CONTENTS

CHAPTER 1  Introduction to the Web Security Appliance

Introduction to the Product and the Release 1

Introduction to the Web Security Appliance 1

What’s New in AsyncOS 11.5.1 1

What’s New in AsyncOS 11.5 2

Related Topics 4

Using the Appliance Web Interface 4

Web Interface Browser Requirements 4

Enabling Access to the Web Interface on Virtual Appliances 4

Accessing the Appliance Web Interface 5

Committing Changes in the Web Interface 5

Clearing Changes in the Web Interface 6

Supported Languages 6

The Cisco SensorBase Network 6

SensorBase Benefits and Privacy 6

Enabling Participation in The Cisco SensorBase Network 7

CHAPTER 2  Connect, Install, and Configure

Overview of Connect, Install, and Configure 9

Comparison of Modes of Operation 10

Task Overview for Connecting, Installing, and Configuring 14

Connecting the Appliance 14

Gathering Setup Information 16

System Setup Wizard 18

System Setup Wizard Reference Information 19

Network / System Settings 19

Network / Network Context 20
CHAPTER 3
How to Configure and Use Features in Cloud Connector Mode
Deployment in Cloud Connector Mode
Configuring the Cloud Connector
Controlling Web Access Using Directory Groups in the Cloud
Bypassing the Cloud Proxy Server
Partial Support for FTP and HTTPS in Cloud Connector Mode
Preventing Loss of Secure Data
Viewing Group and User Names and IP Addresses
Subscribing to Cloud Connector Logs
Identification Profiles and Authentication with Cloud Web Security Connector
Identifying Machines for Policy Application
Guest Access for Unauthenticated Users

CHAPTER 4
Overview of Cisco Defense Orchestrator Integration
How to Configure and Use Features in Cisco Defense Orchestrator Mode
Deployment in Cisco Defense Orchestrator Mode
Configuration Changes and Constraints in Cisco Defense Orchestrator Mode
Configuring Your Appliance in Cisco Defense Orchestrator Mode Using System Setup Wizard
Configuring Your Standard Mode Appliance in Cisco Defense Orchestrator Mode Using the Web Interface
Disabling Cisco Defense Orchestrator
Enabling Cisco Defense Orchestrator
Cisco Defense Orchestrator Reporting
How to Enable Cisco Defense Orchestrator Reporting
Troubleshooting Cisco Defense Orchestrator Mode Issues
Unable to Register Cisco Defense Orchestrator 59

CHAPTER 5

Intercepting Web Requests 61

Overview of Intercepting Web Requests 61
Tasks for Intercepting Web Requests 61
Best Practices for Intercepting Web Requests 62
Web Proxy Options for Intercepting Web Requests 63

Configuring Web Proxy Settings 63
Web Proxy Cache 65

Clearing the Web Proxy Cache 65
Removing URLs from the Web Proxy Cache 66

Specifying Domains or URLs that the Web Proxy never Caches 66

Choosing The Web Proxy Cache Mode 67
Web Proxy IP Spoofing 68
Web Proxy Custom Headers 68

Adding Custom Headers To Web Requests 68
Web Proxy Bypassing 69

Web Proxy Bypassing for Web Requests 70
Configuring Web Proxy Bypassing for Web Requests 70
Configuring Web Proxy Bypassing for Applications 70

Web Proxy Usage Agreement 70
Client Options for Redirecting Web Requests 70
Using PAC Files with Client Applications 71

Options For Publishing Proxy Auto-Config (PAC) Files 71
Client Options For Finding Proxy Auto-Config (PAC) Files 71

Automatic PAC File Detection 71
Hosting PAC Files on the Web Security Appliance 72
Specifying PAC Files in Client Applications 72

Configuring a PAC File Location Manually in Clients 73
Detecting the PAC File Automatically in Clients 73

FTP Proxy Services 73

Overview of FTP Proxy Services 74
Enabling and Configuring the FTP Proxy 74

SOCKS Proxy Services 75
Overview of SOCKS Proxy Services 76
Enabling Processing of SOCKS Traffic 76
Configuring the SOCKS Proxy 76
Creating SOCKS Policies 77
Troubleshooting Intercepting Requests 78

CHAPTER 6

Acquire End-User Credentials 79
Overview of Acquire End-User Credentials 79
Authentication Task Overview 79
Authentication Best Practices 80
Authentication Planning 80
Active Directory/Kerberos 81
Active Directory/Basic 82
Active Directory/NTLMSSP 83
LDAP/Basic 83
Identifying Users Transparently 84
Understanding Transparent User Identification 84
Rules and Guidelines for Transparent User Identification 86
Configuring Transparent User Identification 87
Using the CLI to Configure Advanced Transparent User Identification Settings 87
Configuring Single-Sign-on 88
Creating a Service Account in Windows Active Directory for Kerberos Authentication in High Availability Deployments 88
Authentication Realms 90
External Authentication 90
Configuring External Authentication through an LDAP Server 91
Enabling RADIUS External Authentication 91
Creating an Active Directory Realm for Kerberos Authentication Scheme 91
How to Create an Active Directory Authentication Realm (NTLMSSP and Basic) 95
Prerequisites for Creating an Active Directory Authentication Realm (NTLMSSP and Basic) 95
About Using Multiple NTLM Realms and Domains 95
Creating an Active Directory Authentication Realm (NTLMSSP and Basic) 95
Creating an LDAP Authentication Realm 97

**CHAPTER 11**

**Create Policies to Control Internet Requests** 183

Overview of Policies: Control Intercepted Internet Requests 183
Intercepted HTTP/HTTPS Request Processing 184
Managing Web Requests Through Policies Task Overview 185
Managing Web Requests Through Policies Best Practices 185
Policies 185
Policy Types 185
Policy Order 188
Creating a Policy 189
Adding and Editing Secure Group Tags for a Policy 192
Policy Configuration 193
Access Policies: Blocking Objects 194
Archive Inspection Settings 196
Block, Allow, or Redirect Transaction Requests 196
Client Applications 198
About Client Applications 198
Using Client Applications in Policies 199
Defining Policy Membership Using Client Applications 199
Defining Policy Control Settings Using Client Applications 199
Exempting Client Applications from Authentication 200
Time Ranges and Quotas 200
Time Ranges for Policies and Acceptable Use Controls 200
Creating a Time Range 200
Time and Volume Quotas 201
Volume Quota Calculations 202
Time Quota Calculations 202
Defining Time and Volume Quotas 202
Access Control by URL Category 203
Using URL Categories to Identify Web Requests 203
Using URL Categories to Action Web Request 203
Remote Users 204
CHAPTER 12
Create Decryption Policies to Control HTTPS Traffic 209
Overview of Create Decryption Policies to Control HTTPS Traffic 209
Managing HTTPS Traffic through Decryption Policies Task Overview 210
Managing HTTPS Traffic through Decryption Policies Best Practices 210
Decryption Policies 210
   Enabling the HTTPS Proxy 212
   Controlling HTTPS Traffic 213
   Configuring Decryption Options 215
   Authentication and HTTPS Connections 216
Root Certificates 216
   Managing Certificate Validation and Decryption for HTTPS 217
      Valid Certificates 217
      Invalid Certificate Handling 218
   Uploading a Root Certificate and Key 218
   Generating a Certificate and Key for the HTTPS Proxy 219
Configuring Invalid Certificate Handling 219
   Options for Certificate Revocation Status Checking 220
      Enabling Real-Time Revocation Status Checking 220
   Trusted Root Certificates 221
      Adding Certificates to the Trusted List 221
      Removing Certificates from the Trusted List 222
Routing HTTPS Traffic 222
Troubleshooting Decryption/HTTPS/Certificates 222

CHAPTER 13
Scan Outbound Traffic for Existing Infections 223
Overview of Scanning Outbound Traffic 223
   User Experience When Requests Are Blocked by the DVS Engine 223
Understanding Upload Requests 224
Criteria for Group Membership 224
Matching Client Requests to Outbound Malware Scanning Policy Groups 224
Creating Outbound Malware Scanning Policies 225
Controlling Upload Requests 226
Logging of DVS Scanning 227

CHAPTER 14  Configuring Security Services 229
Overview of Configuring Security Services 229
Overview of Web Reputation Filters 230
Web Reputation Scores 230
Understanding How Web Reputation Filtering Works 230
Web Reputation in Access Policies 231
Web Reputation in Decryption Policies 231
Web Reputation in Cisco Data Security Policies 232
Overview of Anti-Malware Scanning 232
Understanding How the DVS Engine Works 232
Working with Multiple Malware Verdicts 232
Webroot Scanning 233
McAfee Scanning 233
Matching Virus Signature Patterns 234
Heuristic Analysis 234
McAfee Categories 234
Sophos Scanning 234
Understanding Adaptive Scanning 234
Adaptive Scanning and Access Policies 235
Enabling Anti-Malware and Reputation Filters 235
Clearing the Advanced Malware Protection Services Cache 236
Configuring Anti-Malware and Reputation in Policies 237
Anti-Malware and Reputation Settings in Access Policies 237
Configuring Anti-Malware and Reputation Settings with Adaptive Scanning Enabled 238
Configuring Anti-Malware and Reputation Settings with Adaptive Scanning Disabled 239
Configuring Web Reputation Scores 240
Configuring Web Reputation Score Thresholds for Access Policies 240
Configuring Web Reputation Filter Settings for Decryption Policy Groups 240
Configuring Web Reputation Filter Settings for Data Security Policy Groups 241
Integrating the Appliance with AMP for Endpoints Console 241
Maintaining the Database Tables 243
  The Web Reputation Database 243
Logging of Web Reputation Filtering Activity and DVS Scanning 243
  Logging Adaptive Scanning 244
Caching 244
Malware Category Descriptions 244

CHAPTER 15

File Reputation Filtering and File Analysis 247
Overview of File Reputation Filtering and File Analysis 247
  File Threat Verdict Updates 247
  File Processing Overview 248
Supported Files for File Reputation and Analysis Services 248
  Archive or Compressed File Processing 249
Privacy of Information Sent to the Cloud 250
Configuring File Reputation and Analysis Features 250
  Requirements for Communication with File Reputation and Analysis Services 250
Configuring an On-premises File Reputation Server 251
Configuring an On-Premises File Analysis Server 251
Enabling and Configuring File Reputation and Analysis Services 252
Important! Changes Needed in File Analysis Setting 255
(Public Cloud File Analysis Services Only) Configuring Appliance Groups 255
  Which Appliances Are In the Analysis Group? 256
Ensuring That You Receive Alerts About Advanced Malware Protection Issues 256
Configuring Centralized Reporting for Advanced Malware Protection Features 257
File Reputation and File Analysis Reporting and Tracking 257
  Identifying Files by SHA-256 Hash 257
  File Reputation and File Analysis Report Pages 258
  Viewing File Reputation Filtering Data in Other Reports 259
  About Tracking and Advanced Malware Protection Features 259
Taking Action When File Threat Verdicts Change 259
Troubleshooting File Reputation and Analysis 260
  Log Files 260
Several Alerts About Failure to Connect to File Reputation or File Analysis Servers  260
API Key Error (On-Premises File Analysis)  260
Files are Not Uploaded As Expected  261
Alerts about File Types That Can Be Sent for Analysis  261

CHAPTER 16
Managing Access to Web Applications  263
Overview of Managing Access to Web Applications  263
Enabling the AVC Engine  264
AVC Engine Updates and Default Actions  264
User Experience When Requests Are Blocked by the AVC Engine  265
Policy Application Control Settings  265
Range Request Settings  265
Rules and Guidelines for Configuring Application Control  266
Configuring Application Control Settings in an Access Policy Group  267
Controlling Bandwidth  267
Configuring Overall Bandwidth Limits  268
Configuring User Bandwidth Limits  268
Configuring the Default Bandwidth Limit for an Application Type  269
Overriding the Default Bandwidth Limit for an Application Type  269
Configuring Bandwidth Controls for an Application  269
Controlling Instant Messaging Traffic  270
Viewing AVC Activity  270
AVC Information in Access Log File  270

CHAPTER 17
Prevent Loss of Sensitive Data  271
Overview of Prevent Loss of Sensitive Data  271
Bypassing Upload Requests Below a Minimum Size  272
User Experience When Requests Are Blocked As Sensitive Data  272
Managing Upload Requests  273
Managing Upload Requests on an External DLP System  273
Evaluating Data Security and External DLP Policy Group Membership  274
Matching Client Requests to Data Security and External DLP Policy Groups  274
Creating Data Security and External DLP Policies  275
Managing Settings for Upload Requests  277
URL Categories 277
Web Reputation 278
Content Blocking 278
Defining External DLP Systems 278
Configuring External DLP Servers 279
Controlling Upload Requests Using External DLP Policies 281
Logging of Data Loss Prevention Scanning 281

CHAPTER 18
Notify End-Users of Proxy Actions 283
End-User Notifications Overview 283
Configuring General Settings for Notification Pages 284
End-User Acknowledgment Page 284
Access HTTPS and FTP Sites with the End-User Acknowledgment Page 285
About the End-user Acknowledgment Page 285
Configuring the End-User Acknowledgment Page 286
End-User Notification Pages 287
Configuring On-Box End-User Notification Pages 288
Off-Box End-User Notification Pages 289
Displaying the Correct Off-Box Page Based on the Reason for Blocking Access 289
URL Criteria for Off-Box Notification Pages 289
Off-Box End-User Notification Page Parameters 289
Redirecting End-User Notification Pages to a Custom URL (Off-Box) 291
Configuring the End-User URL Filtering Warning Page 291
Configuring FTP Notification Messages 292
Custom Messages on Notification Pages 292
Supported HTML Tags in Custom Messages on Notification Pages 292
Caveats for URLs and Logos in Notification Pages 293
Editing Notification Page HTML Files Directly 294
Requirements for Editing Notification HTML Files Directly 294
Using Variables in Notification HTML Files 295
Variables for Customizing Notification HTML Files 296
Notification Page Types 298
### CHAPTER 19

**Generate Reports to Monitor End-user Activity** 307

- Overview of Reporting 307
- Working with Usernames in Reports 307
- Report Pages 308

**Using the Reporting Pages** 308
- Changing the Time Range 309
- Searching Data 309
- Choosing Which Data to Chart 310
- Custom Reports 310
  - Modules That Cannot Be Added to Custom Reports 311
  - Creating Your Custom Report Page 311
- Subdomains vs. Second-level Domains in Reporting and Tracking 312
- Printing and Exporting Reports from Report Pages 312
  - Exporting Report Data 312

**Enabling Reporting** 313

**Scheduling Reports** 313
- Adding a Scheduled Report 314
- Editing Scheduled Reports 314
- Deleting Scheduled Reports 315
- Generating Reports On Demand 315

**Archived Reports** 316

### CHAPTER 20

**Web Security Appliance Reports** 317

- Overview Page 317
- Users Page 319
  - User Details Page 319
- User Count Page 320
- Web Sites Page 320
- URL Categories Page 320
  - URL Category Set Updates and Reports 321
- Application Visibility Page 321
- Anti-Malware Page 322
  - Malware Category Report Page 322
Log File Types 339
Adding and Editing Log Subscriptions 344
  Deanonymizing W3C Log Fields 348
Pushing Log Files to Another Server 349
Archiving Log Files 349
Log File Names and Appliance Directory Structure 350
  Reading and Interpreting Log Files 350
Viewing Log Files 351
Web Proxy Information in Access Log Files 351
  Transaction Result Codes 355
  ACL Decision Tags 355
  Interpreting Access Log Scanning Verdict Entries 361
W3C Compliant Access Log Files 367
  W3C Field Types 367
  Interpreting W3C Access Logs 367
    W3C Log File Headers 368
    W3C Field Prefixes 368
Customizing Access Logs 369
  Access Log User Defined Fields 369
  Customizing Regular Access Logs 370
  Customizing W3C Access Logs 370
    Configuring Cisco CTA-specific Custom W3C Logs 371
    Configuring Cisco Cloudlock-specific Custom W3C Logs 372
Traffic Monitor Log Files 373
  Interpreting Traffic Monitor Logs 373
Log File Fields and Tags 374
  Access Log Format Specifiers and W3C Log File Fields 374
  Malware Scanning Verdict Values 384
Troubleshooting Logging 385

CHAPTER 23
Perform System Administration Tasks 387
  Overview of System Administration 387
  Saving, Loading, and Resetting the Appliance Configuration 388
    Viewing and Printing the Appliance Configuration 388
Contents

Feature Key Alerts 403
Hardware Alerts 403
Logging Alerts 404
Reporting Alerts 405
System Alerts 407
Updater Alerts 408
Anti-Malware Alerts 409
Policy Expiration Alerts 409
FIPS Compliance 409
  FIPS Certificate Requirements 409
  FIPS Certificate Validation 410
  Enabling or Disabling FIPS Mode 410
System Date and Time Management 411
  Setting the Time Zone 411
  Synchronizing the System Clock with an NTP Server 411
SSL Configuration 412
Certificate Management 413
  Strict Certificate Validation 413
  About Certificates and Keys 414
  Managing Trusted Root Certificates 414
  Certificate Updates 415
  Viewing Blocked Certificates 415
  Uploading or Generating a Certificate and Key 415
    Uploading a Certificate and Key 415
    Generating a Certificate and Key 416
    Certificate Signing Requests 416
    Intermediate Certificates 417
AsyncOS for Web Upgrades and Updates 417
  Best Practices For Upgrading AsyncOS for Web 417
  Upgrading and Updating AsyncOS and Security Service Components 418
    Downloading and Installing an Upgrade 418
    Viewing Status of, Canceling, or Deleting a Background Download 419
Automatic and Manual Update and Upgrade Queries 420
  Manually Updating Security Service Components 420
Local And Remote Update Servers 421
  Updating and Upgrading from the Cisco Update Servers 421
  Upgrading from a Local Server 422
  Differences Between Local and Remote Upgrading Methods 423
Configuring Upgrade and Service Update Settings 423
Reverting to a Previous Version of AsyncOS for Web 424
  Reverting AsyncOS on Virtual Appliances Impacts the License 425
  Configuration File Use in the Revert Process 425
Reverting AsyncOS for an Appliance Managed by the SMA 425
Reverting AsyncOS for Web to a Previous Version 425
Monitoring System Health and Status Using SNMP 426
  MIB Files 427
  Enabling and Configuring SNMP Monitoring 427
Hardware Objects 427
SNMP Traps 428
  About the connectivityFailure SNMP Trap 428
CLI Example: snmpconfig 428
Web Traffic Tap 430
  Enabling Web Traffic Tap 431
  Configuring Web Traffic Tap Policies 432

APPENDIX A

Troubleshooting 433
  General Troubleshooting Best Practices 433
FIPS Mode Problems 434
  CSP Encryption 434
  Certificate Validation 434
Authentication Problems 434
  Troubleshooting Tools for Authentication Issues 435
  Failed Authentication Impacts Normal Operations 435
LDAP Problems 435
  LDAP User Fails Authentication due to NTLMSSP 435
  LDAP Authentication Fails due to LDAP Referral 435
Basic Authentication Problems 436
  Basic Authentication Fails 436
Single Sign-On Problems 436
Users Erroneously Prompted for Credentials 436
Blocked Object Problems 436
Some Microsoft Office Files Not Blocked 436
Blocking DOS Executable Object Types Blocks Updates for Windows OneCare 437
Browser Problems 437
WPAD Not Working With Firefox 437
DNS Problems 437
Alert: Failed to Bootstrap the DNS Cache 437
Failover Problems 437
Failover Misconfiguration 437
Failover Issues on Virtual Appliances 438
Feature Keys Expired 438
FTP Problems 438
URL Categories Do Not Block Some FTP Sites 438
Large FTP Transfers Disconnect 439
Zero Byte File Appears On FTP Servers After File Upload 439
Chrome Browser Not Detected As User Agent in FTP-over-HTTP Requests 439
Upload/Download Speed Issues 439
Hardware Issues 440
Cycling Appliance Power 440
Appliance Health and Status Indicators 440
Alert: Battery Relearn Timed Out (RAID Event) on 380 or 680 Hardware 440
HTTPS/Decryption/Certificate Problems 441
Accessing HTTPS Sites Using Routing Policies with URL Category Criteria 441
HTTPS Request Failures 441
HTTPS with IP-based Surrogates and Transparent Requests 441
Different Client “Hello” Behavior for Custom and Default Categories 441
Bypassing Decryption for Particular Websites 442
Conditions and Restrictions for Exceptions to Blocking for Embedded and Referred Content 442
Alert: Problem with Security Certificate 442
Identity Services Engine Problems 443
Tools for Troubleshooting ISE Issues 443
ISE Server Connection Issues 443
Contents

Certificate Issues 443
Network Issues 444
Other ISE Server Connectivity Issues 445
ISE-related Critical Log Messages 445

Problems with Custom and External URL Categories 446
Issues Downloading An External Live Feed File 446
MIME Type Issue on IIS Server for .CSV Files 447
Malformed Feed File Following Copy and Paste 447

Logging Problems 447
Custom URL Categories Not Appearing in Access Log Entries 447
Logging HTTPS Transactions 447
Alert: Unable to Maintain the Rate of Data Being Generated 448
Problem Using Third-Party Log-Analyzer Tool with W3C Access Logs 448

Policy Problems 448
Access Policy not Configurable for HTTPS 448
Blocked Object Problems 449
Some Microsoft Office Files Not Blocked 449
Blocking DOS Executable Object Types Blocks Updates for Windows OneCare 449
Identification Profile Disappeared from Policy 449
Policy Match Failures 449
Policy is Never Applied 449
HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication 449
User Matches Global Policy for HTTPS and FTP over HTTP Requests 450
User Assigned Incorrect Access Policy 450
Policy Trace Mismatch after Modifying Policy Parameters 450
Policy Troubleshooting Tool: Policy Trace 450
About the Policy Trace Tool 451
Tracing Client Requests 451
Advanced: Request Details 452
Advanced: Response Detail Overrides 453

Problems with File Reputation and File Analysis 453
Reboot Issues 453
Virtual Appliance Running on KVM Hangs on Reboot 453
Hardware Appliances: Remotely Resetting Appliance Power 454

Site Access Problems 454
    Cannot Access URLs that Do Not Support Authentication 455
    Cannot Access Sites With POST Requests 455

Upstream Proxy Problems 455
    Upstream Proxy Does Not Receive Basic Credentials 455
    Client Requests Fail Upstream Proxy 456
    Unable to Route FTP Requests Via an Upstream Proxy 456

Virtual Appliances 456
    Do Not Use Force Reset, Power Off, or Reset Options During AsyncOS Startup 456
    Network Connectivity on KVM Deployments Works Initially, Then Fails 456
    Slow Performance, Watchdog Issues, and High CPU Usage on KVM Deployments 457
    General Troubleshooting for Virtual Appliances Running on Linux Hosts 457

WCCP Problems 457
    Maximum Port Entries 457

Packet Capture 457
    Starting a Packet Capture 458
    Managing Packet Capture Files 458
    Downloading or Deleting Packet Capture Files 459

Working With Support 459
    Gathering Information for Efficient Service 459
    Opening a Technical Support Request 459
    Getting Support for Virtual Appliances 460
    Enabling Remote Access to the Appliance 460

APPENDIX B

Command Line Interface 463
    Overview of the Command Line Interface 463
    Accessing the Command Line Interface 463
        First Access 463
        Subsequent Access 464
    Working with the Command Prompt 464
    Command Syntax 464
    Select Lists 465
    Yes/No Queries 465

Introduction to the Product and the Release

This chapter contains the following sections:

- Introduction to the Web Security Appliance, on page 1
- What’s New in AsyncOS 11.5.1, on page 1
- What’s New in AsyncOS 11.5, on page 2
- Related Topics, on page 4
- Using the Appliance Web Interface, on page 4
- Supported Languages, on page 6
- The Cisco SensorBase Network, on page 6

Introduction to the Web Security Appliance

The Cisco Web Security Appliance intercepts and monitors Internet traffic and applies policies to help keep your internal network secure from malware, sensitive data loss, productivity loss, and other Internet-based threats.

What’s New in AsyncOS 11.5.1

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Traffic Tap</td>
<td>You can configure your appliance to tap the HTTP and HTTPS web traffic that passes through the appliance and copy it to a Web Security appliance interface in-line with the real time data traffic. You can tap the traffic based on the policy filters that you define. The selected tap interface must be connected to an external security device for analysis, forensics, and archiving. See Web Traffic Tap, on page 430, Enabling Web Traffic Tap, on page 431, and Configuring Web Traffic Tap Policies, on page 432 for more information. The Overview Report page now includes sections on Web Traffic Tap Status, Web Traffic Tap Summary, Tapped HTTP/HTTPS Traffic, and Tapped Traffic Summary. See Overview Page, on page 317</td>
</tr>
</tbody>
</table>
### What’s New in AsyncOS 11.5

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AMP Clear Cache</td>
<td>You can now clear the cache of AMP file reputation dispositions for clean, malicious, and unknown files.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Clearing the Advanced Malware Protection Services Cache</a> on page 236</td>
</tr>
<tr>
<td>AMP Upstream Proxy Settings for File Analysis</td>
<td>You can now configure an upstream proxy for file analysis.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Enabling and Configuring File Reputation and Analysis Services</a> on page 252</td>
</tr>
<tr>
<td>Support for Submitting Compressed Files for Cisco Threat Grid Analysis</td>
<td>You can now submit compressed files to Cisco Threat Grid for analysis without extracting them. This improves efficacy by reducing the number of file submissions.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Archive or Compressed File Processing</a> on page 249</td>
</tr>
<tr>
<td>Kerberos support for high availability clusters</td>
<td>You can use the <strong>Use keytab authentication</strong> option in the Kerberos High Availability section, while creating or editing an Active Directory realm, to enable Kerberos authentication for all appliances in high availability clusters.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Creating a Service Account in Windows Active Directory for Kerberos Authentication in High Availability Deployments</a> on page 88 and <a href="#">Creating an Active Directory Realm for Kerberos Authentication Scheme</a> on page 91.</td>
</tr>
<tr>
<td>Support for HTTP PATCH requests.</td>
<td>Cisco Web Security appliance now includes a new CLI command: <code>httppatchconfig</code>. You can use this command to enable or disable outgoing HTTP PATCH requests.</td>
</tr>
<tr>
<td></td>
<td>See <a href="#">Web Security Appliance CLI Commands</a> on page 467.</td>
</tr>
</tbody>
</table>

---

**Cisco Cloudlock-specific Custom W3C Logs**

You can configure your appliance to send W3C access logs to the Cisco Cloudlock portal for analysis and reporting. These custom W3C logs provide better visibility into the SaaS usage of the customers. Cisco Cloudlock is a cloud-native CASB and cloud cybersecurity platform that protects users, data, and applications across Software-as-a-Service, Platform-as-a-Service, and Infrastructure-as-a-Service.

See [Configuring Cisco Cloudlock-specific Custom W3C Logs](#) on page 372 for more information.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| Cisco CTA-specific Custom W3C Logs Enhancements | You can now configure and send the CTA-specific custom W3C logs to the CTA portal for analysis using the new Cisco Cognitive Threat Analytics page on the appliance’s GUI.  
You can also choose to anonymize the username, IP address, and user group field values of the log so that the client related information will not be disclosed to external systems like CTA to which the logs are pushed to.  
See Configuring Cisco CTA-specific Custom W3C Logs, on page 371 for more information. |
| Scheduled Policy Expiration | You can now set the expiry time for Access and Decryption policies. The policies will be automatically disabled once they exceed the set expiry time. You will receive alerts 3 days prior to expiry and also on expiry.  
See Creating a Policy, on page 189 and Policy Expiration Alerts, on page 409 for more information. |
| User Count Report | The User Count page allows you to view information about the total number of authenticated and unauthenticated users of the appliance.  
See User Count Page, on page 320 for more information. |
| Anonymization and Deanonymization of W3C Log Fields | You can now choose to anonymize the username, IP address, and user group field values of the W3C logs so that the client related information will not be disclosed to external servers like CTA to which the logs are pushed to.  
If you want to view the actual values of the anonymized log field values, you must deanonymize the field values using the Deanonymization feature.  
See Adding and Editing Log Subscriptions, on page 344 and Deanonymizing W3C Log Fields, on page 348 for more information. |
| AMP for Endpoints Console Integration | You can now integrate your appliance with AMP for Endpoints console, and add your own blacklisted or whitelisted file SHAs.  
After the integration, when a file SHA is sent to the File Reputation server, the verdict obtained for the file SHA from the File Reputation Server is overridden by the verdict already available for the same file SHA in the AMP for Endpoints console.  
To integrate your appliance with AMP for Endpoints console, see Integrating the Appliance with AMP for Endpoints Console, on page 241  
The Advanced Malware Protection Report page now includes a new section-Malware Files by Category to view the percentage of blacklisted file SHAs received from the AMP for Endpoints console. The threat name of a blacklisted file SHA is displayed as Simple Custom Detection in the Malware Threat Files section of the report. See File Reputation and File Analysis Report Pages, on page 258 |
Cisco Web Security appliance now includes an OPENSSL command tool: `ssltool`. This command executes different OPENSSL commands from the appliance's CLI to troubleshoot SSL connections. The administrators can use this command to debug HTTPS/SSL/TLS issues.

See the Command Line Interface, on page 463 chapter in the user guide or online help.

### Related Topics

### Using the Appliance Web Interface

- Web Interface Browser Requirements, on page 4
- Enabling Access to the Web Interface on Virtual Appliances, on page 4
- Accessing the Appliance Web Interface, on page 5
- Committing Changes in the Web Interface, on page 5
- Clearing Changes in the Web Interface, on page 6

### Web Interface Browser Requirements

To access the web interface, your browser must support and be enabled to accept JavaScript and cookies. It must be able to render HTML pages containing Cascading Style Sheets (CSS).

Your session automatically times out after 30 minutes of inactivity.

Some buttons and links in the web interface cause additional windows to open. Therefore, you may need to configure the browser’s pop-up blocking settings in order to use the web interface.

**Note**

Only use one browser window or tab at a time to edit the appliance configuration. Also, do not edit the appliance using the web interface and the CLI at the same time. Editing the appliance from multiple places concurrently results in unexpected behavior and is not supported.

### Enabling Access to the Web Interface on Virtual Appliances

By default, the HTTP and HTTPS interfaces are not enabled on virtual appliances. To enable these protocols, you must use the command-line interface.

**Step 1**

Access the command-line interface. See Accessing the Command Line Interface, on page 463.
Step 2
Run the `interfaceconfig` command.
Pressing Enter at a prompt accepts the default value.
Look for the prompts for HTTP and HTTPS and enable the protocol(s) that you will use.

---

**Accessing the Appliance Web Interface**

If you are using a virtual appliance, see [Enabling Access to the Web Interface on Virtual Appliances](page 4), on page 4.

---

**Step 1**
Open a browser and enter the IP address (or hostname) of the Web Security appliance. If the appliance has not been previously configured, use the default settings:

`https://192.168.42.42:8443`

-or-

`http://192.168.42.42:8080`

where 192.168.42.42 is the default IP address, and 8080 is the default admin port setting for HTTP, and 8443 is default admin port for HTTPS.

Otherwise, if the appliance is currently configured, use the IP address (or host name) of the M1 port.

**Note** You must use a port number when connecting to the appliance (by default, port 8080). Failing to specify a port number when accessing the web interface results in a default port 80, Proxy Unlicensed error page.

---

**Step 2**
When the appliance login screen appears, enter your username and passphrase to access the appliance.
By default, the appliance ships with the following user name and passphrase:

- User name: **admin**
- Passphrase: **ironport**

If this is the first time you have logged in with the default **admin** user name, you will be prompted to immediately change the passphrase.

**Step 3**
To view a listing of recent appliance access attempts, both successes and failures, for your username, click the recent-activity icon (i for success or f for failure respectively) in front of the “Logged in as” entry in the upper right corner of the application window.

---

**Committing Changes in the Web Interface**

**Step 1**
Click the **Commit Changes** button.

**Step 2**
Enter comments in the Comment field if you choose.

**Step 3**
Click **Commit Changes**.
You can make multiple configuration changes before you commit all of them.

## Clearing Changes in the Web Interface

**Step 1**  
Click the **Commit Changes** button.

**Step 2**  
Click **Abandon Changes**.

## Supported Languages

AsyncOS can display its GUI and CLI in any of the following languages:

- German
- English
- Spanish
- French
- Italian
- Japanese
- Korean
- Portuguese
- Russian
- Chinese
- Taiwanese

## The Cisco SensorBase Network

The Cisco SensorBase Network is a threat management database that tracks millions of domains around the world and maintains a global watch list for Internet traffic. SensorBase provides Cisco with an assessment of reliability for known Internet domains. The Web Security appliance uses the SensorBase data feeds to improve the accuracy of Web Reputation Scores.

## SensorBase Benefits and Privacy

Participating in the Cisco SensorBase Network means that Cisco collects data and shares that information with the SensorBase threat management database. This data includes information about request attributes and how the appliance handles requests.
Cisco recognizes the importance of maintaining your privacy, and does not collect or use personal or confidential information such as usernames and passphrases. Additionally, the file names and URL attributes that follow the hostname are obfuscated to ensure confidentiality. When it comes to decrypted HTTPS transactions, the SensorBase Network only receives the IP address, web reputation score, and URL category of the server name in the certificate.

If you agree to participate in the SensorBase Network, data sent from your appliance is transferred securely using HTTPS. Sharing data improves Cisco’s ability to react to web-based threats and protect your corporate environment from malicious activity.

### Enabling Participation in The Cisco SensorBase Network

**Note**

Standard SensorBase Network Participation is enabled by default during system setup.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Choose Security Services &gt; SensorBase.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Verify that SensorBase Network Participation is enabled. When it is disabled, none of the data that the appliance collects is sent back to the SensorBase Network servers.</td>
</tr>
</tbody>
</table>
| **Step 3** | In the Participation Level section, choose one of the following levels:  
• **Limited.** Basic participation summarizes server name information and sends MD5-hashed path segments to the SensorBase Network servers.  
• **Standard.** Enhanced participation sends the entire URL with unobfuscated path segments to the SensorBase Network servers. This option assists in providing a more robust database, and continually improves the integrity of Web Reputation Scores. |
| **Step 4** | In the AnyConnect Network Participation field, choose whether or not to include information collected from clients that connect to the Web Security appliance using Cisco AnyConnect Client. AnyConnect Clients send their web traffic to the appliance using the Secure Mobility feature. |
| **Step 5** | In the Excluded Domains and IP Addresses field, optionally enter any domains or IP addresses to exclude from traffic sent to the SensorBase servers. |
| **Step 6** | Submit and commit your changes. |
Enabling Participation in The Cisco SensorBase Network
Connect, Install, and Configure

Overview of Connect, Install, and Configure

- The Standard mode of Web Security appliance operation includes on-site Web Proxy services and Layer-4 traffic monitoring, which are not available in the Cloud Web Security Connector mode.

- In Cloud Web Security Connector mode, the appliance connects to and routes traffic to a Cisco Cloud Web Security (CWS) proxy, where Web security policies are enforced.

- In the Cisco Defense Orchestrator mode, the appliance is on-boarded to the Cisco Defense Orchestrator. Policy management, and optionally, reporting, is carried out through the Cisco Defense Orchestrator. See Configuration Changes and Constraints in Cisco Defense Orchestrator Mode, on page 54 for more information on the configuration changes and constraints.

The appliance has multiple network ports, with each assigned to manage one or more specific data types.
The appliance uses network routes, DNS, VLANs, and other settings and services to manage network connectivity and traffic interception. The System Setup Wizard lets you set up basic services and settings, while the appliance’s Web interface lets you modify settings and configure additional options.

### Deploying a Virtual Appliance

### Migrating from a Physical to a Virtual Appliance

To migrate your deployment from a physical appliance to a virtual appliance, see the virtual appliance installation guide referenced in the previous topic and the Release Notes for your AsyncOS version.

### Comparison of Modes of Operation

The following table presents the various menu commands available in Standard and Cloud connector Modes, thereby indicating the various features available in each mode.

To see the features available in the Cisco Defense Orchestrator mode, see *Configuration Changes and Constraints in Cisco Defense Orchestrator Mode*, on page 54.

Task Overview for Connecting, Installing, and Configuring

<table>
<thead>
<tr>
<th>Task</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Connect the appliance to Internet traffic.</td>
<td>Connecting the Appliance, on page 14</td>
</tr>
<tr>
<td>• Gather and record set-up information.</td>
<td>Gathering Setup Information, on page 16</td>
</tr>
<tr>
<td>• Run the System Setup Wizard.</td>
<td>System Setup Wizard, on page 18</td>
</tr>
</tbody>
</table>
| • Configure HTTPS proxy settings, Authentication Realms and Identification Profiles. This step must be completed for Hybrid Web Security mode. | Enabling the HTTPS Proxy, on page 212  
Identification Profiles and Authentication , on page 126 |
| • (Optional) Connect upstream proxies.                              | Upstream Proxies, on page 24 |

Connecting the Appliance

Before you begin

• To mount the appliance, cable the appliance for management, and connect the appliance to power, follow the instructions in the hardware guide for your appliance. For the location of this document for your model, see Documentation Set, on page 485.
• If you plan to physically connect the appliance to a WCCP v2 router for transparent redirection, first verify that the WCCP router supports Layer 2 redirection.
• Be aware of Cisco configuration recommendations:
  • Use simplex cabling (separate cables for incoming and outgoing traffic) if possible for enhanced performance and security.

Step 1 Connect the Management interface if you have not already done so:
### Ethernet Port Notes

<table>
<thead>
<tr>
<th>M1</th>
<th>Connect M1 to where it can:</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Send and receive Management traffic.</td>
</tr>
<tr>
<td></td>
<td>• (Optional) Send and receive web proxy data traffic.</td>
</tr>
</tbody>
</table>

You can connect a laptop directly to M1 to administer the appliance.

To connect to the management interface using a hostname (http://hostname:8080), add the appliance hostname and IP address to your DNS server database.

| P1 and P2 (optional) | • Available for outbound management services traffic but not administration. |
|                      | • Enable **Use M1 port for management only** (Network > Interfaces page). |
|                      | • Set routing for the service to use the Data interface. |

### Step 2
(Optional) Connect the appliance to data traffic either directly or through a transparent redirection device:

<table>
<thead>
<tr>
<th>Ethernet Port</th>
<th>Explicit Forwarding</th>
<th>Transparent Redirection</th>
</tr>
</thead>
<tbody>
<tr>
<td>P1/P2</td>
<td>P1 only:</td>
<td>Device: WCCP v2 router:</td>
</tr>
<tr>
<td></td>
<td>• Enable <strong>Use M1 port for management only</strong>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Connect P1 and M1 to different subnets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Use a duplex cable to connect P1 the internal network and the internet to receive both inbound and outbound traffic.</td>
<td></td>
</tr>
<tr>
<td>P1 and P2</td>
<td>• Enable P1.</td>
<td>• For Layer 2 redirection, physically connect router to P1/P2.</td>
</tr>
<tr>
<td></td>
<td>• Connect M1, P1, and P2 to different subnets.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Connect P2 to the internet to receive inbound internet traffic.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>After running the System Setup Wizard, enable P2.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>M1 (optional)</th>
<th>If <strong>Use M1 port for management only</strong> is disabled, M1 is the default port for data traffic.</th>
</tr>
</thead>
<tbody>
<tr>
<td>N/A</td>
<td>The appliance does not support inline mode.</td>
</tr>
</tbody>
</table>

### Step 3
(Optional) To monitor Layer-4 traffic, connect the Appliance to a TAP, switch, or hub after the proxy ports and before any device that performs network address translation (NAT) on client IP addresses:
### Ethernet Port | Notes
--- | ---
T1/T2 | To allow Layer-4 Traffic Monitor blocking, put Layer 4 Traffic Monitor on the same network as the Web Security appliance.  
**Recommended configuration:**  
**Device: Network TAP:**  
- Connect T1 to network TAP to receive outbound client traffic.  
- Connect T2 to network TAP to receive inbound internet traffic.

Other options:  
**Device: Network TAP:**  
- Use duplex cable on T1 to receive inbound and outbound traffic.  
**Device: Spanned or mirrored port on a switch**  
- Connect T1 to receive outbound client traffic and connect T2 to receive inbound internet traffic.  
- (Less preferred) Connect T1 using a half or full duplex cable to receive both inbound and outbound traffic.  
**Device: Hub:**  
- (Least preferred) Connect T1 using a duplex cable to receive both inbound and outbound traffic.  
The appliance listens to traffic on all TCP ports on these interfaces.

---

**Step 4** Connect external proxies upstream of the appliance to allow the external proxies to receive data from the appliance.

---

**What to do next**

Gathering Setup Information, on page 16

<td>Hostname</td>
<td></td>
</tr>
</tbody>
</table>

System Setup Wizard

Before you begin

- Connect the Appliance to networks and devices. See Connecting the Appliance, on page 14.
- Complete the System Setup Wizard worksheet. See Gathering Setup Information, on page 16.
- If you are setting up a virtual appliance:
  - Enable the HTTP and/or HTTPS interfaces: In the command-line interface (CLI), run the interfaceconfig command.
  - Note that reference information for each configuration item used in the System Setup Wizard is available at System Setup Wizard Reference Information, on page 19.

⚠️ Warning

Only use the System Setup Wizard the first time you install the appliance, or if you want to completely overwrite the existing configuration.

Step 1

Open a browser and enter the IP address of the Web Security appliance. The first time you run the System Setup Wizard, use the default IP address:

https://192.168.42.42:8443

-or-

http://192.168.42.42:8080

where 192.168.42.42 is the default IP address, and 8080 is the default admin port setting for HTTP, and 8443 is default admin port for HTTPS.

Otherwise, if the appliance is currently configured, use the IP address of the M1 port.

Step 2

When the appliance login screen appears, enter the user name and passphrase to access the appliance. By default, the appliance ships with the following user name and passphrase:

- **User name:** admin
- **Passphrase:** ironport
Step 3 You must immediately change the passphrase.

Step 4 Choose System Administration > System Setup Wizard.

If the appliance is already configured, you will be warned that you are about to reset the configuration. To continue with the System Setup Wizard, check Reset Network Settings, and then click the Reset Configuration button. The appliance will reset and the browser will refresh to the appliance home screen.

Step 5 Read and accept the terms of the end-user license agreement.

Step 6 Click Begin Setup to continue.

Step 7 Configure all settings using the reference tables provided in the following sections as required. See System Setup Wizard Reference Information, on page 19.

Step 8 Review the configuration information. If you need to change an option, click Edit for that section.

Step 9 Click Install This Configuration.

---

What to do next

A Next Steps page should appear once the configuration installed. However, depending on the IP, host name, or DNS settings you configured during setup, you may lose connection to the appliance at this stage. If a “page not found” error is displayed in your browser, change the URL to reflect any new address settings and reload the page. Then continue with any post-setup tasks you wish to perform.

System Setup Wizard Reference Information

- Network / System Settings, on page 19
- Network / Network Interfaces and Wiring, on page 21
- Network / Routes for Management and Data Traffic, on page 22
- Network / Transparent Connection Settings, on page 22
- Network / Administrative Settings, on page 23

Network / System Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default System Hostname</td>
<td>The system hostname is the fully-qualified hostname used to identify the appliance in the following areas:</td>
</tr>
<tr>
<td></td>
<td>• the command line interface (CLI)</td>
</tr>
<tr>
<td></td>
<td>• system alerts</td>
</tr>
<tr>
<td></td>
<td>• end-user notification and acknowledgment pages</td>
</tr>
<tr>
<td></td>

<td>The system hostname does not correspond directly to interface hostnames and is not used by clients to connect to the appliance.</td>
</tr>
</tbody>
</table>

---
### Network / Network Context

When you use the Web Security appliance in a network that contains another proxy server, it is recommended that you place the Web Security appliance downstream from the proxy server, closer to the clients.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| DNS Server(s)                     | • **Use the Internet’s Root DNS Servers** – You can choose to use the Internet root DNS servers for domain name service lookups when the appliance does not have access to DNS servers on your network.  
  **Note** Internet Root DNS servers will not resolve local host names. If you need the appliance to resolve local host names you must use a local DNS server, or add the appropriate static entries to the local DNS using the CLI.  
  • **Use these DNS Servers** – Provide address(es) for the local DNS server(s) that the appliance can use to resolve host names.  
  See DNS Settings, on page 42 for more information about these settings. |
| NTP Server                        | The Network Time Protocol (NTP) server used to synchronize the system clock with other servers on the network or the Internet.  
  The default is time.sco.cisco.com. |
| Time Zone                         | Provide time-zone information for location of the appliance; affects timestamps in message headers and log files. |
| Appliance Mode of Operation       | • **Standard** – Used for standard on-premise policy enforcement.  
  • **Cloud Web Security Connector** – Used primarily to direct traffic to Cisco’s Cloud Web Security service for policy enforcement and threat defense.  
  • **Hybrid Web Security** – Used in conjunction with Cisco’s Cloud Web Security service for cloud and on-premise policy enforcement and threat defense.  
  See Comparison of Modes of Operation, on page 10 for more information about these modes of operation. |

### Connect, Install, and Configure

#### Network / Network Context

**Note**

When you use the Web Security appliance in a network that contains another proxy server, it is recommended that you place the Web Security appliance downstream from the proxy server, closer to the clients.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Is there another web proxy on your network? | Is there another proxy on your network, such that traffic must pass through it? it will be upstream of the Web Security appliance?  
  If yes for both points, select the checkbox. This allows you to create a proxy group for one upstream proxy. You can add more upstream proxies later. |
<p>| Proxy group name                  | A name used to identify the proxy group on the appliance.                    |
| Address                           | The hostname or IP address of the upstream proxy server.                     |</p>
<table>

Network / Layer 4 Traffic Monitor Wiring

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer-4 Traffic Monitor</td>
<td>The type of wired connections plugged into the “T” interfaces:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Duplex TAP.</strong> The T1 port receives both incoming and outgoing traffic.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Simplex TAP.</strong> The T1 port receives outgoing traffic (from the clients to the Internet) and the T2 port receives incoming traffic (from the Internet to the clients).</td>
</tr>
<tr>
<td></td>
<td>Cisco recommends using Simplex when possible because it can increase performance and security.</td>
</tr>
</tbody>
</table>

Network / Routes for Management and Data Traffic

**Note**

If you enable “Use M1 port for management only”, this section will have separate sections for management and data traffic; otherwise one joint section will be shown.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Gateway</td>
<td>The default gateway IP address to use for the traffic through the Management and Data interfaces.</td>
</tr>
<tr>
<td>Static Routes Table</td>
<td>Optional static routes for management and data traffic. Multiple routes can be added.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Name</strong> – A name used to identify the static route.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Internal Network</strong> – The IPv4 address for this route’s destination on the network.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Internal Gateway</strong> – The gateway IPv4 address for this route. A route gateway must reside on the same subnet as the Management or Data interface on which it is configured.</td>
</tr>
</tbody>
</table>

Network / Transparent Connection Settings

**Note**

By default, the Cloud Connector is deployed in transparent mode, which requires a connection to a Layer-4 switch, or a version 2 WCCP router.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Layer-4 Switch or No Device</td>
<td>Specifies that the Web Security appliance is connected to a layer 4 switch for transparent redirection, or that no transparent redirection device is used and clients will explicitly forward requests to the appliance.</td>
</tr>
</tbody>
</table>
**WCCP v2 Router**

Specifies that the Web Security appliance is connected to a version 2 WCCP-capable router.

If you connect the appliance to a version 2 WCCP router, you must create at least one WCCP service. You can enable the standard service on this screen, or after the System Setup Wizard is finished, where you can also create multiple dynamic services.

When you enable the standard service, you can also enable router security and enter a passphrase. The passphrase used here must be used all appliances and WCCP routers within the same service group.

A standard service type (also known as the “web-cache” service) is assigned a fixed ID of zero, a fixed redirection method (by destination port), and a fixed destination port of 80.

A dynamic service type allows you to define a custom ID, port numbers, and redirection and load balancing options.

---

### Network /Administrative Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator Passphrase</td>
<td>The passphrase used to access the Web Security appliance for administrative purposes.</td>

<tr>
<td>Email System Alerts To</td>
<td>The email address to which the appliance sends systems alerts.</td>
</tr>
<tr>
<td>Send Email via SMTP Relay Host (optional)</td>
<td>The address and port for an SMTP relay host that AsyncOS can use to send system generated email messages.</td>
</tr>
<tr>
<td></td>
<td>If no SMTP relay host is defined, AsyncOS uses the mail servers listed in the MX record.</td>
</tr>
<tr>
<td>AutoSupport</td>
<td>Specifies whether the appliance sends system alerts and weekly status reports to Cisco Customer Support.</td>
</tr>
<tr>
<td>SensorBase Network Participation</td>
<td>Specifies whether to participate in the Cisco SensorBase Network. If you participate, you can configure Limited or Standard (full) participation. Default is Standard.</td>
</tr>
<tr>
<td></td>
<td>The SensorBase Network is a threat management database that tracks millions of domains around the world and maintains a global watch list for Internet traffic. When you enable SensorBase Network Participation, the Web Security appliance sends anonymous statistics about HTTP requests to Cisco to increase the value of SensorBase Network data.</td>
</tr>
</tbody>
</table>
Security / Security Settings

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Policy Default</td>
<td>Specifies whether to block or monitor all web traffic by default after the System Setup Wizard completes. You can change this behavior later by editing the Protocols and User Agents settings for the Global Access Policy. The default setting is to monitor traffic.</td>
</tr>
<tr>
<td>Action</td>
<td></td>
</tr>
<tr>
<td>L4 Traffic Monitor</td>
<td>Specifies whether the Layer-4 Traffic Monitor should monitor or block suspected malware by default after the System Setup Wizard completes. You can change this behavior later. The default setting is to monitor traffic.</td>
</tr>
<tr>
<td>Acceptable Use Controls</td>
<td>Specifies whether or not to enable Acceptable Use Controls. If enabled, Acceptable Use Controls allow you to configure policies based on URL filtering. They also provide application visibility and control, as well as related options such as safe search enforcement. The default setting is enabled.</td>
</tr>
<tr>
<td>Reputation Filtering</td>
<td>Specifies whether or not to enable Web Reputation filtering for the Global Policy Group. Web Reputation Filters is a security feature that analyzes web server behavior and assigns a reputation score to a URL to determine the likelihood that it contains URL-based malware. The default setting is enabled.</td>
</tr>
<tr>
<td>Malware and Spyware</td>
<td>Specifies whether to enable malware and spyware scanning using Webroot, McAfee, or Sophos. The default setting is that all three options are enabled. Most security services will be automatically enabled/disabled to match the services normally available for cloud policies. Similarly, policy-related defaults will not be applicable. At least one scanning option must be enabled.</td>
</tr>
<tr>
<td>Scanning</td>
<td>If any option is enabled, also choose whether to monitor or block detected malware. The default setting is to monitor malware. You can further configure malware scanning after you finish the System Setup Wizard.</td>
</tr>
<tr>
<td>Cisco Data Security</td>
<td>Specifies whether or not to enable Cisco Data Security Filters. If enabled, the Cisco Data Security Filters evaluate data leaving the network and allow you to create Cisco Data Security Policies to block particular types of upload requests. The default setting is enabled.</td>
</tr>
<tr>
<td>Filtering</td>
<td></td>
</tr>
</tbody>
</table>

Upstream Proxies

The web proxy can forward web traffic directly to its destination web server or use routing policies to redirect it to an external upstream proxy.

- Upstream Proxies Task Overview, on page 25
- Creating Proxy Groups for Upstream Proxies, on page 25
Upstream Proxies Task Overview

<table>
<thead>
<tr>
<th>Task</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Connect the external proxy upstream of the Cisco Web Security Appliance.</td>
<td>Connecting the Appliance, on page 14.</td>
</tr>
<tr>
<td>• Create and configure a proxy group for the upstream proxy.</td>
<td>Creating Proxy Groups for Upstream Proxies, on page 25.</td>
</tr>
<tr>
<td>• Create a routing policy for the proxy group to manage which traffic is routed to the upstream proxy.</td>
<td>Create Policies to Control Internet Requests, on page 183</td>
</tr>
</tbody>
</table>

Creating Proxy Groups for Upstream Proxies

**Step 1** Choose Network > Upstream Proxies.
**Step 2** Click Add Group.
**Step 3** Complete the Proxy Group settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>The name used to identify proxy groups on the appliance, such as in routing policies, for example.</td>
</tr>
<tr>
<td>Proxy Servers</td>
<td>The address, port and reconnection attempts (should a proxy not respond) for the proxy servers in the group. Rows for each proxy server can be added or deleted as required.</td>
</tr>
<tr>
<td>Note</td>
<td>You can enter the same proxy server multiple times to allow unequal load distribution among the proxies in the proxy group.</td>
</tr>
<tr>
<td>Load Balancing</td>
<td>The strategy that the web proxy uses to load balance requests between multiple upstream proxies. Choose from:</td>
</tr>
<tr>
<td></td>
<td>• <strong>None (failover)</strong>. The Web Proxy directs transactions to one external proxy in the group. It tries to connect to the proxies in the order they are listed. If one proxy cannot be reached, the Web Proxy attempts to connect to the next one in the list.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Fewest connections</strong>. The Web Proxy keeps track of how many active requests are with the different proxies in the group and it directs a transaction to the proxy currently servicing the fewest number of connections.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Hash based. Least recently used</strong>. The Web Proxy directs a transaction to the proxy that least recently received a transaction if all proxies are currently active. This setting is similar to round robin except the Web Proxy also takes into account transactions a proxy has received by being a member in a different proxy group. That is, if a proxy is listed in multiple proxy groups, the “least recently used” option is less likely to overburden that proxy.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Round robin</strong>. The Web Proxy cycles transactions equally among all proxies in the group in the listed order.</td>
</tr>
<tr>
<td>Note</td>
<td>The Load Balancing option is dimmed until two or more proxies have been defined.</td>
</tr>
<tr>
<td>Property</td>
<td>Description</td>

<tr>
<td></td>
<td>• Connect directly. Send the requests directly to their destination servers.</td>
</tr>
<tr>
<td></td>
<td>• Drop requests. Discard the requests without forwarding them.</td>
</tr>
</tbody>
</table>

**Step 4** Submit and commit your changes.

---

**What to do next**

- Creating a Policy, on page 189

---

**Network Interfaces**

- IP Address Versions, on page 26
- Enabling or Changing Network Interfaces, on page 27

**IP Address Versions**

In Standard mode, Cisco Web Security Appliance supports IPv4 and IPv6 addresses in most cases.

---

**Note**

In Cloud Connector mode, Cisco Web Security Appliance supports IPv4 only.

A DNS server may return a result with both an IPv4 and an IPv6 address. DNS settings include an IP Address Version Preference to configure AsyncOS behavior in these cases.

<table>
<thead>
<tr>
<th>Interface/Service</th>
<th>IPv4</th>
<th>IPv6</th>

</tbody>
</table>
### Enabling or Changing Network Interfaces

- Add or modify interface IP addresses
- Change the Layer-4 Traffic Monitor wiring type
- Enable split routing of management and data traffic

**Step 1** Choose **Network > Interfaces**.

**Step 2** Click **Edit Settings**.

**Step 3** Configure the Interface options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Interfaces | Modify or add new IPv4 or IPv6 Address, Netmask, and Hostname details for the M1, P1, or P2 interfaces as required.  
  - **M1** – AsyncOS requires an IPv4 address for the M1 (Management) port. In addition to the IPv4 address, you can specify an IPv6 address. By default, the Management interface is used to administer the appliance and Web Proxy (data) monitoring. However, you can configure the M1 port for management use only.  
  - **P1 and P2** – Use an IPv4 address, IPv6 address, or both for the Data ports. The Data interfaces are used for Web Proxy monitoring and Layer-4 Traffic Monitor blocking (optional). You can also configure these interfaces to support outbound services such as DNS, software upgrades, NTP, and traceroute data traffic.  
**Note** If the Management and Data interfaces are all configured, each must be assigned IP addresses on different subnets. |
| Separate Routing for Management Services | Check **Restrict M1 port to appliance management services only** to limit M1 to management traffic only, requiring use of a separate port for data traffic.  
**Note** When you use M1 for management traffic only, configure at least one data interface, on another subnet, for proxy traffic. Define different routes for management and data traffic. |
Enable/disable use of, and specify a default port number for, the following network protocols:

- **FTP** – Disabled by default.
- **SSH**
- **HTTP**
- **HTTPS**

Also, you can enable/disable redirection of HTTP traffic to HTTPS.

**Step 4** Submit and commit your changes.

**What to do next**

If you added an IPv6 address, add an IPv6 routing table.

**Related Topics**

- Connecting the Appliance, on page 14.
- IP Address Versions, on page 26
- Configuring TCP/IP Traffic Routes, on page 31

## Configuring Failover Groups for High Availability

Using the Common Address Redundancy Protocol (CARP), the WSA enables multiple hosts on your network to share an IP address, providing IP redundancy to ensure high availability of services provided by those hosts.

Failover is available only for the proxy service. The proxy automatically binds to the failover interface when the failover group is created. Thus, if the proxy goes down for any reason, failover is triggered.

In CARP there are three states for a host:

- **master** – there can be only one master host in each failover group
- **backup**
- **init**

The master host in the CARP failover group sends regular advertisements to the local network so that the backup hosts know it’s still “alive.” (This advertisement interval is configurable on the WSA.) If the back-up hosts don’t receive an advertisement from the master for the specified period of time (because the proxy is down, or the WSA itself has gone down, or the WSA is disconnected from the network), then failover is triggered and one of the back-ups will take over the duties of master.

## Add Failover Group

**Before you begin**

- Identify a virtual IP address that will be used exclusively for this failover group. Clients will use this IP address to connect to the failover group in explicit forward proxy mode.
- Configure all Appliances in the failover group with identical values for the following parameters:
- Failover Group ID
- Hostname
- Virtual IP Address

- If you are configuring this feature on a virtual appliance, ensure that the virtual switch and the virtual interfaces specific to each appliance are configured to use promiscuous mode. For more information, see the documentation for your virtual hypervisor.

Step 1
Choose Network > High Availability.

Step 2
Click Add Failover Group.

Step 3
Enter a Failover Group ID in the range 1 to 255.

Step 4
(Optional) Enter a Description.

Step 5
Enter the Hostname, for example www.example.com.

Step 6
Enter the Virtual IP Address and Netmask, for example 10.0.0.3/24 (IPv4) or 2001:420:80:1::5/32 (IPv6).

Step 7
Choose an option from the Interface menu. The Select Interface Automatically option will select the interface based on the IP address you provided.

Note
If you do not select the Select Interface Automatically option, you must choose an interface in the same subnet as the virtual IP address you provided.

Step 8
Choose the priority. Click Master to set the priority to 255. Alternatively, select Backup and enter a priority between 1 (lowest) and 254 in the Priority field.

Step 9
(Optional). To enable security for the service, select the Enable Security for Service check box and enter a string of characters that will be used as a shared secret in the Shared Secret and Retype Shared Secret fields.

Note
The shared secret, virtual IP, and failover group ID must be the same for all appliances in the failover group.

Step 10
Enter the delay in seconds (1 to 255) between hosts advertising their availability in the Advertisement Interval field.

Step 11
Submit and commit your changes.

What to do next

Related Topics
- Failover Problems, on page 437

Edit High Availability Global Settings

Step 1
Choose Network > High Availability.

Step 2
In the High Availability Global Settings area, click Edit Settings.

Step 3
In the Failover Handling menu, choose an option.

- Preemptive—The highest priority host will assume control when available.

- Non-preemptive—The host in control will remain in control even if a higher priority host becomes available.
### View Status of Failover Groups

Choose **Network > High Availability**. The Failover Groups area displays the current fail-over group. You can click **Refresh Status** to update the display. You can also view fail-over details by choosing **Network > Interfaces** or **Report > System Status**.

### Using the P2 Data Interface for Web Proxy Data

By default, the web proxy does not listen for requests on P2, even when enabled. However, you can configure P2 to listen for web proxy data.

**Note**

If you enable P2 to listen for client requests using the `advancedproxyconfig > miscellaneous` CLI command, you can choose whether to use P1 or P2 for outgoing traffic. To use P1 for outgoing traffic, change the Default Route for data traffic to specify the next IP address that the P1 interface is connected to.

**Before you begin**

Enable P2 (you must also enable P1 if not already enabled) (see **Enabling or Changing Network Interfaces**, on page 27).

---

**Step 1**  
Access the CLI.

**Step 2**  
Use the `advancedproxyconfig > miscellaneous` commands to access the required area

```
example.com> advancedproxyconfig
```

Choose a parameter group:
- AUTHENTICATION - Authentication related parameters
- CACHING - Proxy Caching related parameters
- DNS - DNS related parameters
- EUN - EUN related parameters
- NATIVEFTP - Native FTP related parameters
- FTPOVERHTTP - FTP Over HTTP related parameters
- HTTPS - HTTPS related parameters
- SCANNING - Scanning related parameters
- PROXYCONN - Proxy connection header related parameters
- CUSTOMHEADERS - Manage custom request headers for specific domains
- MISCELLANEOUS - Miscellaneous proxy related parameters
- SOCKS - SOCKS Proxy parameters

**Step 3**  
`[..] miscellaneous`

**Step 4**  
Press **Enter** past each question until the question:

Do you want proxy to listen on P2?

Enter ‘y’ for this question.

**Step 5**  
Press **Enter** past the remaining questions.
Step 6 Commit your changes.

What to do next

Related Topics
- Connecting the Appliance, on page 14.
- Configuring TCP/IP Traffic Routes, on page 31.
- Configuring Transparent Redirection, on page 33

Configuring TCP/IP Traffic Routes

Routes are used for determining where to send (or route) network traffic. The Web Security appliance routes the following kinds of traffic:

- **Data traffic.** Traffic the Web Proxy processes from end users browsing the web.
- **Management traffic.** Traffic created by managing the appliance through the web interface and traffic the appliance creates for management services, such as AsyncOS upgrades, component updates, DNS, authentication, and more.

By default, both types of traffic use the routes defined for all configured network interfaces. However, you can choose to split the routing, so that management traffic uses a management routing table and data traffic uses a data routing table. Both types of traffic split are split as follows:

<table>
<thead>
<tr>
<th>Management Traffic</th>
<th>Data Traffic</th>
</tr>
</thead>
<tbody>
<tr>
<td>WebUI</td>
<td>HTTP</td>
</tr>
<tr>
<td>SSH</td>
<td>HTTPS</td>
</tr>
<tr>
<td>SNMP</td>
<td>FTP</td>
</tr>
<tr>
<td>NTLM authentication (with domain controller)</td>
<td>WCCP negotiation</td>
</tr>
<tr>
<td>ICAP request with external DLP server</td>
<td>DNS (configurable)</td>
</tr>
<tr>
<td>Syslogs</td>
<td>Update/Upgrade/Feature Key (configurable)</td>
</tr>
<tr>
<td>FTP push</td>
<td></td>
</tr>
<tr>
<td>DNS (configurable)</td>
<td></td>
</tr>
<tr>
<td>Update/Upgrade/Feature Key (configurable)</td>
<td></td>
</tr>
</tbody>
</table>

The number of sections on the Network > Routes page is determined by whether or not split routing is enabled:

- **Separate route configuration sections for Management and Data traffic** (split routing enabled). When you use the Management interface for management traffic only (Restrict M1 port to appliance management services only is enabled), then this page includes two sections to enter routes, one for management traffic and one for data traffic.
- **One route configuration section for all traffic** (split routing not enabled). When you use the Management interface for both management and data traffic (Restrict M1 port to appliance management services only is disabled), then this page includes one section to enter routes for all traffic that leaves the Web Security appliance, both management and data traffic.
A route gateway must reside on the same subnet as the Management or Data interface on which it is configured. If multiple data ports are enabled, the web proxy sends out transactions on the data interface that is on the same network as the default gateway configured for data traffic.

**Outbound Services Traffic**

The Web Security appliance also uses the management and data interfaces to route outbound traffic for services such as DNS, software upgrades, NTP, and traceroute data traffic. You configure this for each service individually, by choosing the route it uses for outbound traffic. By default, the management interface is used for all services.

**Related Topics**
- To enable split routing of management and data traffic, see [Enabling or Changing Network Interfaces](#), on page 27.

### Modifying the Default Route

**Step 1** Choose Network > Routes.
**Step 2** Click on Default Route in the Management or Data table as required (or the combined Management/Data table if split routing is not enabled).
**Step 3** In the Gateway column, enter the IP address of the computer system on the next hop of the network connected to the network interface you are editing.
**Step 4** Submit and commit your changes.

### Adding a Route

**Step 1** Choose Network > Routes.
**Step 2** Click the Add Route button corresponding to the interface for which you are creating the route.
**Step 3** Enter a Name, Destination Network, and Gateway.
**Step 4** Submit and commit your changes.

### Saving and Loading Routing Tables

Choose Network > Routes.

To save a route table, click Save Route Table and specify where to save the file.

To load a saved route table, click Load Route Table, navigate to the file, open it, and submit and commit your changes.
When the destination address is on the same subnet as one of the physical network interfaces, AsyncOS sends data using the network interface with the same subnet. It does not consult the routing tables.

### Deleting a Route

**Step 1** Choose **Network > Routes**.
**Step 2** Check the checkbox in the Delete column for the appropriate route.
**Step 3** Click **Delete** and confirm.
**Step 4** Submit and commit your changes.

**What to do next**

**Related Topics**

- Enabling or Changing Network Interfaces, on page 27.

### Configuring Transparent Redirection

- Specifying a Transparent Redirection Device, on page 33
- Configuring WCCP Services, on page 34

### Specifying a Transparent Redirection Device

**Before you begin**

Connect the appliance to a Layer-4 switch or a WCCP v2 router.

**Step 1** Choose **Network > Transparent Redirection**.
**Step 2** Click **Edit Device**.
**Step 3** Choose the type of device that transparently redirects traffic to the appliance from the Type drop-down list: **Layer 4 Switch or No Device** or **WCCP v2 Router**.
**Step 4** Submit and commit your changes.
**Step 5** For WCCP v2 devices, complete these additional steps:
  a) Configure the WCCP device using device documentation.
  b) On the WSA’s Transparent Redirection page, click Add Service to add a WCCP service, as described in Adding and Editing a WCCP Service, on page 35.
  c) If IP spoofing is enabled on the appliance, create a second WCCP service.

**What to do next**

**Related Topics**
Using An L4 Switch

If you are using a Layer 4 switch for transparent redirection, depending how it is configured, you may need to configure a few additional options on the WSA.

- Generally, do not enable IP Spoofing; if you spoof upstream IP addresses you may create an asynchronous routing loop.

- On the Edit Web Proxy Settings page (Security Services > Web Proxy), check **Enable Identification of Client IP Addresses using X-Forwarded-For** in the **Use Received Headers** section (Advanced Settings). Then add one or more egress IP addresses to the **Trusted Downstream Proxy or Load Balancer** list.

- Optionally, you can use the CLI command **advancedproxyconfig > miscellaneous** to configure the following proxy-related parameters as necessary:
  
  - Would you like proxy to respond to health checks from L4 switches (always enabled if WSA is in L4 transparent mode)?— Enter Y if you want to allow the WSA to respond to health checks.
  
  - Would you like proxy to perform dynamic adjustment of TCP receive window size?— Use the default Y in most cases; enter N if you have another proxy device upstream of the WSA.

  - Do you want to pass HTTP X-Forwarded-For headers?— No need unless there is a requirement upstream for X-Forwarded-For (XFF) headers.

  - Would you like proxy to log values from X-Forwarded-For headers in place of incoming connection IP addresses?— To aid in troubleshooting, you can enter Y; client IP addresses will be displayed in the access logs.

  - Would you like the proxy to use client IP addresses from X-Forwarded-For headers? Again, to aid policy configuration and reporting, you can enter Y.

  - If you are using X-Forwarded-For (XFF) headers, add \%f to the Access Logs subscription in order to log the XFF headers. For the W3C Logs format, add cs(X-Forwarded-For).

Configuring WCCP Services

A WCCP service is an appliance configuration that defines a service group to a WCCP v2 router. It includes information such as the service ID and ports used. Service groups allow a web proxy to establish connectivity with a WCCP router and to handle redirected traffic from the router.

If WCCP proxy health checking is enabled, the WSA’s WCCP daemon sends a proxy health check message (xmlrpc client request) to the xmlrpc server running on the Web proxy every 10 seconds. If the proxy is up and running, the WCCP service receives a response from the proxy and the WSA sends a WCCP “here I am” (HIA) message to the specified WCCP-enabled routers every 10 seconds. If the WCCP service doesn’t receive a reply from the proxy, then HIA messages are not sent to the WCCP routers.

After a WCCP router misses three consecutive HIA messages, the router removes the WSA from its service group and traffic is no longer forwarded to the WSA.
You can use the CLI command `advancedproxyconfig > miscellaneous > Do you want to enable WCCP proxy health check?` to enable and disable the proxy health check messages; the health check is disabled by default.

**Note**

You can configure a maximum of 15 service groups on a single appliance.

- About WCCP Load Balancing, on page 35
- Adding and Editing a WCCP Service, on page 35
- Creating WCCP Services for IP Spoofing, on page 38

### About WCCP Load Balancing

The **Assignment Weight** parameter in the WCCP service definition is used to adjust the load on this WSA when it is operating as member of a WCCP pool, or service group. This weighting represents the proportion of total WCCP traffic that can be sent to this WSA for processing.

Assignment weighting adjustment is required only when different types of gateway appliances are members of the same WCCP pool and you need to divert more of the traffic to the stronger appliances.

**Note**

All WSAs that are members of a WCCP pool must be running a version of AsyncOS that supports assignment weighting to benefit from WCCP load balancing.

See Adding and Editing a WCCP Service, on page 35 for more information about the **Assignment Weight** parameter.

### Adding and Editing a WCCP Service

**Before you begin**

Configure the appliance to use a WCCP v2 Router (see Specifying a Transparent Redirection Device, on page 33).

**Step 1** Choose Network > Transparent Redirection.

**Step 2** Click Add Service, or, to edit a WCCP service, click the name of the WCCP service in the Service Profile Name column.

**Step 3** Configure the WCCP options as described:

<table>
<thead>
<tr>
<th>WCCP Service Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service Profile Name</td>
<td>The name for the WCCP service.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If you leave this empty and choose a standard service (see below), the name ‘web_cache’ is automatically assigned here.</td>
</tr>
<tr>
<td>WCCP Service Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td><strong>Service</strong></td>
<td>The service group type for the router. Choose from:</td>
</tr>
<tr>
<td><strong>Standard service.</strong></td>
<td>This service type is assigned a fixed ID of zero, a fixed redirection method of <em>by destination port</em>, and a fixed destination port of 80. You can create one standard service only. If a standard service already exists on the appliance, this option is dimmed.</td>
</tr>
<tr>
<td><strong>Dynamic service.</strong></td>
<td>This service type allows you to define a custom ID, port numbers, and redirection and load balancing options. Enter the same parameters when creating the service on the WCCP router as you entered for the dynamic service.</td>
</tr>
<tr>
<td><strong>Service ID.</strong></td>
<td>You can enter any number from 0 to 255 in the Dynamic Service ID field. However, note that you can configure no more than 15 service groups on this appliance.</td>
</tr>
<tr>
<td><strong>Port number(s).</strong></td>
<td>Enter up to eight port numbers for traffic to redirect in the Port Numbers field.</td>
</tr>
<tr>
<td><strong>Redirection basis.</strong></td>
<td>Choose to redirect traffic based on the source or destination port. Default is destination port.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>To configure Native FTP with transparent redirection and IP spoofing, choose Redirect based on source port (return path) and set the source port to 13007.</td>
</tr>
<tr>
<td><strong>Load balancing basis.</strong></td>
<td>When the network uses multiple Web Security appliances, you can choose how to distribute packets among the appliances. You can distribute packets based on the server or client address. When you choose client address, packets from a client always get distributed to the same appliance. Default is server address.</td>
</tr>
<tr>
<td><strong>Router IP Addresses</strong></td>
<td>The IPv4 or IPv6 address for one or more WCCP enabled routers. Use each router’s unique IP; you cannot enter a multicast address. You cannot mix IPv4 and IPv6 addresses within a service group.</td>
</tr>
<tr>
<td><strong>Router Security</strong></td>
<td>Check <strong>Enable Security for Service</strong> to require a passphrase for this service group. If enabled, every appliance and WCCP router that uses the service group must use the same passphrase.</td>
</tr>
<tr>
<td></td>
<td>Provide and confirm the passphrase to use.</td>
</tr>
</tbody>
</table>
**WCCP Service Option** | **Description**  
--- | ---  
Advanced | **Load-Balancing Method.** This determines how the router performs load balancing of packets among multiple Web Security appliances. Choose from:  
- **Allow Mask Only.** WCCP routers make decisions using hardware in the router. This method can increase router performance over the hash method. Not all WCCP routers support mask assignment, however. (IPv4 only.)  
- **Allow Hash Only.** This method relies on a hash function to make redirection decisions. This method can be less efficient than the mask method, but may be the only option the router supports. (IPv4 and IPv6.)  
- **Allow Hash or Mask.** Allows AsyncOS to negotiate a method with the router. If the router supports mask, then AsyncOS uses masking, otherwise hashing is used.  

**Mask Customization.** If you select Allow Mask Only or Allow Hash or Mask, you can customize the mask or specify the number of bits:  
- **Custom mask (max 6 bits).** You can specify the mask. The web interface displays the number of bits associated with the mask you provide. You can use up to five bits for an IPv4 router, or six bits for an IPv6 router.  
- **System generated mask.** You can let the system generate a mask for you. Optionally, you can specify the number of bits for the system-generated mask, between one and five bits.  

**Assignment Weight** – The WCCP weighting for this WSA; valid values are zero to 255. This weighting represents the proportion of total traffic that can be sent to this WSA for processing as member of a WCCP service group. A value of zero means this WSA will be a part of the service group, but it will not receive any redirected traffic from the router. See About WCCP Load Balancing, on page 35 for more information.  

**Forwarding method.** This is the method by which redirected packets are transported from the router to the web proxy.  

**Return Method.** This is the method by which redirected packets are transported from the web proxy to the router.  

Both the forwarding and return methods use one of the following method types:  
- **Layer 2 (L2).** This redirects traffic at layer 2 by replacing the packet’s destination MAC address with the MAC address of the target web proxy. The L2 method operates at hardware level and typically offers the best performance. Not all WCCP routers support L2 forwarding, however. In addition, WCCP routers only allow L2 negotiation with a directly (physically) connected Web Security appliance.  
- **Generic Routing Encapsulation (GRE).** This method redirects traffic at layer 3 by encapsulating the IP packet with a GRE header and a redirect header. GRE operates at software level, which can impact performance.  
- **L2 or GRE.** With this option, the appliance uses the method that the router says it supports. If both the router and appliance support L2 and GRE, the appliance uses L2.  

If the router is not directly connected to the appliance, you must choose GRE.
Creating WCCP Services for IP Spoofing

**Step 1**  If you have enabled IP spoofing on the web proxy, create two WCCP services. Create a standard WCCP service, or create a dynamic WCCP service that redirects traffic based on destination ports.

**Step 2**  Create a dynamic WCCP service that redirects traffic based on source ports.

Use the same port numbers, router IP address, and router security settings as used for the service created in Step 1.

**Note**  Cisco suggests using a service ID number from 90 to 97 for the WCCP service used for the return path (based on the source port).

---

**What to do next**

**Related Topics**

- Web Proxy Cache, on page 65.

---

**Increasing Interface Capacity Using VLANs**

You can configure one or more VLANs to increase the number of networks the Cisco Web Security Appliance can connect to beyond the number of physical interfaces included.

VLANs appear as dynamic “Data Ports” labeled in the format of: “VLAN DDDD” where the “DDDD” is the ID and is an integer up to 4 digits long (VLAN 2, or VLAN 4094 for example). AsyncOS supports up to 30 VLANs.

A physical port does not need an IP address configured in order to be in a VLAN. The physical port on which a VLAN is created can have an IP that will receive non-VLAN traffic, so you can have both VLAN and non-VLAN traffic on the same interface.

VLANs can only be created on the Management and P1 data ports.

**Configuring and Managing VLANs**

You can create, edit and delete VLANs via the `etherconfig` command. Once created, a VLAN can be configured via the `interfaceconfig` command in the CLI.

**Example 1: Creating a New VLAN**

In this example, two VLANs are created (named VLAN 31 and VLAN 34) on the P1 port:

---

**Note**  Do not create VLANs on the T1 or T2 interfaces.

---

**Step 1**  Access the CLI.
**Step 2**  
Follow the steps shown.

```
example.com> etherconfig
Choose the operation you want to perform:
  - MEDIA - View and edit ethernet media settings.
  - VLAN - View and configure VLANs.
  - MTU - View and configure MTU.
[>] vlan
VLAN interfaces:
Choose the operation you want to perform:
  - NEW - Create a new VLAN.
[>] new
VLAN ID for the interface (Ex: "34"):
[>] 34
Enter the name or number of the ethernet interface you wish bind to:
  1. Management
  2. P1
  3. T1
  4. T2
[1]> 2
VLAN interfaces:
  1. VLAN 34 (P1)
Choose the operation you want to perform:
  - NEW - Create a new VLAN.
  - EDIT - Edit a VLAN.
  - DELETE - Delete a VLAN.
[>] new
VLAN ID for the interface (Ex: "34"):
[>] 31
Enter the name or number of the ethernet interface you wish bind to:
  1. Management
  2. P1
  3. T1
  4. T2
[1]> 2
VLAN interfaces:
  1. VLAN 31 (P1)
  2. VLAN 34 (P1)
Choose the operation you want to perform:
  - NEW - Create a new VLAN.
  - EDIT - Edit a VLAN.
  - DELETE - Delete a VLAN.
[>]
```

**Step 3**  
Commit your changes.

---

**Example 2: Creating an IP Interface on a VLAN**

In this example, a new IP interface is created on the VLAN 34 ethernet interface.

---

**Note**  
Making changes to an interface may close your connection to the appliance.

---

**Step 1**  
Access the CLI.

**Step 2**  
Follow the steps shown:
example.com> interfaceconfig
Currently configured interfaces:
1. Management (10.10.1.10/24 on Management: example.com)
2. P1 (10.10.0.10 on P1: example.com)
Choose the operation you want to perform:
- NEW - Create a new interface.
- EDIT - Modify an interface.
- DELETE - Remove an interface.
[]> new
IP Address (Ex: 10.10.10.10):
[]> 10.10.31.10

example.com> commit

Step 3 Commit your changes.

What to do next

Related Topics
- Enabling or Changing Network Interfaces, on page 27.
- Configuring TCP/IP Traffic Routes, on page 31.

Redirect Hostname and System Hostname

After running the System Setup Wizard, the System Hostname and the Redirect Hostname are the same. However, changing the system hostname using the sethostname command does not change the redirect hostname. Therefore the settings may have different values.

AsyncOS uses the redirect hostname for end-user notifications and acknowledgments.

The system hostname is the fully-qualified hostname used to identify the appliance in the following areas:
- The command line interface (CLI)
- System alerts
- When forming the machine NetBIOS name when the Web Security appliance joins an Active Directory domain.
The system hostname does not correspond directly to interface hostnames and is not used by clients to connect to the appliance.

### Changing the Redirect Hostname

**Step 1**  
In the web user interface, navigate to **Network > Authentication**.

**Step 2**  
Click Edit Global Settings.

**Step 3**  
Enter a new value for Redirect Hostname.

### Changing the System Hostname

**Step 1**  
Access the CLI.

**Step 2**  
Use the `sethostname` command to change the name of the Web Security appliance:

```
example.com> sethostname
example.com> hostname.com
example.com> commit
```

**Step 3**  
Commit your changes.

### Configuring SMTP Relay Host Settings

AsyncOS periodically sends system-generated email messages, such as notifications, alerts, and Cisco Customer Support requests. By default, AsyncOS uses information listed in the MX record on your domain to send email. However, if the appliance cannot directly reach the mail servers listed in the MX record, you must configure at least one SMTP relay host on the appliance.

---

**Note**  
If the Web Security appliance cannot communicate with the mail servers listed in the MX record or any of the configured SMTP relay hosts, it cannot send email messages and it writes a message in the log files.

---

You can configure one or more SMTP relay hosts. When you configure multiple SMTP relay hosts, AsyncOS uses the topmost available SMTP relay host. If an SMTP relay host is unavailable, it tries to use the one below it in the list.
Configuring an SMTP Relay Host

Step 1 Choose Network > Internal SMTP Relay.
Step 2 Click Edit Settings.
Step 3 Complete the Internal SMTP Relay settings.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Relay Hostname or IP Address</td>
<td>The hostname or IP address to use for the SMTP relay</td>
</tr>
<tr>
<td>Port</td>
<td>The port for connecting to the SMTP relay. If this property is left empty, the appliance uses port 25.</td>
</tr>
<tr>
<td>Routing Table to Use for SMTP</td>
<td>The routing table associated with an appliance network interface, either Management or Data, to use for connecting to the SMTP relay. Choose whichever interface is on the same network as the relay system.</td>
</tr>
</tbody>
</table>

Step 4 (Optional) Click Add Row to add additional SMTP relay hosts.
Step 5 Submit and commit your changes.

DNS Settings

AsyncOS for Web can use the Internet root DNS servers or your own DNS servers. When using the Internet root servers, you can specify alternate servers to use for specific domains. Since an alternate DNS server applies to a single domain, it must be authoritative (provide definitive DNS records) for that domain.

You can also specify secondary DNS name servers to resolve the queries not resolved by the primary name servers. Secondary DNS servers are not used as failover DNS servers. They are queried according to the priority, when primary DNS servers return errors specified in Editing DNS Settings, on page 43.

- Split DNS, on page 42
- Clearing the DNS Cache, on page 43
- Editing DNS Settings, on page 43

Split DNS

AsyncOS supports split DNS where internal servers are configured for specific domains and external or root DNS servers are configured for other domains. If you are using your own internal server, you can also specify exception domains and associated DNS servers.
Clearing the DNS Cache

Before you begin

Be aware that using this command might cause a temporary performance degradation while the cache is repopulated.

Step 1   Choose Network > DNS.
Step 2   Click Clear DNS Cache.

Editing DNS Settings

Step 1   Choose Network > DNS
Step 2   Click Edit Settings.
Step 3   Configure the DNS settings as required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Primary DNS Servers | Use these DNS Servers. The local DNS server(s) that the appliance can use to resolve hostnames.  
                      | Alternate DNS servers Overrides (Optional). Authoritative DNS servers for particular domains  
                      | Use the Internet’s Root DNS Servers. You can choose to use the Internet root DNS servers for domain name service lookups when the appliance does not have access to DNS servers on your network.  
                      | Note   Internet Root DNS servers will not resolve local hostnames. If you need the appliance to resolve local hostnames you must use a local DNS server or add the appropriate static entries to the local DNS using the Command Line Interface. |
| Secondary DNS Servers | The secondary DNS server(s) that the appliance can use to resolve hostnames not resolved by the primary name servers.  
                        | Note   The secondary DNS servers receive host name queries when the primary DNS servers return the following errors:  
                        |       • No Error, no answer section received.  
                        |       • Server failed to complete request, no answer section.  
                        |       • Name Error, no answer section received.  
                        |       • Function not implemented.  
                        |       • Server Refused to Answer Query. |
### Description

**Property** | **Description**
--- | ---
Routing Table for DNS Traffic | Specifies which interface the DNS service will route traffic through.
IP Address Version Preference | When a DNS server provides both an IPv4 and an IPv6 address, AsyncOS uses this preference to choose the IP address version.
  - **Note**: AsyncOS does not honor the version preference for transparent FTP requests.
Wait Before Timing out Reverse DNS Lookups | The wait time in seconds before timing out non-responsive reverse DNS lookups.
Domain Search List | A DNS domain search list used when a request is sent to a bare hostname (with no '.') character. The domains specified will each be attempted in turn, in the order entered, to see if a DNS match for the hostname plus domain can be found.

### Step 4
Submit and commit your changes.

CHAPTER 3

Connect the Appliance to a Cisco Cloud Web Security Proxy

This chapter contains the following sections:

• How to Configure and Use Features in Cloud Connector Mode, on page 45
• Deployment in Cloud Connector Mode, on page 45
• Configuring the Cloud Connector, on page 46
• Controlling Web Access Using Directory Groups in the Cloud, on page 49
• Bypassing the Cloud Proxy Server, on page 49
• Partial Support for FTP and HTTPS in Cloud Connector Mode, on page 49
• Preventing Loss of Secure Data, on page 50
• Viewing Group and User Names and IP Addresses, on page 50
• Subscribing to Cloud Connector Logs, on page 50
• Identification Profiles and Authentication with Cloud Web Security Connector, on page 51

How to Configure and Use Features in Cloud Connector Mode

Use of the features included in the Cloud Connector subset is the same as in standard mode, except as noted. See Comparison of Modes of Operation, on page 10 for additional information.

This chapter links to locations within this documentation that provide information about some of the major features of the Web Security Appliance that are common to both standard mode and Cloud Web Security Connector mode. With the exception of Cloud Connector configuration settings and information about sending directory groups to the cloud, relevant information is in other locations throughout this document.

This chapter includes information about configuring the Cloud Web Security Connector that is not applicable in standard mode.

Deployment in Cloud Connector Mode

When you initially set up the appliance, you choose whether to deploy in Cloud Connector mode or standard mode. You can also run the System Setup Wizard on an appliance that is currently deployed in standard mode.
to redeploy it in Cloud Connector mode, if you have the required licensing. Running the System Setup Wizard overwrites your existing configurations and deletes all existing data.

Deployment of the appliance is the same in both standard and Cloud Security mode except that on-site web proxy services and Layer-4 Traffic Monitor services are not available in Cloud Web Security Connector mode.

You can deploy the Cloud Web Security Connector in either explicit forward mode or in transparent mode.

To modify Cloud Connector settings after initial setup, select Network > Cloud Connector.

Related Topics
- Connect, Install, and Configure, on page 9

Configuring the Cloud Connector

Before you begin
See Enabling Access to the Web Interface on Virtual Appliances, on page 4.

Step 1
Access the Web Interface for the Web Security Appliance:
Enter the IPv4 address of the Web Security appliance in an Internet browser.
The first time you run the System Setup Wizard, use the default IPv4 address:
https://192.168.42.42:8443
-or-
http://192.168.42.42:8080
where 192.168.42.42 is the default IPv4 address, and 8080 is the default admin port setting for HTTP, and 8443 is default admin port for HTTPS.

Step 2
Select System Administration > System Setup Wizard.

Step 3
Accept the terms of the license agreement.

Step 4
Click Begin Setup.

