows. The outside device cannot use the IP address of the inside device because it is the same as the address assigned to itself (the outside device). Instead, the outside device sends a Domain Name System (DNS) query for the inside device's domain name. The source of this query is the IP address of the outside device, which is translated to an address from a designated address pool. The DNS server located on the inside network replies with the IP address associated with the inside device's domain name in the data portion of the packet. The destination address of the reply packet is translated back to the outside device's address, and the address in the data portion of the reply packet is translated to an address from a different address pool. In this way, the outside device learns that the IP address for the inside device is one of the addresses from that second address pool, and it uses this address when it communicates with the inside device. The router running NAT takes care of the translations at this point.

To disable the translation of the address inside the payload, check the **No Payload** option when you create a static NAT rule based on a global IP translation.

NAT Page: Dynamic Rules

Use the NAT Dynamic Rules tab of the router's NAT page to manage dynamic address translation rules. A dynamic address translation rule dynamically maps hosts to addresses, using either the IP address of a specific interface (with dynamic port translation), or the addresses included in an address pool that are globally unique in the destination network.

Defining Dynamic NAT Rules

You define a dynamic NAT rule by first selecting an access control list (ACL) whose rules specify the traffic requiring translation.

Then, you must either select an interface with an IP address to which the addresses should be translated, or define a pool of addresses to be used. You define the pool by specifying a range of addresses and giving the range a unique name; you can specify multiple ranges. The router uses the available addresses in the pool (those not used for static translations, or for its own WAN IP address) for connections to the Internet or another outside network. When an address is no longer in use, it is returned to the address pool to be dynamically assigned later to another device.

If the addressing requirements of your network exceed the available addresses in your dynamic NAT pool, you can use the Port Address Translation (PAT) feature (also called Overloading) to associate many private addresses with one or a small group of public IP address, using port addressing to make each translation unique. With PAT enabled, the router chooses a unique port number for the IP address of each outbound translation slot. This feature is useful if you cannot allocate enough unique IP addresses for your outbound connections. Note that Port Address Translation does not occur until the address pool is depleted.

Note By default, Security Manager does not perform NAT on traffic that is meant to be transmitted over a VPN. Otherwise, any traffic appearing in both the NAT ACL and the crypto ACL defined on an interface would be sent out unencrypted because NAT is always performed before encryption. However, you can change this default setting.

Tip You can perform PAT on split-tunneled traffic on the spokes of your VPN topology directly from the Global VPN Settings page. There is no need to create a dynamic NAT rule for each spoke. Any NAT rules that you define on an individual device override the VPN setting. For more information, see Configuring VPN Global NAT Settings , on page 1192.

The Add Dynamic NAT Rule and Edit Static NAT Rule dialog boxes are used to add and edit these rules. Refer to NAT Dynamic Rule Dialog Box , on page 1028 for descriptions of the fields displayed in the table on this page.

Before You Begin

- Define the inside and outside interfaces used for NAT. See NAT Page: Interface Specification , on page 1022.

Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Dynamic Rules** tab.

- (Policy view) Select **NAT (Router) > Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Dynamic Rules** tab.

  - Table Columns and Column Heading Features , on page 51

NAT Dynamic Rule Dialog Box

Use the Add/Edit NAT Dynamic Rule dialog boxes to add or edit dynamic address translation rules. Except for their titles, the two dialog boxes are identical.

Navigation Path

Go to the NAT Page: Dynamic Rules , on page 1027 tab; click the **Add** button beneath the table to add a new rule, or select a rule in the table and click **Edit** to update that rule.

Related Topics

- Creating Access Control List Objects , on page 283
- Understanding Interface Role Objects , on page 303

Field Reference

Table 304: NAT Dynamic Rule Dialog Box

Element	Description
Traffic Flow	In the **Access List** field, enter or Select the name of the access control list (ACL) object whose entries define the addresses requiring dynamic translation. **Note** Make sure that the specified ACL does not permit the translation of Security Manager management traffic over any device address on this router. Translating this traffic will cause a loss of communication between the router and Security Manager.

Element	Description
Translated Address	Use the options in this section of the dialog box to specify the method and address(es) used for dynamic translation: • **Use Interface IP** – Select this option to specify that the globally registered IP address assigned to a particular interface be used as the translated address; port addressing ensures each translation is unique. (The Enable Port Translation (Overload) option is checked automatically when you select Use Interface IP.) Enter or Select the name of the desired **Interface**. This is typically the interface from which translated packets leave the router, meaning the interface or interface role must represent an outside interface on the router (see NAT Page: Interface Specification , on page 1022). • **Address Pool** – Select this option to base address translation on the addresses you specify in the **Network Ranges** pool. Enter one or more address ranges, including the prefix, using the format min1-max1/prefix (in CIDR notation), where "prefix" represents a valid netmask. For example, 172.16.0.0-172.31.0.223/12 . You can add as many address ranges to the address pool as required, but all ranges must share the same prefix. Separate multiple entries with commas.
Settings	This section contains two options • **Enable Port Translation (Overload)** – When selected, the router uses port addressing (PAT) if supply of global addresses in the address pool is depleted; when deselected, PAT is not used. **Note** When you use select Use Interface IP in the Translated Address section, this box is checked automatically; it cannot be changed. • **Do Not Translate VPN Traffic (Site-to-Site VPN only)** – Deselect this option to allow address translation on traffic intended for a site-to-site VPN. When selected, address translation is not performed on VPN traffic. When deselected, the router performs address translation on VPN traffic in cases of overlapping addresses between the NAT ACL and the crypto ACL. **Note** We strongly recommend that you not deselect this option, or any traffic defined in both the NAT ACL and the crypto ACL will be sent unencrypted. When you perform NAT into IPsec, we also recommend that you leave this option selected; it does not interfere with the translation of addresses arriving from overlapping networks. This setting applies only in situations where the NAT ACL overlaps the crypto ACL used by the site-to-site VPN. Because the interface performs NAT first, any traffic arriving from an address within this overlap would get translated, causing the traffic to be sent unencrypted. Leaving this box checked prevents that from happening. **Note** This option does not apply to remote access VPNs.

NAT Page: Timeouts

Use the NAT Timeouts tab of the router's NAT page to manage the timeout values for port address (overload) translations. These timeouts cause a dynamic translation to expire after a specified period of inactivity. In addition, you can use options on this page to place a limit on the number of entries allowed in the dynamic NAT table, and to modify the default timeout on all dynamic translations that do not include PAT processing.

About Dynamic NAT Timeouts

Dynamic NAT translations have a timeout period for non-use, after which they expire and are purged from the translation table. If you enable the Overload feature for performing PAT, you can specify a variety of values that provide finer control over these timeouts, because each translation entry contains additional contextual information about the traffic using it.

For example, non-DNS translations time out by default after five minutes, but DNS translations time out after 1 minute. Further, TCP translations time out after 24 hours, unless an RST or FIN is seen on the stream, in which case they time out after one minute. You can change any of these timeout values.

Note If you disable the Port Translation (Overload) feature for all dynamic rules, you need not enter any PAT-related timeout values. However, you can still modify the default timeout value for non-PAT dynamic translations. (By default, all dynamic translations expire after 24 hours.) For more information about the Overload feature, see NAT Dynamic Rule Dialog Box , on page 1028.

Navigation Path

- (Device view) Select **NAT** from the Policy selector, then click the **Timeouts** tab.
- (Policy view) Select **NAT (Router)** > **Translation Rules** from the Policy Type selector. Select an existing policy or create a new one, and then click the **Timeouts** tab.

Field Reference

Table 305: NAT Timeouts Tab

Element	Description
Max Entries	The maximum number of entries allowed in the dynamic NAT table. You can enter a value between 1 and 2147483647, or you can leave the field blank (the default), which means that the number of entries in the table is unlimited.
Timeout (sec.)	The number of seconds after which dynamic translations expire; this does not apply to PAT (overload) translations. The default is 86400 seconds (24 hours).

Element	Description
UDP Timeout (sec.)	The timeout value applied to User Datagram Protocol (UDP) ports. The default is 300 seconds (5 minutes). **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
DNS Timeout (sec.)	The timeout value applied to Domain Naming System (DNS) server connections. The default is 60 seconds. **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
TCP Timeout (sec.)	The timeout value applied to Transmission Control Protocol (TCP) ports. The default is 86400 seconds (24 hours). **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
FINRST Timeout (sec.)	The timeout value applied when a Finish (FIN) packet or Reset (RST) packet (both of which terminate connections) is found in the TCP stream. The default is 60 seconds. **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
ICMP Timeout (sec.)	The timeout value applied to Internet Control Message Protocol (ICMP) flows. The default is 60 seconds. **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
PPTP Timeout (sec.)	The timeout value applied to NAT Point-to-Point Tunneling Protocol (PPTP) flows. The default is 86400 seconds (24 hours). **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.
SYN Timeout (sec.)	The timeout value applied to TCP flows after a synchronous transmission (SYN) message (used for precise clocking) is encountered. The default is 60 seconds. **Note** This value applies only when Port Translation (Overload) is enabled for a dynamic NAT rule; see NAT Dynamic Rule Dialog Box , on page 1028.

NAT Policies on Security Devices

The following topics describe configuring network address translation (NAT) options on managed security appliances: PIX firewalls, Firewall Service Modules (FWSMs) on Catalyst switches, pre-version-8.3 Adaptive Security Appliances (ASAs), and ASA 8.3+ devices. The topics are arranged as follows:

- Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035
- Address Pools , on page 1036

- **ASA 8.3+**
  - Configuring NAT on ASA 8.3+ Devices , on page 1052
  - Translation Rules: ASA 8.3+ , on page 1053

NAT in Transparent Mode

Using NAT on a security appliance operating in transparent mode eliminates the need for upstream or downstream routers to perform NAT for their networks. NAT in transparent mode has the following requirements and limitations:

- When the mapped addresses are not on the same network as the transparent firewall, you need to add a static route for the mapped addresses on the upstream router that points to the downstream router (through the security appliance).
- If the real destination address is not directly connected to the security appliance, you also need to add a static route on the security appliance for the real destination address that points to the downstream router. Without NAT, traffic from the upstream router to the downstream router does not need any routes on the security appliance because it uses the MAC address table. Using NAT, however, causes the security appliance to use a route look-up instead of a MAC address look-up, so it needs a static route to the downstream router.
- Because the transparent firewall does not have any interface IP addresses, you cannot use interface PAT.
- ARP inspection is not supported. Moreover, if for some reason a host on one side of the security appliance sends an ARP request to a host on the other side of the security appliance, and the initiating host real address is mapped to a different address on the same subnet, then the real address remains visible in the ARP request.

CGNAT Map Page

Beginning with version 4.20, Cisco Security Manager supports Carrier-Grade NAT Mapping of Address and Port (CGNAT MAP) domains for ASA 9.13(1) devices operating in single, multi-context, and routed modes. This feature helps configure MAP domains using default or basic mapping rules.

Note CGNAT MAP is not supported in transparent mode.

Navigation Path

- (Device view) Select **NAT** > **CGNAT MAP** from the Device Policy selector.
- (Policy View) Select **NAT (PIX/ASA/FWSM)** > **CGNAT MAP** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click CGNAT MAP to create a new **CGNAT MAP** policy.

Related Topics

- NAT Policies on Security Devices , on page 1031

Field Reference

Table 306:

Element	Description
Add Map Domain	When selected, lets you add a map domain using basic or default mapping rules.
Map Domain Name	Enter the name of the map domain for which the mapping rule must be applied.
Basic Mapping Rule	Select the Basic Mapping Rule check box to specify the IPv4 and IPv6 prefixes, Share Ratio, and Start Port number.
Default Mapping Rule	Enter the IPv6 prefix to apply the default mapping rule.

Global Options Page

Security Manager version 4.9 supports Carrier Grade NAT to configure the block size and maximum blocks per host limit for port block allocation, for ASA devices 9.5(1) or later. Use the Global Options page to configure these options.

Navigation Path

- (Device view) Select **NAT > Global Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Global Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Global Options** to create a new policy.

Related Topics

- NAT Policies on Security Devices , on page 1031
- Add and Edit NAT Rule Dialog Boxes , on page 1055

Field Reference

Table 307: Global Options Page

Element	Description
xlate block-allocation size	Enter a value between 32 and 4096. The default value is 512.
xlate block-allocation maximum-per-host	Enter a value between 1 to 8. The default value is 4.

Element	Description
xlate block-allocation interim logging	Configure a timer interval to generate syslog for all the active port blocks allocated at that time for ASA 9.12(1) devices and later. Enter a value between 43200 to 604800.

Translation Options Page

Use the Translation Options page to set options that affect network address translation for the selected security appliance. These settings apply to all interfaces on the device.

Navigation Path

- (Device view) Select **NAT > Translation Options** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Options** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Options** to create a new policy.

Related Topics

- NAT Policies on Security Devices , on page 1031

Field Reference

Table 308: Translation Options Page

Element	Description
Enable traffic through the firewall without address translation	When selected, lets traffic pass through the security appliance without address translation. If this option is not selected, any traffic that does not match a translation rule will be dropped. **Note** This option is available only on PIX 7.x, FWSM 3.x, and ASA devices.

Element	Description
Enable xlate bypass	When selected, establishment of NAT sessions for untranslated traffic is disabled (this feature is called “xlate bypass”). **Note** This option is available only on FWSM 3.2 and later. By default, the FWSM creates NAT sessions for all connections even if NAT is not used. For example, a session is created for each untranslated connection even if NAT control is not enabled, if NAT exemption or identity NAT is used, or if you use same-security interfaces and do not configure NAT. Because there is a maximum number of NAT sessions (266,144 concurrent), these kinds of NAT sessions might cause you to run into the limit. To avoid reaching the limit, enable xlate bypass. If you disable NAT control and have untranslated traffic or use NAT exemption, or if you enable NAT control and use NAT exemption, then with xlate bypass, the FWSM does not create a session for those types of untranslated traffic. However, NAT sessions are still created in the following instances: • You configure identity NAT (with or without NAT control)—identity NAT is considered to be a translation. • You use same-security interfaces with NAT control. Traffic between same-security interfaces create NAT sessions even when you do not configure NAT for the traffic. To avoid NAT sessions in this case, disable NAT control, or use NAT exemption as well as xlate bypass.
Do not translate VPN traffic	When selected, VPN traffic passes through the security appliance without address translation.
Clear translates for existing connections	When selected, the translation slots assigned to dynamic translations and any associated connections are cleared following each session. Each session connecting through the security appliance, and undergoing some form of NAT or PAT, is assigned a translation slot known as an “xlate.” These translation slots can persist after the session is complete, which can lead to a depletion of translation slots, unexpected traffic behavior, or both.

Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functions, it does not support any enhancements.

The following sections describe configuring network address translation on PIX and FWSM devices, and on pre-8.3-version ASAs. (See Configuring NAT on ASA 8.3+ Devices , on page 1052 for information about configuring NAT on ASA 8.3+ devices.)

- Dynamic Rules Tab , on page 1040
- Policy Dynamic Rules Tab , on page 1042
- Static Rules Tab , on page 1044
- General Tab , on page 1050

Address Pools

Use the Address Pools page to view and manage the global address pools used in dynamic NAT rules.

The Address Pool dialog box is used to add and edit these address pools. Refer to Address Pool Dialog Box , on page 1036 for descriptions of the fields displayed in the Global Address Pools table on this page.

Navigation Path

- (Device view) Select **NAT > Address Pools** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Address Pools** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.

Related Topics

- Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035

Address Pool Dialog Box

Use the Address Pool dialog box to add or edit a global address pool for use in dynamic NAT rules.

Navigation Path

You open the Address Pool dialog box by clicking the Add Row or Edit Row buttons on the Address Pools , on page 1036.

Related Topics

- Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035

Field Reference

Table 309: Address Pools Dialog Box

Element	Description
Interface Name	Enter or Select the name of the device interface on which the mapped IP addresses will be used.
Pool ID	Enter a unique identification number for this address pool, an integer between 1 and 2147483647. When configuring a dynamic NAT rule, you select a Pool ID to specify the pool of addresses to be used for translation.

Element	Description
IP address ranges	Enter or Select the addresses to be assigned to this address pool. You can specify these addresses as follows: • Address range for dynamic NAT (e.g., 192.168.1.1-192.168.1.15) • Subnetwork (e.g., 192.168.1.0/24) • List of addresses separated by commas (e.g., 192.168.1.1, 192.168.1.2, 192.168.1.3) • Single address to use for PAT (e.g., 192.168.1.1) • Combinations of the above (e.g., 192.168.1.1-192.168.1.15, 192.168.1.25) • Names of hosts on the connected network; these will be resolved to IP addresses.
Description	Enter a description for the address pool.
Enable Interface PAT	When checked, port address translation is enabled on the specified interface.

Translation Rules: PIX, FWSM, and pre-8.3 ASA

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

Use the Translation Rules page to define network address translation (NAT) rules on the selected device. The Translation Rules page consists of the following tabs:

- Translation Exemptions (NAT 0 ACL) , on page 1038 – Use this tab to configure rules specifying traffic that is exempt from address translation.

Note Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- Dynamic Rules Tab , on page 1040 – Use this tab to configure dynamic NAT and PAT rules.

Note Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- Policy Dynamic Rules Tab , on page 1042 – Use this tab to configure dynamic translation rules based on source and destination addresses and services.

Note Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

- Static Rules Tab , on page 1044 – Use this tab to configure static translation rules for a security appliance or shared policy.
- General Tab , on page 1050 – Use this tab to view all current translation rules, listed in the order that they will be evaluated on the device.

Note The General tab is visible only for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

Navigation Path

To access the Translation Rules page, do one of the following:

- (Device view) Select **NAT > Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

Translation Exemptions (NAT 0 ACL)

Use the Translation Exemptions (NAT 0 ACL) tab of the Translation Rules page to view and specify rules that exempt traffic from address translation. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box is used to add and edit these rules. Refer to Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box , on page 1039 for descriptions of the fields displayed in the table on this page.

Note Translation exemptions are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

Navigation Path

You can access the Translation Exemptions (NAT 0 ACL) tab from the Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037 page.

Related Topics

- Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035

- Advanced NAT Options Dialog Box , on page 1048
- General Tab , on page 1050
- Standard Security Manager rules table topics:
  - Using Rules Tables , on page 604
  - Filtering Tables , on page 50
  - Table Columns and Column Heading Features , on page 51

Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box

Use the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box to define and edit translation exemption rules on PIX, FWSM and pre-8.3 ASA devices in router mode, and FWSM 3.2 devices in transparent mode.

Navigation Path

You can access the Add/Edit Translation Exemption (NAT-0 ACL) Rule dialog box from the Translation Exemptions (NAT 0 ACL) tab. See Translation Exemptions (NAT 0 ACL) , on page 1038 for more information.

Related Topics

- Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035
- Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037
- Advanced NAT Options Dialog Box , on page 1048

Field Reference

Table 310: Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box

Element	Description
Enable Rule	If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.
Action	Select the action for this rule: • exempt – The rule identifies traffic that is exempt from NAT. • do not exempt – The rule identifies traffic that is not exempt from NAT.
Original: Interface	Enter the name of (or Select) the device interface to which the rule applies.
Original: Sources	Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas. Note that this parameter is displayed in the Translation Exemptions (NAT 0 ACL) table under the column heading “Original Address.”
Translated: Direction	The rule can be applied to Inbound or Outbound traffic, as specified with this option.

Element	Description
Traffic flow: Destinations	Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.
Category	To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See Using Category Objects , on page 241 for more information. **Note** No commands are generated for the Category attribute.
Description	Enter a description of the rule.
Advanced button (FWSM only)	Click to open the Advanced NAT Options Dialog Box , on page 1048 to configure advanced settings for this rule.

Dynamic Rules Tab

Use the Dynamic Rules tab of the Translation Rules page to view and configure dynamic NAT and PAT rules. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With dynamic NAT, internal IP addresses are dynamically translated using IP addresses from a pool of global addresses. With dynamic PAT, internal IP addresses are translated to a single mapped address by using dynamically assigned port numbers with the mapped address. Dynamic translations are often used to map local RFC 1918 IP addresses to addresses that are Internet-routable.

The Add/Edit Dynamic Translation Rule dialog box is used to add and edit these rules. Refer to Add/Edit Dynamic Translation Rule Dialog Box , on page 1041 for descriptions of the fields displayed in the table on this page.

Note Dynamic translation rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

Navigation Path

You can access the Dynamic Rules tab from the Translation Rules page. For more information about the Translation Rules page, see Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037.

Note By default, only standard Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the General Tab , on page 1050).

Field Reference

Table 311: Add/Edit Dynamic Translation Rule Dialog Box

Element	Description
Enable Rule	If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.
Original: Interface	Enter the name or Select the device interface to which the rule applies.
Original: Address	Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas.
Translated: Pool	Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the Select Address Pool Dialog Box , on page 1042. Enter a value of zero to specify this as an identity NAT rule.
Translated: Direction	The rule can be applied to Inbound or Outbound traffic, as specified with this option.
Advanced button	Click to open the Advanced NAT Options Dialog Box , on page 1048 to configure advanced settings for this rule.

Select Address Pool Dialog Box

The Select Address Pool dialog box presents a list of global address pools; these pools are defined and managed via the Address Pools , on page 1036. Use this dialog box to select an address pool for use by a dynamic translation rule, or a policy dynamic translation rule.

Navigation Path

You can access the Select Address Pool dialog box from the Add/Edit Dynamic Translation Rule Dialog Box , on page 1041 when adding or editing a dynamic translation rule, or from the Add/Edit Policy Dynamic Rules Dialog Box , on page 1043 when adding or editing a policy dynamic translation rule.

Related Topics

- Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037
- Address Pools , on page 1036

Field Reference

Table 312: Select Address Pool Dialog Box

Element	Description
Pool ID	The identification number of the address pool.
Interface	The name of the device interface to which the address pool applies.
IP Address Ranges	The IP addresses assigned to the pool; “interface” in this list indicates PAT is enabled on the specified Interface.
Description	The description provided for the address pool.
Selected Row	This field identifies the pool currently selected in the list. When you click OK to close the dialog box, this pool is assigned to the translation rule.

Policy Dynamic Rules Tab

Use the Policy Dynamic Rules tab of the Translation Rules page to view and configure dynamic translation rules based on source and destination addresses and services. Rules are evaluated sequentially in the order listed. The row number indicates the rule’s position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

The Add/Edit Policy Dynamic Rule dialog box is used to add and edit these rules. Refer to Add/Edit Policy Dynamic Rules Dialog Box , on page 1043 for a description of the fields displayed in the table on this page.

Note Policy dynamic rules are only supported by PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules.

Navigation Path

You can access the Policy Dynamic Rules tab from the Translation Rules page. See Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037 for more information.

Note By default, only standard Policy Dynamic Rule elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the General Tab , on page 1050.)

Field Reference

Table 313: Add/Edit Policy Dynamic Rules Dialog Box

Element	Description
Enable Rule	If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.
Original: Interface	Enter the name of (or Select) the device interface to which the rule applies.
Original: Sources	Enter IP addresses for (or Select) the source hosts and network objects to which the rule applies. Multiple entries must be separated by commas. Note that this parameter is displayed in the Policy Dynamic Rules table under the column heading "Original Address."
Translated: Pool	Enter (or Select) the ID number of the pool of addresses used for translation; clicking Select opens the Select Address Pool Dialog Box , on page 1042. Enter a value of zero to specify this as an identity NAT rule.
Translated: Direction	The rule can be applied to Inbound or Outbound traffic, as specified with this option.
Traffic flow: Destinations	Enter IP addresses for (or Select) the destination hosts and network objects to which the rule applies. Multiple entries must be separated by commas.
Traffic flow: Services	Enter (or Select) the services to which the rule applies. Multiple entries must be separated by commas.
Category	To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See Using Category Objects , on page 241 for more information. **Note** No commands are generated for the Category attribute.
Description	Enter a description of the rule.
Advanced button	Click to open the Advanced NAT Options Dialog Box , on page 1048 to configure advanced settings for this rule.

Static Rules Tab

Use the Static Rules tab of the Translation Rules page to view and configure static translation rules for a security appliance or shared policy. Rules are evaluated sequentially in the order listed. The row number indicates the rule's position in the ordering of the list. You can use the Up Row and Down Row buttons to change the position of the selected rule.

With static translation, internal IP addresses are permanently mapped to a global IP address. These rules map a host address on a lower security-level interface to a global address on a higher security-level interface. For example, a static rule would be used for mapping the local address of a web server on a perimeter network to a global address that hosts on the outside interface would use to access the web server.

Caution The order of Static NAT rules on a security device is important, and Security Manager preserves this ordering during deployment. However, security appliances do not support in-line editing of Static NAT rules. This means that if you move, edit, or insert a rule anywhere above the end of the list, Security Manager will remove from the device all Static NAT rules that follow the new or modified rule, and then re-send the updated list from that point. Depending on the length of the list, this can require substantial overhead, and may result in traffic interruption. Whenever possible, add any new Static NAT rules to the end of the list.

The Add/Edit Static Rule dialog box is used to add and edit these rules. Refer to Add/Edit Static Rule Dialog Box , on page 1046 for descriptions of the fields displayed in the table on this page.

The "Nailed"Column in the Static Rules Table

In addition to the columns representing parameters specified in the Add/Edit Static Rule Dialog Box , on page 1046, the Static Rules table displays a column labeled "Nailed." This value is a product of device discovery; it cannot be changed in Security Manager.

The entry in the "Nailed" Column indicates whether TCP state tracking and sequence checking is skipped for the connection: true or false.

Navigation Path

You can access the Static Rules tab from the Translation Rules page. See Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037 for more information.

Note By default, only standard Static Rules elements are displayed in this table. Additional columns for elements defined in the Advanced NAT Options dialog box can be displayed by right-clicking any column heading. (All columns are displayed by default on the General Tab , on page 1050.)

Field Reference

Table 314: Add/Edit Static Rule Dialog Box

Element	Description
Enable Rule	If checked, the rule is enabled. Deselect this option to disable the rule without deleting it.
Translation Type	Select the type of translation for this rule: NAT or PAT.
Original Interface	Enter (or Select) the device interface connected to the host or network with original addresses to be translated.
Original Address	Enter (or Select) the source address to be translated.
Translated Interface	Enter (or Select) the interface on which the translated addresses are to be used. To specify this as an identity NAT rule, enter the same interface in both this and the Original Interface fields.
Use Interface IP/Use Selected Address	Specify the address used for the Translated Interface: select Use Interface IP (address), or select Use Selected Address and enter an address, or Select a network/host object.
Enable Policy NAT	Select this option to enable Policy NAT for this translation rule.
Dest Address	If Policy NAT is enabled, specify the destination addresses of the hosts or networks to which the rule applies.

Element	Description
Services	If Policy NAT is enabled, enter or Select the Services to which the rule applies. **Note** For Static Policy NAT, IP is the only Service that can be specified. The syntax for service and service-object specification is: {**tcp** | **udp** | **tcp&udp**}/{*source_port_number* | *port_list_object* }/ {*destination_port_number* | *port_list_object* } Note that if you enter only one port parameter, it is interpreted as the destination port (with a source port of "any"). For example, **tcp/4443** means tcp, source port any, destination port 4443, while **tcp/4443/Default Range** means tcp, source port 4443, and destination port Default Range (generally 1-65535). As with all text-entry fields, Security Manager may display auto-complete options. For example, if you type **tcp/** in this field, an auto-complete list of all Port Lists objects defined in Security Manager is displayed. This list will include system-generated objects such as DEFAULT RANGE, HTTPS and WEBPORTS. Refer to Configuring Port List Objects , on page 333 for more information about Port Lists, and Configuring Service Objects , on page 334 for more information about defining Services.
Protocol	If PAT is the selected Translation Type, select the protocol, TCP or UDP, to which the rule applies.
Original Port	If PAT is the selected Translation Type, enter the port number to be translated. Note that this parameter is displayed in the Static Rules table under the column heading "Local Port."
Translated Port	If PAT is the selected Translation Type, enter the port number to which the original port number will be translated. Note that this parameter is displayed in the Static Rules table under the column heading "Global Port."
Category	To assign the rule to a category, choose the category from this list. Categories can help identify rules and objects using labels and color-coding. See Using Category Objects , on page 241 for more information. **Note** No commands are generated for the Category attribute.
Description	Enter a description of the rule.
Advanced button	Click to open the Advanced NAT Options Dialog Box , on page 1048 to configure advanced settings for this rule.

Edit Translated Address Dialog Box

Use the Edit Translated Address dialog box to change just the translated address assigned to a static translation rule. The translated address is the address to which the original address is changed. The interface's IP address can be used, or you can enter a specific IP address. See Static Rules Tab , on page 1044 for more information about static rules and translated addresses.

For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

Navigation Path

Right-click the Translated Address cell in the Static Rules table (on the NAT > Translation Rules page) and choose **Edit Translated Address**.

Advanced NAT Options Dialog Box

Use the Advanced NAT Options dialog box to configure the advanced connection settings—DNS Rewrite, Maximum TCP and Maximum UDP Connections, Embryonic Limit, Timeout (PIX 6.x), and Randomize Sequence Number—for NAT and Policy NAT. You can also configure these options for Translation Exemption (NAT 0 ACL) rules on an FWSM.

Navigation Path

You can access the Advanced NAT Options dialog box by clicking the **Advanced** button when adding or editing a translation rule. See the following topics for more information:

- Add/Edit Translation Exemption (NAT-0 ACL) Rule Dialog Box , on page 1039
- Add/Edit Dynamic Translation Rule Dialog Box , on page 1041
- Add/Edit Policy Dynamic Rules Dialog Box , on page 1043
- Add/Edit Static Rule Dialog Box , on page 1046

Related Topics

- Translation Rules: PIX, FWSM, and pre-8.3 ASA , on page 1037

Field Reference

Table 315: Advanced NAT Options Dialog Box

Element	Description
Translate the DNS replies that match the translation rule	If checked, the security appliance rewrites DNS replies so an outside client can resolve the name of an inside host using an inside DNS server, and vice versa. For instance, if your NAT rule includes the real address of a host with an entry in a DNS server, and the DNS server is on a different interface from a client, then the client and the DNS server need different addresses for the host: one needs the mapped address and one needs the real address. This option rewrites the address in the DNS reply to the client. As an example, assume an inside web server, www.example.com, has the IP address 192.168.1.1, which is translated to 10.1.1.1 on the outside interface of the appliance. An outside client sends a DNS request to an inside DNS server, which will resolve www.example.com to 192.168.1.1. When the reply comes to the security appliance with DNS Rewrite enabled, the security appliance will translate the IP address in the payload to 10.1.1.1, so that the outside client will get the correct IP address. Note that the mapped host needs to be on the same interface as either the client or the DNS server. Typically, hosts that need to allow access from other interfaces use a static translation, so this option is more likely to be used with a static rule.
Max TCP Connections per Rule	Enter the maximum number of TCP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.
Max UDP Connections per Rule	Enter the maximum number of UDP connections allowed; valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited.
Max Embryonic Connections	Enter the number of embryonic connections allowed to form before the security appliance begins to deny these connections. An embryonic connection is a connection request that has not finished the necessary handshake between source and destination. Set this limit to prevent attack by a flood of embryonic connections. Valid values are 0 through 65,535. If this value is set to zero, the number of connections is unlimited. Any positive value enables the TCP Intercept feature. TCP Intercept protects inside systems from a DoS attack perpetrated by flooding an interface with TCP SYN packets. When the embryonic limit has been surpassed, the TCP Intercept feature intercepts TCP SYN packets from clients to servers on a higher security level. SYN cookies are used during the validation process and help to minimize the amount of valid traffic being dropped. Thus, connection attempts from unreachable hosts will never reach the server.
Timeout	For PIX 6.x devices, enter a timeout value for this translation rule, in the format *hh:mm:ss* . This value overrides the default translation timeout specified in Platform > Security > Timeouts, unless this value is 00:00:00, in which case translations matching this rule use the default translation timeout (specified in Platform > Security > Timeouts).

Element	Description
Randomize Sequence Number	If checked, the security appliance randomizes the sequence numbers of TCP packets. Each TCP connection has two Initial Sequence Numbers (ISNs): one generated by the client and one generated by the server. The security appliance randomizes the ISN of the TCP SYN in both the inbound and outbound directions. Randomizing the ISN of the protected host prevents an attacker from predicting the next ISN for a new connection and potentially hijacking the new session. Disable this feature only if: • Another in-line security appliance is also randomizing initial sequence numbers and data is being scrambled. • You are using eBGP multi-hop through the security appliance, and the eBGP peers are using MD5. Randomization breaks the MD5 checksum. • You are using a WAAS device which requires that the security appliance not randomize the sequence numbers of connections. Disabling this option opens a security hole in the security appliance.

General Tab

Use the General tab of the Translation Rules page to view a summary of all translation rules defined for the current device or shared policy. The translation rules are listed in the order that they will be evaluated on the device.

Note The General tab is only visible for PIX, ASA and FWSM devices in router mode, and FWSM 3.2 devices in transparent mode. Other devices in transparent mode support only static translation rules and do not need to display summary information.

Navigation Path

You can access the General tab from the Translation Rules page. See for more information.

Field Reference

Table 316: General Tab - Translation Rules Summary Table

Element	Description
Note Hatching (a series of slanted lines) across an entry in the table indicates that rule is currently disabled. (See Enable Rule in Add/Edit Dynamic Translation Rule Dialog Box , on page 1041 for information about enabling and disabling these rules.)	
No.	Rules are evaluated sequentially in the order listed. This number indicates the rule's position in the ordering of the list.
Type	The type of translation rule; for example, Static, Dynamic, Exemption, etc.
Action	Displays "exempt" if the rule is exempt from NAT.
Original Interface	The ID of the device interface to which the rule is applied.
Original Address	The object names or IP addresses of the source hosts and networks to which the rule applies.
Local Port	The port number supplied by the host or network (for static PAT).
Translated Pool	The ID number of the address pool used for translation.
Translated Interface	The interface on which the translated addresses are to be used.
Translated Address	The translated addresses.
Global Port	The port number to which the original port number will be translated (for static PAT).
Destination	The object names and IP addresses of the destination hosts or networks to which the rule applies.
Protocol	The protocol to which the rule applies.
Service	The services to which the rule applies.
Direction	The traffic direction (Inbound or Outbound) on which the rule is applied.
DNS Rewrite	Whether the DNS Rewrite option is enabled: Yes or No. This option is set in the Advanced NAT Options Dialog Box , on page 1048.
Maximum TCP Connections	The maximum number of TCP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the Advanced NAT Options Dialog Box , on page 1048.

Element	Description
Embryonic Limit	The number of embryonic connections allowed to form before the security appliance begins to deny these connections. If zero, the number of connections is unlimited. A positive number enables the TCP Intercept feature. This option is set in the Advanced NAT Options Dialog Box , on page 1048.
Maximum UDP Connections	The maximum number of UDP connections allowed to connect to the statically translated IP address. If zero, the number of connections is unlimited. This option is set in the Advanced NAT Options Dialog Box , on page 1048.
Timeout	For PIX 6.x devices, this is the timeout value for a static translation rule. This value overrides the default translation timeout specified in Platform > Security > Timeouts. A Timeout value of 00:00:00 here means that translations matching this rule should use the default translation timeout specified in Platform > Security > Timeouts.
Randomize Sequence Number	Whether the security appliance will randomize the sequence number of TCP packets: Yes or No. This option is set in the Advanced NAT Options Dialog Box , on page 1048, and is enabled by default.
Category	The category to which the rule is assigned. Categories use labels and color-coding to help identify rules and objects. See Using Category Objects , on page 241 for more information. **Note** No commands are generated for the Category attribute.
Description	The description of the rule, if provided.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).

Configuring NAT on ASA 8.3+ Devices

The following section describes configuring network address translation on version 8.3 or later ASA devices:

- Translation Rules: ASA 8.3+ , on page 1053
  - Add and Edit NAT Rule Dialog Boxes , on page 1055
  - Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062
- Per-Session NAT Rules: ASA 9.0(1)+ , on page 1066

See Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035 for information about configuring NAT on other security appliances. Refer to About "Simplified" NAT on ASA 8.3+ Devices , on page 1020 for general information about NAT rules, and the changes to NAT configuration implemented on the ASA 8.3.

Note You can create a NAT object only if you have the Modify privilege mapped to your role. Cisco Security Manager displays error message for authorization.

Translation Rules: ASA 8.3+

Use the Translation Rules page to manage network address translation (NAT) rules on the selected ASA 8.3+ device. See NAT Policies on Security Devices , on page 1031 for information about configuring Translation Rules on other security devices.

Two types of NAT rules are displayed in this table: "manual" rules added by you and any other users, and "automatic" rules generated and applied by Security Manager when an object with NAT properties is assigned to the device. These are referred to as "NAT rules" and "Network Object NAT rules," respectively.

Some Features of the Translation Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in Using Rules Tables , on page 604. For example, you can move, show and hide columns; you can re-order the manual rules; and you can right-click certain table cells to edit that parameter. In addition, the following features are specific to this Translation Rules table:

- All rules are assigned to one of three pre-defined sections in the table:
  - **NAT Rules Before** – These are rules you or another user have "manually" defined on the device. You can specify that a rule be added to this section by clicking the section heading before adding the rule, although if you do not specify a section, the new rule will be added to this section by default.
  - **Network Object NAT Rules** – These are rules generated and ordered automatically by Security Manager when network objects that include NAT properties are assigned to the device. See Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062 for information about assigning NAT properties to objects. See the section "The NAT Table" in About "Simplified" NAT on ASA 8.3+ Devices , on page 1020 for information about how these rules are ordered.

Note This section is not displayed in the Translation Rules table in Policy View because these rules are device-specific.

  - **NAT Rules After** – These also are rules you or another user have manually defined on the device. You can specify that a rule is added to this section by clicking the section heading before adding the rule.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important. Providing a manual section both before and after the automatic rules lets you ensure all your rules are in the appropriate order, since you can re-order rules only within their section. The rules in each section take precedence over the rules in the section below it. For example, the rules in the top, "Before" section take precedence over the rules in the Network Object NAT section, and so on.

- The type of each rule—Static, Dynamic PAT, or Dynamic NAT and PAT— is indicated visually in the table by presenting **(S)**, **(DP)**, or **(DNP)** in blue following the Source parameter in the "Translated" column.

- A Bi-directional rule is a static rule that actually consists of two paired rules, one each for outgoing and incoming translation of the specified source and destination values. Each Bi-directional rule entry in the rules table is presented as two lines.

For example, if Bi-directional is chosen when you create a static rule with Host1 in the Source field and Host2 in the Translated field, two lines are added to the rules table: one with Host1 being translated to Host2, and one with Host2 being translated to Host1.

Related Topics

- NAT Policies on Security Devices , on page 1031
- About "Simplified" NAT on ASA 8.3+ Devices , on page 1020
- Standard rules table topics:
  - Using Rules Tables , on page 604
  - Filtering Tables , on page 50
  - Table Columns and Column Heading Features , on page 51

Navigation Path

- (Device view) Select **NAT** > **Translation Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM)** > **Translation Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Translation Rules page is displayed. Note that in Policy View, the Network Object NAT Rules section is not displayed because those rules are device-specific.

Adding, Editing and Deleting Rules

To **add** a NAT rule:

1. Select the heading of the section to which the rule is to be added. If you do not select a heading, the rule will be added to *NAT Rules Before* by default.
2. Open the Add NAT Rule dialog box: either click the Add Row button at the bottom of the table, or right-click anywhere in the table (except on an existing rule entry) and choose Add Row from the pop-up menu.
3. Define the rule and then click OK to close the dialog box, adding the rule to the table.

To **edit** a NAT rule:

1. Open the Edit NAT Rule dialog box for the desired rule: either select the rule in the NAT rules table and then click the Edit Row button at the bottom of the table, or simply right-click the desired rule entry and choose Edit Row from the pop-up menu.
2. Edit the rule and then click OK to close the dialog box.

See Add and Edit NAT Rule Dialog Boxes , on page 1055 for a complete description of the Add NAT Rule dialog box.

To **delete** a NAT rule, select the rule in the table and click the Delete Row button at the bottom of the table, or simply right-click the desired rule entry and choose Delete Row from the pop-up menu.

Note To remove a Network Object NAT rule from this table, you must uncheck the Add Automatic Address Translation NAT Rule option, or change the device to which the rule is assigned, in the related Edit Network Host dialog box. See Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062 for additional information.

Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

Add and Edit NAT Rule Dialog Boxes

Use the Add NAT Rule dialog box to add a NAT rule to the selected ASA 8.3+ device; this dialog box is not available on earlier-version ASAs, nor on PIX or FWSM devices. Refer to Configuring NAT on PIX, FWSM, and pre-8.3 ASA Devices , on page 1035 for information about adding and editing NAT rules on those devices.

Note Except for their titles, the Add NAT Rule and Edit NAT Rule dialog boxes are identical, and the following descriptions apply to both.

Navigation Path

To add a rule, select the section to which you want the rule added (NAT Rules Before or NAT Rules After), and then click the Add Row button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add NAT Rule dialog box. Note that if you do not select a section, the new rule is added to the NAT Rules Before section.

To edit a rule, select the rule and click the Edit Row button, or simply right-click the rule and choose the Edit Row command, to open the Edit NAT Rule dialog box for that rule.

Field Reference

Table 317: Add and Edit NAT Rule Dialog Boxes

Element	Description
Source Interface	The name of the interface on which a packet may originate; this is the "real" interface. Defaults to "any," which represents all interfaces. Enter or Select the desired interface. **Note** In transparent firewall mode, you must set specific interfaces.
Destination Interface	**Destination Interface** – The name of the interface on which a packet may terminate; this is the "mapped" interface. Defaults to "any," which represents all interfaces. Enter or Select the desired interface. **Note** In transparent firewall mode, you must set specific interfaces.
Source NAT Type	The type of translation rule you are creating: • **Static** – Provides static assignment of real addresses to mapped addresses. • **Dynamic PAT (Hide)** – Provides dynamic assignment of multiple local addresses to a single global IP address and a unique port number, in effect "hiding" the local addresses behind the one global address. • **Dynamic NAT and PAT** – Provides dynamic assignment of real addresses to mapped addresses, and real ports to mapped ports. Selecting this option adds the PAT Pool Address Translation options to the dialog box. On devices operating in routed mode, this option also provides the fallthrough option described below. **Note** This selection applies only to the specified source translation; destination translation is always static.
Source Translation	
Original Source	The source address the NAT rule will translate. If this is a range or network, all addresses in the range or network are translated.

Element	Description
Translated Source Address Interface	Whether the translation is based on an address or an interface on the device. Select either: • **Address** – Translate the original address using the Networks/Hosts object specified in the Translated Source field. This entry represents the pool of translation addresses: enter or Select the desired Networks/Hosts; defaults to the Original Source (which will produce an Identity NAT rule). • **Interface** – Translate the original address based on the interface specified in the Destination Interface field. For port address translation based on this interface, be sure to configure the options in the Service Translation section (in the Advanced panel of this dialog box). If the Destination Interface is not defined, the Address/Interface selection reverts to Address and the Original Source is inserted into the Address field. This produces an Identity NAT rule, meaning the specified address(es) are translated to themselves (effectively not translated); Identity NAT applies to outbound connections only. **Note** These options are not available when Dynamic NAT and PAT is the selected Type, nor are they available on devices operating in transparent mode.

Element	Description
PAT Pool Address Translation	This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a "pool" of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to PAT Pools and Round Robin Allocation , on page 1061 for additional information about these features. Check the PAT Pool Address Translation box to enable the following options: • **Address** or **Interface** – Select Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Interface to provide a Fallthrough Interface. • **Address** – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above. • **Use Round Robin Allocation** – Check this box to map addresses/ports using a "round-robin" approach. See PAT Pools and Round Robin Allocation , on page 1061 for more information about this option. • **Extended PAT Table** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1). • **Flat Port Range** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select **Include Reserve Ports**. • **Include Reserve Ports** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range. • **Block Allocation** (Available for ASA 9.5(1) and later) – Check this box to allocate a block of ports per host. This feature is supported from Security Manager version 4.9 onwards for ASA devices 9.5(1) or later.

Element	Description
Destination Translation Use the options in this section to configure optional static translation of destination addresses: **Note** If defined, Destination Translation is always static, regardless of the rule Type. **Note** These options are not available on devices operating in transparent mode.	
Original Destination Address Interface	Whether the translation is based on an address or an interface on the device. Select either: • **Address** - Translate the original destination using the Networks/Hosts object specified in the Translated Destination field. If Address is selected, specify the Networks/Hosts object, whose original destination addresses should be translated, in the **Original Destination** entry field. • **Interface** – Translate the original destination using the Networks/Hosts object specified in the Translated Destination field. If Interface is selected, enter or select the desired interface in the Destination Interface field. The Interface Selector list contains all interfaces currently defined on the device.
Translated Destination	This entry represents the pool of destination addresses to use for translation: enter or select the desired Networks/Hosts object. **Note** You can now enter or select an FQDN Singleton object for ASA 9.17(1) and above devices for the FPR-2000, FPR-4000, and FPR-9000 series platform.
Service Translation Use the options in this section to configure port address translation. These service objects represent a service protocol (TCP or UDP), and one or more ports. The mapping of original ports to translated port is circular. That is, the first original value is mapped to the first translated value, and the second original value is mapped to the second translated value, and so on until all original values are translated. If the pool of translated port is exhausted before that point, mapping continues using the first translated value again. See Understanding and Specifying Services and Service and Port List Objects , on page 331 for information about configuring service objects. **Note** Service Translation and the following **Translate DNS replies that match this rule** option cannot be used together.	
Original Service	Enter or select the Service object that defines the service(s) to be translated. Leave the Original Service field blank to configure translation of any service to the specified Translated Service. **Note** The protocol specified in both Service objects must be the same.
Translated Service	Enter or select the Service object that provides the service(s) to be used for translation.

Element	Description
Options	
Translate DNS replies that match this rule	When checked, addresses embedded in DNS replies that match this rule are rewritten. For DNS replies traversing from a mapped interface to a real interface, the Address (or "A") record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality.
Fallthrough to Interface PAT (Destination Interface)	When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.
IPv6	When selected, the IPv6 address of the interface is used.
Net to net mapping of IPv4 to IPv6	When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.
Do not proxy ARP on Destination Interface	Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type. **Note** This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction. By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.) **Note** You also can disable Proxy ARP on individual interfaces, as described in Configuring No Proxy ARP , on page 2083.
Perform route lookup for Destination Interface	If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT. **Note** This option is available on ASA 8.4.2+ devices, only when Bidirectional is the chosen Direction. The option is not available on devices operating in transparent mode.

Element	Description
Unidirectional	This feature lets you configure a static NAT rule in a single direction only; or dual rules, one each for both directions (forward and reverse). When selected, a single static NAT is created, as specified by the other options in this dialog box. Dynamic rules are uni-directional by default. If deselected, two linked static NAT rules are created, encompassing both directions of the translation, as specified by the other options in this dialog box. Note that each bi-directional rule entry in the rules table consists of two lines.
Description	(Optional) Provide a description of the rule.
Category	(Optional) Choose a category to assign to the rule. Categories can help you organize and identify rules and objects; see Using Category Objects , on page 241 for more information. **Note** This option is not available when Dynamic NAT and PAT is the chosen rule Type.

PAT Pools and Round Robin Allocation

Adaptive Security Appliances, version 8.4.2 and later, include two features that let you alter how port address translation (PAT) occurs: you can explicitly define a pool of IP addresses specifically for PAT, and you can select a “round robin” algorithm for port allocation during PAT.

These features simplify configuration of large numbers of PAT addresses, and help prevent a large number of connections from a single PAT address, which can appear to be part of a DoS attack.

Explicit PAT Pool Definition

Prior to version 8.4.2, when you defined a Dynamic NAT and PAT rule, you provided a “pool” of IP addresses (in the Translated Source field of the Add/Edit NAT Rule dialog boxes) to be used for translation. This pool could consist of individual IP addresses, ranges of addresses, Networks/Hosts objects, or Network/Host group objects, and combinations thereof.

Ranges and objects with more than one IP address were considered to be in the “NAT Pool,” while individual IP addresses and group objects consisting of one or more individual addresses were considered to be part of the “PAT Pool.”

Address translation on the device would work its way through the NAT Pool until all available addresses were exhausted. Port address translation would then begin using the PAT Pool—assigning ports on the first IP address in the PAT Pool until all ports (approximately 64,000) are assigned, then assigning ports on the next address in the pool, and so on. When all ports are fully subscribed on all IP addresses in the PAT Pool, no further translation could occur.

On version 8.4.2 and later ASA devices, you can explicitly define a separate PAT Pool for a Dynamic NAT and PAT rule. If you do so, the first collection of addresses (defined in the Translated Source field) is considered the NAT Pool, while the PAT Pool addresses are specified in the PAT Pool Address Translation field.

Note If you do not explicitly specify a PAT Pool, address translation takes place as described for pre-8.4.2 devices.

Refer to Add and Edit NAT Rule Dialog Boxes , on page 1055 for more information about the defining translation rules.

Round Robin Port Assignment

On version 8.4.2 and later ASA devices, you also can specify an alternate method of port assignment during PAT processing. As mentioned earlier, PAT port numbers are assigned to a single IP address in succession until the final port number is assigned, and then the process begins again with the next available IP address in the pool.

However, a new parameter on 8.4.2 and later devices—Use Round Robin Allocation for PAT Pool—lets you specify "round robin" cycling through available IP addresses and port numbers. This method assigns an address/port combination using each successive address in the pool; it then uses the first address again with a different port, proceeds to the second address again, and so on.

Further, the round-robin algorithm incorporates two additional principles it will attempt to adhere to when assigning address/port combinations during PAT processing:

- If a specific source-to-destination mapping already exists, the algorithm attempts to use the existing translation for the new connection. If this is not possible (for example, when all ports for that IP address have been exhausted), the algorithm proceeds with standard round-robin cycling.
- If possible, the original source port number is used as the mapped port number. That is, if the port number of the address/port combination to be translated is 4904, for example, and 4904 is available with the next IP address in the PAT Pool, the translated address will be *PAT_address* /4904. Note if this is not possible (that port is not available with the next PAT address), the algorithm proceeds with standard round-robin cycling.

Note If you do not explicitly specify Round Robin Allocation, port-allocation cycling occurs as described for pre-8.4.2 devices.

Add or Edit Network/Host Dialog Box: NAT Tab

Use the NAT tab in any of the dialog boxes used to add or edit host, network, or address range objects to create or update object NAT rules. This NAT configuration is used only for ASA 8.3+ devices; if you use the object on any other type of device, the NAT configuration is ignored.

The NAT configuration is created as a device override and is not kept in the global object. Therefore, you must select the **Allow Value Override per Device** option if you configure these NAT options. (This option is selected automatically when you close the dialog box.)

This topic describes the fields on the NAT tab. For information about the fields on the General tab, see Add or Edit Network/Host Dialog Box , on page 314.

Navigation Path

Select the NAT tab on the Add or Edit Network/Host Dialog Box , on page 314 when creating or editing a host, network, or address range object.

Field Reference

Table 318: Network/Host Dialog Box NAT Tab

Element	Description
Add Automatic Address Translation NAT Rule	If checked, a network address translation (NAT) rule, as defined here, will be applied to the device specified in the Translated By field. The rule will appear in the Network Object NAT Rule section of the Translation Rules table for that device (see Translation Rules: ASA 8.3+ , on page 1053).
Translated By	The device on which you are configuring the NAT rule. Click Select to select the device from a list. The list is filtered to show only ASA 8.3+ devices.
Source Interface	The name of the interface on which a packet may originate; this is the "real" interface. Defaults to **any**, which represents all interfaces.
Destination Interface	The name of the interface on which a packet may terminate; this is the "mapped" interface. Defaults to **any**, which represents all interfaces.
Type	The type of translation rule you are creating: • **Static** – Enables static assignment of real addresses to mapped addresses. • **PAT (Hide)** – Enables dynamic assignment of multiple local addresses to a single global IP address and a unique port number. • **Dynamic NAT and PAT** – Enables dynamic assignment of real addresses to mapped addresses, and real ports to mapped ports.
Source Translation	
Original value	Shows the address configured on the General tab of this dialog box. This is the source address the NAT rule will translate. If it is a range or network, all addresses in the range or network will be translated.
Translated Source Use Address Use Interface (available only for Static and PAT)	Whether the translation is based on an address or an interface on the device: • **Use Address**—Translate the original address using the specified address or network/host object. Enter the address or object name in the **Address** field, or click Select to select the object from a list. • **Use Interface** – Translate the original address based on the interface specified in the Destination Interface field. **Note** The Use Interface options are available only when either Static or PAT (Hide) is chosen as the Type.

Element	Description
PAT Pool Address Translation	This option is available when Dynamic NAT and PAT is the selected Type. The related parameters let you specify a "pool" of IP addresses to be used for specifically for port address translation, as well as change the algorithm used for PAT mapping. Refer to PAT Pools and Round Robin Allocation , on page 1061 for additional information about these features. Check the PAT Pool Address Translation box to enable the following options: • **Use Address** or **Use Interface** – Select Use Address to indicate that the PAT Pool Address field contains networks/hosts (or networks/hosts objects) for use as the PAT pool. Select Use Interface to provide a Fallthrough Interface. • **PAT Pool Address** – Enter or Select the desired Networks/Hosts or desired Interface according to your Address or Interface selection above. • **Use Round Robin Allocation for PAT Pool** – Check this box to map addresses/ports using a "round-robin" approach. See PAT Pools and Round Robin Allocation , on page 1061 for more information about this option. • **Extended PAT Table** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable extended PAT. Extended PAT uses 65535 ports per service, as opposed to per IP address, by including the destination address and port in the translation information. Normally, the destination port and address are not considered when creating PAT translations, so you are limited to 65535 ports per PAT address. For example, with extended PAT, you can create a translation of 10.1.1.1:1027 when going to 192.168.1.7:23 as well as a translation of 10.1.1.1:1027 when going to 192.168.1.7:80. This option is available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1). • **Flat Port Range** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to enable use of the entire 1024 to 65535 port range when allocating ports. When choosing the mapped port number for a translation, the ASA uses the real source port number if it is available. However, without this option, if the real port is not available, by default the mapped ports are chosen from the same range of ports as the real port number: 1 to 511, 512 to 1023, and 1024 to 65535. To avoid running out of ports at the low ranges, configure this setting. To use the entire range of 1 to 65535, also select **Include Reserve Ports**. • **Include Reserve Ports** (Available for ASA 8.4(3) and later, not including 8.5(1) or 8.6(1)) - Check this box to include the reserve ports, 1-1023, in the PAT range.
Service Translation Use the options in this section of the Advanced panel to configure static port address translation: (Available for Static rules only.) **Note** Service Translation and the **Translate DNS replies that match this rule** option cannot be used together.	

Element	Description
Protocol	Whether a TCP or UDP port.
Original Port	The port on which the traffic enters the device.
Translated Port	The port number which is to replace the original port number.
Options	
Translate DNS replies that match this rule	When checked, addresses embedded in DNS replies that match this rule are rewritten. For DNS replies traversing from a mapped interface to a real interface, the Address (or "A") record is rewritten from the mapped value to the real value. Conversely, for DNS replies traversing from a real interface to a mapped interface, the A record is rewritten from the real value to the mapped value. Note that DNS inspection must be enabled to support this functionality. **Note** This option and Service Translation cannot be used together.
Fallthrough to Interface PAT (Destination Interface)	When checked, dynamic PAT back-up is enabled. When the pool of dynamic NAT addresses is depleted, port address translation is performed, using the address pool specified in the Use Address field. This option is available only when Dynamic NAT and PAT is the chosen Type on devices operating in routed mode.
IPv6	When selected, the IPv6 address of the interface is used.
Net to net mapping of IPv4 to IPv6	When checked, translates the first IPv4 address to the first IPv6 address, the second to the second, and so on. Without this option, the IPv4-embedded method is used where the 32-bits of the IPv4 address is embedded after the IPv6 prefix. For a one-to-one translation, you must select this option.
Do not proxy ARP on Destination Interface	Check this box to disable proxy ARP on the specified Destination Interface. This option is available only when Static is the chosen rule Type. By default, all NAT rules include proxy ARP on the egress interface. A NAT Exempt rule is used to bypass NAT for both ingress and egress traffic, relying on route look-up to locate the egress interface. Thus, Proxy ARP should be disabled for NAT Exempt rules. (The NAT Exempt rules always take priority and appear above all other NAT rules in the Translation Rules table.) **Note** You also can disable Proxy ARP on individual interfaces, as described in Configuring No Proxy ARP , on page 2083.
Perform route lookup for Destination Interface	If this option is selected, the egress interface is determined using route look-up instead of using the specified Destination Interface. Be sure this box is checked for a NAT Exempt rule. This option is supported only for Static Identity NAT. **Note** This option is not available on devices operating in transparent mode.

Per-Session NAT Rules: ASA 9.0(1)+

Use the Per-Session NAT Rules page to configure per-session PAT rules on the selected ASA 9.0(1)+ device. By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. You can configure per-session rules to use multi-session PAT for specific traffic.

Per-Session PAT vs. Multi-Session PAT (Version 9.0(1) and Later)

The per-session PAT feature improves the scalability of PAT and, for clustering, allows each member unit to own PAT connections; multi-session PAT connections have to be forwarded to and owned by the control unit. At the end of a per-session PAT session, the ASA sends a reset and immediately removes the xlate. This reset causes the end node to immediately release the connection, avoiding the TIME_WAIT state. Multi-session PAT, on the other hand, uses the PAT timeout, by default 30 seconds. For "hit-and-run" traffic, such as HTTP or HTTPS, the per-session feature can dramatically increase the connection rate supported by one address. Without the per-session feature, the maximum connection rate for one address for an IP protocol is approximately 2000 per second. With the per-session feature, the connection rate for one address for an IP protocol is 65535/average-lifetime.

By default, all TCP traffic and UDP DNS traffic use a per-session PAT xlate. For traffic that can benefit from multi-session PAT, such as H.323, SIP, or Skinny, you can disable per-session PAT by creating a per-session deny rule.

Some Features of the Per-Session NAT Rules Table

This Translation Rules table is a standard Security Manager rules table, as described in Using Rules Tables , on page 604. For example, you can move, show and hide columns; you can re-order the rules; and you can right-click certain table cells to edit that parameter.

The NAT rules listed in this table are processed on a first-match basis; therefore, order is important.

Related Topics

- Add and Edit Per Session NAT Rule Dialog Boxes , on page 1067
- NAT Policies on Security Devices , on page 1031
- About “Simplified” NAT on ASA 8.3+ Devices , on page 1020
- Standard rules table topics:
  - Using Rules Tables , on page 604
  - Filtering Tables , on page 50
  - Table Columns and Column Heading Features , on page 51

Navigation Path

- (Device view) Select **NAT > Per-Session NAT Rules** from the Device Policy selector.
- (Policy view) Select **NAT (PIX/ASA/FWSM) > Per-Session NAT Rules** from the Policy Type selector. Select an existing policy from the Shared Policy selector, or right-click **Translation Rules** to create a new policy.

The Per-Session NAT Rules page is displayed.

Adding, Editing and Deleting Rules

To **add** a per-session NAT rule:

1. Select the rule under which the rule is to be added. If you do not select a heading, the rule will be added to the end of the table by default.
2. Open the Add Per-Session NAT Rule dialog box: either click the **Add Row** button at the bottom of the table, or right-click anywhere in the table and choose **Add Row** from the pop-up menu.
3. Define the rule and then click **OK** to close the dialog box, adding the rule to the table.

See Add and Edit Per Session NAT Rule Dialog Boxes , on page 1067 for a complete description of the Add Per-Session NAT Rule dialog box.

To **edit** a per-session NAT rule:

1. Open the Edit Per-Session NAT Rule dialog box for the desired rule: either select the rule in the Per-Session NAT rules table and then click the **Edit Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Edit Row** from the pop-up menu.
2. Edit the rule and then click **OK** to close the dialog box.

See Add and Edit Per Session NAT Rule Dialog Boxes , on page 1067 for a complete description of the Edit Per-Session NAT Rule dialog box.

To **delete** a per-session NAT rule, select the rule in the table and click the **Delete Row** button at the bottom of the table, or simply right-click the desired rule entry and choose **Delete Row** from the pop-up menu.

Enabling and Disabling Rules

You can disable one or more consecutive rules without removing them from the table, as follows:

1. Select the rule(s) to be disabled. If selecting a contiguous block of rules, click the first and then Shift-click the last rule of the block.
2. Right-click a selected rule, and choose **Disable** from the pop-up menu.

Disabled rules are grayed-out in the table.

To re-enable one or one or more consecutive disabled rules, repeat this process, choosing **Enable** from the pop-up menu.

Add and Edit Per Session NAT Rule Dialog Boxes

By default, all TCP PAT traffic and all UDP DNS traffic uses per-session PAT. To use multi-session PAT for traffic, you can configure per-session PAT rules: a permit rule uses per-session PAT, and a deny rule uses multi-session PAT.

For more information about per-session vs. multi-session PAT, see Per-Session NAT Rules: ASA 9.0(1)+ , on page 1066.

Defaults

By default, the following rules are installed:

- Permit TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)
- Permit UDP from any (IPv4 and IPv6) to domain

These rules do not appear in the rule table.

Note You cannot remove these rules, and they always exist after any manually-created rules. Because rules are evaluated in order, you can override the default rules. For example, to completely negate these rules, you could add the following:Deny TCP from any (IPv4 and IPv6) to any (IPv4 and IPv6)Deny UDP from any (IPv4 and IPv6) to domain

Navigation Path

From the Per-Session NAT Rules: ASA 9.0(1)+ , on page 1066 page, do one of the following:

- To add a rule, select the rule under which you want the rule added, and then click the **Add Row** button below the rules table, or right-click anywhere inside the table and choose **Add Row** to open the Add Per-Session NAT Rule dialog box.
- To edit a rule, select the rule and click the **Edit Row** button, or simply right-click the rule and choose **Edit Row** to open the Edit Per-Session NAT Rule dialog box for that rule.

Field Reference

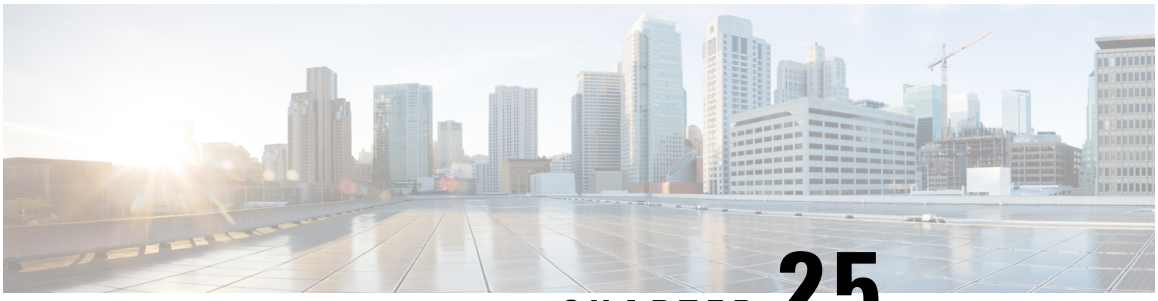
Table 319: Add and Edit NAT Rule Dialog Boxes

Element	Description
Action	The action for this rule: Permit or Deny. A permit rule uses per-session PAT; a deny rule uses multi-session PAT.
Original Network	The source address or addresses (or Networks/Hosts objects) to which the rule applies. If this is a range or network, all addresses in the range or network are translated.
Destination Network	The destination address or addresses (or Networks/Hosts objects) to which the rule applies.
Service (tcp/udp Only)	Enter or Select the Service object that defines the service(s) to be translated. These service objects represent a service protocol (TCP or UDP), and one or more ports. See Understanding and Specifying Services and Service and Port List Objects , on page 331 for information about configuring service objects.

Element	Description
Category	(Optional) Choose a category to assign to the rule. Categories can help you organize and identify rules and objects; see Using Category Objects , on page 241 for more information. **Note** This option is not available when Dynamic NAT and PAT is the chosen rule Type.
Description	(Optional) Provide a description of the rule.

PART III

VPN Configuration



CHAPTER 25

Managing Site-to-Site VPNs: The Basics

A virtual private network (VPN) consists of multiple remote peers transmitting private data securely to one another over an unsecured network, such as the Internet. Site-to-site VPNs use tunnels to encapsulate data packets within normal IP packets for forwarding over IP-based networks, using encryption to ensure privacy and authentication to ensure integrity of data.

In Cisco Security Manager, site-to-site VPNs are implemented based on IPsec policies that are assigned to VPN topologies. An IPsec policy is a set of parameters that define the characteristics of the site-to-site VPN, such as the security protocols and algorithms that will be used to secure traffic in an IPsec tunnel. Security Manager translates IPsec policies into CLI commands that can be deployed to the devices in the VPN topology. Several policy types might be required to define a full configuration image that can be assigned to a VPN topology, depending on the IPsec technology type.

The Site-to-Site VPN Manager defines and configures site-to-site VPN topologies and policies on Cisco IOS security routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) firewall devices.

Tip In ASA documentation, site-to-site VPNs are called LAN-to-LAN VPNs. These phrases are equivalent, and we use “site-to-site VPN” in this documentation.

You can access the Site-to-Site VPN Manager by selecting **Manage > Site-To-Site VPNs** or clicking the Site-To-Site VPN Manager button on the toolbar.

You can also configure shared policies in Policy view and view and configure topologies in Device view. In Policy View, you can assign IPsec policies to VPN topologies.

This chapter contains the following topics:

Understanding VPN Topologies

A VPN topology specifies the peers and the networks that are part of the VPN and how they connect to one another. After you create a VPN topology, the policies that can be applied to your VPN topology become available for configuration, depending on the assigned IPsec technology.

Security Manager supports three main types of topologies—hub and spoke, point to point, and full mesh, with which you can create a site-to-site VPN. Not all policies can be applied to all VPN topologies. The policies that can be applied depend on the IPsec technology that is assigned to the VPN topology. In addition, the IPsec technology that is assigned to a VPN depends on the topology type. For example, the DMVPN and Easy VPN technologies can only be applied in a hub-and-spoke topology.

For more information, see Understanding IPsec Technologies and Policies , on page 1077.

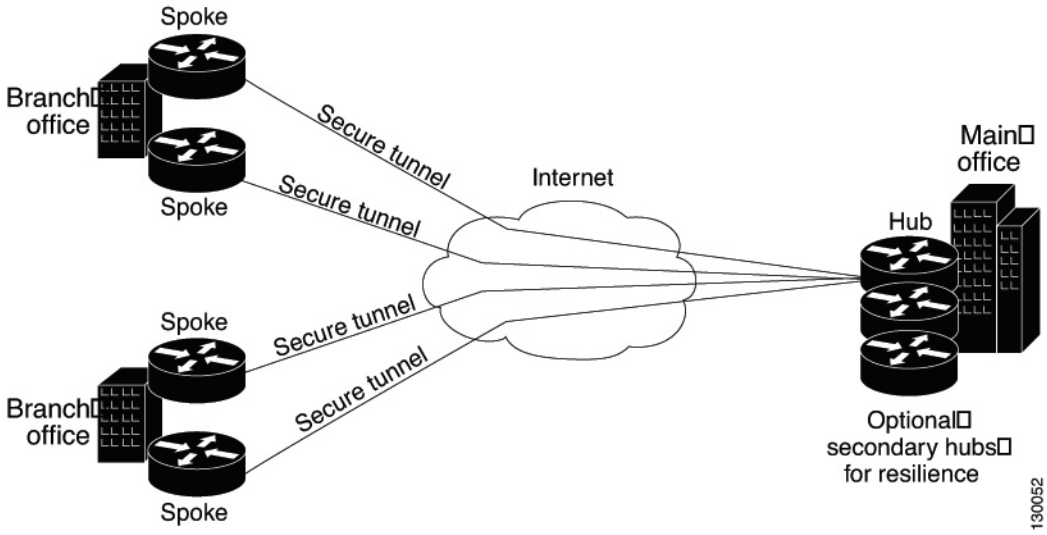
The following topics describe:

Hub-and-Spoke VPN Topologies

In a hub-and-spoke VPN topology, multiple remote devices (spokes) communicate securely with a central device (hub). A separate, secured tunnel extends between the hub and each individual spoke.

The following illustration shows a typical hub-and-spoke VPN topology.

Figure 30: Hub-and-spoke VPN Topology



This topology usually represents an intranet VPN that connects an enterprise's main office with branch offices using persistent connections to a third-party network or the Internet. VPNs in a hub-and-spoke topology

provide all employees with full access to the enterprise network, regardless of the size, number, or location of its remote operations.

A hub is generally located at an enterprise's main office. Spoke devices are generally located at an enterprise's branch offices. In a hub-and-spoke topology, most traffic is initiated by hosts at the spoke site, but some traffic might be initiated from the central site to the spokes.

If the hub in a hub-and-spoke configuration becomes unavailable for any reason, IPsec failover transfers tunnel connections seamlessly to a failover (backup) hub, which is used by all spokes. You can configure multiple failover hubs for a single primary hub.

In a hub-and-spoke VPN topology, all IPsec technology types can be assigned except GET VPN.

Point-to-Point VPN Topologies

In a point-to-point VPN topology, two devices communicate directly with each other, without the option of IPsec failover as in a hub-and-spoke configuration. To establish a point-to-point VPN topology, you specify two endpoints as peer devices. Because either of the two devices can initiate the connection, the assigned IPsec technology type can be only regular IPsec or IPsec/GRE.

In Security Manager, you can configure a special type of regular IPsec point-to-point VPN called an Extranet. An Extranet VPN is a connection between a device in your managed network and an unmanaged device, such as a router in your service provider's network, a non-Cisco device, or simply a device in your network that is being managed by a different group (that is, one that does not appear in the Security Manager inventory).

The following illustration shows a typical point-to-point VPN topology.

Figure 31: Point-to-Point VPN Topology

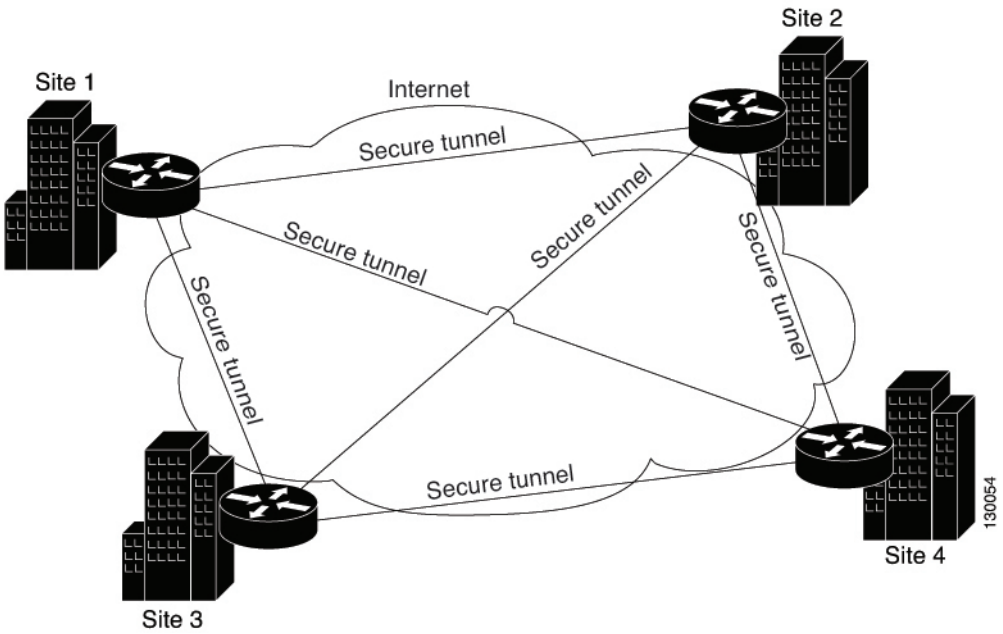
Full Mesh VPN Topologies

A full mesh topology works well in a complicated network where all peers need to communicate with each other. In this topology type, every device in the network communicates with every other device through a unique IPsec tunnel. All devices have direct peer relationships with one another, preventing a bottleneck at the VPN gateway device, and saving the overhead of encryption and decryption on the device.

You can assign only Regular IPsec, IPsec/GRE, and GET VPN technologies to a full mesh VPN topology.

The following illustration shows a typical full mesh VPN topology.

Figure 32: Full Mesh VPN Topology



A full mesh network is reliable and offers redundancy. When the assigned technology is GRE and one device (or node) can no longer operate, all the rest can still communicate with one another, directly or through one or more intermediate nodes. With regular IPsec, if one device can no longer operate, a crypto access control list (ACL) that specifies the protected networks, is created per two peers.

GET VPN is based on the group trust model. In this model, group members register with a key server. The key server uses the Group Domain of Interpretation (GDOI) protocol for distributing the security policy and keys for encrypting traffic between the group members. Because you can configure a primary key server and secondary key servers that synchronize their policies with the primary one, if the primary key server becomes unavailable, a secondary key server can take over.

Note When the number of nodes in a full mesh topology increases, scalability may become an issue—the limiting factor being the number of tunnels that the devices can support at a reasonable CPU utilization.

Implicitly Supported Topologies

In addition to the three main VPN topologies, other more complex topologies can be created as combinations of these topologies. They include:

- Partial mesh—A network in which some devices are organized in a full mesh topology, and other devices form either a hub-and-spoke or a point-to-point connection to some of the fully meshed devices. A partial mesh does not provide the level of redundancy of a full mesh topology, but it is less expensive to implement. Partial mesh topologies are generally used in peripheral networks that connect to a fully meshed backbone.
- Tiered hub-and-spoke—A network of hub-and-spoke topologies in which a device can behave as a hub in one or more topologies and a spoke in other topologies. Traffic is permitted from spoke groups to their most immediate hub.
- Joined hub-and-spoke—A combination of two topologies (hub-and-spoke, point-to-point, or full mesh) that connect to form a point-to-point tunnel. For example, a joined hub-and-spoke topology could comprise two hub-and-spoke topologies, with the hubs acting as peer devices in a point-to-point topology.

Understanding IPsec Technologies and Policies

Security Manager provides seven types of IPsec technologies that you can configure on the devices in your site-to-site VPN topology—Regular IPsec, IPsec/GRE, GRE Dynamic IP, standard and large scale DMVPN, Easy VPN, and GET VPN. The assigned technology determines which policies you can configure for the VPN.

You assign an IPsec technology to a VPN topology during its creation. After an IPsec technology is assigned to a VPN topology, you cannot change the technology, other than by deleting the VPN topology and creating a new one. See Defining the Name and IPsec Technology of a VPN Topology , on page 1106.

The following topics explain some basic concepts about IPsec technologies and site-to-site VPN policies:

- Understanding Mandatory and Optional Policies for Site-to-Site VPNs , on page 1078

Understanding Mandatory and Optional Policies for Site-to-Site VPNs

Some site-to-site VPN policies are mandatory, which means that you must configure them to create a VPN topology or to save your changes when editing them. Most mandatory policies have predefined defaults, which you can use to complete the definition of a VPN topology, but you typically must edit the policies to ensure their settings work for your network.

Optional policies, which you need to configure only if you desire the services defined by the policy, do not come with predefined defaults.

Tip You can configure your own mandatory policy defaults by creating shared policies that specify the desired settings, and then by selecting these shared policies when creating a VPN. You can even make the shared policies the defaults for the Create VPN wizard. However, these default policies do not apply when you create Extranet VPNs; with Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow. In addition, you cannot create a default policy for IKEv2 Authentication. For more information, see Understanding and Configuring VPN Default Policies , on page 1086.

Some mandatory policies are mandatory only under certain conditions. For example, an IKEv1 preshared key policy is mandatory only if the default (mandatory) IKEv1 proposal uses preshared key authentication. If the selected IKE authentication method is Certificate (RSA Signature), an IKEv1 Public Key Infrastructure policy is mandatory (see Deciding Which Authentication Method to Use , on page 1157). If you allow IKEv2 negotiations in the topology, an IKEv2 Authentication policy is mandatory.

The following table lists the mandatory and optional policies for each predefined technology that you can assign to the devices in your site-to-site VPN topology.

Table 320: Site-to-Site VPN IPsec Technologies and Policies

Technology	Mandatory Policies	Optional Policies
Regular IPsec See Understanding IPsec Proposals for Site-to-Site VPNs , on page 1168.	• IKE Proposal • IPsec Proposal • When allowing IKEv1, one of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • When allowing IKEv2, IKEv2 Authentication	• VPN Global Settings

Technology	Mandatory Policies	Optional Policies
IPsec/GRE (Generic Routing Encapsulation) See Understanding GRE , on page 1226.	• IKE Proposal • IPsec Proposal • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • GRE Modes	• VPN Global Settings
GRE Dynamic IP See Understanding GRE Configuration for Dynamically Addressed Spokes , on page 1229.	• IKE Proposal • IPsec Proposal • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • GRE Modes	• VPN Global Settings
Dynamic Multipoint VPN (DMVPN). See Understanding DMVPN , on page 1234.	• IKE Proposal • IPsec Proposal • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • GRE Modes	• VPN Global Settings
Large Scale DMVPN See Configuring Large Scale DMVPNs , on page 1241.	• IKE Proposal • IPsec Proposal • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • GRE Modes • Server Load Balance	• VPN Global Settings
Easy VPN See Understanding Easy VPN , on page 1245.	• IKE Proposal • Easy VPN IPsec Proposal • Client Connection Characteristics • If any servers are IOS or PIX 6.3 devices: User Group • If any servers are ASA or PIX 7.0+ devices: Connection Profiles	• IKEv1 Public Key Infrastructure (mandatory if using certificates) • VPN Global Settings

Technology	Mandatory Policies	Optional Policies
GET VPN See Understanding Group Encrypted Transport (GET) VPNs , on page 1261.	• Group Encryption • IKE Proposal for GET VPN • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure	• Global Settings for GET VPN
Regular IPSec VTI See Configuring Tunnel Interface, on page 1826.	• IKE Proposal • Peers • One of: IKEv1 Preshared Key or IKEv1 Public Key Infrastructure • IKEv2 Authentication • Tunnel Interface with IPSec Profile

Overview of Site-to-Site VPN Policies

You can access site-to-site VPN policies by selecting **Manage > Site-To-Site VPNs**, or by clicking the **Site-To-Site VPN Manager** button on the toolbar, and then selecting the required policy in the Policies selector of the Site-to-Site VPN window. You can also access site-to-site VPN policies from Device view or Policy view. For more information, see Accessing Site-to-Site VPN Topologies and Policies , on page 1092.

From version 4.21 onwards, Cisco Security Manager supports multi-peer crypto maps in site-to-site VPNs for IKEv2. However, you can set up a multi-peer crypto map only through Flex Config.

Note After you configure the multi-peer crypto map, deploy, and discover the VPN topology, the next crypto map in the sequence will not be generated. For deployments thereafter, single-peer crypto map will be negated and multi-peer crypto map will be generated.

The following is a summary of all of the site-to-site VPN policies, some of which you cannot create as shared policies. Note that some of these policies are documented in the sections that explain remote access VPNs, because the policies are used for both remote access and site-to-site VPNs. However, you must configure these policies separately for each type of VPN.

Configuring Multi-Peer Crypto Maps in Site-to-Site VPNs for IKEv2

From version 4.21 onwards, Cisco Security Manager supports multi-peer crypto maps in site-to-site VPNs for IKEv2. However, you can set up a multi-peer crypto map only through Flex Config. You can create multi-peer crypto maps for P2P, Hub and Spoke, or Full Mesh topologies.

This procedure describes how to configure multi-peer crypto maps in site-to-site VPNs for P2P, Hub and Spoke, and Full Mesh topologies. For more information on site-to-site VPN tolopologies and policies, see Accessing Site-to-Site VPN Topologies and Policies , on page 1092.

Step 1 Deploy the intended VPN topology - P2P, Hub and Spoke, or Full Mesh.

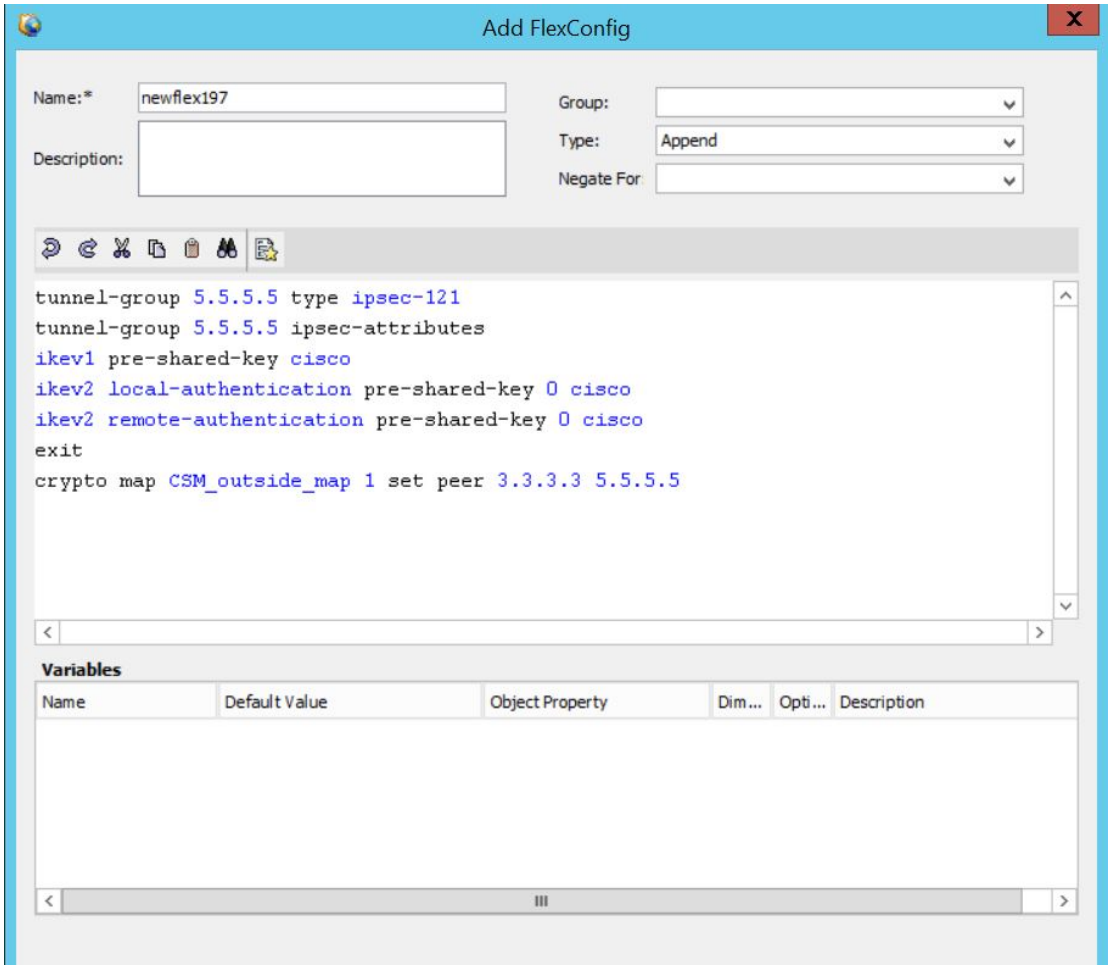
Note: Ensure the **Connection Type** is set to **Bidirectional** for Hub peer when using Hub-and-Spoke topology.

Step 2 In **Tools** > **Security Manager Admin** > **Deployment**, uncheck the **Deploy only new or modified Flexconfigs** checkbox.

Step 3 Click **Add FlexConfig**, select **Type** as **Append**, and enter the multi-peer CLI and the corresponding tunnel group CLI.

Step 4 Enter the multi-peer support-specific CLI, as shown in the Figure 33: Multi Peer-Specific and Tunnel-Group CLI.

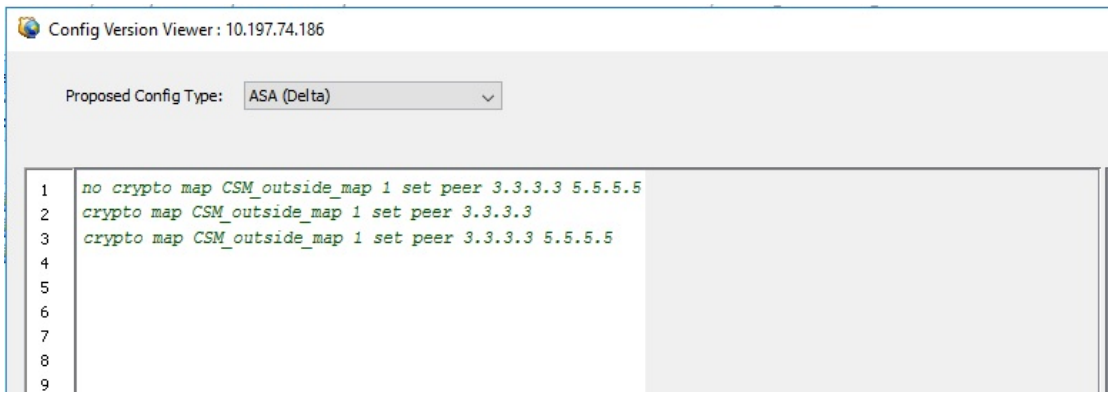
Figure 33: Multi Peer-Specific and Tunnel-Group CLI



Step 5 Do a preview configuration, deploy the new configuration, and rediscover the VPN topology for which you have configured the multi-peer crypto map using **Policy** > **Discover VPN Policies**.

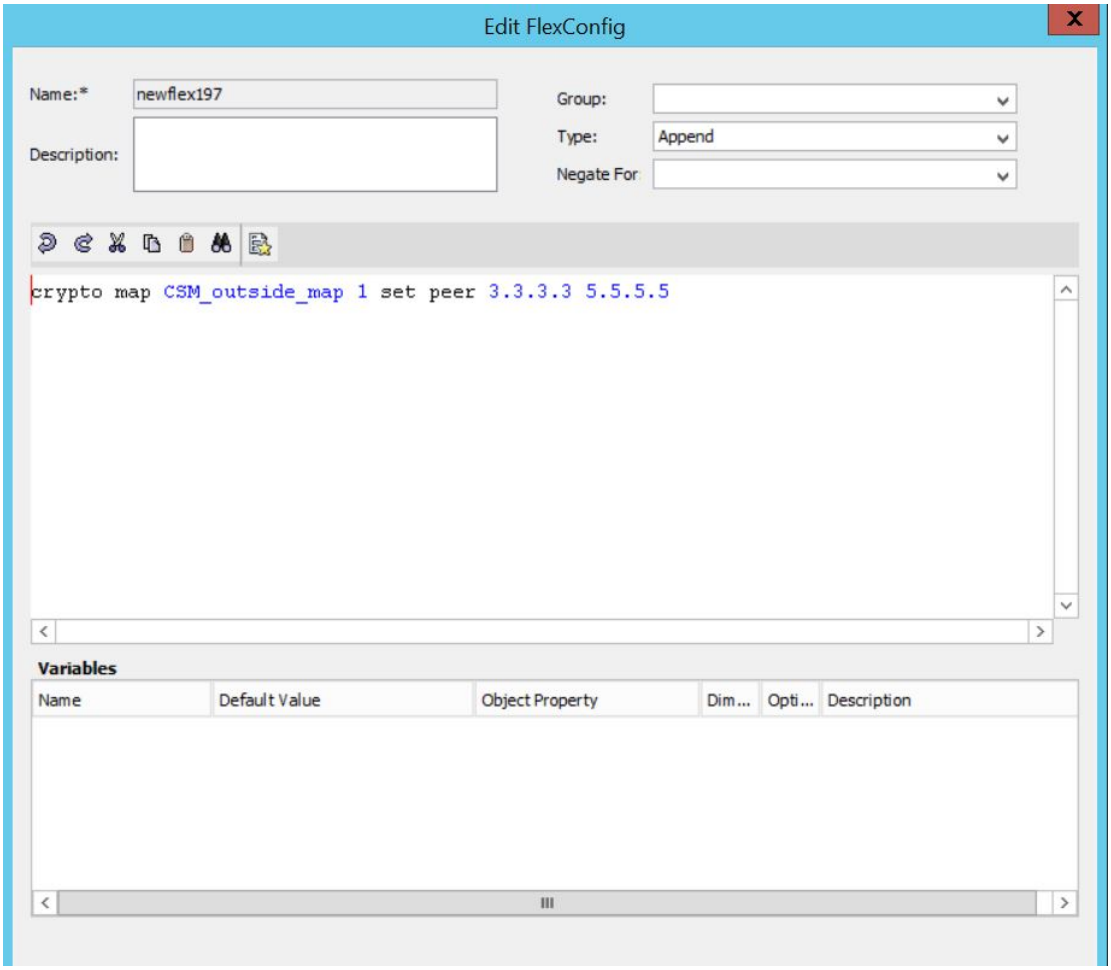
Step 6 After rediscovering the VPN topology, the multi-peer cryptomap CLI is negated and added each time a new deployment is done. Refer the image below to see how the CLI gets negated.

Figure 34: CLI Negation



Step 7 Ensure to remove the tunnel-group CLI and retain only the multi-peer CLI in Flex Configs for further deployments as shown below.

Figure 35: Multi Peer-Specific CLI



Understanding Devices Supported by Each IPsec Technology

Each IPsec technology supports different devices as members of their topology. The following table describes the basic device support. These requirements are enforced when you select devices for a VPN; in some cases, the device lists are filtered to show only supported devices. In other cases, a device might be supported in one role (for example, as a spoke), but not supported in another role; in these cases, you can select the wrong device type, but you are prevented from saving the change (a message will explain the specific problem).

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

Tip Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

Table 321: Devices Supported by Each IPsec Technology

Technology	Supported Platforms
Regular IPsec See Configuring IKE and IPsec Policies, on page 1149.	Regular IPsec policies can be configured on Cisco IOS security routers (including Aggregation Service Routers, or ASRs), PIX Firewalls, and ASA 5500 series devices. Except for Extranet VPNs, Catalyst VPN service modules are also supported. IKEv2 is supported on ASA release 8.4(x) only. If you limit the topology to IKEv2 only, all devices must support IKEv2. If you allow both IKEv1 and IKEv2, devices that do not support IKEv2 automatically use IKEv1.
IPsec/GRE (Generic Routing Encapsulation). See Understanding GRE , on page 1226.	GRE policies can be configured on Cisco IOS security routers (including ASRs) and Catalyst 6500/7600 devices.
GRE Dynamic IP. See Understanding GRE Configuration for Dynamically Addressed Spokes , on page 1229.	GRE Dynamic IP can be configured on Cisco IOS security routers (including ASRs) and Catalyst 6500/7600 devices.
Dynamic Multipoint VPN (DMVPN), Large Scale DMVPN. See Dynamic Multipoint VPNs (DMVPN) , on page 1234 and Configuring Large Scale DMVPNs , on page 1241.	DMVPN configuration is supported on Cisco IOS 12.3T devices and later, and on ASRs running Cisco IOS XE Software 2.x or later (known as 12.2(33)XNA+ in Security Manager). Large Scale DMVPN configuration also supports Catalyst 6500/7600 devices as IPsec Terminators. To use DMVPN phase 3 connections between spokes, devices must run IOS Software release 12.4(6)T or later; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or later.
Easy VPN. See Easy VPN, on page 1245.	The Easy VPN Server can be a Cisco IOS security router (including ASRs), a Catalyst 6500/7600 (with supported VPN service modules or port adapters), a PIX Firewall, or an ASA 5500 series device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running OS version 7.2 or later.

Technology	Supported Platforms
GET VPN. See Group Encrypted Transport (GET) VPNs, on page 1261.	Key servers can be configured on: • Cisco 1800, 2800, 3800 Series ISR, Cisco 7200 Series Routers, and Cisco 7301 Routers running Cisco IOS Software release 12.4(15)T or later. • Cisco 1900, 2900, 3900 Series ISR running release 15.0 or later. Group members can be configured on Cisco 1800, 1900, 2800, 2900, 3800, 3900 Series ISR, Cisco 7200 Series Routers, and Cisco 7301 Routers with the same minimum software releases. The Cisco 871 ISR can also be used as a group member if GET VPN is deployed with very few (1-3) IPSec SAs. In addition, you can configure Cisco ASR Routers using Cisco IOS XE Software Release 2.3 (12.2(33)XNC) and above as group members.

Note Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

Including Unmanaged or Non-Cisco Devices in a VPN

Your VPN might include devices that you cannot, or should not, manage in Security Manager. These include:

- Cisco devices that Security Manager supports, but for which your organization is not responsible. For example, you might have a VPN that includes spokes in networks managed by other organizations within your company, or a connection to a service provider or partner network.
- Non-Cisco devices. You cannot use Security Manager to create and deploy configurations to non-Cisco devices.

You have two options for handling these kinds of devices:

- If the connection is a regular IPsec point-to-point connection, you can configure the connection as an Extranet VPN as described in Creating or Editing Extranet VPNs , on page 1144.
- For other types of connections, you can include these devices in the Security Manager inventory as "unmanaged" devices. These devices can serve as endpoints in a VPN topology, but Security Manager does not discover any configurations from the device, nor does it deploy configurations to them.

When the Extranet VPN option will not work, you must do the following before you can add an unmanaged device to a VPN topology:

- Manually add the device as an unmanaged device to the device inventory using the procedure described in Adding Devices by Manual Definition , on page 94. Ensure that you make the following selections:
  - Select a Cisco device type that is comparable to the device you are adding in terms of VPN-supported technologies. The device type controls the types of VPN topologies to which you can add the device. For example, for GRE/DMVPN, you might select an integrated services router such as an 1800 or 2800 series, whereas in Easy VPN you could also select an ASA or PIX device if appropriate.
  - Deselect the **Manage in Cisco Security Manager** option. This is very important, because the default is to make all new devices managed devices. If you forget to do this while adding the device, you can deselect the option later on the General tab in the device properties (right-click the device and select **Device Properties**).
- Using the interface policy for the device, define the external VPN interface to which managed devices will point. Because the device is unmanaged, your definitions in this policy are never configured on the device; the policy simply represents what you have configured on the device outside of Security Manager.

Understanding and Configuring VPN Default Policies

For most VPN policies that are mandatory, Security Manager includes "factory default" settings for the policies. These defaults are generic, and might not be appropriate for your network, but they do allow you to complete the creation of a VPN without having to stop and start over when you do not have the needed shared policy configured. Therefore, you can, and should, create your own default VPN policies for mandatory policies. You can also create defaults for certain optional policies.

Before configuring new defaults, consider the types of VPNs you are likely to configure, then review the types of policies for which you can create defaults. Select **Tools > Security Manager Administration**, then select **VPN Policy Defaults** from the table of contents. Select the tabs for the desired IPsec technologies to see which policies are available. If a policy is assigned Factory Default, or if this option is available from the drop-down list, the policy is mandatory; other policies are optional. You can also create default policies for remote access VPNs, and for site-to-site endpoint configurations. Click the **View Content** button next to a selected policy to see the policy definition.

The following procedure explains how to create and use VPN policy defaults.

Tips

- When you configure VPN default policies, you are selecting shared policies. Although you can configure only one default per policy per IPsec technology, users can select different shared policies when configuring VPNs. Thus, you might want to configure more than one shared policy that users can select, and configure the most commonly-used policy as the default policy. For more information about how users can select different policies when configuring a VPN, see Assigning Initial Policies (Defaults) to a New VPN Topology , on page 1139.
- Although the IKEv2 Authentication policy is a mandatory policy for topologies that allow IKEv2 negotiations, there are no IKEv2 Authentication factory default settings, and you cannot create IKEv2 Authentication shared policies. Therefore, whenever you allow IKEv2 in a topology, you must manually configure the IKEv2 Authentication policy before the topology is valid.
- The Public Key Infrastructure policy is required for IKEv1 if you configure the IKE Proposal policy to use certificate authentication. However, there are no factory default settings for this policy, so if you intend to use certificate authentication for IKEv1, consider creating default Public Key Infrastructure policies.
- Keep in mind that any change to a shared policy affects all VPNs that are using the policy. This can make it easy to implement across-the-board changes that are required for every VPN. However, after creating the VPN, the user can switch from a shared policy to a local policy, so that any changes to the configuration must be done specifically for the VPN topology. For more information about shared policies, see Managing Shared Policies in Policy View , on page 217.
- These default policies do not apply when you create Extranet VPNs. With Extranet VPNs, you must always configure the settings for mandatory policies as part of the normal wizard flow.

Step 1 Create the default policies. All default policies are shared policies.

a) In Policy view (select **View** > **Policy View**), select the policy for which you want to configure defaults. The policies are in the **Site-to-Site VPN** or **Remote Access VPN** folders.
b) Click the **Create a Policy (+)** button at the bottom of the shared policy selector, enter a name for the policy, and click **OK**.
c) Configure the desired settings. Click the **Help (?)** button in the toolbar to get reference information about the settings available in the selected policy.
d) Repeat the process until you have created at least one shared policy for each policy for which you want to define a default policy.

Step 2 If desired, create defaults for the VPN endpoints. These defaults are interface role objects, which identify the interface names used for VPN connections (for example, GigabitEthernet0/1). Create separate roles for internal and external VPN interfaces.

a) Select **Manage** > **Policy Objects** to open the Policy Object Manager , on page 232.
b) Select **Interface Roles** from the table of contents.
c) Click the **New Object (+)** button, enter the interface name patterns that identify the most commonly used interfaces for VPN internal or external interfaces in your network, and click **OK**.

For more information about interface roles and the wildcards you can use to configure them, see Understanding Interface Role Objects , on page 303 and Creating Interface Role Objects , on page 304.

Step 3 Submit the policies and policy objects to the database. You will have to resolve any validation errors.

- In non-Workflow mode, select **File** > **Submit**.
- In Workflow mode without an activity approver, select **Activities** > **Approve Activity**.

- In Workflow mode with an activity approver, select **Activities > Submit Activity**. You will have to wait for the activity to be approved before you can select the policies and objects as defaults.

Step 4 Select your newly-configured policies and policy objects as VPN policy defaults.

a) Select **Tools > Security Manager Administration**, and then select **VPN Policy Defaults** from the table of contents (see VPN Policy Defaults Page , on page 588).

b) Select the desired tabs, then select the policies you configured from the drop-down lists for each of the mandatory or optional policies for which you configured defaults.

On the S2S Endpoints tab, select the appropriate interface role objects.

c) Click **Save** to save your defaults.

The next time a user runs the Create VPN wizard, the defaults you selected will be used as the wizard's defaults. Users can select any other shared policy or interface role to override the default.

Using Device Overrides to Customize VPN Policies

Many VPN policies use Security Manager policy objects in their configuration. Policy objects are containers that allow you to create reusable configurations.

Because a VPN policy applies to every device in a VPN topology, you might need to make modifications to a policy object used in a policy for certain devices within the VPN topology. There might even be situations where you need to make modifications for all devices within a topology. You accomplish these modifications with device-level overrides on the policy objects.

For example, when defining a PKI policy, you need to select a PKI enrollment object. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object differs for the hub, based on the device-level override you define.

To enable a policy object to be overridden, you must select the **Allow Override per Device** option in the policy object definition. You can then create device-level overrides. For more information about overriding a VPN policy object at the device level, see the following topics:

- Understanding Policy Object Overrides for Individual Devices , on page 246
- Allowing a Policy Object to Be Overridden , on page 247
- Creating or Editing Object Overrides for a Single Device , on page 248
- Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248

Understanding VRF-Aware IPsec

One obstacle to successfully deploying peer-to-peer VPNs is the separation of routing tables, and the use of overlapping addresses, which usually results from using private IP addresses in customer networks. The VRF-Aware IPsec feature, which introduces IPsec tunnel mapping to Multiprotocol Label Switching (MPLS) VPNs, solves this problem.

The VRF-Aware IPsec feature enables you to map IPsec tunnels to Virtual Routing Forwarding (VRF) instances, using a single public-facing address. A VRF instance defines the VPN membership of a customer

site attached to the Provider Edge (PE) router. A VRF comprises an IP routing table, a derived Cisco Express Forwarding (CEF) table, a set of interfaces that use the forwarding table, and a set of rules and routing protocol parameters that control the information that is included in the routing table. A set of routing and CEF tables is maintained for each VPN customer across the MPLS/VPN network.

Since each VPN has its own routing and forwarding table in the router, any customer or site that belongs to a VPN is provided access only to the set of routes contained within that table. Any PE router maintains a number of routing tables and a global routing table per VPN, which can be used to reach other routers in the provider network. Effectively, a number of virtual routers are created in a single physical router. Across the MPLS core to the other PE routers, this routing separation is maintained by adding unique VPN identifiers, such as the route distinguisher (RD).

Note VRF-Aware IPsec can also be configured on devices in a remote access VPN. For more information, see Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices) , on page 1476.

In Security Manager, you can configure VRF-Aware IPsec in your hub-and spoke VPN topology, with either a single device providing all functionality (“one-box” solution) or with multiple devices, each providing a part of the functionality (“two-box” solution). The solution of one device providing all the functionality can affect performance by overloading the system, whereas separating the functionality in a two-box solution provides better scaling for each function.

The following topics describe:

- VRF-Aware IPsec One-Box Solution , on page 1089
- VRF-Aware IPsec Two-Box Solution , on page 1090
- Enabling and Disabling VRF on Catalyst Switches and 7600 Devices , on page 1092

For information on configuring VRF-aware IPsec, see Configuring VRF Aware IPsec Settings , on page 1124.

VRF-Aware IPsec One-Box Solution

In the one-box solution, IPsec tunnels terminate on a Cisco IOS router, which serves as the Provider Edge (PE) device. The PE device maps these tunnels to the appropriate MPLS/VPN network and serves as the IPsec Aggregator, by performing IPsec encryption and decryption from the Customer Edge (CE) devices.

Note The configuration of routing between the PE device and the MPLS cloud is done by Cisco IP Solution Center. See the Cisco IP Solution Center MPLS VPN User Guide .

The following illustration shows the topology of a one-box solution.

Figure 36: VRF-Aware IPsec One-Box Solution

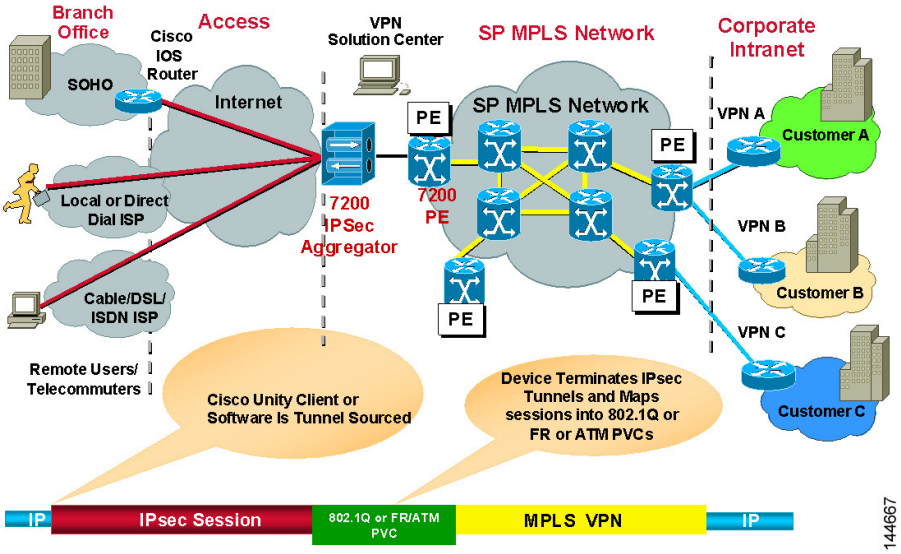
VRF-Aware IPsec Two-Box Solution

In the two-box solution, the PE device does just the MPLS mapping, while a separate IPsec Aggregator device does the IPsec encryption and decryption from the CEs.

Note Security Manager fully manages the IPsec Aggregator, including routing to the PE device. The PE device is fully managed by Cisco IP Solution Center. This includes routing between the PE device and the MPLS cloud, and routing from the PE to the IPsec Aggregator. For more information, see the Cisco IP Solution Center MPLS VPN User Guide.

The following illustration shows the topology of a two-box solution.

Figure 37: VRF-Aware IPsec Two-Box Solution



Using the two-box solution, you configure VRF-Aware IPsec on devices in your VPN topology, as follows:

1. Configure the connection between the IPsec Aggregator and the PE device.

Create a hub-and-spoke VPN topology and assign an IPsec technology to it. In this topology, the hub is the IPsec Aggregator, and the spokes may be Cisco IOS routers, PIX Firewalls, Catalyst VPN service modules, or Adaptive Security Appliance (ASA) devices. The IPsec Aggregator may be a security router or a Catalyst VPN service module. You then define the VRF parameters (VRF name and unique routing identifier) on the hub.

Note VRF-Aware IPsec supports the configuration of IPsec, GRE, or Easy VPN technologies on Cisco IOS routers and Catalyst VPN service modules. DMVPN is also supported, but only on Cisco IOS routers.

1. Specify the VRF forwarding interface (or VLAN for a Catalyst VPN service module) between the IPsec Aggregator and the PE device.
2. Define the routing protocol and autonomous system (AS) number to be used between the IPsec Aggregator and the PE. Available routing protocols include BGP, EIGRP, OSPF, RIPv2, and Static Route.

If the routing protocol defined between the IPsec Aggregator and the PE differs from the routing protocol used for the secured IGP, routing is redistributed to the secured IGP, using this routing protocol and AS number. Routing is also redistributed from the secured IGP to the PE.

Note Redistributing the routing is only relevant when IPsec/GRE or DMVPN is the selected technology.

Enabling and Disabling VRF on Catalyst Switches and 7600 Devices

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, it does not support any enhancements as Cisco Catalyst switches is now End of Life.

Deployment fails when you change the virtual routing and forwarding (VRF) mode on the Catalyst switches and 7600 hub of an existing site-to-site VPN. For example, if you initially configured VRF in the Create VPN wizard and deployed, but later return to the Peers policy and deselect the Enable VRF Settings check box, deployment fails. (This setting is found in the VRF Aware IPSec tab of the Edit Endpoints dialog box; see Configuring VRF Aware IPsec Settings , on page 1124.) Deployment likewise fails if you try to enable VRF on a VPN that was not initially configured with it.

You cannot change the VRF mode on a Catalyst 6500/7600 during VPN operation. This restriction applies only to Catalyst 6500/7600 hubs, not to any other device type.

This restriction does not apply to changes made to the VRF settings themselves. For example, if VRF is configured on the VPN topology, you can return to the Peers policy and change the VRF name or route distinguisher.

If you need to change the VRF mode of a VPN, and you are using Catalyst 6500/7600 devices as hubs, use the following procedure.

Related topics

- Understanding VRF-Aware IPsec , on page 1088
- VRF-Aware IPsec One-Box Solution , on page 1089
- VRF-Aware IPsec Two-Box Solution , on page 1090

Step 1 Delete the VPN topology from Security Manager.

Step 2 Deploy your changes.

Step 3 Reload (restart) the Catalyst 6500/7600 device.

Step 4 Right-click the device in Security Manager and select **Discover Policies on Device**. Perform a complete policy rediscovery.

Step 5 Open the Create VPN wizard and redefine the VPN topology. At this point, you can select a different VRF mode. See Configuring VRF Aware IPsec Settings , on page 1124 and Creating or Editing VPN Topologies , on page 1103.

Accessing Site-to-Site VPN Topologies and Policies

You can use the following methods to access and configure site-to-site VPN topologies and policies:

- **Site-to-Site VPN Manager**—This is the main tool for configuring VPN topologies. You can view a list of all site-to-site VPNs configured in Security Manager and edit their configurations and policies, including

device membership. For information on using this tool, see Site-to-Site VPN Manager Window , on page 1093.

- **Site-to-Site VPN policy in Device view**—When you select a device in device view, you can select the Site-to-Site VPN policy in the Policies selector to see a list of all site-to-site VPNs in which the device participates and edit those topologies. You can also create new VPNs, or select a VPN and open the Site-to-Site VPN Manager to edit the policies for the selected VPN. This device view policy is essentially a short-cut into the Site-to-Site VPN Manager. For more information about using this policy, see Configuring VPN Topologies in Device View , on page 1094.
- **Site-to-Site VPN folder in Policy view**—Policy view is used to create shared policies. Many of the site-to-site VPN policies are shareable. Thus, you can configure shared policies that you can assign to more than one VPN topology while configuring the topology in the Site-to-Site VPN Manager. You can configure shared policies as defaults for the Create VPN wizard, as described in Understanding and Configuring VPN Default Policies , on page 1086.

You can also create shared policies from the Site-to-Site VPN Manager window in much the same way you can create them from local policies in Device view, although all sharing commands in the Site-to-Site VPN Manager window are available only on the right-click context menu (when right-clicking a shareable policy).

For more information on creating shared policies in Policy view, see Managing Shared Policies in Policy View , on page 217.

Site-to-Site VPN Manager Window

The Site-to-Site VPN Manager lists all site-to-site VPNs configured in Security Manager. The VPNs selector, in the upper left pane of the window, lists all existing VPN topologies (see Understanding VPN Topologies , on page 1074). An icon indicates the type of VPN (hub and spoke, point to point, or full mesh).To view or edit a topology, select it, and its policies are loaded into the policy selector in the lower left pane. Select a policy to see its definition in the right pane.

To open the Site-to-Site VPN Manager, click the **Site-To-Site VPN Manager** button on the toolbar or select **Manage > Site-To-Site VPNs**.

Use the Site-to-Site VPN Manager window to:

- Create, edit, and delete VPN topologies.
  - To create a VPN topology, click the **Create VPN Topology (+)** button above the VPN selector and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see Creating or Editing VPN Topologies , on page 1103 or Creating or Editing Extranet VPNs , on page 1144.
  - To edit a VPN topology, select it and click the **Edit VPN Topology (pencil)** button, or right-click it and select **Edit**. This opens the Edit VPN or Edit Extranet VPN dialog box, which contains the most of the same pages as the Create VPN wizard in a tabbed layout.
  - To delete a VPN topology, select it and click the **Delete VPN Topology (trash can)** icon, or right-click it and select **Delete**. You are asked to confirm the deletion. See Deleting a VPN Topology , on page 1148.
- View detailed information about each VPN topology; select the topology, then select the VPN Summary policy. See Viewing a Summary of a VPN Topology's Configuration , on page 1140.

- View and configure the endpoints defined for a VPN topology. You can see endpoints on the Endpoints tab or when editing a VPN topology, or by selecting the **Peers** policy. For GET VPN topologies, there is no Peers policy; instead, use the **Key Servers** and **Group Members** policies to view and configure endpoints. For Extranet VPNs, the endpoints are on the Device Selection tab when editing the VPN, or also in the Peers policy.
- View and edit the policies assigned to a VPN topology, assign shared policies, or create shared policies from existing policies. For information on individual policies, see Overview of Site-to-Site VPN Policies , on page 1080.

The options and methods for configuring shared policies from the Site-to-Site VPN Manager are the same as those from Device view, as explained in the sections under Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203 and Using the Policy Banner , on page 205. You can share, assign, unassign, edit assignments, and rename policies, but no VPN policies allow inheritance. To perform these tasks, select the VPN topology, then right-click the desired policy and select the desired command.

You can also use Policy view to configure shared VPN policies.

Configuring VPN Topologies in Device View

Use the Site-to-Site VPN Device view policy to view and edit the site-to-site VPN topologies to which a device belongs, if any. You can edit the VPN policies and change whether the device participates in the topology. You can also create new VPN topologies.

This policy is essentially an access point for the Site-to-Site VPN Manager (see Site-To-Site VPN Discovery , on page 1095).

To open this policy, in Device view, select the desired device and then select **Site-to-Site VPN** from the Policy selector.

The VPN topologies table lists all of the site-to-site VPNs to which this device belongs. Information includes the type of VPN, its name, IPSec technology, and description. Beginning with version 4.9, Security Manager also displays the Last Modified Ticket information for the VPN topologies. The VPN topologies that have been created or edited using the Ticket Management system will have the last Modified Ticket ID information available on this page. You can also filter the VPN topologies by the Last Modified Ticket ID.

- To add a VPN, click the **Create VPN Topology** button, or right-click in the table and select **Create VPN Topology** and select the type of topology you want to create from the options that are displayed. This action opens the Create VPN Wizard or the Create Extranet VPN wizard. For more information, see Creating or Editing VPN Topologies , on page 1103 or Creating or Editing Extranet VPNs , on page 1144.
- To edit a VPN, select it and click the **Edit VPN Topology** button, right-click the VPN and select **Edit VPN Topology**, or simply double-click the entry. This opens the Edit VPN or Edit Extranet VPN dialog box, which is a tabbed version of the Create VPN wizard (see Creating or Editing VPN Topologies , on page 1103 or Creating or Editing Extranet VPNs , on page 1144).
- To edit the policies for a VPN, select it and click the **Edit VPN Policies** button. The Site-to-Site VPN Window opens displaying information about the VPN topology; select the desired policy from the Policies selector to edit it.
- To delete a VPN, select it and click the **Delete VPN Topology** button, or right-click the VPN and select **Delete VPN Topology**. You are asked to confirm the deletion. For more information, see Deleting a VPN Topology , on page 1148.

Site-To-Site VPN Discovery

You can discover the VPN topologies that are already deployed in your network so that you can use Security Manager to manage them. Your VPN configurations are brought into Security Manager and displayed as site-to-site VPN policies.

Except for Extranet VPNs, you can also rediscover the configurations of existing VPN topologies that are already managed with Security Manager. For information about Site-to-Site VPN rediscovery, see Rediscovering Site-to-Site VPNs , on page 1102.

Note You can also discover configurations on devices in remote access VPNs that are already deployed in your network. See Discovering Remote Access VPN Policies , on page 1298.

These topics provide information about Site-to-Site VPN discovery:

Supported and Unsupported Technologies and Topologies for VPN Discovery

This topic lists the technologies and topologies that Security Manager can discover, as well as the VPN features that are provisioned by Security Manager but cannot be discovered.

Supported Technologies for VPN Discovery

- IPsec, including LAN-to-LAN configurations on ASA devices.
- IPsec + GRE
- IPsec + GRE dynamic IP
- DMVPN
- Easy VPN
- GET VPN

Supported Topologies for VPN Discovery

- Point to point
- Hub and spoke

- Full mesh
- Extranet VPN (point-to-point to an unmanaged device)

VPN Features Provisioned by Security Manager but Unsupported for VPN Discovery

- Large Scale DMVPN with IPsec Terminator (high-concentration hub)
- VRF-Aware IPsec
- Dial backup
- IPsec and ISAKMP profiles for Easy VPN
- Easy VPN with High Availability

If you define and deploy policies of these types using Security Manager, your policies overwrite the device configurations that were not discovered. Therefore, if you want Security Manager to manage existing configurations, you should define policies that match the existing configurations as closely as possible. (Use **Tools > Preview Configuration** to examine the results before deploying.) The VPN provisioning mechanism leverages the content of the existing configuration as much as possible (assuming the content matches the policies configured in Security Manager), but does not retain the naming conventions used in the CLI commands.

Related Topics

- Discovering Site-to-Site VPNs , on page 1099

Prerequisites for VPN Discovery

For successful VPN discovery, the following prerequisites must be met:

- Except for Extranet VPNs, all devices participating in the VPN must be added to the Security Manager inventory.
- You must provide Security Manager with some basic information about the VPN. The VPN discovery wizard prompts you for the following information:
  - VPN topology (hub and spoke, point to point, full mesh, Extranet).
  - VPN technology (Regular IPsec, IPsec/GRE, GRE dynamic IP, DMVPN, Easy VPN, GET VPN).
  - Devices in the VPN and their roles (hub/spoke). For Extranet VPNs, you specify the managed device only.
  - Source of the VPN configuration. The VPN can be discovered directly from the live network or from Security Manager's Configuration Archive.
- Each device in the VPN must have a crypto map associated with a physical interface. This rule does not apply to the remote (unmanaged) devices in an Extranet VPN.

- If you use OSPF as your routing protocol in a VPN topology, all devices in the VPN must use the same OSPF process number.
- Each PIX 6.3 or ASA 5505 client device in an Easy VPN topology must have a vpnclient configuration.

VPN Discovery Rules

The following table describes the rules by which Security Manager translates and discovers your VPN configurations, and how it handles instances where your configuration on the device does not match what is supported by Security Manager.

Tip Because Extranet VPN discovery involves the analysis of a single device (the managed device), most of these rules do not apply to Extranet VPN discovery. Any rule that involves consistency of values among devices in the VPN is not applicable.

Table 322: VPN Discovery Rules

If this condition exists:	The VPN discovery is handled as follows:
Security Manager cannot contact a device in the VPN for live device discovery.	• If the device is the only hub or spoke in the VPN, discovery fails. • If there are other hubs or spokes in the VPN, discovery proceeds but the unavailable device is not discovered. • Except for Extranet VPNs, if the device is a peer in a point-to-point topology, discovery fails. For Extranet VPNs, only the managed device is contacted, and discovery fails if it cannot be contacted. • If the device is a peer in a full mesh topology and there are only two devices, including the unavailable one, in the topology, discovery fails. If there are more than two devices, discovery proceeds but the unavailable device is not discovered.

If this condition exists:	The VPN discovery is handled as follows:
The VPN is a LAN-to-LAN VPN on an ASA.	The ASA documentation uses “LAN-to-LAN” as a synonym for “site-to-site.” In a LAN-to-LAN VPN configuration, the ASA uses tunnel groups, which when used in a remote access VPN configuration, Security Manager discovers as connection profiles. When discovering site-to-site VPNs on an ASA that uses LAN-to-LAN (L2L) tunnel groups, Security Manager creates a site-to-site VPN topology, and the L2L tunnel groups are not presented to you as connection profiles. Instead, you edit the properties of the VPN topology, and during deployment, Security Manager will translate the configuration into the appropriate L2L tunnel group commands.
There are inconsistencies in the policies or values in the VPN configurations across the devices in the VPN.	• If the values on the hub and the spokes differ, preference is given to the values on the hub. • If a simple selection of one policy or value from several eligible policies or values is required and does not put functionality at risk, Security Manager selects a single policy/value that is common to all devices. For example, a VPN can have a single IKE policy only, whereas there can be more than one IKE policy on the devices. • If selecting one value puts the functionality at risk, no value is discovered for the policy and a validation message is received upon deployment. • If numeric values differ, a message is generated during discovery, and the lower value is discovered. For example, the lowest SA lifetime value in an IPsec policy. • If none of the above options are possible, VPN discovery fails.
Preshared key configuration—there is a different key per set of peers.	The preshared key policy is not discovered; you will have to configure it after discovery is completed. Security Manager discovers preshared key policies only when the preshared key has the same value on all devices.
There is more than one eligible crypto map on the device.	The crypto map that is associated with all or the majority of the devices selected for VPN discovery is used.
A spoke does not have a crypto map associated with the hub.	VPN discovery proceeds but the spoke is not discovered and an error message is generated.
A device does not have the selected transform set value.	VPN discovery proceeds but the device might removed from the VPN topology.
A device does not have the selected IKE proposal.	VPN discovery proceeds but the device might removed from the VPN topology.
A device supports DVTI, but does not have DVTI or a crypto map configured.	VPN discovery fails.

If this condition exists:	The VPN discovery is handled as follows:
A server supports DVTI, but does not have an IP address configured in the DVTI configuration.	VPN discovery proceeds but with a warning.
A client does not support DVTI.	If the hub is configured with DVTI, discovery proceeds without any warning or Error.
A Hub and Spoke topology where the spokes are not using the same VPNSPA/VSPA slot on the hub (Catalyst 6500/7600).	VPN discovery fails.
The same set of key servers and group members are participating in more than one GET VPN.	Security Manager discovers only one of the topologies.
A User Group policy is configured with backup servers using hostnames instead of an IP addresses.	VPN policy discovery fails with the following error: Policy Discovery Failed: com.cisco.nm.vms.discovery.DiscoveryException: Internal Error In order for discovery to be successful, you need to reconfigure the user group policy on the device with backup servers using IP address, not hostnames.

Discovering Site-to-Site VPNs

This procedure describes how to discover a Site-to-Site VPN that is already working in your network but that has not yet been defined in Security Manager.

Related Topics

- Discovering Site-to-Site VPNs , on page 1099
- Discovering Policies , on page 178
- Supported and Unsupported Technologies and Topologies for VPN Discovery , on page 1095
- Prerequisites for VPN Discovery , on page 1096
- VPN Discovery Rules , on page 1097
- Understanding Devices Supported by Each IPsec Technology , on page 1083

• Including Unmanaged or Non-Cisco Devices in a VPN , on page 1085

Step 1 In Device view, select **Policy > Discover VPN Polices** to open the Discover VPN Policies Wizard—Name and Technology page.

Step 2 Specify the following information:

- **VPN Name**—The name of the VPN being discovered.

You cannot specify the name when discovering Extranet VPNs. Instead, Security Manager discovers all Extranets defined on the device, and for each Extranet, the VPN name is a hyphenation of the local and remote IP addresses. For example, if the local address is 10.100.10.1 and the remote address is 10.100.11.1, the Extranet VPN is named **10.100.10.1-10.100.11.1**.

- **Description**—An optional description of the VPN. You cannot add a description to Extranet VPN discovery.
- **Topology**—The type of VPN that you are discovering—Hub and Spoke, Point to Point, Full Mesh, or Extranet.
- **IPsec Technology**—The IPsec technology assigned to the VPN—Regular IPsec, IPsec/GRE, GRE Dynamic IP (sub-technology), DMVPN, Easy VPN, GET VPN, or Regular IPSEC VTI. The topology you select controls what is available in this list.

If you selected IPsec/GRE, you must also specify the type which may be **Standard** (for IPsec/GRE) or **Spokes with Dynamic IP** (to configure GRE Dynamic IP).

Note You can select Regular IPSEC VTI for tunnel based routing as applicable for Hub and Spoke, and Point to Point topologies.

- **Discover From**—You can either discover the VPN directly from the network or from Configuration Archive.
  - Network—Security Manager connects to all live devices to obtain the device configuration. For Extranet VPN discovery, Security Manager connects to the single managed device that you specify.
  - Config Archive—Discovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.

Step 3 Click **Next** to open the Discover VPN Policies Wizard—Device Selection Page.

Step 4 Select the devices participating in the VPN and their role in the VPN (hub, spoke, peer one, peer two, local device, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see Selecting Devices for Your VPN Topology , on page 1108.

Step 5 Click **Finish** to close the wizard and start the discovery process. The Discovery Status window opens and displays the status of the discovery and indicates whether the discovery of each device has been successful or has failed (see Viewing Policy Discovery Task Status , on page 188). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

Except for Extranet discovery, when the discovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was discovered. For Extranet discovery, you must either manually open the Site-to-Site VPN Manager, or select the Site-to-Site VPN policy in Device view, to see the list of discovered Extranet VPNs.

Step 6 Verify that the VPN polices are as required. Edit the policies as necessary.

Tip When discovering Extranet VPNs, all Extranet VPNs defined on the selected device are discovered. Delete the ones that you do not want to manage in Security Manager.

Defining or Repairing Discovered VPNs with Multiple Spoke Definitions

If you discover a VPN whose spokes contain different definitions (for example, different client modes for Easy VPN spokes), Security Manager changes the definitions during discovery to create a uniform definition for all spokes. This behavior occurs because VPN topologies in Security Manager can contain only one set of spoke definitions.

If you want to maintain your original definitions, or create a new VPN that has spokes with different definitions, you can choose one of two approaches:

- Define multiple VPN topologies in Security Manager, where each topology includes spokes containing matching spoke definitions.
- Define a FlexConfig policy that contains the specialized definition, then assign the policy to the spokes that require this definition, as described in the following procedure.

Related Topics

- Creating a New Shared Policy , on page 221
- Creating FlexConfig Policy Objects , on page 368
- Modifying Policy Assignments in Policy View , on page 221
- Site-To-Site VPN Discovery , on page 1095
- Discovering Site-to-Site VPNs , on page 1099
- VPN Discovery Rules , on page 1097

Step 1 Create a shared FlexConfig policy in Policy view:

a) Select **View > Policy View**.
b) Right-click **FlexConfigs** in the Policy Type selector, then select **New FlexConfigs Policy**.
c) Enter a name for the policy and click **OK**.

Step 2 Define the FlexConfig policy by creating and selecting a FlexConfig object:

a) In the work area of Policy view, click the **Add** button on the Details tab.
b) In the FlexConfigs Selector, click the **Create** button in the lower-left corner of the window to open Add or Edit FlexConfig Dialog Box , on page 369.
c) Define an appended FlexConfig object that contains the required client definition. For example, to define the client mode on an Easy VPN spoke, enter the following commands:

crypto ipsec client ezvpn CSM_EASY_VPN_CLIENT_1

mode client

exit

d) After you create the FlexConfig object, add it to the FlexConfig policy using the selector.

Step 3 In the work area of Policy view, use the Assignments tab to select the spokes to which this policy should be assigned, then click **Save**.

Step 4 Deploy the policy.

Rediscovering Site-to-Site VPNs

You can rediscover the configurations of existing VPN topologies that are already managed with Security Manager so that you do not have to recreate policies changes in the application.

The same rules by which Security Manager translates and discovers VPN configurations apply also to rediscovery. However, you can perform rediscovery only on devices that participate in a VPN topology, and you cannot make any changes to the IPsec technology or topology type. Only the configurations of device specific policies, such as VPN interfaces and protected networks, and any High Availability (HA) policies that are configured on hubs, can be rediscovered. VPN global policies, such as IKE proposals or PKI enrollments, cannot be rediscovered. In addition, you cannot rediscover the following topologies:

- Easy VPN topologies with Dynamic VTI
- Extranet VPNs

This procedure describes how to rediscover the configurations of a Site-to-Site VPN topology that already exists in Security Manager.

Related Topics

- Discovering Site-to-Site VPNs , on page 1099
- Discovering Policies , on page 178
- Prerequisites for VPN Discovery , on page 1096
- VPN Discovery Rules , on page 1097
- Understanding Devices Supported by Each IPsec Technology , on page 1083
- Including Unmanaged or Non-Cisco Devices in a VPN , on page 1085

Step 1 In the Site-to-Site VPN Manager window, right-click the VPN topology whose configurations you want to rediscover and select **Rediscover Peers**. This opens the Rediscover VPN Policies Wizard—Name and Technology page.

This page displays the type of topology and IPsec technology used in the VPN, which you cannot change.

Step 2 Specify the following information:

- **VPN Discovery Name**—The name of the rediscover VPN job.
- **Description**—An optional description of the VPN.

- **Discover From**—You can either rediscover the VPN directly from the network or from Configuration Archive.
  - Network—Security Manager connects to all live devices to obtain the device configuration.
  - Config Archive—Rediscovery from Configuration Archive is recommended if you deploy to configuration files instead of live devices. The most recent version of the device configuration in Configuration Archive is used for all devices.

Step 3 Click **Next** to open the Rediscover VPN Policies Wizard—Device Selection page.

Step 4 Select the devices whose peer level policies need to be rediscovered and their role in the VPN (hub, spoke, peer one, peer two, key server, group member, or simply selected devices for full-mesh VPNs) depending on the topology type. For Easy VPN topologies, servers are hubs and clients are spokes.

If there are two or more IPsec terminators in a hub-and-spoke VPN, use the Up and Down arrow buttons to ensure the primary hub is listed first. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

For more detailed information on selecting devices for a VPN, see Selecting Devices for Your VPN Topology , on page 1108.

Step 5 Click **Finish** to close the wizard and start the rediscovery process. The Discovery Status window opens and displays the status of the rediscovery and indicates whether the rediscovery of each device has been successful or has failed (see Viewing Policy Discovery Task Status , on page 188). Error or warning messages are provided to indicate the source of any problems, which may be VPN specific or device specific.

When the rediscovery process completes successfully, and you close the Discovery Status dialog box, the Site-to-Site VPN Manager window opens, displaying summary information for the VPN that was rediscovered.

Creating or Editing VPN Topologies

Security Manager supports three basic types of topologies with which you can create a site-to-site VPN. Use the Create VPN wizard to create a hub-and-spoke, point-to-point, or full mesh VPN topology across multiple device types. For more information about these topologies, see Understanding VPN Topologies , on page 1074.

Tip If you want to create an Extranet point-to-point VPN, read Creating or Editing Extranet VPNs , on page 1144 instead of this topic.

Creating a VPN topology involves specifying the devices and the networks that make up the site-to-site VPN. You define the devices and their roles (such as hub, spoke, peer, key server, group member), the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. When you create a VPN topology, you assign to it the IPsec technology (such as Regular IPSec, IPSec/GRE, GRE Dynamic IP, DMVPN, Large Scale DMVPN, Easy VPN, GET VPN) with which a predefined set of policies is associated. See Understanding Mandatory and Optional Policies for Site-to-Site VPNs , on page 1078.

Note When you complete the Create VPN wizard, your topology might be immediately deployable, because Security Manager provides defaults for mandatory policies. However, if you use Security Manager defaults, be sure to verify that the settings will work properly in your network. For more information, see Understanding and Configuring VPN Default Policies , on page 1086.

When you edit a VPN topology, the Edit VPN dialog box contains the same pages as the Create VPN wizard (except for the VPN defaults page), but the pages are laid out in a tabbed format rather than being presented as a wizard. The only exception is for GET VPN topologies, where you can edit only the name and description of the topology (you must edit GET VPN policies to change topology attributes, see Configuring GET VPN , on page 1272). Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For all topologies, you must edit mandatory and optional policies originally presented on the VPN defaults page directly.

By editing a VPN topology, you can change its device structure (adding or removing devices), change the VPN interfaces and protected networks defined for a device, or modify the policies that are assigned to the VPN. For example, if your organization frequently opens new sites, you might need to add spokes to an existing hub-and-spoke VPN while applying all policies of the VPN to the new spokes. Or, you might want to increase resiliency by adding a secondary hub to a VPN that has only one hub. While editing a VPN topology, you might also need to modify the policies assigned to it, for example, to change an IKE algorithm to a more secured one, or to change the DES encryption algorithm for a VPN to make it more secure.

Tip After you create a topology, you cannot change the technology used in the VPN. Instead, you must delete the old VPN and create a new one using the desired technology.

To start the Create VPN wizard, or to edit an existing VPN topology:

- To open the Create VPN wizard, in the Site-to-Site VPN Manager Window , on page 1093 or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select the type of VPN topology you want to create from the options that are displayed—Hub and Spoke, Point to Point, or Full Mesh. Use the Back and Next buttons to move through the pages; when finished, click Finish to create the topology.
- To open the Edit VPN dialog box, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button.

The pages or tabs that appear and their sequence depend on the type of VPN topology you are creating, as explained in the following table.

Table 323: Create/Edit VPN Wizard Pages

Page	Hub and Spoke VPN	Point to Point VPN	Full Mesh VPN
Name and Technology Page. See Defining the Name and IPsec Technology of a VPN Topology , on page 1106.	Step 1	Step 1	Step 1

Page	Hub and Spoke VPN	Point to Point VPN	Full Mesh VPN
Device Selection Page. See Selecting Devices for Your VPN Topology , on page 1108.	Step 2	Step 2	Step 2
Endpoints Page. See Defining the Endpoints and Protected Networks , on page 1109. From this page, you can also create several advanced configurations; see the information following the table for further explanation.	Step 3	Step 3	Step 3 (Regular IPSec, IPSec GRE only)
High Availability Page. See Configuring High Availability in Your VPN Topology , on page 1130	Step 4	—	—
GET VPN Group Encryption Policy Page. See Defining GET VPN Group Encryption , on page 1132.	—	—	Step 3 (GET VPN only.)
GET VPN Peers Page. See Defining GET VPN Peers , on page 1138.	—	—	Step 4 (GET VPN only.)
VPN Defaults Page. See Assigning Initial Policies (Defaults) to a New VPN Topology , on page 1139.	Step 5	Step 4	Step 4 (Step 5 for GET VPN.)
Synchronize Keys dialog box. When completing the Create VPN wizard for a GET VPN, you are asked if you want to synchronize keys. Clicking **Yes** initiates the process. See Generating and Synchronizing RSA Keys , on page 1273.	—	—	Step 6 (GET VPN only.)

Either during or after you create a VPN topology, you can also create the following advanced configurations when editing endpoints:

- VRF-Aware IPsec on a hub in a hub-and-spoke topology (see Configuring VRF Aware IPsec Settings , on page 1124).
- A VPNSM or VPNSPA/VSPA on a Catalyst 6500/7600 in a hub-and-spoke, point-to-point, or full mesh VPN topology (see Configuring VPNSM or VPN SPA/VSPA Endpoint Settings , on page 1118).
- A Firewall Services Module together with a VPN Services Module or VPN SPA on a Catalyst 6500/7600 device in a hub-and-spoke, point-to-point, or full mesh VPN topology (see Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA , on page 1123).

Note You can create a visual representation of your VPN topology with all its elements in the Map view. For more information, see Creating VPN Topologies in Map View , on page 1606.

- Using Wizards , on page 50

Defining the Name and IPsec Technology of a VPN Topology

Note This topic does not apply to Extranet VPNs. For information about configuring the name of an Extranet VPN, see Creating or Editing Extranet VPNs , on page 1144.

Use the Name and Technology page (or tab) of the Create VPN wizard and Edit VPN dialog box to define a name and description for the VPN topology. When creating a new topology, you must select the IPsec technology that will be assigned to it, but you cannot change the technology when editing an existing topology.

For information on opening the Create VPN wizard or Edit VPN dialog box, see Creating or Editing VPN Topologies , on page 1103.

Note If you are editing an existing VPN, the assigned IPsec technology and type is displayed, but you cannot change them. To change the technology or type, you must delete the topology and create a new one.

The following table describes the options you can configure when defining the name and technology.

Table 324: Name and Technology Page

Element	Description
Name	A unique name that identifies the VPN topology.
Description	Information about the VPN topology.

Element	Description
IPsec Technology	The IPsec technology used in the VPN topology: • Regular IPsec • IPsec/GRE • DMVPN (Hub and Spoke VPN only) • Easy VPN (Hub and Spoke VPN only) • GET VPN (Full Mesh VPN only) • Regular IPSec VTI
Type	The technology type field appears if you have selected IPsec/GRE or DMVPN as IPsec technology for a hub-and-spoke topology: • IPsec/GRE—Select either **Standard** (for IPsec/GRE) or **Spokes with Dynamic IP** (for GRE Dynamic IP). For more information, see Understanding GRE Configuration for Dynamically Addressed Spokes , on page 1229. • DMVPN—Select either **Standard** (for regular DMVPN) or **Large Scale with IPsec Terminator** (for a large scale DMVPN). For more information, see Configuring Large Scale DMVPNs , on page 1241.
IKE version	The Internet Key Exchange (IKE) version to allow in IKE negotiations. When configuring regular IPsec VTI topology, you can allow version 1 (**IKEv1**) or version 2 (**IKEv2**). When configuring regular IPsec topology, you can allow version 1 (**IKEv1**), version 2 (**IKEv2**), or both **IKEv1 & IKEv2**. If you select **IKEv1 & IKEv2**, IKEv1 is automatically used by any device that does not support IKEv2. However, if you select IKEv2 only, you must ensure that you do not select any devices that do not support IKEv2 (the wizard does not prevent an invalid selection). You can edit the IKE Proposal and IPsec Proposal policies to change which IKE versions are supported after creating the VPN if you select the wrong option. For information on IKE and how these versions differ, see Overview of IKE and IPsec Configurations , on page 1150. For information on devices that support IKEv2, see Understanding Devices Supported by Each IPsec Technology , on page 1083. **Tip** When using the Create VPN wizard, if you select an option that allows IKEv2, the wizard never creates a valid topology. After completing the wizard, you must manually configure the IKEv2 Authentication policy to complete the configuration.

Selecting Devices for Your VPN Topology

Note This topic does not apply to Extranet VPNs. For information about selecting devices in an Extranet VPN, see Creating or Editing Extranet VPNs , on page 1144.

Use the Device Selection page (or tab) of the Create VPN wizard and Edit VPN dialog box to select the devices to include in the VPN topology. The contents of this page differ depending on whether you are creating or editing a hub-and-spoke, large scale DMVPN, point-to-point, or full mesh VPN topology. Also, you cannot use this page to edit the membership in a GET VPN (instead, see Configuring GET VPN Group Members , on page 1280 and Configuring GET VPN Key Servers , on page 1278 when working with an existing GET VPN).

For information on opening the Create VPN wizard or Edit VPN dialog box, see Creating or Editing VPN Topologies , on page 1103.

In most cases, the devices that are listed in the **Available Devices** list include only those that can be used for the selected VPN topology type, that support the IPsec technology type, and which you are authorized to view. In addition, the available devices depend on the selected IPsec technology—for example, if the IPsec technology is IPsec/GRE, GRE Dynamic IP, or DMVPN, PIX Firewalls and ASA devices are not displayed. The lists are not adjusted to account for the IKE versions you are supporting in the topology. However for regular IPsec VTI topology configuration, when IKEv1 is selected, ASA 9.7.1 and above single context devices are displayed; for IKEv2, ASA 9.8.1 and above single context devices are displayed. For more information, see the supported platforms described in Understanding Devices Supported by Each IPsec Technology , on page 1083.

Tip When selecting devices, you can select a device group to select all of the eligible devices in the group.

The following list explains how to add or remove devices based on the type of topology:

- **To select devices for a full mesh VPN topology with Regular IPSec or IPSec/GRE technology**, select them in the Available Devices list and click >>.
- **To select devices for a full mesh VPN topology that uses the GET VPN technology:**
  - Select the devices that you want to define as key servers and click >> next to the **Key Servers** field.

If you have more than one key server, use the **Up** and **Down** arrow buttons to ensure the primary key server is listed first. Group members register with the first key server in the list. If the first key server cannot be reached, they try to register with the second key server, and so on.

- Select the devices that you want to define as group members and click >> next to the **Group Members** field.

- **To select devices for a hub-and-spoke VPN topology**:
  - Select the devices that you want to define as hubs (or servers in an Easy VPN configuration) and click >> next to the **Hubs** list.

If you have more than one hub, ensure the hubs list is in priority order with the primary hub listed first. To change the order, select a hub and click the **Up** and **Down** arrow buttons until the device is ordered as desired.

Note You need to select the primary hub only when there are two or more IPsec terminators. When there is only one IPsec terminator, regardless of how many hubs are connected to the same IPsec terminator, it is not possible to designate one hub as the primary hub.

- Select the devices that you want to define as spokes (or clients in an Easy VPN configuration) and click >> next to the **Spokes** list.
- If you are configuring a **Large Scale DMVPN with IPsec Terminator** topology, you must also select the Catalyst 6500/7600 devices you want to be **IPsec Terminators** in your Large Scale DMVPN configuration. If you select more than one IPsec Terminator, use the **Up** and **Down** arrow buttons to put them in priority order. For more information, see Configuring Large Scale DMVPNs , on page 1241.
- **To select devices for a point-to-point VPN topology:**
  - From the Devices list, select a device to be **Peer One** and click >>.
  - Select another device to be **Peer Two** and click >>.
- **To remove devices (any topology or technology combination)**, select them from one of the selected devices lists and click << to move them back to the Available Devices list.

If you are editing an existing VPN topology, you can remove devices from the VPN topology, but you cannot save your changes if your device selections result in an invalid VPN configuration. When removing devices, you should be aware of the following:

- You cannot remove a device if it is the only hub in a hub-and-spoke VPN topology, unless you replace it with a different hub.
- You cannot remove a device that is one of the two devices in a point-to-point VPN topology, unless you replace it with a different device.
- In a VPN topology with multiple hub devices, deleting a hub causes the appropriate tunnels to be removed.
- If some, but not all, spokes in a VPN topology are deleted, the hub side crypto statements change to reflect the removal.
- GET VPNs must have at least one key server and one group member.

Related Topics

- Including Unmanaged or Non-Cisco Devices in a VPN , on page 1085

Defining the Endpoints and Protected Networks

Use the Endpoints page of the Create VPN wizard and Edit VPN dialog box, or the Peers policy, to view the devices in your VPN topology and to define or edit their VPN characteristics and features. You are primarily defining the external or internal VPN interfaces and the protected networks for the devices in the VPN topology. The VPN interfaces are the interfaces that encrypt the data. The protected networks are the networks that are encrypted.

To get to the Endpoints page, do any of the following:

- Open the Create VPN wizard or the Edit VPN dialog box; for the procedure, see Creating or Editing VPN Topologies , on page 1103.
- In the Site-to-Site VPN Manager, select the desired VPN topology (excepting GET VPN topologies) and select the **Peers** policy.

Tips:

- This configuration applies to all IPsec technology types except GET VPN. To configure GET VPN endpoints when creating the VPN, see Defining GET VPN Peers , on page 1138. For existing GET VPNs, configure endpoints using the Key Servers and Group Members policies; see Configuring GET VPN Key Servers , on page 1278 and Configuring GET VPN Group Members , on page 1280.
- The devices listed on this page are selected in the Device Selection Page (see Selecting Devices for Your VPN Topology , on page 1108). You can change the list only when editing the Peers policy, where you can select a device and click the **Delete (trash can)** button to remove it. To add devices, you must edit the VPN topology itself.
- Although you can edit the endpoints for an Extranet VPN using the Peers policy, you should instead edit the endpoints through the Edit Extranet VPN dialog box by editing the VPN topology. The Endpoints page does not appear in the Create Extranet VPN wizard.

The table shows the role each device plays in the VPN (hub, spoke, peer, or IPsec Terminator), the device name, and the VPN interface and protected networks. Initially, the VPN interface and protected network is set to the default interface roles defined in the Security Manager Administrative settings for external and internal interfaces (see VPN Policy Defaults Page , on page 588). The endpoint configuration might include configurations not shown in this table, but the VPN interface and protected network are the only required settings.

- To change the endpoint configuration for a device, select it and click the **Edit Row** button beneath the table. You can select more than one device to edit at a time, but the devices must serve the same role, and you cannot include Catalyst 6500/7600 devices or VPN service modules when selecting multiple devices. You perform endpoint editing in the Edit Endpoints Dialog Box, whose content differs depending on the selected device type and IPsec technology.

See the following topics for detailed information about the options you can configure in the Edit Endpoints dialog box:

- - **VPN Interface tab**—To configure the VPN interface and other required interface settings (see Configuring VPN Interface Endpoint Settings , on page 1111). In some cases, you can also configure dial backup (for more information about dial backup, see Configuring Dial Backup , on page 1115).

For Catalyst 6500/7600 devices, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device (which might be an IPsec Terminator in a large scale DMVPN), and are described in Configuring VPNSM or VPN SPA/VSPA Endpoint Settings , on page 1118.

For configuring tunnel based VPN, only the VPN Interface tab appears. Use the Select button to choose the tunnel interface.

Easy VPN works by determining the highest and lowest security level interfaces during ASA bootup. VPN client rejects two or more interfaces having same highest security level. In BVI, Easy VPN determines that there are more than two interfaces with same highest security level because of which VPN client is not enabled. In order to overcome this issue, vpnclient secure interface CLI was introduced for all ASA 5506, 5508, and

5512 [x/h/w] devices from ASA 9.9(2) onwards. Thus, to support the CLI in Cisco Security Manager, starting from version 4.17, a new component “VPN Client Interface” is introduced in Hub & Spoke Topology of type (Easy VPN).

- - **Extranet Device Details**—To configure the endpoint settings for the remote (unmanaged) device in an Extranet VPN. The tab appears in the Peers policy only. Instead of editing the information on this tab, the preferred method is to edit the VPN topology and change the settings there. For more information, see Creating or Editing Extranet VPNs , on page 1144.
  - **Hub Interface tab**—If the selected device is a hub in a large scale DMVPN, specify the interface that is connected to the IPsec Terminator. See Configuring Large Scale DMVPNs , on page 1241.
  - **Protected Networks tab**—To define the networks that are encrypted (see Identifying the Protected Networks for Endpoints , on page 1121). The protected network can be an interface role, network/host group object, or in the case of regular IPsec, an ACL policy object.
  - **FWSM tab**—To define the settings that enable you to connect between a Firewall Services Module (FWSM) and an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. This is possible only in a hub-and-spoke topology where the hub is a Catalyst 6500/7600 device that has these modules installed. For more information, see Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA , on page 1123.
  - **VRF Aware IPsec tab**—To configure a VRF-Aware IPsec policy on a hub (IPsec Aggregator) in a hub-and-spoke VPN topology. For more information, see Configuring VRF Aware IPsec Settings , on page 1124 and Understanding VRF-Aware IPsec , on page 1088.
  - **Crypto Map tab**—To manually configure the Crypto Map name and Crypto ACL name for each peer, which is supported by Security Manager starting with version 4.7. Crypto Map and Crypto ACL are supported in regular IPSec technology. Therefore, this configuration is applicable only for the topologies with regular IPSec technology. For more information see, Configuring Crypto Map , on page 1127.
  - **Tunnel Group tab**—To configure the Tunnel Group Name and Group Policy Name for each peer device. This configuration is applicable only for Regular IPSec and IPSec VTI topology. For more information, see Configuring Tunnel Group .

- To view the actual interfaces associated with an interface role for each device, select **Matching Interfaces** in the **Show** list beneath the table. If there are no matching interfaces, “No Match” is displayed. The default is to show the interface role policy object names. To create a valid VPN, these roles must match to actual interfaces defined on the device.

- Filtering Tables , on page 50

Configuring VPN Interface Endpoint Settings

Use the VPN Interface tab in the Edit Endpoints dialog box to edit the VPN interfaces defined for devices in the Endpoints table. When defining a primary VPN interface for a router device, you can also configure a backup interface to use as a fallback link for the primary route VPN interface, if its connection link becomes unavailable. You can configure a backup interface on a Cisco IOS security router, that is in a point-to-point

or full mesh topology, or that is a spoke in a hub-and-spoke topology, or is a remote client in an Easy VPN topology. For more information, see Configuring Dial Backup , on page 1115.

Tips

- If the device is a hub in a large scale DMVPN, this tab is called **Hub Interface**. Specify the interface that is connected to the IPsec Terminator in the **Hub Interface Toward the IPsec Terminator** field. Enter the name of the interface or interface role, or click **Select** to select it from a list. For more information, see Configuring Large Scale DMVPNs , on page 1241.
- If the device is a Catalyst 6500/7600 device, the VPN Interface tab provides settings that enable you to configure a VPN Services Module (VPNSM) or a VPNSPA/VSPA blade on the device. For a description of the elements that appear on the VPN Interface tab for a Catalyst 6500/7600 device, see Configuring VPNSM or VPN SPA/VSPA Endpoint Settings , on page 1118. The table below assumes the device is not a Catalyst 6500/7600 device.

Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VPN Interfaces** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109.

