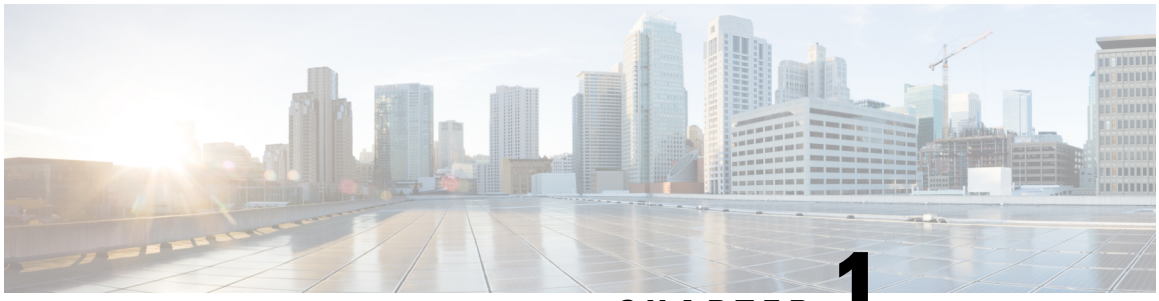
CHAPTER 6

PART I

The Basics of Using Security Manager



CHAPTER 1

Getting Started With Security Manager

Product Overview

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software, including the following devices:

- Cisco Catalyst 6500 and 7600 Series Firewall Services Modules (EOL8184)
- Cisco Catalyst 6500 Series Intrusion Detection System Services Module 2 (EOL8843)
- Cisco Intrusion Prevention System: IPS 4200, 4300, and 4500 Series Sensors (EOL9916)
- Cisco SR 500 Series Secure Routers (EOL7687, EOL7657)
- PIX Firewalls (EOL)

Caution From version 4.18, Cisco Security Manager does not support SFR from ASA 9.10(1) onwards for ASA 5512, ASA 5506, ASA 5506H and ASA 5506W models. Therefore, if you upgrade to 9.10(1) through Image Manager, the exiting SFR configuration will be lost.

Cisco Security Manager (Security Manager) enables you to manage security policies on Cisco security devices. Security Manager supports integrated provisioning of firewall, and VPN (site-to-site, remote access, and SSL) services across ASA security appliances.

For a complete list of devices and OS versions supported by Security Manager, please refer to Supported Devices and Software Versions for Cisco Security Manager on Cisco.com.

Security Manager also supports provisioning of many platform-specific settings, for example, interfaces, routing, identity, QoS, logging, and so on.

Security Manager efficiently manages a wide range of networks, from small networks consisting of a few devices to large networks with thousands of devices. Scalability is achieved through a rich feature set of shareable objects and policies and device grouping capabilities.

Security Manager supports multiple configuration views optimized around different task flows and use cases.

The following topics provide an overview of Security Manager:

Primary Benefits of Cisco Security Manager

These are the primary benefits of working with Security Manager:

- **Scalable network management**—Centrally administer security policies and device settings for either small networks or large scale networks consisting of thousands of devices. Define policies and settings once and then optionally assign them to individual devices, groups of devices or all the devices in the enterprise.
- **Provisioning of multiple security technologies across different platforms**—Manage VPN, firewall, and IPS technologies on routers, security appliances, Catalyst devices and service modules, and IPS devices.
- **Provisioning of platform-specific settings and policies**—Manage platform-specific settings on specific device types. For example: routing, 802.1x, EzSDD, and Network Admission Control on routers, and device access security, DHCP, AAA, and multicast on firewall devices.
- **VPN wizards**—Quickly and easily configure point-to-point, hub-and-spoke, full-mesh, and Extranet site-to-site VPNs across different VPN device types. Quickly and easily configure remote access IPsec and SSL VPNs on ASA, IOS, and PIX devices.
- **Multiple management views**—Device, policy, and map views enable you to manage your security in the environment that best suits your needs.
- **Reusable policy objects**—Create reusable objects to represent network addresses, device settings, VPN parameters, and so on, then use them instead of manually entering values.
- **Device grouping capabilities**—Create device groups to represent your organizational structure. Manage all devices in the groups concurrently.
- **Policy inheritance**—Centrally specify which policies are mandatory and enforced lower in the organization.
- **Role-based administration**—Enable appropriate access controls for different operators.

- **Workflow**—Optionally allow division of responsibility and workload between network operators and security operators and provide a change management approval and tracking mechanism.
- **Ticket Management**—Associate a ticket ID with policy changes, easily add and update comments pertaining to those changes, and quickly navigate to an external change management system from Security Manager.
- **Single, consistent user interface for managing common firewall features**—Single rule table for all platforms (router, PIX, ASA, and FWSM).
- **Image management**—Complete image management for ASA devices. Facilitates at every stage of image upgrade of devices by: downloading and maintaining image repository, evaluating images, analyzing impact of upgrades, preparing and planning reliable and stable device upgrades, and ensuring sufficient fallback and recovery mechanisms.
- **Intelligent analysis of firewall policies**—The conflict detection feature analyzes and reports rules that overlap or conflict with other rules. The ACL hit count feature checks in real-time whether specific rules are being hit or triggered by packets.
- **Sophisticated rule table editing**—In-line editing, ability to cut, copy, and paste rules and to change their order in the rule table.
- **Discover firewall policies from device**—Policies that exist on the device can be imported into Security Manager for future management.
- **Flexible deployment options**—Support for deployment of configurations directly to a device or to a configuration file. You can also use Auto-Update Server (AUS), Configuration Engine, or Token Management Server (TMS) for deployment.
- **Rollback**—Ability to roll back to a previous configuration if necessary.
- **FlexConfig (template manager)**—Intelligent CLI configlet editor to manage features available on a device but not natively supported by Security Manager.
- **Integrated device monitoring and reporting**—Features for monitoring events on IPS, ASA, and FWSM devices and correlating them to the related configuration policies, and for creating security and usage reports. These features include the following stand-alone Security Manager applications:
  - **Event Viewer**—Event Viewer monitors your network for system log (syslog) events from ASA and FWSM devices, as well as security contexts and SDEE events from IPS devices and virtual sensors. Event Viewer collects these events and provides an interface by which you can view them, group them, and examine their details in near real time.
  - **Report Manager**—Report Manager lets you collect, display and export a wide variety of network usage and security information for ASA and IPS devices, and for ASA-hosted remote-access IPsec and SSL VPNs. These reports aggregate security data such as top sources, destinations, attackers, victims, as well as security information such as top bandwidth, duration, and throughput users. Data is available for hourly, daily, and monthly periods. (Report Manager aggregates information collected from devices monitored by the Event Manager service. Thus, to view reports about a device, you must be monitoring that device in Event Viewer.)

Note Report Manager does not report FWSM events even though Event Viewer works with FWSM.

- **Health and Performance Monitor**—Health and Performance Monitor (HPM) periodically polls monitored ASA devices, IPS devices, and ASA-hosted VPN services for key health and performance data, including critical and non-critical issues, such as memory usage, interface status, dropped packets, tunnel status, and so on. This information is used for alert generation and email notification, and to display trends based on aggregated data, which is available for hourly, daily, and weekly periods.

Note Health and Performance Monitor does not monitor FWSM devices.

- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see Dashboard Overview, on page 2835.

Additional features let you monitor devices from Security Manager using other closely related applications, including Cisco Security Monitoring, Analysis and Response System (CS-MARS), Cisco Performance Monitor, and device managers such as ASDM (read-only versions of which are included with Security Manager).

Security Manager Policy Feature Sets

Security Manager provides the following primary feature sets for configuration policies:

Firewall Services

Configuration and management of firewall policies across multiple platforms, including IOS routers, ASA/PIX devices, and Catalyst Firewall Service Modules (FWSMs). Features include:

- Access control rules—Permit or deny traffic on interfaces through the use of access control lists for both IPv4 and IPv6 traffic.
- Botnet Traffic Filter rules—(ASA only.) Filter traffic based on known malware sites and optionally drop traffic based on threat level.
- Inspection rules—Filter TCP and UDP packets based on application-layer protocol session information.
- AAA/Authentication Proxy rules—Filter traffic based on authentication and authorization for users who log into the network or access the Internet through HTTP, HTTPS, FTP, or Telnet sessions.
- Web filtering rules—Use URL filtering software, such as Websense, to deny access to specific web sites.
- ScanSafe Web Security—(Routers only.) Redirect HTTP/HTTPS traffic to the ScanSafe web security center for content scanning and malware protection services.
- Transparent firewall rules—Filter layer-2 traffic on transparent or bridged interfaces.
- Zone-based firewall rules—Configure access, inspection, and web filtering rules based on zones rather than on individual interfaces.

For more information, see Introduction to Firewall Services, on page 597.

Site-to-Site VPN

Setup and configuration of IPsec site-to-site VPNs. Multiple device types can participate in a single VPN, including IOS routers, PIX/ASA devices, and Catalyst VPN Service Modules. Supported VPN topologies are:

- Point to point
- Hub and spoke
- Full mesh
- Extranet (a point-to-point connection to an unmanaged device)

Supported IPsec technologies are:

- Regular IPsec
- GRE
- GRE Dynamic IP
- DMVPN
- Easy VPN
- GET VPN

For more information, see Managing Site-to-Site VPNs: The Basics, on page 1073.

Remote Access VPN

Setup and configuration of IPsec and SSL VPNs between servers and mobile remote workstations running Cisco VPN client or Secure Client software. For more information, see Managing Remote Access VPNs: The Basics, on page 1287.

Intrusion Prevention System (IPS) Management

Management and configuration of Cisco IPS sensors (appliances and service modules) and IOS IPS devices (Cisco IOS routers with IPS-enabled images and Cisco Integrated Services Routers).

For more information, see Overview of IPS Configuration , on page 1617 and Overview of Cisco IOS IPS Configuration , on page 1792.

Features Specific to Firewall Devices (PIX/ASA/FWSM)

Configuration of advanced platform-specific features and settings on PIX/ASA devices and Catalyst FWSMs. These features provide added value when managing security profiles and include:

- Interface configuration
- Identity-aware firewall settings
- Device administration settings
- Security
- Routing
- Multicast
- Logging
- NAT

- Bridging
- Failover
- Security contexts

For more information, see Managing Firewall Devices, on page 1803.

Features Specific to IOS Routers

Configuration of advanced platform-specific features and settings on IOS routers. These features provide added value when managing security profiles and include:

- Interface configuration
- Routing
- NAT
- 802.1x
- NAC
- QoS
- Dialer interfaces
- Secure device provisioning

For more information, see Managing Routers, on page 2303.

Features Specific to Catalyst 6500/7600 Devices and Catalyst Switches

Configuration of VLAN, network connectivity, and service module features and settings on Catalyst 6500/7600 devices and on other Catalyst switches.

For more information, see Managing Cisco Catalyst Switches and Cisco 7600 Series Routers, on page 2621.

FlexConfigs

Flexconfig policies and policy objects enable you to provision features that are available on the device but not natively supported by Security Manager. They enable you to manually specify a set of CLI commands and to deploy them to devices using Security Manager's provisioning mechanisms. These commands can be either prepended or appended to the commands generated by Security Manager to provision security policies.

For more information, see Managing Flexconfigs, on page 341.

Security Manager Applications Overview

The Security Manager client has six main applications and one application designed for mobile devices:

- **Configuration Manager**—This is the primary application. You use Configuration Manager to manage the device inventory, create and edit local and shared policies, manage VPN configurations, and deploy policies to devices. Configuration Manager is the largest of the applications and most of the documentation addresses this application. If a procedure does not specifically mention an application, the procedure is using Configuration Manager. For an introduction to Configuration Manager, see Using Configuration Manager - Overview , on page 14.

- **Event Viewer**—This is an event monitoring application, where you can view and analyze events generated from IPS, ASA, and FWSM devices that you have configured to send events to Security Manager. For information about using Event Viewer, see Viewing Events, on page 2677.
- **Report Manager**—This is a reporting application, where you can view and create reports of aggregated information on device and VPN statistics. Much of the information is derived from events available through Event Viewer, but some of the VPN statistics are obtained by communicating directly with the device. For information about using Report Manager, see Managing Reports, on page 2747.
- **Health & Performance Monitor**—The HPM application lets you monitor key health and performance data for ASA (including ASA-SM) devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information. This ability to monitor key network and device metrics lets you quickly detect and resolve device malfunctions and bottlenecks in the network. See Health and Performance Monitoring, on page 2787 for more information about this application.
- **Image Manager**—The Image Manager application provides complete image management of ASA devices. It facilitates downloading, evaluating, analyzing, preparing, and planning image updates. It assesses image availability, compatibility, and impact on devices and provides scheduling, grouping, and change management of device updates. In addition, Image Manager includes capabilities for maintaining an image repository as well as for ensuring stable fallback and recovery mechanisms for image updates on ASA devices. For information about using Image Manager, see Using Image Manager, on page 2889.
- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see Dashboard Overview, on page 2835.

You can open any of these applications directly from the Windows Start menu or a desktop icon, or you can open them from within any of these applications through the application's Launch menu. For information on opening applications, see Logging In to and Exiting Security Manager , on page 11.

The Security Manager client has an additional application, CSM Mobile, which is designed specifically for mobile devices:

- **CSM Mobile**—CSM Mobile allows you to access device health summary information from mobile devices. The information available to you in this way is the same as that available in the Device Health Summary widget in the Dashboard: current high or medium severity active alerts generated by HPM. Alerts can be grouped by Alert-Description, Predefined-Category, Device, or Alert Technology. For more information on CSM Mobile, see CSM Mobile, on page 2846. For more details on device health summary information, see Dashboard Overview, on page 2835. For information on enabling or disabling CSM Mobile, see CSM Mobile Page , on page 520.

Device Monitoring Overview

Security Manager includes several facilities for monitoring devices:

- **Event Viewer**—This integrated tool allows you to view events on ASA, FWSM, and IPS devices and correlate them to the related configuration policies. This helps you identify problems, troubleshoot configurations, and then fix the configurations and redeploy them. For more information, see Viewing Events, on page 2677.

- **Report Manager**—This is a reporting application, where you can view and create reports of aggregated information on device and VPN statistics. Much of the information is derived from events available through Event Viewer, but some of the VPN statistics are obtained by communicating directly with the device. For information about using Report Manager, see Managing Reports, on page 2747.

For information on all of the types of reports available in Security Manager, see Understanding the Types of Reports Available in Security Manager , on page 2748.

- **Health & Performance Monitor**—The HPM application lets you monitor key health and performance data for ASA (including ASA-SM) device Health and Performance Monitoring, on page 2787 for more information about this application.
- **Dashboard**—The Dashboard is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see Dashboard Overview, on page 2835.
- **Packet Tracer**—You can use this tool to test whether certain types of packets will be allowed to go through an ASA device. For more information, see Analyzing an ASA or PIX Configuration Using Packet Tracer , on page 2859.
- **Ping, Trace route, and NS Lookup**—You can use ping and traceroute on a managed device to check whether there is a route between the device and a specific destination. You can use NS lookup to resolve addresses to DNS names. For more information, see Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools , on page 2862.
- **Cisco Prime Security Manager (PRSM) Integration**—You can “cross launch” PRSM from the Configuration Manager application. The PRSM application is used to configure and manage ASA CX devices. For more information, see Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856.
- **Device Manager Integration**—Security Manager includes read-only copies of the various device managers, such as Adaptive Security Device Manager (ASDM). You can use these tools to view device status, but not to change the device configuration. For more information, see Starting Device Managers , on page 2849.
- **Cisco Security Monitoring, Analysis and Response System (CS-MARS) Integration**—If you use the CS-MARS application, you can integrate it with Security Manager and view events in CS-MARS from Security Manager, and conversely, Security Manager policies related to events from CS-MARS. For more information, see Integrating CS-MARS and Security Manager , on page 2873.

IPv6 Support in Security Manager

Security Manager provides increasing support for IPv6 configuration, monitoring, and reporting.

Beginning with version 4.12, Security Manager supports communication from Security Manager server to the managed devices over either IPv6 address or IPv4 address. This feature is available only for firewall devices, that is, those devices where the OS type is either ASA or FWSM. To enable communication over IPv6 addresses, you must first enable IPv6 address on the Security Manager server. See Configuring IPv6 on Security Manager Server, on page 9 for more information.

Note The communication between Security Manager server and Security Manager client is over IPv4 address only. IPv6 address is not supported for server to client communication. Also, if ACS server is used for authentication, the ACS must have IPv4 address. IPv6 communication to ACS server is not supported. Auto Update Server (AUS) does not support IPv6 addresses.

For versions prior to 4.12, to manage a device that supports IPv6 addressing with Security Manager, you must configure the device's management address as an IPv4 address. All communications between the device and Security Manager, such as policy discovery and deployment, use IPv4 transport. If the IPv6 policies are not appearing for a supported device, rediscover the device policies; if necessary, delete the device from the inventory and add it again.

Configuring IPv6 on Security Manager Server

Follow these steps to configure IPv6 on Security Manager server for communicating with a device over IPv6 address.

Step 1 On the Security Manager server, go to **Start > Control panel > Network and Internet > Network Connections**.

Step 2 Click the available Network Connection to open the **Ethernet Status** window. Click **Properties**. The Ethernet Properties window appears.

Step 3 On the Networking tab, check the **Internet Protocol Version 6 (TCP/IPv6)** check box, and then click **Properties**. The Internet Protocol Version 6 (TCP/IPv6) Properties window appears.

Step 4 Configure the IPv6 static address and DNS servers, and click **OK**.

Note You must configure Security Manager server hostname to resolve to IPv4 addresses only. The server hostname should not resolve to IPv6 address.

Configuring IPv6 Policies

In general, you can configure IPv6 policies on the following types of device. In addition, you can monitor IPv6 alerts generated by IPS, ASA, and FWSM devices. For other types of devices, use FlexConfig policies to configure IPv6 settings. For more specific information on IPv6 device support, see the Supported Devices and Software Versions for Cisco Security Manager document on Cisco.com.

- **ASA**—Release 7.0+ when running in router mode; release 8.2+ when running in transparent mode. Both single and multiple security context devices are supported.
- **FWSM**—Release 3.1+ when running in router mode. Not supported in transparent mode. Both single and multiple security context devices are supported.
- **IPS**—Release 6.1+.

Following is a summary of the Security Manager features that support IPv6 addressing:

- **Policy Objects**—The following policy objects support IPv6 addresses:
  - Networks/Hosts. See Understanding Networks/Hosts Objects , on page 310.
  - Services. This object includes predefined services for ICMP6 and DHCPv6, which you can use only with IPv6 policies. The other services apply to both IPv4 and IPv6. For more information on service

objects, see Understanding and Specifying Services and Service and Port List Objects , on page 331.

- **Firewall Services Policies**—The following Firewall Services policies and tools support IPv6 configurations:
  - AAA Rules. See Managing Firewall AAA Rules, on page 685.
  - Access Rules. See Configuring Access Rules , on page 723.
  - Inspection Rules. See Managing Firewall Inspection Rules, on page 767.

    Settings > Access Control. See Configuring Settings for Access Control , on page 739.
  - Tools:

Hit Count. See Viewing Hit Count Details , on page 753.

Find and Replace. See Finding and Replacing Items in Rules Tables , on page 614.

- **ASA and FWSM Policies**—The following ASA and FWSM policies support IPv6 configurations:
  - (ASA 7.0+ routed mode; ASA 8.2+ transparent mode; FWSM 3.1+ routed mode.) Interfaces: IPv6 tab of the Add Interface and Edit Interface dialog boxes. See Configuring IPv6 Interfaces (ASA/FWSM) , on page 1860.
  - (ASA only.) **Platform > Bridging > IPv6 Neighbor Cache**. See Managing the IPv6 Neighbor Cache , on page 1895.
  - (ASA 5505 8.2/8.3 only.) **Platform > Bridging > Management IPv6**. See Management IPv6 Page (ASA 5505) , on page 1900.
  - (ASA 8.4.2+ only.) **Platform > Device Admin > Server Access > DNS**. See DNS Page , on page 2015.
- **FlexConfig Policies**—There are two Firewall system variables that you can use to identify IPv6 ACLs on a device. For more information, see FlexConfig System Variables , on page 347.

There is also a predefined FlexConfig policy object that uses these variables, ASA_add_IPv6_ACEs.

- **Event Viewer**—Events that include IPv6 addresses are supported, and the addresses are displayed in the same columns as IPv4 addresses: Source, Destination, and IPLog Address (for IPS alerts). However, you must configure the device to use IPv4 for sending events to the Security Manager server. All event communications use IPv4 transport. For more information on Event Viewer, see Viewing Events, on page 2677.
- **Dashboard**—On the Dashboard, all the widgets that use IP addressing support IPv6 addresses. However, as is true elsewhere in Security Manager, you must configure the device to use IPv4 for sending events to the Security Manager server. All event communications use IPv4 transport. For more information on the Dashboard, see Dashboard Overview, on page 2835.
- **Report Manager**—Reports include statistics for IPv6 events collected by Event Management. For more information on Report Manager, see Managing Reports, on page 2747.

Policy Object Changes in Security Manager 4.4

Certain changes were made to a few policies and policy objects in Security Manager 4.4, in order to unify previously separate IPv4 and IPv6 elements. The most important of these changes are to the Networks/Hosts object (which itself represents a unification of the Networks/Hosts and the Networks/Hosts-IPv6 objects):

- The new Networks/Hosts object "All-IPv4-Addresses" replaces the IPv4 "any" network policy object. If you upgrade to Security Manager 4.4 from a previous version, all references to the IPv4 "any" network policy object will be changed to "All-IPv4-Addresses."
- The new Networks/Hosts object "All-IPv6-Addresses" replaces the IPv6 "any" network policy object. If you upgrade to Security Manager 4.4 from a previous version, all references to the IPv6 "any" network policy object will be changed to "All-IPv6-Addresses."
- The new Networks/Hosts object "All-Addresses" does not have a corresponding policy object in earlier versions of Security Manager. It is a new global "any" policy object, and it encompasses all IPv4 and IPv6 address ranges.

Other related changes include unification of IPv4 and IPv6 versions of device-specific policies such as Access Rules, Inspection Rules, and so on.

Further, when editing policies and objects, IPv4, IPv6, or mixed-mode (both IPv4 and IPv6) entries are automatically filtered in elements, such as dialog boxes, in which one or more of those entries is not appropriate to that element.

Related Topics

- Policy Object Manager , on page 232
- Understanding Networks/Hosts Objects , on page 310

Logging In to and Exiting Security Manager

Security Manager has two main interfaces:

- Cisco Security Management Suite home page—Use this interface to install the Security Manager client and to manage the server. You can also access other CiscoWorks applications you installed, such as Resource Manager Essentials (RME).
- Security Manager clients—Use these interfaces to perform most Security Manager tasks. You can log directly into any of six client applications: Configuration Manager, Event Viewer, Report Manager, Health & Performance Monitor, Image Manager, and Dashboard.

These topics describe how to log in to and exit these interfaces:

- Understanding User Permissions , on page 12
- Logging In to the Cisco Security Management Suite Server , on page 12
- Logging In to and Exiting the Security Manager Client , on page 13

Understanding User Permissions

Cisco Security Manager authenticates your username and password before you can log in. After you are authenticated, Security Manager establishes your role within the application. This role defines your permissions (also called privileges), which are the set of tasks or operations that you are authorized to perform. If you are not authorized for certain tasks or devices, the related menu items, items in tables of contents, and buttons are hidden or disabled. In addition, a message tells you that you do not have permission to view the selected information or perform the selected operation.

Authentication and authorization for Security Manager is managed either by the CiscoWorks server or the Cisco Secure Access Control Server (ACS). By default, CiscoWorks manages authentication and authorization, but you can configure Security Manager to use your Cisco Secure ACS setup.

Note Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

When using ACS, if all of the ACS servers become unavailable, you cannot perform tasks in Security Manager. If you are logged in, you might be abruptly logged out of the system (without an opportunity to save changes) if you try to perform a task that requires ACS authorization. If this happens, you get a message stating this is the reason you are getting logged off. For details on configuring Security Manager and ACS integration, see Integrating Security Manager with Cisco Secure ACS.

For more information about user permissions and AAA configuration, see the Installation Guide for Cisco Security Manager.

For more information about authorization control in the Event Viewer and Report Manager applications, see the following topics:

- Understanding Event Viewer Access Control , on page 2680
- Understanding Report Manager Access Control , on page 2752

Logging In to the Cisco Security Management Suite Server

Use the Cisco Security Management Suite home page, and CiscoWorks Common Services, to install the Security Manager client and to manage the server. You can also access other CiscoWorks applications you installed, such as RME.

Note The **Software Center > Software Update** feature in Common Services is not supported by Cisco Security Manager.

Step 1 In your web browser, open one of these URLs, where *SecManServer* is the name of the computer where Security Manager is installed. Click **Yes** on any Security Alert windows.

- If you are not using SSL, open http://*SecManServer* :1741
- If you are using SSL, open https://*SecManServer* :443

The Cisco Security Management Suite login screen is displayed. Verify on the page that JavaScript and cookies are enabled and that you are running a supported version of the web browser. For information on configuring the browser to run Security Manager, see Installation Guide for Cisco Security Manager .

Step 2 Log in to the Cisco Security Management Suite server with your username and password. When you initially install the server, you can log in using the username **admin** and the password defined during product installation.

Step 3 On the Cisco Security Management Suite home page, you can access at least the following features. Other features might be available depending on how you installed the product.

- Cisco Security Manager Client Installer—Click this item to install the Security Manager client. The client is the main interface for using the product.
- Server Administration—Click this item to open the CiscoWorks Common Services Server page. CiscoWorks Common Services is the foundation software that manages the server. Use it to configure and manage back-end server features such as server maintenance and troubleshooting, local user definition, and so on.
- CiscoWorks link (in the upper right of the page)—Click this link to open the CiscoWorks Common Services home page.

Step 4 To exit the application, click **Logout** in the upper right corner of the screen. If you have both the home page and the Security Manager client open at the same time, exiting the browser connection does not exit the Security Manager client.

What to do next

Note To meet PCI compliance, TLS 1.0 is disabled from CSM server. Hence, CSM server will not allow any TLS 1.0 clients to connect. This change is not applicable for CSM server to device communication. Existing CSM server to device communication will be supported as is.

Logging In to and Exiting the Security Manager Client

Use the Security Manager client to perform most Security Manager tasks.

Tip You must log into the workstation using a Windows user account that has Administrator privileges to fully use the Security Manager client applications. If you try to operate the applications with lesser privileges, you might find that some features do not work correctly.

Before You Begin

Install the client on your computer. To install the client, log into the Security Manager server as described in Logging In to the Cisco Security Management Suite Server , on page 12, and then click **Cisco Security Manager Client Installer** and follow the instructions in the installation wizard.

Step 1 Select one of the following applications from the **Start > All Programs > Cisco Security Manager Client** menu:

- Configuration Manager

- Event Viewer
- Report Manager
- Health & Performance Monitor
- Image Manager
- Dashboard

Tip If the client was installed on the workstation, but it does not appear in your Start menu, it probably was installed by another user. To make Security Manager Client visible in the Start menu for every user of the client station, copy the Cisco Security Manager Client folder from Documents and Settings\<user>\Start Menu\Programs\Cisco Security Manager to Documents and Settings\All Users\Start Menu\Programs\Cisco Security Manager.

Step 2 In the application's login window, select the server to which you want to log in, and enter your Security Manager username and password. Click **Login**.

The client logs in to the server and opens the application you selected based on the following conditions. Note that these conditions are per application, for example, if you have Configuration Manager open on one workstation, opening Event Viewer from a different workstation has no implications for your Configuration Manager session unless or until you start Configuration Manager from Event Viewer.

- In both Workflow and non-Workflow mode, you cannot log into the same server from a single workstation and have more than one active session using the same user account. You are reminded that you are already logged in and asked to reuse the existing open application.
- In both workflow modes, you can log into different servers using the same (or different) user name from the same workstation.
- In non-Workflow mode, for a given server, if the user name is logged in on a different workstation, the client on the other workstation is automatically logged out, and any unsaved changes are lost. Thus, do not share user accounts, and if you must log in from different workstations to the same server, be sure to save your changes before leaving an active client.
- In Workflow mode, you can log in using the same user account multiple times but only from different workstations. However, you cannot open the same activity in Configuration Manager at the same time in more than one client; you must open different activities. Activities do not apply when using Event Viewer or Report Manager.

Tip The client automatically closes if it is idle for 120 minutes. To change the idle timeout, in Configuration Manager, select **Tools > Security Manager Administration**, select **Customize Desktop** from the table of contents, and enter the desired timeout period. You can also disable the feature so that the client does not close automatically. All applications use the same timeout setting, and working in one application resets the timer for all other applications.

Step 3 To exit the application, select **File > Exit**.

Using Configuration Manager - Overview

These topics provide an overview of the different views in which you can work in Configuration Manager, the basic task flow for defining and deploying policies to devices, and some basic concepts:

- Configuration Manager Overview , on page 15

- Task Flow for Configuring Security Policies , on page 19
- Policy and Policy Object Overview , on page 20
- Workflow and Activities Overview , on page 20

Configuration Manager Overview

The Configuration Manager application provides three views in which you can manage devices and policies: Device view, Policy view, and Map view. You can switch between these views according to your needs using toolbar buttons or the View menu.

- Device view—Provides a device-centric view, where you configure policies on specific devices. For more information, see Device View Overview , on page 15.
- Policy view—Provides a policy-centric view, where you can create device-independent shared policies that you can assign to one or more devices. For more information, see Policy View Overview , on page 17.
- Map view—Provides a visual representation of your network, which is primarily useful for visualizing and configuring site-to-site VPNs. For more information, see Map View Overview , on page 18.

Each view presents a different way to access Configuration Manager functionality. What you can do, and how you do it, are determined by the view you select. In the Device and Policy views you see two selectors on the left and a work area on the right. In each of these, your selection in the upper selector determines what you can select in the lower selector. Your selection in the lower selector determines what you view in the work area. This design enables you to quickly and easily drill down to the network details that you want to view or edit.

Besides the main views, there are several additional tools used for configuring other items such as site-to-site VPNs and policy objects, or for monitoring devices. These tools are typically available from the Manage menu, although some are available on the Policy, Activities, Tools, or Launch menus. Some tools have related buttons in the toolbar. These tools open in a separate window so that you do not loose your place in the main view that you are currently using.

The following topics provide reference information about the basic features of the user interface:

- Menu Bar Reference for Configuration Manager , on page 30
- Toolbar Reference (Configuration Manager) , on page 40
- Using Selectors , on page 47
- Using Wizards , on page 50
- Using Rules Tables , on page 604
- Using Text Fields , on page 52
- Accessing Online Help , on page 54

Device View Overview

Device view in Configuration Manager enables you to add devices to the Security Manager inventory and to centrally manage device policies, properties, interfaces, and so on. The following figure identifies the functional areas of the Device view.

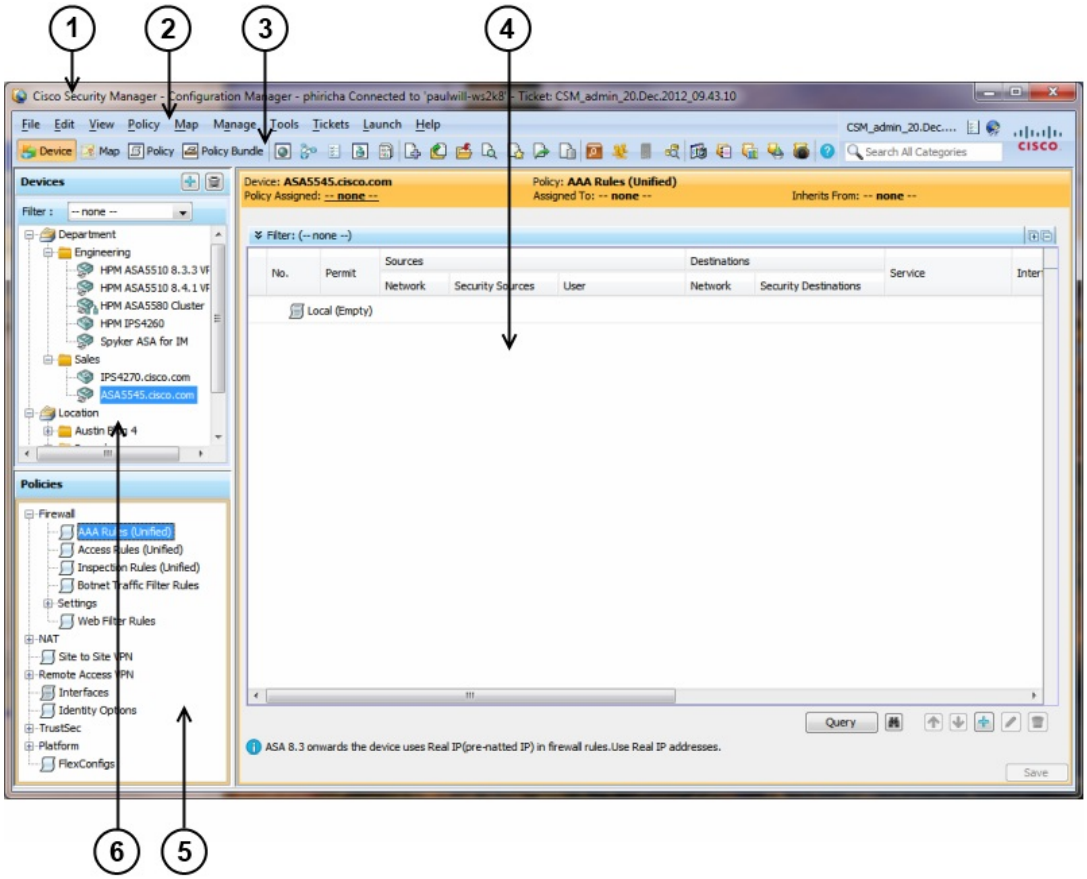
This is a device-centric view in which you can see all devices that you are managing and you can select specific devices to view their properties and define their settings and policies.

Note Security Manager also provides the ability to see the status of the devices in the Security Manager inventory. To access the Device Status View, select **View > Device Status View** or select one of the folder nodes in the Device selector. For more information, see Working with Device Status View , on page 136.

In Device View, you can define security policies locally on specific devices. You can then share these policies to make them globally available to be assigned to other devices.

For more information, see Understanding the Device View , on page 71.

Figure 1: Device View Overview



1	Title bar	2	Menu bar (see Menu Bar Reference for Configuration Manager , on page 30)
3	Toolbar (see Toolbar Reference (Configuration Manager) , on page 40)	4	Work area
5	Policy selector	6	Device selector (see Using Selectors , on page 47)

The title bar displays the following information about Security Manager:

- Your login name.
- The name of the Security Manager server to which you are connected.
- If Workflow mode is enabled, the name of the open activity.

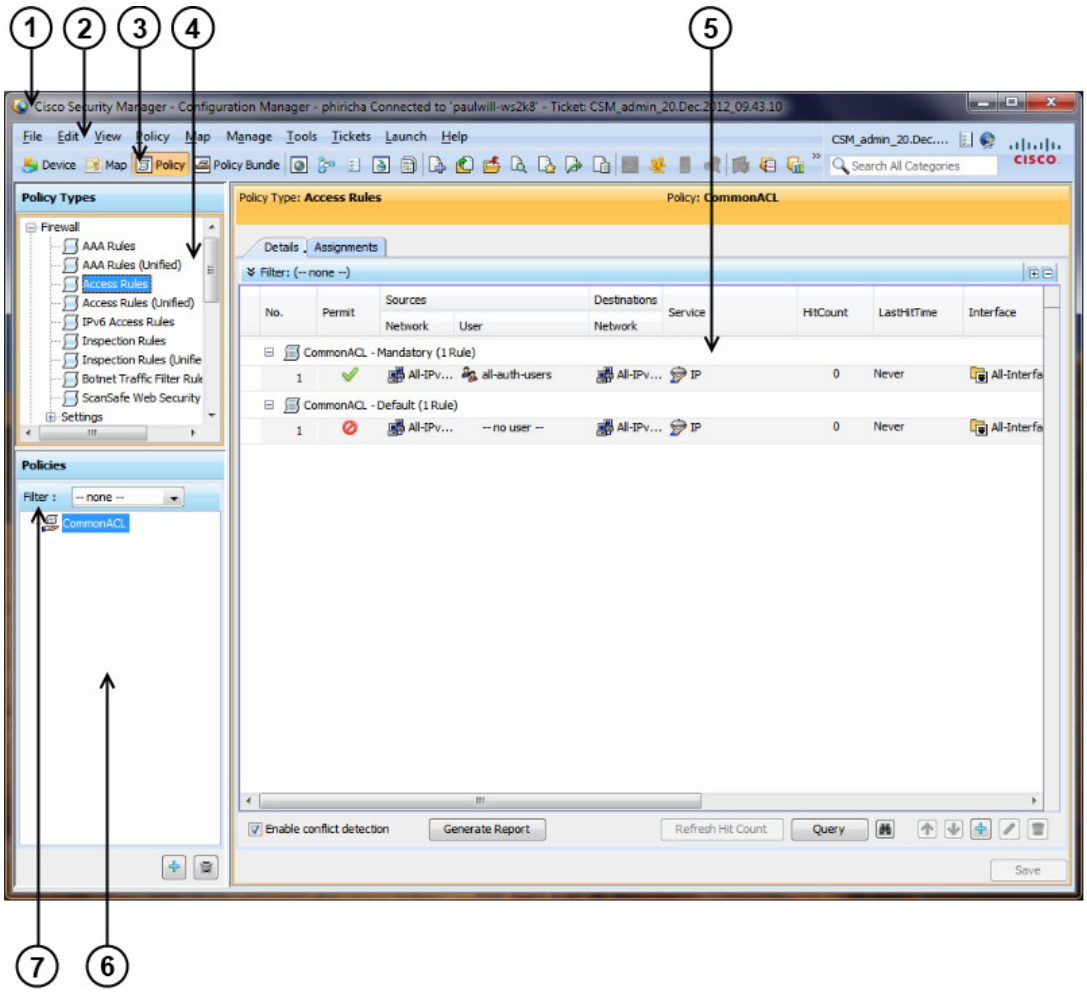
Policy View Overview

Policy view in Configuration Manager enables you to create and manage reusable policies that can be shared among multiple devices. The following figure identifies the functional areas of the Policy view.

This is a policy-centric view in which you can see all the shareable policy types supported by Security Manager. You can select a specific policy type and create, view, or modify shared policies of that type. You can also see the devices to which each shared policy is assigned and change the assignments as required.

For more information, see Managing Shared Policies in Policy View , on page 217.

Figure 2: Policy View Overview

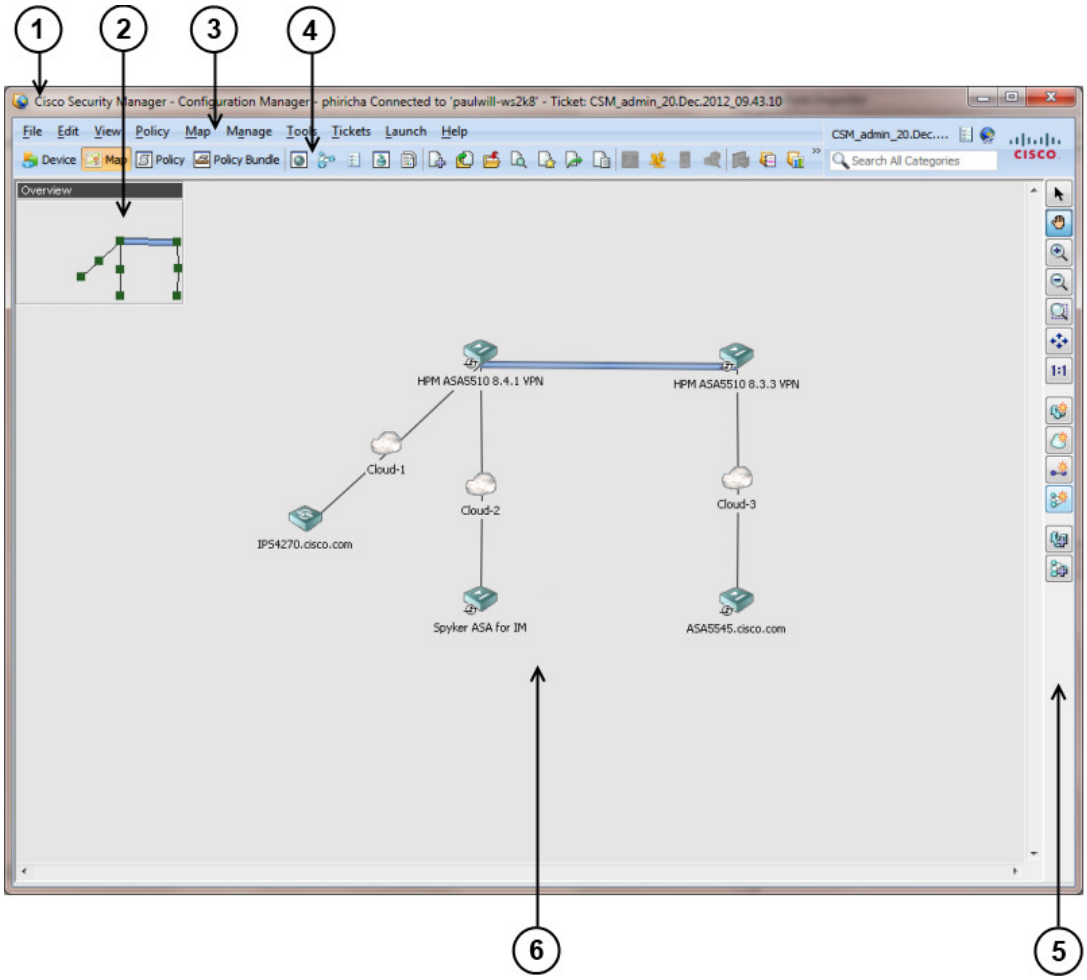


1	Title bar	2	Menu bar (see Menu Bar Reference for Configuration Manager , on page 30)
3	Toolbar (see Toolbar Reference (Configuration Manager) , on page 40)	4	Policy type selector (see Using Selectors , on page 47)
5	Work area	6	Shared policy selector
7	Policy filter		

Map View Overview

Map view in Configuration Manager enables you to create customized, visual topology maps of your network, within which you can view connections between your devices and easily configure VPNs and access control settings. The following figure identifies the functional areas of the Map view.

Figure 3: Map View Overview



1	Title bar	2	Navigation Window

3	Menu bar (see Map Menu (Configuration Manager) , on page 34)	4	Toolbar (see Toolbar Reference (Configuration Manager) , on page 40)
5	Map toolbar (see Map Toolbar , on page 1588)	6	Map

Task Flow for Configuring Security Policies

The basic user task flow for configuring security policies on devices involves adding devices to the Security Manager inventory, defining the policies, and then deploying them to the devices. You perform these tasks in Configuration Manager. The following briefly describes the steps in a typical user task flow:

Step 1 **Prepare devices for management.**

Before you can add a device to the Security Manager device inventory and manage it, you must configure some minimal settings on the device to enable Security Manager to contact it. For more information, see Preparing Devices for Management, on page 57.

Step 2 **Add devices to the Security Manager device inventory.**

To manage a device with Security Manager, you must first add it to the Security Manager inventory. Security Manager provides multiple methods to add devices: from the network (live devices), from an inventory file exported from another Security Manager server or CiscoWorks Common Services Device Credential Repository (DCR), or in Cisco Security Monitoring, Analysis and Response System (CS-MARS) format, or from a device configuration file. You can also add a device that does not yet exist in the network but which will be deployed in the future, by creating it in Security Manager.

When you add a device, you can also discover its interfaces and certain policies that were already configured on the device. Discovery brings the information into the Security Manager database for continued management with Security Manager in the future.

For more information, see Managing the Device Inventory, on page 71.

Step 3 **Define security policies.**

After you have added your devices, you can define the security policies you require. You can use Device view to define policies on specific devices. You can use Policy view to create and manage reusable policies that can be shared by any number of devices. When you make a change to a shared policy, the change is applied to all devices to which that policy is assigned.

To simplify and speed up policy definition, you can use policy objects, which are named, reusable representations of specific values. You can define an object once and then reference it in multiple policies instead of having to define the values individually in each policy.

Note If you are using Workflow mode, you must create an activity before you start defining policies. For more information, see Workflow and Activities Overview , on page 20.

Step 4 **Submit and deploy your policy definitions.**

Policy definition is done within your private view. Your definitions are not committed to the database and cannot be seen by other Security Manager users until you submit them. When you submit your policy definitions, the system validates their integrity. Errors or warnings are displayed to inform you of any problems that need to be addressed before the policies can be deployed to the devices.

Security Manager generates CLI commands according to your policy definitions and enables you to quickly and easily deploy them to your devices. You can deploy directly to live devices in the network (including dynamically addressed devices) through a secure connection, or to files that can be transferred to your devices at any time.

In non-Workflow mode, submitting and deploying your changes can be done in a single action. In Workflow mode, you first submit your activity and then you create a deployment job to deploy your changes.

For more information, see Managing Deployment, on page 381.

Policy and Policy Object Overview

A **policy** is a set of rules or parameters that define a particular aspect of network configuration. In Configuration Manager, you define policies that specify the security functionality you want on your devices. Security Manager translates your policies into CLI commands that can be deployed to the relevant devices.

Security Manager enables you to configure local policies and shared policies.

- **Local policies** are confined to the device on which they are configured; they are automatically assigned (applied) to the device when you configure them. Unconfigured policies (those whose default settings you do not change) are not considered to be assigned or configured. To remove a policy, you unassign it.
- **Shared policies** are named, reusable policies that can be assigned to multiple devices at once. Any changes you make to a shared policy are reflected on all devices to which that policy is assigned, so you do not have to make the change on each device.

When you add a device to the inventory, you can discover the existing policies configured on the device. Security Manager translates your device configuration into Security Manager policies, populates the relevant local policies, and assigns them to the device. **Policy discovery** ensures that you do not need to recreate your existing configurations in Security Manager terms. You can also rediscover policies on devices after you add them to the inventory if you change their configuration through the CLI.

When you create policies, you often have the option to use **policy objects**, which are reusable definitions of related sets of values. (Sometimes, you are required to use policy objects.) For example, you can define a network object called MyNetwork that contains a set of IP addresses in your network. Whenever you configure a policy requiring these addresses, you can simply refer to the MyNetwork network object rather than manually entering the addresses each time. Furthermore, you can make changes to policy objects in a central location and these changes will be reflected in all the policies that reference those objects.

For more detailed information, see Managing Policies, on page 167 and Managing Policy Objects, on page 229.

Workflow and Activities Overview

To provide flexible, secure policy management while allowing your organization to implement change control processes, Security Manager provides three closely-related features in Configuration Manager:

- **Workflow/Non-Workflow modes**—Configuration Manager provides two modes of operation that scale to different organizational working environments: Workflow mode and non-Workflow mode (the default).
  - **Workflow Mode**—Workflow mode is for organizations that have division of responsibility between users who define security policies and those who administer security policies. It imposes a formal

change-tracking and management system by requiring all policy configuration to be done within the context of an explicitly-created activity. A user can create multiple activities so that a single activity contains only logically-related policy changes. You can configure Workflow mode to require a separate approver, so that configuration changes cannot be made without oversight. After approval, the user defines a separate deployment job to push the policy changes to the devices. For more information, see Working in Workflow Mode , on page 21.

- **Non-Workflow Mode**—In non-Workflow mode, you do not explicitly create activities. When you log in, Configuration Manager creates an activity for you or opens the one you were previously using if it was not submitted. You can define and save your policies, and then submit and deploy them in one step. For more information, see Working in Non-Workflow Mode , on page 22.

For information on selecting a mode, see Changing Workflow Modes , on page 28.

- **Activities or Configuration Sessions**—An activity (in non-Workflow mode, a configuration session), is essentially a private view of the Security Manager database. In Configuration Manager, you use activities to control changes made to policies and policy assignments. Adding devices to the inventory does not involve an activity, however, unless you discover policies that define security contexts (on multi-context firewall devices) or virtual sensors (on IPS devices). Isolating policy changes in activities helps prevent "work in progress" from accidentally making it into active device configurations. For more information about activities and configuration sessions, see Understanding Activities , on page 141 and Working with Activities/Tickets , on page 148.
- **Ticket Management**—Ticket management allows you to associate a Ticket ID with policy configuration changes made in Security Manager. Ticket management works in coordination with activities or configuration sessions depending on whether you have workflow mode enabled or not. If workflow mode is enabled, you can also enable ticket management so that a Ticket ID can optionally be associated with a specific activity. If workflow mode is not enabled, using ticket management makes it so that all changes must be done as part of a ticket and the ticket must be submitted before those changes can be deployed. In this respect, ticket management with workflow disabled is very similar to how activities function when workflow is enabled; however, no approval of submitted tickets is required.

For a comparison of the various modes of operation, see Comparing Workflow Modes , on page 23.

Working in Workflow Mode

Workflow mode is an advanced mode of operation that imposes a formal change-tracking and change-management system. Workflow mode is suitable for organizations in which there is division of responsibility among security and network operators for defining policies and deploying those policies to devices. For example, a security operator might be responsible for defining security policies on devices, another security operator might be responsible for approving the policy definitions, and a network operator might be responsible for deploying the resulting configurations to a device. This separation of responsibility helps maintain the integrity of deployed device configurations.

You can use Workflow mode with or without an approver. When using Workflow mode with an approver, device management and policy configuration changes performed by one user are reviewed and approved by another user before being deployed to the relevant devices. When using Workflow mode without an approver, device and policy configuration changes can be created and approved by a single user, thus simplifying the change process.

Note Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

For information about enabling or disabling Workflow mode or enabling or disabling Ticket Management, see Changing Workflow Modes , on page 28.

In Workflow mode:

- A user must create an activity before defining or changing policy configurations in Configuration Manager. The activity is essentially a proposal to make configuration changes. The changes made within the activity are applied only after the activity is approved by a user with the appropriate permissions. An activity can either be submitted to another user for review and approval, or it can be approved by the current user. For detailed information about the process of creating, submitting, and approving activities, see Managing Activities, on page 141.
- After the activity is approved, the configuration changes need to be deployed to the relevant devices. To do this, a user must create a *deployment job* . A deployment job defines the devices to which configurations will be deployed, and the deployment method to be used. A deployment job can either be submitted to another user for review and approval, or it can be approved by the current user. Deployment preferences can be configured with or without job approval. For more information, see Managing Deployment, on page 381.

Working in Non-Workflow Mode

Some organizations have no division of responsibility between users when defining and administering their VPN and firewall policies. These organizations can work in non-Workflow mode. When using non-Workflow mode, you do not explicitly create activities. When you log in, Configuration Manager creates an activity for you, also called a configuration session, or opens the activity you were using when previously logged in (the configuration session is automatically closed when you log out of Security Manager). This activity is transparent to the user and does not need to be managed in any way. When you submit your configuration changes to the database, this is equivalent to submitting and approving the activity in Workflow mode. In addition, when you submit and deploy configuration changes, Security Manager creates a deployment job for you as well. Like activities, deployment jobs are transparent and do not need to be managed.

When using non-Workflow mode, multiple users with the same username and password cannot be logged into Security Manager at the same time. If another user logs in with the same username and password while you are working, your session will be terminated and you will have to log in again.

Ticket Management in Non-Workflow Mode

If your organization uses a change management system, Security Manager can associate the changes made to configurations with a ticket ID. Before making any configuration changes, you must open a ticket and the ticket must be submitted before the changes associated with that ticket are available to be deployed. Tickets can be opened and closed as needed, and you can discard a ticket if the changes associated with that ticket are no longer desired. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

Non-Workflow mode with Ticket Management enabled is the default mode for Security Manager. For information about enabling or disabling Workflow mode or enabling or disabling Ticket Management, see Changing Workflow Modes , on page 28.

Comparing Workflow Modes

The following table highlights the differences between the workflow modes.

Note Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

Table 1: Comparison Between Workflow Mode and Non-Workflow Mode in Configuration Manager

Question	Non-Workflow Mode with Ticket Management Enabled	Non-Workflow Mode with Ticket Management Disabled	Workflow Mode
What is the default mode for Security Manager?	Default	Not Default	Not default
How do I know which mode is currently selected?	Select **Tools > Security Manager Administration > Workflow**. If the **Enable Workflow** check box is selected, you are in Workflow mode. Select **Tools > Security Manager Administration > Ticket Management**. If the **Enable Ticketing** check box is selected, ticket management is enabled.		
Must I explicitly create activities to make configuration changes?	You must explicitly create a Ticket before you can make configuration changes. Configuration Manager automatically creates an activity that is associated with that ticket.	No. Configuration Manager automatically creates an activity when you log in, or opens the previous session if you did not submit it before logging out.	Yes.
Must I explicitly create deployment jobs to deploy configurations to devices?	No. Configuration Manager creates a deployment job for you when you deploy configuration changes.	No. Configuration Manager creates a deployment job for you when you deploy configuration changes.	Yes.

Question	Non-Workflow Mode with Ticket Management Enabled	Non-Workflow Mode with Ticket Management Disabled	Workflow Mode
How do I deploy my configuration changes to the devices?	Do one of the following: • Select **File** > **Deploy**. • Select **Manage** > **Deployments** and click **Deploy** on the Deployment Jobs tab.	Do one of the following: • Click the **Submit and Deploy Changes** button in the Main toolbar. • Select **File** > **Submit and Deploy**. • Select **Manage** > **Deployments** and click **Deploy** on the Deployment Jobs tab.	Select **Manage** > **Deployments** and create a deployment job.
At what stage are the CLI commands for my configuration changes generated?	When initiating deployment.	When initiating deployment.	When creating a deployment job.
How do I delete my current changes?	Select **Tickets** > **Discard Ticket** to discard the currently-open ticket, or select the ticket in the Ticket Manager and click **Discard**. If you have already started deploying devices, abort the deployment by selecting the job in the Deployment Manager and clicking **Abort**.	Select **File** > **Discard**. If you have already started deploying devices, abort the deployment by selecting the job in the Deployment Manager and clicking **Abort**.	Select **Activities** > **Discard Activity** to discard the currently-open activity, or select the activity in the Activity Manager and click **Discard**. If you already created a deployment job, select the job in the Deployment Manager and click **Discard**. If the job has already been deployed, you can abort the job by selecting **Abort**.
Can multiple users log into Security Manager at the same time?	Yes. Each user can open a different ticket and make configuration changes. A single user can log in multiple times, but the user must open separate tickets.	Yes, but only if each one has a different username. If a user with the same username logs into Security Manager, the first user is automatically logged out.	Yes. Each user can open a different activity and make configuration changes. A single user can log in multiple times, but the user must open separate activities.
What if another user is configuring the devices I want to configure?	You will receive a message indicating that the devices are locked. See Activities and Locking , on page 143.		

Using the JumpStart to Learn About Security Manager

The JumpStart is an introduction to Security Manager. It describes and illustrates the major concepts of using the product. Use the jumpstart to explore Security Manager features and capabilities.

The JumpStart opens automatically when you first launch Security Manager. To get to the JumpStart while you are working with Security Manager, select **Help > JumpStart** from the main menu in Configuration Manager.

The JumpStart contains the following navigation features:

- A table of contents, which is always visible in the upper right corner. Click an entry to open its page.
- Links in the page enable you to drill down to more detailed information in the JumpStart or to relevant information in the online help.

Completing the Initial Security Manager Configuration

After you install Security Manager, there are several configuration steps you might want to perform to complete the installation. Although most of the features you initially configure have default settings, you should familiarize yourself with the features and decide if the default settings are the best settings for your organization.

The following list explains the features you might want to initially configure, with pointers to topics that provide more detailed information where appropriate. You can configure these features in any order, or delay configuring those that you do not yet need to use.

- Configure an SMTP server and default e-mail addresses. Security Manager can send e-mail notifications for several actions that occur in the system. For example, you can get an e-mail when your deployment job finishes reconfiguring network devices. For e-mail notifications to work, you must configure an SMTP server.

For information on configuring an SMTP server and setting the default e-mail addresses, see Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.

- Create user accounts. Users must log into Security Manager to use the product. However, if a user logs in with an account another user is already using, the first user is automatically disconnected. Thus, each user should have a unique account. You can create accounts local to the Security Manager server, or you can use your ACS system to manage user authentication. For more information, see the *Installation Guide for Cisco Security Manager*.
- Configure default deployment settings. When users deploy configurations to devices, they can select how the configurations should be deployed and how Security Manager should handle anomalies. However, you can select system-default settings that make it easier for users to follow your organization's recommendations. To set deployment defaults, in Configuration Manager, select **Tools > Security Manager Administration**, and then select **Deployment** from the table of contents to open the Deployment settings page (see Deployment Page , on page 524).

The following deployment settings are of particular interest:

- • Default Deployment Method—Whether configuration deployments should be written directly to the device or to a transport server, or if configuration files should be written to a specified directory on the Security Manager server. The default is to deploy configurations directly to the device or

transport server, if one is configured for the device. However, if you have your own methods for deploying configuration files, you might want to select File as the default deployment method. For more information on deployment methods, see Understanding Deployment Methods , on page 389.

- When Out-of-Band Changes Detected—How to respond when Security Manager detects that configuration changes were made on the device through the CLI rather than through Security Manager. The default is to issue a warning and proceed with the deployment, overwriting the changes that were made through the CLI. However, you can change this behavior to simply skip the check for changes (which means Security Manager overwrites the changes but does not warn you), or to cancel the deployment, thus leaving the device in its current state. For more information about handling out-of-bound changes, see Understanding How Out-of-Band Changes are Handled , on page 392.
- Allow Download on Error—Whether to allow deployment to continue if minor configuration errors are found. The default is to not allow deployment when minor errors are found.

- Select a workflow mode. The default mode is non-Workflow mode with Ticket Management enabled. In non-Workflow mode, users have more freedom to create and deploy configurations. However, if your organization requires a more transaction-oriented approach to network management, where separate individuals perform policy creation, approval, and deployment, you can enable Workflow mode to enforce your procedures. If you are using Workflow mode, ensure that you configure user permissions appropriately when you define user accounts to enforce your required division of labor. For information on the types of workflow you can use, see Workflow and Activities Overview , on page 20. For information on how to change workflow modes, see Changing Workflow Modes , on page 28.

Tip You can disable Ticket Management in non-Workflow mode to make most activity management tasks automatic.

- Configure default device communication settings. Security Manager uses the most commonly used methods for accessing devices based on the type of device. For example, Security Manager uses SSH by default when contacting Catalyst switches. If the default protocols work for the majority of your devices, you do not need to change them. For devices that should use a non-default protocol, you can change the protocol in the device properties for the specific devices. However, if you typically use a protocol that is not the Security Manager default (for example, if you use a token management server (TMS) for your routers), you should change the default setting. To change the default communication settings, in Configuration Manager, select **Tools > Security Manager Administration**, and select **Device Communication** from the table of contents. In the Device Connection Settings group, select the most appropriate protocols for each type of device. You can also change the default connection time out and retry settings. For more information about device communication settings, see Device Communication Page , on page 532.
- Select the types of router and firewall policies you will manage with Security Manager. When you manage IPS devices in Security Manager, you automatically manage the entire configuration. However, with routers and firewall devices (ASA, PIX, and FWSM), you can select which types of policies are managed by Security Manager. You can manage other parts of the device configuration using other tools (including the devices's CLI). By default, all security-related policies are managed. To change which policies are managed, in Configuration Manager, select **Tools > Security Manager Administration > Policy Management**. For detailed information about changing these settings and what you should do before and after making the change, see Customizing Policy Management for Routers and Firewall Devices , on page 177.

- Decide whether you want to use the Event Viewer to manage firewall and IPS events. You can configure the disk and location for collecting syslog events from devices, and the port number to use for syslog communication. If you do not want to use Security Manager for event management, you can turn off the feature, which is enabled by default. For more information on the configuration options, see Event Management Page , on page 538.
- Configure Security Manager for communication with Cisco Security Monitoring, Analysis and Response System (CS-MARS). If you use CS-MARS for monitoring your network, you can identify the servers to Security Manager and then access CS-MARS event information from within Security Manager. For information on configuring this cross-communication, see Checklist for Integrating CS-MARS with Security Manager , on page 2873.

Configuring an SMTP Server and Default Addresses for E-Mail Notifications

Security Manager can send e-mail notifications for several types of events such as deployment job completion, activity approval, or ACL rule expiration. To enable e-mail notifications, you must configure an SMTP server that Security Manager can use for sending the e-mails. Then, you can configure e-mail addresses and notification settings on these settings pages (in Configuration Manager, select **Tools > Security Manager Administration** and select the page from the table of contents):

- Workflow page—For default e-mail addresses and notification settings for deployment jobs and activities. Users can override the defaults when managing deployment jobs and activities.
- Rules Expiration page—For default e-mail addresses and notification settings for ACL rule expiration. Rules expire only if you configure them with expiration dates.
- IPS Updates page—For the e-mail address that should be notified of IPS update availability.
- Server Security page—When you configure local user accounts (click **Local User Setup**), specify the user's e-mail address. This address is used as the default target for some notifications such as deployment job completion.
- Event Management page—When you configure an extended data storage location, you must specify at least one e-mail address. The email addresses receive notifications if problems arise with the use of the extended storage location. Also, if you are using the Syslog Relay Service, you can configure e-mail addresses that should be notified when the syslog relay service enters or exits CPU throttling.

Tip If you are using ACS for user authorization, you might have already configured an SMTP server and system administrator e-mail address in the ACS integration procedure as described in the Installation Guide for Cisco Security Manager. Security Manager sends a notification to this address if all ACS servers become unavailable.

Note Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

Step 1 Access CiscoWorks Common Services on the Security Manager server:

- If you are currently using the Security Manager client, the easiest way to do this is to select **Tools > Security Manager Administration**, select **Server Security** from the table of contents, and click any button on that page (for example, **Local User Setup**).
- You can use your web browser to log into the home page on the Security Manager server (https://*servername* /CSCOnm/servlet/login/login.jsp) and click **Server Administration**.

Step 2 Click **Server > Admin** and select **System Preferences** from the table of contents.

Step 3 On the System Preferences page, enter the host name or IP address of an SMTP server that Security Manager can use. The SMTP server cannot require user authentication for sending e-mail messages.

Also, enter an e-mail address that CiscoWorks can use for sending e-mails. This does not have to be the same e-mail address that you configure for Security Manager to use when sending notifications. If you are using ACS for authorization, Security Manager sends an e-mail message to this address if all ACS servers become unavailable. This can alert you to a problem that needs immediate attention. The administrator might also receive e-mail messages from Common Services for non-ACS-related events.

Step 4 Click **Apply** to save your changes.

Changing Workflow Modes

You can change the workflow mode that Security Manager enforces if you have the appropriate administrator permissions. Changing the workflow mode has significant effects on users. Before making a change, be sure to understand the following:

- When you change the workflow mode, the change will take effect for all Security Manager users working from the same server.
- Before you can change from Workflow mode to non-Workflow mode, all activities in editable states (Edit, Edit Open, Submit, or Submit Open) must be approved or discarded, and all generated jobs must be deployed, rejected, discarded, or aborted so that the locks on the devices can be released. You do not have to do anything to jobs that are in the failed state.
- Before you can disable Ticket Management in non-Workflow mode, all tickets in editable states (Edit or Edit Open) must be submitted or discarded.
- If you change from Workflow mode to non-Workflow mode and then restore an earlier version of the database, Security Manager automatically changes to Workflow mode if the restored database has any activities in an editable state (Edit, Edit Open, Submit, or Submit Open). Approve or delete the editable activities, and then turn Workflow mode off again.
- When changing from non-Workflow mode to Workflow mode or enabling Ticket Management in non-Workflow mode, current configuration sessions are listed as activities/tickets in the Edit_Open state, and these activities/tickets must now be explicitly managed.
- When Ticket Management is enabled or disabled, any other users logged into Security Manager are logged out.

For an explanation of workflow modes, see Workflow and Activities Overview , on page 20.

Step 1 In Configuration Manager, select **Tools > Security Manager Administration** and select **Workflow** from the table of contents to open the Workflow page (see Workflow Page , on page 590).

Step 2 Configure the workflow mode settings in the Workflow Control group. If you select Enable Workflow (to use Workflow mode), you can also select these options:

- Require Activity Approval—To enforce explicit approval of activities before policy changes are committed to the database.
- Submitter can Approve Activity— Instead of separating submission and approval roles, a submitter can also approve his/her own activity, when enabled.
- Require Deployment Approval—To enforce explicit approval of deployment jobs before they can be run.
- Submitter can Approve Deployment Job—When enabled, submitter can approve deployment jobs submitted by him/her.

Step 3 Configure the e-mail notification settings. These are the default e-mail addresses for the e-mail sender (that is, Security Manager), the approvers, and another person or e-mail alias who should be notified when deployment jobs are complete.

You also have the options to include the job deployer when sending notifications of job status, and to require that e-mail notifications are sent for deployment job status changes.

Step 4 Click **Save** to save and apply changes.

Step 5 Select **Workflow** from the table of contents to open the Ticket Management page (see Token Management Page , on page 587).

Step 6 Configure the Ticket Management settings. If you select Enable Ticketing, you can also select these options:

Note See Token Management Page , on page 587 for detailed information on these fields.

- Ticket System URL—To provide linking between a Ticket ID and an external ticket management system.
- Ticket History—Specify how long to keep information related to tickets.

Step 7 Click **Save** to save and apply changes.

Understanding Basic Security Manager Interface Features

The following topics provide information about some basic interface features such as descriptions of the menu commands, toolbar buttons, and how to use common user interface elements. Many of the features described are used only in Configuration Manager.

• Selecting or Specifying a File or Directory in Security Manager , on page 53
• Troubleshooting User Interface Problems , on page 54

Menu Bar Reference for Configuration Manager

The menu bar in Configuration Manager contains menus with commands for using Security Manager. Commands may become unavailable depending on the task you are performing.

The menus in the menu bar are described in the following topics:

• File Menu (Configuration Manager) , on page 30
• Edit Menu (Configuration Manager) , on page 32
• View Menu (Configuration Manager) , on page 32
• Policy Menu (Configuration Manager) , on page 33
• Map Menu (Configuration Manager) , on page 34
• Manage Menu (Configuration Manager) , on page 35
• Tools Menu (Configuration Manager) , on page 36
• Launch Menu (Configuration Manager) , on page 38
• Activities Menu (Configuration Manager) , on page 37
• Tickets Menu (Configuration Manager) , on page 38
• Help Menu (Configuration Manager) , on page 40

File Menu (Configuration Manager)

The following table describes the commands on the File menu in Configuration Manager. The menu items differ depending on the workflow mode.

Table 2: File Menu (Configuration Manager)

Command	Description
New Device	Initiates the wizard to add a new device. See Adding Devices to the Device Inventory , on page 77.
Clone Device	Creates a device by duplicating an existing device. See Cloning a Device , on page 128
Delete Device	Deletes a device. See Deleting Devices from the Security Manager Inventory , on page 130.
Save	Saves any changes made on the active page, but does not submit them to the Security Manager database.
Import	Import policies and devices exported from another Security Manager server. See Importing Policies or Devices, on page 491.

Command	Description
Export	Export policies or devices so that they can be imported into another Security Manager server. A device export can include policy information, or it can be a simple CSV file that you can import into CiscoWorks Common Services Device Credential Repository (DCR) or Cisco Security Monitoring, Analysis and Response System (CS-MARS). See Exporting the Device Inventory from the Security Manager Client, on page 484 and Exporting Shared Policies, on page 489.
View Changes (non-Workflow mode only)	Opens the Activity Change Report (in PDF format) for the current configuration session. To see changes for the current activity in Workflow mode, select **Activities** > **View Changes**.
Validate (non-Workflow mode only)	Validates the changes you have saved. See Validating an Activity/Ticket , on page 160. To validate the current activity in Workflow mode, select **Activities** > **Validate Activity**.
Submit (non-Workflow mode only)	Submits all changes made since the last submission to the Security Manager database. To validate the current activity in Workflow mode, select **Activities** > **Submit Activity**.
Submit and Deploy (non-Workflow mode only)	Submits all changes made since the last submission to the Security Manager database and deploys all changes made since the last deployment. See Understanding Deployment , on page 381. In Workflow mode, you must have your activity approved and then create a deployment job to deploy changes to devices.
Deploy (non-Workflow mode only)	Deploys all changes made since the last deployment. See Understanding Deployment , on page 381. In Workflow mode, you must have your activity approved and then create a deployment job to deploy changes to devices.
Discard (non-Workflow mode only)	Discards all configuration changes since the last submission. To validate the current activity in Workflow mode, select **Activities** > **Discard Activity**.
Edit Device Groups	Edits device groups. See Working with Device Groups , on page 131.
New Device Group	Adds a device group. See Creating Device Groups , on page 134.
Add Devices to Group	Adds a device to a group. See Adding Devices to or Removing Them From Device Groups , on page 135.
Print	Prints the active page. Not all pages can be printed. If the Print command is not available, you cannot print the active page.

Command	Description
Exit	Exits Security Manager.

Edit Menu (Configuration Manager)

The following table describes the commands on the Edit menu in Configuration Manager. You can typically use these commands only when you are working with a table in a policy, and some work only for rules tables (see Using Rules Tables , on page 604).

Table 3: Edit Menu (Configuration Manager)

Command	Description
Cut	Cuts the selected row in a rules table and saves it on the clipboard.
Copy	Copies the selected row in a rules table and saves it on the clipboard.
Paste	Pastes the rules table row from the clipboard to the into the rules table after the selected row.
Add Row	Adds a row into the active table.
Edit Row	Edits the selected table row.
Delete Row	Deletes the selected table row.
Move Row Up Move Row Down	Moves the selected row up or down in the rules table. For more information, see Moving Rules and the Importance of Rule Order , on page 617.
Global Search	Opens the Global Search window. For more information, see Using Global Search , on page 43.

View Menu (Configuration Manager)

The View menu in Configuration Manager contains commands to navigate within the user interface or to alter the toolbar.

Table 4: View Menu

Menu Command	Description
Device View	Opens Device view. See Device View Overview , on page 15.
Device Status View	Opens the Device Status View window. See Working with Device Status View , on page 136.
Map View	Opens Map view. See Map View Overview , on page 18.
Policy View	Opens Policy view. See Policy View Overview , on page 17.
Policy Bundle View	Opens Policy Bundle view. See Managing Policy Bundles .

Menu Command	Description
Customized Toolbar	Allows you to add or remove some optional buttons on the toolbar. For information on all the buttons that can appear on the toolbar, see Toolbar Reference (Configuration Manager) , on page 40.

Policy Menu (Configuration Manager)

The Policy menu in Configuration Manager contains commands for managing policies.

Table 5: Policy Menu (Configuration Manager)

Menu Command	Description
Share Policy	Saves the active local policy as a shared policy. See Sharing a Local Policy , on page 207.
Unshare Policy	Saves the active shared policy as a local policy. See Unsharing a Policy , on page 210.
Assign Shared Policy	Assigns shared policies to devices. See Assigning a Shared Policy to a Device or VPN Topology , on page 211.
Unassign Policy	Unassigns the current policy from the selected device. See Unassigning a Policy , on page 202.
Copy Policies Between Devices	Copies policies between devices. See Copying Policies Between Devices , on page 199
Share Device Polices	Enables you to share local device policies. See Sharing a Local Policy , on page 207.
Edit Policy Assignments	Edits assignment of shared policies to devices. See Modifying Policy Assignments in Policy View , on page 221.
Clone Policy	Creates a copy of a policy with a new name. See Cloning (Copying) a Shared Policy , on page 214.
Rename Policy	Renaming a Shared Policy , on page 215
Add Local Rules	Adds local rules to a shared policy on a device. You must select a rule-based shared policy to use this command.
Inherit Rules	Edits policy inheritance. See Inheriting or Uninheriting Rules , on page 213.
Discover Policies on Device	Discovers policies on a device. See Discovering Policies , on page 178.
Discover VPN Policies	Opens the Discover VPN Policies wizard. See Site-To-Site VPN Discovery , on page 1095.

Map Menu (Configuration Manager)

The Map menu in Configuration Manager contains commands for using the Map view. The commands in this menu are available only when the Map view is open. For more information, see Using Map View, on page 1585.

Table 6: Map Menu (Configuration Manager)

Menu Command	Description
New Map	Creates a map. See Creating New or Default Maps , on page 1594.
Open Map	Opens a saved map or the default map. See Opening Maps , on page 1594.
Show Devices On Map	Selects the managed devices to show on the active map. See Displaying Managed Devices on the Map , on page 1601.
Show VPNs On Map	Selects the VPNs to show on the active map. See Displaying Existing VPNs on the Map , on page 1606.
Add Map Object	Creates a map object on the open map. See Using Map Objects To Represent Network Topology , on page 1602.
Add Link	Creates a Layer 3 link on the open map. See Creating and Managing Layer 3 Links on the Map , on page 1604.
Find Map Node	Finds nodes on the open map. See Searching for Map Nodes , on page 1597.
Save Map	Saves the open map. See Saving Maps , on page 1595.
Save Map As	Saves the open map with a new name. See Saving Maps , on page 1595.
Zoom In	Zooms in on the map. See Panning, Centering, and Zooming Maps , on page 1596.
Zoom Out	Zooms out from the map. See Panning, Centering, and Zooming Maps , on page 1596.
Fit to Window	Zooms the open map to display the entire map. See Panning, Centering, and Zooming Maps , on page 1596.
Display Actual Size	Zooms the open map to display at actual size. See Panning, Centering, and Zooming Maps , on page 1596.
Refresh Map	Refreshes the open map with updated network data. See Creating New or Default Maps , on page 1594.
Export Map	Exports the open map to a file. See Exporting Maps , on page 1595.
Delete Map	Deletes the map you select from a list. See Deleting Maps , on page 1595.
Map Properties	Displays or edits properties for the open map. See Setting the Map Background Properties , on page 1598.

Menu Command	Description
Show/Hide Navigation Window	Displays or hides the navigation window on the open map. See Using the Navigation Window , on page 1589.
Undock/Dock Map View	Undocks the maps window, allowing you to use other features while keeping the map open. If the window is already undocked, the Dock Map View command reattaches the window to the primary Security Manager window. See Understanding the Map View Main Page , on page 1586.

Manage Menu (Configuration Manager)

The Manage menu in Configuration Manager contains commands that start tools that run in a window separate from the Security Manager main interface. This enables you to access features without closing the page from which you are currently working.

Table 7: Manage Menu (Configuration Manager)

Menu Command	Description
Policy Objects	Opens the Policy Object Manager, where you can view all available objects grouped according to object type; create, copy, edit, and delete objects; and generate usage reports, which describe how selected objects are being used by other Security Manager objects and policies. For information see Policy Object Manager , on page 232.
Site-to-Site VPNs	Opens the Site-to-Site VPN Manager, where you can configure site-to-site VPNs. See Managing Site-to-Site VPNs: The Basics, on page 1073.
Activities (Workflow mode only)	Opens the Activity Manager, where you can create and manage activities. See Activity/Ticket Manager Window , on page 151.
Deployments	Opens the Deployment Manager, where you can deploy configurations and manage deployment jobs. See Managing Deployment, on page 381
Configuration Archive	Stores archived device configuration versions and allows you to view, compare, and roll back from one configuration to another. See Configuration Archive Window , on page 403.
Policy Discovery Status	Opens the Policy Discovery Status window, where you can see the status of policy discovery and device import. See Viewing Policy Discovery Task Status , on page 188.
IPS	Manage IPS device certificates, which are required for device communications.
Audit Report	Generates an audit report according to parameters set in the audit report page. See Using the Audit Report Window, on page 499.

Menu Command	Description
Change Reports (non-Workflow mode only)	Allows you to generate a report of changes to devices, shared policies, and policy objects for a previous configuration session. See Viewing Change Reports , on page 158. To view changes for the current configuration session, select **File > View Changes**.

Tools Menu (Configuration Manager)

The To

Opens the Device Properties window, which provides general information about the device, including credentials, the group the device is assigned to, and policy object overrides. For more information, see Understanding Device Properties , on page 76.

ols menu in Configuration Manager contains commands that start tools that run in a window separate from the Security Manager main interface. This enables you to access features without closing the page from which you are currently working.

Table 8: Tools Menu (Configuration Manager)

Menu Command	Description
Device Properties	
Detect Out of Band Changes	Analyzes devices to determine if their configurations have changed since the last time Security Manager deployed configurations. You can use this information to ensure that you do not loose important configuration changes. See Detecting and Analyzing Out of Band Changes , on page 426.
Packet Capture Wizard	Opens the Packet Capture wizard, where you can set up a packet capture on an ASA device.
Ping, TraceRoute and NSLookup	Opens the Ping, TraceRoute, and NSLookup tool, where you can use these troubleshooting commands. Ping and traceroute run on managed devices, whereas NSLookup runs on your client workstation. See Analyzing Connectivity Issues Using the Ping, Trace Route, or NS Lookup Tools , on page 2862.
IP Intelligence	Opens the IP Intelligence tool, where you can access various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see IP Intelligence, on page 2870. Before you can use any of the IP Intelligence features, you must enable and configure those features on the IP Intelligence Settings page (see IP Intelligence Settings Page , on page 553).
Wall	Opens the Wall window, where you can send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page. See Wall Settings Page, on page 592.
Show Containment	Shows security contexts or service modules for a device. See Showing Device Containment , on page 128.

Menu Command	Description
Inventory Status	Shows device summary information for all devices. See Viewing Inventory Status , on page 2847.
Catalyst Summary Info	Shows high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered on the selected Catalyst switch. See Viewing Catalyst Summary Information , on page 2622.
Apply IPS Update	Manually applies IPS image and signature updates. See Manually Applying IPS Updates , on page 1783.
Preview Configuration	Displays the proposed changes, last deployed configuration, or current running configuration for specific devices. See Previewing Configurations , on page 424.
Backup	Backs up the Security Manager database using CiscoWorks Common Services. See Backing up and Restoring the Security Manager Database , on page 502.
Security Manager Diagnostics	Gathers troubleshooting information to send to the Technical Assistance Center (TAC) if they request it. See Creating Diagnostics Files for the Cisco Technical Assistance Center , on page 506. **Tip** Beginning with Version 4.7 of Cisco Security Manager, you can select "Light Diagnostics" instead of the existing "General Diagnostics."
Security Manager Administration	Configures system-wide settings that control the functioning of Security Manager.

Activities Menu (Configuration Manager)

The Activities menu in Configuration Manager contains commands for managing activities. It appears only when Workflow mode is enabled. For more detailed information about these commands, see Accessing Activity Functions in Workflow Mode , on page 149.

Table 9: Activities Menu (Configuration Manager)

Menu Command	Description
New Activity	Creates a new activity. See Creating an Activity/Ticket , on page 155.
Open Activity	Opens an activity. See Opening an Activity/Ticket , on page 156.
Close Activity	Closes the open activity. See Closing an Activity/Ticket , on page 157.
View Changes	Opens the Activity Change Report (in PDF format). See Viewing Change Reports , on page 158.
Validate Activity	Validates the open activity. See Validating an Activity/Ticket , on page 160.
Submit Activity	Submits the open activity. See Submitting an Activity for Approval (Workflow Mode with Activity Approver) , on page 161.

Menu Command	Description
Approve Activity	Approves the open activity. See Approving or Rejecting an Activity (Workflow Mode) , on page 162.
Reject Activity	Rejects the open activity. See Approving or Rejecting an Activity (Workflow Mode) , on page 162.
Discard Activity	Discards the open activity. See Discarding an Activity/Ticket , on page 164.

Tickets Menu (Configuration Manager)

The Tickets menu in Configuration Manager contains commands for managing tickets. It appears only when Ticket Management is enabled in non-Workflow mode. For more detailed information about these commands, see Accessing Activity Functions in Workflow Mode , on page 149.

Table 10: Tickets Menu (Configuration Manager)

Menu Command	Description
New Ticket	Creates a new ticket. See Creating an Activity/Ticket , on page 155.
Open Ticket	Opens an ticket. See Opening an Activity/Ticket , on page 156.
Close Ticket	Closes the open ticket. See Closing an Activity/Ticket , on page 157.
View Changes	Opens the Ticket Change Report (in PDF format). See Viewing Change Reports , on page 158.
Validate Ticket	Validates the open ticket. See Validating an Activity/Ticket , on page 160.
Submit Ticket	Submits the open ticket. See Understanding Activity/Ticket States , on page 144.
Discard Ticket	Discards the open ticket. See Validating an Activity/Ticket , on page 160.

Launch Menu (Configuration Manager)

The Launch menu contains commands that start other applications.

Table 11: Launch Menu (Configuration Manager)

Menu Command	Description
Device Manager	Starts device managers for all supported devices, such as PIX security appliances, Firewall Services Modules (FWSM), IPS sensors, IOS routers, and Adaptive Security Appliance (ASA) devices. Device managers provide several monitoring and diagnostic features that enable you to get information regarding the services running on the device and a snapshot of the overall health of the system. See Starting Device Managers , on page 2849.

Menu Command	Description
Prime Security Manager	Launches the Cisco Prime Security Manager (PRSM) application, used to manage ASA CX devices. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information.
FireSIGHT Management Center	Launches the FireSIGHT Management Center application, used to manage FirePOWER modules. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information.
Dashboard	Opens the Dashboard, which is a configurable launch point for Security Manager that makes IPS and FW tasks more convenient for you. In addition to the original dashboard, you can create new, additional dashboards, and you can customize all dashboards. By using the dashboard, you can accomplish in one place many tasks that are found in several other areas of Security Manager, such as the IPS Health Monitor page, Report Manager, Health and Performance Monitor, and IP Intelligence Settings. For detailed information on the dashboard, see Dashboard Overview, on page 2835.
Event Viewer	Opens the Event Viewer, where you can view and analyze device events. See Viewing Events, on page 2677 for more information. If you have already logged into another Security Manager application, Event Viewer is opened using the same user account; you are not prompted to log in. To open Event Viewer using a different user account, open the application from the Windows Start menu or desktop icon.
Report Manager	Opens the Report Manager, where you can generate and analyze security and usage reports. See Managing Reports, on page 2747 for more information. If you have already logged into another Security Manager application, Report Manager is opened using the same user account; you are not prompted to log in. To open Report Manager using a different user account, open the application from the Windows Start menu or desktop icon.
Image Manager	Opens the Image Manager, where you can manage the images on ASA devices. See Using Image Manager, on page 2889 for more information. If you have already logged into another Security Manager application, Image Manager is opened using the same user account; you are not prompted to log in. To open Image Manager using a different user account, open the application from the Windows Start menu or desktop icon.
Health & Performance Monitor	Opens the Health & Performance Monitor (HPM), where you can view device status and traffic information across your network, and view and acknowledge device-specific alerts. See Health and Performance Monitoring, on page 2787 for more information. If you have already logged into another Security Manager application, HPM is opened using the same user account; you are not prompted to log in. To open HPM using a different user account, open the application from the Windows Start menu or desktop icon.

Help Menu (Configuration Manager)

The Help menu in Configuration Manager contains commands for accessing product documentation and training. For more information, see Accessing Online Help , on page 54.

Table 12: Help Menu (Configuration Manager)

Menu Command	Description
Help Topics	Opens the online help system.
Help About This Page	Open online help for the active page.
JumpStart	Opens the JumpStart.
Security Manager Online	Opens the Security Manager web page on Cisco.com.
About Configuration Manager	Displays information about Configuration Manager.

Toolbar Reference (Configuration Manager)

The main toolbar contains buttons that perform actions in Configuration Manager.

The buttons that appear on the main toolbar vary depending on whether Workflow/Ticket Management mode is enabled and how you have customized the toolbar. By selecting you can select some of the buttons included in the toolbar. Many buttons are on the toolbar permanently; you cannot remove them.

The following table presents all buttons.

Table 13: Configuration Manager Toolbar

Button	Description
	Opens the Device view. For more information, see Understanding the Device View , on page 71.
	Opens the Map view. For more information, see Using Map View, on page 1585.
	Opens the Policy view. For more information, see Managing Shared Policies in Policy View , on page 217.
	Opens the Policy Bundle view. For more information, see Managing Policy Bundles , on page 224.
	Opens the Policy Object Manager. For more information, see Managing Policy Objects, on page 229.
	Opens the Site-to-Site VPN Manager. For more information, see Managing Site-to-Site VPNs: The Basics, on page 1073.

Button	Description
	Opens the Deployment Manager. For more information, see Managing Deployment, on page 381.
	Opens the Audit Report. For more information, see Understanding Audit Reports, on page 497.
	(Non-Workflow mode with Ticket Management disabled only.) Submits and deploys changes. For more information, see Managing Deployment, on page 381.
	Discovers configuration policies defined on the currently selected device. For more information, see Discovering Policies , on page 178.
	Detects out-of-band changes, those made to the device outside of Security Manager, for the currently selected devices. For more information, see Detecting and Analyzing Out of Band Changes , on page 426.
	Opens the IP Intelligence tool, where you can access various pieces of information about an IPv4 address, such as the fully qualified domain name (FQDN), geographic location information, and WHOIS information. For more information on the IP Intelligence tool, see IP Intelligence, on page 2870. Before you can use any of the IP Intelligence features, you must enable and configure those features on the IP Intelligence Settings page (see IP Intelligence Settings Page , on page 553).
	Opens the Wall window, where you can send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page. For more information, see Workflow Page , on page 590.
	Shows high-level system information, including any service modules, ports, and VLANs that Security Manager has discovered on the selected Catalyst switch. For more information, see Viewing Catalyst Summary Information , on page 2622.
	Previews the configuration for the currently selected device. For more information, see Previewing Configurations , on page 424.
	Configures system-wide settings that control the functioning of Security Manager. For information, see Configuring Security Manager Administrative Settings, on page 511.
	Opens the device manager for the currently selected device. For more information, see Starting Device Managers , on page 2849.

Button	Description
	Launches the Cisco Prime Security Manager (PRSM) application, used to manage ASA CX devices. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information.
	Launches the FireSIGHT Management Center application, used to manage FirePOWER modules. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information.
	Opens the Dashboard application. For more information, see Dashboard Overview, on page 2835.
	Opens the Event Viewer application. For more information, see Viewing Events, on page 2677.
	Opens the Report Manager application. For more information, see Managing Reports, on page 2747.
	Opens the Image Manager application. For more information, see Using Image Manager, on page 2889.
	Opens the Health & Performance Monitor application. For more information, see Health and Performance Monitoring, on page 2787.
	Opens online help for the current page. For more information, see Accessing Online Help , on page 54.
Note The following buttons are not available in non-Workflow mode when Ticket Management is disabled.	
	Opens the Activity Manager window in Workflow mode or the Ticket Manager window when Ticket Management is enabled in non-Workflow mode. You can use these windows to create and manage activities/tickets. For more information, see Activity/Ticket Manager Window , on page 151. For more information on the activity buttons, and the conditions under which they are enabled, see Accessing Activity Functions in Workflow Mode , on page 149. For more information on the ticket buttons, and the conditions under which they are enabled, see Accessing Ticket Functions in Non-Workflow Mode , on page 150.
	Creates a new activity/ticket.
	Opens an activity/ticket.
	Saves all changes made while the activity/ticket was open and closes it.

Button	Description
	Evaluates all changes made in the activity/ticket and produces a Change Report in PDF format in a separate window. For more information, see Viewing Change Reports , on page 158.
	Validates the integrity of changed policies within the current activity/ticket.
	(Workflow mode with an approver only.) Submits the activity for approval when using Workflow mode with an activity approver. (Non-Workflow mode with Ticket Management enabled only.) Submits the ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state.
	(Workflow mode only.) Approves the changes proposed in an activity.
	(Workflow mode only.) Rejects the changes proposed in an activity.
	Discards the selected activity/ticket.

Using Global Search

Security Manager provides a global search feature to make finding and working with information that you are interested in easier. The Global Search feature allows you to search for devices, policy objects, policies, and tickets that contain a particular search string. The scope of the search can be limited to just devices, policy objects, policies, or tickets.

Note Search is only performed using data that has been committed. Changes that have not yet been submitted to the database will not be included in search results.

Wildcard Matching

The search string supports the use of the following wildcard characters:

- **Asterisk (*)**—matches zero or more characters
- **Question Mark (?)**—matches a single character

Semantic Searching

If the search string that is entered is an IP address, Security Manager will perform a semantic search. For example, entering "192.168.0.0/16" in the search string will return items matching that subnet as well as any specific hosts or other subnets belonging to that subnet or to which that subnet belongs.

Global Search Scope

Global search is supported only within a set of policies and policy objects, not all. The supported policies and the policy objects are the most frequently used policies and objects in the customer deployments. The policies and policy objects supported are:

- Devices: All Devices
- Policy Objects:
  - AAA Server Groups
  - AAA Servers
  - Access Control Lists
  - As Path Policies
  - ASA Group Policies
  - BFD Template
  - Categories
  - Cisco Secure Desktop (Router)
  - Community List Policies
  - Credentials
  - DHCPv6 Pool
  - File Objects
  - FlexConfigs
  - Identity User Group
  - IKE Proposals
  - Interface Roles
  - IPSec Transform Sets
  - LDAP Attribute Maps
  - Networks/Hosts (IPv4 and IPv6)
  - PKI Enrollments
  - Policy List Policies
  - Port Forwarding List
  - Prefix List Policies
  - Route List Policies
  - Services
  - Single Sign On Servers
  - SLA Monitors

- SSL VPN Bookmarks
- SSL VPN Customizations
- SSL VPN Gateways
- SSL VPN Smart Tunnel Auto Signon Lists
- SSL VPN Smart Tunnels
- Text Objects
- Time Ranges
- Traffic Flows
- User Groups
- WINS Server Lists

- Policies:
  - AAA Rules
  - Access Rules
  - IPv6 Access Rules
  - Inspection Rules
  - Translation Rules
  - Web Filter Rules
  - Zone Based Firewall Rules

- Tickets
  - Configuration Manager
  - Image Manager

Performing a Global Search

To perform a global search, do one of the following:

- Select **Edit > Global Search** or press **Ctrl+F** to open the Global Search window. Select the scope for the search in the drop-down list to the left of the search field, enter your search string in the search field, and then click **Search**.

Note If you are currently viewing a rule table, pressing **Ctrl+F** will open the Find and Replace dialog box instead of the Global Search window. Use one of the other methods to access the Global Search feature instead of the Find and Replace feature.

- Using the search field in the upper-right corner of the Configuration Manager window, select the scope for the search by clicking on the Search icon, enter your search string in the search field, and then press **Enter**.

The Global Search window displays the results matching your search criteria. Select the desired data type from the Category selector tree to see results for that category.

Acting on Search Results

You can perform the following actions on the items returned from your search:

- **Export Data (All)**—Allows you to export the search results for the selected category in CSV format. Select the desired data type from the Category selector tree in the Global Search window to see results for that category, then click **Export** in the toolbar above the search results to export that table of data in CSV format.
- **Print (All)**—Allows you to print the search results for the selected category. Select the desired data type from the Category selector tree in the Global Search window to see results for that category, then click **Print** in the toolbar above the search results to print the table of data.
- **Device Properties (Devices)**—Allows you to view the device properties for devices returned in search results. Select the desired device group from the Category selector tree in the Global Search window to see results for that category. Select a device in the results table to highlight it, right-click the device, and then select **Device Properties**. The Device Properties dialog box for the selected device is displayed. For more information, see Viewing or Changing Device Properties , on page 109.
- **Go To (Policies)**—Allows you to navigate to a policy from the search results. Select the desired policy type from the Category selector tree in the Global Search window to see results for that policy type. Select an item in the results table to highlight it, right-click the item, and then select **Go To**. The relevant policy for the selected item is displayed.
- **Filter (Policies)**—Allows you to filter the search results using the standard table filter. For more information, see Filtering Tables , on page 50.
- **View (Policy Objects)**—Allows you to view the policy object details for an object in the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to highlight it, then click **View** in the toolbar above the search results (or right-click the object and select **View**). The relevant Edit dialog box for the selected policy object is displayed in read-only mode.
- **Edit (Policy Objects)**—Allows you to edit a policy object from the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to highlight it, then click **Edit** in the toolbar above the search results (or right-click the object and select **Edit**). The relevant Edit dialog box for the selected policy object is displayed.

Note If a ticket or activity is not currently open, you will be prompted to create one or open an existing one before you can edit the policy object.

- **Find Usage (Policy Objects)**—Allows you to find which policies, objects, VPNs, and devices are using an object in the search results. Select the desired policy object type from the Category selector tree in the Global Search window to see results for that object type. Select an object in the results table to

highlight it, then click **Find Usage** in the toolbar above the search results (or right-click the object and select **Find Usage**). The Object Usage dialog box for the selected policy object is displayed. For more information, see Generating Object Usage Reports , on page 243.

- **Show Ticket (Tickets)**—Allows you to navigate to the Ticket Manager window for a ticket returned in the search results. Select the desired ticket group from the Category selector tree in the Global Search window to see results for that category. Click the Ticket column in the results table for the ticket you want to view. The Ticket Manager window is displayed with the selected ticket highlighted. For more information, see Activity/Ticket Manager Window , on page 151.

Using Selectors

Selectors appear in several places in the user interface; for example, the Device selector in Device view (see Figure 1-1). These tree structures enable you to select items (like devices) on which to perform actions. Several types of items can appear in a selector, depending on the task you are performing.

Items in selectors are presented in a hierarchy of folders. You can browse for items in a selector by expanding and collapsing folders, which can contain other folders, items, or a combination of folders and items. To expand and collapse a folder, click the +/- next to it.

To select an item, click it. If it is possible to perform actions on multiple items (for example, in a device selector), you can use Ctrl+click to select each item, or Shift+click on the first and last item to select all items between them. Many selectors support auto select, that is, when you type a single letter, the next folder or item in the selector that begins with that letter is selected.

You can right-click an item to see commands that you can use with the item. Some commands on the right-click menus are unique and not repeated on the regular menus.

Many times a device selector appears in a dialog box divided into two panes, Available Devices and Selected Devices. In these dialog boxes, you must select the devices in the available devices list and click >> to move them to the selected list to actually select the devices. To deselect the devices, you select them in the selected devices list and click <<.

If a selector contains a large number of items, you can filter it to view a subset of those items. For more information, see Filtering Items in Selectors , on page 47.

Filtering Items in Selectors

To view a subset of the items in a selector, you can create filters to display only those items that match the criteria you specify. You can have a maximum of 10 filters per user for each selector. After that, when you create another filter, that new filter replaces the oldest filter. There is no duplication check for filters that are created. You cannot delete filters manually.

A filter list appears above all selectors that can be filtered. From this list, you can do the following:

- Select a filter that you created previously.
- Select **None** to see the tree without any filters applied to it.
- Select **Create Filter** to create a filter.

Each filter can contain several filter rules. Each filter rule specifies a rule type, criteria, and values. You select whether items must match any or all filter rules before they can be displayed in the selector.

When you create a filter, the fields that you can filter on depend on the types of items displayed in the filter. However, the general procedure is the same for all selectors.

For information on filtering tables, see Filtering Tables , on page 50.

Tip When you filter a selector, that filter might remain applied to the selector when you open another window that includes the selector. For example, when you apply a filter to the Device selector in Device view, that filter is applied to the selector if you open the New Device wizard. If you have problems finding an item in a selector, check the Filter field to see if a filter is being applied.

Step 1 Select **Create Filter** from the selector filter field to open the Create Filter dialog box.

Step 2 Select one of the radio buttons to determine the matching criteria. The choices are:

- Match Any of the Following—Creates an OR relationship among the filter criteria. Policies matching any of your criteria are included in the filter.
- Match All of the Following—Creates an AND relationship among the filter criteria. Only those policies matching all your criteria are included in the filter.

Step 3 Establish a filter rule by entering three criteria, as follows:

- From the first list, select the type to be filtered; for example, *Name* .
- From the next list, select the operating criteria for the filter; for example, *contains* .
- In the final field, enter or select a value on which to filter; for example *Cisco* .

Step 4 Click **Add**.

Tip If you make a mistake in forming the filter rule, select the rule and click **Remove** to delete it.

Step 5 Add any additional filter rules that you require. Click **OK** when you are finished.

The selector is filtered according to the new filter criteria, and the new filter is added to the filter list.

Create Filter Dialog Box

Use the Create Filter dialog box to filter and display a subset items in a selector or a table. Creating filters helps you find items more easily when viewing large lists.

For more information on filtering, see these topics:

- Filtering Items in Selectors , on page 47
- Filtering Tables , on page 50

Navigation Path

Do one of the following:

- Select **Create Filter** from the Filter field in a selector tree.

- Select **Advanced Filter** from the Filter field above a table.

Field Reference

Table 14: Create Filter Dialog Box

Element	Description
Match All of the Following	When you select this option an AND relationship is created among the filtering criteria you define. An item must satisfy every rule in the filter to be displayed in the list. For example, if you define the following criteria: • Name contains OSPF • Name contains West When you click OK, the filter is defined as: Name contains OSPF **and** Name contains West.
Match Any of the Following	When you select this option an OR relationship is created among the filtering criteria you define. An item must satisfy only one of the rules in the filter to be displayed in the list. For example, if you define the following criteria: • Name contains OSPF • Name contains RIP When you click OK, the filter is defined as: Name contains OSPF **or** Name contains RIP.
Filter Type (First field.)	The type of property on which you are filtering. For tables, this is the column heading. You might have only one option for filtering certain lists (for example, you might only be able to filter by the name of the item).
Filter Operator (Second field.)	The relationship between the filter type and the filter value. The available options depend on the selected type.
Filter Value (Third field.)	The value on which you want to filter. Depending on the selected type, you either enter a text string in this field, or you select a value from the list.
Filter Content Area Add button Remove button	The filter type, operator, and value that you have selected for each criterion. • To add a criterion, create it in the fields above this area and click **Add**. • To remove a criterion, select it and click **Remove**.

Using Wizards

Some tasks that you can perform with Security Manager are presented as wizards. A wizard is a series of dialog boxes (or steps) that enables you to perform a task. The current step number and the total number of steps in the wizard are displayed in the wizard title bar.

Wizards share the following buttons:

- **Back**—Returns to the previous dialog box. Enables you to review and modify settings that you defined in previous wizard steps.
- **Next**—Continues to the next dialog box. If this button is unavailable, you must define some required settings in the current dialog box before you can continue. Required settings are marked with an asterisk (*).
- **Finish**—Finishes the wizard, saving the settings you defined. You can finish the wizard whenever this button is available. If this button is not available, you must define more settings.
- **Cancel**—Closes the wizard without saving any settings.
- **Help**—Opens online help for the wizard.

Using Tables

Many policies in Security Manager use tables. A small number of policies use a specialized type of table called a rules table. Rules tables have extra features compared to standard tables; for more information, see Using Rules Tables , on page 604.

Standard tables include these basic features:

- Table filter—You can filter the rows displayed to help you find items in a large table. For more information, see Filtering Tables , on page 50.
- Table column headings—You can sort by column and move, show, and hide columns. For more information, see Table Columns and Column Heading Features , on page 51.
- Table buttons—Use the buttons below the table to do the following:
  - Add Row button (+ icon)—Click this button to add an item to the table.
  - Edit Row button (pencil icon)—Select a row and click this button to edit its properties.
  - Delete Row button (trash can icon)—Select a row and click this button to delete it from the table.

Filtering Tables

You can filter the items in a table to view a subset that satisfies specific criteria. Filtering a table does not change the contents of the table, but allows you to focus on just those entries that currently interest you. This is helpful for tables that have hundreds of entries.

To filter a table, use the Filter fields above the table. With these controls, you can do the following:

- To do simple filtering, select the column name on which you want to filter, select the relationship you are looking for (such as “begins with”), enter the desired text string (or in some cases, select one of the pre-defined options), and click **Apply**.

You can filter the results by selecting another criteria and clicking Apply. Your filters are added together, showing the results that satisfy all criteria. For example, you could first enter "Service begins with IP," click Apply, then enter "Source contains 10.100.10.10," and click Apply. The result would be a table that shows all rows where the service is IP AND the source includes 10.100.10.10 (it might include other IP addresses as well).

- To do advanced filtering, select **Advanced Filter** from the left most menu (the one that contains the column headings). This opens the Create Filter dialog box. Using this dialog box, you can create multiple filter criteria just as you can with the regular filter controls. However, you also have the option to create a list of disjoined, OR'ed criteria, by selecting **Match Any of the Following**, where you can say "show me all rows that have IP for service or 10.100.10.10 for source address."
  - To add criteria, enter the criteria and click **Add**.
  - To remove criteria, select the undesired criteria and click **Remove**.

If you filter a table using the simple method, you can select Advanced Filter to alter your existing filter, adding or removing criteria as desired. The dialog box is filled with whatever filter criteria are currently applied to the table.

- The current filter is shown next to the Filter label in the filter control area. You can click **Clear** to remove the filter and show all rows.
- Any filter you apply is kept in the left most menu below the Advanced Filter entry. You can apply the filter by selecting it from the list. However, this list can have at most 10 entries. When you create your eleventh filter, your oldest filter is removed from the list. If you select a filter and add criteria, you are modifying that filter rather than creating a new one. You cannot delete the listed filters.

Tip Your filter is maintained for a given type of table even if you select another device or log out and subsequently log back in. For example, if you filter the Access Rules table for one device, it will be filtered the same way for other devices. When you clear the filter, it is cleared for the same type of table for all devices. Your filters do not affect what any other user sees.

Table Columns and Column Heading Features

Tables contain columns, each of which has a column heading in the heading row. These columns and their headings include the following features:

- Show/hide Columns—Right-click the table heading row to open the context menu and then select Show Columns. This menu enables you to select which columns appear. Showing or hiding columns does not affect the content of items defined in the table; it affects only your view.

By default, the tables for some policies do not display all available columns.

- Show Details/Show Summary—Right-click the table heading row to open the context menu and then select either **Show Details** or **Show Summary**. This toggling menu enables you to select whether to view detailed or summarized information in the table.
- Move columns—Click and drag a column heading to move the column to a new position.
- Resize columns—Click a column heading divider (when the cursor turns into an arrow) and drag it to resize the column.

- Sort by column headings—Click a column heading to sort the table by that column's contents. Click the same column heading again to reverse the sort order. The sorted column has an arrow next to its heading.

Using Text Fields

Text fields can be single- or multiple-line, depending on the purpose of the field. Text fields that can contain multiple text lines include several features to make them easier to use. The following topics describe limitations and features of text fields:

- Understanding ASCII Limitations for Text , on page 52
- Finding Text in Text Boxes , on page 52
- Navigating Within Text Boxes , on page 52

Understanding ASCII Limitations for Text

Devices typically restrict text to ASCII characters. If you include non-ASCII characters in Security Manager text fields that are used to generate commands in a device configuration file, the presence of those characters can prevent the configuration file from loading on the device. For example, a non-ASCII character in an interface description for an FWSM can prevent the device from loading the startup configuration when you restart the device.

The only places where you can include non-ASCII, non-English languages in device configurations is in the SSL VPN Bookmarks and SSL VPN Customization policy objects, which are used in configuring browser-based clientless SSL VPNs on ASA devices. For information on how you can support local languages for these objects, see Localizing SSL VPN Web Pages for ASA Devices , on page 1409.

Finding Text in Text Boxes

Use the Find dialog box to find text within a multiple line text field.

Step 1 Click in a multiple line text field.
Step 2 Press **Ctrl+F**. The Find dialog box opens.
Step 3 Enter text to search for in the Find what field.
Step 4 To specify the direction of the search, select either **Up** or **Down** in the Direction field.
Step 5 To match the case of the text you entered, select the **Match Case** check box.
Step 6 Click **Find**. The next occurrence of your search text is highlighted in the text field.

Navigating Within Text Boxes

Use the Goto line dialog box to navigate to a specific line in a multiple line text field.

Step 1 Click in a multiple line text field.
Step 2 Press **Ctrl+G**. The Goto line dialog box opens.
Step 3 Enter a line number in the Line number field.

Step 4 Click **OK**. The text field scrolls to the line number you entered.

Selecting or Specifying a File or Directory in Security Manager

Cisco Security Manager uses a standard file system browser to let you select a directory or file or to specify a file.

You will be able to choose between client and server file systems when performing the following file operations:

- Installing Security Manager license files
- Importing/exporting device inventory files
- Importing/exporting shared policies
- Creating the following file objects:
  - Cisco Secure Desktop Package
  - Plug-In—For browser plug-in files.
  - Secure Client Profile
  - Secure Client Image
  - Hostscan Image

For all other file operations, you can create or select files only on the Security Manager server--you cannot use a drive mounted on the server, and you cannot use your client system.

Tip You can control whether file operations are allowed on the Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520.

Typically, to create or select a file, you click a **Browse** button to open a dialog box that has a title related to the action you are performing (for example, Choose Files when selecting configuration files). The Browse button appears on various dialog boxes throughout the product.

In the dialog box, use the folder tree on the left to navigate to the folder you want:

- If client-side file browsing is enabled and you are performing a function that supports client-side browsing (see above), select the tab that corresponds to the system you want to import from or export to.
- If you are selecting a file, find it in the folder tree and select it in the right pane. If the action you are taking allows you to select multiple files, use Ctrl+click to select files individually, or Shift+click to select a range of files. You might also need to select a file type to view only those files that apply to your action.
- If you are specifying (creating) a file, navigate to the folder in which you want to create the file, enter a file name, and select the appropriate file type.

Note The path and file name are restricted to characters in the English alphabet. Japanese characters are not supported. When selecting files on a Windows Japanese OS system, the usual file separator character \ is supported, although you should be aware that it might appear as the Yen symbol (U+00A5).

Troubleshooting User Interface Problems

The following tips might help you resolve general user interface problems that you might encounter:

- **Interface appears to freeze** —Occasionally, when you go from a Security Manager dialog box to some other application (for example, to check your e-mail), when you come back to Security Manager, nothing you click on responds. It appears the interface is frozen.

This might be caused by an open dialog box that is covered by another Security Manager window. Until you close the dialog box, you will not be able to use any other window in the application. To find the hidden dialog box, press Alt+Tab, which opens a Windows panel that has icons for all currently open windows. Keep holding Alt, then press Tab repeatedly to cycle through the icons until you find the right one (the icon might be a generic Java icon rather than the Security Manager icon). You can also use your mouse to click the desired icon rather than using Tab to cycle through them.

- **Text and list elements missing, Java errors when clicking buttons** —If you change your Windows color scheme while running the Security Manager client, you must close and then restart the client. Otherwise, the behavior of the client can be unpredictable.

If you are experiencing these problems and you did not change the color scheme, try closing and restarting the application.

- **Dialog Box is too big for the screen** —The minimum screen resolution for the Security Manager client is actually bigger than the best screen resolution available on many laptops (for screen resolution requirements, see the client system requirements in the Installation Guide for Cisco Security Manager). Because some dialog boxes are quite large, if you run the client on a laptop, you might find the occasional dialog box that is too big to fit on your screen.

Usually, you can reposition the dialog box to get access to the OK, Cancel, and Help buttons. However, if you cannot get those buttons on the screen, you can use the following techniques to perform the same actions:

- **OK**—Put your cursor in a field near the bottom of the dialog box, then press Tab to move from field to field. Typically, the first off-screen field is the OK button. When the cursor highlight moves off screen, press Enter.

You can also put the cursor in a field that does not allow carriage returns (for example, the typical Name field) and press Enter. In many cases, this is the equivalent of clicking OK.

- **Cancel**—Click the X on the right side of the window's title bar.
- **Help**—Press F1.

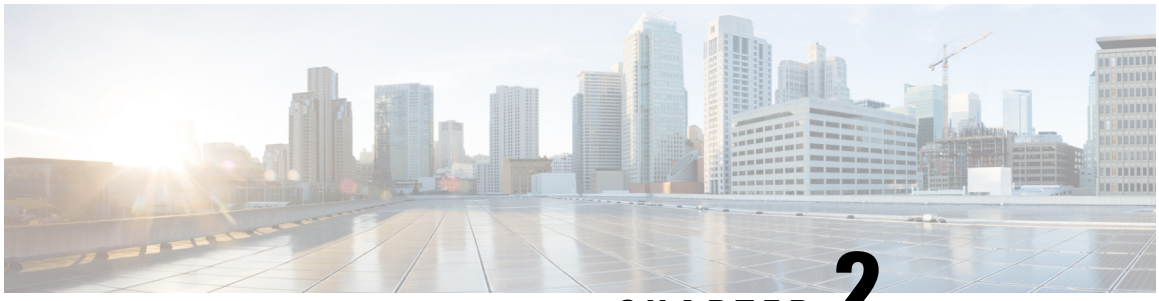
Accessing Online Help

To access online help for Security Manager, do one of the following:

- To open the main Security Manager online help page, select **Help > Help Topics**.
- To open context-sensitive online help for the active page, select **Help > Help About This Page** or click the **?** button in the toolbar.
- To open context-sensitive online help for a dialog box, click **Help** in the dialog box.

Tip You must configure Internet Explorer to allow active content to run on your computer for the online help to open unblocked. In Internet Explorer, select **Tools > Internet Options** and click the **Advanced** tab. Scroll to the Security section, and select **Allow active content to run in files on My Computer**. Click **OK** to save the change. For a complete list of configuration requirements for Internet Explorer and Firefox browsers, see the Installation Guide for Cisco Security Manager .

The online help page appears without any user authentication. Though the pages are opening with direct URL access, they are only static content pages and function within the Cisco Security Manager.



CHAPTER 2

Preparing Devices for Management

Before you start to manage a device using Security Manager, you should prepare the device with at least a minimal configuration. The following sections describe the basic device configurations needed for various transport protocols or device types.

Understanding Device Communication Requirements

Security Manager provides many different ways for you to manage devices. The easiest methods involve Security Manager directly contacting the devices. Security Manager might access a device during inventory or policy discovery, during configuration deployment, or in response to actions you take in Security Manager that request device contact (such as testing connectivity).

Because you can use off-line methods to add devices to the Security Manager inventory or to deploy configuration changes to the devices, configuring device communication settings for Security Manager's use is optional. However, you typically need to configure basic device communication settings on the devices to implement your off-line or customized configuration deployment tools.

In Security Manager, you can configure which transport protocol to use as the default for a type of device, and change it for specific devices that are configured to respond to a different protocol. Security Manager is configured with default protocols that are the most commonly-used protocols for that type of device. To change the default device communication setting for a type of device, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents (for more information, see Device Communication Page , on page 532). To change the transport setting for a specific device, modify its device properties as described in Viewing or Changing Device Properties , on page 109.

Security Manager can use these transport protocols:

- SSL (HTTPS)—Secure Socket Layer, which is an HTTPS connection, is the only transport protocol used with PIX Firewalls, Adaptive Security Appliances (ASA), and Firewall Services Modules (FWSM). It is also the default protocol for IPS devices and for routers running Cisco IOS Software release 12.3 or later

If you use SSL as the transport protocol on Cisco IOS routers, you must also configure SSH on the routers. Security Manager uses SSH connections to handle interactive command deployments during SSL deployments.

Cisco Security Manager was using OpenSSL for the Transport Layer Security (TLS) and Secure Sockets Layer (SSL) protocols. Beginning with version 4.13, Cisco Security Manager replaced OpenSSL version 1.0.2 with Cisco SSL version 6.x. Cisco SSL enables FIPS compliance over full FIPS Validation which results in fast and cost-effective connectivity. The Common Criteria mode in Cisco SSL allows easier compliance. Cisco SSL is feature-forward when compared to OpenSSL. The product Security Baseline (PSB) requirements for CiscoSSL ensures important security aspects such as credential and key management, cryptography standards, antispoofing capabilities, integrity and tamper protection, and session, data, and stream management and administration are taken care of.

For information on configuring SSL, see Setting Up SSL (HTTPS) , on page 59

- SSH—Secure Shell is the default transport protocol for Catalyst switches and Catalyst 6500/7600 devices. You can also use it with Cisco IOS routers.

For information on configuring SSH, see Setting Up SSH , on page 62.

- Telnet—Telnet is the default protocol for routers running Cisco IOS software releases 12.1 and 12.2. You can also use it with Catalyst switches, Catalyst 6500/7600 devices, and routers running Cisco IOS Software release 12.3 and later. See the Cisco IOS software documentation for configuring Telnet.
- HTTP—You can use HTTP instead of HTTPS (SSL) with IPS devices. HTTP is not the default protocol for any device type.
- SQL Anywhere—Up to version 4.20, Security Manager used SQL Anywhere version 12.x as the database. Beginning with version 4.21, Security Manager uses Sybase SQL Anywhere version 17.0.10.5855.
- TMS—Token Management Server is treated like a transport protocol in Security Manager, but it is not a real transport protocol. Instead, by configuring TMS as the transport protocol of a router, you are telling Security Manager to deploy configurations to a TMS. From the TMS, you can download the configuration to an eToken, plug the eToken into the router's USB bus, and update the configuration. TMS is available only for certain routers running Cisco IOS Software 12.3 or later.

For information on deploying configurations to a TMS and downloading them to a router, see Deploying Configurations to a Token Management Server , on page 423.

Security Manager can also use indirect methods to deploy configurations to devices, staging the configuration on a server that manages the deployment to the devices. These indirect methods also allow you to use dynamic IP addresses on your devices. The methods are not treated as transport protocols, but as adjuncts to the transport protocol for the device. You can use these indirect methods:

- AUS (Auto Update Server)—When you add a device to Security Manager, you can select the AUS server that is managing it. You can use AUS with PIX Firewalls and ASA devices.

For information on configuring a device to use an AUS server, see Setting Up AUS or Configuration Engine , on page 66.

- Configuration Engine—When you add a router to Security Manager, you can select the Configuration Engine that is managing it.

For more information on configuring a router to use a Configuration Engine server, see Setting Up AUS or Configuration Engine , on page 66.

For information on adding devices that use AUS or Configuration Engine servers to Security Manager, and how to add the servers, see these topics:

- Adding Devices to the Device Inventory , on page 77
- Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105

Setting Up SSL (HTTPS)

With many devices, you can use the Secure Socket Layer (SSL) protocol, also known as HTTPS, to communicate with the device. When you deploy configurations with this protocol, Security Manager encrypts the configuration file before sending it to the device.

The following topics describe how to set up SSL on the devices:

- Setting Up SSL (HTTPS) on PIX Firewall, ASA and FWSM Devices , on page 59
- Setting Up SSL on Cisco IOS Routers , on page 60

Setting Up SSL (HTTPS) on PIX Firewall, ASA and FWSM Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

This procedure describes the tasks to complete before you use SSL as the transport protocol for device management on PIX Firewall, ASA and FWSM devices.

Step 1 Enter configuration mode.

Example:

```
hostname# config terminal
```

Respond to the prompts appropriately. Here are some tips:

- Enter **y** when the prompt asks if you want to preconfigure using interactive prompts.
- Enter the current enable password.
- Specify the time zone, year, month, day, and time.
- If the device:
  - Is new—Specify the network interface IP address and network mask that applies to the inside IP address of the device.
  - Exists—Verify that the interface IP address and mask are correct.
- If the device:
  - Is new—Specify the hostname and the domain name.

- Exists—Verify that the hostname and domain name are correct.

- When prompted for the IP address of the host that runs the PIX Device Manager, specify the IP address of the Security Manager server.
- Enter **yes** when the prompt asks if you want to write the above changes to Flash.

Step 2 If you are configuring an ASA, specify the SSL/TLS protocol version the ASA uses when acting as a server. Beginning with version 4.8, Security Manager supports all SSL/TLS protocol versions, the latest certified version being TLS 1.2.

Example:

```
hostname(config)# ssl server-version any
```

Step 3 Enable the HTTP server.

Example:

```
hostname(config)# http server enable
```

Step 4 Specify the host or network authorized to initiate an HTTP connection to the device.

Example:

```
hostname(config)# http
 ip_address
 [netmask
] [if_name
```

Step 5 Save the current configuration in Flash memory.

Example:

```
hostname(config)# write memory
```

Where:

- *ip_address* —The IP address of the Security Manager server
- *netmask* —The network mask for the IP address.
- *if_name* —The device interface name (default is **inside**) from which Security Manager initiates the HTTP connection.

Setting Up SSL on Cisco IOS Routers

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSMand IPS it does not support any enhancements.

This procedure describes the tasks to complete before you use SSL as the transport protocol for device management on Cisco IOS routers.

Step 1 Enter configuration mode.

Example:

```
hostname# config terminal
```

Step 2 Configure the hostname and domain name if the device is new.

Example:

```
router(config)# hostname
 name

hostname(config)# ip domain-name
 your_domain
```

Step 3 Configure level 15 privilege. SSL requires that you must have level 15 privileges to log in to a Cisco IOS router.

Example:

```
hostname(config)# username
 username
 privilege 15 password 0
 password
```

Step 4 Enable either local authorization or AAA authorization:

- Local authorization— If you are using AAA for authorization but would like to use local authorization, use the following commands to disable AAA authorization and AAA authentication at login, where *list-name* is a character string used to name the list of authorization methods, and to enable local authorization using the username you just configured:

Example:

```
hostname(config)# no aaa authorization network
 list-name

hostname(config)# no aaa authentication login
 list-name
hostname(config)#ip http authentication local
```

If you do not enter the **ip http authentication local** command, the default enable password is used for authentication.

- AAA authorization—Use the following commands to enable AAA authentication and authorization. The last two commands are necessary only if multiple AAA lists are defined; *list-name* is a character string used to name the list of authorization methods. These commands authenticate the user that is contacting the device using the HTTPS protocol.

Example:

```
hostname(config)#ip http authentication aaa

hostname(config)#ip http authentication aaa login-authentication
 list-name
hostname(config)# ip http authentication aaa exec-authorization
 list-name
```

Step 5 Enable the HTTPS server.

Example:

```
hostname(config)# ip http secure-server
```

Step 6 Exit configuration mode and return to Exec mode.

Example:

```
hostname(config)# exit
```

Step 7 Verify that SSL is set up on the device. The Device should respond with an "enabled" status.

Example:

```
hostname# show ip http server secure status
```

Setting Up SSH

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

You can use the Secure Shell (SSH) protocol to communicate with Cisco IOS Routers, Catalyst switches, and Catalyst 6500/7600 devices. This protocol provides strong authentication and secure communications over insecure channels. Security Manager supports both SSH versions 1.5 and 2. Once connected to the device, Security Manager determines which version to use and communicates using that version.

The following topics describe how to set up SSH on the supported devices:

- Critical Line-Ending Conventions for SSH , on page 62
- Testing Authentication , on page 63
- Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices , on page 63
- Preventing Non-SSH Connections (Optional) , on page 65

Critical Line-Ending Conventions for SSH

The following line-ending conventions for SSH must be observed to avoid system failure:

- Do not end banner message lines with "#", "# ", ">", or "> ". If your system requires a pound sign or greater-than sign at the end of a banner message, ensure that it is followed by two spaces
- Do not use banner message lines that contain only "Username: " or "Password: "
- Do not customize the device user EXEC mode prompt to not end with ">" or "#".

Testing Authentication

Before you set up SSH, you must test authentication without SSH to make sure the device can be authenticated. You can authenticate with a local username and password or with an authentication, authorization, and accounting (AAA) server running TACACS+ or RADIUS.

This procedure describes how to test authentication without SSH using a local or AAA server username and password.

Step 1 Enter configuration mode.

Example:

```
router# config terminal
```

Step 2 Specify that the local username and password should be used in the absence of AAA statements. On Cisco IOS routers, you can use the **login local** command on VTY lines instead of the **aaa new-model** command.

Example:

```
hostname(config)#aaa new-model
```

Step 3 (Optional) Configure a user account in the local database of the device.

Example:

```
hostname(config)# username
 name
 password 0
 password
```

Step 4 Exit configuration mode and return to Exec mode.

Example:

```
hostname(config)# exit
```

Step 5 Save the configuration changes.

Example:

```
hostname(config)# write memory
```

Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSMand IPS it does not support any enhancements.

This procedure describes the tasks required to set up SSH on Cisco IOS routers, Catalyst switches, and Catalyst 6500/7600 devices.

Tip You must configure SSH on Cisco IOS routers because Security Manager uses SSH connections to handle interactive command deployments during SSL deployments.

Related Topics

- Critical Line-Ending Conventions for SSH , on page 62
- Testing Authentication , on page 63
- Preventing Non-SSH Connections (Optional) , on page 65

Step 1 Enter configuration mode.

Example:

```
router# config terminal
```

Step 2 Configure the hostname and domain name if the device is new.

Example:

```
router(config)# hostname
 name

hostname(config)# ip domain-name
 your_domain
```

Step 3 Generate the RSA key pair for the SSH session. When the device prompts you to enter the size of the modulus, we recommend that you enter 1024.

Example:

```
hostname(config)# crypto key generate rsa
```

Step 4 (Optional) Set the timeout interval in minutes and the number of retries.

Example:

```
hostname(config)# ip ssh timeout
 time
hostname(config)# ip ssh authentication-retries
 n
```

Step 5 Exit configuration mode and return to Exec mode.

Example:

```
hostname(config)# exit
```

Step 6 Save the configuration changes.

Example:

```
hostname# write memory
```

Preventing Non-SSH Connections (Optional)

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches, PIX, FWSMand IPS it does not support any enhancements.

After configuring SSH, you can configure the Cisco IOS routers, Catalyst switches, and Catalyst 6500/7600 devices to use SSH connections only.

Related Topics

- Critical Line-Ending Conventions for SSH , on page 62
- Testing Authentication , on page 63
- Setting Up SSH on Cisco IOS Routers, Catalyst Switches, and Catalyst 6500/7600 devices , on page 63

Step 1 Enter configuration mode.

Example:

```
router# config terminal
```

Step 2 Set up the router for Telnet access, specifying the first and last line numbers that can be used (numbers range from 0 to 1180, and the last number must be greater than the first number).

Example:

```
hostname(config)# line vty
 first_line last_line
```

Step 3 Prevent non-SSH connections, such as Telnet.

Example:

```
hostname(config-line)# transport input ssh
```

Step 4 Exit configuration mode.

Example:

```
hostname(config-line)# end
```

Step 5 Save the configuration changes.

Example:

```
hostname# write memory
```

Setting Up AUS or Configuration Engine

With many devices, you can use an intermediate transport server to stage configuration updates to the device. These transport servers can also allow you to manage devices that use dynamically assigned IP address (using a DHCP server) instead of static IP addresses. When you deploy configurations using a transport server, Security Manager deploys the configuration to the server, and the device retrieves the configuration from the server. You can use Auto Update Server, running the AUS protocol, or Cisco Configuration Engine, running the CNS protocol.

The following topics describe how to set up AUS or CNS on the devices:

• Setting Up AUS on PIX Firewall and ASA Devices , on page 66

Setting Up AUS on PIX Firewall and ASA Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

You can configure PIX firewalls and ASA devices to use the AUS protocol to contact an Auto Update Server or CNS Configuration Engine for configuration and image updates. When using Configuration Engine, the device uses the same AUS protocol used for Auto Update Server, so the configuration is the same. For an end-to-end explanation of how AUS/CE deployment works, see Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422.

You need to initially configure AUS settings on the device so that the device knows that it must contact the AUS/CE server for configuration updates. After the initial deployment, you can change these settings using the **Platform > Device Admin > Server Access > AUS** policy.

This procedure describes the tasks to complete before you use AUS or CNS as the transport protocol for device management on PIX firewall and ASA devices.

Step 1 Enter configuration mode.

Example:

```
router# config terminal
```

Step 2 Connect to the AUS. Specify a username and its password that can log into Security Manager. The port number is typically 443.

Example:

```
hostname(config)# auto-update server https://
username:password@AUSserver_IP_address:port
 /autoupdate/AutoUpdateServlet
```

Step 3 Specify the polling period for AUS.

Example:

```
hostname(config)# auto-update poll-period
 poll_period
 [retry_count
 ] [retry_period
 ]
```

Where:

- *poll_period* —The polling period interval between two updates. Default is 720 minutes (12 hours).
- *retry_count* —(Optional) The number of times to retry if the server connection attempt failsDefault is 0.

Step 4 Configure the device to use the specified unique device ID to identify itself.

Example:

```
hostname(config)# auto-update device-id
 [ hardware-serial | hostname |
ipaddress
 [if_name
 ] |  mac-address
 [if_name
 ] | string
 text
 ]
```

Where:

- *if_name* —The device interface name (the default is **inside**).
- *text* —A unique string name.

Step 5 Save the configuration changes.

Example:

```
hostname# write memory
```

Configuring Licenses on Cisco ASA Devices

Devices that run Cisco ASA Software require Product Activation Keys for each feature license. Some licenses are optional, such as Botnet Traffic Filtering, and can be time-based. Other features are standard on some models, but optional on others, such as the Failover license, which is optional on the 5505 and 5510 models but standard on all other models.

You cannot install or activate ASA licenses through Security Manager. Instead, use the Adaptive Security Device Manager (ASDM). Enter the activation keys by selecting **Configuration > Device Management > Licensing > Activation Key** and following the instructions in the online help for that page. The Activation Key page also lists the state of all feature licenses. The ASDM online help includes extensive information about ASA licensing.

When you deploy configurations from Security Manager, the device must have active licenses for all features in the configuration or you will see deployment errors. In most cases, Security Manager does not prevent you from configuring a feature based on the licenses that are active on a device. For example, you can configure Botnet Traffic Filtering for a device even if that device has a disabled Botnet license.

The exception is the Failover license on the 5505 and 5510 models. There is a device property that you can set to indicate whether there is an active Failover license on a device: License Supports Failover. You can set this property by double-clicking the device (in Device view) to open the Device Properties page; the option is on the General tab (see Device Properties: General Page , on page 110). If you discover policies on the device, for example, when adding the device to the inventory using the Add Device From Network or Add Device from File (from an inventory file, not a configuration file) options, Security Manager determines the state of the Failover license and sets the property appropriately. You are responsible for ensuring that the property remains accurate. You will see deployment failures if the property is selected but the device has an inactive Failover license.

Tip If you add the device using the New Device or Configuration File options, you can set the License Supports Failover property while adding the device instead of waiting to set it in the device properties.

Configuring Licenses on Cisco IOS Devices

Devices that run Cisco IOS Software require license files for various features, including security features. If these licenses are not installed on the device (such as the securityk9 package), Security Manager cannot configure commands that require a particular license level, and you will experience deployment failures when you try to deploy your policies to an unlicensed device.

Although you can use Security Manager to deploy and manage IPS licenses, you cannot use it to deploy and manage any other type of license. Configure these licenses directly on the device using the command line interface or use Cisco License Manager. Following is the general process for configuring licenses. For more information about configuring licenses, see Cisco IOS Software Activation Command Guide and Cisco IOS Software Activation Command Reference on Cisco.com.

1. obtain the licenses required for the features you want to use or you can use the evaluation licenses that come bundled with some devices. Use the **show license all** command to view the available licenses
2. Copy the purchased licenses to the flash storage on the device or put them on a TFTP server. For example, you could place the licenses on a TFTP server and use the **copy tftp flash0:** command to copy the files to the flash0 storage area
3. Use the **license install** command to install each purchased license. For example:

license install flash0:uc-base-CISCO2951-FHH1216P06Z.xml

Some licenses prompt you to read and accept a license agreement.

If you want to use an evaluation license, use the **license boot** command to enable them and then reload the device. You must accept the end-user license agreement before Security Manager can deploy configurations to the device.

- You can use the **show version**, **show license feature**, and **show license all** commands to check on your installed licenses

Initializing IPS Devices

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

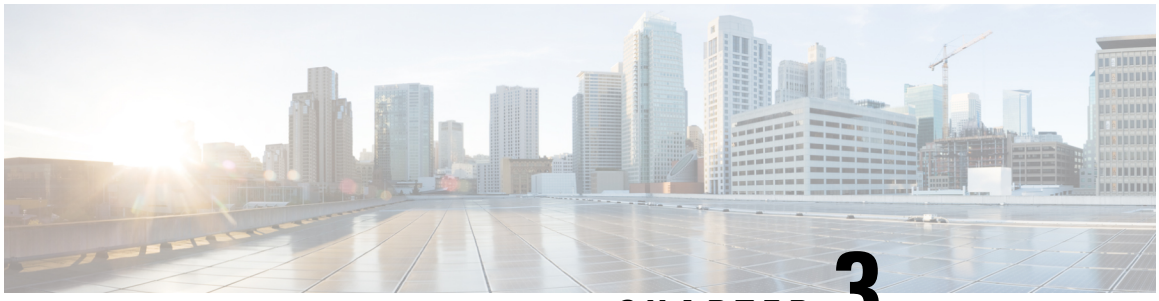
To initialize an IPS device, you must configure the following settings. These are network settings, and only a user with administrator privileges on the IPS device can configure them:

- Sensor name
- IP address
- Netmask
- Default route
- Enable TLS/SSL (to enable TLS/SSL in the web server on the device)
- Web server port
- Use default ports

You configure these settings through the **setup** command in Intrusion Prevention System Device Manager (IDM) or in a command-line session, depending upon which platform is used by your IPS device. For a list of supported IPS platforms, see the supported devices and software versions information at the following URL: http://www.cisco.com/en/US/products/ps6498/products_device_support_tables_list.html

For detailed information on these settings, refer to the technical documentation for your IPS device.

Note For information o n preparing an IOS IPS device for use, see Initial Preparation of a Cisco IOS IPS Router, on page 1793.



CHAPTER 3

Managing the Device Inventory

The following topics describe how to manage the device inventory:

Understanding the Device Inventory

Security Manager maintains an inventory of the devices that it manages. The inventory includes the information required to locate and log into the device, so that your policies can be deployed to the devices. The following topics describe some general concepts related to the device inventory:

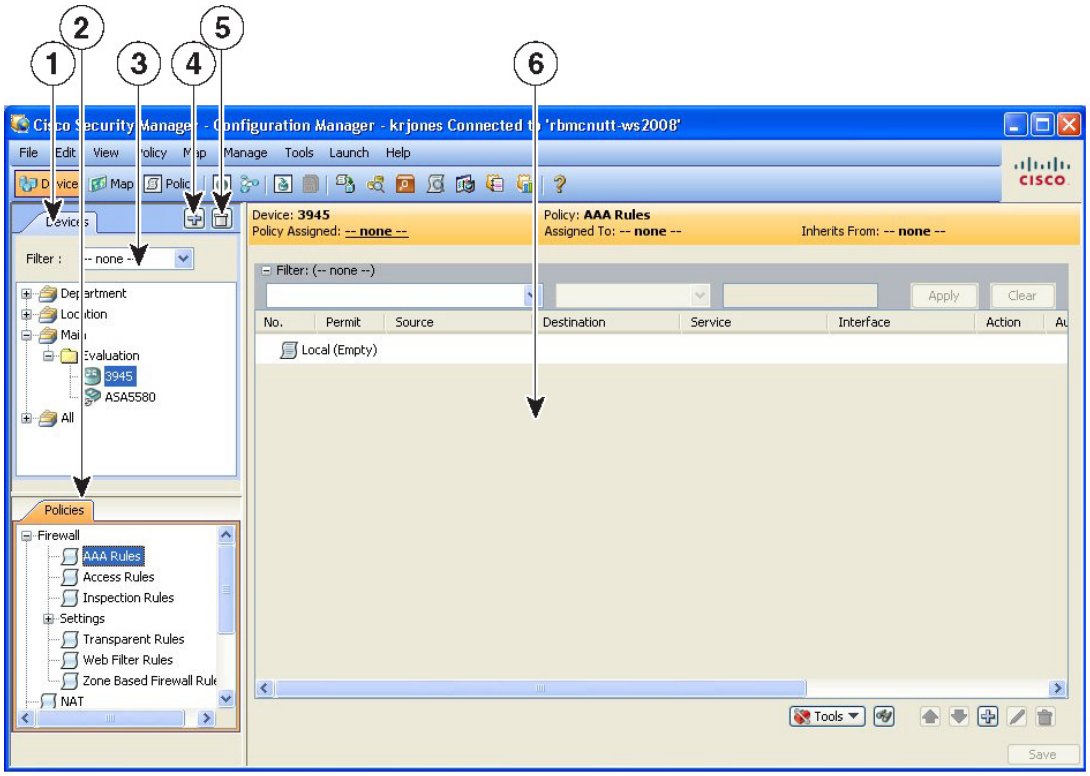
Understanding the Device View

The Device View button opens the Devices page, from which you can add and delete devices from the Security Manager inventory and manage device policies, properties, and interfaces centrally.

This is a device-centric view in which you can see all devices that you are managing and you can select specific devices to view their properties and define their settings and policies. You can define security policies locally on specific devices. You can then share those policies to make them globally available to be assigned to other devices.

The Devices page contains two panes. The left pane contains two elements: the Device selector, located in the top left pane, and the Policy selector, located in the bottom left pane. The right pane is the main content area. The following illustration shows the Devices page.

Figure 4: Devices Page



Device selector (1, 3, 4, 5)—Contains the following:

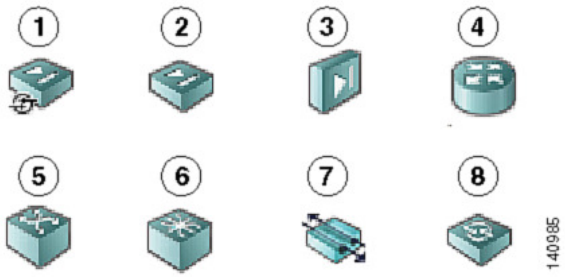
- Add and Delete buttons (4, 5)—Enables you to add and delete devices from the Security Manager inventory.
- Filter field (3)—Enables you to display a subset of devices based on the filtering criteria you define. For details, see Filtering Items in Selectors , on page 47.
- Device tree—Lists the device groups and devices that exist in the system. Each device type is represented by an icon. For information about the icons, see Figure 5: Device Icons.

If you hover the mouse pointer over a device, detailed information about the device appears in a popup window. The information is a summary of the device properties (see Device Properties: General Page , on page 110).

Note Beginning from version 4.8, Security Manager displays the updated version information of a device that has been upgraded using Auto Update Server (AUS). To enable this feature you must configure Security Manager details in the AUS user interface. If you hover the mouse over a device, the following message appears if AUS has successfully updated the device version:

"State Description: Version update is successfully completed by Auto Update Server. Check if any other configuration changes are required in Security Manager."

Figure 5: Device Icons



1	Adaptive Security Appliances (ASA)	5	Catalyst Switch
2	PIX Firewall	6	Catalyst 7600 Series Router
3	Catalyst security Services Modules: Firewall Services Module (FWSM) and ASA-SM	7	VPN 3000 Concentrator
4	Cisco IOS Router	8	Intrusion Prevention System (IPS)

- Shortcut menu options—When you right-click a device or device group, you get a menu of commands related to that device or group. These commands are shortcuts to commands available in the regular menus.

Policy selector (2)—Contains the following:

- Policy groups—Lists the policy groups that are supported on the selected device type. The policy groups that are displayed are dependent on four factors:
  - The type of device selected in the Device selector.
  - The operating system running on the device.
  - The target operating system version selected for determining which commands will be available for generated configurations.
  - Whether the device contains supported service modules.

For more information about policies, see Understanding Policies , on page 167

- Shortcut menu options—When you right-click a policy, you get a menu of commands related to that policy. These commands are shortcuts to commands available in the regular menus.

Contents pane (6)—The main content area.

The information displayed in this area depends on the device you select from the Device selector and the option you select from the Policy selector.

Understanding Device Names and What Is Considered a Device

Besides managing traditional devices, you can use Security Manager to manage virtual devices that you can define on some types of security devices. These virtual devices are treated as separate devices in the device

inventory, and they appear as separate entries in the device selectors. Because these virtual devices actually reside on a host physical device, many actions, such as deployment, will have to include the host device as well as the virtual device.

All physical devices appear in the device selectors. In addition, these are the types of virtual devices that appear in the device selectors:

- Security Contexts—You can define security contexts on PIX Firewall, FWSM, and ASA devices. Security contexts act as virtual firewalls. By default, security contexts appear in the device selectors using this naming convention: *host-display-name_context-name* , where *host-display-name* is the display name of the device on which the context is defined, and *context-name* is the name of the security context. For example, the admin security context on the device named firewall12 would be called firewall12_admin.

Tip You can control whether the display name is added to the context name using the **Prepend Device Name when Generating Security Context Names** property on the Discovery settings page (see Discovery Page , on page 536). However, if you do not add the display name, it is very difficult to determine the hosting device for a context, and the context names are not sorted with the host device (they do not appear in a folder attached to the host device). If you do not add the display name, Security Manager adds a numeric suffix to the context name if more than one context of the same name is added to the inventory (for example, admin_01, admin_02), and these numbers are not related to the host device.

- Virtual Sensors—You can define virtual sensors on IPS devices. Virtual sensors appear in device selectors using the *host-display-name_virtual-sensor-name* naming convention, and there is not a discovery setting to control this convention.

Tip You can always change the display name for a virtual sensor, security context, or other type of device in the device's properties.

Besides the naming conventions for virtual devices, you also need to understand the relationship between various types of device names:

- Display name—The display name is simply the name that appears within Security Manager in device selectors. This name does not have to be related to any name actually defined on the device. When you add devices to the inventory, a display name is suggested based on the DNS name or IP address you enter, but you can use whatever naming convention you want to use.
- DNS name—The DNS name you define for a device must be resolvable by the DNS server configured for the Security Manager server.
- IP address—The IP address you define for a device should be the management IP address for the device.
- Hostname—When you discover a device, the hostname property that is shown in the device properties is taken from the device's configuration. If you add devices using configuration files, and a file does not contain a hostname command, the initial hostname is the name of the configuration file.

However, the hostname device property is not updated if you change the hostname on the device. There is a Hostname policy in the device platform policy area, and it is this Hostname policy that determines the hostname that is defined on the device.

Understanding Device Credentials

Security Manager requires credentials for logging in to devices. You can provide device credentials in two ways:

- When you add a device manually or from network discovery. For more information, see these topics:
  - Adding Devices from the Network , on page 82
  - Adding Devices by Manual Definition , on page 94
- By editing the device properties. For more information, see Viewing or Changing Device Properties , on page 109.

You can provide the following device credentials:

- Primary Credentials—The username and password for logging into the device using SSH or Telnet. This information is required for device communication.
- HTTP Credentials—Some devices allow HTTP or HTTPS connections, and some devices (such as IPS devices) require it. By default, Security Manager uses the primary credentials for HTTP/HTTPS access, but you can configure unique HTTP/HTTPS credentials.
- RX-Boot Mode—(Optional) Some Cisco routers are designed to run from flash memory where they boot only from the first file in flash. This means that you must run an image other than the one in flash to upgrade the flash image. That image is a reduced command-set image referred to as RX-Boot (a ROM-based image).
- SNMP Credentials—(Optional) The Simple Network Management Protocol (SNMP) facilitates the exchange of management information between network devices. SNMP enables network administrators to manage network performance, find and solve network problems, and plan for network growth.

Note PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.

Rather than using device-based credentials, you can configure Security Manager to use the credentials you use when you log into Security Manager. You can then use the AAA server's accounting facilities to track configuration changes by user. Using user login credentials is suitable only if your environment is configured according to these standards:

- You use TACACS+ or RADIUS for change auditing. User-login credentials will be reflected in these accounting records. If you use device credentials, all changes made through Security Manager will come from the same account, regardless of which user made the change.
- User accounts are configured in the AAA server, and they have appropriate device-level access to perform configuration changes.
- You configure Security Manager and the managed devices to use the AAA server for authorization. For information on configuring Security Manager to use AAA, see the Installation Guide for Cisco Security Manager .
- You do not use one-time passwords.

If your network setup supports using user-login credentials, you can configure Security Manager to use them by selecting **Tools > Security Manager Administration**. Select **Device Communication** from the table of contents, and select **Security Manager User Login Credentials** in the **Connect to Device Using** field. The default is to use device credentials for all device access.

Related Topics

- Device Credentials Page , on page 114
- Adding Devices to the Device Inventory , on page 77
- Device Communication Page , on page 532

Understanding Device Properties

You define device properties when you add devices to Security Manager. Device properties are general information about the device, credentials, the group the device is assigned to, and policy overrides. You must provide some device property information, such as device identity and primary credentials, when you add the device, but you can add or edit the properties from the Device Properties dialog box.

To view the device properties, do one of the following in the Device selector:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

The Device Properties dialog box has two panes. The left pane contains a table of contents with these items:

- General—Contains general information about the device, such as device identity, the operating system running on the device, and device communication settings.
- Credentials—Contains device primary credentials (username, password, and enable password), SNMP credentials, Rx-Boot Mode credentials, and HTTP credentials.
- Device Groups—Contains the groups to which the device is assigned.
- Cluster Information—Contains detailed informatio for the cluster group, if any.
- License Information—Contains license status, license expiry date, and license fetch date information of the FPR-3100 series devices.

Note License information panel is visible only for FPR-3100 series devices in CSM 4.24.

- Policy Object Overrides—Contains global settings of certain types of reusable policy objects that you can override for this device.

When you select an item in the table of contents, the corresponding information is displayed in the right pane.

Notes

- Security Manager does not assume that the DNS hostname that appears on the Device Properties page is the same as the hostname that you configured on the device.
- When you add a device to Security Manager, you must enter either the management IP address or the DNS hostname. Because it is not possible to determine the management interface and, therefore, the management IP address when you discover from a configuration file, the hostname in the configuration file is used as the DNS hostname. If the hostname is missing in the CLI of the configuration file, the configuration filename is used as the DNS hostname.
- When you discover a device from the network, the DNS hostname in the Device Properties page is not updated with the hostname configured on the device. Therefore, if you want to specify the DNS hostname for the device, you must specify it manually when you add the device to Security Manager or on the Device Properties page.

For more information about device properties, see Viewing or Changing Device Properties , on page 109.

Adding Devices to the Device Inventory

When you add a device to Security Manager, you specify the identifying information for the device, such as its DNS name and IP address. This information is added during device discovery. You can also bring in existing network configurations associated with a device by initiating policy discovery. For complete information on policy discovery, see Discovering Policies , on page 178. Once you add the device, it appears in the Security Manager device inventory.

The New Device wizard guides you through the process of adding devices to the inventory. You can add devices from many different sources, and the path through the wizard differs significantly based on the method you are using.

Note Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

Note There is also another way to add devices. If you exported a .dev file from another Security Manager server, which contains not only a device inventory but also the policies and policy objects assigned to them, you can import the file using the **File > Import** command. For more information, see Importing Policies or Devices, on page 491.

Tips on Adding Devices and Service Modules

- For PIX Firewalls and FWSM and ASA devices that are configured for failover, add only the active unit to Security Manager. Ensure that the device is configured with a management IP address and use that address for discovery. When discovering Catalyst switches that contain more than one service module (FWSM or ASA-SM) configured for failover, when prompted, select **Do Not Discover Module** for the

failover modules. Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.

- Security Manager can manage ASA clusters after they have been configured as a cluster using the CLI bootstrapping as defined in the ASA Configuration Guide (see http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html). All the members of a cluster are assigned individual IP addresses during the bootstrap process. When adding a cluster to Security Manager, you do so by discovering the cluster using the main cluster IP address. The main cluster IP address is a fixed address for the cluster that always belongs to the current control unit. This is not the control unit's individual IP Address. For more information about clusters, see Working with Device Clusters , on page 79.
- Service modules are treated as separate devices. For most modules, you must add the service module separately from its host device. However, Security Manager can automatically discover FWSM or IDSM modules in a Catalyst 6500 device, so you need only add the parent device. (You cannot discover an ASA-SM during discovery of the parent device. You must add the ASA-SM separately.) The only exception is if you configure an FWSM or IDSM module to use a non-default port for HTTPS (SSL), in which case you must add the module separately.
- When adding an ASA-SM or FWSM that has multiple security contexts (they are running in multiple-context mode), do not add the security contexts individually using their management IP addresses. Instead, add the device using the admin context management address (this also adds the individual contexts). Then, configure Security Manager to deploy configurations to multiple-context devices serially as described in Changing How Security Manager Deploys Configurations to Multiple-Context FWSM , on page 474.
- You cannot add devices beyond the device limits defined by your Security Manager license. For example, if you have a license for 50 devices, and there are 45 devices in the inventory, if you try to add a multiple-context ASA with 6 security contents, the device addition and discovery fails.

The following topics describe the various methods of adding devices:

- **Add Device from Network**—To add devices that are currently active on the network, see Adding Devices from the Network , on page 82. Security Manager connects directly and securely to the device and discovers its identifying information and properties.
  - **Pros**—You need to specify minimal information about a device, and Security Manager obtains the detailed information directly from the device, ensuring accuracy.
  - **Cons**—You can add only one device at a time. You cannot add devices that have dynamic IP addresses, unless you determine the device's current IP address, add it using that address, and then update the device properties in Security Manager to identify the Configuration Engine that is managing the device.
- **Add from Configuration File**—To add devices by using a copy of the device configuration files, see Adding Devices from Configuration Files , on page 91.
  - **Pros**—You can add more than one device at a time.
  - **Cons**—You cannot use this method to add Catalyst 6500/7600 or IPS devices. When adding groups of configuration files, all files must be for the same device type.

Also, you cannot successfully discover policies that require a connection with the device. For example, if a policy points to a file that resides on the device, adding the device using the configuration file will result in

a Security Manager configuration that includes the **no** form of the command, because Security Manager cannot retrieve the referenced file from the device. For example, the **svc image** command for web VPNs might be negated.

- **Add New Device**—To add a device that does not yet exist in the network, so that you can pre-provision it in Security Manager, see Adding Devices by Manual Definition , on page 94. You can create the device in the system, assign policies to the device, and generate configuration files before installing the device hardware.
  - **Pros**—You can pre-provision devices that do not yet exist in the network.
  - **Cons**—You must specify more information than that required by any other method. If you create a Catalyst 6500 device, or a router that contains an IPS module, you should discover its modules by selecting **Policy > Discover Policies on Device**.
- **Add Device from File**—To add devices from an inventory file in comma-separated values (CSV) format, see Adding Devices from an Inventory File , on page 99.
  - **Pros**—You can add multiple devices of different types at one time. You can reuse the inventory list from your other network management applications, including CiscoWorks Common Services, Cisco Security Monitoring, Analysis and Response System (CS-MARS), and other Security Manager servers. If you use a file exported from another Security Manager server, you can optionally add the devices without discovering policies, which is convenient for adding offline or standby devices.
  - **Cons**—You cannot use this method to update the properties of devices already defined in the inventory. Also, policy discovery can fail if you attempt to import more than 100 devices at one time, and might fail for even fewer devices. In the case of IPS devices, do not add more than four IPS devices at a time to avoid policy discovery failures.

Working with Device Clusters

Clustering lets you group multiple ASAs together as a single logical device. A cluster provides all the convenience of a single device (management, integration into a network) while achieving the increased throughput and redundancy of multiple devices. Clustering is supported on ASA 5580 and 5585 devices running 9.0(1) or later and on ASA 5512-X, 5515-X, 5525-X, 5545-X and 5555-X devices running 9.1(4) or later.

Security Manager can manage ASA clusters after they have been configured as a cluster using the CLI bootstrapping as defined in the ASA Configuration Guide (see http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html).

All the members of a cluster are assigned individual IP addresses during the bootstrap process. When adding a cluster to Security Manager, you do so by discovering the cluster using the main cluster IP address. The main cluster IP address is a fixed address for the cluster that always belongs to the current control unit. This is not the control unit's individual IP Address.

Note You cannot convert a standalone device to a cluster in Security Manager by rediscovering the device after performing the necessary CLI bootstrapping. You must first delete the device from Security Manager, and then after performing the necessary CLI bootstrapping, you can add the cluster to Security Manager as a new device.

The cluster is represented as a single device in Security Manager. After the cluster has been added to Security Manager, you can finish configuring the cluster settings such as cluster interfaces and security policies.

Note Clustering has specific configuration requirements and restrictions. Please refer to the ASA documentation at http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html for detailed information about requirements, configuration recommendations, and performance information.

Unsupported Features on ASA Clusters

These features cannot be configured with clustering enabled, and the commands will be rejected.

- Unified Communications
- Remote access VPN (SSL VPN and IPsec VPN)
- The following application inspections:
  - CTIQBE
  - GTP
  - H323, H225, and RAS
  - IPsec passthrough
  - MGCP
  - MMP
  - RTSP
  - SIP
  - SCCP (Skinny)
  - WAAS
  - WCCP
- Botnet Traffic Filter
- Auto Update Server
- DHCP client, server, relay, and proxy
- VPN load balancing
- Failover
- ASA CX module

Centralized Features

The following features are only supported on the control unit, and are not scaled for the cluster. For example, you have a cluster of eight units (5585-X with SSP-60). The Other VPN license allows a maximum of 10,000

IPsec tunnels for one ASA 5585-X with SSP-60. For the entire cluster of eight units, you can only use 10,000 tunnels; the feature does not scale.

Note Traffic for centralized features is forwarded from member units to the control unit over the cluster control link; see "Sizing the Cluster Control Link" in the ASA documentation to ensure adequate bandwidth for the cluster control link. If you use the rebalancing feature, traffic for centralized features may be rebalanced to non-control units before the traffic is classified as a centralized feature; if this occurs, the traffic is then sent back to the control unit. For centralized features, if the control unit fails, all connections are dropped, and you have to re-establish the connections on the new control unit.

- Site-to-site VPN
- The following application inspections:
  - DCERPC
  - NetBios
  - PPTP
  - RADIUS
  - RSH
  - SUNRPC
  - TFTP
  - XDMCP
- Dynamic routing (spanned EtherChannel mode only)
- Multicast routing (individual interface mode only)
- Static route monitoring
- IGMP multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- PIM multicast control plane protocol processing (data plane forwarding is distributed across the cluster)
- Authentication and Authorization for network access. Accounting is decentralized.
- Filtering Services

Features Applied to Individual Units

These features are applied to each ASA unit, instead of the cluster as a whole.

- QoS—The QoS policy is synced across the cluster as part of configuration replication. However, the policy is enforced on each unit independently. For example, if you configure policing on output, then the conform rate and conform burst values are enforced on traffic exiting a particular ASA. In a cluster with 8 units and with traffic evenly distributed, the conform rate actually becomes 8 times the rate for the cluster.

- Threat detection—Threat detection works on each unit independently; for example, the top statistics is unit-specific. Port scanning detection, for example, does not work because scanning traffic will be load-balanced between all units, and one unit will not see all traffic.
- Resource management—Resource management in multiple context mode is enforced separately on each unit based on local usage.
- IPS module—There is no configuration sync or state sharing between IPS modules. Some IPS signatures require IPS to keep the state across multiple connections. For example, the port scanning signature is used when the IPS module detects that someone is opening many connections to one server but with different ports. In clustering, those connections will be balanced between multiple ASA devices, each of which has its own IPS module. Because these IPS modules do not share state information, the cluster may not be able to detect port scanning as a result.

Adding Devices from the Network

One of the easiest and most reliable ways to add devices to the inventory is to identify devices that are active in the network. By providing the IP address (or DNS hostname) of a device, and the credentials required to log into it, Security Manager can obtain much of the information it needs directly from the device, ensuring the accuracy of the information.

Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see Preparing Devices for Management, on page 57.
- If you are using ACS for authentication, define the devices in ACS. See the Installation Guide for Cisco Security Manager .

Related Topics

- Understanding the Device View , on page 71
- Working with Device Groups , on page 131
- Viewing or Changing Device Properties , on page 109

Step 1 In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

Step 2 On the Choose Method page, select **Add Device from Network** and click **Next** to open the Device Information page.

Step 3 On the Device information page, at minimum fill in the following fields. For a detailed explanation of all fields, see Device Information Page – Add Device from Network , on page 84.

- Enter either a hostname and DNS name, or an IP address (or both).
- Enter a display name, which is the name that will appear in the Security Manager Device selector.

- Select the correct operating system and version. If you are configuring a Catalyst switch or a 7600 router, ensure that you select **IOS - Catalyst Switch/7600** rather than one of the other IOS entries.
- Select the transport protocol that should be used to log into the device, if the device is configured to use a protocol that differs from the default defined in Security Manager. The default is set on the Device Communication administration page (see Device Communication Page , on page 532).

Click **Next**.

Step 4 On the Device Credentials page, enter the usernames and passwords required to log into the device. Enter at least the primary device credentials, which are the traditional User EXEC mode and Privileged EXEC mode passwords.

For information on the different types of credentials, see Device Credentials Page , on page 114.

Tip When you click Next or Finished from the Device Credentials page, Security Manager tests whether it can connect to the device. You cannot add the device unless the test succeeds. For more information, see Testing Device Connectivity , on page 457.

Step 5 (Optional) Click **Next** to open the Device Grouping page, and select the device group to which the imported devices should be added (see Device Groups Page , on page 119).

Step 6 Click **Finish**. Security Manager opens the Discovery Status dialog box where you can view the status of the device discovery and policy analysis (see Discovery Status Dialog Box , on page 189).

Tip If you are discovering policies while adding a device, carefully read any messages that are presented to you. These messages can contain important recommendations on the next steps you should take. We recommend that you immediately deploy the discovered configuration to a file so that Security Manager can take over ownership of the configuration. For more information about deployment methods, see Understanding Deployment Methods , on page 389.

Step 7 If you are adding a device that contains modules, and Security Manager supports discovering modules for that type of device, you are notified when the discovery of the device chassis is complete and you are asked if you want to discover the device's modules. When you click **Yes**, you are prompted for this information:

- Catalyst 6500 service modules—The Service Module Credentials dialog box opens prompting for the following information, based on the modules contained in the chassis. For more information, see Service Module Credentials Dialog Box , on page 88.
  - FWSM—The management IP address (recommended), the username and passwords, and the type of discovery you want to perform. If the FWSM is the second device in a failover pair, select **Do Not Discover Module** for the failover module. (Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.)
  - IDSM—The username and password and the type of discovery you want to perform.
  - ASA-SM—Discovering ASA service modules in a Catalyst 6500 through the chassis is not supported. You must directly add the ASA-SM using the management IP address of the ASA-SM.

    Note Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

- IPS Router Module—The type of discovery you want to perform, the management IP address, the username and password, and other SSL connection information. For more information, see IPS Module Discovery Dialog Box , on page 89.

You can skip discovery for any module you do not want to manage in Security Manager.

Click **OK**. You are returned to the Discovery Status dialog box, where you can view the progress of service module discovery. When finished, close the window and the device is added to the inventory list. A message will explain if you need to submit the activity for all devices to appear in the list (for example, individual security contexts defined on an ASA device).

Step 8 If you added a device that is managed by an Auto Update Server or Configuration engine, with the device selected in the device selector, select **Tools > Device Properties**. Select the server used with the device in the Auto Update or Configuration Engine settings. You can add the server if it is not listed. For more information, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.

Device Information Page – Add Device from Network

Use the New Device wizard's Device Information page for adding devices from the network to specify the device's identifying information.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

Field Reference

Table 15: New Device Wizard, Device Information Page When Adding Devices from the Network

Element	Description
Identity	

Element	Description
IP Type	Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ. You can add only devices that have static IP addresses. If you want to add a device that uses dynamic addresses (supplied by a DHCP server), determine the current IP address for the device, use that address, and after adding the device, update its properties to change the IP Type to Dynamic and to identify the AUS or Configuration Engine that is managing the device. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.
Hostname	The DNS hostname for the device. Enter the DNS hostname if the IP address is not known. **Note** You must enter either the DNS hostname or the IP address, or both.
Domain Name	The DNS domain name for the device.
IP Address	The management IP address of the device. The IP address must be in the dotted quad format, for example, 10.64.3.8. **Note** You must enter either the IP address or the DNS hostname, or both. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.
Display Name	The name to display in the Security Manager Device selector. If you enter a hostname or IP address, it is entered automatically in this field, but you can change it. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ -. : and space. **Note** Two devices cannot have the same display name.

Element	Description
OS Type	The family of the operating system running on the device. You must be careful to select the correct type, because your selection affects how Security Manager tries to log into the device and obtain its configuration. The options are: • **IOS 12.3+**—For Cisco routers running Cisco IOS Software Release 12.3 or higher. Do not select this for Catalyst 6500/7600 or other Catalyst devices. **Tip** Select this option for Aggregation Services Routers (ASR) even if they are running a version of 12.2. The ASR IOS releases are treated as higher releases. • **IOS - Catalyst Switch/7600**—For all Catalyst switches and 7600 devices. • **ASA**—For all ASA devices. • **FWSM**—For all FWSM devices. • **IPS**—For all devices running the IPS software. • **PIX**—For all PIX devices. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.
Transport Protocol	The protocol Security Manager should use when connecting to the device. Select a protocol that is configured on the device and for which you can supply credentials. Each device type has a default protocol that is the method normally used with the device.
System Context	Whether to discover the system execution space of a PIX Firewall 7, ASA, or FWSM device that is running in multiple-context mode. If you are discovering a device that hosts multiple security contexts, whether you select this checkbox has important implications in how you can configure the device in Security Manager. What gets discovered on the device also depends on whether you select the **Discover Policies for Security Contexts** checkbox. • Both **System Context** and **Discover Policies for Security Contexts** selected—This is the recommended selection. Security Manager discovers the system execution space and all of the security contexts defined on the device, and lists them in the device selector. The base display name represents the system execution space (for example, 10.10.11.24), whereas the security contexts are represented by nodes with the context name appended to the device name (for example, 10.10.11.24_admin), unless you changed the default naming convention configured on the Discovery page (see Discovery Page , on page 536). • **System Context** selected, **Discover Policies for Security Contexts** deselected—The system execution space is discovered and added to the device selector. You can then discover the policies for the security contexts at a later time. This method might be appropriate if you have one group of people who discover inventory and another group that discovers policies. • Neither checkbox selected—Only the Admin context gets discovered and added to the device selector. You cannot discover the other security contexts or manage them.

Element	Description
Discover Device Settings	
Discover	The type of elements that should be discovered and added to the inventory. You have these options: • Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option. When policy discovery is initiated, the system analyzes the configuration on the device, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces on the device and then imports the interface list. If the device is a composite device, all the service modules in the device are discovered and imported. If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered. **Note** During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager. • Inventory Only—Discovers interfaces and service modules (if applicable). • No Discovery—All discovery is skipped. No policy, interface, or service module information for the device is added to the device inventory.
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices and Cisco IOS routers. These domains contain policies that configure features that are specific to the selected platform. For more information, see Service Policies vs. Platform-Specific Policies , on page 168.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, Introduction to Firewall Services, on page 597.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see Overview of IPS Configuration , on page 1617 or Overview of Cisco IOS IPS Configuration , on page 1792.
RA VPN Policies	Whether to discover IPSec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see Managing Remote Access VPNs: The Basics, on page 1287.
Discover Policies for Security Context	Whether to discover policies for security contexts. Security contexts apply to PIX Firewall, ASA, or FWSM devices. This field is active only if you select **Static** for IP Type and **System Context**.

Service Module Credentials Dialog Box

Use the Service Module Credentials dialog box to add the credentials required to log into supported service modules in a Catalyst device.

The dialog box includes a group for each slot that contains a supported module, and the type of module is indicated. For example, a group might be called **Slot 3 (IDSM) Credentials**, which indicates that there is an IDSM in the third slot of the chassis.

Note Although Security Manager discovers VPN modules, the discovery is done through the chassis and no credentials are required. ASA service modules (ASA-SM) cannot be discovered through the chassis; you must add them individually.

Navigation Path

After you discover policies on a Catalyst chassis that can contain service modules, you are asked if you want to discover its service modules. If you click **Yes**, this dialog box appears. You can perform policy discovery using any of these methods:

- When adding a device from the network. See Adding Devices from the Network , on page 82.
- When adding devices from an export file. See Adding Devices from an Inventory File , on page 99.
- When performing policy discovery on a device that is already in the inventory. See Discovering Policies on Devices Already in Security Manager , on page 181.

Field Reference

Table 16: Service Module Credentials Dialog Box

Element	Description
Discovery Mode	The types of policies to discovery for this module: • Discover Inventory and Policies—Discover inventory and security policies. This is the recommended option. • Discover Inventory Only—Do not discover security policies, but discover inventory, such as VLAN configuration, security contexts, and interfaces. You can discover the policy configuration later by right-clicking the service module and then selecting **Discover Policies on Device**. • Do Not Discover Module—Skip discovery on this module and do not add it to the inventory.

Element	Description
Connect to FWSM	How Security Manager should access the FWSM: • Directly—Connect to the FWSM using its management IP address. This is the recommended approach. It is the required method if you are connecting to a failover device; otherwise, Security Manager might connect to a standby FWSM after a failover. • via Chassis—Connect to the FWSM through the chassis. This method has the restriction that there should be fewer than 20 security contexts defined on the FWSM. Security Manager connects to the Catalyst device through SSH and then to the FWSM through the **session** command. The number of concurrent SSH sessions is limited on a Catalyst device, with a default of 5. Policy discovery uses one SSH session for each security context, so a large number of contexts might lead to connection failures. If you select **Directly**, Security Manager connects to the FWSM through SSL, which has a greater concurrent session limit.
Management IP	The management IP address for the service module. For FWSMs, this field is not available if you select **via Chassis** for the connection method.
Username	The user name for the service module. For FWSMs running in multiple-context mode, a footnote explains which context's username and password to enter, either the system or the admin context. If you are connecting to a multiple-context mode device through the switch chassis, you must configure the same username and password for both the system execution space and the admin context, and specify those credentials in this dialog box. User names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.
Password	The User EXEC mode password for the service module. In the Confirm field, enter the password again.
Enable Password (FWSM only)	The Privileged EXEC mode password for the service module. In the Confirm field, enter the password again.

IPS Module Discovery Dialog Box

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS Module Discovery dialog box to add the credentials required to log into an IPS module, such as an AIM-IPS or NME, on a router you are adding to the inventory.

Navigation Path

After you discover policies on a router chassis that contains an IPS module, you are asked if you want to discover its modules. If you click **Yes**, this dialog box appears. You can perform policy discovery using any of these methods:

- When adding a device from the network. See Adding Devices from the Network , on page 82.
- When adding devices from an inventory file. See Adding Devices from an Inventory File , on page 99.
- When performing policy discovery on a device that is already in the network. See Discovering Policies on Devices Already in Security Manager , on page 181.

Field Reference

Table 17: IPS Module Discovery Dialog Box

Element	Description
Discovery	The type of discovery for this module: • Discover Inventory and Policies—Discover inventory and security policies. This is the recommended option. • Discover Inventory Only—Do not discover security policies, but discover inventory, such as virtual sensors and interfaces. You can discover the policy configuration later by right-clicking the module and selecting **Discover Policies on Device**. • Do Not Discover Module—Skip discovery on this module and do not add it to the inventory.
IP Address	The management IP address for the module.
HTTP Credentials Group The credentials required to log into the module.	
Username	The username for the module.
Password	The password for the specified username. In the Confirm field, enter the password again.
HTTP Port	The port configured for HTTP access to the module. The default is 80.
HTTPS Port	The port configured for SSL (HTTPS) access to the module. The default is defined on the Device Communication page (**Tools > Security Manager Administration > Device Communication**, for more information, see Device Communication Page , on page 532). The port typically used is 443. To override the default, deselect **Use Default** and enter the correct port number.
IPS RDEP Mode	The connection method to use for contacting IPS devices when making RDEP or SDEE connections (for event monitoring).

Element	Description
Certificate Common Name	The name assigned to the certificate. The common name can be the name of a person, system, or other entity that was assigned to the certificate. In the Confirm field, enter the common name again.

Adding Devices from Configuration Files

You can add devices to the inventory by having Security Manager process the device configurations without logging into the devices. For each device, you must copy the device configuration to a file and put the file on the Security Manager server.

You cannot use this procedure to add IPS or Catalyst 6500/7600 devices to the inventory.

Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see Preparing Devices for Management, on page 57.
- If you are using ACS for authentication, define the devices in ACS. See the Installation Guide for Cisco Security Manager.
- Copy the device configuration files to a directory on the Security Manager server. You cannot use a mounted drive. Use a naming convention that will help you select the correct device type for each configuration.

Note Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

Related Topics

- Understanding the Device View , on page 71
- Working with Device Groups , on page 131
- Viewing or Changing Device Properties , on page 109

Step 1 In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

Step 2 On the Choose Method page, select **Add from Configuration File** and click **Next** to open the Device Information page (see Device Information Page—Configuration File , on page 92).

Step 3 Select the device type for the configuration files from the Device Type selector, and select the appropriate system object ID. If you have configuration files for more than one device type, add them in batches based on device type.

Note Beginning from 4.26 version onwards, the Firepower device models FPR4K-SM-12, FPR4K-SM-24, FPR4K-SM-36, FPR4K-SM-44, FPR9K-SM-24, FPR9K-SM-24-NEB, FPR9K-SM-36, and FPR9K-SM-44 are not supported in CSM.

Step 4 Click **Browse** and select the configuration files that contain the devices (of the specified type) that you want to add.

Step 5 Select the appropriate discovery options to indicate which types of policies you want to discover, if any.

Step 6 (Optional) Click **Next** and select the device groups to which the new devices should belong.

Step 7 Click **Finish**. Security Manager opens the Discovery Status dialog box where you can view the status of the configuration file analysis (see Discovery Status Dialog Box , on page 189). When finished, close the window and the device is added to the inventory list.

Tip If you are discovering policies and get unexpected errors, it might be because the configuration file includes only the major Cisco IOS software version and not the point release information. Some policies defined on the device might use features that became available in a point release, which means that Security Manager might not recognize them as being supported. To resolve the problem, after adding the device, select it in the Device selector, right-click, and select **Device Properties**. On the General page, update the **Target OS Version** field with the software version closest to the one running on the device without being higher than it (you can get the version number using the **show version** command on the device's CLI). You can then rediscover policies by right-clicking and selecting **Discover Policies on Device**.

Step 8 If you added a device that is managed by an Auto Update Server or Configuration engine, with the device selected in the device selector, select **Tools > Device Properties**. Select the server used with the device in the Auto Update or Configuration Engine settings. You can add the server if it is not listed. For more information, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.

Device Information Page—Configuration File

Use the New Device wizard's Device Information page for adding devices from configuration files to select the configuration files and to specify policy discovery options.

Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

Related Topics

- Understanding the Device View , on page 71

- Device Groups Page , on page 119
- Discovering Policies , on page 178
- Discovery Status Dialog Box , on page 189

Field Reference

Table 18: New Device Wizard, Device Information Page When Adding Devices from Configuration Files

Element	Description
Device Type selector	Organizes the devices by device-type and device-family. Select the device type for the new device. You must select the correct device type for the configuration file you are adding.

Element	Description
System Object ID	The system object identifiers for the device type you selected from the Device Type selector. Select the correct ID for your device.
Configuration Files	The configuration files from the devices you are adding to the inventory. You can specify more than one configuration file, but they must all be for the same device type. Separate the file names with commas. For ASA, PIX, and FWSM devices that have multiple security contexts, keep in mind that there are separate configuration files for each security context and the system execution space (the system context). Select the configuration file for the system execution space to add the base device. Click **Browse** to select the files from the Security Manager server, or manually type in the file names (including the full path). For information on selecting files, see Selecting or Specifying a File or Directory in Security Manager , on page 53.
Options	The additional options available on the device. Select IPS if the IPS feature is available on the device.
License Supports Failover (ASA 5505, 5510 only.)	Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected. **Tip** If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.
Discover Device Settings	
Discover	The type of elements that should be discovered and added to the inventory. You have these options: • Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option. When policy discovery is initiated, the system analyzes the configuration file, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces defined in the file and then imports the interface list. If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered. **Note** During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager. • Inventory Only—Discovers interfaces and service modules (if applicable). • No Discovery—All discovery is skipped. No policy, interface, or service module information for the device is added to the device inventory.

Element	Description
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices. These domains contain policies that configure features that are specific to the selected platform. For more information, see Service Policies vs. Platform-Specific Policies , on page 168.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, Introduction to Firewall Services, on page 597.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see Overview of IPS Configuration , on page 1617 or Overview of Cisco IOS IPS Configuration , on page 1792.
RA VPN Policies	Whether to discover IPSec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see Managing Remote Access VPNs: The Basics, on page 1287.

Adding Devices by Manual Definition

If a device is not yet active on the network, you can add it to Security Manager and preprovision a configuration for the device. In general, you should not use manual definition for a device that exists in the network, because it is much easier to use one of the other techniques for adding devices.

Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see Preparing Devices for Management, on page 57.
- If you are using ACS for authentication, define the devices in ACS. See the Installation Guide for Cisco Security Manager .

Related Topics

- Understanding the Device View , on page 71
- Working with Device Groups , on page 131
- Viewing or Changing Device Properties , on page 109

Step 1 In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

Step 2 On the Choose Method page, select **Add New Device** and click **Next** to open the Device Information page.

Step 3 On the Device Information page, at minimum fill in the following fields. For a detailed explanation of all fields, see Device Information Page—New Device , on page 95.

- Select the device type from the Device Type selector at the left of the page, and select the system object ID at the bottom of the selector.
- In the IP Type field, select whether the device uses a static address (the IP address is defined on the device) or a dynamic one (the address is provided by a DHCP server).
- For devices with static addresses, enter either a DNS hostname and domain name, or an IP address (or both).
- Enter a display name, which is the name that will appear in the Security Manager Device selector.
- Ensure that the correct operating system and version are selected.
- If you use a server to manage configurations for the device, which is required for dynamically addressed devices, select the Auto Update Server or Configuration Engine that manages the device and enter the device identity string the server uses for the device. If the server is not listed, select **Add Server** and add it to the inventory. For information on adding servers, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.

When you are finished filling in the device information, click **Next** to proceed to the Device Credentials page.

Step 4 (Optional) On the Device Credentials page, enter the usernames and passwords required to log into the device. Typically, you need to enter the primary device credentials, which are the traditional User EXEC mode and Privileged EXEC mode passwords. If you do not enter credentials, you can add them later on the Device Properties page.

For information on the different types of credentials, see Device Credentials Page , on page 114.

Click **Next**.

Step 5 (Optional) On the Device Grouping page, select the group to which the device should belong, if any. See Device Groups Page , on page 119.

Step 6 Click **Finish**. The device is added to the inventory.

Tip If you are adding a PIX, ASA, or FWSM device, you should discover the factory default settings for the device and its security contexts. For more information, see Discovering Policies on Devices Already in Security Manager , on page 181.

Device Information Page—New Device

Use the New Device wizard's Device Information page for adding new devices (that do not yet exist in the network) to specify the device's identifying information.

Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

Field Reference

Table 19: New Device Wizard, Device Information Page When Adding New Devices

Element	Description
Device Type	
Device Type selector	Organizes the devices by device-type and device-family. Select the device type for the new device. **Note** Beginning with version 4.26, the Firepower device models FPR4K-SM-12, FPR4K-SM-24, FPR4K-SM-36, FPR4K-SM-44, FPR9K-SM-24, FPR9K-SM-36, and FPR9K-SM-44 are not supported in CSM. Secure Firewall 3105 device support is introduced for ASA 9.19(1) and above devices in CSM.
System Object ID	The system object identifiers for the device type you selected from the Device Type selector. Select the correct ID for your device.
Identity	
IP Type	Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.
Hostname (Static IP only)	The DNS hostname for the device. Enter the DNS hostname if the IP address is not known. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and hyphen (-). **Note** You must enter either the DNS hostname or the IP address, or both. Two devices cannot have the same DNS hostname and domain name combination.
Domain Name (Static IP only)	The DNS domain name for the device. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; period (.) and hyphen (-).

Element	Description
IP Address (Static IP only)	The management IP address of the device. The IP address must be in the dotted quad format, for example 10.64.3.8. **Note** You must enter either the IP address or the DNS hostname, or both. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.
Display Name	The name to display in the Security Manager Device selector. If you enter a hostname or IP address, it is entered automatically in this field, but you can change it. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ -. : and space. **Note** Two devices cannot have the same display name.
Operating System	
OS Type	The type of operating system. Based on the device type, the OS type is selected automatically. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.
Image Name	The name of the image that will run on the device.
Target OS Version	The target OS version for which you want to apply the configuration. This selection determines the type of commands used when Security Manager generates configuration files.
Options	The additional options available on the device. Select IPS if the IPS feature is available on the device.
Contexts	Whether the device hosts a single security context (Single) or multiple security contexts (Multi). This field is displayed only if the OS type is an FWSM, ASA, or PIX Firewall 7.0.
Operational Mode	The mode in which the device is operating. This field is displayed only if the OS type is FWSM, ASA, or PIX Firewall 7.0+. The options available are: Transparent or Router. If you choose Multi for Contexts, this mode defaults to Mixed. Mixed applies only to ASA 9.0+ and FWSM 3.1+ devices, and ASA-SMs. **Note** Beginning with Cisco Security Manager 4.21, although ASA software enhancements and bug fixes are still supported, any hardware support for routers is not rendered, as Cisco IOS Software has reached its end of life.

Element	Description
FXOS Mode	The FXOS mode in which the device is operating. The options available are Platform and Appliance. If you choose Appliance Mode, you can perform all end-user configuration either from the CLI, an on-box device such as ASDM, or from a multi-device manager such as Cisco Security Manager. The Platform Mode option is displayed only for Firepower 2000 series appliances. **Note** Beginning with version 4.20, Security Manager supports Appliance Mode for Firepower 2000 and 1000 series appliances.
Auto Update or Configuration Engine This group is named differently depending on the device type you select: • Auto Update—For PIX Firewall and ASA devices. • Configuration Engine—For Cisco IOS Routers. Use these fields to identify the server that manages the device, if any. A server is required for a device with a dynamic IP address. You cannot define a server for Catalyst 6500/7600 or FWSM devices. **Note** From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.	
Server	The Auto Update Server or Configuration Engine that manages the device. You can add servers to the list by selecting **Add Servers**, which opens the Server Properties dialog box (see Server Properties Dialog Box , on page 106). You can also edit the properties of a server by selecting **Edit Server**, which opens the Available Servers dialog box (see Available Servers Dialog Box , on page 108). For more information on managing this list of servers, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.
Device Identity	The string value that uniquely identifies the device in Auto Update Server or the Configuration Engine.
Additional Fields	
Manage in Cisco Security Manager	Whether Security Manager manages the device. This check box is selected by default. If the only function of the device you are adding is to serve as a VPN end point, deselect this check box. Security Manager will not manage configurations nor will it upload or download configurations on this device. For more information, see Including Unmanaged or Non-Cisco Devices in a VPN , on page 1085.

Element	Description
Security Context of Unmanaged Device	Whether to manage a security context whose parent (the PIX Firewall, ASA, or FWSM device) is not managed by Security Manager. This field is active only if the device you selected in the Device selector is a firewall device, such as PIX Firewall, ASA, or FWSM and that firewall device supports security contexts. You can partition a PIX Firewall, ASA, or FWSM into multiple security firewalls, also known as security contexts. Each context is an independent system with its own configuration and policies. You can manage these standalone contexts in Security Manager, even though the parent device is not managed by Security Manager. For more information, see Configuring Security Contexts on Firewall Devices, on page 2287 . **Note** If you select this check box, the available target OS version for the security module is displayed in the Target OS Version field.
License Supports Failover (ASA 5505, 5510 only.)	Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected. **Tip** If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.

Adding Devices from an Inventory File

You can add devices from an inventory file in comma-separated values (CSV) format. For example, an inventory file you exported from CiscoWorks Common Services Device Credential Repository (DCR) or another Security Manager server, or the seed file you used with Cisco Security Monitoring, Analysis and Response System (CS-MARS). For detailed information about the inventory file formats, see Supported CSV Formats for Inventory Import/Export, on page 487.

Tips

- This procedure explains how to use a CSV file for importing devices. If you have a .dev file, which includes not only the inventory but the policies and policy objects assigned to the devices, you cannot use this procedure. Instead, use the **File > Import** command and follow the instructions in Importing Policies or Devices, on page 491.
- If you want to build an inventory file by hand, the easiest approach is to export the Security Manager inventory in the desired format and use that file as the basis for your inventory file.
- The devices you import cannot be duplicates of devices already in the device inventory. You cannot, for example, update device information in the inventory by re-importing the device.

Before You Begin

Before beginning this procedure, ensure the following preparations have been made:

- Prepare the devices to be managed by Security Manager. For more information, see Preparing Devices for Management, on page 57.

- If you are using ACS for authentication, define the devices in ACS. See the Installation Guide for Cisco Security Manager.
- Put the inventory file you want to use on the Security Manager server. You cannot import devices from a file on your client system.
- If you are using a non-standard communication protocol for a type of device, update the global device communication properties to specify the correct protocol. For more information, see Device Communication Page , on page 532.

Related Topics

- Understanding the Device View , on page 71
- Working with Device Groups , on page 131
- Viewing or Changing Device Properties , on page 109

Step 1 In Device view, select **File > New Device** or click the **New Device** button in the Device selector. The New Device wizard opens to the Choose Method page.

Step 2 On the Choose Method page, select **Add Device from File** and click **Next** to open the Device Information page (see Device Information Page—Add Device from File , on page 101).