Step 5
Configure system settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default System Hostname</td>
<td>The fully-qualified hostname for the Web Security appliance.</td>
</tr>
<tr>
<td>DNS Server(s)</td>
<td>The Internet root DNS servers for domain name service lookups. See also DNS Settings, on page 42.</td>
</tr>
<tr>
<td>NTP Server</td>
<td>A server with which to synchronize the system clock. The default is time.ironport.com.</td>
</tr>
<tr>
<td>Time Zone</td>
<td>Sets the time zone on the appliance so that timestamps in message headers and log files are correct.</td>
</tr>
</tbody>
</table>

Step 6
Select Cloud Web Security Connector for the appliance mode.
Step 7
Configure Cloud Connector settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Web Security Proxy Servers</td>
<td>The address of the Cloud Proxy Server (CPS), for example, proxy1743.scansafe.net.</td>
</tr>
<tr>
<td>Failure Handling</td>
<td>If AsyncOS fails to connect to a Cloud Web Security proxy, either <strong>Connect directly</strong> to the Internet or <strong>Drop requests</strong>.</td>
</tr>
<tr>
<td>Cloud Web Security Authorization Scheme</td>
<td>Method for authorizing transactions:</td>
</tr>
<tr>
<td></td>
<td>• Web Security Appliance public facing IPv4 address</td>
</tr>
<tr>
<td></td>
<td>• Authorization key included with each transaction. You can generate an authorization key within the Cisco Cloud Web Security Portal.</td>
</tr>
</tbody>
</table>

Step 8
Configure network interfaces and wiring:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet Port</td>
<td>If you configure the M1 interface for management traffic only, you must configure the P1 interface for data traffic. However, you can configure the P1 interface even when the M1 interface is used for both management and data traffic.</td>
</tr>
<tr>
<td>IP Address</td>
<td>The IPv4 address to use to manage the Web Security appliance.</td>
</tr>
<tr>
<td>Network Mask</td>
<td>The network mask to use when managing the Web Security appliance on this network interface.</td>
</tr>
<tr>
<td>Hostname</td>
<td>The hostname to use when managing the Web Security appliance on this network interface.</td>
</tr>
</tbody>
</table>

Step 9
Configure routes for Management and Data traffic:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default Gateway</td>
<td>The default gateway IPv4 address to use for the traffic through the Management and/or Data interface.</td>
</tr>
<tr>
<td>Name</td>
<td>A name used to identify the static route.</td>
</tr>
<tr>
<td>Internal Network</td>
<td>The IPv4 address for this route’s destination on the network.</td>
</tr>
<tr>
<td>Internal Gateway</td>
<td>The gateway IPv4 address for this route. A route gateway must reside on the same subnet as the Management or Data interface on which it is configured.</td>
</tr>
</tbody>
</table>

Step 10
Configure transparent connection settings:

**Note**     By default, the Cloud Connector is deployed in transparent mode, which requires a connection to a Layer-4 switch or a version 2 WCCP router.
Configuring the Cloud Connector

### Setting

<table>
<thead>
<tr>
<th>Description</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>• The Web Security appliance is connected to a layer 4 switch.</td>
<td>Layer-4 Switch or No Device</td>
</tr>
<tr>
<td>• You will deploy the Cloud Connector in explicit forward mode.</td>
<td></td>
</tr>
<tr>
<td>The Web Security appliance is connected to a version 2 WCCP capable router.</td>
<td>WCCP v2 Router</td>
</tr>
</tbody>
</table>

Note: A passphrase can contain up to seven characters and is optional.

### Step 11

Configure administrative settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator Passphrase</td>
<td>A passphrase to access the Web Security appliance. The passphrase must be six characters or more.</td>
</tr>
<tr>
<td>Email system alerts to</td>
<td>An email address to which the appliance sends alerts.</td>
</tr>
<tr>
<td>Send Email via SMTP Relay Host</td>
<td>(Optional) A hostname or address for an SMTP relay host that AsyncOS uses for sending system generated email messages. The default SMTP relay host is the mail servers listed in the MX record. The default port number is 25.</td>
</tr>
<tr>
<td>AutoSupport</td>
<td>The appliance can send system alerts and weekly status report to Cisco Customer Support.</td>
</tr>
</tbody>
</table>

### Step 12

Review and install:

a) Review the installation.

b) Click Previous to go back and make changes.

c) Click Install This Configuration to continue with the information you provided.

---

**What to do next**

- Preventing Loss of Secure Data, on page 50
- Network Interfaces, on page 26
- Configuring TCP/IP Traffic Routes, on page 31
- Configuring Transparent Redirection, on page 33
- Managing Alerts, on page 400
- Configuring an SMTP Relay Host, on page 42
Controlling Web Access Using Directory Groups in the Cloud

You can use Cisco Cloud Web Security to control web access based on directory groups. When traffic to Cisco Cloud Web Security is being routed through a Web Security Appliance in Cloud Connector mode, Cisco Cloud Web Security needs to receive the directory-group information with the transactions from the Cloud Connector so it can apply the group-based cloud policies.

Before you begin
Add an authentication realm to the Web Security Appliance configuration.

Step 1
Navigate to Network > Cloud Connector.

Step 2
In the Cloud Policy Directory Groups area, click Edit Groups.

Step 3
Select the User Groups and Machine Groups for which you have created Cloud Policies within Cisco Cloud Web Security.

Step 4
Click Add.

Step 5
Click Done and Commit your changes.

What to do next

Bypassing the Cloud Proxy Server

Cloud routing policies allow you to route web traffic to either Cisco Cloud Web Security proxies or directly to the Internet based on these characteristics:

- Identification Profile
- Proxy Port
- Subnet
- URL Category
- User Agent

The process of creating cloud routing policies in Cloud Connector mode is identical to the process of creating routing policies using the standard mode.

Related Topics
- Creating a Policy, on page 189

Partial Support for FTP and HTTPS in Cloud Connector Mode

The Web Security appliance in Cloud Connector mode does not fully support FTP or HTTPS.
FTP

FTP is not supported by the Cloud Connector. AsyncOS drops native FTP traffic when the appliance is configured for Cloud Connector.

FTP over HTTP is supported in Cloud Connector mode.

HTTPS

The Cloud Connector does not support decryption. It passes HTTPS traffic without decrypting.

Because the Cloud Connector does not support decryption, AsyncOS generally does not have access to information in the client headers of HTTPS traffic. Therefore, AsyncOS generally cannot enforce routing policies that rely on information in encrypted headers. This is always the case for transparent HTTPS transactions. For example, for transparent HTTPS transactions, AsyncOS does not have access to the port number in the HTTPS client header and therefore it cannot match a routing policy based on port number. In this case, AsyncOS uses the default routing policy.

There are two exceptions for explicit HTTPS transactions. AsyncOS has access to the following information for explicit HTTPS transactions:

- URL
- Destination port number

For explicit HTTPS transactions, it is possible to match a routing policy based on URL or port number.

Preventing Loss of Secure Data

You can integrate the Cloud Connector with external Data Loss Prevention servers through Network > External DLP Servers.

Related Topics

- Prevent Loss of Sensitive Data, on page 271

Viewing Group and User Names and IP Addresses

To view the configured group names, user names, and IP addresses, go to whoami.scansafe.net.

Subscribing to Cloud Connector Logs

The Cloud Connector Logs provides useful information for troubleshooting problems with the Cloud Connector, for example, authenticated users and groups, the Cloud header, and the authorization key.

Step 1  Navigate to System Administration > Log Subscriptions.
Step 2  Select Cloud Connector Logs from the Log Type menu.
Step 3  Type a name in the Log Name field.
Step 4  Set the log level.
Step 5  
Submit and Commit your changes.

What to do next

Related Topics
- Monitor System Activity Through Logs, on page 337

Identification Profiles and Authentication with Cloud Web Security Connector

The Cloud Web Security Connector supports basic authentication and NTLM. You can also bypass authentication for certain destinations.

In Cloud Connector mode, using an Active Directory realm, you can identify transaction requests as originating from specific machines. The Machine ID service is not available in standard mode.

With two exceptions, Authentication works the same throughout the Web Security Appliance, whether in standard configuration or Cloud Connector configuration. Exceptions:
- The Machine ID service is not available in standard mode.
- AsyncOS does not support Kerberos when the appliance is configured in Cloud Connector mode.

Note
Identification Profiles based on User Agent or Destination URL are not supported for HTTPS traffic.

Related Topics
- Identifying Machines for Policy Application, on page 51
- Guest Access for Unauthenticated Users, on page 52
- Classify End-Users for Policy Application, on page 119
- Acquire End-User Credentials, on page 79

Identifying Machines for Policy Application

By enabling the Machine ID service, AsyncOS can apply policies based on the machine that made the transaction request rather than the authenticated user or IP address or some other identifier. AsyncOS uses NetBIOS to acquire the machine ID.

Note
Be aware that the machine identity service is only available through Active Directory realms. If you do not have an Active Directory realm configured, this service is disabled.

Step 1  
Select Network > Machine ID Service.
Step 2  
Click Enable and Edit Settings.
### Step 3
Configure Machine Identification settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable NetBIOS for Machine Identification</td>
<td>Select to enable the machine identification service.</td>
</tr>
<tr>
<td>Realm</td>
<td>The Active Directory realm to use to identify the machine that is initiating the transaction request.</td>
</tr>
<tr>
<td>Failure Handling</td>
<td>If AsyncOS cannot identify the machine, should it drop the transaction or continue with policy matching?</td>
</tr>
</tbody>
</table>

### Step 4
Submit and Commit your changes.

---

### Guest Access for Unauthenticated Users

If the Web Security appliance is configured to provide guest access for unauthenticated users, in Cloud Connector mode, AsyncOS assigns guest users to the group, __GUEST_GROUP__, and sends that information to Cisco Cloud Web Security. Use Identities to provide guest access to unauthenticated users. Use Cisco Cloud Web Security policies to control these guest users.

CHAPTER 4

Connect the Appliance to Cisco Defense Orchestrator

This chapter contains the following sections:

- Overview of Cisco Defense Orchestrator Integration, on page 53
- How to Configure and Use Features in Cisco Defense Orchestrator Mode, on page 53
- Deployment in Cisco Defense Orchestrator Mode, on page 54
- Disabling Cisco Defense Orchestrator, on page 58
- Enabling Cisco Defense Orchestrator, on page 58
- Cisco Defense Orchestrator Reporting, on page 59
- Troubleshooting Cisco Defense Orchestrator Mode Issues, on page 59

Overview of Cisco Defense Orchestrator Integration

The Cisco Defense Orchestrator is a cloud-based platform that helps network operations staff establish and maintain an end-to-end security posture by managing security policies across Cisco security devices. You can connect your appliances with Cisco Defense Orchestrator and analyze security policy configuration of your appliances to identify and resolve policy inconsistencies, model policy changes to validate their impact, and orchestrate policy changes to achieve consistency and maintain clarity in security posture.

How to Configure and Use Features in Cisco Defense Orchestrator Mode

Use of the features included in the Cisco Defense Orchestrator subset is the same as in standard mode, except as noted. See Configuration Changes and Constraints in Cisco Defense Orchestrator Mode, on page 54 for additional information.

This chapter links to locations within this documentation that provide information about some of the major features of the Web Security Appliance that are common to both standard mode and Cisco Defense Orchestrator mode.

This chapter also includes information about configuring Cisco Defense Orchestrator that is not applicable in standard mode.
Deployment in Cisco Defense Orchestrator Mode

Depending on your requirements, you can use one of the following methods to configure your appliance in Cisco Defense Orchestrator mode:

- **Using System Setup Wizard.** Use this option when you have a new appliance. Choose the Cisco Defense Orchestrator mode of operation while running the System Setup Wizard. For instructions, see Configuring Your Appliance in Cisco Defense Orchestrator Mode Using System Setup Wizard, on page 55.

- **Using the Cisco Defense Orchestrator Settings page in the web interface.** Use this option if you have an existing device in the standard mode and have existing policies. You will be able to manage these policies using the Cisco Defense Orchestrator. For instructions, see Configuring Your Standard Mode Appliance in Cisco Defense Orchestrator Mode Using the Web Interface, on page 57.

Configuration Changes and Constraints in Cisco Defense Orchestrator Mode

This section specifies the configuration changes that will occur in your Web Security Appliance after on-boarding it to the Cisco Defense Orchestrator. It also specifies configurable options and constraints.

---

**Note**

There are no limitations in the web interface other than what is specified below. Authentication is not supported from the Cisco Defense Orchestrator.

---

**Constraints in the Web Security Appliance after on-boarding:**

In the appliance, you will not be able to configure the features that are administered through the Cisco Defense Orchestrator. Configurations for these features are migrated to the Cisco Defense Orchestrator when the appliance is on-boarded. All other configuration settings in the appliance are set to default settings.

Barring features administered through the Cisco Defense Orchestrator, all other features will be available in your appliance.

After on-boarding, Access Policies are controlled through Cisco Defense Orchestrator. Exceptions are specified below. You can configure the following Access Policies features only in the Web Security Appliance:

- Access Policies - Policy Definitions
  - Protocols and User Agents
  - Anti-Malware and Reputation
  - Custom URL Categories (External Live Feed Category)

You can configure the following features only in the Cisco Defense Orchestrator:

- Custom URL Categories (Local Custom Category)
- URL Filtering, Applications, and Objects (except size and custom MIME type)
Global and non global access policies

Access Policies support:
  • Adding multiple access policies is supported.
  • Adding, reordering, deleting access policies is supported.
  • URL filtering (Predefined URL Category Filtering), applications, and objects (object types), with the following limitations:
    • Bandwidth limits for applications and application-types is not supported.
    • For archived objects, inspect is not supported.
    • Advanced membership definitions for access policies and identities are not supported.
    • Range Request Forwarding is not supported.
    • Time and volume quota management is not supported.
    • Safe Search, Referred Exceptions, Site Content Rating are not supported for URLs

If reporting through Cisco Defense Orchestrator is enabled:
  • Summarized reports in the Cisco Defense Orchestrator will be available.
  • Reporting will also be available in the Web Security Appliance.
  • Reporting will not be available in the Security Management Appliance.

Configuring Your Appliance in Cisco Defense Orchestrator Mode Using System Setup Wizard

You can configure your new appliance in Cisco Defense Orchestrator mode while installing it, using the System Setup Wizard.

Before you begin
See Configuration Changes and Constraints in Cisco Defense Orchestrator Mode, on page 54 to know more about the configuration changes that will occur in your Web Security Appliance after on-boarding it to the Cisco Defense Orchestrator.

Step 1
Open a browser and enter the IP address of the Web Security appliance. Use the default IP address when you run the System Setup Wizard for the first time:

https://192.168.42.42:8443
-or-
http://192.168.42.42:8080

Where 192.168.42.42 is the default IP address, and 8080 is the default admin port setting for HTTP, and 8443 is default admin port for HTTPS.

Otherwise, if the appliance is currently configured, use the IP address of the M1 port.
**Step 2**  
When the appliance login screen appears, enter the username and passphrase to access the appliance. By default, the appliance ships with the following username and passphrase:

- **Username:** admin
- **Passphrase:** ironport

**Step 3**  
Select System Administration > System Setup Wizard.

**Step 4**  
Accept the terms of the license agreement.

**Step 5**  
Click Begin Setup.

**Step 6**  
Select Cisco Defense Orchestrator for the appliance mode.

**Step 7**  
Configure all settings using the reference tables provided in the following sections as required. See System Setup Wizard Reference Information, on page 19, page 2-11.

**Step 8**  
Review and install:

a) Review the installation.
b) Click Previous to go back and make changes.
c) Click Install This Configuration to continue with the information you provided.

Depending on the IP address, hostname, or DNS settings you configured during setup, you may lose connection to the appliance at this stage. If a “page not found” error is displayed in your browser, change the URL to reflect any new address settings and reload the page. Enter your credentials if prompted.

**Step 9**  
Click Cisco Defense Orchestrator Portal. The portal opens in a new window or tab, according to your browser settings.

**Step 10**  
On the Cisco Defense Orchestrator portal, perform the following steps:

a) Log in to the Cisco Defense Orchestrator portal.
b) On-board the Web Security Appliance in the portal.
c) Copy the registration token (key).

**Step 11**  
Complete the Cisco Defense Orchestrator registration on your Web Security Appliance. Perform the following steps:

a) Select Network > Cisco Defense Orchestrator.
b) Enter the registration token (key) and click Register.
c) A success message displays after successful registration.

**Note**  
After you perform this step, any Content Security Management Appliance used for policy enforcement will be unable to effect policy changes in the Cisco Web Security Appliance.

---

**What to do next**

- (Optional) Configure your appliance to send reports to Cisco Defense Orchestrator. See How to Enable Cisco Defense Orchestrator Reporting, on page 59.

- Configure access policies in Cisco Defense Orchestrator. See https://docs.defenseorchestrator.com/.

**Related Topics**

- Troubleshooting Cisco Defense Orchestrator Mode Issues, on page 59
Configuring Your Standard Mode Appliance in Cisco Defense Orchestrator Mode Using the Web Interface

Use this procedure if you have existing policies on your appliance and you want to manage these policies using Cisco Defense Orchestrator.

Before you begin

See Configuration Changes and Constraints in Cisco Defense Orchestrator Mode, on page 54 to know more about the configuration changes that will occur in your Web Security Appliance after on-boarding it to the Cisco Defense Orchestrator.

**Step 1**
Select **Network > Cisco Defense Orchestrator**.

**Step 2**
Under Cisco Defense Orchestrator Settings, click **Edit Settings**.

**Step 3**
Select **Enable** and click **Submit**.

**Step 4**
Commit your changes.

**Note**
After you perform this step, any Content Security Management Appliance used for policy enforcement will be unable to effect policy changes in the Cisco Web Security Appliance.

**Step 5**
Click **Cisco Defense Orchestrator Portal**. The portal opens in a new window or tab, according to your browser settings.

**Step 6**
On the Cisco Defense Orchestrator portal, perform the following steps:

a) Log in to the Cisco Defense Orchestrator portal.
b) On-board the Web Security Appliance in the portal.
c) Copy the registration token (key).

**Step 7**
Complete the Cisco Defense Orchestrator registration on your Web Security Appliance. Perform the following steps:

a) Select **Network > Cisco Defense Orchestrator**.
b) Enter the registration token (key) and click **Register**.
c) A success message displays after successful registration.

What to do next

- (Optional) Configure your appliance to send reports to Cisco Defense Orchestrator. See How to Enable Cisco Defense Orchestrator Reporting, on page 59.

- Analyze your appliance's access policies on Cisco Defense Orchestrator. See [https://docs.defenseorchestrator.com/](https://docs.defenseorchestrator.com/).

Related Topics

Troubleshooting Cisco Defense Orchestrator Mode Issues, on page 59
Disabling Cisco Defense Orchestrator

Before you begin

After disabling Cisco Defense Orchestrator, if you need to enable it, you will have to regenerate the registration token (key) from the Cisco Defense Orchestrator portal, and on-board the appliance again. See Enabling Cisco Defense Orchestrator, on page 58.

Step 1  Select Network > Cisco Defense Orchestrator.
Step 2  Click Edit Settings.
Step 3  Uncheck Enable.
Step 4  Submit and commit the change.

Enabling Cisco Defense Orchestrator

Before you begin

Ensure you have connectivity to the Cisco Defense Orchestrator portal.

Step 1  Select Network > Cisco Defense Orchestrator.
Step 2  Click Edit Settings.
Step 3  Check Enable.
Step 4  Submit and commit the change.
Step 5  Click Cisco Defense Orchestrator Portal. The portal opens in a new window or tab, according to your browser settings.
Step 6  On the Cisco Defense Orchestrator portal, perform the following steps:
  a)  Log in to the Cisco Defense Orchestrator portal.
  b)  On-board the Web Security Appliance in the portal.
  c)  Copy the registration token (key).
Step 7  Complete the Cisco Defense Orchestrator registration on your Web Security Appliance. Perform the following steps:
  a)  Navigate to the Cisco Defense Orchestrator Registration section.
  b)  Enter the registration token (key) and click Register.
  c)  A success message displays after successful registration.

Note  After you perform this step, any Content Security Management Appliance used for policy enforcement will be unable to effect policy changes in the Cisco Web Security Appliance.
Cisco Defense Orchestrator Reporting

After deploying your appliance in Cisco Defense Orchestrator mode, you can configure your appliance to send reports to Cisco Defense Orchestrator.

To enable Cisco Defense Orchestrator reporting, see How to Enable Cisco Defense Orchestrator Reporting, on page 59. You will not be able to view and manage your report data on Security Management Appliance also.

How to Enable Cisco Defense Orchestrator Reporting

Before you begin

Deploy your appliance in Cisco Defense Orchestrator mode. For instructions, see Deployment in Cisco Defense Orchestrator Mode, on page 54.

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Select Security Services &gt; Reporting and click Edit Settings.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Select Local Reporting.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select Cisco Defense Orchestrator Reporting.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Submit and commit your changes.</td>
</tr>
</tbody>
</table>

Note

Once you enable Cisco Defense Orchestrator reporting, centralized reporting using Security Management appliance will no longer work. However, you can continue to use Advanced Web Security Reporting application for centralized reporting.

What to do next

View your appliance's summary reports on Cisco Defense Orchestrator. See https://docs.defenseorchestrator.com/.

Troubleshooting Cisco Defense Orchestrator Mode Issues

Unable to Register Cisco Defense Orchestrator

After enabling Cisco Defense Orchestrator mode on your appliance, if you are unable to register Cisco Defense Orchestrator, do the following:

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Make sure that the registration key obtained from the Cisco Defense Orchestrator portal is correct.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Make sure that the registration key obtained from the Cisco Defense Orchestrator portal is valid.</td>
</tr>
</tbody>
</table>
If the registration key has expired, generate a new registration key on Cisco Defense Orchestrator. For more information, see https://docs.defenseorchestrator.com.
Intercepting Web Requests

This chapter contains the following sections:

- Overview of Intercepting Web Requests, on page 61
- Tasks for Intercepting Web Requests, on page 61
- Best Practices for Intercepting Web Requests, on page 62
- Web Proxy Options for Intercepting Web Requests, on page 63
- Client Options for Redirecting Web Requests, on page 70
- Using PAC Files with Client Applications, on page 71
- FTP Proxy Services, on page 73
- SOCKS Proxy Services, on page 75
- Troubleshooting Intercepting Requests, on page 78

Overview of Intercepting Web Requests

The Web Security appliance intercepts requests that are forwarded to it by clients or other devices over the network.

The appliance works in conjunction with other network devices to intercept traffic. These may be ordinary switches, transparent redirection devices network taps, and other proxy servers or Web Security appliances.

Tasks for Intercepting Web Requests

<table>
<thead>
<tr>
<th>Steps</th>
<th>Task</th>
<th>Links to Related Topics and Procedures</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Review best practices.</td>
<td>• Best Practices for Intercepting Web Requests, on page 62</td>
</tr>
</tbody>
</table>
### Best Practices for Intercepting Web Requests

- Enable only the proxy services you require.
- Use the same forwarding and return method (either L2 or GRE) for all WCCP services defined in the Web Security appliance. This allows the proxy bypass list to work consistently.
- Ensure that users cannot access PAC files from outside the corporate network. This allows your mobile workers to use the web proxy when they are on the corporate network and to connect directly to web servers at other times.
- Allow a web proxy to accept X-Forwarded-For headers from trustworthy downstream proxies or load balancers only.
- Leave the web proxy in the default transparent mode, even if initially using only explicit forwarding. Transparent mode also accepts explicitly forwarded requests.

#### Steps and Tasks

<table>
<thead>
<tr>
<th>Steps</th>
<th>Task</th>
<th>Links to Related Topics and Procedures</th>
</tr>
</thead>
</table>
| Step 2 | (Optional) Perform follow up networking tasks:  
- Connect and configure upstream proxies.  
- Configure network interface ports.  
- Configure transparent redirection devices.  
- Configure TCP/IP routes.  
- Configure VLANs. | - Upstream Proxies, on page 24  
- Network Interfaces, on page 26  
- Configuring Transparent Redirection, on page 33  
- Configuring TCP/IP Traffic Routes, on page 31  
- Increasing Interface Capacity Using VLANs, on page 38 |
| Step 3 | (Optional) Perform follow up Web Proxy tasks:  
- Configure the web proxy to operate in either Forward or Transparent mode.  
- Decide if additional services are needed for the protocol types you want to intercept  
- Configure IP spoofing.  
- Manage the web proxy cache.  
- Use custom web request headers.  
- Bypass the proxy for some requests. | - Web Proxy Options for Intercepting Web Requests, on page 63  
- Configuring Web Proxy Settings, on page 63  
- Web Proxy Options for Intercepting Web Requests, on page 63  
- Web Proxy Cache, on page 65  
- Web Proxy IP Spoofing, on page 68  
- Web Proxy Bypassing, on page 69 |
| Step 4 | Perform client tasks:  
- Decide how clients should redirect requests to the web proxy.  
- Configure clients and client resources. | - Client Options for Redirecting Web Requests, on page 70  
- Using PAC Files with Client Applications, on page 71 |
| Step 5 | (Optional) Enable and Configure the FTP proxy. | - FTP Proxy Services, on page 73 |
Web Proxy Options for Intercepting Web Requests

By itself, the Web Proxy can intercept web requests that use HTTP (including FTP over HTTP) and HTTPS. Additional proxy modules are available to enhance protocol management:

- **FTP Proxy.** The FTP Proxy allows the interception of native FTP traffic (rather than just FTP traffic that has been encoded within HTTP).
- **HTTPS Proxy.** The HTTPS proxy supports the decryption of HTTPS traffic and allows the web proxy to pass unencrypted HTTPS requests on to policies for content analysis.

---

**Note**

When in transparent mode, the Web Proxy drops all transparently redirected HTTPS requests if the HTTPS proxy is not enabled. No log entries are created for dropped transparently redirected HTTPS requests.

- **SOCKS Proxy.** The SOCKS proxy allows the interception of SOCKS traffic.

Each of these additional proxies requires the Web Proxy in order to function. You cannot enable them if you disable the Web Proxy.

---

**Note**

The Web proxy is enabled by default. All other proxies are disabled by default.

---

**Related Topics**

- FTP Proxy Services, on page 73
- SOCKS Proxy Services, on page 75

---

Configuring Web Proxy Settings

**Before you begin**

Enable the web proxy.

**Step 1** Choose Security Services > Web Proxy.

**Step 2** Click Edit Settings.

**Step 3** Configure the basic web proxy settings as required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HTTP Ports to Proxy</td>
<td>The ports that the web Proxy will listen on for HTTP connections</td>
</tr>
<tr>
<td>Caching</td>
<td>Specifies whether to enable or disable Web Proxy caching.</td>
</tr>
<tr>
<td></td>
<td>The web proxy caches data to increase performance.</td>
</tr>
</tbody>
</table>
Intercepting Web Requests

Configuring Web Proxy Settings

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Proxy mode                      | • **Forward** — Allow the client browser to name the internet target. Requires individual configuration of each web browser to use the web proxy. The web proxy can intercept only explicitly forwarded web requests in this mode.  
   • **Transparent** (Recommended) — Allow the web proxy to name the internet target. The web proxy can intercept both transparent and explicitly forwarded web requests in this mode. |
| IP Spoofing                     | • **IP Spoofing disabled** — The web proxy changes the request source IP address to match its own address to increase security.  
   • **IP Spoofing enabled** — The web proxy retains the source address so that it appears to originate from the source client rather than from the Web Security appliance. |

**Step 4**

Complete the advanced web proxy settings as required.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Persistent Connection Timeout   | The maximum time in seconds the web proxy keeps open a connection to a client or server after a transaction has been completed and no further activity is detected.  
   • **Client side.** The timeout value for connections to clients.  
   • **Server side.** The timeout value for connections to servers.  
   If you increase these values connections will remain open longer and reduce the overhead used to open and close connections repeatedly. However, you also reduce the ability of the Web Proxy to open new connections if the maximum number of simultaneous persistent connections has been reached.  
   Cisco recommends keeping the default values. |
| In-Use Connection Timeout       | The maximum time in seconds that the web proxy waits for more data from an idle client or server when the current transaction has not yet been completed.  
   • **Client side.** The timeout value for connections to clients.  
   • **Server side.** The timeout value for connections to servers. |
| Simultaneous Persistent Connections (Server Maximum Number) | The maximum number of connections (sockets) the Web Proxy keeps open with servers. |
### Property

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generate Headers</td>
<td>Generate and add headers that encode information about the request. • <strong>X-Forwarded-For</strong> headers encode the IP address of the client from which an HTTP request originated.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> To turn header forwarding on or off, use the CLI <code>advancedproxyconfig</code> command, Miscellaneous option, “Do you want to pass HTTP X-Forwarded-For headers?” Using an explicit forward upstream proxy to manage user authentication or access control with proxy authentication requires forwarding of these headers.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Request Side VIA</strong> headers encode the proxies through which the request passed on its way from the client to the server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Response Side VIA</strong> headers encode the proxies through which the request passed on its way from the server to the client.</td>
</tr>
<tr>
<td>Use Received Headers</td>
<td>Allows a Web proxy deployed as an upstream proxy to identify clients using X-Forwarded-For headers send by downstream proxies. The Web Proxy will not accept the IP address in a X-Forwarded-For header from a source that is not included in this list.</td>
</tr>
<tr>
<td></td>
<td>If enabled, requires the IP address of a downstream proxy or load balancer (you cannot enter subnets or host names).</td>
</tr>
<tr>
<td>Range Request Forwarding</td>
<td>Use the <strong>Enable Range Request Forwarding</strong> checkbox to enable or disable forwarding of range requests. Refer to Managing Access to Web Applications, on page 263 for more information.</td>
</tr>
</tbody>
</table>

### Step 5

Submit and commit your changes.

### What to do next

- Web Proxy Cache, on page 65
- Configuring Transparent Redirection, on page 33

### Web Proxy Cache

The web proxy caches data to increase performance. AsyncOS includes defined caching modes that range from safe to aggressive, and also allows customized caching. You can also exclude specific URLs from being cached, either by removing them from the cache, or by configuring the cache to ignore them.

### Clearing the Web Proxy Cache

**Step 1** Choose Security Services > Web Proxy.

**Step 2** Click Clear Cache and confirm your action.
Removing URLs from the Web Proxy Cache

Step 1  Access the CLI.
Step 2  Use the `webcache > evict` commands to access the required caching area:

```
example.com> webcache
Choose the operation you want to perform:
- EVICT - Remove URL from the cache
- DESCRIBE - Describe URL cache status
- IGNORE - Configure domains and URLs never to be cached
[]> evict
Enter the URL to be removed from the cache.
[]>
```

Step 3  Enter the URL to be removed from the cache.

**Note**  If you do not include a protocol in the URL, `http://` will be prepended to it (e.g., `www.cisco.com` will become `http://www.cisco.com`)

Specifying Domains or URLs that the Web Proxy never Caches

Step 1  Access the CLI.
Step 2  Use the `webcache -> ignore` commands to access the required submenus:

```
example.com> webcache
Choose the operation you want to perform:
- EVICT - Remove URL from the cache
- DESCRIBE - Describe URL cache status
- IGNORE - Configure domains and URLs never to be cached
[]> ignore
Choose the operation you want to perform:
- DOMAINS - Manage domains
- URLS - Manage urls
[]>
```

Step 3  Enter the address type you wish to manage: DOMAINS or URLS.

```
[]> urls
Manage url entries:
Choose the operation you want to perform:
- DELETE - Delete entries
- ADD - Add new entries
- LIST - List entries
[]>
```

Step 4  Enter `add` to add new entries:

```
[]> add
Enter new url values; one on each line; an empty line to finish
[]>
```

Step 5  Enter domains or URLs, one per line; for example:
Enter new url values; one on each line; an empty line to finish

[]> www.example1.com

Enter new url values; one on each line; an empty line to finish

[]>

You can include certain regular expression (regex) characters when specifying a domain or URLs. With the **DOMAINS** option, you can use a preceding dot character to exempt an entire domain and its subdomains from caching. For example, you can enter `.google.com` rather than simply `google.com` to exempt `www.google.com`, `docs.google.com`, and so on.

With the **URLS** option, you can use the full suite of regular-expression characters. See Regular Expressions, on page 167 for more information about using regular expressions.

**Step 6** When you are finished entering values, press Enter until you are returned to the main command-line interface.

**Step 7** Commit your changes.

---

**Choosing The Web Proxy Cache Mode**

**Step 1** Access the CLI.

**Step 2** Use the `advancedproxyconfig -> caching` commands to access the required submenus:

```
example.com> advancedproxyconfig
Choose a parameter group:
- AUTHENTICATION - Authentication related parameters
- CACHING - Proxy Caching related parameters
- DNS - DNS related parameters
- EUN - EUN related parameters
- NATIVEFTP - Native FTP related parameters
- FTPOVERHTTP - FTP Over HTTP related parameters
- HTTPS - HTTPS related parameters
- SCANNING - Scanning related parameters
- PROXYCONN - Proxy connection header related parameters
- CUSTOMHEADERS - Manage custom request headers for specific domains
- MISCELLANEOUS - Miscellaneous proxy related parameters
- SOCKS - SOCKS Proxy parameters
[]> caching
Enter values for the caching options:
The following predefined choices exist for configuring advanced caching
options:
1. Safe Mode
2. Optimized Mode
3. Aggressive Mode
4. Customized Mode
Please select from one of the above choices:
[2]>
```

**Step 3** Enter a number corresponding to the web proxy cache settings you require:

<table>
<thead>
<tr>
<th>Entry</th>
<th>Mode</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Safe</td>
<td>The least caching and the most adherence to RFC #2616 compared to the other modes.</td>
</tr>
<tr>
<td>2</td>
<td>Optimized</td>
<td>Moderate caching and moderate adherence to RFC #2616. Compared to safe mode, in optimized mode the Web Proxy caches objects when no caching time is specified when a Last-Modified header is present. The Web Proxy caches negative responses.</td>
</tr>
<tr>
<td>Entry</td>
<td>Mode</td>
<td>Description</td>
</tr>
<tr>
<td>-------</td>
<td>---------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>3</td>
<td>Aggressive</td>
<td>The most caching and the least adherence to RFC #2616. Compared to optimized mode, aggressive mode caches authenticated content, ETag mismatches, and content without a Last-Modified header. The Web Proxy ignores the no-cache parameter.</td>
</tr>
<tr>
<td>4</td>
<td>Customized mode</td>
<td>Configure each parameter individually.</td>
</tr>
</tbody>
</table>

**Step 4**  
If you chose option 4 (Customized mode), enter values (or leave at the default values) for each of the custom settings.

**Step 5**  
Press **Enter** until you return to the main command interface.

**Step 6**  
Commit your changes.

---

**What to do next**

**Related Topics**

- Web Proxy Cache, on page 65.

---

**Web Proxy IP Spoofing**

When the web proxy forwards a request, it changes the request source IP address to match its own address by default. This increases security, but you can change this behavior by implementing IP spoofing, so that requests retain their source address and appear to originate from the source client rather than from the Web Security appliance.

IP spoofing works for transparent and explicitly forwarded traffic. When the Web Proxy is deployed in transparent mode, you have the choice to enable IP spoofing for transparently redirected connections only or for all connections (transparently redirected and explicitly forwarded). If explicitly forwarded connections use IP spoofing, you should ensure that you have appropriate network devices to route return packets back to the Web Security appliance.

When IP spoofing is enabled and the appliance is connected to a WCCP router, you must configure two WCCP services: one based on source ports and one based on destination ports.

**Related Topics**

- Configuring Web Proxy Settings, on page 63
- Configuring WCCP Services, on page 34

---

**Web Proxy Custom Headers**

You can add custom headers to specific outgoing transactions to request special handling from destination servers. For example, if you have a relationship with YouTube for Schools, you can use a custom header to identify transaction requests to YouTube.com as coming from your network and as requiring special handling.

**Adding Custom Headers To Web Requests**

**Step 1**  
Access the CLI.
Step 2  Use the `advancedproxyconfig -> customheaders` commands to access the required submenus:

```
example.com> advancedproxyconfig
Choose a parameter group:
- AUTHENTICATION - Authentication related parameters
- CACHING - Proxy Caching related parameters
- DNS - DNS related parameters
- EUN - EUN related parameters
- NATIVEFTP - Native FTP related parameters
- FTPOVERHTTP - FTP Over HTTP related parameters
- HTTPS - HTTPS related parameters
- SCANNING - Scanning related parameters
- PROXYCONN - Proxy connection header related parameters
- CUSTOMHEADERS - Manage custom request headers for specific domains
- MISCELLANEOUS - Miscellaneous proxy related parameters
- SOCKS - SOCKS Proxy parameters
[]> customheaders
Currently defined custom headers:
Choose the operation you want to perform:
- DELETE - Delete entries
- NEW - Add new entries
- EDIT - Edit entries
[]>
```

Step 3  Enter the required subcommand as follows:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Delete</td>
<td>Deletes the custom header you identify. Identify the header to delete using the number associated with the header in the list returned by the command.</td>
</tr>
<tr>
<td>New</td>
<td>Creates the header you provide for use with the domain or domains you specify. Example header: X-YouTube-Edu-Filter: ABCD1234567890abcdef (The value in this case is a unique key provided by YouTube.) Example domain: youtube.com</td>
</tr>
<tr>
<td>Edit</td>
<td>Replaces an existing header with one you specify. Identify the header to delete using the number associated with the header in the list returned by the command.</td>
</tr>
</tbody>
</table>

Step 4  Press Enter until you return to the main command interface.
Step 5  Commit your changes.

---

# Web Proxy Bypassing

- Web Proxy Bypassing for Web Requests, on page 70
- Configuring Web Proxy Bypassing for Web Requests, on page 70
- Configuring Web Proxy Bypassing for Applications, on page 70
Web Proxy Bypassing for Web Requests

You can configure the Web Security appliance so that transparent requests from particular clients, or to particular destinations, bypass the Web Proxy.

Bypassing the web proxy allows you to:

- Prevent interference with non-HTTP-compliant (or proprietary) protocols that use HTTP ports but do not work properly when they connect to a proxy server.
- Ensure that traffic from a particular machine inside the network, such as a malware test machine, bypasses the Web Proxy and all its built-in security protection.

Bypassing only works for requests that are transparently redirected to the web proxy. The web proxy processes all requests that clients explicitly forward to it, whether the proxy is in transparent or forward mode.

Configuring Web Proxy Bypassing for Web Requests

Step 1 Choose Web Security Manager > Bypass Settings.
Step 2 Click Edit Bypass Settings.
Step 3 Enter the addresses for which you wish to bypass the web proxy.
Step 4 Submit and commit your changes.

Configuring Web Proxy Bypassing for Applications

Step 1 Choose Web Security Manager > Bypass Settings.
Step 2 Click Edit Application Bypass Settings.
Step 3 Select the application(s) you wish to bypass scanning for.
Step 4 Submit and commit your changes.

Web Proxy Usage Agreement

You can configure the Web Security appliance to inform users that it is filtering and monitoring their web activity. The appliance does this by displaying an end-user acknowledgment page when a user first accesses a browser after a certain period of time. When the end-user acknowledgment page appears, users must click a link to access the original site requested or any other website.

Related Topics

- Notify End-Users of Proxy Actions, on page 283

Client Options for Redirecting Web Requests

If you choose to have clients explicitly forward requests to the web proxy, you must also decide how to configure the clients to do this. Choose from the following methods:
Configure Clients Using Explicit Settings. Configure clients with the web proxy hostname and port number. See individual client documentation for details on how to do this.

**Note**
The web proxy port uses port numbers 80 and 3128 by default. Clients can use either port.

Configure Clients Using a Proxy Auto-Config (PAC) File. PAC files provide clients with instructions on where to direct web requests. This option allows you to centrally manage subsequent changes to the proxy details.

If you choose to use PAC files, you must also choose where to store them and how clients will find them.

Related Topics
- Using PAC Files with Client Applications, on page 71

# Using PAC Files with Client Applications

**Options For Publishing Proxy Auto-Config (PAC) Files**

You must publish PAC files where clients can access them. Valid locations are:

- **Web servers.**
- **Web Security appliances.** You can place PAC files on a Web Security appliance, which appears to clients as a web browser. The appliance also offers additional options to manage PAC files, including the ability to service requests that use different hostnames, ports, and file names.
- **Local machines.** You can place the PAC file locally on a client’s hard disk. Cisco does not recommend this as a general solution, and it is not suited to automatic PAC file detection methods, but it can be useful for testing.

Related Topics
- Hosting PAC Files on the Web Security Appliance, on page 72
- Specifying PAC Files in Client Applications, on page 72

**Client Options For Finding Proxy Auto-Config (PAC) Files**

If you choose to use PAC files for your clients, you must also choose how clients will find the PAC files. You have two options:

- **Configure client with the PAC file location.** Configure the client with a URL that specifically points to the PAC file.
- **Configure clients to detect the PAC file location automatically.** Configure clients to find PAC files automatically using the WPAD protocol along with DHCP or DNS.

**Automatic PAC File Detection**

WPAD is a protocol that allows the browser determine the location of a PAC file using DHCP and DNS.

- **To use WPAD with DHCP,** you must set up option 252 on the DHCP server’s with the url of the PAC file location. Not all browsers support DHCP, however.
• **To use WPAD with DNS**, you must configure a DNS record to point to the PAC file’s host server.

You can configure either or both options. WPAD will first try to find PAC files using DHCP, and if it cannot, it will then try DNS.

**Related Topics**

• [Detecting the PAC File Automatically in Clients, on page 73](#)

### Hosting PAC Files on the Web Security Appliance

**Step 1** Choose Security Services > PAC File Hosting

**Step 2** Click Enable and Edit Settings.

**Step 3** (Optional) Complete the following basic settings:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PAC Server Ports</td>
<td>The ports that the Web Security appliance will use to listen for PAC file requests.</td>
</tr>
<tr>
<td>PAC File Expiration</td>
<td>Allows the PAC file to expire after a specified number of minutes in the browser’s cache.</td>
</tr>
</tbody>
</table>

**Step 4** Click Browse in the PAC Files section and select a PAC file from your local machine for upload to the Web Security appliance.

**Note** If the file you select is called `default.pac`, you do not have to specify the file name when configuring its location in a browser. The Web Security appliance looks for a file called `default.pac` if no name is specified.

**Step 5** Click Upload to upload the PAC file selected in step 4 to the Web Security appliance.

**Step 6** (Optional) In the Hostnames for Serving PAC Files Directly section, configure hostnames and associated file names for PAC file requests that do not include a port number:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hostname</td>
<td>The hostname that the PAC file request must include if the Web Security appliance is to service the request. As the request does not include a port number, it will be processed through the Web Proxy HTTP ports (e.g. port 80) and must be distinguishable as a PAC file request through this hostname value.</td>
</tr>
<tr>
<td>Default PAC File for &quot;Get&quot; Request through Proxy Port</td>
<td>The PAC file name that will be associated with the hostname on the same row. Request to the hostname will return the PAC file specified here. Only PAC files that have been uploaded are available for selection.</td>
</tr>
<tr>
<td>Add Row</td>
<td>Adds another row to specify additional hostnames and PAC file names.</td>
</tr>
</tbody>
</table>

**Step 7** Submit and commit your changes.

### Specifying PAC Files in Client Applications

• [Configuring a PAC File Location Manually in Clients, on page 73](#)
**Configuring a PAC File Location Manually in Clients**

**Step 1**  
Create and publish a PAC file.

**Step 2**  
Enter a URL in your browser’s PAC file configuration area that points to the PAC file location.

The following are valid URL formats if the Web Security appliance is hosting the PAC file:

\[
\]

where \textit{WSAHostname} is the \textit{hostname} value configured when hosting the PAC file on a Web Security appliance. Otherwise the URL format will depend on the storage location and, in some cases, on the client.

**What to do next**

- Hosting PAC Files on the Web Security Appliance, on page 72

**Detecting the PAC File Automatically in Clients**

**Step 1**  
Create a PAC file called wpad.dat and publish it to a web server or Web Security appliance (the file must be placed in a web server’s root folder if you intend using WPAD with DNS).

**Step 2**  
Configure the web server to set up .dat files with the following MIME type:

\[ 
application/x-ns-proxy-autoconfig 
\]

\textbf{Note}  
A Web Security appliance does this for you automatically.

**Step 3**  
To support DNS lookup, create an internally resolvable DNS name beginning with ‘wpad’ (for example, wpad.example.com) and associate it with the IP address of the server hosting the wpad.dat file.

**Step 4**  
To support DHCP lookup, configure your DHCP server’s option 252 with the url of the wpad.dat file location (for example: “http://wpad.example.com/wpad.dat”). The URL can use any valid host address, including an IP address, and does not require a specific DNS entry.

**What to do next**

- Hosting PAC Files on the Web Security Appliance, on page 72
- WPAD Not Working With Firefox, on page 437

**FTP Proxy Services**

- Overview of FTP Proxy Services, on page 74
- Enabling and Configuring the FTP Proxy, on page 74
Overview of FTP Proxy Services

The web proxy can intercept two types of FTP requests:

- **Native FTP.** Native FTP requests are generated by dedicated FTP clients (or by browsers using built-in FTP clients). Requires the FTP proxy.
- **FTP over HTTP.** Browsers sometimes encode FTP requests inside HTTP requests, rather than using native FTP. Does not require the FTP proxy.

**Related Topics**

- Enabling and Configuring the FTP Proxy, on page 74
- Configuring FTP Notification Messages, on page 292

Enabling and Configuring the FTP Proxy

To configure proxy settings that apply to FTP over HTTP connections, see **Configuring Web Proxy Settings**, on page 63.

**Step 1** Choose Security Services > FTP Proxy.

**Step 2** Click **Enable and Edit Settings** (if the only available option is **Edit Settings** then the FTP proxy is already enabled).

**Step 3** (Optional) Configure the basic FTP Proxy settings.

### Property | Description
--- | ---
Proxy Listening Port | The port that the FTP Proxy will listen to for FTP control connections. Clients should use this port when configuring an FTP proxy (not as the port for connecting to FTP servers, which normally use port 21).
Caching | Whether of not data connections from anonymous users are cached.
**Note** | Data from non-anonymous users is never cached.
Server Side IP Spoofing | Allows the FTP Proxy to imitate the FTP server’s IP address. This supports FTP clients that do not allow transactions when the IP address is different for the control and data connections.
Authentication Format | Allows a choice of authentication format the FTP Proxy can use when communicating with FTP clients.
Passive Mode Data Port Range | The range of TCP ports that FTP clients should use to establish a data connection with the FTP Proxy for passive mode connections.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Mode Data Port Range</td>
<td>The range of TCP ports FTP servers should use to establish a data connection with the FTP Proxy for active mode connections. This setting applies to both native FTP and FTP over HTTP connections. Increasing the port range accommodates more requests from the same FTP server. Because of the TCP session TIME-WAIT delay (usually a few minutes), a port does not become available again for the same FTP server immediately after being used. As a result, any given FTP server cannot connect to the FTP Proxy in active mode more than ( n ) times in a short period of time, where ( n ) is the number of ports specified in this field.</td>
</tr>
</tbody>
</table>

Welcome Banner | The welcome banner that appears in FTP clients during connection. Choose from:  
- **FTP server message.** The message will be provided by the destination FTP server. This option is only available when the web proxy is configured for transparent mode, and only applies for transparent connections.  
- **Custom message.** When selected, this custom message is displayed for all native FTP connections. When not selected, this is still used for explicit forward native FTP connections. |

---

**Step 4**  
(Optional) Configure the advanced FTP Proxy settings:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
</table>
| Control Connection Timeouts  | The maximum number of seconds the FTP Proxy waits for more communication in the control connection from an idle FTP client or FTP server when the current transaction has not been completed.  
  - **Client side.** The timeout value for control connections to idle FTP clients.  
  - **Server side.** The timeout value for control connections to idle FTP servers. |

Data Connection Timeouts | How long the FTP Proxy waits for more communication in the data connection from an idle FTP client or FTP server when the current transaction has not been completed.  
  - **Client side.** The timeout value for data connections to idle FTP clients.  
  - **Server side.** The timeout value for data connections to idle FTP servers. |

---

**Step 5**  
Submit and commit your changes.

---

**What to do next**

**SOCKS Proxy Services**

- Overview of SOCKS Proxy Services, on page 76  
- Enabling Processing of SOCKS Traffic, on page 76  
- Configuring the SOCKS Proxy, on page 76  
- Creating SOCKS Policies, on page 77
Overview of SOCKS Proxy Services

The Web Security appliance includes a SOCKS proxy to process SOCKS traffic. SOCKS policies are the equivalent of access policies that control SOCKS traffic. Similar to access policies, you can make use of Identification Profiles to specify which transactions are governed by each SOCKS policy. Once SOCKS policies are applied to transactions, routing policies can then govern routing of the traffic.

Note the following regarding the SOCKS proxy:

• The SOCKS protocol only supports direct forward connections.
• The SOCKS proxy does not support (will not forward to) upstream proxies.
• The SOCKS proxy does not support scanning services, which are used by Application Visibility and Control (AVC), Data Loss Prevention (DLP), and malware detection.
• The SOCKS proxy does not support policy tracing.
• The SOCKS proxy does not decrypt SSL traffic; it tunnels from client to server.

Enabling Processing of SOCKS Traffic

Before you begin
Enable the Web Proxy.

Step 1 Choose Security Services > SOCKS Proxy.
Step 2 Click Edit Settings.
Step 3 Select Enable SOCKS Proxy.
Step 4 Submit and Commit Changes.

Configuring the SOCKS Proxy

Step 1 Choose Security Services > SOCKS Proxy.
Step 2 Click Edit Settings.
Step 3 Select Enable SOCKS Proxy.
Step 4 Configure the basic and advanced SOCKS Proxy settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOCKS Proxy</td>
<td>Enabled.</td>
</tr>
<tr>
<td>SOCKS Control Ports</td>
<td>Ports that accept SOCKS requests. Default is 1080.</td>
</tr>
<tr>
<td>UDP Request Ports</td>
<td>UDP ports on which the SOCKS server should listen. Default is 16000-16100.</td>
</tr>
<tr>
<td>Proxy Negotiation</td>
<td>Time to wait (in seconds) to send or receive data from a SOCKS client in the negotiation phase. Default is 60.</td>
</tr>
</tbody>
</table>
Creating SOCKS Policies

**Step 1**  Choose Web Security Manager > SOCKS Policies.

**Step 2**  Click Add Policy.

**Step 3**  Assign a name in the Policy Name field.

- **Note**: Each policy group name must be unique and only contain alphanumeric characters or the space character.

**Step 4**  (Optional) Add a description.

**Step 5**  In the Insert Above Policy field, choose where in the SOCKS policies table to insert this SOCKS policy.

- **Note**: When configuring multiple SOCKS policies, determine a logical order for each policy. Order your policies to ensure that correct matching occurs.

**Step 6**  In the Identities and Users section, choose one or more Identities to apply to this policy group.

**Step 7**  (Optional) Expand the Advanced section to define additional membership requirements.

| Proxy Ports | The port configured in the browser.  
| (Optional) Define policy group membership by the proxy port used to access the Web Proxy. Enter one or more port numbers in the Proxy Ports field. Separate multiple ports with commas.  
| You might want to define policy group membership on the proxy port if you have one set of clients configured to explicitly forward requests on one port, and another set of clients configured to explicitly forward requests on a different port.  
| **Note**: If the Identity associated with this policy group defines Identity membership by this advanced setting, the setting is not configurable at the SOCKS policy group level.  

| Subnets | (Optional) Define policy group membership by subnet or other addresses.  
| You can choose to use the addresses that may be defined with the associated Identity, or you can enter specific addresses here.  
| **Note**: If the Identity associated with this policy group defines its membership by addresses, then in this policy group you must enter addresses that are a subset of the Identity’s addresses. Adding addresses in the policy group further narrows down the list of transactions that match this policy group.  

| Time Range | (Optional) Define policy group membership by time range:  
| 1. Select a time range from the Time Range field.  
| 2. Specify whether this policy group should apply to the times inside or outside the selected time range.  

**Step 8**  Submit and Commit Changes.
What to do next

• (Optional) Add an Identity for use with SOCKS Policies.
• Add one or more SOCKS Policies to manage SOCKS traffic.

Troubleshooting Intercepting Requests

  - Configuring Global Authentication Settings, on page 101

### Step 3
Configure external authentication. You can authenticate users through an external LDAP or RADIUS server.

- **Links to Related Topics and Procedures**
  - External Authentication, on page 90

### Step 4
(Optional) Create and order additional authentication realms. Create at least one authentication realm for each authentication protocol and scheme combination you plan to use.

- **Links to Related Topics and Procedures**
  - Creating Authentication Sequences, on page 107

### Step 5
(Optional) Configure credential encryption.

- **Links to Related Topics and Procedures**
  - Configuring Credential Encryption, on page 116

### Step 6
Create Identification Profiles to classify users and client software based on authentication requirements.

- **Links to Related Topics and Procedures**
  - Classifying Users and Client Software, on page 121

### Step 7
Create policies to manage Web requests from the users and user groups for which you created Identification Profiles.

- **Links to Related Topics and Procedures**
  - Managing Web Requests Through Policies Best Practices, on page 185

### Authentication Best Practices

- Create as few Active Directory realms as is practical. Multiple Active Directory realms require additional memory usage for authentication.
- If using NTLMSSP, authenticate users using either the Web Security appliance or the upstream proxy server, but not both. (Recommend Web Security appliance)
- If using Kerberos, authenticate using the Web Security appliance.
- For optimal performance, authenticate clients on the same subnet using a single realm.
- Some user agents are known to have issues with machine credentials or authentication failures, which can negatively impact normal operations. You should bypass authentication with these user agents. See Bypassing Authentication with Problematic User Agents, on page 109.

### Authentication Planning

- Active Directory/Basic, on page 82
- Active Directory/NTLMSSP, on page 83
- LDAP/Basic, on page 83
- Identifying Users Transparently, on page 84
## Active Directory/Kerberos

### Explicit Forward

<table>
<thead>
<tr>
<th>Advantages:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Better performance and interoperability when compared to NTLM</td>
</tr>
<tr>
<td>- Works with both Windows and non-Windows clients that have joined the domain</td>
</tr>
<tr>
<td>- Supported by all browsers and most other applications</td>
</tr>
<tr>
<td>- RFC-based</td>
</tr>
<tr>
<td>- Minimal overhead</td>
</tr>
<tr>
<td>- Works for HTTPS (CONNECT) requests</td>
</tr>
<tr>
<td>- Because the passphrase is not transmitted to the authentication server, it is more secure</td>
</tr>
<tr>
<td>- Connection is authenticated, not the host or IP address</td>
</tr>
<tr>
<td>- Achieves true single sign-on in an Active Directory environment when the client applications are configured to trust the Web Security appliance</td>
</tr>
</tbody>
</table>

### Transparent, IP-Based Caching

<table>
<thead>
<tr>
<th>Advantages:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Better performance and interoperability when compared to NTLM</td>
</tr>
<tr>
<td>- Works with both Windows and non-Windows clients that have joined the domain</td>
</tr>
<tr>
<td>- Works with all major browsers</td>
</tr>
<tr>
<td>- With user agents that do not support authentication, users only need to authenticate first in a supported browser</td>
</tr>
<tr>
<td>- Relatively low overhead</td>
</tr>
<tr>
<td>- Works for HTTPS requests if the user has previously authenticated with an HTTP request</td>
</tr>
</tbody>
</table>

### Transparent, Cookie-Based Caching

<table>
<thead>
<tr>
<th>Advantages:</th>
</tr>
</thead>
<tbody>
<tr>
<td>- Better performance and interoperability when compared to NTLM</td>
</tr>
<tr>
<td>- Works with both Windows and non-Windows clients that have joined the domain</td>
</tr>
<tr>
<td>- Works with all major browsers</td>
</tr>
<tr>
<td>- Authentication is associated with the user rather than the host or IP address</td>
</tr>
</tbody>
</table>

### Disadvantages:

<p>| |</p>
<table>
<thead>
<tr>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>- Each new web domain requires the entire authentication process because cookies are domain specific</td>
</tr>
<tr>
<td>- Requires cookies to be enabled</td>
</tr>
<tr>
<td>- Does not work for HTTPS requests</td>
</tr>
</tbody>
</table>
# Active Directory/Basic

## Advantages:
- Supported by all browsers and most other applications
- RFC-based
- Minimal overhead
- Works for HTTPS (CONNECT) requests
- Because the passphrase is not transmitted to the authentication server, it is more secure
- Connection is authenticated, not the host or IP address
- Achieves true single sign-on in an Active Directory environment when the client applications are configured to trust the Web Security appliance

## Disadvantages:
- Passphrase sent as clear text (Base64) for every request
- No single sign-on
- Moderate overhead: each new connection needs to be re-authenticated
- Primarily supported on Windows only and with major browsers only

## Advantages:
- Works with all major browsers
- With user agents that do not support authentication, users only need to authenticate first in a supported browser
- Relatively low overhead
- Works for HTTPS requests if the user has previously authenticated with an HTTP request

## Disadvantages:
- Authentication credentials are associated with the IP address, not the user (does not work in Citrix and RDP environments, or if the user changes IP address)
- No single sign-on
- Passphrase is sent as clear text (Base64)

## Advantages:
- Works with all major browsers
- Authentication is associated with the user rather than the host or IP address

## Disadvantages:
- Each new web domain requires the entire authentication process because cookies are domain specific
- Requires cookies to be enabled
- Does not work for HTTPS requests
- No single sign-on
- Passphrase is sent as clear text (Base64)
# Active Directory/NTLMSSP

<table>
<thead>

Identifying Users Transparently

Traditionally, users are identified and authenticated by prompting them to enter a username and passphrase. These credentials are validated against an authentication server, and then the Web Proxy applies the appropriate policies to the transaction based on the authenticated user name.

However, you can configure the Web Security appliance to authenticate users transparently—that is, without prompting the end user for credentials. Transparent identification authenticates the user by means of credentials obtained from another trusted source, with the assumption that the user has already been authenticated by that trusted source, and then applies the appropriate policies.

You might want to identify users transparently to:

- Create a single sign-on environment so users are not aware of the presence of a proxy on the network.
- To apply authentication-based policies to transactions coming from client applications that are incapable of displaying an authentication prompt to end users.

Identifying users transparently only affects how the Web Proxy obtains the user name and assigns an Identification Profile. After it obtains the user name and assigns an Identification Profile, it applies all other policies normally, regardless of how it assigned the Identification Profile.

If transparent authentication fails, you can configure how to handle the transaction: you can grant the user guest access, or you can force an authentication prompt to appear to the user.

When an end user is shown an authentication prompt due to failed transparent user identification, and the user then fails authentication due to invalid credentials, you can choose whether to allow the user guest access.

---

Note

When you enable re-authentication and a transaction is blocked by URL filtering, an end-user notification page appears with the option to log in as a different user. Users who click the link are prompted for authentication. For more information, see Failed Authorization: Allowing Re-Authentication with Different Credentials, on page 112.

Understanding Transparent User Identification

The available methods of transparent user identification are:

- **Transparencyly identify users with ISE** – Available when the Identity Services Engine (ISE) service is enabled (Network > Identity Services Engine). For these transactions, the user name and associated Secure Group Tags will be obtained from an Identity Services Engine server. See Tasks for Certifying and Integrating the ISE Service, on page 137.

- **Transparealty identify users with ASA** – Users are identified by the current IP address-to-user name mapping received from a Cisco Adaptive Security Appliance (for remote users only). This option is available when AnyConnect Secure Mobility is enabled and integrated with an ASA. The user name will be obtained from the ASA, and associated directory groups will be obtained from the authentication realm or sequence specified on the Web Security appliance. See Remote Users, on page 204.

- **Transparealty identify users with authentication realms** – This option is available when one or more authentication realms are configured to support transparent identification using one of the following authentication servers:
  - **Active Directory** – Create an NTLM or Kerberos authentication realm and enable transparent user identification. In addition, you must deploy a separate Active Directory agent such as Cisco’s Context Directory Agent. For more information, see Transparent User Identification with Active Directory, on page 85.
• **LDAP** – Create an LDAP authentication realm configured as an eDirectory, and enable transparent user identification. For more information, see Transparent User Identification with LDAP, on page 86.

AsyncOS for Web communicates at regular intervals with eDirectory or an Active Directory agent to maintain mappings that match authenticated user names to their current IP addresses.

**Transparent User Identification with Active Directory**

Active Directory does not record user log-in information in a format that is easily queried by other systems such as the Web Security appliance. Active Directory agents, such as Cisco’s Context Directory Agent (CDA), are necessary to query the Active Directory security event logs for information about authenticated users.

AsyncOS for Web communicates with the Active Directory agent to maintain a local copy of the IP-address-to-user-name mappings. When AsyncOS for Web needs to associate an IP address with a user name, it first checks its local copy of the mappings. If no match is found, it queries an Active Directory agent to find a match.

For more information on installing and configuring an Active Directory agent, see the section “Setting Up an Active Directory Agent to Provide Information to the Web Security Appliance” below.

Consider the following when you identify users transparently using Active Directory:

• Transparent user identification with Active Directory works with an NTLM or Kerberos authentication scheme only. You cannot use it with an LDAP authentication realm that corresponds to an Active Directory instance.

• Transparent user identification works with the versions of Active Directory supported by an Active Directory agent.

• You can install a second instance of an Active Directory agent on a different machine to achieve high availability. When you do this, each Active Directory agent maintains IP-address-to-user-name mappings independently of the other agent. AsyncOS for Web uses the backup Active Directory agent after three unsuccessful ping attempts to the primary agent.

• The Active Directory agent uses on-demand mode when it communicates with the Web Security appliance.

• The Active Directory agent pushes user log-out information to the Web Security appliance. Occasionally, some user log-out information is not recorded in the Active Directory security logs. This can happen if the client machine crashes, or if the user shuts down the machine without logging out. If there is no user log-out information in the security logs, an Active Directory agent cannot inform the appliance that the IP address no longer is assigned to that user. To obviate this possibility, you can define how long AsyncOS caches the IP-address-to-user mappings when there are no updates from an Active Directory agent. For more information, see Using the CLI to Configure Advanced Transparent User Identification Settings, on page 87.

• The Active Directory agent records the `sAMAccountName` for each user logging in from a particular IP address to ensure the user name is unique.

• The client IP addresses that the client machines present to the Active Directory server and the Web Security appliance must be the same.

• AsyncOS for Web searches only direct parent groups for a user. It does not search nested groups.

**Setting Up an Active Directory Agent to Provide Information to the Web Security Appliance**

Because AsyncOS for Web cannot obtain client IP addresses directly from Active Directory, it must obtain IP-address-to-user-name mapping information from an Active Directory agent.

Install an Active Directory agent on a machine in the network that is accessible to the Web Security appliance, and which can communicate with all visible Windows domain controllers. For best performance, this agent
should be physically as close as possible to the Web Security appliance. In smaller network environments, you may want to install the Active Directory agent directly on the Active Directory server.

**Note**

The Active Directory agent instance used to communicate with the Web Security appliance can also support other appliances, including Cisco’s Adaptive Security Appliance and other Web Security appliances.

**Obtaining, Installing, and Configuring Cisco’s Context Directory Agent**

**Note**

The Web Security appliance and Active Directory agent communicate with each other using the RADIUS protocol. The appliance and the agent must be configured with the same shared secret to obfuscate user passphrases. Other user attributes are not obfuscated.

**Transparent User Identification with LDAP**

AsyncOS for Web can communicate with an eDirectory server configured as a Lightweight Directory Access Protocol (LDAP) realms maintaining IP-address-to-user-name mappings. When a user logs in through an eDirectory client, the user is authenticated against the eDirectory server. When authentication succeeds, the client IP address is recorded in the eDirectory server as an attribute (NetworkAddress) of the user who logged in.

Consider the following when you identify users transparently using LDAP (eDirectory):

- The eDirectory client must be installed on each client workstation, and end users must use it to authenticate against an eDirectory server.
- The LDAP tree used by the eDirectory client log-in must be the same LDAP tree configured in the authentication realm.
- If the eDirectory clients use multiple LDAP trees, create an authentication realm for each tree, and then create an authentication sequence that uses each LDAP authentication realm.
- When you configure the LDAP authentication realm as an eDirectory, you must specify a Bind DN for the query credentials.
- The eDirectory server must be configured to update the NetworkAddress attribute of the user object when a user logs in.
- AsyncOS for Web searches only direct parent groups for a user. It does not search nested groups.
- You can use the NetworkAddress attribute for an eDirectory user to determine the most-recent log-in IP address for the user.

**Rules and Guidelines for Transparent User Identification**

Consider the following rules and guidelines when using transparent user identification with any authentication server:

- When using DHCP to assign IP addresses to client machines, ensure the IP-address-to-user-name mappings are updated on the Web Security appliance more frequently than the DHCP lease. Use the `tuconfig` CLI command to update the mapping update interval. For more information, see [Using the CLI to Configure Advanced Transparent User Identification Settings](#), on page 87.
• If a user logs out of a machine and another user logs into the same machine before the IP-address-to-user-name mapping is updated on the Web Security appliance, then the Web Proxy logs the client as the previous user.

• You can configure how the Web Proxy handles transactions when transparent user identification fails. It can grant users guest access, or it can force an authentication prompt to appear to end users.

• When a user is shown an authentication prompt due to failed transparent user identification, and the user then fails authentication due to invalid credentials, you can choose whether to allow the user guest access.

• When the assigned Identification Profile uses an authentication sequence with multiple realms in which the user exists, AsyncOS for Web fetches the user groups from the realms in the order in which they appear in the sequence.

• When you configure an Identification Profile to transparently identify users, the authentication surrogate must be IP address. You cannot select a different surrogate type.

• When you view detailed transactions for users, the Web Tracking page shows which users were identified transparently.

• You can log which users were identified transparently in the access and WC3 logs using the %m and x-auth-mechanism custom fields. A log entry of SSO_TUI indicates that the user name was obtained by matching the client IP address to an authenticated user name using transparent user identification. (Similarly, a value of SSO_ASA indicates that the user is a remote user and the user name was obtained from a Cisco ASA using AnyConnect Secure Mobility.)

Configuring Transparent User Identification

Configuring transparent user identification and authorization is detailed in Acquire End-User Credentials, on page 79. The basic steps are:

• Create and order authentication realms.

• Create Identification Profiles to classify users and client software.

• Create policies to manage web requests from the identified users and user groups.

Using the CLI to Configure Advanced Transparent User Identification Settings

AsyncOS for Web provides the following TUI-related CLI commands:

• tuiconfig – Configure advanced settings associated with transparent user identification. Batch mode can be used to configure multiple parameters simultaneously.

  • Configure mapping timeout for Active Directory agent – Length of time, in minutes, IP-address-to-user mappings are cached for IP addresses retrieved by the AD agent when there are no updates from the agent.

  • Configure proxy cache timeout for Active Directory agent – Length of time, in seconds, proxy-specific IP-address-to-user mappings are cached; valid values range from five to 1200 seconds. The default and recommended value is 120 seconds. Specifying a lower value may negatively affect proxy performance.

  • Configure mapping timeout for Novell eDirectory – Length of time, in seconds, IP-address to-user mappings are cached for IP addresses retrieved from the eDirectory server when there are no updates from the server.

  • Configure query wait time for Active Directory agent – The length of time, in seconds, to wait for a reply from the Active Directory agent. When the query takes more than this value, transparent user identification is considered to have failed. This limits the authentication delay experienced by the end user.

  • Configure query wait time for Novell eDirectory – The length of time, in seconds, to wait for a reply from the eDirectory server. When the query takes more than this value, transparent user
identification is considered to have failed. This limits the authentication delay experienced by the end user.

The Active Directory settings apply to all AD realms using an AD agent for transparent user identification. The eDirectory settings apply to all LDAP realms using eDirectory for transparent user identification.

If validation fails for any one parameter, none of the values will be changed.

- **tuistatus** – This command provides the following AD-related subcommands:
  - **adagentstatus** – Displays the current status of all AD agents, as well as information about their connections with the Windows domain controllers.
  - **listlocalmappings** – Lists all IP-address-to-user-name mappings stored on the Web Security appliance, as retrieved by the AD agent(s). It does not list entries stored on the agent(s), nor does it list mappings for which queries are currently in progress.

## Configuring Single-Sign-on

Obtaining credentials transparently facilitates a single-sign-on environment. Transparent user identification is an authentication realm setting.

For Internet Explorer, be sure the Redirect Hostname is the short host name (containing no dots) or the NetBIOS name rather than a fully qualified domain. Alternatively, you can add the appliance host name to Internet Explorer’s Local intranet zone (Tools > Internet options > Security tab); however, this will be required on every client. For more information about this, see How do I properly set up NTLM with SSO (credentials sent transparently)?

With Firefox and other non-Microsoft browsers, the parameters `network.negotiate-auth.delegation-uris`, `network.negotiate-auth.trusted-uris` and `network.automatic-ntlm-auth.trusted-uris` must be set to the transparent-mode Redirect Hostname. You also can refer to Firefox is not sending authentication credentials transparently (SSO). This article provides general information about changing Firefox parameters.

For information about the Redirect Hostname, see Configuring Global Authentication Settings, on page 101, or the CLI command `sethostname`.

## Creating a Service Account in Windows Active Directory for Kerberos Authentication in High Availability Deployments

Use this procedure if you are having issues with high availability with Kerberos authentication. Scenarios, where issues may arise when using Kerberos Authentication in High Availability Deployments are:

- The servicePrincipalName of the high availability hostname is added to multiple machine accounts in the Active Directory.

- Kerberos authentication works if the servicePrincipalName has been added to single machine account in the Active Directory. When the master node changes, high availability may be impacted, because different appliance nodes use different encryption strings to decrypt Kerberos service tickets.

## Before you begin

- Choose the user name to be used for high availability with Kerberos authentication. We recommend creating a new user name, which will be used solely for this purpose.

- If you prefer using an existing user name:
• Set a password, if the user name does not have one.

• In the user account properties dialog box (in Active Directory users and computers):
  Ensure that the User must change password at next logon check box is unchecked.
  Check the Password never expires check box.

---

**Step 1**

Create a new user name in Active Directory users and computers.

• Specify a password.

• Uncheck the User must change password at next logon check box.

• Check the Password never expires check box.

**Step 2**

Check if the SPN of the high availability hostname is associated with the Active Directory user object created or chosen. SPN consists of a http/ prefix, and is suffixed with the appliance’s high availability hostname. Ensure that the clients are able to resolve the hostname.

1. Use the `setspn -q` command in Windows, to query for any existing association.
   
   Example: `setspn -q http/highavail.com`

   In this example, `highavail.com` is the appliance’s high availability hostname.

2. Remove, or add the SPN depending on the results of the query:

<table>
<thead>
<tr>
<th>Query Result</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>No such SPN found.</td>
<td>Associate the SPN of the high availability hostname is associated with the Active Directory user object.</td>
</tr>
<tr>
<td></td>
<td>• Use the <code>setspn -s</code> command:</td>
</tr>
<tr>
<td></td>
<td><code>setspn -s http/highavail.com hausername</code></td>
</tr>
<tr>
<td></td>
<td>In this example, <code>highavail.com</code> is the appliance’s high availability hostname, and <code>hausername</code> is the user name created or chosen.</td>
</tr>
<tr>
<td>Existing SPN found!</td>
<td>No further action is necessary in the Active Directory.</td>
</tr>
<tr>
<td>The common name (CN) shows the user name created or chosen. Example: <code>CN = hausername</code></td>
<td></td>
</tr>
</tbody>
</table>
### Query Result

<table>
<thead>
<tr>
<th>Action</th>
</tr>
</thead>
</table>
| **Existing SPN found!**  
The common name (CN) does not show the user name created or chosen. |

---

### Action

1. **Remove the SPN.**  
   Use the `setspn -d` command:  
   ```shell
   setspn -d http/highavail.com johndoe
   ```  
   In this example, `highavail.com` is the appliance's high availability hostname, and `johndoe` is the user name to be disassociated.

2. **Add the SPN.**  
   Use the `setspn -s` command:  
   ```shell
   setspn -s http/highavail.com hausername
   ```  
   In this example, `highavail.com` is the appliance’s high availability hostname, and `hausername` is the user name created or chosen.

---

### Note

Ensure that keytab authentication is enabled in the relevant Active Directory realm. See [Creating an Active Directory Realm for Kerberos Authentication Scheme](#), on page 91. For realms already created, edit the realm, and enable the keytab authentication.

---

### Authentication Realms

Authentication realms define the details required to contact the authentication servers and specify which authentication scheme to use when communicating with clients. AsyncOS supports multiple authentication realms. Realms can also be grouped into authentication sequences that allow users with different authentication requirements to be managed through the same policies.

- External Authentication, on page 90
- Creating an Active Directory Realm for Kerberos Authentication Scheme, on page 91
- How to Create an Active Directory Authentication Realm (NTLMSSP and Basic), on page 95
- Creating an LDAP Authentication Realm, on page 97
- About Deleting Authentication Realms, on page 101
- Configuring Global Authentication Settings, on page 101

#### Related Topics

---

### External Authentication

You can authenticate users through an external LDAP or RADIUS server.
Configuring External Authentication through an LDAP Server

**Before you begin**

Create an LDAP authentication realm and configure it with one or more external authentication queries. Creating an LDAP Authentication Realm, on page 97.

**Step 1**

Enable external authentication on the appliance:

a) Navigate to **System Administration > Users**.
b) Click **Enable** in the External Authentication section.
c) Configure the options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable External Authentication</td>
<td>—</td>
</tr>
<tr>
<td>Authentication Type</td>
<td>Select LDAP.</td>
</tr>
<tr>
<td>External Authentication Cache Timeout</td>
<td>The number of seconds AsyncOS stores the external authentication credentials before contacting the LDAP server again to re-authenticate. Default is zero (0).</td>
</tr>
<tr>
<td>LDAP External Authentication Query</td>
<td>A query configured with the LDAP realm.</td>
</tr>
<tr>
<td>Timeout to wait for valid response from server</td>
<td>The number of seconds AsyncOS waits for a response to the query from the server.</td>
</tr>
<tr>
<td>Group Mapping</td>
<td>For each group name in the directory, assign a role.</td>
</tr>
</tbody>
</table>

**Step 2**

Submit and commit your changes.

Enabling RADIUS External Authentication

See Enabling External Authentication Using RADIUS, on page 395.

Creating an Active Directory Realm for Kerberos Authentication Scheme

**Before you begin**

- Ensure the appliance is configured in Standard mode (not Cloud Connector Mode).

- If you are setting up high availability, ensure that you also enable **Use keytab authentication** check box in the Kerberos High Availability section, specified in **step 9**.

If your appliance resides behind a HTTP/HTTPS traffic distribution device like a load balancer, you should associate the SPN of the traffic distribution device in the Active Directory with a user account, and enter the credentials of that user account in the Kerberos High Availability section. The SPN of the first device that redirects traffic in the network topology should be added. For example, if client devices’ outbound network traffic passes through a traffic manager, a load balancer, and then to the Web Security
appliance, the SPN for the traffic manager should be added to a user account on the Active Directory, and the user credentials should be entered in this section. This is because the traffic manager is the first device that encounters client devices’ traffic.

• Prepare the Active Directory Server.
  • Install Active Directory on one of these servers: Windows server 2003, 2008, 2008R2 or 2012.
  • Create a user on the Active Directory server:
    • Create a user on the Active Directory server that is a member of the Domain Admins or Account Operators group.
    Or
    • Create a user name with the following permissions:
      • Active Directory permissions Reset Password
      • Validated write to servicePrincipalName
      • Write account restrictions
      • Write dNSHostName
      • Write servicePrincipalName
      These are the minimal Active Directory permissions required by a user name to join an appliance to the domain and ensure its complete functioning.

  • Join your client to the domain. Supported clients are Windows XP, Windows 7 and Mac OS 10.5+.
  • Ticket viewer application on Mac clients is available under main menu > KeyChain Access to view the Kerberos tickets.

• Ensure you have the rights and domain information needed to join the Web Security appliance to the Active Directory domain you wish to authenticate against.

• Compare the current time on the Web Security appliance with the current time on the Active Directory server and verify that the difference is no greater than the time specified in the “Maximum tolerance for computer clock synchronization” option on the Active Directory server.

• If the Web Security appliance is managed by a Security Management appliance, be prepared to ensure that same-named authentication realms on different Web Security appliances have identical properties defined on each appliance.

• Web Security appliance configuration:
  • In explicit mode, the WSA host name (CLI command `sethostname`) and the proxy name configured in the browser must be the same.
  • In transparent mode, the WSA host name must be the same as the Redirect Hostname (see Configuring Global Authentication Settings, on page 101). Further, the WSA host name and Redirect Hostname must be configured prior to creating a Kerberos realm.
• Be aware that once you commit the new realm, you cannot change a realm’s authentication protocol.

• Note that single sign on (SSO) must be configured on client browsers; see Configuring Single-Sign-on, on page 88.

• To simplify use of logs, customize the access log to use the %m custom field parameter. See Customizing Access Logs, on page 369.

| Step 1 | In the Cisco Web Security Appliance web interface, choose Network > Authentication. |
| Step 2 | Click Add Realm. |
| Step 3 | Assign a unique name to the authentication realm using only alphanumeric and space characters. |
| Step 4 | Select Active Directory in the Authentication Protocol field. |
| Step 5 | Enter up to three fully-qualified domain names or IP addresses for the Active Directory server(s). Example: ntlm.example.com . An IP address is required only if the DNS servers configured on the appliance cannot resolve the Active Directory server hostname. When multiple authentication servers are configured in the realm, the appliance attempts to authorize with up to three authentication servers before failing to authorize the transaction within this realm. |
| Step 6 | Join the appliance to the domain: |
| a) | Configure the Active Directory Account: |

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Directory Domain</td>
<td>The Active Directory serve3r domain name. Also known as a DNS Domain or realm.</td>
</tr>
<tr>
<td>NetBIOS domain name</td>
<td>If the network uses NetBIOS, provide the domain name.</td>
</tr>
<tr>
<td></td>
<td><strong>Tip</strong> If this option is not available use the <code>setntlmsecuritnymode</code> CLI command to verify that the NTLM security mode is set to “domain.”</td>
</tr>
<tr>
<td>Computer Account</td>
<td>Specify a location within the Active Directory domain where AsyncOS will create an Active Directory computer account, also known as a “machine trust account,” to uniquely identify the computer on the domain.</td>
</tr>
<tr>
<td></td>
<td>If the Active Directory environment automatically deletes computer objects at particular intervals, specify a location for the computer account that is in a container, protected from automatic deletion.</td>
</tr>
</tbody>
</table>

b) Click Join Domain.  

**Note** If you attempt to join a domain you have already joined (even if you use the same credentials), existing connections will be closed, as the Active Directory will send a new set of keys to all clients including this WSA. Affected clients will need to log off and log back in again.

c) Provide login credentials (user name and passphrase) for the account on the Active Directory, and click Create Account. 

Step 7 (Optional) Configure transparent user identification.
Setting | Description
--- | ---
Enable Transparent User Identification using Active Directory agent | Enter both the server name for the machine where the primary Context Directory agent is installed and the shared secret used to access it. (Optional) Enter the server name for the machine where a backup Context Directory agent is installed and its shared secret.

**Step 8**
Configure Network Security:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client Signing Required</td>
<td>Select this option if the Active Directory server is configured to require client signing. With this option selected, AsyncOS uses Transport Layer Security when communicating with the Active Directory server.</td>
</tr>
</tbody>
</table>

**Step 9**
If you will use high availability, check the **Use keytab authentication** check box in the Kerberos High Availability section.

a) Enter the Username and Password.

Enter the username of Active Directory user name associated with SPN(s) corresponding to the IP address or hostname of the high availability cluster. Do not include the domain name with the username (for example, enter ‘johndoe’, rather than ‘DOMAIN\johndoe’, or ‘johndoe@domain’). See Creating a Service Account in Windows Active Directory for Kerberos Authentication in High Availability Deployments, on page 88 for specific information about creating a service account that will be used for authentication in high availability deployments.

b) Repeat this step for all appliances in the high availability cluster.

**Note** If your appliance resides behind a HTTP/HTTPS traffic distribution device like a load balancer, you should associate the SPN of the traffic distribution device in the Active Directory with a user account, and enter the credentials of that user account in the Kerberos High Availability section. The SPN of the first device that redirects traffic in the network topology should be added. For example, if client devices’ outbound network traffic passes through a traffic manager, a load balancer, and then to the Web Security appliance, the SPN for the traffic manager should be added to a user account on the Active Directory, and the user credentials should be entered in this section. This is because the traffic manager is the first device that encounters client devices’ traffic.

**Step 10** (Optional) Click **Start Test**. This will test the settings you have entered, ensuring they are correct before real users use them to authenticate. For details on the testing performed, see Using Multiple NTLM Realms and Domains, on page 101.

**Step 11** Troubleshoot any issues found during testing. See Troubleshooting Tools for Authentication Issues, on page 435.

**Step 12** Submit and commit your changes.

---

**What to do next**
Create an Identification Profile that uses the Kerberos authentication scheme. Classifying Users and Client Software, on page 121.
How to Create an Active Directory Authentication Realm (NTLMSSP and Basic)

Prerequisites for Creating an Active Directory Authentication Realm (NTLMSSP and Basic)

- Ensure you have the rights and domain information needed to join the Web Security appliance to the Active Directory domain you wish to authenticate against.
- If you plan to use “domain” as the NTLM security mode, use only nested Active Directory groups. If Active Directory groups are not nested, use the default value, “ads”. See setntlmsecuritymode in the Command Line Interface appendix of this guide.
- Compare the current time on the Web Security appliance with the current time on the Active Directory server and verify that the difference is no greater than the time specified in the “Maximum tolerance for computer clock synchronization” option on the Active Directory server.
- If the Web Security appliance is managed by a Security Management appliance, be prepared to ensure that same-named authentication realms on different Web Security appliances have identical properties defined on each appliance.
- Be aware that once you commit the new realm, you cannot change a realm’s authentication protocol.
- The WSA needs to connect to the domain controllers for all trusted domains, and to the configured domain controllers into the NTLM realm. For authentication to work correctly, you need to open the following ports to all domain controllers on the internal domain and on the external domain:
  - LDAP (389 UDP and TCP)
  - Microsoft SMB (445 TCP)
  - Kerberos (88 UDP)
  - End-point resolution – port mapper (135 TCP) Net Log-on fixed port
- For NTLMSSP, single sign on (SSO) can be configured on client browsers. See Configuring Single-Sign-on, on page 88.

About Using Multiple NTLM Realms and Domains

The following rules apply in regard to using multiple NTLM realms and domains:

- You can create up to 10 NTLM authentication realms.
- The client IP addresses in one NTLM realm must not overlap with the client IP addresses in another NTLM realm.
- Each NTLM realm can join one Active Directory domain only but can authenticate users from any domains trusted by that domain. This trust applies to other domains in the same forest by default and to domains outside the forest to which at least a one way trust exists.
- Create additional NTLM realms to authenticate users in domains that are not trusted by existing NTLM realms.

Creating an Active Directory Authentication Realm (NTLMSSP and Basic)

Step 1 Choose Network > Authentication.
Step 2 Click Add Realm.
Step 3 Assign a unique name to the authentication realm using only alphanumeric and space characters.
Step 4 Select Active Directory in the Authentication Protocol and Scheme(s) field.
Step 5
Enter up to three fully-qualified domain names or IP addresses for the Active Directory server(s).

Example: active.example.com.

An IP address is required only if the DNS servers configured on the appliance cannot resolve the Active Directory server hostname.

When multiple authentication servers are configured in the realm, the appliance attempts to authorize with up to three authentication servers before failing to authorize the transaction within this realm.

Step 6
Join the appliance to the domain:

a) Configure the Active Directory Account:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active Directory Domain</td>
<td>The Active Directory server domain name. Also known as a DNS Domain or realm.</td>
</tr>
<tr>
<td>NetBIOS domain name</td>
<td>If the network uses NetBIOS, provide the domain name.</td>
</tr>
<tr>
<td>Computer Account</td>
<td>Specify a location within the Active Directory domain where AsyncOS will create an Active Directory computer account, also known as a “machine trust account”, to uniquely identify the computer on the domain. If the Active Directory environment automatically deletes computer objects at particular intervals, specify a location for the computer account that is in a container, protected from automatic deletion.</td>
</tr>
</tbody>
</table>

b) Click Join Domain.

Note If you attempt to join a domain you have already joined (even if you use the same credentials), existing connections will be closed, as the Active Directory will send a new set of keys to all clients including this WSA. Affected clients will need to log off and log back in again.

c) Enter the sAMAccountName user name and passphrase for an existing Active Directory user that has rights to create computer accounts in the domain.

Example: “jazzdoe” Do not use: “DOMAIN\jazzdoe” or “jazzdoe@domain”

This information is used once to establish the computer account and is not saved.

d) Click Create Account.

Step 7
(Optional) Configure transparent authentication.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Transparent User Identification using Active Directory agent</td>
<td>Enter both the server name for the machine where the primary Context Directory agent is installed and the shared secret used to access it. (Optional) Enter the server name for the machine where a backup Context Directory agent is installed and its shared secret.</td>
</tr>
</tbody>
</table>

Step 8
Configure Network Security:
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Client Signing Required | Select this option if the Active Directory server is configured to require client signing.  
With this option selected, AsyncOS uses Transport Layer Security when communicating with the Active Directory server. |

**Step 9**  
(Optional) Click **Start Test**. This will test the settings you have entered, ensuring they are correct before real users use them to authenticate.

**Step 10**  
Submit and commit your changes.

## Creating an LDAP Authentication Realm

**Before you begin**

- Obtain the following information about LDAP in your organization:
  - LDAP version
  - Server addresses
  - LDAP ports

- If the Web Security appliance is managed by a Security Management appliance, ensure that same-named authentication realms on different Web Security appliances have identical properties defined on each appliance.

**Step 1**  
Choose **Network > Authentication**.

**Step 2**  
Click **Add Realm**.

**Step 3**  
Assign a unique name to the authentication realm using only alphanumeric and space characters.

**Step 4**  
Select **LDAP** in the Authentication Protocol and Scheme(s) field.

**Step 5**  
Enter the LDAP authentication settings:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| LDAP Version | Choose the version of LDAP, and choose whether or not to use Secure LDAP.  
The appliance supports LDAP versions 2 and 3. Secure LDAP requires LDAP version 3.  
Choose whether or not this LDAP server supports Novell eDirectory to use with transparent user identification. |
### Setting | Description
---|---
**LDAP Server** | Enter the LDAP server IP address or hostname and its port number. You can specify up to three servers.

The hostname must be a fully-qualified domain name. For example, ldap.example.com. An IP address is required only if the DNS servers configured on the appliance cannot resolve the LDAP server hostname.

The default port number for Standard LDAP is 389. The default number for Secure LDAP is 636.

If the LDAP server is an Active Directory server, enter the hostname or IP address and the port of the domain controller here. Whenever possible, enter the name of the Global Catalog Server and use port 3268. However, you might want to use a local domain controller when the global catalog server is physically far away and you know you only need to authenticate users on the local domain controller.

**Note:** When you configure multiple authentication servers in the realm, the appliance attempts to authorize with up to three authentication servers before failing to authenticate the transaction within that realm.

**LDAP Persistent Connections (under the Advanced section)** | Choose one of the following values:
- **Use persistent connections (unlimited).** Use existing connections. If no connections are available a new connection is opened.
- **Use persistent connections.** Use existing connections to service the number of requests specified. When the maximum is reached, establish a new connection to the LDAP server.
- **Do not use persistent connections.** Always create a new connection to the LDAP server.

**User Authentication** | Enter values for the following fields:

**Base Distinguished Name (Base DN)**

The LDAP database is a tree-type directory structure and the appliance uses the Base DN to navigate to the correct location in the LDAP directory tree to begin a search. A valid Base DN filter string is composed of one or more components of the form object-value. For example `dc=companyname, dc=com`.

**User Name Attribute**

Choose one of the following values:
- **uid, cn, and sAMAccountName.** Unique identifiers in the LDAP directory that specify a username.
- **custom.** A custom identifier such as `UserAccount`.

**User Filter Query**

The User Filter Query is an LDAP search filter that locates the users Base DN. This is required if the user directory is in a hierarchy below the Base DN, or if the login name is not included in the user-specific component of that users Base DN.

Choose one of the following values:
- **none.** Filters any user.
- **custom.** Filters a particular group of users.
**Query Credentials**

Choose whether or not the authentication server accepts anonymous queries.

If the authentication server does accept anonymous queries, choose **Server Accepts Anonymous Queries**.

If the authentication server does not accept anonymous queries, choose **Use Bind DN** and then enter the following information:

- **Bind DN.** The user on the external LDAP server permitted to search the LDAP directory. Typically, the bind DN should be permitted to search the entire directory.
- **Passphrase.** The passphrase associated with the user you enter in the Bind DN field.

The following text lists some example users for the Bind DN field:

- `cn=administrator,cn=Users,dc=domain,dc=com`
- `sAMAccountName=jdoe,cn=Users,dc=domain,dc=com`

If the LDAP server is an Active Directory server, you may also enter the Bind DN username as “DOMAIN\username.”