Field Reference

Table 325: Edit Endpoints Dialog Box, VPN Interface Tab

Element	Description
Enable the VPN Interface Changes on All Selected Peers	Available if you selected more than one device on the Endpoints page for editing. When selected, applies any changes you make in the VPN interface tab to all the selected devices.
VPN Interface	The VPN interface defined for the selected device. Enter the name of the interface role policy object that defines identifies the interface, or click **Select** to select it from a list or to create a new interface role object. (See Creating Interface Role Objects , on page 304.) **Note** When manually configuring Crypto Map in devices, you must specify the IP Address of the peer interface and not its name. If the device is an ASA 5505 version 7.2(1) or later, it must have two interfaces defined with different security levels. For more information, see Managing Device Interfaces, Hardware Ports, and Bridge Groups , on page 1835.
VPN Client Interface	The VPN client interface defined for the selected device. Click **Select** to select it from a list. From Cisco Security Manager 4.17, you can specify the client interface for the Easy VPN. This is applicable for: • ASA 5506 devices and later • BVI interface or any other physical interface and not for the BVI member interfaces • Devices in hub and spoke topology

Element	Description
VPN Client Secure Interface	Beginning from 4.17, Cisco Security Manager supports ASA 9.9(2)s' EzVPN feature support for BVI. This field allows you to define the secured interface. Select the interface to act as the protected network for tunnel establishment. This feature is applicable only for: • EasyVPN topology • spoke interface • ASA 9.9.2 devices onwards
Connection Type	Only available in a hub-and-spoke VPN topology, if the selected device is an ASA or PIX 7.0+ device, and the selected technology is Regular IPsec. Select the type of connection that the hub or spoke will use during an SA negotiation: • **Answer Only**—To configure the hub to only respond to an SA negotiation, but not initiate it. This is the default for hubs. • **Originate Only**—To configure the device to only initiate an SA negotiation, but not respond to one. This is the default for spokes. • **Bidirectional**—To configure the hub or spoke to both initiate and respond to an SA negotiation.

Element	Description
Local Peer IPSec Termination	Unavailable if the selected technology is Easy VPN. Specifies the IP address of the VPN interface of the local router. You can select one of the following options: • **Tunnel Source IP Address**—Use the IP address of the tunnel source. • **VPN Interface IP Address**—Uses the configured IP address on the selected VPN interface. Only one VPN interface can match the interface role. This option is available only if you select **Configure Unique Tunnel Source for each Tunnel** in the GRE Modes policy. **Note** Beginning with version 4.9, Security Manager enables you to select IPv6 addresses. This feature is supported for interfaces that have IPv6 addresses and is applicable for devices running the ASA software version 9.0 or later. Also, the option of IPv6 address is available only with Regular IPSec technology. • **IP Address**—Explicitly specify the IP address of the VPN interface of the local router. Use this option when the device is behind a NAT boundary to specify the NAT IP Address. Beginning with version 4.9, Security Manager enables you to specify IPv6 addresses. **Note** If you select a tunnel source as the VPN interface, it is likely that the VPN interface has a dynamically assigned IP address. • **IP Address of Another Existing Interface to be Used as Local Address** (unavailable if IPsec technology is DMVPN)—To use the configured IP address on any interface as a local address, not necessarily a VPN interface. Enter the interface in the field provided. You can choose the required interface by clicking **Select**. A dialog box opens that lists all available predefined interface roles, and in which you can create an interface role object.
Tunnel Source	Available only for IPsec/GRE or DMVPN. If you have enabled the setting to use a unique tunnel source per tunnel interface in the **GRE Modes > Tunnel Parameters** tab, the **Override Unique Tunnel Source per Tunnel Interface** check box is available. Select this option to specify a different tunnel source for the selected device. Specifies the tunnel source address to be used by the GRE or DMVPN tunnel on the spoke side. You can select one of the following options: • **VPN Interface**—Uses the VPN interface as the tunnel source address. • **Interface**—To use any interface as the tunnel source address, not necessarily a VPN interface. Enter the interface name or click **Select** to select an interface role that identifies the interface (you can also create a role from the selection dialog box).
Dial Backup Settings	

Element	Description
Enable Backup	Available if the selected device is an IOS router that is in a point-to-point or full mesh topology, or that is a spoke in a hub-and-spoke topology, or that is a remote client in an Easy VPN topology. Whether to configure a backup interface to use as a fallback link for the primary route VPN interface, if its connection link becomes unavailable. **Tip** Before configuring a backup interface, you must first configure the dialer interface settings on the device. For more information, see Dialer Interfaces on Cisco IOS Routers , on page 2333.
Dialer Interface	The logical interface through which the secondary route traffic is directed when the dialer interface is activated. This can be a Serial, Async, or BRI interface. Enter the name of the interface or interface role object, or click **Select** to select it from a list.
Primary Next Hop IP Address	Available only if the selected technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN. The IP address to which the primary interface connects when it is active. This is known as the next hop IP address. If you do not specify the next hop IP address, Security Manager configures a static route using the VPN interface name. The VPN interface must be point-to-point or deployment fails. You can choose the required IP address by clicking **Select**. The Network/Hosts selector opens, in which you can select a network from which the IP address will be allocated.
Tracking IP Address	The IP address of the destination device to which connectivity must be maintained from the primary VPN interface connection. This is the device that is pinged by the Service Assurance agent through the primary route to track connectivity. The backup connection is triggered if connectivity to this device is lost. If you do not specify an IP address, the primary hub VPN interface is used in a hub-and-spoke or Easy VPN topology. In a point-to-point or full mesh VPN topology, the peer VPN interface is used. You can choose the required IP address by clicking **Select**. The Network/Hosts selector opens, in which you can select a network from which the IP address will be allocated.
Advanced button	Available if the selected technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN. Click this button to configure additional optional settings using the Dial Backup Settings Dialog Box , on page 1117.

Configuring Dial Backup

You can use dial backup to provide a fallback link for a primary, direct connection when the primary link becomes unavailable. You can configure dial backup on Cisco IOS security routers that participate in a point-to-point, Extranet, or full mesh VPN topology, or that are spokes in a hub-and-spoke topology. You can also configure it on a remote client router running IOS version 12.3(14)T+ in an Easy VPN topology.

Implementation of the dial backup feature is based on the assumption that two static routes exist:

- A primary route through a primary gateway, which has highest priority.
- A secondary route through a secondary gateway, which has lower priority and only appears in the routing table when the primary gateway is down.

Security Manager configures a logical dialer interface on the spoke. The dialer interface is associated with a physical backup interface. When the primary route is down, the dialer interface is activated and traffic is redirected through this backup interface along the secondary route. To ensure that the spoke-hub traffic is encrypted, Security Manager applies a crypto map to the dialer interface. This crypto map is identical to the crypto map on the VPN interface (the primary route interface). In Easy VPN, the backup configuration is attached to the dialer interface.

Depending on the IOS version, Response Time Reporter (RTR) or Service Level Agreement (SLA) IOS technology is used to detect loss of network performance on the primary route. If the assigned IPsec technology is DMVPN, Dialer Watch-List (DWL) is used.

ISDN Basic Rate Interface (BRI) and analog modem interfaces can be configured as backup interfaces to other primary interfaces. In such a case, an ISDN or analog modem connection is made if the primary interface goes down. Should the primary interface and connection go down, the ISDN or analog modem interface immediately dials out to establish a connection so that network services are not lost.

Before You Begin

- Configure the dialer interface settings on the Cisco IOS routers. This requires defining the relationship between the physical BRI and Async interfaces, and the virtual dialer interfaces used when configuring dial backup. For more information, see Dialer Interfaces on Cisco IOS Routers , on page 2333.
- Make sure that the primary route is functioning.
- For Extranet VPNs, you can configure dial backup on the local (managed) device only.

Step 1 For most VPN topologies, you configure dial backup when creating or editing a site-to-site VPN. You can also edit the Peers policy for existing VPN topologies. For Extranet VPNs, you configure dial backup through the Peers policy only.

Do one of the following:

- In the Create VPN wizard, proceed to the Endpoints page (see Creating or Editing VPN Topologies , on page 1103 and Defining the Endpoints and Protected Networks , on page 1109).
- In the Edit VPN dialog box, click the **Endpoints** tab (see Creating or Editing VPN Topologies , on page 1103 and Defining the Endpoints and Protected Networks , on page 1109).
- For Extranet VPNs, or for editing any other VPN topology, select the Peers policy. For general information on editing endpoints, see Defining the Endpoints and Protected Networks , on page 1109.

Step 2 Select the router on which you want to configure dial backup and click the **Edit (pencil)** button. If there is more than one router that will have the same dialer configuration, you can select and edit them all at once.

This action opens the Edit Endpoints dialog box. Select the **VPN Interface** tab if it is not already selected.

Step 3 On the VPN Interface tab, configure the following options related to dial backup. If you are creating a new VPN, you need to configure the other settings (such as VPN interface) as well. For detailed reference information for these options, see Configuring VPN Interface Endpoint Settings , on page 1111.

- **Enable Backup**—Select this option.
- **Dialer Interface**—Specify the physical interface through which the secondary route traffic will be directed when the logical dialer interface is activated.
- **Primary Next Hop IP Address**—If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, enter the next hop IP address. If you do not enter the next hop IP address, Security Manager configures a static route using the interface name.
- **Tracking IP Address**—Specify the IP address of the destination device to which connectivity must be maintained from the primary VPN interface connection. This is the device that is pinged through the primary route to track connectivity. The backup connection is triggered if connectivity to this device is lost.

If you do not specify an IP address, the primary hub VPN interface is used in a hub-and-spoke or Easy VPN topology. In a point-to-point or full mesh VPN topology, the peer VPN interface is used.

Step 4 If the selected IPsec technology is Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN, click **Advanced** to configure additional (optional) settings in the Dial Backup Settings dialog box. These settings are explained in Dial Backup Settings Dialog Box , on page 1117. Click **OK** to save your changes.

Step 5 Click **OK** in the Edit Endpoints dialog box.

Dial Backup Settings Dialog Box

Use the Dial Backup Settings dialog box to define optional settings for configuring a dial backup policy for your site-to-site VPN. These settings are available for Regular IPsec, IPsec/GRE, GRE Dynamic IP, or Easy VPN technologies.

Mandatory settings for dial backup are configured in the VPN Interface tab on the Edit Endpoints dialog box. See Configuring VPN Interface Endpoint Settings , on page 1111.

Note You must configure the dialer interface settings before dial backup can work properly. For more information, see Dialer Interfaces on Cisco IOS Routers , on page 2333.

Navigation Path

To open the Dial Backup Settings dialog box, enable dial backup and click **Advanced** on the **VPN Interface** tab of the Edit Endpoints dialog box. For information on opening the Edit Endpoints dialog box, see Defining the Endpoints and Protected Networks , on page 1109.

Related Topics

Field Reference

Table 326: Dial Backup Settings Dialog Box

Element	Description
Next Hop Forwarding Backup Next Hop IP Address	If required, enter the next hop IP address of the ISDN BRI or analog modem backup interface (that is, the IP address to which the backup interface will connect when it is active). You can enter an IP address or the name of a network/host object, or click Select to select a network/host object that specifies the IP address. If you do not enter the next hop IP address, Security Manager configures a static route using the interface name.
Tracking Object Settings	
Timeout	The number of milliseconds the Service Assurance Agent operation waits to receive a response from the destination device. The default is 5000 ms.
Frequency	How often Response Time Reporter (RTR) should be used to detect loss of performance on the primary route. The default is every 60 seconds.
Threshold	The rising threshold in milliseconds that generates a reaction event and stores history information for the RTR operation. The default is 5000 ms.

Configuring VPNSM or VPN SPA/VSPA Endpoint Settings

When you select a Catalyst 6500/7600 device in the Endpoints table for editing, the VPN Interface tab of the Edit Endpoints dialog box provides settings for configuring Cisco VPN Services Modules (VPNSM), Cisco VPN Shared Port Adapters (VPN SPAs), and Cisco VPN Service Port Adapters (VSPAs) on the device. You can select more than one Catalyst 6500/7600 device at the same time. Your changes are applied to all the selected devices.

The device can be in a point-to-point or full mesh VPN topology, or a hub or spoke in a hub-and-spoke VPN topology managed by Security Manager (except in an Easy VPN configuration, where the device cannot be a spoke). These settings must also be configured if the selected device is an IPsec Terminator in a large scale DMVPN, although not all settings described below are available. See Configuring Large Scale DMVPNs , on page 1241.

General Notes

- A Catalyst 6500/7600 device can contain from 3 to 13 chassis slots. Due to the design of the blades, you can install one VPNSM or two VPNSPA/VSPA per slot. The location of a VPNSPA/VSPA is identified with a slot and subslot number. Security Manager stores this information in its inventory, so that Security Manager can manage the VPN topologies.
- If you are configuring intra-chassis high availability, you cannot use a VPNSM blade and a VPNSPA/VSPA blade on the same device as primary and failover blades.
- In a remote access VPN, you can configure only one failover unit for each IPsec proposal. See VPNSM/VPN SPA/VSPA Settings Dialog Box , on page 1474.

- If the Catalyst 6500/7600 has a Firewall Services Module (FWSM), you can configure it to work with these modules. For more information, see Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA , on page 1123.
- If you are configuring a VPNSM or VPNSPA/VSPA with VRF-Aware IPsec on a device, the device cannot belong to a different VPN topology in which VRF-Aware IPsec is not configured. For more information, see Configuring VRF Aware IPsec Settings , on page 1124.
- Create an inside VLAN on the Catalyst 6500/7600 device, or edit an existing port or VLAN configuration. If the device is configured with VRF-Aware IPsec, you must create a forwarding VLAN.

Notes for VPNSMs

- Security Manager supports the configuration of multiple VPNSMs on a Catalyst 6500/7600 device, but only one module (or two if you are configuring intra chassis high availability) can be configured per VPN topology.
- VPNSM configuration requires that its parent Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXD1 and later.
- You can use only Layer 3 VLANs for VPNSM configuration.

Notes for VPNSPA/VSPAs

- This configuration also applies if you are configuring an IPsec Terminator in a large scale DMVPN configuration. For more information, see Configuring Large Scale DMVPNs , on page 1241.
- The VPN SPA supports the AES encryption algorithm for all key sizes (128-, 192-, and 256-bit), as well as the DES and 3DES encryption algorithms. For more information, see Deciding Which Encryption Algorithm to Use , on page 1154.

In VRF mode, the **crypto engine slot** *slot/subslot* {**inside | outside**} command is deployed on the inside and outside VPN interfaces.

- Make sure that the Catalyst 6500/7600 device is running Cisco IOS Software release 12.2(18)SXE2 or later.
- If you plan to use Crypto Connect Alternate mode (whereby encrypted traffic entering the VPNSM/VPN SPA is passed through and clear text traffic is bypassed), the Catalyst 6500 device must be running Cisco IOS Software version 12.2(33)SXH or later, and the 7600 router must be running 12.2(33)SRA or later.
- In the case of a DMVPN topology in which multiple hubs participate, if one hub is configured with a VPN SPA blade, a tunnel key must not be configured on *any* of the devices, whether they are spokes or hubs. Devices that participate in such a topology must be running Cisco IOS Software version 12.3T and later in order to support tunnels without keys.

Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109.

Field Reference

Table 327: Edit Endpoints Dialog Box, VPN Interface Tab's VPNSM/VPN SPA/VSPA Settings

Element	Description
Enable the VPN Interface Changes on All Selected Peers	**Note** Available if you selected more than one Catalyst 6500/7600 device for editing in the Endpoints page. When selected, applies any changes you make in the VPN interface tab to all the selected devices.
VPNSM/VPN SPA/VSPA Settings	• **Use Crypto Connect Alternate**—When selected, only encrypted traffic entering the VPNSM/VPN SPA on the Catalyst 6500/7600 is passed through. Clear text traffic does not go through (bypasses) the adapters. To use this option, the Catalyst 6500 must be running version 12.2(33)SXH or later, and the 7600 router must be running 12.2(33)SRA or later. This mode is recommended as an alternate to Crypto connect mode for enterprise customers who have a need to support large VPN topologies (financial institutions, for example) or need to pass large amounts of data over an encrypted channel (remote disaster recovery or backup over the Internet). • **Inside VLAN**—The VLAN that serves as the inside interface to the service module or adapter. It is also the hub endpoint of the VPN tunnel (unless VRF-Aware IPsec is configured on the device). Enter the name of the VLAN or interface role object, or click **Select** to select it from a list. • **Slot and Subslot**—The number designating the slot location of the VPNSM or VPNSPA/VSPA. If you are configuring a VPNSPA/VSPA, the subslot number is also required. • **Outside VLAN/External port**—The external port or VLAN that connects to the inside VLAN. Enter the name of the VLAN or interface role object, or click **Select** to select it from a list. You must select an interface or interface role that differs from the one selected for the inside VLAN. **Note** If VRF-Aware IPsec is configured on the device, the external port or VLAN must have an IP address.

Element	Description
Tunnel Source	**Note** Available only for a hub when the selected technology is IPsec/GRE or DMVPN. Specifies the tunnel source address to be used by the GRE or DMVPN tunnel on the spoke side. You can select one of the following options: • **Override Unique Tunnel Source per Tunnel Interface**—If you have enabled the setting to use a unique tunnel source per tunnel interface in the GRE Modes > Tunnel Parameters tab, this option is available. Select this option to specify a different tunnel source for the selected device. • **Outside VLAN/External Port (When CCA/VRF is Enabled)**—When the **Use Crypto Connect Alternate** check box is selected, this radio button is available. When selected, specifies the outside VLAN/external port as the tunnel source. • **Inside VLAN**—When selected, uses the interface configured for the inside VLAN as the tunnel source. • **Interface**—To use any interface as the tunnel source address, not necessarily a VPN interface, enter the interface name or click **Select** to select an interface role that identifies the interface. You can create new roles from the selection list.
Local Peer IPSec Termination	Define the IPSec termination point of the VPN interface on the local router: • **Inside VLAN**—Use the interface configured as the inside VLAN. • **IP Address**—Use the IP address of the VPN interface on the local router. Enter the IP address. **Note** If you select a tunnel source as the VPN interface, it is likely that the VPN interface has a dynamically assigned IP address.
Enable Failover Blade	Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability. **Note** A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades. Specify the failover blade, as follows: • **Slot**—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located. • **Subslot**—If you are configuring a VPNSPA/VSPA, select the number of the subslot (0 or 1) on which the failover VPN SPA blade is installed. **Note** If you are configuring a VPNSM, select the blank option.

Identifying the Protected Networks for Endpoints

Use the Protected Networks tab on the Edit Endpoints dialog box to edit the protected networks that are defined on devices in the Endpoints table. (See Defining the Endpoints and Protected Networks , on page 1109.)

You can specify the protected networks as interface roles whose naming patterns match the internal VPN interface of the device, as network/host group objects containing one or more network or host IP addresses, interfaces, or other network objects, or as access control list objects (if Regular IPsec is the assigned technology).

- If you are editing more than one device at a time, select **Enable the Protected Networks Changes on All Selected Peers** to apply any changes you make in the Protected Networks tab to all the selected devices.
- To add a protected network, select it from the Available Protected Networks list and click >> to move it to the Selected Protected Networks list. You can use any combination of interface role objects, network/host group objects (listed in the Protected Networks folder), or Access Control List objects to define the protected network for the device. (ACL objects are available only if Regular IPsec is the assigned technology.)

Beginning with version 4.9, Security Manager supports IPv6 addresses.

- The Protected Networks folder now supports IPv6 objects.
- Access Control Lists folder now supports Extended and Unified ACLs.
- For Interface Roles, if you select an IPv6 enabled interface and click >>, a popup window appears with a list of all the IPv6 addresses that are configured. You can select an address from the list and then click **OK** to move the address to the Selected Protected Networks list. To edit an address, select it in the Selected Protected Networks list and click the **Edit Selection** link.
- For Extranet VPNs, remote backup peer supports IPv6 addresses.

Note In a hub-and-spoke VPN topology in which Regular IPsec is the assigned technology, when an ACL object is used to define the protected network on a spoke, Security Manager mirrors the spoke's ACL object on the hub to the matching crypto map entry.

If you do not provide a crypto map entry, then during deployment Security Manager generates the crypto ACL name on the hub device as the ACL object name on the spoke device appended with an "_1". For example, if the ACL object name of a spoke is, say, "spokeACL", Security Manager generates the Crypto ACL name on the hub device as "spokeACL_1". If there are multiple spoke devices with the same ACL object name, Security Manager generates the crypto ACL name on the hub device as "ACLobjectName_spokeDisplayName_1".

where, "ACLobjectName" is the ACL object name for all the spoke devices in the topology, and, "spokeDisplayName" is the display name of the spoke devices, which is different for each spoke.

Cisco Security Manager creates a new ACL for ASA devices, irrespective of topology type, when you execute any of the following:

- Add an extra entry to a protected network.
- Select Enable Spoke to spoke connectivity check box in the VPN Global Setting > General Settings tab for an existing hub and spoke topology.
- Add a new peer (as a spoke) to the existing hub and spoke topology.

This new ACL that is generated on-the-fly may disrupt the VPN traffic. Hence, we recommend you to directly make changes using the ACL building block in protected networks.

- To remove a selected protected network, select it and click the << button.
- If the order of the objects matters, you can adjust the priority order of the selected objects using the Move Up, Move Down buttons to position the objects in the selected list as desired. These buttons are not available if order does not matter.
- If an object that you need to define the protected network is not listed, click the **Create (+)** button to add the object; you are prompted to select the type of object you want to add. You can also modify the definition of an existing object by selecting it and clicking the **Edit (pencil)** button. For more information, see the following topics:
  - Understanding Interface Role Objects , on page 303 and Creating Interface Role Objects , on page 304.
  - Understanding Networks/Hosts Objects , on page 310 and Creating Networks/Hosts Objects , on page 313.
  - Creating Access Control List Objects , on page 283

Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the Peers policy, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **Protected Networks** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109.

Configuring a Firewall Services Module (FWSM) Interface with VPNSM or VPNSPA/VSPA

Note From 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any enhancements as FWSM is now End of Life.

Security Manager supports the configuration of a Firewall Services Module (FWSM) with an IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA on a Catalyst 6500/7600 device. This feature enables a FWSM to apply firewall policies to untrusted clients, while the VPNSM or VPN SPA/VSPA provides secure access to the internal network.

Use the FWSM tab on the Edit Endpoints dialog box to define the settings that enable you to connect between the FWSM and a VPNSM or VPNSPA/VSPA that is already configured on a Catalyst 6500/7600 device. The FWSM tab is available only in a hub-and-spoke VPN topology when the selected hub is a Catalyst 6500/7600 device.

Tips

- Before you can define the FWSM settings, you must add the hosting Catalyst 6500/7600 device to the Security Manager inventory and discover its FWSM and its policies and security contexts. See Adding Devices from the Network , on page 82 and Managing Security Contexts , on page 2290.
- If an inside interface is not already created on the Catalyst 6500/7600 device, you must create it (see Creating or Editing VLANs , on page 2648). Then, you must assign the FWSM inside interface (VLAN) to the appropriate security context, or directly to the FWSM blade.

- You also must configure the settings on the VPN Interfaces tab related to IPsec VPN Services Module (VPNSM) or VPNSPA/VSPA. For more information, see Configuring VPNSM or VPN SPA/VSPA Endpoint Settings , on page 1118.

Navigation Path

On the Endpoints Page of the Create VPN wizard or **Edit** VPN dialog box, or on the VPN Peers policy, select a Catalyst 6500/7600 device that contains an FWSM, then click **Edit** to open the Edit Endpoints Dialog Box. Select the **FWSM** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109.

Field Reference

Table 328: Edit Endpoints Dialog Box, FWSM Tab

Element	Description
Enable FWSM Settings	Whether you want to configure the connection between the Firewall Services Module (FWSM) and the VPN Services Module (VPNSM) or VPN SPA on the Catalyst 6500/7600 device.
FWSM Inside VLAN	The VLAN that serves as the inside interface to the Firewall Services Module (FWSM). Enter the name of the interface or interface role, or click **Select** to select it from a list or to create a new interface role object.
FWSM Blade	From the list of available blades, select the blade number to which the selected FWSM inside VLAN interface is connected.
Security Context	If the FWSM inside VLAN is part of a security context (that is, the FWSM is running in multiple-context mode), specify the security context name in this field. The name is case-sensitive.

Configuring VRF Aware IPsec Settings

Use the VRF-Aware IPsec tab on the Edit Endpoints dialog box to configure a VRF-Aware IPsec policy on a hub in your hub-and-spoke VPN topology. You can configure VRF-Aware IPsec as a one-box or two-box solution. For more information about VRF-Aware IPsec, see Understanding VRF-Aware IPsec , on page 1088.

Tips

- VRF-Aware IPsec can be configured only on hubs in a hub-and-spoke VPN topology.
- In a VPN topology with two hubs, you must configure VRF-Aware IPsec on both devices.
- You cannot configure VRF-Aware IPsec on a device that belongs to another VPN topology in which VRF-Aware IPsec is not configured.
- You cannot configure VRF-Aware IPsec on hubs that have been configured with high availability. See Configuring High Availability in Your VPN Topology , on page 1130.
- Deployment might fail if the IPsec Aggregator is configured with the same **keyring** CLI command as the existing preshared key (keyring) command, and is not referenced by any other command. In this case, Security Manager does not use the VRF keyring CLI, but generates the keyring with a different name,

causing deployment to fail. You must manually remove the preshared key keyring command through the CLI before you can deploy the configuration.

Navigation Path

On the Endpoints Page of the Create VPN wizard or Edit VPN dialog box, or on the VPN Peers policy, select a device that supports VRF-Aware IPsec configuration in a hub-and-spoke topology, and click **Edit** to open the Edit Endpoints Dialog Box. Select the **VRF-Aware IPsec** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109 and Creating or Editing VPN Topologies , on page 1103.

Field Reference

Table 329: Edit Endpoints Dialog Box, VRF Aware IPsec Tab

Element	Description
Enable the VRF Settings Changes on All Selected Peers	Available if you selected more than one device for editing in the Endpoints page. When selected, applies any changes you make in the VRF Settings tab to all the selected devices.
Enable VRF Settings	Whether to enable the configuration of VRF settings on the device. **Note** You can remove VRF settings that were defined for the VPN topology by deselect this check box. However, if VRF-Aware IPsec is configured on a Catalyst 6500/7600 device, disabling it requires additional steps, as explained in Enabling and Disabling VRF on Catalyst Switches and 7600 Devices , on page 1092.
VRF Solution	The type of VRF solution you want to configure: • 1-Box (IPsec Aggregator + MPLS PE)—In the one-box solution, one device serves as the Provider Edge (PE) router that does the MPLS tagging of the packets in addition to IPsec encryption and decryption from the Customer Edge (CE) devices. For more information, see VRF-Aware IPsec Two-Box Solution , on page 1090. • 2-Box (IPsec Aggregator Only)—In the two-box solution, the PE device does just the MPLS tagging, while the IPsec Aggregator device does the IPsec encryption and decryption from the CEs. For more information, see VRF-Aware IPsec Two-Box Solution , on page 1090.
VRF Name	The name of the VRF routing table on the IPsec Aggregator. The VRF name is case-sensitive.

Element	Description
Route Distinguisher	The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains the routing separation for each VPN across the MPLS core to the other PE routers. The identifier can be in either of the following formats: • *IP address:X* (where *X* is in the range 0- 2147483647). • *N:X* (where *N* is in the range 0-65535, and X is in the range 0-2147483647). **Note** You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it using the device CLI, and then deploy again.
Interface Towards Provider Edge (2-Box solution only.)	The VRF forwarding interface on the IPsec Aggregator towards the PE device. If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN. Enter the name of the interface or interface role object, or click **Select** to select it from a list or to create a new interface role object.
Routing Protocol (2-Box solution only.)	The routing protocol to be used between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route. The default is BGP. If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol to use for redistributing the routing to the secured IGP. For information about protocols, see Managing Routers, on page 2303. **Note** In a one-box solution, these fields are unavailable as you do not need to specify the routing protocol and AS number. In the one-box solution, only the BGP protocol is supported.
AS Number (2-Box solution, BGP or EIGRP routing only.)	The number that will be used to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be within the range 1-65535. If the routing protocol used for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that will be used to identify the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only when IPsec/GRE or DMVPN are applied.
Process Number (2-Box solution, OSPF routing only.)	The routing process ID number that will be used to identify the secured IGP if you are using OSPF routing. The range is 1-65535.

Element	Description
OSPF Area ID (2-Box solution, OSPF routing only.)	The ID number of the area in which the packet belongs. You can enter any number from 0-4294967295. **Note** All OSPF packets are associated with a single area, so all devices must have the same area ID number.
Next Hop IP Address (2-Box solution, static routing only.)	The IP address of the Provider Edge (PE) or the interface that is connected to the IPsec Aggregator, if you are using static routing.
Redistribute Static Route (2-Box solution, non-static routing only.)	Whether to have static routes advertised in the routing protocol configured on the IPsec Aggregator towards the PE device.

Configuring Crypto Map

Beginning with version 4.7, Security Manager enables you to manually configure the Crypto Map name and Crypto ACL name for each peer device in a VPN topology. This feature is supported only in Regular IPsec topologies.

Use the Crypto Map tab in the Edit Endpoints dialog box to list the peer devices along with the Crypto Map Name and Crypto ACL Name configured for the peers. Selecting any peer device in the list and clicking the **Edit (pencil)**button opens the Edit Crypto Map Entry dialog box.

Note If the topology supports dynamic Crypto Map, the dialog box that opens on clicking the **Edit** button enables you to enter the Dynamic Crypto Map Name.

Navigation Path

On the Edit Endpoints Page of the Create VPN wizard or Edit VPN dialog box, select a device and click **Edit** to open the Edit Endpoints Dialog Box. Select the **Crypto Map** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks , on page 1109.

Field Reference

Table 330: Edit Endpoints Dialog Box, Crypto Map Tab

Element	Default Value
Crypto Map Name	There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name. If a Crypto Map already exists on the VPN interface, Security Manager will reuse the same name.

Element	Default Value
Crypto Map Sequence	Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value. If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value.
Crypto ACL Name	There is no default value. If you do not enter any value, Security Manager generates a new Crypto ACL name.
Dynamic Crypto Map Name	There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name.

- You can apply only one crypto map to an interface.
- You cannot assign the same Crypto Map Name on multiple interfaces of a device.
- You cannot assign different Crypto Map names on the same interface of a device.

Edit Crypto Map Entry Dialog Box

Field Reference

Table 331: Edit Crypto Map Entry Dialog Box

Element	Default Value
Crypto ACL Name	There is no default value. If you do not enter any value, Security Manager generates a new Crypto ACL name.
Crypto Map Sequence	Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value. If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value.
Crypto Mode	Beginning with Security Manager version 4.12 for ASA devices version 9.6(2) or later, you can select an option from the following Crypto Modes: • Tunnel - Default value. Encapsulation mode will be tunnel mode. • Transport - Encapsulation mode will be Transport mode with option to fallback on tunnel mode, if peer does not support it. • Transport-Require - Encapsulation mode will be Transport-Require mode only. **Note** Transport and Transport-Require modes are supported only for IKEv2"

Configuring Tunnel Group

Use the L2L tunnel group to deploy site to site connectivity for your device. If there is no group policy assigned to the tunnel group then the device by default assigns the arguments of system default group policy (

DfltGrpPolicy). Group policy selection to each peer participating in the S2S Regular IPsec and Regular IPsec VTI topology solves this problem.

Note You can only assign the group policies, which are deployed in ASA, to the L2L tunnel group. Hence, you must deploy any new group policy in ASA before assigning it to the L2L tunnel group.

Security Manager enables you to configure the tunnel group name and group policy for each peer device in a VPN topology. This feature is supported only in Regular IPsec and Regular IPsec VTI topologies.

Note You can configure the tunnel group name only when digital certificates are used in the ASA device.

Use the Tunnel Group tab in the Edit Endpoints dialog box to list the peer devices along with the Tunnel Group Name and Group Policy Name configured for the peers. Selecting any peer device in the list and clicking the **Edit (pencil)** button opens the Edit Tunnel Group Entry dialog box.

Navigation Path

On the Edit Endpoints page of the Create VPN wizard or Edit VPN dialog box, select a device and click **Edit** to open the Edit Endpoints dialog Box. Select the **Tunnel Group** tab in the Edit Endpoints dialog box. For information on how to access these pages and dialog boxes, see Defining the Endpoints and Protected Networks.

Field Reference

Table 332: Edit Endpoints Dialog Box, Tunnel Group Tab

Element	Default Value
Tunnel Group Name	There is no default value. The tunnel may go down when this value does not match with the digital certificate. L2L named tunnel group is supported only when the digital certificates are used as the authentication method in ASA. The L2L named tunnel group supports only the deployment of ASA devices.
Group Policy Name	You can assign a group policy that is already deployed in the ASA. Tunnel group policy supports both the deployment and the discovery of ASA devices in CSM. **Note** To add a new group policy to the L2L tunnel group, you must create the group policy from RAVPN under group policy, perform the deployment, and assign it to L2L tunnel group.

Note If you configure the group policy for the extranet topology which has multiple peers, only the first peer device takes up the group policy.

Configuring High Availability in Your VPN Topology

Use the High Availability page of the Create VPN wizard and Edit VPN dialog box to define a group of hubs as a high availability (HA) group. Configuring high availability is optional.

For information on opening the Create VPN wizard or Edit VPN dialog box, see Creating or Editing VPN Topologies , on page 1103.

High Availability (HA) policies provide automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can configure high availability in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.

In Security Manager, HA is supported by an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the hubs in the HA group present the appearance of a single virtual device or default gateway to the hosts on a LAN. One hub in the HA group is always active and assumes the virtual IP address, while the others are standby hubs. The hubs in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby hub takes ownership of the virtual IP address and takes over the hub functionality. This transfer is seamless and transparent to hosts on the LAN and to the peering devices.

Keep the following points in mind when working with HA groups:

- You can configure High Availability only on hubs in a hub-and-spoke VPN topology that uses Regular IPsec or Easy VPN technologies.
- You can configure high availability only on Cisco IOS routers or Catalyst 6500/7600 devices; however, an HA group cannot contain both Cisco IOS routers and Catalyst 6500/7600 devices.
- If you want to configure stateful failover, the HA group can contain only two hubs, and they must be Cisco IOS routers. You cannot use Catalyst 6500/7600 devices.
- You cannot configure High Availability on hubs that have been configured with VRF-Aware IPsec. See Understanding VRF-Aware IPsec , on page 1088.
- You cannot configure GRE on an HA group.
- A device in an HA group can belong to more than one hub-and-spoke topology.
- A device configured as a hub in a site-to-site VPN with an HA configuration cannot be configured as a hub in a different site-to-site VPN with an HA configuration using the same outside interface. Similarly, such a device cannot be configured as a remote access VPN server on which HA is configured using the same outside interface.
- The same auto-generated preshared key must be used for authentication on all peers. If you specified not to use this option when configuring a preshared key policy, this is overridden during configuration of High Availability. For more information, see Configuring IKEv1 Preshared Key Policies , on page 1198.
- During generation of configurations, all hubs in the HA group receive the same commands, which must be deployed to the HA group as a unit. You cannot deploy to individual hubs in the group.

The following table describes the options for configuring high availability.

Table 333: High Availability Page

Element	Description
Enable	Whether to enable high availability configuration on a group of hubs. If you already configured high availability, you can remove the configuration by deselecting this option.
Inside Virtual IP	The IP address that is shared by the hubs in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the hubs in the HA group, but must not be identical to the IP address of any of these interfaces. **Note** If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.
Inside Mask	The subnet mask for the inside virtual IP address.
VPN Virtual IP	The IP address that is shared by the hubs in the HA group and represents the VPN interface of the HA group. This IP address serves as the hub endpoint of the VPN tunnel. **Note** If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.
VPN Mask	The subnet mask for the VPN virtual IP address.
Hello Interval	The duration in seconds (within the range of 1-254) between each hello message sent by a hub to the other hubs in the group to indicate status and priority. The default is 5 seconds.
Hold Time	The duration in seconds (within the range of 2-255) that a standby hub will wait to receive a hello message from the active hub before concluding that the hub is down. The default is 15 seconds.
Standby Group Number (Inside)	The standby number of the inside hub interface that matches the internal virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 1.
Standby Group Number (Outside)	The standby number of the outside hub interface that matches the external virtual IP subnet for the hubs in the HA group. The number must be within the range of 0-255. The default is 2. **Note** The outside standby group number must be different from the inside standby group number.

Element	Description
Enable Stateful Failover	Whether to enable stateful failover, which uses Stateful SwitchOver (SSO) to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations. You can configure stateful failover only on an HA group that contains two hubs that are Cisco IOS routers. This check box is disabled if the HA group contains more than two hubs. In an Easy VPN topology, this check box appears selected and disabled, as stateful failover must always be configured. **Tips:** • When deselected in a Regular IPsec topology, stateless failover is configured on the HA group. Stateless failover will also be configured if the HA group contains more than two hubs. You can configure stateless failover on Cisco IOS routers or Catalyst 6500/7600 devices. • Stateful failover cannot be used when RSA Signature is the IKE authentication method. • Stateful failover can be configured together with PKI configuration, but only on devices with Cisco IOS version 12.3(14)T and later.

Defining GET VPN Group Encryption

Use the GET VPN Group Encryption page to define the group settings and security associations for a GET VPN topology.

The contents of this page differ depending on whether you are using the Create VPN wizard or you are editing the Group Encryption Policy. The wizard page is not tabbed, whereas the policy is tabbed. There is an extra field on the wizard page to allow the security association configuration.

To open the GET VPN Group Encryption page:

- When creating a new GET VPN, use the Create VPN wizard. For information on starting the wizard, see Creating or Editing VPN Topologies , on page 1103.
- (Site-to-Site VPN Manager Window , on page 1093) Select an existing GET VPN topology and then select **Group Encryption Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Group Encryption Policy**, and then select an existing policy or create a new one.

The following table describes the options you can configure when defining the GET VPN group encryption settings.

Table 334: GET VPN Group Encryption Policy Page

Element	Description
Group Settings Tab	
Group Name	The name of the Group Name of Interpretation (GDOI) group. This name is the same as a VPN name.
Group Identity	A parameter that is used to identify the group. All key servers and group members use this parameter to identify with the group. The identity can be either a number (such as 3333) or any IP address (such as the multicast address used for rekey).
Receive Only	If enabled, group members decrypt traffic and forward it in clear text. This feature is useful for testing the VPN. In normal operation, ensure that this option is not selected. For detailed information, see Using Passive Mode to Migrate to GET VPN , on page 1283.
Security Policy (Create VPN wizard only.)	An ACL policy object to be used as the security policy. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see Understanding the GET VPN Security Policy and Security Associations , on page 1270. This field appears only if you are using the Create VPN wizard. In the Group Encryption Policy, you configure the security policy on the Security Associations tab (described below). **Note** If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol.
Authorization Type	The type of authorization mechanism used by the group: None, Certificates, or Preshared Key. Selecting Certificates or Preshared Key provides additional security in allowing only authorized group members to register with the key server. This type of additional security is required when a key server serves multiple GDOI groups. If you select **Certificates**, you must create a list of certificate filters (using some combination of distinguished name or full-qualified domain name attributes). This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the GDOI group. Enter a name for the certificate filter, click the **Add Row (+)** button, and fill in the Add Certificate Filter Dialog Box , on page 1135. **Note** To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI enrollment object that you use should define the same distinguished names, or include the device's fully-qualified domain name, as appropriate. If you select **Preshared Key**, also select an ACL policy object to identify the authorized group members. Use permit rules to identify the host or network addresses of group members.

Element	Description
Key Distribution	The transport method to be used to distribute keys to each group member, either unicast or multicast. For help deciding which to use, see Choosing the Rekey Transport Mechanism , on page 1266. If you select **unicast**, the key server sends a rekey message to each registered group member and waits for an acknowledgment. If you select multicast, the key server sends a rekey message to all group members at once and does not wait for acknowledgment. Rekey messages are retransmitted after the retransmit interval configured in this policy. If you select **multicast**, make sure that the router used as the key server is multicast enabled, and also configure the following options: • **Group IP Address**—The IP address of the multicast group to be used for key distribution. • **Use Static IGMP Joins on Group Members**—If you select this option, the static Source Specific Multicast (SSM) mappings are enabled, which reveal the source of multicast traffic to the group member. In the case of GET VPN, the group member learns the key server address.
RSA Key Label	The label for the RSA key, which is used to encrypt a variety of messages. This key can either already exist on the device, or it can be an unused new label. If you are creating a new VPN, you are asked at the end of the Create VPN wizard whether you want this key synchronized among the key servers; if you click **Yes**, Security Manager generates the key if it does not already exist. If you change this value for an existing GET VPN, you need to synchronize keys from the Key Servers policy. For more detailed information about how this key is used, and the key generation and synchronization process, see Generating and Synchronizing RSA Keys , on page 1273.
Lifetime (KEK)	The number of seconds that the key encryption key (KEK) is valid. This key is used for encrypting rekey messages. Before the end of this lifetime, the key server sends rekey messages to the group, which includes a new KEK encryption key and transforms and new TEK encryption keys and transforms. The KEK lifetime value should be greater than the TEK lifetime value (it is recommended that the KEK lifetime value be at least three times greater than the TEK lifetime value). The default value of 86,400 seconds is usually appropriate. The TEK lifetime value is configured for each security association (see Add New or Edit Security Association Dialog Box , on page 1136).
Encryption Algorithm	The algorithm used to encrypt the rekey message from the key server to the group member.
Retransmits	The number of times the rekey message can be sent if one or more group members do not receive it.
Interval	The number of seconds between retries.
Security Associations Tab	

Element	Description
Security Associations table	Use the Security Associations table to define security associations for the VPN. The columns in the table summarize the settings for an entry and are explained in Add New or Edit Security Association Dialog Box , on page 1136. When creating a new VPN, the Security Policy field (explained above) is used instead of this tab, which does not appear in the wizard. To configure security associations: • Click the **Add** button to add an entry to the table, and fill in the Add New Security Association dialog box. • Select an entry and click the **Edit** button to edit an existing entry. • Select an entry and click the **Delete** button to delete it.

Add Certificate Filter Dialog Box

Use the Add Certificate Filter dialog box to define a certificate filter for the group encryption policy for GET VPNs. This filter, located on the key server, specifies the attributes and values used to validate whether the group member is authorized to join the group.

Select one of the following filter types:

- **dn**—(Distinguished name.) Specify a comma separated list of *name=value* pairs in the **Subject** field. For example, OU=Cisco, C=US. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should define the same values on the Certificate Subject Name tab (see PKI Enrollment Dialog Box—Certificate Subject Name Tab , on page 1217). Using a distinguished name can let you match multiple devices with a single filter.
- **fqdn**—(Fully-qualified domain name.) Specify the fully qualified domain name of a single device (for example, router1.example.com) in the **Domain Name** field. When you configure the Public Key Infrastructure policy, the PKI enrollment object you select should have the **Include Device's FQDN** option selected. Because each device has a unique name, an FQDN filter matches a single device only.

Tip To configure certificate authorization, you must also configure a Public Key Infrastructure (PKI) policy for the GET VPN. The PKI policy is configured on all devices in the VPN.

Navigation Path

From the Group Settings tab on the GET VPN Group Encryption page, select Certificates as the authorization type and click the **Add Row** button under the Authorization Filter table, or select a filter and click the **Edit**

Row button. For information on opening the Group Encryption page, see Defining GET VPN Group Encryption , on page 1132.

Add New or Edit Security Association Dialog Box

Use the Add New or Edit Security Association dialog boxes to define an IPSec profile (name and transform set only) and security policy used by the selected GET VPN topology.

Navigation Path

To open the Add New Security Association dialog box, from the Security Associations tab on the GET VPN Group Encryption page, click the **Add Row (+)** button or select an existing association and click the **Edit Row (pencil)** button. For information on opening the Group Encryption page, see Defining GET VPN Group Encryption , on page 1132.

- Configuring GET VPN , on page 1272

Field Reference

Table 335: Add New Security Association Dialog Box

Element	Description
ID	The sequence number of the profile. This number defines the relative priority of the security association (1 being the highest). If you have more than one security association, the ACLs for each are concatenated (and merged) in the order represented by this number, and the group members process the collected ACL as a single ACL. Keep the default number or enter a new one.
IPSec Profile Name	The name of the IPSec profile.
Transform Sets	The transform set policy objects (security protocols, algorithms, and other settings) defined for the IPSec profile. Separate multiple entries with commas, and place them in priority order. Click **Select** to choose from a list of predefined transform sets or to create a new one.

Element	Description
Security Policy	The access control list policy object defined for the security association. Click **Select** to choose from a list of predefined ACL objects or to create a new one. For a detailed explanation of the contents of this object and how it relates to the group member security policy, see Understanding the GET VPN Security Policy and Security Associations , on page 1270. **Note** If you are using multicast as the method to distribute the keys, then the ACL policy object must contain a deny rule (ACE) for the multicast address. In this way, the rekey packets sent using multicast will not be encrypted by the TEK. This statement allows the group members to receive rekey packets sent using the multicast protocol.
Enable Anti-Replay	Whether to enable the anti-replay feature, which helps prevent eavesdroppers from inserting packets into the data stream. You can configure anti-replay based on traffic counters or time: • **Counter Window Size**—Although this is the default, it is not recommended. Counter-based anti-replay is useful only if there are two group members (essentially a point-to-point VPN). Select a window size. • **Time Window Size**—This is the preferred method, but it requires that there are more than two group members. Enter the number of seconds of the interval duration of the Synchronous Anti-Replay (SAR) clock. The value range is 1 through 100. The default value is 100. For more information on time-based anti-replay, see Understanding Time-Based Anti-Replay , on page 1271. **Note** If you are encrypting high packet rates for count-based anti-replay, ensure that you do not make the KEK or TEK lifetime too long or it can take several hours for the sequence number to wrap. For example, if the packet rate is 100 kilopackets per second, the lifetime should be configured as less than 11.93 hours so that the SA is used before the sequence number wraps.
Enable IPSec Lifetime	Whether to configure an IPsec security association lifetime that overrides the global setting, which is configured in the Global Settings for GET VPN policy (see Configuring Global Settings for GET VPN , on page 1276). This lifetime value controls how long the traffic encryption key (TEK) can be used before a rekey is required. Configure a value based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. Use the following recommendations: • The lifetime should be significantly shorter than the one used for the key encryption key (KEK) (see Defining GET VPN Group Encryption , on page 1132), perhaps a third of the length. • The timed lifetime is the recommended approach, because high traffic volumes can cause excessive rekeys (with potential data loss). • Leave a field blank to not override that global setting.

Defining GET VPN Peers

Use the GET VPN Peers page of the Create VPN wizard to configure peer properties for the key servers and group members in a GET VPN topology. After creating the topology, use the **Key Servers** and **Group Members** policies to modify these settings. The policies are the same as the wizard page, except that the key server and group member tables are split into separate policies.

Tip The list of key servers and group members includes those devices you selected on the Device Selection page of the wizard (see Selecting Devices for Your VPN Topology , on page 1108), however, you can use the **Add (+)** and **Delete (trash can)** buttons to add or remove devices from this page.

Examine the list of key servers and group members to determine if the default settings are appropriate for your VPN. You can select **Matching Interfaces** from the **Show** field below each table to display the actual interfaces that will be selected by the default interface roles. The interface roles must resolve to actual interfaces on the device for the GET VPN configuration to be valid.

Before You Begin

This procedure describes how to define peers for GET VPN when creating a new VPN, and explains just the GET VPN peers configuration. For information on opening the Create VPN wizard, see Creating or Editing VPN Topologies , on page 1103.

Related Topics

- Configuring Fail-Close to Protect Registration Failures , on page 1268
- Using Passive Mode to Migrate to GET VPN , on page 1283
- Configuring GET VPN Key Servers , on page 1278
- Configuring GET VPN Group Members , on page 1280

Step 1 Configure the key servers if the default settings are not appropriate.

For each key server you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least following settings. For information on all available settings, see Edit Key Server Dialog Box , on page 1279.

- **Identity Interface**—Select the interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces defined on the key server.
- **Priority**—Define the role of the key server as primary or secondary by entering a priority value between 1-100. The key server with the highest priority becomes the primary key server. If two or more key servers are assigned the same priority value, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on.

Note There can be more than one primary key server if the network is partitioned.

Step 2 Move key servers up or down in the table to specify the order that group members use to register with key servers. Group members register with the first key server in the list. If the first key server cannot be reached, they will register with the second key server, and so on. Note that this order does not define the overall key server priority, which is used to determine which key server is the primary key server.

Step 3 Configure the group members if the default settings are not appropriate.

For each group member you want to modify, select it, click the **Edit (pencil)** button beneath the table, and configure at least the following settings:

- **GET-Enabled Interface**—This is the VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. You can configure multiple interfaces by selecting an interface role object that resolves to more than one interface. Click **Select** to select an interface role object or to create a new object.
- **Interface To Be Used As Local Address**—The interface whose IP address is used to identify the group member to the key server for sending data, such as rekey information. If GET is enabled on only one interface, you do not need to specify the interface to be used as the local address. If GET is enabled on more than one interface, you must specify the interface to be used as the local address. Enter the name of the interface or interface role, or click **Select** to select an interface role.

For information on the other available settings, see Edit Group Member Dialog Box , on page 1281.

Assigning Initial Policies (Defaults) to a New VPN Topology

Use the VPN Defaults page of the Create VPN wizard to view and select the shared site-to-site VPN policies that will be assigned to the VPN topology you are creating. The page displays all the available mandatory and optional policies that can be assigned to your VPN topology, according to the selected IPsec technology. (For more information, see Understanding Mandatory and Optional Policies for Site-to-Site VPNs , on page 1078.)

For information on opening the Create VPN wizard, see Creating or Editing VPN Topologies , on page 1103. After you create the topology, you edit these policies directly.

For each policy type, select the shared VPN policy you want to assign to your VPN topology. Only shared policies are available for selection. Use the following tips to guide your selection:

- The initial defaults listed in this page are configured in the Security Manager Administration VPN Policy Defaults Page , on page 588. If no specific default was configured for a mandatory policy, the Factory Default policy is selected. For more information about configuring default policies, see Understanding and Configuring VPN Default Policies , on page 1086.
- The shared policies listed are only those that have been committed to the database. For example, if you create a new shared IPsec Proposal policy before using the Create VPN wizard, but you do not submit (and have approved, if necessary) the policy beforehand, the new policy does not appear in the list. Ensure that you submit policies before creating a VPN if you need to use the new policies.
- If a policy is mandatory, you must make a selection. If there are no shared policies, Factory Default is your only option. You can always edit the policy after you create the topology.

Note If you try to select a shared policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN topology creation until the lock is removed. For more information, see Understanding Policy Locking , on page 174.

- If a policy is optional, and there are no shared policies, you cannot select anything. If you want the features provided by that policy, configure it after you finish creating the topology.

- To view the contents of the policy in a read-only dialog box, select the policy and click the **View Contents** button beside the policy list.
- If you are creating a topology that supports IKEv2 only, the Create VPN wizard will still create either an IKEv1 Preshared Key or IKEv1 Public Key Infrastructure policy according to your selection. There are no default configurations for IKEv2 Authentication policies. Whenever you choose to support IKEv2, you must manually edit the IKEv2 Authentication policy after creating the VPN to define at least the global IKEv2 settings. You can also create peer-specific IKEv2 overrides. When supporting IKEv2 only, you can unassign the IKEv1-specific policies created by the wizard.

When you are done, click **Finish** to create the new VPN topology. The new VPN topology appears in the VPNs selector in the Site-to-Site VPN window, with the VPN Summary page displayed. See Viewing a Summary of a VPN Topology's Configuration , on page 1140.

Viewing a Summary of a VPN Topology's Configuration

Use the VPN Summary page to view a summary of the configuration of a selected VPN topology. This includes information about the type of VPN topology, its devices, the assigned technology, and specific policies that are configured in it. The summary page is opened automatically after you create a VPN topology. When creating an Extranet VPN, it is also shown as the final step of the Create Extranet VPN wizard.

To open the VPN Summary page for a VPN topology:

- (Site-to-Site VPN Manager Window , on page 1093) Select the VPN topology, then select **VPN Summary** from the Policies list.
- (Device view) Select a device that participates in the VPN and select the **Site-to-Site VPN** policy from the Policies list. Select the VPN topology, then click the **Edit VPN Policies** button. This opens the Site-to-Site VPN Manager window with the topology selected, where you can select **VPN Summary** from the Policies list.

The following table describes the information shown on this page.

Note The summary for standard VPNs is significantly different from the summary for Extranet VPNs. This table is divided in two, with the top half explaining summaries for standard VPNs, and the bottom half explaining summaries for Extranet VPNs.

Table 336: VPN Summary Page

Element	Description
Summary Information for Standard VPNs	
Name	The name of the VPN topology.
Technology	The IPsec technology assigned to the VPN topology. See Understanding IPsec Technologies and Policies , on page 1077.
Type	The VPN topology type: Hub-and-Spoke, Point-to-Point, or Full Mesh.
Description	A description of the VPN topology.

Element	Description
IPsec Terminator	Available if the VPN topology is large scale DMVPN. The name of the IPsec Terminators used to load balance GRE traffic to the hubs in the large scale DMVPN.
Primary Hub	Available if the VPN topology type is hub-and-spoke. The name of the primary hub in the hub-and-spoke topology.
Failover Hubs	Available if the VPN topology type is hub-and-spoke. The name of any secondary backup hubs that are configured in the hub-and-spoke topology.
Number of Spokes	Available if the VPN topology type is hub-and-spoke. The number of spokes that are included in the hub-and-spoke topology.
Peer 1	Available if the VPN topology type is point-to-point. The name of the device that is defined as Peer One in the point-to-point VPN topology.
Peer 2	Available if the VPN topology type is point-to-point. The name of the device that is defined as Peer Two in the point-to-point VPN topology.
Number of Peers	Available if the VPN topology type is full mesh. The number of devices included in the full mesh VPN topology.
IKE Proposal	The security parameters of the IKEv1 proposal configured in the VPN topology. See Configuring an IKE Proposal , on page 1158. **Note** IKEv2 proposals are not displayed in the summary.
Dynamic VTI	Available in an Easy VPN topology. Displays if a dynamic virtual template interface is configured on a device in an Easy VPN topology. See Configuring Dynamic VTI for Easy VPN , on page 1257.
Transform Sets	The IPsec IKEv1 transform sets that specify the authentication and encryption algorithms that will be used to secure the traffic in the VPN tunnel. See Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172. **Note** IPsec IKEv2 transform sets are not displayed in the summary.
Preshared Key	Unavailable if the selected technology is Easy VPN. Specifies whether the shared key to use in the IKEv1 preshared key policy is user defined or auto-generated. See Configuring IKEv1 Preshared Key Policies , on page 1198. **Note** IKEv2 preshared key settings are not displayed in the summary.

Element	Description
Public Key Infrastructure	If an IKEv1 Public Key Infrastructure policy is configured in the VPN topology, specifies the certificate authority (CA) server. See Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204. **Note** IKEv2 PKI configurations are not displayed in the summary.
Routing Protocol	Available only if the selected technology is IPsec/GRE, GRE Dynamic IP, or DMVPN. The routing protocol and autonomous system (or process ID) number used in the secured IGP for configuring a GRE, GRE Dynamic IP, or DMVPN routing policy. **Note** Security Manager adds a routing protocol to all the devices in the secured IGP on deployment. If you want to maintain this secured IGP, you must create a router platform policy using this routing protocol and autonomous system (or process ID) number. See Understanding the GRE Modes Page , on page 1225.
Tunnel Subnet IP	Available only if the selected technology is IPsec/GRE, GRE Dynamic IP, or DMVPN. If a tunnel subnet is defined, displays the inside tunnel interface IP address, including the unique subnet mask. See Understanding the GRE Modes Page , on page 1225.
User Group	Available for an Easy VPN topology. If a User Group policy is configured on a device in the Easy VPN topology, displays the details of the policy. See Configuring a User Group Policy for Easy VPN , on page 1259.
PIX7.0/ASA Tunnel Group	Available for an Easy VPN topology. If a Connection Profile policy is configured on a PIX Firewall version 7.0+ or ASA appliance in the Easy VPN topology, displays the details of the policy.
High Availability	Available if the VPN topology type is hub-and-spoke. If a High Availability policy is configured on a device in your hub-and-spoke VPN topology, displays the details of the policy. See Configuring High Availability in Your VPN Topology , on page 1130.
VRF-Aware IPsec	Available if the VPN topology type is hub-and-spoke. If a VRF-Aware IPsec policy is configured on a hub in your hub-and-spoke VPN topology, displays the type of VRF solution (1-Box or 2-Box) and the name of the VRF policy. See Configuring VRF Aware IPsec Settings , on page 1124.
Summary Information for Extranet VPNs	

Element	Description
IKE Phase 1 Proposal section	The parameters for the IKE Phase 1 proposal, which are defined in the IKE Proposal policy object that is assigned to the Extranet. For information about the settings, see the following topics: • Configuring IKEv1 Proposal Policy Objects , on page 1160 • Configuring IKEv2 Proposal Policy Objects , on page 1163
IKE Phase 2 Proposal section	The parameters of the IKE Phase 2 proposal. Most of these parameters are configured in the IPsec transform set policy object assigned to the Extranet. For explanations, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177. The Lifetime attribute parameter is defined in the VPN Global Settings policy, see Configuring VPN Global Settings , on page 1180. The Perfect Forward Secrecy parameter is defined in the IPsec Proposal policy, see Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172.
Authentication section	The preshared key or the PKI enrollment policy object that defines the certificate used to authenticate the connection. When using preshared keys, you can click the **Show/Hide Key** button to toggle between showing and masking the key. If you print the summary or generate a PDF, the key is shown or hidden based on your selection here.
Local	The device at the local (managed) end of the Extranet VPN, including the display name, VPN interface name and IP address, and the protected networks.
Remote	The device at the remote (unmanaged) end of the Extranet VPN, including the device name, the IP address of the VPN interface, and the protected networks.
Print button	Click this button to print the summary. The preshared key is shown or hidden based on what is currently displayed in the page. To print the summary, you must have Adobe Acrobat Reader installed. Security Manager generates a PDF of the summary and then prints it using Acrobat's printing capability.
Generate PDF button	Click this button to create a PDF of the summary. The preshared key is shown or hidden based on what is currently displayed in the page. You are prompted for a file name and a location to save the PDF.

Creating or Editing Extranet VPNs

Security Manager provides a simplified method of creating a regular IPsec point-to-point VPN between a device that you are managing in Security Manager and one that is not managed. This type of VPN is called an *Extranet* .

Typically, an Extranet is a site-to-site VPN connection between your network and the network of a partner or a service provider. However, it can also be a VPN connection within your organization's network, but between devices managed by different groups, or between a Cisco device and a non-Cisco device (which Security Manager cannot manage).

Use the Create Extranet VPN wizard to create this type of point-to-point VPN topology. Creating an Extranet VPN involves specifying the devices, the VPN interfaces that are the source and destination endpoints of the VPN tunnel, and the protected networks that will be secured by the tunnel. You also specify the IKE and IPsec proposals and preshared key or certificates required to complete a secure connection.

When you edit an Extranet VPN topology, the Edit Extranet VPN dialog box contains the same pages as the Create Extranet VPN wizard, with the exception of the IKE proposal page, but the pages are laid out in a tabbed format rather than being presented as a wizard. Clicking **OK** on any tab in the dialog box saves your definitions on all the tabs. For IKE proposals, IPsec proposals, preshared keys, and Public Key Infrastructure certificates, you must edit the policies directly.

Tips

- VPN default policies do not apply to Extranet VPNs. The settings defined on the Security Manager Administration VPN Defaults page are ignored. If you have shared policies that you want to use in the Extranet VPN configuration, you can assign them to the VPN after you create it with the Create Extranet VPN wizard. Assigning the shared policy replaces the policy created by the wizard.
- You cannot select your pre-defined IKE proposal or IPsec transform set policy objects when creating an Extranet VPN. If you have existing objects that you want to use, you can edit the relevant policies after creating the VPN and select the objects. You can then delete the objects created by the Create Extranet VPN wizard, if desired.
- After creating an Extranet VPN, you cannot convert it to a standard point-to-point VPN, where you are managing both ends of the VPN in Security Manager. Instead, you must delete and recreate the VPN.
- You can configure Extranet VPN connections for regular IPsec point-to-point connections only. For example, you cannot use this method to identify a GET VPN key server that exists in your service provider's network. To configure all other types of Extranet connections, you must add dummy unmanaged devices to the Security Manager inventory as described in Including Unmanaged or Non-Cisco Devices in a VPN , on page 1085.

Related Topics

- Understanding VPN Topologies , on page 1074
- Configuring VPN Topologies in Device View , on page 1094
- Understanding IPsec Technologies and Policies , on page 1077
- Using Wizards , on page 50

Step 1 Do one of the following

- To create a new Extranet VPN, in the Site-to-Site VPN Manager Window , on page 1093 or the Site-to-Site VPN policy page (Device View), click the **Create VPN Topology (+)** button and select **Extranet VPN**. The Create Extranet VPN wizard starts with the Name and Technology page.
- To edit an existing Extranet VPN, select the VPN topology in the Site-to-Site VPN Manager window or the Site-to-Site VPN policy page (Device View) and click the **Edit VPN Topology (pencil)** button. The Edit Extranet VPN dialog box opens to the Device Selection tab.

Step 2 On the Name and Technology page or tab, configure the following; only the name is required:

- **Name**—A unique name that identifies the VPN topology.
- **Description**—A description of the VPN, up to 1024 characters.
- **Creation Date**—The date on which the VPN was created. When creating the VPN, today's date is the default. However, you can click the calendar icon beside the edit box and select the desired date.
- **Ticket Number**—If you use a ticket system, and the action you are taking relates to a tracked requirement, enter the number in this field. Security Manager does not use this number; it is for your internal tracking purposes only.
- **Last Modified By**—The name, user ID, email address, or other indicator of the person who last changed the settings for the VPN. Security Manager does not use this field; it is for your internal tracking purposes only.

In the wizard, click **Next**; in the Edit Extranet VPN dialog box, click the **Device Selection** tab.

Step 3 On the Device Selection page or tab, configure the devices, interfaces, and protected networks for each end of the connection:

- **Local**—This is the device in your managed network. The device must be in the Security Manager inventory. Configure all of these properties:
  - **Device**—Enter the display name of the device or click **Select** to select it from the list of devices in the inventory. You can select ASA 5500 series devices, PIX firewalls, or Cisco IOS routers (including ASRs).
  - **VPN Tunnel Interface**—The name of the interface or interface role that identifies the external interface for the VPN connection. Click **Select** to select an existing interface or interface role, or to create a new interface role.

When you select an interface or role, the IP address for the matching interface are listed in the drop-down list next to the IP Address field. Beginning with version 4.9, Security Manager supports IPv6 addresses in Extranet VPN. You can see a list of IPv4 and IPv6 addresses, by default the IPv4 address will be displayed. If no address appears, Security Manager could not determine the IP address. Check your configuration or object selection.

- • **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using an interface name, interface role object, network/host group object, or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

Note You can also edit the local device endpoint settings as described in Defining the Endpoints and Protected Networks , on page 1109. The settings are similar to these, with the added ability to define interface role objects.

- • **Crypto Map name**—You can manually enter the Crypto Map name for the device. There is no default value. If you do not enter any value, Security Manager uses the Crypto Map Name of the device or generates a new Crypto Map Name. If a Crypto Map already exists on the VPN interface, Security Manager will reuse the same name.
  - **Crypto ACL name**—You can manually enter the Crypto ACL name for the device. There is no default value. If you do not enter any value, Security Manager generates a new Crypto ACL name.
  - **Crypto Map Sequence**—Security Manager displays the sequence number of the device in this field after it has discovered the device in the managed network. You cannot edit this value. If you are adding a new VPN topology, Security Manager populates the Sequence Number field with a value of #. You cannot edit this value.

For more information see, Configuring Crypto Map , on page 1127

- **Crypto Mode**—Beginning with Security Manager version 4.12 for ASA devices version 9.6(2) or later, you can select an option from the following Crypto Modes:
  - Tunnel—Default value. Encapsulation mode will be tunnel mode.
  - Transport—Encapsulation mode will be Crypto mode with option to fallback on tunnel mode, if peer does not support it.
  - Transport-Require—Encapsulation mode will be Transport mode only. Transport Mode is supported only for IKEv2.
- **Remote**—This is the device that you are not managing in Security Manager. Configure all of these properties:
  - **Name**—The name of the device, equivalent to the display name used in the Security Manager inventory.
  - **IP Address**—The IP address of the VPN interface on the device. You can enter a maximum of 10 IP addresses using space as the delimiter. Beginning with version 4.9, Security Manager supports IPv6 addresses in addition to IPv4 addresses.

Note Beginning from version 4.8, Security Manager enables you to configure multiple peer IP addresses for the same extranet VPN configuration. This allows the next peer device in the list to act as a failover when the first device is not available for VPN services. This backup peer support is available for Cisco Adaptive Security Appliance (ASA) devices and Cisco IOS routers.

- • **Protected Networks**—The networks that the device is protecting for this VPN. Click **Select** to display the Protected Network Selection dialog box in which you can specify the protected networks using a network/host group object or ACL object. You can also use the Protected Network Selection dialog box to define new network/host group or ACL objects.

Note You can also edit the remote device endpoint settings as described in Defining the Endpoints and Protected Networks , on page 1109. However, the settings are identical to these, and you cannot specify the protected networks using an interface name or interface role object.

In the wizard, click **Next**. In the Edit VPN dialog box, you are finished; to edit the remaining characteristics, you must edit the IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, and VPN Global Settings policies to change the settings described in the next step.

Step 4 On the IKE Proposal page of the Create Extranet VPN wizard, define the IKE proposal, the IPsec proposal, and either the preshared key or the certificate:

- Select **IKEv1** or **IKEv2**. You can use IKEv2 on ASA 5500 series devices running release 8.4(x) only.

If you want to change IKE versions after creating the Extranet VPN, you must edit all of these policies to unassign or replace the old configuration while configuring options for the desired version: IKE Proposal, IPsec Proposal, IKEv1 Preshared Key, IKEv1 Public Key Infrastructure, IKEv2 Authentication, VPN Global Settings. For information on how IKEv1 and IKEv2 differ, see Comparing IKE Version 1 and 2 , on page 1152.

- Configure the IKE Phase 1 Proposal parameters. These parameters will be used to create an IKE proposal policy object with the name *ExtranetName*_**ikeBB**. For an explanation of the parameters, see Configuring IKEv1 Proposal Policy Objects , on page 1160 or Configuring IKEv2 Proposal Policy Objects , on page 1163.

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IKE Proposal policy for the VPN.

Note The **DH Group** attribute (for Diffie-Hellman modulus group) is called **Modulus Group** in other policies and policy objects.

- Configure the IKE Phase 2 (IPsec) Proposal parameters. Most of these parameters will be used to create an IPsec transform set policy object with the name *ExtranetName*_**transformSet**. For an explanation of the parameters, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177. Note that the AH Hash Algorithm setting is available only if the local device is a router.

To edit these values after creating the VPN, you simply need to edit the object. You can edit the object in the Policy Object Manager or directly through the IPsec Proposal policy for the VPN.

The following settings are not part of the IPsec transform set object:

- • **Enable Perfect Forward Secrecy, DH Group**—Whether to use a unique session key for each encrypted exchange, which prevents an attacker from decrypting a captured exchange even if the attacker knows the preshared or private keys used by both ends of the tunnel. If you select this option, also select the Diffie-Hellman (DH) modulus group to use for deriving the key. For more information on the modulus group, see Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156.

To change this option after creating the VPN, edit the IPsec Proposal policy.

- • **Lifetime**—The number of seconds a security association will exist before expiring. The default is 3,600 seconds (one hour).

To change this option after creating the VPN, edit the VPN Global Settings policy.

- If you select **Preshared Key** for authentication, enter the key used to authenticate connections with the remote host.

To edit the key after creating the VPN, you must edit either the IKEv1 Preshared Key or IKEv2 Authentication policy depending on the IKE version you are using. The key is masked in these policies, but you can display the key by selecting the VPN Summary policy and clicking the Show Key button beside the preshared key.

- If you select **Certificate**, select the PKI enrollment object that defines the certificate name. If the required object is not yet defined, select **<Add New>** to open the Add PKI selector, from which you can add new, or edit existing,

PKI enrollment objects. For more information about PKI enrollment objects, see PKI Enrollment Dialog Box , on page 1208.

To edit the certificate settings after creating the VPN, you can edit the object in the Policy Object Manager or directly through either the IKEv1 Public Key Infrastructure or IKEv2 Authentication policy depending on the IKE version you are using.

In the wizard, click **Next**.

Step 5 (Create Extranet VPN wizard only.) On the Summary page, verify that the settings are correct and click **Finish**.

Security Manager creates the topology and the required policy objects, and adds the VPN to the list of VPNs in the Site-to-Site VPN Manager.

Step 6 If you want to configure dial backup, select the **Peers** policy and follow the instructions in Configuring Dial Backup , on page 1115.

Deleting a VPN Topology

Deleting a VPN topology removes IPsec tunnels between peers and all configurations associated with the VPN topology from the devices and networks assigned to the site-to-site VPN. The actual VPN is not removed from the network until you deploy configurations.

Step 1 Do one of the following:

- Select **Manage > Site-To-Site VPNs** to open the Site-to-Site VPN Manager Window , on page 1093.
- In Device view, select a device that participates in the VPN you want to delete, then select the **Site to Site VPN** policy from the policy selector (see Configuring VPN Topologies in Device View , on page 1094).

Step 2 Select the VPN topology you want to delete and click the **Delete VPN Topology (trash can)** button. You are asked to confirm the deletion.

CHAPTER 26

Configuring IKE and IPsec Policies

This chapter describes how to configure Internet Protocol Security (IPsec) and the Internet Security Association and Key Management Protocol (ISAKMP, or IKE) standards to build site-to-site and remoteaccess IPsec Virtual Private Networks (VPNs). These policies are used in regular IPsec and other typesof IPsec-based VPN technologies to build VPN tunnels.

Tunneling makes it possible to use a public TCP/IP network, such as the Internet, to create secureconnections between remote users and a private corporate network. Each secure connection is called a tunnel.

IPsec-based VPN technologies use the ISAKMP and IPsec tunneling standards to build and manage tunnels. ISAKMP and IPsec accomplish the following:

- Negotiate tunnel parameters.
- Establish tunnels.
- Authenticate users and data.
- Manage security keys.
- Encrypt and decrypt data.
- Manage data transfer across the tunnel.
- Manage data transfer inbound and outbound as a tunnel endpoint or router.

A device in a VPN functions as a bidirectional tunnel endpoint. It can receive plain packets from theprivate network, encapsulate them, create a tunnel, and send them to the other end of the tunnel wherethey are unencapsulated and sent to their final destination. It can also receive encapsulated packets from the public network, unencapsulate them, and send them to their final destination on the private network.

The following topics explain the basic IKE and IPsec policies and how to configure them:

Overview of IKE and IPsec Configurations

Internet Key Exchange (IKE) is a key management protocol that is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. For IKE version 1 (IKEv1), IKE proposals contain a single set of algorithms and a modulus group. You can create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation, potentially making it possible to create a single IKE proposal (although you might want different proposals to give higher priority to your most desired options). You can define several IKE proposals per VPN.

You must configure several policies to define the settings required to make successful regular IPsec connections in a site-to-site or remote access VPN. The following procedure provides an overview of the steps required to complete the configuration, and points to other topics that provide detailed information for each step.

Related Topics

- Understanding IKE , on page 1153
- Understanding IPsec Proposals , on page 1168
- Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs , on page 1197
- Understanding Public Key Infrastructure Policies , on page 1200

Step 1 Configure the **IKE Proposal** policy.

In the IKE Proposal policy, you define the IKE proposal policy objects to use for making VPN connections. When defining the IKE proposal object, you select the algorithms to use for encrypting the IKE negotiation and for integrity checking, and the Diffie-Hellman group to use to operate the encryption algorithm. For IKEv1, you also determine whether you are using preshared keys or Public Key Infrastructure, whereas in IKEv2, the IKE proposal does not include a specification for authentication mode.

The following topics explain how to configure the IKE Proposal policy:

- Configuring an IKE Proposal , on page 1158
  - Configuring IKEv1 Proposal Policy Objects , on page 1160
  - Configuring IKEv2 Proposal Policy Objects , on page 1163
- Configuring the IKE Proposal for GET VPN , on page 1275

Step 2 Complete the authentication mode configuration.

Your selection for authentication mode in the IKEv1 proposal, and your decision on which mode to use for IKEv2, controls what other policies are required to complete the authentication mode configuration:

- Preshared keys—For remote access IKEv1 IPsec VPNs, you define the preshared keys in the **Connection Profiles** policy; preshared keys are not supported for IKEv2 in remote access VPNs. For site-to-site VPNs, you define the keys in the **IKEv1 Preshared Keys** or the **IKEv2 Authentication** policy based on the IKE version you are using.

The following topics explain preshared key configuration:

- IPSec Tab (Connection Profiles) , on page 1344
- Configuring IKEv1 Preshared Key Policies , on page 1198
- Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219

- Public Key Infrastructure Certificate Authority servers—If you configure IKE to use Certificate Authority (CA) servers, you must configure the **Public Key Infrastructure** policy. You also use this policy to define the Public Key Infrastructure for SSL VPNs. For site-to-site VPNs, the policy is **IKEv1 Public Key Infrastructure** or **IKEv2 Authentication**, based on the IKE version you are using.

The Public Key Infrastructure policy identifies the PKI enrollment object that identifies the Certificate Authority server. For site-to-site VPNs, you can select a single PKI enrollment object; for remote access VPNs, you can select all objects needed for your remote access connections. These trustpoints are then identified in the remote access **Connection Profiles** policy (on the IPsec tab).

The following topics explain public key infrastructure configuration:

- Understanding Public Key Infrastructure Policies , on page 1200
- Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204
- Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs , on page 1205
- Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207
- IPSec Tab (Connection Profiles) , on page 1344
- Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219

Step 3 Configure the **IPsec Proposal** policy. The IPsec Proposal policy defines the IPsec transform set policy objects used to create a secure IPsec tunnel for the VPN.

The following topics explain how to configure the IPsec Proposal policy:

- Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172
  - Selecting the IKE Version for Devices in Site-to-Site VPNs , on page 1176
  - Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177
- Configuring an IPsec Proposal for Easy VPN , on page 1254
- Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices) , on page 1367
- Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471

Step 4 Configure the **Global Settings** policy.

The **Global Settings** (remote access) and **VPN Global Settings** (site-to-site) policies define various ISAKMP, IKEv1, IKEv2, IPsec, NAT, fragmentation, and other settings. These settings have default values that are frequently adequate, so normally you need to configure the Global Settings policy only if you want non-default behavior. However, you must configure the policy for remote access IKEv2 IPsec VPNs, because you must specify a remote access global trustpoint on the **IKEv2 Settings** tab.

The following topics explain how to configure the Global Settings policy:

- Configuring VPN Global Settings , on page 1180
  - Configuring VPN Global ISAKMP/IPsec Settings , on page 1183
  - Configuring VPN Global IKEv2 Settings , on page 1187
  - Configuring VPN Global NAT Settings , on page 1192
  - Configuring VPN Global General Settings , on page 1193
- Configuring Global Settings for GET VPN , on page 1276

Step 5 If you are configuring a remote access IKEv2 IPsec VPN, you must also configure several policies for SSL VPN. IKEv2 shares several configuration settings with SSL VPNs. For information on the other policies you need to configure, see Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311.

Comparing IKE Version 1 and 2

There are two versions of IKE: version 1 (IKEv1) and version 2 (IKEv2). When you configure IKE on a device that supports IKEv2, you have the option of configuring either version alone, or both versions together. When the device attempts to negotiate a connection with another peer, it uses whichever versions you allow and that the other peer accepts. If you allow both versions, the device automatically falls back to the other version if negotiations are unsuccessful with the initially chosen version (IKEv2 is always tried first if it is configured). Both peers must support IKEv2 to use it in a negotiation.

Tip Security Manager supports IKEv2 on ASA 8.4(1)+ only. For remote access IPsec VPNs, users must use the AnyConnect 3.0+ client to complete IKEv2 connections, and IKEv2 connections use the same license pool that is used for SSL VPN connections. The legacy VPN Client is used for IKEv1 remote access connections on ASAs. For more information about device support in VPNs, see Understanding Devices Supported by Each IPsec Technology , on page 1083.

IKEv2 differs from IKEv1 in the following ways:

- IKEv2 fixes the Photuris style cookie mechanism.
- IKEv2 has fewer round trips in a negotiation than IKEv1, two round trips versus five for IKEv1 for a basic exchange.
- Transform options are OR'ed, which means that you can specify multiple options in a single proposal rather than creating separate unique proposals for each allowed combination.
- Built-in dead peer detection (DPD).
- Built-in configuration payload and user authentication mode.

- Built-in NAT traversal (NAT-T). IKEv2 uses ports 500 and 4500 for NAT-T.
- Improved re-keying and collision handling.
- A single security association (SA) can protect multiple subnets, which improves scalability.
- Asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys, different certificates, or one side a key and the other side a certificate.
- For remote access IPsec VPNs, you can configure double authentication for IKEv2 connections in the same way that you configure them for remote access SSL VPNs. IKEv1 does not support double authentication.

- Overview of IKE and IPsec Configurations , on page 1150
- Configuring an IKE Proposal , on page 1158

Understanding IKE

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA). It provides a common framework for agreeing on the format of SA attributes. This includes negotiating with the peer about the SA, and modifying or deleting the SA. IKE creates the cryptographic keys used to authenticate IPsec peers, negotiates and distributes IPsec encryption keys, and automatically establishes IPsec security associations.

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, creating the first tunnel that enables the peers to communicate securely in Phase 2, protecting later ISAKMP negotiation messages. During Phase 2 negotiation, IKE establishes SAs for other applications, such as IPsec, which protects the data sent between peers. Both phases use proposals when they negotiate a connection.

An IKE proposal is a set of algorithms that two peers use to secure the IKE negotiation between them. IKE negotiation begins by each peer agreeing on a common (shared) IKE policy. This policy states which security parameters will be used to protect subsequent IKE negotiations. In remote access IPsec VPNs, you can define several IKE proposals per VPN to create multiple, prioritized policies at each peer to ensure that at least one policy matches a remote peer's policy. For site-to-site VPNs, you can create a single IKE proposal.

To define an IKE proposal, you must specify:

- A unique priority (1 through 65,543, with 1 the highest priority).
- An encryption method for the IKE negotiation, to protect the data and ensure privacy. See Deciding Which Encryption Algorithm to Use , on page 1154.
- A Hashed Message Authentication Codes (HMAC) method (called *integrity algorithm* in IKEv2) to ensure the identity of the sender, and to ensure that the message has not been modified in transit. See Deciding Which Hash Algorithm to Use , on page 1155.
- For IKEv2, a separate pseudo-random function (PRF) used as the algorithm to derive keying material and hashing operations required for the IKEv2 tunnel encryption. The options are the same as those used for the hash algorithm; see Deciding Which Hash Algorithm to Use , on page 1155.

- A Diffie-Hellman group to determine the strength of the encryption-key-determination algorithm. The device uses this algorithm to derive the encryption and hash keys. See Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156.
- An authentication method, to ensure the identity of the peers. See Deciding Which Authentication Method to Use , on page 1157.
- A limit to the time the device uses an encryption key before replacing it.

Note Configuring IKEv2 Proposal Policy Objects , on page 1163

Tip (ASA devices only.) With IKEv1 policies, for each parameter, you set one value. For IKEv2, you can configure multiple encryption, integrity, PRF, and Diffie-Hellman options. The ASA orders the settings from the most secure to the least secure and negotiates with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed transforms instead of the need to send each allowed combination as with IKEv1.

When IKE negotiation begins, the peer that initiates the negotiation sends all of its policies to the remote peer, and the remote peer searches for a match with its own policies, in priority order.

A match between IKE policies exists if they have the same encryption, hash (integrity and PRF for IKEv2), authentication, and Diffie-Hellman values, and an SA lifetime less than or equal to the lifetime in the policy sent. If the lifetimes are not identical, the shorter lifetime—from the remote peer policy—applies. If no match exists, IKE refuses negotiation and the IKE SA is not established.

The following topics explain how to configure IKE proposals:

- Configuring an IKE Proposal , on page 1158
- Configuring IKEv1 Proposal Policy Objects , on page 1160
- Configuring IKEv2 Proposal Policy Objects , on page 1163
- Configuring the IKE Proposal for GET VPN , on page 1275

Deciding Which Encryption Algorithm to Use

When deciding which encryption and hash algorithms to use for the IKE proposal, your choice is limited to algorithms that are supported by the devices in the VPN.

You can choose from the following encryption algorithms:

- DES (Data Encryption Standard) is a symmetric secret-key block algorithm. It is faster than 3DES and uses less system resources, but it is also less secure. If you do not need strong data confidentiality, and if system resources or speed is a concern, you should choose DES.
- 3DES (Triple DES) is more secure because it processes each block of data three times, each time with a different key. However, it uses more system resources and is slower than DES. 3DES is the recommended encryption algorithm, assuming that the devices support it.

Note DES and 3DES encryption algorithms are no longer secure against modern threats. Therefore, Cisco Security Manager 4.22 terminates their support, for IKEv1 and IKEv2 proposals, for ASA 9.15(1) or higher version devices.

- AES (Advanced Encryption Standard) provides greater security than DES and is computationally more efficient than 3DES. AES offers three different key strengths: 128-, 192- and 256-bit keys. A longer key provides higher security but a reduction in performance. When you configure IKE on a router, the router must use Cisco IOS Software 12.3T or later to use AES.

Note AES cannot be used in conjunction with a hardware encryption card.

Related Topics

- Understanding IKE , on page 1153
- Configuring an IKE Proposal , on page 1158

Deciding Which Hash Algorithm to Use

You can choose from the following hash algorithms. In IKEv2, the hash algorithm is separated into two options, one for the integrity algorithm, and one for the pseudo-random function (PRF).

- SHA (Secure Hash Algorithm) is more resistant to brute-force attacks than MD5. However, it is also more resource intensive than MD5. For implementations that require the highest level of security, use the SHA hash algorithm.

Standard SHA produces a 160-bit digest.

The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices:

- SHA512—A 512-bit key.
- SHA384—A 384-bit key.
- SHA256—A 256-bit key.
- MD5 (Message Digest 5) produces a 128-bit digest and uses less processing time for an overall faster performance than SHA, but it is considered to be weaker than SHA.

Note Cisco Security Manager 4.22 terminates support for MD5 hash algorithm in both IKEv1 and IKEv2 proposals for ASA 9.15(1) or higher version devices, because it is no longer considered secure against modern threats.

Related Topics

- Understanding IKE , on page 1153
- Configuring an IKE Proposal , on page 1158

Deciding Which Diffie-Hellman Modulus Group to Use

Security Manager supports the following Diffie-Hellman key derivation algorithms to generate IPsec security association (SA) keys. Each group has a different size modulus. A larger modulus provides higher security, but requires more processing time. You must have a matching modulus group on both peers.

Tip If you select AES encryption, to support the large key sizes required by AES, ISAKMP negotiation should use Diffie-Hellman (DH) Group 5 or later. For IKEv1, ASA devices support groups 2 and 5 only.

- Diffie-Hellman Group 1: 768-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 768 bits.

Note Beginning with Cisco Security Manager 4.19, DH group 1 for IKEv1 and IKEv2 is not supported for ASA 9.12(1) and later devices.

- Diffie-Hellman Group 2: 1024-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 1024 bits. Cisco VPN Client Version 3.x or later requires a minimum of Group 2.
- Diffie-Hellman Group 5: 1536-bit modulus. Use to generate IPsec SA keys where the prime and generator numbers are 2048 bits. Considered good protection for 128-bit keys, but group 14 is better.
- Diffie-Hellman Group 7: Use to generate IPsec SA keys when the elliptical curve field size is 163 characters. Group 7 is not supported on a Catalyst 6500/7600 device with VPNSM or VPN SPA configuration.
- Diffie-Hellman Group 14: 2048-bit modulus. Considered good protection for 128-bit keys. (ASA 9.0.1+ devices only).

Note Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv1 and IKEv2 on ASA 9.13(1) and later devices.

- Diffie-Hellman Group 15: 3072-bit modulus. Considered good protection for 192-bit keys.
- Diffie-Hellman Group 16: 4096-bit modulus. Considered good protection for 256-bit keys.

Note Beginning with Cisco Security Manager 4.20, DH groups 15 and 16 are supported for IKEv2 on ASA 9.13(1) and later devices.

- Diffie-Hellman Group 19: (256-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 20: (384-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 21: (521-bit elliptical curve field size). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 24: (2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only).
- Diffie-Hellman Group 31: (256-bit elliptical curve field size). (ASA 9.16.1+ devices only).

Note Cisco Security Manager 4.22 terminates support for DH groups 2 and 24 in IKEv2 proposal and DH group 2 in IKEv1 for ASA 9.15(1) and higher version devices, because they are no longer considered secure against modern threats.

Note Beginning with Cisco Security Manager 4.23, DH group 31 is supported for IPsec profile and IKEv2 on ASA 9.16(1) and later devices.

Deciding Which Authentication Method to Use

Security Manager supports two methods for peer device authentication in a VPN communication:

- **Preshared Key**—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. The same shared key must be configured at each peer or the IKE SA cannot be established.

To use IKE successfully with this device authentication method, you must define various preshared key parameters. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See Configuring IKEv1 Preshared Key Policies , on page 1198.
- Site-to-site VPN, IKEv2 configuration—See Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.
- Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile. See IPSec Tab (Connection Profiles) , on page 1344.
- Remote access IPsec VPN, IKEv2—You cannot use preshared keys when using IKEv2 in a remote access IPSec VPN. You must use certificates.
- **Certificate**—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. Certificates provide non-repudiation of communication between two peers,

meaning that it can be proved that the communication actually took place. When using this authentication method, peers are configured to obtain digital certificates from a Certification Authority (CA). CAs manage certificate requests and issue certificates to participating IPsec network devices. These services provide centralized key management for the participating devices.

While the use of preshared keys does not scale well, using a CA does improve the manageability and scalability of your IPsec network. With a CA, you do not need to configure keys between all encrypting devices. Instead, each participating device is registered with the CA, and requests a certificate from the CA. Each device that has its own certificate and the public key of the CA can authenticate every other device within a given CA's domain.

To use IKE successfully with the Certificate authentication method, you must define parameters for CA authentication and enrollment. For more information, see the appropriate topic:

- Site-to-site VPN, IKEv1 configuration—See Understanding Public Key Infrastructure Policies , on page 1200.
- Site-to-site VPN, IKEv2 configuration— Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.
- Remote access IPsec VPN, IKEv1—Configured on the IPsec tab of the connection profile as explained in IPSec Tab (Connection Profiles) , on page 1344. You must also configure the Public Key Infrastructure policy with the same trustpoint; see Understanding Public Key Infrastructure Policies , on page 1200.
- Remote access IPsec VPN, IKEv2—Configure the global trustpoint on the IKEv2 Settings tab of the Global Settings policy as explained in Configuring VPN Global IKEv2 Settings , on page 1187. You must also configure the Public Key Infrastructure policy with the same trustpoint; see Understanding Public Key Infrastructure Policies , on page 1200.

Configuring an IKE Proposal

In Security Manager, an IKE proposal is a mandatory policy when you configure a site-to-site or remote access IPsec VPN. When you use the configuration wizard to create a new IPsec VPN, an IKE Proposal policy is automatically assigned to the VPN; the policy might be the factory default, or it might be a shared policy specifically selected for the VPN. For more information about the IKE (Internet Key Exchange) key management protocol, see Understanding IKE , on page 1153.

Use the IKE Proposal policy to examine the current IKE proposals and to configure new proposals except for GET VPN topologies. For GET VPN, see Configuring the IKE Proposal for GET VPN , on page 1275.

Note Beginning with Cisco Security Manager version 4.17, you can configure and deploy IKE Proposal policy on ASA multi-context devices running the software version 9.9(2) or later.

Tips

- For site-to-site VPNs, you can select at most one IKE proposal per IKE version. For remote access IPsec VPNs, you can select multiple proposals for each IKE version; select all IKE proposals that are allowed in the remote access VPN.
- To configure IKEv2 (version 2), the device must be an ASA running ASA Software release 8.4(1) or later.
- The IPsec Proposal policy must enable IKEv1, IKEv2, or both, to match the IKE proposals you configure in this policy. In cases where you cannot configure IKEv2 in the IPsec proposal, such as in Easy VPN topologies, IKEv2 is not supported. For more information, see Understanding IPsec Proposals , on page 1168.
- The IKEv1 Proposal objects specify whether preshared keys or certificates are used for authentication. If the IKEv1 Proposal object is of certificate authentication type, ensure that you specify the appropriate CA Server in the IKEv1 Public Key Infrastructure (from Policy Selector) policy. For preshared keys, ensure that the IKEv1 Preshared Key policy is assigned. For IKEv2, the object does not specify whether preshared keys or certificates are used, but other policies must define the authentication requirements. For more information, see Deciding Which Authentication Method to Use , on page 1157.
- For Regular IPSec VTI technology, you can specify only one of the IKE Proposals—IKEv1 proposal or IKEv2 proposal. That is, if you have selected IKE version 1 for the Regular IPSec VTI, (in the IKE Proposal window) you must be specifying the IKEv1 Proposal and leave the IKEv2 Proposal field blank and vice versa.

Related Topics

- Deciding Which Hash Algorithm to Use , on page 1155
- Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156
- Deciding Which Authentication Method to Use , on page 1157

Step 1 Do one of the following to open the IKE Proposal policy based on the type of VPN you are configuring:

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > IPSec VPN > IKE Proposal** from the Policy selector.
  - (Policy View) Select **Remote Access VPN > IPSec VPN > IKE Proposal** from the Policy Type selector. Select an existing policy or create a new one.
- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology (other than GET VPN) in the VPNs selector, then select **IKE Proposal** in the Policies selector.
  - (Policy view) Select **Site-to-Site VPN > IKE Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.

Step 2 Click **Select** against the appropriate IKE versions to choose the policy objects that define the settings for an IKE version 1 or version 2 proposal. Configure proposals only for those IKE versions supported in the VPN.

Note Beginning with 4.16, Cisco Security Manager does not support IKEv1 configuration for Firepower 9300 devices with distributed mode.

- To select an IKE proposal for site-to-site VPNs, simply highlight it in the available proposals list. For remote access IPsec VPNs, highlight the desired objects in the available proposals list and click >> to move them to the selected proposals list.
- To remove an IKE proposal for remote access IPsec VPNs, highlight it in the selected proposals list and click << to move it to the available proposals list.
- To create a new IKE proposal, click the **Create (+)** button beneath the available proposals list. The Add IKEv1 or IKEv2 Proposal dialog box opens. For instructions on creating the object, see the following topics:
  - Configuring IKEv1 Proposal Policy Objects , on page 1160
  - Configuring IKEv2 Proposal Policy Objects , on page 1163
- To edit an object, or to view its settings, select it and click the **Edit (pencil)** button beneath the list.

Configuring IKEv1 Proposal Policy Objects

Use the IKEv1 Proposal dialog box to create, copy, and edit an IKEv1 proposal object.

Internet Key Exchange (IKE) version 1 proposal objects contain the parameters required for IKEv1 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. For more information about IKE proposals, see the following topics:

- Overview of IKE and IPsec Configurations , on page 1150
- Comparing IKE Version 1 and 2 , on page 1152
- Understanding IKE , on page 1153
- Deciding Which Encryption Algorithm to Use , on page 1154
- Deciding Which Hash Algorithm to Use , on page 1155
- Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156
- Deciding Which Authentication Method to Use , on page 1157

Navigation Path

Select **Manage** > **Policy Objects**, then select **IKE Proposals** > **IKEv1 Proposals** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Tip You can also access this dialog box when configuring the IKE Proposal policy as explained in Configuring an IKE Proposal , on page 1158.

Field Reference

Table 337: IKEv1 Proposal Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 1024 characters is allowed.
Priority	The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number. Valid values range from 1 to 10000. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.
Encryption Algorithm	The encryption algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations: • AES-128—Encrypts according to the Advanced Encryption Standard using 128-bit keys. • AES-192—Encrypts according to the Advanced Encryption Standard using 192-bit keys. • AES-256—Encrypts according to the Advanced Encryption Standard using 256-bit keys. • DES—Encrypts according to the Data Encryption Standard using 56-bit keys. • 3DES—Encrypts three times using 56-bit keys. 3DES is more secure than DES, but requires more processing for encryption and decryption. It is less secure than AES. A 3DES license is required to use this option. **Note** From version 4.22, Cisco Security Manager terminates support for DES and 3DES encryption algorithms for ASA 9.15(1) or higher version devices.

Element	Description
Hash Algorithm	The hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Options are: • SHA (Secure Hash Algorithm)—Produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5. • MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA. **Note** From version 4.22, Cisco Security Manager terminates support for MD5 hash algorithm for ASA 9.15(1) or higher version devices.
Modulus Group	The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Options are: **Tip** For IKEv1, ASA devices support DH group 14 only. • 1—Diffie-Hellman Group 1 (768-bit modulus). **Note** Beginning with Cisco Security Manager 4.19, DH group 1 is not supported for ASA 9.12(1) and later devices. The default value will be Group 2. • 2—Diffie-Hellman Group 2 (1024-bit modulus). **Note** Cisco Security Manager 4.22 terminates support for DH group 2 for ASA 9.15(1) and higher version devices. • 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or later). • 7—Diffie-Hellman Group 7 (163-bit elliptical curve field size). • 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys). **Note** Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv1 on ASA 9.13(1) and later devices. • 15—Diffie-Hellman Group 15 (3072-bit modulus, considered good protection for 192-bit keys). • 16—Diffie-Hellman Group 16 (4096-bit modulus, considered good protection for 256-bit keys). **Note** Although Diffie-Hellman groups 15 and 16 are listed, they are not supported for IKEv1 and will cause a validation error if selected for IKEv1 policies.
Lifetime	The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes. You can specify a value from 60 to 2147483647 seconds. The default is 86400.

Element	Description
Authentication Method	The method of authentication to use between the two peers. For information on how this selection determines which other policies you must configure, see Deciding Which Authentication Method to Use , on page 1157. Select one of the following: • Preshared Key—Preshared keys allow for a secret key to be shared between two peers and to be used by IKE during the authentication phase. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established. • Certificate—An authentication method in which RSA key pairs are used to sign and encrypt IKE key management messages. This method provides non-repudiation of communication between two peers, meaning that it can be proved that the communication actually took place. When you use this authentication method, the peers are configured to obtain digital certificates from a Certification Authority (CA).
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Configuring IKEv2 Proposal Policy Objects

Use the IKEv2 Proposal dialog box to create, copy, and edit an IKEv2 proposal object. You can use IKEv2 proposals with ASA Software release 8.4(1)+ only.

Internet Key Exchange (IKE) version 2 proposal objects contain the parameters required for IKEv2 proposals when defining remote access and site-to-site VPN policies. IKE is a key management protocol that facilitates the management of IPsec-based communications. It is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and automatically establish IPsec security associations (SAs).

The IKE negotiation comprises two phases. Phase 1 negotiates a security association between two IKE peers, which enables the peers to communicate securely in Phase 2. During Phase 2 negotiation, IKE establishes security associations (SAs) for other applications, such as IPsec. Both phases use proposals when they negotiate a connection. Unlike IKEv1, in an IKEv2 proposal, you can select multiple algorithms and modulus groups from which peers can choose during the Phase 1 negotiation. For more information about IKE proposals, see the following topics:

- Overview of IKE and IPsec Configurations , on page 1150
- Comparing IKE Version 1 and 2 , on page 1152
- Understanding IKE , on page 1153
- Deciding Which Encryption Algorithm to Use , on page 1154
- Deciding Which Hash Algorithm to Use , on page 1155
- Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156

Tip Unlike IKEv1, you do not specify the authentication method in the IKE proposal. For more information on how to configure the authentication method in IKEv2, see Deciding Which Authentication Method to Use , on page 1157.

Navigation Path

Select **Manage > Policy Objects**, then select **IKE Proposals > IKEv2 Proposals** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Tip You can also access this dialog box when configuring the IKE Proposal policy as explained in Configuring an IKE Proposal , on page 1158.

Related Topics

- Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177

Field Reference

Table 338: IKEv2 Proposal Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 1024 characters is allowed.
Priority	The priority value of the IKE proposal. The priority value determines the order of the IKE proposals compared by the two negotiating peers when attempting to find a common security association (SA). If the remote IPsec peer does not support the parameters selected in your first priority policy, the device tries to use the parameters defined in the policy with the next lowest priority number. Valid values range from 1 to 65535. The lower the number, the higher the priority. If you leave this field blank, Security Manager assigns the lowest unassigned value starting with 1, then 5, then continuing in increments of 5.

Element	Description
Encryption Algorithm	The encryption algorithm used to establish the Phase 1 SA for protecting Phase 2 negotiations. Click **Select** and select all of the algorithms that you want to allow in the VPN: • AES-GCM-256—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 256-bit keys. (ASA 5580 and ASA 5500-X Series devices running 9.0.1+ only). • AES-GCM-192—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 192-bit keys. (ASA 5580 and ASA 5500-X Series devices running 9.0.1+ only). • AES-GCM—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 128-bit keys. (ASA 5580 and ASA 5500-X Series devices running 9.0.1+ only). • AES-256—Encrypts according to the Advanced Encryption Standard using 256-bit keys. • AES-192—Encrypts according to the Advanced Encryption Standard using 192-bit keys. • AES—Encrypts according to the Advanced Encryption Standard using 128-bit keys. • 3DES—Encrypts three times using 56-bit keys. 3DES is more secure than DES, but requires more processing for encryption and decryption. It is less secure than AES. A 3DES license is required to use this option. • DES—Encrypts according to the Data Encryption Standard using 56-bit keys. • Null—No encryption algorithm. **Note** Beginning with version 4.22, Cisco Security Manager terminates support for DES and 3DES encryption algorithms and Null option for ASA 9.15(1) or higher version devices.

Element	Description
Integrity (Hash) Algorithm	The integrity portion of the hash algorithm used in the IKE proposal. The hash algorithm creates a message digest, which is used to ensure message integrity. Click **Select** and select all of the algorithms that you want to allow in the VPN: **Note** If using AES-GCM, AES-GCM-192, or AES-GCM-256, you must select Null as the Integrity Algorithm. • SHA (Secure Hash Algorithm)—SHA is more resistant to brute-force attacks than MD5. Standard SHA produces a 160-bit digest. The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices: • SHA512—A 512-bit key. • SHA384—A 384-bit key. • SHA256—A 256-bit key. • MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA. **Note** From version 4.22, Cisco Security Manager terminates support for MD5 hash algorithm for ASA 9.15(1) or higher version devices. • Null—No encryption algorithm. For use with AES-GCM, AES-GCM-192, and AES-GCM-256 only.
Prf Algorithm	The pseudo-random function (PRF) portion of the hash algorithm used in the IKE proposal. In IKEv1, the Integrity and PRF algorithms are not separated, but in IKEv2, you can specify different algorithms for these elements. Click **Select** and select all of the algorithms that you want to allow in the VPN. The options are described above under Integrity Algorithm. **Note** Cisco Security Manager 4.22 terminates support for MD5 PRF algorithm, as it is no longer secure against modern threats.

Element	Description
Modulus Group	The Diffie-Hellman group to use for deriving a shared secret between the two IPsec peers without transmitting it to each other. A larger modulus provides higher security but requires more processing time. The two peers must have a matching modulus group. Click **Select** and select all of the groups that you want to allow in the VPN: • 1—Diffie-Hellman Group 1 (768-bit modulus). **Note** Beginning with Cisco Security Manager 4.19, DH group 1 option is not supported for ASA 9.12(1) and later devices. • 2—Diffie-Hellman Group 2 (1024-bit modulus). • 5—Diffie-Hellman Group 5 (1536-bit modulus, considered good protection for 128-bit keys, but group 14 is better). If you are using AES encryption, use this group (or later). • 14—Diffie-Hellman Group 14 (2048-bit modulus, considered good protection for 128-bit keys). (ASA 9.0.1+ devices only). **Note** Beginning with Cisco Security Manager 4.20, DH group 14 is supported, and is the default DH group, for IKEv1 on ASA 9.13(1) and later devices. • 15—Diffie-Hellman Group 15 (3072-bit modulus, considered good protection for 192-bit keys). (ASA 9.13.1+ devices only). • 16—Diffie-Hellman Group 16 (4096-bit modulus, considered good protection for 256-bit keys). (ASA 9.13.1+ devices only). • 19—Diffie-Hellman Group 19 (256-bit elliptical curve field size). (ASA 9.0.1+ devices only). • 20—Diffie-Hellman Group 20 (384-bit elliptical curve field size). (ASA 9.0.1+ devices only). • 21—Diffie-Hellman Group 21 (521-bit elliptical curve field size). (ASA 9.0.1+ devices only). • 24—Diffie-Hellman Group 24 (2048-bit modulus and 256-bit prime order subgroup). (ASA 9.0.1+ devices only). • 31—Diffie-Hellman Group 31 (256-bit elliptical curve field size). (ASA 9.16.1+ devices only). **Note** Beginning with version 4.22 onwards, Cisco Security Manager does not support DH groups 2 and 24 for ASA 9.15(1) and higher version devices. **Note** Beginning with Cisco Security Manager 4.23, DH group 31 is supported for IPsec profile and IKEv2 on ASA 9.16(1) and later devices.
Lifetime	The lifetime of the security association (SA), in seconds. When the lifetime is exceeded, the SA expires and must be renegotiated between the two peers. As a general rule, the shorter the lifetime (up to a point), the more secure your IKE negotiations will be. However, with longer lifetimes, future IPsec security associations can be set up more quickly than with shorter lifetimes. You can specify a value from 120 to 2147483647 seconds. The default is 86400.

Element	Description
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Understanding IPsec Proposals

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers, which can be devices in a site-to-site VPN or a device and user in remote access IPsec VPNs. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

An IPsec proposal is used in Phase 2 of an IKE negotiation, as explained in Understanding IKE , on page 1153. The specific content of the proposal varies according to topology type (site-to-site or remote access) and device type, although the proposals are broadly similar and contain many of the same elements, such as IPsec transform sets.

The following topics explain IPsec proposal concepts and procedures in more detail:

Understanding IPsec Proposals for Site-to-Site VPNs

IPsec is one of the most secure methods for setting up a VPN. IPsec provides data encryption at the IP packet level, offering a robust security solution that is standards-based. Pure IPsec configurations cannot use routing protocols—the policy created is used for pure IPsec provisioning. You can configure pure IPsec on Cisco IOS routers, PIX Firewalls, Catalyst VPN Service Modules, and Adaptive Security Appliance (ASA) devices.

With IPsec, data is transmitted over a public network through tunnels. A tunnel is a secure, logical communication path between two peers. Traffic that enters an IPsec tunnel is secured by a combination of security protocols and algorithms called a transform set.

In Security Manager, you use an IPsec Proposal policy to define the settings required for a IPsec tunnels. An IPsec proposal is a collection of one or more crypto maps that are applied to the VPN interfaces on the devices. A crypto map combines all the components required to set up IPsec security associations, including transform sets. A crypto map can also be configured with Reverse Route Injection (RRI).

The following topics provide more information:

- Understanding Crypto Maps , on page 1169
- Understanding Transform Sets , on page 1170
- Understanding Reverse Route Injection , on page 1171

Related Topics

- Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172

Understanding Crypto Maps

A crypto map combines all components required to set up IPsec security associations (SA), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. A crypto map entry is a named series of CLI commands. Crypto map entries with the same crypto map name (but different map sequence numbers) are grouped into a crypto map set, which is applied to the VPN interfaces on relevant devices. All IP traffic passing through the interface is evaluated against the applied crypto map set.

When two peers try to establish an SA, they must each have at least one compatible crypto map entry. The transform set defined in the crypto map entry is used in the IPsec security negotiation to protect the data flows specified by that crypto map's IPsec rules.

Dynamic crypto map policies are used in site-to-site VPNs when an unknown remote peer tries to initiate an IPsec security association with the local hub. The hub cannot be the initiator of the security association negotiation. Dynamic crypto policies allow remote peers to exchange IPsec traffic with a local hub even if the hub does not know the remote peer's identity. You can create a dynamic crypto policy on individual hubs or on a device group that contains hubs. The policy is written only to the hubs, not to any spokes that might be contained in the group. A dynamic crypto map policy essentially creates a crypto map entry without all the parameters configured. The missing parameters are later dynamically configured (as the result of an IPsec negotiation) to match a remote peer's requirements. The peer addresses for dynamic or static crypto maps are deduced from the VPN topology.

Dynamic crypto map policies apply only in a hub-and-spoke VPN configuration—in a point-to-point or full mesh VPN topology, you can apply only static crypto map policies.

Note (Site-to-site VPNs.) Except for Extranet VPNs, Security Manager can manage an existing VPN tunnel only if the tunnel's peers are managed by Security Manager. In such a case, Security Manager uses the same crypto map name for the tunnel on the peers. On subsequent deployments, only Security Manager tunnels are managed (Security Manager maintains a log of all tunnels that were configured).

Related Topics

- Understanding IPsec Proposals , on page 1168
- Understanding Transform Sets , on page 1170
- Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172

Understanding Transform Sets

A transform set is a combination of security protocols and algorithms that secure traffic in an IPsec tunnel. During the IPsec security association (SA) negotiation, peers search for a transform set that is the same at both peers. When such a transform set is found, it is applied to create an SA that protects data flows in the access list for that crypto map, protecting the traffic in the VPN.

There are separate IPsec transform sets for IKEv1 and IKEv2. With IKEv1 transform sets, for each parameter, you set one value. For IKEv2 transform sets, you can configure multiple encryption and integration algorithms for a single proposal. ASA devices order the settings from the most secure to the least secure and negotiate with the peer using that order. This allows you to potentially send a single proposal to convey all the allowed combinations instead of the need to send each allowed combination individually as with IKEv1.

You can specify a number of transform sets per IPsec proposal policy. If you are defining the policy on a spoke or a group of spokes, you do not usually have to specify more than one transform set. This is because the spoke's assigned hub would typically be a higher performance router capable of supporting any transform set that the spoke supports. However, if you are defining the policy on a hub for dynamic crypto, you should specify more than one transform set to ensure that there will be a transform set match between the hub and the unknown spoke. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security is used.

Security Manager provides predefined transform sets that you can use in your tunnel policies. You can also create your own transform sets. For more information, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177.

Selecting Tunnel Mode for IKEv1 Transform Sets

When defining an IKEv1 transform set, you must specify which IPsec mode of operation to use—tunnel mode or transport mode. You can use the AH and ESP protocols to protect an entire IP payload (Tunnel mode) or just the upper-layer protocols of an IP payload (Transport mode).

In tunnel mode (the default), the entire original IP datagram is encrypted, and it becomes the payload in a new IP packet. This mode allows a router to act as an IPsec proxy. That is, the router performs encryption on behalf of the hosts. The source's router encrypts packets and forwards them along the IPsec tunnel. The destination's router decrypts the original IP datagram and forwards it on to the destination system. The major advantage of tunnel mode is that the end systems do not need to be modified to enjoy the benefits of IPsec. Tunnel mode also protects against traffic analysis. With tunnel mode, an attacker can only determine the tunnel endpoints and not the true source and destination of the tunneled packets, even if they are the same as the tunnel endpoints.

In transport mode, only the IP payload is encrypted, and the original IP headers are left intact. This mode has the advantage of adding only a few bytes to each packet. It also allows devices on the public network to see the final source and destination of the packet. However, by passing the IP header in the clear, transport mode allows an attacker to perform some traffic analysis. For example, an attacker could see when a company's CEO sent many packets to another senior executive. However, the attacker would only know that IP packets were sent; the attacker would not be able to decipher the contents of the packets. With transport mode, the destination of the flow must be an IPsec termination device.

Note You cannot use transport mode for VPN topologies using regular IPsec or Easy VPN.

Understanding Reverse Route Injection

Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. These protected hosts and networks are known as remote proxy identities. Each route is created on the basis of the remote proxy network and mask, with the next hop to this network being the remote tunnel endpoint. By using the remote VPN router as the next hop, the traffic is forced through the crypto process to be encrypted.

After the static route is created on the VPN router, this information is propagated to upstream devices, allowing them to determine the appropriate VPN router to which to send returning traffic in order to maintain IPsec state flows. This is particularly useful if multiple VPN routers are used at a site to provide load balancing or failover, or if the remote VPN devices are not accessible through a default route. Routes are created in either the global routing table or the appropriate virtual route forwarding (VRF) table.

Note Security Manager automatically configures RRI on devices with High Availability (HA) or on the IPsec Aggregator when VRF-Aware IPsec is configured. You can also configure RRI on a device's crypto map in a remote access VPN.

In Security Manager, the following options are available for configuring Reverse Route Injection:

- For dynamic crypto maps, routes are created upon the successful establishment of IPsec security associations (SAs) for those remote proxies. The next hop back to those remote proxies is through the remote VPN router whose address is learned and applied during the creation of the dynamic crypto map template. The routes are deleted after the SAs are deleted.
- The Remote Peer option (available for IOS devices only) enables you to specify an interface or address as the explicit next hop to the remote VPN device. Two routes are created. One route is the standard remote proxy ID and the next hop is the remote VPN client tunnel address. The second route is the actual route to the remote tunnel endpoint, when a recursive lookup is forced to impose that the remote endpoint is reachable via "next-hop." Creation of the second route for the actual next hop is very important for VRF-Aware IPsec when a default route must be overridden by a more explicit route.

Note For devices using a VPN Services Module (VPNSM), the next hop is the interface or subinterface/VLAN on which the crypto map is applied. See Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices) , on page 1367 and Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471.

- In the case of Remote Peer IP (available for IOS devices only), one route is created to a remote proxy by way of a user-defined next hop. The next hop can be used to override a default route to properly direct outgoing encrypted packets. This option reduces the number of routes created and supports those platforms that do not readily facilitate route recursion.

Configuring IPsec Proposals in Site-to-Site VPNs

Use the IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for site-to-site VPN topologies with the exception of Easy VPN topologies.

IPsec proposals used with Easy VPN topologies, and with remote access VPNs, are significantly different than the basic site-to-site proposal explained in this topic. For information on IPsec proposals in these other topologies, see the following topics:

- Configuring an IPsec Proposal for Easy VPN , on page 1254
- Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices) , on page 1367
- Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471

Navigation Path

- (Site-to-Site VPN Manager Window , on page 1093) Select a non-Easy VPN topology in the VPNs selector, then select **IPsec Proposal** in the Policies selector. If necessary, click the **IPsec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one.

Related Topics

Field Reference

Table 339: IPsec Proposal Page, Site-to-Site VPNs (except Easy VPN)

Element	Description
Crypto Map Type (Hub and spoke and full mesh topologies only.)	A crypto map combines all the components required to set up IPsec security associations (SA). When two peers try to establish an SA, they must each have at least one compatible crypto map entry. For more information, see Understanding Crypto Maps , on page 1169. Select the type of crypto map you want to generate: • Static—Use a static crypto map in a point-to-point or full mesh VPN topology. • Dynamic—Dynamic crypto maps can only be used in a hub-and-spoke VPN topology. Dynamic crypto map policies allow remote peers to exchange IPsec traffic with a local hub, even if the hub does not know the remote peer's identity.
Enable IKEv1 Enable IKEv2	The IKE versions to use during IKE negotiations. IKEv2 is supported on ASA Software release 8.4(x) only. Similarly, beginning with 4.16, Cisco Security Manager does not support IKEv1 configurations for Firepower 9300 devices configured with distributed mode. Select either or both options as appropriate; you must select IKEv1 if any device in the topology does not support IKEv2. When you select both options in hub-and-spoke or full mesh topologies, Security Manager automatically assigns the IKE version to devices based on the OS type and version used by the device. You can change these assignments by clicking the **IKE Version** tab, then click the Select button beneath the IKEv1 Enabled Peers or IKEv2 Enabled Peers to change which version is assigned to the device. You can change the assignments for devices that support each version only; other devices are not selectable. For more information, see Selecting the IKE Version for Devices in Site-to-Site VPNs , on page 1176.
Transform Sets IKEv2 Transform Sets	The transform sets to use for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. The transform sets are different for each IKE version; select objects for each supported version. You can select up to 11 transform sets for each. For more information, see Understanding Transform Sets , on page 1170. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used. Click **Select** to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the **Create (+)** button beneath the available objects list in the selection dialog box to create a new one. For more information, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177. **Note** IKEv1 Transform sets can use tunnel mode or transport mode of IPsec operation. However, you cannot use transport mode in IPsec or Easy VPN topologies.

Element	Description
Enable Perfect Forward Secrecy Modulus Group	Whether to use Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. The unique session key protects the exchange from subsequent decryption, even if the entire exchange was recorded and the attacker has obtained the preshared or private keys used by the endpoint devices. If you select this option, also select the Diffie-Hellman key derivation algorithm to use when generating the PFS session key in the **Modulus Group** list. For an explanation of the options, see Deciding Which Diffie-Hellman Modulus Group to Use , on page 1156. **Note** DH group 1 is deprecated and will be removed in later ASA version. In later ASA versions, the default value will be Group 2.
Lifetime (sec) Lifetime (kbytes)	The global lifetime settings for the crypto IPsec security association (SA). You can specify the IPsec lifetime in seconds, in kilobytes, or both. • Seconds (sec)—The number of seconds an SA will exist before expiring. The default is 3600 seconds (one hour). • Kilobytes (kbytes)—The volume of traffic (in kilobytes) that can pass between IPsec peers using a given SA before it expires. Valid values depend on the device type. Enter a value within the range 10-2147483647 for an IOS router, and 2560-536870912 for an ASA/PIX7.0+ device. The default value is 4,608,000 kilobytes.
QoS Preclassify	Supported on Cisco IOS routers, except 7600 devices. When selected, enables the classification of packets before tunneling and encryption occur. The Quality of Service (QoS) for VPNs feature enables Cisco IOS QoS services to operate with tunneling and encryption on an interface. The QoS features on the output interface classify packets and apply the appropriate QoS service before the data is encrypted and tunneled, enabling traffic flows to be adjusted in congested environments, and resulting in more effective packet tunneling.

Element	Description
Reverse Route	Supported on ASA devices, PIX 7.0+ devices, and Cisco IOS routers except 7600 devices. Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see Understanding Reverse Route Injection , on page 1171. Select one of the following options to configure RRI on the crypto map: • **None**—Disables the configuration of RRI on the crypto map. • **Standard**—(ASA, PIX 7.0+, IOS devices) Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option. • **Remote Peer**—(IOS devices only) Creates two routes, one for the remote endpoint and one for route recursion to the remote endpoint via the interface to which the crypto map is applied. • **Remote Peer IP**—(IOS devices only) Specifies an address as the explicit next hop to the remote VPN device. Enter the IP address or a network/host object that specifies the address, or click **Select** to select the network/host object from a list or to create a new object. **Note** If you use network/host objects, you can select the **Allow Value Override per Device** option in the object to override the IP address, if required, for specific devices that use this object.
Enable Dynamic RRI	**Note** This option is supported from ASA 9.7(1) onwards. It is only applicable if IKEV2 is enabled or Static Crypto Maps are selected. When enabled, the crypto map does not install the reverse-route during configuration but defers it till the IPsec security associations (SA) come up.
ESPv3 Settings (ASA 9.0.1+ only) Specify whether incoming ICMP error messages are validated for cryptography and dynamic cryptography maps, set the per-security association policy, or enable traffic flow packets:	
Validate Incoming ICMP error messages	Whether to validate those ICMP error messages received through an IPsec tunnel and destined for an interior host on the private network.
Enable Do Not Fragment (DF) Policy	Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header. Choose one of the following: • Set—Sets and uses the DF bit. • Copy—Maintains the DF bit. • Clear—Ignores the DF bit.

Element	Description
Enable Traffic Flow Confidentiality (TFC) Packets	Enable dummy TFC packets that mask the traffic profile which traverses the tunnel. **Note** You must have an IKEv2 IPsec proposal set on the Tunnel Policy (Crypto Map) Basic tab before enabling TFC. Traffic Flow Confidentiality is not available when IKEv1 is enabled. Use the Burst, Payload Size, and Timeout parameters to generate random length packets at random intervals across the specified SA.

Selecting the IKE Version for Devices in Site-to-Site VPNs

Use the IKE Version tab in the IPsec Proposal page to select which version of IKE to use for each device in a hub-and-spoke or full mesh site-to-site VPN. This tab appears only in the Site-to-Site VPN Manager; you cannot configure the options in Policy view, because they are specific to the actual devices in a VPN topology.

The IKE Version tab contains two lists: IKEv1 Enabled Peers and IKEv2 Enabled Peers. When you configure the IPsec proposal, as described in Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172, you select which IKE versions to allow in the VPN (version 1, version 2, or both). Security Manager automatically chooses which IKE version to use for a device based on the OS version used by the device. For example, IOS routers always appear in the IKEv1 Enabled Peers list. If a device supports both IKEv1 and IKEv2, it appears in both lists.

You need to alter the selection only if you are allowing both IKE versions in a VPN and you want to specifically prevent some IKEv2-capable devices from using one of the IKE versions.

To change which IKE version is allowed for a device, click the **Select** button beneath the list from which you want to remove the device (or to add the device after previously removing it). A selection dialog box opens where you can do the following (click **OK** to confirm your choices):

- To remove a device, so that it cannot use the IKE version, highlight it in the Selected Peers list and click << to move it to the Available Peers list.
- To add a device, so that it is allowed to use the IKE version, highlight it in the Available Peers list and click >> to move it to the Selected Peers list.

Tip The selection lists include only those devices that support both IKE versions, because you cannot change the version selection for devices that support a single version. IKEv2 is supported on ASA Software 8.4(1)+.

Navigation Path

(Site-to-Site VPN Manager Window , on page 1093) Select a non-Easy VPN topology in the VPNs selector, then select **IPsec Proposal** in the Policies selector. Click the **IKE Version** tab.

Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects

Use the Add or Edit IPSec Transform Set dialog box to configure IPSec transform sets for use in IKE negotiations.

You can create IPSec transform set objects for use in IPSec proposals when defining IPSec-protected traffic in site-to-site and remote access VPNs. During IPSec security association negotiation, the peers agree to use a particular transform set when protecting a particular data flow.

Two different security protocols are included within the IPSec standard:

- Encapsulating Security Protocol (ESP)—Provides authentication, encryption, and anti-replay services. ESP is IP protocol type 50.
- Authentication Header (AH)—Provides authentication and anti-replay services. AH does not provide encryption and has largely been superseded by ESP. It is also supported on routers only. AH is IP protocol type 51.

Note We recommend using both encryption and authentication on IPSec tunnels.

There are separate IPsec transform set objects based on the IKE version, IKEv1 or IKEv2:

- When you create an IPSec IKEv1 transform set object, you select the mode in which IPSec should operate, as well as define the required encryption and authentication types. Additionally, you can select whether to include compression in the transform set. You can select single options for the algorithms, so if you want to support multiple combinations in a VPN, you must create multiple IPsec IKEv1 transform set objects.
- When you create an IPSec IKEv2 transform set object, you can select all of the encryption and hash algorithms that you will allow in a VPN. During IKEv2 negotiations, the peers select the most appropriate options that each support.

Note If you configure an IPsec IKEv1 or IKEv2 Proposal on a device, you must use the configured Proposal for that device. For example, in a Site-to-Site (Point-to-Point) VPN configuration, the endpoint (interface) configured with the IPsec Proposal can be used in generating the crypto map. However, if the configured Proposal is not used by Security Manager for that device, in the following preview configuration, Security Manager will generate a negate command and the configured IPsec Proposal will be negated by Security Manager.

Navigation Path

Select **Manage > Policy Objects**, then select **IPSec Transform Sets > IPSec IKEv1 Transform Sets** or **IPSec Transform Sets > IPSec IKEv2 Transform Sets** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 340: IPSec IKEv1 or IKEv2 Transform Set Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 1024 characters is allowed.
Mode (IKEv1 only.)	The mode in which the IPSec tunnel operates: • Tunnel—Tunnel mode encapsulates the entire IP packet. The IPSec header is added between the original IP header and a new IP header. This is the default. Use tunnel mode when the firewall is protecting traffic to and from hosts positioned behind the firewall. Tunnel mode is the normal way regular IPSec is implemented between two firewalls (or other security gateways) that are connected over an untrusted network, such as the Internet. • Transport—Transport mode encapsulates only the upper-layer protocols of an IP packet. The IPSec header is inserted between the IP header and the upper-layer protocol header (such as TCP). Transport mode requires that both the source and destination hosts support IPSec, and can only be used when the destination peer of the tunnel is the final destination of the IP packet. Transport mode is generally used only when protecting a Layer 2 or Layer 3 tunneling protocol such as GRE, L2TP, and DLSW.

Element	Description
ESP Encryption	The Encapsulating Security Protocol (ESP) encryption algorithm that the transform set should use. For more information on the following options, see Deciding Which Encryption Algorithm to Use , on page 1154. For IKEv1, select one of the following options. For IKEv2, click **Select** to open a dialog box where you can select all of the options you want to support: **Note** AES-GCM/GMAC can only be configured on 5580 and newer ASA platforms. • (Blank)—Do not use ESP encryption. • DES—Encrypts according to the Data Encryption Standard using 56-bit keys. • 3DES—Encrypts three times using 56-bit keys. 3DES is more secure than DES, but requires more processing for encryption and decryption. It is less secure than AES. A 3DES license is required to use this option. **Note** Beginning with version 4.22, Cisco Security Manager does not support DES and 3DES ESP Encryption Algorithms for IPsec IKEv1 proposal, because they are no longer considered secure againt modern threats. • AES-128 (AES)—Encrypts according to the Advanced Encryption Standard using 128-bit keys. • AES-192—Encrypts according to the Advanced Encryption Standard using 192-bit keys. • AES-256—Encrypts according to the Advanced Encryption Standard using 256-bit keys. • ESP-Null (NULL)—A null encryption algorithm. Transform sets defined with ESP-Null provide authentication without encryption; this is typically used for testing purposes only. • AES-GCM (IKEv2 only)—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 128-bit keys. (ASA 9.0.1+ devices only). • AES-GCM-192 (IKEv2 only)—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 192-bit keys. (ASA 9.0.1+ devices only). • AES-GCM-256 (IKEv2 only)—Encrypts according to the Advanced Encryption Standard in Galois/Counter Mode using 256-bit keys. (ASA 9.0.1+ devices only). • AES-GMAC (IKEv2 only)—Encrypts according to the Advanced Encryption Standard Galois Message Authentication Codeusing 128-bit keys. • AES-GMAC-192 (IKEv2 only)—Encrypts according to the Advanced Encryption Standard Galois Message Authentication Codeusing 192-bit keys. • AES-GMAC-256 (IKEv2 only)—Encrypts according to the Advanced Encryption Standard Galois Message Authentication Code using 256-bit keys. **Note** Beginning with version 4.22, Cisco Security Manager terminates support for DES, 3DES, AES-GMAC, AES-GMAC-192, and AES-GMAC-256 ESP Encryption Algorithms for IPsec IKEv2 proposal, for ASA 9.15(1) and higher version devices, as they are no longer considered secure against modern threats:

Element	Description
ESP Hash Algorithm (IKEv1) ESP Integration Algorithm (IKEv2) AH Hash Algorithm (IKEv1 only)	The hash or integrity algorithm to use in the transform set for authentication. For IKEv1, the default is to use SHA for ESP authentication and to not use AH authentication. For IKEv2, there is no default. The AH hash algorithm is used on routers only. For IKEv1, select one of the following options. For IKEv2, click **Select** to open a dialog box where you can select all of the options you want to support. • None—Does not perform ESP or AH authentication. • SHA, SHA-1 (Secure Hash Algorithm version 1)—Produces a 160-bit digest. SHA is more resistant to brute-force attacks than MD5, but requires more processing time. The following options, which are even more secure, are available for IKEv2 configurations on ASA 8.4(2+) devices: • SHA512—A 512-bit key. • SHA384—A 384-bit key. • SHA256—A 256-bit key. • MD5 (Message Digest 5)—Produces a 128-bit digest. MD5 uses less processing time than SHA, but is less secure. **Note** Beginning with version 4.22, Cisco Security Manager terminates support for MD5 algorithm for ASA 9.15(1) and higher version devices, as it is no longer considered secure against modern threats. • Null—No encryption algorithm. For use with AES-GCM, AES-GCM-192, AES-GCM-256, AES-GMAC, AES-GMAC-192, and AES-GMAC-256 only.
Compression (IKEv1 only, IOS devices only.)	Whether to compress the data in the IPSec tunnel using the Lempel-Ziv-Stac (LZS) algorithm.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Configuring VPN Global Settings

You can define global settings that apply to all devices in your remote access or site-to-site VPN topology. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations in a remote access IPsec VPN.

Note The VPN Global Settings policy for site-to-site VPNs applies to all technologies except GET VPN. For an explanation of global settings for GET VPN, see Configuring Global Settings for GET VPN , on page 1276.

Step 1 Do one of the following to open the global settings policy based on the type of VPN you are configuring:

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one.
- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one.

Step 2 Select the desired tab and configure the settings as needed:

- **ISAKMP/IPsec Settings**—To configure global settings for IKE and IPsec. For detailed information about the options, see Configuring VPN Global ISAKMP/IPsec Settings , on page 1183.
- **IKEv2 Settings**—To configure global settings for IKE version 2 negotiations. For detailed information about the options, see Configuring VPN Global IKEv2 Settings , on page 1187.
- **NAT Settings**—To configure NAT behavior. For detailed information about the options, see Configuring VPN Global NAT Settings , on page 1192. Also see Understanding NAT in VPNs , on page 1191.
- **Address Assignment**—To specify one or more methods of address assignment to remote clients, see Configuring VPN Global Address Assignment Settings , on page 1181. The address assignment applies only to remote access VPN.
- **General Settings**—To configure fragmentation behavior and some other miscellaneous options. For detailed information about the options, see Configuring VPN Global General Settings , on page 1193.

Configuring VPN Global Address Assignment Settings

Use the Address Assignment tab of the VPN Global Settings page to specify one or more methods of address assignment to remote clients. The available methods are:

- Obtain IP addresses from an authentication server.
- Obtain IP addresses from a DHCP server.
- Obtain IP addresses from an internally configured pool.

Note You can configure address assignment on devices running the ASA software version 7.0(1) or later. By default all the methods are enabled.

Address Assignment is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **Address Assignment** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **Address Assignment** tab.

Related Topics

- Configuring VPN Global Settings , on page 1180

Field Reference

Table 341: VPN Global Settings Page, Address Assignment Tab

Element	Description
IPv4 Address Assignment Priority	
Use Authentication Server	Choose to assign IPv4 addresses retrieved from an authentication server on a per-user basis. If you are using an authentication server (external or internal) that has IPv4 addresses configured, we recommend using this method. If you select this option, use the **Platform** > **Device Admin** > **AAA** policy to define the AAA server groups to use for authenticating user access. This method is available for IPv4 and IPv6 assignment policies.
Use DHCP	Choose to obtain IP addresses from a DHCP server. If you use DHCP, you must configure the server using the **Platform** > **Device Admin** > **Server Access** > **DHCP Server** from the Device Policy selector. You must also define the range of IP addresses that the DHCP server can use. This method is available for IPv4 assignment policies.
Use internal address pools	Choose to have the ASA assign IPv4 addresses from an internally configured pool. Internally configured address pools are the easiest method of address pool assignment to configure. If you use this method, you must configure the IP address pools. To configure IP address pools, on the Device view, select **NAT** > **Address Pools** from the Device Policy Selector. Or on the Policy view, select **NAT (PIX/ASA/FWSM)** > **Address Pools** from the Policy Type selector, then select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.
Allow the reuse of an IP address - minutes after it is released	Delays the reuse of an IP address after its return to the address pool. Adding a delay helps to prevent problems firewalls can experience when an IP address is reassigned quickly. By default, this is unchecked, meaning the ASA does not impose a delay. To add a delay, check the box and enter the number of minutes in the range 0 - 480 to delay IP address reassignment. **Note** This feature is available on devices running the ASA software version 8.0(3) or later.

Element	Description
IPv6 Address Assignment Priority - Security Manager 4.12 onwards for ASA devices running version 9.0 or later.	
Use Authentication Server	Choose to assign IPv6 addresses retrieved from an authentication server on a per-user basis. If you are using an authentication server (external or internal) that has IPv6 addresses configured, we recommend using this method. If you select this option, use the **Platform** > **Device Admin** > **AAA** policy to define the AAA server groups to use for authenticating user access.
Use internal address pools	Choose to have the ASA assign IPv6 addresses from an internally configured pool. Internally configured address pools are the easiest method of address pool assignment to configure. If you use this method, you must configure the IP address pools. To configure IPv6 address pools, on the Device view, select **NAT** > **Address Pools** from the Device Policy Selector. Or on the Policy view, select **NAT (PIX/ASA/FWSM)** > **Address Pools** from the Policy Type selector, then select an existing policy from the Shared Policy selector, or right-click **Address Pools** to create a new policy.

Configuring VPN Global ISAKMP/IPsec Settings

Use the ISAKMP/IPsec Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) and IPsec.

The Internet Key Exchange (IKE) protocol, also called the Internet Security Association and Key Management Protocol (ISAKMP) is the negotiation protocol that lets two hosts agree on how to build an IPsec security association. Each ISAKMP negotiation is divided into a Phase 1 and Phase 2. Phase 1 creates the first tunnel, which protects ISAKMP negotiation messages. Phase 2 creates the tunnel that protects data.

To set terms for ISAKMP negotiations, you create an IKE proposal. For more information, see Configuring an IKE Proposal , on page 1158.

About IKE Keepalive

With IKE keepalive, tunnel peers exchange messages that demonstrate they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel, using a backup device.

Devices that rely on IKE keepalive for resiliency transmit their keepalive messages regardless of whether they are exchanging other information. These keepalive messages can therefore create a small but additional demand on your network.

A variation on IKE keepalive called keepalive dead-peer detection (DPD) sends keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent. If you want to send DPD keepalive messages when no incoming traffic is received regardless of whether there is any outbound traffic, you can specify this using the Periodic option.

Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN** > **Global Settings** from the Policy selector. Click the **ISAKMP/IPsec Settings** tab.

- (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.

- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **ISAKMP/IPsec Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **ISAKMP/IPsec Settings** tab.

Field Reference

Table 342: VPN Global Settings Page, ISAKMP/IPsec Settings Tab

Element	Description
ISAKMP Settings	
Enable Keepalive	Whether to configure dead-peer detection (DPD) settings. If the peer fails to respond, a new tunnel is constructed on the assumption that the peer is no longer available. IKE keepalive is defined on the spokes in a hub-and-spoke VPN topology, on both devices in a point-to-point VPN topology, or in remote access VPN configurations. Configure the following options: • Interval—The number of seconds the peer can be idle before beginning keepalive monitoring. The range is 10-3600 seconds. The default is 10, although the ASA device default for remote access groups is 300. • Retry—The interval in seconds between retries after a keepalive response has not been received. The range is 2-10 seconds for ASA, 2-60 for IOS devices. The default is 2 seconds. • Periodic—(Routers running IOS Software version 12.3(7)T and later, except 7600 devices.) Whether to send DPD keepalive messages at regular intervals regardless of IPsec traffic. This changes how the interval value is used. • Infinite—(ASA only.) Whether to ignore the interval and retry settings and allow the peer to be idle indefinitely.

Element	Description

Identity	During Phase I IKE negotiations, peers must identify themselves to each other. Select one of the following:
	• Address—Use the IP address of the host exchanging ISAKMP identity information. This is the default.
	• Hostname—Use the fully-qualified domain name of the host exchanging ISAKMP identity information.
	• Auto/DN—Use automatic selection or distinguished name based on device type:
	  • Distinguished Name (IOS devices only)—Use a distinguished name (DN) to identify a user group name.
	  • Auto (ASA devices only)—Determine ISAKMP negotiation by connection type; IP address for preshared key or certificate distinguished name for certificate authentication.

SA Requests System Limit	Supported on routers running Cisco IOS Software Release 12.3(8)T and later, except 7600 routers. The maximum number of SA requests allowed before IKE starts rejecting them, from 0 to 99999. The number must equal or exceed the number of peers, or the VPN tunnels might be disconnected.
SA Requests System Threshold	Supported on Cisco IOS routers and Catalyst 6500/7600 devices. The percentage of system resources that can be used before IKE starts rejecting new SA requests. The default is 75 percent.
Enable Aggressive Mode (Site to site VPNs only.)	Supported on ASA devices and PIX 7.0+ devices. When selected, enables you to use aggressive mode in ISAKMP negotiations. Aggressive mode is enabled by default.
IPsec Settings	
Enable Lifetime	Select to enable you to configure the global lifetime settings for the crypto IPsec security associations (SAs) on the devices in your site-to-site or remote access VPN. Configure the following: • Lifetime (secs)—The number of seconds a security association will exist before expiring. The default is 3,600 seconds (1 hour). • Lifetime (kbytes)—The volume of traffic (in kilobytes) that can pass between IPsec peers using a given security association before it expires. The default is 4,608,000 kilobytes.

Element	Description
Xauth Timeout	Supported on Cisco IOS routers and Catalyst 6500/7600 devices in remote access VPN and Easy VPN topologies only. The number of seconds the device will wait for a system response to the Xauth challenge. When negotiating tunnel parameters for establishing IPsec tunnels in a remote access or Easy VPN configuration, Xauth adds another level of authentication that identifies the user who requests the IPsec connection. Using the Xauth feature, the client waits for a username/password (Xauth) challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.
Max Sessions	Supported on ASA devices and PIX 7.0+ devices. The maximum number of security associations (SAs) that can be enabled simultaneously on the device. The maximum number differs based on device model. For ASA devices, the limits are: • 5505—10 sessions. • 5510—250 sessions. • 5520—750 sessions. • 5540, 5550, 5585-X with SSP-10—5000 sessions. • 5580, 5585-X (other models)—10000 sessions.
Enable IPsec via Sysopt	Supported on ASA devices, and PIX Firewalls versions 6.3 or 7.0+. Whether to bypass the access rules defined on the VPN interface for VPN traffic. By default, the device allows VPN traffic to terminate on an interface; you do not need to allow IKE or ESP (or other types of VPN packets) in an interface access list. By default, you also do not need an interface access list for local IP addresses of decrypted VPN packets. Because the VPN tunnel was terminated successfully using VPN security mechanisms, this feature simplifies configuration and maximizes the device performance without any security risks. (Group policy and per-user authorization access lists still apply to the traffic.) If you deselect this option, the interface access rules are also applied to VPN traffic. The access list applies to the local IP address and not to the original client IP address used before the VPN packet was decrypted. The command applied is **no sysopt connection permit-vpn**.
Enable IPsec inner routing lookup (Security Manager version 4.12 onwards for ASA devices 9.6(2) or later)	To enable per-packet routing lookups for the IPsec inner packets. This checkbox is deselected by default.

Element	Description
Enable SPI Recovery (Site-to-site VPNs only.)	Supported on routers running IOS version 12.3(2)T and later, in addition to Catalyst 6500/7600 devices running version 12.2(18)SXE and later. When selected, enables the SPI recovery feature to configure your device so that if an invalid SPI (Security Parameter Index) occurs, an IKE SA will be initiated. SPI is a number which, together with a destination IP address and security protocol, uniquely identifies a particular security association. When using IKE to establish security associations, the SPI for each security association is a pseudo-randomly derived number. Without IKE, the SPI is manually specified for each security association. When an invalid SPI occurs during IPsec packet processing, the SPI recovery feature enables an IKE SA to be established.
ESPv3 Settings	
Enable PMTU (Path Maximum Transmission Unit) Aging	Supported for IKEv2 on ASA devices versions 9.0.1+. Whether to enable Path Maximum Transmission Unit aging. If you select this option, configure the interval, in minutes, at which the PMTU value is reset to its original value. The value can be from 10 to 30 minutes. The default is 10 minutes.

Configuring VPN Global IKEv2 Settings

Use the IKEv2 Settings tab of the VPN Global Settings page to specify global settings for Internet Key Exchange (IKE) version 2. These settings apply to ASA 8.4(x) devices only.

Internet Key Exchange (IKE), also called Internet Security Association and Key Management Protocol (ISAKMP), is the negotiation protocol that lets two hosts agree on how to build an IPsec security association (SA).

Preventing DoS Attacks by Limiting IKEv2 Open SAs

You can prevent denial-of-service (DoS) attacks for IPsec IKEv2 connections by always cookie challenging incoming security associations (SAs) or by limiting the number of open SAs and cookie challenging any additional connections. By default, the ASA does not limit the number of open SAs and never cookie challenges SAs.

You can also limit the number of SAs allowed, which stops further connections from negotiating to protect against memory or CPU attacks that the cookie-challenge feature may be unable to thwart. Limiting the maximum number of SAs can protect the current connections.

With a DoS attack, an attacker initiates the attack when the peer device sends an SA initiate packet and the ASA sends its response, but the peer device does not respond further. If the peer device does this continually, all the allowed SA requests on the ASA can be used up until it stops responding.

Enabling a threshold percentage for cookie challenges limits the number of open SA negotiations. For example, with the default setting of 50%, when 50% of the allowed SAs are in-negotiation (open), the ASA cookie challenges any additional SA initiate packets that arrive. For the Cisco ASA 5580 with 10,000 allowed IKEv2 SAs, after 5000 SAs become open, any more incoming SAs are cookie-challenged.

If used in conjunction with the **Maximum SAs in Negotiation** option, configure a lower cookie-challenge threshold.

Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **IKEv2 Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **IKEv2 Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **IKEv2 Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **IKEv2 Settings** tab.

- Understanding IPsec Proposals , on page 1168
- Configuring Group Load Balance Policies (ASA) , on page 1330

Field Reference

Table 343: VPN Global Settings Page, IKEv2 Settings Tab

Element	Description
Maximum SAs	The number of allowed IKEv2 connections (security associations) on the device. The default limit is the maximum number of connections specified by the device license, which differs by device model. Specify a number only if you want to create a limit that is lower than the device license. The range is 1 to 10000.
Maximum SAs in Negotiation	The maximum number of IKEv2 security associations (SAs) that can be in negotiation at any time as a percentage of the maximum allowed SAs. The default is no limit on SAs in negotiation, so it is possible for all available SAs to be in negotiation. The range is 1 to 100%. If you configure this option and also enable custom cookie challenge, configure the cookie challenge threshold lower than this limit.

Element	Description
Enable Cookie Challenge	Whether to send cookie challenges to peer devices in response to SA initiate packets, which can help thwart denial of service (DoS) attacks. The default is to use cookie challenges when 50% of the available SAs are in negotiation. Select one of these options: • **Custom**—Cookie challenge when the number of SAs in negotiation exceeds the total number of allowed SAs on the device based on percentage (SAs in negotiation as a percentage of total allowed SAs). In Custom Cookie Challenge, enter the percentage that triggers cookie challenges for any future SA negotiations. The range is 1 to 100%. The default is 50%. • **Never**—The device never uses cookie challenge. • **Always**—The device always uses cookie challenge, regardless of the percentage of SAs in negotiation.
Remote Access Authentication RA Trustpoint (Remote access VPN only.)	(Required when supporting IKEv2 negotiations.) The PKI enrollment object that identifies the Certificate Authority (CA) server that the device can use to authenticate itself to the remote user. This authorization is required before the user can select a connection profile and log into the VPN. This CA server is used in remote access IKEv2 IPsec VPNs only. Click **Select** to select the object or to create a new one. **Note** Beginning with Cisco Security Manager version 4.17, you can configure remote access authentication on ASA 9.9(2) or later multi-context devices. **Tip** You must also select this PKI enrollment object in the Remote Access VPN > Public Key Infrastructure policy.

Element	Description

Load Balancing Settings
Redirect Connections During
(Remote access VPNs only.)
	If you configure load balancing, using the ASA Group Load Balance policy, you can specify the IKEv2 negotiation phase in which a user can be redirected to another device in the group. Select one of these options:
	• **INIT**—Redirect at unauthenticated initiation requests (the first IKEv2 message IKE_SA_INIT), before any group or user authentication.
	  • Pros—This option allows the main server to do minimal processing and state keeping (using CPU and memory) prior to redirecting the connection.
	  • Cons—This option is not as secure as AUTH (even though security risks are minimal) because anyone can get a redirected IP address without authenticating at all.
	• **AUTH** (the default)—Redirect during authentication (during IKE_AUTH). The device still has not identified or authenticated the user at this point, but it allows the client to authenticate the server to make sure it can trust the redirection that it receives.
	  • Pros—This option is more secure as the reply is encrypted in the IKEv2 tunnel and it allows the client side to authenticate the server before retrying with the redirected IP address, providing better DoS protection than the INIT option.
	  • Cons—This option requires more processing as the IKEv2 tunnel needs to be almost brought up before redirecting, although child SAs and data tunnels do not need to be brought up. The client is not authenticated at all. Note that IKEv1 redirection occurs after group authentication of both sides of the tunnel.

Enable Invalid Selectors Notification	Whether to enable sending an IKE notification to the peer when an inbound packet is received on an SA that does not match the traffic selectors for that SA. This feature is available in Security Manager version 4.9 onwards for ASA devices version 9.4(1) or later.
Fragmentation Settings (ASA devices 9.6(1) or later)	
Enable Fragmentation before Encryption	Whether to enable fragmentation of IKEv2 messages. The Internet Key Exchange Version 2 (IKEv2) fragmentation protocol splits large IKEv2 message into a set of smaller ones, called IKE Fragment Messages. Fragmentation is supported on the ASA devices running the software version 9.6(1) or later.
Local MTU Size (ASA)	Enter the MTU size value. MTU size is used to divide the clear text packet into chunks. The MTU value used includes the IP header plus UDP header size. The default MTU size is 576.

Element	Description
Fragmentation Mode (ASA)	Select one of the following: • CSCO—refers to the current Cisco Proprietary Fragmentation method. • IETF—refers to the method defined by the IETF standard: draft-ietf-ipsecme-ikev2-fragmentation. By default IETF is selected.

Understanding NAT in VPNs

Network Address Translation (NAT) enables devices that use internal IP addresses to send and receive data through the Internet. It converts private, internal LAN addresses into globally routable IP addresses when they try to access data on the Internet. In this way, NAT enables a small number of public IP addresses to provide global connectivity for a large number of hosts.

NAT enhances the stability of your hub-and-spoke VPN tunnels or remote access connections because resources required for VPN connections are not used for other purposes, and the VPN tunnel is kept available for traffic requiring complete security. Sites inside the VPN can use NAT through a split tunnel to exchange non secure traffic with outside devices, and they do not squander VPN bandwidth or overwhelm the hub at the tunnel head-end by directing nonessential traffic through it.

Security Manager supports NAT with dynamic IP addressing only, and applies to it an overload feature that permits what is known as port-level NAT or Port Address Translation (PAT). PAT uses port addressing to associate thousands of private NAT addresses with a small group of public IP address. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool.

Note When you enable PAT on Cisco IOS routers, an additional NAT rule is implicitly created for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy. You can remove the NAT rule by disabling this feature. For more information, see NAT Page: Dynamic Rules , on page 1027.

You can configure traffic to bypass NAT configuration on site-to-site VPN traffic. To bypass NAT configuration on Cisco IOS routers, make sure the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see NAT Dynamic Rule Dialog Box , on page 1028). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see Translation Options Page , on page 1034).

About NAT Traversal

NAT traversal is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow.

If the IP address of the VPN interface on the spoke is not globally routable, the NAT on the middle device replaces it with a new globally routable IP address. This change is made in the IPsec header, and violates the checksum of the spoke causing a mismatch with the hub's checksum calculation. This results in loss of connectivity between the hub and the spoke.

With NAT traversal, the spoke adds a UDP header to the payload. The NAT on the middle device changes the IP address in the UDP header, leaving the IPsec header and checksum intact. On a middle device that uses static NAT, you must provide the static NAT IP address (globally routable) on the inside interface. The static

NAT IP address is provided for all traffic through that interface that requires NAT. However, if the middle device uses dynamic NAT where the NAT IP address is unknown, you must define dynamic crypto on the hub to serve any connection request from the spoke. Security Manager generates the required tunnel configuration for the spoke.

Note NAT traversal is enabled by default on routers running IOS version 12.3T and later. If you want to disable the NAT traversal feature, you must do this manually on the device or using a FlexConfig (see Managing Flexconfigs, on page 341).

You can define global NAT settings on the NAT Settings tab of the Global VPN Settings page as described in Configuring VPN Global NAT Settings , on page 1192.

Configuring VPN Global NAT Settings

Use the NAT Settings tab of the Global Settings page to define global Network Address Translation (NAT) settings that enable devices that use internal IP addresses to send and receive data through the Internet.

Note For site-to-site VPNs, if you want to bypass NAT configuration on IOS routers, make sure that the **Do Not Translate VPN Traffic** option is selected in the NAT Dynamic Rule platform policy (see NAT Dynamic Rule Dialog Box , on page 1028). To exclude NAT on PIX Firewalls or ASA devices, make sure this option is selected in the NAT Translation Options platform policy (see Translation Options Page , on page 1034).

Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **NAT Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **NAT Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **NAT Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **NAT Settings** tab.

Related Topics

- Understanding NAT in VPNs , on page 1191
- Configuring VPN Global Settings , on page 1180

Field Reference

Table 344: VPN Global Settings Page, NAT Settings Tab

Element	Description
Enable Traversal Keepalive Interval	Whether to enable NAT traversal keepalive. NAT traversal keepalive is used for the transmission of keepalive messages when there is a device (middle device) located between a VPN-connected hub and spoke, and that device performs NAT on the IPsec flow. If you select this option, configure the interval, in seconds, between the keepalive signals sent between the spoke and the middle device to indicate that the session is active. The value can be from 5 to 3600 seconds. The default is 10 seconds. **Note** On Cisco IOS routers, NAT traversal is enabled by default. If you want to disable the NAT traversal feature, you must do this manually on the device or by using a FlexConfig.
Enable Traversal over TCP TCP Ports (Remote access VPNs only.)	Supported on ASA and PIX 7.0+ devices. When selected, encapsulates both the IKE and IPsec protocols within a TCP packet and enables secure tunneling through both NAT and PAT devices and firewalls. If you select this option, specify the TCP ports for which you want to enable NAT traversal (NAT-T). You must configure TCP ports on the remote clients and on the VPN device. The client configuration must include at least one of the ports you set for the security appliance. You can enter up to 10 ports. **Tip** These ports are used for IKEv1 connections only. IKEv2 uses ports 500 and 4500 for NAT-T. Ensure that any ports that you specify are opened in the access rules for the applicable interface.
Enable PAT (Port Address Translation) on Split Tunneling for Spokes (Site-to-site VPNs only.)	Supported on Cisco IOS routers and Catalyst 6500/7600 devices. When selected, enables Port Address Translation (PAT) to be used for split-tunneled traffic on spokes in your VPN topology. PAT can associate thousands of private NAT addresses with a small group of public IP address through the use of port addressing. PAT is used if the addressing requirements of your network exceed the available addresses in your dynamic NAT pool. **Note** When you select this option, Security Manager implicitly creates an additional NAT rule for split-tunneled traffic on deployment. This NAT rule, which denies VPN-tunneled traffic and permits all other traffic (using the external interface as the IP address pool), is not reflected as a router platform policy. For information on creating or editing a dynamic NAT rule as a router platform policy, see NAT Page: Dynamic Rules , on page 1027.