Step 3 Click **Browse** and select the inventory file that contains the devices that you want to import. Make sure that you select the correct file type to indicate how the file is formatted.

Security Manager evaluates the contents of the inventory file and displays the list of devices in the import table. All devices that have the status Ready to Import are automatically selected. The list identifies the reasons the unselected devices cannot be imported. You can deselect any devices that you do not want to import.

To see detailed information on a device, select it in the import table. The details are displayed in the bottom pane. You can select different discovery options or transport settings per device.

Tip If you selected an inventory file in the Security Manager format, you have the option to import the devices without performing policy discovery. This makes it possible for you to add devices that are not currently active in the network. If you want to perform policy discovery on a device, select the device, select **Perform Device Discovery** in the bottom panel, and select your discovery options. You can select policy discovery settings for all devices in a folder by selecting the folder instead of individual devices. The other CSV formats require that you perform policy discovery during import.

When you are finished analyzing the list and modifying discovery and transport settings, click **Next** to continue to the optional step of selecting groups, or click **Finish** to complete the wizard. In either case, Security Manager attempts to log into each device and perform the discovery you selected unless you are using a CSV file in Security Manager format and elected not to perform discovery. For the other formats, Security Manager must be able to log into the device to add it to the inventory. The status is displayed in the Discovery Status dialog box (see Discovery Status Dialog Box , on page 189).

Tip If you are discovering policies while adding a device, carefully read any messages that are presented. These messages can contain important recommendations on the next steps you should take. We recommend that you immediately deploy the discovered configuration to a file so that Security Manager can take ownership of the configuration. For more information about deployment methods, see Understanding Deployment Methods , on page 389.

Step 4 (Optional) On the Device Grouping page, select the device group to which the imported devices should be added (see Device Groups Page , on page 119).

Click **Finish**.

Step 5 If you are adding a device that contains modules and you are performing device discovery, and Security Manager supports discovering modules for that type of device, you are notified when the discovery of the device chassis is complete and you are asked if you want to discover the device's modules. When you click **Yes**, you are prompted for this information:

- Catalyst 6500 service modules—The Service Module Credentials dialog box opens prompting for the following information, based on the modules contained in the chassis. For more information, see Service Module Credentials Dialog Box , on page 88.
  - FWSM—The management IP address (recommended), the user name and passwords, and the type of discovery you want to perform. If the FWSM is the second device in a failover pair, select **Do Not Discover Module** for the failover module. (Security Manager always manages the active admin context, regardless of whether you added the primary or secondary failover service module.)
  - IDSM—The user name and password and the type of discovery you want to perform.
  - ASA-SM—Discovering ASA service modules in a Catalyst 6500 through the chassis is not supported. You must directly add the ASA-SM using the management IP address of the ASA-SM.
- IPS Router Module—The type of discovery you want to perform, the management IP address, the user name and password, and other SSL connection information. For more information, see IPS Module Discovery Dialog Box , on page 89.

You can skip discovery for any module you do not want to manage in Security Manager.

Click **OK**. You are returned to the Discovery Status dialog box, where you can view the progress of service module discovery.

Device Information Page—Add Device from File

Use the New Device wizard's Device Information page for adding devices from an inventory file to select the file and to specify policy discovery options. The inventory file must be on the Security Manager server; you cannot use an inventory file on a client system.

The formats you can use for the inventory file are explained in Supported CSV Formats for Inventory Import/Export, on page 487. Typically, the inventory file will have been exported from another Security Manager server, from a CiscoWorks Common Services server, or it will be the seed file used to populate the inventory of a Cisco Security Monitoring, Analysis and Response System (CS-MARS) server.

If you are trying to import devices using a .dev file, you need to use the File > Import command instead of this page. For more information, see Importing Policies or Devices, on page 491.

Tip If you are adding devices that contain modules, for example, a Catalyst switch with an FWSM, you are prompted for module discovery information after you click **Finish**.

Navigation Path

To start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.

Field Reference

Table 20: New Device Wizard, Device Information Page When Adding Devices from Inventory Files

Element	Description
Import Devices From	The inventory file that contains the devices you want to import. Click **Browse** to select the file on the Security Manager server. When selecting the file, you must also select the correct file type so that Security Manager can correctly evaluate the comma-separated values (CSV) file.
Device Import Table After you select a file, Security Manager evaluates its contents and displays the list of devices defined in the file in the table in the upper pane of the page. Security Manager automatically selects all devices whose status is Ready to Import. Typically, these are the devices that do not already exist in the device inventory. The table contains the following columns.	
Import	Select this checkbox to add the device to the inventory. You can select or deselect a folder to select or deselect all devices within the folder.
Display Name	The name that will be displayed in the Security Manager Device selector.
Host Name	The host name defined on the device.
Transport	The transport protocol that should be used to connect to the device.
Status	Whether Security Manager can import the device. Devices can be imported only if they have the status Ready to Import. For detailed information on a device's status, select it and read the expanded status information in the Status text box in the lower right corner of the page.
Device Type	The type of device.

Element	Description
Details Pane Below the device import table is a pane that displays the details for the device selected in the table. The Identity information repeats the table fields. The Status text box displays an extended explanation of the import status. The Discover Device Settings and Transport groups let you specify how Security Manager should import the device. If you select a folder instead of a device, the settings you select apply to all devices in the folder. The settings are explained below.	
Discover Device Settings	
Perform Device Discovery	Whether to discover policies directly from the device: • If the inventory file is in Security Manager format, you must select Perform Device Discovery to discovery inventory and policies (otherwise, the device is added without being evaluated). If you are adding offline or standby devices, you can leave this option deselected to easily add the device to the inventory. • All other inventory file types require device discovery.
System Context	Whether the selected device is the system execution space on a device running in multiple context mode (that is, more than one security context is defined on the device). If the device is the system execution space, you must select this option for discovery to complete correctly.
Discover	The type of elements that should be discovered and added to the inventory. You have these options: • Policies and Inventory—Discover policies, interfaces, and service modules (if applicable). This is the default and recommended option. When policy discovery is initiated, the system analyzes the configuration on the device, then imports the configured service and platform policies. When inventory discovery is initiated, the system analyzes the interfaces on the device and then imports the interface list. If the device is a composite device, all the service modules in the device are discovered and imported. If you select this option, the checkboxes below are activated and you can use them to control the types of policies that are discovered. **Note** During discovery, if you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the same ACL, it will be removed by Security Manager. • Inventory Only—Discovers interfaces and service modules (if applicable).

Element	Description
Platform Settings	Whether to discover the platform settings, which are also called platform-specific policy domains. Platform-specific policy domains exist on firewall devices and Cisco IOS routers. These domains contain policies that configure features that are specific to the selected platform. For more information, see Service Policies vs. Platform-Specific Policies , on page 168.
Firewall Policies	Whether to discover firewall policies, which are also called firewall services. Firewall services include policies such as access rules, inspection rules, AAA rules, web filter rules, and transparent rules. For details see, Introduction to Firewall Services, on page 597.
IPS Policies	Whether to discover IPS policies such as signatures and virtual sensors. For more information, see Overview of IPS Configuration , on page 1617 or Overview of Cisco IOS IPS Configuration , on page 1792.
RA VPN Policies	Whether to discover IPSec and SSL remote access VPN policies such as IKE proposals and IPsec proposals. This option is disabled if the device does not support remote access VPN configuration. For more information, see Managing Remote Access VPNs: The Basics, on page 1287.
Discover Policies for Security Contexts	For devices running in multiple-context mode, where more than one security context is defined on the device, whether to discover those security contexts.
Transport The transport settings determine the method Security Manager will use to contact the device. Each device type has a default method, but you can select your preferred transport method. The device must be configured to respond to the method you select. If you are not performing device discovery, the device is not contacted.	
Protocol	The protocol Security Manager should use when connecting to the device.
Server	For devices that use them, the name of the Auto Update Server (AUS) or Configuration Engine server the device uses to obtain configuration updates. The server must already be defined in Security Manager, or you must select the server from the import list, to import devices that use these servers.
Device Identity	For devices that use servers, the string value that uniquely identifies the device in the Auto Update Server or the Configuration Engine.

Working with the Device Inventory

The following topics describe tasks related to managing the device inventory.

- Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105
- Adding or Changing Interface Modules , on page 109
- Viewing or Changing Device Properties , on page 109
- Changing Critical Device Properties , on page 124

- Showing Device Containment , on page 128
- Cloning a Device , on page 128
- Deleting Devices from the Security Manager Inventory , on page 130

In addition to these topics, see the following related topics:.

- Adding Devices to the Device Inventory , on page 77
- Exporting the Device Inventory, on page 483
- Importing Policies or Devices, on page 491

Adding, Editing, or Deleting Auto Update Servers or Configuration Engines

If you want to use Security Manager to manage devices that use other servers to manage their configuration (for example, devices that have dynamic IP addresses supplied by a DHCP server, an address that might not stay constant between device reboots), you must identify the server in Security Manager. These are the servers you can use:

- Auto Update Server (AUS), which is used for upgrading device configuration files on PIX Firewall and ASA devices that use the auto update feature.
- Cisco Configuration Engine, which is used for upgrading device configuration files on Cisco IOS routers, ASA devices, and PIX Firewalls that use the configuration engine feature.

Security Manager cannot initiate direct communication with devices that acquire their interface addresses using DHCP because their IP addresses are not known ahead of time. Furthermore, these devices might not be running, or they might be behind firewalls and NAT boundaries when the management system must make changes. These devices connect to an Auto Update Server or Configuration Engine to get device information.

You can add AUS and Configuration Engine servers to the device inventory when you add devices manually or when you view device properties. You do not have to be adding or viewing the properties of a device that uses one of these servers, you just have to get to the appropriate field to access the controls to add, edit, or delete these servers.

You can also add these servers if you import them from an inventory file exported from CiscoWorks Common Services Device Credential Repository (DCR) or from another Security Manager server. If you import the server, you bypass the procedure described in this section. For more information about importing devices, see Adding Devices from an Inventory File , on page 99.

Before You Begin

If you want to populate the Security Manager inventory with your list of AUS and Configuration Engine servers without respect to adding devices, the best approach is to use the New Device wizard and to select **Add New Device** as the add method. This approach is described in this procedure.

You can also add or edit servers by selecting a device in the Device selector and clicking **Tools > Device Properties**. Click **General** in the device properties table of contents. The Server field is in either the Auto Update or Configuration Engine groups. You can add or edit only the type of server identified in the group name.

Tip Security Manager cannot determine the software version running on a Configuration Engine when you add it. However, Security Manager cannot deploy configurations correctly to all versions of Configuration. Ensure that your Configuration Engines are running a supported release (see the release notes for this version of the product to see which Configuration Engine versions are supported at http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html).

Related Topics

- Adding Devices from the Network , on page 82
- Adding Devices by Manual Definition , on page 94
- Viewing or Changing Device Properties , on page 109

Step 1 Locate the field that allows you to identify and manage either AUS or Configuration Engine entries in the device inventory:

a) Select **File > New Device** to open the New Device wizard, select **Add New Device** on the Choose Method page, and click **Next**.

b) On the Device Information page, select an ASA device from the Device Type selector, for example, Cisco ASA-5580 Adaptive Security Appliance. The **Server** field in the Auto Update group should include **Add Server** in the drop-down list. It will also include **Edit Server** if there are servers already defined. If these entries have specific server types (for example, Add Auto Update Server or Add Configuration Engine), then you will be limited to adding, editing, or deleting that type of server (in this case, select other types of devices to find the appropriate server type).

Step 2 To add a new AUS or Configuration Engine server, select **Add Server** from the Server drop-down list to open the Server Properties dialog box (see Server Properties Dialog Box , on page 106).

Step 3 To edit a server, select **Edit Server** from the Server drop-down list to open the Available Servers dialog box (see Available Servers Dialog Box , on page 108). You can then select the server and click **Edit**, which opens the Server Properties dialog box where you can make your changes.

From the Available Servers dialog box, you can also:

- Click **Create** to add a server.
- Select a server and click **Delete** to remove it from the inventory. You are asked to confirm the deletion. Make sure that the server is not being used by a device in the inventory.

Server Properties Dialog Box

Use the Server Properties dialog box to specify the properties of an Auto Update Server or Configuration Engine.

Depending on how you open this dialog box, the title of the dialog box might specify the type of server (for example, Auto Update Server Properties or Configuration Engine Properties). The dialog boxes are essentially identical.

Tip Security Manager cannot determine the software version running on a Configuration Engine when you add it. However, Security Manager cannot deploy configurations correctly to all versions of Configuration. Ensure that your Configuration Engines are running a supported release (see the release notes for this version of the product to see which Configuration Engine versions are supported at http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html).

Navigation Path

To open this dialog box, do one of the following:

- Select **Add Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Information page of the New Device wizard when adding a device manually. The selection might also be named Add Auto Update Server or Add Configuration Engine.
- Select **Add Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Properties—General page. The selection might also be named Add Auto Update Server or Add Configuration Engine.
- Click **Create**, or select a server and click **Edit**, in the Available Servers dialog box (see Available Servers Dialog Box , on page 108).

Field Reference

Table 21: Server Properties Dialog Box

Element	Description
Type	The type of server you are defining, either Auto Update Server or Configuration Engine. This field is displayed only if you are adding a server. You cannot change the type of an existing server. For new servers, this field is also not displayed if the title of the dialog box specifies the type of server you are adding.
Server Name	The DNS hostname of the server.
Domain Name	The DNS domain name of the server.
IP Address	The IP address of the server.

Element	Description
Display Name	The name to display in Security Manager for the server.
Username	The username for logging into the server.
Password	The password for accessing the server. In the Confirm field, enter the password again.
Port	The port number that the device managed by the Auto Update Server or Configuration Engine uses to communicate with the server. The port number is typically 443.
URN	This field is displayed only for Auto Update Servers. The uniform resource name for the Auto Update Server. The URN is the name that identifies the resource on the Internet. The URN is part of a URL, for example, /autoupdate/AutoUpdateServlet. The full URL could be: https://: *server ip* :443/autoupdate/AutoUpdateServlet where: • *server ip* is the IP address of the Auto Update Server. • 443 is the port number of the Auto Update Server. • /autoupdate/AutoUpdateServlet is the URN of the Auto Update Server.

Available Servers Dialog Box

Use the Available Servers dialog box to add, edit, or delete an Auto Update Server or Configuration Engine.

Depending on how you open this dialog box, the title of the dialog box might specify the type of servers listed (for example, Available Auto Update Servers or Available Configuration Engines). The dialog boxes are essentially identical.

Each row represents a single server, and shows the display name for the server in Security Manager, its IP address, and DNS hostname and domain name. If the dialog box title does not include the server type, the Type field specifies AUS or CE (Configuration Engine).

- To add a server, click the **Create** button and fill in the Server Properties dialog box (see Server Properties Dialog Box , on page 106).
- To edit the properties of a server, select it and click the **Edit** button.
- To delete a server, select it and click the **Delete** button. You are asked to confirm the deletion.

Navigation Path

To open this dialog box, do one of the following:

- Select **Edit Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Information page of the New Device wizard when adding a device manually. The selection might also be named Edit Auto Update Server or Edit Configuration Engine.
- Select **Edit Server...** from the **Server** field in the Auto Update Server or Configuration Engine groups on the Device Properties—General page. The selection might also be named Edit Auto Update Server or Edit Configuration Engine.

Related Topics

- Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105
- Viewing or Changing Device Properties , on page 109

Adding or Changing Interface Modules

Many devices allow you to add or change interface modules. When you make a change to the interface modules hosted in a device, you change the device's inventory.

If you add or change an interface card, you should rediscover the inventory on the device. Rediscovering inventory will replace the Interfaces policy (for routers, the Interfaces > Interfaces policy) and ensure that Security Manager has a correct view of the capabilities of the interfaces available on the device.

Note Inventory rediscovery is especially important for ASA 5580 devices in which you install a 4 GB Ethernet Fiber interface card. For other types of devices, you can usually make manual changes to the Interfaces policy, but rediscovering inventory is the easier and more reliable choice.

Step 1 Right-click the device and select **Discover Policies on Device**.

Step 2 In the Create Discovery Task dialog box, make at least these selections and click **OK** to start rediscovery:

- Discover from **Live Device**.
- Policies to discover: **Inventory**.

Step 3 After discovery completes, edit the Interfaces or Interfaces > Interfaces policy as appropriate and verify that the policy reflects your desired configuration.

Viewing or Changing Device Properties

When you add a device to the inventory, you specify at least some of the device's properties, such as names and credentials. For devices that are in the inventory, you can view and change the device properties.

Related Topics

- Understanding the Device View , on page 71

- Understanding Policies , on page 167
- Changing Critical Device Properties , on page 124

Step 1 In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

Step 2 In the Device Properties dialog box, click these entries in the table of contents in the left pane to view or change the properties. You must click **Save** before moving from one page to another.

- General—General information about the device, such as the device identity, the operating system running on the device, and transport settings. For information about the fields, see Device Properties: General Page , on page 110.
- Credentials—The device credentials required to log into the device. For information about the fields, see Device Credentials Page , on page 114.
- Device Groups—The groups to which the device belongs. For information about the fields, see Device Groups Page , on page 119.
- Group Information—Group details for the group, if any. For information about the fields, see Group Information Page , on page 120.
- License Information—License details of the FPR-3100 series device. For moreinformation about the fields, see License Information Page.

  Note License Information panel is visible only for the FPR-3100 series devices in CSM 4.24.

- Policy Object Overrides—The local overrides to policy objects for the device. Policy Object Overrides is a folder that contains the various policy object types that are available for the device. Click a specific policy object type to view the policy objects of that type used by the device and their overrides, if any. For more information about the fields, see Policy Object Override Pages , on page 124.

Device Properties: General Page

Use the Device Properties General page to add or edit information about the basic properties of the device.

Navigation Path

- From the Device selector, right-click a device and select **Device Properties**, then click **General**.
- From the Device selector, double-click a device, then click **General**.
- Select a device and select **Tools > Device Properties**, then click **General**.

Field Reference

Table 22: Device Properties General Page

Element	Description
Identity	
Device Type	The type of device.
IP Type	Whether the IP address for the device is static (defined on the device) or dynamic (supplied by a DHCP server). Depending on the IP type you select, the displayed fields differ. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. The IPv6 address is a 128-bit unique address. For IPv6 address, only Static IP Type is supported. Dynamic IP Type is not supported for IPv6 addresses.
Hostname (Static IP only)	The DNS hostname for the device. This is not necessarily the same name that is configured as the hostname on the device. This property is not updated with the hostname specified in the Hostname device property. It is also not updated with the name defined in the device configuration if you rediscover the device. If you added the device to Security Manager by adding its configuration file, the hostname is initially set to the name specified in the configuration file. If no hostname is specified in the configuration, the name of the file is used as the DNS hostname.
Domain Name (Static IP only)	The DNS domain name for the device.
IP Address (Static IP only)	The management IP address of the device, for example 192.168.3.8. **Note** You must enter either the IP address or the DNS hostname, or both. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. If a device is configured in dual stack, Security Manager would communicate with the device based on the device's IP address added in Security Manager. The IPv6 address is a 128-bit unique address.
Display Name	The name to display in the Security Manager Device selector. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ -. : and space.
Operating System	

Element	Description
OS Type	The type of operating system. Based on the device type, the OS type is selected automatically. **Note** Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address. This feature is available only for devices where the Operating System type is ASA or FWSM.
Image Name	The name of the image running on the device. The image name is updated whenever you deploy to the device or rediscover its policies.
Running OS Version	The version of the operating system running on the device.
Target OS Version	The OS version on which you want to base the device's configuration. When creating a configuration file using the rules you configure, Security Manager uses commands available in the target OS version. This field is read-only for IPS devices. You cannot change the target OS version to a version that significantly changes the feature set available for the device. For more information, see Changes That Change the Feature Set in Security Manager , on page 126.
Options	A read-only field whose values are NONE or IPS. The value IPS indicates that the IPS feature is available on the device.
IPS Running OS Version	A read-only field that displays the version of IOS IPS running on the router. This field does not appear if the Options field has the value of NONE.
IPS Target OS Version	A read-only field that displays the target version of IOS IPS running on the router. This field does not appear if the Options field has the value of NONE.
Contexts	Whether the device hosts a single security context (Single) or multiple security contexts (Multi). This field is displayed only if the OS type is an FWSM, ASA, or PIX Firewall 7.0.
Operational Mode	The mode in which the device is operating. This field is displayed only if the OS type is FWSM, ASA, or PIX Firewall 7.0+. The options available are: Transparent or Router. If you choose Multi for Contexts, this mode defaults to Mixed. Mixed applies only to ASA 9.0+ and FWSM 3.1+ devices, and ASA-SMs.
FXOS Mode	The FXOS mode in which the device is operating. The options available are Platform and Appliance. If you choose Appliance Mode, you can perform all end-user configuration either from the CLI, an on-box device such as ASDM, or from a multi-device manager such as Cisco Security Manager. The Platform Mode option is displayed only for Firepower 2000 series appliances. **Note** Beginning with version 4.20, Security Manager supports Appliance Mode for Firepower 2000 and 1000 series appliances.
Device Communication Settings	

Element	Description
Transport Protocol	The transport protocol that Security Manager should use when accessing the device or deploying configurations to it. If you select **Use Default**, the transport protocol set in the Device Communication page (**Tools > Security Manager Administration > Device Communication**) is used (see Device Communication Page , on page 532). You can select a different protocol if the device is not configured to use the default protocol. The available transport protocols differ depending on what the device type supports. For some device types, such as ASA, there is only one option, so the field is grayed out.
CS-MARS Monitoring	
Monitored By	The CS-MARS server that monitors this device, if any. Click **Discover CS-MARS** to have Security Manager determine which CS-MARS server is monitoring the device. If only one CS-MARS server is monitoring it, the field is updated with the server name. If there is more than one, you are prompted to select the CS-MARS server to use. Your selection determines which server is accessed when you try to view CS-MARS collected syslogs or events when viewing firewall access rules or IPS signatures in the policy rule tables for the device. Before you can discover a CS-MARS server for the device, the server must be register with Security Manager on the CS-MARS administration page (Tools > Security Manager Administration > CS-MARS). For more information, see CS-MARS Page , on page 518.
Auto Update or Configuration Engine This group is named differently depending on the device type: • Auto Update—For PIX Firewall and ASA devices. • Configuration Engine—For Cisco IOS routers. Use these fields to identify the server that manages the device, if any. A server is required for a device with a dynamic IP address.	
Server	The Auto Update Server or Configuration Engine that manages the device. For AUS, this server should match the one defined in the AUS policy (see AUS Page , on page 2001). You can add servers to the list by selecting **Add Servers**, which opens the Server Properties dialog box (see Server Properties Dialog Box , on page 106. You can also edit the properties of a server by selecting **Edit Server**, which opens the Available Servers dialog box (see Available Servers Dialog Box , on page 108. For more information on managing this list of servers, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105. For information on how these servers are used during deployment, see Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422.

Element	Description
Device Identity	The string value that uniquely identifies the device in Auto Update Server or the Configuration Engine. For AUS, this ID should match the one defined in the AUS policy (see AUS Page , on page 2001).
ASA-CX/FirePOWER Module	
Management IP	The management IP address of the ASA's CX or FirePOWER module; detected during device discovery, or after the module is added to the device. See Detecting ASA CX and FirePOWER Modules , on page 2857 for more information. This field is available only for an ASA CX or FirePOWER module already detected by Security Manager.
Manager Address	The IP address of the Cisco Prime Security Manager (PRSM) or FireSIGHT Management Center used to configure and manage the ASA-CX or FirePOWER module; detected during device discovery, or after the module is added to the device. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information. You can edit this address. However, Security Manager will not perform any validation of the address, and rediscovery or re-detection may alter this address. This field is available only for an ASA CX or FirePOWER module already detected by Security Manager.
Manage in Cisco Security Manager	Whether Security Manager manages the device. Security Manager will not manage configurations nor will it upload or download configurations on this device. You might want to include an unmanaged device in the inventory for these reasons: • If the only function of the device is to serve as a VPN end point. • If the device is a security context that you are using for failover. Because you cannot delete security contexts for managed devices without actually deleting the context from the device itself, you must unmanage the failover contexts.
License Supports Failover (ASA 5505, 5510 only.)	Whether an optional failover license is installed on the device. The option is active for ASA 5505 and 5510 devices only. Security Manager deploys failover policies to the device only if this option is selected. **Tip** If you discover policies from the device, Security Manager determines the license status and sets this option appropriately.

Device Credentials Page

Use the Device Credentials page to add or change the usernames and passwords that are required for device access. For information about device credentials, see Understanding Device Credentials , on page 75.

The Credentials page is the same whether you are adding a new device (in the New Device wizard), or viewing an existing device's properties.

When adding a new device, you are prompted for credentials only when adding devices manually or from the network.

Tip In the New Device wizard, when you click **Next** or **Finish** when adding a device from the network, Security Manager tests whether it can connect to the device using these credentials. The Device Connectivity Test dialog box stays open while the test is in progress (see Device Connectivity Test Dialog Box , on page 459). If the test fails, click **Details** to see detailed error information. If you are adding devices that contain modules, for example, a Catalyst switch with an FWSM, you are then prompted for module discovery information.

Important For a Cisco Security Manager-managed device, when you intend to change the password in the **Device Properties** page, make sure you update the same in the **User Accounts** page also. When you fail to do so, although the initial phase of communication between Security Manager and the device is successful and even the **Test Connectivity** gets verified successfully, the deployment still fails, because the password configured in the **User Accounts** page gets updated in the **Device Properties** page. It is therefore recommended to ensure that credential updates are made *parallelly* in **Device Properties** and the **User Accounts** pages.

Navigation Path

- For new devices, to start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.
- For existing devices, to open the device properties, double-click a device in the Device selector, then click **Credentials** on the Device Properties Page.

Field Reference

Table 23: Device Credentials Page

Element	Description
Primary Credentials Required for all device types. These credentials are used for SSH and Telnet connections, and for HTTP and HTTPS connections if you select **Use Primary Credentials** in the HTTP group. If you change the password for the specified user, or the enable password, in a device policy, Security Manager uses the old password to log in during deployment. After a successful deployment, the passwords in the device credentials are updated to the newly-deployed passwords. For information on updating the device policies related to these passwords, see the following topics: • ASA/PIX/FWSM devices— Configuring Device Credentials , on page 1921 • IPS devices— Configuring IPS User Accounts , on page 1631 • IOS devices— Defining Accounts and Credential Policies , on page 2403	
Username	The user name for logging into the device. The user should have privilege level 15. If the device requires an enable password only to configure it, you can leave the Username and Password fields blank and enter just the Enable Password. **Note** PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.
Password	The password for logging into the device (User EXEC mode). In the Confirm field, enter the password again.
Enable Password	The password that activates enable mode (Privileged EXEC mode) on the device if the mode is configured on that device. In the Confirm field, enter the password again.
HTTP Credentials Credentials for making HTTP or HTTPS connections to a device. Some devices support this type of connection, and other devices (such as IPS devices) require it.	

Element	Description
Use Primary Credentials Username Password	Whether Security Manager should use the configured primary credentials for HTTP and HTTPS connections. If the device uses different credentials for HTTP/HTTPS connections, deselect **Use Primary Credentials** and enter the username and password configured for HTTP/HTTPS. Reenter the password in the Confirm field. **Note** PIX/ASA/FWSM devices require that user names be at least four characters. Passwords can be three to 32 characters; we recommend that passwords be at least eight characters. For ASA devices running the software version 9.6(1) or later, you can enter a password up to 127 characters.
HTTP Port	The port to use for HTTP connections. The default is port 80. Change this setting only if the device is configured to accept HTTP connections on a different port.
HTTPS Port	The port to use for HTTPS connections. The default is port 443 (unless a different default is configured in the Security Manager device communication settings). To change the default, first deselect **Use Default**. Change this setting only if the device is configured to accept HTTPS connections on a different port. **Note** If you configure the local HTTP policy to be a shared policy and assign the HTTP policy to multiple devices, the HTTPS port number setting in the shared policy overrides the port number configured in the Device Credentials page for all devices to which the policy is assigned.
IPS RDEP Mode	The connection method to use for contacting IPS devices when making RDEP or SDEE connections (for event monitoring).
Certificate Common Name	The name assigned to the certificate. The common name can be the name of a person, system, or other entity that was assigned to the certificate. In the Confirm field, enter the common name again.
Additional Fields and Buttons	
Authentication Certificate Thumbprint (Device properties only.)	The certificate thumbprint for the device that is available in the Security Manager certificate data store. Click **Retrieve From Device** to obtain the current certificate from the device and to replace the one stored in Security Manager. For IPS devices, there are additional options for managing the certificate as described in Managing IPS Certificates , on page 1786.
RX-Boot Mode button	Opens the RX-Boot Mode Credentials Dialog Box , on page 118, where you can enter the credentials for booting the router from a reduced command-set image (RX-Boot). If these credentials are for a Cisco router that runs from flash memory (where it boots only from the first file in flash), you must run an image other than the one in flash to upgrade the flash image. The RX-Boot credentials are for running this other image.

Element	Description
SNMP button	Opens the SNMP Credentials Dialog Box , on page 118, where you can specify the SNMP community strings defined on the device.
Test Connectivity button (Device properties and manual device addition only.)	Tests whether Security Manager can connect to the device using the credentials you entered and the configured transport method. For more information about testing device connectivity, see Testing Device Connectivity , on page 457.

RX-Boot Mode Credentials Dialog Box

Use the RX-Boot Mode Credentials dialog box to add RX-Boot mode credentials, which are used for booting the router from a reduced command-set image (RX-Boot). Enter the RX-Boot Mode username and password; in the Confirm field, enter the password again.

Navigation Path

To open the RX-Boot Mode Credentials dialog box, click **RX-Boot Mode** in the Device Credentials Page , on page 114 in either the New Device wizard (when adding a device manually or from the network), or the Device Properties page.

SNMP Credentials Dialog Box

Use the SNMP Credentials dialog box to add SNMP credentials.

Navigation Path

To open the SNMP Credentials dialog box, click **SNMP** in the Device Credentials Page , on page 114 in either the New Device wizard (when adding a device manually or from the network), or the Device Properties page.

Field Reference

Table 24: SNMP Credentials Dialog Box

Element	Description
SNMP V2C These are the credentials for devices running SNMP version 2.	
RO Community String	The read-only community string. In the Confirm field, enter the community string again.
RW Community String	The read-write community string. In the Confirm field, enter the community string again.
SNMP V3 These are the credentials for devices running SNMP version 3.	
Username	The SNMP version 3 authentication user name.
Password	The SNMP version 3 authentication user password. In the Confirm field, enter the password again.

Element	Description
Auth Algorithm	The authorization algorithm for encrypting the password. You can choose MD5 or SHA-1.
Privacy Password	The SNMP version 3 encryption user password. In the Confirm field, enter the password again.
Privacy Algorithm	Specify the encryption level by choosing an encryption algorithm and version: • DES – Apply the Data Encryption Standard cipher algorithm, using 56-bit keys.. • 3DES – Use Triple DES; the Data Encryption Standard cipher algorithm is applied three times to each packet. • AES128 – Use the Advanced Encryption Standard with 128-bit keys. • AES192 – Use the Advanced Encryption Standard with 192-bit keys. • AES256 – Use the Advanced Encryption Standard with 256-bit keys.
Engine ID	Enter the hexadecimal identifier for the SNMP v3 authorization agent in the device.

Device Groups Page

Use the Device Groups page to assign the device to device groups. You can also edit or delete device groups from this page.

Navigation Path

- For new devices, to start the New Device wizard, from Device view, select **File > New Device**, or click the **Add** button in the device selector.
- For existing devices, to open the device properties, double-click a device in the Device selector, then click **Device Groups** on the Device Properties Page.

Related Topics

- Discovery Status Dialog Box , on page 189

Field Reference

Table 25: Device Grouping Page

Element	Description
Group Types, such as Department and Location	The group types defined in Security Manager, for example, Department or Location. Each field contains a list of the device groups defined within that group type. Select the device groups to which the device should belong. If you want to create a new device group, or group type, select **Edit Groups** from the drop-down list for any of the existing group types. This opens the Edit Device Groups page, where you can create new groups and group types or delete them (see Edit Device Groups Dialog Box , on page 133).
Set values as default	Whether to set the selected groups as the default groups. If you select this option, other devices you add are automatically added to these groups.

Group Information Page

Use the Device Properties Group Information page to view details for a group.

Navigation Path

- From the Device selector, right-click a device and select **Device Properties**, then click **Group Information**.
- From the Device selector, double-click a device, then click **Group Information**.
- Select a device and select **Tools > Device Properties**, then click **Group Information**.

- Policy Object Override Pages , on page 124

Field Reference

Table 26: Device Properties Group Information Page

Element	Description
Group Details	
Device Type	The type of device.
Group Name	The name assigned to the Group.

Element	Description
Group Control	The group member name of the device that is serving as the control unit. **Note** Changes to the control unit are not automatically reflected in Security Manager.
Retrieve From Device	Use **Retrieve From Device** to update the control unit information.
Interface Mode	Whether the interfaces are configured for Layer 2 load balancing (Spanned EtherChannel) or Layer 3 load balancing (Individual).
Management IP Pool Range	Enter the IP address pool used for cluster management. You can provide this value for the device in user context. This field is mandatory, if Eventviewer is being used to monitor syslogs for a Multi-context ASA cluster. If you leave this field blank, or enter an incorrect IP address pool, Eventviewer cannot categorize the syslogs for a specific context and drops the syslog events. **Note** Ensure that you enter valid IP addresses. Cisco Security Manager will not be validating the entered IP address pool.
Last Update in CSM	The date and time that group information was last updated for this group by Security Manager.
Group VPN Mode	Beginning from Cisco Security Manager 4.16, after discovering the Group device, group VPN mode will be displayed. This value will be Centralized or Distributed. **Note** This value is also displayed in the pop up window that appears when you hover the mouse pointer over the device in the device selector view.
Group VPN Backup	Beginning from Cisco Security Manager 4.16, the Group VPN Backup is displayed. One of the following values will be displayed for distributed mode — • Flat —When group VPN backup is on any other member • Remote Chassis — When group VPN backup is on a different chassis Group VPN Backup information is not shown for centralized VPN mode. The value for this field in a centralized VPN mode is N/A. **Note** This value is also displayed in the pop up window that appears when you hover the mouse pointer over the device in the device selector view.
Group Node Details The Group Node Details table lists details for each device in the group.	
Group ID	The group ID of the group node.
Node Name	The member name of the group node.
Serial Number	The serial number of the group node.

Element	Description
CCL IP	The group control link IP address for the group node.
CCL MAC	The group control link MAC address for the group node.
Site ID	The site that the current group member belongs to. Configuring a site ID prevents MAC address flapping.

License Information Page

You can monitor platform license subscription status, license expiry date, and license fetch date of the FPR-3100 series devices in the **Device properities** window.

CSM License Scheduler

The CSM license scheduler runs daily, fetches the platform license details from the device, and updates the same in the CSM database. It is a background process that runs once for every 24 hours and the default time is 4:00 a.m. The license scheduler time in the CSM property file is customizable. The CSM property file is located in ..\CSCOpx\MDC\athena\configcsm.properties. The following are the three modes supported in the license scheduler:

- AM—You can enter any time between 0 and 11 and the scheduler runs at that specific time every morning.
- PM—You can enter any time between 1 and 12 and the scheduler runs at that specific time in the evening.
- AMPM—Use this if you follow 24-hour clock format and the scheduler runs at that specific time, respectively.

Note License scheduler starts when a service or a system restarts and cannot be stopped.

The updated license information gets reflected in the CSM in **Policy Header** and **Device Properties** under the **License Information** tab.

Navigation Path

- From the Device selector, right-click an FPR-3100 series device and select **Device Properties**, then click **License Information**.
- From the Device selector, double-click an FPR-3100 series device, then click **License Information**.
- Select an FPR-3100 series device and select **Tools > Device Properties**, then click **License Information**.

Note License Fetch time for the Platform License information will not be displayed during DST.

License subscription status in Device Properties

For FPR-3100 series devices, CSM handles different status of platform license subscription. The **License Details** are displayed under **License Information** in **Device Properties** page. The following are the status of license subscriptions supported:

Status	Description
Fresh Install	No license changes after the installation.
Eval Mode	Configuration changes done and license feature tier standard is configured. The available license validity is 90 days.
Eval Mode Expired	The evaluation mode validity is expired.
Compliant	Firepower device is registered with the Account and the licenses are sufficient.
Grace Period	Number of licenses on the Account is insufficient compared to the number of subscribed devices. Configuration changes deployment is valid till 90 days.
Grace Period Expired	Grace period expiration. **Tip** Connect to the Account to remediate or to unregister unnecessary devices.

Note FPR-3100 series devices, whose platform license has expired, triggers activity validation error on deployment. Activity validation error prevents you from managing the device, hence you must either upgrade the license to perform any deployment or delete the device from the CSM. Use the **Re-discovery via inventory** option to update the Platform License details in CSM at once.

License subscription status in Policy Header

The **Platform License** for an FPR-3100 series device is displayed in color codes in the Policy Header GUI in CSM. The colour codes of license details are as follows:

- AUTHORIZED: BLACK
- GRACE PERIOD: ORANGE
- EVAL MODE: ORANGE
- EVAL EXPIRED: RED
- GRACE PERIOD EXPIRED: RED
- NO LICENSES IN USE: BLACK

Note Policy view does not display the license status for the FPR-3100 series devices.

Policy Object Override Pages

You can override the global settings for many types of policy objects from the Device Properties window of a selected device. This enables you to customize the definition of an object on that device. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246.

The Policy Object Overrides folder in the table of contents includes all of the types of objects for which you can create overrides for the particular type of device. When you select an object type, the existing policy objects that are configured to allow device overrides appear in the table in the right pane, if any. If an object has an override already defined for the device, the Value Overridden? column contains a check mark.

You can create and manage overrides for these objects. Select an object and you can do the following:

- To create an override, click the Create Override button. This opens the edit dialog box for that type of object. Click the Help button for object-specific information.
- To edit an existing override, click the Edit Override button.
- To remove an override, click the Delete Override button.

Navigation Path

Double-click a device in the Device selector, then click the desired policy object type in the **Policy Object Overrides** folder in the table of contents in the left pane.

Changing Critical Device Properties

You must use caution when changing the image version of a device, the device type, or the security context or operational mode of FWSM and ASA devices that are managed by Security Manager. In certain cases, these changes enable a different set of features for the device. As a result, some of the policies that you configured for the device in Security Manager might no longer apply.

The key device changes, their effect on the policies available in Security Manager, and the procedure you should follow to implement these device changes, are described in the following sections:

- Image Version Changes That Do Not Change the Feature Set in Security Manager , on page 125
- Changes That Change the Feature Set in Security Manager , on page 126

Image Version Changes That Do Not Change the Feature Set in Security Manager

The following image version changes *do not* affect the types of policies available for that device in Security Manager:

- Upgrading from one IOS individual release number to another individual release number within the same Cisco IOS release; for example, upgrading from IOS 12.3(10) to 12.3(13).
- Upgrading from any IOS 12.1 image to any 12.2 image.
- Upgrading from any IOS 12.2 image to any 12.3 image.
- Upgrading from any IOS 15.0 image to any 15.1 image.
- Upgrading from any IOS 15.2 image to any 15.3 image.
- Upgrading from any PIX 6.x image to another PIX 6.x image.
- Upgrading from any PIX 7.x image to another PIX 7.x image, retaining the same security context and mode configuration.
- Upgrading from any ASA 7.x image to another ASA 7.x image, retaining the same security context and mode configuration.
- Upgrading from any ASA 8.0(x)-8.2(x) image to another ASA 8.0(x)-8.2(x) image, retaining the same security context and mode configuration.
- Upgrading from any FWSM 2.x image to another 2.x FWSM image, retaining the same security context and mode configuration.
- Upgrading from any FWSM 3.x image to another 3.x FWSM image, retaining the same security context and mode configuration.
- Upgrading a Catalyst 6500/7600 chassis from any IOS 12.x image to another IOS 12.x image.

Note This list applies only to images that are supported by Security Manager. For a list of supported images, see *Supported Devices and Software Versions for Cisco Security Manager* for this version of the product at http://www.cisco.com/en/US/products/ps6498/products_device_support_tables_list.html .

For these cases, use the following procedure to change the image version.

Related Topics

- Understanding the Device View , on page 71
- Understanding Device Properties , on page 76
- Understanding Policies , on page 167
- Changes That Change the Feature Set in Security Manager , on page 126

Step 1 Upgrade the image version on the device.

Step 2 In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.

- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

Step 3 In the Device Properties dialog box, change the **Target OS Version** property on the General page to the updated version number and click **Save**.

Changes That Change the Feature Set in Security Manager

These are the main types of device changes that affect the policy feature set available for a device:

- Image version changes—The following image version changes affect the types of policies available for that device in Security Manager:
  - Upgrading to ASA 8.4(x) or higher from an ASA 8.3(x) or lower release.
  - Upgrading to ASA 8.3(x) or higher from an ASA 8.2(x) or lower release.
  - Changes in the major version number for ASA, PIX, FWSM, and IPS devices. For example, upgrading an ASA from 8.x to 9.x, or downgrading an IPS device from 7.x to 6.x.
  - Upgrading from an IOS 12.1 or 12.2 image to an IOS 12.3 or 12.4 image.
  - Downgrading from an IOS 12.3 or 12.4 image to an IOS 12.1 or 12.2 image.
  - Upgrading to IOS 15.2 or higher from an IOS 12.3 or lower release.

If you make these changes, and you do not have any policies defined that are affected by the change, you might be able to change the target OS version of the device. Security Manager prevents you from changing the target OS version of a managed device to a version that changes the types of policies that are available for that device, and informs you when it cannot make the change (identifying the problem policies). Therefore, you must first delete the device from Security Manager, perform the image change, then add the device back.

Certain types of policies, such as access rules, are not affected by changes in image version or changes in platform type.

Changes to NAT policies that were introduced in the 8.3 and 9.0.1 ASA releases require that the NAT policies are rediscovered in Security Manager. This can be accomplished by deleting the device and then adding it back in to Security Manager, as described below, or you can rediscover just the NAT policies using the Discover Policies on Device feature. For more information on the Discover Policies on Device feature, see Discovering Policies on Devices Already in Security Manager , on page 181.

Note If an ASA device was upgraded or downgraded from the current version to a higher or lower version outside of Security Manager, you should delete the device and then add it back in to Security Manager.

- Security context and operational mode changes—Changes that you make to the security context and operational mode settings on an FWSM or ASA device enable a different set of features on that device. These changes occur if you change the device from:
  - Single context to multiple context (or vice-versa).
  - Routed mode to transparent mode (or vice-versa).

Security Manager prevents you from changing the security context or operational mode settings of a managed device. Therefore, you must first delete the device from Security Manager, change the context or mode, then add the device back.

Certain policy types (for example, Banner, Clock, Console Timeout, and HTTP) are not affected by changes in operational mode. Other policy types (for example, ICMP, SSH, and TFTP, in addition to Banner and Clock) are not affected by changes in security context settings.

- Replacing device hardware—In some cases, you might replace a particular device but retain the original contact information (such as the IP address), for example:
  - Replacing a PIX firewall with a Cisco IOS router.
  - Replacing a PIX firewall with an ASA device.
  - Replacing a router with a firewall device.
  - Replacing a router with a new router of a different model.

In all of these cases, the new device changes the types of policies available for that device in Security Manager. Security Manager prevents you from modifying the hardware model of an existing device. Therefore, you must first delete the device from Security Manager, change the physical device, then add the device back.

Certain policy types (for example, access rules) are not affected by changes in device type.

We recommend that you share the policies configured on your device that will not be affected by the change before you remove it from Security Manager. This provides a useful method for reassigning the policies to the device (with any inheritance and policy object references intact) after you add it back to Security Manager. The following procedure describes how to do this.

Related Topics

- Understanding the Device View , on page 71
- Understanding Device Properties , on page 76
- Understanding Policies , on page 167
- Image Version Changes That Do Not Change the Feature Set in Security Manager , on page 125

Step 1 Submit and deploy all the changes you configured for the device in Security Manager. This ensures that the desired configuration is on the device before the image upgrade.

Step 2 Share the local policies defined on the device:

a) Right-click the device in the Device selector, then select **Share Device Policies**. By default, all policies configured on the device (local and shared) are selected for sharing in the Share Policies wizard.

b) Deselect the check box next to each existing shared policy, as indicated by the hand in the policy icon. You should do this because there is no need to create a copy of the shared policies that already exist; you will reassign the existing shared policies after the image version upgrade.

c) Enter a name for the shared policies. We recommend using the device name as a convenient means of identification. For example, if the device name is MyRouter, each shared policy is given the name MyRouter. Make a note of all the policies you are creating for this purpose.

d) Click **Finish**. The selected local policies become shared policies.

Step 3 Delete the device from Security Manager.

Step 4 Make the desired change to the device, for example, upgrade the image version, change the operational mode, or replace the device.

Step 5 Add the device back to Security Manager and perform policy discovery.

Step 6 Reassign the policies to the device:

a) Right-click the first policy type displayed in the Device Policies selector, then select **Assign Shared Policy**.

b) In the Assign Shared Policy dialog box, do one of the following:

- If a local policy was previously defined on the device, select the shared policy you created for this procedure and click **OK**.
- If a shared policy of this type was previously assigned to the device, select it and click **OK**.

c) (Local policies only) Right-click the policy type again in the Device Policies selector, then select **Unshare Policy**.

d) Repeat the process for each policy type that is relevant to the device's configuration. If a shared policy is not available, this indicates that this is a policy type that was not available for the previous image version.

Step 7 (Optional) Delete the shared policies created for this procedure from Policy view:

a) Select **View > Policy View** or click the **Policy View** icon on the toolbar.

b) Select one of the policies you want to delete and click the **Assignments** tab in the work area to verify that the policy is not assigned to any devices.

c) Click the **Delete Policy** button beneath the Shared Policy selector to delete the policy.

d) Repeat the process for each policy type that you want to delete.

Showing Device Containment

You can display the service modules, security contexts, and virtual sensors that are contained in devices that include them. Based on the type of device, you can view these contained elements:

- Catalyst 6500 devices—The IDSM and FWSM service modules, security contexts, and virtual sensors.
- For FWSM, PIX Firewall 7.0, and ASA devices—The security contexts defined on the device. For information about security contexts, see Configuring Security Contexts on Firewall Devices, on page 2287.
- IPS devices—The virtual sensors defined on the device.

To view contained items, in Device view, select one of these types of devices and then select **Tools > Show Containment**, or right-click the device and select **Show Containment**. The Composite View dialog box opens and displays elements contained in the selected device, if any.

Cloning a Device

A cloned (duplicate) device shares the configurations and properties of the source device. Cloning a device saves you time because you do not need to re-create configuration and properties on the new device.

The cloned device shares the device operating system version, credentials and grouping attributes with the source device, but it has its own unique identity, such as display name, IP address, hostname, and domain name. You can clone only one device at a time.

Note You cannot clone a Catalyst switch or a Catalyst 6500/7600 device.

Related Topics

- Understanding the Device View , on page 71
- Copying Policies Between Devices , on page 199

Step 1 Do one of the following:

- (Device view) Select the device and select **File > Clone Device**, or right-click the device in the Device selector and select **Clone Device**.
- (Map view) Right click a device and select **Clone Device**.

The Create a Clone of Device dialog box appears.

Step 2 Enter the IP address and names for the clone in the appropriate fields. Following are the available attributes:

- **IP Type**—Whether the device uses a static or dynamic (DHCP-provided) IP address. You cannot change the IP type when cloning a device.
- **Hostname**—(Static IP only.) The DNS hostname for the cloned device.
- **Domain Name**—(Static IP only.) The DNS domain name for the cloned device. If you do not provide the domain name, Security Manager uses the default domain name configured on the server.
- **IP Address**—The management IP address of the cloned device, for example, 10.10.100.1. If you do not know the IP address, enter the DNS hostname in the Hostname field. You must enter either the IP address or the hostname for devices with static IP addresses.

Note Beginning with version 4.12, Security Manager server to device communication for ASA devices is supported over either IPv6 address or over IPv4 address.

- **Display Name**—The name that appears in Security Manager device lists. The maximum length is 70 characters. Valid characters are: 0-9; uppercase A-Z; lowercase a-z; and the following characters: _ -. : and space.
- **Device Identity**—(Dynamic IP only.) The string value that uniquely identifies the device in Auto Update Server or Configuration Engine. This field appears only if the device is configured to use one of these servers.
- **Clone VPN Assignments**—Whether to copy the VPN assignments defined for the device. This field is displayed only if the device supports VPN assignments.

You can clone the VPN assignments of a device that is a spoke in a hub-and-spoke configuration, or a device that participates in a full mesh topology. If you clone a spoke device, the new device is added to the VPN as a new spoke with the same policies. If you clone a device in a full mesh VPN, the new device is added to the full mesh VPN with the same policies. You cannot clone a device in a point-to-point VPN topology.

Step 3 Click **OK**. A clone of the source device with its unique display name is created in the Device selector.

Deleting Devices from the Security Manager Inventory

If you do not want to continue managing a device in Security Manager, you can delete it from the inventory. Deleting a device from Security Manager does not change any configuration settings on the device.

Tip If someone is configuring policies on the device, locks will prevent you from deleting the device.

There are special considerations when deleting certain types of devices:

- If the device participates in a VPN, deleting the device removes it from the VPN. However, if removing the device invalidates the VPN topology, the entire VPN topology is also deleted when you delete the device. You are warned of this and given the opportunity to cancel the device deletion.
- For ASA, PIX, and FWSM devices running in multiple context mode, or for IPS devices that contain virtual sensors, deleting the device also deletes all of its security contexts or virtual sensors. You cannot delete an individual security context or virtual sensor using this procedure: instead, you must modify the appropriate policies on the hosting device to remove them.
- If you delete a device that contains managed service modules, the contained devices are also deleted. For example, if you added a Catalyst switch and its contained FWSM, if you delete the switch, the FWSM is also deleted. You are warned if contained devices will be deleted.

Tip Device deletion requires the removal of a lot of information from the database. If you delete a lot of devices at one time, it can take a while for the operation to complete. If you have a lot of devices to delete, consider deleting them in smaller groups.

Step 1 In Device view, do one of the following:

- Select the devices you want to delete, or a device group if you want to delete all devices within the group, right-click and select **Delete Devices**. You can also click the **Delete Device** button (the trash can icon) above the device selector.
- Select **File > Delete Device**, then select the devices to delete in the Device Selector dialog box and click >> to move them to the selected devices list (which is pre-filled with any devices that were selected in the device tree). You can select a device group to delete all of its member devices. Click **OK** when finished.

Tip When you select a device group, you are deleting only the devices in the group, you are not deleting the group itself. For information on deleting device groups, see Deleting Device Groups or Group Types , on page 135.

Step 2 You are asked to confirm that you want to delete the devices.

Security Manager then validates whether the device can be deleted. If problems or potential problems are identified, they are listed in the Device Delete Validation Dialog Box , on page 131. This dialog box shows errors (indicating devices that cannot be deleted) as well as warnings and informational messages.

You can elect to confirm the deletion of devices that have warnings or informational messages if you accept the consequences described in the message. The dialog box has an **OK** button if you can continue deleting all selected devices,

or a **Continue** button if there are any error messages. If you click **Continue**, you are deleting only those devices without error conditions. You are asked to confirm.

Device Delete Validation Dialog Box

Use the Device Delete Validation dialog box to view error, warning, and informational messages during device deletion. For detailed information on deleting devices, see Deleting Devices from the Security Manager Inventory , on page 130.

Each row represents a device for which a validation issue arises when trying to delete it. Displayed are the message severity icon, device display name, and the result of validation, which indicates the reason why you cannot delete the device, or warnings or information about the perhaps unexpected consequences of deleting the device. If there are no messages for a device, it is not listed.

Double-click a row or select it and click the **Details** button to read longer messages. The information is displayed in the Device Delete Validation Details dialog box in a more readable format.

The message severity can be one of the following.

- Error—A problem was detected that will prevent you from deleting the device. For example, another user has a lock on a device.
- Warning—Proceed with caution. For example, deleting the device will invalidate a VPN topology, and if you continue, the VPN topology will also be deleted.
- Information—A minor problem exists. For example, deleting the device will delete it from a VPN.

To proceed with the device deletion, click the OK or Continue button, which is actually the same button:

- If the text says **OK**, then when you click it, all devices you selected for deletion are deleted.
- If the text says **Continue**, then there are errors for some of the devices you selected. If you click Continue, you will delete only those devices that do not have errors.

If all selected devices have errors, the button is greyed out and you must click Cancel. Resolve any errors before attempting to delete the devices.

Navigation Path

This dialog box appears only if you try to delete devices and Security Manager determines that there are problems with the deletion.

Working with Device Groups

You can create device groups to help you organize your devices for more effective device management. The following topics explain device groups and how to use them:

- Understanding Device Grouping , on page 132
- Creating Device Group Types , on page 134
- Creating Device Groups , on page 134
- Deleting Device Groups or Group Types , on page 135

• Adding Devices to or Removing Them From Device Groups , on page 135

Understanding Device Grouping

Device groups are simple, arbitrary, organizational collections of devices that you create for more effective network visualization. They are not policy-sharing entities. They are distinct from the various policy object groups (for example AAA server group objects and user group objects). For information on policy objects, see Managing Policy Objects, on page 229.

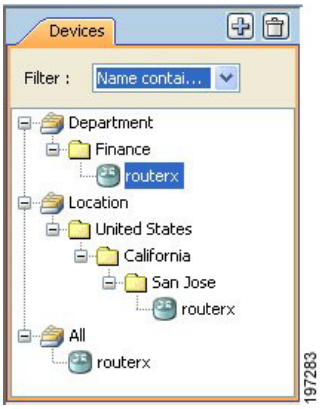
Tip If you have a large number of devices, grouping them can make it easier to select a subset of devices when you deploy changes to them. For example, if there is a set of devices that you know you will want to deploy changes to simultaneously, if you put them in a single device group, you just have to select the group in the deployment job. For more information about policy deployment, see Managing Deployment, on page 381.

Device grouping enables you to view a subset of devices in the inventory. The device group hierarchy has two types of folders:

- Device group types—Group types are the highest level in the hierarchy. A group type can contain specific device groups, but it cannot contain devices, except for the All group type, which includes all devices in the inventory. Security Manager comes with the group types Department and Location predefined, but you do not need to use them, and you can delete them. You can create a maximum of 10 group types.
- Device groups—Device groups are subfolders within a group type folder. You can create multiple levels of nested device groups. You can place devices within device groups. However, a device can be in only one group within a group type. For example, in Figure 6: Device Groups under the group type, Location, you can assign routerx to San Jose, but you cannot assign routerx to San Jose and California.

Figure 6: Device Groups shows an example of nested device groups with devices in some of the groups. Notice that an individual device can reside in multiple groups. In this example, routerx is in the Finance group (under the Department group type), and also in the Location > United States > California > San Jose nested group. If you select routerx in any of these places, you are configuring a single device (the configurations are not tied to the grouping).

Figure 6: Device Groups



Security Manager lets you create or delete group and group types, and put devices in groups, in many locations in the interface:

- When adding devices to the inventory—The New Device wizard includes a Device Grouping page, where you can create device group types and select a group for the newly-added device. You can also select a default group to which all new devices are added.
- When viewing the device inventory in Device view—The File > Edit Device Groups command opens a dialog box where you can create or delete groups and group types. If you select a group or group type in the Device selector, the File menu and the right-click shortcut menu includes commands for adding groups or adding devices to groups.

To add devices to a group, or remove them from a group, select the group and select **File > Add Devices to Group**.

- When viewing the properties for a device—The Device Grouping page allows you to select the groups to which the device belongs, and to set defaults for devices added to the inventory. This is the only place where you can remove a device from a device group. Double-click a device in the Device selector to open the device properties.
- When using the administration pages—Select **Tools > Security Manager Administration > Device Groups** to open the administration page for device groups, where you can create or delete groups and group types, but you cannot add devices to groups here.

- Deleting Device Groups or Group Types , on page 135
- Adding Devices to or Removing Them From Device Groups , on page 135

Edit Device Groups Dialog Box

Use the Edit Device Groups dialog box to manage the device groups and group types defined in the device inventory.

Navigation Path

Do one of the following:

- Right-click a device group type or a device group in the Device selector and select **Edit Device Groups**.
- Select **File > Edit Device Groups**.
- From the Device Grouping page in the New Device wizard or for existing devices, the device properties, select **Edit Groups** from a group type list. See Device Groups Page , on page 119.

Related Topics

Field Reference

Table 27: Edit Device Groups Dialog Box

Element	Description
Groups	Displays the device groups and group types. To rename a group or type, select it and then click it again to make the text editable. Type in the new name and press Enter.
Add Type button	Click this button to create a new group type. The type is added with a default name. Overtype the name and press Enter. You can have a maximum of 10 group types.
Add Group to Type button	Click this button to add a device group to the selected device group or group type.
Delete button (trash can)	Click this button to delete the selected device group or group type and all device groups that it contains. Deleting a device group or group type does not delete any devices it contains.

Creating Device Group Types

This procedure describes the most direct method to create device group types. For information on other methods of adding group types, see Understanding Device Grouping , on page 132.

Device group types are the top-level categories in your device group hierarchy. If you want add a device group, see Creating Device Group Types , on page 134.

Related Topics

- Understanding Device Grouping , on page 132
- Deleting Device Groups or Group Types , on page 135
- Adding Devices to or Removing Them From Device Groups , on page 135

Step 1 Select **File > Edit Device Groups**.

The Edit Device Groups page opens (see Edit Device Groups Dialog Box , on page 133).

Step 2 Click **Add Type**. A new device group type entry is added to the selector.

Step 3 Enter a name for the group type and press **Enter**.

Step 4 Click **OK** to close the Edit Device Groups page.

Creating Device Groups

This procedure describes the most direct method to create device groups. For information on other methods of adding groups, see Understanding Device Grouping , on page 132.

Device groups are the lower-level categories in your device group hierarchy, and are added either within a device group type (top-level) or within another device group. If you would rather add a device type group, see Creating Device Group Types , on page 134.

Related Topics

- Understanding Device Grouping , on page 132
- Adding Devices to or Removing Them From Device Groups , on page 135
- Deleting Device Groups or Group Types , on page 135

Step 1 Select a device group or group type in the Device selector and select **File > New Device Group**, or right-click and select **New Device Group**.

The Add Group dialog box appears.

Step 2 Enter a name for the device group and click **OK**. The new device group is added to the Device selector.

Deleting Device Groups or Group Types

If you no longer need a device group or group type, you can delete it. The only group type that you cannot delete is the All group.

When you delete a group or group type, you delete any groups that are in it. However, you are not deleting any devices. The devices that are in the group remain in the inventory and can be found in other groups to which they belong (you can find all devices in the All group).

There are many ways to delete device groups and group types. This procedure explains the most direct way. For information on other methods of deleting them, see Understanding Device Grouping , on page 132.

Step 1 In Device view, select **File > Edit Device Groups**. The Edit Device Groups page opens (see Edit Device Groups Dialog Box , on page 133).

Step 2 Select the group type or group you want to delete and click the **Delete** button. You are asked to confirm the deletion.

Adding Devices to or Removing Them From Device Groups

You must create a device group before you add devices to it. To create groups, see Creating Device Groups , on page 134.

Related Topics

- Understanding Device Grouping , on page 132
- Filtering Items in Selectors , on page 47

Step 1 Select the device group in the Device selector, right-click and select **Add Devices to Group**. The Add Devices to Group dialog box appears.

Step 2 To add devices to the group, select the devices in the Available Devices selector and click >> to move them to the Selected Devices list.

To remove devices, select them in the Selected Devices list and click <<.

Step 3 Click **OK**. The device group membership is adjusted to include the devices that were in the Selected Devices list.

Working with Device Status View

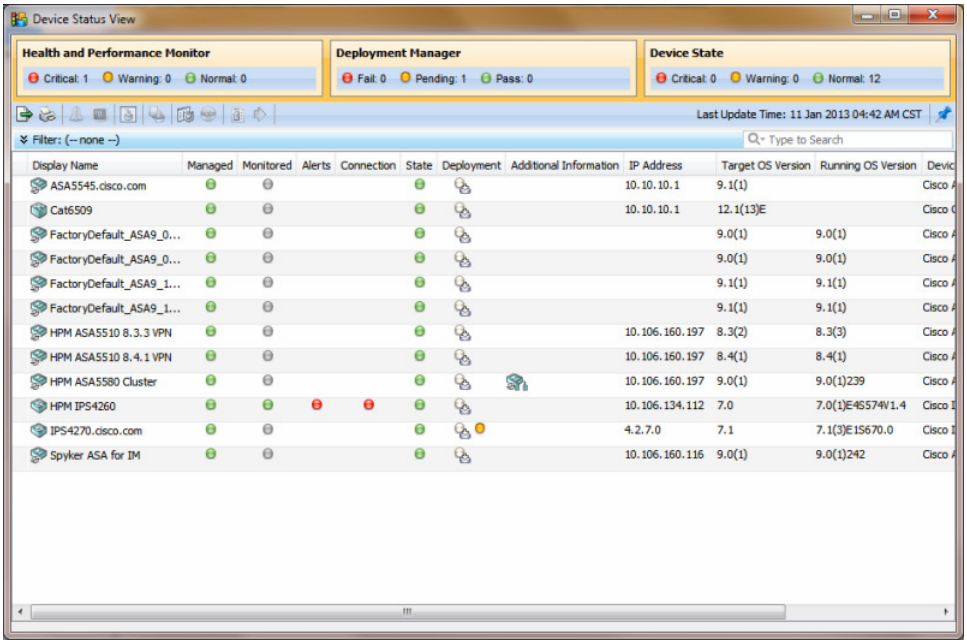
You can use the Device Status View to quickly see the status of the devices in the Security Manager inventory. The Device Status View window aggregates information from several applications and tools within Cisco Security Manager. You can use the Device Status View to quickly see the status of all your devices or specific groups of devices and can easily navigate to the areas in Security Manager you need to act on that information.

Caution In some cases, for a particular device, Health and Performance Monitor displays a "critical" device status while Configuration Manager displays a "normal" device status. Restarting the services or the server does not resolve this discrepancy. For this reason, you should monitor device status in HPM in addition to Configuration Manager.

Navigation Path

- Select **View** > **Device Status View**. The Device Status View window opens showing information for all devices.
- Select a device group in the Device selector. The Device Status View window opens showing information for the devices that are part of that device group or a subgroup.

Figure 7: Device Status View



Field Reference

Table 28: Device Status View

Element	Description
Device Status Summary Boxes The Device Status Summary boxes provide a high-level view of the overall status of the devices in the Device Status View. The counts shown in the summary boxes reflect the status for the devices in the currently selected device group. If you select View > Device Status View or select the All devices group, then the summary boxes reflect the counts for all devices. **Note** Filtering the device list in the Device Status View window will not affect the counts in the Device Status Summary boxes.	
Health and Performance Monitor summary box	Shows the device counts for the Critical (red), Warning (yellow), and Normal (green) alert statuses.
Deployment Manager summary box	Shows the device counts for the Fail (red), Pending (yellow), and Pass green) deployment statuses.
Device State summary box	Shows the device counts for the Critical (red), Warning (yellow), and Normal (green) device states.
Device Status View Toolbar The Device Status View toolbar provides the following buttons: **Note** These options are all also available from the right-click menu for a device.	
	Allows you to export the device status information to a PDF file.
	Allows you to print the device status information.
	Shows alert status information for the selected device in the Health & Performance Monitor application. For more information, see Health and Performance Monitoring, on page 2787.
	Shows monitoring information for the selected device in the Health & Performance Monitor application. For more information, see Health and Performance Monitoring, on page 2787.
	Opens the Deployment Manager. For more information, see Managing Deployment, on page 381.
	Opens the Image Manager application for the selected device. For more information, see Using Image Manager, on page 2889.

Element	Description
	Opens the device manager for the selected device. For more information, see Starting Device Managers , on page 2849.
	Launches the Cisco Prime Security Manager (PRSM) application for the selected device. See Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856 for more information.
	Opens the Device Properties dialog box for the selected device. For more information, see Viewing or Changing Device Properties , on page 109.
	Allows you to navigate to the selected device from the Device Status View window. For more information, see Understanding the Device View , on page 71.
	Opens online help for the current page. For more information, see Accessing Online Help , on page 54.
	Undocks the Device Status View window, which enables you to use other product features while keeping the window open.
	Docks the Device Status View window. **Note** If the selection has changed in the Device Selector, the Work area will reflect the current selection when the Device Status View window is docked.
Table Filter You can filter the list of devices displayed in the Device Status View table to help you find items meeting specific criteria. For more information, see Filtering Tables , on page 50.	
Device Status Table	
Display Name	The display name for the device. This is the name used for display in the Security Manager Device selector and is not necessarily the same as the host name for the device.
Managed	Whether Security Manager manages the device.
Monitored	Whether the device is monitored by the Health and Performance Monitor.
Alerts	Indicates current alert level for the device; can be Normal (green), Warning (yellow), or Critical (red). You can hover over the alert indicator to view more details.

Element	Description
Connection	Indicates HPM's ability to connect to/poll the device: Connected, Authentication Error, Certificate Mismatch Error, Connection error, Timeout during Read operation, or Service unavailable. You can hover over the alert indicator to view more details. **Note** If the device is not selected as a Normal or Priority Monitored Device in HPM (Tools > Device Selector), this status will not apply. Changes to Monitored Device selection may take several minutes to become effective and be reflected on screen.
State	Indicates the current state of the device. You can hover over the alert indicator to view more details. For ASA devices that are being monitored by the Health and Performance Monitor, the State column will also alert when possible out of band changes have been detected. Any out of band changes that occurred prior to monitoring the device in Health and Performance Monitor will not be reflected in the State column. For more information about out of band changes, see Understanding How Out-of-Band Changes are Handled , on page 392 and Detecting and Analyzing Out of Band Changes , on page 426.
Deployment	Indicates the deployment method and the current deployment status for the device. Deployment status can be Fail (red), Pending (yellow), and Pass (green). You can hover over the alert indicator to view more details.
Additional Information	Shows additional information for the device, such as whether the device is in cluster mode. You can hover over the alert indicator to view more details.
IP Address	The management IP address of the device, for example 192.168.3.8.
Hostname.Domain	The DNS hostname and domain name for the device.
Target OS Version	The OS version on which you the device's configuration is based.
Running OS Version	The version of the operating system running on the device.
Device Type	The type of device.

CHAPTER 4

Managing Activities

Whether you are using Workflow or non-Workflow mode, all policy configuration is done within an activity, which is also called a configuration session in non-Workflow mode. In Workflow mode, you must explicitly create and manage activities, whereas in non-Workflow mode much of the activity creation and management is done automatically for you. However, in non-Workflow mode, you are in fact working within an activity whenever you modify policies, and so you should understand the basic activity concepts.

In non-Workflow mode with Ticket Management enabled, an activity is created automatically and transparently whenever you open a ticket. You must actively open and manage tickets in this mode.

The following topics provide information about activities:

- Understanding Activities , on page 141
- Working with Activities/Tickets , on page 148

Understanding Activities

An activity is a temporary context within which you define policies and assign them to devices. You do not need to create an activity to import, create, or delete devices (unless you perform policy discovery as part of the action), or to perform various system management tasks.

The requirements for creating or opening activities differ depending on your Workflow mode:

- Non-Workflow mode with Ticket Management—An activity is created automatically and transparently whenever you open a ticket. If you do not explicitly open a ticket, you are prompted to create a new ticket or open an existing one whenever you perform an action that requires an activity. You must actively open and manage tickets in this mode.
- Non-Workflow mode without Ticket Management—An activity is created automatically and transparently for you whenever you define, modify, or assign policies to devices. The same activity is used until you submit your changes to the database, and is automatically closed and reopened as needed. You cannot actively open or manage activities in non-Workflow mode. These types of activities are also called configuration sessions.
- Workflow mode—If you do not explicitly open an activity, you are prompted to create a new activity or open an existing one whenever you perform an action that requires an activity. You must actively open and manage activities in Workflow mode.

Note Workflow mode works in the same manner whether Ticket Management is enabled or not. Enabling Ticket Management in Workflow mode simply enables the Ticket field for use with Activities. Entering a ticket ID is not required, but if one is used, the Ticket field can be configured to link to an external change management system. For more information, see Ticket Management.

When you create an activity, or one is created for you, you open a virtual copy of the Security Manager policy database. You define and assign policies within this copy. Changes that you made within this copy are only available within the copy. Other users in different activities cannot see these changes. After the activity is submitted and, in Workflow mode, approved, the changes within this copy are committed to the database so that all other users can view the changes. Then, you can create a deployment job to generate the relevant CLI commands and deploy them to the devices.

How you submit your activity changes differs depending on Workflow mode:

- Non-Workflow mode with Ticket Management (default)—Select **Tickets > Submit Ticket** to submit your changes to the policy database.
- Non-Workflow mode without Ticket Management—Select **File > Submit** to submit your changes to the policy database.
- Workflow mode—Select **Activities > Submit Activity** if you are working with an activity approver, or **Activities > Approve Activity** if you do not have a separate activity approver.

The following topics describe why activities are important and how they operate in Workflow mode:

Benefits of Activities

You use activities to control changes made to policies and policy assignments. Although how activities are implemented depends on the workflow settings you choose, all activities provide the following benefits:

- Audit trail—Activities track changes that are made in Security Manager. You can use this information to determine what changes were made and who made the changes as described in Viewing Activity/Ticket Status and History , on page 165. For both Workflow and non-Workflow mode, there is also an audit report that provides visibility into activities and other actions, as described in Working with Audit Reports, on page 497.
- Safety mechanism—Activities provide a means for experimenting with changes. Because you are making the changes to a private database view, if you do not want to implement the changes, you can easily discard the activity or configuration session. For more information, see Discarding an Activity/Ticket , on page 164.

- Task isolation—The policies that are modified within an activity (or configuration session) are locked from being modified within other activities. This prevents conflicting changes that could make a policy unstable. For more information, see Activities and Locking , on page 143.

In addition, the changes you make within an activity are visible *only* within the activity. Other users see only the last approved committed configurations, unless they view your activity before you close it (in Workflow mode).

Activity Approval

When you enable Workflow mode, you can choose to operate with or without an activity approver.

If your organization requires a different person with higher permissions to approve activities, you can enable workflow with an approver. When using Workflow mode with an approver, the activity must be approved by a person with the appropriate permissions so the policies can be committed to the database. This approval process at the policy definition level helps to ensure that no inappropriate configurations reach the network devices.

If you choose to operate without an approver, the person defining the policies has the permissions to approve them.

For information about enabling or disabling activity approval and changing the default activity approver, see Workflow Page , on page 590.

Activities and Locking

To prevent multiple users from making conflicting changes, Security Manager obtains activity-level locks when a user performs certain actions within an activity or configuration session in Workflow or non-Workflow mode. This prevents two or more people from making changes to the same feature policy, policy assignment, or object at the same time.

Security Manager also uses locking to ensure that operations related to the committed configuration always run exclusive of one another. These operations can be divided into two categories:

Operations that change the committed configuration:

- Activity approval, which includes configuration session submission in non-Workflow mode.
- Device deletion.
- Editing device properties.

Operations that read the committed configuration:

- Configuration preview.
- Deployment (in non-Workflow mode).
- Creation of deployment job (in Workflow mode).
- Activity or configuration session validation.

If you are performing an operation that changes the committed configuration, no one can perform any of the operations in either list until this operation is complete. An error message is displayed to the user who tries, indicating the action and activity (or user, in non-Workflow mode) that has the lock. For example, if you are

approving an activity (which occurs automatically when an activity is submitted in non-Workflow mode), no one else can delete a device or validate a different activity until the approval is complete. This type of locking is particularly important in multi-user settings as it prevents multiple users from simultaneously making changes to the committed configuration.

If you are performing an operation that reads the committed configuration, no one can perform an operation that changes the committed configuration. For example, if you are validating an activity, another user cannot approve an activity. However, other users can perform another operation that reads the configuration. For example, if you are validating an activity, another user can create a deployment job. Similarly, if you are previewing the configuration before deployment, another user is permitted to do the same. This is because these two operations are limited to reading the committed configuration; they do not make any changes to it.

Tip Activity locking is broader in scope than policy locking, which is described in Understanding Policy Locking , on page 174. Policy locking prevents two users from changing the same policy on the same device simultaneously.

Activities and Multiple Users

Only one user can define or change policies within an individual activity at one time. However, when Workflow mode is enabled or when Ticket Management is enabled in non-Workflow mode, multiple users can work in the activity in sequence. That is, if an activity or ticket is closed (but not yet approved or submitted for approval), another user can open it and make changes to it if they have the necessary privileges. Multiple users can work in parallel in different activities.

Understanding Activity/Ticket States

Activities in Workflow mode and tickets in non-Workflow mode (when Ticket Management is enabled) can have the states described in the following table. The main states are shown in bold.

Table 29: Activity/Ticket States

State	Description
Edit	The activity/ticket was created, but the activity is not currently being edited. The activity/ticket can be opened or discarded while it is in the Edit state.

State	Description
Edit Open	The activity/ticket is open for editing. Changes, such as defining and assigning policies, can be made in the activity/ticket. The policies, policy assignments (devices being assigned policies), and objects being configured or modified in the activity/ticket are locked. That is, they cannot be configured or modified within the context of another activity/ticket. An activity can be closed, discarded, submitted, or approved while it is in the Edit Open state. A ticket can be closed, discarded, or submitted while it is in the Edit Open state. The configuration changes can be seen only in the context of the activity/ticket.
Submitted Submitted Open	The activity was submitted for review and approval or the ticket was submitted. (In Workflow mode, this state is available only if you have activity approval required. For more information, see Workflow Page , on page 590.) No further changes can be made within the activity/ticket. The policies, devices (through policy assignment), or objects affected by the policy changes remain locked to other activities/tickets. When an activity is submitted, an e-mail is sent to the approver. The approver can open the activity (in read-only mode, moving to the Submitted Open state) to review the changes within the activity, then approve or reject it. An approved activity moves to the approved state. A rejected activity returns to the Edit state.
Approved (Workflow mode only)	The activity was approved, and the corresponding configuration elements are now committed policy configurations. The devices affected by the policy changes are no longer locked to other activities. The activity can be deployed while it is in the Approved state.
Approve Failed(Workflow mode only)	The activity is placed in the Approve Failed state if errors occur during approval (for example, due to a power failure). If this happens, try to approve the activity again or reboot the server.
Discarded	Changes made to the activity/ticket since it was created were discarded and further changes to the activity/ticket are not allowed. Devices associated with the activity/ticket are unlocked and can now be used in a new activity/ticket. The activity/ticket remains in the table showing a Discarded state until it is purged from the system.

Figure 8: Ticket Workflow, on page 146 shows the stages in the ticket workflow. Figure 9: Activity Workflow without an Approver, on page 147 shows the stages in the activity workflow without an approver. Figure 10: Activity Workflow with an Approver, on page 148 shows the stages in the activity workflow with an approver.

Figure 8: Ticket Workflow

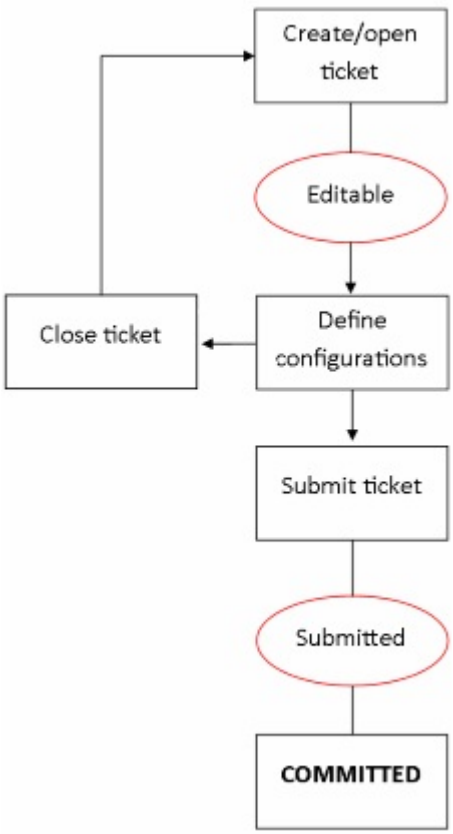

Figure 9: Activity Workflow without an Approver

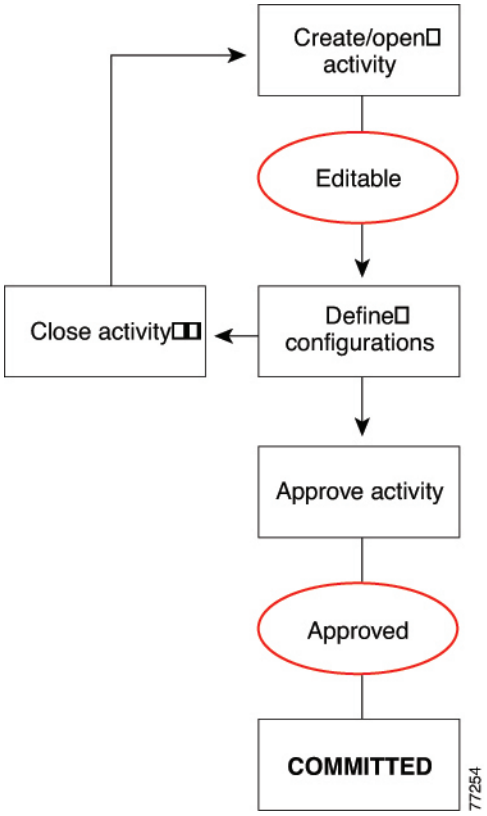

Figure 10: Activity Workflow with an Approver

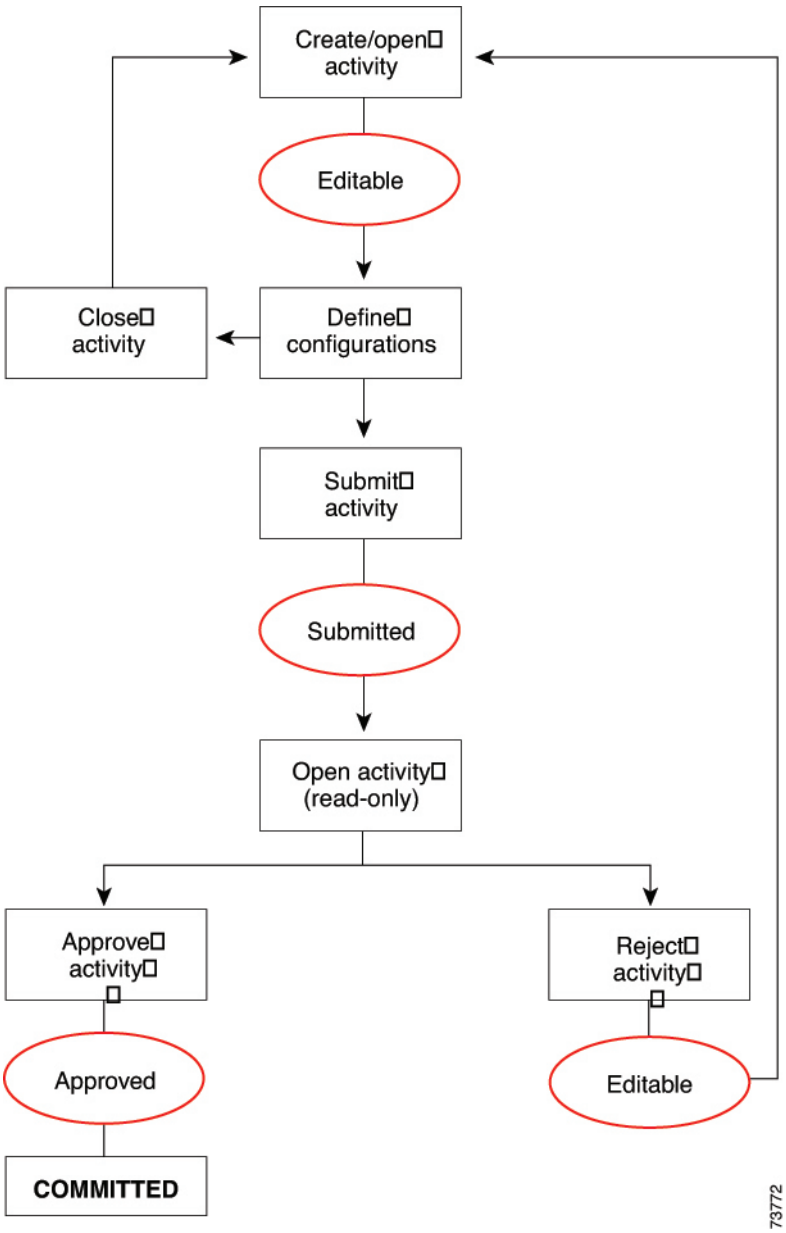


Working with Activities/Tickets

The following topics provide information to help you use activities and configuration sessions:

- Accessing Activity Functions in Workflow Mode , on page 149
- Accessing Ticket Functions in Non-Workflow Mode , on page 150
- Creating an Activity/Ticket , on page 155
- Opening an Activity/Ticket , on page 156

Accessing Activity Functions in Workflow Mode

In Workflow mode, you can access activity management functions in the following ways:

- Select **Manage** > **Activities**. The Activity Manager window contains a list of existing activities and their states. From this window, you can create new activities, and open, close, submit, approve, reject, or discard existing activities. For more information, see Activity/Ticket Manager Window , on page 151.
- Click a button in the Activities portion of the main toolbar or select the equivalent command in the Activities menu. Whether a button or command is active depends on your user permissions, the state of the activity, and whether you are using workflow with or without an approver. The following table explains the buttons and commands and the conditions under which you can them.

Note If an activity is open, the activity name is displayed above the Global Search field in the upper right corner of the Configuration Manager interface. You can click the activity name to open the Activity Manager window.

Table 30: Activities Tool Bar Buttons and Commands When Workflow Mode Is Enabled

Button	Activities Menu Command	Description
	New Activity	Creates an activity.
	Open Activity	Opens an activity. You can open an activity when it is in the Edit or the Submitted state. To open a submitted activity, you must have user privileges to approve or reject changes made in that activity. For more information, see the Installation Guide for Cisco Security Manager .
	Close Activity	Saves all changes made while the activity was open and closes it. You can close an activity when it is in the Edit Open or the Submit Open state.

Button	Activities Menu Command	Description
	View Changes	Evaluates all changes made in the activity and produces an Activity Change Report in PDF format in a separate window. For more information, see Viewing Change Reports , on page 158.
	Validate Activity	Validates the integrity of changed policies within the current activity. By validating an activity, you can check for configuration errors that you might have introduced by your policy changes.
	Submit Activity	In Workflow mode with an activity approver, submits the activity for approval. You can submit an activity when it is in the Edit or the Edit Open state.
	Approve Activity	Approves the changes proposed in an activity. You can approve an activity when it is in the Submitted state when using an activity approver, or the Edit or Edit Open state when not using an approver. You must have user privileges to accept the changes proposed in an activity. For more information, see the Installation Guide for Cisco Security Manager.
	Reject Activity	In Workflow mode with an activity approver, rejects the changes proposed in an activity. You can reject an activity when it is in the Submitted or Submitted Open state. You must have user privileges to deny changes proposed in an activity. For more information, see the Installation Guide for Cisco Security Manager .
	Discard Activity	Discards the selected activity. The activity is discarded and later purged from the system after it exceeds the age for keeping activities as set under Tools > Security Manager Administration > Workflow. The activity state is shown as discarded until the activity is actually purged from the system.

Accessing Ticket Functions in Non-Workflow Mode

In non-Workflow mode with Ticket Management enabled, you can access ticket management functions in the following ways:

- Select **Manage > Tickets**. The Ticket Manager window contains a list of existing tickets and their states. From this window, you can create new tickets, and open, close, submit, or discard existing tickets. For more information, see Activity/Ticket Manager Window , on page 151.
- Click a button in the Tickets portion of the main toolbar or select the equivalent command in the Tickets menu. Whether a button or command is active depends on your user permissions and the state of the ticket. The following table explains the buttons and commands and the conditions under which you can them.

Note If a ticket is open, the ticket ID is displayed above the Global Search field in the upper right corner of the Configuration Manager interface. You can click the ticket ID to open the Ticket Manager window.

Table 31: Tickets Tool Bar Buttons and Commands When Ticket Management Is Enabled in Non-Workflow Mode

Button	Activities Menu Command	Description
	New Ticket	Creates a ticket.
	Open Ticket	Opens a ticket. You can open a ticket when it is in the Edit state.
	Close Ticket	Saves all changes made while the ticket was open and closes it. You can close a ticket when it is in the Edit Open state.
	View Changes	Evaluates all changes made in the ticket and produces a Ticket Change Report in PDF format in a separate window. For more information, see Viewing Change Reports , on page 158.
	Validate Ticket	Validates the integrity of changed policies within the current ticket. By validating a ticket, you can check for configuration errors that you might have introduced by your policy changes.
	Submit Ticket	Submits the ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state.
	Discard Ticket	Discards the selected ticket. The ticket is discarded and later purged from the system after it exceeds the age for keeping tickets as set under **Tools > Security Manager Administration > Ticket Management**. The ticket state is shown as discarded until the ticket is actually purged from the system. For more information, see Ticket Management Page , on page 586.

Activity/Ticket Manager Window

Activity management and ticket management are very similar processes. The primary difference between activities and tickets is that tickets do not use an approval process. For a comparison of the various modes of operation, see Comparing Workflow Modes , on page 23.

- **Activity Manager**—Use the Activity Manager window to create and manage activities and to view activity status and history. The upper pane lists the activities that have been created. Select an activity to view its details and history in the lower pane.
- **Ticket Manager**—Use the Ticket Manager window to create and manage tickets and to view ticket status and history. The upper pane lists the tickets that have been created. Select a ticket to view its details and history in the lower pane.

Note The Activity Manager window is available only if you are operating in Workflow mode. The Ticket Manager window is available only if you are operating in non-Workflow mode with Ticket Management enabled. In non-Workflow mode without Ticket Management enabled, Security Manager automatically and transparently manages activities. For information on selecting a mode, see Changing Workflow Modes , on page 28.

Navigation Path

- In non-Workflow mode with Ticket Management enabled, click the Ticket Manager button on the Main toolbar, or select **Manage > Tickets**.
- In Workflow mode, click the Activity Manager button on the Main toolbar, or select **Manage > Activities**.

Field Reference

Table 32: Activity/Ticket Manager Window

Element	Description
*	Activities with unapproved changes (Edit, Edit Open, or Submitted state) or tickets with unsubmitted changes (Edit or Edit Open state) are flagged for easy identification.
Activity Ticket	The name of the activity or ID of the ticket. If Ticket Management is enabled in Workflow mode, both columns are displayed. If Ticket Management is enabled, you can click the ticket ID to view details of the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Last Modified	The date and time of the most recent change to the activity/ticket.
State	The state of the activity/ticket. For a list of states, see Understanding Activity/Ticket States , on page 144.
User	The username of the person who last changed the state of the activity/ticket.
Last Action	The most recent action performed on the activity/ticket.
Create button	Click this button to create a new activity or ticket so that you can create or change policies or assign policies to devices. For more information, see Creating an Activity/Ticket , on page 155.
Open button	Click this button to open the selected activity/ticket so that changes, such as defining and assigning policies, are captured within the activity/ticket. You can open an activity when it is in the Edit or the Submitted state. Submitted activities are opened read-only. You can open a ticket when it is in the Edit state. For more information, see Opening an Activity/Ticket , on page 156.

Element	Description
Close button	Click this button to close the selected activity/ticket if you or others want to continue configuring policies at a later time. For more information, see Closing an Activity/Ticket , on page 157.
Validate button	Click this button to validate changes that you have made to the selected activity/ticket from the time you created it to the current time. Validating an activity/ticket checks policy integrity and deployability, and displays detailed error information if errors are detected. For more information, see Validating an Activity/Ticket , on page 160.
Submit button	In Workflow mode with an activity approver, click this button to submit the selected activity. Submitting the activity sends notification that the activity is ready for review to the specified approver. You can submit an activity when it is in the Edit or the Edit Open state. In non-Workflow mode with Ticket Management enabled, click this button to submit the selected ticket. Submitting the ticket saves the proposed changes to the database. Devices associated with the ticket are unlocked, meaning they can be included in policy definitions and changes in other tickets. You can submit a ticket when it is in the Edit or the Edit Open state. You are prompted for a comment. For more information, see Submitting an Activity for Approval (Workflow Mode with Activity Approver) , on page 161.
Approve button (Activity Manager only)	Click this button to approve the selected activity, which saves the proposed changes to the database. Devices associated with the activity are unlocked, meaning they can be included in policy definitions and changes in other activities. You must have appropriate user permissions to approve the activity. In Workflow mode without an approver, you can approve your own activities when they are in the Edit state. In workflow mode with an approver, you must submit your activity, and the approver can approve an activity only when it is in the Submitted state. You are prompted for an approval comment. For more information, see Approving or Rejecting an Activity (Workflow Mode) , on page 162.
Reject button (Activity Manager only)	In Workflow mode with an activity approver, click this button to reject the changes proposed in the selected activity or activities. You must have appropriate user permissions to reject an activity. If the activity is rejected, the submitter can continue to make changes to the activity. Devices associated with the activity are not unlocked, meaning that they cannot be included in policy definitions or changes in another activity. You can reject an activity only when it is in the Submitted or the Submitted Open state. You are prompted for a rejection comment. For more information, see Approving or Rejecting an Activity (Workflow Mode) , on page 162.

Element	Description
Discard button	Click this button to discard the selected activity/ticket. Devices associated with the activity/ticket are unlocked, meaning they can be used by other activities/tickets. Multiple activities/tickets can be discarded at the same time. You are prompted for a comment. For more information, see Discarding an Activity/Ticket , on page 164. Discarded activities are removed from the system according to the settings defined in the Security Manager settings for Workflow. The activity state is shown as discarded until the activity is purged from the system. For more information, see Workflow Page , on page 590. Discarded tickets are removed from the system according to the settings defined in the Security Manager settings for Ticket Management. The ticket state is shown as discarded until the ticket is purged from the system. For more information, see Ticket Management Page , on page 586.
View Changes	Click this button to generate a report in PDF format for the selected activity/ticket. If the activity/ticket is closed, this button is grayed out. For more information, see Viewing Change Reports , on page 158.
Refresh button	Click this button to refresh the information presented in the window.
Details tab	Displays detailed information for the selected activity/ticket. Besides the information repeated from the table, the details include this information: • Activity ID—The identification number assigned by Security Manager when you created the activity. • Ticket ID—The identification number entered when the ticket was created. You can click the Edit Ticket button next to the ticket ID to edit the ticket ID. • Created—The date and time the activity/ticket was created. • Last Modified—The date and time changes were last made to the activity/ticket. • Description—The description that was entered when the activity/ticket was created. • Comments History—Shows a history of the comments that were entered for this activity/ticket. The user that entered the comment is shown as well as the date and time the comment was entered. You can add and edit comments using the buttons below the Comments History table.
History tab	Displays a log of the changes that have been made to the selected activity/ticket. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.

Creating an Activity/Ticket

In Workflow mode, before you create or change policies or assign policies to devices, you must create an activity. In non-Workflow mode, if you have Ticket Management enabled, before you create or change policies or assign policies to devices, you must create a ticket.

Tip In non-Workflow mode with Ticket Management disabled, activities are created automatically when needed.

Related Topics

- Understanding Activities , on page 141
- Opening an Activity/Ticket , on page 156

Step 1 Do one of the following:

For activities:

- Click the **Create Activity** button in the activity toolbar.
- Select **Activities > New Activity**.
- Click **Create** in the Activity Manager window.

For tickets:

- Click the **Create Ticket** button in the tickets toolbar.
- Select **Tickets > New Ticket**.
- Click **Create** in the Ticket Manager window.

The Create Activity/Ticket dialog box appears.

Step 2 In the Create Activity/Ticket dialog box, enter a name for the activity or keep the system-generated name. The default name contains the username, date, and time the activity/ticket was created. You can also enter a comment to describe the activity/ticket.

Ticket Management supports linking between a Ticket ID and an external ticket management system. For more information, see Ticket Management Page , on page 586.

Tip You can use a comma to separate multiple ticket IDs.

Step 3 Click **OK**.

The activity/ticket is listed in the Activity/Ticket Manager window. For more information, see Activity/Ticket Manager Window , on page 151.

Responding to the Activity/Ticket Required Dialog Box

When in Workflow mode, you must create or open an activity before you create or modify policies. When in non-Workflow mode, if Ticket Management is enabled, you must create or open a ticket before you create or modify policies. If you attempt to perform an action that requires an activity or a ticket, and you have not created or opened one yet, you are prompted to do so with the Activity/Ticket Required dialog box.

You can choose from the following options:

- **Create a new activity/ticket**—Create a completely new activity/ticket, specifying an activity name or ticket ID and optionally a description of the purpose of the activity/ticket. The default activity/ticket name contains the username, date, and time the activity/ticket was created.
- **Open an existing activity/ticket**—To open the activity/ticket you select from the Activity/Ticket list. This option is displayed only if there are activities/tickets available in the Edit state.

Related Topics

- Creating an Activity/Ticket , on page 155
- Understanding Activity/Ticket States , on page 144

Opening an Activity/Ticket

In Workflow mode, you can open an existing activity if no one else has it opened. You might open an existing activity in the Edit state to make further policy changes, or you might open an existing activity in the Submitted state to review proposed policy changes before approving or rejecting it (if you have the appropriate permissions and you are working in Workflow mode with an approver).

You can make changes to activities in the Edit state, but you can only view activities in the Submitted state.

In non-Workflow mode, if you have Ticket Management enabled, you can open an existing ticket to make further policy changes if no one else has it opened.

To open an activity/ticket, do one of the following:

- For activities:
  - Click the **Open** button in the activity toolbar or select **Activities > Open Activity**. The Openable Activities dialog box lists all activities that can be opened, including the name of the activity, its state, and the username of the person who created the activity. Select the activity you want to open and click **OK**.
  - Select **Manage > Activities**. From the Activity Manager window, select the activity you want to open and click **Open**.
- For tickets:
  - Click the **Open** button in the tickets toolbar or select **Tickets > Open Ticket**. The Openable Tickets dialog box lists all tickets that can be opened, including the ticket ID, its state, and the username of the person who created the ticket. Select the ticket you want to open and click **OK**.
  - Select **Manage > Tickets**. From the Ticket Manager window, select the ticket you want to open and click **Open**.

Tip In non-Workflow mode with Ticket Management disabled, your previous configuration session is opened whenever needed until you submit it. A new activity is then created the next time you perform an action that requires an activity.

Note In Workflow mode and in non-Workflow mode with Ticket Management enabled, you are prompted to open or create an activity/ticket when you launch Security Manager.

Related Topics

- Understanding Activities , on page 141

Closing an Activity/Ticket

You can close an activity without approving it (or submitting it for approval) or close a ticket without submitting it if you or others want to continue configuring policies at a later time.

A person with administrator privileges can close an activity/ticket opened by another user.

To close an open activity/ticket, do one of the following:

- For activities:
  - Click the **Close** button in the activity toolbar.
  - Select **Activities** > **Close Activity**.
  - Select **Manage** > **Activities**. From the Activity Manager window, click **Close**.
- For tickets:
  - Click the **Close** button in the tickets toolbar.
  - Select **Tickets** > **Close Ticket**.
  - Select **Manage** > **Tickets**. From the Ticket Manager window, click **Close**.

Tip In non-Workflow mode with Ticket Management disabled, your configuration session is closed whenever you log out. The same session is reopened the next time you log in.

Related Topics

- Understanding Activities , on page 141

Viewing Change Reports

There are many places in the interface where you can open change reports. Typically, the button or command to generate the report is **View Changes**. These change reports provide detailed information about the policy and policy object changes, and the devices that were acted on, that have been made in an activity/ticket, whether you are operating in Workflow or non-Workflow mode.

The change report is in Adobe Acrobat (PDF) format. You can use all of the Acrobat features, including the bookmarks tab, to view the report.

If you discover a device or rediscover policies on a device, then subsequent policy changes in the same activity/ticket performed on that device are not listed in the activity change report. This is also true on a device that you clone from another device.

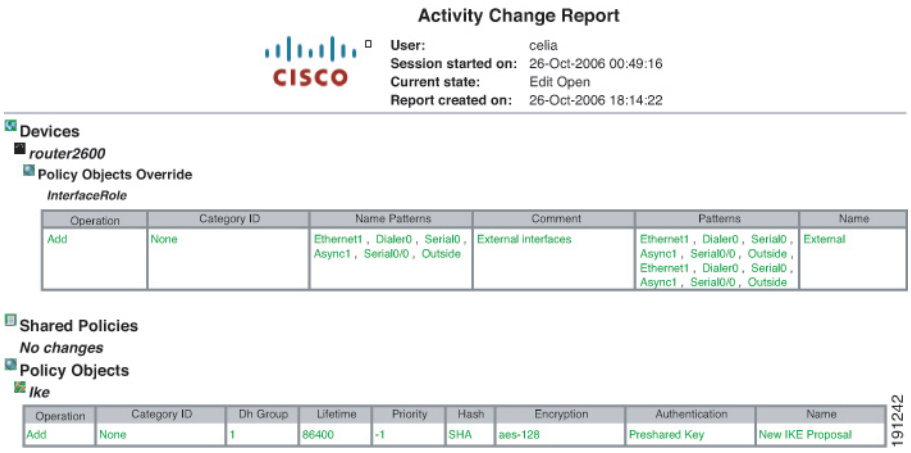
Following are some of the ways you can view change reports:

- Non-Workflow mode with Ticket Management:
  - Select **Tickets > View Changes**, or click the **View Changes** button in the toolbar, to view the changes made during the currently open ticket.
  - Highlight a ticket in the Ticket Manager window and click **View Changes** to view the changes made in that ticket
- Non-Workflow mode without Ticket Management:
  - Select **File > View Changes** to view the changes made during the current configuration session.
  - Select **Manage > Change Reports** to view the changes made during previous sessions (which are closed when you submit or discard your changes). Select a configuration session from the Change Report window and click **View Changes**. (See Selecting a Change Report in Non-Workflow Mode with Ticket Management Disabled , on page 159.)
- Workflow mode:
  - Select **Activities > View Changes**, or click the **View Changes** button in the toolbar, to view the changes made during the currently open activity.
  - Highlight an activity in the Activity Manager window and click **View Changes** to view the changes made in that activity.
- In all modes, you can view changes from various dialog boxes when creating deployment jobs.

Note You must disable any popup-blocker applications you have running to ensure the activity report will open.

The following illustration shows a sample activity report.

Figure 11: Activity Change Report



The change report includes these elements:

- Activity name/Ticket ID—The name of the activity (or the user and session start date and time if it is unnamed) or the Ticket ID.
- Created by—The username of the person who created the activity/ticket, with the date and time.
- Current state—The current state of the activity.
- Report created on—The date and time the report was created.
- Devices section—A summary of the devices that were acted on in the activity/ticket (that is, they were added, modified, or deleted). Changes to local policies are displayed here.

Changes in this section and the other sections of the report are color-coded to help you identify changes:

- Green—Indicates a newly inserted item.
- Red—Indicates a deleted item or the old value of a changed item.
- Blue—Indicates the new value of a changed item.
- Shared Policies section—Changes to all shared policies are displayed here.
- Policy Bundles—Changes to all policy bundles are displayed here.
- Policy Objects—Changes to all policy objects are displayed here.
- VPN—Changes to VPN topologies and policies are displayed here, including newly discovered VPNs and deleted VPN topologies.

Selecting a Change Report in Non-Workflow Mode with Ticket Management Disabled

In non-Workflow mode with Ticket Management disabled, you can view change reports for closed configuration sessions by selecting **Manage > Change Reports** and then selecting the session in the Change Report dialog box.

In non-Workflow mode with Ticket Management disabled, a configuration session is considered complete when you either submit or discard your changes. The Change Report dialog box lists all closed sessions,

showing the date and time the session was closed, the action that closed it (submitted or discarded), and the user name associated with the session. These sessions are equivalent to activities in Workflow mode. Select a session and click **View Changes** to view the report. For information on reading the report, see Viewing Change Reports , on page 158.

Tip To view the report for the current configuration session, close this dialog box and select **File > View Changes**.

Validating an Activity/Ticket

In Workflow mode, Security Manager validates activities when you submit them for approval, or you can validate an activity at any time while you are creating and changing policies in an activity. After an activity is submitted, the validation report remains static.

In non-Workflow mode, Security Manager validates policies when you submit them to the database, when you try to deploy them, or when you validate them. The validation process reports on policy changes that were made up until the changes are submitted or deployed.

The validation process checks the following areas. If there are errors, you can display a detailed summary of the validation results.

- Policy integrity—There are no unresolvable references (for example, missing objects, unresolved interface roles, overrides of mandatory settings, and so on).
- Policy deployability—The platform, operating system, and configured features are supported by the target devices so that policies can be correctly translated into CLI commands.

If a policy contains options that require specific device types or operation system versions, you will see validation warnings for non-supported devices, but Security Manager will not generate the associated commands for unsupported devices. This allows you to create policies that apply to a wide range of devices without having to create policies that are too device-specific.

- FlexConfig integrity—There are no corrupted FlexConfig objects. If corrupted objects are found, a warning with a list of the corrupted FlexConfig objects results.
- FlexConfig syntax—If syntax errors are found, a warning with a list of affected FlexConfigs and their syntax errors results.
- FlexConfig object references—All object references are resolvable. If FlexConfig objects reference non-existent objects, a warning with a list of the missing objects results.

Related Topics

- Submitting an Activity for Approval (Workflow Mode with Activity Approver) , on page 161
- Deploying Configurations in Non-Workflow Mode , on page 408

Step 1 Do one of the following:

- In Workflow mode:

- Open an activity, and then click the **Validate** button on the activity toolbar or select **Activities > Validate Activity**.
- Select **Manage > Activities**. From the Activity Manager window, select an activity, and then click **Validate**.

- In non-Workflow mode with Ticket Management enabled:
  - Open a ticket, and then click the **Validate Saved Changes** button on the tickets toolbar or select **Tickets > Validate Ticket**.
  - Select **Manage > Tickets**. From the Ticket Manager window, select a ticket, and then click **Validate**.
- In non-Workflow mode with Ticket Management disabled, select **File > Validate**, or try to preview or deploy policies.

Security Manager performs the validation and opens an informational message dialog box that summarizes the validation results. If there are no errors, validation passes. If there are errors or warnings, click **Details** to open the Validation dialog box, where you can view detailed information about the errors.

Step 2 Evaluate the errors to determine how to fix them.

The Validation dialog box organizes the errors and warnings in two ways, which are displayed on separate tabs:

- Errors tab—The Errors tab organizes validation problems based on the type of error. Each error indicates the number of devices that are affected and the severity of the error.

Select an error in the upper pane, and a list of devices (with the type of device) that have the error appears in the lower left pane. The lower right pane describes the error, its cause, and what you might do to fix it.

- Devices tab—The Devices tab organizes validation problems based on the device. Each device indicates the number and types of errors and warnings for the device, and the device type. The device status indicates the worst problem in the device configuration (error or warning).

Select a device in the upper pane, and a list of the errors for that device appears in the lower left pane. Select an error and the lower right pane describes the error, its cause, and what you might do to fix it.

You must correct errors before submitting the activity. Security Manager does not allow an activity to be submitted with validation errors.

Note A validation warning (as opposed to an error) will not prevent activity approval or deployment.

Submitting an Activity for Approval (Workflow Mode with Activity Approver)

In Workflow mode with an activity approver, you must submit activities for approval. When you submit the activity, the integrity and deployability of the activity is validated. For details about the validation process and report, see Validating an Activity/Ticket , on page 160.

The activity is also closed so that it can be opened by the user who has the permissions to approve it. When the activity is approved, its configurations are committed to the Security Manager database, and they can be deployed to the devices.

When you submit an activity, Security Manager sends an e-mail to the relevant approvers to notify them that an activity requires approval.

If you are working in Workflow mode without an activity approver, you do not need to submit activities (in fact, you cannot submit them). You can approve the activity yourself. For more information about changing activity approval settings, and configuring the e-mail addresses for notifications, see Workflow Page , on page 590.

Related Topics

- Understanding Activities , on page 141
- Opening an Activity/Ticket , on page 156
- Understanding Activity/Ticket States , on page 144
- Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27

Step 1 Do one of the following:

- Open an activity and click the **Submit Activity** button on the activity toolbar or select **Activities > Submit Activity**.
- Select **Manage > Activities**. From the Activity Manager window, select an activity, then click **Submit**.

The Submit Activity dialog box opens.

Step 2 In the Submit Activity dialog box, fill in the following fields:

- **Approver**—Enter the e-mail address of the person who should approve the activity if the default address is not the right one. This person receives notification of your submission.

The default e-mail address is set in Tools > Security Manager Administration > Workflow.

- **Comment**—Enter comments that will help the approver evaluate the activity.
- **Submitter**—Enter the e-mail address of the person submitting the approval request if the default address is not the right one. The field initially contains the e-mail address associated with the username you used to log into Security Manager. Notifications of activity state changes are sent to this address.

If desired, you can click the **View Changes** button to view a report in PDF format of the changes made in the activity. For more information, see Viewing Change Reports , on page 158.

Step 3 Click **OK**. The activity status changes to Submitted in the Activity Manager window and notifications are sent.

Note Security Manager warns you if the e-mail cannot be sent and you must contact the approver directly.

Approving or Rejecting an Activity (Workflow Mode)

Before the changes in an activity are committed to the database, you must approve the activity. If you have activity approval permissions, you can open an activity, review the policies and policy assignments, and then either approve or reject the activity.

If you are operating in Workflow mode without an approver, you can approve your own activities. When working without an approver, you cannot reject an activity, but you can discard it if you do not want to save your changes. In non-Workflow mode, you use the Submit and Discard commands on the file menu to submit (and automatically approve) or discard the configuration session.

In Workflow mode with an activity approver, the activity must be submitted before you can open it and approve it. In this mode, you can also reject the activity.

If you approve an activity, policies and policy assignments are committed to the database and are ready to be deployed to devices or files. Devices associated with the activity are unlocked, meaning they can be included in policy definitions and changes in other activities.

If you reject the activity, it is returned to the Edit state and the submitter can reopen the activity to make the necessary changes and resubmit it for approval. Devices associated with the activity are not unlocked, meaning that they cannot be included in policy definitions or changes in another activity.

Note After an activity is approved, changes cannot be undone. You must create a new activity and manually change policies and policy assignments to the desired state.

Related Topics

- Understanding Activities , on page 141
- Opening an Activity/Ticket , on page 156
- Understanding Activity/Ticket States , on page 144

Step 1 Perform the appropriate step below:

- To approve an activity, do one of the following:
  - Open an activity and click the **Approve Activity** button on the activity toolbar or select **Activities > Approve Activity** from the menu.
  - Select **Manage > Activities**. In the Activity Manager window, select an activity and click **Approve**.
- To reject an activity or multiple activities, do one of the following:
  - Open an activity and click the **Reject Activity** button on the activity toolbar or select **Activities > Reject Activity** from the menu.
  - Select **Manage > Activities**. In the Activity Manager window, select an activity or multiple activities and click **Reject**.

The Approve Activity, Reject Activity, or Reject Multiple Activities dialog box appears.

Step 2 In the Comment field, enter a brief explanation of why you are approving or rejecting the activity or activities. If you are rejecting, you might want to include suggested revisions.

Step 3 Click **OK** (for a single activity) or **Reject** (for multiple activities). The activity status changes to Approved or Edit (if rejected) in the Activity Manager window. For a description of the elements in the window, see Activity/Ticket Manager Window , on page 151.

Discarding an Activity/Ticket

You can discard an activity/ticket (configuration session in non-Workflow mode) if it is no longer required. When you discard an activity/ticket, you delete all the policies and policy assignments that were defined within the activity. Those policies and policy assignments are not in the database; therefore, they cannot be deployed.

Discarded activities are removed from the system according to the settings defined in the Security Manager settings for Workflow and devices associated with the activity are unlocked, meaning they can be used by other activities. For more information, see Workflow Page , on page 590.

Discarded tickets are removed from the system according to the settings defined in the Security Manager settings for Ticket Management and devices associated with the ticket are unlocked, meaning they can be used by other tickets. The ticket state is shown as discarded until the ticket is purged from the system. For more information, see Ticket Management Page , on page 586.

Note When a ticket is discarded, Image Management jobs assigned to that ticket will not be discarded automatically. If required, you must search for pending Image Manager jobs with that ticket ID in Image Manager and delete those jobs.

To discard an activity/ticket:

Workflow Mode—Do one of the following:

- To discard a single activity, do one of the following:
  - Open an activity, then click the **Discard** button on the activity toolbar or select **Activities > Discard Activity**.
  - Select **Manage > Activities**. From the Activity Manager window, select an activity, then click **Discard**. Only an activity in the Edit or Edit Open state can be discarded.

Using either method, you are prompted with the Discard Activity dialog box, which allows you to enter an optional comment to explain why you are discarding the activity. Enter a comment and click **OK** to discard it.

- To discard multiple activities, select **Manage > Activities**. From the Activity Manager window, select the activities you wish to discard, then click **Discard**. Only activities in the Edit or Edit Open state can be discarded.

You are prompted with the Discard Multiple Activities dialog box, which allows you to enter an optional comment to explain why you are discarding the activities. If you selected activities belonging to other users, you can choose to discard those activities or not using the Discard selected activities of other users as well check box. Enter a comment, select or deselect the Discard selected activities of other users as well check box as desired, and then click **OK** to discard the selected activities.

Non-Workflow Mode with Ticket Management Enabled—Do one of the following:

- To discard a single ticket, do one of the following:
  - Open a ticket, then click the **Discard** button on the tickets toolbar or select **Tickets > Discard Ticket**.

- Select **Manage > Tickets**. From the Ticket Manager window, select a ticket, then click **Discard**. Only a ticket in the Edit or Edit Open state can be discarded.

Using either method, you are prompted with the Discard Ticket dialog box, which allows you to enter an optional comment to explain why you are discarding the ticket. Enter a comment and click **OK** to discard it.

- To discard multiple activities, select **Manage > Tickets**. From the Ticket Manager window, select the tickets you want to discard, then click **Discard**. Only tickets in the Edit or Edit Open state can be discarded.

You are prompted with the Discard Multiple Tickets dialog box, which allows you to enter an optional comment to explain why you are discarding the tickets. If you selected tickets belonging to other users, you can choose to discard those tickets or not using the Discard selected tickets of other users as well check box. Enter a comment, select or deselect the Discard selected tickets of other users as well check box as desired, and then click **OK** to discard the selected tickets.

Non-Workflow Mode with Ticket Management Disabled—Select **File > Discard** to discard the changes in the current configuration session.

Viewing Activity/Ticket Status and History

In Workflow mode, you can view the status and history of changes for activities in the Activity Manager window. In non-Workflow mode with Ticket Management enabled, you can view the status and history of changes for tickets in the Ticket Manager window.

To open the window for activities, click the Activity Manager button in the toolbar or select **Manage > Activities**.

To open the window for tickets, click the Ticket Manager button in the toolbar or select **Manage > Tickets**.

The upper pane lists all available activities/tickets, including the current state of the activity/ticket. Select an activity/ticket to see additional information in the tabs in the lower pane:

- Details tab—Shows the date and time the activity/ticket was created, and its description.
- History tab—Shows the transaction history for the activity/ticket. Each time the state is changed, a record of the change is kept, including the user who made the change and any comments about the change.

CHAPTER 5

Managing Policies

The following topics describe the concept of policies in Cisco Security Manager, and how to use and manage them:

Understanding Policies

In Security Manager, a policy is a set of rules or parameters that define a particular aspect of network configuration. You configure your network by defining policies on devices (which includes individual devices, service modules, security contexts, and virtual sensors) and VPN topologies (which are made up of multiple devices), and then deploying the configurations defined by these policies to these devices.

Several types of policies might be required to configure a particular solution. For example, to configure a site-to-site VPN, you might need to configure multiple policies, such as IPsec, IKE, GRE, and so forth.

Policies are assigned to one or more devices. After a policy is assigned to a device, any changes to the policy definition change the behavior of the device.

The following topics describe policies in more detail:

Settings-Based Policies vs. Rule-Based Policies

Security Manager policies are structured as either rule-based policies or settings-based policies.

Rule-Based Policies

Rule-based policies contain one or more rules that govern how to handle traffic on a selected device, such as the access rules and inspection rules defined as part of a firewall service. Rule-based policies can contain hundreds or even thousands of rules arranged in a table, each defining different values for the same set of parameters. The ordering of the rules is very important, as traffic flows are assigned the first rule whose definition matches the flow (known as first matching).

The structure of the rules table depends on whether you configure a local policy or a shared policy (see Local Policies vs. Shared Policies , on page 169). If you configure a local rule-based policy for a single device, the policy contains a flat table of local rules. If you configure a shared rule-based policy (either in Device view or Policy view), the table is divided into two sections, Mandatory and Default. Mandatory rules always precede the default rules, and cannot be overridden by local or default rules. The Default section contains rules that can be overridden by mandatory and local rules. You can define rules in either the Mandatory or Default section and move rules between sections using cut-and-paste.

When you define certain types of rule-based policies, such as firewall service policies, you can create a policy hierarchy in which rules located at lower levels in the hierarchy acquire properties from the rules located above them. This is known as rule inheritance. For example, you can define a set of inspection rules that apply globally to all firewalls, while supplementing these rules with additional rules that can be applied to a subset of devices. By maintaining common rules in a parent policy, inheritance enables you to reduce the chance of introducing configuration errors that will cause deployment to fail. For more information, see Understanding Rule Inheritance , on page 170.

Settings-Based Policies

Settings-based policies contain sets of related parameters that together define one aspect of security or device operation. For example, when you configure a Cisco IOS router, you can define a quality of service (QoS) policy that defines which interfaces are included in the policy, the type of traffic on which QoS is applied, and the definition of how this traffic should be queued and shaped. Unlike rule-based policies, which can contain hundreds of rules containing values for the same set of parameters, you can define only one set of parameters for each settings-based policy defined on a device.

Related Topics

- Understanding Policies , on page 167

Service Policies vs. Platform-Specific Policies

Security Manager policies are divided into several domains, each of which represents a major policy category. These domains can be divided into two categories: service policies and platform-specific policies.

Service policies are divided into the following policy domains:

- Firewall.
- Site-to-site VPN.
- Remote Access VPN.

- IPS service policies.

For example, the firewall policy domain contains policies for access rules, inspection rules, and transparent rules, among others. The site-to-site VPN policy domain contains policies for IKE proposals, IPsec proposals, and preshared keys, among others. Service policies can be applied to any kind of device, regardless of platform, although there may be some variation in policy definition depending on the device type.

Platform-specific policy domains contain policies that configure features that are specific to the selected platform. Not all platform-specific policies are directly related to security. For example, the Router policy domain contains routing policies, identity policies (Network Admission Control and 802.1x), policies related to device administration (DHCP, SNMP, device access), and other policies such as QoS and NAT.

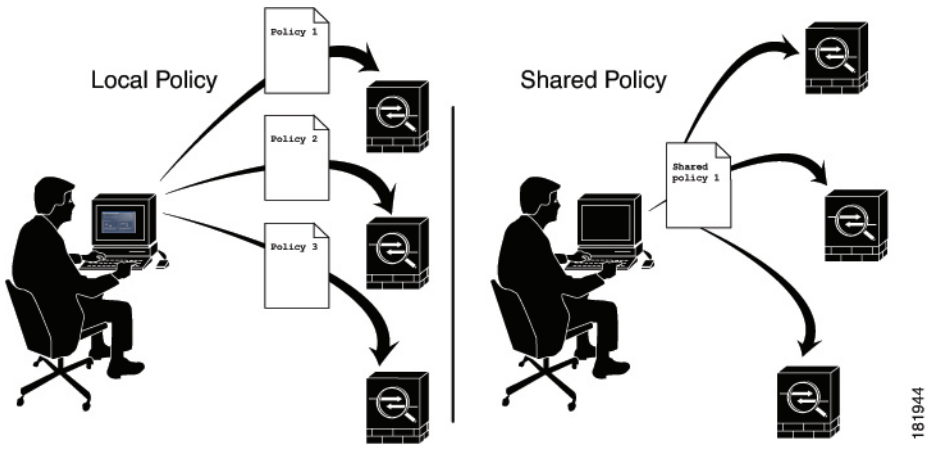
For routers and firewalls (ASA, PIX, FWSM), you can choose which platform-specific policies to manage. For more information, see Customizing Policy Management for Routers and Firewall Devices , on page 177.

Local Policies vs. Shared Policies

The policies that you configure on devices can either be local or shared. Local policies refer to policies that are defined for a single device. Any changes that you make to a local policy affect only that device. Local policies are well-suited to smaller networks and to devices requiring nonstandard configurations. For example, you might configure a local policy on a router that requires a different OSPF routing policy than the one used by the other routers in your network. For more information about the actions you can perform on local policies, see Performing Basic Policy Management , on page 197.

As your network grows, maintaining local policies on each device greatly increases the effort required to manage these policies in a comprehensive and efficient manner. To meet this challenge, Security Manager features policy sharing. With policy sharing, you can create a single policy and assign it to multiple devices. For more information, see Sharing a Local Policy , on page 207.

Figure 12: Local vs. Shared Policies



For example, if you want all the Cisco IOS routers in your network to implement the same Network Admission Control (NAC) policy, you need only define a single NAC policy and share it. You can then assign the shared policy to all the routers in your network with a single action. For more information, see Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.

Any changes that you make to a shared policy are automatically applied to all the devices to which it is assigned. As a result, shared policies both streamline the process of policy creation and help maintain consistency and uniformity in your device configurations.

For more information about the actions you can perform on shared policies, see Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203.

Tips

- Shared policies can be grouped together to form policy bundles. Policy bundles make managing the assignment of shared policies easier especially when working with a large number of devices. For more information, see Managing Policy Bundles , on page 224.
- In addition to sharing policies, you can choose to inherit the rules of a rule-based policy when defining another policy of the same type. This makes it possible, for example, to maintain a set of corporate access rules that apply to all firewall devices while providing the flexibility to define additional rules on individual devices as required. For more information, see Understanding Rule Inheritance , on page 170.
- If you use more than one Security Manager server, you can maintain a consistent set of policies among the servers by regularly exporting shared policies from your primary server and importing them into the other servers. You must decide which server to use as the official policy source. For more information, see Exporting Shared Policies, on page 489 and Importing Policies or Devices, on page 491.
- In Version 4.7, Cisco Security Manager has added a new option to the available filtering choices in the Device Filter. This new option provides a filter for devices that have shared policies applied. To see this in the Security Manager GUI, navigate to **View > Device View > Filter: > Create Filter**... [in the dropdown list]. When the Create Filter dialog box appears, use the dropdown lists to select "Device," "has," and "Shared Policy," for a resulting filter of "Device has 'Shared Policy'".

Shared Policies and VPNs

In the same way that shared policies facilitate device configuration, they also facilitate the configuration of VPNs. For example, you can create a shared IPsec proposal policy and assign it to multiple site-to-site VPNs. Any changes that you make to the shared policy affect all the VPNs to which the policy is assigned.

You can assign the shared policies to an existing VPN using the Site-to-Site VPN Manager; right-click a shareable policy and select **Assign Shared Policy**. This is done in much the same way as assigning shared policies in Device view. You can also configure shared policies as the default policies to use in the Create VPN wizard, as described in Understanding and Configuring VPN Default Policies , on page 1086.

Related Topics

- Understanding Policies , on page 167

Understanding Rule Inheritance

As described in Local Policies vs. Shared Policies , on page 169, shared policies enable you to configure and assign a common policy definition to multiple devices. Rule inheritance takes this feature one step further by enabling a device to contain the rules defined in a shared policy *in addition to* local rules that are specific to that particular device. Using inheritance, Security Manager can enforce a hierarchy where policies at a lower level (called child policies) inherit the rules of policies defined above them in the hierarchy (called parent policies).

Note If a policy bundle includes a shared policy that inherits from other shared policies, those inherited rules are also applied to any devices on which the policy bundle is applied.

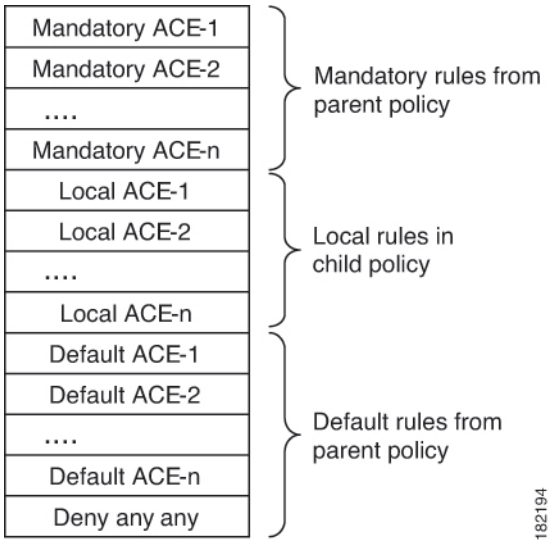
Rule Order When Using Inheritance

As described in Understanding Access Rules , on page 717, an access list (ACL) consists of rules (also called access control entries or ACEs) arranged in a table. An incoming packet is compared against the first rule in the ACL. If the packet matches the rule, the packet is permitted or denied, depending on the rule. If the packet does not match, the packet is compared against the next rule in the table and so forth, until a matching rule is found and executed.

This first-match system means that the order of rules in the table is of critical importance. When you create a shared access rule policy, Security Manager divides the rules table into multiple sections, Mandatory and Default. The Mandatory section contains rules that cannot be overridden by the local rules defined in a child policy. The Default section contains rules that *can* be overridden by local rules.

The below figure describes how rules are ordered in the rules table when using inheritance.

Figure 13: Order of Rules When Using Inheritance



Benefits of Using Inheritance

The ability to define rule-based policies in a hierarchical manner gives you great flexibility when defining your rule sets, and the hierarchy can extend as many levels as required. For example, you can define an access rule policy for the device at a branch office that inherits rules from a parent policy that determines access at the regional level. This policy, in turn, can inherit rules from a global access rules policy at the top of the hierarchy that sets rules at the corporate level.

In this example, the rules are ordered in the rules table as follows:

```
Mandatory corporate access rules
    Mandatory regional access rules
        Local rules on branch device
    Default regional access rules
Default corporate access rules
```

The policy defined on the branch device is a child of the regional policy and a grandchild of the corporate policy. Structuring inheritance in this manner enables you to define mandatory rules at the corporate level that apply to all devices and that cannot be overridden by rules at a lower level in the hierarchy. At the same time, rule inheritance provides the flexibility to add local rules for specific devices where needed.

Having default rules makes it possible to define a global default rule, such as “deny any any”, that appears at the end of all access rule lists and provides a final measure of security should gaps exist in the mandatory rules and default rules that appear above it in the rules table.

Inheritance Example

For example, you can define a mandatory worm mitigation rule in the corporate access rules policy that mitigates or blocks the worm to all devices with a single entry. Devices configured with the regional access rules policy can inherit the worm mitigation rule from the corporate policy while adding rules that apply at the regional level. For example, you can create a rule that allows FTP traffic to all devices in one region while blocking FTP to devices in all other regions. However, the mandatory rule at the corporate level always appears at the top of the access rules list. Any mandatory rules that you define in a child policy are placed after the mandatory rules defined in the parent policy.

With default rules, the order is reversed—default rules defined in a child policy appear before default rules inherited from the parent policy. Default rules appear after any local rules that are defined on the device, which makes it possible to define a local rule that overrides a default rule. For example, if a regional default rule denies FTP traffic to a list of destinations, you can define a local rule that permits one of those destinations.

IPS Policy Inheritance

Event action filter policies for IPS devices can also use inheritance to add rules defined in a parent policy to the local rules defined on a particular device. The only difference is that although active and inactive rules are displayed together in the Security Manager interface, all inactive rules are deployed last, after the inherited default rules.

Signature policies for IPS devices use a different type of inheritance that can be applied on a per-signature basis. See Configuring Signatures , on page 1680.

Related Topics

- Understanding Access Rules , on page 717
- Understanding Global Access Rules , on page 719
- Inheritance vs. Assignment , on page 172
- Inheriting or Uninheriting Rules , on page 213

Inheritance vs. Assignment

It is important to understand the difference between rule inheritance and policy assignment:

- Inheritance—When you inherit the rules from a selected policy, you do not overwrite the local rules that are already configured on the device. Instead, the inherited rules are *added* to the local rules. If the inherited rules are mandatory rules, they are added before the local rules. If the inherited rules are default rules, they are added *after* the local rules. Any changes that you make to the inherited rules in the parent policy are reflected in the policy that inherits those rules.

Note Inheritance works differently for IPS signature policies and signature event actions. For more information, see Understanding Signature Inheritance , on page 1679.

- Assignment—When you assign a shared policy to a device, you *replace* whatever was already configured on the device with the selected policy. This holds true whether the device previously had a local policy or a different shared policy of that type.

Therefore, when working with rule-based policies such as access rules, you must use discretion when choosing these options. Use inheritance to supplement the local rules on the device with additional rules from a parent policy. Use assignment to replace the policy on the device with a selected shared policy.

Tip To prevent overwriting your local rules by mistake, Security Manager displays a warning message when you select the Assigned Shared Policy option for a rule-based policy. The message provides you the option of inheriting the rules of the policy instead of assigning it. Choose the inheritance option if you want to preserve your local rules.

Related Topics

- Local Policies vs. Shared Policies , on page 169
- Settings-Based Policies vs. Rule-Based Policies , on page 168

Policy Management and Objects

Objects make it easier to configure policies in Security Manager by providing a set of values with a logical, easy-to-remember name that can be applied wherever it is needed. For example, you can define a network/host object called MyNetwork that contains a set of IP addresses in your network. Whenever you configure a policy requiring these addresses, you can simply refer to the MyNetwork object instead of manually entering the addresses each time.

When you define a policy, you can create objects on the fly by clicking the **Select** button next to any field that accepts an object as a value. For more information, see Selecting Objects for Policies , on page 230. You can also create and manage objects system-wide from the Policy Object Manager , on page 232.

Policy objects also are created when you discover policies that already exist on a device. You can discover policies when you add a device to the Security Manager inventory, or you can discover policies on devices that are already in the inventory, as described in Discovering Policies , on page 178. You can configure Security Manager to reuse already-defined policy objects for newly-discovered policies. For more information on configuring policy object settings for discovery, see Discovery Page , on page 536.

Certain types of objects enable you to override their predefined values at the device level, which enables you to use an object in a policy while retaining the ability to customize particular values. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246.

For more information about objects and how to use them when defining policies, see Managing Policy Objects, on page 229.

Related Topics

- Understanding Policies , on page 167

Understanding Policy Locking

Security Manager has a policy locking mechanism that is useful in organizations where several people have the authority to make configuration changes. It prevents a potential situation in which two or more people are making changes to the same device, policy, policy assignment, or object at the same time. When a lock is applied, a message is displayed across the top of the work area to other users who access that device or policy.

Tip Security Manager also obtains activity (or configuration session) locks, which are broader in scope than policy locks, when users perform some actions. For more information, see Activities and Locking , on page 143.

Lock Types

Security Manager uses two different types of locks:

- Policy content locks—Locks the content of a particular policy. The banner displayed above the work area reads:

This data for this policy is locked by activity/user: <name>.

The content lock prevents other users from making any changes to the configuration of the locked policy.

- Assignment locks—Locks the assignment of a policy type to a particular device. The banner displayed above the work area reads:

The assignment of this policy is locked by activity/user: <name>.

For a local policy, an assignment lock prevents other users from unassigning the policy or assigning a shared policy of the same type in place of the local policy. For a shared policy, an assignment lock prevents other users from assigning a different shared policy of the same type in place of one already assigned.

These locks can either work together or independently of one another, depending on the actions being performed by the user. If both locks are active at the same time, the banner displayed above the work area reads:

This policy is locked by activity/user: <name>.

See Understanding Locking and Policies , on page 175 for a summary of the effects locking has on the actions you can perform.

Releasing Locks

After is locked is enabled, it remains in place until you either submit your changes (when working in non-Workflow mode) or submit and approve the activity (when working in Workflow mode). If you discard the activity, any locks generated by the activity are also discarded. For more information about workflow modes, see Workflow and Activities Overview , on page 20.

Keep in mind that:

- Locks are based on the device name, not the IP address of the device. Therefore, we recommend that you avoid defining two devices with different names but the same IP address in Security Manager. Any attempt to deploy to both devices, especially at the same time, leads to unpredictable results.
- In addition, locks do not extend across different operations. For example, locking does not prevent one user from deploying to the same device that is being discovered by a different user.

Additional details about locking can be found in the following sections:

- Understanding Locking and Policies , on page 175
- Understanding Locking and VPN Topologies , on page 176
- Understanding Locking and Objects , on page 176

Understanding Locking and Policies

The following table summarizes the effects of policy locks in Security Manager.

Note The ability to modify policies and policy assignments is dependent on the user permissions assigned to the user. See the Installation Guide for Cisco Security Manager.

Table 33: Locking Summary

If Another User or Activity...	You Cannot...	You Can...
Changes a policy definition	• Modify the policy or assign it to other devices. • Unassign the policy (if it is a local policy)	Unassign the policy from any device (if it is shared).
Changes the definition of a rule-based policy with descendants	• Modify the parent policy or any of the descendants. • Assign the parent policy or any of its descendants to additional devices. • Change the rule inheritance of the parent policy or any of the descendants.	Unassign the policy from any device.
Changes a policy assignment without changing its definition	Modify the policy. **Note** In Policy view, a content lock is placed on the policy. In Device view, an assignment lock is placed on those devices whose assignment is being changed by the other user.	Assign and unassign the policy from other devices.
Changes a policy definition and changes its assignment	Modify the policy or assign it to other devices.	Unassign the policy from any device.

Related Topics

- Understanding Policy Locking , on page 174
- Understanding Policies , on page 167

Understanding Locking and VPN Topologies

If you change the device assignment for a VPN topology, or make changes to a specific VPN policy, a lock is placed on the whole VPN topology, and on any other topologies in which the policy is shared. This means that other users cannot make changes to the device assignment, nor can they make changes to any of the VPN policies defined for those VPN topologies.

In order to view and modify site-to-site VPN policies, you must have the required permissions for each device in the VPN topology. You also need permissions to add a device to a VPN topology. If you have different levels of permissions to the devices in the VPN topology, the lowest permission level is applied to the entire topology. For example, if you have read/write permissions to the spokes in a hub-and-spoke topology, but read-only permissions to the device serving as the hub, you are granted read-only permission to the policies and devices in the hub-and-spoke topology. For more information about permissions, see Installation Guide for Cisco Security Manager .

Note Unassigning devices from a VPN topology also creates device locks in the VPN topology, which means that these devices cannot be deleted from the inventory. Other users cannot edit the device assignments for the topology until you deploy configurations to all affected devices, including those you remove. The device is not actually removed from the topology until you deploy configurations.

Related Topics

- Understanding Policy Locking , on page 174
- Managing Site-to-Site VPNs: The Basics, on page 1073

Understanding Locking and Objects

When you create or modify a reusable object, that object is locked to prevent other users from modifying or deleting the same object. Additional rules for object locking include:

- An object lock does not prevent you from modifying the definition or assignment of a policy that uses that object.
- The lock placed on a policy does not prevent you from making changes to an object that is included in the policy definition.
- You can change the definition of any object even if it is part of a policy assigned to a device to which you do *not* have permissions.
- When an object makes use of other objects (such as network/host objects and AAA server group objects), the lock on the object does not prevent another user from modifying those other objects. For example, when you modify a AAA server group object, the lock on that object does not prevent another user from modifying any of the AAA servers that make up the AAA server group.

When an object is locked, users who try to modify that object see a read-only version of the relevant dialog box. When you are working in Workflow mode, a message indicates which activity has locked the object.

Customizing Policy Management for Routers and Firewall Devices

When you manage Cisco IOS routers or ASA, PIX, or FWSM firewall devices, you have the option of selecting which policy types to manage with Security Manager and which policy types to leave unmanaged. Managing a policy type means that Security Manager controls the configuration of the policy and considers the information that it stores in its database about that policy to be the desired configuration. Security Manager does not configure unmanaged policy types, nor does it track configurations of these types that were configured using other methods. For example, if you decide not to manage SNMP policies, any SNMP configurations that you configured using CLI commands are unknown to Security Manager.

Caution If you use AUS or CNS to deploy configurations to ASA or PIX devices, be aware that the device downloads a full configuration from AUS or CNS. Thus, reducing the policies managed by Security Manager actually removes the configurations from the device. If you intend to deselect some ASA/PIX policies for management to use other applications along with Security Manager to configure devices, do not use AUS or CNS.

The ability to customize policy management on routers and firewalls makes it possible, for example, to use Security Manager to manage DHCP and NAT policies while leaving routing protocol policies, such as EIGRP and RIP, unmanaged. These settings, which can be modified only by a user with administrative permissions, affect all Security Manager users.

Unmanaged policies are removed from both Device view and Policy view. Any existing policies of that type, local or shared, are removed from the Security Manager database.

To customize policy management for routers and firewalls, select **Tools > Security Manager Administration > Policy Management** to open the Policy Management Page , on page 577. The policy types are organized in folders, with router and firewall (which includes all ASA, PIX, and FWSM devices) handled separately. Select or deselect policy types as desired and click **Save**. Subsequent processing depends on whether you are changing a policy type to be managed or unmanaged:

- **Unmanaging a policy type**—If you unmanage a policy type, and any device of that type has that policy configured, you must unassign the policies before unmanaging them. Security Manager displays a list of all devices that have assigned policies of that type, including the policy name, device name, and the user or activity that has a lock on the policy. If you click **Yes** to continue unmanaging the policy, Security Manager obtains the required locks, unassigns the policies, and then unmanages the policy type.

If a lock could not be obtained for even one device, no policies are unassigned, the policy type is not unmanaged, and you are told of the problem. You can then either manually unassign the policies from the affected devices, or release the user or activity locks, and try again to unmanage the policy type.

Note Unmanaging a policy has no effect on the active configuration running on the device; Security Manager does not remove the configuration from the device. Instead, unmanaging the policy removes it from the database, and Security Manager no longer considers that part of the device configuration.

- **Managing a previously-unmanaged policy type**—If you start managing a policy type that you previously did not manage using Security Manager, it is possible that the active configuration on the device has commands controlled by the newly-managed policy type. **It is therefore important that you rediscover policies on all devices of that type (either all routers or all ASA, PIX, FWSM devices)**. This ensures that Security Manager has the current configuration for these policies.

If you do not rediscover policies and leave the newly-managed policies unconfigured, on the next deployment to the device, the existing settings configured on the device are removed. For more information on discovering policies on devices already managed, see Discovering Policies on Devices Already in Security Manager , on page 181.

Note Features that are unmanaged by Security Manager can still be modified manually with CLI commands or FlexConfigs. For more information about FlexConfigs, see Managing Flexconfigs, on page 341.

Discovering Policies

Policy discovery enables you to bring your existing network configuration into Security Manager to be managed. Policy discovery can be performed by importing the configuration of a live device or by importing a configuration file. If you import a configuration file, the file must have been generated by the device (for example, by using the **show run** command on Cisco IOS Software devices); you cannot discover configuration files in any other format.

You can initiate policy discovery when you add a device by selecting the relevant options in the New Device wizard. For more information, see Adding Devices to the Device Inventory , on page 77.

You can also initiate policy discovery on existing devices from Device view. For more information, see Discovering Policies on Devices Already in Security Manager , on page 181.

When you initiate policy discovery on a device, the system analyzes the configuration on the device and then translates this configuration into Security Manager policies and policy objects so that the device can be managed. Warnings are displayed if the imported configuration completes only a partial policy definition. If additional settings are required, you must go to the relevant page in the Security Manager interface to complete the policy definition. Warnings and errors are also displayed if the imported configuration is invalid.

After performing policy discovery, you must submit your changes (or approve your activity when working in Workflow mode) to have the information included in change reports and to make the information available to other users. If you make any changes to the discovered policies, you must deploy the changes to the device for them to take effect. For more information, see Managing Deployment, on page 381.

Tip Use the Security Manager Administration window to configure discovery-related settings that apply to all devices. For more information, see Discovery Page , on page 536.

Policy Discovery and VPNs

In addition to performing discovery on individual devices, Security Manager allows you to discover the VPNs that are already deployed in your network. How you discover VPNs depends on the type of VPN being discovered:

- Site-to-Site VPNs—A wizard walks you through the discovery procedure step by step. For more information, see Site-To-Site VPN Discovery , on page 1095.

Tip We recommend that you deploy to a file immediately after discovering a Site-to-Site VPN. This enables Security Manager to assume full management of the relevant CLI commands that are configured on the device.

- IPSec and SSL Remote Access VPNs—You can discover IPSec and SSL VPNs when you discover policies on the device, either when you add the device to the inventory or if you discover policies on a device already in the inventory. Policies related to these VPNs are treated as regular device policies. However, when selecting discovery options, you must specifically select to discover RA VPN policies. For more information about remote access VPN policy discovery, see Discovering Remote Access VPN Policies , on page 1298. For more information about performing policy discovery, see Adding Devices to the Device Inventory , on page 77 and Discovering Policies on Devices Already in Security Manager , on page 181.

Note If you add a device using a configuration file, and discover security policies while adding the device, Security Manager cannot successfully discover policies that require that files be downloaded from the discovered device. This especially affects devices that include the **svc image** command in an SSL VPN configuration. Because Security Manager does not have the referenced file in its database, the **no** form of the command is generated for the discovered configuration.

Policy Discovery and Cisco IOS Routers and Catalyst Devices

Security Manager supports a subset of the complete list of commands available in the Cisco IOS software, mostly centered on security-related commands. You can discover all supported Cisco IOS commands. Commands that are not supported are left in place unless they conflict directly with a policy configured in Security Manager. For more information about performing policy discovery on Cisco IOS routers, see Discovering Router Policies , on page 2305. For more information about performing policy discovery on Catalyst devices, see Discovering Policies on Cisco Catalyst Switches and Cisco 7600 Series Routers , on page 2621.

Tip We recommend that you deploy to a file immediately after discovering a Cisco IOS router or Catalyst device. This enables Security Manager to assume full management of the relevant CLI commands that are configured on the device.

Policy Discovery and Firewall Security Contents

When you add a device that has security contexts, you should discover all contexts and policies at the same time; otherwise, you will have to discover policies for each context separately. When you add the device, select **MULTI** for Context and do not select Security Context of Unmanaged Device. (If you select this option, only the admin context is imported, and it has no relationship to other security contexts on the device; select

this option only if you want to manage the security context independently from the parent device). Depending on how you add the device, you might need to select the option to discover security contexts. During discovery, Security Manager identifies each security context and adds it as a separate device to the device list, appending the security context name to the end of the parent's name; for example, if the parent is pix_141, the admin context would be pix_141_admin. (You can control the naming convention for security contexts; for more information, see Discovery Page , on page 536). You can create new security contexts, or delete existing contexts, as well as create and delete policies for those contexts.

If you create multiple security contexts on FWSM, which are contained in Catalyst 6500 devices, and you are running IOS software on the chassis, add the chassis device using the SSH credentials for the chassis. Then Security Manager can identify each FWSM on the chassis, and give you the option to add each of them. During FWSM discovery, Security Manager discovers the security contexts for each FWSM, including the policies for the FWSM and for each context. However, if you are using the Catalyst OS on the device, you must discover each FWSM individually.

For more information about adding devices to the inventory, see Adding Devices to the Device Inventory , on page 77.

Policy Discovery and IPS Devices

When you discover policies on an IPS device, the virtual sensors defined on the device are also discovered along with the policies defined for the virtual sensors. If more than one virtual sensor uses the same policy, that policy is created as a shared policy and is assigned to the virtual sensors. Policies defined for a single virtual sensor, or only for the parent device, are created as local policies. You cannot discover policies just for an individual virtual sensor; you can discover policies only on the parent device. If policies are discovered on the parent device that are not assigned to any virtual sensors, those policies are created as shared policies that are not assigned to any device or virtual sensor.

After discovering an IPS device that contains virtual sensors, you must submit your changes to the database for the virtual sensors to appear in the device selector.

Policy Discovery and Object Groups

When you perform policy discovery, any object groups already configured on PIX, ASA, FWSM, and IOS 12.4(20)T+ devices are brought into Security Manager as policy objects. For more information about how Security Manager policy objects are translated into object groups and vice-versa, see How Policy Objects are Provisioned as Object Groups , on page 337.

In addition, **object network** and **object service** configurations on ASA 8.3+ devices are brought into Security Manager as host, network, or address range network/host objects, or service objects (as opposed to service group objects). The only exception is that address range objects that have the same address for the start and end range are instead created as host network/host objects.

Note For IOS devices, any objects discovered that are used by access control lists that are discovered as ACL objects are subsequently replaced during deployment by the contents of the object. Object groups used with ACL objects are not preserved, although they are discovered as Security Manager policy objects.

Policy Discovery and Security Manager Policy Objects

When you perform policy discovery, Security Manager tries to reuse the policy objects that you have already created in Security Manager. Based on the contents of the device configuration, the following are the possible actions:

- Named policy objects in the configuration—Existing policy objects are reused if their content matches the configuration on the device.

  If the contents of the named policy object does not match, the policy object is reused and a device-level override is created if **Allow Device Override for Discovered Policy Objects** is selected on the Discovery administration page. For more information, see these topics:

  - Understanding Policy Object Overrides for Individual Devices , on page 246
  - Discovery Page , on page 536

- Unnamed policy objects in the configuration—Existing policy objects are used if their content matches the configuration on the device. You can control this behavior by changing the value of the **Reuse Policy Objects for Inline Values** setting on the Discovery administration page.
- You can discover objects that have the same definition as existing objects, regardless of the setting you have defined for detecting redundant objects. For more information about this setting, see Policy Objects Page , on page 579.

For more information on policy objects, see Managing Policy Objects, on page 229.

Policy Discovery and Access Control Lists

Certain policies in Security Manager support only standard or only extended ACLs, even if both types are supported by the CLI. In such cases, policy discovery works as follows:

- If the Security Manager policy supports only extended ACLs (for example, firewall service policies), any standard ACLs configured on the device for that policy are imported as extended ACLs.
- If the Security Manager policy supports only standard ACLs (for example, SNMP traps on IOS routers), any extended ACLs configured on the device for that policy are imported as standard ACLs.

During the discovery process, Security Manager will show any inactive ACLs that are imported as disabled. If you later deploy these disabled ACLs, they are removed from the device configuration.

- Understanding Policy Object Overrides for Individual Devices , on page 246

Discovering Policies on Devices Already in Security Manager

When you add a device to the inventory, you can discover policies at the same time that you add the device. However, you can skip policy discovery and do it later, or rediscover policies after adding the device.

You might initiate policy discovery on existing devices when:

- You make changes to device configurations using CLI commands, for example, device upgrade. In such a situation, you can rediscover existing policies on the device to make sure that the Security Manager database has the most current information. We recommended you to enter out-of-band changes in Security Manager rather than performing a rediscovery. However, beginning with version 4.13, in a single discovery action, all the policies are properly discovered (as applicable for upgrade of ASA 8.x to 9.x).

- You want to discover a subset of policies (for example, platform-specific settings) that was not discovered when you first added the device to Security Manager.
- You want to import the factory-default configuration of a firewall device. For more information, see Default Firewall Configurations , on page 1805.

Caution If you perform policy discovery on a device *after* configuring policies in Security Manager but before you deploy your changes, the discovered policies overwrite the undeployed changes. For example, if you select the option to discover platform-specific settings, the discovered configuration overwrites any platform-specific undeployed policies you configured in Security Manager. This is true even if the discovered configuration does not include the specific platform policy you configured. For example, discovering platform-specific settings overwrites any routing policies that you have configured for the device in Security Manager, even if the configuration you discover does not contain any routing information. Another result of rediscovery is that any shared policies that were configured on the device are replaced by the local policies that are discovered.

Caution Under certain conditions, Security Manager may fail to discover ASA interfaces in system context. Specifically, if a rediscovery/deployment is done on the system context of a multiple context ASA without checking (selecting) "inventory," then Security Manager may fail to discover the interfaces on other security contexts. This can potentially result in Security Manager altering or altogether deleting interface configurations of other contexts in a subsequent deployment. To avoid this problem, simply be sure to select "inventory" when doing a rediscovery of the system context.

Before You Begin

Ensure that no one is configuring policies on the device or deploying configurations to the device. If you rediscover policies on a device while a deployment job is deploying configurations to the device, you might not be able to see the deployed changes after the rediscovery. Use the Deployment Manager to determine if there are active jobs that include the device before you rediscover policies (select **Manage > Deployments**). If you inadvertently rediscover policies during a deployment job, wait until the deployment job is completed and then discover policies again to ensure that Security Manager is synchronized with the device.

- Viewing Policy Discovery Task Status , on page 188
- Discovering Policies , on page 178
- Frequently Asked Questions about Policy Discovery, on page 193
- Understanding Policies , on page 167
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196
- Managing Shared Policies in Policy View , on page 217

Step 1 Decide whether you need to discover policies on a single device or if you want to discover policies on more than one device at a time. Policy discovery options vary based on how you start the discovery process.

- **Single device discovery**—If you need to discover policies related to any of the following, you can do it using only single-device discovery. (Note that single-device discovery is the type of discovery performed when you add a device to the inventory.)
  - Security context configurations for ASA, PIX, and FWSM devices running in multiple context mode.
  - Virtual sensor configurations for IPS devices.
  - Service module information for Catalyst devices.
  - Policy discovery from a configuration file.
  - Policy discovery from the factory default configuration.
- **Bulk rediscovery**—If you need to discover policies for more than one device, you can perform bulk rediscovery. However, bulk rediscovery can be performed only on live devices (that is, devices currently running and accessible in your network), and you cannot discover security context, virtual sensor, or Catalyst service module configurations. (You can discover service modules if you select them directly instead of selecting the device that contains them.)

Step 2 **If you want to perform single-device discovery**, do the following:

a) In device view or map view, ensure that only one device is selected, then right-click and select **Discover Policies on Device**. This opens the Create Discovery Task dialog box.

Tip: If the dialog box is called Bulk Rediscovery, you need to close the dialog box and try again. Ensure that only a single device is selected and reissue the command. You must use the right-click menu; it is the only way to perform single-device discovery.

b) Modify the discovery task name, if desired, and select the following discovery options. For detailed information, see Create Discovery Task and Bulk Rediscovery Dialog Boxes , on page 185.

- **Discover From**—Whether you are discovering from a live device (which is active and accessible in the network), a configuration file (click **Browse** to select the file on the Security Manager server), or factory default configuration (for ASA, PIX, and FWSM devices running an OS version for which a factory default configuration exists). You can discover the default configuration only for devices that run in single-context mode or for individual security contexts.

Tip: We recommend that you use the Factory Default Configuration settings when you add PIX, ASA, and FWSM devices manually (as described in Adding Devices by Manual Definition , on page 94). You should discover the default configuration for single-context mode devices and for each security context on a multiple-context mode device. For more information about factory-default policies, see Default Firewall Configurations , on page 1805.

- **Discover Policies for Security Contexts**—Select this option for firewall devices running in multiple-context mode if you want to discover policies for the security contexts defined on them.

c) Select the types of policies you want to discover. For more information about the difference between different types of policies, see Service Policies vs. Platform-Specific Policies , on page 168.

- Detect ASA-CX/FirePOWER Module—Determines if a CX or FirePOWER module is installed; see Detecting ASA CX and FirePOWER Modules , on page 2857 for more information.
- Inventory—Discovers basic device information (such as hostname and domain name), interfaces, and security contexts on devices running in multiple-context mode. On Cisco IOS routers, this option also discovers all interface-related policies, such as DSL, PPP, and PVC policies.
- Platform Settings—Discovers platform-specific policies, such as routing policies.

- Firewall Services—Discovers firewall services policies, such as access rules and inspection rules, on all platforms.
- NAT Policies—Discovers network address translation (NAT) policies, such as address pools, static translation rules, and dynamic NAT/PAT. Discovery of NAT policies is supported on ASA, ASA-SM, PIX and FWSM devices.
- Routing Policies—Discovers routing policies for ASA devices.
- SSL Policy—Discovers SSL policy for ASA devices.
- RA VPN Policies—Discovers IPSec and SSL remote access VPN policies, such as IKE proposals and IPsec proposals.
- IPS—Discovers IPS policies, such as signatures and virtual sensors.

For more information, see Create Discovery Task and Bulk Rediscovery Dialog Boxes , on page 185.

d) Click **OK**. The discovery task is initiated and the Discovery Status dialog box opens so you can view the task status (see Discovery Status Dialog Box , on page 189). You cannot perform other tasks in Security Manager while discovery is in progress.

Step 3 **If you want to perform bulk rediscovery**, do the following:

a) In device view, do one of the following:

- Select a device group, or multiple devices, then right-click and select **Discover Policies on Device**. Ensure that the Bulk Rediscovery dialog box opens.

Tip: If the dialog box is called Create Discovery Task, you need to close the dialog box and try again. Ensure that a device group or more than one device is selected and reissue the command.

- Select **Policy > Discover Policies on Device**. This opens the Device Selector dialog box. Select the devices you want to discover from the Available Devices list and click >> to move them to the Selected Devices list. Click **Next**.

Note If you use the right-click command, Security Manager assumes you have selected the desired devices. You can always click the **Back** button to go to the Device Selector screen and change the device list.

b) Modify the discovery task name, if desired, and select discovery options. For detailed information, see Create Discovery Task and Bulk Rediscovery Dialog Boxes , on page 185.

The devices are organized in groups according to device type, with your device groups (if any) shown within each type:

- To change options for all devices of a given type, select the device type folder and modify the Discover Device Settings options. If the Discover drop-down list shows Multiple Values, then there are different discovery options selected for devices of that type. If you change the value, it changes for all devices. The check boxes for the policy types (explained above for single-device discovery) are available only if you select Policies and Inventory. Only options available for all devices in the selected group are shown, so you might need to select individual devices separately to select the most appropriate set of options.
- To change options for a single device, click the + icons next to folders to open them until you find the device, select the device, and then select the discovery options.

Note When the list of options is not expanded, all policies, namely the Platform Settings, Firewall Policies, NAT Policies and RA VPN, are discovered. However, when you expand the list of options, the discovery will be based on the options that you select from the available list.

c) Click **Finish**. The discovery task is initiated and the Discovery Status dialog box opens so you can view the task status (see Discovery Status Dialog Box , on page 189). You cannot perform other tasks in Security Manager while discovery is in progress.

Create Discovery Task and Bulk Rediscovery Dialog Boxes

Use the Create Discovery Task dialog box to have Security Manager discover the policies for a device that is already in the device inventory. Use the Bulk Rediscovery dialog box to discover policies on more than one device at a time. Your options for policy discover differ based on which dialog box you use. For detailed information on the procedure, including how to get to each of these dialog boxes, see Discovering Policies on Devices Already in Security Manager , on page 181.

You can also discover policies when you add the device to the inventory. For more information about adding devices, see Adding Devices to the Device Inventory , on page 77.

Navigation Path

In Device view, select a device from the Device selector and do one of the following:

- Select **Policy > Discover Policies on Device** to perform bulk rediscovery.
- Right-click the device in the Device selector and select **Discover Policies on Device**. If a single device is selected, you get the Create Discovery Task dialog box. Otherwise, you are performing bulk rediscovery.

Tip You can also right click a device in Map view and select **Discover Policies on Device**.

Field Reference

Table 34: Create Discovery Task Dialog Box

Element	Description
Discovery Task Name	The name assigned to the discovery task. Security Manager automatically generates a name for the task based on the current date and time, but you can modify this name as desired.

Element	Description
Selected Devices table (Bulk rediscovery only)	The devices you selected for rediscovery. The devices are organized in groups according to device type, with your device groups (if any) shown within each type: • To change options for all devices of a given type, select the device type folder and modify the Discover Device Settings options. If the Discover drop-down list shows Multiple Values, then there are different discovery options selected for devices of that type. If you change the value, it changes for all devices. The check boxes for the policy types (explained above for single-device discovery) are available only if you select Policies and Inventory. Only options available for all devices in the selected group are shown, so you might need to select individual devices separately to select the most appropriate set of options. • To change options for a single device, click the + icons next to folders to open them until you find the device, select the device, and then select the discovery options. **Tip**: To change which devices are selected for rediscovery, click **Back** to go to the Device Selector dialog box.
Discover From Config. File (Not available for bulk rediscovery)	The source of policy information to be discovered: • Live Device—Discover policies directly from the device. • Config File—Discover policies from a configuration file. Specify the location of the file in the **Config File** field. Click **Browse** to select the file on the Security Manager server. You can discover policies only from configuration files that were generated from the device (for example, with the **show run** command). For more information, see Adding Devices from Configuration Files , on page 91. • Factory Default Configuration—Performs discovery on a firewall device using a file containing the factory-default settings for that device. Security Manager automatically chooses the appropriate file for the selected device (shown in the Config File edit box). This option is available only if Security Manager has a default configuration for the OS version running on an ASA, PIX, or FWSM device. You can discover the default configuration only for devices that run in single-context mode or for individual security contexts. For more information, see Default Firewall Configurations , on page 1805.
Discover Policies for Security Contexts (Not available for bulk rediscovery)	Whether to discover policies for each security context that is configured on a firewall device running in multiple-context mode. This field applies only to PIX, ASA, and FWSM devices. When deselected, Security Manager treats the entire device as having a single set of policies configured in single-context mode. For more information about security contexts, see Configuring Security Contexts on Firewall Devices, on page 2287.

Element	Description
Policies to Discover (for single-device discovery) Discover Device Settings (for bulk rediscovery)	The policy types to discover on the selected device. **Note** For bulk rediscovery, from the Discover drop-down menu, choose **Policies and Inventory** to enable the following options, **Inventory Only** to discover the inventory without discovering other policy types, or **Detect ASA-CX/FirePOWER Module** to determine if a CX or FirePOWER module is installed without discovering other policies. If the drop-down list has **Multiple Values** selected, this means that the devices in the selected group have different discovery options selected. If you change the selection, your change applies to all the devices in the group. The discovery options are: • Detect ASA-CX/FirePOWER Module—Determines if a CX module or FirePOWER module is installed; see Detecting ASA CX and FirePOWER Modules , on page 2857 for more information. • Inventory—Includes device information such as the hostname and domain name, interfaces, and security contexts (for firewall devices running in multiple-context mode). On Cisco IOS routers, this option also discovers all interface-related policies, such as DSL, PPP, and PVC policies. • Platform Settings—Includes all platform-specific policies that can be configured on the selected device. • Firewall Services—Includes all firewall service policies. For more information, see Introduction to Firewall Services, on page 597. • NAT Policies—Includes all network address translation (NAT) policies that are configured on the selected device, such as address pools, static translation rules, and dynamic NAT/PAT. Discovery of NAT policies is supported on ASA, ASA-SM, PIX and FWSM devices. For more information, see Configuring Network Address Translation, on page 1017. • Routing Policies—Discovers routing policies for ASA devices. For more information, see Configuring Routing Policies on Firewall Devices, on page 2083. • SSL Policy—Discovers SSL policy for ASA devices. • RA VPN Policies—Includes all IPSec and SSL remote access VPN policies that are configured on the selected device. This option is disabled if the device does not support remote access VPN configuration. For more information, see Managing Remote Access VPNs: The Basics, on page 1287. • IPS Policies—Includes all IPS policies that are configured on the selected device. For more information, see Overview of IPS Configuration , on page 1617 or Overview of Cisco IOS IPS Configuration , on page 1792.

Element	Description
	Notes: • Routing Policies and SSL Policy options are applicable for Adaptive Security Appliance (ASA) devices only. • If you select Platform Settings as the policies to discover, the Routing Policies and SSL Policy which are sub options of Platform Settings, cannot be deselected. • To discover either Routing Policies or SSL Policy or both, you can deselect the Platform Settings option and then select either Routing Policies or SSL policy or both to discover only those policies. • For non-ASA devices, the Routing Policies and SSL Policy options may be listed but will always be unavailable for selection. • In bulk rediscovery, for transparent mode and system context you can select the Routing Policies option but no discovery will happen.

Viewing Policy Discovery Task Status

When you initiate policy discovery a discovery task is created. For each policy discovery initiation, only one task is created regardless of the number of devices being discovered.

You can view the status of the current policy discovery task in the Discovery Status dialog box, which opens automatically when the task is initiated. This dialog box provides updated status information about the discovery task, including summary information about the task and details about each device being discovered.

You can abort a discovery task, if required. When you perform policy discovery on a single device, aborting the task results in partial discovery. In such cases, we recommend deleting the information and starting again. When you perform policy discovery on multiple devices, any devices for which discovery was completed before you aborted the operation are fully discovered. Security Manager automatically discards the information for any partially discovered device.

The Discovery Status dialog box also displays the appropriate warning and error messages if any problems are encountered during the discovery process. For example, if the CLI commands in a configuration file do not define a complete Security Manager policy, a warning message is displayed that you must complete the policy definition in the relevant Security Manager policy page.

For more information, see Discovery Status Dialog Box , on page 189.

To view information about previous discovery tasks, select **Manage > Policy Discovery Status** to open the Policy Discovery Status window. Select the discovery task in the top pane of the window, and the results of the task are displayed in the lower panes. For more information about using the Policy Discovery Status window, see Policy Discovery Status Page , on page 191.

Field Reference

Table 35: Discovery Status Dialog Box

Element	Description
Progress bar	Indicates what percentage of the discovery task on the current device has been completed.
Status	The current state of the discovery task.
Devices to be discovered	The total number of devices being discovered during this task. The number includes service modules, security contexts, and virtual sensors.
Devices discovered successfully	The number of devices discovered without errors.
Devices discovered with errors	The number of devices that generated errors during discovery.

Element	Description
Discovery Details table	The devices that are being discovered. Select a device to see the messages generated during the discovery of that device in the message list below the summary list. Besides the device name, information in the table includes: • Severity—The overall severity level of the discovery task. For example, if the discovery task completed successfully, an Information icon is displayed. If the task failed, an Error icon is displayed. • State—The current state of the policy discovery task for the selected device: • Device Added—The device has been added to Security Manager, but policy discovery has not yet started. • Discovery Started—Policy discovery has started. • Reading and Parsing Device Config—The policy discovery task is interpreting the device configuration. • Importing Objects—The policy discovery task is importing objects from the configuration. • Importing Policies—The policy discovery task is importing policies from the configuration. • Discovery Complete—Policy discovery has been completed successfully. • Discovery Failed—Policy discovery failed due to errors. • Discovered From—The source of policy information. For example, when discovering from a configuration file, this field displays the name and path of the file.
Messages list	The messages generated during the discovery for the selected device. Select a message to see detailed information in the fields to the right of the list.
Description	Additional information about the message selected in the message list.
Action	The steps you should take to resolve the described problem.
Generate Report button	Click this button to create a discovery status report for this job. The report is a PDF file, saved to your client system, that includes a summary of the job. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see Generating Deployment or Discovery Status Reports, on page 508.

Element	Description
Abort button	Aborts the discovery task. If you abort the task when performing policy discovery on a single device, the result is partial discovery of that device. In such cases, we recommend deleting the information (for example, by discarding the activity) and starting again. If you abort the task when performing policy discovery on multiple devices, Security Manager automatically discards the information for any partially discovered device. Devices for which discovery was completed before you aborted the operation are fully discovered.

Policy Discovery Status Page

Use the Policy Discovery Status page to view the status of previous policy discovery and device addition tasks.

Navigation Path

Select **Manage** > **Policy Discovery Status**.

Related Topics

- Viewing Policy Discovery Task Status , on page 188

Field Reference

Table 36: Policy Discovery Status Page

Element	Description
Task Table The upper portion of the window lists the previous policy discovery or device addition tasks. Select a task to view detailed information about it in the lower portion of the window. The columns in the table provide overall status information for the task. When adding devices that contain security contexts, the context discovery appears as a separate Policy Discovery task.	
Name	The name of the discovery or device addition task. This might be a system generated name or a name you specified when rediscovering device policies.
Type	The type of task, either Policy Discovery (when you rediscover device policies) or Add Device (when you add a device using the New Device wizard and elect to discover policies).
Start Time	The time the task started.
End Time	The time the task stopped.

Element	Description
Status	The overall status of the task. One of the following: • Completed successfully—The task succeeded. • Completed with errors—The task was partially successful. This could occur if all policies were not discovered or if the device was added but no policies were discovered. • Completed with warnings—The task was successful but a minor problem occurred. • Failed—The task failed. No polices were discovered or no device was added because of errors or because you stopped discovery.
Generate Report button	Click this button to create a discovery status report for the selected job. The report is a PDF file, saved to your client system, that includes a summary of the job. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see Generating Deployment or Discovery Status Reports, on page 508.
Refresh button	Click this button to refresh the task list to update the information if there are tasks running in the background or if new tasks were created.
Delete button	Click this button to delete the selected task from the database. Deleting old tasks does not affect the related devices or discovered policies.
Discovery Details or Import Details Tables These tables display the devices included in the selected task. The name differs depending on the type of task (Discovery Details for Policy Discovery tasks, Import Details for Add Device tasks). Select a device to see the messages generated during the task for that device in the message list below the table.	
Device	The name of the device. If the name is followed by (deleted), the device is no longer in the Security Manager inventory.
Config File (Import Details only)	The location of the configuration file. This field is displayed only if you are importing from a configuration file.
Task Type (Import Details only)	One of the following: • Import only—Adding devices to Security Manager. • Import and Discover—Adding devices and discovering policies and inventory, or adding devices and discovering policies.
Severity	An icon for one of the following is displayed: • Error—The device addition or policy discovery failed. • Information—The device was added successfully or policy discovery was successful.

Element	Description
State Details	These fields have the same meaning, although different names are used in the Discovery Details and Import Details tables. The fields describe the status of the task for the device: • Device Added—The device was successfully added to the inventory. • Device Add Failed—The device was not added to the inventory. • Discovery Completed—Discovery succeeded and the discovered policies are added to the Security Manager database. • Discovery Failed—No polices were discovered because errors occurred.
Discovered From (Discovery Details only)	One of the following: • Live Device—Security Manager contacted the device to obtain configuration and policy information. • File—Security Manager obtained the configuration and policy information from a configuration file.
Messages list	The messages generated during the task for the selected device. Select a message to see detailed information in the fields to the right of the list. The severity icons have these meanings: • Error—A problem was detected. • Warning—A minor problem occurred during discovery. • Information—An informational message about the selected device.
Description	Additional information about the message selected in the message list.
Action	The steps you should take to resolve the described problem.

Frequently Asked Questions about Policy Discovery

These questions and answers describe how policy discovery processes your device configurations into Security Manager policies.

Question: How does policy discovery work?

Answer: After you select the device whose policies, settings, and interfaces (inventory) you want to discover, Security Manager obtains the running configuration (from live devices) or the supplied configuration (when discovering from configuration files) and translates the CLI into Security Manager policies and objects. The imported configuration is added to the Configuration Archive as the initial configuration for the device. After discovery, you can review the discovered policies and objects and decide whether to commit them to the database. If you dislike them, you can discard them instead. Please note that commit and discard affect all discovered devices as a group and cannot be implemented on a per-device basis.

Question: When should I discover policies?

Answer: Typically, you should discover policies when you add devices to Security Manager. However, if you are creating devices in Security Manager (instead of importing live devices or configuration files), you must perform policy discovery after adding the device. You should also perform policy discovery in order to synchronize Security Manager with any out-of-band changes that have been made to the device, for example through the CLI.

Question: How can I determine the results of the discovery?

Answer: When you initiate a discovery task, a window opens that shows you the discovery status and results. You can also view a history of discovery task results on the Policy Discovery Status page (select **Manage > Policy Discovery Status**).

Question: Does Security Manager show which commands are not discovered, and what can I do about them?

Answer: In the discovery status window, go to the Message Summary section, then select **Commands Not Discovered**. Any undiscovered commands are listed in the Description field. You can either remove the command from the device and repeat the discovery process, or continue. If you continue, Security Manager will remove the unsupported command in the next deployment.

If Security Manager does not support a command found on a device, the discovery is generally not aborted; however, if the device has any access control entries (ACEs) that refer to unsupported object groups, the discovery is aborted. Other error messages, such as **User groups not supported**, might also provide details about undiscovered commands. Read the information in the Action box for suggestions.

Question: How are discovered policies reflected in the user interface?

Answer: Security Manager converts the device commands into policies. There is no difference in appearance between a policy discovered from a device configuration and one defined directly in Security Manager.

Question: I am using Auto Update Server for my PIX or ASA devices. How do I discover policies?

Answer: If a device has a static IP address, you can discover policies from the device. If it has a dynamic IP address, you must discover policies from the device's configuration file (offline).

Question: I am using Cisco Secure ACS to manage authentication and authorization to Security Manager. How does this affect policy discovery?

Answer: You must add all managed devices to Cisco Secure ACS before you can perform policy discovery and manage these devices in Security Manager. This includes security contexts on PIX/ASA/FWSM devices. For more information, see the Installation Guide for Cisco Security Manager .

Question: What should I do after discovering VPN or router platform policies?

Answer: Due to the way these features are discovered, Security Manager does not assume management of discovered VPN and router platform policies until after it deploys them. This means that if you discover a router, unassign one of its policies and deploy, no commands are removed from the router's configuration. We recommend, therefore, that you perform deployment to a file immediately after discovering VPN or router platform policies, *before* you make any changes to those policies. After this initial deployment, you can reconfigure these policies and deploy your changes as required.

Question: If I discover policies on a device and then deploy the policies from Security Manager without changing them, what is the difference between the original configuration on the device and the one that exists after the deployment?

Answer: Typically, there will be no differences between the new configuration and your original one, assuming you set up FlexConfigs for any unsupported CLI commands. However, in certain cases minor changes might occur in your ACL or object-group naming schemes. For more information, see How Policy Objects are Provisioned as Object Groups , on page 337. In addition, any discovered objects that are not being used by a

policy are removed from the configuration. There can also be instances where the new configuration is functionally equivalent to the old one but does not use the same commands.

Question: How does Security Manager handle my current CLI naming schemes for ACLs and object groups?

Answer: When you discover policies from a device, Security Manager tries to use the same names you have used. However, depending on your naming scheme, some minor differences might occur between what you defined on your device and the policies created through discovery. Additionally, there is a possibility that a naming conflict can occur between an existing ACL or object on the device and the name required for the new policy or object; in this case, Security Manager generates a different name so as not to misconfigure the device. For example, if the name of a discovered object conflicts with an object of the same type that already exists in Security Manager, a suffix is added to the name of the new object to make it unique or a device-level override is created.

Question: Are all configuration commands discovered and brought into Security Manager?

Answer: No. Security Manager does not discover all device configuration commands. Instead, it discovers security policies. For any configuration commands not discovered, use the FlexConfig feature to include the commands that Security Manager does not support.

Question: If I rediscover policies on a device already in Security Manager, what happens to the policies assigned to the device?

Answer: If you rediscover policies on a device that you are already managing with Security Manager, the newly discovered policies replace the ones assigned to the device. All policies within the selected policy domain (firewall services, platform settings, or both) are replaced, not just the ones that are different on the device compared to the ones in the Security Manager database. If you assigned shared policies to the device, the assignment is removed and the shared policy is left unchanged (so that other devices that use the shared policy are not affected). After policy discovery, all policies assigned to the device are specific to that device; none of them are shared with other devices. If you want to use shared policies with the device, you must redo the assignments after policy discovery.

In addition, any customizations done to local policies are also lost. For example, if you used sections to organize rules-based firewall policies, the sections are removed and the rediscovered policy is a flat list of entries.

Question: Does Security Manager use existing policies and objects during policy discovery?

Answer: During policy discovery, Security Manager uses existing policy objects (ones that you already defined in Security Manager) when creating policies for the device. However, Security Manager does not reuse existing policies; all policies created during discovery are local to the device being discovered. Thus, you might find it beneficial to define your policy objects (such as network objects) before adding devices to Security Manager.

Question: After adding a device and discovering policies, I cannot submit my changes to the database; instead I get warnings such as “Connection Policies Not Set.” What must I do to complete the device addition?

Answer: When you add a device and discover policies (particularly when you add devices from configuration files), Security Manager warns you if the resulting configuration is incomplete in ways that will prevent it from successfully managing the device. Connection policies, for example, are simply the device credentials (user names and passwords) required to log into the device, as well as other connection-related configuration settings (such as HTTP settings). Because these missing settings result in an invalid configuration or prevent Security Manager from contacting and managing the device later, you are prevented from submitting the changes to the database. Ensure that you have complete and valid configurations for these settings, then resubmit your changes to the database.

Question: Why does the AAA policy not show the AAA configuration that I discovered on the device?

Answer: The AAA policy contains the default configurations for authentication, authorization, and accounting. Other AAA commands that specify a particular list name are mapped to the policies that reference them. If the list name is not referenced by a policy, it is not discovered.

Question: Why are parts of the AAA method list definitions configured on my router not discovered?

Answer: Security Manager does not support certain keywords, such as if-needed. Method lists containing these keywords are discovered without the keyword. If the default AAA definitions on the device contain unsupported keywords, the entire command is not discovered.

Question: Can I discover AAA servers on devices running IOS software that were configured using the server-private command?

Answer: Yes, you can discover these servers. However, Security Manager converts them into standard AAA servers that can be used globally or in multiple AAA server groups. The server-private command is not supported.

Question: What do I need to know about discovery and device hostnames?

Answer: When you discover a device, the hostname policy is populated with the hostname discovered on the device. However, the hostname listed in Device Properties is not updated with this value. Ensure that the hostname defined in the device properties is the correct DNS name for the device. For more information, see Understanding Device Properties , on page 76.

Question: Why does CSM remove policy descriptions of policy-maps from the discovered ASA policies?

Answer: During policy discovery, CSM does not move the policy-map description from the policies into its database. Hence, when you preview the configuration, the descriptions inside the policy-maps are blank. After deployment, the ASA displays the CSM deployed policy-maps without the descriptions.

Managing Policies in Device View and the Site-to-Site VPN Manager

You can use Device view or the Site-to-Site VPN Manager to manage both local policies and shared policies, as described in the following sections:

- Policy Status Icons , on page 197
- Performing Basic Policy Management , on page 197
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

To access Device view, select **View > Device View** or click the **Device View** button on the toolbar. To access the Site-to-Site VPN Manager, select **Manage > Site-to-Site VPNs** or click the **Site-to-Site VPN Manager** button on the toolbar.

Related Topics

- Understanding the Device Inventory , on page 71

Policy Status Icons

You can learn the status of any policy in Security Manager at a glance by viewing the icon displayed next to the policy name.

Table 37: Policy Status Icons

Icon	Status
147969	The policy is not configured. Upon deployment, any policy of this type already present on the device is effectively removed.
147967	A local policy is configured. The definition of this policy affects only the device or VPN topology on which it is configured.
147968	A shared policy is configured. Any changes to the definition of this policy affect all of the devices or VPN topologies to which this policy is assigned.
	A policy bundle is configured. Any changes to the definition of this policy affect all of the devices or VPN topologies to which this policy is assigned, whether those policies are assigned using the same policy bundle, another policy bundle that includes the shared policy, or are assigned the shared policy directly and not through a policy bundle.

Performing Basic Policy Management

The following topics describe the operations you can perform on local policies in Device view. Local policies are policies that are specific to the device or VPN topology on which they are configured. They are not shared by other network elements.

- Configuring Local Policies in Device View , on page 197
- Copying Policies Between Devices , on page 199
- Unassigning a Policy , on page 202 (This topic also applies to the Site-to-Site VPN Manager)

Related Topics

- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203
- Managing Shared Policies in Policy View , on page 217
- Understanding Policies , on page 167

Configuring Local Policies in Device View

Use Device view to configure local platform and service policies on individual devices. Each policy defines a particular configuration or security task that the device can perform, such as NAT, OSPF routing or inspection

rules. Local policies are unnamed and are particular to the individual device on which they have been defined. Any changes that you make to a local policy do not affect other devices that Security Manager is managing.

When you configure a policy, a lock is placed on that policy to prevent other users from making changes to the same policy at the same time. See Understanding Policy Locking , on page 174.

You can modify any local policy assigned to a particular device provided you have permissions to modify policies and to access that device. For more information about permissions, see the Installation Guide for Cisco Security Manager.

After configuring a policy, you must deploy the changes to the device in order to make them active on that device. For more information, see Managing Deployment, on page 381

Related Topics

- Understanding the Device View , on page 71
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196
- Copying Policies Between Devices , on page 199
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

Step 1 In Device view, select a device from the Device selector, then select a policy for that device from the Device Policies selector. The details of the policy appear in the work area.

Step 2 Modify the definition of the policy as required. Click the Help button to access information specific to the selected policy. For more information, see:

- Managing Site-to-Site VPNs: The Basics, on page 1073
- Managing Remote Access VPNs: The Basics, on page 1287
- Introduction to Firewall Services, on page 597
- Overview of IPS Configuration , on page 1617
- Overview of Cisco IOS IPS Configuration , on page 1792
- Managing Routers, on page 2303
- Managing Firewall Devices, on page 1803
- Managing Cisco Catalyst Switches and Cisco 7600 Series Routers, on page 2621

Step 3 Click **Save** to save your changes.

If this is the first time you are configuring this policy on this particular device, the icon next to the selected policy changes to indicate that the policy is configured and assigned locally to the device. For more information about policy status icons, see .

After you save the policy, the policy is configured but you are the only one who can view the changes. There are additional steps to take to commit your changes and to deploy them to the device. The exact changes depend on whether you are working in Workflow or non-Workflow mode. Before taking the additional steps, configure all of the policies that you want to deploy; you are not required to deploy policy changes one at a time.

Following is a summary of the additional steps you need to take:

- Submit your changes. Submission updates the database on the Security Manager server with your changes.

- In non-Workflow mode, you submit changes by selecting **File > Submit**. You can also submit your changes and deploy them in a single step by selecting **File > Submit and Deploy**.
- In Workflow mode, if you are working with an activity approver, you submit your activity, and the changes are committed when the activity is approved. If you are not working with an activity approver, your changes are committed when you approve your own activity. For more information, see Submitting an Activity for Approval (Workflow Mode with Activity Approver) , on page 161 and Approving or Rejecting an Activity (Workflow Mode) , on page 162.

In both Workflow and non-Workflow mode, policies are validated when you submit them. For more information on validation, see Validating an Activity/Ticket , on page 160.

- Deploy your changes. Deployment either updates the devices directly with the new configuration, creates configuration files that you can deploy yourself, or copies the configuration files to an intermediate server (Auto Update Server, Configuration Engine, or Token Management Server) from which the device retrieves the updates. The method you use depends on the requirements of your organization, and you can select different methods for each device. For general information about deployment, see Working with Deployment and the Configuration Archive , on page 405. For the specific steps based on workflow mode, and information on the deployment methods, see the following topics:
  - Deploying Configurations in Non-Workflow Mode , on page 408
  - Deploying a Deployment Job in Workflow Mode , on page 420
  - Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422
  - Deploying Configurations to a Token Management Server , on page 423
  - Deploying Directly to a Device , on page 389
  - Deploying to a Device through an Intermediate Server , on page 390
  - Deploying to a File , on page 391

Copying Policies Between Devices

You can streamline device configuration by copying multiple policies, or even a complete set of policies, from one device to other devices that support the selected policies. This makes it easy, for example, to quickly configure a new firewall device with the same policies configured on an existing firewall device.

When you copy policies between devices, those policies that are local on the source device are copied locally to the target device. Shared policies assigned to the source device are copied as shared policies to the target device as well.

Tips

- If your intention is to assign a single shared policy to additional devices, we recommend that you use the assignment feature, rather than copying the policies. For more information about sharing policies in Device view, see Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.

- To create a new device of the same type that shares the same configuration and properties (including the operating system version, credentials, and grouping attributes) as the source device, use the Clone Device feature. For more information, see Cloning a Device , on page 128.

Related Topics

- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196
- Configuring Local Policies in Device View , on page 197
- Understanding the Device View , on page 71
- Policy Status Icons , on page 197
- Filtering Items in Selectors , on page 47

Step 1 In Device view, do one of the following:

- Select **Policy > Copy Policies Between Devices**. The Copy Policies wizard starts at step 1, the Copy Policies from this Device page. Select the device that has the policies you want to copy and click **Next**.
- Right-click the device in the Device selector, then select **Copy Policies Between Devices**. The Copy Policies wizard selects the device as the source device and starts at step 2, the Select Policies to Copy page. You can change the source device by clicking **Back**.

Tip You can also right click a device in Map view and select **Copy Policies Between Devices**.