---

**Step 6** (Optional) Enable Group Authorization via group object or user object and complete the settings for the chosen option accordingly:

<table>
<thead>
<tr>
<th>Group Object Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Group Membership Attribute Within Group Object** | Choose the LDAP attribute which lists all users that belong to this group. Choose one of the following values:
- **member** and **uniquemember.** Unique identifiers in the LDAP directory that specify group members.
- **custom.** A custom identifier such as `UserInGroup`. |
| **Attribute that Contains the Group Name** | Choose the LDAP attribute which specifies the group name that can be used in the policy group configuration. Choose one of the following values:
- **cn.** A unique identifier in the LDAP directory that specifies the name of a group.
- **custom.** A custom identifier such as `FinanceGroup`. |
| **Query String to Determine if Object is a Group** | Choose an LDAP search filter that determines if an LDAP object represents a user group. Choose one of the following values:
- **objectclass=groupofnames**
- **objectclass=groupofuniquenames**
- **objectclass=group**
- **custom.** A custom filter such as `objectclass=person`. |

**Note:** The query defines the set of authentication groups which can be used in policy groups.
<table>
<thead>
<tr>
<th>User Object Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Group Membership Attribute Within User Object | Choose the attribute which list all the groups that this user belongs to. Choose one of the following values:  
  - memberOf. Unique identifiers in the LDAP directory that specify user members.  
  - custom. A custom identifier such as UserInGroup. |
| Group Membership Attribute is a DN    | Specify whether the group membership attribute is a distinguished name (DN) which refers to an LDAP object. For Active Directory servers, enable this option. When this is enabled, you must configure the subsequent settings. |
| Attribute that Contains the Group Name | When the group membership attribute is a DN, this specifies the attribute that can be used as group name in policy group configurations. Choose one of the following values:  
  - cn. A unique identifier in the LDAP directory that specifies the name of a group.  
  - custom. A custom identifier such as FinanceGroup. |
| Query String to Determine if Object is a Group | Choose an LDAP search filter that determines if an LDAP object represents a user group. Choose one of the following values:  
  - objectClass=groupofnames  
  - objectClass=groupofuniquenames  
  - objectClass=group  
  - custom. A custom filter such as objectClass=person. Note: The query defines the set of authentication groups which can be used in Web Security Manager policies. |

**Step 7**  
(Optional) Configure external LDAP authentication for users.  
a) Select **External Authentication Queries**.  
b) Identify the user accounts:.  

<table>
<thead>
<tr>
<th>Base DN</th>
<th>The Base DN to navigate to the correct location in the LDAP directory tree to begin a search.</th>
</tr>
</thead>
</table>
| Query String | The query to return the set of authentication groups, for example:  
  (+objectClass=posixAccount){uid={u}}  
  or  
  (+objectClass=user){sAMAccountName={u}} |
| Attribute containing the user’s full name | The LDAP attribute, for example, displayName or gecos. |

c) (Optional) Deny login to expired accounts based on RFC 2307 account expiration LDAP attributes.  
d) Provide a query to retrieve group information for users.  

If a user belongs to multiple LDAP groups with different user roles, AsyncOS grants the user the permissions for the most restrictive role.
The Base DN to navigate to the correct location in the LDAP directory tree to begin a search.

<table>
<thead>
<tr>
<th>Base DN</th>
<th>The Base DN to navigate to the correct location in the LDAP directory tree to begin a search.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query String</td>
<td>(&amp;(objectClass=posixAccount){uid={u}})</td>
</tr>
<tr>
<td>Attribute containing the user’s full name</td>
<td>gecos</td>
</tr>
</tbody>
</table>

Step 8  
(Optional) Click **Start Test**. This will test the settings you have entered, ensuring they are correct before real users use them to authenticate. For details on the testing performed, see Using Multiple NTLM Realms and Domains, on page 101.

**Note**  
Once you submit and commit your changes, you cannot later change a realm’s authentication protocol.

Step 9  
Submit and commit your changes.

---

**What to do next**

Create an Identification Profile that uses the Kerberos authentication scheme. See Classifying Users and Client Software, on page 121.

**Related Topics**

- External Authentication, on page 90

**Using Multiple NTLM Realms and Domains**

The following rules apply in regard to using multiple NTLM realms and domains:

- You can create up to 10 NTLM authentication realms.
- The client IP addresses in one NTLM realm must not overlap with the client IP addresses in another NTLM realm.
- Each NTLM realm can join one Active Directory domain only but can authenticate users from any domains trusted by that domain. This trust applies to other domains in the same forest by default and to domains outside the forest to which at least a one way trust exists.
- Create additional NTLM realms to authenticate users in domains that are not trusted by existing NTLM realms.

---

**About Deleting Authentication Realms**

Deleting an authentication realm disables associated identities, which in turn removes those identities from associated policies.

Deleting an authentication realm removes it from sequences.

---

**Configuring Global Authentication Settings**

Configure Global Authentication Settings to apply settings to all authentication realms, independent of their authentication protocols.

The Web Proxy deployment mode affects which global authentication settings you can configure. More settings are available when it is deployed in transparent mode than in explicit forward mode.
Before you begin

- Be familiar with the following concepts:
  - Failed Authentication, on page 108
  - Failed Authorization: Allowing Re-Authentication with Different Credentials, on page 112

---

Step 1
Choose Network > Authentication

Step 2
Click Edit Global Settings.

Step 3
Edit the settings in the Global Authentication Settings section:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Action if Authentication Service Unavailable</td>
<td>Choose one of the following values:</td>
</tr>
<tr>
<td></td>
<td>• <strong>Permit traffic to proceed without authentication.</strong> Processing continues as if the user was authenticated.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Block all traffic if user authentication fails.</strong> Processing is discontinued and all traffic is blocked.</td>
</tr>
<tr>
<td>Failed Authentication Handling</td>
<td>When you grant users guest access in an Identification Profile policy, this setting determines how the Web Proxy identifies and logs the user as a guest in the access logs.</td>
</tr>
<tr>
<td></td>
<td>For more information on granting users guest access, see Granting Guest Access After Failed Authentication, on page 111.</td>
</tr>
<tr>
<td>Re-authentication (Enable Re-Authentication Prompt If End User Blocked by URL Category or User Session Restriction)</td>
<td>This setting allows users to authenticate again if the user is blocked from a website due to a restrictive URL filtering policy or due to being restricted from logging into another IP address.</td>
</tr>
<tr>
<td></td>
<td>The user sees a block page that includes a link that allows them to enter new authentication credentials. If the user enters credentials that allow greater access, the requested page appears in the browser.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This setting only applies to authenticated users who are blocked due to restrictive URL filtering policies or User Session Restrictions. It does not apply to blocked transactions by subnet with no authentication.</td>
</tr>
<tr>
<td></td>
<td>For more information, see Failed Authorization: Allowing Re-Authentication with Different Credentials, on page 112.</td>
</tr>
<tr>
<td>Basic Authentication Token TTL</td>
<td>Controls the length of time that user credentials are stored in the cache before revalidating them with the authentication server. This includes the username and passphrase and the directory groups associated with the user.</td>
</tr>
<tr>
<td></td>
<td>The default value is the recommended setting. When the Surrogate Timeout setting is configured and is greater than the Basic Authentication Token TTL, then the Surrogate Timeout value takes precedence and the Web Proxy contacts the authentication server after surrogate timeout expires.</td>
</tr>
</tbody>
</table>

The remaining authentication settings you can configure depends on how the Web Proxy is deployed, in transparent or explicit forward mode.
### Step 4

If the Web Proxy is deployed in transparent mode, edit the settings as follows:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential Encryption</td>
<td>This setting specifies whether or not the client sends the login credentials to the Web Proxy through an encrypted HTTPS connection. This setting applies to both Basic and NTLMSSP authentication schemes, but it is particularly useful for Basic authentication scheme because user credentials are sent as plain text. For more information, see Failed Authentication, on page 108.</td>
</tr>
<tr>
<td>HTTPS Redirect Port</td>
<td>Specify a TCP port to use for redirecting requests for authenticating users over an HTTPS connection. This specifies through which port the client will open a connection to the Web Proxy using HTTPS. This occurs when credential encryption is enabled or when using Access Control and users are prompted to authenticate.</td>
</tr>
</tbody>
</table>
| Redirect Hostname        | Enter the short hostname of the network interface on which the Web Proxy listens for incoming connections. When you configure authentication on an appliance deployed in transparent mode, the Web Proxy uses this hostname in the redirection URL sent to clients for authenticating users. You can enter either of the following values:  
  - **Single word hostname.** You can enter the single word hostname that is DNS resolvable by the client and the Web Security appliance. This allows clients to achieve true single sign-on with Internet Explorer without additional browser side setup. Be sure to enter the single word hostname that is DNS resolvable by the client and the Web Security appliance. For example, if your clients are in domain mycompany.com and the interface on which the Web Proxy is listening has a full hostname of **proxy.mycompany.com**, then you should enter **proxy** in this field. Clients perform a lookup on proxy and they should be able to resolve **proxy.mycompany.com**.  
  - **Fully qualified domain name (FQDN).** You can also enter the FQDN or IP address in this field. However, if you do that and want true single sign-on for Internet Explorer and Firefox browsers, you must ensure that the FQDN or IP address is added to the client’s Trusted Sites list in the client browsers. The default value is the FQDN of the M1 or P1 interface, depending on which interface is used for proxy traffic.                                                                                           |
| Credential Cache Options: Surrogate Timeout | This setting specifies how long the Web Proxy waits before asking the client for authentication credentials again. Until the Web Proxy asks for credentials again, it uses the value stored in the surrogate (IP address or cookie). It is common for user agents, such as browsers, to cache the authentication credentials so the user will not be prompted to enter credentials each time. |
### Configuring Global Authentication Settings

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential Cache Options:</td>
<td></td>
</tr>
<tr>
<td>Client IP Idle Timeout</td>
<td>When IP address is used as the authentication surrogate, this setting specifies how long the Web Proxy waits before asking the client for authentication credentials again when the client has been idle. You might want to use this setting to reduce the vulnerability of users who leave their computers. When this value is greater than the Surrogate Timeout value, this setting has no effect and clients are prompted for authentication after the Surrogate Timeout is reached.</td>
</tr>
<tr>
<td>Credential Cache Options:</td>
<td>Specifies the number of entries that are stored in the authentication cache. Set this value to safely accommodate the number of users that are actually using this device. The default value is the recommended setting.</td>
</tr>
<tr>
<td>Cache Size</td>
<td></td>
</tr>
<tr>
<td>User Session Restrictions</td>
<td>This setting specifies whether or not authenticated users are allowed to access the Internet from multiple IP addresses simultaneously. You might want to restrict access to one machine to prevent users from sharing their authentication credentials with non-authorized users. When a user is prevented from logging in at a different machine, an end-user notification page appears. You can choose whether or not users can click a button to login as a different username using the Re-authentication setting on this page. When you enable this setting, enter the restriction timeout value, which determines how long users must wait before being able to log into a machine with a different IP address. The restriction timeout value must be greater than the surrogate timeout value. You can remove a specific user or all users from the authentication cache using the authcache CLI command.</td>
</tr>
<tr>
<td>Advanced</td>
<td>When using Credential Encryption or Access Control, you can choose whether the appliance uses the digital certificate and key shipped with the appliance (the Cisco Web Security Appliance Demo Certificate) or a digital certificate and key you upload here.</td>
</tr>
</tbody>
</table>

### Step 5

If the Web Proxy is deployed in explicit forward mode, edit the settings as follows:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credential Encryption</td>
<td>This setting specifies whether or not the client sends the login credentials to the Web Proxy through an encrypted HTTPS connection. To enable credential encryption, choose “HTTPS Redirect (Secure)”. When you enable credential encryption, additional fields appear to configure how to redirect clients to the Web Proxy for authentication. This setting applies to both Basic and NTLMSSP authentication schemes, but it is particularly useful for Basic authentication scheme because user credentials are sent as plain text. For more information, see Failed Authentication, on page 108.</td>
</tr>
</tbody>
</table>
### Setting | Description
---|---
**HTTPS Redirect Port** | Specify a TCP port to use for redirecting requests for authenticating users over an HTTPS connection.

This specifies through which port the client will open a connection to the Web Proxy using HTTPS. This occurs when credential encryption is enabled or when using Access Control and users are prompted to authenticate.

**Redirect Hostname** | Enter the short host name of the network interface on which the Web Proxy listens for incoming connections.

When you enable Authentication Mode above, the Web Proxy uses this hostname in the redirection URL sent to clients for authenticating users.

You can enter either the following values:

* **Single word hostname.** You can enter the single word host name that is DNS resolvable by the client and the Web Security appliance. This allows clients to achieve true single sign-on with Internet Explorer without additional browser side setup. Be sure to enter the single word host name that is DNS resolvable by the client and the Web Security appliance. For example, if your clients are in domain mycompany.com and the interface on which the Web Proxy is listening has a full host name of proxy.mycompany.com, then you should enter proxy in this field. Clients perform a lookup on proxy and they should be able to resolve proxy.mycompany.com.

* **Fully qualified domain name (FQDN).** You can also enter the FQDN or IP address in this field. However, if you do that and want true single sign-on for Internet Explorer and Firefox browsers, you must ensure that the FQDN or IP address is added to the client’s Trusted Sites list in the client browsers. The default value is the FQDN of the M1 or P1 interface, depending on which interface is used for proxy traffic.

**Credential Cache Options:**<br>**Surrogate Timeout** | This setting specifies how long the Web Proxy waits before asking the client for authentication credentials again. Until the Web Proxy asks for credentials again, it uses the value stored in the surrogate (IP address or cookie).

Note that it is common for user agents, such as browsers, to cache the authentication credentials so the user will not be prompted to enter credentials each time.

**Credential Cache Options:**<br>**Client IP Idle Timeout** | When IP address is used as the authentication surrogate, this setting specifies how long the Web Proxy waits before asking the client for authentication credentials again when the client has been idle.

When this value is greater than the Surrogate Timeout value, this setting has no effect and clients are prompted for authentication after the Surrogate Timeout is reached.

You might want to use this setting to reduce the vulnerability of users who leave their computers.
### Setting Cache Size

Specifies the number of entries that are stored in the authentication cache. Set this value to safely accommodate the number of users that are actually using this device. The default value is the recommended setting.

### User Session Restrictions

This setting specifies whether or not authenticated users are allowed to access the Internet from multiple IP addresses simultaneously.

You might want to restrict access to one machine to prevent users from sharing their authentication credentials with non-authorized users. When a user is prevented from logging at a different machine, an end-user notification page appears. You can choose whether or not users can click a button to login as a different username using the Re-authentication setting on this page.

When you enable this setting, enter the restriction timeout value, which determines how long users must wait before being able to log into a machine with a different IP address. The restriction timeout value must be greater than the surrogate timeout value.

You can remove a specific user or all users from the authentication cache using the `authcache` CLI command.

### Advanced

When using Credential Encryption or Access Control, you can choose whether the appliance uses the digital certificate and key shipped with the appliance (the Cisco Web Security Appliance Demo Certificate) or a digital certificate and key you upload here.

To upload a digital certificate and key, click **Browse** and navigate to the necessary file on your local machine. Then click **Upload Files** after you select the files you want.

---

### Step 6
Submit and commit your changes.

---

### Authentication Sequences

- About Authentication Sequences, on page 106
- Creating Authentication Sequences, on page 107
- Editing And Reordering Authentication Sequences, on page 108
- Deleting Authentication Sequences, on page 108

---

### About Authentication Sequences

Use authentication sequences to allow single Identities to authenticate users via different authentication servers or protocols. Authentication sequences are also useful for providing backup options in case primary authentication options become unavailable.

Authentication sequences are collections of two or more authentication realms. The realms used can have different authentication servers and different authentication protocols. For more information on authentication realms, see Authentication Realms, on page 90.
After you create a second authentication realm, the appliance automatically displays a Realm Sequences section under Network > Authentication and includes a default authentication sequence named All Realms. The All Realms sequence automatically includes each realm you define. You can change the order of the realms within the All Realms sequence, but you cannot delete the All Realms sequence or remove any realms from it.

When multiple NTLM authentication realms are defined, the Web Security appliance uses the NTLMSSP authentication scheme with only one NTLM authentication realm per sequence. You can choose which NTLM authentication realm to use for NTLMSSP within each sequence, including the All Realms sequence. To use NTLMSSP with multiple NTLM realms, define a separate Identification Profile for each realm.

Which authentication realms within a sequence get used during authentication depends on:

- The authentication scheme used. This is generally dictated by the type of credentials entered at the client.
- The order in which realms are listed within the sequence (for Basic realms only, as only one NTLMSSP realm is possible).

For optimal performance, authenticate clients on the same subnet using a single realm.

Creating Authentication Sequences

Before you begin

- Create two or more authentication realms (see Authentication Realms, on page 90).
- If the Web Security appliance is managed by a Security Management appliance, ensure that same-named authentication realms on different Web Security appliances have identical properties defined on each appliance.
- Be aware that AsyncOS will use the realms to process authentication sequentially, beginning with the first realm in the list.

Step 1  Choose Network > Authentication
Step 2  Click Add Sequence.
Step 3  Enter a unique name for the sequence using alphanumeric and space characters.
Step 4  In the first row of the Realm Sequence for Basic Scheme area, choose the first authentication realm you want to include in the sequence.
Step 5  In the second row of the Realm Sequence for Basic Scheme area, choose the next realm you want to include in the sequence.
Step 6  (Optional) Click Add Row to include another realm that uses Basic credentials.
Step 7  If an NTLM realm is defined, choose an NTLM realm in the Realm for NTLMSSP Scheme field. The Web Proxy uses this NTLM realm when the client sends NTLMSSP authentication credentials.
Step 8  Submit and commit your changes.
Editing And Reordering Authentication Sequences

Step 1
Choose Network > Authentication.

Step 2
Click the name of the sequence you wish to edit or re-order.

Step 3
Choose a realm name from the Realms drop-down list on the row corresponding to the position number you want the realm to occupy in the sequence.

Note For the All Realms sequence, you can only change the order of its realms, you cannot change the realms themselves. To change the order of realms in the All Realms sequence, click the arrows in the Order column to reposition the corresponding realms.

Step 4
Repeat Step 3 until all realms are listed and ordered as required, ensuring that each realm name appears in one row only.

Step 5
Submit and commit your changes.

Deleting Authentication Sequences

Before you begin
Be aware that deleting an authentication sequence also disables associated identities, which in turn removes those identities from associated policies.

Step 1
Choose Network > Authentication.

Step 2
Click the trash can icon for the sequence name.

Step 3
Click Delete to confirm that you want to delete the sequence.

Step 4
Commit your changes.

Failed Authentication

- About Failed Authentication, on page 108
- Bypassing Authentication with Problematic User Agents, on page 109
- Bypassing Authentication, on page 110
- Permitting Unauthenticated Traffic While Authentication Service is Unavailable, on page 111
- Granting Guest Access After Failed Authentication, on page 111
- Failed Authorization: Allowing Re-Authentication with Different Credentials, on page 112

About Failed Authentication

Users may be blocked from the web due to authentication failure for the following reasons:

- **Client/user agent limitations.** Some client applications may not properly support authentication. You can bypass authentication for these clients by configuring Identification Profiles that do not require authorization and basing their criteria on the clients (and, optionally, on the URLs they need to access).
• **Authentication service is unavailable.** An authentication service might be unavailable due to network or server issues. You can choose to allow unauthenticated traffic in this circumstance.

• **Invalid credentials.** Some users may be unable to supply valid credentials for proper authentication (for example, visitors or users awaiting credentials). You can choose to grant these users limited access to the web.

**Related Topics**

- Bypassing Authentication with Problematic User Agents, on page 109
- Bypassing Authentication, on page 110
- Permitting Unauthenticated Traffic While Authentication Service is Unavailable, on page 111
- Granting Guest Access After Failed Authentication, on page 111

**Bypassing Authentication with Problematic User Agents**

Some user agents are known to have authentication issues that can impact normal operations.

You should bypass authentication via the following user agents:

- Windows-Update-Agent
- MICROSOFT_DEVICE_METADATA_RETRIEVAL_CLIENT
- Microsoft BITS
- SLSSoapClient
- Akamai NetSession Interface
- Microsoft-CryptoAPI
- NCSI
- MSDW
- Gnotify
- msde
- Google Update

**Note**

The access policies will still filter (based on URL categories) and scan (McAfee, Webroot) traffic as per the access policy setup.

**Step 1**

Configure the Identification Profile to bypass authentication with the specified user agents:

a) Select **Web Security Manager > Identification Profile**.

b) Click **Add Identification Profile**.

c) Enter information:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>User Agent AuthExempt Identification Profile</td>
</tr>
<tr>
<td>Insert Above</td>
<td>Set to the first profile in the processing order</td>
</tr>
<tr>
<td>Define Members by Subnet</td>
<td>Leave blank.</td>
</tr>
<tr>
<td>Option</td>
<td>Value</td>
</tr>
<tr>
<td>------------------------------------</td>
<td>------------------------------------------------</td>
</tr>
<tr>
<td>Define Members by Authentication</td>
<td>No Authentication Required.</td>
</tr>
</tbody>
</table>

d) Click **Advanced > User Agents**.
e) Click **None Selected**.
f) Under Custom user Agents, specify the problematic User Agent strings.

**Step 2** Configure the Access Policy:

a) Choose **Web Security Manager > Access Policies**.
b) Click **Add Policy**.
c) Enter information:

<table>
<thead>
<tr>
<th>Option</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Policy Name</td>
<td>Auth Exemption for User Agents</td>
</tr>
<tr>
<td>Insert Above Policy</td>
<td>Set to the first policy in the processing order.</td>
</tr>
<tr>
<td>Identification Profile Policy</td>
<td>User Agent AuthExempt Identification Profile</td>
</tr>
<tr>
<td>Advanced</td>
<td>None</td>
</tr>
</tbody>
</table>

**Step 3** Submit and commit your changes.

**Bypassing Authentication**

<table>
<thead>
<tr>
<th>Step</th>
<th>More Information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a custom URL category that contains the affected websites by configuring the Advanced properties.</td>
</tr>
<tr>
<td>2</td>
<td>Create an Identification Profile with these characteristics:</td>
</tr>
<tr>
<td></td>
<td>• Placed above all identities that require authentication.</td>
</tr>
<tr>
<td></td>
<td>• Includes the custom URL category.</td>
</tr>
<tr>
<td></td>
<td>• Includes affected client applications.</td>
</tr>
<tr>
<td></td>
<td>• Does not require authentication</td>
</tr>
<tr>
<td>3</td>
<td>Create a policy for the Identification Profile.</td>

**Related Topics**

- Bypassing the Web Proxy
Permitting Unauthenticated Traffic While Authentication Service is Unavailable

This configuration applies only when an authentication service is unavailable. It will not bypass authentication permanently. For alternative options, see About Failed Authentication, on page 108

Step 1 Choose Network > Authentication.
Step 2 Click Edit Global Settings.
Step 3 Click the Permit Traffic To Proceed Without Authentication in the Action If Authentication Service Unavailable field.
Step 4 Submit and commit your changes.

Granting Guest Access After Failed Authentication

Granting guest access requires that the following procedures are completed:

1. Define an Identification Profile that Supports Guest Access, on page 111
2. Use an Identification Profile that Supports Guest Access in a Policy, on page 111
3. (Optional) Configure How Guest User Details are Logged, on page 112

Note
If an Identification Profile allows guest access and there is no user-defined policy that uses that Identification Profile, users who fail authentication match the global policy of the applicable policy type. For example, if MyIdentificationProfile allows guest access and there is no user-defined Access Policy that uses MyIdentificationProfile, users who fail authentication match the global Access Policy. If you do not want guest users to match a global policy, create a policy above the global policy that applies to guest users and blocks all access.

Define an Identification Profile that Supports Guest Access

Step 1 Choose Web Security Manager > Identification Profiles.
Step 2 Click Add Identification Profile to add a new identity, or click the name of an existing identity that you wish to use.
Step 3 Check the Support Guest Privileges check box.
Step 4 Submit and commit your changes.

Use an Identification Profile that Supports Guest Access in a Policy

Step 1 Choose a policy type from the Web Security Manager menu.
Step 2 Click a policy name in the policies table.
**Configure How Guest User Details are Logged**

**Step 3** Choose **Select One Or More Identification Profiles** from the Identification Profiles And Users drop-down list (if not already chosen).

**Step 4** Choose a **profile** that supports guest access from the drop-down list in the Identification Profile column.

**Step 5** Click the **Guests (Users Failing Authentication)** radio button.

**Note** If this option is not available it means the **profile** you chose is not configured to support guest access. Return to step 4 and choose another, or see **Define an Identification Profile that Supports Guest Access**, on page 111 to define a new one.

**Step 6** Submit and commit your changes.

---

**Failed Authorization: Allowing Re-Authentication with Different Credentials**

- **About Allowing Re-Authentication with Different Credentials**, on page 112
- **Allowing Re-Authentication with Different Credentials**, on page 113

**About Allowing Re-Authentication with Different Credentials**

Use re-authentication to allow users the opportunity to authenticate again, using different credentials, if the credentials they previously used have failed authorization. A user may authenticate successfully but still be prevented from accessing a web resource if not authorized to do so. This is because authentication merely identifies users for the purpose of passing their verified credentials on to policies, but it is the policies that authorize those users (or not) to access resources.

A user must have authenticated successfully to be allowed to re-authenticate.

- To use the re-authentication feature with user defined end-user notification pages, the CGI script that parses the redirect URL must parse and use the Reauth_URL parameter.
Allowing Re-Authentication with Different Credentials

**Step 1** Choose Network > Authentication.
**Step 2** Click Edit Global Settings.
**Step 3** Check the Re-Authentication Prompt If End User Blocked by URL Category Or User Session Restriction check box.
**Step 4** Click Submit.

---

Tracking Identified Users

---

**Note** When the appliance is configured to use cookie-based authentication surrogates, it does not get cookie information from clients for HTTPS and FTP over HTTP requests. Therefore, it cannot get the user name from the cookie.

* Works after the client makes a request to an HTTP site and is authenticated. Before this happens, the behavior depends on the transaction type:

- **Native FTP transactions.** Transactions bypass authentication.
- **HTTPS transactions.** Transactions are dropped. However, you can configure the HTTPS Proxy to decrypt the first HTTPS request for authentication purposes.

** When cookie-based authentication is used, the Web Proxy cannot authenticate the user for HTTPS, native FTP, and FTP over HTTP transactions. Due to this limitation, all HTTPS, native FTP, and FTP over HTTP requests bypass authentication, so authentication is not requested at all.

*** No surrogate is used in this case even though cookie-based surrogate is configured.

** Related Topics **

- Identification Profiles and Authentication, on page 126

** Tracking Re-Authenticated Users **

With re-authentication, if a more privileged user authorizes and is authorized, the Web Proxy caches this user identity for different amounts of time depending on the authentication surrogates configured:

- **Session cookie.** The privileged user identity is used until the browser is closed or the session times out.
- **Persistent cookie.** The privileged user identity is used until the surrogate times out.
- **IP address.** The privileged user identity is used until the surrogate times out.
- **No surrogate.** By default, the Web Proxy requests authentication for every new connection, but when re-authentication is enabled, the Web Proxy requests authentication for every new request, so there is an increased load on the authentication server when using NTLMSSP. The increase in authentication activity may not be apparent to a user, however, because most browsers will cache the privileged user credentials and authenticate without prompting until the browser is closed. Also, when the Web Proxy is deployed in transparent mode, and the “Apply same surrogate settings to explicit forward requests” option is not enabled, no authentication surrogates are used for explicit forward requests and increased load will occur with re-authentication.

** If the Web Security appliance uses cookies for authentication surrogates, Cisco recommends enabling credential encryption.

** Credentials **

Authentication credentials are obtained from users by either prompting them to enter their credentials through their browsers, or another client application, or by obtaining the credentials transparently from another source.

- Tracking Credentials for Reuse During a Session, on page 115
- Authentication and Authorization Failures, on page 115
- Credential Format, on page 115
Tracking Credentials for Reuse During a Session

Using authentication surrogates, after a user authenticates once during a session, you can track credentials for reuse throughout that session rather than having the user authenticate for each new request. Authentication surrogates may be based on the IP address of the user’s workstation or on a cookie that is assigned to the session.

For Internet Explorer, be sure the Redirect Hostname is the short host name (containing no dots) or the NetBIOS name rather than a fully qualified domain. Alternatively, you can add the appliance host name to Internet Explorer’s Local intranet zone (Tools > Internet options > Security tab); however, this will be required on every client. For more information about this, see How do I properly set up NTLM with SSO (credentials sent transparently)?

With Firefox and other non-Microsoft browsers, the parameters network.negotiate-auth.delegation-uris, network.negotiate-auth.trusted-uris and network.automatic-ntlm-auth.trusted-uris must be set to the transparent-mode Redirect Hostname. You also can refer to Firefox is not sending authentication credentials transparently (SSO). This article provides general information about changing Firefox parameters.

For information about the Redirect Hostname, see Configuring Global Authentication Settings, on page 101, or the CLI command sethostname.

Authentication and Authorization Failures

If authentication fails for accepted reasons, such as incompatible client applications, you can grant guest access.

If authentication succeeds but authorization fails, it is possible to allow re-authentication using a different set of credentials that may be authorized to access the requested resource.

</tbody>
</table>
Credential Encryption for Basic Authentication

About Credential Encryption for Basic Authentication

Enable credential encryption to transmit credentials over HTTPS in encrypted form. This increases security of the basic authentication process.

The Web Security appliance uses its own certificate and private key by default to create an HTTPS connection with the client for the purposes of secure authentication. Most browsers will warn users, however, that this certificate is not valid. To prevent users from seeing the invalid certificate message, you can upload a valid certificate and key pair that your organization uses.

Configuring Credential Encryption

Before you begin

• Configure the appliance to use IP surrogates.
• (Optional) Obtain a certificate and unencrypted private key. The certificate and key configured here are also used by Access Control.

Step 1  Choose Network > Authentication.
Step 2  Click Edit Global Settings.
Step 3  Check the Use Encrypted HTTPS Connection For Authentication check box in the Credential Encryption field.
Step 4  (Optional) Edit the default port number (443) in the HTTPS Redirect Port field for client HTTP connections during authentication.
Step 5  (Optional) Upload a certificate and key:
  a) Expand the Advanced section.
  b) Click Browse in the Certificate field and find the certificate file you wish to upload.
  c) Click Browse in the Key field and find the private key file you wish to upload.
  d) Click Upload Files.
Step 6  Submit and commit your changes.

CHAPTER 7

Classify End-Users for Policy Application

This chapter contains the following sections:

- Overview of Classify Users and Client Software, on page 119
- Classify Users and Client Software: Best Practices, on page 120
- Identification Profile Criteria, on page 120
- Classifying Users and Client Software, on page 121
- Identification Profiles and Authentication, on page 126
- Troubleshooting Identification Profiles, on page 128

Overview of Classify Users and Client Software

Identification Profiles let you classify users and user agents (client software) for these purposes:

- Group transaction requests for the application of policies (except SaaS)
- Specification of identification and authentication requirements

AsyncOS assigns an Identification Profile to every transaction:

- Custom Identification Profiles — AsyncOS assigns a custom profile based on that identity’s criteria.
- The Global Identification Profile — AsyncOS assigns the global profile to transactions that do not meet the criteria for any custom profile. By default, the global profile does not require authentication.

AsyncOS processes Identification Profiles sequentially, beginning with the first. The global profile is the last profile.

An Identification Profile may include only one criterion. Alternately, Identification Profiles that include multiple criteria require that all the criteria are met.

One policy may call on multiple Identification Profiles:
This Identification Profile allows guest access and applies to users who fail authentication.

Authentication is not used for this Identification Profile.

The specified user groups in this Identification Profile are authorized for this policy.

This Identification Profile uses an authentication sequence and this policy applies to one realm in the sequence.

### Classify Users and Client Software: Best Practices

- Create fewer, more general Identification Profiles that apply to all users or fewer, larger groups of users. Use policies, rather than profiles, for more granular management.
- Create Identification Profiles with unique criteria.
- If deployed in transparent mode, create an Identification Profile for sites that do not support authentication. See [Bypassing Authentication](#), on page 110.

### Identification Profile Criteria

These transaction characteristics are available to define an Identification Profile:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subnet</td>
<td>The client subnet must match the list of subnets in a policy.</td>
</tr>
<tr>
<td>Protocol</td>
<td>The protocol used in the transaction: HTTP, HTTPS, SOCKS, or native FTP.</td>
</tr>
<tr>
<td>Port</td>
<td>The proxy port of the request must be in the Identification Profile’s list of ports, if any are listed. For explicit forward connections, this is the port configured in the browser. For transparent connections, this is the same as the destination port.</td>
</tr>
</tbody>
</table>
Classifying Users and Client Software

Before you begin

- Create authentication realms. See How to Create an Active Directory Authentication Realm (NTLMSSP and Basic), on page 95 or Creating an LDAP Authentication Realm, on page 97.
- Be aware that when you commit changes to Identification Profiles, end-users must re-authenticate.
- If you are in Cloud Connector mode, be aware that an additional Identification Profile option is available: Machine ID. See Identifying Machines for Policy Application, on page 51.
- (Optional) Create authentication sequences. See Creating Authentication Sequences, on page 107
- (Optional) Enable Secure Mobility if the Identification Profile will include mobile users.
- (Optional) Understand authentication surrogates. See Tracking Identified Users, on page 113.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>User Agent</td>
<td>The user agent (client application) making the request must be in the Identification Profile’s list of user agents, if any are listed. Some user agents cannot handle authentication, therefore creating an profile that does not require authentication is necessary. User agents include programs such as updaters and browsers, such as Internet Explorer and Mozilla Firefox.</td>
</tr>
<tr>
<td>URL Category</td>
<td>The URL category of the request URL must be in the Identification Profile’s list of URL categories, if any are listed.</td>
</tr>
<tr>
<td>Authentication requirements</td>
<td>If the Identification Profile requires authentication, the client authentication credentials must match the Identification Profile’s authentication requirements.</td>
</tr>
</tbody>
</table>

Step 1  Choose Web Security Manager > Identification Profiles.

Step 2  Click Add Profile to add a profile.

Step 3  Use the Enable Identification Profile check box to enable this profile, or to quickly disable it without deleting it.

Step 4  Assign a unique profile Name.

Step 5  A Description is optional.

Step 6  From the Insert Above drop-down list, choose where this profile is to appear in the table.

Note  Position Identification Profiles that do not require authentication above the first Identification Profile that requires authentication.

Step 7  In the User Identification Method section, choose an identification method and then supply related parameters; displayed options vary according to the method chosen.

There are three types of methods: exempt from authentication/identification, authenticate users, and three ways to transparently identify users: ISE, ASA (via AnyConnect Secure Mobility), or an appropriately configured authentication realm. The latter includes either an Active Directory realm, or an LDAP realm configured as a Novell eDirectory.

There are three types of methods: exempt from authentication/identification, authenticate users, and three ways to transparently identify users: ISE, ASA (via AnyConnect Secure Mobility), or an appropriately configured authentication realm. The latter includes either an Active Directory realm, or an LDAP realm configured as a Novell eDirectory.

a)  Choose an identification method from the User Identification Method drop-down list.
### Option | Description
--- | ---
**Exempt from authentication/identification** | Users are identified primarily by IP address. No additional parameters are required.

**Authenticate users** | Users are identified by the authentication credentials they enter.

**Transparencyly identify users with ISE** | Available when the ISE service is enabled (Network > Identity Services Engine). For these transactions, the user name and associated Secure Group Tags will be obtained from the Identity Services Engine. For more information, see Tasks for Certifying and Integrating the ISE Service, on page 137.

**Transparencyly identify users with ASA** | Users are identified by the current IP address-to-user name mapping received from a Cisco Adaptive Security Appliance (for remote users only). This option appears when Secure Mobility is enabled and integrated with an ASA. The user name will be obtained from the ASA, and associated directory groups will be obtained from the selected authentication realm or sequence.

**Transparencyly identify users with authentication realm** | This option is available when one or more authentication realms are configured to support transparent identification.

**Note** | When at least one Identification Profile with authentication or transparent identification is configured, the policy tables will support defining policy membership using user names, directory groups, and Secure Group Tags.

b) Supply parameters appropriate to the chosen method. Not all of the sections described in this table are visible for each choice.

| Fallback to Authentication Realm or Guest Privileges | If user authentication is not available from ISE:

- **Support Guest Privileges** – The transaction will be allowed to continue, and will match subsequent policies for Guest users from all Identification Profiles.
- **Block Transactions** – Do not allow Internet access to users who cannot be identified by ISE.
- **Support Guest privileges** – Check this box to grant guest access to users who fail authentication due to invalid credentials.
### Authentication Realm

**Select a Realm or Sequence** – choose a defined authentication realm or sequence.

**Select a Scheme** – Choose an authentication scheme:

- **Kerberos** – The client is transparently authenticated by means of Kerberos tickets.
- **Basic** – The client always prompts users for credentials. After the user enters credentials, browsers typically offer a check box to remember the provided credentials. Each time the user opens the browser, the client either prompts for credentials or resends the previously saved credentials.

  Credentials are sent unsecured as clear text (Base64). A packet capture between the client and Web Security appliance can reveal the user name and pass phrase.

- **NTLMSSP** – The client transparently authenticates using its Windows login credentials. The user is not prompted for credentials.

  However, the client prompts the user for credentials under the following circumstances:

  - The Windows credentials failed.
  - The client does not trust the Web Security appliance because of browser security settings.

  Credentials are sent securely using a three-way handshake (digest style authentication). The passphrase is never sent across the connection.

- **Support Guest privileges** – Check this box to grant guest access to users who fail authentication due to invalid credentials.

### Realm for Group Authentication

- **Select a Realm or Sequence** – Choose a defined authentication realm or sequence.
Specify how transactions will be associated with a user after successful authentication (options vary depending on Web Proxy deployment mode):

- **IP Address** – The Web Proxy tracks an authenticated user at a particular IP address. For transparent user identification, select this option.
- **Persistent Cookie** – The Web Proxy tracks an authenticated user on a particular application by generating a persistent cookie for each user per application. Closing the application does not remove the cookie.
- **Session Cookie** – The Web Proxy tracks an authenticated user on a particular application by generating a session cookie for each user per domain per application. (However, when a user provides different credentials for the same domain from the same application, the cookie is overwritten.) Closing the application removes the cookie.
- **No Surrogate** – The Web Proxy does not use a surrogate to cache the credentials, and it tracks an authenticated user for every new TCP connection. When you choose this option, the web interface disables other settings that no longer apply. This option is available only in explicit forward mode and when you disable credential encryption on the Network > Authentication page.
- **Apply same surrogate settings to explicit forward requests** – Check to apply the surrogate used for transparent requests to explicit requests; enables credential encryption automatically. This option appears only when the Web Proxy is deployed in transparent mode.

**Note** You can define a timeout value for the authentication surrogate for all requests in Global Authentication Settings.

---

### Step 8

In the **Membership Definition** section, supply membership parameters appropriate to the chosen identification method. Note that all of the options described in this table are not available to every User Identification Method.

<table>
<thead>
<tr>
<th>Membership Definition</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Define Members by User Location</strong></td>
<td>Configure this Identification Profile to apply to: <strong>Local Users Only</strong>, <strong>Remote Users Only</strong>, or <strong>Both</strong>. This selection affects the available authentication settings for this Identification Profile.</td>
</tr>
</tbody>
</table>
| **Define Members by Subnet** | Enter the addresses to which this Identification Profile should apply. You can use IP addresses, CIDR blocks, and subnets.  

**Note** If nothing is entered, the Identification Profile applies to all IP addresses. |
| **Define Members by Protocol** | Select the protocols to which this Identification Profile should apply; select all that apply:  

- **HTTP/HTTPS** – Applies to all requests that use HTTP or HTTPS as the underlying protocol, including FTP over HTTP, and any other protocol tunneled using HTTP CONNECT.  
- **Native FTP** – Applies to native FTP requests only.  
- **SOCKS** – Applies to SOCKS Policies only |
| Define Members by Machine ID | • Do Not Use Machine ID in This Policy – The user is not identified by machine ID.  
• Define User Authentication Policy Based on Machine ID – The user is identified primarily by machine ID.  
  
  Click the Machine Groups area to display the Authorized Machine Groups page.  
  
  For each group you want to add, in the Directory Search field, start typing the name of the group to add and then click Add. You can select a group and click Remove to remove it from the list.  
  
  Click Done to return to the previous page.  
  
  Click the Machine IDs area to display the Authorized Machines page.  
  
  In the Authorized Machines, field, enter the machine IDs to associate with the policy then click Done.  
  
  Note Authentication using Machine ID is supported only in Connector mode and requires Active Directory. |
|---|---|
| Advanced | Expand this section to define additional membership requirements.  
• Proxy Ports – Specify one or more proxy ports used to access the Web Proxy. Enter port numbers separated by commas. For explicit forward connections, the proxy port is configured in the browser.  
  
  For transparent connections, this is the same as the destination port.  
  
  Defining identities by port works best when the appliance is deployed in explicit forward mode, or when clients explicitly forward requests to the appliance. Defining identities by port when client requests are transparently redirected to the appliance may result in some requests being denied.  
  
  • URL Categories – Select user-defined or predefined URL categories. Membership for both is excluded by default, meaning the Web Proxy ignores all categories unless they are selected in the Add column.  
  
  If you need to define membership by URL category, only define it in the Identity group when you need to exempt from authentication requests to that category.  
  
  • User Agents – Defines policy group membership by the user agents found in the client request. You can select some commonly defined agents, or define your own using regular expressions.  
  
  Also specify whether these user-agent specifications are inclusive or exclusive. In other words, whether membership definition includes only the selected user agents, or specifically excludes the selected user agents |

**Step 9** Submit and Commit Changes.

### What to do next
- Overview of Acquire End-User Credentials, on page 79
- Managing Web Requests Through Policies Task Overview, on page 185
Enable/Disable an Identity

Before you begin

• Be aware that disabling an Identification Profile removes it from associated policies.
• Be aware that re-enabling an Identification Profile does not re-associate it with any policies.

Step 1 Choose Web Security Manager > Identification Profiles.
Step 2 Click a profile in the Identification Profiles table to open the Identification Profile page for that profile.
Step 3 Check or clear Enable Identification Profile immediately under Client/User Identification Profile Settings.
Step 4 Submit and Commit Changes.

Identification Profiles and Authentication

The following diagram shows how the Web Proxy evaluates a client request against an Identification Profile when the Identification Profiles is configured to use:

• No authentication surrogates
• IP addresses as authentication surrogates
• Cookies as authentication surrogates with transparent requests
• Cookies as authentication surrogates with explicit requests and credential encryption is enabled
The following diagram shows how the Web Proxy evaluates a client request against an Identification Profile when the Identification Profile is configured to use cookies as the authentication surrogates, credential encryption is enabled, and the request is explicitly forwarded.
Troubleshooting Identification Profiles

- Basic Authentication Problems, on page 436
- Policy Problems, on page 448
- Policy is Never Applied, on page 449

- Upstream Proxy Problems, on page 455
SaaS Access Control

This chapter contains the following sections:

- Overview of SaaS Access Control, on page 129
- Configuring the Appliance as an Identity Provider, on page 130
- Using SaaS Access Control and Multiple Appliances, on page 131
- Creating SaaS Application Authentication Policies, on page 132
- Configuring End-user Access to the Single Sign-on URL, on page 134

Overview of SaaS Access Control

The Web Security appliance uses the Security Assertion Markup Language (SAML) to authorize access to SaaS applications. It works with SaaS applications that are strictly compliant with SAML version 2.0.

Cisco SaaS Access Control allows you to:

- Control which users can access SaaS applications and from where.
- Quickly disable access to all SaaS applications when users are no longer employed by the organization.
- Reduce the risk of phishing attacks that ask users to enter their SaaS user credentials.
- Choose whether users are transparently signed in (single sign-on functionality) or prompted to enter their authentication user name and pass phrase.

SaaS Access Control only works with SaaS applications that require an authentication mechanism that is supported by the Web Security appliance. Currently, the Web Proxy uses the “PasswordProtectedTransport” authentication mechanism.

To enable SaaS Access Control, you must configure settings on both the Web Security appliance and the SaaS application:

**Procedure**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Configure the Web Security appliance as an identity provider.</td>
<td>Configuring the Appliance as an Identity Provider, on page 130</td>
</tr>
<tr>
<td>Step 2</td>
<td>Create an authentication policy for the SaaS application.</td>
<td>Creating SaaS Application Authentication Policies, on page 132</td>
</tr>
</tbody>
</table>
Configuring the Appliance as an Identity Provider

When you configure the Web Security appliance as an identity provider, the settings you define apply to all SaaS applications it communicates with. The Web Security appliance uses a certificate and key to sign each SAML assertion it creates.

Before you begin

- (Optional) Locate a certificate (PEM format) and key for signing SAML assertions.
- Upload the certificate to each SaaS application.

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Configure the SaaS application for single sign-on.</td>
<td>Configuring End-user Access to the Single Sign-on URL, on page 134</td>
</tr>
<tr>
<td>4</td>
<td>(Optional) Configure multiple Web Security appliances.</td>
<td>Using SaaS Access Control and Multiple Appliances, on page 131</td>
</tr>
</tbody>
</table>

Step 1
Choose Network > Identity Provider for SaaS.

Step 2
Click Edit Settings.

Step 3
Check Enable SaaS Single Sign-on Service.

Step 4
Enter a virtual domain name in the Identity Provider Domain Name field.

Step 5
Enter a unique text identifier in the Identity Provider Entity ID field (a URI formatted string is recommended).

Step 6
Either upload or generate a certificate and key:

<table>
<thead>
<tr>
<th>Method</th>
<th>Additional Steps</th>
</tr>
</thead>
</table>
| Upload a certificate and key | 1. Select Use Uploaded Certificate and Key.  
2. In the Certificate field, click Browse; locate the file to upload.  
   Note: The Web Proxy uses the first certificate or key in the file. The certificate file must be in PEM format. DER format is not supported.  
3. In the Key field, click Browse; locate the file to upload.  
   If the key is encrypted, select Key is Encrypted.  
   Note: The key length must be 512, 1024, or 2048 bits. The private key file must be in PEM format. DER format is not supported.  
4. Click Upload Files.  
5. Click Download Certificate to download a copy of the certificate for transfer to the SaaS applications with which the Web Security appliance will communicate. |
### Method | Additional Steps
--- | ---
**Generate a certificate and key** | 1. Select **Use Generated Certificate and Key**.
2. Click **Generate New Certificate and Key**.
   1. In the Generate Certificate and Key dialog box, enter the information to display in the signing certificate.
   **Note** You can enter any ASCII character except the forward slash (/) in the Common Name field.
   2. Click **Generate**.
3. Click **Download Certificate** to transfer the certificate to the SaaS applications with which the Web Security appliance will communicate.
4. (Optional) To use a signed certificate, click the **Download Certificate Signing Request** (DCSR) link to submit a request to a certificate authority (CA). After you receive a signed certificate from the CA, click **Browse** and navigate to the signed certificate location. Click **Upload File**. (bug 37984)

**Note** If the appliance has both an uploaded certificate and key pair and a generated certificate and key pair, it only uses the certificate and key pair currently selected in the Signing Certificate section.

**Step 7** Make note of the settings when you configure the appliance as an identity provider. Some of these settings must be used when configuring the SaaS application for single sign-on.

**Step 8** Submit and Commit Changes.

---

**What to do next**

After specifying the certificate and key to use for signing SAML assertions, upload the certificate to each SaaS application.

**Related Topics**
- Configuring End-user Access to the Single Sign-on URL, on page 134

### Using SaaS Access Control and Multiple Appliances

**Before you begin**

Configuring the Appliance as an Identity Provider, on page 130

**Step 1** Configure the same Identity Provider Domain Name for each Web Security appliance.

**Step 2** Configure the same Identity Provider Entity ID for each Web Security appliance.

**Step 3** Upload the same certificate and private key to each appliance on the **Network > Identity Provider for SaaS** page.

**Step 4** Upload this certificate to each SaaS application you configure.
Creating SaaS Application Authentication Policies

Before you begin

• Create associated identities.
• Configure Identity Provider, see Configuring the Appliance as an Identity Provider, on page 130.
• Provide an Identity Provider Signing Certificate and Key: Network > Identity Provider for SaaS > Enable and Edit Settings.
• Create an Authentication Realm, Authentication Realms, on page 90.

Step 1
Choose Web Security Manager > SaaS Policies.

Step 2
Click Add Application.

Step 3
Configure the settings:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Name</td>
<td>Enter a name to identify the SaaS application for this policy; each application name must be unique. The Web Security appliance uses the application name to generate a single sign-on URL.</td>
</tr>
<tr>
<td>Description</td>
<td>(Optional) Enter a description for this SaaS policy.</td>
</tr>
<tr>
<td>Metadata for Service Provider</td>
<td>Configure the metadata that describes the service provider referenced in this policy. You can either describe the service provider properties manually or upload a metadata file provided by the SaaS application. The Web Security appliance uses the metadata to determine how to communicate with the SaaS application (service provider) using SAML. Contact the SaaS application to learn the correct settings to configure the metadata.</td>
</tr>
</tbody>
</table>

Configure Keys Manually – If you select this option, provide the following:

• Service Provider Entity ID. Enter the text (typically in URI format) the SaaS application uses to identify itself as a service provider.
• Name ID Format. Choose from the drop-down list the format the appliance should use to identify users in the SAML assertion it sends to service providers. The value you enter here must match the corresponding setting configured on the SaaS application.
• Assertion Consumer Service URL. Enter the URL to which the Web Security appliance is to send the SAML assertion it creates. Read the SaaS application documentation to determine the correct URL to use (also known as the login URL).

Import File from Hard Disk – If you select this option, click Browse, locate the file, and then click Import.

Note: This metadata file is an XML document, following the SAML standard, that describes a service provider instance. Not all SaaS applications use metadata files, but for those that do, contact the SaaS application provider for the file.
Specify how users are identified/authenticated for SaaS single sign-on:

- Always prompt users for their local authentication credentials.
- Prompt users for their local authentication credentials if the Web Proxy obtained their user names transparently.
- Automatically sign in SaaS users using their local authentication credentials.

Choose the authentication realm or sequence the Web Proxy should use to authenticate users accessing this SaaS application. Users must be a member of the authentication realm or authentication sequence to successfully access the SaaS application. If an Identity Services Engine is used for authentication, and LDAP was selected, the realm will be used for the SAML user names and attribute mapping.

Specify how the Web Proxy should represent usernames to the service provider in the SAML assertion. You can pass the user names as they are used inside your network (No mapping), or you can change the internal user names into a different format using one of the following methods:

- **LDAP query.** The user names sent to the service provider are based on one or more LDAP query attributes. Enter an expression containing LDAP attribute fields and optional custom text. You must enclose attribute names in angled brackets. You can include any number of attributes. For example, for the LDAP attributes “user” and “domain,” you could enter "<user>@<domain>.com."

- **Fixed Rule Mapping.** The user names sent to the service provider are based on the internal user name with a fixed string added before or after the internal user name. Enter the fixed string in the **Expression Name** field, with %s either before or after the string to indicate its position in the internal user name.

(Optional) You can provide to the SaaS application additional information about the internal users from the LDAP authentication server if required by the SaaS application. Map each LDAP server attribute to a SAML attribute.

Choose the authentication mechanism the Web Proxy uses to authenticate its internal users.

**Note** The authentication context informs the service provider which authentication mechanism the identity provider used to authenticate the internal users. Some service providers require a particular authentication mechanism to allow users to access the SaaS application. If a service provider requires an authentication context that is not supported by an identity provider, users cannot access the service provider using single sign-on from the identity provider.

**Step 4** Submit and Commit Changes.

**What to do next**

Set up the single sign-on settings on the SaaS application side, using the same parameters to configure the application.
Configuring End-user Access to the Single Sign-on URL

After you configure the Web Security appliance as an identity provider and create a SaaS Application
Authentication Policy for the SaaS application, the appliance creates a single sign-on URL (SSO URL). The
Web Security appliance uses the application name configured in the SaaS Application Authentication Policy
to generate the single sign-on URL; the SSO URL format is:

http://IdentityProviderDomainName/SSOURL/ApplicationName

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Obtain the single sign-on URL from the Web Security Manager &gt; SaaS Policies page.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Make the URL available to end-users depending on which flow type.</td>
</tr>
<tr>
<td>Step 3</td>
<td>If you choose Identity provider initiated flow, the appliance redirects users to the SaaS application.</td>
</tr>
</tbody>
</table>
| Step 4 | If you choose Service Provider initiated flows, you must configure this URL in the SaaS application.  
  - Always prompt SaaS users for proxy authentication. After entering valid credentials, users are logged into the SaaS application.  
  - Transparently sign in SaaS users. Users are logged into the SaaS application automatically. |

**Note**  
To achieve single sign-on behavior using explicit forward requests for all authenticated users when the appliance is deployed in transparent mode, select “Apply same surrogate settings to explicit forward requests” when you configure the Identity group.
Integrate the Cisco Identity Services Engine (ISE)

This chapter contains the following sections:

- Overview of the Identity Services Engine Service, on page 135
- Identity Services Engine Certificates, on page 136
- Tasks for Certifying and Integrating the ISE Service, on page 137
- Connect to the ISE Services, on page 140
- Troubleshooting Identity Services Engine Problems, on page 142

Overview of the Identity Services Engine Service

Cisco’s Identity Services Engine (ISE) is an application that runs on separate servers in your network to provide enhanced identity management. AsyncOS can access user-identity information from an ISE server. If configured, user names and associated Secure Group Tags will be obtained from the Identity Services Engine for appropriately configured Identification Profiles, to allow transparent user identification in policies configured to use those profiles.

Note

- The ISE service is not available in Connector mode.
- ISE versions up to ISE v 2.2 / PxGrid 1.0 are supported.

Related Topics

- About pxGrid, on page 135
- About the ISE Server Deployment and Failover, on page 136

About pxGrid

Cisco’s Platform Exchange Grid (pxGrid) enables collaboration between components of the network infrastructure, including security-monitoring and network-detection systems, identity and access management platforms, and so on. These components can use pxGrid to exchange information via a publish/subscribe method.

There are essentially three pxGrid components: the pxGrid publisher, the pxGrid client, and the pxGrid controller.
• pxGrid publisher – Provides information for the pxGrid client(s).
• pxGrid client – Any system, such as the Web Security appliance, that subscribes to published information; in this case, Security Group Tag (SGT) and user-group and profiling information.
• pxGrid controller – In this case, the ISE pxGrid node that controls the client registration/management and topic/subscription processes.

Trusted certificates are required for each component, and these must be installed on each host platform.

About the ISE Server Deployment and Failover

A single ISE node set-up is called a “standalone deployment,” and this single node runs the Administration, Policy Service, and Monitoring personae. To support failover and to improve performance, you must set up multiple ISE nodes in a “distributed deployment.” The minimum required distributed ISE configuration to support ISE failover on your Web Security appliance is:

• Two pxGrid nodes
• Two Monitoring nodes
• Two Administration nodes
• One Policy Service node

This configuration is referred to in the Cisco Identity Services Engine Hardware Installation Guide as a “Medium-Sized Network Deployment”. Refer to that network deployments section in the Installation Guide for additional information.

Related Topics

Identity Services Engine Certificates

Note

This section describes the certificates necessary for ISE connection. Tasks for Certifying and Integrating the ISE Service, on page 137 provides detailed information about these certificates. Certificate Management, on page 413, provides general certificate-management information for AsyncOS.

A set of three certificates is required for mutual authentication and secure communication between the Web Security appliance and each ISE server:

• WSA Client Certificate – Used by the ISE server to authenticate the Web Security appliance.
• ISE Admin Certificate – Used by the Web Security appliance to authenticate an ISE server on port 443 for bulk download of ISE user-profile data.
• **ISE pxGrid Certificate** – Used by the Web Security appliance to authenticate an ISE server on port 5222 for WSA-ISE data subscription (on-going publish/subscribe queries to the ISE server).

These three certificates can be Certificate Authority (CA)-signed or self-signed. AsyncOS provides the option to generate a self-signed WSA Client certificate, or a Certificate Signing Request (CSR) instead, if a CA-signed certificate is needed. Similarly, the ISE server provides the option to generate self-signed ISE Admin and pxGrid certificates, or CSRs instead if CA-signed certificates are needed.

**Related Topics**
- Using Self-signed Certificates, on page 137
- Using CA-signed Certificates, on page 137
- Overview of the Identity Services Engine Service, on page 135
- Tasks for Certifying and Integrating the ISE Service, on page 137
- Connect to the ISE Services, on page 140

**Using Self-signed Certificates**

When self-signed certificates are used on the ISE server, all three certificates—the ISE pxGrid and Admin certificates, developed on the ISE server, as well as the WSA Client certificate, developed on the WSA—must be added to the Trusted Certificates store on the ISE server (Administration > Certificates > Trusted Certificates > Import).

**Using CA-signed Certificates**

In the case of CA-signed certificates:

- On the ISE server, ensure the appropriate CA root certificate for the WSA Client certificate is present in the Trusted Certificates store (Administration > Certificates > Trusted Certificates).
- On the WSA, ensure the appropriate CA root certificates are present in the Trusted Certificates list (Network > Certificate Management > Manage Trusted Root Certificates). On the Identity Services Engine page (Network > Identity Services Engine), be sure to upload the CA root certificate(s) for the ISE Admin and pxGrid certificates.

**Tasks for Certifying and Integrating the ISE Service**

**Note**

ISE versions up to ISE v 2.2 / PxGrid 1.0 are supported.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>

</tr>
</thead>
</table>
| 1a   | On the WSA, add a WSA Client certificate. | • Create or upload a CA-signed or self-signed WSA Client certificate on the WSA.  
See Connect to the ISE Services, on page 140 , and Certificate Management, on page 413. |
<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Links to Related Topics and Procedures</th>
</tr>
</thead>
</table>
| 1b   | On the WSA, download this WSA Client certificate for upload to the ISE server. | • Download the WSA Client certificate, save it, and then transfer it to the ISE server.  
See [Connect to the ISE Services](#), on page 140. |
| 2    | If the WSA Client Certificate is self-signed, upload it and its signing certificate to the ISE server. | • Import the WSA Client certificate downloaded from the WSA in the previous step, adding it to the ISE server’s Trusted Certificate store. ([Administration > Certificates > Trusted Certificates > Import.](#))  
• Be sure to also add the appropriate signing certificate for this WSA Client certificate to the Trusted Certificates store on the ISE server, as discussed in [Using Self-signed Certificates](#), on page 137. |
| 3    | On the ISE server, add ISE Admin and pxGrid certificates. | • Navigate to the [Administration > Certificates](#) page, and generate or upload ISE Admin and pxGrid certificates:  
  • For CA-signed certificates, generate two Certificate Signing Requests, one each for Admin and pxGrid Usage, and then have the certificates signed.  
  Upon receipt of the signed certificates, upload both to the ISE server.  
  Perform the “Bind the CA Signed Certificate” operation for both.  
  Be sure to add the CA root certificate to the ISE server’s Trusted Certificates store.  
  Restart the ISE server.  
  • For self-signed certificates, navigate to [Administration > Certificates > System Certificates](#), and generate two Self Signed Certificates, one each for Admin and pxGrid. (You can also elect to generate one common certificate for both.)  
  Add both to the Trusted Certificates store.  
  Export the self-signed certificate(s) for import onto the WSA.  

**Note** Ensure the appropriate self-signed or CA root certificates for these ISE Admin and pxGrid certificates are added to the Trusted Certificates store, as discussed in [Identity Services Engine Certificates](#), on page 136. |

</tr>
</thead>
</table>
| 4    | Ensure the ISE server is configured appropriately for WSA access. | Each ISE server must be configured to allow identity topic subscribers (such as WSA) to obtain session context in real-time. The basic steps are:  
  - Ensure “Enable Auto Registration” is turned ON (Administration > pxGrid Services > Top Right).  
  - Delete all existing WSA clients from the ISE server (Administration > pxGrid Services > Clients).  
  - Be sure the ISE server footer (Administration > pxGrid Services) says “Connected to pxGrid.”  
  - Configure SGT groups on ISE server (Policy > Results > TrustSec > Security Groups).  
  - Configure policies that associate the SGT groups with users.  
Refer to Cisco Identity Services Engine documentation for more information. |
| 5    | On the WSA, add the exported ISE Admin and pxGrid certificates. | Upload the ISE Admin and pxGrid certificates for each ISE server you are configuring on this WSA. See Connect to the ISE Services, on page 140.  
  - If using a single self-signed certificate for both ISE Admin and pxGrid, upload the file twice, once each in the ISE Admin Certificate and ISE pxGrid Certificate fields. See Connect to the ISE Services, on page 140.  
  - If using CA-signed certificates, be sure the Certificate Authority that signed each pair of ISE certificates is listed in the Trusted Root Certificates list on the WSA. If not, import the CA root certificate. See Managing Trusted Root Certificates, on page 414.  
  **Note**  
  If the ISE Admin and pxGrid certificates are signed by your Root CA certificate, be sure to upload Root CA certificate itself to the ISE Admin Certificate and ISE pxGrid Certificate fields on the WSA (Network > Identity Services Engine). |

## Connect to the ISE Services

### Before you begin
- Be sure each ISE server is configured appropriately for WSA access; see Tasks for Certifying and Integrating the ISE Service, on page 137.
- Obtain ISE server connection information.
- Obtain valid ISE-related certificates (client, Portal and pxGrid) and keys. See also Identity Services Engine Certificates, on page 136for related information.

### Step 1
Choose Network > Identification Service Engine.

### Step 2
Click Edit Settings.

### Step 3
Check Enable ISE Service.

### Step 4
Identify the Primary ISE pxGrid Node using its host name or IPv4 address.

  a) Provide an ISE pxGrid Node Certificate for WSA-ISE data subscription (on-going queries to the ISE server).

      Browse to and select the certificate file, and then click Upload File. See Uploading a Certificate and Key, on page 415 for additional information.
**Step 5**  
If using a second ISE server for failover, identify the **Secondary ISE pxGrid Node** using its host name or IPv4 address.

a) Provide the secondary **ISE pxGrid Node Certificate**.

Browse to and select the certificate file, and then click **Upload File**. See Uploading a Certificate and Key, on page 415 for additional information.

**Note**  
During failover from primary to secondary ISE servers, any user not in the existing ISE SGT cache will be required to authenticate, or will be assigned Guest authorization, depending on your WSA configuration. After ISE failover is complete, normal ISE authentication resumes.

**Step 6**  
Upload the **ISE Monitoring Node Admin Certificates**:

a) Provide the **Primary ISE Monitoring Node Admin Certificate** for use in bulk download of ISE user-profile data to the WSA.

Browse to and select the certificate file, and then click **Upload File**. See Uploading a Certificate and Key, on page 415 for additional information.

b) If using a second ISE server for failover, provide the **Secondary ISE Monitoring Node Admin Certificate**.

**Step 7**  
Provide a **WSA Client Certificate** for WSA-ISE server mutual authentication:

**Note**  
This must be a CA trusted-root certificate. See Identity Services Engine Certificates, on page 136 for related information.

- **Use Uploaded Certificate and Key**
  
  For both the certificate and the key, click Choose and browse to the respective file.

  If the **Key is Encrypted**, check this box.

  Click **Upload Files**. (See Uploading a Certificate and Key, on page 415 for additional information about this option.)

- **Use Generated Certificate and Key**
  
  Click **Generate New Certificate and Key**. (See Generating a Certificate and Key, on page 416 for additional information about this option.)

**Step 8**  
Download the WSA Client Certificate, save it, and then upload it to the ISE server host (Administration > Certificates > Trusted Certificates > Import on the specified server).

**Step 9**  
(Optional) Click **Start Test** to test the connection with the ISE pxGrid node(s).

**Step 10**  
Click **Submit**.

---

**What to do next**

- Classifying Users and Client Software, on page 121
- Create Policies to Control Internet Requests, on page 183

Overview of Categorizing URL Transactions

Using policy groups, you can create secure policies that control access to web sites containing questionable content. The sites that are blocked, allowed, or decrypted depend on the categories you select when setting up category blocking for each policy group. To control user access based on a URL category, you must enable Cisco Web Usage Controls. This is a multi-layered URL filtering engine that uses domain prefixes and keyword analysis to categorize URLs.

You can use URL categories when performing the following tasks:

<table>
<thead>
<tr>
<th>Option</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define policy group membership</td>
<td>Matching URLs to URL Categories, on page 145</td>
</tr>
<tr>
<td>Control access to HTTP, HTTPS, and FTP</td>
<td>Filtering Transactions Using URL Categories, on page 151</td>
</tr>
<tr>
<td>requests</td>
<td></td>
</tr>
<tr>
<td>Create user defined custom URL categories</td>
<td>Creating and Editing Custom URL Categories, on page 157</td>
</tr>
<tr>
<td>that specify specific hostnames and IP</td>
<td></td>
</tr>
<tr>
<td>addresses</td>
<td></td>
</tr>
</tbody>
</table>
Categorization of Failed URL Transactions

The Dynamic Content Analysis engine categorizes URLs when controlling access to websites in Access Policies only. It does not categorize URLs when determining policy group membership or when controlling access to websites using Decryption or Cisco Data Security Policies. This is because the engine works by analyzing the response content from the destination server, so it cannot be used on decisions that must be made at request time before any response is downloaded from the server.

If the web reputation score for an uncategorized URL is within the WBRS ALLOW range, AsyncOS allows the request without performing Dynamic Content Analysis.

After the Dynamic Content Analysis engine categorizes a URL, it stores the category verdict and URL in a temporary cache. This allows future transactions to benefit from the earlier response scan and be categorized at request time instead of at response time.

Enabling the Dynamic Content Analysis engine can impact transaction performance. However, most transactions are categorized using the Cisco Web Usage Controls URL categories database, so the Dynamic Content Analysis engine is usually only called for a small percentage of transactions.

Enabling the Dynamic Content Analysis Engine

It is possible for an Access Policy, or an Identity used in an Access Policy, to define policy membership by a predefined URL category and for the Access Policy to perform an action on the same URL category. The URL in the request can be uncategorized when determining Identity and Access Policy group membership, but must be categorized by the Dynamic Content Analysis engine after receiving the server response. Cisco Web Usage Controls ignores the category verdict from the Dynamic Content Analysis engine and the URL retains the “uncategorized” verdict for the remainder of the transaction. Future transactions will still benefit from the new category verdict.

Step 1: Choose Security Services > Acceptable Use Controls.
Step 2: Enable the Cisco Web Usage Controls.
Step 3: Click to enable the Dynamic Content Analysis engine.
Step 4: Submit and Commit Changes.

Uncategorized URLs

An uncategorized URL is a URL that does not match any pre-defined URL category or included custom URL category.

When determining policy group membership, a custom URL category is considered included, only when it is selected for policy group membership.

All transactions resulting in unmatched categories are reported on the Reporting > URL Categories page as “Uncategorized URLs.” A large number of uncategorized URLs are generated from requests to web sites.
within the internal network. Cisco recommends using custom URL categories to group internal URLs and allow all requests to internal web sites. This decreases the number of web transactions reported as “Uncategorized URLs” and instead reports internal transactions as part of “URL Filtering Bypassed” statistics.

Related Topics
• Understanding Unfiltered and Uncategorized Data, on page 167.
• Creating and Editing Custom URL Categories, on page 157.

Matching URLs to URL Categories

When the URL filtering engine matches a URL category to the URL in a client request, it first evaluates the URL against the custom URL categories included in the policy group. If the URL in the request does not match an included custom category, the URL filtering engine compares it to the predefined URL categories. If the URL does not match any included custom or predefined URL categories, the request is uncategorized.

Note
When determining policy group membership, a custom URL category is considered included only when it is selected for policy group membership.

To see what category a particular web site is assigned to, go to the URL in Reporting Uncategorized and Misclassified URLs, on page 145.

Related Topics
• Uncategorized URLs, on page 144.

Reporting Uncategorized and Misclassified URLs

You can report uncategorized and misclassified URLs to Cisco. Cisco provides a URL submission tool on its website that allows you to submit multiple URLs simultaneously:
• https://securityhub.cisco.com/web/submit_urls
  • To check the status of submitted URLs, click the Status on Submitted URLs tab on this page.
  • You can also use the URL submission tool to look up the assigned URL category for any URL.

• https://www.talosintelligence.com/reputation_center/support
  • To submit a dispute, you must be logged into your Cisco account. Disputes can be filed for URLs, IPs, or domains.
  • Use the Reputation Center Search box to look up web reputation information.

URL Categories Database

The category that a URL falls into is determined by a filtering categories database. The Web Security appliance collects information and maintains a separate database for each URL filtering engine. The filtering categories databases periodically receive updates from the Cisco update server.
The URL categories database includes many different factors and sources of data internal to Cisco and from the Internet. One of the factors occasionally considered, heavily modified from the original, is information from the Open Directory Project.

To see what category a particular web site is assigned to, go to the URL in Reporting Uncategorized and Misclassified URLs, on page 145.

**Related Topics**
- Manually Updating Security Service Components, on page 420.

## Configuring the URL Filtering Engine

By default, the Cisco Web Usage Controls URL filtering engine is enabled in the System Setup Wizard.

### Step 1
Choose Security Services > Acceptable Use Controls.

### Step 2
Click Edit Global Settings.

### Step 3
Verify the Enable Acceptable Use Controls property is enabled.

### Step 4
Choose whether to enable the Dynamic Content Analysis Engine.

### Step 5
Choose the default action the Web Proxy should use when the URL filtering engine is unavailable, either Monitor or Block. Default is Monitor.

### Step 6
Submit and Commit Changes.

## Managing Updates to the Set of URL Categories

The set of predefined URL categories may occasionally be updated in order to accommodate new web trends and evolving usage patterns. Updates to the URL category set are distinct from the changes that add new URLs and re-map misclassified URLs. Category set updates may change configurations in your existing policies and therefore require action. URL category set updates may occur between product releases; an AsyncOS upgrade is not required.

Take the following actions:

<table>
<thead>
<tr>
<th>When to Act</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Before updates occur (Do these tasks as part of your initial setup)</td>
<td>Understanding the Impacts of URL Category Set Updates, on page 147</td>
</tr>
<tr>
<td></td>
<td>Controlling Updates to the URL Category Set, on page 149</td>
</tr>
<tr>
<td></td>
<td>Default Settings for New and Changed Categories, on page 150</td>
</tr>
<tr>
<td></td>
<td>Receiving Alerts About Category and Policy Changes, on page 151</td>
</tr>
<tr>
<td>After updates occur</td>
<td>Responding to Alerts about URL Category Set Updates, on page 151</td>
</tr>
</tbody>
</table>
Understanding the Impacts of URL Category Set Updates

URL category set updates can have the following impacts on existing Access Policies, Decryption Policies, and Cisco Data Security policies, and on Identities:

- Effects of URL Category Set Changes on Policy Group Membership, on page 147
- Effects of URL Category Set Updates on Filtering Actions in Policies, on page 147

Effects of URL Category Set Changes on Policy Group Membership

This section applies to all policy types with membership that can be defined by URL category, and to Identities. When policy group membership is defined by URL category, changes to the category set may have the following effects:

- If the sole criterion for membership is a deleted category, the policy or identity is disabled.

If membership in any policy is defined by a URL category that changes, and if this causes ACL list changes, the web proxy will restart.

Effects of URL Category Set Updates on Filtering Actions in Policies

URL category set updates can change policy behavior in the following ways:

<table>
<thead>
<tr>
<th>Change</th>
<th>Effect on Policies and Identities</th>
</tr>
</thead>
<tbody>
<tr>
<td>A new category can be added</td>
<td>For each policy, the default action for newly-added categories is the action specified for Uncategorized URLs for that policy.</td>
</tr>
<tr>
<td>A category can be deleted</td>
<td>The action associated with the deleted category is deleted.</td>
</tr>
<tr>
<td></td>
<td>If the policy depended exclusively on the deleted category, the policy is disabled.</td>
</tr>
<tr>
<td></td>
<td>If a policy depends on an identity that depended exclusively on a deleted category, the policy will be disabled.</td>
</tr>
<tr>
<td>A category can be renamed</td>
<td>No change to the behavior of the existing policy.</td>
</tr>
<tr>
<td>A category can split</td>
<td>A single category can become multiple new categories. Both new categories have the action associated with the original category.</td>
</tr>
<tr>
<td>Change</td>
<td>Effect on Policies and Identities</td>
</tr>
<tr>
<td>--------</td>
<td>----------------------------------</td>
</tr>
</tbody>
</table>
| Two or more existing categories can merge | If all original categories in a policy had the same action assigned, the merged category has the same action as the original categories. If all original categories were set to “Use Global Setting” then the merged category is also set to “Use Global Setting.”  

If the policy had different actions assigned to the original categories, the action assigned to the merged category depends on the Uncategorized URLs setting in that policy:  

- If Uncategorized URLs is set to Block (or “Use Global Setting” when the global setting is Block), then the most restrictive action among the original categories is applied to the merged category.  
- If Uncategorized URLs is set to any action other than Block (or “Use Global Setting” when the global setting is anything other than Block), then the least restrictive action among the original categories is applied to the merged category.  

In this case, sites that were previously blocked may now be accessible to users.  

If policy membership is defined by URL category, and some of the categories involved in the merge, or the Uncategorized URLs action, are not included in the policy membership definition, then the values in the Global Policy are used for the missing items.  

The order of restrictiveness is as follows (not all actions are available for all policy types):  

- Block  
- Drop  
- Decrypt  
- Warn  
- Time-based  
- Monitor  
- Pass Through  

**Note** Time-based policies that are based on merged categories adopt the action associated with any one of the original categories. (In time-based policies, there may be no obviously most- or least-restrictive action.)

<td>An action for this category is not specified in this policy, but the value in the Global Policy for this category is Block</td>
<td>An action for Uncategorized URLs is not specified in this policy, but the value in the Global Policy for Uncategorized URLs is Monitor</td>
<td>Monitor</td>
</tr>
</tbody>
</table>

Controlling Updates to the URL Category Set

By default, URL category set updates to occur automatically. These updates may change existing policy configurations, so you may prefer to disable all automatic updates.
Manually Updating the URL Category Set

If you disable updates, you will need to manually update all services listed in the Update Servers (list) section of the System Administration > Upgrade and Update Settings page.

Disabling all automatic updates

Note: If you use the CLI, disable updates by setting the update interval to zero (0).

### Default Settings for New and Changed Categories

URL category set updates may change the behavior of your existing policies. You should specify default settings for certain changes when you configure your policies, so that they are ready when URL category set updates occur. When new categories are added, or existing categories merge into a new category, the default action for these categories for each policy are affected by the Uncategorized URLs setting in that policy.

### Verifying Existing Settings and/or Making Changes

**Step 1** Choose Web Security Manager.

**Step 2** For each Access Policy, Decryption Policy, and Cisco Data Security policy click the URL Filtering link.
Step 3  

Check the selected setting for Uncategorized URLs.

---

**What to do next**

**Related Topics**

- Effects of URL Category Set Updates on Filtering Actions in Policies, on page 147.

---

**Receiving Alerts About Category and Policy Changes**

Category set updates trigger two types of alerts:

- Alerts about category changes
- Alerts about policies that have changed or been disabled as a result of category set changes.

---

**Step 1**  
Choose System Administration > Alerts.

**Step 2**  
Click Add Recipient and add email address (or multiple email addresses).

**Step 3**  
Decide which Alert Types and Alert Severities to receive.

**Step 4**  
Submit and Commit Changes.

---

**Responding to Alerts about URL Category Set Updates**

When you receive an alert about category set changes, you should do the following:

- Check policies and identities to be sure that they still meet your policy goals after category merges, additions, and deletions, and
- Consider modifying policies and identities to benefit from new categories and the added granularity of split categories.

**Related Topics**

- Understanding the Impacts of URL Category Set Updates, on page 147

---

**Filtering Transactions Using URL Categories**

The URL filtering engine lets you filter transactions in Access, Decryption, and Data Security Policies. When you configure URL categories for policy groups, you can configure actions for custom URL categories, if any are defined, and predefined URL categories.

The URL filtering actions you can configure depends on the type of policy group:

<table>
<thead>
<tr>
<th>Option</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Policies</td>
<td>Configuring URL Filters for Access Policy Groups, on page 152</td>
</tr>
<tr>
<td>Decryption Policies</td>
<td>Configuring URL Filters for Decryption Policy Groups, on page 155</td>
</tr>
</tbody>
</table>
Configuring URL Filters for Access Policy Groups

You can configure URL filtering for user-defined Access Policy groups and the Global Policy Group.

**Step 1** Choose Web Security Manager > Access Policies.

**Step 2** Click the link in the policies table under the URL Filtering column for the policy group you want to edit.

**Step 3** (Optional) In the Custom URL Category Filtering section, you can add custom URL categories on which to take action in this policy:

a) Click Select Custom Categories.

b) Choose which custom URL categories to include in this policy and click Apply.

Choose which custom URL categories the URL filtering engine should compare the client request against. The URL filtering engine compares client requests against included custom URL categories, and ignores excluded custom URL categories. The URL filtering engine compares the URL in a client request to included custom URL categories before predefined URL categories.

The custom URL categories included in the policy appear in the Custom URL Category Filtering section.

**Step 4** In the Custom URL Category Filtering section, choose an action for each included custom URL category.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Global Settings</td>
<td>Uses the action for this category in the Global Policy Group. This is the default action for user defined policy groups. Applies to user defined policy groups only. <strong>Note</strong> When a custom URL category is excluded in the global Access Policy, then the default action for included custom URL categories in user defined Access Policies is Monitor instead of Use Global Settings. You cannot choose Use Global Settings when a custom URL category is excluded in the global Access Policy.</td>
</tr>
<tr>
<td>Block</td>
<td>The Web Proxy denies transactions that match this setting.</td>
</tr>
<tr>
<td>Redirect</td>
<td>Redirects traffic originally destined for a URL in this category to a location you specify. When you choose this action, the Redirect To field appears. Enter a URL to which to redirect all traffic.</td>
</tr>
<tr>
<td>Action</td>
<td>Description</td>
</tr>
<tr>
<td>---------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Allow</td>
<td>Always allows client requests for web sites in this category. Allowed requests bypass all further filtering and malware scanning. Only use this setting for trusted web sites. You might want to use this setting for internal sites.</td>
</tr>
<tr>
<td>Monitor</td>
<td>The Web Proxy neither allows nor blocks the request. Instead, it continues to evaluate the client request against other policy group control settings, such as web reputation filtering.</td>
</tr>
<tr>
<td>Warn</td>
<td>The Web Proxy initially blocks the request and displays a warning page, but allows the user to continue by clicking a hypertext link in the warning page.</td>
</tr>
<tr>
<td>Quota-Based</td>
<td>As an individual user approaches either the volume or time quotas you have specified, a warning is displayed. When a quota is met, a block page is displayed. See Time Ranges and Quotas, on page 200.</td>
</tr>
<tr>
<td>Time-Based</td>
<td>The Web Proxy blocks or monitors the request during the time ranges you specify. See Time Ranges and Quotas, on page 200.</td>
</tr>
</tbody>
</table>

**Step 5**  
In the Predefined URL Category Filtering section, choose one of the following actions for each category:

- Use Global Settings
- Monitor
- Warn
- Block
- Time-Based
- Quota-Based

**Step 6**  
In the Uncategorized URLs section, choose the action to take for client requests to web sites that do not fall into a predefined or custom URL category. This setting also determines the default action for new and merged categories resulting from URL category set updates.

**Step 7**  
Submit and Commit Changes.

**What to do next**

- Exceptions to Blocking for Embedded and Referred Content, on page 153

**Exceptions to Blocking for Embedded and Referred Content**

A Website may embed or refer to content that is categorized differently than the source page, or that is considered an application. By default, embedded/referred content is blocked or monitored based on the action selected for its assigned category or application, regardless of how the source Website is categorized. For example, a News site could contain content, or a link to content, that categorized as Streaming Video and identified as being the application YouTube. According to your policy, Streaming Video and YouTube are both blocked, while News sites are not.
Requests for embedded content usually include the address of the site from which the request originated (this is known as the “referer” field in the request’s HTTP header). This header information is used to determine categorization of the referred content.

You can use this feature to define exceptions to the default actions for embedded/referred content; for example, to permit all content embedded in or referred to from News Websites, or from a custom category representing your intranet.

Referer-based exceptions are supported only in Access policies. To use this feature with HTTPS traffic, before defining exceptions in Access policies, you must configure HTTPS decryption of the URL Categories that you will select for exception. See Configuring URL Filters for Decryption Policy Groups, on page 155 for information about configuring HTTPS decryption. See Conditions and Restrictions for Exceptions to Blocking for Embedded and Referred Content, on page 442 for additional information about using this feature with HTTPS decryption.

---

**Step 1** On the URL Filtering page for a particular Access Policy (see Configuring URL Filters for Access Policy Groups, on page 152), click **Enable Exceptions** in the Exceptions to Blocking for Embedded/Referred Content section.

**Step 2** Click the **Click to select categories** link in the Set Exception for Content Referred by These Categories column, opening the URL filtering category referral-exception selection page.

**Step 3** From the Predefined and Custom URL Categories lists, select the categories for which you wish to define this referral exception, then click **Done** to return to the URL Filtering page for this Access Policy.

**Step 4** Choose an exception type from the Set Exception for this Referred Content drop-down list:

- **All embedded/referred content** – All content embedded in and referred from sites of the specified category types is not blocked, regardless of the categorization of that content.
- **Selected embedded/referred content** – After choosing this option, select specific Categories and Applications that are not blocked when originating from the specified URL categories.
- **All embedded/referred content except** – After choosing this option, all content embedded in and referred from sites of the specified category types is not blocked, except those URL categories and applications you now specify here. In other words, these types will remain blocked.

**Step 5** Submit and Commit Changes.

---

**What to do next**

You can elect to display “Permitted by Referrer” transaction data in the tables and charts provided on the following Reporting pages: URL Categories, Users and Web Sites, as well as related charts on the Overview page. See Choosing Which Data to Chart, on page 310 for more information about selecting chart-display options.
Configuring URL Filters for Decryption Policy Groups

You can configure URL filtering for user defined Decryption Policy groups and the global Decryption Policy group.

Step 1
Choose Web Security Manager > Decryption Policies.

Step 2
Click the link in the policies table under the URL Filtering column for the policy group you want to edit.

Step 3
(Optional) In the Custom URL Category Filtering section, you can add custom URL categories on which to take action in this policy:

a) Click Select Custom Categories.
b) Choose which custom URL categories to include in this policy and click Apply.

Choose which custom URL categories the URL filtering engine should compare the client request against. The URL filtering engine compares client requests against included custom URL categories, and ignores excluded custom URL categories. The URL filtering engine compares the URL in a client request to included custom URL categories before predefined URL categories.

The custom URL categories included in the policy appear in the Custom URL Category Filtering section.

Step 4
Choose an action for each custom and predefined URL category.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Global Setting</td>
<td>Uses the action for this category in the global Decryption Policy group. This is the default action for user defined policy groups. Applies to user defined policy groups only. When a custom URL category is excluded in the global Decryption Policy, then the default action for included custom URL categories in user defined Decryption Policies is Monitor instead of Use Global Settings. You cannot choose Use Global Settings when a custom URL category is excluded in the global Decryption Policy.</td>
</tr>
<tr>
<td>Pass Through</td>
<td>Passes through the connection between the client and the server without inspecting the traffic content.</td>
</tr>
<tr>
<td>Monitor</td>
<td>The Web Proxy neither allows nor blocks the request. Instead, it continues to evaluate the client request against other policy group control settings, such as web reputation filtering.</td>
</tr>
<tr>
<td>Decrypt</td>
<td>Allows the connection, but inspects the traffic content. The appliance decrypts the traffic and applies Access Policies to the decrypted traffic as if it were a plain text HTTP connection. By decrypting the connection and applying Access Policies, you can scan the traffic for malware.</td>
</tr>
<tr>
<td>Drop</td>
<td>Drops the connection and does not pass the connection request to the server. The appliance does not notify the user that it dropped the connection.</td>
</tr>
</tbody>
</table>

Note: If you want to block a particular URL category for HTTPS requests, choose to decrypt that URL category in the Decryption Policy group and then choose to block the same URL category in the Access Policy group.

Step 5
In the Uncategorized URLs section, choose the action to take for client requests to web sites that do not fall into a predefined or custom URL category.
This setting also determines the default action for new and merged categories resulting from URL category set updates.

Step 6 Submit and Commit Changes.

---

Configuring URL Filters for Data Security Policy Groups

You can configure URL filtering for user defined Data Security Policy groups and the Global Policy Group.

**Step 1** Choose Web Security Manager > Cisco Data Security.

**Step 2** Click the link in the policies table under the URL Filtering column for the policy group you want to edit.

**Step 3** (Optional) In the Custom URL Category Filtering section, you can add custom URL categories on which to take action in this policy:

a) Click Select Custom Categories.

b) Choose which custom URL categories to include in this policy and click Apply.

Choose which custom URL categories the URL filtering engine should compare the client request against. The URL filtering engine compares client requests against included custom URL categories, and ignores excluded custom URL categories. The URL filtering engine compares the URL in a client request to included custom URL categories before predefined URL categories.

The custom URL categories included in the policy appear in the Custom URL Category Filtering section.

**Step 4** In the Custom URL Category Filtering section, choose an action for each custom URL category.

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Use Global Setting</td>
<td>Uses the action for this category in the Global Policy Group. This is the default action for user defined policy groups.</td>
</tr>
<tr>
<td></td>
<td>Applies to user defined policy groups only.</td>
</tr>
<tr>
<td></td>
<td>When a custom URL category is excluded in the global Cisco Data Security Policy, then the default action for included custom URL categories in user defined Cisco Data Security Policies is Monitor instead of Use Global Settings. You cannot choose Use Global Settings when a custom URL category is excluded in the global Cisco Data Security Policy.</td>
</tr>
<tr>
<td>Allow</td>
<td>Always allows upload requests for web sites in this category. Applies to custom URL categories only.</td>
</tr>
<tr>
<td></td>
<td>Allowed requests bypass all further data security scanning and the request is evaluated against Access Policies.</td>
</tr>
<tr>
<td></td>
<td>Only use this setting for trusted web sites. You might want to use this setting for internal sites.</td>
</tr>
<tr>
<td>Monitor</td>
<td>The Web Proxy neither allows nor blocks the request. Instead, it continues to evaluate the upload request against other policy group control settings, such as web reputation filtering.</td>
</tr>
<tr>
<td>Block</td>
<td>The Web Proxy denies transactions that match this setting.</td>
</tr>
</tbody>
</table>

**Step 5** In the Predefined URL Category Filtering section, choose one of the following actions for each category:

- Use Global Settings
• Monitor
• Block

Step 6  In the Uncategorized URLs section, choose the action to take for upload requests to web sites that do not fall into a predefined or custom URL category. This setting also determines the default action for new and merged categories resulting from URL category set updates.

Step 7  Submit and Commit Changes.

What to do next

Related Topics
• Effects of URL Category Set Updates on Filtering Actions in Policies, on page 147.

Creating and Editing Custom URL Categories

You can create custom and external live-feed URL categories that describe specific host names and IP addresses. In addition, you can edit and delete existing URL categories. When you include these custom URL categories in the same Access, Decryption, or Cisco Data Security Policy group and assign different actions to each category, the action of the higher included custom URL category takes precedence.

Note
You can use no more than five External Live Feed files in these URL category definitions, and each file should contain no more than 1000 entries. Increasing the number of external feed entries causes performance degradation.

The Web Security appliance uses the first four characters of custom URL category names preceded by “c_” in the access logs. Consider the custom URL category name if you use Sawmill to parse the access logs. If the first four characters of the custom URL category include a space, Sawmill cannot properly parse the access log entry. Instead, only use supported characters in the first four characters. If you want to include the full name of a custom URL category in the access logs, add the %XF format specifier to the access logs.

Before you begin
Go to Security Services > Acceptable Use Controls to enable Acceptable Use Controls.