Configuring VPN Global General Settings

Use the General Settings tab of the VPN Global Settings page to define fragmentation settings including maximum transmission unit (MTU) handling parameters for site-to-site and remote access VPNs.

Fragmentation breaks a packet into smaller units when it is transmitted over a physical interface that cannot support the original size of the packet. Fragmentation minimizes packet loss in a VPN tunnel, because it enables transmission of secured packets that might otherwise be too large to transmit. This is particularly relevant when using GRE, because any packet of more than 1420 bytes will not have enough room in its header for the additional 80 bytes that the combined use of IPsec and GRE adds to the packet payload.

The maximum transmission unit (MTU) specifies the maximum packet size, in bytes, that an interface can handle. If a packet exceeds the MTU, it is fragmented, typically after encryption. If the DF (Do Not Fragment) bit is set, the packet is dropped. A DF bit is a bit within the IP header that indicates if a device can fragment a packet. You must specify whether the device can clear, set, or copy the DF bit from the encapsulated header.

Because reassembly of an encrypted packet is difficult, fragmentation can degrade network performance. To prevent network performance problems, you can select **Enable Fragmentation Before Encryption** so that fragmentation occurs before encryption.

Navigation Path

- For remote access VPNs, do one of the following:
  - (Device View) Select **Remote Access VPN > Global Settings** from the Policy selector. Click the **General Settings** tab.
  - (Policy View) Select **Remote Access VPN > Global Settings** from the Policy Type selector. Select an existing policy or create a new one, then click the **General Settings** tab.
- For site-to-site VPNs, do one of the following:
  - Open the Site-to-Site VPN Manager Window , on page 1093, select a topology in the VPNs selector, then select **VPN Global Settings** in the Policies selector. Click the **General Settings** tab.
  - (Policy view) Select **Site-to-Site VPN > VPN Global Settings** from the Policy Types selector. Select an existing shared policy or create a new one, then click the **General Settings** tab.

Related Topics

- Configuring VPN Global Settings , on page 1180

Field Reference

Table 345: VPN Global Settings Page, General Settings Tab

Element	Description
Fragmentation Settings	

Element	Description
Fragmentation Mode Local MTU Size	Supported on Cisco IOS routers and Catalyst 6500/7600 devices. Fragmentation minimizes packet loss in a VPN tunnel when packets are transmitted over a physical interface that cannot support the original size of the packet. Select the fragmentation mode: • **No Fragmentation**—Do not fragment before IPsec encapsulation. After encapsulation, the device fragments packets that exceed the MTU setting before transmitting them through the public interface. • **End to End MTU Discovery**—Use ICMP messages to determine the maximum MTU. Use this option with IPsec VPNs. End-to-end MTU discovery uses Internet Control Message Protocol (ICMP) messages to determine the maximum MTU that a host can use to send a packet through the VPN tunnel without causing fragmentation. The MTU setting for each link in a transmission path is checked to ensure that no transmitted packet exceeds the smallest MTU in that path. The discovered MTU is used to decide whether fragmentation is necessary. If ICMP is blocked, MTU discovery fails and packets are either lost (if the DF bit is set) or fragmented after encryption (if the DF bit is not set). **Note** (Site-to-site VPNs) For Catalyst 6500/7600 devices, end-to-end path MTU discovery is supported only on images 12.2(33)SRA, 12.2(33)SRB, 12.2(33)SXH, 12.2(33)SXI or above. • **Local MTU Handling**—Set the MTU locally on the devices. This option is typically used when ICMP is blocked or in site-to-site IPsec/GRE VPNs. If you select this option, specify the local MTU size, which can be between 68 and 65535 bytes depending on the VPN interface.
DF Bit	Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices. A Do Not Fragment (DF) bit within an IP header determines whether a device is allowed to fragment a packet. Select how to handle the DF bit: • **Copy**—Copy the DF bit from the encapsulated header in the current packet to all the device's packets. If the packet's DF bit is set to fragment, all future packets are fragmented. This is the default option. • **Set**—Set the DF bit in the packet you are sending. A large packet that exceeds the MTU is dropped and an ICMP message is sent to the packet's initiator. • **Clear**—Fragment packets regardless of the original DF bit setting. If ICMP is blocked, MTU discovery fails and packets are fragmented only after encryption.

Element	Description
Enable Fragmentation Before Encryption	Supported on Cisco IOS routers, Catalyst 6500/7600 devices, PIX 7.0+ and ASA devices. When selected, enables fragmentation to occur before encryption if the expected packet size exceeds the MTU. Look ahead Fragmentation (LAF) is used before encryption takes place to calculate the packet size that would result after encryption, depending on the transform sets configured on the IPsec SA. If the packet size exceeds the specified MTU, the packet will be fragmented before encryption.
Enable Notification on Disconnection	Supported on ASA and PIX 7.0+ devices. When selected, enables the device to notify qualified peers of sessions that are about to be disconnected. The peer receiving the alert decodes the reason and displays it in the event log or in a pop-up window. This feature is disabled by default. IPsec sessions might be dropped for several reasons, such as a security appliance shutdown or reboot, session idle timeout, maximum connection time exceeded, or administrator cut-off.
Enable Split Tunneling (Site-to-site VPN only.)	When selected (the default), enables you to configure split tunneling in your site-to-site VPN topology. Split tunneling allows you to transmit both secured and unsecured traffic on the same interface. Split tunneling requires that you specify exactly which traffic will be secured and what the destination of that traffic is, so that only the specified traffic enters the IPsec tunnel, while the rest is transmitted unencrypted across the public network.
Enable Spoke-to-Spoke Connectivity through the Hub	Supported on ASA and PIX 7.0+ devices. When selected, enables direct communication between spokes in a hub-and-spoke VPN topology in which the hub is an ASA or PIX 7.0+ device.
Enable Default Route	Supported on Cisco IOS routers and Catalyst 6500/7600 devices. When selected, the device uses the configured external interface as the default outbound route for all incoming traffic.
Do not reboot until all the sessions are terminated (ASA)	Select this option if you want the ASA to postpone a scheduled reboot until all active sessions terminate. This feature is disabled by default. **Note** The **crypto isakmp reload-wait** command in ASA software is supported only in System context for ASA devices that are on multiple context mode. However, since System context is not supported on VPN configurations, Security Manager does not generate this command for devices in VPN configuration, that are on multiple context mode. You must use the FlexConfig policies in System context for the **crypto isakmp reload-wait** command to work on devices that are on multiple context mode. FlexConfig policies allow you to configure device commands that are not otherwise supported by Security Manager. For more information, see Managing Flexconfigs, on page 341.

Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs

If you want to use preshared key as your authentication method for IKEv1 negotiations, you must define a shared key for each tunnel between two peers that will be their shared secret for authenticating the connection. The key will be configured on each peer. If the key is not the same on both peers of the tunnel, the connection cannot be established. The peer addresses that are required for configuring the preshared key are deduced from the VPN topology.

Tip You can also use preshared keys for IKEv2 negotiations, but the configuration is different from the one used for IKEv1, as are the rules and requirements. For information on configuring preshared keys for IKEv2 negotiations, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

Preshared keys are configured on spokes. In a hub-and-spoke VPN topology, Security Manager mirrors the spoke's preshared key and configures it on its assigned hub, so that the key on the spoke and hub are the same. In a point-to-point VPN topology, you must configure the same preshared key on both peers. In a full mesh VPN topology, any two devices that are connected must have the same preshared key.

In a preshared key policy, you can use a specific key, or you can use automatically generated keys for peers participating in each communication session. Using automatically generated keys (the default method) is preferred, because security can be compromised if all connections in a VPN use the same preshared key.

Beginning with 4.16, Cisco Security Manager does not support IKEv1 related configuration for Firepower 9300 devices with distributed mode.

While discovering a VPN topology, where one of the devices is in cluster distributed mode (IKEv2 configured), and other is a non-cluster mode (IKEv1 and IKEv2 configured), Cisco Security Manager does not display any error. However, during preview config, the activity validation error is displayed to remove IKEv1 related configuration.

There are three methods for negotiating key information and setting up IKE security associations (SAs):

- Main mode address—Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. This is the default negotiation method.

This method has three options for creating keys:

- You can create a key for each peer, based on the unique IP address of each peer, providing high security.
- You can create a group preshared key on a hub in a hub-and-spoke VPN topology, to be used for communication with any device in a specified subnet. Each peer is identified by its subnet, even if the IP address of the device is unknown. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers.
- You can create a wildcard key on a hub in a hub-and-spoke VPN topology, or on a group containing hubs, to be used for dynamic crypto where a spoke does not have a fixed IP address or belong to a specific subnet. All spokes connecting to the hub have the same preshared key, which could compromise security. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers.

Note If you are configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.

- Main mode fully qualified domain name (FQDN)—Negotiation is based on DNS resolution, with no reliance on IP address. This option can only be used if the DNS resolution service is available for the host. It is useful when managing devices with dynamic IP addresses that have DNS resolution capabilities.
- Aggressive mode—Negotiation is based on hostname (without DNS resolution) and domain name. Aggressive mode is less secure than main mode. However, it provides more security than using group preshared keys if the IP address of the VPN interface on the host is unknown, and the FQDN of the dynamic IP peer is not DNS resolvable. This negotiation method is recommended for use with a GRE Dynamic IP or DMVPN failover and routing policy.

- Configuring IKEv1 Preshared Key Policies , on page 1198

Configuring IKEv1 Preshared Key Policies

Use the IKEv1 Preshared Key page to define the preshared key configuration when using IKEv1 in a site-to-site VPN topology. For information on configuring preshared keys when using IKEv2, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

Note The preshared key policy does not apply to Easy VPN topologies.

Note Beginning with 4.16, Cisco Security Manager does not support IKEv1 preshared key configuration for Firepower 9300 devices with distributed mode.

To open the IKEv1 Preshared Key page:

- (Site-to-Site VPN Manager Window , on page 1093) Select a topology in the VPNs selector, then select **IKEv1 Preshared Key** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Preshared Key** from the Policy Types selector. Select an existing shared policy or create a new one.

The following table explains the settings you can configure in this policy.

Table 346: IKEv1 Preshared Key Page

Element	Description
Key Specification Select whether to manually define the key (User Defined) or to have the key automatically generated. There are additional options you can configure when using auto generated keys.	
User Defined	When selected, enables you to use a manually defined preshared key. Enter the required preshared key in the **Key** field, then enter it again in the **Confirm** field.
Auto Generated	When selected, allocates a random key to the participating peers. This ensures security because a different key is generated for every hub-spoke connection. Auto Generated is the default selection. Auto generated is not a useful option when you do not manage all nodes in the VPN, for example, in the case of an Extranet VPN. **Note** The key is allocated during the first deployment to the devices and is used in all subsequent deployments to the same devices, until you select the Regenerate Key (Only in Next Deployment) check box.
Key Length	The required length of the preshared key to be automatically generated, from 1 to 127. The default is 24.
Same Key for All Tunnels	Unavailable in a point-to-point VPN topology. When selected, enables you to use the same auto-generated key for all tunnels. **Note** If you do not select this option, different keys are used for the tunnels, except in cases, such as DMVPN configuration, when different multipoint GRE interfaces in the same network must use the same preshared key.
Regenerate Key (Only in Next Deployment)	When selected, enables Security Manager to generate a new key for the next deployment to the devices. This is useful if it is possible that the secrecy of the keys might be compromised. When you submit the job for deployment, this check box is cleared. It does not remain selected because the new key will only be generated for the upcoming deployment, and not for subsequent deployments (unless you select it again).
Negotiation Method Select the type of negotiation method. The methods are explained in more detail in Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs , on page 1197.	

Element	Description
Main Mode Address	Use this negotiation method for exchanging key information if the IP address of the devices is known. Negotiation is based on IP address. Main mode provides the highest security because it has three two-way exchanges between the initiator and receiver. Main mode address is the default negotiation method. Select one of the following options to define the negotiation address type: • **Peer Address**—Negotiation is based on the unique IP address of each peer. A key is created for each peer, providing high security. This is the default. • **Subnet**—Creates a group preshared key on a hub in a hub-and-spoke topology to use for communication with any device in a specified subnet, even if the IP address of the device is unknown. Each peer is identified by its subnet. In a point-to-point or full mesh VPN topology, a group preshared key is created on the peers. Enter the subnet in the field provided, for example, 10.10.10.0/24. • **Wildcard**—Creates a wildcard key on a hub or on a group of hubs in a hub-and-spoke topology to use when a spoke does not have a fixed IP address or belong to a specific subnet. In this case, all spokes connecting to the hub have the same preshared key, which could compromise security. Use this option if a spoke in your hub-and-spoke VPN topology has a dynamic IP address. In a point-to-point or full mesh VPN topology, a wildcard key is created on the peers. **Note** When configuring DMVPN with direct spoke-to-spoke connectivity, you create a wildcard key on the spokes.
Main Mode FQDN	Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution is available for the devices. Negotiation is based on DNS resolution, with no reliance on IP address.
Aggressive Mode	Available only in a hub-and-spoke VPN topology. Select this negotiation method for exchanging key information if the IP address is not known and DNS resolution might not be available on the devices. Negotiation is based on hostname and domain name. **Note** If direct spoke to spoke tunneling is enabled, you cannot use aggressive mode.

Understanding Public Key Infrastructure Policies

Security Manager supports IPsec configuration with Certification Authority (CA) servers that manage certificate requests and issue certificates to devices in your VPN topology. You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and manage keys and certificates, providing centralized key management for the participating devices.

CA servers, also known as trustpoints, manage public CA certificate requests and issue certificates to participating IPsec network devices. When you use Certificates as the authentication method for IKE and IPsec proposal policies, peers are configured to obtain digital certificates from a CA server. With a CA server, you do not have to configure keys between all the encrypting devices. Instead, you individually enroll each participating device with the CA server, which is explicitly trusted to validate identities and create a digital certificate for the device. When this has been accomplished, each participating peer can validate the identities of the other participating peers and establish encrypted sessions with the public keys contained in the certificates.

CAs can also revoke certificates for peers that no longer participate in an IPsec VPN topology. Revoked certificates are either managed by an Online Certificate Status Protocol (OCSP) server or are listed in a certificate revocation list (CRL) stored on an LDAP server, which each peer can check before accepting a certificate from another peer.

PKI enrollment can be set up in a hierarchical framework consisting of multiple CAs. At the top of the hierarchy is a root CA, which holds a self-signed certificate. The trust within the entire hierarchy is derived from the RSA key pair of the root CA. Subordinate CAs within the hierarchy can enroll with either the root CA or with another subordinate CA. Within a hierarchical PKI, all enrolled peers can validate each other's certificate if the peers share a trusted root CA certificate or a common subordinate CA.

Keep the following in mind:

- PKI policies can be configured on Cisco IOS routers running version 12.3(7)T and later, PIX Firewalls, and Adaptive Security Appliance (ASA) devices for site-to-site and remote access VPNs.
- In site-to-site VPNs, you use the IKEv1 Public Key Infrastructure policy to identify CA servers for IKEv1 negotiations only. For IKEv2 negotiations, you identify the CA servers in the IKEv2 Authentication policy as described in Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.
- To save the RSA key pairs and the CA certificates between reloads permanently to Flash memory on a PIX Firewall release 6.3, you must configure the **ca save all** command. You can do this manually on the device or using a FlexConfig.

CA Server Authentication Methods

You can authenticate the CA server using one of the following methods:

- Using the Simple Certificate Enrollment Protocol (SCEP) to retrieve the CA's certificates from the CA server. Using SCEP, you establish a direct connection between your device and the CA server. Be sure your device is connected to the CA server before beginning the enrollment process. Because this method of retrieving CA certificates for routers is interactive, you can deploy your PKI policy to live devices only, not to files.

Note When using SCEP, you must enter the fingerprint for the CA server. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. You can obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: **http://<URLHostName>/certsrv/mscep/mscep.dll**.

- Manually creating an enrollment request that you can submit to a CA server offline, by copying the CA server's certificates from another device.

Use this method if your device cannot establish a direct connection to the CA server or if you want to generate an enrollment request and send it to the server at a later time.

Note This method enables you to deploy the PKI policy either to devices or to files.

For more information, see PKI Enrollment Dialog Box , on page 1208.

Note You can also use Cisco Secure Device Provisioning (SDP) to enroll for a certificate for a router. For more information about using SDP for certificate enrollment, see Secure Device Provisioning on Cisco IOS Routers , on page 2471.

The following topics explain Public Key Infrastructure configuration in more detail:

Requirements for Successful PKI Enrollment

The following are prerequisites for configuring a PKI policy in your network:

- For IKEv1, the IKE proposal must specify Certificate for the IKE authentication method. See Configuring IKEv1 Proposal Policy Objects , on page 1160.
- The domain name must be defined on the devices for PKI enrollment to be successful (unless you specify the CA server nickname).
- To enroll with the CA server directly, you must specify the server's enrollment URL.
- To enroll with the CA server by means of a TFTP server, you must ensure that the CA certificates file is saved to the TFTP server. After deployment of the PKI policy, you must copy the certificate request from your TFTP server to the CA server.
- You may specify an RSA public key to use in the enrollment request. If you do not specify an RSA key pair, the Fully Qualified domain Name (FQDN) key will be used.

If using RSA keys, once the certificate has been granted, the public key is included in the certificate so that peers can use it to encrypt data sent to the device. The private key is kept on the device and used to decrypt data sent by peers, and to digitally sign transactions when negotiating with peers. You can use an existing key pair or generate a new one. If you want to generate a new key pair to use in the certificate for router devices, you must also specify the modulus to determine the size of the key.

For more information, see PKI Enrollment Dialog Box—Enrollment Parameters Tab , on page 1214.

- If you are making a PKI enrollment request on a Cisco Easy VPN IPsec remote access system, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment Editor dialog box.

Note You do not need to configure the name of the user group on the hub (Easy VPN server).

For more information, see PKI Enrollment Dialog Box—Certificate Subject Name Tab , on page 1217.

- To deploy PKI policies to files (not to live devices), the following prerequisites must be met:
  - Routers must run Cisco IOS Software 12.3(7)T or later.
  - CA authentication certificates must be cut and pasted into the Security Manager user interface (so that CA authentication is not interactive and does not require communication with the live device).
- If you are deploying to live devices, the PKI server must be online.
- Security Manager supports the Microsoft, Verisign, and Entrust PKIs.
- Security Manager supports Cisco IOS Certificate Servers. The Cisco IOS Certificate Server feature embeds a simple certificate server, with limited CA functionality, into the Cisco IOS software. An IOS Certificate Server can be configured as a FlexConfig policy. For more information, see Managing Flexconfigs, on page 341.
- To configure PKI with AAA authorization that uses the entire subject name on an IOS router, use the predefined FlexConfig object named IOS_PKI_WITH_AAA.

Prerequisites for PKI Enrollment Using TFTP

If you do not have constant direct access to the CA server, you can enroll using TFTP if your devices are routers running Cisco IOS Software 12.3(7)T or later.

On deployment, Security Manager generates the corresponding CA trustpoint command and authenticate command. The trustpoint command is configured with the enrollment URL tftp://<certserver> <file_specification> entry to retrieve the CA certificate using TFTP. If file_specification is not specified, the FQDN of the router is used.

Before using this option, you must make sure that the CA certificates file (.ca) is saved on the TFTP server. To do this, use this procedure:

1. Connect to http://servername/certsrv, where servername is the name of the Windows 2000 web server on which the CA you want to access is located.
2. Select **Retrieve the CA certificate or certificate revocation list**, then click **Next**.
3. Select **Base64 encoded**, then click **Download CA certificate**.
4. Save the .crt file as a .ca file on the TFTP server using your browser's Save As function.

After deployment, you must transfer the certificate request generated by Security Manager on the TFTP server to the CA, and then transfer the device's certificates from the CA to the device.

Transferring the Certificate Request from the TFTP Server to the CA Server

Security Manager creates a PKCS#10 formatted enrollment request (.req) on the TFTP server. You must transfer it to the PKI server using this procedure:

1. Connect to http://servername/certsrv, where servername is the name of the Windows 2000 web server where the CA you want to access is located.

2. Select **Request a certificate**, then click **Next**.
3. Select **Advanced request**, then click **Next**.
4. Select **Submit a certificate request using a base64 encoded PKCS #10 file or a renewal request using a base64 encoded PKCS #7 file**, then click Next.
5. Either select browse for a file (and browse to the TFTP server and select the .req file) or open the just received by TFTP .req file with WordPad/Notepad and copy/paste the contents in the first window.
6. Export the .crt file from the CA and put it on the TFTP server.
7. Configure the 'crypto ca import <label> certificate' to import the device's certificates from the tftp server.

Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to the participating devices in your VPN topology.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see Understanding Public Key Infrastructure Policies , on page 1200.

This procedure describes how to specify the CA server that will be used to create an IKEv1 Public Key Infrastructure (PKI) policy in your VPN topology.

Tip For information on specifying CA servers for use in IKEv2 negotiations, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

Before You Begin

For important information about successfully configuring PKI, see Requirements for Successful PKI Enrollment , on page 1202.

Related Topics

- Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs , on page 1205
- Deciding Which Authentication Method to Use , on page 1157
- Filtering Items in Selectors , on page 47

Step 1 Do one of the following:

- (Site-to-Site VPN Manager Window , on page 1093) Select an existing topology and then select **IKEv1 Public Key Infrastructure** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKEv1 Public Key Infrastructure**, and then select an existing policy or create a new one.

The Public Key Infrastructure page opens, displaying the currently selected CA server, if any, in the **Selected** field.

Step 2 Select the PKI enrollment policy object that defines the desired CA server in the Available CA Servers list. You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see PKI Enrollment Dialog Box , on page 1208.
- To change the configuration of an existing object, select it and click the **Edit (pencil)** button.

Note If you are making a PKI enrollment request on an Easy VPN topology, you must configure each remote component (spoke) with the name of the user group to which it connects. You specify this information in the Organization Unit (OU) field in the Certificate Subject Name tab of the PKI Enrollment dialog box. You do not need to configure the name of the user group on the hub (Easy VPN server). For more information, see PKI Enrollment Dialog Box—Certificate Subject Name Tab , on page 1217.

Defining Multiple IKEv1 CA Servers for Site-to-Site VPNs

You can select only one CA server when defining an IKEv1 Public Key Infrastructure (PKI) policy on a site-to-site VPN. This creates a problem when the devices in the VPN enroll with different CA servers when using IKEv1. For example, the spoke devices might enroll with a different CA server than the hub, or the spokes in one part of the VPN might enroll with a different CA server than the spokes in another part of the VPN.

Tip When using IKEv2, you can configure different CA servers for various devices by creating overrides for the IKEv2 Authentication policy global settings rather than creating device-level overrides for PKI enrollment policy objects. However, you can also use device-level overrides for IKEv2 as described in this topic. For information on configuring CA servers for IKEv2, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

To define an IKEv1 PKI policy, you select a PKI enrollment object that specifies the CA server to which the devices should enroll. Although by default the policy object refers globally to a single CA server, you can use device-level overrides to have the object refer to a different CA server on selected devices.

For example, if PKI enrollment object PKI_1 refers to a CA server named CA_1, you can create a device-level override for selected devices that has PKI_1 refer to a different CA server, for example, CA_2. Theoretically, you can use overrides to define a different CA server for each device in the VPN.

This procedure describes the basic steps for creating overrides for PKI enrollment objects.

Note You can also use device-level overrides when the CA servers are arranged in a PKI hierarchy beneath a common, trusted CA server. To do this, you must ensure that both the global definition of the object and the device-level override specify the trusted CA server in the Trusted CA Hierarchy tab of the PKI Enrollment dialog box. See PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab , on page 1218.

Related Topics

- Understanding Public Key Infrastructure Policies , on page 1200
- Deciding Which Authentication Method to Use , on page 1157

Step 1 To create the PKI enrollment object, open the PKI Enrollment dialog box. You can access this dialog box in two ways:

- From the Public Key Infrastructure policy—Click the **Create (+)** button beneath the Selected field. See Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204.
- From the Policy Object Manager (select **Manage > Policy Objects**)—Select PKI Enrollments from the Object Type selector, then click the **New Object (+)** button.

Step 2 Define the global definition of the PKI enrollment object, including the CA server to which the object refers. Be sure to select **Allow Value Override per Device**. This option makes the object overridable on individual devices. See PKI Enrollment Dialog Box , on page 1208.

Base the global definition of the object on the CA server that is used by the most devices in the VPN. Doing this reduces the number of device-level overrides that are required.

Step 3 When you finish defining the PKI enrollment object, click **OK**. As a result:

- If you accessed the dialog box through the PKI policy, the new object appears in the Selected field of the policy page.
- If you accessed the dialog box using the Policy Object Manager, the new object appears in the work area of the Policy Object Manager window. A green check mark in the Overridable column indicates that device-level overrides can be created for this object. (The check mark does not indicate whether any overrides actually exist.)

Step 4 Create the device-level overrides for the PKI enrollment object. You can do this in one of two ways:

- From Device Properties (with the device selected in Device view, select **Tools > Device Properties**)—This option is recommended when you want to create a device-level override for a single device. In the device properties, select **Policy Object Overrides > PKI Enrollments**, select the PKI enrollment object that you want to override, then click the **Create Override** button. You can then define the content of the override, including the CA server defined by the object.

For more information, see Creating or Editing Object Overrides for a Single Device , on page 248.

- From the Policy Object Manager—This option is recommended when you want to create a device-level override for multiple devices at the same time. Double-click the green check mark in the Overridable column, select the devices to which the override should apply, then define the content of the override, including the CA server defined by the object.

For more information, see Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248.

Configuring Public Key Infrastructure Policies for Remote Access VPNs

You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN.

In Security Manager, CA servers are predefined as PKI enrollment objects that you can use in your PKI policies. A PKI enrollment object contains the server information and enrollment parameters that are required for creating enrollment requests for CA certificates.

For more information about Public Key Infrastructure policies, see Understanding Public Key Infrastructure Policies , on page 1200.

Note Beginning with version 4.12, Security Manager provides support for Public Key Infrastructure policy for ASA multi-context devices running the software version 9.5(2) or later.

This procedure describes how to specify the CA servers that will be used to create a Public Key Infrastructure (PKI) policy in your remote access VPN.

Before You Begin

Keep the following in mind:

- For important information about successfully configuring PKI, see Requirements for Successful PKI Enrollment , on page 1202.
- The **IKE Proposal** policy for IPsec remote access VPNs should use an IKE Proposal object that requires certificate authorization when configuring IKEv1.
- For remote access VPNs defined on an ASA or PIX 7.x+ device, be aware that the Public Key Infrastructure policy is directly related to the following policies. Any trustpoints defined in these policies must also be selected in the Public Key Infrastructure policy; they are not automatically added to the policy. You might want to first configure these policies to determine which PKI enrollment objects are required in your remote access VPNs.
  - **Connection Profiles**—When you create a IPsec connection profile for which CA trustpoints should be used, you select the PKI enrollment object that identifies the trustpoint on the IPsec tab.
  - **SSL VPN Access**—You can configure trustpoints for each interface and also a fallback trustpoint.
  - **Global Settings, IKEv2 Settings tab**—For IKEv2 IPsec, you must specify a global trustpoint.

Related Topics

- Deciding Which Authentication Method to Use , on page 1157
- Filtering Items in Selectors , on page 47

Step 1 Do one of the following:

- (Device view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Public Key Infrastructure** from the Policy Type selector. Select an existing policy or create a new one.

The Public Key Infrastructure page opens, displaying the currently available and selected CA servers (PKI enrollment objects), if any.

Step 2 Select the PKI enrollment policy objects that define the desired CA servers in the Available CA Servers list and click >> to move them to the Selected CA Servers list. You can remove undesired objects by selecting them in the selected list and clicking <<.

Note When configuring IKEv2 in a Site-to-Site VPN, and choosing PKI as the authentication method, you are required to specify the object name that must be listed here, under Selected CA Servers (see Step 2 of Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219). Hence, ensure that you include the required CA Servers in the Selected CA Servers list.

For ASA and PIX 7.x+ devices, the list of selected PKI enrollment objects must include all objects that are specified in the connection profiles defined for the remote access VPN. For more information on connection profiles, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331. Also, any trustpoints configured for IKEv2 on the Global Settings policy must be included; see Configuring VPN Global IKEv2 Settings , on page 1187.

You can do the following to modify the listed objects:

- To add a new PKI enrollment object, click the **Create (+)** button below the list of available servers. The Add PKI Enrollment dialog box opens. For detailed information about the attributes of a PKI enrollment object, see PKI Enrollment Dialog Box , on page 1208.
- To change the configuration of an existing object, select it in either list and click the **Edit (pencil)** button.

PKI Enrollment Dialog Box

Use the PKI Enrollment dialog box to view, create, copy, or edit Public-Key Infrastructure (PKI) enrollment objects. A PKI enrollment object represents an external certification authority (CA) server that responds to certificate requests from devices in the network.

You can create PKI enrollment objects to define the properties of a CA server used when devices exchange certificates as part of an IPsec network. When you create a PKI enrollment object, you define a name for the server and the URL for enrollment. You must specify whether the devices you wish to enroll with this server should retrieve the CA server's own certificate using the Simple Certificate Enrollment Process (SCEP) or use a certificate that you have entered manually into the device configuration. You must also select the method of support used by the CA server for revocation checking.

Note You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

In addition, you can optionally define the following:

- Whether the CA server is acting as a Registration Authority (RA) server.
- Enrollment parameters, including retry settings and RSA key pair settings.
- Additional attributes to include in the certificate request.
- The list of trusted CA servers located above this server in the PKI hierarchy.

Navigation Path

Select **Manage > Policy Objects**, then select **PKI Enrollments** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Tip You can also open this dialog box from the **Public Key Infrastructure** policy for remote access or site-to-site VPNs.

Field Reference

Table 347: PKI Enrollment Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
CA Information tab	Use this tab to enter settings related to the Certificate Authority server, its certificate, and its level of revocation checking support. For information on the specific settings, see PKI Enrollment Dialog Box—CA Information Tab , on page 1210.
Enrollment Parameters tab	Use this tab to enter settings related to PKI enrollment. For information on the specific settings, see PKI Enrollment Dialog Box—Enrollment Parameters Tab , on page 1214. **Note** You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

Element	Description
Certificate Subject Name tab	Use this tab to enter optional information to be included in the certificate, including subject attributes. For information on the specific settings, see PKI Enrollment Dialog Box—Certificate Subject Name Tab , on page 1217.
Trusted CA Hierarchy tab	Use this tab to define trusted CA servers that are arranged in a hierarchical framework. For information on the specific settings, see PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab , on page 1218.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

PKI Enrollment Dialog Box—CA Information Tab

Use the CA Information tab of the PKI Enrollment dialog box to:

- Define the name and location of the external certificate authority (CA) server.
- Manually paste the certificate, if known.
- Define the server's level of support for revocation checking.

Navigation Path

Go to the PKI Enrollment dialog box and click the **CA Information** tab. For information on opening the dialog box, see PKI Enrollment Dialog Box , on page 1208.

- PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab , on page 1218

Field Reference

Table 348: PKI Enrollment Dialog Box—CA Information Tab

Element	Description
CA Server Nickname	The name used to identify the CA server in the certificate request. If you leave this field blank, the domain name is used. You must leave this field blank for Verisign CAs. Also, keep the following in mind: • You cannot configure two CA servers with the same name but different URLs on the same device. • The CA name cannot match the name of a trusted CA configured as part of the same PKI enrollment object (as defined on the PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab , on page 1218). • When the device is configured as part of a VPN, do not configure a device-level override that uses the same CA name as that of the CA server used by any of the peers. (This is not a problem when the device and its peers use a tiered PKI hierarchy.)
Enrollment Type	The type of enrollment you want to perform. Security Manager completes the enrollment only if you configure URL enrollment. If you select another type, you must complete the enrollment using your own methods. • Self-Signed Certificate (ASA only)—To configure the **enrollment self** command. • Terminal (ASA only)—To configure the **enrollment terminal** command. • URL—To configure the URL for the CA server so that you can complete automatic enrollment. • None—Do not configure any enrollment command.
Protocols	Specify whether you want to configure an SCEP CA URL or a CMP CA URL.
Enrollment URL (URL enrollment only.)	The URL of the CA server to which devices should attempt to enroll. The URL can be in the following formats: • SCEP—Uses an HTTP URL in the form of **http://CA_name:port**, where CA_name is the host DNS name or IP address of the CA server. The port number is mandatory. • TFTP—Uses the format **tftp://certserver/file_specification**. Use this option when you do not have direct access to the CA server. The TFTP server transfers certificate requests and certificates. • Other supported formats include: bootflash, cns, flash, ftp, null, nvram, rcp, scp, system. **Note** If the CA cgi-bin script location at the CA is not the default (/cgi-bin/pkiclient.exe), you must also include the nonstandard script location in the URL, in the form of **http://CA_name:port/script_location**, where script_location is the full path to the CA scripts.

Element	Description
CA Certificate Source Fingerprint Certificate (URL enrollment only.)	How to obtain the certificate: • **Retrieve CA Certificate Using SCEP** (the default)—Have the router retrieve the certificate from the CA server using the Simple Certificate Enrollment Process (SCEP). Enter the fingerprint for the CA server in hexadecimal format. If the value you enter does not match the fingerprint on the certificate, the certificate is rejected. Using the Fingerprint to verify the authenticity of the CA's certificate helps prevent an unauthorized party from substituting a fake certificate in place of the real one. **Tip** You can obtain the CA's fingerprint by contacting the server directly, or by entering the following address in a web browser: **http://URLHostName/certsrv/mscep/mscep.dll**. Using the fingerprint is supported only on Cisco IOS software releases 12.3(12) or later, 12.3(14)T or later, 12.4 or later (including 15.x), 12.2(33)XNA or later. • **Enter CA Certificate from CA Server Manually**—Copy and Paste up to three certificates from another device into the **Certificate** field (using your browser's Paste function or the Ctrl-V keyboard shortcut). Use this option when you want the PKI enrollment object to represent predefined certificates. Each certificate must begin with the word "certificate" and end with the word "quit".CMP authentication requires base 64 encoded CA certificate for authentication. For CMP, we can configure base 64 encoded CA certificate in this field. Copy and paste the base 64 encoded CA certificate from CA server and end with the word "quit". **Note** Enter the certificate details within the words,----BEGIN CERTIFICATE---- and ----END CERTIFICATE----.
CA Certificate Check	Certificates without the CA flag now cannot be installed on the ASA as CA certificates by default. The basic constraints extension identifies whether the subject of the certificate is a CA and the maximum depth of valid certification paths that include this certificate. Beginning with version 4.9, you can use Security Manager to configure the ASA to allow installation of these certificates if desired. This feature is supported only in devices running ASA software version 9.4(1) or later. CA Certificate check is enabled by default.

Element	Description
Revocation Check Support	The type of certificate revocation checking to be performed: • Checking Not Performed—This is the default. The device does not perform any revocation checking, even if a CRL is on the device. • CRL Check Required—The device must check a CRL. If no CRL exists on the device and the device cannot obtain one, certificates are rejected and a tunnel cannot be established. • OCSP Check Required—The device must check revocation status from an OCSP server. If this check fails, certificates are rejected. • CRL Check Attempted—The device tries to download the latest CRL from the specified LDAP server. If the download fails, however, certificates are accepted. • OCSP Check Attempted—The device tries to check revocation status from an OCSP server. If this fails, however, certificates are accepted. • CRL or OCSP Check Required—The device first checks for a CRL. If a CRL does not exist or cannot be obtained, the device tries to check revocation status from an OCSP server. If both options fail, certificates are rejected. • OCSP or CRL Check Required—The device first tries to check revocation status from an OCSP server. If this fails, the device checks for a CRL. If both options fail, certificates are rejected. • CRL and OCSP Checks Attempted—The device first checks for a CRL. If a CRL does not exist or cannot be obtained, the device tries to check revocation status from an OCSP server. If both options fail, however, certificates are accepted. • OCSP and CRL Checks Attempted—The device first tries to check revocation status from an OCSP server. If this fails, the device tries to download the latest CRL. If both options fail, however, certificates are accepted.
OCSP Server URL	The URL of the OCSP server checking for revocation if you require OCSP checks. This URL must start with **http://**
CRL Server URL	The URL of the LDAP server from which the CRL can be downloaded if you require CRL checks. This URL must start with **ldap://** **Note** You must include a port number in the URL when using this AAA server on ASA devices, otherwise LDAP will fail.
Enable Registration Authority Mode (PIX 6.3)	For PIX 6.3 devices, whether the CA server operates in RA (Registration Authority) mode. A Registration Authority is a server that acts as a proxy for the actual CA so that CA operations can continue when the CA server is offline. **Note** Cisco IOS routers configure RA mode automatically, if required.

PKI Enrollment Dialog Box—Enrollment Parameters Tab

Use the Enrollment Parameters tab of the PKI Enrollment dialog box to define the retry settings to use when the device contacts the CA server as well as the settings for generating the RSA key pair to associate with the certificate.

If the PKI enrollment object represents a Microsoft CA, you can define the challenge password required to validate the router's identity.

Note You do not have to define enrollment parameters in order to create or import a trustpoint in Security Manager.

Navigation Path

Go to the PKI Enrollment dialog box and click the **Enrollment Parameters** tab. For information on opening the dialog box, see PKI Enrollment Dialog Box , on page 1208.

Field Reference

Table 349: PKI Enrollment Dialog Box—Enrollment Parameters Tab

Element	Description
Challenge Password Confirm	The password used by the CA server to validate the identity of the device. This password is mandatory for PIX 6.3 devices, but optional for PIX/ASA 7.0+ devices and Cisco IOS routers. You can obtain the password by contacting the CA server directly or by entering the following address in a web browser: **http://URLHostName/certsrv/mscep/mscep.dll**. The password is good for 60 minutes from the time you obtain it from the CA server. Therefore, it is important that you deploy the password as soon as possible after you create it. **Note** Each password is valid for a single enrollment by a single device. Therefore, we do not recommend that you assign a PKI enrollment object where this field is defined to a VPN, unless you first configure a device-level override for each device in the VPN. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246.
Retry Period	The interval between certificate request attempts, in minutes. Values can be 1 to 60 minutes. The default is 1 minute.

Element	Description
Retry Count	The number of retries that should be made if no certificate is issued upon the first request. Values can be 1 to 100. The default is 10.
Certificate Auto-Enrollment (IOS devices only)	The percentage of the current certificate's lifetime after which the router requests a new certificate. For example, if you enter 70, the router requests a new certificate after 70% of the lifetime of the current certificate has been reached. Values range from 10% to 100%. If you do not specify a value, the router requests a new certificate after the old certificate expires.
Enable Auto-Enrollment	When enabled, certificates are automatically requested based on configurable triggers. The following specific parameters can also be further configured: • whether or not CMPv2 update will be used • when it will be triggered • whether the current key pair will be used or a new key pair will be generated
Certificate Auto-Enrollment (ASA 9.7.1 onwards)	The percentage of the current certificate's lifetime after which the router requests a new certificate. For example, if you enter 50, the router requests a new certificate after 50% of the lifetime of the current certificate has been reached. Values range from 10% to 99%. If you do not specify a value, the router requests a new certificate after the old certificate expires. **Note** The default value is 70%.
Auto Enroll Regenerate Key (ASA 9.7.1 onwards)	Select to generate a new key while renewing the certificate.
Regenerate Key Pair (ASA 9.7.1 onwards)	Select to regenerate a new key pair before enrolling the trustpoint request.
Shared Key (ASA 9.7.1 onwards)	Specify the user credentials obtained from the CA, out of band. This will be used by the CA and ASA to confirm the authenticity and integrity of the messages that they exchange. The key length cannot exceed 64 characters. **Note** The shared key must be in the format, 'reference: shared key'.
Signing Certificate (ASA 9.7.1 onwards)	Specify the name of the trust point that contains a previously issued device certificate to be used to sign the CMP enrollment request.
Note For the CMP protocol, options like Certificate, Shared Key or Signing Certificate will not be discovered, for security reasons. As a result, the PKI enrollment dialog will be creating a override on rediscovery.	

Element	Description
Key Pair	New key pairs will be automatically generated for all CMP manual and automatic enrollments. To support this, we the ability to configure key pair parameters in the trust point has been added. Select the algorithm - RSA or EDCSA, that should be used to generate the key pair. **Note** The RSA algorithm has the following modulus options: 1024| 2048| 4096| 512|768 and the EDCSA algorithm, has the following elliptic-curve options 256|384|521 to generate a key pair.
Include Device's Serial Number	Whether to include the serial number of the device in the certificate. **Tip** The CA uses the serial number to either authenticate certificates or to later associate a certificate with a particular device. If you are in doubt, include the serial number, as it is useful for debugging purposes.
RSA Key Pair Name (PIX 7.0+, ASA, IOS devices only.)	If the key pair you want to associate with the certificate already exists, this field specifies the name of that key pair. If the key pair does not exist, this field specifies the name to assign to the key pair that will be generated during enrollment. **Note** If you do not specify an RSA key pair, the fully qualified domain name (FQDN) key pair is used instead. On PIX and ASA devices, the key pair must exist on the device before deployment.
RSA Key Size (IOS devices only.)	If the key pair does not exist, defines the desired key size (modulus), in bits. If you want a modulus between 512 and 1024, enter an integer that is a multiple of 64. If you want a value higher than 1024, enter 1536 or 2048. The recommended size is 1024. **Note** The larger the modulus size, the more secure the key. However, keys with larger modulus sizes take longer to generate (a minute or more when larger than 512 bits) and longer to process when exchanged.
RSA Encryption Key Size (IOS devices only.)	The size of the second key, which is used to request separate encryption, signature keys, and certificates.

Element	Description
Source Interface (IOS devices and ASA 9.5(1) or later)	The source address for all outgoing connections sent to a CA or LDAP server during authentication, enrollment, and when obtaining a revocation list. This parameter may be necessary when the CA server or LDAP server cannot respond to the address from which the connection originated (for example, due to a firewall). If you do not define a value in this field, the address of the outgoing interface is used. Enter the name of an interface or interface role, or click **Select** to select it. If the object that you want is not listed, click the **Create** button to create it. **Note** Security Manager 4.9 supports separate routing table for Management traffic on devices running ASA 9.5(1) or later. This functionality enables to completely segregate management traffic from other data traffic on the ASA. Apart from IOS devices you can now select ASA devices running the software version 9.5(1) or later.

PKI Enrollment Dialog Box—Certificate Subject Name Tab

Use the Certificate Subject Name tab of the PKI Enrollment dialog box to optionally define additional information about the device in certificate requests sent to the CA server. This information is placed in the certificate and can be viewed by any party who receives the certificate from the router.

Enter all information using the standard LDAP X.500 format.

Navigation Path

Go to the PKI Enrollment dialog box and click the **Certificate Subject Name** tab. For information on opening the dialog box, see PKI Enrollment Dialog Box , on page 1208.

Field Reference

Table 350: PKI Enrollment Dialog Box—Certificate Subject Name Tab

Element	Description
Include FQDN	Whether to include the device's fully qualified domain name (FQDN) in the certificate request. The name is taken from the Hostname policy (ensure that you specify both the hostname and domain name in the policy to get a valid fully-qualified domain name). If you do not configure the Hostname policy, the name is derived from the display name for the device in Security Manager, *display_name***.null**, which is unlikely to give you the desired results.
Include Device's IP Address	The interface whose IP address is included in the certificate request. Enter the name of the interface or interface role, or click **Select** to select it. If the object that you want is not listed, click the **Create** button to create it.
Common Name (CN)	The X.500 common name to include in the certificate.
Organization Unit (OU)	The name of the organization unit (for example, a department name) to include in the certificate. **Note** When you configure PKI enrollment objects for Cisco Easy VPN Remote components, this field must contain the name of the client group to which the component connects. Otherwise, the component will not be able to connect. Although this information is not required for the Easy VPN Server, including it does not create configuration problems. For more information about Easy VPN, see Understanding Easy VPN , on page 1245.
Organization (O)	The organization or company name to include in the certificate.
Locality (L)	The locality to include in the certificate.
State (ST)	The state or province to include in the certificate.
Country (C)	The country to include in the certificate.
Email (E)	The email address to include in the certificate.

PKI Enrollment Dialog Box—Trusted CA Hierarchy Tab

Use the Trusted CA Hierarchy tab of the PKI Enrollment dialog box to define the trusted CA servers within an hierarchical PKI framework. Within this framework, all enrolled peers can validate each other's certificates if they share a trusted root CA certificate or a common subordinate CA.

Select the CA servers (as defined as PKI enrollment objects) to include in the hierarchy in the Available Servers list and click >> to move them to the selected list. You can do the reverse to remove servers.

If the PKI enrollment object you need is not yet defined, click the **Create (+)** button beneath the available servers list to create the object. You can also select an object and click the **Edit** button to change its definition, if needed.

Navigation Path

Go to the PKI Enrollment dialog box and click the **Trusted CA Hierarchy** tab. For information on opening the dialog box, see PKI Enrollment Dialog Box , on page 1208.

Configuring IKEv2 Authentication in Site-to-Site VPNs

When you configure IKE version 2 (IKEv2) in a site-to-site VPN, you must configure the IKEv2 Authentication policy to define authentication settings. Unlike IKEv1, authentication settings are not part of the IKEv2 proposal.

In Security Manager, when you configure IKEv2 authentication for a site-to-site VPN, you configure default settings that will be used in the VPN topology. You can then configure exceptions to the default, specifying different preshared keys or trustpoints for specific segments of the VPN. You can use a mixture of preshared keys and trustpoints, for example, configuring a global preshared key, but trustpoints for selected members of the VPN.

Configuring asymmetric authentication for IKEv2 tunnels

IKEv2 allows you to use asymmetric authentication, unlike IKEv1. This means that two peers can have different preshared keys, different trustpoints, or one peer could use a preshared key and the other peer could use a trustpoint. In Security Manager, you can configure asymmetric authentication by doing any of the following:

- On the Global IKEv2 Authentication Settings tab, you can configure different preshared keys if you elect to auto-generate keys and **do not** select the Same Keys for All Tunnels or the Same Key at Tunnel Endpoints option. A different preshared key is generated for each end of each tunnel.
- On the Override IKEv2 Authentication Settings tab, you can create overrides for the global settings. You add overrides that specify different keys or trustpoints for subsets of local and remote peers. Because you can create more than one override for a device or a specific tunnel, you can configure a set of preshared keys and trustpoints from which peers will authenticate.

Tip The IKEv2 Authentication policy is not a shared policy. You must configure the policy for each VPN topology in which you support IKEv2 negotiations. You cannot configure global IKEv2 authentication options for use by all of your VPN topologies. When using the Create VPN wizard, even if you elect to support IKEv2, the IKEv2 Authentication policy is never configured.

Before You Begin

The IKEv2 Authentication policy is used only if you enable IKEv2 in the VPN in the IKE Proposal and IPsec Proposal policies, and if at least some of the devices in the topology support IKEv2.

To configure IKEv2, the device must be an ASA running ASA Software release 8.4(1) or later. For more information on device support, see Understanding Devices Supported by Each IPsec Technology , on page 1083.

Tip If you support only IKEv2 in the topology, ensure that you unassign the IKEv1 Preshared Keys and IKEv1 Public Key Infrastructure policies to avoid validation warnings.

Related Topics

- Understanding IKE , on page 1153
- Deciding Which Authentication Method to Use , on page 1157

Step 1 Open the Site-to-Site VPN Manager Window , on page 1093, select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

For reference information on the policy, see IKEv2 Authentication Policy , on page 1221.

Step 2 On the **Global IKEv2 Authentication Settings** tab, configure the authentication type that should be used for devices in the VPN for which no override is configured on the Override IKEv2 Authentication Settings tab. Select the option that is used by most devices in the VPN. You can configure a global preshared key or trustpoint:

- **Global Preshared Keys**—To configure a global preshared key, select **Key Specification** and then configure one of the following options:
  - User Defined—Enter the desired global key and enter it again in the Confirm field.
  - Auto Generated—Enter the length of the key that should be generated and select whether you want to use the same key for all tunnels or the same key at both ends of a single tunnel. If you select neither of these options, unique keys are generated for every end point.

You can also select **Regenerate Key (On Next Deployment)** to have new keys generated. This allows you to periodically re-key the VPN. The check box is cleared after the next successful deployment.

- **Global Trustpoint (CA Servers)**—To configure trustpoint certificate authorization, select **PKI Specification** and enter the name of the PKI enrollment object that identifies the Certificate Authority (CA) server.

Note Ensure that you enter the same object name as deployed in the PKI policy (see Step 2 of Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207).

Click **Select** to select the object from a list or to create a new object.

- **Sign IKEv2 Authentication Payload with SHA1**—To enable SHA1 authentication on IKEv2 payload, select the check box. This option is available only from Cisco Security Manager 4.19 and for ASA 9.12(1) or later devices.

Step 3 If you want to override the global IKEv2 authentication configuration for specific devices, click the **Override IKEv2 Authentication Settings** tab and do any of the following:

- To add an override, click the **Add Row (+)** button and fill in the IKEv2 Authentication dialog box. You select the local and remote peers for which to create the override, and then specify the preshared key or CA server that should be used. See IKEv2 Authentication (Override) Dialog Box , on page 1223.
- To edit an override, select it in the table and click the **Edit Row (pencil)** button.

- To delete an override, select it in the table and click the **Delete Row (trash can)** button.

Note Override IKEV2 authentication settings are applicable for only Hub & Spoke VPN and Full Mesh VPN topologies.

Note You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. For more information, see IKEv2 Authentication (Override) Dialog Box , on page 1223.

IKEv2 Authentication Policy

Use the IKEv2 Authentication policy to configure the device authentication settings for Internet Key Exchange (IKE) version 2 in site-to-site VPNs. These settings apply to ASA 8.4(1)+ devices only. For more information about configuring IKEv2 authentication, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

The policy contains two tabs:

- Global IKEv2 Authentication Settings—The global settings apply to all devices in the VPN unless overrides are configured on the Overrides tab. Configure the global settings to represent the authentication scheme used by most devices in the VPN.
- Override IKEv2 Authentication Settings—The override settings apply unique authentication settings to specific tunnels, allowing you to create unique preshared key and trustpoint combinations that are required by various tunnels in the VPN. The settings you configure on this tab are used first and always take precedence over the global settings.

Navigation Path

Open the Site-to-Site VPN Manager Window , on page 1093, select a regular IPsec topology (that supports IKEv2) in the VPNs selector, then select **IKEv2 Authentication** in the Policies selector.

This policy is not available as a shared policy.

Field Reference

Table 351: IKEv2 Authentication Policy

Element	Description
Global IKEv2 Authentication Settings Tab	

Element	Description

Key Specification	Use a preshared key for authentication in the VPN. Configure one of the following:
	• **User Defined**—Enter the desired global key and enter it again in the Confirm field. The key can be 1 to 128 characters.
	• **Auto Generated**—Have Security Manager generate a key for you. Specify the following options to indicate how the key should be generated:
	  • **Key Length**—The length of the key that should be generated, from 1 to 128.
	  • **Same Keys for All Tunnels**—Select this option to generate the same keys for all tunnels in the VPN. If you do not select this option, different keys or pair of keys (if you select Same Key for Tunnel Endpoints) are used for each tunnel.
	  • **Same Key for Tunnel Endpoints**—Select this option to generate the same key on each end of each tunnel within the VPN. If you do not select this option, different keys are generated on each end of the tunnel.
	  • **Regenerate Key (On Next Deployment)**—Select this option to generate new keys for the next deployment to the devices. This allows you to easily re-key the VPN.
	
	After a successful deployment, this check box is cleared so that keys are not regenerated on the subsequent deployment. Select the option each time you want to re-key the VPN.

PKI Specification	The name of the PKI enrollment policy object that defines the trustpoint for IKEv2 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the PKI enrollment object or to create a new object.
Override IKEv2 Authentication Settings tab	The table lists the IKEv2 authentication overrides defined for the VPN. These policies take precedence over the preshared key/PKI configuration defined in the global settings. Do any of the following to configure overrides: • To add an override, click the **Add Row (+)** button and fill in the IKEv2 Authentication dialog box. You select the local and remote peers for which to create the override, and then specify the preshared key or CA server that should be used. See IKEv2 Authentication (Override) Dialog Box , on page 1223. • To edit an override, select it in the table and click the **Edit Row (pencil)** button. • To delete an override, select it in the table and click the **Delete Row (trash can)** button. **Note** You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. For more information, see IKEv2 Authentication (Override) Dialog Box , on page 1223

IKEv2 Authentication (Override) Dialog Box

Use the IKEv2 Authentication dialog box to configure overrides to the IKEv2 authentication global settings for a site-to-site VPN. For more information about IKEv2 global and override authentication settings, see Configuring IKEv2 Authentication in Site-to-Site VPNs , on page 1219.

Navigation Path

From the Override IKEv2 Authentication Settings tab of the IKEv2 Authentication policy (see IKEv2 Authentication Policy , on page 1221), click the **Add Row (+)** button or select an override in the table and click **Edit Row (pencil)**.

Field Reference

Table 352: IKEv2 Authentication Dialog Box

Element	Description
Local Peers Remote Peers	The local and remote sides of the tunnels for which you are defining this override. To add devices to the list, click the **Select** button to the right of the list to open the Local or Remote Peer Selection dialog box. In that dialog box, select the desired peers in the Available list and click >> to move them to the Selected list. You can deselect a device by doing the reverse (using the << button). The list of available devices includes only those devices that support IKEv2 connections, which might not be all of the devices in the VPN.
IKEv2 Authentication Mode	The IKEv2 authentication mode to use between the selected local and remote peers. Select one of the following: • Key Specification—A user-defined preshared key, from 1 to 128 characters. Enter the desired key and enter it again in the Confirm field. • PKI Specification—The name of the PKI enrollment policy object that defines the trustpoint for IKEv2 connections. Click **Select** to select the PKI enrollment object or to create a new object.

Configuring Asymmetric keys for IKEv2 Authentication

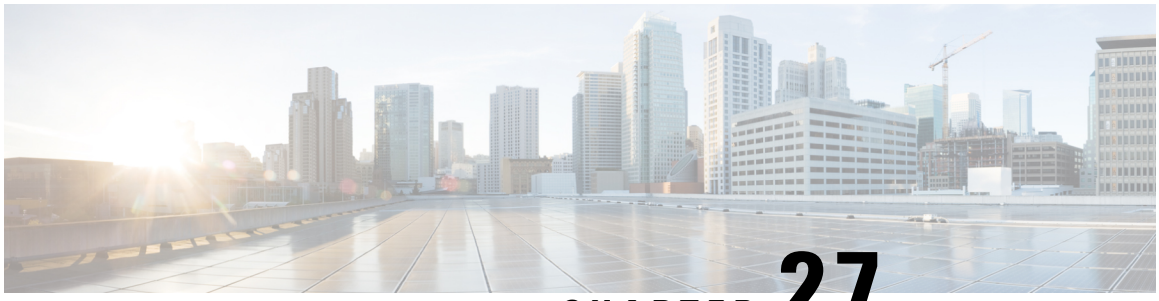
You can configure asymmetric authentication in site-to-site VPNs, where each side of a tunnel can have different preshared keys. To create asymmetric keys for IKEv2 authentication, for each peer device that is part of the site-to-site topology, you must add two rows on the Override IKEv2 Authentication Settings tab. Perform the following:

1. Click the **Override IKEv2 Authentication Settings** tab and then click the**Add Row (+)** button. The IKEv2 Authentication dialog box opens. On Peers specification, select the Local Peer device and the Remote Peer device that are part of the site-to-site VPN topology. On **IKEv2 Authentication Mode** select Key Specification and then specify a key and confirm. Security Manager considers this key as the local preshared key for the selected local peer device and the same key as the remote preshared key for the selected remote peer device. Click **OK** to return to the Override IKEv2 Authentication Settings tab.
2. With the **Override IKEv2 Authentication Settings** tab selected, click the **Add Row (+)** button. The IKEv2 Authentication dialog box opens. On Peers specification, for Local Peer, select the Remote Peer

device of Step 1 and for Remote Peer, select the Local Peer device of Step 1. On **IKEv2 Authentication Mode** select Key Specification and then specify a key and confirm. This key must be different from the key that you specified in Step 1.

The following table illustrates the configuration of asymmetric keys for IKEv2 authentication:

	Local Peer Device	**Remote Peer Device**	**Authentication method (Preshared Key)**
Add Row 1	Peer1	Peer2	test123
Add Row 2	Peer2	Peer1	sample123



CHAPTER 27

GRE and DM VPNS

You can configure Generic Routing Encapsulation (GRE) and Dynamic Multipoint (DM) VPNs that include GRE mode configurations. You can configure IPsec GRE VPNs for hub-and-spoke, point-to-point, and full mesh VPN topologies. DMVPN is available for hub-and-spoke topologies only.

This chapter contains the following topics:

Understanding the GRE Modes Page

Use the GRE Modes page to define the routing and tunnel parameters for IPsec tunneling with GRE, GRE Dynamic IP, and DMVPN policies.

The content of the policy differs depending on how you access it:

- (Site-to-Site VPN Manager Window , on page 1093) When you select a GRE VPN or DMVPN, the GRE Modes policy contains the properties related to the technology and technology type used in the VPN.
- (Policy view) When you select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy, there is an additional field in the policy called **GRE Method**. From the GRE Method list, you must select the VPN technology and technology type for which you are defining the policy: IPsec/GRE, GRE Dynamic IP, DMVPN, or Large Scale DMVPN. This option controls which fields are displayed in the policy. You cannot change the GRE Method after you save the policy.

When you assign a shared GRE Modes policy to a VPN, the GRE Method and the VPN's technology and type must match or the policy cannot be selected. For example, you cannot assign a shared DMVPN GRE Modes policy to an IPsec/GRE VPN.

The following topics describe the GRE Modes policy in detail based on the selected GRE Methods:

- IPsec/GRE or GRE Dynamic IP—See Configuring GRE Modes for GRE or GRE Dynamic IP VPNs , on page 1230.
- DMVPN or Large Scale DMVPN—See Configuring GRE Modes for DMVPN , on page 1237.

Note When configuring an IPsec/GRE, GRE Dynamic IP, or DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

GRE and Dynamic GRE VPNs

You can use Generic Routing Encapsulation (GRE) to create VPNs using Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

This section contains the following topics:

- Understanding GRE , on page 1226
- Configuring IPsec GRE VPNs , on page 1229
- Configuring GRE Modes for GRE or GRE Dynamic IP VPNs , on page 1230

Understanding GRE

Generic Routing Encapsulation (GRE) is a tunneling protocol that encapsulates a variety of protocol packet types inside IP tunnels, creating a virtual point-to-point connection to devices at remote points over an IP network. With this technology, GRE encapsulates the entire original packet with a standard IP header and GRE header before the IPsec process. Then, IPsec views the GRE packet as an unremarkable IP packet and performs encryption and authentication services, as dictated by the IKE negotiated parameters. Because GRE can carry multicast and broadcast traffic, it is possible to configure a routing protocol for virtual GRE tunnels. The routing protocol detects loss of connectivity and reroutes packets to the backup GRE tunnel, thus providing high resiliency.

For VPN resilience, a spoke must be configured with two GRE tunnels, one to the primary hub and the other to the backup hub. Both GRE tunnels are secured with IPsec: each one has its own IKE security association (SA) and a pair of IPsec SAs. An associated routing protocol automates the failover mechanism, transferring to the backup tunnel if virtual link loss is detected.

Note GRE can be configured on Cisco IOS security routers and Catalyst 6500/7600 devices in hub-and-spoke, point-to-point, and full mesh VPN topologies.

This section contains the following topics:

Advantages of IPsec Tunneling with GRE

The main advantages of IPsec tunneling with GRE are the following:

- GRE uses a routing protocol by which every IPsec peer knows the status of every other peer at all times.
- GRE provides higher resiliency than IKE keepalive.
- Spoke-to-spoke connectivity is supported when you use GRE.
- GRE supports multicast and broadcast transmissions.

Note GRE does not support the use of dynamic cryptographic tunnels.

How Does Security Manager Implement GRE?

Security Manager implements an additional Interior Gateway Protocol (IGP) solution for GRE. An IGP refers to a group of devices that receive routing updates from one another by a routing protocol, EIGRP, OSPF, or RIP. Each “routing group” is identified by a logical number. For general routing purposes, the interfaces on the routers in your networks belong to an IGP. Security Manager adds an additional IGP that is dedicated for IPsec and GRE-secured communication. This additional IGP is the secured IGP. The existing IGP (unsecured IGP), is used for routing traffic that does not require encryption.

For a GRE tunnel to be established, Security Manager configures a virtual interface on each device. These virtual interfaces are the endpoints of the GRE tunnel. Each virtual interface is unique. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from an interface that Security Manager creates. The GRE tunnel points to the source and destination IP addresses of either the physical or loopback interfaces on each device. The GRE virtual interfaces belong to the secured IGP, as do the inside interfaces. Routing updates within the secured IGP are GRE encapsulated and IPsec is applied. A flow whose destination is a secured interface (according to the routing updates of the secured IGP) is directed through the GRE interface where it is GRE encapsulated and then evaluated against the crypto ACL. If it matches the crypto ACL, it is routed through the GRE and VPN tunnels.

Prerequisites for Successful Configuration of GRE

Consider the following prerequisites before using GRE in your network:

- You must identify the inside interfaces on your devices—the physical interfaces on the device that connect the device with its internal subnets and networks.
- You must select a routing protocol (known as an IGP) or a static route, whenever you enable GRE.

Security Manager supports the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes.

- • EIGRP—Enhanced Interior Gateway Routing Protocol enables the exchange of routing information within an autonomous system and addresses some of the more difficult issues associated with routing in large, heterogeneous networks. Compared to other protocols, EIGRP provides superior convergence properties and operating efficiency, and combines the advantages of several different protocols. For more information, see EIGRP Routing on Cisco IOS Routers , on page 2573.

  • OSPF—Open Shortest Path First is a link-state, hierarchical protocol that features least-cost routing, multipath routing, and load balancing.

Using OSPF, a host that obtains a change to a routing table or detects a change in the network immediately multicasts the information to all other hosts in the network, so that all will have the same routing table information. For more information, see OSPF Routing on Cisco IOS Routers , on page 2585.

- • RIPv2—Routing Information Protocol is a distance-vector protocol that sends routing-update messages at regular intervals and whenever the network topology changes.

Using RIPv2, a gateway host (with a router) sends its entire routing table to its closest neighbor host every 30 seconds, which in turn passes the information on to its next neighbor, and so on, until all hosts within the network have the same knowledge of routing paths. RIPv2 uses a hop count to determine network distance. Each host with a router in the network uses the routing table information to determine the next host to route a packet to for a specified destination.

RIP is considered an effective solution for small homogeneous networks. For larger, more complicated networks, RIP's transmission of the entire routing table every 30 seconds may put a heavy amount of extra traffic in the network. For more information, see RIP Routing on Cisco IOS Routers , on page 2608.

- • Static route—Use a static routing policy to provide a robust, stable IPsec-protected GRE tunnel if there is a fixed, unchanging route between two devices. For each device subnet, a static route is created on the device pointing to the corresponding tunnel interface. For more information, see Static Routing on Cisco IOS Routers , on page 2617.

- You must specify an IGP process number. The IGP process number identifies the IGP process to which the inside interface on the device belongs. When GRE is implemented, this will be the secured IGP. For secure communication, the inside interfaces on the devices in your VPN must use the same IGP process. The IGP process number must be within a specified range. If you have an existing IGP process on the device that is within this range, but is different from the IGP process number specified in your GRE settings, Security Manager removes the existing IGP process. If the existing IGP process matches the one specified in your GRE settings, any networks included in the existing IGP process that do not match the specified inside interfaces are removed.
- If the inside interfaces on your devices are configured to use an IGP process other than the IGP process specified in your GRE settings (meaning that the interfaces belong to an unsecured IGP):
  - For spokes: Manually remove the inside interfaces from the unsecured IGP through the device CLI before configuring GRE.
  - For hubs: If the hub inside interface is used as a network access point for Security Manager, then on deployment, the interface is advertised in both secured and unsecured IGPs. To ensure that the spoke peers use only the secured IGP, manually add the auto-summary command for the unsecured IGP or remove the unsecured IGP for that inside interface.

- You must provide a subnet that is unique yet it can be non-globally-routable for loopback. This subnet must only be used to support the implementation of loopback for GRE. The loopback interfaces are created, maintained, and used only by Security Manager. You should not use them for any other purpose.
- If you are using static routes, not unsecured IGP, make sure you configure static routes on the spokes through to the hub inside interfaces.

Note You can configure the above settings in the GRE Modes page when IPsec/GRE is the selected IPsec technology.

Understanding GRE Configuration for Dynamically Addressed Spokes

When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke, to be used as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.

Note GRE Dynamic IP can only be configured on Cisco IOS routers and Catalyst 6500/7600 devices in hub-and-spoke VPN topologies.

Security Manager uses the Cisco Configuration Engine to retrieve device IP addresses and other information from dynamically addressed devices. Devices that have dynamic IP addresses connect to the Configuration Engine manager at periodic intervals to upgrade device configuration files and to pass device and status information.

For more information, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.

Note You can configure the GRE Dynamic IP settings in the GRE Modes page when GRE Dynamic IP is the selected IPsec technology.

Configuring IPsec GRE VPNs

To configure an IPsec GRE (generic routing encapsulation) VPN, use the Create VPN wizard as described in Creating or Editing Extranet VPNs , on page 1144. You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a hub-and-spoke VPN with dynamically addressed spokes, also see Understanding GRE Configuration for Dynamically Addressed Spokes , on page 1229.

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPSec settings, select **VPN Global Settings**. See Configuring VPN Global Settings , on page 1180.
- For IKE proposal policies, select **IKE Proposal**. See Configuring an IKE Proposal , on page 1158.
- For IPSec proposals, select **IPsec Proposal**. See Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172.
- For preshared key policies, select **IKEv1 Preshared Key**. See Configuring IKEv1 Preshared Key Policies , on page 1198.
- For public key (PKI) policies, select **Public Key Infrastructure**. See Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204.
- For Generic Routing Encapsulation configuration, select **GRE Modes**. See Configuring GRE Modes for DMVPN , on page 1237.

Configuring GRE Modes for GRE or GRE Dynamic IP VPNs

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a GRE or GRE Dynamic IP VPN.

To open the GRE Modes policy:

- (Site-to-Site VPN Manager Window , on page 1093) Select an IPsec/GRE or GRE Dynamic IP topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either IPsec/GRE or Dynamic GRE from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring IPsec tunneling with GRE or GRE Dynamic IP.

Note When configuring a GRE routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

Table 353: GRE Modes Page for GRE or GRE Dynamic IP VPNs

Element	Description
Routing Parameters Tab	
Routing Protocol	Select the required dynamic routing protocol (EIGRP, OSPF, or RIPv2,) or static route to be used for GRE or GRE Dynamic IP. The default routing protocol is EIGRP. For more information about configuring these protocols, see Prerequisites for Successful Configuration of GRE , on page 1227.
AS Number (EIGRP only.)	The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110. An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number.
Hello Interval (EIGRP only.)	The interval between hello packets sent on the interface, between 1 and 65535 seconds. The default is 5 seconds.
Hold Time (EIGRP only.)	The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is between 1 and 65535. The default hold time is 15 seconds (three times the hello interval).
Delay (EIGRP only.)	The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.
Failover Delay (EIGRP only.)	The throughput delay for the failover route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1500.
Bandwidth (EIGRP only.)	The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes. You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb. **Note** By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.
Failover Bandwidth (EIGRP only.)	The amount of bandwidth available to the failover route interface for the EIGRP packets. Enter a value in the range 1 to 10000000 kb. The default is 1000 kb.

Element	Description
Process Number (OSPF only.)	The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring GRE. The range is between 1 and 65535. The default is 110. Security Manager adds an additional Interior Gateway Protocol (IGP) that is dedicated for IPsec and GRE secured communication. An IGP refers to a group of devices that receive routing updates from one another by means of a routing protocol. Each "routing group" is identified by the process number. For more information, see Understanding GRE , on page 1226.
Hub Network Area ID (OSPF only.)	The ID number of the area in which the hub's protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 0.
Spoke Protected Network Area ID (OSPF only.)	The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can specify any number. The default is 1.
Authentication (OSPF or RIPv2 only.)	A string that specifies the OSPF or RIPv2 authentication key. The string can be up to eight characters long.
Cost (OSPF or RIPv2 only.)	The cost of sending a packet on the primary route interface. If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100. If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.
Failover Cost (OSPF or RIPv2 only.)	The cost of sending a packet on the secondary (failover) route interface. You can enter a value in the range 1-65535 for OSPF (the default is 125), or in the range 1-15 for RIPv2 (the default is 2).
Filter Dynamic Updates on Spokes	When selected, enables the creation of a redistribution list that filters all dynamic routing updates on the spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.
Tunnel Parameters Tab	

Element	Description
Tunnel IP	Select the required option to specify the GRE or GRE Dynamic IP tunnel interface IP address. • **Use Physical Interface**—When selected, uses the private IP address of the tunnel taken from the protected network. • **Use Subnet**—When selected, uses the tunnel IP address taken from an IP range. This is the default. In the Subnet field, enter the private IP address including the unique subnet mask (default is 1.1.1.0/24). If you are also configuring a dial backup interface, enter its subnet in the Dial Backup Subnet field provided (default is 1.1.2.0/24). **Note** In most cases, when you use a subnet to specify a GRE tunnel interface IP address, Security Manager creates a loopback interface on the device which is used for the tunnel IP address. If the device belongs to a VPN topology whose configurations were discovered by Security Manager, and you configure an IP address directly on the device's GRE tunnel, Security Manager keeps that configuration and does not create a loopback interface on the device. However, a loopback is always configured on a hub in a VPN topology; in a hub-and-spoke VPN topology with multiple hubs, a loopback interface is also configured on the spokes. • **Use Loopback Interface**—When selected, uses the tunnel IP address taken from an existing loopback interface. In the Role field, enter the name of the interface role object that defines the loopback interface name, or click **Select** to select it from a list or to create a new object. **Note** To view the new GRE tunnel or loopback interfaces in the Router Interfaces page, you must rediscover the device inventory details after successfully deploying the VPN to the device.
Configure Unique Tunnel Source for each Tunnel	When enabled, each GRE tunnel interface in the VPN is assigned a unique tunnel source. In the **Tunnel Source IP Range** field, enter a subnet IP to be used as tunnel sources. **Note** When enabled, this feature is set for all GRE tunnel interfaces in the VPN. If you want to assign a specific tunnel source for an interface, use the Peers policy to configure the endpoints for the desired devices; see Defining the Endpoints and Protected Networks , on page 1109.

Element	Description
Tunnel Source IP Range (GRE Dynamic IP only.)	The private IP address including the unique subnet mask that supports the loopback for GRE. The GRE tunnel interface has an IP address (inside tunnel IP address) which is taken from a loopback interface that Security Manager creates specifically for this purpose. When a spoke has a dynamic IP address, there is no fixed GRE tunnel source address (to be used by the GRE tunnel on the spoke side) or destination address (to be used by the GRE tunnel on the hub side). Therefore, Security Manager creates additional loopback interfaces on the hub and the spoke to use as the GRE tunnel endpoints. You must specify a subnet from which Security Manager can allocate an IP address for the loopback interfaces.
Enable IP Multicast	When selected, enables multicast transmissions across your GRE tunnels. IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.
Rendezvous Point	Only available if you selected the Enable IP Multicast check box. If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.

Dynamic Multipoint VPNs (DMVPN)

Dynamic Multipoint VPN (DMVPN) is a hub-and-spoke VPN technology that enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing.

This section contains the following topics:

Understanding DMVPN

Dynamic Multipoint VPN (DMVPN) enables better scaling of large and small IPsec VPNs by combining generic routing encapsulation (GRE) tunnels, IP Security (IPsec) encryption, and Next Hop Resolution Protocol (NHRP) routing. (For information about large scale DMVPNs, see Configuring Large Scale DMVPNs , on page 1241.)

Security Manager supports DMVPN using the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. In addition, On-Demand Routing (ODR) is supported. ODR is not a routing protocol. It may be used in a hub-and-spoke VPN topology when the spoke routers do not connect to any router other than the hub. If you are running dynamic protocols, ODR is not suitable for your network environment.

You can use DMVPN on a hub-and-spoke VPN topology only with devices running Cisco IOS Software release 12.3T devices and later, or ASRs running Cisco IOS XE Software 2.x or later (known as 12.2(33)XNA+ in Security Manager). DMVPN is not supported on Catalyst VPN Services Module devices or on High Availability (HA) groups. If your device does not support DMVPN, use GRE dynamic IP to configure GRE for dynamically addressed spokes. See Understanding GRE Configuration for Dynamically Addressed Spokes , on page 1229.

The following topics provide more overview information on DMVPN:

- Enabling Spoke-to-Spoke Connections in DMVPN Topologies , on page 1235
- Advantages of DMVPN with GRE , on page 1236

The following documents on Cisco.com explain DMVPN in further detail:

- *Cisco Dynamic Multipoint VPN: Simple and Secure Branch-to-Branch Communications* —Explains DMVPN technology and where and why you would use it. This data sheet explains the technologies used with DMVPN and the benefits derived from those technologies.
- *Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3* —Explains the difference between phase 2 and phase 3 spoke-to-spoke connections. Creating spoke-to-spoke connections is a configuration option with DMVPN. Phase 3 uses shortcut switching enhancements to increase network performance and scalability.
- Additional white papers and presentations are available at http://www.cisco.com/en/US/products/ps6658/prod_literature.html.

Enabling Spoke-to-Spoke Connections in DMVPN Topologies

You can use DMVPN to essentially create a full-mesh VPN, in which traditional hub-and-spoke connectivity is supplemented by dynamically-created IPsec tunnels directly between the spokes. With direct spoke-to-spoke tunnels, traffic between remote sites does not need to traverse the hub; this eliminates additional delays and conserves WAN bandwidth. Spoke-to-spoke capability is supported in a single-hub or multihub environment. Multihub deployments provide increased spoke-to-spoke resiliency and redundancy.

You can use the 80:20 traffic rule to determine whether to use a pure hub-and-spoke topology or to allow direct spoke-to-spoke connections:

- If 80 percent or more of the traffic from the spokes are directed into the hub network itself, deploy the hub-and-spoke model.
- If more than 20 percent of the traffic is meant for other spokes, consider the spoke-to-spoke model.

For networks with a high volume of IP Multicast traffic, the hub-and-spoke model is usually preferred.

When you configure the GRE Modes policy for a DMVPN, you can elect to allow spokes to create these direct connections. You must select the DMVPN phase to use for these connections:

- **Phase 2**—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized.
- **Phase 3** (Default)—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or later; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or later. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version.

For more information on configuring the GRE Modes policy, see Configuring GRE Modes for DMVPN , on page 1237.

Advantages of DMVPN with GRE

Using DMVPN with GRE provides the following advantages:

- **Simplified GRE configuration on the hub**

With GRE, a tunnel is configured on the hub for each connected spoke. With GRE + DMVPN, only one tunnel is configured for all the connected spokes.

- **Support for dynamically addressed spokes**

When using GRE, the physical interface IP address of the spoke routers must be configured as the GRE tunnel destination address, when configuring the hub router. DMVPN enables spoke routers to have dynamic external interface IP addresses, and provides robust configuration that does not have to be redeployed to the device even if the external interface IP address changes. When the spoke comes online, it sends to the hub registration packets that contain the physical interface IP address of the spoke.

- **Dynamic tunnel creation for direct spoke-to-spoke communication**

NHRP enables spoke routers to dynamically learn the external interface IP address of the routers in the VPN network. Using NHRP, the hub maintains an NHRP database of the public interface addresses of all the spokes (the clients). Each spoke registers its real address with the hub when it boots.

When a spoke wants to transmit a packet to another spoke, it can use NHRP to dynamically determine the required destination address of the destination spoke. The hub acts as the NHRP server, handling the request for the source spoke. This enables the dynamic creation of an IPsec+GRE tunnel directly between spoke routers, without having to go through a hub router, thus reducing the delay of multiple encryption and decryption actions on the hub.

Configuring DMVPN

To configure a hub-and-spoke Dynamic Multipoint VPN, use the Create VPN wizard as described in Creating or Editing VPN Topologies , on page 1103. You can also edit the membership of the VPN, or some of its policies, using the described procedures. If you are creating a Large Scale DMVPN, also see Configuring Large Scale DMVPNs , on page 1241.

If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPSec settings, select **VPN Global Settings**. See Configuring VPN Global Settings , on page 1180.
- For IKE proposal policies, select **IKE Proposal**. See Configuring an IKE Proposal , on page 1158.

- For IPSec proposals, select **IPsec Proposal**. See Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172.
- For preshared key policies, select **IKEv1 Preshared Key**. See Configuring IKEv1 Preshared Key Policies , on page 1198.
- For public key (PKI) policies, select **Public Key Infrastructure**. See Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204.
- For Generic Routing Encapsulation configuration, including the selection of phase 2 or 3 connections between spokes, select **GRE Modes**. See Configuring GRE Modes for DMVPN , on page 1237.
- For server load balancing policies that are used with Large Scale DMVPN, select **Server Load Balance**. See Configuring Server Load Balancing in Large Scale DMVPN , on page 1242.

Configuring GRE Modes for DMVPN

Use the GRE Modes policy to define the routing and tunnel parameters for IPsec tunneling in a DMVPN.

To open the GRE Modes policy:

- (Site-to-Site VPN Manager Window , on page 1093) Select a DMVPN or Large Scale DMVPN topology, then select **GRE Modes** from the policies list.
- (Policy view) Select **Site-to-Site VPN > GRE Modes**, and create a new policy or select an existing policy. Then, select either DMVPN or Large Scale DMVPN from the **GRE Method** list.

The following table describes the elements on the GRE Modes page for configuring a DMVPN.

Note When configuring a DMVPN routing policy, Security Manager adds a routing protocol to all the devices in the secured IGP, on deployment. If you want to maintain this secured IGP, you must create a router platform policy (on each member device) using the same routing protocol and autonomous system (or process ID) number as defined in the GRE Modes policy.

Table 354: GRE Modes Page for DMVPN

Element	Description
Routing Parameters Tab	

Element	Description
Routing Protocol	Select the required dynamic routing protocol, or static route, to be used in the DMVPN tunnel. Options include the EIGRP, OSPF, and RIPv2 dynamic routing protocols, and GRE static routes. On-Demand Routing (ODR) is also supported. On-Demand Routing is not a routing protocol. It can be used in a hub-and-spoke VPN topology when the spoke routers connect to no other router other than the hub. If you are running dynamic protocols, On-Demand Routing is not suitable for your network environment. For more information, see Understanding GRE , on page 1226.
AS Number (EIGRP only.)	The number that is used to identify the autonomous system (AS) area to which the EIGRP packet belongs. The range is 1-65535. The default is 110. An autonomous system (AS) is a collection of networks that share a common routing strategy. An AS can be divided into a number of areas, which are groups of contiguous networks and attached hosts. Routers with multiple interfaces can participate in multiple areas. An AS ID identifies the area to which the packet belongs. All EIGRP packets are associated with a single area, so all devices must have the same AS number.
Hello Interval (EIGRP only.)	The interval between hello packets sent on the interface, from 1 to 65535 seconds. The default is 5 seconds.
Hold Time (EIGRP only.)	The number of seconds the router will wait to receive a hello message before invalidating the connection. The range is 1-65535. The default hold time is 15 seconds (three times the hello interval)
Delay (EIGRP only.)	The throughput delay for the primary route interface, in microseconds. The range of the tunnel delay time is 1-16777215. The default is 1000.
Bandwidth (EIGRP only.)	The bandwidth for the primary route interface, in kilobits. The range of bandwidth is 1 to 10000000. The default is 1000.
Bandwidth (EIGRP only.)	The amount of bandwidth available to the primary route interface for the EIGRP packets. You should enter a value that gives priority to the primary route over other routes. You can enter a value in the range 1 to 10000000 kb. The default is 1000 kb. **Note** By default, the cost of sending a packet on an interface is calculated based on the bandwidth—the higher the bandwidth, the lower the cost.
Process Number (OSPF only.)	The routing process ID number that will be used to identify the secured IGP that Security Manager adds when configuring DMVPN. The valid range for either protocol is 1-65535. The default is 110.
Hub Network Area ID (OSPF only.)	The ID number of the area in which the hub's protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 0.

Element	Description
Spoke Protected Network Area ID (OSPF only.)	The ID number of the area in which the remote protected networks will be advertised, including the tunnel subnet. You can enter any number. The default is 1.
Authentication Key (OSPF and RIPv2.)	A string that indicates the OSPF or RIPv2 authentication key. The string can be up to eight characters long.
Cost (OSPF and RIPv2.)	The cost of sending a packet on the primary route interface. If the selected protocol is OSPF, enter a value in the range 1-65535; the default is 100. If the selected protocol is RIPv2, enter a value in the range 1-15; the default is 1.
Allow Direct Spoke to Spoke Connectivity	Whether to enable direct communication between spokes without going through the hub. Select the DMVPN phase you want to use, which determines the types of connections that spokes can make: • **Phase 2**—Spoke to spoke connections go through regional hubs and routing protocol updates from hubs to spokes are not summarized. • **Phase 3** (Default)—Spokes can create direct connections with each other and routing updates from hubs to spokes are summarized. This option allows the greatest scalability and reduces latency. Devices must run IOS Software release 12.4(6)T or later; ASRs must run IOS XE Software release 2.4 (called 12.2(33)XND) or later. Security Manager automatically creates a phase 2 configuration for devices running a lower OS version. For detailed information on how phase 2 and 3 differ, see "Migrating from Dynamic Multipoint VPN Phase 2 to Phase 3" on Cisco.com. **Note** With direct spoke-to-spoke communication, you must use the Main Mode Address option for preshared key negotiation. For more information, see Understanding IKEv1 Preshared Key Policies in Site-to-Site VPNs , on page 1197.
Filter Dynamic Updates On Spokes	Unavailable if you are using On-Demand Routing or a static route for your DMVPN tunnel. When selected, enables the creation of a redistribution list that filters all dynamic routing updates (EIGRP, OSPF, and RIPv2) on spokes. This forces the spoke devices to advertise (populate on the hub device) only their own protected subnets and not other IP addresses.
Tunnel Parameters Tab	
Tunnel IP Range	The IP address range of the inside tunnel interface IP address, including the unique subnet mask. This field defines a subnet, such as 10.1.1.0/24. **Note** If Security Manager detects that a tunnel interface IP address already exists on the device, and its IP address matches the tunnel's IP subnet field, it will use that interface as the GRE tunnel.

Element	Description
Dial Backup Tunnel IP Range	If you are configuring a dial backup interface, enter its inside tunnel interface IP address range, including the unique subnet mask. This field defines a subnet.
Server Load Balance	When selected, enables the configuration of load balancing on a Cisco IOS router that serves as a hub in a multiple hubs configuration. Server load balancing optimizes performance in a multiple hubs configuration, by sharing the workload. In this configuration, the DMVPN server hubs share the same tunnel IP and source IP addresses, presenting the appearance of a single device to the spokes in a VPN topology.
Enable IP Multicast	When selected, enables multicast transmissions across your GRE tunnels. IP multicast delivers application source traffic to multiple receivers without burdening the source or the receivers, while using a minimum of network bandwidth.
Rendezvous Point	Only available if you selected the Enable IP Multicast check box. If required, you can enter the IP address of the interface that will serve as the rendezvous point (RP) for multicast transmission. Sources send their traffic to the RP. This traffic is then forwarded to receivers down a shared distribution tree.
Tunnel Key	A number that identifies the tunnel key. The default is 1. The tunnel key differentiates between different multipoint GRE (mGRE) tunnel Non Broadcast Multiple Access (NBMA) networks. All mGRE interfaces in the same NBMA network must use the same tunnel key value. If there are two mGRE interfaces on the same router, they must have different tunnel key values. **Note** To view the newly created tunnel interfaces in the Router Interfaces page for routers that are members of the VPN, you must rediscover the device inventory details after successfully deploying the VPN to the device.
NHRP Parameters	
Network ID	All Next Hop Resolution Protocol (NHRP) stations within one logical Non-Broadcast Multi-Access (NBMA) network must be configured with the same network identifier. Enter a globally unique, 32-bit network identifier within the range of 1 to 4294967295.
Hold time	The time, in seconds, that routers will keep information provided in authoritative NHRP responses. The cached IP-to-NBMA address mapping entries are discarded after the hold time expires. The default is 300 seconds.
Authentication	An authentication string that controls whether the source and destination NHRP stations allow intercommunication. All routers within the same network using NHRP must share the same authentication string. The string can be up to eight characters long.

Configuring Large Scale DMVPNs

You can configure DMVPN for large scale deployments that might comprise thousands of spokes. In large scale DMVPN topologies, IPsec Terminators, also referred to as Server Load Balance (SLB) devices, reside between the spokes and the hubs. The hubs must be directly connected to the IPsec Terminator—there can be no other device between them.

The IPsec Terminator, which is a Catalyst 6500/7600 device, performs encryption and decryption while the hubs handle all tasks related to Next Hop Resolution Protocol (NHRP) and multipoint generic routing encapsulation (mGRE). The IPsec Terminator is configured to specifically load balance GRE traffic to the hubs, and is configured with dynamic crypto to accept any spokes with any proxies. When using tunnel protection on spokes, these proxies are automatically set to match GRE traffic. One GRE tunnel is configured on the spokes. All hubs connecting to the same IPsec Terminator will use the same Tunnel IP address, and the tunnel source is the Virtual IP address of the IPsec Terminator.

In Security Manager, you configure a Large Scale DMVPN during the creation of a new hub-and-spoke VPN topology as described in Creating or Editing VPN Topologies , on page 1103. You cannot edit an existing standard DMVPN and convert it to a Large Scale DMVPN. When you create the Large Scale DMVPN, keep the following points in mind:

- When you define the technology of the VPN, select **DMVPN** as the technology, and **Large Scale with IPsec Terminator** as the type. For the procedure, see Defining the Name and IPsec Technology of a VPN Topology , on page 1106.
- When you select the devices for the VPN, select the required IPsec Terminators (Catalyst 6500/7600 devices), the hubs and all the spokes. For the procedure, see Selecting Devices for Your VPN Topology , on page 1108.

There must be direct connectivity between the IPsec Terminators and the hubs.

- When you configure the endpoints, as described Defining the Endpoints and Protected Networks , on page 1109, configure the following in the Edit Endpoints dialog box:
  - For each hub device, in the Hub Interface tab, select the interface that is connected to the IPsec Terminator. Each hub can be connected to only one IPsec Terminator. Also, identify the protected networks. Each hub in the Large Scale DMVPN must identify itself and its protected networks.
  - For each IPsec Terminator in the Large Scale DMVPN, specify a VPN external interface, the crypto engine slot, and the Inside VLAN. No protected networks are configured on an IPsec Terminator.

After you create the Large Scale DMVPN topology, a Server Load Balance policy is configured on the IPsec Terminators with all the required parameters, which you can edit if required. Initially, all hubs are given the same priority and number of VPN connections. For information on configuring the Server Load Balance policy, see Configuring Server Load Balancing in Large Scale DMVPN , on page 1242.

Note VRF-Aware IPsec cannot be configured in a Large Scale DMVPN.

Configuring Server Load Balancing in Large Scale DMVPN

Use the Server Load Balance page to view or edit the server load balance policy configured on the IPsec Terminators in a large scale DMVPN. Server load balancing optimizes performance in multiple hub-and-spoke VPN topologies by sharing the workload among a group of hubs. In large scale DMVPN configurations, the IPsec Terminators perform the traffic load balancing. For more information, see Configuring Large Scale DMVPNs , on page 1241.

A weighted round robin (WRR) scheduling algorithm is used to control the bandwidth allocated to output transmission queues. Weighting is based on the amount of bandwidth used by each transmit queue on an interface. Packets from queues with higher capacity are transmitted more often than those from queues with less capacity.

To open the Server Load Balance policy, in the Site-to-Site VPN Manager Window , on page 1093, select an existing Large Scale DMVPN topology, then select **Server Load Balance** from the Policies list.

The table displays the hubs in the VPN, the hub's weight relative to other hubs connected to the same IPsec Terminator, and the maximum number of active connections allowed for the hub. To change the weight or maximum connections, select the hub and click the Edit (pencil) button beneath the table to open the Edit Load Balancing Parameters Dialog Box , on page 1242.

Edit Load Balancing Parameters Dialog Box

Use the Edit Load Balancing Parameters dialog box to change the server load balance parameters configured on a hub that is connected to an IPsec Terminator in a large scale DMVPN.

Navigation Path

From the Server Load Balance policy, select a hub and click the **Edit (pencil)** button below the table. For information on opening the Server Load Balance policy, see Configuring Server Load Balancing in Large Scale DMVPN , on page 1242.

Related Topics

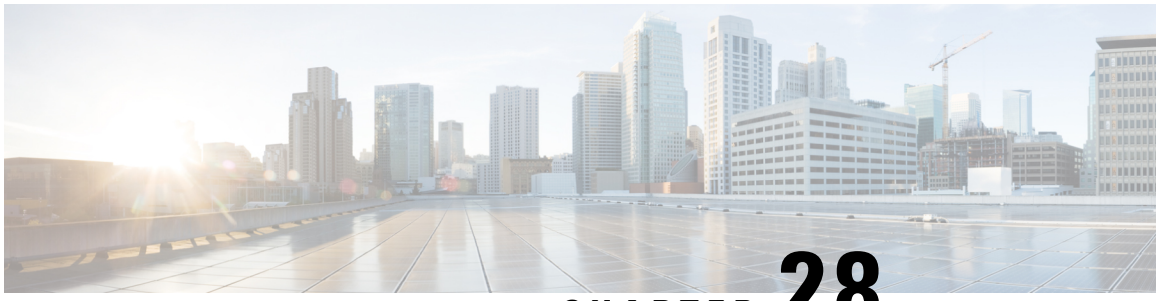
- Configuring Large Scale DMVPNs , on page 1241

Field Reference

Table 355: Edit Load Balancing Parameters Dialog Box

Element	Description
Weight	The capacity of the hub relative to other hubs connected to the IPsec Terminator, based on the weighted round robin (WRR) scheduling algorithm. You can enter a value between 1 and 255. The default is 1.

Element	Description
Max Connections	The maximum number of active connections to the IPsec Terminator that are permitted to the hub. You can enter a value between 1 and 65535. The default is 500.



CHAPTER 28

Easy VPN

Easy VPN is a hub-and-spoke VPN topology that can be used with a variety of routers, PIX, and ASA devices. Policies are defined mostly on the hub and pushed to remote spoke VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

This chapter contains the following topics:

Understanding Easy VPN

Easy VPN simplifies VPN deployment for remote offices. With Easy VPN, security policies defined at the head end are pushed to remote VPN devices, ensuring that clients have up-to-date policies in place before establishing a secure connection.

Security Manager supports the configuration of Easy VPN policies on hub-and-spoke VPN topologies. In such a configuration, most VPN parameters are defined on the Easy VPN server, which acts as the hub device. The centrally managed IPsec policies are pushed to the Easy VPN client devices by the server, minimizing the remote (spoke) devices configuration.

The Easy VPN Server can be a Cisco IOS router, a PIX Firewall, or an ASA 5500 series device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.

Beginning with version 4.17, Cisco Security Manager provides Easy VPN support with BVI. Typically, Easy VPN determines the highest and lowest security level interfaces during ASA startup. The lowest security level interface is used as the External interface on which vpn client initiates tunnel to the head-end, and highest security level interface is used as Internal Secured interface.

On ASA5506 platform, the default configuration includes BVI with highest security level interface 100 with security level of its member interfaces also set at level 100, along with an external interface with security level 0 (zero). VPN client rejects two or more interfaces having same highest security level. Easy VPN determines that there are more than two interfaces with same highest security level and hence vpn client is not enabled.

In order to overcome this issue, vpnclient secure interface CLI was introduced for all ASA 5506, 5508, and 5512 [x/h/w] devices from ASA 9.9(2) onwards. Thus, to support the CLI in Cisco Security Manager, starting from version 4.17, a new component “VPN Client Interface” is introduced in Hub & Spoke Topology of type (Easy VPN).

Note Some of the policies used in Easy VPN topologies are similar to those used in remote access VPNs. In remote access VPNs, policies are configured between servers and mobile remote PCs running VPN client software, whereas, in site-to-site Easy VPN topologies, the clients are hardware devices.

This section contains the following topics:

Easy VPN with Dial Backup

Dial backup for Easy VPN allows you to configure a dial backup tunnel connection on your remote client device. The backup feature is activated only when real traffic is ready to be sent, eliminating the need for expensive dialup or ISDN links that must be created and maintained even when there is no traffic.

Note Easy VPN dial backup can be configured only on remote clients that are routers running IOS version 12.3(14)T or later.

In an Easy VPN configuration, when a remote device attempts to connect to the server and the tracked IP is no longer accessible, the primary connection is torn down and a new connection is established over the Easy VPN backup tunnel to the server. If the primary hub cannot be reached, the primary configuration switches to the failover hub with the same primary configuration and not to the backup configuration.

Only one backup configuration is supported for each primary Easy VPN configuration. Each inside interface must specify the primary and backup Easy VPN configuration. IP static route tracking must be configured for dial backup to work on an Easy VPN remote device. The object tracking configuration is independent of the Easy VPN remote dial backup configuration. The object tracking details are specified in the spoke’s Edit Endpoints dialog box.

For more information about dial backup, see Configuring Dial Backup , on page 1115.

Easy VPN with High Availability

You can configure High Availability (HA) on devices in an Easy VPN topology. High Availability provides automatic device backup when configured on Cisco IOS routers or Catalyst 6500/7600 devices that run IP over LANs. You can create an HA group made up of two or more hub devices in your Easy VPN that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see Configuring High Availability in Your VPN Topology , on page 1130.

Easy VPN with Dynamic Virtual Tunnel Interfaces

The IPsec virtual tunnel interface (VTI) feature simplifies the configuration of GRE tunnels that need to be protected by IPsec for remote access links. A VTI is an interface that supports IPsec tunneling, and allows you to apply interface commands directly to the IPsec tunnels. The configuration of a virtual tunnel interface reduces overhead as it does not require a static mapping of IPsec sessions to a particular physical interface where the crypto map is applied.

IPsec VTIs support both unicast and multicast encrypted traffic on any physical interface, such as in the case of multiple paths. Traffic is encrypted or decrypted when it is forwarded from or to the tunnel interface and is managed by the IP routing table. Dynamic or static IP routing can be used to route the traffic to the virtual interface. Using IP routing to forward traffic to the tunnel interface simplifies IPsec VPN configuration compared to the more complex process of using access control lists (ACLs) with a crypto map. Dynamic VTIs function like any other real interface so that you can apply quality of service (QoS), firewall, and other security services as soon as the tunnel is active.

Dynamic VTIs use a virtual template infrastructure for dynamic instantiation and management of IPsec interfaces. In an Easy VPN topology, Security Manager implicitly creates the virtual template interface for the device. If the device is a hub, the user must provide the IP address on the hub that will be used as the virtual template interface—this can be a subnet (pool of addresses) or an existing loopback or physical interface. On a spoke, the virtual template interface is created without an IP address.

In Security Manager, you configure Dynamic VTI in the Easy VPN IPsec Proposal page. See Configuring Dynamic VTI for Easy VPN , on page 1257.

Notes

- Dynamic VTI can be configured only in a hub-and-spoke Easy VPN topology on routers running IOS version 12.4(2)T and later, except 7600 devices. It is not supported on PIX Firewalls, ASA devices, or Catalyst 6000 series switches.
- Not all the hubs/spokes require Dynamic VTI configuration during discovery or provision. You can extend the existing Easy VPN topology (including routers not supporting dVTI) to add routers that support dVTI.
- Dynamic VTI is supported on only servers, only clients (if server does not support dVTI), or both clients and servers.
- You cannot configure High Availability on hubs/servers that have been configured with dVTI.
- You can also configure Dynamic VTI in remote access VPNs. For more information, see Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices) , on page 1476.

Easy VPN Configuration Modes

Easy VPN can be configured in three modes—Client, Network Extension, and Network Extension Plus.

- Client mode—The default configuration that allows devices at the client site to access resources at the central site, but disallows access to the central site for resources at the client site. In client mode, a single IP address is pushed to the remote client from the server when the VPN connection is established. This address is typically a routable address in the private address space of the customer network. All traffic passing across the Easy VPN tunnel undergoes Port Address Translation (PAT) to that single pushed IP address.
- Network Extension mode—Allows users at the central site to access the network resources at the client site, and allows the client PCs and hosts direct access to the PCs and hosts at the central site. Network Extension mode specifies that the hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by the destination network. The devices at both ends of the connection will form one logical network. PAT is not used, so the hosts at the client end have direct access to the hosts at the destination network. In other words, the Easy VPN server (the hub) gives routable addresses to the Easy VPN client (the spoke), while the whole LAN behind the client will not undergo PAT.
- Network Extension Plus mode—An enhancement to Network Extension mode, which can be configured only on IOS routers. It enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. This IP address can be used for connecting to your router for remote management and troubleshooting (ping, Telnet, and Secure Shell). If you select this option an some clienx`ts are not IOS routers, those clients are configured in Network Extension mode.

Note All modes of operation can also support split tunneling, which allows secure access to corporate resources through the VPN tunnel while also allowing Internet access through a connection to an ISP or other service (thereby eliminating the corporate network from the path for web access).

You configure the mode in the Client Connection Characteristics policy as described in Configuring Client Connection Characteristics for Easy VPN , on page 1251.

Easy VPN and IKE Extended Authentication (Xauth)

When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, IKE Extended Authentication (Xauth) adds another level of authentication that identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a username/password challenge after the IKE security association (SA) has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication.

The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

Note VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

Security Manager allows you to save the Xauth username and password on the device itself so you do not need to enter these credentials manually each time the Easy VPN tunnel is established. The information is saved in the device's configuration file and used each time the tunnel is established. Saving the credentials in the device's configuration file is typically used if the device is shared between several PCs and you want to keep the VPN tunnel up all the time, or if you want the device to automatically bring up the tunnel whenever there is traffic to be sent.

Saving the credentials in the device's configuration file, however, could create a security risk, because anyone who has access to the device configuration can obtain this information. An alternative method for Xauth authentication is to manually enter the username and password each time Xauth is requested. You can select whether to use a web browser window or the router console to enter the credentials. Using web-based interaction, a login page is returned, in which you can enter the credentials to authenticate the VPN tunnel. After the VPN tunnel comes up, all users behind this remote site can access the corporate LAN without being prompted again for the username and password. Alternatively, you can choose to bypass the VPN tunnel and connect only to the Internet, in which case a password is not required.

Easy VPN Tunnel Activation

If the device credentials (Xauth username and password) are stored on the device itself, you must select a tunnel activation method for IOS router clients. Two options are available:

- Auto—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely. This is the default option.
- Traffic Triggered Activation—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. Traffic Triggered Activation is recommended for use with the Easy VPN dial backup configuration so that backup is activated only when there is traffic to send across the tunnel. When using this option, you must specify the Access Control List (ACL) that defines the "interesting" traffic.

Note Manual tunnel activation is configured implicitly if you select to configure the Xauth password interactively. In this case, the device waits for a command before attempting to establish the Easy VPN remote connection. When the tunnel times out or fails, subsequent connections will also have to wait for the command.

You configure the xauth and tunnel activation mode in the Client Connection Characteristics policy as described in Configuring Client Connection Characteristics for Easy VPN , on page 1251.

- Configuring Credentials Policy Objects , on page 1253

Overview of Configuring Easy VPN

When a remote client initiates a connection to a VPN server, device authentication between the peers occurs using IKE, followed by user authentication using IKE Extended Authentication (Xauth), VPN policy push (in Client, Network Extension, or Network Extension Plus mode), and IPsec security association (SA) creation.

The following provides an overview of this process:

1. The client initiates IKE Phase 1 via aggressive mode if a preshared key is to be used for authentication, or main mode if digital certificates are used. If the client identifies itself with a preshared key, the accompanying user group name (defined during configuration) is used to identify the group profile associated with this client. If digital certificates are used, the organizational unit (OU) field of a distinguished name (DN) is used to identify the user group name. See PKI Enrollment Dialog Box—Certificate Subject Name Tab , on page 1217.

Note Because the client may be configured for preshared key authentication, which initiates IKE aggressive mode, the administrator should change the identity of the VPN device via the crypto isakmp identity hostname command. This will not affect certificate authentication via IKE main mode.

1. The client attempts to establish an IKE SA between its public IP address and the public IP address of the VPN server. To reduce the amount of manual configuration on the client, every combination of encryption and hash algorithms, in addition to authentication methods and D-H group sizes, is proposed.
2. Depending on its IKE policy configuration, the VPN server determines which proposal is acceptable to continue negotiating Phase 1.

Note Device authentication ends and user authentication begins at this point.

1. After the IKE SA is successfully established, and if the VPN server is configured for Xauth, the client waits for a “username/password” challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Token cards may also be used via AAA proxy. During Xauth, a user-specific attribute can be retrieved if the credentials of that user are validated via RADIUS.

Note VPN servers that are configured to handle remote clients should always be configured to enforce user authentication.

1. If the server indicates that authentication was successful, the client requests further configuration parameters from the peer. The remaining system parameters (for example, IP address, DNS, and split tunnel attributes) are pushed to the client using client or network extension mode configuration.

Note The IP address pool and group preshared key (if Rivest, Shamir, and Adelman [RSA] signatures are not being used) are the only required parameter in a group profile. All other parameters are optional.

1. After each client is assigned an internal IP address via mode configuration, Reverse Route Injection (RRI), if configured, ensures that a static route is created on the device for each client internal IP address.
2. IKE quick mode is initiated to negotiate and create IPsec SAs.

The connection is complete.

Important Notes About Easy VPN Configuration

Before you configure an Easy VPN policy in your topology, you should know the following:

- In an Easy VPN topology configuration, deployment fails if a 72xx series router is used as a remote client device. The Easy VPN client is supported on PIX 501, 506, 506E Firewalls running PIX 6.3, Cisco 800-3900 Series routers, and ASA 5505 devices running ASA Software release 7.2 or later.
- If you try to configure a Public Key Infrastructure (PKI) policy on a PIX 6.3 remote client in an Easy VPN topology configuration, deployment fails. For successful deployment on this device, you must first issue the PKI certificate on the CA server, and then try again to deploy the device. For more information about PKI policies, see Understanding Public Key Infrastructure Policies , on page 1200.
- In some cases, deployment fails on a device that serves as an Easy VPN client if the crypto map is configured on the NAT (or PAT) internal interface instead of the external interface. On some platforms, the inside and outside interfaces are fixed. For example, on a Cisco 1700 series router the VPN interface must be the device's FastEthernet0 interface. On a Cisco 800 series router the VPN interface could be either the device's Ethernet0 or Dialer1 interface, depending on the configuration. On a Cisco uBR905/uBR925 cable access router, the VPN interface must be the Ethernet0 interface.

Configuring Client Connection Characteristics for Easy VPN

Use the Client Connection Characteristics page to specify how traffic will be routed in the Easy VPN topology and how the VPN tunnel will be established. The characteristics defined in this policy are configured on the remote clients. Before configuring this policy, read the following topics:

- Easy VPN Configuration Modes , on page 1248
- Easy VPN and IKE Extended Authentication (Xauth) , on page 1248

Navigation Path

- (Site-to-Site VPN Manager Window , on page 1093) Select an Easy VPN topology in the VPNs selector, then select **Client Connection Characteristics** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Client Connection Characteristics** and create a new policy or edit an existing policy.

Related Topics

- Understanding Easy VPN , on page 1245
- Creating Access Control List Objects , on page 283
- Important Notes About Easy VPN Configuration , on page 1251

Field Reference

Table 356: Easy VPN Client Connection Characteristics Page

Element	Description
Mode	The configuration mode for the remote devices: • **Client**—Specifies that all traffic from the remote client's inside network will undergo Port Address Translation (PAT) to a single IP address which was assigned for the device by the head end server at connect time. • **Network Extension**—Specifies that PCs and other hosts at the client end of the VPN tunnel should be given IP addresses that are fully routable and reachable by destination network. PAT is not used, allowing the client PCs and hosts to have direct access to the PCs and hosts at the destination network. • **Network Extension Plus**—An enhancement to Network Extension mode, that enables an IP address that is received via mode configuration to be automatically assigned to an available loopback interface. The IPsec SAs for this IP address are automatically created by the Easy VPN client. The IP address is typically used for troubleshooting (using ping, Telnet, and Secure Shell). If you select Network Extension Plus, this mode is configured on IOS routers only. Clients that are PIX or ASA devices are configured in Network Extension mode. For more information, see Easy VPN Configuration Modes , on page 1248.
Xauth Credentials Source	Select how you want to enter the Xauth credentials for user authentication when you establish a VPN connection with the server: • Device Stored Credentials (default)—The username and password are saved on the device itself in the device's configuration file to be used each time the tunnel is established. • Interactive Entered Credentials—Enables you to manually enter the username and password each time Xauth is requested, in a web browser window or from the router console. For more information, see Easy VPN and IKE Extended Authentication (Xauth) , on page 1248.
Xauth Credentials	Available only if you selected **Device Stored Credentials** as the Xauth Credentials Source. The credentials policy object that defines the default Xauth credentials. Enter the name of the object or click **Select** to select it from a list or to create a new object. For more information, see Configuring Credentials Policy Objects , on page 1253. **Note** If you want to configure different Xauth credentials on your remote client, you must configure the credentials policy object to allow overrides (select **Allow Value Override per Device** in the object definition).

Element	Description
Tunnel Activation (IOS)	Available only if you selected the **Device Stored Credentials** option for the Xauth password source. For IOS router clients, select a tunnel activation method: • **Auto** (default)—The Easy VPN tunnel is established automatically when the Easy VPN configuration is delivered to the device configuration file. If the tunnel times out or fails, the tunnel automatically reconnects and retries indefinitely. • **Traffic Triggered Activation**—The Easy VPN tunnel is established whenever outbound local (LAN side) traffic is detected. If you select traffic triggered activation, also enter the name of the Access Control List (ACL) policy object that defines the traffic that should activate the tunnel. Click **Select** to select the object or to create a new object. Traffic Triggered Activation is recommended for use when Easy VPN dial backup is configured so that backup is activated only when there is traffic to send across the tunnel. **Note** Manual tunnel activation is configured implicitly when you select to configure the Xauth password interactively.
User Authentication Method (IOS)	Available only if you selected the **Interactive Entered Credentials** option for the Xauth credentials source. The option applies to remote IOS routers only. Select one of these ways to enter the Xauth username and password interactively each time Xauth authentication is requested: • Web Browser (default)—Manually in a web browser window. • Router Console—Manually from the router's command line.

Configuring Credentials Policy Objects

Use the Credentials dialog box to create, copy and edit Credential objects.

Credential objects are used in Easy VPN configuration during IKE Extended Authentication (Xauth) when authenticating user access to the network and network services. When negotiating tunnel parameters for establishing IPsec tunnels in an Easy VPN configuration, Xauth identifies the user who requests the IPsec connection. If the VPN server is configured for Xauth, the client waits for a "username/password" challenge after the IKE SA has been established. When the end user responds to the challenge, the response is forwarded to the IPsec peers for an additional level of authentication. You can save the Xauth credentials (username and password) on the device itself so you do not need to enter them manually each time the Easy VPN tunnel is established.

Navigation Path

Select **Manage > Policy Objects**, then select **Credentials** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

- Policy Object Manager , on page 232

Field Reference

Table 357: Credentials Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object (up to 1024 characters).
Username	The name that will be used to identify the user during Xauth authentication.
Password Confirm	The password for the user, entered in both fields. The password must be alphanumeric and a maximum of 128 characters. Spaces are not allowed.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring an IPsec Proposal for Easy VPN

Use the Easy VPN IPsec Proposal page to configure the IPsec proposal used during IKE Phase 2 negotiations for Easy VPN topologies. The IPsec proposal is configured on the IPSec Proposal tab; the options are described below.

In Easy VPN topologies, you can also configure a dynamic virtual interface on the Dynamic VTI tab. For an explanation of dVTI configuration, see Configuring Dynamic VTI for Easy VPN , on page 1257 .

Note This topic describes the IPsec Proposal page when the site-to-site VPN technology is Easy VPN. For a description of the IPsec Proposal page when the site-to-site VPN technology is something else, see Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172 .

Navigation Path

- (Site-to-Site VPN Manager Window , on page 1093) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **IPSec Proposal** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **IPSec Proposal** tab.

Field Reference

Table 358: Easy VPN IPsec Proposal Tab

Element	Description
IKEv1 Transform Sets	The transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. You can select up to 11 transform sets. For more information, see Understanding Transform Sets , on page 1170. Transform sets may use only tunnel mode IPsec operation. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used. Click **Select** to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the **Create (+)** button beneath the available objects list in the selection dialog box to create a new one. For more information, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177.

Element	Description
Reverse Route	Supported on ASA 5500 series devices, PIX 7.0+ devices, and Cisco IOS routers except 7600 devices. Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see Understanding Reverse Route Injection , on page 1171. Select one of the following options to configure RRI on the crypto map: • **None**—Disables the configuration of RRI on the crypto map. • **Standard**—(ASA, PIX 7.0+, IOS devices) Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option. • **Remote Peer**—(IOS devices only) Creates two routes, one for the remote endpoint and one for route recursion to the remote endpoint via the interface to which the crypto map is applied. • **Remote Peer IP**—(IOS devices only) Specifies an address as the explicit next hop to the remote VPN device. Enter the IP address or a network/host object that specifies the address, or click **Select** to select the network/host object from a list or to create a new object. **Note** If you use network/host objects, you can select the **Allow Value Override per Device** option in the object to override the IP address, if required, for specific devices that use this object.
Enable Network Address Translation Traversal	Supported on PIX 7.0+ and ASA 5500 series devices. Whether to allow Network Address Translation (NAT) traversal. Use NAT traversal when there is a device between a VPN-connected hub and spoke, and that performs Network Address Translation (NAT) on the IPsec traffic. For information about NAT traversal, see Understanding NAT in VPNs , on page 1191.
Group Policy Lookup/AAA Authorization Method	Supported on Cisco IOS routers only. The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group. Click **Select** to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.

Element	Description
User Authentication (Xauth)/AAA Authentication Method	Supported on Cisco IOS routers and PIX 6.3 firewalls only. The AAA or Xauth user authentication method used to define the order in which user accounts are searched. Xauth allows all AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange. The AAA configuration list-name must match the Xauth configuration list-name for user authentication to occur. After the IKE SA is successfully established, and if the device is configured for Xauth, the client waits for a username/password challenge and then responds to the challenge of the peer. The information that is entered is checked against authentication entities using authentication, authorization, and accounting (AAA) protocols such as RADIUS and TACACS+. Click **Select** to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.

Configuring Dynamic VTI for Easy VPN

Use the Dynamic VTI tab of the Easy VPN IPSec Proposal policy to configure a dynamic virtual tunnel interface on a device in a hub-and-spoke Easy VPN topology. For more information, see Easy VPN with Dynamic Virtual Tunnel Interfaces , on page 1247.

Note Dynamic VTI can be configured only on IOS routers running IOS version 12.4(2)T and later, except 7600 devices.

Navigation Path

- (Site-to-Site VPN Manager Window , on page 1093) Select an Easy VPN topology in the VPNs selector, then select **Easy VPN IPsec Proposal** in the Policies selector. Click the **Dynamic VTI** tab.
- (Policy view) Select **Site-to-Site VPN > Easy VPN IPsec Proposal** from the Policy Types selector. Select an existing shared policy or create a new one. Click the **Dynamic VTI** tab.

Related Topics

- Understanding Easy VPN , on page 1245
- Configuring an IPsec Proposal for Easy VPN , on page 1254

Field Reference

Table 359: Easy VPN IPSec Proposal, Dynamic VTI Tab

Element	Description
Enable Dynamic VTI	When selected, enables Security Manager to implicitly create a dynamic virtual template interface on the device. If the device is a hub server that does not support Dynamic VTI, a warning message is displayed, and a crypto map is deployed without dynamic VTI. In the case of a client device, an error message is displayed.
Virtual Template IP	If you are configuring Dynamic VTI on a hub in the topology, specify either the subnet address or interface role: • **Subnet**—To use the IP address taken from a pool of addresses. Enter the private IP address including the subnet mask, for example 10.1.1.0/24. • **Interface Role**—To use a physical or loopback interface on the device. If required, click **Select** to open the Interface selector where you can select the interface role object that identifies the desired interface. If an appropriate object does not already exist, you can create one in the selection dialog box. If you are configuring Dynamic VTI on a spoke in the topology, select **None**.

Configuring a Connection Profile Policy for Easy VPN

A connection profile consists of a set of records that contain IPsec tunnel connection policies. Connection profiles, or tunnel groups, identify the group policy for a specific connection, and include user-oriented attributes. If you do not assign a particular group policy to a user, the default group policy for the connection applies. For a successful connection, the username of the remote client must exist in the database, otherwise the connection is denied.

In site-to site VPNs, you configure connection profile policies on an Easy VPN server, which can be a PIX Firewall version 7.0+ or an ASA 5500 series device. The Easy VPN connection profile policy is similar to the one used for remote access VPNs.You can unassign the connection profile policy if none of the Easy VPN servers are ASA or PIX 7.0+ devices.

Creating a connection profile policy involves specifying:

- The group policy—A collection of user-oriented attributes stored either internally on the device or externally on RADIUS/LDAP server.
- Global AAA settings—Authentication, Authorization, and Accounting servers.
- The DHCP servers to be used for client address assignment, and the address pools from which the IP addresses will be assigned.
- Settings for Internet Key Exchange (IKE) and IPsec (such as preshared key).

On the PIX7.0+/ASA Connection Profiles page, you can connection profiles on your Easy VPN server.

Related Topics

- Creating or Editing VPN Topologies , on page 1103
- Understanding IPsec Technologies and Policies , on page 1077
- Understanding Easy VPN , on page 1245

Step 1 Do one of the following:

- (Site-to-Site VPN Manager Window , on page 1093) Select an Easy VPN topology in the VPNs selector, then select **Connection Profiles (PIX 7.0/ASA)** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX 7.0/ASA)** from the Policy Types selector. Select an existing shared policy or create a new one.

For information on the policy, see Connection Profiles Page , on page 1333.

Step 2 On the **General** tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a description of the available properties, see General Tab (Connection Profiles) , on page 1335.

Step 3 Click the **AAA** tab and specify the AAA authentication parameters for an the connection profile. For a description of the elements on the tab, see AAA Tab (Connection Profiles) , on page 1338.

Step 4 Click the **IPsec** tab and specify IPsec and IKE parameters for the connection profile. For a description of the elements on the tab, see IPSec Tab (Connection Profiles) , on page 1344.

Configuring a User Group Policy for Easy VPN

Use the User Group Policy page to create or edit a user group policy on your Easy VPN server. When you configure an Easy VPN server, you create a user group to which remote clients belong. An Easy VPN user group policy can be configured on a Cisco IOS security router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device. You can unassign the user group policy if none of the Easy VPN servers are IOS routers, Catalyst 6500/7600 devices, or PIX 6.3 firewalls.

Remote clients must have the same group name as the user group configured on the server in order to connect to the device, otherwise no connection is established. When the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group.

Select the user group policy object that you want to use in the policy from the Available User Groups list. You can create a new user group object by clicking the **Create (+)** button, or edit an existing group by selecting it and clicking the **Edit (pencil icon)** button. For information about configuring the user group object, see Add or Edit User Group Dialog Box , on page 1564.

Navigation Path

- (Site-to-Site VPN Manager Window , on page 1093) Select an Easy VPN topology in the VPNs selector, then select **User Group Policy** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > User Group Policy** from the Policy Types selector. Select an existing shared policy or create a new one.

CHAPTER 29

Group Encrypted Transport (GET) VPNs

Cisco Group Encrypted Transport virtual private network (GET VPN) is a full-mesh VPN technology that can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). GET VPN comprises a set of features that are necessary to secure IP multicast group traffic or unicast traffic over a private WAN that originates on or flows through a Cisco IOS device. GET VPN combines the keying protocol Group Domain of Interpretation (GDOI) with IP security (IPsec) encryption to provide users with an efficient method to secure IP multicast or unicast traffic. GET VPN enables the router to apply encryption to nontunneled (that is, "native") IP multicast and unicast packets and eliminates the requirement to configure tunnels to protect multicast and unicast traffic.

Understanding Group Encrypted Transport (GET) VPNs

Networked applications such as voice and video increase the need for instantaneous, branch-interconnected, and QoS-enabled WANs. The distributed nature of these applications results in increased demands for scale. At the same time, enterprise WAN technologies force businesses to trade off between QoS-enabled branch interconnectivity and transport security. As network security risks increase and regulatory compliance becomes essential, Group Encrypted Transport VPN (GET VPN), a WAN encryption technology, eliminates the need to compromise between network intelligence and data privacy.

With GET, Cisco provides tunnelless VPN, which eliminates the need for IPsec tunnels. By removing the need for point-to-point tunnels, meshed networks can scale higher while maintaining network-intelligence features critical to voice and video quality. GET is a standards-based security model that is based on the concept of a trusted group to eliminate point-to-point IPsec tunnels and their associated overlay routing. Trusted group members share a common security association (SA), also known as a group SA. This enables group members to decrypt traffic that was encrypted by any other group member. By using trusted groups

instead of point-to-point tunnels, full-mesh networks can scale higher while maintaining network-intelligence features (such as QoS, routing, and multicast), which are critical to voice and video quality.

GET-based networks can be used in a variety of WAN environments, including IP and Multiprotocol Label Switching (MPLS). MPLS VPNs that use this encryption technology are highly scalable, manageable, and cost-effective, and they meet government-mandated encryption requirements. The flexible nature of GET allows security-conscious enterprises either to manage their own network security over a service provider WAN service or to offload encryption services to their providers. GET simplifies securing large Layer 2 or MPLS networks that require partial or full-mesh connectivity.

In addition to leveraging the existing IKE, IPsec and multicast technologies, a GET VPN topology includes these key elements and features:

- Group members—The routers that exchange the actual traffic within the VPN are called group members. Group members provide encryption services to the traffic. Encryption policies are defined centrally on the key server and downloaded to the group member at the time of registration. Based on these downloaded policies, a group member decides whether traffic needs to be encrypted or decrypted and what keys to use.

Although group members primarily obtain encryption policies from the key server, you can configure local service policy ACLs on the group members to exclude traffic from encryption based on local requirements. For more information, see Understanding the GET VPN Security Policy and Security Associations , on page 1270.

Note A device can be a group member of more than one group.

- Key servers—The routers that act as key servers are the gatekeepers to the topology. The group member must successfully register with a key server before becoming an active member of the VPN. The key servers control the shared service policy, and generate and transmit keys to group members. Key servers cannot be group members themselves, but a single key server can service more than one topology. For more information, see Understanding the GET VPN Registration Process , on page 1264.
- The Group Domain of Interpretation (GDOI) group key management protocol is used to provide a set of cryptographic keys and policies to a group of devices. In a GET VPN network, GDOI is used to distribute common IPsec keys to a group of enterprise VPN gateways (group members) that must communicate securely. Devices designated as key servers periodically refresh and send out the updated keys to the group members using a process called “rekeying.”

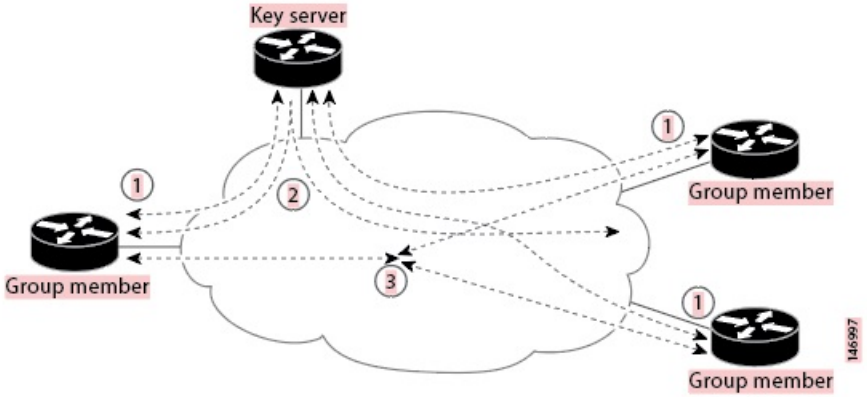
The GDOI protocol uses the Phase 1 Internet Key Exchange (IKE) SA. All participating VPN gateways authenticate themselves to the device providing keys using IKE. All IKE authentication methods, for example, pre-shared keys (PSKs) and public key infrastructure (PKI), are supported for initial authentication. After the VPN gateways are authenticated and provided with the appropriate security keys using the IKE SA, the IKE SA expires and GDOI is used to update the group members in a more scalable and efficient manner. For more information about GDOI, refer to RFC 3547.

- Address preservation—IPsec-protected data packets carry the original source and destination in the outer IP header rather than replacing them with tunnel endpoint addresses. Address preservation allows GET VPN to use the routing functionality present within the core network. Address preservation allows routing to deliver the packets to any customer-edge (CE) device in the network that advertises a route to the destination address. Any source and destination matching the policy for the group will be treated in a similar manner. In the situation where a link between IPsec peers is not available, address preservation also helps combat traffic “black-hole” situations.

Header preservation also maintains routing continuity throughout the enterprise address space and in the WAN. As a result, end host addresses of the campus are exposed in the WAN (for MPLS, this applies to the edge of the WAN). For this reason, GET VPN is applicable only when the WAN network acts as a “private” network (for example, in an MPLS network).

The following figure shows the general operation of a GET VPN topology.

Figure 38: General GET VPN Operation



1. Group members register with the key server using the Group Domain of Interpretation (GDOI) protocol. The key server authenticates and authorizes the group members and downloads the IPsec policy and keys that are necessary for them to encrypt and decrypt IP multicast and unicast packets. The registration process can use unicast or multicast communications.
2. Group members exchange IP packets that are encrypted using IPsec. Only the group members are an active part of the VPN.
3. As needed, the key server pushes a rekey message to the group members. The rekey message contains new IPsec policy and keys to use when old IPsec security associations (SAs) expire. Rekey messages are sent in advance of the SA expiration time to ensure that valid group keys are always available.

GET VPN is provisioned using Security Manager with the following caveats:

- GET VPN-aware VRF is not supported.
- DMVPN with GET is not supported, because there is no way to define DMVPN without tunnel protection in Security Manager.
- Manual configuration of a group member to join a multicast group (ip igmp join-group) is not supported. Security Manager only provisions static source-specific multicast (SSM) mappings.

Understanding the GET VPN Registration Process

In GET VPN, group members comprise the VPN topology. Traffic in the VPN is traffic between group members. For a device to become a group member, the device must successfully register with a key server. Key servers maintain the security association (SA) policy and create and maintain the keys for the group. When a group member registers, the key server downloads the policy and the keys to the group member. The key server also rekeys the group before existing keys expire.

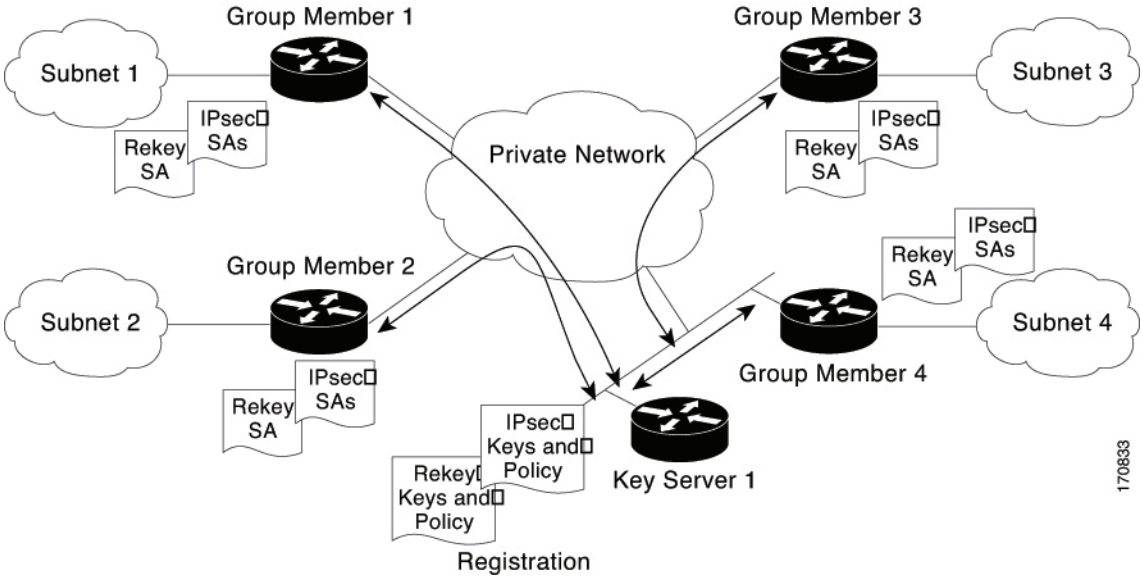
The key server has two responsibilities: servicing registration requests and sending rekeys. A group member can register at any time and receive the most current policy and keys. When a group member registers with the key server, the key server verifies the group ID that the group member is attempting to join. If the group ID is valid, the key server sends the security association policy to the group member. After the group member acknowledges that it can handle the downloaded policy, the key server downloads the respective keys.

Communication among the key server and group members is encrypted and secured using two types of keys: the traffic encryption key (TEK) and the key encryption key (KEK). The TEK is downloaded by the key server to all the group members. The downloaded TEK is used by all the group members to communicate securely among each other. This key is essentially the group key that is shared by all the group members. The group policies and IPsec SAs are refreshed by the key server using periodic rekey messages to the group members. The KEK is also downloaded by the key server and is used by the group members to decrypt the incoming rekey messages from the key server.

The key server sends out rekey messages either because of an impending IPsec SA expiration or because the security policy has changed on the key server. A rekey can also happen if the KEK timer has expired (the key server sends out a KEK rekey). Rekey messages might also be retransmitted periodically to account for possible packet loss. If the rekey mechanism is multicast, there is no efficient feedback mechanism by which receivers can indicate that they did not receive a rekey message, so retransmission seeks to bring all receivers up to date. If the rekey mechanism is unicast, the receivers send an acknowledgment message.

The key server generates the group policy and IPsec security associations (SAs) for the GDOI group. The information generated by the key server includes multiple TEK attributes, traffic encryption policy, lifetime, source and destination, a Security Parameter Index (SPI) ID that is associated with each TEK, and the rekey policy (one KEK). Note that the group member might also have a local security policy configured that is merged with the one downloaded; for complete information see Understanding the GET VPN Security Policy and Security Associations , on page 1270.

The following figure illustrates the communication flow between group members and the key server. The key server, after receiving registration messages from a group member, generates the information that contains the group policy and new IPsec SAs. The new IPsec SA is then downloaded to the group member. The key server maintains a table that contains the IP address of each group member per group. When a group member registers, the key server adds its IP address in its associated group table, thus allowing the key server to monitor an active group member. A key server can support multiple groups. A group member can be part of multiple groups.



When you configure the GET VPN topology, you can configure the following registration-related features:

- Decide whether to use unicast or multicast for group registration and rekeying. For more information, see Choosing the Rekey Transport Mechanism , on page 1266.

Note If you use multicast, you need to enable multicast on the key servers and group members manually. Security Manager does not provision multicast commands.

- Decide whether to configure more than one key server to provide redundancy and load balancing. For more information, see Configuring Redundancy Using Cooperative Key Servers , on page 1267.
- Decide whether to configure fail-close mode on group members to protect their traffic prior to successful registration with the key server. For more information, see Configuring Fail-Close to Protect Registration Failures , on page 1268.
- Decide whether to require authorization for group members to join the group. You can use certificate authorization (which requires that you also configure the Public Key Infrastructure policy) or preshared keys. Configuring authorization is required if the key server serves more than one group. For information about the configuration options, see the Authorization Type setting described in Defining GET VPN Group Encryption , on page 1132.

• Configuring GET VPN , on page 1272

Choosing the Rekey Transport Mechanism

When you configure the rekey settings in the Group Encryption Policy (as described in Defining GET VPN Group Encryption , on page 1132), you must select whether to use multicast or unicast as the rekey transport mechanism. The key server uses this method whenever sending new keys and IPsec security associations (SAs) to group members or each other. There are advantages and disadvantages to each method.

Multicast is the standard choice. Using multicast, the key server sends one copy of each rekey message to all group members at once using a multicast group address, so there is no rekey delay and group members can install the updated security policy essentially simultaneously (not accounting for regular network delay). However, in some networks, multicast is either an extra cost feature, or it is simply not allowed. If you configure multicast, you must supply the multicast address that will be used by the GET VPN topology.

Unicast can be used when multicast is unavailable or undesirable. Using unicast, the key server sends directed rekey and IPsec SAs to group members, and the group member sends an acknowledgment that the message was received. Because unicast requires sending direct messages and receiving acknowledgments, the key server sends the unicast messages to a subset of the group members at a time (unless you have a relatively small VPN, perhaps fewer than 30 group members, in which case all group members might be sent messages at the same time).

Thus, the relative benefits of multicast and unicast include the following:

- With multicast, the key server does not know if a group member receives a message, whereas with unicast, there are acknowledgments. With unicast, if the key server does not receive the acknowledgment, it resends the message.
- Multicast is faster than unicast, especially for large topologies with hundreds of group members. Multicast rekey uses the same low CPU overhead whether there is one group member in the group or a few thousand.
- With unicast, if a group member continuously fails to send acknowledgments, the key server decides the group member is no longer there and stops sending rekey messages. Thus, the key server always has a list of active group members. The unresponsive group member must reregister to rejoin the GET VPN topology. Because multicast does not use acknowledgments, the key server does not know if a group member becomes unresponsive, and it does not maintain a list of active group members.

Tip To use multicast, you must enable multicast on the key servers and group members. Security Manager does not provision these commands; it only enables multicast rekey, it does not enable the router to send and receive multicast traffic. Therefore, you must manually enable multicast on the device, or use the FlexConfig policy to provision the commands (see Creating FlexConfig Policy Objects , on page 368).

Fortunately, it is possible to mix multicast and unicast in a single GET VPN topology so long as all key servers support multicast. When deciding which transport mechanism to use, consider the following recommendations:

- If all key servers and group members, and the network, support multicast, use multicast.
- If all of the key servers and most of the group members support multicast, but a small number of group members do not support multicast, use multicast. Group members that do not support multicast will not receive rekey and IPsec SA updates. However, when the lifetime settings for these items are about to expire, unicast group members will reregister with the key server and obtain the new keys and IPsec SAs.

- If no group members, or only a few, support multicast, use unicast. The group members will then receive rekeys and IPsec SA updates from the key server and not need to reregister to get them.

Related Topics

- Understanding the GET VPN Registration Process , on page 1264
- Generating and Synchronizing RSA Keys , on page 1273
- Configuring GET VPN , on page 1272

Configuring Redundancy Using Cooperative Key Servers

The key server is the most important entity in the GET VPN network because the key server maintains the control plane. Therefore, a single key server is a single point of failure for an entire GET VPN network. Because redundancy is an important consideration for key servers, GET VPN supports multiple key servers, called cooperative (COOP) key servers, to ensure seamless fault recovery if a key server fails or becomes unreachable.

You can configure a group member to register to any available key server from a list of all COOP key servers. The group member configuration determines the registration order (see Configuring GET VPN Group Members , on page 1280 and Edit Group Member Dialog Box , on page 1281). The key server defined first is contacted first, followed by the second defined key server, and so on. It is a best practice to distribute group member registration to all available COOP key servers to reduce the IKE processing load on a single key server. Note that only the primary key server sends rekey messages.

When COOP key servers boot, all key servers assume a *secondary* role and begin an election process. One key server, typically the one having the highest priority, is elected as a *primary* key server. The other key servers remain in the secondary state. The primary key server is responsible for creating and distributing group policies to all group members and to periodically synchronize the COOP key servers.

Cooperative key servers exchange one-way announcement messages (primary to secondary). If a secondary key server does not hear from the primary key server for a certain length of time, the secondary key server tries to contact the primary key server and request updated information. If the primary key server does not respond, or if the secondary key server does not hear from the primary key server, a COOP key server reelection is triggered and a new primary key server is elected.

Up to eight key servers can be defined as COOP key servers, but more than four COOP key servers are seldom required. Because rekey information is generated and distributed from a single primary key server, the advantage of deploying more than two key servers is the ability to handle registration load in case of a network failure and reregistration taking place at the same time. This is especially important when using Public Key Infrastructure (PKI) group member authorization because IKE negotiation using PKI requires a lot more CPU power compared to IKE negotiation using pre-shared keys (PSKs).

Tips

- The RSA key must be the same on all cooperative key servers. For information on synchronizing the RSA key, see Generating and Synchronizing RSA Keys , on page 1273.
- It is a best practice to enable periodic ISAKMP keepalives between key servers so that the primary key server can track and display the state of the other secondary key servers. IKE Keepalives between group members and the key server is not required and is not supported. For information on configuring keepalives, see Configuring Global Settings for GET VPN , on page 1276.

- The COOP protocol is configured on a per GDOI group basis. A key server that is configured with multiple GDOI groups can maintain multiple unique COOP relationships with disparate key servers.

Configuring Fail-Close to Protect Registration Failures

Group members must register with the key server to become members of the GET VPN. Before a group member successfully registers with the key server, traffic passing through the group member's GET VPN interface is not encrypted. The period of time in which clear-text transmissions occur can be short (if registration succeeds) or potentially long, if the group member fails to register for any reason.

This default behavior is known as fail-open. If you consider it a violation of your security standards that traffic is sent in clear text at any time, you can configure fail-close mode to protect traffic before (or during) registration. With fail-close mode, all traffic on the interface is dropped except for the traffic you specifically identify in the fail-close ACL. Fail-close mode essentially shuts down the interface until the group member successfully registers with the key server and downloads the required keys and security policy and associations. Note that the use of fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs (see Understanding Devices Supported by Each IPsec Technology , on page 1083).

Fail-close mode is used only during the initial registration. If a group member has already successfully registered, the group member keeps the downloaded policy from the key server even if future registrations fail. However, if you use the **clear crypto gdoi** command on the group member, the subsequent registration attempt is considered a first-time attempt and fail-close mode is enforced.

You configure fail-close mode on the individual group members as described in Configuring GET VPN Group Members , on page 1280. Thus, you can enable the mode on selected group members rather than on all of them. You must specify a fail-close ACL to ensure that you do not lock yourself (and Security Manager) out of the device, preventing configuration updates and maintenance until registration succeeds.

The fail-close ACL is an extended ACL policy object and is configured as part of a crypto map on the device. You configure the rules from the perspective of the group member. Use the following tips to help you create an appropriate fail-close ACL:

- You can configure both **permit** and **deny** statements. In the fail-close ACL, "permit" means "do not send this traffic," whereas "deny" means "send this traffic in clear text." This behavior is different from that of the typical crypto map ACL, where the statements have the following meaning:
  - **Permit**—Means "encrypt this traffic." Because the group member does not have the IPsec security association required to encrypt the traffic prior to registration, the result is that the traffic is dropped.
  - **Deny**—Means "do not encrypt this traffic." In a typical crypto map ACL, a deny statement results in the matching packet being compared to the next crypto map ACL configured on the device (if any). However, if traffic matches a deny statement in the fail-close ACL, all crypto map ACL processing ends and the traffic is allowed in clear text.

The reason deny works this way in fail-close mode is because fail-close includes an implicit ACL statement that gets added at the bottom of the list of crypto map ACLs. This statement is **permit ip any any**, which matches all traffic. Because there is no IPsec security association due to the fact that registration has yet to occur, there is no way to encrypt the remaining traffic and it is dropped.

Note that because of this final permit ip any any statement, you might be able to limit yourself to deny statements in your fail-close ACL.

- The fail-close ACL is processed sequentially after the optional group member security policy ACL. However, all statements in the group member security policy ACL must be deny statements, which indicate that matching traffic should be sent in clear text. Because the security policy is processed according to normal crypto map rules, traffic that matches deny statements is subsequently compared to the fail-close ACL. If the fail-close ACL does not have matching deny statements, the traffic will subsequently be dropped by the implicit final fail-close permit ip any any statement.

Therefore, if you use a group member security policy ACL, and you want the identified traffic to be sent in clear text regardless of the registration status of the group member, your fail-close ACL should contain all of the same statements contained in the security policy ACL at the least. It might even be possible to use the same ACL object for both ACLs.

For more information about group member security policies, see Understanding the GET VPN Security Policy and Security Associations , on page 1270.

- The fail-close ACL is inserted as the final crypto map ACL. Thus, if you configure other features on the GET VPN interface that use crypto maps, any traffic identified on deny statements in those other ACLs will also get trapped (and dropped) by the fail-close ACL and the implicit final permit ip any any statement. Thus, configuring fail-close mode for GET VPN can influence the non-GET VPN services you configure on the interface.
- Upon successful registration, the fail-close ACL and the implicit final permit ip any any statement are removed from the crypto maps. These policies are not persistent.
- You should consider including the following rules in the fail-close ACL policy object. Remember that these rules are from the perspective of the group member:
  - SSH, SSL (HTTPS) traffic—You, and Security Manager, need to be able to access the device to configure it. To ensure that you do not lock down the device, include deny statements for SSH and SSL. For SSH, **deny tcp any eq 22 <host or network address>**. For SSL, **deny tcp any eq 443 <host or network address>**. If you specify host addresses, ensure that the Security Manager server is one of the hosts.
  - Routing traffic—To enable routing, allow the traffic for your routing process. For example, if you are using OSPF, **deny ospf any any**.
  - GDOI traffic—Regardless of the contents of the fail-close ACL, the device looks for GDOI registration messages, so you do not need to explicitly allow them to enable successful registration. However, if a group member (1) is in the path between the key server and another group member (2), a registration failure by group member (1) will prevent successful registration by the blocked group member (2). For registration on group member (2) to succeed, the fail-close ACL on group member (1) would have to allow GDOI traffic to pass. Thus, you might want to make it a general practice to allow GDOI traffic in the fail-close ACL: **deny udp any eq 848 any eq 848**.

Understanding the GET VPN Security Policy and Security Associations

GET VPN uses crypto map access control lists (ACLs) to identify the traffic that needs to be encrypted in the VPN. These ACLs also identify traffic that should be sent as clear text instead of being encrypted (essentially, traffic that lies outside of the VPN). The collection of these ACLs define the security policy for the VPN.

GET VPN provides a multi-layered security policy. You define the general policy for the entire VPN on the key server, but you can also define a separate security policy on group members to account for local variations. The group member security policy always takes priority over the policy received from the key server. When the group member registers with the key server, the group member downloads the key server's security policy and associations and the group member creates a new, single security policy crypto map ACL by concatenating the individual security policies in this order: first, the group member's ACL; second, the key server's first ACL; third, and so forth, any additional ACLs from the key server in the order defined on the key server. It is important to understand that these merged ACLs are treated as a single ACL; they are not searched as separate ACLs. Thus, if traffic matches a deny statement from the group member's ACL, that traffic is never tested against any ACL rules downloaded from the key server.

Tip If a group member leaves the GET VPN, the ACLs downloaded from the key server are removed, but the group member security policy ACL is retained and remains configured on the device.

In GET VPN security policy ACLs (and crypto map ACLs in general), the permit and deny keywords have special meaning:

- **Permit**—Means "encrypt this traffic." Permit entries are allowed only in the security policy ACLs defined on the key server (in the **Group Encryption Policy**), because encrypted traffic needs to have a full IPsec security association, which includes the transform set used for encrypting traffic, and anti-replay and IPsec lifetime configurations. If a packet matches a permit entry, but no IPsec SA exists for that packet, the packet is dropped.

Normally, your permit rules should be symmetric, that is, the source and destination addresses should be the same. If you need to specify different source and destination addresses, you must create two rules; the second rule should be a mirror image of the first rule, with the source and destination address switched.

- **Deny**—Means "do not encrypt this traffic." In practice, this typically means that the traffic that matches the deny statement is sent in the clear. However, if you configure other features that use crypto maps, "denied" traffic is actually compared to subsequent (lower priority) crypto map ACLs to see if there is a match. IPsec security associations (SAs) are not generated for deny rules.

Following is a summary of the security policies that you can configure, in priority order:

- **Group member security policy**—When you configure the group member, as described in Configuring GET VPN Group Members , on page 1280, you can optionally select an ACL policy object that defines the local group member security policy.

This group member ACL policy object is allowed to have deny statements only. You use this ACL to identify any traffic that you want to exclude from encryption and send in the clear. For example, if a handful of group members in the group are running a different routing protocol than the usual one, you can configure a local

entry to these group members' security policy ACL to bypass encryption of the routing protocol traffic instead of defining the policy globally at the key server level.

- **Key server security policies and security associations**—When you configure the Group Encryption Policy for the GET VPN, as described in Defining GET VPN Group Encryption , on page 1132, you configure ACLs that identify the traffic that should be encrypted and protected in the VPN.

The security policies on the key server are coupled with transform sets and other settings to define security associations; two IPsec security associations (SAs) are actually configured for every rule within the ACL, and these SAs define how the selected traffic should be encrypted. Thus, all group members use the same group SAs and they do not need to negotiate them with each other.

Because the key server policy is appended to the group member policy, the policy might be as simple as **permit ip any any**, that is, encrypt all traffic that has not been excluded by the group member policy.

However, you can create more complex sets of security policies and associations, setting up several separate ACL policy objects that are coupled to different transform sets to define different types of encryption.

If you create more than one security association, you must identify their order, and they are appended to the group policy in that order. Remember, the end result is a single ACL, so if you include a deny statement in the first ACL, any permit rules for the same traffic in subsequent security associations are ignored, and the traffic is sent in clear text rather than being encrypted.

Note When you consider the security associations defined in the Group Encryption Policy as a whole, you can define up to 100 ACL permit entries. Each permit entry results in a pair of IPsec SAs; the maximum number of IPsec SAs in a group can not exceed 200. It is a best practice to summarize interesting traffic to as few permit entries as possible, and to build symmetric policies, where the source and destination addresses are the same. Unlike traditional IPSec policies, where source and destination address ranges must be uniquely defined, GET VPN is optimized when the source and destination address range are the same. If you configure a rule that has different source and destination addresses, you must also configure the mirrored rule (where the source and destination address are flipped), meaning that four SAs are consumed.

In addition to these security policies, there is an additional fail-close ACL that influences traffic patterns if you configure fail-close mode on a group member. For a complete discussion, see Configuring Fail-Close to Protect Registration Failures , on page 1268.

Understanding Time-Based Anti-Replay

Anti-replay is an important feature in a data encryption protocol such as IPSec (RFC 2401). Anti-replay prevents a third party from eavesdropping on an IPsec conversation, stealing packets, and injecting those packets into a session at a later time. The time-based anti-replay mechanism helps ensure that invalid packets are discarded by detecting the replayed packets that have already arrived at an earlier time.

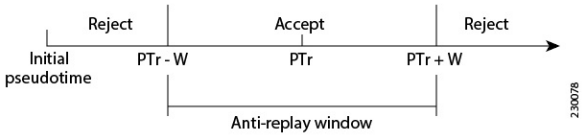
GET VPN uses the Synchronous Anti-Replay (SAR) mechanism to provide anti-replay protection for multisender traffic. SAR is independent of real-world Network Time Protocol (NTP) clock or sequential-counter mechanisms (which guarantee packets are received and processed in order). A SAR clock advances regularly. The time tracked by this clock is called pseudotime. The pseudotime is maintained on the key server and is sent periodically to the group members within a rekey message as a timestamp field called pseudoTimeStamp. Group members have to be resynchronized to the pseudotime of the key server periodically. The pseudotime of the key server starts ticking from when the first group member registers. Initially, the key server sends the current pseudotime value of the key server and window size to group members during the registration process. New attributes, such as time-based replay-enabled information, window size, and the pseudotime of the key server, is sent under the SA payload (TEK).

The group members use the pseudotime to prevent replay as follows: the pseudoTimeStamp contains the pseudotime value at which a sender created a packet. A receiver compares the pseudotime value of senders with its own pseudotime value to determine whether a packet is a replayed packet. The receiver uses a time-based anti-replay window to accept packets that contain a timestamp value within that window. The window size is configured on the key server and is sent to all group members.

The following figure illustrates an anti-replay window in which the value PTr denotes the local pseudotime of the receiver, and W is the window size.

You configure anti-replay in the security association definitions in the Group Encryption Policy. For more information, see Defining GET VPN Group Encryption , on page 1132 and Add New or Edit Security Association Dialog Box , on page 1136.

Figure 39: Anti-Replay Window



Configuring GET VPN

To configure a full mesh VPN with group encrypted transport (GET), use the Create VPN wizard as described in Creating or Editing VPN Topologies , on page 1103. When you finish the wizard, you are asked if you want to synchronize RSA keys, which is required for normal VPN functioning; for detailed information, see Generating and Synchronizing RSA Keys , on page 1273.

If you select multicast as the rekey transport mechanism, you must enable multicast on all key servers and the desired group members. For more information, see Choosing the Rekey Transport Mechanism , on page 1266.

You can change only the name and description of a GET VPN using the Edit VPN wizard. If you need to make changes to other policies and settings, open the policies from the Site-to-Site Manager page, as follows:

- For ISAKMP and IPSec settings, select **Global Settings for GET VPN**. See Configuring Global Settings for GET VPN , on page 1276.
- For IKE proposal policies, select **IKE Proposal Policy for GET VPN**. See Configuring the IKE Proposal for GET VPN , on page 1275.
- For security associations (ACL rules) and IPSec policies, select **Group Encryption Policy > Security Associations**. See Defining GET VPN Group Encryption , on page 1132.
- For preshared key policies, select **IKEv1 Preshared Key**. See Configuring IKEv1 Preshared Key Policies , on page 1198.
- For public key (PKI) policies, select **Public Key Infrastructure**. See Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204.
- For rekey settings, select **Group Encryption Policy > Group Settings**. See Defining GET VPN Group Encryption , on page 1132 and Generating and Synchronizing RSA Keys , on page 1273.
- For key server configuration, including RSA key synchronization, select **Key Servers**. See Configuring GET VPN Key Servers , on page 1278 and Generating and Synchronizing RSA Keys , on page 1273.
- For group membership and endpoint settings, select **Group Members**. See Configuring GET VPN Group Members , on page 1280.