Step 2 Select the policies you want to copy on the Select Policies to Copy page. Initially, most policies from the source device (both local and shared) that can be copied are selected. You can change the selection, however, if you select a policy that depends on another policy, you must select the dependant policies. Security Manager will prompt you if your selections are not valid.

Consider the following when selecting policies:

- Selecting the check box for a policy group selects all of the policies in that group.
- When you copy policies between firewall devices (ASA, PIX, FWSM), copying the failover policy automatically copies the interface policy and vice-versa.
- It is usually not a good idea to copy interface policies, because these policies can have specific IP addresses. Other types of policies that you should carefully consider before copying them include NAT, routing, or the IPS policy on IOS devices.
- If you select the security contexts policy (for FWSM, PIX Firewall, or ASA devices), you must submit your changes after copying the devices for the contexts to appear in the device selector. In non-Workflow mode, select **File > Submit**. In Workflow mode, submit your activity.

Step 3 Use the policy object copy options to determine how policy objects are handled. These options are not mutually exclusive, and the combination you select has important implications on how the policies are defined on the target devices.

These are the possible combinations and their meanings:

- To ensure that the target devices have the same policy object settings as the source device, select both **Copy the Global Values of Policy Objects** and **Copy the Overridden Values of Policy Objects**.

- To ensure that if a policy object is used on the target device, its value is not overridden, select **neither** option. If a selected policy uses a policy object, and an equivalent policy on the target device uses the same policy object, the policy object's value defined on the target device is preserved. If the target device does not use the policy object, it is copied to the target using the policy object's global value (any overrides on the source device are ignored).
- To ensure that any policy objects on the target device use the policy object's global values, select **Copy the Global Values of Policy Objects** but deselect **Copy the Overridden Values of Policy Objects**. If the source device includes policies that use policy objects, only policies that use global values for the policy objects are copied. If the target device has an equivalent policy that uses local values for the policy object, the local values are replaced by the policy object's global values.
- To ensure that only policy objects with local values on the source device are copied to the target device, deselect **Copy the Global Values of Policy Objects** but select **Copy the Overridden Values of Policy Objects**. If the source device includes policies that use policy objects, only policies that override the policy object's global values are copied. The target devices get the source device's override value for the policy object.

The following table shows the possible outcomes when copying policy objects depending on which of the two options are selected:

Source Device	Target Device	User Option	Target device (copy result)
Global Definition	No reference	Any	Global Definition
Global Definition	Global Definition	Any	Global Definition
Global Definition	Device-level override	Neither option selected	Retains target device's override
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Retains target device's override
		Both options selected	Global Definition
Device-level override	No reference	Neither option selected	Global Definition
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override
Device-level override	Global Definition	Neither option selected	Global Definition
		Copy the Global Values of Policy Objects only	Global Definition
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override

Source Device	Target Device	User Option	Target device (copy result)
Device-level override	Device-level override	Neither option selected	Retains target device's override
		Copy the Global Values of Policy Objects only	Retains target device's override
		Copy the Overridden Values of Policy Objects only	Uses source device's override
		Both options selected	Uses source device's override

Click **Next**.

Step 4 Select the target devices to which you want to copy policies on the Copy Policies to these Devices page. Selecting the check box for a device group selects all of the devices in that group.

The device selector displays only those devices that support all of the policies you selected to copy. If you do not see all of the devices to which you want to copy policies, you can return to the policy selection page and deselect the more restrictive policies, and use the wizard a second time to copy the restrictive policies to the subset of devices that support them.

The device list is empty if no other device in the inventory can support all selected policies.

Tip After selecting devices, Click the **Preview** button to view a summary of the policies that will be copied. The summary shows the selected devices, the policies that will be copied to them, and any overrides that will be created, updated, or deleted due to the copied policies.

Step 5 Click **Finish**. You are asked to confirm that you want to copy policies.

The policies are copied to the target devices. If the copy operation fails for any target device, the copy is undone for successful devices, and you are shown a list of reasons why the copy failed for each problem device. Typically, copy failures are because someone else has a lock on a policy or device, or you do not have the required permissions to a device.

Unassigning a Policy

If you unassign a policy that has already been deployed to a device, in most cases the values that are defined for the policy are erased, effectively removing the policy from the device's planned configuration. When you perform deployment, the configuration for this feature that already exists on the device is removed.

The exact behavior depends on the type of policy that you unassign:

- Firewall service policies—If you unassign a policy, Security Manager erases the policy from the device.
- VPN policies:
  - Site-to-site VPN policies—You cannot unassign mandatory site-to-site VPN policies from the devices in the topology. If you unshare a mandatory policy, Security Manager assigns default values to the affected device. If you unassign an optional policy, Security Manager erases the configuration from the device. For more information, see Understanding Mandatory and Optional Policies for Site-to-Site VPNs , on page 1078.
  - IPSec remote access VPN policies—If you unassign a policy, Security Manager erases the policy from the device, even if it is a mandatory policy. In most cases, deployment fails if you do not create a new definition for the mandatory policy. In those cases where deployment does not fail, the device will fail to establish VPN tunnels.

- SSL VPN policies—If you unassign a policy, Security Manager erases the policy from the device.

- Catalyst 6500/7600 or Catalyst switch policies—Interface and VLAN policies cannot be shared or unassigned. If you unassign a platform policy (such as IDSM settings or VLAN access lists) Security Manager removes the policy from the device.
- IPS policies—For all IPS device and service policies, a default policy is assigned to the device.
- PIX/ASA/FWSM policies—Policies that you cannot share with other devices cannot be unassigned from the device on which they are created. This includes interface, failover, security context, and resource policies. For other policy types (such as timeout policies), Security Manager makes a best effort to restore the system default configuration on the device.
- IOS router policies—Core connectivity policies, such as basic interface settings and accounts and credentials policies cannot be unassigned from the device on which they are created. If you unassign a device access policy that was used to define the password for configuring the device, you might prevent Security Manager from configuring that device in the future. For more information, see User Accounts and Device Credentials on Cisco IOS Routers , on page 2402.

If you unassign a VTY or console policy, Security Manager restores a default configuration to ensure continued communication with the device. For all other policy types, if you unassign the policy, Security Manager erases the configuration from the device.

Related Topics

- Configuring Local Policies in Device View , on page 197
- Copying Policies Between Devices , on page 199
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196

Step 1 Do one of the following:

- (Device view) Select the device that has a policy you want to unassign.
- (Site-to-Site VPN Manager) Select the VPN topology that has a policy you want to unassign.

Step 2 Right-click the local policy and select **Unassign Policy**.

Note You can unshare a policy only if you have the Assign privilege mapped to your role. Cisco Security Manager displays error message for authorization.

You are asked to confirm that you want to unassign the current policy.

Working with Shared Policies in Device View or the Site-to-Site VPN Manager

Sharing policies makes it possible to configure multiple devices with common policies, which provides greater consistency in your policy definitions and streamlines your management efforts. Any changes to a shared policy affect all the devices and VPN topologies to which the policy is assigned. This makes it easy, for example, to update all of your Cisco IOS routers with new quality of service policies by updating the shared Quality of Service policy assigned to these devices.

When working in Device view or the Site-to-Site VPN Manager, you can take a local policy (such as a policy created during device discovery) and share it. You can then assign the shared policy to as many devices or VPN topologies as you want (provided they are not locked by another user; see Understanding Policy Locking , on page 174), and you can change these assignments at any time. You can also take these shared policies that were created from the local policy and add them to a policy bundle. For more information on policy bundles, see Managing Policy Bundles , on page 224.

Tip If you have a device that you are using as a template for the creation of other devices, you can quickly create a policy bundle that can be used for device configuration based on the template device. To do so, first make all policies on the device shared policies (see Sharing Multiple Policies of a Selected Device , on page 208), then create a policy bundle from those shared policies.

In addition, you can take a shared policy that is assigned to a device or VPN topology and turn it into a local policy for that particular device or topology. This enables you to create a special configuration that affects only that device or topology. Other devices or topologies assigned the shared policy continue to use the shared policy as before.

As an alternative to sharing local policies, you can create new shared policies and manage them at the network level using Policy view. For more information, see Managing Shared Policies in Policy View , on page 217. After creating the shared policy and assigning it to devices or VPN topologies in Policy view, you can return to Device view or the Site-to-Site VPN Manager and perform additional operations on the policy as described in the sections that follow. Note that all shared policies that you create in Device view or the Site-to-Site VPN Manager automatically appear as shared policies in Policy view.

Tip In Device view or the Site-to-Site VPN Manager, if you edit a shared policy, your changes are applied to all devices or VPN topologies that share the policy. Thus, you do not need to go to Policy view to edit shared policies. You are warned when you try to edit a shared policy that this will happen, to ensure you do not inadvertently make a change to more devices or topologies than what you intend. If you need to change the policy for just one device or topology, you can unshare the policy before editing it, as described in Unsharing a Policy , on page 210.

The following topics describe how to share policies and the operations that can be performed on them in Device view or the Site-to-Site VPN Manager:

- Modifying Shared Policy Definitions in Device View or the Site-to-Site VPN Manager , on page 215
- Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216

Related Topics

- Importing Policies or Devices, on page 491
- Understanding Policies , on page 167
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196

Using the Policy Banner

When you view a device policy in Device view, or a site-to-site VPN policy in the Site-to-Site VPN Manager, there is a banner above the content of the policy in the work area. The banner provides information about whether the policy is local to the device or a shared policy. For shared policies, the banner also indicates the number of devices that use the policy. For policies that allow inheritance, the banner includes information about inheritance.

Messages might appear below the banner to indicate the following:

- That the policy is locked by another user. You cannot save changes to the policy until the other user submits (and approves) the changes, cancels an edit, or discards the changes.
- That the shared policy was imported. Imported policies might be re-imported at some point if the policy is managed on a different server. Any changes that you make are eliminated if the policy is imported again. Before editing the policy, ensure that you understand the protocols used in your organization for policy management and importation. You can control whether this message appears using an option on the Tools > Security Manager Administration > Policy Management page (see Policy Management Page , on page 577).

You can use the links in the banner to create shared policies, assign a shared policy, and configure policy inheritance. The following illustration shows an example of a device policy banner.

The fields in the policy banner have the following meanings and uses:

- Policy Assigned—The name of the policy assigned to this device or VPN. If the name has a link, you can assign a shared policy to the element by clicking the link. If there is no link, a shared policy cannot be assigned to this particular type of policy.
  - Local—The policy is a local policy (configured on this device only) rather than a shared policy.
  - Specific policy name—The shared policy is assigned to the device policy.
- Assigned To—If a shared policy is assigned, the number of devices or VPNs to which the policy is assigned. If no shared policy is assigned, **local device** or **this VPN** is indicated. If the name has a link, you can do the following:
  - Local Device or This VPN links—Click the link to create a shared policy from this local policy. You can then assign the shared policy to other devices or VPNs.
  - Number of Devices or VPNs links—Click the link to change the devices or VPNs assigned to the shared policy.

- Inherits From—The name of the policy from which this policy inherits rules. This field appears only for policies that allow inheritance. Click the link to specify a policy or set of policies from which the policy will inherit rules. For more information about inheritance, see Understanding Rule Inheritance , on page 170.

  The field can contain these entries:

  - None—The policy does not inherit rules from any other policy.
  - Single policy name—The policy inherits rules from this policy.
  - Multiple policy names separated by > signs—The policy inherits rules from the indicated hierarchy of policies.

- Policy Bundle Assigned—The name of the policy bundle assigned to this device or VPN.

Policy Shortcut Menu Commands in Device View and the Site-to-Site VPN Manager

When you right-click a policy in Device view or the Site-to-Site VPN manager, you get a list of commands that you can use on the policy. The shortcut command list includes only those commands available for the selected policy, so the list differs according to your selection.

The available commands depend on whether the policy:

- Is unassigned.
- Contains a local policy for that specific device or VPN topology.
- Contains a shared policy that might be assigned to multiple devices or VPN topologies.
- Can be shared. There are no shortcut commands for policies that cannot be shared between devices or topologies.

The current status of each policy type is indicated by the icon displayed next to the policy name. See Policy Status Icons , on page 197.

The following table provides a comprehensive list of the possible commands.

Table 38: Policy Shortcut Commands

Menu Command	Description
Commands available for both local and shared policies	
Assign Shared Policy	Assigns an existing shared policy to the selected device or VPN topology. If the policy is already assigned a shared policy, your selection assigns a new shared policy, replacing the existing selection. See Assigning a Shared Policy to a Device or VPN Topology , on page 211.
Inherit Rules	Enables you to identify a shared policy from which to inherit rules, or to remove any inheritance from the child policy. Child policies inherit both the mandatory rules and default rules that are defined in the parent policy. See Inheriting or Uninheriting Rules , on page 213.
Additional local policy commands	
Share Policy	Shares the local policy so that it can be assigned to other devices or VPN topologies. See Sharing a Local Policy , on page 207.
Unassign Policy	Unassigns the policy from the device or VPN topology. When deployed, the configuration that corresponds to the settings defined in this policy is removed from the device or the devices in the topology. See Unassigning a Policy , on page 202.
Additional shared policy commands	
Unshare Policy	Creates a local copy of the shared policy and assigns it to the device or VPN topology in place of the shared policy. See Unsharing a Policy , on page 210.
Edit Policy Assignments	Enables you to change which devices or VPN topologies are assigned to this policy, not just the device or VPN topology you are currently viewing. See Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.
Clone Policy	Creates a copy of a policy with a new name. Use this option to create a new policy with the same definition as the policy from which it was created, which you can then edit. See Cloning (Copying) a Shared Policy , on page 214.
Rename Policy	Renames the selected policy. See Renaming a Shared Policy , on page 215.

Sharing a Local Policy

As your network grows, you might decide to convert a local policy into a shared policy that you can assign to multiple devices or VPN topologies (see Local Policies vs. Shared Policies , on page 169). Sharing a policy provides a streamlined management approach that ensures that all devices or topologies assigned to the policy are configured in a consistent manner. For example, if you configure a set of firewall inspection rules on a particular device, sharing that device's inspection rules policy makes it possible to assign that policy to other devices, eliminating the need to configure each device individually. See Assigning a Shared Policy to a Device or VPN Topology , on page 211.

In addition, having a shared policy enables you to update the configurations of each assigned device or topology at one time, saving time and promoting greater consistency across your set of managed devices.

When you share a policy, you must name the policy. (Local policies do not have names, because they are associated with only a single device or topology.) This enables you to identify this policy when managing shared policies in Policy view.

- Assigning a Shared Policy to a Device or VPN Topology , on page 211
- Unsharing a Policy , on page 210
- Adding Local Rules to a Shared Policy , on page 212
- Sharing Multiple Policies of a Selected Device , on page 208
- Inheriting or Uninheriting Rules , on page 213
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

Step 1 In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy > Share Policy**.
- Right-click the policy and select **Share Policy**.
- Click the **local device/this VPN** link in the Assigned To field in the policy banner. A warning dialog box called Local Policies Cannot Be Assigned to Multiple Devices opens to inform you that you are viewing a local policy. Click **Share Policy** to continue.

The Share Policy dialog box is displayed.

Step 2 Enter a name for the shared policy and click **OK**.

Policy names can contain up to 255 characters, including spaces and special characters.

Sharing Multiple Policies of a Selected Device

With one procedure, you can share multiple policies configured on a particular device. When you perform this procedure, you can choose to share all the policies configured on the device or only some of them. For example, you can take all the firewall service policies defined on an ASA device and share them.

Initially, the resulting shared policies are assigned only to the device from which the procedure was performed. However, you can then assign these shared policies to additional devices as required. See Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.

This feature provides a convenient way to take the policies configured on a single device and use them as a template for configuring similar devices. For example, after you discover the devices at your branch offices,

you can take all the local access rules that you have configured on a similar device and share them with a single procedure so that you can assign them to the branch office devices.

Tip You can use this procedure to make all policies on the device shared policies and then create a policy bundle from those shared policies. This policy bundle can then be used to quickly configure new devices based on the template device.

Tip To create a new device of the same type that shares the same configuration and properties (including device operating system version, credentials, and grouping attributes) as the source device, create a clone of the device. For more information, see Cloning a Device , on page 128.

Related Topics

- Understanding the Device View , on page 71
- Copying Policies Between Devices , on page 199
- Sharing a Local Policy , on page 207
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203
- Unsharing a Policy , on page 210
- Filtering Items in Selectors , on page 47

Step 1 In Device view, do one of the following:

- Select **Policy** > **Share Device Policies**. The Share Policies wizard opens at the Share Policies from this Device page (step 1). Select the device whose policies you want to share and click **Next**.
- Right-click the device and select **Share Device Policies**. The Share Policies wizard opens at the Select Policies to Share page (step 2); you can click **Back** to go to step 1 and select a different device, if desired.

Tip You can also right click a device in Map view and select **Share Device Policies**.

Step 2 On the Select Policies to Share page, select all policies that you want to share. Initially, all shareable policies configured on the device, whether local or shared, are selected. Deselect the check box next to each policy that you do not want to share.

Following are some tips:

- Local policies that are not checked remain local to the selected device.
- If you select a policy that is already shared, Security Manager creates a copy of that policy using the name that you define in the wizard.
- Selecting the check box for a policy group selects all of the policies in that group.
- If a policy is configured on the device, but you cannot select it (the check box is solid grey), it is an unshareable policy.

Step 3 Enter a name for the shared policies. All policies are given the same name. You can later rename the individual policies. For more information, see Renaming a Shared Policy , on page 215.

If you select a policy that is already shared, Security Manager creates a copy of that policy using this name.

Step 4 Click **Finish**. The selected policies become shared policies, which you can then assign to additional devices as needed. For more information, see Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.

Unsharing a Policy

When you unshare a shared policy assigned to a particular device or VPN topology, you create a copy that becomes a local policy for that device or topology. This means that any subsequent changes made to the local policy affect only this particular device or topology. Other devices or topologies assigned the original shared policy continue to use the shared policy as before.

Note You can unshare a policy only if you have the Assign privilege defined for your role. Cisco Security Manager displays error message for authorization.

Note You cannot unshare a policy that is assigned to a device as part of a policy bundle. You must either unassign the policy bundle from the device or remove the shared policy from the policy bundle that is assigned to the device.

For example, Security Manager might be managing a BGP routing policy called MyBGP, which is assigned to 20 routers. If you decide that one of the routers (Router1) requires a variation of this policy, you can select the device, unshare the policy, and make the changes you need for that router. From that point on, Router1 has a local BGP policy while the other 19 routers continue to use the original shared policy, MyBGP.

Related Topics

- Understanding the Device View , on page 71
- Sharing a Local Policy , on page 207
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203
- Policy Status Icons , on page 197

Step 1 In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy** > **Unshare Policy**.
- Right-click the selected shared policy, then select **Unshare Policy**.

Note You can unshare a policy only if you have the Assign privilege mapped to your role. Cisco Security Manager displays error message for authorization.

Step 2 Click **OK**. The shared policy is converted into a local policy for the selected device or VPN topology. The shared policy icon in the Policies selector is replaced by the local policy icon.

Assigning a Shared Policy to a Device or VPN Topology

You can replace any shareable policy (local or shared) assigned in Device view or the Site-to-Site VPN Manager with an existing shared policy of the same type. For example, if you have a local NAT policy assigned to a Cisco IOS router, you can assign a shared NAT policy in its place. Similarly, if a shared NAT policy was assigned to the router, you can replace it with a different shared NAT policy.

Tip You can use bundle shared policies together to make assigning those policies easier. For more information, see Managing Policy Bundles , on page 224.

If you are assigning a shared policy to replace a local, rule-based policy (for example, an inspection rules policy), any local rules that you configured are replaced by the rules defined in the shared policy. A warning message gives you the opportunity to preserve the local rules by inheriting the rules of the shared policy instead of assigning the shared policy in place of the local policy. For more information, see Inheritance vs. Assignment , on page 172.

Tip If you want to use the rules defined in the shared policy and still keep your local rules, we recommend that you select the Inherit Rules option instead of assigning the policy. For more information, see Inheriting or Uninheriting Rules , on page 213.

Note You can also inherit IPS signature policies and signature event actions, but inheritance works differently than for rules-based policies. For more information, see Understanding Signature Inheritance , on page 1679.

Related Topics

- Understanding the Device View , on page 71

- Unassigning a Policy , on page 202
- Adding Local Rules to a Shared Policy , on page 212
- Copying Policies Between Devices , on page 199
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

Step 1 In Device view or the Site-to-Site VPN Manager, select a policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy** > **Assign Shared Policy**.
- Right-click the policy in the Policies selector, then select **Assign Shared Policy**.

- Click the link in the Policy Assigned field in the policy banner.

The Assign Shared Policy dialog box is displayed if there are any shared policies available for assignment.

Step 2 Select a shared policy from the displayed list to assign to the device or VPN topology and click **OK**. If the policy does not allow inheritance, the shared policy is assigned to the selected device and you are finished.

Step 3 If the policy allows inheritance, you are warned that the shared policy will replace the Customize Desktop Page , on page 520 current policy and given the option to inherit the rules instead with the Local Policy Will Be Replaced dialog box.

Your options are:

- Assign Policy—Assign the shared policy to replace the existing local policy. If you choose to assign, all local rules are removed and they cannot be retrieved.
- Inherit From Policy—Inherit the rules of the shared policy. If you choose to inherit, the inherited rules are added to the local rules that are already defined in the device's local policy. Use inheritance instead of assignment when the device needs to maintain the set of local rules already defined for it.

Tip You can select **Do not show this again** to save your selection and have it applied to all future times that you assign rule-based policies. Otherwise, you are prompted each time you assign policies so that you can make different selections based on the circumstances. If you select this option, you can turn it off by resetting it on the Customize Desktop administration settings page (see).

Adding Local Rules to a Shared Policy

After you assign a shared rule-based policy, such as access rules, to a device, you can define additional rules in the policy that are local to that device. Selecting this option creates an inheritance relationship, where the policy defined on the device inherits rules from the shared policy while adding rules that affect only this particular device. For more information about inheritance, see Understanding Rule Inheritance , on page 170.

Local rules that you add to a device do not affect the shared policy from which the device inherits its remaining rules. For example, if the shared policy Access_Rules_South is assigned to five devices and you define local rules on one of those devices, the access rules policy on that device consists of the rules defined in Access_Rules_South plus the local rules; the other four devices continue to use only the rules defined Access_Rules_South.

Before You Begin

Assign a shared, rule-based policy to the device as described in Assigning a Shared Policy to a Device or VPN Topology , on page 211.

Related Topics

- Understanding the Device View , on page 71
- Cloning (Copying) a Shared Policy , on page 214
- Assigning a Shared Policy to a Device or VPN Topology , on page 211
- Unsharing a Policy , on page 210
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

Step 1 In Device view, select a device from the Device selector, then select a shared policy assigned to that device from the Device Policies selector. You must select a rule-based policy, such as access rules. The details of the policy appear in the work area.

Step 2 Do one of the following:

- Select **Policy** > **Add Local Rules**.
- Right-click the policy, then select **Add Local Rules**.

A message is displayed indicating that the policy on this device is now defined as a child policy that inherits rules from the shared policy. If the shared policy in turn inherits rules from a different shared policy, those rules are automatically inherited as well.

Note To change the parent policy from which this policy inherits rules, see Inheriting or Uninheriting Rules , on page 213.

Step 3 Click **OK** to confirm. In the work area, headings are added for local mandatory and default rules in addition to the mandatory and default rules inherited from the shared policy.

In the Device Policies selector, the status icon changes to the icon for a local policy. For more information, see Policy Status Icons , on page 197.

Step 4 Define local rules as required.

Tip If you assign a shared policy after adding local rules, both the inherited rules and your local rules are replaced with the selected shared policy.

Inheriting or Uninheriting Rules

This procedure describes how certain types of rule-based policies, such as access rules, can inherit rules from shared policies of the same type. Child policies inherit both the mandatory rules and default rules that are defined in the parent policy.

When working in Device view, you can then define additional rules that are local to the selected device. For more information, see Adding Local Rules to a Shared Policy , on page 212.

You can edit rule inheritance from either Device view or Policy view.

Related Topics

- Understanding the Device View , on page 71
- Managing Shared Policies in Policy View , on page 217
- Assigning a Shared Policy to a Device or VPN Topology , on page 211
- Understanding Rule Inheritance , on page 170
- Inheritance vs. Assignment , on page 172
- Using the Policy Banner , on page 205
- Understanding Policies , on page 167

Step 1 Select a local or shared rule-based policy in either Device view or Policy view, then do one of the following:

- Select **Policy** > **Inherit Rules**.
- Right-click the policy, then select **Inherit Rules**.
- (Device view only) Click the link in the Inherits From field in the policy banner.

The Inherit Rules dialog box is displayed, containing a list of all shared policies of the selected type, including any inheritance relationships among them.

Step 2 Select the policy from which to inherit rules, or select **No Inheritance** to remove any inheritance from the child policy. The name of the parent policy is displayed below the selector.

For example, if you select an access rules policy called West Coast, your access policy inherits the rules of the West Coast policy. If the West Coast policy is a child policy of another access rules policy called US, your policy inherits the properties of the West Coast policy, which in turn inherits the properties of the US policy.

Step 3 Click **OK** to save your definitions. The work area displays the inherited rules under the name of the parent policy and any local rules, if defined, under the name of the original shared policy.

Cloning (Copying) a Shared Policy

You can clone an existing shared policy. This provides a useful shortcut for creating a new policy that is similar to an existing one; after creating the clone, you can modify it as required.

If you clone a rule-based policy with inheritance, the new policy contains the same inheritance properties as the policy from which it was created. For more information, see Understanding Rule Inheritance , on page 170.

Tip If you clone a policy in Device view or the Site-to-Site VPN Manager, the new policy is assigned to the selected device or VPN topology. If you want to clone a policy without changing policy assignments, make the clone in Policy view.

Related Topics

- Understanding the Device View , on page 71
- Managing Shared Policies in Policy View , on page 217
- Renaming a Shared Policy , on page 215
- Deleting a Shared Policy , on page 223

Step 1 Select a shared policy in Device view, Policy view, or the Site-to-Site VPN Manager, then do one of the following:

- (Device or Policy view only) Select **Policy** > **Clone Policy**.
- Right-click the shared policy, then select **Clone Policy**.

The Clone Policy dialog box is displayed.

Step 2 Enter a name for the new policy and click **OK**.

Names can contain up to 255 characters, including spaces and special characters.

Renaming a Shared Policy

You can rename a shared policy. The new name is immediately reflected in all devices and VPN topologies to which the policy is assigned.

Related Topics

- Understanding the Device View , on page 71
- Managing Shared Policies in Policy View , on page 217
- Cloning (Copying) a Shared Policy , on page 214
- Deleting a Shared Policy , on page 223

Step 1 Select a shared policy in Device view, Policy view, or the Site-to-Site VPN Manager, then do one of the following:

- (Device or Policy view) Select **Policy > Rename Policy**.
- Right-click the policy, then select **Rename Policy**.

The Rename Policy dialog box is displayed.

Step 2 Enter a new name for the selected policy and click **OK**.

Names can contain up to 255 characters, including spaces and special characters.

Modifying Shared Policy Definitions in Device View or the Site-to-Site VPN Manager

You can modify any shared policy in Device view or the Site-to-Site VPN Manager by selecting one of the devices or VPN topologies to which the policy is assigned, making the necessary changes, and then saving these changes to the Security Manager server. Any changes made to a shared policy in Device view or the Site-to-Site VPN Manager automatically affect all devices to which the shared policy is assigned.

Tip To apply your changes only to the device or VPN topology that you are modifying, you must first unshare the policy (see Unsharing a Policy , on page 210). This action converts the policy to a local policy and prevents your changes from affecting other devices or topologies.

Related Topics

- Understanding the Device View , on page 71
- Using the Policy Banner , on page 205
- Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216

- Configuring Local Policies in Device View , on page 197
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196

Step 1 Do one of the following:

- (Device view) Select the device that has a shared policy you want to modify.
- (Site-to-Site VPN Manager) Select the VPN topology that has a shared policy you want to modify.

Step 2 Redefine the policy as required.

Step 3 Click **Save**. You are asked to confirm that you want to save your changes, reminding you that the changes you made will be applied to all devices or topologies to which the policy is assigned.

Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager

You can modify the list of devices or VPN topologies assigned a particular shared policy as required. If you remove a device or topology from a policy assignment, that policy is effectively removed from the device's or topology's planned configuration. Upon deployment, any configuration of that type that exists on the device or topology is removed. For more information about the implications of unassigning a policy, see Unassigning a Policy , on page 202.

Caution Use the policy assignment feature with care, as unassigning a policy removes that configuration from the device or topology and can have unintended consequences. For example, if you unassign a device access policy from a Cisco IOS router and then deploy that change, you might prevent Security Manager from configuring that device in the future (see User Accounts and Device Credentials on Cisco IOS Routers , on page 2402).

Policy assignment can also be modified from Policy view. For more information, see Modifying Policy Assignments in Policy View , on page 221.

Related Topics

- Understanding the Device View , on page 71
- Using the Policy Banner , on page 205
- Assigning a Shared Policy to a Device or VPN Topology , on page 211
- Unassigning a Policy , on page 202
- Copying Policies Between Devices , on page 199
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203
- Inheritance vs. Assignment , on page 172
- Inheriting or Uninheriting Rules , on page 213

Step 1 In Device view or the Site-to-Site VPN Manager, select a shared policy from the Policies selector, then do one of the following:

- (Device view only) Select **Policy > Edit Policy Assignments**.
- Right-click the policy and select **Edit Policy Assignments**.
- Click the *n* device/VPN link in the Assigned To field in the policy banner.

Step 2 Modify the list of devices or VPN topologies to which the policy is assigned, as follows:

- To assign the selected policy to additional devices or topologies, select them from the Available Devices/VPNs list, then click >> to move them to the Assigned Devices list.
- To unassign the selected policy from devices or topologies, select them from the Assigned Devices/VPNs list, then click << to return them to the Available Devices/VPNs list. Devices or topologies that are unassigned from the policy remove this policy from their running configuration during deployment.

Tip To assign a policy to all the devices in a device group, select the name of the device group, then click >>.

Step 3 Click **OK** to save your assignment changes.

Managing Shared Policies in Policy View

Use Policy view to globally manage all the shared policies configured in Security Manager. Unlike Device view, which you use to manage all the policies configured on a selected device, Policy view enables you to manage all shared policies of a particular type regardless of device.

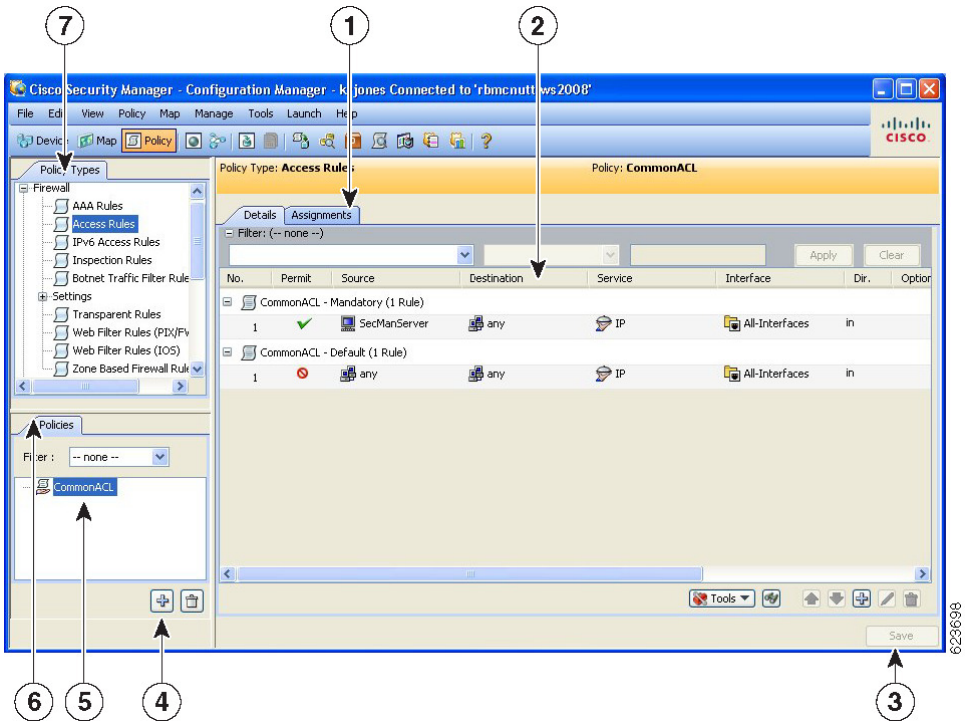
Policy view enables you to:

- Create new shared policies.
- Edit any policy configuration.
- Modify the list of devices or VPNs to which shared policies are assigned.
- Delete shared policies that are not assigned to any devices or VPNs.

To access Policy view, select **View > Policy View** or click the **Policy View** button on the toolbar.

The below figure shows the main areas of Policy view.

Figure 14: Policy View



1	**Assignments tab**	5	**Shared Policy selector**
2	Work area and Details tab	6	Shared Policy filter
3	Save button	7	Policy Type selector
4	Create a Policy and Delete a Policy buttons		

- **(7) Policy Type Selector**—Lists the policy types available in Security Manager, divided by category. Clicking a policy type in the selector displays all the shared policies defined for that type in the Shared Policy selector. To create a new policy, right click the policy type and select **New [policy type] Policy** or click the Create a Policy button in the shared policy selector. For more information, see Policy View Selectors , on page 219.
- **(4, 5, 6) Shared Policy Selector**—Lists the shared policies that are defined for the selected type. Clicking a policy in the selector displays the definition of the policy and its assignments in the work area. For more information, see Policy View Selectors , on page 219.

Right-click a policy in the selector to perform actions on the policy. For more information on the available commands, see Policy View—Shared Policy Selector Options , on page 220.

Use the Filter field to filter the list of policies displayed in the selector. For more information about creating filters, see Filtering Items in Selectors , on page 47.

- **(1, 2, 3) Work Area**—Contains two tabs:
  - Details—Use this tab to view and edit the definition of the selected policy. You can modify the definition as required; click **Save** in the work area to save your changes. Changes affect all devices or VPN topologies to which the policy is assigned. The information displayed on the Details tab is

identical to the information displayed in Device view or the Site-to-Site VPN Manager and can be modified in exactly the same way. See Policy View Selectors , on page 219.

- Assignments—Use this tab to view and edit the list of devices or VPNs to which a shared policy is assigned. For more information, see Modifying Policy Assignments in Policy View , on page 221.

Related Topics

- Importing Policies or Devices, on page 491
- Managing Policies in Device View and the Site-to-Site VPN Manager , on page 196
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

Policy View Selectors

Policy view contains two selectors. The upper selector displays all the policy types available for a selected policy domain. The root of the policy type selector is the policy domain name. To display the policy types for a different policy domain, click the root of the tree and select a different domain from the list.

Policy domains include:

- Firewall—Lists all policy types for configuring firewall services. See Introduction to Firewall Services, on page 597.
- NAT (PIX/ASA/FWSM)—Lists all NAT policies configured on PIX, ASA, and FWSM devices. See NAT Policies on Security Devices , on page 1031.
- NAT (Router)—Lists all NAT policies configured on Cisco IOS routers. See NAT Policies on Cisco IOS Routers , on page 1022.
- Site-to-Site VPN—Lists all policy types for configuring site-to-site VPNs. See Managing Site-to-Site VPNs: The Basics, on page 1073.
- Remote Access VPN—Lists all policy types for configuring remote-access IPSec and SSL VPNs. See Managing Remote Access VPNs: The Basics, on page 1287.
- Catalyst Platform—Lists all policy types for configuring Catalyst switches and 7600 routers. See Managing Cisco Catalyst Switches and Cisco 7600 Series Routers, on page 2621.
- IPS—Lists all policy types for configuring IPS devices. See Overview of IPS Configuration , on page 1617.
- IPS (Router)—Lists all policy types for configuring Cisco IOS IPS policies on IOS routers. See Overview of Cisco IOS IPS Configuration , on page 1792.
- PIX/ASA/FWSM Platform—Lists all policy types for configuring PIX/ASA/FWSM platform-specific policies. See Managing Firewall Devices, on page 1803.
- Router Interfaces—Lists all policy types for configuring platform-specific Cisco IOS router interface policies. See Managing Routers, on page 2303.
- Router Platform—Lists all policy types for configuring platform-specific Cisco IOS router policies. See Managing Routers, on page 2303.
- FlexConfigs—Lists all FlexConfig policies. See Managing Flexconfigs, on page 341.

You can expand and collapse the selector as required to view all the available policy types and subtypes. To create a new policy, right click the policy type and select **New [policy type] Policy** or click the Create a Policy button in the shared policy selector.

Selecting a policy type from the Policy Type selector displays all the shared policies of that type in the Shared Policy selector. Local policies configured in Device view are not displayed.

For example, when you select a configuration policy type, such as NAT translation rules, the Shared Policy selector displays a flat list of each shared policy of that type. If you select a rule-based policy type, such as firewall access rules, the Shared Policy selector displays a hierarchical tree of shared policies. This enables you to view the inheritance relationships among the various policies. The Shared Policy selector includes a shortcut menu with options for actions that can be performed on that policy, such as renaming it.

Tip You can create and apply a filter to shorten the list of policies displayed in the Shared Policy selector. For more information about filters, see Filtering Items in Selectors , on page 47.

Policy View—Shared Policy Selector Options

Right-click a policy in the Shared Policy selector of Policy view to display a shortcut menu for performing functions on the selected policy.

Field Reference

Table 39: Shared Policy Selector Options

Menu Command	Description
Clone Policy	Creates a new shared policy with the same definition as the policy from which it was cloned. See Cloning (Copying) a Shared Policy , on page 214.
Rename Policy	Renames the selected policy. See Renaming a Shared Policy , on page 215.
Add to Policy Bundle	Allows you to add the selected shared policy to a policy bundle. See Managing Policy Bundles , on page 224.
Inherit Rules	Applies only to rule-based policies such as access rules. Causes a rule-based policy to inherit the rules of a different shared policy of the same type. See Inheriting or Uninheriting Rules , on page 213.
New [policy type] Policy	Creates a new shared policy of the selected type. See Creating a New Shared Policy , on page 221.
Delete Policy	Deletes the selected shared policy. See Deleting a Shared Policy , on page 223.

Creating a New Shared Policy

Use Policy view to create a new shared policy. In most cases, the new policy starts out undefined, but in certain cases (for example, many site-to-site VPN policies, such as IPsec proposals and GRE modes) default values are supplied. In all cases, the new policy is not initially assigned to any devices. If the new policy is a rule-based policy that supports inheritance, it can be created as a child of an existing shared policy of the same type. For more information, see Understanding Rule Inheritance , on page 170.

Tip You can also create shared policies by converting local policies in Device view. For more information, see Sharing a Local Policy , on page 207.

Related Topics

- Importing Policies or Devices, on page 491
- Managing Shared Policies in Policy View , on page 217
- Deleting a Shared Policy , on page 223

Step 1 In Policy view, select a policy type in the Policy Type selector.

Step 2 Do one of the following:

- Right-click the policy type in the Policy Type selector, then select **New [policy type] Policy**.
- Right-click a policy in the Shared Policy selector, then select **New [policy type] Policy**.
- Click the **Create a Policy** button beneath the Shared Policy selector.

The Create a Policy dialog box is displayed.

Step 3 Enter a name for the new policy. Policy names can contain up to 255 characters, including spaces and special characters.

When creating a Translation Rules policy for NAT rules on security devices (PIX/ASA/FWSM), you must also choose a device software Version: **PIX/ASA 6.3-8.2** or **ASA 8.3 & Later**.

Step 4 Click **OK**. The new policy appears in the Shared Policy selector.

To configure a definition for the new shared policy, click the Help button in the toolbar with the Details tab open to see information specific to the type of policy you are creating. To assign the new shared policy, see Modifying Policy Assignments in Policy View , on page 221.

Modifying Policy Assignments in Policy View

Use the Assignments tab in Policy view to modify the list of devices or VPN topologies to which you assigned a selected shared policy. The Assignments tab shows a list of all devices that are currently assigned the selected shared policy. It also shows devices that are assigned the policy through inheritance.

Assigning a policy to a device or VPN overwrites any policy of the same type (local or shared) that was previously assigned to the device in Security Manager. When deployed, the newly assigned policy overrides

any policy of the same type that is already configured on the device, whether it was configured using Security Manager or using another method, such as the CLI.

When you unassign a shared policy from a device or VPN topology, Security Manager removes the policy from the planned configuration of that device or VPN topology. When the configuration defined by the policy is deployed, any configuration of the same type that is already configured on the device (including the devices in the VPN topology) is removed. For more information, see Unassigning a Policy , on page 202.

Therefore, if your intention when performing unassign is to assign a different shared policy to a particular device or VPN topology, it is important to select the replacement policy and perform the assignment before performing deployment.

Tip Assigning a replacement policy is particularly important when you use a device access policy to configure the enable password or enable secret password on a Cisco IOS router. If you unassign this policy and fail to define a different password in its place before deployment, Security Manager might be unable to configure this device in the future. For more information, see User Accounts and Device Credentials on Cisco IOS Routers , on page 2402.

Alternatively, you can return to Device view and replace the shared policy assigned to the device with a different shared policy. For more information, see Assigning a Shared Policy to a Device or VPN Topology , on page 211.

Note If you unassign a mandatory site-to-site VPN policy, such as an IKE proposal policy, Security Manager automatically replaces it with a default policy. If you unassign a mandatory remote access VPN policy, you must manually configure a new policy of that same type or deployment will fail.

Related Topics

- Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216
- Managing Shared Policies in Policy View , on page 217

Step 1 In Policy view, select a policy type from the Policy Type selector, then select a policy from the Shared Policy selector. For more information about using these selectors, see Policy View Selectors , on page 219.

Step 2 Click the **Assignments** tab in the work area.

The Assignments tab shows a list of all devices that are currently assigned the selected shared policy. It also shows devices that are assigned the policy through inheritance.

Step 3 Modify the list of devices or VPNs to which the policy is assigned, as follows:

- To assign the selected policy to additional devices or VPNs, select one or more items from the Available Devices/VPNs list, then click >> to move them to the Assigned Devices/VPNs list.

Tip To assign a policy to all the devices in a device group, select the name of the device group, then click >>.

- To unassign the selected policy from devices or VPNs, select one or more items from the Assigned Devices/VPNs list, then click << to return them to the Available Devices/VPNs list.

Note Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.If you assign an IPv4 AAA-, access-, or inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified AAA-, access-, or inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

Step 4 Click **Save** to save your assignment changes.

Deleting a Shared Policy

Use Policy view to delete a shared policy from Security Manager.

Before you delete a shared policy, you should unassign it from any devices that use it, and configure replacement policies for those devices. If a shared policy is assigned to a device, when the policy is deleted the device no longer has a policy configured for the deleted shared policy, other than whatever defaults might exist for the policy type. For more information about removing assignments, see Modifying Policy Assignments in Policy View , on page 221.

Note If a shared policy is part of a policy bundle that is assigned to a device, you must remove the assignment before you can delete the shared policy.

Related Topics

- Creating a New Shared Policy , on page 221
- Cloning (Copying) a Shared Policy , on page 214
- Managing Shared Policies in Policy View , on page 217

Step 1 In Policy view, select a policy type from the Policy Type selector, then select the policy to delete from the Shared Policy selector. For more information about using these selectors, see Policy View Selectors , on page 219.

Step 2 Do one of the following:

- Right-click the policy, then select **Delete Policy**.
- Click the **Delete a Policy** button beneath the Shared Policy selector.

You are asked to confirm the deletion.

Managing Policy Bundles

Policy bundles are collections of shared policies that can be managed as a group. Policy bundles make managing shared policies easier by allowing you to create the bundle one time and then assign all of the policies in the bundle to a new device at once. The shared policies that are part of the bundle function in the same way as other shared policies and modifying any of the shared policies that are part of a bundle affects all devices that are assigned that policy either directly or through a policy bundle.

When creating a policy bundle, you can only assign one shared policy of each type to the policy bundle. Multiple policy bundles can be assigned to a device as long as the policy types in those policy bundles do not overlap.

When assigning a policy bundle to a device, if local policies on that device are the same policy type as those contained in the policy bundle, you are given the option to inherit or replace the existing policies.

Note When you unassign a policy bundle, all policies that are part of that bundle are removed from the device. Local policies will be lost and cannot be retrieved.

This section contains the following topics:

Creating a New Policy Bundle

You can use the Policy Bundle view to create new policy bundles. When creating a policy bundle, you can only assign one shared policy of each type to the policy bundle.

Related Topics

- Managing Policy Bundles , on page 224
- Cloning a Policy Bundle , on page 225
- Renaming a Policy Bundle , on page 226
- Assigning Policy Bundles to Devices , on page 226

Step 1 Use one of the following methods to create a policy bundle:

- In Policy Bundle view, do one of the following:
  - From the All Shared Policies view, select the shared policies that you would like to bundle, then right-click on a selected shared policy and select **Create Policy Bundle**.
  - Right-click an existing policy bundle in the Policy Bundle selector, then select **Create Policy Bundle**.

- Click the **Create a Policy Bundle** button beneath the Policy Bundle selector.

- To create a new policy bundle that includes all of the shared policies on a device, right-click a device in the Device selector in Device view, then select **Create Policy Bundle**.

The Create Policy Bundle dialog box is displayed.

Step 2 Enter a name for the new policy bundle.

Step 3 Click **OK**.

The policy bundle is added to the list of policy bundles in Policy Bundle view.

Step 4 To configure the definition for a policy bundle, do any of the following:

- In Policy Bundle view:
  - To add shared policies to the bundle, select **All Shared Policies** in the Policy Bundle selector and then drag and drop the required shared policies onto the policy bundle.
  - To remove shared policies from the bundle, select the bundle in the Policy Bundle selector. Select the shared policy you want to remove on the Details tab of the Policy Bundle View window, and then click **Delete**.
- In Policy view, right-click the shared policy you want to add to a policy bundle, select **Add to Policy Bundle**, and then select the bundle to which you want to add the shared policy.

Cloning a Policy Bundle

You can use Policy Bundle view to create a new policy bundle by cloning an existing bundle.

Related Topics

- Managing Policy Bundles , on page 224
- Creating a New Shared Policy , on page 221
- Renaming a Shared Policy , on page 215
- Assigning Policy Bundles to Devices , on page 226

Step 1 In Policy Bundle view, right-click an existing policy bundle in the Policy Bundle selector, then select **Clone Policy Bundle**.

The Clone Policy Bundle dialog box is displayed.

Step 2 Enter a name for the new policy bundle.

Step 3 Click **OK**.

The new policy bundle appears in the Policy Bundle selector.

Renaming a Policy Bundle

You can rename existing policy bundles from the Policy Bundle view. Renaming a policy bundle will not affect device assignments.

Related Topics

- Managing Policy Bundles , on page 224
- Creating a New Shared Policy , on page 221
- Cloning a Policy Bundle , on page 225
- Assigning Policy Bundles to Devices , on page 226

Step 1 In Policy Bundle view, right-click an existing policy bundle in the Policy Bundle selector, then select **Rename Policy Bundle**.

The Rename Policy Bundle dialog box is displayed.

Step 2 Enter a new name for the policy bundle.

Step 3 Click **OK**.

The policy bundle name is updated in the Policy Bundle selector.

Assigning Policy Bundles to Devices

You can modify the list of devices assigned a particular policy bundle as required. Multiple policy bundles can be assigned to a device as long as the policy types in those policy bundles do not overlap. When assigning a policy bundle to a device, if local policies on that device are the same policy type as those contained in the policy bundle, you are given the option to inherit or replace the existing policies.

Note If any of the policies that are part of a policy bundle are not compatible with the device to which you are assigning it, the bundle cannot be assigned.

If you remove a device from a policy bundle assignment, all policies that are part of that bundle are effectively removed from the device's planned configuration. Local policies will be lost and cannot be retrieved. Upon deployment, any configuration of that type that exists on the device is removed. For more information about the implications of unassigning a policy, see Unassigning a Policy , on page 202.

Caution Use the policy bundle assignment feature with care, as unassigning a policy bundle removes that configuration from the device and can have unintended consequences. For example, if you unassign a device access policy from a Cisco IOS router and then deploy that change, you might prevent Security Manager from configuring that device in the future (see User Accounts and Device Credentials on Cisco IOS Routers , on page 2402).

Related Topics

- Managing Policy Bundles , on page 224
- Creating a New Shared Policy , on page 221
- Cloning a Policy Bundle , on page 225
- Renaming a Policy Bundle , on page 226

Step 1 In Policy Bundle view, select an existing policy bundle in the Policy Bundle selector.

The policy bundle details are displayed in the Policy Bundle main window.

Step 2 Click the **Assignments** tab.

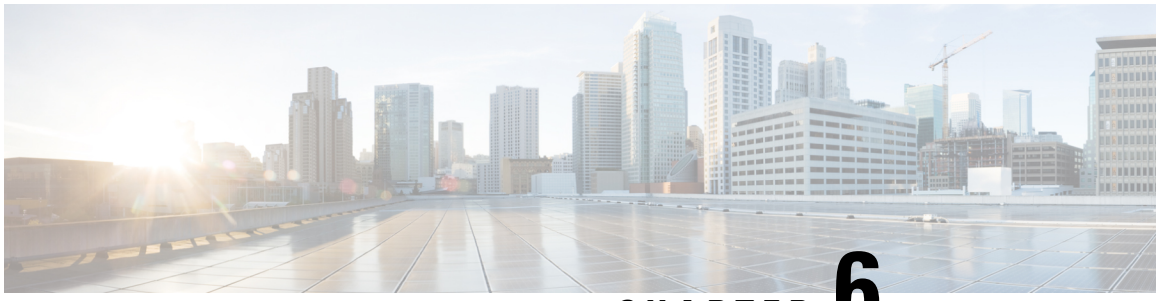
Step 3 Modify the list of devices to which the policy bundle is assigned, as follows:

- To assign the selected policy bundle to additional devices, select them from the Available Devices list, then click >> to move them to the Assigned Devices list.
- To unassign the selected policy bundle from devices, select them from the Assigned Devices list, then click << to return them to the Available Devices/VPNs list. Devices or topologies that are unassigned from the policy remove this policy from their running configuration during deployment.

Tip To assign a policy to all the devices in a device group, select the name of the device group, then click >>.

Step 4 Click **OK** to save your assignment changes.

The policy bundle name is updated in the Policy Bundle selector.



CHAPTER 6

Managing Policy Objects

Policy objects enable you to define logical collections of elements. They are reusable, named components that can be used by other objects and policies. Objects aid policy definition by eliminating the need to define that component each time you define a policy. When used, an object becomes an integral component of the object or policy. This means that if you change the definition of an object, this change is reflected in all objects and policies that reference the object.

Objects facilitate network updates, because you can identify objects separately but maintain them in a central location. For example, you can identify the servers in your network as a network/host object called MyServers, and the protocols to allow on these servers in a service object. You can then create an access rule that permits the MyServers network/host object to send and receive traffic for the services defined in the service object. If a change is made to these servers, you need only update the network/host or service object and redeploy, instead of trying to locate and edit each rule in which the servers are used.

Objects are defined globally. This means that the definition of an object is the same for every object and policy that references it. However, many object types (for example, interface roles) can be overridden at the device level. Thus, you can create an object that works for most of your devices, yet customize the object to match the configuration of a particular device that has slightly different requirements. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246.

This chapter contains the following topics:

Selecting Objects for Policies

Modifying Policies using Drag and Drop

If you are modifying an existing policy, you can easily update the policy definition by dragging and dropping objects from the Policy Object Manager onto the applicable field in the policy. You can select a range of objects from the Policy Object Manager window by selecting the first object in the range and then, with the Shift key pressed, selecting the last object in the range. You can select multiple objects by clicking those objects while keeping the Ctrl key pressed. You can also select a range of objects and then add additional objects to your selection by using the Ctrl key method. To drag multiple objects, press and hold the Ctrl key while dragging or drag using the right-mouse button.

Creating Policies using Object Selector

When creating a policy, you often need to select one or more objects to include in the policy definition. For example, firewall policies make use of network/host objects, interface role objects, and service objects.

To include objects in policies, you can manually enter the object name or click the **Select** button to display an object selector dialog box. In certain cases, the object selector is prefiltered to display only the objects that are applicable to the policy that you are configuring. For example, when configuring a policy that requires a subnet, the object selector displays only those network/host objects that represent subnets, not network/host objects that represent single hosts. Object selectors make it easy for you to select which objects to include in a particular policy.

Additionally, object selectors enable you to create and edit objects of that type on the fly. This makes it easy to work with objects without leaving the policy you are defining to open the Policy Object Manager. For example, if when creating a dynamic NAT rule you discover that the ACL object you require does not exist, you can click the Create button to open the dialog box for creating an ACL object. When you finish creating the object, you are returned to the object selector with the new object selected and ready for inclusion in the policy. If you need to modify an existing object before using it, select it, click the Edit button and make your modifications, then click OK to save your changes; this returns you to the object selector.

When you create an object by opening the object editor from within a selector, the new object must conform to the requirements of the field from which the selector was opened. For example, if you open a selector from a field requiring a host and then decide to create a network/host object for that field, you must define the network/host object as a host.

There are two types of objects selectors—a simple list selector for policies that require you to select a single object, and a dual selector for policies that allow you to select multiple objects of a certain type. The following table explains these selectors and how to use them.

Table 40: Object Selectors

Element	Description
Type	The type of object to display in the selector, if there is an option. For example: • You can choose between network/host objects and interface roles when configuring sources and destinations in some rule-based policies. • You can choose between standard and extended ACL objects when configuring some ACLs (for example, when configuring VLAN ACLs on Catalyst 6500/7600 devices). **Tip** In some policies, if you select more than one type of object, they are displayed on different tabs within the field.
Available [object type]	Displays all objects that are relevant to the policy or object you are configuring. When selecting interfaces, be aware that there can be interfaces and interface roles with the same name. They can be distinguished by the icon displayed next to the name. For more information, see Specifying Interfaces During Policy Definition , on page 306. **Tip** You can quickly find an object inside a selector by clicking in the list box and then starting to type the name of the object.
Selected [object type]	Displays the objects that you selected to apply to the policy or object that you are editing.
Multi-Object Selector Buttons	
>> button << button	Moves the selected objects from one list to the other list in the direction indicated. You can select multiple objects by using Ctrl+click. You can also move objects between lists by double-clicking them or by selecting them and pressing Enter.
Up/Down arrow buttons	For a limited number of object types, order matters. If the selector includes **Move Up** and **Move Down** buttons, arrange the objects in priority order. For example, when defining a method list for AAA, use the arrows to determine the order in which different types of AAA server groups are used.
Common Buttons	
Create button	Click this button to create an object of this type. **Tip** In a few cases, such as network/host and service objects, clicking this button opens a list from which you need to select a specific type for the object.
Edit button	Click this button to edit the selected user-defined object. If you try to edit a system-defined object, it is opened in read-only mode.

Policy Object Manager

Use the Policy Object Manager to:

- View all available objects grouped by object type.
- Create, copy, edit, and delete policy objects.
- Drag and drop objects onto existing policies to update the policy definition.
- Generate usage reports, which describe how selected objects are being used by other Security Manager objects and policies.

Navigation Path

In Device view or Policy view, click the **Policy Object Manager** button on the toolbar, or choose **Policy Objects** from the **Manage** menu. (The Policy Object Manager cannot be opened from Map view.)

Note When you open the Policy Object Manager, it is initially displayed as a pane in the lower half of the current view to make dragging and dropping objects easier. You can "undock" this pane, making the Policy Object Manager a separate window; you also can "re-dock" the window. See Policy Object Manager: Undocking and Docking , on page 236 for more information.

Related Topics

- Creating Policy Objects , on page 237

- Managing Object Overrides , on page 246
- Filtering Tables , on page 50

Field Reference

Table 41: Policy Object Manager Window

Element	Description
Object Type selector, or table of contents (Left pane)	Lists the object types available in Security Manager. When you select an object type, all existing objects of that type are listed in the table in the right pane. The objects are organized into three folders: Favorites, Recent Objects, and All Object Types. Click the arrow to left of a folder name to expand that folder. You can also specify your favorite object types and they will be presented in a separate list so that they can be more easily accessed. To add an object type to your favorites list, right-click the object and then select **Add to Favorites**. To remove an object type from your Favorites list, right-click the object and choose **Remove from Favorites**. Recent Objects is a list of the ten most recently modified objects. Click a recent object to see a summary of the object that includes the name, type, description, and last modified date. You can also access the View Object, Edit Object, and Find Usage buttons for the object. Expand the All Object Types folder to view all types of object available.
Policy Object Table (Right Pane) The policy object table in the right pane lists existing objects of the type selected in the table of contents. Using this table, you create new objects and work with existing ones. You can use the buttons below the table, or right-click within the table to see additional commands (see Policy Object Manager Shortcut Menu , on page 236). Except for the Access Control Lists (ACL) object, there is one table per object type. For ACLs, there are tabs to separate Extended, Standard, Web, and Unified ACL objects. Select the appropriate tab to work with the desired object type. The columns in the table vary based on the type of object you select. You can alter the columns displayed in the table by right-clicking the table heading and selecting or deselecting columns in the Show Columns command. You can also sort the information by the contents in a column by clicking the column heading; click the heading to toggle between alphabetical and reverse alphabetical sorting. For detailed information on the settings that are displayed in the table, click the Create or Edit buttons below the table and click Help in the dialog box that is opened. The following section, “Table Columns,” is a description of the columns that you typically see.	
Buttons Above Table	
Referenced	Select this option to view reference information for objects. When selected, a "Referenced" column is added to the table to display information on whether an object is being used by any policies or policy objects.
Find Usage	Use the Find Usage feature to view a report on the policies or policy objects that are using the selected object and any device overrides for the object. For more information, see Generating Object Usage Reports , on page 243.

Element	Description
View Object	When a single object is selected in the table, you can click this button to open the Edit dialog box for that type of object in read-only mode to view the settings for that particular object.
Export	Use the Export feature to download a CSV file of the object data for the selected object type.
Print	Use the Print feature to print the object data for the selected object type.
Filter	Allows you to filter the rows displayed to help you find items in a large table. For more information, see Filtering Tables , on page 50.
Table Columns	
*	Indicates the policy object status: • - Policy object has been locked for editing. Hover over the lock icon to see the user and ticket/activity that has the object locked. • - Policy object has been modified in the current ticket/activity but the changes have not been submitted. **Note** You can hover over the status icons to see details about the ticket/activity in which the policy object has been modified/locked and to navigate to that ticket/activity.
Icon (unlabeled field)	The icon displayed for a policy object type identifies objects of that type wherever they appear, such as in rules tables. If the icon includes the image of a pencil, you can edit it.
Name	The name of the policy object.
Content	A summary of the object definition that might not include all defined settings.
Permit	For ACL objects, if the Access Control Entry (ACE) allows traffic, a check mark appears in the Permit column. If the action is deny, a red circle with a slash appears.
Category	The category object that is assigned to the object, if any. Categories help you organize and identify rules and objects. For more information, see Using Category Objects , on page 241.
Overrides	Whether a user can override the object properties at the device level. A check mark indicates that the object can be overridden. Not all object types are overridable. If an object has been overridden, the Overrides column displays the number of overrides for that object. You can click on the number to see the list of overrides. For more information about device overrides, see Managing Object Overrides , on page 246.

Element	Description
Referenced	Whether the object is being used in any policy definitions. You can find out which policies or policy objects are using the selected object and any device overrides for the object using the Find Usage feature (see Generating Object Usage Reports , on page 243). **Note** To view reference information, make sure the Referenced option is selected on the toolbar above the Policy Object Table. **Note** The Referenced column reports usage based on both committed data and uncommitted data across all activities/tickets, whereas as the Find Usage feature only reports usage based on committed data and data from the current activity/ticket.
Description	The description for the object. If the column is too narrow to display the description, you can double-click the icon to view the description or mouse-over the icon.
Last Ticket(s)	If ticketing is enabled, shows the Ticket ID of the ticket last used to modify the object. You can click on the If ticketing is enabled, shows the ticket(s) associated with last modification to the object. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Last Modified Date	Shows the date and time the object was last modified.
Buttons Below Table	
	Click the New Object button to create a new object. The same icon is used for any button that adds an item to a table. **Tip** In a few cases such as Networks/Hosts and Services objects, clicking this button opens a list from which you need to select a specific type for the object. Clicking this button opens a dialog box to create the object. Click the Help button in the dialog box for information on the selected object type. Also, see Creating Policy Objects , on page 237.
	Click the Edit Object button to edit the selected object. The same icon is used for editing any object in a table. The dialog box used for editing the object is the same as the one used for creating the object. If you try to edit a system-defined default object, you are allowed only to view the object contents. Click the Help button in the dialog box for information on the settings. For more information, see Editing Objects , on page 241.
	Click the Delete Object button to delete the selected object. You can delete only user-defined objects that are not currently being used in a policy or another policy object. For more information, see Deleting Objects , on page 245.

Policy Object Manager: Undocking and Docking

Whenever you open the Policy Object Manager, it is initially displayed as a pane in the lower half of the current view to make dragging and dropping objects easier. You can "undock" this pane, making the Policy Object Manager a separate window, you can "re-dock" the window, and you can close the pane or window:

- To undock the Policy Object Manager from the current view in the Configuration Manager window, click the Undock Window button in the upper right corner of the pane's title bar.
- To put the floating window back as a pane in the Configuration Manager window, click the Dock Frame button in the upper right corner of the Policy Object Manager window.
- To close either the pane or the floating window, click the Close button in its upper right corner.

Navigation Path

In Device view or Policy view, click the **Policy Object Manager** button on the toolbar, or choose **Policy Objects** from the **Manage** menu. (The Policy Object Manager cannot be opened from Map view.)

Policy Object Manager Shortcut Menu

Right-clicking inside the policy object table in the Policy Object Manager , on page 232 displays a shortcut menu for performing various functions on the selected object type.

Field Reference

Table 42: Policy Object Manager Shortcut Menu

Menu Command	Description
New Object	Choose this command to create a new policy object. Click Help in the dialog box that is opened for information specific to the object type. Also, see Creating Policy Objects , on page 237. **Tip** For network/host and service objects, you need to also select an object type from the submenu.
Edit Object	Choose this command to edit the policy object selected in the table. If you select a system-defined default object, you are presented with a view-only look at the object definition. For more information, see Editing Objects , on page 241.
Delete Object	Choose this command to delete the policy object selected in the table. You can delete only user-defined objects that are not being used in a policy or in another policy object. For more information, see Deleting Objects , on page 245.
Enable/Disable Device Overrides	Choose the Enable Device Overrides command to enable device overrides on one or more devices on which overrides are disabled. Choose the Disable Device Overrides command to disable device overrides on one or more devices on which overrides are enabled.
Edit Device Overrides	Select this command to change the device-level overrides for this object using the Policy Object Overrides Window , on page 249. You can create, edit, and delete overrides. For more information, see Managing Object Overrides , on page 246.

Menu Command	Description
Clone Object	Select this command to create a copy of the policy object. For more information, see Cloning (Duplicating) Objects , on page 242.
Copy Object	Choose this command to copy one or more selected objects to the system Clipboard. **Tip** You can also use **Ctrl+C** to copy objects.
Paste Object	Choose this command to paste the object(s) on the system Clipboard into another object. For example, you might add a host-type Networks/Hosts object to an existing group-type Networks/Hosts object. The two object types must be compatible. **Tip** You can also use **Ctrl+V** to paste objects.
Find Usage	Choose this command to generate a usage report for the selected object using the Object Usage dialog box. The usage report tells you where the object is currently being used. for more information, see Generating Object Usage Reports , on page 243.
View Object	Choose this command to view the definition of the object using a read-only version of the edit dialog box for the object. For more information, see Viewing Object Details , on page 243.

Working with Policy Objects—Basic Procedures

The following topics describe the actions that you can perform on policy objects. Some tasks are limited to certain types of objects. For example, not all types of object can be overridden, you cannot edit predefined objects, and you cannot import or export all objects.

This section contains the following topics:

Creating Policy Objects

Security Manager provides predefined policy objects of various types that you can use to define policies. Additionally, you can create your own objects, as required.

You can create objects in one of two ways:

- Using the Policy Object Manager window. This option is best suited for situations where you are defining one or more objects outside of the context of defining a particular policy. See Policy Object Manager , on page 232.
- Using object selectors. When you define a policy that uses objects, object selectors include buttons for creating and editing objects so you don't have to leave the policy you are defining. This is frequently the best method to use, because during policy creation you are prompted for the specific type of object that applies to the situation, and you are more aware of the settings you need for the policy. See Selecting Objects for Policies , on page 230.

Tip Your ability to create multiple objects with the same definition depends on a setting on the Policy Objects page in the Security Manager Administration window (select **Tools > Security Manager Administration**). By default, Security Manager warns you when you create an object whose definition is identical to that of an existing object, but it does not prevent you from proceeding. For more information, see Policy Objects Page , on page 579.

Related Topics

- Managing Policy Objects, on page 229
- Working with Policy Objects—Basic Procedures , on page 237

Step 1 Do one of the following:

- Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232. Select the type of object you want to create from the table of contents, right-click in the table and select **New Object**.
- While configuring a rule, click **Select** next to a field that allows or requires a policy object. In the object selector, click the **Create** button below the available objects list.

Tip In a few cases, such as network/host and service objects, clicking these buttons opens a list from which you need to select a specific type for the object.

The dialog box for adding the selected type of object opens. For more information about the individual types of objects, see the following topics:

- Add or Edit User Group Dialog Box , on page 1564
- Configuring WINS/NetBIOS Name Service (NBNS) Servers To Enable File System Access in SSL VPNs , on page 1416

Step 2 Enter a name for the object and optionally a description of the object.

Object names are not case-sensitive and are limited to 128 characters. You can begin object names with a letter, a number, or an underscore. You can use a mix of letters, numbers, special characters, and spaces for the remainder of the object name.

Supported special characters include

- hyphens (-),
- underscores (_),
- periods (.), and,
- plus signs (+).

Beginning with version 4.12, Security Manager allows you to use additional special characters including

- exclamation mark (!),
- at sign (@),
- hash sign (#),
- percent sign (%),
- ampersand sign (&), and,
- parentheses or round brackets ().

Security Manager does not support the following characters:

- caret character (^)
- dollar character ($)

Some objects also support the use of colons (:) in the object name; however, objects with a colon in the name are not supported on IPS devices. If you share objects between different device types that include IPS devices, you should avoid using a colon (:) in the object name.

Note Certain object types, such as AAA server groups, ASA user groups, maps, network/host objects, service objects, and traffic flows, have different naming guidelines. For more details, refer to the online help when you are creating each object type.

Step 3 Configure the settings specific to the type of object. Refer to the online help page for the dialog box.

Step 4 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 5 (Optional) If the object type provides the option, select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 6 Click **OK** to save the object.

Editing Objects

You can edit any user-defined object as required. Changes that you make to the object are reflected in all policies (and other objects) that use the object. However, if an override for the object is already defined for a device, your edits are not reflected in the object used on those devices.

Tips

- You cannot edit predefined objects, but you can copy them to create new objects. See Cloning (Duplicating) Objects , on page 242.
- Messages appear at the top of the Edit dialog box to indicate the following situations:
  - That you have read-only access to the object. You cannot save changes to these objects.
  - That the policy object was imported using the procedure described in Importing Policies or Devices, on page 491. Imported objects might be re-imported at some point if the shared policy that uses the object is managed on a different server. Any changes that you make are eliminated if the policy object is imported again. Before editing the object, ensure that you understand the protocols used in your organization for policy management and importation. You can control whether this message appears using an option on the **Tools > Security Manager Administration > Policy Management page** (see Policy Management Page , on page 577).
- You can also edit objects when you define policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Before You Begin

Determine if the object is being used, and which policies, objects, and devices would be affected by the changes. You can generate a usage report for this purpose. See Generating Object Usage Reports , on page 243.

Related Topics

- Creating Policy Objects , on page 237

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232.

Step 2 Select the object type from the table of contents.

Step 3 Right-click the object you want to edit and select **Edit Object**.

Step 4 Modify the fields in the Edit dialog box for that object type as required, then click **OK** to save your changes. Click the Help button for information specific to the type of object.

Using Category Objects

Categories provide an intermediate level of detail to objects. By assigning a category to an object, you can look for the name and color of a category to more easily identify rules and objects in rules tables. You can assign a category to a rule or object when you create the rule, or you can edit the rule or object to include category information later. No device configuration commands are generated for category assignments.

The benefits of assigning categories to policy objects are:

- Visibility is improved when you view rules tables using objects that are categorized.
- Objects can be filtered in the rules tables based on category, facilitating rule maintenance.

For example, you might want to create a network/host object and keep track of its use for administrative purposes. When you define this network/host object, you associate it with a category. When you view the access rules table, you can easily identify those rules that use your network/host object. You can also filter the table to display only those items associated with the category.

Security Manager includes a set of predefined categories. Although you cannot change the colors, you can change their names and descriptions. The following procedure explains how to change the name and description.

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **Categories** from the Object Type selector.

Step 3 Click **Edit Object** to open the Category Editor dialog box.

Step 4 Modify the names and descriptions of the predefined category objects as required:

- Label—The color associated with the category.
- Name—The category name. Names can have a maximum of 128 characters, including special characters and spaces.
- Description—Additional information about the object (up to 1024 characters).

Step 5 Click **OK** to save your changes.

Cloning (Duplicating) Objects

An alternative to creating a policy object from scratch is to clone, or duplicate, an existing object. The new object contains all the attributes of the copied object. You can then modify the name and all attributes as required.

Cloning is useful for creating objects that are based on predefined objects that cannot be edited.

Related Topics

- Working with Policy Objects—Basic Procedures , on page 237

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232.

Step 2 Select the object type from the table of contents.

Step 3 Right-click the object you want to duplicate and select **Clone Object**.

The dialog box for that object type appears. The Name field contains the following default name for the new object: Copy of *name of copied object* . The remaining fields contain the same values as the copied object.

Step 4 Modify the name of the new object and its configuration, as required. Click the Help button for information specific to that type of object.

Step 5 Click **OK** to save your changes.

Viewing Object Details

You can view contents of an object in read-only mode, even when the object is locked by another activity. This is useful when you need to view complete configuration details for complex objects whose definitions cannot be fully displayed in the Policy Object Manager window or when your user privileges allow you only to view object information.

Related Topics

- Working with Policy Objects—Basic Procedures , on page 237

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232.

Step 2 Select the object type from the table of contents.

Step 3 Right-click the object and select **View Object**.

The dialog box for that object appears in read-only mode.

Generating Object Usage Reports

Before you make any changes to a policy object, you should determine if the object is being used. You can do this by viewing the Referenced column in the Policy Object Manager window. Select the Referenced button above the Policy Object Table to enable the Referenced column.

For objects that are referenced, you can generate usage reports that show which policies, objects, VPNs, and devices are using the selected object and would therefore be affected by changes to that object. Usage reports contain any references to the selected object in your current activity as well as references found in the data committed to the database.

Note The Referenced column reports usage based on both committed data and uncommitted data across all activities/tickets, whereas as the Find Usage feature only reports usage based on committed data and data from the current activity/ticket.

You can use either of these methods to generate usage reports:

- Policy Object Manager—Select **Manage > Policy Objects** to open the Policy Object Manager , on page 232. Select the type of object from the table of contents, right-click the object and select **Find Usage**.
- Firewall rules policies—Left-click an object in a firewall rules table, then right-click and select **Find Usage**.

The usage information is displayed in the Object Usage dialog box. Select the appropriate usage type above the table to view devices, policies, VPNs, or other objects that use the selected object.

For certain policies,

The following table describes the fields in the dialog box.

Table 43: Object Usage Dialog Box

Element	Description
Name Type Description	General information about the object for which you are finding usage is displayed at the top of the Object Usage dialog box.
Devices Policies Objects VPN	The type of references you want to view. For example, you can select Objects to view only references to the object from other objects.
Used By	The name of the device, policy, VPN, or object that is referencing the selected object.
Type	The type of item that is referencing the selected object. This can be a device, policy, VPN, or another object.
Usage	Indicates how the object is being referenced. For example, if a device is referencing the selected object, this column will indicate that it is a policy assigned to the device that is referencing the object.
Proximity	Indicates the relationship between the selected object and the item that it using it. For example: • A policy that includes a network/host object in its definition has a *direct* relationship with the object and an *indirect* relationship with any other network/host objects contained within the object. • A device on which this policy is assigned references the network/host object *directly* and any other network/host objects contained within the object *indirectly* .

Element	Description

Details Panel	Shows additional details for certain types of references:
	• **Devices** - For supported policy types, device information is displayed in the Details panel.
	• **Policies** - For the following supported policy types, the actual rules referencing the object are presented in the Details panel:
	  • AAA Rules
	  • Access Rules
	  • IPv6 Access Rules
	  • Inspection Rules
	  • Translation Rules
	  • Web Filter Rules (PIX/FWSM/ASA)
	  • Zone Based Firewall Rules
	You can navigate to the rule, export the rule data, or print the rule data from the Details panel.
	• **Objects** - Details for other objects that are referencing the specified object are presented in the Details panel. You can export the detailed information, print the information, view the object in read-only mode, edit the object, or even find usage for the object from the Details panel in the Object Usage dialog box.

Deleting Objects

You can delete user-defined objects only when they are not being used by policies or other objects. You cannot delete predefined objects. If you delete an object for which device-level overrides are defined, all overrides are also deleted.

Tip You might be prevented from deleting an unused object from the database, if, for example, you replace a local policy that used the object with a shared policy that does not. If object deletion fails, submit or discard all pending changes (in Workflow mode, submit or discard all pending activities), then try again to delete the object. Alternatively, you can leave unused objects in the database, because they will not affect your policies.

Before You Begin

Determine if the object is currently being used and which policies, objects, and devices would be affected by the deletion. You need to remove all references to the object before you can delete it. You can generate a usage report for this purpose. See Generating Object Usage Reports , on page 243.

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager , on page 232.

Step 2 Select the object type from the table of contents.

Step 3 Right-click the object you want to delete and select **Delete Object**, or select the object and click the **Delete Object** button. You are asked to confirm the deletion.

Managing Object Overrides

When you create a policy object, you can elect to allow the object to be overridden. This makes it possible to create a generic object to enable you to create general policies. For individual devices, you override the policy object definition to make the policy apply correctly to the device.

From the Policy Object Manager , on page 232, you can select a policy object that can be overridden and generate a table of device-level overrides that are defined for that global object. Right-click the object and select **Edit Device Overrides** to generate the table (see Policy Object Overrides Window , on page 249).

You can create device-level overrides in two places:

- In the Device Properties window of a selected device, which allows you to create and manage overrides for the selected device only. For more information, see Creating or Editing Object Overrides for a Single Device , on page 248.
- In the Policy Object Manager window, which allows you to create and manage overrides for more than one device at a time. For more information, see Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248.

Tip If you override any part of the object definition at the device level, any subsequent changes made to the policy definition at the global level do not affect the device on which the object was overridden.

The following topics explain policy object overrides in more detail:

Understanding Policy Object Overrides for Individual Devices

For many types of policy objects, you can elect to allow an object to be overridden for a particular device. Thus, you can create an object whose definition works for most devices, and then create modifications to the object for the few devices that need slightly different definitions. Or, you can create an object that needs to be overridden for all devices, but which allows you to create a single policy for all devices. Object overrides make it possible for you to create a smaller set of shared policies for use across your devices without giving up the ability to alter policies when needed for individual devices.

For example, you might want to deny ICMP traffic to the different departments in your company, each of which is connected to a different network. You can do this by defining an access rule firewall policy with a rule that includes a network/host object called Departmental Network. By allowing device override for this

object, you can then create overrides on each relevant device that specify the actual network to which that device is connected.

Device-level object overrides are especially important when the global object is included in the definition of a VPN policy, which applies to every device in the VPN topology. For example, you select a PKI enrollment object when defining a PKI policy on a site-to-site VPN. If the hub of your VPN uses a different CA server than the spokes, you must use device-level overrides to specify the CA server used by the hub. Although the PKI policy references a single PKI enrollment object, the actual CA server represented by this object will differ for the hub, based on the device-level override you define.

You can quickly tell if an object can be overridden by looking for the Overrides column in the objects table in the Policy Object Manager , on page 232. A green checkmark indicates that you can create overrides for the object; the presence of the column indicates the object type allows overrides.

Related Topics

- Allowing a Policy Object to Be Overridden , on page 247
- Creating or Editing Object Overrides for a Single Device , on page 248
- Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248
- Deleting Device-Level Object Overrides , on page 250

Allowing a Policy Object to Be Overridden

To create overrides for an object, the object must allow overrides. Not all object types allow overrides.

For those that do allow overrides, you define the object as allowing overrides by selecting **Allow Value Override per Device** when defining the object. After selecting this option, you must click **OK** to save the object before you can define any overrides. For more information on creating objects, see Creating Policy Objects , on page 237.

You can also configure Security Manager to create device-level overrides for existing objects when you discover policies on devices that you add to the inventory. During discovery, if Security Manager determines that an existing object applies to a discovered policy, but that it is not a perfect fit, the object is used but a device-level override is created to account for the difference. For example, if you run policy discovery on a device that has an ACL with the same name as an ACL policy object in Security Manager, the name of the discovered policy object is reused, but a device-level override is created for the object. If you do not allow device-level overrides during discovery, a new policy object is created with a number appended to the name; this is the default.

To configure Security Manager to allow device overrides during discovery, select **Tools > Security Manager Administration > Discovery** and select **Allow Device Override for Discovered Policy Objects**.

Note To ensure that a specific policy object will be reused for device-level override during discovery, make sure the **Allow Value Override per Device** check box has been selected for the policy object in Policy Object Manager before policy discovery.

Related Topics

- Understanding Policy Object Overrides for Individual Devices , on page 246

- Creating or Editing Object Overrides for a Single Device , on page 248
- Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248
- Deleting Device-Level Object Overrides , on page 250

Creating or Editing Object Overrides for a Single Device

You can create or edit device-level object overrides from the Device Properties window.

An override specifies a definition for a global object that affects only the selected device. For example, you can override the definition of a AAA server group object so that the object represents a different group of AAA servers for one device than the group it represents for other devices.

Related Topics

- Allowing a Policy Object to Be Overridden , on page 247
- Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248
- Understanding Policy Object Overrides for Individual Devices , on page 246
- Deleting Device-Level Object Overrides , on page 250

Step 1 (Device view) Right-click a device in the Device selector and select **Device Properties**.

Step 2 Select the object type you want to override from the **Policy Object Overrides** folder.

The table displays all objects of the selected type that can be overridden at the device level. If an object has an override already defined for the device, the Value Overridden? column contains a check mark.

Step 3 Select the object whose override you want to change and do one of the following:

- Click the **Create Override** button, or right-click and select **Create Override**.
- Click the **Edit Override** button, or right-click and select **Edit Override**.

The dialog box for defining that type of object is displayed with the current properties (either the global properties or the local override).

Step 4 Modify the definition of the object and click **OK** to save the device-level override. In the Device Properties window, a green check mark appears in the Value Overridden? column.

Creating or Editing Object Overrides for Multiple Devices At A Time

You can create or edit device-level object overrides from the Policy Object Manager window.

This method enables you to create overrides on multiple devices at the same time, which is especially useful when creating overrides for several devices that participate in the same VPN topology. For example, if the spokes located in one part of the VPN use a different CA server than the spokes located in a different part of the VPN, you can override the PKI enrollment object that defines the server for these devices. This is a more convenient method than selecting each device individually from Device view and defining the override from the Device Properties window.

Related Topics

- Understanding Policy Object Overrides for Individual Devices , on page 246
- Allowing a Policy Object to Be Overridden , on page 247
- Creating or Editing Object Overrides for a Single Device , on page 248
- Deleting Device-Level Object Overrides , on page 250

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager , on page 232.

Step 2 Select the object type you want to override from the table of contents, and then select the object to override.

Tip Not all types of object allow overrides, and not all objects are defined as overridable. Look for a green check mark in the Overridable column. If the object type allows overrides, but this object does not have a check mark, edit the object to enable object override (see Allowing a Policy Object to Be Overridden , on page 247).

Step 3 Double-click the checkmark, or right-click the object and select **Edit Device Overrides**, to open the Policy Object Overrides Window , on page 249. The window contains a table listing each device for which an override is defined for the object.

Tip You can also edit the overridable object and click **Edit** next to the Overrides field.

Step 4 Do one of the following:

- To add an override, click the **Create Override** button, select the devices to which you want to apply the override, and define the override.

The dialog boxes for creating and editing the override are the same ones used to create the object; click the Help button for information specific to the type of object.

The override you create applies to all policies on the device that use the object; you cannot override the object for one policy but not for another policy.

- To edit an override, select it and click the **Edit Override** button.

Policy Object Overrides Window

Use the Policy Object Overrides window to view a list of all device-level overrides that are defined for the selected object. The content displayed in the table differs depending on the type of object, but it always includes the device name, object description, and category. Sometimes the content of the object is shown, including the overrides.

- To add an override, click the **Create Override** button. In the Create Overrides for Device window, select the devices from the available list and click >> to move them to the selected list. When you click **OK**, you are presented with the dialog box for defining your override, which applies to all newly selected devices. (You are not changing the override of the greyed out devices)

Note The available devices list shows the devices that have not already had overrides defined for the object. Devices with overrides are shown greyed out in the selected devices list.

The dialog boxes for creating and editing the override are the same ones used to create the object; click the Help button for information specific to the type of object.

The override you create applies to all policies on the device that use the object; you cannot override the object for one policy but not for another policy.

- To edit an override, select it and click the **Edit Override** button.
- To delete an override, select it and click the **Delete Override** button.

Deleting an override does not delete the object or remove the object from its device assignment. When you delete the override, the policies on the device that use the object start using the global definition for the object. This changes the meaning of the policies.

Tip You can also create and edit device-level overrides from the Device Properties window of a selected device. Using the Device Properties windows makes it easy for you to manage the overrides for all objects used by a single device. For more information, see Creating or Editing Object Overrides for a Single Device , on page 248.

Navigation Path

Open the Policy Object Manager , on page 232. Select an object type that can be overridden (its object page contains a column called Overrides), then do one of the following:

- Double-click the green checkmark in the Overrides column.
- Right-click the object and select **Edit Device Overrides**.
- Edit the overridable object and click **Edit** next to the Overrides field.

Related Topics

- Filtering Items in Selectors , on page 47

Deleting Device-Level Object Overrides

Deleting a device-level override restores the global definition of the object to the selected device. You can delete overrides from the Device Properties window or from the Policy Object Manager window:

- Deleting overrides from Device view—Right-click the device and select **Device Properties**, then select the object type from the **Policy Object Overrides** folder. Select the override you want to delete and click **Delete Override**.

- Deleting overrides from the Policy Object Manager—Select the object type from the table of contents, then right-click the object and select **Edit Device Overrides**. Select the override you want to delete and click **Delete Override**.

Importing and Exporting Policy Objects

Security Manager includes a Perl script that you can use to export network/host, service, and port list policy objects so that you can import them into another Security Manager server. The information includes device-level overrides for policy objects that have them.

Note The command works with network/host objects that contain IPv4 addresses only. You cannot use the command to import network/host-IPv6 objects.

You can also manually create a CSV file that you can import. For example, you might obtain a list of IP addresses that identify networks or hosts that should be denied entry to your network. You can create a CSV file that will bulk-load the list as one or more network/host objects if that is easier than manually creating the object in the Policy Object Manager.

Tip Besides using this command, you can use other facilities to export and import policy objects that are assigned to shared policies or configured in local device policies. For more information, see the following topics: Exporting the Device Inventory from the Security Manager Client, on page 484, Exporting Shared Policies, on page 489, and Importing Policies or Devices, on page 491.

The Perl command is located in $NMSROOT\bin, which is typically C:\Program Files\CSCSpx\bin. The syntax of the command is:

perl [*path*]**PolicyObjectImportExport.pl -u** *username* **-p** *password* **-o {import | export}** [**-a** *activity*] **-t** *object_type* **-f** *filename* [**-c {true | false}**] [**-d {true | false}**] [**-e {true | false}**] [**-g {true | false}**] [**-h**]

Syntax

perl [*path*] **PolicyObjectImportExport.pl**	The Perl script command. Include the path to the PolicyObjectImportExport.pl file if the path is not defined in the system path variable. **Tip** If you forget to include the "perl" command, the system accepts the input but does nothing and provides no feedback on your error. Use Ctrl+Z to return to the command prompt.
-u *username*	A Security Manager username. The data exported is limited by the permissions assigned to this user. The user must have Modify Objects permission for the import or export of policy objects, and additionally the Modify Devices permission for the import or export of device-level overrides. If you are importing objects in non-Workflow mode, you must also have Submit and Approve privileges.
-p *password*	The user's password.
-o {import | export}	The type of operation you are performing, either to import policy objects from an existing file, or to export policy objects to a CSV file. Only committed objects are exported.

-a *activity*	(Optional.) The name of a Workflow activity. If you do not specify a name, a new activity is created with the name username_time.
-t *object_type*	Object type, one of the following: • network—For network/host objects. • service—For service objects. • portlist—For port-list objects.
-f *filename*	The name of the CSV file. When exporting, if the file exists, it is overwritten.
-c {true | false}	(Optional.) When importing objects, whether to enable policy object conflict detection. • false—An object is imported even if an existing object has the same content. • true—If an existing object has the same content as an imported object, the imported object is skipped. You must also select **Enforce** for the **When Redundant Objects Detected** option on the Policy Objects Page , on page 579.
-d {true | false}	(Optional.) How to handle device-level policy object overrides during either an import or export operation: • true—Include all globally-defined objects and all device-level overrides of the objects. • false—Include only the global definitions of the policy objects. Do not include any device-level policy object override information. This is the default.
-e {true | false}	(Optional.) Whether to "flatten" port-list objects in service objects and service-group objects: • true—The names of any port-list objects found in service objects and service-group objects are replaced with the actual ports from the lists. That is, the two objects, port-list and service, or port-list and service-group, are "flattened" into a single service or service-group. Port-list objects are used in Security Manager to group sets of port definitions, and are used when defining service and service-group objects. However, port-list objects are not supported in PRSM. • false—Port-list objects in service and service-group objects are not flattened. This is the default.

-g {true | false}	(Optional.) Whether to include object and object-group types in the CSV file: • true—The final column in the file will be **Type** and it will indicate "Service" or "Network." • false—The Type column is not included. This is the default.
-h	(Optional.) Display the command line help. If you include this option, all other options are ignored.

Importing Policy Objects

When you are importing objects, if an object refers to another object, that object must already be defined in Security Manager, or it must be defined in the same CSV file that you are importing. If the object is in the same CSV file, it must come before the object that refers to it. (Security Manager automatically sorts objects as required when exporting them.)

If Security Manager already has a policy object of the same name as one you are importing, the object is skipped and not imported. The name conflict can even occur if another user has created an object but not yet committed it for public viewing, so you might not be able to see the conflicting object. Security Manager creates only new objects, it does not update existing objects. Use the -c option to specify whether new objects can be created that have the same content as existing objects.

When you run the command, if there are any errors in the file, only the affected objects are not imported. Error messages indicate these problems as they occur, and Security Manager continues evaluating all records in the file. All correctly defined policy objects are imported, and the objects with errors are skipped. The total count and the names of the policy objects that are not imported are shown in the output screen.

After the import command completes, additional actions depend on the Workflow mode you are using:

- Workflow mode—You must log into Security Manager using the same username and password and submit the activity you specified during the import. The activity must be submitted and approved for the changes to take effect.
- Non-Workflow mode—The imported objects are automatically submitted and approved without action on your part. However, you will receive an error if the username you supplied does not have Submit and Approve privileges, and the import operation will fail.

CSV File Format

All objects in a single file are of the same policy object type. The file is in standard comma-separated values (CSV) format. The first line has column headings. Each row represents a single policy object. The columns, left to right, are:

- Name—(Mandatory.) The name of the object.
- Node—The display name of the device on which an override of the policy object is defined. If the policy object is defined on the global level, the field is empty. When importing objects, if the display name does not match a device already in the Security Manager inventory, the object is skipped and not imported.
- Description—The description of the object, if any.
- Category—The category identifier of the object, if any. The category ID is from 10 to 19.

- Allow Override—Whether the object can be overridden. True if the policy object can be overridden on device level, False (or an empty field) if not.
- Group—The names of other policy objects with the same type referenced by this policy object. If there is more than one object, they are separated by commas. For example, network building block Net1 references network building block Net2 and Net3. The Group field of Net1 would have "Net2,Net3" as its value.
- Data—The content of the object.
- Subtype—The object subtype, if any, for network/host and service objects. For an explanation of network/host and service object types, see Understanding Networks/Hosts Objects , on page 310 and Understanding and Specifying Services and Service and Port List Objects , on page 331. Possible values are:
  - Blank, or space—The object is a group object, either network/host or service.
  - NH—(Network/host objects only.) Single host network/host object.
  - NF—(Network/host objects only.) Single fully-qualified domain name (FQDN) network/host object.
  - NN—(Network/host objects only.) Single network address network/host object.
  - NR—(Network/host objects only.) Single Address range network/host object.
  - SO—(Service objects only.) Single-service service object.
- Type—The type of object represented by this entry: "Network" or "Service."

If there is no value for a particular field, that field is blank in the output. If there are multiple values for a field, the field is enclosed in double quotation marks.

Understanding AAA Server and Server Group Objects

You use AAA server objects to identify the AAA servers used in your network. AAA enables devices to determine who the user is (authentication), what the user is permitted to do (authorization), and what the user actually did (accounting), as described below:

- Authentication—Authentication is the way a user is identified before being allowed access to the network and network services. It controls access by requiring valid user credentials, which are typically a username and password. All authentication methods, except for local, line password, and enable authentication, must be defined through AAA. You can use authentication alone or with authorization and accounting.
- Authorization—After authentication is complete, authorization controls the services and commands available to each authenticated user. Authorization works by assembling a set of attributes that describe what the user is authorized to perform. These attributes are compared to the information contained in a database for a given user and the result is returned to AAA to determine the user's actual capabilities and restrictions. The database can be located locally on the access server or router or it can be hosted remotely on a RADIUS or TACACS+ security server. Were you not to use authorization, authentication alone would provide the same access to services to all authenticated users. You must use authorization together with authentication.
- Accounting—Accounting is used to track the services users are accessing, as well as the amount of network resources they are consuming. When AAA accounting is activated, the network access server reports user activity to the RADIUS or TACACS+ security server (depending on which security method

you have implemented) in the form of accounting records. Accounting information includes when sessions start and stop, usernames, the number of bytes that pass through the device for each session, the service used, and the duration of each session. This data can then be analyzed for network management, client billing, or auditing. You can use accounting alone or together with authentication and authorization.

AAA provides an extra level of protection and control for user access over using access rules (ACLs) alone. For example, you can create an access rule allowing all outside users to attempt to use Telnet on a server on the DMZ network. If you want only some users to actually reach the server (and you might not always know the IP addresses of these users, making it impossible to configure simple access rules), you can enable AAA to allow only authenticated or authorized users to make it through the network device (for example, the ASA or router). Thus, users must authenticate before reaching the Telnet server, where Telnet can also require a separate login.

AAA server objects are collected into AAA server group objects. Policies requiring AAA (such as Easy VPN, Remote Access VPNs, and router platform policies such as Secured Device Provisioning and 802.1x) usually refer to AAA server group objects. These objects contain multiple AAA servers that use the same protocol, such as RADIUS or TACACS+. In essence, AAA server groups represent collections of authentication servers focused on enforcing specific aspects of your overall network security policy. For example, you can group those servers dedicated to authenticating internal traffic, external traffic, or remote dial-in users, as well as servers that authorize the administration of your firewall devices.

The following topics describe how to work with AAA server objects:

- Supported AAA Server Types , on page 257
- Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258
- Predefined AAA Authentication Server Groups , on page 260
- Default AAA Server Groups and IOS Devices , on page 261
- Creating AAA Server Objects , on page 262
- Add or Edit AAA Server Dialog Box , on page 263
- Add and Edit LDAP Attribute Map Dialog Boxes , on page 276
- Creating AAA Server Group Objects , on page 278

Supported AAA Server Types

You can use AAA servers that use the RADIUS protocol with all devices, and the TACACS+ and LDAP protocols with all devices except IPS. For ASA, PIX, and FWSM devices, you can also use the protocols described in Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258.

- **RADIUS**—Remote Authentication Dial-In User Service (RADIUS) is a distributed client/server system that secures networks against unauthorized access. In the Cisco implementation, RADIUS clients run on Cisco devices and send authentication requests to a central RADIUS server that contains all user authentication and network service access information.

You can use RADIUS with other AAA security protocols, such as TACACS+, Kerberos, and local username lookup, depending on what is supported by a particular device type. RADIUS is supported on all Cisco platforms, but some RADIUS-supported features run only on specified platforms.

Beginning with Cisco Security Manager 4.17, IPv6 is enabled in RADIUS protocol. This support is applicable only for ASA 9.9.2 devices and above. Users can now configure IPv6 Host Address for Radius authentication in the Add AAA Server dialog box (see, Add or Edit AAA Server Dialog Box , on page 263). Activity validation is also introduced for unsupported device version.

- **TACACS+**—Terminal Access Controller Access Control System (TACACS+) is a security application that provides centralized validation of users attempting to gain access to a router or network access server. The goal of TACACS+ is to provide a methodology for managing multiple network access points from a single management service.

TACACS+ provides for separate and modular authentication, authorization, and accounting facilities. TACACS+ allows for a single access control server (the TACACS+ daemon) to provide each service independently.

- **LDAP**—Lightweight Directory Access Protocol (LDAP). The use of LDAP servers is specific to certain policies. For example, identity firewall configurations on ASA, VPN configurations on ASA, and ScanSafe configurations on IOS devices. For more information on using LDAP on ASA, see Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258.

Related Topics

- Creating AAA Server Objects , on page 262
- Understanding AAA Server and Server Group Objects , on page 256

Additional AAA Support on ASA, PIX, and FWSM Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

In addition to supporting RADIUS and TACACS+, ASA, PIX 7.0+, and FWSM 3.1+ devices can support AAA servers running the following protocols. For more information, see the explanation of AAA usage in the configuration guides for the device type and operating system version that interests you.

- **Kerberos**—These devices can use Kerberos servers for authentication. 3DES, DES, and RC4 encryption types are supported.
- **NT**—These devices can use Windows Domain servers for NTLMv1 authentication.
- **SDI Servers**—SecureID servers from RSA Security, Inc. are known as SDI servers. When a user attempts to establish VPN access and the applicable tunnel-group policy specifies an SDI authentication server group, the ASA device sends the username and one-time password to the SDI server. The device then grants or denies user access based on the response from the server. Version 5.0 of SDI introduced the concept of SDI primary and secondary servers that share a single-node secret file (SECURID). As a result, when you configure an SDI server as a AAA server object, you must specify whether the server is version 5.0 or an earlier version.
- **LDAP**—These devices can use Lightweight Directory Access Protocol (LDAP) servers for VPN authorization and user group identification for identity-aware firewall policies. These devices support LDAP version 3 and are compatible with any v3 or v2 directory server. However, password management

is supported only on the Sun Microsystems JAVA System Directory Server and the Microsoft Active Directory.

With any other type of LDAP server (such as Novell or OpenLDAP), all LDAP functions are supported except for password management. Therefore, if someone tries to log in to one of these devices using one of these other servers for authentication and their password has expired, the device drops the connection and a manual password reset is required.

You can configure Simple Authentication and Security Layer (SASL) mechanisms to authenticate an LDAP client (in this case, the ASA, PIX, or FWSM device) to an LDAP server. These devices and LDAP servers can support multiple mechanisms. If both mechanisms (MD5 and Kerberos) are available, the ASA, PIX, or FWSM device uses the stronger mechanism, Kerberos, for authentication.

When user authentication for VPN access has succeeded and the applicable tunnel-group policy specifies an LDAP authorization server group, the ASA, PIX, or FWSM device queries the LDAP server and applies the authorizations it receives to the VPN session.

- **HTTP-Form**—These devices can use the HTTP Form protocol for single sign-on (SSO) authentication of WebVPN users only. Single sign-on support lets WebVPN users enter a username and password only once to access multiple protected services and Web servers. The WebVPN server running on the security appliance acts as a proxy for the user to the authenticating server. When a user logs in, the WebVPN server sends an SSO authentication request, including username and password, to the authenticating server using HTTPS. If the server approves the authentication request, it returns an SSO authentication cookie to the WebVPN server. The security appliance keeps this cookie on behalf of the user and uses it to authenticate the user to secure websites within the domain protected by the SSO server.

The following table describes the AAA services that are supported by each protocol:

Table 44: AAA Services Supported by ASA, PIX, and FWSM Devices

AAA Service	Database Type							
	Local	RADIUS	TACACS+	SDI	NT	Kerberos	LDAP	HTTP Form
Authentication of...								
VPN users	Yes	Yes	Yes	Yes	Yes	Yes	Yes	Yes 1
Firewall sessions	Yes	Yes	Yes	Yes	Yes	Yes	Yes	No
Administrators	Yes	Yes	Yes	Yes 2	Yes	Yes	Yes	No
Authorization of...								
VPN users	Yes	Yes	No	No	No	No	Yes	No
Firewall sessions	No	Yes 3	Yes	No	No	No	No	No
Administrators	Yes 4	No	Yes	No	No	No	No	No
Accounting of...								

VPN connections	No	Yes	Yes	No	No	No	No	No
Firewall sessions	No	Yes	Yes	No	No	No	No	No
Administrators	No	Yes 5	Yes	No	No	No	No	No
1. HTTP Form protocol supports single sign-on (SSO) authentication for WebVPN users only. 2. SDI is not supported for HTTP administrative access. 3. For firewall sessions, RADIUS authorization is supported with user-specific ACLs only, which are received or specified in a RADIUS authentication response. 4. Local command authorization is supported by privilege level only. 5. Command accounting is available for TACACS+ only.

Predefined AAA Authentication Server Groups

There are several predefined AAA server groups that define an authentication method without specifying particular AAA servers. In policies such as IPSec proposals, you can use these predefined server groups to define the types of AAA authentication to perform and the order in which to perform them.

The below table describes the predefined AAA authentication server groups.

Table 45: Predefined AAA Authentication Server Groups

Name	Description
Enable	Uses the enable password defined on the device for authentication.
KRB5 KRB5-Telnet	Uses Kerberos 5 for authentication. Use KRB5-Telnet when using Telnet to connect. For Cisco IOS routers, you can use Kerberos 5 client configuration only on selected platforms running IOS Software versions that support this protocol. Server configuration is not supported. The device must include an Advanced series feature set (k9 crypto image).
If-Authenticated	Uses the if-authenticated method, which allows the user to access the requested function if the user is authenticated.
Line	Uses the line password defined on the device for authentication.
Local Local-case	Uses the local username database (defined on the device) for authentication. Use Local-case if you want the login to be case-sensitive.
None	Uses no authentication.

Name	Description
RADIUS	Use RADIUS or TACACS+ authentication. (Does not apply to Cisco IOS routers.)
TACACS+	These AAA server groups do not contain any AAA servers. To use one of them when defining a policy, you must create a device-level override and define the AAA servers to associate with the group. For more information, see Creating or Editing Object Overrides for a Single Device , on page 248.

Related Topics

- Understanding AAA Server and Server Group Objects , on page 256

Default AAA Server Groups and IOS Devices

IOS software enables you to define AAA servers either as members of AAA server groups or as individual servers. Security Manager, however, requires all AAA servers to belong to a AAA server group.

Therefore, when you discover an IOS device whose device configuration contains individual AAA servers that do not belong to a AAA server group, Security Manager creates the following server groups to contain these servers:

- For RADIUS: CSM-rad-grp
- For TACACS+: CSM-tac-grp

Both of these special AAA server groups are marked in the Policy Object Manager as the default groups for their protocol. This is indicated by the **Make this Group the Default AAA Server Group** check box.

These groups are created solely for the purpose of management by Security Manager. During deployment, the AAA servers in these special groups are deployed back to the IOS device as individual servers, *not* as part of the group.

You can also create your own default group. The default group can be used in most cases, except when you need to configure multiple AAA server groups that use the same protocol. For example, you might want to define multiple RADIUS groups so that one group can be used for authentication and another group for authorization. Service providers may want to define multiple groups with the same protocol in order to provide customer separation when using VRF.

Note If you use one of these default AAA server groups in a policy defined for a PIX/ASA/FWSM device, the AAA servers are deployed as a group to that device, not as individual servers. This is because all AAA servers on PIX/ASA/FWSM devices must belong to a AAA server group.

Caution We recommend that you use caution when using these default AAA server groups in a policy definition. There are certain commands (for example, **ip radius** and **ip tacacs**, which are configured using the Interface field in the AAA Server dialog box) that can be defined once for each AAA server group and once for all individual AAA servers. Because the AAA servers in the default group are deployed to IOS devices as individual servers, you might inadvertently change the **ip radius** or **ip tacacs** settings for all the individual AAA severs configured on the device, including servers that are not being managed by Security Manager (and whose configurations would otherwise be left undisturbed).

Related Topics

- Understanding AAA Server and Server Group Objects , on page 256

Creating AAA Server Objects

You can create AAA server objects to populate the AAA server group objects that are referenced by policies such as AAA rules, Easy VPN, and 802.1x. In some cases, AAA server objects are used directly by a policy, such as in AAA policies on IPS devices.

When creating a AAA server object, you must specify the IP address or DNS name of the external AAA server and the protocol used by the server. The other settings required depend on the protocol.

Note On PIX/ASA/FWSM devices, AAA objects in a device configuration that are not referenced by any policies are removed from the device during the next deployment. However, the predefined AAA objects named RADIUS and TACACS+ are never removed from PIX 6.3 devices, even if they are not referenced by any policies.

Related Topics

- Creating Policy Objects , on page 237
- Supported AAA Server Types , on page 257
- Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258
- Understanding AAA Server and Server Group Objects , on page 256

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **AAA Servers** from the Object Type selector.

Step 3 Right-click in the work area, then select **New Object** to open the Add or Edit AAA Server Dialog Box , on page 263.

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Identify the AAA server:

- In the Host field, enter the IP address or for ASA or PIX 7.2+ devices, the host name of the AAA server. You can also enter the name of a network/host object that contains the host IP address, or click **Select** to select the object.
- Optionally, in the Interfaces field, enter the name of an interface or an interface role (which must resolve to a single interface name on the device) whose IP address should be used for all outgoing RADIUS or TACACS+ packets. Do not specify an interface for objects used on an IPS device.
- Optionally, enter the amount of time to wait until a AAA server is considered unresponsive.

Step 6 Select the protocol used by the AAA server and configure protocol-specific properties. You can use RADIUS with all device types, and TACACS+ with all device types except for IPS devices. You can use the Kerberos, LDAP, NT, SDI, and HTTP-FORM protocols only with ASA, PIX 7.x+, and FWSM 3.1+ devices.

For details about the properties, see the following topics:

- RADIUS—See AAA Server Dialog Box—RADIUS Settings , on page 265.
- TACACS+—See AAA Server Dialog Box—TACACS+ Settings , on page 268.
- Kerberos—See AAA Server Dialog Box—Kerberos Settings , on page 269.
- LDAP—See AAA Server Dialog Box—LDAP Settings , on page 270.
- NT—See AAA Server Dialog Box—NT Settings , on page 273.
- SDI—See AAA Server Dialog Box—SDI Settings , on page 274.
- HTTP-FORM—See AAA Server Dialog Box—HTTP-FORM Settings , on page 275.

Step 7 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 8 Click **OK** to save the object.

Add or Edit AAA Server Dialog Box

Use Add or Edit AAA Server dialog box to create, copy, and edit a AAA server object. These objects are collected into AAA server group objects and identify the AAA servers that you want to use when defining various AAA policies. In some cases these objects are used directly in a AAA policy.

For a description of the protocols you can use, see Supported AAA Server Types , on page 257 and Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258.

Note You cannot edit the protocol if the object is already included in a AAA server group.

Navigation Path

Select **Manage** > **Policy Objects**, then select **AAA Servers** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 46: AAA Server Dialog Box—General Settings

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Host	The address of the AAA server to which authentication requests will be sent. Specify one of the following: • IP Address—The IPv4 or IPv6 address of the AAA server. You can also enter the name of a network/host object that contains the host IP address, or click **Select** to select the object. **Note** AAA- IPV6 hosts are only supported for the LDAP and TACACS+ protocols. Beginning with Cisco Security Manager 4.17, IPv6 hosts for the Radius protocol are supported on ASA 9.9(2) devices onwards. • DNS Name (for PIX/ASA 7.2+ devices only)—The DNS hostname of the AAA server, up to 128 characters. The hostname can contain alphanumeric characters and hyphens, but each element of the hostname must begin and end with an alphanumeric character.
Interface	The interface whose IP address should be used for all outgoing RADIUS or TACACS packets (known as the source interface). Enter the name of an interface or interface role, or click **Select** to select it from a list or to create a new interface role. **Tips** • If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name. • If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces. • Only one source interface can be defined for the AAA servers in a AAA server group. An error is displayed when you submit your changes if different AAA servers in the group use different source interfaces. See Creating AAA Server Group Objects , on page 278. • You cannot specify an interface name for a AAA server used on an IPS device.

Element	Description
Timeout	The amount of time to wait for a response to a request until the AAA server is considered unresponsive. If there are other servers in the group, the next server is tried. • Cisco IOS routers—The range is 1-1000 seconds. The default is 5 seconds. • ASA/PIX 7.x+, FWSM 3.1+ devices—The range is 1-300 seconds. The default is 10 seconds. • PIX 6.3 firewalls—The range is 1-512 seconds. The default is 5 seconds. • IPS devices—The range is 1-512 seconds. The default is 3 seconds.
Protocol	The protocol used by the AAA server. The fields below the protocol list change depending on your selection. For specific information about the fields, see the topics indicated. • The following protocols are the most common: • RADIUS—All device types. See AAA Server Dialog Box—RADIUS Settings , on page 265. • TACACS+—All device types except IPS. See AAA Server Dialog Box—TACACS+ Settings , on page 268. • The following protocols are supported for ASA/PIX 7.x+ and FWSM 3.1+ devices; LDAP is supported on IOS devices that support ScanSafe policies: • Kerberos—See AAA Server Dialog Box—Kerberos Settings , on page 269. • LDAP—See AAA Server Dialog Box—LDAP Settings , on page 270. • NT—See AAA Server Dialog Box—NT Settings , on page 273. • SDI—See AAA Server Dialog Box—SDI Settings , on page 274. • HTTP-FORM—See AAA Server Dialog Box—HTTP-FORM Settings , on page 275.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

AAA Server Dialog Box—RADIUS Settings

Use the RADIUS settings in the AAA Server dialog box to configure a RADIUS AAA server object.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **RADIUS** in the Protocol field.

- AAA Server Group Dialog Box , on page 280

Field Reference

Table 47: AAA Server Dialog Box—RADIUS Settings

Element	Description
Key Confirm	The shared secret that is used to encrypt data between the network device (client) and AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted. The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field. Note the following: • A key is required for AAA server objects used in an IPS AAA policy. Otherwise, the key is optional. • Spaces are not permitted on PIX, ASA, or FWSM devices. Otherwise, they are permitted. • If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted.
Authentication/Authorization Port	The port on which AAA authentication and authorization are performed. The default is 1645. **Tip** The default port for IPS devices is 1812, so you need to change this value if you are configuring the object for IPS and you want to use the default port.
Accounting Port	The port on which AAA accounting is performed. The default is 1646.

Element	Description
RADIUS Password Confirm (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	A case-sensitive, alphanumeric keyword of up to 127 characters that is common among users who access this RADIUS authorization server through this device. Enter the password again in the Confirm field. The RADIUS authorization server requires a password and username for each connecting user. The RADIUS server administrator must configure the RADIUS server to associate this password with each user authorizing to the server through this device. Be sure to provide this information to your RADIUS server administrator. If you do not specify a common user password, each user password is the username. Never use a RADIUS authorization server for authentication. Common passwords or usernames as passwords are less secure than assigning unique user passwords. **Tips** • The password applies to authorization servers only, not to authentication servers. For an authentication RADIUS servers, do not configure a common password. • Although the password is required by the RADIUS protocol and the RADIUS server for authorization, users do not need to know it. The device provides the password automatically.
Retry Interval (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	The interval between attempts to contact the AAA server. Values are: • ASA/FWSM devices—1 to 10 seconds. • PIX devices—1 to 5 seconds.

Element	Description
ACL Netmask Convert (ASA, PIX 7.x+, and FWSM 3.x+ devices only.)	The method for handling the netmask expressions that are contained in downloadable ACLs received from the RADIUS server. The ASA/PIX/FWSM expects downloadable ACLs to contain standard netmask expressions whereas devices using Cisco IOS Software expect downloadable ACLs to contain wildcard netmask expressions, which are the reverse of a standard netmask expression. A wildcard mask has ones in bit positions to ignore, zeros in bit positions to match. Translation of wildcard netmask expressions means that downloadable ACLs written for Cisco IOS routers can be used by ASA/PIX/FWSM devices without altering the configuration of the ACLs on the RADIUS server. Select one of the following options: • Standard—The security appliance assumes that all downloadable ACLs received from the RADIUS server contain only standard netmask expressions. No translation from wildcard netmask expressions is performed. This is the default. • Auto-Detect—The security appliance tries to determine the type of netmask expression used in the downloadable ACL. If it detects a wildcard netmask expression, it converts it to a standard netmask expression. This option is useful when you are uncertain how the RADIUS server is configured; however, wildcard netmask expressions with holes in them cannot be unambiguously detected and converted. For example, the wildcard netmask 0.0.255.0 permits anything in the third octet, but the device might not detect this expression as a wildcard netmask. • Wildcard—The security appliance assumes that all downloadable ACLs received from the RADIUS server contain only wildcard netmask expressions, which it converts to standard netmask expressions.

AAA Server Dialog Box—TACACS+ Settings

Use the TACACS+ settings in the AAA Server dialog box to configure a TACACS+ AAA server object.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **TACACS+** in the Protocol field.

Related Topics

- AAA Server Group Dialog Box , on page 280

Field Reference

Table 48: AAA Server Dialog Box—TACACS+ Settings

Element	Description
Key Confirm	The shared secret that is used to encrypt data between the client and the AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters (U.S. English). Spaces and special characters are permitted. The key you define in this field must match the key on the TACACS+ server. Enter the key again in the Confirm field. Note the following: • Activity validation fails if you try defining a key with a space on a PIX, ASA, or FWSM device. • If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted.
Server Port	The port used for communicating with the AAA server. The default is 49.

AAA Server Dialog Box—Kerberos Settings

Use the Kerberos settings in the AAA Server dialog box to configure a Kerberos AAA server object.

Note This type of AAA server can be configured only on ASA, PIX 7.x+, and FWSM 3.1+ devices.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **Kerberos** in the Protocol field.

Related Topics

Field Reference

Table 49: AAA Server Dialog Box—Kerberos Settings

Element	Description
Server Port	The port used for communicating with the AAA server. The default is 88.

Element	Description
Kerberos Realm Name	The name of the realm containing the Kerberos authentication server and ticket granting server (maximum of 64 characters, typically all uppercase). For example, EXAMPLE.COM.
Retry Interval	The interval between attempts to contact the AAA server. Values range from 1 to 10 seconds.

AAA Server Dialog Box—LDAP Settings

Use the LDAP settings in the AAA Server dialog box to configure an LDAP AAA server object.

Note This type of AAA server can be configured only on ASA, PIX 7.x+, FWSM 3.1+, and IOS devices.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **LDAP** in the Protocol field.

Related Topics

Field Reference

Table 50: AAA Server Dialog Box—LDAP Settings

Element	Description
Enable LDAP over SSL/Secure Communication	Whether to establish a secure SSL connection between the device and the LDAP server. **Tip** You must select this option when using a Microsoft Active Directory LDAP server in order to enable password management.
No Negotiation (IOS only.)	When selected, this checkbox precludes further negotiation and moves to accept the channels previously established and accepted.
Server Port	The port used for communicating with the AAA server. The default is 389.

Element	Description
Login Directory	The name of the username or directory object in the LDAP hierarchy used for authenticated binding (maximum of 128 characters). Authenticated binding is required by some LDAP servers (including the Microsoft Active Directory server) before other LDAP operations can be performed. This field describes the authentication characteristics of the device. These characteristics should correspond to those of a user with administrator privileges. This string is case-sensitive. Spaces are not permitted in the string, but other special characters are allowed. Typically, this is a username such as DOMAIN\Administrator. However, you can use the more traditional format too, for example, cn=Administrator,OU=Employees,DN=example,DN=com.
Login Password	The case-sensitive, alphanumeric password for accessing the LDAP server (maximum of 64 characters). Spaces are not allowed.
Encrypted (IOS)	Whether the login password is encrypted.
LDAP Hierarchy Location	The base distinguished name (DN), which is the location in the LDAP hierarchy where the authentication server should being searching when it receives an authorization request. For example, OU=Cisco. The maximum length is 128 characters. The string is case-sensitive. Spaces are not permitted, but other special characters are allowed.
PIX/ASA/FWSM Tab	
LDAP Scope	The extent of the search the server should make in the LDAP hierarchy when it receives an authorization request. The available options are: • onelevel—Searches only one level beneath the base DN. This type of search scope is faster than a subtree search, because it is less comprehensive. This is the default. • subtree—Searches all levels beneath the base DN (that is, searches the entire subtree hierarchy). This option takes more time.
LDAP Distinguished Name	The Relative Distinguished Name attribute (or attributes) that uniquely identifies an entry on the LDAP server. Common naming attributes are Common Name (CN), sAMAccountName, userPrincipalName, and User ID (uid). The case-sensitive, alphanumeric string can be up to 128 characters. Spaces are not permitted in the string, but other special characters are allowed.

Element	Description
SASL MD5 Authentication SASL Kerberos Authentication Kerberos Server Group	These options establish a Simple Authentication and Security Layer (SASL) mechanism to authenticate an LDAP client (the ASA/PIX/FWSM device) with an LDAP server. If you do not select one of these options, the simple mechanism is used, and usernames and passwords are transmitted in clear text. You can define one or both SASL authentication mechanisms. When negotiating SASL authentication, the ASA/PIX/FWSM device retrieves the list of SASL mechanisms configured on the LDAP server and selects the strongest mechanism configured on both devices. • SASL MD5 Authentication—Whether to have the device send the LDAP server an MD5 value computed from the username and password. You must configure the LDAP server to store the user passwords in reversible manner, or the LDAP server will not be able to validate the passwords. • SASL Kerberos Authentication—Whether to have the device send the LDAP server the username and realm using the GSSAPI (Generic Security Services Application Programming Interface) Kerberos mechanism. This mechanism is stronger than the MD5 mechanism. If you select Kerberos, you must also enter the name of the Kerberos AAA server group used for SASL authentication. The maximum length is 16 characters.
LDAP Server Type	The type of LDAP server used for AAA: • Auto-Detect—The ASA/PIX/FWSM device tries to determine the server type automatically. This is the default. • Microsoft—The LDAP server is a Microsoft Active Directory server. **Note** You must configure LDAP over SSL to enable password management with Microsoft Active Directory. • Sun—The LDAP server is a Sun Microsystems JAVA System Directory Server. • OpenLDAP—The server is an Open LDAP server. You can use this only with ASA/PIX 8.0+ devices. • Novell—The server is a Novell LDAP server. You can use this only with ASA/PIX 8.0+ devices.
LDAP Attribute Map	The LDAP attribute configuration to bind to the LDAP server. Enter the name of an LDAP attribute map policy object or click **Select** to select it from a list or to create a new object. LDAP attribute maps take the attribute names that you define and map them to Cisco-defined attributes. For more information, see Add and Edit LDAP Attribute Map Dialog Boxes , on page 276.

Element	Description
Group Base DN	(Microsoft LDAP AD servers only.) The base designated name (DN) under which all user groups are defined. When the ASA contacts the AD server for user group membership, the search starts at this DN. All groups must reside under this DN in the LDAP directory hierarchy and no group can reside outside of this path, or the group will not be found. Specifying this location can decrease the time required to complete user group searches. The alphanumeric string is case-sensitive and can be up to 128 characters. Spaces are not permitted in the string, but other special characters are allowed. For example: DN=cisco,DN=com **Tip** If you do not specify the group base DN, the LDAP Distinguished Name setting is used as the starting point for group searches.
Group Search Timeout	(Microsoft LDAP AD servers only.) The maximum time to wait for a response from an Active Directory server queried for user group information, in seconds. The default is 10 seconds, the range is 1 to 300 seconds.
IOS Tab	
Secure Cipher	The encryption method to be used.
Attribute Map (IOS)	The name of the IOS attribute map the server employs.
Secure Trust Point	The name of a trust point for certificates.
Authentication bind-first	You can configure the sequence of search and bind of an authentication request with this option. The default is search first and then bind.
No Authorization Required	No authorization required for authentication requests.
Authentication Compare	Select this checkbox to replace the bind request with compare request for authentication. By default authentication request is performed with bind request.
User Object Filter	Specify the search filter user attribute type to be used in a search request. This helps in filtering out the requested user being searched.

AAA Server Dialog Box—NT Settings

Use the NT settings in the AAA Server dialog box to configure an NT AAA server object.

Note This type of AAA server can be configured only on ASA, PIX 7.x+, and FWSM 3.1+ devices.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **NT** in the Protocol field.

Field Reference

Table 52: AAA Server Dialog Box—SDI Settings

Element	Description
Server Port	The port used for communicating with the AAA server. The default is 5500.
Retry Interval	The interval between attempts to contact the AAA server. Values range from 1 to 10 seconds. The default is 10 seconds.

Element	Description
SDI Server Version	The SDI server version: • SDI-pre-5—All SDI versions before version 5.0 • SDI-5—SDI version 5.0 or later.
SDI pre-5 Secondary Server	(Optional) A secondary server to be used for authentication if the primary server fails when using an SDI version prior to 5.0. Enter the IP address or the name of a network/host object, or click **Select** to select an object or create a new one.

AAA Server Dialog Box—HTTP-FORM Settings

Use the HTTP-FORM settings in the AAA Server dialog box to configure an HTTP-Form AAA server object for single sign-on authentication (SSO).

Note This type of AAA server can be configured only on ASA, PIX 7.x+, and FWSM 3.1+ devices.

Navigation Path

Go to the Add or Edit AAA Server Dialog Box , on page 263 and select **HTTP-FORM** in the Protocol field.

Related Topics

- Creating AAA Server Objects , on page 262

Field Reference

Table 53: AAA Server Dialog Box—HTTP-Form Settings

Element	Description
Start URL	The URL from which the WebVPN server of the security appliance should retrieve an optional pre-login cookie. The maximum URL length is 1024 characters. The authenticating web server might execute a pre-login sequence by sending a Set-Cookie header along with the login page content. The URL in this field defines the location from which the cookie is retrieved. **Note** The actual login sequence starts after the pre-login cookie sequence.

Element	Description
Action URI	The Uniform Resource Identifier (URI) that defines the location and name of the authentication program on the web server to which the security appliance sends HTTP POST requests for single sign-on (SSO) authentication. The maximum length of the action URI is 2048 characters. **Tip** You can discover the action URI on the authenticating web server by connecting to the web server's login page directly with a browser. The URL of the login web page displayed in your browser is the action URI for the authenticating web server.
Username Parameter	The name of the username parameter included in HTTP POST requests for SSO authentication. The maximum length is 128 characters. At login, the user enters the actual name value, which is entered into the HTTP POST request and passed on to the authenticating web server.
Password Parameter	The name of the password parameter included in HTTP POST requests for SSO authentication. The maximum length is 128 characters. At login, the user enters the actual password value, which is entered into the HTTP POST request and passed on to the authenticating web server.
Hidden Values	The hidden parameters included in HTTP POST requests for SSO authentication. They are referred to as hidden parameters because, unlike the username and password, they are not visible to the user. The maximum length of the hidden parameters is 2048 characters. **Tip** You can discover the hidden parameters that the authenticating web server expects in POST requests by using an HTTP header analyzer on a form received from the web server.
Authentication Cookie Name	The name of the authentication cookie used for SSO by the security appliance. The maximum length is 128 characters. If SSO authentication succeeds, the authenticating web server passes this authentication cookie to the client browser. The client browser then authenticates to other web servers in the SSO domain by presenting this cookie.

Add and Edit LDAP Attribute Map Dialog Boxes

Use the Add and Edit LDAP (Lightweight Directory Access Protocol) Attribute Map dialog boxes to populate the attribute map with name mappings that translate Cisco LDAP attribute names to custom, user-defined attribute names.

If you are introducing a security appliance to an existing LDAP directory, your existing custom LDAP attribute names and values are probably different from the Cisco attribute names and values. Rather than renaming your existing attributes, you can create LDAP attribute maps that map your custom attribute names and values to Cisco attribute names and values. By using simple string substitution, the security appliance then presents you with only your own custom names and values. You can then bind these attribute maps to LDAP servers or remove them as needed. You can also delete entire attribute maps or remove individual name and value entries.

For more information regarding LDAP support on ASA, PIX, and FWSM devices, see Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258.

Navigation Path

Select **Manage** > **Policy Objects**, then select **LDAP Attribute Map** from the Object Type selector. Right-click inside the table and select **New Object**, or right-click a row and select **Edit Object**.

Related Topics

- Creating AAA Server Objects , on page 262

Field Reference

Table 54: Add and Edit LDAP Attribute Map Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Attribute Map table	The table shows the mapped values. Each entry shows the customer map name, Cisco map name, and the attribute mapping of customer name to Cisco name. • To add a mapping, click the **Add Row** button to open the Add and Edit LDAP Attribute Map Value Dialog Boxes , on page 277. • To edit a mapping, select it and click the **Edit Row** button. • To delete a mapping, select it and click the **Delete Row** button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add and Edit LDAP Attribute Map Value Dialog Boxes

Use the Add and Edit LDAP Attribute Map Value dialog boxes to populate the attribute map with value mappings that apply user-defined attribute values to the custom attribute name and to the matching Cisco attribute name and value.

Navigation Path

From the Add and Edit LDAP Attribute Map Dialog Boxes , on page 276, click the **Add Row** button to add a new mapping, or select a row and click the **Edit Row** button.

Field Reference

Table 55: Add and Edit LDAP Attribute Map Value Dialog Boxes

Element	Description
Customer Map Name	The name of your attribute map that relates to the Cisco map.
Cisco Map Name	The Cisco attribute map name you want to map to the customer map name.
Customer to Cisco Map Value table	The mappings of customer names to Cisco names. • To add a mapping, click the **Add Row** button to open the Add and Edit Map Value Dialog Boxes , on page 278. • To edit a mapping, select it and click the **Edit Row** button. • To delete a mapping, select it and click the **Delete Row** button.

Add and Edit Map Value Dialog Boxes

Use the Add and Edit Map Value dialog boxes to map a customer LDAP attribute value to a Cisco map value. Enter the value from your LDAP map that you want to equate with a Cisco value.

Navigation Path

From the Add and Edit LDAP Attribute Map Value Dialog Boxes , on page 277, click the **Add Row** button to add a new mapping, or select a row and click the **Edit Row** button.

Creating AAA Server Group Objects

You can create AAA server group objects for Security Manager policies requiring AAA services, such as authentication and authorization. Each AAA server group object can contain multiple AAA servers, all of which use the same protocol, such as RADIUS or TACACS+. For example, if you want to use RADIUS to authenticate network access and TACACS+ to authenticate CLI access, you must create at least two AAA server group objects, one for RADIUS servers and one for TACACS+ servers.

In addition, only one source interface can be defined for the AAA servers in the group. An error is displayed when you submit your changes if different AAA servers in the group use different source interfaces.

Note The error is triggered by the actual interface defined as the source, not the name of the interface role that represents the interface. That is, two AAA servers can have different interface roles defined as the source interface as long as they both resolve to the same device interface. An error is also displayed if the interface role defined for the source interface matches more than one actual interface on the device.

The number of AAA server group objects that can be created and the number of AAA server objects that can be included in each group object depend on the selected platform. For example, ASA devices support up to 18 single-mode server groups (with up to 16 servers each) and 7 multi-mode server groups (with up to 4 servers each). PIX firewalls support up to 14 server groups, each containing up to 14 servers.

Note Security Manager includes a predefined AAA server group object that you can use when you perform authentication locally inside the Cisco IOS router.

Tip You can also create AAA server group objects when you define policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Related Topics

- Creating Policy Objects , on page 237
- Predefined AAA Authentication Server Groups , on page 260
- Default AAA Server Groups and IOS Devices , on page 261
- Understanding AAA Server and Server Group Objects , on page 256

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **AAA Server Groups** from the Object Type selector.

Step 3 Right-click inside the work area, then select **New Object** to open the AAA Server Group Dialog Box , on page 280.

Step 4 Enter a name for the object. The maximum name length is 16 characters if you plan to use this object with ASA, PIX, or FWSM devices and 128 characters for Cisco IOS routers. Spaces are not supported.

Note Cisco IOS routers do not support the following AAA server group names: RADIUS, TACACS, TACACS+. In addition, we do not recommend using an abbreviation of one of these names, such as rad or tac.

Step 5 Select the protocol to be used by the servers in the group.

Step 6 Enter the names of the AAA server policy objects that define the AAA servers to include in the group. Click **Select** to select the objects from a list filtered by the protocol you selected. You can also create new AAA server objects from the selection list. Separate multiple objects with commas.

Step 7 Configure the additional options that you want:

- Make this Group the Default AAA Server Group—For IOS devices only, whether you are using this group as the default group. Use this option if you intend to have a single global server group for this protocol for all policies requiring AAA. For more information, see Default AAA Server Groups and IOS Devices , on page 261.
- ASA 8.4(2+) devices—If you are creating a RADIUS group containing Active Directory agent servers, select **AD Agent Mode**. This option indicates that the servers in the group are not full-function RADIUS servers but instead provide AD agent functions for identity-aware firewall. Use this group in the Identity Options policy.
- ASA, PIX, FWSM devices—Select options for how to handle AAA servers that stop responding, and for how to send accounting messages. For more information, see AAA Server Group Dialog Box , on page 280.

Step 8 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 9 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 10 Click **OK** to save the object.

AAA Server Group Dialog Box

Use the AAA Server Group dialog box to create, copy, and edit AAA server groups. When defining a policy that uses a AAA server for authentication, authorization, or accounting, you select the server by selecting the server group to which the server belongs.

Navigation Path

Select **Manage > Policy Objects**, then select **AAA Server Groups** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Related Topics

- Add or Edit AAA Server Dialog Box , on page 263
- Policy Object Manager , on page 232

Field Reference

Table 56: AAA Server Group Dialog Box

Element	Description
Name	The object name (up to 16 characters when using this object with firewall devices; up to 128 characters for Cisco IOS routers). Object names are not case-sensitive. Spaces are not supported. Consider the following important points: • Cisco IOS routers do not support AAA server groups named RADIUS, TACACS, or TACACS+. In addition, we do not recommend using an abbreviation of one of these names, such as rad or tac. • If you define this AAA server group as the RADIUS or TACACS+ default group, any name you define here is automatically replaced in the device configuration by the default name (RADIUS or TACACS+) upon deployment.
Description	An optional description of the object.

Element	Description
Protocol	The protocol used by the AAA servers in the group. For more information about these options, see Supported AAA Server Types , on page 257 and Additional AAA Support on ASA, PIX, and FWSM Devices , on page 258.
AAA Servers	The AAA server policy objects that comprise the server group. Enter the names of the objects or click **Select** to select them from a list that is filtered to show only those AAA server objects that use the selected protocol. Separate multiple objects with commas. You can also create new objects from the selection list.
Make this Group the Default AAA Server Group (IOS) (IOS devices only.)	Whether to designate this AAA server group as the default group for the RADIUS or TACACS+ protocol. Select this option if you intend to use a single global group for the selected protocol for all policies on a specific device requiring AAA. Do not select this option if you intend to create multiple RADIUS or TACACS+ AAA server groups. Multiple groups can be used to separate different AAA functions (for example, use one group for authentication and a different group for authorization) or to separate different customers in a VRF environment. **Note** When you discover an IOS router, any AAA servers in the device configuration that are not members of a AAA server group are placed in special groups called CSM-rad-grp (for RADIUS) and CSM-tac-grp (for TACACS+), both of which are marked as default groups. These two groups are created solely to enable Security Manager to manage these servers. During deployment, the AAA servers in these special groups are deployed back to the device as individual servers. For more information, see Default AAA Server Groups and IOS Devices , on page 261.
AD Agent Mode (ASA 8.4(2+) devices only.)	Whether the servers in the group are Active Directory agents, which are used in identity-aware firewall configurations. You must select this option for an AD agent group to indicate that the group is not a full-function RADIUS server group. Use the AD agent group in the Identity Options policy. For more information, see Identifying Active Directory Servers and Agents , on page 645.
Dynamic Authorization (ASA 9.2(1+) devices only.)	When using the RADIUS protocol, select the Dynamic Authorization check box to enable the RADIUS Dynamic Authorization Change of Authorization (CoA) services for the AAA server group. Specify the listening port for RADIUS CoA requests in the Port field. The valid range is 1024 to 65535 and the default value is 1700. Once defined, the corresponding RADIUS server group will be registered for CoA notification and the ASA will listen to the port for the CoA policy updates from the Cisco Identity Services Engine (ISE).

Element	Description
Interim Account Update (ASA 9.2(1+) devices only.)	When using the RADIUS protocol, select the Interim Account Update check box to enable the generation of RADIUS interim-accounting-update messages. Currently these messages are only generated when a VPN tunnel connection is added to a clientless VPN session. When this happens the accounting update is generated in order to inform the RADIUS server of the newly assigned IP address. Specify the length, in hours, of the interval between periodic accounting updates in the Interval field. The valid range is 1 to 120 and the default value is 24.
Authorize only (ASA 9.2(1+) devices only.)	When using the RADIUS protocol, select the Authorize only check box to enables authorize-only mode for the RADIUS server group. When this check box is selected, the common password configured for individual AAA servers is not required and does not need to be configured.
Max Failed Attempts (PIX, ASA, FWSM devices only.)	The number of connection failures that will be tolerated for any given server in the server group before that server is deactivated. The default is 3 attempts, the range is 1 to 5.
Internal Realm ID (ASA 9.8(1) and above devices only)	Enter a realm ID that corresponds to the RADIUS or LDAP protocol for the AAA server group policy object. **Note** The realm ID is a unique value in the range of 1-65535; it is only applicable for RADIUS and LDAP protocols.
Reactivation Mode (PIX, ASA, FWSM devices only.)	The method to use when reactivating failed servers in the group: • Depletion—Reactivate failed servers only after all of the servers in the group are inactive. This is the default. When a server is deactivated, it remains inactive until all other servers in the group are inactive. When and if this occurs, all servers in the group are reactivated. This approach minimizes the occurrence of connection delays due to failed servers. If you configured a fallback method using the local database (for management access only) and all the servers in the group fail to respond, then the group is considered to be unresponsive, and the fallback method is tried. You can configure the Reactivation Deadtime value to determine the number of minutes that will elapse between the disabling of the last server in the group and the subsequent re-enabling of all servers. If you do not have a fallback method, the device continues to retry the servers in the group. • Timed—Reactivate failed servers after 30 seconds of downtime. This option is useful if the first server in the group is the primary server and you prefer that it be used whenever possible rather than the backup servers. This policy breaks down in the case of UDP servers. Because a connection to a UDP server will not fail, even if the server is not present, UDP servers are put back on line blindly. This could lead to slowed connection times or connection failures if a server group contains multiple servers that are not reachable.

Element	Description
Reactivation Deadtime (PIX, ASA, FWSM devices only.)	When you select **Depletion** as the reactivation mode, the number of minutes that should elapse between the deactivation of the last server in the group and the reactivation of all the servers in the group. The default is 10, the range is 0 to 1440 minutes (24 hours).
Group Accounting Mode (PIX, ASA, FWSM devices only.)	When using the RADIUS or TACACS+ protocols, the method for sending accounting messages to the AAA servers in the group: When using the server group for accounting (the protocol must be RADIUS or TACACS+), the method for sending accounting messages to the AAA servers in the group: • Single—Accounting messages are sent to a single server in the group. This is the default. • Simultaneous—Accounting messages are sent to all servers in the group simultaneously. If you select this option, the ASA forces the use of **Timed** as the reactivation mode.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Creating Access Control List Objects

An Access Control List (ACL) object is made up of one or more access control entries (ACEs), one or more ACL objects, or a combination of both. Each ACE is an individual permit or deny statement within an ACL. You can use ACL policy objects in several other policies and policy objects.

Beginning with Cisco Security Manager version 4.13, if an object group contains VM attribute and if it is applied to any other policies (except Access Rules), the deployment will fail. The VM Attribute Object is only applicable to the devices, which are ASA 9.7.1 or later, and when object-group-search access-control is enabled.

You can create the following types of ACL objects:

- Extended – Extended ACLs enable you to specify source and destination addresses and service (or traffic protocol), and, based on the protocol type, the ports (for TCP or UDP), or the ICMP type (for ICMP) can be specified. For information on extended ACL objects, see Creating Extended Access Control List Objects , on page 284.
- Standard – Standard ACLs use the source address for matching traffic. For information on standard ACL objects, see Creating Standard Access Control List Objects , on page 286.

- Web – Web ACLs use destination address and port or a URL filter. For information on Web Type ACL objects, Creating Web Access Control List Objects , on page 287.
- Unified – Unified ACL objects let you use source networks/hosts, source security groups, users, destination source networks/hosts, destination security groups, and services to match traffic. Further, the network/host specifications can contain IPv4 addresses, IPv6 addresses, or a combination of both. (With the release of Security Manager 4.4 and the ASA 9.0+, the separate IPv4 and IPv6 addressing/objects were "unified.") See Creating Unified Access Control List Objects , on page 289 for more information these ACLs.
- Ethertype – EtherType ACLs apply to non-IP layer-2 traffic on bridge group member interfaces only, in routed and transparent modes. You can use these rules to permit or drop traffic based on the EtherType value in the layer-2 packet.With EtherType ACLs, you can control the flow of non-IP traffic across the device. See Configuring Transparent Firewall Rules , on page 1009.

For reference information about the dialog boxes used with these objects, see Add or Edit Access List Dialog Boxes , on page 290.

Note CSM has design-level constraints to the ACL objects on reference positions. Thus, the **Referenced** button in the **Policy Object Manager** table is disabled.

Creating Extended Access Control List Objects

Extended access control lists allow you to permit or deny traffic from specific IP addresses to specific destination IP address and port, and specify the protocol of the traffic, such as ICMP, TCP, UDP, and so forth. Extended ACLs range from 100 to 199, and for devices running Cisco IOS Software Release 12.0.1 and later, 2000 to 2699.

Extended ACL example:

```
access-list 110 - Applied to traffic leaving the office (outgoing)
access-list 110 permit tcp 10.128.2.0 0.0.0.255 any eq 80
```

ACL 110 permits traffic originating from any address on the 10.128.2.0 network. The "All-IPv4-Addresses" statement means that the traffic is allowed to have any destination address with the limitation of going to port 80. The value of 0.0.0.0/255.255.255.255 can be specified as "All-IPv4-Addresses."

Uses:

- Identifying addresses for NAT (policy NAT and NAT exemption)—Policy NAT lets you identify local traffic for address translation by specifying the source and destination addresses and ports in an extended access list. Regular NAT can only consider local addresses. An access list that is used with policy NAT cannot be configured to deny an access control entry (ACE).
- Identifying addresses for IOS dynamic NAT—For user-defined ACLs, the NAT plug-in generates its own ACL CLIs when deducing NAT traffic from VPN traffic.
- Filtering traffic that will be intercepted by Network Admission Control (NAC).
- Identifying traffic in a traffic class-map for modular policy—Access lists can be used to identify traffic in a class-map, which is used for features that support Modular Policy Framework such as TCP and general connection settings, inspection, IPS, and QoS. You can use one or more access lists to identify specific types of traffic.

- For transparent mode, enabling protocols that are blocked by a routed mode security appliance, including BGP, DHCP, and multicast streams. Because these protocols do not have sessions on the security appliance to allow return traffic, these protocols also require access lists on both interfaces.
- Establishing VPN access—You can use an extended access list in VPN commands to identify the traffic that should be tunneled on the device for an IPsec site-to-site tunnel or to identify the traffic that should be tunneled on the device for a VPN client. Use in conjunction with the policy objects and settings shown in the below table:

Table 57: Policy Objects and Settings

Policy Object	Device	Purpose
VPN Topology	Any	Selecting Protected Networks.
ASA User Group	ASA	Inbound Firewall Policy; Outbound Firewall Policy; Filter ACL.
Traffic Flow	ASA, PIX 7+	Service Policy Rules (MPC). The traffic flow BB (class-map) uses Extended ACL as one of its traffic match types.
User Group	• IOS • Catalyst 6500/7600 • PIX 6.3	For Easy VPN, Split Tunnel ACL and Firewall ACL (IOS devices only).

Related Topics

- Creating Access Control List Objects , on page 283

- Creating Policy Objects , on page 237
- Understanding Networks/Hosts Objects , on page 310
- Understanding and Specifying Services and Service and Port List Objects , on page 331

Step 1 Choose **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears. The Extended tab is displayed by default.

Step 3 Right-click inside the work area, then select **New Object**.

The Add Extended Access List dialog box appears (see Add or Edit Access List Dialog Boxes , on page 290).

Step 4 Enter a name for the object and optionally a description of the object.

Note Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see Firewall ACL Setting Dialog Box , on page 742.

Step 5 Right-click inside the table in the dialog box, then select **Add**.

The Add Extended Access Control Entry dialog box appears.

Step 6 Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates, the destination addresses whither the traffic travels, and the services that define the characteristics of the traffic. Click **Advanced** to define logging options. For detailed information about the fields on the dialog box, see Add and Edit Extended Access Control Entry Dialog Boxes , on page 291.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

Step 7 Click **OK** to save your changes.

The dialog box closes and you return to the Add Extended Access List page. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

Step 8 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 9 Click **OK** to save the object.

Creating Standard Access Control List Objects

A standard access control list allows you to permit or deny traffic from specific IP addresses. The destination of the packet and the ports involved can be anything. Standard IP ACLs range from 1 to 99.

Standard ACL example:

```
access-list 10 permit 192.168.2.0 0.0.0.255
```

Uses:

- Identifying OSPF route redistribution.
- Filtering users of a community string using SNMP.
- Configuring VLAN ACLs for a Catalyst 6500/7600 device.

- Creating Access Control List Objects , on page 283
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Creating Policy Objects , on page 237
- Understanding Networks/Hosts Objects , on page 310

Step 1 Choose **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

Step 3 Click the **Standard** tab.

Step 4 Right-click inside the work area, then select **New Object**.

The Add Standard Access List dialog box appears (see Add or Edit Access List Dialog Boxes , on page 290).

Step 5 Enter a name for the object and optionally a description of the object.

Note Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see Firewall ACL Setting Dialog Box , on page 742.

Step 6 Right-click inside the table, then select **Add**.

The Add Standard Access Control Entry dialog box appears.

Step 7 Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates and select logging options. For detailed information about the fields on the dialog box, see Add and Edit Standard Access Control Entry Dialog Boxes , on page 294.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

Step 8 Click **OK** to save your changes.

The dialog box closes and you return to the Add Standard Access List dialog box. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

Step 9 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 10 Click **OK** to save the object.

Creating Web Access Control List Objects

Web ACLs, also referred to as WebVPN, let you establish a secure, remote-access VPN tunnel to the security appliance using a web browser. There is no need for either a software or hardware client. WebVPN provides easy access to a broad range of web resources and both web-enabled and legacy applications from almost any computer that can reach HTTPS Internet sites. WebVPN uses Secure Socket Layer Protocol and its successor, Transport Layer Security (SSL/TLS) to provide a secure connection between remote users and specific, supported internal resources that you configure at a central site.

The following table presents examples of Web VPN ACLs.

Table 58: Examples of Web VPN ACLs

Action	Filter	Effect
Deny	url http://*.yahoo.com/	Denies access to all of Yahoo!
Deny	url cifs://fileserver/share/directory	Denies access to all files in the specified location.

Action	Filter	Effect
Deny	url https://www.company.com/directory/file.html	Denies access to the specified file.
Permit	url https://www.company.com/directory	Permits access to the specified location
Deny	url http://*:8080/	Denies HTTPS access to anywhere via port 8080.
Deny	url http://10.10.10.10	Denies HTTP access to 10.10.10.10.
Permit	url any	Permits access to any URL. Usually used after an ACL that denies url access.

Uses:

- As a filter ACL in an ASA User Group policy object (under SSL VPN > Clientless).

Related Topics

- Creating Access Control List Objects , on page 283
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Creating Policy Objects , on page 237

Step 1 Choose **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

Step 3 Click the **Web** tab.

Step 4 Right-click inside the work area and select **New Object**.

The Add WebType Access List dialog box appears (see Add or Edit Access List Dialog Boxes , on page 290).

Step 5 Enter a name for the object and optionally a description of the object.

Note Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see Firewall ACL Setting Dialog Box , on page 742.

Step 6 Right-click inside the access control entry table and choose **Add**.

The Add Web Access Control Entry dialog box appears.

Step 7 Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. You can filter based on the network destination of the traffic (Network Filter) or the web address (URL Filter). For detailed information about the fields on the dialog box, see Add and Edit Web Access Control Entry Dialog Boxes , on page 296.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

Step 8 Click **OK** to save your changes.

The dialog box closes and you return to the Add WebType Access List page. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

Step 9 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 10 Click **OK** to save the object.

Creating Unified Access Control List Objects

A unified access control list allows you to permit or deny traffic from specific networks, hosts, security groups, and users, destined for specific networks, hosts and security groups. You also specify the service(s) involved.

Related Topics

- Creating Access Control List Objects , on page 283
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Creating Policy Objects , on page 237
- Understanding Networks/Hosts Objects , on page 310

Step 1 Choose **Manage > Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 From the Object Type selector, select **Access Control Lists**.

The Access Control List page appears.

Step 3 Click the **Unified** tab.

Step 4 Right-click inside the work area, then select **New Object**.

The Add Unified Access List dialog box appears (see Add or Edit Access List Dialog Boxes , on page 290).

Step 5 Enter a name for the object and optionally a description of the object.

Note Make sure that the name of the ACL Object is unique and is not the same name as the Firewall Rules ACL defined in the Firewall ACL Setting. For more information, see Firewall ACL Setting Dialog Box , on page 742.

Step 6 Right-click inside the table in the dialog box, then choose **Add**.

The Add Unified Access Control Entry dialog box appears.

Step 7 Create the access control entry:

- If you choose **Access Control Entry** for Type, specify the characteristics of the traffic that you want to match and whether you are permitting or denying the traffic. Enter the source addresses whence the traffic originates and select logging options. For detailed information about the fields on the dialog box, see Add and Edit Unified Access Control Entry Dialog Boxes , on page 298.
- If you choose **ACL Object**, select the object in the available objects list and click >> to add it to the list of selected objects.

Step 8 Click **OK** to save your changes.

The dialog box closes and you return to the Add Unified Access List dialog box. The new entry is shown in the table. If necessary, select it and click the up or down buttons to position it at the desired location.

Step 9 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 10 Click **OK** to save the object.

Add or Edit Access List Dialog Boxes

Use the Add and Edit Access List dialog boxes to define access control entries (ACEs) for an ACL object. From this page, you can change the order of the ACEs and ACL objects within the table, add or edit ACEs and ACL objects, and delete ACEs and ACL objects.

The title of the dialog box indicates the type of ACL you are creating: Extended, Standard, or Web Type. The dialog boxes are essentially the same, the difference being the columns displayed in the ACE table.

Navigation Path

Select **Manage > Policy Objects**, then select **Access Control Lists** from the Object Type selector. Select the tab for the type of ACL object you want to create, and then right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 59: Add and Edit Access List Dialog Boxes

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description

Access Control Entry table	The access control entries (ACEs) and ACL objects that are part of the ACL. The table displays the name of the entry or object, description, options, services, and other attributes of the entry.
	
	In the Permit column, a green checkmark indicates that the entry permits traffic (typically, the traffic is considered a match for the service you are defining), whereas a red circle with a slash indicates that traffic is denied (typically, the traffic is considered to not match, and the service you are defining is not applied to the denied traffic).
	
	The source and, if applicable, destination addresses can be host IP addresses, network addresses, or network/host policy objects.
	
	• To add an ACE, click the Add button and fill in the dialog box for the type of ACL you are creating:
	  • Add and Edit Extended Access Control Entry Dialog Boxes , on page 291
	  • Add and Edit Standard Access Control Entry Dialog Boxes , on page 294
	  • Add and Edit Web Access Control Entry Dialog Boxes , on page 296
	• To edit an ACE, select it and click the Edit button.
	• To delete an ACE, select it and click the Delete button.
	• To change the position of an entry, select it and click the Up/Down arrow buttons as required. Entries are evaluated top to bottom, so correct positioning is crucial for you to get the results you intend.

Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add and Edit Extended Access Control Entry Dialog Boxes

Use the Add or Edit Extended Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to an Extended ACL object.

Navigation Path

From the Add or Edit Access List Dialog Boxes , on page 290 for Extended ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

Field Reference

Table 60: Add and Edit Extended Access Control Entry Dialog Boxes

Element	Description
Type	The type of entry you are adding. The fields on the dialog box change based on your selection. • Access Control Entry—You want to define an ACE. • ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the >> button to move them to the list of selected objects. You can remove an object by selecting it and clicking <<. You can also edit objects in the selected objects list.
Action	The action to take on traffic defined in the entry: • Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service. • Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Source Destination	The source or destination of the traffic. You can enter more than one value by separating the items with commas. You can enter any combination of the following address types. For more information, see Specifying IP Addresses During Policy Definition , on page 318. • Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list. (ASA 8.4(2+) only.) You can select FQDN network/host objects to select traffic based on fully-qualified host names. • Host IP address, for example, 10.10.10.100. • Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0. • A range of IP addresses, for example, 10.10.10.100-10.10.10.200. • An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).
Users	(ASA 8.4(2+) only.) The Active Directory (AD) usernames, user groups, or identity user group objects for the rule, if any. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. You can enter more than one value by separating the items with commas. You can enter any combination of the following values. • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. Click **Select** to select objects, users, or user groups from a list or to create new objects. For more information, see: • Selecting Identity Users in Policies , on page 658 • Configuring Identity-Based Firewall Rules , on page 659 • Creating Identity User Group Objects , on page 656
Services	The services that define the type of traffic to act on. You can enter more than one value by separating the items with commas. You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.

Element	Description
Description	An optional description of the object.

Advanced button	Click this button to define logging options for the entry:
	• For PIX, ASA, and FWSM devices, you can enable:
	  • Default logging—If a packet is denied, message 106023 is generated. If a packet is permitted, no message is generated.
	  • Per ACE logging—If a packet is denied, message 106100 is generated. You can select the logging severity level for the messages, and the interval (in seconds from 1 to 600) for generating messages.
	• For IOS devices, when you enable logging, informational messages about packets that match the entry are sent to the console. You can also elect to include the input interface and source MAC address or VC in the logging output.

Add and Edit Standard Access Control Entry Dialog Boxes

Use the Add or Edit Standard Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Standard ACL object.

Navigation Path

From the Add or Edit Access List Dialog Boxes , on page 290 for Standard ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

Related Topics

- Creating Standard Access Control List Objects , on page 286

- Filtering Items in Selectors , on page 47

Field Reference

Table 61: Add and Edit Standard Access Control Entry Dialog Boxes

Element	Description
Type	The type of entry you are adding. The fields on the dialog box change based on your selection. • Access Control Entry—You want to define an ACE. • ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the >> button to move them to the list of selected objects. You can remove an object by selecting it and clicking <<. You can also edit objects in the selected objects list.
Action	The action to take on traffic defined in the entry: • Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service. • Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Source	The source of the traffic. You can enter more than one value by separating the items with commas. You can enter any combination of the following address types. For more information, see Specifying IP Addresses During Policy Definition , on page 318. • Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list. • Host IP address, for example, 10.10.10.100. • Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0. • A range of IP addresses, for example, 10.10.10.100-10.10.10.200. • An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).
Description	An optional description of the object.
Log Option	Whether to create log entries when traffic meets the entry criteria. ACL logging generates syslog message 106023 for denied packets. Deny packets must be present to log denied packets.

Add and Edit Web Access Control Entry Dialog Boxes

Use the Add or Edit Web Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Web Type ACL object.

Navigation Path

From the Add or Edit Access List Dialog Boxes , on page 290 for Web Type ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

Field Reference

Table 62: Add and Edit Web Access Control Entry Dialog Boxes

Element	Description
Type	The type of entry you are adding. The fields on the dialog box change based on your selection. • Access Control Entry—You want to define an ACE. • ACL Objects—You want to include an existing ACL object. You are presented with a list of available ACL objects. Select the objects you want to include and click the >> button to move them to the list of selected objects. You can remove an object by selecting it and clicking <<. You can also edit objects in the selected objects list.
Action	The action to take on traffic defined in the entry: • Permit—The service associated with this ACL is applied to this traffic. That is, the traffic is permitted to use the service. • Deny—The service associated with this ACL is not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACL in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.
Filter Destination	Whether the entry specifies a network filter (host or network address) or a URL filter (web site address). Your selection changes the fields on the dialog box. The fields are described below.

Element	Description
Destination (Network Filter only.)	The destination of the traffic. You can enter more than one value by separating the items with commas. You can enter any combination of the following address types. For more information, see Specifying IP Addresses During Policy Definition , on page 318. • Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list. • Host IP address, for example, 10.10.10.100. • Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0. • A range of IP addresses, for example, 10.10.10.100-10.10.10.200. • An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).
Ports (Network Filter only.)	The port numbers or port list policy objects that define the port the traffic uses, if you want to use port identification. You can enter more than one value by separating the items with commas. You can enter any combination of the following types: • Port list object. Enter the name of the object or click **Select** to select it from a list. You can also create new port list objects from the selection list. • Port number, for example, 80. • A range of ports, for example, 80-90.
URL Filter (URL Filter only.)	The Universal Resource Locator (URL), or web address, of the traffic. You can use an asterisk as a match-all wildcard. For example, http://*.cisco.com matches all servers on the cisco.com network. You can specify any valid URL.
Logging	The type of logging to use for this entry: • Select Log Disabled to not create log entries. • Select Default to use the default settings on the device. • All other available options enable logging and identify the log level that will be used.
Logging Interval	The interval of time, in seconds, used to generate logging messages, from 1 to 600. The default is 300. You can modify this field only if you select a logging level in the Logging field.

Element	Description
Time Range	The time range policy object that defines the time range associated with the entry. The time range defines the access to the device and relies on the device's system clock. For more information, see Configuring Time Range Objects , on page 301. Enter the name of the object or click **Select** to select it from a list. You can also create new time range objects from the selection list. **Note** Time range is not supported on FWSM 2.x or PIX 6.3 devices.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	An optional description of the object.

Add and Edit Unified Access Control Entry Dialog Boxes

Use the Add or Edit Unified Access Control Entry dialog box to add an access control entry (ACE) or an ACL object to a Unified ACL object.

Navigation Path

From the Add or Edit Access List Dialog Boxes , on page 290 for Unified ACL objects, click the **Add** button in the ACE table, or select a row and click the **Edit** button.

Related Topics

- Creating Unified Access Control List Objects , on page 289

- Understanding Networks/Hosts Objects , on page 310
- Understanding and Specifying Services and Service and Port List Objects , on page 331
- Filtering Items in Selectors , on page 47

Field Reference

Table 63: Add and Edit Unified Access Control Entry Dialog Boxes

Element	Description
Type	The type of entry; the fields in the dialog box change based on your choice: • Access Control Entry—You want to define an ACE. • ACL Objects—You want to include one or more existing ACL objects. You are presented with a list of available ACL objects. Select the objects you want to include and click the >> button to move them to the list of selected objects. You can remove an object by selecting it and clicking <<. You can also edit an object in the selected objects list.

Element	Description
Action	The action to take on traffic defined in the entry: • Permit—The Services associated with the ACE are applied to this traffic. That is, the traffic defined by this entry is permitted to use the Services. • Deny—The Services associated with this ACE are not applied to this traffic. If there are multiple ACLs configured for a service, denied traffic is typically compared to the next ACE in the list; if it matches no permit entry in any ACL for the service, the service is not applied to the traffic. Whether the traffic is dropped from the network depends on the service.
Source	Provide traffic sources for this rule; can be networks and hosts. You can enter values or object names, or Select objects, for one or more of the following: • Networks/Hosts – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces. Enter more than one value in any of these fields by separating the items with commas or ranges. The "All-Address" objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles. **Note** (ASA 8.4.2+ only) You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN. See Understanding Networks/Hosts Objects , on page 310, Specifying IP Addresses During Policy Definition , on page 318 and Understanding Interface Role Objects , on page 303 for additional information about these definitions. **Note** Enter the IPv6 addresses as comma separated values only. Preview configuration displays an error when IPv6 address is provided as a range. All Source, Source SG, and Users specifications area combined to limit traffic matches to only those flows that include all source definitions. For example, specified user traffic originating from within a specified source address range.
Source SG	(ASA 9.0+ only) Enter or Select the name or tag number for one or more source Security Groups for the ACE, if any. For more information about security groups, see: • Selecting Security Groups in Policies , on page 683 • Configuring TrustSec-Based Firewall Rules , on page 683 • Creating Security Group Objects , on page 681

Element	Description
Users	(ASA 8.4.2+ only) Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the ACE, if any. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. You can enter more than one value by separating the items with commas. You can enter any combination of the following values: • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. For more information, see: • Selecting Identity Users in Policies , on page 658 • Configuring Identity-Based Firewall Rules , on page 659 • Creating Identity User Group Objects , on page 656
Destination	The source or destination of the traffic. You can enter more than one value by separating the items with commas. **Note** Enter the IPv6 addresses as comma separated values only. Preview configuration displays an error when IPv6 address is provided as a range. Provide traffic destinations, and optionally destination security groups (ASA 9.0+ only), for this ACE. As with the source entries, you can enter values or object names, or Select objects, for one or more destinations.
Destination SG	(ASA 9.0+ only) Enter or Select the name or tag number for one or more source Security Groups for the ACE, if any. For more information about security groups, see: • Selecting Security Groups in Policies , on page 683 • Configuring TrustSec-Based Firewall Rules , on page 683 • Creating Security Group Objects , on page 681
Service	The services that define the type of traffic to act on. You can enter more than one value by separating the items with commas. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.

Element	Description
Advanced button	Click this button to open the Advanced dialog box and define logging options for the ACE. For PIX, ASA, and FWSM devices, you can enable: • Default logging—If a packet is denied, message 106023 is generated. If a packet is permitted, no message is generated. • Per ACE logging—If a packet is denied, message 106100 is generated. You can select the logging severity level for the messages, and the interval (in seconds from 1 to 600) for generating messages.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	An optional description of the object.

Configuring Time Range Objects

Use the Add or Edit Time Range dialog box to create, edit, or copy a time range object.

You can create time range objects for use when creating time-based ACLs and some firewall rules. While similar to extended ACLs in function, time-based ACLs allow for access control based on time considerations. The time range applies to specific rules, and makes those rules active for the specific time period defined in the range. For example, you can implement a rule for typical work hours to allow or prevent certain types of access.

You can also use time range objects when defining ASA user groups to restrict VPN access to specific times during the week. For more information, see ASA Group Policies SSL VPN Settings , on page 1512.

Time range objects can rely on the device's system clock, but they work best when using Network Time Protocol (NTP) synchronization.

Navigation Path

Select **Manage > Policy Objects**, then select **Time Ranges** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 64: Time Range Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object (up to 1024 characters).

Element	Description
Start Time End Time	The overall starting and ending time for the time range object: • Start Now—Defines the time of deployment as the start time. • Never End—Defines no end time for the range. • Start At, End At—Defines a specific start or end date and time. Click the calendar icon to display a tool for selecting the date. Enter the time in the Time field using the 24-hour clock format, HH:MM.
Recurring Ranges	Recurring time periods that happen within the overall start and end times, if any. For example, if you want to create a time range object that defines work hours, you could select Start Now and Never End for the overall range, and enter a recurring range of weekdays from 08:00 to 18:00 hours. • To add a range, click the **New Recurring Range** button and fill in the Recurring Ranges Dialog Box , on page 302. • To edit a range, select it and click the **Edit Recurring Range** button. • To delete a range, select it and click the **Delete Recurring Range** button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Recurring Ranges Dialog Box

Use the Recurring Ranges dialog box to add or edit recurring time intervals that are defined as part of a time range object. You can define as many recurring ranges as required.

Navigation Path

Go to the Add or Edit Time Range dialog box and click the **New Recurring Range** button under Recurring Ranges, or select a range and click **Edit Recurring Range**. See Configuring Time Range Objects , on page 301.

Field Reference

Table 65: Recurring Ranges Dialog Box

Element	Description
Specify days of the week and times during which this recurring range will be active	Defines a recurring range that is based on specific days and times of the week. You can select from: • Every day • Weekdays • Weekends • On these days of the week—Select the specific days to include in the range. Also select the starting and ending time during the day. The default is all day.
Specify a weekly interval during which this recurring range will be active	Defines a recurring range for every week. Select the starting and ending day and time. For example, you can start the weekly period on Sunday and end it on Thursday.

Understanding Interface Role Objects

Interface Role objects have the following uses:

- Specifying multiple interfaces— Interface role objects allow you to apply policies to specific interfaces on multiple devices without having to manually define the names of each interface. Because most devices follow a standard naming convention for their interfaces, you can define a naming pattern that describes a particular interface type and then assign a policy to all interfaces matching that pattern.
- Zones—You use interface role objects to define the zones in a zone-based firewall rules policy.

For example, you might define an interface role with a naming pattern of DMZ*. When you include this interface role in a policy, the policy is applied to all interfaces whose name begins with “DMZ” on the selected devices. As a result, you can, for example, assign a policy that enables anti-spoof checking on all DMZ interfaces to all relevant device interfaces with a single action. Interface roles can refer to any of the actual interfaces on the device, including physical interfaces, subinterfaces, and virtual interfaces, such as loopback interfaces.

Interface roles serve as an indirection entity between interfaces on the one hand and policies on the other. This enables you to apply policies to particular device interfaces based on the assigned role. Additionally, if you change the naming convention used for a particular interface type, you do not need to determine which policies are affected by the change. All you do is edit the interface role.

Interface roles are especially useful when you apply policies to new devices. As long as the devices you are adding share the same interface naming scheme as existing devices, the relevant policies can be extended to them without the need to make additional assignments.

Security Manager includes the following predefined interface roles:

- All-Interfaces—Includes every interface defined on a device.

- Internal—Includes only specific interfaces that are meant to be on the inside of a network. See the object definition for a list.
- External—Includes only specific interfaces that are meant to be on the outside of a network. See the object definition for a list.
- Self—Does not include any interfaces. The Self interface role is specific to zone-based firewall rules policies. The Self zone is the router itself. You can use it to identify traffic originating from the router, or traffic directed to the router. It does not include traffic passing through the router.

The following topics describe how to work with interface role objects:

- Creating Interface Role Objects , on page 304
- Specifying Interfaces During Policy Definition , on page 306
- Using Interface Roles When a Single Interface Specification is Allowed , on page 307
- Handling Name Conflicts between Interfaces and Interface Roles , on page 308
- Managing Traffic Zones, on page 1001

Creating Interface Role Objects

You can create interface role objects that represent one or more interfaces on devices. You can then use these roles when you define policies that require interfaces or zones. When you create an interface role object, you must define the naming pattern of the device interfaces to include in the object. Interface roles can refer to any of the actual interfaces on the device, including physical interfaces, subinterfaces, and virtual interfaces.

Tip You can also create interface role objects when you define policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Related Topics

- Creating Policy Objects , on page 237
- Specifying Interfaces During Policy Definition , on page 306
- Understanding Interface Role Objects , on page 303
- Using Interface Roles When a Single Interface Specification is Allowed , on page 307
- Managing Object Overrides , on page 246
- Managing Traffic Zones, on page 1001

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **Interface Roles** from the Object Type selector.

Step 3 Right-click in the work area, then select **New Object**.

The Interface Role dialog box appears.

Step 4 Enter a name for the object and optionally a description of the object. Names can be up to 128 characters, descriptions up to 1024.

Step 5 Enter one or more naming patterns for the interface role object. The names are the complete or partial names of interfaces, subinterfaces, and other virtual interfaces. Separate multiple name patterns with commas.

You can use these wildcards to create name patterns that apply to multiple interfaces:

- Use a period (.) as a wildcard for a single character. To use a period as part of the pattern itself, enter a backslash (\) before the period.
- Use an asterisk (*) as a wildcard for one or more characters at the end of the interface pattern.

For example, **DMZ*** would include all interfaces whose name begins with "DMZ", while **DMZ.** would match interfaces such as DMZ1 and DMZ2, but would not match DMZ10.

If the pattern does not include a wildcard, it must match the exact name of the interface. For example, the pattern **FastEthernet** will not match FastEthernet0/1 unless you include an asterisk at the end of the pattern.

Step 6 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 7 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 8 Click **OK** to save the object.

Interface Role Dialog Box

Use the Interface Role dialog box to create, copy, or edit an interface role object. Interface Role objects have the following uses:

- Specifying multiple interfaces— Interface role objects allow you to apply policies to specific interfaces on multiple devices without having to manually define the names of each interface.
- Zones—You use interface role objects to define the zones in a zone-based firewall rules policy.

Navigation Path

Select **Manage > Policy Objects**, then select **Interface Roles** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

- Policy Object Manager , on page 232

Field Reference

Table 66: Interface Role Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 1024 characters is allowed.
Interface Name Patterns	The names to include in this interface role. The names are the complete or partial names of interfaces, subinterfaces, and other virtual interfaces. Separate multiple name patterns with commas. **Note** For firewall devices, use the name assigned to the interface (for example, Inside, Outside, or DMZ) and not the hardware port identifier (for example, Ethernet0). You can use these wildcards to create name patterns that apply to multiple interfaces: • Use a period (.) as a wildcard for a single character. To use a period as part of the pattern itself, enter a backslash (\) before the period. • Use an asterisk (*) as a wildcard for one or more characters at the end of the interface pattern. For example, DMZ* would include all interfaces whose name begins with "DMZ", while DMZ. would match interfaces such as DMZ1 and DMZ2, but would not match DMZ10. If the pattern does not include a wildcard, it must match the exact name of the interface. For example, the pattern "FastEthernet" will not match FastEthernet0/1 unless you include an asterisk at the end of the pattern.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Specifying Interfaces During Policy Definition

When you configure policies that require you to identify an interface, you have several options for specifying the interface:

- Enter the name of the interface manually, for example, Ethernet0.

To manually specify a subinterface as part of a policy definition, you must enter a backslash (\) before the period. For example, Ethernet0\.1.

If you enter the period without the backslash, Security Manager treats the period as a wildcard for a single character. For example, if you want to define Ethernet1/1.0 as part of an access rule, you need to enter **Ethernet1/1\.0**. If you enter **Ethernet1/1.0** instead, the name matches interfaces named Ethernet1/1.0 and Ethernet1/1/0, because the period on its own is treated as a wildcard.

- Enter the name of an interface role manually. For more information about interface roles, see Understanding Interface Role Objects , on page 303.
- Select an interface or interface role from a list. By clicking **Select** next to the Interfaces field, you are prompted with a list of valid interface names and interface roles. Subinterfaces appear with a backslash before the period in their names.

By selecting from a list, you can ensure that your entry is valid. For more information, see Selecting Objects for Policies , on page 230.

When a policy allows multiple interfaces, separate entries with commas.

In policies and object selectors, icons distinguish between interfaces and interface roles. If you create interface roles with the same name as interfaces, be careful to select exactly what you want. The below table explains the icons.

Table 67: Icons for Interfaces and Interface Roles

Type	Icon
Interface	
Interface role If you can edit the role, a pencil image overlays the icon.	
Global “interface” on ASA 8.3+ devices, used for rules created as global instead of interface-specific.	

Related Topics

Using Interface Roles When a Single Interface Specification is Allowed

Interface role objects can match a variable number of actual interfaces defined on a device depending on how you define the role. Thus, for a particular device, an interface role might match zero, one, or more than one interface. When you use an interface role in a policy, Security Manager converts the role to commands that configure all interfaces defined on the device that match the role.

Many policies, however, require that you specify a single interface name. If you use an interface role in a situation where the policy allows a single interface name, you should define the interface role so that it matches a single interface. If you use an interface role that matches two or more interfaces on the device, Security

Manager selects the first interface on the device that matches the role, which might not be the interface you desire (or that will work properly).

- Specifying Interfaces During Policy Definition , on page 306
- Understanding Interface Role Objects , on page 303
- Creating Interface Role Objects , on page 304

Handling Name Conflicts between Interfaces and Interface Roles

Under normal circumstances, you can configure an interface role that has the same name as an actual interface on the device. If you use object selectors when defining policies (see Selecting Objects for Policies , on page 230), both the interface and the interface role are listed as available choices, enabling you to select either option. If you type in this common name when you define a policy, Security Manager automatically associates the interface role with the policy, not the interface.

However, a naming conflict can occur under the following circumstances:

1. You type the name of an interface when defining a policy.
2. You later create an interface role that has the same name.
3. You type this name again when defining a policy.
4. You click **Select** to display the object selector, or **Save** to save the policy, or in some cases, **OK** to update the policy.

When this sequence of events occurs, the Interface Name Conflict dialog box opens automatically so that you can select whether you want to specify the interface or the interface role. The dialog box lists only those names for which there are conflicts.

Understanding Map Objects

The objects in the Maps folder in the Policy Object Manager allow you to configure class, parameter, and policy maps for inspection rules, zone-based firewall rules, or IPS, QoS and connection rules policies. The types of maps you can use with these policies depends on the operating system running on the device as well as the specific version number, so typically it is best to configure the maps when you are configuring the policies.

Tip Devices enforce unique names for all configured maps. For example, you cannot use the same name for an FTP and DNS class map on the same device. If you select maps with the same name for a device, Security Manager automatically adds a numerical suffix to the duplicate names, for example, dnsmap_1.

The Maps folder contains the following folders. Subfolders organize the maps based on whether they are used for inspection or web content filtering.

- Class Maps—Layer 7 class maps used for identifying traffic that you want to act on.
- Parameter Maps—Parameter maps that configure settings used in zone-based firewall rules policies or other maps.
- Policy Maps—Layer 7 policy maps used for identifying the action to take on selected traffic.

Also included in the Maps folder are entries for TCP Map objects (a Layer 4 object), Regular Expression objects, and Regular Expression Group objects.

The following sections describe the different types of maps in more detail.

Class Maps

Class maps are subordinate to policy maps. You cannot specify a class map directly in a device policy. Instead, you create a policy map to incorporate the class map. The class map itself defines the match conditions for the traffic that you want to target in an inspection rule or zone-based firewall rule.

- ASA/PIX 7.2 and later, and FWSM devices—You can create class maps for the inspection of DNS, FTP, HTTP, IM, and SIP traffic. You also have the option of defining the traffic match directly in the policy map object, but if you create separate class maps, you can reuse them in more than one policy map.
- IOS 12.4(6)T and later devices—You can create class maps for the inspection of IM applications (AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), P2P applications (eDonkey, FastTrack, Gnutella, Kazaa2), H.323, HTTP, IMAP, POP3, SIP, SMTP, Sun RPC. You can also create class maps for filtering web content using the Local, N2H2, Trend, and Websense objects.

Unlike the class maps used for ASA/PIX/FWSM, you must create separate class maps and refer to them from the related policy maps. You can use these policy maps in zone-based firewall inspection or content filtering rules. For more information, see these topics:

- Configuring Inspection Maps for Zone-based Firewall Policies , on page 945
- Configuring Content Filtering Maps for Zone-based Firewall Policies , on page 966

To create class maps, see these topics:

- Configuring Class Maps for Inspection Policies , on page 792
- Configuring Class Maps for Zone-Based Firewall Policies , on page 947

To create the regular expressions and regular expression groups that you can use in class, parameter, and policy maps, see these topics:

- Add/Edit Regular Expressions , on page 879
- Configuring Regular Expression Groups , on page 878

Parameter Maps

Parameter maps define settings that you can use in zone-based firewall inspection or content filtering rules, or in other policy map objects.

- Inspection—You can create Inspection Parameter maps for general zone-based firewall rule parameters, or Protocol Info Parameter maps for use with IM application inspection.
- Content Filtering—You can create the following parameter maps to define web content filtering: Local, N2H2, Trend, URL Filter, URLF Glob, Websense.

Policy Maps

You can configure policy maps to alter the default actions of inspection or to configure web content filtering in zone-based firewall settings policies. Policy maps typically apply to applications that require special handling, perhaps due to embedded IP address information or the fact that the traffic opens secondary channels on dynamically assigned ports.

The policy map identifies the action to take on traffic that matches the conditions identified in the map. For most policy maps, you can specify traffic match conditions by referring to a class map. However, some policy maps require that you specify the match criteria within the policy map.

You can configure these types of policy maps:

- Inspection Rules—When configuring inspection rules, you can use Security Manager to create policy map objects for the following applications: DCE/RPC, DNS, ESMTP, FTP, GTP, H.323, HTTP, IM, IP options, IPsec, NetBIOS, SIP, Skinny, and SNMP. for more information, see Configuring Protocols and Maps for Inspection , on page 787.
- Zone-Based Firewall Inspection Rules—When configuring zone-based firewall inspection rules, you can use Security Manager to create policy map objects for the following applications: H.323, HTTP, IM (includes AOL, ICQ, MSN Messenger, Windows Messenger, and Yahoo Messenger), IMAP, P2P (includes eDonkey, FastTrack, Gnutella, Kazaa2), POP3, SIP, SMTP, Sun RPC. For more information, see Configuring Inspection Maps for Zone-based Firewall Policies , on page 945.
- Zone-Based Firewall Content Filtering Rules—When configuring zone-based firewall content filtering rules, you can use Security Manager to create Web Filter policy maps. You can also configure HTTP policy maps to inspect HTTP traffic. For more information, see Configuring Content Filtering Maps for Zone-based Firewall Policies , on page 966.
- IPS, QoS and Connection Rules—When configuring this service policy, which is specific to PIX 7.x+ and ASA devices, you can customize TCP inspection using a TCP map. For more information, see Configuring TCP Maps , on page 2281 and Configuring Service Policy Rules on Firewall Devices, on page 2259.

Understanding Networks/Hosts Objects

Networks/Hosts objects are logical collections of IP addresses that represent networks, hosts, or both.

Note As of Security Manager 4.4, there are no longer separate IPv4 and IPv6 Networks/Hosts objects—there is now a single, unified Networks/Hosts object, which may accept IPv4 addresses, IPv6 addresses, or both (in the case of group objects). However, group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices. See Policy Object Changes in Security Manager 4.4 , on page 11 for more information.

When you create a Networks/Hosts object, you must choose the type of object, which defines and limits the type of addresses the object can contain:

- Group – You can include combinations of any of the following types of addresses:
  - Networks or subnets, specified by IPv4 addresses and subnet masks, or IPv6 prefixes and prefix lengths.
  - Ranges of IPv4 or IPv6 network addresses.
  - Individual hosts, specified by IPv4 or IPv6 addresses (but not a domain name).
  - Other network/host objects, selected from a list of existing Networks/Hosts objects, including fully qualified domain name (FQDN) objects.
- FQDN – (ASA 8.4(2+) only) This object can contain a single host's fully qualified domain name, such as myhost.cisco.com. The device uses DNS to periodically resolve the FQDN to its IP address.
- Host – This object can contain a single host IPv4 or IPv6 address, such as 10.100.10.10 or 2001:DB8::0DB8:800:200C:417A.
- Attribute – This object can contain one or more policy based VM attribute agents, which allow a user to define network objects to filter traffic according to attributes associated with one or more Virtual Machines (VMs) in an VMware ESXi environment managed by VMware vCenter. Each VM attribute agent communicates with a single vCenter server.
- Address Range – This object can contain a single range of IPv4 or IPv6 addresses; the start and end addresses must be different, with the start being lower than the end.
- Network – This object can contain a single IPv4 network address and subnet mask, such as 10.100.10.0/24, or a single IPv6 prefix and prefix length, such as 2001:DB8::/32.

Networks/Hosts group objects make it easier to manage scalable policies. By using the associative capabilities of Networks/Hosts objects, you can expand your policies along with your network. For example, when you make changes to the list of addresses contained in a Networks/Hosts object, the changes propagate to all other Networks/Hosts objects, and to policies that refer to that Networks/Hosts object.

The host, network, and address range objects have special uses when used in policies for an ASA 8.3+ device. On these devices, you can configure object NAT rules in the policy object itself. If you use the object on other types of device, this NAT configuration is ignored.

The following topics describe how to work with Networks/Hosts objects:

- Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311
- Creating Networks/Hosts Objects , on page 313
- Using Unspecified Networks/Hosts Objects , on page 317
- Specifying IP Addresses During Policy Definition , on page 318
- VM Attribute Policies, on page 320

Contiguous and Discontiguous Network Masks for IPv4 Addresses

A network mask determines which portion of an IPv4 address identifies the network and which portion identifies the host. Like the IP address, the mask is represented by four octets. (An octet is an 8-bit binary

number equivalent to a decimal number in the range 0-255.) If a given bit of the mask is 1, the corresponding bit of the IP address is in the network portion of the address, and if a given bit of the mask is 0, the corresponding bit of the IP address is in the host portion.

Standard, or contiguous, network masks start with zero or more 1s followed by zero or more 0s. This kind of network mask is considered contiguous because it represents a network that consists of a contiguous IP address range. For example, the network 192.168.1.0/255.255.255.0 contains all the IP addresses ranging from 192.168.1.0 to 192.168.1.255.

The following table shows different methods of representing commonly used standard network masks:

Table 68: Standard Network Masks

Dotted Decimal Notation	Classless Inter-Domain Routing (CIDR) Notation
255.0.0.0	/8
255.255.0.0	/16
255.255.255.0	/24
255.255.255.255	/32

For example, 255.255.255.0 indicates that the first three octets of the IP address (24 bits or /24 in CIDR notation) are made up of ones and identify the network; the last octet is made up of zeros and identifies the host.

Discontiguous Network Masks

Nonstandard, or discontiguous, network masks are masks that do not conform to the contiguous format. For example, 10.0.1.1/255.0.255.255 indicates that you want to match an address that matches octets 1, 3, and 4 exactly, but any value in octet 2 is accepted.

Although discontiguous network masks are not typically used for network configurations, they are sometimes used for certain commands, such as filtering commands when defining access control lists (ACLs). Security Manager supports the use of nonstandard network masks in the policies whose CLI commands support them. An error is displayed if you try to define a discontiguous network mask in a policy that does not support them.

Network Masks and Discovery

During discovery, Security Manager attempts to match network/host objects with existing equivalent objects defined in the Policy Object Manager:

- For contiguous network masks—Two network/host objects containing only standard networks are considered equivalent if they consist of the same set of IP addresses.
- For discontiguous network masks—Two network/host objects are considered equivalent only if the standard networks consist of the same set of IP addresses and the nonstandard networks are syntactically equivalent.

How Network Masks are Displayed

Although you can enter both contiguous and discontiguous network masks using dotted decimal notation, all contiguous network masks are converted to CIDR notation. This makes it easier to distinguish them from discontiguous network masks, which are displayed in dotted decimal notation only.

- Creating Networks/Hosts Objects , on page 313
- Specifying IP Addresses During Policy Definition , on page 318
- Using Unspecified Networks/Hosts Objects , on page 317
- Understanding Networks/Hosts Objects , on page 310

Creating Networks/Hosts Objects

You can create Networks/Hosts objects to represent networks, individual hosts, or groups of both. When you create a Networks/Hosts object, you must choose the type of object (group, host, FQDN, network, attribute, address range). Once created, you cannot change the object type.

Tip You can create Networks/Hosts objects "on the fly" when defining policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

You can specify NAT object only if you have the Modify privilege mapped to your role.

Related Topics

- VM Attribute Policies, on page 320
- Using Unspecified Networks/Hosts Objects , on page 317
- How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups , on page 338

Step 1 Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window; see Policy Object Manager , on page 232 for more information.

Step 2 Select **Networks/Hosts** in the Object Type selector.

Step 3 Click the New Object button at the bottom of the window and choose one of the following types of Networks/Hosts object to open the Add or Edit Network/Host Dialog Box , on page 314. You also can right-click in the work area, choose **New Object**, and then choose one of the following options to open the dialog box.

- **Group** – To create an object that has one or more entry. You can include any combination of networks, hosts, address ranges, or other network/host objects (including FQDN objects).
- **FQDN** – (ASA 8.4(2+) only) To create an object with a single host's fully qualified domain name, such as myhost.cisco.com.
- **Host** – To create an object with a single host address, such as 10.100.10.10 or 2001:DB8::12ab:5689.