Step 1  Choose Web Security Manager > Custom and External URL Categories.
Step 2  To create a custom URL category, click Add Category. To edit an existing custom URL category, click the name of the URL category.
Step 3  Provide the following information.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category Name</td>
<td>Enter an identifier for this URL category. This name appears when you configure URL filtering for policy groups.</td>
</tr>
</tbody>
</table>
### Setting | Description
--- | ---
**List Order** | Specify the order of this category in the list of custom URL categories. Enter “1” for the first URL category in the list. The URL filtering engine evaluates a client request against the custom URL categories in the order specified.

**Category Type** | Choose Local Custom Category or External Live Feed Category.

**Routing Table** | Choose Management or Data. This choice is available only if “split routing” is enabled; that is, it is not available with local custom categories. See Enabling or Changing Network Interfaces, on page 27 for information about enabling split routing.

**Sites / Feed File Location** | If you choose Local Custom Category for the Category Type, provide the custom Sites:
- Enter one or more Site addresses for this custom category. You can enter multiple addresses separated by line breaks or commas. These addresses can be in any of the following formats:
  - IPv4 address, such as 10.1.1.0
  - IPv6 address, such as 2001:0db8::
  - IPv4 CIDR address, such as 10.1.1.0/24
  - IPv6 CIDR address, such as 2001:0db8::/32
  - Domain name, such as example.com
  - Hostname, such as crm.example.com
  - Partial hostname, such as .example.com; this will also match www.example.com
  - Regular expressions can be entered in the Advanced section, as described below.
- (Optional) Click Sort URLs to sort all addresses in the Sites field.

**Note** | It is possible to use the same address in multiple custom URL categories, but the order in which the categories are listed is relevant. If you include these categories in the same policy, and define different actions for each, the action defined for the category listed highest in the custom URL categories table will be the one applied.

**Note** | Once you sort the addresses, you cannot retrieve their original order.
<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Feed Location (cont.)</td>
<td>If you choose <strong>External Live Feed Category</strong> for the <strong>Category Type</strong>, provide the <strong>Feed File Location</strong> information; that is, locate and download the file containing the addresses for this custom category:</td>
</tr>
<tr>
<td></td>
<td><strong>1.</strong> Select either <strong>Cisco Feed Format</strong>, or <strong>Office 365 Feed Format</strong>, or <strong>Office 365 Web Service</strong>, and provide the appropriate feed-file information.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Cisco Feed Format:</strong></td>
</tr>
<tr>
<td></td>
<td>• Choose the transport protocol to be used—either HTTPS or HTTP—and then enter the URL of the live-feed file. This file must be a comma-separated values (.csv)-formatted file. See <strong>External Feed-file Formats, on page 161</strong> for more information about this file.</td>
</tr>
<tr>
<td></td>
<td>• Optionally, provide Authentication credentials in the <strong>Advanced</strong> section. Provide a Username and Passphrase to be used for connection to the specified feed server.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Office 365 Feed Format:</strong></td>
</tr>
<tr>
<td></td>
<td>• Enter the <strong>Office 365 Feed Location</strong> (URL) of the live-feed file.</td>
</tr>
<tr>
<td></td>
<td>This file must be an XML-formatted file; see <strong>External Feed-file Formats, on page 161</strong> for more information about this file.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Office 365 Web Service</strong></td>
</tr>
<tr>
<td></td>
<td>Enter the web service URL. It must not contain a ClientRequestId, and have JSON as the format.</td>
</tr>
<tr>
<td></td>
<td><strong>2.</strong> For Cisco Feed Format and Office 365 Feed formats, click <strong>Get File</strong> to test the connection to the feed server, and then parse and download the feed file from the server.</td>
</tr>
<tr>
<td></td>
<td>Progress is displayed in the text box below the <strong>Get File</strong> button. If an error occurs, the problem is indicated and must be rectified before trying again. Refer to <strong>Issues Downloading An External Live Feed File, on page 446</strong> for additional information about possible errors.</td>
</tr>
<tr>
<td></td>
<td>For the Office 365 Web Service, click <strong>Start Test</strong> to initiate the service and download URLs and IPs.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>You can use no more than five External Live Feed files in these URL category definitions, and each file should contain no more than 1000 entries. Increasing the number of external feed entries causes performance degradation.</td>
</tr>
<tr>
<td><strong>Tip</strong></td>
<td>After you save your changes to this live-feed category, you can click <strong>View</strong> in the <strong>Feed Content</strong> column for this entry on the Custom and External URL Categories page (<strong>Web Security Manager &gt; Custom and External URL Categories</strong>) to open a window that displays the addresses contained in the Cisco Feed Format or Office 365 Feed Format feed file you downloaded here.</td>
</tr>
</tbody>
</table>
If you choose Local Custom Category for the Category Type, you can enter regular expressions in this section to specify additional sets of addresses. You can use regular expressions to specify multiple addresses that match the patterns you enter.

Note: The URL filtering engine compares URLs with addresses entered in the Sites field first. If the URL of a transaction matches an entry in the Sites field, it is not compared to any expression entered here.

See Regular Expressions, on page 167 for more information about using regular expressions.

### Auto Update the Feed

Choose a feed update option:

- **Do not auto update**
- **Every n HH:MM**: for example, enter 00:05 for five minutes. However, note that updating frequently can affect WSA performance.

Note: If the available feed file is different than the currently downloaded file, the newer file will be downloaded and the download time updated. Otherwise, the file is not fetched, and a “304 not modified” entry is logged.

### What to do next

**Step 4** Submit and Commit Changes.

---

**What to do next**

**Related Topics**

- Regular Expressions, on page 167.
- Customizing Access Logs, on page 369.
- Problems with Custom and External URL Categories, on page 446

---

**Address Formats and Feed-file Formats for Custom and External URL Categories**

When creating and editing Custom and External URL Categories, you must provide one or more network addresses, whether for a Local Custom Category, or in an External Live Feed Category feed file. In each instance, you can enter multiple addresses separated by line breaks or commas. These addresses can be in any of the following formats:

- IPv4 address, such as 10.1.1.0
- IPv6 address, such as 2001:0db8::
- IPv4 CIDR address, such as 10.1.1.0/24
- IPv6 CIDR address, such as 2001:0db8::/32
- Domain name, such as example.com
- Hostname, such as crm.example.com
• Partial hostname, such as .example.com; this will also match www.example.com

• Regular expressions to specify multiple addresses that match the provided patterns (see Regular Expressions, on page 167 for more information about using regular expressions)

It is possible to use the same address in multiple custom URL categories, but the order in which the categories are listed is relevant. If you include these categories in the same policy, and define different actions for each, the action defined for the category listed highest in the custom URL categories table will be the one applied.

External Feed-file Formats

If you select External Live Feed Category for the Category Type when Creating and Editing Custom and External URL Categories, you must select the feed format (Cisco Feed Format or Office 365 Feed Format) and then provide a URL to the appropriate feed-file server.

The expected format for each feed file is as follows:

• **Cisco Feed Format** – This must be a comma-separated values (.csv) file; that is, a text file with a .csv extension. Each entry in the .csv file must be on a separate line, formatted as address/comma/address type (for example: www.cisco.com,site or ad2.*.com,regex). Valid address types are site and regex. Here is an excerpt from a Cisco Feed Format .csv file:

  - www.cisco.com,site
  - \.xyz,regex
  - ad2.*.com,regex
  - www.trafficholder.com,site
  - 2000:1:11:1:1::200,site

  **Note** Do not include http:// or https:// as part of any site entry in the file, or an error will occur. In other words, www.example.com is parsed correctly, while http://www.example.com produces an error.

• **Office 365 Feed Format** – This is an XML file located on a Microsoft Office 365 server, or a local server to which you saved the file. It is provided by the Office 365 service and cannot be modified. The network addresses in the file are enclosed by XML tags, following this structure: products > product > addresslist > address. In the current implementation, an addresslist type can be IPv6, IPv4, or URL (which can include domains and regex patterns). Here is a snippet of an Office 365 feed file:

  ```xml
  <products updated="4/15/2016">
    <product name="o365">
      <addresslist type="IPv6">
        <address>2603:1040:401::d:80</address>
        <address>2603:1040:401::a</address>
  ```
Filtering Adult Content

You can configure the Web Security appliance to filter adult content from some web searches and websites. To enforce safe search and site content ratings, the AVC engine takes advantage of the safe mode feature implemented at a particular website by rewriting URLs and/or web cookies to force the safety mode to be on.

The following features filter adult content:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enforce safe searches</td>
<td>You can configure the Web Security appliance so that outgoing search requests appear to search engines as safe search requests. This can prevent users from bypassing acceptable use policies using search engines.</td>
</tr>
</tbody>
</table>
Some content sharing sites allow users to restrict their own access to the adult content on these sites by either enforcing their own safe search feature or blocking access to adult content, or both. This classification feature is commonly called content ratings.

**Note**
Any Access Policy that has either the safe search or site content ratings feature enabled is considered a safe browsing Access Policy.

### Enforcing Safe Searches and Site Content Ratings

When you enable Safe Search or Site Content Rating, the AVC Engine is tasked with identifying applications for safe browsing. As one of the criteria, the AVC engine will scan the response body to detect a search application. As a result, the appliance will not forward range headers.

### Step 1
Choose **Web Security Manager > Access Policies**.

### Step 2
Click the link under the URL Filtering column for an Access Policy group or the Global Policy Group.

### Step 3
When editing a user-defined Access Policy, choose **Define Content Filtering Custom Settings** in the Content Filtering section.

### Step 4
Click the **Enable Safe Search** check box to enable the safe search feature.

### Step 5
Choose whether to block users from search engines that are not currently supported by the Web Security appliance safe search feature.

### Step 6
Click the **Enable Site Content Rating** check box to enable the site content ratings feature.

### Step 7
Choose whether to block all adult content from the supported content ratings websites or to display the end-user URL filtering warning page.

**Note**
When the URL of one of the supported search engines or supported content ratings websites is included in a custom URL category with the Allow action applied, no search results are blocked and all content is visible.

### Step 8
Submit and Commit Changes.

---

**What to do next**

**Related Topics**

- Warning Users and Allowing Them to Continue, on page 165.
Logging Adult Content Access

By default, the access logs include a safe browsing scanning verdict inside the angled brackets of each entry. The safe browsing scanning verdict indicates whether or not either the safe search or site content ratings feature was applied to the transaction. You can also add the safe browsing scanning verdict variable to the access logs or W3C access logs:

- Access logs: %XS
- W3C access logs: x-request-rewrite

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ensrch</td>
<td>The original client request was unsafe and the safe search feature was applied.</td>
</tr>
<tr>
<td>encrt</td>
<td>The original client request was unsafe and the site content ratings feature was applied.</td>
</tr>
<tr>
<td>unsupp</td>
<td>The original client request was to an unsupported search engine.</td>
</tr>
<tr>
<td>err</td>
<td>The original client request was unsafe, but neither the safe search nor the site content ratings feature could be applied due to an error.</td>
</tr>
<tr>
<td>-</td>
<td>Neither the safe search nor the site content ratings feature was applied to the client request because the features were bypassed (for example, the transaction was allowed in a custom URL category) or the request was made from an unsupported application.</td>
</tr>
</tbody>
</table>

Requests blocked due to either the safe search or site content rating features, use one of the following ACL decision tags in the access logs:

- BLOCK_SEARCH_UNSAFE
- BLOCK_CONTENT_UNSAFE
- BLOCK_UNSUPPORTED_SEARCH_APP
- BLOCK_CONTINUE_CONTENT_UNSAFE

Related Topics

- ACL Decision Tags, on page 355.

Redirecting Traffic in the Access Policies

You can configure the Web Security appliance to redirect traffic originally destined for a URL in a custom URL category to a location you specify. This allows you to redirect traffic at the appliance instead of at the destination server. You can redirect traffic for a custom Access Policy group or the Global Policy Group

**Before you begin**

To redirect traffic you must define at least one custom URL category.

**Step 1** Choose Web Security Manager > Access Policies.

**Step 2** Click the link under the URL Filtering column for an Access Policy group or the Global Policy Group.

**Step 3** In the Custom URL Category Filtering section, click Select Custom Categories.
Step 4  In the **Select Custom Categories for this Policy** dialog box, choose **Include in policy** for the custom URL category you want to redirect.

Step 5  Click **Apply**.

Step 6  Click the **Redirect** column for the custom category you want to redirect.

Step 7  Enter the URL to which you want to redirect traffic in the **Redirect To** field for the custom category.

Step 8  Submit and Commit Changes.

**Note**  Beware of infinite loops when you configure the appliance to redirect traffic.

---

**What to do next**

**Related Topics**

- [Creating and Editing Custom URL Categories, on page 157](#)

---

**Logging and Reporting**

When you redirect traffic, the access log entry for the originally requested website has an ACL tag that starts with REDIRECT_CUSTOMCAT. Later in the access log (typically the next line) appears the entry for the website to which the user was redirected.

The reports displayed on the Reporting tab display redirected transactions as “Allowed.”

---

**Warning Users and Allowing Them to Continue**

You can warn users that a site does not meet the organization’s acceptable use policies. Users are tracked in the access log by user name if authentication has made a user name available, and tracked by IP address if no user name is available.

You can warn and allow users to continue using one of the following methods:

- Choose the Warn action for a URL category in an Access Policy group or
- Enable the site content ratings feature and warn users that access adult content instead of blocking them.

---

**Configuring Settings for the End-User Filtering Warning Page**

**Note**

- The warn and continue feature only works for HTTP and decrypted HTTPS transactions. It does not work with native FTP transactions.
- When the URL filtering engine warns users for a particular request, it provides a warning page that the Web Proxy sends to the end user. However, not all websites display the warning page to the end user. When this happens, users are blocked from the URL that is assigned the Warn option without being given the chance to continue accessing the site anyway.

---

Step 1  Choose **Security Services > End-User Notification**.
Step 2: Click Edit Settings.

Step 3: Configure the following settings on the End-User Filtering Warning page:

<table>
<thead>
<tr>
<th>Option</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Between Warning</td>
<td>The Time Between Warning determines how often the Web Proxy displays the end-user URL filtering warning page for each URL category per user. This setting applies to users tracked by username and users tracked by IP address. Specify any value from 30 to 2678400 seconds (one month). Default is 1 hour (3600 seconds).</td>
</tr>
<tr>
<td>Custom Message</td>
<td>The custom message is text you enter that appears on every end-user URL filtering warning page. Include some simple HTML tags to format the text.</td>
</tr>
</tbody>
</table>

Step 4: Click Submit.

---

Creating Time Based URL Filters

You can configure how the Web Security appliance handles requests for URLs in particular categories differently based on time and day.

Before you begin

Go to the Web Security Manager > Defined Time Range page to define at least one time range.

Step 1: Choose Web Security Manager > Access Policies.
Step 2: Click the link in the policies table under the URL Filtering column for the policy group you want to edit.
Step 3: Select Time-Based for the custom or predefined URL category you want to configure based on time range.
Step 4: In the In Time Range field, choose the defined time range to use for the URL category.
Step 5: In the Action field, choose the action to enact on transactions in this URL category during the defined time range.
Step 6: In the Otherwise field, choose the action to enact on transactions in this URL category outside the defined time range.
Step 7: Submit and Commit Changes.
What to do next

Understanding Unfiltered and Uncategorized Data

When viewing URL statistics on the Reporting > URL Categories page, it is important to understand how to interpret the following data:

<table>
<thead>
<tr>
<th>Data Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Filtering Bypassed</td>
<td>Represents policy, port, and admin user agent blocking that occurs before URL filtering.</td>
</tr>
<tr>
<td>Uncategorized URL</td>
<td>Represents all transactions for which the URL filtering engine is queried, but no category is matched.</td>
</tr>
</tbody>
</table>

URL Category Logging in Access Logs

The access log file records the URL category for each transaction in the scanning verdict information section of each entry.

Regular Expressions

The Web Security appliance uses a regular expression syntax that differs slightly from the regular expression syntax used by other Velocity pattern-matching engine implementations. Further, the appliance does not support using a backward slash to escape a forward slash. If you need to use a forward slash in a regular expression, simply type the forward slash without a backward slash.

Note

Technically, AsyncOS for Web uses the Flex regular expression analyzer.
You can use regular expressions in the following locations:

- **Custom URL categories for Access Policies.** When you create a custom URL category to use with Access Policy groups, you can use regular expressions to specify multiple web servers that match the pattern you enter.
- **Custom user agents to block.** When you edit the applications to block for an Access Policy group, you can use regular expressions to enter specific user agents to block.

**Note**
Regular expressions that perform extensive character matching consume resources and can affect system performance. For this reason, regular expressions should be cautiously applied.

**Related Topics**
- Creating and Editing Custom URL Categories, on page 157

### Forming Regular Expressions

Regular expressions are rules that typically use the word “matches” in the expressions. They can be applied to match specific URL destinations or web servers. For example, the following regular expression matches any pattern containing “blocksite.com”:

```
\.blocksite\..com
```

Consider the following regular expression example:

```
servers[0-9]\..example\..com
```

In this example, `servers[0-9]` matches `server0, server1, server2, ..., server9` in the domain `example.com`.

In the following example, the regular expression matches files ending in `.exe`, `.zip` and `.bin` in the downloads directory.

```
/downloads/.*\.(exe|zip|bin)
```

**Note**
You must enclose regular expressions that contain blank spaces or non-alphanumeric characters in ASCII quotation marks.

### Guidelines for Avoiding Validation Failures

Important: Regular expressions that return more that 63 characters will fail and produce an invalid-entry error. Please be sure to form regular expressions that do not have the potential to return more than 63 characters.

Follow these guidelines to minimize validation failures:

- Use literal expressions rather than wildcards and bracketed expressions whenever possible. A literal expression is essentially just straight text such as “It’s as easy as ABC123”. This is less likely to fail
than using “It’s as easy as \{A-C\}(\{1-3\}\{3\})”. The latter expression results in the creation of non-deterministic finite automata (NFA) entries, which can dramatically increase processing time.

- Avoid the use of an unescaped dot whenever possible. The dot is a special regular-expression character that means match any character except for a newline. If you want to match an actual dot, for example, as in “url.com”, then escape the dot using the \ character, as in “url\.com”. Escaped dots are treated as literal entries and therefore do not cause issues.

- Any unescaped dot in a pattern that will return more than 63 characters after the dot will be disabled by the pattern-matching engine, and an alert to that effect will be sent to you, and you will continue to receive an alert following each update until you correct or replace the pattern.

Similarly, use more specific matches rather than unescaped dots wherever possible. For example, if you want to match a URL that is followed by a single digit, use “url\{0-9\}” rather than “url.”.

- Unescaped dots in a larger regular expression can be especially problematic and should be avoided. For example, “Four score and seven years ago our fathers brought forth on this continent, a new nation, conceived in Liberty, and dedicated to the proposition that all men are created .qual” may cause a failure. Replacing the dot in “.qual” with the literal “equal” should resolve the problem.

Also, an unescaped dot in a pattern that will return more than 63 characters after the dot will be disabled by the pattern-matching engine. Correct or replace the pattern.

- You cannot use “.\*” to begin or end a regular expression. You also cannot use “./” in a regular expression intended to match a URL, nor can you end such an expression with a dot.

- Combinations of wildcards and bracket expressions can cause problems. Eliminate as many combinations as possible. For example, “id:\{A-F0-9\}\{8\}-\{A-F0-9\}\{4\}-\{A-F0-9\}\{4\}-\{A-F0-9\}\{4\}-\{A-F0-9\}\{12\}\ Gecko/20100101 Firefox/9.0.1\$” may cause a failure, while “Gecko/20100101 Firefox/9.0.1\$” will not. The latter expression does not include any wildcards or bracketed expressions, and both expressions use only escaped dots.

When wildcards and bracketed expressions cannot be eliminated, try to reduce the expression’s size and complexity. For example, “[0-9a-z]{64}” may cause a failure. Changing it to something smaller or less complex, such as “[0-9]{64}” or “[0-9a-z]{40}” may resolve the problem.

If a failure occurs, try to resolve it by applying the previous rules to the wildcard (such as *+, + and .) and bracketed expressions.

---

**Note**

You can use the CLI option **advancedproxyconfig > miscellaneous > Do you want to enable URL lower case conversion for velocity regex?** to enable or disable default regex conversion to lower case for case-insensitive matching. Use if you are experiencing issues with case sensitivity. See [Web Security Appliance CLI Commands](#) on page 467 for more information about this option.
Regular Expression Character Table

<table>
<thead>
<tr>
<th>Meta-character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>.</td>
<td>Matches any single character, except the newline character (0x0A). For example, the regular expression r.t matches the strings rat, rut, r t, but not root. Be wary of using unescaped dots in long patterns, and especially in the middle of longer patterns. See Guidelines for Avoiding Validation Failures, on page 168 for more information.</td>
</tr>
<tr>
<td>*</td>
<td>Matches zero or more occurrences of the character immediately preceding. For example, the regular expression .* means match any string of characters, and [0-9]* matches any string of digits. Be wary of using this meta-character, especially in conjunction with the dot character. Any pattern containing an unescaped dot that returns more than 63 characters after the dot will be disabled. See Guidelines for Avoiding Validation Failures, on page 168 for more information.</td>
</tr>
<tr>
<td>\</td>
<td>The escape character; it means treat the following meta-character as an ordinary character. For example, ^ is used to match the caret character (^) rather than the beginning of a line. Similarly, the expression . is used to match an actual dot rather than any single character.</td>
</tr>
<tr>
<td>^</td>
<td>Matches the beginning of a line. For example, the regular expression ^When in matches the beginning of the string “When in the course of human events” but not the string “What and when in the”.</td>
</tr>
<tr>
<td>$</td>
<td>Matches the end of a line or string. For example, b$. matches any line or string that ends with “b.”</td>
</tr>
<tr>
<td>+</td>
<td>Matches one or more occurrences of the character or regular expression immediately preceding. For example, the regular expression 9+ matches 9, 99, and 999.</td>
</tr>
<tr>
<td>?</td>
<td>Matches zero or one occurrence of the preceding pattern element. For example, colour?r matches both “colour” and “color” since the “u” is optional.</td>
</tr>
<tr>
<td>( )</td>
<td>Treat the expression between the left and right parens as a group, limiting the scope of other meta-characters. For example, (abc)+ matches one or more occurrences of the string “abc”; such as, “abcabcabc” or “abc123” but not “abab” or “ab123”.</td>
</tr>
<tr>
<td></td>
<td>Logical OR: matches the preceding pattern or the following pattern. For example (him</td>
</tr>
<tr>
<td>Meta-character</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-------------</td>
</tr>
<tr>
<td>[ ]</td>
<td>Matches any one of the characters between the brackets. For example, the regular expression r[aou]t matches “rat”, “rot”, and “rut”, but not “ret”. Ranges of characters are specified by a beginning character, a hyphen, and an ending character. For example, the pattern [0-9] means match any digit. Multiple ranges can be specified as well. The pattern [A-Za-z] means match any upper- or lower-case letter. To match any character except those in the range (that is, the complementary range), use a caret as the first character after the opening bracket. For example, the expression[^269A-Z] matches any characters except 2, 6, 9, and uppercase letters.</td>
</tr>
<tr>
<td>{ }</td>
<td>Specifies the number of times to match the previous pattern. For example: D{1,3} matches one to three occurrences of the letter D Matches a specific number {n} or a minimum number {n,} of instances of the preceding pattern. For example, the expression A{0-9}{3} matches “A” followed by exactly three digits. That is, it matches “A123” but not “A1234”. The expression [0-9]{4,} matches any sequence of four or more digits.</td>
</tr>
<tr>
<td>“…”</td>
<td>Literally interpret any characters enclosed within the quotation marks.</td>
</tr>
</tbody>
</table>

### URL Category Descriptions

This section lists the URL categories for Cisco Web Usage Controls. The tables also include the abbreviated URL category names that may appear in the Web Reputation filtering and anti-malware scanning section of an access log file entry.

**Note**

In the access logs, the URL category abbreviations for Cisco Web Usage Controls include the prefix “IW_” before each abbreviation so that the “art” category becomes “IW_art.”

Overview of Policies: Control Intercepted Internet Requests

When the user creates a web request the configured Web Security Appliance intercepts the requests and manages the process of which the request travels to get to its final outcome, be that accessing a particular website, an email or even accessing an online application. In configuring the Web Security Appliance policies are created to define the criteria and actions of requests made by the user.

Policies are the means by which the Web Security Appliance identifies and controls web requests. When a client sends a web request to a server, the Web Proxy receives the request, evaluates it, and determines to which policy it belongs. Actions defined in the policy are then applied to the request.

The Web Security Appliance uses multiple policy types to manage different aspects of web requests. Policy types might fully manage transactions by themselves or pass transactions along to other policy types for additional processing. Policy types can be groups by the functions they perform, such as access, routing, or security.

AsyncOS evaluates transactions based on policies before it evaluates external dependencies to avoid unnecessary external communication from the appliance. For example, if a transaction is blocked based on a policy that blocks uncategorized URLs, the transaction will not fail based on a DNS error.
Intercepted HTTP/HTTPS Request Processing

The following diagram depicts the flow of an intercepted Web request as it is processed by the appliance.

Figure 3: HTTP/HTTPS Transaction Flow

Also see the following diagrams depicting various transaction processing flows:

Managing Web Requests Through Policies Best Practices

If you want to use Active Directory user objects to manage web requests, do not use primary groups as criteria. Active Directory user objects do not contain the primary group.

Policies

</table>

Each policy type uses a policy table to store and manage its policies. Each policy table comes with a predefined, global policy, which maintains default actions for a policy type. Additional, user-defined policies are created and added to the policy table as required. Policies are processed in the order in which they are listed in the policy table.

Individual policies define the user-request types they manage, and the actions they perform on those requests. Each policy definition has two main sections:

- **Identification Profiles and Users** – Identification Profiles are used in policy membership criteria and are particularly important as they contain many options for identifying web transaction. They also share many properties with policies.
- **Advanced** – The criteria used to identify users to which the policy applies. One or more criteria can be specified in a policy, and all must be match for the criteria to be met.
  - **Protocols** – Allow the transfer of data between various networking devices such as http, https, ftp, etc.
  - **Proxy Ports** – the numbered port by which the request accesses the web proxy,
  - **Subnets** – The logical grouping of connected network devices (such as geographic location or Local Area Network [LAN]), where the request originated
  - **Time Range** – Time ranges can be created for use in policies to identify or apply actions to web requests based on the time or day the requests were made. The time ranges are created as individual units.
  - **URL Categories** – URL categories are predefined or custom categories of websites, such as News, Business, Social Media, etc. These can be used to identify or apply actions to web requests.
  - **User Agents** – These are the client applications (such as updaters and Web browsers) used to make requests. You can define policy criteria based on user agents, and you can specify control settings based on user agents. You can also exempt user agents from authentication, which is useful for
applications that cannot prompt for credentials. You can define custom user agents but cannot re-use these definitions other policies.

---

**Note**

When you define multiple membership criteria, the client request must meet all criteria to match the policy.

---

**Policy Order**

The order in which policies are listed in a policy table determines the priority with which they are applied to Web requests. Web requests are checked against policies beginning at the top of the table and ending at the first policy matched. Any policies below that point in the table are not processed.

If no user-defined policy is matched against a Web request, then the global policy for that policy type is applied. Global policies are always positioned last in Policy tables and cannot be re-ordered.

The following diagram depicts the flow of a client request through the Access policies table.
Creating a Policy

Before you begin

- Enable the appropriate proxy:
  - Web Proxy (for HTTP, decrypted HTTPS, and FTP)
  - HTTPS Proxy
  - SOCKS Proxy
- Create associated Identification Profiles.
- Understand Policy Order, on page 188.
- (Encrypted HTTPS only) Upload or generate a Certificate and Key.
• (Data Security only) Enable Cisco Data Security Filters Settings.
• (External DLP only) Define an External DLP server.
• (Routing only) Define the associated upstream proxy on the Web Security appliance.
• (Optional) Create associated client applications.
• (Optional) Create associated time ranges. See Time Ranges and Quotas, on page 200.
• (Optional) Create associated URL categories. See Creating and Editing Custom URL Categories, on page 157.

---

**Step 1**

In the **Policy Settings** section, use the **Enable Identity** check box to enable this policy, or to quickly disable it without deleting it.

**Step 2**

Assign a unique policy **Name**.

**Step 3**

A **Description** is optional.

**Step 4**

From the Insert Above drop-down list, choose where this policy is to appear in the table.

**Note**

Arrange policies such that, from top to bottom of the table, they are in most-restrictive to least-restrictive order. See **Policy Order**, on page 188 for more information.

**Step 5**

In the **Policy Expires** area, check the **Set Expiration for Policy** check box to set the expiry time for the policy. Enter the date and time for the policy expiration that you want to set. The policies are automatically disabled once they exceed the set expiry time.

**Note**

System checks the policies every minute to disable the policies which get expired during the minute. For example, if a policy is set to expire at 11:00, at maximum it will be disabled by 11:01.

Policy Expiry feature is applicable only for Access, Decryption, and Web Traffic Tap policies.

You will receive an email prior to three days of the policy expiry and another one upon policy expiry.

**Note**

To receive alerts, you must enable Policy Expiration alerts using **System Administration > Alerts**. See **Policy Expiration Alerts**, on page 409

You can set the policy expiration time through Cisco Content Security Management Appliances as well. The policies will get expired after the set expiry time but will not be shown as disabled in the Cisco Content Security Management Appliances GUI.

Once you set the policy expiration feature, the expiry happens based on the appliance's local time settings.

**Step 6**

In the **Policy Member Definition** section, specify how user and group membership is defined: from the Identification Profiles and Users list, choose one of the following:

- **All Identification Profiles** – This policy will apply to all existing profiles. You must also define at least one Advanced option.
- **Select One or More Identification Profiles** – A table for specifying individual Identification Profiles appears, one profile-membership definition per row.

**Step 7**

If you chose **All Identification Profiles**:

a) Specify the authorized users and groups to which this policy applies by selecting one of the following options:

- **All Authenticated Users** – All users identified through authentication or transparent identification.
- **Selected Groups and Users** – Specified users and groups are used.

To add or edit the specified ISE Secure Group Tags (SGTs) and the specified Users, click the link following the appropriate label. For example, click the list of currently specified users to edit that list. See **Adding and Editing Secure Group Tags for a Policy**, on page 192 for more information.
• **Guests** – Users connected as guests and those failing authentication.
• **All Users** – All clients, whether authenticated or not. If this option is selected, at least one **Advanced** option also must be provided.

**Step 8**  If you chose **Select One or More Identification Profiles**, a profile-selection table appears.

a) Choose an Identification Profile from the Select Identification Profile drop-down list in the Identification Profiles column.

b) Specify the Authorized Users and Groups to which this policy applies:

- **All Authenticated Users** – All users identified through authentication or transparent identification.
- **Selected Groups and Users** – Specified users and groups are used.

To add or edit the specified ISE Secure Group Tags (SGTs) and the specified Users, click the link following the appropriate label. For example, click the list of currently specified users to edit that list. See Adding and Editing Secure Group Tags for a Policy, on page 192 for more information.

- **Guests** – Users connected as guests and those failing authentication.

c) To add a row to the profile-selection table, click **Add Identification Profile**. To delete a row, click the trash-can icon in that row.

Repeat steps (a) through (c) as necessary to add all desired Identification Profiles.

**Step 9**  Expand the **Advanced** section to define additional group membership criteria. (This step may be optional depending on selection in the **Policy Member Definition** section. Also, some of the following options will not be available, depending on the type of policy you are configuring.)

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocols</td>
<td>Select the protocols to which this policy will apply. All others means any protocol not selected. If the associated identification profile applies to specific protocols, this policy applies to those same protocols.</td>
</tr>
<tr>
<td>Proxy Ports</td>
<td>Applies this policy only to traffic using specific ports to access the web proxy. Enter one or more port numbers, separating multiple ports with commas. For explicit forward connections, this is the port configured in the browser. For transparent connections, this is the same as the destination port. <strong>Note</strong> If the associated identification profile applies only to specific proxy ports, you cannot enter proxy ports here.</td>
</tr>
<tr>
<td>Subnets</td>
<td>Applies this policy only to traffic on specific subnets. Select Specify subnets and enter the specific subnets, separated by commas. Leave <strong>Use subnets from selected Identities</strong> selected if you do not want additional filtering by subnet. <strong>Note</strong> If the associated identity applies to specific subnets, you can further restrict the application of this policy to a subset of the addresses to which the identity applies.</td>
</tr>
</tbody>
</table>
### Advanced Option | Description
--- | ---
Time Range | You can apply time ranges for policy membership:
- **Time Range** – Choose a previously defined time range (Time Ranges and Quotas, on page 200).
- **Match Time Range** – Use this option to indicate whether this time range is inclusive or exclusive. In other words, whether to match only during the range specified, or at all times except those in the specified range.

URL Categories | You can restrict policy membership by specific destinations (URLs) and by categories of URLs. Select all desired custom and predefined categories. See Creating and Editing Custom URL Categories, on page 157 for information about custom categories.

User Agents | You can select specific user agents, and define custom agents using regular expressions, as part of membership definition for this policy.
- **Common User Agents**
  - **Browsers** – Expand this section to select various Web browsers.
  - **Others** – Expand this section to select specific non-browser agents such as application updaters.
- **Custom User Agents** – You can enter one or more regular expressions, one per line, to define custom user agents.
- **Match User Agents** – Use this option to indicate whether these user-agent specifications are inclusive or exclusive. In other words, whether membership definition includes only the selected user agents, or specifically excludes the selected user agents.

---

### Adding and Editing Secure Group Tags for a Policy

To change the list of Secure Group Tags (SGTs) assigned to a particular Identification Profile in a policy, click the link following the ISE Secure Group Tags label in the Selected Groups and Users list on the Add/Edit Policy page. (See Creating a Policy, on page 189.) This link is either “No tags entered,” or it is a list of currently assigned tags. The link opens the Add/Edit Secure Group Tags page.

All SGTs currently assigned to this policy are listed in the Authorized Secure Group Tags section. All SGTs available from the connected ISE server are listed in the Secure Group Tag Search section.

**Step 1**
To add one or more SGTs to the Authorized Secure Group Tags list, select the desired entries in the Secure Group Tag Search section, and then click **Add**.

The SGTs already added, are highlighted in green. To quickly find a specific SGT in the list of those available, enter a text string in the **Search** field.

**Step 2**
To remove one or more SGTs from the Authorized Secure Group Tags list, select those entries and then click **Delete**.

**Step 3**
Click Done to return to the Add/Edit Group page.

---

**What to do next**

- **Related Topics**
Policy Configuration

Each row in a table of policies represents a policy definition, and each column displays current contains a link to a configuration page for that element of the policy.

**Note**

Of the following policy-configuration components, you can specify the “Warn” option only with URL Filtering.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocols and User Agents</td>
<td>Used to control policy access to protocols and configure blocking for particular client applications, such as instant messaging clients, web browsers, and Internet phone services. You can also configure the appliance to tunnel HTTP CONNECT requests on specific ports. With tunneling enabled, the appliance passes HTTP traffic through specified ports without evaluating it.</td>
</tr>
<tr>
<td>URL Filtering</td>
<td>AsyncOS for Web allows you to configure how the appliance handles a transaction based on the URL category of a particular HTTP or HTTPS request. Using a predefined category list, you can choose to block, monitor, warn, or set quota-based or time-based filters. You can also create custom URL categories and then choose to block, redirect, allow, monitor, warn, or apply quota-based or time-based filters for Websites in the custom categories. See Creating and Editing Custom URL Categories, on page 157 for information about creating custom URL categories. In addition, you can add exceptions to blocking of embedded or referred content.</td>
</tr>
<tr>
<td>Applications</td>
<td>The Application Visibility and Control engine (AVC) engine is an Acceptable Use policy component that inspects Web traffic to gain deeper understanding and control of Web traffic used for applications. The appliance allows the Web Proxy to be configured to block or allow applications by Application Types, and by individual applications. You can also apply controls to particular application behaviors, such as file transfers, within a particular application. See Managing Access to Web Applications, on page 263 for configuration information.</td>
</tr>
<tr>
<td>Objects</td>
<td>These options let you configure the Web Proxy to block file downloads based on file characteristics, such as file size, file type, and MIME type. An object is, generally, any item that can be individually selected, uploaded, downloaded and manipulated. See Access Policies: Blocking Objects, on page 194 for information about specifying blocked objects.</td>
</tr>
</tbody>
</table>
Option | Description
--- | ---
Anti-Malware and Reputation | Web reputation filters allow for a web-based reputation score to be assigned to a URL to determine the probability of it containing URL-based malware. Anti-malware scanning identifies and stops web-based malware threats. Advanced Malware Protection identifies malware in downloaded files.

The Anti-Malware and Reputation policy inherits global settings respective to each component. Within Security Services > Anti-Malware and Reputation, malware categories can be customized to monitor or block based on malware scanning verdicts and web reputation score thresholds can be customized. Malware categories can be further customized within a policy. There are also global settings for file reputation and analysis services.

For more information, see Anti-Malware and Reputation Settings in Access Policies, on page 237 and Configuring File Reputation and Analysis Features, on page 250.

Access Policies: Blocking Objects

You can use the options on the Access Policies: Objects page to block file downloads based on file characteristics, such as file size, file type, and MIME type. An object is, generally, any item that can be individually selected, uploaded, downloaded and manipulated.

You can specify a number of types of objects to be blocked by each individual Access policy, and by the Global policy. These object types include Archives, Document Types, Executable Code, Web Page Content, and so on.

**Step 1** On the Access Policies page (Web Security Manager > Access Policies), click the link in the Objects column of the row representing the policy you wish to edit.

**Step 2** Choose the desired type of object blocking for this Access policy:

- **Use Global Policy Objects Blocking Settings** – This policy uses the object-blocking settings defined for the Global Policy; these settings are displayed in read-only mode. Edit the settings for the Global Policy to change them.

- **Define Custom Objects Blocking Settings** – You can edit all object-blocking settings for this policy.

- **Disable Object Blocking for this Policy** – Object blocking is disabled for this policy; no object-blocking options are presented.

**Step 3** If you chose Define Custom Objects Blocking Settings in the previous step, select and deselect object-blocking options on the Access Policies: Objects page as needed.

<table>
<thead>
<tr>
<th>Object Size</th>
<th>You can block objects based on their download size:</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>HTTP/HTTPS Max Download Size</strong></td>
<td>Either provide the maximum object size for HTTP/HTTPS download (objects larger than this will be blocked), or indicate that there is no maximum size for object download via HTTP/HTTPS.</td>
</tr>
<tr>
<td><strong>FTP Max Download Size</strong></td>
<td>Either provide the maximum object size for FTP download (objects larger than this will be blocked), or indicate that there is no maximum size for object download via FTP.</td>
</tr>
</tbody>
</table>
Block Object Type

<table>
<thead>
<tr>
<th>Block Object Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Archives</td>
<td>Expand this section to select types of Archive files that are to be blocked. This list includes Archive types such as ARC, BinHex, and StuffIt.</td>
</tr>
<tr>
<td>Inspectable Archives</td>
<td>Expand this section to select whether to Allow, Block, or Inspect specific types of Inspectable Archive files. Inspectable Archives are archive or compressed files that the WSA can inflate to inspect each of the contained files in order to apply the file-type block policy. The Inspectable Archives list includes archive types such as 7zip, Microsoft CAB, RAR, and TAR. The following points apply to archive inspection:</td>
</tr>
<tr>
<td></td>
<td>• Only archive types marked <strong>Inspect</strong> will be inflated and inspected.</td>
</tr>
<tr>
<td></td>
<td>• Only one archive will be inspected at a time, Additional concurrent inspeetable archives may not be inspected.</td>
</tr>
<tr>
<td></td>
<td>• If an inspected archive contains a file type that is assigned the Block action by the current policy, the entire archive will be blocked, regardless of any allowed file types it may contain.</td>
</tr>
<tr>
<td></td>
<td>• An inspected archive that contains an unsupported archive type will be marked as “unscannable.” If it contains a blocked archive type, it will be blocked.</td>
</tr>
<tr>
<td></td>
<td>• Password-protected and encrypted archives are not supported and will be marked as “unscannable.”</td>
</tr>
<tr>
<td></td>
<td>• An inspectable archive which is incomplete or corrupt is marked as “unscannable.”</td>
</tr>
<tr>
<td></td>
<td>• The <strong>DVS Engine Object Scanning Limits</strong> value specified for the Anti-Malware and Reputation global settings also applies to the size of an inspeetable archive; an object exceeding this size is marked as “unscannable.” See Enabling Anti-Malware and Reputation Filters, on page 235 for information about this object size limit.</td>
</tr>
<tr>
<td></td>
<td>• An inspectable archive marked as “unscannable” can be either Blocked in its entirety or Allowed in its entirety.</td>
</tr>
<tr>
<td>Document Types</td>
<td>Expand this section to select types of text documents to be blocked. This list includes document types such as FrameMaker, Microsoft Office, and PDF.</td>
</tr>
<tr>
<td>Executable Code</td>
<td>Expand this section to select types of executable code to be blocked. The list includes Java Applet, UNIX Executable and Windows Executable.</td>
</tr>
<tr>
<td>Installers</td>
<td>Types of installers to be blocked; the list includes UNIX/LINUX Packages.</td>
</tr>
<tr>
<td>Media</td>
<td>Types of media files to be blocked. The list includes Audio, Video and Photographic Image Processing Formats (TIFF/PSD).</td>
</tr>
<tr>
<td>P2P Metafiles</td>
<td>This list includes BitTorrent Links (.torrent).</td>
</tr>
<tr>
<td>Web Page Content</td>
<td>This list includes Flash and Images.</td>
</tr>
<tr>
<td>Miscellaneous</td>
<td>This list includes Calendar Data.</td>
</tr>
</tbody>
</table>
You can define additional objects/files to be blocked based on MIME type. Enter one or more MIME types in the **Block Custom MIME Types** field, one per line.

### Archive Inspection Settings

You can Allow, Block, or Inspect specific types of Inspectable Archives for individual Access policies. Inspectable Archives are archive or compressed files that the WSA can inflate to inspect each of the contained files in order to apply the file-type block policy. See *Access Policies: Blocking Objects*, on page 194 for more information about configuring archive inspection for individual Access policies.

**Note**

During archive inspection, nested objects are written to disk for examination. The amount of disk space that can be occupied at any given time during file inspection is 1 GB. Any archive file exceeding this maximum disk-use size will be marked unscannable.

The WSA’s Acceptable Use Controls page provides system-wide Inspectable Archives Settings; that is, these settings apply to archive extraction and inspection whenever enabled in an Access policy.

### Block, Allow, or Redirect Transaction Requests

The web proxy controls web traffic based on the policies that you create for groups of transaction requests.

- **Allow.** The Web Proxy permits the connection without interruption. Allowed connections may not have been scanned by the DVS engine.
- **Block.** The Web Proxy does not permit the connection and instead displays an end user notification page explaining the reason for the block.
Redirect. The Web Proxy does not allow the connection to the originally requested destination server and instead connects to a different specified URL, see Redirecting Traffic in the Access Policies, on page 164.

The preceding actions are final actions that the Web Proxy takes on a client request. The Monitor action that you can configure for Access Policies is not a final action.

Generally, different types of policies control traffic based on the transport protocol.

<table>

</tbody>
</table>

Decryption policy takes precedence over Access policy.

The following diagram shows how the Web Proxy determines which action to take on a request after it has assigned a particular Access Policy to the request. The Web reputation score of the destination server is evaluated only once, but the result is applied at two different points in the decision flow.
Figure 5: Applying Access Policy Actions

Client Applications

About Client Applications

Client Applications (such as a web browser) are used to make requests. You can define policy membership based on client applications, and you can specify control settings and exempt client applications from authentication, which is useful for applications that cannot prompt for credentials.
Using Client Applications in Policies

Defining Policy Membership Using Client Applications

Step 1  Choose a policy type from the Web Security Manager menu.
Step 2  Click a policy name in the policies table.
Step 3  Expand the Advanced section and click the link in the Client Applications field.
Step 4  Define one or more of the client applications:

<table>
<thead>
<tr>
<th>Option</th>
<th>Method</th>
</tr>
</thead>
</table>
| Choose a predefined client application | Expand the Browser and Other sections and check the required client application check boxes.  
**Tip** Choose only the Any Version options when possible, as this provides better performance than having multiple selections. |
| Define a custom client application | Enter an appropriate regular expression in the Custom Client Applications field. Enter additional regular expressions on new lines as required.  
**Tip** Click Example Client Applications Patterns for examples of regular expressions. |

Step 5  (Optional) Click the Match All Except The Selected Client Applications Definitions radio button to base the policy membership on all client applications *except* those you have defined.
Step 6  Click Done.

Defining Policy Control Settings Using Client Applications

Step 1  Choose a policy type from the Web Security Manager menu.
Step 2  Find the required policy name in the policies table.
Step 3  Click the cell link in the Protocols and Client Applications column on the same row.
Step 4  Choose Define Custom Settings from the drop-down list in the Edit Protocols and Client Applications Settings pane (if not already set).
Step 5  Enter a regular expression in the Custom Client Applications field that matches the client application you wish to define. Enter additional regular expressions on new lines as required.  
**Tip** Click Example Client Application Patterns for examples of regular expressions.
Step 6  Submit and commit your changes.
Exempting Client Applications from Authentication

Exempting Client Applications from Authentication

<table>
<thead>
<tr>
<th>Procedure</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Create an Identification Profile that does not require authentication.</td>
<td><strong>Classifying Users and Client Software, on page 121</strong></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>Set the Identification Profile membership as the client application to exempt.</td>
<td><strong>Using Client Applications in Policies, on page 199</strong></td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>Place the Identification Profile above all other Identification Profiles in the policies table that require authentication.</td>
<td><strong>Policy Order, on page 188</strong></td>
</tr>
</tbody>
</table>

Time Ranges and Quotas

You can apply time ranges and time and volume quotas to access policies and decryption policies to restrict when a user has access, as well as their maximum connection time or data volume (also referred to as a “bandwidth quota”).

- **Time Ranges for Policies and Acceptable Use Controls, on page 200**
- **Time and Volume Quotas, on page 201**

Time Ranges for Policies and Acceptable Use Controls

Time ranges are defined periods of time during which policies and acceptable use controls apply.

**Note**

You cannot use time ranges to define the times at which users must authenticate. Authentication requirements are defined in Identification Profiles, which do not support time ranges.

- **Creating a Time Range, on page 200**

Creating a Time Range

**Step 1**  
Choose **Web Security Manager > Define Time Ranges and Quotas**.

**Step 2**  
Click **Add Time Range**.

**Step 3**  
Enter a name for the time range.

**Step 4**  
Choose a **Time Zone** option:

- **Use Time Zone Setting From Appliance** – Use the same time zone as the Web Security appliance.
- **Specify Time Zone for this Time Range** – Define a different time zone, either as a GMT Offset, or as a region, country and a specific time zone in that country.

**Step 5**  
Check one or more **Day of Week** check boxes.

**Step 6**  
Select a **Time of Day** option:
• **All Day** – Use the full 24-hour period.
• **From** and **To** – Define a specific range of hours: enter a start time and end time in HH:MM (24-hour format).

**Tip**
Each time range defines a start time and an end-time boundary. For example, entering 8:00 through 17:00 matches 08:00:00 through 16:59:59, but not 17:00:00. Midnight must be specified as 00:00 for a start time, and as 24:00 for an end time.

**Step 7**
Submit and commit your changes.

---

**Time and Volume Quotas**

Quotas allow individual users to continue accessing an Internet resource (or a class of Internet resources) until they exhaust the data volume or time limit imposed. AsyncOS enforces defined quotas on HTTP, HTTPS and FTP traffic.

As a user approaches either their time or volume quota, AsyncOS displays first a warning, and then a block page.

Please note the following regarding use of time and volume quotas:

• If AsyncOS is deployed in transparent mode and HTTPS proxy is disabled, there is no listening on port 443, and requests are dropped. This is standard behavior. If AsyncOS is deployed in explicit mode, you can set quotas in your access policies.

  When HTTPS proxy is enabled, possible actions on a request are pass-through, decrypt, drop, or monitor. Overall, quotas in decryption policies are applicable only to the pass-through categories.

  With pass-through, you will also have the option to set quotas for tunnel traffic. With decrypt, this option is not available, as the quotas configured in the access policy will be applied to decrypted traffic.

• If URL Filtering is disabled or if its feature key is unavailable, AsyncOS cannot identify the category of a URL, and the **Access Policy > URL Filtering** page is disabled. Thus, the feature key needs to be present, and Acceptable Use Policies enabled, to configure quotas.

• Many websites such as Facebook and Gmail auto-update at frequent intervals. If such a website is left open in an unused browser window or tab, it will continue to consume the user’s quota of time and volume.

• A proxy restart will cause quotas to be reset, potentially allowing much more access than planned. A proxy restart may occur because of a configuration change, a crash, a machine reboot, and so on. Some confusion is possible, as administrators are not explicitly informed about proxy restarts.

• Your EUN pages (both warning and block) cannot be displayed for HTTPS even when decrypt-for-EUN option is enabled.

---

**Note**
The most restrictive quota will always apply when more than one quota applies to any given user.

- Volume Quota Calculations, on page 202
- Time Quota Calculations, on page 202
- Defining Time and Volume Quotas, on page 202
Volume Quota Calculations

Calculation of volume quotas is as follows:

- HTTP and decrypted HTTPS traffic – The HTTP request and response body are counted toward quota limits. The request headers and response headers will not be counted toward the limits.
- Tunnel traffic (including tunneled HTTPS) – AsyncOS simply shuttles the tunneled traffic from the client to the server, and vice versa. The entire data volume of the tunnel traffic is counted toward quota limits.
- FTP – The control-connection traffic is not counted. The size of the file uploaded and downloaded is counted toward quota limits.

**Note**
Only client-side traffic is counted toward quota limits. Cached content also counts toward the limit, as client-side traffic is generated even when a response is served from the cache.

Time Quota Calculations

Calculation of time quotas is as follows:

- HTTP and decrypted HTTPS traffic – The duration of each connection to the same URL category, from formation to disconnect, plus one minute, is counted toward the time quota limit. If multiple requests are made to the same URL category within one minute of each other, they are counted as one continuous session and the one minute is added only at the end of this session (that is, after at least one minute of “silence”).
- Tunnel traffic (including tunneled HTTPS) – The actual duration of the tunnel, from formation to disconnect, counts toward quota limits. The above calculation for multiple requests applies to tunneled traffic as well.
- FTP – The actual duration of the FTP control session, from formation to disconnect, counts toward quota limits. The above calculation for multiple requests applies to FTP traffic as well.

Defining Time and Volume Quotas

**Before you begin**

- Go to **Security Services > Acceptable Use Controls** to enable Acceptable Use Controls.
- Define a time range unless you want the quota to apply as a daily limit.

**Step 1** Navigate to **Web Security Manager > Define Time Ranges and Quotas**.
**Step 2** Click **Add Quota**.
**Step 3** Enter a unique **Quota Name** in the field.
**Step 4** To reset the quota every day, select **Reset this quota daily at** and enter a time in the 12-hour format in the field, then choose **AM** or **PM** from the menu. Alternatively, select **Select a predefined time range profile**.
**Step 5** To set a time quota, select the **Time Quota** check box and choose the number of hours from the **hrs** menu and the number of minutes from the **mins** menu, from zero (always blocked) to 23 hours and 59 minutes.
**Step 6** To set a volume quota enter a number in the field and choose **KB** (kilobytes), **MB** (megabytes), or **GB** (gigabytes) from the menu.
Step 7. Click **Submit** and then click **Commit Changes** to apply your changes. Alternatively, click **Cancel** to abandon your changes.

What to do next

(Optional) Navigate to **Security Services > End-User Notification** to configure end-user notifications for quotas.

Access Control by URL Category

You can identify and action Web requests based on the category of Website they address. The Web Security appliance ships with many predefined URL categories, such as Web-based Email and others.

Predefined categories, and the Websites associated with them, are defined within filtering databases that reside on the Web Security appliance. These databases are automatically kept up to date by Cisco. You can also create custom URL categories for host names and IP addresses that you specify.

URL categories can be used by all policies except policies to identify requests. They can also be used by Access, Encrypted HTTPS Management and Data Security policies to apply actions to requests.

See Creating and Editing Custom URL Categories, on page 157 for information about creating custom URL categories.

Using URL Categories to Identify Web Requests

Before you begin

- Enable Acceptable Use Control, see Configuring the URL Filtering Engine, on page 146.
- (Optional) Create Custom URL Categories, see Creating and Editing Custom URL Categories, on page 157.

Step 1. Choose a policy type (except SaaS) from the Web Security Manager menu.

Step 2. Click a policy name in the policies table (or add a new policy).

Step 3. Expand the **Advanced** section and click the link in the URL Categories field.

Step 4. Click the Add column cells corresponding to URL Categories you wish to identify web requests by. Do this for the Custom URL Categories and Predefined URL Categories lists as required.

Step 5. Click **Done**.

Step 6. Submit and commit your changes.

Using URL Categories to Action Web Request

Before you begin

- Enable Acceptable Use Control, see Configuring the URL Filtering Engine, on page 146.
(Optional) Create Custom URL Categories, see Creating and Editing Custom URL Categories, on page 157.

Note
If you have used URL categories as criteria within a policy then those categories alone are available to specify actions against within the same policy. Some of the options described below may differ or be unavailable because of this.

Step 1
Choose one of Access Policies, Cisco Data Security Policies, or Encrypted HTTPS Management from the Web Security Manager menu.

Step 2
Find the required policy name in the policies table.

Step 3
Click the cell link in the URL Filtering column on the same row.

Step 4
(Optional) Add custom URL categories:
   a) Click Select Custom Categories.
   b) Choose which custom URL categories to include in this policy and click Apply.

   Choose which custom URL categories the URL filtering engine should compare the client request against. The URL filtering engine compares client requests against included custom URL categories, and ignores excluded custom URL categories. The URL filtering engine compares the URL in a client request to included custom URL categories before predefined URL categories.

   The custom URL categories included in the policy appear in the Custom URL Category Filtering section.

Step 5
Choose an action for each custom and predefined URL category.

Note
Available actions vary between custom and predefined categories and between policy types.

Step 6
In the Uncategorized URLs section, choose the action to take for client requests to web sites that do not fall into a predefined or custom URL category.

Step 7
Submit and commit your changes.

Remote Users

About Remote Users, on page 204
How to Configure Identification of Remote Users, on page 205
Display Remote User Status and Statistics for ASAs, on page 206

About Remote Users

Cisco AnyConnect Secure Mobility extends the network perimeter to remote endpoints, enabling the integration of web filtering services offered by the Web Security appliance.

Remote and mobile users use the Cisco AnyConnect Secure VPN (virtual private network) client to establish VPN sessions with the Adaptive Security Appliance (ASA). The ASA sends web traffic to the Web Security appliance along with information identifying the user by IP address and user name. The Web Security appliance
scans the traffic, enforces acceptable use policies, and protects the user from security threats. The security appliance returns all traffic deemed safe and acceptable to the user.

When Secure Mobility is enabled, you can configure identities and policies to apply to users by their location:

- **Remote users.** These users are connected to the network from a remote location using VPN. The Web Security appliance automatically identifies remote users when both the Cisco ASA and Cisco AnyConnect client are used for VPN access. Otherwise, the Web Security appliance administrator must specify remote users by configuring a range of IP addresses.
- **Local users.** These users are connected to the network either physically or wirelessly.

When the Web Security appliance integrates with a Cisco ASA, you can configure it to identify users by an authenticated user name transparently to achieve single sign-on for remote users.

### How to Configure Identification of Remote Users

<table>
<thead>
<tr>
<th>Task</th>
<th>Further information</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. Configure identification of remote users.</td>

Create Decryption Policies to Control HTTPS Traffic

This chapter contains the following sections:

- Overview of Create Decryption Policies to Control HTTPS Traffic, on page 209
- Managing HTTPS Traffic through Decryption Policies Best Practices, on page 210
- Decryption Policies, on page 210
- Root Certificates, on page 216
- Routing HTTPS Traffic, on page 222
- Troubleshooting Decryption/HTTPS/Certificates, on page 222

Overview of Create Decryption Policies to Control HTTPS Traffic

Decryption policies define the handling of HTTPS traffic within the web proxy:

- When to decrypt HTTPS traffic.
- How to handle requests that use invalid or revoked security certificates.

You can create decryption policies to handle HTTPS traffic in the following ways:

- Pass through encrypted traffic
- Decrypt traffic and apply the content-based access policies defined for HTTP traffic. This also makes malware scanning possible.
- Drop the HTTPS connection
- Monitor the request (take no final action) as the web proxy continues to evaluate the request against policies that may lead to a final drop, pass through, or decrypt action.

Caution

Handle personally identifiable information with care: If you choose to decrypt an end-user’s HTTPS session, the Web Security appliance access logs and reports may contain personally identifiable information. The Administrator can configure how much URI text is stored in the logs using the `advancedproxyconfig` CLI command and the `HTTPS` subcommand. You can log the entire URI, or a partial form of the URI with the query portion removed. However, even when you choose to strip the query from the URI, personally identifiable information may still remain.

Managing HTTPS Traffic through Decryption Policies Best Practices

Create fewer, more general Decryption Policy groups that apply to all users or fewer, larger groups of users on the network. Then, if you need to apply more granular control to decrypted HTTPS traffic, use more specific Access Policy groups.

Decryption Policies

The appliance can perform any of the following actions on an HTTPS connection request:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Monitor</td>
<td>Monitor is an intermediary action that indicates the Web Proxy should continue evaluating the transaction against the other control settings to determine which final action to ultimately apply.</td>
</tr>
<tr>
<td>Drop</td>
<td>The appliance drops the connection and does not pass the connection request to the server. The appliance does not notify the user that it dropped the connection.</td>
</tr>
</tbody>
</table>
The appliance passes through the connection between the client and the server without inspecting the traffic content. However, with a standard pass-through policy, the WSA does check the validity of the requested server by initiating an HTTPS handshake with the server. This validity check includes server certificate validation. If the server fails the check, the transaction is blocked.

You can skip validation checks for specific sites by configuring policies that incorporate custom categories which include these sites, thereby indicating that these sites are trustworthy—these sites are passed through without validity checks. Exercise care when configuring policies that allow validity checks to be skipped.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Pass through</strong></td>
<td>The appliance passes through the connection between the client and the server without inspecting the traffic content. However, with a standard pass-through policy, the WSA does check the validity of the requested server by initiating an HTTPS handshake with the server. This validity check includes server certificate validation. If the server fails the check, the transaction is blocked. You can skip validation checks for specific sites by configuring policies that incorporate custom categories which include these sites, thereby indicating that these sites are trustworthy—these sites are passed through without validity checks. Exercise care when configuring policies that allow validity checks to be skipped.</td>
</tr>
<tr>
<td><strong>Decrypt</strong></td>
<td>The appliance allows the connection, but inspects the traffic content. It decrypts the traffic and applies Access Policies to the decrypted traffic as if it were a plaintext HTTP connection. By decrypting the connection and applying Access Policies, you can scan the traffic for malware.</td>
</tr>
</tbody>
</table>

All actions except Monitor are “final actions” the Web Proxy applies to a transaction. A final action is an action that causes the Web Proxy to stop evaluating the transaction against other control settings. For example, if a Decryption Policy is configured to monitor invalid server certificates, the Web Proxy makes no final decision on how to handle the HTTPS transaction if the server has an invalid certificate. If a Decryption Policy is configured to block servers with a low Web reputation score, then any request to a server with a low reputation score is dropped without considering the URL category actions.

The following diagram shows how the Web Proxy evaluates a client request against the Decryption Policy groups. **Figure 7: Applying Decryption Policy Actions**, on page 215 shows the order the Web Proxy uses when evaluating control settings for Decryption Policies. **Figure 5: Applying Access Policy Actions**, on page 198 shows the order the Web Proxy uses when evaluating control settings for Access Policies.
Enabling the HTTPS Proxy

To monitor and decrypt HTTPS traffic, you must enable the HTTPS Proxy. When you enable the HTTPS Proxy, you must configure what the appliance uses for a root certificate when it sends self-signed server certificates to the client applications on the network. You can upload a root certificate and key that your organization already has, or you can configure the appliance to generate a certificate and key with information you enter.

Once the HTTPS Proxy is enabled, all HTTPS policy decisions are handled by Decryption Policies. Also on this page, you can configure what the appliance does with HTTPS traffic when the server certificate is invalid.

Before you begin

When the HTTPS proxy is enabled, HTTPS-specific rules in access policies are disabled and the web proxy processes decrypted HTTPS traffic using rules for HTTP.

Step 1  Security Services > HTTPS Proxy, click Enable and Edit Settings.
The HTTPS Proxy License Agreement appears.

**Step 2**  Read the terms of the HTTPS Proxy License Agreement, and click **Accept**.

**Step 3**  Verify the Enable HTTPS Proxy field is enabled.

**Step 4**  In the **HTTPS Ports to Proxy** field, enter the ports the appliance should check for HTTPS traffic. Port 443 is the default port.

**Note**  The maximum number of ports for which the Web Security appliance can serve as proxy is 30, which includes both HTTP and HTTPS.

**Step 5**  Upload or generate a root/signing certificate to use for decryption.

**Note**  If the appliance has both an uploaded certificate and key pair and a generated certificate and key pair, it only uses the certificate and key pair currently selected in the Root Certificate for Signing section.

**Step 6**  In the HTTPS Transparent Request section, select one of the following options:

- Decrypt the HTTPS request and redirect for authentication
- Deny the HTTPS request

This setting only applies to transactions that use IP address as the authentication surrogate and when the user has not yet been authenticated.

**Note**  This field only appears when the appliance is deployed in transparent mode.

**Step 7**  In the Applications that Use HTTPS section, choose whether to enable decryption for enhanced application visibility and control.

**Note**  Decryption may cause some applications to fail unless the root certificate for signing is installed on the client. For more information on the appliance root certificate, see Managing Certificate Validation and Decryption for HTTPS, on page 217.

**Step 8**  Submit and commit your changes.

---

**What to do next**

**Related Topics**

- Managing Certificate Validation and Decryption for HTTPS, on page 217

**Controlling HTTPS Traffic**

After the Web Security appliance assigns an HTTPS connection request to a Decryption Policy group, the connection request inherits the control settings of that policy group. The control settings of the Decryption Policy group determine whether the appliance decrypts, drops, or passes through the connection:
You can configure the action to take on HTTPS requests for each predefined and custom URL category. Click the link under the URL Filtering column for the policy group you want to configure.

**Note** If you want to block (with end-user notification) a particular URL category for HTTPS requests instead of drop (with no end-user notification), choose to decrypt that URL category in the Decryption Policy group and then choose to block the same URL category in the Access Policy group.

You can configure the action to take on HTTPS requests based on the web reputation score of the requested server. Click the link under the Web Reputation column for the policy group you want to configure.

**Note** You can configure the action the appliance should take when none of the other settings apply. Click the link under the Default Action column for the policy group you want to configure.

The configured default action only affects the transaction when no decision is made based on URL category or Web Reputation score. If Web Reputation filtering is disabled, the default action applies to all transactions that match a Monitor action in a URL category. If Web Reputation filtering is enabled, the default action is used only if the Monitor action is selected for sites with no score.

The following diagram shows how the appliance determines which action to take on an HTTPS request after it has assigned a particular Decryption Policy to the request. The Web reputation score of the destination server is evaluated only once, but the result is applied at two different points in the decision flow. For example, note that a Web reputation score Drop action overrides any action specified for predefined URL categories.
Configuring Decryption Options

**Before you begin**

Verify that the HTTPS proxy is enabled as described in Enabling the HTTPS Proxy, on page 212.

**Step 1**  
Security Services > HTTPS Proxy.
**Step 2** Click *Edit Settings*.

**Step 3** Enable the decryption options.

<table>
<thead>
<tr>
<th>Decryption Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Decrypt for Authentication</td>
<td>For users who have not been authenticated prior to this HTTPS transaction, allow decryption for authentication.</td>
</tr>
<tr>
<td>Decrypt for End-User Notification</td>
<td>Allow decryption so that AsyncOS can display the end-user notification.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> If the certificate is invalid and invalid certificates are set to drop, when running a policy trace, the first logged action for the transaction will be “decrypt”.</td>
</tr>
<tr>
<td>Decrypt for End-User Acknowledgment</td>
<td>For users who have not acknowledged the web proxy prior to this HTTPS transaction, allow decryption so that AsyncOS can display the end-user acknowledgment.</td>
</tr>
<tr>
<td>Decrypt for Application Detection</td>
<td>Enhances the ability of AsyncOS to detect HTTPS applications.</td>
</tr>
</tbody>
</table>

## Authentication and HTTPS Connections

Authentication at the HTTPS connection layer is available for these types of requests:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Explicit requests</td>
<td>• secure client authentication disabled or&lt;br&gt;• secure client authentication enabled and an IP-based surrogate</td>
</tr>
<tr>
<td>Transparent requests</td>
<td>• IP-based surrogate, decryption for authentication enabled or&lt;br&gt;• IP-based surrogate, client previously authenticated using an HTTP request</td>
</tr>
</tbody>
</table>

## Root Certificates

The HTTPS proxy uses the root certificates and private key files that you upload to the appliance to decrypt traffic. The root certificate and private key files you upload to the appliance must be in PEM format; DER format is not supported.

You can enter root certificate information in the following ways:

- **Generate.** You can enter some basic organization information and then click a button so the appliance generates the rest of the certificate and a private key.
- **Upload.** You can upload a certificate file and its matching private key file created outside of the appliance.
You can also upload an intermediate certificate that has been signed by a root certificate authority. When the Web Proxy mimics the server certificate, it sends the uploaded certificate along with the mimicked certificate to the client application. That way, as long as the intermediate certificate is signed by a root certificate authority that the client application trusts, the application will trust the mimicked server certificate, too. See About Certificates and Keys, on page 414 for more information.

You can choose how to handle the root certificates issued by the Web Security appliance:

- **Inform users to accept the root certificate.** You can inform the users in your organization what the new policies are at the company and tell them to accept the root certificate supplied by the organization as a trusted source.
- **Add the root certificate to client machines.** You can add the root certificate to all client machines on the network as a trusted root certificate authority. This way, the client applications automatically accept transactions with the root certificate.

---

**Managing Certificate Validation and Decryption for HTTPS**

The Web Security appliance validates certificates before inspecting and decrypting content.

**Valid Certificates**

Qualities of a valid certificate:

- **Not expired.** The certificate’s validity period includes the current date.
- **Recognized certificate authority.** The issuing certificate authority is included in the list of trusted certificate authorities stored on the Web Security appliance.
- **Valid signature.** The digital signature was properly implemented based on cryptographic standards.
- **Consistent naming.** The common name matches the hostname specified in the HTTP header.
- **Not revoked.** The issuing certificate authority has not revoked the certificate.

**Related Topics**

- Enabling Real-Time Revocation Status Checking, on page 220
- Configuring Invalid Certificate Handling, on page 219
- Options for Certificate Revocation Status Checking, on page 220

---

**Step 1** Security Services > HTTPS Proxy.

**Step 2** Click Edit Settings.

**Step 3** Click the Download Certificate link for either the generated or uploaded certificate.

**Note** To reduce the possibility of client machines getting a certificate error, submit the changes after you generate or upload the root certificate to the Web Security appliance, then distribute the certificate to client machines, and then commit the changes to the appliance.
Invalid Certificate Handling

The appliance can perform one of the following actions for invalid server certificates:

- Drop.
- Decrypt.
- Monitor.

Certificates that are Invalid for Multiple Reasons

For server certificates that are invalid due to both an unrecognized root authority and an expired certificate, the HTTPS proxy performs the action that applies to unrecognized root authorities.

In all other cases, for server certificates that are invalid for multiple reasons simultaneously, the HTTPS Proxy performs actions in order from the most restrictive action to the least restrictive action.

Untrusted Certificate Warnings for Decrypted Connections

When the Web Security appliance encounters an invalid certificate and is configured to decrypt the connection, AsyncOS creates an untrusted certificate that requires the end-user to accept or reject the connection. The common name of the certificate is “Untrusted Certificate Warning.”

Adding this untrusted certificate to the list of trusted certificates will remove the end user’s option to accept or reject the connection.

When AsyncOS generates one of these certificates, it creates a proxy log entry with the text “Signing untrusted key” or “Signing untrusted cert”.

Uploading a Root Certificate and Key

Before you begin

Enable the HTTPS Proxy. Enabling the HTTPS Proxy, on page 212.

Step 1 Security Services > HTTPS Proxy.
Step 2 Click Edit Settings.
Step 3 Select Use Uploaded Certificate and Key.
Step 4 Click Browse for the Certificate field to navigate to the certificate file stored on the local machine.
   If the file you upload contains multiple certificates or keys, the Web Proxy uses the first certificate or key in the file.
Step 5 Click Browse for the Key field to navigate to the private key file.
   Note The key length must be 512, 1024, or 2048 bits.
Step 6 Select Key is Encrypted if the key is encrypted.
Step 7 Click Upload Files to transfer the certificate and key files to the Web Security appliance.
   The uploaded certificate information is displayed on the Edit HTTPS Proxy Settings page.
Step 8 (Optional) Click Download Certificate so you can transfer it to the client applications on the network.
Generating a Certificate and Key for the HTTPS Proxy

Before you begin
Enable the HTTPS Proxy. Enabling the HTTPS Proxy, on page 212.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Security Services &gt; HTTPS Proxy.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Edit Settings.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Select Use Generated Certificate and Key.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click Generate New Certificate and Key.</td>
</tr>
<tr>
<td>Step 5</td>
<td>In the Generate Certificate and Key dialog box, enter the information to display in the root certificate. You can enter any ASCII character except the forward slash (/) in the Common Name field.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click Generate.</td>
</tr>
<tr>
<td>Step 7</td>
<td>The generated certificate information is displayed on the Edit HTTPS Proxy Settings page.</td>
</tr>
<tr>
<td>Step 8</td>
<td>(Optional) Click Download Certificate so you can transfer it to the client applications on the network.</td>
</tr>
<tr>
<td>Step 9</td>
<td>(Optional) Click the Download Certificate Signing Request link. so you can submit the Certificate Signing Request (CSR) to a certificate authority (CA).</td>
</tr>
<tr>
<td>Step 10</td>
<td>(Optional) Upload the signed certificate to the Web Security appliance after receiving it back from the CA. You can do this at anytime after generating the certificate on the appliance.</td>
</tr>
<tr>
<td>Step 11</td>
<td>Submit and Commit Changes.</td>
</tr>
</tbody>
</table>

Configuring Invalid Certificate Handling

Before you begin
Verify that the HTTPS proxy is enabled as described in Enabling the HTTPS Proxy, on page 212.

<table>
<thead>
<tr>
<th>Certificate Error Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Expired</td>
<td>The current date falls outside of the range of validity for the certificate.</td>
</tr>
<tr>
<td>Mismatched hostname</td>
<td>The hostname in the certificate does not match the hostname the client was trying to access. Note The Web Proxy can only perform hostname match when it is deployed in explicit forward mode. When it is deployed in transparent mode, it does not know the hostname of the destination server (it only knows the IP address), so it cannot compare it to the hostname in the server certificate.</td>
</tr>
</tbody>
</table>
### Options for Certificate Revocation Status Checking

To determine whether the issuing certificate authority has revoked a certificate, the Web Security appliance can check with the issuing certificate authority in these ways:

- **Certificate Revocation List (Comodo certificates only).** The Web Security appliance checks Comodo’s certificate revocation list. Comodo maintains this list, updating it according to their own policies. Depending on when it was last updated, the certificate revocation list may be out of date at the time the Web Security appliance checks it.

- **Online Certificate Status Protocol (OCSP).** The Web Security appliance checks the revocation status with the issuing certificate authority in real time. If the issuing certificate authority supports OCSP, the certificate will include a URL for real-time status checking. This feature is enabled by default for fresh installations and disabled by default for updates.

#### Note

The Web Security appliance only performs the OCSP query for certificates that it determines to be valid in all other respects and that include the OCSP URL.

- [Configuring Invalid Certificate Handling](#), on page 219

## Enabling Real-Time Revocation Status Checking

### Before you begin

Ensure the HTTPS Proxy is enabled. See [Enabling the HTTPS Proxy](#), on page 212.

### Step 1

Security Services > HTTPS Proxy.

### Step 2

Click Edit Settings.

### Step 3

Select Enable Online Certificate Status Protocol (OCSP).
Step 4 Configure the **OCSP Result Handling** properties,

Cisco recommends configuring the OCSP Result Handling options to the same actions as Invalid Certificate Handling options. For example, if you set Expired Certificate to Monitor, configure Revoked Certificate to monitor.

Step 5 (Optional) Expand the Advanced configuration section and configure the settings described below.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OCSP Valid Response Cache Timeout</td>
<td>Time to wait before rechecking a valid OCSP response in seconds (s), minutes (m), hours (h), or days (d). Default unit is seconds. Valid range is from 1 second to 7 days.</td>
</tr>
<tr>
<td>OCSP Invalid Response Cache Timeout</td>
<td>Time to wait before rechecking an invalid OCSP response in seconds (s), minutes (m), hours (h), or days (d). Default unit is seconds. Valid range is from 1 second to 7 days.</td>
</tr>
<tr>
<td>OCSP Network Error Cache Timeout</td>
<td>Time to wait before attempting to contact the OCSP responder again after failing to get a response in seconds (s), minutes (m), hours (h), or days (d). Valid range from 1 second to 24 hours.</td>
</tr>
<tr>
<td>Allowed Clock Skew</td>
<td>Maximum allowed difference in time settings between the Web Security appliance and the OCSP responder in seconds (s) or minutes (m). Valid range from 1 second to 60 minutes.</td>
</tr>
<tr>
<td>Maximum Time to Wait for OCSP Response</td>
<td>Maximum time to wait for a response from the OCSP responder. Valid range is from 1 second to 10 minutes. Specify a shorter duration to reduce delays in end user access to HTTPS requests in the event that the OCSP responder is unavailable.</td>
</tr>
<tr>
<td>Use upstream proxy for OCSP checking</td>
<td>Group Name of the upstream proxies.</td>
</tr>
<tr>
<td>Servers exempt from upstream proxy</td>
<td>IP addresses or hostnames of the servers to exempt. May be left blank.</td>
</tr>
</tbody>
</table>

Step 6 Submit and Commit Changes.

**Trusted Root Certificates**

The Web Security appliance ships with and maintains a list of trusted root certificates. Web sites with trusted certificates do not require decryption.

You can manage the trusted certificate list, adding certificates to it and functionally removing certificates from it. While the Web Security appliance does not delete certificates from the master list, it allows you to override trust in a certificate, which functionally removes the certificate from the trusted list.

**Adding Certificates to the Trusted List**

**Before you begin**

Verify that the HTTPS Proxy is enabled. See [Enabling the HTTPS Proxy](#), on page 212.

Step 1 Security Services > HTTPS Proxy.
Removing Certificates from the Trusted List

Step 1 Select Security Services > HTTPS Proxy.
Step 2 Click Manage Trusted Root Certificates.
Step 3 Select the Override Trust checkbox corresponding to the certificate you wish to remove from the list.
Step 4 Submit and Commit Changes.

Routing HTTPS Traffic

The ability of AsyncOS to route HTTPS transactions based on information stored in client headers is limited and is different for transparent and explicit HTTPS.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transparent HTTPS</td>
<td>In the case of transparent HTTPS, AsyncOS does not have access to information in the client headers. Therefore, AsyncOS cannot enforce routing policies that rely on information in client headers.</td>
</tr>
<tr>
<td>Explicit HTTPS</td>
<td>In the case of explicit HTTPS, AsyncOS has access to the following information in client headers:</td>
</tr>
<tr>
<td></td>
<td>• URL</td>
</tr>
<tr>
<td></td>
<td>• Destination port number</td>
</tr>
<tr>
<td></td>
<td>Therefore, for explicit HTTPS transactions, it is possible to match a routing policy based on URL or port number.</td>
</tr>
</tbody>
</table>

Troubleshooting Decryption/HTTPS/Certificates

- Accessing HTTPS Sites Using Routing Policies with URL Category Criteria, on page 441
- HTTPS with IP-based Surrogates and Transparent Requests, on page 441
- Bypassing Decryption for Particular Websites, on page 442
- Alert: Problem with Security Certificate, on page 442
Overview of Scanning Outbound Traffic

To prevent malicious data from leaving the network, the Web Security appliance provides the Outbound Malware Scanning feature. Using policy groups, you can define which uploads are scanned for malware, which anti-malware scanning engines to use for scanning, and which malware types to block.

The Cisco Dynamic Vectoring and Streaming (DVS) engine scans transaction requests as they leave the network. By working with the Cisco DVS engine, the Web Security appliance enables you to prevent users from unintentionally uploading malicious data.

You can perform the following tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>Link to Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create policies to block malware</td>
<td>Creating Outbound Malware Scanning Policies, on page 225</td>
</tr>
<tr>
<td>Assign upload requests to outbound</td>
<td>Controlling Upload Requests, on page 226</td>
</tr>
<tr>
<td>malware policy groups</td>
<td></td>
</tr>
</tbody>
</table>

User Experience When Requests Are Blocked by the DVS Engine

When the Cisco DVS engine blocks an upload request, the Web Proxy sends a block page to the end user. However, not all Websites display the block page to the end user. Some Web 2.0 Websites display dynamic content using Javascript instead of a static Webpage and are not likely to display the block page. Users are still properly blocked from uploading malicious data, but they may not always be informed of this by the Website.
Understanding Upload Requests

Outbound Malware Scanning Policies define whether or not the Web Proxy blocks HTTP requests and decrypted HTTPS connections for transactions that upload data to a server (upload requests). An upload request is an HTTP or decrypted HTTPS request that has content in the request body.

When the Web Proxy receives an upload request, it compares the request to the Outbound Malware Scanning policy groups to determine which policy group to apply. After it assigns the request to a policy group, it compares the request to the policy group’s configured control settings to determine whether to block the request or monitor the request. When an Outbound Malware Scanning Policy determines to monitor a request, it is evaluated against the Access Policies, and the final action the Web Proxy takes on the request is determined by the applicable Access Policy.

Note
Upload requests that try to upload files with a size of zero (0) bytes are not evaluated against Outbound Malware Scanning Policies.

Criteria for Group Membership

Each client request is assigned to an Identity and is then evaluated against the other policy types to determine to which policy group it belongs for each type. The Web Proxy applies the configured policy control settings to a client request based on the request’s policy group membership.

The Web Proxy follows a specific process for matching the group membership criteria. It considers the following factors for group membership:

<table>
<thead>
<tr>
<th>Criteria</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Identification Profile</td>
<td>Each client request either matches an Identification Profile, fails authentication and is granted guest access, or fails authentication and is terminated.</td>
</tr>
<tr>
<td>Authorized users</td>
<td>If the assigned Identification Profile requires authentication, the user must be in the list of authorized users in the Outbound Malware Scanning Policy group to match the policy group. The list of authorized users can be any of the specified groups or users or can be guest users if the Identification Profile allows guest access.</td>
</tr>
<tr>
<td>Advanced options</td>
<td>You can configure several advanced options for Outbound Malware Scanning Policy group membership. Some options, such as proxy port and URL category, can also be defined within the Identification Profile. When an advanced option is configured in the Identification Profile, it is not configurable in the Outbound Malware Scanning Policy group level.</td>
</tr>
</tbody>
</table>

Matching Client Requests to Outbound Malware Scanning Policy Groups

The Web Proxy compares the upload request status to the membership criteria of the first policy group. If they match, the Web Proxy applies the policy settings of that policy group.
If they do not match, the Web Proxy compares the upload request to the next policy group. It continues this process until it matches the upload request to a user defined policy group. If it does not match a user defined policy group, it matches the global policy group. When the Web Proxy matches the upload request to a policy group or the global policy group, it applies the policy settings of that policy group.

Creating Outbound Malware Scanning Policies

You can create Outbound Malware Scanning Policy groups based on combinations of several criteria, such as one or more Identities or the URL category of the destination site. You must define at least one criterion for policy group membership. When you define multiple criteria, the upload request must meet all criteria to match the policy group. However, the upload request needs to match only one of the configured Identities.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Choose <strong>Web Security Manager &gt; Outbound Malware Scanning</strong>.</td>
</tr>
<tr>
<td>2</td>
<td>Click <strong>Add Policy</strong>.</td>
</tr>
<tr>
<td>3</td>
<td>Enter a name and an optional description for the policy group. <strong>Note</strong>: Each policy group name must be unique and only contain alphanumeric characters or the space character.</td>
</tr>
<tr>
<td>4</td>
<td>In the <strong>Insert Above Policy</strong> field, select where in the policies table to place the policy group. When configuring multiple policy groups, you must specify a logical order for each group.</td>
</tr>
<tr>
<td>5</td>
<td>In the <strong>Identification Profiles</strong> and Users section, select one or more Identity groups to apply to this policy group.</td>
</tr>
<tr>
<td>6</td>
<td>(Optional) Expand the Advanced section to define additional membership requirements.</td>
</tr>
<tr>
<td>7</td>
<td>To define policy group membership by any of the advanced options, click the link for the advanced option and configure the option on the page that appears.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocols</td>
<td>Choose whether or not to define policy group membership by the protocol used in the client request. Select the protocols to include. “All others” means any protocol not listed above this option. <strong>Note</strong>: When the HTTPS Proxy is enabled, only Decryption Policies apply to HTTPS transactions. You cannot define policy membership by the HTTPS protocol for Access, Routing, Outbound Malware Scanning, Data Security, or External DLP Policies.</td>
</tr>
<tr>
<td>Proxy Ports</td>
<td>Choose whether or not to define policy group membership by the proxy port used to access the Web Proxy. Enter one or more port numbers in the Proxy Ports field. Separate multiple ports with commas. For explicit forward connections, this is the port configured in the browser. For transparent connections, this is the same as the destination port. If you define policy group membership by the proxy port when client requests are transparently redirected to the appliance, some requests might be denied. <strong>Note</strong>: If the Identity associated with this policy group defines Identity membership by this advanced setting, the setting is not configurable at the non-Identity policy group level.</td>
</tr>
</tbody>
</table>
Controlling Upload Requests

Each upload request is assigned to an Outbound Malware Scanning Policy group and inherits the control settings of that policy group. After the Web Proxy receives the upload request headers, it has the information necessary to decide if it should scan the request body. The DVS engine scans the request and returns a verdict to the Web Proxy. The block page appears to the end user, if applicable.

### Step 1
Choose Web Security Manager > Outbound Malware Scanning.

### Step 2
In the Destinations column, click the link for the policy group you want to configure.

---

**Advanced Option** | **Description**
--- | ---
Subnets | Choose whether or not to define policy group membership by subnet or other addresses. You can select to use the addresses that may be defined with the associated Identity, or you can enter specific addresses here. **Note** If the Identity associated with this policy group defines its membership by addresses, then in this policy group you must enter addresses that are a subset of the addresses defined in the Identity. Adding addresses in the policy group further narrows down the list of transactions that match this policy group.

URL Categories | Choose whether or not to define policy group membership by URL categories. Select the user defined or predefined URL categories. **Note** If the Identity associated with this policy group defines Identity membership by this advanced setting, the setting is not configurable at the non-Identity policy group level.

User Agents | Choose whether to define policy group membership by the user agents (client applications such as updaters and Web browsers) used in the client request. You can select some commonly defined user agents, or define your own using regular expressions. Specify whether membership definition includes only the selected user agents, or specifically excludes the selected user agents. **Note** If the Identification Profile associated with this policy group defines Identification Profile membership by this advanced setting, the setting is not configurable at the non-Identification Profile policy group level.

User Location | Choose whether or not to define policy group membership by user location, either remote or local.

---

**Step 8**
Submit your changes.

**Step 9**
Configure Outbound Malware Scanning Policy group control settings to define how the Web Proxy handles transactions. The new Outbound Malware Scanning Policy group automatically inherits global policy group settings until you configure options for each control setting.

**Step 10**
Submit and Commit Changes.

Scan Outbound Traffic for Existing Infections
Step 3  
In the **Edit Destination Settings** section, select **Define Destinations Scanning Custom Settings** from the drop-down menu.

Step 4  
In the **Destinations to Scan** section, select one of the following:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Do not scan any uploads</td>
<td>The DVS engine scans no upload requests. All upload requests are evaluated against the Access Policies</td>
</tr>
<tr>
<td>Scan all uploads</td>
<td>The DVS engine scans all upload requests. The upload request is blocked or evaluated against the Access Policies, depending on the DVS engine scanning verdict</td>
</tr>
<tr>
<td>Scan uploads to specified custom URL categories</td>
<td>The DVS engine scans upload requests that belong in specific custom URL categories. The upload request is blocked or evaluated against the Access Policies, depending on the DVS engine scanning verdict. Click <a href="#">Edit custom categories list</a> to select the URL categories to scan</td>
</tr>
</tbody>
</table>

Step 5  
Submit your changes.

Step 6  
In the **Anti-Malware Filtering** column, click the link for the policy group.

Step 7  
In the **Anti-Malware Settings** section, select **Define Anti-Malware Custom Settings**.

Step 8  
In the **Cisco DVS Anti-Malware Settings** section, select which anti-malware scanning engines to enable for this policy group.

Step 9  
In the **Malware Categories** section, select whether to monitor or block the various malware categories.

The categories listed in this section depend on which scanning engines you enable.

**Note**  
URL transactions are categorized as unscannable when the configured maximum time setting is reached or when the system experiences a transient error condition. For example, transactions might be categorized as unscannable during scanning engine updates or AsyncOS upgrades. The malware scanning verdicts **SV_TIMEOUT** and **SV_ERROR** are considered unscannable transactions.

Step 10  
Submit and Commit Changes.

## Logging of DVS Scanning

The access logs indicate whether or not the DVS engine scanned an upload request for malware. The scanning verdict information section of each access log entry includes values for the DVS engine activity for scanned uploads. You can also add one of the fields to the W3C or access logs to more easily find this DVS engine activity:

**Table 2: Log Fields in W3C Logs and Format Specifiers in Access Logs**

<table>
<thead>
<tr>
<th>W3C Log Field</th>
<th>Format Specifier in Access Logs</th>
</tr>
</thead>
<tbody>
<tr>
<td>x-req-dvs-scanverdict</td>
<td>%X2</td>
</tr>
<tr>
<td>x-req-dvs-threat-name</td>
<td>%X4</td>
</tr>
<tr>
<td>x-req-dvs-verdictname</td>
<td>%X3</td>
</tr>
</tbody>
</table>
When the DVS engine marks an upload request as being malware and it is configured to block malware uploads, the ACL decision tag in the access logs is BLOCK_AMW_REQ.

However, when the DVS engine marks an upload request as being malware and it is configured to monitor malware uploads, the ACL decision tag in the access logs is actually determined by the Access Policy applied to the transaction.

To determine whether or not the DVS engine scanned an upload request for malware, view the results of the DVS engine activity in the scanning verdict information section of each access log entry.
Overview of Configuring Security Services

The Web Security appliance uses security components to protect end users from a range of malware threats. You can configure anti-malware and web reputation settings for each policy group. When you configure Access Policies, you can also have AsyncOS for Web choose a combination of anti-malware scanning and web reputation scoring to use when determining what content to block.

To protect end users from malware, you enable these features on the appliance, and then configure anti-malware and web reputation settings per policy.

<table>

<td>Overview of File Reputation Filtering and File Analysis, on page 247</td>
</tr>
</tbody>
</table>
Overview of Web Reputation Filters

Web Reputation Filters assigns a web-based reputation score (WBRS) to a URL to determine the likelihood that it contains URL-based malware. The Web Security appliance uses web reputation scores to identify and stop malware attacks before they occur. You can use Web Reputation Filters with Access, Decryption, and Cisco Data Security Policies.

Web Reputation Scores

Web Reputation Filters use data to assess the reliability of Internet domains and score the reputation of URLs. The web reputation calculation associates a URL with network parameters to determine the probability that malware exists. The aggregate probability that malware exists is then mapped to a Web Reputation Score between -10 and +10, with +10 being the least likely to contain malware.