Generating and Synchronizing RSA Keys

When you specify the RSA key label in the Group Encryption Policy (as described in Defining GET VPN Group Encryption , on page 1132, the corresponding RSA key (public and private keys) needs to be configured on all key servers in the GET VPN topology. The key can either be a pre-existing key that you defined on the device, or it could be a new key label, and Security Manager can generate the key for you and synchronize all key servers to use the same key.

You can use the following methods to have Security Manager generate and synchronize the RSA key:

- When creating a new GET VPN using the Create VPN wizard, you are asked at the end of the wizard if you want to synchronize the keys. If you click **Yes**, Security Manager does the key synchronization

immediately, and generates a new key if the key does not already exist. For information on using the Create VPN wizard, see Creating or Editing VPN Topologies , on page 1103.

- For an existing GET VPN, you can click the **Synchronize Keys** button on the Key Servers policy. Use this process whenever you add key servers or generate a new key on the primary key server. For information on configuring key server settings for existing topologies, see Configuring GET VPN Key Servers , on page 1278.

Tip For existing GET VPN topologies, if you want to generate a new RSA key, it might be easiest to update the Group Encryption Policy to specify a new, unused RSA key label, then click the Synchronize Keys button in the Key Servers policy. Because the key will not exist on any key server, Security Manager will generate the new key and import it into all key servers. You can then manually delete the old key from each key server.

Following are the uses for the RSA key:

- The key server uses the private RSA key to authenticate rekey messages from the group members.
- The key server provides the public RSA key to group members during registration.
- The key server uses the private key to sign the key encryption key (KEK) and traffic encryption key (TEK). The absence of an RSA key prevents the key server from creating the KEK and TEK.
- The RSA key is also used to sign messages between cooperative key servers.

When you start the RSA key synchronization process, the Synchronize Keys dialog box opens and shows you the overall progress as well as the results for each key server. (You can click the **Abort** button at any time to stop the process.) Security Manager performs the following steps:

1. Logs into all key servers and retrieves the RSA key information from each of them for the RSA key label configured for the VPN.
2. Determines whether any key server has a key with the required label:
   - If no key server has an RSA key with the required label, Security Manager generates the key on the primary key server (the one with the highest priority).
   - If one or more key server does not have the key, but all of the key servers that do have the key have the identical keys, Security Manager uses the existing key on any key server that has it.
   - If more than one key server has the key, but the contents of the key is different among the servers, you are asked if Security Manager can overwrite the keys. If you click **Yes**, Security Manager uses the existing key on the primary key server.

If you click **No**, you can log into the key servers outside of Security Manager and manually adjust the keys according to your requirements. However, all key servers must have the same key contents for the RSA key. See below for an explanation of the process.

1. Creates an exportable version of the key.
2. Imports the key into each of the remaining key servers.

Tip For the synchronization process to succeed, the devices must be online and reachable and you must have Deploy authorization. If the device connection fails or times out, ensure that you can ping the key server from the Security Manager server. If it is your practice to deploy to file instead of to live devices, you might need to manually generate and synchronize the keys as described below. If you do not have sufficient authorization, you are prevented from initiating the process; someone else must do it.

Manually Generating and Synchronizing the RSA Key

If you do not want Security Manager to generate and synchronize keys, or if for some reason Security Manager cannot complete the process, you can manually generate and synchronize keys using the following sequence in Privileged EXEC (enable) configuration mode:

1. Generate the key on a key server using the following command, where **rekeyrsa** is the name of the key (you can specify a name of your choosing). You must make the key exportable.

crypto key generate rsa general-keys label rekeyrsa modulus 1024 exportable

1. Create an exportable copy of the key using the following command, where **passphrase** is a string used to encrypt the key for import (you can specify your own pass phrase):

crypto key export rsa rekeyrsa pem terminal 3des passphrase

This command prints out the public and private keys to the terminal, where you can copy them to the clipboard for import into the other key servers. The keys are demarcated by **----BEGIN/END PUBLIC KEY----** and **----BEGIN/END RSA PRIVATE KEY----**.Note that you can also export to a URL; see the *Cisco IOS Security Command Reference* on Cisco.com for detailed usage information.

1. Import the key into each of the other key servers using the following command:

crypto key import rsa rekeyrsa pem exportable terminal passphrase

When copying and pasting the keys, include the begin/end lines.

Configuring the IKE Proposal for GET VPN

Use the IKE Proposal for GET VPN page to define the IKE proposal to be used by the GET VPN topology. The IKE proposal is configured on the key servers and the group members.

These settings are for the ISAKMP security association (SA). If you are using a single key server, the ISAKMP SA is not used after initial group member registration. If you are using more than one key server (cooperative key servers), the ISAKMP SA is needed for communications among the key servers.

To open the IKE Proposal for GET VPN page:

- (Site-to-Site VPN Manager Window , on page 1093) Select an existing GET VPN topology and then select **IKE Proposal for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN > IKE Proposal for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

Table 360: IKE Proposal for GET VPN Policy

Element	Description
IKE Proposal	The IKE proposal policy object that defines the settings you want to use. There are several predefined objects that you might be able to use as is. Click **Select** to open the list of existing IKE proposal objects. The object you select needs to use the same authorization method you are configuring for the group (for example, an object name with the prefix **preshared** when using preshared keys, or with the prefix **cert** when using Public Key Infrastructure (PKI) certificates). When you select an object and click **OK**, the settings defined in the object are displayed in the IKE Proposal Settings display fields. You can also see the settings by editing them in the selection list. If you do not find an appropriate pre-existing object, click the **Add (+)** button in the selection list and create a new object (see Configuring IKEv1 Proposal Policy Objects , on page 1160 for more information and detailed descriptions of the options).
IKE Proposal Overrides	The number of seconds that the ISAKMP SA for key servers and group members is valid. When the lifetime is exceeded, the SA expires and must be renegotiated between the peers. Values can be 1 to 86400. • If you are using cooperative key servers (more than one key server), set the key server lifetime high. The default 86400 is appropriate. • If you are using a single key server, you can set the lifetime low (but not less than 60 seconds) so that the ISAKMP SA is not retained unnecessarily. It is not used after a group member registers. • We recommend that you set the group member lifetime low as compared to the key server lifetime, especially when cooperative key servers are configured.

Configuring Global Settings for GET VPN

Use the Global Settings for GET VPN page to define global settings for ISAKMP and IPsec that apply to devices in your GET VPN topology.

Note The lifetime settings in this policy do not apply to the ISAKMP security association lifetime for the key server and group members. Those lifetime values are configured in the IKE Proposal for GET VPN policy. For more information, see Configuring the IKE Proposal for GET VPN , on page 1275.

To open the Global Settings for GET VPN page:

- (Site-to-Site VPN Manager Window , on page 1093) Select an existing GET VPN topology and then select **Global Settings for GET VPN** in the Policies selector.
- (Policy view) Select **Site-to-Site VPN** > **Global Settings for GET VPN**, and then select an existing policy or create a new one.

The following table explains the settings you can configure in this policy.

Table 361: Global Settings for GET VPN

Element	Description
Enable Keepalive (Key Servers Only)	Whether to enable dead peer detection (DPD) keepalive messages between key servers. If there is more than one key server (cooperative key servers), you should enable periodic keepalive so the servers know each other's status and can elect a new primary server when necessary. Configure the following settings: • **Interval**—When you also select **Periodic**, the number of seconds between DPD messages. If you do not select Periodic, it is the number of seconds during which traffic is not received from the peer before DPD retry messages are sent. The range is from 10 to 3600 seconds. • **Retry**—The number of seconds between DPD retry messages if the DPD retry message is missed by the peer; the range is from 2 to 60 seconds. The default DPD retry message is sent every 2 seconds. Five aggressive DPD retry messages can be missed before the key server is marked as down. • **Periodic**—Whether to send DPD messages at regular intervals (regardless of traffic received from the other key servers). For GET VPN, you should select Periodic.
Identity	During Phase I IKE negotiations, peers must identify themselves to each other. Select the ISAKMP identity to use: • Address—(Default) The IP address of the interface that participates in IKE negotiations. Use the address if only one interface participates in negotiations, and its IP address is known (static). • Hostname—The fully-qualified host name (for example, router1.example.com). • Distinguished Name
SA Requests System Limit	The maximum number of SA requests allowed before IKE starts rejecting them. The specified value must equal or exceed the number of peers, or the VPN tunnels might be disconnected. You can enter a value in the range of 0-99999.

Element	Description
SA Requests System Threshold	The percentage of system resources that can be used before IKE starts rejecting new SA requests. The default is 75 percent.
IPsec Settings	Select **Enable Lifetime** if you want to change the default lifetime settings for IPsec SAs. You can configure a lifetime based on the volume of traffic (in kilobytes) between group members, seconds, or both. The key expires when either of the values is reached. The defaults (which are configured even if you do not select this option) are: • **Lifetime (secs)**—3600 seconds (one hour). • **Lifetime (kbytes)**—4,608,000 kilobytes. **Tip** You can override these values for the traffic encryption key when configuring a security association. See Defining GET VPN Group Encryption , on page 1132 and Add New or Edit Security Association Dialog Box , on page 1136.

Related Topics

- Understanding IKE , on page 1153

Configuring GET VPN Key Servers

Use the Key Servers policy to define key servers to be used by a GET VPN topology.

To open the Key Servers policy, in the Site-to-Site VPN Manager Window , on page 1093, select an existing GET VPN topology, then select **Key Servers** from the Policies list.

The table lists the key servers used in the VPN, showing the device name, identity, priority, and registration interface. For detailed information about these attributes, see Edit Key Server Dialog Box , on page 1279.

- To add a key server to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as key servers are shown.
- To edit the characteristics of a key server, select it and click the **Edit Row** button. Fill in the Edit Key Server dialog box (see Edit Key Server Dialog Box , on page 1279).
- To delete a key server, select it and click the **Delete Row** button.
- To synchronize the RSA keys among the key servers, so that they all use the identical key, click the **Synchronize Keys** button. For detailed information about the key synchronization process, including when and why you would do it, see Generating and Synchronizing RSA Keys , on page 1273.

  To change the order of a key server when using cooperative key servers, select it and click the up or down arrow button. This order does not define which server is the primary key server (this is determined by the Priority value, the higher the value, the higher the likelihood that the server will be elected the primary key server).

Instead, the order determines the default order in which group members will try to register with a key server. Group members register with the first key server in the list. If the first key server cannot be reached, group members register with the second key server, and so on. For more information about key server redundancy, see Configuring Redundancy Using Cooperative Key Servers , on page 1267. Note that you can override this order for individual group members; see Configuring GET VPN Group Members , on page 1280 and Edit Group Member Dialog Box , on page 1281.

Tip You can toggle between showing the interface roles or the actual interfaces defined by those roles in the Identity and interfaces columns using the **Show** field below the table.

Add Key Server, Group Member Dialog Box

Use the Add Key Server and Add Group Member dialog boxes to select key servers or group members to be used in the GET VPN topology. Select the check box next to the desired devices and click **OK**.

Navigation Path

To add key servers or group members to a GET VPN topology, click the **Add Row (+)** button beneath the Key Server or Group Member table in the **GET VPN Peers** page of the Create VPN wizard, or for existing topologies, the **Key Servers** or **Group Members** policies. For detailed information, see the following topics:

- Defining GET VPN Peers , on page 1138
- Configuring GET VPN Key Servers , on page 1278
- Configuring GET VPN Group Members , on page 1280

Edit Key Server Dialog Box

Use the Edit Key Servers dialog box to change the attributes defined for a key server in a GET VPN topology.

Navigation Path

- (Create VPN Wizard) Go to the GET VPN Peers Page, select a key server and click the **Edit Row** button. See Defining GET VPN Peers , on page 1138.
- (Site-to-Site VPN Manager Window , on page 1093) Select the **Key Servers** policy, select a key server and click the **Edit Row** button. See Configuring GET VPN Key Servers , on page 1278.

Related Topics

- Understanding Group Encrypted Transport (GET) VPNs , on page 1261

Field Reference

Table 362: Edit Key Server Dialog Box

Element	Description
Identity Interface	The interface that group members use to identify the key server and register with it. The default is the Loopback interface role, which identifies all Loopback interfaces.
Priority	A number between 1-100 that designates the role of the key server, either primary or secondary. The key server with the highest number becomes the primary key server. If two or more key servers are assigned the same priority, the device with the highest IP address is used. The default priority is 100 for the first key server, 95 for the second, and so on. **Note** There can be more than one primary key server if the network is partitioned.
Registration Interface	The interface on which group domain of interpretation (GDOI) registrations can be accepted. If you do not specify a registration interface, GDOI registrations can occur on any interface.

Configuring GET VPN Group Members

Use the Group Members policy to define the group members in a GET VPN topology.

To open the Group Members policy, in the Site-to-Site VPN Manager Window , on page 1093, select an existing GET VPN topology, then select **Group Members** from the Policies list.

The group members table lists the members of the GET VPN, showing the device name, GET-enabled interface, local interface, and security policy. For detailed information about these attributes, see Edit Group Member Dialog Box , on page 1281.

- To add a group member to the table, click the **Add Row** button and select the device from the list presented. Only devices that can be included as group members are shown.
- To edit the endpoint characteristics of a group member, select it and click the **Edit Row** button. Fill in the Edit Group Member dialog box (see Edit Group Member Dialog Box , on page 1281).

If you select multiple group members in the table, you can also right-click and select the following commands to edit just these attributes:

- **Edit Key Server Order**—To change the key server list and priority order for the selected group members.
- **Edit Passive SA Mode**—To change whether the selected group members use passive SA mode.
- To delete a group member, select it and click the **Delete Row** button.

Tip You can toggle between showing the interface roles or the actual interfaces defined by those roles in the interfaces columns using the **Show** field below the table.

- Configuring VPN Topologies in Device View , on page 1094
- Filtering Tables , on page 50

Edit Group Member Dialog Box

Use the Edit Group Members dialog box to change the attributes defined for a group member of a GET VPN topology.

Tip If you selected multiple devices and chose an edit command from the right-click menu, this dialog box shows only those options related to the edit command you chose.

Navigation Path

- (Create VPN Wizard) Go to the GET VPN Peers page, select a group member and click the **Edit Row** button. See Defining GET VPN Peers , on page 1138.
- (Site-to-Site VPN Manager Window , on page 1093) Select a GET VPN topology, then select the **Group Members** policy. Select a group member and click the **Edit Row** button. See < Configuring GET VPN Group Members , on page 1280.

Field Reference

Table 363: Edit Group Member Dialog Box

Element	Description
GET-Enabled Interface	The VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. You can configure multiple interfaces. Enter the name of the interface or interface role, or click **Select** to select it from a list or to create a new interface role.
Interface to be used as local address	The interface whose IP address is used to identify the group member to the key server for sending data, such as rekey information. If GET is enabled on only one interface, you do not need to specify the interface to be used as the local address. If GET is enabled on more than one interface, you must specify the interface to be used as the local address. Enter the name of the interface or interface role, or click **Select** to select it from a list or to create a new interface role.
Security Policy	The local group member security ACL used to deny some group member-specific traffic over and above the security ACL downloaded from the key server. Denied traffic is sent in clear text rather than encrypted. For detailed information, see Understanding the GET VPN Security Policy and Security Associations , on page 1270. Enter the name of the ACL object or click **Select** to select it from a list or to create a new object.
Enable Fail Close Fail Close ACL	Whether to enable fail-close mode on the device, which prevents the device from transmitting clear text traffic before the device successfully registers with the key server. Fail-close mode requires as a minimum Cisco IOS Software release 12.4(22)T or 15.0; you can also configure it on all supported ASRs. **Tip** Fail-close mode is a complex feature, and you must carefully construct the fail-close ACL or you might lock yourself out of the device. Before enabling fail-close mode, read Configuring Fail-Close to Protect Registration Failures , on page 1268. You must select an ACL policy object that identifies allowable clear text traffic (using deny statements), such as SSH and SSL communications with the Security Manager server to allow for configuration updates. Enter then name of the object or click **Select** to select it or to create a new object.
Override Key Servers	Whether to override the key server list configured for the GET VPN topology as a whole for this particular group member. If you select this option, you can choose a subset of the key servers configured for the topology to be used by the selected group member, and change their priority order. This can help you load-balance registration activity among a group of cooperative key servers. For more information, see Configuring Redundancy Using Cooperative Key Servers , on page 1267. Click **Select** to change the key server list and priority order of the key servers using the Key Servers Selection dialog box. A key server must be defined for the GET VPN topology before you can modify its use for a group member.

Element	Description
Enable Passive SA Mode	Whether to put the group member into passive security association (SA) mode, which means the group member installs the SA in the inbound direction only. This means the group member can receive encrypted data, but it sends clear text data only. This mode is useful for testing the VPN only, primarily when you are migrating from an existing VPN to a GET VPN. (The group member must be running Cisco IOS Software version 12.4(22)T or 15.0 at minimum, or be a supported ASR, to use this mode.) This setting is similar to the **Receive Only** setting in the Group Encryption Policy, which applies to the topology as a whole. This group member option overrides the setting in the Group Encryption Policy. For detailed information on how you can use these passive mode features to migrate or test a GET VPN, see Using Passive Mode to Migrate to GET VPN , on page 1283.

Using Passive Mode to Migrate to GET VPN

If you are migrating an existing VPN to the GET VPN technology, especially a clear-text VPN, you can use two features to help you migrate in a phased approach to help prevent network down-time. The features are essentially the same, and involve the passive acceptance of encrypted traffic, but you configure them on different devices in the GET VPN.

Normally, in a fully-deployed GET VPN, traffic is encrypted in both directions (bidirectional security associations, or SAs). However, during testing, you can use passive mode. In passive mode, the group member installs the SA in the inbound direction only, so that the group member receives encrypted traffic but sends traffic in clear text. You can then test the VPN to ensure that it is performing as expected before turning on full encryption.

Use the following features to configure passive mode in a GET VPN:

- **SA Receive-only mode**—You configure receive-only mode for security associations on the key servers in the topology using the Group Encryption Policy. Thus, the setting applies to the entire topology.
- **Passive SA mode**—You configure passive security association mode on individual group members. This setting overrides the SA receive-only setting; thus, you can turn on full encryption for the entire topology, but leave some group members in passive mode. This lets you test the group members in stages and enable full encryption after you verify each member device.

Tip Passive SA mode on group members requires Cisco IOS Software release 12.4(22)T+ or 15.0+, or Release 2.3 (12.2(33)XNC)+ on ASRs.

The following procedure shows an example of the end-to-end migration process you might follow to convert to GET VPN using these passive mode features.

Related Topics

- Understanding Group Encrypted Transport (GET) VPNs , on page 1261
- Configuring GET VPN , on page 1272

Step 1 Create the new GET VPN topology in Security Manager using the Create VPN wizard. When you are in the wizard, ensure that you make these selections:

- When selecting devices, choose the key servers for the topology, but for group members, select the first set of group members that will be migrated. For more information, see Selecting Devices for Your VPN Topology , on page 1108.
- When configuring the group encryption settings, select **Receive Only**. This enables the SA receive-only feature for the entire topology. For more information, see Defining GET VPN Group Encryption , on page 1132.

For information about creating VPNs, see Creating or Editing VPN Topologies , on page 1103.

Step 2 Deploy the configurations to all devices in the VPN. The group members should now be able to receive encrypted traffic but not send it. For information on the deployment process, see the following topics based on the Workflow mode you are using:

- Deploying Configurations in Non-Workflow Mode , on page 408
- Deploying Configurations in Workflow Mode , on page 414

Step 3 Outside of Security Manager, verify that all of the group members are functioning properly.

For example, you can test whether the group members are able to send and receive encrypted packets using some CLI commands on the group member devices:

- On group member 1, configure the following command, where “groupexample” is the name of the GDOI group for the VPN. This command sets the device to accept encrypted or clear text, but to send only clear text.

crypto gdoi gm group groupexample ipsec direction inbound only

- On group member 2, configure the following command. This command sets the device to accept encrypted or clear text, but to send encrypted text.

crypto gdoi gm group groupexample ipsec direction inbound optional

- Ping group member 1 from group member 2. Group member 2 should encrypt the packet before sending it, and group member 1 should accept it and decrypt it. If you ping member 2 from member 1, the ping should be sent in clear text and accepted by member 2. Ensure that your ACLs allow pings.

Step 4 In Security Manager, select **Manage > Site-to-Site VPNs** (see Site-to-Site VPN Manager Window , on page 1093).

Select the GET VPN topology, then select **Group Members**.

Add the remaining group members that you want to add to the topology (click the **Add Group Member (+)** button, select the devices, and click **OK**).

If you want to use passive mode to test the new group members before enabling full encryption, ensure that you select **Enable Passive SA Mode** when configuring the group members:

- To configure an individual group member, select it and click the **Edit Group Member (pencil)** button.
- To enable passive mode on more than one device at a time, use Shift+click or Ctrl+click to select multiple devices, then right-click and select **Edit Passive SA Mode**. You can then select the option and click **OK**.

For more information on configuring group members, see Configuring GET VPN Group Members , on page 1280.

Step 5 Deploy the configuration changes to all devices in the VPN. All devices should be operating in passive mode at this point.

Step 6 In the Site-to-Site VPN Manager, select the GET VPN topology, then select **Group Encryption Policy**.

Deselect **Receive Only**. This turns off SA receive-only mode at the topology level.

Step 7 Deploy the configuration changes to all devices in the VPN. Now the GET VPN should be operating in fully encrypted mode for the original group members that you tested. Any new members that you added with passive SA mode enabled should be receiving encrypted traffic and sending clear text traffic.

Step 8 Use the following process to verify the new devices and to turn off passive mode. You can follow this process for all new devices at once, or you can do smaller groups of them at a time. You can also use this process for new group members as you extend your network. Iterate the following steps as appropriate:

a) Verify that the new group members are functioning properly using the same techniques that you used to verify the original group members.

b) When you are ready to move a set of group members to fully-encrypted mode, in the Site-to-Site VPN Manager, select the GET VPN topology and select **Group Members**.

c) Select all passive mode group members that should use full encryption, right-click and select **Edit Passive SA Mode**. Deselect the **Enable Passive SA Mode** option and click **OK**.

d) Deploy configurations to all devices in the VPN, not just the ones whose passive mode you changed. Normally, you should not deploy to less than all devices in a VPN.

Troubleshooting GET VPN Configurations

If after provisioning and deploying GET VPN using Security Manager, the GET VPN is not working, check the following:

- Ensure that the RSA key is synchronized among all cooperative key servers (that is, the RSA key is the same). For information on how to synchronize keys, see Generating and Synchronizing RSA Keys , on page 1273.
- If desired traffic is not being encrypted, make sure the key server security policy ACL (security association) has a permit ACE for the desired traffic. For asymmetric ACEs (where the source and destination addresses are different), ensure that there is a mirrored ACE (with the source and destination addresses reversed). For more information, see Understanding the GET VPN Security Policy and Security Associations , on page 1270.
- For multicast rekey, make sure that the network is multicast enabled and that all key servers and most group members are configured to enable multicast. You must enable multicast on the devices directly; Security Manager does not provision the commands required to enable multicast. For more information, see Choosing the Rekey Transport Mechanism , on page 1266.
- When using multicast rekey, check whether there is a deny ACE in the key server security ACL for the multicast group address to prevent encryption of multicast rekey messages.
- Check that the local security ACL on the group member has only deny ACEs. If you include a permit statement in an attempt to identify traffic that should be encrypted, the matching traffic is actually dropped because there is no corresponding IPsec SA. Because the permit entry is defined in the group member, the key server is not aware of it and cannot generate the required IPsec SA. For more information, see Understanding the GET VPN Security Policy and Security Associations , on page 1270.

- For group member authorization using certificates, check that the ISAKMP authentication uses certificates and that a PKI policy is configured. ISAKMP identity on the group member and key server should be set to use the distinguished name (dn).
- Normally, network address translation (NAT) is not used in the type of WAN environments where GET VPN is deployed. However, if you use NAT, ensure that the security policy ACL has permit statements for the translated addresses. Also, if you are using Network Address Translation-Traversal (NAT-T), the GDOI protocol port changes to 4500.
- A control plane replay protection mechanism was added to Cisco IOS Software releases 12.4(15)T10, 12.4(22)T3, 12.4(24)T2, 15.0(1)M, and 12.2(33)XNE. This mechanism is not backward-compatible, so if any GET VPN group member in the network is running any of these (or later) releases, you must also upgrade all key servers to one of these (or newer) releases. Otherwise, network disruption might occur because of a failed rekey, which causes one of the following system logging (syslog) messages to appear:
  - %GDOI-3-GDOI_REKEY_SEQ_FAILURE: Failed to process rekey seq # 2 in seq payload for group get-group, last seq # 6
  - %GDOI-3-PSEUDO_TIME_TOO_OLD: Rekey received in group get-group is too old and failed PST check: my_pst is 184 sec, peer_pst is 25 sec, allowable_skew is 10 sec

Tip For additional troubleshooting tips from the CLI configuration perspective, including information about valuable **show** commands, see Cisco Group Encrypted Transport VPN on Cisco.com.

CHAPTER 30

Managing Remote Access VPNs: The Basics

Cisco Security Manager lets you configure both remote access IPSec VPNs and remote access SSL VPNs. Security Manager provides flexible configuration and management of remote access VPNs:

You can discover existing remote access VPN configuration policies from existing live devices or from configuration files. Then, you can change and deploy new or updated policies, as necessary.

You can use the configuration wizard to help you quickly and easily set up these two types of remote access VPNs with basic functionality.

If you know the functions and feature your network requires, you can configure remote access VPNs independently. You can also use the wizard to create a basic remote access VPN and then configure additional features that are not included in the wizard separately.

In addition, Cisco Security Manager provides flexibility in how remote access VPN configuration policies are assigned: Device view or Policy view.

For some policies, you can also assign either the factory default policy (a private policy), or a shared policy that you created using Security Manager.

This chapter contains the following topics:

Understanding Remote Access VPNs

Security Manager supports two types of remote access VPNs: IPSec and SSL.

This section contains the following topics:

Understanding Remote Access IPSec VPNs

Remote access IPSec VPNs permit secure, encrypted connections between a company's private network and remote users, by establishing an encrypted IPSec tunnel across the Internet using broadband cable, DSL, dial-up, or other connections.

A remote access IPSec VPN consists of a VPN client and a VPN headend device, or VPN gateway. The VPN client software resides on a user's workstation and initiates the VPN tunnel access to the corporate network. At the other end of the VPN tunnel is the VPN gateway at the edge of the corporate site.

When a VPN client initiates a connection to the VPN gateway device, negotiation consists of authenticating the device through Internet Key Exchange (IKE), followed by user authentication using IKE Extended Authentication (Xauth). Next the group profile is pushed to the VPN client using mode configuration, and an IPsec security association (SA) is created to complete the VPN connection.

Tip For a remote access IPsec VPN hosted on an ASA 8.4(x) device, you have the option of configuring IKE version 2 (IKEv2). If you decide to use IKEv2, you must configure several SSL VPN policies in addition to the regular IPSec policies. The user also must use the AnyConnect 3.0+ VPN client to make an IKEv2 connection. For more information, see - Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311.

For remote access IPSec VPNs, AAA (authentication, authorization, and accounting) is used for secure access. With user authentication, a valid user name and password must be entered before the connection is completed. User names and passwords can be stored on the VPN device itself, or on an external AAA server that can provide authentication to numerous other databases. For more information on using AAA servers, see Understanding AAA Server and Server Group Objects , on page 256.

Note Site-to-site Easy VPN topologies use some of the same policies and policy objects that are used in remote access IPsec VPNs, but the policies are kept distinct from the remote access policies. In Easy VPN, the remote clients are hardware clients, such as routers, whereas in remote access IPSec VPNs, remote clients are workstations or other devices that use VPN client software. For more information, see Understanding Easy VPN , on page 1245.

Understanding Remote Access SSL VPNs

An SSL VPN lets users access enterprise networks from any Internet-enabled location. Users can make clientless connections, which use only a Web browser that natively supports Secure Socket Layer (SSL) encryption, or they can make connections using a full client (such as Secure Client) or a thin client.

Note SSL VPN is supported on ASA 5500 devices running software version 8.0 and later, running in single-context and router modes, on Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager.

On IOS devices, remote access is provided through an SSL-enabled VPN gateway. Using an SSL-enabled Web browser, the remote user establishes a connection to the SSL VPN gateway. After the remote user is authenticated to the secure gateway via the Web browser, an SSL VPN session is established and the user can access the internal corporate network. A portal page lets users access all the resources available on the SSL VPN networks.

On ASA devices, remote users establish a secure, remote access VPN tunnel to the security appliance using the Web browser. The SSL protocol provides the secure connection between remote users and specific, supported internal resources that you configure at a central site. The security appliance recognizes connections that need to be proxied, and the HTTP server interacts with the authentication subsystem to authenticate users.

User authentication can be done using usernames and passwords, certificates, or both.

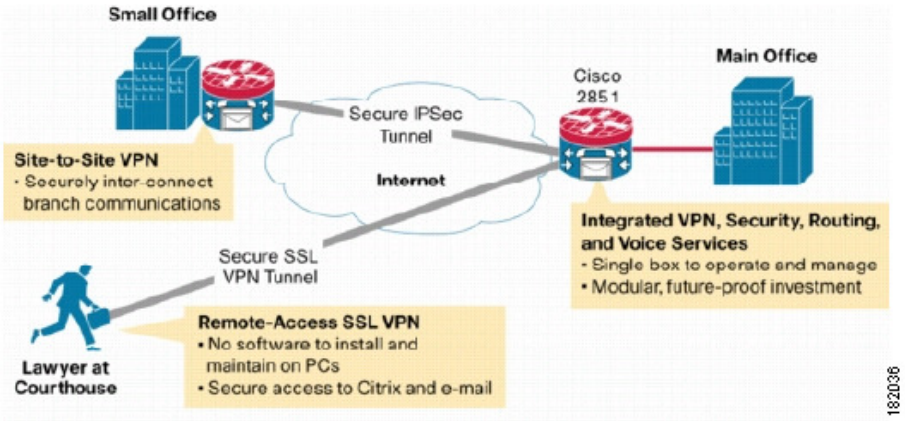
Note Network administrators provide user access to SSL VPN resources on a group basis instead of on an individual user basis.

This section contains the following topics:

Remote Access SSL VPN Example

The following illustration shows how a mobile worker can access protected resources from the main office and branch offices. Site-to-site IPsec connectivity between the main and remote sites is unaltered. The mobile worker needs only Internet access and supported software (Web browser and operating system) to securely access the corporate network.

Figure 40: Secure SSL VPN Access Example



SSL VPN Access Modes

SSL VPN provides three modes of remote access on IOS routers: Clientless, Thin Client and Full Client. On ASA devices, there are two modes: Clientless (which includes Clientless and Thin Client port forwarding) and Secure Client (a full client).

Clientless Access Mode

In Clientless mode, the remote user accesses the internal or corporate network using a Web browser on the client machine. No applet downloading is required.

Clientless mode is useful for accessing most content that you would expect in a Web browser, such as Internet access, databases, and online tools that employ a Web interface. It supports Web browsing (using HTTP and HTTPS), file sharing using Common Internet File System (CIFS), and Outlook Web Access (OWA) email. For Clientless mode to work successfully, the remote user's PC must be running Windows 2000, Windows XP, or Linux operating systems.

Browser-based SSL VPN users connecting from Windows operating systems can browse shared file systems and perform the following operations: view folders, view folder and file properties, create, move, copy, copy from the local host to the remote host, copy from the remote host to the local host, and delete. Internet Explorer indicates when a Web folder is accessible. Accessing this folder launches another window, providing a view of the shared folder, on which users can perform web folder functions, assuming the properties of the folders and documents permit them.

Thin Client Access Mode

Thin Client mode, also called TCP port forwarding, assumes that the client application uses TCP to connect to a well-known server and port. In this mode, the remote user downloads a Java applet by clicking the link provided on the portal page. The Java applet acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The Java applet starts a new SSL connection for every client connection.

The Java applet initiates an HTTP request from the remote user client to the SSL VPN gateway. The name and port number of the internal email server is included in the HTTP request. The SSL VPN gateway creates a TCP connection to that internal email server and port.

Thin Client mode extends the capability of the cryptographic functions of the Web browser to enable remote access to TCP-based applications such as Post Office Protocol version 3 (POP3), Simple Mail Transfer Protocol (SMTP), Internet Message Access protocol (IMAP), Telnet, and Secure Shell (SSH).

Note The TCP port-forwarding proxy works only with Sun's Java Runtime Environment (JRE) version 1.4 or later. A Java applet is loaded through the browser that verifies the JRE version. The Java applet refuses to run if a compatible JRE version is not detected.

When using Thin Client mode, you should be aware of the following:

- The remote user must allow the Java applet to download and install.
- For TCP port-forwarding applications to work seamlessly, administrative privileges must be enabled for remote users.
- You cannot use Thin Client mode for applications such as FTP, where the ports are negotiated dynamically. That is, you can use TCP port forwarding only with static ports.

Full Tunnel Client Access Mode

Full Tunnel Client mode enables access to the corporate network completely over an SSL VPN tunnel, which is used to move data at the network (IP) layer. This mode supports most IP-based applications, such as Microsoft Outlook, Microsoft Exchange, Lotus Notes E-mail, and Telnet. Being part of the SSL VPN is completely transparent to the applications run on the client. A Java applet is downloaded to handle the tunneling between the client host and the SSL VPN gateway. The user can use any application as if the client host was in the internal network.

The tunnel connection is determined by the group policy configuration. The SSL VPN client (SVC) or Secure Client is downloaded and installed to the remote client, and the tunnel connection is established when the remote user logs in to the SSL VPN gateway. By default, the client software is removed from the remote client after the connection is closed, but you can keep it installed, if required.

Note Full Tunnel SSL VPN access requires administrative privileges on the remote client.

Understanding and Managing SSL VPN Support Files

SSL VPNs sometimes require supporting files that reside in the device's flash storage. This is especially true of SSL VPNs configured on ASA devices. Supporting files include Cisco Secure Desktop (CSD) packages, Secure Client images, and plug-in files. Security Manager includes many of these files for your use. However, some supporting files, such as graphic files used for portal pages, or client profiles used for Secure Client are not provided by Security Manager.

Typically, you need to create a File Object to specify a supporting file, and you then select the File Object when you create a policy that refers to it. You can create the File Objects that you need when you create the policies, or you can create them before you start defining policies. For more information, see Add and Edit File Object Dialog Boxes , on page 1526.

When you deploy policies to the devices, any supporting files referenced in your policies are copied to the device and placed in flash memory in the \csm folder. For the most part, you do not have to do any manual work to make this happen. The following are some situations where you might need to do some manual work:

- If you are trying to discover existing SSL VPN policies, or rediscover them, file references from the SSL VPN policies must be correct. For detailed information on how supporting files are handled during policy discovery, see Discovering Remote Access VPN Policies , on page 1298.

- If you have configured the ASA device in an Active/Failover configuration, you must get the supporting files onto the failover device. The supporting files are not copied over to the failover device during a failover. You have these choices for getting the files onto the failover device:
  - Manually copy the files from the \csm folder on the active unit to the failover unit.
  - After deploying the policies to the active unit, force a failover and redeploy the policies to the now-active unit.
- If you are using a VPN cluster for load balancing, the same supporting files must be deployed to all devices in the cluster.

Cisco Secure Desktop (CSD) Packages

These packages are for ASA SSL VPNs. You select a package in the Dynamic Access policy. The package you select must be compatible with the ASA operating system version running on the device. When you create a Dynamic Access policy for an ASA device, the version number that is compatible with the device's operating system is displayed in the Version field.

You can find the CSD packages in Program Files\CSCOpx\files\vms\repository\. The file names are in the form securedesktop-asa_k9-*version* .pkg or csd_*version* .pkg, where *version* is the CSD version number such as 3.5.1077.

Following is the CSD compatibility with ASA versions for the CSD packages shipped with Security Manager:

- csd_3_6_181-3.6.181.pkg—ASA 8.4 or later.
- csd_3_5_2008-3.5.2008.pkg—ASA 8.0(4) or later.
- csd_3_5_2001-3.5.2001.pkg—ASA 8.0(4) or later.
- csd_3_5_1077-3.5.1077.pkg—ASA 8.0(4) or later.
- csd_3_5_841-3.5.841.pkg—ASA 8.0(4) or later.
- csd_3_4_2048-3.4.2048.pkg—ASA 8.0(4) or later.
- csd_3_4_1108-3.4.1108.pkg—ASA 8.0(4) or later.
- securedesktop_asa_k9-3.3.0.151.pkg—ASA 8.0(3.1) or later.
- securedesktop_asa-k9-3.3.0.118.pkg—ASA 8.0(3.1) or later.
- securedesktop-asa-k9-3.2.1.126.pkg—ASA 8.0(3) or later.
- securedesktop-asa_k9-3.2.0.136.pkg—ASA 8.0(2) or later.

For more information on CSD version compatibility with ASA versions, see the CSD release notes at http://www.cisco.com/en/US/products/ps6742/prod_release_notes_list.html and Supported VPN Platforms on Cisco.com.

For more information on creating Dynamic Access policies to specify the CSD, see Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427 .

Secure Client Images

These images are for remote access SSL and IKEv2 IPsec VPNs hosted on an ASA. The Secure Client is downloaded to the user's PC and manages the client's VPN connection. Security Manager includes several

Secure Client images, which you can find in Program Files\CSCOpx\files\vms\repository\. The package names indicate the workstation operating system and the Secure Client release number in this general pattern: anyconnect-*client_OS_information -anyconnect_release* .pkg. For example, anyconnect-win-3.0.0610-k9-3.0.0610.pkg is the AnyConnect 3.0(0610) client for Windows workstations. The k9 indicates that the package includes encryption. In this example, the Secure Client release number is repeated; in some file names, the release number appears once.

Packages are available for the following workstation operating systems (OS). For specific information on which OS versions that each client supports, see the documentation for the Secure Client on Cisco.com.

- Linux—Packages start with anyconnect-linux, or anyconnect-linux-64 for 64-bit versions.
- Mac OS—Packages start with anyconnect-macosx for Mac OS X on i386 workstations, and anyconnect-macosx-powerpc for Mac OS X on Power PC workstations.
- Windows—Packages start with anyconnect-win.

You can also download other Secure Client packages to the Security Manager server or your local Security Manager client and use them in remote access policies. However, Security Manager might not be able to configure newer parameters for those clients, although it might be possible to use FlexConfigs to configure newer parameters.

For more information on the Secure Client, its profiles, and how to configure policies to load the client onto the device, see the following topics:

- Understanding SSL VPN Secure Client Settings , on page 1389
- Configuring SSL VPN Secure Client Settings (ASA), on page 1391
- Cisco Secure Client Profile Editor , on page 1391

Plug-in Files

These files are used as browser plug-ins. You can find plug-in files in Program Files\CSCOpx\files\vms\repository\. For complete information on the available files, see Configuring SSL VPN Browser Plug-ins (ASA) , on page 1387.

Prerequisites for Configuring SSL VPNs

For a remote user to securely access resources on a private network behind an SSL VPN gateway, the following prerequisites must be met:

- A user account (login name and password).
- An SSL-enabled browser (such as Internet Explorer, Netscape, Mozilla, or Firefox).
- An email client (such as Eudora, Microsoft Outlook, or Netscape Mail).
- One of the following operating systems:
  - Microsoft Windows 2000 or Windows XP, with either JRE for Windows version 1.4 or later, or a browser that supports ActiveX controls.
  - Linux with JRE for Linux version 1.4 or later. To access Microsoft shared files from Linux in clientless remote access mode, Samba must also be installed.

Related Topics

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318

SSL VPN Limitations

SSL VPN configurations in Security Manager are subject to the following limitations:

- SSL VPN license information cannot be imported into Security Manager. As a result, certain command parameters, such as **vpn sessiondb** and **max-webvpn-session-limit**, cannot be validated.
- You must configure DNS on each device in the topology in order to use clientless SSL VPN. Without DNS, the device cannot retrieve named URLs, but only URLs with IP addresses.
- If you share your Connection Profiles policy among multiple ASA devices, bear in mind that all devices share the same address pool unless you use device-level object overrides to replace the global definition with a unique address pool for each device. Unique address pools are required to avoid overlapping addresses in cases where the devices are not using NAT.
- If the device configuration contains an address pool for SSL VPN with a name that begins CSM_ (the naming convention used by Cisco Security Manager), Cisco Security Manager cannot detect whether the addresses in that pool overlap with the pool configured in your SSL VPN policy. (This can occur, for example, when the pool was configured by a user on a different installation of Security Manager.) This can lead to errors during deployment. Therefore, we recommend that you configure the same IP address pool as a network/host object in Security Manager and define it as part of the SSL VPN policy. This enables the proper validation to take place.
- The same IP address and port number cannot be shared by multiple SSL VPN gateways on the same IOS device. As a result, deployment errors can occur if a duplicate gateway exists in the device configuration but was not redefined using the Security Manager interface. If such an error occurs, you must choose a different IP address and port number and redeploy.
- If you define AAA authentication or accounting as part of an SSL VPN policy, the **aaa new-model** command is deployed to enable AAA services. Bear in mind that this command is not removed if you later delete the SSL VPN policy, as there might be other parts of the device configuration that require the **aaa new-model** command for AAA services.

Note In addition, we recommend that you define at least one local user on the device with a privilege level of 15. This ensures that you will not be locked out of the device if the **aaa new-model** command is configured without an associated AAA server.

Understanding Devices Supported by Each Remote Access VPN Technology

There are three types of remote access VPN: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. The devices on which you can configure these technologies differs, and broadly speaking, the configuration for each type of VPN differs for ASA/PIX 7.0+ compared to IOS/PIX 6.3 devices.

The following table describes the basic device support. When you select a device, the device type will determine which remote access policies are visible or configurable.

Tip Some device models have NO-VPN versions, which do not support VPN configuration. Thus, although the 3845 model might be supported for a type of VPN, the 3845 NOVPN model is not supported. In addition, the Cisco Catalyst 6500 series ASA Services Module (running software release 8.5(x)) does not support any type of VPN.

Table 364: Devices Supported by Each Remote Access Technology

Technology	Supported Platforms
IKE version 1 IPsec	• ASA/PIX 7.0+—ASA 5500 series and PIX 515, 515E, 525, or 535 with PIX Software 7.0+ (including 8.0+), running in single context and router modes. • IOS/PIX 6.3—Cisco IOS security routers (including Aggregation Service Routers, or ASRs), Catalyst 6500/7600, and PIX Firewalls running PIX Software 6.3 only.
IKE version 2 IPsec	ASA 5500 series only, running ASA Software 8.4(x) only.
SSL	• ASA—ASA 5500 series devices running software version 8.0 and later, running in single-context and router modes. • IOS—Cisco 870, 880, 890, 1800, 2800, 3700, 3800, 7200, and 7301 Series routers running software version 12.4(6)T and later, and on Cisco 1900, 2900, and 3900 Series routers running software version 15.0(1)M and later. For the 880 Series routers, the minimum software version is 12.4(15)XZ, which is mapped to 12.4(20)T in Security Manager. **Tip** No version of PIX is supported for SSL VPN configuration.

Overview of Remote Access VPN Policies

The following list summarizes the various policies used in remote access VPN configuration based on the technology used in the VPN. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. Where indicated, many of these policies apply to specific device types only. To see an edited version of this list per device type, see the following topics:

- Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices , on page 1326
- Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices , on page 1470

Note You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

Note You can create Unified ACL object on-the-fly in certain Remote Access VPN policies, such as Dynamic Access Policy. However, when you create Unified ACL object on-the-fly, Cisco Security Manager displays an error message. To overcome this issue, you must select the created ACL in the Selector window and save the policy.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**
  - **ASA Group Load Balancing** (ASA/PIX 7.0+)—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see Understanding Group Load Balancing (ASA) , on page 1329.
  - **Connection Profiles** (ASA/PIX 7.0+)—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331 .
  - **Dynamic Access** (ASA 8.0+)—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. For more information, see Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices), on page 1419 .
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see Configuring VPN Global Settings , on page 1180.

- **Group Policies** (ASA/PIX 7.0+)—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see Configuring Group Policies for Remote Access VPNs , on page 1352.
- **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see Understanding Public Key Infrastructure Policies , on page 1200 and Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207.

- **Policies used in remote access IPsec VPNs only:**
  - **Certificate To Connection Profile Maps, Policy and Rules** (IKEv1 IPSec only, ASA/PIX 7.0+ only.)—Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods. For more information, see Configuring Certificate to Connection Profile Map Policies (ASA) , on page 1363.
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see Configuring an IKE Proposal , on page 1158.
  - **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices) , on page 1367.
  - **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471.
  - **High Availability** (IOS/PIX 6.3)—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see Configuring High Availability in Remote Access VPNs (IOS) , on page 1479.
  - **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see Configuring User Group Policies , on page 1481.

- **Policies used in remote access IKEv2 IPSec and SSL VPNs only:**

- **Access** (ASA only.)—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or Secure Client Essentials. For more information, see Understanding SSL VPN Access Policies (ASA) , on page 1371.
- **Other Settings** (ASA only.)—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, Secure Client Image and Secure Client Profile, Kerberos Constrained Delegation, and some other advanced settings. For more information, see Configuring Other SSL VPN Settings (ASA) , on page 1378.
- **Shared License** (ASA only.)—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see Configuring SSL VPN Shared Licenses (ASA 8.2+) , on page 1403.
- **SSL VPN** (IOS devices only.)—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see Configuring an SSL VPN Policy (IOS) , on page 1482.

Discovering Remote Access VPN Policies

Security Manager allows you to import the configurations of remote access IPSec VPN policies during policy discovery. You can also discover SSL VPN policies on ASA devices, but not on IOS devices. To discover remote access VPN policies, select the **RA VPN Policies** option in the Discover Device settings when adding the device to the inventory or when discovering policies on a device already in the inventory. For more information on adding devices or discovering policies, see the following topics:

- Adding Devices to the Device Inventory , on page 77
- Discovering Policies on Devices Already in Security Manager , on page 181

You can discover configurations on devices that are already deployed in your remote access VPN network, so that Security Manager can manage them. These configurations are imported into Security Manager as remote access VPN policies. Remote access VPN policy discovery can be performed by importing the configuration of a live device or by importing a configuration file. However, SSL VPN policies that refer to files in flash storage cannot be discovered from configuration files, therefore, we recommend that you do not discover SSL VPNs from configuration files.

When you initiate policy discovery on a device in a remote access VPN, the system analyzes the configuration on the device and then translates this configuration into Security Manager policies so that the device can be managed. Warnings are displayed if the imported configuration completes only a partial policy definition. If additional settings are required, you must go to the relevant page in the Security Manager interface to complete the policy definition. You can also rediscover the configurations of devices that are already managed with Security Manager.

When discovering SSL VPN policies, files residing in flash storage that are referenced in SSL VPN policies are copied to the Security Manager server to be stored in the /csm directory on the target device when policies are deployed from Security Manager. If the flash storage contains files that you want to use, but they are not referenced by an SSL VPN policy, either configure commands that refer to them or manually copy them to

the Security Manager server. Policy discovery fails if an SSL VPN policy on the device refers to a file that has been deleted from flash; in this case, either fix the configuration directly before discovering the device, or deselect the **RA VPN Policies** option when adding the device and create the desired SSL VPN configuration in Security Manager.

Tips

- You should perform deployment immediately after you discover the policies on a device before you make any changes to policies or unassign policies from the device; otherwise, the changes that you configure in Security Manager might not be deployed to the device.
- For ASA and PIX 7.0+ devices, the default connection profiles and group policy are discovered and added to the Connection Profiles and Group Policies policy. You can modify these default profiles and group, but you cannot delete them:
  - DefaultRAGroup—The default connection profile for remote access IPsec VPNs.
  - DefaultWEBVPNGroup—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.
  - DfltGrpPolicy—The default group policy, which is used by the default connection profiles. When discovered, Security Manager uses the name <*device_display_name*> DfltGrpPolicy. However, when you deploy configurations, the device display name is stripped off and DfltGrpPolicy is used.

This naming convention is necessary because group policies are modeled as shared policy objects, and you might have modified the default group policy differently on your devices. However, the naming convention does not prevent you from using shared policies that incorporate the default group policy; the device display name is stripped from the object name regardless of the device to which it is assigned. For example, if you use the object 10.100.10.1DfltGrpPolicy with device 10.200.11.1, Security Manager still uses “DfltGrpPolicy” in the configuration.

Important When assigning a shared policy to a connection profile or a group policy, ensure that you assign it first to the connection profile followed by the group policy, to avoid multiple entries of the default group policy.

Note Although these default connection profiles use the DfltCustomization object for SSL VPN portal customization, Security Manager does not discover it. To modify DfltCustomization, you must do so directly on the device. However, you can simply create your own customization object and specify it in the default connection profile to use non-default settings.

Using the Remote Access VPN Configuration Wizard

You can use the Remote Access VPN Configuration wizard to create the policies required to configure a basic IPsec or SSL VPN. The wizard provides simplified options to configure the basic settings. Thus, after using the wizard, you might need to configure additional settings in the individual remote access VPN policies.

Tip The wizard never creates a valid IKEv2 IPSec VPN. You must always configure additional policies to complete an IKEv2 configuration.

Note For Remote Access VPN Multi-Context Mode, only Remote Access SSL VPN is supported for ASA devices running the software version 9.5(2) or later.

Depending on the device type and VPN type (IPSec or SSL), the wizard takes you through the steps to configure a basic remote access VPN.

To access the Remote Access Configuration wizard:

1. In Device view, select the device to configure as your remote access server from the Device selector.
2. Select **Remote Access VPN > Configuration Wizard** from the Policy selector.
3. Select the radio button corresponding to the type of remote access VPN you want to create: **Remote Access SSL VPN** or **Remote Access IPSec VPN**.
4. Click **Remote Access Configuration Wizard** to open the appropriate wizard.

For detailed information on how to use each version of the wizard, see the following topics:

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices) , on page 1300
- Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311
- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318
- Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices) , on page 1322

Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices)

This procedure describes how to create or edit SSL VPNs on ASA devices using the Remote Access SSL VPN Configuration Wizard.

Related Topics

- Understanding Remote Access SSL VPNs , on page 1289
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295

Step 1 In Device view, select the desired ASA device.

Step 2 From the Policy selector, select **Remote Access VPN > Configuration Wizard**.

Step 3 Select the **Remote Access SSL VPN** radio button.

Step 4 Click **Remote Access Configuration Wizard**. The Access page opens. For a description of the elements on this page, see SSL VPN Configuration Wizard—Access Page (ASA) , on page 1302.

Step 5 Specify the interfaces on which you want to enable the SSL VPN connections. Click **Select** to select an interface or an interface role object that identifies the interfaces.

Step 6 Specify the port number you want to use for the SSL VPN sessions. Enter the port number or the name of a port list object that defines the number, or click **Select** to select the object or to create a new object.

The default port is 443, for HTTPS traffic. The port number can be 443, or within the range of 1024-65535. If you change the port number, all current SSL VPN connections terminate, and current users must reconnect.

Note If HTTP port redirection is enabled, the default HTTP port number is 80.

Step 7 To allow users to select a tunnel group from a list of tunnel group connection profiles configured on the device at login, select the **Allow Users to Select Connection Profile in Portal Page** option.

Step 8 To allow users to use the AnyConnect VPN client to connect to the SSL VPN, select the **Enable Secure Client Access** check box.

Step 9 Click **Next**. The Connection Profile page opens. For a description of the elements on this page, see SSL VPN Configuration Wizard—Connection Profile Page (ASA) , on page 1303.

Step 10 In **Connection Profile Name**, enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.

Step 11 On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see General Tab (Connection Profiles) , on page 1335):

- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box, which opens a wizard to guide you through the creation process as described in Creating User Groups with the Create Group Policy Wizard , on page 1306.

For more information about ASA Group Policies objects, see ASA Group Policies Dialog Box , on page 1489.

- **Group Policies**—This table lists all group policies currently used on the device, whether for SSL or IPsec VPNs. You can click **Edit** to add other group policies.
- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start_Address -End_Address* , for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

Step 12 On the Connection Profile page, configure these options that will later appear in the SSL VPN tab of the connection profile (see SSL Tab (Connection Profiles) , on page 1348):

- **Portal Page Customization**—The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. Click **Select** to select the object or to create a new object.

Note You can set up different login windows for different groups by using a combination of customization profiles and tunnel groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN tunnel group called sales that uses that customization profile.

- **Connection URL**—The URL of the connection profile. This URL provides users with direct access to the customized portal page. Select a protocol (**http** or **https**) from the list, and specify the URL including the name of the connection profile, in the field provided.

The URL is made up of the host name or IP address of the ASA device and port number, and the alias used to identify the SSL VPN connection profile.

Note If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See SSL VPN Configuration Wizard—Access Page (ASA) , on page 1302.

Step 13 On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, and secondary authentication, which will later appear on the AAA and Secondary AAA tab of the connection profile (see AAA Tab (Connection Profiles) , on page 1338 and Secondary AAA Tab (Connection Profiles) , on page 1342).

Step 14 Click **Finish** to save your changes.

SSL VPN Configuration Wizard—Access Page (ASA)

Use the Access page of the SSL VPN Configuration Wizard to configure the security appliance interfaces for SSL VPN sessions. After you complete the wizard, you can later edit these settings in the SSL VPN Access policy; see SSL VPN Access Policy Page , on page 1372 .

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see Using the Remote Access VPN Configuration Wizard , on page 1300). The Access page is the first page that appears.

Related Topics

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices) , on page 1300
- Understanding Interface Role Objects , on page 303

Field Reference

Table 365: SSL VPN Wizard—Access Page (ASA)

Element	Description
Interfaces to Enable SSL VPN Service	The interfaces or interface roles that identify the interfaces on which you want to enable SSL VPN connections. Click **Select** to select interfaces or interface roles, or to create new interface roles.

Element	Description
Port Number	The port number to use for the SSL VPN sessions. Enter a port number or port list object name, or click **Select** to select an object that defines the port, or to create a new object. The default port is 443, for HTTPS traffic. The port number can be 443, or within the range of 1024-65535. If you change the port number, all current SSL VPN connections terminate, and current users must reconnect. **Note** If HTTP port redirection is enabled, the default HTTP port number is 80.
Portal Page URLs	The URLs that users would use to connect to the VPN. The URLs are displayed after you specify the interfaces and port number.
Allow Users to Select Connection Profile in Portal Page	Whether to present a list of configured connection profiles (tunnel groups) from which the user can select the appropriate profile when the user logs in (for example, in the SSL VPN portal page). If you do not select this option, the user cannot select a profile and must use the default profile for the connection.
Enable Secure Client Access	Whether to allow the user to use the AnyConnect VPN client to make an SSL or IKEv2 IPSec VPN connection. The option is selected by default. For details about AnyConnect VPN clients, see Understanding SSL VPN Secure Client Settings , on page 1389. **Note** To enable Secure Client Essentials, go to Remote Access VPN > SSL VPN > Access. For details, see Configuring an Access Policy , on page 1376.

SSL VPN Configuration Wizard—Connection Profile Page (ASA)

Use the Connection Profile page in the SSL VPN Configuration wizard to configure the tunnel group policies on your security appliance. You can specify a name for the tunnel connection profile policy that you are adding, select the user group policy, specify address pools for this policy, and specify authentication server group settings.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see Using the Remote Access VPN Configuration Wizard , on page 1300); then click **Next** until you reach this page.

- Understanding Networks/Hosts Objects , on page 310
- Understanding AAA Server and Server Group Objects , on page 256

Field Reference

Table 366: SSL VPN Configuration Wizard, Connection Profile Page (ASA)

Element	Description
Connection Profile Name	The name of the connection profile (tunnel group).
Group Policy	Default ASA user group associated with the device. Enter an ASA user group policy or click **Select** to select one from a list or to create a new one. If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server. Click **Select** to select an existing object or to create a new one. If you click the **Create (+)** button in the group policy selection dialog box, you are guided through the group creation process using a wizard, as explained in Creating User Groups with the Create Group Policy Wizard , on page 1306.
Full Tunnel	A read-only field that indicates whether full tunnel access mode is configured for the object selected in the Group Policy field.
Group Policies	The names of all ASA user group policies that are configured for the device, even those that are configured for IPSec VPN connections only. The contents of this table is identical to the contents of the Remote Access VPN > Group Policies policy. The table shows whether full tunnel access mode is enabled or disabled for each group policy. You can change the list by clicking **Edit**. This opens a dialog box where you can select additional group policies, or deselect currently selected policies (do not deselect policies that are used by other connection profiles). You can also create new group policies (click the **Create (+)** button below the available group policies list) or edit the group policy object by selecting it and clicking the **Edit (pencil)** button below either list. If you create a new group policy, the Create Group Policy wizard is used to guide you through the process. See Creating User Groups with the Create Group Policy Wizard , on page 1306.
Portal Page Customization	The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click **Select** to select the object or to create a new object.

Element	Description
Connection URL	The URL of the connection profile. This URL provides users with direct access to the customized portal page. Select a protocol (**http** or **https**) from the list and specify the URL, including host name or IP address of the ASA device and port number and the alias used to identify the SSL VPN connection profile. **Note** If you do not specify a URL, you can access the portal page by entering the portal page URL, and then selecting the connection profile alias from a list of configured connection profile aliases configured on the device. See SSL VPN Configuration Wizard—Access Page (ASA) , on page 1302.
Global IPv4 Address Pool	The address pools from which IPv4 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. Enter the address pool ranges or the names of network/host objects that define these pools. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.
Global IPv6 Address Pool	The address pools from which IPv6 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 2001:db8::1-2001:db8::2:1. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. . Enter the address pool ranges or the names of network/host objects that define these pools. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.
Authentication Server Group	The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.
Use LOCAL if Server Group Fails	Whether to fall back to the local database for authentication if the selected authentication server group fails.
Authorization Server Group	The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.
Accounting Server Group	The name of the accounting server group. Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.

Element	Description
Secondary Authentication	Whether to enable double authentication, which prompts the user for two sets of credentials (username and password) before completing the remote access VPN connection. • **Enable Secondary Authentication**—Select this option to require double authentication. • **Authentication Server Group**—The name of the authentication server group (LOCAL if the tunnel group is configured on the local device) to be used with the second set of credentials. Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object. • **Use LOCAL if Server Group Fails**—Whether to fall back to the local database for authentication if the selected authentication server group fails.

Creating User Groups with the Create Group Policy Wizard

When you are using the Remote Access SSL VPN Configuration wizard to create an SSL VPN on ASA or IOS devices, you can create new ASA group policy or IOS user group objects using a wizard. The wizard lets you configure select elements of the group, so you might need to edit the object after creating it to configure additional settings.

The Create Group Policy wizard is available only through the Remote Access SSL VPN Configuration wizard. For an explanation of how to start and use the wizard, see the following topics:

The following procedure assumes that you are already in the Remote Access SSL VPN Configuration wizard, as described in the following topics:

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices) , on page 1300
- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318

Related Topics

- SSL VPN Access Modes , on page 1290

Step 1 When using the Remote Access VPN Configuration wizard for SSL VPNs, proceed to the page where you select group policies. On this page, you can open the selection page for user groups by doing the following:

- ASA devices—On the Connection Profile page of the wizard, click **Select** next to the Group Policy field, or click **Edit** next to the Group Policies table.
- IOS devices—On the Gateway and Context page of the wizard, click **Edit** next to the Group Policies table.

Step 2 In the Group Policy Selector dialog box, click the **Create (+)** button below the list of available group policies to start the Create Group Policy wizard. The wizard starts at the Group Policy page.

You can also do the following on the Group Policy Selector:

- Select existing groups and click >> to use them in the SSL VPN. When selecting a group for the default group on an ASA (the Group Policy field), you select the object simply by clicking it in the list.

- Select an existing group and click **Edit (pencil)** to change its properties.

Step 3 On the Group Policy page, configure the following options:

- **Name**—The name of the user group. Enter up to 128 characters, including uppercase and lowercase characters and most alphanumeric or symbol characters.
- **Access Method**—Select the required remote access method options, as follows:
  - **Full Tunnel**—To access to the corporate network completely over an SSL VPN tunnel. This is the recommended option.
  - **Clientless**—To access the internal or corporate network using a web browser on the client machine.
  - **Thin Client**—To download a Java applet that acts as a TCP proxy on the client machine.

Step 4 Click **Next**. The page that opens next depends on which access methods you selected. This procedure assumes that you selected all methods, in which case the Full Client page opens.

Step 5 On the Full Client page, select whether to restrict access to full tunnel only or to allow other methods of access if the full client download fails. Also, specify DNS and WINS server information, and configure split tunneling if you want to allow it. For an explanation of the options, see Create Group Policy Wizard—Full Tunnel Page , on page 1307.

Step 6 Click **Next**. The Clientless and Thin Client page opens.

Step 7 On the Clientless and Thin Client page, configure these access modes. For an explanation of the options, see Create Group Policy Wizard—Clientless and Thin Client Access Modes Page , on page 1310.

Step 8 Click **Finish** to create the group policy object.

Step 9 When you complete the wizard, the group policy is added to the available groups list, but it is not selected (unless you are configuring the default group for an ASA). To select it, highlight it in the available groups list and click >> to move it to the selected groups list.

Note To specify a user group as the default user group, select it and click **Set As Default**. This option is only available for IOS routers.

Step 10 Click **OK** in the Group Policy Selector page to save your changes and return to the Remote Access SSL VPN Configuration wizard.

Create Group Policy Wizard—Full Tunnel Page

Note This page is available only if you selected the **Full Client** option in the Group Policy of the Create Group Policy wizard.

In this page, you can configure the mode used to access the corporate network.

Navigation Path

For information on starting the Create Group Policy wizard, see Creating User Groups with the Create Group Policy Wizard , on page 1306.

Field Reference

Table 367: Create User Group Wizard—Full Tunnel Page

Element	Description
Mode	The access modes to allow in the SSL VPN. Select one of the following: • **Use Other Access Modes if SSL VPN Client Download Fails**—To allow the remote client to use clientless or thin client access modes if the download of the VPN client fails. • **Full Tunnel Only**—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN. Ensure that you configure the full client images on the device. For ASA devices, use the Client Settings tab of the SSL VPN > Other Settings policy; see Configuring SSL VPN Secure Client Settings (ASA), on page 1391. For IOS devices, the client is managed using a FlexConfig policy; see Predefined FlexConfig Policy Objects , on page 360.
Client IP Address Pools (IOS device only.)	The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses. Enter the address range separating the first and last IP address with a hyphen, for example, 10.100.10.2-10.100.10.255. If you enter a single address, the pool has just one address. Do not enter subnet designations. You can also enter the name of a network/host policy object that defines the range, or click **Select** to select the object from a list or to create a new object. Separate multiple ranges with commas.
Primary IPv4 DNS Server	The IPv4 address of the primary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Secondary IPv4 DNS Server	The IPv4 address of the secondary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Primary IPv6 DNS Server	The IPv6 address of the primary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Secondary IPv6 DNS Server	The IPv6 address of the secondary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Default DNS Domain	The domain name of the DNS server to be used for Full Client SSL VPN connections.
Primary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.

Element	Description
Secondary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Split Tunnel Option	Whether to allow split tunneling for IPv4 traffic and if so, which traffic should be secured or transmitted unencrypted across the public network: • Disabled—(Default) No IPv4 traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks. • Tunnel Specified Traffic—Tunnel all IPv4 traffic from or to the addresses listed in the **Networks** or **Destinations** field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. • Exclude Specified Traffic—IPv4 traffic goes in the clear from and to the addresses listed in the **Networks** or **Destinations** field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.
IPv6 Split Tunnel Option	Whether to allow split tunneling for IPv6 traffic and if so, which traffic should be secured or transmitted unencrypted across the public network: • Disabled—(Default) No IPv6 traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks. • Tunnel Specified Traffic—Tunnel all traffic from or to the addresses listed in the **Networks** or **Destinations** field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. • Exclude Specified Traffic—Traffic goes in the clear from and to the addresses listed in the **Networks** or **Destinations** field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.
Networks (ASA device only.)	If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, enter the name of the ACL object that defines the traffic to be tunneled or excluded. Click **Select** to select the object or to create a new object.
Destinations (IOS device only.)	If you select Tunnel Specified Traffic or Exclude Specified traffic in the Split Tunnel Option, specify the IP addresses that define the traffic to be tunneled or excluded. Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click **Select** to select the object from a list or to create a new object. Separate multiple addresses with commas.

Element	Description
Exclude Local LANs (IOS device only.)	Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the **Exclude Specified Traffic** split tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN. When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.
Split DNS Names	A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server. Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.

Create Group Policy Wizard—Clientless and Thin Client Access Modes Page

In the Clientless and Thin Client page of the Create Group Policy wizard, you can configure the Clientless and Thin Client modes to be used for accessing the corporate network in your SSL VPN.

Note This page is only available if you selected the **Clientless** or **Thin Client** options in step 1 of the Create Group Policy wizard.

Navigation Path

For information on starting the Create Group Policy wizard, see Creating User Groups with the Create Group Policy Wizard , on page 1306.

Field Reference

Table 368: Create User Group Wizard—Clientless and Thin Client Page

Element	Description
Clientless—Appears only if you selected **Clientless** in step 1 of the wizard.	
Portal Page Websites	The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click **Select** to select it from a list or to create a new object.

Element	Description
Allow Users to Enter Websites	Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.
Thin Client—Appears only if you selected **Thin Client** in step 1 of the wizard.	
Port Forwarding List	The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Port Forwarding Applet Name (ASA device only.)	The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway.
Download Port Forwarding Applet on Client Login	Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.

Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices)

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

This procedure describes how to create IPSec VPNs on ASA or PIX 7.0+ devices using the Remote Access VPN Configuration Wizard.

Tip The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see Understanding and Configuring VPN Default Policies , on page 1086.

Related Topics

- Understanding Remote Access IPSec VPNs , on page 1288
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295

Step 1 In Device view, select the desired ASA or PIX 7.0+ device.

Step 2 From the Policy selector, select **Remote Access VPN > Configuration Wizard**.

Step 3 Select the **Remote Access IPSec VPN** radio button.

Step 4 Click **Remote Access Configuration Wizard**. The Connection Profile page opens. For a description of the options that appear on this page, see Remote Access VPN Configuration Wizard—IPSec VPN Connection Profile Page (ASA) , on page 1314.

Step 5 On the Connection Profile page, configure these basic options:

- **Connection Profile name**—Enter the name of the connection profile. This is the name of the tunnel group, and will appear in the Remote Access VPN > Connection Profiles policy. For more information about the connection profile policy, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.
- **IKE Versions**—Select the IKE versions to use during IKE negotiations between the VPN server and the remote users, version 1, 2 or both. IKEv2 is supported on ASA Software release 8.4(1)+ only.

Step 6 On the Connection Profile page, configure these options that will later appear in the General tab of the connection profile (see General Tab (Connection Profiles) , on page 1335):

- **Group Policy**—Enter the name of the ASA Group Policy policy object that will be the default group for the connection profile, or click **Select** to select the object. If the required object does not yet exist, click **Select**, then click the **Create (+)** button in the ASA User Groups Selector dialog box to open the dialog boxes that are used to create these objects.

When creating a new group policy object, you must select the same IKE versions that you select in the Connection Profile page of the wizard. These options are on the Technology page of the Add ASA Group Policies dialog box: Easy VPN/IPSec IKEv1 and Easy VPN/IPSec IKEv2.

For more information about ASA Group Policies objects, see ASA Group Policies Dialog Box , on page 1489.

- **Global IP Address Pool**—Enter the address pools from which IP addresses are assigned. The server uses these address pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools.

Specify the pools as address ranges or network/host objects that contain address ranges, in the format *Start_Address -End_Address* , for example, 10.100.10.2-10.100.10.254. Click **Select** to select network/host objects or to create new objects.

Step 7 On the Connection Profile page, configure the AAA options for authentication, authorization, and accounting, which will later appear on the AAA tab of the connection profile (see AAA Tab (Connection Profiles) , on page 1338).

Step 8 Click **Next** to move to the IPsec Settings page.

Step 9 On the IPSec Settings page, configure the options for IPSec, which will later appear on the IPSec tab of the connection profile (see IPSec Tab (Connection Profiles) , on page 1344). Note that some of these settings apply to IKEv1 only.

- **Preshared Key**, **Confirm**—Enter the IKEv1 preshared key for the tunnel group in each field. The maximum length of a preshared key is 127 characters.

You cannot configure a preshared key for remote access IKEv2 IPsec VPNs.

- **Trustpoint Name**—Enter the name of the PKI enrollment policy object that defines the trustpoint name, if any trustpoints are configured, for an IKEv1 connection. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object.

For IKEv2, the trustpoint name is not configured here, but on the IKEv2 Settings tab of the Global Settings policy. The configuration is explained later in this procedure.

- The other options (other than the client table) apply to both IKEv1 and IKEv2. Change the settings if you need non-default behavior. For an explanation of the options, including the client software update table, see Remote Access VPN Configuration Wizard—IPSec Settings Page (ASA) , on page 1315.

Step 10 Click **Next** to move to the VPN Defaults page.

Step 11 On the Defaults page, select the additional shared policies that you want to assign to the VPN. Initially, the policies listed are those chosen on the Security Manager Administration VPN Defaults page.

For more information about selecting these policies, see Remote Access VPN Configuration Wizard—Defaults Page , on page 1317.

Step 12 Click **Finish** to save your changes.

Because the wizard does not configure all possible options, inspect the policies created and configure any additional options that you want to implement.

The remaining steps are required if you selected IKE version 2 as a supported IKE version, or if you specified an IPsec trustpoint.

Step 13 (IKEv2 Optional.) Configure group aliases and double authentication if required:

a) Select the Connection Profiles policy.

b) Select the connection profile you configured in the wizard, and click the **Edit Row (pencil)** button to open the Connection Profiles dialog box.

- If you want to configure double authentication, select the Secondary AAA tab and configure the required settings. For more information, see Secondary AAA Tab (Connection Profiles) , on page 1342.
- If you want to configure aliases for the profile, which helps users select the correct profile during login, select the SSL tab and configure the alias table. For more information, see SSL Tab (Connection Profiles) , on page 1348.
- There are several additional connection profile settings that are not configured in the wizard. Examine the tabs in the Connection Profile dialog box to determine if additional changes are required.

c) Click **OK** in the Connection Profiles dialog box to save your changes.

Step 14 (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Access** policy and configure at least the following. For detailed information about configuring an Access policy, see Configuring SSL VPN Secure Client Settings (ASA), on page 1391.

- Add the remote access VPN interface to the access interfaces table.
- Select **Allow Users to Select Connection Profile in Portal Page**.
- Select **Enable Secure Client Access**.

Step 15 (IKEv2 Requirement.) Select the **Remote Access VPN > SSL VPN > Other Settings** policy, and click the **Client Settings** tab.

In the Secure Client Image table, add an AnyConnect 3.0 or later client image, one that supports IKEv2 negotiations.

For more information on configuring client images, see Configuring VPN Global IKEv2 Settings , on page 1187 .

Step 16 (IKEv2 Requirement.) Select the **Remote Access VPN > Global Settings** policy, and click the IKEv2 Settings tab.

At minimum, configure the **RA Trustpoint** for remote access IKEv2 authentication. Enter the name of the PKI enrollment object that identifies the certificate authority (CA) server or click **Select** to select the object or to create a new one.

For more information on configuring IKEv2 global settings, see IPsec Proposal Editor (ASA, PIX 7.0+ Devices) , on page 1368.

Step 17 (IKEv1, IKEv2 Requirement.) Select the **Remote Access VPN > Public Key Infrastructure** policy and ensure that the following PKI enrollment objects are selected:

- (IKEv1) The object specified on the IPSec tab of the connection profile, if a trustpoint is configured.
- (IKEv2) The object specified on the IKEv2 Settings tab of the Global Settings policy.

Note In the wizard, you might have applied a shared Public Key Infrastructure policy that already specifies these objects.

Step 18 (IKEv2 Optional.) IKEv2 connections require the use of the AnyConnect 3.0+ client. The Secure Client might need to download files, such as software upgrades, profiles, localization and customization files, CSD, SCEP, and so forth. The wizard does not enable these types of download.

To enable Secure Client file downloads:

a) Select **Remote Access VPN > IPSec VPN > IPSec Proposal**.
b) Select the IPSec proposal created by the wizard, and click **Edit Row (pencil)** to open the IPSec Proposal Editor. For information about the various options, see IPsec Proposal Editor (ASA, PIX 7.0+ Devices) , on page 1368.
c) Select the **Enable Client Services** option, and enter a port number if you do not want to use the default port 443. (You can use the same port number used for SSL VPN or other SSL uses.)
d) Click **OK** to save your changes.

Remote Access VPN Configuration Wizard—IPSec VPN Connection Profile Page (ASA)

Use the Connection Profile page of the Remote Access VPN Configuration wizard to configure the connection profile policies on your security appliance for a remote access IPSec VPN. You can specify a name for the connection profile policy that you are adding, select the IKE versions to allow during IKE negotiations, select the user group policy, specify address pools for this policy, and specify authentication, authorization, and accounting server group settings.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see Using the Remote Access VPN Configuration Wizard , on page 1300). The IPSec Connection Profile page is the first page that appears.

Field Reference

Table 369: Remote Access VPN Configuration Wizard, IPSec Connection Profile Page (ASA)

Element	Description
Connection Profile Name	The name of the connection profile (tunnel group).

Element	Description
IKE Versions	The IKE versions to use during IKE negotiations between the VPN server and the remote users. IKEv2 is supported on ASA Software release 8.4(1)+ only; you cannot change the option selection on other types of device. Select **IKE Version 1**, **IKE Version 2**, or **Both** (to allow either version). IKEv2 connections are allowed using Secure Clients only.
Group Policy	If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server. Click **Select** to select an existing object or to create a new one. **Tip** If you enable IKEv2 for this VPN, there are special considerations for the group policy you choose. For detailed information, see Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311.
Global IP Address Pool	The address pools from which IP addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. Enter the address pool ranges or the names of network/host objects that define these pools. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.
Authentication Server Group	The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.
Use LOCAL if Server Group Fails	Whether to fall back to the local database for authentication if the selected authentication server group fails.
Authorization Server Group	The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.
Accounting Server Group	The name of the accounting server group. Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.

Remote Access VPN Configuration Wizard—IPSec Settings Page (ASA)

Use the IPSec Settings page of the Remote Access VPN Configuration wizard to configure the IPSec settings on your security appliance for a remote access IPSec VPN. Some of these settings apply to IKE version 1 (IKEv1) only; if you are configuring an IKEv2-only VPN, these fields are greyed and unconfigurable.

For more information about using the wizard to configure remote access IPsec VPNs on ASA, see Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN on an ASA or PIX 7.0+ device (see Using the Remote Access VPN Configuration Wizard , on page 1300); then click **Next** until you reach this page.

Field Reference

Table 370: Remote Access VPN Configuration Wizard, IPSec VPN Wizard—IPSec Settings (ASA)

Element	Description
Preshared Key (IKEv1 only.)	The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field. **Tip** You cannot configure preshared keys for IKEv2 remote access VPNs.
Trustpoint Name (IKEv1 only.)	The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv1 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object. **Tip** This trustpoint is used for IKEv1 negotiations only. To configure the global trustpoint for IKEv2 negotiations, use the IKEv2 Settings tab of the Global Settings policy; see Configuring VPN Global IKEv2 Settings , on page 1187.
IKE Peer ID Validation	Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.
Enable Sending Certificate Chain	Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.
Enable Password Update with RADIUS Authentication	When selected, enables passwords to be updated with the RADIUS authentication protocol. Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see Supported AAA Server Types , on page 257.
ISAKMP Keepalive	Whether to monitor ISAKMP keepalive. If you select the **Monitor Keepalive** option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters: • **Confidence Interval**—The number of seconds that a device waits between sending IKE keepalive packets. • **Retry Interval**—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds. For more information, see Configuring VPN Global ISAKMP/IPsec Settings , on page 1183.

Element	Description
Client Software Update table (IKEv1 only.)	The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client. To configure the client for a platform, select it, click the **Edit Row** button, and fill in the IPSec Client Software Update Dialog Box , on page 1347.

Remote Access VPN Configuration Wizard—Defaults Page

Use the Defaults page of the Remote Access VPN Configuration wizard to select the shared policies to assign to the remote access IPSec VPN. Initially, the policies selected are those configured in the Security Manager Administration VPN Defaults for remote access VPNs. For information on how to configure these defaults, see Understanding and Configuring VPN Default Policies , on page 1086.

Required policies must always have a policy selected. If "Factory Default" is shown, then the policy applied is not a shared policy but default policy settings supplied by Security Manager. If you can select the empty option, the policy is optional and you need to configure it only if you want the associated features.

When evaluating which policies to assign (if any), keep the following in mind:

- The drop-down lists for each policy type list the existing shared policies that you can select. You can select only shared policies that have been committed to the Security Manager database (and approved, if you are using Workflow mode with an approver). You cannot create a shared policy and use it before you submit it.
- To view the content of a policy, select it and click the **View Content** button. You are presented with a read-only view of the policy. Use this to help verify that you are selecting the desired policy.

Note If you try to select a default policy that is currently locked by another user, a message is displayed warning you of a lock problem. To bypass the lock, select a different policy or cancel the VPN creation until the lock is removed. For more information, see Understanding Policy Locking , on page 174.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access IPsec VPN (see Using the Remote Access VPN Configuration Wizard , on page 1300) and click **Next** until you reach this page.

- Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices) , on page 1322
- Overview of Remote Access VPN Policies , on page 1296

Field Reference

Table 371: Remote Access VPN Configuration Wizard, Defaults Page

Element	Description
ASA Group Load Balance	Defines load balancing for an ASA device in your remote access VPN.
High Availability	Defines a High Availability (HA) policy on a Cisco IOS router in a remote access VPN.
Certificate to Connection Profile Map Policy	(IKEv1 only.) Defines the certificate to connection profile map options for an ASA device in your remote access VPN.
IKE Proposal	Defines the set of algorithms that two peers use to secure the IKE negotiation between them.
IPSec Proposal	Defines the crypto maps required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.
Public Key Infrastructure	Defines the Public Key Infrastructure (PKI) policy used to generate PKI enrollment requests for PKI certificates and RSA keys.
VPN Global Settings	Defines global settings for IKE, IPsec, IKEv2, NAT, and fragmentation that apply to devices in your remote access VPN.

Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices)

This procedure describes how to create or edit SSL VPNs on IOS devices using the Remote Access SSL VPN Configuration Wizard.

Related Topics

- Understanding Remote Access SSL VPNs , on page 1289
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295

Step 1 In Device view, select the desired IOS device.

Step 2 From the Policy selector, select **Remote Access VPN > Configuration Wizard**.

Step 3 Select the **Remote Access SSL VPN** radio button.

Step 4 Click **Remote Access Configuration Wizard**. The Gateway and Context page opens. For a description of the elements on this page, see SSL VPN Configuration Wizard—Gateway and Context Page (IOS) , on page 1319.

Step 5 Select the gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are:

- **Use Existing Gateway**—Lets you use an existing gateway object. If you select this option, specify the name of the SSL VPN Gateway policy object that defines the gateway. Click **Select** to select the object or to create a new object.

- **Create Using IP Address**—Lets you configure a new gateway object using a reachable (public, static) IP address on the router. Enter the IP address.
- **Create Using Interface**—Lets you configure a new gateway using the public, static IP address of a router interface. Select the interface or interface role object.

If you elected to create a new gateway using an IP address or an interface:

- Specify a gateway name.
- Specify the number of the port that will carry the HTTPS traffic. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you want to use a different port, it must be between 1024 and 65535.

Step 6 Enter the name of the name of the context that defines the virtual configuration of the SSL VPN.

Step 7 Select the user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click **Edit** to select the desired groups, or to create new groups.

Step 8 Configure the AAA options for authentication, authentication domain, and accounting. For detailed information, see SSL VPN Configuration Wizard—Gateway and Context Page (IOS) , on page 1319.

Step 9 Click **Next**. The Portal Page Customization page opens. For a description of the elements on this page, see SSL VPN Configuration Wizard—Portal Page Customization Page (IOS) , on page 1321.

Step 10 On the Portal Customization page, configure the following options. The bottom of the page is a preview of what the portal page will look like based on your selections; use the preview to fine-tune your selections.

- **Title**—The name of the portal page, which appears at the top of the page.
- **Logo**—The graphic to show in the title area of the page: None, Default (the Cisco logo graphic), or Custom. If you select custom, click **Select** to select the graphic on the Security Manager server. You must copy the custom graphic to the server before you can use it in the portal customization.

The source image file for the logo can be a GIF, JPG, or PNG file, with a file name of up to 255 characters, and up to 100 kilobytes in size.

- **Login Message**—The text that should appear above the login prompt.
- **Title and Text Colors**—The colors to use for the title and login area and the fonts.

Step 11 Click **Finish** to save your changes.

SSL VPN Configuration Wizard—Gateway and Context Page (IOS)

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

A gateway and context must be configured on a device before a remote user can access resources on a private network behind the SSL VPN. Use this step of the SSL VPN Configuration wizard to specify a gateway and context configuration, including information that will allow users to access a portal page.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an IOS device (see Using the Remote Access VPN Configuration Wizard , on page 1300). The Gateway and Context page is the first page that appears.

Related Topics

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318
- Add or Edit SSL VPN Gateway Dialog Box , on page 1555
- Understanding AAA Server and Server Group Objects , on page 256

Field Reference

Table 372: SSL VPN Configuration Wizard, Gateway and Context Page

Element	Description
Gateway	The gateway to be used as a proxy for connections to the protected resources in your SSL VPN. Options are: • **Use Existing Gateway**—When selected, enables you to use an existing gateway for your SSL VPN. • **Create Using IP Address**—When selected, enables you to configure a new gateway using a reachable (public static) IP address on the router. • **Create Using Interface**—When selected, enables you to configure a new gateway using the public static IP address of the router interface.
Gateway Name	The name of the SSL VPN gateway policy object that defines the gateway: • If you selected Use Existing Gateway, click **Select** to select the object from a list or to create a new object. **Note** After selecting the gateway, the port number and digital certificate required to establish a secure connection are displayed in the relevant fields. • If you selected Create Using IP Address or Interface, enter the name of the object that you want to create (up to 128 characters).
IP Address	Available if you selected to create a gateway using an IP address. The IP address on the router that should be used as the gateway address.
Interface	Available if you selected to create a gateway using an interface. The name of the interface, or the interface role object that defines the interface, that should be used as the SSL VPN gateway. Click **Select** to select the interface or interface role, or to create a new interface role.

Element	Description
Port	The port number used for SSL VPN connections. The default is 443, unless HTTP port redirection is enabled, in which case the default HTTP port number is 80. If you enter a different number, it must be between 1024 and 65535. • If you selected Use Existing Gateway, this is a read-only field that shows the port number configured in the selected object. • If you selected Create Using IP Address or Interface, enter the port number or the name of a port list object that specifies the number, or click **Select** to select the port list object.
Trustpoint	The digital certificate required to establish the secure connection. A self-signed certificate is generated when an SSL VPN gateway is activated.
Context Name	The name of the context that defines the virtual configuration of the SSL VPN. **Note** To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.
Portal Page URL	The URL for the SSL VPN, which is filled in when you select (or define) a gateway object. Users connect to this URL to enter the VPN.
Group Policies	The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client access is enabled for the group. Click **Edit** to select the desired groups, or to create new groups.
Authentication Server Group	The authentication server groups. The list is in prioritized order. Authentication is attempted using the first group and proceeds through the list until the user is successfully authenticated or denied. Use the LOCAL group if the users are defined on the gateway itself. Enter the names of the AAA server groups; separate multiple entries with commas. You can click **Select** to select the groups or to create new ones.
Authentication Domain	A list or method for SSL VPN remote user authentication. If you do not specify a list or method, the gateway uses global AAA parameters for remote-user authentication.
Accounting Server Group	The accounting server group. Enter the name of the AAA server group policy object, or click **Select** to select it from a list or to create a new object.

SSL VPN Configuration Wizard—Portal Page Customization Page (IOS)

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use this step of the SSL VPN Configuration wizard to define the appearance of the portal page that remote users see when connecting to the SSL VPN. The portal page allows remote users access to all websites available on the SSL VPN networks.

Navigation Path

(Device view) Open the Remote Access VPN Configuration Wizard for configuring a remote access SSL VPN on an ASA device (see Using the Remote Access VPN Configuration Wizard , on page 1300); then click **Next** until you reach this page.

Related Topics

- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318

Field Reference

Table 373: SSL VPN Configuration Wizard, Portal Page Customization Page

Element	Description
Title	The text displayed at the top of the page. Control the color using the Primary settings in the Title Color and Text Color fields.
Logo	The graphic displayed next to the title. Select None, Default, or Custom. To configure a custom graphic, you must copy the desired graphic to the Security Manager server, then click **Browse** to select the file. Supported graphic types are GIF, JPG, and PNG, with a maximum size of 100 KB.
Login Message	The text displayed immediately above the login prompt. Control the color using the Secondary settings in the Title Color and Text Color fields.
Title Color Text Color	The colors used for the title and login area and the text: • Primary—The Title, Login Box title, and the text in those areas. • Secondary—The Login Box username/password background and the text in that area. Click **Select** to choose background colors. For text, select either Black or White from the text list.
Preview	A preview of how the portal page will appear based on your selections.

Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices)

Note From version 4.17, though Cisco Security Manager continues to support Cisco IOS, FWSM, IPS, and PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit IPSec VPNs on IOS and PIX 6.3 devices using the Remote Access VPN Configuration Wizard.

Tip The wizard allows you to select shared policies to use in the VPN on the Defaults page (the final step of the wizard). If you want to use this feature, you must first ensure that all required shared policies are configured and submitted to the database. For information on configuring shared policies and VPN policy defaults, see Understanding and Configuring VPN Default Policies , on page 1086.

Related Topics

- Understanding Remote Access IPSec VPNs , on page 1288
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295

Step 1 In Device view, select the desired IOS or PIX 6.3 device.

Step 2 From the Policy selector, select **Remote Access VPN > Configuration Wizard**.

Step 3 Select the **Remote Access IPSec VPN** radio button.

Step 4 Click **Remote Access Configuration Wizard**. The User Group Policy page opens.

Step 5 Select the required user groups from the Available User Groups list and click >>.

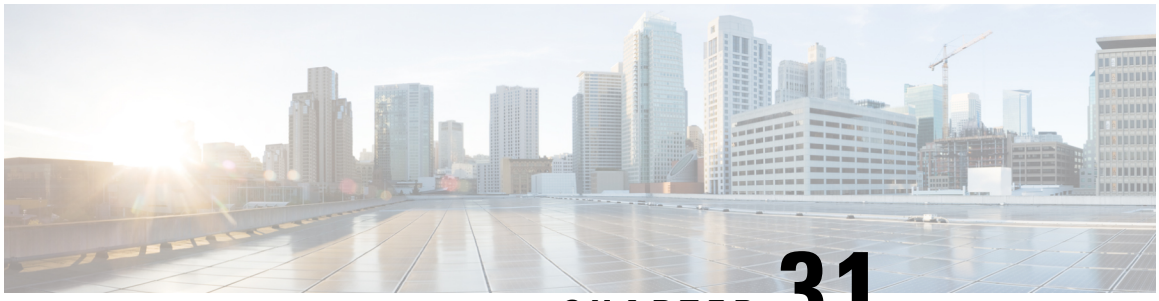
- If the required user group is not in the list, click **Create (+)** to open the Add User Groups dialog box, which enables you to create or edit a user group object. See Add or Edit User Group Dialog Box , on page 1564.
- You can edit an existing user group by selecting it in either list and clicking **Edit (pencil)**.
- To deselect a user group, select it and click <<.

Step 6 Click **Next**. The Defaults page opens.

Step 7 Select the shared policies to assign to the VPN. Initially, the selected policies are those configured on the Security Manager Administration VPN Defaults page. You can use the defaults or select different policies, if any are available. For more information about these policy defaults, see Remote Access VPN Configuration Wizard—Defaults Page , on page 1317.

Step 8 Click **Finish** to save your changes.

Inspect the policies created and configure any additional options that you want to implement.



CHAPTER 31

Managing Remote Access VPNs on ASA and PIX 7.0+ Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

You can configure and manage remote access IPsec on devices running Cisco ASA Software or PIX 7.0+, and SSL VPNs on ASA 8.0+ devices (but not on PIX devices). Additionally, you can use IKE version 2 (IKEv2) negotiations in remote access IPsec VPNs on ASA 8.4(x) devices.

Note No VPN configuration is supported on Cisco Catalyst 6500 Series ASA Service Modules and the ASA Software Release 8.5(x) used on the module.

The configuration of these remote access VPNs are the same for these device types. IOS and PIX 6.3+ devices use different configurations for remote access VPNs.

The topics in this chapter explain how to configure policies that are specific to ASA and PIX 7.0+ devices. Additionally, review the following topics for more information about remote access VPNs:

- Understanding Remote Access VPNs , on page 1287
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295

  - Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (ASA and PIX 7.0+ Devices) , on page 1311
  - Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (ASA Devices) , on page 1300
- Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices), on page 1419

This chapter contains the following topics:

Overview of Remote Access VPN Policies for ASA and PIX 7.0+ Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

When you configure remote access VPNs on ASA or PIX 7.0+ devices, you use the following policies based on the type of VPN you are configuring. Possible remote access VPN types are: IKE version 1 (IKEv1) IPsec, IKE version 2 (IKEv2) IPsec, and SSL. IKEv2 is supported on ASA devices running the software version 8.4(x) and later. Table 374: Remote Access VPN Policy Requirements for ASA Devices, on page 1328 explains the conditions under which these policies are required or optional.

Note You cannot configure SSL VPNs on PIX devices; PIX devices support remote access IKEv1 IPsec VPNs only.

- **Policies used with remote access IKEv1 and IKEv2 IPsec and SSL VPNs:**
  - **ASA Group Load Balancing**—In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device. For more information, see Understanding Group Load Balancing (ASA) , on page 1329.
  - **Connection Profiles**—A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. For more information, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.
  - **Dynamic Access**—Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles that each user might inhabit within an organization, and logins from remote access sites with different configurations and levels of security. Dynamic access policies (DAP) let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you

associate with a specific user tunnel or session. For more information, see Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices), on page 1419.

Note For multi-context ASA devices, the Dynamic Access policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

- **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IKEv2, IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional in most cases; configure it only if you need non-default behavior or if you are supporting IKEv2 negotiations. For more information, see Configuring VPN Global Settings , on page 1180.
- **Group Policies**—You can view the user group policies defined for your remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For more information, see Configuring Group Policies for Remote Access VPNs , on page 1352.
- **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see Understanding Public Key Infrastructure Policies , on page 1200 and Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207.

Note For multi-context ASA devices, the Public Key Infrastructure policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

- **Username from Cert Scripts**—You can use this policy to define a script to use in mapping the username from the certificate. For more information, see Add/Edit Scripts Dialog Box , on page 1360.

Note For multi-context ASA devices, the Username from Cert Scripts policy is supported by Security Manager version 4.12 and ASA version 9.6(2) onwards only.

- **Policies used in remote access IPsec VPNs only:**
  - **Certificate To Connection Profile Maps, Policy and Rules** (IKEv1 IPSec only.)—Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use

any or all of these methods. For more information, see Configuring Certificate to Connection Profile Map Policies (ASA) , on page 1363.

- **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see Configuring an IKE Proposal , on page 1158.
- **IPsec Proposal (ASA/PIX 7.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices) , on page 1367.

- **Policies used in remote access IKEv2 IPSec and SSL VPNs only:**
  - **Access**—An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or Secure Client Essentials. For more information, see Understanding SSL VPN Access Policies (ASA) , on page 1371.
  - **Other Settings**—The SSL VPN Other Settings policy defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, Secure Client images and profiles, Kerberos Constrained Delegation, and some other advanced settings. For more information, see Configuring Other SSL VPN Settings (ASA) , on page 1378.
  - **Shared License**—Use the SSL VPN Shared License page to configure your SSL VPN Shared License. For more information, see Configuring SSL VPN Shared Licenses (ASA 8.2+) , on page 1403.

The following table explains whether a policy is required or optional for a particular type of VPN.

Table 374: Remote Access VPN Policy Requirements for ASA Devices

Policy	Required, Optional
ASA Group Load Balancing	**Optional** for all VPN types.
Dynamic Access	**Optional** for all VPN types.
Dynamic Access	**Optional** for all VPN types.
Global Settings	**Required**: IKEv2 IPsec. **Optional**: IKEv1 IPsec, SSL.
Group Policies	**Required** for all VPN types.

Policy	Required, Optional
Public Key Infrastructure	**Required**: IKEv2 IPsec. Also required if you configure any trustpoints for IKEv1 IPsec or SSL VPNs. Otherwise, it is optional.
Certificate To Connection Profile Maps, Policy and Rules	**Optional**: IKEv1 IPsec. **Not used in**: IKEv2 IPsec, SSL.
IKE Proposal	**Required**: IKEv1 IPsec, IKEv2 IPsec. **Not used in**: SSL.
IPsec Proposal (ASA/PIX 7.x)	**Required**: IKEv1 IPsec, IKEv2 IPsec. **Not used in**: SSL.
Access	**Required**: IKEv2 IPsec, SSL. **Not used in**: IKEv1 IPsec.
Other Settings	**Required**: IKEv2 IPsec, SSL. **Not used in**: IKEv1 IPsec.
Shared License	**Optional**: IKEv2 IPsec, SSL. **Not used in**: IKEv1 IPsec.

Understanding Group Load Balancing (ASA)

In a remote client configuration in which you are using two or more devices connected to the same network to handle remote sessions, you can configure these devices to share their session load. This feature is called load balancing. Load balancing directs session traffic to the least loaded device, thus distributing the load among all devices. Load balancing is effective only on remote sessions initiated with an ASA device.

To implement load balancing, you must group two or more devices on the same private LAN-to-LAN network into a virtual cluster. All devices in the virtual cluster carry session loads. One device in the virtual cluster, called the virtual director, directs incoming calls to the other devices, called secondary devices. The virtual cluster director monitors all devices in the cluster, keeps track of how busy each is, and distributes the session load accordingly.

The virtual cluster appears to outside clients as a single virtual group IP address. This IP address is not tied to a specific physical device—it belongs to the current virtual director. A VPN client trying to establish a connection connects first to this virtual group IP address. The virtual director then sends back to the client the public IP address of the least-loaded available host in the cluster. In a second transaction (transparent to the user), the client connects directly to that host. In this way, the virtual director directs traffic evenly and efficiently across resources.

The role of virtual director is not tied to a physical device—it can shift among devices. If a machine in the cluster fails, the terminated sessions can immediately reconnect to the virtual group IP address. The virtual director then directs these connections to another active device in the cluster. Should the virtual director itself fail, a secondary device in the cluster immediately takes over as the new virtual session director. Even if

several devices in the cluster fail, users can continue to connect to the cluster as long as any one device in the cluster is available.

Understanding Redirection Using a Fully Qualified Domain Name (FQDN)

By default, the ASA sends only IP addresses in load-balancing redirection to a client. If certificates are in use that are based on DNS names, the certificates will be invalid when redirected to a secondary device. As a VPN director, this security appliance can send a fully qualified domain name (FQDN) of a cluster device (another security appliance in the cluster) when redirecting VPN client connections to that group device. The security appliance uses reverse DNS lookup to resolve the FQDN of the device to its outside IP address to redirect connections and perform VPN load balancing. All outside and inside network interfaces on the load-balancing devices in a group must be on the same IP network.

After you enable load balancing using FQDNs, add an entry for each of your ASA outside interfaces into your DNS server, if such entries are not already present. Each ASA outside IP address should have a DNS entry associated with it for lookups. These DNS entries must also be enabled for Reverse Lookup. Enable DNS lookups on your ASA and define your DNS server IP address on the ASA.

For the procedure to configure group load balancing, see Configuring Group Load Balance Policies (ASA) , on page 1330.

Configuring Group Load Balance Policies (ASA)

Use the ASA Group Load Balance page to enable load balancing for an ASA device in your remote access VPN. You must explicitly enable load balancing, as it is disabled by default. All devices that participate in a cluster must share the same cluster-specific values: IP address, encryption settings, encryption key, and port. For more information on cluster load balancing, see Understanding Group Load Balancing (ASA) , on page 1329.

Note Load balancing requires an active 3DES/AES license and an ASA Model 5510 with a Plus license or an ASA Model 5520 or later. The ASA device checks for the existence of this crypto license before enabling load balancing. If it does not detect an active 3DES or AES license, the device prevents load balancing, and also prevents internal configuration of 3DES by the load balancing system unless the license permits this usage.

Step 1 Do one of the following:

- (Device View) Select an ASA device; then select **Remote Access VPN > ASA Group Load Balance** from the Policy selector.
- (Policy View) Select **Remote Access VPN > ASA Group Load Balance** from the Policy Type selector. Select an existing policy or create a new one.

The ASA Group Load Balance page opens.

Step 2 Select **Participate in Load Balancing Group** to indicate that the device belongs to a load-balancing cluster.

Step 3 Configure the VPN Group Configuration options:

- **Group IPv4/IPv6 Address**—Specify the single IP address that represents the entire virtual cluster. Choose an IP address that is in the same subnet as the external interface. Beginning with version 4.12, Security Manager supports IPv6 address for IPv6 group in addition to the IPv4 address. This is for ASA devices running the version 9.0 or later.

- **UDP Port**—Specify the UDP destination port for the virtual cluster to which the device belongs. The port is typically 9023, but if that port is in use by another application, enter the UDP destination port number that you want to use for load balancing.
- **Enable IPSec Encryption**, **IPSec Shared Secret**—If required, select **Enable IPsec Encryption** to ensure that all load-balancing information communicated between the devices is encrypted. If you select this option, also enter (and confirm) the shared secret password. This can be a case-sensitive value between 4 and 16 characters, without spaces. The security appliances in the virtual group communicate through LAN-to-LAN tunnels using IPsec. This password must match the passwords passed on by the client.

Step 4 Configure NAT Configuration options:

- **Nat IP Address IPv4/IPv6**—Specify the single NAT IP address. Beginning with version 4.24, CSM supports IPv4 and IPv6 NAT IP address configuration.

Step 5 Configure the priority of the server in the cluster. Select one of the following options:

- **Accept default device value**—To accept the default priority value assigned to the device.
- **Configure same priority on all devices in the cluster**—To configure the same priority value to all the devices in the cluster. Then enter the priority number (1-10) to indicate the likelihood of the device becoming the virtual director, either at startup or when the existing director fails.

Step 6 Specify the public and private interfaces to be used on the server:

- **Public Interfaces**—The public interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.
- **Private Interfaces**—The private interfaces to be used on the server. Enter the name of an interface or interface role object, or click **Select** to select the interface or role or to create a new role.

Step 7 If required, select **Send FQDN to client instead of an IP address when redirecting** to enable redirection using fully-qualified domain names. This option is available only for ASA devices running 8.0(2) or later. For more information, see Understanding Group Load Balancing (ASA) , on page 1329.

Configuring Connection Profiles (ASA, PIX 7.0+)

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

A connection profile is a set of records that contain VPN tunnel connection policies, including the attributes that pertain to creating the tunnel itself. Connection profiles identify the group policies for a specific connection, which includes user-oriented attributes. If you do not assign a group policy to a user, the default connection profile for the connection applies. You can create one or more connection profiles specific to your environment. You can configure connection profiles on the local remote access VPN server or on external AAA servers.

When you discover remote access VPN policies on a device, Security Manager adds the default connection profiles to the policy. You can edit these profiles, and the associated DlftGrpPolicy (renamed in Security

Manager as <*device_display_name*> DfltGrpPolicy), but you cannot delete them. The following default connection profiles are supported in Security Manager:

- DefaultRAGroup—The default connection profile for remote access IPsec VPNs.
- DefaultWEBVPNGroup—The default connection profile for SSL VPNs. This connection profile is discovered only for ASA 8.0+ devices.

If you are configuring a connection profile on an ASA device, you have the option of configuring double authentication. The double authentication feature implements two-factor authentication for remote access to the network, in accordance with the Payment Card Industry Standards Council Data Security Standard. This feature requires that the user enter two separate sets of login credentials at the login page. For example, the primary authentication might be a one-time password, and the secondary authentication might be a domain (Active Directory) credential. If the primary credential authentication fails, the security appliance does not attempt to validate the secondary credentials. If either authentication fails, the connection is denied. Both the AnyConnect VPN client (SSL VPN or IKEv2 IPSec VPN) and Clientless SSL VPN support double authentication. The Secure Client supports double authentication on Windows computers (including supported Windows Mobile devices and Start Before Login), Mac computers, and Linux computers.

This procedure describes how to create or edit connection profiles on your remote access VPN server using the Connection Profile policy.

Note You can also create connection profiles from the Remote Access VPN Configuration wizard; see Using the Remote Access VPN Configuration Wizard , on page 1300. For information on connection profiles in Easy VPN site-to-site topologies, see Configuring a Connection Profile Policy for Easy VPN , on page 1258.

Related Topics

- Discovering Remote Access VPN Policies , on page 1298

Step 1 Do one of the following:

- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Connection Profiles** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Connection Profiles page opens. The policy lists all connection profiles and shows the group policy used in the profile. For more information, see Connection Profiles Page , on page 1333.

Step 2 Click **Add Row (+)** beneath the table, or select a profile and click **Edit Row (pencil)**. The Connection Profiles dialog box opens.

Step 3 (All remote access VPN types.) On the General tab, specify the connection profile name and group policies and select which method (or methods) of address assignment to use. For a detailed explanation of the configuration, see General Tab (Connection Profiles) , on page 1335.

Step 4 (All remote access VPN types.) Click the **AAA** tab to specify the AAA authentication parameters for the connection profile. For a detailed explanation of the configuration, see AAA Tab (Connection Profiles) , on page 1338.

Step 5 (Remote access IKEv2 IPsec and SSL VPN only.) If you are setting up a connection profile on an ASA device, you can configure secondary authentication. To do so, click the **Secondary AAA** tab. For a detailed explanation of the configuration, see Secondary AAA Tab (Connection Profiles) , on page 1342.

Step 6 (Remote access IPsec VPN only.) Click the **IPsec** tab to specify IPsec and IKE parameters for the connection profile. Some of these settings apply to IKEv1 but not to IKEv2 connections. For a detailed explanation of the configuration, see IPSec Tab (Connection Profiles) , on page 1344.

Note To configure IKEv2 settings, use the IKEv2 Settings tab of the Global Settings policy; see Configuring VPN Global IKEv2 Settings , on page 1187.

Step 7 (Remote access SSL VPN only.) Click the **SSL** tab to specify the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, specify DHCP servers to be used for client address assignment, and establish an association between an interface and client IP address pools. For a detailed explanation of the configuration, see SSL Tab (Connection Profiles) , on page 1348.

Step 8 Click **OK**.

Connection Profiles Page

Use the Connection Profiles page to manage connection profile policies for remote access VPN or Easy VPN topologies. The Connection Profiles page lists the connection profiles that are configured, shows the group policy associated with those connection profiles, and indicates whether a connection profile is the default connection profile to use for Citrix clients when no specific tunnel group is identified during tunnel negotiation.

Use of this policy differs depending on the type of VPN you are configuring:

- Remote access SSL VPN—The policy is used only for ASA devices. You can create multiple profiles, and configure settings on all tabs of the Connection Profiles dialog box.
- Remote access IPSec VPN—The policy is used for ASA devices and PIX Firewalls running PIX 7.0+ software. You can create multiple profiles, but only the General, AAA, and IPSec tabs on the Connection Profiles dialog box apply to this configuration (in some cases, you will see only these tabs).
- Easy VPN topologies—The policy is used for Easy VPN servers (hubs) that are ASA devices or PIX Firewalls running PIX 7.0+ software. You can create a single profile, so the policy page actually imbeds the Connection Profiles dialog box, so that you have direct access to the tabs that define the profile. Only the General, AAA, and IPSec tabs apply.

For remote access IPSec and SSL VPNs:

- To add a profile, click the **Add Row** button and fill in the Connection Profiles dialog box.
- To edit an existing profile, select it and click the **Edit Row** button.
- To delete a profile, select it and click the **Delete Row** button.

The connection profile consists of the following tabs. Configure them as appropriate for the type of VPN you are configuring.

- General Tab (Connection Profiles) , on page 1335
- AAA Tab (Connection Profiles) , on page 1338
- Secondary AAA Tab (Connection Profiles) , on page 1342 (SSL VPN and IKEv2 IPsec VPN only.)

- IPSec Tab (Connection Profiles) , on page 1344 (Some of these settings apply to IKEv1 but not to IKEv2 connections.)
- SSL Tab (Connection Profiles) , on page 1348 (SSL VPN only)

Navigation Path

Remote access VPNs:

- (Device View) Select an ASA or PIX 7+ device and select **Remote Access VPN > Connection Profiles** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Connection Profiles (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Easy VPN:

- From the Site-to-Site VPN Manager Window , on page 1093, select the Easy VPN topology and then select **Connection Profiles (PIX7.0/ASA)**.
- (Device view) Select a device that participates in the Easy VPN topology and select **Site to Site VPN** from the Policy selector. Select the Easy VPN topology and click **Edit VPN Policies** to open the Site-to-Site VPN Manager Window , on page 1093, where you can select the policy.
- (Policy view) Select **Site-to-Site VPN > Connection Profiles (PIX7.0/ASA)**. Select an existing policy or create a new one.

This section contains the following topics:

Supported CLIs in Remote Access VPN Multi-Context Mode - Connection Profiles

The following CLIs are supported for ASA 9.5(2) for Connection Profiles for remote access VPN in multiple context mode. These CLIs are supported in Admin and User Context for Tunnel-Group.

DefaultWEBVPNGroup is the default Connection Profile. DefaultRAGroup is not supported in ASA 9.5(2) remote access VPN Multiple Context mode.

Note For the configurations that are not supported, Security Manager displays a warning message that you can ignore. No delta will be generated.

- Type remote-access

- General-attributes
  - Accounting-server-group
  - Address-pool
  - Annotation
  - Authenticated-session-username
  - Authentication-attr-from-server
  - Authentication-server-group

General Tab (Connection Profiles)

Use the General tab of the Connection Profiles dialog box to configure the basic properties for a VPN Connection Profile policy. These properties are used in remote access IPsec and SSL VPNs and site-to-site Easy VPN topologies.

The General Tab is supported in ASA 9.5(2) Remote Access VPN in Multiple Context mode.

Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see Connection Profiles Page , on page 1333), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **General** tab if necessary.

- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see Connection Profiles Page , on page 1333). Click the **General** tab if necessary.

Table 375: Connection Profile General Tab

Element	Description
Connection Profile Name	The name of the connection profile (tunnel group).
Group Policy	If required, the name of the ASA group policy object that defines the default user group associated with the connection profile. A group policy is a collection of user-oriented attribute/value pairs stored either internally on the device or externally on a RADIUS/LDAP server. Click **Select** to select an existing object or to create a new one.
Client Address Assignment	
DHCP Servers	The DHCP servers to be used for client address assignments. The servers are used in the order listed. Enter the IP addresses of the DHCP servers or the names of network/host policy objects that define the DHCP server addresses. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.
Global IPv4 Address Pool	The address pools from which IPv4 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Address pools are entered as a range of addresses, such as 10.100.12.2-10.100.12.254. The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. Enter the address pool ranges or the names of network/host objects that define these pools. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.

Element	Description
Global IPv6 Address Pool	The address pools from which IPv6 addresses will be assigned to clients if no pool is specified for the interface to which the client connects. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running version 9.0 or later. Address pools are entered as a range of addresses, for example, fe80::60/5 4, where fe80::60/5 is the IPv6 address and prefix length, and 4 is the count (number of addresses). The server uses these pools in the order listed. If all addresses in the first pool have been assigned, it uses the next pool, and so on. You can specify up to 6 pools. Enter the address pool ranges or the names of network/host objects that define these pools. Click **Select** to select existing network/host objects or to create new ones. Separate multiple entries with commas.
Interface-Specific Address Pools table	If you want to configure separate IP address pools for specific interfaces, so that clients connecting through that interface use a pool different from the global pool, add the interface to this table and configure the separate pool. Any interface not listed here uses the global pool. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running version 9.0 or later. Therefore, you see an additional column for IPv6 address pool. • To add an interface-specific address pool, click the **Add Row** button and fill in the Add/Edit Interface Specific Client Address Pools Dialog Box , on page 1337. • To edit an interface pool, select it and click the **Edit Row** button. • To delete an interface, select it and click the **Delete Row** button.

Add/Edit Interface Specific Client Address Pools Dialog Box

Use the Add/Edit Interface Specific Client Address Pools dialog box to configure interface-specific client address pools for your connection profile policy.

Navigation Path

Open the General tab in the Connection Profiles dialog box (see General Tab (Connection Profiles) , on page 1335), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

Related Topics

- Creating Interface Role Objects , on page 304

Field Reference

Table 376: Add/Edit Interface Specific Client Address Pools Dialog Box

Element	Description
Interface	The interface to which you are assigning an address pool. Enter the interface name or the name of an interface role object, or click **Select** to select an interface or object or to create a new object.
IPv4 Address Pool	The IPv4 address pool to assign to the interface. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. Address pools are specified using the starting and ending IP addresses of the pool, for example, 10.100.10.2-10.100.10.254. You can either type in the IP address range, or use a network/host object that specifies an address range. Click **Select** to select a network/host object or to create a new object.
IPv6 Address Pool	TheIPv6 address pool to assign to the interface. IPv6 address pools are specified using the IPv6 address along with the prefix length and followed by the count, where count refer to the number of addresses in the pool. You can either type in the IP address range, or use a network/host object that specifies an address range. Click **Select** to select a network/host object or to create a new object.

AAA Tab (Connection Profiles)

Use the AAA tab of the Connection Profile dialog box to configure the AAA authentication parameters for a connection profile policy.

For AAA, the Distinguished Name Authorization Settings policy is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

However, beginning with Security Manager version 4.12, this policy is supported for ASA 9.6(2) Remote Access VPN in Multi-context mode. The supported CLIs for the Admin and User context are:

- Tunnel-group General-attributes
  - Secondary-username-from-certificate
  - Username-from-certificate

Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see Connection Profiles Page , on page 1333), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **AAA** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see Connection Profiles Page , on page 1333). Click the **AAA** tab.

Field Reference

Table 377: Connection Profile AAA Tab

Element	Description
Authentication Method	Whether to authenticate connections using AAA, certificates, or both, Multiple Certificate, AAA and Multiple Certificate, and SAML. If you select Certificate, many of the options on the dialog box are disabled as the required details are obtained from the certificate. Beginning with version 4.10, Security Manager enables you to select SAML Identity Provider as an authentication method. This is to enable SAML Service Provider for the current tunnel group. SAML Identity Provider will not be used until they are applied in a tunnel group. The SAML authentication is a mutual exclusion authentication method. See Configuring SAML Identity Provider, on page 329 for more information. Beginning with version 4.13, Security Manager enables you to select Multiple Certificate, or AAA & Multiple Certificate as an authentication method. This method is enabled to support the Multiple certificate authentication feature of ASA 9.7.1 devices. If you select this method for a ASA device earlier to 9.7.1 release, validation error message appears. For more information, see Multiple Certificate Authentication Support, on page 460.
Authentication Server Group	The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object. If you want to use different authentication server groups based on the interface to which the client connects, configure the server groups in the Interface-Specific Authentication Server Groups table at the bottom of this tab (described below).
Use LOCAL if Server Group Fails	Whether to fall back to the local database for authentication if the selected authentication server group fails.
Authorization Server Group	The name of the authorization server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.
Users must exist in the authorization database to connect	Whether to require that the username of the client must exist in the authorization database to allow a successful connection. If the username does not exist in the authorization database, then the connection is denied.
Accounting Server Group	The name of the accounting server group. Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object.

Element	Description
Strip Realm from Username Strip Group from Username	Whether to remove the realm or group name from the username before passing the username on to the AAA server. A realm is an administrative domain. Enabling these options allows the authentication to be based on the username alone. You can enable any combination of these options. However, you must select both check boxes if your server cannot parse delimiters.
Override Account-Disabled Indication from AAA Server	Whether to override the "account-disabled" indicator from a AAA server. This configuration is valid for servers, such as RADIUS with NT LDAP, and Kerberos, that return an "account-disabled" indication. If you are using an LDAP directory server for authentication, password management is supported with the Sun Microsystems JAVA System Directory Server (formerly named the Sun ONE Directory Server) and the Microsoft Active Directory. • **Sun**—The DN configured on the security appliance to access a Sun directory server must be able to access the default password policy on that server. We recommend using the directory administrator, or a user with directory administrator privileges, as the DN. Alternatively, you can place an ACI on the default password policy. • **Microsoft**—You must configure LDAP over SSL to enable password management with Microsoft Active Directory.
Enable Notification Upon Password Expiration to Allow User to Change Password Enable Notification Prior to Expiration Notify Prior to Expiration	Whether to have the security appliance notify the remote user at login that the current password is about to expire or has expired, and to then offer the user the opportunity to change the password. If you want to give the user prior warning of an impending password expiration, select **Enable Notification Prior to Expiration** and specify the number of days prior to expiration that you want to start notifications (1 to 180 days). You can use this option with AAA servers that support such notification—RADIUS, RADIUS with an NT server, and LDAP servers. There is no prior notification for other types of servers.

Element	Description
Distinguished Name (DN) Authorization Settings	How you want to use the distinguished name for authorization. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a tunnel group. DN rules are used for enhanced certificate authentication. Select from the following options to determine how the DN is used during authorization: • **Use Entire DN as the Username**—Use the entire DN; do not focus on any one field. • **Specify Individual DN fields as the Username**—Focus on specific fields. Select a primary field, and optionally, a secondary field. The default is to use the common name (CN) as primary and the organization unit (OU) as secondary. • **Use Script to Select Username**—Beginning with version 4.7, Security Manager enables you to define a script to use in mapping the username from the certificate. Select the script that you have defined from the drop-down list. For more information, see Add/Edit Scripts Dialog Box , on page 1360.
Interface-Specific Authentication Server Groups table	If you want to configure separate authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available. • To add an interface-specific authentication group to the list, click the **Add Row** button and fill in the Add/Edit Interface Specific Authentication Server Groups Dialog Box , on page 1341. • To edit an interface setting, select it and click the **Edit Row** button. • To delete an interface setting, select it and click the **Delete Row** button.

Add/Edit Interface Specific Authentication Server Groups Dialog Box

Use the Add/Edit Interface Specific Authentication Server Groups dialog boxes to configure interface-specific authentication for your connection profile policy. This setting overrides the global authentication server group settings if the client connects to the specified interface.

If you are configuring the secondary AAA server for an SSL VPN on an ASA device, the settings are specifically used for the secondary set of credentials that the user enters; this is reflected in the name of the dialog box.

Navigation Path

Open the AAA or Secondary AAA tabs in the Connection Profiles dialog box (see AAA Tab (Connection Profiles) , on page 1338 or Secondary AAA Tab (Connection Profiles) , on page 1342), then click **Add Row** below the Interface-Specific Address Pools table, or select a row in the table and click **Edit Row**.

Field Reference

Table 378: Add/Edit (Secondary) Interface Specific Authentication Server Groups

Element	Description
Interface	The name of the interface or interface role (that identifies the interfaces) for which you are configuring an authentication server group. Click **Select** to select an interface or interface role or to create a new interface role.
Server Group	The name of the authentication server group (LOCAL if the tunnel group is configured on the local device). Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object. When you are configuring secondary AAA, this group is used specifically for the second credentials. You can specify different server groups for primary and secondary credentials.
Use LOCAL if Server Group Fails	Whether to fall back to the local database for authentication if the selected authentication server group fails.
Use Primary Username (Secondary authentication only; remote access SSL or IKEv2 IPSec VPN on ASA 8.2+ only.)	Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.

Secondary AAA Tab (Connection Profiles)

Use the Secondary AAA tab to configure the secondary AAA authentication parameters for a remote access SSL VPN connection profile policy for use with ASA 8.2+ devices, or a remote access IKEv2 IPSec VPN connection profile policy for use with an ASA 8.4(1)+ device. These settings do not apply to remote access IKEv1 IPSec VPNs or Easy VPN topologies or to other device types.

Navigation Path

Remote Access VPNs only—From the Connection Profiles page (see Connection Profiles Page , on page 1333), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **Secondary AAA** tab.

Related Topics

- Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331

Field Reference

Table 379: Connection Profile Secondary AAA Tab

Element	Description
Enable Double Authentication	Whether to enable double authentication, which prompts the user for two sets of credentials (username and password) before completing the remote access VPN connection.
Secondary Authentication Server Group	The name of the authentication server group (LOCAL if the tunnel group is configured on the local device) to be used with the second set of credentials. Enter the name of a AAA server group object or click **Select** to select it from a list or to create a new object. If you want to use different authentication server groups based on the interface to which the client connects, configure the server groups in the Secondary Interface-Specific Authentication Server Groups table at the bottom of this tab (described below).
Use LOCAL if Server Group Fails	Whether to fall back to the local database for authentication if the selected authentication server group fails.
Use Primary Username for Secondary Authentication	Whether to use the same username for the secondary credentials that was used for the primary credentials. If you select this option, after users authenticate with their primary credentials, they are prompted for the secondary password only. If you do not select this option, the secondary prompt requires both a username and password.
Username for Session	The username that the software will use for the user session, either the primary or secondary name. If you prompt for the primary name only, select primary. **Note** By default, if there is more than one username, Secure Client remembers both usernames between sessions. In addition, the head-end device might offer a feature to allow for administrative control over whether the client remembers both or neither usernames.
Authorization Authentication Server	The server to use for authorization, either the primary authentication server (defined on the AAA tab) or the secondary authentication server configured on this tab.

Element	Description
Distinguished Name (DN) Secondary Authorization Setting	How you want to use the distinguished name for authorization. A distinguished name (DN) is a unique identification, made up of individual fields, that can be used as the identifier when matching users to a tunnel group. DN rules are used for enhanced certificate authentication. Select from the following options to determine how the DN is used during authorization: • **Use Entire DN as the Username**—Use the entire DN; do not focus on any one field. • **Specify Individual DN fields as the Username**—Focus on specific fields. Select a primary field, and optionally, a secondary field. The default is to use only the user identification (UID) field. • **Use Script to Select Username**—Beginning with version 4.7, Security Manager enables you to define a script to use in mapping the username from the certificate. Select the script that you have defined from the drop-down list. For more information, see Add/Edit Scripts Dialog Box , on page 1360. **Note** The Distinguished Name (DN) Secondary Authorization Settings policy is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) in Multi-context mode. The supported CLIs for the Admin and User context are: • Tunnel-group General-attributes • Secondary-username-from-certificate • Username-from-certificate
Secondary Interface-Specific Authentication Server Groups table	If you want to configure separate secondary authentication server groups for specific interfaces, so that clients connecting through that interface use a server group different from the global group, add the interface to this table and configure the separate group. Any interface not listed here uses the global authentication server group. The table shows the server group and whether you are falling back to local authentication if the server group is not available. • To add a secondary interface-specific authentication group to the list, click the **Add Row** button and fill in the Add/Edit Interface Specific Authentication Server Groups Dialog Box , on page 1341. • To edit an interface setting, select it and click the **Edit Row** button. • To delete an interface setting, select it and click the **Delete Row** button.

IPSec Tab (Connection Profiles)

Use the IPsec tab of the Connection Profiles page to specify IPsec and IKE parameters for the connection policy.

Beginning with version 4.8, Security Manager supports VPN connectivity via standards-based, third-party, IKEv2 remote-access clients (in addition to Secure Client). Authentication support includes preshared keys, certificates, and user authentication via the Extensible Authentication Protocol (EAP).

IPSec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Beginning with Cisco Security Manager version 4.17, IPSec is supported from ASA 9.9(2) or later multi-context devices. However, the following attributes under Connection Profile > IPSec tab is not supported for ASA 9.9(2) or later multi-context devices:

- Enable IKEv2 Mobike RRC
- Client Software Update Table

Navigation Path

- Remote Access VPNs—From the Connection Profiles page (see Connection Profiles Page , on page 1333), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **IPSec** tab.
- Easy VPN topologies—Select the site-to-site VPN Connection Profiles policy in either Policy view or in the Site-to-Site VPN Manager with an Easy VPN topology selected (see Connection Profiles Page , on page 1333). Click the **IPSec** tab.

Related Topics

- Configuring a Connection Profile Policy for Easy VPN , on page 1258
- Understanding Easy VPN , on page 1245

Field Reference

Table 380: Connection Profiles IPsec Tab

Element	Description
IKEv1 Peer Authentication	
Preshared Key	The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.
Trustpoint Name	The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv1 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object. **Tips** If you specify a trustpoint, you must also select the same PKI enrollment object in the Public Key Infrastructure policy. For more information, see Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207.

Element	Description
IKEv2 Peer Authentication You can configure one or more authentication options such as preshared key, certificate, and EAP for remote authentication.	
Preshared Key	The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.
Enable Certificate Authentication	Allows you to use certificates for authentication if checked.
Enable EAP Authentication	Allows you to use EAP for authentication if checked. **Note** You must use certificates for local authentication if you check this check box since EAP authentication requires the server to authenticate via a certificate.
Send EAP identity request to the client	Enables you to send an EAP request for authentication to the remote access VPN client.
IKEv2 Local Authentication You can configure either a preshared key or a trustpoint name for local authentication.	
Preshared key	The preshared key for the connection profile. The maximum length of a preshared key is 127 characters. Enter the key again in the Confirm field.
Trustpoint Name	The name of the PKI enrollment policy object that defines the trustpoint name if any trustpoints are configured for IKEv2 connections. A trustpoint represents a Certificate Authority (CA)/identity pair and contains the identity of the CA, CA-specific configuration parameters, and an association with one enrolled identity certificate. Click **Select** to select the object from a list or to create a new object. **Note** Local authentication must be using certificate if you select EAP for remote authentication.
Enable IKEv2 Mobike RRC	Select to enable Return Routability checking for dynamic IP address changes in IKE/IPSEC security associations on which mobike is enabled. By default, Mobike RRC is disabled. **Note** You can enable Return Routability Checking for dynamic IP address changes, only for ASA 9.8.1 and later. **Note** This option is not supported for ASA 9.9(2) or later multi-context devices.
Enable IKEv2 RSA Signature SHA-1	Select to enable RSA signature SHA-1 for IKEv2 authentication. By default, RSA Signature SHA-1 is disabled. **Note** This option is supported from Cisco Security Manager 4.19 and ASA 9.12(1) or later devices.

Element	Description
IKE Peer ID Validation	Select whether IKE peer ID validation is ignored (Do not check), required, or checked only if supported by a certificate. During IKE negotiations, peers must identify themselves to one another.
Enable Sending Certificate Chain	Whether to enable the sending of the certificate chain for authorization. A certificate chain includes the root CA certificate, identity certificate, and key pair.
Enable Password Update with RADIUS Authentication	Whether to enable passwords to be updated with the RADIUS authentication protocol. For more information, see Supported AAA Server Types , on page 257.
ISAKMP Keepalive	Whether to monitor ISAKMP keepalive. If you select the **Monitor Keepalive** option, you can configure IKE keepalive as the default failover and routing mechanism. Enter the following parameters: • **Confidence Interval**—The number of seconds that a device waits between sending IKE keepalive packets. • **Retry Interval**—The number of seconds a device waits between attempts to establish an IKE connection with the remote peer. The default is 2 seconds. For more information, see Configuring VPN Global ISAKMP/IPsec Settings , on page 1183.
Client Software Update table	The VPN client revision level and URLs for client platforms. You can configure different revision levels for All Windows Platforms, Windows 95/98/ME, Windows NT4.0/2000/XP, or the VPN3002 Hardware Client. To configure the client for a platform, select it, click the **Edit Row** button, and fill in the IPSec Client Software Update Dialog Box , on page 1347. **Note** This option is not supported for ASA 9.9(2) or later multi-context devices.

IPSec Client Software Update Dialog Box

Use the IPsec Client Software Update dialog box to configure the specific revision level and image URL of a VPN client.

Navigation Path

Open the IPSec tab in the Connection Profiles dialog box (see IPSec Tab (Connection Profiles) , on page 1344), select a client type from the Client Software Update table, then click **Edit Row**.

Field Reference

Table 381: IPSec Client Software Update Dialog Box

Element	Description
Client Type	Type of client being modified.
Client Revisions	Revision level of the client.
Image URL	URL of the client software image.

SSL Tab (Connection Profiles)

Use the SSL tab of the Connection Profile dialog box to configure the WINS servers for the connection profile policy, select a customized look and feel for the SSL VPN end-user logon web page, DHCP servers to be used for client address assignment, and to establish an association between an interface and client IP address pools. Some items, such as connection profile aliases, apply to remote access IKEv2 IPsec VPNs, but otherwise these settings do not apply to remote access IKEv1 IPSec VPNs or Easy VPN topologies.

The following profiles are supported for the SSL tab in ASA 9.5(2) Remote Access VPN in Multi-context mode.

- Radius-Reject-Message
- Connection alias
- Group-url
- Group-alias

Navigation Path

Remote Access VPNs only—From the Connection Profiles page (see Connection Profiles Page , on page 1333), click the **Add Row (+)** button, or select a profile and click the **Edit Row (pencil)** button, to open the Connection Profiles dialog box. Click the **SSL** tab.

Related Topics

- Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331
- Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs , on page 1416
- Understanding Networks/Hosts Objects , on page 310
- Configuring ASA Portal Appearance Using SSL VPN Customization Objects , on page 1406

Field Reference

Table 382: Connection Profile SSL Tab

Element	Description
WINS Servers List	The name of the WINS (Windows Internet Naming Server) servers list to use for CIFS name resolution. Click **Select** to select the WINS servers list policy object or to create a new object. SSL VPN uses the CIFS protocol to access or share files on remote systems. When you attempt a file-sharing connection to a Windows computer by using its computer name, the file server you specify corresponds to a specific WINS server name that identifies a resource on the network. A WINS servers list defines a list of WINS servers, which are used to translate Windows file server names to IP addresses. The security appliance queries the WINS servers to map WINS names to IP addresses. You must configure at least one, and up to three WINS servers for redundancy. The security appliance uses the first server on the list for WINS/CIFS name resolution. If the query fails, it uses the next server.
DNS Group	The DNS group to use for the SSL VPN tunnel group. The DNS group resolves the hostname to the appropriate DNS server for the tunnel group. Select the desired group from the list; the DefaultDNS group is the default group that is always available on the device. **Tip** The DNS groups are defined in the **Platform > Device Admin > Server Access > DNS** policy. Use the DNS policy to change the servers defined in a group or to add or remove groups. See DNS Page , on page 2015.
Portal Page Customization	The name of the SSL VPN Customization policy object that defines the default portal page for the VPN. This profile defines the appearance of the portal page that allows the remote user access to all resources available on the SSL VPN. Click **Select** to select the object or to create a new object. **Note** You can set up different login windows for different groups by using a combination of customization profiles and groups. For example, assuming that you had created a customization profile called salesgui, you can create an SSL VPN group called sales that uses that customization profile. You would then specify the SSL VPN customization object in the group policy object on the SSL VPN > Settings tab; see ASA Group Policies SSL VPN Settings , on page 1512.
SAML Identity Provider	Select the SAML Identity Provider. SAML Identity Provider will not be used until it is applied in a tunnel group. See Configuring SAML Identity Provider, on page 329 for more information.
Override SVC Download (ASA 8.0(2)+ only)	Whether you want clientless users logging in under specific tunnel groups to not have to wait for the download prompt to expire before being presented with the clientless SSL VPN home page. Instead, these users are immediately presented with the clientless SSL VPN home page.

Element	Description
Reject Radius Message (ASA 8.0(2)+ only)	Whether you want to display to remote users a RADIUS message about their authentication failure.
Connection Aliases table	A list of alternate names by which the tunnel group can be referred to. The status indicates whether the name is enabled for use or disabled (cannot be used). A group alias creates one or more alternate names by which a user can refer to a tunnel group. This feature is useful when the same group is known by several common names (such as "Devtest" and "QA"). If you want the actual name of the tunnel group to appear on this list, you must specify it as an alias. The group alias that you specify here appears on the login page. Each tunnel group can have multiple aliases or no alias. • To add an alias, click the **Add Row (+)** button beneath the table and fill in the Add/Edit Connection Alias Dialog Box , on page 1351. • To edit an alias, select it and click the **Edit Row (pencil)** button. • To delete an alias, select it and click the **Delete Row (trash can)** button.
Group URLs table	A list of URLs associated with the tunnel group connection profile. The status indicates whether the URL is enabled for use. When enabled, the user can use the URL, which eliminates the need to select a group during login. You can configure multiple URLs (or no URLs) for a tunnel group. Each URL can be enabled or disabled individually. You must use a separate specification for each URL, specifying the entire URL using either the HTTP or HTTPS protocol. • To add a URL, click the **Add Row (+)** button beneath the table and fill in the Add/Edit Connection URL Dialog Box , on page 1351. • To edit a URL, select it and click the **Edit Row (pencil)** button. • To delete a URL, select it and click the **Delete Row (trash can)** button.
Default Citrix Client Profile (ASA 9.1(4)+ only)	Whether this connection profile should be the default connection profile to use for Citrix clients when no specific tunnel group is identified during tunnel negotiation. **Note** Only one connection profile can be configured as the Default Citrix Client Profile. If you try to configure a connection profile as the Default Citrix Client Profile when another profile is already configured as such, you will receive a warning message. If you continue with the operation, the selected connection profile will be made the Default Citrix Client Profile and the other connection profile will be deselected as the Default Citrix Client Profile.

Element	Description
Disable CSD (ASA 8.2(0)+ only) Both Clientless and Secure Client Secure Client only	Whether to disable Cisco Secure Desktop (CSD) for this connection profile. Security Manager supports this feature on all devices that are running ASA software version 8.2(0) and later. **Note** If you choose to disable CSD, by default Security Manager selects the option for both SSL Clientless VPN and Secure Client.

Add/Edit Connection Alias Dialog Box

Use the Add/Edit Connection Alias dialog box to create or edit a connection alias for an SSL or IKEv2 IPsec VPN connection profile. Specifying the connection alias creates one or more alternate names by which the user can refer to a tunnel group.

Navigation Path

Open the SSL tab in the Connection Profiles dialog box (see SSL Tab (Connection Profiles) , on page 1348), and click **Add Row** beneath the Connection Alias table, or select an alias from the table and click **Edit Row**.

Field Reference

Table 383: Add/Edit Connection Alias Dialog Box

Element	Description
Enabled	Whether to enable the connection alias. You must enable the alias for users to use it.
Connection Alias	The alternative name for the connection profile. The connection alias that you specify here appears in a list on the user's login page.

Add/Edit Connection URL Dialog Box

Use this dialog box to specify incoming URLs for the tunnel group. If a connection URL is enabled in a tunnel group, when the user connects using that URL, the security appliance selects the associated tunnel group and presents the user with only the username and password fields in the login window.

Tips

- You can configure multiple URLs or addresses (or none) for a group. Each URL or address can be enabled or disabled individually.
- You cannot associate the same URL or address with multiple groups. The security appliance verifies the uniqueness of the URL or address before accepting the URL or address for a tunnel group.

Navigation Path

Open the SSL tab in the Connection Profiles dialog box (see SSL Tab (Connection Profiles) , on page 1348), and click **Add Row** beneath the Group URLs table, or select a URL from the table and click **Edit Row**.

Field Reference

Table 384: Add/Edit Connection URL Dialog Box

Element	Description
Enabled	Whether to enable the connection alias. You must enable the alias for users to use it.
Connection URL	Select a protocol (**http** or **https**) from the list, and specify the incoming URL for the connection.

Configuring Group Policies for Remote Access VPNs

In the Group Policies page, you can view the user group policies defined for your ASA remote access VPN connection profiles. From this page, you can specify new ASA user groups and edit existing ones. When you create a connection profile, if you specify a group policy that has not been used on the device, the group policy is automatically added to the Group Policies page; you do not need to add it to this policy before you create the connection profile. For information on creating connection profiles, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.

For more information about group policies, see Understanding Group Policies (ASA) , on page 1353.

Tip Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

Each row in the table represents an ASA group policy object, displaying the name of the policy object assigned to the remote access VPN connection profile, whether it is stored on the ASA device itself (Internal) or on a AAA server (External), and whether the group is for IKEv1 (IPsec), IKEv2 (IPsec), SSL, or all types of VPN. For external groups, the protocol is unknown and listed as N/A.

- To add an ASA group policy object, click the **Add Row** button. This opens an object selector, from which you can select an existing policy object or click the **Create** button to create a new object. For more information about creating group policies, see Creating Group Policies (ASA, PIX 7.0+) , on page 1354.

Note You cannot create more than one group policy that includes DfltGrpPolicy in its name. DfltGrpPolicy is the default policy defined on the device; if Security Manager discovers the group during remote access policy discovery, the group appears in the list under the name <*device_display_name*> DfltGrpPolicy. When you deploy the configuration to the device, the display name prefix is removed so that DfltGrpPolicy is updated correctly. For more information, see Discovering Remote Access VPN Policies , on page 1298.

- To edit an object, select it and click the **Edit Row** button to open the ASA Group Policies Dialog Box , on page 1489.
- To delete an object from the policy, select it and click the **Delete Row** button. The associated policy objects are not deleted, they are only removed from this policy.

Note You cannot delete the default group policy.

Navigation Path

- (Device view) Select an ASA device, then select **Remote Access VPN > Group Policies** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy selector. Select an existing policy or create a new one.

Note From Cisco Security Manager 4.24 onwards, if you do not configure vpn-tunnel-protocol to the **Group Policy** upon ASA device discovery, then CSM will discover the **Group Policy** by inheriting the vpn-tunnel-protocol value from **DfltGrpPolicy**.

Understanding Group Policies (ASA)

When you configure a remote access IPSec or SSL VPN connection, you must create user groups to which remote clients will belong. A user group policy is a set of user-oriented attribute/value pairs for remote access VPN connections that are stored either internally (locally) on the device or externally on an AAA server. The connection profile uses a user group policy that sets terms for user connections after the connection is established. Group policies let you apply whole sets of attributes to a user or a group of users, rather than having to specify each attribute individually for each user.

Tip Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

An ASA user group comprises the following attributes:

- Group policy source—Identifies whether the user group's attributes and values are stored internally (locally) on the security appliance or externally on an AAA server. If the user group is an external type, no other settings need to be configured for it. For more information, see ASA Group Policies Dialog Box , on page 1489.
- Client Configuration settings, which specify the Cisco client parameters for the user group in an Easy VPN or remote access VPN. For more information, see ASA Group Policies Client Configuration Settings , on page 1494.
- Client Firewall Attributes, which configure the firewall settings for VPN clients in an Easy VPN or remote access VPN. For more information, see ASA Group Policies Client Firewall Attributes , on page 1495.
- Hardware Client Attributes, which configure the VPN 3002 Hardware Client settings in an Easy VPN or remote access VPN. For more information, see ASA Group Policies Hardware Client Attributes , on page 1497.

- IPsec settings, which specify tunneling protocols, filters, connection settings, and servers for the user group in an Easy VPN or remote access VPN. For more information, see ASA Group Policies IPSec Settings , on page 1498.
- Clientless settings, which configure the Clientless mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see ASA Group Policies SSL VPN Clientless Settings , on page 1500.
- Full Client settings, which configure the Full Client mode of access to the corporate network in an SSL VPN, for the ASA user group. For more information, see ASA Group Policies SSL VPN Full Client Settings , on page 1506.
- General settings that are required for Clientless/Port Forwarding in an SSL VPN. For more information, see ASA Group Policies SSL VPN Settings , on page 1512.
- DNS/WINS settings that define the DNS and WINS servers and the domain name that should be pushed to remote clients associated with the ASA user group. For more information, see ASA Group Policies DNS/WINS Settings , on page 1519.
- Split tunneling that lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. For more information, see ASA Group Policies Split Tunneling Settings , on page 1520.
- Remote access or SSL VPN session connection settings for the ASA user group. For more information, see ASA Group Policies Connection Settings , on page 1522.

- Configuring Group Policies for Remote Access VPNs , on page 1352

Creating Group Policies (ASA, PIX 7.0+)

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Group Policies page to create group policies for ASA or PIX 7.0+ devices used in remote access IPSec VPNs, or ASA devices used in remote access SSL VPNs. For information about group policies, see:

- Understanding Group Policies (ASA) , on page 1353
- Configuring Group Policies for Remote Access VPNs , on page 1352

Step 1 Do one of the following:

- (Device view) With an ASA or PIX 7.0+ device selected, select **Remote Access VPN > Group Policies** from the Policy selector.

- (Policy view) Select **Remote Access VPN > Group Policies (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Group Policies page opens. The table lists the existing group policies, whether they are defined internally on the device or externally on a AAA server, and the protocol for the group: IKEv1 (IPsec), IKEv2 (IPsec), or SSL.

Step 2 Click **Add Row (+)** to open a dialog box from which you can select a user group from a list of predefined ASA user group objects, or create new ones if necessary. To create a new group, click the **Create (+)** button in the dialog box.

Step 3 Select the required ASA user group from the list and click **OK**. If the required group already exists, you are finished.

If the required ASA user group does not exist, create it by clicking **Create (+)**. The Add ASA User Group dialog box appears, displaying a list of settings that you can configure for the ASA user group object. For a description of the elements on this dialog box, see ASA Group Policies Dialog Box , on page 1489.

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Select whether to store the ASA user group's attributes and values locally on the device, or on an external server.

Note If you selected to store the ASA user group's attributes on an external server, you do not need to configure any Technology settings. After you specify the AAA server group that will be used for authentication and a password to the AAA server, click **OK** and then select the group in the object selector and click **OK** to add it to the policy.

Step 6 If you selected to store the ASA user group's attributes locally on the device, select the type of VPN for which you are creating the ASA user group from the **Technology** list:

- Easy VPN/IPSec IKEv1—For remote access IPsec VPNs that use IKE version 1 negotiations.
- Easy VPN/IPSec IKEv2—(ASA only.) For remote access IPsec VPNs that use IKE version 2 negotiations.
- SSL Clientless—(ASA only.) For SSL VPNs, all access modes (not just clientless).

Step 7 To configure the user group for Easy VPN/IPSec IKEv1 and Easy VPN/IPSec IKEv2, from the Easy VPN/IPSec VPN folder in the Settings pane:

a) Select **Client Configuration** to configure the Cisco client parameters. For a description of these settings, see ASA Group Policies Client Configuration Settings , on page 1494.
b) Select **Client Firewall Attributes** to configure the firewall settings for VPN clients. For a description of these settings, see ASA Group Policies Client Firewall Attributes , on page 1495.
c) Select **Hardware Client Attributes** to configure the VPN 3002 Hardware Client settings. For a description of these settings, see ASA Group Policies Hardware Client Attributes , on page 1497.
d) Select **IPsec** to specify tunneling protocols, filters, connection settings, and servers. For a description of these settings, see ASA Group Policies IPSec Settings , on page 1498.

Step 8 To configure the user group for an SSL VPN, from the SSL VPN folder in the Settings pane:

a) Select **Clientless** to configure the Clientless mode of access to the corporate network in an SSL VPN. For a description of these settings, see ASA Group Policies SSL VPN Clientless Settings , on page 1500.
b) Select **Full Client** to configure the Full Client mode of access to the corporate network in an SSL VPN. For a description of these settings, see ASA Group Policies SSL VPN Full Client Settings , on page 1506.
c) Select **Settings** to configure the general settings that are required for clientless and thin client (port forwarding) access modes in an SSL VPN. For a description of these settings, see ASA Group Policies SSL VPN Settings , on page 1512.

Step 9 Specify the following settings for an ASA user group in an Easy VPN/IPSec IKEv1 or IKEv2 VPN and SSL VPN configuration, in the Settings pane:

a) Select **DNS/WINS** to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA user group. For a description of these settings, see ASA Group Policies DNS/WINS Settings , on page 1519.
b) Select **Split Tunneling** to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. For a description of these settings, see ASA Group Policies Split Tunneling Settings , on page 1520.
c) Select **Connection Settings** to configure the SSL VPN connection settings for the ASA user group, such as the session and idle timeouts, including the banner text. For a description of these settings, see ASA Group Policies Connection Settings , on page 1522.

Step 10 Click **OK**.

Step 11 Select the ASA user group from the list and click **OK**.

Understanding SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

Note If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

For more information on managing trusted certificates, see the following topics:

- Configuring SSL VPN Server Verification (ASA) , on page 1402
- Configuring Trusted Pool Settings (ASA) , on page 1356
- Using the Trustpool Manager , on page 1358

Configuring Trusted Pool Settings (ASA)

Use the Trusted Pool Settings page to configure options for certificate revocation. You can also launch the Trustpool Manager.

Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > Trusted Pool** from the Policy selector.

Related Topics

- Configuring SSL VPN Server Verification (ASA) , on page 1402
- Using the Trustpool Manager , on page 1358

Field Reference

Table 385: Trusted Pool Page

Element	Description
Revocation Check	Whether to check certificates for revocation. Select the appropriate option: • **Check Certificates** If you select this option, also specify the method or methods to use for revocation by selecting the appropriate method (CRL or OCSP) and moving it to the box on the right by clicking >>. **Note** You can choose either or both methods. If choosing both methods, add the methods in the order in which you want them used. • **Do not check Certificates**
Certificate Map Settings	Optionally, specify override options for a certificate map by selecting the map from the following lists. Each list will include all certificate maps that are configured on the device. • **Allow Expired Certificates**—Select the certificate map for which you want to allow expired certificates. • **Skip Revocation Check**—Select the certificate map for which you want to skip revocation check.
CRL Options	Specifies options for managing the Certificate Revocation List: • **Cache Refresh Time**—The number of minutes (1-1440) before the ASA considers a CRL too old to be reliable. The default value is 60 minutes. • **Enforce next CRL update**—Whether the ASA should enforce the next CRL update.
Certificate Expiration Alerts	Beginning with version 4.9, Security Manager enables checking all CA and ID certificates in the trust points for expiration once every 24 hours. If a certificate is nearing expiration, a syslog will be issued as an alert. You can configure the reminder and recurrence intervals. This feature is supported only in devices running ASA software version 9.4(1) or later. **Begin**—Enter the number of days before the expiration in which the first alert will be sent. The range is 1 to 90 days. By default, reminders will start at 60 days prior to expiration. **Repeat**—Enter the frequency, in number of days, at which the alert will be repeated if the certificate is not renewed. The range is 1 to 14 days. By default reminders will be sent every 7 days.

Element	Description
Automatic Import	Beginning with version 4.10, Security Manager enables automatic import of Trustpool certificate bundle. When you enable automatic import, you can configure the URL that the ASA will use to download and import the Trustpool certificate bundle.This feature is supported only in devices running ASA software version 9.5(2) or later. Beginning with version 4.13, Security Manager provides source interface option that ASA can use to identify the destination URL. This feature is not supported for ASA versions lower to 9.7.1. Interface—Click the Select button and choose the interface. If the interface configured is management-only, the destination URL is routed through management VRF. For non-management interface, the URL is routed through data VRF. If interface is not specified, both the routing table of the management and data VRF are polled to identify the route to reach the URL. **Import from a URL**—Enter the URL from which the ASA has to download the Trustpool certificate bundle. **Download Time**—Enter the time at which the ASA will download the certificate bundle. The import takes place daily at the time specified here. The default value of the URL is http://www.cisco.com/security/pki/ios_core.p7b and the default value of the download time is 22:00:00.
Launch Trustpool Manager	Launches the Trustpool Manager, which is used to manage Trustpool certificates. You can use the Trustpool Manager to perform the following: For more information, see Using the Trustpool Manager , on page 1358.

Using the Trustpool Manager

Use the Trustpool Manager to manage the certificates that are included in the trustpool. The Trustpool Manager provides the following functions:

- Updating the trustpool
- Importing a certificate bundle
- Exporting a certificate bundle
- Removing certificates from the trustpool

Navigation Path

(Device View only) Select an ASA device, select **Remote Access VPN > Trusted Pool** from the Policy selector, and then click **Launch Trustpool Manager**.

Updating the Trustpool

The trustpool should be updated if either of the following conditions exists:

- Any certificate in the trustpool is due to expire or has been re-issued.

- The published CA certificate bundle contains additional certificates that are required by a specific application.

To update the certificates in the trustpool, click **Refresh Certificates**.

Importing a Certificate Bundle

You can import individual certificates or bundles of certificates from a variety of locations in one of the following formats:

- x509 certificates in DER format wrapped in a pkcs7 structure
- a file of concatenated x509 certificates in PEM format (complete with PEM header)

To import a certificate or bundle:

1. Click **Import Bundle**.
2. Select the location of the bundle:
   - **Import from Cisco published signed root file distribution**—Select this option to import from the published distribution site.
   - **Import from a URL**—If the bundle is hosted on a server, select this option, select the protocol from the list, and enter the URL in the box.
   - **Bundle file on device**—If the bundle is stored on the ASA flash file system, select this option and then enter the path to the bundle.
   - **Select bundle file**—If the bundle is stored on your machine, click Import from a file, then click Browse Local Files and navigate to the bundle.
3. Specify the following import options:
   - **Clear all certificates before import**—Whether to clear the trustpool before importing the bundle.
   - **Continue to import the bundle if signature validation fails or can't be performed**—Whether to continue import if the signature can not be validated.
4. Click **Import**.

Exporting a Certificate Bundle

When you have correctly configured the Trustpool you should export the pool. This will enable you to restore the Trustpool to this point, for example if you wish to remove a certificate that was added to the trustpool after the export. You can export the pool to the Security Manager server file system or your local file system.

To export the certificate bundle:

1. Click **Export Bundle**.
2. Click **Browse.**
3. Select the tab that corresponds to the file system you want to export to (local machine or Security Manager server).
4. Navigate to the folder where you want to save the trustpool.

5. Enter a unique memorable name for the trustpool in the File name box.
6. Click **Save**.

Removing Certificates from the Trustpool

You can remove certificates from the trustpool using the following methods:

- To remove an individual certificate, select the certificate and click **Delete**.
- To remove all certificates that are not part of the default bundle, click **Clear Trustpool**.

Note Before clearing the trustpool you should export the current trustpool so that you can restore your current settings if needed.

- Configuring Trusted Pool Settings (ASA) , on page 1356

Add/Edit Scripts Dialog Box

Use the Add/Edit Scripts dialog box to define a script to use in mapping the username from the certificate.