- **Attribute** – (ASA 9.7.1+ only) To create a network object to filter traffic according to attributes associated with one or more virtual machines (VMs) in a VMware ESXi environment managed by VMware vCenter.
- **Address Range** – To create an object with a single range of addresses, such as 10.100.10.1-10.100.10.255.
- **Network** – To create an object with a single network address, such as 10.100.10.0/24 or 2001:DB8::/32.

Tip Host, network, and address range objects also let you configure object NAT rules for ASA 8.3+ devices. Any NAT configuration is ignored for other devices.

Step 4 Provide the appropriate information in the Add or Edit Network/Host Dialog Box , on page 314.

Add or Edit Network/Host Dialog Box

Use the Add or Edit Network/Host dialog box to view, create, or edit network/host objects. The title, content and appearance of the dialog box differ slightly based on the type of network/host object you are creating: Group, FQDN, Host, Attribute, Address Range, or Network. FQDN objects require ASA 8.4.2 or later devices. Attribute objects require ASA 9.7.1 or later devices.The Group type lets you enter multiple definitions, so you can have a collection of networks, hosts, and other network/host objects, whereas the other types allow a single definition only.

The Host, Network, and Address Range versions of the dialog box provide two tabbed panels of options: General and NAT. Options on the General panel and the non-tabbed versions of the dialog box are described in the following table; the NAT options are described in Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062.

Note As of Security Manager 4.4, there are no longer separate IPv4 and IPv6 Networks/Hosts objects—there is now a single, unified Networks/Hosts object, which may accept IPv4 addresses, IPv6 addresses, or both (in the case of group objects only). However, group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices.

When you create IPv4-based Host, Network, or Address Range objects for use on ASA 8.3+ devices, or unified Host, Network, or Address Range objects for use on ASA 9.0.1+ devices, you can also configure object NAT rules on the NAT tab of the dialog box. In both cases, you must select **Allow Value Override per Device** to allow object NAT. For reference information on the NAT tab, see Add or Edit Network/Host Dialog Box: NAT Tab , on page 1062.

In addition, you can create an object with no addresses. For this type of object, you must also select **Allow Value Override per Device** and create overrides for every device that uses the object. For more information about using unspecified addresses, see Using Unspecified Networks/Hosts Objects , on page 317.

Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Networks/Hosts** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

Field Reference

Table 69: Network/Host Dialog Box (General Tab)

Element	Description
Name	The object name (up to 64 characters). Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. **Tip** If you configure NAT for host, address range, or network objects, you must select this option. The NAT configuration is created as a device override and is not kept in the object. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.
Group object options	

Element	Description
Available Networks/Hosts Members In Group Type in comma separated IP addresses	The Members In Group list shows the networks, hosts, and other network/host objects that are included in this object. To populate the list, do any combination of the following: • Select one or more Address, Attribute, FQDN, Group, Host, Network objects in the Existing Networks/Hosts list and then click the >> button between the lists. • Type one or more IP addresses in the "Type in comma separated IP addresses" field and then click the >> button between the lists. Separate multiple addresses with commas; they are added as separate lines in the Members list. For IPv4 addresses, you can include host addresses, network addresses (with subnet masks entered after a / character, such as 10.100.10.0/24), or a range of addresses (separate the starting and ending address with a hyphen, and optionally include a subnet mask). For IPv6 addresses, you can include host addresses, network addresses (with prefixes entered after a / character, such as 2001:DB8::/32), or a range of addresses (such as 2001:DB8::1-2001:DB8::100). See Specifying IP Addresses During Policy Definition , on page 318 for more information. • To remove an item from the Members In Group list, select it and click the appropriate << button to return the item to its source location. You can select and remove multiple items at one time. **Note** Group objects containing a mixture of IPv4 and IPv6 addresses can be assigned only to policies on ASA 9.0.1 and later devices.
FQDN object options	
FQDN FQDN Type	The fully qualified domain name of a single host; for example, somehost.cisco.com. The FQDN Type specifies the type of IP address mapped to the provided domain: IPv4 Only, IPv6 Only, or **Default**, which applies a device-specific default; for all non-ASA and pre-9.0.1 ASA devices, the default is IPv4.
Host object options	
IP Address	The IPv4 or IPv6 address of the single host to include in the object.
Attribute object options	
Agent Name Type Value	The VM Attribute Agent name. Select from a list of VM attribute agents or add a new VM Attribute Agent. The VM Attribute Agent Type should not exceed 128 characters. The VM Attribute Agent Value should not exceed 128 characters. **Note** A user can assign custom attribute types and values to a set of VMs in order to apply a common set of policies to a set of VMs with a common user-defined characteristic

Element	Description
Address Range object options	
Start IP Address End IP Address	The first and last IP address that define a range of addresses. The start and end addresses must be different, with the start being lower than the end.
Network object options	
IP Address Net Mask/Prefix	The IPv4 or IPv6 address that represents the network; for example, 10.100.10.0 or 2001:DB8::/32. If you entered an IPv4 address, enter its subnet mask in the Net Mask/Prefix field. You can type a mask in either CIDR format, for example, 24 (without the forward slash), or in dotted decimal format, for example, 255.255.255.0. If you entered an IPv6 address, enter its prefix length in the Net Mask/Prefix field.

Using Unspecified Networks/Hosts Objects

When you define a Networks/Hosts object, you can leave the address fields blank, thereby creating a Networks/Hosts object with an unspecified value. Networks/Hosts objects with unspecified values require that you create overrides for every device that uses them.

The advantage of using a Networks/Hosts object with an unspecified value is that Security Manager displays an error if you submit your changes without creating a device-level override on every device using the object. By contrast, when you define the global object with a placeholder value (such as, 10.10.10.10), that global value could be deployed by mistake if you fail to define an override.

The following procedure describes how to create and implement Networks/Hosts objects with unspecified values.

Related Topics

- Understanding Policy Object Overrides for Individual Devices , on page 246
- Creating Networks/Hosts Objects , on page 313
- Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311
- Specifying IP Addresses During Policy Definition , on page 318
- Understanding Networks/Hosts Objects , on page 310

Step 1 Create a Networks/Hosts object, making sure to:

- Leave the address fields blank (for example, the Members in Group, IP Address and Net Mask/Prefix, FQDN, or Start and End IP Address).
- Select the **Allow Value Override per Device** check box.

For more information, see Creating Networks/Hosts Objects , on page 313.

Step 2 Create overrides for each device that will use the object:

a) Click the green checkmark in the Overrides column for the object in the Networks/Hosts table to open the Policy Object Overrides Window , on page 249.
b) Click the **Create Override** button and select the devices on which you want to create overrides, then define a value in the address field. At this point, this override value applies to all the selected devices. For more information, see Creating or Editing Object Overrides for Multiple Devices At A Time , on page 248.
c) Double-click each device in the Policy Object Overrides dialog box, then modify the address field for the value required by that device.

Step 3 Define a policy that requires this object. You can use one of two methods:

- Define the policy on a single device in Device view, share the policy, then assign the policy to the other devices. See Sharing a Local Policy , on page 207 and Modifying Shared Policy Assignments in Device View or the Site-to-Site VPN Manager , on page 216.
- Create a shared policy in Policy view, then assign the policy to the other devices using the Assignments tab. See Modifying Policy Assignments in Policy View , on page 221.

Note You can create a Networks/Hosts group object that refers to a Networks/Hosts object with an unspecified value. You do not have to create the device-level overrides before you assign the policy containing the object to devices.

Specifying IP Addresses During Policy Definition

Many policies and policy objects require that you enter an IP address for a host or network. For some policies or objects, you must enter just a host, or just a network. For other policies or objects, you can enter some combination of hosts and networks. You are prevented from entering or selecting addresses that are not appropriate for the circumstances.

The following is a description of all acceptable formats that you can use, both for IPv4 and IPv6 addresses, although a particular policy or object might not allow specific formats (for example, interface roles are allowed as address designations in only a very limited number of policies). If the policy or object allows it, you can enter multiple addresses by separating them with commas.

- Networks/Hosts object. Enter the name of the object or click **Select** to select it from a list. You can also create new Networks/Hosts objects from the selection list.

Note The only way to specify a fully qualified domain name (FQDN) is to use an FQDN Networks/Hosts object, or a group object that includes an FQDN object. You cannot directly type in an FQDN.

- Host IP address, in v4 or v6 format.
  - Complete IPv4 address; for example, 10.10.10.100
  - Complete IPv6 address, showing all eight components. For example, 2001:DB8:0:0:0DB8:800:200C:417A. It is not necessary to include the leading zeros in an individual field. Security Manager converts the address to compressed format if possible.
  - Compressed IPv6 address, where a group of fields is replaced by two colons (::). It is common for IPv6 addresses to contain successive hexadecimal fields of zeros. To make IPv6 addresses less cumbersome, you can use two colons (::) to compress successive hexadecimal fields of zeros at the

beginning, middle, or end of an IPv6 address (the colons represent successive hexadecimal fields of zeros). You can use :: at most once in an IPv6 address. For example, 2001:DB8::0DB8:800:200C:417A. The unspecified address, 0:0:0:0:0:0:0:0, can be represented as ::. The loopback address is ::1.

- IPv6 representation of an IPv4 address. When dealing in mixed IPv4/IPv6 environments, you can represent the IPv4 addresses in an alternate IPv6 format: x:x:x:x:x:x:d.d.d.d, where the Xs are the hexadecimal values of the first 6 fields, and the Ds are the IPv4 address with the octets separated by periods. The first 6 fields are either all zeros, ::FFFF, or 2001:DB8::. For example, 0:0:0:0:0:0:10.1.68.3, which in compressed format is ::10.1.68.3, or 0:0:0:0:0:FFFF:10.1.68.3, or 2001:DB8::10.1.68.3.

- Network address, in either IPv4 or IPv6 format:
  - IPv4 address, including subnet mask, in either CIDR format (10.10.10.0/24), or dotted decimal format (10.10.10.0/255.255.255.0).
  - IPv6 address, including the prefix length in decimal format in a manner similar to CIDR notation for IPv4, for example, /64. The number specifies the number of the left-most contiguous bit of the address that comprise the prefix. For example, 2001:DB8:0:CD30::/60.

Note You could also enter 2001:DB8:0:CD30::/60 as 2001::CD30:0:0:0:0/60. However, compressing the trailing zeros is the preferred method, and Security Manager will translate the address to 2001:DB8:0:CD30::/60.

For more detailed information on IPv6 addressing, see the IETF RFC 4291, IP Version 6 Addressing Architecture, at http://www.ietf.org/rfc/rfc4291.txt.

- A range of IP addresses. Separate the beginning and ending addresses with a hyphen. The range does not need to be within a single subnet unless the policy requires it.

You can also include a prefix or subnet mask in CIDR format; for example, 2001:db8::1 - 2001:db8::2/64, or 10.10.10.100-10.10.10.200/24.

- An IPv4 address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).
- Interface role object (in rare cases). Enter the name of the object or click **Select** to select it from a list (you must select Interface Role as the object type). When you use an interface role, the rule behaves as if you supplied the IP address of the selected interface. This is useful for interfaces that get their address through DHCP, because you do not know what IP address will be assigned to the device. For more information, see Understanding Interface Role Objects , on page 303.

When you create a network/host object or define IP addresses as part of a policy, Security Manager verifies that the syntax of the address is correct and that a mask or prefix was entered when required. For example, when you define a policy that requires a host, you do not need to enter a mask/prefix. However, when you define a policy that requires a subnet, you must enter the address with the mask/prefix, or select a network/host object that has a mask/prefix defined.

VM Attribute Policies

You can define network objects to filter traffic based on attributes associated with one or more virtual machines (VMs) in a VMware ESXi environment. This environment is managed by VMware vCenter. Users can assign attributes to VMs within the ESXi environment and configure an attribute agent; the attribute agent connects to vCenter or to a single ESXi host using HTTPS and requests and retrieves one or more bindings that associate the specific attribute to the primary IP address of the an ESXi VM.

A single ASA can have multiple attribute agents defined; each communicating with a different vCenter, or one or more communicating with the same vCenter.

This enables a user to define access control lists (ACLs) to assign policies to traffic from a group of VMs that share one or more attributes.This feature is referred to as Policy Based on VM Attributes

The VM attributes feature is supported on all hardware platforms, and on all ASAv platforms running on ESXi, KVM, or HyperV hypervisors. VM attributes can only be retrieved from VMs running on an ESXi hypervisor.

Note The ASA uses the term attribute or attribute type to refer to the characteristic to be monitored. VMWare uses the term property for the same characteristic. The terms may be used interchangeably.

Communication between the VM attribute agent and vCenter

There are two types of messages exchanged between the VM attribute agent and the vCenter - Property Request and Binding Update.:

- Property Request -This is a HTTPS message sent from the ASA to the IP address of the vCenter Server, indicating the complete list of attribute types currently configured for network objects associated with this attribute agent. attributes that have been configured. This message contains the SSL credentials necessary to authenticate the connection to vCenter. The vCenter responds with a corresponding HTTPS response.
- Binding Update - This is a asynchronous HTTPS message sent from the vCenter to the ASA, whenever an attribute changes for one or more VMs. Each binding update is identified by the IP address of the VM reporting the attribute change. If multiple attributes are being monitored by a single agent, a single binding update contains the current value of all monitored attributes for each VM. If a specific attribute being monitored by the agent is not configured on a VM, the binding will contain an empty attribute value for that VM. If a VM has not been configured with any monitored attributes, vCenter does not send a binding update to the ASA.

When an attribute agent issues a property request containing a new attribute type, vCenter responds with a binding update for each VM where the attribute type is configured. After that point, vCenter only issues a new binding when an attribute value is added or changed on a VM.

Attribute Agent States

There are two kinds of attribute agent states - Connection State and Agent State.

- Connection State - This indicates whether or not the attribute agent is currently in contact with vCenter.

Connection State	Explanation
No Host Credentials	The user has not entered vCenter host credentials using the host subcommand, or the agent has been deleted using the no attribute source-group command while there are network objects still using the agent.
Disconnected	The agent has host credentials defined, but is currently not in contact with vCenter. The connection is established when the ASA receives a HTTP 200 response to a keepalive packet.
Connected	The agent has received a response from vCenter to the latest keepalive packet.
Invalid Host Credentials	The agent has attempted to contact vCenter to issue a property request, but the request was rejected because the user name and/or password was incorrect. The agent stays in this state until new credentials are entered, at which point it will move to Disconnected state until a keepalive response is received from vCenter.

- Agent State - This indicates whether or not any network objects are configured to monitor attribute types through this agent.

Table 70: Agent State Table

Agent State	Explanation
Inactive	The agent currently has no attributes configured.
Active	The agent has one or more attributes configured. An agent can be Active even if there is no connection to vCenter.

Guidelines for Configuring vCenter Virtual Machines

To leverage the VM attributes feature, those attributes must be made available to the vCenter server by the managed virtual machines. As an example, some attributes are:

- summary.config.name - The user-defined name associated with the virtual machine - for example, VM-build-machine-1
- summary.config.guestFullName - The full name of the guest OS running on the virtual machine - for example, Red Hat Enterprise Linux 7 (64-bit)
- summary.config.annotation - The text description field for the virtual machine.

For string attribute values such as summary.config. annotation, the value in the network object attribute definition must be an exact match to the value reported to vCenter by the VM. For example, a network object attribute value, 'This is a Build Machine' does not match the VM summary.config.annotation value, 'this is a build machine' on the VM. A binding update containing the latter string will not be added to the host-map for the former.

VMs being monitored by the VM attributes feature must have VMware Tools installed. VMware Tools is the software component that reports the IPv4 or IPv6 address of the VM to the vCenter server. Since the function of VM attribute is to bind an IP address to an attribute type/value pair, vCenter will not report any binding information for VMs that are not running VMware Tools.

Within the ESXi environment, VMs are defined by a primary IP address, which roughly corresponds to the management IP address of an ASA. There can only be one primary address per VM, which can be either an IPv4 or IPv6 address. Bindings are always provided between the primary IP address and the attribute type/value pair. If a VM is configured with multiple IP addresses (such as IPv6 link local addresses), vCenter will only send binding updates for the primary address (usually the first address configured).

Note A user can assign custom attribute types and values to a set of VMs in order to apply a common set of policies to a set of VMs with a common user-defined characteristic.

For a comprehensive list of the attributes and related guidelines, refer to the VMware vCenter 5.5/6.0 documentation.

Configuring VM Attribute Policies

There are three steps to configuring a policy based on VM attributes:

Step 1 Configure the Network Object Attribute.

a) Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Networks/Hosts** from the Object Type Selector. Right-click inside the work area and select **New Object** > Attribute; you also can use the + button at the bottom of the pane to add a new network object attribute.

Note A Network Attribute Object can be used only if object-group-search is enabled.

b) Select a VM Attribute Agent, specify a VM Attribute Type and add a value for VM Attribute Value.

Step 2 Add a VM Attribute Agent.

a) Specify a Name for the VM Attribute Agent and add a Description for the VM attribute Agent.
b) By default, the Agent Type is esxi.
c) Enter the primary IP address of the vCenter server in the DNS Host Name/IP Address field.
d) Specify a Username and Password to authenticate to the vCenter Server.
e) Specify a duration of time that the connection is kept active while the agent is contacting the vCenter server. The default value of the Retry Interval is 30 seconds.
f) Specify the number of times that the agent will attempt to contact the vCenter server before declaring it inactive in the Retry Count field. The default value is 3.
g) Click OK.

Step 3 Configure an access-list using a VM Attribute. For more information see Creating Access Control List Objects , on page 283.

Note VM Attribute only supports an access-list object.

Understanding Pool Objects

Pool objects have the following uses:

- Specifying pools for use in Layer 3 load balancing for ASA clusters
- Specifying pools for use in Layer 3 EIGRP and OSPFv3 on ASA clusters

The following topics describe how to work with pool objects:

- Add or Edit IPv4 Pool Dialog Box , on page 323
- Add or Edit IPv6 Pool Dialog Box , on page 324
- Add or Edit MAC Address Pool Dialog Box , on page 325
- Add or Edit NET Pool Object Dialog Box, on page 326
- Add or Edit DHCPv6 Pool Dialog Box, on page 327

Add or Edit IPv4 Pool Dialog Box

Use the Add or Edit IPv4 Pool dialog box to view, create, or edit IPv4 pool objects.

Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > IPv4 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

Related Topics

Field Reference

Table 71: Add IPv4 Pool Object Dialog Box

Element	Description
Name	The object name (up to 64 characters). Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Type	Select whether the pool object is a single IP address or a range of IP addresses.
Address	The IPv4 address of the single host to include in the object.
Start Address End Address	The first and last IP address that define a range of addresses. The start and end addresses must be different, with the start being lower than the end.
Mask	The subnet mask for the IP address or address range.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. **Note** IPv4 Pool objects are always overridable. Clearing this option results in an error. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit IPv6 Pool Dialog Box

Use the Add or Edit IPv6 Pool dialog box to view, create, or edit IPv6 pool objects.

Navigation Path

Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > IPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

Add or Edit DHCPv6 Pool Dialog Box

This dialog box is used to add or edit the DHCPv6 Server Pool. For clients that use StateLess Address Auto Configuration (SLAAC) in conjunction with the Prefix Delegation feature, you can configure the ASA to provide information such as the DNS server or domain name when they send Information Request (IR) packets to the ASA. The ASA only accepts IR packets, and does not assign addresses to the clients.

Navigation Path

- Choose **Policy Objects** from the **Manage** menu, or click the Policy Object Manager button in the button bar, to open the Policy Object Manager pane in the lower section of the Configuration Manager window. Select **Pool Objects > DHCPv6 Pool Object** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type), or right-click a row and select **Edit Object**; you also can use the related buttons at the bottom of the pane to open either dialog box.

OR

- You can access the Add DHCPv6 Pool dialog box from DHCPv6 Pool Selector dialog box: click the Add Row or Edit Row buttons beneath the Available DHCPv6 Pool table. The DHCPv6 Pool Selector dialog box can been accessed from the Server Pool radio button in the Interface IPv6 DHCP section of the IPv6 panel of the Add Interface and Edit Interface dialog box.

Field Reference

Table 75: Add DHCPv6 Pool Dialog Box

Element	Description
Name	The DHCPv6 Pool name should not exceed 200 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.

• Configure parameters on one or more tabs, to provide responses to IR messages to clients.
• For each of these tabs, specify the following as appropriate:
  • DNS/SIP/ NIS/ NISP/ SNTP Server: Enter a server name. Make sure that the IPv6 addresses are in the correct format. For more information on IPv6 address format, see http://www.ietf.org/rfc/rfc2373.txt .
  • DNS/ SIP/NIS/NISP Domain Name: Enter a domain name. Domain names must begin and end with a digit/letter, only letters, digits and hyphen are allowed as internal characters, labels are separated by a dot.Each label must be up to 63 characters and the entire host name has a maximum of 255 characters. For more information on domain names format, see http://www.ietf.org/rfc/rfc1123.txt .
Note The import command uses one or more parameters that the ASA obtained from the DHCPv6 server on the Prefix Delegation client interface. You can mix and match manually-configured parameters with imported parameters; however, you cannot configure the same parameter manually and in the import command.	

Server tab	(Optional) Specify DNS Server Name and Domain Name.
SIP tab	(Optional) Specify SIP Server Name and SIP Domain Name.
NIS tab	(Optional) Specify NIS Server Name and NIS Domain Name.
NISP tab	(Optional) Specify NISP Server Name and NISP Domain Name.
SNTP tab	(Optional) Specify SNTP Server Name.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring SAML Identity Provider

Beginning with version 4.10, Security Manager enables you to configure Security Assertion Markup Language (SAML) 2.0 based Single-Sign on and Single-Logout for ASA VPN. Single Sign-on Server configuration is no longer supported from ASA version 9.5(2). This has been replaced by SAML Identity Provider.

Security Assertion Markup Language is an XML-based, open-standard data format for exchanging authentication and authorization data between parties, in particular, between an identity provider and a service provider. Identity Provider is a service that can assert a user's identity to another resource. An Identity Provider is responsible for authenticating users in an identity management system. Service Provider is a service that the user wants to access (such as a public or a private web application).

Navigation Path

Select **Manage > Policy Objects and** then select **SAML Identity Provider** from the Object Type Selector.

Adding or Editing SAML Identity Provider

Use the Add or Edit SAML Identity Provider dialog box to add a new SAML Identity Provider or edit an existing row.

Navigation Path

Select **Manage > Policy Objects and** then select **SAML Identity Provider** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 76: Add or Edit SAML Identity Provider

Element	Description
Name	Enter a name for the SAML Identity Provider, between 4 and 256 characters.
Description	(Optional) Enter a description for the SAML Identity Provider.
Sign In URL	This URL is used for signing into the Identity Provider. It must begin with http:// or https:// (not case sensitive) and the length of the Sign In URL must be less than or equal to 500 characters. The Sign In URL field allows only the following special characters: :, /, *, [,],.
Sign Out URL	(Optional) This URL is used for redirecting to when signing out of the Identity Provider. It must begin with http:// or https:// (not case sensitive) and the length of the Sign Out URL must be less than or equal to 500 characters. The Sign Out URL field allows only the following special characters: :, /, *, [,],.

Element	Description
Base URL	(Optional) This is the clientless VPN's base URL. This URL is used in SAML metadata that is provided to third-party identity providers so that they can redirect end users back to the ASA device. If the Base URL is not configured it is retrieved from the ASA device's hostname and domain name. For example, if the host name is ssl-vpn and domain name is xyz, the Base URL used is https://ssl-vpn.xyz.com. The Base URL must begin with http:// or https:// (not case sensitive) and the length of the Base URL must be less than or equal to 500 characters. The Base URL field allows only the following special characters: :, /, *, [,],. **Note** Either Base URL or Domain Name must be configured in the ASA device to configure SAML.
Identity Provider	Select the Identity Provider from the CA Servers Selector Dialog box. Identity Provider is the service that can assert a user's identity to another resource. An Identity Provider is responsible for authenticating users in an identity management system.
Service Provider	(Optional) Select the Service Provider from the CA Servers Selector Dialog box. Service Provider is the service that the user wants to access (such as a public or private web application).
Request Timeout	(Optional) Enter a value between 1 and 7200. By default there is no SAML timeout.
Enable Signature	(Optional) Enable or disable signature in SAML request. If this is enabled, you must configure the Service Provider. Select the cipher suite for the signature in the Authentication Request drop-down.When you enable the signature, the SHA-256 cipher suite is selected by default. You can change the cipher suite in the Authentication Request drop-down. By default, the Signature is disabled and the Authentication Request drop down is hidden. **Note** You can specify an Authentication Request for a SAML signature, only for ASA 9.8.1 and above.
Enable Internal	(Optional) Enable or disable the Internal flag for SAML Identity Provider. When enabled, the Internal flag identifies the Identity Provider in a private network and the SAML Identity Provider can only be accessed through a WebVPN connection. This also implies that the ASA works as a gateway. By default, the Internal flag is disabled and the Identity Provider can be directly accessed.
Enable Force Re-Authentication	(Optional) Enable or disable Force Re-authentication for SAML Identity Provider.When enabled, the identity provider must authenticate the presenter directly rather than rely on a previous security context. By default, the Force Re-authentication flag is enabled.
Category	(Optional) Select a category between CAT-A to CAT-J.
Allow Value Override per Device	(Optional) If the Allow Value Override per device is selected, edit the Overrides.

Understanding and Specifying Services and Service and Port List Objects

Many policies in Security Manager require that you identify a service to which the policy applies. A service is a protocol and port definition that identifies a particular type of traffic. In many cases, you can specify the service directly in the policy. You can also select service policy objects that define the required services, or use a combination of service objects and policy-specific service designations.

Service objects are convenient because you can create objects to represent the composition of a particular application, or you can model them after the logical organizations that exist on your network, such as a development team or corporate department. There are two types of service policy object:

- Service group—Can contain one or more service, including other service objects. This is the type of service object that was available in all Security Manager 3.x releases.
- Service object—Can contain a single service.

When configuring a policy that requires that you identify a service, you can select or create service objects by clicking the **Select** button next to the Services field. To create a new service from the selection dialog box, click the **Add** button beneath the service list and select a type: group or object. You can also create services from the **Policy Object Manager** by selecting **Services > Services** from the table of contents and clicking the **Add Object** button and selecting group or object. For information on the specific fields available when creating a service object, see Configuring Service Objects , on page 334.

Security Manager includes a comprehensive collection of predefined service group objects, including ICMP messages and objects for commonly used services such as HTTP, Syslog, POP3, Telnet, and SNMP. Before using a predefined service group object, you should review the object definition to verify that it conforms to your network implementation. If the predefined object does not meet your needs (for example, if you require different destination ports), you can create a new service object from scratch or based on a copy of an existing object. For more information, see Cloning (Duplicating) Objects , on page 242.

Whether you are creating a service object or specifying services directly in a policy, you can specify services using the following formats. As you type, Security Manager might prompt you with text-completion options related to your entry. You can select a value from the list and press Enter or Tab. You can enter more than one service by separating services with commas.

- *protocol* , where the protocol is 1-255 or a well known protocol name such as tcp, udp, gre, icmp, and so forth. If you enter a number, Security Manager might convert it to the associated name.
- **icmp/***message_type* /*message_code* , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp/unreachable/1** or **icmp/echo-reply**).
- **icmp6/***message_type* /*message_code* , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp6/unreachable/1** or **icmp6/echo-reply**).
- **{tcp | udp | tcp&udp}/**{*destination_port_number* | *port_list_object* } where the destination port number is 1-65535 or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20. The source port number is the Default Range port list object. The Default Range object includes either all ports (1-65535) or all secure ports (1024-65535), depending on the setting you select in the Policy Objects Page , on page 579 (select **Tools > Security Manager Administration > Policy Objects**).

For example, defining a service as tcp/10 means that 10 is the destination port and no source port is defined.

When you specify ports, you can also use the following special keywords: **lt** (less than), **gt** (greater than), **eq** (equal to), and **neq** (not equal to), followed by a number. For example, **lt 440** specifies all ports less than 440.

Tip To create port list objects, select **Services > Port Lists** in the **Policy Object Manager** and click the **Add Object** button. For more information, see Configuring Port List Objects , on page 333.

- **{tcp | udp | tcp&udp}**/{*source_port_number* | *port_list_object* }/ {*destination_port_number* | *port_list_object* }, where the source and destination port numbers are 1-65535 or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20.

For example, defining a service as tcp/10/20 means that 10 is the source port and 20 is the destination port. If you do not want to specify a destination port, use the Default Range port list object, for example, tcp/10/Default Range.

- (Service groups only) *service_object_name* , which is the name of another existing service object. Specifying other objects lets you nest object definitions. Click **Select** to select a service object or to create a new object.

The following ICMP message types which are applicable only on IOS devices are automatically replaced with ASA/PIX/FWSM device supported ICMP message types.

- ICMP-Mobile-Redirect
- ICMP-Host-Unreachable
- ICMP-Network-Redirect
- ICMP-Port-Unreachable
- ICMP-Protocol-Unreachable
- ICMP-Reassembly-Timeout
- ICMP-Redirect
- ICMP-protocol-redirect

Configuring Port List Objects

Use the Port List dialog box to create, edit, or copy a port list object. Each port list object can contain one or more ports or port ranges (for example, 1-1000 and 2000-2500). Additionally, a port list object can include other port list objects.

You typically use port list objects when defining services, but you can also use them in various policies to identify a port rather than typing in the port number. For more information about using port lists in service definitions, see Understanding and Specifying Services and Service and Port List Objects , on page 331.

Tip The predefined Default Range port list object includes either all ports (1-65535) or all secure ports (1024-65535), depending on the setting you select in the Security Manager Administration window (select **Tools > Security Manager Administration > Policy Objects** and see Policy Objects Page , on page 579).

Navigation Path

Select **Manage > Policy Objects**, then select **Services > Port Lists** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Related Topics

- Understanding and Specifying Services and Service and Port List Objects , on page 331
- Configuring Service Objects , on page 334

Field Reference

Table 77: Port List Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Ports	The ports or ranges included in the port list object, for example, 443, or 1-1000. You can define a single port, a range of ports, multiple port ranges, or any combination of single ports and ranges. Separate multiple entries with commas. Port values range from 1 to 65535. You can use the following operators to identify ranges: • **gt**—Greater than. For example, gt 1000. • **lt**—Less than. For example, lt 1000. • **eq**—Equals. For example, eq 1000. However, **eq 1000** has the same meaning as simply entering **1000**. • **neq**—Does not equal. For example, neq 1000. If you use this operator, you can include only the neq value in the Ports field. However, you can include port ranges in the object. Thus, if you want to create an object that specifies all ports from 1000-1200 except for 1150, create a port list object for the 1000-1200 range, and another object that specifies neq 1150 and that includes the other port list object.
Port Lists	The other port list objects included in the object, if any. Enter the name of the port lists or click **Select** to select them from a list or to create new objects. Separate multiple entries with commas.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring Service Objects

Use the Add and Edit Service dialog boxes to create or edit service objects. You can create a service object to describe a type of traffic carried by the devices in your network. When creating a service object, you must specify the protocol used by the service.

When you create a service object, you must choose the object type:

- Service Group—Can contain one or more services, including other service objects. This is the type of service object available in all Security Manager 3.x releases.
- Service object—Can contain a single service.

Security Manager provides many predefined service group objects. Before creating an object, scan the list in the Policy Object Manager to see if an existing object fits your needs. Note that although you can duplicate a predefined object, you cannot edit it.

Cisco Security Manager supports the service objects whose definitions are available in the show running configuration. For the predefined objects, the definition would not be available in the show running configuration. Therefore, any policies configured with these predefined objects in ASA device would not be discovered in Cisco Security Manager.

In order to align with device behavior, in Cisco Security Manager version 4.17, support to these predefined objects was introduced. The ASA predefined objects will be discovered, provided, the device is updated with the object whenever a new predefined service object is added in the ASA. This feature is supported for ASA supporting images across all versions.

Note The PPTP predefined object is not supported.

However, Cisco Security Manager does not support activity validation with respect to ASA versions. Also, the ICMP and ICMPv6 predefined objects of Cisco Security Manager are converted to device predefined objects. Hence, any usage of Cisco Security Manager's predefined objects causes negation and re-creation of that policy.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Services** > **Services** from the Object Type Selector. Right-click inside the work area and select **New Object** (and select an object type) or right-click a row and select **Edit Object**.

Field Reference

Table 78: Add and Edit Service Dialog Boxes

Element	Description
Name	The object name. If you are using the object for ASA or PIX devices running software version 8.x, limit the length of the name to 64 characters. For other devices the name can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.

Element	Description
Services (for groups) Service (for objects)	The services to include in this policy object. When creating a Service Group, you can enter more than one service by separating services with commas. When creating a Service Object, you can enter one service only. You can specify services using the following formats. As you type, Security Manager may prompt you with text-completion options related to your entry. If you enter a service that translates directly to a predefined service object, the entry is converted to the predefined object name; for example, TCP/80 is converted to HTTP. • *protocol* , where the protocol is 1 to 255 or a well known protocol name such as tcp, udp, gre, icmp, and so forth. If you enter a number, Security Manager might convert it to the associated name. • **icmp/***message_type* /*message_code* , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp/unreachable/1** or **icmp/echo-reply**). • **icmp6/***message_type* /*message_code* , where the message type is 1 to 255 or a well-known ICMP message type name such as echo, and the message code is 0 to 255 (for example, **icmp6/unreachable/1** or **icmp6/echo-reply**).
	• **{tcp | udp | tcp&udp}**/{*destination_port_number* | *port_list_object* } where the destination port number can be 1 to 65535, or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20. In this instance, the source port number is the Default Range port list object, which specifies the range 1-65535. (See Configuring Port List Objects , on page 333 for information about creating and editing port list objects.) Whenever you specify ports, you can also use the following special keywords: **lt** (less than), **gt** (greater than), **eq** (equal to), and **neq** (not equal to), followed by a number. For example, **lt 440** specifies all ports less than 440. • **{tcp | udp | tcp&udp}**/{*source_port_number* | *port_list_object* }/{*destination_port_number* | *port_list_object* }, where the source and destination port numbers can be 1 to 65535, or the name of a port list object. You can enter a range of ports using a hyphen, for example, 10-20. • (Service groups only) *service_object_name* , which is the name of another existing service object. Specifying other objects lets you nest object definitions. Click **Select** to select a service object or to create a new object.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

The following ICMP message types which are applicable only on IOS devices are automatically replaced with ASA/PIX/FWSM device supported ICMP message types.

- ICMP-Mobile-Redirect
- ICMP-Host-Unreachable
- ICMP-Network-Redirect
- ICMP-Port-Unreachable
- ICMP-Protocol-Unreachable
- ICMP-Reassembly-Timeout
- ICMP-Redirect
- ICMP-protocol-redirect

How Policy Objects are Provisioned as Object Groups

Object groups are a feature of ASA, PIX, FWSM, and IOS 12.4(20)T+ devices that enable you reduce the size of access rules by grouping objects such as IP hosts, networks, protocols, ports, and ICMP message types. Although the functionality of object groups is similar to the functionality of policy objects in Security Manager, there are several important differences in implementation.

As a result, when deploying policies to a device, it is not always possible to create object groups that are an exact copy of the policy objects that you configured in Security Manager. To take one example, policy object names are unique per object type in Security Manager (that is, you can define a network/host object and a service object with the same name), whereas object groups of all types defined on the device share a single naming scheme. Therefore, if you deploy a network/host object whose name matches an existing service object group on the device, a suffix is added to the name of the network/host object to distinguish it from the service object group.

Note For information about the options available when deploying object groups, see Deployment Page , on page 524.

Similarly, when discovering policies on a device, it is not always possible to create policy objects that are an exact copy of the object groups that are configured on the device. However, Security Manager preserves as much of the original configuration as possible.

Note For IOS devices, any policy objects that are used by access control list objects are subsequently replaced during deployment by the contents of the object. Object groups used with ACL objects are not preserved, although they are discovered as Security Manager policy objects.

The following sections describe the changes that are made when provisioning policy objects to object groups on the device, or when creating the policy objects when discovering policies on these devices:

- How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups , on page 338

• How Service Objects are Provisioned as Object Groups , on page 339

How Network/Host, Port List, and Service Objects are Named When Provisioned As Object Groups

In most cases, network/host, port list, and service objects can be provisioned as object groups without changing the object name. The below table describes how object names are changed when the names cannot be converted directly to object groups on supported devices.

Note The predefined network/host object **any** is not provisioned as an object group.

Table 79: How Network/Host, Port List, and Service Objects are Named as Object Groups

Condition	New Name	Examples
Object name includes a space.	Space is replaced with an underscore.	An object named **my object** is provisioned as an object group named **my_object**.
Object name is longer than 64 characters (the maximum supported by object groups).	Name is truncated so that any suffixes required by the object group (such as _TCP or _UDP, or unique numbers, such as _1) can be added while remaining within the 64-character limit.	
Device already has an object group (Protocol/ICMP/Service) with the same name.	A numeric suffix is added to the name, starting from 1.	If you have a network/host object named **West** and the device already has a TCP service object group named **West**, the name of the object group is changed to **West_1** when deployed.
You have already created a network/host object group with the same name.	A numeric suffix is added to the name, starting from 1.	If you have a network/host object and a port list or service object that are both named **West**, the network/host object is deployed as **West** and the port list is deployed as **West_1**.

Note For ASA software versions 8.2 and earlier, if you create an object of the type Network Object on Security Manager, upon discovering the ASA device with an object of the same object name but of type Network-Object Group, Security Manager does not create a new object. Instead, it reuses the existing objects. However, for ASA software versions 8.3 and later, if you create an object of type Network Object on Security Manager, upon discovering the ASA device with an object of the same object name but of type Network-Object Group, Security Manager creates new objects, say, name_1, name_2, and so on. This implies that for Security Manager managing ASA devices that are running the software version 8.2 or earlier, it creates new objects upon upgrading the ASA to version 8.3 or later.

How Service Objects are Provisioned as Object Groups

The following table describes how Security Manager creates object groups when deploying service objects to supported devices.

Tip For ASA 8.3+ devices, service objects are provisioned using the **object service** command instead of the **object-group** command.

Table 80: How Service Objects are Provisioned as Object Groups

Condition	Generated Object Group	Examples

Service object contains the ICMP protocol and ICMP message types.	Generates an ICMP-type object group with the same name as the service object.	Service object service1: **icmp/icmp-echo, 23**
		Object group:
		`object-group icmp-type service1`
		`  icmp-object icmp-echo`
		`  icmp-object 23`

Service object contains only protocols.	Generates a protocol object group with the same name as the service object.	Service object service1: **tcp, gre, 34**
		Object group:
		`object-group protocol service1`
		`  protocol-object tcp`
		`  protocol-object gre`
		`  protocol-object 34`

Service object uses port list objects for both source and destination ports.	Generates service object groups that match the port list objects.	

Service object contains multiple ports or port ranges, but does not use a port list object for the source ports.	Generates service object group with the name <ObjectName>.src for the source ports.	Service object serv1: **tcp/400,600/23-80**
		Object group:
		`object-group service serv1.src tcp`
		`  port-object eq 400`
		`  port-object eq 600`

Condition	Generated Object Group	Examples

Service object contains multiple ports or port ranges, but does not use a port list object for the destination ports.	Generates service object group for the destination ports with the same name as the service object.	Service object serv1: **tcp/400,600/23-80, 566**
		Object group:
		`object-group service serv1 tcp`
		`  port-object range 23 80`
		`  port-object eq 566`
		`object-group service serv1.src tcp`
		`  port-object eq 400`
		`  port-object eq 600`

Service object contains the TCP&UDP protocol and includes defined ports.		Service object serv1: **tcp&udp/400,600/23-80, 566**
		Object group:
		`object-group service serv1 tcp`
		`  port-object range 23 80`
		`  port-object eq 566`
		`object-group service serv1.src tcp`
		`  port-object eq 400`
		`  port-object eq 600`
		`object-group protocol tcp-udp`
		`  protocol-object tcp`
		`  protocol-object udp`

CHAPTER 7

Managing Flexconfigs

FlexConfig policies allow you to configure device commands that are not otherwise supported by Security Manager. By using Flexconfigs, you can extend Security Manager's control over a device configuration and take advantage of new device features before upgrading the product.

FlexConfig policies are made up of FlexConfig objects. These objects are essentially subroutines that can include scripting language commands, device commands, and variables. You can configure an object to be processed prior to applying the Security Manager configuration to a device, or you can have it processed after the configuration. Security Manager processes your objects in the order you specify so that you can create objects whose processing depends on the processing of another object. A FlexConfig policy object's contents can range from a single simple command string to elaborate CLI command structures that incorporate scripting and variables.

Note You can configure Cisco Security Manager either to deploy FlexConfigs only once after creation or modification of a FlexConfig, or to deploy FlexConfigs with each deployment. By default, Cisco Security Manager deploys FlexConfigs one time. If you have FlexConfigs that need to be deployed with each deployment, disable the "Deploy only new or modified Flexconfigs" setting on the Tools > Security Manager Administration > Deployment page. After changing this setting, you have to manage one-time FlexConfigs by deleting them after they have been deployed. For more information, see Deployment Page , on page 524.

Understanding policies and objects is central to understanding and using FlexConfig policy objects. For more information on how Security Manager defines and uses polices, see Managing Policies, on page 167 and for information on how Security Manager defines and uses objects, see Managing Policy Objects, on page 229.

Note With "Deploy only new or modified Flexconfigs" setting on **Tools > Security Manager Administration > Deployment page** enabled, if you have an activity open, with changes, and when you attempt to deploy FlexConfigs, Cisco Security Manager considers the FlexConfig changes specific to that activity alone and not those of other activities. On the other hand, if all activities are submitted and no activity is open, then Security Manager considers the FlexConfig changes specific to the lastly submitted activity that was submitted with changes. Therefore, if you need FlexConfig changes for an activity to reflect during deployment, then ensure the changes are done in a single activity, submitted, and deployed.

The following topics describe FlexConfig policies and policy objects and how to use them:

Understanding FlexConfig Policies and Policy Objects

FlexConfig policy objects are used in FlexConfig policies. They allow you to configure device features that are not otherwise supported by Security Manager, or to otherwise fine-tune your device configurations. These policy objects include device configuration commands, variables, and optionally, scripting language instructions to control processing. FlexConfig objects are essentially programming routines to add content to the device configurations that Security Manager generates.

You can create FlexConfig policy objects from scratch or you can duplicate one of the objects that are included with Security Manager.

FlexConfig policies are simply an ordered list of FlexConfig policy objects. Your objects are processed in the order that you specify.

The following topics help you understand FlexConfig policy objects and by extension, FlexConfig policies. For more information about policy objects in general, see Managing Policy Objects, on page 229.

Using CLI Commands in FlexConfig Policy Objects

The configuration commands that you enter into the FlexConfig Editor are actual CLI commands used to configure devices, such as PIX Firewalls and Cisco IOS Routers. You can include CLI commands that are not supported in Security Manager. You are responsible for knowing and implementing the command according to the proper syntax for the device type. See the command reference for the particular operating system for more information.

When you create a Flexconfig policy object, you determine whether the commands and instructions should be added to the beginning or end of the configuration that is generated from regular Security Manager policies:

- Prepended objects—FlexConfig objects that are processed at the beginning of the configurations. If Security Manager policies configure any of the same commands included in the object, the prepended commands are replaced when configuration files are deployed.
- Appended objects—FlexConfig objects that are processed at the end of the configurations, after all other commands in the configuration file and before the **write mem** command.

If the appended commands are already configured on the device, the device generates an error when you try to add them again. To resolve this, two workarounds are available:

- Enter the command that removes the configuration in question as an appended command. For example, if the command is **xyz**, enter the following two lines:

```
no xyz
xyz
```

- Change the setting that controls the action that the device will take to “warn.” This is set under **Tools > Security Administration > Deployment**.

The setting change will affect the behavior of devices for all commands being deployed, not just those designated as appended commands.

Note If you are deploying to a device, you should remove most appended commands after the initial deployment. This is especially true for object groups, where any unbound object group is replaced in the Ending Command section during command generation, then re-sent each time the configuration is deployed to a device. The device displays an error because the firewall device shows that the object group already exists. If you are deploying to a file or AUS, the appended commands should remain.

Using Scripting Language Instructions

You can use scripting language instructions in a FlexConfig policy object to control how the commands in the object are processed. Scripting language instructions are a subset of commands supported in the Velocity Template Engine, a Java-based scripting language that supports looping, if/else statements, and variables.

Security Manager supports all Velocity Template Engine commands except the **include** and **parse** commands. For information about additional supported commands supported, see the Velocity Template Engine documentation.

The following topics provide examples of the most commonly used functions:

- Scripting Language Example 1: Looping , on page 343
- Scripting Language Example 2: Looping with Two-Dimensional Arrays , on page 344
- Example 3: Looping with If/Else Statements , on page 344

Scripting Language Example 1: Looping

A plain old telephone service (POTS) dial peer enables incoming calls to be received by a telephony device by associating a telephone number to a voice port. The following example enables caller ID for a set of POTS dial peers.

Object Body

```
#foreach ($peer_id in ["2", "3", "4"])
    dial-peer voice $peer_id pots
    caller-id
#end
```

CLI Output

```
dial-peer voice 2 pots
caller-id
dial-peer voice 3 pots
```

```
caller-id
dial-peer voice 4 pots
caller-id
```

Scripting Language Example 2: Looping with Two-Dimensional Arrays

In this example, a set of phone numbers is associated to voice ports so that incoming calls can be received at a router.

Object Body

```
#foreach ($phone in [ [ "2000", "15105552000", "1/0/0" ], [ "2100",
"15105552100", "1/0/1" ], [ "2200", "15105552200", "1/0/2" ] ] )
    dial-peer voice $phone.get(0) pots
 destination-pattern $phone.get(1)
 port $phone.get(2)
#end
```

CLI Output

```
dial-peer voice 2000 pots
destination-pattern 15105552000
port 1/0/0
dial-peer voice 2100 pots
destination-pattern 15105552100
port 1/0/1
dial-peer voice 2200 pots
destination-pattern 15105552200
port 1/0/2
```

Example 3: Looping with If/Else Statements

In this example, a set of phone numbers is associated to voice ports so that incoming calls can be received at a router. In addition, another set of phone numbers is associated to IP addresses to enable Voice Over IP outgoing calls from the router.

Object Body

```
#foreach ( $phone in [ [ "2000", "15105552000", "1/0/0", "" ],
[ "2100", "15105552100", "1/0/1", "" ],
[ "2200", "15105552200", "", "ipv4:150.50.55.55"]
[ "2300", "15105552300", "", "ipv4:150.50.55.55"] ] )
    dial-peer voice $phone.get(0) pots
     destination-pattern $phone.get(1)
 #if ( $phone.get(2) == "" )
     session target $phone.get(3)
 #else
     port $phone.get(2)
 #end

#end
```

CLI Output

```
dial-peer voice 2000 pots
    destination-pattern 15105552000
```

```
 port 1/0/0

dial-peer voice 2100 pots
    destination-pattern 15105552100
 port 1/0/1

dial-peer voice 2200 pots
    destination-pattern 15105552000
 session target ipv4:150.50.55.55

dial-peer voice 2300 pots
    destination-pattern 15105552300
 session target ipv4:150.50.55.55
```

Understanding FlexConfig Object Variables

Variables in FlexConfig policy objects start with the $ character. For example, in the following line, $inside is a variable:

```
interface $inside
```

There are three types of variables you can use in a FlexConfig policy object:

- Policy object variables—Static variables that reference a specific property. For example, Text objects are a type of policy object variable. They are a name and value pair, and the value can be a single string, a list of strings, or a table of strings. Their flexibility allows you to enter any type of textual data to be referenced and acted upon by any policy object.

There are three ways to add policy object variables to a FlexConfig policy object. First, move the cursor to the desired location, and then:

- Right-click and select **Create Text Object**. This command opens a dialog box where you can create a simple single-value text object and assign it a value. When you click OK, the variable is added to the object, and it is added to the list of defined Text objects in the Policy Object Manager window so that you can use it in other objects or edit its definition. For an example of creating simple text variables, see Example of FlexConfig Policy Object Variables , on page 346.
- Right-click and select a policy object type from the **Insert Policy Object** sub-menu. These commands open a selector dialog box where you can select the specific policy object that contains the variable that you want to insert. After selecting the policy object, you are presented with the Property Selector dialog box, where you choose the specific property of the object that you want to use and optionally change the name of the variable associated with the property.

By using this technique, you can add a property from an existing policy object when you know that the property has the value that you want to use. For example, if you want to insert a variable that specifies the RADIUS protocol from the AAA Server Group policy object named RADIUS, you would right-click, select **Insert Policy Object > AAA Server Group**, select RADIUS in the AAA Server Group Selector dialog box, click OK, and then select Protocol in the Object Property field on the AAA Server Group Property Selector dialog box and click OK. The $protocol variable is inserted at the cursor, and the value for the property as defined in the selected object is added to the variables list.

- Type in a variable name. If you type in a variable, you cannot assign it a value until you click OK on the Add or Edit FlexConfig dialog box. You will be prompted that a variable is undefined, and given the opportunity to define its value. In the FlexConfig Undefined Variable dialog box, you can select the object type of the policy object that contains the desired value, which will prompt you to select the specific

policy object and variable. This is essentially identical to the process for inserting policy object variables described above. The technique you use is a matter of personal preference; the end result is the same.

- System variables—Dynamic variables that reference a value during deployment when the configuration is generated. The values are obtained from either the target device or policies configured for the target device. You can declare system variables to be optional in FlexConfig policy objects, which means that the variables do not need to be assigned a value for it to be deployed to the device.

To insert a system variable into a FlexConfig policy object, move the cursor to the desired location, right-click, and select the variable from the **Insert System Variable** sub-menus. For a description of the available system variables, see FlexConfig System Variables , on page 347.

- Local Variables—Variables that are local in the looping and assignment derivatives (the **for each** and **set** statements). Local variables get their values directly from the Velocity Template Engine. There is no need to supply values for the local variables.

To insert a local variable, simply type it in. When you click OK on the Add or Edit FlexConfig dialog box, you will be asked if you want to define the undefined variable. You can click No, or if you click Yes to define other variables, you can leave the object type of the local variable as Undefined.

Example of FlexConfig Policy Object Variables

Using CLI commands and variables, you can create a FlexConfig policy object to name the inside interface and crypto map on a Cisco router:

```
interface $inside
crypto map $mapname
```

The following example shows how to create a FlexConfig policy object that adds these commands and configures the value of $inside as **serial0** and $mapname as **my_crypto**.

When you add the FlexConfig policy object to a device, and the configuration is generated, the following output is created:

```
interface serial0
crypto map my_crypto
```

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **FlexConfigs** from the table of contents. The table in the right pane lists the existing FlexConfig objects.

Step 3 Right-click in the table and select **New Object**. The Add FlexConfig dialog box appears (see Add or Edit FlexConfig Dialog Box , on page 369).

Step 4 Enter a name and optionally a description for the object.

Tip You can also enter a group name. Groups help you find FlexConfig objects if you create a lot of them. Either type in a group name, or select an existing one from the drop-down list.

Step 5 Keep **Appended** for Type so that the commands are added at the end of the device configuration.

Step 6 Create the content of the object:

a) Click in the FlexConfig edit box (the large white box) and type in **interface** followed by a space.
b) Right-click and select **Create Text Object**.
c) In the Create Text Object dialog box, enter **inside** as the name and **serial0** as the value. Click **OK** to add the variable.

d) Press Enter to move to the next line and type **crypto map** followed by a space.
e) Right-click and select **Create Text Object**.
f) In the Create Text Object dialog box, enter **mapname** as the name and **my_crypto** as the value. Click **OK** to add the variable.

Step 7 Click the **Validate FlexConfig** icon button above the edit box to check the integrity and deployability of the object. If any errors are identified, fix them.

Step 8 Click **OK** to save the policy object. You can now add the object to a device's local or shared FlexConfig policy.

FlexConfig System Variables

System variables reference values during deployment when commands are generated. Security Manager provides a set of defined system variables for you to use in defining FlexConfig policy objects. The values come from the policies you create for the target devices. The values for these variables are required unless otherwise noted. For information about these variables, see the following tables:

- Device system variables—Table 81: Device System Variables (Applying to All Device Types) , on page 347. For more information about discovering or configuring devices to obtain values for these variables, see Managing the Device Inventory, on page 71.
- Firewall system variables—Table 82: Firewall System Variables , on page 349. For more information about firewall policies, see Managing Firewall Devices, on page 1803 and Introduction to Firewall Services, on page 597.
- Router platform system variables—Table 83: Router Platform System Variables , on page 353. For more information about router policies, see Managing Routers, on page 2303.
- VPN system variables—Table 84: VPN System Variables , on page 354. For more information about VPN policies, seeManaging Site-to-Site VPNs: The Basics, on page 1073.
- Remote access system variables—Table 85: Remote Access System Variables , on page 359. For more information about remote access policies, see Managing Remote Access VPNs: The Basics, on page 1287.

Table 81: Device System Variables (Applying to All Device Types)

Name	Dimension	Description
SYS_DEVICE_IDENTITY	0	Unique device identity for devices managed by a Configuration Engine or Auto Update Server (AUS) as defined on the Tools > Device Properties > General tab. There must be a device identity for devices managed by these servers.
SYS_DOMAIN_NAME	0	DNS domain name as defined on the Tools > Device Properties > General tab. This is not necessarily the same value that is defined in the Platform > Device Admin > Hostname policy.
SYS_FW_OS_MODE	0	Operating system mode of the FWSM or ASA device as defined on the Tools > Device Properties > General tab. Possible values are ROUTER (routed mode), TRANSPARENT, or NOT_APPLICABLE.

Name	Dimension	Description
SYS_FW_OS_MULTI	0	Whether the FWSM or ASA is running in single- or multiple-context mode as defined on the Tools > Device Properties > General tab. Possible values are SINGLE, MULTI, or NOT_APPLICABLE.
SYS_HOSTNAME	0	Device hostname as defined on the Tools > Device Properties > General tab. This is not necessarily the same value that is defined in the Platform > Device Admin > Hostname policy.
SYS_IMAGE_NAME	0	Device image name as defined on the Tools > Device Properties > General tab.
SYS_INTERFACE_IP_LIST	1	IP addresses and masks of the interfaces configured in the Interfaces policy. The IP address and mask are in the x.x.x.x/nn format (for example, 10.20.1.2/24). If there are no interfaces defined on the device, no list is returned. Each element in SYS_INTERFACE_NAME_LIST and SYS_INTERFACE_IP_LIST share the same index for the interface. For example, if element 3 in SYS_INTERFACE_NAME_LIST is for Ethernet1, element 3 in SYS_INTERFACE_IP_LIST is the IP address for Ethernet1. If Ethernet1 has no IP address, element 3 in the SYS_INTERFACE_IP_LIST is empty. This variable is optional.
SYS_INTERFACE_NAME_LIST	1	Names of the interfaces on the device configured in the Interfaces policy. If no interfaces are defined on the device, no list is returned. See the explanation above for SYS_INTERFACE_IP_LIST for additional information. This variable is optional.
SYS_MANAGEMENT_IP	0	Management IP address of the device as defined on the Tools > Device Properties > General tab.
SYS_MDF_TYPE	0	Cisco MDF (MetaData Framework) device type, which indicates the device model. This value is displayed on the Tools > Device Properties > General tab, and is determined when you add the device to Security Manager.
SYS_OS_RUNNING_VERSION	0	Software version of the operating system running on the device as displayed on the Tools > Device Properties > General tab. For example, 12.1, 12.2S, and so on, on an IOS platform. This value is determined when you discover policies from the device.
SYS_OS_TARGET_VERSION	0	Operating system version to be used when generating the device configuration as defined on the Tools > Device Properties > General tab.

Name	Dimension	Description
SYS_OS_TYPE	0	Operating system for the device as defined on the Tools > Device Properties > General tab. Possible values are IOS, PIX, ASA, FWSM, IPS. You configure this value when you add the device to Security Manager.
SYS_SYS_OID	0	System object ID (SysObjId) of the device, which is determined when you add the device to Security Manager.

Table 82: Firewall System Variables

Name	Dimension	Description
SYS_FPM_INPUT_SP	1	FPM policy map names applied on the interface corresponding to the entry in the SYS_FPM_INTERFACE list in the “in” direction. This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FPM_INTERFACE	1	Interface names. This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FPM_OUTPUT_SP	1	FPM policy map names applied on the interface corresponding to the entry in the SYS_FPM_INTERFACE list in the “out” direction. This data is not configured in Security Manager. It is obtained from a router’s running configuration and is used by the IOS_FPM FlexConfig.
SYS_FW_ACL_IN_NAME	1	Names of ACLs applied to interfaces for traffic filtering in the inbound direction. Each element has a one-to-one correspondence with the SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers, PIX Firewalls, Firewall Service Modules, and ASA devices. Configure firewall access rules to generate values for this variable.
SYS_FW_ACL_OUT_NAME	1	Names of ACLs applied to interfaces for traffic filtering in the outbound direction. Each element of this array has a one-to-one correspondence with SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers, PIX Firewalls, Firewall Service Modules, and ASA devices. Configure Access Rules policies to generate values for this variable.

Name	Dimension	Description
SYS_FW_BRIDGE_INTERFACE_NAMES	1	Names of bridge interfaces. This variable applies only to IOS transparent firewalls. Configure the Firewall > Transparent Rules policies to generate values for this variable.
SYS_FW_ETHERTYPERULE_ ACL_NAMES	1	Names of ethertype access-lists applied to interfaces for traffic filtering coming in or going out. Each element of this array has a one-to-one correspondence with the elements in the SYS_FW_ETHERTYPERULE_INTERFACE_NAMES and SYS_FW_ETHERTYPERULE_DIRECTION_NAMES variables. Configure Firewall > Transparent Rules policies to generate values for this variable.
SYS_FW_ETHERTYPERULE_ DIRECTION_NAMES	1	Direction that ethertype access-lists are applied. The value is either “in” or “out.” Each element has a one-to-one correspondence with the elements in the SYS_FW_ETHERTYPERULE_ACL_NAMES and SYS_FW_ETHERTYPERULE_INTERFACE_NAMES variables. Configure Firewall > Transparent Rules policies to generate values for this variable.
SYS_FW_ETHERTYPERULE_ INTERFACE_NAMES	1	Interface names to which ethertype access-lists are applied. Each element has a one-to-one correspondence with the SYS_FW_ETHERTYPERULE_ACL_NAMES and SYS_FW_ETHERTYPERULE_DIRECTION_NAMES variables. Configure Firewall > Transparent Rules policies to generate values for this variable.
SYS_FW_INSPECT_IN_NAME	1	Names of Inspect Rules applied to Cisco IOS router interfaces in the inbound direction. Each element of this array has a one-to-one correspondence with the SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers. Configure Inspection Rules policies to generate values for this variable. This variable is optional.

Name	Dimension	Description
SYS_FW_INSPECT_OUT_NAME	1	Names of Inspect rules applied to Cisco IOS router interfaces in the outbound direction. Each element of this array has a one-to-one correspondence with the SYS_INTERFACE_NAME_LIST variable for Cisco IOS routers. Configure Inspection Rules policies as values for this variable. This variable is optional.
SYS_FW_INTERFACE_HARDWARE_ ID_ LIST	1	Hardware IDs for the device. Configure Interface policies on the device to generate values for this variable. This variable is optional.
SYS_FW_INTERFACE_NETWORK_LIST	1	Interface networks on the device. Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_SECURITY_ LEVEL_LIST	1	Interface security levels on the device. Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_STATE_LIST	1	Interface states on the device. Configure Interface policies on the device to generate values for this variable.
SYS_FW_INTERFACE_VLAN_ID_LIST	0	VLAN IDs on the device. Configure Interface policies on the device to generate values for this variable.
SYS_FW_IPV6_ACL_IN_NAME	1	A list of all IPv6 ACLs in the In direction on the device. Configure IPv6 Access Rules policies in the In direction on the device to generate values for this variable.
SYS_FW_IPV6_ACL_OUT_NAME	1	A list of all IPv6 ACLs in the Out direction on the device. Configure IPv6 Access Rules policies in the Out direction on the device to generate values for this variable.

Name	Dimension	Description
SYS_FW_MPCRULE_TRAFFICFLOW_TUNNELGROUPNAME	1	Names of tunnel groups specified in Traffic Flow objects. Traffic Flow objects configure **class-map** commands on PIX/ASA devices, and the names of the tunnel groups listed in Traffic Flow objects populate this variable. This variable is used by the ASA_define_traffic_flow_tunnel_group FlexConfig object to create tunnel groups on PIX/ASA devices. This variable is optional.
SYS_FW_MULTICAST_PIM_ACCEPT_REG_ROUTEMAP	0	Route-map name used in the **pim accept-register route-map** command. Enter a name for the route-map (Platform > Multicast > PIM > Request Filter), then configure its features using FlexConfig to generate values for this variable. This variable is optional.
SYS_FW_NAT0_ACL_NAMES	1	Names of ACLs used in the **nat** *interface_name* **0 access-list acl_name** command. This variable is optional.
SYS_FW_OSPF_PROCESS_ID_LIST	1	IDs for OSPF routing processes globally configured on PIX Firewalls, Firewall Service Modules, and ASA devices. Configure Platform > Routing > OSPF policies to generate values for this variable.
SYS_FW_OSPF_REDISTRIBUTION_ROUTE_MAP_LIST	1	Names for the route maps to apply to the OSPF redistribute commands configured on PIX Firewalls, Firewall Service Modules, and ASA devices. Configure Platform > Routing > OSPF policies to generate values for this variable.
SYS_FW_POLICY_NAT_ACL_NAMES	1	Names of ACLs used in the **policy nat** commands (nat commands with non-0 pool id). Configure NAT (NAT > Translation Rules > Policy NAT) to generate values for this variable. This variable applies to only PIX 6.3(3) and later, PIX/ASA 7.x, 8.0(x), 8.1(x), and 8.2(x), and FWSM devices. This variable does not apply to Cisco IOS routers. This variable is optional.

Name	Dimension	Description
SYS_FW_POLICY_STATIC_ ACL_NAMES	1	Names of ACLs used in the **policy static** commands that include access lists. Configure NAT 0 (NAT > Translation Rules > Policy NAT) to generate values for this variable. The variable contains the access-list names used by the **nat-0**, **policy nat**, and **policy static** commands. This variable applies to only PIX 6.3(3) and later, PIX/ASA 7.x, 8.0(x), 8.1(x), and 8.2(x), and FWSM devices. This variable does not apply to Cisco IOS routers. This variable is optional.

Table 83: Router Platform System Variables

Name	Dimension	Description
SYS_ROUTER_BGP_AS_NUMBERS_LIST	1	Autonomous system (AS) number of the border gateway protocol (BGP) and exterior gateway protocol (EGP) on the device. Configure Router Platform > Routing > BGP policies to generate values for this variable. This variable is optional.
SYS_ROUTER_EIGRP_AS_ NUMBERS_LIST	1	Autonomous system (AS) numbers of the different enhanced Internet gateway routing protocols (EIGRP) and interior gateway protocols (IGP) on the device. Configure Router Platform > Routing > EIGRP policies to generate values for this variable. This variable is optional.
SYS_ROUTER_OSPF_PROCESS_ IDS_LIST	1	Open shortest path first (OSPF) interior gateway protocol (IGP) process numbers on the device. Configure Router Platform > Routing > OSPF Process policies to generate values for this variable. This variable is optional.
SYS_ROUTER_QOS_CLASS_MAP_LIST	1	Names of QoS class maps on the device. Configure Quality of Service policies to generate values for this variable. This variable is optional.

Name	Dimension	Description
SYS_ROUTER_QOS_POLICY_MAP_LIST	1	Names of the QoS policy-maps on the device. Configure Quality of Service policies to generate values for this variable. This variable is optional.

Table 84: VPN System Variables

Name	Dimension	Description
Topology Variables related to the VPN in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_TOPOLOGY	1	Virtual private network (VPN) topology type. Possible values are HUB_AND_SPOKE, POINT_TO_POINT, and FULL_MESH.
SYS_VPN_TOPOLOGY_NAME	1	Name of the VPN topology in which the device participates.
SYS_VPN_TOPOLOGY_ROLE	1	Details about the role of the device in the VPN. Possible values are PEER, HUB, and SPOKE.
Devices Variables related to devices in the VPN in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_HOST_NAME	1	Device hostname.
SYS_VPN_LOCAL_PREFIXES	2	Interface and network IP addresses of protected networks.
SYS_VPN_PRIVATE_INTERFACES	2	Private interface names.
SYS_VPN_PRIVATE_TUNNEL_ENDPT_IP	1	Interface tunnel IP address.
SYS_VPN_PUBLIC_INTERFACES	2	Public interface names.
SYS_VPN_TUNNEL_ENDPT_INTERFACE_IP	1	IP address of the VPN endpoint. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_TUNNEL_ENDPT_ INTERFACE_NAME	1	Name of the VPN endpoint. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_VPNSM_PUBLIC_IFC	2	Export port names for Catalyst 6000 series switches.

Name	Dimension	Description
Remote Peers Variables related to remote peers in which a device participates. Configure VPNs to generate values for these variables.		
SYS_VPN_REM_PEER_BAK_ LOGICAL_PRIVATE_IP	3	Interface tunnel IP addresses of remote peers of failover hubs. This value is used in DMVPN for next hop resolution protocol (NHRP).
SYS_VPN_REM_PEER_BAK_PREFIX	3	Protected networks (interface and network IP addresses) of remote peers of failover hubs.
SYS_VPN_REM_PEER_BAK_PUBLIC_IP	3	Public interface names of remote peers of failover hubs.
SYS_VPN_REM_PEER_BAK_TUNNEL_SRC	3	IP address of the VPN endpoint of remote peers. In IPSec, the endpoint is the VPN interface; in GRE, it is the tunnel source.
SYS_VPN_REM_PEER_DEVICE_NAME	2	Device hostnames of remote peers.
SYS_VPN_REM_PEER_LOGICAL_ PRIVATE_IP	2	Interface tunnel IP addresses of remote peers. This value is used in DMVPN for next hop resolution protocol (NHRP).
SYS_VPN_REM_PEER_PREFIX	3	Protected networks (interface and network IP addresses) of remote peers.
SYS_VPN_REM_PEER_PRIVATE_IP	2	Private interface names of remote peers.
SYS_VPN_REM_PEER_PUBLIC_IP	2	Public interface names of remote peers.
SYS_VPN_REM_PEER_TUNNEL_SRC	2	Tunnel sources (if included in the interface tunnel of remote peers).
IPSec Proposal Variables related to IPSec Proposal policies. For more information, see Configuring IPsec Proposals in Site-to-Site VPNs , on page 1172 and Configuring High Availability in Your VPN Topology , on page 1130. Configure the IPSec Proposal policy to generate values for these variables.		
SYS_VPN_CRYPTO_MAP_TYPE	1	Crypto map type. Possible values are STATIC and DYNAMIC.
SYS_VPN_DYNAMIC_CRYPTO_NAME	1	Dynamic crypto map name.
SYS_VPN_DYNAMIC_CRYPTO_NUM	1	Dynamic crypto map number.
SYS_VPN_STATIC_CRYPTO_NAME	1	Static crypto map name.
SYS_VPN_STATIC_CRYPTO_NAME_BAK	1	Static crypto map name of failover hubs.

Name	Dimension	Description
SYS_VPN_STATIC_CRYPTO_NUM	2	Static crypto map number.
SYS_VPN_STATIC_CRYPTO_NUM_BAK	2	Static crypto map number of failover hubs.
Preshared Keys Variables related to Preshared Key and IKE Proposal policies. For more information, see Configuring IKEv1 Preshared Key Policies , on page 1198.		
SYS_VPN_IKE_AUTHENTICATION_MODE	1	Authentication method of the IKE policy. Possible values are pre-share, rsa-sig, rsa-encr, dsa-sig. Configure an IKE Proposal policy to generate values for this variable.
SYS_VPN_IKE_PRIORITY	1	Priority number of the IKE policy Configure an IKE Proposal policy to generate values for this variable.
SYS_VPN_NEGOTIATION_MODE	1	Negotiation method. Possible values are MAIN_ADDRESS, MAIN_HOST, and AGGRESSIVE. Configure a Preshared Key policy to generate values for this variable.
GRE Modes Variables related to GRE Modes policies. For more information, see Understanding the GRE Modes Page , on page 1225.		
SYS_VPN_BAK_TUNNEL_IFC	2	Interface tunnel number of remote peers of failover hubs, for example, tunnel0. Configure VPNs to generate values for this variable.
SYS_VPN_SIGP_PROCESS_NUMBER	1	Process number of the interior gateway protocol (IGP). Configure GRE Modes policies to generate values for this variable.
SYS_VPN_SIGP_ROUTING_PROTOCOL	1	Type of secured interior gateway protocol (IGP) used. Possible values are STATIC, OSPF, EIGRP, RIPV2, BGP, and ODR. Configure GRE Modes policies to generate values for this variable.

Name	Dimension	Description
SYS_VPN_SPOKE_TO_SPOKE_ CONN	1	Whether DMVPN is configured for spoke-to-spoke connectivity. Possible values are true or false. Configure GRE Modes policies to generate values for this variable.
SYS_VPN_TUNNEL_IFC	2	Interface tunnel number of remote peers, for example, tunnel0. Configure VPNs to generate values for this variable.
VRF Variables related to virtual routing and forwarding (VRF). For more information, see Configuring VRF Aware IPsec Settings , on page 1124. Configure VPN VRF settings to generate values for these variables.		
SYS_VPN_VRF_AREA_ID	1	Area ID numbers if the OSPF process number was chosen.
SYS_VPN_VRF_MPLS_INTERFACE_IP	1	Multiprotocol label switching (MPLS) interface IP addresses.
SYS_VPN_VRF_MPLS_INTERFACE_NAME	1	Multiprotocol label switching (MPLS) interface names.
SYS_VPN_VRF_NAME	1	VRF names.
SYS_VPN_VRF_PROCESS_NUMBER	1	Interior gateway protocol (IGP) process numbers.
SYS_VPN_VRF_RD	1	RD values.
SYS_VPN_VRF_ROUTING_PROTOCOL	1	Interior gateway protocol (IGP) values. IGP is used for routing the IPSec aggregator toward the Provider Edge (PE)/Multiprotocol Label Switching (MPLS) network. Possible values are STATIC, OSPF, EIGRP, RIPV2, and BGP.
SYS_VPN_VRF_SOLUTION	1	Virtual routing and forwarding (VRF) solution. Possible values are 1BOX and 2BOX.
CA Variables related to certificate authority policies. For more information, see Configuring IKEv1 Public Key Infrastructure Policies in Site-to-Site VPNs , on page 1204.		

Name	Dimension	Description
SYS_VPN_CA_NAME	2	Certificate authority (CA) names. Configure PKI policies to generate values for this variable.
EZVPN Variables related to EZVPN. For more information, see Understanding Easy VPN , on page 1245.		
SYS_VPN_EZVPN_GROUP_NAME	2	User group names. Configure User Group policies to generate values for this variable.
Dial Backup Variables related to dial backup configurations. For more information, see Configuring Dial Backup , on page 1115.		
SYS_VPN_RTR_WATCH	1	The rtr/watch number. Configure dial backup to generate values for this variable.
GETVPN Variables related to Group Encrypted Transport (GET) VPN. For more information, see Understanding Group Encrypted Transport (GET) VPNs , on page 1261.		
SYS_GDOI_GROUP_NAME	1	Name of the Group Domain of Interpretation (GDOI) group. Configure the Group Encryption policy to generate values for this variable (Manage > Site-to-Site VPNs > Group Encryption Policy > Group Settings).
SYS_GM_GET_ENABLED_INTF_NAME	1	VPN-enabled outside interface to the provider edge (PE). Traffic originating or terminating on this interface is evaluated for encryption or decryption, as appropriate. Configure group members to generate values for this variable (Manage > Site-to-Site VPNs > Group Members).

Name	Dimension	Description
SYS_IPSEC_PROFILE_NAME	1	Name of the profile that defines the parameters to be used for IPsec encryption between two group members. Configure the Group Encryption policy to generate values for this variable (Manage > Site-to-Site VPNs > Group Encryption Policy > Security Associations).
SYS_KS_REG_INTERFACE	0	Interface on the key server assigned to handle group domain of interpretation (GDOI) registrations. If no registration interface is specified, GDOI registrations can occur on any interface. Configure key servers to generate values for this variable (Manage > Site-to-Site VPNs > Key Servers).

Table 85: Remote Access System Variables

Name	Dimension	Description
SYS_ASA_RA_TUNNEL_GROUP_NAME	2	Tunnel group name for ASA devices.
SYS_ASA_RA_USER_GROUP_NAME	2	Name of the ASA user group.
SYS_EZVPN_RA_DYNAMIC_CRYPTO_MAP_NAME	1	Dynamic Crypto map name for EZVPN.
SYS_EZVPN_RA_DYNAMIC_CRYPTO_MAP_SEQ_NUM	1	Dynamic Crypto map number for EZVPN.
SYS_EZVPN_RA_PUBLIC_INTERFACE_PIX	2	External interface names for EZVPN for PIX firewall and ASA devices only.
SYS_EZVPN_RA_STATIC_CRYPTO_MAP_NAME	1	Static crypto map names for EZVPN.
SYS_EZVPN_RA_STATIC_CRYPTO_MAP_SEQ_NUM	1	Static crypto map numbers for EZVPN.
SYS_IOS_RA_CA_NAME	1	Certificate authority (CA) names for Cisco IOS devices.
SYS_IOS_RA_PUBLIC_INTERFACE	1	External interface names for Cisco IOS devices.
SYS_IOS_RA_USER_GROUP	1	User group names for Cisco IOS devices.
SYS_IOS_RA_VRF_NAME	1	Virtual routing and forwarding (VRF) names for Cisco IOS devices.

Predefined FlexConfig Policy Objects

Security Manager provides predefined FlexConfig policy objects for you to use. These policy objects have predefined commands and scripting.

Predefined FlexConfig policy objects are read-only objects. To edit these predefined FlexConfig policy objects, duplicate the desired object, make changes to the copy, and save it with a new name. This way, the original predefined FlexConfigs remain unchanged. For lists of these predefined policy objects and further information on each, see the following tables:

- Predefined ASA FlexConfig Policy Objects—Table 88: Predefined Cisco IOS FlexConfig Policy Objects , on page 362
- Predefined Catalyst FlexConfig Policy Objects—Table 87: Predefined Catalyst 6500/7600 FlexConfig Policy Objects , on page 362
- Predefined Cisco IOS FlexConfig Policy Objects—Table 88: Predefined Cisco IOS FlexConfig Policy Objects , on page 362
- Predefined PIX Firewall FlexConfig Policy Objects—Table 89: Predefined PIX 6.3 Firewall FlexConfig Policy Objects , on page 364
- Predefined Router FlexConfig Policy Objects—Table 90: Predefined Router FlexConfig Policy Objects , on page 364

Table 86: Predefined ASA FlexConfig Policy Objects

Name	Description
ASA_add_ACEs	Adds an access control entry (ACE) to all access control lists on the device.
ASA_add_EtherType_ACL_remark	Loops through a list of ethertype access-list names and adds ACEs or remarks to them. The ethertype access list is the same as Transparent Rules for Firewalls in Security Manager. The remarks set by the CLI in this FlexConfig will be shown in the description field of a transparent rule.
ASA_add_IPv6_ACEs	Loops through a list of IPv6 access lists and adds a **deny ip any any log** entry to the end of the ACL.
ASA_command_alias	Creates a command alias named “save” for the **copy running-config** and **copy startup_config** commands.
ASA_copy_image	Copies an image package from a TFTP server to flash.
ASA_csd_image	Provides an ASA Cisco Secure Desktop image. It copies the CSD image from /CSCOpx/tftpboot/*device-hostname* on the Cisco Security Manager server to the device, then configures the CSD image path. Make sure you fill out the device’s hostname in Device Properties. If the image name is different than the default, you can override it in Device Properties > Policy Object Overrides > Text Objects > AsaCsdImageName. Unassign this FlexConfig from the device after the image has been copied and configured.

Name	Description
ASA_define_traffic_flow_tunnel _group	Defines site-to-site VPN tunnel groups listed in the SYS_FW_MPCRULE_TRAFFICFLOW_TUNNELGROUPNAME system variable. This variable is populated with tunnel group names defined in Traffic Flow objects.
ASA_established	Permits return access for outbound connections through the security appliance. This command works with an original connection that is outbound from a network and protected by the security appliance and a return connection that is inbound between the same two devices on an external host. Uses the **established** command to specify the destination port that is used for connection lookups, which gives you more control over the command and supports protocols where the destination port is known, but the source port is unknown. The **permitto** and **permitfrom** keywords define the return inbound connection.
ASA_FTP_mode_passive	Sets the FTP mode to passive.
ASA_generate_route_map	Generates a route map to be used by the **pim accept-register route-map** command configured under Platform > Multicast > PIM > Request Filter. Security Manager exports the route-map name used in the **pim** command so that you can configure it as desired.
ASA_IP_audit	Uses the **ip-audit** command to provide the following: • Sets the default actions (alarm, drop, reset) for packets that match an attack signature. • Sets the default actions (alarm, drop, reset) for packets that match an informational signature. • Creates a named audit policy that identifies the actions to take (alarm, drop, reset) when a packet matches a defined attack signature or an informational signature. • Disables a signature for an audit policy. • Assigns an audit policy to an interface.
ASA_MGCP	Identifies a specific map for defining the parameters for Media Gateway Control Protocol (MGCP) inspection.
ASA_no_router_Id	Removes the router ID for each OSPF process.
ASA_no_shut_Intf	Loops through and enables all interfaces on a device.
ASA_privilege	Sets the privilege levels for the **configuration**, **show** and **clear** commands.
ASA_route_map	Defines a route map for each OSPF process redistribution route map name.

Name	Description
ASA_RSA_KeyPair_generation	Resets and generates RSA key pairs for certificates.
ASA_svc_image	Provides an ASA SSL VPN Client image. It copies the SVC image from /CSCOpx/tftpboot/*device-hostname* on the Cisco Security Manager server to the device, then configures the SVC image path. Make sure you fill out the device's hostname in Device Properties. If the image name is different than the default, you can override it in Device Properties > Policy Object Overrides > Text Objects > AsaSvcImageName. Unassign this FlexConfig from the device after the image has been copied and configured.
ASA_sysopt	Uses the **sysopt** command to provide the following examples: • Ensures that the maximum TCP segment size does not exceed the value you set or that the minimum is not less than a specified size. • Forces each TCP connection to remain in a shortened TIME_WAIT state of at least 15 seconds after the final normal TCP close-down sequence. • Disables DNS inspection that alters the DNS A record address. • Ignores the authentication key in RADIUS accounting responses. • Enables the web browser to supply a username and password from its cache when it reauthenticates with the virtual HTTP server on the security appliance.
ASA_virtual	Configures virtual HTTP and Telnet servers.

Table 87: Predefined Catalyst 6500/7600 FlexConfig Policy Objects

Name	Description
Cat6K_ECLB_algorithm	Sets the Ether Channel load balance algorithm for modules.
Cat6K_ECLB_port_mode	Applies an Ether Channel to the Catalyst trunk ports where IPS sensors are plugged in. Make sure the ports are configure in trunk mode.
Cat6K_ECLB_portchannel	Sets the port channel to trunk mode and add trunk-allowed VLANs.
Cat6K_firewall_multiple_vlan_interfaces	Sets multiple VLAN interfaces mode if multiple SVIs need to be provisioned.

Table 88: Predefined Cisco IOS FlexConfig Policy Objects

Name	Description
IOS_add_bridge_interface_desc	Loops through a list of bridge interfaces and adds the description "this is a bridge interface."

Name	Description
IOS_CA_server	Configures a certificate authority server.
IOS_compress_config	Compresses large Cisco IOS configurations.
IOS_config_root_wireless_station	Creates and configures the root radio station for a wireless LAN on Cisco IOS routers such as the 851 and 871.
IOS_console_AAA_bypass	Provides examples of the following scenarios: • Enables the authentication, authorization, and accounting (AAA) access-control model. • Sets AAA at login. • Enables AAA authentication for logins.
IOS_Copy_Image	Copies the an SVC image from the Security Manager server to the device, then configures the SVC image path. Unassign this FlexConfig from the device after the image has been copied and configured.
IOS_enable_SSL	Enables SSL.
IOS_FPM	Copies traffic class definition files to a router and applies policy-maps.
IOS_IPS_PUBLIC_KEY	Defines public keys on an IOS IPS device. Public keys are required for Security Manager to perform signature updates.
IOS_IPS_SIGNATURE_CATEGORY	Retires all signatures except those in the ios_ips basic category.
IOS_PKI_with_AAA	Configures a PKI AAA authorization using the entire subject name.
IOS_set_clock	Sets the clock to the current time on the Security Manager server.
IOS_VOIP_advance	Loops through and associates a POTS port number to a telephone number and port or IP address number.
IOS_VOIP_simple	Associates a POTS port number to a telephone number and port number.
IOS_VPN_config_gre_tunnel	Uses VPN variables to configure the GRE tunnel for each VPN in which the device participates.
IOS_VPN_set_interface_desc	Using VPN variables, updates the description of the public interface for each VPN in which the device participates.
IOS_VPN_shutdown_inside_interface	Using VPN variables, shuts down all inside interfaces for each VPN in which the device participates.
IOS_VRF_on_vFW	Configures virtual routing and forwarding (VRF) on virtual firewall interfaces.

Table 89: Predefined PIX 6.3 Firewall FlexConfig Policy Objects

Name	Description
PIX6.3_nat0_acl_compiled	Generates a compiled access list for NAT 0 access-control lists.
PIX6.3_policy_nat_acl_compiled	Generates a compiled access list for Policy NAT ACLs
PIX6.3_policy_static_acl_compiled	Generates a compiled access list for Policy Static ACLs.
PIX_VPDN	Configures a virtual private dialup network (VPDN).

Table 90: Predefined Router FlexConfig Policy Objects

Name	Description
ROUTER_add_inspect_rules	Loops through and appends inspect rules.
ROUTER_BGP_no_auto_summary	Disables the auto route summary for each BGP process by using the **no auto-summary** sub-command. This FlexConfig policy object uses the list of border gateway protocol (BGP) numbers from the SYS_ROUTER_BGP_AS_NUMBERS_LIST system variable.
ROUTER_BGP_untrusted_info	Uses the **distance bgp 255 255 255** sub-command to make the border gateway protocol (BGP) routing information untrusted for each BGP. This FlexConfig policy object uses the list of BGP numbers from the SYS_ROUTER_BGP_AS_NUMBERS_LIST system variable.
ROUTER_EIGRP_min_cost_routes	Configures traffic to use minimum cost routes when multiple routes have different cost routes to the same destination network. This is done using multi-interface load splitting on different interfaces with equal cost paths. This FlexConfig policy object uses the list of router enhanced interior gateway routing protocol (EIGRP) numbers from the SYS_ROUTER_EIGRP_AS_NUMBERS_LIST system variable.
Router_EIGRP_no_auto_summary	Disables the auto route summary for each router enhanced interior gateway routing protocol (EIGRP) processes by using the **no auto-summary** sub-command. This FlexConfig policy object uses the list of EIGRP numbers from the SYS_ROUTER_EIGRP_AS_NUMBERS_LIST system variable.
ROUTER_interface_prevent_dos_attacks	Prevents denial-of-service (DOS) attacks on all device interfaces. This FlexConfig policy object uses the list of interface names from the SYS_INTERFACE_NAME_LIST system variable.
ROUTER_OSPF_no_router_Id	Removes the router OSPF ID for each OSPF process. This FlexConfig policy uses the list of OSPF IDs from the SYS_ROUTER_OSPF_PROCESS_IDS_LIST system variable.

Name	Description
ROUTER_QoS_Class_Map _description	Sets QoS class map descriptions. This FlexConfig policy object uses the list of router QoS class names from the SYS_ROUTER_QOS_CLASS_MAP_LIST system variable.
ROUTER_QoS_Policy_Map _description	Sets QoS policy descriptions. This FlexConfig policy object uses the list of router QoS policy names from the SYS_ROUTER_QOS_POLICY_MAP_LIST system variable.

Configuring FlexConfig Policies and Policy Objects

You create and manage FlexConfig policy objects in the same way that you create other policy objects. The following topics describe how to create FlexConfig policies and policy objects. For information on other tasks you can perform with FlexConfig policy objects (such as deleting them), see Working with Policy Objects—Basic Procedures , on page 237.

A FlexConfig Creation Scenario

This scenario takes you through the steps to set up Media Gateway Control Protocol (MGCP) for an ASA device using one of the predefined FlexConfig policy objects that are shipped with Security Manager. MGCP is used by the call agent application to control media gateways (devices that convert telephone circuit audio to data packets). Security Manager does not support MGCP configuration, but you can use a FlexConfig policy object to provide a configuration. This illustrates how FlexConfigs enable you to customize, for your network, what is not otherwise supported in Security Manager.

In this scenario, you do the following:

1. Create a policy object by duplicating an existing policy object.
2. Assign the policy object to a device.
3. Preview the configuration to verify that it is correct.
4. Share the policy object with another device.
5. Deploy the configuration to the devices.

You can use this scenario as an example to implement other features by creating copies of and modifying predefined FlexConfig policy objects or by creating your own objects.

Before You Begin

Add two ASA devices to Security Manager for this scenario.

Step 1 Duplicate the FlexConfig policy object by doing the following:

a) Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232.
b) Select **FlexConfigs** from the table of contents. The table in the right pane lists the existing FlexConfig objects.
c) Right-click ASA_MGCP FlexConfig and select **Clone Object**. The Add FlexConfig dialog box appears (see Add or Edit FlexConfig Dialog Box , on page 369).
d) Enter a name for the new FlexConfig object, for this example, MyASA_MGCP.
e) Enter a new group name and a description of the object.

Tip The group name and description are optional. We recommend you establish descriptions and groups for objects you create.

f) Click **OK**. The new FlexConfig object appears in the list.

Step 2 Duplicate and edit the $callAgentList text object.

The original ASA_MGCP FlexConfig object uses the variable $callAgentList, which is a text object. The text object is read-only and cannot be edited. Duplicating the text object enables you to edit the duplicate object to apply to your network settings.

a) Select **Text Objects** from the table of contents.
b) Right-click **callAgentList** and select **Clone Object**. The Add Text Object dialog box appears.
c) Edit the name of the text object. For this example change it to mycallAgentList.
d) Double-click the first value in column A and enter the IP address for a call agent in your network. For this example, change the value to 10.10.10.10.
e) Double-click the first value in column B and enter the port number for a call agent in your network. For this example, change the value to 105.
f) Change the IP address and port number values for another call agent. For this example, change the IP address to 20.20.20.20 and the port number to 106. Or, if you have only one call agent in your network, you could remove the second row in the table by decreasing the number in the Number of Rows field. Similarly, if you have *more* than two call agents, you can add rows by increasing the number in this field.

This concept is similar for increasing and decreasing the number of columns by increasing or decreasing the Number of Columns field.

g) Click **OK**. The new text object appears in the list of text objects.

Step 3 Edit the new FlexConfig policy object to use the new variable by doing the following:

a) Select **FlexConfigs** from the table of contents.
b) Double-click MyASA_MGCP. The Edit FlexConfig dialog box appears.
c) Edit $callAgentList to read $mycallAgentList.
d) Click **OK**.

A warning appears that reads: “The following variables are undefined: mycallAgentList Define them now?”

e) Click **Yes** to the warning.

The FlexConfig Undefined Variables dialog box appears with mycallAgentList listed in the Variable Name column.

f) From the Object Type list, select **Text Objects**. The Text Objects window appears.
g) Select **mycallAgentList** from the Available Text Objects list and click **OK**.
h) In the FlexConfig Undefined Variables window, click **OK**.

The mycallAgentList variable appears in the Variables list of the Edit FlexConfig dialog box.

i) In the Edit FlexConfig dialog box, click **OK**.
j) Close the Policy Object Manager window.

Step 4 Assign the new FlexConfig policy object to a device by doing the following:

a) From the Device view, select the device for which you want to set up MGCP.
b) Select **FlexConfigs** from the Policy selector. The FlexConfigs Policy page appears.
c) Click the **Add** button. The FlexConfigs Selector dialog box appears.
d) Select the new MyASA_MGCP FlexConfig policy object and click >> to add the policy object to the Selected FlexConfigs column.

   You can select multiple policy objects at one time by holding either the Ctrl (for multiple selections) or Shift (for multiple continuous selections) keys while selecting.

e) Click **OK**.

   The MyASA_MGCP policy object is added to the Appended FlexConfigs table, because the object is set to be appended to the configuration. You configure FlexConfig policy objects that you want added to the beginning of the configuration as prepended policy objects.

f) Click **Save**.

Step 5 Preview the commands before they are generated and sent to the device by doing the following:

a) From the FlexConfigs Policy page, select the MyASA_MGCP policy object.
b) Click **Preview**.

   The commands that are generated with this FlexConfig policy object and the values assigned to the selected device appear. Note the changed values:

   Example:

```
class-map sj_mgcp_class
  match access-list mgcp_list
  exit
mgcp-map inbound_mgcp
       call-agent 10.10.10.10 105
       call-agent 20.20.20.20 106
       gateway 10.10.10.115 101
       gateway 10.10.10.116 102
  command-queue 150
  exit
policy-map inbound_policy
  class sj_mgcp_class
    inspect mgcp inbound_mgcp
    exit
exit
service-policy inbound_policy interface outside
```

Step 6 If you have additional ASA devices that require MGCP, you can share this policy with them by doing the following:

a) Right-click **FlexConfigs** in the Policy selector and select **Share Policy**.

   The Share Policy dialog box appears.

b) Enter a name for the policy and click **OK**. For this example, enter MyShared_ASA_MGCP.

   The banner above the FlexConfigs policy now shows that the device is using a shared policy and displays the name of the policy.

c) In the FlexConfigs banner, click the link in the Assigned To field. In this example, the link should be labeled **1 Device**, which indicates that this shared policy is assigned to one device (the device you are viewing).

Clicking the link opens the Shared Policy Assignments dialog box. Using this dialog box, you can select the other devices that should use this policy in the Available Devices list, and click >> to add them to the list of devices that are assigned the policy.

d) Click **OK**. The Shared Policy Assignments dialog box closes, and the additional devices you selected are configured to use the shared policy. The link in the banner changes to indicate the number of devices that now use this policy (in this example, **2 Devices**).

Tip You can also share policies from Policy view. Select **View** > **Policy View**, select FlexConfigs in the policy type selector, select the MyShared_ASA_MGCP policy, click the Assignments tab, select the devices to which you want to assign the policy, click>>, and then **Save**.

Step 7 Submit your changes and deploy the configurations to the devices. For information about deploying configurations, see Working with Deployment and the Configuration Archive , on page 405.

Creating FlexConfig Policy Objects

You can create FlexConfig policy objects to configure features on devices that are not supported by Security Manager. For more information about FlexConfig objects, see Understanding FlexConfig Policies and Policy Objects , on page 342.

Tip You can also create FlexConfig policy objects when defining policies or objects that use this object type. For more information, see Selecting Objects for Policies , on page 230.

Before You Begin

Ensure that your commands do not conflict in any way with the VPN or firewall configuration on the devices.

Keep the following in mind:

- Security Manager does not manipulate or validate your commands; it simply deploys them to the devices.
- If there is more than one set of commands for an interface, only the last set of commands is deployed. Therefore, we recommend you not use beginning and ending commands to configure interfaces.
- When editing FlexConfig objects that involve route-maps (for example, OSPF or multicast route-maps), you must define the corresponding access control lists (ACLs) before the route-maps.This is a device requirement. If you do not define ACLs before route-maps, you will get a deployment error.

Related Topics

- A FlexConfig Creation Scenario , on page 365
- Working with Policy Objects—Basic Procedures , on page 237
- Creating Policy Objects , on page 237
- Managing Policies, on page 167

Step 1 Select **Manage > Policy Objects** to open the Policy Object Manager window (see Policy Object Manager , on page 232).

Step 2 Select **FlexConfigs** from the Policy Object Type selector.

Step 3 Right-click inside the work area and select **New Object**.

The Add FlexConfig Object dialog box appears (see Add or Edit FlexConfig Dialog Box , on page 369.

Step 4 Enter a name for the object and optionally a description. Other optional informational fields include:

- Group—Select an existing group name or type in a new one. These names can help you identify the use of an object.
- Negate For—If this FlexConfig object is designed to negate another, enter the name of the FlexConfig object whose commands are undone by this object.

Step 5 In the Type field, select whether commands in the object are to be prepended (put at the beginning) or appended (put at the end) of the configurations generated from Security Manager policies.

Step 6 In the object body area, enter the commands and instructions to produce the desired configuration file output. You can type in the following types of data:

- Scripting commands to control processing. For more information, see Using Scripting Language Instructions , on page 343.
- CLI commands that are supported by the operating system running on the devices to which you will deploy the FlexConfig policy object. For more information, see Using CLI Commands in FlexConfig Policy Objects , on page 342.
- Variables. You can insert variables using the right-click menu, which allows you to create simple single-value text variables (**Create Text Object**), select variables from existing policy objects (**Insert Policy Object**), or select system variables (**Insert System Variable**). For more information, see Understanding FlexConfig Object Variables , on page 345.

Tip If you want to remove a variable, select it in the object body and click the Cut button or press the Backspace or Delete key. When you click **OK** to save your changes, the variable is removed from the list of variables.

Step 7 Click the **Validate FlexConfig** icon button above the object body to check the integrity and deployability of the object.

Step 8 Click **OK** to save the object.

Add or Edit FlexConfig Dialog Box

Use the Add or Edit FlexConfig dialog box to create or edit FlexConfig policy objects. FlexConfig objects are small programs that allow you to add configuration commands before or after the configurations generated from Security Manager policies, so that you can extend the abilities of the product to configure your devices. You use these policy objects in FlexConfig device or shared policies.

Before creating FlexConfig policy objects, read the sections in Understanding FlexConfig Policies and Policy Objects , on page 342.

Navigation Path

Select **Manage > Policy Objects**, then select **FlexConfigs** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 91: FlexConfigs Editor Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object.
Group	The name of the group of FlexConfig objects to which this object belongs, if any. You can type in a name, or select an existing name from the list. This field is for informational purposes only, and can help you find a FlexConfig object in the FlexConfig Objects page in the Policy Object Manager.
Type	Whether the commands in the object are prepended (put at the beginning) or appended (put at the end) of configurations.
Negate For	The name of the FlexConfig object whose commands are undone in this FlexConfig object. This field is for informational purposes only and does not affect the processing of the object. For example, if FlexConfig A has the command **banner login**, and FlexConfig B has the command **no banner login**, FlexConfig B negates the configuration for FlexConfig A.
FlexConfig Object Body	
Object Body edit box	The commands and instructions to produce the desired configuration file output. You can type in the following types of data: • Scripting commands to control processing. For more information, see Using Scripting Language Instructions , on page 343. • CLI commands that are supported by the operating system running on the devices to which you will deploy the FlexConfig policy object. For more information, see Using CLI Commands in FlexConfig Policy Objects , on page 342. • Variables. You can insert variables using the right-click menu, which allows you to create simple single-value text variables (**Create Text Object**), select variables from existing policy objects (**Insert Policy Object**), or select system variables (**Insert System Variable**). For more information, see Understanding FlexConfig Object Variables , on page 345.
Undo button	Deletes the previous action.
Redo button	Performs the previously undone action.

Element	Description
Cut button	Deletes the highlighted text and copies it to the clipboard.
Copy button	Copies the highlighted text to the clipboard.
Paste button	Pastes previously cut or copied text.
Find button	Locates the specified text string in the object body.
Validate FlexConfig button	Checks the integrity and deployability of the FlexConfig object.
FlexConfig Object Variables This table lists the variables that are used in the FlexConfig object.	
Name	The name of the variable. Click the cell to edit the name, which also changes the name in the FlexConfig object body.
Default Value	The value to use when one is not provided. Click the cell to edit the value for user-defined variables. You cannot edit system-defined variables. **Note** Except for optional variables, if a default value is not provided, you must provide a value for the variable.
Object Property	The property of the object. The object property name is in the following format: *type.name* .data.*property* where • *Type* —The type of object, for example Text, Network, AAA Server, and so on. • *Name* —The name of the object. • Data—Indicates that the property of the object is data. • *Property* —The property of the data.
Dimension	The structure of the data in the variable. Possible values are: • 0—scaler (a single string) • 1—one-dimensional array (a list of strings) • 2—two-dimensional table (a table of strings)
Optional	Whether the variable is required to have a value.
Description	A description of the contents of the object. Click the cell to edit the description.

Create Text Object Dialog Box

Use the Create Text Object dialog box as a shortcut to create text objects of dimension 0, which are single-value variables, for use in FlexConfig policy objects. Enter the name of the variable and the value to assign to it.

When you click **OK**, the variable is added to the FlexConfig object at the cursor location and it is added to the list of variables for the object.

Navigation Path

In the Add or Edit FlexConfig Dialog Box , on page 369, right-click in the object body field and select **Create Text Object**.

Tip If you want to create a multiple-value text object, right-click and select **Insert Policy Object > Text Objects**, and click the **Add** button under the available objects list. For more information, see Add or Edit Text Object Dialog Box , on page 372.

Add or Edit Text Object Dialog Box

Use the Add or Edit Text Object dialog box to create, edit, duplicate, and view text objects. Create a text object if you need textual data to be referenced and acted upon by another policy object that accepts text objects.

Text objects are a type of policy object variable. They are a name and value pair, where the value can be a single string, a list of strings, or a table of strings. You can enter any type of textual data to be referenced and acted upon by FlexConfig policies. For more information about FlexConfigs, see Understanding FlexConfig Policies and Policy Objects , on page 342.

Create the variable by first selecting the dimension: a simple single-value variable (dimension 0), a list of variables (dimension 1) or a table or variables (dimension 2). After you create the desired grid by selecting the dimension and if applicable, the number of rows and columns, enter the data into each cell by first clicking in the cell.

Navigation Path

Select **Manage > Policy Objects**, then select **Text Objects** from the Object Type Selector. Right-click inside the work area and select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 92: Text Object Dialog Box

Element	Description
Name	The object name, which can be up to 128 characters. Object names are not case-sensitive. For more information, see Creating Policy Objects , on page 237.
Description	An optional description of the object (up to 1024 characters).
Dimension	The structure of the data in the variable: • 0—scalar (a single string) • 1—one-dimensional array (a list of strings) • 2—two-dimensional table (a table of strings)

Element	Description
Number of Rows	The number of data rows in the variable if the dimension is 1 or 2.
Number of Columns	The number of data columns in the variable if the dimension is 2.
[text field]	The content of the text object. Click the cell and enter the data.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

FlexConfig Undefined Variables Dialog Box

Use the FlexConfig Undefined Variables dialog box to define variables used in the FlexConfig object that have not yet been defined. You can choose from a list of policy object types or add a new policy object to use.

Each row in the table represents a single undefined variable.

Tip You do not need to define local variables, those used by the scripting language for processing control. For more information about variables, see Understanding FlexConfig Object Variables , on page 345.

Navigation Path

In the Add or Edit FlexConfig Dialog Box , on page 369, if you enter a variable name but do not define its values, when you click **OK**, Security Manager displays a warning and asks if you want to define the variables. If you click **Yes**, this dialog box is opened.

Field Reference

Table 93: FlexConfig Undefined Variables Dialog Box

Element	Description
Variable Name	The name of the undefined variable that you used in the FlexConfig object.

Element	Description
Object Type	The type of policy object that contains the value you want to assign to the variable. For local variables, use the Undefined object type. For variables you want to define, you must select the specific policy object and value within that object to assign to the selected variable. You start by selecting the type of policy object from this list. You are then prompted to select the specific policy object. When you click **OK**, you are prompted to select the specific property within that object that contains the desired value (see Property Selector Dialog Box , on page 374). When you select the value on the Property Selector dialog box and click **OK**, the value is assigned to the variable.
Object Property	The property of the object. For a detailed explanation, see Add or Edit FlexConfig Dialog Box , on page 369.
Optional	Whether the variable is required to have a value.

Property Selector Dialog Box

Use the Property Selector dialog box to select the specific property within a selected policy object that you want to assign to a variable within a FlexConfig policy object. The title of the dialog box indicates the type of policy object that you selected (for example, AAA Server Groups Property Selector).

For more information on variables, see Understanding FlexConfig Object Variables , on page 345.

Navigation Path

- In the Add or Edit FlexConfig Dialog Box , on page 369, right-click and select a specific policy object group type from the **Insert Policy Object** menu, select a specific policy object when prompted, and click **OK**.
- In the FlexConfig Undefined Variables Dialog Box , on page 373, select a policy object type from the Object Type field, select a specific policy object when prompted, and click **OK**.

Field Reference

Table 94: Property Selector Dialog Box

Element	Description
Object Property	The property of the object that contains the value you want to assign to the variable. For specific information on the properties, see topics related to the configuration of those objects.
Name	The name of variable. This field is not available when you are defining undefined variables.
Description	An optional description of the variable. This field is not available when you are defining undefined variables.

Editing FlexConfig Policies

You can assign FlexConfig policies to devices using either Device view or Policy view (for shared policies) by selecting **FlexConfigs** from the policy selector. You can deploy configurations containing these policies as you would deploy any configuration generated by Security Manager. For a scenario that takes you through setting up a FlexConfig policy object and creating a shared FlexConfig policy, see A FlexConfig Creation Scenario , on page 365.

Note With "Deploy only new or modified Flexconfigs" setting on **Tools > Security Manager Administration > Deployment page** enabled, if you have an activity open, with changes, and when you attempt to deploy FlexConfigs, Cisco Security Manager considers the FlexConfig changes specific to that activity alone and not those of other activities. On the other hand, if all activities are submitted and no activity is open, then Security Manager considers the FlexConfig changes specific to the lastly submitted activity that was submitted with changes. Therefore, if you need FlexConfig changes for an activity to reflect during deployment, then ensure the changes are done in a single activity, submitted, and deployed.

When you edit a FlexConfig policy, you can perform the following actions:

- **Add FlexConfig objects**—To add a FlexConfig object to a policy, click the Add icon button and select the desired object. You can also create new objects from the object selector dialog box. The objects are added to the prepended or appended list depending on how the objects themselves are defined.
- **Remove FlexConfig objects**—If you no longer want to include an object in the policy, select it and click the Remove icon button. This action removes the object from the policy, but it does not delete the object from Security Manager. For information on deleting objects, see Deleting Objects , on page 245.
- **Change the order of the objects**—Objects are processed in the order you specify. If an object depends on the processing of another object, it is important that you order them correctly. Select the object whose order you want to change and click the Up or Down arrow buttons until the object is in the desired location.

When changing the order of FlexConfig objects that involve route-maps (for example, OSPF or multicast route-maps), make sure that the corresponding access control lists (ACLs) are defined before the route-maps. This is a device requirement. If you do not define ACLs before route-maps, you will get a deployment error.

- **Change the values assigned to the variables used in a policy object**—If you want to configure a variable with a different value for a particular device, creating a device-level override for the object, select the object and click **Values**. In the Values Assignment dialog box, click in the Values cell to change the value. For more information, see Values Assignment Dialog Box , on page 377.
- **Preview the CLI that will be generated for a policy object**—In Device view, you can view the CLI that will be generated for a policy object by selecting the object and clicking **Preview**. This is especially useful for checking that the CLI commands generated are what you intend to implement on the device.

Note During deployment, when the FlexConfig policy objects are compiled on the Security Manager server, the correct system variable values and settings are used to generate commands. However, because the Preview function does not have access to these values the way it normally would during deployment, it might not display some CLI commands. In addition, because the Preview function generates CLI commands on the client, some macros used in FlexConfig policy objects reflect client settings instead of server settings.

FlexConfig Policy Page

Use the FlexConfig Policy page to create FlexConfig policies. FlexConfig policies contain ordered lists of FlexConfig policy objects, which are subroutines that allow you to extend the ability of Security Manager to configure your devices. For more information on FlexConfig policy objects, see Understanding FlexConfig Policies and Policy Objects , on page 342.

Navigation Path

- (Device view) Select **FlexConfigs** from the Policy selector.
- (Policy view) Select **FlexConfigs** from the Policy Type selector and select an existing policy or click the Create a Policy button to create a new one.

Related Topics

- Creating FlexConfig Policy Objects , on page 368

Field Reference

Table 95: FlexConfigs Policy Page

Element	Description
Prepended FlexConfigs	The FlexConfig policy objects that are added to the beginning of the configuration. The objects are processed in the order shown.
Appended FlexConfigs	The FlexConfig policy objects that are added to the end of the configuration. The objects are processed in the order shown.

Element	Description
Values button	Click this button to view, modify, or validate the values assigned to the variables used in the selected FlexConfig policy object using the Values Assignment Dialog Box , on page 377.
Preview button (Device view only.)	Click this button to view the CLI commands that will be generated for the selected FlexConfig policy object. In Policy view, you can preview CLI by first clicking **Values**, selecting a device in the Values Assignment dialog box, and clicking **Preview**.
Up/Down arrow buttons	Click these buttons to move the selected object up or down in the list. The objects are processed in the displayed order, so it is important that an object whose processing depends on the processing of another object comes after the object it depends on.
Add button	Click this button to add a FlexConfig policy object to the policy. The object itself defines whether it will be added to the prepended or appended list. You can create new FlexConfig objects or select existing ones.
Edit button	Click this button to edit the selected FlexConfig policy object. Your changes affect all devices that use the edited object; your changes are not local policy object overrides for the device. **Note** If you selected a predefined FlexConfig policy object packaged with Security Manager, or an object for which you do not have edit permission, you are allowed only to view the object definition.
Remove button	Click this button to remove the selected object from the policy The object is not deleted from Security Manager; it is simply removed from the FlexConfig policy.

Values Assignment Dialog Box

Use the Values Assignment dialog box to view the variables used in a FlexConfig policy object, validate the object, or preview the CLI generated from the object. For more information, see Understanding FlexConfig Object Variables , on page 345 FlexConfig Policy Page , on page 376.

Navigation Path

Select an object and click **Values** from the Add or Edit FlexConfig Dialog Box , on page 369

Field Reference

Table 96: Values Assignment Dialog Box

Element	Description
Assigned Devices (Policy view only)	The devices to which the shared FlexConfig policy has been assigned. Select the device for which you want to display variable values.
Name	The name of the variable.

Element	Description
Value	The value to use for the variable. To change the value, double-click the cell. When you change this value, Security Manager creates a device-level override for the policy object. If the policy object is configured so that its values cannot be overridden, you cannot edit the value. If there is no default value for the variable, you must provide a value unless it is an optional variable.
Default Value	The value assigned to the variable in the policy object. Double-click this cell to view the definition of the policy object that defines the variable's value.
Override	Whether you can override the value of the variable. You can edit the value of only those variables that have a checkmark in this column.
Object Property	The property of the object. For a detailed explanation, see Add or Edit FlexConfig Dialog Box , on page 369.
Dimension	The structure of the data in the variable: • 0—scalar (a single string) • 1—one-dimensional array (a list of strings) • 2—two-dimensional table (a table of strings)
Optional	Whether the variable value can be empty.
Description	A description of the variable.
Validate button	Click this button to validate the Velocity Template Language syntax and make sure that all required variables have values, that variables do not start with SYS_, and that referenced policy objects exist.
Preview button	Click this button to display the generated CLI commands for the selected FlexConfig policy object.

FlexConfig Preview Dialog Box

Use the FlexConfig Preview dialog box to view the generated CLI commands based on the variables of the selected object defined in the FlexConfig policy.

Navigation Path

To open the FlexConfig Policy Preview dialog box, do one of the following:

- In the Values Assignment Dialog Box , on page 377, click **Preview**. In Policy view, you must first select a device(Device view) Select a device and click **FlexConfig** (see FlexConfig Policy Page , on page 376). Select an object in the FlexConfig policy and click **Preview**.

Troubleshooting FlexConfigs

Problem: When adding a FlexConfig using the Cisco Security Manager client, you might receive the following error message:

```
Syntax Error: Failed to setup Velocity Engine to validate syntax.
```

This problem is due to administrator privilege rights on Microsoft Windows. In Microsoft Windows Vista and Microsoft Windows 7, Security Manager requires administrator privileges in order to use the FlexConfig feature.

Solution: To resolve this issue, launch the Security Manager client with administrator privileges in either of the following ways:

- To launch the Security Manager client with administrator privileges, right-click the **Configuration Manager** shortcut and select **Run as administrator**.
- To permanently enable administrator privileges for the Security Manager client, right-click the **Configuration Manager** shortcut and select **Properties**. On the Compatibility tab, select **Run this program as an administrator**, and then select **OK**.

Problem: When using FlexConfigs to deploy to an ASA firewall the following two commands in one job: **reload in x noconfirm**, **reload cancel**, you will receive the following error message:

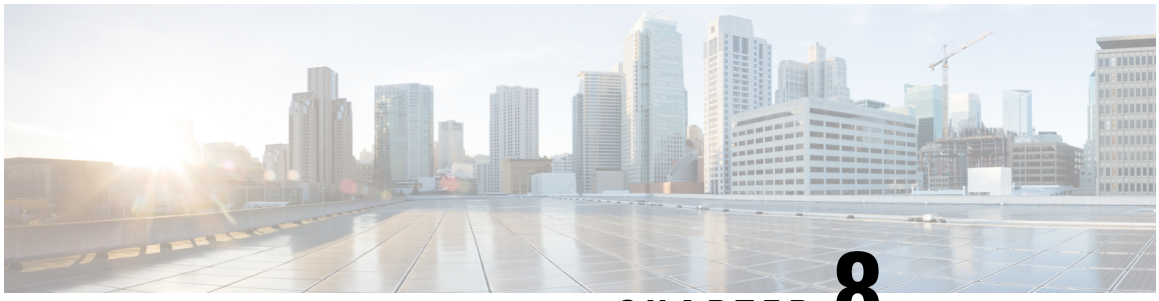
```
An error response from the device prevented successful completion of this
operation. The device provided the following description: reload cancel No
reload is scheduled
```

Unfortunately, deployment always fails due to fact that both commands are pushed too fast, such that the **reload cancel** is sent before the reload schedule is activated on the device.

Solution: To work around this problem, the commands must be sent in two separate deployments created manually.

Problem: When a FlexConfig is assigned and deployed to a device, the FlexConfig is sometimes shown in subsequent Full configuration previews even after the FlexConfig is deleted from a device.

Solution: No workaround is needed. The FlexConfig will not be included in the deployment because only the delta configuration is pushed to the device during deployment.



CHAPTER 8

Managing Deployment

The settings and policies you define in Security Manager must be deployed to your devices so that you can implement them in your network. The steps you take to deploy configurations to devices depend on whether you are using Workflow mode or non-Workflow mode. Although non-Workflow mode is the default mode of operation for Security Manager, you can use Workflow mode if your company requires it. For more information, see Workflow and Activities Overview , on page 20.

The following topics provide information about deploying configurations to devices, in each workflow mode:

Understanding Deployment

A deployment job defines how configuration changes are sent to devices. In a deployment job, you can define several parameters, such as the devices to which you want to deploy configurations and the method used to deploy configurations to devices. You can also create deployment schedules to automatically spawn deployment jobs at regular intervals.

The following topics will help you better understand and use deployment jobs:

Overview of the Deployment Process

Broadly speaking, deployment is a three-step process, as described in the following table.

Table 97: Overview of the Deployment Process

Steps	Deployment Steps
Step 1	Security Manager obtains the current configuration for the device and compares it to the latest saved policies for the device in Security Manager. What Security Manager considers to be the current configuration depends on the type of device, the deployment method, and the settings for deployment preferences. These are the possible sources and the conditions under which they are used: • Obtain the running configuration from the device. The running configuration is used when deploying to the device *unless* the deployment method is AUS, TMS, or CNS. You can force Security Manager to use Configuration Archive by selecting **When Deploying to Device Get Reference Config from: Config Archive** as the deployment preference (select **Tools > Security Manager Administration**, then select **Deployment**). • Obtain the last full configuration from the Security Manager Configuration Archive. The Configuration Archive is used when: • Deploying to file, unless you select **When Deploying to File Get Reference Config from: Device** as the deployment preference. • The deployment method is TMS or CNS. • The device is not managed by Security Manager. • Deploying to a device if uploading the configuration from the device failed. Configuration Archive is used as a backup to obtaining the configuration from the live device. • You preview configurations. • Use the factory default configuration. The factory default configuration is used with PIX or ASA devices if you use the AUS deployment method. It is used for deployment and for configuration preview.
Step 2	Security Manager builds a delta configuration that contains the commands needed to update the device configuration to make it consistent with the assigned policies. It also builds a full device configuration.

Steps	Deployment Steps
Step 3	If you are deploying to the device, Security Manager deploys either the delta configuration or the full configuration, depending on which deployment method you use. If you are deploying to file, Security Manager creates two files: *device_name* _delta.cfg for the delta configuration, and *device_name* _full.cfg for the full configuration. In both cases, the configurations are also added to Configuration Archive. These are the actions based on deployment method: • SSL (HTTPS), SSH, or Telnet—Security Manager contacts the device directly and sends the delta configuration to it. • Auto Update Server (standalone or running on Configuration Engine) for PIX and ASA devices—Security Manager sends the full configuration to Auto Update Server, where the device retrieves it. The delta configuration is not sent. • Configuration Engine for IOS devices—Security Manager sends the delta configuration to Configuration Engine, where the device retrieves it. • TMS—Security Manager sends the delta configuration to the TMS server, from which it can be downloaded to an eToken to be loaded onto the device.

During deployment, if Security Manager determines that the configuration on the device differs from the last-deployed configuration, Security Manager overwrites the changes by default. You can control this behavior using the deployment preferences; select **Tools > Security Manager Administration**, then select **Deployment**, and look for the **When Out of Band Changes Detected** setting. You can also control this for a specific deployment job by editing the deployment method for the job.

If you make changes to the device configuration outside of Security Manager, you have two choices for bringing those changes into Security Manager:

1. You can rediscover policies on the device, in which case all policies for the device become local policies, and any assignments of shared policies to the device are removed.
2. You can make the required changes in Security Manager and redeploy them to the device. During deployment, do not select the option to force an error if out-of-band changes are found on the device. This is the recommended approach.

For more information on how out-of-band changes affect deployment, see Understanding How Out-of-Band Changes are Handled , on page 392.

After configurations are deployed, you should make changes only through Security Manager for configurations that Security Manager controls. This varies based on operating system. For IPS devices, Security Manager controls the entire configuration. For IOS, ASA, PIX, and FWSM devices, you have more control over which aspects of the device configuration Security Manager controls. If you do not create policies for a feature in Security Manager, such as routing policies, Security Manager does not control those features on the device. If you do create policies for these features, Security Manager overwrites the settings on the device with the settings you defined in Security Manager. Through administration settings, you can control the types of policies that will be available for these devices, thereby preventing Security Manager from displaying or changing policies for these features. To see the available features and control whether they are available for management in Security Manager, select **Tools > Security Manager Administration**, then select **Policy Management**. Security Manager does manage VPN-related policies.

Related Topics

- Deployment Page , on page 524
- Policy Management Page , on page 577

Deployment in Non-Workflow Mode

These topics help you understand deployment in non-Workflow mode:

- Deployment in Non-Workflow Mode , on page 384
- Job States in Non-Workflow Mode , on page 385

Deployment Task Flow in Non-Workflow Mode

The deployment task flow in non-Workflow mode consists of three simple steps:

1. **Create the job:** A deployment job is created for you when you do one of the following:
   - Click the **Submit and Deploy Changes** button on the main toolbar, or select **File > Submit and Deploy**.

Note These options are not available when Ticket Management is enabled.

   - Select **File > Deploy**.
   - Select **Manage > Deployments** and click **Deploy**.

1. **Define the job:** You specify parameters, such as the devices to which you want to deploy the configurations and whether you want to deploy directly to the devices or to a file.

   During this step, you can also preview configurations and compare them to the previously deployed configurations or the configuration currently running on the device.

Note Devices selected for one job cannot be included in any other job. This measure ensures that the order in which policies are deployed is correct. However, you can include devices that are specified in deployment schedules.

2. **Deploy the job:** Deploying the job sends the generated CLI to devices, either directly or through an intermediary transport server (such as AUS, CNS, or TMS) or to output files. You select the destination (device or file) when defining a job. The transport server is specified in the device properties. For more details about defining deployment methods and transport servers, see Understanding Deployment Methods , on page 389.

Job States in Non-Workflow Mode

In non-Workflow mode, the Status column on the Deployment Manager window lists the state of each job. The following table lists and describes all possible job states in non-Workflow mode. For more details, see Deployment Manager Window , on page 395.

Table 98: Job States in Non-Workflow Mode

State	Description
Deployed	Configurations for all the devices in the job were successfully deployed to the devices or to configuration files. Devices in the job can now be included in another job.
Deploying	Configurations generated for the job are being deployed to the devices or to a directory on the Security Manager server. You can monitor the job progress in the Deployment Manager window if the Deployment Status window is not already open.
Aborted	The job was manually halted. Devices in the job can now be included in another job.
Failed	The deployment to one or more devices in the job failed. Devices in the job can now be included in another job.
Rolling Back	Security Manager is in the process of reverting to and deploying previous configurations for the devices within the deployment job. You can abort a job that is in the Rolling Back state.
Rolled Back	Security Manager has successfully reverted to and deployed previous configurations for the devices within the deployment job.

Deployment in Workflow Mode

These topics help you understand deployment in Workflow mode:

Deployment Task Flow in Workflow Mode

The following is a typical task flow in Workflow mode (see Figure 15: Deployment Task Flow in the Workflow Mode, on page 386):

1. **Create the job:** Before you deploy configurations to your devices, you must create a deployment job.
2. **Define the job:** When you create a job, you specify parameters, such as the devices to which you want to deploy the configurations, whether you want to deploy directly to the devices or to a file, and when you want the job to take place.
3. **Submit the job:** In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In this case, Workflow mode is enabled *with* a deployment job

approver, and you must submit the job to this user for review. The user reviews the job and either approves or rejects it.

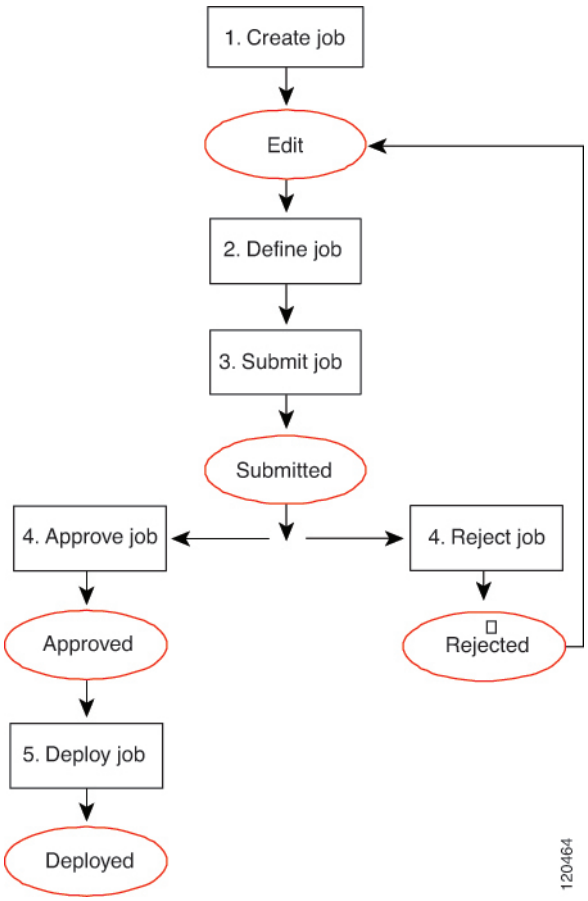
4. **Approve or reject the job:** If you are working in Workflow mode with a deployment job approver, the approver reviews it, and can then either approve or reject the job. If the job is approved, the submitter can then deploy the job. If the job is rejected, the submitter can discard the job and start over or modify the job and resubmit it.

If you are working in workflow mode without an approver, you can approve the job yourself.

- **Deploy the job:** Deploying the job sends the generated CLI to either devices, intermediary transport servers (such as AUS, CNS, or TMS), or files. You select the destination (device or file) when defining the job. The transport server is specified in the device properties. For more details about defining deployment methods and transport servers, see Understanding Deployment Methods , on page 389.

For descriptions of job states (shown in red in Figure 15: Deployment Task Flow in the Workflow Mode, on page 386), see Job States in Workflow Mode , on page 387.

Figure 15: Deployment Task Flow in the Workflow Mode



Job States in Workflow Mode

In Workflow mode, the Status column in the Deployment Manager window lists the state of each job. The following table lists and describes all possible job states. For more details about the Deployment Manager window, see Deployment Manager Window , on page 395.

Table 99: Job States in Workflow Mode

State	Description
Edit	The job was created, but it is not currently being edited. The job can be opened, approved (in auto-approval mode), or discarded while it is in the Edit state.
Edit-In Use	The job is open for editing. The job can be closed, approved, discarded, or submitted while it is in the Edit Open state.
Submitted	The job was submitted for review. It can be viewed but not edited while it is in the Submitted state. The job can be opened for viewing, discarded, rejected, or approved while it is in the Submitted state. This state occurs only when Workflow mode is enabled with deployment job approval required.
Approved	The job was approved and is ready to be deployed. The job can be deployed while it is in the Approved state.
Rejected	The job was rejected. You can open the job for editing or discard the job while it is in the Rejected state. This state occurs only when Workflow mode is enabled with deployment job approval required.
Discarded	The job was discarded. No further changes to the job are not allowed. The job remains in the Deployment table showing a Discarded state until it is purged from the system. Devices in the job can be included in another job.
Deployed	Configurations for all the devices in the job were successfully deployed to the devices or to configuration files. Devices in the job can now be included in another job.
Deploying	Configurations generated for the job are being deployed to the devices or to a directory on the Security Manager server. You can monitor the job progress in the Deployment Manager window.
Aborted	The job was manually halted. Devices in the job can now be included in another job.
Failed	The deployment to one or more devices in the job failed. Devices in the job can now be included in another job.
Scheduled to run at [date]	The job is scheduled to be deployed at the date and time specified.
Rolling Back	Security Manager is in the process of reverting to and deploying previous configurations for the devices within the deployment job. You can abort a job that is in the Rolling Back state.
Rolled Back	Security Manager has successfully reverted to and deployed previous configurations for the devices within the deployment job.

Deployment Job Approval

By default, Security Manager operates in non-Workflow mode; deployment jobs are handled behind the scenes and the user does not need to be aware of jobs or their approval. When using Workflow mode, you can choose to operate with or without a deployment job approver.

If you choose to operate without an approver, you have the permissions to define and approve jobs.

If your organization requires a different person with higher permissions to approve deployment of new or changed configurations to devices, use Workflow mode with a deployment job approver. When using Workflow mode with a deployment job approver, the job must be reviewed by a person with the appropriate permissions to approve or reject the job. This approval process helps to ensure that no inappropriate configurations reach the network devices and that deployment jobs are scheduled effectively.

Note You enable and disable deployment job approval under Tools > Security Manager Administration > Workflow. For more information, see Workflow Page , on page 590.

Deployment Jobs and Multiple Users

Only one user can define or change parameters or devices within an individual deployment job at one time. However, multiple users can work on the same deployment job in sequence: if a deployment job is closed, another user can open it and make changes to it. Multiple users can work in parallel on different deployment jobs.

Including Devices in Deployment Jobs or Schedules

When you create a deployment job or schedule, you select the devices to include in it. The inclusion of a device influences how the device can be used in other jobs or schedules. When you select a device for a specific job, it cannot be selected for any other job until the original job is deployed, rejected (in Workflow mode), discarded, or aborted. This mechanism prevents two or more people from deploying changes to the same device at the same time and ensures that policies are deployed to devices in the correct order.

However, a device can be part of a deployment schedule and still be selected for specific deployment jobs. While a deployment job is running, the device is locked. The device cannot be included in other jobs while the deployment job is running.

When you create a deployment job, Security Manager displays the devices on which policy changes were made but were not yet deployed. You can deploy to these devices, and you can select additional devices for the job. Although you can add as many devices to a deployment job as you desire (there is no limitation), as a practical matter, you should limit the number of devices per job. The deployment job might fail if you select a large number of devices or several devices that have large configuration files. If you encounter deployment failures, resubmit the job with fewer devices selected.

For VPNs, Security Manager must generate commands for devices that are affected by the policies defined for the devices you select for the job. So, if you select a device that is part of a VPN, Security Manager adds the other relevant devices to the job. For example, if you define a tunnel policy on a spoke, and you select the spoke for the job, Security Manager adds the spoke's assigned hub to the job. During job generation, Security Manager generates commands for both peers so that the VPN configuration is complete and the tunnel can be established. If you deselect one of the devices associated with the VPN, Security Manager warns that removing the device might result in the VPN not functioning property.

Understanding Deployment Methods

Security Manager lets you deploy configurations to devices using three main methods: deploying directly to the device, deploying to a configuration file (which you must then manually apply to the device), and deploying to an intermediate server (which is treated like deploying directly to the device). The system default deployment method is to deploy directly to the device.

When you add devices to Security Manager, you select the deployment method to be used by that device. This determines the method used for deploying to the device (instead of a file). When you create a deployment job, an additional deployment method default applies to the job as a whole, which determines whether deployment creates configuration files or whether it sends the configuration to the device using the method selected for the device. You control this default in the administration settings (select **Tools > Security Manager Administration**, then select **Deployment**; see Deployment Page , on page 524). When you create a deployment job, you can also change whether the deployment is to a file or to the device for each device by clicking **Edit Deploy Method** in the Create Job window. If you are using non-Workflow mode, see Deploying Configurations in Non-Workflow Mode , on page 408. If you are using Workflow mode, see Creating and Editing Deployment Jobs , on page 415.

The method you choose to use depends on the processes and procedures of your organization and the transport protocols supported by a particular type of device. If you are using Configuration Engine (CNS) or Auto Update Server (AUS), use those deployment methods. You must use one of these for devices that use dynamic IP addresses. Otherwise, for devices with static IP addresses, use SSL (HTTPS) for IOS, PIX, ASA, IPS, and standalone FWSM devices, and SSH for FWSM through the Catalyst chassis. If you are using a Token Management Server (TMS) for some devices, you can also use that method with Security Manager.

The following topics describe the deployment methods in more detail:

- Deploying Directly to a Device , on page 389
- Deploying to a Device through an Intermediate Server , on page 390
- Deploying to a File , on page 391
- Understanding How Out-of-Band Changes are Handled , on page 392

Deploying Directly to a Device

If you choose to deploy directly to a device, Security Manager uses the transport protocol defined in the device properties for the device (right click the device, select **Device Properties**, and click **General**). The protocol is typically the default protocol defined in the Device Communication page in the Security Manager Administration settings (see Device Communication Page , on page 532). Table 100: Default Deployment Transport Protocols , on page 390 lists some of the default transport protocol settings.

When you select Device as the deployment method, deployment is affected if you configure a transport server for the device, such as an AUS or Configuration Engine. When using an intermediate transport server, configuration deployment goes through the server. For more information on using an intermediate server, see Deploying to a Device through an Intermediate Server , on page 390.

Deployment can also be affected if you made out-of-band changes to the device since the last deployment. For more information, see Understanding How Out-of-Band Changes are Handled , on page 392.

During deployment, Security Manager sends only the changes made since the last deployment to the device.

Caution You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

Table 100: Default Deployment Transport Protocols

Device Type	Transport Protocol	Description
ASA, IOS 12.3 and later routers, FWSM, PIX Firewall, IPS sensors	SSL (HTTPS) (Default)	Security Manager deploys the configuration to the device using the Secure Socket Layer (SSL) protocol, otherwise known as HTTPS. With this protocol, Security Manager encrypts the configuration file and sends it to the device.
Catalyst 6500/7600 and other Catalyst switches	SSH	Security Manager deploys the configuration to the device using a Secure Shell (SSH). This provides strong authentication and secure communications over insecure channels. Security Manager supports both SSHv1.5 and SSHv2. Once connected to the device, Security Manager determines which version to use and downloads using that version.
IOS 12.2 and 12.1 routers	Telnet	Security Manager deploys the configuration to the device using the Telnet protocol.

Deploying to a Device through an Intermediate Server

Deploying configurations through an intermediate server, such as an Auto Update Server (AUS), Cisco Networking Services (CNS) Configuration Engine, or Token Management Server (TMS), is a version of deploying directly to device. When selecting the deployment method, select Device. Security Manager sends the configuration updates to the intermediate server, where the device retrieves it (for AUS and CNS), or where you can download it to an eToken (for TMS).

You must use an intermediate server if you are using dynamic IP addresses for your device interfaces (that is, the IP addresses are provided by a DHCP server). You can also use them with static IP addresses. However, you cannot use Configuration Engine to manage IOS devices with dynamic IP addresses if you configure features that use interactive CLI commands. The following features are affected:

- Certificate Enrollment:
  - **crypto pki trustpoint**
  - **crypto isakmp client configuration group**
  - **crypto key generate rsa**

- IPS signature configuration (**ip ips signature-category**)
- IP Authproxy Banner (**ip auth-proxy-banner**)
- Catalyst device interface switchport (**interface switchport**)

Security Manager uses an intermediate server if you have configured the device to use one. The following topics describe the required configuration steps when using an intermediate server:

- Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422
- Deploying Configurations to a Token Management Server , on page 423

Deployment can be affected if you made out-of-band changes to the device since the last deployment. For more information, see Understanding How Out-of-Band Changes are Handled , on page 392.

During deployment, Security Manager sends configuration changes based on the type of server:

- Auto Update Server (standalone or running on Configuration Engine) for PIX and ASA devices—Security Manager sends the full configuration to Auto Update Server, where the device retrieves it. The delta configuration is not sent.
- Configuration Engine for IOS devices—Security Manager sends the delta configuration to Configuration Engine, where the device retrieves it.
- TMS—Security Manager sends the delta configuration to the TMS server, from which it can be downloaded to an eToken to be loaded onto the device.

Deploying to a File

If you choose to deploy configurations to configuration files, Security Manager creates two files: *device_name* _delta.cfg for the delta configuration, and *device_name* _full.cfg for the full configuration. If the files are created by a job that was generated from a deployment schedule, the name includes a time stamp. Configuration files are in TFTP format so that you can upload them to your devices using TFTP.

Tip You cannot deploy configurations to file for IPS devices.

If you deploy to file, you are responsible for transferring the configurations to your devices. Security Manager assumes that you have done this, so the next time you deploy to the same devices, the generated incremental commands are based on the configurations from the previous deployment. If for some reason the last change was not applied to the device, the new delta configuration will not bring the device configuration up to the one reflected in Security Manager.

Caution Although Security Manager in one sense assumes that you applied the delta configuration, in another sense, it assumes that it cannot know if the delta was deployed. Thus, Security Manager maintains an internal view of the configuration based on the last deployment made directly to the device. So, when you apply the delta, those delta changes will be considered out-of-band changes. On next deployment to the device, your out-of-band change setting might cancel the deployment. If you mix deployments to file with deployments to device, you should rediscover policies after applying file deployments to the device. For more information, see Understanding How Out-of-Band Changes are Handled , on page 392.

To set a default directory for file deployments, select **Tools > Security Manager Administration**, then select **Deployment** (see Deployment Page , on page 524). If you select File for the default deployment method, you also select the default directory. When you create a deployment job, you can change this directory for that job.

Deploying configurations to a file is useful when the devices are not yet in place in your network (known as green field deployment), if you have your own mechanisms in place to transfer configurations to your devices, or if you want to delay deployment. When deploying to a file, the deployment job might fail if you select a large number of devices or several devices that have large configuration files. If you encounter deployment failures, resubmit the job with fewer devices selected.

Tip Do not use commands that require interaction with the device during deployment when deploying to file. We recommend previewing your configuration before deployment to make sure there are no such commands in the file. For more information, see Previewing Configurations , on page 424.

Understanding How Out-of-Band Changes are Handled

Security Manager considers an out-of-band change to be any change made to a device manually or outside of Security Manager control, for example, by logging into the device directly and entering configuration commands through the CLI. Paradoxically, this includes the application of delta changes that Security Manager creates when you deploy configurations to file rather than to the device.

If you are deploying to the device (rather than to file), and the deploy to device method is configured to compare the new configuration to the current configuration on the device, you can specify how to handle out-of-band changes when they are detected using the **Out of Band Change Behavior** setting. The setting does not apply when deploying to file.

This setting is ignored if you are comparing the new device configuration with the latest version stored in the Security Manager Configuration Archive. The default way to handle out-of-band changes, is set in Tools > Security Manager Administration > Deployment; for more information see Deployment Page , on page 524. Look for the **Deploy to Device Reference Configuration** and **When Out of Band Changes Detected** settings.

Your options for handling out-of-band changes are:

- **Overwrite changes and show warning**—When configurations are deployed, Security Manager uploads the device's current configuration and compares it against the configuration it has in its database. If changes were made to the device manually, Security Manager continues with the deployment and displays a warning notifying you of this action. Out-of-band changes are removed from the device.
- **Cancel deployment**—When configurations are deployed, Security Manager uploads the device's current configuration and compares it against the configuration it has in its database. If changes were made to

the device manually, Security Manager cancels the deployment and displays a warning notifying you of this action. You must either manually remove the out-of-band changes, or configure the same settings in Security Manager, before you can deploy configuration changes to the device.

- **Do not check for changes**—Security Manager does not check for changes and deploys the changes to the device. No warnings are issued, and any out-of-band changes are removed from the device configuration.

Before you deploy configurations, you might want to detect whether there are out of band changes on a device and analyze whether you want to recreate those changes in Security Manager policies, or allow Security Manager to overwrite the changes. For more information, see Detecting and Analyzing Out of Band Changes , on page 426.

- Deploying to a File , on page 391

Handling Device OS Version Mismatches

Before deploying a changed configuration file directly to a device, Security Manager normally uploads the current running configuration file from the device and checks the OS version running on the device with the OS version stored in the Security Manager database (you can configure it so that the archived configuration is used instead of the configuration from the device). Security Manager takes action depending on whether the OS versions match or differ from each other.

In some cases, Security Manager deploys the configuration and issues a warning, but in other cases, Security Manager cannot deploy the configuration. Security Manager deploys the configuration when:

- The device has a newer minor version, for example, ASA 8.1(2) instead of the 8.1(1), indicated in Security Manager.
- The device has a down-level minor version, for example, ASA 8.1(1) instead of 8.1(2).

Security Manager does not deploy the configuration when the device is running a new major version of the OS (for example, ASA 8.0 instead of the 7.2 indicated in Security Manager) or if the device is running a down-level major version (7.2 instead of 8.0).

The following table lists the possible actions Security Manager takes depending on the whether the OS versions match or differ from each other. The table uses the ASA device as an example; however, the actions apply to all supported device types.

Table 101: Deployment Action Based on OS Version Match or Mismatch

Scenario	OS Version in Security Manager Database	OS Version On Device	OS Version Used In Deployment	Action
Versions match	ASA 8.2(1)	ASA 8.2(1)	ASA 8.2(1)	Deployment proceeds with no warnings.

Scenario	OS Version in Security Manager Database	OS Version On Device	OS Version Used In Deployment	Action
Device has newer minor OS version.	ASA 8.1(1)	ASA 8.1(2)	ASA 8.1(2)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database. Security Manager generates the CLI based on the OS version running on the device.
Device has newer minor OS version, one that is not directly supported by Security Manager.	ASA 8.0(2)	ASA 8.0(4)	ASA 8.0(3)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database. Security Manager generates the CLI based on the OS version that it supports to which the running OS version is downward-compatible.
Device has a new major OS version.	ASA 7.2(4)	ASA 8.2(1)	None. Deployment fails.	Security Manager reports an error indicating that it has detected a different OS version on the device than the one in the Security Manager database. Security Manager cannot proceed until you correct this mismatch. Remove the device from the inventory, add it again, and discover the device policies.
Device has an older minor OS version.	ASA 8.1(2)	ASA 8.1(1)	ASA 8.1(1)	Security Manager warns that it has detected a different OS version on the device than the one in the Security Manager database. Security Manager generates the CLI based on the OS version running on the device.
Device has an older major OS version	ASA 8.2(1)	ASA 7.2(4)	None. Deployment fails.	Security Manager reports an error indicating that it has detected a different OS version on the device than the one in the Security Manager database. Security Manager cannot proceed until you correct this mismatch. Remove the device from the inventory, add it again, and discover the device policies.

Overview of the Deployment Manager and Configuration Archive

The Deployment Manager and Configuration Archive are the main tools that you can use to manage deployment and device configurations. The following topics provide an overview of these tools:

Understanding What You Can Do with the Deployment Manager

The Deployment Manager, where you create and manage deployment jobs and schedules, provides the following benefits:

- Previewing and comparing configurations—Before you deploy a configuration file to a device, you can preview the proposed configuration file. You can also compare the proposed configuration file to what was last imported from the device or what is currently running on the device.

After successful deployment to a device, you can view a transcript of the configuration commands downloaded and the device's responses. For more information, see Previewing Configurations , on page 424.

- Aborting deployment jobs—You can stop a deployment job even if it is currently running. However, aborting a job that is in process does not roll back the configuration on devices that have already been reconfigured, or on devices that are in the process of being reconfigured. Only devices for which deployment has not started are prevented from being reconfigured. For more information, see Aborting Deployment Jobs , on page 436.
- Rolling back to a previous configuration—If you deploy configurations to devices, and then determine that there is something wrong with the new configurations, you can revert to and deploy the previous configurations for those devices. For more information, see Rolling Back Configurations to Devices Using the Deployment Manager , on page 452.
- Viewing deployment job status—You can display information about the deployment to specific devices, including information about errors, the proposed configuration, and the transcript of the download. For more information, see Viewing Deployment Status and History for Jobs and Schedules , on page 405.
- Scheduling deployment jobs—You can create deployment schedules to spawn deployment jobs at regular intervals. In Workflow mode, you can also schedule a deployment job to start at a future time when you deploy the job. Scheduling jobs lets you plan deployments for times when traffic on devices is low. For more information, see these topics:
  - Creating or Editing Deployment Schedules , on page 436
  - Deploying a Deployment Job in Workflow Mode , on page 420
- Logging deployment job history (Workflow mode only)—You can view the history of transactions for a job. The transactions show the changes in job status initiated by various users, such as job approval, and the comments related to those status changes. For more information, see Viewing Deployment Status and History for Jobs and Schedules , on page 405.

Deployment Manager Window

Use the Deployment Manager window to manage deployment jobs and schedules. You can display a list of deployment jobs, view job details, deploy and redeploy configurations to devices, abort deployment jobs, roll

back to previous configurations on selected devices, and create schedules to automatically generate deployment jobs. You can also track changes made to deployment jobs and schedules.

Note The buttons available in the Deployment Manager depend on the Workflow mode you are using.

Navigation Path

Click the **Deployment Manager** button on the Main toolbar or select **Manage** > **Deployments**.

Field Reference

Table 102: Deployment Manager Window (Workflow Mode)

Element	Description
Deployment Jobs Tab This tab shows individual deployment jobs. Select a job in the upper pane to view its details in the tabs in the lower pane. Filter Options Beginning with 4.14, Cisco Security Manager provides filter options to search deployment jobs based on Name (deployment job name), Status, Changed By, and Device Name. After specifying the filter criteria, click Apply. The grid displays the search result. Select a job in the table to view its details in the tabs in the lower pane.	
Name	The name of the job.
Last Action	The date and time that the job or status was changed based on the time zone of the server, not the time zone of the client.
Status	The state of each job. The possible states differ based on workflow mode. For a description of the states, see the following topics: • Job States in Non-Workflow Mode , on page 385 • Job States in Workflow Mode , on page 387

Element	Description
Changed By	The name of the user who modified the job.
Description	The description of the job. Double-click the icon to see the description in a separate dialog box.
Job Type	The type of job with respect to scheduling. A **one time** job was not created from a regularly recurring job, whereas a **recurring** job was.
Create button (Workflow mode only.)	In Workflow mode, click this button to create a new job. The Create a Job dialog box opens. See Creating and Editing Deployment Jobs , on page 415.
Open button (Workflow mode only.)	In Workflow mode, click this button to open the selected job. The Edit a Job dialog box opens. See Creating and Editing Deployment Jobs , on page 415.
Close button (Workflow mode only.)	In Workflow mode, click this button to close and save all changes made while the selected job was open. You can close a job when it is in the Edit Open or the Submit Open state. Normally, you do not need to close a job, because you will typically submit, approve, deploy, or schedule the job for deployment. However, if the Security Manager server is suddenly unavailable or your login session times out, a job might be left in the Edit Open state. If this happens, you can close it manually by selecting it and clicking Close.
Submit button (Workflow mode only.)	In Workflow mode, click this button to submit the selected job for approval. You can submit a job when it is in the Edit or the Edit Open state. The Submit Deployment Job dialog box opens. See Submitting Deployment Jobs , on page 418. This button is active only if you are using Workflow mode with a deployment job approver.
Reject button (Workflow mode only.)	In Workflow mode, click this button to reject the selected job if you are not satisfied with the configurations generated for the devices. You can reject jobs only in workflow mode with a deployment job approver. After a job is rejected, it can be opened for editing or discarded. See Approving and Rejecting Deployment Jobs , on page 419. You are prompted to enter an optional comment to explain why you are rejecting the job.
Approve button (Workflow mode only.)	In Workflow mode, click this button to approve the selected job. After a job is approved, it can be deployed. See Approving and Rejecting Deployment Jobs , on page 419. You are prompted to enter an optional comment to explain why you are approving the job.

Element	Description
Discard button (Workflow mode only.)	In Workflow mode, click this button to discard the selected job. You can discard a job when it is in any state except Deployed, Deployment Failed, or Aborted. Once discarded, the job cannot be edited, submitted, approved, or deployed. The job state is shown as discarded until the job is purged from the system either automatically as set on the Workflow settings page or manually (for more information, see Workflow Page , on page 590. You are prompted to enter an optional comment to explain why you are discarding the job. See Discarding Deployment Jobs , on page 421.
Deploy button (All modes.)	Click this button to deploy generated CLI commands devices or files. The behavior of this button differs depending on Workflow mode: • (Non-Workflow mode.) Click this button to create a deployment job. If you have unsubmitted changes, you are first prompted to submit them. The Deploy Saved Changes dialog box opens, where you can select which devices to include in the job. Note that this button does not act on the deployment job selected in the table, if any; instead, it creates a new deployment job. See Deploying Configurations in Non-Workflow Mode , on page 408. • (Workflow mode.) Click this button to deploy the selected job. If the job is in the Approved state, the Deploy Job dialog box opens (see Deploying a Deployment Job in Workflow Mode , on page 420). If the job is in the deployed, failed, or aborted state then the Redeploy Job dialog box opens. See Redeploying Configurations to Devices , on page 434.
Generate Report button (All modes.)	Click this button to create a deployment status report for the selected job. You can generate the report in HTML and PDF formats. Jobs must be in deployed, failed, rolled back, or aborted state. The deployment status report includes a summary of the job plus the full and delta configurations and the job transcript. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see Generating Deployment or Discovery Status Reports, on page 508.
Refresh button (All modes.)	Click this button to reload job information from the Security Manager server. If the message *Auto Refresh is On* is displayed beneath the table, the job list is automatically refreshed periodically. **Note** The auto refresh setting is configured in the administration settings for deployment: select **Tools > Security Manager Administration > Deployment**.
Redeploy button (Non-Workflow mode only.)	In Non-Workflow mode, click this button to redeploy the selected job, which deploys the same generated CLI commands to the same devices or files selected in the original job. The Redeploy Job dialog box opens. See Redeploying Configurations to Devices , on page 434. (In Workflow mode, click the Deploy button to redeploy configurations for the selected job.)

Element	Description
Abort button (All modes.)	Click this button to abort the selected job if it is in the Deploying, Scheduled, or Rolling Back state. A warning asks you to confirm the action. See Aborting Deployment Jobs , on page 436.
Rollback button (All modes.)	Click this button to deploy the previously deployed configuration to the devices in the selected job. The Deployment Rollback dialog box opens (see Rolling Back Configurations to Devices Using the Deployment Manager , on page 452).
Summary tab	Displays summary information about the status of the selected deployment job, such as the status of the job, the name of the deployment job, the number of devices included in the job, the number of devices deployed successfully, and the number of devices deployed with errors.
Details tab	Displays detailed information for the selected job. The table lists each device included in the job, whether deployment succeeded or failed, the tickets containing changes that are part of the job for the device, and a summary of the number of warnings, errors, or failures for the device. Select a device in the table to view the results for that device: • Double-click the icon in the Config column to view the configuration (see Previewing Configurations , on page 424). If you deleted the device from the inventory, the configuration and transcript might not be available. • If you were deploying to the device, double-click the icon in the Transcripts column to view a transcript of the commands sent to the device and the device's responses. See Viewing Deployment Transcripts , on page 444. • If Ticket Management is enabled, the Last Ticket(s) column displays the ticket IDs of the tickets containing changes that are part of the deployment for the device. You can click on the Ticket IDs to view additional information about the ticket, such as Creator and Last Modified date. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586). • When you select a device, the Messages box in the lower left contains a summary of the messages generated for the deployment. Select an item to view its description to the right. You might have to enlarge the window to make the Description box visible. If applicable, there might also be information on the actions you can take to resolve the problems.
History tab (Workflow mode only.)	Displays a log of the changes that have been made to the selected job. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.
Deployment Schedules Tab Use this tab to schedule regular deployment jobs. For detailed information about this tab, see Deployment Schedules Tab, Deployment Manager , on page 400.	

Deployment Workflow Commentary Dialog Box

When you perform an action in the Deployment Manager while working in Workflow mode, you are prompted to enter a comment to describe the action. The comments are preserved in the history for the job or schedule.

The title of the dialog box indicates the action you are taking. Enter an optional comment and click **OK** to perform the action.

Navigation Path

In Workflow mode, select a job or schedule in the Deployment Manager and click the appropriate button to perform the desired action.

Deployment Schedules Tab, Deployment Manager

Use the Deployment Schedules tab on the Deployment Manager window to create regularly recurring deployment jobs. Whenever the scheduled deployment time occurs, Security Manager creates a specific deployment job based on the scheduled job.

Navigation Path

Click the **Deployment Manager** button on the Main toolbar or select **Manage** > **Deployments**, and then click the **Deployment Schedules** tab in the upper pane.

Related Topics

Field Reference

Table 103: Deployment Schedules Tab, Deployment Manager Window

Element	Description
Deployment Schedule Table This table shows deployment job schedules. Select a schedule in the table to view its details in the tabs in the lower pane. Filter Options Beginning with 4.14, Cisco Security Manager provides filter options to search deployment schedules based on Name (deployment schedule name), Status, and Device Name. After specifying the filter criteria, click Apply. The grid displays the search result. Select a schedule in the table to view its details in the tabs in the lower pane.	
Name	Name of the job schedule. Jobs created from this schedule use this name plus a time stamp.

Element	Description
Status	The status of the schedule: • Edit—In Workflow mode, the schedule is being created. You can open it and change its settings. No jobs are created from schedules that are being edited. • Active—Deployment jobs will be created according to this schedule. • Suspended—The schedule was suspended and no jobs are being created by it. You can restart the schedule by selecting it and clicking **Resume**.
Recurrence	How often deployment jobs will be created from this schedule.
Next Run	The date and time a deployment job will next be created from this schedule.
Last Run	The date and time of the most recent deployment job created from this schedule.
Schedule End	The date and time the schedule is no longer active. If the schedule has no end date, Active Indefinitely is indicated.
Description	The description of the job schedule. Double-click the icon to see the description.
Create button	Click this button to create a deployment job schedule. The Schedule dialog box opens where you can create the schedule (see Schedule Dialog Box , on page 438.
Open button	Click this button to open the selected schedule. The Schedule dialog box opens where you can view or modify the schedule (see Schedule Dialog Box , on page 438). In non-Workflow mode, modifying the schedule does not change its status. In Workflow mode, the status changes to Edit, and you must resubmit it for approval.
Close button (Workflow mode only)	Click this button to close and save all changes made while the schedule was open. You can close a schedule when it is in the Edit Open or the Submit Open state. Typically, you will have to close schedules only if the Security Manager server becomes unavailable while you have a schedule open.
Submit button (Workflow mode only)	Click this button to submit the selected schedule for approval if you are operating in Workflow mode with an approver. You can submit a schedule when it is in the Edit or the Edit Open state. You are prompted for an optional comment to explain the submission, and an e-mail is generated to the approver in Workflow mode.
Reject button (Workflow mode only)	Click this button to reject the selected schedule. You are prompted for an optional comment to explain the rejection, and an e-mail is generated to the approver and submitter in Workflow mode.
Approve button (Workflow mode only)	Click this button to approve the selected schedule. You are prompted for an optional comment to explain the approval, and an e-mail is generated to the approver and submitter in Workflow mode.

Element	Description
Discard button	Click this button to discard the selected schedule. You can discard a schedule unless there is an active deployment job that was created from the schedule. (You can wait for the job to finish, or abort the job and then discard the schedule.) You are prompted for an optional comment to explain the discard, and an e-mail is generated to the approver and submitter in Workflow mode.
Refresh button	Click this button to reload schedule information from the Security Manager server. If the message *Auto Refresh is On* is displayed beneath the table, the schedule list is automatically refreshed periodically. **Note** The auto refresh setting is configured in the administration settings for deployment: select **Tools > Security Manager Administration > Deployment**.
Suspend button	Click this button to suspend the selected schedule. Suspending the schedule does not delete the schedule, but it prevents the creation of deployment jobs based on it. You are prompted for a comment to explain the suspension, and an e-mail is generated to the approver in Workflow mode.
Resume button	Click this button to reactivate a suspended schedule. You are prompted for a comment to explain the suspension, and an e-mail is generated to the approver in Workflow mode.
Summary tab	Displays summary information about the selected schedule. Besides the fields shown in the table, summary information includes the number of devices included in the schedule and the user ID of the person who last changed the schedule.
Devices tab	Displays the devices that are included in the selected schedule. These are the devices to which configurations are deployed when a deployment job is created from the schedule. To change the device list, click **Open**, then click **Add Devices** on the Schedule dialog box.
History tab	Displays a log of the changes that have been made to the selected schedule. The information includes the state changes, the user who made the change, the date and time of the change (based on the Security Manager server time), and any comments the user entered to document the change.
Jobs tab	Displays a list of the deployment jobs that have been created based on the selected schedule. Information includes the name of the job, the date and time the job was created based on server time (not the client time), and the job status. If you select a job, and click the **Deployment Job** tab, the selected job is highlighted and you can view the job details. For information on job status, see these topics: • Job States in Workflow Mode , on page 387 • Job States in Non-Workflow Mode , on page 385

Configuration Archive Window

The Configuration Archive stores configuration versions for each device managed by Security Manager. If you delete a device from Security Manager, all of the device's configurations are also deleted from the Configuration Archive.

You can use Configuration Archive to:

- View the transcript of a configuration deployment for a selected device.
- View and compare configuration versions.
- View CLI differences between deployed configuration versions.
- Roll back to an earlier configuration version, provided that the configuration originated from the device. You should roll back configurations only under extreme circumstances. For more information, see these topics:
  - Understanding Configuration Rollback , on page 445
  - Using Rollback to Deploy Archived Configurations , on page 453
- Add the current running configuration for a device to the archive.

You can sort the list of configuration versions for a device by clicking on the column heading that you want to sort on. Clicking the column heading toggles between sorting the rows in ascending or descending order. You can also control the fields displayed by right-clicking on any column heading and selecting or deselecting the desired column names under the Show Columns command.

Navigation Path

Select **Manage > Configuration Archive**.

Field Reference

Table 104: Configuration Archive Window

Element	Description
Device Selector	Lists the devices in the device inventory. Select a device to see the configuration versions for the device that are available in the archive. These are displayed in the right pane.
Version ID	The version number of the configuration version. By default, this column is not displayed. To display it, right click any column heading and select **Show Columns > Version ID**.
Created On	The date and time that the configuration version was archived.
Created By	The user ID or system ID associated with adding the configuration version to the archive. If there are two names in the form *username1* (*username2*), the first name is the user who initiated the request, and the name in parentheses is the system identity user. For more information on the system identity trust user, see the Installation Guide for Cisco Security Manager .
Archival Source	The origin of the archiving event (for example, User Request, Deployment or Provision, Discovery).
Creation Comment	A description about how or why the configuration version was created.
Transcript Icon	When double-clicked, displays a transcript of a configuration version that was deployed to a device. A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device.
View button	Click this button to display the selected configuration in the Config Version Viewer window (see Configuration Version Viewer , on page 442), where you can also compare the configuration to other configuration versions.
Rollback button	Click this button to roll the device configuration back to the selected configuration version, provided that the configuration originated from the device. You should roll back configurations only under extreme circumstances. For more information see these topics: • Understanding Configuration Rollback , on page 445 • Using Rollback to Deploy Archived Configurations , on page 453

Element	Description
Add from Device button	Click this button to have Security Manager retrieve the current running configuration from the device and add it as a configuration version to the archive. This is useful for any device whose configuration might have been changed directly in its CLI. For more information on adding configuration versions, see Adding Configuration Versions from a Device to the Configuration Archive , on page 441.

Working with Deployment and the Configuration Archive

The following topics provide information about managing deployment and using the Configuration Archive:

Viewing Deployment Status and History for Jobs and Schedules

Using the Deployment Manager, you can view status and history information for deployment jobs and schedules, as well as create and manage them. To open the Deployment Manager window, select **Manage > Deployments**.

Jobs and schedules are displayed on separate tabs. However, as jobs are created based on a deployment schedule, those jobs appear in the regular jobs list. Click the appropriate tab to view the list of jobs or schedules, where you can see this information:

- Deployment Jobs—The top pane displays a list of the deployment jobs. If you select a job, more detailed information appears in the lower pane:

  - Summary tab—The Summary tab shows information such as the job status, number of devices deployed successfully, and number of devices deployed with errors.
  - Details tab—The Details tab shows the status details for each device in the deployment.
  - History tab (Workflow mode only)—The History tab displays transactions that occurred to the selected job since it was created. Each row in the table shows the action that occurred, the user who performed the action, the date and time it occurred, and comments, if any, that the user entered.

- Deployment Schedules—The top pane displays a list of the deployment schedules. If you select a schedule, more detailed information appears in the lower pane:
  - Summary tab—The Summary tab shows information such as the schedule, the time of the next job to be created from the schedule, the time a job was last run based on the schedule, the number of devices included in the schedule and the user ID of the person who last changed the schedule.
  - Devices tab—The Devices tab shows the list of devices that are included in the schedule.
  - History tab—The History tab shows the state changes and related comments of the schedule. You can track which user performed each action.
  - Jobs tab—The Jobs tab shows a list of deployment jobs that were created from the schedule and their statuses. You can also view these jobs on the Deployment Jobs tab.

The status information in the Deployment Manager window refreshes automatically unless you turned off automatic refresh in the Security Manager Administration Deployment page (Tools > Security Manager Administration > Deployment). A message below the job or schedule table indicates whether automatic refresh is on. If it is off, refresh status information by clicking **Refresh**.

Tips for Successful Deployment Jobs

Successful deployment depends on many things, as explained in Troubleshooting Deployment , on page 466. In addition to factors involving network communications and the proper functioning of the device, you can also improve the results of deployment by keeping the following tips in mind when you select devices for a deployment job or start the job:

- You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration and the device will be non-functional.
- Firewall devices only—If you manually added a firewall device (as described in Adding Devices by Manual Definition , on page 94), we highly recommend that you discover (import) the factory-default policies for that device before deploying to that device. Bringing these policies into Security Manager prevents you from unintentionally removing them the first time you deploy to that device. For more information about factory-default policies for firewall devices, see Default Firewall Configurations , on page 1805. For more information about importing policies, see Discovering Policies , on page 178.
- Deployment might take from a few minutes to an hour or more, depending on the number of devices in the deployment job.
- Modifying a subset of devices that are part of a VPN might make the VPN inoperable. If you select a subset of devices that are part of a VPN when creating a deployment job, you are warned and given the opportunity to select the other devices in the VPN. See Warning - Partial VPN Deployment Dialog Box , on page 411.
- You cannot select devices that were included in other deployment jobs that are in an active state (Edit, Edit Open, and Approved). You can select devices that were included in other deployment jobs that are in the Deployed, Failed, Discarded, or Aborted states.
- Firewall service modules (FWSMs) and Intrusion Detection System service modules (IDSMs) contain virtual devices. Security Manager considers the module and the virtual devices to be separate devices.
- Some changes to the FWSM might require the Catalyst Multiservice function card (MSFC) to be updated as well. If you select an FWSM that has these types of changes, Security Manager notifies you that you must include the MSFC in the deployment job, and it will select the MSFC device for you automatically. However, if the MSFC is already included in another active deployment job, you cannot include the MSFC in the current deployment job. You must remove the MSFC from the other deployment job, discard the other deployment job, or include the FWSM in the other deployment job.
- The status of deployments to Catalyst 6500/7600 devices shows deployment to the device as well as its interface contexts when policy changes contain interface commands that affect the interface contexts (child devices). This can occur when you deploy a policy change that affects a VLAN in which the switch participates or when you update inventory, for example, by adding or deleting interface contexts.

Deploying Configurations in Non-Workflow Mode

When you deploy configurations, you can transfer them to devices either directly or to another transport server (such as AUS, CNS, or TMS) in the network or create them as configuration files in a directory on the Security Manager server. See Understanding Deployment Methods , on page 389 for more information.

Note If you have made changes to a Unified ACL entry through Policy Object Manager which is used in a RAVPN policy (DAP, Group Policy, and alike) on a device, the device and the ticket does not get displayed in the Deploy Saved Changes window. You must click Add other devices and add the device manually.

Tip Before creating the deployment job, read Tips for Successful Deployment Jobs , on page 407. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

Caution You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

Note When using virtual sensors: An IPS device and all of the virtual sensors on it must be deployed as a group. If you make changes to a virtual sensor and then deploy it, Security Manager deploys the parent device and all virtual sensors associated with it.

Before You Begin

- Make sure that devices have been bootstrapped. For more information, see Preparing Devices for Management, on page 57.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

Related Topics

- Overview of the Deployment Process , on page 381
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422
- Deploying Configurations to a Token Management Server , on page 423

- Managing Device Communication Settings and Certificates , on page 460
- Understanding How Out-of-Band Changes are Handled , on page 392

Step 1 Do one of the following in non-Workflow mode:

- Select **File > Submit and Deploy** or click the **Submit and Deploy Changes** button on the toolbar.

Note These options are not available when Ticket Management is enabled.

- Select **File > Deploy**.
- Click the **Deployment Manager** button on the Main toolbar and click the **Deployment Jobs** tab if it is not active. Click **Deploy**.

Security Manager validates all of the policy changes that were made since the last deployment. If the validation results in errors, resolve the errors before attempting to deploy again. If there are only warnings or informational messages, click **OK** to proceed to the Deploy Saved Changes dialog box.

Step 2 In the Deploy Saved Changes dialog box, do the following:

- Select the devices to which you want to deploy configurations. The device selector lists all devices for which policy changes were made but not yet deployed, and initially all changed devices are selected for deployment.

All device groups that contain changed devices are shown, and you can select or deselect the devices using the device group folder. If you select or deselect a device that appears in more than one group, it is selected or deselected in all groups; however, a device is deployed to only once in the job. Right-click and select **Expand All** to open all of the folders.

The Deploy Saved Changes dialog box shows the date, time, and user associated with the changes that will be included in the deployment for the selected devices. This information changes based on the devices you select for deployment. If you have Ticket Management enabled, the tickets associated with the changes to be deployed are also displayed. You can click a ticket ID to view details of the ticket and to navigate to an external ticket management system if configured (see Ticket Management Page , on page 586).

If you detect out of band changes, when you close the OOB Changes dialog box, the device names are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

- If you want to add devices that do not have policy changes to the deployment job, click **Add other devices** to open the Add Other Devices dialog box (see Add Other Devices Dialog Box , on page 439). You might want to add unchanged devices if a device was manually modified and you want to return the device to its previous configuration (the one stored in the Security Manager database).
- (Optional) To change the method used to deploy configurations, click **Edit Deploy Method** to open the Edit Deployment Method dialog box (see Edit Deploy Method Dialog Box , on page 410). There is a system default deployment method (which your organization chooses), so you might not need to change the method. You can select these methods:
  - Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see Deploying Directly to a Device , on page 389 or Deploying to a Device through an Intermediate Server , on page 390.
  - File—Deploys the configuration file to a directory you select on the Security Manager server. For more information, see Deploying to a File , on page 391.

Before proceeding with the deployment, you can do the following:

- Preview proposed configurations and compare them against last deployed configurations or current running configurations. Right-click the device and select **Preview Config**. For more information, see Previewing Configurations , on page 424.
- Analyze the devices for out of band changes by clicking the **Detect OOB Changes** button. For more information, see Detecting and Analyzing Out of Band Changes , on page 426 and OOB (Out of Band) Changes Dialog Box , on page 429.

Step 3 Click **Deploy** to start the deployment job for the selected devices, which generates the required configuration files and applies them according to your selected deployment method.

The Deployment Status Details dialog box opens so that you can view the status of the deployment. It displays summary information about the job, status about the deployment to each device, and messages indicating why the deployment failed.

In the Deployment Details table, select a row corresponding to a device to display deployment status messages specifically for that device. For more information, see Deployment Status Details Dialog Box , on page 412.

If deployment to any device failed, you can redeploy configurations to the failed devices. For more information, see Redeploying Configurations to Devices , on page 434.

Edit Deploy Method Dialog Box

Use the Edit Deploy Method dialog box to specify whether to deploy the generated configurations directly to the devices in the network or to create configuration files in a directory on the Security Manager server.

Navigation Path

Click **Edit Deploy Method** in the Deployment—Create or Edit a Job dialog box (Workflow mode) or Deploy Saved Changes dialog box (non-Workflow mode). For the procedures, see:

- Creating and Editing Deployment Jobs , on page 415
- Deploying Configurations in Non-Workflow Mode , on page 408

Field Reference

Table 105: Edit Deploy Method Dialog Box

Element	Description
Device	The name of the device.
Method	The deployment method to use: • Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see Deploying Directly to a Device , on page 389 or Deploying to a Device through an Intermediate Server , on page 390. • File—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. You cannot use file deployment with IPS devices. For more information, see Deploying to a File , on page 391. **Note** To set the deployment method for more than one device at a time, select the desired rows, right-click and select **Edit Selected Deploy Method**. The Edit Selected Deploy Method dialog box opens where you can make your selections.
Destination	If you selected File in the Method field, enter the directory to which you want to deploy the configuration file. Click **Browse** to select from a list of available directories.
Preview Config button	Click this button to display the proposed configuration changes for the selected device. You can compare it to the last deployed configuration or the current running configuration. For more information, see Previewing Configurations , on page 424.
Out of Band Change Behavior	Click the radio button corresponding to the action you want Security Manager to take regarding changes made directly on the device using the CLI. For a complete explanation of how to handle out-of-band changes, including the meaning of the available options, see Understanding How Out-of-Band Changes are Handled , on page 392.

Warning - Partial VPN Deployment Dialog Box

Use the Partial VPN Deployment dialog box to select other devices that are part of a VPN to which you are deploying configurations.

When you create a deployment job and the job contains devices in a VPN, you must select all of the devices in the VPN. If you select a subset of devices and try to deploy to only those devices, this dialog box appears so that you can select the other devices that are part of the VPN.

Navigation Path

- Non-Workflow mode—If you select a subset of devices in a VPN in the Deploy Saved Changes dialog box, this dialog box appears when you click **Deploy**.
- Workflow mode—If you select a subset of devices in a VPN in the Create or Edit a Job dialog box, this dialog box appears when you click **OK**.

Related Topics

Field Reference

Table 106: Partial VPN Deployment Warning Dialog Box

Element	Description
VPN	The name of the VPN.
Missing Devices	All the devices in the VPN that were not selected for deployment.
Is Device in Other Job	Whether the missing device is part of another deployment job.
Deploy to All Devices in VPN button	Click this button to deploy to all devices in the VPN. You can deploy to all devices in the VPN only if the devices are not in other deployment jobs.
Deploy to Selected Devices button	Click this button to deploy only to the devices selected in the Create or Edit a Job or Deploy Saved Changes dialog boxes.

Deployment Status Details Dialog Box

The Deployment Status Details dialog box appears while configurations are being deployed to selected devices. It displays summary information about the job, status about the deployment to each device, and messages indicating why the deployment failed.

In the Deployment Details table, select a row corresponding to a device to display deployment status messages for that device.

Note You can click **Close** to close this dialog box and continue working in Security Manager while deployment continues.

Navigation Path

From the Deploy Saved Changes dialog box, click **Deploy**.

- Managing Device Communication Settings and Certificates , on page 460

- Device Communication Page , on page 532

Field Reference

Table 107: Deployment Status Details Dialog Box

Element	Description
Deployment Status Details	
Progress Status Bar	A visual representation and percentage of devices that were successfully updated.
Status	The status of the deployment. The possible states are Deploying, Aborted, Successful, and Failed. For descriptions of these states, see Job States in Workflow Mode , on page 387.
Deployment Job Name	The name of the deployment job.
Devices To Be Deployed	The total number of devices in the deployment job.
Devices Deployed Successfully	The number of devices that were updated successfully.
Devices Deployed With Errors	The number of devices that failed to be updated.
Deployment Details This table lists the devices that are included in the deployment job.	
Device	The name of the device.
Status	The status of the deployment to the device. For descriptions of these states, see Job States in Non-Workflow Mode , on page 385.
Summary	The number of warnings, errors, and failures for the device.
Method	The method of deployment to the device. Possible methods are File and Device.
Config	The device configuration file. Double click the icon to preview the configuration for a device. For more information, see Previewing Configurations , on page 424.
Transcript	The commands Security Manager issued to the device and the responses from the device during deployment if you are deploying to the device (instead of deploying to a file). Double-click the icon to see the transcript for a device.
Last Ticket(s)	The tickets containing changes that are part of the deployment for the device. You can click on the Ticket IDs to view additional information about the ticket, such as Creator and Last Modified date. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Device Communication Page , on page 532).

Element	Description
Messages	The warning, error, and failure messages, as indicated by the severity icon. When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem.
Generate Report button	Click this button to create a deployment status report for this job. You can generate the report in HTML and PDF formats. The report includes a summary of the job plus the full and delta configurations and the job transcript. You can use this report for your own purposes or to aid in troubleshooting a problem with Cisco TAC. For more information, see Generating Deployment or Discovery Status Reports, on page 508.
Refresh button	Click this button to update the status information.
Abort button	Click this button to abort the deployment job. You can abort deployment jobs only while they are in the Deploying, Scheduled, or Rolling Back state. Aborting a job stops deployment of configuration files to pending devices, but has no effect on devices to which deployments are in progress (commands are being written to a device) or to which deployment has already completed successfully.

Deploying Configurations in Workflow Mode

The task of deploying configurations in Workflow mode is a multiple step process. You must create a deployment job, get it approved, and then deploy the job. This process ensures that organizations that separate task authorizations among personnel can implement their control processes.

When you deploy configurations, you can transfer them to devices either directly or to another transport server (such as AUS, CNS, or TMS) in the network or create them as configuration files in a directory on the Security Manager server. See Understanding Deployment Methods , on page 389 for more information.

Tip Before creating the deployment job, read Tips for Successful Deployment Jobs , on page 407. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

Before You Begin

- Make sure that devices have been bootstrapped. For more information, see Preparing Devices for Management, on page 57.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

Related Topics

- Overview of the Deployment Process , on page 381
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422

- Deploying Configurations to a Token Management Server , on page 423
- Managing Device Communication Settings and Certificates , on page 460
- Understanding How Out-of-Band Changes are Handled , on page 392

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Create the deployment job. Click **Create** and enter the job properties. For the procedure, see Creating and Editing Deployment Jobs , on page 415.

When you finish creating a job, you can select whether to submit it. If you are not using a deployment job approver, you can also automatically submit, approve, and deploy the job, in which case you do not need to complete the other steps in this procedure.

Step 3 (Workflow with approver) Submit the job. If you did not submit the job, select it in the Deployment Manager window and click **Submit**. An e-mail is sent to the approver. For more information, see Submitting Deployment Jobs , on page 418.

Step 4 (Workflow with or without an approver) Approve the job. If you did not approve the job when you created it, select it in the Deployment Manager window and click **Approve**. If there is a separate person who approves jobs, that person must perform this step. For more information, see Approving and Rejecting Deployment Jobs , on page 419.

Step 5 (Workflow with or without an approver) Deploy the job. If you did not deploy the job when you created it, select it in the Deployment Manager window and click **Deploy**. You can specify a future time to start the job, or start it immediately, and configurations are deployed according to the properties of the job. For more information, see Deploying a Deployment Job in Workflow Mode , on page 420

Note You can discard a deployment job at any time before you deploy it. For more information, see Discarding Deployment Jobs , on page 421.

Creating and Editing Deployment Jobs

In Workflow mode, before you deploy policy configurations to your devices, you must create a deployment job. When you create a job, you select the devices to which you want to deploy the configurations, whether you want to deploy directly to the devices or to an output file, and when you want the job to take place.

Note If you have made changes to a Unified ACL entry through Policy Object Manager which is used in a RAVPN policy (DAP, Group Policy, and alike) on a device, the device and the ticket does not get displayed in the Deployment- Create a Job window. You must click Add other devices and add the device manually.

Tip Before creating the deployment job, read Tips for Successful Deployment Jobs , on page 407. That topic includes tips and cautions you should keep in mind when creating deployment jobs.

Caution You must configure at least one policy on a device before deploying to that device. If you deploy to a device without assigning at least one policy, the device's current configuration is overwritten with a blank configuration.

Before You Begin

- Make sure that devices have been bootstrapped. For more information, see Preparing Devices for Management, on page 57.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

Related Topics

- Overview of the Deployment Process , on page 381
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Understanding How Out-of-Band Changes are Handled , on page 392
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Do one of the following:

- Click **Create** to create a new job.
- Select an editable job and click **Open** to edit the job. You cannot edit a job that has already been deployed.

The Create a Job or Edit a Job dialog box opens.

Step 3 In the dialog box, do the following to define the contents of the job:

- **Job Name and Description**—Keep the default job name or enter a more meaningful name. Because the job name enables you to distinguish one job from another, you should assign a name that reflects the contents of the job. You cannot change the name after you create the job. Optionally, enter a description of the job.
- Select the devices to which you want to deploy configurations. The device selector lists all devices for which policy changes were made but not yet deployed, and initially all changed devices are selected for deployment.

All device groups that contain changed devices are shown, and you can select or deselect the devices using the device group folder. If you select or deselect a device that appears in more than one group, it is selected or deselected in all groups; however, a device is deployed to only once in the job. Right-click and select **Expand All** to open all of the folders.

If you detect out of band changes, when you close the OOB Changes dialog box, the device names are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

- If you want to add devices that do not have policy changes to the deployment job, click **Add other devices** to open the Add Other Devices dialog box (see Add Other Devices Dialog Box , on page 439). You might want to add unchanged devices if a device was manually modified and you want to return the device to its previous configuration (the one stored in the Security Manager database).
- (Optional) To change the method used to deploy configurations, click **Edit Deploy Method** to open the Edit Deployment Method dialog box (see Edit Deploy Method Dialog Box , on page 410). There is a system default deployment method (which your organization chooses), so you might not need to change the method. You can select these methods:
  - Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see Deploying Directly to a Device , on page 389 or Deploying to a Device through an Intermediate Server , on page 390.
  - File—Deploys the configuration file to a directory you select on the Security Manager server. For more information, see Deploying to a File , on page 391.

Before proceeding with the deployment, you can do the following:

- Preview proposed configurations and compare them against last deployed configurations or current running configurations. Right-click the device and select **Preview Config**. For more information, see Previewing Configurations , on page 424.
- Analyze the devices for out of band changes by clicking the **Detect OOB Changes** button. For more information, see Detecting and Analyzing Out of Band Changes , on page 426 and OOB (Out of Band) Changes Dialog Box , on page 429.

Step 4 Select how you want the job handled when you close the dialog box. The options available to you depend on whether you are using Workflow mode with a deployment job approver:

- **Without an approver**—If you are not using a separate approver, you have these options:
  - **Close the job**—Close the job and leave it in the edit state. Select this option if you know you want to make additional modifications to the job.
  - **Approve the job**—Close the job and approve it but do not deploy it. Configure the following:
  - **Comments**—(Optional) Comments about the job approval.
  - **Submitter**—The e-mail address of the person submitting the job for approval. Notifications of job state changes are sent to this address, which is initially the e-mail address associated with the user account you used to log into Security Manager. Ensure that the address is the correct one so that you receive the notifications.
  - **Deploy the job**—Close the job, approve it, and deploy it. Configure the following:
  - **Options**—Whether to Deploy Now or Schedule. If you select Schedule, additional fields appear where you can specify the date and time when the job should be run. The time is in 24-hour format and is based on the time zone of the Security Manager server, which is not necessarily the same time zone that you are currently in. The target time must be at least five minutes in the future.
  - **Comments**—(Optional) Comments about the deployment job.
  - **Send Deployment Status Notification**—Whether Security Manager should send e-mail notifications whenever the job status changes.

If you select this option, enter the e-mail addresses of the people who should receive notifications in the Job Completion Recipients field. If you enter multiple addresses, separate them with commas. The field initially contains the default approver and your e-mail addresses.

- **With an approver**—If you are using a separate approver, you can configure the following options:
  - **Submit the job**—Whether to submit the job for approval. By default this check box is selected.
  - **Approver E-mail**—The e-mail address of the approver if you are submitting the job for approval. The default approver e-mail address is entered in the field, but you can change it.
  - **Comments**—(Optional) Comments you want to send to the approver, if any.
  - **Submitter E-mail**—The e-mail address of the submitter. The field initially contains the e-mail address associated with the user account you used to log in, but you can change it to another address.

Step 5 Click **OK**.

Depending on your selection for how to handle the job, you might still need to submit, approve, and deploy the job. See these topics for more information:

- Submitting Deployment Jobs , on page 418
- Approving and Rejecting Deployment Jobs , on page 419
- Deploying a Deployment Job in Workflow Mode , on page 420

Submitting Deployment Jobs

In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In this case, Workflow mode is enabled *with* a deployment job approver, and you must submit the job to this user for review. The user reviews the job and either approves or rejects it.

If you are using Workflow mode *without* a deployment job approver, you can review and approve the job yourself. You do not submit jobs in this mode. For more information, see Approving and Rejecting Deployment Jobs , on page 419.

Note You enable and disable deployment job approval under Tools > Security Manager Administration > Workflow. For more information, see Workflow Page , on page 590.

This procedure assumes that you already created the job. You can also submit the job when you create it by selecting the **Submit the job** checkbox in the Create a Job dialog box.

Related Topics

- Deployment Manager Window , on page 395
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Status window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the job to submit.

Step 3 Click **Submit**.

The Submit Deployment Job dialog box opens.

Step 4 Enter the following information:

- **Approver**—The e-mail address of the person to be notified of your submission. The default approver e-mail address is entered in the field, but you can change it.
- **Comment**—(Optional) Comments you want to send to the approver, if any.
- **Submitter**—The e-mail address of the person submitting the deployment job. The field initially contains the e-mail address associated with the username you used to log into Security Manager, but you can change it to another e-mail address.

Step 5 Click **OK**.

The job status changes to Submitted. The approver must approve the job before you can deploy it.

Approving and Rejecting Deployment Jobs

In some organizations, before jobs can be deployed, they must be approved by a separate user with the appropriate permissions. In Workflow mode *with* a deployment job approver, one user submits a job, and another one previews the job and either approves or rejects it.

In Workflow mode without a deployment job approver, you can create and approve the job at the same time. For more information, see Creating and Editing Deployment Jobs , on page 415.

When you reject a job, the devices in the job immediately become available for inclusion in other jobs. A rejected job cannot be deployed, but it can be opened for viewing and editing.

Note You enable and disable deployment job approval under **Tools > Security Manager Administration > Workflow**. For more information, see Workflow Page , on page 590.

Related Topics

- Deployment Manager Window , on page 395
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select a submitted job and do one of the following:

- Click **Approve**.
- Click **Reject**.

You are prompted for an optional comment for your action. The comments are preserved in the history for the job. After submitting your comment, an e-mail notification is sent (if e-mail notifications are configured) and the job status changes to Approved or Rejected, as appropriate. The job can now be deployed (see Deploying a Deployment Job in Workflow Mode , on page 420).