Example parameters include the following:

- URL categorization data
- Presence of downloadable code
- Presence of long, obfuscated End-User License Agreements (EULAs)
- Global volume and changes in volume
- Network owner information
- History of a URL
- Age of a URL
- Presence on any block lists
- Presence on any allow lists
- URL typos of popular domains
- Domain registrar information
- IP address information

Note: Cisco does not collect identifiable information such as user names, passphrases, or client IP addresses.

Understanding How Web Reputation Filtering Works

Web Reputation Scores are associated with an action to take on a URL request. You can configure each policy group to correlate an action to a particular Web Reputation Score. The available actions depend on the policy group type that is assigned to the URL request:

<table>
<thead>
<tr>
<th>Policy Type</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Policies</td>
<td>You can choose to block, scan, or allow</td>
</tr>
<tr>
<td>Decryption Policies</td>
<td>You can choose to drop, decrypt, or pass through</td>
</tr>
</tbody>
</table>
### Web Reputation in Access Policies

When you configure web reputation settings in Access Policies, you can choose to configure the settings manually, or let AsyncOS for Web choose the best options using Adaptive Scanning. When Adaptive Scanning is enabled, you can enable or disable web reputation filtering in each Access Policy, but you cannot edit the Web Reputation Scores.

<table>
<thead>
<tr>
<th>Score</th>
<th>Action</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>-10 to -6.0</td>
<td>Block</td>
<td>Bad site. The request is blocked, and no further malware scanning occurs.</td>
<td>• URL downloads information without user permission.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Sudden spike in URL volume.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• URL is a typo of a popular domain.</td>
</tr>
<tr>
<td>-5.9 to 5.9</td>
<td>Scan</td>
<td>Undetermined site. Request is passed to the DVS engine for further malware scanning. The DVS engine scans the request and server response content.</td>
<td>• Recently created URL that has a dynamic IP address and contains downloadable content.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Network owner IP address that has a positive Web Reputation Score.</td>
</tr>
<tr>
<td>6.0 to 10.0</td>
<td>Allow</td>
<td>Good site. Request is allowed. No malware scanning required.</td>
<td>• URL contains no downloadable content.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Reputable, high-volume domain with long history.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• Domain present on several allow lists.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• No links to URLs with poor reputations.</td>
</tr>
</tbody>
</table>

By default, URLs in an HTTP request that are assigned a Web Reputation Score of +7 are allowed and require no further scanning. However, a weaker score for an HTTP request, such as +3, is automatically forwarded to the Cisco DVS engine where it is scanned for malware. Any URL in an HTTP request that has a poor reputation is blocked.

<td>Decrypt</td>
<td>Undetermined site. Request is allowed, but the connection is decrypted and Access Policies are applied to the decrypted traffic.</td>
<td></td>
</tr>
</tbody>
</table>
### Overview of Anti-Malware Scanning

The Web Security appliance anti-malware feature uses the Cisco DVS™ engine in combination with anti-malware scanning engines to stop web-based malware threats. The DVS engine works with the Webroot™, McAfee, and Sophos anti-malware scanning engines.

The scanning engines inspect transactions to determine a malware scanning verdict to pass to the DVS engine. The DVS engine determines whether to monitor or block the request based on the malware scanning verdicts. To use the anti-malware component of the appliance, you must enable anti-malware scanning and configure global settings, and then apply specific settings to different policies.

### Understanding How the DVS Engine Works

The DVS engine performs anti-malware scanning on URL transactions that are forwarded from the Web Reputation Filters. Web Reputation Filters calculate the probability that a particular URL contains malware, and assign a URL score that is associated with an action to block, scan, or allow the transaction.

When the assigned web reputation score indicates to scan the transaction, the DVS engine receives the URL request and server response content. The DVS engine, in combination with the Webroot and/or Sophos or McAfee scanning engines, returns a malware scanning verdict. The DVS engine uses information from the malware scanning verdicts and Access Policy settings to determine whether to block or deliver the content to the client.

### Working with Multiple Malware Verdicts

The DVS engine might determine multiple malware verdicts for a single URL. Multiple verdicts can come from one or both enabled scanning engines:
• **Different verdicts from different scanning engines.** When you enable both Webroot and either Sophos or McAfee, each scanning engine might return different malware verdicts for the same object. When a URL causes multiple verdicts from both enabled scanning engines, the appliance performs the most restrictive action. For example, if one scanning engine returns a block verdict and the other a monitor verdict, the DVS engine always blocks the request.

• **Different verdicts from the same scanning engine.** A scanning engine might return multiple verdicts for a single object when the object contains multiple infections. When a URL causes multiple verdicts from the same scanning engine, the appliance takes action according to the verdict with the highest priority. The following text lists the possible malware scanning verdicts from the highest to the lowest priority.
  - Virus
  - Trojan Downloader
  - Trojan Horse
  - Trojan Phisher
  - Hijacker
  - System monitor
  - Commercial System Monitor
  - Dialer
  - Worm
  - Browser Helper Object
  - Phishing URL
  - Adware
  - Encrypted file
  - Unscannable
  - Other Malware

**Webroot Scanning**

The Webroot scanning engine inspects objects to determine the malware scanning verdict to send to the DVS engine. The Webroot scanning engine inspects the following objects:

• **URL request.** Webroot evaluates a URL request to determine if the URL is a malware suspect. If Webroot suspects the response from this URL might contain malware, the appliance monitors or blocks the request, depending on how the appliance is configured. If Webroot evaluation clears the request, the appliance retrieves the URL and scans the server response.

• **Server response.** When the appliance retrieves a URL, Webroot scans the server response content and compares it to the Webroot signature database.

**McAfee Scanning**

The McAfee scanning engine inspects objects downloaded from a web server in HTTP responses. After inspecting the object, it passes a malware scanning verdict to the DVS engine so the DVS engine can determine whether to monitor or block the request.

The McAfee scanning engine uses the following methods to determine the malware scanning verdict:

• Matching virus signature patterns
• Heuristic analysis
Matching Virus Signature Patterns

McAfee uses virus definitions in its database with the scanning engine to detect particular viruses, types of viruses, or other potentially unwanted software. It searches for virus signatures in files. When you enable McAfee, the McAfee scanning engine uses this method to scan server response content.

Heuristic Analysis

Heuristic analysis is a technique that uses general rules, rather than specific rules, to detect new viruses and malware. When the McAfee scanning engine uses heuristic analysis, it looks at the code of an object, applies generic rules, and determines how likely the object is to be virus-like.

Using heuristic analysis increases the possibility of reporting false positives (clean content designated as a virus) and might impact appliance performance. When you enable McAfee, you can choose whether or not to also enable heuristic analysis when scanning objects.

Sophos Scanning

The Sophos scanning engine inspects objects downloaded from a web server in HTTP responses. After inspecting the object, it passes a malware scanning verdict to the DVS engine so the DVS engine can determine whether to monitor or block the request. You might want to enable the Sophos scanning engine instead of the McAfee scanning engine if McAfee anti-malware software is installed.

Understanding Adaptive Scanning

Adaptive Scanning decides which anti-malware scanning engine (including Advanced Malware Protection scanning for downloaded files) will process the web request.
Adaptive Scanning applies the ‘Outbreak Heuristics’ anti-malware category to transactions it identifies as malware prior to running any scanning engines. You can choose whether or not to block these transactions when you configure anti-malware settings on the appliance.

**Adaptive Scanning and Access Policies**

When Adaptive Scanning is enabled, some anti-malware and reputation settings that you can configure in Access Policies are slightly different:

- You can enable or disable web reputation filtering in each Access Policy, but you cannot edit the Web Reputation Scores.
- You can enable anti-malware scanning in each Access Policy, but you cannot choose which anti-malware scanning engine to enable. Adaptive Scanning chooses the most appropriate engine for each web request.

---

**Note**

If Adaptive Scanning is not enabled and an Access Policy has particular web reputation and anti-malware settings configured, and then Adaptive Scanning is enabled, any existing web reputation and anti-malware settings are overridden.

Per-policy Advanced Malware Protection settings are the same whether or not Adaptive Scanning is enabled.

**Enabling Anti-Malware and Reputation Filters**

**Before you begin**

Check the Web Reputation Filters, DVS engine, and the Webroot, McAfee, and Sophos scanning engines are enabled. By default these should be enabled during system setup.

<table>
<thead>
<tr>

</tbody>
</table>
Setting | Description
---|---
DVS Engine Object Scanning Limits | Specify a maximum object size for scanning. The Maximum Object Size value you specify applies to the entire size of requests and responses that might be scanned by all anti-malware and anti-virus scanning engines and by Advanced Malware Protection features. It also specifies the maximum size of an inspectable archive for Archive inspection; see Access Policies: Blocking Objects, on page 194 for more about Archive inspection.

When an upload or download size exceeds this size, the security component may abort the scan in progress and may not provide a scanning verdict to the Web Proxy. If an inspectable archive exceeds this size, it is marked “Not Scanned.”

Sophos | Choose whether or not to enable the Sophos scanning engine.

McAfee | Choose whether or not to enable the McAfee scanning engine.
When you enable the McAfee scanning engine, you can choose whether or not to enable heuristic scanning.

**Note** Heuristic analysis increases security protection, but can result in false positives and decreased performance.

Webroot | Choose whether or not to enable the Webroot scanning engine.
When you enable the Webroot scanning engine, you can configure the Threat Risk Threshold (TRT). The TRT assigns a numerical value to the probability that malware exists.
Proprietary algorithms evaluate the result of a URL matching sequence and assign a Threat Risk Rating (TRR). This value is associated with the threat risk threshold setting. If the TRR value is greater than or equal to the TRT, the URL is considered malware and is passed on for further processing.

**Note** Setting the Threat Risk Threshold to a value lower than 90 dramatically increases the rate of URL blocking and denies legitimate requests. Cisco strongly recommends maintaining the TRT default value of 90. The minimum value for a TRT setting is 51.

</tr>
<tr>
<td>Cisco Data Security Policies</td>
<td>Configuring Web Reputation Filter Settings for Decryption Policy Groups, on page 240</td>
</tr>
</tbody>
</table>

You can configure Advanced Malware Protection settings only in Access Policies. See Configuring File Reputation and Analysis Features, on page 250

**Anti-Malware and Reputation Settings in Access Policies**

When Adaptive Scanning is enabled, the web reputation and anti-malware settings you can configure for Access Policies are slightly different than when Adaptive Scanning is turned off.

---

**Step 1** Choose Security Services > Anti-Malware and Reputation.

**Step 2** In the Advanced Malware Protection Services section, click **Clear Cache** and confirm your action.
Configuring Anti-Malware and Reputation Settings with Adaptive Scanning Enabled

Step 1  Choose Web Security Manager > Access Policies.
Step 2  Click the Anti-Malware and Reputation link for the Access Policy you want to configure.
Step 3  Under the Web Reputation and Anti-Malware Settings section, choose Define Web Reputation and Anti-Malware Custom Settings.

This allows you to configure web reputation and anti-malware settings for this Access Policy that differ from the global policy.

Step 4  In the Web Reputation Settings section, choose whether or not to enable Web Reputation Filtering. Adaptive Scanning chooses the most appropriate web reputation score thresholds for each web request.
Step 5  Configure the settings in the Advanced Malware Protection Settings section.
Step 6  Scroll down to the Cisco DVS Anti-Malware Settings section.
Step 7  Configure the anti-malware settings for the policy as necessary.

| Enablesuspectuseragent scanning | Choose whether or not to scan traffic based on the user-agent field specified in the HTTP request header.
|                                | When you select this checkbox, you can choose to monitor or block suspect user agents in the Additional Scanning section at the bottom of the page.
|                                | **Note** Chrome browsers do not include a user-agent string in FTP-over-HTTP requests; therefore, Chrome cannot be detected as the user agent in those requests.

| Enable anti-malware scanning | Choose whether or not to use the DVS engine to scan traffic for malware. Adaptive Scanning chooses the most appropriate engine for each web request.

| Malware categories | Choose whether to monitor or block the various malware categories based on a malware scanning verdict.

| Other categories | Choose whether to monitor or block the types of objects and responses listed in this section.
|                 | **Note** The category Outbreak Heuristics applies to transactions which are identified as malware by Adaptive Scanning prior to running any scanning engines.
|                 | **Note** URL transactions are categorized as unscannable when the configured maximum time setting is reached or when the system experiences a transient error condition. For example, transactions might be categorized as unscannable during scanning engine updates or AsyncOS upgrades. The malware scanning verdicts SV_TIMEOUT and SV_ERROR, are considered unscannable transactions.
Step 8  Submit and Commit Changes.

What to do next
- Configuring Web Reputation Score Thresholds for Access Policies, on page 240
- Malware Category Descriptions, on page 244

Configuring Web Reputation Scores

When you install and set up the Web Security appliance, it has default settings for Web Reputation Scores. However, you can modify threshold settings for web reputation scoring to fit your organization’s needs. You configure the web reputation filter settings for each policy group.

Configuring Web Reputation Score Thresholds for Access Policies

Step 1 Choose Web Security Manager > Access Policies.
Step 2 Click the link under the Anti-Malware and Reputation column for the Access Policy group you want to edit.
Step 3 Under the Web Reputation and Anti-Malware Settings section, choose Define Web Reputation and Anti-Malware Custom Settings.
This allows you to configure web reputation and anti-malware settings for this Access Policy that differ from the global policy.
Step 4 Verify the Enable Web Reputation Filtering field is enabled.
Step 5 Move the markers to change the range for URL block, scan, and allow actions.
Step 6 Submit and Commit Changes.
Note: You can edit the web reputation score thresholds in Access Policies when Adaptive Scanning is disabled.

Configuring Web Reputation Filter Settings for Decryption Policy Groups

Step 1 Choose Web Security Manager > Decryption Policies.
Step 2 Click the link under the Web Reputation column for the Decryption Policy group you want to edit.
Step 3 Under the Web Reputation Settings section, choose Define Web Reputation Custom Settings. This allows you to override the web reputation settings from the Global Policy Group.
Step 4  Verify the **Enable Web Reputation Filtering** field is checked.
Step 5  Move the markers to change the range for URL drop, decrypt, and pass through actions.
Step 6  In the **Sites with No Score** field, choose the action to take on request for sites that have no assigned Web Reputation Score.
Step 7  Submit and Commit Changes.

---

### Configuring Web Reputation Filter Settings for Data Security Policy Groups

**Step 1**  Choose **Web Security Manager > Cisco Data Security**.
**Step 2**  Click the link under the Web Reputation column for the Data Security Policy group you want to edit.
**Step 3**  Under the **Web Reputation Settings** section, choose **Define Web Reputation Custom Settings**.
This allows you to override the web reputation settings from the Global Policy Group.
**Step 4**  Move the marker to change the range for URL block and monitor actions.
**Step 5**  Submit and Commit Changes.

**Note**  Only negative and zero values can be configured for web reputation threshold settings for Cisco Data Security Policies. By definition, all positive scores are monitored

---

### Integrating the Appliance with AMP for Endpoints Console

You can integrate your appliance with AMP for Endpoints console, and perform the following actions in AMP for Endpoints console:

- Create a simple custom detection list.
- Add new malicious file SHAs to the simple custom detection list.
- Create an application whitelist.
- Add new file SHAs to the application whitelist.
- Create a custom policy.
- Attach the simple custom detection list and the application whitelist to the custom policy.
- Create a custom group.
- Attach the custom policy to the custom group.
- Move your registered appliance from the default group to the custom group.
- View the file trajectory details of a particular file SHA.

To integrate your appliance with AMP for Endpoints console, you need to register your appliance with the console.
After the integration, when a file SHA is sent to the File Reputation server, the verdict obtained for the file SHA from the File Reputation Server is overridden by the verdict already available for the same file SHA in the AMP for Endpoints console.

If a file SHA is already marked as malicious globally, and if you blacklist the same file SHA in AMP for Endpoints console, the file disposition is malicious.

The Advanced Malware Protection report page includes a new section - **Malware Files by Category** to view the percentage of blacklisted file SHAs received from the AMP for Endpoints console that are displayed as **Custom Detection**. The threat name of a blacklisted file SHA is displayed as **Simple Custom Detection** in the Malware Threat Files section of the report. To view the file trajectory details of a blacklisted file SHA in the AMP for Endpoints console, see File Reputation and File Analysis Report Pages, on page 258.

**Before you begin**

Make sure you have a user account in AMP for Endpoints console with admin access rights. For more details on how to create an AMP for Endpoints console user account, contact Cisco TAC.

Make sure you have enabled and configured File Reputation Filtering. See Enabling and Configuring File Reputation and Analysis Services, on page 252 to know how to enable and configure File Reputation Filtering.

---

**Step 1**
Select **Security Services > Anti-Malware and Reputation**.

**Step 2**
Click **Edit Global Settings**.

**Step 3**
Click **Register Appliance with AMP for Endpoints** in the Advanced Settings panel for File Reputation in the Anti-Malware Reputation page of the web interface.

Once you click Register Appliance with AMP for Endpoints, the AMP for Endpoints console login page appears.

**Note** You must enable and configure File Reputation Filtering before you register the appliance with AMP for Endpoints. See Enabling and Configuring File Reputation and Analysis Services, on page 252 to know how to enable and configure File Reputation Filtering.

**Step 4**
Log in to the AMP for Endpoints console with your user credentials.

**Step 5**
Click **Allow** in the AMP for Endpoints authorization page to register your appliance.

Once you click Allow, the registration is complete, and it redirects you to the Anti-Malware Reputation page of your appliance. Your appliance name is displayed in the AMP for Endpoints Console Integration field. You can use the appliance name to customize your appliance settings in the AMP for Endpoints console page.

---

**What to do next**

**Next Steps:**

- You can go to **Accounts > Applications** section of the AMP for Endpoints console page, to verify whether your appliance is registered with AMP for Endpoints console. Your appliance name is displayed in the Applications section of the AMP for Endpoints console page.

- After registration, your appliance is added to the default group (Audit Group) which has a default policy (Network Policy) attached to it. The default policy contains a list of blacklisted or whitelisted file SHAs. If you want to customize the AMP for Endpoints settings for your appliance, and add your own blacklisted or whitelisted file SHAs, see the AMP for Endpoints user documentation at https://console.amp.cisco.com/docs.
• To deregister your appliance connection from AMP for Endpoints console, you can click **Deregister** in the Advanced Settings for File Reputation section in your appliance, or you need to go to the AMP for Endpoints console page at [https://console.amp.cisco.com/](https://console.amp.cisco.com/). For more information, see the AMP for Endpoints user documentation at [https://console.amp.cisco.com/docs](https://console.amp.cisco.com/docs).

**Note**
When you change your File Reputation server to a different data center, your appliance is automatically deregistered from the AMP for Endpoints console. You must re-register your appliance with AMP for Endpoints console with the same data center selected for the File Reputation server.

**Note**
If a malicious file SHA gets a clean verdict, then you need to verify whether the same file SHA is whitelisted in AMP for Endpoints console.

### Maintaining the Database Tables

The web reputation, Webroot, Sophos, and McAfee databases periodically receive updates from the Cisco update server. Server updates are automated and the update interval is set by the server.

#### The Web Reputation Database

The Web Security appliance maintains a filtering database that contains statistics and information about how different types of requests are handled. The appliance can also be configured to send web reputation statistics to a Cisco SensorBase Network server. SensorBase server information is leveraged with data feeds from the SensorBase Network and the information is used to produce a Web Reputation Score.

#### Logging of Web Reputation Filtering Activity and DVS Scanning

The access log file records the information returned by the Web Reputation Filters and the DVS engine for each transaction. The scanning verdict information section in the access logs includes many fields to help understand the cause for the action applied to a transaction. For example, some fields display the web reputation score or the malware scanning verdict Sophos passed to the DVS engine.
Logging Adaptive Scanning

<table>
<thead>
<tr>
<th>Custom Field in Access Logs</th>
<th>Custom Field in W3C Logs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%X6</td>
<td>x-as-malware-threat-name</td>
<td>The anti-malware name returned by Adaptive Scanning. If the transaction is not blocked, this field returns a hyphen (“-”). This variable is included in the scanning verdict information (in the angled brackets at the end of each access log entry).</td>
</tr>
</tbody>
</table>

Transactions blocked and monitored by the adaptive scanning engine use the ACL decision tags:

- BLOCK_AMW_RESP
- MONITOR_AMW_RESP

Caching

The following guidelines explains how AsyncOS uses the cache while scanning for malware:

- AsyncOS only caches objects if the entire object downloads. If malware is blocked during scanning, the whole object is not downloaded and therefore is not cached.
- AsyncOS scans content whether it is retrieved from the server or from the web cache.
- The length of time that content is cached varies with many factors - there is no default.
- AsyncOS rescans content when signatures are updated.

Malware Category Descriptions

<table>
<thead>
<tr>
<th>Malware Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adware</td>
<td>Adware encompasses all software executables and plug-ins that direct users towards products for sale. These programs may also change security settings making it impossible for users to make changes to their system settings.</td>
</tr>
<tr>
<td>Browser Helper Object</td>
<td>A browser helper object is a browser plug-in that may perform a variety of functions related to serving advertisements or hijacking user settings.</td>
</tr>
<tr>
<td>Commercial System Monitor</td>
<td>A commercial system monitor is a piece of software with system monitor characteristics that can be obtained with a legitimate license through legal means.</td>
</tr>
<tr>
<td>Dialer</td>
<td>A dialer is a program that utilizes your modem or another type of Internet access to connect you to a phone line or a site that causes you to accrue long distance charges to which you did not provide your full consent.</td>
</tr>
<tr>
<td>Generic Spyware</td>
<td>Spyware is a type of malware installed on computers that collects small pieces of information about users without their knowledge.</td>
</tr>
<tr>
<td>Malware Type</td>
<td>Description</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hijacker</td>
<td>A hijacker modifies system settings or any unwanted changes to a user’s system that may direct them to a website or run a program without a user’s consent.</td>
</tr>
<tr>
<td>Known Malicious and High-Risk Files</td>
<td>These are files that were identified as threats by the Advanced Malware Protection file reputation service.</td>
</tr>
<tr>
<td>Other Malware</td>
<td>This category is used to catch all other malware and suspicious behavior that does not exactly fit in one of the other defined categories.</td>
</tr>
<tr>
<td>Phishing URL</td>
<td>A phishing URL is displayed in the browser address bar. In some cases, it involves the use of domain names and resembles those of legitimate domains.</td>
</tr>
<tr>
<td>PUA</td>
<td>Potentially Unwanted Application. A PUA is an application that is not malicious, but may be considered to be undesirable.</td>
</tr>
<tr>
<td>System Monitor</td>
<td>A system monitor encompasses any software that performs one of the following:</td>
</tr>
<tr>
<td></td>
<td>• Overtly or covertly records system processes and/or user action.</td>
</tr>
<tr>
<td></td>
<td>• Makes those records available for retrieval and review at a later time.</td>
</tr>
<tr>
<td>Trojan Downloader</td>
<td>A trojan downloader is a Trojan that, after installation, contacts a remote host/site and installs packages or affiliates from the remote host.</td>
</tr>
<tr>
<td>Trojan Horse</td>
<td>A trojan horse is a destructive program that masquerades as a benign application. Unlike viruses, Trojan horses do not replicate themselves.</td>
</tr>
<tr>
<td>Trojan Phisher</td>
<td>A trojan phisher may sit on an infected computer waiting for a specific web page to be visited or may scan the infected machine looking for user names and passphrases.</td>
</tr>
<tr>
<td>Virus</td>
<td>A virus is a program or piece of code that is loaded onto your computer without your knowledge.</td>
</tr>
<tr>
<td>Worm</td>
<td>A worm is program or algorithm that replicates itself over a computer network and performs malicious actions.</td>
</tr>
</tbody>
</table>
Overview of File Reputation Filtering and File Analysis

Advanced Malware Protection protects against zero-day and targeted file-based threats by:

- Obtaining the reputation of known files.
- Analyzing behavior of certain files that are not yet known to the reputation service.
- Continuously evaluating emerging threats as new information becomes available, and notifying you about files that are determined to be threats after they have entered your network.

This feature is available for.

The file reputation service is in the cloud. The file analysis service has options for either public- or private-cloud (on-premises).

- The private-cloud file reputation service is provided by Cisco AMP Virtual Private Cloud appliance, operating in either “proxy” or “air-gap” (on-premises) mode. See Configuring an On-premises File Reputation Server, on page 251.

- The private-cloud file analysis service is provided by an on-premises Cisco AMP Threat Grid appliance. See Configuring an On-Premises File Analysis Server, on page 251.

File Threat Verdict Updates

Threat verdicts can change as new information emerges. A file may initially be evaluated as unknown or clean, and, if the threat verdict changes as new information becomes available, you will be alerted, and the file and its new verdict appear in the AMP Verdict Updates report. You can investigate the point-of-entry as a starting point to remediating any impacts of the threat.

Verdicts can also change from malicious to clean.
When the appliance processes subsequent instances of the same file, the updated verdict is immediately applied.

Information about the timing of verdict updates is included in the file-criteria document referenced in Supported Files for File Reputation and Analysis Services, on page 248.

Related Topics

- File Reputation and File Analysis Reporting and Tracking, on page 257
- Taking Action When File Threat Verdicts Change, on page 259

File Processing Overview

Communications between the appliance and the file reputation service are encrypted and protected from tampering.

After a file’s reputation is evaluated:

- If the file is known to the file reputation service and is determined to be clean, ...
- If the file reputation service returns a verdict of malicious, then the appliance applies the action that you have specified.
- If the file is known to the reputation service but there is insufficient information for a definitive verdict, the reputation service returns a score based on characteristics of the file such as threat fingerprint and behavioral analysis. If this score meets or exceeds the configured reputation threshold, the appliance applies the action that you have configured in the policy for ...
- If the reputation service has no information about the file, and the file does not meet the criteria for analysis (see Supported Files for File Reputation and Analysis Services, on page 248), the file is considered clean and ...
- For deployments with on-premises file analysis, the reputation evaluation and file analysis occur simultaneously. If the reputation service returns a verdict, that verdict is used, as the reputation service includes inputs from a wider range of sources. If the file is unknown to the reputation service, ...
- If the file reputation verdict information is unavailable because the connection with the server timed out, the file is considered as Unscannable and the actions configured are applied.

If the file is sent for analysis:

- If the file is sent to the cloud for analysis: Files are sent over HTTPS.
- Analysis normally takes minutes, but may take longer.
- A file that is flagged as malicious after File Analysis may not be identified as malicious by the reputation service. File reputation is determined by a variety of factors over time, not necessarily by a single file analysis verdict.
- Results for files analyzed using an on premises Cisco AMP Threat Grid appliance are cached locally.

For information about verdict updates, see File Threat Verdict Updates, on page 247.

Supported Files for File Reputation and Analysis Services

The reputation service evaluates most file types. File type identification is determined by file content and is not dependent on the filename extension.

Some files with unknown reputation can be analyzed for threat characteristics. When you configure the file analysis feature, you choose which file types are analyzed. New types can be added dynamically; you will receive an alert when the list of uploadable file types changes, and can select added file types to upload.
Details about what files are supported by the reputation and analysis services are available only to registered Cisco customers. For information about which files are evaluated and analyzed, see File Criteria for Advanced Malware Protection Services for Cisco Content Security Products, available from . The criteria for evaluating a file’s reputation and for sending files for analysis may change at any time.

In order to access this document, you must have a Cisco customer account with a support contract. To register, visit https://tools.cisco.com/RPF/register/register.do.

You should configure policies to block of files that are not addressed by Advanced Malware Protection.

---

**Note**

A file (either in incoming mail or outgoing mail) that has already been uploaded for analysis from any source will not be uploaded again. To view analysis results for such a file, search for the SHA-256 from the File Analysis reporting page.

---

**Related Topics**

- Enabling and Configuring File Reputation and Analysis Services, on page 252
- Ensuring That You Receive Alerts About Advanced Malware Protection Issues, on page 256
- Archive or Compressed File Processing, on page 249

---

**Archive or Compressed File Processing**

If the file is compressed or archived,

- Reputation of the compressed or archive file is evaluated.
- In case of some selective file types, the compressed or archive file is decompressed and reputations of all the extracted files are evaluated.

For information about which archived and compressed files are examined, including file formats, see the information linked from Supported Files for File Reputation and Analysis Services, on page 248.

In this scenario,

- If one of the extracted files is malicious, the file reputation service returns a verdict of Malicious for the compressed or the archive file.
- If the compressed or archive file is malicious and all the extracted files are clean, the file reputation service returns a verdict of Malicious for the compressed or the archive file.
- If the verdict of any of the extracted files is unknown, the extracted files are optionally (if configured and the file type is supported for file analysis) sent for file analysis.
- If the extraction of a file fails while decompressing a compressed or an archive file, the file reputation service returns a verdict of Unscannable for the compressed or the archive file. Keep in mind that, in this scenario, if one of the extracted files is malicious, the file reputation service returns a verdict of Malicious for the compressed or the archive file (Malicious verdict takes precedence over Unscannable verdict).

**Note**

Reputation of the extracted files with safe MIME types, for example, text/plain, are not evaluated.
Privacy of Information Sent to the Cloud

- Only the SHA that uniquely identifies a file is sent to the reputation service in the cloud. The file itself is not sent.
- If you are using the file analysis service in the cloud and a file qualifies for analysis, the file itself is sent to the cloud.
- Information about every file that is sent to the cloud for analysis and has a verdict of "malicious" is added to the reputation database. This information is used along with other data to determine a reputation score. Information about files analyzed by an on-premises Cisco AMP Threat Grid appliance is not shared with the reputation service.

Configuring File Reputation and Analysis Features

- Requirements for Communication with File Reputation and Analysis Services, on page 250
- Configuring an On-premises File Reputation Server, on page 251
- Configuring an On-Premises File Analysis Server, on page 251
- Enabling and Configuring File Reputation and Analysis Services, on page 252
- (Public Cloud File Analysis Services Only) Configuring Appliance Groups, on page 255
- Ensuring That You Receive Alerts About Advanced Malware Protection Issues, on page 256
- Configuring Centralized Reporting for Advanced Malware Protection Features, on page 257

Requirements for Communication with File Reputation and Analysis Services

- All that use these services must be able to connect to them directly over the internet (excluding File Analysis services configured to use an on-premises Cisco AMP Threat Grid Appliance.)
- By default, communication with file reputation and analysis services.
- By default, communication with file reputation and cloud-based analysis services is routed through the interface that is associated with the default gateway. To route this traffic through a different interface, create a static route for each address in the Advanced section of the Security Services > File Reputation and Analysis page.
- The following firewall ports must be open:

<table>
<thead>
<tr>
<th>Firewall Ports</th>
<th>Description</th>
<th>Protocol</th>
<th>In/Out</th>
<th>Hostname</th>
<th>Appliance Interface</th>
</tr>
</thead>
<tbody>
<tr>
<td>32137 (default) or 443</td>
<td>Access to cloud services for obtaining file reputation.</td>
<td>TCP</td>
<td>Out</td>
<td>As configured in Security Services &gt; Anti-Malware and Reputation, Advanced section, Cloud Server Pool parameter.</td>
<td>Management, unless a static route is configured to route this traffic through a data port.</td>
</tr>
<tr>
<td>443</td>
<td>Access to cloud services for file analysis.</td>
<td>TCP</td>
<td>Out</td>
<td>As configured in Security Services &gt; Anti-Malware and Reputation, Advanced section.</td>
<td></td>
</tr>
</tbody>
</table>
Configuring an On-premises File Reputation Server

If you will use a Cisco AMP Virtual Private Cloud appliance as a private-cloud file analysis server:

Use that documentation to perform the tasks described in this topic.

Additional documentation is available using the Help link in the AMP Virtual Private Cloud appliance.

- Set up and configure the Cisco AMP Virtual Private Cloud appliance in either “proxy” or “air-gap” (on-premises) mode.
- Ensure the Cisco AMP Virtual Private Cloud appliance software version is 2.2, which enables integration with Cisco.
- Download the AMP Virtual Private Cloud certificate and keys on that appliance for upload to this appliance.

After you have set up the on-premises file-reputation server, you will configure connection to it from this appliance; see Step 6 of Enabling and Configuring File Reputation and Analysis Services, on page 252

Note

Configuring an On-Premises File Analysis Server

If you will use a Cisco AMP Threat Grid Appliance as a private-cloud file analysis server:

Use this documentation to perform the tasks described in this topic.

Additional documentation is available from the Help link in the AMP Threat Grid appliance.

In the Administration Guide, search for information about all of the following: integrations with other Cisco appliances, CSA, Cisco Sandbox API.

- Set up and configure the Cisco AMP Threat Grid Appliance.
- If necessary, update your Cisco AMP Threat Grid Appliance software to version 1.2.1, which supports integration with Cisco.

See the AMP Threat Grid documentation for instructions for determining the version number and for performing the update.

- Ensure that your appliances can communicate with each other over your network. Cisco must be able to connect to the CLEAN interface of the AMP Threat Grid appliance.
- If you will deploy a self-signed certificate: Generate a self-signed SSL certificate from the Cisco AMP Threat Grid appliance to be used on your. See instructions for downloading SSL certificates and keys in the administrator’s guide for your AMP Threat Grid appliance. Be sure to generate a certificate that has the hostname of your AMP Threat Grid appliance as CN. The default certificate from the AMP Threat Grid appliance does NOT work.
Registration of your Threat Grid appliance occurs automatically when you submit the configuration for File Analysis, as described in Enabling and Configuring File Reputation and Analysis Services, on page 252. However, you must activate the registration as described in the same procedure.

Note
After you have set up the on-premises file-analysis server, you will configure connection to it from this Web Security appliance; see Step 7 of Enabling and Configuring File Reputation and Analysis Services, on page 252

Enabling and Configuring File Reputation and Analysis Services

Before you begin

• Acquire feature keys for the file reputation service and the file analysis service and transfer them to this appliance.
• Meet the Requirements for Communication with File Reputation and Analysis Services, on page 250.
• Ensure that a Data network interface is enabled on the appliance if you want to use a Data network interface for File Reputation and Analysis services. See Enabling or Changing Network Interfaces, on page 27
• Verify connectivity to the update servers configured.
• If you will use a Cisco AMP Virtual Private Cloud Appliance as a private cloud file reputation server, see Configuring an On-premises File Reputation Server, on page 251.
• If you will use a Cisco AMP Threat Grid Appliance as a private cloud file analysis server, see Configuring an On-Premises File Analysis Server, on page 251.

Step 1
Select Security Services > Anti-Malware and Reputation.

Step 2
Click Edit Global Settings.

Step 3
Click Enable File Reputation Filtering and optionally Enable File Analysis.

• If Enable File Reputation Filtering is checked, you must configure the section File Reputation Server (in Step 6), by either choosing the URL of an external public-reputation cloud server, or by providing the Private reputation cloud server connection information.

• Similarly, if Enable File Analysis is checked, you must configure the section File Analysis Server URL (in Step 7), providing either the URL of an external cloud server, or the Private analysis cloud connection information.

Step 4
Accept the license agreement if presented.

Step 5
Expand the Advanced Settings for File Reputation panel and adjust the following options as needed:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cloud Domain</td>
<td>The name of the domain to be used for file reputation queries.</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| File Reputation Server        | Choose either: the host name of the public reputation cloud server, or Private reputation cloud. If you choose Private reputation cloud, provide the following:  
  • **Server** – The host name or IP address of the Cisco AMP Virtual Private Cloud appliance.  
  • **Public Key** – Provide a valid public key for encrypted communications between this appliance and your private cloud appliance. This must be the same key used by the private cloud server: locate the key file on this appliance, and then click **Upload File**.  
  **Note** You must have already downloaded the key file from the server to this appliance. |
| Routing Table                 | The routing table (associated with an appliance network interface type, either Management or Data) to be used for Advanced Malware Protection services. If the appliance has both the Management interface and one or more Data interfaces enabled, you can select Management or Data.                                                                                                                                                                                      |
| SSL Communication for File Reputation | Check **Use SSL (Port 443)** to communicate on port 443 instead of the default port, 32137. Refer to the Cisco AMP Virtual Private Cloud Appliance user guide for information about enabling SSH access to the server.  
  **Note** SSL communication over port 32137 may require you to open that port in your firewall.  
  This option also allows you to configure an upstream proxy for communication with the file reputation service. If checked, provide the appropriate **Server**, **Username** and **Passphrase** information.  
  When **Use SSL (Port 443)** is selected, you can also check **Relax Certificate Validation** to skip standard certificate validation if the tunnel proxy server's certificate is not signed by a trusted root authority. For instance, select this option if using a self-signed certificate on a trusted internal tunnel proxy server.  
  **Note** If you checked **Use SSL (Port 443)** in the SSL Communication for File Reputation section of the Advanced Settings for File Reputation, you must add the AMP on-premises reputation server CA certificate to the certificate store on this appliance, using Network > Certificates (Custom Certificate Authorities) in the Web interface. Obtain this certificate from the server (Configuration > SSL > Cloud server > download). |
| Heartbeat Interval            | The frequency, in minutes, with which to ping for retrospective events.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Reputation Threshold          | The upper limit for acceptable file reputation scores. Scores above this threshold indicate the file is infected.  
  • **Use value from Cloud Service (60)**  
  • **Enter Custom Value** – defaults to 60.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Query Timeout                 | The number of elapsed seconds before the reputation query times out.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

User Guide for AsyncOS 11.5.1 for Cisco Web Security Appliances - GD (General Deployment)
### Step 6

If you will use the cloud service for file analysis, expand the Advanced Settings for File Analysis panel and adjust the following options as needed:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| **File Analysis Server URL**  | Choose either: the name (URL) of an external cloud server, or Private analysis cloud. If specifying an external cloud server, choose the server that is physically nearest to your appliance. Newly available servers will be added to this list periodically using standard update processes. Choose Private analysis cloud to use an on-premises Cisco AMP Threat Grid appliance for file analysis, and provide the following:  
  • **Server** – The URL of the on-premises private analysis cloud server.  
  • **Certificate Authority** – Choose either Use Cisco Default Certificate Authority, or Use Uploaded Certificate Authority. If you choose Use Uploaded Certificate Authority, click Browse to upload a valid certificate file for encrypted communications between this appliance and your private cloud appliance. This must be the same certificate used by the private cloud server. |
| **Proxy Settings**            | Check **Use File Reputation Proxy** checkbox to use the same File Reputation tunnel proxy that you have already configured, as an upstream proxy for file analysis. If you want to configure a different upstream proxy, uncheck the **Use File Reputation Proxy** checkbox and enter the appropriate **Server**, **Port**, **Username**, and **Passphrase** information. |
| **File Analysis Client ID**   | The client ID for this appliance on the File Analysis server (read-only). |

### Step 7

(Optional) Expand the Cache Settings panel, if you want to configure the cache expiry period for File Reputation disposition values.

### Step 8

Submit and commit your changes.

### Step 9

If you are using an on-premises Cisco AMP Threat Grid appliance, activate the account for this appliance on the AMP Threat Grid appliance.

Complete instructions for activating the “user” account are available in the AMP Threat Grid documentation.

a) Note the File Analysis Client ID that appears at the bottom of the page section. This identifies the “user” that you will activate.

b) Sign in to the AMP Threat Grid appliance.

c) Select **Welcome... > Manage Users** and navigate to User Details.

d) Locate the “user” account based on the File Analysis Client ID of your.
e) Activate this “user” account for your appliance.

---

**Important! Changes Needed in File Analysis Setting**

If you plan to use a new public cloud File Analysis service, make sure you read the following instructions to maintain datacenter isolation:

- The existing appliance grouping information is not preserved in the new File Analysis server. You must regroup your appliances on the new File Analysis server.

- Messages that are quarantined to the File Analysis Quarantine are retained until the retention period. After the quarantine retention period, the messages are released from the File Analysis Quarantine, and re-scanned by the AMP engine. The file is then uploaded to the new File Analysis server for analysis but the message is not sent to the File Analysis Quarantine again.

---

**(Public Cloud File Analysis Services Only) Configuring Appliance Groups**

In order to allow all content security appliances in your organization to view file analysis result details in the cloud for files sent for analysis from any appliance in your organization, you need to join all appliances to the same appliance group.

- You can configure appliance groups at the machine level. The appliance groups cannot be configured at the cluster level.

---

**Step 1**

Select **Security Services** >.

**Step 2**

In the Appliance Grouping for File Analysis Cloud Reporting section, enter the File Analysis Group ID.

- If this is the first appliance being added to the group, provide a useful identifier for the group.

- This ID is case-sensitive, and cannot contain spaces.

- The ID you provide must be identical on all appliances that will share data about files that are uploaded for analysis. However, the ID is not validated on subsequent group appliances.

- If you enter the Group ID incorrectly or need to change it for any other reason, you must open a case with Cisco TAC.

- This change takes effect immediately; it does not require a Commit.

- All appliances in the group must be configured to use the same File Analysis server in the cloud.

- An appliance can belong to only one group.

- You can add a machine to a group at any time, but you can do it only once.
Which Appliances Are In the Analysis Group?

Step 1 Select Security Services > .
Step 2 In the Appliance Grouping for File Analysis Cloud Reporting section, click .
Step 3 To view the File Analysis Client ID of a particular appliance, look in the following location:

<table>
<thead>
<tr>
<th>Appliance</th>
<th>Location of File Analysis Client ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>Email Security appliance</td>
<td>Advanced Settings for File Analysis section on the Security Services &gt; File Reputation and Analysis page.</td>
</tr>
<tr>
<td>Security Management appliance</td>
<td>At the bottom of the Management Appliance &gt; Centralized Services &gt; Security Appliances page.</td>
</tr>
</tbody>
</table>

Ensuring That You Receive Alerts About Advanced Malware Protection Issues

Ensure that the appliance is configured to send you alerts related to Advanced Malware Protection.

You will receive alerts when:

<table>
<thead>
<tr>
<th>Alert Description</th>
<th>Type</th>
<th>Severity</th>
</tr>
</thead>
<tbody>
<tr>
<td>You are setting up a connection to an on-premises (private cloud) Cisco AMP Threat Grid appliance and you need to activate the account as described in Enabling and Configuring File Reputation and Analysis Services , on page 252</td>
<td>Anti-Malware</td>
<td>Warning</td>
</tr>
<tr>
<td>Feature keys expire</td>
<td></td>
<td>(As is standard for all features)</td>
</tr>
<tr>
<td>The file reputation or file analysis service is unreachable.</td>
<td></td>
<td>Warning</td>
</tr>
<tr>
<td>Communication with cloud services is established.</td>
<td></td>
<td>Info</td>
</tr>
<tr>
<td>A file reputation verdict changes.</td>
<td></td>
<td>Info</td>
</tr>
<tr>
<td>File types that can be sent for analysis have changed. You may want to enable upload of new file types.</td>
<td></td>
<td>Info</td>
</tr>
<tr>
<td>Analysis of some file types is temporarily unavailable.</td>
<td></td>
<td>Warning</td>
</tr>
</tbody>
</table>
### File Reputation Filtering and File Analysis

**Configuring Centralized Reporting for Advanced Malware Protection Features**

If you will centralize reporting on a Security Management appliance, see important configuration requirements in the Advanced Malware Protection sections in the reporting chapter of the online help or user guide for your management appliance.

**File Reputation and File Analysis Reporting and Tracking**

- Identifying Files by SHA-256 Hash, on page 257

**Identifying Files by SHA-256 Hash**

Because filenames can easily be changed, the appliance generates an identifier for each file using a Secure Hash Algorithm (SHA-256). If an appliance processes the same file with different names, all instances are recognized as the same SHA-256. If multiple appliances process the same file, all instances of the file have the same SHA-256 identifier.

In most reports, files are listed by their SHA-256 value (in an abbreviated format

Viewing File Reputation Filtering Data in Other Reports

Data for file reputation and analysis is available in other reports where relevant. A Advanced Malware Protection column may be hidden by default in applicable reports. To display additional columns, click the Columns link below the table.

About Tracking and Advanced Malware Protection Features

When searching for file threat information in Tracking, keep the following points in mind:

• To search for malicious files found by the file reputation service, select in the Advanced section in Web Message Tracking.
• Tracking includes only information about file reputation processing and the original file reputation verdicts returned at the time a transaction message was processed. For example, if a file was initially found to be clean, then a verdict update found the file to be malicious, only the clean verdict appears in Tracking results.
• Verdict updates are available only in the AMP Verdict Updates report. The original details in Tracking are not updated with verdict changes. To see transactions, click a SHA-256 in the verdict updates report.
• Information about File Analysis, including analysis results and whether or not a file was sent for analysis, are available only in the File Analysis report.

Additional information about an analyzed file may be available from the cloud or on-premises File Analysis server. To view any available File Analysis information for a file, select Reporting > File Analysis and enter the SHA-256 to search for the file. If the File Analysis service has analyzed the file from any source, you can see the details. Results are displayed only for files that have been analyzed.

If the appliance processed a subsequent instance of a file that was sent for analysis, those instances will appear in Tracking search results.

Taking Action When File Threat Verdicts Change

Step 1 View the AMP Verdict Updates report.
Step 2 Click the relevant SHA-256 link to view tracking data for all that file that.
Step 3 Using the tracking data, identify the users that may have been compromised, as well as information such as the file names involved in the breach and.
Step 4 Check the File Analysis report to see if this SHA-256 was sent for analysis, to understand the threat behavior of the file in more detail.

- API Key Error (On-Premises File Analysis), on page 260
- Files are Not Uploaded As Expected, on page 261
- Alerts about File Types That Can Be Sent for Analysis, on page 261

Log Files

In logs:
- AMP and amp refer to the file reputation service or engine.
- Retrospective refers to verdict updates.
- VRT and sandboxing refer to the file analysis service.

Information about Advanced Malware Protection including File Analysis is logged in AMP Engine Logs. In the log message “Response received for file reputation query” possible values for “upload action” are:
- 0: The file is known to the reputation service; do not send for analysis.
- 1: Send
- 2: The file is known to the reputation service; do not send for analysis.

Several Alerts About Failure to Connect to File Reputation or File Analysis Servers

Problem

You receive several alerts about failures to connect to the file reputation or analysis services in the cloud. (A single alert may indicate only a transient issue.)

Solution

- Ensure that you have met the requirements in Requirements for Communication with File Reputation and Analysis Services, on page 250.
- Check for network issues that may prevent the appliance from communicating with the cloud services.
- Increase the Query Timeout value:
  Select Security Services >. The Query Timeout value is in the Advanced settings area.

API Key Error (On-Premises File Analysis)

Problem

You receive an API key alert when attempting to view File Analysis report details, or the is unable to connect to the AMP Threat Grid server to upload files for analysis.

Solution
This error can occur if you change the hostname of the AMP Threat Grid server and you are using a self-signed certificate from the AMP Threat Grid server, as well as possibly under other circumstances. To resolve the issue:

• Generate a new certificate from the AMP Threat Grid appliance that has the new hostname.
• Upload the new certificate to the.
• Reset the API key on the AMP Threat Grid appliance. For instructions, see the online help on the AMP Threat Grid appliance.

Related Topics
• Enabling and Configuring File Reputation and Analysis Services, on page 252

Files are Not Uploaded As Expected

Problem
Files are not evaluated or analyzed as expected. There is no alert or obvious error.

Solution
Consider the following:

• The file may have been sent for analysis by another appliance and thus already be present on the File Analysis server or in the cache of the appliance that is processing the file.

Alerts about File Types That Can Be Sent for Analysis

Problem
You receive alerts of severity Info about file types that can be sent for file analysis.

Solution
This alert is sent when supported file types change, or when the appliance checks to see what file types are supported. This can occur when:

• You or another administrator changes the file types selected for analysis.
• Supported file types change temporarily based on availability in the cloud service. In this case, support for the file types selected on the appliance will be restored as soon as possible. Both processes are dynamic and do not require any action from you.
• The appliance restarts, for example as part of an AsyncOS upgrade.
Alerts about File Types That Can Be Sent for Analysis
# Managing Access to Web Applications

This chapter contains the following sections:

- Overview of Managing Access to Web Applications, on page 263
- Enabling the AVC Engine, on page 264
- Policy Application Control Settings, on page 265
- Controlling Bandwidth, on page 267
- Controlling Instant Messaging Traffic, on page 270
- Viewing AVC Activity, on page 270

## Overview of Managing Access to Web Applications

The Application Visibility and Control (AVC) engine lets you create policies to control application activity on the network without having to fully understand the underlying technology of each application. You can configure application control settings in Access Policy groups. You can block or allow applications individually or according to application type. You can also apply controls to particular application types.

Using Access Policies you can:

- Control application behaviors
- Control the amount of bandwidth used for particular application types
- Notify end-users when they are blocked
- Assign controls to Instant Messaging, Blogging and Social Media applications
- Specify Range Request settings

To control applications using the AVC engine, perform the following tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>Link to Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable the AVC engine</td>
<td>Enabling the AVC Engine, on page 264</td>

<tr>
<td>Allow instant messaging traffic, but disallow file sharing using instant messenger</td>
<td>Controlling Instant Messaging Traffic, on page 270</td>
</tr>
</tbody>
</table>

User Guide for AsyncOS 11.5.1 for Cisco Web Security Appliances - GD (General Deployment)
Enabling the AVC Engine

Enable the AVC engine when you enable the Acceptable Use Controls.

Note: You can view the AVC engine scanning activity in the Application Visibility report on the Reporting > Application Visibility page.

Step 1: Choose Security Services > Acceptable Use Controls.
Step 2: Click Enable or Edit Global Settings, depending on the current status of the Acceptable Use Controls.
Step 3: Be sure Enable Cisco Web Usage Controls is checked.
Step 4: In the Acceptable Use Controls Service panel, select Cisco Web Usage Controls, and then select Enable Application Visibility and Control.
Step 5: Select the Default Action for Unreachable Service: Monitor or Block.
Step 6: Submit and Commit Changes.

What to do next

Related Topics

- AVC Engine Updates and Default Actions, on page 264
- User Experience When Requests Are Blocked by the AVC Engine, on page 265

AVC Engine Updates and Default Actions

AsyncOS periodically queries the update servers for new updates to all security service components, including the AVC engine. AVC engine updates can include support for new application types and applications, as well as updated support for existing applications if any application behaviors change. By updating the AVC engine between AsyncOS version updates, the Web Security appliance remains flexible without requiring a server upgrade.

AsyncOS for Web assigns the following default actions for the Global Access Policy:

- New Application Types default to Monitor.
- New application behaviors, such as block file transfer within a particular application; defaults to Monitor.
- New applications for an existing application type default to the Application Type’s default.

Note: In the Global Access Policy, you can set the default action for each Application Type, so new applications introduced in an AVC engine update automatically inherit the specified default action. See Configuring Application Control Settings in an Access Policy Group, on page 267.
User Experience When Requests Are Blocked by the AVC Engine

When the AVC engine blocks a transaction, the Web Proxy sends a block page to the end user. However, not all Websites display the block page to the end user; many Websites display dynamic content using JavaScript instead of a static Web page and are not likely to display the block page. Users are still properly blocked from downloading malicious data, but they may not always be informed of this by the Website.

Policy Application Control Settings

Controlling applications involves configuring the following elements:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application Types</td>
<td>A category that contains one or more applications.</td>
</tr>
<tr>
<td>Applications</td>
<td>Particular applications within an Application Type.</td>
</tr>
<tr>
<td>Application behaviors</td>
<td>Particular actions or behaviors that users can do within an application that administrators can control. Not all applications include behaviors you can configure.</td>
</tr>
</tbody>
</table>

You can configure application control settings in Access Policy groups. On the Web Security Manager > Access Policies page, click the Applications link for the policy group you want to configure. When configuring applications, you can choose the following actions:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block</td>
<td>This action is a final action. Users are prevented from viewing a webpage and instead an end-user notification page displays</td>
</tr>
<tr>
<td>Monitor</td>
<td>This action is an intermediary action. The Web Proxy continues comparing the transaction to the other control settings to determine which final action to apply</td>
</tr>
<tr>
<td>Restrict</td>
<td>This action indicates that an application behavior is blocked. For example, when you block file transfers for a particular instant messaging application, the action for that application is Restrict.</td>
</tr>
<tr>
<td>Bandwidth Limit</td>
<td>For certain applications, such as Media and Facebook, you can limit the bandwidth available for Web traffic. You can limit bandwidth for the application itself, and for its users.</td>
</tr>
</tbody>
</table>

Related Topics

- Range Request Settings, on page 265
- Rules and Guidelines for Configuring Application Control, on page 266

Range Request Settings

When HTTP range requests are disabled and a large file is downloaded over multiple streams, the consolidated package is scanned. This disables the performance advantages of download-management utilities and applications that are used to download large objects.
Alternatively, when Range Request Forwarding is enabled (see Configuring Web Proxy Settings, on page 63), you can control how incoming range requests are handled on a per-policy basis. This process is known as “byte serving” and is a means of bandwidth optimization when requesting large files.

However, enabling range request forwarding can interfere with policy-based Application Visibility and Control (AVC) efficiency, and can compromise security. Please exercise caution and enable HTTP Range Request Forwarding only if the advantages outweigh the security implications.

The Range Request Settings are read-only when Range Request Forwarding is not enabled, and also when it is enabled but all applications are set to Monitor. The settings are available when at least one application is set to Block, Restrict, or Throttle.

### Range Request Settings for Policy

<table>
<thead>
<tr>
<th>Range Request Settings</th>
<th>Action Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Do not forward range requests</td>
<td>Any request for a portion of a file is not forwarded; the entire file is returned.</td>
</tr>
<tr>
<td>• Forward range requests</td>
<td>If the requested range is valid, it is forwarded and the target server will return the only requested portion of the desired file.</td>
</tr>
</tbody>
</table>

**Exception list**

You can specify traffic destinations which are exempt from the current forwarding selection. That is, when Do not forward range requests is selected, you can specify destinations for which requests are forwarded. Similarly, when Forward range requests is selected, you can specify destinations for which requests are not forwarded.

### Rules and Guidelines for Configuring Application Control

Consider the following rules and guidelines when configuring application control settings:

- The supported Application Types, applications, and application behaviors may change between AsyncOS for Web upgrades, or after AVC engine updates.

- If you enable Safe Search or Site Content Rating, the AVC Engine is tasked with identifying applications for safe browsing. As one of the criteria, the AVC engine will scan the response body to detect a search application. As a result, the appliance will not forward range headers.

- In Application Type listings, the summary for each Application Type lists the final actions for its applications, but does not indicate whether these actions are inherited from the global policy or configured in the current Access Policy. To learn more about the action for a particular application, expand the application type.

- In the Global Access Policy, you can set the default action for each Application Type, so new applications introduced in an AVC engine update automatically inherit the default action.

- You can quickly configure the same action for all applications in an application type by clicking the “edit all” link for the Application Type in Browse view. However, you can only configure the application action, not application behavior actions. To configure application behaviors, you must edit the application individually.

- In Search view, when you sort the table by the action column, the sort order is by the final action. For example, “Use Global (Block)” comes after “Block” in the sort order.
Decryption may cause some applications to fail unless the root certificate for signing is installed on the client.

Related Topics

- Configuring Application Control Settings in an Access Policy Group, on page 267
- Configuring Overall Bandwidth Limits, on page 268
- Viewing AVC Activity, on page 270

Configuring Application Control Settings in an Access Policy Group

Step 1

Step 2
Click the link in the Policies table under the Applications column for the policy group you want to edit.

Step 3
When configuring the Global Access Policy:

a) Define the default action for each Application Type in the Default Actions for Application Types section.

b) You can edit the default actions for each Application Type’s individual members, as a group or individually, in the Edit Applications Settings section of the page. Editing the default action for individual applications is described in the following steps.

Step 4
When configuring a user defined Access Policy, choose Define Applications Custom Settings in the Edit Applications Settings section.

Step 5
In the Application Settings area, choose Browse view or Search view from the drop-down menu:

- Browse view. You can browse Application Types. You can use Browse view to configure all applications of a particular type at the same time. When an Application Type is collapsed in Browse view, the summary for the Application Type lists the final actions for its applications; however it does not indicate whether the actions are inherited from the global policy, or configured in the current Access Policy.

- Search view. You can search for applications by name. You might use Search view when the total list of applications is long and you need to quickly find and configure a particular application.

Step 6
Configure the action for each application and application behavior.

Step 7
Configure the bandwidth controls for each applicable application.

Step 8
Submit and Commit Changes.

What to do next

Related Topics

- Controlling Bandwidth, on page 267

Controlling Bandwidth

When both the overall limit and user limit applies to a transaction, the most restrictive option applies. You can define bandwidth limits for particular URL categories by defining an Identity group for a URL category and using it in an Access Policy that restricts the bandwidth.
You can define the following bandwidth limits:

<table>
<thead>
<tr>
<th>Bandwidth Limit</th>
<th>Description</th>
<th>Link to Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overall</td>
<td>Define an overall limit for all users on the network for the supported</td>
<td>Configuring Overall Bandwidth Limits, on page 268</td>
</tr>
<tr>
<td></td>
<td>application types. The overall bandwidth limit affects the traffic between</td>
<td></td>
</tr>
<tr>
<td></td>
<td>the Web Security appliance and web servers. It does not limit traffic</td>
<td></td>
</tr>
<tr>
<td></td>
<td>served from the web cache.</td>
<td></td>
</tr>
<tr>
<td>User</td>
<td>Define a limit for particular users on the network per application type.</td>
<td>Configuring User Bandwidth Limits, on page 268</td>
</tr>
<tr>
<td></td>
<td>User bandwidth limits traffic from web servers as well as traffic served</td>
<td></td>
</tr>
<tr>
<td></td>
<td>from the web cache.</td>
<td></td>
</tr>
</tbody>
</table>

**Note**
Defining bandwidth limits only throttles the data going to users. It does not block data based on reaching a quota. The Web Proxy introduces latency into each application transaction to mimic a slower link to the server.

### Configuring Overall Bandwidth Limits

- **Step 1**: Choose **Web Security Manager > Overall Bandwidth Limits**
- **Step 2**: Click **Edit Settings**.
- **Step 3**: Select the **Limit to** option.
- **Step 4**: Enter the amount of traffic to limit in either Megabits per second (Mbps) or kilobits per second (kbps).
- **Step 5**: Submit and Commit Changes.

### Configuring User Bandwidth Limits

You can define user bandwidth limits by configuring bandwidth control settings on the Applications Visibility and Control page of Access Policies. You can define the following types of bandwidth controls for users in Access Policies:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Link to task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Default bandwidth limit for an application</td>
<td>In the Global Access Policy, you can define the default bandwidth limit for</td>
<td>Configuring the Default Bandwidth Limit for an Application Type, on page 269</td>
</tr>
<tr>
<td>type</td>
<td>all applications of an application type.</td>
<td></td>
</tr>
<tr>
<td>Bandwidth limit for an application type</td>
<td>In a user defined Access Policy, you can override the default bandwidth</td>
<td>Overriding the Default Bandwidth Limit for an Application Type, on page 269</td>
</tr>
<tr>
<td></td>
<td>limit for the application type defined in the Global Access Policy.</td>
<td></td>
</tr>
</tbody>
</table>
### Configuring the Default Bandwidth Limit for an Application Type

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Link to task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bandwidth limit for an application</td>
<td>In a user defined or Global Access Policy, you can choose to apply the application type bandwidth limit or no limit (exempt the application type limit).</td>
<td>Configuring Bandwidth Controls for an Application, on page 269</td>
</tr>
</tbody>
</table>

**Step 1**  Choose Web Security Manager > Access Policies.

**Step 2**  Click the link in the policies table under the Applications column for the Global Access Policy.

**Step 3**  In the **Default Actions for Application Types** section, click the link next to “Bandwidth Limit” for the application type you want to edit.

**Step 4**  Select **Set Bandwidth Limit** and enter the amount of traffic to limit in either Megabits per second (Mbps) or kilobits per second (kbps).

**Step 5**  Click **Apply**.

**Step 6**  Submit and Commit Changes.

### Overriding the Default Bandwidth Limit for an Application Type

You can override the default bandwidth limit defined at the Global Access Policy group in the user defined Access Policies. You can only do this in Browse view.

**Step 1**  Choose Web Security Manager > Access Policies.

**Step 2**  Click the link in the policies table under the Applications column for the user defined policy group you want to edit.

**Step 3**  Choose **Define Applications Custom Settings** in the **Edit Applications Settings** section.

**Step 4**  Click the link next to “Bandwidth Limit” for the application type you want to edit.

**Step 5**  To choose a different bandwidth limit value, select **Set Bandwidth Limit** and enter the amount of traffic to limit in either Megabits per second (Mbps) or kilobits per second (kbps). To specify no bandwidth limit, select **No Bandwidth Limit for Application Type**.

**Step 6**  Click **Apply**.

**Step 7**  Submit and Commit Changes.

### Configuring Bandwidth Controls for an Application

**Step 1**  Choose Web Security Manager > Access Policies.

**Step 2**  Click the link in the policies table under the Applications column for the policy group you want to edit.

**Step 3**  Expand the application type that contains the application you want to define.

**Step 4**  Click the link for the application you want to configure.

**Step 5**  Select **Monitor**, and then choose to use either the bandwidth limit defined for the application type or no limit.
Controlling Instant Messaging Traffic

You can block or monitor the IM traffic, and depending on the IM service, you can block particular activities (also known as application behaviors) in an IM session.

**Step 1** Choose Web Security Manager > Access Policies.

**Step 2** Click the link in the policies table under the Applications column for the policy group you want to edit.

**Step 3** Click Define Applications Custom Setting.

**Step 4** Expand the Instant Messaging application type.

**Step 5** Click the link next to the IM application you want to configure.

**Step 6** To block all traffic for this IM application, select **Block**.

**Step 7** To monitor the IM application, but block particular activities within the application, select **Monitor**, and then select the application behavior to **Block**.

**Step 8** Click **Done**.

**Step 9** Submit and Commit Changes.

Viewing AVC Activity

The Reporting > Application Visibility page displays information about the top applications and application types used. It also displays the top applications and application types blocked.

AVC Information in Access Log File

The access log file records the information returned by the Application Visibility and Control engine for each transaction. The scanning verdict information section in the access logs includes the fields listed below:

<table>
<thead>
<tr>
<th>Description</th>
<th>Custom Field in Access Logs</th>
<th>Custom Field in W3C Logs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application name</td>
<td>%XO</td>
<td>x-avc-app</td>
</tr>
<tr>
<td>Application type</td>
<td>%Xu</td>
<td>x-avc-type</td>
</tr>
<tr>
<td>Application behavior</td>
<td>%Xb</td>
<td>x-avc-behavior</td>
</tr>
</tbody>
</table>
Overview of Prevent Loss of Sensitive Data

The Web Security appliance secures your data by providing the following capabilities:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Data Security filters</td>
<td>The Cisco Data Security filters on the Web Security appliance evaluate data leaving the network over HTTP, HTTPS and FTP.</td>
</tr>
<tr>
<td>Third-party data loss prevention (DLP) integration</td>
<td>The Web Security appliance integrates with leading third party content-aware DLP systems that identify and protect sensitive data. The Web Proxy uses the Internet Content Adaptation Protocol (ICAP) which allows proxy servers to offload content scanning to external systems.</td>
</tr>
</tbody>
</table>

When the Web Proxy receives an upload request, it compares the request to the Data Security and External DLP Policy groups to determine which policy group to apply. If both types of policies are configured, it compares the request to Cisco Data Security policies before external DLP policies. After it assigns the request to a policy group, it compares the request to the policy group's configured control settings to determine what to do with the request. How you configure the appliance to handle upload requests depends on the policy group type.
Upload requests that try to upload files with a size of zero (0) bytes are not evaluated against Cisco Data Security or External DLP policies.

To restrict and control data that is leaving the network, you can perform the following tasks:

<table>
<thead>
<tr>
<th>Task</th>
<th>Link to Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create Cisco Data Security policies</td>
<td>Managing Upload Requests, on page 273</td>
</tr>
<tr>
<td>Create External DLP policies</td>
<td>Managing Upload Requests on an External DLP System, on page 273</td>
</tr>
<tr>
<td>Create Data Security and External DLP policies</td>
<td>Creating Data Security and External DLP Policies, on page 275</td>
</tr>
<tr>
<td>Control Upload Requests using Cisco Data Security policies</td>
<td>Managing Settings for Upload Requests, on page 277</td>
</tr>
<tr>
<td>Control Upload Requests Using External DLP policies</td>
<td>Controlling Upload Requests Using External DLP Policies, on page 281</td>
</tr>
</tbody>
</table>

**Bypassing Upload Requests Below a Minimum Size**

To help reduce the number of upload requests recorded in the log files, you can define a minimum request body size, below which upload requests are not scanned by the Cisco Data Security Filters or the external DLP server.

To do this, use the following CLI commands:

- `datasecurityconfig`. Applies to the Cisco Data Security filters.
- `externaldlpconfig`. Applies to the configured external DLP servers.

The default minimum request body size is 4 KB (4096 bytes) for both CLI commands. Valid values are 1 to 64 KB. The size you specify applies to the entire size of the upload request body.

**User Experience When Requests Are Blocked As Sensitive Data**

When the Cisco Data Security filters or an external DLP server blocks an upload request, it provides a block page that the Web Proxy sends to the end user. Not all websites display the block page to the end user. For example, some Web 2.0 websites display dynamic content using javascript instead of a static Web page and are not likely to display the block page. Users are still properly blocked from performing data security violations, but they may not always be informed of this by the website.
Managing Upload Requests

Before you begin

Go to Security Services > Data Security Filters to enable the Cisco Data Security filters.

Create and configure Data Security Policy groups.

Cisco Data Security policies use URL filtering, Web reputation, and upload content information when evaluating the upload request. You configure each of these security components to determine whether or not to block the upload request.

When the Web Proxy compares an upload request to the control settings, it evaluates the settings in order. Each control setting can be configured to perform one of the following actions for Cisco Data Security policies:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Block</td>
<td>The Web Proxy does not permit the connection and instead displays an end user notification page explaining the reason for the block.</td>
</tr>
<tr>
<td>Allow</td>
<td>The Web Proxy bypasses the rest of the Data Security Policy security service scanning and then evaluates the request against the Access Policies before taking a final action. For Cisco Data Security policies, Allow bypasses the rest of data security scanning, but does not bypass External DLP or Access Policy scanning. The final action the Web Proxy takes on the request is determined by the applicable Access Policy (or an applicable external DLP Policy that may block the request).</td>
</tr>
<tr>
<td>Monitor</td>
<td>The Web Proxy continues comparing the transaction to the other Data Security Policy group control settings to determine whether to block the transaction or evaluate it against the Access Policies.</td>
</tr>
</tbody>
</table>

For Cisco Data Security policies, only the Block action is a final action that the Web Proxy takes on a client request. The Monitor and Allow actions are intermediary actions. In both cases, the Web Proxy evaluates the transaction against the External DLP Policies (if configured) and Access Policies. The Web Proxy determines which final action to apply based on the Access Policy group control settings (or an applicable external DLP Policy that may block the request).

What to do next

Related Topics

- Managing Upload Requests on an External DLP System, on page 273
- Managing Settings for Upload Requests, on page 277

Managing Upload Requests on an External DLP System

To configure the Web Security appliance to handle upload requests on an external DLP system, perform the following tasks:
Choose **Network > External DLP Servers**. Define an external DLP system. To pass an upload request to an external DLP system for scanning, you must define at least one ICAP-compliant DLP system on the Web Security appliance.

**Step 2**

Create and configure **External DLP Policy groups**. After an external DLP system is defined, you create and configure External DLP Policy groups to determine which upload requests to send to the DLP system for scanning.

**Step 3**

When an upload request matches an External DLP Policy, the Web Proxy sends the upload request to the DLP system using the Internet Content Adaptation Protocol (ICAP) for scanning. The DLP system scans the request body content and returns a block or allow verdict to the Web Proxy. The allow verdict is similar to the Allow action for Cisco Data Security policies in that the upload request will be compared to the Access Policies. The final action the Web Proxy takes on the request is determined by the applicable Access Policy.

---

**What to do next**

**Related Topics**

- Controlling Upload Requests Using External DLP Policies, on page 281
- Defining External DLP Systems, on page 278

---

**Evaluating Data Security and External DLP Policy Group Membership**

Each client request is assigned to an Identity and then is evaluated against the other policy types to determine which policy group it belongs for each type. The Web Proxy evaluates upload requests against the Data Security and External DLP policies. The Web Proxy applies the configured policy control settings to a client request based on the client request’s policy group membership.

**Matching Client Requests to Data Security and External DLP Policy Groups**

To determine the policy group that a client request matches, the Web Proxy follows a specific process for matching the group membership criteria. It considers the following factors for group membership:

- **Identity**. Each client request either matches an Identification Profile, fails authentication and is granted guest access, or fails authentication and gets terminated.

- **Authorized users**. If the assigned Identification Profile requires authentication, the user must be in the list of authorized users in the Data Security or External DLP Policy group to match the policy group. The list of authorized users can be any of the specified groups or users or can be guest users if the Identification Profile allows guest access.

- **Advanced options**. You can configure several advanced options for Data Security and External DLP Policy group membership. Some options (such as proxy port and URL category) can also be defined within the Identity. When an advanced option is configured in the Identity, it is not configurable in the Data Security or External DLP Policy group level.

The information in this section gives an overview of how the Web Proxy matches upload requests to both Data Security and External DLP Policy groups.

The Web Proxy sequentially reads through each policy group in the policies table. It compares the upload request status to the membership criteria of the first policy group. If they match, the Web Proxy applies the policy settings of that policy group.
If they do not match, the Web Proxy compares the upload request to the next policy group. It continues this process until it matches the upload request to a user defined policy group. If it does not match a user defined policy group, it matches the global policy group. When the Web Proxy matches the upload request to a policy group or the global policy group, it applies the policy settings of that policy group.

Creating Data Security and External DLP Policies

You can create Data Security and External DLP Policy groups based on combinations of several criteria, such as one or more Identification Profiles or the URL category of the destination site. You must define at least one criterion for policy group membership. When you define multiple criteria, the upload request must meet all criteria to match the policy group. However, the upload request needs to match only one of the configured Identification Profiles.

Step 1

Step 2
Click Add Policy.

Step 3
In the Policy Name field, enter a name for the policy group, and in the Description field (optional) add a description. Each policy group name must be unique and only contain alphanumeric characters or the space character.

Step 4
In the Insert Above Policy field, choose where in the policies table to place the policy group.

When configuring multiple policy groups you must specify a logical order for each group. Order your policy groups to ensure that correct matching occurs.

Step 5
In the Identities and Users section, choose one or more Identification Profile groups to apply to this policy group.

Step 6
(Optional) Expand the Advanced section to define additional membership requirements.

Step 7
To define policy group membership by any of the advanced options, click the link for the advanced option and configure the option on the page that appears.

<table>
<thead>
<tr>
<th>Advanced Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocols</td>
<td>Choose whether or not to define policy group membership by the protocol used in the client request. Select the protocols to include. “All others” means any protocol not listed above this option.</td>
</tr>
<tr>
<td>Note</td>
<td>When the HTTPS Proxy is enabled, only Decryption Policies apply to HTTPS transactions. You cannot define policy membership by the HTTPS protocol for Access, Routing, Outbound Malware Scanning, Data Security, or External DLP Policies.</td>
</tr>
</tbody>
</table>
### Advanced Option | Description
--- | ---
Proxy Ports | Choose whether or not to define policy group membership by the proxy port used to access the Web Proxy. Enter one or more port numbers in the Proxy Ports field. Separate multiple ports with commas.

For explicit forward connections, this is the port configured in the browser. For transparent connections, this is the same as the destination port. You might want to define policy group membership on the proxy port if you have one set of clients configured to explicitly forward requests on one port, and another set of clients configured to explicitly forward requests on a different port.

Cisco recommends only defining policy group membership by the proxy port when the appliance is deployed in explicit forward mode, or when clients explicitly forward requests to the appliance. If you define policy group membership by the proxy port when client requests are transparently redirected to the appliance, some requests might be denied.

**Note** If the Identity associated with this policy group defines Identity membership by this advanced setting, the setting is not configurable at the non-Identity policy group level.

Subnets | Choose whether or not to define policy group membership by subnet or other addresses.

You can choose to use the addresses that may be defined with the associated Identification Profile, or you can enter specific addresses here.

**Note** If the Identification Profile associated with this policy group defines its membership by addresses, then in this policy group you must enter addresses that are a subset of the addresses defined in the Identification Profile. Adding addresses in the policy group further narrows down the list of transactions that match this policy group.

URL Categories | Choose whether or not to define policy group membership by URL categories. Select the user defined or predefined URL categories.

**Note** If the Identity associated with this policy group defines Identity membership by this advanced setting, the setting is not configurable at the non-Identity policy group level.

User Agents | Choose whether to define policy group membership by the user agents (client applications such as updaters and Web browsers) used in the client request. You can select some commonly defined user agents, or define your own using regular expressions. Specify whether membership definition includes only the selected user agents, or specifically excludes the selected user agents.

**Note** If the Identification Profile associated with this policy group defines Identification Profile membership by this advanced setting, the setting is not configurable at the non-Identification Profile policy group level.

User Location | Choose whether or not to define policy group membership by user location, either remote or local.

This option only appears when the Secure Mobility is enabled.

---

**Step 8** Submit your changes.

**Step 9** If you are creating a Data Security Policy group, configure its control settings to define how the Web Proxy handles upload requests.
The new Data Security Policy group automatically inherits global policy group settings until you configure options for each control setting.

If you are creating an External DLP Policy group, configure its control settings to define how the Web Proxy handles upload requests.

The new External DLP Policy group automatically inherits global policy group settings until you configure custom settings.

**Step 10** Submit and Commit Changes.

---

**What to do next**

**Related Topics**
- Evaluating Data Security and External DLP Policy Group Membership, on page 274
- Matching Client Requests to Data Security and External DLP Policy Groups, on page 274
- Managing Settings for Upload Requests, on page 277
- Controlling Upload Requests Using External DLP Policies, on page 281

---

**Managing Settings for Upload Requests**

Each upload request is assigned to a Data Security Policy group and inherits the control settings of that policy group. The control settings of the Data Security Policy group determine whether the appliance blocks the connection or evaluates it against the Access Policies.

Configure control settings for Data Security Policy groups on the Web Security Manager > Cisco Data Security page.

You can configure the following settings to determine what action to take on upload requests:

<table>
<thead>
<tr>
<th>Option</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Categories</td>
<td>URL Categories, on page 277</td>
</tr>
<tr>
<td>Web Reputation</td>
<td>Web Reputation, on page 278</td>
</tr>
<tr>
<td>Content</td>
<td>Content Blocking, on page 278</td>
</tr>
</tbody>
</table>

After a Data Security Policy group is assigned to an upload request, the control settings for the policy group are evaluated to determine whether to block the request or evaluate it against the Access Policies.

---

**URL Categories**

AsyncOS for Web allows you to configure how the appliance handles a transaction based on the URL category of a particular request. Using a predefined category list, you can choose to monitor or block content by category. You can also create custom URL categories and choose to allow, monitor, or block traffic for a website in the custom category.
Web Reputation

The Web Reputation setting inherits the global setting. To customize web reputation filtering for a particular policy group, you can use the Web Reputation Settings pull-down menu to customize web reputation score thresholds.

Only negative and zero values can be configured for web reputation threshold settings for Cisco Data Security policies. By definition, all positive scores are monitored.

Content Blocking

You can use the settings on the Cisco Data Security > Content page to configure the Web Proxy to block data uploads based on the following file characteristics:

- **File size.** You can specify the maximum upload size allowed. All uploads with sizes equal to or greater than the specified maximum are blocked. You can specify different maximum file sizes for HTTP/HTTPS and native FTP requests.

  When the upload request size is greater than both the maximum upload size and the maximum scan size (configured in the “DVS Engine Object Scanning Limits” field on Security Services > Anti-Malware page), the upload request is still blocked, but the entry in the data security logs does not record the file name and content type. The entry in the access logs is unchanged.

- **File type.** You can block predefined file types or custom MIME types you enter. When you block a predefined file type, you can block all files of that type or files greater than a specified size. When you block a file type by size, the maximum file size you can specify is the same as the value for the “DVS Engine Object Scanning Limits” field on Security Services > Anti-Malware page. By default, that value is 32 MB.

  Cisco Data Security filters do not inspect the contents of archived files when blocking by file type. Archived files can be blocked by its file type or file name, not according to its contents.

  **Note**
  
  For some groups of MIME types, blocking one type blocks all MIME types in the group. For example, blocking application/x-java-applet blocks all java MIME types, such as application/java and application/javascript.

  - **File name.** You can block files with specified names. You can use text as a literal string or a regular expression for specifying file names to block.

    **Note**
    
    Only enter file names with 8-bit ASCII characters. The Web Proxy only matches file names with 8-bit ASCII characters.

Defining External DLP Systems

The Web Security appliance can integrate with multiple external DLP servers from the same vendor by defining multiple DLP systems in the appliance. You can define the load-balancing technique the Web Proxy uses when contacting the DLP systems. This is useful when you define multiple DLP systems. See SSL Configuration
Verify the external DLP server does not send the Web Proxy modified content. AsyncOS for Web only supports the ability to block or allow upload requests. It does not support uploading content modified by an external DLP server.

### Configuring External DLP Servers

**Step 1** Choose Network > External DLP Servers.

**Step 2** Click Edit Settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Protocol for External DLP Servers</td>
<td>Choose either:</td>
</tr>
<tr>
<td></td>
<td>• ICAP – DLP client/server ICAP communications are not encrypted.</td>

</tr>
<tr>
<td></td>
<td>Additional related options appear.</td>
</tr>
<tr>
<td>External DLP Servers</td>
<td>Enter the following information to access an ICAP compliant DLP system:</td>
</tr>
<tr>
<td></td>
<td>• Server address and Port – The hostname or IP address and TCP port for accessing the DLP system.</td>
</tr>
<tr>
<td></td>
<td>• Reconnection attempts – The number of times the Web Proxy tries to connect to the DLP system before failing.</td>
</tr>
<tr>
<td></td>
<td>• Service URL – The ICAP query URL specific to the particular DLP server. The Web Proxy includes what you enter here in the ICAP request it sends to the external DLP server. The URL must start with the ICAP protocol: icap://</td>
</tr>
<tr>
<td></td>
<td>• Certificate (optional) – The certificate provided to secure each External DLP Server connection can be Certificate Authority (CA)-signed or self-signed. Obtain the certificate from the specified server, and then upload it to the appliance:</td>
</tr>
<tr>
<td></td>
<td>• Browse to and select the certificate file, and then click Upload File.</td>
</tr>
<tr>
<td></td>
<td>This single file must contain both the client certificate and private key in unencrypted form.</td>
</tr>
<tr>
<td></td>
<td>• Use this certificate for all DLP servers using Secure ICAP – Check this box to use the same certificate for all External DLP Servers you define here. Leave the option unchecked to enter a different certificate for each server.</td>
</tr>
<tr>
<td></td>
<td>• Start Test – You can test the connection between the Web Security appliance and the defined external DLP server(s) by clicking Start Test.</td>
</tr>
</tbody>
</table>
### Setting Description

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Load Balancing** | If multiple DLP servers are defined, select which load-balancing technique the Web Proxy uses to distribute upload requests to different DLP servers. You can choose the following load-balancing techniques:  
  - **None (failover).** The Web Proxy directs upload requests to one DLP server. It tries to connect to the DLP servers in the order they are listed. If one DLP server cannot be reached, the Web Proxy attempts to connect to the next one in the list.  
  - **Fewest connections.** The Web Proxy keeps track of how many active requests are with the different DLP servers and it directs the upload request to the DLP server currently servicing the fewest number of connections.  
  - **Hash based.** The Web Proxy uses a hash function to distribute requests to the DLP servers. The hash function uses the proxy ID and URL as inputs so that requests for the same URL are always directed to the same DLP server.  
  - **Round robin.** The Web Proxy cycles upload requests equally among all DLP servers in the listed order. |
| **Service Request Timeout** | Enter how long the Web Proxy waits for a response from the DLP server. When this time is exceeded, the ICAP request has failed and the upload request is either blocked or allowed, depending on the Failure Handling setting.  
  Default is 60 seconds. |
| **Maximum Simultaneous Connections** | Specifies the maximum number of simultaneous ICAP request connections from the Web Security appliance to each configured external DLP server. The Failure Handling setting on this page applies to any request which exceeds this limit.  
  Default is 25. |
| **Failure Handling** | Choose whether upload requests are blocked or allowed (passed to Access Policies for evaluation) when the DLP server fails to provide a timely response.  
  Default is allow (“Permit all data transfers to proceed without scanning”). |
| **Trusted Root Certificate** | Browse to and select the trusted-root certificate for the certificate(s) provided with the External DLP Servers, and then click Upload File. See Certificate Management, on page 413 for additional information. |
| **Invalid Certificate Options** | Specify how various invalid certificates are handled: **Drop** or **Monitor**. |
| **Server Certificates** | This section displays all DLP server certificates currently available on the appliance. |

**Step 3** (Optional) You can add another DLP server by clicking **Add Row** and entering the DLP Server information in the new fields provided.

**Step 4** Submit and Commit Changes.
Controlling Upload Requests Using External DLP Policies

Once the Web Proxy receives the upload request headers, it has the information necessary to decide if the request should go to the external DLP system for scanning. The DLP system scans the request and returns a verdict to the Web Proxy, either block or monitor (evaluate the request against the Access Policies).

Step 1 Choose Web Security Manager > External Data Loss Prevention.
Step 2 Click the link under the Destinations column for the policy group you want to configure.
Step 3 Under the Edit Destination Settings section, choose “Define Destinations Scanning Custom Settings.”
Step 4 In the Destination to scan section, choose one of the following options:
  • Do not scan any uploads. No upload requests are sent to the configured DLP system(s) for scanning. All upload requests are evaluated against the Access Policies.
  • Scan all uploads. All upload requests are sent to the configured DLP system(s) for scanning. The upload request is blocked or evaluated against the Access Policies depending on the DLP system scanning verdict.
  • Scan uploads except to specified custom and external URL categories. Upload requests that fall in specific custom URL categories are excluded from DLP scanning policies. Click Edit custom categories list to select the URL categories to scan.

Step 5 Submit and Commit Changes.

Logging of Data Loss Prevention Scanning

The access logs indicate whether or not an upload request was scanned by either the Cisco Data Security filters or an external DLP server. The access log entries include a field for the Cisco Data Security scan verdict and another field for the External DLP scan verdict based.

In addition to the access logs, the Web Security appliance provides the following log file types to troubleshoot Cisco Data Security and External DLP Policies:
  • Data Security Logs. Records client history for upload requests that are evaluated by the Cisco Data Security filters.
  • Data Security Module Logs. Records messages related to the Cisco Data Security filters.
  • Default Proxy Logs. In addition recording errors related to the Web Proxy, the default proxy logs include messages related to connecting to external DLP servers. This allows you to troubleshoot connectivity or integration problems with external DLP servers.

The following text illustrates a sample Data Security Log entry:

```
Mon Mar 30 03:02:13 2009 Info: 303 10.1.1.1 - -
<<bar,text/plain,5120><foo,text/plain,5120>>
BLOCK_WEBCAT_IDS-allowall-DefaultGroup-DefaultGroup-NONE-DefaultRouting ns server.com nc
```

</tbody>
</table>

**Note**<br>To learn when data transfer, such as a POST request, to a site was blocked by the external DLP server, search for the IP address or hostname of the DLP server in the access logs.
CHAPTER 18

Notify End-Users of Proxy Actions

This chapter contains the following sections:

• End-User Notifications Overview, on page 283
• Configuring General Settings for Notification Pages, on page 284
• End-User Acknowledgment Page, on page 284
• End-User Notification Pages, on page 287
• Configuring the End-User URL Filtering Warning Page, on page 291
• Configuring FTP Notification Messages, on page 292
• Custom Messages on Notification Pages, on page 292
• Editing Notification Page HTML Files Directly, on page 294
• Notification Page Types, on page 298

End-User Notifications Overview

You can configure the following types of notifications for end users:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Further information</th>
</tr>
</thead>
<tbody>
<tr>
<td>End-user acknowledgement page</td>
<td>Informs end users that their web activity is being filtered and monitored. An end-user acknowledgement page is displayed when a user first accesses a browser after a certain period of time.</td>
<td>End-User Acknowledgment Page, on page 284</td>
</tr>
<tr>
<td>End-user notification pages</td>
<td>Page shown to end users when access to a particular page is blocked, specific to the reason for blocking it.</td>
<td>End-User Notification Pages, on page 287</td>
</tr>
<tr>
<td>End-user URL filtering warning page</td>
<td>Warns end users that a site they are accessing does not meet your organization’s acceptable use policies, and allows them to continue if they choose.</td>
<td>Configuring the End-User URL Filtering Warning Page, on page 291</td>
</tr>
<tr>
<td>FTP notification messages</td>
<td>Gives end users the reason a native FTP transaction was blocked.</td>
<td>Configuring FTP Notification Messages, on page 292.</td>
</tr>
</tbody>
</table>
Configuring General Settings for Notification Pages

Specify display languages and logo for notification pages. Restrictions are described in this procedure.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
<th>Further information</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time and Volume Quotas Expiry Warning Page</td>
<td>Notifies end users when their access is blocked because they have reached the configured data volume or time limit.</td>
<td>Configure these settings on the Security Services &gt; End User Notification page, Time and Volume Quotas Expiry Warning Page section. See also Time Ranges and Quotas, on page 200.</td>
</tr>
</tbody>
</table>

Step 1
Select **Security Services > End-User Notification**.

Step 2
Click **Edit Settings**.

Step 3
In the General Settings section, select the language the Web Proxy should use when displaying notification pages.

- The HTTP language setting applies to all HTTP notification pages (acknowledgment, on-box end-user, customized end-user, and end-user URL filtering warning).
- The FTP language applies to all FTP notification messages.

Step 4
Choose whether or not to use a logo on each notification page. You can specify the Cisco logo or any graphic file referenced at the URL you enter in the Use Custom Logo field.
This setting applies to all HTTP notification pages served over IPv4. AsyncOS does not support images over IPv6.

Step 5
Submit and Commit Changes.

What to do next
Related Topics
- Caveats for URLs and Logos in Notification Pages, on page 293

End-User Acknowledgment Page

You can configure the Web Security appliance to inform users that it is filtering and monitoring their web activity. When configured, the appliance displays an end-user acknowledgment page for every user accessing the web using HTTP or HTTPS. It displays the end-user acknowledgment page when a user tries to access a website for the first time, or after a configured time interval.

The Web Proxy tracks users by username if authentication has made a username available. If no user name is available, you can choose how to track users, either by IP address or web browser session cookie.
Native FTP transactions are exempt from the end-user acknowledgment page.

- Access HTTPS and FTP Sites with the End-User Acknowledgment Page, on page 285
- About the End-user Acknowledgment Page, on page 285
- Configuring the End-User Acknowledgment Page, on page 286

Access HTTPS and FTP Sites with the End-User Acknowledgment Page

The end-user acknowledgment page works because it displays an HTML page to the end user that forces them to click an acceptable use policy agreement. After users click the link, the Web Proxy redirects clients to the originally requested website. It keeps track of when users accepted the end-user acknowledgment page using a surrogate (either by IP address or web browser session cookie) if no username is available for the user.

- **HTTPS.** The Web Proxy tracks whether the user has acknowledged the end-user acknowledgment page with a cookie, but it cannot obtain the cookie unless it decrypts the transaction. You can choose to either bypass (pass through) or drop HTTPS requests when the end-user acknowledgment page is enabled and tracks users using session cookies. Do this using the `advancedproxyconfig > EUN CLI command`, and choose bypass for the “Action to be taken for HTTPS requests with Session based EUA (“bypass” or “drop”).” command.
- **FTP over HTTP.** Web browsers never send cookies for FTP over HTTP transactions, so the Web Proxy cannot obtain the cookie. To work around this, you can exempt FTP over HTTP transactions from requiring the end-user acknowledgment page. Do this by creating a custom URL category using “ftp://” as the regular expression (without the quotes) and defining an Identity policy that exempts users from the end-user acknowledgment page for this custom URL category.