Navigation Path

- (Device view) Select an ASA device, then select **Remote Access VPN > Username from Cert Scripts** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Username from Cert Scripts (ASA)** from the Policy selector. Select an existing policy or create a new one.

Field Reference

Table 386: Add/Edit Scripts Dialog Box

Element	Description
Script Name	Specify the name of the script and use the script in the tunnel group AAA authentication and authorization. The script name may be different for authentication and authorization. You define the script here, and CLI uses the same script to perform this function.
Select Script Parameters	Specify the attributes and content of the script.
Value for Username	Select an attribute from the drop-down list of standard DN attributes to use as the username (Subject DN).

Element	Description
No Filtering	Specify that you want to use the entire specified DN name.
Filter by Substring	Specify the Starting Index (the position in the string of the first character to match) and Ending Index (number of characters to search). If you choose this option, the starting index cannot be blank. If you leave the ending index blank, it defaults to -1, indicating that the entire string is searched for a match.
Filter by Regular Expression	Enter a regular expression to apply to the search in the Regular Expression field. Standard regular expression operators apply.
Use Custom Script in LUA format	Specify a custom script written in the LUA programming language to parse the search fields. Selecting this option makes available a field in which you can enter your custom LUA script. The following are examples of custom scripts in LUA format: • "return findpattern(cert.subject.cn,"%a+")" • local a,b,c; a,b,c = string.find(cert.subject.fulldn, ',cn=(.+),cn=Users'); return c; **Note** LUA is case-sensitive. The following table provides the attribute names and their descriptions that you can use in an LUA script.

Table 387: Attributes in an LUA script

Attribute	Description
cert.subject.c	Country
cert.subject.cn	Common Name
cert.subject.dnq	DN qualifier
cert.subject.ea	E-mail Address
cert.subject.genq	Generational qualified
cert.subject.gn	Given Name
cert.subject.i	Initials
cert.subject.l	Locality
cert.subject.n	Name
cert.subject.o	Organization
cert.subject.ou	Organization Unit

Attribute	Description
cert.subject.ser	Subject Serial Number
cert.subject.sn	Surname
cert.subject.sp	State/Province
cert.subject.t	Title
cert.subject.uid	User ID
cert.issuer.c	Country
cert.issuer.cn	Common Name
cert.issuer.dnq	DN qualifier
cert.issuer.ea	E-mail Address
cert.issuer.genq	Generational qualified
cert.issuer.gn	Given Name
cert.issuer.i	Initials
cert.issuer.l	Locality
cert.issuer.n	Name
cert.issuer.o	Organization
cert.issuer.ou	Organization Unit
cert.issuer.ser	Issuer Serial Number
cert.issuer.sn	Surname
cert.issuer.sp	State/Province
cert.issuer.t	Title
cert.issuer.uid	User ID
cert.serialnumber	Certificate Serial Number
cert.subjectaltname.upn	User Principal Name

Working with IPSec VPN Policies

Certain policies need to be configured for IPSec VPNs. The topics listed below explain these remote access IPsec VPN policies, with the exception of the IKE Proposal policy, which is explained in Configuring an IKE Proposal , on page 1158.

This section contains the following topics:

Configuring Certificate to Connection Profile Map Policies (ASA)

Certificate to connection profile map policies are used for enhanced certificate authentication on ASA devices in remote access IKEv1 IPSec VPNs. They are not used in remote access IKEv2 IPSec or SSL VPNs.

Certificate to connection profile map policies let you define rules to match a user's certificate to a permission group based on specified fields. To establish authentication, you can use any field of the certificate, or you can have all certificate users share a permission group. You can match the group from the DN rules, the Organization Unit (OU) field, the IKE identity, or the peer IP address. You can use any or all of these methods.

To match user permission groups based on DN fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. A connection profile must already exist in the configuration before you can create a rule for it.

This procedure describes how to configure a Certificate to Connection Profile Map policy for a remote client trying to connect to an ASA server device.

Step 1 Do one of the following:

- (Device View) Select an ASA device; then select **Remote Access VPN > IPSec VPN > Certificate to Connection Profile Maps > Policies** from the Policy selector.
- (Policy View) Select **Remote Access VPN > IPSec VPN > Certificate to Connection Profile Maps > Policies** from the Policy Type selector. Select an existing policy or create a new one.

The Certificate to Connection Profile Map Policies page opens.

Step 2 Select any, or all, of the following options to establish authentication and to determine to which connection profile (tunnel group) to map the client:

- **Use Configured Rules to Match a Certificate to a Group**—To use the rules defined in the Certificate to Connection Profile Maps > Rules policy. For information on configuring the rules, see Configuring Certificate to Connection Profile Map Rules (ASA) , on page 1363.
- **Use Certificate Organization Unit (OU) Field to Determine the Group**—To use the organizational unit (OU) field of the client certificate.
- **Use IKE Identify to Determine the Group**—To use the IKE identity.
- **Use Peer IP address to Determine the Group**—To use the peer's IP address.
- Use Group URL if Group URL and Certificate Map match different Connection profiles is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Configuring Certificate to Connection Profile Map Rules (ASA)

If you configure certificate to connection profile maps, and select the option to **Use Configured Rules to Match a Certificate to a Group** (as explained in Configuring Certificate to Connection Profile Map Policies

(ASA) , on page 1363), you need to configure the rules required to match a user to a connection profile based on the user certificate.

To match user permission groups based on fields of the certificate, you define rules that specify the fields to match for a group and then enable each rule for that selected group. You must first define a connection profile (tunnel group) before you can create and map a rule to it.

This procedure describes how to configure the Certificate to Connection Profile Map rules and parameters for any remote client trying to connect to an ASA server device.

Tip Certificate to connection profile map policies apply to remote access IKEv1 IPSec VPNs only. They do not apply to IKEv2 or SSL VPNs.

Before You Begin

- Make sure the connection profiles for which you are creating mapping rules has been configured on the device. See Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.
- Make sure that you select **Use Configured Rules to Match a Certificate to a Group** in the Certificate to Connection Profile Maps Policies policy. See Configuring Certificate to Connection Profile Map Policies (ASA) , on page 1363.

Step 1 (Device view only) With an ASA device selected, select **Remote Access VPN > IPSec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector.

The Certificate to Connection Profile Map Rules page is displayed. The policy has two tables:

- **Maps table (upper table)**—The upper table lists all connection profiles for which you are defining certificate to connection map rules. Each row is a profile map, which includes the name of the connection profile that is being mapped, the priority of the map (lower numbers have higher priority), and the map name. You can configure more than one map for the same connection profile.
  - To configure rules for a map, select it and then use the rules table to create, edit, and delete the rules.
  - To add a map, click the **Add Row** button and fill in the Map Rule Dialog Box (Upper Table) , on page 1365.
  - To edit map properties (not rules), select it and click the **Edit Row** button.
  - To delete an entire map, select it and click the **Delete Row** button.
- **Rules table (lower table)**—The rules for the map selected in the upper table. You must ensure that the map is actually selected in the upper table: the group title above the rules table should say "**Details for (Connection Profile Name)**."

When you select a map, the table shows all rules configured for the map, including the field (subject or issuer), certificate component, matching operator, and the value that the rule is looking for. The remote user must match all configured rules in a map for the device to use the mapped connection profile.

- To add a rule, click the **Add Row** button and fill in the Map Rule Dialog Box (Lower Table) , on page 1366.
- To edit a rule, select it and click the **Edit Row** button.
- To delete a rule, select it and click the **Delete Row** button.

Step 2 To add a rule to a map:

a) Select the map in the upper table.

If the map does not already exist, create it by clicking the **Add Row (+)** button beneath the upper table and fill in the Map Rule dialog box for creating maps. In the dialog box, you must select the connection profile for the map, assign a relative priority between 1 and 65535 (lower numbers have higher priority), and a unique map name.

b) Ensure that the map is actually selected. Highlighting the map in the table is not sufficient. The heading above the lower table should be "**Details for (Connection Profile Name)**," and unless the map is new, the table should show some rules.

c) To add a new certificate to connection profile matching rule that must be satisfied in order for a remote client to connect to the device using the profile in this map, click the **Add Row (+)** button beneath the lower table. This opens the Map Rule dialog box with different fields.

Note If you get the error message "Missing Settings, A value ID required for Mapping field, Please select a Mapping," it means that you have not successfully selected a map in the upper table. Click on the desired map again.

d) From the **Field** list, select whether the rule should examine the Subject or Issuer field of the client certificate.

e) From the **Component** list, select the component of the client certificate to use for the matching rule.

f) From the **Operator** field, select how the component should be compared to the Value field: Equals (exact match is required), Contains (the entire value must appear), Does Not Equal, Does Not Contain.

g) In the **Value** field, specify the value to match, then click **OK** to save the rule.

h) Add additional rules to the map as desired.

Step 3 In the **Default Connection Profile** field, select the connection profile that should be used for users who do not meet any of the map rules.

Map Rule Dialog Box (Upper Table)

Use the Map Rule dialog box, when opened for the maps table in the upper part of the Certificate to Connection Profile Maps > Rules policy, to configure maps for which you can then configure rules in the lower table of the Rules policy. For a detailed explanation of configuring these maps and their associated rules, see .
Configuring Certificate to Connection Profile Map Rules (ASA) , on page 1363

Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the upper table, or select a map in the upper table and click **Edit Row**.

Field Reference

Table 388: Map Rule Dialog Box (Upper Table)

Element	Description
Map Name	The name of the connection profile map.

Element	Description
Priority	The priority number of the matching rule, between 1 and 65535. A lower number has a higher priority. For example, a matching rule with a priority number of 2, has a higher priority than a matching rule with a priority number of 5. If you create multiple maps, they are processed in priority order, and the first matching rule determines to which profile the user is mapped.
Connection Profile	Select the connection profile for IPSec and for SSL for which you are creating matching rules. You must select either or both connection profiles. Clients attempting to connect to the connection profiles must satisfy the associated matching rule conditions to connect to the device. Connection Profile for IPSec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Map Rule Dialog Box (Lower Table)

Use the Map Rule dialog box, when opened for the rules table in the lower part of the Certificate to Connection Profile Maps > Rules policy, to configure rules for the map selected in the maps table (upper table of the Rules policy). For a detailed explanation of configuring these rules, see Configuring Certificate to Connection Profile Map Rules (ASA) , on page 1363.

Navigation Path

(Device View only) Select an ASA device; then select **Remote Access VPN > IPSec VPN > Certificate to Connection Profile Maps > Rules** from the Policy selector. Click the **Add Row** button beneath the lower table, or select a rule in the lower table and click **Edit Row**.

Field Reference

Table 389: Map Rule Dialog Box (Lower Table)

Element	Description
Field	Select the field for the matching rule according to the **Subject** or the **Issuer** of the client certificate.
Component	Select the component of the client certificate to use for the matching rule.

Element	Description
Operator	Select the operator for the matching rule as follows: • Equals—The certificate component must match the entered value. If they do not match exactly, the connection is denied. • Contains—The certificate component must contain the entered value. If the component does not contain the value, the connection is denied. • Does Not Equal—The certificate component *cannot* equal the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value equals US, then the connection is denied. • Does Not Contain—The certificate component *cannot* contain the entered value. For example, for a selected certificate component of Country, and an entered value of US, if the client county value contains US, the connection is denied.
Value	The value of the matching rule. The value entered is associated with the selected component and operator.
Default Connection Profile	This option is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Configuring an IPsec Proposal on a Remote Access VPN Server (ASA, PIX 7.0+ Devices)

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server is an ASA or PIX 7.0+ device.

Note Beginning with Cisco Security Manager version 4.17, you can configure and deploy IPSec Proposal policy on ASA multi-context devices running the software version 9.9(2) or later.

If you are configuring an IPsec proposal for IOS or PIX 6.3 devices, including Catalyst 6500/7600 devices, see Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471.

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, the IKE version to use during IKE negotiation, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also enable reverse route injection and NAT traversal.

For more information on IPsec tunnel concepts, see Understanding IPsec Proposals , on page 1168.

Related Topics

- Table Columns and Column Heading Features , on page 51

Step 1 Do one of the following:

- (Device view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one.

The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal.

Step 2 Do any of the following:

- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see IPsec Proposal Editor (ASA, PIX 7.0+ Devices) , on page 1368.
- To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
- To delete a proposal, select it and click the **Delete Row (trash can)** button.

IPsec Proposal Editor (ASA, PIX 7.0+ Devices)

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an ASA or PIX 7.0+ device.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when an ASA or PIX 7.0+ device is selected.

Note For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected, see IPsec Proposal Editor (IOS, PIX 6.3 Devices) , on page 1472.

Navigation Path

- (Device view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (ASA/PIX 7.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

Related Topics

Field Reference

Table 390: IPsec Proposal Editor, ASA and PIX 7.0+ Devices)

Element	Description
External Interface	The external interface through which remote access clients will connect to the server. Enter the name of the interface or interface role object, or click **Select** to select it or to create a new object.
Enable IKEv1 Enable IKEv2	The IKE versions to use during IKE negotiations. IKEv2 is supported on ASA Software release 8.4(1)+ only with Anyconnect 3.0+ clients. Select either or both options as appropriate.
Enable Client Services Client Services Port Number	Available only if you enable IKEv2. Whether to enable the Client Services Server on the ASA for this connection. The Client Services Server provides HTTPS (SSL) access to allow the Secure Client Downloader to receive software upgrades, profiles, localization and customization files, CSD, SCEP, and other file downloads required by the Secure Client. If you select this option, specify the client services port number, which is 443 by default. If you do not enable the Client Services Server, users will not be able to download any of these files that the Secure Client might need. **Tip** You can use the same port that you use for SSL VPN running on the same device. Even if you have an SSL VPN configured, you must select this option to enable file downloads over SSL for IKEv2 IPsec clients.
IKEv1 Transform Sets IKEv2 Transform Sets	The transform sets to use for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. The transform sets are different for each IKE version; select objects for each supported version. You can select up to 11 transform sets for each. For more information, see Understanding Transform Sets , on page 1170. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used. Click **Select** to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the **Create (+)** button beneath the available objects list in the selection dialog box to create a new one. For more information, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177.

Element	Description
Reverse Route Injection	Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see Understanding Reverse Route Injection , on page 1171. Select one of the following options to configure RRI on the crypto map: • **None**—Disables the configuration of RRI on the crypto map. • **Standard**—Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option.
Enable Network Address Translation Traversal	Whether to allow Network Address Translation traversal (NAT-T). Use NAT traversal when there is a device between a VPN-connected hub and spoke that performs Network Address Translation (NAT) on the IPsec traffic. For information about NAT traversal, see Understanding NAT in VPNs , on page 1191.
ESPv3 Settings (ASA 9.0.1+ only) Specify whether incoming ICMP error messages are validated for cryptography and dynamic cryptography maps, set the per-security association policy, or enable traffic flow packets:	
Validate Incoming ICMP error messages	Whether to validate those ICMP error messages received through an IPsec tunnel and destined for an interior host on the private network.
Enable Do Not Fragment (DF) Policy	Define how the IPsec subsystem handles large packets that have the do-not-fragment (DF) bit set in the IP header. Choose one of the following: • Set—Sets and uses the DF bit. • Copy—Maintains the DF bit. • Clear—Ignores the DF bit.
Enable Traffic Flow Confidentiality (TFC) Packets	Enable dummy TFC packets that mask the traffic profile which traverses the tunnel. **Note** You must have an IKEv2 IPsec proposal set on the Tunnel Policy (Crypto Map) Basic tab before enabling TFC. Traffic Flow Confidentiality is not available when IKEv1 is enabled. Use the Burst, Payload Size, and Timeout parameters to generate random length packets at random intervals across the specified SA.

Working with SSL and IKEv2 IPSec VPN Policies

Certain policies need to be configured for SSL VPNs. These policies are also used with remote access IKEv2 IPSec VPNs. The topics listed below explain these remote access VPN policies.

This section contains the following topics:

Understanding SSL VPN Access Policies (ASA)

An Access policy specifies the security appliance interfaces on which a remote access SSL or IKEv2 IPsec VPN connection profile can be enabled, the port to be used for the connection profile, Datagram Transport Layer Security (DTLS) settings, the SSL VPN session timeout and maximum number of sessions. You can also specify whether to use the AnyConnect VPN Client or Secure Client Essentials.

For more information about the Anyconnect VPN Client, see Understanding SSL VPN Secure Client Settings , on page 1389. The remainder of this topic explains DTLS and Secure Client Essentials in more detail.

Datagram Transport Layer Security (DTLS)

Enabling Datagram Transport Layer Security (DTLS) allows the Secure Client establishing an SSL VPN connection to use two simultaneous tunnels—an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with SSL connections and improves the performance of real-time applications that are sensitive to packet delays. By default, DTLS is enabled when SSL VPN access is enabled on an interface. If you disable DTLS, SSL VPN connections connect with an SSL VPN tunnel only.

Note In order for DTLS to fall back to a TLS connection, you must specify a fallback trustpoint. If you do not specify a fallback trustpoint and the DTLS connection experiences a problem, the connection terminates instead of falling back to the specified trustpoint.

AnyConnect Essentials VPN Client

Secure Client Essentials is a separately licensed VPN client for SSL or IKEv2 IPsec, entirely configured on the adaptive security appliance, that provides the full Secure Client capability, with the following exceptions:

- No CSD (including HostScan/Vault/Cache Cleaner)
- No clientless SSL VPN
- Optional Windows Mobile Support

The Secure Client Essentials provides remote end users running Microsoft Windows Vista, Windows Mobile, Windows XP or Windows 2000, Linux, or Macintosh OS X, with the benefits of a Cisco VPN client. If this feature is disabled, the full AnyConnect VPN client is used. This feature is disabled by default.

Note This license cannot be used at the same time as the shared license for SSL VPN.

This section contains the following topics:

SSL VPN Access Policy Page

Use the SSL VPN Access Policy page to configure access parameters for your remote access SSL or IKEv2 IPsec VPN. For more information about configuring an Access policy, see Configuring an Access Policy , on page 1376.

Tip Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207.

Navigation Path

- (Device View) Select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Related Topics

- Understanding SSL VPN Access Policies (ASA) , on page 1371
- Understanding Interface Role Objects , on page 303

Field Reference

Table 391: SSL VPN Access Policy Page

Element	Description
Access Interface Table	The Access Interface table lists the interfaces that are configured for remote access SSL or IKEv2 IPSec VPN connections. The table displays the access settings for each interface: whether the interface is enabled to allow VPN access, whether DTLS is enabled, whether client certificates are required, and the trustpoints used by the interface. • To configure access on an interface, click the **Add row (+)** button (see Access Interface Configuration Dialog Box , on page 1375). • To edit access settings for an interface, select the interface and click the **Edit Row (pencil)** button (see Access Interface Configuration Dialog Box , on page 1375). • To delete access settings for an interface, select the interface and click the **Delete Row (trash can)** button.

Element	Description
Server Name Indication Table	The Server Name Indication table lists the Server Name Indication mappings that have been defined. • To define a Server Name Indication mapping, click the **Add row (+)** button (see Server Name Indication Dialog Box, on page 1376). • To edit an existing mapping, select the mapping and click the **Edit Row (pencil)** button (see Server Name Indication Dialog Box, on page 1376). • To delete a Server Name Indication mapping, select the mapping and click the **Delete Row (trash can)** button. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Port Number	The port to use for VPN sessions. The default port is 443, for HTTPS traffic. If HTTP port redirection is enabled, the default HTTP port number is 80. To specify a non-default port, the range is 1024 through 65535. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Enter the port number or the name of a port list object, or click **Select** to select a port list object or to create a new object. **Note** If you change the port number, all current SSL VPN connections terminate (upon configuration deployment), and current users must reconnect.
DTLS Port Number	The UDP port to use for DTLS connections. The default port is 443. For details about DTLS, see Understanding SSL VPN Access Policies (ASA) , on page 1371. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Enter the port number or the name of a port list object, or click **Select** to select a port list object or to create a new object.
Fallback Trustpoint	The trustpoint (Certificate Authority, or CA server) to use for interfaces that do not have an assigned trustpoint. Enter the name of a PKI enrollment object, or click **Select** to select the object from a list or to create a new object. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Element	Description
Default Idle Timeout	The amount of time, in seconds, that an SSL or IKEv2 IPSec VPN session can be idle before the security appliance terminates it. This value applies only if the Idle Timeout value in the group policy for the user is set to zero (0), which means there is no timeout value; otherwise the group policy Idle Timeout value takes precedence over the timeout you configure here. The minimum value you can enter is 60 seconds (1 minute). The default is 30 minutes (1800 seconds). The maximum is 24 hours (86400 seconds). We recommend that you set this attribute to a short time period. This is because a browser set to disable cookies (or one that prompts for cookies and then denies them) can result in a user not connecting but nevertheless appearing in the sessions database. If the Simultaneous Logins attribute for the group policy is set to one, the user cannot log back in because the database indicates that the maximum number of connections already exists. Setting a low idle timeout removes such phantom sessions quickly, and lets a user log in again. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Max Session Limit	The maximum number of SSL or IKEv2 IPSec VPN sessions allowed. Be aware that the different ASA models have different maximum session limits: • ASA 5505—25. • ASA 5510—250. • ASA 5520—750. • ASA 5540—2500. • ASA 5550, 5585-X with SSP-10—5000. • ASA 5580, 5585-X (other models)—10,000. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Certificate Authentication Timeout (ASA 8.4(5) or ASA 9.1(2)+)	The amount of time, in minutes, to wait before timing out certificate authentication. Valid values are from 1 to 120 minutes. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Allow Users to Select Connection Profile in Portal Page	Whether to present a list of configured connection profiles (tunnel groups) from which the user can select the appropriate profile when the user logs in (for example, in the SSL VPN portal page). If you do not select this option, the user cannot select a profile and must use the default profile for the connection. **Tip** You must select this option for remote access IKEv2 IPSec VPNs. It is optional for SSL VPNs. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Element	Description
Enable Secure Client Access	Whether to allow the user to use the AnyConnect VPN client to make an SSL or IKEv2 IPSec VPN connection. The option is selected by default. For details about AnyConnect VPN clients, see Understanding SSL VPN Secure Client Settings , on page 1389. **Tip** You must select this option for remote access IKEv2 IPSec VPNs. For SSL VPN, select this option if you want to enable full client access. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Enable Secure Client Essentials	Whether to enable the Secure Client Essentials feature, which can be used with both SSL and IKEv2 IPSec VPNs. For details about AnyConnect Essentials VPN clients, see Understanding SSL VPN Access Policies (ASA) , on page 1371.

Access Interface Configuration Dialog Box

Use the Access Interface Configuration dialog box to configure an interface on an ASA device for remote access SSL or IKEv2 IPSec VPN connections.

Navigation Path

Open the SSL VPN Access policy (see SSL VPN Access Policy Page , on page 1372), then click **Add Row** below the interface table, or select a row in the table and click **Edit Row**.

Related Topics

- Configuring an Access Policy , on page 1376
- Understanding Interface Role Objects , on page 303

Field Reference

Table 392: Access Interface Configuration Dialog Box

Element	Description
Access Interface	The interface or interface role object on which you want to configure SSL or IKEv2 IPSec VPN access. Enter the name of the interface or interface role, or click **Select** to select one from a list or to create new interface role objects. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Trustpoint Load Balancing Trustpoint	The trustpoint (Certificate Authority, or CA server) to use for authenticating users on the interface. Enter the name of a PKI enrollment object, or click **Select** to select one or to create a new object. If load balancing is configured, you can also select a separate PKI enrollment object for the load balancing trustpoint. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Element	Description
Allow Access	Select this option to enable VPN access via this interface. If the option is not selected, access is configured on the interface, but it is disabled. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
Enable DTLS	When selected, enables Datagram Transport Layer Security (DTLS) on the interface and allows an AnyConnect VPN Client to establish an SSL VPN connection using two simultaneous tunnels—an SSL tunnel and a DTLS tunnel. This is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Server Name Indication Dialog Box

Beginning from version 4.8, Security Manager enables you to configure Server Name Indication mappings used by the enabled VPN interface for authentication. This capability includes the mapping of domain names to trustpoints.

Use the Server Name Indication dialog box to define or modify a domain and trustpoint for each interface.

NOTES:

- You can configure a unique domain name to a trustpoint. However, you can map a trustpoint to multiple domain names. You can configure a maximum of 16 unique trustpoints.
- Server Name Indication mapping of domain names to trustpoints is supported for devices that are running the ASA software version 9.3(2) or later.

Navigation Path

Open the SSL VPN Access policy (see SSL VPN Access Policy Page , on page 1372), then click **Add Row** below the ServerNameIndication table, or select a row in the table and click **Edit Row**.

Field Reference

Table 393: Server Name Indication Dialog Box

Element	Description
Domain Mask	Enter the domain name that the trustpoint will be configured with. This domain will not be associated with any particular interface. A certificate with an associated domain may be used by any interface.
Trustpoint	The trustpoint (Certificate Authority, or CA server) to use for authenticating users on the interface. Enter the name of a PKI enrollment object, or click **Select** to select one or to create a new object.

Configuring an Access Policy

This procedure describes how to configure an Access policy on an ASA device. Access policies are required for remote access SSL and IKEv2 IPSec VPN connections. For more information about access policies, see Understanding SSL VPN Access Policies (ASA) , on page 1371.

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Access page opens. For a description of the elements on this page, see SSL VPN Access Policy Page , on page 1372.

Step 2 In the interface table at the top of the policy, configure all of the interfaces on which you will allow remote access SSL or IKEv2 IPSec VPN connections:

- To add an interface, click the **Add Row (+)** button beneath the table and fill in the Add Access Interface Configuration dialog box. You must specify the interface name (or an interface role object that identifies the desired interfaces) and whether to allow access on the interface.

You can also specify the PKI enrollment object that identifies the Certificate Authority (CA) server trustpoint for the interface (and a load balancing trustpoint if you use load balancing), whether to enable DTLS connections, and whether to require that the client have a valid certificate to complete a connection. For details about the options, see Access Interface Configuration Dialog Box , on page 1375.

- To edit the settings for an interface, select it and click the **Edit Row (pencil)** button.
- To delete an interface, select it and click the **Delete Row** button. Keep in mind that you can edit the interface settings to disable access, so you should delete an interface only if you want to permanently remove it from VPN use.

Step 3 Configure the remaining settings. The settings are described in detail in SSL VPN Access Policy Page , on page 1372. The following are the settings that are of particular interest:

- **Fallback Trustpoint**—The Certificate Authority (CA) server trustpoint to use if an interface does not have a trustpoint configured in the table. Enter the name of a PKI enrollment object, or click **Select** to select one or to create a new object.
- **Allow Users to Select Connection Profile in Portal Page**—If you have multiple tunnel groups, selecting this option allows the user to select the correct tunnel group during login. You must select this option for IKEv2 IPSec VPNs.
- **Enable Secure Client Access**—The AnyConnect VPN client is a full client; you must enable Secure Client access if you want to allow full client access to the VPN. You must select this option for IKEv2 IPSec VPNs.

For more information about Secure Client, including Secure Client Essentials, see Understanding SSL VPN Secure Client Settings , on page 1389.

- **Enable Secure Client Essentials**—Select this option if you are using Secure Client Essentials, which you can use with remote access SSL or IKEv2 IPSec VPNs.

Step 4 Any trustpoints that you specify in this policy must also be selected in the **Public Key Infrastructure** policy. For more information, see Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207.

Configuring Other SSL VPN Settings (ASA)

The SSL VPN Other Settings policy for ASA devices defines settings that include caching, content rewriting, character encoding, proxy and proxy bypass definitions, browser plug-ins, Secure Client images and profiles, Kerberos Constrained Delegation, and some other advanced settings.

To configure the Other Settings policy, do one of the following:

- (Device View) Select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

You can then configure the settings on the following tabs:

- Performance tab—To configure caching to improve SSL VPN performance. See Configuring SSL VPN Performance Settings (ASA) , on page 1379. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Content Rewrite tab—To create rules that permit users to browse certain sites and applications without going through the security appliance itself. See Configuring SSL VPN Content Rewrite Rules (ASA) , on page 1380. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Encoding tab—To configure non-default encoding for web pages delivered from CIFS servers. Encoding is normally determined by the remote user's browser. See Configuring SSL VPN Encoding Rules (ASA) , on page 1382. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Proxy tab—To define HTTP or HTTPS proxy servers, if your network requires them, and proxy bypass rules. See Configuring SSL VPN Proxies and Proxy Bypass (ASA) , on page 1384. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Plug In tab—To define browser plug-ins, which are separate programs that a web browser invokes to perform a dedicated function. See Configuring SSL VPN Browser Plug-ins (ASA) , on page 1387. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Client Settings tab—To configure Secure Client images and profiles for downloading to clients. See the following topics:
  - Understanding SSL VPN Secure Client Settings , on page 1389
  - Configuring SSL VPN Secure Client Settings (ASA), on page 1391

This is partially supported for ASA 9.5(2) Remote Access VPN in Multi-context mode. Only the Secure Client Image is supported in ASA 9.5(2) Multiple Context Mode. Beginning with version 4.12, Security Manager provides support for multi-context ASA 9.6(2) and later devices for Admin and User contexts. The CLIs supported are:

- Secure Client Image
- Secure Client Profile

During discovery, the Secure Client Image is not discovered for ASA 9.5(2) remote access VPN Multiple Context mode. After discovery if you want to remove the Secure Client Image configuration you must use FlexConfig.

- Microsoft KCD Server—To configure Kerberos Constrained Delegation (KCD) for use with clientless SSL VPN connections. See the following topics:

- Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1394
- Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1397

This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

- Secure Client Custom Attributes tab—To configure Secure Client custom attributes. See Configuring Secure Client Custom Attributes (ASA) , on page 1398. Secure Client Custom Attributes tab is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.
- Advanced tab—To configure the memory, on-screen keyboard, and internal password features. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Note Beginning with 4.15, Cisco Security Manager supports HTTP Strict Transport Security (HSTS). HTTS is a web security policy mechanism which helps to protect websites against protocol downgrade attacks and hijack of cookies.

You can enable or disable HSTS and also provide the timeout values in the Advanced tab. See Configuring SSL VPN Advanced Settings (ASA) , on page 1400.

- SSL Server Verification tab—To enable HTTPS server verification for clientless SSL VPN users. See Configuring SSL VPN Server Verification (ASA) , on page 1402. This is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Tip You must also configure a connection profile policy on the device. See Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.

Configuring SSL VPN Performance Settings (ASA)

Caching enhances SSL VPN performance. It stores frequently reused objects in the system cache, which reduces the need to perform repeated rewriting and compressing of content. It reduces traffic between SSL VPN and both the remote servers and end-user browsers, with the result that many applications run much more efficiently.

This procedure describes how to enable caching on your ASA security appliance.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **Performance** tab if it is not already selected.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **Performance** tab if it is not already selected.

Step 2 Select **Enable** to enable caching on the security appliance.

If you deselect this option, the cache settings configured on the security appliance do not take effect.

Step 3 Configure the following options:

- **Minimum Object Size**—The minimum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 0 KB.
- **Maximum Object Size**—The maximum size of an HTTP object that can be stored in the cache on the security appliance, in kilobytes. The range is 0-10,000 KB. The default is 1000 KB. The maximum size must be larger than the minimum size.
- **Last Modified Factor**—An integer to set a revalidation policy for caching objects that have only the last-modified timestamp, and no other server-set expiration values. The range is 1-100. The default is 20.

The Expires response from the origin web server to the security appliance request, which indicates the time that the response expires, also affects caching. This response header indicates the time that the response becomes stale and should not be sent to the client without an up-to-date check (using a conditional GET operation).

The security appliance can also calculate an expiration time for each web object before it is written to disk. The algorithm to calculate an object's cache expiration date is as follows:

Expiration date = (Today's date - Object's last modified date) * Freshness factor

After the expiration date has passed, the object is considered stale and subsequent requests causes a fresh retrieval of the content by the security appliance. Setting the last modified factor to zero is equivalent to forcing an immediate revalidation, while setting it to 100 results in the longest allowable time until revalidation.

- **Expiration Time**—The amount of time (in minutes) that the security appliance caches objects without revalidating them. The range is 0-900 minutes. The default is one minute.

Revalidation consists of rejecting the objects from the origin server before serving the requested content to the client browser when the age of the cached object has exceeded its freshness lifetime. The age of a cached object is the time that the object has been stored in the security appliance's cache without the security appliance explicitly contacting the origin server to check if the object is still fresh.

- **Cache Static Content**—Whether to cache static content on the security appliance. Each web page can include static and dynamic objects. The security appliance caches individual static objects, such as image files (*.gif, *.jpeg), java applets (.js), and cascading style sheets (*.css).

Configuring SSL VPN Content Rewrite Rules (ASA)

SSL VPN processes application traffic through a content transformation/rewriting engine that includes advanced elements (such as, JavaScript, VBScript, Java, and multi-byte characters) to proxy HTTP traffic depending on whether the user is using an application within or independently of an SSL VPN device.

If you do not want some applications and web resources, such as public web sites, to go through the security appliance, you can create rewrite rules that permit users to browse certain sites and applications without going through the security appliance itself. This is similar to split tunneling in an IPsec VPN connection.

In the Content Rewrite tab of the SSL VPN Other Settings page, you can configure multiple content rewrite rules. The Content Rewrite tab lists all applications for which content rewrite is enabled or disabled.

Tip The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches.

This procedure shows you how to create or edit content rewrite rules.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Content Rewrite** tab. The Content Rewrite tab displays all applications for which content rewrite is enabled or disabled.

The security appliance searches rewrite rules by order number, starting with the lowest, and applies the first rule that matches. The resource mask defines the application string to which the rule is matched.

If a rule does not have a number, it is evaluated after all of the numbered rules.

Step 3 Do any of the following:

- To add a rule, click the **Add Row** button beneath the table and fill in the Add Content Rewrite dialog box. The options are described in detail in Add/Edit Content Rewrite Dialog Box , on page 1381.
- To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit Content Rewrite dialog box.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Note From Cisco Security Manager 4.24 onwards, **Content Rewrite** feature is deprecated for ASA 9.17(1) and higher version devices.

Add/Edit Content Rewrite Dialog Box

Use the Add or Edit Content Rewrite dialog box to configure the rewriting engine that includes advanced elements such as JavaScript, VBScript, Java, and multi-byte characters to proxy HTTP traffic over a SSL VPN connection. For more information about content rewrite rules, see Configuring SSL VPN Content Rewrite Rules (ASA) , on page 1380.

Navigation Path

From the Content Rewrite tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see Configuring SSL VPN Content Rewrite Rules (ASA) , on page 1380.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378

Field Reference

Table 394: Add or Edit Content Rewrite Dialog Box

Element	Description
Enable	When selected, enables content rewriting on the security appliance for the rewrite rule. Some applications do not require this processing, such as external public web sites. For these applications, you might choose to turn off content rewriting.
Rule Number	The number for this rule. This number specifies the position of the rule in the list. Rules without a number are at the end of the list. The range is from 1 to 65534. Rules are processed from the lowest to the highest number, and the first match is applied to the traffic.
Rule Name	An alphanumeric string that describes the content rewrite rule. The maximum length is 128 characters.
Resource Mask	The name of the application or resource to which the rule applies. The maximum length is 300 characters. You can use the following wildcards: • *—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string. • ?—Matches any single character. • [!x-y]—Matches any character not in the sequence. • [x-y]—Matches any character in the sequence.

Configuring SSL VPN Encoding Rules (ASA)

Use the Encoding tab of the SSL VPN Other Settings page to specify the character set to encode in SSL VPN portal pages to be delivered to remote users. By default, the encoding type set on the remote browser determines the character set for SSL VPN portal pages, so you need to set the character encoding only if it is necessary to ensure proper encoding on the browser.

Character encoding is the pairing of raw data (such as 0's and 1's) with characters to represent the data. The language determines the character encoding method to use. Some languages use the same method, while others do not. Usually, the geographic region determines the default encoding method used by the browser, but the remote user can change this. The browser can also detect the encoding specified on the page, and render the document accordingly.

The encoding attribute lets you specify the value of the character encoding method in the SSL VPN portal page to ensure that the browser renders it properly, regardless of the region in which the user is using the browser, or any changes made to the browser.

The character encoding attribute is a global setting that, by default, all SSL VPN portal pages inherit. However, you can override the file-encoding attribute for Common Internet File System (CIFS) servers that use character encoding that differs from the value of the character-encoding attribute. You can use different file-encoding values for CIFS servers that require different character encodings.

The SSL VPN portal pages downloaded from the CIFS server to the SSL VPN user encode the value of the SSL VPN file-encoding attribute identifying the server, or if one does not, they inherit the value of the character encoding attribute. The remote user's browser maps this value to an entry in its character encoding set to determine the proper character set to use. The SSL VPN portal pages do not specify a value if SSL VPN configuration does not specify a file encoding entry for the CIFS server and the character encoding attribute is not set. The remote browser uses its own default encoding if the SSL VPN portal page does not specify the character encoding, or if it specifies a character encoding value that the browser does not support.

In the Encoding tab of the SSL VPN Global Settings page, you can view the currently configured character sets associated with the CIFS server to be encoded in the portal pages. From this tab, you can create or edit the character sets, as described in the following procedure.

Related Topics

• Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Encoding** tab. The Encoding tab displays the default encoding and a list of CIFS servers for which encoding rules are configured.

Step 3 From the **Global SSL VPN Encoding Type** list, select the attribute that determines the character encoding that all SSL VPN portal pages inherit, except for those from the CIFS servers listed in the table.

Note If you choose **none** or specify a value that the browser on the SSL VPN client does not support, the browser uses its own default encoding. The default global encoding is none.

You can select from the following encoding types:

- big5
- gb2312
- ibm-850
- iso-8859-1
- shift_jis

Note If you are using Japanese Shift_jis Character encoding, click **Do not specify** in the Font Family area of the associated Select Page Font pane to remove the font family.

- unicode
- windows-1252

- none

Step 4 Do any of the following:

- To add a rule, click the **Add Row** button beneath the table and configure the following settings in the Add File Encoding dialog box:
  - **CIFS Server IP, CIFS Server Host**—Select one of these options to specify the CIFS server either by IP address or hostname. If you select IP address, you can either enter the IP address or the name of a network/host object that specifies one or more individual IP addresses.

If you specify a hostname, the security appliance retains the case you specify, although it ignores the case when matching the name to a server.

- **Encoding Type**—Select the encoding type. The options are the same as for the global setting described above.
- To edit a rule, select it, click the **Edit Row** button, and make your changes in the Edit File Encoding dialog box.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Configuring SSL VPN Proxies and Proxy Bypass (ASA)

Use the Proxy tab of the SSL VPN Other Settings page to configure the security appliance to terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. On this tab, you can also configure the security appliance to perform minimal content rewriting and to specify the types of content to rewrite—external links, XML, or neither.

The security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers. These servers act as intermediaries between users and the Internet. Requiring all Internet access through a server you control provides another opportunity for filtering to assure secure Internet access and administrative control.

Note The HTTP/HTTPS proxy does not support connections to personal digital assistants.

You can specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server; however, you cannot use proxy authentication when specifying the PAC file.

You can configure the security appliance to use proxy bypass when applications and web resources work better with the content rewriting this feature provides. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

You can configure multiple proxy bypass entries. The order in which you configure them is unimportant. The interface and path mask or interface and port uniquely identify a proxy bypass rule.

If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction. Be aware, however, that path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities.

This procedure shows you how to define proxies and proxy bypass rules for your SSL VPN.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Proxy** tab. The Proxy tab displays any currently defined proxies and proxy rules.

Step 3 From the **Proxy Type** field, select the type of external proxy server to use for SSL VPN connections:

- **HTTP/HTTPS Proxy Server**—To specify proxy servers to handle HTTP or HTTPS requests.
- **Proxy Using PAC**—To specify a proxy auto-configuration (PAC) file to download from an HTTP proxy server to the user's browser. Once downloaded, the PAC file uses a JavaScript function to identify a proxy for each URL.

If you select this option, enter the URL for the PAC file in the **Specify Proxy Auto Config file URL** field. The URL must begin with **http://** or the security appliance will not use the PAC file.

Step 4 If you select HTTP/HTTPS Proxy Server for the proxy type, configure the settings for the HTTP and HTTPS proxy servers. There are separate settings for the HTTP and HTTPS server, allowing you to use different servers, or to specify only one type of proxy. Configure the following options:

- **Enable HTTP Proxy Server, Enable HTTPS Proxy Server**—Select either or both of these options to configure the proxy server.
- **HTTP Proxy Server (IPv4/IPv6), HTTPS Proxy Server (IPv4/IPv6)**—Enter the IP address, or the name of a network/host object that contains the single proxy server's IP address, for each type of proxy server you are configuring. You can click **Select** to select the object from a list or to create a new object.

The default ports are 80 for HTTP and 443 for HTTPS.

Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA 9.0(1) or later devices. If the IPv6 address you entered is invalid, Security Manager would throw an error. Security Manager displays a warning message if the object is not available when you select the proxy server from the list.

- **HTTP Proxy Port, HTTPS Proxy Port**—Enter the port on the proxy server to which HTTP or HTTPS requests will be forwarded. You can also enter the name of a port list object that defines the port, or click **Select** to select an object or to create a new one.
- **Exception Address List**—A URL or a comma-delimited list of several URLs to exclude from those that should be sent to the HTTP or HTTPS proxy servers. The string does not have a character limit, but the entire command cannot exceed 512 characters. You can specify literal URLs or use the following wildcards:
  - ***** to match any string, including slashes (/) and periods (.). You must accompany this wildcard with an alphanumeric string.
  - **?** to match any single character, including slashes and periods.
  - **[x-y]** to match any single character in the range of x and y, where x represents one character and y represents another character in the ANSI character set.

- **[!x-y]** to match any single character that is not in the range.

- **Authentication User Name, Authentication Password, Confirm**—If the proxy server requires user authentication, enter a valid user name and password.

Step 5 If necessary, configure proxy bypass rules in the Proxy Bypass table at the bottom of the tab. Proxy bypass rules specify the ASA interface, port, and target URL configured for proxy bypass. Do any of the following:

- To create a proxy bypass rule, click the **Add Row** button and fill in the Add Proxy Bypass dialog box. For specific information on the attributes of a proxy bypass rule, see Add or Edit Proxy Bypass Dialog Box , on page 1386.
- To edit a proxy bypass rule, select the rule and click the **Edit Row** button.
- To delete a rule, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Tip If you configure proxy bypass rules, you must also configure the SSL VPN Access policy. For more information, see Configuring an Access Policy , on page 1376.

Add or Edit Proxy Bypass Dialog Box

Use the Add or Edit Proxy Bypass dialog box to set proxy bypass rules when the security appliance should perform little or no content rewriting.

Navigation Path

From the Proxy tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button, or select a rule and click the **Edit Row** button. For detailed information on opening the tab, see Configuring SSL VPN Encoding Rules (ASA) , on page 1382.

Field Reference

Table 395: Add or Edit Proxy Bypass Dialog Box

Element	Description
Interface	The interface on the security appliance that is used for proxy bypass. Enter the name of the interface or the interface role object, or click **Select** to select it from a list or to create a new object.
Bypass On Port	Select this option to use a port number for proxy bypass. Valid port numbers are 20000-21000. Enter the ports or the name of a port list object, or click **Select** to select an object or to create a new one. **Note** If you configure proxy bypass using ports rather than path masks, depending on your network configuration, you might need to change your firewall configuration to allow these ports access to the security appliance. Use path masks to avoid this restriction.

Element	Description
Bypass Matching Specific Pattern	Select this option to use a URL path mask to match for proxy bypass. A path is the text in a URL that follows the domain name. For example, in the URL www.mycompany.com/hrbenefits, *hrbenefits* is the path. You can use the following wildcards: • *****—Matches everything. You cannot use this wildcard by itself. It must accompany an alphanumeric string. • **?**—Matches any single character. • **[x-y]**—Matches any character in the sequence. • **[!x-y]**—Matches any character not in the sequence. The maximum is 128 bytes. **Note** Path masks can change, so you might need to use multiple path mask statements to exhaust the possibilities.
URL	Select the **http** or **https** protocol, then enter a URL to which you want to apply proxy bypass. URLs used for proxy bypass allow a maximum of 128 bytes. The port for HTTP is 80 and for HTTPS it is 443, unless you specify another port.
Rewrite XML	Whether to rewrite XML sites and applications to be bypassed by the security appliance.
Rewrite Hostname	Whether to rewrite external links to be bypassed by the security appliance.

Configuring SSL VPN Browser Plug-ins (ASA)

A browser plug-in is a separate program that a web browser invokes to perform a dedicated function, such as connect a client to a server within the browser window. The security appliance lets you import plug-ins for download to remote browsers in clientless SSL VPN sessions.

Cisco redistributes the following open-source, Java-based components to be accessed as plug-ins for web browsers in Clientless SSL VPN sessions. Cisco tests the plug-ins it redistributes, and in some cases, tests the connectivity of plug-ins we cannot redistribute. These files are available in the \files\vms\repository folder in the product installation folder (usually C:\Program Files\CSCOpx) on the Security Manager server. The actual file names include release numbers:

- rdp-plugin.jar—The Remote Desktop Protocol plug-in lets the remote user connect to a computer running Microsoft Terminal Services. The web site containing the source of the redistributed plug-in is http://properjavardp.sourceforge.net/ .
- ssh-plugin.jar—The Secure Shell-Telnet plug-in lets the remote user establish a Secure Shell or Telnet connection to a remote computer. The web site containing the source of the redistributed plug-in is http://javassh.org/ .

Note The ssh-plugin.jar provides support for both SSH and Telnet protocols. The SSH client supports SSH Version 1.0.

- vnc-plugin.jar—The Virtual Network Computing plug-in lets the remote user use a monitor, keyboard, and mouse to view and control a computer with remote desktop sharing turned on. The web site containing the source of the redistributed plug-in is http://www.tightvnc.com .

Note Per the GNU General Public License (GPL), Cisco redistributes plug-ins without having made any changes to them. Per the GPL, Cisco cannot directly enhance these plug-ins.

The security appliance does the following when you install a plug-in onto the flash device:

- (Cisco-distributed plug-ins only) Unpacks the jar file specified in the URL.
- Writes the file to the csco-config/97/plugin directory on the security appliance file system.
- Enables the plug-in for all future clientless SSL VPN sessions, and adds a main menu option and an option to the drop-down menu next to the Address field of the portal page.

When the user in a clientless SSL VPN session clicks the associated menu option on the portal page, the portal page displays a window to the interface and displays a help pane. The user can select the protocol displayed in the drop-down menu and enter the URL in the Address field to establish a connection.

Note Some Java plug-ins might report a status of connected or online even when a session to the destination service is not set up. The open-source plug-in reports the status, not the security appliance.

In the Plug-in tab of the SSL VPN Global Settings page, you can view the currently configured browser plug-ins for clientless SSL VPN browser access. From this tab, you can create or edit the plug-in files, as described in the following procedure.

Plug-in Requirements and Restrictions

Clientless SSL VPN must be enabled on the security appliance to provide remote access to the plug-ins. The minimum access rights required for remote use belong to the guest privilege mode. The plug-ins automatically install or update the Java version required on the remote computer. A stateful failover does not retain sessions established using plug-ins. Users must reconnect following a failover.

Before installing a plug-in, prepare the security appliance as follows:

- Make sure clientless SSL VPN is enabled on an interface on the security appliance.
- Install an SSL certificate onto the security appliance interface to which remote users use a fully-qualified domain name (FQDN) to connect.

Note Do not specify an IP address as the common name (CN) for the SSL certificate. The remote user attempts to use the FQDN to communicate with the security appliance. The remote PC must be able to use DNS or an entry in the System32\drivers\etc\hosts file to resolve the FQDN.

Related Topics

- Understanding and Managing SSL VPN Support Files , on page 1291
- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Plug-in** tab. The Plug-in tab lists all configured plug-ins, including the type of plug-in and the name of the File policy object that defines the actual plug-in file.

Step 3 Do any of the following:

- To add a plug-in, click the **Add Row** button beneath the table and fill in the Add Plug-In Entry dialog box as follows:
  - **Plug-in**—Select the type of plug-in that you are adding:
  - Remote Desktop (RDP) or RDP2—For Remote Desktop Protocol services.
  - Secure Shell (SSH), Telnet—For Secure Shell and Telnet services.
  - VNC—For Virtual Network Computing services.
  - Citrix (ICA)—For Citrix MetaFrame services.
  - Post—For post services.
  - **Plug-in File**—The name of the File policy object that defines the plug-in file. Enter the name of the File object or click **Select** to select an object or to create a new one. For more information on creating File Objects, see Add and Edit File Object Dialog Boxes , on page 1526.
- To edit a plug-in, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
- To delete a plug-in, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Understanding SSL VPN Secure Client Settings

The Cisco AnyConnect VPN Client provides secure SSL and IKEv2 IPsec connections to the security appliance for remote users. The client gives remote users the benefits of an SSL or IKEv2 IPsec VPN client without the need for network administrators to install and configure clients on remote computers.

Tip IKEv2 IPsec connections require AnyConnect 3.0 or later clients.

Without a previously installed client, remote users enter the IP address in their browser of an interface configured to accept SSL or IKEv2 IPsec VPN connections. Unless the security appliance is configured to redirect http:// requests to https://, users must enter the URL in the form https://<*address*> .

After the user enters the URL, the browser connects to that interface and displays the login screen. If the user satisfies the login authentication, and the security appliance identifies the user as requiring the client, it downloads the client that matches the operating system of the remote computer. After downloading, the client installs and configures itself, establishes a secure connection and either remains or uninstalls itself (depending on the security appliance configuration) when the connection terminates.

In the case of a previously installed client, when the user authenticates, the security appliance examines the revision of the client and upgrades the client as necessary.

When the client negotiates a connection with the security appliance, it connects using Transport Layer Security (TLS), and optionally, Datagram Transport Layer Security (DTLS). DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.

The Secure Client can be downloaded from the security appliance, or it can be installed manually on the remote workstation by the system administrator. For more information about installing the client manually, see the *Cisco Secure Client Administrator Guide* . Secure Client documentation is available at http://www.cisco.com/en/US/products/ps10884/tsd_products_support_series_home.html . You can find general information about Secure Client at http://www.cisco.com/go/secure-client .

The security appliance downloads the client based on the group policy or username attributes of the user establishing the connection. You can configure the security appliance to automatically download the client, or you can configure it to prompt the remote user about whether to download the client. In the latter case, if the user does not respond, you can configure the security appliance to either download the client after a timeout period or present the login page.

Secure Client Profiles

The Secure Client Profile is a group of configuration parameters, stored in an XML file, that the client uses to configure the connection entries that appear in the client user interface. These parameters (XML tags) include the names and addresses of host computers and settings to enable additional client features.

The Secure Client installation includes a profile template, named *AnyConnectProfile.tmpl* , that you can edit with a text editor and use as a basis to create other profile files. You can also set advanced parameters that are not available through the user interface. The installation also includes a complete XML schema file, named *AnyConnectProfile.xsd* .

You can add the profile to the Client Settings tab in the Other Settings policy to have it loaded onto the security appliance and subsequently downloaded to the client workstations based on group policies and username attributes.

Related Topics

- Understanding and Managing SSL VPN Support Files , on page 1291
- Configuring SSL VPN Secure Client Settings (ASA), on page 1391
- Cisco Secure Client Profile Editor , on page 1391

Cisco Secure Client Profile Editor

You can configure a profile using the Secure Client Profile Editor, a convenient GUI-based configuration tool launched from Cisco Security Manager. The Secure Client software package for Windows, version 2.5 and later, includes the editor, which activates when you launch the editor from the Add/Edit Secure Client Profile dialog box as long as you have added an appropriate Secure Client package to the Secure Client Image list.

Note The **Launch Editor** option under **Add Secure Client Profile** gets disabled automatically when **Web Security WSO** type is selected, because WSO files cannot be edited using the Secure Client Profile Editor.

Note The Cisco Secure Client Profile Editor is an independent program. For information about configuring Secure Client profiles, and what Secure Client Profile Editor can do for you, see the materials available online at http://www.cisco.com/en/US/products/ps10884/products_installation_and_configuration_guides_list.html .

Navigation Path

Open the Add/Edit Secure Client Profile dialog box , then click **Launch Editor** (you must first add an appropriate Secure Client package to the Secure Client Image list before accessing the Add/Edit Secure Client Profile dialog box). The Secure Client Profile Editor is displayed.

Related Topics

- Understanding SSL VPN Secure Client Settings , on page 1389

- Understanding and Managing SSL VPN Support Files , on page 1291

Note Beginning with version 4.7, Security Manager provides support for AnyConnect version 3.2.

Configuring SSL VPN Secure Client Settings (ASA)

This procedure shows you how to define SSL and IKEv2 IPsec VPN client images and profiles. For a detailed explanation of Secure Client images and profiles, see Understanding SSL VPN Secure Client Settings , on page 1389.

Tip Ensure that you add Secure Client images of the required releases. For example, if you are configuring an IKEv2 IPsec VPN, you must include an AnyConnect 3.0 or later image. In general, the image versions must support the features you are deploying in the remote access VPN.

Related Topics

- Understanding SSL VPN Secure Client Settings , on page 1389
- Cisco Secure Client Profile Editor , on page 1391
- Understanding and Managing SSL VPN Support Files , on page 1291
- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Client Settings** tab. The tab has two tables listing the configured Secure Client and profiles separately.

The Secure Client images include an order number. The security appliance downloads portions of the Secure Client images to the remote computer until it achieves a match with the operating system, starting with the highest order number. Therefore, you should give the highest number to the image used by the most commonly-encountered operating system.

Because mobile users have slower connection speeds, you should load the Secure Client image for Windows Mobile at the top of the list. Alternatively, you can decrease the connection time by specifying the regular expression **Windows CE** to match the user agent on Windows Mobile devices. When the browser on the mobile device connects to the ASA, it includes the User-Agent string in the HTTP header. The ASA, receiving the string, immediately downloads Secure Client for Windows Mobile without ascertaining whether the other Secure Client images are appropriate.

Step 3 To add an Secure Client image or make changes to the existing list, do any of the following:

- To add an Secure Client image, click the **Add Row** button beneath the table and fill in the Add Secure Client Image dialog box. You need to specify the name of the File object that defines the image and the priority order of the image. You can also specify a regular expression for the connecting client to speed up the download. For detailed information about the options, see Add/Edit Secure Client Image Dialog Box , on page 1393.
- To edit an image, select it, click the **Edit Row** button, and make your modifications in the Edit Secure Client Image dialog box.
- To delete an image, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Step 4 To add an Secure Client Profile or make changes to the existing list, do any of the following:

- To add an Secure Client Profile, click the **Add Row** button beneath the table and configure these options in the Add Secure Client Profile dialog box:
  - **Secure Client Profile Name**—The name of the profile.

To use this profile, ensure that you specify the profile name in an ASA Group Policy object assigned to the security appliance (in the Full Client settings page as described in ASA Group Policies SSL VPN Full Client Settings , on page 1506). Configure the ASA Group Policy object through the remote access Connection Profiles policy for the device as described in Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.

- **Secure Client Profile Type**—Select the type of Secure Client Profile you are adding or editing: VPN, Network Access Manager, Telemetry, Web Security, ISE Posture, or Customer Experience Feedback.

- **Secure Client Profile File**—The name of the File object that identifies the Secure Client Profile XML file. The filename extension varies with the type of Secure Client Profile—VPN (.xml), Network Access Manager (.nsp), Telemetry (.tsp), Web Security (.wsp), Web Security WSO (.wso), ISE Posture (.isp), and Customer Experience Feedback (.fsp). Click **Select** to select the object or to create a new one. For more information about File objects, see Add and Edit File Object Dialog Boxes , on page 1526.

Note From version 4.22, Cisco Security Manager supports direct upload of WSO files through the new **Web Security WSO** Profile type under **Add Secure Client Image**. However, once the **Web Security WSO** Profile type is selected, the **Launch Editor** option is disabled automatically, because WSO files cannot be edited using the Secure Client Profile Editor.

Note Beginning with version 4.7, Security Manager provides support for AnyConnect version 3.2. If you select ISE Posture as the Secure Client Profile Type, the Secure Client Profile File should have a filename extension of .isp.

- **Enable Storage URL**—Beginning with version 4.12, Security Manager enables you to select either Private or Shared option for ASA 9.6(2) or later Multi-Context devices.
- **Launch Editor**—Click **Launch Editor** to use the Secure Client Profile Editor to edit the profile specified in Secure Client Profile File or to create a new profile if no profile file is specified. For more information about File objects, see Cisco Secure Client Profile Editor , on page 1391.

  Note If you are going to create a new profile using the Secure Client Profile Editor, do not specify an Secure Client Profile File.

- To edit a profile, select it, click the **Edit Row** button, and make your modifications in the Edit Secure Client Profile dialog box.
- To delete a profile, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Note For storing **Secure Client Image/Profile** configurations, the device must be added as a multi-context device to Cisco Security Manager. A system context is mandatory for Security Manager to get the **Storage URL**, and if you add the multi-context device as a stand-alone one, you might end up getting deployment errors when adding **Secure Client Image/Profile** configurations, as the default **Storage URL** (disk0:/csm) gets assigned by default. This default assignation happens because Security Manager becomes unable to fetch the **Storage URL** as there is no system context for the multi-context device that is added as a stand-alone device.

Add/Edit Secure Client Image Dialog Box

Use the Add or Edit Secure Client Image dialog box to create or edit a package file as the client image, and establish the order that the security appliance downloads the image to the remote workstation.

Navigation Path

From the Client Settings tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the Secure Client Image table, or select an image and click the **Edit Row** button. For detailed information on opening the tab, see Understanding SSL VPN Secure Client Settings , on page 1389.

Field Reference

Table 396: Add or Edit Secure Client Image Dialog Box

Element	Description
Secure Client Image	The name of the File object that identifies the Secure Client. Click **Select** to select an object or to create a new one. For more information about File objects, see Add and Edit File Object Dialog Boxes , on page 1526.
Image Order	The order in which the security appliance downloads the client images to the remote workstation. It downloads the image in priority order. Therefore, you should enter a lower value for the image used by the most commonly-encountered operating system.
Regular Expression	A regular expression to match the user agent. Enter a name of an existing regular expression policy object or click **Select** to select an entry from the Regular Expressions Selector dialog box. To add a new regular expression, click the **Add (+)** button on the Regular Expressions Selector dialog box. For more information see Add/Edit Regular Expressions , on page 879. If you are adding an Secure Client package for Windows Mobile, specify the regular expression **Windows CE** to match the user agent on Windows Mobile devices. This decreases the connection time of the mobile device. When the browser on the mobile device connects to the adaptive security appliance, it includes the User-Agent string in the HTTP header. The adaptive security appliance, receiving the string, immediately downloads Secure Client for Windows Mobile without ascertaining whether the other Secure Client images are appropriate.
Enable Storage URL (Only for ASA 9.6(2) or later Multi-Context devices)	Beginning with version 4.12, Security Manager enables you to select either Private or Shared option for ASA 9.6(2) or later Multi-Context devices. **Note** For storing **Secure Client Image/Profile** configurations, the device must be added as a multi-context device to Cisco Security Manager. A system context is mandatory for Security Manager to get the **Storage URL**, and if you add the multi-context device as a stand-alone one, you might end up getting deployment errors when adding **Secure Client Image/Profile** configurations, as the default **Storage URL** (disk0:/csm) gets assigned by default. This default assignation happens because Security Manager becomes unable to fetch the **Storage URL** as there is no system context for the multi-context device that is added as a stand-alone device.

Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

There are many ways to protect network resources through the use of authentication. Many organizations want to use Kerberos to protect certain web applications while using other authentication techniques, such as username and password, digital certificates, RSA SecureID, or SmartCards, to control access to an SSL VPN. However, a restriction in the Kerberos protocol prevents Kerberos authentication if the user has already used another technique to authenticate to the VPN.

Microsoft overcomes this limitation in Kerberos starting with Windows Server 2003. Using protocol transition and constrained delegation, the ASA can authenticate to the Kerberos Key Distribution Center (KCD) on the

Windows domain controller and obtain impersonate tickets for users who have authenticated to the ASA using non-Kerberos protocols. The ASA can use the impersonate ticket to obtain other Kerberos service tickets for remote users.

To configure the domain controller so that Kerberos constrained delegation works, you must do the following:

- Each instance of a service that uses Kerberos authentication must have a service principle name (SPN) defined so that clients can identify it on the network. Register the SPN in the Active Directory **Service-Principal-Name** attribute of the Windows account under which the instance of the service is running. When a service needs to authenticate to another service running on a specific computer, it uses that service's SPN to differentiate it from other services running on that computer.

The SPN syntax is *service_class/host_name:port* , where:

- *service_class* identifies the service. It can be a built-in service, such as http, or a user defined service.
- *host_name* identifies the fully-qualified domain name or NetBIOS name of the server that hosts the service, but it cannot be an IP address.
- *port* identifies the port on which the service runs. You can omit the port if you use the default service port.
- Create a service account username and password that the ASA can use. Configure the account to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated.

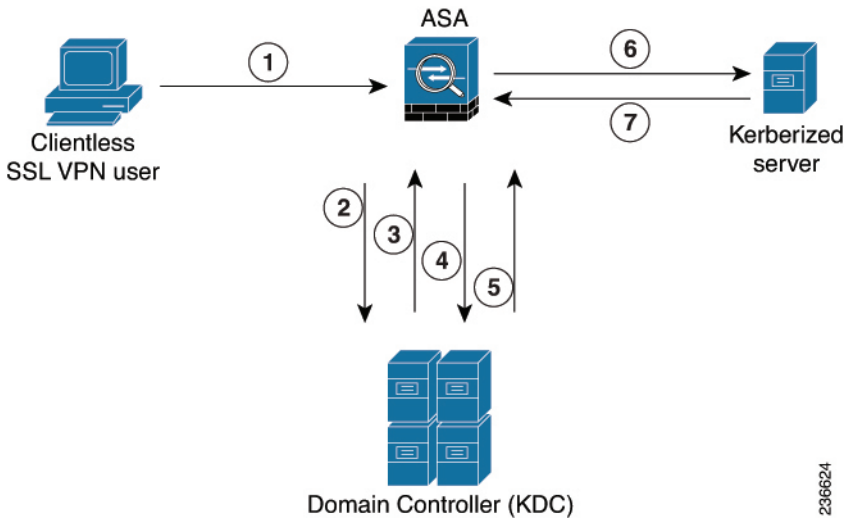
To configure the ASA to allow KCD, once the ASA joins the domain, an entry should appear under the Users and Computers list on the domain controller for the ASA. In the Properties dialog box, on the Delegation tab, select **Trust this computer for delegation to specified services only**, and then select **Use any authentication protocol**. In the table of authorized services, add all services for which the ASA is delegated for authentication on behalf of users.

Tip For definitive information on configuring this feature on the Windows domain controller, refer to the Microsoft documentation.

For the ASA to use Kerberos constrained delegation, you must configure the ASA as described in Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1397. The feature is available on ASA Software release 8.4 and later only.

Following is an example that explains how Kerberos constrained delegation works with a clientless SSL VPN hosted on an ASA.

Figure 41: Kerberos Constrained Delegation Example



After verifying the identity of an SSL VPN user with the configured authentication mechanism, the ASA uses protocol transition to switch to the Kerberos protocol for authentication on behalf of the user and then sends a Kerberos service ticket instead of the user's credentials to a published Web server that accepts Kerberos for authentication. Following are the steps:

1. An SSL VPN user session is authenticated by the ASA using the authentication mechanism configured for the user. For example, in case of Smartcard credentials, the ASA extracts the required information (the user's principle name) from the digital certificate and performs LDAP authorization against Windows Active Directory.
2. After successful authentication, the user logs into the ASA SSL VPN portal page. The VPN user accesses a web service by entering a URL in the portal page or by clicking on a bookmark. If the access requires authentication, the server challenges the ASA for credentials and along with the challenge sends a list of authentication mechanisms supported by the server. Based on the HTTP headers in the challenge, the ASA deduces whether the server requires Kerberos authentication. If connecting to a backend server requires Kerberos authentication, then the ASA requests an impersonate ticket, for itself on behalf the user, from the KDC.
3. The KDC returns the requested tickets to the ASA. Even though these tickets are passed to the ASA, they contain the user's authorization data.

Note These first steps comprise protocol transition; after these steps, a user who authenticated to the ASA using a non-Kerberos authentication protocol is transparently authenticated to the KDC using Kerberos.

1. The ASA now requests a service ticket from the KDC for the specific service that the user wants to access. The service ticket request contains the SPN (the unique identifier) of the service.
2. The KDC returns a service ticket for the specific service to the ASA.
3. The ASA uses the service ticket to request access to the web service, in the above scenario this is sent to the web server in a HTTP GET request.

4. The web server authenticates the Kerberos service ticket and grants access to the service. An authentication failure will display an appropriate error message after acknowledgment of which the portal will be displayed.

Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA)

Use the Microsoft KCD Server tab of the SSL VPN Other Settings page to configure Kerberos Constrained Delegation (KCD) for clientless SSL VPNs hosted on an ASA.

KCD addresses a limitation of Kerberos. If a user authenticates to the SSL VPN using a method other than Kerberos, the user cannot access Kerberos-protected resources. This prevents a remote access device, such as ASA, from authenticating users using non- Kerberos methods and still provide single sign-on access to Kerberos-authenticated web applications in the enterprise.

If this limitation applies to your network, you can configure KCD to get around the limitation. KCD offloads the Kerberos authentication to the ASA. Users log into the corporate network using the SSL VPN portal, and from then on, access Kerberos-protected services in a transparent fashion.

Tips

- KCD requires ASA release 8.4+. If you configure KCD for other releases, the configuration is ignored.
- The feature is used with clientless SSL VPN access only.
- Microsoft Windows Server (2003 or 2008), configured as domain controllers, are required for KCD.
- If you use SSL VPN Bookmark policy objects to define bookmarks to include on the SSL VPN portal page, you might need to add explicit service principle name (SPN) parameters to bookmarks if a service uses a non-default port. For services that use Kerberos authentication, an SPN must be defined in the Service-Principle-Name attribute of the account under which the service runs.

Bookmarks need to reflect this configuration. The SPN is a parameter on the URL: http://<url>?SPN=<spn> or http://<url>?SPN=<spn>. For example, **http://owa.example.com?SPN=http/owa:444**. For more details about the SPN syntax, see Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1394.

- To configure this feature, you must also configure the Hostname, DNS, and NTP policies. Configure both hostname and domain name in the Hostname policy.
- Kerberos authentication requires that the clock between the hosts to be synchronized with a maximum drift of 5 minutes (this is the default setting). This restriction is applicable to the clocks on the ASA, the domain controller, and the application servers. Configuring the same NTP server for all servers should address the requirement.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378
- Understanding AAA Server and Server Group Objects , on page 256

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.

- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Microsoft KCD Server** tab.

Step 3 Select **Configure KCD** and configure the following options:

- **KCD Server**—The AAA server group object that identifies the Microsoft KCD server (the domain controller) to use for Kerberos Constrained Delegation. Enter the name of the object or click **Select** to select it from a list or to create a new object. The object must use a Kerberos AAA server policy object to identify the domain controller.
- **Username, Password, Confirm**—A user account that the ASA can use to join the Active Directory domain.

For the ASA to use Kerberos protocol transition and constrained delegation, and obtain service tickets on behalf of the remote access users, the account used by the ASA to authenticate with the domain controller must be configured in Active Directory and configured to allow Kerberos constrained delegation to any authentication protocol. In addition, the user account must not be marked as a sensitive account that cannot be delegated. For more information about Active Directory configuration requirements, see Understanding Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1394.

Configuring Secure Client Custom Attributes (ASA)

Secure Client custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

In the Secure Client Custom Attribute tab of the SSL VPN Other Settings page, you can view configured Secure Client custom attributes, add new attributes, and modify or delete existing attributes.

Related Topics

- Understanding and Managing SSL VPN Support Files , on page 1291
- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Secure Client Custom Attribute** tab. The Secure Client Custom Attribute tab lists all defined custom attributes.

Step 3 Do any of the following:

- To add a custom attribute, click the **Add Row** button beneath the table and fill in the Add Secure Client Custom Attribute dialog box. The options are described in detail in Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399.

- To edit a custom attribute, select it, click the **Edit Row** button, and make your changes in the Edit Plug-In Entry dialog box.
- To delete a custom attribute, select it and click the **Delete Row** button. You are asked to confirm the deletion.

Add/Edit Secure Client Custom Attribute Dialog Box

Use the Add or Edit Secure Client Custom Attribute dialog box to add or modify an Secure Client custom attribute. Secure Client custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade.

Beginning with version 4.7, Security Manager enables to add Custom Attribute Data to an existing Custom Attribute Type for ASA devices running the software version 9.3(1) or later. Use the Add or Edit Secure Client Custom Attribute Data dialog box to add or modify the attribute name and attribute value for an existing Secure Client custom attribute type. For more information see Add/Edit Secure Client Custom Attribute Data Dialog Box , on page 1400.

Navigation Path

From the Secure Client Custom Attribute tab of the SSL VPN Other Settings policy for ASA devices, click the **Add Row** button for the Secure Client Custom Attributes table, or select an attribute and click the **Edit Row** button. For detailed information on opening the tab, see Configuring Secure Client Custom Attributes (ASA) , on page 1398.

Field Reference

Table 397: Add or Edit Secure Client Custom Attributes Dialog Box

Element	Description
Type	The type of the Secure Client custom attribute. This is used when referencing the attribute in Security Manager and in the aggregate auth protocol messages sent to the Secure Client. The maximum length is 32 characters.
Description	A free form description of attribute usage. This text will appear in the command help when the custom attribute is referenced from the group-policy attribute configuration mode. The maximum length is 128 characters.

Add/Edit Secure Client Custom Attribute Data Dialog Box

Beginning with Security Manager version 4.7, you can use the Add or Edit Secure Client Custom Attribute Data dialog box to add or modify the attribute name and attribute value for an existing Secure Client custom attribute type.

Navigation Path

Click the Secure Client Custom Attribute tab of the SSL VPN Other Settings policy for ASA devices. On the Custom Attribute table, select an attribute type and then click the **Add Row** button for the Custom Attribute Data table. Or on the Custom Attribute Data table select an existing Custom Attribute Data and click the **Edit Row** button.

For each attribute type, you can define multiple attribute names with corresponding values.

For information on adding or modifying an attribute type, see Understanding SSL VPN Secure Client Settings , on page 1389.

Related Topics

- Understanding SSL VPN Secure Client Settings , on page 1389
- Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399
- Configuring SSL VPN Secure Client Settings (ASA), on page 1391

Field Reference

Table 398: Add or Edit Secure Client Custom Attribute Data Dialog Box

Element	Description
Attribute Name	The name of an Secure Client custom attribute. The name is used when referencing the attribute in group-policy and dynamic-access-policy-record config mode. The maximum length is 32 characters.
Attribute Value	A free form string containing the attribute value. The attribute value is associated with the attribute name and it is passed to the client during the configuration of the connection. The maximum length of the string can be 420 characters. The attribute value can contain multiple text lines.

Configuring SSL VPN Advanced Settings (ASA)

Use the Advanced tab of the SSL VPN Other Settings page to configure the memory, on-screen keyboard, and internal password features on ASA devices. Beginning with Cisco Security Manager 4.15, you can also enable the HSTS support and specify the timeout values. All of these settings are optional.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 On the Other Settings page, click the **Advanced** Tab.

Step 3 In the **Memory Size** field, specify the amount of memory you want to allocate to SSL VPN sessions. The default is 50%.

To change the setting, select one of the following options and enter the desired number:

- **% of Total Physical Memory**—As a percentage of total memory. Default is 50%.
- **Kilobytes**—In kilobytes. 20KB is the minimum setting allowed. Cisco recommends that you do not specify memory in terms of KB because different ASA models have different total amounts of memory, for example:

Note When you change the memory size, the new setting takes effect only after the system reboots.

Step 4 In the **Enable On-Screen Keyboard** field, select one of the following options:

- **Disabled**—The on-screen keyboard is not displayed. Users must input their credentials using the standard keyboard. This is the default.
- **On All Pages**—Allows a user to input credentials using an on-screen keyboard, which is displayed whenever logon credentials are required.
- **On Logon Page Only**—Allows a user to input credentials using an on-screen keyboard, which is displayed on the logon page but not on any other pages that require credentials.

Note From Cisco Security Manager 4.24 onwards, **Enable On-Screen Keybord** feature is deprecated for ASA 9.17(1) and higher version devices.

Step 5 Select **Allow Users to Enter Internal Password** to require an additional password when accessing internal sites. This feature is useful if you require that the internal password be different from the SSL VPN password. For example, you can use a one-time password for authentication to ASA and another password for internal sites.

Note The HSTS option is available for ASA 9.8.2 and later devices only.

Step 6 In the HTTP Strict Transport Security (HSTS) area, do the following:

- To enable HSTS support, select the **Enable HSTS Header** check box. The HSTS feature can be enabled by sending header to clients. To disable the support, clear this check box.
- If you have selected the **Enable HSTS Header** check box, in HSTS Header Timeout enter the timeout value. If you leave this field blank, Cisco Security Manager will use the default Timeout value of 10886400.
- If you want to include sub domains directive to the header, select the **Include Sub Domains** check box.
- If you want to include payload directive to the header, select the **Payload** check box.
- Checking the **Enable HSTS-Client** check box controls the HSTS policy enforcement for HSTS hosts.
- Checking the **Enable X-Content-Type-Options** check box allows sending of X-Content-Type-Options response headers to clients.

- Checking the **Enable X-XSS-Protection** check box allows sending of X-XSS-Protection response headers to clients.

Note If you select the Payload check box, the Include Sub Domains is also selected by default.

- If you choose payload, ensure that the HSTS Header Timeout value is 31536000 or greater.

Note From version 4.21, Cisco Security Manager begins to suppport the CLI options **Enable HSTS-Client**, **Enable X-Content-Type-Options**, and **Enable X-XSS-Protection** under HSTS server command. However, **Content-Security-Policy** is not supported. You can configure it through Flex Config only.

Configuring SSL VPN Server Verification (ASA)

When connecting to a remote SSL-enabled server through clientless SSL VPN, it is important to know that you can trust the remote server, and that it is in fact the server you are trying to connect to. ASA 9.0 introduces support for SSL server certificate verification against a list of trusted certificate authority (CA) certificates for clientless SSL VPN.

When you connect to a remote server via a web browser using the HTTPS protocol, the server will provide a digital certificate signed by a CA to identify itself. Web browsers ship with a collection of CA certificates which are used to verify the validity of the server certificate. This is a form of public key infrastructure (PKI).

Just as browsers provide certificate management facilities, so does the ASA in the form of trusted certificate pool management facility: trustpools. This can be thought of as a special case of trustpoint representing multiple known CA certificates. The ASA includes a default bundle of certificates, similar to that provided with web browsers, but it is inactive until activated by the administrator.

Note If you are already familiar with trustpools from Cisco IOS then you should be aware that the ASA version is similar, but not identical.

This procedure describes how to enable HTTPS server verification for clientless SSL VPN users.

Related Topics

- Configuring Other SSL VPN Settings (ASA) , on page 1378
- Configuring Trusted Pool Settings (ASA) , on page 1356
- Using the Trustpool Manager , on page 1358

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Other Settings** from the Policy selector. Click the **SSL Server Verification** tab.
- (Policy view) Select **Remote Access VPN > SSL VPN > Other Settings (ASA)** from the Policy Type selector. Select an existing policy or create a new one. Click the **SSL Server Verification** tab.

Step 2 Select **Enable** to enable HTTPS Server Verification for Clientless SSL VPN users.

Step 3 Specify the action you want to be taken if server certificate verification fails:

- **Disconnect user from Https page** – Disconnect if the server could not be verified.
- **Allow user to continue to Https page** – Allow the user to continue the connection, even if the check failed.

Configuring SSL VPN Shared Licenses (ASA 8.2+)

Use the SSL VPN Shared License page to configure your SSL VPN Shared License.

You can purchase a shared license with a large number of SSL or remote access IKEv2 IPsec VPN sessions and share the sessions as needed among a group of ASA devices by configuring one of the ASA devices as a shared license server, and the rest as clients. For the server license, you can share 500-50,000 licenses in increments of 500 and 50,000-1,040,000 licenses in increments of 1000.

A license is consumed by each remote access user that makes an SSL or IKEv2 IPsec connection.

Note The shared license cannot be used at the same time as the Secure Client Essentials license.

The following topics explain the procedure for configuring shared licenses:

- Configuring an ASA Device as a Shared License Client , on page 1405
- Configuring an ASA Device as a Shared License Server , on page 1405

Navigation Path

- (Device View) Select an ASA device using version 8.2 or later, and select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy View) Select **Remote Access VPN > SSL VPN > Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

Field Reference

Table 399: SSL VPN Shared License Page

Element	Description
Select Role	The role you are configuring, either Shared License Client or Shared License Server. Depending on your choice, different fields appear.
Shared License Client	
Shared Secret	The case-sensitive string (4-128 characters) used for communicating with the shared license server.
License Server	The IP address or the name of a network/host object that identifies the ASA device configured as the license server. Click **Select** to select an existing object or to create a new one.

Element	Description
License Server Port	The number of the TCP port on which the license server communicates. Enter a port number or the name of a port list object, or click **Select** to select an object or to create a new one.
Select Backup Role of Client	The backup role of the client: • Client Only—When selected, the client acts only as the client. In this case, you can specify another device as a backup server. Enter the IP address or the name of a network/host object, or click **Select** to select the object from a list or to create a new object. • Backup Server—When selected, the client also acts as the backup server. In this case, you must also specify the interfaces to be used for this purpose. Enter a comma-separated list of interface names or interface role objects, or click **Select** to select interfaces or objects or to create new objects.
Shared License Server	
Shared Secret	The case-sensitive string (4-128 characters) used for communicating with the shared license server.
License Server Port	The number of the TCP port on which the license server communicates. Enter a port number or the name of a port list object, or click **Select** to select an object or to create a new one.
Refresh Interval	The refresh interval, between 10-300 seconds. The default is 30 seconds.
Interfaces	A comma-separated list of interfaces used for communicating shared licenses to clients. Enter the names of interfaces or interface role objects, or click **Select** to select interfaces or objects or to create new objects.
Configure Backup shared SSL VPN License Server	Whether to configure a backup server for the shared license server. If you select this option, configure the following: • **Backup License Server**—The IP address, or network/host object that contains the address, of the server to act as a backup license server if the current one is unavailable. Click **Select** to select an object or to create a new one. • **Backup Server Serial Number**—The serial number of the backup license server. • **HA Peer Serial Number**—(Optional) The serial number of the backup server of a failover pair.

This section contains the following topics:

• Configuring an ASA Device as a Shared License Client , on page 1405
• Configuring an ASA Device as a Shared License Server , on page 1405

Configuring an ASA Device as a Shared License Client

This procedures describes how to configure an ASA device as a shared license client.

Tip You must ensure that the SSL VPN Shared License Client activation key is present on the device.

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN >Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN Shared License page appears (see Configuring SSL VPN Shared Licenses (ASA 8.2+) , on page 1403).

Step 2 Select **Shared License Client** as the role of the device.

Step 3 In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.

Step 4 In the License Server field, enter the IP address or the name of a network/host object that identifies the ASA device configured as the license server.

Step 5 In the License Server Port field, enter the number of the TCP port on which the license server communicates.

Step 6 Select the role of the client:

- **Client Only**—When selected, the client acts only as the client. In this case, you can specify another device as a backup server.
- **Backup Server**—When selected, the client also acts as the backup server. In this case, you must also specify the interfaces to be used for this purpose.

Configuring an ASA Device as a Shared License Server

This procedures describe how to configure an ASA device as a shared license server.

Tip You must ensure that the SSL VPN Shared License Server activation key is present on the device.

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > SSL VPN > Shared License** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN >Shared License (ASA 8.2+)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN Shared License page appears (see Configuring SSL VPN Shared Licenses (ASA 8.2+) , on page 1403).

Step 2 Select **Shared License Server** as the role of the device.

Step 3 In the Shared Secret field, enter and confirm a case-sensitive string (4-128 characters) used for communicating with the shared license server.

Step 4 In the License Server Port field, enter the number of the TCP port on which the license server communicates.

Step 5 In the Refresh Interval field, enter a value between 10-300 seconds to be used as the refresh interval. Default is 30 seconds.

Step 6 In the Interfaces field, enter or select the interfaces to be used for communicating with clients.

Step 7 (Optional.) Select **Configure Backup shared SSL VPN License Server** to configure a backup server for the shared license server, then configure the following:

- **Backup License Server**—The IP address, or network/host object that contains the address, of the server to act as a backup license server if the current one is unavailable.
- **Backup Server Serial Number**—The serial number of the backup license server.
- **HA Peer Serial Number**—(Optional) The serial number of the backup server of a failover pair.

Customizing Clientless SSL VPN Portals

You can customize the web site and its contents that you use for the portal page for a browser-based clientless SSL VPN. ASA devices allow much more customization than IOS devices. You can create several policy objects that define the look of the web pages the user sees when logging into or out of the VPN and the home page for the portal, as well as the bookmarks and smart tunnels available to the user.

This section contains the following topics:

Configuring ASA Portal Appearance Using SSL VPN Customization Objects

An SSL VPN Customization object describes the appearance of browser-based clientless SSL VPN web pages displayed to users. This includes the Logon page displayed when they connect to the ASA security appliance, the Home page displayed after authentication, and the Logout page displayed when users log out of the SSL VPN service.

You use SSL VPN Customization objects when defining ASA group objects or Remote Access VPN Connection policies for ASA devices. You can create several customization objects and define multiple ASA group or connection profiles so that each user group sees web pages designed specifically for their use. Customization

can include localizing the web pages in the languages appropriate for each group. For more information about localization, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409.

Initially, when a user first connects, the default customization object identified in the connection profile determines how the logon screen appears. If the user selects a different group from the connection profile list on the logon page, and that group has its own customization, the screen changes to reflect the customization object for the selected group. After the remote user is authenticated, the screen appearance is determined by the customization object that has been assigned to the group policy.

After you create the SSL VPN customization object as described in this procedure, you can use the object to specify the portal characteristics in these policies:

- On the **SSL VPN > Settings** page in an ASA group policy object (see ASA Group Policies SSL VPN Settings , on page 1512), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- In the **Remote Access VPN > Connection Profiles** policy, you can also specify the SSL VPN customization object on the **SSL** tab (see SSL Tab (Connection Profiles) , on page 1348).

Related Topics

- Localizing SSL VPN Web Pages for ASA Devices , on page 1409
- Creating Policy Objects , on page 237
- Add or Edit SSL VPN Gateway Dialog Box , on page 1555

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Tip You can also create SSL VPN Customization objects when defining policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Step 2 Select **SSL VPN Customization** from the Object Type selector. The SSL VPN Customization page opens, displaying a list of the existing SSL VPN Customization objects.

Step 3 Right-click in the work area and select **New Object**.

The Add SSL VPN Customization dialog box appears (see Add and Edit SSL VPN Customization Dialog Boxes , on page 1541).

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Before you configure settings for the various pages, use the Preview button to view the default settings. Clicking **Preview** opens a browser window to display the current settings for the Logon page, Portal page, or Logout page, whichever one is selected in the table of contents (selecting a page within one of these folders is the same as selecting the parent folder).

Tip Click **Preview** after making any changes to settings to verify that the changes are what you desire.

Step 6 Configure the settings for the Logon page. This web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents on the left of the dialog box to view and change the settings:

- **Logon Page**—Specify the title of the web page, which is displayed in the browser's title bar.

- **Title Panel**—Determine whether the Logon page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see SSL VPN Customization Dialog Box—Title Panel , on page 1543.
- **Language**—If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. For information about translation tables and localization support, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409. For more information about the settings, see SSL VPN Customization Dialog Box—Language , on page 1544.
- **Logon Form**—Configure the labels and colors used in the form that accepts user logon information. For more information about the settings, see SSL VPN Customization Dialog Box—Logon Form , on page 1547.
- **Informational Panel**—If you want to provide extra information to the user, you can enable an informational panel and add text and a logo graphic. For more information about the settings, see SSL VPN Customization Dialog Box—Informational Panel , on page 1548.
- **Copyright Panel**—If you want to include copyright information on the logon page, you can enable the copyright panel and enter your copyright statement. For more information about the settings, see SSL VPN Customization Dialog Box—Copyright Panel , on page 1549.
- **Full Customization**—If you do not want to use the security appliance's built-in logon page, even customized, you can instead enable full customization and supply your own web page. For information on creating the required file, see Creating Your Own SSL VPN Logon Page for ASA Devices , on page 1410. For more information about the settings, see SSL VPN Customization Dialog Box—Full Customization , on page 1549.

Step 7 Configure the settings for the Portal page. This is the home page for the SSL VPN portal, and is displayed after the users log in. Select the following items in the Portal Page folder in the table of contents on the left of the dialog box to view and change the settings:

- **Portal Page**—Specify the title of the web page, which is displayed in the browser's title bar.
- **Title Panel**—Determine whether the Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic. For more information about the settings, see SSL VPN Customization Dialog Box—Title Panel , on page 1543.
- **Toolbar**—Determine whether the Portal page will have a toolbar, which contains a field for entering a URL to browse. For more information about the settings, see SSL VPN Customization Dialog Box—Toolbar , on page 1550.
- **Applications**—Determine which application buttons will appear on the page. For more information about the settings, see SSL VPN Customization Dialog Box—Applications , on page 1551.
- **Custom Panes**—Determine how you want to organize the body of the Portal page. The default is a single column with no internal panes. You can create a multiple-column layout, create internal panes that display text or references to URLs, and determine in which column and row to place the panes. For more information about the settings, see SSL VPN Customization Dialog Box—Custom Panes , on page 1551.
- **Home Page**—Determine how and whether to display URL lists on the home page, and whether to use your own web page for the main body of the Portal page. For more information about the settings, see SSL VPN Customization Dialog Box—Home Page , on page 1553.

Step 8 Select **Logout Page** to configure the settings of the page displayed when a user logs out of the SSL VPN. You can configure the title, message text, fonts, and colors. For more information about the settings, see SSL VPN Customization Dialog Box—Logout Page , on page 1554.

Step 9 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 10 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 11 Click **OK** to save the object.

Localizing SSL VPN Web Pages for ASA Devices

Localization is the process of providing text in a language that is appropriate for the target users. When you create an SSL VPN Customization object for defining the look of browser-based clientless SSL VPN web pages hosted on an ASA device, you can configure the pages to use the desired language.

To see localized web pages correctly, users must configure their browsers to use UTF-8 encoding (for example, in Internet Explorer, select **View > Encoding > Unicode (UTF-8)**. They also must install the required fonts or language support files for their language using the Regional and Language Options control panel. On the Languages tab, click Details to install the desired languages, and select the appropriate supplemental language settings for East Asian, complex scripting, and right-left languages. On the Advanced tab, select the desired code page conversion tables. If users do not configure the browser correctly, they might see boxes instead of characters.

There are two techniques you can use to localize SSL VPN web pages that are hosted on an ASA device. These techniques are not mutually exclusive; you can use both of them. These are the techniques:

- **Configure the SSL VPN Customization object using the desired language**—When you create the SSL VPN Customization object, you can enter text for labels and messages in non-English, non-ASCII languages in UTF-8 encoding. To enter non-ASCII languages in UTF-8 encoding, you must configure Windows with the correct locale setting and have the required fonts installed. Use the Regional and Language Options control panel to configure your system and install files required for complex script or East Asian languages. If you want to type in text directly, you also need to install an appropriate keyboard; otherwise, you can use a text editor that supports the language's characters and copy and paste text from a document that contains the text you want to use.

You can also enter non-ASCII languages into SSL VPN Bookmarks objects.

- **Configure translation tables on the ASA device to support the languages you want to make available**—To enable the security appliance to provide language translation for the portal and screens displayed to users, you must define the necessary languages in a translation table and import the table into the security appliance. The software image package for the security appliance includes a translation table template. Every language you list in an SSL VPN Customization object must have a corresponding translation table on the device. Conversely, translation tables for languages that are not listed in the SSL VPN Customization object are ignored.

If you use this technique, you must use the ASA CLI or ASDM to configure and upload the translation tables. You cannot manage the translation tables with Security Manager. However, the SSL VPN Customization object includes settings that allow you to configure automatic browser language selection and to enable users to select their desired language. Thus, if you install translation tables for ten languages, the pages defined in

the SSL VPN Customization object will be available to users in all of those languages. For more information on these settings, see SSL VPN Customization Dialog Box—Language , on page 1544.

Although both of the following features require translation tables, they are separate and complementary:

- • **Automatic Browser Language Selection**—Automatic browser language selection attempts to select the appropriate language based on the user's browser settings. This technique does not ask for user input. In the SSL VPN Customization object, you create a list of languages that will be used in the negotiation with the browser. During a connection, the security appliance receives a list of languages (and their priorities) from the browser, and looks through your list of languages top to bottom until a match is found. If there is no match, then the language you defined in the list as the default language is used. If you do not specify a default language, English is used.

The languages on the security appliance are labels for the translation tables. The languages must mirror those of the browser, and can consist of groups of up to 8 alphanumeric characters (starting from alpha characters), separated by hyphens. For example, fr-FR-paris-univ8. However, when you add a language to the list in Security Manager, only the first two characters are available.

When looking for a match, the security appliance starts with the longest language name, and if it does not match, it discards the rightmost group of the name. For example, if the preferred language on the browser is fr-FR-paris-univ8, and the security appliance supports fr-FR-paris-univ8, fr-FR-paris, fr-FR, and fr, it matches fr-FR-paris-univ8 and uses the translated strings from that translation table. If fr is the only language on the security appliance, the security appliance considers it a match also, and uses that translation table.

For more information about setting up translation tables, see the user documentation for the ASA device and operating system or the ASDM online help.

- • **Language Selector**—By enabling the language selector, you provide the user with the ability to actively select the desired language from a list of languages that you support. This technique does not rely on the browser language settings being configured correctly. The language selector is displayed on the logon page.

Creating Your Own SSL VPN Logon Page for ASA Devices

You can create your own custom SSL VPN Logon page rather than use the page provided by the security appliance for browser-based clientless SSL VPNs. This is called full customization, and replaces the settings you can configure in the SSL VPN Customization policy object.

To provide your own Logon page, you must create the page, copy it to the Security Manager server, and identify the page on the Full Customization page of the SSL VPN Customization object dialog box. For information on creating SSL VPN Customization objects, see Configuring ASA Portal Appearance Using SSL VPN Customization Objects , on page 1406.

When you enable full customization, all other settings for the Logon page configured in the policy object are ignored. When you deploy your configuration to the ASA device, Security Manager copies your custom page to the device.

The Logon page you create must include all of the HTML code required to present the page correctly, and include special Cisco HTML code that provides the functions for the login form and the Language Selector drop-down list. Keep the following in mind when you create the HTML file:

- The file extension must be **.inc**.
- All images in the custom Logon page must be present on the security appliance. Replace the file path with the keyword **/+CSCOU+/**, which is an internal directory on the ASA device. When you upload an image to the device, it is saved in this directory.
- Use the **csco_ShowLoginForm('lform')** Javascript function to add the login form to the page. This form prompts for the username, passwords, and group information. You must include this function somewhere on the page.
- Use the **csco_ShowLanguageSelector('selector')** Javascript function to add the Language Selector drop-down list to the page. You do not have to use this function if you are not supporting the use of more than one language.

Configuring SSL VPN Bookmark Lists for ASA and IOS Devices

When you configure a browser-based clientless SSL VPN, you can define a list of bookmarks, or URLS, to include on the SSL VPN portal page. Use SSL VPN bookmarks policy objects to define bookmark lists.

You can create SSL VPN bookmark objects for SSL VPNs hosted on IOS devices or ASA devices. However, these device types allow different bookmark configurations, the ASA device allowing more configuration options than IOS devices. Besides allowing more configuration options, you can also create bookmarks for ASA devices in non-English, non-ASCII languages. For more information on localizing the bookmarks and portal for ASA devices, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409.

After you create the SSL VPN bookmark object as described in this procedure, you can use the object to specify the bookmark object in the **Portal Web Pages** or **Bookmarks** fields in these policies:

- ASA devices—On the **SSL VPN > Clientless** page in an ASA group policy object (see ASA Group Policies SSL VPN Clientless Settings , on page 1500), which you then select in one of these policies:
  - **Remote Access VPN > Group Policies**
  - **Remote Access VPN > Connection Profiles** on the **General** tab
- ASA devices—In the **Remote Access VPN > Dynamic Access** policy, you can specify the SSL VPN bookmark object on the **Main > Bookmarks** tab (see Main Tab , on page 1433).

- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see User Group Dialog Box—Clientless Settings , on page 1575), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

Related Topics

- Creating Group Policies (ASA, PIX 7.0+) , on page 1354
- Configuring Dynamic Access Policies , on page 1420
- Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331
- Configuring an SSL VPN Policy (IOS) , on page 1482
- Creating Policy Objects , on page 237
- Policy Object Manager , on page 232

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Tip You can also create SSL VPN bookmark objects when you define policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Step 2 Select **SSL VPN Bookmarks** from the Object Type selector. The SSL VPN Bookmarks page opens, displaying a list of the existing SSL VPN bookmark objects.

Step 3 Right-click in the work area, then select **New Object**.

The Add SSL VPN Bookmark dialog box appears (see Add or Edit Bookmarks Dialog Boxes , on page 1533).

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 If you are creating the object for an SSL VPN hosted on an IOS device, you can enter a name for the heading that is displayed above the bookmarks list in the **Bookmarks Heading (IOS)** field.

Step 6 The Bookmarks table displays any URLs that are defined for the object. To add a bookmark, click the **Add Row** button below the table; to edit an existing bookmark, select it and click the **Edit Row** button.

The Add/Edit SSL VPN Bookmark Entry dialog box opens. For more information about the fields on this dialog box, see Add or Edit Bookmark Entry Dialog Boxes , on page 1534.

- In the **Bookmark Option** field, select whether you are defining a bookmark (**Enter Bookmark**) or adding bookmarks from another SSL VPN bookmark object (**Include Existing Bookmarks**). If you are including an existing object, enter the object's name or click **Select** to select it from a list of existing objects.
- If you are creating the object for use on an IOS device, enter the title of the bookmark, which is displayed to users, and the URL. Be careful to select the correct protocol for the URL. Click **OK** to add the bookmark to the table of bookmarks.
- If you are creating the object for use on an ASA device, you have many more options. Besides the title and the URL, you can define a subtitle and image icon for the bookmark plus other options.

Tip If you choose the protocols RDP, SSH, Telnet, VNC, or ICA, you must configure the plug-in for the protocol in the **Remote Access VPN > SSL VPN > Other Settings** policy (see Configuring SSL VPN Browser Plug-ins (ASA) , on page 1387).

You can also configure the bookmark to use the Post method rather than the Get method. If you use Post, you must configure the post parameters by clicking **Add Row** beneath the Post Parameters table. For more information on Post parameters, see these topics:

- Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks , on page 1413
- Add and Edit Post Parameter Dialog Boxes , on page 1537

Click **OK** to add the bookmark to the table of bookmarks.

Step 7 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 8 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 9 Click **OK** to save the object.

Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks

One of the options you have for configuring bookmarks on an SSL VPN hosted on an ASA device is the method used by a URL, either Get or Post. The Get method is the standard method; a user clicks the URL and is taken to the web page. The Post method is useful when processing the data might involve changes to it, for example, storing or updating data, ordering a product, or sending e-mail.

If you choose the Post URL method, you must configure Post parameters for bookmark entries. Because these are often personalized resources that contain the user ID and password or other input parameters, you might need to define clientless SSL VPN macro substitutions.

Clientless SSL VPN macro substitutions let you configure users for access to personalized resources that contain the user ID and password or other input parameters. Examples of such resources include bookmark entries, URL lists, and file shares.

Note For security reasons, password substitutions are disabled for file access URLs (cifs://). Also for security reasons, use caution when introducing password substitutions for web links, especially for non-SSL instances.

You can use the following macro substitutions:

- **Logon Information Substitutions**— The security appliance obtains values for these substitutions from the SSL VPN Logon page. It recognizes these strings in user requests, and replaces them with the value specific to the user before it passes the request on to a remote server.

These are the available macro substitutions:

- CSCO_WEBVPN_USERNAME

The username used to log into the SSL VPN.

- CSCO_WEBVPN_PASSWORD

The password used to log into the SSL VPN.

- CSCO_WEBVPN_INTERNAL_PASSWORD

The internal resource password entered when logging into the SSL VPN.

- CSCO_WEBVPN_CONNECTION_PROFILE

The connection profile associated with the user group selected when logging into the SSL VPN.

For example, if a URL list contains the link http://someserver/homepage/CSCO_WEBVPN_USERNAME.html, the security appliance translates it to the following unique links:

- For USER1 the link becomes http://someserver/homepage/USER1.html
- For USER2 the link is http://someserver/homepage/USER2.html

In the following example, cifs://server/users/CSCO_WEBVPN_USERNAME lets the security appliance map a file drive to specific users:

- For USER1 the link becomes cifs://server/users/USER1
- For USER2 the link is cifs://server/users/USER2

- **RADIUS/LDAP Vendor-Specific Attributes (VSAs)**—These substitutions let you set substitutions configured on either a RADIUS or an LDAP server. These are the available macro substitutions:
  - CSCO_WEBVPN_MACRO1
  - CSCO_WEBVPN_MACRO2

For information on configuring bookmarks, see Configuring SSL VPN Bookmark Lists for ASA and IOS Devices , on page 1411.

Configuring SSL VPN Smart Tunnels for ASA Devices

A smart tunnel is a connection between an application running on a user's workstation and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway and proxy server. Smart tunnels do not require the user to connect the application to the local port, so the application can gain access to the network without giving the user administrative privileges, as is required for full tunnel support. If you do not otherwise configure the network to allow access to an application, you can create a smart tunnel for those applications that you want to support.

You can configure smart tunnel access to an application under the following conditions:

- The application is a Winsock 2, TCP-based application and there is a browser plug-in for the application. Cisco distributes plug-ins for some applications for use in clientless SSL VPN, including SSH (for both SSH and Telnet sessions), RDP, and VNC. You must supply or obtain plug-ins for any other applications. Configure plug-ins in the **Remote Access VPN > SSL VPN > Other Settings** policy on the Plug-Ins tab.
- The user's workstation is a supported platform. See the Cisco ASA 5500 Series Adaptive Security Appliances documentation that corresponds with your ASA version for supported platforms, http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html .

Users of Microsoft Windows Vista who use smart tunnels (or port forwarding) must add the URL of the ASA device to the Trusted Site zone. Configure the Trusted Site zone in Internet Explorer (**Tools > Internet Options**, **Security** tab).

- The user's browser must be enabled with Java, Microsoft ActiveX, or both.
- If the user's workstation requires a proxy server to reach the security appliance, the URL of the terminating end of the connection must be in the list of URLs excluded from proxy services. In this configuration, smart tunnels support only basic authentication.

Tip A stateful failover does not retain smart tunnel connections. Users must reconnect following a failover.

You configure smart tunnel access for an application by creating an SSL VPN smart tunnel list policy object and including that object in an ASA group policy object. You then assign the ASA group policy object to a device in the **Remote Access VPN > Group Policies** policy.

Related Topics

- Understanding Group Policies (ASA) , on page 1353
- Creating Policy Objects , on page 237
- Policy Object Manager , on page 232

Step 1 Create an SSL VPN smart tunnel list policy object:

a) Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232), and select **SSL VPN Smart Tunnel Lists** from the table of contents.

Tip You can also create SSL VPN smart tunnel list objects when you create or edit the ASA group policy object. For more information, see Selecting Objects for Policies , on page 230.

b) Click the **Add Object** button to open the Add and Edit Smart Tunnel List Dialog Boxes , on page 1557.

c) Enter a name for the object, up to 64 characters.

d) To the table of applications, add those applications for which you are granting smart tunnel access (click the **Add Row** button to open the Add and Edit A Smart Tunnel Entry Dialog Boxes , on page 1558). Consider the following:

- Enter an application name that is easy to understand and include version numbers if you support more than one version. For example, Microsoft Outlook.
- For the application path, entering only the filename, for example, outlook.exe, is the simplest and most maintainable option. This allows the user to install the application in any folder. Enter the full path if you want to enforce a specific installation structure.
- Hash values are optional, but you can use them to prevent spoofing. Without hash values, a user can rename an application to a supported filename; the security appliance checks only the filename and path (if specified). However, if you enter hash values, you must maintain them as users apply patches or application upgrades. For specific information on determining hash values, see Add and Edit A Smart Tunnel Entry Dialog Boxes , on page 1558.

Click **OK** to save the entry.

e) You can also incorporate other SSL VPN smart list objects into the object. This allows you to create a core set of smart list objects that you can use repeatedly in other objects.
f) Click **OK** to save the object.

Step 2 (Optional) Create an SSL VPN smart tunnel auto sign-on list policy object:

a) Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232), and select **SSL VPN Smart Tunnel Auto Signon Lists** from the table of contents.

Tip You can also create SSL VPN smart tunnel auto sign-on list objects when you create or edit the ASA group policy object. For more information, see Selecting Objects for Policies , on page 230.

b) Click the **Add Object** button to open the Add and Edit Smart Tunnel Auto Signon List Dialog Boxes , on page 1562.
c) Enter a name for the object, up to 64 characters.
d) To the table of smart tunnel auto sign-on entries, add the servers for which to automate the submission of login credentials during smart tunnel setup (click the **Add Row** button to open the Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes , on page 1563).
e) You can also incorporate other SSL VPN smart tunnel auto sign-on list objects into the object. This allows you to create a core set of smart tunnel auto sign-on list objects that you can use repeatedly in other objects.
f) Click **OK** to save the object.

Step 3 Configure the ASA group policy object to use the SSL VPN smart tunnel list object:

a) Edit (or create) the ASA group policy object either from the Policy Object Manager , on page 232 or the **Remote Access VPN > Group Policies** policy. The object must be configured to support SSL VPNs. (You can also edit these objects from the **Remote Access VPN > Connection Profiles** policy from an individual profile.)
b) Select the **SSL VPN > Clientless** folder from the table of contents to open ASA Group Policies SSL VPN Clientless Settings , on page 1500.
c) Enter the name of the SSL VPN smart tunnel list object in the **Smart Tunnel** field.
d) Select **Auto Start Smart Tunnel** to automatically start smart tunnels for the applications when the user connects to the SSL VPN portal.

If you do not select this option, users must start smart tunnel access using the **Application Access > Start Smart Tunnels** button on the clientless SSL VPN portal page.

e) Enter the name of the SSL VPN smart tunnel auto sign-on list object in the **Smart Tunnel Auto Signon Server List** field.
f) If the universal naming convention (domain\username) is required for authentication, specify the Windows domain to add it to the username during auto sign-on in the **Domain Name** field. For example, enter CISCO to specify CISCO\qa_team when authenticating for the username qa_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.

Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Clientless SSL VPN uses WINS and the Common Internet File System (CIFS) protocol to access or share files, printers, and other machine resources on remote systems. The ASA or IOS device uses a proxy CIFS client to provide this access transparently; users appear to have direct access to the file systems (subject to individual file and user permissions).

When users attempt a file-sharing connection to a Windows computer by using its computer name, the file server they specify corresponds to a specific WINS name that identifies a resource on the network. The security appliance queries WINS or NetBIOS name servers to map WINS names to IP addresses. SSL VPN requires NetBIOS to access or share files on remote systems.

You use WINS server list policy objects to configure the list of WINS servers that are used to resolve these Microsoft file-directory share names. The WINS server list objects define the NetBIOS Name Service (NBNS) server list on the device (using the **nbns-list** and **nbns-server** commands) for Common Internet File System (CIFS) name resolution.

After creating the WINS server list policy object, you can configure it in the following policies and policy objects, and also select the file access services that you want to allow:

- ASA devices—In the **Remote Access VPN > Connection Profiles** policy, specify the WINS server list object on the **SSL** tab (see SSL Tab (Connection Profiles) , on page 1348).

Select the file access options on the **SSL VPN > Clientless** page in an ASA group policy object (see ASA Group Policies SSL VPN Clientless Settings , on page 1500), which you then select in one of these policies:

- **Remote Access VPN > Group Policies**
- **Remote Access VPN > Connection Profiles** on the **General** tab
- IOS devices—On the **Clientless** page in a user group policy object configured for SSL VPN (see User Group Dialog Box—Clientless Settings , on page 1575), which you then select in the **Remote Access VPN > SSL VPN** policy on the **General** tab.

Related Topics

- Creating Policy Objects , on page 237

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232.

Tip You can also create WINS server list objects when defining policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Step 2 Select **WINS Server Lists** from the Object Type selector.

The WINS Server List page opens, displaying the currently defined WINS server list objects.

Step 3 Right-click in the work area and select **New Object** to open the Add or Edit WINS Server List Dialog Box , on page 1582.

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Click the **Add Row** button below the table, or select a server in the table and click **Edit Row**, to configure the WINS servers defined in the object. Configure these settings:

- **Server**—The IP address of the WINS server. You can select a network/host object or enter the address directly.
- **Set as Primary Browser**—Select this option if the server is a primary browser, which maintains the list of computers and shared resources.

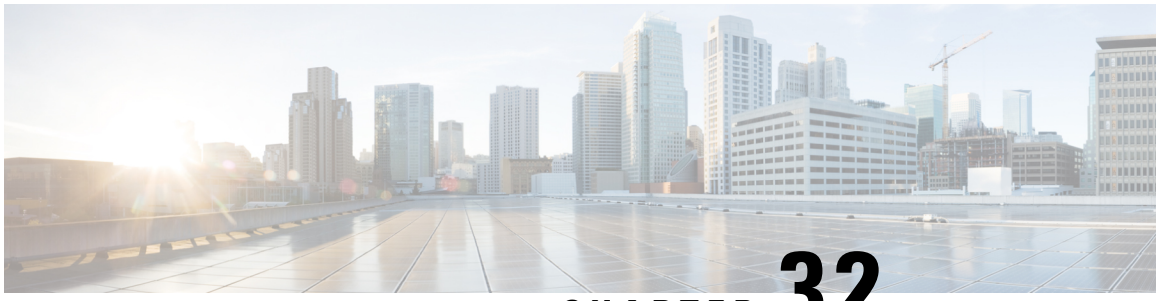
Other fields are optional; change them if you want non-default values. For more information, see Add or Edit WINS Server Dialog Box , on page 1583.

Click **OK** to save your changes.

Step 6 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 7 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 8 Click **OK** to save the object.



CHAPTER 32

Managing Dynamic Access Policies for Remote Access VPNs (ASA 8.0+ Devices)

This chapter explains Dynamic Access Policies (DAP) for assigning remote access users to connection profiles (tunnel groups). You can configure these policies for remote access IKEv1 IPsec on ASA 8.0+ devices, IKEv2 IPsec on ASA 8.4(x) devices, and SSL VPNs on ASA 8.0+ (except 8.5) devices.

For information on configuring other remote access policies for ASA and PIX 7.0+ devices, see Managing Remote Access VPNs on ASA and PIX 7.0+ Devices, on page 1325.

This chapter contains the following topics:

Understanding Dynamic Access Policies

Multiple variables can affect each VPN connection, for example, intranet configurations that frequently change, the various roles each user may inhabit within an organization, and logins from remote access sites with different configurations and levels of security. The task of authorizing users is much more complicated in a VPN environment than it is in a network with a static configuration.

Dynamic access policies (DAP) on a security appliance let you configure authorization that addresses these many variables. You create a dynamic access policy by setting a collection of access control attributes that you associate with a specific user tunnel or session. These attributes address issues of multiple group membership and endpoint security. That is, the security appliance grants access to a particular user for a particular session based on the policies you define. It generates a DAP at the time the user connects by selecting and/or aggregating attributes from one or more DAP records. It selects these DAP records based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the DAP record to the user tunnel or session. The DAP system includes the following components that require your attention:

- DAP Selection Configuration File—A text file containing criteria that the security appliance uses for selecting and applying DAP records during session establishment. It is stored on the security appliance. You can use Security Manager to modify it and upload it to the security appliance in XML data format. DAP selection configuration files include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding, and URL lists.

- DfltAccess Policy—Always the last entry in the DAP summary table, always with a priority of 0. You can configure Access Policy attributes for the default access policy, but it does not contain—and you cannot configure—AAA or endpoint attributes. You cannot delete the DfltAccessPolicy, and it must be the last entry in the summary table.

Tip Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

Integration of Cisco Secure Desktop with DAP

The security appliance integrates the Cisco Secure Desktop (CSD) features into dynamic access policies (DAPs). Depending on the configuration, the security appliance uses one or more endpoint attribute values in combination with optional, AAA attribute values as conditions for assigning a DAP. The Cisco Secure Desktop features supported by the endpoint attributes of DAPs include OS detection, prelogin policies, Basic Host Scan results, and Endpoint Assessment.

As an administrator, you can specify a single attribute or combine attributes that together form the conditions required to assign a DAP to a session. The DAP provides network access at the level that is appropriate for the endpoint AAA attribute value. The security appliance applies a DAP when all of its configured endpoint criteria are satisfied.

Note From version 4.22, Cisco Security Manager supports Host Scan version 4.6 and above. For more information, see Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427.

Related Topics

Configuring Dynamic Access Policies

This procedure describes how to create or edit a dynamic access policy.

Related Topics

- Understanding Dynamic Access Policies , on page 1419
- Understanding DAP Attributes , on page 1422
- Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.

- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see Dynamic Access Page (ASA) , on page 1430.

Step 2 Click **Create** or select a policy in the table and click **Edit**.

The Add/Edit Dynamic Access Policy dialog box opens, with the Main tab open by default. For a description of the elements in this dialog box, see Add/Edit Dynamic Access Policy Dialog Box , on page 1432.

Step 3 Enter the name of the DAP record (up to 128 characters).

Step 4 Specify a priority for the DAP record. The security appliance applies access policies in the order you set here, highest number having the highest priority.

Step 5 Enter a description for the DAP record.

Step 6 In the **Main** tab, configure the DAP attributes and the type of remote access method supported by the DAP system on your security appliance. For a detailed description of the elements on this tab, see Main Tab , on page 1433.

a) Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see Add/Edit DAP Entry Dialog Box , on page 1439.

For a full description of the procedure to define the DAP attributes, see Configuring DAP Attributes , on page 1426.

b) Select the type of remote access permitted by the DAP system.

c) Select the **Network ACL** tab to select and configure network ACLs to apply to this DAP record. Beginning with Security Manager version 4.10, you can select Unified ACL entries in addition to Extended entries.

This tab is available only if you selected an access method other than Web Portal.

d) Select the **WebType ACL** tab to select and configure Web-type ACLs to apply to this DAP record.

This tab is available only if you selected an access method other than Secure Client.

e) Select the **Functions** tab to configure file server entry and browsing, HTTP proxy, and URL entry for the DAP record.

This tab is available only if you selected an access method other than Secure Client.

f) Select the **Port Forwarding** tab to select and configure port forwarding lists for user sessions.

This tab is available only if you selected an access method other than Secure Client.

From Cisco Security Manager 4.24 onwards, **Port Forwarding** policy object is deprecated for ASA 9.17(1) and higher version devices.

Note When you upgrade your ASA device to 9.17(1) and higher versions, you must remove the Port Configuration CLI to avoid deployment failure.

g) Select the **Bookmark** tab to select and configure URL lists for user sessions.

This tab is available only if you selected an access method other than Secure Client.

h) Select the **Action** tab to configure the type of remote access permitted.

This tab is available for all types of access methods.

i) Select the **Secure Client** tab to choose if the setting for Always-On VPN on the Secure Client service profile remains unchanged, is disabled, or the Secure Client Profile Setting must be used. Always-On VPN enables Secure Client to automatically establish a VPN session after you log onto the system.

j) Select the **Custom Attributes** tab to add Secure Client Custom Attributes.

This tab is available only if you selected the access method as Unchanged, Secure Client, Both Default Web Portal, or Both Default Secure Client. For information about how to add Secure Client Custom Attributes, see Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399.

Step 7 Select the **Logical Operations** tab to create multiple instances of each type of endpoint attribute. For a description of the elements on this tab, see Logical Operations Tab , on page 1463.

Step 8 Select the **Advanced Expressions** tab to set additional attributes for the DAP using free-form LUA. For a description of the elements on this tab, see Advanced Expressions Tab , on page 1465.

Step 9 Click **OK**.

Understanding DAP Attributes

DAP records include all of the attributes that you configure. These can include AAA attributes, endpoint attributes, and access policies as configured in network and web-type ACL filter, port forwarding and URL lists.

DAP and AAA Attributes

DAP complements AAA services. It provides a limited set of authorization attributes that can override those AAA provides. The security appliance selects DAP records based on the AAA authorization information for the user and posture assessment information for the session. The security appliance can select multiple DAP records depending on this information, which it then aggregates to create DAP authorization attributes.

You can specify AAA attributes from the Cisco AAA attribute hierarchy, or from the full set of response attributes that the security appliance receives from a RADIUS or LDAP server.

AAA Attribute Definitions

The below table defines the AAA selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box.

Table 400: AAA Attribute Definitions

Attribute Type	Attribute Name	Source	Value	Max String Length	Description
Cisco	aaa.cisco.memberof	AAA	string	128	memberof value
	aaa.cisco.username	AAA	string	64	username value
	aaa.cisco.class	AAA	string	64	class attribute value
	aaa.cisco.ipaddress	AAA	number	–	framed-ip address value
	aaa.cisco.tunnelgroup	AAA	string	64	tunnel-group name
LDAP	aaa.ldap.<label>	LDAP	string	128	LDAP attribute value pair
RADIUS	aaa.radius.<number>	RADIUS	string	128	Radius attribute value pair

DAP and Endpoint Security

The security appliance obtains endpoint security attributes by using posture assessment methods that you configure. These include Cisco Secure Desktop and NAC. You can use a match of a prelogin policy, Basic Host Scan entry, Host Scan Extension, or any combination of these and any other policy attributes to assign access rights and restrictions. At minimum, configure DAPs to assign to each prelogin policy and Basic Host Scan entry.

Endpoint Assessment, a Host Scan extension, examines the remote computer for a large collection of antivirus and antispyware applications, associated definitions updates, and firewalls. You can use this feature to combine endpoint criteria to satisfy your requirements before the security appliance assigns a specific DAP to the session.

DAP and Anti-Virus, Anti-Spyware, and Personal Firewall Programs

The security appliance uses a DAP policy when the user attributes matches the configured AAA and endpoint attributes. The Prelogin Assessment and Host Scan modules of Cisco Secure Desktop return information to the security appliance about the configured endpoint attributes, and the DAP subsystem uses that information to select a DAP record that matches the values of those attributes. Most, but not all, anti-virus, anti-spyware, and personal firewall programs support active scan, which means that the programs are memory-resident, and therefore always running. Host Scan checks to see if an endpoint has a program installed, and if it is memory-resident as follows:

- If the installed program does not support active scan, Host Scan reports the presence of the software. The DAP system selects DAP records that specify the program.
- If the installed program does support active scan, and active scan is enabled for the program, Host Scan reports the presence of the software. Again the security appliance selects DAP records that specify the program.
- If the installed program does support active scan and active scan is disabled for the program, Host Scan ignores the presence of the software. The security appliance does not select DAP records that specify the program. Further, the output of the **debug trace** command, which includes a lot of information about DAP, does not indicate the program presence, even though it is installed.

Endpoint Attribute Definitions

The below table defines the endpoint selection attribute names that are available for DAP use. The Attribute Name field shows you how to enter each attribute name in a LUA logical expression, which you might do on the Advanced tab of the Add/Edit Dynamic Access Policy dialog box. The *label* variable identifies the application, filename, process, or registry entry.

Table 401: Endpoint Attribute Definitions

Attribute Type	Attribute Name	Source	Value	Max String Length	Description
Antispyware (Requires Cisco Secure Desktop)	endpoint.as.label.exists	Host Scan	true	–	Antispyware program exists
	endpoint.as.label.version		string	32	Antispyware description
	endpoint.as.label.description		string	128	class attribute value
	endpoint.as.label.lastupdate		integer	–	Seconds since update of antispyware definitions
Antivirus (Requires Cisco Secure Desktop)	endpoint.av.label.exists	Host Scan	true	–	Antivirus program exists
	endpoint.av.label.version		string	32	Antivirus description
	endpoint.av.label.description		string	128	class attribute value
	endpoint.av.label.lastupdate		integer	–	Seconds since update of antivirus definitions
Application	endpoint.application.clienttype	Application	string	–	Client type: CLIENTLESS SECURE CLIENT IPSEC L2TP
File	endpoint.file.label.exists	Secure Desktop	true	–	The files exists
	endpoint.file.label.lastmodified		integer	–	Seconds since file was last modified
	endpoint.file.label.crc.32		integer	–	CRC32 hash of the file
NAC	endpoint.nac.status	NAC	string	-	User defined status string
Operating System	endpoint.os.version	Secure Desktop	string	32	Service pack for Windows
	endpoint.os.servicepack		integer	–	Operating system
Personal firewall (Requires Secure Desktop)	endpoint.fw.label.exists	Host Scan	true	–	The personal firewall exists
	endpoint.fw.label.version		string	32	Version
	endpoint.fw.label.description		string	128	Personal firewall description
Policy	endpoint.policy.location	Secure Desktop	string	64	Location value from Cisco Secure Desktop

Attribute Type	Attribute Name	Source	Value	Max String Length	Description
Process	endpoint.process.label.exists	Secure Desktop	true	–	The process exists
	endpoint.process.label.path		string	255	Full path of the process
Registry	endpoint.registry.label.type	Secure Desktop	dword string	–	dword
	endpoint.registry.label.value		string	255	Value of the registry entry
VLAN	endpoint.vlan.type	CNA	sting	–	VLAN type: ACCESS AUTH ERROR GUEST QUARANTINE ERROR STATIC TIMEOUT

About Advanced Expressions for AAA or Endpoint Attributes

In the text box you enter free-form LUA text that represents AAA and/or endpoint selection logical operations. ASDM does not validate text that you enter here; it just copies this text to the DAP policy file, and the security appliance processes it, discarding any expressions it cannot parse.

This option is useful for adding selection criteria other than what is possible in the AAA and endpoint attribute areas above. For example, while you can configure the security appliance to use AAA attributes that satisfy any, all, or none of the specified criteria, endpoint attributes are cumulative, and must all be satisfied. To let the security appliance employ one endpoint attribute or another, you need to create appropriate logical expressions in LUA and enter them here.

Examples of DAP Logical Expressions

Study these examples for help in creating logical expressions in LUA.

- This AAA LUA expression tests for a match on usernames that begin with "b". It uses the string library and a regular expression:

```
not(string.find(aaa.cisco.username, "^b") == nil)
```

- This endpoint expression tests for a match on CLIENTLESS OR CVC client types:

```
endpoint.application.clienttype=="CLIENTLESS" or endpoint.application.clienttype=="CVC"
```

- This endpoint expression tests for Norton Antivirus versions 10.x but excludes 10.5.x:

```
(endpoint.av.NortonAV.version > "10" and endpoint.av.NortonAV.version < "10.5") or
endpoint.av.NortonAV.version > "10.6"
```

DAP Connection Sequence

The following sequence outlines a typical remote access connection establishment.

1. A remote client attempts a VPN connection.

2. The security appliance performs posture assessment, using configured NAC and Cisco Secure Desktop Host Scan values.
3. The security appliance authenticates the user via AAA. The AAA server also returns authorization attributes for the user.
4. The security appliance applies AAA authorization attributes to the session, and establishes the VPN tunnel.
5. The security appliance selects DAP records based on the user AAA authorization information and the session posture assessment information.
6. The security appliance aggregates DAP attributes from the selected DAP records, and they become the DAP policy.
7. The security appliance applies the DAP policy to the session.

Configuring DAP Attributes

The attributes you must define for a DAP policy include specifying the authorization attributes and endpoint attributes. You can also configure network and webtype ACLs, file browsing, file server entry, HTTP proxy, URL entry, port forwarding lists and URL lists.

This procedure describes how to create or edit the AAA and endpoint attributes required for a DAP policy.

Related Topics

- Understanding DAP Attributes , on page 1422
- Configuring Dynamic Access Policies , on page 1420
- Understanding Dynamic Access Policies , on page 1419

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see Dynamic Access Page (ASA) , on page 1430.

Step 2 Click **Create** on the Dynamic Access policy page, or select the row of a policy in the table on the page, and click **Edit**.

The Add/Edit Dynamic Access Policy dialog box opens, displaying the Main tab. For a description of the elements on the Main tab, see Main Tab , on page 1433.

Step 3 Click **Create** below the table, or select a DAP entry in the table and click **Edit**. The Add/Edit DAP Entry dialog box opens. For a description of the elements on this dialog box, see Add/Edit DAP Entry Dialog Box , on page 1439.

Step 4 Select the attribute type from the Criterion list, then enter the appropriate values. The dialog box values vary based on your selection. Options are:

- AAA Attributes Cisco; see Table 405: Add/Edit DAP Entry Dialog Box AAA Attributes Cisco , on page 1442.
- AAA Attributes LDAP; see Table 406: Add/Edit DAP Entry Dialog Box AAA Attributes LDAP , on page 1444.
- AAA Attributes RADIUS; see Table 407: Add/Edit DAP Entry Dialog Box AAA Attributes RADIUS , on page 1445.
- Anti-Spyware; see Table 408: Add/Edit DAP Entry Dialog Box Anti-Spyware , on page 1446.
- Anti-Virus; see Table 409: Add/Edit DAP Entry Dialog Box Anti-Virus , on page 1447.
- Secure Client Identity; see Table 410: Add/Edit DAP Entry Dialog Box Secure Client Identity , on page 1449.
- Application; see Table 411: Add/Edit DAP Entry Dialog Box Application , on page 1450.
- Device; see Table 412: Add/Edit DAP Entry Dialog Box Device , on page 1450.
- File; see Table 413: Add/Edit DAP Entry Dialog Box File , on page 1452.
- NAC; see Table 414: Add/Edit DAP Entry Dialog Box NAC , on page 1453.
- Operating System; see Table 415: Add/Edit DAP Entry Dialog Box Operating System , on page 1454.
- Personal Firewall; see Table 416: Add/Edit DAP Entry Dialog Box Personal Firewall , on page 1455.
- Policy; see Table 417: Add/Edit DAP Entry Dialog Box Policy , on page 1456.
- Process; see Table 418: Add/Edit DAP Entry Dialog Box Process , on page 1457.
- Registry; see Table 419: Add/Edit DAP Entry Dialog Box Registry , on page 1458.
- Multiple Certificate Authentication; see Table 421: Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication , on page 1461.

Step 5 Click **OK**.

Configuring Cisco Secure Desktop Policies on ASA Devices

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session. All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly. This ensures that cookies, browser history, temporary files, and downloaded content do not remain on a system.

When the session closes, CSD overwrites and removes all data using a U.S. Department of Defense (DoD) sanitation algorithm to provide endpoint security protection.

Note A complete explanation of the capabilities and configuration of the Cisco Secure Desktop program is beyond the scope of this document. For information about configuring CSD, and what CSD can do for you, see the materials available online athttp://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html. Select the configuration guide for the CSD version you are configuring.

This procedure describes how to configure the Cisco Secure Desktop feature on an ASA device.

Before You Begin

- Make sure a connection profile policy has been configured on the device. See Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.

Related Topics

- Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331

Step 1 Do one of the following:

- (Device view) With an ASA device selected, select **Remote Access VPN > Dynamic Access** from the Policy selector.
- (Policy view) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

The Dynamic Access page opens. For a description of the elements on this page, see Dynamic Access Page (ASA) , on page 1430.

Step 2 In the Cisco Secure Desktop section, select **Enable CSD** to enable CSD on the ASA device.

Note The Enable CSD option is available for devices running ASA version less than ASA 9.5(2). Beginning with Security Manager 4.10, a new check box is available to configure Hostscan (to disable CSD) only for devices running the ASA version 9.5(2) or later.

Step 3 In the **CSD Package** field, specify the name of the File Object that identifies the Cisco Secure Desktop package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see Add and Edit File Object Dialog Boxes , on page 1526.

Note The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the **Version** field indicates the CSD package version you should select. (The version is included in the package file name. For example, securedesktop-asa_k9-3.3.0.118.pkg is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the **Version** field indicates the version of the CSD file you selected. For more information on version compatibility, see Understanding and Managing SSL VPN Support Files , on page 1291.

Step 4 (Optional) In the **Hostscan Package** field, specify the name of the File Object that identifies the Host Scan package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see Add and Edit File Object Dialog Boxes , on page 1526.

Step 5 Click **Configure** to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. This application is independent of Security Manager; read the CSD documentation cited above for an explanation of how to use the policy editor.

The editor contains these main items (select them in the table of contents):

- Prelogin Policies—This is a decision tree. When a user attempts a connection, the user's system is evaluated against your rules and the first rule that matches is applied. Typically, you create policies for secure locations, home locations, and insecure public locations. You can make your checks based on registry information, the presence of specific files or certificates, the workstation's operating system, or IP address.

All editing is done through the right-click menu. Right click on boxes or + signs to activate related settings, if any.

For end nodes, you can select these options:

- Access Denied—Workstations that match your criteria are prevented from accessing the network.
- Policy—You want to define a specific admission policy at this point. After naming the policy, it is added to the table of contents. Select each item in the policy and configure its settings.
- Subsequence—You want to perform additional checks. Enter the name of the next decision tree that you want to evaluate for this workstation.
- Host scan—You can specify a set of registry entries, file names, and process names, which form a part of the basic host scan. The host scan occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the basic host scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a dynamic access policy. You can also enable:
  - Endpoint Assessment—The remote workstation scans for a large collection of antivirus, antispyware, and personal firewall applications, and associated updates.
  - Advanced Endpoint Assessment—Includes all of the Endpoint Assessment features, and lets you configure an attempt to update noncompliant workstations to meet the version requirements you specify. You must purchase and install a license for this feature before you can configure it.

Upgrading Host Scan to Version 4.6 and Above

Host Scan versions 4.6 and above no longer support the Anti-Virus (AV), Anti-Spyware (AS), and Firewall (FW) criteria. However, two new criteria Anti-Malware (AM) and Personal Firewall (PFW) have been added in place of them, which you can use when configuring a Host Scan. It is recommended that you upgrade your Host Scan to a possible higher version and Cisco Security Manager 4.22 lets you do that.

When directly upgrading from Host Scan 4.3 to 4.6 or higher versions, as the attributes **Anti-Virus (AV)**, **Anti-Spyware (AS)**, and **Firewall (FW)** are no longer supported by Host Scan, there are certain manual actions required to be performed. Follow the steps below for all the devices:

Note It is important to remember to follow these steps for each device separately.

Step 1 Create a manual backup of **dap.xml**, **data.xml**, and **data-record.txt** files in the HostScan_Migration_Backup directory on ASA.

Step 2 Navigate to **RAVPN** > **Dynamic Access Policy** > **Enable HostScan**, choose any intended version of the Host Scan package higher than version 4.3, and click **Save**.

Step 3 Then, navigate to a different policy in the list of policies and navigate back to **Dynamic Access Policy**. This ensures that all the policy attributes are loaded properly.

Step 4 Create a Dynamic Access Policy using the new criteria **Anti-Malware (AM)** and **Personal Firewall (PFW)**.

Step 5 Manually delete the **Anti-Virus (AV)**, **Anti-Spyware (AS)**, and **Firewall (FW)** attributes and LUA scripts, if any.

Step 6 Deploy the changes into the device.

Dynamic Access Page (ASA)

Use the Dynamic Access page to view the dynamic access policies (DAP) defined on the security appliance. From this page, you can create, edit, or delete DAPs.

Use the Cisco Secure Desktop section to enable and download the Cisco Secure Desktop (CSD) software on the selected ASA device. Cisco Secure Desktop provides a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

Note The CSD client software must be installed and activated on a device in order for an SSL VPN policy to work properly.

Tip Dynamic Access policies take precedence over Group policies. If a setting is not specified in a Dynamic Access policy, an ASA device checks for Group policies that specify the setting.

Navigation Path

- (Device View) Select an ASA device; then select **Remote Access VPN > Dynamic Access (ASA)** from the Policy selector.
- (Policy View) Select **Remote Access VPN > Dynamic Access (ASA)** from the Policy Type selector. Select an existing policy or create a new one.

Field Reference

Table 402: Dynamic Access Policy Page (ASA)

Element	Description
Priority	Priority of the configured dynamic access policy record.
Name	Name of the configured dynamic access policy record.
Network ACL	Name of the firewall ACL that applies to the session.
WebType ACL	Name of the WebType VPN ACL that applies to the session.
Port Forwarding	Name of the port forwarding list that applies to the session.
Bookmark	Name of the SSL VPN Bookmark object that applies to the session.
Terminate	Indicates whether the session is terminated or not.
Description	Additional information about the configured dynamic access policy.
Create button	Click this button to create a dynamic access policy. See Add/Edit Dynamic Access Policy Dialog Box , on page 1432.
Edit button	Click this button to edit the selected dynamic access policy. See Add/Edit Dynamic Access Policy Dialog Box , on page 1432.
Delete button	Click this button to delete the selected dynamic access policies.
Cisco Secure Desktop For the procedure to configure CSD on an ASA device, see Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427.	
Enable CSD	When selected, enables the CSD on the device. Enabling CSD loads the specified Cisco Secure Desktop package. If you transfer or replace the CSD package file, disable and then enable CSD to load the file.
CSD Package	Specify the name of the File Object that identifies the Cisco Secure Desktop package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see Add and Edit File Object Dialog Boxes , on page 1526.
Hostscan Package	Specify the name of the File Object that identifies the Hostscan package you want to upload to the device. Click **Select** to select an existing File Object or to create a new one. For more information, see Add and Edit File Object Dialog Boxes , on page 1526.

Element	Description
Version	The package version must be compatible with the ASA operating system version. When you create a local policy in Device view, the Version field indicates the CSD package version you should select. (The version is included in the package file name. For example, securedesktop-asa_k9-3.3.0.118.pkg is CSD version 3.3.0.118.) When you create a shared policy in Policy view, the Version field indicates the version of the CSD file you selected. For more information on version compatibility, see Understanding and Managing SSL VPN Support Files , on page 1291.
Configure	Click **Configure** to open the Cisco Secure Desktop Manager (CSDM) Policy Editor that lets you configure CSD on the security appliance. For a description of the elements in this dialog box, see Cisco Secure Desktop Manager Policy Editor Dialog Box , on page 1466.

Add/Edit Dynamic Access Policy Dialog Box

Use the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policies (DAP) on your security appliance. You can specify a name for the dynamic access policy that you are adding, select the priority, specify attributes in a LUA expression, and set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

Note For detailed information about dynamic access policy attributes, see Understanding DAP Attributes , on page 1422.

These tabs are available in the Add/Edit Dynamic Access Policy dialog box:

- Main Tab , on page 1433
- Logical Operations Tab , on page 1463
- Advanced Expressions Tab , on page 1465

Navigation Path

Open the Dynamic Access Page (ASA) , on page 1430, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit Dynamic Access Policy dialog box is displayed.

Related Topics

- Understanding Dynamic Access Policies , on page 1419
- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 403: Add/Edit Dynamic Access Policy Dialog Box

Element	Description
Name	The name of the dynamic access policy record (up to 128 characters).
Priority	A priority for the dynamic access policy record. The security appliance applies access policies in the order you set here, highest number having the highest priority. In the case of dynamic access policy records with the same priority setting and conflicting ACL rules, the most restrictive rule applies. Priority is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.
Description	Additional information about the dynamic access policy record (up to 1024 characters). Description is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.
Main tab	Enables you to add a dynamic access policy entry and set attributes for the access policy depending on the type of remote access that you configure. For a description of the elements on this tab, see Main Tab , on page 1433.
Logical Operations tab	Enables you to create multiple instances of each type of endpoint attribute. For a description of the elements on this tab, see Logical Operations Tab , on page 1463.
Advanced Expressions tab	Enables you to configure one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas. For a description of the elements on this tab, see Advanced Expressions Tab , on page 1465.

Main Tab

Use the Main tab of the Add/Edit Dynamic Access Policy dialog box to configure the dynamic access policy attributes and the type of remote access method supported your security appliance. You can set attributes for network and webtype ACL filters, file access, HTTP proxy, URL entry and lists, port forwarding, and clientless SSL VPN access methods.

Navigation Path

The Main tab appears when you open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432.

Related Topics

- Configuring Dynamic Access Policies , on page 1420
- Configuring DAP Attributes , on page 1426

Field Reference

Table 404: Add/Edit Dynamic Access Policy Dialog Box Main Tab

Element	Description
Criteria ID	The AAA and endpoint selection attribute names that are available for dynamic access policy use.
Content	Values of the AAA and endpoint attributes criteria that the security appliance uses for selecting and applying a dynamic access policy record during session establishment. Attribute values that you configure here override authorization values in the AAA system, including those in existing group policy, tunnel group, and default group records.
Create button	Click this button to configure AAA and endpoint attributes as selection criteria for the DAP record. See Add/Edit DAP Entry Dialog Box , on page 1439.
Edit button	Click this button to edit the selected dynamic access policy. See Add/Edit DAP Entry Dialog Box , on page 1439.
Delete button	Click this button to delete the selected dynamic access policies.
Access Method	Specify the type of remote access permitted: • **Unchanged**—Continue with the current remote access method. • **Secure Client**—Connect using the Cisco AnyConnect VPN Client. • **Web Portal**—Connect with clientless VPN. • **Both default Web Portal**—Connect via either clientless or the Secure Client, with a default of clientless. • **Both default Secure Client**—Connect via either clientless or the Secure Client, with a default of Secure Client.
Network ACL tab—Lets you select and configure network ACLs to apply to this dynamic access policy. An ACL for a dynamic access policy can contain permit or deny rules, but not both. If an ACL contains both permit and deny rules, the security appliance rejects it.	
Network ACL	Lists the Access Control Lists (ACLs) that will be used to restrict user access to the SSL†VPN. Beginning with Security Manager version 4.10, Network ACL supports IPv6 entries. Also IPv6 is supported for devices running the software version ASA 9.0 or later. This is applicable for both Network ACL and Web Type ACL. Click the **Select** button to open the Access Control Lists Selector from which you can make your selection. The ACL contains conditions that describe a traffic stream of packets, and actions that describe what should occur based on those conditions. Only ACLs having all permit or all deny rules are eligible. Network ACL is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices.

Element	Description
Secure Client tab—Lets you choose if the setting for Always-On VPN on the Secure Client service profile remains unchanged, is disabled, or the Secure Client Profile Setting must be used. Always-On VPN enables Secure Client to automatically establish a VPN session after you log onto the system.	
Custom Attributes tab—Lists the Secure Client Custom Attribute Type and Custom Attribute Name. Secure Client custom attributes allow for a more expeditious delivery and deployment of new endpoint features by giving the ASA the ability to generically support the addition of new client controls without the need for an ASA software upgrade. Beginning with version 4.7, Security Manager enables to add Custom Attribute Data to an existing Custom Attribute Type. This feature is supported for devices that are running the ASA software version 9.3(1) or later.	
Attribute Type	Select the Attribute Type that you configured in Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399 page.
Attribute Name	Select the Attribute Name that you configured in Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399 page.
WebType ACL tab—Lets you select and configure web-type ACLs to apply to this dynamic access policy. An ACL for a dynamic access policy can contain only permit or deny rules. If an ACL contains both permit and deny rules, the security appliance rejects it.	
Web Type ACL	Specifies the WebType access control list that will be used to restrict user access to the SSL†VPN. Click the **Select** button to open the Access Control Lists Selector from which you can make your selection. Only ACLs having all permit or all deny rules are eligible. Beginning with version 4.10, you can enter IPv6 values for the Web Type ACL.
Functions tab—Lets you configure file server entry and browsing, HTTP proxy, and URL entry for the dynamic access policy.	
File Server Browsing	Specify the file server browsing setting to be configured on the portal page: • **Unchanged**—Uses values from the group policy that applies to this session. • **Enable**—Enables CIFS browsing for file servers or shared features. • **Disable**—Disables CIFS browsing for file servers or shared features. **Note** Browsing requires NBNS (Primary Browser or WINS). If that fails or is not configured, we use DNS. The CIFS browse feature does not support internationalization.

Element	Description
File Server Entry	Specify the file server entry setting to be configured on the portal page: • **Unchanged**—Uses values from the group policy that applies to this session. • **Enable**—Enables a user from entering file server paths and names on the portal page. When enabled, places the file server entry drawer on the portal page. Users can enter pathnames to Windows files directly. They can download, edit, delete, rename, and move files. They can also add files and folders. Shares must also be configured for user access on the applicable Windows servers. Users might have to be authenticated before accessing files, depending on network requirements. • **Disable**—Disables a user from entering file server paths and names on the portal page.
HTTP Proxy	Specify how you want to configure the security appliance to terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers: • **Unchanged**—Uses values from the group policy that applies to this session. • **Enable**—Allows the forwarding of an HTTP applet proxy to the client. The proxy is useful for technologies that interfere with proper content transformation, such as Java, ActiveX, and Flash. It bypasses mangling while ensuring the continued use of the security appliance. The forwarded proxy modifies the browser's old proxy configuration and redirects all HTTP and HTTPS requests to the new proxy configuration. It supports virtually all client side technologies, including HTML, CSS, JavaScript, VBScript, ActiveX, and Java. The only browser it supports is Microsoft Internet Explorer. • **Disable**—Disables the forwarding of an HTTP applet proxy to the client. • **Auto-start**—Enables HTTP proxy and to have the DAP record automatically start the applets associated with these features.

Element	Description
URL Entry	Using SSL VPN does not ensure that communication with every site is secure. SSL VPN ensures the security of data transmission between the remote user's PC or workstation and the security appliance on the corporate network. If a user then accesses a non-HTTPS web resource (located on the Internet or on the internal network), the communication from the corporate security appliance to the destination web server is not secured. In a clientless VPN connection, the security appliance acts as a proxy between the end user web browser and target web servers. When a user connects to an SSL-enabled web server, the security appliance establishes a secure connection and validates the server SSL certificate. The end user browser never receives the presented certificate, so therefore cannot examine and validate the certificate. The current implementation of SSL VPN does not permit communication with sites that present expired certificates. Neither does the security appliance perform trusted CA certificate validation. Therefore, users cannot analyze the certificate an SSL-enabled web-server presents before communicating with it. Specify how the URL entry setting must be configured on the portal page: • **Unchanged**—Uses values from the group policy that applies to this session. • **Enable**—Allows a user from entering HTTP/HTTPS URLs on the portal page. If this feature is enabled, users can enter web addresses in the URL entry box, and use clientless SSL VPN to access those websites. • **Disable**—Disables a user from entering HTTP/HTTPS URLs on the portal page. **Note** To limit Internet access for users, select **Disable** for the URL Entry field. This prevents SSL VPN users from surfing the Web during a clientless VPN connection.
Port Forwarding tab—Lets you select and configure port forwarding lists for user sessions. **Note** Port Forwarding does not work with some SSL/TLS versions. **Caution** Make sure Sun Microsystems Java Runtime Environment (JRE) 1.4+ is installed on the remote computers to support port forwarding (application access) and digital certificates.	
Port Forwarding	Select an option for the port forwarding lists that apply to this DAP record: • **Unchanged**—Removes the attributes from the running configuration. • **Enable**—Enables port forwarding on the device. • **Disable**—Disables port forwarding on the device. • **Auto-start**—Enables port forwarding, and to have the DAP record automatically start the port forwarding applets associated with its port forwarding lists.

Element	Description
Port Forwarding List	The Port Forwarding List, that defines the mapping of the port number on the client machine to the application's IP address and port behind the SSL VPN gateway. You can click **Select** to open the Port Forwarding List Selector from which you can select the required Port Forwarding List from a list of Port Forwarding List objects. A Port Forwarding List object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.
Bookmark tab—Lets you enable and configure SSL VPN bookmarks. When enabled, users who successfully log into the SSL VPN are presented with the portal page containing the list of defined bookmarks. These bookmarks enable users to access resources available on SSL VPN websites in Clientless access mode.	
Enable Bookmarks	Specify the file server browsing setting to be configured on the portal page: • **Unchanged**—Uses values from the group policy that applies to this session. • **Enable**—Enables bookmarks on the SSL VPN portal page. • **Disable**—Disables bookmarks on the SSL VPN portal page.
Bookmarks	A list of websites that will be displayed on the portal page as a bookmark to enable users to access the resources available on the SSL VPN websites. You can click **Select** to open the Bookmarks Selector from which you can select the required bookmark from a list or create a new bookmark, as desired.
Action tab—Specifies special processing to apply to a specific connection or session. Action Tab is supported by Security Manager version 4.12 onwards for Multi-Context ASA version 9.6(2) or later devices. Select one of the following options from the drop-down list:	
Continue	(Default) When selected, continues the session. By default, the access policy attributes are applied to the session and it is running.
Quarantine	When selected, quarantines the session. By selecting quarantine, you can restrict a particular client who already has an established tunnel through a VPN. Restricted ACLs are applied to a session to form a restricted group, based on the selected DAP record. When an endpoint is not compliant with an administratively defined policy, the user can still access services for remediation (such as updating the antivirus and so on), but restrictions are placed upon the user. After the remediation occurs, the user can reconnect, which invokes a new posture assessment. If this assessment passes, the user connects. **Note** This parameter requires an Secure Client release that supports Secure Client features.

Element	Description
Terminate	When selected, terminates the session. By default, the access policy attributes are applied to the session and it is running.
User Message	Enter a text message to display on the portal page when this DAP record is selected. Maximum 128 characters. A user message displays as a yellow orb. When a user logs on it blinks three times to attract attention, and then it is still. If several DAP records are selected, and each of them has a user message, all user messages display. **Note** You can include in such messages URLs or other embedded text, which require that you use the correct HTML tags.For example: All contractors please read Instructions for the procedure to upgrade your antivirus software. **Note** User Message is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) or later in Multi-context mode.

The supported Dynamic Access Policy CLIs in Security Manager version 4.12 onwards for Multi-Context ASA 9.6(2) devices are as follows:

- Dynamic-access-policy-record action
- description
- exit
- help
- network-acl
- no
- priority
- quit
- user-message

Add/Edit DAP Entry Dialog Box

Use the Add/Edit DAP Entry dialog box to specify the authorization attributes and endpoint attributes for a dynamic access policy. The security appliance selects the dynamic access policy based on the endpoint security information of the remote device and the AAA authorization information for the authenticated user. It then applies the dynamic access policy to the user tunnel or session.

For detailed information about dynamic access policy attributes, see Understanding DAP Attributes , on page 1422.

The content of the dialog box differs based on the criterion that you select. The criterion is the authorization or endpoint attribute that serves as the selection criterion that the security appliance uses for selecting and applying dynamic access policies during session establishment. You can select from the following criteria:

- AAA Attributes Cisco—Refers to user authorization attributes that are stored in the AAA hierarchical model. See Add/Edit DAP Entry Dialog Box AAA Attributes Cisco , on page 1441

- AAA Attributes LDAP—Sets the LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. See Add/Edit DAP Entry Dialog Box AAA Attributes LDAP , on page 1443.
- AAA Attributes RADIUS—Sets the RADIUS client stores all native RADIUS response attribute value pairs in a database associated with the AAA session for the user. See Add/Edit DAP Entry Dialog Box AAA Attributes RADIUS , on page 1444.
- Anti-Spyware—Creates an endpoint attribute of type Anti-Spyware. You can use the Host Scan modules of Cisco Secure Desktop to scan for antispyware applications and updates that are running on the remote computer. See Add/Edit DAP Entry Dialog Box Anti-Spyware , on page 1445.

Note Host Scan 4.6 and higher versions do not support the Anti-Spyware (AS) criterion.

- Anti-Virus—Creates an endpoint attribute of type Anti-Virus. You can use the Host Scan modules of Cisco Secure Desktop to scan for antivirus applications and updates that are running on the remote computer. See Add/Edit DAP Entry Dialog Box Anti-Virus , on page 1447.

Note Host Scan 4.6 and higher versions do not support the Anti-Virus (AV) crieterion.

- Secure Client Identity—Creates an endpoint attribute of type Secure Client Identity. See Add/Edit DAP Entry Dialog Box Secure Client Identity , on page 1448.
- Application—Indicates the type of remote access connection. See Add/Edit DAP Entry Dialog Box Application , on page 1449.
- Device—Creates an endpoint attribute of type Device. The Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. See Add/Edit DAP Entry Dialog Box Device , on page 1450.
- File—Creates an endpoint attribute of type File. Filename checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See Add/Edit DAP Entry Dialog Box File , on page 1451.
- NAC—Creates an endpoint attribute of type NAC. NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy. We refer to these checks as posture†validation. See Add/Edit DAP Entry Dialog Box NAC , on page 1452.
- Operating System—Creates an endpoint attribute of type Operating System. The prelogin assessment module of the CSD can check the remote device for the OS version, IP address, and Microsoft Windows registry keys. See Add/Edit DAP Entry Dialog Box Operating System , on page 1453.
- Personal Firewall—Creates an endpoint attribute of type Personal Firewall. You can use the Host Scan modules of Cisco Secure Desktop to scan for personal firewall applications and updates that are running on the remote computer. For a description of the elements in the dialog box, see Add/Edit DAP Entry Dialog Box Personal Firewall , on page 1454.

Note Personal Firewall is indicated as **FW** for Host Scan versions below 4.6, and for 4.6 and higher versions as **PFW**.

- Policy—Creates an endpoint attribute of type Policy. See Add/Edit DAP Entry Dialog Box Policy , on page 1455.
- Process—Process name checking to be performed by Basic Host Scan must be explicitly configured using Cisco Secure Desktop Manager. See Add/Edit DAP Entry Dialog Box Process , on page 1456.
- Registry—Creates an endpoint attribute of type Registry. Registry key scans apply only to computers running Windows Microsoft Windows operating systems. See Add/Edit DAP Entry Dialog Box Registry , on page 1457.
- Anti-Malware—This option is supported only for Host Scan versions 4.6 and above. It creates an endpoint attribute of type Anti-Malware. You can use the Host Scan modules of Cisco Secure Desktop to scan for anti-malware applications and updates that are running on the remote computer. See Add/Edit DAP Entry Dialog Box Anti-Malware, on page 1459.
- Multiple Certificate Authentication— Creates an endpoint attribute of type Multiple Certificate Authentication. You can specify the attributes for the multiple certificate authentication of remote VPN users. See Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication, on page 1460.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed.

Add/Edit DAP Entry Dialog Box AAA Attributes Cisco

To configure AAA attributes as selection criteria for dynamic access policies, in the Add/Edit DAP Entry dialog box, set AAA Attributes Cisco as the selection criterion to be used to select and apply the dynamic access policies during session establishment. You can set these attributes either to match or not match the value you enter. There is no limit for the number of AAA attributes for each dynamic access policy.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes Cisco** as the Criterion.