Deploying a Deployment Job in Workflow Mode

When you work in Workflow mode, to deploy configurations to devices you must create a deployment job and have it approved. If you are working without a separate approver, you can approve and deploy the job yourself. Otherwise, you must submit it to an approver.

Deploying a deployment job in workflow mode simply starts a job. You cannot change the contents of a job during deployment.

Note Deployment might take from a few minutes to an hour or more, depending on the number of devices in the deployment job.

Before You Begin

- Make sure that devices have been bootstrapped. For more information, see Preparing Devices for Management, on page 57.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.
- Create a job. For more information, see Creating and Editing Deployment Jobs , on page 415.
- If using Workflow mode with a deployment job approver, submit the job. For more information, see Submitting Deployment Jobs , on page 418.
- Approve the job. For more information, see Approving and Rejecting Deployment Jobs , on page 419.

Related Topics

- Overview of the Deployment Process , on page 381
- Deployment Manager Window , on page 395
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Managing Device Communication Settings and Certificates , on page 460

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the job to deploy.

Step 3 Click **Deploy**.

The Deploy Job dialog box opens.

Step 4 In the Deploy Job dialog box, make these selections:

- **Options**—How you want to run the job. Select **Schedule** to run the job at some point in the future. Select **Deploy Now** to run the job immediately. If you schedule the job for a future time, the changes deployed in the job are based on the changes that existed when the job was created, not when the job is run.

If you select Schedule, date and time fields appear.

- Click the calendar icon to pick the day on which to run the job.
- In the Time field, enter the time to start the job in 24-hour clock format. The time must be in time zone of the Security Manager server, which is not necessarily the same as your time zone. The time must be at least 5 minutes in the future.
- **Comments**—(Optional) An explanation of why you are deploying the job.
- **Require Deployment Status Notifications, Job Completion Recipients**— Whether Security Manager should send an e-mail when the job status changes.

If you elect to send status notifications, enter the recipient's e-mail address. The field initially contains the e-mail address associated with the user account you used to log in. You can enter multiple addresses by separating them with commas.

Step 5 Click **OK**.

You are returned to the Deployment Manager window. The job status changes to Deploying. When the deployment is complete, the job status changes to Deployed.

Discarding Deployment Jobs

In Workflow mode, you can discard a job when it is in any state except Deployed, Deployment Failed, or Aborted. The job state is shown as discarded until the job is purged from the system, either automatically as set on the Workflow Management page or manually.

Related Topics

- Deployment Manager Window , on page 395
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the job to discard.

Step 3 Click **Discard**. You are prompted for an optional comment to explain why you are discarding the job.

Deploying Configurations Using an Auto Update Server or CNS Configuration Engine

If your organization uses Auto Update Server (AUS) or Cisco Networking Services (CNS) Configuration Engine to manage the deployment of configurations to your network devices, you can use these intermediate servers with Security Manager. To perform this type of deployment, you need to set up the device, the AUS or Configuration Engine, and Security Manager properly. This procedure explains the tasks that you need to perform.

Tip You cannot successfully deploy a configuration to AUS that requires Security Manager to download other files to the device. For example, some remote access VPN policies allow you to configure plug-ins, Secure Client, and Cisco Secure Desktop configurations. These files are not sent to AUS. Do not use AUS if you want to configure these types of policy.

Related Topics

- Overview of the Deployment Process , on page 381
- Preparing Devices for Management, on page 57
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Managing Device Communication Settings and Certificates , on page 460

Step 1 Set up the AUS or Configuration Engine using the documentation for those products.

Step 2 Configure the devices to use the server. The following topics describe the configuration steps depending on the type of server and the desired setup:

- Setting Up AUS on PIX Firewall and ASA Devices , on page 66

Step 3 When you add the device to Security Manager, select the AUS or Configuration Engine for the device if your chosen method allows it. If the AUS or Configuration Engine is not already defined in Security Manager, you can identify it to Security Manager as you add the network device. For detailed procedures, see these topics:

- Adding Devices from the Network , on page 82
- Adding Devices from Configuration Files , on page 91
- Adding Devices by Manual Definition , on page 94
- Adding Devices from an Inventory File , on page 99
- Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105

Tip After you add a device to the Security Manager inventory, you can change the assigned server in the device properties. Right-click the device and select **Device Properties**. Configure the server using the device properties if you could not identify it while adding the device.

Step 4 For devices that are using AUS, configure the AUS policy for the device in Security Manager. Do one of the following:

- Configure the policy for a single device. In Device view, select the device, and then select **Platform** > **Device Admin** > **Server Access** > **AUS** from the Device Policy selector.
- Configure a shared policy that you can assign to many devices that share the same AUS. In Policy view, select **PIX/ASA/FWSM Platform** > **Device Admin** > **Server Access** > **AUS** from the Policy Types selector. Right-click **AUS** and select **New AUS Policy** to create a policy, or select an existing policy from the Policies selector to change the policy. Select the Assignments tab to assign the policy to specific devices.

The server you identify in this policy must also be the server you identify in the device properties. The device properties identify the server to which Security Manager will send the configuration, whereas the AUS policy defines the server the device will contact.

Tip If you change AUS servers, keep in mind that the device will continue to use the AUS server defined in its current configuration until it receives a new configuration. Thus, you should change the AUS policy but deploy the configuration using the previous AUS server. After deployment is successful, change the device properties to point to the new server.

Step 5 In Security Manager, deploy your configurations using the **Deploy to Device** deployment method. Security Manager sends the configuration to the AUS or Configuration Engine, where the network device retrieves it.

Depending on the Workflow mode you are using, follow these procedures:

- Deploying Configurations in Non-Workflow Mode , on page 408
- Deploying Configurations in Workflow Mode , on page 414

Deploying Configurations to a Token Management Server

If your organization requires the use of a Token Management Server (TMS) for applying configuration updates to routers, you can use Security Manager in conjunction with your TMS processes. To perform this type of deployment, you need to set up the device, TMS, and Security Manager properly. This procedure explains the tasks that you need to perform.

Related Topics

- Overview of the Deployment Process , on page 381
- Preparing Devices for Management, on page 57
- Including Devices in Deployment Jobs or Schedules , on page 388
- Understanding Deployment Methods , on page 389
- Managing Device Communication Settings and Certificates , on page 460

Step 1 Set up the TMS as an FTP server. Security Manager uses FTP to deploy the configuration file to the TMS, from which it can be downloaded and encrypted onto an eToken. The eToken can then be connected to the USB port of a router and the configuration downloaded. See the TMS product documentation for more information.

Step 2 In Security Manager, select **Tools** > **Security Manager Administration** > **Token Management** to identify the TMS server to Security Manager.

By default, Security Manager uses the Security Manager server as the TMS, but you can specify a different server. You must enter the hostname or IP address, a username and password for the TMS, the directory to which configuration files should be copied, and the public key file location in Security Manager. For more information, see Ticket Management Page , on page 586.

Step 3 Specify TMS as the transport protocol to be used for Cisco IOS routers.

You can set this parameter globally for all Cisco IOS routers or for a specific device:

- Globally—Select **Tools > Security Manager Administration > Device Communication** and select TMS in **Transport Protocol (IOS Routers 12.3 and above)**.
- Device—Right click the device in the Device selector and select **Device Properties**. On the General tab, select TMS as the transport protocol in the Device Communications Group. Because not all routers support TMS, you might not be able to configure TMS for specific devices.

Step 4 In Security Manager, deploy your configurations using the **Deploy to Device** deployment method. Security Manager sends the delta configuration to the TMS server.

Depending on the Workflow mode you are using, follow these procedures:

- Deploying Configurations in Non-Workflow Mode , on page 408
- Deploying Configurations in Workflow Mode , on page 414

Step 5 Using the TMS, download the configuration to the eToken. See the TMS product documentation for more information.

Step 6 Download the configuration from the eToken to the router and save the configuration to the device. Plug the eToken into the router, then enter the following commands to download the configuration to the router, where *usb_token_id* is either **usbtoken0** or **usbtoken1**, depending on which USB port you used. The default PIN is 1234567890.

Example:

```
router# crypto pki token
usb_token_id
login
PIN

router# config terminal

router(config)# crypto pki token default secondary config CCCD

router(config)# exit

router# write memory
```

Tip CCCD is the private sector on the eToken where the configuration file resides. When you enter the **crypto pki token default secondary config CCCD** command, the CLI on the e-token merges with the CLI on the router.

Previewing Configurations

There are many ways to preview a device configuration. You can select a device from the Device selector and select **Tools > Preview Configuration**, or you can click the **Preview Config** button in several dialog boxes.

Tip You can also right click a device in Map view and select **Preview Configuration**.

When you preview a configuration, the configuration is displayed in the Config Version Viewer dialog box. The proposed configuration is on the left. You can select to view the delta configuration (which shows the changes since the last deployment) or the full configuration. You can also compare the configuration to the last one deployed to the device or the current running configuration in the right pane.

The contents of the proposed configuration can differ depending on where you view it from:

- If you use **Tools > Preview Configuration**, or right click the device in the Device selector and select **Preview Configuration**, the proposed configuration includes changes that you have not yet submitted to the database.
- If you preview the configuration while creating a deployment job, the proposed configuration includes only those changes that you have submitted to the database. These are the changes that will be deployed to the device if you start the deployment job.

The value of previewing configurations is that it lets you see the actual device commands that will be used to configure the device. If you are a CLI expert, this can help you verify that you are getting the configuration you expect. Even if you are not a CLI expert, you can use the information to look for more information in the command reference for the operating system on Cisco.com.

Note New objects are created when you rediscover ASA 8.2.3 devices through Cisco Security Manager after configuring network objects on the device. Ignore the CLIs for these new objects that are generated in preview configuration.

Following are some tips for previewing configurations:

- Many configuration options are specific to one or more interfaces. If you must specify an interface name in a policy, the previewed configuration will include the commands for the policy only if the Interfaces policy defines the interface that you specify. Ensure that you configure the Interfaces policy before previewing configurations.
- If you preview the configuration for a virtual sensor, the preview that you see is for the parent device, not the virtual sensor, because the configuration for a virtual sensor is stored on the parent device.
- If you are just curious about what commands a policy will configure, consider adding a dummy device and configure the policy for that device. This will help prevent unintended configuration changes in your real devices. To add a dummy device, use the procedure described in Adding Devices by Manual Definition , on page 94.
- Policies are validated before you can view the configuration. The validation happens for all devices, not just the device you are previewing. Thus, you might see errors and warnings that apply to different devices. If any errors or warnings occur, the Preview Messages dialog box appears. The dialog box lists all of the messages, including their severity and possible solutions. Click **OK** to continue to the Config Version Viewer dialog box. Click **Details** to see detailed information on the problems.

The following table explains the fields in the Config Version Viewer window used for previewing configurations.

Table 108: Config Version Viewer (Preview Configuration) Dialog Box

Element	Description
Proposed Config Type	The type of configuration you want to view. For example, you can view the full configuration or just the delta (the changes from the last deployed configuration). The proposed configuration is displayed in the left pane.
Compare to Version	Choose a configuration to compare against the proposed configuration. The selected configuration is displayed in the right pane. • None—Leaves the reference configuration blank. • Last Deployed—Displays the last configuration that was deployed to the device and compares it with the proposed configuration. • Running Config—Displays the current configuration running on the device and compares it with the proposed configuration. The device must be accessible to obtain the running configuration.
First Difference button	Moves the cursor to the first difference noted between the proposed and reference configurations.
Previous Difference button	Moves the cursor to the previous difference noted between the proposed and reference configurations.
Current Difference button	Centers the currently selected difference on the page.
Next Difference button	Moves the cursor to the next difference noted between the proposed and reference configurations.
Last Difference button	Moves the cursor to the last difference noted between the proposed and reference configurations.
Print button	Prints the configuration.

Detecting and Analyzing Out of Band Changes

When you deploy configurations to devices, Security Manager either removes out of band changes or cancels the deployment based on your deployment settings. (For a detailed explanation of out of band changes and how they are handled during deployment, see Understanding How Out-of-Band Changes are Handled , on page 392.)

In the most typical scenario, Security Manager removes any out of band changes during deployment. However, there might have been good reason for those changes to have been made to the device outside of Security Manager. Thus, it is good practice to analyze a device for out of band changes before deploying configurations, so that you have the opportunity to proactively recreate any configuration changes that should be preserved.

Note When a device is rebooted from console, the Config_mod value becomes 0. Config_mod parameter value will be stored soon after a discovery or a deployment is done. Ideally, CSM will poll the device every 5 minutes to check for the config_mod parameter value changes to detect the OOB.

There are many ways to detect whether there have been out of band changes to a device configuration since the last deployment to the device. If there have been changes (by another device management application or by direct CLI updates), you can preview the changes and determine whether to update the device policies before deployment, or to deploy and overwrite those out of band changes. (Out of band changes are sometimes called OOB changes in Security Manager). In some scenarios, the OOB changes are not detected. For information on handling such exceptions, see Exceptions to Out of Band Change Detection, on page 428.

Tip Out of band change detection is available only for IOS, ASA, PIX, FWSM devices, and security contexts; it is not available for IPS devices. However, the settings for handling out of band changes during deployment also apply to IPS devices; the difference is that you cannot proactively analyze these changes in IPS devices prior to deployment.

To determine whether there have been out of band changes on one or more device, do any of the following in Device view:

- Select **Tools > Detect Out of Band Changes**. You are prompted to select the devices to evaluate for out of band changes. Select the devices or device groups, click >> to move them to the selected list, and click **OK**. For more information on selecting devices, see Using Selectors , on page 47.
- Select one or more devices or device groups, right-click and select **Detect Out of Band Changes**. The selected devices are evaluated for changes.
- During deployment, select the devices to include in deployment and click the **Detect OOB Changes** button. (The button is available on the Deploy Saved Changes dialog box and the Deployment—Create or Edit a Job dialog box, depending on the workflow mode you are using.) The selected devices are evaluated for changes.

For information on the deployment procedure, see:

- Deploying Configurations in Non-Workflow Mode , on page 408
- Creating and Editing Deployment Jobs , on page 415

When you start the detection process, the OOB (Out of Band) Changes Dialog Box , on page 429 is opened so that you can view the results. Each selected device is evaluated by retrieving the current running configuration and comparing it to the most recent configuration stored in Configuration Archive. Security Manager does not consider any unmanaged policy types when evaluating differences between the configurations.

Tip Note that if you are in the process of deployment, the running configuration is **not** compared to the one you are proposing to deploy, so if you detect out of band changes, you might also want to preview the proposed configuration to see if you already implemented the same change in Security Manager policies. Right-click the device in the deployment dialog box and select **Preview Config**. You can compare the proposed configuration to the current running configuration. For more information, see Previewing Configurations , on page 424.

The OOB Changes dialog box shows the results of change detection. If a device has out of band changes, the icon for the device in the device selector changes to green. Select a device in the left pane of the OOB Detail tab to view the changes from the latest configuration in configuration archive. Use the buttons at the bottom of the window to move from change to change. The legend at the bottom explains the color coding used to describe the changes.

When evaluating changes, consider the following:

- If you want to keep the change, update the relevant policy in Security Manager to recreate the policy. Use preview config to ensure that your policy changes produce the desired results. Security Manager might use different naming conventions, so consider whether the policy results in the same thing, rather than being exactly the same text. Keep in mind that out of band change detection looks for syntactic differences, not semantic differences.
- If you use another application to configure certain types of policies, consider unmanaging that policy type in Security Manager. Security Manager ignores any configuration commands related to policies that it is not managing. For more information, see Policy Management Page , on page 577.

Note A config_mod parameter value is stored whenever there is a device discovery or deployment. CSM polls every five minutes to check if the config_mod parameter value is changed and to detect the OOB changes. When you reload an ASA device from the console, the config_mod parameter value becomes 0 thus marking the OOB state in the device.

Tip If you are detecting changes during deployment, when you close the OOB Changes dialog box, the device names in the deployment dialog box are color-coded based on the results: green indicates out of band change; red indicates an error during the detection process; no color change indicates no out of band changes.

Exceptions to Out of Band Change Detection

If you have not approved the activity in which the changes have been done, the Cisco Security Manager database will not get updated. This results in a discrepancy between the Cisco Security Manager configuration archive (that the OOB feature uses) and the Cisco Security Manager database. When you do not approve the activity, Cisco Security Manager does not detect Our of Band (OOB) changes that are applied to the device. As a result, Cisco Security Manager does not stop deployment (overwriting OOB changes) even when you have configured it to cancel deployment when OOB changes are detected (see Understanding How Out-of-Band Changes are Handled , on page 392). This section discusses this exception and how to handle it.

The following tasks are executed in Cisco Security Manager (Workflow mode), when a policy rediscovery is initiated:

Step 1 After rediscovery (Discovering Policies on Devices Already in Security Manager , on page 181), a new device configuration is written to the Cisco Security Manager configuration archive.

Step 2 If you do not approve the activity in which policy rediscovery is done, the Cisco Security Manager database will not be updated with the new device configuration and will continue to use old configuration data. Thus, there will be a mismatch between the configuration archive and the Cisco Security Manager database. This might result in the OOB changes on the device to be overwritten by Cisco Security Manager. This occurs even when you have configured it to cancel deployment when OOB changes are detected (see Understanding How Out-of-Band Changes are Handled , on page 392).

Note If the policy rediscovery activity is not approved, Out of Band (OOB) changes are not detected between the Cisco Security Manager database and configuration on the device. This is because OOB changes are detected using the Cisco Security Manager configuration archive, which has been updated with discovered configuration from device (Step 1, on page 428 above). On the other hand, Cisco Security Manager database still has the previous configuration of device, since activity has not been approved.

What to do next

In addition, when you are Previewing Configurations , on page 424 for the discovered device before the activity is approved, the preview configuration does not show correct configuration changes. In order to see correct differences, you must approve the activity first or preview configurations from another activity.

Exceptions to Out of Band Change Detection

To overcome these exceptions, do the following:

Step 1 Create a new activity for rediscovery.

Step 2 On completion of policy rediscovery, Submit and Approve the activity. Verify if the activity has been approved.

Step 3 To confirm if configuration changes for the rediscovered device is displayed as expected, perform Previewing Configurations , on page 424 for the device.

Step 4 Deploy changes from Cisco Security Manager to the device, if required.

OOB (Out of Band) Changes Dialog Box

Use the OOB Changes dialog box to view and analyze out of band changes on a device. An out of band change is any difference between the running configuration on a device and the most recent configuration for the device stored in Configuration Archive. Note that Security Manager considers only managed policy types when evaluating whether there is a difference between the configurations.

Tip Configurations are compared for syntactic differences, not semantic differences. Thus, functionally equivalent configurations might be identified as out of band changes.

Tip As an example, consider a simple case in which configuration lines are swapped in the device configuration without making any changes to the semantics. In this simple example case: 1) if there is an object group in Security Manager at line number 100, and 2) the same object group exists in the ASA configuration at any line number *except* 100, then 3) Security Manager detects and reports the change as OOB. To summarize this simple example case, Security Manager reports an OOB change even though this change in the order of a few configuration lines did not result in any changes to the semantics.

There are two tabs on this dialog box:

- **OOB Detail**—This tab shows the detailed results and progress of the detection process. The fields are described below.

- **OOB Summary**—This tab shows a summary of the detection results, and becomes available only after the detection process is completed on all selected devices. The information is by device and includes a time stamp (date, time, time zone) and difference data that indicates the additions, subtractions, and changes with the associated configuration line number. You can select text on this tab, use Ctrl+click to copy it to the clipboard, and paste it in another application (such as NotePad).

For more information on detecting and analyzing out of band changes, see Detecting and Analyzing Out of Band Changes , on page 426. For more information on handling out of band changes during deployment, see Understanding How Out-of-Band Changes are Handled , on page 392.

Beginning with Version 4.7, Security Manager has a tool to help you re-sync out of band changes. For more information on this new tool, see OOB Re-sync. Tool, on page 431

Navigation Path

There are several ways to start the out of band change detection process. You can use the **Tools > Detect Out of Band Changes** command, or select one or more devices right-click and select **Detect Out of Band Changes**. You can also click the **Detect OOB Changes** button in Deploy Saved Changes dialog box and Deployment—Create or Edit a Job dialog box as explained in the following procedures:

- Deploying Configurations in Workflow Mode , on page 414
- Creating and Editing Deployment Jobs , on page 415

Related Topics

- Previewing Configurations , on page 424
- Filtering Items in Selectors , on page 47

Field Reference

Table 109: OOB Changes Dialog Box

Element	Description
Selected Devices list (left pane)	This list contains all devices you selected to evaluate for out of band changes, organized in device groups (if any). Select a device to see the results in the right pane. The icons for the devices change color based on the results of the detection process: • Green—There are out of band changes. • Red—The out of band detection process failed for some reason. • No color change—No out of band changes.

Element	Description
Configuration Comparison (right pane)	The right pane shows the results of the change detection process for the selected device. Messages will indicate if OOB detection is still in progress, if there are no changes, or if there was an error that prevented change detection from completing. If there are changes, the right pane shows both the running configuration retrieved from the device and the latest configuration for the device stored in Configuration Archive. The legend at the bottom of the window describes the color coding used to indicate changes, and you can use the following buttons to move from change to change.
First Difference button	Moves the cursor to the first difference noted between the configurations.
Previous Difference button	Moves the cursor to the previous difference noted between the configurations.
Current Difference button	Centers the currently selected difference on the page.
Next Difference button	Moves the cursor to the next difference noted between the configurations.
Last Difference button	Moves the cursor to the last difference noted between the configurations.

OOB Re-sync. Tool

The OOB Re-sync Tool, which is new in Security Manager 4.7, helps you re-sync, or reconcile, out of band data. The OOB Re-sync Tool is an extension of the OOB Detection Tool available in Security Manager 4.6 and earlier versions and continued into 4.7.

Tip Out of band (OOB) data is the difference between the last archived configuration of Security Manager and the latest configuration running on the device. OOB data comes into existence—with the result that you need to update the device CLI—for reasons such as these: 1) emergency requirements (primarily for ACLs) mean that there is no time to use Security Manager and complete its workflow process because an unknown validation error is blocking deployment; 2) the use of management applications other than Security Manager to manage the same devices; and 3) <100% feature support by Security Manager for ASAs means that some ASA features need to be managed by using the CLI. Any changes made to a device using a third-party tool together with any CLI changes made to a device sum up as OOB data.

The OOB Re-sync Tool aims to automate the process of bringing OOB data on a device into your Security Manager installation while retaining the policy structures that you previously established.

Without the OOB Re-sync Tool, Security Manager (versions 4.6 and earlier) has only the following administrative options when OOB data is detected during deployment:

- Warn and override the OOB changes (Default)—Cisco Security Manager detects for OOB changes during deployment, warns the user of the OOB changes but goes ahead and negates/wipes out the OOB changes.
- Stop deployment—Aborts the deployment when OOB changes are detected.
- Do not check for OOB changes—OOB changes are not even detected during deployment and are overridden on the device.

The following objects are supported by the OOB Re-sync Tool:

- Network Object/Object-Group(s)
- Security Group(s)
- Service Object Group(s)
- User Group(s)
- Time Range Object(s)

Note The OOB Re-sync Tool does not support OOB changes for routers.

The OOB Re-sync Tool does not re-sync all objects/ACLs. It re-syncs access rules and unified access rules; it does not, for example, re-sync IPv6 access rules. Note the details for policies in the following list:

- Access rules (unified) are supported
- IPv4 access rules are supported
- IPv6-only access rules are *not* supported
- Ethertype ACLs are *not* supported
- Standard ACLs are *not* supported

The OOB Re-sync Tool has a straightforward work flow:

1. Detect OOB changes by using one of the following methods to run the existing tool:
   - **Configuration Manager > Tools > Detect Out Of Band Changes**... .
   - **Configuration Manager** > [tool bar] > **Detect OOB Changes** icon
   - **Configuration Manager > Device View >** right-click a device > click **Detect Out Of Band Changes**.
   - In the Deploy Saved Changes dialog box, click **Detect OOB**.
2. If out of band changes are detected, they appear in the right pane of the OOB (Out of Band) Changes Dialog Box on the OOB Details tab. The OOB Details tab displays a report of the changes and the target rule number, shared policy, sections, affected devices, and CLI.

   Also if out of band changes are detected, the Re-Sync Summary tab in the right pane of the OOB (Out of Band) Changes Dialog Box becomes active.

   After OOB changes are detected by the existing OOB detection tool, click Evaluate; after you do, Security Manager will further analyze the differences in the configuration running on the device and the configuration available in Security Manager. After this analysis, the Re-Sync Summary Tab becomes active. On this tab, Security Manager displays other details, such as ACE, object(s) that will be added or deleted, and rule location(s).

Note Security Manager also will annotate the policy rule table, both in Device and Policy View and for objects in the Policy Object Manager.

3. After the Re-Sync Summary Tab becomes active, you have the option of generating a report and checking to see if there is any CLI that is not supported by OOB functionality. After checking the report, you can opt to accept the changes by clicking **Accept**, and if the operation of persisting ACL or object changes in the device went through fine, you will be prompted with a "success" message.

Note If you modify access rules that are part of a shared policy, the OOB Re-sync Tool in this particular case will annotate both the rule that has actually been modified and the rule just above it. This occurs when you 1) modify at least two access rules that are part of a shared policy; 2) run the OOB Re-sync Tool; and 3) accept the changes. In this case, the OOB Re-sync Tool reports an OOB condition for some rules in addition to the ones that you modified. It is important to understand that the rules themselves and the shared policy are not adversely affected.

4. On the OOB Detail tab in the left pane, you can request a report in .pdf format. To do this click the **Generate Report** button. Cisco recommends that you always generate this report and save it to help with troubleshooting if needed.

Tip The following example is a brief description of a scenario in which you use the OOB Re-sync Tool and find some changes in a device that are not supported by the OOB Re-sync Tool along with access-rule changes that are supported. In this scenario, you have an ASA that uses both IPv4 and IPv6. If you use **Tools > Detect Out Of Band Changes..** and find OOB changes, you will need to manually reconcile the IPv6 changes before you can elect to re-sync. the OOB changes by using the OOB Re-sync Tool.

You should be aware of several caveats when using the OOB Re-sync Tool. These are listed in the following table.

Table 110: Caveats

Interface Role	Access rules tied to interface roles and multiple interfaces rules will not be absorbed. However, the rules will be annotated to help the user copy the OOB rules from the OOB re-sync report and run "Import Rules" at the right rule location to absorb the OOB CLIs.
Shared Policies	OOB changes that affect shared policies will not be re-synced since doing so would affect other devices. Rules will be annotated to help the user import rules.
Objects	The OOB re-sync process always creates overrides for objects. However, if object override is selectively disabled for that object, then re-sync will not be allowed until the user enables the device overrides for that object.
Unsupported Access List	IPv6 only access-list that existed before the introduction of unified access-list is not supported for resync Ether Type Access List re-sync is not supported

OOB Access-Group CLI	OOB changes on access-group CLI cannot be absorbed. To explain this caveat further: • Under these circumstances (OOB changes on access-group CLI), you cannot choose evaluation; that is, you cannot elect to re-sync. the OOB changes. • In a case involving both 1) OOB changes that the OOB Re-sync Tool can re-sync and 2) changes in access-group CLIs, you must resolve the changes with respect to the access-group command before you can elect to re-sync the OOB changes.
Conditional Re-sync of Remarks	ACL remarks added to an access-list CLI created out-of-band will be absorbed during re-sync as part of re-sync of the rule. However, any random OOB change in an ACL remark alone will not be absorbed during re-sync
Rule Split	Rules get split during re-sync of OOB changes done within combined rules. User needs to run "Combine Rules" on the flattened rules thus re-synced to restore to the original rule if possible

Redeploying Configurations to Devices

You can redeploy a deployment job if you want to. This is especially valuable for jobs in the Failed or Aborted states. You can redeploy to all devices in the job, or you can select specific devices (such as the devices to which deployment failed).

Tips on Redeploying a Configuration to a Replacement Device

If you have to replace a device, for example, due to hardware failure, you cannot simply redeploy the last deployment job from the device, because Security Manager does not know that the device is actually a new one. To deploy the old device's configuration to the new device, you have these options:

- If the new device is the exact same model and operating system version as the replaced device, you can select the old device in the device selector, right-click and select **Preview Configuration**, and copy and paste the full configuration to the new device. However, this does not migrate certificates from the old device to the new one. You must re-enroll the device or renew the certificate yourself.
- If the new device is not exactly identical to the old device, follow the procedure described in Changes That Change the Feature Set in Security Manager , on page 126.

Before You Begin

- Make sure that devices have been bootstrapped. For more information, see Preparing Devices for Management, on page 57.
- If you are deploying to a transport server, such as AUS, CNS, or TMS, make sure the server, Security Manager settings, and device have been set up properly.

Related Topics

- Overview of the Deployment Process , on page 381
- Deploying Configurations in Non-Workflow Mode , on page 408
- Deploying Configurations in Workflow Mode , on page 414
- Deploying Configurations Using an Auto Update Server or CNS Configuration Engine , on page 422
- Deploying Configurations to a Token Management Server , on page 423
- Managing Device Communication Settings and Certificates , on page 460
- Understanding Deployment Methods , on page 389
- Job States in Non-Workflow Mode , on page 385
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the job that contains the devices to which you want to redeploy configurations, then do one of the following:

- In non-Workflow mode, click **Redeploy**.
- In Workflow mode, click **Deploy**.

The Redeploy a Job dialog box opens. The dialog box lists the devices in the deployment job, showing the device name, the deployment method used, the status of the previous deployment, and the name of the deployment job that updated the device.

Step 3 In the Redeploy a Job dialog box, do the following:

- **Selection column**—Select the devices to which you want to redeploy configurations by putting checkmarks in the checkboxes in the Selection column. Initially all failed devices are selected.
- **Deployment Method, Destination**—(Optional) You can change the method used to deploy configurations for individual devices. The initially selected method is the one used in the job. You can select these methods:
  - **Device**—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see Deploying Directly to a Device , on page 389 or Deploying to a Device through an Intermediate Server , on page 390.
  - **File**—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. Click **Browse** to select from a list of available directories. You cannot use file deployment with IPS devices. For more information, see Deploying to a File , on page 391.

Note To set the deployment method for more than one device at a time, select the devices, right-click and select **Edit Selected Deploy Method**. The Edit Selected Deploy Method dialog box opens where you can make your selections.

- **Out of Band Change Behavior**—(Optional) Select how you want Security Manager to respond if it detects that changes were made on the device by someone other than Security Manager (these are called out of band changes).

For a complete explanation of how to handle out-of-band changes, including the meaning of the available options, see Understanding How Out-of-Band Changes are Handled , on page 392.

Note Before proceeding with the deployment, you can preview proposed configurations and compare them against last deployed configurations or current running configurations. Highlight the row for a device and click **Preview Config**. For more information, see Previewing Configurations , on page 424.

Step 4 Click **OK**.

Aborting Deployment Jobs

You can stop a deployment job if you do not want to deploy the configurations or you want to postpone deployment.

You can abort deployment jobs only while they are in the Deploying, Scheduled, or Rolling Back state. Aborting a job stops deployment of configurations to pending devices, but has no effect on devices to which deployments are in progress (commands are being written to a device) or to which deployment has already completed successfully.

To abort a job, do either of the following:

- Click Abort on the Deployment Status dialog box while you are viewing the running status of an active job. See Deployment Status Details Dialog Box , on page 412.
- Select **Manage** > **Deployments** to open the Deployment Manager window, then select the job on the Deployment Jobs tab and click **Abort**.

The Abort the Job dialog box opens and asks you to confirm that you want to abort the job. Click **OK** to confirm.

After you abort a job, the deployment status of pending devices changes to Aborted.

To resume deployment, redeploy the job. See Redeploying Configurations to Devices , on page 434 for more information.

Creating or Editing Deployment Schedules

You can create deployment schedules to create deployment jobs at regular intervals. Schedules can help you ensure that the selected devices get regular configuration updates.

Tip When you include a device in a schedule, the device is included in deployment jobs that are generated from the schedule only if changes have been made to the device configuration and those changes were committed to the database. Thus, you might see changes when previewing the device configuration even though the device was not included in a scheduled deployment, if you have not submitted those changes (or if they have been submitted by not yet approved, when using a separate approver in Workflow mode).

Related Topics

- Overview of the Deployment Process , on page 381
- Viewing Deployment Status and History for Jobs and Schedules , on page 405
- Suspending or Resuming Deployment Schedules , on page 440

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Schedules** tab if it is not active (see Deployment Schedules Tab, Deployment Manager , on page 400).

Step 2 Do one of the following:

- If you are creating a new schedule, click **Create**.
- If you are editing an existing schedule, select it in the Deployment Schedule table and click **Open**.

The Schedule dialog box opens (see Schedule Dialog Box , on page 438).

Step 3 Enter at least this information in the Schedule dialog box:

- The name of the schedule.
- If you are using Workflow mode with an approver, ensure that the approver e-mail address is correct. Also verify your e-mail address (in the Submitter field), and choose whether you want to get notifications whenever the status of the job changes.
- Define the first date and time the schedule should start, and select how often deployment jobs will be generated based on the schedule. Also determine whether the schedule should have an end date, after which no new jobs are created from it.
- Click **Add Devices** and select all the devices that should be included in the deployment job. Including devices does not lock them from being modified by users or included in other deployment jobs or schedules.

If Security Manager is configured to use user-login credentials for accessing devices, your username and password are captured during schedule creation. If you change your password, you will need to recreate the schedule.

Step 4 Click **OK**. The schedule is added to the Deployment Schedule table.

Step 5 (Workflow mode only) If you are operating in Workflow mode, you must complete these additional steps:

- If you are using an approver for deployment jobs, select the schedule in the table and click **Submit** to submit the schedule to the approver. You are prompted to verify the approver's e-mail address and to enter comments to help the approver evaluate the schedule. The approver will have to approve the schedule before it becomes active.

- If you are not using an approver, select the schedule in the table and click **Approve** to approve it yourself and to activate the schedule.

Schedule Dialog Box

Use the Schedule dialog box to create a regularly recurring deployment job.

Navigation Path

Select **Manage** > **Deployments** to open the Deployment Manager window, click the Deployment Schedules tab in the upper pane, and do one of the following:

- Click **Create** to create a new schedule.
- Select a schedule and click **Open** to view or modify its properties.

Field Reference

Table 111: Schedule Dialog Box

Element	Description
Schedule Name Group This group defines the name of the job and the job's notification requirements.	
Name	The name of the job. When individual deployment jobs are created from this schedule, a time stamp is added to the job name.
Description	The description of the purpose of the job.
Approver Email (Workflow only)	The e-mail address of the person who should approve the schedule.
Comments (Workflow only)	(Optional) Information to help the approver evaluate the schedule when you save this schedule.
Submitter Email (Workflow only)	The e-mail address of the person who is submitting this schedule for approval. This field initially contains the e-mail address associated with the user account you used to log into Security Manager, but you can change it.

Element	Description
Require Deployment Status Notifications (Workflow only)	Whether to send e-mail messages for any change in the job status for the job schedule or any job created from it. Messages are sent to the approver and the submitter.
Recurrence Pattern Group The fields in this group define the job schedule.	
Start Date	The first day of the schedule. Click the calendar icon to select the date from a calendar.
Time (Start)	The time of day to run the schedule. The time is in 24-hour format and is based on the server time zone, not the client time zone.
Recurrence	How often to create a deployment job based on this schedule: • One time—Run this job once on the day specified as the start date at the specified start time. • Hourly—Run this job on an hourly schedule. Specify the number of hours between deployment jobs. • Daily—Run this job on a daily schedule. Specify the number of days between deployment jobs. • Weekly—Run this job on the specified days of the week. • Monthly—Run this job on a monthly schedule. Select the day of the month to run the job, and the number of months between deployment jobs.
Run Indefinitely End Date and Time	The expiration date and time for the schedule. Deployment jobs are not created after this time. Select Run Indefinitely if you do not want the schedule to expire.
Devices To Deploy Group This table lists the devices that are included in the deployment job. To add devices to the list, or to remove them from it, click **Add devices**, which opens the Add Other Devices dialog box (see Add Other Devices Dialog Box , on page 439. If Security Manager is configured to use user-login credentials for accessing devices, your username and password are captured during schedule creation. If you change your password, you will need to recreate the schedule.	

Add Other Devices Dialog Box

Use the Add Other Devices dialog box to select devices for the deployment job or schedule. The devices in the list might not have active policy changes. When you are creating a job, you might want to add devices that do not have policy changes if a device was manually modified and you want to return the device to its previous configuration (the configuration stored in the Security Manager database).

- Select the devices to include in the job or schedule in the Available Devices list and click >> to move the devices to the Selected Devices list.
- To remove devices, select them in the Selected Devices list and click <<.

Navigation Path

To open this dialog box, do one of the following:

- (Non-Workflow mode) From the Deploy Saved Changes dialog box, click **Add other devices**. See Deploying Configurations in Non-Workflow Mode , on page 408.
- (Workflow mode) From the Deployment—Create or Edit a Job Dialog Box, click **Add other devices**. See Creating and Editing Deployment Jobs , on page 415.
- (All modes) From the Schedule Dialog Box , on page 438, click **Add devices**.

Suspending or Resuming Deployment Schedules

You can suspend an active deployment schedule without discarding it and then reactivate it later when you want to resume creating jobs based on the schedule. This allows you to turn off a schedule temporarily.

Related Topics

- Viewing Deployment Status and History for Jobs and Schedules , on page 405
- Creating or Editing Deployment Schedules , on page 436

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Schedules** tab if it is not active (see Deployment Schedules Tab, Deployment Manager , on page 400).

Step 2 Do one of the following:

- To suspend an active schedule, select it and click **Suspend**.
- To resume a suspended schedule, select it and click **Resume**.

Adding Configuration Versions from a Device to the Configuration Archive

The Configuration Archive is updated with a new configuration version any time a configuration is deployed to the device or a file, including when you roll back a configuration to a device.

You can also retrieve a configuration directly from the device to add to the Configuration Archive. This is useful when changes have been made directly to device configurations, which are called out-of-band changes.

Note You cannot retrieve configurations from devices that are managed by AUS and that have been configured with dynamic IP addresses.

This procedure will help you retrieve a configuration from a device and add it to the archive.

Related Topics

- Viewing and Comparing Archived Configuration Versions , on page 441

Step 1 Select **Manage > Configuration Archive** to open the Configuration Archive (see Configuration Archive Window , on page 403).

Step 2 In the Device selector, select the device from which you want to retrieve the configuration. The archived configurations appear in the right pane.

Step 3 Click **Add from Device**. Security Manager logs into the device, retrieves the running configuration, and adds it to the archive.

Viewing and Comparing Archived Configuration Versions

Using the Configuration Archive, you can view the previous configurations for a device, compare versions of the configuration, and view the transcripts related to configuration deployment. To open the Configuration Archive window, select **Manage > Configuration Archive**.

To view the configuration versions for a device, select the device in the device selector. All archived versions are listed in the right pane. You can do the following:

- To view a configuration, select it and click **View**, which opens the Config Version Viewer dialog box with the configuration displayed in the left pane (for information about the dialog box, see Configuration Version Viewer , on page 442).

If there is more than one type of configuration available for the selected version, you can choose which type to view using the **Config Type** field. A Full version is a complete configuration, whereas a Delta version is just the commands that were different between this version and the device's previous full configuration. Delta configurations might include negative commands.

- To compare configurations, select one and click **View**. In the Config Version Viewer window, select the configuration you want to compare in the **Compare with Version** field. The second version appears in the right pane with differences color-coded according to the caption below the display area.
- To view the transcript associated with the deployment of a configuration, do one of the following:

- From the Configuration Archive window, double-click the icon in the Transcript column for the desired configuration.
- When viewing a configuration in the left pane of the Config Version Viewer dialog box, click **Transcript View**.

A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device. If rollback is unsuccessful, there might be a partial transcript generated depending on which stage rollback or deployment failed. The transcript is displayed in the Transcript Viewer window (see Viewing Deployment Transcripts , on page 444).

You can configure the number of configuration versions to archive on the Configuration Archive settings page (see Configuration Archive Page , on page 516).

Related Topics

- Adding Configuration Versions from a Device to the Configuration Archive , on page 441

Configuration Version Viewer

Use the Config Version Viewer window (when opened from the Configuration Archive) to view previous configurations for a device and to compare them to other archived configurations. You can compare any version to any other version in the archive for a selected device. The selected version appears in the left pane, and you can select another version for comparison from the list on the upper right of this window. For more information on viewing and comparing versions, see Viewing and Comparing Archived Configuration Versions , on page 441.

Navigation Path

Select **Manage > Configuration Archive**, select a device whose configuration you want to view, select the configuration, and click **View**.

Related Topics

- Viewing and Comparing Archived Configuration Versions , on page 441
- Adding Configuration Versions from a Device to the Configuration Archive , on page 441

Field Reference

Table 112: Configuration Version Viewer Window (Configuration Archive)

Element	Description
Version ID	The configuration version to display in the left pane: • Previous—Display the version in the sequence before the one currently selected. • Next—Display the version in the sequence after the one currently selected. • Last—Display the last version in the list. • Specific Date and Time—Display the version created on that date and time.
Compare with version	The configuration version to compare to the version selected in the left pane, if you want to compare versions. The configuration is displayed in the right pane, with differences summarized and color coded as explained by the caption below the pane.
Config Type	The types of configurations that are available for viewing. The types differ based on the type of device. The types might indicate Full or Delta, which have the following meaning: • Full Configuration—The full configuration for the selected device as saved in the Configuration Archive. You can compare full configurations for a device. • Delta Configuration—The file that is generated by Security Manager during deployment and that represents policy changes between the configuration selected in the Version ID field and the most recently deployed version. **Note** Configuration versions resulting from out-of-band changes (for example, in the CLI) can be added to Configuration Archive using **Add from Device**, but no delta configuration file is generated.
First Difference button	Moves the cursor to the first difference noted between the configuration versions.
Previous Difference button	Moves the cursor to the previous difference noted between the configuration versions.
Current Difference button	Using the cursor, focuses on the currently selected difference in the window.
Next Difference button	Moves the cursor to the next difference noted between the configuration versions.
Last Difference button	Moves the cursor to the last difference noted between the configuration versions.
Transcript View button	Click this button to open the transcript viewer window, which displays the device communication transcript associated with this configuration.
Print button	Click this button to print the configuration.

Viewing Deployment Transcripts

Use the Transcript Viewer window to view the record of messages exchanged between Security Manager and a device. A transcript is the log file of transactions between Security Manager and a device captured during a deployment or rollback operation. It includes commands sent and received between server and device from the time of the deployment or rollback request, but it does not include communication that occurs during the initial discovery phase of deployment, when Security Manager obtains the current configuration from the device. For more information, see Viewing and Comparing Archived Configuration Versions , on page 441.

Navigation Path

- Configuration Archive—Select **Manage > Configuration Archive** to open the Configuration Archive, select the device for which you want to view a transcript and double-click the **Transcript** icon in the row for the desired configuration version.

You can also click the **Transcript View** button from the Configuration Version Viewer window when examining an archived configuration (see Configuration Version Viewer , on page 442).

- Deployment Manager—Select **Manage > Deployments** to open the Deployment Manager, select the deployment job that includes the desired device deployment, select the Details tab in the lower pane, and double-click the **Transcript** icon in the row for the desired device.

Related Topics

Field Reference

Table 113: Transcript Viewer Window

Element	Description
Version ID	The configuration version for which you are viewing transcripts: • Previous—Display the transcripts for the version in the sequence before the one currently selected. • Next—Display the transcripts for the version in the sequence after the one currently selected. • Last—Display the transcripts for the last version in the list. • Specific Date and Time—Display the transcripts for the version created on that date and time.
Transcript Type	The type of transcript that you want to view. Some configuration versions have more than one transcript associated with them. Use this field to select which transcript to view.
Transcript Window	Displays the selected transcript. You can select text and copy it to the clipboard (Ctrl+C) for pasting in a text editor.

Element	Description
View button	Click this button to display the related configuration in the Config Version Viewer window (see Configuration Version Viewer , on page 442).
Print button	Click this button to print the transcript.

Rolling Back Configurations

After you deploy a new configuration to a device, you can roll back the configuration to an older version if you find that the new configuration does not work correctly. However, it is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. Roll back configurations only in extreme circumstances.

The following topics will help you better understand and use configuration rollback:

- Understanding Configuration Rollback , on page 445
- Rolling Back Configurations to Devices Using the Deployment Manager , on page 452
- Using Rollback to Deploy Archived Configurations , on page 453
- Performing Rollback When Deploying to a File , on page 454

Understanding Configuration Rollback

If you deploy configurations to devices using the Device method, either to deploy the configuration directly to the device or to an intermediate server, you can roll back the configuration to an older version if you find that the new configuration does not work correctly. You cannot roll back to a configuration that was deployed to a file.

Caution It is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. After rollback, you should rediscover policies on the device to make the device configuration and its configuration in Security Manager consistent. Roll back configurations only in extreme circumstances.

You can roll back configurations using these tools:

- Deployment Manager—You can roll back a deployment to the last good configuration if that configuration was deployed to the device rather than to a file. To open the Deployment Manager, select **Manage > Deployments**.
- Configuration Archive—You can roll back deployment to any archived configuration that was deployed to the device or that originated from the device. To open the Configuration Archive, select **Manage > Configuration Archive**.

When you roll back a configuration, Security Manager does the following:

- On PIX Firewalls and ASA and FWSM devices, Security Manager uses the **replace config** option on the device's SSL interface to perform the equivalent of a reload (xlates are cleared, IPsec tunnels are torn down, and so on).
- For devices running IOS 12.3(7)T or later, Security Manager uses the **configure replace** command to replace the running configuration with the contents of a configuration file. Support for this command is dependent on the IOS version installed on the device:
  - On devices running IOS 12.3(7)T or later, Security Manager copies the configuration file to the startup configuration before executing the **configure replace** command. If the configure replace operation fails, Security Manager issues the **reload** command to reload the operating system using the contents of the startup configuration. The reload command restarts the system, which might result in a temporary network outage.
  - On routers running a version prior to 12.3(7)T, Security Manager copies the configuration file to the startup configuration and issues the **reload** command, which restarts the system. Security Manager uses the TFTP server and directory specified in the Configuration Archive settings page (see Configuration Archive Page , on page 516) when using this method.
- The rolled-back configuration becomes another archived version in the Configuration Archive for that device.

Tip Configuration rollback does not include user account policies. When you roll back a configuration, the existing state of user accounts is not changed. This helps ensure that users can continue to log into the device.

Special considerations apply to the rollback of certain device types and configurations. See the following sections for more information:

- Understanding Rollback for Devices in Multiple Context Mode , on page 446
- Understanding Rollback for Failover Devices , on page 447
- Understanding Rollback for Catalyst 6500/7600 Devices , on page 447
- Understanding Rollback for IPS and IOS IPS , on page 448
- Commands that Can Cause Conflicts after Rollback , on page 450
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Related Topics

- Rolling Back Configurations to Devices Using the Deployment Manager , on page 452
- Using Rollback to Deploy Archived Configurations , on page 453

Understanding Rollback for Devices in Multiple Context Mode

If the configuration of the system execution space to which you are rolling back specifies connectivity options to security contexts (for example, vlan config) and there is a mismatch between the configuration selected for rollback and the current running configurations of the security contexts, Security Manager might not be able

to connect to the security contexts. In such cases. we recommend that you roll back configurations for the security contexts before rolling back a configuration for the system execution space.

If you roll back a configuration for the system execution space of a device in multiple context mode to one that includes a different set of security contexts, after rollback the security contexts on the device might not match the security contexts managed by Security Manager that appear in the Device selector.

Related Topics

- Rolling Back Configurations to Devices Using the Deployment Manager , on page 452
- Using Rollback to Deploy Archived Configurations , on page 453
- Commands that Can Cause Conflicts after Rollback , on page 450
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Understanding Rollback for Failover Devices

If you roll back a configuration for a security context that contains a failover policy, Security Manager initially disables failover in the system execution space and both devices become active. After the rollback is completed, the devices should return to their failover configuration.

If a switchover occurs during rollback or connectivity between the active and standby units is lost, copy the bootstrap configuration to the standby unit after rollback completes. For more information, see Bootstrap Configuration for LAN Failover Dialog Box , on page 1986.

Security Manager can proceed with rollback action if and only if the following conditions are met:

- Both the Primary unit and Secondary unit must be in Active state.
- If configured on a link, the link must be up.
- If configured on LAN, the interface must be up.

Related Topics

- Rolling Back Configurations to Devices Using the Deployment Manager , on page 452
- Using Rollback to Deploy Archived Configurations , on page 453
- Commands that Can Cause Conflicts after Rollback , on page 450
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Understanding Rollback for Catalyst 6500/7600 Devices

If you roll back a configuration to a Catalyst 6500/7600 device that specifies connectivity options to service modules (for example, vlan config) and there is a mismatch between the configuration selected for rollback and the current running configuration, Security Manager might not be able to connect to the service modules. We recommend that you roll back configurations for the service modules before rolling back a configuration to the Catalyst 6500/7600 chassis.

Thus, the proper order for performing rollback on Catalyst 6500/7600 devices is:

1. Security contexts.

2. Service modules.
3. Chassis.

We recommend performing rediscovery after the rollback operation is complete.

If you are rolling back an FWSM deployment and the system is configured to retrieve security certificates when adding devices, you might need to retrieve the certificate after the rollback operation is complete. This can be done using either of the following methods:

- Retrieving the certificate on a per-device basis from Device Properties.
- Configuring Security Manager to automatically retrieve certificates after rollback. To do this, select **Tools > Security Manager Administration > Device Communication**, then select **Retrieve while adding devices** in the PIX/ASA/FWSM Device Authentication Certificates field (in SSL Certificate Parameters).

- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Understanding Rollback for IPS and IOS IPS

Note From version 4.17, Cisco Security Manager does not support FWSM, IPS, and PIX devices. In addition, from this release, Cisco Security Manager will not provide any enhancements.

Special considerations apply to the rollback of IPS devices and IOS IPS devices. For IPS devices and IOS IPS devices, rollback could possibly include rolling back sensor updates or signature updates. The reason for this is that for IPS devices and IOS IPS devices, Security Manager supports not only the management of configuration but also the support of image management in the form of manual and automatic upgrades and signature updates. Keep in mind that when you do a rollback, you are rolling back the configuration, not the sensor updates or signature updates. These updates are downgraded only if the configuration cannot be rolled back without downgrading the updates.

Rollback is accomplished through Configuration Archive. For IPS devices and IOS IPS devices, only the current configuration is archived. The current configuration for one device version (say, Version X) may not be valid for a different device version (say, Version Y). Security Manager rolls back a configuration of Version X to a sensor with Version Y as long as the configuration for X is valid for Y.

If the configuration for X is valid for Y, rollback proceeds and Security Manager displays a confirmation dialog box to you. If the configuration for X is not valid for Y, Security Manager displays a warning dialog box to you and provides you with the option of downgrading the sensor during rollback if such a downgrade will help accomplish the rollback.

Caution Downgrading an IPS device removes certain capabilities of the IPS device. For example, downgrading the engine prevents you from applying the latest signature updates. Operation of an IPS device without the latest signature updates diminishes the effectiveness of the IPS device.

For rollback of a deployment job, the warning dialog box contains one or more of the following types of warnings:

- Security Manager warns you about IPS devices that need to have their sensor version downgraded before a rollback can be performed.
- Security Manager warns you about IOS IPS devices whose signature level has changed. For these devices, only the non-IPS sections of the configuration can be rolled back.
- Security Manager warns you about IPS devices that must be downgraded more than one level, and as a result, Security Manager cannot do it. You must use the Cisco IPS CLI for such downgrades. The warning dialog box displays the version to which the device must be reimaged or downgraded.

Note The option of downgrading an IOS IPS device during rollback is not available, because IOS IPS devices do not support downgrade.

If the option of downgrading the sensor during rollback will not help accomplish the rollback, you receive an error message stating that rollback cannot occur and that you need to manually reinstall the image on the device to roll back. Only the update package most recently installed on a device can be downgraded, so downgrade does not help in the following cases:

- Rollback of a deployment (signature update) that involves downloading more than one update package to the device.
- Selection of an old deployment or configuration for rollback subsequent to which several upgrades occurred.
- Rollback of an upgrade that cannot be downgraded. Major, minor, and most service pack upgrades cannot be downgraded, as shown in Table 114: Downgrade Support for Possible Sensor Upgrade Types , on page 449

For rollback of a configuration that requires a downgrade to a version prior to Cisco IPS 5.1(4), Security Manager does not support automatic downgrade. You must manually downgrade the device to the specified version and then proceed with rollback.

Table 114: Downgrade Support for Possible Sensor Upgrade Types

Upgrade Type	Downgrade Support
Major Upgrade	Downgrade is not supported.
Minor Upgrade	Downgrade is not supported.
Service Pack Update	Downgrade from Cisco IPS 5.1(4) onward is not supported.
Patch update	Downgrade is supported.

Upgrade Type	Downgrade Support
Signature Update	Downgrade is supported.
Engine Update	Downgrade is supported.
Repackage (applicable to major, minor, and service pack updates).	Repackages for service packs prior to 5.1(4) can be downgraded.

Caution Outbreak Prevention updates on a particular device may be lost if that device is downgraded.

During rollback, if Security Manager discovers that there have been out-of-band changes to the device that prevent rollback, you will receive an error message stating that rollback is prevented.

Commands that Can Cause Conflicts after Rollback

The following commands can potentially cause conflicts after rollback is performed:

- **http server enable** *port***http** *ip_address net_mask interface_name*

Applicable only to security contexts (not the system execution space).

- **allocate-interface** {*physical_interface* | *subinterface* } **[map_name] [visible | invisible]**

Applicable only to the system execution space under the context subcommand.

- **config-url** *diskX:/path/filename*

Applicable only to the system execution space under the context subcommand.

- **join -failover-group** *group_number*

Applicable only for active/active failover and only to the system execution space under the context subcommand. The failover group defaults to group 1 if not specified.

- **failover**

Applicable only to the system execution space. Enabling failover causes configuration synchronization to trigger between peers.

- **failover lan enable**

Applicable only to the system execution space. If this command is omitted, this implies serial cable failover on a PIX platform or warrants an incomplete failover configuration warning on ASA and FWSM.

- **failover lan unit** {*primary* | *secondary* }

Applicable only to the system execution space. If this command is not specified, both units are secondary by default. If rollback takes place on the wrong unit, both can become primary, which impacts which unit becomes active initially.

- **failover group** *group_number*

Applicable only to the system execution space. This command enables active/active failover. If this command is omitted, active/standby is enabled.

- **preempt** *delay*

Applicable only to the system execution space and under the failover group subcommand to force which failover group becomes active if both units are booted up at the same time, or the primary does not boot up within the delay specified.

- **monitor-interface** *interface_name*

Applicable only to security contexts and used to enable health monitoring of critical interfaces. If this interface is 'bounced' or fails, a switchover could occur.

Related Topics

Commands to Recover from Failover Misconfiguration after Rollback

If a switchover happens during rollback and the two units are no longer synchronized, you might need to use the following commands to recover:

- **failover active** *group_number*
- **failover reset** *group_number*
- **failover reload-standby**
- **clear configure failover**

For more information on these commands, please refer to the command reference for your security appliance.

- Commands that Can Cause Conflicts after Rollback , on page 450

Rolling Back Configurations to Devices Using the Deployment Manager

If you deploy configurations to devices and then determine that there is something wrong with the new configurations, you can revert to and deploy the previous configurations for those devices. You cannot roll back to a previous configuration if there are no previous configurations in the Configuration Archive.

You can roll back configurations only to configurations that were deployed to the device, not to a file. For information on how to roll back a configuration that was deployed to a file, see Performing Rollback When Deploying to a File , on page 454.

You can also use the Configuration Archive tool to roll back to any configuration archived from a device. For more information, see Using Rollback to Deploy Archived Configurations , on page 453.

Caution Roll back configurations only in extreme circumstances. It is usually a better idea to fix the configuration in Security Manager and deploy the fixed configuration, because rolling back a configuration creates a situation where the configuration defined in Security Manager is not the same one running on the device. After rollback, you should rediscover policies on the device to make the device configuration and its configuration in Security Manager consistent. Roll back configurations only in extreme circumstances. Before proceeding, read the following topics.

- Understanding Configuration Rollback , on page 445
- Understanding Rollback for Devices in Multiple Context Mode , on page 446
- Understanding Rollback for Failover Devices , on page 447
- Understanding Rollback for Catalyst 6500/7600 Devices , on page 447
- Understanding Rollback for IPS and IOS IPS , on page 448
- Commands that Can Cause Conflicts after Rollback , on page 450
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Before You Begin

When you roll back a configuration, the action is not done as part of an activity or configuration session, which means the device is not locked. Thus, it is possible that two users might roll back configurations simultaneously on a device, which can generate unexpected problems. Before rolling back a configuration, ensure that there are no active deployment jobs for the device listed in the Deployment Manager window.

Related Topics

- Viewing Deployment Status and History for Jobs and Schedules , on page 405
- Job States in Non-Workflow Mode , on page 385
- Job States in Workflow Mode , on page 387

Step 1 Click the **Deployment Manager** button in the Main toolbar. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the deployment job (which must be in the Deployed or Failed states) and click **Rollback**.

The Rollback a Job dialog box opens. The dialog box lists all of the devices included in the job, including the name of the device, the deployment method (file or device), the status of the previous deployment, and the name of the deployment job that last updated the device.

Step 3 Select the devices for which you want to roll back configurations by checking the check box in the Selection column. You can select only devices that used the deploy to device method. By default, all the devices with the status Succeeded are selected.

You can view the configuration that will be deployed to a device by highlighting the row for a device and clicking the **Preview Config** button. You can compare it to the last deployed configuration or the current running configuration. For more information, see Previewing Configurations , on page 424.

Step 4 Click **OK**. You are asked to confirm the action.

Step 5 (Optional) To make the configuration defined in Security Manager consistent with the one running on the device, rediscover the device policies as described in Discovering Policies on Devices Already in Security Manager , on page 181.

Using Rollback to Deploy Archived Configurations

You can roll back any configuration version from Configuration Archive to the device for which it is archived, provided that the configuration was deployed to the device or originated from the device. The rolled-back configuration then becomes another archived version in the list for that device. For information on how to roll back a configuration that was deployed to a file, see Performing Rollback When Deploying to a File , on page 454.

Before You Begin

Tip When you roll back a configuration, the action is not done as part of an activity or configuration session, which means the device is not locked. Thus, it is possible that two users might roll back configurations simultaneously on a device, which can generate unexpected problems. Before rolling back a configuration, check the Deployment Manager to ensure that there are no active deployment jobs for the device (select **Manage > Deployments**).

Roll back configurations only in extreme circumstances. Before rolling back configurations, carefully read these topics:

- Understanding Configuration Rollback , on page 445
- Understanding Rollback for Devices in Multiple Context Mode , on page 446
- Understanding Rollback for Failover Devices , on page 447
- Understanding Rollback for Catalyst 6500/7600 Devices , on page 447
- Understanding Rollback for IPS and IOS IPS , on page 448
- Commands that Can Cause Conflicts after Rollback , on page 450
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451

Related Topics

- Rolling Back Configurations to Devices Using the Deployment Manager , on page 452

- Adding Configuration Versions from a Device to the Configuration Archive , on page 441
- Managing Deployment, on page 381
- Viewing and Comparing Archived Configuration Versions , on page 441

Step 1 Select **Manage** > **Configuration Archive** to open the Configuration Archive (see Configuration Archive Window , on page 403).

Step 2 In the Device selector, select the device for which you want to roll back to a different configuration version. The archived configurations appear in the right pane.

Step 3 Select the configuration version to which you want to roll back. You can roll back only to a configuration that was deployed to the device or that originated from the device. You cannot roll back to a configuration that was deployed to a file.

Tip To view the configuration version before rollback, click **View**.

Step 4 Click **Rollback** to deploy the selected configuration version to the device. A progress box appears, followed by a notification message when the configuration version is successfully deployed.

Step 5 (Optional) To make the configuration defined in Security Manager consistent with the one running on the device, rediscover the device policies as described in Discovering Policies on Devices Already in Security Manager , on page 181.

However, it is usually better to correct the policies for the device and to then redeploy the updated configuration. This preserves your changes and shared-policy configuration for the device, which would otherwise be removed if you rediscover policies.

Performing Rollback When Deploying to a File

You cannot directly perform rollback when deploying to a file instead of to a device. Use this procedure to revert to a previously stored configuration when deploying to file.

Related Topics

- Understanding Configuration Rollback , on page 445
- Understanding Rollback for Devices in Multiple Context Mode , on page 446
- Understanding Rollback for Failover Devices , on page 447

- Understanding Rollback for IPS and IOS IPS , on page 448
- Commands to Recover from Failover Misconfiguration after Rollback , on page 451
- Commands that Can Cause Conflicts after Rollback , on page 450

Step 1 Select **Manage** > **Configuration Archive** to open the Configuration Archive (see Configuration Archive Window , on page 403).

Step 2 In the Device selector, select the device for which you want to roll back to a different configuration version. The archived configurations appear in the right pane.

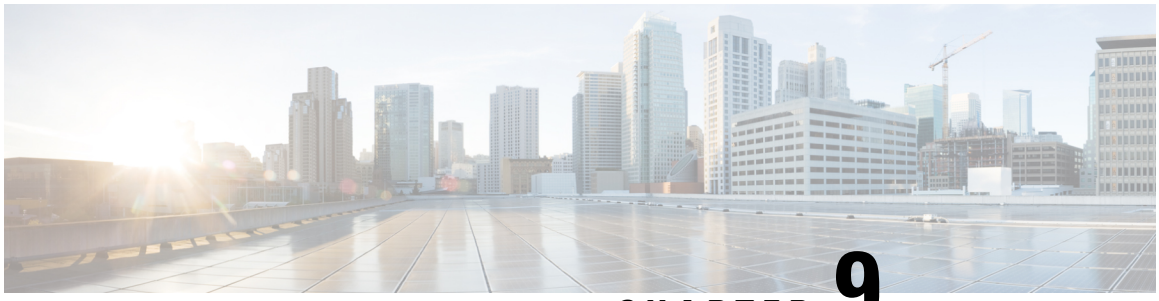
Step 3 Select the configuration version to which you want to roll back and click **View**.

Step 4 In the Configuration Version Viewer window, make sure the Config Type is set to Full.

Step 5 Click in the left-hand pane, then press Ctrl+A followed by Ctrl+C to copy the selected configuration to the Windows clipboard.

Step 6 Open a text editor such as NotePad, then press Ctrl+V to paste the contents of the clipboard into the text file.

Step 7 Save the file. You can use this file to perform manual rollback.



CHAPTER 9

Troubleshooting Device Communication and Deployment

One of the more likely areas where you can run into problems is with actions where Security Manager must log into a device. These types of actions include policy discovery and deployment using live devices, or actions that involve retrieving information from a device.

The key point to remember is that the communication pathway is from the Security Manager server to the device; the workstation on which you are running the Security Manager client is not involved in device communication (unless the server is installed on the same machine, of course). The Security Manager server must have a network pathway to the device as well as the correct credentials and certificates to authenticate with the device for communication to be successful.

The following topics can help you troubleshoot general device communication and policy deployment problems:

Testing Device Connectivity

Security Manager must be able to connect to and log into a device in order to manage it. You can test whether Security Manager can use the credentials and transport method you have defined within Security Manager for this purpose.

You can test connectivity only for devices that have static IP addresses. You also cannot test connectivity for devices that use Token Management Server (TMS) as the transport protocol.

If you add a device from the network or from an inventory file to the inventory, Security Manager tests connectivity automatically.

You can manually test device connectivity for any device in the inventory or for new devices that you are adding manually. The following procedure describes how to test connectivity for devices that are already in the inventory. When adding devices manually, click **Test Connectivity** on the Device Credentials page of the New Device wizard to perform the test described below. For more information on adding devices manually, see Adding Devices by Manual Definition , on page 94.

Before You Begin

Security Manager uses the settings on the Device Communication page to determine the connection timeout, how often to retry the connection, the transport protocol, and which credentials to use. To configure these settings, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents.

Related Topics

- Understanding the Device View , on page 71
- Viewing or Changing Device Properties , on page 109
- Device Communication Page , on page 532

Step 1 In Device view, do one of the following in the Device selector to open the Device Properties dialog box:

- Double-click a device.
- Right-click a device and select **Device Properties**.
- Select a device and select **Tools > Device Properties**.

Step 2 Select **Credentials** from the table of contents.

Step 3 Click **Test Connectivity**.

The Device Connectivity Test dialog box opens and displays the progress of the test, including the protocol being used (see Device Connectivity Test Dialog Box , on page 459). You can abort the test while it is running. When the test is finished, click **Details** to see:

- For successful tests, the output of the **show version** command or the **getVersion** command (for IPS Sensors and Cisco IOS IPS Sensors). You can select the text, press Ctrl+C to copy the text to the clipboard, and then paste it into another file for later analysis.
- For unsuccessful tests, the error information. Some common problems are:
  - The username or password is incorrect.
  - The wrong protocol is selected. For example, the device might not be configured to respond to the selected protocol.
  - The device is not configured to accept connections correctly. Ensure that at least one supported protocol is configured.
  - The wrong operating system is specified for the device (for example, you specified PIX for an ASA device).
  - If you are using ACS authentication and the connection to the device is completed, you can get errors when Security Manager tries to obtain version information if you do not have Control authorization.
  - There might be general network configuration problems. Test connectivity to the device from outside of Security Manager. Look for hardware, media, and booting errors, excessive traffic causing queues to overflow, duplicate MAC or IP addresses on the device, physical discrepancies, such as link, duplex, and speed mismatch, or logical discrepancies, such as VLAN and VTP inconsistencies or ATM network misconfiguration.

Device Connectivity Test Dialog Box

Use the Device Connectivity Test dialog box to view whether Security Manager can contact the device using the configured credentials.

Navigation Path

To start the device connectivity test, click **Test Connectivity** from the Credentials page in one of these areas:

- New Device wizard when adding a device manually. See Adding Devices by Manual Definition , on page 94.
- Device Properties. To open the page, double-click a device in the Device selector or select **Tools > Device Properties**.

The connectivity test is done automatically when you click **Next** or **Finish** on the Credentials page when adding a device from the network.

Field Reference

Table 115: Device Connectivity Test Dialog Box

Element	Description
Connectivity Protocol	The transport protocol being used to log into the device. Security Manager uses the protocol specified in the device properties for the device, which is usually the default protocol configured on the Device Communications page (see Device Communication Page , on page 532).
Connectivity Status	Displays the status of the test and the time elapsed since the start of the test.
Details button	Click this button to display detailed information about the result of the test. • Passed tests—The details display the output of the **show version** command for PIX Firewall, Adaptive Security Appliances (ASA), Firewall Service Modules (FWSM), Cisco IOS routers, and VPN Services Modules (VPNSM), or the output of the **getVersion** command for IPS Sensors and Cisco IOS IPS Sensors. You can copy the command output and paste it into a file for analysis. • Failed tests—The detailed error message.
Abort button	Stops the connectivity test before it is completed.

Managing Device Communication Settings and Certificates

If you discover device inventory and policies directly from devices, or deploy configurations to devices rather than to files, you must configure Security Manager to use the transport protocols that your devices use. For some device types, only one transport protocol is supported, so you do not need to make a choice. For other devices, such as Cisco IOS routers, you have options concerning the protocols you use.

Security Manager has default settings for transport protocols that are the most-used protocols for each device type. To change these settings, select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents (see Device Communication Page , on page 532).

For most users, the communication settings that require management are the certificates used for SSL (HTTPS) connections and the public keys used for SSH connections. You might update the certificates and keys on the device, which would leave Security Manager holding an outdated copy.

The following topics provide more information about managing certificates and keys, and how to troubleshooting device communications:

- SSL certificates—You can configure Security Manager to automatically replace certificates using the ones obtained from the device on the Device Communication page. If you decide to manually manage the SSL certificate store, see Manually Adding SSL Certificates for Devices that Use HTTPS Communications , on page 461. The following topics provide more information about certificate errors:
  - Security Certificate Rejected When Discovering Device , on page 462
  - Invalid Certificate Error During Device Discovery , on page 463
  - Managing IPS Certificates , on page 1786

Tip Ensure that all PIX Firewalls and Adaptive Security Appliances that you intend to manage with Security Manager have a 3DES/AES license. See Understanding Device Communication Requirements , on page 57.

- SSH Public Keys—By default, Security Manager replaces public keys with the new ones obtained during SSH connections. If you have problems with SSH communications, see Troubleshooting SSH Connection Problems , on page 463.
- General Device Communication Troubleshooting—For other problems you might encounter, see Troubleshooting Device Communication Failures , on page 464.

Multiple Certificate Authentication Support

Beginning from version 4.13, the Cisco Security Manager supports ASA 9.7.1 feature of multiple certificate authentication for VPN connectivity. ASA, in its release 9.7.1, has introduced multiple certificate authentication support to its VPN client customers. Thus, the client can authenticate remote VPN users with two client certificates. The two client certificate could be a combination of one user certificate and one machine certificate, or two user certificates. Two machine certificate authentication is not supported for security considerations. The multiple certificate authentication works for both SSL VPN and IPsec VPN.

In Cisco Security Manager 4.13, to enable the multiple certificate authentication support, you are required to appropriately specify the AAA authentication method (see AAA Tab (Connection Profiles) , on page 1338) and configure the DAP policy (see Add/Edit DAP Entry Dialog Box Multiple Certificate Authentication, on page 1460).

Manually Adding SSL Certificates for Devices that Use HTTPS Communications

Note In addition to the techniques described in this topic, for IPS devices you can use the IPS Certificates utility to manage the certificates in Security Manager's certificate data store. For more information, see Managing IPS Certificates , on page 1786.

When you use SSL (HTTPS) as the transport protocol for communicating with IPS, PIX, ASA, or FWSM devices, or Cisco IOS routers, you can configure Security Manager to automatically retrieve the device authentication certificate when adding the device (see Device Communication Page , on page 532).

Tip Having an accurate certificate is required for successful HTTPS communications; Security Manager cannot communicate with the device without the correct certificate, which prevents configuration deployment. When using self-signed certificates, the device might create a new certificate if Security Manager attempts to access it using the wrong certificate. Thus, it is best to configure Security Manager to always retrieve the certificate from the device.

Instead of having Security Manager automatically retrieve the certificates, you can manually add them to increase the level of network security. On the Device Communication page, you would configure the device authentication setting for the device type as **Manually add certificates**.

The easiest way to manually update the certificate for a device is to retrieve it from the device. Right-click the device and select **Device Properties**. Click **Credentials** to open the Credentials page, and then click **Retrieve From Device** to the right of the **Authentication Certificate Thumbprint** field. Security Manager retrieves the certificate and prompts you to accept it. You might need to do this if you encounter certificate problems during configuration deployment. (You can also type or paste the certificate into this field.)

You can also manually type in, or copy and paste, the certificate thumbprint without having Security Manager log into the device. Use the following procedure to manually enter the SSL certificate thumbprint for a device if you configured that device type to require manually added certificates.

Tip Security Manager allows you to generate a 2048-bit self-signed certificate under **Megamenu > Server Administration > Server > Security > Single Server Management > Certificate Setup.**

Tip To reach the Megamenu, double-click the Cisco Security Manager icon on your server desktop and log on. Another way to reach the Megamenu is as follows: Windows > Start > All Programs > Cisco Security Manager > Cisco Security Manager > [log on]. This second navigation path may differ slightly, depending upon how you have personalized your Windows Server installation.

Before You Begin

Obtain the certificate thumbprint (a hexadecimal string) for the device.

Tip If the thumbprint is not readily available, you can copy it from the error message that is displayed when you add the device from the network or from an export file.

Step 1 Select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents to open the Device Communication page (see Device Communication Page , on page 532).

Step 2 Click **Add Certificate** to open the Add Certificate dialog box (see Add Certificate Dialog Box , on page 535).

Step 3 Enter the DNS hostname or IP Address of the device, the certificate thumbprint in hexadecimal format, and click **OK**. The thumbprint is added to the certificate store.

Tip To erase an existing thumbprint, leave the Certificate Thumbprint field empty.

Security Certificate Rejected When Discovering Device

If an error occurs when you attempt to discover a device, and the error message states that the security certificate received from the device was rejected, you need to update the certificate. You can do this using one of the following methods:

- For IPS devices only, select **Manage > IPS > IPS Certificates** and synchronize the certificates. You might also need to regenerate the certificate. For more information, see Managing IPS Certificates , on page 1786.
- Manually enter the thumbprint required by the certificate by doing one of the following:
  - Select **Tools > Security Manager Administration > Device Communication**. Click **Add Certificate**, enter the IP address of the device, then copy and paste the thumbprint displayed in the error message into the Certificate Thumbprint field.
  - Right-click the device and select **Device Properties > Credentials**. Copy and paste the thumbprint displayed in the error message into the Authentication Certificate Thumbprint field.

You must manually enter the thumbprint whenever you add a new device using the Add New Device or Add From Configuration File options and when you perform rediscovery. It is not required when you add a new device using the Add New Device From Network or Add Device From File options.

- Configure the SSL certificate settings to automatically retrieve the certificate when adding devices. You can select different settings for IPS, router, and ASA/PIX/FWSM devices. To configure these settings, select **Tools > Security Manager Administration > Device Communication**, and look at the **SSL Certificate Parameters** group.

Invalid Certificate Error During Device Discovery

If the time settings on the device and Security Manager are not in synchronization, when you try to discover policies on a device (adding it to the inventory or rediscovering policies on a device already in the inventory), an error message might state that the certificate is not yet valid.

When the time set on the Security Manager server is lagging behind the time set on the device, Security Manager cannot validate the device certificate if the start time of the validity period is ahead of the Security Manager time setting. Even if the time zones configured on the device and Security Manager are the same, the invalid certificate error occurs if the daylight saving time (summertime) settings are different. To resolve this problem, make sure that the daylight saving time settings are the same on the device and Security Manager, regardless of whether the time zone is the same. After setting the daylight saving time, synchronize the clock on the device with Security Manager so that both of them display the same time.

To obtain best results, we recommend that you set the same time zone on the device and Security Manager, and modify the time zone after you discover the certificates at a later time, if necessary.

Related Topics

- Manually Adding SSL Certificates for Devices that Use HTTPS Communications , on page 461
- Managing IPS Certificates , on page 1786
- Adding Devices to the Device Inventory , on page 77
- Preparing Devices for Management, on page 57

Troubleshooting SSH Connection Problems

For devices that use SSH as the transport protocol, Security Manager automatically detects the appropriate SSH version (1.5 or 2) to use with each device. During SSH version 2 connections, Security Manager automatically negotiates encryption algorithms or ciphers with the device. Security Manager also automatically overwrites the SSH public key for the device if the key changes. Thus, you typically will not run into SSH connection problems.

If you do have SSH connection problems, consider these fixes:

- If the public key on the device changed, and SSH connections are failing due to a key problem, remove the key for the device from the Program Files/CSCOpx/MDC/be/tmp/.shh/known_hosts file on the Security Manager server and retry the operation.
- Security Manager uses 3DES (Data Encryption Standard) as the default encryption algorithm. If this is not the correct algorithm for your devices, either change the configuration of your devices, or update the Program Files/MDC/athena/config/DCS.properties file to indicate the correct algorithm on the DCS.ssh.encipher property. (Contact Cisco TAC if you need more help). You must restart the Security Manager daemon manager if you change this file.

Related Topics

- Preparing Devices for Management, on page 57
- Device Communication Page , on page 532
- Device Credentials Page , on page 114

Troubleshooting Device Communication Failures

If Security Manager fails to communicate with a device, for example, by failing to log into it, during discovery, deployment, or other actions, look at these areas to identify and resolve the problem:

- Ensure the device is operational.
- Check which transport protocol is selected. You must select a protocol that the device is configured to accept. For most devices, the protocol is selected on the Device Properties General page (select **Tools > Device Properties > General**). For IPS devices, the IPS RDEP mode is selected on the device properties Credentials page.

For IOS devices that do not have a K8 or K9 crypto image, ensure that you select Telnet as the protocol.

Some methods of adding devices also allow you to select a non-default transport protocol. To configure the default transport protocols for classes of devices, select **Tools > Security Manager Administration > Device Communications**.

- On the Device Properties General page, ensure that the hostname, domain name, and IP address are correct. Keep in mind that the Hostname and Accounts and Credentials policies for the device define the actual names and credentials that get configured on the device. However, the policies are not used for device communication. If you make changes to the policies that affect the credentials you are using for device communication, you must also manually update the device properties.
- Make sure DNS names can be resolved from the Security Manager server. You might need to fix the DNS settings on the server.
- Check the credentials for the device in Security Manager and ensure that they are correct and that there is a route between the server and device. Right-click the device, select **Device Properties**, select the Credentials tab, and click the **Test Connectivity** button. If the connection fails, check error messages to determine whether the problem is connectivity or credentials. Update the credentials in the device properties if necessary.

When adding new devices the credentials are defined within the New Device wizard if your method of adding the device requires credentials. Keep the following in mind:

- The primary credentials are used for SSH and Telnet connections.
- The HTTP/HTTPS credentials are used for HTTP and SSL connections unless you select **Use Primary Credentials**, in which case the primary credentials are also used for these connections.
- Beginning with version 4.11, Security Manager does not support the device SSL Certificates using MD5 algorithms. If the device SSL uses MD5 algorithms, Security Manager throws up an error when you try to add the device to Security Manager. This happens because JRE, by default, disables the MD5 algorithms due to security vulnerability. To resolve this, you must use higher encryption algorithm for device SSL certificate.

- Beginning with version 4.19, Cisco Security Manager does not support the device SSL Certificates using DES algorithms. If the device SSL uses DES algorithms, Security Manager throws up an error when you try to add the device to Security Manager. This happens because the JRE, by default, disables the DES algorithms due to security vulnerability. To resolve this, you must use higher encryption algorithm for device SSL certificate, or follow the steps below:
  - Stop Security Manager server services.
  - Ensure you take a backup of MDC\vms\jre\lib\security\java.security properties.
  - In properties, find "jdk.tls.disabledAlgorithms=SSLv3, DES, MD5withRSA, DH keySize <1024, \ EC keySize < 224, RC4_40, 3DES_EDE_CBC" and remove "DES" from the list.
  - Start Security Manager server services again.

Resolving Red X Marks in the Device Selector

If a device is marked with a red X in the device selector in Device view, it means that the Auto Update Server (AUS) or Configuration Engine server assignment for the device was lost during an upgrade from a Security Manager release prior to 3.2.0. AUS and Configuration Engines are not migrated during an upgrade from 3.1.x, and devices managed by them need to be reassigned to them after the upgrade using the following procedure.

Step 1 Do one of the following in Device view:

- From the Device selector, right-click a device with a red X icon, then select **Update Server Info**.
- Click any red X icon in the device selection tree. A warning message is displayed stating that AUS and Configuration Engine information was not migrated after the upgrade process. Click **Yes** to add these servers manually.

The Device Server Assignment dialog box opens.

Step 2 From the Available Devices list, select all the devices that use the same AUS or Configuration Engine server and click >> to move them to the selected list. The Available Devices list includes all devices that are managed by AUS or Configuration Engine that are marked with a red X.

Step 3 Select the AUS or Configuration Engine that manages the selected devices from the Server list. If the correct server is not listed, select **+ Add Server...** to add it to the inventory using the Server Properties Dialog Box , on page 106.

For more information on adding AUS or Configuration Engine servers to the inventory, see Adding, Editing, or Deleting Auto Update Servers or Configuration Engines , on page 105.

Step 4 Repeat the process until no device is marked with a red X.

Troubleshooting Deployment

The deployment process is one of the most likely areas in which you will encounter problems when using Security Manager. There are many different processes involved in deployment that influence whether the deployment job is successful:

- Security Manager itself.
- The stability and availability of your network, including links to remotely-managed devices.
- Any bugs inherent in the versions of the operating systems that you are using on your network devices that affect the commands Security Manager is trying to deploy (Security Manager is not immune to these bugs).
- The licenses you have enabled on the device, because many security commands require specific device licenses.
- The specific features supported by your devices, which Security Manager cannot always determine ahead of time. For example, some platforms support features only if the device has a certain minimum RAM, and some interface settings are available for specific interface cards only.
- The correct functioning of interim applications such as AUS, Configuration Engine, or your TMS server.

If you encounter deployment failures, examine the messages in the deployment status window carefully. In addition, the following topics address some of the problems you might encounter:

- Changing How Security Manager Responds to Device Messages , on page 466

Changing How Security Manager Responds to Device Messages

Security Manager has built-in responses to many of the response messages that can be encountered when configuring a device. You might find that messages Security Manager treats as errors are messages that you want to ignore or treat as informational. Although you can configure your deployment jobs to ignore errors, you might instead want to update Security Manager to treat specific messages differently using a properties file.

It is important to understand that setting the properties file to ignore the error is not always sufficient. Deployment can fail because the **Allow Download on Error** check box (located on the **Tools > Security Manager Administration > Deployment** page) is deselected by default. The following table provides details about how Security Manager behaves when an error occurs during deployment, the **Allow Download on Error** option is either selected or deselected, and the **Save Changes Permanently on Device** option is selected or deselected.

Table 116: Deployment Device Error Handling for SSL and SSH on PIX Firewall, ASA, and Cisco IOS Routers

Allow Download on Error	Error Occurred	Error Ignored Using Warning Expression	Deployment Status	Write Memory Done
Selected	Yes	No	Failed	Based on whether **Save Changes Permanently on Device** is selected.
Selected	Yes	Yes	Success	Based on whether **Save Changes Permanently on Device** is selected.
Selected	No	Not applicable	Success	Based on whether **Save Changes Permanently on Device** is selected.
Deselected	Yes	No	Failed (Deploy not Completed message)	No.
Deselected	Yes	Yes	SSL (ASA, PIX, IOS devices)—Failed SSH (IOS devices—Success	SSL—No. SSH (IOS devices)—Based on whether **Save Changes Permanently on Device** is selected.
Deselected	No	Not applicable	Success	Based on whether **Save Changes Permanently on Device** is selected.

Note On Cisco IOS routers using the SSL protocol, deployment on devices stops on command syntax errors. It does not stop when configuration-related errors occur.

To change how Security Manager treats a message, you need to update the DCS.properties file in \CSCOpx\MDC\athena\config folder in the installation directory (usually c:\Program Files). Use a text editor such as NotePad to update the file.

It is easiest to determine the message you want to ignore by looking at the transcript of a deployment job that encountered the error using the following procedure.

Related Topics

- Viewing Deployment Status and History for Jobs and Schedules , on page 405

Step 1 Click the **Deployment Manager** button in the Main toolbar.

The Deployment Manager window appears. Click the **Deployment Jobs** tab if it is not active.

Step 2 Select the job with the error message.

Step 3 Click the **Transcript** button in the Deployment Details tab to open the transcript.

Step 4 Identify the error text that you want to ignore.

Step 5 Locate the appropriate warning expressions property in the DCS.properties file. For example, for PIX devices the property is called **dev.pix.warningExpressions**, whereas for IOS devices the property is called **dev.ios.warningExpressions**.

Tip Conversely, you can make device responses that are not tagged with the Error prefix to appear as error messages. To do this, add the message to the Error Expressions list (for example, **dev.pix.ErrorExpressions**).

Step 6 Add the error text to the warning expressions list. The warning message should be a generic regular expression string. Except for the last expression, you must delimit all expressions with "$\". For example, if the message you want to ignore is "Enter a public key as a hexadecimal number," enter the following string:

.*Enter a public key as a hexadecimal number .*$

Step 7 Restart the CiscoWorks Daemon Manager.

Memory Violation Deployment Errors for ASA 8.3+ Devices

ASA Software release 8.3+ requires significantly more device memory than previous versions of the ASA software. If you upgrade an ASA device that does not meet the minimum memory requirements, the upgrade process notifies you of the problem and the device regularly sends syslog messages until the minimum memory requirement is met.

Because an ASA device that does not meet the minimum memory requirements can function poorly, Security Manager does not deploy configurations to these devices, although you are allowed to add the device to the inventory and discover policies from it. However, if you try to deploy policies to the device before you add memory, you get a deployment error stating that the device does not meet the minimum memory requirements and deployment fails.

The best way to resolve the error is to add memory to the device. For information about ASA devices and memory upgrade possibilities, see http://www.cisco.com/go/asa .

Alternatively, you can downgrade the ASA software version, in which case you should delete the device from the inventory, then add it back to the inventory and discover policies.

Error While Attempting to Remove Unreferenced Object

If you enable the Remove Unreferenced Object Groups from Device option on the **Tools > Security Manager Administration > Deployment** page, Security Manager will remove objects during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an object, Security Manager will still attempt to delete that object during deployment. In such cases, deployment will fail with a transcript error indicating that it was unable to delete the object as the object is being used. To successfully deploy, disable the Remove Unreferenced Object Groups from Device option.

Security Manager Unable to Communicate With Device After Deployment

There are a number of policies that you can configure in Security Manager that prevent access to a device. That is the point of security, ensuring that unwanted hosts cannot enter your network or network devices.

However, you can inadvertently lock the Security Manager server out of a device, making it impossible for Security Manager to deploy configurations to it or manage it. If you find that after a deployment, Security Manager can no longer contact a device, and you have already checked that the device is up and running and otherwise functioning normally, look into the following policies to see if they are causing the lock-out:

- **Firewall > Access Rules, or Firewall > Zone Based Firewall Rules** —If you use these policies, the rules must allow management traffic from the Security Manager server. Consider allowing at least HTTP, HTTPS, SSH, and Telnet. Consider creating a shared policy that defines the required access for Security Manager and applying it to all devices. Keep in mind that if you create any rules in these policies, an implicit rule is added to the end of the policy that denies any traffic that is not explicitly allowed.
- **NAT policies**—Make sure that you are not using a local address on the device as the original address to be translated. Translating this address might result in translating the management traffic sent between Security Manager and the device, causing the interruption.
- **Device Access policies on routers**—Security Manager might loose contact with a device after you unassign a device access policy from the device and redeploy it. Device access policies can be used to define the enable password for accessing the device. If you unassign this policy and redeploy, the password is removed from the device. In such cases, the device typically reverts to the default password. However, in some cases, the device might contain an additional password that is unknown to Security Manager, such as a line console password. If this additional password exists, the device reverts to that password instead of the default password. If that happens, Security Manager cannot configure this device. Therefore, if you use a device access policy to configure the enable password or enable secret password on a device, make sure that you do not unassign the policy without assigning a new policy before the next deployment.
- **Site-to-Site VPNs**—If you lose communication with a spoke in a VPN, the problem can occur when the Security Manager server communicates with an external interface on the spoke from within the hub's protected network. We recommend that when you add the hub device to Security Manager that you define a management IP address that is located outside of the hub's protected network.
- **Platform > Device Admin > Device Access > Allowed Hosts**—For IPS devices, the Allowed Hosts policy identifies the hosts that can connect to the sensor. The Security Manager server must be included in this policy.

Updating VPNs That Include Routing Processes

Problem: When you define and deploy changes to a routing process that is being used by a VPN topology (using either the Site-to-Site VPN Manager or the routing policies), the changes that you make are not reflected in the CLI commands configured on the device.

Solution: When you discover a VPN topology that includes routing processes, such as GRE full mesh, Security Manager populates the GRE Modes policy in the Site-to-Site VPN Manager, as well as the relevant routing policies. However, changes made to one of these policies in Security Manager are not automatically reflected in the other policy, which can lead to unexpected results after deployment. Therefore, if you make changes

to the secured IGP in the Site-to-Site VPN Manager, be sure to go to Platform > Routing in Device view to make the necessary changes in the device's routing policies. Likewise, if you make changes directly to the routing policy, be sure to make the necessary changes in the Site-to-Site VPN Manager as well.

Mixing Deployment Methods with Router and VPN Policies

You might receive unpredictable results when you deploy router platform and VPN policies to a live device after previously deploying to a configuration file.

This problem can occur when you use a mix of deployment methods (deploy to device and deploy to file) with router platform policies and VPN policies. Because Security Manager does not manage all the available CLI commands for these policy types, it maintains a snapshot of the commands it has configured and leaves all other commands (which includes unsupported commands as well as supported commands in policies that have not been configured in Security Manager) intact on the device.

After each deployment, Security Manager creates a snapshot of the policies that were deployed to each device. This snapshot is used during the next deployment to generate the list of configuration changes that will be deployed to the device. Only one snapshot is maintained at a time per device.

Mixing deployment methods with router platform policies and VPN policies can lead to unpredictable results, as shown in this example:

1. Configure router platform policy A to a live device. When deployment completes, Security Manager creates a snapshot for that device with policy A.
2. Next, configure policy B to replace policy A, but instead of deploying policy B to the device, deploy it to a file instead. When this deployment completes, Security Manager creates a snapshot with policy B that replaces the previous snapshot with policy A. However, because you did not deploy policy B to the device, the CLI commands that are required to negate policy A have not been deployed. Policy A is still deployed on the device.
3. Deploy again to the device without first copying the changes in the configuration file to the device. Security Manager cannot generate the commands that are required to negate policy A from the device because the snapshot with policy A no longer exists.

Because policy A is a router platform policy, any of the following results might occur:

- The policy in the latest deployment overrides policy A.
- Both policies end up defined on the device.
- Deployment fails because the two policies cannot coexist.

Therefore, if you deploy to a file when working on a live device, we strongly recommend that you copy your configuration changes from the file to the device before performing additional deployments to the device.

Deployment Failures for Routers

Following are some potential problems you might encounter when deploying configurations to Cisco IOS routers.

Deployment Fails for Interface Settings

Problem: Deployment fails for interface settings on a router.

Solution: Security Manager cannot validate whether you have the appropriate types of interface cards or shared port adapters (SPAs) installed on the router, or the appropriate licenses configured, to support your interface policies. If you add or remove an interface card without changing your interface policies, you can encounter deployment errors. The best practice is to ensure that you discover inventory from the router whenever you change interface modules or SPAs so that Security Manager can discover the appropriate interface features.

Deploying Layer 2 Interface Definitions

Problem: Deployment fails if the interface policy includes a definition for a Layer 2 interface.

Solution: Layer 2 interfaces do not support Layer 3 interface definitions, such as IP addresses. Make sure that you did not define a Layer 3 definition on the Layer 2 interface.

VPN Traffic Sent Unencrypted

Problem: Traffic that should be sent encrypted over a VPN is instead being sent unencrypted.

Solution: Ensure that you are not performing NAT on VPN traffic. Performing address translation on VPN traffic prevents the traffic from being encrypted and sent through the VPN tunnel. When defining dynamic NAT rules, make sure that the Do Not Translate VPN Traffic check box is selected, even when you perform NAT into IPSec. (This option does not interfere with the translation of addresses arriving from overlapping networks.)

This option can be used only on site-to-site VPNs. For remote access VPNs, you need to create an ACL object that explicitly denies the flow containing VPN traffic and define this ACL as part of a dynamic rule in the NAT policy. For more information, see NAT Page: Dynamic Rules , on page 1027.

Unable to Deploy ADSL or PVC Policy

Problem: Deployment fails for your ADSL or PVC policy.

Solution: Make sure that you have selected the correct ATM interface card type in the policy definition. Security Manager cannot properly validate the policy definition without knowing the correct card type, which can lead to deployment failures.

DHCP Traffic Not Being Transmitted

Problem: DHCP traffic is not being transmitted even after you deploy a DHCP policy to the device.

Solution: Check whether an access rule on the device blocks Bootstrap Protocol (BootP) traffic. Having such a rule prevents DHCP traffic from being transmitted.

NAC Not Implemented on Router

Problem: Network admission control is not being implemented on the router, even though a NAC policy was deployed to it.

Solution: Ensure that the default ACL on the router permits UDP traffic over the port defined in the NAC policy for EAP over UDP traffic. This is the protocol that NAC uses for communication between the Cisco Trust Agent (CTA), which is the NAC client that provides posture credentials for the endpoint device on which it is installed and the network access device (NAD; in this case, the router) that relays the posture credentials to the AAA server for validation. The default port used for EAP over UDP traffic is 21862, but you can change this port as part of the NAC policy. If the default ACL blocks UDP traffic, EAP over UDP traffic is likewise blocked, which prevents NAC from taking place.

Deployment Fails with Error Writing to Server or HTTP Response Code 500 Messages

Problem: Deployment to a Cisco IOS router fails and an "Error Writing to Server" or "Http Response Code 500" error message occurs.

Solution: When you use SSL as the transport protocol for deploying configurations to a Cisco IOS router, the configuration is split into multiple configuration bulks. The size of this configuration bulk varies from platform to platform. If Security Manager tries to deploy a configuration bulk that exceeds the size of the SSL chunk configured on that device, the deployment fails and you get an "Error Writing to Server" or "Http Response Code 500" error message.

To resolve this, do the following:

1. On the Security Manager server, open the DCS.properties file in the \CSCOpx\MDC\athena\config folder in the installation directory (usually C:\Program Files).
2. Locate **DCS.IOS.ssl.maxChunkSize=**<*value of the configuration bulk* >.
3. Reduce the value of the configuration bulk.
4. Restart the CiscoWorks Daemon Manager.

Deployment Failures for Catalyst Switches and Service Modules

Note From version 4.17, though Cisco Security Manager continues to support Cisco Catalyst switches features/functionality, it does not support any enhancements.

Following are some potential problems you might encounter when deploying configurations to Catalyst switches and Catalyst 6500/7600 service modules.

Deployment Fails for Interface Settings

Problem: Deployment fails for interface settings on a Catalyst 6500/7600 device.

Solution: Certain interface settings (such as speed, duplex, and MTU settings) are specific to particular card types and are not validated prior to deployment. Make sure to enter the correct values for your specific card type to ensure successful deployment.

Deployment Failures to FWSM Security Contexts After Changing Interface Policies

Problem: You add an FWSM with security contexts and discover its policies. The configuration includes interface aliases (the allocate interface command). After changing the interfaces policy for a context, deployment fails.

Solution: Connect directly to the FWSM and remove all mapped interface names from the system execution space configuration and in all other contexts, replace interface references to mapped names with the VLAN ID of the interface. You can then delete the FWSM from the Security Manager inventory and rediscover it.

Deployment Failures for FWSMs That Have Multiple Contexts

Problem: Deployment to an FWSM that has multiple security contexts sometimes fails or results in a temporary performance impact to the FWSM.

Solution: The problem is that Security Manager is trying to deploy configurations to more than one security context on a device at the same time. Depending on the configuration changes, this can result in errors on the device that prevent successful deployment. If you use FWSM in multiple-context mode, configure Security Manager to deploy configurations serially to the device so that one context at a time is configured, as described in Changing How Security Manager Deploys Configurations to Multiple-Context FWSM , on page 474.

Deployment Fails for Internal VLANs

Problem: Deployment fails when Security Manager tries to create a VLAN with an ID that is within the range of the device's internal VLAN list.

Solution: Security Manager cannot detect internal VLANs. Therefore, you must define a VLAN ID that falls outside of the device's internal VLAN list. Use the **show vlan internal usage** command on the device to view the list of internal VLANs.

Deployment Fails When Changing the Running Mode of an IDSM Data Port VLAN

Problem: Deployment fails when you attempt to change the running mode of the data port VLAN from Trunk (IPS) to Capture (IDS) and the following error message is displayed:

Command Rejected: Remove trunk allowed vlan configuration from data port 2 before configuring capture allowed-vlans

Solution: On some software releases such as 12.2(18)SFX4, there is a bug that prevents the change from occurring correctly. Reload the device to overcome the problem.

Deployment Fails for FWSM Configuration With Large Numbers of ACLs

Problem: Deployment to FWSM devices fail when the configuration contains a large number of ACLs.

Solution: This could occur because the CPU utilization is high during ACL compilation. To resolve this, reconfigure the CPU utilization threshold limit by doing the following:

1. On the Security Manager server, open the DCS.properties file in the \CSCOpx\MDC\athena\config folder in the installation directory (usually C:\Program Files).
2. Locate the **DCS.FWSM.checkThreshold=False** property.
3. Change the value to true: **DCS.FWSM.checkThreshold=True**.
4. Restart the CiscoWorks Daemon Manager.
5. Deploy the configuration to the device again.

After you set the value to true, discovery and deployment checks the CPU utilization and generates error messages if the CPU utilization is not within the configured value set in the DCS.FWSM.minThresholdLimit property. The default value is 85.

Changing How Security Manager Deploys Configurations to Multiple-Context FWSM

Note From version 4.17, though Cisco Security Manager continues to support FWSM features/functionality, it does not support any enhancements.

If you configure a Firewall Services Module (FWSM) to run in multiple context mode, so that you host more than one security context on the FWSM, you need to configure Security Manager to deploy configurations serially to the FWSM. The FWSM has some limitations that can prevent successful deployments if more than one context is updated at the same time, so you might run into deployment failures if you do not use serial deployment. There can also be an impact on FWSM performance during deployment if you do not use serial deployment.

To change how Security Manager deploys configurations to multiple-context FWSM, you need to update the DCS.properties file. You also need to add the FWSM contexts to the inventory using the FWSM admin context, rather than adding the individual security contexts.

The following procedure explains the end-to-end process for ensuring that FWSM deployments are done serially.

Step 1 Make it a standard practice to add FWSM security contexts using the admin context management IP address. Manage the contexts through the admin context.

Although it is possible to add security contexts for an FWSM individually, using each context's management IP address, Security Manager cannot recognize these individually-added contexts as being hosted on the same physical device. This prevents Security Manager from doing serial deployments to the contexts.

If you have any FWSM security contexts that you added using the security context management IP, delete the contexts and FWSM from the inventory, then add them using the admin context (discover all policies). See Adding Devices to the Device Inventory , on page 77.

Tip If you have any undeployed changes to these contexts that you want to keep, first deploy the changes to ensure that the configurations on the device are complete. Do the deployments one context at a time.

Step 2 Log into Windows on the Security Manager server and edit the **DCS.properties** file in the \CSCOpx\MDC\athena\config folder in the installation directory (usually c:\Program Files). Use a text editor such as NotePad to update the file.

Step 3 Locate the DCS.doSerialAccessForFWSMVCs property in the DCS.properties file and set it to true:

DCS.doSerialAccessForFWSMVCs=true

Step 4 Restart the CiscoWorks Daemon Manager.

Deployment Failures to Devices Managed by AUS

Deployment might fail when deploying to multiple AUS-managed devices after starting the AUS if you perform deployment before the Auto Update Server (AUS) is fully operational. The AUS requires time to start up after the following operations:

- New installation or upgrade.
- Manual restart (including after a power outage).

- Manual restart of the Cisco Security Manager Daemon Manager service.

You can verify whether the AUS is fully operational by verifying the status of its Windows services. To do this, select **Start > Control Panel > Administrative Services > Services**, then check the status of the CiscoWorks AUS Database Engine service. If this service has started, try again to deploy.

Troubleshooting the Setup of Configuration Engine-Managed Devices

The following questions and answers describe issues that might arise when you set up a device managed by a Cisco Configuration Engine (also known as CNS) and how to solve them:

Question: Why does Configuration Engine deployment fail?

Answer: Not all versions of Configuration Engine function in a compatible manner. Because Security Manager does not verify the software version running on a Configuration Engine when you add it to the device inventory, you can add unsupported versions to the inventory. Then, when you try to deploy, you can run into unpredictable errors. Ensure that you are running a supported version of Configuration Engine (for version information, see the release notes for this version of Security Manager at http://www.cisco.com/en/US/products/ps6498/prod_release_notes_list.html).

Question: Why do I receive an InvalidParameterException when I click on an IOS device on the Configuration Engine web page?

Answer: This is the expected behavior. For IOS devices, Security Manager uses deployment jobs to deploy configurations to Configuration Engine instead of associating a configuration to the IOS device in Configuration Engine. Therefore, you do not see an associated configuration when you click the device name on the Configuration Engine web page. For ASA/PIX devices, Security Manager associates the configuration to the device in Configuration Engine. Therefore, clicking the device name displays the associated configuration.

Question: Why am I getting the following error: com.cisco.netmgmt.ce.websvc.exec.ExecServiceException: [002-01003]]deviceName does not exists?

Answer: This error indicates that the device has not been added to Configuration Engine. It appears if you have not performed rollback or deployment in Security Manager (both of which add the device automatically), and have not manually added the device to Configuration Engine.

Question: Why am I getting the following error: com.cisco.netmgmt.ce.websvc.config.ConfigServiceException: [002-01003]]Device device id is not connected

Answer: The answer depends on the type of setup you are performing:

- Event mode setup—Make sure that the Configuration Engine device ID defined in the Device Properties window in Security Manager matches the device ID configured on the router (using the **cns id string** command).
- Call home mode setup—The device is not connected to Configuration Engine in this mode; therefore, all Security Manager operations that require the retrieval of the device configuration using Configuration Engine are not supported. This includes discovery, preview configuration, display running configuration, and connectivity tests (and rollback, for IOS devices).

Question: Why is deployment to my Configuration Engine-managed ASA/PIX device not working?

Answer: There are several possibilities:

- The configuration contains invalid commands. You can test this by copying the configuration associated with the ASA/PIX device in Configuration Engine and pasting it directly into the device.

- The **auto-update server** command contains an invalid username and password.
- You did not wait long enough for the configuration to be polled into the ASA/PIX device. Use the **show auto** command to verify when the next polling cycle will occur.
- If you previously used the Configuration Engine server for the same ASA/PIX device and did not delete the device from the Configuration Engine server before you started the current task, it is possible that the device received the previous configuration from the server before you deployed the new configuration to it.
- If none of the suggestions above solves the problem, turn on Configuration Engine debug mode on the ASA/PIX device and check the log for errors after the next polling cycle.

Question: Why was I able to deploy successfully to a Configuration Engine-managed ASA/PIX device the first time, but subsequent deployments were unsuccessful?

Answer: This can happen if the configuration pushed during the first deployment contains incorrect CLI commands for the auto-update feature. Check the following:

- Make sure the username and password of the Configuration Engine server is defined correctly in the **auto-update** command.
- If you used **name** commands when configuring the auto-update server using the device CLI, make sure that you have defined a FlexConfig that contains the necessary **name** commands. A FlexConfig is necessary because Security Manager does not support this command directly. As a result, even though the command was discovered, it does not appear in the full configuration. If you use Security Manager to configure the AUS policy, **name** commands are not necessary.

Question: How do I debug Configuration Engine on an ASA/PIX device?

Answer: Enter the following CLI commands:

```
logging monitor debug
terminal monitor
logging on
```

You can also find relevant information in the PIX log on the Configuration Engine server.

Question: How do I debug Configuration Engine on an IOS device?

Answer: Enter the following CLI commands:

```
debug cns all
debug kron exec-cli
terminal monitor
```

When working in event mode, you can also find relevant information in the event log on the Configuration Engine server. When working in call home mode, check the config server log on the Configuration Engine server.

Question: Why did I fail to discover an IOS device and acquire its configuration through Configuration Engine?

Answer: If you see the following errors in debug mode:

*Feb 23 21:42:15.677: CNS exec decode: Unknown hostname cnsServer-lnx.cisco.com ... 474F6860: 72726F72 2D6D6573 73616765 3E584D4C error-message>XML 474F6870: 5F504152 53455F45 52524F52 3C2F6572 _PARSE_ERROR

Verify the following:

- The CNS commands use a fully-qualified host name (host name and domain name).
- The device contains the **ip domain name** command.
- The device contains the **ip host** command with the fully qualified hostname of the Configuration Engine with its IP address.

Question: Why does the event mode router not appear on the Configuration Engine Discover Device page or appear in green on the Configuration Engine web page?

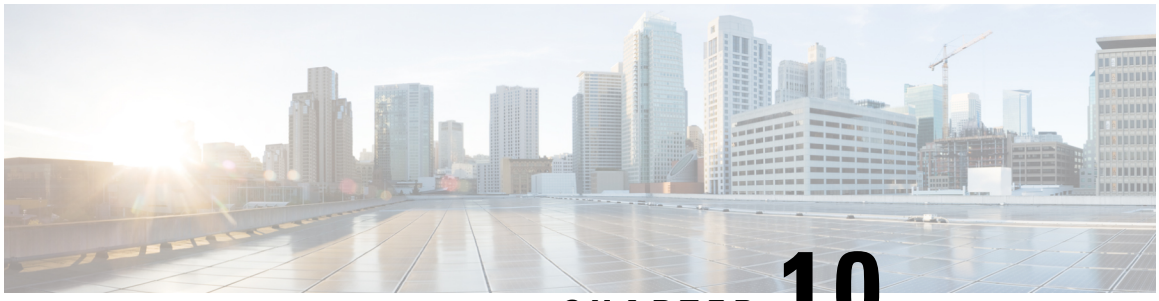
Answer: Check the following:

- Make sure that the router and the Configuration Engine server can ping each other.
- Make sure that the event gateway on the Configuration Engine server is up and running by using one of the following commands:

Status for plain text mode: **/etc/init.d/EvtGateway**

Status for SSL encrypted mode: **/etc/init.d/EvtGatewayCrypto**

- Clear the **cns event** command, then re-enter it without specifying a port number.



CHAPTER 10

Managing Security Manager Server

The following topics describe some system management tasks related to the general operation of the Security Manager product:

Overview of Security Manager Server Management and Administration

As a software application, Cisco Security Manager runs on the framework provided by the CiscoWorks Common Services application. Many of the fundamental server control functions are provided by Common Services. For example, if you want to create a multiple-server setup for Security Manager, you must create that setup in Common Services. Common Services also provides the tools for creating and managing local user accounts, for backing up and restoring the database, for generating various reports on system functions, and for many other basic functions.

To access the Common Services application, do any of the following:

- If you currently have the Security Manager client open, you can select **Tools > Security Manager Administration** and select **Server Security** from the table of contents. The Server Security page has buttons that link to and open specific pages in Common Services. You can click any button and then navigate to any desired page in Common Services.
- Using your web browser, link to the Security Manager server using the URL https://*servername* , where *servername* is the IP address or DNS name of the server. This URL opens the Security Manager home page. Click **Server Administration**, or the **CiscoWorks** link, to open Common Services.

Note A special consideration applies if you are using Internet Explorer 10.x in Windows Server 2012 (Standard or Datacenter)—64-bit, support for which is new in Version 4.7 of Cisco Security Manager. You need to be aware of this consideration when using the following navigation path: Windows Start > Cisco Security Manager Client > [log in] > Configuration Manager > Tools > Security Manager Administration... > Server Security. The Server Security page will open normally for you, but on that page you will be unable to use the buttons (e.g., Local User Setup) to cross-launch the Server Security Tools within Common Services. To work around this problem, decrease the security levels of your intranet settings in Internet Explorer 10.x.

To learn more about the things you can do with Common Services, browse the Common Services online help.

Note The **Software Center > Software Update** feature in Common Services is not supported by Cisco Security Manager.

Managing a Cluster of Security Manager Servers

A Security Manager server cluster is two or more Security Manager servers used to manage a network. Typically, you want to maintain some relationship between the servers. Although there is no systematic relationship between the servers in the cluster, there are some techniques that you can use to maintain a cluster-like relationship. The topics in this section explain how you can manage a group of Security Manager servers as a cluster.

This section contains the following topics:

Overview of Security Manager Server Cluster Management

You can manage a large number of devices with a single Security Manager server. There are, however, a variety of reasons for managing your network with more than one Security Manager server. For example:

- If you have a very large network with thousands of devices to manage, you might find performance to be unacceptable when trying to manage all devices from a single server.
- For geographic reasons, you might find it better to have servers that are closer to managed devices. For example, if you have major sites on different sides of the globe, having separate servers at each major site might simplify management and improve performance. For example, when deploying configurations to managed devices, a Security Manager server located in Bangalore should be able to deploy configurations to a device in Bangalore much faster than a Security Manager server located in San Francisco simply due to the much shorter physical network distance.

- You might want to segment device management based on the technology managed. For example, you might want to use one server to manage your site-to-site VPNs, another server to manage ASA firewall and remote access VPN policies, and a third server to manage IPS.
- Separate IT organizations might be managing different parts of your network. Although you can set up ACS to fine-tune access control to the device level, you might instead find it simpler to have distinct Security Manager servers for each IT organization.

If you decide to install more than one Security Manager server, the main challenges are the following:

- Splitting a single server into two or more servers—You might currently have a single Security Manager server, and decide that you need multiple servers. For information on how to split a Security Manager server into two or more servers, see Splitting a Security Manager Server, on page 481.
- Maintaining the same set of shared policies—If you use multiple servers to manage the same device types, you might want to ensure that the shared policies assigned to the devices are identical. For example, you might want to have the same set of mandatory and default access rules inherited by all ASA devices.

There is no automatic process for maintaining the same set of shared policies among a cluster of servers. Instead, you must manually export them from your main server and import them into the remaining servers. For more information, see Synchronizing Shared Policies Among Security Manager Servers, on page 482.

Splitting a Security Manager Server

If you decide that you need to convert a single Security Manager server into two or more servers, you can split the server by moving subsets of the devices managed by the original server to the new servers. Keep in mind that you should manage a specific network device from a single Security Manager server, so delete the moved devices from the original server.

Tip Use the same release of Security Manager software on all servers.

Related Topics

- Overview of Security Manager Server Cluster Management, on page 480
- Synchronizing Shared Policies Among Security Manager Servers, on page 482
- Exporting Shared Policies, on page 489

Step 1 Install the new Security Manager servers as described in the *Installation Guide for Cisco Security Manager* .

Ensure that the server is functioning correctly, and also ensure that you install licenses with a device count that will be sufficient for the devices you will move to the server. Ensure that you use a professional license if you manage device types that require it. For information on installing licenses, see Installing Security Manager License Files , on page 494.

Step 2 On the original server, verify that the policies of the devices that you will move will allow access from the IP address of the new server. For example, consider access rules on ASAs and routers, and the Allowed Hosts policy on IPS devices.

Step 3 On the original server, ensure that all configuration changes for the devices you are moving have been submitted and deployed. You will need to ask the staff to submit and deploy their changes, there is no simple way to determine this status within Security Manager.

This step ensures that there are no pending uncommited changes. For information on deploying configurations, see the following topics based on workflow mode:

- Deploying Configurations in Non-Workflow Mode , on page 408
- Deploying Configurations in Workflow Mode , on page 414

Step 4 Select **File > Export > Devices** to export the devices with their assigned policies and policy objects from the original Security Manager server. Be sure to select **Export Devices, Policies, and Objects** during the device export so that policy information is included. The file type must be **dev**. For more detailed information, see Exporting the Device Inventory from the Security Manager Client, on page 484.

Create separate export files containing unique devices for each new Security Manager server.

Tip At this point, do not make policy changes to the exported devices in the original server, and do not deploy configurations to those devices. If you find that you need to make changes to the devices from the original server before you complete the split, create a new export file.

Step 5 On each of the new Security Manager servers, select **File > Import** to import the exported information to the new servers. For more detailed information, see Importing Policies or Devices, on page 491.

Tip Device groups are not preserved during import. All devices are placed in the All group. You need to manually recreate the desired device group structure and add the devices to the appropriate groups.

Step 6 Verify that each of the new Security Manager servers can manage the newly-imported devices. For example, you could do a deployment, even for unchanged devices, to ensure that the new server can successfully contact all devices and deploy configurations.

Tip As explained in Importing Policies or Devices, on page 491, you must submit policies before the changes are available for configuring devices. Submit policies before doing a deployment.

Step 7 If you were monitoring any of the moved devices using the original server (that is, with Event Viewer and optionally Report Manager), ensure that you update the relevant policies to have syslog messages sent to the new server and to allow contact from the new server. None of the event or report data from the original server is transferred to the new server.

For information on configuring the devices to enable Security Manager monitoring, see the following topics:

- Configuring ASA and FWSM Devices for Event Management , on page 2704
- Configuring IPS Devices for Event Management , on page 2706

Step 8 On the original Security Manager server, select **File > Delete Devices** to delete the moved devices from the original server. For information on deleting devices, see Deleting Devices from the Security Manager Inventory , on page 130.

Synchronizing Shared Policies Among Security Manager Servers

When you have more than one Security Manager server, you can manually synchronize the shared policies among those servers. When you synchronize shared policies, the policy objects that are used by those shared policies are also synchronized.

Tips

- There is no programmatic way to identify a single Security Manager server as the “primary” server, the one that contains the official version of shared policies. You must decide which server to use as the primary and have the discipline to edit shared policies on that server only.

- Use the same release of Security Manager software on all servers.
- You can also synchronize certain types of policy object among servers even if those objects are not used in shared policies. If you have network/host, service, or port list objects that you want to synchronize, you can use the command described in Importing and Exporting Policy Objects , on page 253.
- When importing shared policies and policy objects, the imported information always replaces any existing shared policies or policy objects of the same name. Therefore, if you allow users to create their own shared policies and objects on a server where you will import policies and objects, it is critical that you develop a policy and object naming standard so that user policies and objects are not accidentally overwritten by newly imported policies and objects.

Related Topics

- Overview of Security Manager Server Cluster Management, on page 480
- Splitting a Security Manager Server, on page 481
- Exporting the Device Inventory from the Security Manager Client, on page 484

Step 1 On the original server, ensure that all configuration changes for the shared policies and policy objects have been submitted. You will need to ask the staff to submit their changes and have them approved, there is no simple way to determine this status within Security Manager.

When exporting shared policies, there is no need to ensure that new changes have been deployed to devices assigned to the policies. Device assignments and deployment status are not part of the exported information.

Step 2 Select **File > Export > Policies** to export the shared policies and any policy objects used by the policies. The export process creates a file with the extension **pol**.

Tip You cannot pick and choose which policies to export. You can select policy types only. All shared policies of a selected type are exported.

For more detailed information, see Exporting Shared Policies, on page 489.

Step 3 On each of the other Security Manager servers, select **File > Import** to import the exported shared policy information to the servers. For more detailed information, see Importing Policies or Devices, on page 491.

Tip Any shared policies or objects that have the same name as imported ones are replaced. The import of a policy or object will fail if a user already has a lock on the policy or object. As explained in Importing Policies or Devices, on page 491, you must submit policies before the changes are available for configuring devices.

Step 4 If you do not want to import all of the shared policies, delete the ones you did not want to import on the other servers. This is a manual process.

Exporting the Device Inventory

Exporting the device inventory allows you to import the inventory into other network management applications, or to manipulate the output for your own reporting purposes. There are two unrelated methods to export the device inventory:

- Use the **File > Export > Devices** command—Using this command, you can create either a simple comma-separated values (CSV) file, or a compressed .dev file that contains the devices along with their

complete configuration policies. The CSV file is in a format suitable for importing into the CiscoWorks Common Services Device Credential Repository (DCR), the Cisco Security Monitoring, Analysis and Response System (CS-MARS), Cisco Prime Security Manager (PRSM), or another Security Manager installation; or you can open it and view it in a spreadsheet or text editor program. The .dev file is suitable for importing into another Security Manager server only. For more information, see Exporting the Device Inventory from the Security Manager Client, on page 484.

- Use the CSMgrDeviceExport Perl script—Using this Perl script, you can export the inventory without starting the Security Manager client. You can direct the output to the screen or to a comma-separated values (CSV) file. For more information, see Exporting the Device Inventory from the Command Line, on page 488.

Note Only the five most recent versions of each device configuration are exported.

Exporting the Device Inventory from the Security Manager Client

You can export the device inventory in a variety of formats. These are the main choices:

- **Export as CSV** (comma-separated values)—You can create a simple CSV file containing inventory information in one of the following formats: CSM (for use with Cisco Security Manager), Device Credential Repository (DCR, for CiscoWorks Common Services), and CS-MARS seed file (for use with Cisco Security Monitoring, Analysis and Response System). You can open a CSV file in a spreadsheet application or text editor, and use the file with any application that supports the format, including other Security Manager servers. However, this format contains no policy information, so if you use it with another Security Manager server, you must discover policies while adding the devices.
  - For more information about the CSV formats, see Supported CSV Formats for Inventory Import/Export, on page 487.
  - For information on how to import devices from a CSV file, see Adding Devices from an Inventory File , on page 99.
- **Export Devices, Policies, and Objects**—Export the device inventory along with all device properties, policies, and policy objects used by the device. Exported information includes the following:

Note Importing of *.pol or *.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

  - All local and shared policies assigned to the devices, including all policy objects used in the policies and any device-level overrides for the objects. Shared policy assignments are maintained.
  - Device properties and inventory.
  - Configuration Archive data for the devices.
  - History snapshots for the devices.
  - Device certificates.

- IPS device license and certificate information. Applied signatures are not exported (when importing the device, you must have the same signature package registered on the server). IPS update settings are not included; you will have to recreate them after import.
- The VPN topologies in which the devices participate. However, a VPN topology is exported only if all devices that participate in the topology are included in the export. Extranet VPNs are always exported.

Thus, the export file includes the complete policy configuration for the selected devices. The file created has the extension .dev and can be read only by another Security Manager server (the file contents are compressed and uninterpretable, which preserves the security of your policy information).

For information on importing a .dev file into another Security Manager server, see Importing Policies or Devices, on page 491.

Export Size Limitations

If your Security Manager database contains a large number of devices or a large number of policies or policy objects, you should limit the number of devices you export at one time to prevent errors. The following guidelines can be used to help estimate the number of devices you can successfully export at one time:

Example 1: 1000+ devices in the database with approximately 1500+ polices per device and approximately 25,000 objects in the database:

- Maximum number of devices (devices only) to be exported at one time = 250
- Maximum number of devices (along with polices and objects) to be exported at one time = 100 to 150

Example 2: Fewer than 1000 devices in the database with approximately 1500+ polices per device and approximately 10,000-15,000 objects in the database:

- Maximum number of devices (devices only) to be exported at one time = 250 to 300
- Maximum number of devices (along with polices and objects) to be exported at one time = 200

Tips

- When you select the **Export Devices, Policies, and Objects** option, you can export to the Security Manager server or to the local Security Manager client. When exporting a CSV file, you can only export to the Security Manager server. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520.
- Exported devices are not deleted from the inventory. If you intend to manage the devices from a different Security Manager server, delete the devices after successfully importing them into the other server.
- If you select a device that uses an AUS or Configuration Engine to manage its configuration, you should also select the server in the list of devices to export. You cannot export AUS or Configuration Engine information in CS-MARS format.
- You can export unmanaged devices.
- When exporting devices with their policies, only policies and policy objects that have been submitted and approved are included in the export file. Make sure that all desired submissions and approvals have occurred before exporting devices with policies and policy objects.
- No type of export file includes event and report data (that is, data that is available through Event Viewer or Report Manager). Thus, if you are exporting devices with the intention of moving them to another

Security Manager server, the event and report data that was already collected for the device will not be available on the new server.

- No type of export file includes device group information. You will have to manually recreate device groups and assign devices to them after importing devices.
- When selecting security contexts or virtual sensors, be sure to select the host device as well. Also, if a device is part of a VPN, ensure that you select all devices in the VPN when exporting devices, policies, and policy objects.
- When selecting IPS or IOS IPS devices, make sure that you have already applied an IPS signature update to the device. Although you can export an IPS or IOS IPS device with the base sensor package (Sig0), you will not be able to import it. The import error will be "missing Sig0 package."
- When you select the following types of device that are contained in another device, the hosting device is also automatically exported: any module in a Catalyst 6500/7600, an AIM or NME module in a router. You can separately export ASA devices and their IPS modules.
- You cannot export devices with their policies (.dev format) while an activity or configuration session is being approved. All approvals must be complete before you can export devices with policies. In Workflow mode with an approver, contact the approver and ask that the approval be completed in a timely manner. In non-Workflow mode, or Workflow mode without an approver, wait a few minutes before retrying the export, because approvals happen automatically when changes are submitted.
- While you are exporting devices with their policies (.dev format), policy changes cannot be approved. Once the export file has been created, and the command finishes, users can again approve policy changes. In non-Workflow mode, or Workflow mode without an approver, this means that submissions are not allowed during the export process.
- To export devices, policies, and policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types, and Modify Device privileges. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.

When exporting devices to CSV, you need Modify Devices privileges only.

Related Topics

- Filtering Items in Selectors , on page 47
- Selecting or Specifying a File or Directory in Security Manager , on page 53
- Customize Desktop Page , on page 520

Step 1 In Device view, select **File > Export > Devices** to open the Export Inventory dialog box.

Step 2 Select either **Export as CSV** or **Export Devices, Policies, and Objects**. These options are described above.

Step 3 Select the devices that you want to include in the export file and click >> to add them to the Selected Devices list. You can select a folder to select all devices in the folder.

The list from which you choose contains only those devices to which you have Modify Device permissions.

Note If your Security Manager database contains a large number of devices or a large number of policies or policy objects, you should limit the number of devices you export at one time to prevent errors. For more information, see **Export Size Limitations** above.

Step 4 Click **Browse** to select the folder in which to create the export file and to enter a name for the file. For File Type, select the type of file that you want to create; this selection is critical when creating a CSV file, whereas there is a single option when creating a .dev file.

Click **Save** to return to the Export Inventory dialog box. The Export Inventory To field is updated with the export file information.

Step 5 Click **OK** to create the export file.

A message indicates when the export completes and whether there were errors in the export. When you click **OK**, if there are problems during the export, a dialog box opens listing the messages. If there is a Details button in the dialog box, you can select a message and click **Details** to see the message in a more readable format.

Supported CSV Formats for Inventory Import/Export

When you export devices to a CSV (comma-separated values) file (by selecting **File > Export > Devices** and selecting Export as CSV), or import devices from a CSV file (by selecting **File > New Device** and then selecting Add Device from File in the New Device wizard), you can select one of the following CSV file formats:

- **Device Credential Repository (DCR)**—The device management system for CiscoWorks Common Services. For information on this format, see the description of the sample version 3.0 CSV file in the Common Services documentation at this URL: http://www.cisco.com/en/US/docs/net_mgmt/ciscoworks_common_services_software/3.3/user/guide/dcr.html#wp1193611
- **CS-MARS seed file**—Cisco Security Monitoring, Analysis and Response System. For information on this format, see the CS-MARS documentation at this URL: http://www.cisco.com/en/US/docs/security/security_management/cs-mars/6.0/device/configuration/guide/chDvcOver.html#wp162016
- **Cisco Security Manager**—The Security Manager format, which is the DCR version 3.0 format with additional fields. If you are importing the inventory into another Security Manager server, selecting this format will allow you to import the inventory without discovering policies on the devices.

Note If the file does not specify os_type and os_version for a device, you must discover policies directly from the device when adding it.

The additional fields, which appear at the end of each row, are:

- os_type. The operating system type, which can be one of the following: PIX, ASA, IOS, FWSM, IPS. This field is required for all device types.
- os_version. The target operating system version, which can be any of the version numbers listed in the New Device wizard when you select Add New Device. The acceptable version numbers differ depending on the device model, so if you are creating a CSV file by hand, look over this list carefully. For more information about adding devices using this method, see Adding Devices by Manual Definition , on page 94. This field is required for all device types.
- fw_os_mode. The mode in which a firewall device is running, which can be one of the following: TRANSPARENT, ROUTER, MIXED. This field is required for ASA, PIX, and FWSM devices.

- fw_os_context. The context in which a firewall device is running, which can be one of the following: SINGLE, MULTI. This field is required for ASA, PIX, and FWSM devices.
- anc_os_type. The ancillary operating system type for Cisco IOS-IPS devices. If present, it is IPS. This field is required for IOS IPS devices.
- anc_os_version. The ancillary target operating system version, which is the IPS target operating system version. If present, it can be any of the supported IOS-IPS versions. This field is required for IOS IPS devices.

You can use these CSV files with any program that supports the file format. You can also create a CSV file yourself and use the file to import inventory into Security Manager.

Related Topics

- Exporting the Device Inventory from the Security Manager Client, on page 484
- Importing Policies or Devices, on page 491
- Adding Devices from an Inventory File , on page 99

Exporting the Device Inventory from the Command Line

Security Manager includes a Perl script that you can use to export the device inventory without starting the Security Manager client. You can use this script to automate various offline reporting tasks that your organization might require. You can pipe the output to a comma-separated values (CSV) file or otherwise capture and manipulate the output.

Tip This command does not produce a file that you can use for importing devices or for adding devices "from file." Although it exports inventory information, making it similar to the integrated export features, the usefulness of the command is limited to reporting purposes for organizations that have unique off-line reporting process requirements.

The Perl command is located in $NMSROOT\bin, which is typically C:\Program Files\CSCSpx\bin. The syntax of the command is:

perl [*path*]**CSMgrDeviceExport.pl -u** *username* [**-p** *password*] [**-s** {**Dhdoirtg**}] [**-h**] [> *filename.csv*]

Syntax

perl [*path*] **CSMgrDeviceExport.pl**	The Perl script command. Include the path to the CSMgrDeviceExport.pl file if the path is not defined in the system path variable.
-u *username*	A Security Manager username. The data exported is limited by the permissions assigned to this user. The user must have View Device permissions.
-p *password*	(Optional.) The user's password. If you do not include the password on the command, you are prompted for it.

-s {**Dhdoirtg**}	(Optional.) The fields you are selecting to include in the output. If you do not specify the -s option, all fields are included. You can specify one or more of the following: • D—Display name. • h—Host name. • d—Domain name. • o—Operating system (OS) type. • I—Image name. • r—Running OS version. • t—Target OS version. • g—Device groups.
-h	(Optional.) Display the command line help. If you include this option, all other options are ignored.
> *filename.csv*	(Optional.) Pipe the output to the specified file. If you do not specify a file, the output is displayed on the screen.

Output Format

The output is in standard comma-separated values (CSV) format, which you can open in spreadsheet programs or process with your own scripts. The first line has column headings. The columns, left to right, are in the order of the fields described for the -s option above.

If there is no value for a particular field, that field is blank in the output.

The device group output field is enclosed in double-quotes and it can contain more than one group name. The group names include the path structure for the group. For example, the following output indicates the device is part of two groups, the East Coast group in the Department folder, and the NewGroup group in the New folder. Groups are separated by a semicolon.

```
"/Department/East Coast; /New/NewGroup"
```

Any error messages generated during the script are written to the output file.

Exporting Shared Policies

You can export shared policies and the policy objects that they use so that you can import them into another Security Manager server. This can help you maintain the same policies among a group of servers, as explained in Synchronizing Shared Policies Among Security Manager Servers, on page 482.

Note Importing of *.pol or *.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

Tips

- You can export to the Security Manager server or to the local Security Manager client. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520.
- Only shared policies and policy objects that have been submitted and approved are included in the export file. Make sure that all desired submissions and approvals have occurred before exporting policies.
- All policy objects referenced by shared policies are also exported. However, if a policy object is not referenced, it is not exported. There is a separate command you can use to export network/host, service, and port list objects directly; for information, see Importing and Exporting Policy Objects , on page 253.
- You cannot export policies while an activity or configuration session is being approved. All approvals must be complete before you can export policies. In Workflow mode with an approver, contact the approver and ask that the approval be completed in a timely manner. In non-Workflow mode, or Workflow mode without an approver, wait a few minutes before retrying the export, because approvals happen automatically when changes are submitted.
- While you are exporting policies, policy changes cannot be approved. Once the export file has been created, and the command finishes, users can again approve policy changes. In non-Workflow mode, or Workflow mode without an approver, this means that submissions are not allowed during the export process.
- To export policies and their policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.

Note Beginning with version 4.21, Cisco Security Manager supports only TACACS+ authentication via Cisco Identity Services Engine (ISE), because ACS has reached its end of life.

Related Topics

- Overview of Security Manager Server Cluster Management, on page 480
- Splitting a Security Manager Server, on page 481
- Synchronizing Shared Policies Among Security Manager Servers, on page 482
- Exporting the Device Inventory from the Security Manager Client, on page 484
- Selecting or Specifying a File or Directory in Security Manager , on page 53
- Customize Desktop Page , on page 520

Step 1 In Configuration Manager, select **File > Export > Policies** to open the Export Shared Policies dialog box.

Before opening the dialog box, Security Manager evaluates and loads any shared policies that are defined.

Step 2 Select the shared policies that you want to export, using any of the following methods:

Tip You can use multiple methods to select policies. For example, you can select all shared policies modified since a certain date and also select all shared policies of a specific type to export those policies in the same file.

- To select all shared policies that have been modified since a certain date, enter that date in the Modified since field and click **Select** >> next to the Modified since field. You can enter the date in *MMM DD YYYY* format or you can click the Calendar to select the desired date.
- To select all shared policies, select the **All** folder and click **Select** >> under Browse All Shared Policies.
- To select all shared policies of a specific type, select the shared policy type and click **Select** >> under Browse All Shared Policies. You can select a folder to move all types within the folder to the selected list.
- To specify specific shared policies to export, select the type of shared policies you want to export from the Browse All Shared Policies list, select the check boxes next to the shared policies of that type that you want to export, and then click **Select** >> to move them to the Selected Policies list. If you do not select any specific shared policies, all policies of the selected type will be added to the Selected Policies list.

Note Only those policy types for which shared policies have been defined are listed.

To remove any policies from the Selected Policies list, select them and then click the **<< Remove** button. Use the **Select All** checkbox to specify that all entries in the Selected Policies list are to be removed.

Step 3 Click **Browse** next to the Export Shared Policies To field to select the folder where the export file is to be created, and enter a name for the file. The file type is pre-selected as .pol; you cannot change the file type.

Click **OK** to save the file name and location.

Step 4 Click **OK** in the Export Shared Policies dialog box to begin the export. When the export is completed, you are told how many shared policies were exported and if there are warnings or errors, a dialog box opens listing the problems.

You can now import the policies into other Security Manager servers as explained in Importing Policies or Devices, on page 491.

Importing Policies or Devices

You can import a shared policy (.pol) or device inventory plus policies (.dev) file that was exported from another Security Manager server.

Note Importing of *.pol or *.dev files is only supported on the same version of Cisco Security Manager as used when exporting those files. You cannot export from one version of Cisco Security Manager and import on a server running a different version.

Tips

- You can import from the Security Manager server or from the local Security Manager client. You can control the ability to export to or import from the local Security Manager client from **Tools > Security Manager Administration > Customize Desktop**. For more information, see Customize Desktop Page , on page 520.
- When importing devices, the server must have a sufficient Security Manager license to support the number and types of devices that you are importing. Ensure that you install a professional license before importing

device types that require it. For information on installing licenses, see Installing Security Manager License Files , on page 494.

- When importing policies, whether during device or shared policy import, only the policy types selected for management on the Security Manager Administration Policy Management page will be visible. However, all policies are imported. If you select a previously deselected policy type for management, those imported policies appear with their imported configurations. For more information about selective policy management, see Customizing Policy Management for Routers and Firewall Devices , on page 177.
- When importing shared polices and policy objects, if a policy or object on the server has the same name as an imported one, it is replaced by the imported policy or object. If there are locks on the policy or object, the import for that policy or object will fail. The message will indicate that the failure was due to a locking problem. To avoid problems, ensure that all users have submitted and approved any changes to shared policies or policy objects before doing an import.
- When importing devices, any shared policies and policy objects assigned to the device are also imported, and these policies and objects replace existing policies and objects under the same conditions as used when importing shared policies.
- To import policies and their policy objects, you must have Modify Policy and Modify Object privileges to the policy and object types. When importing devices, you must also have Modify Device privileges. These privileges can be assigned for separate policies, objects, and devices when using ACS for authorization control. Having system administrator, network administrator, or security administrator privileges provide the required privileges.
- You can import a file only if it was exported from a server running the same release of Security Manager.
- You cannot import a device if the device is already in the inventory. Thus, you cannot update device policies from an import file. If you want to re-import a device, first delete it from the inventory.
- When importing devices that use AUS or Configuration Engine servers to manage configuration deployment, the servers must either be included in the import file or already defined in the Security Manager server, but not both. You will get duplicate display name errors if the import file includes an AUS or Configuration Engine already defined in the inventory. You will get an “invalid server selection” error if you try to import a device that has an AUS or Configuration Engine server assigned to it, but the server is not included in the import file or defined in the inventory.
- You can import unmanaged devices.
- When importing IPS devices, the server must have the same signature levels as the imported devices. For example, if you import two IPS devices, one running signature level 481 and the other 530, you must have both 481 and 530 installed on the server. You might need to download signature packages before importing IPS devices as described in Checking for IPS Updates and Downloading Them , on page 1781.
- This procedure explains how to import .pol or .dev files. If you want to import a device inventory from a CSV file, the procedure is explained in Adding Devices from an Inventory File , on page 99. The procedures are not similar.

Related Topics

- Overview of Security Manager Server Cluster Management, on page 480
- Splitting a Security Manager Server, on page 481
- Synchronizing Shared Policies Among Security Manager Servers, on page 482

- Selecting or Specifying a File or Directory in Security Manager , on page 53
- Customize Desktop Page , on page 520

Step 1 In Configuration Manager, select **File > Import** to open the Import dialog box.

Step 2 Click **Browse** to select the file. Make sure that you select the desired file type (either .pol or .dev) from the Files of Type list on the Select a File dialog box.

Click **OK** when you have selected the file.

Step 3 Click **OK** in the Import dialog box.

You are warned that imported policies or policy objects will replace same-named policies and objects. If you have the required authorization privileges (system administrator or Modify Admin), you have the option to deselect **Display a warning on all shared policies and imported objects**. When selected, the banner for shared policies and imported objects warns users that shared policies might have been created during import, and that specific objects were in fact created during import. This warning provides notice that if the user changes the policy or object, those changes might be overridden by a subsequent policy import. Select whether you want to display a warning and click **Yes**.

Tip If you decide later that you want to change whether the warning is displayed, you can modify the **Display a warning on all shared policies and imported objects** option on the **Tools > Security Manager Administration > Policy Management** page.

The information is imported and you are informed of the results. If errors occur, nothing is imported and a dialog box opens that explains the errors. The most common errors include duplicate device display names when importing devices, or locks on shared policies or policy objects that have the same name as those being imported.

- To resolve the duplicate display name problem, you must delete the device from the inventory or rename it. You cannot selectively import devices, you must import all or none.

Note Not all duplicate device names might be listed. When using AUS or Configuration Engine to manage configuration deployment, imported AUS and Configuration names are evaluated before managed device names. Thus, you might see new duplicate display name errors after fixing the first set of errors.

- To resolve the locking problem, you must ensure that users submit their policy changes and have them approved. When importing devices, you might have to delete the imported devices before retrying the import.

Tip When importing devices, it might take some time for the devices to appear in the device list in Device view. Also, device groups are not preserved during import. All devices are placed in the All group. You need to manually recreate the desired device group structure and add the devices to the appropriate groups.

Step 4 Because policy changes are performed under an activity or configuration session, the imported policies and policy objects are not yet committed to the Security Manager database. You must submit and approve the changes. Based on Workflow mode:

- Non-Workflow mode—Select **File > Submit**.
- Workflow mode without an approver—Select **Activities > Approve Activity**.
- Workflow mode with an approver—Select **Activities > Submit Activity**. The activity must be approved before the changes are committed.

If you are not happy with the import, you can discard the activity or configuration session. However, when importing devices, the devices are added outside an activity or configuration session. Therefore, if you discard the activity or

configuration session, you discard the device policies and VPN topologies, but the devices remain in the inventory. You should also delete the devices as described in Deleting Devices from the Security Manager Inventory , on page 130.

Installing Security Manager License Files

The terms of your Security Manager software license determine many things, including the features that are available to you and the number of devices that you can manage. For licensing purposes, the device count includes any physical device, security context, virtual sensor, or Catalyst security services module that uses an IP address. Failover pairs count as one device. For PIX Firewalls, FWSM, and ASA devices that are configured in multiple-context mode (so that they host more than one security context), only the security contexts are counted as devices; the hosting device is not counted as a separate device.

Three license types, Standard, Professional, and Upgrade, are available, in addition to a free 90-day evaluation period that is restricted to 50 devices. For complete information on the types of licenses available and the various supported upgrade paths, as well as information about the Cisco Software Application Support service agreement contracts that you can purchase, see the product bulletin for this version of Security Manager at http://www.cisco.com/en/US/products/ps6498/prod_bulletins_list.html. Also, see the Installation Guide for Cisco Security Manager .

License limits are imposed when you exceed the allotted time (in the case of the evaluation license), or the number of devices that your license allows you to manage. The evaluation license provides the same privileges as the Professional Edition license. It is important that you register Security Manager as soon as you can within the first 90 days, and for the number of devices that you need, to ensure uninterrupted use of the product. Each time you start the application you are reminded of how many days remain on your evaluation license, and you are prompted to upgrade during the evaluation period. At the end of the evaluation period, you are prevented from logging in until you upgrade your license.

For non-evaluation licenses, if the database contains more devices than what is allowed by your configured licenses, you cannot log into the application using the Security Manager client. You are prompted to add a license during login, and login cannot complete until you add an appropriate license.

Tip The number of devices includes all discovered security contexts and virtual sensors, even if you have not submitted the activity that discovered them and they do not currently appear in the device selector. If it appears there are fewer devices in the inventory than your license allows, but you are getting device count error messages, submit all activities to determine the number of discovered devices. Delete those that you do not want to manage.

Before You Begin

- Obtain the base or upgrade license and any additional licenses that you require. You must have a Cisco.com user ID, and you must register your copy of the software on Cisco.com. When registering, you must provide the Product Authorization Key (PAK) that is attached to the Software License Claim Certificate inside the shipped software package.
  - If you are a registered Cisco.com user, go to http://www.cisco.com/go/license.
  - If you are not a registered Cisco.com user, go to http://tools.cisco.com/RPF/register/register.do .

After registration, the base software license is sent to the e-mail address that you provided during registration. In addition to receiving a PAK and license for Security Manager, you might receive one additional PAK for each incremental device count pack you purchased.

Copy the license files to a folder on the Security Manager server or your local Security Manager client. If you are copying the license files to your Security Manager server, you must store your license files on a disk that is local to your Security Manager server; you cannot use a drive that is mapped to the server. Windows imposes this limitation, which serves to improve Security Manager performance and security.

Note To install a license file that is located on your local Security Manager client, you must have client-side file browsing enabled (see Customize Desktop Page , on page 520).

Tip Do not place the license file in the etc/licenses/CSM folder in the product's installation folder on the Security Manager server, or you will encounter an error when you try to add the license. Place the file in a folder outside the product folders.

- Common Services does not require a license file.
- Auto Update Server does not require a license file.

Step 1 Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

Step 2 Click **CSM** if the tab is not active. For a description of the fields on this tab, see CSM Tab, Licensing Page , on page 570.

Step 3 Click **Install a License** to open the Install a License dialog box.

The Install a License dialog box includes links to Cisco.com for obtaining licenses if you have not already done so. Click **Browse** to select a license file, and then click **OK** on the Install a License dialog box to install the license.

Repeat the process until you have installed all of your licenses.

Certificate Trust Management

Cisco Security Manager downloads ASA images and IPS packages from Cisco.com over HTTPS, which uses certificates for establishing trust. Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates for both types of downloads:

- ASA image downloads. For detailed documentation on certificate trust management for ASA image downloads, refer to Image Manager Page , on page 552 or navigate to **Tools > Security Manager Administration... > Image Manager > Help**.
- IPS package downloads. For detailed documentation on certificate trust management for IPS package downloads, refer to Edit Update Server Settings Dialog Box , on page 564 or navigate to **Tools > Security Manager Administration... > IPS Updates > [Update Server group] > Edit Settings > Help**.

Certificate Trust Management Feature

The certificate trust management feature in Security Manager has these characteristics:

- It behaves like a browser. It imparts trust to what you, as the user, consciously trust.
- It allows you to view the certificate and use your discretion in accepting it.
- It proactively validates a certificate to help you judge whether to accept or reject it. For example, it checks to see if a certificate is self-signed (not issued by a trusted Certificate Authority) and to see if it is expired, not yet valid, or revoked.
- After you accept a certificate, it stores that certificate on your Security Manager server.
- It provides transparency and control: You can retrieve and add a certificate, view a certificate, and remove a stored certificate.
- During communication with Cisco.com, it compares the live server certificate with the stored certificate and proceeds only upon a complete match. The complete certificate chain, not just the root certificate, is compared for a match. If there is a mismatch, the current operation is aborted until you view and accept the new certificate.
- It performs daily checks of your Security Manager server for certificate revocation and validity, and it removes any revoked or invalid certificates from your server. It does this by live contact with the CRL distribution points/URL present in the certificate. The default fixed schedule is for this daily check to be performed at 2:00 a.m.

Download Requirements

To download images from Cisco.com, you must retrieve, view, and accept both the latest image meta-data locator certificate and the latest certificate URL of the download site. The Security Manager interface has messages to assist you in key locations, and detailed documentation is available by referring to Image Manager Page , on page 552 and Edit Update Server Settings Dialog Box , on page 564.

Troubleshooting

During daily checks for certificate revocation and validity, the CRL revocation list is not stored on your Security Manager server. For that reason, if connectivity is lost, the daily checks fail to detect any possible certificate revocations. This problem will be solved after connectivity is restored.

If failure occurs while downloading ASA images or checking for IPS update packages, the most probable causes are the following:

- Site’s certificate is not found on your Security Manager server
- There is a mismatch between the certificate received from the site and the stored certificate
- The site’s certificate has expired

In all of these three cases listed above, the operation is aborted, and a message gives the cause of the error and the URL of the failed site. To recover, navigate to the user interface of the certificate feature (Tools > Security Manager Administration... > Image Manager or Tools > Security Manager Administration... > IPS Updates > [Update Server group] > Edit Settings); then retrieve, view, and accept the new certificate from the site and re-try the download.

If failure occurs while performing a check for IPS updates, verify that you have accepted both the certificate of the Cisco.com site used to obtain the meta-data information for IPS packages and the certificate of the

actual download site of the IPS packages. Cisco recommends that you always configure email for notification of the job execution status. Then you can view the recommended actions in the email for recovering from the error. Copy the failed download URL from the email message to retrieve the certificate.

Because certificates are stored, if you upgrade to Security Manager 4.4 from a previous version, all communication with Cisco.com will fail. To resolve this problem, you must retrieve the certificates from the image meta-data locator and the download site URL.

If the stored certificate table in the user interface does not show the addition of a particular certificate, check to see if the daily checks for certificate revocation and validity have removed it because of revocation or expiration. You can do this by looking for the Certificate Revocation Check Task in the tomcat log; that log will enable you to determine the exact reason for the removal of the stored certificate.

Working with Audit Reports

When state changes occur in Security Manager, an audit entry is created in the audit log, which you can view by selecting **Manage > Audit Report**. The following topics provide more detailed information about audit reports:

- Understanding Audit Reports, on page 497
- Generating the Audit Report, on page 498
- Purging Audit Log Entries, on page 501

Understanding Audit Reports

When state changes occur in Security Manager, an audit entry is created in the audit log, which you can view by selecting **Manage > Audit Report**.

The state changes that generate an event and create an audit entry are:

- Changes to the runtime environment:
  - System changes, such as login attempts (successful or failed), logout, and scheduled backups.
  - Authorization issues, such as failed attempts and security breaches.
  - Map changes, such as saving, deleting, and changing background map views.
  - Administrative changes, such as changing workflow modes.
- Changes to the state of Security Manager objects:
  - Activity changes, such as creating, editing, submitting, or approving an activity.
  - Deployment changes, such as creating, editing, or submitting a deployment job.
- Changes to the state of managed devices:
  - Object changes, such as changes to policy objects.
  - Inventory changes, such as adding, deleting, or modifying devices in the inventory.
  - Policy changes, such as creating, restoring, modifying, or deleting policies.

- VPN changes, such as creating, modifying, or deleting a VPN.

When viewing the audit report, you can view subsets of entries by specifying search criteria to select only the desired records.

Related Topics

- Understanding Audit Reports, on page 497
- Purging Audit Log Entries, on page 501

Generating the Audit Report

You can view the audit log to analyze the events that have occurred in the Security Manager System. This information can help you track changes that users have made to devices or to identify other system events of interest. The Audit Report window provides extensive search criteria to help you view the specific audit log entries that interest you.

Tip You can also view the audit logs through CiscoWorks Common Services. From the Common Services Server Administration page, select **Server > Reports**, and select **Audit Log** from the table of contents. Click **Generate Report** and you are presented with a list of logs, one for each day. Click the link for the desired log to open it. These logs are stored in the Program Files/CSCOpx/MDC/Logs/audit/ directory. For information about logging into Common Services, see Logging In to the Cisco Security Management Suite Server , on page 12.

Related Topics

- Understanding Audit Reports, on page 497

Step 1 Select **Manage > Audit Report** to open the Audit Report window.

Step 2 To reduce the report to a specific set of records that relate to an area of interest, enter the appropriate search criteria in the left pane and click **Search**. For detailed information about the search fields, see Using the Audit Report Window, on page 499.

The following examples describe sample search criteria:

- To find out when the device router1 was removed from Security Manager management—Select **Devices > Delete** from the **Search by action** selector. In the **Search by all or part of the object name** field, enter the display name of the device (router1).
- To find out if a failed login attempt occurred in the system—Select **System > Authorization > Login > Failed** from the **Search by action** selector.

Step 3 To view the contents of an entry in the report, double click the entry. This action opens a dialog box where you can read the message related to the entry. You can scroll through the report in this dialog box by using the up and down arrow buttons.

Using the Audit Report Window

Use the Audit Report window to view records of state changes in Security Manager.

The Audit Report page contains two panes. Use the left pane to define the parameters for generating the audit report. The right pane displays the audit report using one row for each audit entry or message. The content of the audit report depends on the parameters you defined in the left pane. Therefore, all columns listed in the table might not be displayed in the generated audit report.

Navigation Path

Select **Manage** > **Audit Report**.

- Understanding Audit Reports, on page 497
- Generating the Audit Report, on page 498

Field Reference

Table 117: Audit Report Window

Element	Description
Search Criteria (Left Pane) The left side of the Audit Report window contains the search criteria for the report. The default report lists all state changes from yesterday and today, sorted with the most recent changes at the top.	
Search by action	One or more sources of actions to include in the audit report. If you do not make a selection, the report is not filtered based on action. You can select All to include all action sources.
Search by date	The time period to include in the report. Actions that occur between the from and to dates are displayed. Click the calendar icon to select the dates. This filter's default (reset position) is to include actions from yesterday to today.
Search for activity by state	This field works differently from the other search fields, and is primarily of use in Workflow mode. You can use this field to select one or more activities to include in the report. The activities are listed in the display box below the drop-down list. The drop-down list helps you find the activities on which you want to report. To use this search mechanism, select the activity state of the activities on which you want to report, and then select the activities. Use Ctrl+click to select multiple activities. Select No Activity to not filter by activity.
Search by message warning level	The message warning level. The report is limited to messages of the selected severity. Use Ctrl+click to select multiple levels.

Element	Description
Search by user name	The username of the person who performed the actions to include in the report. To see Security Manager system-generated actions, enter the username System.
Search by a phrase in the message body	A string of text that should occur in the message of the audit report entries. You can enter a maximum of 1025 characters. The message is not visible in the report table. To see the messages related to an entry, double-click the entry.
Search by all or part of the object name	A string of text that should occur in the name of the object for which the audit entries were generated. You can enter a maximum of 1025 characters.
Search button	Click this button to generate the report in the right pane.
Reset button	Click this button to reset the search criteria and delete any values or selections you made.
Audit Report (Right Pane) The right side of the Audit Report window contains the audit report. Each row represents one audit entry. Double-click a row to open the Audit Message Details dialog box, where you can view a more readable layout of the information and to see the specific messages associated with the entry. You can scroll through the entries in the report from within the Audit Message Details dialog box.	
Message Level	The message warning level: Information, Warning, Success, Failure and Internal System Error.
Date	The date and time the action occurred.
Source	The origin of the audit entry: Objects, License, Admin, Firewall, Policy Manager, Devices, Topology, VPN, Config Archive, Deployment, System, and Activity.
Action	The action performed: Add, Assign, Create, Delete, Open, Purge, Unassign, and Update.
Object	The identifier of the object of the action. For example, if the category is device, then the object identifier could be the device name or IP address. If the category is deployment, then the object identifier could be job name, job ID, and so on. There frequently is no specific object name.
User Name	The username of the person performing the action.
Activity	The name of the activity in which the action occurred, if any.
# of rows per page	The number of rows to display on each page.
< arrow	Click this button to return to the previous page of the audit report.
> arrow	Click this button to advance to the next page of the audit report.

Purging Audit Log Entries

Security Manager automatically prunes the audit logs based on the age of the log entries. You do not need to actively manage the size of the log. However, you can change the defaults to increase or decrease the maximum size of the log and thus manage the overall size of the database.

To change the default settings for audit logs, select **Tools > Security Manager Administration** and select **Logs** from the table of contents (see Logs Page , on page 575). The size of the log is controlled by the maximum number of days an entry can be, and the overall maximum number of entries that can be in the log. These settings work together, and entries are pruned on a periodic basis to keep the log to the maximum number of entries with none that are older than the maximum number of days. If you reduce the maximum size of the log, click **Purge Now** to delete the excess entries before the regular pruning cycle.

Note The Purge Now button only removes audit report entries from the database. It does not remove the *.csv files from the <*install_dir* >\CSCOpx\MDC\log\audit folder. These *.csv files can be deleted directly.

You can also control the size of the log by changing the severity level of events that are captured in the log. For example, if you capture only Severe events, the log will probably remain small. However, reducing the level of information might reduce the value of the log.

Taking Over Another User's Work

A user with administrative privileges can take over the work of another user in non-Workflow mode. Taking over another user's work is useful when a user is working on devices and policies, causing the devices and policies to be locked, and another user needs access to the same devices and policies.

Step 1 Select **Tools > Security Manager Administration** and select **Take Over User Session** from the table of contents to open the Take Over User Session page (see Take Over User Session Page , on page 585).

Step 2 Select the user session you want to take over.

Step 3 Click **Take over session**. The changes made by the selected user are transferred to you. Any changes that have not already been committed are discarded.

If the selected user is logged in at the time changes are taken over, the user receives a warning message, loses the changes in progress, and then is logged out.

Changing Passwords for the Admin or Other Users

The admin user is a pre-defined user that has access to all Security Manager functions. When you install the product, you configure a password for the admin user. If you forget the password, you can use the following procedure to change it. You can also use this procedure to reset the password for other user accounts.

Step 1 Log into Windows on the Security Manager server and open a Windows command line window.

Step 2 Stop the daemon manager services by using this command:

net stop crmdmgtd

Tip You can also stop and start the daemon manager using the Services control panel.

Step 3 Run ResetPasswd.pl specifying admin as the user name. This example assumes you installed the product in the default directory; change the directory path if you used a different directory:

C:\Program Files\CSCOpx\bin\perl ResetPasswd.pl admin

You are prompted for a new password.

Tip If you want to change the password for a different user, replace **admin** with the desired user name.

Step 4 Start the daemon manager services by using this command:

net start crmdmgtd

Backing up and Restoring the Security Manager Database

You should regularly back up the Security Manager database in case you need to recover your work.

Tip The Security Manager database backup does not include the event data store used by the Event Manager service. If you want to back up event management data, see Archiving or Backing Up and Restoring the Event Data Store , on page 2712.

The following topics describe how to back up and recover the Security Manager database:

Backing Up the Server Database

Security Manager uses CiscoWorks Common Services facilities to back up and restore its database. In the Security Manager client, select **Tools** > **Backup** to open the CiscoWorks Common Services Backup page for creating a backup schedule. You should regularly back up the database so that you can recover it if necessary.

After completing a backup, Security Manager compresses it. If you configure an e-mail address on the CiscoWorks Common Services backup page, you will get notifications of the completion of the backup and

compression processes. If you have problems with file compression, or if you do not want to compress the backups, you can turn off backup compression. Edit the backup.properties file in the %NMSROOT%\conf folder (typically C:\Program Files\CSCOpx\conf) and change the backup compression property to specify NO instead of YES, as follows: VMS_FILEBACKUP_COMPRESS=NO.

Tip The backup includes the configuration and reporting databases, but it does not include the event storage areas. You can exclude the reporting database by changing the SKIP_RPT_DB_BACKUP property value to YES in the backup.properties file. Even if you specify YES, the backup will include reports generated by report schedules. For information on backing up the event data store, see Archiving or Backing Up and Restoring the Event Data Store , on page 2712.

While backing up and restoring data, both Common Services and Security Manager processes will be shut down and restarted. Because Security Manager can take several minutes to fully restart, users might be able to start their client before the restart is complete. If this happens, they might see the message “error loading page” in device policy windows.

We strongly recommend you take a backup of your current system before restoring an older backup.

You cannot restore a backup from an earlier version of Security Manager if that backup contains any pending data, which is data that has not been committed to the database. Before upgrading to a new version of Cisco Security Manager, we recommend that you commit or discard all uncommitted changes and then create a backup of your database. You can use the following instructions to help with committing or discarding pending data:

- **In non-Workflow mode:**
  - To commit changes, select **File > Submit**.
  - To discard uncommitted changes, select **File > Discard**.

If there are multiple users with pending data, the changes for those users must also be committed or discarded. If you need to commit or discard changes for another user, you can take over that user’s session. To take over a session, select **Tools > Security Manager Administration > Take Over User Session**, select the session, and click **Take Over Session**.

- **In Workflow mode:**
  - To commit and approve changes, select **Manage > Activities**. From the Activity Manager window, select an activity and click **Approve**. If you are using an activity approver, click **Submit** and have the approver approve the activity.
  - To discard uncommitted changes, select **Manage > Activities**. From the Activity Manager window, select an activity and click **Discard**. Only an activity in the Edit or Edit Open state can be discarded.

You can also back up the database from a Windows command prompt using the following command:

[*path*]**perl** [*path*]**backup.pl** *backup_directory* [*log_filename* [**email=***email_address* [*number_of_generations* [**compress**]]]]

Syntax

[*path*]**perl** [*path*]**backup.pl**	The Perl script command. Include the path to the perl command and the backup.pl file if the path is not defined in the system path variable. The typical path for both is C:\Progra~1\CSCOpx\bin\.
backup_directory	The directory where you want to create the backup. For example, C:\Backups.
log_filename	(Optional.) The log file for messages generated during backup. Include the path if you want it created somewhere other than the current directory. For example, C:\BackupLogs. If you do not specify a name, the log is %NMSROOT%\log\dbbackup.log.
email=*email_address*	(Optional.) The email address where you want notifications sent. If you do not want to specify an email address, but you need to specify a subsequent parameter, enter **email** without the equal sign or address. You must configure SMTP settings in CiscoWorks Common Services to enable notifications. For more information, see Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.
number_of_generations	(Optional.) The maximum number of backup generations to keep in the backup directory. When the maximum is reached, old backups are deleted. The default is 0, which does not limit the number of generations kept.
compress	(Optional.) Whether you want the backup file to be compressed. If you do not enter this keyword, the backup is not compressed if VMS_FILEBACKUP_COMPRESS=NO is specified in the backup.properties file. Otherwise, the backup is still compressed. We recommend compressing backups.

Example

The following command assumes that you are in the directory containing the perl and backup.pl commands. It creates a compressed backup and log file in the backups directory and sends notifications to admin@domain.com. Note that you must specify a backup generation to include the compress parameter; if you specify any parameter after the log file parameter, you must include values for all preceding parameters.

```
perl backup.pl C:\backups C:\backups\backup.log email=admin@domain.com 0 compress
```

Tip If you stop a backup that is in progress, you need to delete the backup.LOCK file in the Security Manager installation directory (typically C:\Progra~1\CSCOpx) before you can perform another backup.

Restoring the Server Database

You can restore your database by running a script from the command line. You have to shut down and restart CiscoWorks while restoring data. This procedure describes how you can restore the backed up database on your server. A single backup and restore facility exists to back up and restore all applications installed on a CiscoWorks server; you cannot back up or restore individual applications.

If you install the applications on multiple servers, ensure that you recover the database backup that contains data appropriate for the installed applications.

Tip You can restore backups taken from previous releases of the application if the backup is from a version supported for direct local inline upgrade to this version of the application. For information on which versions are supported for upgrade, see the Installation Guide for Cisco Security Manager for this release of the product.

Step 1 Stop all processes by entering the following at the command line:

net stop crmdmgtd

Step 2 Restore the database by entering:

*$NMSROOT***bin\perl** *$NMSROOT***bin\restorebackup.pl** [**-t** *temporary_directory*] [**-gen** *generationNumber*] **-d** *backup_directory* [**-h**]

where:

- *$NMSROOT* —The full pathname of the Common Services installation directory (the default is C:\Program Files\CSCOpx).
- **-t** *temporary_directory* —(Optional) This is the directory or folder used by the restore program to store its temporary files. By default this directory is *$NMSROOT* \tempBackupData.
- **-gen** *generationNumber* —(Optional.) The backup generation number you want to recover. By default, it is the latest generation. If generations 1 through 5 exist, then 5 will be the latest.
- **-d** *backup_directory* —The backup directory that contains the backup to restore.
- **-h**—(Optional) Provides help. When used with -d BackupDirectory, help shows the correct syntax along with available suites and generations.

For example, to restore the most recent version from the c:\var\backup directory, enter the following command:

C:\Progra~1\CSCOpx\bin\perl C:\Progra~1\CSCOpx\bin\restorebackup.pl -d C:\var\backup

Tip If you are restoring a database that contains RME data, you might be asked if you want to collect inventory data. Collecting this data can take a long time. You might want to respond No and then configure RME to schedule an inventory. In RME, select **Devices > Inventory**.

Step 3 Examine the log file, *NMSROOT***log\restorebackup.log**, to verify that the database was restored.

Step 4 Restart the system by entering:

net start crmdmgtd

Step 5 If you restore a database that was backed up prior to installing a Security Manager service pack, you must reapply the service pack after restoring the database.

Generating Data for the Cisco Technical Assistance Center

Cisco Technical Assistance Center (TAC) personnel might ask you to submit a variety of data to help them identify and resolve problems you might encounter when using the application. The following topics can help you generate the required information. However, you should perform these tasks only at the direction of the TAC, because the information is not always required to resolve a problem.

- Creating Diagnostics Files for the Cisco Technical Assistance Center , on page 506
- Generating Deployment or Discovery Status Reports, on page 508
- Generating a Partial Database Backup for the Cisco Technical Assistance Center, on page 508

Creating Diagnostics Files for the Cisco Technical Assistance Center

Cisco Technical Assistance Center (TAC) personnel may ask you to submit system configuration information in the form of a diagnostics file when you submit a problem report. The diagnostics file assists them with diagnosing the problem. You do not need to submit a diagnostics file unless they ask you to.

Before you create the diagnostics file, perform the actions that lead to the problem in your report. If necessary, you can control the level of detail in the diagnostics file by changing the settings on the Debug Options page (**Tools > Security Manager Administration > Debug Options**); see Debug Options Page , on page 522.

Beginning with Version 4.7, Cisco Security Manager supports diagnostics in a new, light variant; this "Light Diagnostics" variant collects only basic information; as a result, the diagnostics file is smaller, and its generation is faster. The existing "General Diagnostics" variant is the same in 4.7 as it was in 4.6 and earlier versions.

General Diagnostics File

The general diagnostics file (CSMDiagnostics.zip) contains the following files and information:

- Configuration files
- Apache configuration and log files
- Tomcat configuration and log files
- Installation, audit, and operation log files
- The CiscoWorks Common Services Registry subtree ([HKEY_LOCAL_MACHINE][SOFTWARE][Cisco][MDC])
- Windows System Event and Application Event log files
- Host environment information (operating system version and installed service packs, amount of RAM, disk space on all volumes, computer name, and virtual memory size)

To create CSMDiagnostics.zip by using the GUI, follow this procedure:

1. Using the Security Manager client, select **Tools > Security Manager Diagnostics... > General Diagnostics...**. A dialog box is opened.
2. Click **OK** to start the file generation. The dialog box displays the progress.
3. When the file is generated, click **Close**.

To create CSMDiagnostics.zip by using the CLI, follow this procedure:

1. Open a command line window on the Security Manager server.
2. Run the **~MDC\bin\CSMDiagnostics** program.
3. CSMDiagnostics.zip is placed in the <*installation_location*> /MDC/etc folder, where <*installation_location*> is the drive and directory in which you installed CiscoWorks Common Services. The default value for <*installation_location*> is C:\Program Files (x86)\CSCOpx.
4. If you want to, you can specify a different folder where CSMDiagnostics.zip is placed. For example, you can specify **CSMDiagnostics C:\Temp**.
5. You should move or rename CSMDiagnostics.zip after you create it, because it will be overwritten the second time you generate it, with only one previous version (appended with "_old") being saved.

Note When creating CSMDiagnostics.zip by using the CLI, you must allow the command to complete before closing the window; if you do not, subsequent attempts to run **CSMDiagnostics** will not work properly. If you mistakenly close the window, delete the C:\Program Files\CSCOpx\MDC\etc\mdcsupporttemp folder before attempting to use the command again.

Light Diagnostics File

The light diagnostics file (CSMDiagnostics_light.zip) contains a subset of the general diagnostics file (CSMDiagnostics.zip), so it is smaller and generated faster.

To create CSMDiagnostics_light.zip by using the GUI, follow this procedure:

1. Using the Security Manager client, select **Tools > Security Manager Diagnostics... > Light Diagnostics...**. A dialog box is opened.
2. Click **OK** to start the file generation. The dialog box displays the progress.
3. When the file is generated, click **Close**.

To create CSMDiagnostics_light.zip by using the CLI, follow this procedure:

1. Open a command line window on the Security Manager Server.
2. Run the following command: <*installation_location*> \MDC\diagnostics\script>rundiag.bat, where <*installation_location*> is the drive and directory in which you installed CiscoWorks Common Services. The default value for <*installation_location*> is C:\Program Files (x86)\CSCOpx.
3. Be certain that you run the command with the following 3 parameters and in the order shown:

3.1. Installation Folder—Folder where Security Manager server is installed. This must not be changed or modified. An error in the path leads to failure in the generation of the diagnostics file. Example: C:\PROGRA~2\CSCOpx\MDC

3.2. Destination Folder—Folder where the diagnostics file will be placed after generation. You can specify any path and folder where you want the file to be saved. If you want the file to be saved in the default path, then you must specify the default path explicitly. If you do not specify the path, there will be an error in generation. Example: C:\PROGRA~2\Light_Diagnostics

3.3. "LightDiagnostics" string without a space. The string alphabets are not case-sensitive, so you can use capital or lower-case letters, but you must not use a space in this string. If you neglect to specify this string, part of the general diagnostics (i.e., not light diagnostics) logs will automatically be collected in the destination folder.

1. Complete command screen example:

C:\Program Files (x86)\CSCOpx\MDC\diagnostics\script>rundiag.bat C:\PROGRA~2\CSCOpx\MDC C:\PROGRA~2\Light_Diagnostics LightDiagnostics

Generating Deployment or Discovery Status Reports

You can generate status reports for deployment and policy discovery jobs. If you have problems involving deployment or discovery, these reports can help the Cisco Technical Support (TAC) personnel resolve your problem. Although the reports are mainly intended for troubleshooting, you can also generate these reports for your own uses.

The status reports are generated as Adobe Acrobat (PDF) files on your workstation (you are prompted to select the location to save the PDF file). The report includes a summary of the job and summaries for each device in the job. Deployment status reports also include the full and delta configurations and the transcript of communications between Security Manager and the device.

You can generate deployment or discovery reports in the following ways:

- **Deployment Status Reports**
  - When a deployment job finishes, either successfully or unsuccessfully, by clicking the **Generate Report** button on the Deployment Status dialog box. See Deployment Status Details Dialog Box , on page 412.
  - For previously completed jobs, by selecting the job in the Deployment Manager and clicking the **Generate Report** button. See Deployment Manager Window , on page 395.
- **Discovery Status Reports**
  - During a discovery job, which might occur when adding devices or when rediscovering policies on devices already in the inventory, by clicking the **Generate Report** button on the Discovery Status dialog box. See Discovery Status Dialog Box , on page 189.
  - For previously completed jobs, by selecting the job in the Policy Discovery Status dialog box and clicking the **Generate Report** button. See Policy Discovery Status Page , on page 191.

Generating a Partial Database Backup for the Cisco Technical Assistance Center

Caution This topic explains how to create a partial database backup. Partial backups are incomplete and you cannot use them as a replacement for full backups. Partial backups are strictly for use in troubleshooting and you should generate one only if instructed to do so by Cisco Technical Assistance (TAC) personnel.

Partial database backups have the same characteristics as regular backups, but they contain a more limited set of data. When creating a partial backup, you are asked whether you want to include data from the Configuration Archive, and if you say yes, how many archive versions (per device) you want to include (regular backups include the entire Configuration Archive). For a description of regular backups, see Backing Up the Server Database, on page 502.

Tip The partial backup will include or exclude the reporting database based on the settings in the backup.properties file as described in Backing Up the Server Database, on page 502.

While backing up and restoring data, both Common Services and Security Manager processes will be shut down and restarted. Because Security Manager can take several minutes to fully restart, users might be able to start their client before the restart is complete. If this happens, they might see the message “error loading page” in device policy windows. Note that if you try to restore a partial backup, the system will point out that it is a partial backup, and you will have to confirm that you want to restore a partial backup.

To generate a partial backup, use the following command at a Windows command prompt on the Security Manager server.

[*path*]**perl** [*path*]**partial_backup.pl** *backup_directory* [*log_filename* [**email**=*email_address* [*number_of_generations* [**compress**]]]]

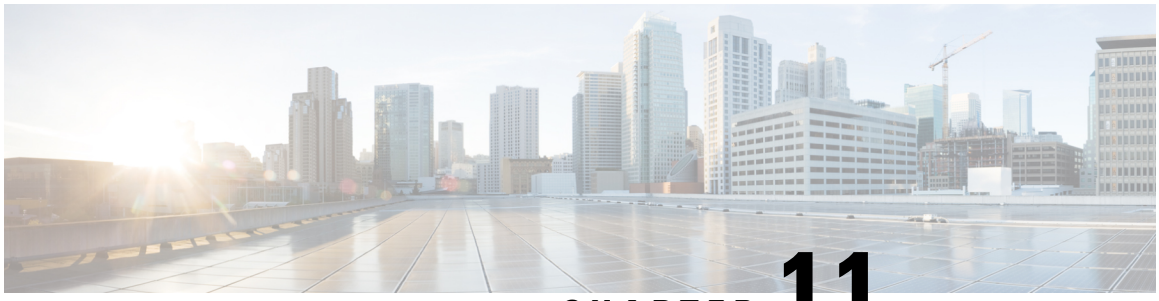
Syntax

[*path*]**perl** [*path*]**partial_backup.pl**	The Perl script command. Include the path to the perl command and the partial_backup.pl file if the path is not defined in the system path variable. The typical path for both is C:\Progra~1\CSCOpx\bin\.
backup_directory	The directory where you want to create the backup. For example, C:\Backups.
log_filename	(Optional.) The log file for messages generated during backup. Include the path if you want it created somewhere other than the current directory. For example, C:\BackupLogs. If you do not specify a name, the log is %NMSROOT%\log\dbbackup.log.
email=*email_address*	(Optional.) The email address where you want notifications sent. If you do not want to specify an email address, but you need to specify a subsequent parameter, enter **email** without the equal sign or address. You must configure SMTP settings in CiscoWorks Common Services to enable notifications. For more information, see Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.
number_of_generations	(Optional.) The maximum number of backup generations to keep in the backup directory. When the maximum is reached, old backups are deleted. The default is 0, which does not limit the number of generations kept.
compress	(Optional.) Whether you want the backup file to be compressed. If you do not enter this keyword, the backup is not compressed if VMS_FILEBACKUP_COMPRESS=NO is specified in the backup.properties file. Otherwise, the backup is still compressed. We recommend compressing backups.

Example

The following command assumes that you are in the directory containing the perl and partial_backup.pl commands. It creates a compressed partial backup and log file in the backups directory and sends notifications to admin@domain.com. Note that you must specify a backup generation to include the compress parameter; if you specify any parameter after the log file parameter, you must include values for all preceding parameters. Also note that you are asked whether you want to include the Configuration Archive, and if yes, how many archive versions to include in the backup. In this example, five archive versions per device are included in the backup.

```
perl partial_backup.pl C:\backups C:\backups\pbackup.log email=admin@domain.com 0 compress
Root: c:\backups
Do you also want to take config-archive backup(Yes/No): Yes
How many previous config-archive you want to restore: 5
```



CHAPTER 11

Configuring Security Manager Administrative Settings

Security Manager has default settings for many system functions that you can change if they do not fit the needs of your organization. To view and change these settings, select **Tools > Security Manager Administration**. You can then select items from the table of contents on the left of the window to view the default settings related to that item.

On most pages, when you change a setting, you must click Save to save your changes. If you make a mistake, you can click **Reset** to return the values to the previously saved values. You can also click **Restore Defaults** to return the settings to the Security Manager defaults.

Besides the pages that contain system defaults, the Security Manager Administration window includes items that relate to system administration activities, such as taking over another user's work or obtaining access to pages in Common Services to perform server security tasks.

The following topics describe the settings and actions available on each of the pages available in the Security Manager Administration window:

API Settings Page

The Security Manager API settings page enables you to enable or disable the API service and change its settings.

Navigation Path

Click **Tools > Security Manager Administration** and select **API** from the table of contents.

Field Reference

Table 118: API Settings Page

Element	Description
Enable API Service	Whether to enable or disable the API service.
Result Set Page Size	Allowed values are 100 through 1000, inclusive.
Active client sessions	Allowed values are 1 through 10, inclusive.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

AutoL-ink Settings Page

The Security Manager Map view provides a graphical view of your VPN and layer 3 network topology. Using device nodes to represent managed devices and map objects to represent unmanaged objects such as devices, clouds, and networks, you can create topology maps with which to study your network. AutoLink settings enable you to exclude any one of five private or reserved networks from Map view. For example, you might want to exclude any test networks that are not relevant to the management tasks you are using Security Manager to perform.

Navigation Path

Click **Tools > Security Manager Administration** and select **AutoLink** from the table of contents.

Related Topics

- Creating and Managing Layer 3 Links on the Map , on page 1604
- Displaying Your Network on the Map , on page 1599

Field Reference

Table 119: AutoLink Page

Element	Description
Enable AutoLink for 10.0.0.0/8 Enable AutoLink for 172.16.0.0/12 Enable AutoLink for 192.168.0.0/16	Whether to automatically include or omit (deselected) these private networks from the maps you create.
Enable AutoLink for 127.0.0.0/8	Whether to automatically include or omit (deselected) the loopback network from the maps you create.
Enable AutoLink for 224.0.0.0/4	Whether to automatically include or omit (deselected) the multicast networks from the maps you create.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

ACL Hit Count Settings Page

The Security Manager ACL Hit Count Settings page enables you to configure and change the settings for Hit Count. This feature is available in Security Manager version 4.9 and later for ASA and ASASM devices.

Navigation Path

Click **Tools > Security Manager Administration** and select **ACL Hit Count Settings** from the table of contents.

Field Reference

Table 120: Hit Count Settings

Element	Description
Hit Count History Persist Limit (per ACE)	The Hit Count History Persist Limit is the limit for the Hit Count history details that can be stored for the particular ACE in the database. The default value is 5 and you can enter a maximum value of 10.
Purge Scheduler Process Time	The Purge Scheduler Process Time is used by the Hit Count Scheduler to schedule the Hit Count purge job at the given time on a daily basis. Select a time from the drop-down list. The default is 12 AM.

Note When you navigate to the ACL policy page after moving across screens, the **HitCount** and **LastHitTime** values display **0** and **Never**, respectively for all the ACL rules. To get the actual **HitCount** and **LastHitTime** values, click the **Refresh Hit Count** button on the ACL policy page. The values are retrieved from the database and displayed on all the ACL rules.

CCO Settings Page

Use the CCO Settings page to configure the settings used to connect to Cisco.com.

Also, use the CCO Settings page for certificate trust management. (Security Manager downloads ASA images from Cisco.com over HTTPS, which uses certificates for establishing trust.) The certificate trust management feature on the Image Manager page is new in Security Manager 4.4. It will help you with improved handling of Cisco.com certificates for ASA image downloads:

- You can use it to view a certificate and use discretion in accepting it.
- After you accept a certificate, it is stored on your Security Manager server.
- You can see all your certificates in a summary table on the Image Manager page, and you can use that table to view or remove certificates.

Tip Please be sure to refer to "Retrieve Certificate" in the table below.

For detailed documentation of the certificate trust management feature, refer to Certificate Trust Management, on page 495.

Navigation Path

Select **Tools > Security Manager Administration** and select **CCO Settings** from the table of contents.

Field Reference

Table 121: CCO Settings Page

Element	Description
Use IPS Updates Settings	If checked, the other settings on this page are disabled and the default prevails (the Cisco.com credentials from the IPS Updates page apply). **Caution** If checked, be sure that the Cisco.com credentials from the IPS Updates page are configured correctly. On that page, the default value for "Update From:" is "Local Server." You must choose "Cisco.com" to see certificate settings. Improper or incomplete certificate setting will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.
Username	The username Security Manager should use to log in to Cisco.com.
Password Confirm	The password for the username. Enter the password in both fields.
Proxy Server Settings	
Enable Proxy	Enables Image Manager to connect to Cisco.com via a web proxy server. When Enable Proxy is selected, the other proxy fields (including IP or Hostname, Port, Username, and Password) are enabled and used to connect to the web proxy.
Test Connection	Used to test for connectivity and credentials for Cisco.com.
Certificate	
Contact URL	• When selected, "Image Meta-data Locator" is used. This is the URL on Cisco.com that is used to obtain meta-data information about images. Meta-data information consists of the images applicable to a particular product, name, size, checksum, and URL to download for each image. • When selected, "Other" is used. You can enter any valid HTTPS URL. This URL is intended primarily for the HTTPS URL to download the image as obtained from the meta-data information about the image. This URL may be different from the URL of the image meta-data locator described in the previous paragraph; the certificate may be different, as well. **Caution** If you choose "Other," you need to explicitly add "https://dl.cisco.com" [without the quotation marks]: Enter it in the text field adjacent to the "Other" button. Failure to do this will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.

Element	Description
Retrieve Certificate	Used to connect to and retrieve the certificate from the selected ‘"Contact URL’." After retrieving the certificate it opens the Certificate Verification dialog, which along with a brief summary of the certificate, i.e., who the certificate is issued to, by whom, and the validity period of the certificate, gives you the following choices: • **View Certificate**—Opens the Certificate Viewer, where you can see all the details of the certificate: Certificate Authority, version, serial number, thumbprint, and other details. It shows the complete certificate chain information all the way up to the root issuing certificate Authority. • **Accept**—Accepts the certificate and adds it to the Cisco Security Manager. • **Reject**—Rejects the certificate and no action is taken. • **Cancel**—Closes the Certificate Verification dialog with no action taken. You must view and accept the following recommended certificates: • https://www.cisco.com • https://www.dl3.cisco.com • https://www.cloudsso.cisco.com • https://www.api.cisco.com • https://www.download-ssc.cisco.com **Note** You can download maximum of two files at a time from Cisco. If you attempt to download more than two files, you will receive an error message.
Certificates	A table that displays, for each certificate in your Security Manager installation, Subject, Issued By, and Accepted By.
View	Opens the Certificate Viewer for a certificate selected in the Certificate table.
Remove	Removes a certificate selected in the Certificate table.
Save button	Saves your changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Configuration Archive Page

Use the Configuration Archive page to define the default settings for the Configuration Archive tool, including how many configuration versions to save and the TFTP server to use for rolling back Cisco IOS software device configurations.

Navigation Path

Click **Tools > Security Manager Administration** and select **Configuration Archive** from the table of contents.

Related Topics

- Configuration Archive Window , on page 403
- Rolling Back Configurations , on page 445

Field Reference

Table 122: Configuration Archive Page

Element	Description
Max. Versions per Device Purge Now button Enable Configuration Archive Versions Auto Purge	The number of configuration versions you want to retain for each managed device, from 1 to 100. If you reduce the number, you can click **Purge Now** to immediately delete extra versions. Purging files using this option deletes transcript files corresponding to the extra configuration versions, from **C:\Program Files (x86)\CSCOpx\MDC\tomcat\vms\athena\transcript** folder. However, after purging, the trancript files pertaining to the deleted versions, which are also related to the corresponding deployment jobs, cannot be viewed; trying to view the transcript files will throw an **Unable to Display Transcript** error, because they have got deleted. . Security Manager automatically deletes extra versions during its normal cleanup cycle if you select the **Enable Configuration Archive Versions Auto Purge** option.
TFTP Server for Rollback	The fully-qualified DNS hostname or IP address of the server to use for TFTP file transfers. TFTP is used during rollback for IOS devices when the configuration cannot be updated using the **configure replace** command, which does not force a system reload. Enter **localhost** to use the Security Manager server. By default, a TFTP server is enabled on the Security Manager server. If you specify a remote TFTP server, you must configure that server appropriately to provide TFTP services.
TFTP Root Directory	The root directory for configuration file transfers if you are using the Security Manager server as the TFTP server. Click **Browse** to select a directory on the Security Manager server. If you specify a server other than the Security Manager server as the TFTP host, Security Manager always uses the root directory of that TFTP server. You cannot specify a non-root directory for remote TFTP servers.
Save button	Saves and applies changes.