About the End-user Acknowledgment Page

- When a user is tracked by IP address, the appliance uses the shortest value for maximum time interval and maximum IP address idle timeout to determine when to display the end-user acknowledgment page again.
- When a user is tracked using a session cookie, the Web Proxy displays the end-user acknowledgment page again if the user closes and then reopens their web browser or opens a second web browser application.
- Using a session cookie to track users when the client accesses HTTPS sites or FTP servers using FTP over HTTP does not work.
- When the appliance is deployed in explicit forward mode and a user goes to an HTTPS site, the end-user acknowledgment page includes only the domain name in the link that redirects the user to the originally requested URL. If the originally requested URL contains text after the domain name, that text is truncated.
- When the end-user acknowledgment page is displayed to a user, the access log entry for that transaction shows OTHER as the ACL decision tag. This is because the originally requested URL was blocked, and instead the user was shown the end-user acknowledgment page.
Configuring the End-User Acknowledgment Page

Before you begin

- To configure the display language and customize the displayed logo, see Configuring General Settings for Notification Pages, on page 284.
- If you will customize the message shown to end users, see Custom Messages on Notification Pages, on page 292. If you require more customization than the Custom Message box allows, see Editing Notification Page HTML Files Directly, on page 294.

You can enable and configure the end-user acknowledgment page in the web interface or the command line interface. When you configure the end-user acknowledgment page in the web interface, you can include a custom message that appears on each page.

In the CLI, use advancedproxyconfig > eun.

Step 1
Choose Security Services > End-User Notification.

Step 2
Click Edit Settings.

Step 3
Enable the “Require end-user to click through acknowledgment page” field.

Step 4
Enter options:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Between Acknowledgements</td>
<td>The Time Between Acknowledgments determines how often the Web Proxy displays the end-user acknowledgment page for each user. This setting applies to users tracked by username and users tracked by IP address or session cookie. You can specify any value from 30 to 2678400 seconds (one month). Default is one day (86400 seconds). When the Time Between Acknowledgments changes and is committed, the Web Proxy uses the new value even for users who have already acknowledged the Web Proxy.</td>
</tr>
<tr>
<td>Inactivity Timeout</td>
<td>The Inactivity Timeout determines how long a user tracked and acknowledged by IP address or session cookie (unauthenticated users only) can be idle before the user is no longer considered to have agreed to the acceptable use policy. You can specify any value from 30 to 2678400 seconds (one month). Default is four hours (144000 seconds).</td>
</tr>
</tbody>
</table>
Setting | Description
--- | ---
**Surrogate Type** | Determines which method the Web Proxy uses to track the user:
- **IP Address.** The Web Proxy allows the user at that IP address to use any web browser or non-browser HTTP process to access the web once the user clicks the link on the end-user acknowledgment page. Tracking the user by IP address allows the user to access the web until the Web Proxy displays a new end-user acknowledgment page due to inactivity or the configured time interval for new acknowledgments. Unlike tracking by a session cookie, tracking by IP address allows the user to open up multiple web browser applications and not have to agree to the end-user acknowledgment unless the configured time interval has expired.

**Note** When IP address is configured and the user is authenticated, the Web Proxy tracks users by username instead of IP address.

- **Session Cookie.** The Web Proxy sends the user’s web browser a cookie when the user clicks the link on the end-user acknowledgment page and uses the cookie to track their session. Users can continue to access the web using their web browser until the Time Between Acknowledgments value expires, they have been inactive longer than the allotted time, or they close their web browser.

If the user using a non-browser HTTP client application, they must be able to click the link on the end-user acknowledgment page to access the web. If the user opens a second web browser application, the user must go through the end-user acknowledgment process again in order for the Web Proxy to send a session cookie to the second web browser.

**Note** Using a session cookie to track users when the client accesses HTTPS sites or FTP servers using FTP over HTTP is not supported.

**Custom message** | Customize the text that appears on every end-user acknowledgment page. You can include some simple HTML tags to format the text.

**Note** You can only include a custom message when you configure the end-user acknowledgment page in the web interface, versus the CLI.

See also Custom Messages on Notification Pages, on page 292.

---

**Step 5** *(Optional)* Click **Preview Acknowledgment Page Customization** to view the current end-user acknowledgment page in a separate browser window.

**Note** If the notification HTML files have been edited, this preview functionality is not available.

**Step 6** Submit and Commit Changes.

---

**End-User Notification Pages**

When a policy blocks a user from a website, you can configure the appliance to notify the user why it blocked the URL request. There are several ways to achieve this:
Configuring On-Box End-User Notification Pages

Before you begin

• To configure the display language and customize the displayed logo, see Configuring General Settings for Notification Pages, on page 284.
• If you will customize the message displayed using on-box notifications, review the topics under Custom Messages on Notification Pages, on page 292. If you require more customization than the Custom Message box allows, see Editing Notification Page HTML Files Directly, on page 294.

On-box pages are predefined, customizable notification pages residing on the appliance.

Step 1 Security Services > End-User Notification.

Step 2 Click Edit Settings.

Step 3 From the Notification Type field, choose Use On Box End User Notification.

Step 4 Configure the on-box end-user notification page settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom Message</td>
<td>Include any additional text required on each notification page. When you enter a custom message, AsyncOS places the message before the last sentence on the notification page which includes the contact information.</td>
</tr>
<tr>
<td>Contact Information</td>
<td>Customize the contact information listed on each notification page. AsyncOS displays the contact information sentence as the last sentence on a page, before providing notification codes that users can provide to the network administrator.</td>
</tr>
<tr>
<td>End-User Misclassification Reporting</td>
<td>When enabled, users can report misclassified URLs to Cisco. An additional button appears on the on-box end-user notification pages for sites blocked due to suspected malware or URL filters. This button allows the user to report when they believe the page has been misclassified. It does not appear for pages blocked due to other policy settings.</td>
</tr>
</tbody>
</table>

Step 5 (Optional) Click Preview Notification Page Customization link to view the current end-user notification page in a separate browser window.

Note If the notification HTML files have been edited, this preview functionality is not available.

Step 6 Submit and Commit Changes.
Off-Box End-User Notification Pages

The Web Proxy can be configured to redirect all HTTP end-user notification pages to a specific URL that you specify.

- Displaying the Correct Off-Box Page Based on the Reason for Blocking Access, on page 289
- URL Criteria for Off-Box Notification Pages, on page 289
- Off-Box End-User Notification Page Parameters, on page 289
- Redirecting End-User Notification Pages to a Custom URL (Off-Box), on page 291

Displaying the Correct Off-Box Page Based on the Reason for Blocking Access

By default, AsyncOS redirects all blocked websites to the URL regardless of the reason why it blocked the original page. However, AsyncOS also passes parameters as a query string appended to the redirect URL so you can ensure that the user sees a unique page explaining the reason for the block. For more information on the included parameters, see Off-Box End-User Notification Page Parameters, on page 289.

When you want the user to view a different page for each reason for a blocked website, construct a CGI script on the web server that can parse the query string in the redirect URL. Then the server can perform a second redirect to an appropriate page.

URL Criteria for Off-Box Notification Pages

- You can use any HTTP or HTTPS URL.
- The URL may specify a specific port number.
- The URL may not have any arguments after the question mark.
- The URL must contain a well-formed hostname.

For example, if you have the following URL entered in the Redirect to Custom URL field:

```
http://www.example.com/eun.policy.html
```

And you have the following access log entry:

```
1182468145.492 1 172.17.0.8 TCP_DENIED/403 3146 GET http://www.espn.com/index.html HTTP/1.1 - NONE/- - BLOCK_WEBCAT-DefaultGroup-DefaultGroup-NONE-NONE-DefaultRouting
IW_sprt,-,-,-,-,-,-,-,-,-,-,-,-,-,-,IW_sprt,->
```

Then AsyncOS creates the following redirected URL:

```
&URL_Cat=Sports%20and%20Recreation&WRRS--&DVS_Verdict--&DVS_ThreatName--&Reauth_URL--
```

Off-Box End-User Notification Page Parameters

AsyncOS passes the parameters to the web server as standard URL Parameters in the HTTP GET request. It uses the following format:

```
<notification_page_url>?param1=value1&param2=value2
```
The table describes the parameters AsyncOS includes in the query string.

<table>
<thead>
<tr>
<th>Parameter Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time</td>
<td>Date and time of the transaction.</td>
</tr>
<tr>
<td>ID</td>
<td>Transaction ID.</td>
</tr>
<tr>
<td>Client_IP</td>
<td>IP address of the client.</td>
</tr>
<tr>
<td>User</td>
<td>Username of the client making the request, if available.</td>
</tr>
<tr>
<td>Site</td>
<td>Hostname of the destination in the HTTP request.</td>
</tr>
<tr>
<td>URI</td>
<td>URL path specified in the HTTP request.</td>
</tr>
<tr>
<td>Status_Code</td>
<td>HTTP status code for the request.</td>
</tr>
<tr>
<td>Decision_Tag</td>
<td>ACL decision tag as defined in the Access log entry that indicates how the DVS engine handled the transaction.</td>
</tr>
</tbody>
</table>
| URL_Cat        | URL category that the URL filtering engine assigned to the transaction request. **Note:** AsyncOS for Web sends the entire URL category name for both predefined and user defined URL categories. It performs URL encoding on the category name, so spaces are written as “%20”.
| WBRS           | WBRS score that the Web Reputation Filters assigned to the URL in the request. |
| DVS_Verdict    | Malware category that the DVS engine assigns to the transaction. |
| DVS_ThreatName | The name of the malware found by the DVS engine. |
| Reauth_URL     | A URL that users can click to authenticate again if the user is blocked from a website due to a restrictive URL filtering policy. Use this parameter when the “Enable Re-Authentication Prompt If End User Blocked by URL Category or User Session Restriction” global authentication setting is enabled and the user is blocked from a website due to a blocked URL category. To use this parameter, make sure the CGI script performs the following steps:

1. Get the value of Reauth_URL parameter.
2. URL-decode the value.
3. Base64 decode the value and get the actual re-authentication URL.
4. Include the decoded URL on the end-user notification page in some way, either as a link or button, along with instructions for users informing them they can click the link and enter new authentication credentials that allow greater access. |

**Note** AsyncOS always includes all parameters in each redirected URL. If no value exists for a particular parameter, AsyncOS passes a hyphen (-).
Redirecting End-User Notification Pages to a Custom URL (Off-Box)

- **Step 1** Security Services > End-User Notification.
- **Step 2** Click Edit Settings.
- **Step 3** In the End-User Notification Pages section, choose Redirect to Custom URL.
- **Step 4** In the Notification Page URL field, enter the URL to which you want to redirect blocked websites.
- **Step 5** (Optional) Click Preview Custom URL link.
- **Step 6** Submit and Commit Changes.

Configuring the End-User URL Filtering Warning Page

**Before you begin**

- If you will customize the message displayed using on-box notifications, review the topics under Custom Messages on Notification Pages, on page 292. If you require more customization than the Custom Message box allows, see Editing Notification Page HTML Files Directly , on page 294.

An end-user URL filtering warning page is displayed when a user first accesses a website in a particular URL category after a certain period of time. You can also configure the warning page when a user accesses adult content when the site content ratings feature is enabled.

- **Step 1** Security Services > End-User Notification.
- **Step 2** Click Edit Settings.
- **Step 3** Scroll down to the End-User URL Filtering Warning Page section.
- **Step 4** In the Time Between Warning field, enter the time interval the Web Proxy uses between displaying the end-user URL filtering warning page for each URL category per user.
  
  You can specify any value from 30 to 2678400 seconds (one month). Default is 1 hour (3600 seconds). You can enter the value in seconds, minutes, or days. Use ‘s’ for seconds, ‘m’ for minutes, and ‘d’ for days.

- **Step 5** In the Custom Message field, enter text you want to appear on every end-user URL filtering warning page.
- **Step 6** (Optional) Click Preview URL Category Warning Page Customization to view the current end-user URL filtering warning page in a separate browser window.

  **Note** If the notification HTML files have been edited, this preview functionality is not available.

- **Step 7** Submit and Commit Changes.
Configuring FTP Notification Messages

Before you begin

If you will customize the message displayed using on-box notifications, review the topics under Custom Messages on Notification Pages, on page 292. If you require more customization than the Custom Message box allows, see Editing Notification Page HTML Files Directly, on page 294.

The FTP Proxy displays a predefined, customizable notification message to native FTP clients when the FTP Proxy cannot establish a connection with the FTP server for any reason, such as an error with FTP Proxy authentication or a bad reputation for the server domain name. The notification is specific to the reason the connection was blocked.

Step 1  Security Services > End-User Notification.
Step 2  Click Edit Settings.
Step 3  Scroll down to the Native FTP section.
Step 4  In the Language field, select the language to use when displaying native FTP notification messages.
Step 5  In the Custom Message field, enter the text you want to display in every native FTP notification message.
Step 6  Submit and Commit Changes.

Custom Messages on Notification Pages

The following sections apply to text entered into the “Custom Message” box for any notification type configured on the Edit End User Notification page.

- Supported HTML Tags in Custom Messages on Notification Pages, on page 292
- Caveats for URLs and Logos in Notification Pages, on page 293

Supported HTML Tags in Custom Messages on Notification Pages

You can use HTML tags to format the text in any notification on the Edit End User Notification page that offers a “Custom Message” box. Tags must be in lower case and follow standard HTML syntax (closing tags, etc.)

You can use the following HTML tags.

- `<a></a>`
- `<span></span>`
- `<b></b>`
- `<big></big>`
- `<br>`
- `<code></code>`
- `<em></em>`
- `<i></i>`
- `<small></small>`
For example, you can make some text italic:

Please acknowledge the following statements <i>before</i> accessing the Internet.

With the <span> tag, you can use any CSS style to format text. For example, you can make some text red:

<span style="color: red">Warning:</span> You must acknowledge the following statements <i>before</i> accessing the Internet.

---

**Note**

If you need greater flexibility or wish to add JavaScript to your notification pages, you must edit the HTML notification files directly. JavaScript entered into the Custom Message box for notifications in the web user interface will be stripped out. See Editing Notification Page HTML Files Directly, on page 294.

---

**Caveats for URLs and Logos in Notification Pages**

This section applies if you will make any of the following customizations:

- Enter text into the “Custom Message” box for any notification on the Edit End User Notification page
- Directly edit HTML files for on-box notifications
- Use a custom logo

All combinations of URL paths and domain names in embedded links within custom text, and the custom logo, are exempted from the following for on-box notifications:

- User authentication
- End-user acknowledgment
- All scanning, such as malware scanning and web reputation scoring

For example, if the following URLs are embedded in custom text:

http://www.example.com/index.html
http://www.mycompany.com/logo.jpg

Then all of the following URLs will also be treated as exempt from all scanning:

http://www.example.com/index.html
http://www.mycompany.com/logo.jpg
http://www.example.com/logo.jpg
http://www.mycompany.com/index.html

Also, where an embedded URL is of the form: <protocol>://<domain-name>/<directory path>/ then all sub-files and sub-directories under that directory path on the host will also be exempted from all scanning.

For example, if the following URL is embedded: http://www.example.com/gallery2/ URLs such as http://www.example.com/gallery2/main.php will also be treated as exempt.

This allows you to create a more sophisticated page with embedded content so long as the embedded content is relative to the initial URL. However, you should also take care when deciding which paths to include as links and custom logos.
Editing Notification Page HTML Files Directly

Each notification page is stored on the Web Security appliance as an HTML file. If you require more customization than the “Custom Message” box in the web-based interface allows, you can directly edit these HTML files. For example, you can include standard JavaScript or edit the overall look and feel of each page.

Information in the following sections applies to any type of end-user notification HTML file on the appliance, including End-User Acknowledgment pages.

- Requirements for Editing Notification HTML Files Directly, on page 294
- Editing Notification Page HTML Files Directly, on page 294
- Using Variables in Notification HTML Files, on page 295
- Variables for Customizing Notification HTML Files, on page 296

Requirements for Editing Notification HTML Files Directly

- Each notification page file must be a valid HTML file. For a list of HTML tags you can include, see Supported HTML Tags in Custom Messages on Notification Pages, on page 292.
- The customized notification page file names must exactly match the file names shipped with the Web Security appliance.

If the configuration\eun directory does not contain a particular file with the required name, then the appliance displays the standard on-box end-user notification page.

- Do not include any links to URLs in the HTML files. Any link included in the notification pages are subject to the access control rules defined in the Access Policies and users might end up in a recursive loop.
- Test your HTML files in supported client browsers to ensure that they behave as expected, especially if they include JavaScript.
- For your customized pages to take effect, you must enable the customized files using the advancedproxyconfig > EUN > Refresh EUN Pages CLI command.

Editing Notification HTML Files Directly

Before you begin

- Understand the requirements in Requirements for Editing Notification HTML Files Directly, on page 294.
- See Variables for Customizing Notification HTML Files, on page 296 and Using Variables in Notification HTML Files, on page 295.

Step 1
Use an FTP client to connect to the Web Security appliance.

Step 2
Navigate to the configuration\eun directory.

Step 3
Download the language directory files for the notification pages you want to edit.

Step 4
On your local machine, use a text or HTML editor to edit the HTML files.

Step 5
Use the FTP client to upload the customized HTML files to the same directory from which you downloaded them in step 3.
Step 6  Open an SSH client and connect to the Web Security appliance.

Step 7  Run the `advancedproxyconfig > eun` CLI command.

Step 8  Type 2 to use the custom end-user notification pages.

Step 9  If the custom end-user notification pages option is currently enabled when you update the HTML files, type 1 to refresh the custom end-user notification pages.

If you do not do this, the new files do not take effect until the Web Proxy restarts.

Step 10  Commit your change.

Step 11  Close the SSH client.

---

**Using Variables in Notification HTML Files**

When editing notification HTML files, you can include conditional variables to create if-then statements to take different actions depending on the current state.

The table describes the different conditional variable formats.

<table>
<thead>
<tr>
<th>Conditional Variable Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%?V</td>
<td>This conditional variable evaluates to TRUE if the output of variable %V is not empty.</td>
</tr>
<tr>
<td>%!V</td>
<td>Represents the following condition: else Use this with the %?V conditional variable.</td>
</tr>
<tr>
<td>%#V</td>
<td>Represents the following condition: endif Use this with the %?V conditional variable.</td>
</tr>
</tbody>
</table>

For example, the following text is some HTML code that uses %R as a conditional variable to check if re-authentication is offered, and uses %r as a regular variable to provide the re-authentication URL.

```html
%?R
<div align="left">
  <form name="ReauthInput" action="%r" method="GET">
    <input name="Reauth" type="button" OnClick="document.location='%r'" id="Reauth" value="Login as different user..."/>
  </form>
</div>
%#R
```

Any variable included in Variables for Customizing Notification HTML Files, on page 296 can be used as a conditional variable. However, the best variables to use in conditional statements are the ones that relate to the client request instead of the server response, and the variables that may or may not evaluate to TRUE instead of the variables that always evaluate to TRUE.
Variables for Customizing Notification HTML Files

You can use variables in the notification HTML files to display specific information to the user. You can also turn each variable into a conditional variable to create if-then statements. For more information, see Using Variables in Notification HTML Files, on page 295.

<table>
<thead>
<tr>
<th>Variable</th>
<th>Description</th>
<th>Always Evaluates to TRUE if Used as Conditional Variable</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>Authentication realm for FTP</td>

<td>Prints the percent symbol (%) in the notification page</td>
<td>N/A</td>
</tr>
</tbody>
</table>
## Notification Page Types

By default, the Web Proxy displays a notification page informing users they were blocked and the reason for the block.

Most notification pages display a different set of codes that may help administrators or Cisco Customer Support troubleshoot any potential problem. Some codes are for Cisco internal use only. The different codes that might appear in the notification pages are the same as the variables you can include in customized notification pages, as shown in Variables for Customizing Notification HTML Files, on page 296.

The table describes the different notification pages users might encounter.

<table>
<thead>
<tr>
<th>File Name and Notification Title</th>
<th>Notification Description</th>
<th>Notification Text</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ERR_ACCEPTED</strong> Feedback Accepted, Thank You</td>
<td>Notification page that is displayed after the users uses the “Report Misclassification” option.</td>
<td>The misclassification report has been sent. Thank you for your feedback.</td>
</tr>
<tr>
<td><strong>ERR_ADAPTIVE_SECURITY</strong> Policy: General</td>
<td>Block page that is displayed when the user is blocked due to the Adaptive Scanning feature.</td>
<td>Based on your organization’s security policies, this web site &lt;URL&gt; has been blocked because its content has been determined to be a security risk.</td>
</tr>
<tr>
<td><strong>ERR_ADULT_CONTENT</strong> Policy Acknowledgment</td>
<td>The warning page that is displayed when the end-user accesses a page that is classified as adult content. Users can click an acknowledgment link to continue to the originally requested site.</td>
<td>You are trying to visit a web page whose content are rated as explicit or adult. By clicking the link below, you acknowledge that you have read and agree with the organization's policies that govern the usage of the Internet for this type of content. Data about your browsing behavior may be monitored and recorded. You will be periodically asked to acknowledge this statement for continued access to this kind of web page. Click here to accept this statement and access the Internet.</td>
</tr>
<tr>
<td><strong>ERR_AVC</strong> Policy: Application Controls</td>
<td>Block page that is displayed when the user is blocked due to the Application Visibility and Control engine.</td>
<td>Based on your organization’s access policies, access to application %1 of type %2 has been blocked.</td>
</tr>
<tr>
<td><strong>ERR_BAD_REQUEST</strong> Bad Request</td>
<td>Error page that results from an invalid transaction request.</td>
<td>The system cannot process this request. A non-standard browser may have generated an invalid HTTP request. If you are using a standard browser, please retry the request.</td>
</tr>
<tr>
<td>File Name and Notification Title</td>
<td>Notification Description</td>
<td>Notification Text</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-------------------------</td>
<td>------------------</td>
</tr>
<tr>
<td>ERR_BLOCK_DEST Policy: Destination</td>
<td>Block page that is displayed when the user tries to access a blocked website address.</td>
<td>Based on your organization’s Access Policies, access to this web site <code>&lt;URL&gt;</code> has been blocked.</td>
</tr>
<tr>
<td>ERR_BROWSER Security: Browser</td>
<td>Block page that is displayed when the transaction request comes from an application that has been identified to be compromised by malware or spyware.</td>
<td>Based on your organization’s Access Policies, requests from your computer have been blocked because it has been determined to be a security threat to the organization’s network. Your browser may have been compromised by a malware/spyware agent identified as “&lt;malware name&gt;”. Please contact &lt;contact name&gt; &lt;email address&gt; and provide the codes shown below. If you are using a non-standard browser and believe it has been misclassified, use the button below to report this misclassification.</td>
</tr>
<tr>
<td>ERR_BROWSER_CUSTOM Policy: Browser</td>
<td>Block page that is displayed when the transaction request comes from a blocked user agent.</td>
<td>Based on your organization’s Access Policies, requests from your browser have been blocked. This browser “&lt;browser type&gt;” is not permitted due to potential security risks.</td>
</tr>
<tr>
<td>ERR_CERT_INVALID Invalid Certificate</td>
<td>Block page that is displayed when the requested HTTPS site uses an invalid certificate.</td>
<td>A secure session cannot be established because the site <code>&lt;hostname&gt;</code> provided an invalid certificate.</td>
</tr>
<tr>
<td>ERR_CONTINUE_UNACKNOWLEDGED Policy Acknowledgment</td>
<td>Warning page that is displayed when the user requests a site that is in a custom URL category that is assigned the Warn action. Users can click an acknowledgment link to continue to the originally requested site.</td>
<td>You are trying to visit a web page that falls under the URL Category <code>&lt;URL category&gt;</code>. By clicking the link below, you acknowledge that you have read and agree with the organization’s policies that govern the usage of the Internet for this type of content. Data about your browsing behavior may be monitored and recorded. You will be periodically asked to acknowledge this statement for continued access to this kind of web page. Click here to accept this statement and access the Internet.</td>
</tr>
<tr>
<td>File Name and Notification Title</td>
<td>Notification Description</td>
<td>Notification Text</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>ERR_DNS_FAIL DNS Failure</td>
<td>Error page that is displayed when the requested URL contains an invalid domain name.</td>
<td>The hostname resolution (DNS lookup) for this hostname &lt;hostname&gt; has failed. The Internet address may be misspelled or obsolete, the host &lt;hostname&gt; may be temporarily unavailable, or the DNS server may be unresponsive. Please check the spelling of the Internet address entered. If it is correct, try this request later.</td>
</tr>
<tr>
<td>ERR_EXPECTATION_FAILED Expectation Failed</td>
<td>Error page that is displayed when the transaction request triggers the HTTP 417 “Expectation Failed” response.</td>
<td>The system cannot process the request for this site &lt;URL&gt;. A non-standard browser may have generated an invalid HTTP request. If using a standard browser, please retry the request.</td>
</tr>
<tr>
<td>ERR_FILE_SIZE Policy: File Size</td>
<td>Block page that is displayed when the requested file is larger than the allowed maximum file size.</td>
<td>Based on your organization’s Access Policies, access to this web site or download &lt;URL&gt; has been blocked because the download size exceeds the allowed limit.</td>
</tr>
<tr>
<td>ERR_FILE_TYPE Policy: File Type</td>
<td>Block page that is displayed when the requested file is a blocked file type.</td>
<td>Based on your organization’s Access Policies, access to this web site or download &lt;URL&gt; has been blocked because the file type “&lt;file type&gt;” is not allowed.</td>
</tr>
<tr>
<td>ERR_FILTER_FAILURE Filter Failure</td>
<td>Error page that is displayed when the URL filtering engine is temporarily unable to deliver a URL filtering response and the “Default Action for Unreachable Service” option is set to Block.</td>
<td>The request for page &lt;URL&gt; has been denied because an internal server is currently unreachable or overloaded. Please retry the request later.</td>
</tr>
<tr>
<td>ERR_FOUND Found</td>
<td>Internal redirection page for some errors.</td>
<td>The page &lt;URL&gt; is being redirected to &lt;redirected URL&gt;.</td>
</tr>
<tr>
<td>ERR_FTP_ABORTED FTP Aborted</td>
<td>Error page that is displayed when the FTP over HTTP transaction request triggers the HTTP 416 “Requested Range Not Satisfiable” response.</td>
<td>The request for the file &lt;URL&gt; did not succeed. The FTP server &lt;hostname&gt; unexpectedly terminated the connection. Please retry the request later.</td>
</tr>
<tr>
<td>File Name and Notification Title</td>
<td>Notification Description</td>
<td>Notification Text</td>
</tr>
<tr>
<td>----------------------------------</td>
<td>--------------------------</td>
<td>-------------------</td>
</tr>
<tr>
<td>ERR_FTP_AUTH_REQUIRED</td>
<td>FTP Authorization Required</td>
<td>Authentication is required by the FTP server <code>&lt;hostname&gt;</code>. A valid user ID and passphrase must be entered when prompted. In some cases, the FTP server may limit the number of anonymous connections. If you usually connect to this server as an anonymous user, please try again later.</td>
</tr>
<tr>
<td>ERR_FTP_CONNECTION_FAILED</td>
<td>FTP Connection Failed</td>
<td>Error page that is displayed when the FTP over HTTP transaction request triggers the FTP 425 “Can’t open data connection” response. The system cannot communicate with the FTP server <code>&lt;hostname&gt;</code>. The FTP server may be temporarily or permanently down, or may be unreachable because of network problems. Please check the spelling of the address entered. If it is correct, try this request later.</td>
</tr>
<tr>
<td>ERR_FTP_FORBIDDEN</td>
<td>FTP Forbidden</td>
<td>Error page that is displayed when the FTP over HTTP transaction request is for an object the user is not allowed to access. Access was denied by the FTP server <code>&lt;hostname&gt;</code>. Your user ID does not have permission to access this document.</td>
</tr>
<tr>
<td>ERR_FTP_NOT_FOUND</td>
<td>FTP Not Found</td>
<td>Error page that is displayed when the FTP over HTTP transaction request is for an object that does not exist on the server. The file <code>&lt;URL&gt;</code> could not be found. The address is either incorrect or obsolete.</td>
</tr>
<tr>
<td>ERR_FTP_SERVER_ERR</td>
<td>FTP Server Error</td>
<td>Error page that is displayed for FTP over HTTP transactions that try to access a server that does support FTP. The server usually returns the HTTP 501 “Not Implemented” response. The system cannot communicate with the FTP server <code>&lt;hostname&gt;</code>. The FTP server may be temporarily or permanently down, or may not provide this service. Please confirm that this is a valid address. If it is correct, try this request later.</td>
</tr>
<tr>
<td>ERR_FTP_SERVICE_UNAVAIL</td>
<td>FTP Service Unavailable</td>
<td>Error page that is displayed for FTP over HTTP transactions that try to access an FTP server that is unavailable. The system cannot communicate with the FTP server <code>&lt;hostname&gt;</code>. The FTP server may be busy, may be permanently down, or may not provide this service. Please confirm that this is a valid address. If it is correct, try this request later.</td>
</tr>
</tbody>
</table>
## Notification Page Types

<table>
<thead>
<tr>
<th>File Name and Notification Title</th>
<th>Notification Description</th>
<th>Notification Text</th>
</tr>
</thead>
<tbody>
<tr>
<td>ERR_GATEWAY_TIMEOUT</td>
<td>Gateway Timeout</td>
<td>The system cannot communicate with the external server <code>&lt;hostname&gt;</code>. The Internet server may be busy, may be permanently down, or may be unreachable because of network problems. Please check the spelling of the Internet address entered. If it is correct, try this request later.</td>
</tr>
<tr>
<td>ERR_IDS_ACCESS_FORBIDDEN</td>
<td>IDS Access Forbidden</td>
<td>Based on your organization’s data transfer policies, your upload request has been blocked. File details: <code>&lt;file details&gt;</code></td>
</tr>
<tr>
<td>ERR_INTERNAL_ERROR</td>
<td>Internal Error</td>
<td>Internal system error when processing the request for the page <code>&lt;URL&gt;</code>. Please retry this request. If this condition persists, please contact <code>&lt;contact name&gt; &lt;email address&gt;</code> and provide the code shown below.</td>
</tr>
<tr>
<td>ERR_MALWARE_SPECIFIC</td>
<td>Malware Detected</td>
<td>Based on your organization’s Access Policies, this web site <code>&lt;URL&gt;</code> has been blocked because it has been determined to be a security threat to your computer or the organization’s network. Generate Reports to Monitor End-user Activity

This chapter contains the following sections:

- Overview of Reporting, on page 307
- Using the Reporting Pages, on page 308
- Enabling Reporting, on page 313
- Scheduling Reports, on page 313
- Generating Reports On Demand, on page 315
- Archived Reports, on page 316

Overview of Reporting

The Web Security appliance generates high-level reports, allowing you to understand what is happening on the network and also allowing you to view traffic details for a particular domain, user, or category. You can run reports to view an interactive display of system activity over a specific period of time, or you can schedule reports and run them at regular intervals.

Related Topics

- Printing and Exporting Reports from Report Pages, on page 312

Working with Usernames in Reports

When you enable authentication, reports list users by their usernames when they authenticate with the Web Proxy. By default, usernames are written as they appear in the authentication server. However, you can choose to make usernames unrecognizable in all reports.

Note

Administrators always see usernames in reports.

Step 1  Choose Security Services > Reporting, and click Edit Settings.

Step 2  Under Local Reporting, select Anonymize usernames in reports.
Step 3  Submit and Commit Changes.

### Report Pages

The Web Security appliance offers the following reports:

- My Dashboard (the reporting “homepage”; can also be accessed by clicking the Home icon in the left edge of the menu bar)
- Overview
- Users
- User Count
- Web Sites
- URL Categories
- Application Visibility
- Anti-Malware
- Advanced Malware Protection
- File Analysis
- AMP Verdict Updates
- Client Malware Risk
- Web Reputation Filters
- L4 Traffic Monitor
- SOCKS Proxy
- Reports by User Location
- Web Tracking
- System Capacity
- System Status
- Scheduled Reports
- Archived Reports

### Using the Reporting Pages

The various report pages provide an overview of system activity and support multiple options for viewing the system data. You can also search each page for Website and client-specific data.

You can perform the following tasks on most report pages:
Changing the Time Range

You can update the data displayed for each security component using the Time Range field. This option allows you to generate updates for predefined time ranges and it allows you to define custom time ranges from a specific start time to a specific end time.

The time range you select is used throughout all of the report pages until you select a different value in the Time Range menu.

<table>
<thead>
<tr>
<th>Time Range</th>
<th>Data is returned in...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Hour</td>
<td>Sixty complete minutes plus up to 5 additional minutes.</td>
</tr>
<tr>
<td>Day</td>
<td>One-hour intervals for the last 24 hours and including the current partial hour.</td>
</tr>
<tr>
<td>Week</td>
<td>On-day intervals for the last 7 days plus the current partial day.</td>
</tr>
<tr>
<td>Month (30 days)</td>
<td>One-day intervals for the last 30 days plus the current partial day.</td>
</tr>
<tr>
<td>Yesterday</td>
<td>The last 24 hours (00:00 to 23:59) using the time zone defined on the Web Security appliance.</td>
</tr>
<tr>
<td>Custom Range</td>
<td>The custom time range you defined.</td>
</tr>
<tr>
<td></td>
<td>When you choose Custom Range, a dialog box appears to let you enter start and end times.</td>
</tr>
</tbody>
</table>

All reports display date and time information based on the system’s configured time zone, shown as a Greenwich Mean Time (GMT) offset. However, data exports display the time in GMT only to accommodate multiple systems in multiple time zones around the world.

Searching Data

Some reports include a field you can use to search for particular data points. When you search for data, the report refines the report data for the particular data set you are searching. You can search for values that exactly match of the string you enter, or for values that start with the string you enter. The following report pages include search fields:
### Choosing Which Data to Chart

The default charts on each Web Reporting page display commonly referenced data, but you can choose to chart different data instead. If a page has multiple charts, you can change each chart. The chart options are the same as the columns headings of the table(s) in the report.

#### Step 1
Click the **Chart Options** link below a chart.

#### Step 2
Choose the data to display.

#### Step 3
Click **Done**.

### Custom Reports

You can create a custom report page by assembling charts (graphs) and tables from existing report pages.

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>Delete modules from your custom report page</td>
<td>Click the [X] in the top right corner of the module.</td>
</tr>
<tr>
<td>Generate a PDF or CSV version of your custom report</td>
<td>Choose <strong>Reporting &gt; Archived Reports</strong> and click <strong>Generate Report Now</strong>.</td>
</tr>
<tr>
<td>Periodically generate a PDF or CSV version of your custom report</td>
<td>Choose <strong>Reporting &gt; Scheduled Reports</strong>.</td>
</tr>
</tbody>
</table>

**Modules That Cannot Be Added to Custom Reports**

• Search results

**Creating Your Custom Report Page**

**Before you begin**

• Ensure that the modules that you want to add can be added. See **Modules That Cannot Be Added to Custom Reports**, on page 311.
• Delete any default modules that you do not need by clicking the [X] in the top right corner of those modules.

**Step 1** Use one of the following methods to add a module to your custom report page:

**Note** Some modules are available only using one of these methods. If you cannot add a module using one method, try another method.

• Go to **My Reports**, click the [+] button, then select the report module that you want to add.

You can add each module only once; if you have already added a particular module to your report, the option to add it will not be available.

**Step 2** If you add a module that you have customized (for example, by adding, deleting, or reordering columns), customize the modules on the My Reports page.

Modules are added with default settings. Time range of the original module is not maintained.

**Step 3** If you add a chart that includes a separate legend (for example, a graph from the Overview page), add the legend separately. If necessary, drag and drop it into position beside the data it describes.
Subdomains vs. Second-level Domains in Reporting and Tracking

In reporting and tracking searches, second-level domains (regional domains listed at http://george.surbl.org/two-level-tlds) are treated differently from subdomains, although the two domain types may appear to be the same. For example:

- Reports will not include results for a two-level domain such as co.uk, but will include results for foo.co.uk. Reports include subdomains under the main corporate domain, such as cisco.com.
- Tracking search results for the regional domain co.uk will not include domains such as foo.co.uk, while search results for cisco.com will include subdomains such as subdomain.cisco.com.

Printing and Exporting Reports from Report Pages

You can generate a printer-formatted PDF version of any report page by clicking the Printable (PDF) link at the top-right corner of the page. You can also export raw data as a comma-separated value (CSV) file by clicking the Export link.

Because CSV exports include only raw data, exported data from a Web-based report page may not include calculated data such as percentages, even if that data appears in the Web-based report.

Exporting Report Data

Most reports include an Export link that allows you to export raw data to a comma-separated values (CSV) file. After exporting the data to a CSV file, you can access and manipulate the data in it using applications such as Microsoft Excel.

The exported CSV data displays all message tracking and reporting data in Greenwich Mean Time (GMT) regardless of the time zone set on the Web Security appliance. The purpose of the GMT time conversion is to allow data to be used independently from the appliance, or when referencing data from appliances in multiple time zones.

The following example is an entry from a raw data export of the Anti-Malware category report, where Pacific Daylight Time (PDT) is displayed as GMT 07:00 hours:

<table>
<thead>
<tr>
<th>Category Header</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begin Timestamp</td>
<td>1159772400.0</td>
<td>Query start time in number of seconds from epoch.</td>
</tr>
<tr>
<td>End Timestamp</td>
<td>1159858799.0</td>
<td>Query end time in number of seconds from epoch.</td>
</tr>
<tr>
<td>Begin Date</td>
<td>2006-10-02 07:00 GMT</td>
<td>Date the query began.</td>
</tr>
<tr>
<td>End Date</td>
<td>2006-10-03 06:59 GMT</td>
<td>Date the query ended.</td>
</tr>
<tr>
<td>Name</td>
<td>Adware</td>
<td>Name of the malware category.</td>
</tr>
<tr>
<td>Transactions Monitored</td>
<td>525</td>
<td>Number of transactions monitored.</td>
</tr>
<tr>
<td>Transactions Blocked</td>
<td>2100</td>
<td>Number of transactions blocked.</td>
</tr>
</tbody>
</table>
Enabling Reporting

If your organization has multiple Web Security appliances and uses a Cisco Content Security Management Appliance to manage and view aggregated report data, you must enable centralized reporting on each Web Security appliance.

You can choose the type of reporting based on the appliance setup. You can choose to retain all reports locally, or access them through Cisco Defense Orchestrator if the appliance has been on-boarded to it. If your organization has multiple Web Security appliances and uses a Cisco Content Security Management Appliance, you can choose centralized reporting to manage and view aggregated report data. If you choose Centralized Reporting or local reporting through Cisco Defense Orchestrator, you have to apply these selections on each Web Security appliance.

Step 1
Choose Security Services > Reporting, and click Edit Settings.

a) Select Local Reporting to enable reporting on the appliance. The reports will be accessible after logging in to the appliance portal.

b) Select Local Reporting, and Cisco Defense Orchestrator Reporting to enable reporting through Cisco Defense Orchestrator.

c) Select Centralized Reporting to enable reporting through Cisco Content Security Management Appliance.

The Web Security appliance only stores all its collected data for local reporting. If Centralized Reporting is enabled on the appliance, then the Web Security appliance retains only System Capacity and System Status data, and those are the only reports available on the Web Security appliance locally.

See the chapter “Using Centralized Web Reporting and Tracking” in your Cisco Content Security Management Appliance user guide for information about configuring this feature on the management appliance.

Step 2
Submit and Commit Changes.

Scheduling Reports

You can schedule reports to run on a daily, weekly, or monthly basis. Scheduled reports can be configured to include data for the previous day, previous seven days, or previous month.
You can schedule reports for the following types of reports:

- Overview
- Users
- Web Sites
- URL Categories
- Application Visibility
- Anti-Malware
- Advanced Malware Protection
- Advanced Malware Protection Verdict Updates
- Client Malware Risk
- Web Reputation Filters
- L4 Traffic Monitor
- SOCKS Proxy
- Reports by User Location
- System Capacity
- My Dashboard

Adding a Scheduled Report

Step 1  Choose Reporting > Scheduled Reports and click Add Scheduled Report.
Step 2  Choose a report Type.
Step 3  Enter a descriptive Title for the report.
        Avoid creating multiple reports with the same name.
Step 4  Choose a time range for the data included in the report.
Step 5  Select the Format for the generated report.
        The default format is PDF. Most reports also allow you to save raw data as a CSV file.
Step 6  Depending on the type of report you configure, you can specify different report options, such as the number of rows to include and by which column to sort the data. Configure these options as necessary.
Step 7  In the Schedule section, choose whether to run the report daily, weekly, or monthly, and at what time.
Step 8  In the Email to field, enter the email address(es) to which the generated report is to be sent.
        If you do not specify an email address, the report is simply archived.
Step 9  Choose a Report Language for the data.
Step 10 Submit and Commit Changes.

Editing Scheduled Reports

Step 1  Choose Reporting > Scheduled Reports.
Step 2  Select the report title from the list.
Deleting Scheduled Reports

Step 1 Choose Reporting > Scheduled Reports.
Step 2 Select the check boxes corresponding to the reports that you want to delete.
Step 3 To remove all scheduled reports, select the All check box.
Step 4 Delete and Commit Changes.

Note Archived versions of deleted reports are not deleted.

Generating Reports On Demand

Step 1 Choose Reporting > Archived Reports.
Step 2 Click Generate Report Now.
Step 3 Choose a report Type.
Step 4 Enter a descriptive Title for the report.
   Avoid creating multiple reports with the same name.
Step 5 Choose a time range for the data included in the report.
Step 6 Select the Format for the generated report.
   The default format is PDF. Most reports also allow you to save raw data as a CSV file.
Step 7 Depending on the type of report you configure, you can specify different report options, such as the number of rows to include and by which column to sort the data. Configure these options as necessary.
Step 8 Select one of the Delivery Options:
   • Archive the report (the report will appear on the Archived Reports page).
   • Email now to recipients; provide one or more email addresses.
Step 9 Choose a Report Language for the data.
Step 10 Click Deliver this Report to generate the report.
Step 11 Commit Changes.
Archived Reports

The **Reporting > Archived Reports** page lists available archived reports. Each name in the Report Title column provides a link to a view of that report. The **Show** menu filters the types of reports that are listed. The column headings can be clicked to sort the data in each column.

The appliance stores up to 12 instances of each scheduled report (up to a total of 1000 reports). Archived reports are stored in the `/periodic_reports` directory on the appliance. Archived reports are deleted automatically. As new reports are added, older reports are removed to keep the number at 1000. The limit of 12 instances applies to each scheduled report with the same name and time range.
CHAPTER 20

Web Security Appliance Reports

This chapter contains the following sections:

• Overview Page, on page 317
• Users Page, on page 319
• User Count Page, on page 320
• Web Sites Page, on page 320
• URL Categories Page, on page 320
• Application Visibility Page, on page 321
• Anti-Malware Page, on page 322
• Advanced Malware Protection Page, on page 323
• File Analysis Page, on page 323
• AMP Verdict Updates Page, on page 323
• Client Malware Risk Page, on page 323
• Web Reputation Filters Page, on page 324
• L4 Traffic Monitor Page, on page 324
• SOCKS Proxy Page, on page 325
• Reports by User Location Page, on page 325
• Web Tracking Page, on page 326
• System Capacity Page, on page 329
• System Status Page, on page 329

Overview Page

The Reporting > Overview page provides a synopsis of the activity on the Web Security appliance. It includes graphs and summary tables for Web traffic processed by the Web Security appliance.

Table 3: System Overview

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Proxy Traffic Characteristics</td>
<td>Listing of Average transactions per second in past minute, Average bandwidth (bps) in past minute, Average response time (ms) in past minute, and Total current connections.</td>
</tr>
</tbody>
</table>
Section | Description
--- | ---
System Resource Utilization | Listing of current Overall CPU Load, RAM and Reporting / logging disk usage. Click System Status Details to switch to the System Status page (see System Status Page, on page 329 for details).

**Note** The CPU utilization value shown on this page and the CPU value shown on the System Status page may differ slightly because they are read separately, at differing moments.

### Table 4: Time Range-based Categories and Summaries

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range: Choose a time range for the data displayed in the following sections. Options are Hour, Day, Week, 30 Days, Yesterday, or a Custom Range.</td>
<td></td>
</tr>
<tr>
<td>Total Web Proxy Activity</td>
<td>Displays the actual number of transactions (vertical scale) as well as the approximate date that the (Web Proxy) activity occurred (horizontal timeline).</td>
</tr>
<tr>
<td>Web Proxy Summary</td>
<td>Allows you to view the percentage of Web Proxy activity that are suspect or clean Web Proxy activity.</td>
</tr>
<tr>
<td>L4 Traffic Monitor Summary</td>
<td>Reports on traffic monitored and blocked by the L4 Traffic Monitor.</td>
</tr>
<tr>
<td>Suspect Transactions</td>
<td>Allows you to view the web transactions that have been labeled as suspect by the various security components. Displays the actual number of transactions as well as the approximate date that the activity occurred.</td>
</tr>
<tr>
<td>Suspect Transactions Summary</td>
<td>Allows you to view the percentage of blocked or warned transactions that are suspect.</td>
</tr>
<tr>
<td>Top URL Categories: Total Transactions</td>
<td>Displays the top 10 URL categories that have been blocked.</td>
</tr>
<tr>
<td>Top Application Types: Total Transactions</td>
<td>Displays the top application types that have been blocked by the AVC engine.</td>
</tr>
<tr>
<td>Top Malware Categories: Monitored or Blocked</td>
<td>Displays all malware categories that have been detected.</td>
</tr>
<tr>
<td>Top Users: Blocked or Warned Transactions</td>
<td>Displays the users that are generating the blocked or warned transactions. Authenticated users are displayed username and unauthenticated users are displayed by IP address.</td>
</tr>
<tr>
<td>Web Traffic Tap Status</td>
<td>Displays the untapped and tapped traffic transactions in a graph format.</td>
</tr>
<tr>
<td>Web Traffic Tap Summary</td>
<td>Displays the summary of the tapped and untapped traffic transactions along with the total traffic transactions.</td>
</tr>
<tr>
<td>Tapped HTTP/HTTPS Traffic</td>
<td>Displays the tapped HTTP and HTTPS traffic transactions in a graph format.</td>
</tr>
<tr>
<td>Tapped Traffic Summary</td>
<td>Displays the summary of HTTP and HTTPS traffic transactions along with the total HTTP/HTTPS traffic transactions.</td>
</tr>
<tr>
<td>EUP Transactions</td>
<td>Displays encapsulated URL transactions. These are transactions that were performed through websites like translate.google.com.</td>
</tr>
</tbody>
</table>
### Users Page

The **Reporting > Users** page provides several links that allows you to view web traffic information for individual users. You can view how much time users on the network have spent on the Internet or on a particular website or URL, and how much bandwidth users have used.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>EUP Transaction Summary</td>
<td>Displays the summary of encapsulated URL transactions.</td>
</tr>
<tr>
<td>EUP Suspect Transactions</td>
<td>Displays the encapsulated URL transactions that were found to be suspect.</td>
</tr>
<tr>
<td>EUP Suspect Transaction Summary</td>
<td>Displays the summary of encapsulated URL transactions that were found to be suspect.</td>
</tr>
</tbody>
</table>

### User Details Page

The **User Details** page displays information about a specific user selected in the Users Table on the **Reporting > Users** page.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>A menu that allows to choose the time range of the data contained in the report.</td>
</tr>
<tr>
<td>URL Categories by Total Transactions</td>
<td>Lists the specific URL categories that a specific user is using.</td>
</tr>
<tr>
<td>Trend by Total Transaction</td>
<td>Displays at what times the user accessed the web.</td>
</tr>
<tr>
<td>URL Categories Matched</td>
<td>Shows all matched URL categories during a specified time range for both completed and blocked transactions.</td>
</tr>
<tr>
<td>Domains Matched</td>
<td>Displays information about a specific Domain or IP address that this user has accessed.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If you export this Domains data to a CSV file, be aware that only the first 300,000 entries are exported to the file.</td>
</tr>
<tr>
<td>Section</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Applications Matched</td>
<td>Displays specific application that a specific user is using as detected by the AVC engine.</td>
</tr>
<tr>
<td>Malware Threats Detected</td>
<td>Displays the top malware threats that a specific user is triggering.</td>
</tr>
<tr>
<td>Policies Matched</td>
<td>Displays a specific policy that is being enforced on this particular user.</td>
</tr>
</tbody>
</table>

**User Count Page**

The Reporting > User Count page displays information about the total number of authenticated and unauthenticated users of the appliance. The page lists the unique user count for the last 30 days, 90 days, and 180 days.

**Note**

System computes the total user count of authenticated and unauthenticated users once a day.

For example, if you view the user count report on May 22, 23:59, at the latest, the system will display the total user count till May 22, 00:00.

**Web Sites Page**

The Reporting > Web Sites page is an overall aggregation of the activity that is happening on the Web Security appliance.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>Menu allows you to choose the time range of the data contained in the report.</td>
</tr>
<tr>
<td>Top Domains by Total Transactions</td>
<td>Lists the top domains that are being visited on the site in a graph format.</td>
</tr>
<tr>
<td>Top Domains by Transactions Blocked</td>
<td>Lists the top domains that triggered a block action to occur per transaction in a graph format.</td>
</tr>
<tr>
<td>Domains Matched</td>
<td>Lists the domains that are that are being visited on the site in an interactive table.</td>
</tr>
</tbody>
</table>

**Note**

If you export this Domains data to a CSV file, be aware that only the first 300,000 entries are exported to the file.

**URL Categories Page**

The Reporting > URL Categories page can be used to view the URL categories that are being visited by users on the network. The URL Categories page can be used in conjunction with the Application Visibility Page and the Users Page to investigate a particular user and also what types of applications or websites that a particular user is trying to access.
The set of predefined URL categories is occasionally updated.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>Choose the time range for your report.</td>
</tr>
<tr>
<td>Top URL Categories by Total Transactions</td>
<td>This section lists the top URL categories that are being visited on the site in a graph format.</td>
</tr>
<tr>
<td>Top URL Categories by Blocked and Warned Transactions</td>
<td>Lists the top URL that triggered a block or warning action to occur per transaction in a graph format.</td>
</tr>
<tr>
<td>URL Categories Matched</td>
<td>Shows the disposition of transactions by URL category during the specified time range, plus bandwidth used and time spent in each category.</td>
</tr>
</tbody>
</table>

If the percentage of uncategorized URLs is higher than 15-20%, consider the following options:

- For specific localized URLs, you can create custom URL categories and apply them to specific users or group policies.
- You can report uncategorized and misclassified and URLs to the Cisco for evaluation and database update.
- Verify that Web Reputation Filtering and Anti-Malware Filtering are enabled.

---

**URL Category Set Updates and Reports**

The set of predefined URL categories may periodically be updated automatically on your Web Security appliance.

When these updates occur, old category names will continue to appear in reports until the data associated with the older categories is too old to be included in reports. Report data generated after a URL category set update will use the new categories, so you may see both old and new categories in the same report.

---

**Application Visibility Page**

The Reporting > Application Visibility page shows the applications and application types used and blocked as detected by the Application Visibility and Control engine.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>A menu that allows to choose the time range of the data contained in the report.</td>
</tr>
<tr>
<td>Top Application Types by Total Transactions</td>
<td>This section lists the top application types that are being visited on the site in a graph format.</td>
</tr>
</tbody>
</table>
### Anti-Malware Page

The **Reporting > Anti-Malware** page allows you to monitor and identify malware detected by the Cisco DVS engine.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Top Applications by Blocked Transactions</td>
<td>Lists the top application types that triggered a block action to occur per transaction in a graph format.</td>
</tr>
<tr>
<td>Application Types Matched</td>
<td>Allows you to view granular details about the application types listed in the Top Applications Type by Total Transactions graph.</td>
</tr>
<tr>
<td>Applications Matched</td>
<td>Shows all the application during a specified time range.</td>
</tr>
</tbody>
</table>

### Malware Category Report Page

**Step 1**  
Choose **Reporting > Anti-Malware**.

**Step 2**  
In the Malware Categories interactive table, click on a category in the Malware Category column.

### Malware Threat Report Page

**Step 1**  
Choose **Reporting > Anti-Malware**.

**Step 2**  
In the Malware Threat table, click on a category in the Malware Category column.
Advanced Malware Protection Page

See File Reputation Filtering and File Analysis, on page 247.

File Analysis Page

See File Reputation and File Analysis Reporting and Tracking, on page 257.

AMP Verdict Updates Page

See File Reputation Filtering and File Analysis, on page 247.

Client Malware Risk Page

The Reporting > Client Malware Risk page is a security-related reporting page that can be used to monitor client malware risk activity. The Client Malware Risk page also lists client IP addresses involved in frequent malware connections, as identified by the L4 Traffic Monitor (L4TM).

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>A menu that allows you to choose the time range of the data contained in the report.</td>
</tr>
<tr>
<td>Web Proxy: Top Clients by Malware Risk</td>
<td>This chart displays the top ten users that have encountered a malware risk.</td>
</tr>
<tr>
<td>L4 Traffic Monitor: Malware Connections Detected</td>
<td>This chart displays the IP addresses of the computers in your organization that most frequently connect to malware sites.</td>
</tr>
<tr>
<td>Web Proxy: Clients by Malware Risk</td>
<td>The Web Proxy: Clients by Malware Risk table shows detailed information about particular clients that are displayed in the Web Proxy: Top Clients by Malware Risk section.</td>
</tr>
<tr>
<td>L4 Traffic Monitor: Clients by Malware Risk</td>
<td>This table displays IP addresses of computers in your organization that frequently connect to malware sites.</td>
</tr>
</tbody>
</table>

Client Detail Page for Web Proxy - Clients by Malware Risk

The Client Details page shows all the web activity and malware risk data for a particular client during the specified time range.

**Step 1** Choose Reporting > Client Malware Risk.

**Step 2** In the Web Proxy - Client Malware Risk section, click a user name in the “User ID / Client IP Address” column.
Web Reputation Filters Page

The Reporting > Web Reputation Filters page is a security-related reporting page that allows you to view the results of your set Web Reputation Filters for transactions during a specified time range.

<table>
<thead>
<tr>
<th>Section</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range (drop-down list)</td>
<td>A menu that allows to choose the time range of the data contained in the report.</td>

</tr>
<tr>
<td>Web Reputation Actions (Volume)</td>
<td>Displays the web reputation action volume in percentages by transactions.</td>
</tr>
<tr>
<td>Web Reputation Threat Types by Blocked Transactions</td>
<td>Displays the threat types that were blocked due to a low reputation score.</td>
</tr>
<tr>
<td>Web Reputation Threat Types by Scanned Further Transactions</td>
<td>Displays the threat types that resulted in a reputation score that indicated to scan the transaction.</td>
</tr>
<tr>
<td>Web Reputation Actions (Breakdown by Score)</td>
<td>Displays the web reputation scores broken down for each action.</td>
</tr>
</tbody>
</table>

L4 Traffic Monitor Page

The Reporting > L4 Traffic Monitor page is a security-related reporting page that displays information about malware ports and malware sites that the L4 Traffic Monitor has detected during the specified time range. It also displays IP addresses of clients that frequently encounter malware sites.

The L4 Traffic Monitor listens to network traffic that comes in over all ports on the appliance and matches domain names and IP addresses against entries in its own database tables to determine whether to allow incoming and outgoing traffic.

<table>
<thead>
<tr>

</tbody>
</table>
## SOCKS Proxy Page

The Reporting > SOCKS Proxy Page allows you to view data and trends for transactions processed through the SOCKS proxy, including information about top destinations and users.

## Reports by User Location Page

The Reporting > Reports by User Location page allows you to find out what activities your local and remote users are conducting.

Activities include:

- URL categories that are being accessed by the local and remote users.
- Anti-Malware activity that is being triggered by sites the local and remote users are accessing.
- Web Reputation of the sites being accessed by the local and remote users.
- Applications that are being accessed by the local and remote users.
- Users (local and remote).
- Domains accessed by local and remote users.

<table>
<thead>
<tr>
<th>Section</th>

</tr>
</tbody>
</table>

Searching for Transactions Processed by the Web Proxy

You can use the Proxy Services tab on the Reporting > Web Tracking page to track and report on web usage for a particular user or for all users.

You can view search results for the type of transactions logged (blocked, monitored, warned, and completed) during a particular time period. You can also filter the data results using several criteria, such as URL category, malware threat, and application.

Note

The Web Proxy only reports on transactions that include an ACL decision tag other than OTHER-NONE.

Step 1
Choose Reporting > Web Tracking.

Step 2
Click the Proxy Services tab.

Step 3
Configure the settings.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Range</td>
<td>Choose the time range on which to report.</td>
</tr>
<tr>
<td>User/Client IP</td>
<td>(Optional) Enter an authentication username as it appears in reports or a client IP address that you want to track. You can also enter an IP range in CIDR format. When you leave this field empty, the search returns results for all users.</td>
</tr>
<tr>
<td>Website</td>
<td>(Optional) Enter a website that you want to track. When you leave this field empty, the search returns results for all websites.</td>
</tr>
</tbody>
</table>
Setting | Description
--- | ---
Transaction Type | Choose the type of transactions that you want to track, either All Transactions, Completed, Blocked, Monitored, or Warned.

**Step 4** (Optional) Expand the Advanced section and configure the fields to filter the web tracking results with more advanced criteria.

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Category</td>
<td>To filter by a URL category, select <strong>Filter by URL Category</strong> and type the first letter of a URL category by which to filter. Choose the category from the list that appears.</td>
</tr>
<tr>
<td>Application</td>
<td>To filter by an application, select <strong>Filter by Application</strong> and choose an application by which to filter.</td>
</tr>
<tr>
<td></td>
<td>To filter by an application type, select <strong>Filter by Application Type</strong> and choose an application type by which to filter.</td>
</tr>
<tr>
<td>Policy</td>
<td>To filter by the name of the policy responsible for the final decision on this transaction, select <strong>Filter by Action Policy</strong> and enter a policy group name (Access Policy, Decryption Policy, or Data Security Policy) by which to filter. See the description for PolicyGroupName in the section Web Proxy Information in Access Log Files, on page 351 for more information.</td>
</tr>
<tr>
<td>Advanced Malware Protection</td>
<td>See <a href="#">About Tracking and Advanced Malware Protection Features</a>, on page 259.</td>
</tr>
<tr>
<td>Malware Threat</td>
<td>To filter by a particular malware threat, select <strong>Filter by Malware Threat</strong> and enter a malware threat name by which to filter.</td>
</tr>
<tr>
<td></td>
<td>To filter by a malware category, select <strong>Filter by Malware Category</strong> and choose a malware category by which to filter.</td>
</tr>
<tr>
<td>WBRS</td>
<td>In the WBRS section, you can filter by web reputation score and by a particular web reputation threat.</td>
</tr>
<tr>
<td></td>
<td>• To filter by web reputation score, select <strong>Score Range</strong> and select the upper and lower values by which to filter. Or, you can filter for websites that have no score by selecting <strong>No Score</strong>.</td>
</tr>
<tr>
<td></td>
<td>• To filter by web reputation threat, select <strong>Filter by Reputation Threat</strong> and enter a web reputation threat by which to filter.</td>
</tr>
<tr>
<td>AnyConnect Secure Mobility</td>
<td>To filter by the location of users (either remote or local), select <strong>Filter by User Location</strong> and choose a user type by which to filter.</td>
</tr>
<tr>
<td>User Request</td>
<td>To filter by transactions that were initiated by the client, select <strong>Filter by User-Requested Transactions</strong>.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong> When you enable this filter, the search results include some “best guess” transactions.</td>
</tr>
<tr>
<td>Encapsulated URL Protection</td>
<td>Enable this filter for encapsulated URL transactions.</td>
</tr>
</tbody>
</table>

**Step 5** Click **Search**.

Results are sorted by time stamp, with the most recent result at the top.
The number in parentheses below the “Display Details” link is the number of related transactions spawned by the user-initiated transaction, such as images loaded, javascripts run, and secondary sites accessed.

**Step 6**  
(Optional) Click **Display Details** in the Transactions column to view more detailed information about each transaction.

**Note**  
If you need to view more than 1000 results, click the **Printable Download** link to obtain a CSV file that includes the complete set of raw data, excluding details of related transactions.

**Tip**  
If a URL in the results is truncated, you can find the full URL in the access log.

To view details for up to 500 related transactions, click the **Related Transactions** link.

---

**What to do next**

- [URL Category Set Updates and Reports](#), on page 321
- [Malware Category Descriptions](#), on page 244
- [About Tracking and Advanced Malware Protection Features](#), on page 259

**Searching for Transactions Processed by the L4 Traffic Monitor**

The L4 Traffic Monitor tab on the **Reporting > Web Tracking** page provides details about connections to malware sites and ports. You can search for connections to malware sites by the following types of information:

- Time range
- Site, using IP address or domain
- Port
- IP address associated with a computer in your organization
- Connection type

The first 1000 matching search results are displayed.

**Searching for Transactions Processed by the SOCKS Proxy**

You can search for transactions that meet a variety of criteria, including blocked or completed transactions; users; and destination domain, IP address, or port.

**Step 1**  
Choose **Web > Reporting > Web Tracking**.

**Step 2**  
Click the **SOCKS Proxy** tab.

**Step 3**  
To filter results, click **Advanced**.

**Step 4**  
Enter search criteria.

**Step 5**  
Click **Search**.

---

**What to do next**

[SOCKS Proxy Page](#), on page 325
System Capacity Page

The Reporting > System Capacity page displays current and historical information about resource usage on the Web Security appliance.

When choosing time ranges for viewing data on the System Capacity page, the following is important to remember:

• **Hour Report.** The Hour report queries the minute table and displays the exact number of items, such as bytes and connection, that have been recorded by the appliance on a minute by minute basis over a 60 minute period.

• **Day Report.** The Day report queries the hour table and displays the exact number of items, such as bytes and connection, that have been recorded by the appliance on an hourly basis over a 24 hour period. This information is gathered from the hour table.

The Week Report and 30 Days Report work similarly to the Hour and Day Reports.

System Status Page

Use the Reporting > System Status page to monitor the System Status. This page displays the current status and configuration of the Web Security appliance.

<table>
<thead>
<tr>
<th>This Section...</th>
<th>Displays</th>

Detecting Rogue Traffic on Non-Standard Ports

This chapter contains the following sections:

- Overview of Detecting Rogue Traffic, on page 331
- Configuring the L4 Traffic Monitor, on page 331
- List of Known Sites, on page 332
- Configuring L4 Traffic Monitor Global Settings, on page 332
- Updating L4 Traffic Monitor Anti-Malware Rules, on page 333
- Creating a Policy to Detect Rogue Traffic, on page 333
- Viewing L4 Traffic Monitor Activity, on page 334

Overview of Detecting Rogue Traffic

The Web Security appliance has an integrated Layer-4 Traffic Monitor that detects rogue traffic across all network ports and stops malware attempts to bypass port 80. When internal clients are infected with malware and attempt to phone-home across non-standard ports and protocols, the L4 Traffic Monitor prevents phone-home activity from going outside the corporate network. By default, the L4 Traffic Monitor is enabled and set to monitor traffic on all ports. This includes DNS and other services.

The L4 Traffic Monitor uses and maintains its own internal database. This database is continuously updated with matched results for IP addresses and domain names.

Configuring the L4 Traffic Monitor

Step 1
Configure the L4 Traffic Monitor inside the firewall.

Step 2
Ensure the L4 Traffic Monitor is “logically” connected after the proxy ports and before any device that performs network address translation (NAT) on client IP addresses.

Step 3
Configure the Global Settings
See Configuring L4 Traffic Monitor Global Settings, on page 332.

Step 4
Create L4 Traffic Monitor Policies
List of Known Sites

<table>
<thead>
<tr>
<th>Address</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Known allowed</td>
<td>Any IP address or hostname listed in the Allow List property. These addresses appear in the log files as “whitelist” addresses.</td>
</tr>
<tr>
<td>Unlisted</td>
<td>Any IP address that is not known to be a malware site nor is a known allowed address. They are not listed on the Allow List, Additional Suspected Malware Addresses properties, or in the L4 Traffic Monitor Database. These addresses do not appear in the log files.</td>
</tr>
<tr>
<td>Ambiguous</td>
<td>These appear in the log files as “greylist” addresses and include:</td>
</tr>
<tr>
<td></td>
<td>• Any IP address that is associated with both an unlisted hostname and a known malware hostname.</td>
</tr>
<tr>
<td></td>
<td>• Any IP address that is associated with both an unlisted hostname and a hostname from the Additional Suspected Malware Addresses property</td>
</tr>
<tr>
<td>Known malware</td>
<td>These appear in the log files as “blacklist” addresses and include:</td>
</tr>
<tr>
<td></td>
<td>• Any IP address or hostname that the L4 Traffic Monitor Database determines to be a known malware site and not listed in the Allow List.</td>
</tr>
<tr>
<td></td>
<td>• Any IP address that is listed in the Additional Suspected Malware Addresses property, not listed in the Allow List and is not ambiguous</td>
</tr>
</tbody>
</table>

Configuring L4 Traffic Monitor Global Settings

**Step 1** Choose Security Services > L4 Traffic Monitor.

**Step 2** Click Edit Global Settings.

**Step 3** Choose whether or not to enable the L4 Traffic Monitor.

**Step 4** When you enable the L4 Traffic Monitor, choose which ports it should monitor:

- **All ports.** Monitors all 65535 TCP ports for rogue activity.
- **All ports except proxy ports.** Monitors all TCP ports except the following ports for rogue activity.
  - Ports configured in the “HTTP Ports to Proxy” property on the Security Services > Web Proxy page (usually port 80).
  - Ports configured in the “Transparent HTTPS Ports to Proxy” property on the Security Services > HTTPS Proxy page (usually port 443).

**Step 5** Submit and Commit Changes.

See [Creating a Policy to Detect Rogue Traffic](#), on page 333.
Updating L4 Traffic Monitor Anti-Malware Rules

Step 1  Choose Security Services > L4 Traffic Monitor.
Step 2  Click Update Now.

Creating a Policy to Detect Rogue Traffic

The actions the L4 Traffic Monitor takes depends on the L4 Traffic Monitor policies you configure:

Step 1  Choose Web Security Manager > L4 Traffic Monitor.
Step 2  Click Edit Settings.
Step 3  On the Edit L4 Traffic Monitor Policies page, configure the L4 Traffic Monitor policies:

a) Define the Allow List
b) Add known good sites to the Allow List
   
   Note  Do not include the Web Security appliance IP address or hostname to the Allow List otherwise the L4 Traffic Monitor does not block any traffic.

c) Determine which action to perform for Suspected Malware Addresses:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Allow</td>
<td>It always allows traffic to and from known allowed and unlisted addresses</td>
</tr>
<tr>
<td>Monitor</td>
<td>It monitors traffic under the following circumstances:</td>
</tr>
<tr>
<td></td>
<td>• When the Action for Suspected Malware Addresses option is set to Monitor, it always monitors all traffic that is not to or from a known allowed address.</td>
</tr>
<tr>
<td></td>
<td>• When the Action for Suspected Malware Addresses option is set to Block, it monitors traffic to and from ambiguous addresses</td>
</tr>
<tr>
<td>Block</td>
<td>When the Action for Suspected Malware Addresses option is set to Block, it blocks traffic to and from known malware addresses</td>
</tr>
</tbody>
</table>

Note  - When you choose to block suspected malware traffic, you can also choose whether or not to always block ambiguous addresses. By default, ambiguous addresses are monitored.

   - If the L4 Traffic Monitor is configured to block, the L4 Traffic Monitor and the Web Proxy must be configured on the same network. Use the Network > Routes page to confirm that all clients are accessible on routes that are configured for data traffic.

d) Define the Additional Suspected Malware Addresses properties

   Note  Adding internal IP addresses to the Additional Suspected Malware Addresses list causes legitimate destination URLs to show up as malware in L4 Traffic Monitor reports. To avoid this do not enter internal IP addresses in the “Additional Suspected Malware Addresses” field on the Web Security Manager > L4 Traffic Monitor Policies page.
Valid Formats

When you add addresses to the Allow List or Additional Suspected Malware Addresses properties, separate multiple entries with whitespace or commas. You can enter addresses in any of the following formats:

- **IPv4 IP address.** Example: IPv4 format: 10.1.1.0. IPv6 format: 2002:4559:1FE2::4559:1FE2
- **CIDR address.** Example: 10.1.1.0/24.
- **Domain name.** Example: example.com.
- **Hostname.** Example: crm.example.com.

Viewing L4 Traffic Monitor Activity

The S-Series appliance supports several options for generating feature specific reports and interactive displays of summary statistics.

Monitoring Activity and Viewing Summary Statistics

The **Reporting > L4 Traffic Monitor** page provides statistical summaries of monitoring activity. You can use the following displays and reporting tools to view the results of L4 Traffic Monitor activity:

<table>
<thead>
<tr>
<th>To view...</th>
<th>See...</th>
</tr>
</thead>
<tbody>
<tr>
<td>Client statistics</td>
<td>Reporting &gt; Client Activity</td>
</tr>
<tr>
<td>Malware statistics</td>
<td>Reporting &gt; L4 Traffic Monitor</td>
</tr>
<tr>
<td>Port statistics</td>
<td></td>
</tr>
<tr>
<td>L4 Traffic Monitor log files</td>
<td>System Administration &gt; Log Subscriptions</td>
</tr>
</tbody>
</table>

**Note**

If the Web Proxy is configured as a forward proxy and L4 Traffic Monitor is set to monitor all ports, the IP address of the proxy’s data port is recorded and displayed as a client IP address in the client activity report on the **Reporting > Client Activity** page. If the Web Proxy is configured as a transparent proxy, enable IP spoofing to correctly record and display the client IP addresses.
L4 Traffic Monitor Log File Entries

The L4 Traffic Monitor log file provides a detailed record of monitoring activity.

- Troubleshooting Logging, on page 385

Overview of Logging

The Web Security appliance records its own system and traffic management activities by writing them to log files. Administrators can consult these log files to monitor and troubleshoot the appliance.

The appliance divides different types of activity into different logging types to simplify the task of finding information on specific activities. The majority of these are automatically enabled by default, but some must be manually enabled as required.

You enable and manage log files through log file subscriptions. Subscriptions allow you to define the settings for creating, customizing, and managing log files.

The two main log files types typically used by administrators are:

- **Access log.** This records all Web Proxy filtering and scanning activity.
- **Traffic Monitor log.** This records all Layer-4 Traffic Monitor activity.
You can view current and past appliance activity using these and other log types. Reference tables are available to help you interpret log file entries.

</tr>
</tbody>
</table>

## Best Practices for Logging

- Minimizing the number of log subscriptions will benefit system performance.
- Logging fewer details will benefit system performance.

## Troubleshooting Web Proxy Issues Using Logs

By default, the Web Security appliance has one log subscription created for Web Proxy logging messages, called the "Default Proxy Logs." This captures basic information on all Web Proxy modules. The appliance also includes log file types for each Web Proxy module so you can read more specific debug information for each module without cluttering up the Default Proxy Logs.

Follow the steps below to troubleshoot Web Proxy issues using the various logs available.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Read the Default Proxy Logs.</td>
</tr>
<tr>
<td>Step 2</td>
<td>If you see an entry that might related to the issue but does not have enough information to resolve it, create a log subscription for the relevant specific Web Proxy module. The following Web Proxy module logs types are available:</td>
</tr>
</tbody>
</table>
Step 3  Recreate the issue and read the new Web Proxy module log for relevant entries.

Step 4  Repeat as required with other Web Proxy module logs.

Step 5  Remove subscriptions that are no longer required.

---

### Log File Types

Some log types related to the web proxy component are not enabled. The main web proxy log type, called the “Default Proxy Logs,” is enabled by default and captures basic information on all Web Proxy modules. Each Web Proxy module also has its own log type that you can manually enable as required.

The following table describes the Web Security appliance log file types.

<table>
<thead>
<tr>
<th>Log File Type</th>
<th>Description</th>
<th>Supports Syslog Push?</th>
<th>Enabled by Default?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Access Control Engine Logs</td>
<td>Records messages related to the Web Proxy ACL (access control list) evaluation engine.</td>
<td>No</td>
<td>No</td>
</tr>
<tr>
<td>AMP Engine Logs</td>
<td>Records information about file reputation scanning and file analysis (Advanced Malware Protection.) See also Log Files, on page 260.</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

</thead>
</table>
| Audit Logs            | Records AAA (Authentication, Authorization, and Accounting) events. Records all user interaction with the application and command-line interfaces, and captures committed changes. Some of the audit log details are as follows:  
  - User - Logon  
  - User - Logon failed incorrect password  
  - User - Logon failed unknown user name  
  - User - Logon failed account expired  
  - User - Logoff  
  - User - Lockout  
  - User - Activated  
  - User - Password change  
  - User - Password reset  
  - User - Security settings/profile change  
  - User - Created  
  - User - Deleted/modified  
  - Group/Role - Deletion / modified  
  - Group /Role - Permissions change | Yes                                                                                                                                           | Yes                   |
<p>| Access Logs           | Records Web Proxy client history.                                                                                                                                                                             | Yes                   | Yes                 |
| Authentication Framework Logs | Records authentication history and messages.                                                                                                                                                            | No                    | Yes                 |
| AVC Engine Framework Logs | Records messages related to communication between the Web Proxy and the AVC engine.                                                                                                                                 | No                    | No                  |
| AVC Engine Logs       | Records debug messages from the AVC engine.                                                                                                                                                             | Yes                   | Yes                 |
| CLI Audit Logs        | Records a historical audit of command line interface activity.                                                                                                                                              | Yes                   | Yes                 |
| Configuration Logs    | Records messages related to the Web Proxy configuration management system.                                                                                                                                 | No                    | No                  |
| Connection Management Logs | Records messages related to the Web Proxy connection management system.                                                                                                                                       | No                    | No                  |</p>

**Adding and Editing Log Subscriptions**

You can create multiple log subscriptions for each type of log file. Subscriptions include configuration details for archiving and storage, including these:

- Rollover settings, which determine when log files are archived.
- Compression settings for archived logs.
- Retrieval settings for archived logs, which specifies whether logs are archived onto a remote server or stored on the appliance.

**Step 1** Choose **System Administration > Log Subscriptions**.

**Step 2** To add a log subscription, click **Add Log Subscription**. Or, to edit a log subscription, click the name of the log file in the Log Name field.
**Step 3** Configure the subscription:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Log Type</strong></td>
<td>A list of available log file types that you can subscribe to. The other options on the page may change according to log file type you choose.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>The Request Debug Logs log type can only be subscribed to using the CLI and does not appear on this list.</td>
</tr>
<tr>
<td><strong>Log Name</strong></td>
<td>The name used to refer to the subscription on the Web Security appliance. This name is also used for the log directory which will store the log files for the subscription.</td>
</tr>
<tr>
<td><strong>Rollover by File Size</strong></td>
<td>The maximum file size to which the current log file can grow before it is archived and a new log file started. Enter a number between 100 kilobytes and 10 gigabytes.</td>
</tr>
<tr>
<td><strong>Rollover by Time</strong></td>
<td>The maximum time interval before the current log file is archived and a new log file started. The following interval types are available:</td>
</tr>
<tr>
<td></td>
<td>• None. AsyncOS only performs a rollover when the log file reaches the maximum file size.</td>
</tr>
<tr>
<td></td>
<td>• Custom Time Interval. AsyncOS performs a rollover after a specified amount of time has passed since the previous rollover. Specify the number of days, hours, minutes, and seconds between rollovers using d, h, m, and s as suffixes.</td>
</tr>
<tr>
<td></td>
<td>• Daily Rollover. AsyncOS performs a rollover every day at a specified time. Separate multiple times a day using a comma. Use an asterisk (*) for the hour to have rollover occur every hour during the day. You can also use an asterisk to rollover every minute of an hour.</td>
</tr>
<tr>
<td></td>
<td>• Weekly Rollover. AsyncOS performs a rollover on one or more days of the week at a specified time.</td>
</tr>
<tr>
<td><strong>Log Style</strong></td>
<td>Specifies the log format to use, either Squid, Apache, or Squid Details.</td>
</tr>
<tr>
<td><strong>Custom Fields</strong></td>
<td>Allows you to include custom information in each access log entry. The syntax for entering format specifiers in the Custom Field is as follows:</td>
</tr>
<tr>
<td>(Access Logs)</td>
<td>&lt;format_specifier_1&gt; &lt;format_specifier_2&gt; ...</td>
</tr>
<tr>
<td></td>
<td>For example: <code>%a %b %E</code></td>
</tr>
<tr>
<td></td>
<td>You can add tokens before the format specifiers to display descriptive text in the access log file. For example:</td>
</tr>
<tr>
<td></td>
<td><code>client_IP %a body_bytes %b error_type %E</code></td>
</tr>
<tr>
<td></td>
<td>where <code>client_IP</code> is the description token for log format specifier <code>%a</code>, and so on.</td>
</tr>
<tr>
<td><strong>FileName</strong></td>
<td>The name of the log files. Current log files are appended with a .c extension and rolled over log files are appended with the file creation timestamp and a .s extension.</td>
</tr>
</tbody>
</table>
### Log Fields (W3C Access Logs)

Allows you to choose the fields you want to include in the W3C access log.

Select a field in the Available Fields list, or type a field in the Custom Field box, and click Add.

The order the fields appear in the Selected Log Fields list determines the order of fields in the W3C access log file. You can change the order of fields using the Move Up and Move Down buttons. You can remove a field by selecting it in the Selected Log Fields list and clicking Remove.

You can enter multiple user defined fields in the Custom Fields box and add them simultaneously as long as each entry is separated by a new line (click Enter) before clicking Add.

When you change the log fields included in a W3C log subscription, the log subscription automatically rolls over. This allows the latest version of the log file to include the correct new field headers

You can anonymize the `c-ip`, `cs-username`, or `cs-auth-group` log fields of W3C logs, if required. Check the Anonymization check box to anonymize `c-ip`, `cs-username`, and `cs-auth-group` fields.

After you select the check box, the field names are changed to `c-a-ip`, `cs-a-username`, and `cs-a-auth-group` respectively.

**Note** You must enable anonymization only if the external server to which the log files are pushed is compatible to handle the anonymization feature.

After the log creation you can deanonymize the anonymized fields, if required. See [Deanonymizing W3C Log Fields](#) on page 348.

### Passphrase for Anonymization (W3C Access Logs)

Allows you to create passphrase for encrypting the field values. This area will be enabled only when you choose to anonymize `c-ip`, `cs-username`, or `cs-auth-group` log fields.

**Note** System applies passphrase rules while configuring passphrase for anonymization.

To automatically generate a passphrase, check the check box next to Auto Generate Passphrase and click Generate

**Note** If you have multiple appliances, all the appliances must set the same passphrase.

### Log Compression

Specifies whether or not rolled over files are compressed. AsyncOS compresses log files using the gzip compression format.

### Log Exclusions (Optional) (Access Logs)

Allows you to specify HTTP status codes (4xx or 5xx only) to exclude the associated transactions from an access log or a W3C access log.

For example, entering 401 will filter out authentication failure requests that have that transaction number.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Log Level</strong></td>
<td>Specifies the level of detail for log entries. Choose from:</td>
</tr>
<tr>
<td>• <strong>Critical</strong></td>
<td>Includes errors only. This is the least detailed setting and is equivalent to the syslog level “Alert.”</td>
</tr>
<tr>
<td>• <strong>Warning</strong></td>
<td>Includes errors and warnings. This log level is equivalent to the syslog level “Warning.”</td>
</tr>
<tr>
<td>• <strong>Information</strong></td>
<td>Includes errors, warnings and additional system operations. This is the default detail level and is equivalent to the syslog level “Info.”</td>
</tr>
<tr>
<td>• <strong>Debug</strong></td>
<td>Includes data useful for debugging system problems. Use the Debug log level when you are trying to discover the cause of an error. Use this setting temporarily, and then return to the default level. This log level is equivalent to the syslog level “Debug.”</td>
</tr>
<tr>
<td>• <strong>Trace</strong></td>
<td>This is the most detailed setting. This level includes a complete record of system operations and activity. The Trace log level is recommended only for developers. Using this level causes a serious degradation of system performance and is not recommended. This log level is equivalent to the syslog level “Debug.”</td>
</tr>
</tbody>
</table>

**Note** More detailed settings create larger log files and have a greater impact on system performance.

<table>
<thead>
<tr>
<th>Retrieval Method</th>
<th>Specifies where rolled over log files are stored and how they are retrieved for reading. See below for descriptions of the available methods.</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Retrieval Method: FTP on Appliance</strong></td>
<td>The FTP on Appliance method (equivalent to FTP Poll) requires a remote FTP client accessing the appliance to retrieve log files using an admin or operator user’s username and passphrase. When you choose this method, you must enter the maximum number of log files to store on the appliance. When the maximum number is reached, the system deletes the oldest file. This is the default retrieval method.</td>
</tr>
<tr>
<td><strong>Retrieval Method: FTP on Remote Server</strong></td>
<td>The FTP on Remote Server method (equivalent to FTP Push) periodically pushes log files to an FTP server on a remote computer. When you choose this method, you must enter the following information:</td>
</tr>
<tr>
<td></td>
<td>• FTP server hostname</td>
</tr>
<tr>
<td></td>
<td>• Directory on FTP server to store the log file</td>
</tr>
<tr>
<td></td>
<td>• Username and passphrase of a user that has permission to connect to the FTP server</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>AsyncOS for Web only supports passive mode for remote FTP servers. It cannot push log files to an FTP server in active mode.</td>
</tr>
<tr>
<td><strong>Retrieval Method: SCP on Remote Server</strong></td>
<td>The SCP on Remote Server method (equivalent to SCP Push) periodically pushes log files using the secure copy protocol to a remote SCP server. This method requires an SSH SCP server on a remote computer using the SSH2 protocol. The subscription requires a user name, SSH server, and destination directory on the remote computer. Log files are transferred based on a rollover schedule set by you. When you choose this method, you must enter the following information:</td>
</tr>
<tr>
<td></td>
<td>• SCP server hostname</td>
</tr>
<tr>
<td></td>
<td>• Directory on SCP server to store the log file</td>
</tr>
<tr>
<td></td>
<td>• Username of a user that has permission to connect to the SCP server</td>
</tr>
</tbody>
</table>
Deanonymizing W3C Log Fields

If you have enabled anonymization feature for field values (c-ip, cs-username, and cs-auth-group) during log subscription, the destination log server will receive the anonymized values (c-a-ip, cs-a-username, and cs-a-auth-group) of those log fields and not the actual values. If you want to view the actual values you must deanonymize the log fields.

You can deanonymize c-a-ip, cs-a-username, and cs-a-auth-group log field values that are anonymized while adding the W3C log subscription.

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose System Administration &gt; Log Subscriptions.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Deanonymization in the Denonymization column corresponding to the log for which you want to deanonymize the anonymized fields.</td>
</tr>
<tr>
<td>Step 3</td>
<td>In the Method area, choose any of the following methods to enter the encrypted text for deanonymization.</td>
</tr>
<tr>
<td></td>
<td>• Paste encrypted text – Paste only the encrypted text in the Anonymized Text field. You can enter a maximum of 500 entries in this field. You must separate the multiple entries with a comma.</td>
</tr>
<tr>
<td></td>
<td>• Upload File – Choose a file that contains the encrypted text. The file can contain a maximum of 1000 entries. The file format should be CSV. The system supports space, new line, tab, and semi colon as the field separator.</td>
</tr>
</tbody>
</table>

Retrieval Method: Syslog Push

You can only choose syslog for text-based logs.

The Syslog Push method sends log messages to a remote syslog server on port 514. This method conforms to RFC 3164.

When you choose this method, you must enter the following information:

- Syslog server hostname
- Protocol to use for transmission, either UDP or TCP
- Maximum message size

Valid values for UDP are 1024 to 9216.

Valid values for TCP are 1024 to 65535.

Maximum message size depends on the syslog server configuration.

- Facility to use with the log

What to do next

If you chose SCP as the retrieval method, notice that the appliance displays an SSH key, which you will add to the SCP server host. See Pushing Log Files to Another Server, on page 349.

Related Topics

- Log File Types, on page 339
- Log File Names and Appliance Directory Structure, on page 350
If you have changed the passphrase, you must enter the old passphrase to deanonymize the older data.

**Step 4**

Click **Deanonymize** and the Deanonymization Result table displays the deanonymized log field values.

---

**Pushing Log Files to Another Server**

**Before you begin**

Create or edit the desired log subscription, choosing SCP as the retrieval method. Adding and Editing Log Subscriptions, on page 344

**Step 1**

Add keys to the remote system:

a) Access the CLI.

b) Enter the `logconfig -> hostkeyconfig` command.

c) Use the commands below to display the keys:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Host</td>
<td>Display system host keys. This is the value to place in the remote system’s ‘known_hosts’ file.</td>
</tr>
<tr>
<td>User</td>
<td>Displays the public key of the system account that pushes the logs to the remote machine. This is the same key that is displayed when setting up an SCP push subscription. This is the value to place in the remote system’s ‘authorized_keys’ file.</td>
</tr>
</tbody>
</table>

d) Add these keys to the remote system.

**Step 2**

Still in the CLI, add the remote server’s SSH public host key to the appliance:

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>New</td>
<td>Add a new key.</td>
</tr>
<tr>
<td>Fingerprint</td>
<td>Display system host key fingerprints.</td>
</tr>
</tbody>
</table>

**Step 3**

Commit your changes.

---

**Archiving Log Files**

AsyncOS archives (rolls over) log subscriptions when a current log file reaches a user-specified limit of maximum file size or maximum time since last rollover.

These archive settings are included in log subscriptions:

- Rollover by File Size
- Rollover by Time
- Log Compression
Log File Names and Appliance Directory Structure

The appliance creates a directory for each log subscription based on the log subscription name. The name of the log file in the directory is composed of the following information:

- Log file name specified in the log subscription
- Timestamp when the log file was started
- A single-character status code, either .c (signifying current) or .s (signifying saved)

The filename of logs are made using the following formula:

/LogSubscriptionName/LogFilename.@timestamp.statuscode

Note

You should only transfer log files with the saved status.

Reading and Interpreting Log Files

You can read current log file activity as a means of monitoring and troubleshooting the Web Security appliance. This is done using the appliance interface.

You can also read archived files for a record of past activity. This can be done using the appliance interface if the archived files are stored on the appliance; otherwise they must be read from their external storage location using an appropriate method.

Each item of information in a log file is represented by a field variable. By determining which fields represent which items of information, you can look up the field function and interpret the log file contents. For W3C compliant access logs, the file header lists field names in the order in which they appear in log entries. For standard Access logs, however, you must consult the documentation regarding this log type for information on its field order.

Viewing Log Files

Before you begin

Be aware that this method of viewing is for log files that are stored on the appliance. The process of viewing files stored externally goes beyond the scope of this documentation.

Step 1
Choose System Administration > Log Subscriptions.

Step 2
Click the name of the log subscription in the Log Files column of the list of log subscriptions.

Step 3
When prompted, enter the administers username and passphrase for accessing the appliance.

Step 4
When logged in, click one of the log files to view it in your browser or to save it to disk.

Step 5
Refresh the browser for updated results.

Note
If a log subscription is compressed, download, decompress, and then open it.

Web Proxy Information in Access Log Files

Access log files provides a descriptive record of all Web Proxy filtering and scanning activity. Access log file entries display a record of how the appliance handled each transaction.

Access logs are available in two formats: Standard and W3C compliant. W3C-compliant log files are more customizable with regard to their content and layout than standard Access logs.