Field Reference

Table 405: Add/Edit DAP Entry Dialog Box AAA Attributes Cisco

Element	Description
Criterion	Shows AAA Attributes Cisco as the selection criterion.
Group Policy	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the name of the AAA server group associated with the user. The maximum length is 64 characters. AAA server groups represent collections of authentication servers focused on enforcing specific aspects of your overall network security policy.
IPv4 Address	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the assigned IP address. Addresses are predefined network objects. You can also click **Select** to open a dialog box that lists all available network hosts, and in which you can create or edit network host objects. **Tip** If you select this option and later look at the rule in ASDM, the IP Address attribute is called Assigned IP Address.
IPv6 Address (Security Manager version 4.12 or later and ASA version 9.0 or later)	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the assigned IP address. Addresses are predefined network objects. You can also click **Select** to open a dialog box that lists all available network hosts, and in which you can create or edit network host objects. **Tip** If you select this option and later look at the rule in ASDM, the IP Address attribute is called Assigned IP Address.

Element	Description
Member-of	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter a comma-separated string of group policy names that apply to the user. This attribute lets you indicate multiple group membership. The maximum length is 128 characters. **Tip** If you select this option, and later look at the rule in ASDM, this option will not appear. In general, this option is not used because it can be confused with the memberof LDAP attribute. Because this rule applies to Local authentication, you might want to use the Username attribute instead of the Member-of attribute.
Username	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the username of the authenticated user. A maximum of 64 characters is allowed.
Username 2	Select the check box, select the matching criteria (*is* or *isn't*) from the drop-down list, and enter the secondary username of the authenticated user.
Connection Profiles	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and select the connection profile from a list of all the SSL VPN Connection Profile policies defined on the security appliance. An SSL VPN connection profile comprises a set of records that contain VPN tunnel connection profile policies, including the attributes that pertain to creating the tunnel itself. **Note** For a description of the procedure to configure an SSL VPN Connection Profiles policy, see Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331.
SCEP Required	Select the check box, select the matching criteria (*is* or *isn't*) from the drop-down list, and select *True* or *False* . This attribute enables to match whether or not the connection fails the certificate authentication.

Add/Edit DAP Entry Dialog Box AAA Attributes LDAP

The LDAP client stores all native LDAP response attribute value pairs in a database associated with the AAA session for the user. The LDAP client writes the response attributes to the database in the order in which it receives them. It discards all subsequent attributes with that name. This scenario might occur when a user record and a group record are both read from the LDAP server. The user record attributes are read first, and always have priority over group record attributes.

To support Active Directory group membership, the AAA LDAP client provides special handling of the LDAP memberOf response attribute. The AD memberOf attribute specifies the DN string of a group record in AD. The name of the group is the first CN value in the DN string. The LDAP client extracts the group name from the DN string and stores it as the AAA memberOf attribute, and in the response attribute database as the LDAP memberOf attribute. If there are additional memberOf attributes in the LDAP response message, then the group name is extracted from those attributes and is combined with the earlier AAA memberOf attribute to form a comma separated string of group names, also updated in the response attribute database.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes LDAP** as the Criterion.

Field Reference

Table 406: Add/Edit DAP Entry Dialog Box AAA Attributes LDAP

Element	Description
Criterion	Shows AAA Attributes LDAP as the selection criterion.
Attribute ID	Specify the name of the LDAP attribute map in the dynamic access policy. LDAP attribute maps take the attribute names that you define and map them to Cisco-defined attributes. A maximum of 64 characters is allowed.
Value	Select the matching criteria (for example, *is*) from the drop-down list, and enter the custom map value that maps to a Cisco Map Value or enter the Cisco map value that maps to the Custom Map Value. To enter multiple values, separate each value with **;** as the delimiter. The attribute map is populated with value mappings that apply customer, user-defined attribute values to the customer attribute name and to the matching Cisco attribute name and value. Alternatively, click the **Fetch AD Groups** button to open the Fetch AD Groups dialog box. The table in the dialog box lists the UserGroup ID and UserGroup Name of the available LDAP servers that you can choose from. Select one or more rows and click the **Select** button. To search for a particular UserGroup in the list you can enter text in the Filter text box and click **Search**. The UserGroup name meeting the criteria appears in the list. **Note** To be able to view the list of available LDAP servers you must first configure the mapping of Domain to AD Server Group. To perform this task, go to **Tools >Security Manager Administration** and select **Identity Settings** from the table of contents. For more information, see Identity Settings Page , on page 550.

Add/Edit DAP Entry Dialog Box AAA Attributes RADIUS

The RADIUS client stores all native RADIUS response attribute value pairs in a database associated with the AAA session for the user. The RADIUS client writes the response attributes to the database in the order in

which it receives them. It discards all subsequent attributes with that name. This scenario might occur when a user record and a group record are both read from the RADIUS server. The user record attributes are read first, and always have priority over group record attributes.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes RADIUS** as the Criterion.

Field Reference

Table 407: Add/Edit DAP Entry Dialog Box AAA Attributes RADIUS

Element	Description
Criterion	Shows AAA Attributes RADIUS as the selection criterion.
Attribute ID	Specify the name of the RADIUS attribute name or number in the dynamic access policy. A maximum of 64 characters is allowed. RADIUS attribute names do not contain the cVPN3000 prefix to better reflect support for all three security appliances (VPN 3000, PIX, and the ASA). The appliances enforce the RADIUS attributes based on attribute numeric ID, not attribute name. LDAP attributes are enforced by their name, not by the ID.
Value	Select the matching criteria (for example, *is*) from the drop-down list, and enter the attribute value.

Add/Edit DAP Entry Dialog Box Anti-Spyware

You can use the Host Scan feature of the Cisco Secure Desktop feature to enable Endpoint Assessment, a scan for antivirus, personal firewall, and antispyware applications and updates that are running on the remote computer. Following the configuration of the prelogin policies and host scan options, you can configure a match of any one or any combination of the Host Scan results to assign a dynamic access policy following the user login.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Spyware** as the Criterion.

Field Reference

Table 408: Add/Edit DAP Entry Dialog Box Anti-Spyware

Element	Description
Criterion	Shows Anti-Spyware as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Not Installed**—Select if the absence of the named anti-spyware from the remote PC is sufficient to match the prelogin policy you are configuring. • **Installed and enabled**—Select if the named anti-spyware must be present and enabled on the remote PC to match the prelogin policy you are configuring. • **Installed and disabled**—Select if the mere presence of the named anti-spyware on the remote PC is sufficient to match the prelogin policy you are configuring.
Vendor Name	Select the text that describes the application vendor from the list.
Product ID	Select a unique identifier for the product that is supported by the selected vendor from the list.
Product Description	Available only if you selected **Matches** as the Type. Select the check box, then select the description of the product from the list.
Version	Available only if you selected **Matches** as the Type. Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.

Element	Description
Last Update	Available only if you selected **Matches** as the Type. Specify the number of days since the last update. You might want to indicate that an update should occur in less than or greater than the number of days you enter here.

Add/Edit DAP Entry Dialog Box Anti-Virus

You can configure a scan for antivirus applications and updates as a condition for the completion of a Cisco Secure Client or clientless SSL VPN connection. Following the prelogin assessment, Cisco Secure Desktop loads Endpoint Assessment checks and reports the results back to the security appliance for use in assigning a dynamic access policy.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Virus** as the Criterion.

Field Reference

Table 409: Add/Edit DAP Entry Dialog Box Anti-Virus

Element	Description
Criterion	Shows Anti-Virus as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Not Installed**—Select if the absence of the named anti-virus from the remote PC is sufficient to match the prelogin policy you are configuring. • **Installed and enabled**—Select if the named anti-virus must be present and enabled on the remote PC to match the prelogin policy you are configuring. • **Installed and disabled**—Select if the mere presence of the named anti-virus on the remote PC is sufficient to match the prelogin policy you are configuring.
Vendor Name	Select the text that describes the application vendor from the list.

Element	Description
Product ID	Select a unique identifier for the product that is supported by the selected vendor from the list.
Product Description	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Select the check box, then select the description of the product from the list.
Version	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.
Last Update	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Specify the number of days since the last update. You might want to indicate that an update should occur in less than or greater than the number of days you enter here.

Add/Edit DAP Entry Dialog Box Secure Client Identity

To configure Secure Client Identity attributes as selection criteria for dynamic access policies, set Secure Client Identity as the selection criterion in the Add/Edit DAP Entry dialog box. The ASA generates DAP endpoint attributes based on the Secure Client Identification attributes received from the Secure Client mobile client. You are not required to enable Cisco Secure Desktop to configure these specific attributes using Security Manager.

For the purposes of assigning a dynamic access policy, if you configure more than one Secure Client Identity attribute for a particular DAP entry, the entry will be considered a match if any of the attributes values are true. There is no limit for the number of Secure Client Identity attributes for each dynamic access policy.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Secure Client Identity** as the Criterion.

Table 410: Add/Edit DAP Entry Dialog Box Secure Client Identity

Element	Description
Criterion	Shows Secure Client Identity as the selection criterion.
Client Version	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the Secure Client version number.
Platform	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and select the appropriate platform from the drop-down list.
Platform Version	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the appropriate version number of the platform.
Device Type	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and select the appropriate device type from the drop-down list.
Device Unique ID	Select the check box, select the matching criteria (for example, *is*) from the drop-down list, and enter the unique device ID. This ID distinguishes the device allowing you to set policies exclusive to that device.

Add/Edit DAP Entry Dialog Box Application

Use this dialog box to indicate the type of remote access connection as the endpoint attribute for the dynamic access policy.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Application** as the Criterion.

Field Reference

Table 411: Add/Edit DAP Entry Dialog Box Application

Element	Description
Criterion	Shows Application as the selection criterion.
Client Type	Select the check box, then select the matching criteria (for example, *is* or *isn't*) from the drop-down list, and specify the type of remote access connection from the list: Secure Client, Clientless, Cut-through Proxy, IPsec, Generic IKEv2 Client, or L2TP. **Note** If you select Secure Client as the client type, make sure to enable Cisco Secure Desktop. If it is not enabled, Security Manager generates an error.

Add/Edit DAP Entry Dialog Box Device

The DAP Device Criterion lets you provide specific device information for use during the associated prelogin policy checking. You can provide one or more of the following attributes for a device—host name, MAC address, port number, Privacy Protection selection—and indicate whether each *is* or *isn't* to be matched.

Note that *isn't* is exclusionary. For example, if you specify the criterion Host Name isn't zulu_2 , all devices not named zulu_2 will match.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Choose **Device** as the Criterion.

Field Reference

Table 412: Add/Edit DAP Entry Dialog Box Device

Element	Description
Criterion	Shows Device as the selected Criterion.
Host Name	Select this option, choose a match criterion (*is* or *isn't*) from the related drop-down list, and then enter the device host name to be matched.
MAC Address	Select this option, choose a match criterion (*is* or *isn't*) from the related drop-down list, and then enter the device's MAC address to be matched.

Element	Description
BIOS Serial Number	Select this option, choose a match criterion (*is* or *isn't*) from the related drop-down list, and then enter the BIOS serial number value of the device you are matching for. The number format is manufacturer-specific. There is no format requirement.
Port Number	Select this option, choose a match criterion (*is* or *isn't*), and then enter or Select the device port to be matched.
TCP/UDP Port Number	Select this option, choose a match criterion (*is* or *isn't*), and then enter or Select the TCP/UDP port in listening state that you are matching for. In the TCP/UDP combo box, select the kind of port you are matching for: TCP (IPv4), UDP(IPv4), TCP(IPv6) or UDP(IPv6). Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. If you are matching for more than one port, make several individual endpoint attribute rules in the DAP and specify one port in each.
Privacy Protection	Select this option, choose a match criterion (*is* or *isn't*), and then choose the Privacy Protection option defined on the device: **none**, **cache cleaner**, or **secure desktop**.
CSD Version	Select this option, choose a match criterion (*is* or *isn't*) from the related drop-down list, and then enter the version of the Host Scan image running on the endpoint.
Endpoint Assessment Version	Select this option, choose a match criterion (*is* or *isn't*) from the related drop-down list, and then enter the version of endpoint assessment (OPSWAT) you are matching for.

Add/Edit DAP Entry Dialog Box File

The file criterion prelogin check lets you specify that a certain file must or must not exist to be eligible for the associated prelogin policy. For example, you might want to use a file prelogin check to ensure a corporate file is present or one or more peer-to-peer file-sharing programs containing malware are not present before assigning a prelogin policy.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **File** as the Criterion.

Related Topics

Field Reference

Table 413: Add/Edit DAP Entry Dialog Box File

Element	Description
Criterion	Shows File as the selection criterion.
Type	Specify whether this endpoint attribute must match or not match the criteria configured for selecting and applying dynamic access policies during session establishment.
Endpoint ID	Select a string that identifies an endpoint for files. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.
Filename	Specify the filename.
Last Update	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Specify the number of days since the last update. You might want to indicate that an update should occur in less than (<) or more than (>) the number of days you enter here.
Checksum	Available only if you selected the criteria to match the endpoint attribute for the DAP record. Select the check box to specify a checksum to authenticate the file, then enter a checksum in hexadecimal format, beginning with 0x. Beginning with version 4.7, Security Manager provides a utility to compute CRC32 checksum for a file. Click the **Compute CRC32 Checksum** button to open the Compute Checksum dialog box. Click Browse to open the File browser, select the required file and then click the Compute button. The CRC32 checksum of the file will be calculated and populated in the Checksum field. **Note** Only client-side browsing is supported for the Compute CRC32 Checksum utility. By default client-side browsing is enabled. If you have disabled it, you must enable it by selecting **Tools > Security Manager Administration** and select **Customize Desktop** from the table of contents. For more information, see Customize Desktop Page , on page 520.

Add/Edit DAP Entry Dialog Box NAC

NAC protects the enterprise network from intrusion and infection from worms, viruses, and rogue applications by performing endpoint compliancy and vulnerability checks as a condition for production access to the network. We refer to these checks as *posture†validation* . You can configure posture validation to ensure that the anti-virus files, personal firewall rules, or intrusion protection software on a host with an Secure Client or Clientless SSL VPN session are up-to-date before providing access to vulnerable hosts on the intranet. Posture validation can include the verification that the applications running on the remote hosts are updated with the latest patches. NAC occurs only after user authentication and the setup of the tunnel. NAC is especially useful for protecting the enterprise network from hosts that are not subject to automatic network policy enforcement, such as home PCs. The security appliance uses Extensible Authentication Protocol (EAP) over UDP (EAPoUDP) messaging to validate the posture of remote hosts.

The establishment of a tunnel between the endpoint and the security appliance triggers posture validation. You can configure the security appliance to pass the IP address of the client to an optional audit server if the client does not respond to a posture validation request. The audit server, such as a Trend server, uses the host IP address to challenge the host directly to assess its health. For example, it may challenge the host to determine whether its virus checking software is active and up-to-date. After the audit server completes its interaction with the remote host, it passes a token to the posture validation server, indicating the health of the remote host.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **NAC** as the Criterion.

Field Reference

Table 414: Add/Edit DAP Entry Dialog Box NAC

Element	Description
Criterion	Shows NAC as the selection criterion.
Posture Status	Select the matching criteria (for example, *is*) from the drop-down list, then enter the posture token string received from ACS.

Add/Edit DAP Entry Dialog Box Operating System

The prelogin assessment includes a check for the OS attempting to establish a VPN connection. When the user attempts to connect, however, Cisco Secure Desktop checks for the OS, regardless of whether you insert an OS prelogin check.

If the prelogin policy assigned to the connection has Secure Desktop (Secure Session) enabled and if the remote PC is running Microsoft Windows XP or Windows 2000, it installs Secure Session, regardless of whether you insert an OS prelogin check. If the prelogin policy has Secure Desktop enabled and the operating system is Microsoft Windows Vista, Mac OS X 10.4, or Linux, Cache Cleaner runs instead. Therefore, you should make sure the Cache Cleaner settings are appropriate for a prelogin policy on which you have configured Secure Desktop or Cache Cleaner to install. Although Cisco Secure Desktop checks for the OS, you may want to insert an OS prelogin check as a condition for applying a prelogin policy to isolate subsequent checks for each OS.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Operating System** as the Criterion.

Field Reference

Table 415: Add/Edit DAP Entry Dialog Box Operating System

Element	Description
Criterion	Shows Operating System as the selection criterion.
OS Version	Select the check box, then select the matching criteria (for example, *is*) from the drop-down list, and select the OS version from the list. Select Apple Plugin for iPhones and similar devices.
Service Pack	Select the check box, then select the matching criteria (for example, *is*) from the drop-down list, and select the service pack for the operating system.

Add/Edit DAP Entry Dialog Box Personal Firewall

You can click Host Scan in the Cisco Secure Desktop interface to enable Endpoint Assessment, a scan for personal firewalls that are running on the remote computer. Most, but not all, personal firewall programs support active scan, which means that the programs are memory-resident, and therefore always running.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Important Personal Firewall criterion is indicated as **FW** for Host Scan versions below 4.6, and for 4.6 and higher versions as **PFW**.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **AAA Attributes Cisco** as the Criterion.

Field Reference

Table 416: Add/Edit DAP Entry Dialog Box Personal Firewall

Element	Description
Criterion	Shows Personal Firewall as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Not Installed**—Select if the absence of the named personal firewall from the remote PC is sufficient to match the prelogin policy you are configuring. • **Installed and enabled**—Select if the named personal firewall must be present and enabled on the remote PC to match the prelogin policy you are configuring. • **Installed and disabled**—Select if the mere presence of the named personal firewall on the remote PC is sufficient to match the prelogin policy you are configuring.
Vendor Name	Select the text that describes the application vendor from the list.
Product ID	Select a unique identifier for the product that is supported by the selected vendor from the list.
Product Description	Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC. Select the check box, then select the description of the product from the list.
Version	Available only if you selected that this endpoint attribute and all its settings must be available on the remote PC. Identify the version of the application, and specify whether you want the endpoint attribute to be equal to/not equal to that version.

Add/Edit DAP Entry Dialog Box Policy

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a Cisco Secure Desktop Windows Location named Work that is specified by IP addresses on the 10.x.x.x

network, and disable both the Cache Cleaner and the Secure Desktop function for this location. Cisco Secure Desktop checks locations in the order listed on the Windows Location Settings window, and grants privileges to client PCs based on the first location definition they match.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Policy** as the Criterion.

Related Topics

Field Reference

Table 417: Add/Edit DAP Entry Dialog Box Policy

Element	Description
Criterion	Shows Policy as the selection criterion.
Location	Select the matching criteria (for example, *is*) from the drop-down list, and select the Cisco Secure Desktop Microsoft Windows location profile from the list. All the locations configured in the Cisco Secure Desktop Manager are displayed in this list.

Add/Edit DAP Entry Dialog Box Process

You can specify a set of process names, which form a part of Basic Host Scan. The host scan, which includes Basic Host Scan and Endpoint Assessment, or Advanced Endpoint Assessment; occurs after the prelogin assessment but before the assignment of a dynamic access policy. Following the Basic Host Scan, the security appliance uses the login credentials, the host scan results, prelogin policy, and other criteria you configure to assign a DAP.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Process** as the Criterion.

Related Topics

- Understanding DAP Attributes , on page 1422

- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 418: Add/Edit DAP Entry Dialog Box Process

Element	Description
Criterion	Shows Process as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Matches**—Select if the mere presence of the named process on the remote PC is sufficient to match the prelogin policy you are configuring. • **Doesn't Match**—Select if the absence of the named process from the remote PC is sufficient to match the prelogin policy you are configuring.
Endpoint ID	A string that identifies an endpoint for files, processes or registry entries. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.
Path	Select the check box, then select the matching criteria (for example, *is*) from the drop-down list, and enter the name of the process. You can display it in Microsoft Windows by opening the Windows Task Manager window and clicking the Processes tab. Configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it and specify the same index when you assign this entry as an endpoint attribute when configuring a DAP, reducing the possibility of errors in typing or syntax.

Add/Edit DAP Entry Dialog Box Registry

Registry key scans apply only to computers running Windows Microsoft Windows operating systems. Basic Host Scan ignores registry key scans if the computer is running Mac OS or Linux.

Note Duplicate entries are not allowed. If you configure a dynamic access policy with no AAA or endpoint attributes, the security appliance always selects it since all selection criteria are satisfied.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Registry** as the Criterion.

Related Topics

- Understanding DAP Attributes , on page 1422

- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 419: Add/Edit DAP Entry Dialog Box Registry

Element	Description
Criterion	Shows Registry as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Matches**—Select if the mere presence of the named registry key on the remote PC is sufficient to match the prelogin policy you are configuring. For example, select this option if you want to require the following registry key to be present to match a criterion for assigning a prelogin policy: HKEY_LOCAL_MACHINE\SOFTWARE\<Protective_Software> • **Doesn't Match**—Select if the absence of the named registry key from the remote PC is sufficient to match the prelogin policy you are configuring. For example, select this option if you want to require the following registry key to be absent to match a criterion for assigning a prelogin policy: HKEY_LOCAL_MACHINE\Software\Microsoft\Windows\CurrentVersion\Run\<Evil_SpyWare>
Endpoint ID	A string that identifies an endpoint for files, processes or registry entries. Dynamic access policies use this ID to match Cisco Secure Desktop host scan attributes for dynamic access policy selection. You must configure Host Scan before you configure this attribute. When you configure Host Scan, the configuration displays in this pane, so you can select it, reducing the possibility of errors in typing or syntax.
Registry Name	Select the text that describes the registry name from the list.
Value	Select the value, **dword** or **string**, from the list, then select the matching criteria (whether it equals or does not equal), and enter a decimal or a string to compare with the dword or string value of the registry key on the remote PC. **Note** "DWORD" refers to the attribute in the Add/Edit Registry Criterion dialog box. "Dword" refers to the attribute as it appears in the registry key. Use the regedit application, accessed on the Windows command line, to view the Dword value of a registry key, or use it to add a Dword value to the registry key to satisfy the requirement you are configuring.
Ignore Case	When selected, ignores the case in the registry entry if it includes a string.

Add/Edit DAP Entry Dialog Box Anti-Malware

Host Scan versions 4.6 and higher no longer support the Anti-Virus (AV), Anti-Spyware (AS), and Firewall (FW) criteria. However, two new criteria Anti-Malware (AM) and Personal Firewall (PFW) have been added in place of them, which you can use when configuring a Host Scan.

Note Anti-Malware criterion is supported only for Host Scan versions 4.6 and above.

You can click **Host Scan** in the Cisco Secure Desktop interface to enable Endpoint Assessment, a scan for anti-malware applications that are running on the remote computer. Following the configuration of the prelogin policies and Host Scan options, you can configure a match of any one or any combination of the Host Scan results to assign a dynamic access policy following the user login.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create** or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Anti-Malware** as the Criterion.

Related Topics

- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 420: Add/Edit DAP Entry Dialog Box Anti-Malware

Element	Description
Criterion	Shows Anti-Malware as the selection criterion.
Type	Select one of the following options and assign the associated values: • **Not Installed**—Select if the absence of the named anti-malware from the remote PC is sufficient to match the prelogin policy you are configuring. • **Installed and enabled**—Select if the named anti-malware must be present and enabled on the remote PC to match the prelogin policy you are configuring. • **Installed and disabled**—Select if the mere presence of the named anti-malware on the remote PC is sufficient to match the prelogin policy you are configuring.
Vendor Name	Select the text that describes the application vendor from the list.
Product ID	Select a unique identifier for the product that is supported by the selected vendor from the list.

Element	Description
Product Description	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Select the check box, then select the description of the product from the list.
Version	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Identify the version of the application, and specify whether you want the endpoint attribute to be one of the following to that version: • **isn't** • **is** • **less than** • **greater than** • **less or equal** • **greater or equal**
Last Update	Available only if you selected the criteria to match the endpoint attribute for the dynamic access policy. Specify the number of days since the last update. You might want to indicate that an update should occur in less than or greater than the number of days you enter here.

Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication

The DAP multiple certificate authentication criterion allows you to provide specific certificate information for use during the associated prelogin policy checking. Cisco Security Manager supports two certificates to authenticate remote VPN users. You can provide one or more of the following attributes for the certificates—subject, issuer, subject alternate name, serial number and certificate store.

Note You can modify the DAP entry except the certificate option.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432 with the Main tab selected, then click **Create**, or select a dynamic access policy in the table and click **Edit**. The Add/Edit DAP Entry dialog box is displayed. Select **Multiple Certificate Authentication** as the Criterion.

Related Topics

- Understanding DAP Attributes , on page 1422
- Configuring DAP Attributes , on page 1426
- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 421: Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication

Element	Description
Criterion	Shows Multiple Certificate Authentication as the selection criterion.
Certificate	Multiple certification in 4.13 refers to two certificate authentication. Select one of the following options and assign the associated attributes: • **Cert1**—Select to provide the certificate 1 details to match the prelogin policy you are configuring. • **Cert2**—Select to provide the certificate 2 details to match the prelogin policy you are configuring. **Note** You cannot edit/modify the certificate option.
Subject	From the drop-down list, select the domain name (DN) attribute field from subject name of the certificate: • dnq—Domain name qualifier • fulldn—Full subject-name • ser—Serial number • cn —Common name • i —Initials • ou —Organization Unit • sp —State/Province • o— Organization • n —Name • sn —Surname • t —Title • uid —User Identifier • genq —Generation Qualifier • c —Country • l —Locality • gn —Given Name • ea —E-mail address In the adjacent text box, enter the DAP entry value for the selected Subject. **Note** If you leave the text box blank, and error message appears while saving.

Element	Description
Issuer	From the drop-down list, select the domain name (DN) attribute field from issuer name of the certificate: • dnq—Domain name qualifier • fulldn—Full issuer-name • ser—Serial number • cn—Common name • i—Initials • ou—Organization Unit • sp—State/Province • o—Organization • n—Name • sn—Surname • t—Title • uid—User Identifier • genq—Generation Qualifier • c—Country • l—Locality • gn—Given Name • ea—E-mail address In the adjacent text box, enter the DAP entry value for the selected issuer. **Note** If you leave the text box blank, an error message appears while saving.
Subject Alternate Name	For configuring the serial number, select upn from this drop-down list. In the adjacent text box, enter the User Principal Name from Subject Alt Name field of certificate
Serial Number	Enter the serial number of certificate to be matched. This value should be a hexadecimal number (a combination of 0 to 9, and A to F). **Note** If you enter a non-hexadecimal number, an error message appears while saving.

Element	Description
Certificate Store	Select the relevant store from where the certificate can be found for authentication: • None—Choose if you are not aware of the certificate type. • Machine—Choose if the certificate pertains to machine (accessible only by privileged processes). You cannot select this option for both cert1 and cert2. • User—Choose if the certificate pertains to user log in (accessible only by processes owned by the logged-in user). **Note** For Windows, the store may be a) one machine and one user, or b) two users. For non-Windows platforms, the indication is always two user certificates.

Logical Operations Tab

Use the Logical Operations tab of the Add/Edit Dynamic Access Policy dialog box to configure multiple instances of the AAA and each type of endpoint attribute that you defined in the DAP Entry dialog box. On this tab, set each type of endpoint or AAA attribute to require only one instance of a type (Match Any = OR) or to have all instances of a type (Match All = AND).

- If you configure only one instance of an endpoint category, you do not need to set a value.
- For some endpoint attributes, it is not useful to configure multiple instances. For example, no users have more than one running OS.
- You are configuring the Match Any/Match All operation within each endpoint type. The security appliance evaluates each type of endpoint attribute, and then performs a logical AND operation on all of the configured endpoints. That is, each user must satisfy the conditions of ALL of the endpoints you configure, as well as the AAA attributes.

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432, then click the **Logical Operations** tab.

Related Topics

- Understanding DAP Attributes , on page 1422
- Configuring DAP Attributes , on page 1426
- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 422: Add/Edit Dynamic Access Policy Dialog Box Logical Operations Tab

Element	Description
AAA	Select one of the following options if you defined the AAA attribute in the dynamic access policy: • **Match Any**—Creates an OR relationship among the attributes. Attributes matching any of your criteria are included in the filter. The security appliance grants access to a particular user for a particular session even if any one of the attributes is matching all your criteria. • **Match All**—Creates an AND relationship among the attributes. The security appliance grants access to a particular user for a particular session only if the attributes are matching all your criteria. • **Match None**—Creates a NOT relationship among the attributes. The dynamic access policy specifies that none of the attributes of the user need to match to be granted access to a session.
Anti-Spyware	Select one of the following options if you defined Anti-Spyware as an endpoint attribute: • **Match Any**—Creates an OR relationship among the attributes. Policies matching any instance of your criteria are used to authorize users. • **Match All**—Creates an AND relationship among the attributes. Only those attributes matching all your criteria are used to authorize users.
Anti-Virus	Select one of the following options if you defined Anti-Virus as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.
Application	Select one of the following options if you defined Application as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.
File	Select one of the following options if you defined File as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.

Element	Description
Personal Firewall	Personal firewall rules let you specify applications and ports for the firewall to allow or block. Select one of the following options if you defined Personal Firewall as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.
Process	Select one of the following options if you defined Process as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.
Registry	Registry key scans apply only to computers running Windows Microsoft Windows operating systems. Basic Host Scan ignores registry key scans if the computer is running Mac OS or Linux. Select one of the following options if you defined Registry as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Antivirus endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring, as well as satisfying the AAA attribute.
Anti-Malware	Select one of the following options if you defined Anti-Malware as an endpoint attribute: • **Match Any**—Set to require that user authorization attributes match any of the values in the Anti-Malware endpoint attributes you are configuring. • **Match All**—Set to require that user authorization attributes match all of the values in the endpoint attributes you are configuring.

Advanced Expressions Tab

Use the Advanced Expressions tab of the Add/Edit Dynamic Access Policy dialog box to set additional attributes for the dynamic access policy. You can configure multiple instances of each type of endpoint attribute. Be aware that this is an advanced feature that requires knowledge of LUA (www.lua.org).

Navigation Path

Open the Add/Edit Dynamic Access Policy Dialog Box , on page 1432, then click the **Advanced Expressions** tab.

Related Topics

- Understanding DAP Attributes , on page 1422

- Configuring DAP Attributes , on page 1426
- Configuring Dynamic Access Policies , on page 1420

Field Reference

Table 423: Add/Edit Dynamic Access Policy Dialog Box Advanced Expressions Tab

Element	Description
Basic Expressions	This text box is populated with basic expressions based on the endpoint and AAA attributes that you configured in the dynamic access policy.
Relationship Drop-down List	Specify the relationship between the basic selection rules and the logical expressions you enter on this tab, that is, whether the new attributes add to or substitute for the AAA and endpoint attributes already set. Select one of the following options: • **Basic AND Advanced**—Creates an AND relationship between the basic and advanced expressions. Both the basic and advanced expressions defined in the dynamic access policy are considered while authenticating users. By default, this option is selected. • **Basic OR Advanced**—Creates an OR relationship between the basic and advanced expressions. Users are granted access to a session if either the basic or advanced expressions in the dynamic access policy are matched with the user policy. • **Basic Only**—Only the basic expressions defined in the DAP entry are used to determine whether the security appliance grants users access to a particular session. • **Advanced Only**—Only the advanced expressions defined in the DAP entry are used to authorize users for an SSL VPN session.
Advanced Expressions	Enter one or more logical expressions to set AAA or endpoint attributes other than what is possible in the AAA and Endpoint areas above. Enter free-form LUA text that defines new AAA and/or endpoint selection attributes. Security Manager does not validate text that you enter here; it just copies this text to the dynamic access policy XML file, and the security appliance processes it, discarding any expressions it cannot parse.

Cisco Secure Desktop Manager Policy Editor Dialog Box

Using the Cisco Secure Desktop Manager (CSDM) Policy Editor dialog box, you can configure prelogin policies, specify the checks to be performed between the time the user establishes a connection with the security appliance and the time the user enters the login credentials, and configure host scans. For an explanation of configuring CSD on an ASA device, see Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427.

Note The Cisco Secure Desktop Manager Policy Editor is an independent program. For information about configuring CSD, and what CSD can do for you, see the materials available online at http://www.cisco.com/en/US/products/ps6742/tsd_products_support_configure.html . Look specifically for information on configuring prelogin policies and host scan. Select the configuration guide for the CSD version you are configuring.

Navigation Path

Open the Dynamic Access Page (ASA) , on page 1430, then click **Configure** from the Cisco Secure Desktop section (you must first specify a CSD package). The CSDM Policy Editor dialog box is displayed.

CHAPTER 33

Managing Remote Access VPNs on IOS and PIX 6.3 Devices

Note From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

You can configure and manage remote access IPsec on devices running Cisco IOS Software or PIX 6.3, and SSL VPNs on IOS 12.4(6)T or later devices (but not on PIX devices). For more information on the specific device models supported, see Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295.

The configuration of these remote access VPNs are the same for these device types. ASA and PIX 7.0+ devices use different configurations for remote access VPNs (as explained in Managing Remote Access VPNs on ASA and PIX 7.0+ Devices, on page 1325).

The topics in this chapter explain how to configure policies that are specific to IOS and PIX 6.3 devices. Additionally, review the following topics for more information about remote access VPNs:

- Understanding Remote Access VPNs , on page 1287
- Understanding Devices Supported by Each Remote Access VPN Technology , on page 1295
- Discovering Remote Access VPN Policies , on page 1298
- Using the Remote Access VPN Configuration Wizard , on page 1300
  - Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices) , on page 1322
  - Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318

This chapter contains the following topics:

Overview of Remote Access VPN Policies for IOS and PIX 6.3 Devices

Note From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

When you configure remote access VPNs on IOS or PIX 6.3 devices, you use the following policies based on the type of VPN you are configuring. Note that you cannot configure SSL VPNs on PIX 6.3 devices.

- **Policies used with both IPsec and SSL remote access VPNs:**
  - **Global Settings**—You can define global settings that apply to all devices in your remote access VPNs. These settings include Internet Key Exchange (IKE), IPsec, NAT, and fragmentation definitions. The global settings typically have defaults that work in most situations, so configuring the Global Settings policy is optional; configure it only if you need non-default behavior. For more information, see Configuring VPN Global Settings , on page 1180.
  - **Public Key Infrastructure**—You can create a Public Key Infrastructure (PKI) policy to generate enrollment requests for CA certificates and RSA keys, and to manage keys and certificates. Certification Authority (CA) servers are used to manage these certificate requests and issue certificates to users who connect to your IPsec or SSL remote access VPN. For more information, see Understanding Public Key Infrastructure Policies , on page 1200 and Configuring Public Key Infrastructure Policies for Remote Access VPNs , on page 1207 .
- **Policies used in remote access IPsec VPNs only:**
  - **IKE Proposal**—Internet Key Exchange (IKE), also called ISAKMP, is the negotiation protocol that enables two hosts to agree on how to build an IPsec security association. IKE is used to authenticate IPsec peers, negotiate and distribute IPsec encryption keys, and to automatically establish IPsec security associations (SAs). Use the IKE Proposal policy to define the requirements for phase 1 of the IKE negotiation. For more information, see Configuring an IKE Proposal , on page 1158.
  - **IPsec Proposal (IOS/PIX 6.x)**—An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA. The policy is used for IKE phase 2 negotiations. For more information, see Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471.
  - **High Availability**—High Availability (HA) is supported by the creation of an HA group made up of two or more hub devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. For more information, see Configuring High Availability in Remote Access VPNs (IOS) , on page 1479.
  - **User Groups (IOS/PIX 6.x)**—A user group policy specifies the attributes that determine user access to and use of the VPN. For more information, see Configuring User Group Policies , on page 1481.
- **Policies used in remote access SSL VPNs only:**

- **SSL VPN**—The SSL VPN policy table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. For more information, see Configuring an SSL VPN Policy (IOS) , on page 1482.

Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices)

Note From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

This procedure describes how to create or edit an IPsec proposal for your remote access VPN server when the server uses Cisco IOS Software or PIX release 6.3.

An IPsec proposal is a collection of one or more crypto maps. A crypto map combines all the components required to set up IPsec security associations (SAs), including IPsec rules, transform sets, remote peers, and other parameters that might be necessary to define an IPsec SA.

When configuring an IPsec proposal, you must define the external interface through which the remote access clients connect to the server, and the encryption and authentication algorithms that protect the data in the VPN tunnel. You can also select a group authorization (Group Policy Lookup) method that defines the order in which group policies are searched (on the local server or on external AAA servers) and a user authentication (Xauth) method that defines the order in which user accounts are searched.

For more information on IPsec tunnel concepts, see Understanding IPsec Proposals , on page 1168.

When you create or edit an IPsec proposal, you can also configure:

- A VPN Services Module (VPNSM) interface IPsec VPN Shared Port Adapter (VPN SPA) on a Catalyst 6500/7600 device (see VPNSM/VPN SPA/VSPA Settings Dialog Box , on page 1474).
- A dynamic virtual interface on an IOS router running Cisco IOS Software version 12.4(2)T or later, except 7600 device. For more information, see Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices) , on page 1476.
- VRF-Aware IPsec on a router or Catalyst 6500/7600 device (see Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices) , on page 1476).

Related Topics

- Understanding VRF-Aware IPsec , on page 1088
- VPNSM/VPN SPA/VSPA Settings Dialog Box , on page 1474
- Table Columns and Column Heading Features , on page 51

Step 1 Do one of the following:

- (Device view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector.

- (Policy view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one.

The IPsec Proposal page opens and lists the configured proposals, including the VPN endpoint, IPsec transform set, and whether reverse route injection is configured for the proposal. You can add other columns to the default display to show the AAA, VRF, and dVTI configuration.

Step 2 Do any of the following:

- To add a new IPsec proposal, click the **Add Row (+)** button and fill in the IPsec Proposal Editor dialog box. For detailed information on the available options, see IPsec Proposal Editor (IOS, PIX 6.3 Devices) , on page 1472.
- To edit an existing proposal, select it and click the **Edit Row (pencil)** button.
- To delete a proposal, select it and click the **Delete Row (trash can)** button.

IPsec Proposal Editor (IOS, PIX 6.3 Devices)

Note From version 4.17, though Cisco Security Manager continues to support IOS and PIX features/functionality, it does not support any enhancements.

Use the IPsec Proposal Editor to create or edit an IPsec proposal for an IOS or PIX 6.3 device, including Catalyst 6500/7600, in your remote access VPN. The editor has two tabs—General and Dynamic VTI/VRF Aware IPsec. This topic explains the basic settings on the General tab. For an explanation of Dynamic VTI/VRF Aware IPsec settings, see Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices) , on page 1476.

The elements in this dialog box differ according to the selected device. The table below describes the elements on the General tab in the IPsec Proposal Editor dialog box when a Cisco IOS router, Catalyst 6500/7600, or PIX 6.3 device is selected.

Note For a description of the elements in the dialog box when a PIX 7.0+ or ASA device is selected is selected, see IPsec Proposal Editor (ASA, PIX 7.0+ Devices) , on page 1368.

Navigation Path

- (Device view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy selector. Click the Add Row (+) or Edit Row (pencil) buttons.
- (Policy view) Select **Remote Access VPN > IPSec VPN > IPsec Proposal (IOS/PIX 6.x)** from the Policy Type selector. Select an existing policy or create a new one. Click the Add Row (+) or Edit Row (pencil) buttons.

- Creating AAA Server Group Objects , on page 278

Field Reference

Table 424: IPsec Proposal Editor, General Tab, IOS and PIX 6.3 Devices

Element	Description
External Interface	**Note** Available only if the selected device is an IOS router. The external interface through which remote access clients will connect to the server. Enter the name of the interface or interface role object, or click **Select** to select it or to create a new object.
Inside VLAN	**Note** Available only if the selected device is a Catalyst 6500/7600. The inside VLAN that serves as the inside interface to the VPN Services Module (VPNSM), VPN SPA, or VSPA. Click **Select** to configure the inside VLAN as explained in VPNSM/VPN SPA/VSPA Settings Dialog Box , on page 1474.
IKEv1 Transform Sets	The transform sets to be used for your tunnel policy. Transform sets specify which authentication and encryption algorithms will be used to secure the traffic in the tunnel. You can select up to nine transform sets. For more information, see Understanding Transform Sets , on page 1170. If more than one of your selected transform sets is supported by both peers, the transform set that provides the highest security will be used. Click **Select** to select the IPsec transform set policy objects to use in the topology. If the required object is not yet defined, you can click the **Create (+)** button beneath the available objects list in the selection dialog box to create a new one. For more information, see Configuring IPSec IKEv1 or IKEv2 Transform Set Policy Objects , on page 1177.

Element	Description
Reverse Route Injection	Reverse Route Injection (RRI) enables static routes to be automatically inserted into the routing process for those networks and hosts protected by a remote tunnel endpoint. For more information, see Understanding Reverse Route Injection , on page 1171. Select one of the following options to configure RRI on the crypto map: • **None**—Disables the configuration of RRI on the crypto map. • **Standard**—Creates routes based on the destination information defined in the crypto map access control list (ACL). This is the default option. • **Remote Peer**—Creates two routes, one for the remote endpoint and one for route recursion to the remote endpoint via the interface to which the crypto map is applied. • **Remote Peer IP**—Specifies an address as the explicit next hop to the remote VPN device. Enter the IP address or a network/host object that specifies the address, or click **Select** to select the network/host object from a list or to create a new object. **Note** If you use network/host objects, you can select the **Allow Value Override per Device** option in the object to override the IP address, if required, for specific devices that use this object.
Group Policy Lookup/AAA Authorization Method	The AAA authorization method list that will be used to define the order in which the group policies are searched. Group policies can be configured on both the local server or on an external AAA server. Remote users are grouped, so that when the remote client establishes a successful connection to the VPN server, the group policies for that particular user group are pushed to all clients belonging to the user group. Click **Select** to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.
User Authentication (Xauth)/AAA Authentication Method	The AAA or Xauth user authentication method that defines the order in which user accounts are searched. Xauth allows all Cisco IOS software AAA authentication methods to perform user authentication in a separate phase after the IKE authentication phase 1 exchange. Click **Select** to open a dialog box that lists all available AAA group servers, and in which you can create AAA group server objects. Select all that apply and use the up and down arrow buttons to put them in priority order.

VPNSM/VPN SPA/VSPA Settings Dialog Box

Note This dialog box is available only if the selected device is a Catalyst 6500/7600.

Use the VPNSM/VPN SPA/VSPA Settings dialog box to specify the settings for configuring a VPN Services Module (VPNSM), a VPN Shared Port Adapter (VPN SPA), or a Cisco VPN Service Port Adapters (VSPAs) on a Catalyst 6500/7600 device.

Notes

- Before you define the settings, you must import your Catalyst 6500/7600 device to the Security Manager inventory and discover its interfaces. For more information, see Configuring VPNSM or VPN SPA/VSPA Endpoint Settings , on page 1118.
- Before you configure VPNSM or VPN SPA with VRF-Aware IPsec on a device, verify that an IPsec proposal with VRF-Aware IPsec and an IPsec proposal without VRF-Aware IPsec were not configured on the device.

Navigation Path

In the General tab of the IPsec Proposal Editor Dialog Box (for Catalyst 6500/7600 Devices), click **Select** next to the Inside VLAN field. For more information about opening the IPsec Proposal Editor, see IPsec Proposal Editor (IOS, PIX 6.3 Devices) , on page 1472.

Related Topics

- Creating Interface Role Objects , on page 304

Field Reference

Table 425: VPNSM/VPN SPA/VSPA Settings Dialog Box

Element	Description
Inside VLAN	The inside VLAN that serves as the inside interface to the VPNSM, VPN SPA, or VSPA, and to which the required crypto maps will be applied. Enter the VLAN ID or click **Select** to select it or to create a new interface role object to identify the VLAN.
Slot Subslot	The number designating the slot location of the VPNSM or VPNSPA/VSPA. If you are configuring a VPNSPA/VSPA, the subslot number is also required. **Note** If you are configuring a VPNSM, select 0.
External Port	The external port or VLAN that connects to the inside VLAN. Enter the name of the VLAN or interface role object, or click **Select** to select it from a list. You must select an interface or interface role that differs from the one selected for the inside VLAN. **Note** If VRF-Aware IPsec is configured on the device, the external port or VLAN must have an IP address. If VRF-Aware IPsec is not configured, the external port or VLAN must not have an IP address.

Element	Description
Enable Failover Blade	Whether to configure a failover VPNSM or VPNSPA/VSPA blade for intra-chassis high availability. **Note** A VPNSM and VPNSPA/VSPA blade cannot be used on the same device as primary and failover blades. Specify the failover blade, as follows: • **Slot**—The slot number that identifies where the VPNSM blade or VPNSPA/VSPA blade is located. • **Subslot**—If you are configuring a VPNSPA/VSPA, select the number of the subslot on which the failover VPN SPA blade is installed. **Note** If you are configuring a VPNSM, select 0.

Configuring Dynamic VTI/VRF Aware IPsec in Remote Access VPNs (IOS Devices)

Note The Dynamic VTI/VRF Aware IPsec tab is available only when the selected device is a Cisco IOS router or Catalyst 6500/7600.

Use the Dynamic VTI/VRF Aware IPsec tab of the IPsec Proposal Editor to configure VRF Aware IPsec settings (on a Cisco IOS router or Catalyst 6500/7600 device), configure a dynamic virtual interface on a Cisco IOS router, or do both, in your remote access VPN.

IOS devices allow dynamic virtual template interfaces (VTIs), which provide highly secure and scalable connectivity for remote-access VPNs, replacing dynamic crypto maps and the dynamic hub-and-spoke method for establishing tunnels. You can use dynamic VTIs for both the server and remote configuration. The tunnels provide an on-demand separate virtual access interface for each VPN session. The configuration of the virtual access interfaces is duplicated from a virtual template configuration, which includes the IPsec configuration and any features configured on the virtual template interface. Dynamic VTIs provide efficiency in the use of IP addresses and provide secure connectivity. They enable dynamically downloadable per-group and per-user policies to be configured on a RADIUS server. Dynamic VTI simplifies VRF-Aware IPsec deployment, as the VRF is configured on the interface.

When this feature is enabled, Security Manager implicitly creates the virtual template interface for the selected device in a remote access VPN. All you must do is provide the IP address on the server that will be used as the virtual template interface, or use an existing loopback interface. The virtual template interface is created on the remote client without an IP address.

Notes

- You can configure dynamic VTI only on routers running Cisco IOS Release 12.4(2)T and later, except 7600 devices.
- You can configure dynamic VTI with or without VRF-Aware IPsec. For more information about VRF-Aware IPsec, see Understanding VRF-Aware IPsec , on page 1088.

- You can also configure dynamic VTI in a site-to-site Easy VPN topology. For more information, see Easy VPN with Dynamic Virtual Tunnel Interfaces , on page 1247.

Navigation Path

In the IPsec Proposal Editor Dialog Box (for IOS routers and Catalyst 6500/7600 devices), click the **Dynamic VTI/VRF Aware IPsec** tab. For more information, see IPsec Proposal Editor (IOS, PIX 6.3 Devices) , on page 1472.

Related Topics

- Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471
- Creating Interface Role Objects , on page 304

Field Reference

Table 426: IPsec Proposal Editor, Dynamic VTI/VRF Aware IPsec Tab

Element	Description
Enable Dynamic VTI	When selected, enables Security Manager to implicitly create a dynamic virtual template interface on an IOS router. **Note** Dynamic VTI can be configured only on IOS routers running Cisco IOS Release 12.4(2)T and later, except 7600 devices. If the device does not support Dynamic VTI, the option is greyed out.
Enable VRF Settings	When selected, enables you to configure VRF settings on the device for the selected hub-and-spoke topology. **Note** To remove VRF settings that were defined for the VPN topology, deselect this check box.
User Group	When you configure a remote access VPN server, remote clients must have the same group name as the user group object configured on the VPN server so that they can connect to the device. Enter the name of the user group policy object associated with the device, or click **Select** to select it from a list. You can also create new objects or edit existing ones from the selection list.
CA Server	Select the Certification Authority (CA) server to use for managing certificate requests for the device. Click **Select** to select the PKI enrollment policy object that defines the CA server, or to create a new object. For more information, see PKI Enrollment Dialog Box , on page 1208. For more information about IPsec configuration with CA servers, see Understanding Public Key Infrastructure Policies , on page 1200.

Element	Description
Virtual Template IP Type	Available if you selected **Enable Dynamic VTI**. Specify the virtual template interface to use: • **IP**—To use an IP address as the virtual template interface. Specify the private IP address. • **Use Loopback Interface**—To use the IP address taken from an existing loopback interface as the virtual template interface. Click **Select** to select the interface or interface role object, or to create a new object that identifies the loopback interface.
VRF Solution	Available if you selected **Enable VRF Settings**. Select the VRF solution: • **1-Box (IPsec Aggregator + MPLS PE)**—One device serves as the Provider Edge (PE) router that does the MPLS tagging of the packets in addition to IPsec encryption and decryption from the Customer Edge (CE) devices. For more information, see VRF-Aware IPsec One-Box Solution , on page 1089. • **2-Box (IPsec Aggregator Only)**—The PE device does only the MPLS tagging, while the IPsec Aggregator device does the IPsec encryption and decryption from the CEs. For more information, see VRF-Aware IPsec Two-Box Solution , on page 1090.
VRF Name	The name of the VRF routing table on the IPsec Aggregator. The VRF name is case-sensitive.
Route Distinguisher	The unique identifier of the VRF routing table on the IPsec Aggregator. This unique route distinguisher maintains routing separation for each VPN across the MPLS core to the other PE routers. The identifier can be in either of the following formats: • *IP address:X* , where *X* is in the range of 0-999999999. • *N:X* , where *N* is in the range of 0-65535, and X is in the range of 0-999999999. **Note** You cannot override the RD identifier after deploying the VRF configuration to your device. To modify the RD identifier after deployment, you must manually remove it through the device CLI and then deploy again.
Interface Towards Provider Edge	Available only for 2-Box VRF. The VRF forwarding interface on the IPsec Aggregator towards the PE device. Click **Select** to select the interface or interface role object, or to create a new object that identifies the interface. **Note** If the IPsec Aggregator (hub) is a Catalyst VPN service module, you must specify a VLAN.

Element	Description
Routing Protocol	Available only for 2-Box VRF. Select the routing protocol to use between the IPsec Aggregator and the PE. The options are BGP, EIGRP, OSPF, RIPv2, or Static route. If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, select the routing protocol for redistributing the routing to the secured IGP.
AS Number	Available only for 2-Box VRF with BGP or EIGRP routing. The number to use to identify the autonomous system (AS) area between the IPsec Aggregator and the PE. The AS number must be between 1 and 65535. If the routing protocol for the secured IGP differs from the routing protocol between the IPsec Aggregator and the PE, enter an AS number that identifies the secured IGP into which the routing will be redistributed from the IPsec Aggregator and the PE. This is relevant only if GRE or DMVPN are applied.
Process Number	Available only for 2-Box VRF with OSPF routing. The routing process ID number to use to configure the routing between the IPsec Aggregator and the PE. The process number must be between 1 and 65535.
OSPF Area ID	Available only for 2-Box VRF with OSPF routing. The ID number of the area in which the packet belongs. You can enter any number from 0 to 4294967295. **Note** All OSPF packets are associated with a single area, so all devices must have the same area ID number.
Redistribute Static Route	Available only for 2-Box VRF with any routing protocol other than Static route. When selected, enables static routes to be advertised in the routing protocol configured on the IPsec Aggregator towards the PE device. **Note** If this check box is deselected and Enable Reverse Route Injection is enabled (default) for the IPsec proposal, static routes are still advertised in the routing protocol on the IPsec Aggregator.
Next Hop IP Address	Available only for 2-Box VRF with Static routing. The IP address of the provider edge device (or the interface that is connected to the IPSec aggregator).

Configuring High Availability in Remote Access VPNs (IOS)

Use the High Availability page to configure a High Availability (HA) policy on a Cisco IOS router or Cisco Catalyst switch in a remote access VPN.

In Security Manager, High Availability (HA) is supported by the creation of an HA group made up of two or more devices that use Hot Standby Routing Protocol (HSRP) to provide transparent, automatic device failover. By sharing a virtual IP address, the devices in the HA group present the appearance of a single virtual device

or default gateway to the remote access users. One device in the HA group is always active and assumes the virtual IP address, while the others are standby devices. The devices in the group watch for hello packets from active and standby devices. If the active device becomes unavailable for any reason, a standby device takes ownership of the virtual IP address and takes over the remote access VPN. This transfer is seamless and transparent to remote access users.

Stateful SwitchOver (SSO) is used to ensure that state information is shared between the HSRP devices in the HA group. If a device fails, the shared state information enables the standby device to maintain IPsec sessions without having to re-establish the tunnel or renegotiate the security associations.

Tips

- When configuring an HA group, you must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal. See Configuring an IPsec Proposal on a Remote Access VPN Server (IOS, PIX 6.3 Devices) , on page 1471.
- A remote access VPN server device on which HA is configured cannot be configured as a hub in a site-to-site VPN topology on which HA is configured, using the same outside interface that was used for the remote access VPN server.

Step 1 Do one of the following:

- (Device view) With an IOS device selected, select **Remote Access VPN > IPSec VPN > High Availability** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPSec VPN > High Availability** from the Policy Type selector. Select an existing policy or create a new one.

The High Availability page opens.

Step 2 Configure the options explained in the following table.

Table 427: High Availability Page, Remote Access VPNs

Element	Description
Inside Virtual IP	The IP address that is shared by the devices in the HA group and that represents the inside interface of the HA group. The virtual IP address must be on the same subnet as the inside interfaces of the devices in the HA group, but must not be identical to the IP address of any of these interfaces. You must provide an inside virtual IP that matches the subnet of one of the interfaces on the device, in addition to a VPN virtual IP that matches the subnet of one of the device's interfaces and is configured with an IPsec proposal. **Note** If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.
Inside Mask	The subnet mask for the inside virtual IP address.

Element	Description
VPN Virtual IP	The IP address that is shared by the devices in the HA group and represents the VPN interface of the HA group. This IP address serves as the endpoint of the VPN tunnel. **Note** If there is an existing standby group on the device, make sure that the IP address you provide is different from the virtual IP address already configured on the device.
VPN Mask	The subnet mask for the VPN virtual IP address.
Hello Interval	The duration in seconds (within the range of 1-254) between each hello message sent by a device to the other devices in the group to indicate status and priority. The default is 5 seconds.
Hold Time	The duration in seconds (within the range of 2-255) that a standby device will wait to receive a hello message from the active device before concluding that the device is down. The default is 15 seconds.
Standby Group Number (Inside)	The standby number of the inside device interface that matches the internal virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 1.
Standby Group Number (Outside)	The standby number of the outside device interface that matches the external virtual IP subnet for the devices in the HA group. The number must be within the range of 0-255. The default is 2. **Note** The outside standby group number must be different to the inside standby group number.
Failover Server	The IP address or network/host policy object that identifies the inside interface of the remote peer failover servers. Enter the IP address or network/host object name, or click **Select** to select an object or to create a new object.
Enable Stateful Failover	Enables SSO for stateful failover. This option is always selected and you cannot deselect it for remote access VPNs.

Configuring User Group Policies

Use the User Groups (IOS/PIX 6.x) policy to specify user groups for your remote access IPSec VPN server. You can configure user groups on a Cisco IOS router, PIX 6.3 Firewall, or Catalyst 6500 /7600 device.

When you configure a remote access VPN server, you must create user groups to which remote clients will belong. A user group policy specifies the attributes that determine user access to and use of the VPN. User groups simplify system management, enabling you to quickly configure VPN access for large numbers of users.

For example, in a typical remote access VPN, you might allow a finance group to access one part of a private network, a customer support group to access another part, and an MIS group to access other parts. In addition, you might allow specific users within MIS to access systems that other MIS users cannot access. User group policies provide the flexibility to do so securely.

Remote clients must have the same group name as the user group configured on the VPN server so that they can connect to the device; otherwise, a connection cannot be established. When a remote client establishes a connection to the VPN server, the group policies for that user group are pushed to all clients belonging to the same user group. You can configure user groups on the local remote access VPN server and external AAA servers.

Notes

- You can also specify user groups using the Remote Access VPN Configuration Wizard. For more information, see Using the Remote Access VPN Configuration Wizard , on page 1300.
- To specify group policies for an SSL VPN on an IOS device, use the SSL VPN policy as explained in Configuring an SSL VPN Policy (IOS) , on page 1482.

Related Topics

- Understanding Remote Access IPSec VPNs , on page 1288

Step 1 Do one of the following:

- (Device view) With an IOS router, Catalyst 6500/7600, or PIX 6.3 device selected, select **Remote Access VPN > IPSec VPN > User Groups (IOS/PIX 6.x)** from the Policy selector.
- (Policy view) Select **Remote Access VPN > IPSec VPN > User Groups (IOS/PIX6.x)** from the Policy Type selector. Select an existing policy or create a new one.

The User Groups page opens.

The page contains two lists: Available User Groups lists all existing User Group policy objects that are configured for remote access IPsec VPNS; Selected User Groups lists all of the User Group policy objects that will be configured on the device.

Step 2 Ensure that the list of selected user groups contains the desired User Group policy objects:

- To create a new User Group policy object, click the Create (+) button beneath the available user groups list to open the Add User Group dialog box. For instructions on creating the object, see Add or Edit User Group Dialog Box , on page 1564.

After you create the group, it is added to the available list, and you must add it to the selected list if you want to use it.

- To add a User Group to the selected list, select it in the available list and click >>.
- To remove a User Group, select it in the selected list and click <<. If the group is already configured on the device, it will be removed during the next deployment.
- You can edit the properties of a User Group object by selecting it in either list and clicking the **Edit** button.

Configuring an SSL VPN Policy (IOS)

Use the SSL VPN policy to configure the SSL VPN connection policies for an IOS router. From this page, you can create, edit, or delete SSL VPN policies.

Related Topics

- Understanding Remote Access SSL VPNs , on page 1289
- Creating SSL VPNs Using the Remote Access VPN Configuration Wizard (IOS Devices) , on page 1318
- Filtering Tables , on page 50

Step 1 Do one of the following:

- (Device view) With an IOS device selected, select **Remote Access VPN > SSL VPN** from the Policy selector.
- (Policy view) Select **Remote Access VPN > SSL VPN > SSL VPN Policy (IOS)** from the Policy Type selector. Select an existing policy or create a new one.

The SSL VPN page appears.

The table lists all of the contexts that define the virtual configurations of the SSL VPN. Each context has a gateway, domain or virtual hostname, and user group policies. The status of the context is also shown, either In Service or Out of Service.

Step 2 Do either of the following:

- To add a context, click the **Add Row** button to open the SSL VPN Context Editor Dialog Box (IOS) , on page 1484.
- To edit a context, select it and click the **Edit Row** button.

Note To delete a context, select it and click the **Delete Row** button.

Step 3 Configure at least the following general settings for the policy. For information on other fields, see General Tab , on page 1485.

- **Name, Domain**—For new policies, the name of the context that defines the virtual configuration of the SSL VPN. To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.
- **Gateway**—The SSL VPN gateway policy object that identifies the gateway device to which users will connect, including interface and port configuration. Click **Select** to select the object from a list or to create a new object.

When you select the object, the Portal Page URL field shows the URL to which users connect.

- **Authentication Server Group**—A prioritized list of AAA server group objects that identify the AAA servers to use for authenticating users.
- **User Groups**— The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway.

To add a user group, click **Add Row** to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the **Create** button below the available groups list and create it. For more information about user group objects, see Add or Edit User Group Dialog Box , on page 1564.

Step 4 Click the **Portal Page** tab and customize the design of the login page. You can customize the title, the logo graphic, the message that appears above the login prompt, and the background and text colors.

If you want to select a different graphic, you must first copy the graphic onto the Security Manager server. You cannot select it from your workstation's hard drive.

Step 5 Click the **Secure Desktop** tab to configure Cisco Secure Desktop (CSD) software. CSD policies define entry requirements for client systems and provide a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session.

If you want to use CSD, select **Enable Cisco Secure Desktop** and click **Select** to select a Secure Desktop Configuration policy object, which defines the rules you want to use to control VPN access and host scanning. You can create a new object from the selection list. For information about configuring these objects, see Creating Cisco Secure Desktop Configuration Objects , on page 1486.

Note You must install and activate the Secure Desktop Client software on a device for your configuration to work.

Step 6 Click the **Advanced** tab to configure a maximum number of simultaneous users for the context or if you are using VRF, the name of the VRF instance that is associated with the SSL VPN context.

Step 7 Click **OK** to save your changes.

SSL VPN Context Editor Dialog Box (IOS)

Use this dialog box to create or modify a context that defines the virtual configuration of an SSL VPN. For more information, see Configuring an SSL VPN Policy (IOS) , on page 1482.

Navigation Path

Open the SSL VPN (IOS) policy, then click **Add Row (+)**, or select a context in the table and click **Edit Row**. For information on opening the SSL VPN policy, see Configuring an SSL VPN Policy (IOS) , on page 1482.

Field Reference

Table 428: SSL VPN Context Editor Dialog Box

Element	Description
General tab	Defines the general settings required for an SSL VPN policy. General settings include specifying the gateway, domain, AAA servers for accounting and authentication, and user groups. For a description of the fields on this tab, see General Tab , on page 1485.
Portal Page tab	Defines the design of the login page for the SSL VPN policy. The display box at the bottom of the tab changes to show you how your selections will look. You can configure: • Title—The text displayed at the top of the page. Control the color using the Primary settings in the Title Color and Text Color fields. • Logo—The graphic displayed next to the title. Select None, Default, or Custom. To configure a custom graphic, you must copy the desired graphic to the Security Manager server, then click **Browse** to select the file. Supported graphic types are GIF, JPG, and PNG, with a maximum size of 100 KB. • Login Message—The text displayed immediately above the login prompt. Control the color using the Secondary settings in the Title Color and Text Color fields.

Element	Description
Secure Desktop tab	Configures the Cisco Secure Desktop (CSD) software on the router. CSD policies define entry requirements for client systems and provide a single, secure location for session activity and removal on the client system, ensuring that sensitive data is shared only for the duration of an SSL VPN session. **Note** You must install and activate the Secure Desktop Client software on a device for your configuration to work. If you want to use CSD, select **Enable Cisco Secure Desktop** and click **Select** to select a Secure Desktop Configuration policy object, which defines the rules you want to use to control VPN access and host scanning. You can create a new object from the selection list. For information about configuring these objects, see Creating Cisco Secure Desktop Configuration Objects , on page 1486.
Advanced tab	Configures these additional settings: • Maximum Number of Users—The maximum number of SSL VPN user sessions allowed at one time, from 1-1000. • VRF Name—If Virtual Routing Forwarding (VRF) is configured on the device, the name of the VRF instance that is associated with the SSL VPN context. For information about VRF, see Understanding VRF-Aware IPsec , on page 1088.

General Tab

Use the General tab of the SSL VPN Context Editor dialog box to define or edit the general settings required for an SSL VPN policy. General settings include specifying the gateway, domain, AAA servers for accounting and authentication, and user groups.

Navigation Path

Open the SSL VPN Context Editor Dialog Box (IOS) , on page 1484, then click the **General** tab.

Related Topics

Field Reference

Table 429: SSL VPN Context Editor General Tab (IOS)

Element	Description
Enable SSL VPN	Whether to activate the SSL VPN connection, putting it “In Service”.

Element	Description
Name	The name of the context that defines the virtual configuration of the SSL VPN. **Note** To simplify the management of multiple context configurations, make the context name the same as the domain or virtual hostname.
Gateway	The name of the SSL VPN gateway policy object that defines the characteristics of the gateway to which users connect when entering the VPN. A gateway object provides the interface and port configuration for an SSL VPN connection. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Domain	The domain or virtual hostname of the SSL VPN connection.
Portal Page URL	The URL for the SSL VPN, which is filled in when you select a gateway object. Users connect to this URL to enter the VPN.
Authentication Server Group	The authentication server groups. The list is in prioritized order. Authentication is attempted using the first group and proceeds through the list until the user is successfully authenticated or denied. Use the LOCAL group if the users are defined on the gateway itself. Enter the names of the AAA server groups; separate multiple entries with commas. You can click **Select** to select the groups or to create new ones.
Authentication Domain	A list or method for SSL VPN remote user authentication. If you do not specify a list or method, the gateway uses global AAA parameters for remote-user authentication.
Accounting Server Group	The accounting server group. Enter the name of the AAA server group policy object, or click **Select** to select it from a list or to create a new object.
User Groups	The user groups that will be used in your SSL VPN policy. User groups define the resources available to users when connecting to an SSL VPN gateway. The table shows whether full client, CIFS file access, and thin client is enabled for the group. • To add a user group, click **Add Row** to open a list of existing user group policy objects from which you can select the group. If the desired group does not already exist, click the **Create** button below the available groups list and create it. For more information about user group objects, see Add or Edit User Group Dialog Box , on page 1564. • To edit a user group, select it and click the **Edit Row** button. • To delete a user group, select it and click the **Delete Row** button. This deletes the group only from the policy, it does not delete the user group policy object.

Creating Cisco Secure Desktop Configuration Objects

Cisco Secure Desktop (CSD) Configuration objects define the settings you want to use if you enable Secure Desktop in an SSL VPN policy for an IOS device (see Configuring an SSL VPN Policy (IOS) , on page 1482).

For ASA devices, the feature is set up as part of the Dynamic Access Policy (see Understanding Dynamic Access Policies , on page 1419 and Configuring Cisco Secure Desktop Policies on ASA Devices , on page 1427).

Cisco Secure Desktop (CSD) provides a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system. CSD provides a session-based interface where sensitive data is shared only for the duration of an SSL VPN session. All session information is encrypted, and all traces of the session data are removed from the remote client when the session is terminated, even if the connection terminates abruptly.

About Windows Locations

Windows locations let you determine how clients connect to your virtual private network, and protect it accordingly. For example, clients connecting from within a workplace LAN on a 10.x.x.x network behind a NAT device are an unlikely risk for exposing confidential information. For these clients, you might set up a CSD Windows Location named Work that is specified by IP addresses on the 10.x.x.x network, and disable both the Cache Cleaner and the Secure Desktop function for this location.

In contrast, users' home PCs might be considered more at risk to viruses due to their mixed use. For these clients, you might set up a location named Home that is specified by a corporate-supplied certificate that employees install on their home PCs. This location would require the presence of antivirus software and specific, supported operating systems to grant full access to the network.

Alternatively, for untrusted locations such as Internet cafes, you might set up a location named "Insecure" that has no matching criteria (thus making it the default for clients that do not match other locations). This location would require full Secure Desktop functions, and include a short timeout period to prevent access by unauthorized users. If you create a location and do not specify criteria, make sure it is the last entry in the Locations list.

- Setting Up CSD for Microsoft Windows Clients, http://www.cisco.com/en/US/docs/security/csd/csd311/csd_for_vpn3k_cat6k/configuration/guide/CSDwin.html
- Creating Policy Objects , on page 237

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **Cisco Secure Desktop Configuration** from the Object Type selector.

Step 3 Right-click in the work area and select **New Object** to open the Add or Edit Secure Desktop Configuration Dialog Box , on page 1524 .

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Select **Windows Location Settings** to create locations (such as Work, Home, or Insecure), and define the location-based settings (also called adaptive policies) for CSD.

a) For each location you want to configure, enter its name in the **Location to Add** field and click **Add** to move it to the Locations field. You can reorder the locations using the Move Up and Move Down buttons. When users connect, these locations are evaluated in order and the first one that matches is used to define the policies for the user.

When you add a location, a folder for the location is added to the table of contents. The folder and its subfolders define the policies for the location.

b) If you want all the open browser windows to close after the Secure Desktop installation, make sure to select the corresponding check box.

c) Select the required check boxes to configure a VPN Feature policy that enables web browsing, file access, port forwarding, and full tunneling, if installation or location matching fails.

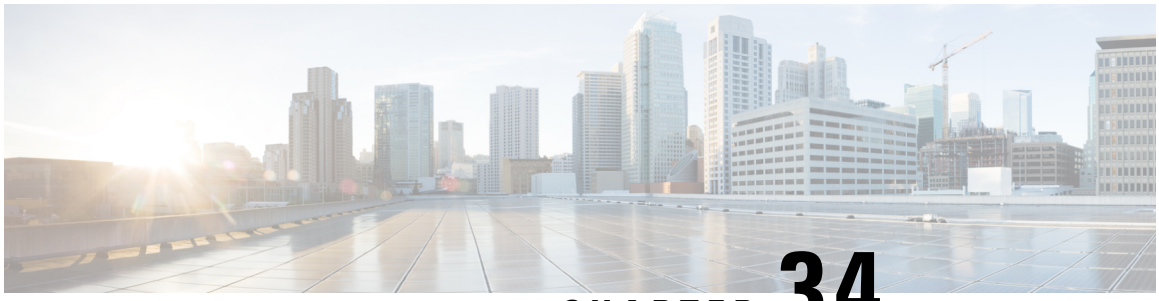
Step 6 Select the folders and subfolders for the Windows locations you added and configure their settings. For detailed information about these settings, see *Setting Up CSD for Microsoft Windows Clients* at http://www.cisco.com/en/US/docs/security/csd/csd311/csd_for_vpn3k_cat6k/configuration/guide/CSDwin.html .

Step 7 Select **Windows CE** to configure a VPN feature policy to enable or restrict web browsing and remote server file access for remote clients running Microsoft Windows CE.

Step 8 Select **Mac and Linux Cache Cleaner** to configure the Cache Cleaner and a VPN Feature Policy for these clients, such as enabling or restricting web browsing, remote server file access, and port forwarding.

Step 9 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 10 Click **OK** to save the object.



CHAPTER 34

Configuring Policy Objects for Remote Access VPNs

There are several policy objects that you use primarily or exclusively with remote access VPNs. Some of these objects, the ASA Group Policies and User Group objects, are also used with Easy VPN site-to-site topologies. This reference explains the configuration of these policy objects.

This chapter contains the following topics:

ASA Group Policies Dialog Box

Use the Add or Edit ASA Group Policies dialog box to create, copy, and edit an ASA user group policies object.

ASA group policies are configured on ASA security appliances in Easy VPN topologies, remote access IPSec VPNs, and remote access SSL VPNs. When you configure an Easy VPN or remote access VPN, you must create group policies to which remote clients will belong. A group policy is a set of user-oriented attribute/value pairs for VPN connections that are stored either internally (locally) on the device or externally on a AAA server. The tunnel group uses a group policy that sets terms for user connections after the tunnel is established. Group policies let you apply whole sets of attributes to a user or a group of users rather than having to specify each attribute individually for each user.

Note You must select the technology for which you are creating the object. Depending on the selected technology, the appropriate settings are available for configuration. If you select the IKEv1 or IKEv2 options, the IKE Proposal and IPSec Proposal policies must also be configured to support the selected IKE version.

From version 4.18, Cisco Security Manager has introduced the option to override group policies. In the ASA Group Policy page, you can enable device overrides and edit device overrides from right-click menu. When override is enabled,

Navigation Path

Select **ASA Group Policies** in the Policy Object Manager , on page 232. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Tip You can also create objects while configuring policies that use this type of object, including Connection Profile policies for remote access and Easy VPN, or the Group Policies policy for remote access VPNs.

Related Topics

- Configuring Connection Profiles (ASA, PIX 7.0+) , on page 1331
- Creating Group Policies (ASA, PIX 7.0+) , on page 1354

Field Reference

Table 430: Add or Edit ASA Group Policies Dialog Box, including Technology Settings

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Settings Pane The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right. You must first configure technology settings, then you can select items from the table of contents on the left and configure the options you require. Your selections on the Technology page control which options are available on these pages and in the table of contents. The top folders in the table of contents represent the VPN technologies or other settings that you can configure, and are explained next.	

Element	Description

Technology settings	These settings control what you can define in the group policy:
	• **Group Policy Type**—Whether you are storing the group policy on the ASA device itself (**Internal**) or on a AAA server (**External**). You cannot change this option when editing an object.
	
	If you select **External**, the only attributes you can configure are the name of the AAA server group object that identifies the AAA server and its password.
	• **Technology**—The types of VPN for which this object defines group policies. Select all that apply:
	  • Easy VPN/IPSec IKEv1—For Easy VPN topologies or remote access IPsec VPNs that allow IKEv1 negotiations.
	  • Easy VPN/IPSec IKEv2—For remote access IPsec VPNs that allow IKEv2 negotiations. IKEv2 is not supported in Easy VPN topologies.
	  • SSL Clientless—For remote access SSL VPNs of all types, not just clientless.
	
	Note To enable web-based VPN (webvpn) option in group-policy attribute, you must enable either "ssl-client" or "ssl-clientless" tunneling protocol. In other words, upon device discovery in Security Manager, if the group-policy attribute "vpn-tunnel-protocol" does not have either "ssl-client" or "ssl-clientless" in the configuration, during the next deployment of the device, Security Manager would remove the "webvpn" option under group-policy attributes.
	
	Note From Cisco Security Manager 4.24 onwards, **SSL Clientless** feature is deprecated for ASA 9.17(1) and higher version devices.
	
	• **External Server Group**—If you are storing the group policy attributes on an external AAA server, specify the AAA server group that will be used for authentication. Click **Select** to select the object from a list or to create a new object.
	
	After you select an external server group, the **Password** and **Confirm** fields become active. Enter the alphanumeric password to use for authenticating with the server in both fields. The password can be a maximum of 128 characters; spaces are not allowed.

DNS/WINS	The DNS and WINS servers and the domain name that should be pushed to clients associated with the group. See ASA Group Policies DNS/WINS Settings , on page 1519.
Split Tunneling	Settings to allow a remote client to conditionally direct encrypted packets through a secure tunnel to the central site and simultaneously allow clear text tunnels to the Internet through a network interface. See ASA Group Policies Split Tunneling Settings , on page 1520.

Element	Description
Easy VPN/IPSec VPN	Settings for Easy VPN and remote access IPSec VPNs: • Client Configuration—The Cisco client parameters for the group. See ASA Group Policies Client Configuration Settings , on page 1494. • Client Firewall Attributes—The firewall settings for VPN clients for the group. See ASA Group Policies Client Firewall Attributes , on page 1495. • Hardware Client Attributes—The VPN 3002 Hardware Client settings for the group. See ASA Group Policies Hardware Client Attributes , on page 1497. • IPSec—The tunneling protocols, filters, connection settings, and servers for the group. See ASA Group Policies IPSec Settings , on page 1498.
SSL VPN	Settings for SSL VPN: • Clientless—Settings for the clientless mode of access to the corporate network in an SSL VPN. See ASA Group Policies SSL VPN Clientless Settings , on page 1500. • Full Client—Settings for the full client mode of access to the corporate network in an SSL VPN. See ASA Group Policies SSL VPN Full Client Settings , on page 1506. • Settings—The general settings that are required for clientless/port forwarding in an SSL VPN. See ASA Group Policies SSL VPN Settings , on page 1512.
Connection Settings	The connection settings for the group, such as the session and idle timeouts, including the banner text. See ASA Group Policies Connection Settings , on page 1522.
General Settings	• Override Group Policy—Beginning with version 4.18, Cisco Security Manager allows group policy overrides. See Override ASA Group Policy , on page 1492.

Override ASA Group Policy

In Cisco Security Manager, group policies are created for the devices and maintained at the Cisco Security Manager level. When there is an upgrade, on rediscovery, Cisco Security Manager recreates these policies as new (with a suffix to the policy name). To overcome this duplication, from version 4.18, an Allow Value Override per device check box is used to set the group policy override on the specific device(s). For more information, see Managing Object Overrides , on page 246.

You can edit the device-level overrides for the group policies. See Policy Object Overrides Window , on page 249.

Supported CLIs in Remote Access VPN Multi-Context Mode - Group Policy

The following CLIs are supported for Group Policy in ASA version 9.5(2) for remote access VPN in multiple context mode. These CLIs are supported in Admin and User Context.

Note For the configurations that are not supported, Security Manager displays a warning message that you can ignore. No delta will be generated.

ASA Group Policies Client Configuration Settings

Use the Client Configuration settings page to configure the Cisco client parameters for the ASA group policy for Easy VPN or remote access VPN.

Client Configuration is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Easy VPN/IPSec VPN > Client Configuration** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 431: ASA Group Policies Client Configuration Settings

Element	Description
Store Password on Client System	Whether to allow users to store a password on their local systems. Enable this feature only if you are certain that the local systems will be in secure sites.

Element	Description
Enable IPsec over UDP UDP Port	Whether to allow a Cisco VPN client or hardware client to connect using UDP to a security appliance that is running NAT. If you select this option, specify the UDP port number within the range of 4001-49151. In IPsec negotiations, the security appliance listens on the configured port and forwards UDP traffic for that port even if other filter rules drop UDP traffic. **Note** The Cisco VPN client must also be configured to use IPsec over UDP, which is configured by default on certain devices.
IPsec Backup Servers Servers List	Specify the backup server configuration: • **Keep Client Configuration**—The security appliance sends no backup server information to the client. The client uses its own backup server list, if configured. This is the default. • **Clear Client Configuration**—The client uses no backup servers. The security appliance pushes a null server list. • **Use Specified Backup Servers**—Use the backup servers you specify in the servers list. Enter the IP addresses of the servers, or the name of a network/host object. Click **Select** to select the object from a list or to create a new object. You can configure backup servers either on the client or on the primary security appliance. If you configure backup servers on the security appliance, it pushes the backup server policy to the clients in the group, replacing the backup server list on the client if one is configured.

ASA Group Policies Client Firewall Attributes

Use the Client Firewall Attributes settings to configure the firewall settings for VPN clients for the ASA group policy for Easy VPN or remote access IPSec VPN. Only VPN clients running Microsoft Windows can use these firewall settings.

Client Firewall Attributes are not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Easy VPN/IPSec VPN > Client Firewall Attributes** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 432: ASA Group Policies Client Firewall Attributes

Element	Description
Firewall Mode	The firewall requirements for client systems for the group: • **No Firewall**—Do not use a firewall. You cannot configure any other options on the page. • **Firewall Required**—All users in this group must use the designated firewall. The security appliance drops any session that attempts to connect without the designated firewall installed and running. In this case, the security appliance notifies the VPN client that its firewall configuration does not match. **Note** Make sure the group does not include any clients other than Windows VPN Clients. Any other clients in the group (including VPN 3002 Hardware Clients) are unable to connect if you require a client firewall. • **Firewall Optional**—Users can use a firewall but it is not required. This option allows all users in the group to connect. Those who have a firewall can use it; users that connect without a firewall receive a warning message. This setting is useful if you are creating a group in which some users have firewalls and others do not. For example, you might have clients with systems that do not run Microsoft windows, or your clients have not all had the opportunity to install firewall software.
Firewall Type	The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco, Network ICE, Sygate, and Zone Labs. • If you select Custom Firewall, you must fill in the fields in the Custom Firewall group. You also need to configure the policy source; select options only if they are supported by the vendor. • Some firewall types require you to specify the source of the policy implemented by the firewall.
Policy Source	Some types of firewall allow you to configure where the client firewall should obtain its policies: • Get Policy From Remote Firewall—The policy is configured in the client firewall application. This is how most client firewalls work. • Use Specified Policy—The policy you specify should be pushed to the client firewall application, which should use your policy. You must enter the name of an extended access control list policy object or Unified ACL, or click **Select** to select one from a list or to create a new one, in both in the **Inbound Traffic Policy** and **Outbound Traffic Policy** fields. Unified ACLs are supported from ASA version 9.0.

Element	Description
Custom Firewall	The attributes that define the required or optional firewall if you select custom firewall as the firewall type: • Vendor ID—The number that identifies the vendor of the custom firewall. Values are 1-255. • Product ID—The number that identifies the product or model of the custom firewall. Values are 1-32 or 255. Multiple ranges are allowed, for example, 4-12, 24-32. Use 255 for all supported products. • Description—An optional description of the custom firewall, for example, the name of the vendor and product.

ASA Group Policies Hardware Client Attributes

Use the Hardware Client Attributes settings to configure the VPN 3002 Hardware Client settings for the ASA group policy in an Easy VPN or remote access IPSec VPN.

Hardware Client Attributes are not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Easy VPN/IPSec VPN > Hardware Client Attributes** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 433: ASA Group Policies Hardware Client Attributes

Element	Description
Require Interactive Client Authentication	Whether to enable secure unit authentication, which provides additional security by requiring VPN hardware clients to authenticate with a username and password each time that the client initiates a tunnel. The hardware client does not have a saved username and password. **Note** Secure unit authentication requires that you have an authentication server group configured for the tunnel group the hardware clients use. If you require secure unit authentication on the primary security appliance, be sure to configure it on any backup servers as well.
Require Individual User Authentication	Whether to require that individual users behind a hardware client authenticate to gain access to the network across the tunnel. Individual users authenticate according to the order of authentication servers that you configure. If you do not select this option, the security appliance allows inheritance of a value for user authentication from another group policy.
Enable Cisco IP Phone Bypass	Whether to allow IP phones behind hardware clients to connect without undergoing a user authentication processes. Secure unit authentication remains in effect for other users.

Element	Description
Enable LEAP Bypass	Whether to enable Lightweight Extensible Authentication Protocol (LEAP) packets from wireless devices behind a VPN hardware client to travel across a VPN tunnel prior to user authentication. This action lets workstations using Cisco wireless access point devices establish LEAP authentication and then authenticate again per user authentication. **Note** LEAP is an 802.1X wireless authentication method that implements mutual authentication between a wireless client on one side of a connection and a RADIUS server on the other side. The credentials used for authentication, including a password, are always encrypted before they are transmitted over the wireless medium.
Allow Network Extension Mode	Whether to enable network extension mode for hardware clients. Network extension mode lets hardware clients present a single, routable network to the remote private network over the VPN tunnel. IPsec encapsulates all traffic from the private network behind the hardware client to networks behind the security appliance. PAT does not apply. Devices behind the security appliance have direct access to devices on the private network behind the hardware client over the tunnel, and only over the tunnel, and vice versa. The hardware client must initiate the tunnel, but after the tunnel is up, either side can initiate data exchange.
Idle Timeout Mode	How to handle periods of inactivity from individual clients: • Specified Timeout—If there is no communication activity by a user behind a hardware client for the number of minutes you specify, the security appliance terminates the client's access. Values are 1-35791394 minutes. • Unlimited Timeout—User sessions are not terminated due to inactivity.

ASA Group Policies IPSec Settings

Use the IPsec settings to specify tunneling protocols, filters, connection settings, and servers for the ASA group policy for Easy VPN or remote access IPSec VPN. This creates security associations that govern authentication, encryption, encapsulation, and key management.

IPSec is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Easy VPN/IPSec VPN > IPsec** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 434: ASA Group Policies IPSec Settings

Element	Description
Enable Re-Authentication on IKE Re-Key	Whether the security appliance should prompt the user to enter a username and password during initial Phase 1 IKE negotiation and also prompt for user authentication whenever an IKE rekey occurs, providing additional security. Reauthentication fails if no user is at the other end of the connection.
Enable IPsec Compression	Whether to enable data compression, which speeds up transmission rates for remote dial-in users connecting with modems. **Caution** Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.
Enable Perfect Forward Secrecy (PFS)	Whether to enable the use of Perfect Forward Secrecy (PFS) to generate and use a unique session key for each encrypted exchange. In IPsec negotiations, PFS ensures that each new cryptographic key is unrelated to any previous key.
Tunnel Group Lock	Tunnel group lock restricts users by checking if the group configured in the VPN client is the same as the tunnel group to which the user is assigned. If it is not, the security appliance prevents the user from connecting. If you do not specify a tunnel name, the security appliance authenticates users without regard to the assigned group. Group locking is disabled by default.
Client Access Rules table	The access rules for clients. These rules control which types of clients are denied access, if any. You can have up to 25 rules, and combined they are limited to 255 characters. **Tip** If you define any rule, an implicit deny all rule is added. Thus, if a client matches no permit rule, the client is denied access. If you create rules, ensure that you have permit rules for all allowed clients. You can use * as a wildcard to match partial strings. The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it. • To add a rule, click the **Add Row** button to open the Add or Edit Client Access Rules Dialog Box , on page 1500. • To edit a rule, select it and click the **Edit Row** button. • To delete a rule, select it and click the **Delete** button.

Add or Edit Client Access Rules Dialog Box

Use the Client Access Rules dialog box to create or edit the priority, action, VPN client type and VPN client version for a client access rule.

Navigation Path

From ASA Group Policies IPSec Settings , on page 1498, click the **Add Row** button beneath the Client Access Rules table, or select a rule and click the **Edit Row** button.

Field Reference

Table 435: Add or Edit Client Access Rules Dialog Box

Element	Description
Priority	The relative priority of the rule. The rule with the lowest integer has the highest priority. Therefore, the rule with the lowest integer that matches a client type or version is the rule that applies. If a lower priority rule contradicts, the security appliance ignores it. Values are 1-65535.
Action	Whether this rule permits or denies traffic access to the client.
VPN Client Type VPN Client Version	The type or version of VPN client to which this rule applies. Spaces are allowed. You can use * as a wildcard to match zero or more characters. You can use n/a for clients that do not send their type or version. The strings you enter in these fields must match the strings displayed using the **show vpn-sessiondb remote** command on the ASA device. Following are some examples, where priority, permit/deny, type, and version are shown in order: • **3 Deny * version 3.*** is a priority 3 rule that denies all client types with software version 3.x. • **5 Permit VPN3002 *** is a priority 5 rule that allows VPN3002 clients of all software versions. • **255 Permit * *** is a priority 255 rule that allows all types and versions of clients. This is useful if you are only trying to deny specific types of clients without wanting to create permit rules for all the other types.

ASA Group Policies SSL VPN Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

When a user connects to the SSL VPN in clientless mode, the user logs into the SSL VPN portal page. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers, depending on how you configure the portal.

Clientless is not supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **SSL VPN** > **Clientless** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 436: ASA Group Policies SSL VPN Clientless Settings

Element	Description
Portal Page Websites	The name of the SSL VPN bookmarks policy object that includes the website URLs to display on the portal page. These websites help users access desired resources. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Allow Users to Enter Websites	Whether to allow the remote user to enter website URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.
Enable File Server Browsing	Whether to allow the remote user to browse for file shares on the CIFS file servers.
Enable File Server Entry	Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.
Enable Hidden Shares	Whether to make hidden CIFS shares visible, and thus accessible, to users.
HTTP Proxy	The type of access you want to allow to the external HTTP proxy server to which the security appliance forwards HTTP connections. You can enable access, disable access, or select Auto Start, which starts the proxy automatically upon user login.
Filter ACL	The name of the web type access control list policy object to use to restrict user access to the SSL VPN. Enter the name of the object or click **Select** to select it from a list or to create a new object. Beginning with version 4.10, you can enter IPv6 values for the web type ACL.
Enable ActiveX Relay	Whether to enable ActiveX relay, which allows users to start ActiveX programs from the portal page. This allows users to start Microsoft Office applications from the web browser and upload and download Office documents.
UNIX Authentication Group ID	The UNIX authentication group ID.
UNIX Authentication User ID	The UNIX authentication user ID.

Element	Description
Smart Tunnel	The name of the smart tunnel list policy object assigned to this group. Click **Select** to select it from a list or to create a new object. A smart tunnel is a connection between a Winsock 2, TCP-based application and a private site. The connection uses a clientless (browser-based) SSL VPN session with the security appliance as the pathway, and the security appliance as a proxy server. Thus, smart tunnels do not require users to have administrator privileges. For more information, see Configuring SSL VPN Smart Tunnels for ASA Devices , on page 1414. **Note** Cisco Security Manager 4.24 onwards, **Smart Tunnel**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
Auto Start Smart Tunnel	Whether to start smart tunnel access automatically upon user login. If you do not select this option, the user must start the tunnel manually through the Application Access tools on the portal page. Auto sign-on supports only applications that use HTTP and HTTPS using the Microsoft WININET library on a Microsoft Windows operating system. For example, Microsoft Internet Explorer uses the WININET dynamic linked library to communicate with web servers. **Note** From Cisco Security Manager 4.24 onwards, **Auto Start Smart Tunnel**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
Smart Tunnel Network List	Choose from the following options to select the list of hosts or network for which you want to use the smart tunnel. To enable the selection, you must first create the smart tunnel network list entries. For more information, see Add and Edit A Smart Tunnel Network List Entry Dialog Box , on page 1561. Note that this feature is supported on devices that are running ASA software version 8.3(1) and later. • None—If you select this option, the group policy inherits the values from the default Group Policy. This option is enabled by default. • Tunnel All—Select this option if you want to use the smart tunnel for all network traffic. • Include—Select this option if you want to use the smart tunnel for specific networks. Then click **Select** to open the Smart Tunnel Network List Selector dialog box. You can select from the available entries or add entries. To add smart tunnel network list entries, see Add and Edit A Smart Tunnel Network List Entry Dialog Box , on page 1561. • Exclude—Select this option if you do not want to use the smart tunnel for specific networks. Then click **Select** to open the Smart Tunnel Network List Selector dialog box. You can select from the available entries or add entries. To add smart tunnel network list entries, see Add and Edit A Smart Tunnel Network List Entry Dialog Box , on page 1561. **Note** From Cisco Security Manager 4.24 onwards, **Smart Tunnel Network List**[1] feature is deprecated for ASA 9.17(1) and higher version devices.

Element	Description
Smart Tunnel Auto Signon Server List	The name of the smart tunnel auto sign-on list policy object assigned to this group. Click **Select** to select it from a list or to create a new object. **Note** From Cisco Security Manager 4.24 onwards, **Smart Tunnel Auto Signon Server List**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
Domain Name(Optional)	The Windows domain to add to the username during auto sign-on, if the universal naming convention (domain\username) is required for authentication. For example, enter CISCO to specify CISCO\qa_team when authenticating for the username qa_team. You must also check the Use Domain option when configuring associated entries in the auto sign-on server list.
Port Forwarding List	The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click **Select** to select it from a list or to create a new object. **Note** From Cisco Security Manager 4.24 onwards, **Port Forwarding List**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
Auto Start Port Forwarding	Whether to start port forwarding automatically upon user login. **Note** From Cisco Security Manager 4.24 onwards, **Auto Start Port Forwarding**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
Port Forwarding Applet Name	The application name or short description to display on the Port Forwarding Java applet screen on the portal, up to 64 characters. This is the name of the applet users will download to act as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. **Note** From Cisco Security Manager 4.24 onwards, **Port Forwarding Applet Name**[1] feature is deprecated for ASA 9.17(1) and higher version devices.
VDI Servers List table	The Citrix XenApp or XenDesktop servers that comprise the Virtual Desktop Infrastructure. • To add a VDI server, click the **Add Row** button to open the Add or Edit VDI Server Dialog Box , on page 1503. • To edit a rule, select it and click the **Edit Row** button. • To delete a rule, select it and click the **Delete** button.

Add or Edit VDI Server Dialog Box

Use the VDI Server dialog box to create or edit a Citrix XenApp or XenDesktop Server entry.

In a Virtual Desktop Infrastructure (VDI) model, administrators publish enterprise applications or desktops pre-loaded with enterprise applications, and end users remotely access these applications. These virtualized

resources appear just as any other resources, such as email, so that users do not need to go through a Citrix Access Gateway to access them. Users log onto the ASA using Citrix Receiver mobile client, and the ASA connects to a pre-defined Citrix XenApp or XenDesktop Server. The administrator must configure the Citrix server's address and logon credentials under Group Policy so that when users connect to their Citrix Virtualized resource, they enter the ASA's SSL VPN IP address and credentials instead of pointing to the Citrix Server's address and credentials. When the ASA has verified the credentials, the receiver client starts to retrieve entitled applications through the ASA.

Supported Mobile Devices

- iPad—Citrix Receiver version 4.x or later
- iPhone/iTouch—Citrix Receiver version 4.x or later
- Android 2.x/3.x/4.0/4.1 phone—Citrix Receiver version 2.x or later
- Android 4.0 phone—Citrix Receiver version 2.x or later

Navigation Path

From ASA Group Policies SSL VPN Clientless Settings , on page 1500, click the **Add Row** button beneath the VDI Servers List table, or select a rule and click the **Edit Row** button.

Field Reference

Table 437: Add or Edit VDI Server Dialog Box

Element	Description
Hostname/IP Address (IPv4/IPv6)	Address of the XenApp or XenDesktop server. This value can be a clientless macro. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the version 9.0 or later. For invalid IPv6 addresses, Security Manager throws up an error.
Port Number (Optional)	Port number for connecting to the Citrix server. This value can be a clientless macro.
Domain	Domain for logging into the virtualization infrastructure server. This value can be a clientless macro.
Secure HTTP	Check the checkbox if you want the server to connect using SSL.

Element	Description
Username	Username for logging into the virtualization infrastructure server. This value can be a clientless macro. The macros available for username are: • CSCO_WEBVPN_USERNAME—SSL VPN user login ID. • CSCO_WEBVPN_CONNECTION_PROFILE—SSL VPN user login group drop-down, a group alias within the connection profile. • CSCO_WEBVPN_MACRO1—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value1. Variable substitution via RADIUS is performed by VSA#223. • CSCO_WEBVPN_MACRO2—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value2. Variable substitution via RADIUS is performed by VSA#224. • CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps. These macros take the following three parameters: • Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128. • URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: • None—No transformation occurs on the string value before sending to the backend server. • url-encode—Each parsed value is URL encoded, except for a list of reserved characters that make up the special characters in a URL. • url-encode-data—Each parsed value is transformed fully with URL encoding. • base64—Each parsed value is base 64 encoded. • CSCO_WEBVPN_PRIMARY_USERNAME—Primary user login ID when double authentication is enabled and login ID has primary login username. • CSCO_WEBVPN_SECONDARY_USERNAME—Secondary user login ID when double authentication is enabled.

Element	Description
Password	Password for logging into the virtualization infrastructure server. This value can be a clientless macro. The macros available for password are: • CSCO_WEBVPN_PASSWORD—SSL VPN user login password. • CSCO_WEBVPN_INTERNAL_PASSWORD—SSL VPN user internal resource password. This is a cached credential, and not authenticated by a AAA server. If a user enters this value, it is used as the password for auto sign-on, instead of the password value. • CSCO_WEBVPN_MACRO1—Password for the MACRO1 username. • CSCO_WEBVPN_MACRO2—Password for the MACRO2 username. • CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps. These macros take the following three parameters: • • Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128. • URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: • None—No transformation occurs on the string value before sending to the backend server. • url-encode—Each parsed value is URL encoded, except for a list of reserved characters that make up the special characters in a URL. • url-encode-data—Each parsed value is transformed fully with URL encoding. • base64—Each parsed value is base 64 encoded. • CSCO_WEBVPN_PRIMARY_PASSWORD—Primary user login password for double authentication. • CSCO_WEBVPN_SECONDARY_PASSWORD—Secondary user login ID for double authentication.

ASA Group Policies SSL VPN Full Client Settings

Use the Full Client settings to configure the full client mode of access to the corporate network in a remote access SSL VPN for the ASA group policy object.

Full client mode enables access to the corporate network completely over an SSL VPN tunnel. In full client access mode, the tunnel connection is determined by the group policy configuration. The full client software, SSL VPN Client (SVC) or Secure Client, is downloaded to the remote client, so that a tunnel connection is established when the remote user logs in to the SSL VPN gateway.

Tip To enable full client access, you must configure the **Remote Access VPN > SSL VPN > Other Settings** policy on the device to identify Secure Client image packages to install on the device. The images must be on the device so that users can download them. For more information, see Understanding SSL VPN Secure Client Settings , on page 1389 and Add and Edit File Object Dialog Boxes , on page 1526.

The following policies are supported for ASA 9.5(2) Remote Access VPN in Multi-context mode:

- Security Group Tag
- Periodic Certificate Verification
- Client Dead Peer Detection Timeout
- Gateway Dead Peer Detection Timeout
- Datalayer Transport layer Security Compression
- Keep Secure Client on Client System
- Ignore Routing and Filter Rules
- Secure Client Modules
- Secure Client MTU
- Secure Client Firewall-Client Public ACL
- Secure Client Firewall-Client Private ACL
- Enable Datagram Transport Layer Security

Navigation Path

Select **SSL VPN > Full Client** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 438: ASA Group Policies SSL VPN Full Client Settings

Element	Description
Enable Full Client	Whether to enable full client mode.

Element	Description
Mode	The mode in which to operate the SSL VPN: • **Use Other Access Modes if Secure Client Client Download Fails**—If the full client fails to download to the remote user, allow the user to make clientless or thin client access to the VPN. • **Full Client Only**—Prohibit clientless or thin client access. The user must have the full client installed and functional to connect to the VPN.
Keep Secure Client on Client System	Whether to leave the Secure Client installed on the client system after the client disconnects. If you do not leave the client installed, it must be download each time the user connects to the gateway.
Enable Keepalive Messages	Whether to exchange keepalive messages between peers to demonstrate that they are available to send and receive data in the tunnel. Keepalive messages transmit at set intervals, and any disruption in that interval results in the creation of a new tunnel using a backup device. If you select this option, enter the time interval (in seconds) that the remote client waits between sending IKE keepalive packets in the **Interval** field.
SSL Compression	Whether to enable data compression, and if so, the method of data compression to use: None, Deflate, or LZS. Data compression speeds up transmission rates for remote dial-in users connecting with modems. **Caution** Data compression increases the memory requirement and CPU usage for each user session and consequently decreases the overall throughput of the security appliance. For this reason, it is recommended that you enable data compression only for remote users connecting with a modem. Design a group policy specific to modem users and enable compression only for them.
Client Dead Peer Detection Timeout (sec)	The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user. DPD is used to send keepalive messages between peer devices only when no incoming traffic is received and outbound traffic needs to be sent.
Gateway Dead Peer Detection Timeout (sec)	The time interval, in seconds, that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway.
Key Renegotiation Method	The method by which the tunnel key is refreshed for the remote user group client: • **Disabled**—Disables the tunnel key refresh. • **Use Existing Tunnel**—Renegotiates the SSL tunnel connection. • **Create New Tunnel**—Initiates a new tunnel connection. Enter the time interval (in minutes) between the tunnel refresh cycles in the **Interval** field.

Element	Description
Enable Datagram Transport Layer Security	Whether to enable Datagram Transport Layer Security (DTLS) connections for the group. Enabling DTLS allows the Secure Client establishing an SSL VPN connection to use two simultaneous tunnels, an SSL tunnel and a DTLS tunnel. Using DTLS avoids latency and bandwidth problems associated with some SSL connections and improves the performance of real-time applications that are sensitive to packet delays.
Datagram Transport Layer Security Compression	Whether to compress Datagram Transport Layer Security (DTLS) connections for the group, and if so, the method of data compression to use: None, Default, or LZS.
Ignore Don't Fragment (DF) bit	Whether to ignore the DF bit in packets that need fragmentation. This feature allows the force fragmentation of packets that have the DF bit set, allowing them to pass through the tunnel. An example use case is for servers in your network that do not respond correctly to TCP MSS negotiations.

Element	Description
Secure Client Module	The modules that the Secure Client needs to enable optional features. Click **Select** to select the applicable modules from the Add Secure Client Module dialog box. • **Secure Client DART**—Select this module to enable the Secure Client Diagnostics and Reporting Tool (DART), which bundles specified log files and diagnostic information that can be used for analyzing and debugging the client connection. • **Secure Client Network Access Manager**—Select this module to enable the Network Access Manager, which enforces administratively defined end user and authentication policies and makes the pre-configured network profiles available to end users. • **Secure Client SBL**—Select this module to enable Start Before Logon (SBL), which forces the user to connect to the enterprise infrastructure over a VPN connection before logging on to Windows by starting Secure Client before the Windows login dialog box appears. After authenticating to the ASA, the Windows login dialog appears, and the user logs in as usual. SBL is only available for Windows and lets you control the use of login scripts, password caching, mapping network drives to local drives, and more. • **Secure Client Web Security Module**—Select this module to enable the Secure Client Web Security module, which is an endpoint component that routes HTTP traffic to a ScanSafe scanning proxy where the ScanSafe web scanning service evaluates it. • **Secure Client Telemetry Module**—Select this module to enable the Secure Client telemetry module for Secure Client, which sends information about the origin of malicious content to the web filtering infrastructure of the Cisco IronPort Web Security Appliance (WSA). The web filtering infrastructure uses this data to strengthen its web security scanning algorithms, improve the accuracy of the URL categories and web reputation database, and ultimately provide better URL filtering rules. • **Secure Client ISE Network Setup Assistant**—Select this module to enable the Secure Client ISE Network Setup Assistant module. • **Secure Client ISE Posture**—Select this module to enable the Secure Client ISE Posture module. • **Secure Client Posture Module**—Select this module to enable the Secure Client Posture Module, which provides the Secure Client the ability to identify the operating system, antivirus, antispyware, and firewall software installed on the host. The Host Scan application, which is among the components delivered by the posture module, is the application that gathers this information. **Note** If other options are listed, see the release notes for the Cisco AnyConnect VPN Client for an explanation of the feature.
Secure Client MTU	The maximum transmission unit (MTU) size for SSL VPN connections established by the Cisco AnyConnect VPN Client.

Element	Description
Secure Client Always-On VPN	Always-On VPN enables AnyConnnect to automatically establish a VPN session after you log onto the system. Note that until you log off from the system, the VPN session will remain open. Select one of these options: • None—Secure Client service profile remains unchanged. It inherits the value from the default group policy. • Secure Client Profile Setting—Always-On VPN option configured in the AnyConnect VPN profile is used by the Secure Client. • Disable—disables the Always-On VPN option.
Secure Client Profile Name	The name of the Secure Client profile to use for the group. You can enter multiple profile names each separated by a comma. You must configure this name and relate it to a profile in the **Remote Access VPN > SSL VPN > Other Settings** policy. **Note** The Secure Client Profile name is supported from Security Manager version 4.12 for ASA devices running version 9.6(2) in Multi-context mode. The supported CLIs are: • Webvpn—Secure Client profiles **Important** If you have selected **Web Security** or **Web Security WSO** as the Secure Client Module, the **Secure Client Profile Name** must contain a ".wso" extension.
Prompt User to Choose Client Time User Has to Choose Default Location	Whether to ask the user to download the client. Enter the number of seconds the user has to make a selection in the **Time User Has to Choose** field. The default is 120 seconds. If you do not select this option, the user is immediately taken to the default location. The user is also taken to the default location after the time to choose expires. • **Web Portal**—The portal page is loaded in the web browser. • Secure Client **Client**—The Secure Client is downloaded.
Security Group Tag	ASA Version 9.3(1)+ supports security group tagging of VPN sessions. A Security Group Tag (SGT) can be assigned to a VPN session using an external AAA server, or by configuration of the local user database. This tag can then be propagated through the Cisco TrustSec system over Layer 2 Ethernet. Security group tags are useful on group policies and for local users when the AAA server cannot provide an SGT. When the Default check box is selected, no Security Group Tag is assigned. To specify a Security Group Tag, clear the **Default** check box and then enter the numerical value of the SGT tag that will be assigned to VPN users connecting with this group policy in the Security Group Tag field. Valid values are from 2 to 65519.

Element	Description
Periodic Certificate Verification	Whether to enable periodic validation and revocation checking of the client certificates in VPN sessions. If you select this option, enter the interval of time, in hours, between 1 to 168. This feature is supported only in devices running ASA software version 9.4(1) or later. Periodic certificate verification is disabled by default.
Secure Client Firewall-Client Public ACL	The name of the Extended or Unified access control list or policy object to use to restrict user access to the SSL VPN. Public rules are applied to all interfaces on the client. Enter the name of the object or click **Select** to select it from a list or to create a new object. Unified ACLs are supported from ASA version 9.0. The default is Extended. If the device version is later than ASA 9.0, all the Secure Client values are discovered as Unified ACL and deployed during deployment.
Secure Client Firewall-Client Private ACL	The name of the Extended or Unified access control list policy object to use to restrict user access to the SSL VPN. Private rules are applied to the Virtual Adapter. Enter the name of the object or click **Select** to select it from a list or to create a new object. Unified ACLs are supported from ASA version 9.0. The default is Extended. If the device version is later than ASA 9.0, all the Secure Client values are discovered as Unified ACL and deployed during deployment.
Secure Client Custom Attributes table	The Secure Client Custom Attribute table lists the custom attributes, names, and the corresponding values that are assigned to this group policy. Secure Client custom attributes that are defined on the Secure Client Custom Attribute tab of the SSL VPN Other Settings page are listed here (see Configuring Secure Client Custom Attributes (ASA) , on page 1398). Beginning with version 4.7, Security Manager enables to add a Custom Attribute Data to an existing Custom Attribute Type. You can add or remove the custom attributes for a group policy, and configure values for each attribute. • To add a custom attribute and its value click the **Add Row** button beneath the table and fill in the Add Secure Client Custom Attribute dialog box. • To edit a custom attribute and its value, select it, click the **Edit Row** button, and make your changes in the Edit Secure Client Custom Attribute dialog box. • To delete a custom attribute, select it and click the **Delete Row** button. You are asked to confirm the deletion. For more details, see Add/Edit Secure Client Custom Attribute Dialog Box , on page 1399.

ASA Group Policies SSL VPN Settings

Use the SSL VPN Settings to configure attributes that are required for clientless and port forwarding (thin client) access modes to work, including auto signon rules for user access to servers. Auto Signon configures the security appliance to automatically pass SSL VPN user login credentials (username and password) on to internal servers. You can configure multiple auto signon rules.

The Homepage URL policy is supported for the SSL tab in ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **SSL VPN > Settings** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 439: ASA Group Policies SSL VPN Settings

Element	Description
Home Page	The URL of the SSL VPN home page. The URL is free text. The page is displayed when users log into the VPN. If you do not enter a URL, no home page is displayed. Beginning with version 4.12, Security Manager supports IPv6 address in the Home Page URL for ASA devices running the software version 9.0 or later. The format for the Home Page URL for IPv6 address is: http://[IPv6 address]/appname.The Home page URL should be prefixed with http:// (or) https://
Authentication Failure Message	The message to deliver to a remote user who successfully logs into the VPN but has no VPN privileges, and so can do nothing. The default message is: "Login was successful, but because certain criteria have not been met or due to some specific group policy, you do not have permission to use any of the VPN features. Contact your IT administrator for more information."
Minimum Keepalive Object Size (kilobytes)	The minimum size (in kilobytes) of an IKE keepalive packet that can be stored in the cache on the security appliance.
Single Sign On Server	The name of the single sign on (SSO) server policy object that identifies the server to use for this group, if any. An SSO server allows users to enter their username and password once and be able to access other server in the network without logging into each of them. If configure an SSO server, also configure the auto signon rules table. Enter the name of the object or click **Select** to select it from a list or to create a new object. For more information, see Add or Edit Single Sign On Server Dialog Boxes , on page 1531.
Enable HTTP Compression	Whether to allow an HTTP compressed object to be cached on the security appliance.

Element	Description
Auto Signon Rules table	If you configure a single sign on server, the auto signon rules table contains the rules that determine which internal servers are provided the user's credentials. Thus, you can provide single sign on for some servers in your network but not others. Each rule is an allow rule, and indicates the IP address, subnet, or Universal Resource Identifier (URI) that identifies the server, and the type of authentication that will be sent to the server when the user tries to access it (either basic HTML, NTLM, FTP, or all of these). The rules are processed in order, top to bottom, and the first match is applied. Therefore, be sure to order the rules correctly using the up and down arrow buttons. If the user accesses a server that is not identified in one of these rules, the user must log into the server to gain access. • To add a rule, click the **Add Row** button to open the Add or Edit Auto Signon Rules Dialog Box , on page 1515. • To edit a rule, select it and click the **Edit Row** button. • To delete a rule, select it and click the **Delete Row** button.
Portal Page Customization	The name of the SSL VPN customization policy object that defines the appearance of the portal web page. The portal page allows the remote user access to all the resources available on the SSL VPN network. If you do not specify an object, the default page appearance is used. Enter the name of the object or click **Select** to select it from a list or to create a new object. For more information, see Configuring ASA Portal Appearance Using SSL VPN Customization Objects , on page 1406.
User Storage Location	The location where personalized user information is stored between clientless SSL VPN sessions. If you do not specify a location, information is not stored between sessions. Stored information is encrypted. Enter a file system designation in the following format: **protocol://username:password@host:port/path** Where **protocol** is the protocol of the server, **username** and **password** are a valid user account on the server, and **host** is the name of the server. Also indicate the **port** number (if you do not use the default for the protocol) and directory **path** of the location on the server to use. For example: **cifs://newuser:12345678@anyfiler02a/new_share**
Storage Key Confirm	The storage key used to protect data stored between sessions. Spaces are not supported.
Post Max Size	The maximum size allowed for a posted object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent posting.
Upload Max Size	The maximum size allowed for a uploaded object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent uploading.

Element	Description
Download Max Size	The maximum size allowed for a downloaded object. The range is 0 through 2147483647 (which is the default). Specify 0 to prevent downloads.

Add or Edit Auto Signon Rules Dialog Box

Use the Add or Edit Auto Signon Rules dialog box to configure the Auto Signon rules that the security appliance uses to pass SSL VPN user login credentials on to an internal server.

Navigation Path

Open the ASA Group Policies SSL VPN Settings , on page 1512, then click **Create**, or select an item in the table and click **Edit**.

Field Reference

Table 440: Add or Edit Auto Signon Rules Dialog Box

Element	Description
Allow IP	Select this option to configure an IPv4 or IPv6 address or subnet for the rule. Any server within this subnet is supplied the specified login credentials. Beginning with version 4.12, Security Manager supports IPv6 addresses for devices running ASA 9.0 or later. • To enter the IP address of a single server, enter the full IP address and use 255.255.255.255 as the subnet mask. • To specify a subnet, enter the network address and subnet mask, for example, IP address 10.100.10.0 mask 255.255.255.0. If you want the appliance to send credentials to any internal server the user tries to access, create rules for all of your internal networks. You might be able to do this with a single rule.
Allow URI	Select this option to configure a Universal Resource Identifier (URI) for the rule. This identifies the internal server based on URI rather than IP address. For example, **https://*.example.com/*** creates a rule for all web pages on any server in the example.com domain. Use the asterisk as a wildcard to apply to zero or more characters.

Element	Description
Login Credentials	

Element	Description
	Beginning with Security Manager version 4.7, you can select the login username and password from the available variables or macros. **Note** These macros are supported on devices running ASA software release version 8.2(1) and later. The macros available for username are: • CSCO_WEBVPN_USERNAME—SSL VPN user login ID. • CSCO_WEBVPN_CONNECTION_PROFILE—SSL VPN user login group drop-down, a group alias within the connection profile. • CSCO_WEBVPN_MACRO1—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value1. Variable substitution via RADIUS is performed by VSA#223. • CSCO_WEBVPN_MACRO2—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value2. Variable substitution via RADIUS is performed by VSA#224. • CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps. These macros take the following three parameters: • Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128. • URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: • None—No transformation occurs on the string value before sending to the backend server. • url-encode—Each parsed value is URL encoded, except for a list of reserved characters that make up the special characters in a URL. • url-encode-data—Each parsed value is transformed fully with URL encoding. • base64—Each parsed value is base 64 encoded. • CSCO_WEBVPN_PRIMARY_USERNAME—Primary user login ID when double authentication is enabled and login ID has primary login username. • CSCO_WEBVPN_SECONDARY_USERNAME—Secondary user login ID when double authentication is enabled. The macros available for password are:

Element	Description
	• CSCO_WEBVPN_PASSWORD—SSL VPN user login password. • CSCO_WEBVPN_INTERNAL_PASSWORD—SSL VPN user internal resource password. This is a cached credential, and not authenticated by a AAA server. If a user enters this value, it is used as the password for auto sign-on, instead of the password value. • CSCO_WEBVPN_PRIMARY_PASSWORD—Primary user login password for double authentication. • CSCO_WEBVPN_SECONDARY_PASSWORD—Secondary user login ID for double authentication.
Authentication Type	The type of credentials that the security appliance will pass on to the servers covered by this rule: Basic HTML, NTLM (NT LAN Manager) authentication, FTP, or all of these methods. The default option is **All**. Use the default unless you want to limit logins to a certain type.

ASA Group Policies Browser Proxy Settings

Use the Browser Proxy settings to configure the attributes for the browser.

Browser Proxy is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Browser Proxy** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 441: ASA Group Policies Browser Proxy Settings

Element	Description
Proxy Server Policy	Select one of the following: • No proxy—If you select this option, proxy settings will not be used. • Do not modify client proxy—If you select this option, ASA will not modify the proxy setting on the endpoint device. • Use proxy—If you select this option, select one or more methods available in Select Proxy Method.

Element	Description
Select Proxy Method	Select one or more of the following: • Auto Detect—Select this option to enable the use of automatic proxy server detection in the client device's browser. • Use Proxy Server Setting Configured Below—Select this option and then specify the proxy server settings. • User Proxy Auto Configuration (PAC) configured below—Select this option to direct the browser to retrieve the HTTP proxy server setting from the proxy auto-configuration file URL.
Proxy Server Setting	Enter the following: • Server Address—Specify the IP address or name and the port of the browser server that is applied for the client device in the format 'ServerAddress:PortNumber'. To configure multiple proxy servers, separate the server addresses using a space. • Exception List—List the server names and IP addresses that you want to exclude from proxy server access. Enter the list of addresses that you do not want to have accessed through a proxy server. This list corresponds to the Exceptions list in the Proxy Settings dialog box in the browser. To configure multiple exception lists, separate the lists using a space, comma, or semicolon. • Bypass Server for Local Addresses—Configures the browser proxy local-bypass settings for a client device. Click **Yes** to enable local bypass or **No**to disable local bypass. Select **None** if you do not want to use this option. The default selected option is None.
Proxy Auto Configuration (PAC) URL	Specify the URL of the auto-configuration file. This file tells the browser where to look for proxy information.
Policy Lockdown	Select **Enable** to hide the Connections tab in the browser for the duration of an AnyConnect VPN session. Select **Disable** to leave the display of the Connections tab unchanged. Select **None** if you do not want to use this option. The default selected option is None.

ASA Group Policies DNS/WINS Settings

Use the DNS/WINS settings to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the ASA group policy. These settings apply to Easy VPN and remote access IPSec and SSL VPN configurations.

DNS/WINS is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **DNS/WINS** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 442: ASA Group Policies DNS/WINS Settings

Element	Description
Primary IPv4 DNS Server	The IPv4 address of the primary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object. Primary IPv4 DNS Server address is mandatory to be able to configure Secondary IPv4 DNS Server.
Secondary IPv4 DNS Server	The IPv4 address of the secondary DNS server for the group. Enter the IPv4 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Primary IPv6 DNS Server	The IPv6 address of the primary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices 9.0 or later. Primary IPv6 DNS Server address is mandatory to be able to configure Secondary IPv6 DNS Server.
Secondary IPv6 DNS Server	The IPv6 address of the secondary DNS server for the group. Enter the IPv6 address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices 9.0 or later.
Primary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Secondary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
DHCP Network Scope	The scope of the DHCP network for the group. Enter the IP network address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Default Domain	The default domain name for the group. The default, blank, is none.

ASA Group Policies Split Tunneling Settings

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet. These settings apply to Easy VPN and remote access IPSec and SSL VPN configurations.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

Split Tunneling is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Tip For optimum security, we recommend that you not enable split tunneling.

Navigation Path

Select **Split Tunneling** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 443: ASA Group Policies Split Tunneling Settings

Element	Description
DNS Names	A list of domain names to be resolved through the split tunnel. All other names are resolved using the public DNS server. If you do not enter a list, the list is inherited from the default group policy. Separate multiple entries with spaces or commas. The entire string can be a maximum of 255 characters.
Send all DNS traffic through the tunnel	Whether the Secure Client should resolve all DNS addresses through the VPN tunnel (SSL or IPsec/IKEv2). If DNS resolution through the tunnel fails, the address remains unresolved and the Secure Client does not try to resolve the address through public DNS servers. If you do not select this option, the client sends DNS queries over the tunnel according to the split tunnel policy specified by the Tunnel Option setting.
Tunnel Option	The policy you want to enable for split tunneling: • Disabled—(Default) No traffic goes in the clear or to any other destination than the security appliance. Remote users reach networks through the corporate network and do not have access to local networks. • Tunnel Specified Traffic—Tunnel all traffic from or to the networks permitted in the network ACL. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. • Exclude Specified Traffic—Traffic goes in the clear from and to the networks permitted in the network ACL. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel. This option applies only to the Cisco VPN Client.

Element	Description
IPv6 Tunnel Option	Beginning with version 4.10, Security Manager provides support for IPv6 traffic for Split Tunneling from ASA version 9.0. The policy you want to enable for split tunneling: • Disabled—(Default) No traffic goes in the clear or to any other destination than the security appliance. Remote users reach networks through the corporate network and do not have access to local networks. • Tunnel Specified Traffic—Tunnel all traffic from or to the networks permitted in the network ACL. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. • Exclude Specified Traffic—Traffic goes in the clear from and to the networks permitted in the network ACL. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel. This option applies only to the Cisco VPN Client.
Networks	The name of a standard, extended, or unified access control list policy object that identifies the networks that require traffic to travel across the tunnel and those that do not require tunneling. Unified ACLs are supported from ASA version 9.0. How permit and deny are interpreted depends on your selection for **Tunnel Option**. Enter the name of the object, or click **Select** to select it from a list or to create a new object. If you do not specify an ACL, the network list is inherited from the default group policy.

ASA Group Policies Connection Settings

Use the Connection Settings to configure the connection characteristics for the ASA group policy, including access control and session timeouts. These settings are used for Easy VPN and remote access IPsec or SSL VPN sessions.

Connection Settings is supported for ASA 9.5(2) Remote Access VPN in Multi-context mode.

Navigation Path

Select **Connection Settings** from the table of contents in the ASA Group Policies Dialog Box , on page 1489.

Field Reference

Table 444: ASA Group Policies Connection Settings

Element	Description
Filter ACL	The name of the extended access control list (ACL) policy object to use for filtering traffic on the VPN connection. The ACL determines which traffic is permitted or denied. Enter the name of the object or click **Select** to select it from a list or to create a new object. Beginning with version 4.10 and ASA version 9.0, you can select from a list of Standard, Extended, or Unified ACL objects. This ACL does not apply to clientless SSL VPN connections.

Element	Description
Banner Text	The banner, or welcome text, to display on remote clients when they connect to the VPN. • Beginning with version 4.9, Security Manager supports up to 4000 characters for the banner text for ASA devices on version 9.5(1) or later. • For ASA version lower than 9.5(1), Security Manager allows you to enter up to 500 characters for the banner text.
IPv4 Address Pools	Specifies the name of one or more IPv4 address pools to use for this group policy. Enter the names of the IPv4 address pool objects separated by a comma or click **Select** to select the objects from a list or to create a new objects.
IPv6 Address Pools	Specifies the name of one or more IPv6 address pools to use for this group policy. Enter the names of the IPv6 address pool objects separated by a comma or click **Select** to select the objects from a list or to create a new objects. Beginning with version 4.12, Security Manager supports IPv6 address pools for ASA devices 9.0 or later.
Access hours	The name of a time range policy object that specifies the times that users are allowed to access the VPN. If you do not specify a time range, users can access the VPN at all times. Specify a time range if you want to limit access to the network to certain hours, such as the typical work days and work hours for your organization. Enter the name of the object or click **Select** to select it from a list or to create a new object. For more information, see Configuring Time Range Objects , on page 301.
Max Simultaneous Logins	The number of simultaneous logins a single user is allowed. Values are 0-2147483647. The default is 3. Specify 0 to disable logins and prevent user access.
Max Connection Time	The maximum amount of time a user is allowed to be connected to the VPN. Select one of the following: • Specified Connection time—Use the maximum time value that you enter. Values are 1-4473924 minutes. After the time is exceeded, the security appliance closes the connection. • Unlimited Connection time—The security appliance does not close connections based on connection time.
Idle Timeout	The amount of time a user is allowed to be connected to the VPN while the connection is idle, that is, there is no communication activity. Select one of the following: • Specified Timeout—Use the time out value you enter. Values are 1-35791394 minutes. When the idle time is exceeded, the security appliance closes the connection. The default is 30 minutes. • Unlimited Timeout—The security appliance does not close idle connections.

Element	Description
VLAN Mapping VLAN ID	The VLAN ID value can be between 1 and 4094 and must correspond to a VLAN interface on the ASA. The VLAN mapping feature on the ASA allows for traffic from VPN connections to be directed to a specified VLAN interface. Beginning with Cisco Security Manager version 4.10 and ASA version 9.5(1), you can assign IPv6 addresses to remote users. Beginning with Cisco Security Manager version 4.17, you can configure VLAN on ASA 9.9(2) or later multi-context devices.

Add or Edit Secure Desktop Configuration Dialog Box

Use the Add or Edit Cisco Secure Desktop Configuration dialog box to create, copy, and edit Cisco Secure Desktop Configuration objects for IOS routers. You can configure the settings required for Windows clients who are connecting from different location types, enable or restrict web browsing and file access for Windows CE clients, and configure the cache cleaner for Macintosh and Linux clients.

Cisco Secure Desktop (CSD) secures network endpoints by providing a reliable means of eliminating all traces of sensitive data by providing a single, secure location for session activity and removal on the client system.

This policy object uses the Secure Desktop Manager application to configure the settings. For an example of configuring settings, see *Cisco Secure Desktop on IOS Configuration Example Using SDM* at http://www.cisco.com/en/US/products/ps6496/products_configuration_example09186a008072aa7b.shtml . The first part of the configuration example explains setting up SDM, which you can ignore. Instead, look for the sections that describe setting up Windows locations midway through the example. The screen shots will help you identify when you are looking at CSD configuration.

Navigation Path

Select **Manage > Policy Objects**, then select **Cisco Secure Desktop (Router)** from the Object Type Selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Related Topics

Field Reference

Table 445: Add or Edit Secure Desktop Configuration Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.

Element	Description
Description	An optional description of the object (up to 1024 characters).
Windows Location Settings	
Windows Locations	The names of the locations that you want to configure for Windows clients connecting from specific locations, such as Work, Home, or Insecure. When you create a location, an item for the location is added to the table of contents, where you can select the settings folders related to the location and configure its properties. The settings include a definition of how to determine if a client is connecting from that particular location. For each location you want to configure, enter its name in the **Location to Add** field and click **Add** to move it to the **Locations** list. You can reorder the locations using the Move Up/Move Down buttons. CSD checks locations in the order listed in this dialog box, and grants privileges to client PCs based on the first location definition they match. You can create a default location, such as Insecure, as the final location and configure the strictest security for it. For more information, see Creating Cisco Secure Desktop Configuration Objects , on page 1486.
Close all open browser windows after installation	Whether to close all the open browser windows after installing the Secure Desktop application.
VPN Feature Policy	Select the check boxes to enable these features if installation or location matching fails: • Web Browsing • File Access • Port Forwarding • Full Tunneling
Windows CE	
VPN Feature Policy	The Windows CE options enable you to configure a VPN feature policy to enable or restrict web browsing and remote server file access for remote clients running Microsoft Windows CE. You cannot configure locations for these clients.
Mac and Linux Cache Cleaner	
Launch Cleanup Upon Global Timeout	Whether to set a global timeout after which CSD launches the cache cleaner. Select a timeout (the default is 30 minutes), and select whether to allow the user to reset the timeout value.
Launch Cleanup Upon Exiting of Browser	Whether to start the cache cleaner when the user closes all web browser windows.
Enable Canceling of Cleaning	Whether to allow the remote user to cancel the cleaning of the cache.

Element	Description
Secure Delete	The number of passes for CSD to perform a secure cleanup. The default is 1 pass. CSD encrypts and writes the cache to the remote client's disk. Upon termination of the Secure Desktop, CSD converts all bits occupied by the cache to all 0's, then to all 1's, and then to randomized 0's and 1's.
Enable Web Browsing if Mac or Linux Installation Fails	Whether to allow web browsing (but not other remote access features) if the cache cleaner installation fails.
VPN Feature Policy	Whether to allow web browsing, remote server file access, and port forwarding for Macintosh and Linux clients. Port forwarding permits the use of the Secure Desktop to connect a client application installed on the local PC to the TCP/IP port of a peer application on a remote server.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Add and Edit File Object Dialog Boxes

Use the Add and Edit File Object dialog boxes to create, copy, and edit file objects. File objects represent files that are used in device configurations, typically for remote access VPN policies and policy objects. Such files include Secure Client profile and image files, image (graphic) files, plug-in jar files, and Cisco Secure Desktop package files.

When you create a file object, Security Manager makes a copy of the file in its storage system. These files are backed up whenever you create a backup of the Security Manager database, and they are restored if you restore the database. When you deploy configurations that specify a file object, the associated file is download to the device in the appropriate directory.

After you create a file object, you typically should not edit it. If you need to replace the file, edit the file object to select the new file, or create a new file object. If the file is editable, you can edit the file object to identify the file's location in the file repository, and use the desired editor to open and edit the file outside of Security Manager. The file repository is the **CSCOpx\MDC\FileRepository** folder in the installation directory (typically, C:\Program Files). The files are organized in subfolders named for the file type.

For all file types except Image files, you can add a file from the Security Manager server or from the local Security Manager client by selecting the appropriate tab on the Choose a file dialog box. You cannot select files from a network server. You can control the ability to add files from the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520.

Tip If you are copying a file to the Security Manager server so that it can be used in a file object, do not copy the file directly to the file repository.

When you delete a file object, the associated file is not deleted from the file repository.

Navigation Path

Select **Manage** > **Policy Objects**, then select **File Objects** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Field Reference

Table 446: Add and Edit File Object Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237. If you do not enter a name, the name of the file is used for the object name.
Description	An optional description of the object.
File Type	The type of file. If you create the object while configuring a policy, the correct file type is pre-selected. Options are: • Image—For graphic files. • Cisco Secure Desktop Package • Plug-In—For browser plug-in files. • Secure Client Profile • Secure Client Image • Hostscan Image

Element	Description
File	The name and full path of the file. Click **Browse** to select the file. The following file types are managed using Image Manager. For more information, see Image Manager Supported Image Types , on page 2894. • Cisco Secure Desktop Package • Plug-In—For browser plug-in files. • Secure Client Image • Hostscan Image For Secure Client Profile and Image files, you can add a file from the Security Manager server. You cannot select files from a network server. **Tip** You can control the ability to add files from the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520. For file objects that you are editing, the path indicates the location in the Security Manager file repository.
File Name on Device	The file name you want to use when the file is downloaded to the device when you deploy policies. The default is to use the same file name as the original file. If the object was created by discovering policies from the device, this field uses the original name of the file as it existed on the device. This might not be the same name as it exists on the Security Manager server if the original name duplicated existing file names on the server.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

File Object — Choose a file Dialog Box

Use the File Object — Choose a file dialog box to select the file to use for the file object you are adding or editing. The available files are managed using Image Manager. For more information, see Image Manager Supported Image Types , on page 2894.

Navigation Path

Select **Manage > Policy Objects**, then select **File Objects** from the Object Type Selector. Add or Edit a file object and from the Add or Edit File Object dialog box, click **Browse** to open the File Object — Choose a file dialog box.

Field Reference

Table 447: File Object — Choose a file Dialog Box

Element	Description
Image Repository	Lists the available files you can use for defining your file object. The available files are managed using Image Manager. For more information, see Image Manager Supported Image Types , on page 2894.
File selected	Shows the currently select file object.
Files of Type	Filters the list of files. Options are: **Note** You can only view all file objects or only objects filtered by the type of file object you are adding or editing. • Cisco Secure Desktop Package • Plug-In—For browser plug-in files. • Secure Client Image • Hostscan Image • All

Add or Edit Port Forwarding List Dialog Boxes

Use the Port Forwarding List dialog box to create, copy and edit port forwarding list policy objects. You can create port forwarding list objects to use when you are configuring the thin client access mode for SSL VPN.

Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. When port forwarding is enabled, the hosts file on the SSL VPN client is modified to map the application to the port number configured in the forwarding list. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Port Forwarding List** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 448: Port Forwarding List Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Port Forwarding List table	The port forwarding entries that are defined in the object. The entries show the mapping of the local port to the remote server and port. • To add a mapping, click the **Add Row** button to open the Add or Edit A Port Forwarding Entry Dialog Box , on page 1530. • To edit a mapping, select it and click the **Edit Row** button. • To delete a mapping, select it and click the **Delete Row** button.
Include Port Forwarding Lists	The names of other port forwarding list objects to include in the object. Enter the name of the object or click **Select** to select it from a list or to create a new object. Separate multiple entries with commas. When you add other port forwarding lists, the entries from those lists are treated as if they were directly entered into this object, and the names of the included objects are not reflected in the device configuration commands during deployment.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit A Port Forwarding Entry Dialog Box

Use the Add or Edit A Port Forwarding Entry dialog boxes to create a new port forwarding list entry or edit an existing one.

Navigation Path

Go to the Add or Edit Port Forwarding List Dialog Boxes , on page 1529 and click the **Add Row** button or select an entry and click the **Edit Row** button beneath the Port Forwarding List table.

Field Reference

Table 449: Add or Edit A Port Forwarding Entry Dialog Box

Element	Description
Local TCP Port	The port number to which the local application is mapped (between 1 and 65535).
Remote Server IPv4/IPv6 Address Name	The IPv4 or IPv6 address or fully qualified domain name of the remote server. Select the type of entry and enter the IP address or name. Beginning with version 4.12, Security Manager supports IPv6 addresses for ASA devices running the software version 9.0 or later. For the IP address, you can enter the name of a network/host object that specifies the remote server's IP address, or click **Select** to select it from a list or to create a new object.
Remote TCP Port	The port number of the application for which port forwarding is configured (between 1 and 65535).
Description	A description of the port forwarding entry. This information is mandatory on Cisco IOS devices.

Add or Edit Single Sign On Server Dialog Boxes

Use the Add or Edit Single Sign On Server dialog box to create, copy, and edit single sign on (SSO) server objects for use with SSL VPNs (as configured in ASA group policy objects). For information on how to configure SSO servers in an ASA group policy, see ASA Group Policies SSL VPN Settings , on page 1512.

Single sign-on lets users access different secure services on different servers without entering a username and password more than once. In the authentication, the security appliance acts as a proxy for the SSL VPN user to the SSO server. You can configure this object to identify either a Computer Associates SiteMinder SSO server or a Security Assertion Markup Language (SAML) Browser Post Profile version 1.1 server.

The SSO mechanism starts as part of the AAA process or just after successful user authentication to an AAA server. The SSL VPN server running on the security appliance acts as a proxy for the user to the authenticating server. When a user logs in, the SSL VPN server sends an SSO authentication request, including username and password, to the authenticating server. If the server approves the authentication request, it returns an SSO authentication cookie to the SSL VPN server. The security appliance keeps this cookie on behalf of the user and uses it to authenticate the user to secure web sites within the domain protected by the SSO server.

If you want to configure SSO for an SSL VPN group, you must also configure a AAA server, such as a RADIUS or LDAP server.

Note The SAML Browser Artifact profile method of exchanging assertions is not supported.

Navigation Path

Select **Single Sign On Servers** in the Policy Object Manager , on page 232. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

You can also create the object when configuring an ASA user group object for SSL VPN (see ASA Group Policies SSL VPN Settings , on page 1512).

Field Reference

Table 450: Add or Edit Single Sign-On Server Dialog Box

Element	Description
Name	The object name, which must be 4 to 31 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Authentication Type	The type of SSO server to use with clientless SSL VPN connections. The other attributes on the page change based on your selection. • **SiteMinder**—Computer Associates SiteMinder SSO server. • **SAML POST**—Security Assertion Markup Language (SAML) Browser Post Profile server.
URL (SiteMinder only.)	The URL of the SiteMinder SSO server to which the security appliance makes authentication requests. Select whether to use HTTP or HTTPS and enter the URL. **Tip** For HTTPS communication, make sure that the SSL encryption settings match on both the security appliance and the SiteMinder server. On the security appliance, you can verify this with the **ssl encryption** command.
Secret Key Confirm (SiteMinder only.)	The key used to encrypt authentication communications with the SiteMinder server, if any. The key can contain any alphanumeric characters. There is no minimum or maximum number of characters. Enter the same key in both fields. **Tip** If you enter a secret key, you must configure the same key in the SiteMinder server using the Cisco Java plug-in authentication scheme.
Assertion URL (SAML POST only.)	The URL for the SAML-type SSO assertion consumer service. Select whether to use HTTP or HTTPS and enter the URL, which must be fewer than 255 characters.
Assertion Issuer (SAML POST only.)	The name of the security device that is sending assertions to a SAML-type SSO server. This is usually the name of the security appliance, for example, asa.example.com. The name must be fewer than 65 characters.
Trustpoint (SAML POST only.)	The name of the PKI enrollment policy object that identifies the certificate authority (CA) server that acts as the trustpoint that contains the certificate to use to sign the SAML-type browser assertion. Enter the name or click **Select** to select it from a list or to create a new object.

Element	Description
Max Retries	The number of times the security appliance retries a failed SSO authentication attempt before the authentication times out. The range is 1 to 5 retries, and the default is 3 retries.
Request Timeout	The number of seconds before a failed SSO authentication attempt times out. The range is 1 to 30 seconds, and the default is 5 seconds.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit Bookmarks Dialog Boxes

Use the Add or Edit Bookmarks dialog boxes to configure browser-based clientless SSL VPN bookmarks (URL lists) for an SSL VPN Bookmark object. From this dialog box, you can change the order of the bookmark entries within the table, create, copy, edit, and delete SSL VPN Bookmark objects.

An SSL VPN Bookmark object defines the URLs that are displayed on the portal page after a successful login.

Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Bookmarks** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Field Reference

Table 451: Add and Edit Bookmarks Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Bookmarks Heading (IOS) (IOS devices only)	The heading that is displayed above the URLs listed on the portal page of an SSL†VPN hosted on an IOS device.
Bookmarks	The list of bookmark entries for the object. • To change the order of an entry, select it and click the Move Up or Move Down arrow buttons. The order of entries in the table defines the order in which the bookmarks are presented to the user. • To add an entry, click the Add button and fill in the Add Bookmark Entry dialog box (see Add or Edit Bookmark Entry Dialog Boxes , on page 1534). • To edit an entry, select it and click the Edit button. • To delete an entry, select it and click the Delete button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit Bookmark Entry Dialog Boxes

Use the Add or Edit Bookmark Entry dialog boxes to create or edit a bookmark to be included in an SSL VPN Bookmark object.

You can use non-English, non-ASCII languages for the text to display for bookmarks if you are configuring the object for use on an ASA device. For more information about how you can configure the SSL VPN portal in local languages, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409.

Navigation Path

In the Policy Object Manager, from the Add or Edit Bookmarks Dialog Boxes , on page 1533, right-click inside the Bookmarks table, then select **Add Row** or right-click a row, then select **Edit Row**.

Field Reference

Table 452: Add or Edit Bookmark Entry Dialog Boxes

Element	Description
Bookmark Option	Select whether you want to define a new SSL VPN Bookmark entry or use the entries from an existing object: • **Enter Bookmark**—You want to define a bookmark entry. • **Include Existing Bookmarks**—You want to include bookmark entries defined in an existing SSL VPN Bookmark object. Enter the name of the object or click **Select** to select it from a list or to create a new object. • **Predefined Application Templates**—You want to use a predefined template that contains the pre-filled necessary values for certain well-defined applications.
Select Auto sign-on Application	If you selected Predefined Application Templates as the Bookmark Option, select the auto sign-on application whose template you want to use: • Citrix XenApp • Citrix XenDesktop • Domino Web Access • Microsoft Outlook Web Access 2010 • Microsoft Outlook Web Access 2013 (ASA 9.4(1)+ only) • Microsoft SharePoint 2007 • Microsoft SharePoint 2010 • Microsoft SharePoint 2013 (ASA 9.5(1)+ only) • Citrix StoreFront 2.1 (ASA 9.3(1)+ only) • Citrix StoreFront 2.5 (ASA 9.4(1)+ only) After selecting an auto sign-on application, the Advanced Form and URL Settings are populated based on the selected application.
Title	The text label that the user sees for the bookmark.
URL	The Universal Resource Locator address for the bookmark. Select the protocol for the bookmark and enter the rest of the URL in the edit box. **Tip** If you are creating bookmarks for use on an ASA device, and you are also configuring Kerberos Constrained Delegation on the device, you might need to add the service principle name (SPN) to the URL. For more information, see Configuring Kerberos Constrained Delegation (KCD) for SSL VPN (ASA) , on page 1397.

Element	Description
Settings These settings are applicable only to SSL VPN portals hosted on ASA devices running software version 8.x or later. Do not configure these settings for SSL VPN Bookmark objects that you will use on other devices.	
Subtitle	An additional user-visible title that describes the bookmark entry.
Thumbnail	The File object that represents an icon you want to associate with the bookmark on the Portal. Enter the name of the File object or click **Select** to select it from a list or to create a new object.
Authentication Access	Whether to display the thumbnail only on the Portal page. If you deselect this option, the thumbnail is also displayed on the Logon page.
Enable Favorite URL Option	Whether to display the bookmark entry on the portal home page. Deselect the check box if you want the bookmark entry to appear on the application page only.
Advanced Form and URL Settings These settings are applicable only to SSL VPN portals hosted on ASA devices running software version 8.x or later. Do not configure these settings for SSL VPN Bookmark objects that you will use on other devices.	
URL Method	Select the required URL method from the list: • **Get**—Select this option if you want simple data retrieval. • **Post**—Select this option when processing the data might involve changes to it, for example, storing or updating data, ordering a product, or sending e-mail. If you select this option, you must configure the Post parameters in the Post Parameters table. • **Auto Sign-on Form**—Select this option if you want to use auto sign-on.
Enable Smart Tunnel Option (Get and Post URL Method only)	Whether to open the bookmark in a new window that uses the smart tunnel functionality to pass data to and from the security appliance.
Preload Page Options (Get and Post URL Method only)	Optionally, configure the following Preload options: **Preload URL**—The URL of a page to load before the bookmark link is loaded. **Wait Time**—The time to allow for loading of the page before you are forwarded to the actual POST URL.

Element	Description
Auto Sign-on (ASA 9.0.1+ only) (Auto Sign-on Form URL Method only)	When Auto Sign-on Form is selected as the URL Method, configure the following options: **Note** Wildcards can be used in the URLs you enter for the following fields. For example, you can enter http*://www.example.com/myurl*. **Login Page URL**—The URL of the login page for which to auto sign-on. **Landing Page URL**—The URL of the page that is loaded after a successful login. The ASA requires the Landing Page to be configured to detect a successful login to the application. **Pre-Login Page URL**—The URL of the page which is loaded before the login page. This page will require user interaction to proceed to the login screen. **Control ID**—The ID of the control/tag that will get a click event on the pre-login page URL to proceed to the login page.
Post Parameters	The list of the names and values of the Post parameters for the bookmark entry. • To add a parameter, click the Add button and fill in the Add Post Parameter dialog box (see Add and Edit Post Parameter Dialog Boxes , on page 1537). • To edit a parameter, select it and click the Edit button. • To delete a parameter, select it and click the Delete button.
Post Script	An optional field for entering JavaScript required by some applications. Some Web applications, such as Microsoft Outlook Web Access, may execute a JavaScript to change the request parameters before the log-on form is submitted.

Add and Edit Post Parameter Dialog Boxes

Use the Add and Edit Post Parameter dialog boxes to create a new Post parameter entry or edit an existing one in the table. For a detailed discussion of Post parameters, see Using the Post URL Method and Macro Substitutions in SSL VPN Bookmarks , on page 1413.

Navigation Path

In the Policy Object Manager, from the Add or Edit Bookmarks Dialog Boxes , on page 1533, right-click inside the Post Parameters table, then select **Add Row** or right-click a row, then select **Edit Row**.

Field Reference

Table 453: Add and Edit Post Parameter Dialog Boxes

Element	Description
Name	The name of the post parameter exactly as defined in the corresponding HTML form. For example, **param_name** in <input name="*param_name* " value="*param_value* ">.

Element	Description
Value	

Element	Description
	The value of the post parameter exactly as defined in the corresponding HTML form. For example, **param_value** in <input name="*param_name* " value="*param_value* ">. Select one of the following: • CSCO_WEBVPN_USERNAME—SSL VPN user login ID. • CSCO_WEBVPN_PASSWORD—SSL VPN user login password. • CSCO_WEBVPN_INTERNAL_PASSWORD—SSL VPN user internal resource password. This is a cached credential, and not authenticated by a AAA server. If a user enters this value, it is used as the password for auto sign-on, instead of the password value. • CSCO_WEBVPN_CONNECTION_PROFILE—SSL VPN user login group drop-down, a group alias within the connection profile. • CSCO_WEBVPN_DYNAMIC_URL1—A single bookmark that can generate multiple bookmark links on the user's portal. This macro takes *delimiter* as an option, where delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • CSCO_WEBVPN_DYNAMIC_URL2—A single bookmark that can generate multiple bookmark links on the user's portal. This macro takes *delimiter* as an option, where delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • CSCO_WEBVPN_MACRO1—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value1. Variable substitution via RADIUS is performed by VSA#223. • CSCO_WEBVPN_MACRO2—Set via the RADIUS/LDAP vendor-specific attribute. If you are mapping this from LDAP via an ldap-attribute-map, the Cisco attribute that uses this variable is WEBVPN-Macro-Substitution-Value2. Variable substitution via RADIUS is performed by VSA#224. • CSCO_WEBVPN_MACROLIST1 and CSCO_WEBVPN_MACROLIST2—Statically configured bookmarks which can use arbitrarily-sized lists provided by LDAP attribute maps. These macros take the following three parameters: • Delimiter—Delimiter is an administrator-supplied string which includes the characters used to separate the LDAP-mapped string into a list of values, using one delimiter per use of the macro. • Index—Index is an administrator-supplied integer which specifies the number of the element in the list to select. The value can range between 1 and 128. • URL Encoding—URL Encoding is the choice to apply the LDAP string before it is substituted into the ASA device's request. You can select one of the following values: • None—No transformation occurs on the string value before sending to the backend server. • url-encode—Each parsed value is URL encoded, except for a list of reserved characters that make up the special characters in a URL.

Element	Description
	• url-encode-data—Each parsed value is transformed fully with URL encoding. • base64—Each parsed value is base 64 encoded. • CSCO_WEBVPN_PRIMARY_USERNAME—Primary user login ID when double authentication is enabled and login ID has primary login username. • CSCO_WEBVPN_SECONDARY_USERNAME—Secondary user login ID when double authentication is enabled. • CSCO_WEBVPN_PRIMARY_PASSWORD—Primary user login password for double authentication. • CSCO_WEBVPN_SECONDARY_PASSWORD—Secondary user login ID for double authentication.

Add and Edit SSL VPN Customization Dialog Boxes

Use the Add and Edit SSL VPN Customization dialog boxes to create, copy, and edit SSL VPN Customization objects. An SSL VPN Customization policy object describes how to customize web pages for a browser-based clientless SSL VPN hosted on an ASA 8.x device. For more information, see

Configuring SSL VPN Bookmark Lists for ASA and IOS Devices , on page 1411

You can use non-English, non-ASCII languages for the text to display on these pages. For more information about how you can configure the SSL VPN portal in local languages, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409.

Navigation Path

Select **Manage** > **Policy Objects**, then select **SSL VPN Customization** from the Object Type Selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Field Reference

Table 454: Add and Edit SSL VPN Customization Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Settings Pane The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right. Before configuring settings, click the Preview button to see the default settings to help you determine what, if anything, you want to change. The top folders in the table of contents represent the SSL VPN web pages that you can customize, and are explained next.	
Logon Page	The Logon web page is the one users see first when connecting to the SSL VPN portal. It is used for logging into the VPN. Select the following items in the Logon Page folder in the table of contents to view and change the settings: • **Logon Page**—The Browser Window Title field defines the title of the web page, which is displayed in the browser's title bar. • **Title Panel**—The title displayed in the web page itself. For more information about the settings, see SSL VPN Customization Dialog Box—Title Panel , on page 1543. • **Language**—The languages you will support for the Logon, Portal, and Logout pages. For more information about the settings, see SSL VPN Customization Dialog Box—Language , on page 1544. • **Logon Form**—The labels and colors used in the form that accepts user logon information. For more information about the settings, see SSL VPN Customization Dialog Box—Logon Form , on page 1547. • **Informational Panel**—An extra informational panel for conveying information to users. For more information about the settings, see SSL VPN Customization Dialog Box—Informational Panel , on page 1548. • **Copyright Panel**—The copyright information on the logon page. For more information about the settings, see SSL VPN Customization Dialog Box—Copyright Panel , on page 1549. • **Full Customization**—If you do not want to use the security appliance's built-in logon page, even customized, you can instead enable full customization and supply your own web page. For more information about creating a custom Logon page and the settings, see Creating Your Own SSL VPN Logon Page for ASA Devices , on page 1410 and SSL VPN Customization Dialog Box—Full Customization , on page 1549.

Element	Description
Portal Page	The Portal web page is the one users see after logging into the SSL VPN; it is the home page. Select the following items in the Portal Page folder in the table of contents to view and change the settings: • **Portal Page**—The **Browser Window Title** field defines the title of the web page, which is displayed in the browser's title bar. • **Title Panel**—The title displayed in the web page itself. For more information about the settings, see SSL VPN Customization Dialog Box—Title Panel , on page 1543. • **Toolbar**—The toolbar displayed above the main part of the Portal page. For more information about the settings, see SSL VPN Customization Dialog Box—Toolbar , on page 1550. • **Applications**—The application buttons that will appear on the page. For more information about the settings, see SSL VPN Customization Dialog Box—Applications , on page 1551. • **Custom Panes**—The layout of the main part of the Portal page. The default is a single column with no internal panes. For more information about the settings, see SSL VPN Customization Dialog Box—Custom Panes , on page 1551. • **Home Page**—How and whether to display URL lists on the home page. For more information about the settings, see SSL VPN Customization Dialog Box—Home Page , on page 1553.
Logout Page	The Logout web page is the one users see after logging out of the SSL VPN. For more information about the settings, see SSL VPN Customization Dialog Box—Logout Page , on page 1554.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The Overrides field indicates the number of devices that have overrides for this object.

SSL VPN Customization Dialog Box—Title Panel

Use the Title Panel page of the SSL VPN Customization dialog box to determine whether the Logon page or Portal page will have a title displayed in the web page itself. If you enable the title panel, you can specify the title, font, font size and weight, styles, and colors used. You can also select a File object that identifies a logo graphic.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Logon Page > Title Panel** in the table of contents to configure the title of the Logon page, or **Portal Page > Title Panel** to configure the title of the Portal page.