Element	Description
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

CS-MARS Page

Use the CS-MARS page to register the Cisco Security Monitoring, Analysis and Response System servers that are monitoring your devices with Security Manager. By registering your CS-MARS servers, you can view messages and events captured in CS-MARS based on a device's firewall access rules or IPS signature rules configured in Security Manager. You must register a CS-MARS server before users can see events collected from it.

Tip If you are using CS-MARS global controllers, add them instead of the individual local controllers. By adding global controllers, Security Manager can identify the correct local controller for a device automatically, without you having to add each of the local controllers. This simplifies your CS-MARS configuration in Security Manager.

Navigation Path

Select **Tools > Security Manager Administration** and select **CS-MARS** from the table of contents.

Related Topics

- Registering CS-MARS Servers in Security Manager , on page 2875

Field Reference

Table 123: CS-MARS Page

Element	Description
CS-MARS Devices	The CS-MARS servers that are registered with Security Manager. • To add a server, click the Add (+) button and fill in the New or Edit CS-MARS Device Dialog Box , on page 519. • To edit a server, select it and click the Edit (pencil) button. • To delete a server, select it and click the Delete (trash can) button. When you delete a server, the device properties for all devices that use the server are updated to remove the server connection. If a device is also monitored by another CS-MARS server on the list, its properties are updated to point to the other server.

Element	Description
When Launching CS-MARS Allow User to Save Credentials	The type of credentials Security Manager should use to log into CS-MARS when obtaining event information: • **Prompt users**—When the user tries to get event information from CS-MARS, prompt the user to log into CS-MARS. If you select this option, you can also select **Allow User to Save Credentials**, which gives users the option to save their credentials so they do not have to log into CS-MARS again the next time they request event status. • **Use CS-Manager Credentials**—When the user tries to get event information from CS-MARS, log into CS-MARS using the same username and password the user used to log into Security Manager.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.

New or Edit CS-MARS Device Dialog Box

Use the New or Edit CS-MARS Device dialog box to register a CS-MARS server with Security Manager. Users can obtain messages or event status for a device's firewall or IPS policies from the CS-MARS server that is monitoring the device. For more information, see Registering CS-MARS Servers in Security Manager , on page 2875.

Navigation Path

From the CS-MARS Page , on page 518, click the Add button to add a new server, or select a server and click the Edit button.

Field Reference

Table 124: Add or Edit CS-MARS Device Dialog Box

Element	Description
CS-MARS Hostname/IP	The IP address or fully-qualified DNS host name of the CS-MARS server. **Tip** If you add a CS-MARS global controller, do not add any of the local controllers that the global controller monitors. Security Manager will automatically determine the local controller that is monitoring a specific device. Adding global controllers simplifies your CS-MARS configuration.
Username Password User Type	The username and password for logging into the server to validate that the CS-MARS server is running the appropriate software version and to obtain other basic information. Security Manager also uses this account to determine which CS-MARS server is monitoring a particular device. For CS-MARS local controllers, you can enter either a global or local user account. For global controllers, you must enter a global account. Identify the type of account in the User Type field.

Element	Description
Certificate Thumbprint Retrieve From Device button	The CS-MARS server certificate, a hexadecimal string that is unique to the device. Click **Retrieve From Device** to have Security Manager retrieve the certificate from the CS-MARS server. If the certificate is retrieved successfully, it is displayed. After verifying the certificate, click **Accept** to save it on the Security Manager server. You must have a correct certificate to use the CS-MARS server from Security Manager.

CSM Mobile Page

Use the CSM Mobile page of the Security Manager Administration window to enable or disable the CSM Mobile feature in Cisco Security Manager. If the CSM Mobile feature is enabled, users can access device health and summary information from mobile devices by navigating to the following link, where <SecManServer> is the DNS name or IP address of the Security Manager server:

https://<*SecManServer*> /mobile/

or

https://<*SecManServer*> /mobile

For more information about the types of information provided, see Dashboard Overview, on page 2835.

For more information about CSM Mobile, see CSM Mobile, on page 2846.

Navigation Path

Click **Tools > Security Manager Administration** and select **CSM Mobile** from the table of contents.

Field Reference

Table 125: CSM Mobile Page

Element	Description
Enable CSM Mobile Feature	Lets you enable or disable the CSM Mobile feature. If you disable this feature, you cannot access device health summary information from mobile devices.
Save button	Saves and applies changes. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.
Reset button	Resets changes to the last saved values.

Customize Desktop Page

Use the Customize Desktop page to control whether Security Manager applications close automatically after being idle for a specified time, to reset whether you are prompted to verify your actions in certain circumstances, and to control whether certain file operations can be performed on the Security Manager client.

Navigation Path

Select **Tools** > **Security Manager Administration** and select **Customize Desktop** from the table of contents.

Related Topics

- Installing Security Manager License Files , on page 494
- Importing Policies or Devices, on page 491
- Exporting the Device Inventory from the Command Line, on page 488
- Exporting Shared Policies, on page 489
- Selecting IPS License Files , on page 574

Field Reference

Table 126: Customize Desktop Page

Element	Description
Reset 'Do Not Ask' on Warnings button	Click this button to reestablish 'Are you sure...?' pop-up warnings. When you perform some actions, you are warned about the consequences and you are given the option to not be warned again. If you selected Do Not Ask Me Again for any of these warnings, clicking this button reenables the warning.
Enable Idle Timeout Idle Timeout (minutes)	Whether to have the Security Manager client applications close automatically if you do not use them for the specified period of time. The timeout applies across all applications; working in one application resets the timer in all applications. If you select this option, enter the number of minutes that must elapse before closing the client in the Idle Timeout field. The default is to close the client after 120 minutes of inactivity.

Element	Description

Enable Client side file browser	Whether to allow file operations on the Security Manager client. If you select this option, you will be able to choose between client and server file systems when performing the following file operations:
	• Installing Security Manager license files
	• Installing IPS license files
	• Importing/exporting device inventory files
	• Importing/exporting shared policies
	• Creating the following file objects:
	  • Cisco Secure Desktop Package
	  • Plug-In—For browser plug-in files.
	  • Secure Client Profile
	  • Secure Client Image
	  • Hostscan Image
	
	This option is enabled by default.

Global Search	
Enable Global Search	Whether to enable or disable the Global Search feature. This feature is enabled by default. **Tip** You can disable Global Search before performing bulk discovery or rediscovery of devices to improve performance. You can reenable Global Search and then recreate the index after discovery is complete or when users are least likely to be using the system.
Recreate Index	Click this button to regenerate the search index. The global search feature is not available while the index is being recreated.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Debug Options Page

Use the Debug Options page to configure the severity level of messages to include in debugging logs and to determine what other debugging information is collected.

You should change debugging levels only if the Cisco Technical Assistance Center (TAC) asks you to change them. This makes it possible for you to include more detailed information in the CSMDiagnostics.zip file.

After you change the message level for the appropriate subcomponent, redo the actions that are resulting in system problems. After the problems occur, create the CSMDiagnostics.zip file (or the CSMDiagnostics_light.zip file) by selecting **Tools > Security Manager Diagnostics... > General Diagnostics...** (or **Tools > Security Manager Diagnostics... > Light Diagnostics...**). You can then reset the debug options to the default levels so that the Security Manager server does not become bogged down collecting extra debug information. For more information about generating the CSMDiagnostics.zip file, see Creating Diagnostics Files for the Cisco Technical Assistance Center , on page 506.

By default, logs contain messages of the Error severity or worse. The severity levels in order of severity are:

- Severe—Problems that make the system unusable.
- Error—Problems from which Security Manager cannot recover.
- Warning—Unexpected conditions from which Security Manager can recover.
- Info—Informational messages.
- Debug—Internal status information.

Navigation Path

Select **Tools > Security Manager Administration**, then select **Debug Options** from the table of contents.

Field Reference

Table 127: Debug Options Page

Element	Description
Capture Discovery/Deployment Debugging Snapshots to File	Whether Security Manager generates data files about configuration generation, deployment, and discovery as these functions are performed. The temporary data files are stored in the MDC\temp directory in the Security Manager installation folder on the server, and you can use these files for debugging purposes. Enable this setting if you encounter problems with deployment or discovery. **Note** Selecting this check box slows down Security Manager response time. Enable this option only in limited circumstances. If you need to send these files to Cisco TAC for debugging, encrypt the files, because they can contain sensitive data such as passwords. **Note** Do not delete any snapshot files under MDC\temp directory in the Security Manager installation folder while discovery (or) deployment is in progress. You can delete them when Security Manager is idle. In addition, ensure you are not deleting any of the default files.
Deployment Debug Level	The message severity level for deployment-related actions such as device communication.
Event Manager Debug Level	The message severity level for the Event Manager subsystem.

Element	Description
Health and Performance Monitor Debug Level	The message severity level for the Health and Performance Monitor subsystem.
Image Manager Debug Level	The message severity level for the Image Manager subsystem.
Firewall Services Debug Level	The message severity level for firewall-related policies.
IOS Platform Debug Level	The message severity level for Cisco IOS Software platform policies.
PIX Platform Debug Level	The message severity level for PIX, ASA, and FWSM platform policies.
Report Manager Debug Level	The message severity level for the Report Manager subsystem.
VPN Services Debug Level	The message severity level for VPN services policies.
API Debug Level	The message severity level for the Application Programming Interface subsystem.
Save button	Saves your changes.
Reset button	Restores all fields to their previous values.
Restore Defaults button	Resets values to Security Manager defaults.

Deployment Page

Use the Deployment page to define the default methods by which Security Manager deploys configurations to devices. You can override some of these settings when you create deployment jobs.

Navigation Path

Select **Tools > Security Manager Administration** and select **Deployment** from the table of contents.

Related Topics

- Managing Deployment, on page 381
- Managing Policy Objects, on page 229

Field Reference

Table 128: Deployment Page

Element	Description
General Parameters	

Element	Description
Snapshot Purge Settings Purge Debugging Files Older Than (days)	The maximum number of days the system should keep debugging files. Debug files are automatically deleted. If you decrease the number of days, you can click **Purge Now** to immediately delete all debugging files older than the number of days specified. **Note** For purging, Security Manager considers only the debugging files that got created after the **Capture Discovery/Deployment Debugging Snapshots to File** checkbox in the **Debug Options** page is enabled.
Default Deployment Method Directory	The method to use as the default method for deploying configurations to devices: • Device—Deploys the configuration directly to the device or to the transport mechanism specified for the device. For more information, see Deploying Directly to a Device , on page 389. • File—Deploys the configuration file to a directory on the Security Manager server. If you select File, specify the directory to which you want to deploy the configuration file in the Destination column. Even if you select file as the default, the setting does not apply to IPS devices; you can use device deployment only for IPS devices. For more information, see Deploying to a File , on page 391. You can override this method when you create deployment jobs.
When Out of Band Changes Detected	How Security Manager should respond when it detects that changes were made directly on the device CLI since a configuration was last deployed to the device. Out of band change detection works correctly only when deploying to device, not to file, and applies only when the deployment method is configured to obtain the reference configuration from the device (see below for a description of the Reference Configuration setting). This setting specifies the default action, which you can override when you create deployment jobs. You can choose one of the following: • **Overwrite changes and show warning** (default)—If changes were made to the device manually, Security Manager continues with the deployment, overwrites the changes, and displays a warning notifying you of this action. • **Cancel deployment**—If changes were made to the device manually, Security Manager cancels the deployment and displays a warning notifying you of this action. • **Do not check for changes**—Security Manager does not check for changes and deploys the changes to the device, overwriting any local modifications. For a more complete discussion of out-of-band change handling, see Understanding How Out-of-Band Changes are Handled , on page 392. **Note** For devices in which failover is not configured, if you select the Cancel Deployment option when Out of Band changes are detected, the bootstrap configuration may cause deployments to fail. For deployments to be successful, you must configure failover before discovering the device in Security Manager.

Element	Description
Deploy to File Reference Configuration	The configuration that Security Manager uses to compare new policies against the previous configuration for the device, if you are deploying the configuration to a file on the Security Manager server. • Archive (default)—The most recently archived configuration. • Device—The current running device configuration, which is obtained from the device. After comparing the configurations, Security Manager generates the correct CLI for deployment.
Deploy to Device Reference Configuration	The configuration that Security Manager uses to compare new policies against the previous configuration for the device, if you are deploying the configuration directly to the device (or to a transport server). • Archive—The most recently archived configuration. • Device (default)—The current running device configuration, which is obtained from the device. After comparing the configurations, Security Manager generates the correct CLI for deployment.
Allow Download on Error	Whether deployments to devices should continue even if there are minor device configuration errors.
Save Changes Permanently on Device	Whether to save the running configuration to the startup configuration (using the **write memory** command) after deploying a configuration to a device. This applies to PIX, FWSM, ASA, or Cisco IOS devices. If you deselect this check box, the startup configuration is not changed, which means your configuration changes will be lost if the device reloads for any reason.
Preselect Devices with Undeployed Changes	Whether the list of changed devices you see when you create a deployment job has all changed devices preselected. If you deselect this option, users must manually select the devices to include in the deployment job.
Enable Auto Refresh in Deployment Main Panel	Whether the deployment job and schedule status information should be automatically refreshed in the Deployment Manager window. If you deselect this option, you must click the Refresh button to refresh the information manually.
Remove Unreferenced SSL VPN Files on Device (ASA Only)	Whether to have Security Manager delete files related to the SSL VPN configuration from the device if the files are no longer referred to by the device's SSL VPN configuration. If you deselect this option, unused files remain on the device after deployment.

Element	Description
Mask Passwords and Keys When Viewing Configs and Transcripts Mask Passwords and Keys When Deploying to File	The conditions, if any, under which Security Manager will mask the following items so that they cannot be read: passwords for users, enable mode, Telnet, and console; SNMP community strings; keys, including those for TACACS+, Preshared Key, RADIUS server, ISAKMP, failover, web VPN attributes, logging policy attributes, AAA, AUS, OSPF, RIP, NTP, logging FTP server, point-to-point protocol, Storage Key, single sign-on server, load balancing, HTTP/HTTPS proxy, and the IPSEC shared key. • Mask Passwords and Keys When Viewing Configs and Transcripts—This option affects only the screen display of the credentials, which guards against unauthorized personnel viewing them. If you do not select this option, credentials in full transcripts might still be masked depending on how the device handles them. • Mask Passwords and Keys When Deploying to File—This option affects the contents of configuration files that are deployed to file, making them undeployable to actual devices. Select this option only if you will never need to actually deploy these configurations to real devices. Selecting this option has no effect on whether credentials are masked when viewed.
Deploy only new or modified Flexconfigs	Whether to deploy FlexConfigs only one time after creation or modification of a FlexConfig, or to deploy all FlexConfigs with each deployment. This option is selected by default. **Note** If you have FlexConfigs that need to be deployed with each deployment, then you will need to disable this option. After changing this setting, you will need to manage one-time FlexConfigs by deleting them after they have been deployed.
ACL Parameters	

Element	Description
Optimize the Deployment of Access Rules For (IPv4 and IPv6 access rules.)	How firewall rules are deployed. You can choose one of the following: • Speed (default)—Increases deployment speed by sending only the delta (difference) between the new and old ACLs. This is the recommended option. By making use of ACL line numbers, this approach selectively adds, updates, or deletes ACEs at specific positions and avoids resending the entire ACL. Because the ACL being edited is still in use, there is a small chance that some traffic might be handled incorrectly between the time an ACE is removed and the time that it is added to a new position. The ACL line number feature is supported by most Cisco IOS, PIX and ASA versions, and became available in FWSM from FWSM 3.1(1). • Traffic—This approach switches ACLs seamlessly and avoids traffic interruption. However, deployment takes longer and uses more device memory before the temporary ACLs are deleted. First, a temporary copy is made of the ACL that is intended for deployment. This temporary ACL binds to the target interface. Then the old ACL is recreated with its original name but with the content of the new ACL. It also binds to the target interface. At this point, the temporary ACL is deleted. **Note** For FWSM devices, this option affects processing only if you also select the Let FWSM Decide When to Compile Access Lists option.
Firewall Access-List Names (IPv4 and IPv6 access rules.)	How ACL names are deployed to devices if the access rule does not have a name in Security Manager. • Reuse existing names—Reuse the ACL name that is configured in the reference configuration (which is usually from the device). • Reset to CS-Manager generated names—Reset the name to a Security Manager auto-generated ACL name.

Element	Description
Enable ACL Sharing for Firewall Rules (IPv4 and IPv6 access rules.)	Whether Security Manager should share a single access control list (ACL) for an access rule policy with more than one interface. If you do not select this option, Security Manager creates unique ACLs for every interface to which you apply an IPv4 or IPv6 access rule policy. The sharing of ACLs is done only for ACLs created by access rule policies. If you select this option, Security Manager evaluates the access rules policy for each interface and deploys the minimum number required to implement your policy while preserving your ACL naming requirements. For example, if you use an interface role to assign the same rules to four interfaces, you specify **Reset to CS-Manager generated names** for the Firewall Access-List Names property, and you do not specify ACL names for the interfaces in the access control settings policy, only a single ACL is deployed, and each interface uses that ACL. If you select this option, keep the following in mind: • An interface might use an ACL that is named for a different interface. • If you specify a name for the ACL in the access control settings policy, an ACL by that name is created even if it is otherwise identical to one used by another interface. Names specified in this policy have precedence over any other settings. • If you select **Reuse existing names** for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device. • Hit count statistics are based on ACL, not on interface, so a shared ACL provides statistics that are combined from all interfaces that share the ACL. • Sharing ACLs is primarily beneficial for memory-constrained devices such as the FWSM.
Let FWSM Decide When to Compile Access Lists (IPv4 access rules only.)	Whether to have the Firewall Services Module (FWSM) automatically determine when to compile access lists. Selecting this option might increase deployment speed but traffic might be disrupted and the system might become incapable of reporting ACL compilation error messages. If you select this option, you can use the Optimize the Deployment of Access Rules For Traffic setting to mitigate potential traffic disruptions. When deselected, Security Manager controls ACL compilation to avoid traffic interruption and to minimize peak memory usage on the device. **Caution** You should not select this option unless you are experiencing deployment problems and you are an advanced user.

Element	Description
Remove Unreferenced Access-lists on Device (IPv4 and IPv6 access rules.)	Whether to delete any access lists that are not being used by other CLI commands managed by Security Manager from devices during deployment. **Note** After enabling this option, Security Manager will remove access lists during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an access list, Security Manager will still attempt to delete that object during deployment. This also applies to access lists that are used in FlexConfigs but are not used in any other policies managed by Security Manager. **Warning** On enabling **Remove Unreferenced Access-lists on Device** option from Administrative Settings, Cisco Security Manager automatically removes access lists that are not used in any policies managed or discovered by Security Manager. However, when a Group Policy VPN filter is used, even if **Remove Unreferenced Access-lists on Device** option has not been enabled, Security Manager still removes the unreferenced access lists.
Generate ACL Remarks During Deployment (IPv4 and IPv6 access rules.)	Whether to display ACL warning messages and remarks during deployment.
Preserve Sections for Access Rules	Whether to deploy the section name under which access rules are organized. This option ensures that if a device is discovered or rediscovered, the section names will not be lost.
Generate CSM Rule Number	Whether to deploy the rule number used in the Cisco Security Manager user interface. This option helps in correlating an access rule in a device configuration to its position in rule table.
Object Group Parameters	
Remove Unreferenced Object Groups from Device (PIX, ASA, FWSM, IOS 12.4(20)T+) (IPv4 and IPv6 objects.)	Whether Security Manager should remove object groups that are not being used by other CLI commands managed by Security Manager from devices during deployment. Object groups include network/host, service, and identity user groups. **Note** After enabling this option, Security Manager will remove objects during deployment that are not used in any policies managed or discovered by Security Manager. If any policy that is NOT discovered or managed by Security Manager is using such an object, Security Manager will still attempt to delete that object during deployment. In such cases, deployment will fail with a transcript error indicating that it was unable to delete the object. **Tip** Network/host objects that include object NAT configurations on ASA 8.3+ devices are never considered unreferenced.

Element	Description
Create Object Groups for Policy Objects (PIX, ASA, FWSM, IOS 12.4(20)T+) Create Object Groups for Multiple Sources, Destinations or Services in a Rule (PIX, ASA, FWSM, IOS 12.4(20)T+) Optimize Network Object Groups During Deployment (PIX, ASA, FWSM, IOS 12.4(20)T+) (IPv4 and IPv6 objects.)	Whether Security Manager should create object groups, such as network objects, service group objects, and identity user group objects, to replace comma-separated values in a rule table cell for the indicated devices. When deselected, Security Manager flattens the object groups to display the IP addresses, sources and destinations, users, ports, and protocols for these devices. **Tip** These options do not apply to host, network, or address range network/host objects, or to service objects (as opposed to service group objects), which are always created as objects. Multiple FQDN network objects can be grouped into a single network object. If you select this option, you can also select these options: • Create Object Groups for Multiple Sources, Destinations or Services in a Rule—Whether to automatically create network objects, service objects, and identity user group objects to replace comma-separated values in a rule table cell that resulted when multiple rules were combined. The objects are created during deployment and are in the format of 'CSM_INLINE...' for example, 'CSM_INLINE_src_rule_8589960758'. For more information, see Combining Rules , on page 620. • Optimize Network Object Groups During Deployment—Whether to optimize network object groups by making them more succinct. For more information on optimizing policy objects, see Optimizing Network Object Groups When Deploying Firewall Rules , on page 634.
IPS Parameters	
Generate transcripts for IPS Auto-Update Jobs	
Attach transcripts to email for IPS Auto-Update Jobs	

Element	Description
Remove Unreferenced Signature and Event Action Variables from IPS Device (IPS Parameters object group)	Whether to delete the unused variables from the sensor (IPS device) configuration during the next deployment. IPS Event and Signature Variables are defined as policy objects in Security Manager. Disabled by default (checkbox is cleared by default); that is, do not remove the unreferenced variables. Applies to the following variables; applies to both IPv4 and IPv6: • signature source and destination addresses • signature service port variables in signature engine parameters • victim and attacker addresses in event action filters • network information target addresses Does not apply to the following variables: • signature source port • OS identification address • signature destination port
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Device Communication Page

Use the Device Communication page to define default settings for communicating with devices. These settings mainly affect device inventory and policy discovery and configuration deployment. You can override the transport settings for individual devices in the device properties for the device.

If you change the transport protocol settings, ensure that your devices are appropriately configured to accept those types of connections.

Navigation Path

Select **Tools > Security Manager Administration** and select **Device Communication** from the table of contents.

- Viewing or Changing Device Properties , on page 109

Field Reference

Table 129: Device Communication Page

Element	Description
Device Connection Parameters	
Device Connection Timeout	The number of seconds that Security Manager has to establish a connection with a device before timing out.
Retry Count	The number of times that Security Manager should try to establish a connection to a device before concluding that the connection cannot be completed. The default value is 3.
Socket Read Timeout	For SSH and Telnet sessions, the maximum number of seconds Security Manager can wait for incoming data before concluding that the connection is lost.
Transport Protocol (IPS)	The default transport protocol for IPS sensors and routers that include the IPS feature. The default is HTTPS.
Transport Protocol (IOS Routers 12.3 and above)	The default transport protocol for routers that run Cisco IOS software release 12.3 and above. The default is HTTPS.
Transport Protocol (Catalyst Switch/7600)	The default transport protocol for Catalyst 6500/7600 devices and all other Catalyst switches, regardless of the Cisco IOS software version running on the devices. The default is SSH.
Transport Protocol (IOS Routers 12.2, 12.1)	The default transport protocol for routers that run Cisco IOS software releases 12.1 and 12.2. The default is Telnet.
Connect to Device Using	The type of credentials Security Manager should use when accessing devices. For more information, see Understanding Device Credentials , on page 75. • **Security Manager User Login Credentials**—Security Manager contacts the device using the credentials that you entered while logging in to Security Manager. The same set of credentials are used for all devices regardless of the credentials configured for each device on the Device Credentials page. • **Security Manager Device Credentials**—Security Manager contacts the device using the credentials specified in the Device Properties Credentials page. This is the default. **Caution** You must use Security Manager Device Credentials, not Security Manager User Login Credentials, if a connection to an IPS sensor is involved. When Security Manager contacts an IPS sensor, it must use device credentials whether or not someone is logged in to Security Manager.
SSL Certificate Parameters	

Element	Description
Device Authentication Certificates (IPS) Device Authentication Certificates (Router) PIX/ ASA/ FWSM Device Authentication Certificates Add Certificate button	How to handle device authentication certificates for SSL (HTTPS) communications. You can configure different behaviors for different types of devices, but the settings have the same meaning: • **Retrieve while adding devices**—Security Manager automatically obtains certificates from the devices while you add devices from the network or from an export file. • **Manually add certificates**—Security Manager does not automatically accept certificates from the device. Click **Add Certificate** to open the Add Certificate dialog box (see Add Certificate Dialog Box , on page 535) where you can manually add the thumbprint before you try to add the device from the network or from an export file. You can also add certificates for devices that you create manually from the Device Properties Credentials page to be successful. For more information, see Manually Adding SSL Certificates for Devices that Use HTTPS Communications , on page 461. • **Do not use certificate authentication**—Security Manager ignores device authentication certificates. This option leaves your system vulnerable to third-party interference with device validation. We recommend that you do not use this option.
Accept Device SSL Certificate after Rollback	For devices that use SSL, whether to obtain the certificate installed on an IPS device, firewall device, FWSM, ASA, or Cisco IOS router from the device when you roll back the configuration on the device.
HTTPS Port Number	The default port number that the device uses for secure communication with Security Manager (as well as other management applications that use these protocols). This value overrides the HTTPS port number that you configure in the HTTP policy for a device. **Note** If you configure the local HTTP policy to be a shared policy and assign the HTTP policy to multiple devices, the HTTPS port number setting in the shared policy overrides the port number configured in the Device Properties Credentials page for all devices to which the policy is assigned. In addition to providing access to the device through the Cisco web browser user interface, the HTTPS port number is used by device management applications (such as the Cisco Router and Security Device Manager (SDM)) and monitoring tools to communicate with the device. **Note** The security appliance can support both SSL VPN connections and HTTPS connections for device manager administrative sessions simultaneously on the same interface. Both HTTPS and SSL VPN use port 443 by default. Therefore, to enable both HTTPS and SSL VPN on the same interface, you must specify a different port number for either HTTPS or WebVPN. An alternative is to configure SSL VPN and HTTPS on different interfaces.

Element	Description
Overwrite SSH Keys	Whether Security Manager can overwrite the SSH key for a device when it changes on the device. For SSH connections, a correct key is required for successful communication. Deselect this check box with caution, and only if you require a greater level of security. Security Manager does not communicate with the device if keys are changed on the device.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Add Certificate Dialog Box

Use the Add Certificate dialog box to add device certificates manually for devices that use the SSL transport protocol (firewall devices, FWSMs, ASAs, IPS devices, and Cisco IOS devices). Adding the device certificates manually gives you the highest level of security because then an intruder is prevented from introducing a fraudulent certificate thumbprint. Device certificates are stored in the database to be used for device authentication.

For more information about manually adding SSL certificates, see Manually Adding SSL Certificates for Devices that Use HTTPS Communications , on page 461.

Navigation Path

Select **Tools > Security Manager Administration**, select **Device Communication** from the table of content, and click **Add Certificate**.

Field Reference

Table 130: Add Certificate Dialog Box

Element	Description
Host Name or IP Address	The hostname or IP address of the device for which you are adding the certificate.
Certificate Thumbprint	The certificate thumbprint, which is a string of hexadecimal digits that is unique to the device.

Device Groups Page

Use the Device Groups page to manage the device groups and group types defined in the device inventory.

Navigation Path

Select **Tools > Security Manager Administration**, then select **Device Groups** from the table of contents.

Related Topics

- Understanding Device Grouping , on page 132
- Working with Device Groups , on page 131

Field Reference

Table 131: Device Groups Page

Element	Description
Groups	Displays the device groups and group types. To rename a group or type, select it and then click it again to make the text editable. Type in the new name and press Enter.
Add Type button	Click this button to create a new group type. The type is added with a default name. Overtype the name and press Enter.
Add Group to Type button	Click this button to add a device group to the selected device group or group type.
Delete button (trash can)	Click this button to delete the selected device group or group type and all device groups that it contains. Deleting a device group or group type does not delete any devices it contains.
Save button	Saves your changes.
Reset button	Restores all fields to their previous values.

Discovery Page

Use the Discovery page to define how Security Manager should handle certain types of objects or events during inventory and policy discovery. You can also control how long Security Manager keeps discovery tasks.

Navigation Path

Select **Tools > Security Manager Administration** and select **Discovery** from the table of contents.

Field Reference

Table 132: Discovery Page

Element	Description
Prepend Device Name when Generating Security Context Names	Whether the name of the device that contains the security context should be added to the front of the security context's name. For example, if a security context is named admin, and it is contained in the device with the display name 10.100.15.16, the name that will appear in the Device selector is 10.100.15.16_admin. If you do not prepend the device name, the security context name appears in the inventory by itself. Because Security Manager does not place security contexts in a folder related to the parent device, the only way to easily see contexts that are related to a device is to prepend the device name. If you do not prepend device names, Security Manager adds a numbered suffix to distinguish identically named devices. For example, if the admin context exists in more than one firewall, you will see admin_01, admin_02, and so on, in the Device selector.
Purge Discovery Tasks Older Than	The number of days to save discovery and device-import tasks. Tasks older than the number of days you enter are deleted.
Maximum Number of Multi context ASA per domain	The number of contexts you can add for a domain. In multi-context ASA, you can create contexts per domain with the same name. The default value is 20 and you can enter any value above 20 as required. **Note** Context name is case-insensitive. For example, context name created with Test, test, and TEST will be considered as same context name.
Reuse Policy Objects for Inline Values	Whether to substitute any named policy objects, such as network/host or identity user group objects already defined in Security Manager, for inline values in the CLI. For more information on policy objects, see Managing Policy Objects, on page 229. **Tip** Although this option generally applies to network/host objects, it does not apply to FQDN network/host objects because you cannot specify a fully-qualified domain name (FQDN) as an inline value.

Element	Description
Allow Device Override for Discovered Policy Objects	For the types of objects for which overrides are possible, whether to allow users to override the parent object values at the device level for policy objects that are discovered. For example, if you select this option, if you run policy discovery on a device that has an ACL with the same name as an ACL policy object in Security Manager, the name of the discovered policy object is reused, but a device-level override is created for the object. If you deselect this option, a new policy object is created with a number appended to the name. **Tip** For objects that have subtypes, such as network/host and service, overrides are limited to within a type. For example, an override can be created for a network/host group when discovering a same-named network/host group, but no override would be created when discovering a same-named network/host address range. Instead, the newly-discovered object will have a number appended to the name. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246.
On Error, Rollback Discovery for Entire Device	Whether Security Manager should roll back all discovered policies if even one error is encountered for a single policy during policy discovery. When deselected, Security Manager keeps the policies successfully discovered and discards only those policies with errors. For more information on policy discovery, see Discovering Policies , on page 178.
Auto-Expand Object Groups with Prefixes	Expands object groups, such as network or identity user group, with the listed prefixes during the device import process. Separate the prefixes with a comma. This expansion causes the elements of the object group to display as separate items in the discovered policies. For more information, see Expanding Object Groups During Discovery , on page 637. **Tip** This option does not apply to policy objects created from the **object network** or **object service** commands from ASA 8.3+ devices. These commands create host, FQDN, network, or address range network/host objects or service objects.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Event Management Page

Use the Event Management page to enable event management, which allows you to view ASA, FWSM, and IPS events using the Event Viewer. You can also configure settings required for event collection.

The Event Manager service is also required by the Report Manager application, which allows you to view reports that aggregate information collected by the service.

Tip If you get a message that Event Viewer is unavailable when you select Launch > Event Viewer, but the **Enable Event Management** option is selected on this page, try restarting the Event Manager Service. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening Event Viewer again.

Navigation Path

Click **Tools > Security Manager Administration** and select **Event Management** from the table of contents.

Field Reference

Table 133: Event Management Page

Element	Description
Event Management Options	
Enable Event Management	Whether to enable the Event Manager service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the Event Viewer or Report Manager applications. **Tip** If you change this setting and click **Save**, you are prompted to confirm that you want to start or stop the Event Manager Service. If you click Yes, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.
Event Data Store Location	The directory to use for collecting event information. This is known as the primary event store. Click **Browse** to select a directory on the Security Manager server. If the directory does not yet exist, create it in Windows Explorer. You cannot create the directory from within Security Manager. **Tip** If you change the location after you have started using the Event Manager service, you cannot query old events.
Event Data Store Disk Size	The amount of disk space you want to allocate for storing event data, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. Before changing this setting, consider the following: • If you reduce the size below the amount of disk space already used by event data, the oldest events are deleted until your new size limit is reached. • You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (**Launch > Event Viewer**), then from Event Viewer, select **Views > Show Event Store Disk Usage**.

Element	Description
Event Syslog Capture Port	The port on which you want to enable syslog event capture. The default is 514. You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server. **Tip** If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see Syslog Servers Page , on page 2058.
Event Data Pagination Size	The maximum number of events per page each query response can contain. The default is 20000, but you can select a different size from the list of supported values. **Note** In Security Manager 4.10, the maximum number of events per page has been increased to 100000.
Extended Store Management Options	
Auto Copy Events to Extended Store	Whether you want to define an extended storage location for event storage. Events are copied from the regular event storage location to the extended location so that they remain available for use. When you query for historical events in Event Viewer, events in the extended storage location are automatically retrieved if they are needed. **Tip** You are prompted to verify that you want to start the extended service and to make changes to the extended storage location.
Extended Data Store Location	The location of the extended data store for events. This location can be on directly-attached storage that appears as a drive on the server and that uses DAS protocols. For example, SAN storage attached through fiber channel. CIFS storage is not supported. Click **Browse** to select the desired drive and directory. **Tips** • When you select an extended storage location and save your changes, Security Manager checks that it can be accessed and that it has write permissions. The primary storage location is used as a reference, and any data that exists in the primary storage location that does not exist in the extended storage location is copied to the extended storage location. Any data that already exists in the extended storage location is not evaluated and is left untouched, although it can be deleted later to make room for new data. • If you change the extended data store location, you cannot query events that exist only in the previous extended data store location (that is, you cannot query events that have already be removed from the primary location). If you want to preserve these events, copy the data from the old location to the new location.

Element	Description
Extended Data Store Disk Size	The amount of space you want to allocate to the extended event storage location, in gigabytes (GB). Events are incrementally deleted (rotated out) from the extended store when it becomes 90% full. The size must be equal to or larger than the primary event data storage location. You can see a visual representation of the amount of space currently used for event data. Open the Event Viewer (**Launch > Event Viewer**), then from Event Viewer, select **Views > Show Event Store Disk Usage**.
Error Notification Email IDs	The email addresses that should receive notifications if problems arise with the use of the extended storage location. Separate multiple addresses with commas. For notifications to be sent successfully, you must also configure an SMTP server as described in Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27. The message indicates the problem, cause, and recommended action. For example, you get notifications if the extended storage is chronically unreachable, if data copy fails repeatedly, or if a partition was deleted from the primary storage area before it could be copied to the extended storage area (which might happen if the storage is chronically unreachable or if there are persistent copy problems).
Syslogs for Failover Devices	
Process Syslogs from Failover Standby Device	Enables or disables processing of syslog messages from the standby ASA. When enabled, syslog messages generated by the standby or failover ASA will be displayed in the Device Identifier column in the Event Monitoring window. **Note** By default, the processing of syslog messages from the standby ASA is disabled.
Syslog Relay Service **Note** Staring with version 4.13, Cisco Security Manager supports syslogs over IPv6 in Event Viewer but the Syslog Relay Service will not be supported for syslogs over IPv6.	
Enable Syslog Relay Service	Enables or disables the Syslog Relay Service. Select the Enable Syslog Relay Service check box to enable the fields required for configuring the Syslog Relay Service.

Element	Description
Syslog Relay Capture Port	Specifies the UDP port on which the Syslog Relay Service listens for syslogs. The default is 514. If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port. **Note** The Syslog Relay Capture Port and the Event Syslog Capture Port cannot be the same. When enabling the Syslog Relay Service, if devices are currently configured to send syslogs to the Event Syslog Capture Port, you should instead use that port number for the Syslog Relay Capture Port and then change the Event Syslog Capture Port to something else. You must ensure that the Security Manager server, and intervening firewalls, allow incoming traffic on this port for Security Manager to collect the events. Managed devices must be configured to send syslog information to this port on the Security Manager server. **Tip** If you change this port, you must also change the Syslog Servers policies for all ASA and FWSM devices and security contexts that send events to Security Manager. For more information, see Syslog Servers Page , on page 2058.
Relay to Local Event Collector	Enables or disables syslog relay for the local event collector.
Relay to Remote Collector 1	Enables or disables syslog relay for Remote Collector 1.
Collector 1 IP address	Specifies the IP address to which syslogs should be sent for Remote Collector 1.
Collector 1 Syslog Capture Port	Specifies the UDP port on which Remote Collector 1 is listening for relayed syslogs.
Relay to Remote Collector 2	Enables or disables syslog relay for Remote Collector 2.
Collector 2 IP address	Specifies the IP address to which syslogs should be sent for Remote Collector 2.
Collector 2 Syslog Capture Port	Specifies the UDP port on which Remote Collector 2 is listening for relayed syslogs.

Element	Description
Device Filter	You can filter the devices for which syslogs should be relayed for a specific collector. Using this feature, you can configure syslogs for one set of devices to go to one collector and syslogs for a different set of devices to go to another collector: 1. Select the tab (Local Collector, Remote Collector 1, or Remote Collector 2) for which you want to filter devices. 2. To specify the devices for which you want relay syslogs for this collector, select **Permit Relay**. If instead you want to specify the devices for which you want to disable syslog relay for this collector, clear the **Permit Relay** check box. If the Permit Relay check box is **not** selected, then syslogs for the devices you add to the filter will not be relayed; however, syslogs for all other devices will be relayed. **Note** For each enabled collector, syslog relays from all devices are enabled by default. **Note** When adding a cluster to the filter list, the IP addresses for the cluster management pool will be included as part of filter configuration. 3. Select the devices or device groups from the Available Devices list that you want to add to the filter and click >> to move them to the Selected Devices list. For more information on selecting devices, see Using Selectors , on page 47. 4. To add a device that is not managed in Security Manager, enter the IP address of the device in the Add Special Device field and then click the bottom >> to move the device to the Selected Devices list.
Restart	Restarts the Syslog Relay Service.
CPU Throttle Settings	Opens the CPU Throttling Policy dialog box in which you can control the CPU load used by the syslog relay service. For more information, see CPU Throttling Policy Dialog Box , on page 545.
View Statistics	Opens the Syslog Relay Statistics dialog box in which you can see the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors. For more information, see Syslog Relay Statistics Dialog Box , on page 546.
Save button	Saves and applies changes. Most changes related to the Event Viewer settings require that the Event Manager service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator. Changes to Syslog Relay Service settings require that the Syslog Relay Service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Troubleshooting Syslog Relay Servers

If the Syslog Relay Service is enabled, devices must send syslogs to the Syslog Relay Capture Port so that they can be forwarded to the local collector and remote collectors. If the Syslog Relay Service is turned off, devices should send syslogs to the Event Syslog Capture Port.

Syslog Relay Servers act as an intermediate connection between device events and Security Manager Event Manager application. It receives device event packets and forwards them to the Local Collectors and Remote Collectors.

Device Management via IP

To manage devices in Security Manager via IP (using IPv4 or IPv6), the Device Management interface must have the appropriate IP information.

For example, see the following sample configuration.

!

interface Management1/1

management-only

nameif management

security-level 100

ip address 10.197.87.95 255.255.255.0

ipv6 address 2016::b2aa:77ff:fe7c:a068/64

ipv6 enable

In this configuration, the Device Management IP address has both IPv4 and IPv6 management addresses. So you can manage a device via IPv4 or IPv6.

Problem:

If a device is managed via IPv6 Management Address in Security Manager, the communication between Security Manager and the device would occur only via IPv6 address and not IPv4 address.

However, Event Syslog server still sends the Event Syslog packets only to IPv4 address, therefore in this scenario Security Manager cannot map the equivalent device for the received IPv4 Event Syslog packets.

When you add a filter device in Local Collector or Remote Collector for Syslog Relay Services in **Tools > Security Manager Administration > Event Management - Syslog Relay Service**, Security Manager tries to extract the device Management IPv4 address instead of the IPv6 management address.

However, there is no IPv4 Management Interface configured in the device. Therefore, Security Manager displays the following error:

Device selection – Ipv4 address not found for device(s)

Solution:

Go to **Device View > Policies > Interfaces**, to configure the device Management Interface with IPv4 address.

CPU Throttling Policy Dialog Box

Use the CPU Throttling Policy dialog box to specify settings for controlling the CPU load used by the syslog relay service.

After CPU throttling is enabled, if the syslog relay service's average CPU usage over the time period selected in the Average Max CPU Usage Time field is greater than the Maximum CPU Usage threshold, then CPU throttling will take place for the collectors specified in the Stop Forwarding To field for the time specified in the Stop Forwarding For field.

Note You can use the Syslog Relay Statistics dialog box to see the number of syslog packets dropped per collector due to the throttle policy (see Syslog Relay Statistics Dialog Box , on page 546).

Navigation Path

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **CPU Throttle Settings**.

Field Reference

Table 134: CPU Throttling Policy Dialog Box

Element	Description
Enable CPU Throttling	Whether to enable throttling for the syslog relay service. CPU throttling for the syslog relay service is disabled by default.
Maximum CPU Usage	Specify the maximum CPU usage for the syslog relay service as a percentage of total CPU capacity. This is threshold at which CPU throttling will be initiated.
Average Max CPU Usage Time (Minutes)	Specifies the time in minutes for which CPU usage by the syslog relay service is calculated. Options are 1 minute, 5 minutes, and 15 minutes. This average is compared to the Maximum CPU Usage value to determine whether throttling should take place.
Stop Forwarding To	Specify the collectors for which you want to stop forwarding syslogs when throttling is engaged.
Stop Forwarding For	Specify how long, in minutes, throttling should be enabled when the threshold is hit. After the specified interval of time has elapsed, if the CPU usage is still above the Maximum CPU Usage threshold, throttling will remain in effect.
Enable Email Notifications	Whether to send email notifications when the syslog relay service enters or exits throttle mode. Email notifications are disabled by default. For the e-mails to be sent, you must configure an SMTP server as described in Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.
Notification Email IDs	Enter one or more valid addresses in the Notification Email IDs field; separate multiple addresses with commas.

Element	Description
Send Email	Specify how often to send notification emails: • **Every time**—Select this option to have a notification sent every time the syslog relay service enters or exits throttle mode. If the CPU usage is still above the Maximum CPU Usage threshold after the Stop Forwarding For timer has elapsed, throttling will remain in effect and an additional notification will be sent. • **Every**—Select this option to have at most one notification sent when the syslog relay service enters or exits throttle mode during a specific period of time. If you select this option, specify the time period by entering the number of minutes or hours and then selecting the corresponding option (Min/Hour) from the drop-down list.

Syslog Relay Statistics Dialog Box

Use the Syslog Relay Statistics dialog box to view the average CPU and memory usage of the syslog relay service process as well as traffic rates for the different collectors.

Navigation Path

Click **Tools > Security Manager Administration**, select **Event Management** from the table of contents, and then click **View Statistics**.

Field Reference

Table 135: Syslog Relay Statistics Dialog Box

Element	Description
Log Relay Service	
Memory Usage Average (last 1 min.)	Shows the amount of memory used by the syslog relay service on average over the last minute.
CPU Usage Average (last 1 min.)	Shows the percentage of CPU capacity used by the syslog relay service on average over the last minute. **Tip** If the average CPU usage is too high, you might consider enabling CPU throttling for the syslog relay service (see CPU Throttling Policy Dialog Box , on page 545).
Total sylog packets received	Shows the total number of syslog packets that have been received by the syslog relay service since the service was started.
Average syslog received per second since start	Shows the average number of syslog packets that have been received by the syslog relay service per second since the service was started.
Average syslog received per second for last 1 minute	Shows the average number of syslog packets that have been received by the syslog relay service per second over the last minute.

Element	Description
Average syslog received per second for last 5 minute	Shows the average number of syslog packets that have been received by the syslog relay service per second over the last five minutes.
Average syslog received per second for last 15 minute	Shows the average number of syslog packets that have been received by the syslog relay service per second over the last fifteen minutes.
Period (in mins.) for which throttle policy is active	Shows how long, in minutes, the CPU throttle policy for the syslog relay service has been active. For more information, see CPU Throttling Policy Dialog Box , on page 545.
Local Collector/Remote Collector 1/Remote Collector 2	
Total syslog packets sent successfully	Shows the total number of syslog packets that have been sent by the syslog relay service since the service was started.
Total syslog packets dropped (filter policy)	Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the defined filter policy since the service was started.
Total syslog packets dropped (throttle policy)	Shows the total number of syslog packets that have been dropped by the syslog relay service in accordance with the throttle policy since the service was started.
Total syslog packets failed during transmit	Shows the total number of syslog packets that were not able to be forwarded by the syslog relay service since the service was started.
Average syslog sent per second since start	Shows the average number of syslog packets that have been sent by the syslog relay service per second since the service was started.
Average syslog sent per second for last 1 minute	Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last minute.
Average syslog sent per second for last 5 minute	Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last five minutes.
Average syslog sent per second for last 15 minute	Shows the average number of syslog packets that have been sent by the syslog relay service per second over the last fifteen minutes.
Refresh	Refreshes the statistics displayed on the Syslog Relay Statistics dialog box.

Health and Performance Monitor Page

Use the Health and Performance Monitor page of the Security Manager Administration window to enable network-wide health and performance monitoring. The Health and Performance Monitor (HPM) is a stand-alone application that lets you monitor key health and performance data for ASA devices, IPS devices, and VPN services by providing network-level visibility into device status and traffic information.

Tip If you get a message that the application is unavailable when you attempt to launch the Health and Performance Monitor, but the **Enable Health and Performance Monitor** option is selected on this page, try restarting Health and Performance Monitoring. First, deselect the Enable option and click Save. Wait for the service to stop. Then, select the Enable option, click Save, and wait for the service to finish restarting. You can then try opening the HPM application again.

Navigation Path

Click **Tools > Security Manager Administration** and select **Health and Performance Monitor** from the table of contents.

Field Reference

Table 136: Health and Performance Monitor Page

Element	Description
Enable Health and Performance Monitor	Lets you enable or disable the Health and Performance Monitoring service, which allows Security Manager to collect event information. If you disable this feature, you cannot use the HPM application. **Tip** If you change this setting and click **Save**, you are prompted to confirm that you want to start or stop the Health and Performance Monitoring service. If you click Yes, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.
OOB Notification Settings **Note** To receive email notifications make sure that an SMTP server has been configured on the Security Manager Server. For more information, see Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27. Cisco Security Manager considers an out-of-band (OOB) change to be any change made to a device manually or outside of Security Manager control, for example, by logging into the (monitored) device directly and entering configuration commands through the CLI. For devices monitored by the HPM application, Cisco Security Manager monitors the OOB changes, detected by the HPM periodically. If any out-of-band changes are detected, HPM generates an alert displayed on the Device Status View page and sends an email, to the configured recipients. **Note** If a Cisco Security Manager restart occurs during the update time, after an OOB change is detected and an email notification has already been sent, the same email maybe sent again after Cisco Security Manager starts up.	

Element	Description
Enable OOB Email Notification	Lets you enable or disable email notifications for Out of Band changes. **Note** When the email notification is disabled, only an alert is displayed on the Device Status View page. **Note** When HPM detects the OOB change and syncs with the Configuration Manager, a separate email alert notification is sent for each device being monitored. To prevent duplication, emails sent for each OOB change are tracked and stored in a file, once in 5 minutes. **Tip** The default tracking time is set as 5 minutes in the Cisco Security Manager properties file. You can update this as needed.
Recipient E-mail(s)	Specify the recipients who must be notified of the OOB change.
Save button	Saves and applies changes. Most changes require that the Health and Performance Monitoring service briefly stop and then restart. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.
Reset button	Resets changes to the last saved values.

Report Manager Page

Use the Report Manager page of the Security Manager Administration window to enable or disable the Report Manager feature in Cisco Security Manager. Report Manager is a stand-alone application that lets you view security and usage reports for devices and remote access IPsec and SSL VPNs.

Navigation Path

Click **Tools** > **Security Manager Administration** and select **Report Manager** from the table of contents.

Field Reference

Table 137: Health and Performance Monitoring Page

Element	Description
Enable Report Manager	Lets you enable or disable the Report Manager service. If you disable this feature, you cannot use the Report Manager application. **Tip** If you change this setting and click **Save**, you are prompted to confirm that you want to start or stop the Report Manager service. If you click Yes, the service is started or stopped immediately, and you are shown a progress indicator and told when the change is completed. Wait until the status change is completed before continuing.

Element	Description
Save button	Saves and applies changes. If you change whether the service is enabled, it stops or starts, as appropriate. You are shown a progress indicator.
Reset button	Resets changes to the last saved values.

Identity Settings Page

Use the Identity Settings page to configure the Active Directory (AD) server group to use for a NetBIOS domain for use with identity-aware firewall policies on ASA devices. These settings enable you to use the Find feature when selecting users or user groups for identity-aware policies or identity user group policy objects.

Tip You can also add entries by configuring the Identity Options policy on an ASA. When you save the policy, you are asked if you want to update the identity settings administrative page. Keep in mind that you can have a single domain-to-AD server match on the settings page, whereas you can configure different ASAs to use different server groups for a domain. Username lookup always selects the AD servers defined in the identity settings administrative page, regardless of what server group is configured for the individual ASA that you are configuring.

Navigation Path

Select **Tools > Security Manager Administration** and select **Identity Settings** from the table of contents.

Related Topics

- Creating Identity User Group Objects , on page 656
- Selecting Identity Users in Policies , on page 658

Field Reference

Table 138: Identity Settings Page

Element	Description
Domain-AD Server Group Mapping table.	Each row in the table defines the Active Directory (AD) server group to use for a NetBIOS domain for use with identity-aware firewall policies on ASA devices. • To add an entry, click the **Add Row (+)** button and fill in the Add AD Domain Server dialog box. See Domain AD Server Dialog Box , on page 647. You need to enter the domain name and select the AAA server group object that specifies the LDAP AD servers. • To edit an entry, select it and click the **Edit Row (pencil)** button. • To delete an entry, select it and click the **Delete Row (trash can)** button. • To test whether Security Manager can successfully contact the servers defined in a server group, select the row and click **Test.**
Default Domain	The NetBIOS domain to use when you do not type in a domain when specifying a user or group name in a firewall policy or an identity user group policy object. The default is LOCAL, which means the name is defined on the ASA itself, either as a local user or as a VPN user who was authenticated by a means other than an LDAP server group associated with a domain name. Other than LOCAL, only domains configured in the Domain-AD Server Group Mapping table appear in this list. **Tip** This setting is not related to the default domain configured on the ASA using the user-identity default-domain command. This setting is a convenience setting to allow you to type in usernames without always having to include the domain name. Select the domain for which you will most often type user names.
Route query via	When you use the Find feature while selecting users or user groups, Security Manager must query the AD server. Select whether the query comes from the Security Manager client (the workstation on which you are running the client) or the server. By default, LDAP queries come from the client.

Element	Description
For user strings without domain	If you select something other than LOCAL for the default domain, how to handle username or user group names that you type in without a domain name: • **Auto determine user/user-group from AD**—Check the AD server associated with the default domain to determine whether the name is for a user or user group, and add the appropriate string: Default-Domain\user or Default-Domain\\user-group. If the name cannot be found, you must manually type in the domain name and the one or two \ characters to indicate whether the name is for a user or a group. • **Change it to Default-Domain/user**—Assume that typed in names are user names, not user group names, and add the default domain: Default-Domain\user. **Tip** When typing, if you precede the name with \ or \\, the default domain is automatically added. Thus, if you select the Change it to Default-Domain/user option, you can still enter group names without typing the domain by first entering \\.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Image Manager Page

Use the Image Manager page to control the administrative settings for Image Manager within Security Manager.

Navigation Path

Select **Tools** > **Security Manager Administration** and select **Image Manager** from the table of contents.

Field Reference

Table 139: Image Manager Page

Element	Description
Edit CCO Settings	Use the Edit CCO Settings link to quickly navigate to the CCO Settings page. For information on the CCO Settings page, see CCO Settings Page , on page 514.
Purge Jobs Older Than	Enter the length of time in days to hold Image Manager jobs before purging them. The default is 365 days. Select **Purge Now** to immediately clear previous Image Manager job specifications.
Include Repository	If checked, the image repository is part of Security Manager backup. The default is to exclude images.
Save button	Saves your changes.

Element	Description
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

IP Intelligence Settings Page

Use the IP Intelligence Settings page to control the administrative settings for the IP Intelligence features within Security Manager.

Navigation Path

Select **Tools > Security Manager Administration** and select **IP Intelligence Settings** from the table of contents.

Field Reference

Table 140: IP Intelligence Settings Page

Element	Description
Edit CCO Settings	Credentials for connecting to Cisco.com are required for automatic updates of the GeoIP database. You can use the **Edit CCO Settings** link to quickly navigate to the CCO Settings page where these credentials are configured. You can also configure settings for a proxy server on the CCO Settings page. For information on the CCO Settings page, see CCO Settings Page , on page 514.
Reverse DNS (FQDN)	
Enable Reverse DNS (FQDN) Lookup Service	Whether to enable or disable the Reverse DNS (FQDN) lookup service. Enable this service if you want to be able to determine the fully qualified domain name (FQDN) for an IPv4 address using the IP Intelligence tool.
Use CSM Server's DNS Server	Select this option to use the DNS server defined on the Cisco Security Manager server for reverse DNS lookup requests.
Use custom DNS servers	Select this option to manually specify the DNS servers to use for reverse DNS lookup requests. You can enter up to three DNS server addresses in the fields provided. **Note** Security Manager does not support the use of external DNS servers configured inside of a virtual machine.
Enable Load Balancing	Whether to distribute reverse DNS lookup requests amongst the DNS servers when multiple DNS servers are available.
Default Blocking Ranges	Lists the IP address ranges that are excluded from Reverse DNS lookup by default: 0.0.0.0, 255.255.255.255, 127.0.0.1, 169.254.0.0-169.254.255.255, 224.0.0.0-239.255.255.255

Element	Description
User-defined Blocking Ranges	Specifies additional IP addresses or address ranges that should be excluded from reverse DNS lookup requests. Click the Edit (pencil) button to open the Edit IPv4 Blocking Range Addresses dialog box in which you can specify the IPv4 addresses or address ranges to be excluded. Separate multiple entries using a comma ",".
GeoIP	
Enable GeoIP Lookup Service	Whether to enable or disable the GeoIP lookup service. Enable this service if you want to be able to retrieve geographic location information for an IPv4 address using the IP Intelligence tool. **Note** You will need to download the geographic location database from Cisco.com before GeoIP information will be included in the IP intelligence data. You will also need to download the geographic location database from Cisco.com after restoring the Security Manager database from a backup. Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com. In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.
GeoIP Manual Upload Use the GeoIP Manual Upload fields to update the geographic location database in Security Manager using a MaxMind GeoLite City update package downloaded from Cisco.com. **Note** New update packages are made available on Cisco.com on a monthly basis.	
GeoIP Database Artifact Location	Click **Browse** and then navigate to and select the MaxMind GeoLite City update package that you downloaded from Cisco.com. Then, click **Upload** to upload the selected database to Cisco Security Manager. **Note** Geolocation updates obtained directly from MaxMind or any other source are not supported in Cisco Security Manager.
GeoIP Maxmind Database Update Settings MaxMind GeoLite City update packages are updated monthly on Cisco.com. Use the GeoIP Maxmind Database Update Settings to download an update package automatically from Cisco.com and to configure scheduled updates. **Note** Credentials for connecting to Cisco.com are required for automatic updates of the geographic location database. You can use the **Edit CCO Settings** link to quickly navigate to the CCO Settings page where these credentials are configured. For information on the CCO Settings page, see CCO Settings Page , on page 514.	

Element	Description
Run immediate database update	Click **Update Now** to update the geographic location database in Security Manager using the latest update package from Cisco.com.
Enable scheduled update	Whether to enable or disable automatic updates of the geographic location database on a regular schedule. After enabling scheduled updates, click **Edit Settings** to specify the schedule for when the update should take place. Using the Weekly option, you can specify the days of the week on which the automatic update should take place. Using the Monthly option, you can specify the day of the month on which the automatic update should take place. For either option, you can specify the time of day that the update should take place. **Tip** The geographic location database is updated by MaxMind on the first Tuesday of every month. New update packages are typically available on Cisco.com approximately one week after they are issued by MaxMind. We recommend configuring your update schedule to occur monthly on day 15 or later. However, you can schedule the updates to take place more frequently if you want to ensure that the updated database is made available in Security Manager as close to the time it is available on Cisco.com as possible. **Note** Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com. In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.
Default Blocking Ranges	Lists the IP address ranges that are excluded from GeoIP lookup by default: 0.0.0.0, 255.255.255.255, 127.0.0.1, 10.0.0.0-10.255.255.255, 169.254.0.0-169.254.255.255, 172.16.0.0-172.31.255.255, 192.168.0.0-192.168.255.255, 224.0.0.0-239.255.255.255
User-defined Blocking Ranges	Specifies additional IP addresses or address ranges that should be excluded from GeoIP lookup requests. Click the Edit (pencil) button to open the Edit IPv4 Blocking Range Addresses dialog box in which you can specify the IPv4 addresses or address ranges to be excluded. Separate multiple entries using a comma ",".
Whois	
Enable Whois Lookup Service	Whether to enable or disable the Whois lookup service. Enable this service if you want to be able to retrieve WHOIS information for an IPv4 address using the IP Intelligence tool.

Element	Description
Enable External Proxy	Whether to enable or disable use of an external proxy for Whois requests. Proxy server configuration is specified on the CCO Settings page. **Tip** You can use the **Edit CCO Settings** link to quickly navigate to the CCO Settings page where the proxy server settings are configured. For information on the CCO Settings page, see CCO Settings Page , on page 514.
Default Blocking Ranges	Lists the IP address ranges that are excluded from Whois lookup by default: 0.0.0.0, 255.255.255.255, 127.0.0.1, 10.0.0.0-10.255.255.255, 169.254.0.0-169.254.255.255, 172.16.0.0-172.31.255.255, 192.168.0.0-192.168.255.255, 224.0.0.0-239.255.255.255
User-defined Blocking Ranges	Specifies additional IP addresses or address ranges that should be excluded from Whois lookup requests. Click the Edit (pencil) button to open the Edit IPv4 Blocking Range Addresses dialog box in which you can specify the IPv4 addresses or address ranges to be excluded. Separate multiple entries using a comma ",".
View Statistics	Opens the IP Intelligence Statistics dialog box which shows statistics for the IP Intelligence feature. Information provided in the IP Intelligence Statistics dialog box includes: • Average number of IP Intelligence lookup requests during the last 5 minutes and last 15 minutes • Average lookup time for all IP Intelligence service requests • Average lookup times for each individual service that is currently enabled • Counts of the number of lookups, both successful and failed, for each individual service that is currently enabled • Cache hit ratios for each individual service that is currently enabled • Upload information for GeoIP updates: last update time, status, and version information for the update Click **Refresh** to update the data in the IP Intelligence Statistics dialog box.
Save button	Saves your changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Eventing Notification Settings Page

Use the Eventing Notification Settings page to receive email notifications for IPS events and critical ASA events. You can configure the time interval at which you want to receive the email notifications.

The events are sent in the form of .CSV files in a .zip file format. By default, email notification is disabled. When you enable email notification, only the notification for IPS events is enabled. To receive email notification for critical events you must enable the additional settings for critical events.

Note For notifications to be sent successfully by Security Manager, you must configure an SMTP server, as described in Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.

Tip You can also use the Security Manager Event Viewer application or the Dashboard to view and monitor all events.

Navigation Path

Select **Tools** > **Security Manager Administration** and select **Eventing Notification Settings** from the table of contents.

Field Reference

Table 141: Eventing Notification Settings Page

Element	Description
Enable Eventing Email Notification	Select to enable notification of IPS events through email.
Notification Interval (15 - 60 minutes)	Enter the interval at which you want Security Manager to send email notifications for IPS events or critical events. **Note** If Security Manager receives more than 50000 events during the configured time interval, only the first 50000 events are selected and sent through email.
Notification Settings (IPS)	
Email IDs (for IPS Events)	Enter one or more email addresses (comma separated).
Select Severity of Events	The severity level that the IPS signature reports: High, Medium, Low, or Informational. By default, High and Medium severity are selected.
Notification Content	Whether to send summarized or detailed notifications through email. If you select Detailed Notifications, select the fields that you want information for, in the email notification. Some fields are selected by default.
Fields	
Event ID	A unique sequential number for each event, assigned internally.
Severity	The Firewall or IPS severity values.

Element	Description
Device	The source of the event; usually the device ID. A device identified as Not Available has been deleted from the Security Manager inventory.
Application Name	The name of the application originating the event.
Receive Time	The time the event was received by Security Manager.
Event Time	The time the event was generated by the device.
Sensor Local Time	The local time of the sensor where the event originated.
Sig ID	The Sig ID value is used by the alert originator to identify the activity. It identifies the pre-defined signature defined for this activity.
Sub Sig. ID	Identifies the unique numerical value assigned to the sub signature. The Sub Sig. Id identifies a more granular version of a broad signature.
Sig. Name	The name assigned to the signature.
Sig. Details	The details of the reported signature that was triggered and resulted in the generation of the alert.
Sig. Version	The version of the signature definition used to generate an alert.
Attacker IP	The IP address of the host that sent the offending packet.
Attacker Port	The port used by the attacker host. This is the port from which the offending packet originated.
Attacker Locality	Identifies whether the attacker address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.
Victim IP	The IP address of the host being attacked.
Victim Port	The port of the host being attacked (the recipient of the offending packet). This is the port to which the offending packet was sent.
Victim OS	The OS of the host being attacked.
Victim Locality	Identifies whether the target address is located inside or outside of a given network, as specified by the intrusion detection device's configuration.
Summary Count	Specifies that this is a summary alert, representing one or more alerts with common characteristics. The numeric value indicates the number of times the signature fired since the last summary alert with a matching initialAlert attribute value.
Initial Alert	This field applies to a summary alert, representing one or more alerts with common characteristics. The value of InitialAlert provides the event ID of the last nonsummary evIdsAlert with the same characteristic (sigid/ subsigid).
Summary Type	Defines the common characteristics of all alerts in a summary alert.

Element	Description
Is Final	Applies to a summary alert, representing one or more alerts with common characteristics. It indicates whether this is the last event alert containing the same value in the initialAlert attribute.
Interface	Name of the IPS interface.
VLAN	The VLAN number associated with packets involved in the activity that triggered the alert.
Virtual Sensor	The name of the virtual sensor associated with the event.
Action Taken	The action performed on the flow. For example: Terminated or denied.
Alert Details	The details regarding the alerts.
Risk Rating	A value that represents the calculated risk associated with the event.
Threat Rating	The threat rating of the event, if any.
Reputation	The attacker's reputation score in the range -10.0 to +10.0. A lower (more negative) score indicates a greater likelihood that the host is malicious.
Reputation Details	Deny Attacker: Whether a deny-attacker action occurred (or would have occurred) because an internal override was exceeded due to the calculated risk rating: true or false.
Protocol	The Level-3 or Level-4 protocol.
Notification Settings (Critical Events only)	
Enable Email IDs	Whether to send email notification for critical events. If you select this option, also enter one or more email addresses (comma separated).
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

IPS Updates Page

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS Updates page to perform administrative tasks associated with keeping your sensors up to date with regard to signatures, minor version updates, and service packs. You can use the IPS Updates page to:

- Monitor update status.

- Check the availability of updates and download them.
- Configure an IPS update server.
- Configure automatic update settings.

Note Beginning with Security Manager version 4.9, only the latest sensor and signature packages for IPS will be available for download from CCO. The older packages will not be available for download from CCO.

Tips

- To apply IPS updates manually, select **Tools > Apply IPS Update**. For more information, see Manually Applying IPS Updates , on page 1783.
- If you later decide that you did not want to apply a signature update, you can revert to the previous update level by selecting the Signatures policy on the device, clicking the **View Update Level** button, and clicking **Revert**.

Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to Certificate Trust Management, on page 495.

Navigation Path

Select **Tools > Security Manager Administration** and select **IPS Updates** from the table of contents.

Related Topics

Field Reference

Table 142: IPS Updates Page

Element	Description
Update Status group Refresh button	Displays the following items. Click **Refresh** to update the information. • Latest Available—The most recent signature and sensor update available on Cisco.com or the local HTTP server when you last checked for updates. • Latest Downloaded—The most recent signature and sensor update downloaded to Security Manager. • Latest Applied—The most recent signature and sensor update applied to any device in Security Manager. • Latest Deployed—The most recent signature and sensor update deployed to any device in Security Manager. • Last Check On—The time that the last check of Cisco.com was performed. • Last Download On—The time that the last update was downloaded to Security Manager. • Last Deployed On—The time that the last update was deployed to any of the devices.
Check for Updates button Download Latest Updates button	These buttons check for updates, or download signature and sensor updates that have not already been downloaded to the Security Manager server, from the IPS Update server. You must configure an IPS Update server before checking for updates or downloading them (click **Edit Settings** in the Update Server group). When you click one of these buttons, a dialog box opens to display the results of the operation. Security Manager logs into the IPS Update server, checks for updates, and downloads them if you clicked the Download button. If a Cisco.com download fails, ensure that the account you are using has applied for eligibility to download strong encryption software. For details, see the description of User Name in Edit Update Server Settings Dialog Box , on page 564. **Tip** If you configure a server, and then try to check for updates, and you are told you did not configure a server, click **Save** at the bottom of the page and try again. **Note** Beginning with version 4.9, Security Manager mandates you to read and accept the End User License Agreement (EULA) before you can proceed to downloading updates from cisco.com. In earlier versions of Security Manager, the End-User License Agreement (EULA) and K9 prompts had to be accepted for all image downloads. However, beginning with version 4.23, EULA and K9 prompts does not appear every time you are attempting to download an image.

Element	Description
Update Server group	Displays the settings used to access Cisco.com or the local server that contains the IPS update packages. The fields indicate whether the update server is Cisco.com or a locally-configured HTTP server, the name of the local server if you are using one, the user account for logging into the server, and the name of the proxy server, if any. To configure or change the IPS Update server, click **Edit Settings** to open the Edit Update Server Settings dialog box (see Edit Update Server Settings Dialog Box , on page 564). For more information, see Configuring the IPS Update Server , on page 1780. Beginning with version 4.4, Security Manager has a certificate trust management feature. This feature helps you with improved handling of Cisco.com certificates. For detailed documentation of this feature, refer to Certificate Trust Management, on page 495.
Signature Filter Settings group	Enables you to download IPS signature updates selectively. Click **Edit Settings** to open the Edit Signature Download Filter Settings dialog box (see Edit Signature Download Filter Settings Dialog Box, on page 567).
Auto Update Settings group	Contains the settings specific to automatic updates. For more information, see Automating IPS Updates , on page 1782.
Auto Update Mode	Establishes whether, and to what extent, automatic updates are performed. Contains the following options: • Download, Apply, and Deploy Updates • Disable Auto Update • Check for Updates • Download Updates • Download and Apply Updates By default, auto update is disabled. The other options are a combination of one or more of the following options: • Check for Updates—Security Manager contacts the IPS Update server to check if an update is available and sends e-mail if e-mail notification is configured. No files are downloaded. • Download Updates—Security Manager downloads the latest updates from the IPS Update server, and sends e-mail notification if e-mail notification is configured. • Apply Updates—Security Manager modifies the configuration of the devices selected in the Apply Update To list based on the downloaded update packages. You have to separately deploy these updates unless you also select Deploy Updates. • Deploy Updates—Security Manager starts a deployment job to send the applicable update packages to the devices selected in the Apply Update To list. The device must have the required license for a signature update to be successful.

Element	Description
Update Schedule Edit Update Schedule button	The schedule for the actions selected in the Auto Update Mode field. To change the schedule, click **Edit Update Schedule** and define the schedule in the Edit IPS Updates Schedule dialog box. You can specify that Security Manager perform the updates based on hourly, daily, weekly, or monthly schedules, or specify a one-time event. When entering the start time, use the 24-hour clock and the *hh:mm* format. **Note** If you schedule an update to occur in less than 10 minutes from your Security Manager server time, the "Next Update" field will show tomorrow's date and the job will run accordingly. This is a safety feature designed to guarantee the first occurrence to run. **Tip** Cisco recommends scheduling automatic downloads during off hours so that they do not conflict with other user operations, such as device discovery. **Tip** Cisco recommends using an account other than the admin account for routine user operations.
Notify Email	The e-mail address to which notifications of automatic updates are sent. If you enter more than one address, separate the addresses with commas. A notification is sent when an update: • Is available for download. • Has been downloaded. • Has been downloaded and applied. • Has been downloaded, applied, and deployed.

Element	Description
Apply Update To Type Edit Row button Devices to be Auto Updated	The selector includes the IPS devices that have local signature policies and the shared signature policies that are defined in Security Manager. The columns in the selector indicate whether a local device policy or a shared policy is selected for these types of updates: • Signature—For auto updating the signature update level. • Minor—For minor updates and service packs. • S.P.—For service pack updates. For shared policies, a partial grey checked box indicates that some, but not all, of the devices that use the policy are selected. If you change the devices assigned to the shared policy between automatic update events, the shared policy is grayed out, and only the old assignments are shown on this page. After the update runs, the assignment list will be synchronized with the shared policy device assignments. To update the device list proactively prior to the next auto update run, select the policy and edit it (to select auto update settings), and the device assignment list will be corrected. **Note** Also for shared policies: You can select only the shared policy assigned to the default virtual sensor (vs0). If you attempt to select the shared policy for a different virtual sensor, your changes will not be applied, and you will not receive an error message. Use the Type field to toggle between viewing local and shared policies. Changing the view does not change your auto update selections. To select a local or shared policy for auto update, select it in the selector and click the **Edit Row** button below the selector. This opens the Edit Auto Update Settings dialog box, where you can select the types of updates for the policy. When you select any type of auto update for a policy, the affected devices are listed in the **Devices to be Auto Updated** list to the right of the selector.
Save button	Saves your changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Edit Update Server Settings Dialog Box

Use the Edit Update Server Settings dialog box to configure the server to use for obtaining IPS updates. If necessary, you can configure a proxy server for communicating with the update server.

Also, use the Edit Update Server Settings dialog box for certificate trust management. (Security Manager downloads IPS packages from Cisco.com over HTTPS, which uses certificates for establishing trust.) The certificate trust management feature on the Image Manager page is new in Security Manager 4.4. It will help you with improved handling of Cisco.com certificates for IPS package downloads:

- You can use it to view a certificate and use discretion in accepting it.
- After you accept a certificate, it is stored on your Security Manager server.

- You can see all your certificates in a summary table on the Image Manager page, and you can use that table to view or remove certificates.

Tip Please be sure to refer to "Retrieve Certificate" in the table below.

Navigation Path

Select **Tools > Security Manager Administration > IPS Updates** and click **Edit Settings** in the Update Server group.

Field Reference

Table 143: Edit Update Server Settings Dialog Box

Element	Description
Update From	Whether to get IPS updates from Cisco.com or from a local HTTP/HTTPS server. Your selection changes the fields on the dialog box. If you select local, you must configure an HTTP or HTTPS server to use as the IPS update server. **Caution** The default value for "Update From:" is "Local Server." You must choose "Cisco.com" to see certificate settings. Improper or incomplete certificate setting will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.
IP Address/ Host Name (Local server only.)	The hostname or IP address of the local IPS update web server.
Web Server Port (Local server only.)	The port number that your local server listens to for connection requests. The default is 80.
User Name	The username to log into the IPS update server. If you are configuring a local server that does not require a user login, leave this field blank. If you are specifying a Cisco.com username, the user account on Cisco.com must be eligible for downloading strong encryption software. If you are not certain that the account has the required permissions, use the account to log into Cisco.com and try to download an IPS update file (http://www.cisco.com/cgi-bin/tablebuild.pl/ips5-system). If the account does not have the appropriate permissions, you are prompted to read and accept the required conditions. If you meet the eligibility requirements, you can accept them. Otherwise, talk to your Cisco sales representative for help.
Password Confirm	The password for the specified username, entered in both fields. If you are configuring a local server that does not require a password, leave these fields blank.

Element	Description
Path to Update Files (Local server only.)	The path to the IPS update files location on your local server. For example, if update files can be accessed at http://local-server-ip:port/update_files_path/, then enter update_files_path in this field.
Connect Using HTTPS (Local server only.)	Whether to use SSL when connecting to the local IPS Update server.
Certificate Thumbprint	Displays the certificate thumbprint after it is calculated from the certificate on the local server.
Retrieve From Server	Used to connect to the local server specified in this dialog box, retrieve the certificate from the local server given, and calculate the certificate thumbprint, which is displayed in the Certificate Thumbprint field.
Contact URL	• When selected, "Image Meta-data Locator" is used. This is the URL on Cisco.com that is used to obtain meta-data information about images. Meta-data information consists of the images applicable to a particular product, name, size, checksum, and URL to download for each image. • When selected, "Other" is used. You can enter any valid HTTPS URL. This URL is intended primarily for the HTTPS URL to download the image as obtained from the meta-data information about the image. This URL may be different from the URL of the image meta-data locator described in the previous paragraph; the certificate may be different, as well. **Caution** If you choose "Other," you need to explicitly add "https://dl.cisco.com" [without the quotation marks]: Enter it in the text field adjacent to the "Other" button. Failure to do this will prevent connectivity to Cisco.com, and all Cisco.com-related operations in this area will fail.
Retrieve Certificate	Used to connect to and retrieve the certificate from the selected ‘"Contact URL’." After retrieving the certificate it opens the Certificate Verification dialog, which along with a brief summary of the certificate, i.e., who the certificate is issued to, by whom, and the validity period of the certificate, gives you the following choices: • **View Certificate**—Opens the Certificate Viewer, where you can see all the details of the certificate: Certificate Authority, version, serial number, thumbprint, and other details. It shows the complete certificate chain information all the way up to the root issuing certificate Authority. • **Accept**—Accepts the certificate and adds it to the Cisco Security Manager. • **Reject**—Rejects the certificate and no action is taken. • **Cancel**—Closes the Certificate Verification dialog with no action taken.
Certificate	A table that displays, for each certificate in your Security Manager installation, Subject, Issued By, and Accepted By.
View	Opens the Certificate Viewer for a certificate selected in the Certificate table.
Remove	Removes a certificate selected in the Certificate table.

Element	Description
Proxy Server Group	
Enable Proxy Server	Whether a proxy server is needed to connect to Cisco.com or to your local server.
IP Address/ Host Name	The hostname or IP address of the proxy server. You can configure the proxy server to use basic, digest, NT LAN Manager (NTLM) V1, or NTLM V2 authentication. NTLM V2 is the most secure scheme.
Port	The port number that the proxy server listens to for connection requests. The default is 80.
User Name	The username to log into the proxy server. If the proxy server does not require a user login, leave this field blank.
Password Confirm	The password for the specified username, entered in both fields. If the proxy server does not require a password, leave these fields blank.

Edit Auto Update Settings Dialog Box

Use the Edit Auto Update Settings dialog box to configure the automatic update options for the device or policy selected in the Apply Update To table on the IPS Updates page. For information on configuring automatic updates, see Automating IPS Updates , on page 1782.

Navigation Path

Select a device or policy on in the Apply Update To table on the IPS Updates page (see IPS Updates Page , on page 559) and click the Edit Row button.

Field Reference

Table 144: Edit Auto Update Settings Dialog Box

Element	Description
Auto Update (IPS sensors and shared policies only)	The type of sensor updates to apply to the selected devices or shared policies. You can apply both minor updates and service packs, service packs only, or select None to apply no sensor updates automatically.
Auto Update Signature Update Level	Whether to select the device or policy for automatic signature updates.

Edit Signature Download Filter Settings Dialog Box

The Edit Signature Download Filter Settings dialog box enables you to download IPS signature updates selectively. It applies both to the manual download and to the automated download.

Note Filtering does not apply to IPS sensor packages or to IPS engine packages; it applies to IPS signature packages only. All the available sensor packages on Cisco.com or on the local server will be downloaded as part of a signature download.

The benefits of selective download are reduced download time, reduced disk storage space, and faster troubleshooting because you can download only what you need.

There are four types of signature download available to you with the Edit Signature Download Filter Settings dialog box:

- No filter
- Download all signatures for engine versions starting with [choose E4, E3, E2, or E1]
- Download all signature versions starting with [enter a signature version such as 1000]
- Download a single signature version number [enter a signature number such as 1000]

The default signature configuration is to download all signatures for engine versions starting with E4.

Tip This default value is the same for a new installation of Security Manager 4.3 and for upgrades from previous versions.

Navigation Path

Select **Tools > Security Manager Administration** and then select **IPS Updates** from the table of contents; then click **Edit Settings** in the Signature Filter Settings group.

Related Topics

Field Reference

Table 145: Edit Signature Download Filter Settings Dialog Box

Element	Description
Filter Type: No filter	All available signatures for all available engines are downloaded.
Filter Type: Download all signatures for engine versions starting with	All available signatures for the engine that you select (E4, E3, E2, or E1) are downloaded.
Filter Type: Download all signature versions starting with	All available signatures starting with the ID that you enter are downloaded.

Element	Description
Filter Type: Download single signature version number	The single signature having the ID that you enter is downloaded.

ISE Settings Page

Use the ISE Settings page to configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE) for use with TrustSec firewall policies.

Note Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.

To be PCI compliant, in Cisco Security Manager 4.15 and 4.16, TLS 1.0 and TLS 1.1 were disabled respectively. Hence from 4.16, Cisco Security Manager was using only TLS 1.2 version.

However, the ISE 1.3 server and its lower versions does not support TLS 1.2. This impacts the legacy ISE settings with Cisco Security Manager from release 4.15. This incompatibility prevents integration of ISE server with Cisco Security Manager.

If you are required to use ISE server (versions 1.3 and lower) in the Cisco Security Manager 4.15, 4.16, or 4.17 versions, to integrate ISE 1.3 and lower versions with Cisco Security Manager successfully, refer Cisco Security Manager User Guide for release 4.17.

Navigation Path

Select **Tools > Security Manager Administration** and select **ISE Settings** from the table of contents.

Related Topics

- Managing Trustsec Firewall Policies, on page 667
- Creating Security Group Objects , on page 681
- Selecting Security Groups in Policies , on page 683

Field Reference

Table 146: Identity Settings Page

Element	Description
Enable ISE feature	Whether to enable communication with the ISE.
Username	The username Security Manager should use to log on to the ISE.
Password	The password for the username.
ISE Server (IP Address/Hostname)	The DNS hostname or IP address of the ISE.

Element	Description
ISE Version	Beginning with version 4.18, Cisco Security Manager supports integration of only ISE version 2.3.
Test Connectivity	Click Test Connectivity to ensure that Security Manager can communicate with the ISE given the settings you have entered.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Licensing Page

Use the Licensing page to manage licenses for the Security Manager application and for IPS devices. For more information, see Managing IPS Licenses , on page 1777.

Navigation Path

Select **Tools > Security Manager Administration** and select **Licensing** from the table of contents.

Field Reference

Table 147: Licensing Page

Element	Description
CSM tab	The license settings for the Security Manager application. For a description of the fields on this tab, see CSM Tab, Licensing Page , on page 570.
IPS tab	The license settings for IPS devices managed by Security Manager. For a description of the fields on this tab, see IPS Tab, Licensing Page , on page 571.

CSM Tab, Licensing Page

Use the CSM tab on the Licensing page to view the list of installed Security Manager licenses and to install new licenses. For more information, see Installing Security Manager License Files , on page 494.

Navigation Path

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click **CSM**.

Field Reference

Table 148: CSM Tab, Licensing Page

Element	Description
License Information	Displays information about the license registered with the product: the edition, license type, expiration date, the number of licensed devices, the number of devices in use, and the percentage of the device count used.
Install License	The list of installed licenses with their installation dates.
Install a License button	Click this button to install a license file. The dialog box that is opened includes links to Cisco.com, where you can obtain licenses if you have not already obtained them. You must copy license files to a local drive on the Security Manager server before you can install them.

IPS Tab, Licensing Page

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

Use the IPS tab on the Licensing page to view the list of installed IPS device licenses, to install new or updated licenses, or to redeploy licenses. The license list shows current licenses, unlicensed devices, devices with expired licenses, and devices with invalid licenses. You can also use the settings on this page to send a report of all those IPS devices whose license would expire within a specified number of days.

Navigation Path

Select **Tools > Security Manager Administration**, select **Licensing** from the table of contents, and click **IPS**.

Related Topics

- Updating IPS License Files , on page 1777
- Redeploying IPS License Files , on page 1778
- Automating IPS License File Updates , on page 1779
- License Update Status Details Dialog Box , on page 575
- Filtering Tables , on page 50
- Table Columns and Column Heading Features , on page 51

Field Reference

Table 149: IPS Tab, Licensing Page

Element	Description
IPS License Table	Displays all the IPS devices in the device inventory and their license status as of the last time you refreshed the information. Click the **Refresh** button to obtain the latest information from the devices. Information includes the serial number for the device, which is used to register for licenses, the license status, and the expiration date of the license. The list shows not only current licenses, but also unlicensed devices, devices with expired licenses, and devices with invalid licenses. **Tip** The list does not include Cisco IOS IPS devices. You cannot use Security Manager to manage licenses for routers running IPS.
Update Selected via CCO button	Click this button to update the license file for the selected devices by connecting to Cisco.com and retrieving a new license. When you click this button, a dialog box opens listing devices that can be updated from Cisco.com, which might not be all the devices you selected. Click **OK** to perform the update. For successful updates, the updated file is automatically applied to the device. To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices. **Tip** The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.
Redeploy Selected Licenses button	Click this button to redeploy licenses to the selected devices. Redeploying licenses might be necessary when you have obtained an updated license file and it was not applied to the device successfully during an automatic update. When you click this button, a dialog box opens listing devices whose licenses you are redeploying. Click **OK** to perform the update. For successful updates, the updated file is automatically applied to the device.
Update from License File button	Click this button to update licenses by selecting a license file from the Security Manager server. When you click this button, a dialog box opens where you can specify the license files. Click **Browse** to select the files, which must be on a local drive on the Security Manager server. When you click **OK**, the updated files are automatically applied to the devices.
Export As button	Select one or more IPS devices from the list and then click the **Export As** button to export their licenses to a Portable Document Format (PDF) or comma-separated values (CSV) file. You are prompted to select the folder on the Security Manager server and to specify a file name. If you do not select any device from the list, the licenses of all available devices are exported.

Element	Description
Refresh License button	Click this button to refresh the data in the IPS license table for the selected devices. The updated information is retrieved from the device. If you do not select any devices, all devices are refreshed; this can take a long time depending on the number of devices listed.
Download and apply licenses Days before the expiration date.	Whether to automatically download IPS licenses from Cisco.com and apply them to the devices. To successfully configure automatic updates, you must have a Cisco.com support contract that includes the serial numbers of your IPS devices. If you select this option, also specify the number of days before the license expiration date for downloading and applying licenses. Security Manager evaluates only those devices that do not have licenses, have expired licenses, or have valid licenses within this number of days of expiration. Licenses are applied only if they are valid and either have an expiration date farther out than the current one, or that have different license information.
Discover devices daily at	If you select automatic license updates, the time of day when Security Manager should contact devices for current licenses status and evaluate whether there are devices that have licenses that will expire within the specified number of days. Cisco.com is contacted only if one or more device meets the expiration requirements.
Email License Update Results Email Notification	Whether to send email notifications of expiration alerts and license update job results. If you select this option, also enter one or more email addresses (comma separated).
Email License Expiration Status Email Notification	Whether to send a PDF report of those IPS devices whose license would expire within a specified number of days. If you select this option: • Enter the number of days (not more than 100) before the device license expiry date, by which you want Security Manager to send the PDF report. • Select the time and day for Security Manager to check the license expiry. • Enter one or more email addresses (comma separated) to which you want the License Expiration Status PDF report to be sent.
Save button	Saves your changes to the automatic license update and e-mail notification settings.

Verifying IPS Devices for License Update or Redeployment

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

When you select a device on the **Licensing > IPS** tab (see IPS Tab, Licensing Page , on page 571) and try to update the license from Cisco.com (CCO) or redeploy the license, you are first shown a list of devices that will be updated. The name of the dialog box is based on the action you are taking:

- **Updating Licenses via CCO dialog box**—Review the IPS devices you selected to update from Cisco.com. The device list displays the IPS devices for which you can update the license from Cisco.com, which might not be all of the devices you selected.

To successfully update the license using this method, you must have a Cisco.com support contract that includes the serial numbers of the selected devices.

Tip The Cisco software license server (SWIFT) that contains the licenses might block requests from the same server for more than 9 licenses within a three minute period. Thus, you should select fewer than 9 devices at a time when performing manual license updates.

- **Redeploying Licenses dialog box**—Review the IPS devices you selected for redeploying licenses. Before you can redeploy a license to a device, you must have already deployed the license. Security Manager uses the file already associated with the IPS device to redeploy the license.

When you click **OK**, the License Update Status Details dialog box opens so that you can view the status of the license redeployment task. See License Update Status Details Dialog Box , on page 575.

Navigation Path

To open these dialog boxes, select one or more device on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update Selected via CCO** or **Redeploy Selected Licenses**.

Selecting IPS License Files

Note From version 4.17, though Cisco Security Manager continues to support IPS features/functionality, it does not support any enhancements.

If you select one or more devices on the **Tools > Security Manager Administration > Licensing > IPS** tab and click **Update from License File**, you are prompted to select the license file you want to use with the Updating Licenses from File dialog box.

You can store the license file on a local drive on the Security Manager server, and, beginning with Version 4.5 of Security Manager, you can store it on a local drive on a client.

Click **Browse** to select the license file. You can select multiple license files using Ctrl+click or a range of files using Shift+click.

Note If you installed the Security Manager client on a different machine than the one on which Security Manager server is installed, you can choose to select the license file from either the client machine or the server machine. If both the client and the server are installed on the same machine, Security Manager allows you to select the license file only from the server.

When you have selected the license files you want to use, click **OK** to apply them to the IPS devices.

Note If you want to store the license file on a client machine, you must select "Enable Client side file browser" on the Customize Desktop page at Tools > Security Manager Administration > Customize Desktop.

License Update Status Details Dialog Box

Use the License Update Status Details dialog box to view the status of an IPS license update task. This dialog box opens whenever you start an update task from the IPS tab of the Licensing page. For more information, see IPS Tab, Licensing Page , on page 571.

Field Reference

Table 150: License Update Status Details Dialog Box

Element	Description
Progress bar	Indicates what percentage of the license update task on the current device has been completed.
Status	The current state of the update task.
Devices to be updated	The total number of devices being updated during this task.
Devices updated successfully	The number of devices updated without errors.
Devices updated with errors	The number of devices that generated errors during the update.
Device list	The devices that are being updated, including the device name, the status of the update, and summary information about the update. Select a device to see the messages generated during the update for that device in the message list below the summary list.
Messages list	The messages generated during the license update for the selected device. Select a message to see detailed information in the fields to the right of the list.
Description	Additional information about the message selected in the message list.
Action	The steps you should take to resolve the described problem.
Abort button	Aborts the license update task.

Logs Page

Use the Logs page to configure the default settings for the audit and operations logs. The audit log keeps a record of all state changes that occur in Security Manager.

Navigation Path

Select **Tools > Security Manager Administration** and select **Logs** from the table of contents.

Related Topics

- Using the Audit Report Window, on page 499
- Understanding Audit Reports, on page 497
- Generating the Audit Report, on page 498
- Purging Audit Log Entries, on page 501

Field Reference

Table 151: Logs Page

Element	Description
Manual Purging	
Keep Audit Log in DB For (days)	The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.
Keep Audit Log in DB For Last (entries)	The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.
Purge Now	To delete the old entries from the database, click **Purge Now**. Based on the values entered in the Keep audit log in DB for Last (days) and Keep audit log in DB for Last (entries) fields, the audit log entries that is maximum gets deleted. For example, if the value for Keep audit log in DB for Last (days) is 5 and Keep audit log in DB for Last (entries) is 5000, and last 5 days log entries is more than 5000, then Cisco Security Manager keeps the last 5000 entries and deletes the older entries even if they belong to the last 5 days. **Note** The Purge Now button only removes audit report entries from the database. It does not remove the *.csv files from the <*install_dir* >\CSCOpx\MDC\log\audit folder. These *.csv files can be deleted directly.
Keep Audit Log File For (days)	Number of days an audit log file should be retained in the system.
Purge Now	Click this button to immediately delete the specified older audit log files. **Note** The Purge Now button deletes the CSDL Audit log files from <*install_dir* >\MDC\log\CSDL Audit Log folder along with Audit log files from <*install_dir* >\MDC\log\audit folder.
Keep Operation Log Files For (days)	The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.
Purge Now button	Click this button to immediately delete the specified older operation log files.

Element	Description
Scheduled Purging	
Enable Scheduled Purging for Audit Log Database Entries	Click this check box to scheduled the purging of older log entries. The schedule options are enabled on clicking this check box.
Keep Audit Log in DB For (days)	The maximum number of days of Audit Log entries that has to be stored in the database before deleting it.
Keep Audit Log in DB For Last (entries)	The maximum number of audit log entries to be stored in the database. If an entry becomes older than the number of days specified in the Keep Audit Log For field, it is deleted even if the log has fewer than the maximum number of entries.
Enable Scheduled Purging for Audit Log Files	Click this check box to schedule purging of audit logs from the system.
Keep Audit Log File For (days)	Number of days an audit log file should be retained in the system.
Enable Scheduled Purging for Operation Log Files	Click this check box to schedule purging of operation logs from the system.
Keep Operation Log Files For (days)	The number of days that Security Manager keeps operation logs before deleting them. These logs are used for debugging purposes.
Log Level	The level of information, according to severity, that you would like collected in the operation logs. Each level collects different amounts of data. For example, the Info level yields the most data, and the Severe level collects the least.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Policy Management Page

Use the Policy Management page to select the types of router and firewall policies you will manage in Security Manager. These selections apply to routers and firewall devices, but do not apply to IPS devices. By default, all policies are selected for management.

Unmanaged policies are removed from both Device view and Policy view. Any unmanaged policies, local or shared, are removed from the Security Manager database. The only exception is interface policies, which continue to appear in Security Manager but are marked as read-only policies. For firewall devices, interface and failover settings are considered a unit and are managed or unmanaged together.

For detailed information on managing and unmanaging policy types, including what you should do before and after changing these settings, see Customizing Policy Management for Routers and Firewall Devices , on page 177.

Caution If you use AUS or CNS to deploy configurations to ASA or PIX devices, be aware that the device downloads a full configuration from AUS or CNS. Thus, reducing the policies managed by Security Manager actually removes the configurations from the device. If you intend to deselect some ASA/PIX policies for management to use other applications along with Security Manager to configure devices, do not use AUS or CNS.

Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Management** from the table of contents.

Field Reference

Table 152: Policy Management Page

Element	Description
Policies to Manage	The policy types are organized in folders, with router and firewall (which includes all ASA, PIX, and FWSM devices) handled separately, and then by category (NAT, Interfaces, and Platform). Select or deselect policy types as desired and click **Save**. Deselecting the check box for a group of policies deselects all policies in that group. By default, all policies are selected. **Note** Beginning with version 4.18, Cisco Security Manager provides support for ASA 9.10(1) devices that are configured on the Umbrella server.
Display a warning on all shared policies and imported objects	Whether to add a message to all shared policies and to objects that were imported using the **File > Import** command. If you select this option, messages appear on the following: • All shared policies, whether they were imported or locally created. • Policy objects that were created by importing devices or shared policies using the **File > Import** command, but not imported policy objects created by the PolicyObjectImportExport.pl command (described in Importing and Exporting Policy Objects , on page 253. If you regularly import shared policies, the imported policies and objects replace any same-named policies and objects, so any changes made locally are removed. This message can notify users that policies might be imported and help users identify policy objects that they might not want to edit. **Tip** When importing policies or devices, you are prompted to select a setting for this option. Thus, users who import policies or devices can change this setting without accessing this page provided they have the required authorization. The change is effective only after the importer submits (and if necessary, approves) the changes. For more information, see Importing Policies or Devices, on page 491.

Element	Description
Save button	Saves your changes. If you are unmanaging a policy, you are shown a list of devices that have the policy assigned to them. Security Manager must be able to obtain the required locks to unassign the policy from all devices, or you must manually unassign the policies (or remove the locks) before unmanaging the policy. If you are managing a previously unmanaged policy, be sure to rediscover all affected devices to bring the existing configurations into Security Manager.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Policy Objects Page

Use the Policy Objects page to define system defaults related to policy object creation.

Navigation Path

Select **Tools > Security Manager Administration** and select **Policy Objects** from the table of contents.

Related Topics

- Understanding and Specifying Services and Service and Port List Objects , on page 331
- Managing Policy Objects, on page 229

Field Reference

Table 153: Policy Objects Page

Element	Description
When Redundant Objects Detected	The action you want Security Manager to take when you try to create a policy object that has the same definition as an existing object: • Ignore—You can freely create objects with identical definitions. Any conflicts are ignored by Security Manager. • Warn—Security Manager displays a warning if you attempt to create an object that is identical to an existing object. You may proceed to create the object, if you wish. • Enforce—Security Manager prevents you from creating an object that is identical to an existing object. An error message is displayed.

Element	Description
Default Source Ports	The port range value that is used as the default source port range for service objects. You can choose one of the following: • Use all ports—Includes all ports from 1 to 65535. • Use secure ports—Includes all ports from 1024 to 65535. If you change the default source ports, you must manually redeploy any previously deployed devices that might be affected. These changes might not be reflected in any open activities until you refresh the data. For more information on port list objects, see Configuring Port List Objects , on page 333.
Enable AutoComplete Dropdown Box	Whether to have Security Manager list matching service and port list names as you type them when you create a service. You can then easily select from names you have already defined. If you deselect AutoComplete, you have to remember the complete service and port list names and type them in yourself.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Process Monitoring Settings Page

Use the Process Monitoring Settings page to enable process monitoring. Here, you can enable or disable monitoring for specific processes and configure notification settings such as monitoring interval and email addresses. This will send an email notification to specified recipients, when a process stops.

Before You Begin

Configure SMTP Server and sender mail in the CS web console, to get email alerts.

Navigation Path

Select **Tools > Security Manager Administration** and select **Process Monitoring Settings** from the table of contents.

Field Reference

Table 154: Process Monitoring Settings Page

Element	Description
Enable Process Monitoring	When selected, Security Manager will allow you to specify the processes that you want to monitor. You must proceed to configure other process monitoring settings. By default, the Process Monitoring feature is disabled on the Cisco Security Manager Server. **Note** Enabling or disabling the process monitor modifies the Windows registry and may generate a system alert.
Monitoring Interval (in minutes)	Specify the interval, at which, the process will be monitored. Valid values are between 1-60 minutes. The default monitoring interval is 5 minutes. **Note** If the monitoring interval is changed, the monitoring task in progress stops and the new monitoring task starts with the updated interval.
Notification Recipient(s) E-mail(s)	Enter email IDs for the notification recipients.You can enter multiple email IDs, separated by a comma. These are the recipients that will be notified, when a process being monitored, stops.
Maximum Mail Alerts	Enter the maximum number of emails that will be sent to the recipients during the course of Security Manager runtime. The default value here, is 10.
Process List	Select one or more processes that you want to monitor. Whenever any of these selected processes stop, a notification email will be sent to the specified recipients. **Note** When Event Management, Health and Performance Monitor and Report Manager are disabled from Tools > Security Manager Administration, email notifications will not be sent, even if, the VmsEventServer, CsmHPMServer and CsmReportServer processes are enabled in the process monitoring settings page.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Single Sign-on Configuration Page

Use the Single Sign-on Configuration page of the Security Manager Administration window to enable and configure a “single sign-on” (SSO) shared key to use for cross-launching Cisco Prime Security Manager or FireSIGHT Management Center.

Note Single sign-on allows users to cross-launch Prime Security Manager or FireSIGHT Management Center from Security Manager without logging into Prime Security Manager or FireSIGHT Management Center separately. However, SSO is not required to cross-launch Prime Security Manager or FireSIGHT Management Center.

Tip Cisco Prime Security Manager is used to manage ASA CX modules. FireSIGHT Management Center is used to manager ASA FirePOWER modules.

Related Topics

- Detecting ASA CX and FirePOWER Modules , on page 2857
- Launching Cisco Prime Security Manager or FireSIGHT Management Center , on page 2856
- Sharing Device Inventory and Policy Objects with PRSM , on page 2858

Navigation Path

1. Click **Tools > Security Manager Administration** and select **Single Sign-on Configuration** from the table of contents.
2. Select **Enable for Prime Security Manager** [checkbox] or **Enable for FireSIGHT Management Center** [checkbox].

Field Reference

Table 155: Single Sign-on Configuration Page

Element	Description
Enable for Prime Security Manager	[checkbox] Lets you enable or disable the SSO feature for Prime Security Manager. When disabled, the shared key is retained.
Enable for FireSIGHT Management Center	[checkbox] Lets you enable or disable the SSO feature for FireSIGHT Management Center. When disabled, the shared key is retained.

Element	Description
Shared Key for Single Sign-on	Use the features in this section to generate and view an encryption key for cross-launching Prime Security Manager or FireSIGHT Management Center. Click the **Generate** button to randomly generate a 128-bit AES key, which is then displayed as a 32 hexadecimal string in the SSO Shared Key field. **Note** This key must be provided when configuring single sign-on cross-launching in Prime Security Manager or FireSIGHT Management Center. Also, each allowed Security Manager user must be configured in the Prime Security Manager database or the FireSIGHT Management Center user database with the same username as that in the Security Manager user database (the password can be different). **Tip** Refer to "Configuring Single Sign-On for Cisco Security Manager" in the *User Guide for ASA CX and Cisco Prime Security Manager* (Cisco ASA CX Context-Aware Security End-User Guides) for information about configuring SSO in PRSM.

Rule Expiration Page

Use the Rule Expiration page to define the default values for policy rule expiration. When you create policies for some types of policy rules (such as access rules), you can set an expiration date for the rule, and Security Manager can notify you by e-mail of the approaching expiration date.

You must configure an SMTP server to enable e-mail notifications. For more information, see Configuring an SMTP Server and Default Addresses for E-Mail Notifications , on page 27.

Navigation Path

Select **Tools > Security Manager Administration** and select **Rule Expiration** from the table of contents.

Field Reference

Table 156: Rule Expiration Page

Element	Description
Notify Email	The default e-mail address that should receive notifications of rule expiration. Users can override this address when configuring individual rules.
Notify Before Expiration	The default number of days before a rule expires that Security Manager should send the e-mail message. Users can override this value when configuring individual rules.
Sender	The e-mail address that Security Manager will use for sending e-mail notifications.

Element	Description
Email Format	The format of the e-mail message: • Text—The e-mail is sent in HTML and plain text formats. • XML—The e-mail is sent using an XML markup. This option might be appropriate if you decide to write a program to automatically process and respond to notifications.
Save button	Saves your changes.
Reset button	Restores all fields to their previous values.
Restore Defaults button	Resets values to Security Manager defaults.

Server Security Page

Use the Server Security page to open specific pages in the CiscoWorks Common Services application, where you can configure various security features on the Security Manager server. CiscoWorks Common Services controls the basic functions of the Security Manager server, including user access control and system security.

When you log in to Security Manager, your username and password are compared with the account information stored in the CiscoWorks or Cisco Secure Access Control Server (ACS) database, depending on which system you established at installation as your AAA provider. After the authentication of your credentials, you have access according to the role you have been assigned.

For more information on Security Manager roles and privileges, including descriptions of how Common Services roles translate to user functions in Security Manager, see the Installation Guide for Cisco Security Manager .

Navigation Path

Select **Tools > Security Manager Administration** and select **Server Security** from the table of contents.

Field Reference

Table 157: Server Security Page

Element	Description
AAA Setup button	Opens Common Services and displays the AAA Mode Setup page. From this page, you can set AAA as your fallback sign-on method. For more information about AAA, click **Help** from the AAA Mode Setup page.
Certificate Setup button	Opens Common Services and displays the Self-Signed Certificate Setup page. CiscoWorks enables you to create self-signed security certificates, which you can use to enable SSL connections between your client browser and management server. For more information about self-signed certificates, click **Help** from the Certificate Setup page.

Element	Description
Single Sign On button	Opens Common Services and displays the Single Sign-On Setup page. With Single Sign On (SSO), you can use your browser session to transparently navigate to multiple CiscoWorks servers without having to authenticate to each of them. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. For more information about setting up SSO, click **Help** from the Single Sign-On page.
Local User Setup	Opens Common Services and displays the Local User Setup page, from which you can add and delete users, edit user settings, and assign roles or permissions. For more information, click **Help** from the Local User Setup page and see the Installation Guide for Cisco Security Manager .
System Identity Setup	Opens Common Services and displays the System Identity Setup page. Communication between multiple CiscoWorks servers is enabled by a trust mode addressed by certificates and shared secrets. System Identity setup helps you to create a trust user on servers that are part of a multi- server setup. For more information about system identity setup, click **Help** from the System Identity Setup page.
Native RBAC Parameters	
Allow logon for user ids not available in Local User Database	For Security Manager installations integrated with an external authentication server like Active Directory, TACACS+, or RADIUS, specifies whether users can log in even when their user name is not defined in the Security Manager user list. When enabled, users are allowed to log in using the default role specified in Role Management Setup. If a default role is not configured, the user is not allowed to log in.

Take Over User Session Page

Use the Take Over User Session page to take over another user's configuration session. A user with administrative privileges can take over the work of another user in non-Workflow mode. Taking over a session is useful when a user is working on devices and policies, causing the devices and policies to be locked, and another user needs access to the same devices and policies. However, when you take over another user's session, your current session is discarded, so make sure that you submit your changes before taking over a session.

The table shows all current configuration sessions, listing the user name and the state of the session, whether the user is currently logged in or logged out. Select the configuration session you want to take over and click **Take over session**. The session is transferred to you in its current state, including any saved changes the user made during the session.

If the selected user is logged in at the time you take over the session, the user receives a warning message, loses any unsaved changes in progress, and then is logged out.

For more information, see Taking Over Another User's Work, on page 501

Navigation Path

Select **Tools > Security Manager Administration** and select **Take Over User Session** from the table of contents.

Ticket Management Page

Use the Ticket Management page to enable Ticket Management, to configure a ticketing system URL for integration with an external change management system, and to configure purge settings for ticket information.

When Ticket Management is enabled, every Image Management installation job must have an assigned ticket or it will not be performed.

Navigation Path

Select **Tools > Security Manager Administration** and select **Ticket Management** from the table of contents.

Related Topics

- Changing Workflow Modes , on page 28
- Comparing Workflow Modes , on page 23

Field Reference

Table 158: Ticket Management Page

Element	Description
Enable Ticketing	Whether to enable Ticket Management.
System Generated Default Ticket Name	By default, this check box is checked. Clear the check box, if you do not want the ticket name to be appended with the system generated default name. The ticket name field in the activity creation dialog is left blank.
Ticketing System URL	
Ticketing System URL	The URL to use for launching an external change management system. When this field is configured, the Ticket ID is a hyperlink that will launch the URL specified. The URL must be formatted as a template that accepts the Ticket ID as part of the URL. The template format uses {0} in place of the actual Ticket ID. For example, if the URL to launch an external ticket management system for a ticket with the ticket ID of *TKT12345* is http://ticketsystem/displayticket?ticketid=TKT12345, then the template URL you would use would be **http://ticketsystem/displayticket?ticketid={0}**. When you create a ticket, the Ticket ID you specify will be used in the hyperlink in place of the {0}.

Element	Description
Generate	Click to display the Generate Template URL dialog box that can be used to create a Ticketing System URL. Using the example above, you would enter **TKT12345** in the Ticket ID field and **http://ticketsystem/displayticket?ticketid=TKT12345** in the Ticket URL field. When you click **OK**, the appropriate template URL is created and entered into the Ticketing System URL field.
Ticket History Ticket History settings are only available in non-Workflow mode. In Workflow mode, purge settings are controlled via the settings for Activities (see Workflow Page , on page 590).	
Purge Tickets (including change report) Older than	The number of days that ticket information should be kept in the Ticket Manager table. The default is 30. You can specify from 1 to 120 days. Click **Purge Now** to delete all tickets older than the number of days specified.
Purge Change Report older than	The number of days that change reports should be maintained. The default is 30. You can specify a value that is less than the Purge Tickets (including change report) Older than setting. Click **Purge Now** to delete all change reports older than the number of days specified.
Save button	Saves your changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

Token Management Page

Use the Token Management page to identify the Token Management System (TMS) server to use for deploying configurations to Cisco IOS routers that use TMS as the communication protocol. Security Manager uses the settings on this page to contact the TMS server.

Security Manager uses FTP to deploy the delta configuration file to the TMS server, from which the configuration file can be downloaded and encrypted onto an eToken.

To use TMS with Cisco IOS routers, you must specify TMS as the transport protocol. You can do this for all routers on the Device Communication page (see Device Communication Page , on page 532), or for a specific router in its device properties (see Device Properties: General Page , on page 110). You must also configure the TMS server as an FTP server, otherwise deployment will fail.

Navigation Path

Select **Tools > Security Manager Administration** and select **Token Management** from the table of contents.

Related Topics

- Deploying Configurations to a Token Management Server , on page 423

- Understanding Deployment Methods , on page 389

Field Reference

Table 159: Token Management Page

Element	Description
Server Name or IP Address	The DNS hostname or IP address of the TMS server.
Username	The username Security Manager should use to log on to the TMS server.
Password Confirm Password	The password for the username. Enter the password in both fields.
Directory in the TMS Server for Config Files	The directory on the TMS server where deployed configuration files will be downloaded. The root FTP directory (".") is the default FTP location on the TMS server.
Public Key File Location	The location of the public and private key files on the Security Manager server, as copied from the TMS server. Security Manager uses the public key to encrypt data sent to the TMS server. Then the server uses its private key to decrypt the data. Security Manager comes with a default public key that matches the default private key on the server. **Note** If needed, you can generate a new pair of public and private keys using the TMS server. If you do this, you need to copy the new public key to the Security Manager server.
Save button	Saves your changes.
Reset button	Resets changes to the last saved values.
Restore Defaults button	Resets values to Security Manager defaults.

VPN Policy Defaults Page

Use the VPN Policy Defaults page to view or assign the default VPN policies that Security Manager uses for each IPsec technology. Before you can select a policy as a default, you must create the policy as a shared policy, submit it to the database and have it approved. You cannot create policies from this page. For detailed information on how to configure these defaults, see Understanding and Configuring VPN Default Policies , on page 1086.

For each tab that relates to a VPN topology, the drop-down lists for each policy type list the existing shared policies that you can select. You can select a policy and click the **View Content** button to see the definition of that policy. In some cases, you are allowed to make changes, but you cannot save them.

Security Manager uses VPN policy defaults to simplify VPN configuration while ensuring that policy consistency is maintained. Security Manager provides factory default policies for mandatory policies, which provide values for settings that must be configured on the devices in your VPN topology for the VPN to work. Mandatory policies differ depending on the assigned IPsec technology. Factory default policies with their default configurations enable you to deploy to your devices immediately after creating the VPN topology.

Default settings are not provided for optional policies. You might want to create shared policies to provide different default settings instead of using the factory default settings.

Navigation Path

Select **Tools > Security Manager Administration** and select **VPN Policy Defaults** from the table of contents.

Related Topics

- Creating IPSec VPNs Using the Remote Access VPN Configuration Wizard (IOS and PIX 6.3 Devices) , on page 1322

Field Reference

Table 160: VPN Policy Defaults Page

Element	Description
DMVPN tab	Lists the policy types for which you can configure default policies for the Dynamic Multipoint VPN technology.
Large Scale DMVPN tab	Lists the policy types for which you can configure default policies for the Large Scale Dynamic Multipoint VPN technology.
Easy VPN tab	Lists the policy types for which you can configure default policies for the Easy VPN technology.
IPsec/GRE tab	Lists the policy types for which you can configure default policies for the IPsec/GRE VPN technology.
GRE Dynamic IP tab	Lists the policy types for which you can configure default policies for the GRE Dynamic IP VPN technology.
Regular IPsec tab	Lists the policy types for which you can configure default policies for regular IPsec VPN technology.
Regular IPsec VTI tab	Lists the policy types for which you can configure default policies for regular, tunnel-based IPSEC VPN technology.
GET VPN	Lists the policy types for which you can configure default policies for the Group Encrypted Transport (GET) VPN technology.
Remote Access VPN	Lists the policy types for which you can configure default policies for IPsec remote access VPNs.
S2S Endpoints tab	The interface roles that define the default endpoints for internal and external interfaces in site-to-site VPNs.

Workflow Page

Use the Workflow page to select the workflow mode that Security Manager enforces and to define the default settings for activity and deployment job notifications and logging.

Before changing the workflow mode, read the following topics to understand how the modes differ and the effects of changing the modes:

- Working in Workflow Mode , on page 21
- Working in Non-Workflow Mode , on page 22
- Comparing Workflow Modes , on page 23
- Changing Workflow Modes , on page 28

Navigation Path

Click **Tools > Security Manager Administration** and select **Workflow** from the table of contents.

Related Topics

- Managing Activities, on page 141
- Managing Deployment, on page 381

Field Reference

Table 161: Workflow Page

Element	Description
Workflow Control	
Enable Workflow	Whether to enable Workflow mode. When Workflow mode is enabled, you can select whether or not to have an approver for activities and deployment jobs.
Require Activity Approval	Whether to require that activities be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see Activity Approval , on page 143.
Submitter can Approve Activity	Activities can be approved by submitter.
Require Deployment & Install Image Approval	Whether to require that deployment jobs and install image jobs be approved explicitly by an assigned approver. For more information about the differences between working with and without an approver, see Understanding Deployment , on page 381.
Submitter can Approve Deployment Jobs	Deployment jobs can be approved by submitter.

Element	Description
System Generated Default Activity Name	By default, this check box is checked. Clear the check box, if you do not want the activity name to be appended with the system generated default name. The activity name field in the activity creation dialog is left blank.
Email Notifications	
Sender	The e-mail address that Security Manager will use for sending e-mail notifications.
Activity Approver	The default e-mail address for the person responsible for approving activities. Users can override this address when submitting an activity for approval. For more information, see Submitting an Activity for Approval (Workflow Mode with Activity Approver) , on page 161.
Job/Schedule Approver	The default e-mail address of the person responsible for approving deployment jobs or schedules. Users can override this address when submitting a job or schedule for approval. For more information, see Submitting Deployment Jobs , on page 418.
Require Deployment Status Notification Include Job Deployer Job Completion Notification	Whether to have e-mail notifications sent whenever the status of a deployment job changes. If you select this option, enter the e-mail addresses that should receive notification in the Job Completion Notification field. Separate multiple addresses with commas. You can also select Include Job Deployer to include the e-mail address of the person who deployed the job on the notification e-mail message.
Workflow History	
Keep Activity for	The number of days that activity information should be kept in the Activity table. The default is 30. You can specify from 1 to 180 days. Click **Purge Now** to delete all activities older than the number of days specified. **Note** If ticketing is enabled in non-Workflow mode, purge settings are controlled via the settings for Tickets (see Ticket Management Page , on page 586).
Keep Job for	The number of days that deployment job information should be kept in the Deployment Job table. The default is 30. You can specify from 1 to 180 days. Click **Purge Now** to delete all jobs older than the number of days specified. **Note** From Cisco Security Manager version 4.22, choosing this option deletes the deployment transcript files older than the number of days specified, from the **C:\Program Files (x86)\CSCOpx\MDC\tomcat\vms\athena\transcript** folder also. This helps eradicate stale entries getting piled up.

Element	Description
Keep job per schedule for	The number of days that deployment job information should be kept in the Deployment Job table for each job schedule. This setting applies only to jobs that were initiated by a schedule. The default is 30. You can specify from 1 to 180 days. Click **Purge Now** to delete all jobs older than the number of days specified.
Save button	Saves your changes.
Reset button	Resets changes to the previously applied values.
Restore Defaults button	Resets values to Security Manager defaults.

Wall Settings Page

The Security Manager Wall Settings page is where you can enable or disable the Wall feature.

The "Wall" feature is also called the "ShoutBox" feature. You can use it to send messages to all users who are logged in on the same Security Manager server. First, however, it must be enabled on the Wall Settings page.

Note Only admin users have permission to enable or disable the Wall feature, but all users have permission to send messages.

You would want to use the Wall feature, for example, to interact with other users while making some changes in your Security Manager installation, perhaps about the changes being made or certain immediate actions to be performed on the changes. The message being sent is broadcast to all users who are logged in. The Wall feature allows users to enter basic profile information that can be viewed by others when logged in. A significant use of the Wall feature is that it can be used to view a list of all users who are currently logged in. (A user is removed from the Wall window after idle timeout or logging out through the Security Manager client.)

You cannot use the Wall feature to send *.pdf, *.xls, or other file attachments.

Navigation Path

Click **Tools > Security Manager Administration** and select **Wall Settings** from the table of contents.

Field Reference

Table 162: Wall Settings Page

Element	Description
Enable users to send messages to others	Whether to enable or disable the Wall feature.
Save button	Saves and applies changes.
Reset button	Resets changes to the last saved values.

Element	Description
Restore Defaults button	Resets values to Security Manager defaults.

When the Wall feature is enabled, you can open the Wall window by clicking **Tools > Wall...** or by clicking the Wall icon in Configuration Manager.

You can also open the Wall window by clicking the Wall icon in Health and Performance Monitor or Image Manager. You cannot open the Wall window in Event Viewer or Report Manager.

Detailed Wall feature help is available on the Wall window by clicking the help icon.

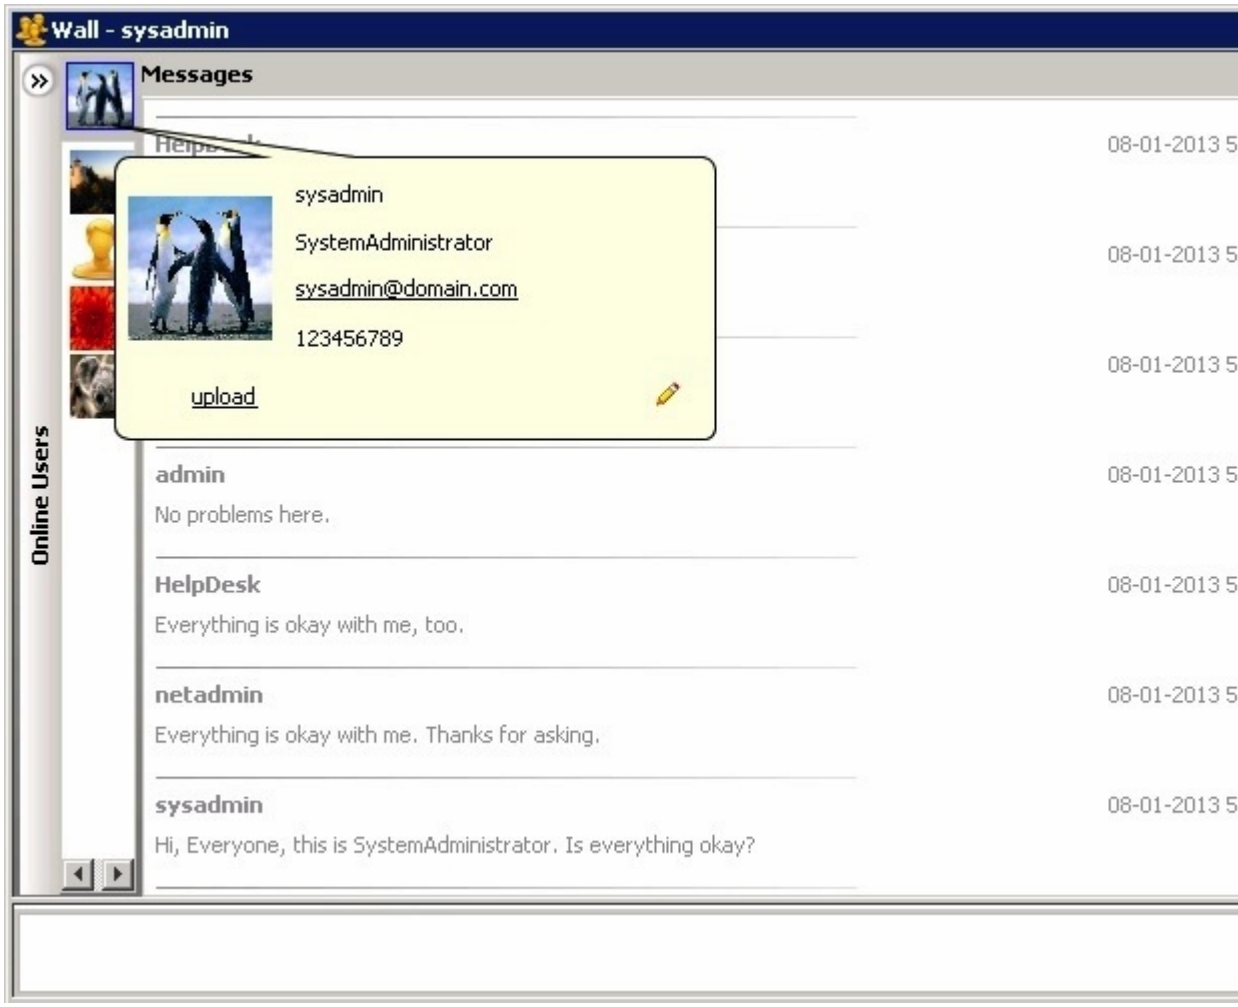
The Wall window contains the following elements:

- Left-hand pane, which shows the users who are logged in on the same Security Manager server and an expand/collapse button.
- Right-hand pane, which occupies most of the page and contains the text of the messages that users have sent. The right-hand pane also has a button to enable or disable wall alerts and the help icon, which you can click to see detailed help.

Summary of the Wall Window	
Message Display	Messages are displayed in the right-hand pane of the Wall window. The latest messages are always displayed at the top. Selective copy of text is allowed from the messages. You are allowed to type a maximum of 280 characters in the message panel, and after completing this number of characters you are alerted by a beep sound.
Message Log	You can see a log of previous messages. The message log keeps 100 messages. The messages become visible to you when you launch the Wall window.
Profile Picture	You can upload a picture for your profile. Valid image types such as JPG, PNG, BMP, and GIF types are supported. To upload a picture, use the **upload** link in the user profile window. To open the user profile window, click on the username or user picture in the Wall window. The user profile window also has an icon that toggles between Edit profile information and Save profile information.
User Profile Window	To open the user profile window, click on the username or user picture in the Wall window. The user profile window contains the following information: • Profile Name (maximum 20 characters) • Designation (maximum 15 characters) • Email (maximum 15 characters) • Phone Click the corresponding email link to send the mail.

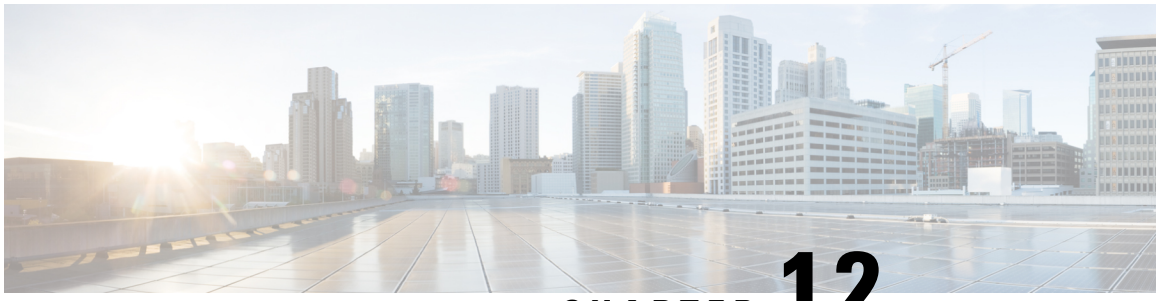
Notification Alert	On receipt of a new message and when the Wall window is not focused, a new notification alert popup is shown to you. You can simply click on the notification to launch the Wall window. When the notification alert popup is shown to you, the Wall window icon also flashes with the message count displayed. You can turn off the notifications alert from the settings options provided on the alert popup or in the Wall window.

Figure 16: Wall Window



PART II

Firewall Services and NAT



CHAPTER 12

Introduction to Firewall Services

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), Catalyst Firewall Services Module (FWSM), and security routers running Cisco IOS Software. These policies allow you to control network access through a device.

This chapter contains the following topics:

Overview of Firewall Services

The Firewall policy folder (in either Device or Policy view) includes firewall-related policies that you can deploy to the Adaptive Security Appliance (ASA), PIX Firewall (PIX), and Catalyst Firewall Services Module (FWSM).

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software

These policies are focused on controlling access through the device, rather than access to the device (that is, logging into the device so that you can change its configuration or use **show** commands). Following is a general overview of the available firewall policies with pointers to topics that provide more detailed information:

- AAA rules—These are AAA firewall or authentication proxy rules that can require a user to authenticate (with a username and password) and optionally be authorized before the device allows the user to make network connections through it. You can also create accounting rules to collect billing, security, or resource allocation information. For more information, see Understanding AAA Rules , on page 685.
- Access rules—These are traditional interface-based extended access control rules. They permit or deny a packet based on source address, destination address, source interface, and service, and you can apply them in both the in and out directions. For more information, see Understanding Access Rules , on page 717.
- Inspection rules—These are traditional Context-Based Access Control (CBAC) inspection rules that filter out bad TCP/UDP packets based on application-layer protocol session information and that enable

return traffic for the selected services. For more information, see Understanding Inspection Rules , on page 767.

- Web filter rules—These are a type of inspection rule that filters web traffic based on the requested URL, allowing you to prevent connections to undesirable web sites. For more information, see Understanding Web Filter Rules , on page 885.
- Zone-based firewall rules—These rules replace access rules, inspection rules, and web filter rules on IOS devices if you want to configure your rules based on zones instead of interfaces. A zone is a defined group of interfaces that perform the same security role (such as Inside or Outside). By using zone rules, you can create more compact device configurations than you can by using the other types of rules. For more information, see Understanding the Zone-based Firewall Rules , on page 933.
- Botnet Traffic Filter Rules—These rules help you to spot botnet traffic when it is sent to known bad addresses. Botnets install malware on unsuspecting computers and use those computers as proxies to perform malicious actions. For more information, see Managing Firewall Botnet Traffic Filter Rules, on page 907.
- Transparent rules—These are Ethertype access control rules that apply to non-IP layer-2 traffic on transparent or bridged interfaces. For more information, see Configuring Transparent Firewall Rules , on page 1009.

Most firewall rules policies are configured in rules tables. These tables allow in-line editing for most cells, rule organization using sections, and the ability to change the order of rules. If you create shared rules policies, you can apply them to a number of devices, even to devices running different operating systems, and Security Manager automatically creates the appropriate device commands to configure the policies based on the characteristics of each individual device, filtering out settings that do not apply to a device. For more information on using rule tables, see Managing Your Rules Tables , on page 604.

Another powerful feature used by most firewall rules policies is the idea of inheritance. When you create shared policies, one of your options is to have a device inherit the policy rather than be assigned the policy. This allows you to have a set of shared rules that apply to all devices, while having unique rules that apply to only those devices that require them. For more information about inheritance, see the following topics:

- Understanding Rule Inheritance , on page 170
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203

The following topics provide additional overview information about firewall services policies:

- Understanding the Processing Order of Firewall Rules , on page 598
- Understanding How NAT Affects Firewall Rules , on page 599
- ACL Names Preserved by Security Manager , on page 600

Understanding the Processing Order of Firewall Rules

When you configure firewall rules policies, you should keep in mind the logical order in which the rules are processed. For example, if you plan to drop all traffic of a certain type in an access rule, there is no reason to create rules in other firewall policies that apply to that type of traffic, because they will never be triggered. Conversely, if you want to apply certain types of inspection or web filtering on traffic, you must ensure that your access rules first allow that traffic to enter the device.

Following is the general logical processing order of firewall rules:

- AAA rules—If you require authentication, with or without authorization, the user must successfully pass the test or the traffic is dropped.
- Access rules (In direction)—The traffic must then get through your access rules. If you used AAA rules, you might have allowed temporary per-user access rules to be configured for the user's session. These per-user rules are configured in your AAA server, not in Security Manager.

  On ASA 8.3+ devices, global access rules are then processed after any interface-specific access rules. For more information, see Understanding Global Access Rules , on page 719.
- Inspection rules (In direction), web filter rules (In direction), botnet rules, service policy rules (IPS, QoS, Connection)—All of these are applied to the traffic. For devices that do not allow you to configure the direction, all rules are considered to be in the In direction.
- Zone-based firewall rules—If you configured zone-based rules for an IOS device, these rules replace inspection and web filter rules (botnet rules do not apply to IOS devices).
- Routing protocols are then applied to the traffic. The traffic is dropped if it cannot be routed. (Routing policies are in the Platform folders for the various device types and are not considered firewall policies.)
- ScanSafe Web Security policies, Inspection rules (Out direction), web filter rules (Out direction)—For IOS devices only, if you created ScanSafe policies, or inspection or web filter rules in the Out direction, they are now applied.
- Access rules (Out direction)—Finally, the traffic must pass through any Out direction access rules.

Transparent rules do not fit into this picture. Because transparent rules apply to non-IP layer-2 traffic only, if a transparent rule applies to a packet, no other firewall rule applies to it; and conversely, if other rules apply, the transparent rule never applies.

Understanding How NAT Affects Firewall Rules

Devices that support firewall rules also allow you to configure network address translation (NAT). NAT substitutes the real address in a packet with a mapped address that is routable on the destination network.

If you configure NAT to occur on an interface, the firewall rules that are also configured on that interface should assess traffic based on the translated address rather than on the original (pre-NAT) address, with the exception of ASA 8.3+ devices.

Devices running ASA software release 8.3 and later use the original, or real, IP address when evaluating traffic with the exception of IPSec VPN traffic policies. Thus, when you configure firewall rules, ACL policy objects, or the IOS, QoS, and connection rules platform service policy, ensure that you use the original addresses.

For more information about NAT, see the following topics:

- ASA, PIX, FWSM devices— Understanding Network Address Translation , on page 1017.
- IOS devices— NAT Policies on Cisco IOS Routers , on page 1022.

ACL Names Preserved by Security Manager

Security Manager tries to preserve user-defined access control list (ACL) names as they appear in device configurations. Security Manager can preserve the ACL names configured on a device in the following circumstances:

- If the ACL name is specified in Security Manager.

For access rules policies, you can specify ACL names in **Firewall > Settings > Access Control** or **Firewall > Settings > IPv6 Access Control**. You can specify a given name for a single interface and direction, but the name is used for any other interfaces and directions that use the same ACL. Keep in mind that you cannot use the same name as an ACL policy object that you assign to other policies on the device, and you cannot use the same name for IPv4 and IPv6 ACLs.

Note Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

- If a policy uses an ACL policy object, the name of the policy object is used for the ACL name. ACL policy objects created during discovery use the name of the ACL defined on the device whenever possible. Behavior depends on an administrative setting:
  - If you select **Allow Device Override for Policy Objects** in **Tools > Security Manager Administration > Discovery**, if a policy object with the same name exists in Security Manager, but it has different content, the name is reused and a device-level override is created.
  - If you do not select that option, a new policy object is created with the same name but with a number appended to it, for example, ACLobject_1. This is the default behavior.
- If you select **Reuse Existing Names** for the **Firewall Access List Names** setting in **Tools > Security Manager Administration > Deployment**, names defined on the device are reused for firewall rules that generate ACLs.
- If the ACL is unshared, even if you change the content of the ACL in Security Manager.
- If the ACL is shared, but the policies that share the ACL are defined identically in Security Manager. If you change the content of the ACL, one ACL retains the name and the others are assigned generated names.

Note On ASA devices and on PIX devices not running version 6.3(x), Security Manager does not reuse the ACL name if it is used by a NAT policy static rule and contains an object-group. The ACL is deployed with the contents of the object-group defined as the source. This is because the device requires that all ACEs in the ACL have the same source.

Tips

- If you use an ACL policy object that uses a name also used by an ACL already defined on the device, and the existing ACL is for a command that Security Manager does not support, you will get a deployment error asking you to choose a different name. If this happens, rename the policy object.
- ACLs named <number>_<number> are not valid on IOS devices. Security Manager strips off the suffix prior to deployment. This also means that you cannot assign an IOS device more than one ACL object with the same numbered prefix. However, named ACLs that have a numbered suffix are allowed, for example, ACLname_1.
- Numbered ACLs must use the correct number ranges for IOS devices. Standard ACLs must be in the range 1-99 or 1300-1999. Extended ACLs must be in the range 100-199 or 2000-2699.
- ACL names for IOS devices cannot begin with an underscore (_).
- Policies that do not preserve user-defined names include SSL VPN policies, transparent firewall rules, and AAA rules (for IOS devices).

The following topics provide additional information about ACL naming:

- ACL Naming Conventions , on page 601
- Resolving User Defined ACL Policy Naming Conflicts, on page 603
- Resolving ACL Name Conflicts Between Policies , on page 603

ACL Naming Conventions

When the name for the ACL is generated by Security Manager, the name is derived from the type of rule or platform being defined and certain configuration settings that make it unique. All newly created ACLs are given a name based on the naming conventions shown in the following table.

Tip During deployment, sometimes a suffix *.n* (where n is an integer) might get added to an ACL name if the existing ACL cannot be edited in place. For example, if an ACL named acl_mdc_outside_10 already exists on the device, a new ACL with the name acl_mdc_outside_10.1 is created if you do not remove the old ACL before you deploy the new ACL.

Table 163: ACL Naming Conventions

Policy Type	Naming Convention
Access ACLs	• Inbound: CSM_FW_ACL_InterfaceName • Outbound: CSM_FW_ACL_OUT_InterfaceName

Policy Type	Naming Convention
IPv6 Access ACLs	• Inbound: CSM_IPV6_FW_ACL_InterfaceName • Outbound: CSM_IPV6_FW_ACL_OUT_InterfaceName **Note** Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.
Inspection Rules	• For ASA 7.0+/PIX 7.0+: CSM_CMAP_ACL_n where n is an integer beginning with 1. • For IOS devices, a numbered ACL.
NAT0 ACLs	• Inbound: CSM_nat0_InterfaceName_in • Outbound: CSM_nat0_InterfaceName
NAT ACLs	• Inbound: CSM_nat_InterfaceName_poolID_in • Outbound: CSM_nat_InterfaceName_poolID **Note** For PIX 6.3(x) devices, the following is added to the ACL name: add _dns for dns, _nrseq for norandomseq, _emb## for embryonic limit and _tcp## and _udp## for tcp and udp max connection limits.

NAT Policy Static Translation Rules ACLs	• For PIX 6.3(x) devices:
	  • For IP: CSM_static_globalIP_LocalInterfaceName_globalInterfaceName
	  • For other protocols: CSM_static_globalIP_LocalInterfaceName_globalInterfaceName_ protocol _globalPort
	• For devices running other OS versions, the localIP string is added:
	  • For IP: CSM_static_localIP_globalIP_LocalInterfaceName_globalInterfaceName
	  • For other protocols: CSM_static_localIP_globalIP_LocalInterfaceName_globalInterfaceName_ protocol _globalPort

Policy Type	Naming Convention
AAA ACLs	For PIX/ASA/FWSM: CSM_AAA_{AUTHO | ATHEN | ACCT}_InterfaceName _ServerGroupName Authentication Proxy for IOS devices: • On an interface without NAC: CSM_AUTH-PROXY_InterfaceName_traffic type_ACL, where InterfaceName is the interface in which the rule is applied and traffic type is HTTP, Telnet, or FTP. • AuthProxy and NAC on the same interface: CSM_ADMISSION_ID_ACL, where ID is an internal identifier of the interface role within Security Manager to which NAC is applied.
Web Filter Rules ACLs	For ASA 7.0+/PIX 7.0+: devices correspond to a filter command. For IOS devices, a numbered ACL.

Resolving User Defined ACL Policy Naming Conflicts

Cisco Security Manager generates ACL names that begin with “CSM_”. You should not use the same naming pattern while defining a ACL in the device. If you declare ACL names with the “CSM_” prefix on device, during discovering the device configuration in Cisco Security Manager, those ACL names are replaced with Security Manager generated names and respective configuration delta would be applied to a device on the next deployment.

For example, Cisco Security Manager has CSM_FW_ACL_InterfaceName as the ACL naming pattern for inbound firewall interface. Here, if you use the CSM pattern for ACL name declaration in device like, CSM_xyz, Security Manager renames it as “CSM_FW_ACL_InterfaceName”.

Note This rule is valid for firewall access list and delta would be generated and applied to a device even when the Reuse existing names setting is configured in Tools > Security Manager Administration > Deployment.

Resolving ACL Name Conflicts Between Policies

If an ACL is shared, but the policies that share the ACL are not defined identically in Security Manager, one policy uses the original name of the ACL and the other policies use a new name generated by Security Manager. The order of preference for determining which policy uses the original name is as follows:

- Access list ACLs
- AAA ACLs
- Static ACLs
- NAT0 ACLs
- NAT ACLs

For example, if an access ACL and a NAT0 ACL try to reuse the same ACL, the access ACL uses the original name as configured on the device and the NAT0 ACL is renamed by Security Manager.

Managing Your Rules Tables

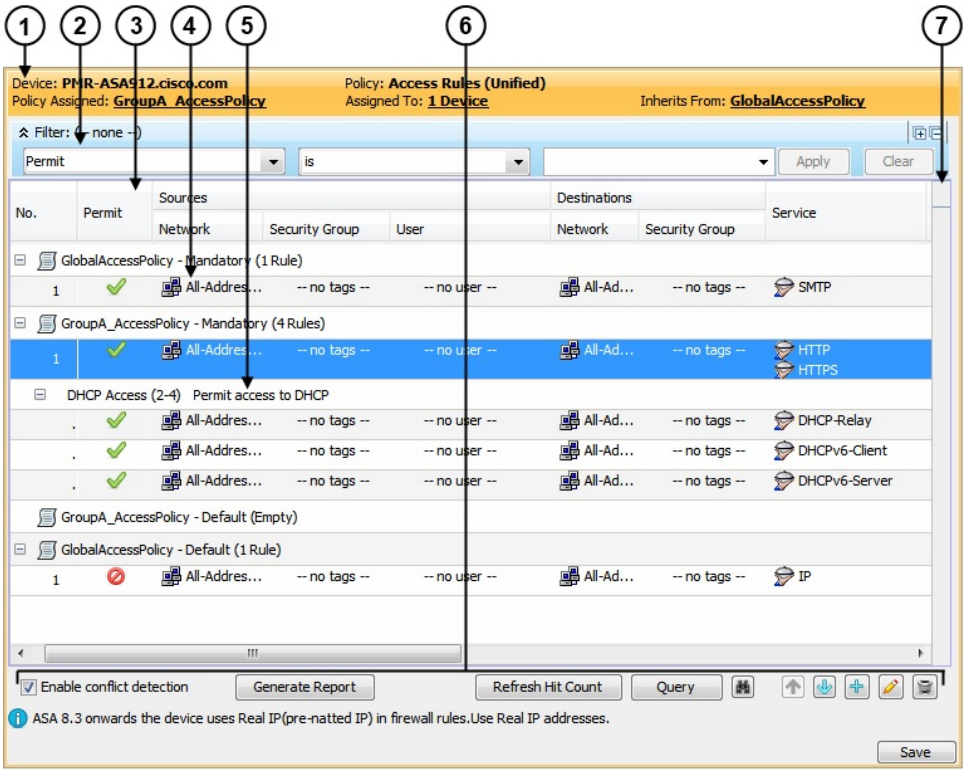
The following sections explain some of the basics of using rules tables, which appear in many of the firewall rules, NAT, and select other policies:

Using Rules Tables

Rules tables in Security Manager display sets of rules (for example, access rules) that make up a policy. These types of tables are used in only a select group of policies, but many of the firewall services rules policies use them. Rules tables are used when the order of the rules within the policy matter.

The below figure details the features in rules tables.

Figure 17: Rules Table Example



Following is an explanation of the numbered call-outs of the rules table features:

- **Device and policy identification banner (1)**—The banner provides information about policy sharing and inheritance and includes the ability to perform some actions. For detailed information, see Using the Policy Banner , on page 205.
- **Table filter (2)**—You can filter the rules displayed to help you find rules in a large table. For more information, see Filtering Tables , on page 50.
- **Table column headings (3)**—You can sort by column and move, show, and hide columns. For more information, see Table Columns and Column Heading Features , on page 51.
- **Rules, Workarea (4)**—The body of the table shows the rules that are included in the policy.
- **User-defined sections (5)**—You can group rules into sections for your convenience. For more information, see Using Sections to Organize Rules Tables , on page 618.
- **Table buttons (6)**—Use the buttons below the table to do the following:
  - Enable automatic conflict detection (Access Rules only). For more information, see Using Automatic Conflict Detection , on page 744.

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool.

When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

- Update the hit count information displayed in the table. For more information, see Viewing Hit Count Details , on page 753 and Hit Count Selection Summary Dialog Box , on page 737.
- Run a policy query, which can help you evaluate your rules and identify ineffective rules. See Generating Policy Query Reports , on page 627.
- Find and replace items within rules (button with the binoculars icon)—For more information, see Finding and Replacing Items in Rules Tables , on page 614.
- Move and rearrange rules (up and down arrows)—For more information, see Moving Rules and the Importance of Rule Order , on page 617.
- Add rules to the table (+ icon)—For more information, see Adding and Removing Rules , on page 606.
- Edit the selected rule (pencil icon)—For more information, see Editing Rules , on page 607.
- Delete the selected rule (trash can icon)—For more information, see Adding and Removing Rules , on page 606.
- **Conflict Navigation Bar (7)**—Use the Conflict navigation bar to navigate to conflicting rules in the rules table. For more information, see Using Automatic Conflict Detection , on page 744.

Adding and Removing Rules

When you work with policies that use rules tables, like many of the firewall rules policies, you can add rules to the policy using several methods:

- **Add Row** button (+ icon)—Clicking the Add Row button beneath the table is the standard method to add a new rule. Clicking this button opens the dialog box for adding rules that is specific to that type of policy. If you select a row or section heading, the new rule is added after the selected row. Otherwise, it is added at the end of the appropriate scope (typically, the local scope).
- Right-click a row and select **Add Row**—This is equivalent to selecting a row and clicking the Add Row button.
- Copy and paste—If you want to create a new rule that is similar to an existing rule, you can select the rule, right-click and select **Copy**, then select the row after which you want to place the rule, right-click and select **Paste**. This creates a duplicate rule, which you can select and edit (see Editing Rules , on page 607).
- Cut and paste—Cut and paste is similar to copy and paste, except you are deleting the existing rule when you select the **Cut** command. Instead of cut and paste, consider moving the rule (see Moving Rules and the Importance of Rule Order , on page 617).

When you no longer need a rule, you can remove it by selecting the rule and clicking the **Delete Row** button (trash can icon).

Tip Rather than deleting a rule, consider first disabling the rule. By disabling a rule, you remove it from the device (when you redeploy the configuration) without removing it from Security Manager. Then, if you discover that you really needed that rule after all, you can simply enable it and redeploy the configuration. If you delete the rule, you would have to recreate it (there is no undo function). Thus, you might want to develop a policy of deleting rules only after they have been disabled for a certain amount of time. For more information, see Enabling and Disabling Rules , on page 618.

Related Topics

- Using Rules Tables , on page 604
- Using Sections to Organize Rules Tables , on page 618

Editing Rules

To edit an existing rule in any of the rules policies that use rules tables, select the rule and click the **Edit Row** button, or right-click and select **Edit Row**. This allows you to edit all aspects of the selected rule.

Tip You cannot edit any aspect of an inherited rule from a local device rule policy. Edit inherited rules in Policy view.

For most rule tables, you can also edit specific attributes, or table cells, instead of editing the entire rule, using commands in the right-click menu.

The ability to edit a cell is limited by whether it makes sense to edit the content. For example, Inspection Rules have many limitations based on how the rule is configured:

- If you applied the rule to All Interfaces, you cannot edit source or destination addresses, the interface, or the direction of the rule.
- If you selected Default Inspection Traffic for the traffic match criteria (without selecting the option to limit inspection between source and destination), or Custom Destination Ports, you cannot edit source or destination addresses.
- If you selected Destination Address and Port (IOS), you cannot edit source addresses.

The following cell-level commands are available, although the ability to edit multiple rows is not supported in all policies that use rule tables:

- **Add <Attribute Type>**—When you select multiple rows and right-click a Source, User, Destination, Services, or Interface cell, you can select the Add command to append entries to the data currently in the selected cells. The Add command's full name includes the name of the attribute, for example, Add Source.
- **Edit <Attribute Type>**—Most attributes allow you to edit the content. Editing replaces the content of the cell. You can edit a single cell, or select multiple rows and edit the contents of the same type of cell in all rows at once. The Edit command's full name includes the name of the attribute, for example, Edit Interfaces.

- **Edit <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and edit just that entry. For example, if the Sources cell contains three network/host objects and an IP address, you can select any of them and edit the entry. The edit command includes the name of the entry, for example, Edit HostObject.
- **Remove <Entry>**—In some cases, when you edit Source, User, Destination, Services, or Interfaces, you can select an entry in the cell and remove the entry. You cannot remove the last entry in the cell, because the rule would become invalid. The remove command includes the name of the entry, for example, Remove IP.
- **Create <Object Type> Object from Cell Contents**—In the Sources, User, Destinations, and Services cells, you can select the Create command to create a policy object of the appropriate type. You can also select an entry in the cell and create a policy object from just the selected item. The create command includes the policy object type you can create, and the name of the item that is the source for the object, either cell contents for everything in the cell, or the name of an entry if you selected one. When creating network/host objects, you are always creating network/host group objects.
- **Show <Attribute Type> Contents; Show <Entry> Contents**—The show commands let you view the actual data defined in the cell. The results depend on the view you are in:
  - Device View, Map View, or Import Rules—You are shown the actual IP addresses, fully-qualified domain names (FQDNs), services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or FQDNs defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.

The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.

Service objects are sorted on protocol, source port, and destination port.

Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, "* (Ethernet1)" indicates that the Ethernet1 interface on the device is selected because it matches the * pattern (which matches all interfaces).

- Policy View—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

Adding or Editing Address Cells in Rules Tables

Use the Add or Edit Sources or Destinations dialog boxes, or Address dialog boxes for NAT tables, to edit the source or destination entry in a rules table that includes sources or destinations. For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

You can enter any combination of the following address types to define the source or destination of the traffic. The type of policy determines whether an IPv4 or IPv6 address is required; you cannot mix address types. You can enter more than one value by separating the items with commas. For more information, see Specifying IP Addresses During Policy Definition , on page 318.

- Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new objects from the selection list.

Note The only way to specify a fully-qualified domain name (FQDN) is to use an FQDN network/host object or a group object that includes an FQDN object. You cannot directly type in an FQDN. Not all policy types allow FQDN; you are prevented from specifying an object that contains an FQDN object if the policy does not allow it.

- Host IP address, for example, 10.10.10.100 (IPv4) or 2001:DB8::200C:417A (IPv6).
- IPv4 network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0.
- IPv6 network address and prefix length in the format 2001:DB8::/32.
- A range of IP addresses, for example, 10.10.10.100-10.10.10.200 (IPv4) or 2001:DB8::1-2001:DB8::100 (IPv6).
- (IPv4 only.) An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311).
- Interface roles object. Enter the name of the object or click **Select** to select it from a list (you must select Interface Role as the object type). When you use an interface role, the rule behaves as if you supplied the IPv4 or IPv6 address of the selected interface. This is useful for interfaces that get their address through DHCP, because you do not know what IP address will be assigned to the device. For more information, see Understanding Interface Role Objects , on page 303.

If you select an interface role as a source, the dialog box displays tabs to differentiate between hosts or networks and interface roles.

Navigation Path

Do any of the following in a rules policy that includes sources, destinations, or other address cells:

- Right-click an address cell in a rules table and select **Edit Sources** or **Edit Destinations** or a similar command. The data replaces the content of the selected cells.
- Select an entry in an address cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Sources or Destination cell, and select **Add Sources** or **Add Destinations**. The data is appended to the data already in the cell.

Adding or Editing User Cells in Rules Tables

Tip The user cell applies to ASA 8.4(2+) only. Anything configured in the cell is ignored for other device types or OS versions.

Use the Add or Edit Users dialog boxes to edit the user entry in a rules table that includes user identity groups. For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

You can enter any combination of the following to identify traffic based on Active Directory (AD) user or user group names. If you configure identity user groups, they apply to source traffic only. For traffic to match the rule, both the source addresses and identity user groups must match. That is, the rule applies to traffic sent from users on the specific networks or hosts defined in the source field when directed at the destination. For more information, see Configuring Identity-Based Firewall Rules , on page 659.

To make the rule apply to a user without regard for the source address, specify **any** in the source cell.

You can enter more than one value by separating the items with commas. Following are the supported formats:

- Identity user group objects.
- Individual users: NETBIOS_DOMAIN\user
- User groups (note the double \): NETBIOS_DOMAIN\\user_group

Click **Select** to select objects, users, or user groups from a list or to create new objects. For more information, see Selecting Identity Users in Policies , on page 658 and Creating Identity User Group Objects , on page 656.

Navigation Path

Do any of the following in a rules policy that includes user cells:

- Right-click a user cell in a rules table and select **Edit Users**. The data replaces the content of the selected cells.
- Select an entry in a user cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a user cell, and select **Add Users**. The data is appended to the data already in the cell.

Adding or Editing Services Cells in Rules Tables

Use the Edit Services dialog box to edit the services that define the type of traffic to act on. You can enter more than one value by separating the items with commas.

You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. You can also click **Select** to select the service from a list, or to create a new service.

For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.

For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

Navigation Path

Do any of the following in a rules policy that includes services:

- Right-click a Services cell in a rules table and select **Edit Services**. The data replaces the content of the selected cells.
- Select an entry in a Services cell and select **Edit <Entry>**. The data replaces the selected entry.
- Select multiple rules, right-click a Services cell, and select **Add Services**. The data is appended to the data already in the cell.

Tip For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

Adding or Editing Interfaces or Zones Cells in Rules Tables

Use the Add or Edit Interfaces (or Zones) dialog box to edit the interfaces or zones for which the rule is defined. For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

- When editing interfaces, you can enter any combination of specific interface names or interface roles. You can enter more than one value by separating the items with commas. Enter the names or click **Select** to select the interfaces and roles from a list, or to create new roles. An interface must already be defined to appear on the list.

When you deploy the policy to the device, interface roles are replaced by actual interface names, and only to interfaces that are actually configured on the device. To see which interfaces will actually be selected by a rule, right-click the Interfaces cell and select **Show Interfaces**.

- When editing zones, you can select only one interface role, and you cannot select individual interfaces. The interface roles are used to create zones for zone based firewall rules. To see the interfaces that will belong to the zone, right-click the Zones cell and select **Show Zone Contents**.

For more information about interface roles and selecting interfaces, see the following topics:

- Understanding Interface Role Objects , on page 303
- Specifying IP Addresses During Policy Definition , on page 318

Navigation Path

Do any of the following in a rules policy that includes interfaces or zones:

- Right-click an Interfaces or Zones cell in a rules table and select **Edit Interfaces**, **Edit Zones**, or similar command. The data replaces the content of the selected cells.
- Select an entry in an Interfaces cell and select **Edit <Entry>**. The data replaces the selected entry. You cannot edit an entry in a zone.
- Select multiple rules, right-click an Interfaces cell, and select **Add Interfaces**. The data is appended to the data already in the cell. You cannot add entries to a zone.

Editing Category Cells in Rules Tables

Use the Edit Category dialog box to change the category assigned to a rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241. For detailed information on editing firewall rules cells, see Editing Rules , on page 607.

Navigation Path

Right-click a Category cell in a rules policy that includes categories and select **Edit Category**.

Editing Description Cells in Rules Tables

Use the Edit Description dialog box to edit the description of the rule. The description helps you identify the purpose of a rule and can be up to 1024 characters. For detailed information on editing rules cells, see Editing Rules , on page 607.

Navigation Path

Right-click a Description cell in a rules policy that includes descriptions and select **Edit Description**.

Showing the Contents of Cells in Rules Tables

Use the Show Contents dialog boxes to display the actual, translated data defined in a source, user, destination, services, interfaces, zones, or other cell in a rules table that includes addresses, identity user groups, interfaces, services, or policy objects that define those things. The title of the dialog box indicates which cell or entry you are examining. Use this information to determine to which addresses, services, or interfaces the rule will actually apply when deployed to the device. For detailed information about editing or viewing cell contents, see Editing Rules , on page 607.

What you see in the dialog box depends on the view you are in:

- Device View, Map View—You are shown the actual IP addresses, users, services, or interfaces to which the rule will apply for the specific device. For example, if the rule uses network/host objects, you will see the specific IP addresses or fully-qualified domain names (FQDN) defined by the objects. If the rule uses interface objects, you will see the specific interfaces defined on the device that the object identifies, if any.
  - The IP addresses for network/host objects are sorted in ascending order on the IP address, and then descending order on the subnet mask.
  - Service objects are sorted on protocol, source port, and destination port.
  - Interface objects are listed in alphabetical order. If the interface is selected because it matches a pattern in an interface object, the pattern is listed first, and the matching interface is shown in parentheses. For example, "* (Ethernet1)" indicates that the Ethernet1 interface on the device is selected because it matches the * pattern (which matches all interfaces).
- Policy View—You are shown the patterns defined in the policy objects and entries defined for the policy. Entries are sorted alphabetically, with numbers and special characters coming first.

Filtering Contents

A List Filter field is provided above the results in the Show Contents dialog box. You can use the List Filter field to quickly locate any entries that contain a specified text string.

Figure 18: List Filter Field

1	Filter-parameters button.	2	Clear button.

To search for a specific text string in the Show Contents list:

- Click in the List Filter field to place the text cursor, and then begin typing.

These are "live filter" fields. That is, as you type each character, entries that do not include your current text string are removed from the list or table.

To clear a List Filter field:

- Click the clear button at the right side of the field.

This button appears when you begin typing in the field. (You also can highlight the characters and press the Delete or Backspace key on your keyboard.)

When you clear the List Filter field, all entries in the list are again displayed.

You can tune the filter results by selecting case sensitivity or insensitivity, by allowing wildcards or regular expressions, and by specifying where in a returned string your characters must be located.

To change the List Filter criteria:

1. Click the filter-parameters button (magnifying glass) at the left side of the List Filter field to open the parameters menu.
2. Choose an option.

The menu consists of three sections:

- **Case sensitive** and **Case insensitive** – Choose one or the other. If you choose **Case sensitive**, found text must match not only the characters you enter, but also their as-typed case.
- **Use wildcards** and **Use regular expression** – Choose one or the other. The following wildcards are recognized:
- ***** (asterisk) – Match zero or more characters at that location in the string.
- **+** (plus sign)– Match one or more characters at that location in the string.
- **?** (question mark) – Match one character at that location in the string.
- **Match from start**, **Match exactly**, and **Match anywhere** – Choose one. **Match from start** means that the string you enter must be found at the beginning of an entry, although it can be part of a larger set of characters. **Match exactly** requires that the string you enter exactly match the entire column entry. **Match anywhere** means the string can be found anywhere within an entry, and it can be part of a larger set of characters.
- Repeat Steps 1 and 2 to change another parameter.

Navigation Path

Do any of the following in a rules policy that includes sources, user, destinations, services, interfaces, zones, or other fields that specify networks, identity user groups, interfaces, or services. You can also show contents when using tools that work with rules, such as importing rules.

- Right-click one of those cells and select **Show <Attribute Type> Contents**, where the attribute type is the name of the cell. The data includes all entries defined in the cell.
- Right-click an entry in one of those cells and select **Show <Entry> Contents**, where the name of the selected entry is included in the command name. The data displayed is only for the selected entry.

Tip For inspection rules, services appear in the Traffic Match column and only for rules where the traffic matches source, destination, and port.

Finding and Replacing Items in Rules Tables

In policies that use rules tables, you can search for items in some cells and selectively replace them. The cells that you can search depend on the policy. You can use wildcard characters to find items based on pattern matching, for example, so that you can replace several related networks with a new network/host policy object defined for them.

To use find and replace, click the **Find and Replace** (binoculars icon) button at the bottom of any policy that uses rules tables to open the Find and Replace Dialog Box , on page 615. In the Firewall folder, this includes AAA rules, access rules, IPv6 access rules, inspection rules, zone based firewall rules, and web filter rules (for ASA/PIX/FWSM devices only). For ASA/PIX/FWSM devices, it also includes the NAT translation rules policy (but not for every combination of context and operational mode) and the IOS, QoS, and connection rules platform service policy.

When searching for items, you select the type of item, the columns you want to search, and enter the string that you want to find and optionally, the string you want to use to replace it. You can find and replace the following types of items:

- Network—A network/host object name, or the IP address of a host or network.
- User—An Active Directory (AD) username (NetBIOS_DOMAIN\user), user group name (NetBIOS_DOMAIN\\user_group), or identity user group object name.
- Service—A service object name or protocol and port, for example TCP/80. The search is syntactic, not semantic, that is, if you are searching for TCP/80 and a rule uses HTTP, the search results will not find it.
- Interface Role—An interface name or interface role object name.

Note In access rules, you can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name “Global,” you are actually creating an interface-specific access rule that uses a policy object named Global.

- Text—A text string in a Description field.

The following are some examples of what you might do with find and replace:

- If you create a new network/host object named network10.100 for all networks in the 10.100.0.0/16 range, you can search and replace all subordinate network specifications. For example, you can search for ^10.100* to find all addresses like 10.100.10.0/24. Select the **Find Whole Words Only** and **Allow Wildcard** options, and enter network10.100 as the replacement string. Because you selected Find Whole Words Only, the string that is replaced is the entire 10.100.10.0/24 string, not just the 10.100 portion.
- If you want to find all rules that use IP addresses (instead of network/host objects), you can search for *.*.*.* to find all host or network IP addresses. You can then selectively edit the cell while the Find and Replace dialog box is open.
- If you want to replace all interface role objects that include “side” in the name (such as inside and outside) with the interface role object named External, search for *side with the **Find Whole Words Only** and **Allow Wildcard** options selected, and enter External in the Replace field.

- Editing Rules , on page 607

Field Reference

Table 164: Find and Replace Page

Element	Description
Type	The type of item you are trying to find. Select the type, then select which columns you want to search. If you select All Columns, the columns searched are those also listed with the All Columns item (the search does not consider every column in the table). • Network—A network/host object name, or the IP address of a host or network. • User—An Active Directory (AD) username (NetBIOS_DOMAIN\user), user group name (NetBIOS_DOMAIN\\user_group), or identity user group object name. • Service—A service object name or protocol and port, for example TCP/80. The search is syntactic, not semantic, that is, if you are searching for TCP/80 and a rule uses HTTP, the search results will not find it. • Interface Role—An interface name or interface role object name. **Note** In access rules, you can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name "Global," you are actually creating an interface-specific access rule that uses a policy object named Global. • Text—A text string in a Description field.
Find	The string you are trying to locate. If you are searching for a policy object, click **Select** to choose the object from a list.
Replace	(Optional) The string you want to use to replace the search string. What gets replaced is controlled by the search options. If you want to replace the search string with the name of a policy object, click **Select** to choose the object from a list. You can replace search strings with multiple items. Separate the items with commas. For example, you can search for the TCP service and replace it with TCP, UDP. You can remove items by not entering anything in the Replace field and clicking the **Replace** button. This field is greyed out if the table does not allow editing.
Direction	The direction in which you want to search relative to the currently selected row or cell, either up or down. When the end of the table is reach, the search continues to the top of the table.
Match Case	For text searches, whether you want to match the capitalization you used in the Find field.

Element	Description
Find Whole Words Only	Whether the search should find and select only whole words, which are strings delimited by spaces or punctuation. For example, a whole word search for SanJose will find SanJose but not SanJose1. If you use this option with the Allow Wildcard option, you can search for partial strings but if you replace the located string, you replace the whole word and not the partial string. For example, you can search for ^10.100* to find all addresses like 10.100.10.0/24, and replace with them with the network10.100 policy object. By selecting Whole Words, the network/host object replaces the entire address, not just the portion you searched for. For text searches, this option and the Allow Wildcards option are mutually exclusive.
Allow Wildcards	Whether the search or replacement strings use wildcard characters. If you do not select this option, all characters are treated literally. You can use the Java regular expression syntax to create your expression with the following exceptions: • Period (.)—The period is a literal period and it is implicitly escaped. • Question mark (?)—The question mark indicates a single character. • Asterisk (*)—The asterisk matches one or more characters. It does not match zero characters. • Plus sign (+)—The plus sign means the same as the asterisk; it matches one or more characters.
Find Next button	Click this button to find the next occurrence of the search string.
Replace button	Click this button to replace the found string with the replacement string.
Replace All button	Click this button to automatically find the search string and replace it throughout the table.

Moving Rules and the Importance of Rule Order

Rules policies that use rules tables are ordered lists. That is, the top to bottom order of the rules matters and has an effect on the policy.

When the device analyzes a packet against a rules policy, the device searches the rules in order from top to bottom. The first rule that matches the packet is the rule that is applied to the packet, and all subsequent rules are ignored. Thus, if you place a general rule pertaining to IP traffic before a more specific rule pertaining to HTML traffic for a given source or destination, the more specific rule might never be applied.

For access control rules, you can use the automatic conflict detection tool to help identify when rule order will prevent a rule from ever being applied to traffic (for more information, see Using Automatic Conflict Detection , on page 744). For other rules policies, carefully inspect the table to spot problems with rule order.

When you find that you need to rearrange the order of a rule, select the rule that needs to be moved and click the **Up Row** (up arrow) or **Down Row** (down arrow) buttons as appropriate. If these buttons do not appear beneath the rules table, rule order does not matter and you cannot rearrange them.

If you use sections to organize your rules, you can move rules only within the section. When you move rules that are outside the sections, you can move them above or below the section. For more information about working with sections, see Using Sections to Organize Rules Tables , on page 618.

Tip Special rules apply to moving access rules when you mix interface-specific and global rules in a policy. For more information, see Understanding Global Access Rules , on page 719.

Enabling and Disabling Rules

You can enable and disable individual rules in a policy that uses rules tables, such as most firewall services rules policies. Your change takes effect when you redeploy the configuration to the device.

If a rule is disabled, it appears in the table overlain with hash marks. When you deploy the configuration, disabled rules are removed from the device.

Disabled rules are kept in the rules policy in Security Manager as a convenience so that you can easily enable needed rules without recreating them. Thus, it is often wise to disable a rule that you believe you no longer need instead of immediately deleting it.

To change whether a rule is enabled or disabled, select the rule, right-click and select **Enable** or **Disable**, as appropriate.

- Moving Rules and the Importance of Rule Order , on page 617
- Using Sections to Organize Rules Tables , on page 618

Using Sections to Organize Rules Tables

You can organize policies that use rules tables into sections. There are two types of sections:

- Scopes, which define inheritance relationships between a policy and an inherited policy. These sections are automatically created when you inherit policies. For more information, see Understanding Rule Inheritance , on page 170.

- User-defined sections, which are convenient groupings that help you organize rules so that you can evaluate and edit the policy more easily. These types of sections are most useful for policies that contain a large number of rules.

All rules within a section must be sequential; you cannot group rules randomly. If you want to identify non-contiguous rules as being related, you can assign the same category to the rules.

User-defined sections are set off visually from the other rules in the table by an indented section heading. The heading contains, left to right, a +/- icon for opening and closing the section, a band of color identifying the category you assigned the section (if any), the section name, the first and last rule number contained in the section (for example, 4-8), and the description, if any, you gave the section.

Note You might need to resize the rule number column to see the numbering of rules in sections.

Whether you create user-defined sections is completely up to you. If you decide creating these types of sections is worthwhile, the following information explains how to create and use them:

- To create a new section, right-click a row that you want to place the section and select **Include in New Section**. (You can also use Shift+click to select a block of rules.) You are prompted for a name, description, and category for the section (the name is the only required element).
- To move existing rules into a section, select one or more contiguous rules, right-click and select **Include in Section <name of section>**. This command appears only if the selected rows are next to an existing section. If the rows you want to add to a section are not currently next to the section, you can do one of two things: move the rules until they are next to the section; cut the rules and paste them into the section.
- You cannot move a section. Instead, you need to move the rules that are outside of the section around it. When you move a rule that is next to, but not within, a section, the rule jumps over the section.
- You cannot move a rule outside of or through a section. A section defines the borders within which you can move rules. If you want to move rules out of a section and back into the Local scope section, select one or more contiguous rules, right-click and select **Remove from Section <name of section>**. The rules must be at the beginning or end of the section to use this command. If they are not, you can either move the rules until they are, or use cut and paste to move them out of the section.
- To add a new rule to a section, select the rule after which you want to create the rule before clicking the Add Row button. To place it at the beginning of the section, select the section heading.

If you want to create a rule after, but outside of, a section, you can either create it as the last rule in the section and then remove it from the section, or create it just above the section and click the down arrow button.

- You can change the name, description, or category of a section by right-clicking the section heading and selecting **Edit Section**.
- When you delete a section, all rules contained in the section are retained and moved back into the Local scope section. No rules are deleted. To delete a section, right-click the section heading and select **Delete Section**.
- If you use the Combine Rules tool, the resulting combined rules respect your sections. Rules that are in a section can be combined only with other rules in that section.

Add and Edit Rule Section Dialog Boxes

Use the Add and Edit Rule Section dialog boxes to add or edit a user-defined section heading in a rules table. For detailed information about how to use sections to organize a rules table, see Using Sections to Organize Rules Tables , on page 618.

Navigation Path

Do one of the following:

- Select one or more rules in a rules table, right-click and select **Include in New Section**.
- Right-click a section heading and select **Edit Section**.

Field Reference

Table 165: Add and Edit Rule Section Dialog Boxes

Element	Description
Name	The name of the section.
Description	A description for the section, up to 1024 characters.
Category	The category assigned to the section. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Combining Rules

Access rules and AAA rules policies can grow over time to include a large number of rules. The size of these policies can make it difficult to manage them. To alleviate this problem, you can use the rule combiner tool to reduce the number of rules in a policy without changing how the policy handles traffic.

Tip Combining rules can dramatically compress the number of access rules required to implement a particular security policy. For example, a policy that required 3,300 access rules might only require 40 rules after hosts and services are efficiently grouped. However, you cannot use the rule combiner with IPv6 access rules or with rules that specify users or user groups, either directly or with identity user group objects. You can use the tool with rules that use FQDN network/host objects.

You might have several rules that allow a specific range of services to various trusted hosts (as sources) to various public servers (as destinations). If you have 10 rules applying to this situation, it is possible that those 10 rules can be combined into a single rule. You could then create new policy objects for the collection of services (for example, AllowedServices), hosts (for example, TrustedHosts), and servers (for example, PublicServers). To create the new objects during rule combination, you can right-click the newly-combined cells and select **Create Network (or Service) Object from Cell Contents**.

For example, you might have two rules for interface FastEthernet0:

- Permit TCP for source 10.100.10.1 to destination 10.100.12.1
- Permit TCP for source 10.100.10.1 to destination 10.100.13.1

These can be combined into a single rule: permit TCP for source 10.100.10.1 to destination 10.100.12.1, 10.100.13.1.

Multidimensional sorting is used to combine rules. For example, for access rules:

1. Rules are sorted by their sources, so rules with the same source are placed together.
2. Same-source rules are sorted by destination, so rules with the same source and destination are placed together.
3. Same-source and same-destination rules are combined into a single rule, and the services are concatenated.
4. Adjacent rules are checked to see if they have the same source and service. If so, they are combined into a single rule, and the destinations are concatenated.
5. Adjacent rules are checked to see if they have the same destination and service. If so, they are combined into a single rule, and the sources are concatenated.

Sorting is repeated based on destination and service in place of source.

Tip Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see Understanding Global Access Rules , on page 719.

Related Topics

- Managing Firewall AAA Rules, on page 685
- Managing Firewall Access Rules, on page 717

Step 1 Select the policy whose rules you want to combine from the **Firewall** folder. You can combine rules for the following types of policy:

- AAA rules
- Access rules

Step 2 If you want the tool to limit possible combinations to a specific group of rules, select them. You can select rules using Shift+click and Ctrl+click, select all rules in a section by selecting the section heading, or all rules within a scope by selecting the scope heading (for example, Local). To not limit the tool, do not select anything in the table. Keep the following in mind:

- In Device view, you can save combinations only for local rules. The tool will allow you to run it on shared and inherited rules, but you cannot save the results. If you do not select any rules, the default is to consider all local scope rules.
- To combine rules in shared policies, you must run the tool in Policy view. If you do not select any rules, the default is to consider all mandatory rules.

You are warned if you try to run the tool when you cannot save the results.

Step 3 Right-click anywhere in the rules table and choose **Combine Rules** to open the Combine Rules Selection Summary Dialog Box , on page 622. If you have selected specific rules for which to limit combining, make sure you right-click on one of the selected rules or the rules will be deselected.

Step 4 Select the columns you want the rule to consider combining. If you do not select certain columns, the combined rules must have the identical settings in those columns to be combined.

You can also elect to consider combining the rules you selected or all rules within the policy.

Tip If a column type is not listed, then combined rules must have the identical content in those cells except for the Description cell. Rules that have different content for the cells are not combined.

Step 5 Click **OK** to generate the combination and display the results in the Rule Combiner Results Dialog Box.

Analyze the results and evaluate whether you want to save the combinations. You must save all or none, you cannot pick and choose which combinations to save.

For more information on evaluating the results, see Interpreting Rule Combiner Results , on page 623. For an example, see Example Rule Combiner Results , on page 625.

Step 6 Click **OK** to replace the original rules in the rules tables with the combined rules.

Combine Rules Selection Summary Dialog Box

Use the Combine Rules Selection Summary dialog box to define the parameters used for combining rules in firewall rules policies. When you click **OK**, the combination results are displayed in the Rule Combiner Results Dialog Box, where you can choose to save or discard the results as explained in Interpreting Rule Combiner Results , on page 623.

Navigation Path

You can combine rules from the AAA Rules Page , on page 693 and the Access Rules Page , on page 726. Click **Tools** located at the bottom of the tables and select **Combine Rules**.

Field Reference

Table 166: Combine Rules Selection Summary Dialog Box

Element	Description
Policy Selected	Shows the policy selected and the scope. Local indicates the local device rules. Otherwise, the field indicates the name of the shared policy and the scope selected within the policy, if any.

Element	Description
Rules to be combined	The rules you want the tool to consider combining: • All Rules—Consider combining all rules within the selected policy. • Selected Rules—Consider combining only those rules you selected in the policy before starting the tool. For detailed information on selecting rules before running the tool, see Combining Rules , on page 620.

Choose which columns to combine	The columns in the rules table that can be combined. Any columns that you do not select must have the identical content for two rules to be combined (even those not listed as combinable, except for the Description column). The columns you can combine are:
	• Source
	• User
	• Destination
	• Service
	• Interface
	• Security Sources
	• Security Destinations
	• For AAA rules, these additional columns:
	  • Action
	  • Auth Proxy

Interpreting Rule Combiner Results

Use the Rule Combiner Results dialog box to evaluate the results of a rule combination (see Combining Rules , on page 620). The dialog box includes a summary of the results, and shows the new rules that will be created if you click **OK**.

Changed rule cells are outlined in red. Select a combined rule in the upper table to see the rules in the lower table that were combined to create the rule.

You can refine some elements of the results in this window:

- You can right-click on the Source, Destination, and Service cells with multiple elements and select **Create Network (or Service) Object from Cell Contents** to create a new policy object that contains the contents of the combined cell. The new object replaces the contents of the cell.

You can also automatically create network object groups in the deployed configuration to replace the comma-separated values in a rule table cell. The network objects are created during deployment, and they do not affect the content of your rules policy. To enable this option, select **Tools > Security Manager**

Administration > Deployment to open the Deployment Page , on page 524 and select **Create Object Groups for Multiple Sources, Destinations, or Services in a Rule**.

- You can right-click on Description and select **Edit Description** to change the description. The descriptions of combined rules are a concatenation of the descriptions of the old rules separated by new lines.

For an example, see Example Rule Combiner Results , on page 625.

Tips

- The combined results are not applied to the policy until you click **OK**. If you do not like the results of the combination, click **Cancel** and consider selecting smaller groups of rules to limit the scope of the Combine Rules tool.

If you click **OK** but then decide you do not want to accept the changes, you have two options. First, make sure you do not click **Save** on the policy page, select a different policy, and click **No** when prompted to save your changes to the policy. If you already clicked **Save**, you can still back out the changes by discarding your activity or configuration session (for example, **File > Discard** in non-Workflow mode), but this also discards any other changes you have made to other policies. Once you submit your changes or your activity is approved, you cannot undo your changes.

- You are allowed to run the Combine Rules tool even if you are combining rules for a policy that you are not allowed to save. For example, you cannot save combined rules for a shared or inherited policy in Device view. You are warned before running the tool if you will not be allowed to save the results.
- Rules from different sections are never combined. Any sections you create to organize rules limit the scope of the possible combinations. Also, interface-specific and global access rules are never combined. For more information about global rules, see Understanding Global Access Rules , on page 719.

Navigation Path

You can combine rules from the AAA Rules Page , on page 693 and the Access Rules Page , on page 726. Click **Tools** located at the bottom of the tables and select **Combine Rules**, fill in the Combine Rules Selection Summary Dialog Box , on page 622 and click **OK**.

Field Reference

Table 167: Combined Rules Results Summary

Element	Description
Result Summary	Provides a summary of the results of the combination and indicates the number of original rules, the number of rules remaining after the combination, and the number of changed and unchanged rules, if any combinations could be made.

Element	Description
Resulting Rules table	The rules that will replace the rules currently in the policy. If you click **OK**, these rules become part of your policy. The columns are the same as those in the associated policy (see AAA Rules Page , on page 693 or Access Rules Page , on page 726), with the addition of the Rule State column. The Rule State column shows the status of the rule: • Modified, Combined—The new rule is the result of combining one or more rules or modifying an existing rule. A red box around a cell indicates cells that have combined contents. • Unchanged—The rule remains unchanged, as it could not be combined with any other rule. • Not Selected—You did not select the rule for possible combination. If there are a large number of rules, you can use the buttons beneath the table to scroll through the rules that have changes. Unchanged and unselected rules are skipped.
Original rules table (lower table)	The table in the lower half of the dialog box shows the original rules that were combined to create the rule you select in the upper table.
Detail Report button	Click this button to create an HTML report of the results. The report summarizes the results and also provides the details about the resulting rules and the rules that were combined to create the new rule. For combined rules that have a lot of entries in cells, this report makes it easier to read the results. You can also print or save the report for later use.

Example Rule Combiner Results

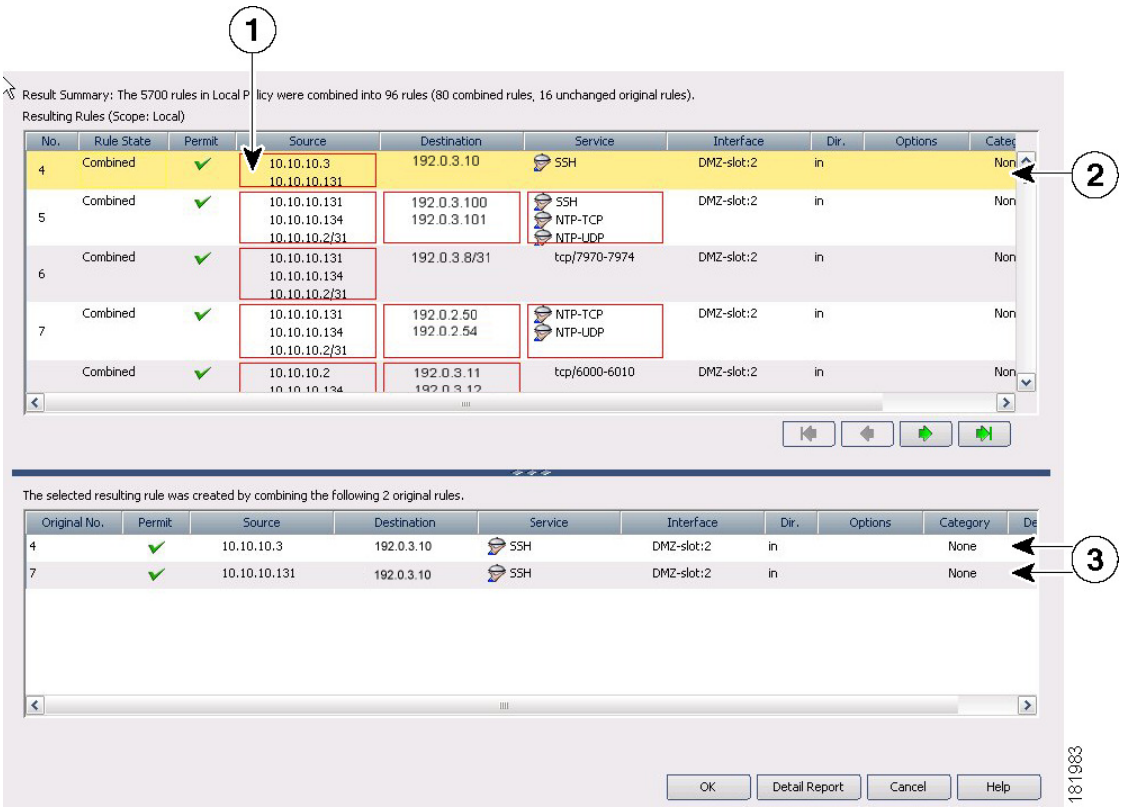
When you run the Combine Rules tool as described in Combining Rules , on page 620, the results of the combination are displayed in the Rule Combiner Results Dialog Box (see Interpreting Rule Combiner Results , on page 623).

The below figure shows an example of a rule combination.

The new rules are shown in the upper table. Any new rules are indicated as modified or combined rules, and the changed cells are outlined in red. When you select a new rule in the upper table, the lower table shows the old rules that were combined to create the new rule. In this example, the two old rules had the same destination, service, and interface, and the two distinct sources were concatenated to form the new rule.

The top of the report summarizes the results. In this example, 5700 rules were reduced to 96 rules.

Figure 19: Example of Rule Combiner Results



1	Combined cell	3	Original rules
2	Newly combined rule

- Managing Firewall Access Rules, on page 717

Converting IPv4 Rules to Unified Rules

Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were combined or unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the AAA-, access- and inspection-rule policy types are provided.

A utility to convert separate IPv4 and IPv6 firewall rules to “unified” rules is provided with Security Manager 4.4 for use when you upgrade an ASA from an earlier version to 9.0 or later.

Navigation Path

To access the firewall-rule unification utility:

- (Policy view) Select the firewall IPv4 rule type from the Policy Type selector and then right-click the desired policy in the Policies pane; choose **Convert to** <*rule-type* > Rules (Unified).

Related Topics

- AAA Rules Page , on page 693
- Access Rules Page , on page 726
- Inspection Rules Page , on page 774

Open the utility as described above; in the Convert Policy dialog box, provide a name for the new unified policy and click OK.

Following processing, the new unified rules policy is displayed. You can now assign this policy to ASA 9.0+ devices.

Generating Policy Query Reports

For most of the firewall rules policies, you can generate policy query reports that can help you evaluate your rules. With policy query reports, you can determine what rules already exist for a particular source, user, destination, interface, service, or zone before creating new rules to apply to those items.

To a limited degree, you can also determine if there are some blocking rules that prevent a rule from being used, or redundant rules that you can delete. If you are evaluating access rules, however, it is better to use the more powerful rule analysis tool to determine these problems.

When you create a policy query, you describe the traffic that interests you, much the same way you describe traffic when creating a rule. Creating a query is essentially the same as creating a rule, but you might want to describe the rule more broadly to capture a wider set of traffic so you can see a set of related rules rather than a single rule or a limited number of rules. The query you create depends on the information you are trying to discover.