The following text is an example access log file entry for a single transaction:

<table>
<thead>
<tr>
<th>Format Specifier</th>
<th>Field Value</th>
<th>Field Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>%t</td>
<td>1278096903.150</td>
<td>Timestamp since UNIX epoch.</td>
</tr>
<tr>
<td>%e</td>
<td>97</td>
<td>Elapsed time (latency) in milliseconds.</td>
</tr>
<tr>
<td>%a</td>
<td>172.xx.xx.xx</td>
<td>Client IP address.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can choose to mask the IP address in the access logs using the advancedproxyconfig &gt; authentication CLI command.</td>
</tr>
<tr>
<td>%w</td>
<td>TCP_MISS</td>
<td>Transaction result code.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>For more information, see W3C Compliant Access Log Files, on page 367.</td>
</tr>
<tr>
<td>%h</td>
<td>200</td>
<td>HTTP response code.</td>
</tr>
<tr>
<td>%s</td>
<td>8187</td>
<td>Response size (headers + body).</td>
</tr>
<tr>
<td>%1r</td>
<td>GET <a href="http://my.site.com/">http://my.site.com/</a></td>
<td>First line of the request.</td>
</tr>
<tr>
<td>%2r</td>
<td></td>
<td>Note: When the first line of the request is for a native FTP transaction, some special characters in the file name are URL encoded in the access logs. For example, the “@” symbol is written as “%40” in the access logs.</td>
</tr>
<tr>
<td>%A</td>
<td>–</td>
<td>Authenticated username.</td>
</tr>
<tr>
<td></td>
<td></td>
<td><strong>Note:</strong> You can choose to mask the username in the access logs using the advancedproxyconfig &gt; authentication CLI command.</td>
</tr>
<tr>
<td>Format Specifier</td>
<td>Field Value</td>
<td>Field Description</td>
</tr>
<tr>
<td>------------------</td>
<td>-------------</td>
<td>-------------------</td>
</tr>
</tbody>
</table>
| %H               | DIRECT      | Code that describes which server was contacted for the retrieving the request content. Most common values include:  
- **NONE.** The Web Proxy had the content, so it did not contact any other server to retrieve the content.  
- **DIRECT.** The Web Proxy went to the server named in the request to get the content.  
- **DEFAULT_PARENT.** The Web Proxy went to its primary parent proxy or an external DLP server to get the content. |
| %d               | my.site.com | Data source or server IP address. |
| %c               | text/plain  | Response body MIME type. |
| %D               | DEFAULT_CASE_11 | ACL decision tag.  
**Note:** The end of the ACL decision tag includes a dynamically generated number that the Web Proxy uses internally. You can ignore this number.  
For more information, see **ACL Decision Tags, on page 355.** |
| N/A (Part of the ACL decision tag) | PolicyGroupName | Name of policy group responsible for the final decision on this transaction (Access Policy, Decryption Policy, or Data Security Policy). When the transaction matches a global policy, this value is “DefaultGroup.”  
Any space in the policy group name is replaced with an underscore (_). |
| N/A (Part of the ACL decision tag) | Identity | Identity policy group name.  
Any space in the policy group name is replaced with an underscore (_). |
| N/A (Part of the ACL decision tag) | OutboundMalwareScanningPolicy | Outbound Malware Scanning Policy group name.  
Any space in the policy group name is replaced with an underscore (_). |
<table>
<thead>

<th>Format Specifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Data Security Policy group name. When the transaction matches the global Cisco Data Security Policy, this value is “DefaultGroup.” This policy group name only appears when Cisco Data Security Filters is enabled. “NONE” appears when no Data Security Policy was applied. Any space in the policy group name is replaced with an underscore (_).</td>
<td>DataSecurityPolicy</td>
<td>N/A (Part of the ACL decision tag)</td>
</tr>
<tr>
<td>External DLP Policy group name. When the transaction matches the global External DLP Policy, this value is “DefaultGroup.” “NONE” appears when no External DLP Policy was applied. Any space in the policy group name is replaced with an underscore (_).</td>
<td>ExternalDLPPolicy</td>
<td>N/A (Part of the ACL decision tag)</td>
</tr>
<tr>
<td>Routing Policy group name as ProxyGroupName/ProxyServerName. When the transaction matches the global Routing Policy, this value is “DefaultRouting.” When no upstream proxy server is used, this value is “DIRECT.” Any space in the policy group name is replaced with an underscore (_).</td>
<td>RoutingPolicy</td>
<td>N/A (Part of the ACL decision tag)</td>
</tr>
<tr>
<td>Scanning verdict information. Inside the angled brackets, the access logs include verdict information from various scanning engines. For more information about the values included within the angled brackets, see Interpreting Access Log Scanning Verdict Entries, on page 361 and Malware Scanning Verdict Values, on page 384.</td>
<td>%Xr</td>
<td>%?BLOCK_SUSPECT_USER_AGENT, MONITOR_SUSPECT_USER_AGENT?%&lt;User-Agent:%!%-%</td>
</tr>
</tbody>
</table>

User Guide for AsyncOS 11.5.1 for Cisco Web Security Appliances - GD (General Deployment)
Transaction Result Codes

Transaction result codes in the access log file describe how the appliance resolves client requests. For example, if a request for an object can be resolved from the cache, the result code is TCP_HIT. However, if the object is not in the cache and the appliance pulls the object from an origin server, the result code is TCP_MISS. The following table describes transaction result codes.

<table>
<thead>
<tr>
<th>Result Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TCP_HIT</td>
<td>The object requested was fetched from the disk cache.</td>
</tr>
<tr>
<td>TCP_IMS_HIT</td>
<td>The client sent an IMS (If-Modified-Since) request for an object and the object was found in the cache. The proxy responds with a 304 response.</td>
</tr>
<tr>
<td>TCP_MEM_HIT</td>
<td>The object requested was fetched from the memory cache.</td>
</tr>
<tr>
<td>TCP_MISS</td>
<td>The object was not found in the cache, so it was fetched from the origin server.</td>
</tr>
<tr>
<td>TCP_REFRESH_HIT</td>
<td>The object was in the cache, but had expired. The proxy sent an IMS (If-Modified-Since) request to the origin server, and the server confirmed that the object has not been modified. Therefore, the appliance fetched the object from either the disk or memory cache.</td>
</tr>
<tr>
<td>TCP_CLIENT_REFRESH_MISS</td>
<td>The client sent a “don’t fetch response from cache” request by issuing the ‘Pragma: no-cache’ header. Due to this header from the client, the appliance fetched the object from the origin server.</td>
</tr>
<tr>
<td>TCP_DENIED</td>
<td>The client request was denied due to Access Policies.</td>
</tr>
<tr>
<td>UDP_MISS</td>
<td>The object was fetched from the origin server.</td>
</tr>
<tr>
<td>NONE</td>
<td>There was an error in the transaction. For example, a DNS failure or gateway timeout.</td>
</tr>
</tbody>
</table>

ACL Decision Tags

An ACL decision tag is a field in an access log entry that indicates how the Web Proxy handled the transaction. It includes information from the Web Reputation filters, URL categories, and the scanning engines.

Note

The end of the ACL decision tag includes a dynamically generated number that the Web Proxy uses internally to increase performance. You can ignore this number.

The following table describes the ACL decision tag values.
<table>
<thead>
<tr>
<th>ACL Decision Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALLOW_ADMIN_ERROR_PAGE</td>
<td>The Web Proxy allowed the transaction to an notification page and to any logo used on that page.</td>
</tr>
<tr>
<td>ALLOW_CUSTOMCAT</td>
<td>The Web Proxy allowed the transaction based on custom URL category filtering settings for the Access Policy group.</td>
</tr>
<tr>
<td>ALLOWREFERER</td>
<td>The Web Proxy allowed the transaction based on an embedded/referred content exemption.</td>
</tr>
<tr>
<td>ALLOW_NBRS</td>
<td>The Web Proxy allowed the transaction based on the Web Reputation filter settings for the Access Policy group.</td>
</tr>
</tbody>
</table>
| AMP_FILE_VERDICT                 | Value representing a verdict from the AMP reputation server for the file:  
  • 1 – Unknown  
  • 2 – Clean  
  • 3 – Malicious  
  • 4 – Unscannable            |
<table>
<thead>
<tr>
<th>ACL Decision Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARCHIVESCAN_ALLCLEAR</td>
<td><strong>Archive scan Verdict</strong> - There are no blocked file types in the inspected archive.</td>
</tr>
<tr>
<td>ARCHIVESCAN_BLOCKEDFILETYPE</td>
<td>ARCHIVESCAN_ALLCLEAR – There is a blocked file type in the inspected archive. The next field in the log entry (Verdict Detail) provides details, specifically the type of file blocked, and the name of the blocked file.</td>
</tr>
<tr>
<td>ARCHIVESCAN_NESTEDTOODEEP</td>
<td>ARCHIVESCAN_BLOCKEDFILETYPE – The archive is blocked because it contains more “encapsulated” or nested archives than the configured maximum. The Verdict Detail field contains “UnScanable Archive-Blocked.”</td>
</tr>
<tr>
<td>ARCHIVESCAN_UNKNOWNFMT</td>
<td>ARCHIVESCAN_NESTEDTOODEEP – The archive is blocked because it contains a file type of unknown format. The Verdict Detail is “UnScanable Archive-Blocked.”</td>
</tr>
<tr>
<td>ARCHIVESCAN_UNSCANABLE</td>
<td>ARCHIVESCAN_UNKNOWNFMT – The archive is blocked because it contain a file which cannot be scanned. The Verdict Detail is “UnScanable Archive-Blocked.”</td>
</tr>
<tr>
<td>ARCHIVESCAN_FILETOOBIG</td>
<td>ARCHIVESCAN_FILETOOBIG – The archive is blocked because the size of the archive is more than the configured maximum. The Verdict Detail is “UnScanable Archive-Blocked.”</td>
</tr>
</tbody>
</table>

**Archive scan Verdict Detail**

The field following the Verdict field in the log entry provides additional information about the Verdict, such as type of file blocked and name of the blocked file, “UnScanable Archive-Blocked,” or “-” to indicate the archive does not contain any blocked file types.

For example, if an Inspectable Archive file is blocked (ARCHIVESCAN_BLOCKEDFILETYPE) based on Access Policy: Custom Objects Blocking settings, the Verdict Detail entry includes the type of file blocked, and the name of the blocked file.

Refer to Access Policies: Blocking Objects, on page 194 and Archive Inspection Settings, on page 196 for more information about Archive Inspection.

<table>
<thead>
<tr>
<th>BLOCK_ADMIN</th>
<th>Transaction blocked based on some default settings for the Access Policy group.</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOCK_ADMIN_CONNECT</td>
<td>Transaction blocked based on the TCP port of the destination as defined in the HTTP CONNECT Ports setting for the Access Policy group.</td>
</tr>
<tr>
<td>BLOCK_ADMIN_CUSTOM_USER_AGENT</td>
<td>Transaction blocked based on the user agent as defined in the Block Custom User Agents setting for the Access Policy group.</td>
</tr>
<tr>
<td>BLOCK_ADMIN_TUNNELING</td>
<td>The Web Proxy blocked the transaction based on tunneling of the non HTTP traffic on the HTTP ports for the Access Policy Group.</td>
</tr>
</tbody>
</table>
## ACL Decision Tags

<table>
<thead>
<tr>
<th>ACL Decision Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BLOCK_ADMIN_HTTPS_</td>
<td>Transaction blocked; client tried to bypass authentication using the SSL port as an explicit proxy. To prevent this, if an SSL connection is to the WSA itself, only requests to the actual WSA redirect hostname are allowed.</td>
</tr>

**Interpreting Access Log Scanning Verdict Entries**

The access log file entries aggregate and display the results of the various scanning engines, such as URL filtering, Web Reputation filtering, and anti-malware scanning. The appliance displays this information in angled brackets at the end of each access log entry.

The following text is the scanning verdict information from an access log file entry. In this example, the Webroot scanning engine found the malware:

```
<IW_infr,ns,24,"Trojan-Phisher-Gamec",0,354385,12559,="",-,-,-,="",-,-,-,="",-,-,-,="",-,-,-,=
IW_infr,-,"Trojan Phisher","-","Unknown","Unknown","-","-",489.73,0,-,
"fd5ef49d4213e05f448f11ed9c98253d85829614fba368a421d4e64c426da5e","-
,ARCHIVESCAN_BLOCKEDFILETYPE,"BlockedFileType: application/x-rpm,
BlockedFile: allfiles/linuxpackage.rpm">
```

**Note**

For an example of a whole access log file entry, see Web Proxy Information in Access Log Files, on page 351.

Each element in this example corresponds to a log-file format specifier as shown in the following table:
<table>
<thead>
<tr>
<th>Position</th>
<th>Field Value</th>
<th>Format Specifier</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>W_infr</td>
<td>%XC</td>
<td>The custom URL category assigned to the transaction, abbreviated. This field shows “nc” when no category is assigned.</td>
</tr>
<tr>
<td>2</td>
<td>ns</td>
<td>%XW</td>
<td>Web Reputation filters score. This field either shows the score as a number, “ns” for no score, or “dns” when there is a DNS lookup error.</td>
</tr>
<tr>
<td>3</td>
<td>24</td>
<td>%Xv</td>
<td>The malware scanning verdict Webroot passed to the DVS engine. Applies to responses detected by Webroot only. For more information, see Malware Scanning Verdict Values, on page 384.</td>

W3C Compliant Access Log Files

The Web Security appliance provides two different log types for recording Web Proxy transaction information: access logs and W3C-formatted access logs. The W3C access logs are World Wide Web Consortium (W3C) compliant, and record transaction history in the W3C Extended Log File (ELF) Format.

• W3C Field Types, on page 367
• Interpreting W3C Access Logs, on page 367

W3C Field Types

When defining a W3C access log subscription, you must choose which log fields to include, such as the ACL decision tag or the client IP address. You can include one of the following types of log fields:

• Predefined. The web interface includes a list of fields from which you can choose.
• User defined. You can type a log field that is not included in the predefined list.

Interpreting W3C Access Logs

Consider the following rules and guidelines when interpreting W3C access logs:

• Administrators decide what data is recorded in each W3C access log subscription; therefore, W3C access logs have no set field format.
• W3C logs are self-describing. The file format (list of fields) is defined in a header at the start of each log file.
• Fields in the W3C access logs are separated by a white space.
• If a field contains no data for a particular entry, a hyphen (-) is included in the log file instead.
Each line in the W3C access log file relates to one transaction, and each line is terminated by a LF sequence.

- W3C Log File Headers, on page 368
- W3C Field Prefixes, on page 368

W3C Log File Headers

Each W3C log file contains header text at the beginning of the file. Each line starts with the # character and provides information about the Web Security appliance that created the log file. The W3C log file headers also include the file format (list of fields), making the log file self-describing.

The following table describes the header fields listed at the beginning of each W3C log file.

<table>
<thead>
<tr>
<th>Header Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Version</td>
<td>The version of the W3C ELF format used.</td>
</tr>
<tr>
<td>Date</td>
<td>The date and time at which the header (and logfile) was created.</td>
</tr>
<tr>
<td>System</td>
<td>The Web Security appliance that generated the log file in the format “Management_IP - Management_hostname.”</td>
</tr>
<tr>
<td>Software</td>
<td>The Software which generated these logs</td>
</tr>
<tr>
<td>Fields</td>
<td>The fields recorded in the log</td>
</tr>
</tbody>
</table>

Example W3C log file:

#Version: 1.0
#Date: 2009-06-15 13:55:20
#System: 10.1.1.1 - wsa.qa
#Software: AsyncOS for Web 6.3.0
#Fields: timestamp x-elapsed-time c-ip
x-resultcode-httpstatus sc-bytes cs-method cs-url cs-username
x-hierarchy-origin cs-mime-type x-acltag x-result-code x-suspect-user-agent

W3C Field Prefixes

Most W3C log field names include a prefix that identifies from which header a value comes, such as the client or server. Log fields without a prefix reference values that are independent of the computers involved in the transaction. The following table describes the W3C log fields prefixes.

<table>
<thead>
<tr>
<th>Prefix Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>c</td>
<td>Client</td>
</tr>
<tr>
<td>s</td>
<td>Server</td>
</tr>
<tr>
<td>cs</td>
<td>Client to server</td>
</tr>
<tr>
<td>sc</td>
<td>Server to client</td>
</tr>
<tr>
<td>x</td>
<td>Application specific identifier.</td>
</tr>
</tbody>
</table>
For example, the W3C log field “cs-method” refers to the method in the request sent by the client to the server, and “c-ip” refers to the client’s IP address.

- Traffic Monitor Log Files, on page 373.
- Log File Fields and Tags, on page 374.
- Viewing Log Files, on page 351.

Customizing Access Logs

You can customize regular and W3C access logs to include many different fields to capture comprehensive information about web traffic within the network using predefined fields or user defined fields.

Related Topics
- For a list of predefined fields, see Log File Fields and Tags, on page 374.
- For information on user defined fields, see Access Log User Defined Fields, on page 369.

Access Log User Defined Fields

If the list of predefined Access log and W3C log fields does not include all header information you want to log from HTTP/HTTPS transactions, you can type a user-defined log field in the Custom Fields text box when you configure the access and W3C log subscriptions.

Custom log fields can be any data from any header sent from the client or the server. If a request or response does not include the header added to the log subscription, the log file includes a hyphen as the log field value.

The following table defines the syntax to use for access and W3C logs:

<table>
<thead>
<tr>
<th>Header Type</th>
<th>Access Log Format Specifier Syntax</th>
<th>W3C Log Custom Field Syntax</th>
</tr>
</thead>
<tbody>
<tr>
<td>Header from the client application</td>
<td>%&lt;ClientHeaderName :</td>
<td>cs(ClientHeaderName )</td>
</tr>
<tr>
<td>Header from the server</td>
<td>%&lt;ServerHeaderName :</td>
<td>sc(ServerHeaderName )</td>
</tr>
</tbody>
</table>

For example, if you want to log the If-Modified-Since header value in client requests, enter the following text in the Custom Fields box for a W3C log subscription:

cs(If-Modified-Since)

Related Topics
- Customizing Regular Access Logs, on page 370.
- Customizing W3C Access Logs, on page 370.
Customizing Regular Access Logs

**Step 1** Choose **System Administration > Log Subscriptions**.

**Step 2** Click the access log file name to edit the access log subscription.

**Step 3** Enter the required format specifiers in the Custom Field.

The syntax for entering format specifiers in the Custom Field is as follows:

```
<format_specifier_1> <format_specifier_2> ...
```

For example: `%a %b %E`

You can add tokens before the format specifiers to display descriptive text in the access log file. For example:

```
client_IP %a body_bytes %b error_type %E
```

where `client_IP` is the description token for log format specifier `%a`, and so on.

**Note** You can create a custom field for any header in a client request or a server response.

**Step 4** Submit and commit your changes.

---

**What to do next**

**Related Topics**

- Web Proxy Information in Access Log Files, on page 351.
- Log File Fields and Tags, on page 374.
- Access Log User Defined Fields, on page 369.

---

**Customizing W3C Access Logs**

**Step 1** Choose **System Administration > Log Subscriptions**

**Step 2** Click the W3C log file name to edit the W3C log subscription.

**Step 3** Type a field in the Custom Field box, and click **Add**.

The order the fields appear in the Selected Log Fields list determines the order of fields in the W3C access log file. You can change the order of fields using the **Move Up** and **Move Down** buttons. You can remove a field by selecting it in the Selected Log Fields list and clicking **Remove**.

You can enter multiple user defined fields in the Custom Fields box and add them simultaneously as long as each entry is separated by a new line (click Enter) before clicking **Add**.

When you change the log fields included in a W3C log subscription, the log subscription automatically rolls over. This allows the latest version of the log file to include the correct new field headers.

**Note** You can create a custom field for any header in a client request or a server response.

**Step 4** Submit and commit your changes.

Configuring Cisco CTA-specific Custom W3C Logs

Before you begin

Create a device account in Cisco ScanCenter for your appliance, selecting SCP (Secure Copy Protocol) as the automatic upload protocol. See the Proxy Device Uploads section of the Cisco ScanCenter Administrator Guide (https://www.cisco.com/c/en/us/td/docs/security/web_security/scancenter/administrator/guide/b_ScanCenter_Administrator_Guide.html)

Note the SCP host name and the generated user name for your appliance. The user name is case sensitive and unique for each device.

---

Step 1
Choose Security Services > Cisco Cognitive Threat Analytics.

Step 2
Click Edit Settings.

Step 3
In the Log Fields area, add additional log fields, if required. See Adding and Editing Log Subscriptions, on page 344.

Step 4
From the Selected Log Fields, check the check boxes next to c-ip, cs-username or cs-auth-group if you want to anonymize these fields individually.

Alternatively, you can check the Anonymization check box to anonymize these fields simultaneously. See Adding and Editing Log Subscriptions, on page 344.

Step 5
In the Retrieval Method area, enter the username generated for your device in Cisco ScanCenter. The device user name is case sensitive and unique for each proxy device.

Step 6
Modify the Advanced Options values, if required.

Step 7
Click Submit.

The appliance generates public SSH keys and displays them on the Cisco Cognitive Threat Analytics page.

Step 8
Copy one of the public SSH key to the clipboard.

Step 9
Click the View Cisco Cognitive Threat Analytics portal link to switch to the Cisco ScanCenter portal, select the appropriate device account and then paste the public SSH key to the CTA Device Provisioning page. (See the Proxy Device Uploads section of the Cisco ScanCenter Administrator Guide).

Log files from your proxy device will be uploaded to the CTA system for analysis on successful authentication between your proxy device and CTA system.

Step 10
Switch back to the appliance and commit your changes.
You can also add CTA W3C logs using **System Administration > Log Subscription**. Follow the instructions in Customizing W3C Access Logs, on page 370 to add a new W3C access log subscription with the following options:

- **W3C Logs** as log type
- **Cisco Cognitive Threat Analytics Subscription** as subscription
- **SCP** as file transfer type

See Adding and Editing Log Subscriptions, on page 344 to know more about custom fields.

**Note** If you have already configured a CTA log subscription, you must change the log name to `cta_log` to list it on the Cisco Cognitive Threat Analytics page in the appliance.

After log creation, if you want to delete the CTA log, click **Disable** in the Cisco Cognitive Threat Analytics page. You can also delete the CTA log from the Log Subscriptions page (**System Administration > Log subscriptions**).

To deanonymize the anonymized CTA-specific W3C log fields, click **Deanonymize** in the Cisco Cognitive Threat Analytics page. See Deanonymizing W3C Log Fields, on page 348.

You can also deanonymize the anonymized CTA-specific W3C log fields using **System Administration > Log Subscription**. See Deanonymizing W3C Log Fields, on page 348.

### Configuring Cisco Cloudlock-specific Custom W3C Logs

Cisco Cloudlock is a cloud-native CASB and cloud cybersecurity platform that protects users, data, and applications across Software-as-a-Service, Platform-as-a-Service, and Infrastructure-as-a-Service. You can configure your appliance to push W3C access logs to Cisco’s Cloudlock portal for analysis and reporting. These custom W3C logs provide better visibility into the SaaS usage of the customers.

**Before you begin**

Create a device account in Cloudlock portal for your appliance, selecting SCP as the automatic upload protocol.

Logon to Cloudlock portal, access the online help and follow the instructions to create device account in the Cloudlock portal.

**Step 1** Choose **Security Services > Cisco Cloudlock**.

**Step 2** Click **Edit Settings**.

**Note** The log fields are selected by default in the **Log Fields** area. You cannot add additional log fields other than the log fields selected by default. You should not change the order of the log fields displayed in the **Log Fields** area.

You cannot anonymize log fields (`c-ip, cs-username, or cs-auth-group`) of Cloudlock log files.

**Step 3** In the **Retrieval Method** area, enter the following information:

- Cloudlock server hostname and port number
- Directory on the Cloudlock server to store the log file
- Username of the user who has permission to connect to the Cloudlock server
Step 4 Modify the Advanced Options values if required.

Step 5 Click Submit.

The appliance generates public SSH keys and displays them on the Cisco Cloudlock page.

Step 6 Copy one of the public SSH key to the clipboard.

Step 7 Click the View Cloudlock Portal link to switch to the Cisco Cloudlock portal. Select the appropriate device account and then paste the public SSH key into the Cloudlock Setting page.

Log files from your proxy device will be uploaded to the Cloudlock system for analysis on successful authentication between your proxy device and Cloudlock system.

Step 8 Switch back to the appliance and commit your changes.

You can also add Cloudlock W3C logs using System Administration > Log Subscription. Follow the instructions in Customizing W3C Access Logs, on page 370 to add a new W3C access log subscription with the following options:

- W3C Logs as log type
- Cisco Cloudlock as subscription
- SCP as file transfer type

See Adding and Editing Log Subscriptions, on page 344 to know more about custom fields.

Note If you have already configured a Cloudlock log subscription, you must change the log name to cloudlock_log to list it on the Cisco Cloudlock page in the appliance.

After log creation, if you want to delete the Cloudlock log, click Disable in the Cisco Cloudlock page. You can also delete the Cloudlock log from the Log Subscriptions page (System Administration > Log subscriptions).

Traffic Monitor Log Files

Layer-4 Traffic Monitor log files provides a detailed record of Layer-4 monitoring activity. You can view Layer-4 Traffic Monitor log file entries to track updates to firewall block lists and firewall allow lists.

Interpreting Traffic Monitor Logs

Use the examples below to interpret the various entry types contains in Traffic Monitor Logs.

Example 1

172.xx.xx.xx discovered for blocksite.net (blocksite.net) added to firewall block list.

In this example, where a match becomes a block list firewall entry. The Layer-4 Traffic Monitor matched an IP address to a domain name in the block list based on a DNS request which passed through the appliance. The IP address is then entered into the block list for the firewall.

Example 2

172.xx.xx.xx discovered for www.allowsite.com (www.allowsite.com) added to firewall allow list.
In this example, a match becomes an allow list firewall entry. The Layer-4 Traffic Monitor matched a domain name entry and added it to the appliance allow list. The IP address is then entered into the allow list for the firewall.

Example 3

Firewall noted data from 172.xx.xx.xx to 209.xx.xx.xx (allowsite.net):80.

In this example, the Layer-4 Traffic Monitor logs a record of data that passed between an internal IP address and an external IP address which is on the block list. Also, the Layer-4 Traffic Monitor is set to monitor, not block.

Access Log Format Specifiers and W3C Log File Fields

Log files use variables to represent the individual items of information that make up each log file entry. These variables are called format specifiers in Access logs and log fields in W3C logs and each format specifier has a corresponding log field.

To configure Access Logs to display these values, see Customizing Access Logs, on page 369 and information about custom fields in Adding and Editing Log Subscriptions, on page 344.

The following table describes these variables:

<table>
<thead>
<tr>
<th>Format Specifier in Access Logs</th>

</tbody>
</table>
| %X#1#                          | x-amp-verdict         | Verdict from Advanced Malware Protection file scanning:  
• 0: File is not malicious.  
• 1: File was not scanned because of its file type.  
• 2: File scan timed out.  
• 3: Scan error.  
• Greater than 3: File is malicious. |
| %X#2#                          | x-amp-malware-name    | Threat name, as determined by Advanced Malware Protection file scanning. “-” indicates no threat. |
| %X#3#                          | x-amp-score           | Reputation score from Advanced Malware Protection file scanning.  
This score is used only if the cloud reputation service is unable to determine a clear verdict for the file.  
For details, see information about the Threat Score and the reputation threshold in File Reputation Filtering and File Analysis, on page 247 |
| %X#4#                          | x-amp-upload          | Indicator of upload and analysis request:  
“0” indicates that Advanced Malware Protection did not request upload of the file for analysis.  
“1” indicates that Advanced Malware Protection did request upload of the file for analysis. |
### Malware Scanning Verdict Values

A malware scanning verdict is a value assigned to a URL request or server response that determines the probability that it contains malware. The Webroot, McAfee, and Sophos scanning engines return the malware scanning verdict to the DVS engine so the DVS engine can determine whether to monitor or block the scanned object. Each malware scanning verdict corresponds to a malware category listed on the Access Policies > Reputation and Anti-Malware Settings page when you edit the anti-malware settings for a particular Access Policy.

The following list presents the different Malware Scanning Verdict Values and each corresponding malware category:

<table>

Overview of System Administration

The S-Series appliance provides a variety of tools for managing the system. Functionality on System Administration tab helps you manage the following tasks:

- Appliance configuration
- Feature keys
- Adding, editing, and removing user accounts
- AsyncOS software upgrades and updates
- System time
Saving, Loading, and Resetting the Appliance Configuration

All configuration settings within the Web Security appliance are managed using a single XML configuration file.

- Viewing and Printing the Appliance Configuration, on page 388
- Saving the Appliance Configuration File, on page 388
- Loading the Appliance Configuration File, on page 389
- Resetting the Appliance Configuration to Factory Defaults, on page 389

Viewing and Printing the Appliance Configuration

**Step 1** Choose System Administration > Configuration Summary.

**Step 2** View or print the Configuration Summary page as required.

Saving the Appliance Configuration File

**Step 1** Choose System Administration > Configuration File.

**Step 2** Complete the Configuration File options.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specify a file-handling option</td>
<td>Choose how the generated configuration file is handled:</td>
</tr>
<tr>
<td></td>
<td>- Download file to local computer to view or save.</td>
</tr>
<tr>
<td></td>
<td>- <strong>Save file to this appliance</strong> (wsa_example.com).</td>
</tr>
<tr>
<td></td>
<td>- <strong>Email file to:</strong> – provide one or more email addresses.</td>
</tr>
<tr>
<td>Specify a passphrase-handling option</td>
<td><strong>Mask passphrases in the Configuration Files</strong></td>
</tr>
<tr>
<td></td>
<td>– The original passphrases are replaced with “*****” in the exported or saved file. Please note that configuration files with masked passphrases cannot be loaded directly back into AsyncOS for Web.</td>
</tr>
<tr>
<td></td>
<td><strong>Encrypt passphrases in the Configuration Files</strong> – If FIPS mode is enabled, this option is available. See Enabling or Disabling FIPS Mode, on page 410 for information about enabling FIPS mode.</td>
</tr>
<tr>
<td>Select a file-naming option</td>
<td>Choose how the configuration file is named:</td>
</tr>
<tr>
<td></td>
<td>- <strong>Use system-generated file name</strong></td>
</tr>
<tr>
<td></td>
<td>- <strong>Use user-defined file name</strong></td>
</tr>
</tbody>
</table>

**Step 3** Click Submit.
Loading the Appliance Configuration File

Caution
Loading configuration will permanently remove all of your current configuration settings. It is strongly recommended that you save your configuration before performing these actions.

Loading configurations from previous release to the latest is not recommended. You can retain the configuration settings by upgrading the paths.

Note
If a compatible configuration file is based on an older version of the set of URL categories than the version currently installed on the appliance, policies and identities in the configuration file may be modified automatically.

Step 1
Choose System Administration > Configuration File.

Step 2
Choose Load Configuration options and a file to load. Note:

Note
• Files with masked passphrases cannot be loaded.
• Files must have the following header:

```xml
<?xml version="1.0" encoding="ISO-8859-1"?> <!DOCTYPE config SYSTEM "config.dtd">
```

and a correctly formatted config section:

```xml
<config> ... your configuration information in valid XML </config>
```

Step 3
Click Load.

Step 4
Read the warning displayed. If you understand the consequences of proceeding, click Continue.

Resetting the Appliance Configuration to Factory Defaults

You can choose whether or not to retain existing network settings when you reset the appliance configuration. This action does not require a commit.

Before you begin
Save your configuration to a location off the appliance.

Step 1
Choose System Administration > Configuration File.

Step 2
Scroll down to view the Reset Configuration section.

Step 3
Read the information on the page and select options.

Step 4
Click Reset.
Working with Feature Keys

Feature keys enable specific functionality on your system. Keys are specific to the serial number of your appliance (you cannot re-use a key from one system on another system).

- Displaying and Updating Feature Keys, on page 390
- Changing Feature Key Update Settings, on page 390

Displaying and Updating Feature Keys

**Step 1** Choose **System Administration > Feature Keys**.

**Step 2** To refresh the list of pending keys, click **Check for New Keys** to refresh the list of pending keys.

**Step 3** To add a new feature key manually, paste or type the key into the Feature Key field and click **Submit Key**. If the feature key is valid, the feature key is added to the display.

**Step 4** To activate a new feature key from the Pending Activation list, mark its “Select” checkbox and click **Activate Selected Keys**.

You can configure your appliance to automatically download and install new keys as they are issued. In this case, the Pending Activation list will always be empty. You can tell AsyncOS to look for new keys at any time by clicking the **Check for New Keys** button, even if you have disabled the automatic checking via the Feature Key Settings page.

Changing Feature Key Update Settings

The Feature Key Settings page is used to control whether your appliance checks for and downloads new feature keys, and whether or not those keys are automatically activated.

**Step 1** Choose **System Administration > Feature Key Settings**.

**Step 2** Click **Edit Settings**.

**Step 3** Change the Feature Key Settings as required.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic Serving of Feature Keys</td>
<td>Options to automatically check and download feature keys and to automatically activate downloaded feature keys. Automatic checks are normally performed once a month but this changes to once a day when a feature key is to expire in less than 10 days and once a day after key expiration, for up to one month. After a month, the expired key is no longer included in the list of expiring/expired keys.</td>
</tr>
</tbody>
</table>

**Step 4** Submit and commit your changes.
Virtual Appliance License

Note

You cannot open a Technical Support tunnel before installing the virtual appliance license.

After the license expires, the appliance will continue to serve as a web proxy without security services for 180 days. Security service updates do not occur during this period.

You can configure the appliance so you receive alerts about license expiration.

Installing a Virtual Appliance License

Enabling Remote Power Cycling

Before you begin

• Cable the dedicated Remote Power Cycle (RPC) port directly to a secure network. For information, see the hardware guide for your appliance model. For the location of this document, see Documentation Set, on page 485.

• Ensure that the appliance is accessible remotely; for example, open any necessary ports through the firewall.

• This feature requires a unique IPv4 address for the dedicated Remote Power Cycle interface. This interface is configurable only via the procedure described in this section; it cannot be configured using the ipconfig command.

• In order to cycle appliance power, you will need a third-party tool that can manage devices that support the Intelligent Platform Management Interface (IPMI) version 2.0. Ensure that you are prepared to use such a tool.

• For more information about accessing the command-line interface, see Command Line Interface, on page 463

The ability to remotely reset the power for the appliance chassis is available only on 80-series hardware.

If you want to be able to remotely reset appliance power, you must enable and configure this functionality in advance, using the procedure described in this section.
Step 1  Use SSH or the serial console port to access the command-line interface.

Step 2  Sign in using an account with Administrator access.

Step 3  Enter the following commands:

```
remotepower
setup
```

Step 4  Follow the prompts to specify the following:

- The dedicated IP address for this feature, plus netmask and gateway.
- The username and passphrase required to execute the power-cycle command.

These credentials are independent of other credentials used to access your appliance.

Step 5  Enter `commit` to save your changes.

Step 6  Test your configuration to be sure that you can remotely manage appliance power.

Step 7  Ensure that the credentials that you entered will be available to you in the indefinite future. For example, store this information in a safe place and ensure that administrators who may need to perform this task have access to the required credentials.

What to do next

## Administering User Accounts

The following types of users can log into the appliance to manage it:

- **Local users.** You can define users locally on the appliance itself.
- **Users defined in an external system.** You can configure the appliance to connect to an external LDAP or RADIUS server to authenticate users logging into the appliance.

---

**Note**

Any user you define can log into the appliance using any method, such as logging into the web interface or using SSH.

---

**Related Topics**

- Managing Local User Accounts, on page 393

- Configuring External Authentication through an LDAP Server, on page 91
Managing Local User Accounts

You can define any number of users locally on the Web Security appliance. The default system admin account has all administrative privileges. You can change the admin account passphrase, but you cannot edit or delete this account.

**Note**  If you have lost the admin user passphrase, contact your Cisco support provider.

Adding Local User Accounts

**Before you begin**

Define the passphrase requirements that all user accounts must follow. See Setting Passphrase Requirements for Administrative Users, on page 397.

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose System Administration &gt; Users.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click Add User</td>
</tr>
</tbody>
</table>
| Step 3 | Enter a username, noting the following rules:  
• Usernames can contain lowercase letters, numbers, and the dash (-) character, but cannot begin with a dash.  
• Usernames cannot greater than 16 characters.  
• Usernames cannot be special names that are reserved by the system, such as “operator” or “root.”  
• If you also use external authentication, usernames should not duplicate externally-authenticated usernames. |
| Step 4 | Enter a full name for the user. |
| Step 5 | Select a user type. |

<table>
<thead>
<tr>
<th>User Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Administrator</td>
<td>Allows full access to all system configuration settings. However, the upgradecheck and upgradeinstall CLI commands can be issued only from the system defined “admin” account.</td>
</tr>
</tbody>
</table>
| Operator | Restricts users from creating, editing, or removing user accounts. The operators group also restricts the use of the following CLI commands:  
• resetconfig  
• upgradecheck  
• upgradeinstall  
The operators group restricts the use of System Setup Wizard as well. |
### User Type

<table>
<thead>
<tr>
<th>User Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Read-Only Operator</td>
<td>User accounts with this role:</td>
</tr>
<tr>
<td></td>
<td>• Can view configuration information.</td>
</tr>
<tr>
<td></td>
<td>• Can make and submit changes to see how to configure a feature, but they cannot commit them.</td>
</tr>
<tr>
<td></td>
<td>• Cannot make any other changes to the appliance, such as clearing the cache or saving files.</td>
</tr>
<tr>
<td></td>
<td>• Cannot access the file system, FTP, or SCP.</td>
</tr>
<tr>
<td>Guest</td>
<td>The guests group users can only view system status information, including reporting and tracking.</td>
</tr>
</tbody>
</table>

#### Deleting User Accounts

**Step 1** Choose **System Administration > Users**.

**Step 2** Click the trash can icon corresponding to the listed user name and confirm when prompted.

**Step 3** Submit and commit your changes.

#### Editing User Accounts

**Step 1** Choose **System Administration > Users**.

**Step 2** Click the user name.

**Step 3** Make changes to the user on the Edit User page as required.

**Step 4** Submit and commit your changes.

#### Changing Passphrases

To change the passphrase of the account currently logged in, select **Options > Change Passphrase** from the top right-hand side of the window.

For other accounts, edit the account and change the passphrase in the Local User Settings page.

**Related Topics**

- [Editing User Accounts, on page 394](#)
- [Setting Passphrase Requirements for Administrative Users, on page 397](#)
**RADIUS User Authentication**

The Web Security appliance can use a RADIUS directory service to authenticate users that log in to the appliance using HTTP, HTTPS, SSH, and FTP. You can configure the appliance to contact multiple external servers for authentication, using either PAP or CHAP authentication. You can map groups of external users to different Web Security appliance user role types.

**Sequence of Events For Radius Authentication**

When external authentication is enabled and a user logs into the Web Security appliance, the appliance:

1. Determines if the user is the system-defined “admin” account.
2. If not, checks the first configured external server to determine if the user is defined there.
3. If the appliance cannot connect to the first external server, it checks the next external server in the list.
4. If the appliance cannot connect to any external server, it tries to authenticate the user as a local user defined on the Web Security appliance.
5. If the user does not exist on any external server or on the appliance, or if the user enters the wrong passphrase, access to the appliance is denied.

**Enabling External Authentication Using RADIUS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>On the <strong>System Administration &gt; Users</strong> page, click <strong>Enable External Authentication</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Choose <strong>RADIUS</strong> as the Authentication Type.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Enter the host name, port number, and Shared Secret passphrase for the RADIUS server. Default port is <strong>1812</strong>.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Enter the number of seconds the appliance is to wait for a response from the server before timing out.</td>
</tr>
<tr>
<td>Step 5</td>
<td>Choose the authentication protocol used by the RADIUS server.</td>
</tr>
<tr>
<td>Step 6</td>
<td>(Optional) Click <strong>Add Row</strong> to add another RADIUS server. Repeat <strong>Steps 1 – 5</strong> for each RADIUS server.</td>
</tr>
<tr>
<td>Note</td>
<td>You can add up to ten RADIUS servers.</td>
</tr>
<tr>
<td>Step 7</td>
<td>In the <strong>External Authentication Cache Timeout</strong> field, enter the number of seconds AsyncOS stores the external authentication credentials before contacting the RADIUS server again to re-authenticate. Default is zero.</td>
</tr>
<tr>
<td>Note</td>
<td>If the RADIUS server uses one-time passphrases, for example passphrases created from a token, enter zero (0). When the value is set to zero, AsyncOS does not contact the RADIUS server again to authenticate during the current session.</td>
</tr>
<tr>
<td>Step 8</td>
<td>Configure Group Mapping—Select whether to map all externally authenticated users to the Administrator role or to different appliance-user role types.</td>
</tr>
</tbody>
</table>
**Setting** | **Description**
--- | ---
Map externally authenticated users to multiple local roles. | Enter a group name as defined in the RADIUS CLASS attribute, and choose an appliance Role type. You can add more role mappings by clicking Add Row.

AsyncOS assigns RADIUS users to appliance roles based on the RADIUS CLASS attribute. CLASS attribute requirements:

- three-character minimum
- 253-character maximum
- no colons, commas, or newline characters
- one or more mapped CLASS attributes for each RADIUS user (With this setting, AsyncOS denies access to RADIUS users without a mapped CLASS attribute.)

For RADIUS users with multiple CLASS attributes, AsyncOS assigns the most restrictive role. For example, if a RADIUS user has two CLASS attributes, which are mapped to the Operator and Read-Only Operator roles, AsyncOS assigns the RADIUS user to the Read-Only Operator role, which is more restrictive than the Operator role.

These are the appliance roles ordered from most restrictive to least restrictive:

- Administrator
- Operator
- Read-Only Operator
- Guest

Map all externally authenticated users to the Administrator role. | AsyncOS assigns all RADIUS users to the Administrator role.

---

**Step 9** Submit and commit your changes.

---

**What to do next**

**Related Topics**
- External Authentication, on page 90
- Adding Local User Accounts, on page 393.

---

**Defining User Preferences**

Preference settings, such as reporting display formats, are stored for each user and are the same regardless from which client machine the user logs into the appliance.

**Step 1** Choose **Options > Preferences**.

**Step 2** On the User Preferences page, click **Edit Preferences**.

**Step 3** Configure the preference settings as required.
<table>
<thead>
<tr>
<th>Preference Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Language Display</td>
<td>The language AsyncOS for Web uses in the web interface and CLI.</td>
</tr>
<tr>
<td>Landing Page</td>
<td>The page that displays when the user logs into the appliance.</td>
</tr>
<tr>
<td>Reporting Time Range Displayed (default)</td>
<td>The default time range that displays for reports on the Reporting tab.</td>
</tr>
<tr>
<td>Number of Reporting Rows Displayed</td>
<td>The number of rows of data shown for each report by default.</td>
</tr>
</tbody>
</table>

**Step 4**  
Submit and commit your changes.

---

### Configuring Administrator Settings

#### Setting Passphrase Requirements for Administrative Users

To set passphrase requirements for locally-defined administrative users of the appliance:

**Step 1**  
Select **System Administration > Users**.

**Step 2**  
In the **Passphrase Settings** section, click **Edit Settings**.

**Step 3**  
Choose options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>List of words to disallow in passphrases</td>
<td>Create a .txt file with each forbidden word on a separate line, then select the file to upload it. Subsequent uploads overwrite previous uploads.</td>
</tr>
</tbody>
</table>
### Additional Security Settings for Accessing the Appliance

You can use the CLI command `adminaccessconfig` to configure the Web Security appliance to have stricter access requirements for administrators logging into the appliance.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>adminaccessconfig &gt; banner</code></td>
<td>Configures the appliance to display any text you specify when an administrator tries to log in. The custom log-in banner appears when an administrator accesses the appliance through any interface; for example, via the Web UI, CLI, or FTP. You can load the custom text either by pasting it into the CLI prompt, or by copying it from a text file located on the Web Security appliance. To upload the text from a file, you must first transfer the file to the configuration directory on the appliance using FTP.</td>
</tr>
<tr>
<td><code>adminaccessconfig &gt; welcome</code></td>
<td>This is a post-log-in banner, displayed after successful administrator log-in. This text is added to the appliance configuration by the same means as the log-in <code>adminaccessconfig &gt; banner</code> text.</td>
</tr>
</tbody>
</table>
### Command Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>adminaccessconfig &gt; ipaccess</code></td>
<td>Controls from which IP addresses administrators access the Web Security appliance. Administrators can access the appliance from any machine, or from machines with an IP address from a list you specify. When restricting access to an allow list, you can specify IP addresses, subnets, or CIDR addresses. By default, when you list the addresses that can access the appliance, the IP address of your current machine is listed as the first address in the allow list. You cannot delete the IP address of your current machine from the allow list. This information also can be provided using the Web UI; see User Network Access, on page 399.</td>
</tr>
<tr>
<td><code>adminaccessconfig &gt; csrf</code></td>
<td>Enable/disable Web UI cross-site request forgery protection, used to identify and protect against malicious or spoofed requests. For best security, it is recommended that CSRF protection be enabled.</td>
</tr>
<tr>
<td><code>adminaccessconfig &gt; hostheader</code></td>
<td>Configure use of host header in HTTP requests. By default, the Web UI responds with the host header sent by the Web client in an HTTP request. For increased security, you can configure the Web UI to respond with only the appliance-specific host name; that is, the appliance’s configured name (for example, <code>wsa_04.local</code>).</td>
</tr>
<tr>
<td><code>adminaccessconfig &gt; timeout</code></td>
<td>Provide an inactivity time-out interval; that is, the number of minutes users can be inactive before being logged out. This value can be between five and 1440 minutes (24 hours); the default value is 30 minutes. This information also can be provided using the Web UI; see User Network Access, on page 399.</td>
</tr>
<tr>
<td><code>adminaccessconfig &gt; strictssl</code></td>
<td>Configures the appliance so administrators log into the web interface on port 8443 using stronger SSL ciphers (greater than 56 bit encryption). When you configure the appliance to require stronger SSL ciphers, the change only applies to administrators accessing the appliance using HTTPS to manage the appliance. It does not apply to other network traffic connected to the Web Proxy using HTTPS.</td>
</tr>
</tbody>
</table>

### User Network Access

You can specify how long a user can be logged into the appliance before AsyncOS logs the user out due to inactivity. You also can specify the type of user connections allowed.

The session timeout applies to all users, including administrators, logged into either the Web UI or the CLI. When AsyncOS logs a user out, the user is redirected to the appliance log-in page.

**Note**  
You also can use the CLI `adminaccessconfig > timeout` to set this time-out value.

**Step 1**  
Choose System Administration > Network Access.
Resetting the Administrator Passphrase

Before you begin

- If you do not know the passphrase for the admin account, contact your customer support provider to reset the passphrase.
- Understand that changes to the passphrase take effect immediately and do not require you to commit the change.

Any administrator-level user can change the passphrase for the “admin” user.

Configuring the Return Address for Generated Messages

You can configure the return address for mail generated by AsyncOS for reports.

Managing Alerts

Alerts are email notifications containing information about events occurring on the Cisco Web Security Appliance appliance. These events can be of varying levels of importance (or severity) from minor (Informational) to major (Critical) and pertain generally to a specific component or feature on the appliance.
To receive alerts and email notifications, you must configure the SMTP relay host that the appliance uses to send the email messages.

Alert Classifications and Severities

The information contained in an alert is determined by an alert classification and a severity. You can specify which alert classifications, at which severity, are sent to any alert recipient.

Alert Classifications

AsyncOS sends the following types of alert:

- System
- Hardware
- Updater
- Web Proxy
- Anti-Malware
- L4 Traffic Monitor
- External URL Categories
- Policy Expiration

Alert Severities

Alerts can be sent for the following severities:

- **Critical**: Requires immediate attention.
- **Warning**: Problem or error requiring further monitoring and potentially immediate attention.
- **Information**: Information generated in the routine functioning of this device.

Managing Alert Recipients

If you enabled AutoSupport during System Setup, the email address you specified will receive alerts for all severities and classes by default. You can change this configuration at any time.

Adding and Editing Alert Recipients

**Step 1** Choose **System Administration > Alerts**.

**Step 2** Click on a recipient in the Alert Recipients list to edit it, or click **Add Recipient** to add a new recipient.

**Step 3** Add or edit the recipient’s email address. You can enter multiple addresses, separated by commas.
Deleting Alert Recipients

Step 1 Choose System Administration > Alerts.
Step 2 Click the trash can icon corresponding to the alert recipient in the Alert Recipient listing and confirm.
Step 3 Commit your changes.

Configuring Alert Settings

Alert settings are global settings, meaning that they affect how all of the alerts behave.

Step 1 Choose System Administration > Alerts.
Step 2 Click Edit Settings.
Step 3 Configure the alert settings as required.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>From Address to Use When Sending Alerts</td>
<td>The RFC 2822 compliant “Header From:” address to use when sending alerts. An option is provided to automatically generate an address based on the system hostname (“alert@&lt;hostname&gt;”)</td>
</tr>
<tr>
<td>Wait Before Sending a Duplicate Alert</td>
<td>Specifies the time interval for duplicate alerts. There are two settings: Initial Number of Seconds to Wait Before Sending a Duplicate Alert. If you set this value to 0, duplicate alert summaries are not sent and instead, all duplicate alerts are sent without any delay (this can lead to a large amount of email over a short amount of time). The number of seconds to wait between sending duplicate alerts (alert interval) is increased after each alert is sent. The increase is the number of seconds to wait plus twice the last interval. So a 5 second wait would have alerts sent at 5 seconds, 15 seconds, 35 seconds, 75 seconds, 155 seconds, 315 seconds, etc. Maximum Number of Seconds to Wait Before Sending a Duplicate Alert. You can set a cap on the number of seconds to wait between intervals via the maximum number of seconds to wait before sending a duplicate alert field. For example, if you set the initial value to 5 seconds, and the maximum value to 60 seconds, alerts would be sent at 5 seconds, 15 seconds, 35 seconds, 60 seconds, 120 seconds, etc.</td>
</tr>
</tbody>
</table>
Cisco AutoSupport

Specifies whether to send Cisco the following support information:
- a copy of all alert messages generated by the system
- weekly reports noting the uptime of the system, the output of the status command, and the AsyncOS version used.

Also specifies whether or not to send internal alert recipients a copy of every message sent to Cisco. This applies only to recipients that are set to receive System alerts at Information severity level.

### Feature Key Alerts

The following table contains a list of the various feature key alerts that can be generated by AsyncOS, including a description of the alert and the alert severity:

<table>
<thead>
<tr>
<th>Message</th>
<th>Alert Severity</th>
<th>Parameters</th>
</tr>
</thead>
<tbody>
<tr>
<td>A “$feature” key was downloaded from the key server and placed into the pending area. EULA acceptance required.</td>

<tr>
<td>$PolicyType': $GroupName' will expire in days: 3.</td>
<td>Information</td>
<td>$PolicyType: Access policy / decryption policy based on the web policy type. $GroupName: Policy group name.</td>
</tr>
</tbody>
</table>

**FIPS Compliance**

Federal Information Processing Standards (FIPS) specify requirements for cryptographic modules that are used by all government agencies to protect sensitive but unclassified information. FIPS help ensure compliance with federal security and data privacy requirements. FIPS, developed by the National Institute for Standards and Technology (NIST), are for use when no voluntary standards exist to meet federal requirements.

The WSA achieves FIPS 140-2 compliance in FIPS mode using Cisco Common Cryptographic Module (C3M). By default, FIPS mode is disabled.

**Related Topics**

- [FIPS Mode Problems](#), on page 434

**FIPS Certificate Requirements**

FIPS mode requires that all enabled encryption services on the Web Security appliance use a FIPS-compliant certificate. This applies to the following encryption services:

- HTTPS Proxy
- Authentication
FIPS Certificate Validation

The Appliance Management HTTPS Service must be configured with a FIPS Complaint certificate before FIPS mode can be enabled. The other encryption services need not be enabled.

A FIPS-compliant certificate must meet these requirements:

<table>
<thead>
<tr>
<th>Certificate</th>
<th>Algorithm</th>
<th>Signature Algorithm</th>
<th>Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>X509</td>
<td>RSA</td>
<td>sha1WithRSAEncryption</td>
<td>Cisco recommends a bit key size of 1024 for best decryption performance and sufficient security. A larger bit size will increase security, but impact decryption performance.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>sha256WithRSAEncryption</td>
<td></td>
</tr>
</tbody>
</table>

FIPS Certificate Validation

When you enable FIPS mode, the appliance performs the following certificate checks:

- All certificates uploaded to the WSA, whether by means of the UI or the `certconfig` CLI command, are validated to comply strictly with CC standards. Any certificate without a proper trust path in the WSA’s trust store cannot be uploaded.

- Certificate Signature with a trusted path validation; Certificate/Public Key tampering with `basicConstrains` and `CAFlag` set validated for all signer certificates.

- OCSP validation is available to validate a certificate against a revocation list. This is configurable using the `certconfig` CLI command.

See also Strict Certificate Validation, on page 413.

Enabling or Disabling FIPS Mode

Before you begin

- Make a back-up copy of the appliance configuration; see Saving the Appliance Configuration File, on page 388

- Ensure the certificates to be used in FIPS mode use FIPS 140-2 approved public key algorithms (see FIPS Certificate Requirements, on page 409).
Changing the FIPS mode initiates a reboot of the appliance.

When you disable FIPS mode, the SSL and SSH settings—which were automatically made FIPS-compliant when FIPS mode was enabled—are not reset to their default values. You must explicitly change these settings if you wish to allow a client using weaker SSH/SSL settings to connect. See SSL Configuration, on page 412 for additional information.

**Note**

Step 1 Choose System Administration > FIPS Mode.
Step 2 Click Edit Settings.
Step 3 Check Enable FIPS Compliance to enable FIPS compliance.
When you check Enable FIPS Compliance, the **Enable encryption of Critical Sensitive Parameters (CSP)** check box is enabled.
Step 4 Check **Enable encryption of Critical Sensitive Parameters (CSP)** to enable encryption of configuration data such as passwords, authentication information, certificates, shared keys, and so on.
Step 5 Click Submit.
Step 6 Click Continue to allow the appliance to reboot.

**System Date and Time Management**

- Setting the Time Zone, on page 411
- Synchronizing the System Clock with an NTP Server, on page 411

**Setting the Time Zone**

Step 1 Choose System Administration > Time Zone.
Step 2 Click Edit Settings.
Step 3 Select your region, country, and time zone or select the GMT offset.
Step 4 Submit and commit the changes.

**Synchronizing the System Clock with an NTP Server**

Cisco recommends that you set your Web Security appliance to track the current date and time by querying a Network Time Protocol (NTP) server, not by manually setting the time on the appliance. This is especially true if your appliance integrates with other devices. All integrated devices should use the same NTP server.

Step 1 Choose System Administration > Time Settings.
Step 2 Click Edit Settings.
Step 3  Select **Use Network Time Protocol** as the Time Keeping Method.

Step 4  Enter the fully qualified hostname or IP address of the NTP server, clicking **Add Row** as needed to add servers.

Step 5  (Optional) Choose the routing table associated with an appliance network interface type, either Management or Data, to use for NTP queries. This is the IP address from which NTP queries should originate.

**Note**  This option is only editable if the appliance is using split routing for data and management traffic.

Step 6  Submit and commit your changes.

---

**SSL Configuration**

For enhanced security, you can enable and disable SSL v3 and various versions of TLS for several services. Disabling SSL v3 for all services is recommended for best security. By default, all versions of TLS are enabled, and SSL is disabled.

**Note**  You also can use the `sslconfig` CLI command to enable or disable these features. See [Web Security Appliance CLI Commands](#), on page 467.

---

Step 1  Choose **System Administration > SSL Configuration**.

Step 2  Click **Edit Settings**.

Step 3  Check the corresponding boxes to enable SSL v3 and TLS v1.x for these services:

- **Appliance Management Web User Interface** – Changing this setting will disconnect all active user connections.

- **Proxy Services** – Includes HTTPS Proxy and Credential Encryption for Secure Client. This section also includes:

  - **Cipher(s) to Use** – You can enter additional cipher suites to be used with Proxy Services communications. Use colons (`:`) to separate the suites. To prevent use of a particular cipher, add an exclamation point (`!`) to the front of that string. For example, `!EXP-DHE-RSA-DES-CBC-SHA`.

  Be sure to enter only suites appropriate to the TLS/SSL versions you have checked. Refer to [https://www.openssl.org/docs/manmaster/man1/ciphers.html](https://www.openssl.org/docs/manmaster/man1/ciphers.html) for additional information, and cipher lists.

  The default cipher for AsyncOS versions 9.0 and earlier is `DEFAULT:+kEDH`. For AsyncOS versions 9.1 and later, it the default cipher is:

  ```
  EECDH:DSS:RSA:!NULL:!eNULL:!EXPORT:!3DES:!RC4:!RC2:!DES:!SEED:!CAMELLIA
  :!SRP:!IDEA:!ECDHE-ECDSA-AES256-SHA:!ECDSA-RSA-AES256-SHA:!DHE-DES-AES256-SHA:
  !AES256-SHA:DHE-RSA-AES128-SHA
  ```

  In both cases, this may change based on your ECDHE cipher selections.

  **Note**  However, regardless of version, the default cipher does not change when you upgrade to a newer AsyncOS version. For example, when you upgrade from an earlier version to AsyncOS 9.1, the default cipher is `DEFAULT:+kEDH`. In other words, following an upgrade, you must update the current cipher suite yourself; Cisco recommends updating to:

  ```
  EECDH:DSS:RSA:!NULL:!eNULL:!EXPORT:!3DES:!RC4:!RC2:!DES:!SEED:!CAMELLIA
  :!SRP:!IDEA:!ECDHE-ECDSA-AES256-SHA:!ECDSA-RSA-AES256-SHA:!DHE-DES-AES256-SHA:
  !AES256-SHA:DHE-RSA-AES128-SHA
  ```
• **Disable TLS Compression (Recommended)** – You can check this box to disable TLS compression; this is recommended for best security.

• **Secure LDAP Services** – Includes Authentication, External Authentication and Secure Mobility.

• **Secure ICAP Services (External DLP)** – Select the protocol(s) used to secure ICAP communications between the appliance and external DLP (data loss prevention) servers. See Configuring External DLP Servers, on page 279 for more information.

• **Update Service** – Select the protocol(s) used for communications between the appliance and available update servers. See AsyncOS for Web Upgrades and Updates, on page 417 for more information about update services.

**Note**
Cisco’s Update servers do not support SSL v3, therefore TLS 1.0 or above must be enabled for the Cisco Update service. However, SSL v3 can still be used with a local update server, if it is so configured—you must determine which versions of SSL/TLS are supported on that server.

**Step 4**
Click **Submit**.

---

**Certificate Management**

The appliance uses digital certificates to establish, confirm and secure a variety of connections. The Certificate Management page lets you view and update current certificate lists, manage trusted root certificates, and view blocked certificates.

**Related Topics**

- About Certificates and Keys, on page 414
- Certificate Updates, on page 415
- Managing Trusted Root Certificates, on page 414
- Viewing Blocked Certificates, on page 415

**Strict Certificate Validation**

With the release of the FIPS-mode updates in AsyncOS 10.5, all presented certificates are validated strictly to comply with Common Criteria (CC) standards before uploading, and OCSP validation is available to validate certificates against a revocation list.

You must ensure that proper, valid certificates are uploaded to the WSA, and that valid, secure certificates are configured on all related servers to facilitate smooth SSL handshakes with those servers.

Strict certificate validation is applied for the following certificate uploads:

- HTTPS Proxy (Security Services > HTTPS Proxy)
- Trusted Root Certificates (Network > Certificate Management)
- Global Authentication Settings (Network > Authentication > Global Authentication Settings)
About Certificates and Keys

When a browser prompts its user to authenticate, the browser sends the authentication credentials to the Web Proxy using a secure HTTPS connection. By default, the Web Security appliance uses the “Cisco Web Security Appliance Demo Certificate” that comes with it to create an HTTPS connection with the client. Most browsers will warn users that the certificate is not valid. To prevent users from seeing the invalid certificate message, you can upload a certificate and key pair that your applications recognize automatically.

Related Topics
- Uploading or Generating a Certificate and Key, on page 415
- Certificate Signing Requests, on page 416
- Intermediate Certificates, on page 417

Managing Trusted Root Certificates

The Web Security appliance ships with and maintains a list of trusted root certificates. Web sites with trusted certificates do not require decryption.

You can manage the trusted certificate list, adding certificates to it and functionally removing certificates from it. While the Web Security appliance does not delete certificates from the master list, it allows you to override trust in a certificate, which functionally removes the certificate from the trusted list.

To add, override or download a trusted root certificate:

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Choose <strong>Network &gt; Certificate Management</strong>.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Click <strong>Manage Trusted Root Certificates</strong> on the Certificate Management page.</td>
</tr>
<tr>
<td>Step 3</td>
<td>To add a custom trusted root certificate with a signing authority not on the Cisco-recognized list: Click <strong>Import</strong> and then browse to, select, and <strong>Submit</strong> the certificate file.</td>
</tr>
<tr>
<td>Step 4</td>
<td>To override the trust for one or more Cisco-recognized certificates:</td>
</tr>
<tr>
<td></td>
<td>a) Check the <strong>Override Trust</strong> checkbox for each entry you wish to override.</td>
</tr>
<tr>
<td></td>
<td>b) Click <strong>Submit</strong>.</td>
</tr>
<tr>
<td>Step 5</td>
<td>To download a copy of a particular certificate:</td>
</tr>
<tr>
<td></td>
<td>a) Click the name of the certificate in the Cisco Trusted Root Certificate List to expand that entry.</td>
</tr>
<tr>
<td></td>
<td>b) Click <strong>Download Certificate</strong>.</td>
</tr>
</tbody>
</table>
Certificate Updates

The Updates section lists version and last-updated information for the Cisco trusted-root-certificate and blacklist bundles on the appliance. These bundles are updated periodically.

Click **Update Now** on the Certificate Management page to update all bundles for which updates are available.

---

Viewing Blocked Certificates

To view a list of certificates which Cisco has determined to be invalid, and has blocked:

Click **View Blocked Certificates**.

---

Uploading or Generating a Certificate and Key

Certain AsyncOS features require a certificate and key to establish, confirm or secure a connection Identity Services Engine (ISE) and . You can either upload an existing certificate and key, or you can generate one when you configure the feature.

**Uploading a Certificate and Key**

A certificate you upload to the appliance must meet the following requirements:

- It must use the X.509 standard.
- It must include a matching private key in PEM format. DER format is not supported.

**Step 1** Select **Use Uploaded Certificate and Key**.

**Step 2** In the **Certificate** field, click **Browse**; locate the file to upload.

**Note** The Web Proxy uses the first certificate or key in the file. The certificate file must be in PEM format. DER format is not supported.

**Step 3** In the **Key** field, click **Browse**; locate the file to upload.

**Note** The key length must be 512, 1024, or 2048 bits. The private key file must be in PEM format. DER format is not supported.

**Step 4** If the key is encrypted, select **Key is Encrypted**.

**Step 5** Click **Upload Files**.
Generating a Certificate and Key

Step 1  Select Use Generated Certificate and Key.

Step 2  Click Generate New Certificate and Key.

a) In the Generate Certificate and Key dialog box, enter the necessary generation information.

   Note  You can enter any ASCII character except the forward slash (/) in the Common Name field.

b) Click Generate in the Generate Certificate and Key dialog box.

   When generation is complete, the certificate information is displayed in the Certificate section, along with two links: Download Certificate and Download Certificate Signing Request. In addition, there is a Signed Certificate option that is used to upload the signed certificate when you receive it from the Certificate Authority (CA).

Step 3  Click Download Certificate to download the new certificate for upload to the appliance.

Step 4  Click Download Certificate Signing Request to download the new certificate file for transmission to a Certificate Authority (CA) for signing. See Certificate Signing Requests, on page 416 for more information about this process.

   a) When the CA returns the signed certificate, click Browse in the Signed Certificate portion of the Certificate field to locate the signed-certificate file, and then click Upload File to upload it to the appliance.

   b) Ensure the CA’s root certificate is present in the appliance’s list of trusted root certificates. If it is not, add it. See Managing Trusted Root Certificates, on page 414 for more information.

Certificate Signing Requests

The Web Security appliance cannot generate Certificate Signing Requests (CSR) for certificates uploaded to the appliance. Therefore, to have a certificate created for the appliance, you must issue the signing request from another system. Save the PEM-formatted key from this system because you will need to install it on the appliance later.

You can use any UNIX machine with a recent version of OpenSSL installed. Be sure to put the appliance hostname in the CSR. Use the guidelines at the following location for information on generating a CSR using OpenSSL:

http://www.modssl.org/docs/2.8/ssl_faq.html#ToC28

Once the CSR has been generated, submit it to a certificate authority (CA). The CA will return the certificate in PEM format.

If you are acquiring a certificate for the first time, search the Internet for “certificate authority services SSL server certificates,” and choose the service that best meets the needs of your organization. Follow the service’s instructions for obtaining an SSL certificate.

Note  You can also generate and sign your own certificate. Tools for doing this are included with OpenSSL, free software from http://www.openssl.org.
**Intermediate Certificates**

In addition to root certificate authority (CA) certificate verification, AsyncOS supports the use of intermediate certificate verification. Intermediate certificates are certificates issued by a trusted root CA which are then used to create additional certificates. This creates a chained line of trust. For example, a certificate may be issued by example.com who, in turn, is granted the rights to issue certificates by a trusted root CA. The certificate issued by example.com must be validated against example.com’s private key as well as the trusted root CA’s private key.

Servers send a “certificate chain” in an SSL handshake in order for clients (for example, browsers and in this case the WSA, which is a HTTPS proxy) to authenticate the server. Normally, the server certificate is signed by an intermediate certificate which in turn is signed by a trusted root certificate, and during the handshake, the server certificate and the entire certificate chain are presented to the client. As the root certificate is typically present in the Trusted Certificate store of the WSA, verification of the certificate chain is successful.

However, sometimes when the end-point entity certificate is changed on the server, necessary updates for the new chain are not performed. As a result, going forward the server presents only the server certificate during the SSL handshake and the WSA proxy is unable to verify the certificate chain since the intermediate certificate is missing.

Previously, the solution was manual intervention by the WSA administrator, who would upload the necessary intermediate certificate to the Trusted Certificate store. Now you can use the CLI command

```
advancedproxyconfig > HTTPS > Do you want to enable automatic discovery and download of missing Intermediate Certificates?
```

to enable “intermediate certificate discovery,” a process the WSA uses in an attempt to eliminate the manual step in these situations.

Intermediate certificate discovery uses a method called “AIA chasing”: when presented with an untrusted certificate, the WSA examines it for an extension named “Authority Information Access.” This extension includes an optional CA Issuers URI field, which can be queried for the Issuer Certificate used to sign the server certificate in question. If it is available, the WSA fetches the issuer’s certificate recursively until the root CA certificate is obtained, and then tries to verify the chain again.

**AsyncOS for Web Upgrades and Updates**

Cisco periodically releases upgrades (new software versions) and updates (changes to current software versions) for AsyncOS for Web and its components.

**Best Practices For Upgrading AsyncOS for Web**

- Before you start the upgrade, save the XML configuration file off the Web Security appliance from the System Administration > Configuration File page or by using the saveconfig command.

- Save other files stored on the appliance, such as PAC files or customized end-user notification pages.

- When upgrading, do not pause for long amounts of time at the various prompts. If the TCP session times out during the download, the upgrade may fail.

- After the upgrade completes, save the configuration information to an XML file.

**Related Topics**

- Saving, Loading, and Resetting the Appliance Configuration, on page 388
Upgrading and Updating AsyncOS and Security Service Components

Downloading and Installing an Upgrade

Before you begin

Save the appliance configuration file (see Saving, Loading, and Resetting the Appliance Configuration, on page 388).

Note

When downloading and upgrading AsyncOS in a single operation from a local server instead of from a Cisco server, the upgrade installs immediately while downloading. A banner is displayed for 10 seconds at the beginning of the upgrade process. While this banner is displayed, you can type Control-C to exit the upgrade process before downloading starts.

Note

While performing an upgrade, if the secure authentication certificate is not FIPs-compliant, it will be replaced with the default certificate of the latest path to which your appliance is upgraded to. This happens only when the customer has used the default certificate before the upgrade.

You can download and install in a single operation, or download in the background and install later.

Step 1

Choose System Administration > System Upgrade.

Step 2

Click Upgrade Options.

Select upgrade options and an upgrade image:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Choose an upgrade option</td>
<td>• <strong>Download and install</strong> – Download and install the upgrade in a single operation. If you have already downloaded an installer, you will be prompted to overwrite the existing download.</td>
</tr>
<tr>
<td></td>
<td>• <strong>Download only</strong> – Download an upgrade installer, but do not install.    If you have already downloaded an installer, you will be prompted to overwrite the existing download. The installer downloads in the background without interrupting service. An Install button is displayed when the download is complete; click to install a previously downloaded upgrade.</td>
</tr>
<tr>
<td></td>
<td>Select an upgrade image to be downloaded, or downloaded and installed, from the List of available upgrade images files at upgrade server.</td>
</tr>
</tbody>
</table>
**Setting** | **Description**
---|---
Upgrade Preparation | • To save a back-up copy of the current configuration to the *configuration* directory on the appliance, check *Save the current configuration to the configuration directory before upgrading*.

  • If the *Save current configuration* option is checked, you can check *Mask passwords in the configuration file* to have all current-configuration passwords masked in the back-up copy. However, you cannot load a configuration file with masked passwords using the *Load Configuration* command, nor with the CLI *loadconfig* command.

  If FIPS mode is enabled, you can select *Encrypt passphrases in the Configuration Files*. These files can be reloaded.

  • If the *Save current configuration* option is checked, you can enter one or more email addresses into the *Email file to* field; a copy of the back-up configuration file is mailed to each address. Separate multiple addresses with commas.

**Step 3** Click *Proceed*.

If you are installing:

a) Be prepared to respond to prompts during the process.

b) At the completion prompt, click *Reboot Now*.

c) After about 10 minutes, access the appliance again and log in.

  If you feel you need to power-cycle the appliance to troubleshoot an upgrade issue, do not do so until at least 20 minutes have passed since you rebooted.

---

**Viewing Status of, Canceling, or Deleting a Background Download**

**Step 1** Choose *System Administration > System Upgrade*.

**Step 2** Click *Upgrade Options*.

**Step 3** Choose an option:

<table>
<thead>
<tr>
<th>To</th>
<th>Do This</th>
</tr>
</thead>
</table>
| View download status | Look in the middle of the page.  
If there is no download in progress and no completed download waiting to be installed, you will not see download status information. |
| Cancel a download | Click the *Cancel Download* button in the middle of the page.  
This option appears only while a download is in progress. |
| Delete a downloaded installer | Click the *Delete File* button in the middle of the page.  
This option appears only if an installer has been downloaded. |
Step 4  (Optional) View the Upgrade Logs.

What to do next

Related Topics

• Local And Remote Update Servers, on page 421

Automatic and Manual Update and Upgrade Queries

AsyncOS periodically queries the update servers for new updates to all security service components, but not for new AsyncOS upgrades. To upgrade AsyncOS, you must manually prompt AsyncOS to query for available upgrades. You can also manually prompt AsyncOS to query for available security service updates. For more information, see Reverting to a Previous Version of AsyncOS for Web, on page 424.

When AsyncOS queries an update server for an update or upgrade, it performs the following steps:

1. Contacts the update server.
   Cisco allows the following sources for update servers:
   • Cisco update servers. For more information, see Updating and Upgrading from the Cisco Update Servers, on page 421.
   • Local server. For more information, see Upgrading from a Local Server, on page 422.

2. Receives an XML file that lists the available updates or AsyncOS upgrade versions. This XML file is known as the “manifest.”

3. Downloads the update or upgrade image files.

Manually Updating Security Service Components

By default, each security service component periodically receives updates to its database tables from the Cisco update servers. However, you can manually update the database tables.

Note

Some updates are available on demand from the GUI pages related to the feature.

Tip

View a record of update activity in the updater log file. Subscribe to the updater log file on the System Administration > Log Subscriptions page.

Note

Updates that are in-progress cannot be interrupted. All in-progress updates must complete before new changes can be applied.

Step 1  Choose System Administration > Upgrade and Update Settings.
Step 2  Click Edit Update Settings.

Step 3  Specify the location of the update files.

Step 4  Initiate the update using the Update Now function key on the component page located on the Security Services tab. For example, Security Services > Web Reputation Filters page.

The CLI and the Web application interface may be sluggish or unavailable during the update process.

### Local And Remote Update Servers

By default, AsyncOS contacts the Cisco update servers for both update and upgrade images and the manifest XML file. However, you can choose from where to download the upgrade and update images and the manifest file. Using a local update server for the images or manifest file for any of the following reasons:

- **You have multiple appliances to upgrade simultaneously.** You can download the upgrade image to a web server inside your network and serve it to all appliances in your network.
- **Your firewall settings require static IP addresses for the Cisco update servers.** The Cisco update servers use dynamic IP addresses. If you have strict firewall policies, you may need to configure a static location for updates and AsyncOS upgrades. For more information, see Configuring a Static Address for the Cisco Update Servers, on page 421.

**Note**

Local update servers do not automatically receive security service updates, only AsyncOS upgrades. After using a local update server for upgrading AsyncOS, change the update and upgrade settings back to use the Cisco update servers so the security services update automatically again.

### Updating and Upgrading from the Cisco Update Servers

A Web Security appliance can connect directly to Cisco update servers and download upgrade images and security service updates. Each appliance downloads the updates and upgrade images separately.

### Configuring a Static Address for the Cisco Update Servers

The Cisco update servers use dynamic IP addresses. If you have strict firewall policies, you may need to configure a static location for updates and AsyncOS upgrades.

**Step 1**  Contact Cisco Customer Support to obtain the static URL address.

**Step 2**  Navigate to the System Administration > Upgrade and Update Settings page, and click Edit Update Settings.

**Step 3**  On the Edit Update Settings page, in the “Update Servers (images)” section, choose Local Update Servers and enter the static URL address received in step 1.

**Step 4**  Verify that Cisco Update Servers is selected for the “Update Servers (list)” section.

**Step 5**  Submit and commit your changes.
Upgrading from a Local Server

The Web Security appliance can download AsyncOS upgrades from a server within your network instead of obtaining upgrades directly from the Cisco update servers. When you use this feature, you download the upgrade image from Cisco once only, and then serve it to all Web Security appliances in your network.

The following figure shows how Web Security appliances download upgrade images from local servers.

**Figure 8: Upgrading from a Local Server**

![Diagram showing the process of upgrading from a local server](image)

**Hardware and Software Requirements for Local Upgrade Servers**

For *downloading* AsyncOS upgrade files, you must have a system in your internal network that has a web browser and Internet access to the Cisco update servers.

---

**Note**

If you need to configure a firewall setting to allow HTTP access to this address, you must configure it using the DNS name and not a specific IP address.

For *hosting* AsyncOS upgrade files, a server on the internal network must have a web server, such as Microsoft IIS (Internet Information Services) or the Apache open source server, which has the following features:

- Supports the display of directory or filenames in excess of 24 characters.
- Has directory browsing enabled.
- Is configured for anonymous (no authentication) or Basic ("simple") authentication.
- Contains at least 350MB of free disk space for each AsyncOS upgrade image.
Configuring Upgrades from a Local Server

Cisco recommends changing the update and upgrade settings to use the Cisco update servers (using dynamic or static addresses) after the upgrade is complete to ensure the security service components continue to update automatically.

---

**Step 1** Configure a local server to retrieve and serve the upgrade files.

**Step 2** Download the upgrade zip file.

Using a browser on the local server, go to [http://updates.ironport.com/fetch_manifest.html](http://updates.ironport.com/fetch_manifest.html) to download a zip file of an upgrade image. To download the image, enter your serial number (for a physical appliance) or VLN (for a virtual appliance) and the version number of the appliance. You will then be presented with a list of available upgrades. Click on the upgrade version that you want to download.

**Step 3** Unzip the zip file in the root directory on the local server while keeping the directory structure intact.

**Step 4** Configure the appliance to use the local server using the System Administration > Upgrade and Update Settings page or the updateconfig command.

**Step 5** On the System Administration > System Upgrade page, click Available Upgrades or run the upgrade command.

---

### Differences Between Local and Remote Upgrading Methods

The following differences apply when upgrading AsyncOS from a local server rather than from a Cisco update server:

- The upgrading installs immediately while downloading.
- A banner displays for 10 seconds at the beginning of the upgrade process. While this banner is displayed, you have the option to type Control+C to exit the upgrade process before downloading starts.

---

### Configuring Upgrade and Service Update Settings

You can configure how the Web Security appliance downloads security services updates and AsyncOS for Web upgrades. For example, you can choose which network interface to use when downloading the files, configure the update interval or disable automatic updates.

**Step 1** Choose System Administration > Upgrade and Update Settings.

**Step 2** Click Edit Update Settings.

**Step 3** Configure the settings, referencing the following information:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatic Updates</td>
<td>Choose whether to enable automatic updates of the security components. If you choose automatic updates, enter the time interval. The default is enabled and the update interval is 5 minutes.</td>
</tr>
</tbody>
</table>
## Reverting to a Previous Version of AsyncOS for Web

AsyncOS for Web supports the ability to revert the AsyncOS for Web operating system to a previous qualified build for emergency uses.

### What to do next

**Related Topics**

- Local And Remote Update Servers, on page 421
- Automatic and Manual Update and Upgrade Queries, on page 420
- Upgrading and Updating AsyncOS and Security Service Components, on page 418

### Step 4

Submit and commit your changes.

---

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
</table>
| Upgrade Notifications    | Choose whether to display a notification at the top of the Web Interface when a new upgrade to AsyncOS is available. The appliance only displays this notification for administrators.  
For more information, see AsyncOS for Web Upgrades and Updates, on page 417. |
| Update Servers (list)    | Whether to download the list of available upgrades and updates (the manifest XML file) from the Cisco update servers or a local web server.  
When you choose a local update server, enter the full path to the manifest XML file for the list including the file name and port number for the server. If you leave the port field blank, AsyncOS uses port 80. If the server requires authentication, you can also enter a valid user name and passphrase.  
  - The URL for obtaining the manifest for hardware appliances is:  
    https://update-manifests.ironport.com  
  - The URL for obtaining the manifest for virtual appliances is:  
    https://update-manifests.sco.cisco.com |
| Update Servers (images)  | Whether to download upgrade and update images from the Cisco update servers or a local web server.  
When you choose a local update server, enter the base URL and port number for the server. If you leave the port field blank, AsyncOS uses port 80. If the server requires authentication, you can also enter a valid user name and passphrase. |
| Routing Table            | Choose which network interface’s routing table to use when contacting the update servers.                                                    |
| Proxy Server (optional)  | If an upstream proxy server exists and requires authentication, enter the server information and user name and passphrase here.               |
You cannot revert to a version of AsyncOS for Web earlier than version 7.5.

**Reverting AsyncOS on Virtual Appliances Impacts the License**

If you revert to AsyncOS 8.0, there is no 180-day grace period during which the appliance processes web transactions without security features. License expiration dates are unaffected.

**Configuration File Use in the Revert Process**

Effective in version 7.5, when you upgrade to a later version, the upgrade process automatically saves the current system configuration to a file on the Web Security appliance. (However, Cisco recommends manually saving the configuration file to a local machine as a backup.) This allows AsyncOS for Web to load the configuration file associated with the earlier release after reverting to the earlier version. However, when it performs a reversion, it uses the current network settings for the management interface.

**Reverting AsyncOS for an Appliance Managed by the SMA**

You can revert AsyncOS for Web from the Web Security appliance. However, if the Web Security appliance is managed by a Security Management appliance, consider the following rules and guidelines:

- When Centralized Reporting is enabled on the Web Security appliance, AsyncOS for Web finishes transferring the reporting data to the Security Management appliance before it starts the reversion. If the files take longer than 40 seconds to transfer to the Security Management appliance, AsyncOS for Web prompts you to continue waiting to transfer the files, or continue the reversion without transferring all files.
- You must associate the Web Security appliance with the appropriate Configuration Master after reverting. Otherwise, pushing a configuration from the Security Management appliance to the Web Security appliance might fail.

**Reverting AsyncOS for Web to a Previous Version**

**Caution**

Reverting the operating system on a Web Security appliance is a very destructive action and destroys all configuration logs and databases. Reversion also disrupts web traffic handling until the appliance is reconfigured. Depending on the initial Web Security appliance configuration, this action may destroy network configuration. If this happens, you will need physical local access to the appliance after performing the reversion.

**Note**

If updates to the set of URL categories are available, they will be applied after AsyncOS reversion.
Before you begin

- Contact Cisco Quality Assurance to confirm that you can perform the intended reversion. (BS: this is a summary of the Available Versions section in the original chapter. Have asked if this is correct.)
- Back up the following information from the Web Security appliance to a separate machine:
  - System configuration file (with passphrases unmasked).
  - Log files you want to preserve.
  - Reports you want to preserve.
  - Customized end-user notification pages stored on the appliance.
  - PAC files stored on the appliance.

Step 1
Log into the CLI of the appliance you want to revert.

Note When you run the `revert` command in the next step, several warning prompts are issued. After these warning prompts are accepted, the revert action takes place immediately. Therefore, do not begin the reversion process until after you have completed the pre-reversion steps.

Step 2
Enter the `revert` command.

Step 3
Confirm twice that you want to continue with the reversion.

Step 4
Choose one of the available versions to revert to.

The appliance reboots twice.

Note The reversion process is time-consuming. It may take fifteen to twenty minutes before reversion is complete and console access to the appliance is available again.

The appliance should now run using the selected AsyncOS for Web version. You can access the web interface from a web browser.

Monitoring System Health and Status Using SNMP

The AsyncOS operating system supports system status monitoring via SNMP (Simple Network Management Protocol). (For more information about SNMP, see RFCs 1065, 1066, and 1067.)

Please note:

- SNMP is off by default.
- SNMP SET operations (configuration) are not implemented.
- AsyncOS supports SNMPv1, v2, and v3. For more information on SNMPv3, see RFCs 2571-2575.
- Message authentication and encryption are mandatory when enabling SNMPv3. Passphrases for authentication and encryption should be different. The encryption algorithm can be AES (recommended) or DES. The authentication algorithm can be SHA-1 (recommended) or MD5. The snmpconfig command “remembers” your passphrases the next time you run the command.
- The SNMPv3 username is: v3get.

```bash
snmpwalk -v 3 -l AuthNoPriv -u v3get -a MD5 serv.example.com
```
• If you use only SNMPv1 or SNMPv2, you must set a community string. The community string does not default to public.
• For SNMPv1 and SNMPv2, you must specify a network from which SNMP GET requests are accepted.
• To use traps, an SNMP manager (not included in AsyncOS) must be running and its IP address entered as the trap target. (You can use a host name, but if you do, traps will only work if DNS is working.)

MIB Files

Use the latest version of each MIB file.

There are multiple MIB files:

- ASYNCOS-MAIL-MIB.txt — an SNMPv2 compatible description of the Enterprise MIB for Email Security appliances.
- IRONPORT-SMI.txt — This “Structure of Management Information” file defines the role of the asyncoswebsecurityappliance-mib.

This release implements a read-only subset of MIB-II as defined in RFCs 1213 and 1907.

Enabling and Configuring SNMP Monitoring

To configure SNMP to gather system status information for the appliance, use the snmpconfig command in the command-line interface (CLI). After you choose and configure values for an interface, the appliance responds to SNMPv3 GET requests.

When you use SNMP monitoring, keep the following points in mind:

- These version 3 requests must include a matching passphrase.
- By default, version 1 and 2 requests are rejected.
- If enabled, version 1 and 2 requests must have a matching community string.

Hardware Objects

Hardware sensors conforming to the Intelligent Platform Management Interface Specification (IPMI) report information such as temperature, fan speed, and power supply status.

To determine the hardware-related objects available for monitoring (for example, the number of fans or the operating temperature range), see the hardware guide for your appliance model.

Related Topics

- Documentation Set, on page 485
SNMP Traps

SNMP provides the ability to send traps, or notifications, to advise an administration application when one or more conditions have been met. Traps are network packets that contain data relating to a component of the system sending the trap. Traps are generated when a condition has been met on the SNMP agent (in this case, the Cisco Web Security Appliance appliance). After the condition has been met, the SNMP agent then forms an SNMP packet and sends it to the host running the SNMP management console software.

You can configure SNMP traps (enable or disable specific traps) when you enable SNMP for an interface.

To specify multiple trap targets: when prompted for the trap target, you may enter up to 10 comma separated IP addresses.

Related Topics

• About the connectivityFailure SNMP Trap, on page 428

About the connectivityFailure SNMP Trap

The connectivityFailure trap is intended to monitor your appliance’s connection to the internet. It does this by attempting to connect and send an HTTP GET request to a single external server every 5 to 7 seconds. By default, the monitored URL is downloads.ironport.com on port 80.

To change the monitored URL or port, run the `snmpconfig` command and enable the connectivityFailure trap, even if it is already enabled. You will see a prompt to change the URL.

Tip

To simulate connectivityFailure traps, you can use the `dnsconfig` CLI command to enter a non-working DNS server. Lookups for downloads.ironport.com will fail, and traps will be sent every 5-7 seconds. Be sure to change the DNS server back to a working server after completing your test.

CLI Example: `snmpconfig`

```
wsa.example.com> snmpconfig

Current SNMP settings:
SNMP Disabled.

Choose the operation you want to perform:
- SETUP = Configure SNMP.
[1]> SETUP

Do you want to enable SNMP?
[Y]>

Please choose an IP interface for SNMP requests.
1. Management (198.51.100.1: wsa.example.com)
[1]>

Which port shall the SNMP daemon listen on interface "Management"?
[161]>

Please select SNMPv3 authentication type:
1. MD5
2. SHA
```
Please select SNMPv3 privacy protocol:
1. DES
2. AES

Enter the SNMPv3 authentication passphrase.

Please enter the SNMPv3 authentication passphrase again to confirm.

Enter the SNMPv3 privacy passphrase.

Please enter the SNMPv3 privacy passphrase again to confirm.

Service SNMP V1/V2c requests?
[N] Y

Enter the SNMP V1/V2c community string.
[ironport]> public

Shall SNMP V2c requests be serviced from IPv4 addresses?
[Y]>

From which IPv4 networks shall SNMP V1/V2c requests be allowed? Separate multiple networks with commas.
[127.0.0.1/32]>

Enter the Trap target as a host name, IP address or list of IP addresses separated by commas (IP address preferred). Enter "None" to disable traps.
[127.0.0.1]> 203.0.113.1

Enter the Trap Community string.
[ironport]> tcomm

Enterprise Trap Status
1. CPUUtilizationExceeded Disabled
2. FIPSModeDisableFailure Enabled
3. FIPSModeEnableFailure Enabled
4. FailoverHealthy Enabled
5. FailoverUnhealthy Enabled
6. RAIDStatusChange Enabled
7. connectivityFailure Disabled
8. fanFailure Enabled
9. highTemperature Enabled
10. keyExpiration Enabled
11. linkUpDown Enabled
12. memoryUtilizationExceeded Disabled
13. powerSupplyStatusChange Enabled
14. resourceConservationMode Enabled
15. updateFailure Enabled

Do you want to change any of these settings?
[N] Y

Do you want to disable any of these traps?
[Y] n

Do you want to enable any of these traps?
[V] y
Enter number or numbers of traps to enable. Separate multiple numbers with commas.
[>] 1,7,12

What threshold would you like to set for CPU utilization?
[95]>

What URL would you like to check for connectivity failure?
[http://downloads.ironport.com]>

What threshold would you like to set for memory utilization?
[95]>

Enter the System Location string.
[Unknown: Not Yet Configured] > Network Operations Center - west; rack #30, position 3

Enter the System Contact string.
[snmp=localhost] > wsadmin@example.com

Current SNMP settings:
Listening on interface "Management" 198.51.100.1 port 161.
SNMP v3: Enabled.
SNMP v1/v2: Enabled, accepting requests from subnet 127.0.0.1/32.
SNMP v1/v2 Community String: public
Trap target: 203.0.113.1
Location: Network Operations Center - west; rack #30, position 3
System Contact: wsadmin@example.com

Choose the operation you want to perform:
- SETUP - Configure SNMP.