Table 455: SSL VPN Customization Dialog Box—Title Panel

Element	Description
Display Title Panel	Whether to display a title panel within the web page. The default is to not display a title. If you select this option, you can configure the title using the other fields on this page.
Gradient	Whether to have the background color change in a gradual progression.
Title Text	The text to display in the title panel.
Font Weight Font Size Font Color	The characteristics of the font used for the title text. You can select a weight, font size, and color. Click **Select** to choose a font color.
Background Color	The color of the background of the title panel. Click **Select** to choose a color.
Style (CSS)	Cascading Style Sheet (CSS) parameters that define the style characteristics of the title panel. You can include a maximum of 256 characters. **Tip** For more information about CSS, visit the World Wide Web Consortium (W3C) website at www.w3.org.
Logo Image	The File policy object that identifies the logo image you want to include in the title panel, if any. Enter the name of the File object or click **Select** to select it from a list or to create a new object. **Tip** The image file can be a GIF, JPG, or PNG file, and it can be up to 100 kilobytes in size. For more information about File objects, see Add and Edit File Object Dialog Boxes , on page 1526.

SSL VPN Customization Dialog Box—Language

Use the Language page of the SSL VPN Customization dialog box identify the languages you will support on the browser-based clientless SSL VPN portal. If you want to configure translation tables for other languages on the ASA device and use them, you can configure the supported languages and allow users to choose their language. Before you configure these settings, read

Localizing SSL VPN Web Pages for ASA Devices , on page 1409

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Logon Page > Language** in the table of contents.

Related Topics

Field Reference

Table 456: SSL VPN Customization Dialog Box—Language

Element	Description
Automatic Browser Language Selection	This table lists the languages you will support on the web pages for automatic browser language selection. Automatic browser language select allows the ASA device to negotiate with the user's web browser to determine the language in which to present the web pages. You must configure a translation table on the ASA device for any language you list here. For more detailed information about automatic browser language selection, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409. Languages are listed by their abbreviation in the table. The languages are evaluated top to bottom until a match is found. The language that is indicated as the default language (indicated as True in the table) is used if the device is unable to negotiate a different language with the browser. If you do not specify a default, English is the default. • To add a language, click the Add Row button below the table. • To edit a language, select it and click the Edit Row button. • To delete a language, select it and click the Delete Row button.
Enable Language Selector	Whether to display the Language Selector on the Logon page. The Language Selector allows users to select their preferred language. The Language Selector is complementary to the automatic browser language selection capability.
Language Selector Prompt	The text label for the Language Selector prompt.

Element	Description
Language Table	The list of languages included in the Language Selector drop-down list. You must configure a translation table on the ASA device for any language you list here. For more detailed information, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409. The table lists the languages by abbreviation and title, or the common name of the language. The title is the text displayed in the drop-down list. You can change the language title but not the abbreviation. • To add a language, click the Add Row button below the table. • To edit a language, select it and click the Edit Row button. • To delete a language, select it and click the Delete Row button.

Add and Edit Language Dialog Boxes

Use the Add and Edit Language dialog boxes to add or edit an entry for a language you will support for automatic browser language selection or in the Language Selector drop-down list.

Navigation Path

From the SSL VPN Customization Dialog Box—Language , on page 1544 page, click the **Add Row** button for either the Automatic Browser Language Selection table or the Language Selector table, or select a row and click the **Edit Row** button.

Field Reference

Table 457: Add and Edit Language Dialog Boxes

Element	Description
Language	The list of languages that you can support on the browser-based clientless SSL VPN web pages, listed by their abbreviation.
Default (Automatic Browser Language Selection only)	Whether the language should be defined as the default language for the portal. The default language is used if the ASA device cannot negotiate a language with the client's browser.
Title (Language Selector only)	The name of the language that should appear in the Language Selector on the Logon page.

SSL VPN Customization Dialog Box—Logon Form

Use the Logon Form settings of the SSL VPN Customization dialog box to customize the title of the login box, login prompts of the SSL VPN page (including username, password, and group prompts), login buttons, and style elements of the login box that appears to browser-based clientless SSL VPN users when they initially connect to the security appliance.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Logon Page > Logon Form** in the table of contents.

Related Topics

Table 458: SSL VPN Customization Dialog Box—Logon Page

Element	Description
Title	The text displayed as the title of the login box.
Message	The message that appears in the login box above the username and password fields. You can enter a maximum of 256 characters.
Username Prompt	The text of the prompt for the username entry field.
Password Prompt	The text of the prompt for the password entry field.
Secondary Username Prompt Secondary Password Prompt	The prompts for a second username and password if you require two login credentials. You can enable secondary authentication only if the Connection Profile policy is configured to require it. The secondary username and password prompt are displayed only if you configure them. If you leave the username prompt blank, the primary username is used and the secondary password must be associated with the primary username.
Internal Password Prompt	The text of the prompt for the internal password entry field.
Show Internal Password First	Whether the prompt for the internal password should be placed above the password prompt. The internal password is required when using a clientless SSL VPN to access an internal protected website.
Group Selector Prompt	The text of the prompt for the Group Selector drop-down list.
Button Text	The name of the button the user clicks to log onto the SSL VPN.
Border Color	The color of the border of the login box. Click **Select** to choose a color.
Title Font Color	The color of the font for the login box title. Click **Select** to choose a color.

Element	Description
Title Background Color	The background color for the Title area of the login box. Click **Select** to choose a color.
Font Color	The color of the font of the login form. Click **Select** to choose a color.
Background Color	The background color for the login form. Click **Select** to choose a color.

SSL VPN Customization Dialog Box—Informational Panel

Use the Informational Panel page of the SSL VPN Customization dialog box to customize the appearance of the Informational panel in the Logon page. The Informational panel is an area where you can provide extra information to the user, and is optional.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Logon Page** > **Informational Panel** in the table of contents.

Field Reference

Table 463: SSL VPN Customization Dialog Box—Applications

Element	Description
No. Move Up and Move Down buttons (below the table)	The sequential number of the application in the table. To change the order of an application, select it and click the Move Up or Move down buttons to the desired position. The applications appear on the Portal page in the order represented here.
Application	The graphic associated with an application.
Title	The name of the application. Standard applications include Home, Web Applications, Browse Networks, Application Access, and Secure Client. Also listed are the browser plug-ins that you create when you configure the SSL VPN global settings are also available for selection from this page. Double-click a title to make it editable so that you can change the name.
Enable	Whether the application is included on the Portal page.
Show Navigation Panel	Whether to display the navigation panel in the portal page. If you deselect this option, the list of applications does not appear on the portal.

SSL VPN Customization Dialog Box—Custom Panes

Use the Custom Panes page of the SSL VPN Customization dialog box to customize the appearance of the main body of the Portal page. By creating custom panes and specifying a column layout, you can create a grid of information that can help you present portal information effectively to your end users.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Portal Page > Custom Panes** in the table of contents.

Related Topics

- Configuring ASA Portal Appearance Using SSL VPN Customization Objects , on page 1406

Field Reference

Table 464: SSL VPN Customization Dialog Box—Custom Panes

Element	Description
Columns table	The list of columns that the main body of the Portal page should be divided into. You define the column based on a percentage of the width of the page. The percentages should add up to 100. If they do not add up to 100, the device will adjust the column widths. Create the columns as you want them to appear, left to right, on the Portal page. • To add a column, click the Add Row button below the table. • To edit a column, select it and click the Edit Row button. • To delete a column, select it and click the Delete Row button.
Custom Panes table	The custom panes that should appear in the main body of the Portal page. The table shows whether a pane is enabled to appear, the type of pane, its characteristics, and the column and row in which it will appear on the page. The panes can display plain text or include a URL for HTML, image, or RSS links. For more detailed information about the settings, see Add or Edit Custom Pane Dialog Boxes , on page 1552. • To add a custom pane, click the Add Row button below the table. • To edit a custom pane, select it and click the Edit Row button. • To delete a custom pane, select it and click the Delete Row button.

Add and Edit Column Dialog Boxes

Use the Add or Edit Column dialog box to create or edit columns in the main body of the Portal page for browser-based clientless SSL VPNs. Enter the desired width of the column as a percentage of the total area in the Percentage field.

Navigation Path

From the SSL VPN Customization Dialog Box—Custom Panes , on page 1551 page, click the **Add Row** button in the Column table, or select a column and click the **Edit Row** button.

Add or Edit Custom Pane Dialog Boxes

Use the Add or Edit Custom Pane dialog box to create or edit a pane to display in the main body or the Portal page of a browser-based clientless SSL VPN.

Navigation Path

From the SSL VPN Customization Dialog Box—Custom Panes , on page 1551 page, click the **Add Row** button in the Custom Pane table, or select a pane and click the **Edit Row** button.

Field Reference

Table 465: Add and Edit Custom Pane Dialog Boxes

Element	Description
Enable	Whether to display the custom pane on the Portal page.
Type	The type of content to show in the pane, one of: • Text—Plain text. You can include HTML mark up. • HTML—HTML content provided by a URL. • Image—An Image provided by a URL. • RSS—An RSS feed provided by a URL.
Show Title Title	Whether to display a title in the pane. If you select this option, enter the title in the Title field.
Show Border	Whether to display a border around the pane.
Column Row	The column and row numbers in which the pane should appear. Select or enter the number for each to specify the desired grid location.
Height	The height of the pane in pixels.
URL (HTML, Image, and RSS content only.)	The URL that hosts the content you want to display in the pane.
Text (Text content only.)	The text you want to display in the pane. You can include HTML markup in the text.

SSL VPN Customization Dialog Box—Home Page

Use the Home Page page in the SSL VPN Customization dialog box to customize the appearance of the URL and file lists on the Portal page and the content of the main body of the Portal page. URL lists are considered to be default elements on the portal home page unless they are explicitly disabled.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Portal Page** > **Home Page** in the table of contents.

Related Topics

Field Reference

Table 466: SSL VPN Customization Dialog Box—Home Page

Element	Description
Enable Custom Intranet Web Page	Whether to display a custom Intranet web page, which also enables URL bookmarks to be displayed on the Portal page. If you select this option, you can configure the panel using the other fields on this page.
URL List Mode	How you want to display URL lists on the home page. If you display URL lists, they are displayed in the column cells that are not occupied by custom panes (as configured on Portal Page > Custom Panes). The options are: • **Group By Application**—Bookmarks are grouped by application type. For example, Web Bookmarks, File Bookmarks. • **No Group**—URL lists are shown as separate panes. • **Do Not Display**—URL lists are not shown.
Custom Intranet Web Page URL	The URL of the custom web page that you want to be loaded as the home page. This page is displayed in the main body of the Portal page. If you specify a custom page, the settings on the Custom Panes page are ignored, and bookmark lists appear on the application pages that are accessed through the navigation panel on the left of the Portal page.

SSL VPN Customization Dialog Box—Logout Page

Use the Logout Page page of the SSL VPN Customization dialog box to customize the appearance of the Logout page for browser-based clientless SSL VPNs. The Logout page appears after the user logs out of the VPN.

Navigation Path

From the Add and Edit SSL VPN Customization Dialog Boxes , on page 1541, select **Logout Page** in the table of contents.

- Configuring ASA Portal Appearance Using SSL VPN Customization Objects , on page 1406

Field Reference

Table 467: SSL VPN Customization Dialog Box—Logout Page

Element	Description
Title	The text to display in the title panel.
Text	The message to display on the Logout page. Click Preview to see the default logout message. You can enter a maximum of 256 characters.
Show Login Button Login Button Text	Whether to display the Login button on the page. Displaying the button makes it easier for the user to log back into the portal. If you enable the button, you can specify the name of the button in the Login Button Text field.
Border Color	The color of the border around the logout box. Click **Select** to choose a color.
Title Font Color Title Background Color	The color of the font and background for the title area of the page. Click **Select** to choose a color.
Font Color Background Color	The font and background color of the message that appears in the logout box. Click **Select** to choose a color.

Add or Edit SSL VPN Gateway Dialog Box

Use the Add or Edit SSL VPN Gateway dialog box to create, copy and edit SSL VPN gateway objects. You use these objects when you are configuring an SSL VPN connection on an IOS device. For more information, see SSL VPN Configuration Wizard—Gateway and Context Page (IOS) , on page 1319.

An SSL VPN gateway acts as a proxy for connections to protected resources that are accessed through an SSL-encrypted connection between the gateway and a web-enabled browser on a remote device. You can configure only one gateway per SSL VPN.

Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Gateway** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Related Topics

- SSL VPN Configuration Wizard—Gateway and Context Page (IOS) , on page 1319
- General Tab , on page 1485
- Policy Object Manager , on page 232

Field Reference

Table 468: Add and Edit SSL VPN Gateway Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object (up to 1024 characters).
IP Address	The IP address for the gateway, which is the address to which remote users connect: • **Use Static IP Address**—Specify the address that you want to use. You must also configure this address on an interface on the router. • **Obtained from Interface**—Specify the interface role that resolves to a single interface on the device. The IP address configured for the interface is used. This option allows you to identify the external interface you want to use for connections without having to explicitly enter the IP address. If you have to change the address on the interface, you do not have to also reconfigure this object.
Port	The number of the port that will carry the HTTPS traffic. You can also enter the name of a port list object that specifies the single port number, or click **Select** to select the object from a list. The default is the HTTPS object, which specifies port 443. If you do not use port 443, you can enter another port number between 1025 and 65535.
Trustpoint	The digital certificate required to establish the secure connection. A self-signed certificate is generated when an SSL VPN gateway is activated.
Enable Gateway	Whether to activate the SSL VPN gateway.
Specify SSL Encryption Algorithms	Whether to restrict the encryption algorithms used for the connection, or to specify a different order of use. The default is to make all algorithms available in this order of preference: 3DES and SHA1, AES and SHA1, RC4 and MD5. Select the priority order for the algorithms. Select None to eliminate one or two algorithms.
Redirect HTTP Traffic HTTP Port	Whether to have the gateway redirect HTTP traffic over secure HTTP (HTTPS). Traffic that comes to this port is redirected to the port you specify in the Port field. Enter the port number for HTTP traffic in the **HTTP Port** field. You can enter a number or the name of a port list object, or click **Select** to select an object from a list or to create a new object. The HTTP port is normally 80. However, you can enter any other number that is used in your network between 1025-65535.

Element	Description
Hostname	The hostname for the gateway. • Do Not Specify—No hostname is assigned; the IP address to the gateway is used. • Use the host and domain names of the device—These are defined in the **Platform > Device Admin > Hostname** policy. • Use the Object—The hostname is the value defined in a text policy object. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add and Edit Smart Tunnel List Dialog Boxes

Use the Add and Edit Smart Tunnel Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel objects.

An SSL VPN smart tunnel list object lists the applications that are eligible for smart tunnel access to a private site. You can configure the clientless settings of an ASA group policy with a smart tunnel list to allow users to access the specified applications through the SSL VPN portal. For an explanation of the types of applications that support smart tunnel access, see Configuring SSL VPN Smart Tunnels for ASA Devices , on page 1414.

You can include other SSL VPN smart tunnel list objects in an object. Thus, you can create a smaller set of objects that identify your basic list of applications, then create other objects that create the required combination of applications. For example, you might want all three of your ASA group policies to allow smart tunnel access to applications A and B, but the remaining applications are unique for each group. By creating a single object that specifies A and B, you can include that object in each of the SSL VPN smart tunnel list objects for the group policies, and these objects need only specify their unique applications in the applications table.

Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 469: Add and Edit Smart Tunnel Lists Dialog Boxes

Element	Description
Name	The object name, which can be up to 64 characters. Spaces are not allowed. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Smart Tunnel Entries table	The applications to which users will be allowed smart tunnel access through the SSL VPN, including the name of the application and its location on client workstations. • To add an application, click the **Add Row** button to open the Add and Edit A Smart Tunnel Entry Dialog Boxes , on page 1558. • To edit an application, select it and click the **Edit Row** button. • To delete an application, select it and click the **Delete Row** button.
Include Smart Tunnel Lists	The other SSL VPN smart tunnel list objects that you want to include in this object, if any. Enter the names of the objects or click **Select** to select them from a list or to create new objects. Separate multiple entries with commas.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add and Edit A Smart Tunnel Entry Dialog Boxes

Use the Add and Edit A Smart Tunnel Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Lists dialog box.

Navigation Path

From Add and Edit Smart Tunnel List Dialog Boxes , on page 1557, click the **Add Row** button beneath the Smart Tunnel Entries table, or select an entry and click the **Edit Row** button.

Related Topics

- Configuring SSL VPN Smart Tunnels for ASA Devices , on page 1414
- Policy Object Manager , on page 232

Field Reference

Table 470: Add and Edit Smart Tunnel Entry Dialog Boxes

Element	Description
App Name	The name of the application to which you are allowing smart tunnel access. The name can be up to 64 characters. Consider including the version number of the application if you are allowing more than one version smart tunnel access.
App Path	The filename and optionally, the path, of the application. This entry can be up to 128 characters. Use one of the following: • Filename—For example, **outlook.exe**. By only specifying the file name, it does not matter where users install the application on their workstations. However, the file name must match exactly. • Full path and filename—For example, **C:\Program Files\Microsoft Office\OFFICE11\OUTLOOK.EXE**. This allows the application smart tunnel access only if it is installed in the specified directory, which you can use to enforce organizational standards. **Tips** • If you specify the full path, and the smart tunnel application stops working after it had been working for a while, it is likely that a product upgrade changed the installation path. Add a new entry that accounts for the new path. • If you are granting smart tunnel access to an application that is started from the command line, create one entry for **cmd.exe** (the Windows command line), and another entry for the application.
Platform	Specify the host operating system of the application: • Windows • Mac

Element	Description
Hash Value	(Optional) The hash value for the application. By specifying a hash value, you can ensure that the user does not rename another application to use a supported filename and thus start an unsupported and undesired application over the smart tunnel. To obtain the hash value, enter the checksum of the application (that is, the checksum of the executable file) into a utility that calculates a hash using the SHA-1 algorithm. One example of such a utility is the Microsoft File Checksum Integrity Verifier (FCIV), which is available at http://support.microsoft.com/kb/841290/ . Place a temporary copy of the application to be hashed on a path that contains no spaces (for example, c:\temp) and then enter **fciv.exe -sha1** application at the command line (for example, **fciv.exe -sha1 c:\msimn.exe**) to display the SHA-1 hash. Copy and paste the value into this field. The SHA-1 hash is always 40 hexadecimal characters. Before authorizing an application for smart tunnel access, clientless SSL VPN calculates the hash of the application matching the App Name. It qualifies the application for smart tunnel access if the result matches the value of hash. Because the checksum varies with each version or patch of an application, the hash you enter can match only one version or patch on the remote host. To specify a hash for more than one version of an application, create a unique smart tunnel entry for each hash value. **Tip** Hash values require maintenance. You must update the smart tunnel list if you want to support future versions or patches of an application for which you supply a hash value. A sudden problem with smart tunnel access might be an indication that the application list containing hash values is not up-to-date with an application upgrade. You can avoid this problem by not entering a hash.

Add and Edit Smart Tunnel Network Lists Dialog Boxes

Beginning from Security Manager version 4.7, you can use the Add and Edit Smart Tunnel Network Lists dialog boxes to create and edit a list of hosts that you can use for configuring smart tunnel policies.

Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Network Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**. Alternatively, you can click the **Add (+)**button to add a new object, or click the **Edit (pencil)** button to edit an object.

Field Reference

Table 472: Add and Edit Smart Tunnel Network List Entry Dialog Boxes

Element	Description
Host	The host mask that will be part of the smart tunnel network list entry.
IP Address	The IP address of the host that will be part of the smart tunnel network list entry. Beginning with version 4.12, Security Manager supports IPv6 addresses.
Subnet Mask	The subnet mask for the specified IP address.

Add and Edit Smart Tunnel Auto Signon List Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Lists dialog boxes to create, copy, and edit SSL VPN smart tunnel auto sign-on objects.

Smart Tunnel Auto Sign-on is a single sign-on method for Clientless SSL VPN users. It passes the login credentials (username and password) to internal servers for authentication using NTLM authentication, HTTP Basic authentication, or both. Smart Tunnel Auto Sign-on is supported on ASA 5500 devices running software version 7.1(1) and later.

An SSL VPN smart tunnel auto sign-on list object identifies the servers for which to automate the submission of login credentials during smart tunnel setup. You can configure the clientless settings of an ASA group policy with a smart tunnel auto sign-on list if you want to reissue the user credentials when the user establishes a smart tunnel connection to a server. For an explanation of the types of applications that support smart tunnel access, see Configuring SSL VPN Smart Tunnels for ASA Devices , on page 1414.

You can include other SSL VPN smart tunnel auto sign-on list objects in an object. Thus, you can create a set of objects that identify your basic list of servers and include those objects in another object that expands upon that list of servers.

Navigation Path

Select **Manage > Policy Objects**, then select **SSL VPN Smart Tunnel Auto Signon Lists** from the Object Type selector. Right-click inside the work area and select **New Object**, or right-click a row and select **Edit Object**.

Element	Description
Name	The object name, which can be up to 64 characters. Spaces are not allowed. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Smart Tunnel Auto Signon Entries table	The servers for which to automate the submission of login credentials during smart tunnel setup. • To add servers, click the **Add Row** button to open the Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes , on page 1563. • To edit an entry, select it and click the **Edit Row** button. • To delete an entry, select it and click the **Delete Row** button.
Include Other Lists	The other smart tunnel auto sign-on list objects that you want to include in this object, if any. Enter the names of the objects or click **Select** to select them from a list or to create new objects. Separate multiple entries with commas.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes

Use the Add and Edit Smart Tunnel Auto Signon Entry dialog boxes to create a new smart tunnel entry or edit an existing entry in the table in the SSL VPN Smart Tunnel Auto Signon List dialog box.

Navigation Path

From Add and Edit Smart Tunnel Auto Signon List Dialog Boxes , on page 1562, click the **Add Row** button beneath the Smart Tunnel Auto Signon Entries table, or select an entry and click the **Edit Row** button.

Related Topics

- Configuring SSL VPN Smart Tunnels for ASA Devices , on page 1414
- Policy Object Manager , on page 232

Field Reference

Table 474: Add and Edit Smart Tunnel Auto Signon Entry Dialog Boxes

Element	Description
Matching Mode: • Host • IPv4/IPv6 Address	Identifies the server for which to automate the submission of login credentials during smart tunnel setup. Use Host to specify the server by host name or wildcard mask, and use IP Address to specify the server by IP address and netmask: • **Host**—Select Host and then enter the host name or a wildcard mask in the Hostname Mask field that identifies the host for which to automate the submission of login credentials during smart tunnel setup. **Note** Using this option protects the configuration from dynamic changes to IP addresses. • **IPv4/IPv6 Address**—Select the IP Address and then enter the IP address and netmask of the host or sub-network of hosts for which to automate the submission of login credentials during smart tunnel setup. **Note** Beginning with version 4.12 Security Manager supports IPv6 addresses. By default, when you select the **IPv4/IPv6 Address,** Security Manager looks for IPv4/IPv6 address. Enter the Subnet Mask or Prefix Length as required. **Note** Firefox requires the administrator to specify hosts using an exact host name or IP address (instead of a host mask with wild cards, a subnet using IP addresses, or a netmask). For example, within Firefox, you cannot enter *.cisco.com and expect auto sign-on to host email.cisco.com.
Port Number	The port that performs auto sign-on. For Firefox, if no port number is specified, auto sign-on is performed on HTTP and HTTPS, accessed by default port numbers 80 and 443 respectively.
Authentication Realm	The realm for the authentication. The Authentication Realm is associated with the protected area of the website and is passed back to the browser either in the authentication prompt or in the HTTP headers during authentication. After auto sign-on is configured and a realm string is specified, users can configure the realm string on a web application (such as Outlook Web Access) and access web applications without signing on.
Use Domain	Select this option to add the Windows domain to the username if authentication requires it. If you use this option, be sure to specify the domain name when assigning the smart tunnel list to one or more group policies.

Add or Edit User Group Dialog Box

Use the Add or Edit User Group dialog box to create or edit a user group object. User group objects are used in Easy VPN topologies, remote access VPNs, and SSL VPNs for IOS devices.

When you configure a remote access VPN, SSL VPN, or Easy VPN server, you can create user groups to which remote clients belong. The remote clients must be configured with the same group name as the user group on the VPN server in order to connect to the server; otherwise, no connection is established. When the

remote client connects to the VPN server successfully, the group policies for that particular user group are pushed to all remote clients belonging to the user group.

For more information about user groups, see:

- Configuring User Group Policies , on page 1481
- Configuring a User Group Policy for Easy VPN , on page 1259
- Configuring an SSL VPN Policy (IOS) , on page 1482

Note You must select the technology (Easy VPN/Remote Access VPN, or SSL VPN) for which you are creating the user group object. If you are editing an existing user group object, the technology is already selected and you cannot change it. Depending on the selected technology, the appropriate settings are available for configuration.

Navigation Path

Select **Manage** > **Policy Objects**, then select **User Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Tip You can also access this dialog box from the **Remote Access VPN** > **IPSec VPN** > **User Groups** or the **Remote Access VPN** > **SSL VPN** policies.

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Settings Pane The body of the dialog box is a pane with a table of contents on the left and settings related to the item selected in the table of contents on the right. You must first configure technology settings, then you can select items from the table of contents on the left and configure the options you require. Your selections on the Technology page control which options are available on these pages and in the table of contents. The top folders in the table of contents represent the VPN technologies or other settings that you can configure, and are explained next.	
Technology settings	These settings control what you can define in the group policy: • **Group Name**—The name for the user group (up to 128 characters). Configure the same user group name within the remote client or device to ensure that the appropriate group attributes are downloaded. • **Technology**—The types of VPN for which this object defines group policies. You cannot change this option when editing an object, or if you are creating the user group object while editing a VPN policy. You can configure settings for Easy VPN/Remote Access IPSec VPN or SSL VPN, but not both.
Easy VPN/Remote Access IPSec VPN pages	When you select Easy VPN/Remote Access IPSec VPN as the technology, you can configure settings on the following pages: • User Group Dialog Box—General Settings , on page 1567 • User Group Dialog Box—DNS/WINS Settings , on page 1568 • User Group Dialog Box—Split Tunneling , on page 1569 • User Group Dialog Box—IOS Client Settings , on page 1570 • User Group Dialog Box—IOS Xauth Options , on page 1572 • User Group Dialog Box—IOS Client VPN Software Update , on page 1573 • User Group Dialog Box—Advanced PIX Options , on page 1574

Element	Description
SSL VPN pages	When you select SSL VPN as the technology, you can configure settings on the following pages: • User Group Dialog Box—Clientless Settings , on page 1575 • User Group Dialog Box—Thin Client Settings , on page 1576 • User Group Dialog Box—SSL VPN Full Tunnel Settings , on page 1577 • User Group Dialog Box—DNS/WINS Settings , on page 1568 • User Group Dialog Box—SSL VPN Split Tunneling , on page 1579 • User Group Dialog Box—Browser Proxy Settings , on page 1580 • User Group Dialog Box—SSL VPN Connection Settings , on page 1581
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

User Group Dialog Box—General Settings

The general settings you configure for your user group include the authentication method, IP address pool information, and connection attributes for PIX 6.3 Firewalls.

Note These settings apply in Easy VPN and remote access IPSec VPN configurations.

Navigation Path

Select **General** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 476: User Group Dialog Box—General Settings

Element	Description
Preshared Key	The preshared key that will be used to authenticate the clients associated to the user group. **Note** You do not have to enter a preshared key if you are using digital certificates for group authentication. In regular IPsec VPNs, preshared keys allow for one or more peers to use individual shared secrets to authenticate encrypted tunnels. A preshared key must be configured on each participating peer. If one of the participating peers is not configured with the same preshared key, the IKE SA cannot be established. In Easy VPN authentication, the same Easy VPN server key is used for the spoke configuration to ensure that the server/client keys match. In remote access IPSec VPN authentication, the same key is used to negotiate a VPN connection between the remote access VPN server and the remote clients.
IP Address Pool Subnet/Ranges	The IP address ranges for a local pool that will be used to allocate an internal IP address to a client. Remote clients are assigned IP addresses from this pool. Separate multiple entries with commas. The default is 172.16.0.1-172.16.4.254.
Backup Servers IP Address	The IP address of the servers to be used as backups for the Easy VPN or remote access IPSec VPN server. The router tries to connect to these servers if the primary connection to the Easy VPN or remote access VPN server fails. Separate multiple entries with commas.
PIX Only Attributes	These attributes apply only to PIX 6.3 devices. • **Idle Time**—The timeout period for VPN connections, in seconds. If no communication occurs on the connection during this period, the device terminates the connection. The minimum is 60 seconds, and the maximum time is 35791394 minutes. The default is 30 minutes. • **Max Time**—The maximum amount of time for VPN connections, in seconds. At the end of the time, the device terminates the connection. The minimum is 60 seconds, and the maximum is 35791394 minutes. There is no default.

User Group Dialog Box—DNS/WINS Settings

Configure the DNS/WINS settings for your user group to define the DNS and WINS servers and the domain name that should be pushed to clients associated with the user group.

Note The DNS/WINS settings you configure for a user group apply in Easy VPN, remote access VPN, and SSL VPN configurations.

Navigation Path

Select **DNS/WINS** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 477: User Group Dialog Box—DNS/WINS Settings

Element	Description
Primary DNS Server	The IP address of the primary DNS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Secondary DNS Server	The IP address of the secondary DNS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Domain Name	The domain name of the DNS server you want to configure on the user group.
Primary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.
Secondary WINS Server	The IP address of the primary WINS server for the group. Enter the IP address or the name of a network/host object, or click **Select** to select an object from a list or to create a new object.

User Group Dialog Box—Split Tunneling

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination.

The split tunneling policy is applied to a specific network. When you configure split tunneling, you can transmit both secured and unsecured traffic on the same interface. You must specify which traffic will be secured and what the destination of that traffic is, so that you have a secure tunnel to the central site, while the clear (unsecured) traffic is transmitted across the public network.

Tip For optimum security, we recommend that you not enable split tunneling.

Note Split tunneling can be applied in Easy VPN, remote access VPN, and SSL VPN configurations. For information about configuring split tunneling for SSL VPN, see User Group Dialog Box—SSL VPN Split Tunneling , on page 1579.

Navigation Path

Select **Split Tunneling** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564 when configuring Easy VPN/Remote Access IPSec VPN.

Field Reference

Table 478: User Group Dialog Box—Split Tunneling

Element	Description
Split Tunneling	The networks for which you want to tunnel traffic. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. You can identify the networks using one of these options: • **Protected Networks**—Specify the networks by network addresses. Enter the addresses or network/host objects, or click **Select** to select the objects from a list or to create new objects. For information on specifying addresses, see Specifying IP Addresses During Policy Definition , on page 318. • **ACL**—Specify the networks using an extended access control list policy object. Enter the name of the object or click **Select** to select the object from a list or to create a new object.
Split DNS	A list of domain names that must be tunneled or resolved to the private network. All other names will be resolved through the public DNS server. You can enter multiple domain names separated by commas.

User Group Dialog Box—IOS Client Settings

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Configure IOS client settings to define Cisco IOS specific options for your user group, including firewall settings for VPN clients.

Note These settings apply in Easy VPN and remote access IPSec VPN configurations.

Navigation Path

Select **Client Settings (IOS)** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 479: User Group Dialog Box—Client Settings (IOS)

Element	Description
Enable Firewall Are-You-There (Not available on 7600 series or ASR routers.)	This feature may be used if a VPN client is running the Black Ice or Zone Alarm personal firewall. When selected, it ensures that the personal firewall is running at connection time and throughout the connection. The Firewall-Are-U-There attribute is sent by the Black Ice and Zone Alarm personal firewalls if the server prompts them to do so. If the personal firewall stops running, the connection is terminated. If this feature is enabled and there is no personal firewall running on the server, the connection is never established.
Mode	A Central Policy Push (CPP) firewall policy on a server allows or denies a tunnel on the basis of whether the remote device has a required firewall for a local AAA server. The Mode option specifies whether the Central Policy Push (CPP) policy is optional or mandatory, as follows: • **Optional**—If the CPP policy is defined as optional, and is included in the Easy VPN server configuration, the tunnel setup is continued even if the client does not confirm the defined policy. • **Required**—If the CPP policy is defined as mandatory and is included in the Easy VPN server configuration, the tunnel setup is allowed only if the client confirms this policy. Otherwise, the tunnel is terminated.
Firewall Type	The type of firewall that you are making required or optional. The list shows all of the supported firewall software, which includes software from Cisco and Zone Labs.

Policy Type	Specifies the CPP firewall policy type:
	
	• **Check Presence**—Instructs the server to check for the presence of the specified firewall type.
	
	• **Central Policy Push**—The actual policy, such as the input and output access lists, that must be applied by the specified client firewall type. Specify the following:
	
	  • The access control list to be used. Enter the name of the extended ACL object or click **Select** to select it from a list or to create a new object.
	
	  • The direction of the access control list—Inbound or Outbound.

Include Local LAN	Whether to allow a non split-tunneling connection to access the local LAN at the same time as the client.
Perfect Forward Secrecy	Whether to enable Perfect Forward Secrecy (PFS). If PFS is enabled, the server is configured to notify the client of the central-site policy about whether PFS is required for any IPsec SA. The Diffie-Hellman (D-H) group that is proposed for PFS is the same that was negotiated in Phase 1 of the IKE negotiation.

User Group Dialog Box—IOS Xauth Options

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

IOS Xauth options configure IKE Extended Authentication (Xauth) user authentication and connection parameters for the user group, including the banner text.

Note These settings apply in Easy VPN and remote access VPN configurations.

Navigation Path

Select **Xauth Options (IOS)** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 480: User Group Dialog Box—IOS Xauth Options

Element	Description
Banner	The banner text that is displayed to Easy VPN remote clients during Xauth and web-based activation the first time the Easy VPN tunnel is brought up. A maximum of 1024 characters is allowed.
Maximum Logins Per User	The maximum number of connections a user can establish simultaneously. The maximum is 10.
Maximum Connections	The maximum number of client connections to the Easy VPN Server from this group. The maximum is 5000 per group.
Enable Group-Lock	Whether to enable group lock, which requires that the user enter the extended Xauth username in one of the following formats: • username/groupname • username\groupname • username@groupname • username%groupname The group that is specified after the delimiter is then compared to the group identifier that is sent during IKE aggressive mode. The groups must match or the connection is rejected. **Note** Do not select this option if you are using RSA signature authentication mechanisms such as certificates.

Element	Description
Enable Save Password	Whether to allow users to save their Xauth password locally on the client. On subsequent authentications, users can activate the password by using the check box on the software client or by adding the username and password to the Cisco IOS hardware client profile. After users activate the password, their username and password are sent to the server automatically during Xauth. This option is useful only if users have static passwords, that is, they are not one-time passwords such as those that are generated by a token.

User Group Dialog Box—IOS Client VPN Software Update

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Client VPN Software Update (IOS) settings configure, for an IOS VPN client, the platform type, VPN Client revisions, and image URL for each client VPN software package installed, for your user group.

The Client Update feature is supported on IOS routers version 12.4(2)T and later, and Catalyst 6500/7600 devices version 12.2(33)SRA and later.

- To add a client, click the **Add Row** button to open the Add/Edit Client Update Dialog Box , on page 1573.
- To edit a client, select it and click the **Edit Row** button.
- To delete a client, select it and click the **Delete Row** button.

Note These settings apply in Easy VPN and remote access VPN configurations.

Navigation Path

Select **Client VPN Software Update (IOS)** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Add/Edit Client Update Dialog Box

Use the Add or Edit Client Update dialog box to configure the platform type, image URL, and VPN Client revisions for a client VPN software package.

Navigation Path

Open the User Group Dialog Box—IOS Client VPN Software Update , on page 1573, then click **Add Row**, or select an item in the table and click **Edit Row**.

Related Topics

- Add or Edit User Group Dialog Box , on page 1564

Field Reference

Table 481: Add or Edit Client Update Dialog Box

Element	Description
System Type	The platform on which the IOS VPN client operates. • All Windows (Default)—This option includes any Windows platform for which a VPN client is available. • Macintosh OS X
IOS Image URL	Enter the URL from where the client can be downloaded. The URL must start with http:// or https://.
IOS VPN Client Revisions	Enter the revision level of the VPN client. You can specify more than one client revision separated by commas.

User Group Dialog Box—Advanced PIX Options

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

The Advanced PIX Options are specifically for PIX 6.3 Firewalls in your user group.

Note These settings apply in Easy VPN and remote access VPN configurations.

Navigation Path

Select **Advanced Options (PIX)** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 482: User Group Dialog Box—Advanced PIX Options

Element	Description
User Idle Timeout (sec)	The length of time that a VPN tunnel can remain open without user activity, in seconds. Values range from 60-86400 seconds.

Element	Description
User Authentication Server	The AAA server to which remote devices send user authentication requests. Enter the name of the server group or click **Select** to select it from a list or to create a new group. See Understanding AAA Server and Server Group Objects , on page 256.
Enable Device Pass-Through	Whether to use Media Access Control (MAC) addresses to bypass authentication for devices, such as Cisco IP phones, that do not support AAA authentication. When MAC-based AAA exemption is enabled, the device bypasses the AAA server for traffic that matches both the MAC address of the device and the IP address that was dynamically assigned by a DHCP server. Authorization services are disabled automatically when you bypass authentication. Accounting records continue to be generated (if enabled), but the username is not displayed.
Enable Secure Unit Authentication	Whether to provide increased security when allowing access to the device from a remote client. With Secure Unit Authentication (SUA), you can use one-time passwords, two-factor authentication, and similar authentication schemes to authenticate the remote device during Extended Authentication (Xauth). SUA is specified in the VPN policy on the device and is downloaded to the remote client. This enables SUA and determines the connection behavior of the remote client.
Enable User Authentication	Whether to enable Individual User Authentication (IUA), which supports individually authenticating clients on the inside network of the remote access VPN, based on the IP address of each inside client. IUA supports both static and OTP authentication mechanisms.

User Group Dialog Box—Clientless Settings

Use the Clientless settings to configure the clientless mode of access to the corporate network in an SSL VPN.

In clientless access mode, once a user is authenticated and a session is established, an SSL VPN portal page and toolbar is displayed on the user's web browser. From the portal page, the user can access all available HTTP sites, access web e-mail, and browse Common Internet File System (CIFS) file servers.

Navigation Path

Select **Clientless** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Related Topics

- Create Group Policy Wizard—Clientless and Thin Client Access Modes Page , on page 1310

Field Reference

Table 483: User Group Dialog Box—Clientless Settings

Element	Description
Portal Page Websites	The name of the SSL VPN bookmarks policy object that includes the web site URLs to display on the portal page. These web sites help users access desired resources. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Allow Users to Enter Websites	Whether to allow the remote user to enter web site URLs directly into the browser. If you do not select this option, the user can access only those URLs included on the portal.
Enable Common Internet File System (CIFS)	In Clientless mode, files and directories created on Microsoft Windows servers can be accessed by the remote client through the web browser. When you enable the Common Internet File System (CIFS), a list of file server and directory links are displayed on the portal page after login. The CIFS protocol lets you customize permissions on the SSL VPN gateway to allow shared files to be accessed or modified by the remote client, as follows: • **Enable File Browsing**—Whether to allow the remote user to browse for file shares on the CIFS file servers. • **Enable File Entry**—Whether to allow the remote user to locate file shares on the CIFS file servers by entering the names of the file shares.
WINS Server List	The name of the WINS server list policy object that identifies the WINS/NetBIOS servers to use for resolving file server names. You should supply an object if you enable CIFS. Enter the name of the object or click **Select** to select if from a list or to create a new object.
Enable Citrix	Whether to enable remote clients to run Citrix-enabled applications, such as Microsoft Word or Excel, through the SSL VPN as if the application were locally installed, without the need for client software. The Citrix software must be installed on one or more servers on a network that the router can reach.

User Group Dialog Box—Thin Client Settings

Use the Thin Client settings to enable the thin client, or port forwarding, mode of access to the corporate network in an SSL VPN. Port forwarding allows users to access applications (such as Telnet, e-mail, VNC, SSH, and Terminal services) inside the enterprise through an SSL VPN session. A port forwarding list object defines the mappings of port numbers on the remote client to the application's IP address and port behind the SSL VPN gateway.

In thin client access mode, the remote user downloads a Java applet that acts as a TCP proxy on the client machine for the services configured on the SSL VPN gateway. The proxy provides the port forwarding services.

Navigation Path

Select **Thin Client** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Related Topics

- Create Group Policy Wizard—Clientless and Thin Client Access Modes Page , on page 1310

Field Reference

Table 484: User Group Dialog Box—Thin Client Settings

Element	Description
Enable Thin Client	Whether to allow thin client access to the SSL VPN.
Port Forward List	The name of the port forwarding list policy object assigned to this group. Port forwarding lists contain the set of applications that users of clientless SSL VPN sessions can access over forwarded TCP ports. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Download Port Forwarding Applet on Client Login	Whether the port forwarding Java applet should be automatically downloaded to the client when a user logs into the SSL VPN. If you do not automatically download the applet, users must download it manually after login.

User Group Dialog Box—SSL VPN Full Tunnel Settings

Use the SSL VPN Full Tunnel settings to enable the full tunnel client access mode in your SSL VPN. When you enable full tunnel access, you should also define DNS/WINS server settings, browser proxy settings, and split tunneling for the user group.

In full tunnel client access mode, the tunnel connection is determined by the group policy configuration. The full tunnel client software, SSL VPN Client (SVC), must be downloaded to the remote client so that a tunnel connection can be established when the remote user logs in to the SSL VPN gateway.

Tip For full tunnel client access to work, you must install the client software on the gateway. The user downloads the client when connecting to the gateway.

Navigation Path

Select **Full Tunnel > Settings** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Related Topics

- Create Group Policy Wizard—Full Tunnel Page , on page 1307

Field Reference

Table 485: User Group Dialog Box—Full Tunnel Settings

Element	Description
Enable Full Tunnel	Whether to enable full tunnel client access to the SSL VPN.
Use Other Access Modes if SSL VPN Client Download Fails Full Tunnel Only	Whether to allow users to connect to the SSL VPN even if a problem prevents the client from downloading, installing, and starting correctly on the user's system. If you select **Full Tunnel Only**, a user cannot connect to the SSL VPN if the download fails, which locks the user out of the network. Select **Use Other Access Modes** to allow clientless or thin client access if there is a download problem.
Client IP Address Pool	The IP address ranges of the address pool that full tunnel clients will draw from when they log on. The address pool must be in the same subnet as one of the device's interface IP addresses. Enter the address range separating the first and last IP address with a hyphen, for example, **10.100.10.2-10.100.10.255**. If you enter a single address, the pool has just one address. Do not enter subnet designations. You can also enter the name of a network/host policy object that defines the range, or click **Select** to select the object from a list or to create a new object. Separate multiple ranges with commas.
Filter ACL	The name of an extended access control list (ACL) object that restricts access to the SSL VPN. Enter the name of the object or click **Select** to select it from a list or to create a new object.
Keep SSL VPN Client on Client Computer	Whether to leave the full client installed on the user's workstation after the user disconnects. If you do not allow the client to remain on the user's system, the client must be downloaded each time the user establishes a connection to the SSL VPN gateway.
Home Page URL	The web address of the login home page for the full client.
Client Dead Peer Detection Timeout	The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the remote user. Enter a value in the range 1-3600 seconds.
Gateway Dead Peer Detection Timeout	The time interval that the Dead Peer Detection (DPD) timer is reset each time a packet is received over the SSL VPN tunnel from the gateway. Enter a value in the range 1-3600 seconds.
Key Renegotiation Method	The method by which the tunnel key is refreshed for the remote user group client: • **Disabled**—Disables the tunnel key refresh. • **Create New Tunnel**—Initiates a new tunnel connection. Enter the time interval (in seconds) between the tunnel refresh cycles in the **Interval** field.

User Group Dialog Box—SSL VPN Split Tunneling

Use the Split Tunneling settings to configure a secure tunnel to the central site and simultaneous clear text tunnels to the Internet for SSL VPNs.

Split tunneling lets a remote client conditionally direct packets over an IPsec or SSL VPN tunnel in encrypted form or to a network interface in clear text form. With split tunneling enabled, packets not bound for destinations on the other side of the tunnel do not have to be encrypted, sent across the tunnel, decrypted, and then routed to a final destination. The split tunneling policy is applied to specific networks.

Tip For optimum security, we recommend that you not enable split tunneling.

Navigation Path

Select **Full Tunnel** > **Split Tunneling** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 486: User Group Dialog Box—Split Tunneling Settings

Element	Description
Tunnel Option	Whether to allow split tunneling and if so, which traffic should be secured or transmitted unencrypted across the public network: • Disabled—(Default) No traffic goes in the clear or to any other destination than the gateway. Remote users reach networks through the corporate network and do not have access to local networks. • Tunnel Specified Traffic—Tunnel all traffic from or to the addresses listed in the **Destinations** field. Traffic to all other addresses travels in the clear and is routed by the remote user's Internet service provider. • Exclude Specified Traffic—Traffic goes in the clear from and to the addresses listed in the **Destinations** field. This is useful for remote users who want to access devices on their local network, such as printers, while they are connected to the corporate network through a tunnel.
Destinations	The IP addresses for hosts or networks that identify the networks that require traffic to travel across the tunnel and those that do not require tunneling. Whether traffic to these addresses is encrypted and tunneled to the gateway, or sent in the clear, is determined by your selection for **Tunnel Option**. Enter network addresses such as 10.100.10.0/24 or host addresses such as 10.100.10.12. You can also enter the name of a network/host policy object, or click **Select** to select the object from a list or to create a new object. Separate multiple addresses with commas.

Element	Description
Exclude Local LANs	Whether to exclude local LANs from the encrypted tunnel. This option is available only if you selected the **Exclude Specified Traffic** tunnel option. By selecting this option, you do not have to enter local LAN addresses into the destinations field to allow users to communicate with systems (such as printers) that are attached to their LAN. When selected, this attribute disallows a non split-tunneling connection to access the local subnetwork at the same time as the client.
Split DNS Names	A list of domain names to be resolved through the split tunnel to the private network. All other names are resolved using the public DNS server. Enter up to 10 entries in the list of domains, separated by commas. The entire string can be no longer than 255 characters.

User Group Dialog Box—Browser Proxy Settings

Use the Browser Proxy settings to configure proxy bypass for full tunnel access in an SSL VPN.

A security appliance can terminate HTTPS connections and forward HTTP/HTTPS requests to HTTP and HTTPS proxy servers, which act as intermediaries between users and the Internet. Proxy bypass is an alternative method of content rewriting that makes minimal changes to the original content. It is useful with custom web applications.

Tip The browser proxy settings work only for Microsoft Internet Explorer; they do not work for other types of browsers.

Navigation Path

Select **Full Tunnel** > **Browser Proxy Settings** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Related Topics

- Configuring SSL VPN Proxies and Proxy Bypass (ASA) , on page 1384

Field Reference

Table 487: User Group Dialog Box—Browser Proxy Settings

Element	Description
Browser Proxy Option	Whether and how to configure proxy settings on the remote client's browser: • Blank—Do not configure proxy settings. • Do Not Use Proxy Server—Configure the browser to not use a proxy. • Automatically Detect Settings—Configure the browser to automatically detect proxy settings. • Bypass Proxy Server for Local Addresses—Configure the browser to bypass proxy settings configured by the user.
Proxy Server	The address of the proxy server: • IP address—The IP address or the name of a network/host object that specifies the address. Click **Select** to select the object from a list. • Name—The fully qualified domain name, for example, proxy.example.com.
Proxy Server Port	The port number on the server that is used for proxy traffic, for example, 80. Enter a value in the range 1-65535.
Do Not Use Proxy Server for Addresses Beginning With	If you configured a proxy, you can identify specific hosts for which the proxy should be bypassed. If the user opens these hosts in the browser, the proxy is not used in the connection. Enter full IP addresses or fully qualified domain names. For example, 10.100.10.14 or www.cisco.com.

User Group Dialog Box—SSL VPN Connection Settings

Use this SSL VPN Connection Settings page to configure the SSL VPN session connection settings for the user group, including the banner text. An SSL VPN session is disconnected if the client is connected longer than the session timeout or if it is idle longer than the idle timeout.

Navigation Path

Select **Connection Settings** from the table of contents in the Add or Edit User Group Dialog Box , on page 1564.

Field Reference

Table 488: User Group Dialog Box—Connection Settings

Element	Description
Idle Timeout	The idle timeout period for the SSL VPN session. The session is disconnected if the client is idle longer than the specified idle timeout. Values range from 0-3600 seconds.

Element	Description
Session Timeout	The timeout period for the SSL VPN session. The session is disconnected when this timeout is reached even if the user is still active. Values range from 1-1209600 seconds.
Banner Text	The banner, for example, a welcome message, that is displayed to remote users when they connect to the SSL VPN. You cannot use double quotes or new lines (carriage returns) in the banner text. However, you can include HTML tags to create the desired layout.

Add or Edit WINS Server List Dialog Box

Use the WINS Server Lists dialog box to create, copy, and edit WINS server list objects. A WINS Server List object defines a list of Windows Internet Naming Server (WINS) servers, which are used to translate Windows file server names to IP addresses.

Navigation Path

Select **Manage > Policy Objects**, then select **WINS Server Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Related Topics

- Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs , on page 1416
- Policy Object Manager , on page 232

Field Reference

Table 489: WINS Server Lists Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
WINS Server List	The WINS servers that are defined for the object. • To add a server, click the Add button and fill in the Add WINS Server dialog box (see Add or Edit WINS Server Dialog Box , on page 1583). • To edit a server, select it and click the Edit button. • To delete a server, select it and click the Delete button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit WINS Server Dialog Box

Use the Add/Edit WINS Server dialog box to create a new WINS server entry or edit an existing entry in the table in the WINS Server Lists dialog box.

Navigation Path

From the Add or Edit WINS Server List Dialog Box , on page 1582, click the **Add** button beneath the WINS Server List table, or select a server in the table and click the **Edit** button.

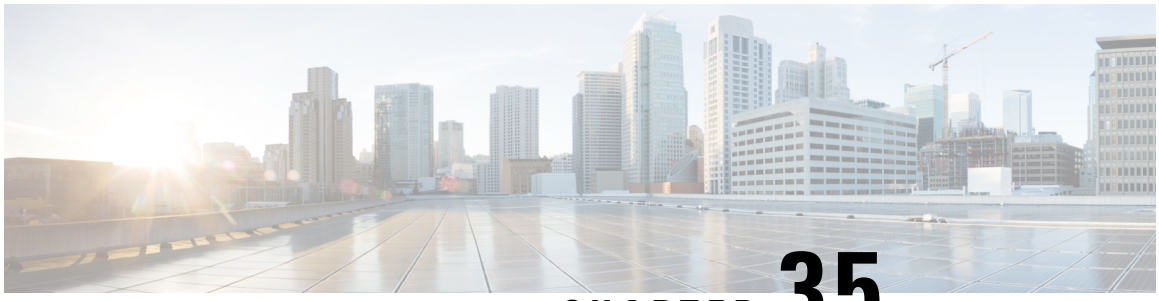
Related Topics

- Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs , on page 1416

Field Reference

Table 490: Add/Edit WINS Server Dialog Box

Element	Description
Server	The IP address of the WINS server used to translate Windows file server names to IP addresses. You can also enter the name of a network/host policy object that identifies the server. Click **Select** to choose a network/hosts object or to create a new object.
Set as Primary Browser	Whether to set the server as the primary browser. The primary browser maintains the list of computers and shared resources.
Timeout	The period of time the security appliance waits for a response to a WINS query before sending the query again to the same server (if it is the only one), or to the next server (if there is more than one). The default timeout is 2 seconds. The range is between 1 and 30 seconds.
Retries	The number of times to retry sending WINS queries to the configured servers. The security appliance recycles through the list of servers this number of times before sending an error message. The default is 2. The range is between 0 and 10.



CHAPTER 35

Using Map View

The following topics describe how to use the Map view:

Understanding Maps and Map View

The Security Manager Map view provides a graphical view of your VPN and Layer 3 network topology.

Using the map view, you can investigate details of your VPN configuration graphically. Topological display of tunnels enables you to easily derive the relationship among multiple VPN configurations (for example, a hierarchical VPN). You can group devices to achieve a more complete picture of your VPN configuration. This is useful in situations where a hub failover pair is a peer with hundreds of spokes.

You can represent your Layer 3 network topology graphically, populating it with managed devices (called device nodes). You can make the picture of the topology more complete by adding unmanaged objects (called map objects) such as devices, clouds, and networks. For large networks, you can choose to simplify the topology graph by incorporating only a portion of the overall topology. You can save the topology maps for future use.

You can save multipleF topology maps to reflect your network's geographical or functional organization. You can link a saved map to a node on a parent map, so that from the parent map you can drill down to the linked map with more detailed information (for more information, see Using Linked Maps , on page 1598). Saved maps are shared among all users who have the necessary access privileges.

You can launch other Security Manager features from the map view. In some cases, you can simplify the use of features by selecting nodes from the map before you start another feature. For example, you can select multiple nodes, then create a VPN that includes those nodes as members.

Tip The network data that is displayed on maps is typically updated as this data changes. However, to be certain that a map displays current network data, you can refresh it manually by selecting **Map > Refresh Map**.

This section contains the following topics:

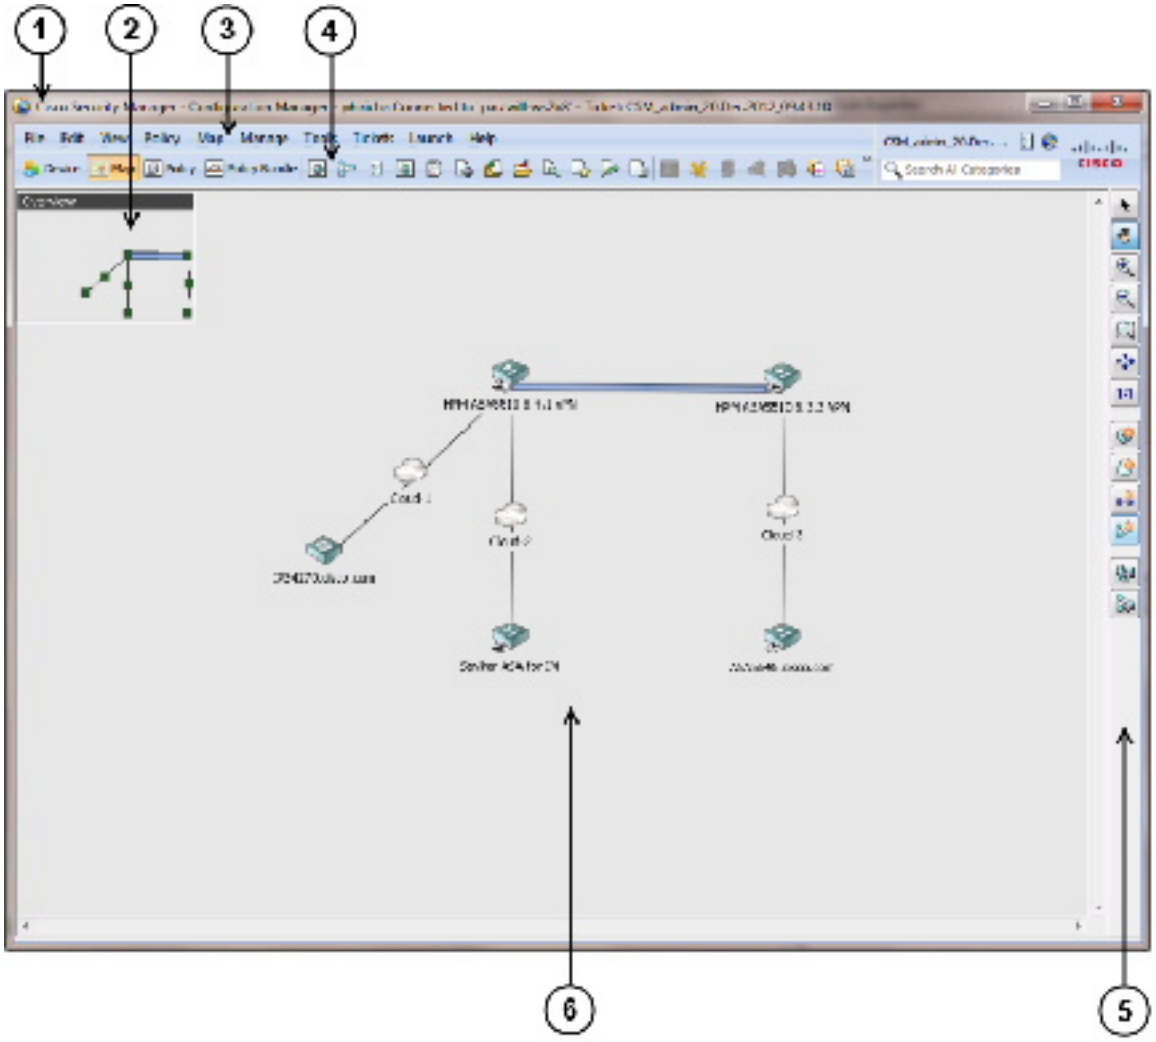
Understanding the Map View Main Page

Map view enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

To open the Map view main page, click the **Map View** button in the toolbar.

You can undock the map window, which enables you to use other product features while keeping the map open. To undock the map, select **Map > Undock Map View**. To dock the map window, select **Map > Dock Map View**.

Figure 42: Map View Main Page



1	**Title bar**	2	**Navigation window (see** Using the Navigation Window , on page 1589**)**
3	Menu bar (see Map Menu (Configuration Manager) , on page 34)	4	Toolbar (see Toolbar Reference (Configuration Manager) , on page 40)

• Managing VPNs in Map View , on page 1606
• Managing Device Policies in Map View , on page 1607

Map Toolbar

The following table describes the buttons on the map toolbar.

Table 491: Map Toolbar

Toolbar Button	Description
	Selects objects on the map. Click the button, then click items on the map.
	Pans the map. Click the button, click and hold on the map, then drag the cursor.
	Zooms in on the map.
	Zooms out from the map.
	Zooms the map to fill a rectangle that you draw.
	Zooms the map to include the entire map.
	Zooms the map to actual size.
	Creates a new Security Manager-managed node. After you create the new device in the inventory, it is added to the active map as a device node.
	Adds a new map object to the map.
	Adds a new link to the map.
	Creates a new VPN connection between nodes on the map.
	Select devices to show on the map as device nodes.
	Select VPNs to show on the map.

Using the Navigation Window

The navigation window displays a smaller version of the entire active map. The shaded rectangle defines the area of the map that is currently displayed.

Use the navigation window to select the portion of the map to view and to change the map zoom level.

- To toggle the display of the navigation window, select **Map > Show/Hide Navigation Window**.
- To pan the navigation control to select which portion of the map to display, click within the shaded rectangle and drag it to a new location.
- To change the zoom level, click one of the resizing handles in the corners of the shaded rectangle, then drag it to increase or decrease the area of the map to display. The map zooms to display the area covered by the map indicator.

The title bar in the navigation window displays the name of the map. If the map has unsaved changes, an asterisk (*) appears next to the map name.

For information on other ways to pan and zoom maps, see Panning, Centering, and Zooming Maps , on page 1596.

Maps Context Menus

The following topics describe the menus that contain maps commands. To open the context menus, right-click map elements.

- Managed Device Node Context Menu , on page 1589
- Multiple Selected Nodes Context Menu , on page 1590
- VPN Connection Context Menu , on page 1591
- Layer 3 Link Context Menu , on page 1591
- Map Object Context Menu , on page 1591
- Map Background Context Menu , on page 1592

Managed Device Node Context Menu

The Managed Device Node context menu opens when you right-click a map node that represents a managed device. The commands that you see depend on the type of device you select. The following table lists all commands that you might see.

Table 492: Managed Device Node Context Menu

Menu Command	Description
Edit Firewall Policies	Edits firewall policies on the device. Select a firewall policy type from the submenu to edit it.
Edit Firewall Settings	Edits firewall settings on the device. Select a setting from the submenu to edit it.

Menu Command	Description
Edit VPN Peers	Edits peers in VPNs in which the device participates.
Edit VPN Policies	Edits VPN policies on the device.
Device Properties	Displays device properties.
Clone Device	Creates a copy of the device. See Cloning a Device , on page 128.
Copy Policies Between Devices	Copies policies between the device and other devices. See Copying Policies Between Devices , on page 199.
Share Device Policies	Shares device local policies.
Catalyst Summary Info	Allows you to view high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered. See Viewing Catalyst Summary Information , on page 2622.
Show in Device View	Opens the Device View for the selected device.
Device Manager	Launches the Device Manager. See Starting Device Managers , on page 2849.
Inventory Status	Displays the Inventory Status window for the device. See Inventory Status Window , on page 2848.
Show VPN Peers	Shows peers in VPNs in which the device participates.
Preview Configuration	Previews the device configuration with all committed changes included.
Show Containment	Shows the security contexts and service modules in devices that have them.
Node Properties	Displays node properties.
Set Linked Map	Creates a link from this node to another map.
Open Linked Map	Opens the map that is linked to the node.
Discover Policies on Device	Discovers policies on the device.
Move To Center	Pans the map to display the node in the center.
Delete Device	Deletes the device from the device inventory.
Remove from Map	Removes the node from the map.

Multiple Selected Nodes Context Menu

The Multiple Selected Device Node context menu opens when you select more than one map node, then right-click on a selected node.

If all of the selected nodes are not VPN-capable, the commands to configure VPNs do not appear.

Table 493: Multiple Selected Nodes Context Menu

Menu Command	Description
Create Point to Point VPN	Creates a point to point VPN between two selected devices. All selected nodes must be managed and VPN-capable.
Create Hub and Spoke VPN	Creates a hub and spoke VPN that includes the selected nodes. The node that you right-click becomes the VPN hub. All selected nodes must be managed and VPN-capable.
Create Meshed VPN	Creates a full mesh VPN that includes the selected nodes. All selected nodes must be managed and VPN-capable.
Remove Selected Nodes	Removes all selected device nodes. Appears only if you right-click on a selected device node.
Delete Map Objects	Deletes all selected map objects. Appears only if you right-click on a selected map object.

VPN Connection Context Menu

The VPN Connection context menu opens when you right-click on a VPN connection on the map. For more information, see Editing VPN Policies or Peers From the Map , on page 1607.

Table 494: VPN Connection Context Menu

Menu Command	Description
Edit VPN Peers	Edits the peers in the VPN.
Edit VPN Policies	Edits the VPN policies.

Layer 3 Link Context Menu

The Layer 3 Link context menu opens when you right-click on a layer 3 link on the map.

Table 495: Layer 3 Link Context Menu

Menu Command	Description
Link Properties	Displays the link properties.
Delete Link	Deletes the link from the map.

Map Object Context Menu

The Map Object context menu opens when you right-click a map object that does not represent a managed device.

Table 496: Map Object Context Menu

Menu Command	Description
Node Properties	Displays the node properties.
Move To Center	Pans the map to display the node in the center.
Set Linked Map	Links the node to a map.
Open Linked Map	Opens the map to which the node is linked.
Delete Map Object	Deletes the map object.

Map Background Context Menu

The Map Background context menu opens when you right-click in the background area of a map, that is, not on any object or link.

Table 497: Map Background Context Menu

Menu Command	Description
Show Devices on Map	Selects the managed devices to show on the map.
Show VPNs on Map	Selects the VPNs to display on the map.
Add Map Object	Adds a map object to the map.
Add Link	Adds a Layer 3 link to the map.
New Device	Creates a new managed device and adds it to the map as a device node.
New VPN	Creates a new VPN and adds it to the map.
Find Map Node	Finds nodes on the map.
Open Map	Opens a saved map.
Save Map	Saves the open map.
Show/Hide Navigation Window	Toggles the display of the navigation window on the map.
Map Properties	Displays the properties of the map.
Hierarchical layout	Arranges the network nodes in a hierarchical layout.
Radial layout	Arranges the network nodes in a radial layout.
Circular layout	Arranges the network nodes in a circular layout.
Dock/Undock Map	Undocks the Map view.

Access Permissions for Maps

Access to maps is controlled based on two systems of user privileges:

- Device privileges—You must have at least read privileges to all the devices in a map to open the map.
- Map privileges—Access to maps is based on your Security Manager user role. There are two levels of map access:
  - Read-only—You can open maps, but you cannot modify them. If you have this map privilege level, the features for modifying maps are not available.
  - Read-write—You can modify maps. All map modification features are available.

Working With Maps

A map is a representation of a portion of your network. You can create and save multiple maps to address your network management needs. To work with any map, you must be in Map view (select **View > Map View**).

After you create and save a map, the map is available to all users on the system that have at least read privileges to all the devices on the map. Users that do not have read privileges to a device on a map do not see the map in the list of existing maps when they try to open a map. For more information, see Access Permissions for Maps , on page 1593.

You can only have one map open at a time. If a map is open and you create a new map or open an existing map, you are prompted to save or discard any unsaved changes that you made to the current map.

Multiple users can open and modify a map at the same time. When a user saves changes to a map, any other users who are using the map are notified and have the option to do one of the following:

- Update their map to the version saved by the other user, losing any changes they have made.
- Save their version of the map as a new map, preserving any changes they made.

This section contains the following topics:

- Setting the Map Background Properties , on page 1598

Creating New or Default Maps

You have two options for creating a new map:

- Create an empty map—To create a new empty map, select **Map > New Map**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it. For information about adding elements to a map, see Displaying Your Network on the Map , on page 1599.
- Create a new map containing all managed devices and VPNs in the inventory—This is called the default map. Generating the default map is a good way to create a map. After generating the map, save it with a unique name to make it a standard map and modify it as desired.

You can generate the default map whenever you want to, and it contains the inventory as it exists at the time you generate it. You cannot specifically save the default map *as* the default map; it is regenerated every time you select it.

The following procedure explains how to create a new map using the default map.

Tips

- If you refresh the map (select **Map > Refresh Map**), items that you added to the inventory after generating the default map are not added to the map. You must reopen the default map to see new devices.

Step 1 In Map view, select **Map > Open Map**.

Step 2 Select **Default Map** from the Available Maps list, then click **OK**.

Note If you have do not have sufficient access rights to all devices in the inventory, the default map that opens shows only the subset of devices for which you do have access rights. For more information, see Access Permissions for Maps , on page 1593.

Step 3 To save the default map as a standard map, select **Map > Save Map** or **Map > Save Map As**, enter a name for the map and click **OK**.

Opening Maps

To open an existing map, select **Map > Open Map**, select the desired map from the list of available maps, and click **OK**. You must already be in Map view (select **View > Map View**). If you currently have a map open with unsaved changes, you are asked if you want to save it.

The list of available maps includes a special map called the **Default Map**. This map contains all of the managed devices and VPNs in the inventory. You are essentially creating a new map each time you open it. For more information about the default map, see Creating New or Default Maps , on page 1594.

Tip You can open any map that you have created or the default map. You can also open any map that another user has created provided you have the requisite permission settings with regard to the devices shown on that map (see Access Permissions for Maps , on page 1593).

Related Topics

- Working With Maps , on page 1593
- Understanding Map Elements , on page 1599

Saving Maps

To save the active map, select **Map > Save Map**. Any changes that you made since you last saved it are saved. If you did not save the map previously, the Save Map As dialog box opens, enabling you to assign a name to the map and save it.

To save a map under a new name, select **Map > Save Map As**. The map name can be as long as 256 characters, but cannot be the reserved names “Default Map” or “New Map.”

If you close a map that contains unsaved changes, you are prompted to save the changes.

If your Security Manager session closes automatically because of inactivity when a map is open with unsaved changes, the current version of the map is saved if it has a name. If you have not yet saved the map, the map is discarded. For example, if you generate the default map, or create a new map, and do not save it before your session times out, you cannot retrieve that map.

Deleting Maps

If you no longer need a map, you can delete it (presuming that you have edit permission). Deleting a map does not delete any devices or VPNs shown on the map, nor does it delete or modify their configurations; only the map is deleted.

When you delete a map, it is permanently deleted from the server. Other users cannot use the deleted map.

To delete a map, select **Map > Delete Map**, select the map you want to delete from the available maps list and click **OK**. You are asked to confirm the deletion.

You must already be in Map view (select **View > Map View**) to delete a map.

Exporting Maps

When viewing a map, you can export the map to a scalable vector graphics (SVG) image file for use outside of Security Manager.

Related Topics

- Working With Maps , on page 1593
- Understanding Map Elements , on page 1599

Step 1 Select **Map > Export Map**. The Export Topology Map to SVG dialog box opens.

Step 2 Browse to the location in which to save the file.

Step 3 Enter a filename in the File name field. The correct file extension will be added for you.

Step 4 Click **Save**.

Arranging Map Elements

To move a map element, click and hold, then drag it to the desired position. Attached links move automatically, but the other end of the link remains where it is.

You can also automatically arrange the network nodes on the map in several predefined layouts. Only nodes that are already displayed on the map are arranged. Any nodes that you later add do not follow the layout.

To select a map layout, right-click the map background, then select one of the following layouts from the map context menu:

- Hierarchical Layout—Arranges the nodes in a hierarchical layout.
- Radial Layout—Arranges the nodes in a radial layout.
- Circular Layout—Arranges the nodes in a circular layout.

Panning, Centering, and Zooming Maps

There are many options for navigating maps. You can pan the map (move around in the map without changing the zoom level), pan a map so that a particular map element is centered in your view, or zoom in or out to see a different map extent.

To pan a map without changing the zoom level:

- Click the Pan Map toolbar button, then click and hold anywhere on the map and drag the cursor.
- Use the vertical and horizontal scroll bars that are available if the entire map does not fit in the visible page.
- Click and drag the shaded rectangle in the navigation window.
- To center the display of the map on a particular map element, right-click the element, then select **Move to Center**.

To zoom in or out of a map:

To change the zoom level of the map in predefined increments:

- To zoom in on the map, select **Map > Zoom In**, or click the **Zoom In** toolbar button.
- To zoom out from the map, select **Map > Zoom Out**, or click the **Zoom Out** toolbar button.

- To zoom into a specific area of the map, click **Zoom Rectangle** in the map toolbar, then click the map and drag a rectangle around the area. When you release the mouse button, the map zooms to display the area defined by the rectangle.
- Alternatively, to zoom in to or out of a specific area of the map, click and drag the corner of the shaded rectangle in the navigation window.
- To display the entire map, select **Map > Fit to Window**.
- To display the map at actual size, select **Map > Display Actual Size**.

Related Topics

- Using the Navigation Window , on page 1589

Selecting Map Elements

The following table describes how to select map elements. If the selected element contains other elements (for example, a Catalyst switch that contains an FWSM), the containment relationship is shown. For more information, see Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances , on page 1601.

Table 498: Selecting Network Elements

To select...	Do the following
A single map element	Click the element.
Multiple noncontiguous map elements	Ctrl+click each element.
Multiple contiguous map elements	Click the map and drag a rectangle that includes the elements.

Searching for Map Nodes

To search for a map node to help you find it in the active map, select **Map > Find Map Node**. This command opens the Find Node dialog box.

The Find Node dialog box initially lists all objects on the map. Use the fields above the list to filter it (the list shows only objects that satisfy all filter criteria). When you find the desired node, select it in the list and click **OK** to have the node centered and selected in the map.

To filter the list, you can:

- Select a node type from the **Type** list to show only objects of that type.
- Enter the name, or at least the initial characters of the name, in the **Name** field. The list is filtered as you type. Your search term must be from the start of the object name. You cannot use wildcard characters.
- Enter all or part of the IP address or subnet mask. The list is filtered as you enter information.

Using Linked Maps

A linked map is a map that you associate with a map element on another map. Because it is not practical to include all the nodes on a large network in a single map, you can use linked maps to create a hierarchical topology of your network.

You cannot link a node to the another node in the same map.

Before You Begin

You must create the map to link to before you can link to it.

Step 1 Right-click the map element to which to link a map, then select **Set Linked Map**. The Set Linked Map dialog box opens.

Step 2 Select a map to associate with the selected map element, then click **OK**.

Step 3 To open the linked map, right-click the linked node, then select **Open Linked Map**. The current map closes and the linked map opens.

Setting the Map Background Properties

You can change the background of a map by changing the color or by configuring an image. A suggested use for a background image is to use an image that represents a geographic area. Then you can position map elements according to their geographic locations.

Some background images are included with Security Manager. You can also transfer images to the server to use as background images. You can use background images of the following file formats: JPEG, GIF, PNG, IVL, and SVG. If you want to use a new image, copy the image file to the Security Manager server file system by connecting directly to the server. For security reasons, Security Manager does not provide a method of transferring files to the server.

To configure the map background, in Map view, select **Map > Map Properties** to open the Map Settings dialog box.

- To configure a background image, select it in the file list. (Select **none** to remove the map's background image.)

If the image is not listed, click **Add** and browse to the file you placed on the server using the Import Background Image dialog box. Click **OK** to have Security Manager add it to the list of available background images.

If you no longer need a listed image, select it and click **Delete**.

Tip You can control the position and scale of the image using the X and Y coordinates and scale settings. The X,Y source point is the upper left corner of the image. You can use positive or negative numbers. You must experiment to get the results you desire. The scale setting is in percentage.

- To change the background color, click **Select** next to the background color field and choose the desired color.

Displaying Your Network on the Map

You use the map view to represent your network topology by creating maps. A map is a visual representation of your network, or a portion of it if it is too large to fit on a single map. Maps consist of map elements that represent devices, links, and other objects in your network. For more information about map, see Working With Maps , on page 1593.

The following topics describe how to create maps:

Understanding Map Elements

All objects that can appear on a map are map elements. You display map elements on a map to create a representation of a portion of your network. For more information about maps, see Working With Maps , on page 1593. To open a map, see Opening Maps , on page 1594.

The following tables describe the elements that can appear on a map:

- Table 499: Device Node Types , on page 1599 describes the device nodes that can appear on a map. These elements are managed by Security Manager.
- Table 500: Map Object Types , on page 1600 describes the map objects that can appear on a map. These elements are not managed by Security Manager.
- Table 501: Map Element Indicators , on page 1600 describes the map element indicators that can appear with a device node.

Table 499: Device Node Types

Node Type	Icon	Description
Firewall security context		When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context.
Adaptive Security Appliance		When you select a device, its security contexts are highlighted.
Firewall		When you select a device, its security contexts are highlighted.
Adaptive Security Appliance security context		When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context.
Router		Router or VPN concentrator.

Node Type	Icon	Description
Catalyst 6500/7600 or Catalyst switch		When you select a Catalyst device node, any Firewall Service Modules contained in it are highlighted.
Firewall Services Module (FWSM)		When you select a Firewall Services Module, the security contexts it contains are highlighted on the map.
FWSM security context		When you select a security context, the parent device is highlighted. The dotted outline distinguishes the icon as a security context.
IPS Sensor or Security Service Module		An IPS sensor.
VPN connection		Any type of VPN connection. For GET VPNs, a dashed line indicates the connection between group members and key servers.

Table 500: Map Object Types

Node Type	Icon	Description
Unmanaged firewall		Unmanaged firewall device.
Unmanaged router		Unmanaged router.
Network		Network with a specified address space.
Host		Network host. Examples: CSA, Syslog Server, CA Server, AAA Host
Cloud		An unspecified group of map objects that provides connectivity between specified nodes.
Layer 3 link	—	Layer 3 network connection

Table 501: Map Element Indicators

Indicator	Icon	Description
Linked map		Node is linked to another map.

Related Topics

- Using Map Objects To Represent Network Topology , on page 1602
- Creating and Managing Layer 3 Links on the Map , on page 1604

Displaying Managed Devices on the Map

A device node represents a device that is managed by Security Manager. You add a device node to a map by selecting the device from the Security Manager inventory.

When you add a device node to a map, its layer 3 connectivity to other nodes on the map is created automatically. For more information, see Creating and Managing Layer 3 Links on the Map , on page 1604.

You can add, remove, or show managed nodes by the following means:

- **To add devices that are already in the Security Manager inventory**—Select **Map > Show Devices on Map** to open a device selector. Select the desired devices from the list of available devices and click >> to move them to the selected devices list. You can select device groups to move all devices in the group. Click **OK** when the list of selected devices has the desired nodes. Only those devices in the selected list are shown on the map.

You can remove devices by selecting them in the selected list and clicking <<.

- **To add a new device to the map and the device inventory**—Click the **New Device** button in the map toolbar or right-click the map background and select **New Device**. The New Device dialog box opens. Follow the procedures for adding new devices described in Adding Devices to the Device Inventory , on page 77.
- **To remove a managed node**—Right-click the node and select **Remove from Map**.
- **To locate a device on the open map when in Device view**—Right-click the device in the device selector and select **Show in Map view**. If the device is shown on the active map, it is shown centered and highlighted on the undocked map. You are told that the device cannot be found if the device is not shown on the active map.
- **To locate a device in Device view from the map**—Right-click the device and select **Show in Device View**. Device view is opened with the device selected so that you can edit its policies.

Related Topics

- Understanding Map Elements , on page 1599
- Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances , on page 1601

Showing Containment of Catalyst Switches, Firewalls, and Adaptive Security Appliances

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

The containment relationship between Catalyst and Adaptive Security Appliance (ASA) devices and their service modules and security contexts, between PIX 7.x+ devices and FWSM and their security contexts, or between IPS devices and their virtual sensors, is displayed in maps as follows:

- When you select a Catalyst device, nodes that represent its Firewall Services Modules (FWSM) are highlighted.

- When you select an ASA, nodes that represent its Security Service Modules are highlighted.
- When you select a service module, the device that contains it is highlighted.
- When you select an IPS device, the nodes that represent virtual sensors defined on the device are highlighted.
- You can view a list of the security contexts contained in an ASA, firewall, or FWSM device, or the virtual sensors contained in an IPS device, by right-clicking the node and selecting **Show Containment**. This command also shows the service modules in a device that has them.
- When you select a security context node, all its ancestor device nodes are highlighted.
- When you select a virtual sensor, the device on which it is defined is highlighted.

Using Map Objects To Represent Network Topology

You can add map elements to a map that represent objects (such as devices and links) that Security Manager does not manage. These nodes are called map objects. You can use map objects to create a more useful representation of your network topology. (If you want to add a managed device, see Displaying Managed Devices on the Map , on page 1601.)

You can add layer 3 links between any map elements, whether they are device nodes, map nodes, or a combination of both types.

Tip To delete a map object, right-click the object and select **Delete Map Object**.

Step 1 Select **Map** > **Add Map Object**. The Add Map Object dialog box appears (see Add Map Object and Node Properties Dialog Boxes , on page 1603).

Step 2 Do one of the following:

- If you are adding a map object based on the definition of an Security Manager policy object, click **Copy Policy Object** to open the Select Policy Object Dialog Box , on page 1603. Then, select the type of object (AAA server, network/host, PKI enrollment), click **Select** to choose the object, then click **OK** in the Select Policy Object dialog box. Information from the policy object is entered in the Add Map Object dialog box.

The name of the object is used as the map object name, but you can edit this if desired.

- If you are adding a map object that is not based on a policy object, enter a name for the map object in the **Name** field.

Step 3 Select the type of object that the node represents from the **Type** list. If you selected a policy object, the type is pre-selected, but you can change the selection.

Step 4 (Optional) Add interfaces to the node by doing the following for each interface:

a) Click **Add** to open the Interface Properties Dialog Box , on page 1604. If items already appear in the list, you can select them and click **Edit** to change them.

b) Enter an interface name, IP address, and network mask, then click **OK**.

Step 5 Click **OK**. The map object is added to the center of the map. Move it to the desired location.

Add Map Object and Node Properties Dialog Boxes

For unmanaged map objects, the Add Map Object and Node Properties dialog boxes are the same. Use the Add Map Object dialog box to add an object to the map. Use the Node Properties dialog box to view or edit map object properties. For more information, see Using Map Objects To Represent Network Topology , on page 1602.

For managed map objects (such as a managed device), the Node Properties dialog box is read-only. It displays the object name, type, and list of interface names and IP addresses (if any are defined in Security Manager for the device). The reference information below does not apply to this version of the Node Properties dialog box.

Navigation Path

- To open the Add Map Object dialog box, select **Map** > **Add Map Object**.
- To open the Node Properties dialog box, right-click a map object or managed device and select **Node Properties**.

Field Reference

Table 502: Add Map Object and Node Properties Dialog Boxes for Unmanaged Nodes

Element	Description
Name	The name of the map object. If you select a policy object, the name of the object is automatically used, but you can change it.
Copy Policy Object button	Click to browse for a policy object to use as the basis for the map object using the Select Policy Object Dialog Box , on page 1603.
Type list	The type of object you are creating. If you select a policy object, a type is selected for you, but you can change it if necessary.
Interfaces table	The interfaces on the node. If you select a policy object, information might have been added to this table. • To add an interface, click the **Add (+)** button and fill in the Interface Properties Dialog Box , on page 1604. • To edit an interface, select it and click the **Edit (pencil)** button. • To delete an interface, select it and click the **Delete (trash can)** button.

Select Policy Object Dialog Box

Use the Select Policy Object dialog box to add an object to the map that is defined in a policy object.

Select the type of object that defines the node you want to add to the map from the **Select a Policy Object** list, then click **Select** to select the specific policy object. If you know the object's name, you can type it into the text box instead of clicking Select.

For more information, see Using Map Objects To Represent Network Topology , on page 1602.

Navigation Path

To open this dialog box, click **Copy Policy Object** in the Add Map Object dialog box (see Add Map Object and Node Properties Dialog Boxes , on page 1603).

Interface Properties Dialog Box

Use the Interface Properties dialog box to add and edit interfaces on map objects. For more information, see Using Map Objects To Represent Network Topology , on page 1602.

Navigation Path

To open this dialog box, click the **Add** or **Edit** button in the Add Map Object and Node Properties Dialog Boxes , on page 1603.

Field Reference

Table 503: Interface Properties Dialog Box

Element	Description
Interface Name	The interface name.
Interface IP Addr/Mask	The interface IP address and network mask, for example, 10.100.10.0/24 or 10.100.10.0/255.255.255.0.

Creating and Managing Layer 3 Links on the Map

A layer 3 link is a line on the map that represents a network connection between two device interfaces.

Layer 3 connectivity information is automatically added to the map when you add map elements that have interface information. When you add a map element that has interface information, one of the following happens:

- If the interface is on a network that is not represented on the map as a network map object, a network map object is added to the map with a layer 3 link to the new map element.
- If the interface is on a network that is represented on the map as a network map object, a layer 3 link is added between the new map element and the network map object.

When you remove a node interface that is a layer 3 link endpoint, the link is also removed.

You can add additional layer 3 links between device nodes and map objects to illustrate your network's connectivity. Adding Layer 3 links to a map does not configure any network devices. Layer 3 links are just visual elements on the map.

You create layer 3 links to connect any two interfaces on a map. Depending on the interfaces that you choose, the layer 3 link might include intermediary networks or network clouds. In some cases, you have the option to select which intermediary networks and networks clouds are inserted between the connected interfaces.

The following procedure explains how to manually create a new layer 3 link.

Tips

- The automatic addition of network objects and links is called Autolink. You can configure Autolink to not automatically add private or certain reserved network addresses. To configure these settings, select **Tools > Security Manager Administration**, then click **Autolink**.
- To view the properties of a link, right-click the layer 3 link and select **Link Properties**.
- To delete a layer 3 link, right-click the layer 3 link to be removed and select **Delete Link**. Deleting a layer 3 link does not delete any intermediary network or network clouds between map elements.

Step 1 In Map view, click **Map > Add Link** or the Add Link button in the toolbar.

Step 2 Click one of the map elements to connect, then click the other map element to connect.

Step 3 If the map elements contain interfaces, select the source and destination interfaces for the link in the Select Interfaces and Link Properties Dialog Boxes , on page 1605, then click **OK**.

The Add Link dialog box might open, depending on which interfaces you select.

Step 4 If the Add Link Dialog Box , on page 1605 opens, select which intermediary objects and network clouds to insert, then click **OK**.

Select Interfaces and Link Properties Dialog Boxes

The Select Interfaces and Link Properties dialog boxes are used with layer 3 links on maps. These dialog boxes show information about the source and destination devices for the link (the source being the first device you clicked when making the link).

If you are creating a link, the Select Interfaces dialog box is used. If there are interfaces defined for the device in Security Manager, select the desired source and destination interfaces for the link you are creating from the **Source/Destination Interface** list.

Tip When creating a link, if there are no interfaces defined for either device, the Interface lists are greyed out. If one device has interfaces defined, both fields are active, but empty for the device that does not have interfaces defined for it. You cannot change the interface when viewing link properties.

Navigation Path

For information on how to create layer 3 links or view their properties, see Creating and Managing Layer 3 Links on the Map , on page 1604.

Add Link Dialog Box

Use the Add Link dialog box to select how to represent the layer 3 link that you are adding to the map.

The contents of the Add Link dialog box vary according to which nodes and interfaces you are connecting. Select the check boxes for each intermediary map object (network or cloud) that you want to insert between the connected nodes. If desired, you can change the names of the map objects.

Navigation Path

This dialog box might open when you add a link between nodes, depending on which interfaces you select to connect. For the procedure, see Creating and Managing Layer 3 Links on the Map , on page 1604.

Managing VPNs in Map View

The following topics describe how to manage VPNs in the Map view:

Displaying Existing VPNs on the Map

To display an existing VPN on the map, select **Map > Show VPNs on Map**. You are prompted with a list of existing VPNs. Select the ones you want from the available VPNs list and click >> to move them to the selected list.

Tip You can also remove a VPN using this command. Select the VPNs you want to remove from the selected VPNs list and click <<. When you remove a VPN, only the VPN tunnels are removed. The device nodes remain on the map.

When you display a VPN, all of the its member devices are added to the map as device nodes, and all of its tunnels are highlighted. However, devices that you removed from the map previously are not added, even if they are members of a VPN that you display. You can add such devices to the map manually, and their VPN connectivity is displayed.

A VPN tunnel is a line on the map that represents a VPN connection between two devices. VPN tunnels are not added to the map automatically when you add a device node that is a member of a VPN. However, if the VPN was already selected to be shown on the map, adding a device in the VPN to the map will also display the tunnel.

For an explanation of the icons used in the map, see Understanding Map Elements , on page 1599.

Creating VPN Topologies in Map View

You can create VPN connections between VPN-capable managed device nodes that are displayed on the map. You cannot create Extranet VPNs, however.

To create a VPN, do one of the following:

- Click the **New VPN** button in the toolbar and select the type of VPN you want to configure: point-to-point, hub and spoke, or full mesh.

- Select the devices that you want to participate in the VPN (use Ctrl+click to select multiple devices), and either right click and select the command for the desired type of VPN, or click the **New VPN** button and select the VPN type.

Consider the following tips:

- Select only 2 devices to create a point-to-point VPN.
- If you create a hub-and-spoke VPN, the device you right-click is initially defined as the hub, but you can change that in the wizard.
- While in the wizard, you can add or remove devices. You are not restricted to the devices you selected on the map.

Using either technique, the Create VPN wizard opens, where you can create the VPN. For more information, see Creating or Editing VPN Topologies , on page 1103 or click the Help button in the wizard.

The VPN is displayed on the map when you are finished with the wizard.

Related Topics

- Selecting Map Elements , on page 1597

Editing VPN Policies or Peers From the Map

You can edit VPN policies, or the peers that participate in a VPN, from map view. To edit policies or peers, right-click a VPN tunnel or device node and select one of these commands:

- **Edit VPN Policies**—To open the Site-to-Site VPN Manager, where you can edit the policies that define the VPN. For more information, see Site-to-Site VPN Manager Window , on page 1093.
- **Edit VPN Peers**—To open a dialog box that allows you to configure the peers that participate in the VPN. Click the **Help** button in the dialog box for more information.
- **Show VPN Peers**—To see which devices participate in a VPN without editing the list (VPN Peers dialog box).

If the device participates in more than one VPN, you are first prompted to select the desired VPN (with the Select VPN to Configure dialog box) before the appropriate dialog box is opened.

Managing Device Policies in Map View

You can perform only basic policy management and configure firewall services policies in Map view. You cannot configure other types of policies. The following topics describe how to manage policies from the Map view:

- Performing Basic Policy Management in Map View , on page 1608
- Managing Firewall Policies in Map View , on page 1608
- Managing Firewall Settings in Map View , on page 1609

Performing Basic Policy Management in Map View

You can perform some basic policy management tasks in Map view. Right click the device and select one of the following commands:

- **Copy Policies Between Devices**—To copy local device policies from one device to another. For more information on copying policies, see Copying Policies Between Devices , on page 199.
- **Share Device Policies**—To create shared policies from local device policies. For more information on sharing policies, see Sharing Multiple Policies of a Selected Device , on page 208.
- **Clone Device**—To create a copy of a device, including its policies. For more information on cloning devices, see Cloning a Device , on page 128.
- **Preview Configuration**—To view the configuration file that will be generated for the device, including the changes from the previous deployment. For more information on previewing configurations, see Previewing Configurations , on page 424.
- **Discover Policies on Device**—To discover the policies defined on the device and configure them in Security Manager, wiping out whatever policies are defined in Security Manager for the device. For more information device discovery, see Discovering Policies on Devices Already in Security Manager , on page 181.

Related Topics

- Managing Deployment, on page 381
- Managing the Device Inventory, on page 71
- Managing Policies, on page 167

Managing Firewall Policies in Map View

You can configure firewall policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

Tip If you want to assign a shared policy to a device, see Performing Basic Policy Management in Map View , on page 1608.

To configure local firewall policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Policies > AAA Rules**—To configure AAA policies, which control who is allowed access to the device and what services they are allowed to use once they have access. For more information on configuring AAA rules, see AAA Rules Page , on page 693.
- **Edit Firewall Policies > Access Rules**—To configure Access Rules policies, which control the traffic that flows through a device. For more information on configuring access rules, see Access Rules Page , on page 726.

- **Edit Firewall Policies > Inspection Rules**—To configure Inspection Rules policies, which analyze traffic at the application layer and track TCP and UDP sessions to perform refined access control. For more information on configuring inspection rules, see Inspection Rules Page , on page 774.
- **Edit Firewall Policies > Botnet Traffic Filter Rules**—(ASA 8.2 and later only) To configure Botnet Traffic Filter Rules policies, which monitor web traffic. For more information on configuring botnet traffic filter rules, see Botnet Traffic Filter Rules Page , on page 915.
- **Edit Firewall Policies > Transparent Rules**—To configure Transparent Rules policies, which define EtherType rules for transparent firewalls. For more information on configuring inspection rules, see Transparent Rules Page , on page 1011.
- **Edit Firewall Policies > Web Filter Rules**—To configure Web Filter Rules policies, which define rules for web access. For more information on configuring web filter rules, see Web Filter Rules Page (ASA/PIX/FWSM) , on page 887 or Web Filter Rules Page (IOS) , on page 896.
- **Edit Firewall Policies > Zone Based Firewall Rules**—(IOS 12.4(6)T and later only) To configure Zone Based Firewall Rules policies, which configure inspection and web filtering using security zones. For more information on configuring zone based firewall rules, see Zone-based Firewall Rules Page , on page 989.

Related Topics

- Introduction to Firewall Services, on page 597
- Managing Policies, on page 167

Managing Firewall Settings in Map View

You can configure firewall settings policies on a device in Map view. These policies are local to the device rather than being shared policies (you must use Policy view to configure shared policies).

Tip If you want to assign a shared policy to a device, see Performing Basic Policy Management in Map View , on page 1608.

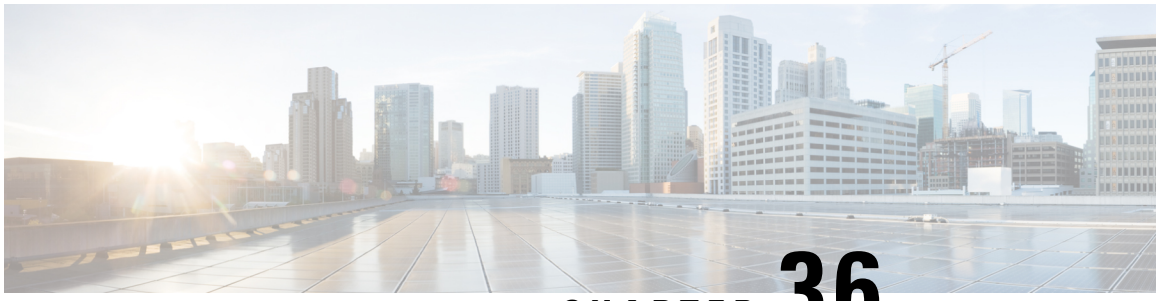
To configure local firewall settings policies on a device in Map view, right click the device and select one of the following commands:

- **Edit Firewall Settings > AAA Firewall**—(ASA/PIX/FWSM only) To configure AAA Firewall settings policies, which configures proxy, authentication challenge, MAC exempt lists, and other general AAA settings. For more information on configuring AAA firewall settings, see AAA Firewall Settings Page, Advanced Setting Tab , on page 704 and AAA Firewall Page, MAC-Exempt List Tab , on page 710.
- **Edit Firewall Settings > Access Control**—To configure Access Control settings policies, which configures optimization and other general access control settings. For more information on configuring access control settings, see Access Control Settings Page , on page 740.
- **Edit Firewall Settings > AuthProxy**—(IOS devices only) To configure AuthProxy settings policies, which configure general settings for authorization proxies. For more information on configuring authorization proxies, see AAA Page , on page 712.

- **Edit Firewall Settings > Inspection**—(IOS devices only) To configure Inspection settings policies, which configure timeout and session settings for inspection rules. For more information on configuring inspection settings, see Configuring Settings for Inspection Rules for IOS Devices , on page 882.
- **Edit Firewall Settings > Web Filter**—To configure Web Filter settings policies, which configure the server used for web filtering. For more information on configuring web filter settings, see Web Filter Settings Page , on page 901.
- **Edit Firewall Settings > Zone Based Firewall**—(IOS 12.4(6)T and later devices) To configure Zone Based Firewall settings policies, which configure zones and Trend web filter server settings.

PART IV

IPS Configuration



CHAPTER 36

Getting Started with IPS Configuration

Cisco Intrusion Prevention System (IPS) Sensors are network devices that perform real-time monitoring of network traffic for suspicious activities and active network attacks. The IPS sensor analyzes network packets and flows to determine whether their contents appear to indicate an attack against your network.

Using Cisco Security Manager, you can configure and manage sensors, which can be dedicated stand-alone network appliances, Catalyst 6500 switch modules, service modules running in supported ASA devices or routers, and IPS-enabled Cisco IOS Software images running on integrated services routers. For a full list of supported IPS devices and software versions, see the Supported Devices and Software Versions for Cisco Security Manager document for this version of the product.

This chapter contains the following topics:

Understanding IPS Network Sensing

Network sensing can be accomplished using Cisco IPS sensors (appliances, switch modules, network modules, and SSMs) and Cisco IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco ISRs). These sensing platforms are components of the Cisco Intrusion Prevention System and can be managed and configured through Cisco Security Manager. These sensing platforms monitor and analyze network traffic in real time. They do this by looking for anomalies and misuse on the basis of network flow validation, an extensive embedded signature library, and anomaly detection engines. However, these platforms differ in how they can respond to perceived intrusions.

Tip Cisco IPS sensors and Cisco IOS IPS devices are often referred to collectively as IPS devices or simply sensors. However, Cisco IOS IPS does not run the full dedicated IPS software, and its configuration does not include IPS device-specific policies. Additionally, the amount of sensing that you can perform with Cisco IOS IPS is more limited. The following sections focus on using dedicated IPS devices, including service modules installed in IOS routers, rather than Cisco IOS IPS. For a discussion focused on Cisco IOS IPS, see Intrusion Prevention System (IPS) Cisco IOS Intrusion Prevention System Deployment Guide on Cisco.com and Configuring IOS IPS Routers, on page 1789http://www.cisco.com/go/iosips .

When an IPS device detects unauthorized network activity, it can terminate the connection, permanently block the associated host, and take other actions.

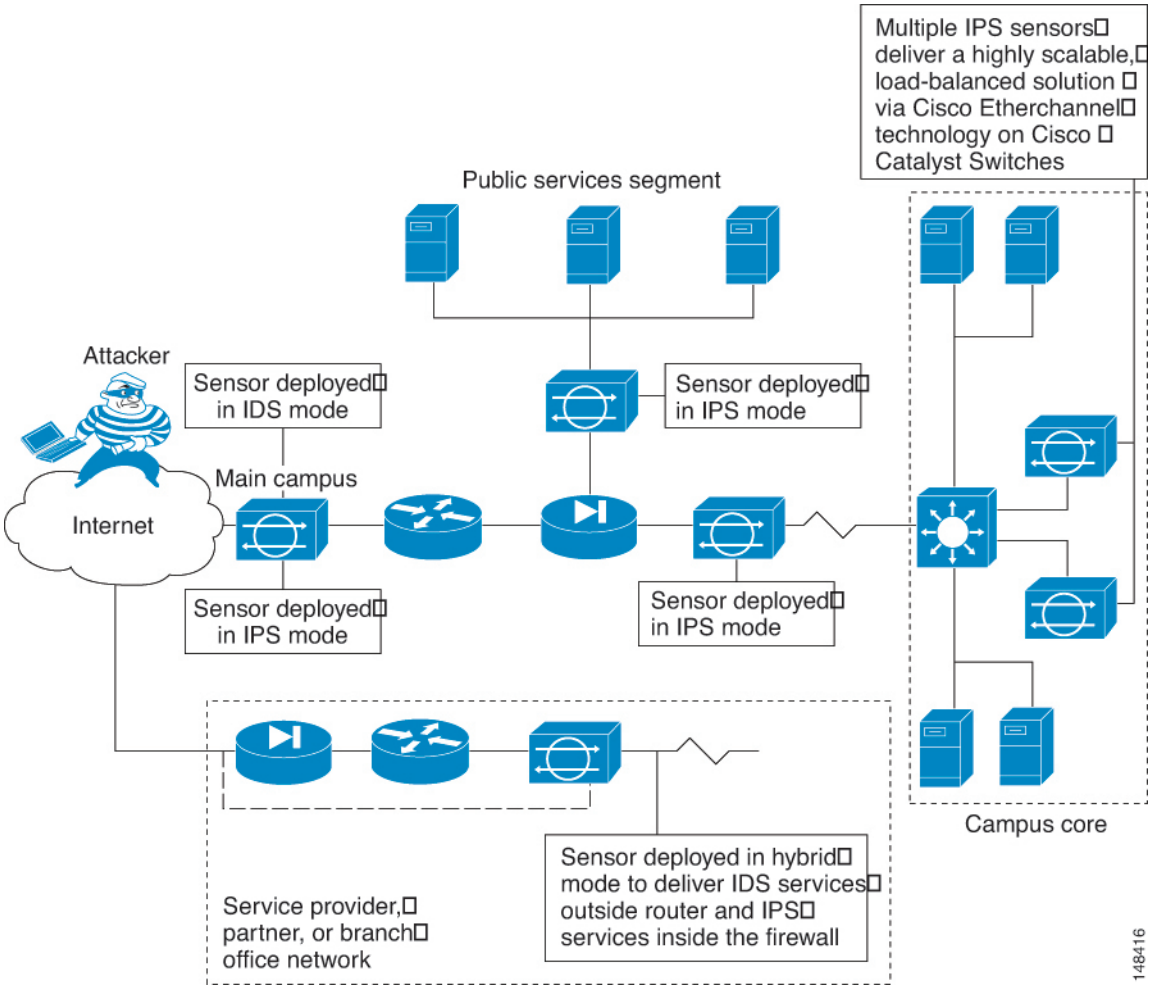
Note For more overview information on IPS sensors, including a comparison of the available appliances and service modules and details about device interfaces, see Introducing the Sensor in *Installing Cisco Intrusion Prevention System Appliances and Modules* . A list of these documents for each IPS release is available at http://www.cisco.com/en/US/products/hw/vpndevc/ps4077/prod_installation_guides_list.html .

This section contains the following topics:

Capturing Network Traffic

The sensor can operate in either promiscuous or inline mode. The following illustration shows how you can deploy a combination of sensors operating in both inline (IPS) and promiscuous (IDS) modes to protect your network.

Figure 43: Comprehensive IPS Deployment Solutions



The command and control interface is always Ethernet. This interface has an assigned IP address, which allows it to communicate with the manager workstation or network devices (Cisco switches, routers, and firewalls). Because this interface is visible on the network, you should use encryption to maintain data privacy. SSH is used to protect the CLI and TLS/SSL is used to protect the manager workstation. SSH and TLS/SSL are enabled by default on the manager workstations.

When responding to attacks, the sensor can do the following:

- Insert TCP resets via the sensing interface.

Note You should select the TCP reset action only on signatures associated with a TCP-based service. If selected as an action on non-TCP-based services, no action is taken. Additionally, TCP resets are not guaranteed to tear down an offending session because of limitations in the TCP protocol.

- Make ACL changes on switches, routers, and firewalls that the sensor manages.

Note ACLs may block only future traffic, not current traffic.

- Generate IP session logs, session replay, and trigger packets display.

IP session logs are used to gather information about unauthorized use. IP log files are written when events occur that you have configured the appliance to look for.

- Implement multiple packet drop actions to stop worms and viruses.

Correctly Deploying the Sensor

Before you deploy and configure your sensors, you should understand the following about your network:

- The size and complexity of your network.
- Connections between your network and other networks, including the Internet.
- The amount and type of traffic on your network.

This knowledge will help you determine how many sensors are required, the hardware configuration for each sensor (for example, the size and type of network interface cards), and how many managers are needed.

You should always position the IPS sensor behind a perimeter-filtering device, such as a firewall or adaptive security appliance. The perimeter device filters traffic to match your security policy thus allowing acceptable traffic in to your network. Correct placement significantly reduces the number of alerts, which increases the amount of actionable data you can use to investigate security violations. If you position the IPS sensor on the edge of your network in front of a firewall, your sensor will produce alerts on every single scan and attempted attack even if they have no significance to your network implementation. You will receive hundreds, thousands, or even millions of alerts (in a large enterprise environment) that are not really critical or actionable in your environment. Analyzing this type of data is time consuming and costly.

Tuning the IPS

Tuning the IPS ensures that the alerts you see reflect true actionable information. Without tuning the IPS, it is difficult to do security research or forensics on your network because you will have thousands of benign events, also known as false positives. False positives are a by-product of all IPS devices, but they occur much less frequently in Cisco IPS devices because Cisco IPS devices are stateful, normalized, and use vulnerability signatures for attack evaluation. Cisco IPS devices also provide risk rating, which identifies high risk events, and policy-based management, which lets you deploy rules to enforce IPS signature actions based on risk rating.

Follow these tips when tuning your IPS sensors:

- Place your sensor on your network behind a perimeter-filtering device.

Proper sensor placement can reduce the number of alerts you need to examine by several thousands a day.

- Deploy the sensor with the default signatures in place.

The default signature set provides you with a very high security protection posture. The Cisco signature team has spent many hours on testing the defaults to give your sensor the highest protection. If you think that you have lost these defaults, you can restore them.

- Make sure that the event action override is set to drop packets with a risk rating greater than 90.

This is the default and ensures that high risk alerts are stopped immediately.

- Filter out known false positives caused by specialized software, such as vulnerability scanner and load balancers by one of the following methods:
  - You can configure the sensor to ignore the alerts from the IP addresses of the scanner and load balancer.
  - You can configure the sensor to allow these alerts and then use Event Viewer to filter out the false positives.
- Filter the Informational alerts.

These low priority events notifications could indicate that another device is doing reconnaissance on a device protected by the IPS. Research the source IP addresses from these Informational alerts to determine what the source is.

- Analyze the remaining actionable alerts:
  - Research the alert.
  - Fix the attack source.
  - Fix the destination host.
  - Modify the IPS policy to provide more information.

Overview of IPS Configuration

There are a wide variety of devices on which you can configure the Intrusion Prevention System. From a configuration point-of-view, you can separate the devices into two groups: dedicated appliances and service modules (for routers, switches, and ASA devices) that run the full IPS software; and IPS-enabled routers running Cisco IOS Software 12.4(11)T and later (Cisco IOS IPS).

The following procedure is an overview of IPS configuration on dedicated appliances and service modules. For Cisco IOS IPS devices (which does not include IPS service modules installed in a router), see Overview of Cisco IOS IPS Configuration , on page 1792.

Step 1 Install and connect the device to your network. Install the device software and perform basic device configuration. Install the licenses required for all of the services running on the device. The amount of initial configuration that you perform influences what you will need to configure in Security Manager.

Follow the instructions in the Installing Cisco Intrusion Prevention System Appliances and Modules document for the IPS version you are using.

Step 2 Add the device to the Security Manager device inventory (see Adding Devices to the Device Inventory , on page 77).

Tip You can discover router and Catalyst switch modules when adding the device in which the module is installed. For ASA devices, you must add the service module separately.

Step 3 Configure the interfaces as described in Configuring Interfaces , on page 1652. You must enable the interfaces connected to your network for the device to function.

For certain types of service module, there are additional policies to configure:

- Router-hosted service modules—Configure the **IPS Module** interface settings policy on the router. For more information, see IPS Module Interface Settings on Cisco IOS Routers , on page 2326.
- IDSM—Configure the **IDSM Settings** Catalyst platform policy. For more information, see IDSM Settings , on page 2666.
- IPS modules on ASA devices—Configure the **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** policy on the host ASA to specify the traffic that should be inspected. For more information, see About IPS Modules on ASA Devices , on page 2274 and Service Policy Rules Page , on page 2263.

Step 4 Use the **Virtual Sensors** policy to assign interfaces to the virtual sensors, including the base vs0 virtual sensor that exists for all IPS devices. For information about virtual sensor settings and assigning interfaces to a virtual sensor, see Defining A Virtual Sensor , on page 1669.

If the device supports it, and you have a need for it, you can also create user-defined virtual sensors so that a single device acts like multiple sensors. Most of the IPS configuration is done on the parent device, but you can configure unique settings per virtual sensor for signatures, anomaly detection, and event actions. For more information, see Configuring Virtual Sensors, on page 1665.

Step 5 Configure basic device access platform policies. These policies determine who can log into the device:

- **AAA**—Configure this policy if you want to use a RADIUS server to control access to the device. You can use AAA control in conjunction with local user accounts defined in the User Accounts policy. See Configuring AAA Access Control for IPS Devices , on page 1634.
- **Allowed Hosts**—The addresses of hosts who are allowed access. Ensure that the Security Manager server is included as an allowed host, or you cannot configure the device using Security Manager. See Identifying Allowed Hosts , on page 1620.
- **SNMP**—Configure this policy if you want to use an SNMP application to manage the device. See Configuring SNMP , on page 1621.
- **Password Requirements**—You can define the acceptable characteristics of a user password. See Configuring User Password Requirements , on page 1633.
- **User Accounts**—The user accounts defined on the device. See Configuring IPS User Accounts , on page 1631.

Step 6 Configure basic server access platform policies. These policies identify the servers to which the device can connect:

- **External Product Interface**—If you use Management Center for Cisco Security Agents, configure this policy to allow the sensor to download host postures from the application. See Configuring the External Product Interface , on page 1640.
- **NTP**—Configure this policy if you want to use a Network Time Protocol server to control the device time. See Identifying an NTP Server , on page 1636.
- **DNS, HTTP Proxy**—The DNS and HTTP Proxy policies are required only if you configure global correlation. They identify a server that can resolve DNS names to IP addresses. Use the HTTP Proxy policy if your network

requires the use of a proxy to make Internet connections; otherwise, use the DNS policy. See Identifying DNS Servers , on page 1637 or Identifying an HTTP Proxy Server , on page 1638.

Step 7 Configure the Logging policy if you want non-default logging. See Configuring IPS Logging Policies , on page 1643.

Step 8 Configure IPS signatures and event actions. Event action policies are easier to configure than creating custom signatures, so try to use event action filters and overrides to modify signature behavior before trying to edit specific signatures. For more information, see the following topics:

- Configuring Event Action Rules, on page 1711
- Configuring Signatures , on page 1680

Step 9 If you use any of the Request Block or Request Rate Limit event actions, configure blocking or rate limiting hosts. See Configuring IPS Blocking and Rate Limiting , on page 1765.

Step 10 Configure other desired advanced IPS services. See the following topics:

- Configuring Global Correlation, on page 1751
- Configuring Anomaly Detection , on page 1742

Step 11 Maintain the device:

- Update and redeploy configurations as necessary.
- Apply updated signature and engine packages. For information about checking for updates, applying them, and setting up regular automated updates, see Managing IPS Updates , on page 1780.
- Manage the device licenses. You can update and redeploy licenses, or automate license updates. For more information, see the following topics:
  - Updating IPS License Files , on page 1777
  - Redeploying IPS License Files , on page 1778
  - Automating IPS License File Updates , on page 1779
- Manage the certificates required for SSL (HTTPS) communication. These certificates expire, so you need to regenerate them approximately every 2 years. For information on regenerating certificates and ensuring that the certificates defined on the device are synchronized with those stored in the Security Manager certificate store, see Managing IPS Certificates , on page 1786.

Step 12 Monitor the device:

- Use the Event Viewer application to view alerts generated from the device. You can open Event Viewer from the Launch menu in Configuration Manager or Report Manager, or from the Windows Start menu.
  - For information on using Event Viewer, see Viewing Events, on page 2677.
  - For an example of how to filter IPS alerts, see Removing False Positive IPS Events from the Event Table , on page 2744.
- Use the Report Manager application to generate reports on IPS usage, including comparisons of inline vs. promiscuous mode, and global correlation vs. traditional inspection. You can also analyze top attackers, victims, signatures, blocked signatures, and perform target analysis. The following topics explain Report Manager and the IPS reports in more detail:

- Managing Reports, on page 2747
- Understanding General IPS Reports , on page 2766
- Understanding IPS Top Reports , on page 2764
- Opening and Generating Reports , on page 2767

Identifying Allowed Hosts

Use the Allowed Hosts policy to identify which hosts or networks have permission to access the IPS sensor. By default, no hosts are permitted to access a sensor, so you must add hosts or networks to this policy.

Specifically, you must add either the IP address of the Security Manager server, or its network address, or Security Manager cannot configure the device. Also add the addresses of all other management hosts that you use, such as CS-MARS.

Tip If you add host addresses only, you will be limited to using those workstations to access the device. Instead, you can specify network addresses to allow all hosts connected to specific "safe" networks access.

Step 1 Do one of the following to open the Allowed Hosts policy:

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **Allowed Hosts** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Device Admin** > **Allowed Hosts**, then select an existing policy or create a new one.

Step 2 Do one of the following:

- To add an entry, click the **Add Row** button and fill in the Access List dialog box.

You can add up to 512 entries.

- To edit an entry, select it and click the **Edit Row** button.
- To delete an entry, select it and click the **Delete Row** button.

Step 3 When adding or editing an entry, specify the host or network address in the Add or Modify Access List dialog box, then click **OK**. You can enter addresses using the following formats:

- Host address—A simple IP address, such as 10.100.10.10.
- Network address—A network address and mask, such as 10.100.10.0/24 or 10.100.10.0/255.255.255.0.
- A network/host policy object—Click **Select** to select an existing object or to create a new one. To use the object in this policy, it must have a single value, either a single network or a single host.

Configuring SNMP

SNMP is an application layer protocol that facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

SNMP is a simple request/response protocol. The network-management system issues a request, and managed devices return responses. This behavior is implemented by using one of four protocol operations: Get, GetNext, Set, and Trap.

You can configure the sensor for monitoring by SNMP. SNMP defines a standard way for network management stations to monitor the health and status of many types of devices, including switches, routers, and sensors.

You can configure the sensor to send SNMP traps. SNMP traps enable an agent to notify the management station of significant events by way of an unsolicited SNMP message.

Trap-directed notification has the following advantage—if a manager is responsible for a large number of devices, and each device has a large number of objects, it is impractical to poll or request information from every object on every device. The solution is for each agent on the managed device to notify the manager without solicitation. It does this by sending a message known as a trap of the event.

After receiving the event, the manager displays it and can take an action based on the event. For example, the manager can poll the agent directly, or poll other associated device agents to get a better understanding of the event.

Tip Trap-directed notification results in substantial savings of network and agent resources by eliminating frivolous SNMP requests. However, it is not possible to totally eliminate SNMP polling. SNMP requests are required for discovery and topology changes. In addition, a managed device agent cannot send a trap if the device has had a catastrophic outage.

This procedure describes how to configure SNMP on an IPS sensor so that you can manage the sensor with an SNMP management station, including the configuration of traps.

Step 1 Do one of the following to open the SNMP policy:

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one.

Step 2 On the **General Configuration** tab, configure at least the following options. For a complete description of all available options, see General SNMP Configuration Options , on page 1623.

- **Enable SNMP Gets/Sets**—Select this option to enable the SNMP management workstation to obtain (get) information, and to modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor.
- **Read-Only Community String**—The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests.

- **Read-Write Community String**—The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests.

Step 3 On the **SNMPv3 Users** tab, add one or more SNMPv3 users to configure SNMPv3 settings on the managed IPS devices. Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. For more information, see SNMPv3 Users Tab , on page 1624.

Note SNMPv3 is supported in IPS version 7.2.2 and later, but not in the IPS version 7.3.1. Security Manager can however manage IPS 7.3.1 devices. If you try to use Security Manager to upgrade an IPS device from version 7.2.2, with SNMP policy configured, to version 7.3.1, a mouse-over tooltip displays the message "Selected upgrade is not recommended. Unassign the SNMP policy on the device and deploy it to continue with the upgrade to 7.3.1". For information about managing SNMPv3 policies on IPS devices with version 7.2.2 and later, see the Release Notes for Cisco Intrusion Prevention System 7.2(2).

Step 4 If you want to configure SNMP traps, click the **SNMP Trap Configuration** tab and configure at least the following options. For a complete description of all available options, see SNMP Trap Configuration Tab , on page 1625.

- **Enable Notifications**—Select this option to allow the sensor to send SNMP traps.
- **Trap Destinations**—Add the SNMP management stations that should be trap destinations. Click the **Add Row (+)** button to add a new destination, or select a destination and click the **Edit Row (pencil)** button to change its configuration.

When adding or editing a trap destination, the trap community string that you enter overrides the default community string entered on the SNMP Trap Configuration tab. The community string appears in the traps sent to this destination and is useful if you are receiving multiple types of traps from multiple agents. For example, a router or sensor could be sending the traps, and if you put something that identifies the router or sensor specifically in your community string, you can filter the traps based on the community string.

To remove a destination, select it and click the **Delete Row (trash can)** button.

Step 5 If you configure trap destinations, you must also ensure that the desired alerts include the **Request SNMP Trap** action. You have the following options for adding this action:

- (Easy way.) Create an event action override to add the Request SNMP Trap action to all alerts of a specified risk rating (**IPS > Event Actions > Event Action Overrides** policy). For example, you could generate traps for all alerts with a risk rating between 85-100. Event action overrides let you add an action without individually editing each signature. For more information, see Configuring Event Action Overrides , on page 1722.
- (Precise way.) Edit the Signatures policy (**IPS > Signatures > Signatures**) to add the Request SNMP Trap action to the signatures for which you want to send trap notifications. Traps are sent only for signatures that you configure to send traps.

Note If the signature has Default for the source, you have to change the source to the Local source before you can change the action. However, if you right-click the Action cell in the signatures table and select **Edit Actions**, then select Request SNMP Trap (along with any other desired action) and click **OK**, the source is automatically changed to Local.

Step 6 Add the SNMP management stations to the Allowed Hosts policy. The management stations must be allowed hosts to access the sensor. See Identifying Allowed Hosts , on page 1620.

General SNMP Configuration Options

Use the General Configuration tab on the SNMP page to configure general SNMP parameters and apply them to IPS sensors. For the procedure, see Configuring SNMP , on page 1621.

Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the General Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the General Configuration tab.

Field Reference

Table 504: General Configuration Tab, SNMP Policy for IPS Sensors

Element	Description
Enable SNMP Gets/Sets	Whether to enable the SNMP management workstation to obtain (get) information, and modify (set) values on the IPS sensor. If you do not enable this option, the management workstation cannot manage this sensor; the sensor will not respond to SNMP requests.
Read-Only Community String	The community string required for read-only access to the sensor. SNMP get requests from the management station must supply this string to get responses from the sensor. This string gives access to all SNMP get requests. Use the string to help identify the sensor.
Read-Write Community String	The community string required for read-write access to the sensor. SNMP set requests from the management station must supply this string to get responses from the sensor; it can also be used on get requests. This string gives access to all SNMP get and set requests. Use the string to help identify the sensor.
Sensor Contact	The network administrator or contact point who is responsible for this sensor.
Sensor Location	The physical location of the sensor, such as building address, name, and room number.
Sensor Agent Port	The port to use for SNMP get/set communication with the sensor. The default is 161. The valid range is 1 to 65535. Enter a port number or the name of a port list object, or click **Select** to select a port list object from a list or to create a new object. The port list object must identify a single port.
SNMP Agent Protocol	The protocol you are using for SNMP, either UDP (the default) or TCP. Select the protocol used by your SNMP management station.

SNMPv3 Users Tab

Beginning with version 4.6, Security Manager enables you to configure SNMPv3 settings on the IPS devices it manages. You must add SNMPv3 users to configure SNMPv3 settings on the managed IPS devices.

You can use the SNMPv3 Users tab on the SNMP page to view, add, edit, or delete SNMPv3 users.

Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab.
- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab.

Do one of the following:

- To add an SNMPv3 user, click the **Add Row (+)** button. This opens the Add SNMPv3 User dialog box. Enter the information required to create the user. For detailed information on the settings, see Add SNMPv3 User Dialog Box , on page 1624
- To edit an SNMPv3 user, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit SNMPv3 User dialog box.
- To delete an existing SNMPv3 user, select it and click the **Delete Row (trash can)** button.

Field Reference

Table 505: SNMPv3 Users

Element	Description
User Name	Name of the user on the host that belongs to the SNMP agent.
Access Control	Access privilege for the SNMPv3 user.
Security Level	Security level for the SNMPv3 user.
Authentication Protocol	The authentication protocol keyword is the authentication level used to configure the SNMPv3 user.
Privacy Protocol	The privacy protocol keyword is the privacy or encryption algorithm used to configure the SNMPv3 user.

Add SNMPv3 User Dialog Box

Use the Add SNMPv3 User dialog box to configure a new SNMPv3 user for the managed IPS device.

Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMPv3 Users tab and click the **Add Row (+)** button.

- (Policy view) Select **IPS > Platform > Device Admin > SNMP**, then select an existing policy or create a new one. Select the SNMPv3 Users tab and click the **Add Row (+)** button.

Field Reference

Table 506: Add SNMPv3 Users Dialog Box

Element	Description
User Name	Enter a name for the new SNMPv3 user.
Access Control	Select the access privilege for the new SNMPv3 user.
Security Level	Select one of the following security levels for the SNMPv3 user: • **NoAuthNoPriv**—There is no authentication and no privacy, which means that no security is applied to the messages. • **AuthNoPriv**—There is authentication but there is no privacy, which means that messages are authenticated. • **AuthPriv**—Authentication and privacy are configured, which means that messages are authenticated and encrypted.
Authentication Protocol	Select the authentication protocol keyword that specifies which authentication level should be used. There is no default value.
Privacy Protocol	Select the privacy protocol keyword that specifies which privacy or encryption algorithm should be used. For the encryption algorithm, you can specify the AES keyword. There is no default value.
Authentication Passphrase	Enter the authentication passphrase argument that specifies the authentication user password. This password must not be less than eight characters. There is no default value.
Privacy Passphrase	Enter the privacy passphrase argument that specifies the encryption user password. This password must not be less than eight characters. There is no default value.

SNMP Trap Configuration Tab

Use the SNMP Trap Communication tab on the SNMP page to configure traps and apply them to sensors and to identify recipients that the traps should be sent to. For the procedure, see Configuring SNMP , on page 1621.

Navigation Path

- (Device view) Select **Platform > Device Admin > Device Access > SNMP** from the Policy selector. Select the SNMP Trap Configuration tab.
- (Policy view) Select **IPS > Platform > Device Admin > Device Access > SNMP**, then select an existing policy or create a new one. Select the SNMP Trap Configuration tab.

Field Reference

Table 507: SNMP Trap Configuration Tab, SNMP Policy for IPS Sensors

Element	Description
Enable Notifications	Whether to enable the sensor to send trap notifications to the trap destinations whenever a specific type of event occurs in a sensor. If you do not select this option, the sensor does not send traps. **Tip** To have the sensor send SNMP traps, you must also select **Request SNMP Trap** as the event action when you configure signatures. Traps are sent only for signatures that you configure to send traps.
Error Filter	The type of events that will generate SNMP traps based on the severity of the event: fatal, error, or warning. Select all severities that you want; use Ctrl+click to select multiple values. The sensor sends notifications of events of the selected severities only.
Enable Detail Traps	Whether to include the full text of the alert in the trap. If you do not select this option, sparse mode is used. Sparse mode includes less than 484 bytes of text for the alert.
Default Trap Community String	The community string used for the traps if no specific string has been set for the trap destination in the Trap Destinations table. **Tip** All traps carry a community string. By default, all traps that have a community string identical to that of the destination are taken by the destination. All other traps are discarded by the destination. However, you can configure the destination to determine which trap strings to accept.
Trap Destinations table	The SNMP management stations that will be sent trap notifications. The table shows the IP address of the management station, the community string added to traps from this sensor, and the port to which traps are sent. • To add a destination, click the **Add Row** button and fill in the Add SNMP Trap Communication dialog box (see SNMP Trap Communication Dialog Box , on page 1626). • To edit a destination, select it, click the **Edit Row** button and make your changes. • To delete a destination, select it and click the **Delete Row** button.

SNMP Trap Communication Dialog Box

Use the Add or Modify SNMP Trap Communication dialog box to configure SNMP trap destinations. These are the SNMP management stations that should receive traps from the IPS sensor.

Navigation Path

Go to the IPS **Platform > Device Admin > Device Access > SNMP** policy, select the **SNMP Trap Configuration** tab, and click the **Add Row** button beneath the Trap Destinations table, or select a destination in the table and click the **Edit Row** button. For more information, see SNMP Trap Configuration Tab , on page 1625.

Field Reference

Table 508: SNMP Trap Communication Dialog Box

Element	Description
IP Address	The IP address of the SNMP management station that should receive trap notifications. Enter the IP address or the name of a network/host object, or click **Select** to select the object from a list or to create a new object. The network/host object must specify a single host IP address.
Trap Community String	The community string of the trap. If you do not enter a trap string, the default trap string defined on the SNMP Trap Communication tab is used for traps sent to this destination.
Trap Port	The port used by the SNMP management station to receive traps. Enter the port number or the name of a port list object, or click Select to select the object from a list or to create a new one. The port list object must identify a single port.
SNMPv3 User	Enter the username of the SNMPv3 user that you configured by using the Add SNMPv3 User Dialog Box , on page 1624. Leave this field blank if you do not want to associate any SNMPv3 user. **Note** If you enter a username that is not a configured SNMPv3 user, you will receive an error message while trying to save the SNMP trap communication settings. () Also, note that you can add up to a maximum of 23 SNMPv3 users.

Managing User Accounts and Password Requirements

You can configure user accounts and passwords, and general password requirements, for your IPS devices. You can configure local users (defined directly on the device), use a RADIUS AAA server, or use them both in conjunction. The policies used are the **AAA**, **User Accounts**, and **Password Requirements** policies in the **Platform > Device Admin > Device Access** folder.

When you create or edit a local user account in Security Manager, the password you enter must satisfy the requirements defined in the Password Requirements policy. This ensures that new passwords meet your security requirements.

Tip If you change the password requirements, and then make changes to any local user account, the new requirements must be met by all user accounts that have passwords managed by Security Manager. This is because Security Manager reconfigures the passwords for all managed accounts if any single account needs to be reconfigured.

The User Accounts policy allows you to centrally manage the local user accounts for your IPS devices. Using a shared policy can help you ensure that all IPS devices contain the same accounts with the same passwords. However, it is important to understand that passwords are encrypted, so Security Manager cannot discover the actual passwords defined on the device. Security Manager manages the passwords for an account only if you define that password in Security Manager. Security Manager does not manage any user accounts defined in a RADIUS AAA server.

The following topics describe IPS user accounts, and Security Manager discovery and deployment considerations, in more detail:

Understanding IPS User Roles

There are four user roles for IPS user accounts:

- **Viewer**—Users can view the device configuration and events, but they cannot modify any configuration data except their user passwords.
- **Operator**—Users can view everything and they can modify the following options:
  - Signature tuning (priority, disable or enable).
  - Virtual sensor definition.
  - Managed routers.
  - Their user passwords.
- **Administrator**—Users can view everything and they can modify all options that Operators can modify in addition to the following:
  - Sensor addressing configuration.
  - List of hosts allowed to connect as configuration or viewing agents.
  - Assignment of physical sensing interfaces.
  - Enable or disable control of physical interfaces.
  - Add and delete users and passwords.
  - Generate new SSH host keys and server certificates.
- **Service**—Only one user with service privileges can exist on a sensor. The service user cannot log in to IDM or IME. The service user logs in to a bash shell rather than the CLI. The service role is a special role that allows you to bypass the CLI if needed.

Note The purpose of the Service account is to provide Cisco Technical Support access to troubleshoot unique and unusual problems. It is not needed for normal system configuration and troubleshooting. You should carefully consider whether you want to create a service account. The service account provides shell access to the system, which makes the system vulnerable. However, you can use the service account to create a password if the administrator password is lost. Analyze your situation to decide if you want a service account existing on the system.

Understanding Managed and Unmanaged IPS Passwords

Every IPS local user account has a password, which allows secure user login to the device. These user passwords are encrypted on the IPS device. Thus, when you add an IPS device to the Security Manager inventory, Security Manager cannot read the actual user passwords.

Because Security Manager cannot read the password, it is unable to deploy newly-discovered user account passwords to the device. To avoid putting user accounts into a state where the passwords are unknown and unusable, Security Manager marks discovered user account passwords as **unmanaged**. The status of a password is indicated in the **Is Password Managed?** column of the **Platform > Device Admin > Device Access > User Accounts** policy:

- If **No** is indicated, the password for this account is not configured in Security Manager. When you deploy this policy, Security Manager will not attempt to configure the password for this user account.
- If **Yes** is indicated, the password for this account was configured or updated in Security Manager. When you deploy this policy, Security Manager reconfigures the passwords for all managed accounts, not just the passwords that changed since the last deployment.

Because Security Manager configures even unchanged passwords, all managed passwords must satisfy the password requirements defined in the Password Requirements policy.

Thus, you can have a mix of managed and unmanaged account passwords. For example, you can have a set of shared user accounts that are centrally managed, and manage these account passwords in Security Manager. Other accounts might be unique to individuals; if you never edit these account passwords in Security Manager, the user can manage these passwords individually on the device.

Tip If you do not want to manage any user accounts in Security Manager, ensure that the User Accounts policy is empty, or simply unassign the policy (right-click the policy and select **Unassign Policy**). Security Manager will not modify user account configurations.

Understanding How IPS Passwords are Discovered and Deployed

Because user passwords are encrypted on IPS devices, Security Manager has to handle them with special care when discovering policies on the device or deploying configurations. When discovering or deploying user accounts on IPS devices, Security Manager does the following:

- **Discovery**—When you add an IPS device to the inventory, or rediscover policies on it, Security Manager determines the current status of each user account, updates the User Account policy with each discovered username and associated role, and marks the user password as unmanaged (as described in Understanding Managed and Unmanaged IPS Passwords , on page 1629).

You cannot view the account status through Security Manager, because it is dynamic and can change. However, the Discovery Status window displays the status at discovery. Accounts can have these statuses:

- **Active**—This state indicates that the account is available for use. Active accounts can be accessed using an authentication token if one has been assigned to the account.
- **Expired**—This state indicates that the account's authentication token has expired and the account can not be accessed using a token until the token has been updated.
- **Locked**—This state indicates that logins to the account have been disabled due to too many failed authentication attempts. You should update the password for these accounts.

Deployment—You are warned if any deployed user accounts are in the Expired or Locked state. Any unmanaged passwords are not deployed to the device. Also, keep in mind the following points:

- If you make changes to any user account on the device, all user accounts with managed passwords are reconfigured. If you also changed the Password Requirements policy, all passwords are compared to the new policy and must meet the new requirements.
- If you change the password of the user account you defined in the device's properties for Security Manager to use when configuring the device, after successful deployment, Security Manager updates the password in the device properties to the new password. You do not need to manually update the password. To see device properties, select **Tools > Device Properties**.

This behavior assumes that you selected **Security Manager Device Credentials** for the Connect to Device Using option on the **Tools > Security Manager Administration > Device Communication** page. If you are using the logged-in users credentials for deployment, after successful deployment, the overall deployment is marked as failed, and a message explains how to reestablish connection. See Device Communication Page , on page 532.

- If you use out-of-band change detection, changes to passwords are not detected. However, changes to usernames and roles are detected. For more information about out-of-band change detection, see Detecting and Analyzing Out of Band Changes , on page 426.
- When previewing configurations, you can see changes to the user accounts by selecting to IPS(Delta – User Passwords). However, passwords are masked. For more information, see Previewing Configurations , on page 424.
- If you are rolling back configurations, the user accounts are never rolled back. The current status and configuration of user accounts does not change.

Tip The IPS sensor can accept public keys for RSA authentication when logging into the device through an SSH client. Each user has an associated list of authorized keys. Users can use these keys instead of passwords. Security Manager ignores these keys during discovery and deployment. Thus, if keys are configured, Security Manager does not remove the configuration.

Configuring IPS User Accounts

Use the User Accounts policy to configure local user accounts for IPS devices. Users can use these accounts to log into the device. You can create new users, modify user privileges and passwords, and delete users.

The user accounts policy should have at least these accounts:

- cisco—An account named “cisco” must exist on the device and you cannot delete it.
- An administrator account that Security Manager can use—Security Manager must be able to log into the device to configure it. Typically, you create an account for this purpose. However, you have the option of having Security Manager use the user account of the person deploying configurations to log into the device. You can configure this using the **Connect to Device Using** option on the **Tools > Security Manager Administration > Device Communication** page. See Device Communication Page , on page 532.

IPS user account configuration is more complicated than it seems. Before you configure IPS user accounts, read the following topics:

- Managing User Accounts and Password Requirements , on page 1627
- Understanding IPS User Roles , on page 1628
- Understanding Managed and Unmanaged IPS Passwords , on page 1629
- Understanding How IPS Passwords are Discovered and Deployed , on page 1629
- Configuring User Password Requirements , on page 1633
- Configuring AAA Access Control for IPS Devices , on page 1634

Tips

- Cisco IOS IPS devices use the same user accounts that are defined for the router. This procedure does not apply to Cisco IOS IPS configurations.
- If you change the password for the user defined in the device properties, which Security Manager uses to deploy configurations to the device, Security Manager uses the existing credentials defined in the device properties to log into the device and deploy changes. After successful deployment, the device properties are then changed to use your new settings. For more information on credentials in device properties, see Device Credentials Page , on page 114.

Related Topics

- Filtering Tables , on page 50
- Table Columns and Column Heading Features , on page 51

Step 1 Do one of the following to open the User Accounts policy:

- (Device view) Select **Platform > Device Admin > Device Access > User Accounts** from the Policy selector.

- (Policy view) Select **IPS > Platform > Device Admin > Device Access > User Accounts**, then select an existing policy or create a new one.

The policy shows existing user accounts, including the username, role, and whether the password is managed by Security Manager (as explained in Understanding Managed and Unmanaged IPS Passwords , on page 1629).

Step 2 Do one of the following:

- To add a user account, click the **Add Row (+)** button. This opens the Add User dialog box. Enter the information required to define the account. For detailed information on the settings, see Add User and Edit User Credentials Dialog Boxes , on page 1632.
- To edit a user account, select it and click the **Edit Row (pencil)** button and make the required changes in the Edit User dialog box.

You cannot change a user role to or from the Service role.

- To delete a user account, select it and click the **Delete Row (trash can)** button. You cannot delete the account named cisco.

Tip All password changes must meet the requirements of the Password Requirements policy. If you change the requirements policy, all new user accounts, or edited accounts, are tested against the new requirements. Although the passwords for existing unedited user accounts are not tested, they too must meet the password requirements if you change any user account defined in this policy, because Security Manager will deploy all of the accounts during the next configuration deployment. Passwords are checked for conformity when you validate policies, which typically happens when you submit changes to the database. For more information, see Understanding How IPS Passwords are Discovered and Deployed , on page 1629.

Add User and Edit User Credentials Dialog Boxes

Use the Add User or Edit User Credentials dialog boxes to add or edit IPS device user accounts.

Navigation Path

From the IPS platform User Accounts policy, click the **Add Row (+)** button to create a new account, or select an existing account and click the **Edit Row (pencil)** button. For information on accessing the User Accounts policy, see Configuring IPS User Accounts , on page 1631.

Field Reference

Table 509: Add or Edit User Dialog Box

Element	Description
User Name	The username for the account. The name can be 1 to 64 characters, including uppercase and lowercase letters and numbers, plus the special characters ( ) + : , _ / -] + $. You cannot change the username when editing an account.

Element	Description
Password Confirm	The password for this user account. Enter the password in both fields. The password must conform to the Password Requirements policy for IPS devices; see Configuring User Password Requirements , on page 1633.
Role	The role for this user. For an explanation of these roles, see Understanding IPS User Roles , on page 1628. **Tip** When editing a user account, you cannot select the Service role. When editing an account assigned to the Service role, you cannot change the role.

Configuring User Password Requirements

Use the IPS platform Password Requirements policy to configure the rules for passwords for local IPS device user accounts. All user-created sensor passwords must conform to the requirements defined in this policy. You can configure password requirements for sensor running IPS software version 6.0 or later.

Tip The requirements you define here determine what is considered an acceptable password in the User Accounts policy (see Configuring IPS User Accounts , on page 1631). If you change this policy, it can be applied even to unchanged user accounts. For more information about the implications of deploying changes to this policy, see Understanding How IPS Passwords are Discovered and Deployed , on page 1629.

To configure IPS password requirements, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Device Access > Password Requirements** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Password Requirements** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the password requirement options that you can configure.

Table 510: Password Requirements Policy

Element	Description
Attempt Limit	How many times a user is allowed to try to log into the device before you lock the user account due to excessive failed attempts. The default is 0, which indicates unlimited authentication attempts. For security purposes, you should change this number.

Element	Description
Size Range	The minimum and maximum size allowed for user passwords; separate the minimum and maximum with a hyphen. The range is 6 to 64 characters; the default is 8-64. **Tip** If you configure non-zero values for any of the minimum characters options, the minimum size you enter in the Size Range field must be equal to or greater than the sum of those values. For example, you cannot set a minimum password size of eight and also require that passwords must contain at least five lowercase and five uppercase characters.
Minimum Digit Characters	The minimum number of numeric digits that must be in a password.
Minimum Uppercase Characters	The minimum number of uppercase alphabet characters that must be in a password.
Minimum Lowercase Characters	The minimum number of lowercase alphabet characters that must be in a password.
Minimum Other Characters	The minimum number of non-alphanumeric printable characters that must be in a password.
Number of Historical Passwords	The number of historical passwords that you want the sensor to remember for each account. Any attempt to change the password of an account fails if the new password matches any of the remembered passwords. If you specify 0, no previous passwords are remembered.

Configuring AAA Access Control for IPS Devices

Use the AAA policy to configure AAA access control for your IPS devices. The device must use IPS Software release 7.0(4) or above or 7.1.3 or above to configure AAA; for example, neither 7.1.1 nor 7.1.2 supports AAA.

You can configure the IPS device to use a RADIUS AAA server to authenticate user access to the device. By configuring AAA, you can reduce the number of local users defined on the device and take advantage of your existing RADIUS setup. If you configure a AAA server, you can configure the device to allow local user accounts as a fallback mechanism if the RADIUS servers are unavailable.

When configuring AAA, you identify the RADIUS server using a AAA server policy object. You can create the object while configuring the policy, or you can create it in the Policy Object Manager. When you configure the AAA server object, you must adhere to the following restrictions:

- **Host**—You must specify the IP address; you cannot use a DNS name.
- **Timeout**—If you enter a timeout value, it must be from 1 to 512 seconds. The generic AAA server object allows higher numbers, but IPS has a more limited timeout range. The default is 3.
- **Protocol**—RADIUS is the only supported protocol.
- **Key**— You must specify the shared secret key that is defined on the RADIUS server. Although this field is optional for a generic AAA server object, IPS requires a key.

- **Port**—Ensure that the RADIUS Authentication/Authorization port is correct. Note that the default port in the AAA server object is different from the IPS default, which is 1812. You will need to change the port if you want to use the IPS default.

For more information about configuring AAA server objects, see Creating AAA Server Objects , on page 262.

Tip You must ensure that the user account configured in the device properties exists in the RADIUS server or as a local user account, depending on the authorization method that you use. If you switch between local and AAA modes, or change AAA servers, you must ensure that the account is defined in whatever user account database you are using. If you are using AAA with local fallback, the account should be defined in all databases. This account must exist, with the same password defined in the Security Manager device properties for the device, or deployment to the device will fail. The user account used for discovery and deployment must have administrator privileges.

Related Topics

- Managing User Accounts and Password Requirements , on page 1627
- Configuring IPS User Accounts , on page 1631

Step 1 Do one of the following:

- (Device view) Select **Platform** > **Device Admin** > **Device Access** > **AAA** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Device Admin** > **AAA**, then select an existing policy or create a new one.

Step 2 Configure the following basic properties:

- **Authentication Mode**—Whether to use Local or AAA mode. Local mode uses user accounts defined on the IPS device only. With AAA mode, the RADIUS servers are the primary means of user authentication, and you can configure local user accounts as a fallback mechanism. The default is Local. You must select AAA to configure any other options in this policy.
- **Primary RADIUS Server, Secondary RADIUS Server**—The main (primary) AAA server and a backup server, if any. Enter the name of the AAA server policy object that identifies the RADIUS server, or click **Select** to select it from a list of objects or to create a new object.

When authenticating users, the IPS device sends the user authentication attempt to the primary server. The secondary server is contacted only if the request to the primary server times out.

Step 3 Configure the following optional properties if you want non-default values:

- **Console Authentication**—How you want to authenticate users who access the IPS device through the console:
  - Local—Users connected through the console port are authenticated through local user accounts.
  - Local and RADIUS—Users connected through the console port are authenticated through RADIUS first. If RADIUS fails, local authentication is attempted.
  - RADIUS—Users connected through the console port are authenticated by RADIUS. If you also select Enable Local Fallback, then users can also be authenticated through the local user accounts.

- **RADIUS NAS ID**—The Network Access ID, which identifies the service requesting authentication. The value can be no NAS-ID, cisco-ips, or a NAS-ID already configured on the RADIUS server. The default is cisco-ips.
- **Enable Local Fallback**—Whether you want to fall back to local user account authentication if all RADIUS servers are unavailable. This option is selected by default. Note that local authentication is not attempted if the RADIUS server responds negatively to the logon attempt; local authentication is tried only if no response is received from the RADIUS server.
- **Default User Role**—The role to assign to users who do not have a role assigned in the RADIUS server. You can make Viewer, Operator, or Administrator the default roles, but not Service; select Unspecified to assign no default role (this is the default). For an explanation of user roles, see Understanding IPS User Roles , on page 1628.

Note User role configuration is very important. If you do not assign a role to the user, either through the default user role or in the RADIUS server, the sensor prevents user login even if the RADIUS server accepted the username and password.

To assign roles specifically to users on the RADIUS server, you configure the Accept Message for those accounts as either ips-role=administrator, ips-role=operator, ips-role=viewer, or ips-role=service. You configure the Accept Message individually for each user account. An example of a Reply attribute for a given user could be configured to return "Hello <user> your ips-role=operator."

If you configure a service account in the RADIUS server, you must also configure an identical service account locally on the device. For service accounts, both the RADIUS and Local accounts are checked during login.

Identifying an NTP Server

Use the NTP policy to configure a Network Time Protocol (NTP) server as the time source for the IPS device. Using NTP helps ensure synchronized time among your network devices, which can aid event analysis. NTP is the recommended way to configure time settings on an IPS device.

For detailed information on how to set the time on a sensor, including how to set up a Cisco IOS router as an NTP server, refer to Configuring Time in *Configuring the Cisco Intrusion Prevention System Sensor Using the Command Line Interface Version 7.0* .

Tip Check the time on your IPS sensor if you are having trouble updating your IPS software. If the time on the sensor is ahead of the time on the associated certificate, the certificate is rejected, and the sensor software update fails.

Step 1 Do one of the following to open the NTP policy:

- (Device view) Select **Platform > Device Admin > Server Access > NTP** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > NTP**, then select an existing policy or create a new one.

Step 2 In the **NTP Server IP Address** field, enter the IP address of the NTP server. You can also enter the name of a network/host object that identifies the single host address of the server, or click **Select** to select the object from a list or to create a new one.

Note Beginning with Cisco Security Manager 4.19, you can configure NTP server with IPV6 address for all ASA 9.12(1) and later devices.

Step 3 If the NTP server does not require authentication, deselect the **Authenticated NTP** checkbox.

If the NTP server requires authentication, configure the following options:

- **Authenticated NTP**—Select this option to enable authenticated connections.
- **Key, Confirm**—The key value of the NTP server. The key is an MD5 type of key (either numeric or character); it is the key that was used to set up the NTP server.
- **Key ID**—The key ID value of the NTP server, a numeric value between 1 and 65535.

Tip The key and key ID are configured on the NTP server; you must obtain them from the NTP server configuration.

Identifying DNS Servers

If you configure global correlation on an IPS 7.0+ sensor, the sensor must be able to resolve domain names to successfully connect to the update server when downloading global correlation updates. Use the DNS policy to identify the Domain Name System (DNS) servers that the sensor can use to resolve domain names to IP addresses.

Tip If your network requires HTTP proxies when making Internet connections, configure the HTTP Proxy policy instead of the DNS policy. See Identifying an HTTP Proxy Server , on page 1638.

Note The AIP-SSC-5 service module does not support DNS servers.

Step 1 Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform > Device Admin > Server Access > DNS** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > DNS**, then select an existing policy or create a new one.

Step 2 Specify the IP addresses of up to three DNS servers in the **Primary, Secondary, and Tertiary Address** fields. The sensor uses the servers in the order listed; if one server does not respond, the next server is contacted.

You can enter an IP address or the name of a network/host object that contains a server address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must specify a single host address.

Identifying an HTTP Proxy Server

If you configure global correlation on an IPS 7.0+ sensor, and your network requires the use of HTTP proxies to connect to the Internet, you need to configure the HTTP Proxy policy to identify a proxy that the IPS sensor can use. When downloading global correlation updates, the IPS sensor connects to the update server using this proxy. The proxy must be able to resolve DNS names.

Tip If you do not use HTTP proxies, configure DNS servers so that the IPS sensor can resolve the address of the update server. See Identifying DNS Servers , on page 1637.

Note The AIP-SSC-5 service module does not support HTTP proxy servers.

Step 1 Do one of the following to open the HTTP Proxy policy:

- (Device view) Select **Platform** > **Device Admin** > **Server Access** > **HTTP Proxy** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Device Admin** > **Server Access** > **HTTP Proxy**, then select an existing policy or create a new one.

Step 2 Configure the following options:

- **Enable Proxy**—Select this option to tell the device to connect through the configured proxy server.
- **IP Address**—Enter the IP address of the proxy server, or the name of the network/host object that contains the server's IP address. Click **Select** to select a network/host object from a list or to create a new one. The network/host object must contain a single host IP address.
- **Port**—Enter the port number used for HTTP connections to the proxy server. The default is 80.

IPS SSHv2 Known Host Keys

The IPS SSHv2 Known Host Keys policy enables you to configure SSHv2 server host keys (outgoing SSHv2 connections from an IPS sensor to an SSH server). This feature is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

The host key can be retrieved from an IPS sensor using valid IP addresses; alternatively, it can be entered manually if you know it. The host key retrieval may take few seconds.

Step 1 Do one of the following to open the IPS SSHv2 Known Host Keys policy:

- (Device view) Select **Platform** > **Device Admin** > **Server Access** > **SSHv2 Known Host Keys** from the Policy selector.

- (Policy view) Select **IPS > Platform > Device Admin > Server Access > SSHv2 Known Host Keys**, then select an existing policy or create a new one.

Step 2 Click the **Add** button to open the Add or Edit Known Host RSA Key Dialog Box, on page 1639.

Step 3 Select a row and then click the **Edit** button to open the Add or Edit Known Host RSA Key Dialog Box, on page 1639.

Add or Edit Known Host RSA Key Dialog Box

Use the Add or Edit Known Host RSA Key dialog box to retrieve an SSHv2 key from an IPS sensor or to enter the key manually if you know it.

Navigation Path

From the SSHv2 Known Host Keys policy, click the **Add** button beneath the IP Address/Public Key table, or select a row in the table and click the **Edit** button. For information on the SSHv2Known Host Keys policy, see IPS SSHv2 Known Host Keys, on page 1638.

Field Reference

Table 511: Add or Edit Known Host RSA Key Dialog Box

Element	Description
IP Address	The IP address of the IPS sensor from which you want to retrieve the public key.
Retrieve Public Key	Initiates retrieval of the public key from the device identified in the IP Address field. The Retrieve Public Key option is available in device view (it is not shown in shared policy view). However, you can enter inline values for the public key in shared policies or retrieve the public key in device view and share it using the "share policy" option.
Public Key	The public key that you know and are able to enter manually. For shared policies, you will be able to enter inline values for the host key.

Configuring IPS SSHv1 Fallback Settings

The IPS SSHv1 Fallback policy is available on IPS sensors running 7.1(8) and later versions of Cisco IPS.

Step 1 Do one of the following to enable or disable SSHv1 Fallback:

- (Device view) Select **Platform > Device Admin > Server Access >Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Server Access > Settings**, then select an existing policy or create a new one.

Step 2 To enable SSHv1 fallback, click the checkbox.

Step 3 To disable SSHv1 fallback, clear the checkbox.

Configuring the External Product Interface

Use the External Product Interface policy to configure the way that Security Manager works with Management Center for Cisco Security Agents (CSA MC).

In general, the external product interface is designed to receive and process information from external security and management products. These external security and management products collect information that can be used to automatically enhance the sensor configuration information. Management Center for Cisco Security Agents is the only external product that can be configured to communicate with the IPS. At most two Management Center for Cisco Security Agents servers can be configured per IPS device.

Tip Management Center for Cisco Security Agents is no longer an active product. Configure this policy only if you are still using that application. For more information, see About CSA MC in *Installing and Using Cisco Intrusion Prevention System Device Manager 6.0* and http://www.cisco.com/en/US/products/sw/cscowork/ps5212/index.html.

Management Center for Cisco Security Agents enforces a security policy on network hosts. It has two components:

- Agents that reside on and protect network hosts.
- A management console, which is an application that manages agents. It downloads security policy updates to agents and uploads operational information from agents.