The possible extent of a query depends on the view you are in:

- Device or Map view—The query is limited to the selected device. However, you can query across all supported rule types. This allows you to compare different types of rules that apply to the same traffic.
- Policy view—The query is limited to the selected policy. You see only rules that are defined in that policy, and you cannot query other types of policies. If you want to query a shared policy while examining other policies, select a device that is assigned to the shared policy, and query the policy from the device in Device view.

Related Topics

- AAA Rules Page , on page 693
- Access Rules Page , on page 726
- Inspection Rules Page , on page 774
- Inspection Rules Page , on page 774

- Zone-based Firewall Rules Page , on page 989

Step 1 Select the policy that you want to query from the **Firewall** folder. You can query any of the following types of policy:

- AAA Rules
- Access Rules
- Inspection Rules
- Web Filter Rules (PIX/ASA/FWSM)
- Zone Based Rules

Step 2 Click the **Query** button located below the table to open the Querying Device or Policy dialog box.

Step 3 Enter the parameters that define the rules you want to query. When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both. For detailed information about the query parameters, see Querying Device or Policy Dialog Box , on page 628.

In Policy view, you cannot change the type of rule you are querying. In Device view, you can query any combination of rule types.

Step 4 Click **OK** to view the rules that match the criteria in the Policy Query Results dialog box. For information on reading the report, see Interpreting Policy Query Results , on page 631.

For an example of a policy query report, see Example Policy Query Result , on page 633.

Querying Device or Policy Dialog Box

Use the Querying Device or Querying Policy dialog box to set up the parameters for a query. The query results show the rules that match your parameters. The title of the dialog box indicates what you are querying:

- In Device or Map view, you are querying rules defined for the selected device.
- In Policy view, you are querying rules within the selected policy only.

You can query rules from these types of policies: AAA rules, access rules, inspection rules, web filter rules for ASA/PIX/FWSM, and zone based firewall rules.

When setting up your query, you must select at least one rule type; enabled, disabled or both; permitted, denied, or both; and mandatory, default, or both.

Note For inspection rules, if you enter Global as the interface value, the match status results will be shown as a partial match even if the match is complete.

Results are displayed in the Policy Query Results dialog box (see Interpreting Policy Query Results , on page 631).

Navigation Path

To generate Policy Query reports, do one of the following:

- (Device view) Select a device, then select one of the supported firewall rules policies from the Firewall folder, and then click the **Query** button located below the table.
- (Policy view) Select any of the supported firewall rules policies from the Firewall folder, then select a specific policy from the Shared Policy selector, and then click the **Query** button located below the table.
- (Map view) Right-click a device and select a supported firewall rules policy from the Edit Firewall Policies menu. Click the **Query** button.

Field Reference

Table 168: Querying Device or Policy Dialog Box

Element	Description
Rule Types	The type of rules you want to query. When querying in Policy view, you cannot change the selection. When querying in Device view, you can select any of the following types of rules; the scope of the query is limited to the selected device: • AAA Rules • Access Rules • Inspection Rules • Web Filter Rules • Zone Based Rules
Enabled and/or Disabled Rules	Whether you want to query enabled or disabled rules, or both.
Mandatory and/or Default Rules	Whether you want to query rules that are in the mandatory or default sections, or both.
Match	Whether you want to query rules that permit or deny traffic, or both.

Element	Description
Sources Destinations	The source or destination of the traffic. You can enter more than one value by separating the items with commas. **Note** If you leave a field blank, the query matches any address for that field. You can enter any combination of the following address types to define the source or destination of the traffic. For more information, see Specifying IP Addresses During Policy Definition , on page 318. • Network/host object. Enter the name of the object or click **Select** to select it from a list. You can also create new network/host objects from the selection list. • Host IP address, for example, 10.10.10.100. • Network address, including subnet mask, in either the format 10.10.10.0/24 or 10.10.10.0/255.255.255.0. • A range of IP addresses, for example, 10.10.10.100-10.10.10.200. • An IP address pattern in the format 10.10.0.10/255.255.0.255, where the mask is a discontiguous bit mask (see Contiguous and Discontiguous Network Masks for IPv4 Addresses , on page 311). **Tip** You can create an object with a list of the IP addresses to facilitate future policy query requests.
User	(ASA 8.4(2+) only.) The Active Directory (AD) usernames, user groups, or identity user group objects for the rule, if any. You can enter more than one value by separating the items with commas. **Note** If you leave a field blank, the query matches only those rules that have nothing in the User field. You can enter any combination of the following values. • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. Click **Select** to select objects, users, or user groups from a list or to create new objects. For more information, see: • Selecting Identity Users in Policies , on page 658 • Configuring Identity-Based Firewall Rules , on page 659 • Creating Identity User Group Objects , on page 656

Element	Description
Services	The services that define the type of traffic that is acted on. You can enter more than one value by separating the items with commas. **Note** If you leave the field blank, the query matches any service. You can enter any combination of service objects and service types (which are typically a protocol and port combination). If you type in a service, you are prompted as you type with valid values. You can select a value from the list and press Enter or Tab. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331 **Tip** You can create an object with a list of the services to facilitate future policy query requests.
Interfaces	The interfaces for which the rule is defined. You can enter any combination of interface or interface role names, separated by commas. Enter the name or click **Select** to select the interface or interface role. **Note** If you leave the field blank, the query matches any interface or interface role.
Query for Global Rules	Whether the query should also consider global rules when querying access rules or inspection rules.
From Zone To Zone	For zone based firewall rules, the zones defined for the rule. Enter the zone names (which are interface roles), or click **Select** to select them from a list.
Actions	For zone based firewall rules, the actions defined for the rule.
Check if Matching Rules Are Shadowed by Rules Above	Whether to have the policy query results include rule conflict detection information. Selecting this option might have an impact on performance and cost results.

Interpreting Policy Query Results

Use the Policy Query Results dialog box to view the results of a policy query that you defined on the Query Device or Policy dialog box. The results report opens after you define your query parameters on the Querying Device or Policy Dialog Box , on page 628 and click **OK**. For the procedure, see Generating Policy Query Reports , on page 627. To see an example report, see Example Policy Query Result , on page 633.

Tip In the query results table, you can double-click a row, or right-click and select **Go to Rule**, to select the rule in the rules policy page, where you can edit the rule. If the appropriate rules policy is not already selected in the policy selector, you might have to do this twice to actually select the rule.

To read the report, consider the following report sections:

- **Query Parameters**—The top portion of the report specifies the parameters you entered for the query. If you want to change them, click **Edit Query** to open the Querying Device or Policy Dialog Box , on page 628, where you can make your changes and regenerate the report.

- **Results Table**—This table lists all rules that match your query. If you queried more than one type of rule, select the rule type you want to examine in the **Display** field. The columns in the table are the same as those for that type of rule, except for the following:
  - Match Status—Indicates how the rule matches your query:

Complete Match—The rule matches all query parameters.

Partial Match—All of the search criteria overlap or are a superset of the matched rule. For example, if you have a rule defined with a source address of 10.100.20.0/24, a destination address of 10.200.100.0/24 and a service of IP, and your query is to search for a source of 10.100.20.0/24, the match status is shown as a partial match because the query results represent only a portion of the rule's definition.

No Effect—Rules are blocked by other matching rules, or a conflict exists that has no effect. For example, you might have two matching rules, A and B. If rule A's source address, destination address, and services are equivalent to, or contain, those of rule B, rule B is blocked by rule A. Thus, rule B will have no effect on traffic.

In another example, you might have a global mandatory rule that permits a service, but a rule at the device (local) level denies the service. Because rules are recognized on a first-match basis, after discovering a match at the mandatory global scope, no other rules are checked. The local rule has no effect; the service is permitted, not denied. You should edit your policies to ensure you get the desired results.

- Scope—Identifies whether a rule is shared or local, mandatory or default.

- **Details Table**—The details table shows the detailed query match information for the rule selected in the results table. The folders on the left represent the attributes for which you can see detailed information. Select a folder to view the details.

The details show the query value, which is the parameter you defined, and the item in the rule that matches the parameter. The matching relationship is one of the following:

- Identical—The parameter is identical to the value in the rule.
- Contains—The parameter is a superset that contains the value in the rule. For example, the query parameter might have been a network/host object, and the rule used an IP address that was part of the object definition.
- Is contained by—The parameter is a subset nested within the value of the rule.
- Overlaps—The query parameter shows results that overlap between more than one policy object used in the rule. For example, the service query parameter was tcp/70-90 and the results show a service defined as tcp/80-100.

Example Policy Query Result

The below figure shows an example of a policy query report on access rules. The criteria does not limit source, destination, service, and interface parameters, but limits the query to enabled rules. Both shared and local rules are included.

The Query Parameters section shows the query criteria for the report. In this example, the first row in the results table is selected, and the detailed information for that rule is shown in the details table in the bottom half of the window. In this example, the source folder is selected in the details table, and the result shows that the rule value, **any**, is an identical match to the query parameter *****, which is equivalent to any source address.

For detailed information on reading the report, see Interpreting Policy Query Results , on page 631.

Optimizing Network Object Groups When Deploying Firewall Rules

When you deploy firewall rules policies to an ASA, PIX, FWSM, or IOS 12.4(20)T+ device, you can configure Security Manager to evaluate and optimize the network/host policy objects that you use in the rules when it creates the associated network object groups on the device. Optimization merges adjacent networks and removes redundant network entries. This reduces the runtime access list data structures and the size of the configuration, which can be beneficial to some FWSM and PIX devices that are memory-constrained.

For example, consider a network/host object named **test** that contains the following entries and that is used in an access rule:

```
192.168.1.0/24
192.168.1.23
10.1.1.0
10.1.1.1
10.1.1.2/31
```

If you enable optimization, when you deploy the policy, the resulting object group configuration is generated. Note that the description indicates the group was optimized:

```
object-group network test
 description (Optimized by CS-Manager)
 network-object 10.1.1.0 255.255.255.252
 network-object 192.168.1.0 255.255.255.0
```

If you do not enable optimization, the group configuration would be as follows:

```
object-group network test
 network-object 192.168.1.0 255.255.255.0
 network-object 192.168.1.23 255.255.255.255
 network-object 10.1.1.0 255.255.255.255
 network-object 10.1.1.1 255.255.255.255
 network-object 10.1.1.2 255.255.255.254
```

This optimization does not change the definition of the network/host object, nor does it create a new network/host policy object. If you rediscover policies on the device, the existing unchanged policy object is used.

Note If a network/host object contains another network/host object, the objects are not combined. Instead, each network/host object is optimized separately. Also, Security Manager cannot optimize network/host objects that use discontiguous subnet masks.

To configure optimization, select the **Optimize Network Object-Groups During Deployment** option on the Deployment Page , on page 524 (select **Tools > Security Manager Administration** and select **Deployment** from the table of contents). The default is to not optimize network object groups during deployment.

Note

if you have upgraded to CSM 4.19 without configuring CSM 4.17 SP1 and CSM 4.18, the deployment of a firewall that has an object-group service fails for the following objects:

- service-object gre
- service-object 41
- service-object ah

You must execute the following SQL queries on the DB side of the CSM server to avoid the deployment failure.

```
$SIG{INT} = 'IGNORE';
use CRM;
use DBI;
use lib "$ENV{NMSROOT}/lib/perl/install";
use InstallUtility;
require "$ENV{NMSROOT}/cgi-bin/dbadmin/pdbadmin/dbAdminCommon.pl";
my $DROP_CONNECTION_FLAG = false;

checkDMisRunning();
&resolveGreSubTypeEntries();

sub checkDMisRunning
{
 my $d = '\\';
    my ($rc, $dmIsRunning, $line, @lines);
    $rc = open IN, "$ENV{NMSROOT}${d}bin${d}pdshow 2>&1 |";
    if (!$rc)
    {
        print "ERROR: *** Could not execute pdshow ***\n";
        print "ERROR: *** probable cause: daemon manger is corrupted ***";
        exit(-1);
    }

    @lines = <IN>;

    $dmIsRunning = 1;
    for $line (@lines)
    {

        if ($line =~ m/ERROR:\s+connect\s+to\s+dmgtd.*on\s+port\s+.+failed:/)
        {
   $dmIsRunning = 0;
             last;
        }
 }
    close IN;

    if ($dmIsRunning)
    {
        print "Daemon manager is  running ..\n";
     }
 else
 {
     print "Daemon manager is not running ..\n";
  print "Deamon manager should be running to execute this file\n";
  exit(-1);
  }
}

sub resolveGreSubTypeEntries
```

```
{

  $dsn="vms";
  $node_dbh = &dbinternal::connect("dsn=$dsn");

  if ($node_dbh)
  {
   print "\n*****************************************\n";
   print "\nScript Execution Starts \n" ;
   print "\n*****************************************\n";
   my $select_query = "select count(*) from BB_MAIN where OBJECTID =1106 and name='gre' and
 subtype!='SO'";
   my $select_query_prep = $node_dbh->prepare($select_query) || die "Error preparing query"
 . $node_dbh->errstr;
   $select_query_prep->execute || die "Error executing query" . $select_query_prep->errstr;

   my @node_results;
      $impactedcount = 0;
   while (@node_results = $select_query_prep->fetchrow_array())
   {
         my $size = @node_results;
      for (my $j=0; $j < $size; $j++)
        {
     $impactedcount = $node_results[$j];
           }
      }
   if($impactedcount > 0){
       my $updateQuery = "update BB_MAIN set subtype='SO' where OBJECTID=1106";
       my $prep = $node_dbh->prepare($updateQuery) || die "Error preparing query" .
$node_dbh->errstr;
       $prep->execute || die "Error executing query" . $prep->errstr;
   }
   print "\n*****************************************\n";
   print "\nScript Execution Completed! \n" ;
   print "\n*****************************************\n";
     }

  return 0;

}
```

Copy the script into ~CSCOpx/bin directory and execute the following command:

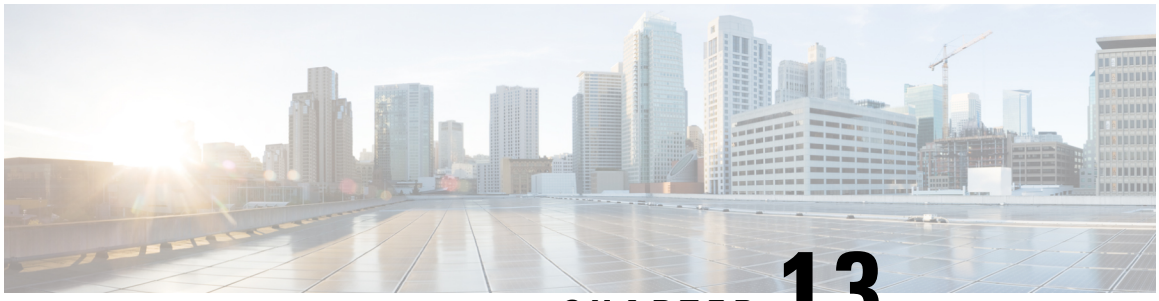
```
C:\PROGRA~2\CSCOpx\bin\perl
C:\PROGRA~2\CSCOpx\bin\resolveDBEntriesCSCvj54910.pl#!/usr/bin/perl
```

Expanding Object Groups During Discovery

When you discover policies from a device that uses object groups, you can elect to have those object groups expanded into the items they contain rather than create policy objects from the group.

For example, if an object group named CSM_INLINE_55 contains the hosts 10.100.10.15, 10.100.10.18, and 10.100.10.25, importing an access control list by expanding the objects will create a rule that includes all three addresses in the source (or destination, as appropriate) cell rather than a network/host policy object named CSM_INLINE_55.

To configure expansion, you must have a naming scheme for your object groups that allows you to identify the prefix of groups that you want to expand. The default is to expand any object group that starts with the prefix CSM_INLINE. Configure these prefixes in the **Auto-Expand Object Groups with These Prefixes** field on the Discovery Page , on page 536 by selecting **Tools > Security Manager Administration** and selecting **Discovery** from the table of contents.



CHAPTER 13

Managing Identity-Aware Firewall Policies

Identity-aware firewall policies allow you to control traffic based on user identity or a host's fully-qualified domain name. For example, you can selectively allow a specific type of traffic for one user group while disallowing it for another user group, instead of allowing or disallowing all of that traffic. With fully-qualified domain names, you could disallow HTTP access to a specific server while allowing HTTP traffic to all other servers.

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. This chapter explains identity-aware firewall policies and how to implement them in the various policies that support identity awareness.

This chapter contains the following topics:

Overview of Identity-Aware Firewall Policies

In traditional firewall policies, decisions are made based on source and destination IP addresses, ports, and services. The Identity Firewall in the ASA provides more granular control based on either or both of the following:

- User identity—You can configure access rules and security policies based on user names and user group names rather than through source IP addresses alone. The ASA applies the security policies based on an association of IP addresses to Windows Active Directory login information and reports events based on the mapped user names instead of network IP addresses.

The Identity Firewall integrates with Microsoft Active Directory in conjunction with an external Active Directory (AD) agent that provides the actual identity mapping. The ASA uses Windows Active Directory as the source to retrieve the current user identity information for specific IP addresses and allows transparent authentication for Active Directory users. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com at http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html.

- FQDN network objects—You can use a host's fully-qualified domain name (FQDN) in a rule instead of its IP address. Thus, if the host's address changes (for example, because it acquires the address through DHCP), the rule will still apply.

Identity-based firewall services enhance the existing access control and security policy mechanisms by allowing users or groups to be specified as sources, and FQDNs in place of source or destination IP addresses. Identity-based security policies can be interleaved without restriction between traditional IP address based rules.

The key benefits of the Identity Firewall include:

- Decoupling network topology from security policies. The rules will apply to a user regardless of where the user connects in the network.
- Simplifying the creation of security policies.
- Providing the ability to easily identify user activities on network resources.
- Simplify user activity monitoring.

This section contains the following topics:

User Identity Acquisition

When you specify Active Directory user names or user group names in a firewall policy, the ASA eventually needs to map the name to an IP address to process packets. The ASA uses two primary sources for this information:

- User group membership—If you specify a user group in a rule, the ASA contacts the configured Active Directory (AD) server to obtain group membership.
- User-to-IP address mappings—For users who log into the network domain on your standard (non-VPN) network, the AD agent, in communication with the AD server, obtains the login information and creates a user-to-IP address mapping table. This information is supplied to the ASA.

You must install and configure the required AD servers and agents before you can configure user-based identity firewall policies. For an explanation of the various deployment scenarios, see the ASA configuration guide for ASDM or CLI at http://www.cisco.com/en/US/products/ps6120/products_installation_and_configuration_guides_list.html .

User names are acquired for the following types of traffic, and include the AD domain unless noted otherwise:

- Standard traffic.
- Remote access VPN, including IPsec IKEv1 and IKEv2, Secure Client, and L2TP VPN. If you use LDAP authentication for the VPN, and use the same server group for a domain for the VPN and identity firewall, the users are associated with the domain used for authentication. For all other authorization mechanisms, users acquired through VPN are considered to be in the LOCAL domain. The ASA reports these users to the AD agent, which distributes them to other ASAs or clients registered with the AD agent.

Note User names are not acquired for clientless SSL VPN.

- IPv4 cut-through proxy. User names are not acquired for IPv6 cut-through proxy. If the user includes the domain name during authentication, the user is associated with the domain name. Otherwise, the domain is the default domain as configured in the Identity Options policy. See Configuring Cut-Through Proxy , on page 661.

Requirements for Identity-Aware Firewall Policies

Identity-aware firewall policies are not supported by all types of device and operating systems. The following table explains the requirements and some limits for implementing these types of policies in your network.

Table 169: Requirements for Identity-Aware Firewall Policies

Requirement	Description
Firewall device	ASA running ASA Software version 8.4(2) or later, but not including the ASA-SM running 8.5(1). Single or multiple context configurations. **Tip** The ASA must have on-board encryption acceleration. To determine if the device has the required ability, log into the device console and use the **show version** command. The output should include "Encryption hardware device." You can register up to 100 ASAs with a single Active Directory agent.
Active Directory (AD)	You must use Active Directory to define users and user groups. The ASA obtains user group information directly from the AD server, which runs the LDAP protocol. You cannot use other types of LDAP servers. For detailed information on the types of AD servers supported, and their configuration requirements, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com at https://www.cisco.com/c/en/us/support/security/asa-5500-series-next-generation-firewalls/products-installation-guides-list.html . **Tip** You can have multiple AD servers, but they must have unique IP addresses among all domains. No other type of LDAP server is supported.
AD agent	You must configure off-box AD agents to act as an intermediary between the ASA and the AD servers. The AD agent maintains an active mapping of users to IP address. By default, except for the 5505, the ASA obtains this list when it boots or reloads, and the AD agent sends new mappings as they are collected. The 5505 queries the AD agent on an as-needed basis in response to traffic matching rules that include identity criteria. We recommend that you use this default behavior, although you can change it using the Identity Options policy. The AD agent uses the RADIUS protocol. For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com at http://www.cisco.com/en/US/products/ps6120/prod_installation_guides_list.html.

Requirement	Description
Client systems	Users who pass traffic through the device must use one of the following client platforms: • Windows XP SP3. • Windows Vista. • Windows 7. • Other systems that use Active Directory in a manner consistent with the explicitly supported platforms.
IPv6	IPv6 is supported with the following exceptions: • NetBIOS over IPv6 is not supported. • Multiple IPv6 addresses on user workstations is not supported. Windows 64-bit systems can use temporary IPv6 addresses when initiating some communications. If a user registers with the AD agent using one IPv6 address, then initiates communication with another address, an identity-aware firewall rule for the user would not be applied and instead a rule that matches the second IPv6 address would be applied . There are two options for disabling the use of these temporary addresses: • Disable IPv6 routing advertisements on all interfaces on all networking devices in the network. • On each Windows machine, open a command window, enter the following commands, and reboot the workstation: **netsh interface ipv6 set privacy state=disable** **netsh interface ipv6 set global randomizeidentifiers=disabled**
NetBIOS logout probing (Optional.)	If you enable NetBIOS logout probing, the ASA can use NetBIOS to determine if an inactive user is logged off so the user can be removed from the database. The probe uses UDP-encapsulated NetBIOS traffic. Thus, you must ensure that access rules allow the following traffic on the networks between the ASA, AD agent, and user workstations: • Query packets: any UDP source port to UDP port 137 (UDP/137). • Query responses: UDP/137 source to any UDP port. In addition, you must configure workstations to provide user name information in NetBIOS reply packets. For Windows workstations, you need to enable the messenger service and configure WINS. If the messenger service is not turned on, the response from the workstation is the same whether the user is logged on or off. **Tips** • The NetBIOS logout probe is never used with VPN or cut-through proxy users. • The ASA has an inactive user timeout that is also used to remove users from the database. The timer applies to all user types. Thus, implementing NetBIOS probing is not required to remove inactive users from the database.

Requirement	Description
DNS configuration (Required for fully-qualified domain name usage.)	If you use fully-qualified domain name (FQDN) network/host objects in firewall rules, you must configure the domain name system (DNS) settings as described in DNS Page , on page 2015. These settings identify the DNS servers used for looking up the names to determine the associated IP address. All processing is ultimately based on the IP address. When configuring DNS for FQDN usage, consider the following points: • DNS replies can be spoofed, which can open a security hole in your network. Specify only trusted DNS servers, ideally only those inside your network. • Some hosts can have constantly changing multiple IP addresses, so the ASA might not always have all valid IP addresses at any one time. • Host names with short time to live values will require frequent DNS lookups; this can impact the performance of the ASA. • Multiple host names can resolve to the same IP address. Ultimately, the firewall rules are applied based on IP address. Thus, if two names map to the same address, and your rules specify different services for those names, the service that is actually provided will be those specified on the first matched rule. Looked at another way, this means that you do not need to specify every version of an FQDN host name in your rules. When you know that several names always point to the same host, you can configure rules for the most commonly-used name and they will apply to all synonyms of that name.

Maximum limits	There are limits to the number of users, user groups, and IP addresses per user. If these limits are exceeded, identity-aware processing will not occur for the additional traffic:
	• IP address limits—A user can be associated with at most 8 IP addresses across all domains.
	• User group limits—Policies can be applied to up to 256 user groups. Users can be in multiple user groups.
	• User limits—Policies can be applied to up to the following number of users. This number is the total aggregate across all contexts defined on the device.
	  • ASA 5505—1024 users.
	  • Other ASA 5500 series—64,000 users.

Configuring the Firewall to Provide Identity-Aware Services

To provide identity-aware firewall services to your network, you need to configure several policies to enable the firewall to process user-based or fully-qualified domain name (FQDN)-based rules. The ASA depends on other servers in your network to provide the user, user group, and FQDN name resolution services required to implement your identity-aware policies.

The required configuration depends on which aspects of identity awareness that you will use:

- User, user group resolution—To use identity user group objects in your firewall rules, you must configure several objects and policies to identify the Active Directory servers that will supply user and user group information.
- FQDN resolution—To use FQDN network/host objects in your firewall rules, you must configure DNS servers to resolve FQDNs to IP addresses.

This procedure explains the overall process for implementing identity-aware policies.

Before You Begin

Your network must meet the requirements explained in Requirements for Identity-Aware Firewall Policies , on page 641. The following procedure assumes that you are already using Active Directory (AD), that you have installed and configured the AD agents, and that these services are working correctly.

Step 1 Enable AD user and user group resolution.

a) Create the policy objects needed to identify the AD servers and agents and configure the NetBIOS domain for the server groups. For detailed information, see Identifying Active Directory Servers and Agents , on page 645.

b) If you want non-default settings, change the identity options. Use these options to enable the NetBIOS logout probe and to configure various timers and error handling. For detailed information, see Configuring Identity Options , on page 653.

c) If you want to create user groups defined on the ASA (in addition to AD-defined user groups), create the required identity user group policy objects. See Creating Identity User Group Objects , on page 656.

Step 2 Enable FQDN network/host object resolution.

a) Configure DNS servers in the DefaultDNS group. DNS is required to resolve FQDNs to IP addresses. For information on configuring DNS, see DNS Page , on page 2015.

b) Create FQDN network/host objects as described in Creating Networks/Hosts Objects , on page 313.

Step 3 Configure firewall rules to use FQDN objects, usernames, user group names, or identity user group objects. See Configuring Identity-Based Firewall Rules , on page 659.

Step 4 Monitor the identity firewall system. See Monitoring Identity Firewall Policies , on page 664.

Configuring Identity-Aware Firewall Policies

Identity awareness is integrated into several existing firewall rules; there is no unique identity-aware firewall policy. The topics in this section explain the various procedures for integrating identity awareness into firewall policies.

This section contains the following topics:

- Filtering VPN Traffic with Identity-Based Rules , on page 664

Enabling Identity-Aware Firewall Services

Use the Identity Options policy to enable identity-aware firewall services. To configure the policy, do one of the following:

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one.

The policy includes the following tabs:

- **AD Setup**—Configure the Active Directory servers that define the users and user groups for the network, and the AD agent used to collect the information and provide it to the ASA. See Identifying Active Directory Servers and Agents , on page 645.
- **Advanced**—Enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. See Configuring Identity Options , on page 653.

Identifying Active Directory Servers and Agents

Use the AD Setup tab of the Identity Options policy to identify the Active Directory servers and agents to use for user identity information. You must configure at least one AD server and one AD agent to enable identity-aware firewall policies that include user specifications (such as identity user group objects).

Note ASA Software 8.4(2+) is required for identity-aware firewall.

Before You Begin

The configuration uses AAA server group policy objects, and the server group objects incorporate AAA server objects. You can create these objects through the Policy Object Manager (by selecting Manage > Policy Objects), or you can create them while completing this procedure (by using the configuration wizard or by clicking the Add Object + button in the object selector dialog box).

The objects need to meet these requirements:

- AD servers—Must use the LDAP protocol. If you select Microsoft as the LDAP server type, you can also specify the LDAP Group Base DN to identify the base directory for user group searches, to reduce search time. If you select Auto Detect, you cannot configure the group base DN, even though Microsoft AD servers are the only type of LDAP server that you can use in the identity firewall configuration. You must also abide by the following limitations for communications between Security Manager and Active Directory:
  - Do not select the Enable LDAP over SSL option.
  - Do not select the SASL Kerberos Authentication option. Only simple and SASL MD5 authentication mechanisms are supported. The simple mechanism, in which usernames and passwords are transmitted in clear text, is used if you do not select one of the SASL options.

- AD agents—Must use the RADIUS protocol. In the AAA server group object, select the **AD Agent Mode** option.

You should install the AD agents and configure them prior to configuring this policy. You can configure at most two AD agents in the server group: the second agent is used only if the first agent ceases to respond to queries. Any agents defined after the first two are ignored.

Obtain the AD agent software from http://www.cisco.com/go/asa . For information on setting up and configuring the AD agent, see *Installation and Setup Guide for the Active Directory Agent* on Cisco.com.

Related Topics

- Requirements for Identity-Aware Firewall Policies , on page 641
- Understanding AAA Server and Server Group Objects , on page 256
- Creating AAA Server Objects , on page 262
- AAA Server Dialog Box—LDAP Settings , on page 270
- Creating AAA Server Group Objects , on page 278
- Configuring Identity Options , on page 653

Step 1 Do one of the following:

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **AD Setup** tab.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **AD Setup** tab.

Step 2 If you want to be guided through the AD setup, click the **Configure Identity** button to start the Identity configuration wizard. The wizard walks you through the process of configuring the AD servers for a domain, and the AD agents, and can create the required AAA server and AAA server group objects for you.

The wizard goes through the following steps:

- AD Server Settings—To configure the AD servers for a domain. See Identity Configuration Wizard Active Directory Settings , on page 648.
- AD Agent Settings—To configure the AD agents for the ASA. See Identity Configuration Wizard Active Directory Agent , on page 650.
- Preview—To show you which objects will be created. See Identity Configuration Wizard Preview , on page 652.

Tip You can use the wizard multiple times to configure different NetBIOS domains. However, the wizard always prompts for AD agent information. Because you can configure a single group for AD agents, not a separate group per domain, the selection overwrites any AD agent configuration that you have already made. So be sure to select the same AAA server group for the AD agents each time you run the wizard.

Step 3 If not using the wizard, configure the AD servers. The AD servers are used for obtaining user membership information for any AD user groups that you use in identity-aware firewall policies.

The table lists the AD servers for the network. You need to add an entry for each NetBIOS domain name. Each row defines the AAA server group used to identify the AD LDAP servers for the domain, and whether identity-aware firewall rules for the domain are active or inactive if the AD server group is unavailable.

You can do the following:

- To add an entry, click the **Add Row (+)** button and fill in the Add AD Domain Server dialog box. See Domain AD Server Dialog Box , on page 647.
- To edit an entry, select it and click the **Edit Row (pencil)** button.
- To delete an entry, select it and click the **Delete Row (trash can)** button.

Step 4 If not using the wizard, configure the AD agents. The AD agents obtain user login/logoff and IP address mappings from the AD servers. The ASA then obtains the information from the AD agent.

In **Active Directory Agent Group**, enter the name of the AAA server group object that defines the list of AD agents, or click **Select** to select it from a list or to create a new group object.

Step 5 In **Default Domain**, select the domain to configure as the default domain on the device. You must add the domain to the AD server table before you can select it as the default domain.

The default is LOCAL, which applies to user groups defined on the device or to VPN users who authenticate using a method other than an AD server configured for identity services. This setting is also used if you configure cut-through proxy (see Configuring Cut-Through Proxy , on page 661).

Step 6 Click **Save** to save your changes.

You are asked if the identity settings page in the administrative settings should be updated with the domain-to-AD server mappings. The identity settings determine which servers are used when you use the Find feature when specifying users or user groups in a firewall policy or an identity user group object. The identity administrative settings do not affect the configuration of the ASA.

Domain AD Server Dialog Box

Use the Add or Edit Domain AD Server dialog box to define the Active Directory server group for a NetBIOS domain. If you configure firewall rules for a user group in the NetBIOS domain, the user membership is determined by querying the AD servers defined for the domain.

Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the Add or Edit buttons for the domain table. See Identifying Active Directory Servers and Agents , on page 645.
- From the Identity Settings Security Manager Administration page, click the Add or Edit buttons for the settings table. These settings determine which servers are used when using Find to locate a user or user group name when configuring firewall rules or identity user group objects. See Identity Settings Page , on page 550.

Field Reference

Table 170: Domain AD Server Dialog Box

Element	Description
Domain	The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name.
AD Server Group	The name of the AAA server group policy object that identifies the AD servers for this domain. The object must use the LDAP protocol. Click **Select** to select the object or to create a new one.
Disable Rules When Server Is Down (Identity Options policy only.)	Whether to disable all identity-aware firewall rules for this domain if the domain controller is down. If you select this option, all users for a domain are marked as disabled until the server becomes available.
Update Administrative Settings (Identity Options policy only.)	Whether to add the domain and server mapping to the Security Manager Administration Identity Settings page. This administrative page determines which AD servers are queried when you try to find users or user groups when adding them to firewall policies or to identity user group objects. For more information, see Identity Settings Page , on page 550.

Identity Configuration Wizard Active Directory Settings

Use the Active Directory Settings page of the Identity Configuration wizard to identify the Active Directory (AD) servers for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button. See Identifying Active Directory Servers and Agents , on page 645.
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

Field Reference

Table 171: Identity Configuration Wizard Active Directory Settings

Element	Description
NetBIOS Domain	The NetBIOS domain for this AD server group. The domain name can be up to 32 characters, typically in all uppercase. For example, if the user specification is DOMAIN\user1, DOMAIN is the NetBIOS domain name.

Element	Description
Select Existing AD Server Group	Select this option if the AAA server group policy object that identifies the required AD servers already exists. The object must use the LDAP protocol. Click **Select** next to the Group Name field to select the object.
Create New AD Server Group	Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object. Configure the remaining options to identify the group and the servers that it contains.
Create AD Server Group Properties	
Group Name (When creating the group in the wizard.)	The name of the AAA server group object that you want to create. The name can be up to 16 characters.
AD Server Name/IP	One of the following: • The name of an existing AAA server object that defines the AD server. Click **Select** to select the object from a list. If you select an object, you cannot configure the remaining properties. • The IP address of the AD server.
Username	The name of the user or the directory object in the LDAP hierarchy used for authenticated binding (maximum of 128 characters). Authenticated binding is required by some LDAP servers (including the Microsoft Active Directory server) before other LDAP operations can be performed. This field describes the authentication characteristics of the device. These characteristics should correspond to those of a user with administrator privileges. This string is case-sensitive. Spaces are not permitted in the string, but other special characters are allowed. Typically, this is a username such as DOMAIN\Administrator. However, you can use the more traditional format too, for example, cn=Administrator,OU=Employees,DN=example,DN=com.
Password Confirm	The case-sensitive, alphanumeric password for accessing the LDAP server (maximum of 64 characters). Spaces are not allowed.

Element	Description
Interface	The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click **Select** to select it from a list or to create a new interface role. **Tips** • If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name. • If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces. • Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.
Add Another AD Server	Click this button only if you want to create an additional server. When you click the button, the information in the server fields is saved and the fields are cleared so that you can add information about the next server. You can add up to 16 servers in single-context mode and 4 servers in multiple-context mode.

Identity Configuration Wizard Active Directory Agent

Use the Active Directory Agent Settings page of the Identity Configuration wizard to identify the Active Directory (AD) agents for a NetBIOS domain. These settings are required to enable user-identity-aware firewall policies for users in the domain.

Tip You can configure a single AD agent group for an ASA; you do not configure a different group for each NetBIOS domain. Thus, if you already configured the correct AD agent group in the Identity Options policy, select the same group on this wizard page. Your selection here will replace the group defined in the policy.

Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See Identity Settings Page , on page 550.
- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

Field Reference

Table 172: Identity Configuration Wizard Active Directory Agent Settings

Element	Description
Select Existing AD Agent Group	Select this option if the AAA server group policy object that identifies the required AD agents already exists. The object must use the RADIUS protocol, and should have the option **AD Agent Mode** selected. Click **Select** next to the Group Name field to select the object.
Create New AD Agent Group	Select this option if the AAA server group policy object does not already exist, or you want the wizard to create a new object. Configure the remaining options to identify the group and the servers that it contains.
Create AD Agent Group Properties	
Group Name (When creating the group in the wizard.)	The name of the AAA server group object that you want to create. The name can be up to 16 characters.
AD Agent Name/IP	One of the following: • The name of an existing AAA server object that defines the AD agent. Click **Select** to select the object from a list. If you select an object, you cannot configure the remaining properties. • The IP address of the AD agent.
Secret Key Confirm	The shared secret that is used to encrypt data between the network device (client) and AAA server. The key is a case-sensitive, alphanumeric string of up to 127 characters. Special characters are permitted. The key you define in this field must match the key on the RADIUS server. Enter the key again in the Confirm field. If you do not define a key, all traffic between the AAA server and its AAA clients is sent unencrypted.

Element	Description
Interface	The interface whose IP address should be used for all outgoing packets (known as the source interface). Enter the name of an interface or interface role, or click **Select** to select it from a list or to create a new interface role. **Tips** • If you enter the name of an interface, make sure the policy that uses this AAA object is assigned to a device containing an interface with this name. • If you enter the name of an interface role, make sure the role represents a single interface, not multiple interfaces. • Only one source interface can be defined for the AAA servers in a AAA server group, so if you specify more than one server, ensure that they all use the same interface.
Add Secondary AD Agent	Click this button only if you want to create an additional agent. The agent is used in case the first agent becomes unavailable. When you click the button, the information in the agent fields is saved and added to the preview pane, and the fields are cleared so that you can add information about the secondary agent.

Identity Configuration Wizard Preview

Use the Preview page of the Identity Configuration wizard to verify the information you entered into the wizard.

The preview summarizes the objects that will be created or used for the Active Directory configuration for the NetBIOS domain.

- AD server group shows the name of the AAA server group object for the AD servers used in the domain. The table shows the AAA server objects that define each of the AD servers.
- AD Agent shows the name of the AAA server group object for the AD agents. The primary and secondary agent shows the AAA server object that defines the agents.

For objects that the wizard will create, names are automatically generated for the AAA server objects, either adding **ldap_** or **radius_** as a prefix to the server IP address.

To make changes, click **Back**. Otherwise, click **Finish** to save the settings.

Tip After you complete the wizard, you can edit the properties of the newly-created objects to configure settings that the wizard left as default settings.

Navigation Path

Do one of the following:

- From the AD Setup tab of the Identity Options page, click the **Configure Identity** button and proceed to this page. See Identifying Active Directory Servers and Agents , on page 645.

- If the Identity Options policy is not already configured, you can start the wizard from the AAA Rules, Access Rules, or Inspection Rules policies by clicking the Select button for the User field and then clicking Yes when asked if you want to configure identity.

Configuring Identity Options

Use the Advanced tab of the Identity Options policy to enable or disable user identity services and configure options for error handling, the NetBIOS logout probe, idle timeout, and AD agent communication settings. The options on this tab have default values, so you need to change them only if you want to fine-tune the settings for your network.

Navigation Path

- (Device view) Select an ASA device, then select **Identity Options** from the Policy selector. Select the **Advanced** tab.
- (Policy view) Select **Identity Options (ASA)** from the Policy selector. Select an existing policy or create a new one. Select the **Advanced** tab.

Related Topics

- Identifying Active Directory Servers and Agents , on page 645
- Requirements for Identity-Aware Firewall Policies , on page 641

Field Reference

Table 173: Identity Options Advanced Tab

Element	Description
Enable User Identity	Whether to enable the device to obtain user identity information from the AD agent and AD servers, if they are configured on the **AD Setup** tab. The default is enabled. If you change this option and deploy, the change has the following effect based on the new setting: • Disabled—The entire IP address to user mapping database is flushed and all users without activated user-specific rules are released. The AD agent and servers are no longer queried for updates, and all activated user-identity-based rules will have no effect on traffic. • Enabled—Activated users are recreated gradually through communications with the AD agent. VPN users might need to reauthenticate. Queries to the AD agent and AD server recommence.
Error Conditions	
Disable Rules When Active Directory Agent Is Down	Whether to disable all rules that include user identity if the connection to the AD agent is unavailable. If you select this option, all user-to-IP address mappings are marked disabled and all rules that include user specifications are not applied to traffic. By default the option is disabled.

Element	Description
Remove User IP When NetBIOS Probe Fails	Whether to remove the User's IP address mapping from the database if the NetBIOS probe for the user fails for any reason, whether the probe is somehow blocked in the network or the probe fails because the user is not in operation. The user must log into the workstation again. This option has effect only if you enable the NetBIOS logout probe on this page. By default the option is disabled.
Remove User IP When User's MAC Address is Inconsistent	Whether to check the Media Access Control (MAC) address in each request from a user-mapped IP address to the MAC address in the previous packet. If you select this option, and the MAC address changes between packets, the user-to-IP address mapping is removed from the database, subsequent packets are dropped, and the user must reauthenticate to Active Directory. The AD agent is notified if the user-to-IP mapping is removed due to MAC mismatch. By default this option is enabled. MAC checking occurs only on packets from IP addresses on networks that are directly attached to the ASA. VPN users are not checked.
Track User Not Found	Whether to enable user-not-found tracking. By default, the option is disabled.
NetBIOS Logout Probe	
Enable (NetBIOS Logout Probe)	Whether to enable the NetBIOS logout probe. You can use the probe to proactively determine if a user has logged out of the network, allowing the device to remove the user-to-IP address mapping more quickly than if idle timeout is the only mechanism used for this purpose. By default the probe is disabled, and users are removed only if they are idle for longer than the Idle Timeout value. Users are probed only if they are in the active state and they are used in at least one activated rule. VPN and cut-through proxy users are not probed. The AD agent is notified if the user-to-IP mapping is removed by the NetBIOS logout probe. In addition to configuring the following options, see Requirements for Identity-Aware Firewall Policies , on page 641.
Probe Timer	The frequency of sending NetBIOS probes to activated users, regardless of whether the user is idle. The default is 15 minutes, the range is 1 to 65535 minutes.
Retry Interval	The frequency of retrying the probe if a response is not received from an IP address, and the number of times the probe should be retried. The default is 3 seconds and 3 retries. The range is 1 to 65535 seconds, for retry count, 1 to 256. If there is no response from the final retry, the user-to-IP address mapping is removed if you selected the **Remove User IP When NetBIOS Probe Fails** option; otherwise, the address is probed during the next interval.

Element	Description
User Name	When a NetBIOS response is received, how to handle the response based on the usernames returned: • **Match Any** (the default)—Any username in the response can match the username in the database for the IP address. If there are multiple names in the response (that is, more than one user is logged into the workstation), if any user in the response matches a user in the database, the probe is considered successful and the mapping is retained. • **User Not Needed**—The usernames in the NetBIOS response are ignored; the query response is sufficient to maintain the user-to-IP address mapping. This option is useful if the messenger service is not turned on in the workstation, in which case the NetBIOS response will not contain usernames. The option is also useful when multiple users log into a workstation. • **Exact Match**—There must be one username in the NetBIOS response, and it must exactly match the username in the user-to-IP address mapping database. If there is more than one user, or if the username does not match, the mapping is removed from the database and the IP address is marked as inactive.
Users	
Idle Timeout	The amount of time, in minutes, to allow the user to be idle before removing the user-to-IP address mapping in the database. Once removed, the user must log in again to update the mapping (for example, by using Ctrl+Alt+Delete to lock the workstation, then log in again). The default is 60 minutes, the range is 1 to 65535 minutes. You can deselect the option to disable idle timeout checking, in which case user-to-IP mappings are not removed due to idleness. VPN and cut-through proxy users are not subject to this timer. The AD agent is not notified if the user-to-IP address mapping is removed due to idle timeout.
Active Directory Agent	
Hello Timer	The frequency of sending Hello packets to the AD agent. The ASA uses Hello packets to obtain ASA replication status and domain status. If the ASA does not receive a response after the final retry, the AD agent is considered down, and the ASA switches to the backup AD agent, if you configure one. By default, Hello packets are sent every 30 seconds, and up to 5 retries are attempted if no response is received. The range is 10 to 65535 seconds and 1 to 65535 retries.

Element	Description
Poll Groups Timer	How often the Active Directory server should be queried to obtain user membership lists for user groups that you have specified in firewall rules. The ASA queries the server for membership in a group only if you have used the group; it does not query every group defined in the AD server. The default is 8 hours, the range is 1 to 65535 hours. **Tip** If group membership changes, the changes are not reflected in rule processing until this timer expires and the ASA polls the AD server for updated information. Thus, you should configure the timer based on the frequency of changes to group membership in your network, balancing the need to update group membership in the ASA with the desire to reduce the amount of polling.
Retrieve User Information	How the ASA should retrieve user-to-IP address mappings from the AD agent. • **Full Download** (default for ASA non-5505 devices)—On boot, the ASA obtains the full user-to-IP address mapping database from the AD agent, and then gets incremental updates as users log into and out of the network. Use this option on the 5505 only if there are fewer than 1024 users in the network, because the 5505 is limited to 1024 user-to-IP mappings. For the 5505, the default On Demand setting is appropriate if only a few users will pass traffic through the device. • **On Demand** (default for ASA 5505 devices)—The ASA queries the AD agent for user-to-IP mappings only when a new packet requires a connection and no mapping exists. This option uses less memory, but there can be a delay in getting the mapping, and the packets are initially evaluated based on traditional source and destination IP address and service information, which might result in the wrong action. The potential delay can be increased if a large number of users log in at the same time, either due to corporate culture or to a malicious attack.

Creating Identity User Group Objects

You can create identity user group objects to identify individual users, user groups, or a combination of users and groups. These users and groups must be defined in Active Directory (AD), you cannot define other types of users.

Tip Identity user groups are defined on the ASA. You do not need to create these groups to duplicate groups that are already defined in AD. You can directly specify AD groups in firewall rules. Identity user group objects are needed only to define collections of users and user groups that do not otherwise exist in AD.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in Configuring Cut-Through Proxy , on page 661.

- all-auth-users—To match any IP address that has been associated with an authenticated user.
- all-unauth-users—To match only IP addresses that have **not** been associated with authenticated users.

Tips

- Use of these objects is supported on ASA 8.4(2+) only.
- You must configure the Identity Options policy on the ASA to enable the use of these objects.
- You can create identity user group objects when defining policies or objects that use this object type. For more information, see Selecting Identity Users in Policies , on page 658.

Related Topics

- Configuring Identity-Based Firewall Rules , on page 659
- Requirements for Identity-Aware Firewall Policies , on page 641
- Identity Settings Page , on page 550
- Creating Policy Objects , on page 237

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **Identity User Group** from the Object Type selector.

Step 3 Right-click in the work area, then select **New Object** to open the Identity User Group dialog box.

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add** >> button between the lists.
- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administration options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add** >> button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add** >> button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS_DOMAIN\user
- User groups (note the double \): NETBIOS_DOMAIN\\user_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page. If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

Step 6 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 7 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 8 Click **OK** to save the object.

Selecting Identity Users in Policies

In any policy or policy object that allows the specification of identity users, whether directly or through the selection of an identity user group object, you can click the Select button next to the User field to help you enter the information.

In the Identity User Group Selector dialog box, you can define the content of the User field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Identity User Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.

There are two pre-defined identity user groups. These groups are used when configuring cut-through proxy, as described in Configuring Cut-Through Proxy , on page 661.

- all-auth-users—To match any IP address that has been associated with an authenticated user.
- all-unauth-users—To match only IP addresses that have **not** been associated with authenticated users.
- In **Search User/User Group**, select a user or user group from the Active Directory server configured for the domain in the Identity Settings administrative options. You must configure the settings before you can select users or user groups, so that Security Manager knows which AD server to use.

To find a user or user group, select the NetBIOS domain, indicate whether you are searching for a user or user group, and enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the name (first, middle initial, last), user ID, CN, or for groups, user group name.

To add the user or group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated identity user or user group**, type in a valid name, then click the **Add >>** button between the lists. Separate multiple names with commas; they are added as separate lines in the members list.

You can enter names in the following formats:

- Individual users: NETBIOS_DOMAIN\user
- User groups (note the double \): NETBIOS_DOMAIN\\user_group

If you do not include the domain name, one is added for you based on the options selected in the Security Manager Administration Identity Settings page as explained in Identity Settings Page , on page 550. If you precede the name with \ or \\, the default domain defined on the Identity Settings page is automatically added.

- To remove an item from the object, select it in the Members list and click the **<< Remove** button between the lists.

Configuring Identity-Based Firewall Rules

Identity awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding identity-based rules to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate identity-based rules into your existing policies, and directs you to more specific information on configuring each type of policy that allows identity-based rules.

Guidelines For Adding Identity-Based Rules

Following are some general guidelines and recommendations for adding identity-based rules:

- FQDN (fully-qualified domain name) network/host objects are allowed in both Source and Destination fields. For information on configuring these objects, see Creating Networks/Hosts Objects , on page 313.
- User, user group, and identity user group objects, which specify Active Directory (AD) user or user group names, are defined in a separate field: User. If you configure a rule with one or more user names, user group names, or identity user group objects, the specifications modify the Source address configuration only. They never apply to the addresses specified in the Destination field. For information on configuring these identity user group objects, see Creating Identity User Group Objects , on page 656.

You must always configure a source address in a rule, even if you want the rule to primarily operate based on the specified users or user groups. The source and user specifications conjoin to control the scope of the rule. Based on the value of the Source field, the rules operate as follows:

- **Source = any**—Use “any” as the source if you want the rule to apply based solely on the user specifications. These rules will match the user specification regardless of the workstation IP address from which the user sends traffic.
- **Source = anything else**—If you specify anything other than “any” as the source address, the rule applies only if the user sends traffic from an IP address that matches the source address specification. Use this technique if you want to provide variable services based on the source network.

For example, you might have an internal trusted network from which you would allow access to a sensitive destination for users in a particular user group, although you would deny access even to those users if they were outside of the trusted network. In this case, you would create a permit rule that specified the trusted network as the source, the trusted user group as the user, and the sensitive server as the destination. You could also create a specific deny rule with just the source and destination specified, or allow the default deny any rule to capture the non-matching traffic.

- Evaluate whether there are classes of traffic that will never be sensitive to user identity. For example, you might allow DNS traffic for all users. Place these types of rules above identity-based rules so that matching traffic can be quickly allowed before the device needs to evaluate identity-based rules.
- When troubleshooting rules, keep in mind that ultimately rules are applied based on IP address. FQDN rule matching is based on DNS lookups, and the IP address of a host can change between a successful lookup and the next time the lookup is refreshed. For users, IP address mappings are obtained from the AD agent configured in the network or by authentications conducted by the ASA itself.
- FQDN and user specifications are completely independent. You can use one without the other.

Firewall Policies That Allow Identity-Based Rules

Identity-based rules are allowed on ASA 8.4.2+ only. The following policies allow you to configure identity-based rules:

- AAA Rules—Select **Firewall > AAA Rules** and see Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688.

Tip You can use AAA rules to configure cut-through proxy, which allows users whose IP address mappings have become invalid, resulting in denied network access, to authenticate directly to the ASA to resolve the mapping problem. See Configuring Cut-Through Proxy , on page 661.

- Access Rules—Select **Firewall > Access Rules** and see Configuring Access Rules , on page 723.
- Inspection Rules—Select **Firewall > Inspection Rules** and see Configuring Inspection Rules , on page 771.
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include FQDN objects or user specifications (see Creating Extended Access Control List Objects , on page 284). You can then use these identity-based extended ACL objects in the following policies:
  - Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913. You can use identity-based ACLs as traffic classification for Enable and Drop rules.
  - IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see Service Policy Rules Page , on page 2263.

Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate identity-based traffic classification. You can use identity-based ACLs for all service types. For more information, see Configuring Traffic Flow Objects , on page 2277.

One of the services available in this policy, User Statistics, is specifically designed to collect accounting information for identity-based firewall users. See Collecting User Statistics , on page 663.

- VPN filter in remote access group policies—The VPN filter ACL is applied to VPN traffic. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See ASA Group Policies Connection Settings , on page 1522 and Filtering VPN Traffic with Identity-Based Rules , on page 664.

Policies That Do Not Allow Identity-Based Rules or Objects

There are several types of policy where you can specify network/host objects or extended ACL objects, but where the policy does not allow FQDN network/host objects or ACLs that use those objects or identity user group objects. Following are some examples where you cannot use these types of objects:

- Routing policies, including route maps.
- Network address translation (NAT).

- WCCP (web cache control protocol).
- Crypto maps in VPN configurations.
- Dynamic access policies in remote access VPN configurations.

Configuring Cut-Through Proxy

When you use identity-aware firewall policies, user-to-IP address mappings are obtained from various facilities, primarily from the AD agent in the network. Although mappings are updated regularly, there can occur instances where a firewall rule blocks a legitimate user because the user-to-IP address mapping is not synchronized.

You can configure cut-through proxy to account for this possibility. With cut-through proxy, if a user is blocked, the user can sign on directly to the ASA, and the ASA will update the user-to-IP mapping to correctly reflect the current IP address for the user. The new mapping is forwarded to all contexts that contain the interface where the HTTP/HTTPS packets are received and authenticated.

You use AAA rules to configure cut-through proxy. You have two configuration choices, based on whether there is one or more NetBIOS domains in the network:

- Single domain—Configure a regular AAA rule for authentication and specify the LDAP server group that identifies the Active Directory servers for the domain. Use “any” for the source, and the IP address of the ASA for the destination. For service, you can include HTTP and HTTPS. Then, when the user needs to authenticate to the server, the user enters one of the standard authentication URLs, where *interface_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table: **http://***interface_ip* [**:***port*]**/netaccess/connstatus.html** or **https://***interface_ip* [**:***port*]**/netaccess/connstatus.html**.

Tip The user-to-IP mapping is put under the same domain as configured for the selected AD server group. If you use another means for authentication, the mapping is placed under the LOCAL domain.

- Multiple domains—Configure two authentication rules that use the User-Identity option instead of a specific AAA server group. The following procedure explains this setup. Note that this setup also works for single domain networks. Users authenticate to the ASA using the same URLs mentioned above.

When you use the User-Identity option, authentication is handled as follows:

- If the user includes the domain in the login credentials, in the format DOMAIN\username, the ASA uses the domain to determine which AD server to use for authentication based on the domain mappings in the Identity Options policy. If no AAA server is mapped to the domain, the authentication attempt is rejected.
- If the login credentials do not include an identifiable domain name (typically, if the \ character is not included in the username string), the ASA uses the AD server assigned to the default domain selected in the Identity Options policy. If no AAA server is mapped to the default domain, the authentication attempt will be rejected.

Tip Cut-through proxy works for IPv4 addresses only; IPv6 is not supported.

- Requirements for Identity-Aware Firewall Policies , on page 641
- Configuring the Firewall to Provide Identity-Aware Services , on page 643
- Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688
- Understanding How Users Authenticate , on page 686

Step 1 Configure the Identity Options policy to specify all of the NetBIOS domains and their AD server groups, and the AD agent group, for the network, as described in Identifying Active Directory Servers and Agents , on page 645.

Step 2 Do one of the following to open the AAA Rules Page , on page 693:

- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 3 Create the following rules using the **Add Row** button. For detailed information about the fields in the Add AAA Rules dialog box, see Add and Edit AAA Rule Dialog Boxes , on page 697.

Tip You can use more specific source, destination, or service specifications than the ones shown here.

Rule 1: Do not force users who have already authenticated to authenticate again.

- Select the **Authentication Action** and **User-Identity** options.
- Action = Deny. For AAA authentication rules, “deny” means the user is not prompted for authentication, it does not mean the user’s traffic is dropped.
- Sources = any.
- Users = all-auth-users.

For users, **all-auth-users** means any user who has already authenticated to Active Directory, for which there is an IP mapping.

- Destination = any.
- Services = IP.
- AAA Server Group = (no selection).
- Interface = (your choice, typically inside interfaces).

Rule 2: Authenticate users who have not been authenticated yet.

- Select the **Authentication Action** and **User-Identity** options.
- Action = Permit. This action requires matching users to authenticate.
- User = all-unauth-users.

In this case, **all-unauth-users** means any user who has not already authenticated to Active Directory.

- All other options are identical to the first rule.

Collecting User Statistics

You can collect user statistics accounting information for identity-based firewall policies. These statistics are kept for users to which a firewall policy is applied based on username or user group membership.

Related Topics

- Requirements for Identity-Aware Firewall Policies , on page 641
- Configuring the Firewall to Provide Identity-Aware Services , on page 643
- Service Policy Rules Page , on page 2263
- Configuring Traffic Flow Objects , on page 2277

Step 1 Do one of the following:

- (Device view) Select an ASA device, then select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy selector.
- (Policy view) Select **PIX/ASA/FWSM Platform > Service Policy Rules > IPS, QoS, and Connection Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to add the rule, then click the **Add Row (+)** button below the table to start the Insert Service Policy Rule wizard.

Step 3 In step 1 of the wizard, select whether the rule will be Global or it will apply to specific interfaces or interface roles. Select Global if you want to collect statistics for users regardless of which interface their traffic passes through.

Click **Next**.

Step 4 In step 2, select the traffic class that defines the traffic for which you are collecting statistics. Select Use class-default if you want to collect statistics on all traffic. Otherwise, select Traffic Class and select the traffic flow object that defines the traffic matching attributes.

Click **Next**.

Step 5 In step 3, select the **User Statistics** tab.

- Select **Enable user statistics accounting**.
- Select the type of information you want to collect:
  - **Account for sent drop count**
  - **Account for sent packet, sent drop and received packet count**

Step 6 Click **Finish** to save your rule.

Filtering VPN Traffic with Identity-Based Rules

When you support remote access VPNs on an ASA, you configure user-sensitive access. You can also use identity-based rules to filter the traffic after validating the remote user access.

Before creating identity-based rules for VPN, understand the rules for VPN user names, to ensure that the rules use the correct domain name:

- If you use an Active Directory LDAP server group for authorization, and you configured that domain/server group in the Identity Options policy, the username is associated with the NetBIOS domain.
- For all other authorization mechanisms, the domain name for VPN users is LOCAL.

With this in mind, there are two methods you can use to filter the traffic on the VPN with identity-based ACL rules:

- Apply a VPN filter in the ASA Group Policy object. The filter applies to all users in the group. You can configure a VPN filter on the Connection Settings page in an ASA Group Policy object, which you use in a remote access connection policy. See ASA Group Policies Connection Settings , on page 1522.
- By default, VPN traffic bypasses interface access rules. You can change this behavior so that all VPN traffic must also pass through the interface access rules. If you take this approach, you must ensure that the interface rules are sensitive to your VPN traffic. To force VPN traffic to go through interface access rules, deselect the **Enable IPsec over Sysopt** option on the ISAKMP/IPsec tab of the RA VPN Global Settings policy. See Configuring VPN Global ISAKMP/IPsec Settings , on page 1183.

Monitoring Identity Firewall Policies

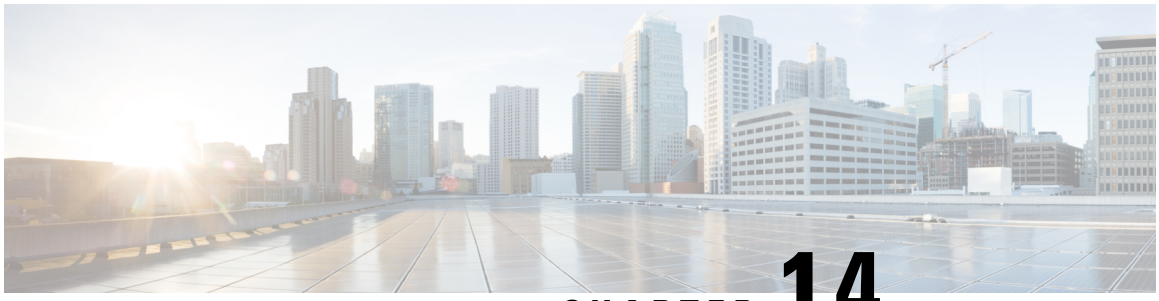
You can use Event Viewer to monitor identity-aware firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see Viewing Events, on page 2677.

- There is a group of syslog messages that relate specifically to identity firewall: 746001-746019. You can find descriptions of these messages in the Syslog Message document for your ASA software version at http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html.

The following messages are of particular concern:

- **746004 and 746011**—These syslogs indicate that you have exceeded the supported number of references to user groups or users. You should consider changing your policies. For more information on these restrictions, see Requirements for Identity-Aware Firewall Policies , on page 641.
- **746003**—There was a failure in downloading user group or user mappings to IP address. The message explains the reason for the failure.
- **746005**—The AD agent could not be reached. Ensure that the agent is functioning correctly and that there is a network path between the ASA and the agent.
- **746010**—An update to the imported user or user group failed for the stated reason.
- **746016**—DNS lookup for the fully-qualified domain name (FQDN) failed for the stated reason.

- Several existing syslog messages now include username or FQDN information. Event Viewer has two columns to display the information: Destination User Identity / FQDN and Source User Identity. Updated messages include:
  - 302005, 302006, 302013, 302014, 302016-302018, 302020, 302021.
  - 305005, 305006, 305009-305013.
  - 304001-304002 include identity information, but they are not parsed.
- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the Identity Firewall Events folder.
- When you use the Go to Policy command on an event, as described in Looking Up a Security Manager Policy from Event Viewer , on page 2731, identity information is included in the lookup criteria. Note that identity information is not included in 106100, so policy lookup on that message cannot be sensitive to user identity.



CHAPTER 14

Managing Trustsec Firewall Policies

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Cisco ASA devices integrate with Cisco TrustSec to provide security group based policy enforcement. Access policies within the Cisco TrustSec domain are topology-independent, based on the roles of source and destination devices rather than on network IP addresses.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. This chapter explains TrustSec firewall policies and how to implement them in the various policies that support security group awareness.

This chapter contains the following topics:

Overview of TrustSec Firewall Policies

Traditionally, security features such as firewalls performed access control based on predefined IP addresses, subnets and protocols. However, with enterprises transitioning to borderless networks, both the technology used to connect people and organizations and the security requirements for protecting data and networks have evolved significantly. End points are becoming increasingly nomadic and users often utilize a variety of end points (for example, laptop versus desktop, smart phone, or tablet), which means that a combination of user attributes plus end-point attributes provide the key characteristics, in addition to existing 6-tuple based rules, that enforcement devices, such as switches and routers with firewall features or dedicated firewalls, can reliably use for making access control decisions.

As a result, the availability and propagation of end point attributes or client identity attributes have become increasingly important requirements to enable security solutions across the customers' networks, at the access, distribution, and core layers of the network and in the data center to name but a few examples.

Cisco TrustSec provides an access-control solution that builds upon an existing identity-aware infrastructure to ensure data confidentiality between network devices and integrate security access services on one platform. In the Cisco TrustSec solution, enforcement devices utilize a combination of user attributes and end-point attributes to make role-based and identity-based access control decisions.

Implementing Cisco TrustSec into your environment has the following advantages:

- Provides a growing mobile and complex workforce with appropriate and more secure access from any device
- Lowers security risks by providing comprehensive visibility of who and what is connecting to the wired or wireless network
- Offers exceptional control over activity of network users accessing physical or cloud-based IT resources
- Reduces total cost of ownership through centralized, highly secure access policy management and scalable enforcement mechanisms

For information about Cisco TrustSec, see http://www.cisco.com/go/trustsec

This section contains the following topics:

Understanding SGT and SXP Support in Cisco TrustSec

In the Cisco TrustSec solution, security group access transforms a topology-aware network into a role-based network, thus enabling end-to-end policies enforced on the basis of role-based access-control (RBAC). Device and user credentials acquired during authentication are used to classify packets by security groups. Every packet entering the Cisco TrustSec cloud is tagged with a security group tag (SGT). The tagging helps trusted intermediaries identify the source identity of the packet and enforce security policies along the data path.

An SGT can indicate a privilege level across the domain when the SGT is used to define a security group ACL. An SGT is assigned to a device through IEEE 802.1X authentication, web authentication, or MAC authentication bypass (MAB), which occurs with a RADIUS vendor-specific attribute. An SGT can be assigned statically to a particular IP address or to a switch interface. An SGT is passed along dynamically to a switch or access point after successful authentication.

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network.

The SXP connections are point-to-point and use TCP as the underlying transport protocol. SXP uses the well known TCP port number 64999 to initiate a connection. Additionally, an SXP connection is uniquely identified by the source and destination IP addresses.

Roles in the Cisco TrustSec Solution

To provide identity and policy-based access enforcement, the Cisco TrustSec solution includes the functionality:

- **Access Requestor (AR):** Access requestors are end-point devices that request access to protected resources in the network. They are primary subjects of the architecture and their access privilege depends on their Identity credentials.

Access requestors include end-point devices such PCs, laptops, mobile phones, printers, cameras, and MACsec-capable IP phones.

- **Policy Decision Point (PDP):** A policy decision point is responsible for making access control decisions. The PDP provides features such as 802.1x, MAB, and Web authentication. The PDP supports authorization and enforcement through VLAN, DACL, and security group access (SGACL/SXP/SGT).

In the Cisco TrustSec solution, the Cisco Identity Services Engine (ISE) acts as the PDP. The Cisco ISE provides identity and access control policy functionality.

- **Policy Information Point (PIP):** A policy information point is a source that provides external information (for example, reputation, location, and LDAP attributes) to policy decision points.

Policy information points include devices such as Session Directory, Sensors IPS, and Communication Manager.

- **Policy Administration Point (PAP):** A policy administration point defines and inserts policies into authorization system. The PAP acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco Trustsec tag to server resource mapping.

In the Cisco TrustSec solution, the Cisco Secure Access Control System (a policy server with integrated 802.1x and SGT support) acts as the PAP.

- **Policy Enforcement Point (PEP):** A policy enforcement point is the entity that carries out the decisions (policy rules and actions) made by the PDP for each AR. PEP devices learn identity information through the primary communication path that exists across networks. PEP devices learn the identity attributes of each AR from many sources, such as end-point agents, authorization servers, peer-enforcement devices, and network flows. In turn, PEP devices use SXP to propagate IP-SGT mappings to mutually-trusted peer devices across the network.

Policy enforcement points include network devices such as Catalyst switches, routers, firewalls (specifically the ASA), servers, VPN devices, and SAN devices.

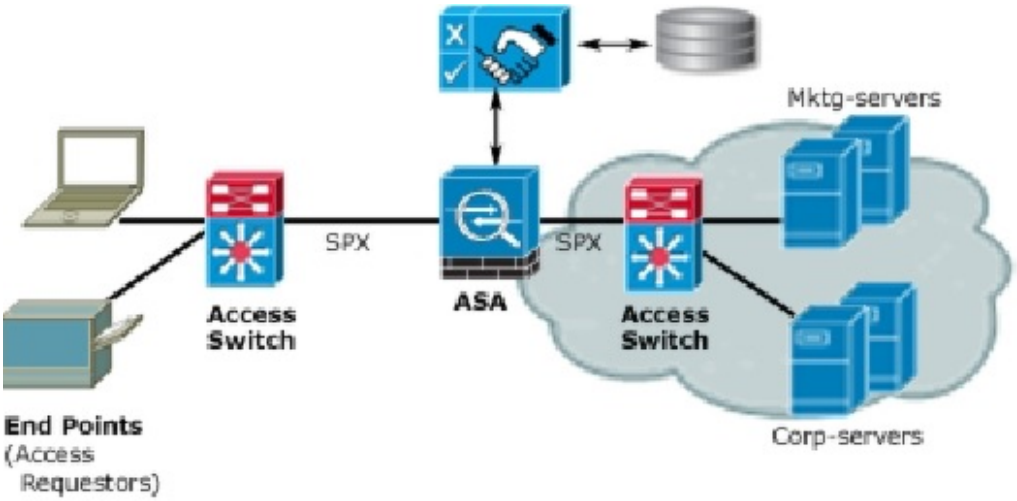
Security Group Policy Enforcement

Security policy enforcement is based on security group name. Compared to traditional IP-based policies configured on firewalls, identity-based policies are configured based on user and device identities. For example, mktg-contractor is allowed to access mktg-servers; mktg-corp-users are allowed to access mktg-server and corp-servers.

The benefits of this type of deployment include:

- User group and Resource is defined and enforced using a single object (SGT) - simplified policy management.
- User identity and resource identity are retained throughout the Cisco Trustsec capable switch infrastructure.

Figure 21: Security Group Name Based Policy Enforcement Deployment



Implementing Cisco TrustSec allows you to configure security policies that support server segmentation and includes the following features:

- A pool of servers can be assigned an SGT for simplified policy management.
- The SGT information is retained within the infrastructure of Cisco Trustsec capable switches.
- The ASA can leverage the IP-SGT mapping for policy enforcement across the Cisco TrustSec domain.
- Deployment simplification is possible because 802.1x authorization for servers is mandatory.

How the ASA Enforces Security Group Based Policies

Note User-based security policies and security-group based policies can coexist on the ASA. Any combination of network, user-based, and security-group based attributes can be configured in a security policy.

To configure the ASA to function with Cisco TrustSec, you must import a Protected Access Credential (PAC) file from the ISE.

Importing the PAC file to the ASA establishes a secure communication channel with the ISE. After the channel is established, the ASA initiates a PAC secure RADIUS transaction with the ISE and downloads Cisco TrustSec environment data (that is, the security group table). The security group table maps SGTs to security group names. Security group names are created on the ISE and provide user-friendly names for security groups.

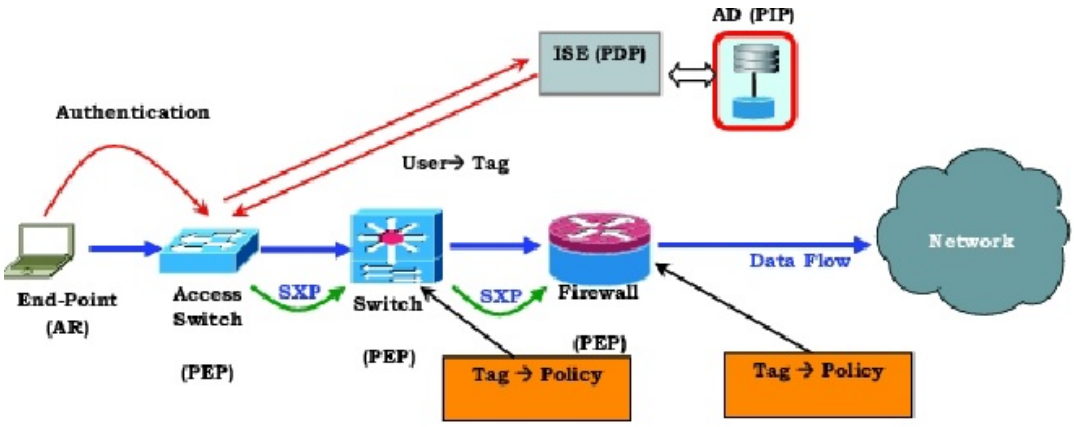
Note From version 4.23 onwards, Cisco Security Manager supports the retrieval of more than 20 Security Group Tags (SGTs) from ISE server in ACL and AAA policies. You can also use underscores in the search text box in SGT and User fields, to reduce the effort of searching usernames with underscores.

Note For more information about the Cisco Identity Services Engine, see http://www.cisco.com/en/US/products/ps11640/index.html

The first time that the ASA downloads the security group table, it walks through all entries in the table and resolves all the security group names included in security policies that have been configured on it; then the ASA activates those security policies locally. If the ASA cannot resolve a security group name, it generates a syslog message for the unknown security group name.

The following figure shows how a security policy is enforced in Cisco TrustSec.

Figure 22: Security Policy Enforcement



1. An end-point device connects to an access layer device directly or via remote access and authenticates with Cisco TrustSec.
2. The access layer device authenticates the end-point device with the ISE by using authentication methods such as 802.1X or web authentication. The end-point device passes role and group membership to classify the device into the appropriate security group.
3. The access layer device uses SXP to propagate the IP-SGT mapping to the upstream devices.
4. The ASA receives the packet and looks up the SGTs for the source and destination IP addresses using the IP-SGT mapping passed by SXP.

If the mapping is new, the ASA records it in its local IP-SGT Manager database. The IP-SGT Manager database, which runs in the control plan, tracks IP-SGT mappings for each IPv4 or IPv6 address. The database records the source from which the mapping was learned. The peer IP address of the SXP connection is used as the source of the mapping. Multiple sources can exist for each IP-SGT mapping.

If the ASA is configured as a Speaker, the ASA transmits all IP-SGT mappings to its SXP peers. See About Speaker and Listener Roles, on page 672.

- If a security policy is configured on the ASA with that SGT or security group name, the ASA enforces the policy. (You can create security policies on the ASA that include SGTs or security group names. To enforce policies based on security group names, the ASA needs the security group table to map security group names to SGTs.)

If the ASA cannot find a security group name in the security group table and it is included in a security policy, the ASA considers the security group name unknown and generates a syslog message. After the ASA refreshes the security group table from the ISE and learns the security group name, the ASA generates a syslog message indicating that the security group name is known.

About Speaker and Listener Roles

The Security-group eXchange Protocol (SXP) is used to send and receive IP-SGT mappings to and from other network devices. Employing SXP allows security devices and firewalls to learn identity information from access switches without the need for hardware upgrades or changes. SXP can also be used to pass IP-SGT mappings from upstream devices (such as datacenter devices) back to the downstream devices.

When configuring an SXP connection to an SXP peer, you must designate the device as a Speaker or a Listener for that connection so that it can exchange identity information:

- Speaker mode—configures the device so that it can forward all active IP-SGT mappings to upstream devices for policy enforcement.
- Listener mode—configures the device so that it can receive IP-SGT mappings from downstream devices (SGT-capable switches) and use that information in creating policy definitions.

If one end of an SXP connection is configured as Speaker, then the other end must be configured as a Listener, and vice versa. If both devices on each end of an SXP connection are configured with the same role (either both as Speakers or both as Listeners), the SXP connection will fail and the device will generate a system log message.

Configuring the device to be both a Speaker and a Listener for an SXP connection can cause SXP looping, meaning that SXP data can be received by an SXP peer that originally transmitted it.

As part of configuring SXP, you configure an SXP reconcile timer. After an SXP peer terminates its SXP connection, the device starts a hold down timer. Only SXP peers designated as Listener devices can terminate a connection. If an SXP peer connects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the IP-SGT mapping database to learn the latest mappings.

Prerequisites for Integrating an ASA with Cisco TrustSec

Before configuring the ASA to integrate with Cisco TrustSec, you must perform the following prerequisites:

- Register the ASA with the ISE.
- Create a security group for the ASA on the ISE.
- Generate the PAC file on the ISE to import into the ASA.

Registering the ASA with the ISE

The ASA must be configured as a recognized Cisco TrustSec network device in the ISE before the ASA can successfully import a PAC file.

1. Log into the ISE.
2. Choose **Administration > Network Devices > Network Devices**.
3. Click **Add**.
4. Enter the IP address of the ASA.
5. When the ISE is being used for user authentication in the Cisco TrustSec solution, enter a shared secret in the Authentication Settings area. When you configure the AAA sever on the ASA, provide the shared secret you create here on the ISE. The AAA server on the ASA uses this shared secret to communicate with the ISE.
6. Specify a device name, device ID, password, and a download interval for the ASA. See the ISE documentation for the details to perform these tasks.

Creating a Security Group on the ISE

When configuring the ASA to communicate with the ISE, you specify a AAA server. When configuring the AAA server on the ASA, you must specify a server group.

The security group must be configured to use the RADIUS protocol.

1. Log into the ISE.
2. Choose **Policy > Policy Elements > Results > Security Group Access > Security Group**.
3. Add a security group for the ASA. (Security groups are global and not ASA specific.)

   The ISE creates an entry under Security Groups with a tag.
4. Under the Security Group Access section, configure a device ID credentials and password for the ASA.

Generating the PAC

Before generating the PAC file, you must have registered the ASA with the ISE.

1. Log into the ISE.
2. Choose **Administration > Network Resources > Network Devices**.
3. From the list of devices, select the ASA device.
4. Under the Security Group Access (SGA), click **Generate PAC**.
5. To encrypt the PAC file, enter a password.

The password (or encryption key) you enter to encrypt the PAC file is independent of the password that was configured on the ISE as part of the device credentials.

The ISE generates the PAC file. The ASA can import the PAC from flash or from a remote server via TFTP, FTP, HTTP, HTTPS, or SMB. (The PAC does not have to reside on the ASA flash before you can import it.)

Configuring TrustSec Firewall Policies

Security group awareness is integrated into several existing firewall rules; there is no unique TrustSec firewall policy. Additionally, supporting tools have been updated to work on TrustSec firewall policies. For example, you can search for rules that include a specific Security Group using the Find and Replace tool.

The topics in this section explain the various procedures for integrating security group awareness into firewall policies.

This section contains the following topics:

Configuring Cisco TrustSec Services

This procedure explains how to enable and configure Cisco TrustSec in Cisco Security Manager and on the required security devices.

Before You Begin

Before configuring an ASA to integrate with Cisco TrustSec, you must meet the prerequisites explained in Prerequisites for Integrating an ASA with Cisco TrustSec, on page 672.

To configure Cisco TrustSec, perform the following tasks:

Step 1 Configure communication between Cisco Security Manager and the Cisco Identity Services Engine (ISE). See ISE Settings Page , on page 569.

Note Security Manager supports communications with only one ISE appliance/server for fetching and resolving security group names and tags.

Step 2 Enable and set the default values for the Security Exchange Protocol (SXP). See Understanding SGT and SXP Support in Cisco TrustSec, on page 668.

Step 3 Add SXP connection peers for the Cisco TrustSec architecture. See Defining SXP Connection Peers , on page 679.

Step 4 (ASA 9.3.1+ devices only) Configure Security Group Tagging options. See Add/Edit Interface Dialog Box: Advanced Tab (ASA/PIX 7.0+) , on page 1850.

Step 5 (ASA 9.3.1+ devices only) Configure Security Group Tagging for VPN sessions. See ASA Group Policies SSL VPN Full Client Settings , on page 1506.

Step 6 Configure the Security Policy. See Configuring TrustSec-Based Firewall Rules , on page 683

Step 7 Monitor the TrustSec firewall system. See Monitoring TrustSec Firewall Policies , on page 684.

Configuring Security Exchange Protocol (SXP) Settings

Use the SXP Settings page to enable the Security Exchange Protocol (SXP) on your security device and to configure SXP settings for the device.

Note All settings are available on the SXP Settings page whether you access that page from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

Navigation Path

- (Device view) Select the security device, then select **TrustSec > SXP Settings** from the Policy selector.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.

Field Reference

Table 174: SXP Settings Page

Element	Description
Enable SGT Exchange Protocol (SXP)	Whether to enable the Security Exchange Protocol on the device. The default is disabled
Retry Timer	The default time interval between attempts to set up new SXP connections between SXP peers. Enter the retry timer value as a number of seconds in the range of 0 to 64000 seconds. If you specify 0 seconds, the timer never expires and the device will not attempt to connect to SXP peers. By default, the timer value is 120 seconds. The device will continue to attempt to connect to new SXP peers until a successful connection is made. The retry timer is triggered as long as there is one SXP connection on the device that is not up. When the retry timer expires, the device goes through the connection database and if the database contains any connections that are off or in a "pending on" state, the device restarts the retry timer.

Element	Description
Reconcile Timer	The reconcile timer value as a number of seconds in the range of 0 to 64000 seconds. By default, the timer value is 120 seconds. After an SXP peer terminates its SXP connection, the security device starts a hold down timer. If an SXP peer reconnects while the hold down timer is running, the device starts the reconcile timer; then, the device updates the SXP mapping database to learn the latest mappings. When the reconcile timer expires, the device scans the SXP mapping database to identify stale mapping entries (entries that were learned in a previous connection session). The device marks these connections as obsolete. When the reconcile timer expires, the device removes the obsolete entries from the SXP mapping database. **Note** Setting the reconciliation period to 0 seconds disables the timer and causes all entries from the previous connection to be removed.
Network Map	The Network Map argument specifies the maximum number of subnet IP hosts from 0 to 65,535 that can be bound to SGTs and exported to the SXP listener. The default is 0 (no expansions performed).
Server Group Name (not applicable for IOS-XE)	Enter or select the name of the security group created on the ISE for the device. **Note** If you choose to select a server group, you are also give the option to add a AAA Server group. The server group name you specify here must match the name of the security group created on the ISE for the device. If these two group names do not match, the device will not be able to communicate with the ISE. Contact your ISE administrator if you do not have this information.
CTS Server Settings (IOS/IOS-XE Only)	
Log Binding Changes	Whether to enable logging for IP-to-SGT binding changes causing SXP syslogs (sev 5 syslog) to be generated whenever a change to IP-to-SGT binding occurs (add, delete, change). These changes are learned and propagated on the SXP connection. This logging function is disabled by default.

Element	Description
Enable Cache Cache NV Storage (not applicable for IOS-XE)	Whether to enable caching of TrustSec authorization and environment data information to DRAM and NVRAM. To have DRAM cache updates written to non-volatile storage and to enable the DRAM cache to be initially populated from non-volatile storage when the device boots, select the desired file system from the Cache NV Storage list. Options include: • flash • flash0 • flash1 • flash2 • disk0 • disk1 • disk2
CTS SGT Number	Enter a number from 1-65533 to manually assign a Security Group Tag (SGT) number for this device.
Server Dead Time (not applicable for IOS-XE)	Specifies how long a server in the group should not be selected for service once it has been marked as dead. The default is 20 seconds; the range is 1 to 864000.
Load Balance (not applicable for IOS-XE)	Whether to configure RADIUS server group load balancing. When Load Balance is enabled, the following options can be specified: Batch size—The number of transactions to be assigned per batch. The default transactions is 25. **Note** Changes in batch size may impact CPU load and network throughput. As batch size increases, CPU load decreases and network throughput increases. However, if a large batch size is used, all available server resources may not be fully utilized. As batch size decreases, CPU load increases, and network throughput decreases. It is recommended that the default batch size, 25, be used because it is optimal for high throughput, without adversely impacting CPU load. Ignore Preferred-Server—Instructs the device not to try to use the same server throughout a session.

Element	Description
SGT Rolebased Map table (ASA 9.3(1)+, IOS15.2(2)T+, and IOS-XE3.5.x(15.2(1)S)+ only)	Use the SGT Rolebased Map table to manually map Security Group Tag (SGT) numbers to individual IP addresses or host objects. You can do the following: • To add an entry, click the **Add Row (+)** button and fill in the Add Connection Peer dialog box. See Add/Edit SGT Role Dialog Box , on page 678. • To edit an entry, select it and click the **Edit Row (pencil)** button. • To delete an entry, select it and click the **Delete Row (trash can)** button.

Add/Edit SGT Role Dialog Box

Use the Add/Edit SGT Role dialog box to manually map Security Group Tag (SGT) numbers to individual IP addresses or host objects.

Navigation Path

- (Device view) Select an ASA device, then select **TrustSec > SXP Settings** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.
- (Policy view) Select **TrustSec > SXP Settings** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button beneath the SGT Rolebased Map table.
  - To edit an entry, select it and click the **Edit Row (pencil)** button beneath the SGT Rolebased Map table.

Related Topics

Field Reference

Table 175: Add/Edit SGT Role dialog box

Element	Description
IP Address	The IPv4 address of the host for which you want to manually assign a Security Group Tag (SGT) number. You can enter an IP address or the name of a host object, or click **Select** to select the object from a list or to create a new one.

Element	Description
CTS SGT Number	The Security Group Tag (SGT) number to assign to the specified host/IP address. Valid security tag numbers are 2-65519 for ASA 9.3(1)+.

Defining SXP Connection Peers

The Security-group eXchange Protocol (SXP) is a protocol developed for Cisco TrustSec to propagate the IP-to-SGT mapping database across network devices that do not have SGT-capable hardware support to hardware that supports SGTs and security group ACLs. SXP, a control plane protocol, passes IP-SGT mappings from authentication points (such as legacy access layer switches) to upstream devices in the network. SXP connections between peers are point-to-point and use TCP as the underlying transport protocol.

Related Topics

- Prerequisites for Integrating an ASA with Cisco TrustSec, on page 672
- About Speaker and Listener Roles, on page 672
- Configuring Security Exchange Protocol (SXP) Settings , on page 675

Step 1 Do one of the following:

- (Device view) Select an ASA device, then select **TrustSec > SXP Connection Peers** from the Policy selector.
- (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.

Step 2 In **Default Source**, enter the default local IP address for SXP connections. You can enter an IP address or the name of a network/host object, or click Select to select the object from a list or to create a new one. The IP address can be an IPv4 or IPv6 address.

Note The device determines the local IP address for an SXP connection as the outgoing interface IP address that is reachable by the peer IP address. If the configured local address is different from the outgoing interface IP address, the device cannot connect to the SXP peer and generates a system log message.

Step 3 In **Default Password** and **Confirm**, enter the default password for TCP MD5 authentication with SXP peers. By default, SXP connections do not have a password set.

You can specify the password as an encrypted string up to 162 characters or an ASCII key string up to 80 characters.

Step 4 Configure the SXP Peers:

You can do the following:

- To add an entry, click the **Add Row (+)** button and fill in the Add Connection Peer dialog box. See Add/Edit Connection Peer Dialog Box , on page 680.
- To edit an entry, select it and click the **Edit Row (pencil)** button.
- To delete an entry, select it and click the **Delete Row (trash can)** button.

Step 5 Click **Save** to save your changes.

Add/Edit Connection Peer Dialog Box

Use the Add/Edit Connection Peer dialog box to define the settings for an SXP Connection.

Note All settings are available on the Add/Edit Connection Peer dialog box whether you access that dialog box from Policy view or from Device view for a specific device type. If you configure a setting that is not supported on a particular device, you will receive a validation warning and the unsupported CLI will not be generated for the device.

Navigation Path

- (Device view) Select an ASA device, then select **TrustSec > SXP Connection Peers** from the Policy selector.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.
- (Policy view) Select **TrustSec > SXP Connection Peers** from the Policy selector. Select an existing policy or create a new one.
  - To add an entry, click the **Add Row (+)** button.
  - To edit an entry, select it and click the **Edit Row (pencil)** button.

Related Topics

- About Speaker and Listener Roles, on page 672
- Prerequisites for Integrating an ASA with Cisco TrustSec, on page 672

Field Reference

Table 176: Add Connection Peer dialog box

Element	Description
Peer IP Address	The IPv4 or IPv6 address of the SXP peer. The peer IP address must be reachable from the outgoing interface. You can enter an IP address or the name of a network/host object, or click **Select** to select the object from a list or to create a new one.
Source IP Address	(Optional) The local IPv4 or IPv6 address of the SXP connection. Specifying the source IP address is optional, however, specifying it safeguards misconfiguration. You can enter an IP address or the name of a network/host object, or click **Select** to select the object from a list or to create a new one. **Note** You cannot configure the Source IP Address and Peer IP Address with the same address. Also, you cannot use an IPv4 address with one field and an IPv6 address with the other.

Element	Description
Password	Whether to use the authentication key for the SXP connection. Select from the following values: • default—Use the default password configured for SXP connections. See Defining SXP Connection Peers , on page 679. • none—Do not use a password for the SXP connection.
Mode	The mode of the SXP connection. Select from the following values: • local—Use the local SXP device. • peer—Use the peer SXP device.
Role	Whether the device functions as a Speaker or Listener for the SXP connection: • listener—The device can receive IP-SGT mappings from downstream devices. • speaker—The device can forward IP-SGT mappings to upstream devices. See About Speaker and Listener Roles, on page 672.
Hold Time Min Only applicable on IOS and IOS-XE	The minimum length of the hold-time period in seconds for the speaker or listener device.
Hold Time Max Only applicable on IOS and IOS-XE	The maximum length of the hold-time period in seconds for the speaker or listener device. A hold-time maximum-period value is required only when you use the following option combinations: peer speaker and local listener. In other instances, only a hold-time minimum-period value is required.

Creating Security Group Objects

You can create security group object groups for use in features that support Cisco TrustSec by including the group in an extended ACL, which in turn can be used in an access rule, for example.

When integrated with Cisco TrustSec, the security device downloads security group information from the Cisco Identity Services Engine (ISE). The ISE acts as an identity repository, by providing Cisco TrustSec tag to user identity mapping and Cisco TrustSec tag to server resource mapping. You provision and manage security group access lists centrally on the ISE.

However, the device might have localized network resources that are not defined globally that require local security groups with localized security policies. Local security groups can contain nested security groups that are downloaded from the ISE. The security device consolidates local and central security groups.

To create local security groups on the device, you create a local security object group. A local security object group can contain one or more nested security object groups or Security IDs or security group names. Users can also create a new Security ID or security group name that does not exist on the device.

You can use the security object groups you create to control access to network resources. You can use the security object group as part of an access group or service policy.

Tips

- Use of these objects is supported on ASA 9.0(1)+ only.
- You must configure the TrustSec policy on the device to enable the use of these objects.
- You can create security group objects when defining policies or objects that use this object type. For more information, see Selecting Security Groups in Policies , on page 683.

Related Topics

- Selecting Security Groups in Policies , on page 683
- Creating Policy Objects , on page 237

Step 1 Select **Manage** > **Policy Objects** to open the Policy Object Manager (see Policy Object Manager , on page 232).

Step 2 Select **Security Group** from the Object Type selector.

Step 3 Right-click in the work area, then select **New Object** to open the Add Security Group dialog box.

Step 4 Enter a name for the object and optionally a description of the object.

Step 5 Add and remove items in the **Members in Group** list to identify the users and user groups defined in the object.

To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add** >> button between the lists.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see ISE Settings Page , on page 569).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add** >> button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add** >> button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+ and 1-65533 for ASA versions less than 9.3.

- To remove an item from the object, select it in the Members list and click the << **Remove** button between the lists.

Note From version 4.21 onwards, Cisco Security Manager terminates whole support, including support for any bug fixes or enhancements, for all Aggregation Service Routers, Integrated Service Routers, Embedded Service Routers, and any device operating on Cisco IOS software.

Step 6 (Optional) Under Category, select a category to help you identify this object in the Objects table. See Using Category Objects , on page 241.

Step 7 (Optional) Select **Allow Value Override per Device** to allow the properties of this object to be redefined on individual devices. See Allowing a Policy Object to Be Overridden , on page 247.

Step 8 Click **OK** to save the object.

Selecting Security Groups in Policies

In any policy or policy object that allows the specification of security groups, whether directly or through the selection of a TrustSec security group object, you can click the Select button next to the Security Groups field to help you enter the information.

In the Security Group Selector dialog box, you can define the content of the Security Groups field by populating the **Members in Group** list. To populate the list, do any combination of the following:

- In **Available Security Group**, select an existing object and click the **Add >>** button between the lists. If the desired object does not exist, you can click the **Add (+)** button below the list to create a new object. You can also select an object and click the **Edit (pencil)** button to modify it or to examine its contents.
- In **Search name/tag**, select a security group from the ISE server configured in the ISE Settings administrative options. You must configure the settings before you can select a name or tag (see ISE Settings Page , on page 569).

To find a security group, enter a search string. Then, click **Search** to find matches. A name is considered a match if the string appears anywhere within the security group name.

To add the security group, select it in the list and click the **Add >>** button between the lists.

- In **Type in comma separated (Name or Tag)**, first select the type of entry you are making, Name or Tag. Type in a valid security group name or tag number, then click the **Add >>** button between the lists. Separate multiple names or tags with commas; they are added as separate lines in the members list. When adding multiple names or tags, avoid adding spaces before or after the comma.

Valid security tag numbers are 0-65533 for ASA 9.3+ and 1-65533 for ASA versions less than 9.3.

- To remove an item from the object, select it in the Members list and click the **<< Remove** button between the lists.

Configuring TrustSec-Based Firewall Rules

Security group awareness is integrated into the access control entries, or rules, in the ACLs used to provide firewall services. Because the feature is integrated into the ACL, the techniques for adding security group awareness to a firewall policy are the same for all types of firewall policy. This topic provides general guidance on how to incorporate security group awareness into your existing policies, and directs you to more specific information on configuring each type of policy that supports security groups.

Firewall Policies That Support Security Groups

For ASA 9.0.1+ only, you can configure security groups for the following policy types:

- AAA Rules—Select **Firewall > AAA Rules** and see Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688.
- Access Rules—Select **Firewall > Access Rules** and see Configuring Access Rules , on page 723.
- Inspection Rules—Select **Firewall > Inspection Rules** and see Configuring Inspection Rules , on page 771.
- Policies that use extended ACL policy objects—Several firewall policies use extended ACL policy objects to define traffic matching criteria instead of incorporating a rule table directly in the policy. You can configure extended ACL policy objects to include security group specifications (see Creating

Extended Access Control List Objects , on page 284). You can then use these extended ACL objects in the following policies:

- Botnet Traffic Filter Rules—Select **Firewall > Botnet Traffic Filter Rules** and see Enabling Traffic Classification and Actions for the Botnet Traffic Filter , on page 913. You can use security groups as part of the traffic classification for Enable and Drop rules.
- IPS, QoS, and Connection Rules (service policy rules)—Select **Platform > Service Policy Rules > IPS, QoS, and Connection Rules** and see Service Policy Rules Page , on page 2263.

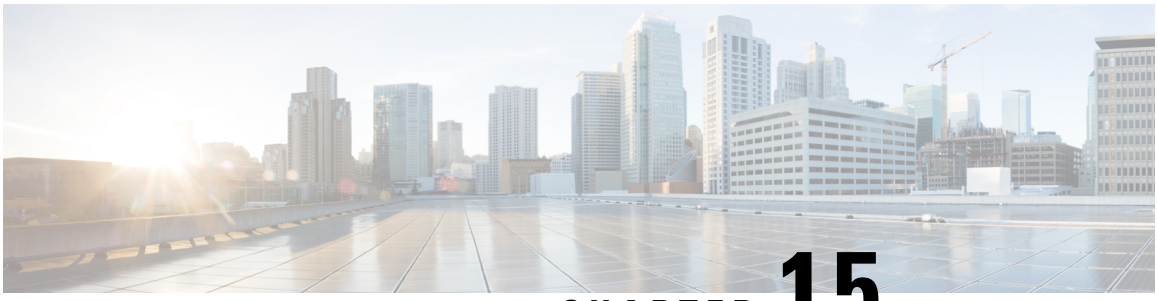
Traffic match criteria in this policy is based on extended ACL policy objects that are incorporated into traffic flow policy objects. You must select one of the options for specifying an ACL in the traffic flow object to incorporate security group traffic classification. For more information, see Configuring Traffic Flow Objects , on page 2277.

For devices running IOS 15.2(2)T+ and IOS-XE 3.5.x(15.2(1)S)+, you can configure security groups for Zone-based Firewall Rules (**Firewall > Zone Based Firewall Rules**). For more information, see Adding Zone-Based Firewall Rules , on page 942.

Monitoring TrustSec Firewall Policies

You can use Event Viewer to monitor TrustSec firewall policies the same way you would monitor other types of policies and events. The following are some tips to help you effectively monitor identity policies. For general information on using Event Viewer, see Viewing Events, on page 2677.

- There are groups of syslog messages that relate specifically to Cisco TrustSec: 766001-766020, 766201-766205, 766251-766254, and 766301-766313. You can find descriptions of these messages in the Syslog Message document for your ASA software version at http://www.cisco.com/en/US/products/ps6120/products_system_message_guides_list.html .
- Event Viewer has the following columns to display TrustSec information: TrustSec Security Group Name, TrustSec Security Group Tag, SXP Connection Source IP, SXP Connection Failure Reason, SXP Peer IP, SXP Peer Connection Failure Reason.
- You can filter on all identity-related syslog messages by creating a filter on Event Type and selecting the All Firewall Events > Trustsec Events folder.



CHAPTER 15

Managing Firewall AAA Rules

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. If you configure authentication rules, users must enter a username and password whenever they attempt to access a network behind the protected device. Once authenticated, you can further require that the user account be checked to ensure the user is authorized for network access. Finally, you can use accounting rules to track access for billing, security, or resource allocation purposes.

AAA rule configuration is complex and requires that you configure more than just the AAA rules policy. The following topics explain AAA rules in greater detail and include procedures that explain not only the AAA rules policy configuration but also what you must configure in related policies:

Understanding AAA Rules

You can use Authentication, Authorization, and Accounting (AAA) rules to control access to network resources based on user privileges rather than by IP addresses. AAA rules provide a different type of control compared to traditional access rules; where access rules allow you to control which IP addresses and services are allowed, AAA rules allow you to configure ACLs for each user to define the authorization available on a user basis, regardless of the IP address from which the user connects. (These per-user ACLs are configured in the AAA server, not in the AAA rule defined on the device.)

AAA rules policies differ from other device platform AAA policies in that AAA rules apply to traffic that is passing through the device, not to traffic directed specifically at the device. By using AAA rules, you can control entry into, or out of, a network. This might be useful if you have a network segment that is high security, where you want to carefully control access. AAA rules are also useful for circumstances where you need to maintain per-user accounting records for billing, security, or resource allocation purposes.

The AAA rules policy actually configures three separate types of rule, and the configuration of these rules differs significantly between IOS devices on the one hand and ASA, PIX, and FWSM devices on the other hand. For IOS devices, these policies define what is called authentication proxy admission control. When creating shared AAA rules, create separate rules for these types of devices. Following are the types of rules you can configure with AAA rules:

- Authentication rules—Authentication rules control basic user access. If you configure an authentication rule, users must log in if their connection request goes through the device on which the rule is defined. You can force users to log in for HTTP, HTTPS, FTP, or Telnet connections. For ASA, PIX, and FWSM devices, you can control other types of services, but users must first authenticate using one of the supported protocols before other types of traffic are allowed.

The device recognizes these traffic types only on the default ports: FTP (21), Telnet (23), HTTP (80), HTTPS (443). If you map these types of traffic to other ports, the user will not be prompted, and access will fail.

- Authorization rules—You can define an additional level of control over and above authentication. Authentication simply requires that users identify themselves. After authentication is successful, an authorization rule can query the AAA server to determine if the user has sufficient privileges to complete the attempted connection. If authorization fails, the connection is dropped.
  - For ASA, PIX, and FWSM devices, you define authorization rules directly in the AAA rules policy; if you require authorization for traffic that does not also require authentication, the unauthenticated traffic is always dropped. If you use RADIUS servers for authentication, authorization is automatically performed and authorization rules are not necessary. If you configure authorization rules, you must use a TACACS+ server.
  - For IOS devices, to configure authorization, you must configure an authorization server group in the **Firewall > Settings > AAA** policy; authorization is done for any traffic that is subject to authentication. You can use TACACS+ or RADIUS servers.
- Accounting—You can define accounting rules even if you do not configure authentication or authorization. If you do configure authentication, accounting records are created for each user, so that you can identify the specific user who made the connection. Without user authentication, accounting records are based on IP address. You can use TACACS+ or RADIUS servers for accounting.
  - For ASA, PIX, and FWSM devices, you define accounting rules directly in the AAA rules policy. You can perform accounting for any TCP or UDP protocol.
  - For IOS devices, to configure accounting, you must configure an accounting server group in the **Firewall > Settings > AAA** policy; accounting is done for any traffic that is subject to authentication.

Understanding How Users Authenticate

When you create AAA rules to require that users authenticate when trying to make connections through a device, users will be prompted to supply credentials: a username and password. These credentials must be defined in a AAA server or in the local database configured on the device.

Users are prompted only for HTTP, HTTPS, FTP, and Telnet connections (if you configure those protocols to require authentication). For ASA, PIX, and FWSM devices, you can also require authentication for other protocols; however, users are not prompted for them, and so they must first attempt one of the four supported protocols and successfully authenticate before completing connections of any other protocol that requires authentication.

Tip For ASA, PIX, and FWSM devices, if you do not want to allow HTTP, HTTPS, Telnet, or FTP through the security appliance but want to authenticate other types of traffic, you can require that the user authenticate with the security appliance directly using HTTP or HTTPS by configuring the interface to use interactive authentication (using the **Firewall > Settings > AAA Firewall** policy). The user would then authenticate with the appliance before trying other connections, using one of the following URLs, where *interface_ip* is the IP address of the interface and *port* is optionally the port number, if you specify a non-default port for the protocol in the interactive authentication table: **http://***interface_ip* [**:***port*]**/netaccess/connstatus.html** or **https://***interface_ip* [**:***port*]**/netaccess/connstatus.html**.

When attempting a connection through the device, the user is prompted based on the protocol:

- HTTP—The device prompts the user with a web page to provide username and password. The user is prompted repeatedly until successfully authorized. After the user authenticates correctly, the device redirects the user to the original destination. If the destination server also has its own authentication, the user enters another username and password.

For ASA, PIX, and FWSM devices, the security appliance uses basic HTTP authentication by default, and provides an authentication prompt. You can improve the user experience by configuring the interface for interactive authentication and specifying redirect for HTTP traffic. This redirects the user to a web page hosted on the appliance for authentication. To configure an interface to use interactive authentication, add the interface to the Interactive Authentication table on the **Firewall > Settings > AAA Firewall** policy (see AAA Firewall Settings Page, Advanced Setting Tab , on page 704). Ensure that you select the HTTP and Redirect options when adding the interface.

You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

However, when using basic HTTP authentication, if the user is going to an HTTP server that requires authentication, the same username and password used to authenticate with the appliance is sent to the HTTP server. Thus, login to the HTTP server fails unless the same username and password are used by the ASA and HTTP server. To avoid this problem, you must configure a virtual HTTP server on the ASA. You can configure a virtual HTTP server using the **Firewall > Settings > AAA Firewall** policy (see AAA Firewall Settings Page, Advanced Setting Tab , on page 704).

Tip In HTTP authentication, the username and password are transmitted in clear text. You can prevent this by selecting the **Use Secure HTTP Authentication** option on the **Firewall > Settings > AAA Firewall** policy. This option ensures that credentials are encrypted.

- HTTPS—The user experience for HTTPS is the same as for HTTP; the user is prompted until successfully authorized, and then redirected to the original destination.

For ASA, PIX, and FWSM devices, the security appliance uses a custom login screen. Like with HTTP, you can configure the interface to use interactive authentication, in which case HTTPS connections use the same authentication page as HTTP connections. You must configure the interface separately for HTTPS redirection; use the **Firewall > Settings > AAA Firewall** policy.

For IOS devices, HTTPS connections are authenticated only if you enable SSL on the device and your AAA rules require HTTP authentication proxy. This configuration is explained in Configuring AAA Rules for IOS Devices , on page 691.

- FTP—The device prompts once for authentication. If authentication fails, the user must retry the connection.

When prompted, the user can enter the username required for device authentication followed by an at sign (@) and then the FTP username (name1@name2). For the password, the user would then enter the device authentication password followed by an at sign (@) and then the FTP password (password1@password2). For example, enter the following text.

name> asa1@partreqpassword> letmein@he110

For IOS devices, this method of entering both the device and FTP credentials is required. For ASA, PIX, and FWSM devices, this feature is useful when you have cascaded firewalls that require multiple logins. You can separate several names and passwords by multiple at signs (@).

- Telnet—The device prompts several times for authentication. After a number of failed attempts, the user must retry the connection. After authentication, the Telnet server prompts for its username/password. You can configure a virtual Telnet server using the **Firewall > Settings > AAA Firewall** policy (see AAA Firewall Settings Page, Advanced Setting Tab , on page 704).

Configuring AAA Rules for ASA, PIX, and FWSM Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX and FWSM features/functionality, it does not support any enhancements.

When you configure AAA rules for an ASA, PIX, or FWSM device, you are configuring policies that define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure network access authentication, you need to configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for network access authentication. You do not need to configure options for features you do not need.

- Understanding Interface Role Objects , on page 303
- Understanding and Specifying Services and Service and Port List Objects , on page 331

- Understanding AAA Server and Server Group Objects , on page 256

Step 1 Do one of the following to open the AAA Rules Page , on page 693:

- (Device view) Select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add and Edit AAA Rule Dialog Boxes , on page 697.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Editing Rules , on page 607.

Step 3 Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see Add and Edit AAA Rule Dialog Boxes , on page 697.

- Authentication (with or without User-Identity), Authorization, or Accounting Action—Select the options applicable for this rule. Authentication prompts the user for a username and password when attempting HTTP, HTTPS, FTP, or Telnet access. Authorization is an additional level, where after the user authenticates, the AAA server is checked to ensure that the user is authorized for that type of access. Accounting generates usage records in the AAA server and can be used for billing, security, or resource allocation purposes. You can generate accounting information for any TCP or UDP traffic.

When you select Authentication, you can also select User-Identity (ASA 8.4(2+) only). This option indicates that the ASA should use the Active Directory servers configured in the identity-firewall domain mappings to authenticate users (see Identifying Active Directory Servers and Agents , on page 645). If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. When you select User-Identity, and you do not select Authorization or Accounting, do not specify a AAA server group.

- Permit or Deny—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use “All-Addresses” as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see Specifying IP Addresses During Policy Definition , on page 318.
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See Selecting Security Groups in Policies , on page 683, Configuring TrustSec-Based Firewall Rules , on page 683 and Creating Security Group Objects , on page 681 for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS_DOMAIN\username), user groups (NetBIOS_DOMAIN\\user_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see Configuring Identity-Based Firewall Rules , on page 659 and Creating Identity User Group Objects , on page 656.
- Services—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be

authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.

- AAA Server Group—The AAA server group policy object to be used for authentication, authorization, or accounting. If the rule applies more than one of these actions, the server group must support all selected actions. For example, only TACACS+ servers can provide services for authorization rules (although using RADIUS for authentication rules automatically includes RADIUS authorization), and only TACACS+ and RADIUS servers can provide accounting services. If you want to use different server groups for particular actions, define separate rules for each type of action that requires different groups.
- Interfaces—The interface or interface role for which you are configuring the rule.

Click **OK** when you are finished defining your rule.

Step 4 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

Step 5 Select **Firewall > Settings > AAA Firewall** (in Device or Policy view) to open the AAA Firewall Settings Page, Advanced Setting Tab , on page 704. Configure the AAA firewall settings:

- If you configured rules for HTTP authentication, you should select **Use Secure HTTP Authentication**. This ensures that the username and password entered for HTTP authentication are encrypted. If you do not select this option, the credentials are sent in clear text, which is insecure.

Tip If you select this option, ensure that you do not configure 0 for the user authentication timeout (**timeout uauth 0**, configured in the **Platform > Security > Timeouts** policy), or users might be repeatedly prompted for authentication, making the feature disruptive to your network.

- If you configured authentication for HTTP or HTTPS traffic on an interface, you should consider adding the interface to the Interactive Authentication table. When you enable an interface for interactive authentication, users get an improved authorization web page, one that is the same for both HTTP and HTTPS.

Click **Add Row** to add the interface to the table. Select whether the interface should listen for HTTP or HTTPS traffic (add the interface twice to listen for both protocols), and the port to listen on if not the default port for the protocol (80 and 443, respectively). Select **Redirect network users for authentication request** so that network access traffic gets the improved authentication prompt; if you do not select the option, only users trying to log into the device get the prompt.

Note You might want to continue to use basic HTTP authentication if: you do not want the security appliance to open listening ports; if you use NAT on a router and you do not want to create a translation rule for the web page served by the security appliance; basic HTTP authentication might work better with your network. For example non-browser applications, like when a URL is embedded in email, might be more compatible with basic authentication.

- For FWSM devices, you can also disable the authentication challenge for protocols you have otherwise configured to require authentication. You can also add interfaces to the Clear Connections table to ensure that active connections for users whose authentication has timed out are cleared and do not hang.
- If you want to exempt some devices from your AAA rules based on their media access control (MAC) address, click the **MAC Exempt List** tab to open the AAA Firewall Page, MAC-Exempt List Tab , on page 710. Enter a name for the exemption list, and then click the **Add Row** button and fill in the Firewall AAA MAC Exempt Setting Dialog Box , on page 711 to add the MAC address to the table with a permit rule. You might want to do this for secure, trusted devices.

The order of entries matters, so ensure that any specific entries that are covered by broader entries come before the broad entries in the table. The device processes the list in order and the first match is applied to the host. For more detailed information about how the entries on the MAC exempt list are processed, see AAA Firewall Page, MAC-Exempt List Tab , on page 710.

Step 6 If you are configuring authentication rules using a RADIUS server, and you include per-user ACL configurations in the user profiles, enable per-user downloadable ACLs on the interface. (RADIUS authentication automatically includes authorization checking.) For information on configuring per-user ACLs, see the information on configuring RADIUS authorization in the *Cisco ASA 5500 Series Configuration Guide Using the CLI* at http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/access_fwaaa.html.

a) Select **Firewall > Settings > Access Control** (in Device or Policy view) to open the Access Control Settings Page , on page 740.

b) Click the Add Row button beneath the interface table and fill in the Firewall ACL Setting Dialog Box , on page 742 with at least these options:

- Enter the interface or interface role on which you are performing authorization.
- Select **Per User Downloadable ACLs**.

c) Click **OK** to save your changes.

Configuring AAA Rules for IOS Devices

When you configure AAA rules for an IOS device, you are configuring authentication proxy (AuthProxy) admission control policies. These policies define who is allowed to make HTTP, HTTPS, FTP, and Telnet connections through (not to) the device. To fully configure authentication proxy, you must configure several policies, not just the AAA rules policy.

The following procedure covers all policies you would need to configure to supply full authentication, authorization, and accounting support for authorization proxy. You do not need to configure options for features you do not need.

Related Topics

- Understanding AAA Rules , on page 685
- Understanding How Users Authenticate , on page 686
- Creating a New Shared Policy , on page 221
- Modifying Policy Assignments in Policy View , on page 221
- Understanding Networks/Hosts Objects , on page 310
- Understanding Interface Role Objects , on page 303
- Understanding and Specifying Services and Service and Port List Objects , on page 331
- Understanding AAA Server and Server Group Objects , on page 256

Step 1 Do one of the following to open the AAA Rules Page , on page 693:

- (Device view) Select **Firewall > AAA Rules** from the Policy selector.

- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add and Edit AAA Rule Dialog Boxes , on page 697.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Editing Rules , on page 607.

Step 3 Configure the rule. Following are the highlights of what you typically need to decide. For specific information on configuring the fields, see Add and Edit AAA Rule Dialog Boxes , on page 697.

- **Authentication Action**—Select this option. Authentication rules are the only type of rule you can configure in the AAA rules policy for IOS devices.
- Permit or Deny—Whether you are subjecting the identified traffic to AAA control (permit) or you are exempting it from AAA control (deny). Any denied traffic is not prompted for authentication and is allowed to pass unauthenticated, although your access rules might drop the traffic.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use "All-Addresses" as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see Specifying IP Addresses During Policy Definition , on page 318.
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See Selecting Security Groups in Policies , on page 683, Configuring TrustSec-Based Firewall Rules , on page 683, and Creating Security Group Objects , on page 681 for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS_DOMAIN\username), user groups (NetBIOS_DOMAIN\\user_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see Configuring Identity-Based Firewall Rules , on page 659 and Creating Identity User Group Objects , on page 656.
- Services—You can specify any type of service for authentication and authorization rules; however, the user is prompted to authenticate only for HTTP, HTTPS, FTP, and Telnet connections. Thus, if you specify something other than these services, the user must first attempt one of these connections and successfully authenticate (and be authorized, if you include that action) before any other types of connections are allowed. For accounting rules, you can specify any TCP or UDP service (or simply TCP and UDP themselves), if you want to account for all types of traffic.
- Interfaces—The interface or interface role for which you are configuring the rule.
- Service triggering the authentication proxy—Select the checkboxes for the type of traffic you want to trigger user authentication: HTTP, FTP, or Telnet. You can select any combination. If you want to trigger the proxy for HTTPS support, select HTTP and perform the HTTPS configuration that is explained in a subsequent step in this procedure.

Click **OK** when you are finished defining your rule.

Step 4 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

Step 5 Select **Firewall > Settings > AuthProxy** (in Device or Policy view) to open the AAA Page , on page 712. Configure the authentication proxy settings:

- **Authorization server groups**—If you want all of your authentication rules to also perform user authorization, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that control authorization. You can also specify LOCAL to use the user database defined on the device. If you do not specify a server group, authorization is not performed.

Tip You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **auth-proxy** as the service (e.g. service = auth-proxy), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the "Configuring the Authentication Proxy" section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at http://www.cisco.com/en/US/docs/ios/sec_user_services/configuration/guide/sec_cfg_authen_prxy_ps6441_TSD_Products_Configuration_Guide_Chapter.html.

- **Accounting server groups**—If you want to perform accounting for all of your authentication rules, specify the list of AAA server group policy objects that identify the TACACS+ or RADIUS servers that perform accounting. If you do not specify a server group, no accounting is performed. When performing accounting, also configure the following options as appropriate:
  - If you specify more than one server group, consider selecting **Use Broadcast for Accounting**. This option sends accounting records to the primary server in each server group.
  - The **Accounting Notice** option defines when the server is notified. The default is to notify the server at the start and stop of a connection, but you can select to only send stop notices (or none at all).
- You can also customize authentication banners for each service, and on the Timeout tab, you can change the default idle and absolute session timeouts globally or for each interface.

Step 6 Select **Platform > Device Admin > AAA** (in policy view, this is in the Router Platform folder) to open the AAA Policy Page , on page 2394. Configure these options on the Authentication tab:

- Select **Enable Device Login Authentication**.
- Enter the list of server groups that will control authentication in priority order. Typically, you will use at least some of the same LDAP, RADIUS, or TACACS+ server groups used in the AuthProxy policy. However, this policy also defines device login control, so you might want to include some other server groups. For more information, see AAA Page—Authentication Tab , on page 2395.

Step 7 If you are using the authentication proxy with HTTP connections, and you also want to use the proxy with HTTPS connections, select **Platform > Device Admin > Device Access > HTTP** (in policy view, this is in the Router Platform folder) to open the HTTP Policy Page , on page 2420. Configure these options:

- Select **Enable HTTP** and **Enable SSL** if they are not already selected.
- On the AAA tab, ensure that the configuration for login access to the device is appropriate. If you are using AAA to control access through the device, you might want to use it for access to the device.

AAA Rules Page

Use the AAA Rules page to configure AAA rules for device interfaces. AAA rules configure network access control (called authentication proxy on IOS devices), which forces the user to authenticate when attempting network connections that traverse the device. Authenticated traffic can also be required to undergo authorization

(where after the user enters a valid user name and password, the AAA server is checked to verify that the user is authorized for network access). You can also configure accounting rules, even for unauthenticated traffic, to provide information you can use for billing, security, and resource allocation purposes.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 AAA rules were "unified," meaning one set of AAA rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See Policy Object Changes in Security Manager 4.4 , on page 11for additional information.) In Policy view, IPv4 and unified versions of the AAA policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see Converting IPv4 Rules to Unified Rules , on page 626). The following descriptions apply to all versions of the AAA rule table, except where noted.If you assign an IPv4 AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified AAA-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

AAA rule configuration is complex and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- Understanding AAA Rules , on page 685
- Understanding How Users Authenticate , on page 686
- Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688
- Configuring AAA Rules for IOS Devices , on page 691

Tip Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see Enabling and Disabling Rules , on page 618.

Navigation Path

To access the AAA Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > AAA Rules** from the Policy selector.
- (Policy view) Select **Firewall > AAA Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > AAA Rules**.

Related Topics.

Field Reference

Table 177: AAA Rules Page

Element	Description
Expand all rows/Collapse all rows	Use these buttons to expand or collapse all sections in the rules table. **Note** The buttons are located in the upper-right corner of the Filter area above the access rules table.
Conflict Indicator icons	Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see Understanding Automatic Conflict Detection , on page 744.
No.	The ordered rule number.
Permit	Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny): • Permit—Shown as a green check mark. • Deny—Shown as a red circle with slash.
Sources	The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.
Destinations	The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.
Service	The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See Understanding and Specifying Services and Service and Port List Objects , on page 331.
Interface	The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See Understanding Interface Role Objects , on page 303.

Element	Description
Action	The type of AAA control defined by this rule: • Authenticate—Users making connections through the device must authenticate with their username and password. Protocols requiring authentication are defined by the Service field (for ASA/PIX/FWSM devices) or the AuthProxy methods (for IOS devices). • Authorize—Authenticated users are also checked with the AAA server to ensure that they are authorized to make the connection (ASA/PIX/FWSM only). • Account—Accounting records for the identified traffic are sent to the AAA server (ASA/PIX/FWSM only). You can right-click the Action cell in an existing AAA rule and choose Edit Action to change your selections. See Edit AAA Option Dialog Box , on page 703 for more information.
AAA Method (IOS) (not presented for ASA 9.0+ devices)	The authentication method for this rule: Web Authorization Proxy (Auth-Proxy), HTTP Basic, or Windows NT LAN Manager (NTLM)
AuthProxy	The protocols that require authentication using the authentication proxy method. This applies only to IOS devices. You can right-click the AuthProxy cell in an existing AAA rule and choose Edit AuthProxy to change your selections. See AuthProxy Dialog Box , on page 703 for more information.
Server Group	The AAA server group that provides the authentication, authorization, or accounting support defined in the rule. This group is used for ASA/PIX/FWSM devices only. For information on configuring AAA servers for IOS devices for use with these rules, see Configuring AAA Rules for IOS Devices , on page 691. You can right-click the Server Group cell in an existing AAA rule and choose Edit Server Group to change your selections. See Edit Server Group Dialog Box , on page 703 for more information.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	The description of the rule, if any.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Page elements below the rules table	
Query	Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See Generating Policy Query Reports , on page 627

Element	Description
Find and Replace button (binoculars icon)	Click this button to search for various types of items within the table and to optionally replace them. See Finding and Replacing Items in Rules Tables , on page 614.
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope or section. For more information, see Moving Rules and the Importance of Rule Order , on page 617.
Add Row button	Click this button to add a rule to the table after the selected row using the Add and Edit AAA Rule Dialog Boxes , on page 697. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see < Adding and Removing Rules , on page 606.
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells. For more information, see Editing Rules , on page 607.
Delete Row button	Click this button to delete the selected rule.

Right-click Menu

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command “Edit Server Group” is included when you right-click a Server Group cell. See Editing Rules , on page 607 for more information.
- The Combine Rules option is also included in the right-click menu. See Combining Rules , on page 620 for more information.

Add and Edit AAA Rule Dialog Boxes

Use the Add and Edit AAA Rules dialog boxes to add and edit AAA rules. AAA rule configuration is more complex than just filling in this dialog box, and differs significantly based on the operating system. Carefully read the following topics before configuring AAA rules:

- Understanding AAA Rules , on page 685
- Understanding How Users Authenticate , on page 686
- Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688
- Configuring AAA Rules for IOS Devices , on page 691

Navigation Path

From the AAA Rules Page , on page 693, click the **Add Row** button or select a row and click the **Edit Row** button.

Related Topics

- Adding and Removing Rules , on page 606
- Editing Rules , on page 607

Field Reference

Table 178: Add and Edit AAA Rules Dialog Boxes

Element	Description
Enable Rule	Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see Enabling and Disabling Rules , on page 618.
Action (Permit/Deny)	Whether the defined traffic will be subject to the rule (Permit) or exempted from the rule (Deny). For example, if you create an authentication deny rule for the 10.100.10.0/24 network to any destination using the HTTP service, users on this network are not prompted to authenticate with the device when making HTTP requests.

Element	Description
Sources	Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources: • Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces. The "All-Address" objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles. **Note** You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN. See Understanding Networks/Hosts Objects , on page 310, Specifying IP Addresses During Policy Definition , on page 318 and Understanding Interface Role Objects , on page 303 for additional information about these definitions. • Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See Selecting Security Groups in Policies , on page 683, Configuring TrustSec-Based Firewall Rules , on page 683 and Creating Security Group Objects , on page 681 for more information about security groups. • Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. For more information, see: • Selecting Identity Users in Policies , on page 658 • Configuring Identity-Based Firewall Rules , on page 659 • Creating Identity User Group Objects , on page 656 **Note** Enter more than one value in any of these fields by separating the items with commas. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.
Destinations	Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.

Element	Description
Services	The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination). Enter more than one value by separating the items with commas. It is important that you select the service type carefully based on the device type: • For IOS devices, only the protocols you select with the authorization proxy check boxes at the bottom of the dialog box are used for AAA control, so you can use IP as the protocol. • For ASA, PIX, and FWSM devices, although you can force authentication for any type of traffic, the security appliance prompts only for HTTP/HTTPS, FTP, and Telnet traffic. If you specify a service other than one of these, users are prevented from making any connection through the appliance until they try one of these services and successfully authenticate. If the rule is only for accounting, you can specify any TCP or UDP protocols for which you want to create records. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331. **Note** Due to an issue in PIX 6.3 and FWSM devices, if you specify a service with a source port, no traffic is authenticated. Therefore, source ports are ignored when the CLI is generated from your rule for these device types.
Interface	The interface or interface role object that identifies the interface from which to authenticate, authorize, or account users. Enter the name of the interface or interface role, or click **Select** to select it from a list or to create a new interface role object. For authentication rules on ASA and PIX devices, you can modify how this interface authenticates HTTP/HTTPS traffic by using the **Firewall > Settings > AAA Firewall** policy. Configuring the interface as an HTTP/HTTPS listening port can improve the authentication experience for users. For more information, see Understanding How Users Authenticate , on page 686 and AAA Firewall Settings Page, Advanced Setting Tab , on page 704.
Description	An optional description of the rule (up to 1024 characters).
The Authentication Action, Authorization Action, and Accounting Action check boxes define the types of rules that will be generated on the device. Each type generates a separate set of commands, but if you select more than one option, your other selections in this dialog box are limited to those supported by all selected actions. You can right-click the Action cell in an existing AAA rule and choose Edit Action to change your selections. See Edit AAA Option Dialog Box , on page 703 for more information.	

Element	Description
Authentication Action User-Identity	• Authentication—Users must supply a user name and password to make a connection through the device. For ASA, PIX, and FWSM devices, what you enter in the Services field determines which protocols require authentication, although the device will prompt only for HTTP, HTTPS, FTP, and Telnet connections. For IOS devices, the protocols that require authentication are based on the authorization proxy check boxes you select at the bottom of the dialog box. • User-Identity (ASA 8.4(2+) only.)—For ASA devices, when you select Authentication Action, you also have the option to select User-Identity. This option indicates that the device should use the identity-firewall domain mappings defined in the Identity Options policy to authenticate users instead of the AAA Server Group setting in the AAA rule. If the user enters a domain name, the AD server associated with the domain is queried. Otherwise, the AD server associated with the default domain is queried. See Identifying Active Directory Servers and Agents , on page 645.
Authorization Action (PIX/ASA/FWSM)	Authorization—After successful authentication, the AAA server is also checked to determine if the user is authorized to make the requested connection. If you specify a RADIUS server for authentication rules, authorization happens without you having to configure authorization rules. If you are using a TACACS+ server, you must create separate authorization rules.
Accounting Action (PIX/ASA/FWSM)	Accounting—Accounting records will be sent to the TACACS+ or RADIUS server for the TCP and UDP protocols specified in the Services field. If you also configure authentication, these records are per-user; otherwise, they are based on IP address. For IOS devices, accounting is configured in the **Firewall > Settings >ScanSafe Web Security** policy, not in AAA rules, and applies only to the protocols you select for authentication proxy.

Element	Description
AAA Server Group (PIX, ASA, FWSM)	The AAA server group policy object that defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click **Select** to select it from a list or to create a new object. You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server. You can use a mix of server groups for different actions for the same source/destination pair by creating separate rules for the desired combination of authentication, authorization, and accounting actions. For more information on AAA server group objects, see Understanding AAA Server and Server Group Objects , on page 256. **Tips** • If you select Authenticate Action and User-Identity, but not the Authorization or Accounting actions, any server you specify here is ignored. Do not select a server to avoid validation warnings. • AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see Configuring AAA Rules for IOS Devices , on page 691. • You can right-click the Server Group cell in an existing AAA rule and choose Edit Server Group to change your selections. See Edit Server Group Dialog Box , on page 703 for more information.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Method (IOS) (not presented for ASA 9.0+ devices)	Choose Auth-Proxy, HTTP-basic, or NTLM. If you choose Auth-Proxy, the following options are available: • HTTP • FTP • Telnet Specify the protocols for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. For specific information, see Configuring AAA Rules for IOS Devices , on page 691. You can right-click the AuthProxy cell in an existing AAA rule and choose Edit AuthProxy to change your selections. See Configuring AAA Rules for IOS Devices , on page 691 for more information.

Edit AAA Option Dialog Box

Use the Edit AAA Option dialog box to select whether the rule performs authentication (with or without user identity), authorization, or accounting. Authorization and accounting rules work only on ASA, PIX, and FWSM devices. For a complete explanation of these options, see the related explanations in the following topics:

- Add and Edit AAA Rule Dialog Boxes , on page 697
- Understanding AAA Rules , on page 685

Navigation Path

Right-click the Action cell in a AAA rule (on the AAA Rules Page , on page 693) and select **Edit AAA**.

AuthProxy Dialog Box

Use the AuthProxy dialog box to edit the authorization proxy settings in a AAA rule. For IOS devices, select the protocols (HTTP, FTP, or Telnet) for which you want to enforce authentication using the authentication proxy. If you select HTTP, you can also configure HTTPS authentication proxy by enabling SSL on the device. For specific information, see Configuring AAA Rules for IOS Devices , on page 691.

Navigation Path

Right-click the AuthProxy cell in a AAA rule (on the AAA Rules Page , on page 693) and select **Edit AuthProxy**.

Edit Server Group Dialog Box

Use the Edit Server Group dialog box to edit the AAA server group used in a AAA rule, which defines the AAA server that should provide authentication, authorization, or accounting for the traffic defined in the rule. Enter the name of the policy object or click **Select** to select it from a list or to create a new object. For more information on AAA server group objects, see Understanding AAA Server and Server Group Objects , on page 256.

You must select a type of server that can perform all actions defined in the rule. For example, the local database (defined on the device) cannot provide authorization services. If you use a RADIUS server for authentication, it automatically provides authorization services, but you cannot define an authorization rule that uses a RADIUS server. Unlike the Add and Edit AAA Rule Dialog Boxes , on page 697, this dialog box does not validate your selection.

Note This setting applies only to ASA, PIX, and FWSM devices. AAA server groups for IOS devices are defined in other policies. For a complete explanation of the configuration, see Configuring AAA Rules for IOS Devices , on page 691.

Navigation Path

Right-click the Server Group cell in a AAA rule (on the AAA Rules Page , on page 693) and select **Edit Server Group**.

AAA Firewall Settings Policies

The AAA firewall settings policy configurations influence the behavior of your AAA rules.

This section contains the following topics:

AAA Firewall Settings Page, Advanced Setting Tab

Use the AAA Firewall settings policy to configure optional settings to refine how your AAA rules policy behaves. This topic describes the settings available on the Advanced Setting tab; for information on the MAC Exempt List tab, see AAA Firewall Settings Page, Advanced Setting Tab , on page 704.

Navigation Path

To access the AAA Firewall settings page, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, select **Firewall > Settings > AAA Firewall**; select the **Advanced Setting** tab if necessary.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select and existing one, then select the **Advanced Setting** tab if necessary.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **Advanced Setting** tab if necessary.

Field Reference

Table 179: Advanced Setting Tab, AAA Firewall Settings Page

Element	Description
Use Secure HTTP Authentication	Whether to require users making HTTP requests that traverse the security appliance to first authenticate with the security appliance using SSL (HTTPS). The user is prompted for username and password. Secure HTTP authentication offers a secure method for user authentication to the security appliance prior to allowing HTTP-based web requests to traverse the security appliance. This is also called HTTP cut-through proxy authentication. If you select this option, ensure that your access rules do not block HTTPS traffic (port 443), and that any PAT configuration also includes port 443. Also, be aware that a maximum of 16 concurrent authentications are allowed, and that if you configure 0 for the user authentication timeout (**timeout uauth 0**, configured in the **Platform > Security > Timeouts** policy) users might be repeatedly prompted for authentication, making the feature disruptive to your network. **Tip** If you do not select this option, HTTP authentication sends the username and password in clear text.
Enable Proxy Limit Maximum Concurrent Proxy Limit per User	Whether to allow proxy connections. If you enable proxies, you must set a limit on the number of proxy connections allowed for each user, from 1 to 128. The device default is 16, but you must specify a number.

Element	Description
Enable Virtual HTTP	Whether to configure a virtual HTTP server. This feature redirects all HTTP connections that require AAA authentication to the virtual HTTP server on the ASA. The ASA prompts for the AAA server username and password. After the AAA server authenticates the user, the ASA redirects the HTTP connection back to the original server, but it does not include the AAA server username and password. Because the username and password are not included in the HTTP packet, the HTTP server prompts the user separately for the HTTP server username and password. For more information, see Understanding How Users Authenticate , on page 686. For inbound users (from lower security to higher security), you must also include the virtual HTTP address as a destination interface in the access rule applied to the source interface. Moreover, you must add a static NAT rule for the virtual HTTP IP address, even if NAT is not required. An identity NAT rule is typically used (where you translate the address to itself). For outbound users, there is an explicit permit for traffic, but if you apply an access rule to an inside interface, be sure to allow access to the virtual HTTP address. A static NAT rule is not required. To configure a virtual HTTP server: **1.** Select the Enable Virtual HTTP check box. **2.** Enter the IP address or select a Networks/Hosts object representing the virtual HTTP server. Make sure this address is an unused address that is routed to the ASA. For example, if you perform NAT for inside addresses accessing an outside server, and you want to provide outside access to the virtual HTTP server, you can use one of the global NAT addresses for the virtual HTTP server address. **3.** (Optional) If you are using text-based browsers, where redirection does not happen automatically, select the Warning check box. This enables an alert to notify users when the HTTP connection is being redirected.

Element	Description
Enable Virtual Telnet	Whether to configure a virtual Telnet server. When an unauthenticated user connects to the virtual Telnet IP address, the user is challenged for a username and password, and then authenticated by the AAA server. After the user is authenticated, the message "Authentication Successful" appears. Then the user can successfully access other services that require authentication. For inbound users (from lower security to higher security), you must also include the virtual Telnet address as a destination interface in the access rule applied to the source interface. In addition, you must add a static NAT rule for the virtual Telnet IP address, even if NAT is not required. An identity NAT rule is typically used (where you translate the address to itself). For outbound users, there is an explicit permit for traffic, but if you apply an access rule to an inside interface, be sure to allow access to the virtual Telnet address. A static NAT rule is not required. To configure a virtual Telnet server: **1.** Select the Enable Virtual Telnet check box. **2.** Enter the IP address or select a Networks/Hosts object representing the virtual Telnet server. Make sure this address is an unused address that is routed to the ASA. For example, if you perform NAT for inside addresses accessing an outside server, and you want to provide outside access to the virtual Telnet server, you can use one of the global NAT addresses for the virtual Telnet server address.
Interactive Authentication table (ASA/PIX 7.2.2+)	Use this table to identify the interfaces that should listen for HTTP or HTTPS traffic for authentication. If your AAA rules require authentication for these protocols on interfaces designated in this table, the user is presented with an improved authentication web page as opposed to the default authentication pages used by the appliance. These pages are also used for authenticating direct connections to the device. • To add an interface to the table, click the **Add Row** button and fill in the Interactive Authentication Configuration Dialog Box , on page 708. • To edit a setting, select it and click the **Edit Row** button. • To delete a setting, select it and click the **Delete Row** button.

Element	Description
Disable FTP Authentication Challenge Disable HTTP Authentication Challenge Disable HTTPS Authentication Challenge Disable Telnet Authentication Challenge (All options FWSM 3.x+ only.)	Whether to disable authentication challenges for the indicated protocols. By default, the FWSM prompts the user for a username and password when a AAA rule enforces authentication for traffic in a new session and the protocol of the traffic is FTP, Telnet, HTTP, or HTTPS. In some cases, you might want to disable the authentication challenge for one or more of these protocols. If you disable challenge authentication for a particular protocol, traffic using that protocol is allowed only if the traffic belongs to a session previously authenticated. This authentication can be accomplished by traffic using a protocol whose authentication challenge remains enabled. For example, if you disable challenge authentication for FTP, the FWSM denies a new session using FTP if the traffic is included in an authentication AAA rule. If the user establishes the session with a protocol whose authentication challenge is enabled (such as HTTP), FTP traffic is allowed.
Clear Connections When Uauth Timer Expires table (FWSM 3.2+ only.)	Use this table to identify the interfaces and source addresses where you want to force any active connections to close immediately after the user authentication times out or when you clear the authentication session with the **clear uauth** command. (User authentication timeouts are defined in the **Platform > Security > Timeouts** policy.) For any interface/source address pairs not listed in this table, active connections are not terminated even though the user authentication session expired. • To add any interface and source address pair, click the **Add Row** button and fill in the Clear Connection Configuration Dialog Box , on page 709. • To edit a setting, select it and click the **Edit Row** button. • To delete a setting, select it and click the **Delete Row** button.

Interactive Authentication Configuration Dialog Box

Use the Interactive Authentication Configuration dialog box to configure an interface to listen for HTTP or HTTPS traffic to authenticate network users. The authentication web page used by a listening port provides an improved user experience compared to the default authentication pages used for these protocols. The authentication pages are used for connections directly to the device and if you select the redirection option, also for through traffic if your AAA rules policy requires HTTP/HTTPS network access authentication. For more information, see Understanding How Users Authenticate , on page 686.

Navigation Path

Go to the AAA Firewall Settings Page, Advanced Setting Tab , on page 704 and click the **Add Row** button beneath the Interactive Authentication table, or select an item in the table and click the **Edit Row** button.

Related Topics

Field Reference

Table 180: Interactive Authentication Configuration Dialog Box

Element	Description
Protocol	The protocol that you want to listen for, either HTTP or HTTPS. If you want to listen for both protocols on an interface, add the interface to the table twice.
Interface	The interface or interface role on which to enable listeners. Enter the name of the interface or interface role, or click **Select** to select it from a list or to create a new interface role.
Port	The port number that the security appliance listens on for this protocol if other than the default, which is 80 (HTTP) and 443 (HTTPS).
Redirect network users for authentication request	Whether to redirect users who are making requests through the device to the authentication web page served by the security appliance. If you do not select this option, only traffic directed to the interface is prompted with the improved authentication web page.

Clear Connection Configuration Dialog Box

Use the Clear Connection Configuration dialog box to identify the source addresses whose active connections to close immediately after the user authentication times out or when you clear the authentication session with the **clear uauth** command. You must specify the interfaces on which those sessions should be cleared. These settings are used only for FWSM 3.2+ devices.

User authentication timeouts are defined in the **Platform** > **Security** > **Timeouts** policy.

Navigation Path

Go to the AAA Firewall Settings Page, Advanced Setting Tab , on page 704 and click the **Add Row** button beneath the Clear Connections When Uauth Timer Expires table, or select an item in the table and click the **Edit Row** button.

Field Reference

Table 181: Clear Connection Configuration Dialog Box

Element	Description
Interface	The interfaces or interface roles for which you are configuring settings. Enter the name or click **Select** to select the interface or interface role or to create a new role. Separate multiple entries with commas.
Source IP Address/Netmask	The host or network addresses for which you want to clear connections immediately when the user authentication timer expires. The list can include host IP addresses, network addresses, address ranges, or network/host objects Separate multiple addresses with commas. For more information on entering addresses, see Specifying IP Addresses During Policy Definition , on page 318.

AAA Firewall Page, MAC-Exempt List Tab

Use the MAC Exempt List tab of the AAA Firewall settings policy to identify hosts that should be exempt from authentication and authorization for ASA, PIX, and FWSM 3.x+ devices. For example, if the security appliance authenticates TCP traffic originating on a particular network but you want to allow unauthenticated TCP connections from a specific server, create a rule permitting traffic from the MAC address of the server.

You can use masks to create rules for groups of MAC addresses. For example, if you want to exempt all Cisco IP phones whose MAC addresses start with 0003.e3, create a permit rule for 0003.e300.0000 with the mask ffff.ff00.0000. (An f in a mask exactly matches the corresponding number in the address, whereas a 0 matches anything.)

Deny rules are necessary only if you are permitting a group of MAC addresses but there are some addresses within the permitted group that you want to require to use authentication and authorization. Deny rules do not prohibit traffic; they simply require the host to go through normal authentication and authorization. For example, if you want to allow all hosts with MAC addresses that start with 00a0.c95d, but you want to force 00a0.c95d.0282 to use authentication and authorization, enter these rules in order:

1. Deny 00a0.c95d.0282 ffff.ffff.ffff
2. Permit 00a0.c95d.0000 ffff.ffff.0000

When you deploy the policy to the device, these entries are configured using the **mac-list** and **aaa mac-exempt** commands.

Tip The MAC exempt list is processed on a first match basis. Thus, the order of entries matters. If you want to permit a group of MAC addresses, but deny a subset of them, the deny rule must come before the permit rule. However, Security Manager does not allow you to order MAC exempt rules: they are implemented in the order shown. If you sort the table, your policy changes. If your entries do not depend on each other, this does not matter. Otherwise, ensure that you enter rows in the proper order.

Navigation Path

To access the MAC Exempt List tab, do one of the following:

- (Device view) Select an ASA, PIX, or FWSM device, then select **Firewall > Settings > AAA Firewall**. Select the **MAC-Exempt List** tab.
- (Policy view) Select **Firewall > Settings > AAA Firewall** from the Policy Type selector. Create a new policy or select an existing one, then select the **MAC-Exempt List** tab.
- (Map view) Right-click an ASA, PIX, or FWSM device and select **Edit Firewall Settings > AAA Firewall**, then select the **MAC-Exempt List** tab.

Related Topics

- Configuring AAA Rules for ASA, PIX, and FWSM Devices , on page 688

Field Reference

Table 182: MAC-Exempt List Tab, AAA Firewall Settings Page

Element	Description
MAC-Exempt List Name	The name of the MAC exempt list.
MAC Exempt List table	The MAC exempt rules that you want to implement. The table shows the MAC addresses and masks (in hexadecimal) and whether you are permitting them (exempting them from authentication and authorization) or denying them (making them go through standard authentication and authorization). The device processes the entries in order and uses the first match (not the best match). • To add an exemption rule, click the **Add Row** button and fill in the Firewall AAA MAC Exempt Setting Dialog Box , on page 711. • To edit an exemption rule, select it and click the **Edit Row** button. • To delete an exemption rule, select it and click the **Delete Row** button.

Firewall AAA MAC Exempt Setting Dialog Box

Use the Firewall AAA MAC Exempt Setting dialog box to add and edit exemption entries in the MAC Exempt List table. The security appliance skips authentication and authorization for hosts associated with permitted MAC addresses.

Navigation Path

Go to the AAA Firewall Page, MAC-Exempt List Tab , on page 710 and click the **Add Row** button beneath the MAC Exempt List table, or select an item in the table and click the **Edit Row** button.

Field Reference

Table 183: Firewall AAA MAC Exempt Setting Dialog Box

Element	Description
Action	The action you want to take for the hosts that use the specified MAC addresses: • Permit—Exempts the host from authentication and authorization. • Deny—Forces the host to go through authentication and authorization.
MAC Address	The MAC address of the hosts in standard 12-digit hexadecimal format, such as 00a0.cp5d.0282. You can enter complete MAC addresses or partial addresses. For partial addresses, you can enter 0 for digits you are not matching.

Element	Description
MAC Mask	The mask to apply to the MAC address. Use f to match a digit exactly, 0 to match any digit at that place: • To specify an exact match of the address, enter ffff.ffff.ffff. • To match an address pattern, enter 0 for any digit for which you want to match any character. For example, ffff.ffff.0000 matches all addresses that have the same first 8 digits.

AAA Page

Use the AAA firewall settings policy to identify the servers and banners to use for the authentication proxy and to configure non-default timeout values. The authentication proxy for IOS devices is a service that forces users to log in and authenticate when trying to make HTTP, Telnet, or FTP connections through an IOS device. The settings you configure here work in conjunction with your AAA rules; only if a AAA rule requires user authentication for one of these services does your AuthProxy settings come into play.

Ensure that your configuration of this policy is consistent with your **Firewall > AAA Rules** policy. Additionally, you must use the **Platform > Device Admin > AAA** policy to define the AAA server groups to use for authenticating user access; this policy defines only the authorization and accounting server groups. If you also want to use authorization proxy for HTTPS access, you must enable SSL and configure AAA in the **Platform > Device Admin > Device Access > HTTP** policy in addition to enabling HTTP authorization proxy in your AAA rules policy.

Tip You must configure per-user ACLs in your AAA server to define the privileges you want to apply to each user. When configuring authorization, specify **AAA** as the service (e.g. service = AAA), with a privilege level of 15. For more information on configuring the AAA server, including information on configuring authentication proxy in general, see the "Configuring the Authentication Proxy" section in the *Cisco IOS Security Configuration Guide: Securing User Services, Release 12.4T* at http://www.cisco.com/en/US/docs/ios/sec_user_services/configuration/guide/sec_cfg_authen_proxy_ps6441_TSD_Products_Configuration_Guide_Chapter.html .

Navigation Path

To access the AAA page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > AAA** from the Policy selector.
- (Policy view) Select **Firewall > Settings > AAA** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Settings > AAA**.

Related Topics

- Understanding AAA Rules , on page 685
- Understanding How Users Authenticate , on page 686

- Configuring AAA Rules for IOS Devices , on page 691

Field Reference

Table 184: AAA Firewall Settings Policy

Element	Description
Virtual IP Address	You use the Virtual IP Address only in communications between the IOS HTTP authentication and clients. For the system to operate correctly, the virtual IP address must be set (it cannot be 0.0.0.0), and no other device on the network can have the same address. Configure with an unassigned and unused gateway IP address, such as 1.1.1.1.
General Tab	
Authorization Server Groups	The AAA server group policy objects that identify the LDAP, TACACS+, or RADIUS servers that will provide per-user authorization control. You can also use the LOCAL user database defined on the device. Enter the names of the server group objects, or click **Select** to select them from a list or to create new objects. Ensure that you put the groups in priority order; authorization is attempted with the first group and if that group is not available, with subsequent groups.
Accounting Server Groups Use Broadcast for Accounting	The AAA server group policy objects that identify the LDAP, TACACS+, or RADIUS servers that will provide accounting services. Accounting collects per-user usage information for billing, security, or resource allocation purposes. Enter the names of the server group objects, or click **Select** to select them from a list or to create new objects. Ensure that you put the groups in priority order; if you do not select the broadcast option, accounting is attempted with the first group and if that group is not available, with subsequent groups. If you select **Use Broadcast for Accounting**, accounting records are sent simultaneously to the first server in each group. If the first server is unavailable, failover occurs using the backup servers defined within that group.
Accounting Notice	The types of accounting notices to be sent to the accounting server groups: • Start-stop—Sends a start accounting notice at the beginning of a user process and a stop accounting notice at the end of the process. The start accounting record is sent in the background. The requested user process begins regardless of whether the start accounting notice was received by the accounting server. • Stop-only—Sends a stop accounting notice at the end of the requested user process. • None—No accounting records are sent.

Element	Description
HTTP Banner FTP Banner Telnet Banner	The banner you want to present on the authentication proxy page to the user when the user is prompted to authenticate for the specified service: • Disable Banner Text—No banner is displayed. • Use Default Banner Text—Displays the default banner "Cisco Systems, *router hostname* Authentication." • Use Custom Banner Text—Enter the text you want to present to the user.
Use HTTP banner from File URL	Whether you want to use your own web page to authenticate HTTP connections. Enter the URL for your HTTP banner. If you configure both HTTP banner text and a URL, the URL banner take precedence; however, the banner text is also configured on the device.
Advanced Tab	
Global Inactivity Time	The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is 60 minutes. Ensure that this timeout value is greater than or equal to the idle timeout values configured in the **Firewall > Settings > Inspection** policy; otherwise, timed-out user sessions might continue to be monitored and eventually hang.
Global Absolute Time	The length of time, in minutes, that an authentication proxy user session can remain active. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 0 to 35,791. The default is 0, which means that there is no global absolute timeout; user sessions are maintained as long as they are active.
Interface Timeout Table	This table contains the interfaces for which you want to configure timeout values that differ from the global timeout values. If you want to use the global values for all interfaces, you do not need to configure anything in this table. • To add an interface with customized timeout values, click the **Add Row** button and fill in the Firewall AAA IOS Timeout Value Setting , on page 714. • To edit a setting, select it and click the **Edit Row** button. • To delete a setting, select it and click the **Delete Row** button.

Firewall AAA IOS Timeout Value Setting

Note From version 4.17, though Cisco Security Manager continues to support IOS features/functionality, it does not support any enhancements.

Use the Firewall AAA IOS Timeout Value Setting dialog box to configure idle and absolute timeout values for specific interfaces. These values override the global timeout values configured on the **Firewall > Settings > ScanSafe Web Security** policy Server Timeout tab.

Navigation Path

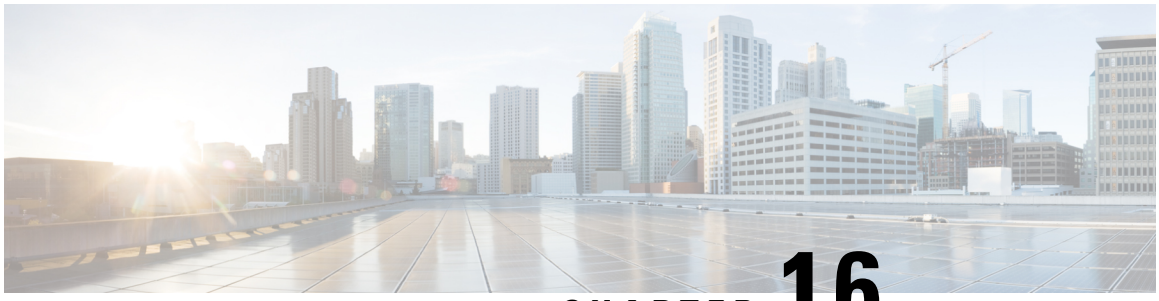
From the Advanced tab of the AAA Page , on page 712, click the **Add Row** button beneath the table of interfaces, or select a row and click the **Edit Row** button.

Field Reference

Table 185: Firewall AAA IOS Timeout Value Setting Dialog Box

Element	Description
Interfaces	The interfaces or interface roles for which you are configuring timeout values. Enter the names of the interfaces or roles, or click **Select** to select them from a list or to create new interface roles. Separate multiple entries with commas.
Auth Proxy Tab	
Inactivity/Cache Time	The length of time, in minutes, that the authentication proxy for a user is maintained when there is no user activity in the session on the interface. If this timer expires, the user session is cleared along with its dynamic user access control list (ACL), and the user must re-authenticate. The range is 1 to 2,147,483,647. The default is the global inactivity timeout value (whose default is 60 minutes).
Absolute Time	The length of time, in minutes, that an authentication proxy user session can remain active on the interface. After this timer expires, the user session must go through the entire process of establishing its connection as if it were a new request. The range is 1 to 35,791. The default is 0, which means that there is no absolute timeout; user sessions are maintained as long as they are active.
Authentication Proxy Method (IOS)	The protocols to which these timeout values should apply. You can select any combination of HTTP, FTP, or Telnet.
HTTP/NTLM Tab	The HTTP and the NTLM areas contain the same following fields and selections: Set the **Inactivity/Cache Time** and the **Absolute Time** for HTTP/NTLM and then, if desired, select Enable Passive Authentication. Finally, select the **Identity Policy** that you want to apply.
Method Order Tab	Select the checkbox of each method you want to employ and then use the up and down arrows to arrange the methods in the order you desire.
AAA Settings Tab	Select the **AAA Settings** tab to specify the Authentication, Authorization, and Account settings as detailed below.

Element	Description
Authenticate Using	In the Authenticate Using section you can select the server group(s) to use for authentication. Choices are: • **None**—No authentication • **Default**—Use the default authentication server group(s). • **Custom**—Enable the selection of user specified authentication server group(s). Then click **Select** to specify or add a server group.
Authorize Exec Operation Using	In the Authorize Exec Operation Using section you can select the server group(s) to use for authorization of executive operations. Choices are: • **None**—No authorization • **Default**—Use the default authorization server group(s) • **Custom**—Enable the selection of user specified authorization server group(s). Then click **Select** to specify or add a server group.
Perform Exec Operation Using	In the Authorize Exec Operation Using section you can select the server group(s) to use for performing executive operations. Choices are: • **None**—No authorization • **Default**—Use the default server group(s) • **Custom**—Enable the selection of user specified server group(s). Then click **Select** to specify or add a server group.
Accounting Notice	Use Accounting Notice to specify accounting operations. • **None**—No accounting notices • **Start-stop**—Accounting notices at the beginning and end of operations • **Stop-only**—Accounting notices at the end of operations.
Accounting Server Groups	Specify what accounting server groups to use. Either enter or select the Accounting Server group. **Note** If you choose to select an accounting server group, you are also give the option to add an Accounting Server group.
Use Broadcast for Accounting	Select this checkbox to broadcast accounting notices.



CHAPTER 16

Managing Firewall Access Rules

Access rules define the rules that traffic must meet to pass through an interface. When you define rules for incoming traffic, they are applied to the traffic before any other policies are applied (with the exception of less common AAA rules). In that sense, they are your first line of defense.

For some types of devices, you can configure IPv6 access rules in addition to IPv4 access rules. For information on supported device types, see <IPv6 Support in Security Manager, page 1-8>.

The following topics help you understand and work with access rules:

Understanding Access Rules

Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them.

When you deploy access rules to devices, they become one or more entries (ACEs) to access control lists (ACLs) that are attached to interfaces. Typically, these rules are the first security policy applied to packets; they are your first line of defense. You use access rules to filter out undesired traffic based on service (protocol and port numbers) and source and destination addresses, either permitting the traffic or denying (dropping) it. Each packet that arrives at an interface is examined to determine whether to forward or drop the packet based on criteria you specify. If you define access rules in the out direction, packets are also analyzed before they are allowed to leave an interface.

Tip For ASA 8.3+ devices, you can augment interface-specific access rules with global access rules. For more information, see Understanding Global Access Rules , on page 719.

When you permit traffic in an access rule, subsequent policies might end up dropping it. For example, inspection rules, web filter rules, and zone-based firewall rules are applied after a packet makes it through the interface's access rules. These subsequent rules might then drop the traffic based on a deeper analysis of the traffic; for example, the packet header might not meet your inspection requirements, or the URL for a web request might be for an undesired web site.

Thus, you should carefully consider the other types of firewall rules you intend to create when you define access rules. Do not create a blanket denial in an access rule for traffic that you really want to inspect. On the other hand, if you know that you will never allow a service from or to a specific host or network, use an access rule to deny the traffic.

Keep in mind that access rules are ordered. That is, when the device compares a packet against the rules, it searches from top to bottom and applies the policy for the first rule that matches it, and ignores all subsequent rules (even if a later rule is a better match). Thus, you should place specific rules above more general rules to ensure those rules are not ignored. To help you identify cases where IPv4 rules will never be matched, and to identify redundant rules, you can use the automatic conflict detection and policy query tools. For more information, see Using Automatic Conflict Detection , on page 744 and Generating Policy Query Reports , on page 627.

The following are additional ways in which you can evaluate your access rules:

- Combine rules—You can use a tool to evaluate your IPv4 rules and combine them into a smaller number of rules that perform the same functions. This can leave you with a smaller, easier to manage list of rules. For more information, see Combining Rules , on page 620.
- Generate hit counts—You can use a tool to view the hit count statistics maintained by the device for IPv4 and IPv6 ACLs. This can tell you how often a rule has permitted or denied traffic. For more information, see Viewing Hit Count Details , on page 753.
- View events collected by CS-MARS—You can analyze real time or historical events related to an IPv4 rule using the Cisco Security Monitoring, Analysis and Response System application if you configured it to monitor the device and you configure the rule to generate syslog messages. For more information, see Viewing CS-MARS Events for an IPS Signature , on page 2881.

Understanding Global Access Rules

Traditionally, access rules (ACLs), which control which traffic can flow through a device, are applied to device interfaces. However, with ASA devices running software release 8.3+, you have the option to create global access rules for IPv4 and IPv6.

Global access rules are defined as a special ACL that is processed for every interface on the device for traffic entering the interface. Thus, although the ACL is configured once on the device, it acts like a secondary interface-specific ACL defined for the In direction. (Global rules are always for the In direction, never the Out direction.)

When traffic enters an interface on an ASA 8.3+ device, when applying ACLs, the device first applies any interface-specific access rules to the traffic. It then applies global rules. (Overall processing is explained in Understanding the Processing Order of Firewall Rules , on page 598.

Global rules are best used for rules that you want to apply to all traffic that enters a device regardless of which interface it enters. For example, there might be a specific host or subnet that you always want to deny or permit. You can create these as global rules, so they are configured once on the device instead of configured again for each interface (although functionally the same as an interface-specific rule configured for the All-Interfaces role, All-Interfaces rules are repeated for each interface rather than being configured once on the device).

Tip If you want to configure the same set of global rules for more than one device, create a shared policy and inherit it in the IPv4 or IPv6 access rules policy for each device. Ensure that all global rules are in the Default section of the shared policy. If you put any global rules in the Mandatory section, you will not be able to inherit it on devices that have local interface-specific access rules defined. For more information on shared and inherited policies, see Local Policies vs. Shared Policies , on page 169 and Understanding Rule Inheritance , on page 170.

When you configure access rules for an ASA 8.3+ device in Security Manager, interface-specific and global rules are configured in the same policy. However, because the device always processes interface-specific rules first, Security Manager prevents you from intermixing these different types of rules. Therefore, if you configure both interface-specific and global rules on a device, keep the following in mind:

- Global rules always come last in the access rules policy. All interface-specific rules come before global rules.
- You cannot move rules in a way that violates the required order. For example, you cannot move an interface-specific rule below a global rule, or a global rule above an interface-specific rule.
- You cannot create rules in a location that violates the required order. For example, if you select an interface-specific rule, and another interface-specific rule follows it in the table, you cannot create a global rule. If you try to create the wrong kind of rule, when you save the rule, Security Manager will ask you if the rule can be created at the nearest valid location. You must accept the suggestion or the rule will not be added to the table. You can always move the rule after creating it if the suggested location is not ideal (but without violating the rules on order).

- You cannot inherit a policy if the rules in the inherited policy will violate the required order. For example, if you create global rules in the device policy, and try to inherit a shared policy that contains interface-specific rules in the Default section, Security Manager will prevent you from inheriting the policy.
- After assigning or inheriting a shared policy, you cannot edit the policy in a way that will violate rule order on any device that uses the policy.
- If you assign or inherit a policy that contains global rules on a device that does not support them, all global rules are ignored and not configured on the device. For example, if you permit all traffic from host 10.100.10.10 in a global rule in a shared policy, and assign that policy to an IOS device, the rule permitting 10.100.10.10 access is not configured on the IOS device, and traffic from that host is handled either by another interface-specific policy, or the default deny all policy. As a good practice, you should not assign shared policies that contain global rules to devices that do not support them, to ensure that you do not mistakenly believe the policy defined in a global rule is being configured on the unsupported device.

There are also some changes in how certain tools work with global rules:

- Find/Replace—You can search for global rules by using the Global interface name. However, there is no way to convert between global and interface-specific rules. Although you can find global rules using the Global interface name, if you try to replace an interface name with the name "Global," you are actually creating an interface-specific access rule that uses a policy object named Global.
- Rule Combiner—Interface-specific and global rules are never combined.

Understanding Device Specific Access Rule Behavior

If you do not create an access rule policy, the following is the default behavior based on the type of device, and what happens when you create an access rule:

- IOS devices—Permit all traffic through an interface.

When you create an access rule permitting source A to destination B without configuring TCP/UDP inspection on the inspection rule table, or configuring the **established** advanced option on the rule, the device permits any packet from A to B. However, for any returning packet from B to A, the packet is not allowed, unless there is a corresponding access rule permitting that packet. If you configure TCP/UDP inspection on the traffic the inspection rule table, a rule permitting B to A is not needed in the access rule, as any returning packet from B to A automatically passes the device.

- ASA and PIX devices—Permit traffic from a higher-security interface to a lower-security interface. Otherwise, all traffic is denied.

If an access rule allows TCP/UDP traffic in one direction, the appliance automatically allows return traffic (you do not need to configure a corresponding rule for the return traffic), except for ICMP traffic, which does require a return rule (where you permit the reverse source and destination), or you must create an inspection rule for ICMP.

- FWSM devices—Deny all traffic entering an interface, permit all traffic leaving an interface.

You must configure access rules to allow any traffic to enter the device.

If you create any rules for an interface for any type of device, the device adds an implicit **deny any** rule at the end of the policy. It is a good practice for you to add this rule yourself so that you remember it is there. Adding the rule also allows you to get hit count information for the rule. For more information, see Viewing Hit Count Details , on page 753.

Tip When you create the access rule policy, ensure that you include a rule that will permit access to the device from the Security Manager server, or you will not be able to manage the device using the product.

Understanding Access Rule Address Requirements and How Rules Are Deployed

One of the complexities of creating access control lists using the operating system commands on the command line interface (CLI) is the fact that different operating systems have different IP address formats for source and destination addresses.

For example, Cisco IOS Software requires that you enter addresses using wildcard masks instead of subnet masks. To create a rule for the 10.100.10.0/24 network (subnet mask 255.255.255.0), you are required to enter the address as 10.100.10.0 0.0.0.255. The 0 and 1 have the reverse meaning in a wildcard mask that they have in a subnet mask. In ASA, PIX, and FWSM software, however, you use subnet masks, so you enter 10.100.10.0 255.255.255.251.

Security Manager simplifies addressing requirements for access rules: you always use the subnet mask. You are not even allowed to enter a wildcard mask. When you deploy the access rules to a device, Security Manager considers the operating system of the device and converts subnet masks to wildcard masks automatically when needed.

This makes it possible for you to create shared rules based on logical policies and to apply those rules to all of your devices. For example, there might be a set of access rules that you want all devices to use, in which case you can create the shared policy and assign it as the inherited policy for all devices. You do not have to worry about defining rules using the “right” syntax for the device type. You can use the same network/host objects that you use in other types of policies to identify targeted hosts and networks.

The specific CLI commands generated in deployed configurations are also based on the type of device. For IOS devices, the **ip access-list** command is used. For ASA, PIX, FWSM devices, the **access-list** or **ipv6 access-list** command is used and the **access-group** command binds it to the interface. With ASA, PIX, FWSM, and IOS 12.4(20)T+ devices, if you use network/host objects to identify the source or destination addresses

for a rule, the **object-group** command is used to create object groups for those network/host objects. Object groups are also created for service objects.

Tips

- Because you can use network/host objects to identify a source or destination, and you can configure deployment optimization for rules, there is not always a one-to-one relationship between an access rule and ACEs in the CLI definition of an ACL.
- All access lists created from firewall rules are extended access lists (rather than standard). Security Manager applies a system-generated name to the ACL unless you specify a name for the ACL on the Access Control Settings Page , on page 740. The name applies to the ACL that includes all of the rules related to the interface and direction for which the name is defined.
- There are several deployment options that control how object groups are deployed. This topic describes the default behavior. On the Deployment Page , on page 524 (select **Tools > Security Manager Administration > Deployment**), you can deselect the option to create object groups from network/host objects. You can also optimize object groups during deployment (see Optimizing Network Object Groups When Deploying Firewall Rules , on page 634), create new object groups from rules with multiple services or source and destination addresses, or remove unused object groups.
- The deployment options also include settings that control the names of ACLs generated from access rules and how many ACLs are created. By default, Security Manager creates a unique ACL for each interface, even if this means that several duplicate ACLs are created.

If you select **Enable ACL Sharing for Firewall Rules**, Security Manager can create a single ACL and apply it to multiple interfaces, thus avoiding the creation of unnecessary duplicate ACLs. However, ACL sharing occurs only if it can be done while preserving your ACL naming requirements:

- If you specify an ACL name for an interface and direction, that name is always used, even if it means a duplicate ACL must be created. For more information, see Configuring Settings for Access Control , on page 739.
- If you select **Reuse existing names** for the Firewall Access-List Names property, the existing names are preserved (unless you override them in the access control settings policy). This means that you might end up with duplicate ACLs under different names if duplicate ACLs already exist on the device.

Tip: To maximize ACL sharing, ensure that you select **Reset to CS-Manager Generated Names** for the Firewall Access-List Names property, select **Speed** for the Optimize the Deployment of Access Rules For property, and that you do not configure ACL names in the access control settings policy.

For more detailed information about the **Enable ACL Sharing for Firewall Rules** property, see Deployment Page , on page 524

- IPv4 and IPv6 ACLs cannot have the same name.

Configuring Access Rules

Access rules policies define the rules for allowing traffic to pass through an interface. If you do not configure an access rules policy, the device behavior differs based on device type as explained in Understanding Device Specific Access Rule Behavior , on page 720.

Note Prior to the release of Security Manager 4.4 and versions 9.0 and later of the ASA, separate pages, policies and policy objects were provided for configuring IPv4 and IPv6 firewall rules and policies. With Security Manager 4.4 and ASA 9.0+, these policies and policy objects were "unified," meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See Policy Object Changes in Security Manager 4.4 , on page 11 for additional information.) However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided in Device view, while in Policy view, IPv4 and unified versions of the access-rule policy types are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see Converting IPv4 Rules to Unified Rules , on page 626). The following descriptions apply to all versions of the access rule table, except where noted.If you assign an IPv4 access-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified access-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

Before you configure access rules, consider the other types of firewall rules you will configure. Access rules are processed before all other types of rules except AAA rules. See the following topics for more information about things you should consider:

- Understanding Access Rules , on page 717
- Understanding Global Access Rules , on page 719
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721

Before You Begin

You might have a set of access rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's access rules policy. For more information, see Creating a New Shared Policy , on page 221 and Inheriting or Uninheriting Rules , on page 213.

Related Topics

- Using Sections to Organize Rules Tables , on page 618
- Copying Policies Between Devices , on page 199
- Working with Shared Policies in Device View or the Site-to-Site VPN Manager , on page 203
- Understanding Networks/Hosts Objects , on page 310
- Understanding Interface Role Objects , on page 303
- Understanding and Specifying Services and Service and Port List Objects , on page 331

Step 1 Do one of the following to open the Access Rules Page , on page 726:

- (Device view) Select **Firewall** > **Access Rules** (or **Firewall** > **Settings** > **IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall** > **Access Rules** (or **Firewall** > **Settings** > **IPv6 Access Rules**) from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add and Edit Access Rule Dialog Boxes , on page 730.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Enabling and Disabling Rules , on page 618. Special rules apply if you mix interface-specific and global rules in a policy; for more information, see Understanding Global Access Rules , on page 719.

Step 3 Configure the rule. Following are the highlights of what you typically need to decide while configuring your rule. For specific information on configuring the fields, see Add and Edit Access Rule Dialog Boxes , on page 730.

- Permit or Deny—Whether you are allowing traffic that matches the rule or dropping it.
- Source and Destination addresses—If the rule should apply no matter which addresses generated the traffic or their destinations, use "All-Addresses" as the source or destination. If the rule is specific to a host or network, enter the addresses or network/host objects. For information on the accepted address formats, see Specifying IP Addresses During Policy Definition , on page 318.
- Source and Destination Security Groups (ASA 9.0+ only)—You can specify TrustSec security groups used to filter traffic in addition to the source and destination addresses. See Selecting Security Groups in Policies , on page 683, Configuring TrustSec-Based Firewall Rules , on page 683 and Creating Security Group Objects , on page 681 for more information about security groups.
- Source Users (ASA 8.4.2+ only)—You can further define the traffic source by specifying Active Directory (AD) user names (in the format NetBIOS_DOMAIN\username), user groups (NetBIOS_DOMAIN\\user_group), or identity user group objects that define the names and groups. The user specification is conjoined to the source address to limit the match to user addresses within the source address range. For more information, see Configuring Identity-Based Firewall Rules , on page 659 and Creating Identity User Group Objects , on page 656.
- Services—Use the IP service to apply to any traffic (for example, if you want to deny all traffic from a specific source). Otherwise, select the more specific service, which is a protocol and port combination, that you are targeting.
- Interfaces or Global—The interface or interface role for which you are configuring the rule, or Global to create global access rules on ASA 8.3+ devices (see Understanding Global Access Rules , on page 719).
- Advanced settings—Click **Advanced** to open the Advanced dialog box for configuring additional settings. You can configure the following options; for detailed information, see Advanced and Edit Options Dialog Boxes , on page 733.
  - Logging options. If you are using Security Manager or CS-MARS to monitor the device, ensure that you enable logging.
  - The direction of traffic to which this rule should apply (in or out). The default is in. You cannot change this setting for global rules.
  - The time range for the rule, which allows you to configure rules that work only for specific periods of time, such as during working hours. For more information, see Configuring Time Range Objects , on page 301.

- IOS device options for fragmentation and allowing the return of traffic for established outbound sessions.
- Rule expiration dates and notification settings. For more information, see Configuring Expiration Dates for Access Rules , on page 738.

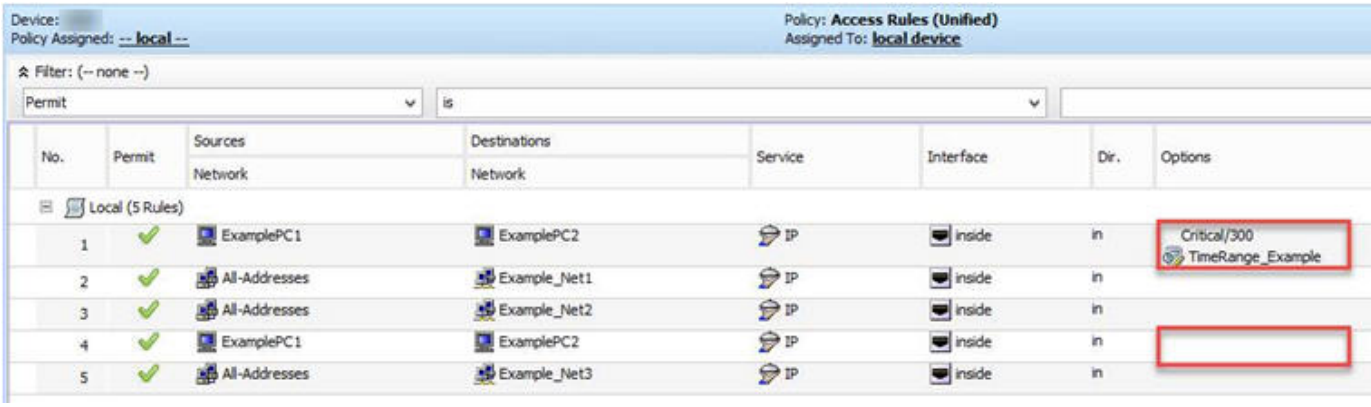
Step 4 Click **OK** when you are finished defining your rule.

Note You can enable conflict detection (see Enable Conflict Detection, on page 749) to see if the new rule conflicts or overlaps with other rules. For more information, see Using Automatic Conflict Detection , on page 744.

While adding or editing a rule, any two rules might become identical (example shown as 1 and 2 in Figure 23: Identical Rules, on page 725) except for differences in time range and/or logging values (defined in Advanced and Edit Options Dialog Boxes , on page 733)—

- Cisco Security Manager deploys only the rule that is at the bottom (2 in Figure 23: Identical Rules, on page 725).
- Only rule (2) is used to identify configuration changes in preview configuration (see Previewing Configurations , on page 424).
- If rule (2) has been deployed on the device, the preview configuration will not detect any changes.

Figure 23: Identical Rules



Step 5 If you are required to find the bottom rule (example, (2) in Figure 23: Identical Rules, on page 725), that prevents Cisco Security Manager from deployment of a top rule (1 in Figure 23: Identical Rules, on page 725), do the following:

a) Enable Conflict Detection, on page 749 for the device.
b) Generate Report, on page 749 for the conflicts found.
c) In the report, under the Rule No column, find the bottom rule (2), determine the rule number it conflicts with [rule (1)] and delete rule (1), if required.

Step 6 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see Moving Rules and the Importance of Rule Order , on page 617. There are special restrictions for moving rules when you mix interface-specific and global rules; see Understanding Global Access Rules , on page 719.

Step 7 If you already have a large number of rules, consider analyzing and combining them before deploying the new rules. You can use the conflict detection tool to analyze your rules (see Using Automatic Conflict Detection , on page 744). If analysis shows that you have a lot of redundant rules, right-click anywhere in the rules table and choose **Combine Rules** to

combine them. You can either allow Security Manager to evaluate all rules for combination, or just the rules you select before starting the rule combination tool. For more information, see Combining Rules , on page 620.

Access Rules Page

Use the Access Rules page to configure access control rules for device interfaces. Access rules policies define the rules that allow or deny traffic to transit an interface. Typically, you create access rules for traffic entering an interface, because if you are going to deny specific types of packets, it is better to do it before the device spends a lot of time processing them. Access rules are processed before other types of firewall rules.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access rules were "unified," meaning one set of access rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See Policy Object Changes in Security Manager 4.4 , on page 11 for additional information.) In Policy view, IPv4 and unified versions of the access policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see Converting IPv4 Rules to Unified Rules , on page 626). The following descriptions apply to apply to all versions of the access rule table, except where noted.

Read the following topics before you configure access rules:

- Understanding Access Rules , on page 717
- Understanding Global Access Rules , on page 719
- Understanding Device Specific Access Rule Behavior , on page 720
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Configuring Access Rules , on page 723

Tip Disabled rules are grayed out. When you deploy the configuration, disabled rules are removed from the device. For more information, see Enabling and Disabling Rules , on page 618.

Navigation Path

To open the Access Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policies selector.
- (Policy view) Select **Firewall > Access Rules** (or **Firewall > Settings > IPv6 Access Rules**) from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Access Rules** (or **Edit Firewall Policies > IPv6 Access Rules**).

Field Reference

Note For details on the fields and user interface elements available as part of the automatic conflict detection feature, see Understanding the Automatic Conflict Detection User Interface , on page 747.

Table 186: Access Rules Page

Element	Description
Expand all rows/Collapse all rows	Use these buttons to expand or collapse all sections in the rules table. **Note** The buttons are located in the upper-right corner of the Filter area above the access rules table.
Conflict Indicator icons	Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see Understanding the Automatic Conflict Detection User Interface , on page 747.
No.	The ordered rule number.
Permit	Whether a rule permits or denies traffic based on the conditions set: • Permit—Shown as a green check mark. • Deny—Shown as a red circle with slash.
Sources	The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.
Destinations	The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.

Element	Description
Service	The services or service objects that specify the protocol and port of the traffic to which the rule applies. Multiple entries are displayed on separate lines within the table cell. See Understanding and Specifying Services and Service and Port List Objects , on page 331.
Hit Count	Number of times this rule has been "hit"; that is, number of times it has permitted or denied traffic; it is actually the sum of the hit counts for all accesss control entries (ACEs) created by the rule. This information is useful in debugging the deployed policies. Use the Refresh Hit Count button at the bottom of this page to update the hit information; opens the Hit Count Selection Summary Dialog Box , on page 737. **Note** The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0. You can right-click this cell and choose Show Hit Count Details to open the Hit Count Details pane at the bottom of the Configuration Manager window. See Viewing Hit Count Details , on page 753 for more information.
Last Hit Time	Timestamp for the most-recent hit.
Interface	The interfaces or interface roles to which the rule is assigned. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed on separate lines within the table cell. See Understanding Interface Role Objects , on page 303. For ASA 8.3+ devices, global rules are indicated with the name **Global** and a special icon to distinguish them from rules that use interface or interface role names (for an explanation of the icons, see Specifying IP Addresses During Policy Definition , on page 318).
Dir.	The direction of the traffic to which this rule applies: • In—Packets entering the interface. • Out—Packets exiting the interface.
Options	Any additional options configured for the rule. These include logging, time range, and some additional IOS rule options. See Advanced and Edit Options Dialog Boxes , on page 733.
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	The description of the rule, if any.
Expiration Date	The date on which the rule expires. Expired rules show **Expired** in bold text. Expired rules are not automatically deleted.

Element	Description
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Page elements below the rules table	
Enable conflict detection Generate Report (neither option presented on the IPv6 Access Control page)	Enable or disable automatic conflict detection. This feature is enabled by default and the setting is managed per user. Disabling conflict detection for one access rules table will also disable the feature for other access rules tables. You can disable conflict detection while creating your rule table or making large modifications and then re-enable it when you are ready to verify your changes. See Using Automatic Conflict Detection , on page 744. **Note** For details on the fields and user interface elements available as part of the automatic conflict detection feature, see Understanding the Automatic Conflict Detection User Interface , on page 747 . If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of any rule conflicts detected. This report can be printed or exported to another application.
Refresh Hit Count (not presented on the IPv6 Access Control page)	Click this button to update the hit information displayed in the table; opens the Hit Count Selection Summary Dialog Box , on page 737.
Query (not presented on the IPv6 Access Control page)	Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See Generating Policy Query Reports , on page 627
Find and Replace button (binoculars icon)	Click this button to search for various types of items within the table and to optionally replace them. See Finding and Replacing Items in Rules Tables , on page 614.
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope or section. For more information, see Moving Rules and the Importance of Rule Order , on page 617.
Add Row button	Click this button to add a rule to the table after the selected row using the Add and Edit Access Rule Dialog Boxes , on page 730. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see Adding and Removing Rules , on page 606.
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells. For more information, see Editing Rules , on page 607.
Delete Row button	Click this button to delete the selected rule.

Right-click Menu

A right-click menu is also available. This menu provides access to many of the functions listed above; the options presented depend on the location right-clicked:

- If you right-click a rule in the table, the options may include editing functions relative to the specific table cell right-clicked. For example, the command "Show Hit Count Details" is included when you right-click a Hit Count cell. See Editing Rules , on page 607 for more information.
- You can also navigate from a rule to events associated with that rule in either Event Viewer or CS MARS. For more information, see Viewing Events for an Access Rule , on page 2733 and Viewing CS-MARS Events for an IPS Signature , on page 2881.
- The Import Rules and Combine Rules options are also included in the right-click menu. See Importing Rules , on page 757 and Combining Rules , on page 620 for more information about these options.

Add and Edit Access Rule Dialog Boxes

Use the Add and Edit Access Rule dialog boxes to add and edit security-device access rules.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to apply to all versions of the page, except where noted.

Read the following topics before you configure access rules:

- Understanding Access Rules , on page 717
- Understanding Global Access Rules , on page 719
- Understanding Device Specific Access Rule Behavior , on page 720
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Configuring Access Rules , on page 723

Navigation Path

On the Access Rules Page , on page 726, click the **Add Row** button or select a row and click the **Edit Row** button.

Note Prior to Cisco Security Manager 4.13, the Add Access Rule dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the csm.properties file. For more information, see Customizing defaults in the Add Access Rule dialog, on page 765

Related Topics

Field Reference

Table 187: Add and Edit Access Rule Dialog Boxes

Element	Description
Enable Rule	Check this box to enable this rule, which means the rule becomes active when you deploy the configuration to the device. Deselect to disable the rule while keeping the rule definition. Disabled rules are shown overlaid with hash marks in the rule table. See Enabling and Disabling Rules , on page 618 for more information.
Action	Whether the rule permits or denies traffic based on the conditions you define.

Element	Description
Sources	Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources: • Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces. The "All-Address" objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles. **Note** You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN. See Understanding Networks/Hosts Objects , on page 310, Specifying IP Addresses During Policy Definition , on page 318 and Understanding Interface Role Objects , on page 303 for additional information about these definitions. • Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. See Selecting Security Groups in Policies , on page 683, Configuring TrustSec-Based Firewall Rules , on page 683 and Creating Security Group Objects , on page 681 for more information about security groups. • Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. For more information, see: • Selecting Identity Users in Policies , on page 658 • Configuring Identity-Based Firewall Rules , on page 659 • Creating Identity User Group Objects , on page 656 **Note** Enter more than one value in any of these fields by separating the items with commas. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.
Destinations	Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.

Element	Description
Services	The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination). Enter more than one value by separating the items with commas. For complete information on how to specify services, see Understanding and Specifying Services and Service and Port List Objects , on page 331.
Interfaces Global (ASA 8.3+)	Specify whether you are creating an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see Understanding Global Access Rules , on page 719). If you select **Interfaces**, enter or Select the name of the interface or the interface role to which the rule is assigned, or click **Select** to select the interface or role from a list. An interface must already be defined to appear on the list. For bridge groups in routed mode, you can create access rules for both the Bridge Virtual Interface (BVI) and each bridge group member interface. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. See Understanding Interface Role Objects , on page 303. Global rules are created as a special global ACL that is not attached to specific interfaces, but are processed for all interfaces in the In direction after interface-specific rules.
Description	An optional description of the rule (up to 1024 characters).
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Advanced button	Click this button to configure other settings for the rule, including logging configuration, traffic direction, time ranges, and rule expiration dates. For more information, see Advanced and Edit Options Dialog Boxes , on page 733

Advanced and Edit Options Dialog Boxes

Use the Advanced dialog box to configure additional settings for an access rule. These settings are displayed in three different cells of the access-rule table: direction, options, and rule expiration. You can then edit those settings directly by right-clicking the appropriate cell.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access rules were unified. However, for the earlier ASA versions, a separate page for IPv6 access rules is still provided. The following descriptions apply to apply to all versions of the page, except where noted.