Before You Begin

Add the external product as an allowed host so that Security Manager allows the sensor to communicate with the external product. For more information, see Identifying Allowed Hosts , on page 1620.

Step 1 Do one of the following to open the External Product Interface policy:

- (Device view) Select **Platform** > **Device Admin** > **Server Access** > **External Product Interface** from the Policy selector.
- (Policy view) Select **IPS** > **Platform** > **Device Admin** > **Server Access** > **External Product Interface**, then select an existing policy or create a new one.

The **Management Center for Cisco Security Agents** tab shows any existing definitions, including the IP address (or network/host object), URL, and port of the external application, the username and password used to log into it, and whether the connection is enabled. The interface type is always Extended SDEE.

Step 2 Do one of the following:

- To add a server, click the **Add Row (+)** button. This opens the External Product Interface dialog box. Enter the information required to identify the server and configure the posture ACLs. For detailed information on the settings, see External Product Interface Dialog Box , on page 1641.

You can add at most two servers.

- To edit a server, select it and click the **Edit Row (pencil)** button and make the required changes in the External Product Interface dialog box.
- To delete a server, select it and click the **Delete Row (trash can)** button.

External Product Interface Dialog Box

Use the Add or Edit External Product Interface dialog box to add or modify interfaces between Management Center for Cisco Security Agents (CSA MC) and the IPS device and the related posture ACLs.

Navigation Path

From the External Product Interface IPS platform policy, click **Add Row** or select an entry and click **Edit Row**. For information on opening the External Product Interface policy, see Configuring the External Product Interface , on page 1640.

Field Reference

Table 512: External Product Interface Dialog Box

Element	Description
External Product's IP Address	The IP address, or the network/host policy object that contains the address, of the external product. Enter the IP address or object name, or click **Select** to select an object from a list or to create a new one.
Interface Type	Identifies the physical interface type, which is always Extended SDEE.
Enable receipt of information	Whether information is allowed to be passed from the external product to the sensor.
SDEE URL	The URL on the CSA MC the IPS uses to retrieve information using SDEE communication. You must configure the URL based on the software version of the CSA MC that the IPS is communicating with as follows: • For CSA MC version 5.0—/csamc50/sdee-server. • For CSA MC version 5.1—/csamc51/sdee-server. • For CSA MC version 5.2 and later—/csamc/sdee-server (the default value).
Port	The port, or the port list object that identifies the port, being used for communications. Enter the port or port list name, or click **Select** to select the object from a list or to create a new object.
User name Password	A username and password that can log into the external product.

Element	Description
Enable receipt of host postures	Whether to allow the receipt of host posture information from CSA MC. The host posture information received from a CSA MC is deleted if you disable this option.
Allow unreachable hosts' postures	Whether to allow the receipt of host posture information for hosts that are not reachable by the CSA MC. A host is not reachable if the CSA MC cannot establish a connection with the host on any IP addresses in the host's posture. This option is useful in filtering the postures whose IP addresses may not be visible to the IPS sensor or that might be duplicated across the network. This filter is most applicable in network topologies where hosts that are not reachable by the CSA MC are also not reachable by the IPS, for example if the IPS and CSA MC are on the same network segment.
Posture ACL table	Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network. • To add a posture ACL, click the **Add Row (+)** button. This opens the Add Posture ACL dialog box. For information on configuring the Posture ACL, see Posture ACL Dialog Box , on page 1642. • To edit a posture ACL, select it and click the **Edit Row (pencil)** button. • To delete a posture ACL, select it and click the **Delete Row (trash can)** button. • To change the priority of an ACL, select it and click the Up or Down button. ACLs are processed in order, and the action associated with the first match is applied.
Enable receipt of watch listed addresses	Whether to allow the receipt of the watch list information from CSA MC. The watch list information received from a CSA MC is deleted if you disable this option.
Manual Watch List RR increase	The percentage of the manual watch list risk rating (RR). The default is 25, and the valid range is 0 to 35.
Session-based Watch List RR Increase	The percentage of the session-based watch list risk rating. The default is 25, and the valid range is 0 to 35.
Packed-based Watch List RR Increase	The percentage of the packet-based watch list risk rating. The default is 10, and the valid range is 0 to 35.

Posture ACL Dialog Box

Use the Add or Modify Posture ACL dialog box to configure posture ACLs for Management Center for Security Agents. Posture ACLs are network addresses for which host postures are allowed or denied. Use posture ACLs to filter postures that have IP addresses that might not be visible to the IPS or that might be duplicated across the network.

Configure the following fields to define a posture ACL:

- **Network Address**—Enter the IP address of a host or network, or the name of a network/host object that specifies one. You can click **Select** to select the object from a list or to create a new object.
- **Action**—Whether host postures will be permitted or denied from the hosts on the network address.

Navigation Path

From the External Product Interface dialog box (see External Product Interface Dialog Box , on page 1641), click the **Add Row (+)** button underneath the Posture ACL table, or select a posture ACL and click the **Edit Row (pencil)** button.

Configuring IPS Logging Policies

Use the IPS platform Logging policy to configure traffic flow notifications and Analysis Engine global variables. These settings apply to the general operation of the IPS sensor.

Traffic flow notifications have to do with the flow of traffic across the interface of a sensor. You can configure the sensor to monitor the flow of packets across an interface and send notification if that flow changes (starts and stops) during a specified interval. You can configure the missed packet threshold within a specific notification interval and also configure the interface idle delay before a status event is reported.

The Analysis Engine performs packet analysis and alert detection. It monitors traffic that flows through specified interfaces. For the Analysis Engine, there is only one global variable: Maximum Open IP Log Files.

Navigation Path

- (Device view) Select **Platform > Logging** from the Policy selector.
- (Policy view) Select **IPS > Platform > Logging**, then select an existing policy or create a new one.

Field Reference

Table 513: IPS Logging Page

Element	Description
Interface Notifications Tab	
Missed Packets Threshold	The percent of missed packets that has to occur before you want to receive notification. The default is 0, and the range is 0 to 100.
Notification Interval	The length of time, in seconds, that you want to check for the percentage of missed packets. The default is 30, and the range is 5 to 3600.
Interface Idle Threshold	The length of time, in seconds, that you will allow an interface to be idle and not receiving packets before you want to be notified. The default is 30, and the range is 5 to 3600.
Analysis Engine Tab	

Element	Description
Specify-Flow-Depth	Lets you specify the inspection depth of the flow. Flow depth is the number of bytes inspected in a flow. The new value applies for new flows only. The valid range is from 0 to 429496296. The default is 0.
Enable Service Activity	Service activity lets you gather information about service activities for diagnostic purposes. The details are more granular and have port level details. Enabling service activity impacts system performance. Enable service activity collection temporarily for diagnostic purposes only. You must reboot the sensor after you enable service activity for the change to take effect.
Service Activity Limit	Sets the limit for how many services you want to enable. The valid range is from 10 to 65536. The default is 15.
Note The Specify-Flow-Depth, Enable Service Activity, and Service Activity Limit fields are applicable to IPS devices of version 7.2(2) or later.	
Maximum Open IP Log Files	The maximum number of open IP log files that you want to allow on the sensor. The default is 20, and the range is 20 to 100.

IPS Health Monitor

Use the IPS Health Monitor page to configure the metrics, or parameters, that are used to determine the health and network security status of your IPS devices. Your IPS devices use these metrics to assign appropriate severity when sending IPS events. The results appear in the Health and Performance Monitor of Security Manager (Launch > Health and Performance Monitor).

IPS Health Monitor is supported in IPS devices beginning with IPS version 6.1 and in Security Manager beginning with version 4.4. Please note the following special cases:

1. For IPS devices running 7.x, all 11 configuration items in the IPS Security Settings Policy are displayed and monitored properly in the Security Manager GUI.
2. For IPS devices running less than 6.1, the Network Participation and Global Correlation entries are hidden in the device view of Security Manager.
3. Some IPS Health Monitor configuration items are protected entries on the device side itself and cannot be edited. Security Manager informs you in such cases.

If you do not select a metric by checking the check box, it does not appear in the Health and Performance Monitor. You can accept the default configuration or edit the values. Items will be disabled and will not be editable if you do not select a metric.

The overall health is set to the most critical settings of any of the metrics. For instance, if all the selected metrics are normal except for one that is critical, the overall health becomes critical. The IPS sensor sends a health and security status event when the overall health status of the IPS sensor changes.

The security status of the IPS sensor is determined for each virtual sensor using the threat ratings of events detected by the virtual sensors. The security status of the virtual sensor is raised when the virtual sensor detects an event with a threat rating that exceeds the threshold for that virtual sensor. After a threshold has been

exceeded, the security status remains at a critical level until the configured amount of time has passed with no more events being detected at the higher level.

To configure the metrics on the IPS Health Monitor page, select one of the following policies:

- (Device view) Select **Platform > Device Admin > Health Monitor** from the Policy selector.
- (Policy view) Select **IPS > Platform > Device Admin > Health Monitor** from the Policy Type selector, then select an existing policy or create a new one.

Note In policy view, no validation is performed if a shared IPS Health Monitor policy is applied to an IPS device running less than 6.1. Security Manager ignores such policies during deployment to device and captures them in deployment logs also.

The following table explains the IPS Health Monitor Metrics that you can configure.

Table 514: IPS Security Settings Policy

Element	Description
Inspection Load	Lets you set a threshold for inspection load and whether this metric is applied to the overall sensor health rating.
Missed Packet	Lets you set a threshold percentage for missed packets and whether this metric is applied to the overall sensor health rating.
Memory Usage	Lets you set a threshold percentage for memory usage and whether this metric is applied to the overall sensor health rating.
Signature Update	Lets you set a threshold for when the last signature update was applied and whether this metric is applied to the overall sensor health rating.
License Expiration	Lets you set a threshold for when the license expires and whether this metric is applied to the overall sensor health rating.
Event Retrieval	Lets you set a threshold for when the last event was retrieved and whether this metric is applied to the overall sensor health rating. **Note** The event retrieval metric keeps track of when the last event was retrieved by an external monitoring application such as IME. Disable Event Retrieval if you are not doing external event monitoring.
Network Participation	Lets you choose whether the Network Participation health metrics contribute to the overall sensor health rating.
Global Correlation	Let you choose whether the Global Correlation health metrics contribute to the overall sensor health rating.
Application Failure	Lets you choose to have an application failure applied to the overall sensor health rating.

Element	Description
IPS in Bypass Mode	Let you choose to know if bypass mode is active and have that apply to the overall sensor health rating.
One or More Active Interfaces Down	Lets you choose to know if one or more enabled interfaces are down and have that apply to the overall sensor health rating.
Warning	Lets you set the lowest threshold in percentage, days, seconds, or failures for the warning threshold.
Critical	Lets you set the lowest threshold in percentage, days, seconds, or failures for the critical threshold.

Configuring IPS Security Settings

Use the IPS Security Settings policy to configure two items that are important to the security of your IPS devices:

- **Permit packet capture logging**—With this feature, IPS devices can prevent users from arbitrarily executing packet capture/display/iplog commands. In previous versions of Security Manager, such actions leave no trace of who executed the command.
- **Configurable idle timeout**—When configured, this feature terminates the connection to an IPS device after a period of time that you specify. Its purpose is to increase the security of a CLI session.

Note These settings are available for devices operating with IPS 7.1.3 and later.

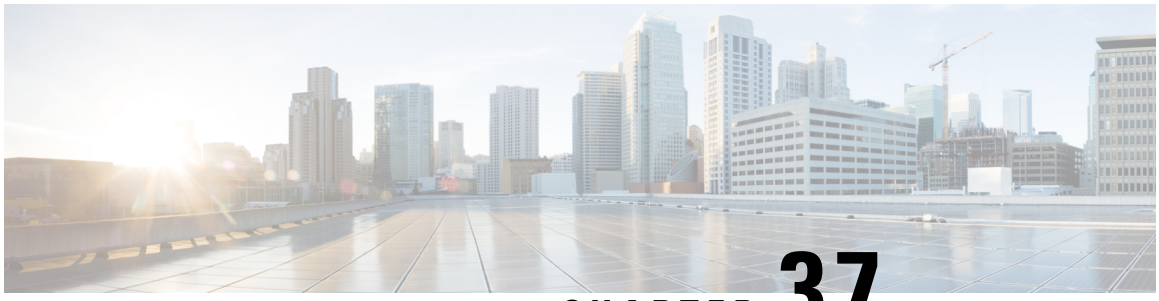
To configure IPS security settings, select one of the following policies:

- (Device view) Select **Platform > Security >Settings** from the Policy selector.
- (Policy view) Select **IPS > Platform > Security > Settings** from the Policy Type selector, then select an existing policy or create a new one.

The following table explains the IPS security settings that you can configure.

Table 515: IPS Security Settings Policy

Element	Description
Permit packet logging	Whether to enable packet logging; applies to packet capture/display/iplog commands.
CLI Inactivity Timeout (In Minutes)	Terminates the connection to an IPS device after the specified period of time.



CHAPTER 37

Managing IPS Device Interface

Dedicated IPS appliances and service modules have their own interface configuration, whereas Cisco IOS IPS devices are configured using the regular router interface policies. This chapter explains how to configure interfaces for dedicated IPS appliances and service modules only.

This chapter contains the following topics:

Understanding Interfaces

Tip This topic is an overview of IPS interfaces. For more detailed information, including the specific interface names and locations for each type of appliance and service module, supported roles, configuration restrictions, and hardware considerations, refer to the "Configuring Interfaces" chapter of the Installing and Using Cisco Intrusion Prevention System Device Manager for the IPS software version you are using on Cisco.com. The information is also in the IME and CLI guidesFor general information, see http://www.cisco.com/go/ips.

The sensor interfaces are named according to the maximum speed and physical location of the interface. For example, GigabitEthernet2/1 supports a maximum speed of 1 Gigabit and is the second-from-the-right interface in the second-from-the bottom expansion slot.

There are three interface roles:

- **Command and control**—The command and control interface has an IP address and is used for configuring the sensor. It receives security and status events from the sensor and queries the sensor for statistics.

The command and control interface is permanently enabled. It is permanently mapped to a specific physical interface, which depends on the specific model of sensor. You cannot use the command and control interface as either a sensing or alternate TCP reset interface. See the IPS document cited above for a list of command and control interfaces by device type.

- **Sensing**—Sensing interfaces are used by the sensor to analyze traffic for security violations. A sensor has one or more sensing interfaces depending on the sensor. Sensing interfaces can operate individually in promiscuous mode or you can pair them to create inline interfaces. In promiscuous mode, packets do

not flow through the sensor; the sensor analyzes a copy of the monitored traffic. In inline mode, the IPS is in the traffic flow and can directly affect the traffic. For more information about sensing modes, see Understanding Interface Modes , on page 1648.

Note On appliances, all sensing interfaces are disabled by default. You must enable them to use them. On modules, the sensing interfaces are permanently enabled. See the IPS document cited above for a list of sensing interfaces by device type.

- **Alternate TCP reset**—You can configure sensors to send TCP reset packets to try to reset a network connection between an attacker host and its intended target host. In some installations when the interface is operating in promiscuous mode, the sensor may not be able to send the TCP reset packets over the same sensing interface on which the attack was detected. In such cases, you can associate the sensing interface with an alternate TCP reset interface and any TCP resets that would otherwise be sent on the sensing interface when it is operating in promiscuous mode are instead sent out on the associated alternate TCP reset interface.

If a sensing interface is associated with an alternate TCP reset interface, that association applies when the sensor is configured for promiscuous mode but is ignored when the sensing interface is configured for inline mode (interface or VLAN pair), because TCP resets are always sent on the sensing interfaces in those modes.

Note With the exception of IDSM-2, any sensing interface can serve as the alternate TCP reset interface for another sensing interface. The alternate TCP reset interface on IDSM-2 is fixed because of hardware limitation. However, there is only one sensing interface on IPS modules (on routers or ASA devices), so you cannot specify an alternate TCP reset interface on them. See the IPS document cited above for a list of eligible alternate TCP reset interfaces by device type, and for more information about the conditions under which you would use one.

Understanding Interface Modes

Sensing interfaces can operate in various modes. The mode configured for an interface determines the traffic it can inspect and how it can respond to events.

This section contains the following topics:

Promiscuous Mode

In promiscuous mode, packets do not flow through the sensor. The sensor analyzes a copy of the monitored traffic rather than the actual forwarded packet. The advantage of operating in promiscuous mode is that the

sensor does not affect the packet flow with the forwarded traffic. The disadvantage of operating in promiscuous mode, however, is the sensor cannot stop malicious traffic from reaching its intended target for certain types of attacks, such as atomic attacks (single-packet attacks). The response actions implemented by promiscuous sensor devices are post-event responses and often require assistance from other networking devices, for example, routers and firewalls, to respond to an attack. While such response actions can prevent some classes of attacks, in atomic attacks the single packet has the chance of reaching the target system before the promiscuous-based sensor can apply an ACL modification on a managed device (such as a firewall, switch, or router).

By default, all sensing interfaces are in promiscuous mode. To change an interface from inline interface mode to promiscuous mode, delete any inline interface that contains that interface and delete any inline VLAN pair subinterfaces of that interface from the interface configuration.

Related Topics

- Understanding Interfaces , on page 1647
- Configuring Physical Interfaces , on page 1655

Inline Interface Mode

Operating in inline interface pair mode puts the IPS directly into the traffic flow and affects packet-forwarding rates making them slower by adding latency. This allows the sensor to stop attacks by dropping malicious traffic before it reaches the intended target, thus providing a protective service. Not only is the inline device processing information on Layers 3 and 4, but it is also analyzing the contents and payload of the packets for more sophisticated embedded attacks (Layers 3 to 7). This deeper analysis lets the system identify and stop or block attacks that would normally pass through a traditional firewall device.

In inline interface pair mode, a packet comes in through the first interface of the pair on the sensor and out the second interface of the pair. The packet is sent to the second interface of the pair unless that packet is being denied or modified by a signature.

Notes:

- If the paired interfaces are connected to the same switch, you should configure them on the switch as access ports with different access VLANs for the two ports. Otherwise, traffic does not flow through the inline interface.
- You can configure IPS modules for routers and ASA devices to operate inline even though these modules have only one sensing interface.

Related Topics

- Understanding Interfaces , on page 1647
- Configuring Inline Interface Pairs , on page 1659

Inline VLAN Pair Mode

You can associate VLANs in pairs on a physical interface. This is known as inline VLAN pair mode. Packets received on one of the paired VLANs are analyzed and then forwarded to the other VLAN in the pair.

Inline VLAN pair mode is an active sensing mode where a sensing interface acts as an 802.1q trunk port, and the sensor performs VLAN bridging between pairs of VLANs on the trunk. The sensor inspects the traffic it receives on each VLAN in each pair, and can either forward the packets on the other VLAN in the pair, or drop the packet if an intrusion attempt is detected. You can configure an IPS sensor to simultaneously bridge up to 255 VLAN pairs on each sensing interface. The sensor replaces the VLAN ID field in the 802.1q header of each received packet with the ID of the egress VLAN on which the sensor forwards the packet. The sensor drops all packets received on any VLANs that are not assigned to inline VLAN pairs.

Notes:

- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.
- Inline VLAN pairs are not supported on IPS modules for routers or ASA devices.

Related Topics

- Understanding Interfaces , on page 1647
- Configuring Inline VLAN Pairs , on page 1660

VLAN Group Mode

You can divide each physical interface or inline interface into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. If you configure multiple virtual sensors, each of them can monitor one or more of these interfaces. This lets you apply multiple policies to the same sensor. The advantage is that now you can use a sensor with only a few interfaces as if it had many interfaces.

Note You cannot divide physical interfaces that are in inline VLAN pairs into VLAN groups.

VLAN group subinterfaces associate a set of VLANs with a physical or inline interface. No VLAN can be a member of more than one VLAN group subinterface. Each VLAN group subinterface is identified by a number between 1 and 255. Subinterface 0 is a reserved subinterface number used to represent the entire unvirtualized physical or logical interface. You cannot create, delete, or modify subinterface 0 and no statistics are reported for it.

When you create a VLAN group, it is either promiscuous or inline:

- Promiscuous VLAN group—If you configure a VLAN group on a physical interface, the VLAN group is promiscuous, as described in Promiscuous Mode , on page 1648.
- Inline VLAN group—If you configure a VLAN group on an inline interface pair (a logical interface), the VLAN group is inline, as described in Inline Interface Mode , on page 1649.

Thus, VLAN groups augment the operation of promiscuous mode interfaces or inline interfaces by confining their operation to selected VLANs. Once you assign a VLAN group to an interface (physical or inline interface), the interface is no longer a plain promiscuous or inline interface pair and can only be used for inline VLAN groups.

An unassigned VLAN group is maintained that contains all VLANs that are not specifically assigned to another VLAN group. You cannot directly specify the VLANs that are in the unassigned group. When a VLAN is added to or deleted from another VLAN group subinterface, the unassigned group is updated.

Packets in the native VLAN of an 802.1q trunk do not normally have 802.1q encapsulation headers to identify the VLAN number to which the packets belong. A default VLAN variable is associated with each physical interface and you should set this variable to the VLAN number of the native VLAN or to 0. The value 0 indicates that the native VLAN is either unknown or you do not care if it is specified. If the default VLAN setting is 0, the following occurs:

- Any alerts triggered by packets without 802.1q encapsulation have a VLAN value of 0 reported in the alert.
- Non-802.1q encapsulated traffic is associated with the unassigned VLAN group and it is not possible to assign the native VLAN to any other VLAN group.

Note You can configure a port on a switch as either an access port or a trunk port. On an access port, all traffic is in a single VLAN is called the access VLAN. On a trunk port, multiple VLANs can be carried over the port, and each packet has a special header attached called the 802.1q header that contains the VLAN ID. This header is commonly referred as the VLAN tag. However, a trunk port has a special VLAN called the native VLAN. Packets in the native VLAN do not have the 802.1q headers attached. IDSM-2 can read the 802.1q headers for all nonnative traffic to determine the VLAN ID for that packet. However, IDSM-2 does not know which VLAN is configured as the native VLAN for the port in the switch configuration, so it does not know what VLAN the native packets are in. Therefore, you must tell IDSM-2 which VLAN is the native VLAN for that port. Then IDSM-2 treats any untagged packets as if they were tagged with the native VLAN ID.

Related Topics

- Deploying VLAN Groups , on page 1651
- Understanding Interfaces , on page 1647
- Configuring VLAN Groups , on page 1662

Deploying VLAN Groups

Because a VLAN group of an inline pair does not translate the VLAN ID, an inline paired interface must exist between two switches to use VLAN groups on a logical interface. For an appliance, you can connect the two pairs to the same switch, make them access ports, and then set the access VLANs for the two ports differently. In this configuration, the sensor connects between two VLANs, because each of the two ports is in access mode and carries only one VLAN. In this case the two ports must be in different VLANs, and the sensor bridges the two VLANs, monitoring any traffic that flows between the two VLANs. IDSM-2 also operates in this manner, because its two data ports are always connected to the same switch.

You can also connect appliances between two switches. There are two variations. In the first variation, the two ports are configured as access ports, so they carry a single VLAN. In this way, the sensor bridges a single VLAN between the two switches.

In the second variation, the two ports are configured as trunk ports, so they can carry multiple VLANs. In this configuration, the sensor bridges multiple VLANs between the two switches. Because multiple VLANs are carried over the inline interface pair, the VLANs can be divided into groups and each group can be assigned to a virtual sensor. The second variation does not apply to IDSM-2 because it cannot be connected in this way.

Understanding the IPS Interfaces Policy

Use the Interfaces policy to configure the physical interfaces, inline pairs, VLAN pairs, and VLAN groups on IPS appliances and service modules. This policy does not apply to Cisco IOS IPS devices.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, inline VLAN pair mode, promiscuous VLAN group, or inline VLAN group, but you cannot configure an interface in a combination of these modes.

Tip The contents of this policy differ depending on the device type and IPS software version. For example, some devices display the physical interfaces tab only; creating the other types of configurations is not supported. If a tab or option described below does not appear on the policy you are configuring, it does not apply to the device.

Navigation Path

(Device view only) Select **IPS** > **Interfaces** from the Policy selector.

Field Reference

Table 516: IPS Interfaces Policy

Element	Description
Physical Interfaces tab	The physical interfaces that are available on the device. You can edit these interfaces only (select the device and click the **Edit Row** button); you must perform inventory discovery on the device to obtain the correct list of physical interfaces, for example, if you add an interface card to the device. The columns displayed on the tab show the configuration of each interface and are explained in Modify Physical Interface Map Dialog Box , on page 1656. Note that the Administrative State column indicates whether the interface is enabled (Yes or No); you must enable an interface for it to function. For more information, see Configuring Physical Interfaces , on page 1655.
Inline Pairs tab	The inline interface pairs that allow inline mode processing, as described in Inline Interface Mode , on page 1649. The table shows the name of the pair, the interfaces that are part it, and a description, if any. For more information, see Configuring Inline Interface Pairs , on page 1659. • To add a pair, click the **Add Row** button and fill in the Add Interface Pair dialog box. • To edit a pair, select it and click the **Edit Row** button. • To delete a pair, select it and click the **Delete Row** button.
VLAN Pairs tab	The VLAN pairs for each physical interface, as described in Inline VLAN Pair Mode , on page 1649. The table shows the interface and subinterface, with the two VLANs that are paired, and a description, if any. For more information, see Configuring Inline VLAN Pairs , on page 1660. • To add a pair, click the **Add Row** button and fill in the Add VLAN Pair dialog box. • To edit a pair, select it and click the **Edit Row** button. • To delete a pair, select it and click the **Delete Row** button.
VLAN Groups tab	The VLAN groups defined for a physical interface or inline pair, as described in VLAN Group Mode , on page 1650. The table shows the name of the interface or pair, the VLAN group (empty means all unassigned VLANs), and a description, if any. For more information, see Configuring VLAN Groups , on page 1662. • To add a group, click the **Add Row** button and fill in the Add VLAN Group dialog box. • To edit a group, select it and click the **Edit Row** button. • To delete a group, select it and click the **Delete Row** button.

Element	Description
Summary tab	A summary of how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, and the interfaces you have configured as inline VLAN pairs. For more information, see Viewing a Summary of IPS Interface Configuration , on page 1654.
Bypass Mode	The bypass mode for the device, which determines how the sensor should handle inline mode traffic when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. This is a global setting that applies to all inline mode interfaces on the device. Select the desired option; for a detailed explanation of how each of these options affect inline traffic, see Configuring Bypass Mode , on page 1658. • **Off (Always inspect inline traffic)**—Disables bypass mode. Traffic is always inspected, and if the monitoring process of the sensor is down, traffic stops flowing. • **On (Never inspect inline traffic)**—Traffic bypasses the Analysis Engine and is never inspected. • **Auto (Bypass inspection when analysis engine is stopped)**—Traffic is inspected unless the monitoring process of the sensor is down, in which case traffic continues to flow through the sensor uninspected. This is the default. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor is being upgraded.
CDP Mode	How to handle Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs). For more information, see Configuring CDP Mode , on page 1659. Select the desired option: • **Forward CDP packets**—To allow CDP packets to pass through the sensor. • **Drop CDP packets**—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.

Viewing a Summary of IPS Interface Configuration

The Summary tab of the Interfaces policy contains a table summarizing how you have configured the sensing interfaces—the interfaces you have configured for promiscuous mode, the interfaces you have configured as inline pairs, the interfaces you have configured as inline VLAN pairs, inline VLAN groups, and promiscuous VLAN groups. The content of this table changes when you change your interface configuration.

You can configure any single physical interface to run in promiscuous mode, inline pair mode, or inline VLAN pair mode, but you cannot configure an interface in a combination of these modes.

Tip Not all service modules have a summary tab.

Navigation Path

(Device view) Select **Interfaces** from the Policy selector. Click the **Summary** tab.

Field Reference

Table 517: IPS Interface Summary Tab

Element	Description
Name	The name of the interface. The names are FastEthernet or GigabitEthernet for promiscuous interfaces. For inline interfaces, the name is whatever you assigned to the pair.
Subinterface Number	The subinterface number of the inline VLAN pair or VLAN group. Subinterface numbers can be from 1 to 255.
Inline Interface Name	The name of the inline interface pair.
Mode	The mode for the interface: promiscuous, inline, promiscuous VLAN group, or inline VLAN group and whether there are VLAN pairs. For an explanation of interface modes, see Understanding Interface Modes , on page 1648.
VLAN A VLAN B	The VLAN ID for the first and second VLANs for VLAN pairs. VLAN numbers can be from 1 to 4095.
VLAN Range	The range of VLAN IDs belonging to the VLAN group, for example, 100-200. If the VLAN group is configured to apply to all unassigned VLANs, the field is empty.

Configuring Physical Interfaces

The Physical Interfaces tab of the IPS Interfaces policy lists the existing physical interfaces on your sensor and their associated settings. You cannot add or delete physical interfaces in this policy; instead, you must use policy discovery to obtain the current list of interfaces from the device. Thus, if you add or remove interface cards (available for some appliances), you must rediscover the device as described in Discovering Policies on Devices Already in Security Manager , on page 181.

To configure the sensor to monitor traffic, you must enable the interface using this procedure. When you initialized the sensor using the **setup** command (using the command line interface on the IPS), you assigned

the interface or the inline pair to a virtual sensor, and enabled the interface or inline pair. If you need to change your interfaces settings, you can do so on the Physical Interfaces tab. To assign an interface to a virtual sensor, select the Virtual Sensors policy and add or edit the virtual sensor, as appropriate.

Tip Each physical interface can be divided into VLAN group subinterfaces, each of which consists of a group of VLANs on that interface. For more information, see Configuring VLAN Groups , on page 1662.

- Configuring CDP Mode , on page 1659
- Configuring Inline Interface Pairs , on page 1659

Step 1 (Device view) Select **Interfaces** from the Policy selector, then click the **Physical Interfaces** tab (if necessary).

Step 2 Select the interface whose configuration you want to change and click the **Edit Row** button. The Modify Physical Interface Map dialog box appears.

Step 3 Make the desired configuration changes and click **OK**. Following are the settings you are most likely to want to change; for a description of all options, see Modify Physical Interface Map Dialog Box , on page 1656.

- **Enabled**—Whether the interface is enabled (**Yes** or **No**). Select Yes to make the interface functional. The value of this option is shown in the Administrative State column in the Physical Interfaces tab.
- **Default VLAN**—The VLAN to which the interface is assigned.
- **Specify Interface for TCP Reset**—If you want to assign an alternate TCP reset interface, as described in Understanding Interfaces , on page 1647, select this option, then select the alternate interface from the **interface-name** list.

Modify Physical Interface Map Dialog Box

Use the Modify Physical Interface Map dialog box to change the configuration of the physical interfaces of an IPS sensor. For the procedure, see Configuring Physical Interfaces , on page 1655.

Navigation Path

(Device view) Select **Interfaces** from the Policy selector. On the **Physical Interfaces** tab, select an interface and click the **Edit Row** button.

Related Topics

- Understanding Interfaces , on page 1647
- Understanding the IPS Interfaces Policy , on page 1652

Field Reference

Table 518: Modify Physical Interface Map Dialog Box

Element	Description
Name	The name of the physical interface.
Media Type	The type of media for the physical interface. The media types are the following: • TX—Copper media. • SX—Fiber media. • XL—Network accelerator card. • Backplane interface—An internal interface that connects the module to the backplane of the parent chassis.
Description	A description of the interface.
Enabled	Whether the interface is enabled, Yes or No. You must select **Yes** for the interface to be functional. You also have to assign the interface to a virtual sensor for it to monitor traffic; use the Virtual Sensors policy.
Duplex	The duplex setting of the interface. The duplex types are the following: • Auto—Sets the interface to auto negotiate duplex. • Full—Sets the interface to full duplex. • Half—Sets the interface to half duplex.
Speed	The speed setting of the interface. The speed options are the following: • Auto—Sets the interface to auto negotiate speed. • 10 MB—Sets the interface to 10 MB (for TX interfaces only). • 100 MB—Sets the interface to 100 MB (for TX interfaces only). • 1 GB—Sets the interface to 1 GB (for gigabit interfaces only). • 10 GB—Sets the interface to 10 GB (for 10 gigabit interfaces only).
Default VLAN	The VLAN ID associated with native traffic, or 0 if unknown or if you do not care which VLAN it is.

Element	Description
Specify Interface for TCP Reset interface-name	Whether to send TCP resets on an alternate interface when this interface is used for promiscuous monitoring and the reset action is triggered by a signature firing. If you select this option, select the alternate TCP reset interface from the interface-name list. For more information about alternate TCP reset, see Understanding Interfaces , on page 1647.

Configuring Bypass Mode

You can use inline bypass as a diagnostic tool and a failover protection mechanism. Normally, the sensor Analysis Engine performs packet analysis. When inline bypass is activated, Analysis Engine is bypassed, allowing traffic to flow through the inline interfaces and inline VLAN pairs without inspection. Inline bypass ensures that packets continue to flow through the sensor when the sensor processes are temporarily stopped for upgrades or when the sensor monitoring processes fail. There are three modes: on, off, and automatic. By default, bypass mode is set to automatic.

Keep the following factors in mind before deciding which bypass mode to use:

- There are security consequences when you put the sensor in bypass mode. When bypass mode is on, the traffic bypasses the sensor and is not inspected; therefore, the sensor cannot prevent malicious attacks.
- The inline bypass functionality is implemented in software, so it functions only when the operating system is running. If the sensor is powered off or shut down, inline bypass does not work—traffic does not flow through the sensor.
- When the sensor applies a signature or global correlation update, it might trigger bypass. Whether bypass is triggered depends on the traffic load of the sensor and the size of the signature or global correlation update. If bypass mode is turned off, an inline sensor stops passing traffic while the update is being applied.

To change the bypass mode setting, follow these steps:

Step 1 (Device view) Select the **Interfaces** policy from the Policy selector.

Step 2 In the **Bypass Mode** field at the bottom of the policy, select the desired option:

- **Off (Always inspect inline traffic)**—Disables bypass mode.

Traffic flows through the sensor for inspection. If the monitoring process of the sensor is down, traffic stops flowing. This means that inline traffic is always inspected.

- **On (Never inspect inline traffic)**—Traffic bypasses the Analysis Engine and is not inspected. This means that inline traffic is never inspected.
- **Auto (Bypass inspection when analysis engine is stopped)**—Traffic flows through the sensor for inspection unless the monitoring process of the sensor is down. This is the default.

If the monitoring process of the sensor is down, traffic bypasses the sensor until the sensor is running again. The sensor then inspects the traffic. Auto mode is useful during sensor upgrades to ensure that traffic is still flowing while the sensor

is being upgraded. Auto mode also helps to ensure traffic continues to pass through the sensor if the monitoring process fails.

Configuring CDP Mode

You can configure the IPS sensor to enable or disable the forwarding of Cisco Discovery Protocol (CDP) packets. The CDP configuration applies globally to all interfaces on the device, however, it has an effect only on inline interfaces (both inline interfaces and inline VLAN pairs).

Cisco Discovery Protocol is a media- and protocol-independent device-discovery protocol that runs on all Cisco-manufactured equipment, including routers, access servers, bridges, and switches. Using CDP, a device can advertise its existence to other devices and receive information about other devices on the same LAN or on the remote side of a WAN. CDP runs on all media that support SNAP, including LANs, Frame Relay, and ATM media.

Tip The CDP Mode setting is not available on all IPS appliances and service modules. If the CDP Mode field does not appear on the Interfaces policy, the setting does not apply to the device you are configuring.

To change the CDP mode setting on a device, follow these steps:

Step 1 (Device view) Select the **Interfaces** policy from the Policy selector.

Step 2 In the **CDP Mode** field at the bottom of the policy, select the desired option:

- **Forward CDP packets**—To allow CDP packets to pass through the sensor.
- **Drop CDP packets**—To have the sensor drop all CDP packets and not allow them to pass through the sensor. This is the default setting.

Configuring Inline Interface Pairs

You can pair interfaces on your sensor if your sensor is capable of inline monitoring. For more information about inline pairs, see Inline VLAN Pair Mode , on page 1649.

Tip IPS modules for routers and ASA devices do not need an inline pair for monitoring. You only need to add the physical interface to a virtual sensor.

Related Topics

- Understanding Interfaces , on page 1647

- Configuring VLAN Groups , on page 1662
- Defining A Virtual Sensor , on page 1669
- Editing Policies for a Virtual Sensor , on page 1673
- Assigning Interfaces to Virtual Sensors , on page 1668

Step 1 (Device view) Select **Interfaces** from the Policy selector, then click the **Inline Pairs** tab.

Step 2 Do one of the following:

- To add a pair, click the **Add Row** button. The Add Interface Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit Interface Pair dialog box opens.

Tip You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline pair if there is an inline VLAN group. First delete the inline VLAN group from the VLAN Groups tab, and then delete the inline pair.

Step 3 In the Add or Edit Inline Pairs dialog box, configure the following options:

- **Inline Interface Name**—The name you want to give to this inline pair. The name cannot be longer than 32 characters; alphanumeric and underscore characters are allowed. You cannot edit this name after you create the pair.
- **Interface 1 and 2**—Select the two physical interfaces that you want to form a pair. The lists include only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline pair, VLAN pair, or VLAN group.
- **Description**—An optional description for the pair.

Step 4 Click **OK** to save your changes.

Configuring Inline VLAN Pairs

Use the VLAN Pairs tab of the IPS Interfaces policy to configure the VLAN pairs for physical interfaces. The summary table displays the existing VLAN pairs for each physical interface. You can create multiple VLAN pairs on a single physical interface. For more information about inline VLAN pair mode, see Inline VLAN Pair Mode , on page 1649.

Tips

- You cannot create a VLAN pair for an interface if it is already part of an inline interface pair; create VLAN groups for inline interface pairs.
- To create an inline VLAN pair for an interface that is in promiscuous mode and assigned to a virtual sensor, you must first remove the interface from the virtual sensor (using the Virtual Sensors policy) and then create the inline VLAN pair.
- You cannot use the default VLAN as one of the paired VLANs in an inline VLAN pair.

- If your sensor does not support inline VLAN pairs, the VLAN Pairs pane is not displayed. IPS modules on routers and ASA devices do not support inline VLAN pairs.
- When using inline VLAN pairs, you should configure UniDirectional Link Detection (UDLD) on the connected switch that is hosting the VLANs. UDLD can help switches prevent spanning-tree forwarding loops and single direction links. For detailed information, see https://www.cisco.com/c/en/us/td/docs/security/ips/7-0/configuration/guide/idm/idmguide7/idm_interfaces.html#wp1169508

Related Topics

- Understanding Interfaces , on page 1647
- Configuring Bypass Mode , on page 1658
- Configuring CDP Mode , on page 1659
- Configuring Physical Interfaces , on page 1655
- Configuring VLAN Groups , on page 1662

Step 1 (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Pairs** tab.

Step 2 Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Pair dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Pair dialog box opens.

Tip You can also delete a pair by selecting it and clicking the **Delete Row** button. You cannot delete an inline VLAN pair if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the inline VLAN pair.

Step 3 In the Add or Edit VLAN Pairs dialog box, configure the following options:

- **Physical Interfaces**—Select the physical interface on which you are creating this VLAN pair. The list includes only those interfaces that are defined on the Physical Interfaces tab and that are not already part of an inline interface pair or VLAN group. However, you can create multiple VLAN pairs on a single interface.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN pair on the selected physical interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the pair.
- **VLAN A, B**—The numbers of the two VLANs that you want to join as a pair. VLAN numbers are from 1 to 4095. You must enter different numbers, and the numbers must not already be part of another VLAN pair on the selected physical interface.

Step 4 Click **OK** to save your changes.

Configuring VLAN Groups

Use the VLAN Groups tab of the IPS Interfaces policy to configure the VLAN groups for physical interfaces and inline interface pairs (logical interfaces). The summary table displays the existing VLAN groups. You can create multiple VLAN groups on a single physical interface or inline interface pair. For more information about VLAN group mode, see VLAN Group Mode , on page 1650.

A VLAN group consists of a group of VLAN IDs that exist on an interface. Each VLAN group consists of at least one VLAN ID. You can have up to 255 VLAN groups per interface (logical or physical). Each group can contain any number of VLAN IDs.

After you assign the VLAN IDs to the VLAN group, you must assign the VLAN group to a virtual sensor for it to be operational. You can assign a single group to at most one virtual sensor. Use the Virtual Sensors policy to make the assignment.

Note VLAN groups are supported in IPS 6.0 and later only. Not all IPS appliances or service modules support VLAN groups. If the VLAN Groups tab does not appear in the Interfaces policy, the device you are configuring does not support the feature.

Related Topics

- Understanding Interfaces , on page 1647
- Configuring Bypass Mode , on page 1658
- Configuring CDP Mode , on page 1659
- Configuring Physical Interfaces , on page 1655
- Defining A Virtual Sensor , on page 1669
- Editing Policies for a Virtual Sensor , on page 1673
- Assigning Interfaces to Virtual Sensors , on page 1668

Step 1 (Device view) Select **Interfaces** from the Policy selector, then click the **VLAN Groups** tab.

The table shows the existing VLAN groups, including the interface for which the group is defined, the subinterface number, description (if any), and the VLANs assigned to the group. If the VLANs cell is empty, the group is defined for all unassigned VLANs on the interface.

Step 2 Do one of the following:

- To add a pair, click the **Add Row** button. The Add VLAN Group dialog box opens.
- To edit a pair, select it and click the **Edit Row** button. The Edit VLAN Group dialog box opens.

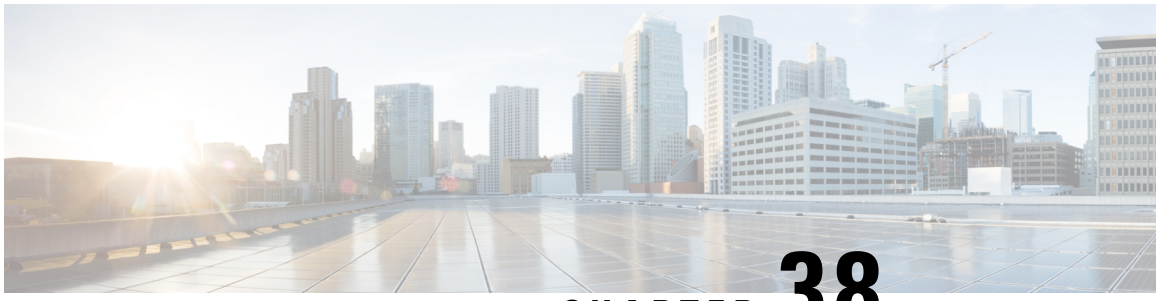
Tip You can also delete a group by selecting it and clicking the **Delete Row** button. You cannot delete a VLAN group if it is assigned to a virtual sensor. First remove the assignment to the virtual sensor using the Virtual Sensors policy, and then delete the VLAN group.

Step 3 In the Add or Edit VLAN Group dialog box, configure the following options:

- **Physical and Logical Interfaces**—Select the physical interface or inline interface pair for which you are creating this VLAN group. The list includes only unpaired physical interfaces (defined on the Physical Interfaces tab) that do not already have inline VLAN pairs defined, or inline interface pairs that are defined on the Inline Pairs tab. You can create multiple VLAN groups on a single interface. Keep the following in mind:
  - If you select a physical interface, you are creating a promiscuous VLAN group.
  - If you select a logical interface, you are creating an inline VLAN group.
- **Subinterface Number**—Enter a number to assign as a subinterface. The number must be unique on the interface, that is, it cannot already be assigned to another VLAN group on the selected interface. Subinterface numbers can be from 1 to 255.
- **Description**—An optional description for the group.
- VLAN assignment—Select one of the following options:
  - **All Unassigned VLAN IDs**—The group contains all VLANs that are not assigned to other VLAN groups. This is the default option
  - **Range of free VLAN IDs**—The group contains specific VLANs. In the **Range** box, enter any combination of single VLAN IDs or ranges (separate starting and ending ID with a hyphen), and separate multiple entries with commas. For example, 10, 12-25, 33-49. VLAN numbers are from 1 to 4095.

The VLAN ID cannot already be in another VLAN group for the selected interface. The VLANs also must be configured on the connected switch or there will be no traffic to inspect.

Step 4 Click **OK** to save your changes.



CHAPTER 38

Configuring Virtual Sensors

All IPS devices and service modules have a base virtual sensor named vs0. When you configure the IPS appliance or service module, you must configure the base vs0 sensor to assign interfaces to it. This assignment tells the device which interfaces to inspect. There are also other settings that are configured on virtual sensors.

In addition to the base vs0 virtual sensor, many IPS appliances and service modules allow you to create user-defined virtual sensors. You can use these virtual sensors to create separate policies for traffic, so that a single physical sensor can act as if it were multiple sensors. A virtual sensor is a logical grouping of sensing interfaces and the configuration policy for the signature engines and event action filters to apply.

This chapter contains the following topics:

Understanding the Virtual Sensor

The sensor can receive data inputs from one or many monitored data streams. These monitored data streams can either be physical interface ports or virtual interface ports. For example, a single sensor can monitor traffic from in front of the firewall, from behind the firewall, or from in front of and behind the firewall concurrently. A single sensor can monitor one or more data streams. In this situation a single sensor policy or configuration is applied to all monitored data streams.

With virtual sensors, you can create separate policies to apply to specific traffic feeds. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

You configure the following policies and settings separately for a virtual sensor:

- Signature and signature settings (policies in the IPS > Signatures folder).
- Event action policies (policies in the IPS > Event Actions folder).
- Anomaly detection policies (the IPS > Anomaly Detection policy) and the anomaly detection mode (in the Virtual Sensors policy).
- The promiscuous interfaces, inline interface pairs, inline VLAN pairs, inline VLAN groups, or promiscuous VLAN groups that the virtual sensor monitors.

Note No packet is processed by more than one virtual sensor; you cannot assign the same physical or logical interface to more than one sensor. Packets from interfaces, inline interface pairs, inline VLAN pairs, and VLAN groups that are not assigned to any virtual sensor are disposed of according to the inline bypass configuration that you define in the **Interfaces** policy.

- The inline TCP session tracking and Normalizer modes (in the Virtual Sensors policy).

Note If you create a policy instance on an IPS device for signatures, event actions, or anomaly detection but do not assign it to any of the virtual sensors on that device (that is, you do not use that policy instance), then that policy instance is deleted by Security Manager during deployment.

All other policies and settings are configured on the parent device that hosts the virtual sensor. For example, if you want to use global correlation, you configure it on the parent device and the virtual sensors share that configuration.

You can configure up to four virtual sensors on one appliance, but you can add only three user-defined virtual sensors. The first virtual sensor, vs0, is the base sensor and you cannot delete it. In Security Manager, virtual sensors are presented as follows:

- The device selector in Device view contains the parent device, which doubles as the base virtual sensor, vs0. Select this device to configure all device-level policies and to create virtual sensors in the Virtual Sensors policy.
- Any user-defined virtual sensors are also shown in the device selector in Device view. The display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob_vs1.”

To configure the signature, anomaly detection, and event action policies for a virtual sensor, you must select it in the device selector. You cannot configure these policies by selecting the parent device; those policies on the parent device are for the vs0 base sensor.

The following topics explain more about virtual sensors:

- Advantages and Restrictions of Virtualization , on page 1667
- Inline TCP Session Tracking Mode , on page 1668
- Understanding Normalizer Mode , on page 1668
- Assigning Interfaces to Virtual Sensors , on page 1668
- Identifying the Virtual Sensors for a Device , on page 1669
- Defining A Virtual Sensor , on page 1669
- Editing Policies for a Virtual Sensor , on page 1673
- Deleting A Virtual Sensor , on page 1674

Advantages and Restrictions of Virtualization

An advantage of using virtual sensors is that you can operate more than one virtual sensor on one appliance while configuring each virtual sensor differently with regard to signature behavior and traffic feed. For example, if you want to create a policy for a data center and a second much different policy for the campus network, yet run both policies on the same hardware device, you can configure separate virtual sensors to implement these policies.

Virtualization has the following advantages:

- You can apply different configurations to different sets of traffic.
- You can monitor two networks with overlapping IP spaces with one sensor.
- You can monitor both inside and outside a firewall or NAT device.

Virtualization has the following restrictions:

- You must assign both sides of asymmetric traffic to the same virtual sensor.
- Using VACL capture or SPAN (promiscuous monitoring) is inconsistent with regard to VLAN tagging, which causes problems with VLAN groups.
  - When using Cisco IOS software, a VACL capture port or a SPAN target does not always receive tagged packets even if it is configured for trunking.
  - When using the MSFC, fast path switching of learned routes changes the behavior of VACL captures and SPAN.
- Persistent store is limited.
- Not all IPS sensors support multiple virtual sensors. The Virtual Sensors policy appears for all IPS appliances and service modules, because you must use it to assign interfaces to the base vs0 sensor. If the Add button in the policy is disabled for a device, and you have not configured user-defined virtual sensors, then the device does not support virtualization. Examples of devices that do not support virtualization include the Cisco IPS 4215, NM-CIDS, AIM-IPS, NME-IPS, and AIP-SSC. IDSM2 supports virtualization, but it does not support VLAN groups or inline interface pairs.
- You must use IPS 6.0+ software. Older software versions do not support virtualization.
- Cisco IOS IPS devices do not support virtualization. Use the **IPS > Interface Rules** policy to specify the interfaces that IPS should monitor.

Virtualization has the following traffic capture requirements:

- The virtual sensor must receive traffic that has 802.1q headers (other than traffic on the native VLAN of the capture port).
- The sensor must see both directions of traffic in the same VLAN group in the same virtual sensor for any given sensor.

Related Topics

- Understanding the Virtual Sensor , on page 1665
- Defining A Virtual Sensor , on page 1669

Inline TCP Session Tracking Mode

When you choose to modify packets inline, if the packets from a stream are seen twice by the Normalizer engine, it cannot properly track the stream state and often the stream is dropped. This situation occurs most often when a stream is routed through multiple VLANs or interfaces that are being monitored by the IPS. A further complication in this situation is the necessity of allowing asymmetric traffic to merge for proper tracking of streams when the traffic for either direction is received from different VLANs or interfaces.

To deal with this situation, you can set the mode so that streams are perceived as unique if they are received on separate interfaces or VLANs (or the subinterface for VLAN pairs).

The following inline TCP session tracking modes apply:

- **Interface and VLAN**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **VLAN Only**—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately.
- **Virtual Sensor**—All packets with the same session key (AaBb) within a virtual sensor belong to the same session. This is the default and almost always the best option to choose.

You configure the inline TCP session tracking mode as a property of the virtual sensor as described in Defining A Virtual Sensor , on page 1669.

Understanding Normalizer Mode

Normalizer mode applies only when the sensor is operating in inline mode. The default is strict evasion protection, which is full enforcement of TCP state and sequence tracking. The Normalizer enforces duplicate packets, changed packets, out-of-order packets, and so forth, which helps prevent attackers from evading the IPS.

Asymmetric mode disables most of the Normalizer checks. Use Asymmetric mode only when the entire stream cannot be inspected, because in this situation, attackers can now evade the IPS.

You configure the Normalizer mode as a property of the virtual sensor as described in Defining A Virtual Sensor , on page 1669.

Assigning Interfaces to Virtual Sensors

An IPS sensor monitors traffic that traverses interfaces, interface pairs, or VLAN pairs assigned to a virtual sensor.

You can assign one or more of the following types of interfaces to a virtual sensor:

- Promiscuous interface—A physical interface that does not have VLAN groups and which is not part of an inline interface pair.
- Inline interface pair—A logical interface composed of two physical interfaces.
- Inline VLAN pair—A logical interface composed of two VLANs.
- Promiscuous VLAN group—A VLAN group that is assigned to a subinterface on a physical interface.

The physical interface cannot already be used for an inline interface or VLAN pair. There can be many promiscuous VLAN groups on the same promiscuous interface, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to a promiscuous interface, it is no longer a plain promiscuous interface and can only be used for promiscuous VLAN groups.

- Inline VLAN group—A VLAN group that is assigned to a subinterface of an inline interface pair.

There can be many inline VLAN groups on the same inline interface pair, but the VLANs assigned cannot overlap. Once a VLAN group is assigned to an inline interface pair it is no longer a plain inline interface pair and can only be used for inline VLAN groups.

VLAN groups cannot be assigned to inline VLAN pairs.

You must configure the interfaces before you can assign them to virtual sensors. For more information about configuring all of these types of interfaces, see Configuring Interfaces , on page 1652. For information on assigning interfaces to virtual sensors, see Defining A Virtual Sensor , on page 1669.

Identifying the Virtual Sensors for a Device

If you configure user-defined virtual sensors on an IPS appliance or service module, the virtual sensor appears in the device selector in Device view.

Normally, the display name of a virtual sensor is in the form *device-name_virtual-sensor-name* , where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10_vs1.

Thus, under normal conditions, the virtual sensors for a device should appear immediately after the parent device in the device selector. However, you can change the virtual sensor's display name by editing the device properties. If you alter the default name, the virtual sensors might not appear anywhere near the parent device in the device selector.

You can use the following techniques to identify the virtual sensors defined on a device, or to identify the parent device of a virtual sensor:

- To see a list of virtual sensors defined on an IPS device, select the **Virtual Sensors** policy on the device. The table shows all virtual sensors, including the base vs0 sensor. Note that the vs0 sensor does not appear separately in the device selector; it is represented by the parent device itself.

Unless you radically alter the display names of virtual sensors, the virtual sensor name, along with the parent device's display name, should help you find the virtual sensor in the device selector.

- To determine which IPS device is the host of a virtual sensor, right-click the virtual sensor in the device selector and select **Device Properties**. The Hostname display-only field on the General tab shows the host device display name plus the virtual sensor name as defined on the device.

Defining A Virtual Sensor

Use the Virtual Sensors policy to configure virtual sensors on your Cisco IPS devices. Even if your IPS device does not support multiple virtual sensors, you must use this policy to assign interfaces to the base sensor, vs0, and configure properties that are associated with the virtual sensor.

Tip For Cisco IOS IPS devices, you configure the interfaces that the IPS examines in the **IPS > Interface Rules** policy. You cannot configure virtual sensors in an IOS IPS device.

Before You Begin

Configure the interfaces on the sensor, including inline interface pairs, inline VLAN pairs, and promiscuous and inline VLAN groups. The interface configurations must exist before you can assign them to a virtual sensor. For information on interfaces, interface modes, and how to configure them, see Managing IPS Device Interface, on page 1647.

Related Topics

- Understanding Interfaces , on page 1647
- Understanding Interface Modes , on page 1648
- Advantages and Restrictions of Virtualization , on page 1667
- Inline TCP Session Tracking Mode , on page 1668
- Inline TCP Session Tracking Mode , on page 1668
- Understanding Normalizer Mode , on page 1668
- Assigning Interfaces to Virtual Sensors , on page 1668
- Identifying the Virtual Sensors for a Device , on page 1669
- Editing Policies for a Virtual Sensor , on page 1673

Step 1 (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

The policy lists all existing virtual sensors, including the base vs0 sensor, which you cannot delete. The information for each sensor shows the interfaces assigned to the sensor, anomaly detection mode, inline TCP tracking mode, normalizer mode, and a description, if any. If the Assignments cell is empty, no interfaces are assigned to the virtual sensor, which means the virtual sensor cannot analyze any traffic.

Step 2 Do one of the following:

- To add a virtual sensor, click the **Add Row** button. The Add Virtual Sensor dialog box opens.

You can add at most three sensors. The device supports four virtual sensors, including the base vs0 sensor. If the Add Row button is disabled, you either have configured the maximum number of sensors, or your device does not support multiple virtual sensors.

- To edit a virtual sensor, select it and click the **Edit Row** button. The Edit Virtual Sensor dialog box opens.

Tip You can also delete a virtual sensor by selecting it and clicking the **Delete Row** button. You cannot delete the base vs0 sensor. For more information about deleting virtual sensors, see Deleting A Virtual Sensor , on page 1674.

Step 3 In the Add or Edit Virtual Sensor dialog box, configure at least the following options. The defaults for the other options are appropriate in most cases. For detailed information on all available options, see Virtual Sensor Dialog Box , on page 1671.

- Virtual Sensor Name—The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces.
- Interface assignments (Available, Assigned lists)—The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor.
  - To assign interfaces, select them in the available list and click >>.
  - To remove an assignment, select the interface in the assigned list and click <<. You must remove an assignment before you can assign an interface to a different virtual sensor.

Tip: If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.

Step 4 Click **OK** to save your changes and add them to the Virtual Sensors policy.

Step 5 Click **Save** to save the Virtual Sensors policy.

Step 6 If you created a new virtual sensor, you must submit your changes to the database for the new virtual sensor to appear in the device selector in Device view.

- Non-Workflow mode—Select **File > Submit**.
- Workflow mode—Select **Activities > Approve Activity**, or if you are operating with an activity approver, **Activities > Submit Activity**. The activity must be approved before the virtual sensor appears in the device selector.

Note In the device selector, the display name of the real device is prepended to the beginning of the name of the virtual sensor. In most cases, the result is that the virtual sensors appear next to the parent (real) device that the virtual sensor is on. For example, on the host (real device) named “bob,” the virtual sensor with the name “vs1” will appear in the device list as “bob_vs1.”

Step 7 To configure the policies associated with a virtual sensor, select it in the device selector in Device view. You can then configure the associated policies. See the following topics:

- Defining IPS Signatures, on page 1677
- Configuring Event Action Rules, on page 1711
- Configuring Anomaly Detection Signatures , on page 1740

Virtual Sensor Dialog Box

Use the Add or Edit Virtual Sensor dialog box to configure the properties for a virtual sensor.

Navigation Path

(Device view only.) Select **Virtual Sensors** from the Policy selector. Click the **Add Row** button, or select an existing virtual sensor and click the **Edit Row** button.

Field Reference

Table 519: Add or Edit Virtual Sensor Dialog Box

Element	Description
Virtual Sensor Name	The name of the virtual sensor. The virtual sensor name can be up to 64 characters and it cannot contain spaces. The name of the default virtual sensor is **vs0**. You cannot change the name after you create the virtual sensor. To change a virtual sensor name, delete the sensor and create a new sensor with the desired name. If you already configured local policies for the sensor (that is, signature, event action, and anomaly detection policies), first save the policies as shared policies, delete the sensor, create the new sensor, then assign the shared policies to the new virtual sensor. For more information about creating shared policies from local policies, see Sharing a Local Policy , on page 207.
Interface Assignments (Available, Assigned)	The promiscuous interfaces, inline interface pairs, inline VLAN pairs, promiscuous VLAN groups, or inline VLAN groups that you want this virtual sensor to use. The list of available interfaces shows only those interfaces that are configured in the Interfaces policy and that are not yet assigned to another virtual sensor. • To assign interfaces, select them in the available list and click >>. • To remove an assignment, select the interface in the assigned list and click <<. You must remove an assignment before you can assign an interface to a different virtual sensor. **Tip** If you are not sure about the content of a specific interface, for example, its mode or assigned VLANs, close the dialog box, go to the Interfaces policy, and examine the various tabs.
Anomaly Detection Mode	The mode that you want the anomaly detection policy to operate in for this virtual sensor: Detect, Inactive, Learn. The default and normal operational mode is Detect. However, if you are using asymmetric normalizer mode, you might want to set the anomaly detection mode to Inactive. For detailed information about these modes, see Anomaly Detection Modes , on page 1738.

Element	Description
Inline TCP Session Tracking Mode	The mode used to segregate multiple views of the same stream if the same stream passes through the sensor more than once. The default mode is Virtual Sensor. For more information, see Inline TCP Session Tracking Mode , on page 1668. Select one of the following: • Interface and VLAN—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) and on the same interface belong to the same session. Packets with the same key but on different VLANs are tracked separately. • VLAN Only—All packets with the same session key (AaBb) in the same VLAN (or inline VLAN pair) regardless of the interface belong to the same session. Packets with the same key but on different VLANs are tracked separately. • Virtual Sensor—All packets with the same session key (AaBb) within a virtual sensor belong to the same session.
Normalizer Mode	The type of Normalizer mode you need for traffic inspection. For more information, see Understanding Normalizer Mode , on page 1668. • Strict Evasion Protection—(Default) If a packet is missed for any reason, all packets after the missed packet are not processed. Strict evasion protection provides full enforcement of TCP state and sequence tracking. Any out-of-order packets or missed packets can produce Normalizer engine signatures 1300 or 1330 firings, which try to correct the situation, but can result in denied connections. • Asymmetric Mode Protection—Can only see one direction of bidirectional traffic flow. Asymmetric mode protection relaxes the evasion protection at the TCP layer. Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen.
Description	The description of the virtual sensor.

Editing Policies for a Virtual Sensor

Virtual sensors have two types of policies: the virtual sensor's properties, and policies assigned to the virtual sensor. You use a different approach to edit these items.

- To edit the properties of a virtual sensor, select the virtual sensor's parent device in the device selector in Device view. Then, select the **Virtual Sensors** policy. You can then select the virtual sensor in the table and click the **Edit Row** button.

Using the Virtual Sensors policy, you can change the interfaces assigned to a sensor, the anomaly detection mode, inline TCP session tracking mode, and Normalizer mode. For more information, see the following topics:

- Defining A Virtual Sensor , on page 1669

- Virtual Sensor Dialog Box , on page 1671
- To edit the policies assigned to a virtual sensor, select the virtual sensor in the device selector in Device view. A virtual sensor's name is in the form *device-name_virtual-sensor-name* , where *device-name* is the name of the parent device, and *virtual-sensor-name* is the name of the virtual sensor. For example, the virtual sensor vs1 on device 10.100.10.10 would be 10.100.10.10_vs1.

Note The base virtual sensor, vs0, is integrated with the parent device and does not appear separately in the device selector. To configure the base virtual sensor, select the parent device.

You can then select the policies in the Policies selector and configure them. For more information, see the following topics:

- Defining IPS Signatures, on page 1677
- Configuring Event Action Rules, on page 1711
- Configuring Anomaly Detection , on page 1742

All other policies are configured on the parent device, and the configurations apply to all virtual sensors configured on the device.

Deleting A Virtual Sensor

Virtual sensors appear in the device selector in Device view. However, you cannot delete them from the selector using the same command used for other devices. Instead, you must delete the virtual sensor from the Virtual Sensors policy of the parent device, that is, the device on which the virtual sensor is defined. The following procedure explains how to delete a user-defined virtual sensor.

Tip The base virtual sensor, vs0, does not appear in the device selector. Instead, it is represented by the parent IPS sensor; it is considered to be the base IPS device. To delete the base vs0 sensor, you delete the entire device from the inventory. For information on deleting devices from the inventory, see Deleting Devices from the Security Manager Inventory , on page 130.

Before You Begin

When you delete a virtual sensor, you also delete the policies defined for the sensor, such as signature, event action, and anomaly detection policies. If you configured non-default local policies, and you want to preserve them for use on other virtual sensors, you must first convert the local policies to shared policies. Then, after you delete the virtual sensor, the policies continue to exist as unassigned shared policies. You can then assign them to another virtual sensor. For more information on creating a shared policy from a local policy, see Sharing a Local Policy , on page 207.

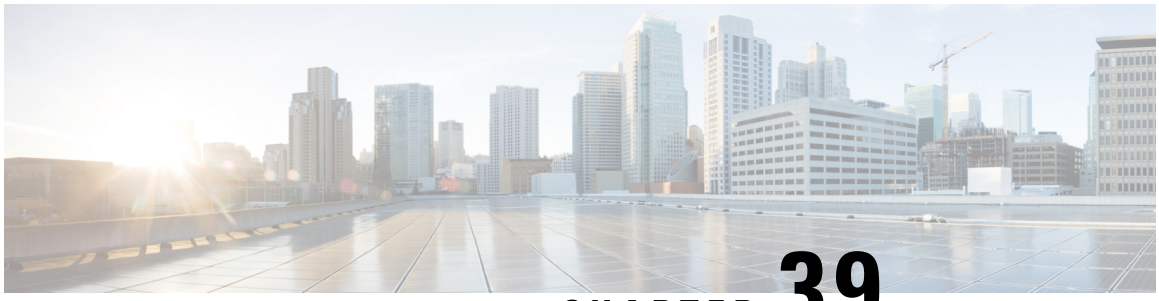
Using this technique is ideal if you are deleting a virtual sensor simply as a means to change the virtual sensor's name. Because you cannot change a virtual sensor's name, you must delete it and create a new virtual sensor with the desired name. If you created shared policies, you could then assign those shared policies to your new sensor, and it will have the same configuration as the sensor had under the old name.

Step 1 (Device view only.) Select **Virtual Sensors** from the Policies selector to open the Virtual Sensors policy.

Step 2 Select the user-defined virtual sensor that you want to delete and click the **Delete Row** button.

Step 3 You are asked for a two-step confirmation. First, you are warned that you must save the policy to keep the policy and device synchronized. Click **OK** to continue, and you are also asked to confirm that you want to delete the node.

If you confirm, the virtual sensor is removed from both the policy and the device selector. It will take a few moments before the device view is updated and the virtual sensor disappears from the list of devices.



CHAPTER 39

Defining IPS Signatures

Note From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see EOL notice.

You can use Security Manager to configure IPS signatures for dedicated IPS appliances and service modules or Cisco IOS IPS devices. When configuring signatures for Cisco IOS IPS, keep in mind that the router cannot use as many signatures as a dedicated appliance or service module.

This chapter contains the following topics:

Understanding Signatures

Network intrusions are attacks on, or other misuses of, network resources. Cisco IPS sensors and Cisco IOS IPS devices use a signature-based technology to detect network intrusions. A signature specifies the types of network intrusions that you want the sensor to detect and report. As sensors scan network packets, they use signatures to detect known types of attacks, such as denial of service (DoS) attacks, and respond with actions that you define.

On a basic level, signature-based intrusion detection technology can be compared to virus-checking programs. Cisco IPS contains a set of signatures that the sensor compares with network activity. When a match is found, the sensor takes some action, such as logging the event or sending an alarm to the Security Manager Event Viewer.

Signatures can produce false positives, because certain normal network activity can be construed as malicious. For example, some network applications or operating systems may send out numerous ICMP messages, which a signature-based detection system might interpret as an attempt by an attacker to map out a network segment. You can minimize false positives by editing your signature parameters (tuning your signatures).

To configure a sensor to monitor network traffic for a particular signature, you must enable the signature. By default, the most critical signatures are enabled when you install the signature update. When an attack is detected that matches an enabled signature, the sensor generates an alert, which is stored in the event store of the sensor. The alerts, as well as other events, may be retrieved from the event store by web-based clients such as Event Viewer. By default the sensor logs all Informational alerts or higher.

Some signatures have subsignatures, that is, the signature is divided into subcategories. When you configure a subsignature, changes made to the parameters of one subsignature apply only to that subsignature. For example, if you edit signature 3050 subsignature 1 and change the severity, the severity change applies to only subsignature 1 and not to 3050 2, 3050 3, and 3050 4.

Cisco IPS contains over 10,000 built-in default signatures. You cannot rename or delete signatures from the list of built-in signatures, but you can retire signatures to remove them from the sensing engine. You can later activate retired signatures; however, this process requires the sensing engines to rebuild their configuration, which takes time and could delay the processing of traffic. You can tune built-in signatures by adjusting several signature parameters. Built-in signatures that have been modified are called tuned signatures.

Note We recommend that you retire any signatures that you are not using. This improves sensor performance.

You can create signatures, which are called custom signatures. Custom signature IDs begin at 60000. You can configure them for several things, such as matching of strings on UDP connections, tracking of network floods, and scans. Each signature is created using a signature engine specifically designed for the type of traffic being monitored.

For more about signatures, see:

- Obtaining Detailed Information About a Signature , on page 1678
- Understanding Signature Inheritance , on page 1679

Related Topics

- Configuring Signatures , on page 1680
- Configuring Global Correlation, on page 1751

Obtaining Detailed Information About a Signature

You can find detailed information about each signature from the Cisco Security Intelligence Operations web site. The web site includes a wealth of information and best practice recommendations for network security, and you can set up IntelliShield alerts. There is education on advanced security topics to help you protect your network, prioritize remediation, and structure your systems to reduce organizational risk.

When you edit the Signatures policy in Security Manager (see Signatures Page , on page 1680), the signature ID is linked directly into the Cisco Security Intelligence Operations database of IPS signatures. Clicking a signature ID opens a page containing information about the signature, including a description, the vulnerabilities on which the signature is based, when the signature was created, and so forth. You can search this database yourself at http://tools.cisco.com/security/center/search.x?search=Signature . (The database was formerly called the Cisco Network Security Database or NSDB.)

If you do not have access to Cisco.com, then the signature ID is linked to a local copy of the signature database information. Security Manager detects whether you have access to Cisco.com and makes the appropriate link for you without your having to set a preference.

The database includes information only for built-in, default signatures. You cannot find information about custom (user-defined) signatures.

Beginning with Security Manager 4.4, the Signatures Page (IPS > Signatures > Signatures) contains an Explanation tab and a Related Threats tab for each signature. These tabs display detailed information in a separate window on the Signatures page. For example, the Explanation tab displays Description, Signature ID, and so forth; the Related Threats tab displays vulnerabilities for other software that you may be using, and so forth.

Tip If this window is not visible to you, expand it with the up arrow button in the bottom-left corner of the Signatures page. To hide this window, collapse it with the corresponding down arrow, also in the bottom-left corner of the Signatures page. You can resize this window with standard controls.

Understanding Signature Inheritance

Signature inheritance for IPS devices is different than for any other Security Manager rules-based policy. Inheritance refers to the capability of Security Manager to enforce hierarchical lists of first-match, rule-based policies such as access rules. Signature inheritance is different because for IPS devices, Security Manager allows inheritance on a per-signature basis.

This example shows what is meant by inheritance on a per-signature basis:

Step 1 In Policy View, select **IPS > Signatures > Signatures**.

Step 2 Create a policy named test1.

Step 3 Create a second policy, named test2.

Step 4 Right-click **test 2** and select **Inherit Signatures**. The Inherit Rules—test 2 dialog box appears.

Step 5 Select **test1** and click the **OK** button.

Step 6 Select **test1** and edit a signature. Note the edit that you made and save your change.

Step 7 Select **test2** and select the signature that you just edited. Observe that test2 inherited the editing that you did on test1.

IPS Signature Purge

Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database.

Note As a result of the purge operation, you may notice the deletion of some of your unused tuning contexts.

Some of the purged signatures may be restored during your next download of IPS signature packages from Cisco.com.

IPS signature purge is disabled by default. To enable IPS signature purge,

Step 1 Stop the Cisco Security Manager Daemon Manager: At the command prompt, enter **net stop crmdmgtd**.

Step 2 Navigate to *NMSROOT* \MDC\ips\etc\sensorupdate.properties file, where *NMSROOT* is the path to the Security Manager installation directory. The default is C:\Program Files\CSCOpx.

Step 3 In sensorupdate.properties, change purgeUnusedSignautesEntriesinDB:false to purgeUnusedSignautesEntriesinDB:true.

Step 4 Re-start the Cisco Security Manager Daemon Manager: At the command prompt, enter **net start crmdmgtd**.

IPS signature purge now runs at midnight every day.

Configuring Signatures

The Signatures policy is where you configure signatures for Cisco IPS sensors and Cisco IOS IPS devices.

This section contains the following topics:

Signatures Page

Use the Signatures page to display the signature summary table, in which you can add, edit, and delete IPS signatures. From this page you can tune the active signature set in a policy by enabling or disabling signatures. You can also use this page to unload signatures from the engine.

Beginning with Version 4.6, Security Manager enables you to apply a signature threat profile to one or more signature policies, starting from IPS device version 7.3(1). A signature threat profile is a predefined signature template that includes customized tunings. These tunings adjust the signature coverage and response actions to enable the sensor to make better choices in various deployment and threat scenarios. This Signatures page displays the threat profile and its version, that has been applied to the policy. Click the **To Change** button to select a threat profile to apply to the policy. For more information, see Apply Signature Threat Profiles , on page 1685. To see the signatures that belong to a threat profile, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see Filtering Tables , on page 50.

If you download a particular signature package that does not contain one or more of the threat profiles already created in shared signature policy, Security Manager displays the warning message "**Currently applied threat profile is not applicable to this signature version**" on the shared signature Policy View. Similarly on the Device View, Security Manager displays the same warning message if you try to apply the shared signature policy to an unsupported device.

Since threat profile updates cannot be performed separately, you must update the current signature version of the device if you want to update its threat profile version. Note that any update made to a threat profile version modifies the signatures associated with the threat profiles, but retains any user-defined signature tuning already performed by the user.

Note Threat profiles are not supported in IOS-IPS.

Tips

- Enabled and disabled signatures are indicated by the "Enabled" checkbox for a particular signature. In previous releases of Security Manager, disabled signatures were indicated by hash marks covering the table row. When you deploy the configuration, disabled signatures are removed from the device. For more information, see Enabling and Disabling Signatures , on page 1690.
- For many columns, you can right-click the column and edit the property directly. Your edits apply to all rows that you have selected. If you select more than one row, the options that you can select are limited to those that are valid for all selected rows. The contents of the right-click menu differ on the basis of the cell that you right-click. For more information on the available commands, see Signature Shortcut Menu , on page 1686.
- To show or hide a column, right-click the table heading row on the signature summary table and then click **Show Columns**. By default, all columns are shown.

Note Beginning with Version 4.5, Security Manager has a Notes column for each signature; this feature enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention. However, the Notes column may not appear by default after you restore a Security Manager database. To show the Notes column, right-click the table heading row on the signature summary table, then click **Show Columns**, and finally click **Notes**. You may discover this situation during installation of Security Manager if you back up and restore the database; however, this situation will not occur during inline upgrades.

Navigation Path

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

- Configuring Event Action Rules, on page 1711

Field Reference

Table 520: Signature Policy

Element	Description
ID	The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature. Click the ID number to open a page in your web browser with detailed information about the signature, as explained in Obtaining Detailed Information About a Signature , on page 1678.
Sub	The subsignature ID, which is the unique numerical value assigned to this subsignature. A Subsignature ID identifies a more granular version of a broad signature.
Name	The name assigned to the signature.
Enabled	A checkbox indicating whether the signature is enabled or disabled in this policy. A signature must be enabled for the sensor to protect against the traffic specified by the signature.
Severity	The severity level that the signature reports: High, Medium, Low, or Informational.
Fidelity	The weight associated with how well this signature might perform in the absence of specific knowledge of the target.

Element	Description
Notes	Enables you to add a note so that you can revisit particular signatures later to see what you or other users have added for a signature or an event. This feature is helpful for network administrators in monitoring noisy signatures or signatures that need particular attention. Notes are not saved to the device during deployment to the device. Notes as described here are a Security Manager GUI feature only and are disregarded during deployment to the device, as they are not part of any IPS policy in Security Manager. Notes are not part of any IPS policy, so assignment or inheritance of a shared signature policy will have no effect on Notes. Right-clicking a signature and adding notes will not prompt for activity/ticket creation. However, adding notes by double-clicking a signature or clicking the Edit button will prompt for activity/ticket creation because this involves signature policy modification. Notes cannot be added to signatures as part of a signature update operation. Other parameters can be edited, though. Notes cannot be searched by the Global Search feature. The Notes column will not display the Notes text. Only an icon will be displayed. You must double-click the icon to display the Notes text. If you use the "Export to File" button, then in the resultant .csv file, the Notes column will display only Y or N, and in this way signifies that those signatures were annotated. The actual text will not be exported. Notes cannot be edited. All added notes are appended to the existing notes as a new note entry. You can of course delete the note and add the updated note afresh. To add a note, right-click the row for a particular signature and then click **Add Note**. After you add the note, click **Save** and then close the Notes dialog box. After you close the Notes dialog box, the row for a particular signature will display a "Note" icon. To add a note to more than one signature, select the signatures you want (Shift-click or Ctrl-click in Windows) and proceed as you would for one particular signature. Notes can be local or shared. If you add a note to a device with only local policies, you can add, edit, and delete only local notes. If you add a note to a device with a shared policy assigned, you can add, edit, and delete both local and shared notes—check the **Share this Note** option. However, you can add notes only to *that particular device* (i.e., local override of notes) even if a shared policy is assigned. **Tip** If you have a shared policy assigned to a device and want to add the notes only to that device for a particular signature without affecting the shared policy, then you need to add the notes without choosing the **Share this Note** option in Device View. **Tip** You can also work with notes in the Edit Signature dialog box. Refer to Edit Button later in this table.
Base RR	The base risk rating value of the signature.
Actions	The actions the sensor takes when this signature fires.

Element	Description
Source	The lowest policy in the inheritance hierarchy that overrides the settings for a signature. Values can be: • Default—The signature uses the default Cisco-defined settings. • Local—The signature is defined specifically for the selected device (Device view only.) • Policy name—The lowest shared policy in the inheritance hierarchy. You can see policy names in Policy view, or in Device view if you assign a shared signature policy to the device.
Retired	The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine. **Timesaver)** Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device. If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired. If the engine level of a signature policy is equal to E-4, the Retired field has four possible values: • **false**—The signature is not retired. • **low-mem-retired**—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 GB RAM or less. • **med-mem-retired**—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 GB RAM or less, but more than 2 GB RAM. (Any device with more than 4 GB RAM is considered a high-memory platform.) • **true**—The signature is retired on all platforms. When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired. **Tip** The term *engine level* used here is not the same as the term *engine* in the row above.
Engine	The engine that parses and inspects the traffic specified by this signature.
View Update Level button (Device view only.)	Click this button view the signature update level for this device. For more information, see Viewing Signature Update Levels , on page 1689.

Element	Description
Export to File button	Click this button to export the signature summary for the current device to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.
Add button	Click this button to add a custom signature. For more information, see the following topics: • Adding Custom Signatures , on page 1695 • Edit Signature or Add Custom Signature Dialog Boxes , on page 1692
Edit button	Click this button to edit the selected signature. You can edit one signature at a time. For more information, see the following topics: • Editing Signatures , on page 1691 • Edit Signature or Add Custom Signature Dialog Boxes , on page 1692
Delete button	Click this button to delete the selected custom signatures. You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.

Apply Signature Threat Profiles

Use the Apply Threat Profile dialog box to select a signature threat profile from the available profiles and apply to the policy. Applying a threat profile modifies only the **Enabled** and **Retired** fields on the Signatures Page , on page 1680. After you have applied a particular threat profile to a policy, the corresponding signature tunings are merged with the existing signatures on the Signatures page. To see the signatures that belong to a threat profile, on the Signatures page, filter the Source column to contain the text **Threat Profile**. For information about how to filter tables, see Filtering Tables , on page 50.

Select any of the following threat profiles that are currently provided by Cisco:

- SCADA—Select this threat profile template if you are using the Cisco IPS device primarily to protect industrial control systems. In addition to signatures in the default set, SCADA signature template includes specialized signatures for general SCADA protocol detections and specific identifiers that address tools and environments common to most device controlled environments.
- Edge—Select this threat profile template if you are using the Cisco IPS device primarily for securing an internet connection. In addition to signatures in the default set, Edge signature template includes additional signatures that provide broader protection for desktop operating systems, web browsers, web technologies, and common desktop applications.
- Web_Applications—Select this threat profile template if you are using the Cisco IPS device primarily for protecting web server farms. In addition to signatures in the default set, Web_Applications signature template includes additional signatures that provide broader protection for web servers, web development tools and frameworks, content management systems, load balancers, and databases.
- Data Center—Select this threat profile template if you are using the Cisco IPS device primarily for protecting data centers. In addition to signatures in the default set, Data Center signature template includes additional signatures that provide broader protection for server operating systems, web servers, application servers, databases, content management systems, messaging servers and virtualization systems.

Note Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved.

Navigation Path

- (Device view) Select **IPS** > **Signatures** > **Signatures** from the Policy selector.
- (Policy view, IPS devices) Select **IPS** > **Signatures** > **Signatures**, then select an existing policy or create a new one.

Field Reference

Table 521: Threat Profile Details

Element	Description
Signature ID	The signature ID, which is the unique numerical value assigned to this signature. This value lets the sensor identify a particular signature.
Sub Signature ID	The sub signature ID, which is the unique numerical value assigned to this sub signature. A sub signature ID identifies a more granular version of a broad signature.
Enabled	Indicates whether the signature is enabled or disabled in this threat profile. A signature must be enabled for the sensor to protect against the traffic specified by the signature.
Retired	Indicates whether the signature is retired or active in this threat profile.
Has Conflict	Indicates whether a signature with tunings from the applied threat profile also has tunings performed by the user. Signatures that are tuned by the user and by the applied threat profile are flagged as True in the Has Conflict column. If there is no conflict between the applied threat profile and user tunings for a signature, the Has Conflict column for that signature shows False. **Note** Any signature tuning performed by the user on Local signatures (signatures defined for a selected device and for which the source policy is Local) will be preserved over the threat profile. For Default signatures, the threat profile tunings will be preserved.

Signature Shortcut Menu

Right-clicking inside the signature summary table in the Signatures policy displays a shortcut menu for performing various functions on the selected signatures. Some commands appear only if you select a single signature, while some commands can be used on more than one signature at a time; your changes apply to all selected signatures. For more information about the Signatures policy, see Signatures Page , on page 1680.

Additionally, the available commands differ depending on which cell you right click. Some commands are available when right-clicking any cell, while others are specific to a single cell.

Tip When you use a right-click command to change the value in a cell of a Default signature, the signature is converted to a Local signature in Device view or a shared-policy-specific signature in Policy view.

The following table explains the available commands.

Table 522: Signature Shortcut Menu

Menu Command	Description
Commands Available for All Cells	
Add Row	Adds a custom signature. For more information, see the following topics: • Adding Custom Signatures , on page 1695 • Edit Signature or Add Custom Signature Dialog Boxes , on page 1692
Edit Row	Edits the selected signature. You can edit one signature at a time. For more information, see the following topics: • Editing Signatures , on page 1691 • Edit Signature or Add Custom Signature Dialog Boxes , on page 1692
Delete Row	Deletes the selected custom signatures. You cannot delete Cisco-defined signatures. If you do not want to deploy a Cisco-defined signature, you can retire it or disable it.
Clone	Creates a new custom signature that contains the same properties as the selected signature. For more information, see Cloning Signatures , on page 1699.
Enable, Disable	Places the signature in the enabled or disabled state, respectively. Disabled signatures appear with crosshatching over them. For more information, see Enabling and Disabling Signatures , on page 1690.
Show Events Show MARS Events	Enables navigation to the Event Viewer or Cisco Security MARS application to view the realtime or historical events detected by the selected signature. For more information, see Viewing Events for an IPS Signature , on page 2734 and Viewing CS-MARS Events for an IPS Signature , on page 2881.
Action Cell Commands	
Add to Actions	Adds an action to the current list of actions for the selected signature.
Delete from Actions	Deletes an action from the current list of actions for the selected signature.
Replace Actions With	Replace the current set of actions for the selected signature with the single action selected. If you want to select more than one action, select **More** from the submenu, then use Ctrl+click to select the desired actions.

Menu Command	Description
Edit Actions	Opens the Edit Actions dialog box, where you can select the desired actions for the signature. Your selection replaces the current list of actions for the signature. For more information, see Edit, Add, Replace Action Dialog Boxes , on page 1688.
Severity Cell Commands	
• High • Medium • Low • Informational	Changes the severity level of the signature to the level you select.
Fidelity Cell Commands	
Edit Fidelity	Changes the fidelity rating of the signature, which is the weight associated with how well this signature might perform in the absence of specific knowledge of the target.
Retired Cell Commands	
• Retire • Activate • Retire on Low Memory • Retire on Medium Memory	Changes the retired status of the signature to the selected status. For more information about the retired status categories, see Edit Signature or Add Custom Signature Dialog Boxes , on page 1692.

Edit, Add, Replace Action Dialog Boxes

Use the Edit, Add, or Replace Action dialog boxes to change the actions defined for a signature. These dialog boxes are available only when you edit the Action cell using the right click menu as explained in Signature Shortcut Menu , on page 1686. The behavior differs depending on the dialog box name:

- Add Actions—The actions that you select are added to those already defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Add to Actions > More**.
- Replace Actions—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Replace Actions With > More**.
- Edit Actions—The actions that you select completely replace those defined in the signature. To open this dialog box, right-click the Actions cell of a signature and select **Edit Actions**.

For an explanation of the available actions, see Understanding IPS Event Actions , on page 1712. You can select multiple actions using Ctrl+click.

Note When you open dialog box, the list of actions that you see varies. The list of actions depends upon whether you right-click in only one signature row in the Actions column or select more than one signature row before right-clicking in the Actions column. If you right-click in only one signature row in the Actions column, the list of actions is that of the engine for that signature. If you select more than one signature row before right-clicking in the Actions column, the list of actions is that which is available for each affected engine. (It is the list of common actions, not the union of actions.)

Edit Fidelity Dialog Box

Use the Edit Fidelity dialog box to make changes in the Fidelity Rating for a particular signature. The Fidelity Rating, or Signature Fidelity Rating (SFR), identifies the weight associated with how well this signature might perform in the absence of specific knowledge of the target. This rating can be any number from 0 to 100, with 100 indicating the most confidence in the signature.

Navigation Path

In the Signatures policy, right-click the Fidelity cell in a signature and select Edit Fidelity. For information on opening the Signatures policy, see Signatures Page , on page 1680. For more information on the signature shortcut menu, see Signature Shortcut Menu , on page 1686.

Viewing Signature Update Levels

In Device view, you can determine the current signature update packages applied to the device in Security Manager and compare it to the one deployed on the device.

Differences between the applied and deployed update levels can occur when:

- The device is updated outside of Security Manager.
- An update is applied to the policy in Security Manager but not yet published to the device.
- During initial Security Manager deployment before the devices are under Security Manager control.

To view the signature update level, select the **IPS > Signatures > Signatures** policy for an IPS device in Device view. Then, click the **View Update Level** button to open the Update Level dialog box.

The following table describes the information displayed in the dialog box.

Table 523: Update Level Dialog Box

Element	Description
Applied Level	This column displays the patch level that is applied to this device in Security Manager.
Deployed Level	This column displays the patch level that is currently running on the selected device.
Major Update	Identifies the major update level.
Minor Update	Identifies the minor update level.
Service Pack	Identifies the service pack level.

Element	Description
Patch	Identifies the patch level.
Engine	Identifies the engine level.
Signature Update	Identifies the signature update level. **Note** This field is the only field on this page that applies to the IOS IPS devices; all of the other fields are exclusive to IPS devices.
Revert button	If you mistakenly modify Applied Level, allows you to discard that new Applied Level; clicking **Revert** syncs the Applied Level to the Deployed Level. **Tip** A warning dialog appears before performing Revert. Also, a warning dialog appears asking you to submit the activity.

Enabling and Disabling Signatures

You can enable and disable individual signatures. Your change takes effect when you redeploy the configuration to the device.

If a signature is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled signatures are removed from the device.

Disabling signatures is useful when you want to reduce the number of signatures used by a device, or if you want to temporarily stop using a custom signature without deleting it. You can later reenable a signature that you disabled.

Note You can enable a signature that is retired, but it then is not used to scan traffic, because it is not in the signature micro-engine. If you want a sensor to scan network traffic for a particular signature, you must enable it and not retire it. The AIP-SSC-5 does not support enabling a signature that is retired.

Step 1 Do one of the following:

- (Device view) Select **IPS** > **Signatures** > **Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS** > **Signatures** > **Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router)** > **Signatures**, then select an existing policy or create a new one.

The Signature page appears; see Signatures Page , on page 1680.

Step 2 Right-click the signature whose enabled status you want to change and select **Enable** or **Disable**, as appropriate.

Editing Signatures

You can edit signatures to change their behavior. For example, you can change the action that should be taken when a signature fires, or the severity and fidelity ratings used to calculate the risk rating of the signature.

Some signatures have special requirements. For example, to configure a sensor to detect ACL violation signatures, you must first configure one or more Cisco IOS routers to log ACL violations. Then, you must configure those routers to communicate with the sensor. Finally, you must configure the sensor to accept syslog traffic from those routers.

Tip This procedure describes how to edit an entire signature. You can also selectively edit individual properties of a signature using the right-click menu in the Signatures policy. For information on the available commands, see Signature Shortcut Menu , on page 1686.

Related Topics

- Understanding Signatures , on page 1677
- Understanding IPS Event Actions , on page 1712
- Enabling and Disabling Signatures , on page 1690
- Cloning Signatures , on page 1699
- Configuring Event Action Filters , on page 1714
- Configuring Event Action Rules, on page 1711

Step 1 Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see Signatures Page , on page 1680.

Step 2 Right-click the signature you want to edit and select **Edit Row**. You can also select the signature and click the Edit Row (pencil) button beneath the signatures table. The Edit Signature dialog box opens.

Tip Use the filter fields above the table to help you find the desired signature. For information on filtering tables, see Filtering Tables , on page 50.

Step 3 Make the desired changes to the signature. For specific details about each option, see x Edit Signature or Add Custom Signature Dialog Boxes , on page 1692.

When editing signatures, keep the following in mind:

- You cannot edit a Default signature. Default signatures are the Cisco-defined version of a signature. Before you can edit a Default signature, you must convert it either to a Local signature (one defined specifically on the selected

device) or a shared-policy-specific signature (one defined in a shared policy). You must select either Local or the shared policy name from the Source Policy field before you can change any field on the Edit Signature dialog box.

- You cannot change every characteristic of a signature. For example, you cannot change the signature or subsignature IDs. These fields are read-only.
- If you want to change the detailed parameters of a signature, follow the procedure described in Editing Signature Parameters (Tuning Signatures) , on page 1700.

Step 4 Click **OK** to save your changes.

Edit Signature or Add Custom Signature Dialog Boxes

The Edit Signature and Add Custom Signature dialog boxes are essentially the same. Most of the fields are identical, although there are some layout differences. Use these dialog boxes as follows:

- Use the Edit Signature dialog box to edit the characteristics of a non-default signature (you can only view the characteristics of a default signature in read-only mode).

You cannot edit default signatures. To make any changes to a signature, you must select something other than Default in the Source Policy field at the top of the dialog box.

- Use the Add Custom Signature dialog box to create a custom signature. In the Add Custom Signature dialog box, you enter a name and then select an existing engine from a drop-down list. The signature ID and subsignature ID are assigned by Security Manager. After you finish selecting the remaining parameters, the new signature is added to the Signatures page in the appropriate numerical location, and it is selected.

Note Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

Navigation Path

From the Signatures page:

- To edit a signature, right-click the policy you want to edit and select **Edit Row**.
- To add a custom signature, click the **Add Row (+)** button beneath the table, or right-click any row and select **Add Row**.

For information on opening the Signature page, see Signatures Page , on page 1680.

Field Reference

Table 524: Edit Signature or Add Custom Signature Dialog Boxes

Element	Description
Source Policy (Edit signature only.)	The policy in which you are editing the signature: • Default—The default Cisco-defined signature, which you cannot edit. You must select something other than Default to edit the signature. • Local—The signature is a local signature defined specifically for the selected device. This option is not available in Policy view. • Policy name (variable)—The name of a shared policy. In Device view, a policy name is available only if you assign a shared policy to the device. In Policy view, this is the name of the policy you are editing. Select the policy name to edit the signature and to have your edits reflected on all devices that are assigned the shared policy.
Name (Add only.)	The name of the signature. You cannot change the name after you create the signature. If you want to change the name, you must create a clone of the signature.
SigID (Add only.)	The signature ID that you specify while adding a custom signature. The allowed range of values is 60000 - 65000.
SubSigID (Add only.)	The subsignature ID that you specify while adding a custom signature. The allowed range of values is 0 - 255.
Inheritance Mandatory (Edit signature only.)	When selected, forces any policy that inherits from this policy to use the signature settings defined.
Enabled	Whether the signature is enabled.
Severity	The severity level that the signature will report: High, Medium, Low, or Informational.
Fidelity Rating	The weight associated with how well this signature might perform in the absence of specific knowledge of the target.
Actions	The actions that the sensor will take when this signature fires. For a complete list of actions, see the Understanding IPS Event Actions , on page 1712. Use Ctrl+click to select multiple actions.

Element	Description
Base Risk Rating Risk Rating (Fields have slightly different names when adding or editing signatures.)	The base risk rating value of the signature, which is calculated by multiplying the fidelity rating and the severity factor and dividing them by 100 (Fidelity Rating x Severity Factor /100). This value is read only; you cannot directly change it. To change the value, alter the Severity and Fidelity fields. The Severity Factor has the following values based on what you select in the Severity field: • High = 100 • Medium = 75 • Low = 50 • Informational = 25
Engine (Read-only when editing; read-write when adding custom signatures.)	The engine that parses and inspects the traffic specified by this signature. For a description of the engines, see Engine Options , on page 1697. When adding a custom signature, you must select the appropriate engine. For detailed information about each engine, and the parameters available, see the "Signature Engines" section in the Installing and Using Cisco Intrusion Prevention System Device Manager document for the IPS Software release you are using. **Tip** The term *engine* used here is not the same as the term *engine level* used in the row below.

Element	Description
Retired	The conditions under which the signature is retired, if any. A retired signature is removed from the signature engine. You can activate a retired signature to place it back in the signature engine. **Timesaver**—Use the retired field to unload disabled signatures on your IOS-IPS device to achieve the most favorable memory consumption of that device. If the engine level of a signature policy is less than E-4, the Retired field has two possible values: false and true. False means that the signature is not retired; true means that the signature is retired. If the engine level of a signature policy is equal to E-4, the Retired field has four possible values: • **false**—The signature is not retired. • **low-mem-retired**—The signature should be retired on low-memory platforms. A low-memory device is one that has 2 MB RAM or less. • **med-mem-retired**—The signature should be retired on both low-end and medium platforms. A medium-memory device is one that has 4 MB RAM or less, but more than 2 MB RAM. (Any device with more than 4 MB RAM is considered a high-memory platform.) • **true**—The signature is retired on all platforms. When you select low-mem-retired or med-mem-retired, Security Manager configures the device with those signatures. Whether the signature is actually retired on the device depends on amount of memory installed on the device; the device makes the decision on which signatures are actually retired. **Tip** The term *engine level* used here is not the same as the term *engine* in the row above.
Obsolete (Edit signature only.)	Identifies whether the signature is obsolete. An obsolete signature is removed from the signature engine. It cannot be re-activated.
Restore Defaults button (Non-custom signatures only. Edit signature only.)	Click this button to revert to default values for this signature as defined by Cisco.
Edit Parameters button	Click this button to edit the detailed parameters for this signature using the Edit Signature Parameters dialog box. For more information, see the following topics: • Edit Signature Parameters Dialog Box , on page 1702 • Editing Signature Parameters (Tuning Signatures) , on page 1700

Adding Custom Signatures

If you want to look for traffic patterns that are not identified by the built-in signatures, you can create your own custom signatures to define the traffic patterns.

Even if a built-in signature covers the traffic pattern, you might want to create a custom signature to edit the detailed signature parameters without altering the default signature. If you are creating a custom signature that is similar to an existing signature, the easiest way to do it is to clone the signature as described in Cloning Signatures , on page 1699.

When adding a custom signature to some IPS devices, you can use regular expressions. For more information on the importance of proper syntax when using regular expressions, refer to Regular Expressions in Custom Signatures, on page 1699

Note The AIP-SSC-5 does not support custom signatures.

Step 1 Do one of the following:

- (Device view) Select **IPS > Signatures > Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Signatures > Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see Signatures Page , on page 1680.

Step 2 Click the **Add Row (+)** button beneath the signature table to open the Add Custom Signature dialog box.

Step 3 Configure the desired settings. For specific details about each option, see Edit Signature or Add Custom Signature Dialog Boxes , on page 1692.

When creating signatures, keep the following in mind:

- You cannot change the signature name after you define the signature. If you later want to change the name, you must clone the signature and change it while creating the clone.
- Select the appropriate signature engine for the signature. For a description of the signature engines, see Engine Options , on page 1697. You cannot change the engine after you create the signature; if you select the wrong engine and click OK to save the signature, you must start over and create an entirely new signature.
- The default is to create an enabled signature, but you can deselect the Enabled check box to initially create a disabled signature. You might want to disable the signature if you have not finished editing its parameters.
- Follow the procedure described in Editing Signature Parameters (Tuning Signatures) , on page 1700 to define the detailed signature parameters. You must select the desired engine before you edit the parameters, because many of the parameters are determined by the signature engine.

Whether you can save the signature before configuring parameters differs based on the engine that you select. At minimum, you must click **Edit Parameters** to open the Edit Signature Parameters dialog box, and then click **OK** in the Edit Signature Parameters dialog box, before you can save the signature definition. However, to create a meaningful signature, you will need to configure the parameters to identify the desired traffic pattern.

Step 4 Click **OK** to save your changes.

The custom signature is added to the end of the table and given the next available signature ID starting at 60000.

Note Beginning with Security Manager 4.4, you can specify a signature ID and a subsignature ID while adding a custom signature. If you specify a signatureID/subsignature ID combination that already exists, you will receive an error message.

Engine Options

The following list identifies the options you can specifying in the Engine field of the Edit Signature Parameters dialog box. For detailed information about each engine, and the parameters available, see the "Signature Engines" section in the Installing and Using Cisco Intrusion Prevention System Device Manager document for the IPS Software release you are using.

- AIC FTP—Inspects FTP traffic and lets you control the commands being issued.
- AIC HTTP—Provides granular control over HTTP sessions to prevent abuse of the HTTP protocol.
- Atomic ARP—Inspects Layer-2 ARP protocol. The Atomic ARP engine is different because most engines are based on Layer-3-IP.
- atomic-ip—Inspects IP protocol packets and associated Layer-4 transport protocols.
- Atomic IPv6—Detects IOS vulnerabilities that are stimulated by malformed IPv6 traffic.
- Flood Host—Detects ICMP and UDP floods directed at hosts.
- Flood Net—Detects ICMP and UDP floods directed at networks.
- Meta—Defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets.
- multi-string—Defines signatures that inspect Layer 4 transport protocol (ICMP, TCP, and UDP) payloads using multiple string matches for one signature. You can specify a series of regular expression patterns that must be matched to fire the signature.
- normalizer—Configures how the IP and TCP normalizer functions and provides configuration for signature events related to the IP and TCP normalizer. Allows you to enforce RFC compliance.
- service-dns—Inspects DNS (TCP and UDP) traffic.
- service-ftp—Inspects FTP traffic.
- Service Generic—Decodes custom service and payload.

The Service Generic engine allows programmatic signatures to be issued in a config-file-only signature update. It has a simple machine and assembly language that is defined in the configuration file. It runs the machine code (distilled from the assembly language) through its virtual machine, which processes the instructions and pulls the important pieces of information out of the packet and runs them through the comparisons and operations specified in the machine code. It is intended as a rapid signature response engine to supplement the String and State engines.

You cannot use the Service Generic engine to create custom signatures.

Note Due to the proprietary nature of this complex language, we do not recommend that you edit the Service Generic engine signature parameters. Change only the severity and event action for these signatures.

- Service Generic Advanced—Generically analyzes network protocols.
- Service H225—Inspects VoIP traffic.
- service-http—Inspects HTTP traffic. The WEBPORTS variable defines inspection port for HTTP traffic.
- Service IDENT—Inspects IDENT (client and server) traffic.
- Service MSRPC—Inspects MSRPC traffic.
- Service MSSQL—Inspects Microsoft SQL traffic.
- Service NTP—Inspects NTP traffic.
- service-rpc—Inspects RPC traffic.
- Service SMB—Inspects SMB traffic.
- Service SMB Advanced—Processes Microsoft SMB and Microsoft RPC over SMB packets.
- Service SNMP—Inspects SNMP traffic.
- Service SSH—Inspects SSH traffic.
- Service TNS—Inspects TNS traffic.
- state—Stateful searches of strings in protocols such as SMTP.
- string-icmp—Searches on Regex strings based on ICMP protocol.
- string-tcp—Searches on Regex strings based on TCP protocol.
- string-udp—Searches on Regex strings based on UDP protocol.
- Sweep—Analyzes sweeps of ports, hosts, and services, from a single host (ICMP and TCP), from destination ports (TCP and UDP), and multiple ports with RPC requests between two nodes.
- Sweep Other TCP—Analyzes TCP flag combinations from reconnaissance scans that are trying to get information about a single host. The signatures look for flags A, B, and C. When all three are seen, an alert is fired.
- Traffic ICMP—Analyzes nonstandard protocols, such as TFN2K, LOKI, and DDOS. There are only two signatures with configurable parameters.
- Traffic Anomaly—Analyzes TCP, UDP, and other traffic for worm-infested hosts.
- Trojan Bo2k—Analyzes traffic from the nonstandard protocol BO2K. There are no user-configurable parameters in this engine.
- Trojan Tfn2k—Analyzes traffic from the nonstandard protocol TFN2K. There are no user-configurable parameters in this engine.
- Trojan UDP—Analyzes traffic from the UDP protocol. There are no user-configurable parameters in this engine.

Cloning Signatures

If you want to create a custom signature that is similar to an existing signature, you can create a clone, or copy, of the signature. You can then edit the parameters to make the clone perform according to your requirements.

For example, you might want to create a clone of a Cisco-defined signature to customize it to your needs. You might find this preferable to converting the Cisco signature to a Local or shared policy signature and directly editing its parameters.

To clone a signature, follow these steps:

Step 1 Do one of the following:

- (Device view) Select **IPS** > **Signatures** > **Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS** > **Signatures** > **Signatures**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router)** > **Signatures**, then select an existing policy or create a new one.

The Signature page appears; see Signatures Page , on page 1680.

Step 2 Right-click the signature that you want to clone and select **Clone**.

Security Manager takes some time to make the copy, and might warn you that some attributes are read-only and cannot be copied. If you receive a warning, click **OK**. The Add Custom Signature dialog box then appears.

Step 3 Edit the properties of the cloned signature, as described in Adding Custom Signatures , on page 1695.

Step 4 Click **OK**. The clone appears in the summary table on the Signatures page as the last signature.

Cloned signatures are enabled and active by default.

Regular Expressions in Custom Signatures

You can use regular expressions when adding a custom signature to some IPS devices.

Regardless of the type of IPS device or the particular characteristics of the custom signature, incorrect syntax in a regular expression will cause device deployment to fail after adding the custom signature.

Regular expressions may contain many control characters or regex notations which are used to describe the regex pattern itself. If you intend to use them as literal characters in the regular expression itself, they should be escaped with the "\" escape character. If you intend to use them for their real meaning, on the other hand, you should be careful to conform to proper regular expression syntax.

Example of regular expression that will cause deployment failure: !@#$%^&*()_+{}|:"<>?

Example of regular expression that will be deployed successfully: !@#$%\^&*\(\)_+\{\}|:\"<>\?

Using regular expressions in custom IPS signatures is described in this example:

Step 1 Add a Cisco ASA 5500 Series IPS Security Services Processor (e.g., 5525-X).

Step 2 Add a custom signature with a string-XL engine (e.g., string-xl-tcp) to the IPS device.

Step 3 Click Edit Parameter and create a regular expression for the custom signature.

Step 4 Deploy the IPS device.

Step 5 Deployment will fail if incorrect syntax for regular expressions used, but deployment will succeed if correct syntax is used.

Editing Signature Parameters (Tuning Signatures)

If you cannot alter the behavior of a signature to fit your needs using the Event Action Filters and Overrides policies, or by changing the actions associated with a signature, you might need to fine-tune the signature parameters. You should considered editing parameters to be your last option, however, because these parameters can be complex and frequently require that you have a deep understanding of packet characteristics.

The reason you would want to edit parameters is to reduce false positives and false negatives:

- A *false positive* occurs when legitimate network activity, such as virus scanning, is interpreted and reported as an attack. This happens when network activity meets criteria that were specified to identify an attack before the attack occurred. You can decrease the number false positives by tuning your sensor configurations.
- A *false negative* occurs when an attack was not detected. Tuning your sensor configurations will help you decrease the number of false negatives.

Tip You cannot edit the parameters of a default signature. Before editing the parameters of a default signature, you must convert the signature to a local- or shared-policy signature. In some cases, such as regular expression editing, you must clone the signature and convert it to a custom signature.

This procedure describes how to edit signature parameters to tune a signature.

Related Topics

- Editing Signatures , on page 1691
- Understanding Signatures , on page 1677
- Configuring Event Action Filters , on page 1714
- Configuring Event Action Overrides , on page 1722

Step 1 Do one of the following:

- (Device view) Select **IPS** > **Signatures** > **Signatures** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS** > **Signatures** > **Signatures**, then select an existing policy or create a new one.

- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Signatures**, then select an existing policy or create a new one.

The Signature page appears; see Signatures Page , on page 1680.

Step 2 Right-click the signature whose parameters you want to edit and select **Edit Row**. The Edit Signature dialog box appears (see Edit Signature or Add Custom Signature Dialog Boxes , on page 1692).

Step 3 If the Source Policy field shows Default, you must change it to Local or to the name of a shared policy before you can edit the parameters. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

Step 4 Click **Edit Parameters**. The Edit Signature Parameters dialog box appears.

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated filed in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see Editing the Component List for Meta Engine Signatures , on page 1706.
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

For more information about the Edit Signature Parameters dialog box, see Edit Signature Parameters Dialog Box , on page 1702.

Step 5 Change the settings as desired, then click **OK** to save your changes. You are returned to the Edit Signature dialog box.

Step 6 Click **OK** in the Edit Signature dialog box to save your changes to the signature.

Tip If you decide that your edits did not have the desired effect, or you suspect that you made a mistake, you can click the **Restore Defaults** button in the Edit Signature dialog box to erase your changes. You can then start over.

Edit Signature Parameters Dialog Box

Use the Edit Signature Parameters dialog box to edit (also called tune) the built-in micro-engine parameters for a particular signature. Different engines have different parameters, so the appearance of the Edit Signature Parameters dialog box varies. For more information about editing signature parameters, see Editing Signature Parameters (Tuning Signatures) , on page 1700.

The Edit Signature Parameters dialog box contains a folder tree structure, with the parameter names in the left side tree, and the values of the parameters shown on the right side.

Values that you can change contain a little box in the name; this is a check box. An empty check box indicates that the default value is being used for the parameter. Check the check box to configure that parameter. Click the value field to change the parameter. A green check indicates that a user-defined value is being used. Click the green check to change the value back to the default. (Editing the field typically adds a check mark to the box.)

To change a parameter, click in the associated filed in the right side. The behavior of clicking on a parameter differs based on the parameter type:

- Read-only parameters—Many parameters are read-only and cannot be changed, such as signature ID. Clicking these parameters typically has no effect, although parameter lists will open a dialog box (such as the Obsoletes list).
- Text or Numeric parameters—When you click a parameter that requires that you type in a value, whether alphanumeric or numeric, the field becomes an edit box. Type in the desired value and either press enter or click outside the edit box.
- Predefined value parameters—Many parameters have a small set of possible values, such as Yes/No. When you click these parameters, you activate a drop-down list. Select the desired option and click outside the field.
- List parameters—Some parameters contain a list of items. These parameters are represented by a pencil icon in the parameter value along with a word, such as Set or List. When you click in the field, a dialog box opens where you can configure the list associated with the item. The Meta engine component list is an example; for more information, see Editing the Component List for Meta Engine Signatures , on page 1706.
- Variable parameters—Some parameters allow you to select policy objects to identify the contents of the parameters. For example, you can select port list objects to identify ports in some signature engines. When you click these parameters, an edit box with a Select button appears. You can type the items directly into the edit box, including the name of the policy object, or click **Select** to select the policy object from a list or to create a new object.

Navigation Path

From the Edit Signature or Add Custom Signature dialog boxes, click the **Edit Parameters** button. For information on opening these dialog boxes, see Edit Signature or Add Custom Signature Dialog Boxes , on page 1692.

Tip If the button is not active, you must first select Local or the name of a shared policy from the Source Policy field, or clone the signature to create a custom policy. The Local option is available in Device view only, and makes your changes apply to the device you are editing and to no other devices. If you select the name of a shared policy, your changes apply to all devices that are assigned the policy.

Field Reference

Table 525: Edit Signature Parameters Dialog Box

Elements	Description
Tuning Context (Policy view only)	Displays the information needed by Security Manager to uniquely describe how the signature parameters were edited (tuned) for a particular signature policy. The Tuning Context field is a character string that contains the following items: • **Context**—The identification given by the Security Manager server for the unique definition of this micro-engine. • **SigLevel (IPS) or Version (IOS IPS)**—For IPS policies, the range of signature update levels to which this definition of the signature micro-engine applies. For IOS IPS, this is the IOS IPS version. • **Engine**—The name of the IPS engine. **Tip** As an example, the Tuning Context field could contain the following character string: Context:9, SigLevel:302-449, Engine:atomic-ip. For any particular signature policy, the Tuning Context field can contain one or many tuning contexts: • The tuning context with the highest signature level is pre-pended with "Reference context." • If you modify the shared policy that is pre-pended with "Reference context," Security Manager may ask you if you want to copy the policy to other applicable contexts. (A particular device may appear in more than one context.) • If you choose to copy the policy to other applicable contexts, an error message informs you if some parameters cannot be copied. **Note** Beginning with Security Manager 4.1, old signature versions (defined as being older than the lowest signature level deployed) are purged during a periodic purge operation, the purpose of which is to optimize the database. As a result, you may notice the deletion of some of your unused tuning contexts.
Signature ID	The unique numerical value assigned to this signature. This value lets the sensor identify a particular signature. The value is 1000 to 65000.
SubSignature ID	The unique numerical value assigned to this subsignature. The subsignature ID identifies a more granular version of a broad signature. The value is 0 to 255.
Promiscuous Delta	Modifies the seriousness of an alert when operating in promiscuous mode. The value is subtracted from an alert's overall risk rating. The promiscuous delta is ignored when operating in inline mode. The value can be 0 to 30.

Elements	Description
Sig Description	A description of the signature to help you distinguish this signature from other signatures: • Alert Notes—Additional information about this signature that will be included in the alert message. • User Comments—Your comments about the signature. • Alarm Traits—Traits you want to document about this signature. The value is 0 to 65535. The default is 0. • Release—The release in which the signature was most recently updated. • Signature Creation Date—The date on which the signature was created. • Signature Type—The type of signature: Anomaly, Component, Exploit, Vulnerability, or Other.
Engine	The engine that parses and inspects the traffic specified by this signature. The engine determines which parameters are available in the Engines folder. For a description of the engines, see Engine Options , on page 1697. For detailed information about each engine, and the parameters available, see the "Signature Engines" section in the Installing and Using Cisco Intrusion Prevention System Device Manager document for the IPS Software release you are using. **Tip** Many engines include the Fragment Status parameter, which lets you identify whether packet fragments should be inspected. You can elect to not inspect fragments, to inspect fragments, or to apply the signature to any packet status.
Event Counter	How the sensor counts events. For example, you can specify that you want the sensor to send an alert only if the same signature fires 5 times for the same address set. Configure the following values: • Event Count—The number of times an event must occur before an alert is generated. The value is 1 to 65535. The default is 1. • Event Count Key—The storage type used to count events for this signature. Choose attacker address, attacker address and victim port, attacker and victim addresses, attacker and victim addresses and ports, or victim address. The default is attacker address. • Specify Alert Interval—Whether you want to specify the time between alerts for resetting the event count, Yes or No. If you select Yes, enter the time in seconds from 2 to 1000.

Elements	Description
Alert Frequency	How often the sensor alerts you when this signature is firing. Specify the following parameters for this signature. These parameters are explained below. • Summary Mode • Summary Interval • Summary Key • Specify Global Summary Threshold
Summary Mode (Alert Frequency group)	The mode of alert summarization. There are four modes: Fire All, Fire Once, Summarize, and Global Summarize. The summary mode is changed dynamically to adapt to the current alert volume. For example, you can configure the signature to Fire All, but after a certain threshold is reached, it starts summarizing. Your selection of summary mode controls which other parameters are available in the Summary Mode group. • Fire All—Fires an alert on all events. • Fire Once—Fires an alert only once. • Summarize—Summarizes alerts. • Global Summarize—Summarizes an alert so that it only fires once regardless of how many attackers or victims. **Note** When multiple contexts from an ASA device are contained in one virtual sensor, the summary alerts contain the context name of the last context that was summarized. Thus, the summary is the result of all alerts of this type from all contexts that are being summarized.
Specify Summary Threshold (Summary Mode group.)	When you select Fire All, you can select whether you want to configure the summary threshold settings that will be used if the device dynamically changes to summary mode. If you select Yes, you can configure the summary interval, key, or global summary thresholds.
Summary Interval (Summary Mode group.)	The time in seconds used in each summary alert. The value is 1 to 65535. The default is 15.
Summary Key (Summary Mode group.)	The storage type used to summarize alerts. Choose Attacker address, Attacker address and victim port, Attacker and victim addresses, Attacker and victim addresses and ports, or Victim address. The default is Attacker address.
Specify Global Summary Threshold (Summary Mode group.)	Whether to specify the threshold number of events to take the alert into global summary, Yes or No. If you select Yes, enter the threshold number of events, from 1 to 65535. The default is 240.

Elements	Description
Status	The status of the signature. The Obsoletes list shows the signatures that are obsoleted by this signature; click the pencil icon to open the list. In many cases, this information is read-only. If you can modify the list, click Set in the parameter field to open the list, where you can add the obsoleted signature IDs.
Vulnerable OS List	The list of operating systems that this attack targets.
MARS Category	The category in Cisco Security MARS to which this signature belongs. This metadata is used to color the events generated in such a way as to provide MARS with the data that it needs to process this signature relative to the event categories that it studies.
Expand All button	Expands all categories and subcategories.
Collapse All button	Collapses all fields to the category.

Editing the Component List for Meta Engine Signatures

Use the Edit Signature Parameter—Component List dialog box to edit the component list for a meta engine signature.

The Meta engine defines events that occur in a related manner within a sliding time interval. This engine processes events rather than packets. As signature events are generated, the Meta engine inspects them to determine if they match any or several Meta definitions. The Meta engine generates a signature event after all requirements for the event are met.

All signature events are handed off to the Meta engine by the Signature Event Action Processor. The Signature Event Action Processor hands off the event after processing the minimum hits option. Summarization and event action are processed after the Meta engine has processed the component events.

The Meta engine is different from other engines in that it takes alerts as input where most engines take packets as input. Thus, in a Meta engine signature, you must identify the signatures that the Meta signature should be looking for. This list of signatures is contained in the Component list.

The Component list is part of the signature parameters. To edit the parameters, follow the procedure described in Editing Signature Parameters (Tuning Signatures) , on page 1700. When you open the Edit Signature Parameters dialog box for a signature that uses the Meta engine, look for the **Engine > Component List** parameter. The parameter value contains a pencil icon and the word List. Click **List** to open the Edit Signature Parameter—Component List dialog box.

The dialog box is divided into two lists, an Inactive list (on the left) and an active list (on the right). The active list defines the signatures that the Meta engine signature is looking for.

To modify the components list:

- **Add new components**—Click the **Add Entry (+)** button to the left of the inactive list. The Add Signature Parameter—List Entry dialog box opens. Configure the following values:
  - **Entry Key**—A name for the component.
  - **Component Sig ID**—The signature ID of the signature you are looking for.
  - **Component SubSig ID**—The subsignature ID; enter 0 if there are no subsignatures.

- **Component Count**—The number of times this signature must fire before the Meta signature is triggered.
- **Is a Not Component**—This field lets you create negative entries; thus, you can identify a list where some signatures must fire, and some signatures must not fire. Select **No** for signatures that must fire, and **Yes** for signatures that must not fire.

When you click **OK** in the Add Signature Parameter—List Entry dialog box, the new component is added to the inactive list. Select it and click the >> button to move it to the active list. Then, use the Up and Down arrow buttons to position the component in the active component list; a third button is available to reset the order to the previously saved order.

- **Edit an existing component**—Select the component (in either list) and click the **Edit Entry (pencil)** button that is between the lists. The Edit Signature Parameter—List Entry dialog box opens. The parameters are the same as for adding a new entry, except that you cannot change the component name.
- **Delete a component**—Select the component in the inactive list and click the **Delete Entry (trash can)** button that is to the left of the inactive list. If you want to delete an active component, you must first select it in the active list and click the << button to move it to the inactive list.
- **Restore defaults**—If you want to restore the default values of a component, select it and click **Restore**.

Obsoletes Dialog Box

Use the Obsoletes dialog box to identify obsolete signatures associated with a particular signature. In many cases, this information is read-only. In some cases, it is read-write; for example, you can edit the list for IOS IPS signature policies for Local or shared-policy-specific signatures.

If you can edit the list:

- Click the **Add Entry (+)** button to add the signature and subsignature ID of a signature that is made obsolete by the signature you are editing.
- Select an entry and click the **Delete Entry (trash can)** button to remove it from the list of obsoleted signatures.

Navigation Path

The Obsoletes list is part of the signature parameters. To edit the parameters, follow the procedure described in Editing Signature Parameters (Tuning Signatures) , on page 1700. When you open the Edit Signature Parameters dialog box, look for the **Status > Obsoletes** parameter. The parameter value contains a pencil icon and the word Set (when the parameter is not read-only). Click the pencil or word to open the Obsoletes dialog box.

Configuring Signature Settings

Use the Signature Settings page to define settings for IPS appliances and service modules (but not Cisco IOS IPS devices). These settings define the following policies:

- **Application policy**—Enable or disable HTTP, determine and specify the maximum number of HTTP requests, specify AIC web ports, and enable or disable FTP.

- **Fragment reassembly policy**—Configure the sensor to reassemble a datagram that has been fragmented over more than one packet by selecting the IP reassembly mode.
- **Stream reassembly policy**—Configure the sensor to monitor only TCP sessions that have been established by a complete three-way handshake by specifying whether a TCP handshake is required and by selecting the TCP reassembly mode.
- **IP logging policy**—Configure the sensor to generate an IP session log when the sensor detects an attack by determining and selecting the maximum allowable number of log packets, the IP log time and the maximum allowable size of the IP log.

Tip All of these settings have default values, so configure this policy only if you need to use a non-default value.

To configure the Signature Settings policy, do one of the following:

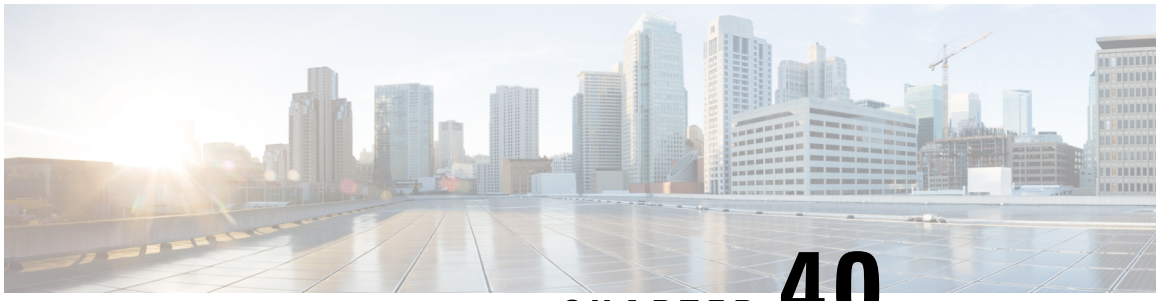
- (Device view) Select **IPS > Signatures > Settings** from the Policy selector.
- (Policy view) Select **IPS > Signatures > Settings**, then select an existing policy or create a new one.

You can then configure the options that are explained in the following table.

Table 526: Signature Settings Page

Element	Description
Enable HTTP	Enables protection for web services. Select **Yes** to require the sensor to inspect HTTP traffic for compliance with the RFC.
Max HTTP Requests	The maximum number of outstanding HTTP requests per connection.
AIC Web Ports	The ports on which to look for AIC traffic. Enter a comma-separated list of port numbers or port list objects that define the ports. You can click **Select** to select a port list object from a list or to create a new object.
Enable FTP	Enables protection for FTP services. Select **Yes** to require the sensor to inspect FTP traffic.
IP Reassembly Mode	The method the sensor uses to reassemble the fragments, based on the operating system.
TCP Handshake Required	Whether the sensor should only track sessions for which the three-way handshake is completed.

Element	Description
TCP Reassembly Mode	The mode the sensor should use to reassemble TCP sessions with the following options: • Asymmetric—May only be seeing one direction of bidirectional traffic flow. **Note** Asymmetric mode lets the sensor synchronize state with the flow and maintain inspection for those engines that do not require both directions. Asymmetric mode lowers security because full protection requires both sides of traffic to be seen. • Loose—Use in environments where packets might be dropped. • Strict—If a packet is missed for any reason, all packets after the missed packet are not processed.
Max IP Log Packets	The number of packets you want logged.
IP Log Time	The duration you want the sensor to log, from 1 to 60 minutes. The default is 30 minutes.
Max IP Log Bytes	The maximum number of bytes you want logged.



CHAPTER 40

Configuring Event Action Rules

Note From 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements as IPS is now End of Life. For more information, see EOL notice.

An IPS event is an IPS message that contains an alert, a block request, a status message, or an error message. An event action is the sensor's response to an event. An event action happens only if the event is not filtered. Possible event actions are TCP reset, block host, block connection, IP logging, and capturing the alert trigger packet. Event actions were known as alarms in Cisco IPS versions earlier than 5.x.

The IPS Event Actions folder is where you configure settings for the event action processing component of the sensor. These settings define the actions for the sensor to take when an event is detected.

Note You cannot use IPv6 addresses in Event Action policies in Security Manager. For more information on IPv6 Support in Security Manager, see IPv6 Support in Security Manager , on page 8.

This chapter contains the following topics:

Understanding the IPS Event Action Process

The IPS event action rules dictate the actions that the sensor performs when an event occurs. Although each signature is configured with specific actions that should be taken, the actual actions performed also depend on other factors.

Following is the general process that occurs when inspection identifies a signature event:

1. A signature alert occurs with actions specified by the signature. A risk rating for the alert is calculated.

For a detailed explanation of how risk rating is calculated, see Calculating the Risk Rating in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.

You can influence risk ratings by configuring target value ratings and OS mappings; see Configuring IPS Event Action Network Information , on page 1727.

2. The **Event Action Overrides** policy is processed. If the risk rating of the event matches an override rule, the actions identified in the override rule are **added** to the actions defined in the signature. The overrides do not replace the actions specified in the signature.

   For information on configuring overrides, see Configuring Event Action Overrides , on page 1722.

3. The **Event Action Filters** policy is processed. If rules apply to the event, the rules **subtract** actions from the event. Thus, an action you added in a signature policy or override rule might be removed by one of your filter rules.

   For information on creating filter rules, see Configuring Event Action Filters , on page 1714.

4. Event summarization occurs, unless you turn off the summarization feature as described in Configuring Settings for Event Actions , on page 1733.

5. The actions are performed. For an explanation of possible actions, see Edit, Add, Replace Action Dialog Boxes , on page 1688.

6. A list of denied attackers is maintained, and subsequent access prevented, based on configurable settings. To change the default settings, see Configuring Settings for Event Actions , on page 1733.

Understanding IPS Event Actions

When you configure an event action filter or override, or a signature, you specify an action for events that meet the rule. For signatures and overrides, you are specifying an action to add to the event; for filters, you are specifying an action to remove from the event.

The most common action is Produce Alert, which generates an alert that you can view in your network management system, such as the Security Manager Event Viewer or CS MARS. However, there are a wide variety of actions that you can assign to an event. When looking over the possible actions, keep the following in mind:

- Many actions produce alerts in addition to the other action performed. The description for each action explains whether an alert is also produced.
- Cisco IOS IPS supports fewer actions for event action override or filter rules. The actions supported are Deny Attacker Inline, Deny Connection Inline, Deny Packet Inline, Product Alert, and Reset TCP Connection.
- Not all actions are necessarily available on all combinations of IPS software version and device type. Whenever you need to select an action, only those actions that are valid are available for selection.
- For deny and block actions, use the event actions settings policy to set the period of time for which addresses or packets are denied. For more information, see Configuring Settings for Event Actions , on page 1733.

The following table explains the possible actions.

Table 527: IPS Event Actions

Menu Command	Description
Deny Attacker Inline	Terminates the current packet and future packets from this attacker address for a specified period of time. The IPS must be operating in inline mode. For Cisco IOS IPS devices, no connection can be established from the attacker to the router until the shun time expires. **Tip** This is the most severe of the deny actions. It denies current and future packets from a single attacker address. For IPS appliances and service modules, you can use the IPS Device Manager to see a list of denied attackers and clear the list if necessary.
Deny Attacker/Service Pair Inline	Does not transmit this packet and future packets on the attacker address victim port pair for a specified period of time. The IPS must be operating in inline mode.
Deny Attacker/Victim Pair Inline	Does not transmit this packet and future packets on the attacker/victim address pair for a specified period of time. The IPS must be operating in inline mode.
Deny Connection Inline	Terminates the current packet and future packets on this TCP flow. Other connections from the attacker can be established. The IPS must be operating in inline mode.
Deny Packet Inline	Terminates the packet. The IPS must be operating in inline mode. For Cisco IOS IPS devices, this action discards the packet without sending a reset. Cisco recommends using “drop and reset” in conjunction with alarm. **Tip** For IPS appliances and service modules, there is an event action override that adds this action to high risk events. You cannot delete the override. If you do not want to use it, disable the override. For more information, see Configuring Event Action Overrides , on page 1722.
Log Attacker Packets	Starts IP logging on packets that contain the attacker address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.
Log Pair Packets	Starts IP Logging on packets that contain the attacker/victim address pair. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.
Log Victim Packets	Starts IP Logging on packets that contain the victim address and sends an alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.

Menu Command	Description
Modify Packet Inline	Modifies packet data to remove ambiguity about what the endpoint might do with the packet. **Tip** This option is not available for event action override or filter rules. It is available in signatures.
Product Alert	Writes the event to the Event Store as an alert. For Cisco IOS IPS devices, the notification is sent through syslog or SDEE. **Note** A Produce Alert event action is added for an event when global correlation has increased the risk rating of an event, and has added either the Deny Packet Inline or Deny Attacker Inline event action.
Produce Verbose Alert	Includes an encoded dump of the offending packet in the alert. This action causes an alert to be written to the Event Store, even if Produce Alert is not selected.
Request Block Connection	Sends a request to block this connection. You must have blocking devices configured to implement this action. For more information, see Configuring IPS Blocking and Rate Limiting , on page 1765.
Request Block Host	Sends a request to block this attacker host. You must have blocking devices configured to implement this action.
Request Rate Limit	Sends a rate limit request to perform rate limiting. You must have rate limiting devices configured to implement this action.
Request SNMP Trap	Requests that the sensor send an SNMP trap notification to the configured trap destinations. This action causes an alert to be written even if Produce Alert is not selected. You must have SNMP configured on the sensor for traps to actually be sent. For more information, see Configuring SNMP , on page 1621.
Reset TCP Connection	Sends TCP resets to hijack and terminate the TCP flow, sending a reset to both the source and destination addresses. Reset TCP Connection works only on TCP signatures that analyze a single connection, for example, half-open SYN attacks. It does not work for sweeps or floods.

- Configuring Signatures , on page 1680

Configuring Event Action Filters

You can configure event action filters to remove specific actions from an event or to discard an entire event and prevent further processing by the sensor.

Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes

all actions from an event effectively consumes the event. Before configuring filter rules, read Tips for Managing Event Action Filter Rules , on page 1716.

Note When filtering sweep signatures, we recommend that you do not filter the destination addresses. If there are multiple destination addresses, only the last address is used for matching the filter.

Related Topics

- Understanding IPS Event Actions , on page 1712

Step 1 Do one of the following to open the Event Action Filters policy:

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

The table shows the existing filter rules organized into sections. The Local section is for rules defined specifically for a selected device (in Device view). For shared or inherited policies, there are also sections for mandatory and default rules. For more information about the contents of this policy, see Event Action Filters Page , on page 1717.

Step 2 Select the row after which you want to create the filter rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add Filter Item dialog box. For detailed information about the options in this dialog box, see Filter Item Dialog Box , on page 1719.

Tips

- If you do not select a row, the new rule is added at the end of the local scope.
- You can also select an existing row and edit either the entire row (by clicking the **Edit Row** button) or specific cells. To edit a specific cell, right-click the cell and select the **Edit** command related to the cell from the top of the context menu.
- You can delete a rule by selecting it and clicking the **Delete Row** button.
- You can export the entire list of filter rules to a comma-separated values (CSV) file. Click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

Step 3 Configure the filter rule. Following are the highlights of what you typically need to configure. For specific information on configuring the fields, and for information on fields not mentioned here, see Filter Item Dialog Box , on page 1719.

- Name—You must enter a name for the rule. Use a name that is meaningful to you.
- Signature, Subsignature ID—If the filter should apply to all signatures, use the default values. If you are targeting a specific signature, enter its signature and subsignature identifiers. You can obtain these values by finding the signature in the Signatures policy (see Signatures Page , on page 1680).

- Attacker and Victim Addresses and Ports—If the filter should apply no matter who is attacking, or who is the victim, use the default values. If you are creating a filter specific to an attacker or victim, update these fields to match the appropriate address and port.
- Risk Rating—You are most likely to want to change this value. The filter is applied to events that are within the minimum-maximum range you configure here. The default value, 0-100, will apply the filter rule to all events. If you configure a specific signature ID, the rating applies only to events for that signature (in which case the default risk rating might be acceptable).

For example, you might want to target only high-risk events, such as 90-100.

- Actions to Subtract—Select the actions that you want to subtract from the event. Use Ctrl+click to select more than one action. If you select an action that is not actually assigned to an event, the filter rule essentially has no effect on the event. For more information about the actions, see Edit, Add, Replace Action Dialog Boxes , on page 1688.
- Stop on Match—Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed:
  - If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event.
  - If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.

Click **OK** when you are finished defining your filter rule.

Step 4 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. Ensure that stop rules are placed after other rules that you want applied prior to the stop.

Tips for Managing Event Action Filter Rules

Following are some tips that might help you effectively manage your event action filter rules:

- Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

Disabling a rule is useful if you want to stop using the rule, but you might want to start using it again in the future. Disabled rules remain in the table so that you do not need to recreate them.

- For existing rules, you can edit most of the fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate Edit command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**.

Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. Other commands simply change a value, or open a sub-menu from which you can select a value to add or remove. For example, right-clicking the Action cell provides four commands:

- **Add to Actions**—Select from a list of actions to add to those already defined in the rule.
- **Delete from Actions**—Select from a list of actions defined in the rule to remove from the rule.

- **Replace Actions With**—Select from a list the action that you want to completely replace those defined in the rule.
- **Edit Actions**—Opens a dialog box where you can select all actions for the rule. Your selection replaces the cell contents.
- Although filter rules are configured as an ordered list, the rules are not processed as a "first match wins" list, even through they are processed and applied top to bottom. Instead, each rule has a Stop property: the rule is either a stop rule or it is not a stop rule. Processing ends only if an event matches a stop rule. If an event matches a non-stop rule, the event is compared to subsequent filter rules. Thus, more than one filter rule can apply to an event. If you decide to create stop rules, ensure that you place them below all other rules that you want processed for an event.

If you define no stop rules, each event is compared to all filter rules, and all matching rules are applied to the event in top-to-bottom order.

- You can inherit event action filter rules policies. Thus, you could configure a shared policy in Policy view that includes filter rules that you want to share among all of your devices, inherit that rule for each device (in Device view), and in Device view configure local filter rules that are unique to each device. For more information on inheriting policies, see:
  - Creating a New Shared Policy , on page 221
  - Inheritance vs. Assignment , on page 172
  - Inheriting or Uninheriting Rules , on page 213

Event Action Filters Page

Use the Event Actions Filters page to configure event action filter rules. Filter rules can remove specific actions from an event or they can discard an entire event and prevent further processing by the sensor.

Event action filters are processed as an ordered list and you can move filters up or down in the list. Filters let the sensor perform certain actions in response to the event without requiring the sensor to perform all actions or remove the entire event. Filters work by removing actions from an event. A filter that removes all actions from an event effectively consumes the event.

Before configuring event action filter rules, read the following topics:

- Configuring Event Action Filters , on page 1714
- Tips for Managing Event Action Filter Rules , on page 1716
- Understanding IPS Event Actions , on page 1712

Tip Disabled rules are shown with hash marks covering the table row. To change the enabled/disabled status of a rule, right click the rule and select **Enable** or **Disable** as appropriate. You can also change the status when editing the rule.

Navigation Path

- (Device view) Select **IPS > Event Actions > Event Action Filters** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Filters**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Filters**, then select an existing policy or create a new one.

Field Reference

Table 528: Event Action Filters Page

Element	Description
Name	The name of the filter rule.
Active	Whether the signature is active. This cell is not available for Cisco IOS IPS policies.
IDs	The signature identifiers to which this rule applies.
Subs	The subsignature identifiers.
Attackers	The IP address of the attacker that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object. **Tip** If you use a network/host object, you can see the contents of the object by right-clicking it and selecting **Show Contents**. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.
Attack Ports	The port used by the attacker host that triggers the filter.
Victims	The IP address of the victim that triggers the filter rule, which can be a host address, an address range (such as 0.0.0.0-255.255.255.255 in the case of IPv4 or ::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF in the case of IPv6), or a network/host policy object. **Tip** If you use a network/host object, you can see the contents of the object by right-clicking it and selecting **Show Contents**. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure.

Element	Description
Victim Ports	The port targeted by the attacker host that triggers the filter.
Actions	The actions that should be removed from the event when the filter is triggered.
RR	The risk rating range that triggers this event action filter. For a detailed explanation of how risk rating is calculated, see Calculating the Risk Rating in *Installing and Using Cisco Intrusion Prevention System Device Manager 7.0* on Cisco.com.
Stop	Whether this is a stop rule. If Yes, then when an event meets the conditions of this rule, the filter is applied to the event but the event is not tested against the remaining rules in the event action filter rules policy.
Export to File button	Click this button to export the event action filters summary to a comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name.
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope. Filter rules are processed in order top to bottom for each event. If the conditions of an event match those defined for a filter, and the filter has the Stop field set to Yes, that filter is applied and no additional filters are considered. Ensure that stop rules are placed after the other rules you want applied to an event. You should order the more restrictive rules before general rules in the table.
Add Row button	Click this button to add a filter rule to the table after the selected row using the Add Filter Item dialog box (see Filter Item Dialog Box , on page 1719). If you do not select a row, the rule is added at the end of the local scope.
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells by right-clicking the cell and selecting the appropriate Edit command.
Delete Row button	Click this button to delete the selected rule. **Tip** Instead of removing the rule, you can right-click the rule and select **Disable**. This prevents the rule from being used, but leaves it in the table in case you want to use it again at a later time.

Filter Item Dialog Box

Use the Add or Edit Filter Item dialog box to configure an event action filter rule.

Tip For existing rules, you can edit most of these fields directly from the event actions filter rules table by right-clicking the cell and selecting the appropriate command from the top portion of the context menu. For example, you can right click the Attacker Ports cell and select **Edit Attacker Ports**. Many of these right-click commands open a version of the Edit Filter Item dialog box that contains only the selected property. When seeking help for these context-editing dialog boxes, look for the property description in the table below.

Navigation Path

From the Event Action Filters page (see Event Action Filters Page , on page 1717), click the **Add Row** button, or select a filter rule and click the **Edit Row** button.

Field Reference

Table 529: Filter Item Dialog Box

Element	Description
Active Enabled (Active does not apply to Cisco IOS IPS devices.)	Whether the filter rule is active and enabled. Active means that the filter has been put into the filter list and will take effect on filtering events. The default is that the rule is both active and enabled, which means that the rule is used when events are processed. **Tips** • If a filter is active but not enabled, it will still be included in the ordering list; it will be processed, but it will not be used. • If a filter is not active, then it will not be included at all in the ordering of the filters; it will not be processed at all. • Disabled rules are shown in the event action filters table with cross-hatching.
Name	The name of the filter rule. The following characters are allowed in filter names: a-z, A-Z, 0-9, -, . (dot or period), : (colon), and _ (underscore).
Signature IDs	The numerical signature IDs to which the filter rule applies. You can enter a single signature ID, a comma-separated list, or a range of IDs. The default is to apply the rule to signatures in the range 900-65535.
SubSignature ID	The subsignature ID for the specified signature to which the filter rule applies. The subsignature ID identifies a more granular version of a broad signature, but it is not used for all signatures. Enter a subsignature ID appropriate for the signature ID you specified, or enter a range of subsignature IDs. The default value is the range of 0-255.
Attacker IPv4 Address	The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click **Select** to select a network/host object from a list or to create a new object. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure. The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).

Element	Description
Attacker IPv6 Address	The IP address of the host that sent the offending packet. You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click **Select** to select a network/host object from a list or to create a new object. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure. The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).
Attacker Port	The port used by the attacker host. This is the port from which the offending packet originated. You can also enter a range of ports. The default value is a range of all ports (0-65535).
Victim IPv4 Address	The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click **Select** to select a network/host object from a list or to create a new object. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure. The default value is a range of all IPv4 addresses (0.0.0.0-255.255.255.255).
Victim IPv6 Address	The IP address of the host being attacked (the recipient of the offending packet). You can specify a single host IP address, a range of addresses, or the name of a network/host policy object that identifies the address or address range. Click **Select** to select a network/host object from a list or to create a new object. **Note** Do not create an IPv4 object and an IPv6 object with the same name; doing so leads to deployment failure. The default value is a range of all IPv6 addresses (::0-FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF:FFFF).
Victim Port	The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent. You can also enter a range of ports. The default value is a range of all ports (0-65535).
Risk Rating Min. and Max.	The risk rating range, between 0 and 100, that should be used to trigger this event action filter. The default value is the complete range (0-100). If an event occurs with a risk rating that falls within the minimum-maximum range you configure here, the event is processed against the rules of this event filter.
OS Relevance	Indicates whether the alert is relevant to the OS that has been identified for the victim. Possible values include one or more of the following: Not Relevant, Relevant, Unknown. Use Ctrl+click to select multiple values. The default is all values selected. **Note** OS Relevance is applicable only to appliances and service modules running IPS 6.x+ software. For Cisco IOS IPS devices, this field is read-only and cannot be edited, and for IPS 5.x devices, this field is blank.

Element	Description
Comments	The user comments associated with this filter, such as an explanation of the purpose of the rule.
Actions to Subtract	The actions that should be removed from the event, should the conditions of the event meet the criteria of the event action filter. You can select one or more actions in this list box. All selected actions are removed from the event. Use Ctrl+click to select multiple values. For more information about the possible actions, see Edit, Add, Replace Action Dialog Boxes , on page 1688. For IOS IPS devices, the possible values are restricted to the following: • *Deny Attacker Inline* blocks the attacker's source IP address completely. No connection can be established from the attacker to the router until the shun time expires. You can configure this time in the Event Actions Settings policy as described in Configuring Settings for Event Actions , on page 1733. • *Deny Connection Inline* blocks the appropriate TCP flow from the attacker. Other connections from the attacker can be established to the router. • *Deny Packet Inline* discards the packet without sending a reset. Cisco recommends using "drop and reset" in conjunction with alarm. • *Produce Alert* sends a notification about the attack through syslog or SDEE. • *Reset TCP Connection* is effective for TCP-based connections and sends a reset to both the source and destination addresses. For example, in case of a half-open SYN attack, Cisco IOS IPS can reset the TCP connections.
% to Deny	The percentage of packets to deny for deny attacker features. The range is 0 to 100. The default is 100 percent. **Note** For IOS IPS devices, this field is read only and cannot be edited.
Stop on Match	Whether to define this filter rule as a stop rule. This setting determines how the remaining rules in the event action filter rules table are processed: • If you select this option, and an event meets the conditions of the rule, this rule is the final rule tested for the event. The actions identified by this rule are removed from the event, and the device moves on to perform all remaining actions assigned to the event. • If you do not select this option, then events that meet the conditions of this filter rule are also compared to subsequent rules in the event actions filters table. Subsequent rules are tested until either all rules are tested, or the event matches a stop rule.

Configuring Event Action Overrides

You can add an event action override to change the actions associated with an event based on the risk rating of that event. Event action overrides are a way to add event actions globally without having to configure each signature individually.

Each event action has an associated risk rating range. If a signature event occurs and the risk rating for that event falls within the range for an event action, that action is added to the event. For example, if you want any event with a risk rating of 85 or more to generate an SNMP trap, you can create an event action override for Request SNMP Trap with the risk rating 85-100.

Tip If you want to prevent the use of action overrides, you can disable the entire event action override component as described in Configuring Settings for Event Actions , on page 1733.

Related Topics

- Understanding IPS Event Actions , on page 1712

Step 1 Do one of the following to open the Event Action Overrides policy:

- (Device view) Select **IPS > Event Actions > Event Action Overrides** from the Policy selector.
- (Policy view, IPS appliances and service modules) Select **IPS > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.
- (Policy view, Cisco IOS IPS devices) Select **IPS (Router) > Event Actions > Event Action Overrides**, then select an existing policy or create a new one.

The table shows the existing overrides, including the action, the risk rating of the alerts the action will be added to, and whether the rule is enabled. The order of the rules does not matter: all overrides that apply to an alert add the associated actions.

The table can have at most a single entry for each possible action.

Step 2 Configure the desired overrides:

- To add a new override, click the **Add Row (+)** button beneath the table and fill in the Add Event Action Rule dialog box. In the dialog box, select the action you want to add, enter the rating range of the alerts to which you are adding the action (for example, 90-100), and click **OK**. For more information, see Add or Edit Event Action Rule Dialog Box, on page 1724.

The risk rating range must be between 0 and 100. Separate the low and high of the range with a hyphen, for example, 80-90.

When adding a new override, you can define your own risk rating, or you can use a pre-defined Risk Rating policy object; beginning with Version 4.5, Security Manager has several pre-defined Risk Rating policy objects:

- Extreme Risk (90-100)
- High Risk (76-90)
- Medium-High Risk (61-75)
- Medium Risk (46-60)
- Medium-Low Risk (30-45)
- Low Risk (16-30)
- Very Low Risk (1-15)

For more information on these pre-defined policy objects, refer to Configuring Risk Rating Policy Objects, on page 1725.

These pre-defined policy objects cannot be edited, but you can add and edit any of your own policy objects that you have defined.

- To edit an override, to disable it or to change the risk rating, select the override and click the **Edit Row (pencil)** button. You cannot change the event action.

Note Re-discovery of an IPS device will replace the Risk Rating policy object's value with its inline value. For example, if you assign the High Risk policy object (80-89) to any of the event actions and deploy it to the device, then after re-discovery that policy object's value will be replaced with its inline value of 80-89.

- To remove an override, select it and click the **Delete Row** button.

Note Policies for IPS appliances and service modules include a default override for Deny Packet Inline, which you cannot delete. If you do not want to use that override, disable it.

- To export the entire list of overrides to a comma-separated values (CSV) file, click **Export to File**, navigate to an appropriate folder on the Security Manager server, change the file name if you do not like the default name, and click **Save**.

Add or Edit Event Action Rule Dialog Box

Use the Add or Edit Event Action Rule dialog box to add an event action rule based on one of the pre-defined Risk Rating policy objects that are available in Security Manager beginning with Version 4.5.

Navigation Path

From the Event Action Overrides policy, click the **Add Row** button beneath the overrides table, or select a row in the table and click the **Edit Row** button. For information on opening the Event Action Overrides policy, see Configuring Event Action Overrides , on page 1722.

Field Reference

Table 530: Add or Edit Event Action Rule Dialog Box

Element	Description
Risk Rating	One of several pre-defined Risk Rating policy objects that are available in Security Manager beginning with Version 4.5: • Extreme Risk (90-100) • High Risk (76-90) • Medium-High Risk (61-75) • Medium Risk (46-60) • Medium-Low Risk (30-45) • Low Risk (16-30) • Very Low Risk (1-15) For more information on using one of these pre-defined Risk Rating policy objects, or defining your own, refer to Configuring Event Action Overrides , on page 1722.
Assigned	Whether a particular action is assigned to at least one of the Risk Rating policy objects.
Action Name	The action to be taken for a particular Risk Rating when assigned.
Enabled	Whether a particular action is enabled. Deselect this option to temporarily disable an action without deleting it.

Configuring Risk Rating Policy Objects

Use the Risk Rating Policy Object Dialog Box to configure policy objects for IPS. Seven pre-defined policy objects are available for risk rating; you can also define your own.

Navigation Path

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

Depending upon whether you selected **New Object** or **Edit Object**, the Add Risk Rating or Edit Risk Rating dialog box appears: refer to Add or Edit Event Action Rule Dialog Box, on page 1724

The remainder of this topic describes the fields that you see in the Risk Rating Policy Object dialog box.

Related Topics

- Configuring Event Action Overrides , on page 1722

Field Reference

Table 531: Risk Rating Policy Object Dialog Box

Element	Description
Name	The name of a pre-defined policy object, such as "High Risk," or the name of a policy object that you have defined.
Range	The Risk Rating of a particular policy object, expressed as a numerical range.
Category	Allows you to select Cat-A through Cat-G. This is the category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Overrides	Whether any IPS event action overrides have been configured for this policy object
Description	A text description that you can provide; applies to policy objects that you have defined, not to pre-defined policy objects.
Last Ticket(s)	The last ticket used for this policy object.
Last Modified Date	The last date on which this policy object was modified.

Add or Edit Risk Rating Dialog Box

Use the Add or Edit Risk Rating dialog box to define policy objects for IPS Risk Rating.

Navigation Path

Select **Manage > Policy Objects > All Object Types**, then select **Risk Rating** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**. You cannot edit the pre-defined policy objects, however.

- Add or Edit Event Action Rule Dialog Box, on page 1724

Field Reference

Table 532: Add or Edit Risk Rating Dialog Box

Element	Description
Name	The name of a pre-defined policy object, such as "High Risk," or the name of a policy object that you have defined.
Description	A text description that you can provide; applies to policy objects that you have defined, not to pre-defined policy objects.

Element	Description
Range	The Risk Rating of a particular policy object, expressed as a numerical range.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring IPS Event Action Network Information

Use the Event Actions Network Information policy to configure these features:

- **Target value ratings (IPv4 Target Value Ratings tab and IPv6 Target Value Ratings tab)**—You can configure the target value ratings of your network assets. The sensor uses these ratings when calculating the overall risk rating of an alert. By identifying your mission-critical assets, you can trigger more severe signature event actions. As the names indicate, you can use IPv4 or IPv6 by selecting the appropriate tab.

Target value rating is available on IPS appliances, service modules, and Cisco IOS IPS devices.

For more information, see Configuring Target Value Ratings , on page 1728.

- **Passive OS fingerprinting and OS mappings (OS Identification tab)**—You can enable the sensor to use information about the operating system running on a device to determine the attack relevance rating, which is a component of the overall risk rating.

Passive OS fingerprinting and OS mappings are available on devices running IPS 6.x+ software only, and are not available on Cisco IOS IPS devices.

For more information, see:

- Understanding Passive OS Fingerprinting , on page 1730
- Configuring OS Identification (Cisco IPS 6.x and Later Sensors Only) , on page 1731