Navigation Path

To access the Advanced dialog box:

- In the Add and Edit Access Rule Dialog Boxes , on page 730, click the **Advanced** button.

To access one of the Edit options dialog boxes:

- Right-click the Options or Expiration Date cell in an access rule (on the Access Rules Page , on page 726) and choose the related Edit command. To change the rule direction, right-click the Dir. cell and choose the opposite direction (in or out).

If you select multiple rows, your changes replace those options for all selected rules.

Related Topics

- Understanding Access Rules , on page 717
- Managing Firewall Access Rules, on page 717
- Configuring Time Range Objects , on page 301

Field Reference

Table 188: Advanced Dialog Box

Element	Description
Enable Logging (PIX, ASA, FWSM)	Whether to generate syslog messages for the rule entries (also known as access-control entries, or ACEs), for PIX, ASA, and FWSM devices. When selected, these additional options are enabled: • Default Logging—Use the default logging behavior. If a packet is denied, message 106023 is generated. If a packet is permitted, no syslog message is generated. The default logging interval is 300 seconds. • Per ACE Logging—Configure logging specific to this entry. Choose the logging Level you want to use to log events for the ACE, and provide a logging Interval, which can range from 1 to 600 seconds. Syslog message 106100 is generated for the ACE. Available logging levels: • Emergency—(0) System is unstable • Alert—(1) Immediate action is needed • Critical—(2) Critical conditions • Error—(3) Error conditions • Warning—(4) Warning conditions • Notification—(5) Normal but significant condition • Informational—(6) Informational messages only • Debugging—(7) Debugging messages **Note** You can change the firewall and IOS logging options for an existing rule in the table on the Access Rules Page , on page 726 by right-clicking the Options cell and choosing Edit Options.
Enable Logging (IOS) Log Input (IPv4 only; neither option presented on the IPv6 Access Control page)	Whether to generate an informational logging message about the packet that matches the entry; the message will be sent to the console for IOS devices. Select Log Input to include the input interface and source MAC address or virtual circuit in the logging output.

Element	Description
Traffic Direction	For interface-specific access rules, the direction of the traffic to which this rule applies: • In—Packets entering an interface. • Out—Packets exiting an interface. **Note** You can change the direction for an existing rule in the table on the Access Rules Page , on page 726 by right-clicking the Dir. cell and choosing the opposite direction. Global rules are always applied in the In direction, so you cannot change this setting when configuring a global rule.
Time Range	The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock. Enter the name or Select the object. If the object that you want is not listed, click the Create button to create it. **Note** Time range is not supported on FWSM 2.x or PIX 6.3 devices.
Options (IOS) (IPv4 only; not presented on the IPv6 Access Control page)	Additional options for IOS devices: • none—Do not apply. • Fragment—Allow fragmentation, which provides additional management of packet fragmentation and improves compatibility with NFS. By default, a maximum of 24 fragments is accepted to reconstruct a full IP packet. However, based on your network security policy, you might want to consider configuring the device to prevent fragmented packets from traversing the firewall. • Established—Allow outbound TCP connections return access through the device. This option works with two connections: an original connection outbound from a network protected by the device, and a return connection inbound between the same two devices on an external host.
Rule Expiration	Lets you configure an expiration date for the rule. Click the calendar icon to select a date. For more information, see Configuring Expiration Dates for Access Rules , on page 738. If you configure an expiration date, you can also configure the number of days before the rule expires to send out a notification of the pending expiration, and e-mail addresses to which to send the notifications. These fields are initially filled with the information configured on the Rule Expiration administrative settings page (select **Tools > Security Manager Administration > Rule Expiration**). You can change these options for an existing rule in the table on the Access Rules Page , on page 726 by right-clicking the Expiration Date cell and choosing Edit Rule Expiration. **Note** Expired rules are not automatically deleted. You must delete them yourself and redeploy the configuration to the device.

Hit Count Selection Summary Dialog Box

Use the Hit Count Selection Summary dialog box to select the rules for which you want to refresh hit count information. Your options are limited by the rules you selected before clicking the Refresh Hit Count button. When you click OK in this dialog box, updated hit count information is obtained from the device, which can take some time, so you are given the option to abort the operation.

Note The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

Tip You can view detailed hit count information for a rule by right-clicking the Hit Count cell for that rule on the Access Rules Page , on page 726. Detailed hit count information is displayed in the Hit Count Details window, as described in Viewing Hit Count Details , on page 753.

Navigation Path

(Device view only) On the Access Rules Page , on page 726, select one access rule in the table for which you want detailed hit count information, then right-click the Hit Count column and choose Show Hit Count Details.

Related Topics

- Viewing Hit Count Details , on page 753
- Understanding Access Rules , on page 717

Field Reference

Table 189: Hit Count Selection Summary Dialog Box

Element	Description
Policy Selected	Identifies the selected policy. If you do not select a policy, this is Local, which means the rules defined specifically for the device. The policy might also be a scope within a shared or inherited policy. The indication in this field does not actually limit the scope of your hit count report.
Rules Selected	The rules for which you want to obtain hit count details; choose: • Select the **rules** option to obtain information for only those rules you selected. You can select the rows related to the name of a scope, a section name, multiple individual rules, or create a filter and select all filtered rules. This is the default if any row is selected when you initiate the hit count report. • Select **All Rules** to get hit counts for all inherited, shared, and local rules. The option is not restricted to the scope indicated in the Policy Selected field. This is the only available option if you do not select any rules before initiating the hit count report.

Element	Description
Fetch Data From	Select one of the following options and then click **Refresh Hit Count**: • Device—Security Manager fetches the Hit Count information from the device and displays the same on the Access Rules policy page. Beginning from version 4.9, Security Manager stores the Hit Count information in its database for ASA and ASASM devices. • History—Security Manager fetches the latest Hit Count information for the particular ACEs from its database (the Hit Count history) and displays the same on the Access Rules policy page. **NOTE:** If there is an open activity the Hit Count data will not be persisted in the Security Manager database. This feature is supported in IPv4 Access Rules starting from ASASM/ASA version 8.3 and Unified Access Rules starting from ASASM/ASA version 9.0. If the Fetch Data From Device is based on Rules Selected option, the Hit Count persistence support will not be enabled. The support of Hit Count persistence will be enabled only if you choose the All Rules option within Fetch Data from Device. While fetching data From history, if the value of Hit Count is zero, Security Manager checks whether the rule was hit earlier based on the Hit Count History of the rule and displays its corresponding values. If Security Manager is not able to find the values of previous Hit from History, it displays the value of Hit Count as zero.

Configuring Expiration Dates for Access Rules

A frequent use of access rules is to provide temporary access to a network. For example, you might configure an access rule to allow a partner access for the duration of a specific project. Ideally, you want to remove the access rule at the completion of the project. However, as access rule lists grow, it is hard to manage them and to remember which rules were meant to be temporary.

To help you deal with this problem, you can configure expiration dates for access rules. By configuring an expiration date, you can project when you believe the rule will no longer be needed.

Expiration dates are not hard and fast dates; Security Manager does not delete rules that reach their expiration date. Instead, when an expiration date is reached, Security Manager displays “Expired” in bold letters in the Expiration Date column for the rule. You can filter the access rules page based on the expiration date field, for example, filtering for “expiration date has passed” to see all expired rules.

If the rule is no longer needed, you can delete it (right-click and select **Delete Row**), or disable it (right-click and select **Disable**), and then redeploy the configuration to the device. You might want to initially disable the rule, which leaves the rule in the table (overlain with hash marks), in case you discover the rule really was still needed after all, saving you the time of recreating the rule. You then just need to re-enable the rule (right-click and select **Enable**) and redeploy the configuration.

When you configure an expiration date, you can also configure notification settings, specifying an e-mail address that should be notified when an expiration date is approaching. You can specify how many days before the expiration date to send the notification e-mail message to allow you time to evaluate the rule. The notification settings are initially filled with the values configured in the administration settings (select **Tools > Security Manager Administration > Rule Expiration**); you can enter different settings for a given rule.

To configure rule expiration:

- When creating a new rule, or editing an entire rule, click the Advanced button in the Add and Edit Access Rule Dialog Boxes , on page 730 to get to the rule expiration settings.
- For existing rules, you can add or edit expiration settings without editing the entire rule. Right-click the Expiration Date cell for the rule and select **Edit Rule Expiration**. You can select multiple rows to configure the same rule expiration settings. For more information, see Advanced and Edit Options Dialog Boxes , on page 733.

Related Topics

- Rule Expiration Page , on page 583
- Configuring Access Rules , on page 723

Configuring Settings for Access Control

You can configure various settings that apply to security-device access control lists. These settings work in conjunction with your access rules policy. The main setting of interest is that you can configure your own ACL names for each interface/traffic direction combination, or for the global ACL on ASA 8.3+ devices. For PIX, ASA, and FWSM devices, you can also control the maximum number of concurrent flows and the related syslog interval.

You can also configure an interface to allow per-user downloadable ACLs for PIX, ASA, and FWSM devices. This allows you to configure user-based ACLs in your AAA server to override the ACLs defined on a device.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate pages for configuring IPv4 and IPv6 access control were unified. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. The following descriptions apply to apply to all versions of the page, except where noted.

Related Topics

- Configuring Access Rules , on page 723

Step 1 Do one of the following to open the Access Control Settings Page , on page 740:

- (Device view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Configure the global settings in the top part of the page. For PIX, ASA, and FWSM devices, you can define the maximum number of concurrent deny flows and the related syslog interval. For ASA 8.3+ devices, you can enable object group search to optimize ACL performance when converting from Checkpoint, but this setting is not recommended unless you have a memory-constrained device. (Not available on the IPv6 Access Control page.)

For specific information about these settings, and the platforms that support ACL compilation, see Access Control Settings Page , on page 740.

Step 3 For each interface on which you want to configure an ACL name, or enable per-user ACLs, add the interface to the interfaces table by clicking the **Add Row** button beneath the table and filling in the Firewall ACL Setting Dialog Box , on page 742. Keep the following in mind:

- If you configure an ACL name, the name is applied to the specific interface and direction. Security Manager creates system-generated names for any interface/direction combinations that you do not specifically name.
- You can also specify the name of the global ACL for ASA 8.3+ devices.

You can edit existing entries in the list by selecting them and clicking **Edit Row**, or delete them by clicking **Delete Row**.

Access Control Settings Page

Use the Access Control Settings page to configure settings to use in conjunction with your access rules policy. You can control some performance and logging features, and configure ACL names for individual interfaces.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 access control were "unified," meaning one set of rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. However, for the earlier ASA versions, a separate page for IPv6 settings is still provided. (See Policy Object Changes in Security Manager 4.4 , on page 11 for additional information.) The following descriptions apply to apply to all versions of the page, except where noted.

Thus, many of these settings apply only to specific device types or software versions. If you configure an option and apply the policy to unsupported device types, the option is ignored for those unsupported devices.

Navigation Path

To open the Access Control Page, do one of the following:

- (Device view) Select a device, then select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policies selector.
- (Policy view) Select **Firewall > Settings > Access Control** (or **Firewall > Settings > IPv6 Access Control**) from the Policy Type selector. Create a new policy or select an existing policy.
- (Map view) Right-click a device and select **Edit Firewall Settings > Access Control** (or **Edit Firewall Settings > IPv6 Access Control**).

- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Understanding Interface Role Objects , on page 303

Field Reference

Table 190: Access Control Settings Page

Element	Description
Maximum number of concurrent flows (PIX, ASA, FWSM) (not presented on the IPv6 Access Control page)	The maximum number of concurrent deny flows that the device is allowed to create. Syslog message 106101 is generated when the device reaches the number. The range you should use depends on the amount of flash memory available in the device: • More than 64 MB—Values are 1-4096. The default is 4096. • More than 16 MB—Values are 1-1024. The default is 1024. • Less than or equal to 16 MB—Values are 1-256. The default is 256.
Syslog interval (PIX, ASA, FWSM) (not presented on the IPv6 Access Control page)	The interval of time for generating syslog message 106101, which alerts you that the security appliance has reached a deny flow maximum. When the deny flow maximum is reached, another 106101 message is generated if the specified number of seconds has passed since the last 106101 message. Values are 1-3600 milliseconds. The default is 300.
Enable Access List Compilation (Global) (IPv4 only; also not presented on the IPv6 Access Control page)	Whether to compile access lists, which speeds up the processing of large rules tables. Compilation optimizes your policy rules and performance for all ACLs, but is supported on a limited number of older platforms: • Routers (global configuration only): 7120, 7140, 7200, 7304, and 7500. • PIX 6.3 firewalls, in global mode or per interface. An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000. To compile access lists, the device must have a minimum of 2.1 MB of memory. Access list compilation is also known as Turbo ACL.
Enable Object Group Search (ASA 8.3+) (not presented on the IPv6 Access Control page)	Whether to enable object group search on ASA 8.3+ devices, which optimizes ACL performance without expanding object groups. Object group search is mainly for use when migrating from Checkpoint to ASA, which can result in a large increase in the number of access rules, when you have a memory-constrained device (that is, you find during operations that memory runs low). If you enable object group search, you cannot use the Hit Count tool to analyze your rules. In most cases, you should not enable this feature. Instead, use the rule combination tool to simplify your access rules, and consider using global rules for rules you want to enforce on all interfaces. Enable Object Group Search option is enabled by default for ASA 9.18 and above devices.

Element	Description
Enable Threshold Object Group Search (IPv4 only; also not presented on the IPv6 Access Control page)	Check this box to enable the threshold limit on object group search. By default the threshold is not enabled.
Access Control settings table	The table lists the interfaces for which you want to configure special processing. The **Interface Name** can be a specific interface or an interface role, or **Global** for global ACL settings on ASA 8.3+ devices. The main use of this table is to configure names for ACLs if you do not want Security Manager to configure system-generated names. The name applies to the ACL generated for an interface in a specific direction. You can also configure interface-level settings for per user downloadable ACLs, object group search, and ACL compilation. • To add an Access Control interface setting, click the Add Row button and fill in the Firewall ACL Setting Dialog Box , on page 742. • To edit an Access Control interface setting, select it and click the Edit Row button. • To delete an Access Control interface setting, select it and click the Delete Row button.

Note CSM does not support forward reference options for the ASA devices. CSM does not discover the CLIs that are configured in the device whose reference links are not properly established. Those CLIs are categorized as unsupported and are not be managed via CSM.

Firewall ACL Setting Dialog Box

Use the Firewall ACL Setting dialog box to configure settings for specific interfaces, interface roles, or global rules for use with security-device access rules policies.

Navigation Path

Go to the Access Control Settings Page , on page 740 and click the **Add Row** button below the interface table, or select a row in the table and click the **Edit Row** button.

Related Topics

- Configuring Settings for Access Control , on page 739

- Understanding Device Specific Access Rule Behavior , on page 720

- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Understanding Interface Role Objects , on page 303

Field Reference

Table 191: Firewall ACL Setting Dialog Box

Element	Description
Interface Global (ASA 8.3+)	Specify whether you are configuring settings for specific interfaces (or interface roles), or for global rules on ASA 8.3+ devices. If you select **Interface**, specify the name of the interface or interface role for which you are configuring settings. Enter the name or click **Select** to select it from a list or to create a new object. If you select Global, your only option is to specify the name of the global ACL.
Traffic Direction	The direction of the traffic through the interface, In or Out. The settings you configure apply only to this direction, if direction matters. For global ACLs on ASA 8.3+ devices, the direction is always in.
User Defined ACL Name (checkbox not presented on the IPv6 Access Control page) ACL Name	Whether you want to supply the name for the ACL. If you select this option, enter the name you want to use, which is applied to the ACL generated for the interface and direction combination. The name must be unique on the device. If you are configuring the name for the global ACL on ASA 8.3+ devices, the option is automatically selected; simply enter the desired name. **Note** Make sure that the firewall rules ACL name is unique and is not the same name as the ACL object defined in the Policy Object Manager. For more information see Creating Access Control List Objects , on page 283. If you do not configure a name, Security Manager generates a name for you.
Enable Per User Downloadable ACLs (PIX, ASA, FWSM) (not presented on the IPv6 Access Control page)	Whether to enable the download of per-user ACLs to override the ACLs on the interface. User ACLs are configured in a AAA server; they are not configured in Security Manager. If there are no per-user ACLs, the access rules configured for the interface are applied to the traffic. The option is configured on the device for the specified interface only when the Traffic Direction is in.

Element	Description
Enable Object Group Search (PIX 6.x) (not presented on the IPv6 Access Control page)	Whether to enable object group search on a PIX 6.x interface, which reduces the memory requirement on the device to hold large ACLs. However, object group search impacts performance by making ACL processing slower for each packet. Object group search is recommended when you have very large object groups. **Tip** If you are trying to configure object group search on ASA 8.3+ devices, the setting is on the Access Control Settings Page , on page 740.
Enable Access List Compilation (PIX 6.x) (not presented on the IPv6 Access Control page)	Whether to compile access lists on this interface for PIX 6.x devices. This setting overrides the equivalent global setting that you configure on the Access Control Settings page. ACL compilation speeds the processing of large rules tables and optimizes your policy rules and performance for the interface. An ACL is compiled only if the number of access list elements is greater than or equal to 19. The maximum recommended number of entries is 16,000. To compile access lists, the device must have a minimum of 2.1 MB of memory.

Using Automatic Conflict Detection

Security Manager provides an Automatic Conflict Detection feature for access rules. You can use Automatic Conflict Detection to evaluate the logic of your access rules. When enabled, Automatic Conflict Detection identifies rules that overlap or conflict with other rules in the access rule policy. Use this information to identify rules that need to be deleted, moved, or edited.

This section contains the following topics:

Understanding Automatic Conflict Detection

Security Manager provides an automatic conflict detection feature to help identify unnecessary redundant or duplicate rules. Certain conflicting rules might have no effect on a device after they are deployed; however, they create unnecessary clusters in the rules table. By detecting these rules, you can clean up the rule set to develop an easier to use and more efficient access rules policy.

Other conflicting rules, can create unwanted results to your network. By detecting these conflicting rules, you can identify rules that need to be deleted, moved, or edited to implement your security needs as intended.

Note The conflict detection feature will report on the first conflict between two rules. If there are additional rules in the table that also conflict with a rule, they will not be reported until the first conflict is resolved.

Conflicts detected by Security Manager are categorized in the following way:

- Redundant Object—An element in a field of a rule is a subset of one or more elements in the same field of the rule. In the following example, the source cell has two network objects: *net-group2* and *net-group1* . Since *net-group2* is a sub-set of *net-group1* , it is a redundant object and can safely be removed:

```
object-group network net-group1
network-object 10.2.0.0 255.255.0.0
object-group network net-group2
network-object 10.2.1.1 255.255.255.255
```

- Redundant Rule—Two rules apply the same action to the same type of traffic, and removing the base rule would not change the ultimate result. For example, if a rule permitting FTP traffic for a particular network were followed by a rule allowing IP traffic for that same network, and there were no rules in between denying access, then the first rule is redundant and can be deleted.

The following is a simple example of redundant rules:

```
access-list acl permit ip 2.1.1.1 255.255.255.255 any
access-list acl permit ip 2.1.1.0 255.255.255.0 any
```

- Partially Redundant Rule—A portion of a compound rule is redundant to a rule or a portion of a compound rule that follows it.
- Shadowed Rule—This is the reverse of a redundant rule. In this case, one rule will match the same traffic as another rule such that the second rule will never be applied to any traffic because it comes later in the access list. If the action for both rules are the same, you can delete the shadowed rule. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy. For example, the base rule might deny IP traffic, and the shadowed rule might permit FTP traffic, for a given source or destination.

The following is a simple example of shadowed rules:

```
access-list acl permit ip 1.0.0.0 255.0.0.0 any
access-list acl permit ip 1.1.0.0 255.255.0.0 any
```

Note Duplicate rules are reported as shadowed rules by the automatic conflict detection feature.

- Partially Shadowed Rule—A portion of a compound rule is shadowed by a rule before it. If the action for both rules are the same, you can delete the portion of the rule that is shadowed. If the two rules specify different actions for traffic, you might need to move the shadowed rule or edit one of the two rules to implement your desired policy.

Scope of Automatic Conflict Detection

When detecting conflicts, Security Manager evaluates the following pieces of information in your access rules:

- source
- destination
- services
- users
- interfaces

Note Beginning with version 4.23, Cisco Security Manager introduces the following new enhancements to the Conflict Detection feature:

- Conflict Detection is triggered only when specific fields are updated. For example Source, Destination, Security group tag, User interface and traffic detection fields in the rule policy.
- For ACL modifications, Conflict Detection gets triggered in the background when detected and does not affect the user interface.
- You can now perform upto 5 changes simultanouesly for the ACL policies and also see its progress. When you try to perform another change, a pop-up message appears indicating that you have to wait till the previous change is validated before proceeding.
- Security manager instantly frees up the memory space consumed, when the conflict detection option is disabled, and this enables optimized memory usage and reduces the possibility of overload. To perform this, you can make the parameter changes to the client LAX file to enable security manager clear more space.
- To enable Security Manager free up more space when Conflict Detection is disabled, you can make the following changes to the Client LAX file:

```
# LAX.NL.JAVA.OPTION.ADDITIONAL
 # required for optimized garbage collection
 lax.nl.java.option.additional=-client -Djdk.tls.client.protocols="TLSv1.2" -XX:+UseG1GC

 -XX:NewRatio=3 -XX:PermSize=64m -XX:MaxPermSize=128m -XX:+HeapDumpOnOutOfMemoryError
 -XX:HeapDumpPath=./logs -XX:+UseCompressedOops -Xdebug
 -Xrunjdwp:transport=dt_socket,address=5005,server=y,suspend=n
```

- Conflict Detection deep scanning requires additional time and memory usage when compared to Cisco Security Manager 4.16. Therefore, when need you can disable this functionality by setting `fwsvc.Legacy_4_16_RuleAnalysis` to true in Cisco Security Manager properties.

Note The following notes apply to Conflict Detection:

- Conflict detection is only available for access rules in the Access Rules policy for a device or shared policy. Conflict detection is not available for access rules that are part of other policies, such as AAA or inspection rules.
- If a rule contains an FQDN network/host object, the FQDN object is ignored, but the rule is otherwise included in the analysis.
- Disabled rules are not evaluated during conflict detection.
- Conflict detection does not consider time ranges when evaluating access rules. Make sure that such rules truly conflict before removing any rules flagged during conflict detection.

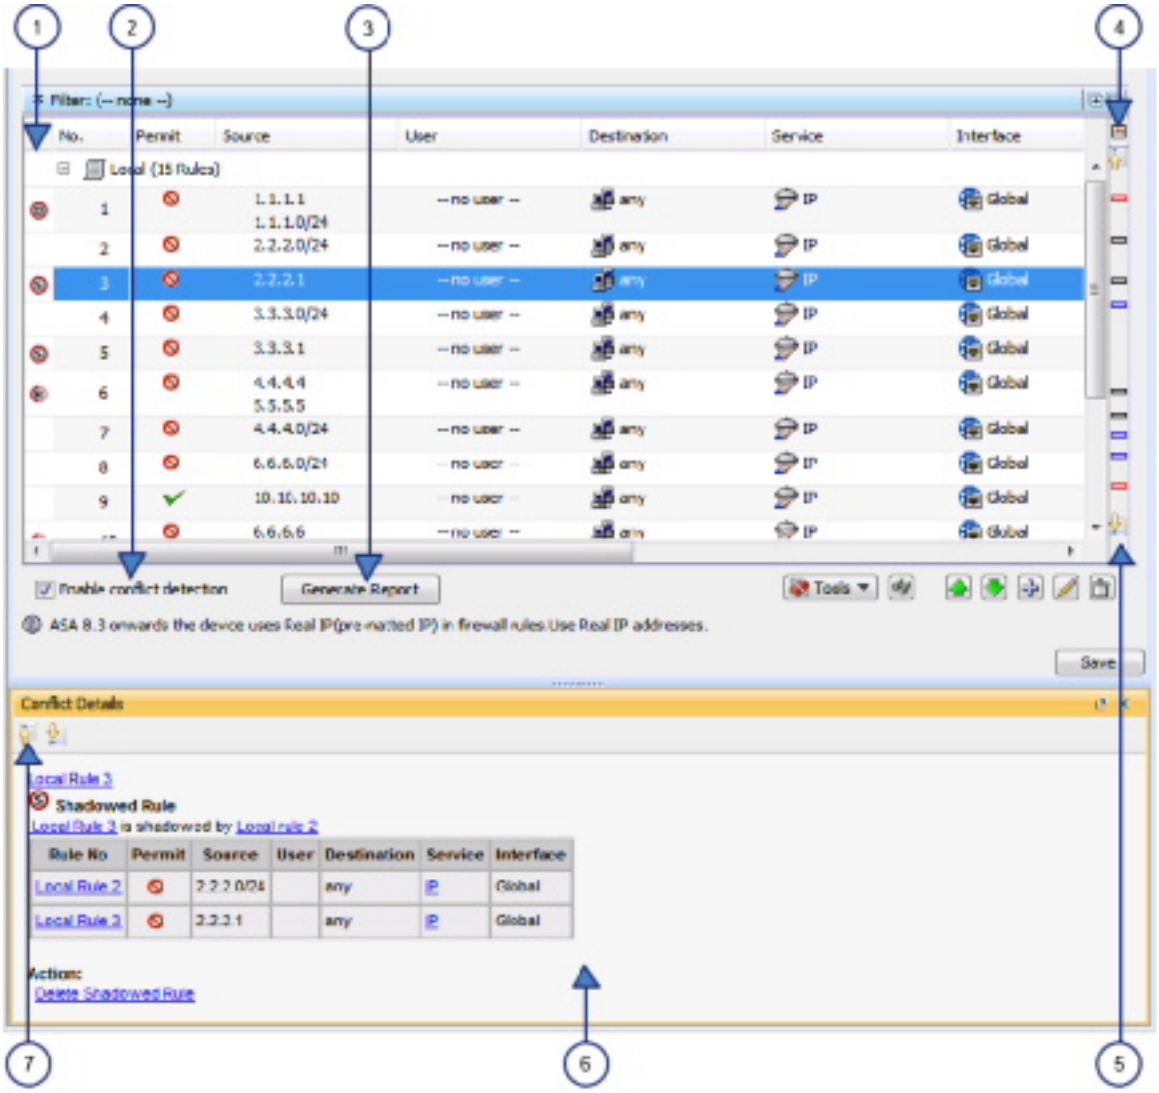
Understanding the Automatic Conflict Detection User Interface

The Automatic Conflict Detection feature is tightly coupled with the access rules table to make identifying conflicts and then resolving those conflicts faster and easier. When conflict detection is enabled, additional user interface elements are available for navigating between the conflicts and for resolving those conflicts.

Note For information on the standard elements of the Access Rules page, see Access Rules Page , on page 726.

Figure 24: Automatic Conflict Detection



1	Conflict Indicator icons	2	Enable Conflict Detection
3	Generate Report button	4	Annotation Display Options
5	Conflict navigation bar	6	Conflict Details area
7	Conflict Navigation buttons		

Conflict Indicator Icons

The Conflict Indicator icons are used to identify conflicts and to provide a quick visual representation of the type of conflict. The following table details the available icons:

Note For an explanation of the types of conflicts, see Understanding Automatic Conflict Detection , on page 744.

	Redundant Object
	Redundant Rule
	Partially Redundant Rule
	Shadowed Rule
	Partially Shadowed Rule
Note If an access rule has multiple conflicts or if it has a user note attached to it, the conflict indicator icon for that rule will have a small plus sign (+) on it.	

You can perform the following actions using the Conflict Indicator icon:

- Hover the mouse pointer over the **Conflict Indicator** icon to view a description of the conflict including any user notes attached to the conflict.
- Click the **Conflict Indicator** icon, or right-click the icon and select **Show Conflict Detail**, to open the Conflict Details pane for the selected conflict.
- Right-click the **Conflict Indicator** icon for a redundant object and select **Remove Redundant Object** to remove the redundant object from a rule.
- Right-click the **Conflict Indicator** icon and select **Add User Note** to open the Add User Note dialog box for the selected conflict. You can use the Add User Note dialog box to enter a note about the conflict that can later be included in the Rule Analysis Detail Report.

Note User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

Enable Conflict Detection

The Enable Conflict Detection option controls whether automatic conflict detection is enabled. Conflict detection is enabled by default but can be disabled by deselecting this option. The setting is managed per user and enabling or disabling conflict detection for one access rules table, will also enable or disable the feature for other access rules tables.

Generate Report

If conflict detection is enabled, you can click the **Generate Report** button to create an HTML report of the conflicts that can be printed or exported to another tool. The Rule Analysis Detail Report shows details of all the conflicts in your rules table and includes any user notes that were entered for the conflicts. It does not use

the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table.

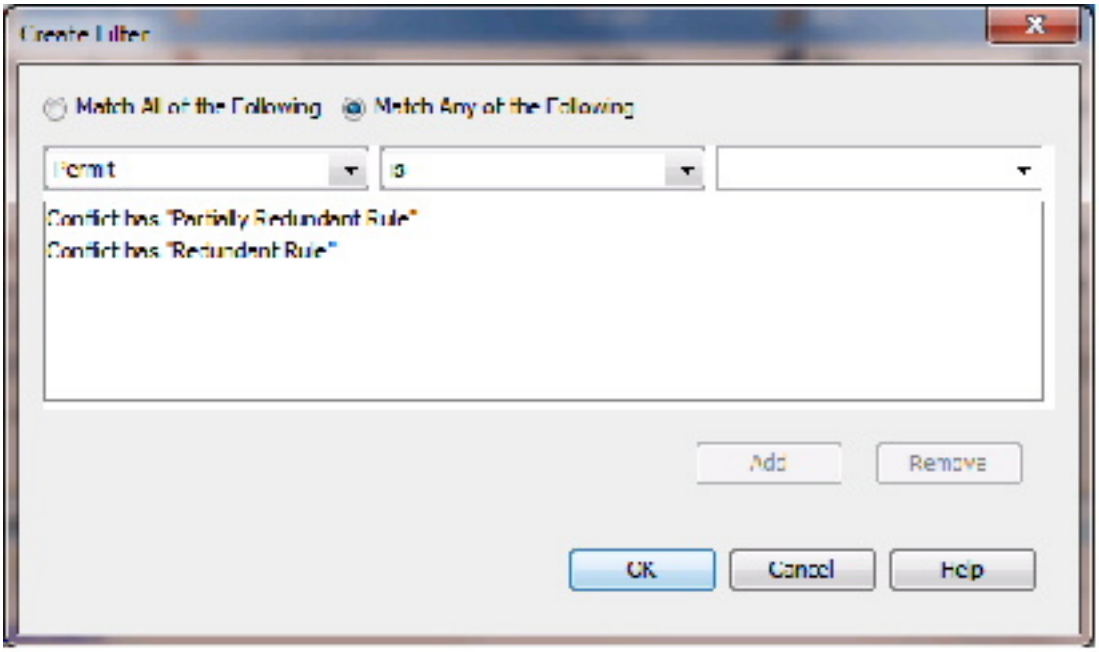
Note User notes are not saved when leaving the access rules page or after editing a rule that has a user note.

When you first open the Access Rules page, the Generate Report button is replaced with a progress bar. After conflict analysis has completed, the Generate Report button becomes available along with the other conflict detection features.

Annotation Display Options button

Click the **Annotation Display Options** button to open the Annotation Display Options dialog box, which is used for selecting the types of conflicts that should be reported. For an explanation of the types of conflicts, see Understanding Automatic Conflict Detection , on page 744.

Disabling a certain type of conflict does not remove those rules from the access rules table; it only turns off the rule conflict notification for those types of conflicts. To hide or show only conflicting rules of a certain type, you can use the table filter feature. For example, if you only wanted to see redundant and partially redundant rule conflicts, you could set up the following advanced filter:



You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

Note The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

Conflict Navigation Bar

Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

Tip Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Black locators**—Shadowed and partially shadowed rules

Conflict Details Area

The Conflict Details pane shows details for the selected conflict. The pane can be docked and undocked as needed. If the Conflict Details pane is docked while the Policy Object Manager pane is also docked, you can navigate between the two features using the tabs at the bottom of the window.

The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

You can use the links provided to navigate to the conflicting rules. You can also click the link under Action to have Security Manager perform the suggested action automatically.

Conflict Navigation Buttons

The Previous Conflict and Next Conflict buttons at the top of the Conflict Details pane allow you to step through the conflicts that need to be resolved without leaving the Conflict Details pane.

- Configuring Access Rules , on page 723

Resolving Conflicts

The following procedure explains how to use the Automatic Conflict Detection feature to resolve conflicts in your access rules.

Tip You can use the Combine Rules tool to have Security Manager evaluate your rules and find ways to combine them into more efficient rules. For more information, see Combining Rules , on page 620.

Related Topics

- Understanding Automatic Conflict Detection , on page 744
- Understanding the Automatic Conflict Detection User Interface , on page 747
- Understanding Access Rules , on page 717
- Understanding Device Specific Access Rule Behavior , on page 720
- Understanding Access Rule Address Requirements and How Rules Are Deployed , on page 721
- Configuring Access Rules , on page 723

Step 1 Do one of the following:

- (Device view) Select **Firewall** > **Access Rules** from the Policy selector.
- (Policy view) Select **Firewall** > **Access Rules** from the Policy Type selector and select an existing policy.

This opens the Access Rules Page , on page 726. If conflict detection is enabled, the access rules will be analyzed for conflicts after the table has been loaded. If conflict detection is not enabled, select **Enable conflict detection** to begin the conflict analysis.

The analysis progress is shown below the rules table. With the exception of the conflict detection features, you can perform functions on the rules table while the rules are being analyzed. After analysis has completed, the conflict detection features are enabled.

Step 2 Make sure that the rules you are interested in analyzing are being shown in the rules table. This includes expanding sections and making sure that if you are using filters that they are set correctly. Any rules that are being filtered or are in a section that is collapsed will not be included in the conflict detection analysis.

Tip You can use the Expand all rows/Collapse all rows buttons located in the upper-right corner of the Filter area above the access rules table, to quickly expand or collapse all sections in the rules table.

Step 3 Click the **Annotation Display Options** button, which is located above the Conflict navigation bar to the right of the vertical scroll bar, to open the Annotation Display Options dialog box. Verify that the types of conflicts you want detected are all enabled, and then click **OK**.

Tip You can hover the mouse pointer over the Annotation Display Options button to view a summary of the conflicts for each type and also to see which conflict types are disabled.

Note The Annotation Display Options that you select remain in effect until those options are changed. Be sure to verify these settings whenever you are working on resolving conflicts.

Step 4 If you would like to print or save a copy of the conflicts that are found in the rule table, click **Generate Report**.

The Rule Analysis Detail Report is opened in your browser. The Rule Analysis Detail Report shows details of all the conflicts in your rules table. It does not use the settings you selected in the Annotation Display Options dialog box and does not consider the filter settings defined for the table. You can save the report or print it as needed.

Step 5 Use the Conflict navigation bar to navigate to a conflict. You can use the Previous Conflict and Next Conflict buttons on the Conflict navigation bar to step through the conflicts. You can also click on one of the conflict locators in the Conflict navigation bar to move directly to a specific conflict. This is particularly helpful when working with large rules tables.

Tip Hovering over a conflict locator provides a quick summary of the conflict.

The conflict locators are color-coded as follows:

- **Red locators**—Redundant objects
- **Blue locators**—Redundant and partially redundant rules
- **Grey locators**—Shadowed and partially shadowed rules

Step 6 Click on the **Conflict Indicator** icon for the selected conflict to open the Conflict Details pane. For more information on the Conflict Indicator icons, see Understanding the Automatic Conflict Detection User Interface , on page 747.

The Conflict Details pane shows details for the selected conflict. The conflicting rules are shown together in a table for easier direct comparison. The type of conflict is shown above the table. A suggested action is shown below the table for all conflicts except partially redundant rules and partially shadowed rules, which must be resolved manually. Links are provided for direct navigation to the rules involved. Policy objects that are part of the conflicting rules can be expanded by clicking on them to see the object contents. Click again to collapse the policy object.

Step 7 Use the links provided to navigate to the rules and resolve the conflict as needed or click the link under Action to have Security Manager perform the suggested action automatically.

Note If you do not want to resolve the conflict at this time, you can enter a note about the conflict by right-clicking the **Conflict Indicator** icon to the left of the conflict in the access rule table and then selecting **Add User Note**. User notes are included in the Rule Analysis Detail Report, but are not saved when leaving the access rules page or after editing a rule that has a user note.

Step 8 Use the Conflict navigation bar or the **Previous Conflict** and **Next Conflict** buttons at the top of the Conflict Details pane to access additional conflicts that need to be resolved.

Step 9 If there are any remaining conflicts that you do not want to resolve at this time, you can click **Generate Report** to print or save a copy of the remaining conflicts, if desired.

Viewing Hit Count Details

Use Hit Count Details window to view information about the number of times an access rule was applied to traffic. These rules are the ones that become interface ACLs on the device. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the detailed hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

Tip You can click the Refresh Hit Count button at the bottom of the page to update hit count information before viewing the details for a rule. See Hit Count Selection Summary Dialog Box , on page 737 for more information.

Consider the following points when analyzing the hit count details:

- You get best results if you deploy policies to the device before viewing hit counts. If you discover a device and then generate a hit count report before deployment, the results might be incomplete or hard to interpret. For example, an access rule might not have any hit count information.
- Hit count statistics are based on ACL, not on interface. If you select **Enable ACL Sharing for Firewall Rules** on the Security Manager Administration Deployment page (see Deployment Page , on page 524), any shared ACL provides statistics that are combined from all interfaces that share the ACL.
- If you enable network object group optimization, as described in Optimizing Network Object Groups When Deploying Firewall Rules , on page 634, you might not get good hit count information.
- If you enable ACL optimization, as described in Optimizing Access Rules Automatically During Deployment , on page 763, the hit count results might have problems matching ACEs from the device to access rules. Thus, when you select an access rule, you might not get any hit count results for it.
- FQDN network/host objects are ignored. You cannot obtain hit count information on these objects.
- Hit count and last hit time information is cleared when a device is restarted.
- The Hit Count of a duplicated ACE, either within the same rule or different rules, is always set to 0.

Before You Begin

Hit count reports are subject to the following limitations:

- Hit count reports are device-specific. You can generate the report for one device at a time from Device view only. Ensure that you deploy policies to the device before generating the reports.
- If you enable object group search on an ASA 8.3+ device, you cannot use the Hit Count tool. Object group search is configured on the Access Control Settings Page , on page 740.
- Although you can select rules that include FQDN network/host objects, the objects are ignored in the hit count results.

Navigation Path

(Device view only) From the Access Rules Page , on page 726, right-click the Hit Count cell for a rule in the table and choose **Show Hit Count Details**.

The Hit Count Details window opens as a pane at the bottom of the access rules table. Click the expand button on the right side of its title bar to view the hit count details in a separate window.

Related Topics

Field Reference

Table 192: ACE Hit Count Details Window

Element	Description
Choose	You can choose how to view the hit count information: **Expanded Table** or **Raw ACE** (both are explained below).
Expanded Table	This view lists hit count information for the access control list entry (ACE) for the rule selected in the Access Rules table (on the Access Rules Page , on page 726) when you opened this window. The list contains more than one ACE if the access rule generated more than one ACE when you deployed the policy to the device. Most of the columns in this table match those of the Access Rules table; many contain the specific data configured in the ACE in place of any network/host, service, or interface role objects contained in the rule, with the exception of IOS 12.4(20)T+ devices, which show data only at the object level. Also, the name of the ACL that contains the ACE is listed. The Delta column the difference in hit count for the ACE since the last refresh. The Hit Count column shows the hits for the specific ACE rather than the overall rule. See Sample Hit Count Details Window , on page 755for an example of this table. **Tip** You can sort on multiple columns at the same time by pressing and holding the **Ctrl** key while you click the column headings. You can sort on all columns except Interface, Direction, and ACL Name.
Raw ACE	This view shows the actual CLI for the access control entry, along with the Hit Count and Last Hit Time. Use this information if you are more comfortable evaluating device commands. See Sample Hit Count Details Window , on page 755for an example of this table.
Note Beginning with version 4.9, Security Manager enables to view the Hit Count history in the Expanded Table and Raw ACE options. Click the **Show History** link to view the Hit Count history in a new window. This new Hit Count History Details window displays the Hit Count and the Last Hit Time information.	

Sample Hit Count Details Window

You can generate hit count reports to determine how often each rule in your access rule policy is matched to traffic. If an access rule is deployed as multiple access control entries (ACEs), for example, when you use interface roles to define rules and the roles apply to more than one interface, you can see the separate hit count information for each ACE deployed. The hit count results do not show counts for any other type of ACL (for example, those used with class maps or AAA rules).

For access rules on ASA 8.3(1) devices and later, the hit count report also shows the last time the access rule policy was applied to traffic. This information is helpful for determining rules that might have been superseded by other policy changes.

Use the hit count information to help you debug your access rules. The information can help you identify rules that are never hit (which might mean you do not need them, or that they are duplicates of rules higher in the ACL), and rules that are hit often (which means you might want to refine the rules).

The following figures show an example of a hit count report and how to use the information.

- Figure 25: Expanded Table, on page 756 shows the default view. The upper table lists the rules as they exist in your access rules policy, either all rules or just the ones you selected before generating the report. When you select a rule, the ACEs created on the device for that rule are listed in the expanded table in the lower half of the window. When you initially open the report, the expanded table shows the ACEs for all policies listed in the upper table.

Hit counts in the expanded table are for each ACE, whereas the count in the rules table is the sum of the hit counts for all ACEs created by the rule. Note that the expanded table for ASA/PIX/FWSM devices, and IOS devices lower than 12.4(20)T, shows hit counts for each element within any policy objects used in the rule, whereas for IOS 12.4(20)T+ devices, the information is only provided at the object group level.

- Figure 26: Raw ACE Table, on page 757shows the same ACEs in CLI format. These are the ACEs as they exist in the device configuration.

  For more information about how to read and interpret hit count reports, see Viewing Hit Count Details , on page 753.

Figure 25: Expanded Table

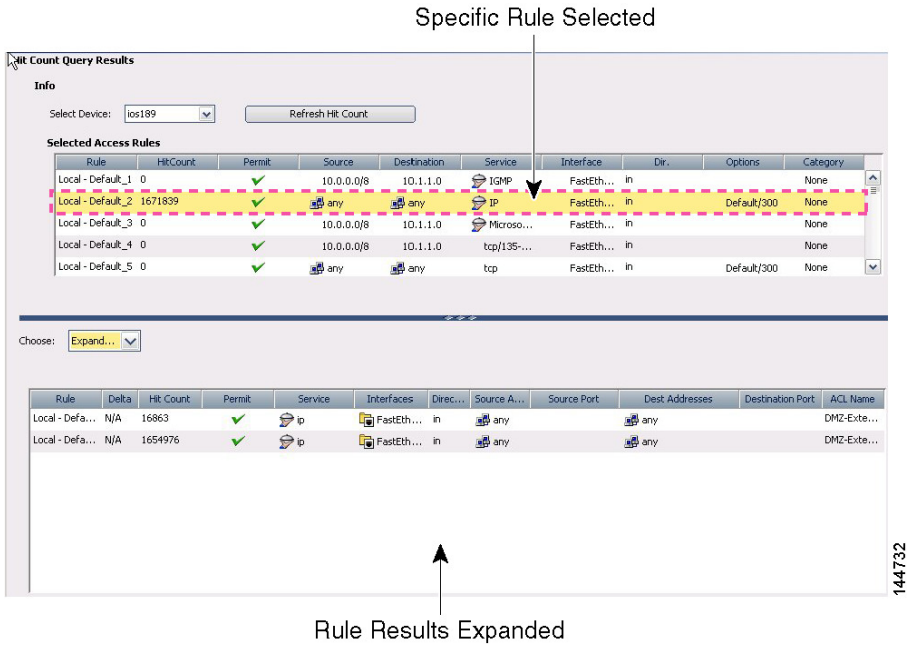

Figure 26: Raw ACE Table

Importing Rules

Typically, when you add a device to Security Manager, you discover policies from the device. This action populates your access rules policy with the access control entries (ACEs) from all active ACLs on the device.

If you find there are other ACLs that have ACEs you want included in your policy, you can define them directly in Security Manager.

Another alternative, however, is to import them by copying and pasting the CLI entries from a device running-configuration, or by typing in the desired commands. Using the Import Rules wizard, you can quickly create ACEs and associated policy objects from ACLs that you know already work. You might also want to use this method if you are more comfortable using CLI commands to define your rules.

The following steps describe using the Import Rules wizard to add CLI-based rules and preview the results.

Step 1 (Device view only) Select **Firewall** > **Access Rules** to open the Access Rules Page , on page 726.

Step 2 Select the row after which you want to add the rules. The row must be within the Local scope. If you do not select a row, the rules are added at the end of the Local scope.

Step 3 Right-click anywhere in the rules table and choose **Import Rules** to start the wizard.

The first page—Enter Parameters—of the three-page wizard appears.

Step 4 On the Import Rules Wizard—Enter Parameters Page , on page 758:

- Enter the desired CLI information in the *running-configuration* format appropriate for the selected device. For examples of importable CLI-based rules, see Examples of Imported Rules , on page 762.
- Specify whether you are creating an interface-specific rule (and enter the interface or interface role to which you want the rules to apply), or for ASA 8.3+ devices, a global rule (see Understanding Global Access Rules , on page 719).
- Specify the traffic direction with respect to the interface (the direction is always In for global rules).

Beside access control rules, you should also include the CLI information for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands), which can create time range policy objects.
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T+ devices (the **object-group** command with its subcommands), which can create network/host policy objects.

For ASA 8.3+ devices, you can also include the **object network** and **object service** commands. However, any object NAT configuration is not imported.

Step 5 Click **Next** to process the rules and open the Import Rules Wizard—Status Page , on page 760.

You are notified if your CLI input contains errors when you click the Next button. For some detailed tips about what commands you can enter, see Import Rules Wizard—Enter Parameters Page , on page 758.

The CLI is evaluated and if importable, you are told the types of objects that were created from the CLI.

Step 6 Click **Next** to view the rules and objects on the Import Rules Wizard—Preview Page , on page 760, or click **Finish** to import the rules without previewing them.

The information on the Preview page is read-only. If the rules are acceptable, click **Finish**.

If you want to make changes, you can click the **Back** button to return to the Enter Parameters page of the wizard, or you can click Finish and edit the rules on the Access Rules page.

Import Rules Wizard—Enter Parameters Page

Use the Import Rules wizard to import a set of access control entries from an ACL in device running-configuration format to your access rules policy. The command syntax you can enter is controlled by the type of device to which you are importing rules.

Beside access control rules, you should also include the CLI for the following items if they are referred to by the rules. If you do not include these items, the named objects must already be defined in Security Manager for the import to be successful.

- Time range objects (the **time-range** command with its subcommands).
- Object groups for PIX, ASA, FWSM, and IOS 12.4(20)T devices (the **object-group** command with its subcommands).

For ASA 8.3+ devices, you can also include **object network** and **object service** commands. However, any object NAT configuration is not imported.

Navigation Path

(Device view only) Right-click anywhere in the rules table on the Access Rules Page , on page 726 and choose **Import Rules**.

Related Topics

- Importing Rules , on page 757
- Understanding Interface Role Objects , on page 303

Field Reference

Table 193: Import Rules - Enter Parameters Dialog Box

Element	Description
CLI	The OS commands that define the rules and related objects that you want to import. These rules must be in running-configuration format, so they are best copied and pasted from a configuration (use Ctrl+V to paste into the field). You can also type in the commands; you will be prompted if they cannot be interpreted. You can import only one ACL at a time. To see some examples of the CLI you can import, see Examples of Imported Rules , on page 762. **Tips** • If you refer to an object but do not include the CLI, the rule might be created but it will not use the object. • For PIX, FWSM, ASA, and IOS 12.4(20)T+, you can include object group and name commands. • If you import an ACL that is inactive, it is shown as disabled in Security Manager. If you deploy the configuration, it is removed from the device. • You can import extended ACLs for all device types, and standard ACLs for IOS devices. However, standard ACLs are converted to extended ACLs.
Interface Global (ASA 8.3+)	Select whether you are importing an interface-specific or global rule. Global rules are available only for ASA 8.3+ devices, and are handled according to special rules (for detailed information, see Understanding Global Access Rules , on page 719). If you select **Interfaces**, enter the name of the interface or the interface role for which you are defining this rule, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. You can enter any combination of interface or interface role names, separated by commas.
Traffic Direction	The direction of the traffic with respect to the interface, in or out.
Category	The category assigned to the rules. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Import Rules Wizard—Status Page

Use the Status page of the Import Rules wizard to view information about the results of the import process.

Navigation Path

For information on starting the Import Rules wizard, see Import Rules Wizard—Enter Parameters Page , on page 758

Related Topics

- Importing Rules , on page 757

Field Reference

Table 194: Import Rules Wizard—Status Page

Element	Description
Progress bar	Shows the status of the import process.
Status	The status of the imported configuration.
Rules Imported	The number of rules that will be imported.
Policy Objects Created	The number of policy objects that will be created.
Messages	The warning, error, and informational messages, as indicated by the severity icon. Typical informational messages describe the policy objects created during the operation or the existing policy objects that were reused. When you select an item, the Description box to the right describes the message in detail. The Action box to the right provides information on how you can correct the problem.
Abort button	Click this button to stop the import operation.

Import Rules Wizard—Preview Page

Use the Preview page of the Import Rules wizard to view the rules and objects that will be imported if you click Finish.

This preview is read-only; you cannot edit the rules or objects. If the rules or objects are not exactly what you want, you can click Finish to add the rules and objects, and then edit them from the access rules page. For example, you cannot import rule expiration dates, because those dates have meaning only in Security Manager.

The tabs on this dialog box appear only if the data you are importing includes items to be displayed on the tab.

Tip If your CLI refers to an object that does not exist, such as a time range, the object is not included in the rule. You can either go back and add the CLI for the object, or you can click Finish, create the object yourself, and edit the rule.

Navigation Path

For information on starting the Import Rules wizard, see Import Rules Wizard—Enter Parameters Page , on page 758.

Related Topics

- Importing Rules , on page 757
- Access Rules Page , on page 726
- Understanding Networks/Hosts Objects , on page 310

- Filtering Tables , on page 50

Field Reference

Table 195: Import Rules Wizard—Preview Page

Element	Description
Rules tab	The rules that were created from your CLI and that will be imported to the access rules policy. All rules are converted to extended format, even if your CLI was for a standard ACL. Icons indicate the permit and deny status: • Permit—Shown as a green check mark. • Deny—Shown as a red circle with slash. You can right-click the source, destination, services, and interfaces cells and select **Show Contents** to see the detailed information in the cell. You can also right-click and select **Copy** to copy a rule to the clipboard in HTML format, which you can paste into a text editor.
Objects tab	The policy objects created from your CLI, if any. Depending on the CLI, Security Manager might create time range, network/host, service, or port list objects. Right-click an object and select **View Object** to see the object definition in read-only format.

Examples of Imported Rules

The following are some examples of CLI that you can import and the rules and policy objects that are created from them. For information on how to import rules, see Importing Rules , on page 757.

Example 1: Restrict a network from accessing FTP servers (ASA devices)

The following access list uses object groups and restricts the 10.200.10.0/24 network from accessing some FTP servers. All other traffic is allowed.

```
object-group network ftp_servers
network-object host 172.16.56.195
network-object 192.168.1.0 255.255.255.224
access-list ACL_IN extended deny tcp 10.200.10.0 255.255.255.0 object-group ftp_servers
access-list ACL_IN extended permit ip any any
```

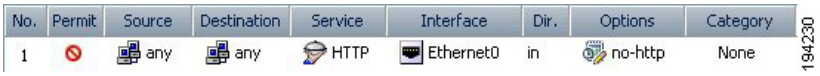
This example creates a network/host object named ftp_servers and two access rules.

Example 2: Restrict web access during working hours (ASA devices)

The following example denies HTTP requests between the hours of 8 AM and 6 PM, which are typical work hours.

```
time-range no-http
 periodic weekdays 8:00 to 18:00
access-list 101 deny tcp any any eq www time-range no-http
```

This example creates a time range object named no-http and one access rule.



Example 3: Filtering on TCP and ICMP using port numbers (IOS devices)

In the following example, the first line of the extended access list named goodports permits any incoming TCP connections with destination ports greater than 1023. The second line permits incoming TCP connections to the Simple Mail Transfer Protocol (SMTP) port of host 172.28.1.2. The last line permits incoming ICMP messages for error feedback.

```
ip access-list extended goodports
 permit tcp any 172.28.0.0 0.0.255.255 gt 1023
 permit tcp any host 172.28.1.2 eq 25
 permit icmp any 172.28.0.0 255.255.255.255
```

This example creates three access rules. Notice that the wildcard masks used in the IOS ACL syntax are converted to regular subnet masks. Security Manager automatically converts between standard network/host subnet mask designations and the wildcard masks required in IOS ACLs. Because ASA/PIX/FWSM requires the use of subnet masks in ACL commands, this makes it possible for you to create rules that can apply to all devices; Security Manager takes care of converting your rules to the correct syntax.

No.	Per...	Source	Destination	Service	Interface	Dir.	Category
1	✓	any	172.28.0.0/16	tcp/gt 1023	Ethernet0	in	None
2	✓	any	172.28.1.2	SMTP	Ethernet0	in	None
3	✓	any	any	ICMP	Ethernet0	in	None

194229

Example 4: Standard ACLs restricting hosts (IOS devices)

In the following example, the workstation belonging to Jones is allowed access to Ethernet interface 0 and the workstation belonging to Smith is not allowed access:

```
ip access-list standard workstations
 remark Permit only Jones workstation through
 permit 172.16.2.88
 remark Do not allow Smith workstation through
 deny 172.16.3.13
```

This example creates two rules, converting the standard rules to extended rules (to any destination). The remarks are saved in the description field.

No.	Permit	Source	Destination	Service	Interface	Dir.	Description
1	✓	172.16.2.88	any	IP	Ethernet0	in	Permit only Jo...
2	⊘	172.16.3.13	any	IP	Ethernet0	in	Do not allow S...

194228

For more examples of ACLs in command language format, see the following:

- IOS Devices—http://www.cisco.com/en/US/docs/ios/sec_data_plane/configuration/guide/sec_create_IP_apply.html#wp1027258 .
- ASA Devices— http://www.cisco.com/en/US/docs/security/asa/asa82/configuration/guide/acl_extended.html.

Optimizing Access Rules Automatically During Deployment

You can configure the system to optimize the access control lists (ACLs) that are created from your access rules policies when they are deployed to specific devices or to all devices. This optimization affects only the deployed policies, it does not make any changes to your access rules policy.

Optimization removes redundancies and conflicts and can combine multiple entries (ACEs) into single entries. Although the order of entries might change, the semantics of your policies are preserved; the optimized ACL accepts or denies the same set of packets as did its unoptimized form. Following are the basic cases where changes are made:

- Ineffective ACE—Where one entry is a subset of, or equal to, another entry, the ineffective ACE is removed. Consider the following example:

```
access-list acl_mdc_inside_access deny ip host 10.2.1.1 any
access-list acl_mdc_inside_access deny ip 10.2.1.0 255.255.255.0 any
```

The first ACE is actually a subset of the second ACE. ACL optimization will deploy only the second entry.

- Superset ACE—Where one entry is a superset of another and the order of the rules does not matter, the redundant rule is removed. Consider the following example:

```
access-list acl_mdc_inside_access permit tcp any any range 110 120
access-list acl_mdc_inside_access deny tcp any any range 115
```

The second ACE will never be hit. ACL optimization will remove the second ACE and deploy only the first one.

- Adjacent ACEs—Where two entries are similar enough that a single entry can do the same job. There can be no intervening rules that change which packets will hit each rule. Consider the following example:

```
access-list myacl permit ip 1.1.1.0 255.255.255.128 any
access-list myacl permit ip 1.1.1.128 255.255.255.128 any
```

The two ACEs are merged into one: access-list myacl permit ip 1.1.1.0 255.255.255.0 any.

By configuring ACL deployment optimization, you can create smaller ACLs that are more efficient, which can improve performance on devices with limited, non-expandable memory, such as the FWSM, which can be shared among multiple virtual contexts.

However, there are down sides to configuring ACL deployment optimization:

- Because optimization changes what would normally be deployed for your access rules, it is hard to correlate those rules to the actual deployed ACEs. This can make the results of the hit count tool unusable, and make it very difficult to correlate events in the Cisco Security Monitoring, Analysis and Response System application. If it is important to you that you can monitor your access rules using these tools, do not enable optimization. For more information, see Viewing Hit Count Details , on page 753 and Viewing CS-MARS Events for an IPS Signature , on page 2881.
- Optimization does not address inherent problems in your access rules policy. It is typically better to address redundancies and conflicts proactively by using the automatic conflict detection tool (see Using Automatic Conflict Detection , on page 744). You can also use the combine rules tool to optimize your rules in the access rules policy before you deploy them (see Combining Rules , on page 620).

If you decide to configure ACL deployment optimization, consider enabling it only for those devices that are memory constrained.

Step 1 Log into Windows on the Security Manager server.

Step 2 Use a text editor such as NotePad to open the **C:\Program Files\CSCOpx\MDC\athena\config\csm.properties** file. Locate the optimization section and read the instructions.

- To turn on full optimization for all devices, enter the following:

OPTIMIZE.*=full

- To turn on full optimization for a specific device, replace the asterisk with the Security Manager display name for the device. For example, if the display name is west_coast.cisco.com, enter the following:

OPTIMIZE.west_coast.cisco.com=full

- To turn on optimization but preserve the object groups used in the ACE, replace the full keyword with preserve_og. For example:

OPTIMIZE.west_coast.cisco.com=preserve_og

- If you do not want to allow the merger of adjacent entries, enter the following:

AclOptimization.doMerge=false

Step 3 Save the file. The settings take effect immediately and will be applied to all subsequent deployment jobs.

You can generate optimization reports for deployment jobs by selecting **Capture Discovery/Deployment Debugging Snapshots to File**, which is located in **Tools > Security Manager Administration > Debug Options**.

The deployment results will show optimization results summarized as an informational message that includes the original number of ACEs before optimization and the number of ACEs after optimization. The results are saved to a file on the server in the C:\Program Files\CSCOpx\MDC\temp folder. A job ID is used as part of the file name.

Customizing defaults in the Add Access Rule dialog

Prior to Cisco Security Manager 4.13, the Add Access Rule dialog was populated with default values. Starting from 4.13, the user can customize the appearance of default values by updating the csm.properties file.

To customize defaults in the Add Access Rule dialog, perform the following steps:

Step 1 Close and exit the Cisco Security Manager interface.

Step 2 Use a text editor such as NotePad to open the **C:\Program Files\CSCOpx\MDC\athena\config\csm.properties** file.

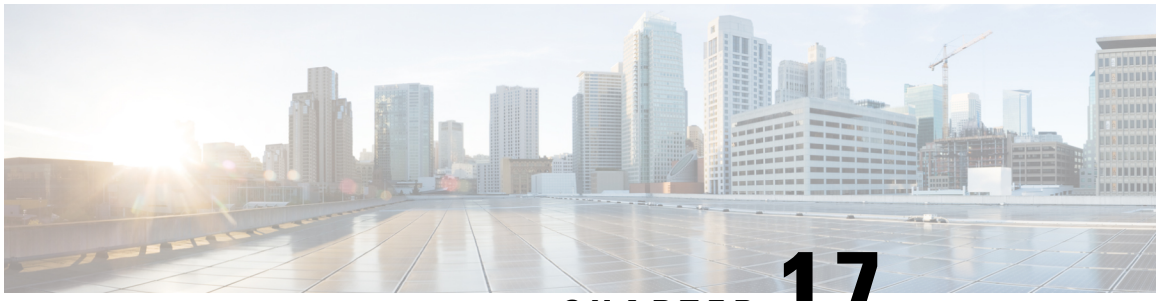
Step 3 Locate the CustDesk.Rule property at the bottom of the csm.properties file and set the values as true or false, based on your requirements:

- CustDesk.Rule.Add.Op.Load.Intf.Default.Values - Set this value as true to load the interface information by default in the Add Access rule dialog.
- CustDesk.Rule.Add.Op.Load.Other.Default.Values - Set this value as true to load the other values by default in the Add Access rule dialog.

Step 4 Save the file.

Note The settings do not take effect immediately. Restart the Cisco Security Manger services for the customized default values to take effect.

Step 5 Launch the Cisco Security Manager interface again.



CHAPTER 17

Managing Firewall Inspection Rules

Inspection rules configure protocol inspection on a device. Inspection opens temporary holes in your access rules to allow return traffic for connections initiated within your trusted network. When traffic is inspected, the device also implements additional controls to eliminate mal-formed packets based on the inspected protocols.

Note From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

The device commands generated for inspection rules vary based on device type. For devices running ASA, PIX 7.0+, and FWSM 3.x+, access-list, policy-map, and class-map commands are used. For older FWSM and PIX 6.3 devices, fixup commands are used. For IOS devices, ip-inspect commands are used.

The following topics will help you work with inspection rules:

Understanding Inspection Rules

Inspection rules configure Context-Based Access Control (CBAC) inspection commands. CBAC inspects traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

CBAC creates temporary openings in access lists at firewall interfaces. These openings are created when inspected traffic exits your internal network through the firewall. The openings allow returning traffic (that would normally be blocked) and additional data channels to enter your internal network back through the firewall. The traffic is allowed back through the firewall only if it is part of the same session as the original traffic that triggered inspection when exiting through the firewall.

Inspection rules are applied after your access rules, so any traffic that you deny in the access rule is not inspected. The traffic must be allowed by the access rules at both the input and output interfaces to be inspected.

Whereas access rules allow you to control connections at layer 3 (network, IP) or 4 (transport, TCP or UDP protocol), you can use inspection rules to control traffic using application-layer protocol session information.

For all protocols, when you inspect the protocol, the device provides the following functions:

- Automatically opens a return path for the traffic (reversing the source and destination addresses), so that you do not need to create an access rule to allow the return traffic. Each connection is considered a session, and the device maintains session state information and allows return traffic only for valid sessions. Protocols that use TCP contain explicit session information, whereas for UDP applications, the device models the equivalent of a session based on the source and destination addresses and the closeness in time of a sequence of UDP packets.

These temporary access lists are created dynamically and are removed at the end of a session.

- Tracks sequence numbers in all TCP packets and drops those packets with sequence numbers that are not within expected ranges.
- Uses timeout and threshold values to manage session state information, helping to determine when to drop sessions that do not become fully established. When a session is dropped, or reset, the device informs both the source and destination of the session to reset the connection, freeing up resources and helping to mitigate potential Denial of Service (DoS) attacks.

The following topics provide more information about inspection:

- Choosing the Interfaces for Inspection Rules , on page 768
- Selecting Which Protocols To Inspect , on page 769
- Understanding Access Rule Requirements for Inspection Rules , on page 770
- Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices , on page 771
- Configuring Protocols and Maps for Inspection , on page 787
- Configuring Inspection Rules , on page 771
- Configuring Settings for Inspection Rules for IOS Devices , on page 882

Choosing the Interfaces for Inspection Rules

Configure inspection on devices that protect internal networks. Use it with TCP, UDP, or more specific protocols. Inspect these applications if you want the application's traffic to be permitted through the device only when the traffic session is initiated from a particular side of the device (usually from the protected internal network).

Tip For IOS devices, you need to configure inspection explicitly, and you can identify the direction of traffic to be inspected. For ASA, PIX, and FWSM devices, you cannot identify the direction, and you need to configure inspection only if you do not want the inspection defaults. In the remaining discussion, statements concerning direction apply only to IOS devices. For ASA, PIX, and FWSM, simply configure inspection on the identified interface.

In many cases, you will configure inspection in one direction only at a single interface, which causes traffic to be permitted back into the internal network only if the traffic is part of a permissible (valid, existing) session. This is a typical configuration for protecting your internal networks from traffic that originates on the Internet.

You can also configure inspection in two directions at one or more interfaces. Configure inspection in two directions when the networks on both sides of the firewall should be protected, such as with extranet or intranet configurations, and to protect against DoS attacks. For example, if the device is situated between two partner companies' networks, you might want to restrict traffic in one direction for certain applications, and restrict traffic in the opposite direction for other applications. If you are protecting a web server in the DMZ zone, you might want to configure deep inspection on HTTP traffic to identify and reset connections that have undesirable characteristics.

You might want to configure your inspection rules on the outbound interfaces of your network, those that connect to the Internet or another uncontrolled network, while allowing unfiltered connections within the trusted network. Thus, your devices use resources for inspection only on sessions that travel over unsecured and therefore potentially dangerous networks.

- Configuring Inspection Rules , on page 771

Selecting Which Protocols To Inspect

You can generically inspect TCP and UDP, which covers all applications that use these protocols. However, you can also inspect more specific protocols. In some cases, inspecting a specific protocol provides better service than generic TCP/UDP inspection. TCP and UDP inspection do not recognize application-specific commands, and therefore might not permit all return packets for an application, particularly if the return packets have a different port number than the previous exiting packet.

For example:

- Some protocols allow you to configure deep inspection. Deep inspection allows you to configure more specific rules for a traffic stream. For example, you can drop HTTP connections where the content type of the request and response do not match. For information on deep inspection and your configuration options, see Configuring Protocols and Maps for Inspection , on page 787.
- Protocols that negotiate return channels, such as FTP, should be specifically inspected. If you use simple generic TCP inspection of FTP traffic, the negotiated channels are not opened, and the connection will fail. If you want to allow FTP, ensure that you create a specific inspection rule for it.

Multimedia protocols also negotiate return channels and should be specifically inspected. These include H.323, RTSP (Real Time Streaming Protocol), and other application-specific protocols. Some applications also use a generic TCP channel, so you might also need to configure generic TCP inspection. Any generic TCP inspection rule should appear below a more specific inspection rule in the table (that is, any rule that specifies TCP or UDP should appear at the end of the inspection rule table).

Understanding Access Rule Requirements for Inspection Rules

Access rules are applied before inspection rules. Therefore, you must ensure that your access rules do not prohibit traffic that you want inspected. Use the following guidelines:

- Permit inspected traffic to leave the network through the firewall.

All access rules that evaluate traffic leaving the protected network should permit traffic that will be inspected. For example, if Telnet will be inspected, then Telnet traffic should be permitted on all access rules that apply to traffic leaving the network.

- Deny inspected return traffic entering the network through the firewall.

For temporary openings to be created in an access list, the access list should deny inspected return traffic because the inspection engine will open up temporary holes in the access lists for this traffic. (You want traffic to be normally blocked when it enters your network.)

- Permit or deny traffic that cannot be inspected, or that you do not want to inspect, as required by your network.

For example, if you do not want to inspect ICMP traffic, but you want to allow some ICMP traffic, configure your access rules to allow the traffic in both directions. Consider permitting at least these ICMP message types: echo reply (for ping commands), time-exceeded (for trace route), packet-too-big (for path MTU discovery), traceroute (for trace route), and unreachable (to notify that a host cannot be found).

- Add an access rule entry denying any network traffic from a source address matching an address on the protected network.

This is known as anti-spoofing protection because it prevents traffic from an unprotected network from assuming the identity of a device on the protected network.

- Add an entry denying broadcast messages with a source address of 255.255.255.255.

This entry helps to prevent broadcast attacks.

Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Inspecting packets at the application layer, and maintaining TCP and UDP session information, provides a device with the ability to detect and prevent certain types of network attacks such as SYN-flooding. A SYN-flood attack occurs when a network attacker floods a server with a barrage of requests for connection and does not complete the connection. The resulting volume of half-open connections can overwhelm the server, causing it to deny service to valid requests. Network attacks that deny access to a network device are called denial-of-service (DoS) attacks.

Inspection helps to protect against DoS attacks in other ways. Inspection looks at packet sequence numbers in TCP connections to see if they are within expected ranges and drops any suspicious packets. You can also configure inspection to drop half-open connections, which require firewall processing and memory resources to maintain. Additionally, inspection can detect unusually high rates of new connections and issue alert messages.

For IOS devices, you can configure several inspection setting parameters to fine-tune your defenses against SYN flooding and half-open connections. Configure the **Firewall > Settings > Inspection** policy. For details about each setting, see Configuring Settings for Inspection Rules for IOS Devices , on page 882.

Inspection can also help by protecting against certain DoS attacks involving fragmented IP packets. Even though the firewall prevents an attacker from making actual connections to a given host, the attacker can disrupt services provided by that host. This is done by sending many non-initial IP fragments or by sending complete fragmented packets through a router with an ACL that filters the first fragment of a fragmented packet. These fragments can tie up resources on the target host as it tries to reassemble the incomplete packets. To fine-tune fragment inspection, configure an inspection rule for the **fragment** protocol and configure the maximum number of fragments you want to allow and a timeout value.

Configuring Inspection Rules

Inspection rules policies identify the traffic that will be inspected through an interface. Inspection tracks permitted sessions and opens temporary holes in your access rules to allow return traffic.

Inspection rules are processed after access rules, so any traffic dropped by an access rule is not inspected. You can also use deny rules to selectively exclude certain types of traffic from inspection. For example, you might create a deny inspection rule to prevent a specific class of DNS traffic from being inspected, while all other DNS traffic is inspected. The basic procedure is:

- Add a new deny rule before the default inspection rule for the specific protocol. For the Match Traffic By option, select Source and Destination Address and Port. Next, define the specific type of traffic by providing Source and Destination Network IP addresses, and selecting the desired Service type (for example, DNS-TCP). Finally, in the third screen of the inspection-rule wizard, select the appropriate protocol (for example, DNS).
- Now edit the default inspection rule (below your new deny rule in the table). Again select Source and Destination Address and Port for the Match Traffic By option. Be sure this is a Permit rule, provide an all-addresses option as the source and destination addresses, and enter IP as the Service type. In the third screen, keep the selected protocol; configure or remove the related map, as necessary.

See Inspection Rules Page , on page 774 and Add or Edit Inspect/Application FW Rule Wizard , on page 777 for additional information about this process.

See the following topics for more information about things you should consider when creating inspection rules:

- Understanding Inspection Rules , on page 767
- Choosing the Interfaces for Inspection Rules , on page 768
- Selecting Which Protocols To Inspect , on page 769
- Understanding Access Rule Requirements for Inspection Rules , on page 770
- Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices , on page 771
- Configuring Protocols and Maps for Inspection , on page 787
- Understanding Map Objects , on page 308

Before You Begin

You might have a set of inspection rules that you want to apply to all devices. To do this, you can create a shared rule and inherit its rules to each device's inspection rules policy. For more information, see Creating a New Shared Policy , on page 221 and Inheriting or Uninheriting Rules , on page 213.

Step 1 Do one of the following to open the Inspection Rules Page , on page 774:

- (Device view) Select **Firewall > Inspection Rules** from the Policy selector.
- (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Select an existing policy or create a new one.

Step 2 Select the row after which you want to create the rule and click the **Add Row** button or right-click and select **Add Row**. This opens the Add or Edit Inspect/Application FW Rule Wizard , on page 777.

Tip If you do not select a row, the new rule is added at the end of the local scope. You can also select an existing row and edit either the entire row or specific cells. For more information, see Editing Rules , on page 607.

Step 3 Select whether to apply the rule to all interfaces on the device or to only the interfaces you specify.

If you elect to specify interfaces, enter the interface name or interface role, or click **Select** to select it from a list. For IOS devices, you also can select whether the rule applies in the Out direction (traffic leaving the interface). Use the In direction for all other device types.

Step 4 Select the criteria you want to use for matching traffic. This determines what gets inspected based on this rule.

- **Default Protocol Ports**—Select this option if the protocol you are inspecting uses the default ports on your network.

If you want to constrain the inspection based on the source or destination address, also select **Limit inspection between source and destination IP addresses** (available only for ASA, PIX 7.x+, and FWSM 3.x+ devices). When you click **Next**, you are prompted for the source and destination addresses. You can specify **any** for source or destination if you are interested only in configuring the other value.

- **Custom Destination Ports**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic. When you click **Next**, you are prompted for the port or port range.
- **Destination Address and Port (IOS devices only)**—Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10. When you click **Next**, you are prompted for the destination address and the port information.
- **Source and Destination Address and Port (PIX 7.x+, ASA, FWSM 3.x+)**—Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic. When you click **Next**, you are prompted for the source and destination addresses and the service port information.

Note For FWSM 2.x and PIX 6.3(x), you can select either Default Inspection Traffic or Custom Destination Ports only.

Step 5 Click **Next**. If you selected anything other than Default Protocol Ports, fill in the required addressing and port information explained above and click **Next**. See Add or Edit Inspect/Application FW Rule Wizard, Step 2 , on page 779.

Step 6 On the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select the protocol you want to inspect from the list. Ensure that the Device Type field indicates that inspection is supported for that protocol on the devices to which you are assigning the rule. (If you assign a rule to an unsupported device type, the rule is ignored but you will get a validation warning).

If the protocol you select allows additional configuration, the **Configure** button becomes active. Click it to view and select your options. For more information, see Configuring Protocols and Maps for Inspection , on page 787.

For IOS devices only:

- If you selected **Custom Destination Ports** or **Destination Address and Port** as the traffic match, you can select **custom protocol** as the protocol name and click **Configure** to assign a name to the configuration.
- You can configure additional alert, audit, and timeout settings that override those set in the inspection settings policy. You can also specify whether to inspect router generated traffic for a limited number of protocols. For more information about inspection settings, see Configuring Settings for Inspection Rules for IOS Devices , on page 882.

Step 7 Click **Finish** to save the rule.

Step 8 If you did not select the right row before adding the rule, select the new rule and use the up and down arrow buttons to position the rule appropriately. For more information, see Moving Rules and the Importance of Rule Order , on page 617.

What to do next

From ASA 9.9.1, for cluster mode devices which are enabled with Security Gateway feature, the following list of centralized inspections are disabled:

- DCERPC
- NetBIOS
- PPTP
- RADIUS
- RSH
- SUNRPC
- TFTP
- XDMCP

During preview config, if inspection rules are configured for the unsupported devices, a validation error is displayed.

Note When there is rollback of device, the default dns policy-map configuration is automatically added to the device. Thus, after Cisco Security Manager processes the device rollback, on re-discovery of the device, the default dns-policy-map configuration is discovered in Cisco Security Manager.

Inspection Rules Page

Use the Inspection Rules page to configure inspection rules for device interfaces. Inspection examines traffic that travels through the device to discover and manage state information for TCP and UDP sessions. The device uses this state information to create temporary openings to allow return traffic and additional data connections for permissible sessions.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies and objects for configuring IPv4 and IPv6 inspection rules were "unified," meaning one set of inspection rules in which you can use either IPv4 or IPv6 addresses, or a mixture of both. (See Policy Object Changes in Security Manager 4.4 , on page 11for additional information.) In Policy view, IPv4 and unified versions of the inspection policy type are provided. In addition, a utility that you can use to convert existing IPv4 policies is provided (see Converting IPv4 Rules to Unified Rules , on page 626). The following descriptions apply to all versions of the inspection rule table, except where noted.If you assign an IPv4 inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign unified versions of those policies to that device. Likewise, if you assign a unified inspection-rule shared policy to a 9.0+ device, you will no longer be able to assign IPv4 versions of those shared policies to that device--the device will not be included in the list of available devices on the Assignments tab for the shared policy.

Inspection rules are processed after your access rules. Thus, any traffic denied by an access rule is never inspected.

Read the following topics before you configure inspection rules:

- Understanding Inspection Rules , on page 767

- Choosing the Interfaces for Inspection Rules , on page 768
- Selecting Which Protocols To Inspect , on page 769
- Understanding Access Rule Requirements for Inspection Rules , on page 770
- Using Inspection To Prevent Denial of Service (DoS) Attacks on IOS Devices , on page 771
- Configuring Inspection Rules , on page 771

Tip Disabled rules are shown with hash marks covering the table row. When you deploy the configuration, disabled rules are removed from the device. For more information, see Enabling and Disabling Rules , on page 618.

Navigation Path

To access the Inspection Rules page, do one of the following:

- (Device view) Select a device, then select **Firewall > Inspection Rules** from the Policy selector.
- (Policy view) Select **Firewall > Inspection Rules** from the Policy Type selector. Create a new policy or select an existing one.
- (Map view) Right-click a device and select **Edit Firewall Policies > Inspection Rules**.

Field Reference

Table 196: Inspection Rules Page

Element	Description
Expand all rows/Collapse all rows	Use these buttons to expand or collapse all sections in the rules table. **Note** The buttons are located in the upper-right corner of the Filter area above the inspection rules table.

Element	Description
Conflict Indicator icons	Identifies conflicts and provides a quick visual representation of the type of conflict. For more details, including types of conflicts and the actions you can take from this column, see Understanding Automatic Conflict Detection , on page 744.
No.	The ordered rule number.
Permit	Whether a rule identifies traffic that should be inspected based on the conditions set: • Permit—Identifies traffic that will be inspected. Shown as a green check mark. • Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked. Shown as a red circle with slash.
Sources	The sources of traffic for this rule; can be networks, security groups (ASA 9.0+ only), and users. Multiple entries are displayed on separate lines within the table cell.
Destinations	The destinations for this rule; can be networks and security groups (ASA 9.0+ only). Multiple entries are displayed on separate lines within the table cell.
Traffic Match	The type of matching used in the rule: • **default-inspection**—The rule inspects traffic based on the default port. • TCP,UDP/port number—The rule inspects traffic based on a custom port number. • Service—The rule inspects traffic based on a service specification or service object. Multiple entries are displayed as separate subfields within the table cell. See Understanding and Specifying Services and Service and Port List Objects , on page 331.
Interface	The interfaces or interface roles to which the rule is assigned. **Global** indicates that the rule is assigned to all interfaces. Interface role objects are replaced with the actual interface names when the configuration is generated for each device. Multiple entries are displayed as separate subfields within the table cell. See Understanding Interface Role Objects , on page 303.
Dir.	The direction of the traffic to which this rule applies: • In—Packets entering the interface. • Out—Packets exiting the interface.
Inspected Protocol	The protocol to be inspected and possibly some configuration settings for the protocol. You can right-click this cell and choose Edit Inspected Protocol to edit this; see Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783 for more information.
Time Range	The time range policy object assigned to the rule. This object defines the time window within which inspection occurs.

Element	Description
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	The description of the rule, if any.
Last Ticket(s)	Shows the ticket(s) associated with last modification to the rule. You can click the ticket ID in the Last Ticket(s) column to view details of the ticket and to navigate to the ticket. If linkage to an external ticket management system has been configured, you can also navigate to that system from the ticket details (see Ticket Management Page , on page 586).
Page elements below the rules table	
Query	Click this button to run a policy query, which can help you evaluate your rules and identify ineffective rules. See Generating Policy Query Reports , on page 627
Find and Replace button (binoculars icon)	Click this button to search for various types of items within the table and to optionally replace them. See Finding and Replacing Items in Rules Tables , on page 614.
Up Row and Down Row buttons (arrow icons)	Click these buttons to move the selected rules up or down within a scope or section. For more information, see Moving Rules and the Importance of Rule Order , on page 617.
Add Row button	Click this button to add a rule to the table after the selected row using the Add or Edit Inspect/Application FW Rule Wizard , on page 777. If you do not select a row, the rule is added at the end of the local scope. For more information about adding rules, see Adding and Removing Rules , on page 606.
Edit Row button	Click this button to edit the selected rule. You can also edit individual cells. For more information, see Editing Rules , on page 607.
Delete Row button	Click this button to delete the selected rule.

Add or Edit Inspect/Application FW Rule Wizard

Use the Add or Edit Inspect/Application FW Rule wizard to add and edit inspection rules. The wizard steps you through the process of configuring an inspection rule based on your selection in the **Match Traffic By** group on this page.

Read the following topics before you configure inspection rules:

- Understanding Inspection Rules , on page 767
- Choosing the Interfaces for Inspection Rules , on page 768
- Selecting Which Protocols To Inspect , on page 769

Field Reference

Table 197: Add and Edit Inspect/Application FW Rule Wizard Step 1: Traffic Match Method

Element	Description
Enable Rule	Whether to enable the rule, which means the rule becomes active when you deploy the configuration to the device. Disabled rules are shown overlain with hash marks in the rule table. For more information, see Enabling and Disabling Rules , on page 618.
Apply the Rule to	The interface to which the rule applies: • All Interfaces—Apply the rule to all interfaces. The rule becomes a global rule on ASA, PIX, and FWSM devices. For IOS devices, the rule is configured for each interface in the In direction. • Interface (PIX 7.x+, ASA, FWSM 3.x+, IOS)—Apply the rule only to those interfaces identified in the Interfaces field. Enter the name of the interface or the interface role, or click **Select** to select the interface or role from a list, or to create a new role. An interface must already be defined to appear on the list. For IOS devices only, you can select the direction of the traffic to which this rule applies, either traffic entering an interface (**In**) or exiting it (**Out**). For other devices, leave **In** as the direction.
Match Traffic By How you want to identify the traffic to inspect. If you select something other than Default Protocol Ports (by itself), you are prompted for the other port or address information when you click **Next**.	

Element	Description
Default Protocol Ports Limit inspection between source and destination IP addresses (PIX 7.x+, ASA, FWSM 3.x+)	Inspect traffic based on the default ports assigned to a protocol. You will select a protocol on the next page (Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783). You can also select **Limit inspection between source and destination IP addresses** to configure the inspection to occur only between a specified source and destination. Do not select this option if you want to inspect a protocol without applying any constraints to the inspected traffic. If you also select this option, the next page of the wizard is described in Add or Edit Inspect/Application FW Rule Wizard, Step 2 , on page 779.
Custom Destination Ports	Inspect traffic based on specified non-default TCP or UDP destination ports. Select this option if you want to associate additional TCP or UDP traffic with a given protocol, for example, treating TCP traffic on destination port 8080 as HTTP traffic. You will specify the protocol and port(s) on the next page of the wizard; see Add or Edit Inspect/Application FW Rule Wizard, Step 2 , on page 779.
Destination Address and Port (IOS devices only)	Inspect traffic on IOS devices based on destination IP address and port. Select this option if you want to associate additional non-default TCP or UDP ports with a given protocol only when the traffic is going to certain destinations, for example, if you want to treat TCP traffic on destination port 8080 as HTTP only when the traffic is going to server 192.168.1.10.
Source and Destination Address and Port (PIX 7.x, ASA, FWSM 3.x)	Inspect traffic on PIX 7.x+, ASA, and FWSM 3.x+ devices based on source and destination IP addresses and services. Select this option for the same reason you would select Destination Address and Port for IOS devices, although you have the additional option of identifying the source of the traffic. You will specify the action, sources, destinations, and Services on the next page of the wizard; see Add or Edit Inspect/Application FW Rule Wizard, Step 2 , on page 779 .
Category	The category assigned to the rule. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Description	An optional description of the rule (up to 1024 characters).

Add or Edit Inspect/Application FW Rule Wizard, Step 2

The options presented on the second page of the Inspect/Application FW Rule Wizard depend on your **Match Traffic By** selection on the first page (see Add or Edit Inspect/Application FW Rule Wizard , on page 777). The possibilities are as follows:

- If you select Default Protocol Ports on the first page and *do not* select Limit inspection between source and destination IP addresses, the second page consists of the options described in Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783.
- If you select Default Protocol Ports on the first page and *do* select Limit inspection between source and destination IP addresses, the second page consists of the options described in the second table in this

section. (The third page will consist of the options described in Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783.)

- If you select Custom Destination Ports on the first page, the second page consists of the options described in the first table in this section. (The third page will consist of the options described in Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783.)
- If you select Source and Destination Address and Port on the first page, the second page consists of the options described in the second table in this section. (The third page will consist of the options described in Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783.)

Navigation Path

From the Add or Edit Inspect/Application FW Rule Wizard , on page 777, select a Match Traffic By option and click Next.

Field Reference

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Custom Destination Ports** on the first page of the wizard (described in Add or Edit Inspect/Application FW Rule Wizard , on page 777).

Table 198: Add and Edit Inspect/Application FW Rule Wizard Step 2: Protocol and Port Page

Element	Description
Protocol	The protocol for the ports you are specifying, either TCP, UDP, or both TCP/UDP. When configuring Custom Destination Ports for an IOS device, you must select TCP/UDP.

Element	Description
Ports	The port(s) used by the traffic you want to inspect. Valid values range from 1 to 65535. • Single—Specify one port number only. • Range—Specify a range of ports, for example, 10000-11000. When configuring custom ports, be aware that port ranges might not be supported on all platforms or OS versions. Any conflicts are identified during policy validation, not while you are editing this rule. **Tip** If you specify a port or port range that conflicts with a pre-defined port mapping, the device does not allow the port to be remapped.

The following table describes the options presented on page 2 of the Inspect/Application FW Rule Wizard after you have selected **Default Protocol Ports** and **Limit inspection between source and destination IP addresses** on the first page of the wizard, and when you select **Source and Destination Address and Port** on the first page. The first page of the wizard is described in Add or Edit Inspect/Application FW Rule Wizard , on page 777.

Table 199: Add and Edit Inspect/Application FW Rule Wizard Step 2: Action, Sources, Destinations, and Services Page

Element	Description
Action	Whether you are identifying traffic that should be inspected based on the conditions set. Typically, you will create Permit rules. • Permit—Identifies traffic that will be inspected. • Deny—Exempts the traffic from inspection. Your access rules will determine if the traffic is allowed or blocked.

Element	Description
Sources	Provide traffic sources for this rule; can be networks, security groups, and users. You can enter values or object names, or Select objects, for one or more of the following types of sources: • Network – You can specify a various network, host and interface definitions, either individually or as objects. If you Select an interface object as a source, the dialog box displays tabs to differentiate between hosts/networks and interfaces. The "All-Address" objects do not restrict the rule to specific hosts, networks, or interfaces. These addresses are IPv4 or IPv6 addresses for hosts or networks, network/host objects, interfaces, or interface roles. **Note** You can only specify a fully qualified domain name (FQDN) by providing an FQDN network/host object, or a group object that includes an FQDN object. You cannot directly type in an FQDN. • Security Groups (ASA 9.0+) – Enter or Select the name or tag number for one or more source security groups for the rule, if any. • Users – Enter or Select the Active Directory (AD) user names, user groups, or identity user group objects for the rule, if any. You can enter any combination of the following: • Individual user names: NetBIOS_DOMAIN\username • User groups (note the double \): NetBIOS_DOMAIN\\user_group • Identity user group object names. **Note** Enter more than one value in any of these fields by separating the items with commas. Each specification is combined with any others to limit traffic matches to only those flows that include all definitions. For example, specified user traffic originating from within a specified source address range.
Destinations	Provide traffic destinations for this rule; can be networks or security groups. As with Sources, you can enter values or object names, or Select objects, for one or more destinations of Network and Security Group (ASA 9.0+) type.
Services	The services that define the type of traffic upon which to act. You can enter or Select any combination of service objects and service types (which are typically a protocol and port combination). Enter more than one value by separating the items with commas.
Time Range	The name of a time range policy object that defines the times when this rule applies. The time is based on the system clock of the device. The feature works best if you use NTP to configure the system clock. Enter the name or click **Select** to select the object. If the object that you want is not listed, click the **Create** button to create it.

Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page

Use the Inspect/Application FW Rule wizard's inspected protocol page to configure the protocol monitored by this inspection rule.

The options in this section are presented when you add or edit a firewall inspection rule, and when you right-click the Inspected Protocol cell of an existing rule in the table on the Inspection Rules Page , on page 774.

Note Beginning with version 4.9, Security Manager supports SIP protocol for ASA cluster devices running the software version 9.4.0 or later.

Navigation Path

Do one of the following:

- In the Add or Edit Inspect/Application FW Rule Wizard , on page 777, click Next until you reach this page.
- To open the Edit Inspected Protocols dialog box, right-click the Inspected Protocol cell of an inspection rule and choose **Edit Inspected Protocol**. If you select multiple rows, your changes replace the inspected protocol defined for all selected rules.

Field Reference

Table 200: Inspected Protocol Options

Element	Description
Protocols table	Lists the protocols that can be inspected. You can select one protocol per rule. The list includes information on the device operating systems that allow inspection of the protocol: do not select protocols that are not supported by the device type to which you will apply the inspection rule. **Tip** For IOS devices, if you selected Custom Destination Ports or Destination Address and Port for the match type on the first page of the wizard, you can select **custom protocol** and click Configure to give your protocol a name. For other device types, select the protocol that you associate with the ports previously specified. The Options column displays configured options for the selected protocol, if any. The Group column provides additional information on the use of some of the protocols.
Selected Protocol Configure button	Displays the protocol you selected. If the protocol allows additional configuration, the Configure button becomes active; click it to see your options, and click the Help button in the dialog box that is opened for information about the options. For more information about protocols that allow configuration, see Configuring Protocols and Maps for Inspection , on page 787.
Rule Settings (IOS)	Additional settings for the rule if it is used on devices running Cisco IOS software. If you select Use Default Inspection settings, the IOS defaults, or the settings defined in the inspection settings policy (see Configuring Settings for Inspection Rules for IOS Devices , on page 882), are used. These are the settings you can enable or disable: • Alert—Whether to generate stateful packet inspection alert messages on the console. • Audit—Whether audit trail messages are logged to the syslog server or router. • Timeout—Whether to configure the length of time, in seconds, for which a session is managed while there is no activity. If you select Specify Timeout, enter the timeout value; the range is 5 to 43200 seconds. • Inspect Router Generated Traffic—Whether to inspect traffic that is generated by the device itself. This option is available for a limited number of the protocols.

Configure DNS Dialog Box

Use the Configure DNS dialog box to configure settings for DNS inspection on PIX 7.0+, ASA, FWSM, and IOS devices.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select DNS in the protocols table, and click **Configure**.

Field Reference

Table 201: Configure DNS Dialog Box

Element	Description
Maximum DNS Packet Length	The maximum DNS packet length. Values are 512 to 65535.
DNS Map	The DNS policy map object that defines traffic match conditions and actions, protocol conformance policies, and filter settings. Enter the object name, or click **Select** to select it. If the object that you want is not listed, click the **Create** button to create it.
Enable Dynamic Filter Snooping	Whether to allow the security appliance to snoop DNS packets in order to build a database of DNS lookup information. This information is used by botnet traffic filtering to match DNS names to IP addresses. If you configure a botnet traffic filtering rules policy, select this option. Otherwise, do not select the option. For more information, see Botnet Traffic Filter Rules Page , on page 915.

Configure SMTP Dialog Box

Use the SMTP dialog box to edit settings for Simple Mail Transfer Protocol (SMTP) inspection. SMTP is used to transfer email between servers and clients on the Internet.

SMTP inspection drops any packets with illegal commands. You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select SMTP in the protocols table, and click **Configure**.

Configure ESMTP Dialog Box

Use the Configure ESMTP dialog box to edit settings for Extended Simple Mail Transport Protocol (ESMTP) inspection. You can configure these settings based on platform:

- IOS devices—You can configure a maximum data length for packets. Enter a length in the range 0-4294967295.
- ASA/PIX 7.x+ devices—You can specify an ESMTP policy map object to define deep inspection parameters. Enter the name of the object or click **Select** to select it from a list or to create a new object.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select ESMTP in the protocols table, and click **Configure**.

Configure Fragments Dialog Box

Use the Configure Fragments dialog box to edit settings for fragment inspection on IOS devices.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select fragment in the protocols table, and click **Configure**.

Field Reference

Table 202: Configure Fragments Dialog Box

Element	Description
Maximum Fragments	The maximum number of unassembled packets for which state information (structures) is allocated by Cisco IOS software. Unassembled packets are packets that arrive at the router interface before the initial packet for a session. Values are 0-10000 state entries. The default is 256. **Note** Memory is allocated for the state structures, and setting this value to a larger number may cause memory resources to be exhausted.
Timeout (sec)	The number of seconds that a packet state structure remains active. When the timeout value expires, the router drops the unassembled packet, freeing that structure for use by another packet. Values are 1-1000. The default timeout value is one second.

Configure IMAP or POP3 Dialog Boxes

Use the Configure IMAP or POP3 dialog boxes to edit settings for Internet Message Access Protocol (IMAP) or Post Office Protocol 3 (POP3) inspection on IOS devices.

- IMAP is a method for accessing electronic mail or bulletin board messages that are kept on a mail server that may be shared. It permits a client email program to access remote messages as though they were local.
- POP3 is used to receive email that is stored on a mail server. Unlike IMAP, POP retrieves mail only from a remote host.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select IMAP or POP3, and click **Configure**.

Field Reference

Table 203: Configure IMAP or POP3 Dialog Boxes

Element	Description
Reset Connection on Invalid IMAP/POP3 packet	Whether to reset, or drop, the connection between the client and server if an invalid packet is encountered. The client will have to repeat the validation process to reconnect to the server.
Enforce Secure Authentication	Whether to require that the client use a secure login to the server, that is, so that passwords are not sent in clear text.

Configure RPC Dialog Box

Use the RPC dialog box to edit settings for RPC inspection on IOS devices. RPC inspection blocks traffic for all RPC programs except for those you specify. To allow more than one RPC program, create a rule for each program number you want to allow.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select RPC in the protocols table, and click **Configure**.

Field Reference

Table 204: Configure RPC Dialog Box

Element	Description
Program Number	The program number to permit. Values are 1-4294967295.
Wait Time	The number of minutes to keep a hole in the firewall open to allow subsequent connections from the same source address to the same destination address and port. Values are 0-35791 minutes. The default is 0.

Custom Protocol Dialog Box

Use the Custom Protocol dialog box to assign a name to the protocol and port specification you made on the Add or Edit Inspect/Application FW Rule Wizard, Step 2 , on page 779 for IOS devices.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select custom protocol in the protocols table, and click **Configure**.

Configure Dialog Box

Use the Configure dialog box to select a policy map object for HTTP or IM inspection. The maps used for these types of inspection differ depending on the operating system version used on the device. Select the desired version and then click **Select** to select the desired policy map object or to create a new one.

Navigation Path

Go to the Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783, select HTTP or IM in the protocols table, and click **Configure**.

Configuring Protocols and Maps for Inspection

When you configure inspection rules for a device, you select the protocols that you want to inspect. Some of these protocols allow additional configuration for deep inspection. Deep inspection allows you to specify additional requirements that packets must meet in order to traverse the device. For example, you can drop

HTTP connections where the content type of the request and response do not match. (For a full list of inspectible protocols, click **Add Row** on the Inspection Rule page and click Next to view the protocols list.)

What you can configure depends not only on the protocol but on the device's operating system and version number. Typically, your ability to fine-tune inspection is higher on an ASA device compared to an IOS device. (If you are configuring an IOS device and you want greater control over inspection, consider configuring zone-based firewall inspection; for more information, see Understanding the Zone-based Firewall Rules , on page 933.)

Some deep inspection configuration is done directly in the inspection rule. However, for some protocols, you can configure the inspection rule to include a policy map that you create as an independent policy object. (You need to configure policy maps only if you want something other than the default inspection options.) You can configure these maps from the policy object selector dialog box while configuring the policy, or from the Policy Object Manager window (select **Manage > Policy Objects**).

For protocols that use policy maps, you can select the desired policy map, which defines the match conditions for the targeted traffic. For ASA, PIX, and FWSM devices, these policy maps might point to class maps that define the match conditions. To create these policy maps in the Policy Object Manager, select one of the maps listed in the following table in the **Maps > Policy Maps > Inspect** folder and review the detailed usage information in the references mentioned. For information on creating class maps, which are in the **Maps > Class Maps > Inspect** folder, see the references to the match criterion dialog boxes and Configuring Class Maps for Inspection Policies , on page 792.

Table 205: Configuring Protocols for Deep Inspection in Inspection Rules

Protocol	Device Types	Policy Map	Class Map(ASA, PIX, FWSM only)	Description and Match Criteria Reference
DNS	ASA, PIX, FWSM, IOS	DNS	DNS	Inspect traffic based on a wide variety of criteria using the class and policy map, which allow extensive control over DNS packets. In addition, you can configure a maximum length in the inspection rule, and enable dynamic DNS snooping for use with Botnet rules (on ASA devices). See the following topics: • Configuring DNS Maps , on page 796 • DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 801 • Configure DNS Dialog Box , on page 784
FTP Strict	ASA, PIX, FWSM, IOS	FTP	FTP	Inspect traffic based on file name, type, server, user, or FTP command. See Configuring FTP Maps , on page 807 and FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 808.

Protocol	Device Types	Policy Map	Class Map(ASA, PIX, FWSM only)	Description and Match Criteria Reference
GTP	ASA, PIX, FWSM, IOS	GTP	GTP	Inspect traffic based on timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance. See Configuring GTP Maps , on page 811 and GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 815.
H.323 H.225 H.323 RAS	ASA, PIX, FWSM	H.323 (ASA, PIX, FWSM)	H.323 (ASA, PIX, FWSM)	Inspect traffic based on a wide variety of criteria, including the H.323 message type, calling party, and called party. See Configuring H.323 Maps , on page 818 and H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 821.
HTTP	ASA, PIX, FWSM, IOS	HTTP (ASA 7.1.x, PIX 7.1.x, FWSM 3.x, IOS) HTTP (ASA 7.2+, PIX 7.2+)	HTTP (ASA, PIX, FWSM)	Inspect traffic based on a wide variety of criteria including the content of the header or body, port misuse, and whether the traffic includes a Java applet. The maps used differ based on the operating system and version. **For ASA/PIX 7.2+**, see Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices , on page 831 and HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 833. **For ASA/PIX 7.1.x, FWSM 3.x+, and IOS**, see Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.
SIP	ASA, PIX, FWSM	SIP (ASA, PIX, FWSM)	SIP (ASA, PIX, FWSM)	Inspect traffic based on a wide variety of criteria. See Configuring SIP Maps , on page 851 and SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 853
Skinny	ASA, PIX, FWSM, IOS	Skinny	(none)	Inspect traffic based on a wide variety of criteria. See Configuring Skinny Maps , on page 856 and Skinny Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 858.
SMTP	ASA, PIX 7.x+, FWSM 3.x+, IOS	(none)	(none)	Inspect Simple Mail Transfer Protocol (SMTP) traffic and drop any that use illegal commands. You can configure a maximum data length for packets. See Configure SMTP Dialog Box , on page 785.

Protocol	Device Types	Policy Map	Class Map(ASA, PIX, FWSM only)	Description and Match Criteria Reference
SNMP	ASA, PIX, FWSM 3.x+, IOS	SNMP	(none)	Inspect SNMP traffic based on SNMP version. See Configuring SNMP Maps , on page 859.
NetBIOS	ASA, PIX 7.x+, FWSM	NetBIOS	(none)	Inspect NetBIOS traffic to translate IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration. You can drop packets that violate the protocol. See Configuring NetBIOS Maps , on page 849.
IPSec Pass Through	ASA, PIX 7.x+	IPsec Pass Through	(none)	Inspect IPSec traffic and control whether ESP or AH traffic is allowed. See Configuring IPsec Pass Through Maps , on page 848.
DCE/RPC	ASA 7.2+, PIX 7.2+, FWSM 3.2+	DCE/RPC	(none)	Inspect traffic based on timeouts and enforcing the mapper service. See Configuring DCE/RPC Maps , on page 793.
IP options	ASA 8.2(2)+	IP Options	(none)	Allow IP packets that have certain options configured in the Options section of the IP header. In routed mode, packets that contain the router-alert option are allowed. Otherwise, if any option is set, packets are dropped. IP options are unnecessary for most communication, but the NOP (no operation) option might be used for padding, so you might want to allow it. See Configuring IP Options Maps , on page 842.
IPv6	ASA 8.4(2)+	IPv6	(none)	Inspect IPv6 traffic based on the following types of extension headers found anywhere in an IPv6 packet: Hop-by-Hop Options, Routing (Type 0), Fragment, Destination Options, Authentication, and Encapsulating Security Payload. See Configuring IPv6 Maps , on page 844 and IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 846.
ESMTP	ASA, PIX 7.x+, FWSM 3.x+, IOS	ESMTP	(none)	Inspect ESMTP traffic. For IOS, you can configure only maximum data length. For ASA, PIX, FWSM, you can inspect traffic based on a wide variety of criteria. See Configure ESMTP Dialog Box , on page 785.
Fragment	IOS	(none)	(none)	Inspect traffic based on a maximum allowed number of unassembled packet fragments. See Configure Fragments Dialog Box , on page 785.

Protocol	Device Types	Policy Map	Class Map(ASA, PIX, FWSM only)	Description and Match Criteria Reference
IMAP (Internet Message Access Protocol) POP3 (Post Office Protocol 3)	IOS	(none)	(none)	Inspect traffic based on invalid commands or clear text logins. See Configure IMAP or POP3 Dialog Boxes , on page 786.
RPC (Sun Remote Procedure Call)	FWSM 2.x, IOS	(none)	(none)	Inspect traffic based on the RPC protocol number. See Configure RPC Dialog Box , on page 787.
IM	ASA, PIX 7.x+, IOS	IM (ASA 7.2+, PIX 7.2+) IM (IOS)	IM (only for ASA, PIX)	Inspect traffic based on a wide variety of criteria. The allowed maps differ based on operating system version. **For ASA, PIX**, see Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices , on page 837 and IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 838. **For IOS**, see Configuring IM Maps for IOS Devices , on page 841.
SCTP	ASA 9.5(2)+	SCTP	(none)	Inspect traffic based on Payload PID (PPID). See Configuring SCTP Maps , on page 860 and SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 862
Diameter	ASA 9.5(2)+	Diameter	Diameter	Inspect traffic based on application ID, command codes, and AVP. See Configuring Diameter Maps , on page 863 and Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 865
LISP	ASA 9.5(2)+	LISP	None	Inspect traffic allowed Endpoint Identifiers access list and validation key. See Configuring LISP Maps , on page 872
M3UA	ASA 9.6(2)+	M3UA	None	Drops and logs packets that do not meet M3UA protocol conformance. See Configuring M3UA Maps , on page 873

Configuring Class Maps for Inspection Policies

Use the Add and Edit Class Map dialog boxes to define class maps to be used in policy maps of the same type. The name of the dialog box indicates the type of map you are creating.

A class map defines application traffic based on criteria specific to the application. You then select the class map in the corresponding policy map and configure the action to take for the selected traffic. Thus, each class map must contain traffic that you want to handle in the same way (for example, to allow it or to drop it).

When configuring inspection rules for devices running ASA/PIX 7.2 or later, or FWSM, you can create class maps for the inspection of the following types of traffic: DNS, FTP, H.323, HTTP, IM, SIP, and ScanSafe.

You can also define class criteria in the related policy map. However, creating class maps allows you to reuse the map in multiple policy maps.

The following topics describe the available match criteria:

- DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 801
- FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 808
- H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 821
- HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 833
- IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 838
- SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 853
- Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 865

Navigation Path

Select **Manage > Policy Objects**, then select DNS, FTP, H.323 (ASA/PIX/FWSM), HTTP (ASA/PIX/FWSM), IM, SIP (ASA/PIX/FWSM), Diameter in the **Maps > Class Maps > Inspect** folder in the table of contents. Right-click inside the work area, then select **New Object**, or right-click a row, then select **Edit Object**.

Related Topics

- Understanding Inspection Rules , on page 767

Field Reference

Table 206: Add or Edit Class Maps Dialog Boxes for Inspection Rules

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Match table Match Type	The Match table lists the criteria included in the class map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion and the criterion and value that is inspected. • To add a criterion, click the Add button and fill in the Match Criterion dialog box. For more information, see the topics referenced above. • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring DCE/RPC Maps

Use the Add or Edit DCE/RPC Map dialog boxes to define a map for DCE/RPC inspection. A DCE/RPC inspection policy map lets you change the default configuration values used for DCE/RPC inspection.

DCE/RPC is a protocol widely used by Microsoft distributed client and server applications that allows software clients to execute programs on a server remotely.

This typically involves a client querying a server called the Endpoint Mapper listening on a well-known port number for the dynamically allocated network information of a required service. The client then sets up a secondary connection to the server instance providing the service. The security appliance allows the appropriate port number and network address and also applies NAT, if needed, for the secondary connection.

DCE/RPC inspection maps inspect for native TCP communication between the EPM and client on well-known TCP port 135. Map and lookup operations of the EPM are supported for clients. Client and server can be

located in any security zone. The embedded server IP address and port number are received from the applicable EPM response messages. Because a client may attempt multiple connections to the server port returned by EPM, multiple use of pinholes are allowed, which have user configurable timeouts.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DCE/RPC** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Field Reference

Table 207: Add and Edit DCE/RPC Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Pinhole Timeout	The timeout for DCE/RPC pinholes. The default is 2 minutes (00:02:00). Valid values are between 00:00:01 and 1193:00:00.
Enforce Endpoint Mapper Service	Whether to enforce the endpoint mapper service during binding. Using this service, a client queries a server, called the Endpoint Mapper, for the dynamically allocated network information of a required service.
Enable Endpoint Mapper Service Lookup Service Lookup Timeout	Whether to enable the lookup operation of the endpoint mapper service. If you select this option, you can enter the time out for the lookup operation. If you do not specify a timeout, the pinhole timeout or default pinhole timeout value is used. Valid values are between 00:00:01 and 1193:00:00.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see DCE/RPC Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes, on page 795). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	

Element	Description
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

DCE/RPC Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DCE/RPC Match Criterion (for DCE/RPC class maps) or Match Condition and Action (for DCE/RPC policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DCE/RPC class map.
- Select a DCE/RPC class map when creating a DCE/RPC policy map.
- Define the match criterion, value, and action directly in a DCE/RPC policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating a DCE/RPC class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DCE/RPC, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring DCE/RPC Maps , on page 793.

Related Topics

Field Reference

Table 208: DCE/RPC Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing DCE/RPC class map or define a new DCE/RPC class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing DCE/RPC class map policy object. Enter the name of the DNS class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of traffic to match: • ms-rpc-epm—Matches Microsoft RPC EPM messages. • ms-rpc-isystemactivator—Matches ISystemMapper messages. • ms-rpc-oxidresolver-—Matches OxidResolver messages.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria. • Reset—Drop the packet, close the connection, and send a TCP reset to the server or client. • Log—Send a system log message. You can use this option alone or with one of the other actions. • Reset and Log— Perform the reset and log actions.

Configuring DNS Maps

Use the Add and Edit DNS Map dialog boxes to define DNS Maps for inspection. A DNS map lets you change the default configuration values used for DNS application inspection.

DNS application inspection supports DNS message controls that provide protection against DNS spoofing and cache poisoning. You can configure rules for certain DNS types to be allowed, dropped, or logged, while others are blocked. For example, you can restrict zone transfer between servers.

The Recursion Desired and Recursion Available flags in the DNS header can be masked to protect a public server from attack if that server only supports a particular internal zone. In addition, DNS randomization can be enabled to avoid spoofing and cache poisoning of servers that either do not support randomization or that use a weak pseudo random number generator. Limiting the domain names that can be queried protects the public server further.

You can configure a DNS mismatch alert as notification if an excessive number of mismatching DNS responses are received, which could indicate a cache poisoning attack.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > DNS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 209: Add and Edit DNS Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Protocol Conformance Tab Defines DNS security settings and actions. For a description of the options on this tab, see DNS Map Protocol Conformance Tab , on page 798.	
Filtering Tab Defines the filtering settings for DNS. For a description of the options on this tab, see DNS Map Filtering Tab , on page 799.	
Mismatch Rate Tab The **Log When DNS ID Mismatch Rate Exceeds** option determines whether you want to report excessive instances of DNS identifier mismatches based on the following criteria: • Threshold—The maximum number of mismatch instances before a system message log is sent. Values are 0 to 4294967295. • Time Interval—The time period to monitor (in seconds). Values are 1 to 31536000.	
Umbrella Connector Tab Defines DNS umbrella connector settings for a DNS. For a description of the options on this tab, see DNS Umbrella Connector Tab , on page 800.	

Element	Description
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 801). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

DNS Map Protocol Conformance Tab

Use the Protocol Conformance tab to define DNS security settings and actions for a DNS map.

Navigation Path

Click the Protocol Conformance tab on the Add and Edit DNS Map dialog boxes. See Configuring DNS Maps , on page 796.

Related Topics

Field Reference

Table 210: DNS Map Protocol Conformance Tab

Element	Description
Enable DNS Guard Function	Whether to perform a DNS query and response mismatch check using the identification field in the DNS header. One response per query is allowed to go through the security appliance.

Element	Description
Generate Syslog for ID Mismatch	Whether to create syslog entries for excessive instances of DNS identifier mismatches.
Randomize the DNS Identifier for DNS Query	Whether to randomize the DNS identifier in the DNS query message.
Enable NAT Rewrite Function	Whether to enable IP address translation in the A record of the DNS response.
Enable Protocol Enforcement	Whether to enable DNS message format check, including domain name, label length, compression, and looped pointer check.
Enable DNS on TCP	Whether to enable inspection of DNS over TCP traffic.Ensure that DNS/TCP port 53 traffic is part of the class to which you apply DNS inspection. The inspection default class includes TCP/53.
Require Authentication Between DNS Server (RFC2845) Action	Whether to require authentication between DNS servers as defined in RFC 2845. If you select this option, select the action to take when there is no authentication.

DNS Map Filtering Tab

Use the Filtering tab to define DNS filtering settings and actions for a DNS map.

Navigation Path

Click the Filtering tab on the Add and Edit DNS Map dialog boxes. See Configuring DNS Maps , on page 796.

Related Topics

Field Reference

Table 211: DNS Map Filtering Tab

Element	Description
Drop Packets that Exceed Specified Length Maximum Packet Length	Whether to drop packets that exceed the maximum length in bytes that you specify. This is a global setting.
Drop Packets Sent to Server that Exceed Specified Maximum Length Maximum Length	Whether to drop packets sent to the server that exceed the maximum length in bytes that you specify.

Element	Description
Drop Packets Sent to Server that Exceed Length Indicated by Resource Record	Whether to drop packets sent to the server that exceed the length indicated by the resource record.
Drop Packets Sent to Client that Exceed Specified Length Maximum Length	Whether to drop packets sent to a client that exceed the maximum length in bytes that you specify.
Drop Packets Sent to Client that Exceed Length Indicated by Resource Record	Whether to drop packets sent to the client that exceed the length indicated by the resource record.

DNS Umbrella Connector Tab

Use the Umbrella Connector tab to define DNS umbrella connector settings for a DNS map. Beginning with Cisco Security Manager version 4.18, the Umbrella global policy is supported on ASA 9.10.1 devices and above.

Navigation Path

Click the Umbrella Connector tab on the Add and Edit DNS Map dialog boxes. See Configuring DNS Maps , on page 796.

Related Topics

- Configuring Umbrella Global Policy, on page 1920

Field Reference

Table 212: DNS Umbrella Connector Tab

Element	Description
Enable Umbrella Connector Tag for Umbrella Policy	Select the check box and enter the DNS policy-map umbrella tag name. The tag name can be a maximum of 50 characters. Cisco Security manager throws an error message if the tag name is greater than 50 characters. **Note** If the Umbrella global policy is not configured, Cisco Security Manager displays activity validation error. For more information on Umbrella global policy configuration, see Configuring Umbrella Global Policy, on page 1920.
Enable Fail-Open	Select this check box if you want DNS resolution to work when the Umbrella DNSserver is unavailable. When fail-open is selected, if the Cisco Umbrella DNS server is unavailable, Umbrella disables itself on this policy map and allows DNS requests to go to the other DNS servers configured on the system, if any. When the Umbrella DNS servers are available again, the policy map resumes using them. If you do not select this option, DNS requests continue to go to the unreachable Umbrella resolver and will not get a response.

Element	Description
Device ID	The device ID is generated after a successful registration of the device with the umbrella server. The ID is displayed in this field only after you rediscover the device in the Cisco Security Manager. **Note** Whenever there is a change in the device ID, ensure to rediscover the device in Cisco Security Manager to be in sync with the change.
Enable DNScrypt	Select this check box to enable the DNS crypt in the Umbrella datapath. For every hour, the secret key is exchanged between the key exchange thread and the Umbrella resolver. Ensure that the Enable Umbrella Connector check box is selected. If the check box is not selected, an error message is displayed for configuration discrepancy. **Note** If the Umbrella global policy is not configured, Cisco Security Manager displays activity validation error. For more information on Umbrella global policy configuration, see Configuring Umbrella Global Policy, on page 1920.

DNS Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit DNS Match Criterion (for DNS class maps) or Match Condition and Action (for DNS policy maps) dialog boxes to do the following:

- Define the match criterion and value for a DNS class map.
- Select a DNS class map when creating a DNS policy map.
- Define the match criterion, value, and action directly in a DNS policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating a DNS class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for DNS, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating a DNS policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit DNS Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring DNS Maps , on page 796.

Related Topics

Field Reference

Table 213: DNS Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing DNS class map or define a new DNS class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing DNS class map policy object. Enter the name of the DNS class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of traffic to match: • DNS Class—Matches a DNS query or resource record class. • DNS Type—Matches a DNS query or resource record type. • Domain Name—Matches a domain name from a DNS query or resource record. • Header Flag—Matches a DNS flag in the header. • Question—Matches a DNS question. • Resource Record—Matches a DNS resource record.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Value (for DNS Class criterion)	The DNS class you want to inspect: • Internet—Matches the Internet DNS class. • DNS Class Field Value—Matches the specified number. • DNS Class Field Range—Matches the specified range of numbers.

Element	Description
Value (for DNS Type criterion)	The DNS type you want to inspect: • DNS Type Field Name—Matches the name of a DNS type: • A—IPv4 address. • AXFR—Full (zone) transfer. • CNAME—Canonical name. • IXFR—Incremental (zone) transfer. • NS—Authoritative name server. • SOA—Start of a zone of authority. • TSIG—Transaction signature. • DNS Type Field Value—Matches the specified number. • DNS Type Field Range—Matches the specified range of numbers.
Value (for Domain Name criterion)	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
Options Value (for Header Flag criterion)	The header flag you want to inspect. Use the Options field to indicate whether you want an exact match (Equals) or a partial match (Contains). • Header Flag Name—Matches the selected header flag names: • AA (authoritative answer) • QR (query) • RA (recursion available) • RD (recursion denied) • TC (truncation) flag bits • Header Flag Value—Matches the specified 16-bit hexadecimal value.

Element	Description
Resource Record	Lists the sections to match: • Additional—DNS additional resource record. • Answer—DNS answer resource record. • Authority—DNS authority resource record.

Configuring ESMTP Maps

Use the Add and Edit ESMTP Map dialog boxes to define the match criterion and values for the ESMTP inspect map. An ESMTP policy map lets you change the default configuration values used for ESMTP inspection.

ESMTP inspection detects attacks, including spam, phising, malformed message attacks, and buffer overflow/underflow attacks. It also provides support for application security and protocol conformance, which enforce the sanity of the ESMTP messages as well as detect several attacks, block senders/receivers, and block mail relay.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **ESMTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row and select **Edit Object**.

Related Topics

Field Reference

Table 214: Add and Edit ESMTP Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Mask Server Banner	Whether to mask the server banner to prevent the client from discovering server information.
Configure Mail Relay Domain Name Action	Whether to have ESMTP inspection detect mail relay. When you select this option, enter the domain name you are inspecting and select the action you want to take when mail relay is detected.

Element	Description
Special Character (ASA7.2.3+/PIX7.2.3+) Action	Whether you want to detect special characters in sender or receiver email addresses. If you select this option, select the action you want to take when special characters are detected.
Allow TLS (ASA7.2.3+, 8.0.3+/PIX7.2.3) Action Log	Whether to allow a TLS proxy on the security appliance. If you select this option, you can also select Action Log to create a log entry when TLS is detected.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see ESMTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 805). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

ESMTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for an ESMTP policy map.

The fields on this dialog box change based on the criterion you select. You can use the following criteria:

- Body Length—Matches the message body length.
- Body Line Length—Matches the length of a line in the message body.
- Commands—Matches ESMTP commands.
- Command Recipient Count—Matches the number of recipient email addresses.
- Command Line Length—Matches the number of characters of a command line.
- EHLO Reply Parameters—Matches the ESMTP EHLO reply parameters.
- Header Length—Matches the number of characters of the header.

- Header Line Length—Matches the number of characters of a line in the message header.
- To Recipients Count—Matches the number of recipients in the To field of the header.
- Invalid Recipients Count—Matches the number of invalid recipients in the header.
- MIME File Type—Matches the MIME file type.
- MIME Filename Length—Matches the number of characters of the filename.
- MIME Encoding—Matches the MIME encoding scheme.
- Sender Address—Matches the address of the sender.
- Sender Address Length—Matches the number of characters of the sender's address.

Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit ESMTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring ESMTP Maps , on page 804.

Table 215: ESMTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Criterion	Specifies which criterion of ESMTP traffic to match. The criteria are described above.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	

Element	Description
Greater Than Length	The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number. The dialog box indicates the valid range for the length, except for Body Length and Header length, which can be 1 to 4294967295.
Commands	The ESMTP command verbs you want to inspect.
Greater Than Count	The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.
Parameters	The ESMTP EHLO reply parameters you want to inspect.
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
MIME Encoding	The type of MIME encoding schemes you want to inspect.

Configuring FTP Maps

Use the Add and Edit FTP Map dialog boxes to define the match criterion and values for an FTP inspect map. You can use an FTP map to block specific FTP protocol methods, such as an FTP PUT, from passing through the security appliance and reaching your FTP server.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > FTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

Table 216: Add and Edit FTP Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Mask Greeting Banner from Server	Whether to mask the greeting banner from the FTP server to prevent the client from discovering server information.
Mask Reply to SYST Command	Whether to mask the reply to the **syst** command to prevent the client from discovering server information.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 808). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.
Validate For Validate button	The device platforms for which to validate the object. Select the platform for which you intend to use this object and click **Validate** to determine if the object is configured in a way that will prevent policy deployment.

FTP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit FTP Match Criterion (for FTP class maps) or Match Condition and Action (for FTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an FTP class map.
- Select an FTP class map when creating an FTP policy map.
- Define the match criterion, value, and action directly in an FTP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating an FTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for FTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating an FTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit FTP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring FTP Maps , on page 807.

Field Reference

Table 217: FTP Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing FTP class map or define a new FTP class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing FTP class map policy object. Enter the name of the FTP class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of FTP traffic to match: • Request Command—Matches an FTP request command. • Filename—Matches a filename for FTP transfer. • File Type—Matches a file type for FTP transfer. • Server—Matches an FTP server name. • Username—Matches an FTP username.

Element	Description
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Request Commands	The FTP commands you want to inspect: • Append (APPE)—Appends to a file. • Delete (DELE)—Deletes a file at the server site. • Help (HELP)—Provides help information from the server. • Put (PUT)—FTP client command for the stor (store a file) command. • Rename From (RNFR)—Specifies rename-from filename. • Server Specific Command (SITE)—Specifies commands that are server specific. Usually used for remote administration. • Change to Parent (CDUP)—Changes to the parent directory of the current working directory. • Get (GET)—FTP client command for the retr (retrieve a file) command. • Create Directory (MKD)—Creates a directory. • Remove Directory (RMD)—Removes a directory. • Rename To (RNTO)—Specifies rename-to filename. • Store File with Unique Name (STOU)—Stores a file with a unique filename.
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.

Configuring GTP Maps

Use the Add and Edit GTP Map dialog boxes to define the match criterion and values for a GTP inspect map.

The GPRS Tunnel Protocol (GTP) provides uninterrupted connectivity for mobile subscribers between GSM networks and corporate networks or the Internet. GTP uses a tunneling mechanism to provide a service for carrying user data packets.

A GTP map object lets you change the default configuration values used for GTP application inspection. The GTP protocol is designed to provide security for wireless connections to TCP/IP networks such as the Internet. You can use a GTP map to control timeout values, message sizes, tunnel counts, and GTP versions traversing the security appliance.

Starting from version 4.18, Cisco Security Manager supports anti-replay feature of ASA 9.10.1. By enabling data packet replay, your network is protected from replay attacks.

Tip GTP inspection requires a special license. If you do not have the required license, you will see device errors if you try to deploy a GTP map.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **GTP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 218: Add and Edit GTP Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	

Element	Description
Country and Network Codes Table	The three-digit Mobile Country Code (mcc) and Mobile Network Code (mnc) to include in the map. The codes are 000 to 999. • To add codes, click the Add button and fill in the dialog box. • To edit a row, select it and click the Edit button. • To delete a row, select it and click the Delete button.
Permit Response Table	The Network/Host policy objects for which you will allow GTP responses from a GSN that is different from the one to which the response was sent. • To add objects, click the Add button and fill in the dialog box. For more information, see Add and Edit Permit Response Dialog Boxes , on page 814. • To edit a row, select it and click the Edit button. • To delete a row, select it and click the Delete button.
Request Queue	The maximum requests allowed in the queue. When the limit has been reached and a new request arrives, the request that has been in the queue for the longest time is removed. Values are 1-9999999. The default is 200.
Tunnel Limit	The maximum number of tunnels allowed.
Permit Errors	Whether to permit packets with errors or different GTP versions. By default, all invalid packets or packets that failed during parsing are dropped.
Enable Data Packet Replay Window	Select the check box to configure the anti-replay and select one of the four window sizes—128, 256, 512, or 1024. Messages that are outside of the window size are dropped. For information on configuration of GTP Map policy, refer to Add or Edit Inspect/Application FW Rule Wizard, Inspected Protocol Page , on page 783.
Enable Header	Check Select the check box to enable header check of the data packets.

Element	Description
Anti-User Spoofing	This field is enabled only when you select the Enable Header Check check box. Select the relevant option: • Bypass—to forward the packets that pass the header check. • Drop—to drop the packets that pass the header check.
Edit Timeouts button	Click this button to configure time out values for various operations. For more information about the options, see GTP Map Timeouts Dialog Box , on page 814.
Enable Location Logging	Select the check box to get the location information through a syslog message containing the mobile country code and mobile network code. This syslog message is displayed when activating/updating a PDP context on Gn/Gp in GTPv0/v1 or S5/S8 in GTPv2.
Enable Cell ID	(Optional) Select this check box to add a cell ID to the syslog message. **Note** This option is enabled only when you select the Enable Logging Location check box.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 815). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.
Validate For Validate button	The device platforms for which to validate the object. Select the platform for which you intend to use this object and click **Validate** to determine if the object is configured in a way that will prevent policy deployment.

Add and Edit Country Network Codes Dialog Boxes

Use the Add and Edit Country Network Codes dialog boxes to add Mobile Country Code (mcc) and Mobile Network Code (mnc) values to the GTP policy map. The codes can be 000 to 999.

Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Country and Network codes table, or select a row and click the **Edit** button. See Configuring GTP Maps , on page 811.

Add and Edit Permit Response Dialog Boxes

Use the Add and Edit Permit Response dialog boxes to permit GTP responses from a GSN that is different from the one to which the response was sent.

Enter the name of a Network/Host policy object that defines the destination (**To Object Group**) and source (**From Object Group**) of the traffic. You can click **Select** to select the object from a list, where you can also create an new object by clicking the **Create** button in the Object Selector dialog box.

You cannot use the Network/Host object named “any.”

Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Add** button in the Permit Response table, or select a row and click the **Edit** button. See Configuring GTP Maps , on page 811.

GTP Map Timeouts Dialog Box

Use the GTP Map Timeouts dialog box to set timeout values for a GTP Map.

Navigation Path

From the Add and Edit GTP Map dialog boxes, click the **Edit Timeouts** button on the Parameters tab. See Configuring GTP Maps , on page 811.

Field Reference

Table 219: GTP Map Timeouts Dialog Box

Element	Description
GSN Timeout (Prior to ASA 9.5(1)) Endpoint Timeout (ASA 9.5(1) or later)	The period of inactivity (hh:mm:ss) after which a GSN is removed. The default is 30 minutes. Enter 0 to never tear down immediately.
PDP Context Timeout	The maximum period of time allowed (hh:mm:ss) before beginning to receive the PDP context. The default is 30 minutes. Enter 0 to specify no limit.
Request Queue Timeout	The maximum period of time allowed (hh:mm:ss) before beginning to receive the GTP message. The default is 60 seconds. Enter 0 to specify no limit.
Signaling Connections Timeout	The period of inactivity (hh:mm:ss) after which the GTP signaling is removed. The default is 30 minutes. Enter 0 to not remove the signal.
Tunnel Timeout	The period of inactivity (hh:mm:ss) after which the GTP tunnel is torn down. The default is 60 seconds (when a Delete PDP Context Request is not received). Enter 0 to never tear down immediately.
T3 Response Timeout	The maximum wait time for a response before removing the connection.

GTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define the match criterion, value, and action for a GTP policy map.

The fields on this dialog box change based on the criterion you select.

Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit GTP Map dialog box, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring GTP Maps , on page 811.

Field Reference

Table 220: GTP Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Criterion	Specifies which criterion of GTP traffic to match: • Access Point Name—Matches the access point name so you can define the access points to drop when GTP application inspection is enabled. • Message ID—Matches the numeric identifier for the message that you want to drop. By default, all valid message IDs are allowed. • Message Length—Matches the length of the UDP packet. Use this criterion to change the default for the maximum allowed message length for the UDP payload. • Version—Matches the GTP version. • MSISDN—Matches the MSISDN with regular expressions or class and drop all GTP packets that have matching MSISDN. • Selection Mode—Ranges between 0 and 3.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action	The action you want the device to take for traffic that matches the defined criteria. • Drop Packet—By default, all invalid packets or packets that failed during parsing are dropped. • Drop Packet and Log • Rate Limit
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	

Element	Description
Access Point Name	The access points to act on when GTP application inspection is enabled. • Specified By—An access point name to be dropped. By default, all messages with valid APNs are inspected, and any APN is allowed. • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
ID type	The numeric identifier of the message that you want to act on. • Value—A single message ID. The Value can be between 1 and 255. • Range—A range of message IDs. The Range can be between 1 and 255.
Minimum Length	The minimum number of bytes in the UDP payload.
Maximum Length	The maximum number of bytes in the UDP payload.
Version	Beginning with version 4.9, Security Manager provides support for GPRS Tunnel Protocol (GTP) v2 and enhanced v1 in the GTP Map Object for ASA devices 9.5(1) or later. You can now configure separate message ID matching for GTPv1 and GTPv2. For ASA devices 9.5(1) or later, if you select Message ID as the Criterion, two options for Version, v1 and v2, are displayed. Select v1 or v2 and enter a single Value between 1 and 255, or a Range of values from 1 to 255.
Version Type	Prior to ASA version 9.5(1)—Use 0 to identify Version 0 and 1 to identify Version 1. Version 0 of GTP uses port 2123, while Version 1 uses port 3386. By default all GTP versions are allowed.
Regular Expression	Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.
Regular Expression Group	Beginning with version 4.18, Cisco Security Manager allows configuring of MSISDN with regular expressions class and drop all GTP packets that have matching MSISDN. This field appears when you select MSISDN in the Criterion drop-down.
Mode Value	If Selection is selected in the Criterion drop-down, this field appears. Enter the mode value in the range of 0 – 3. This is a mandatory field.

Configuring H.323 Maps

Use the Add and Edit H.323 Map dialog boxes to define the match criterion and values for an H.323 inspect map. An H.323 policy map lets you change the default configuration values used for H.323 inspection.

H.323 inspection supports H.323 compliant applications such as Cisco CallManager and VocalTec Gatekeeper. H.323 is a suite of protocols defined by the International Telecommunication Union for multimedia conferences over LANs. The security appliance supports H.323 through Version 4, including H.323 v3 feature Multiple Calls on One Call Signaling Channel.

With H.323 inspection enabled, the security appliance supports multiple calls on the same call signaling channel, a feature introduced with H.323 Version 3. This feature reduces call setup time and reduces the use of ports on the security appliance. The two major functions of H.323 inspection are as follows:

- NAT the necessary embedded IPv4 addresses in the H.225 and H.245 messages. Because H.323 messages are encoded in PER encoding format, the security appliance uses an ASN.1 decoder to decode the H.323 messages.
- Dynamically allocate the negotiated H.245 and RTP/RTCP connections.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > H.323 (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 221: Add and Edit H.323 Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	

Element	Description
HSI Group table	The HSI groups to include in the map. The group number, IP address of the HSI host, and IP addresses and interface names of the clients connected to the security appliance are shown in the table. Up to five HSI hosts per group, and up to ten end points per HSI group, are allowed. • To add a group, click the Add button and fill in the dialog box (see Add or Edit HSI Group Dialog Boxes , on page 820). • To edit a group, select it and click the Edit button. • To delete a group, select it and click the Delete button.
Call Duration Limit	The call duration limit in seconds. The range is from 0:0:0 to 1163:0:0. A value of 0 means never timeout.
Enforce Presence of Calling and Called Party Numbers	Whether to enforce calling and called party numbers used in call setup.
Allow the facility message before SETUP for H.460.18	Whether to allow the FACILITY message to be sent before the SETUP message as part of the Incoming Call Message Procedure. **Note** H.460.18 defines a method for traversal of H.323 signaling across network address translators and firewalls.
Check State Transition on H.225 Messages	Whether to enable state checking validation on H.225 messages.
Check State Transition on RAS Messages	Whether to enable state checking validation on RAS messages.
Create Pinholes on Seeing RCF Packets	Whether to enable call setup between H.323 endpoints when the Gatekeeper is inside the network. The device opens pinholes for calls based on Registration Request/Registration Confirm (RRQ/RCF) messages. Because these RRQ/RCF messages are sent to and from the Gatekeeper, the calling endpoint's IP address is unknown and the device opens a pinhole through source IP address/port 0/0. This option is available for ASA 8.0(5)+ devices.
Check for H.245 Tunneling Action	Whether to enforce H.245 tunnel blocking and perform the action you select in the Action list box.
Check RTP Packets for Protocol Conformance	Whether to check RTP packets flowing through the pinholes for protocol conformance.
Payload Type must be Audio or Video based on Signaling Exchange	Whether to enforce the payload type to be audio or video based on the signaling exchange.

Element	Description
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 821). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Add or Edit HSI Group Dialog Boxes

Use the Add or Edit HSI group dialog boxes to add HSI groups to an H.323 policy inspection map.

Navigation Path

From the Parameters tab on the Add and Edit H.323 Map dialog boxes, click the **Add Row** button in the HSI group table, or select a row and click the **Edit Row** button. See Configuring H.323 Maps , on page 818.

Field Reference

Table 222: Add and Edit HSI Group Dialog Boxes

Element	Description
Group ID	The HSI group ID number (0 to 2147483647).
IP Address	The IP address of the HSI host.

Element	Description
Endpoint table	The end points associated with HSI group. You can add up to 10 end points per group. For each end point, you specify the IP address and interface policy group. • To add an end point, click the Add button and fill in the dialog box (see Add or Edit HSI Endpoint IP Address Dialog Boxes , on page 821). • To edit an end point, select it and click the Edit button. • To delete an end point, select it and click the Delete button.

Add or Edit HSI Endpoint IP Address Dialog Boxes

Us the Add or Edit HSI Endpoint IP Address dialog box to add end points to an HSI group.

Navigation Path

From the Add and Edit HSI Group dialog boxes, click the **Add Row** button in the end point table, or select a row and click the **Edit Row** button. See Configuring H.323 Maps , on page 818.

Field Reference

Table 223: Add and Edit HSI Endpoint IP Address Dialog Boxes

Element	Description
Network/Host	The IP address of the end point host or network.
Interface	The Interface policy group that identifies the interface connected to the security appliance. Enter the name of a policy group, or click **Select** to select it from a list, where you can also create new policy groups.

H.323 Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit H.323 Match Criterion (for H.323 class maps) or Match Condition and Action (for H.323 policy maps) dialog boxes to do the following:

- Define the match criterion and value for an H.323 class map.
- Select an H.323 class map when creating an H.323 policy map.
- Define the match criterion, value, and action directly in an H.323 policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating an H.323 class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for H.323, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating an H.323 policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit H.323 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring H.323 Maps , on page 818.

Related Topics

Field Reference

Table 224: H.323 Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing H.323 class map or define a new H.323 class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing H.323 class map policy object. Enter the name of the H.323 class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of H.323 traffic to match: • Called Party—Matches the called party address. • Calling Party—Matches the calling party address. • Media Type—Matches the media type.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	

Element	Description
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
Media Type	The type of media you want to inspect, audio, video, or data.

Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define HTTP maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x, and IOS devices.

The enhanced HTTP inspection feature, which is also known as an application firewall, verifies that HTTP messages conform to RFC 2616, use RFC-defined methods, and comply with various other criteria. This can help prevent attackers from using HTTP messages for circumventing network security policy.

When you enable HTTP inspection with an HTTP map, strict HTTP inspection with the action reset and log is enabled by default. You can change the actions performed in response to inspection failure, but you cannot disable strict inspection as long as the HTTP map remains enabled. Security Manager uses the **http-map** command to configure the map on the device.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.1.x/PIX 7.1.x/FWSM3.x/IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 225: Add and Edit HTTP Map Dialog Boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
General tab	Defines the action taken when non-compliant HTTP requests are received and to enable verification of content type. For a description of the options, see HTTP Map General Tab , on page 824.
Entity Length tab	Defines the action taken if the length of the HTTP content falls outside of configured targets. For a description of the options, see HTTP Map Entity Length Tab , on page 826.
RFC Request Method tab	Defines the action that the security appliance should take when specific RFC request methods are used in the HTTP request. For a description of the options, see HTTP Map RFC Request Method Tab , on page 827.
Extension Request Method tab	Defines the action taken when specific extension request methods are used in the HTTP request. For a description of the options, see HTTP Map Extension Request Method Tab , on page 828.
Port Misuse tab	Defines the action taken when specific undesirable applications are encountered. For a description of the options, see HTTP Map Port Misuse Tab , on page 829.
Transfer Encoding tab	Defines the action taken when specific transfer encoding types are used in the HTTP request. For a description of the options, see HTTP Map Transfer Encoding Tab , on page 830.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

HTTP Map General Tab

Use the General tab to define the action taken when non-compliant HTTP requests are received and to enable verification of content type.

Navigation Path

Click the General tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Field Reference

Table 226: HTTP Map General Tab

Element	Description
Take action for non-RFC 2616 compliant traffic	Whether you want to configure the action to be taken for traffic that does not comply with RFC 2616. Possible actions are: • Allow Packet—Allow the message. • Drop Packet—Close the connection. • Reset Connection (default)—Send a TCP reset message to client and server. You can also select **Generate Syslog** to write a message to the syslog if non-compliant traffic is encountered.
Verify Content-type field belongs to the supported internal content-type list.	Whether you want to configure the action to be taken for traffic whose content type does not belong to the supported internal content-type list. Possible actions are: • Allow Packet—Allow the message. • Drop Packet—Close the connection. • Reset Connection (default)—Send a TCP reset message to client and server. You can also select these options: • **Verify Content-type field for response matches the ACCEPT field of request**—To also verify that the content type of the response matches the request. • **Generate Syslog**—To write a message to the syslog if non-compliant traffic is encountered.
Override Global TCP Idle Timeout (IOS only)	Whether to change the TCP idle timeout default setting. An IOS device terminates a connection if there is no communication activity after this length of time. If you select this option, specify the desired timeout value in seconds.
Override Global Audit Trail Setting (IOS only) Enable Audit Trail	Whether to change the audit trail setting for IOS devices. If you select this option, you can select **Enable Audit Trail** to generate audit trail messages.

HTTP Map Entity Length Tab

Use the Entity Length tab to enable inspection based on the length of the HTTP content.

Navigation Path

Click the Entity Length tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Related Topics

- Understanding Map Objects , on page 308

Field Reference

Table 227: HTTP Map Entity Length Tab

Element	Description

Inspect URI Length	Whether to enable inspection based on the length of the URI. If you select this option, configure the following:
	• Maximum—The desired maximum length, in bytes, of the URI, from 1 to 65535.
	• Excessive URI Length Action—The action to take when the length is exceeded:
	  • Allow Packet—Allow the message.
	  • Drop Packet—Close the connection.
	  • Reset Connection—Send a TCP reset message to client and server.
	• Generate Syslog—Whether to generate a syslog message when a violation occurs.

Inspect Maximum Header Length	Whether to enable inspection based on the length of the HTTP header. If you select this option, configure the following:
	• Request—The desired maximum length, in bytes, of the request header, from 1 to 65535.
	• Response—The desired maximum length, in bytes, of the response header, from 1 to 65535.
	• Excessive Header Length Action—The action to take when the length is exceeded:
	  • Allow Packet—Allow the message.
	  • Drop Packet—Close the connection.
	  • Reset Connection—Send a TCP reset message to client and server.
	• Generate Syslog—Whether to generate a syslog message when a violation occurs.

Element	Description

Inspect Body Length	Whether to enable inspection based on the length of the message body. If you select this option, configure the following:
	• Minimum Threshold—The desired minimum length, in bytes, of the message body, from 1 to 65535.
	• Maximum Threshold—The desired maximum length, in bytes, of the message body, from 1 to 65535.
	• Body Length Threshold Action—The action to take when the message body falls outside of the configured boundaries:
	  • Allow Packet—Allow the message.
	  • Drop Packet—Close the connection.
	  • Reset Connection—Send a TCP reset message to client and server.
	• Generate Syslog—Whether to generate a syslog message when a violation occurs.

HTTP Map RFC Request Method Tab

Use the RFC Request Method tab to define the action to take when specific request methods are used in the HTTP request.

Navigation Path

Click the RFC Request Method tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Table 228: HTTP Map RFC Request Method

Element	Description
Available and Selected Methods Action Generate Syslog	The Available Methods list contains the request methods defined in RFC 2616. To configure an action for a method, select it, then select an action and optionally select **Generate Syslog** if you want a message added to the syslog when an HTTP request containing the selected method is encountered. Click the >> button to add it to the Selected Methods list. (To remove a method from the selected list, select it and click the << button.) **Tip** You can select multiple methods at a time using Ctrl+click if the action and syslog requests are the same for each. The actions you can specify are: • Allow Packet—Allow the message. • Drop Packet—Close the connection. • Reset Connection (default)—Send a TCP reset message to client and server.
Specify the action to be applied for the remaining available methods above.	Whether to define a default action for the methods for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.

HTTP Map Extension Request Method Tab

Use the Extension Request Method tab to define the action taken when specific extension request methods are used in the HTTP request.

Navigation Path

Click the Extension Request Method tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Specify the action to be applied for the remaining available methods above.	Whether to define a default action for the methods for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.

HTTP Map Port Misuse Tab

Use the Port Misuse tab to enable port misuse application firewall inspection. The application categories you can configure are:

- IM—Instant Messaging. The applications checked for are Yahoo! Messenger, AIM, and MSN IM.
- P2P—Peer-to-peer applications. The Kazaa application is checked.
- Tunneling—Tunneling applications. The applications checked for are HTTPort/HTTHost, GNU Httptunnel, GotoMyPC, Firethru, and Http-tunnel.com Client.

Navigation Path

Click the Port Misuse tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Field Reference

Table 230: HTTP Map Port Misuse Tab

Element	Description
Available and Selected Application Categories Action Generate Syslog	The Available Application Categories list contains the categories for which you can define firewall inspection settings. To configure an action for a category, select it, then select an action and optionally select **Generate Syslog** if you want a message added to the syslog when an HTTP request containing the selected application is encountered. Click the >> button to add it to the Selected Categories list. (To remove a category from the selected list, select it and click the << button.) **Tip** You can select multiple categories at a time using Ctrl+click if the action and syslog requests are the same for each. The actions you can specify are: • Allow Packet—Allow the message. • Drop Packet—Close the connection. • Reset Connection (default)—Send a TCP reset message to client and server.
Specify the action to be applied for the remaining available categories above.	Whether to define a default action for the categories for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.

HTTP Map Transfer Encoding Tab

Use the Transfer Encoding tab to enable inspection based on the transfer encoding type. The encoding types that you can configure are:

- Chunked—Identifies the transfer encoding type in which the message body is transferred as a series of chunks.
- Compressed—Identifies the transfer encoding type in which the message body is transferred using UNIX file compression.
- Deflate—Identifies the transfer encoding type in which the message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951).
- GZIP—Identifies the transfer encoding type in which the message body is transferred using GNU zip (RFC 1952).
- Identity—Identifies connections in which no transfer encoding is performed in the message body.

Navigation Path

Click the Transfer Encoding tab on the Add and Edit HTTP Map dialog boxes for ASA 7.1.x/PIX 7.1.x/FWSM 3.x/IOS Devices. See Configuring HTTP Maps for ASA 7.1.x, PIX 7.1.x, FWSM 3.x and IOS Devices , on page 823.

Table 231: HTTP Map Transfer Encoding Tab

Element	Description
Available and Selected Encoding Types Action Generate Syslog	The Available Encoding Types list contains the types of transfer encoding for which you can define firewall inspection settings. To configure an action for a type, select it, then select an action and optionally select **Generate Syslog** if you want a message added to the syslog when an HTTP request containing the selected type is encountered. Click the >> button to add it to the Selected Encoding Types list. (To remove a type from the selected list, select it and click the << button.) **Tip** You can select multiple types at a time using Ctrl+click if the action and syslog requests are the same for each. The actions you can specify are: • Allow Packet—Allow the message. • Drop Packet—Close the connection. • Reset Connection (default)—Send a TCP reset message to client and server.
Specify the action to be applied for the remaining available encoding types above.	Whether to define a default action for the types for which you have not configured specific actions above. If you select this option, select the action and syslog setting to use for the default action.

Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit HTTP Map dialog boxes to define the match criterion and values for the HTTP inspect map for ASA and PIX software releases 7.2 and later.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > HTTP (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Related Topics

Field Reference

Table 232: Add and Edit HTTP Map Dialog Boxes (ASA 7.2+/PIX 7.2+)

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Body Match Maximum	The maximum number of characters in the body of an HTTP message that should be searched in a body match. **Tip** A high value can have a significant impact on performance.
Check for protocol violations	Whether to check for protocol violations.
Action	The action to take based on the defined settings. You can drop, reset, or log the connection.
Spoof Server	Enables you to replace the server HTTP header value with the specified string.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 833). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.
Overrides: None	Shows that no overrides exist on the device. You must manually set overrides in order to change the display. For more information, see Understanding Policy Object Overrides for Individual Devices , on page 246. **Note** Selecting Allow Value Override per Device does not automatically set overrides.

HTTP Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit HTTP Match Criterion (for HTTP class maps) or Match Condition and Action (for HTTP policy maps) dialog boxes to do the following:

- Define the match criterion and value for an HTTP class map.
- Select an HTTP class map when creating an HTTP policy map.
- Define the match criterion, value, and action directly in an HTTP policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map. You can use the following criteria:

- Request/Response Content Type Mismatch—Specifies that the content type in the response must match one of the MIME types in the accept field of the request.
- Request Arguments—Applies the regular expression match to the arguments of the request.
- Request Body—Applies the regular expression match to the body of the request.
- Request Body Length—Specifies that the body length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Count—Specifies that the number of headers in the request be matched as greater than or less than the specified number.

- Request Header Length—Specifies that the header length of the request be matched as greater than or less than the specified number of bytes.
- Request Header Field—Applies the regular expression match to the header of the request.
- Request Header Field Count—Applies the regular expression match to the header of the request based on a specified number of header fields.
- Request Header Field Length—Applies the regular expression match to the header of the request based on a specified field length.
- Request Header Content Type—Specifies the content type to evaluate in the content-type header field of the request.
- Request Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the request.
- Request Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the request.
- Request Method—Specifies the method of the request to match.
- Request URI—Applies the regular expression match to the URI of the request.
- Request URI Length—Specifies that the URI length of the request be matched as greater than or less than the specified number of bytes.
- Response Body ActiveX—Specifies whether there is ActiveX content in the body of the request.
- Response Body Java Applet—Specifies whether there is a Java applet in the body of the request.
- Response Body—Applies the regular expression match to the body of the response.
- Response Body Length—Specifies that the body length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Count—Specifies that the number of headers in the response be matched as greater than or less than the specified number.
- Response Header Length—Specifies that the header length of the response be matched as greater than or less than the specified number of bytes.
- Response Header Field—Applies the regular expression match to the header of the response.
- Response Header Field Count—Applies the regular expression match to the header of the response based on a specified number of header fields.
- Response Header Field Length—Applies the regular expression match to the header of the response based on a specified field length.
- Response Header Content Type—Specifies the content type to evaluate in the content-type header field of the response.
- Response Header Transfer Encoding—Specifies the transfer encoding to evaluate in the transfer-encoding header field of the response.
- Response Header Non-ASCII—Specifies whether there are non-ASCII characters in the header of the response.
- Response Status Line—Applies the regular expression match to the status line of the response.

Navigation Path

When creating an HTTP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for HTTP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating an HTTP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit HTTP Map dialog boxes for ASA/PIX 7.2+ devices, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring HTTP Maps for ASA 7.2+ and PIX 7.2+ Devices , on page 831.

Field Reference

Table 233: HTTP Class and Policy Maps (ASA 7.2+/PIX 7.2+) Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing HTTP class map or define a new HTTP class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing HTTP class map policy object. Enter the name of the HTTP class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of HTTP traffic to match. The criteria are described above.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. For some criteria, this is the only available option. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria. The types of action depend on the criterion you select.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	

Element	Description
Field Name	The name of the header field to evaluate. You can select one of the following: • Predefined—The predefined HTTP header fields. • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object.
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object. When you are evaluating the Request Header Transfer Encoding or Response Header Transfer Encoding criteria, you can also select these options: • Specified By—One of the following predefined types of transfer encoding: • Chunked—The message body is transferred as a series of chunks. • Compressed—The message body is transferred using UNIX file compression. • Deflate—The message body is transferred using zlib format (RFC 1950) and deflate compression (RFC 1951). • GZIP—The message body is transferred using GNU zip (RFC 1952). • Identity—No transfer encoding is performed. • Empty—The transfer-encoding field in request header is empty.
Greater Than Length	The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.
Greater Than Count	The number of evaluated items. The criterion matches if the count is greater than the specified number, and does not match if the count is less than the specified number.

Element	Description
Content Type	The content type to evaluate as specified in the content-type header field. You can select one of the following: • Specified By—A predefined MIME type. • Unknown—The MIME type is not known. Select Unknown when you want to evaluate the item against all known MIME types. • Violation—The magic number in the body must correspond to the MIME type in the content-type header field. • Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.
Request Method	The specified request method to match. You can select one of the following: • Specified By—The predefined request method. • Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.

Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map dialog boxes to define settings for define an Instant Messenger (IM) inspect map for devices running ASA/PIX 7.2 or later. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

For ASA and PIX devices, IM application inspection provides detailed access control to control network usage. You can use regular expressions to help stop leakage of confidential data and the propagation of network threats. You can inspect Yahoo! Messenger or MSN Messenger traffic.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (ASA 7.2+/PIX 7.2+)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Related Topics

Table 234: Add and Edit IM Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes , on page 838). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

Note From version 4.17, though Cisco Security Manager continues to support PIX features/functionality, it does not support any enhancements.

Use the Add or Edit IM Match Criterion (for IM class maps) or Match Condition and Action (for IM policy maps) dialog boxes to do the following:

- Define the match criterion and value for an IM class map.

- Select an IM class map when creating an IM policy map.
- Define the match criterion, value, and action directly in an IM policy map.

These types of maps are used only for devices running ASA 7.2 or later, or PIX 7.2 or later, operating systems.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating an IM class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for IM, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating an IM policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit IM Map dialog boxes for ASA 7.2/PIX 7.2, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring IM Maps for ASA 7.2+, PIX 7.2+ Devices , on page 837.

Field Reference

Table 235: IM Class and Policy Map (ASA 7.2+/PIX 7.2+) Add or Edit Match Condition (and Action) Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing IM class map or define a new IM class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing IM class map policy object. Enter the name of the IM class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.

Element	Description
Criterion	Specifies which criterion of IM traffic to match. The criteria are: • Filename—Matches the filename from IM file transfer service. • Client IP Address—Matches the source client IP address. • Client Login Name—Matches the client login name from IM service. • Peer IP Address—Matches the peer, or destination, IP address. • Peer Login Name—Matches the peer, or destination, login name from IM service. • Protocol—Matches IM protocols. • Service—Matches IM services. • File Transfer Service Version—Matches the IM file transfer service version.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
IP Address	The IP address you want to match.
Protocol	The IM protocol, either MSN Messenger or Yahoo! Messenger.
Services	The IM services you want to inspect. Select one or more of the listed services.

Configuring IM Maps for IOS Devices

Note From version 4.17, though Cisco Security Manager continues to support PIX, FWSM, and IPS features/functionality, it does not support any enhancements.

Use the Add and Edit IM Map (IOS) dialog boxes to configure Instant Messaging (IM) inspection policy map objects for IOS devices. An IM map lets you change the default configuration values used for IM application inspection.

Instant Messaging causes concern due to its use of clear text when conducting business and the potential for network attacks and the spreading of viruses. Thus, you might want to block certain types of instant messages from occurring, while allowing others.

IM application inspection provides detailed access control to control network usage. It also helps stop leakage of confidential data and the propagation of network threats. The scope can be limited by identifying permitted or denied servers. Inspection of Yahoo! Messenger, MSN Messenger, and AOL instant messages are supported.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IM (IOS)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

Related Topics

- Understanding Map Objects , on page 308

Field Reference

Table 236: Add and Edit IM Map (IOS) Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Service Tabs The tabs represent different IM service providers. The settings available on each tab are identical. You must configure the settings separately for each service provider. The descriptions of the following fields apply to each of the services: Yahoo!, MSN, and AOL.	
Text Chat	How you want the text chat service to be handled, for example, allowed, denied, logged, or some combination.
Other Services	How you want services other than text chat to be handled, for example, allowed, denied, logged, or some combination. IOS software recognizes all services other than text chat, such as voice-chat, video-chat, file sharing and transferring, and gaming as a single group.

Element	Description
Permit Servers	The servers from which to permit traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.
Deny Servers	The servers from which to deny traffic. Accepted formats are IP addresses, IP ranges, and hostnames separated by commas.
Alert	Whether you want to enable or disable alerts. The default is to use the default inspection settings.
Audit	Whether you want to enable or disable an audit trail. The default is to use the default inspection settings.
Timeout	A timeout for the service. You can use the default inspection settings, or you can elect to specify a timeout. If you select Specify Timeout, enter the timeout value in seconds.
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring IP Options Maps

Use the Add and Edit IP Options Map dialog boxes to define maps for the inspection of the options in an IP packet header on ASA 8.2(2)+ devices. The options field provides for control functions that are required in some situations but unnecessary for most common communications.

If you do not configure IP options inspection, the ASA device drops packets that have any options configured, with one exception. In routed mode, packets that contain the router alert option are allowed. (To disallow router alert packets, create an IP options map with router alert deselected, and configure an inspection rule to inspect IP Options using the policy map.)

Tip Because the no operation (NOP) option might be used as padding to ensure proper packet-header size and alignment, you might want to allow NOP.

For each option, you can select whether to:

- **Allow**—Allow the packet and do not change the IP header options field.
- **Clear**—Allow the packet and clear the option from the IP header options field.

If you do not select an option, the option is prohibited, and packets containing the option are dropped. Any option not listed here also results in a dropped packet; you cannot change this behavior.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **IP Options** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

Field Reference

Table 237: Add and Edit IP Options Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object.
End of Options List	End of Options List (EOOL), or IP Option 0, contains just a single zero byte and appears at the end of all options to mark the end of a list of options. This might not coincide with the end of the header according to the header length.
No operation	No Operation (NOP), or IP Option 1, is used for padding. The Options field in the IP header can contain zero, one, or more options, which makes the total length of the field variable. However, the IP header must be a multiple of 32 bits. If the number of bits of all options is not a multiple of 32 bits, the NOP option is used as to align the options on a 32-bit boundary.
Router alert	Router Alert (RTRALT), or IP Option 20, notifies transit routers to inspect the contents of the packet even when the packet is not destined for that router. This inspection is valuable when implementing RSVP and similar protocols require relatively complex processing from the routers along the packet's delivery path.
Basic Security *(ASA devices 9.5(1) or later)*	IP-option Basic Security (number 130) from RFC 1108, default is to drop.
Commercial Security *(ASA devices 9.5(1) or later)*	IP-option Commercial Security (number 134), default is to drop.
Default *(ASA devices 9.5(1) or later)*	IP-option default configuration, default is drop.

IMI Traffic Descriptor *(ASA devices 9.5(1) or later)*	IP-option IMI Traffic Descriptor (number 144), default is to drop.
Quick Start *(ASA devices 9.5(1) or later)*	IP-option Router Alert (number 25) from RFC 4782, default is to drop.
Record Route *(ASA devices 9.5(1) or later)*	IP-option Record Route (number 7) from RFC 791, default is to drop.
Time Stamp *(ASA devices 9.5(1) or later)*	IP-option Router Alert (number 68) from RFC 791, default is to drop.
Note Beginning with version 4.9, Security Manager supports 10 new IP Options for ASA devices running the software version 9.5(1) or later. You can tune the inspection to allow, clear, or drop any standard or experimental options. You can also configure specific IP Options apart from the ones that are defined. For example, a value ranging between 0 and 255 can be used to configure an IP Option directly. Security Manager supports the CLI '[no] 0-255 allow | clear'. You can also set a default behavior for options not explicitly defined in an IP options inspection map. You now select which options to allow and optionally clear. For a list of IP options, with references to the relevant RFCs, see the IANA page, http://www.iana.org/assignments/ip-parameters/ip-parameters.xhtml	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring IPv6 Maps

Use the Add and Edit IPv6 Map dialog boxes to define the match criteria and values for an IPv6 inspect map. You can use an IPv6 map to selectively drop IPv6 packets based on following types of extension headers found anywhere in the IPv6 packet:

- Hop-by-Hop Options
- Routing (Type 0)
- Fragment

- Destination Options
- Authentication
- Encapsulating Security Payload

Service objects corresponding to these protocols are available in the Services table in the Policy Object Manager , on page 232.

Note With the release of Security Manager 4.4 and versions 9.0 and later of the ASA, the separate policies for configuring IPv4 and IPv6 inspection rules were unified. However, IPv6 maps are still provided in support of earlier versions.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **IPv6** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

Related Topics

Field Reference

Table 238: Add and Edit IPv6 Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Permit only known Extension Headers	Whether the ASA should verify the IPv6 extension header. When selected and an unknown IPv6 extension header is encountered, the ASA drops the packet and logs the action. This option is selected by default.
Enforce Extension Header Order	Whether the ASA should enforce extension header order as defined in the RFC 2460 specification. When selected and an error is detected, the ASA drops the packet and logs the action. This option is selected by default.

Element	Description
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. These criteria entries are created and edited in the IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 846.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides in the Policy Object Overrides Window , on page 249. The **Overrides** field indicates the number of devices that have overrides for this object.

IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define an Extension Header match criterion and action for an IPv6 policy map. The contents of the Extension Headers are not processed; an action is applied based solely on the presence of a specified EH type.

The fields in these dialog boxes change based on the criterion you select.

Note You can apply multiple match definitions to one IPv6 policy map.

Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring IPv6 Maps , on page 844.

Related Topics

Field Reference

Table 239: IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Element	Description

Criterion	Choose the type of IPv6 Extension Header to match:
	• Authentication Header (AH)—Provides integrity and data-origin authentication for IP packets.
	• Destination Options Header—Used for IPv6 Mobility, as well as in support of certain applications.
	• Encapsulating Security Payload Header (ESP)—All information following the ESP header is encrypted and not accessible to intermediate network devices.
	• Fragment Header—Supports traffic-source fragmented-packet communications.
	• Hop-by-Hop Options Header—Optional information that must be examined by every node in the packet's delivery path.
	• Header Count—The number of headers in the packet. When you choose this option, the following field appears; specify an upper bound for the number of headers:
	  • Greater Than Count—Enter a value between 0 and 255.
	The packet is considered a match if the Header Count is greater than the specified number; it is not a match if the count is equal to, or less than the specified number.
	• Routing Header Type—Use this option to match one or EH types based on their header codes. When you choose this type, the following Value options appear; specify one or the other:
	  • Routing Type—Enter one Extension Header code; for example, *51* for Authentication Header.
	  • Routing Type Field Range—Enter a starting value and an ending value to define a range of EH codes.
	• Routing Header Address Count—The number of IP addresses embedded in the packet. When you choose this option, the following field appears; specify an upper bound for the number of addresses:
	  • Greater Than Count—Enter a value between 0 and 255.
	The packet is considered a match if the address count is greater than the specified number; it is not a match if the count is equal to, or less than the specified number.

Type	Specifies that the map is applied only to traffic that matches the defined criteria.
Action	Choose the action you want the device to take for traffic that matches the defined criteria: • Drop Packet—Matching packets are dropped without notification. • Drop Packet and Log—Matching packets are logged and then dropped. • Log—Matching packets are logged and processing continues.

Configuring IPsec Pass Through Maps

Use the Add and Edit IPsec Pass Through Map dialog boxes to configure settings for the IPsec Pass Through Map policy object. An IPsec Pass Through policy map lets you change the default configuration values used for IPsec Pass Through inspection.

The IPSec Pass Through inspection engine lets the security appliance pass ESP (IP protocol 50) and AH (IP protocol 51) traffic that is formed between two hosts because of successful IKE (UDP port 500) negotiation without the requirement of specific ESP or AH access lists.

The ESP or AH traffic is permitted by the inspection engine with the configured idle timeout if there is an existing control flow and it is within the connection limit defined in the MPF framework. A new control flow is created for IKE UDP port 500 traffic with the configured UDP idle timeout if there is not one, or it uses the existing flow.

To ensure that the packet arrives into the inspection engine, a hole is punched for all such traffic (ESP and AH). This inspect is attached to the control flow. The control flow is present as long as there is at least one data flow (ESP or AH) established, but the traffic always flows on the same connection. Because this IKE connection is kept open as long as data flows, a rekey would always succeed. The flows are created irrespective of whether NAT is being used. However, PAT is not supported.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > IPsec Pass Through** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 240: Add and Edit IPsec Pass Through Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Allow ESP Maximum ESP Tunnels per Client ESP Idle Timeout	Whether to allow ESP traffic. If you select this option, you can configure the maximum number of ESP tunnels that each client can have and the amount of time that an ESP tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00).
Allow AH Maximum AH Tunnels per Client AH Idle Timeout	Whether to allow AH traffic. If you select this option, you can configure the maximum number of AH tunnels that each client can have and the amount of time that an AH tunnel can be idle before it is closed (in hours:minutes:seconds format). The default timeout is 10 minutes (00:10:00).

Element	Description
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Configuring NetBIOS Maps

Use the Add or Edit NetBIOS Map dialog boxes to define maps for NetBIOS inspection. A NetBIOS policy map lets you change the default configuration values used for NetBIOS inspection.

The NetBIOS inspection engine translates IP addresses in the NetBIOS name service (NBNS) packets according to the security appliance NAT configuration.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **NetBIOS** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Match Condition and Action tab only	
Class	The name of the class map
Action	Allows you to select the action you want to take when policy violations occur
+ [the "add" button]	Opens the Add Match Condition and Action dialog box. This dialog box has the following fields: • Match Type • Class Map • Action

Configuring SIP Maps

Use the Add and Edit SIP Map dialog boxes to configure values used for SIP application inspection. A SIP inspection map lets you change the default configuration values used for SIP application inspection.

SIP is a widely used protocol for Internet conferencing, telephony, presence, events notification, and instant messaging. Partially because of its text-based nature and partially because of its flexibility, SIP networks are subject to a large number of security threats.

SIP application inspection provides address translation in message header and body, dynamic opening of ports and basic sanity checks. It also supports application security and protocol conformance, which enforce the sanity of the SIP messages, as well as detect SIP-based attacks.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SIP (ASA/PIX/FWSM)** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 243: Add and Edit SIP Map Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Enable SIP Instant Messaging Extensions	Whether to enable Instant Messaging extensions.
Permit Non-SIP Traffic on SIP Port	Whether to permit non-SIP traffic on the SIP port.
Hide Server's and Endpoint's IP Address	Whether to hide the IP addresses, which enables IP address privacy.
Check RTP Packets for Protocol Conformance Limit Payload to Audio or Video based on the Signaling Exchange	Whether to check RTP/RTCP packets flowing on the pinholes for protocol conformance. If you select this option, you can also elect to enforce the payload type to be audio/video based on the signaling exchange.
If Number of Hops to Destination is Greater Than 0	Whether to check if the value of Max-Forwards header is zero. When it is greater than zero, the action you select in the Action field is implemented. The default is to drop the packet.
If State Transition is Detected	Whether to check SIP state transitions. When a transition is detected, the action you select in the Action field is implemented. The default is to drop the packet.
If Header Fields Fail Strict Validation	Whether to take the action specified in the Action field if the SIP header fields are invalid. The default is to drop the packet.
Inspect Server's and Endpoint's Software Version	Whether to inspect the SIP endpoint software version in User-Agent and Server headers. The default is to mask the information.
If Non-SIP URI is Detected	Whether to take the action specified in the Action field if a non-SIP URI is detected in the Alert-Info and Call-Info headers. The default is to mask the information.

Element	Description
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 853). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

SIP Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit SIP Match Criterion (for SIP class maps) or Match Condition and Action (for SIP policy maps) dialog boxes to do the following:

- Define the match criterion and value for a SIP class map.
- Select a SIP class map when creating a SIP policy map.
- Define the match criterion, value, and action directly in a SIP policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating a SIP class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for SIP, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating a SIP policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit SIP Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring SIP Maps , on page 851.

Related Topics

Field Reference

Table 244: SIP Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type Class Name (Policy Map only)	Enables you to use an existing SIP class map or define a new SIP class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing SIP class map policy object. Enter the name of the SIP class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.
Criterion	Specifies which criterion of SIP traffic to match. • Called Party—Matches the called party as specified in the To header. • Calling Party—Matches the calling party as specified in the From header. • Content Length—Matches the Content Length header. • Content Type—Matches the Content Type header. • IM Subscriber—Matches the SIP Instant Messenger subscriber. • Message Path—Matches the SIP Via header. • Third Party Registration—Matches the requester of a third-party registration. • URI Length—Matches a URI in the SIP headers. • Request Method—Matches the SIP request method.
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on the string "example.com," then any traffic that contains "example.com" is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
Action (Policy Map only)	The action you want the device to take for traffic that matches the defined criteria.
Variable Fields The following fields vary based on what you select in the Criterion field. This list is a super-set of the fields you might see.	

Element	Description
Value	The regular expression you want to evaluate. You can select one of the following: • Regular Expression—The regular expression object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression object. • Regular Expression Group—The regular expression group object that defines the regular expression you want to use for pattern matching. Enter the name of the object. You can click **Select** to choose the object from a list of existing ones or to create a new regular expression group object.
URI Type	The type of URI to match, either SIP or TEL.
Greater Than Length	The length in bytes of the evaluated field. The criterion matches if the length is greater than the specified number, and does not match if the field is less than the specified number.
Content Type	The content type to evaluate as specified in the content-type header field. You can select one of the following: • SDP—Matches an SDP SIP content header type. • Regular Expression, Regular Expression Group—The regular expression or regular expression group to evaluate. See the explanation for the Value field for an explanation of these options.

Element	Description
Resource Method	The request method you want to inspect: • ack—Confirms that the client has received a final response to an INVITE request. • bye—Terminates a call and can be sent by either the caller or the called party. • cancel—Cancels any pending searches but does not terminate a call that has already been accepted. • info—Communicates mid-session signaling information along the signaling path for the call. • invite—Indicates a user or service is being invited to participate in a call session. • message—Sends instant messages where each message is independent of any other message. • notify—Notifies a SIP node that an event which has been requested by an earlier SUBSCRIBE method has occurred. • options—Queries the capabilities of servers. • prack—Provisional response acknowledgment. • refer—Requests that the recipient REFER to a resource provided in the request. • register—Registers the address listed in the To header field with a SIP server. • subscribe—Requests notification of an event or set of events at a later time. • unknown—Uses a nonstandard extension that could have unknown security impacts on the network. • update—Permits a client to update parameters of a session but has no impact on the state of a dialog.

Configuring Skinny Maps

Use the Add or Edit Skinny Map dialog boxes to define Skinny maps for Skinny inspection. A Skinny policy map lets you change the default configuration values used for Skinny inspection.

Skinny (SCCP) is a simplified protocol used in VoIP networks. Cisco IP Phones using SCCP can coexist in an H.323 environment. When used with Cisco CallManager, the SCCP client can interoperate with H.323 compliant terminals. Application layer functions in the security appliance recognize SCCP version 3.3. There are 5 versions of the SCCP protocol: 2.4, 3.0.4, 3.1.1, 3.2, and 3.3.2.

The security appliance supports all versions through 3.3.2. The security appliance supports PAT and NAT for SCCP. PAT is necessary if you have more IP phones than global IP addresses for the IP phones to use. By supporting NAT and PAT of SCCP Signaling packets, Skinny application inspection ensures that all SCCP signaling and media packets can traverse the security appliance.

Normal traffic between Cisco CallManager and Cisco IP Phones uses SCCP and is handled by SCCP inspection without any special configuration. The security appliance also supports DHCP options 150 and 66, which it

accomplishes by sending the location of a TFTP server to Cisco IP Phones and other DHCP clients. Cisco IP Phones might also include DHCP option 3 in their requests, which sets the default route.

Navigation Path

Select **Manage** > **Policy Objects**, then select **Maps** > **Policy Maps** > **Inspect** > **Skinny** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row, then select **Edit Object**.

- Configuring Protocols and Maps for Inspection , on page 787

Field Reference

Table 246: Skinny Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Criterion	Specifies which criterion of Skinny traffic to match.

Element	Description
Type	Specifies whether the map includes traffic that matches or does not match the criterion. For example, if Doesn't Match is selected on 0xFFFF, then any traffic that has the message ID 0xFFFF is excluded from the map. • Matches—Matches the criterion. • Doesn't Match—Does not match the criterion.
ID Type	The hexadecimal value for the message ID to inspect: • Value—Matches a single hexadecimal value. • Range—Matches a range of values.
Action	The action you want the device to take for traffic that matches the defined criteria.

Configuring SNMP Maps

Use the Add and Edit SNMP Map dialog boxes to define maps for SNMP inspection. An SNMP policy map lets you change the default configuration values used for SNMP application inspection.

SNMP application inspection lets you restrict SNMP traffic to a specific version of SNMP. Earlier versions of SNMP are less secure; therefore, denying certain SNMP versions may be required by your security policy. The security appliance can deny SNMP versions 1, 2, 2c, or 3. You control the versions permitted by creating an SNMP map. You then apply the SNMP map when you enable SNMP inspection.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SNMP** from the Object Type selector. Right-click inside the work area, then select **New Object**, or right-click a row and select **Edit Object**.

Configuring SCTP Maps

SCTP is a transport-layer protocol operating on top of IP in the protocol stack, similar to TCP and UDP. SCTP creates a logical communication channel, called an association, between two end nodes over multiple source or destination IP addresses. An association defines a set of IP addresses on each node (source and destination) and a port on each node. Any IP address can be used as either a source or a destination IP address of data packets in the association. Messages can be transmitted between a pair of IP addresses, which is defined as a stream.

If you have SCTP traffic going through the ASA, you can configure Cisco Security Manager to control access based on SCTP ports, and implement application layer inspection to enable connections and to optionally filter on payload protocol ID (PPID) to selectively drop, log, or rate limit applications.

You can refine your access rules by adding an SCTP inspect map and filtering on SCTP applications.You can selectively drop, log, or rate limit SCTP traffic classes based on the payload protocol identifier (PPID).

When you filter on PPID, keep the following in mind:

- PPIDs are in data chunks, and a given packet can have multiple data chunks. If a packet includes data chunks with different PPIDs, the packet will not be filtered, and the assigned action will not be applied to the packet.
- If you use PPID filtering to drop or rate-limit packets, be aware that the transmitter will resend any dropped packets. Although a packet for a rate-limited PPID might make it through on the next attempt, a packet for a dropped PPID will again be dropped. You might want to evaluate the eventual consequence of these repeated drops on your network.

Use the Add and Edit SCTP Map dialog boxes to define the match criteria and values for an SCTP inspect map. You can use an SCTP map to inspect packets based on the Payload PID criteria. You can perform the following actions on the packets, based on the PPID match criteria:

- No Action
- Drop Packet
- Log Packet
- Rate Limit

Service objects corresponding to the SCTP protocol are available in the Services table in the Understanding Map Objects , on page 308.

Note SCTP inspect maps are supported from Security Manager 4.10 and ASA versions 9.5.2 and later.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > SCTP** from the Object Type selector. Right-click inside the table, then select **New Object** or right-click a row, then select **Edit Object**.

Table 248: Add and Edit SCTP Map Dialog Boxes

Element	Description
Name	The name of the policy object. A maximum of 40 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. These criteria entries are created and edited in the SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes , on page 862.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.

Element	Description
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides in the Policy Object Overrides Window , on page 249. The **Overrides** field indicates the number of devices that have overrides for this object.

SCTP Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Use the Add or Edit Match Condition and Action dialog boxes to define a Payload PID match criterion and action for a SCTP policy map. Repeat the process until you identify all PPIDs you want to selectively handle.

Navigation Path

In the Policy Object Manager, from the Match Condition and Action tab on the Add or Edit IPv6 Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring IPv6 Maps , on page 844.

Field Reference

Table 249: IPv6 Policy Maps Add or Edit Match Condition and Action Dialog Boxes

Element	Description
Criterion	Select the Payload PID (PPID) criterion.
Type	Specifies that the map is applied only to traffic that matches or does not match the defined criteria.
You can find the current list of SCTP PPIDs at http://www.iana.org/assignments/sctp-parameters/sctp-parameters.xhtml#sctp-parameters-25.	
Min. Payload PID	Enter a PPID number. There are certain PPIDs associated with a name, which Cisco Security Manager accepts, and processes internally. Enter the PPID number in the text box, and click OK. The corresponding name will be displayed in the match action table if it matches the default names.
Max. Payload PID	(Optional) Enter a second, higher PPID to specify a range of PPIDs.

Element	Description
Action	Choose the action based on the PPID in SCTP data chunks: • Drop Packet—Drop and log all packets that match. • Log—Send a system log message. • Rate Limit— Limit the rate of messages. The rate is in packets per second.

Configuring Diameter Maps

Diameter is an Authentication, Authorization, and Accounting (AAA) protocol used in next-generation mobile and fixed telecom networks such as EPS (Evolved Packet System) for LTE (Long Term Evolution) and IMS (IP Multimedia Subsystem). It replaces RADIUS and TACACS in these networks.

Diameter uses TCP and SCTP as the transport layer, and secures communications using TCP/TLS and SCTP/DTLS. It can optionally provide data object encryption as well. For detailed information on Diameter, see RFC 6733.

Diameter applications perform service management tasks such as deciding user access, service authorization, quality of service, and rate of charging. Although Diameter applications can appear on many different control-plane interfaces in the LTE architecture, the ASA inspects Diameter command codes and attribute-value pairs (AVP) for the following interfaces only:

- S6a: Mobility Management Entity (MME) - Home Subscription Service (HSS).
- S9: PDN Gateway (PDG) - 3GPP AAA Proxy/Server.
- Rx: Policy Charging Rules Function (PCRF) - Call Session Control Function (CSCF).

Diameter inspection opens pinholes for Diameter endpoints to allow communication. The inspection supports 3GPP version 12 and is RFC 6733 compliant.

You can use the Add and Edit Diameter Map dialog boxes to filter traffic based on application ID, command codes, and AVP, to apply special actions such as dropping packets or connections, or logging them. You can create custom AVP for newly-registered Diameter applications. Filtering lets you fine-tune the traffic you allow on your network. For more information see Create and Add Custom AVPs, on page 867.

Note Diameter messages for applications that run on other interfaces will be allowed and passed through by default. However, you can configure a Diameter inspection policy map to drop these applications by application ID, although you can specify actions based on the command codes or AVP for these unsupported applications.

Navigation Path

Select **Manage > Policy Objects**, then select **Maps > Policy Maps > Inspect > Diameter** from the Object Type selector. Right-click inside the work area, then select **New Object** or right-click a row and select **Edit Object**.

Table 250: Add and Edit Diameter Map Dialog Box

Element	Description
Name	The name of the policy object. A maximum of 128 characters is allowed.
Description	A description of the policy object. A maximum of 200 characters is allowed.
Parameters tab	
Unsupported application-id action log	To log unsupported Diameter application identifier (Diameter application name) in the map. Application ID is a number between 0-4294967295, in the map. These applications are registered with the IANA. Following are the core supported applications, but you can filter on other applications. 3gpp-rx-ts29214 (16777236) 3gpp-s6a (16777251) 3gpp-s9 (16777267) common-message (0) - This is the base Diameter protocol
Unsupported command code action log	To log unsupported Diameter command codes in the map, where code is the Diameter command code name or number (0-4294967295).
Unsupported avp action log	To log unsupported attribute- value pair parameter
Strict Parameters	
Enable Session Validation	To validate session-ID AVP related messages
Enable State Validation	To enable validation of state machine

Element	Description
Match Condition and Action Tab The Match All table lists the criteria included in the policy map. Each row indicates whether the inspection is looking for traffic that matches or does not match each criterion, the criterion and value that is inspected, and the action to be taken for traffic that satisfies the conditions. • To add a criterion, click the Add button and fill in the Match Condition and Action dialog box (see Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes , on page 865). • To edit a criterion, select it and click the Edit button. • To delete a criterion, select it and click the Delete button.	
Category	The category assigned to the object. Categories help you organize and identify rules and objects. See Using Category Objects , on page 241.
Allow Value Override per Device Overrides Edit button	Whether to allow the object definition to be changed at the device level. For more information, see Allowing a Policy Object to Be Overridden , on page 247 and Understanding Policy Object Overrides for Individual Devices , on page 246. If you allow device overrides, you can click the **Edit** button to create, edit, and view the overrides. The **Overrides** field indicates the number of devices that have overrides for this object.

Diameter Class and Policy Maps Add or Edit Match Condition (and Action) Dialog Boxes

Use the Add or Edit Diameter Match Criterion (for Diameter class maps) or Match Condition and Action (for Diameter policy maps) dialog boxes to do the following:

- Define the match criterion and value for a Diameter class map.
- Select a Diameter class map when creating a Diameter policy map.
- Define the match criterion, value, and action directly in a Diameter policy map.

The fields on this dialog box change based on the criterion you select and whether you are creating a class map or policy map.

Navigation Path

When creating a Diameter class map, in the Policy Object Manager, from the Add or Edit Class Maps dialog boxes for Diameter, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Class Maps for Inspection Policies , on page 792.

When creating a Diameter policy map, in the Policy Object Manager, from the Match Condition and Action tab on the Add and Edit Diameter Map dialog boxes, right-click inside the table, then select **Add Row** or right-click a row, then select **Edit Row**. See Configuring Diameter Maps , on page 863.

Field Reference

Table 251: Diameter Class and Policy Maps Add and Edit Match Condition and Action Dialog Boxes

Element	Description
Match Type (Only Policy Map)	Enables you to use an existing Diameter class map or define a new Diameter class map. • Use Specified Values—You want to define the class map on this dialog box. • Use Values in Class Map—You want to select an existing Diameter class map policy object. Enter the name of the Diameter class map in the **Class Name** field. Click **Select** to select the map from a list or to create a new class map object.

Criterion	Specifies which criterion of Diameter traffic to match.
	• Application ID—Matches the application identifier, where the application identifier is the Diameter application name or number (0-4294967295) in the Begin Value field. If there is a range of consecutively-numbered applications that you want to match, you can include a second ID in the End Value field. You can define the range by application name or number, and it applies to all the numbers between the Begin Value and the End Value.
	• Command Code—Matches the command code, where code is the Diameter command code name or number (0-4294967295) in the Begin Value field. If there is a range of consecutively-numbered command codes that you want to match, you can include a second code in the End Value field. You can define the range by command code name or number, and it applies to all the numbers between the Begin Value and the End Value.
	• AVP—Matches the Attribute Value Pair.
	  • To match AVP based on attribute only, specify the name or number (1-4294967295) of an attribute-value pair. For the first code, you can specify the name of a custom AVP or one that is registered in RFCs or 3GPP technical specifications and is directly supported in the software in the Begin Value field. If you want to match a range of AVP, specify the second code by number only in the End Value field. If you want to match an AVP by its value, you cannot specify a second code. Specify the ID number of the vendor to also match, from 0-4294967295 in the Vendor ID field. For example, the 3GPP vendor ID is 10415, the IETF is 0.
	  • To match AVP based on the value of the attribute, additionally specify the value of the attribute in the AVP Data Type field.
	
	Note You can create and add custom AVPs to new diameter applications. For more information see, Create and Add Custom AVPs, on page 867