Changes committed: Fri Nov 06 18:13:16 2015 GMT
wsadmin@example.com>

Web Traffic Tap

**Before You Begin:** Enabling Web Traffic Tap feature will result in reduced transaction handling capacity (requests per second) for the appliance as appliance will need additional CPU cycles and memory to copy the messages to the tap interface.

For reducing the performance impact due to Web Traffic Tap feature, reduce the amount of traffic that gets tapped by setting appropriate Web Traffic Tap policies.

This feature is not supported on Amazon Web Services (AWS)

Web Traffic Tap feature allows you to tap the HTTP and HTTPS web traffic that passes through the appliance and copy it to a Web Security appliance interface in-line with the real time data traffic. You can select the Web Security appliance interface to which the tapped traffic data is sent. If the tapped traffic includes HTTPS data, the appliance decrypts them based on the decryption policies before sending them to the tap interface. See [Decryption Policies](#), on page 210.
The selected tap interface must be directly connected to an external security device for analysis, forensics, and archiving. Alternatively, it may be connected to a L2 switch on a dedicated VLAN.

---

**Note**

The traffic mirrored on the tap interface is broadcast over Ethernet layer and not IP routable. Therefore a dedicated VLAN is required if connected to a L2 switch.

This feature also enables you to set Web Traffic Tap policies. Based on these customer defined policy filters, the appliance mirrors the web traffic that is available for the external security device. Web Traffic Tap feature provides visibility to the HTTPS traffic.

The term tapping refers to the reconstruction of complete TCP (Transmission Control Protocol) streams as if occurring between a directly connected client and server.

Virtual Web Security appliances support Web Traffic Tap feature.

---

**Note**

The act of inspecting SSL traffic might be subject to corporate policy guidelines and/or national legislation. Cisco is not responsible for any legal obligations and it is your sole responsibility to ensure that your use of Web Traffic Tap feature on Web Security appliance is in accordance with any such legal or policy requirements.

You must perform the following procedures to tap the web traffic using the appliance:

1. Enable Web Traffic Tap feature
2. Configure Web Traffic Tap policies

**Related Topics**

- Enabling Web Traffic Tap, on page 431
- Configuring Web Traffic Tap Policies, on page 432

---

**Enabling Web Traffic Tap**

**Before you begin**

The Web Traffic Tap feature is disabled by default. You must enable the feature before you define the Web Traffic Tap policies using Web Security Manager > Web Traffic Tap Policies.

---

**Note**

Decryption policies must be defined in order to tap HTTPS transactions. See Decryption Policies, on page 210.

---

**Step 1** Choose Network > Web Traffic Tap.

**Step 2** Click Edit Settings.

**Step 3** In the Edit Web Traffic Tap page, check the Enable check box to enable Web Traffic Tap feature.
To disable the Web Traffic Tap feature, uncheck the **Enable** check box. If you disable the Web Traffic Tap feature, you will not be able to view or edit the Web Traffic Tap policies. You must enable the feature again to view and edit the policies.

**Step 4**

From the Tap Interface drop-down list, choose the WSA interface to which the tapped traffic data is sent. The interface options are P1, P2, T1, and T2. See **Connecting the Appliance, on page 14** to know about interfaces.

**Note**
The selected tap interface must be directly connected to an external security device for analysis, forensics, and archiving. Alternatively, it may be connected to a L2 switch on a dedicated VLAN. The tap interface chosen should be connected and its status should be active; if not, mirroring of tapped traffic will fail.

**Step 5**

Click **Submit** and commit your changes.

---

**Configuring Web Traffic Tap Policies**

**Step 1**

Choose **Web Security Manager > Web Traffic Tap Policies**.

**Step 2**

Click **Add Policy**.

Follow the instructions in **Creating a Policy, on page 189** to add a new Web Traffic Tap policy.

**Note**

A Global Traffic Tap policy with no tapping set is available by default on the Web Traffic Tap Policies page (**Web Security Manager > Web Traffic Tap Policies**).

**Step 3**

Expand the Advanced section of the Policy Member Definition area to add the following additional group membership criteria for Web Traffic Tap.

- **Protocols** - Choose either HTTP or HTTPS protocol or both of them to create Web Traffic Tap Policy.

  **Note**
  
  You must define matching decryption policy (**Web Security Manager > Decryption Policies**) in order to tap HTTPS traffic.

  Web Traffic Tap policies do not support Native FTP and SOCKS protocols.

- **Subnets**

- **URL Categories** – Set **Tap** or **No Tap** for the URL Filtering categories as required. To set traffic tap for uncategorized URLs, choose **Tap** from the Uncategorized URLs drop-down list and click **Submit**.

- **User Agents**

See **Creating a Policy, on page 189** to know more about defining additional group membership criteria.

**Note**

The traffic that you want to tap must satisfy all the filter conditions that you have defined for the Web Traffic Tap policy.

You can also add URL categories from the URL Filtering table using **Web Security Manager > Web Traffic Tap Policies**.

**Note**

If you have already added the URL categories in the Advanced section, you will see only those URL categories listed in the URL Filtering table (**Web Security Manager > Web Traffic Tap Policies**).

See **Policy Order, on page 188** to know about the Web Traffic Tap policy order.
Troubleshooting

This appendix contains the following sections:

• General Troubleshooting Best Practices, on page 433
• FIPS Mode Problems, on page 434
• Authentication Problems, on page 434
• Blocked Object Problems, on page 436
• Browser Problems, on page 437
• DNS Problems, on page 437
• Failover Problems, on page 437
• Feature Keys Expired, on page 438
• FTP Problems, on page 438
• Upload/Download Speed Issues, on page 439
• Hardware Issues, on page 440
• HTTPS/Decryption/Certificate Problems, on page 441
• Identity Services Engine Problems, on page 443
• Problems with Custom and External URL Categories, on page 446
• Logging Problems, on page 447
• Policy Problems, on page 448
• Problems with File Reputation and File Analysis, on page 453
• Reboot Issues, on page 453
• Site Access Problems, on page 454
• Upstream Proxy Problems, on page 455
• Virtual Appliances, on page 456
• WCCP Problems, on page 457
• Packet Capture, on page 457
• Working With Support, on page 459

General Troubleshooting Best Practices

Configure your Access Logs to include the following custom fields:

%u, %g, %m, %k, %L (These values are case-sensitive.)

For descriptions of these fields, see Access Log Format Specifiers and W3C Log File Fields, on page 374.
For configuration instructions, see Customizing Access Logs, on page 369 and Adding and Editing Log Subscriptions, on page 344.

FIPS Mode Problems

Check the following topics if you encounter encryption and certificate problems after you upgraded your WSA to AsyncOS 10.5, and enabled FIPS mode and CSP encryption.

- CSP Encryption, on page 434
- Certificate Validation, on page 434

CSP Encryption

For a feature that worked before you enabled FIPS-mode CSP encryption, but doesn’t work after encryption is enabled, determine if the CSP encryption is the problem. Disable CSP encryption and FIPS mode and then test the feature. If it works, enable FIPS mode and test it again. If it works, enable CSP encryption and test it again. See Enabling or Disabling FIPS Mode, on page 410.

Certificate Validation

Certificates which were accepted by your WSA prior to upgrading to AsyncOS 10.5 might be rejected when they are uploaded again, regardless of upload method. (That is, via UI pages such as HTTPS Proxy, Certificate Management, Identity Provider for SaaS, ISE configuration, Authentication configuration, or via the `certconfig` CLI command.)

Ensure that the certificate’s signer CAs have been added as “Custom Trusted Certificate Authorities” on the Certificate Management page (Network > Certificate Management). A certificate cannot be uploaded to the WSA if the complete certificate path is untrusted.

Also, when reloading an older configuration, its likely that the included certificates will not be trusted and the reload will fail. Ensure these certificates are replaced while loading the saved configuration.

Note

All certificate validation failures are logged in the audit logs (`/data/pub/audit_logs/audit_log.current`).

Authentication Problems

- Troubleshooting Tools for Authentication Issues, on page 435
- Failed Authentication Impacts Normal Operations, on page 435
- LDAP Problems, on page 435
- Basic Authentication Problems, on page 436
- Single Sign-On Problems, on page 436
- Also see:
  - General Troubleshooting Best Practices, on page 433
  - HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication, on page 449
Troubleshooting Tools for Authentication Issues

KerbTray or klist (both part of the Windows Server Resources Kit) for viewing and purging a Kerberos ticket cache. Active Directory Explorer for viewing and editing an Active directory. Wireshark is a packet analyzer you can use for network troubleshooting.

Failed Authentication Impacts Normal Operations

When certain user agents or applications fail to authenticate and are denied access, they repeatedly send requests to the Web Security appliance, which in turn repeatedly sends requests to the Active Directory servers with machine credentials, sometimes to the point of impacting normal operations.

For best results, bypass authentication with these user agents. See Bypassing Authentication with Problematic User Agents , on page 109.

LDAP Problems

• LDAP User Fails Authentication due to NTLMSSP, on page 435
• LDAP Authentication Fails due to LDAP Referral, on page 435

LDAP User Fails Authentication due to NTLMSSP

LDAP servers do not support NTLMSSP. Some client applications, such as Internet Explorer, always choose NTLMSSP when given a choice between NTLMSSP and Basic. When all of the following conditions are true, the user will fail authentication:

• The user only exists in the LDAP realm.
• The Identification Profile uses a sequence that contains both LDAP and NTLM realms.
• The Identification Profile uses the “Basic or NTLMSSP” authentication scheme.
• A user sends a request from an application that chooses NTLMSSP over Basic.

Reconfigure the Identification Profile or the authentication realm or the application such that at least one of the above conditions will be false.

LDAP Authentication Fails due to LDAP Referral

LDAP authentication fails when all of the following conditions are true:

• The LDAP authentication realm uses an Active Directory server.
• The Active Directory server uses an LDAP referral to another authentication server.
• The referred authentication server is unavailable to the Web Security appliance.

Workarounds:
• Specify the Global Catalog server (default port is 3268) in the Active Directory forest when you configure the LDAP authentication realm in the appliance.

• Use the `advancedproxyconfig > authentication` CLI command to disable LDAP referrals. LDAP referrals are disabled by default.

## Basic Authentication Problems

- **Basic Authentication Fails, on page 436**

### Related Problems

- **Upstream Proxy Does Not Receive Basic Credentials, on page 455**

## Basic Authentication Fails

AsyncOS for Web only supports 7-bit ASCII characters for passphrases when using the Basic authentication scheme. Basic authentication fails when the passphrase contains characters that are not 7-bit ASCII.

## Single Sign-On Problems

- **Users Erroneously Prompted for Credentials, on page 436**

### Users Erroneously Prompted for Credentials

NTLM authentication does not work in some cases when the Web Security appliance is connected to a WCCP v2 capable device. When a user makes a request with a highly locked down version of Internet Explorer that does not do transparent NTLM authentication correctly and the appliance is connected to a WCCP v2 capable device, the browser defaults to Basic authentication. This results in users getting prompted for their authentication credentials when they should not get prompted.

**Workaround**

In Internet Explorer, add the Web Security appliance redirect hostname to the list of trusted sites in the Local Intranet zone (Tools > Internet Options > Security tab).

## Blocked Object Problems

- **Some Microsoft Office Files Not Blocked, on page 436**
- **Blocking DOS Executable Object Types Blocks Updates for Windows OneCare, on page 437**

### Some Microsoft Office Files Not Blocked

When you block Microsoft Office files in the Block Object Type section, it is possible that some Microsoft Office files will not be blocked.

If you need to block all Microsoft Office files, add `application/x-ole` in the Block Custom MIME Types field. However, blocking this custom MIME type also blocks all Microsoft Compound Object format types, such as Visio files and some third-party applications.
Blocking DOS Executable Object Types Blocks Updates for Windows OneCare

When you configure the Web Security appliance to block DOS executable object types, the appliance also blocks updates for Windows OneCare.

Browser Problems

• WPAD Not Working With Firefox, on page 437

WPAD Not Working With Firefox

Firefox browsers may not support DHCP lookup with WPAD. For current information, see https://bugzilla.mozilla.org/show_bug.cgi?id=356831.

To use Firefox (or any other browser that does not support DHCP) with WPAD when the PAC file is hosted on the Web Security appliance, configure the appliance to serve the PAC file through port 80.

Step 1
Choose Security Services > Web Proxy and delete port 80 from the HTTP Ports to Proxy field.

Step 2
Use port 80 as the PAC Server Port when you upload the file to the appliance.

Step 3
If any browsers are manually configured to point to the web proxy on port 80, reconfigure those browsers to point to another port in the HTTP Ports to Proxy field.

Step 4
Change any references to port 80 in PAC files.

DNS Problems

• Alert: Failed to Bootstrap the DNS Cache, on page 437

Alert: Failed to Bootstrap the DNS Cache

If an alert with the message “Failed to bootstrap the DNS cache” is generated when an appliance is rebooted, it means that the system was unable to contact its primary DNS servers. This can happen at boot time if the DNS subsystem comes online before network connectivity is established. If this message appears at other times, it could indicate network issues or that the DNS configuration is not pointing to a valid server.

Failover Problems

• Failover Misconfiguration, on page 437
• Failover Issues on Virtual Appliances, on page 438

Failover Misconfiguration

Misconfiguration of failover groups might result in multiple master appliances or other failover problems. Diagnose failover problems using the testfailovergroup subcommand of the CLI failoverconfig command.
Failover Issues on Virtual Appliances

For deployments on virtual appliances, ensure that you have configured the interface/virtual switch on the hypervisor to use promiscuous mode.

Feature Keys Expired

If the feature key for the feature you are trying to access (via the web interface) has expired, please contact your Cisco representative or support organization.

FTP Problems

- URL Categories Do Not Block Some FTP Sites, on page 438
- Large FTP Transfers Disconnect, on page 439
- Zero Byte File Appears On FTP Servers After File Upload, on page 439
- Chrome Browser Not Detected As User Agent in FTP-over-HTTP Requests, on page 439
- Also see:
  - Unable to Route FTP Requests Via an Upstream Proxy, on page 456
  - HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication, on page 449

URL Categories Do Not Block Some FTP Sites

When a native FTP request is transparently redirected to the FTP Proxy, it contains no hostname information for the FTP server, only its IP address. Because of this, some predefined URL categories and Web Reputation Filters that have only hostname information will not match native FTP requests, even if the requests are destined for those servers. If you wish to block access to these sites, you must create custom URL categories for them using their IP addresses.
Large FTP Transfers Disconnect

If the connection between the FTP Proxy and the FTP server is slow, uploading a large file may take a long time, particularly when Cisco Data Security Filters are enabled. This can cause the FTP client to time out before the FTP Proxy uploads the entire file and you may get a failed transaction notice. The transaction does not fail, however, but continues in the background and will be completed by the FTP Proxy.

You can workaround this issue by increasing the appropriate idle timeout value on the FTP client.

Zero Byte File Appears On FTP Servers After File Upload

FTP clients create a zero byte file on FTP servers when the FTP Proxy blocks an upload due to outbound anti-malware scanning.

Chrome Browser Not Detected As User Agent in FTP-over-HTTP Requests

Chrome browsers do not include a user-agent string in FTP-over-HTTP requests; therefore, Chrome cannot be detected as the user agent in those requests.

Upload/Download Speed Issues

The WSA is designed to handle thousands of client and server connections in parallel, and the sizes of the send and receive buffers are configured to deliver optimal performance, without sacrificing stability. Generally, actual usage is browse traffic, consisting of numerous short-lived connections for which we have receive-packet-steering (RPS) and receive-flow-steering (RFS) data, and for which the WSA has been optimized. However, at times you may experience a noticeable reduction in upload or download speeds; for example, when transferring large files via proxy. To illustrate: assuming a 10-Mbps line, downloading a 100-MB file that passes through a WSA can be approximately seven to eight times slower than downloading the file directly from its server.

In non-typical environments that include a larger proportion of large-file transfers, you can use the `networktuning` command to increase send and receive buffer size to alleviate this issue, but doing so can also cause network memory exhaustion and affect system stability. See Web Security Appliance CLI Commands, on page 467 for details of the `networktuning` command.

⚠️ Caution

Exercise care when changing the TCP receive and send buffer control points and other TCP buffer parameters. Use the `networktuning` command only if you understand the ramifications.

Here are examples of using the `networktuning` command on two different appliances:

**On an S380**

```
networktuning
sendspace = 131072
recvspace = 131072
send-auto = 1 [Remember to disable miscellaneous > advancedproxy > send buf auto tuning]
recv-auto = 1 [Remember to disable miscellaneous > advancedproxy > recv buf auto tuning]
mbuf clusters = 98304 * (X/Y) where is X is RAM in GBs on the system and Y is 4GB.
```
Questions

What are these parameters?

The WSA has several buffers and optimization algorithms which can be altered for specific needs. Buffer sizes are originally optimized to suit the “most common” deployment scenarios. However, larger buffer sizes can be used when faster per-connection performance is needed, but note that overall memory usage will increase. Therefore, buffer-size increases should be in line with the memory available on the system. The send- and receive-space variables control the size of the buffers available for storing data for communication over a socket. The send- and receive-auto options are used to enable and disable dynamic scaling of send and receive TCP window sizes. (These parameters are applied in the FreeBSD kernel.)

How were these example values determined?

We tested different sets of values on a customer’s network where this “problem” was observed, and “zeroed in” on these values. We then further tested these changes for stability and performance increase in our labs. You are free to use values other than these at your own risk.

Why are these values not the defaults?

As mentioned, by default the WSA is optimized for the most-common deployments, and operating in a very large number of locations without per-connection performance complaints. Making the changes discussed here will not increase RPS numbers, and in fact may cause them to drop.

Hardware Issues

- Cycling Appliance Power, on page 440
- Appliance Health and Status Indicators, on page 440
- Alert: Battery Relearn Timed Out (RAID Event) on 380 or 680 Hardware, on page 440

Cycling Appliance Power

Important! If you need to cycle power to your x80 or x90 appliance, wait at least 20 minutes for the appliance to come up again (all LEDs are green) before pushing the power button.

Appliance Health and Status Indicators

Lights on the front and/or rear panels of your hardware appliance indicate health and status of your appliance. For descriptions of these indicators, see the hardware guides, such as the Cisco x90 Series Content Security Appliances Installation and Maintenance Guide, available from http://www.cisco.com/c/en/us/support/security/web-security-appliance/products-installation-guides-list.html.

Specifications for your appliance, such as temperature ranges, are also available in these documents.

Alert: Battery Relearn Timed Out (RAID Event) on 380 or 680 Hardware

This alert may or may not indicate a problem. The battery relearn timeout, in itself, does not mean there is any problem with the RAID controller. The controller can recover in the subsequent relearn. Please monitor your email for any other RAID alerts for the next 48 hours, to ensure that this is not the side-effect of any
other problem. If you do not see any other RAID-type alerts from the system, then you can safely ignore this alert.

**HTTPS/Decryption/Certificate Problems**

- Accessing HTTPS Sites Using Routing Policies with URL Category Criteria, on page 441
- HTTPS Request Failures, on page 441
- Bypassing Decryption for Particular Websites, on page 442
- Conditions and Restrictions for Exceptions to Blocking for Embedded and Referred Content, on page 442
- Alert: Problem with Security Certificate, on page 442
- Also see:
  - Logging HTTPS Transactions, on page 447
  - Access Policy not Configurable for HTTPS, on page 448
  - HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication, on page 449

**Accessing HTTPS Sites Using Routing Policies with URL Category Criteria**

For transparently redirected HTTPS requests, the Web Proxy must contact the destination server to determine the server name and therefore the URL category in which it belongs. Due to this, when the Web Proxy evaluates Routing Policy Group membership, it cannot yet know the URL category of an HTTPS request because it has not yet contacted the destination server. If the Web Proxy does not know the URL category, it cannot match the transparent HTTPS request to a Routing Policy that uses a URL category as membership criteria.

As a result, transparently redirected HTTPS transactions only match Routing Policies that do not define Routing Policy Group membership criteria by URL category. If all user-defined Routing Policies define their membership by URL category, transparent HTTPS transactions match the Default Routing Policy Group.

**HTTPS Request Failures**

- HTTPS with IP-based Surrogates and Transparent Requests, on page 441
- Different Client “Hello” Behavior for Custom and Default Categories, on page 441

**HTTPS with IP-based Surrogates and Transparent Requests**

If the HTTPS request comes from a client that does not have authentication information available from an earlier HTTP request, AsyncOS either fails the HTTPS request or decrypts the HTTPS request in order to authenticate the user, depending on how you configure the HTTPS Proxy. Use the HTTPS Transparent Request setting on the Security Services > HTTPS Proxy page to define this behavior. Refer to the Enabling HTTPS Proxy section in Decryption Policies chapter.

**Different Client “Hello” Behavior for Custom and Default Categories**

When scanning packet captures, you may notice that the “Client Hello” handshake is sent at different times for custom category and default (Web) category HTTPS Decryption pass-through policies.
For an HTTPS page passed through via the default category, the Client Hello is sent before receipt of a Client Hello from the requestor, and the connection fails. For an HTTPS page passed through via a custom URL category, the Client Hello is sent after the Client Hello is received from the requestor, and the connection is successful.

As a remedy, you can create a custom URL category with a pass-through action for SSL 3.0-only-compatible Web pages.

### Bypassing Decryption for Particular Websites

Some HTTPS servers do not work as expected when traffic to them is decrypted by a proxy server, such as the Web Proxy. For example, some websites and their associated web applications and applets, such as high security banking sites, maintain a hard-coded list of trusted certificates instead of relying on the operating system certificate store.

You can bypass decryption for HTTPS traffic to these servers to ensure all users can access these types of sites.

#### Step 1
Create a custom URL category that contains the affected HTTPS servers by configuring the Advanced properties.

#### Step 2
Create a Decryption Policy that uses the custom URL category created in Step 1 as part of its membership, and set the action for the custom URL category to Pass Through.

### Conditions and Restrictions for Exceptions to Blocking for Embedded and Referred Content

Referrer-based exceptions are supported only in Access policies. To use this feature with HTTPS traffic, before defining exceptions in Access policies, you must configure HTTPS decryption of the URL Categories that you will select for exception. However, this feature will not work under certain conditions:

- If the connection is tunneled and HTTPS decryption is not enabled, this feature will not work for requests going to HTTPS sites.
- According to RFC 2616, a browser client could have a toggle switch for browsing openly/anonymously, which would respectively enable/disable the sending of Referer and from information. The feature is exclusively dependent on the Referer header, and turning off sending them would cause our feature not to work.
- According to RFC 2616, clients should not include a Referer header field in a (non-secure) HTTP request if the referring page was transferred with a secure protocol. So, any request from an HTTPS-based site to an HTTP-based site would not have the Referer header, causing this feature to not work as expected.
- When a Decryption policy is set up such that when a custom category matches the Decryption policy and the action is set to Drop, any incoming request for that category will be dropped, and no bypassing will be done.

### Alert: Problem with Security Certificate

Typically, the root certificate information you generate or upload in the appliance is not listed as a trusted root certificate authority in client applications. By default in most web browsers, when users send HTTPS requests, they will see a warning message from the client application informing them that there is a problem
with the website’s security certificate. Usually, the error message says that the website’s security certificate was not issued by a trusted certificate authority or the website was certified by an unknown authority. Some other client applications do not show this warning message to users nor allow users to accept the unrecognized certificate.

Mozilla Firefox browsers: The certificate you upload must contain “basicConstraints=CA:TRUE” to work with Mozilla Firefox browsers. This constraint allows Firefox to recognize the root certificate as a trusted root authority.

Identity Services Engine Problems

- Tools for Troubleshooting ISE Issues, on page 443
- ISE Server Connection Issues, on page 443
- ISE-related Critical Log Messages, on page 445

Tools for Troubleshooting ISE Issues

The following can be useful when troubleshooting ISE-related issues:

- The ISE test utility, used to test the connection to the ISE server, provides valuable connection-related information. This is the Start Test option on the Identity Services Engine page; see Connect to the ISE Services, on page 140.
- ISE and Proxy Logs; see Monitor System Activity Through Logs, on page 337
- ISE-related CLI commands iseconfig and isedata, particularly isedata to confirm security group tag (SGT) download. See Web Security Appliance CLI Commands, on page 467 for additional information.
- The Web Tracking and Policy Trace functions can be used to debug policy match issues; for example, a user that should be allowed is blocked, and vice versa. See Policy Troubleshooting Tool: Policy Trace, on page 450 for additional information.
- Packet Capture, on page 457 if Working With Support, on page 459.
- For checking certificate status, you can use the openssl Online Certificate Status Protocol (ocsp) utility, available from https://www.openssl.org/.

ISE Server Connection Issues

Certificate Issues

The WSA and the ISE server(s) use certificates to mutually authenticate for successful connection. Thus, each certificate presented by one entity should be recognizable by other. For example, if the WSA’s Client certificate is self-signed, the same certificate must be present in the trusted certificates list on the appropriate ISE server(s). Correspondingly, if the WSA Client certificate is CA-signed, then the CA root certificate must be present on
the appropriate ISE server(s). Similar requirements apply to the ISE server-related Admin and pxGrid certificates.

Certificate requirements and installation are described in Integrate the Cisco Identity Services Engine (ISE), on page 135. If you encounter certificate-related issues, check the following:

• If using CA-signed certificates:
  • Verify that the root CA signing certificate(s) for the Admin and pxGrid certificates are present on the WSA.
  • Verify that the root CA signing certificate for the WSA Client certificate is present in the trusted-certificates list on the ISE server.

• If using self-signed certificates:
  • Verify that the WSA Client certificate—generated on the WSA and downloaded—has been uploaded to the ISE server and is present in the ISE servers trusted-certificates list.
  • Verify that the ISE Admin and pxGrid certificates—generated on the ISE server and downloaded—have been uploaded to the WSA are present in the its certificate list.

• Expired certificates:
  • Confirm that certificates which were valid when uploaded have not expired.

Log Output Indicating Certificate Issue

The following ISE-service log snippet shows a client-connection timeout due to a missing or invalid certificate.

These Trace-level log entries on the WSA show that after 30 seconds the attempts to connect to the ISE server are terminated.

Network Issues

• If connection to the ISE server fails during the Start Test on the Identity Services Engine page (Connect to the ISE Services, on page 140), check connectivity to the configured ISE server on ports 443 and 5222.

Port 5222 is the official client-to-server Extensible Messaging and Presence Protocol (XMPP) port, and is used for connection to the ISE server; it is also used by applications such as Jabber and Google Talk. Note that some firewalls are configured to block port 5222.

Tools that can be used to check connectivity include tcpdump.
Other ISE Server Connectivity Issues

The following issues can cause failure when the WSA attempts to connect with the ISE server:

- Licenses on the ISE server have expired.
- The pxGrid node status is “not connected” on the ISE server’s Administration > pxGrid Services page. Be sure Enable Auto-Registration is selected on this page.
- Outdated WSA clients (specifically “test_client” or “pxgrid_client”) are present on the ISE server. These need to be deleted; see Administration > pxGrid Services > Clients on the ISE server.
- The WSA is attempting to connect to the ISE server before all its services are up and running. Some changes on the ISE server, such as certificate updates, require the ISE server or services running on it to restart. Any attempt to connect to the ISE server during this time will fail; however, eventually the connection will succeed.

ISE-related Critical Log Messages

This section contains explanations for ISE-related critical Log messages on the WSA:

- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: Waiting for client connection timed out
  The WSA’s ISE process failed to connect to the ISE server for 30 seconds.
- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: WSA Client cert/key missing. Please check ISE config
  The WSA Client certificate and key were not uploaded or generated on the WSA’s Identity Service Engine configuration page.
- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: ISE service exceeded maximum allowable disconnect duration with ISE server
  The WSA’s ISE process could not connect to the ISE server for 120 seconds and exited.
- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: Subscription to updates failed ...
  The WSA’s ISE process could not subscribe to the ISE server for updates.
- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: Could not create ISE client: ...
  Internal error when creating the WSA’s ISE client for ISE server connection.
- Tue Mar 24 03:56:47 2015 Critical: ISEEngineManager: Bulk Download thread failed: ...
  Internal error indicating bulk download of SGTS failed on connection or re-connection.
- Tue Mar 24 03:56:47 2015 Critical: ISEService: Unable to start service. Error: ...
  The WSA’s ISE service failed to start.
- Tue Mar 24 03:56:47 2015 Critical: ISEService: Unable to send ready signal ...
  The WSA’s ISE service was unable to send a ready signal to heimdall .
- Tue Mar 24 03:56:47 2015 Critical: ISEService: Unable to send restart signal ...
The WSA’s ISE service was unable to send a restart signal to heimdall.

Problems with Custom and External URL Categories

- Issues Downloading An External Live Feed File, on page 446
- MIME Type Issue on IIS Server for .CSV Files, on page 447
- Malformed Feed File Following Copy and Paste, on page 447

Issues Downloading An External Live Feed File

When Creating and Editing Custom and External URL Categories and providing an External Live Feed file (either Cisco Feed Format or Office 365 Feed Format), you must click the Get File button to initiate connection to the specified server, and download and parsing of the file. Progress and results of this process are displayed; if errors occur they are described. Rectify the problems and try downloading the file again.

There are four types of possible error:

- Connect exceptions

  Failed to resolve server hostname – the URL provided as the feed-file location is invalid; provide a correct URL to resolve this issue.

- Protocol errors

  Authentication failed due to invalid credentials – Server authentication failed; provide the correct user name and passphrase for server connection.

  The requested file is not found on the server – The URL provided for the feed file points to an invalid resource. Ensure the correct file is available on the specified server.

- Content validation errors

  Failed to validate the content of the field – The content of the feed file is invalid.

- Parsing errors

  • The Cisco Feed Format .csv file must contain one or more entries, where each entry is a site address or a valid regex string, followed by a comma and then the address type (which can be either site or regex). If this convention is not followed for any entry in the feed file, a parsing error is thrown.

    Also, do not include http:// or https:// as part of any site entry in the file, or an error will occur. In other words, www.example.com is parsed correctly, while http://www.example.com produces an error.

  • The XML feed file obtained from a Microsoft server is parsed by a standard XML parser. Any inconsistencies in the XML tagging are also flagged as parsing errors.

  The line number of a parsing error is included in the log. For example:

  Line 8: "www.anyurl.com" - Line is missing address or address-type field. Line 8 in the feed file doesn’t include a valid address or regex pattern, or an address type.

  Line 12: "www.test.com" - Unknown address type. Line 12 has a invalid address type; the address type can be either site or regex.
MIME Type Issue on IIS Server for .CSV Files

When providing a .csv file for the External Live Feed Category > Cisco Feed Format option while Creating and Editing Custom and External URL Categories, you may encounter a “406 not acceptable” error when fetching the file if the Cisco Feed Format server is running Internet Information Services (IIS) version 7 or 8 software. Similarly, the feedsd log will report something like: 31 May 2016 16:47:22 (GMT +0200) Warning: Protocol Error: 'HTTP error while fetching file from the server'.

This is because the default MIME type for .csv files on IIS is application/csv rather than text/csv. You can remedy the problem by logging into the IIS server and editing the MIME type entry for .csv files to be text/csv.

Malformed Feed File Following Copy and Paste

If you copy and paste the contents of a .csv (text) feed file from a UNIX or OS X system to a Windows system, an extra carriage return (\r) is added automatically and this can make the feed file malformed.

If you manually create the .csv file, or if you transfer the file from a UNIX or OS X system to a Windows server using SCP, FTP, or POST, there should be no problem.

Logging Problems

- Custom URL Categories Not Appearing in Access Log Entries, on page 447
- Logging HTTPS Transactions, on page 447
- Alert: Unable to Maintain the Rate of Data Being Generated, on page 448
- Problem Using Third-Party Log-Analyzer Tool with W3C Access Logs, on page 448

Custom URL Categories Not Appearing in Access Log Entries

When a web access policy group has a custom URL category set to Monitor and some other component, such as the Web Reputation Filters or the DVS engine, makes the final decision to allow or block a request for a URL in the custom URL category, then the access log entry for the request shows the predefined URL category instead of the custom URL category.

Logging HTTPS Transactions

HTTPS transactions in the access logs appear similar to HTTP transactions, but with slightly different characteristics. What gets logged depends on whether the transaction was explicitly sent or transparently redirected to the HTTPS Proxy:

- TUNNEL. This gets written to the access log when the HTTPS request was transparently redirected to the HTTPS Proxy.
- CONNECT. This gets written to the access log when the HTTPS request was explicitly sent to the HTTPS Proxy.

When HTTPS traffic is decrypted, the access logs contain two entries for a transaction:

- TUNNEL or CONNECT depending on the type of request processed.
- The HTTP Method and the decrypted URL. For example, “GET https://ftp.example.com”.
The full URL is only visible when the HTTPS Proxy decrypts the traffic.

**Alert: Unable to Maintain the Rate of Data Being Generated**

AsyncOS for Web sends a critical email message to the configured alert recipients when the internal logging process drops web transaction events due to a full buffer.

By default, when the Web Proxy experiences a very high load, the internal logging process buffers events to record them later when the Web Proxy load decreases. When the logging buffer fills completely, the Web Proxy continues to process traffic, but the logging process does not record some events in the access logs or in the Web Tracking report. This might occur during a spike in web traffic.

However, a full logging buffer might also occur when the appliance is over capacity for a sustained period of time. AsyncOS for Web continues to send the critical email messages every few minutes until the logging process is no longer dropping data.

The critical message contains the following text:

*Reporting Client: The reporting system is unable to maintain the rate of data being generated. Any new data generated will be lost.*

If AsyncOS for Web sends this critical message continuously or frequently, the appliance might be over capacity. Contact Cisco Customer Support to verify whether or not you need additional Web Security appliance capacity.

**Problem Using Third-Party Log-Analyzer Tool with W3C Access Logs**

If you want to use a third party log analyzer tool to read and parse the W3C access logs, you might need to include the “timestamp” field. The timestamp W3C field displays time since the UNIX epoch, and most log analyzers only understand time in this format.

**Policy Problems**

- Access Policy not Configurable for HTTPS, on page 448
- Blocked Object Problems, on page 436
- Identification Profile Disappeared from Policy, on page 449
- Policy Match Failures, on page 449
- Policy Troubleshooting Tool: Policy Trace, on page 450
- Also see: Accessing HTTPS Sites Using Routing Policies with URL Category Criteria, on page 441

**Access Policy not Configurable for HTTPS**

With the HTTPS Proxy is enabled, Decryption Policies handle all HTTPS policy decisions. You can no longer define Access and Routing Policy group membership by HTTPS, nor can you configure Access Policies to block HTTPS transactions.

If some Access and Routing Policy group memberships are defined by HTTPS and if some Access Policies block HTTPS, then when you enable the HTTPS Proxy, those Access and Routing Policy groups become disabled. You can choose to enable the policies at any time, but all HTTPS related configurations are removed.
**Blocked Object Problems**

- **Some Microsoft Office Files Not Blocked, on page 436**
- **Blocking DOS Executable Object Types Blocks Updates for Windows OneCare, on page 437**

**Some Microsoft Office Files Not Blocked**

When you block Microsoft Office files in the Block Object Type section, it is possible that some Microsoft Office files will not be blocked.

If you need to block all Microsoft Office files, add `application/x-ole` in the Block Custom MIME Types field. However, blocking this custom MIME type also blocks all Microsoft Compound Object format types, such as Visio files and some third-party applications.

**Blocking DOS Executable Object Types Blocks Updates for Windows OneCare**

When you configure the Web Security appliance to block DOS executable object types, the appliance also blocks updates for Windows OneCare.

**Identification Profile Disappeared from Policy**

Disabling an Identification Profile removes it from associated policies. Verify that the Identification Profile is enabled and then add it to the policy again.

**Policy Match Failures**

- **Policy is Never Applied, on page 449**
- **HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication, on page 449**
- **User Matches Global Policy for HTTPS and FTP over HTTP Requests, on page 450**
- **User Assigned Incorrect Access Policy, on page 450**

**Policy is Never Applied**

If multiple Identification Profiles have identical criteria, AsyncOS assigns the transactions to the first Identification Profile that matches. Therefore, transactions never match the additional, identical Identification Profiles, and any policies that apply to those subsequent, identical Identification Profiles are never matched or applied.

**HTTPS and FTP over HTTP Requests Match only Access Policies that Do Not Require Authentication**

Configure the appliance to use IP addresses as the surrogate when credential encryption is enabled.

When credential encryption is enabled and configured to use cookies as the surrogate type, authentication does not work with HTTPS or FTP over HTTP requests. This is because the Web Proxy redirects clients to the Web Proxy itself for authentication using an HTTPS connection if credential encryption is enabled. After successful authentication, the Web Proxy redirects clients back to the original website. In order to continue to identify the user, the Web Proxy must use a surrogate (either the IP address or a cookie). However, using a cookie to track users results in the following behavior if requests use HTTPS or FTP over HTTP:
User Matches Global Policy for HTTPS and FTP over HTTP Requests

When the appliance uses cookie-based authentication, the Web Proxy does not get cookie information from clients for HTTPS and FTP over HTTP requests. Therefore, it cannot get the user name from the cookie.

HTTPS and FTP over HTTP requests still match the Identification Profile according to the other membership criteria, but the Web Proxy does not prompt clients for authentication even if the Identification Profile requires authentication. Instead, the Web Proxy sets the user name to NULL and considers the user as unauthenticated.

Then, when the unauthenticated request is evaluated against a policy, it matches only a policy that specifies “All Identities” and apply to “All Users.” Typically, this is the global policy, such as the global Access Policy.

User Assigned Incorrect Access Policy

- Clients on your network use Network Connectivity Status Indicator (NCSI)
- Web Security appliance uses NTLMSSP authentication.
- Identification Profile uses IP based surrogates

A user might be identified using the machine credentials instead of the user’s own credentials, and as a result, might be assigned to an incorrect Access Policy.

Workaround:
Reduce the surrogate timeout value for machine credentials.

Policy Trace Mismatch after Modifying Policy Parameters

When you modify policy parameters such as Access Policy, Identification Profiles and Users, Select One or More Identification Profiles, or Selected Groups and Users, the changes will take a few minutes to take effect.

Policy Troubleshooting Tool: Policy Trace

- About the Policy Trace Tool, on page 451
- Tracing Client Requests, on page 451
- Advanced: Request Details, on page 452
- Advanced: Response Detail Overrides, on page 453
About the Policy Trace Tool

The Policy Trace Tool can emulate a client request and then detail how the Web Proxy processes that request. It can be used to trace client requests and debug policy processing when troubleshooting Web Proxy issues. You can perform a basic trace, or you can enter advanced trace settings and override options.

---

**Note**

When you use the Policy Trace tool, the Web Proxy does not record the requests in the access log or reporting database.

The Policy Trace tool evaluates requests against policies used by the Web Proxy only. These are Access, Encrypted HTTPS Management, Routing, Data Security, and Outbound Malware Scanning polices.

---

**Note**

SOCKS and External DLP polices are not evaluated by the Policy Trace tool.

Tracing Client Requests

---

**Note**

You can use the CLI command `maxhttpheadersize` to change the maximum HTTP header size for proxy requests. Increasing this value can alleviate Policy Trace failures that can occur when the specified user belongs to a large number of authentication groups, or when the response header is larger than the current maximum header size. See Web Security Appliance CLI Commands, on page 467 for more information about this command.

---

**Step 1** Choose System Administration > Policy Trace.

**Step 2** Enter the URL you wish to trace to in the Destination URL field.

**Step 3** (Optional) Enter additional emulation parameters:

<table>
<thead>
<tr>
<th>To emulate...</th>
<th>Enter...</th>
</tr>
</thead>
<tbody>
<tr>
<td>The client source IP used to make the request.</td>
<td>An IP address in the Client IP Address field.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>If an IP address is not specified, AsyncOS uses localhost. Also, SGTs (security group tags) cannot be fetched and policies based on SGTs will not be matched.</td>
</tr>
<tr>
<td>The authentication/identification credentials used to make the request.</td>
<td>A user name in the User Name field, and then choose Identity Services Engine or an authentication realm from the Authentication/Identification drop-down list.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>Only enabled option(s) are available. That is, authentication options and the ISE option are available only if they are both enabled.</td>
</tr>
<tr>
<td></td>
<td>For authentication of the user you enter here, the user must have already successfully authenticated through the Web Security appliance.</td>
</tr>
</tbody>
</table>

**Step 4** Click Find Policy Match.

The Policy Trace output is displayed in the Results pane.
For a Pass Through HTTPS transaction, the Policy Trace tool bypasses further scanning and no Access policy is associated with the transaction. Similarly, for a Decrypt HTTPS transaction, the tool cannot actually decrypt the transaction to determine the applied Access policy. In both cases, as well as for Drop transactions, the trace results display: “Access policy: Not Applicable.”

**What to do next**

**Related Topics**

- Advanced: Request Details, on page 452
- Advanced: Response Detail Overrides, on page 453

**Advanced: Request Details**

You can use the settings in the Request Details pane of the Policy Trace page, Advanced section, to tune the outbound malware scan request for this policy trace.

**Step 1**
Expand the **Advanced** section on the Policy Trace page.

**Step 2**
Complete the fields in the Request Details pane as required:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Proxy Port</td>
<td>Select a specific proxy port to use for the trace request to test policy membership based on proxy port.</td>
</tr>
<tr>
<td>User Agent</td>
<td>Specify the User Agent to simulate in the request.</td>
</tr>
<tr>
<td>Time of Request</td>
<td>Specify the Date and Time of day to simulate in the request.</td>
</tr>
<tr>
<td>Upload File</td>
<td>Choose a local file to simulate uploading in the request.</td>
</tr>
<tr>
<td></td>
<td>When you specify a file to upload here, the Web Proxy simulates an HTTP POST request instead of a GET request.</td>
</tr>
<tr>
<td>Object Size</td>
<td>Enter the size of the request object in bytes. You can enter K, M, or G to represent Kilobytes, Megabytes, or Gigabytes.</td>
</tr>
<tr>
<td>MIME Type</td>
<td>Enter the MIME type.</td>
</tr>
<tr>
<td>Anti-malware Scanning Verdicts</td>
<td>To override a Webroot, McAfee, or Sophos scanning verdict, choose the specific type of verdict to be overridden.</td>
</tr>
</tbody>
</table>

**Step 3**
Click **Find Policy Match**.

The Policy Trace output is displayed in the Results pane.
**Advanced: Response Detail Overrides**

You can use the settings in the Response Detail Overrides pane of the Policy Trace page, Advanced section, to “tweak” aspects of the Web Access Policies response for this trace.

**Step 1** Expand the **Advanced** section on the Policy Trace page.

**Step 2** Complete the fields in the Response Detail Overrides pane as required:

<table>
<thead>
<tr>
<th>Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL Category</td>
<td>Use this setting to override the URL transaction category of the trace response. Choose a category which is to replace the URL category in the response results.</td>
</tr>
<tr>
<td>Application</td>
<td>Similarly, use this setting to override the application category of the trace response. Choose a category which is to replace the application category in the response results.</td>
</tr>
<tr>
<td>Object Size</td>
<td>Enter a size for the response object in bytes. You can enter K, M, or G to represent Kilobytes, Megabytes, or Gigabytes.</td>
</tr>
<tr>
<td>MIME Type</td>
<td>Enter a MIME type.</td>
</tr>
<tr>
<td>Web Reputation Score</td>
<td>Enter a web reputation score from -10.0 to 10.0.</td>
</tr>
<tr>
<td>Anti-malware Scanning Verdicts</td>
<td>Use these options to override specific anti-malware scanning verdicts provided in the trace response. Choose verdicts which are to replace the Webroot, McAfee, and Sophos scanning verdicts in the response results.</td>
</tr>
</tbody>
</table>

**Step 3** Click **Find Policy Match**.

The Policy Trace output is displayed in the Results pane.

---

**Problems with File Reputation and File Analysis**

See Troubleshooting File Reputation and Analysis, on page 260

**Reboot Issues**

- Virtual Appliance Running on KVM Hangs on Reboot, on page 453
- Hardware Appliances: Remotely Resetting Appliance Power, on page 454

**Virtual Appliance Running on KVM Hangs on Reboot**

**Note**

This is a KVM issue and may change at any time.
For more information, see https://www.mail-archive.com/kvm@vger.kernel.org/msg103854.html and https://bugs.launchpad.net/qemu/+bug/1329956.

---

### Step 1
Check the following:

```bash
cat /sys/module/kvm_intel/parameters/enable_apicv
```

### Step 2
If the above value is set to Y:

a) Stop your virtual appliances and reinstall the KVM kernel module:

```bash
rmmod kvm_intel
modprobe kvm_intel enable_apicv=N
```

b) Restart your virtual appliance.

---

### Hardware Appliances: Remotely Resetting Appliance Power

#### Before you begin

- Obtain and set up a utility that can manage devices using IPMI version 2.0.
- Understand how to use the supported IPMI commands. See the documentation for your IPMI tool.

If a hardware appliance requires a hard reset, you can reboot the appliance chassis remotely using a third-party Intelligent Platform Management Interface (IPMI) tool.

#### Restrictions

- Remote power cycling is available only on certain hardware. For specifics, see Enabling Remote Power Cycling, on page 391.
- If you want be able to use this feature, you must enable it in advance, before you need to use it. For details, see Enabling Remote Power Cycling, on page 391.
- Only the following IPMI commands are supported: status, on, off, cycle, reset, diag, soft. Issuing unsupported commands will produce an “insufficient privileges” error.

---

#### Step 1
Use IPMI to issue a supported power-cycling command to the IP address assigned to the Remote Power Cycle port, which you configured earlier, along with the required credentials.

For example, from a UNIX-type machine with IPMI support, you might issue the command:

```
ipmitool -I lan -H 192.0.2.1 -U remoteresetuser -P passphrase chassis power reset
```

where 192.0.2.1 is the IP address assigned to the Remote Power Cycle port and remoteresetuser and passphrase are the credentials that you entered while enabling this feature.

#### Step 2
Wait at least eleven minutes for the appliance to reboot.

---

### Site Access Problems

- Cannot Access URLs that Do Not Support Authentication, on page 455
- Cannot Access Sites With POST Requests, on page 455
Cannot Access URLs that Do Not Support Authentication

This is a partial list of applications cannot be used when the Web Security appliance is deployed in transparent mode because they do not support authentication.

- Mozilla Thunderbird
- Adobe Acrobat Updates
- HttpBridge
- Subversion, by CollabNet
- Microsoft Windows Update
- Microsoft Visual Studio

Workaround: Create a class of user for the URL that does not require authentication.

Related Topics
- Bypassing Authentication, on page 110

Cannot Access Sites With POST Requests

When the user’s first client request is a POST request and the user still needs to authenticate, the POST body content is lost. This might be a problem when the POST request is for a application with the Access Control single sign-on feature in use.

Workarounds:

- Have users first authenticate with the Web Proxy by requesting a different URL through the browser before connecting to a URL that uses POST as a first request.
- Bypass authentication for URLs that use POST as a first request.

Note

When working with Access Control, you can bypass authentication for the Assertion Consumer Service (ACS) URL configured in the Application Authentication Policy.

Related Topics
- Bypassing Authentication, on page 110.

Upstream Proxy Problems

- Upstream Proxy Does Not Receive Basic Credentials, on page 455
- Client Requests Fail Upstream Proxy, on page 456

Upstream Proxy Does Not Receive Basic Credentials

If both the appliance and the upstream proxy use authentication with NTLMSSP, depending on the configurations, the appliance and upstream proxy might engage in an infinite loop of requesting authentication.
credentials. For example, if the upstream proxy requires Basic authentication, but the appliance requires NTLMSSP authentication, then the appliance can never successfully pass Basic credentials to the upstream proxy. This is due to limitations in authentication protocols.

Client Requests Fail Upstream Proxy

Configuration:

• Web Security appliance and upstream proxy server use Basic authentication.
• Credential Encryption is enabled on the downstream Web Security appliance.

Client requests fail on the upstream proxy because the Web Proxy receives an “Authorization” HTTP header from clients, but the upstream proxy server requires a “Proxy-Authorization” HTTP header.

Unable to Route FTP Requests Via an Upstream Proxy

If your network contains an upstream proxy that does not support FTP connections, then you must create a Routing Policy that applies to all Identities and to just FTP requests. Configure that Routing Policy to directly connect to FTP servers or to connect to a proxy group whose proxies all support FTP connections.

Virtual Appliances

• Do Not Use Force Reset, Power Off, or Reset Options During AsyncOS Startup, on page 456
• Network Connectivity on KVM Deployments Works Initially, Then Fails, on page 456
• Slow Performance, Watchdog Issues, and High CPU Usage on KVM Deployments, on page 457
• General Troubleshooting for Virtual Appliances Running on Linux Hosts, on page 457

Do Not Use Force Reset, Power Off, or Reset Options During AsyncOS Startup

The following actions on your virtual host are the equivalent of pulling the plug on a hardware appliance and are not supported, especially during AsyncOS startup:

• In KVM, the Force Reset option.
• In VMWare, the Power Off and Reset options. (These options are safe to use after the appliance has come up completely.)

Network Connectivity on KVM Deployments Works Initially, Then Fails

Problem

Network connectivity is lost after previously working.

Solution

This is a KVM issue. See the section on "KVM: Network connectivity works initially, then fails" in the OpenStack documentation at http://docs.openstack.org/admin-guide-cloud/content/section_network-troubleshoot.html
Slow Performance, Watchdog Issues, and High CPU Usage on KVM Deployments

Problem
Appliance performance is slow, watchdog issues occur, and the appliance shows unusually high CPU usage when running on an Ubuntu virtual machine.

Solution
Install the latest Host OS updates from Ubuntu.

General Troubleshooting for Virtual Appliances Running on Linux Hosts

Problem
Issues with virtual appliances running on KVM deployments may be related to host OS configuration issues.

Solution
See the troubleshooting section and other information in the Virtualization Deployment and Administration Guide available from:

WCCP Problems

• Maximum Port Entries, on page 457

Maximum Port Entries

In deployments using WCCP, the maximum number of port entries is 30 for HTTP, HTTPS, and FTP ports combined.

Packet Capture

• Starting a Packet Capture, on page 458
• Managing Packet Capture Files, on page 458

The appliance provides the ability to capture and display TCP/IP and other packets being transmitted or received over the network to which the appliance is attached.

Note
The packet capture feature is similar to the Unix tcpdump command.
Starting a Packet Capture

**Step 1** Choose **Support and Help > Packet Capture**.
**Step 2** (Optional) Click **Edit Settings** to change the packet capture settings.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Capture File Size Limit</td>
<td>Specifies the maximum size that the capture file can reach. One the limit is reached, the data will be discarded and a new file started, unless the Capture Duration setting is 'Run Capture Until File Size Limit Reached.'</td>
</tr>
</tbody>
</table>
| Capture Duration     | Options for if and when the capture automatically stops. Choose from:  
  - **Run Capture Until File Size Limit Reached.** The capture runs until the file limit set above is reached.  
  - **Run Capture Until Time Elapsed Reaches.** The capture runs for a specified duration. If you enter the amount of time without specifying the units, AsyncOS uses seconds by default.  
  - **Run Capture Indefinitely.** The packet capture runs until you manually stop it. |
| Interfaces           | The interfaces from which traffic will be captured.                                                                                         |
| Filters              | The filtering options to apply when capturing packets. Filtering allows you to capture required packets only. Choose from:  
  - **No Filters.** All packets will be captured.  
  - **Predefined Filters.** The predefined filters provide filtering by port and/or IP addresses. If left blank, all traffic will be captured.  
  - **Custom Filter.** Use this option if you already know the exact syntax of the packet capture options that you need. Use standard tcpdump syntax. |

(Optional) Submit and commit your packet capture changes.

**Note** When you change the packet capture settings without committing the changes and then start a packet capture, AsyncOS uses the new settings. This allows you to use the new settings in the current session without enforcing the settings for future packet capture runs. The settings remain in effect until you clear them.

**Step 3** Click **Start Capture**. To manually stop a running capture, click **Stop Capture**.

Managing Packet Capture Files

The appliance saves the captured packet activity to a file and stores the file locally. You can send packet capture files using FTP to Cisco Customer Support for debugging and troubleshooting purposes.

- **Downloading or Deleting Packet Capture Files, on page 459**
Downloading or Deleting Packet Capture Files

- **Note**
  You can also connect to the appliance using FTP and retrieving packet capture files from the captures directory.

**Step 1**
Choose **Support and Help > Packet Capture**.

**Step 2**
Select the packet capture file you wish to use from the Manage Packet Capture Files pane. If this pane is not visible then no packet capture files have been stored on the appliance.

**Step 3**
Click **Download File** or **Delete Selected Files** as required.

### Working With Support

- Gathering Information for Efficient Service, on page 459
- Opening a Technical Support Request, on page 459
- Getting Support for Virtual Appliances, on page 460
- Enabling Remote Access to the Appliance, on page 460

### Gathering Information for Efficient Service

Before contacting Support:

- Enable custom logging fields as described in General Troubleshooting Best Practices, on page 433.
- Consider doing a packet capture. See Packet Capture, on page 457.

### Opening a Technical Support Request

**Before you begin**

- Verify that your Cisco.com user ID is associated with your service agreement contract for this appliance. To view a list of service contracts that are currently associated with your Cisco.com profile, visit the Cisco.com Profile Manager at [https://sso.cisco.com/autho/forms/CDClogin.html](https://sso.cisco.com/autho/forms/CDClogin.html). If you do not have a Cisco.com user ID, register to get one.

You can use the appliance to send a non-urgent request for assistance to Cisco Customer Support. When the appliance sends the request, it also sends the configuration of the appliance. The appliance must be able to send mail to the Internet to send a support request.

- **Note**
  If you have an urgent issue, please call a Cisco Worldwide Support Center.

**Step 1**
Choose **Support And Help > Contact Technical Support**.
Getting Support for Virtual Appliances

If you file a support case for a Cisco content security virtual appliance, you must provide your Virtual License Number (VLN), your contract number, and your Product Identifier code (PID).

You can identify your PID based on the software licenses running on your virtual appliance, by referencing your purchase order, or from the following table:

<table>
<thead>
<tr>
<th>Functionality</th>
<th>PID</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Web Security Essentials</td>
<td>WSA-WSE-LIC=</td>
<td>Includes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Web Usage Controls</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Web Reputation</td>
</tr>
<tr>
<td>Web Security Premium</td>
<td>WSA-WSP-LIC=</td>
<td>Includes:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Web Usage Controls</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Web Reputation</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Sophos and Webroot Anti-Malware signatures</td>
</tr>
<tr>
<td>Web Security Anti-Malware</td>
<td>WSA-WSM-LIC=</td>
<td>Includes Sophos and Webroot Anti-Malware signatures</td>
</tr>
<tr>
<td>McAfee Anti-Malware</td>
<td>WSA-AMM-LIC=</td>
<td>—</td>
</tr>
<tr>
<td>Advanced Malware Protection</td>
<td>WSA-AMP-LIC=</td>
<td>—</td>
</tr>
</tbody>
</table>

Enabling Remote Access to the Appliance

The Remote Access option allows Cisco Customer Support to remotely access your appliance for support purposes.

Step 1 Choose Support And Help > Remote Access.
Step 2 Click Enable.
Step 3 Complete the Customer Support Remote Access options:
### Option

| **Seed String** | If you enter a string, the string should not match any existing or future pass phrase. The string will appear near the top of the page after you click Submit. You will give this string to your support representative. |
| **Secure Tunnel** (recommended) | Specifies whether or not to use a secure tunnel for remote access connections. When enabled, the appliance creates an SSH tunnel over the specified port to the server upgrades.ironport.com, over port 443 (by default). Once a connection is made, Cisco Customer Support is able to use the SSH tunnel to obtain access to the appliance. Once the techsupport tunnel is enabled, it will remain connected to upgrades.ironport.com for 7 days. After 7 days, no new connections can be made using the techsupport tunnel, though any existing connections will continue to exist and work. The Remote Access account will remain active until specifically deactivated. |

### Step 4
Submit and commit your changes.

### Step 5
Look for the seed string in the Success message near the top of the page and make a note of it. For security reasons, this string is not stored on the appliance and there is no way to locate this string later. Keep this seed string in a safe place.

### Step 6
Give the seed string to your Support representative.
Command Line Interface

This appendix contains the following sections:

- Overview of the Command Line Interface, on page 463
- Accessing the Command Line Interface, on page 463
- General Purpose CLI Commands, on page 466
- Web Security Appliance CLI Commands, on page 467

Overview of the Command Line Interface

The AsyncOS Command Line Interface (CLI) allows you to configure and monitor the Web Security appliance. The Command Line Interface is accessible using SSH on IP interfaces that have been configured with these services enabled, or using terminal emulation software on the serial port. By default, SSH is configured on the Management port.

The commands are invoked by entering the command name with or without any arguments. If you enter a command without arguments, the command prompts you for the required information.

Accessing the Command Line Interface

You can connect using one of the following methods:

- **Ethernet.** Start an SSH session with the IP address of the Web Security appliance. The factory default IP address is 192.168.42.42. SSH is configured to use port 22.
- **Serial connection.** Start a terminal session with the communication port on your personal computer that the serial cable is connected to.

First Access

You can add other users with differing levels of permissions after you have accessed the CLI the first time using the **admin** account—log in to the appliance by entering the default **admin** user name and passphrase:

- User name: **admin**
- Passphrase: **ironport**

The System Setup Wizard prompts you to change the passphrase for the **admin** account the first time you log in with the default passphrase.
You can also reset the admin account passphrase at any time using the passwd command.

Subsequent Access

You can connect and log into the appliance at any time, using a valid user name and passphrase. Note that a listing of recent appliance access attempts, both successes and failures, for the current user name is displayed automatically upon log-in.

See the following userconfig command description, or Administering User Accounts, on page 392 for information about configuring additional users.

Working with the Command Prompt

The top-level command prompt consists of the fully qualified hostname, followed by the greater than (>) symbol, followed by a space. For example:

example.com>

When running commands, the CLI requires input from you. When the CLI is expecting input, the prompt displays the default values enclosed in square brackets ([ ]) followed by the greater than (>) symbol. When there is no default value, the brackets are empty.

For example:

example.com> routeconfig

Choose a routing table:
- MANAGEMENT - Routes for Management Traffic
- DATA - Routes for Data Traffic
[ ]>

When there is a default setting, the setting is displayed within the command-prompt brackets. For example:

example.com> setgateway

Warning: setting an incorrect default gateway may cause the current connection to be interrupted when the changes are committed.
Enter new default gateway:
[172.xx.xx.xx]>>

When a default setting is shown, typing Return is equivalent to accepting the default.

Command Syntax

When operating in the interactive mode, the CLI command syntax consists of single commands with no white space and no arguments or parameters. For example:

example.com> logconfig
Select Lists

When you are presented with multiple choices for input, some commands use numbered lists. Enter the number of the selection at the prompt.

For example:

Log level:
1. Critical
2. Warning
3. Information
4. Debug
5. Trace
[3]> 3

Yes/No Queries

When given a yes or no option, the question is posed with a default in brackets. You may answer Y, N, Yes, or No. Case is not significant.

For example:

Do you want to enable the proxy? [Y]> Y

Subcommands

Some commands give you the opportunity to use subcommand directives such as NEW, EDIT, and DELETE. The EDIT and DELETE functions provide a list of previously configured values.

For example:

e.example.com> interfaceconfig
Currently configured interfaces:
1. Management (172.xxx.xx.xx/xx: example.com)
Choose the operation you want to perform:
- NEW - Create a new interface.
- EDIT - Modify an interface.
- DELETE - Remove an interface.
[1]>

Within subcommands, pressing Enter or Return at an empty prompt returns you to the main command.

Escaping Subcommands

You can use the Ctrl+C keyboard shortcut at any time within a subcommand to immediately exit return to the top level of the CLI.

Command History

The CLI keeps a history of all commands entered during a session. Use the Up and Down arrow keys on your keyboard, or the Ctrl+P and Ctrl+N key combinations to scroll through a running list of the recently-used commands.
Completing Commands

The AsyncOS CLI supports command completion. You can enter the first few letters of some commands followed by the Tab key and the CLI completes the string. If the letters you entered are not unique among commands, the CLI “narrows” the set. For example:

```
example.com> set (press the Tab key)
setagateway, setgoodtable, sethostname, settime, settz
example.com> seth (pressing the Tab again completes the entry with sethostname)
example.com> sethostname
```

Committing Configuration Changes Using the CLI

- Many configuration changes do not take effect until you commit them.
- The `commit` command allows you to change configuration settings while other operations proceed normally.
- To successfully commit changes, you must be at the top-level command prompt. Type `Return` at an empty prompt to move up one level in the command line hierarchy.
- Changes to configuration that have not been committed are recorded, but do not go into effect until you run the `commit` command. However, not all commands require the `commit` command to be run. Exiting the CLI session, system shutdown, reboot, failure, or issuing the `clear` command clears changes that have not yet been committed.
- Changes are not actually committed until you receive confirmation and a timestamp.

General Purpose CLI Commands

This section describes some basic commands you might use in a typical CLI session, such as committing and clearing changes.

CLI Example: Committing Configuration Changes

Entering comments after the `commit` command is optional.

```
example.com> commit
Please enter some comments describing your changes:
[]> Changed "psinet" IP Interface to a different IP address
Changes committed: Wed Jan 01 12:00:01 2007
```

CLI Example: Clearing Configuration Changes

The clear command clears any changes made to the appliance configuration since the last commit or clear command was issued.

```
example.com> clear
Are you sure you want to clear all changes since the last commit? [Y]> y
Changes cleared: Wed Jan 01 12:00:01 2007
example.com>
```
CLI Example: Exiting the Command Line Interface Session

The exit command logs you out of the CLI application. Configuration changes that have not been committed are cleared.

example.com> exit

Configuration changes entered but not committed. Exiting will lose changes. Type 'commit' at the command prompt to commit changes.

Are you sure you wish to exit? [N]> y

CLI Example: Seeking Help on the Command Line Interface

The help command lists all available CLI commands and gives a brief description of each command. The help command can be invoked by typing either help or a single question mark (?) at the command prompt.

example.com> help

Further, you can access help for a specific command by entering help commandname.

Related Topics
- Web Security Appliance CLI Commands, on page 467

Web Security Appliance CLI Commands

The Web Security Appliance CLI supports a set of proxy and UNIX commands to access, upgrade, and administer the system.

Note
Not all CLI commands are applicable/available in all operating modes (Standard and Cloud Web Security Connector).

adminaccessconfig

You can configure the Web Security appliance to have stricter access requirements for administrators logging into the appliance, and you can specify an inactivity time-out value. See Additional Security Settings for Accessing the Appliance, on page 398 and User Network Access, on page 399 for more information.

advancedproxyconfig

Configure advanced Web Proxy options; subcommands are:

AUTHENTICATION – Authentication configuration options:

- When would you like to forward authorization request headers to a parent proxy
- Enter the Proxy Authorization Realm to be displayed in the end user authentication dialog
- Would you like to log the username that appears in the request URI
• Should the Group Membership attribute be used for directory lookups in the Web UI (when it is not used, empty groups and groups with different membership attributes will be displayed)
• Would you like to use advanced Active Directory connectivity checks
• Would you like to allow case insensitive username matching in policies
• Would you like to allow wild card matching with the character * for LDAP group names
• Enter the charset used by the clients for basic authentication [ISO-8859-1/UTF-8]
• Would you like to enable referrals for LDAP
• Would you like to enable secure authentication
• Enter the hostname to redirect clients for authentication
• Enter the surrogate timeout for user credentials
• Enter the surrogate timeout for machine credentials
• Enter the surrogate timeout in the case traffic permitted due to authentication service unavailability
• Enter re-auth on request denied option [disabled / embedlinkinblockpage]
• Would you like to send Negotiate header along with NTLM header for NTLMSSP authentication
• Configure username and IP address masking in logs and reports

**CACHING** – Proxy Caching mode; choose one:

- Safe Mode
- Optimized Mode
- Aggressive Mode
- Customized Mode

See also *Choosing The Web Proxy Cache Mode*, on page 67.

**DNS** – DNS configuration options:

- Enter the URL format for the HTTP 307 redirection on DNS lookup failure
- Would you like the proxy to issue a HTTP 307 redirection on DNS lookup failure
- Would you like proxy not to automatically failover to DNS results when upstream proxy (peer) is unresponsive
- Do you want to disable IP address in Host Header
- Find web server by:
  0 = Always use DNS answers in order
  1 = Use client-supplied address then DNS
  2 = Limited DNS usage
  3 = Very limited DNS usage

The default value is 0. For options 1 and 2, DNS will be used if Web Reputation is enabled. For options 2 and 3, DNS will be used for explicit proxy requests, if there is no upstream proxy or in the event the configured upstream proxy fails. For all options, DNS will be used when Destination IP Addresses are used in policy membership.

**EUN** – End-user notification parameters:

- Choose:
  1. Refresh EUN pages
2. Use Custom EUN pages
3. Use Standard EUN pages
   * Would you like to turn on presentation of the User Acknowledgement page?

See also Web Proxy Usage Agreement, on page 70 and End-User Notifications Overview, on page 283.

**NATIVEFTP** – Native FTP configuration:
   * Would you like to enable FTP proxy
   * Enter the ports that FTP proxy listens on
   * Enter the range of port numbers for the proxy to listen on for passive FTP connections
   * Enter the range of port numbers for the proxy to listen on for active FTP connections
   * Enter the authentication format:
     1. Check Point
     2. No Proxy Authentication
     3. Raptor
   * Would you like to enable caching
   * Would you like to enable server IP spoofing
   * Would you like to pass FTP server welcome message to the clients
   * Enter the max path size for the ftp server directory

See also Overview of FTP Proxy Services, on page 74.

**FTPOVERHTTP** – FTP Over HTTP options:
   * Enter the login name to be used for anonymous FTP access
   * Enter the password to be used for anonymous FTP access

See also Overview of FTP Proxy Services, on page 74.

**HTTPS** – HTTPS-related options:
   * HTTPS URI Logging Style - fulluri or stripquery
   * Would you like to decrypt unauthenticated transparent HTTPS requests for authentication purpose
   * Would you like to decrypt HTTPS requests for End User Notification purpose
   * Action to be taken when HTTPS servers ask for client certificate during handshake:
     1. Pass through the transaction
     2. Reply with certificate unavailable
   * Do you want to enable server name indication (SNI) extension?
   * Do you want to enable automatic discovery and download of missing Intermediate Certificates?
Do you want to enable session resumption?

See also Overview of Create Decryption Policies to Control HTTPS Traffic, on page 209.

**SCANNING** – Scanning options:

• Would you like the proxy to do malware scanning all content regardless of content type
• Enter the time to wait for a response from an anti-malware scanning engine (Sophos, McAfee, or Webroot), in seconds
• Do you want to disable Webroot body scanning

See also Overview of Anti-Malware Scanning, on page 232 and Overview of Scanning Outbound Traffic, on page 223.

**PROXYCONN** – Manage the list of user agents that cannot accept the proxy connection header. The list entries are interpreted as regular expressions in Flex (Fast Lexical Analyzer) dialect. A user agent will be matched if any substring of it matches any regular expression in the list.

• Choose the operation you want to perform:
  NEW - Add an entry to the list of user agents
  DELETE - Remove an entry from the list

**CUSTOMHEADERS** – Manage custom request headers for specific domains.

• Choose the operation you want to perform:
  DELETE - Delete entries
  NEW - Add new entries
  EDIT - Edit entries

See also Adding Custom Headers To Web Requests, on page 68.

**MISCELLANEOUS** – Miscellaneous proxy-related parameters:

• Would you like proxy to respond to health checks from L4 switches (always enabled if WSA is in L4 transparent mode)
• Would you like proxy to perform dynamic adjustment of TCP receive window size
• Would you like proxy to perform dynamic adjustment of TCP send window size
• Do you want to filter non-HTTP responses?
  (Non-HTTP responses are filtered by default. Enter N if you want to allow non-HTTP responses via proxy)
• Enable caching of HTTPS responses
• Enter minimum idle timeout for checking unresponsive upstream proxy (in seconds)
• Enter maximum idle timeout for checking unresponsive upstream proxy (in seconds)
• Mode of the proxy:
  1. Explicit forward mode only
  2. Transparent mode with L4 Switch or no device for redirection
3. Transparent mode with WCCP v2 Router for redirection

• Spoofing of the client IP by the proxy:
  1. Disable
  2. Enable for all requests
  3. Enable for transparent requests only

• Do you want to pass HTTP X-Forwarded-For headers?
• Do you want to enable server connection sharing?
• Would you like to permit tunneling of non-HTTP requests on HTTP ports?
• Would you like to block tunneling of non-SSL transactions on SSL Ports?
• Would you like proxy to log values from X-Forwarded-For headers in place of incoming connection IP addresses?
• Do you want proxy to throttle content served from cache?
• Would you like the proxy to use client IP addresses from X-Forwarded-For headers
• Do you want to forward TCP RST sent by server to client?
• Do you want to enable WCCP proxy health check?
• Do you want to enable URL lower case conversion for velocity regex?

See also Using the P2 Data Interface for Web Proxy Data, on page 30 and Configuring Web Proxy Settings, on page 63.

SOCKS – SOCKS Proxy options:

• Would you like to enable SOCKS proxy
• Proxy Negotiation Timeout
• UDP Tunnel Timeout
• SOCKS Control Ports
• UDP Request Ports

See also Using the P2 Data Interface for Web Proxy Data, on page 30 and SOCKS Proxy Services, on page 75.

CONTENT-ENCODING – Allow and block content-encoding types.
Currently allowed content-encoding type(s): compress, deflate, gzip
Currently blocked content-encoding type(s): N/A
To change the setting for a specific content-encoding type, select an option:
1. compress
2. deflate
3. gzip
The encoding type "compress" is currently allowed
Do you want to block it? [N]>

**adminaccessconfig**
You can configure the Web Security appliance to have stricter access requirements for administrators logging into the appliance.

**alertconfig**
Specify alert recipients, and set parameters for sending system alerts.

**authcache**
Allows you to delete one or all entries (users) from the authentication cache. You can also list all users currently included in the authentication cache.

**bwcontrol**
Enable bandwidth control debug messages in the Default Proxy log file.

**certconfig**

**SETUP** – Configure security certificates and keys.

**OCSPVALIDATION** – Enable/disable OCSP validation of certificate during upload.

**clear**
Clears pending configuration changes since last commit.

**commit**
Commits pending changes to the system configuration.

**createcomputerobject**
Creates a computer object at the location you specify.

**curl**
Send a cURL request directly to a Web server, or to a Web server via proxy, with the request and response HTTP headers returned to let you determine why a Web page is failing to load.

---

**Note**
This command is for Administrator or Operator use only, under TAC supervision.

Subcommands are:

- **DIRECT** – URL access going direct
- **APPLIANCE** – URL access through the Appliance
datasecurityconfig
Defines a minimum request body size, below which upload requests are not scanned by the Cisco Data Security Filters.

date
Displays the current date. Example:

Thu Jan 10 23:13:40 2013 GMT

diagnostic
Proxy- and reporting-related subcommands:

NET – Network Diagnostic Utility
This command has been deprecated; use packetcapture to capture network traffic on the appliance.

PROXY – Proxy Debugging Utility
Choose the operation you want to perform:

• SNAP – Take a snapshot of the proxy
• OFFLINE – Take the proxy off-line (via WCCP)
• RESUME – Resume proxy traffic (via WCCP)
• CACHE – Clear proxy cache

REPORTING – Reporting Utilities
The reporting system is currently enabled.
Choose the operation you want to perform:

• DELETEDB – Re-initialize the reporting database
• DISABLE – Disable the reporting system
• DBSTATS – List DB and Export Files (Displays the list of unprocessed files and folders under export_files and always_onbox folders.)
• DELETEEXPORTDB – Delete Export Files (Deletes all unprocessed files and folders under export_files and always_onbox folders.)
• DELETEJOURNAL – Delete Journal Files (Deletes all aclog_journal_files.)

dnsconfig
Configure DNS server parameters.

dnsflush
Flush DNS entries on the appliance.

etherconfig
Configure Ethernet port connections.
**externaldlpconfig**
Defines a minimum request body size, below which upload requests are not scanned by the external DLP server.

**externaldlpconfig**
Defines a minimum request body size, below which upload requests are not scanned by the external DLP server.

**featurekey**
Submits valid keys to activate licensed features.

**featurekeyconfig**
Automatically check for and update feature keys.

**fipsconfig**

- **SETUP** – Enable/disable FIPS 140-2 compliance, and encryption of Critical Sensitive Parameters (CSP). Note that an immediate reboot will be necessary.
- **FIPS CHECK** – Check FIPS mode compliance. Indicates whether various certificates and services are FIPS compliant.

See FIPS Compliance, on page 409 for additional information.

**grep**
Searches named input files for lines containing a match to the given pattern.

**help**
Returns a list of commands.

**httppatchconfig**
Enables or disables outgoing HTTP PATCH requests. The default value is disable.

**iccm_message**
Clears the message in the web interface and CLI that indicates when this Web Security appliance is managed by a Security Management appliance (M-Series).

**ifconfig**
Configure and manage network interfaces including M1, P1, and P2. Displays currently configured interfaces, and provides an operations menu to create, edit, or delete interfaces.

**iseconfig**
Displays current ISE configuration parameters; specify an ISE configuration operation to perform:

- **setup** – Configure ISE settings: enable/disable, ISE server name or IPv4 address, proxy cache timeout, statistics back-up interval.
isedata
Specify an ISE data-related operation:

statistics – Show ISE server status and ISE statistics.
cache – Show the ISE cache, or check an IP address:
show – Show the ISE ID cache.
checkip – Query the local ISE cache for an IP address.
sgts – Show the ISE Secure Group Tag (SGT) table.

iseconfig
Displays current ISE configuration parameters; specify an ISE configuration operation to perform:

• setup – Configure ISE settings: enable/disable, ISE server name or IPv4 address, proxy cache timeout, statistics back-up interval.

isedata
Specify an ISE data-related operation:

statistics – Show ISE server status and ISE statistics.
cache – Show the ISE cache, or check an IP address:
show – Show the ISE ID cache.
checkip – Query the local ISE cache for an IP address.
sgts – Show the ISE Secure Group Tag (SGT) table.

last
Lists user-specific user information that includes ttys and hosts, in reverse time order or lists the users that are logged in at a specified date and time.

loadconfig
Load a system configuration file.

logconfig
Configure access to log files.

mailconfig
Mail the current configuration file to the address specified.

maxhttpheadersize
Set the maximum HTTP header size or URL size for proxy requests; enter the value in bytes, or append a K to the number to indicate kilobytes.

Policy Trace can fail for a user that belongs to a large number of authentication groups. It can also fail if the HTTP response header size or URL size is greater than the current “max header size.” Increasing this value can alleviate such failures. Minimum value is 32 KB; default value is 32 KB; maximum value is 1024 KB.
modifyauthhelpers

Use this command to configure the number of Kerberos authentication helpers within a range of 5 to 21 for BASIC, NTLMSSP, and NEG0.

musconfig

Use this command to enable Secure Mobility and configure how to identify remote users, either by IP address or by integrating with one or more Cisco adaptive security appliances.

Note

Changes made using this command cause the Web Proxy to restart.

musstatus

Use this command to display information related to Secure Mobility when the Web Security appliance is integrated with an adaptive security appliance.

This command displays the following information:

- The status of the Web Security appliance connection with each adaptive security appliance.
- The duration of the Web Security appliance connection with each adaptive security appliance in minutes.
- The number of remote clients from each adaptive security appliance.
- The number of remote clients being serviced, which is defined as the number of remote clients that have passed traffic through the Web Security appliance.
- The total number of remote clients.

networktuning

The WSA utilizes several buffers and optimization algorithms to handle hundreds of TCP connections simultaneously, providing high performance for typical Web traffic—that is, short-lived HTTP connections.

In certain situations, such as frequent downloading of large files (100+ MB), larger buffers can provide better per-connection performance. However, overall memory usage will increase, and thus any buffer increases should be in line with the memory available on the system.

The send- and receive-space variables represent the buffers used for storing data for communications over any given TCP socket. The send- and receive-auto variables are used to enable and disable the FreeBSD auto-tuning algorithm for dynamically controlling window size. These two parameters are applied directly in the FreeBSD kernel.

When SEND_AUTO and RECV_AUTO are enabled, the system tunes the window size dynamically based on system load and available resources. On a lightly loaded WSA, the system attempts to keep window sizes large to reduce per transaction latency. The maximum value of the dynamically tuned window size is dependent on the configured number of mbuf clusters, which in turn is dependent on the total RAM available on the system. As the total number of client connections increases, or when the available network buffer resources become scarce, the system tunes down the window sizes to protect itself from losing all network buffer resources to proxied traffic.

See Upload/Download Speed Issues, on page 439 for additional information about using this command.

The networktuning subcommands are:

SENDSPACE – TCP send-space buffer size; range is from 8192 to 131072 bytes; the default is 16000 bytes.
**RECVSPACE** – TCP receive-space buffer size; range is from 8192 to 131072 bytes; the default is 32768 bytes.

**SEND-AUTO** – Enable/disable TCP send auto-tuning; 1 = On, 0 = Off; default is Off. If you enable TCP send auto-tuning, be sure to use `advancedproxyconfig > miscellaneous > Would you like proxy to perform dynamic adjustment of TCP send window size?` to disable send buffer auto-tuning.

**RECV-AUTO** – Enable/disable TCP receive auto-tuning; 1 = On, 0 = Off; default is Off. If you enable TCP receive auto-tuning, be sure to use `advancedproxyconfig > miscellaneous > Would you like proxy to perform dynamic adjustment of TCP receive window size?` to disable receive buffer auto-tuning.

**MBUF CLUSTER COUNT** – Change the number of available mbuf clusters; acceptable range is from 98304 to 1572864. The value should vary according to installed system memory, using this calculation: 98304 * (X/Y) where X is gigabytes of RAM on the system and Y is 4 GB. For example, with 4 GB RAM, the recommended value is 98304 * (4/4) = 98304. Linear scaling is recommended as RAM increases.

**SENDBUF-MAX** – Specify the maximum send buffer size; range is from 131072 bytes to 2097152 bytes; the default is 1 MB (1048576 bytes).

**RECVBUF-MAX** – Specify the maximum receive buffer size; range is from 131072 bytes to 2097152 bytes; the default is 1 MB (1048576 bytes).

**CLEAN-FIB-1** – Remove all M1/M2 entries from the data-routing table—essentially, enable control-plane/data-plane separation. That is, disable any data-plane process from sending data over the M1 interface when “Separate Routing” is enabled. Data-plane processes are those for which “Use data routing table” is enabled, or which carry strictly non-management traffic. Control-plane processes can still send data over either the M1 or P1 interfaces.

Following any changes to these parameters, be sure to commit your changes and the restart the appliance.

⚠️ **Caution**

Use this command only if you understand the ramifications. We recommend using only with TAC guidance.

**nslookup**

Queries Internet domain name servers for information about specified hosts and domains or to print a list of hosts in a domain.

**ntpconfig**

Configure NTP servers. Displays currently configured interfaces, and provides an operations menu to add, remove, or set the interface from whose IP address NTP queries should originate.

**packetcapture**

Intercepts and displays TCP/IP and other packets being transmitted or received over the network to which the appliance is attached.

**passwd**

Set the passphrase.

**pathmtudiscovery**

Enables or disables Path MTU Discovery.

You might want to disable Path MTU Discovery if you need to packet fragmentation.
ping
Sends an ICMP ECHO REQUEST to the specified host or gateway.

proxyconfig <enable | disable>
Enables or disables the Web Proxy.

proxystat
Display web proxy statistics.

quit, q, exit
Terminates an active process or session.

reboot
Flushes the file system cache to disk, halts all running processes, and restarts the system.

reportingconfig
Configure a reporting system.

resetconfig
Restores the configuration to factory defaults.

revert
Revert the AsyncOS for Web operating system to a previous qualified build. This is a very destructive action, destroying all configuration logs and databases. Refer to Reverting to a Previous Version of AsyncOS for Web, on page 424 for information about using this command.

rollovernow
Roll over a log file.

routeconfig
Configure destination IP addresses and gateways for traffic. Displays currently configured routes, and provides an operations menu to create, edit, or delete, or clear entries.

saveconfig
Saves a copy of the current configuration settings to a file. This file can be used to restore defaults, if necessary. If FIPS mode is enable, provide a passphrase-handling option: masked passphrases or encrypted passphrases.

setgateway
Configure the default gateway for the machine.
sethostname
Set the hostname parameter.

setntlmsecuritymode
Changes the security setting for the NTLM authentication realm to either “ads” or “domain”.

- domain — AsyncOS joins the Active Directory domain with a domain security trust account. AsyncOS requires Active Directory to use only nested Active Directory groups in this mode.
- ads — AsyncOS joins the domain as a native Active Directory member.

Default is ads.

settime
Set system time.

settz
Displays the current time zone and the time zone version. Provides an operations menu to set a local time zone.

showconfig
Display all configuration values.

Note
User passphrases are encrypted.

shutdown
Terminates connections and shuts down the system.

smtprelay
Configure SMTP relay hosts for internally generated email. An SMTP relay host is required to receive system generated email and alerts.

smtpconfig
Configure the local host to listen for SNMP queries and allow SNMP requests.

sshconfig
Configure hostname and host key options for trusted servers.

sslconfig
The default cipher for AsyncOS versions 9.0 and earlier is DEFAULT:+kEDH. For AsyncOS versions 9.1 and later, it the default cipher is

EECDH::DSS::RSA::!NULL::!eNULL::!EXPORT::!3DES::!RC4::!RC2::!DES::!SEED::!CAMELLIA::!SRP::!IDEA::!ECDHE-ECDSA-AES256-SHA::!ECDHE-RSA-AES256-SHA::!DHE-DSS-AES256-SHA::!AES256-SHA::DHE-RSA-AES128-SHA
In both cases, this may change based on your ECDHE cipher selections.

**Note**

However, regardless of version, the default cipher does not change when you upgrade to a newer AsyncOS version. For example, when you upgrade from an earlier version to AsyncOS 9.1, the default cipher is `DEFAULT:+kEDH`. In other words, following an upgrade, you must update the current cipher suite yourself; Cisco recommends updating to:

```
ECDH:DSS:RSA:!NULL:!eNULL:!EXPORT:!3DES:!RC4:!RC2:!DES:!SEED:!CAMELLIA:!SRP:!IDEA:!ECDHE-ECDSA-AES256-SHA:!ECDHE-RSA-AES256-SHA:!DHE-DSS-AES256-SHA:!AES256-SHA:DHE-RSA-AES128-SHA
```

**FALLBACK** – Enable/disable the SSL/TLS fall-back option. If enabled, communications with remote servers will fall back to the lowest configured protocol following a handshake failure.

After a protocol version is negotiated between client and server, handshake failure is possible because of implementation issues. If this option is enabled, the proxy attempts to connect using the lowest version of the currently configured TLS/SSL protocols.

**Note**

On new AsyncOS 9.x installations, fall-back is disabled by default. For upgrades from earlier versions on which the fall-back option exists, the current setting is retained; otherwise, when upgrading from a version on which the option did not exist, fall-back is enabled by default.

**ECDHE** – Enable/disable use of ECDHE ciphers for LDAP.

Additional ECDH ciphers are supported in successive releases; however, certain named curves provided with some of the additional ciphers cause the appliance to close a connection during secure LDAP authentication and HTTPS traffic decryption. See SSL Configuration, on page 412 for more information about specifying additional ciphers.

If you experience these issues, use this option to disable or enable ECDHE cipher use for either or both features.

**ssltool**

Executes different OPENSSL commands from appliance's CLI to troubleshoot SSL connections. The `ssltool` command has the following subcommands:

- **sclient** – This is CLI version of openssl s_client command. It will connect to a remote host using SSL/TLS directly without using the appliance.
  - **COMMAND** – Executes an openssl s_client command. The following openssl s_client commands are supported:
    - `-connect`, `-servername`, `-verify`, `-cipher`, `-verify_return_error`, `-reconnect`, `-pause`, `-showcerts`, `-prexit`, `-state`, `-debug`, `-msg`, `-tls1`, `-tls1_1`, `-tls1_2`, `-no_ssl2`, `-no_ssl3`, `-no_tls1`, `-no_tls1_1`, `-no_tls1_2`, `-tlsextdebug`, `-no_ticket`, `-status`, `-save`, `-noout`
    
    See the inline help for more information about the supported openssl s_client commands.
After you execute the `command`, you can save the output to a file using the `-save` option. You cannot access the saved log files. These log files are used by Cisco support team for debugging.

- **HELP** - Provides help information.

- **CLEARLOGS** - Deletes all logs generated by `ssltool`.

**status**

Displays system status.

**supportrequest**

Send the support request email to Cisco Customer Support. This includes system information and a copy of the master configuration.

(Optional) If you provide the service request number, a larger set of system and configuration information is added to the service request automatically. This information is zipped and uploaded to the service request using FTP.

**tail**

Displays the end of a log file. Command accepts log file name as parameter.

**Example 1**

```
example.com> tail
Currently configured logs:
1. "accesslogs" Type: "Access Logs" Retrieval: FTP Poll
2. "amp_logs" Type: "AMP Engine Logs" Retrieval: FTP Poll
...

Enter the number of the log you wish to tail.
[]> 9
Press Ctrl-C to stop scrolling, then `q` to quit.
~
~
Thu Dec 14 10:03:07 2017 Info: Begin Logfile
~
~
...`CTRL-C` + "q"
```

**Example 2**

```
example.com> tail system_logs
Press Ctrl-C to stop scrolling, then `q` to quit.
~
~
Thu Dec 14 09:59:10 2017 Info: Begin Logfile
...`CTRL-C` + "q"
```
**tcp services**
Displays information about open TCP/IP services.

**techsupport**
Provides a temporary connection to allow Cisco Customer Support to access the system and assist in troubleshooting.

**telnet**
Communicates with another host using the TELNET protocol, usually used to check connectivity.

**testauthconfig**
Tests the authentication settings for a given authentication realm against the authentication servers defined in the realm.

**testauthconfig [-d level] [realm name]**
Running the command without any option causes the appliance to list the configured authentication realms from which you can make a selection.

The debug flag (\(-d\) ) controls the level of debug information. The levels can range between 0-10. If unspecified, the appliance uses a level of 0. With level 0, the command will return success or failure. If the test settings fail, the command will list the cause of the failure.

---

**Note**
Cisco recommends you use level 0. Only use a different debug level when you need more detailed information to troubleshoot.

**tuiconfig tuistatus**
These two commands are documented in Using the CLI to Configure Advanced Transparent User Identification Settings, on page 87.

**traceroute**
Traces IP packets through gateways and along the path to a destination host.

**updateconfig**
Configure update and upgrade settings.

**updatenow**
Update all components.

**upgrade**
Install the Async OS software upgrade.

downloadinstall – Download and immediately install an upgrade package.
download – Download and save upgrade package for installation later.

After you enter either of these commands, a list of upgrade packages applicable for this WSA is displayed. Select the desired package by entering its entry number and then pressing Enter; download begins in the background. During download, additional subcommands are available: downloadstatus and canceldownload.

When download is complete, if you initially entered downloadinstall, installation begins immediately. If you entered download, two additional commands are available when download is complete: install and delete. Enter install to begin installing a previously downloaded package. Use delete to remove the previously downloaded package from the WSA.

userconfig

Configure system administrators.

version

Displays general system information, installed versions of system software, and rule definitions.

wccpstat

all - Displays details of all WCCP (Web Cache Communication Protocol) service groups.

servicegroup - Displays details of a specific WCCP service group.

webcache

Examine or modify the contents of the proxy cache, or configure domains and URLs that the appliance never caches. Allows an administrator to remove a particular URL from the proxy cache or specify which domains or URLs to never store in the proxy cache.

who

Displays users logged into the system, for both CLI and Web interface sessions.

Note

Individual users can have a maximum of 10 concurrent sessions.

whoami

Displays user information.
Additional Information

This appendix contains the following sections:

- Cisco Notification Service, on page 485
- Documentation Set, on page 485
- Training, on page 486
- Knowledge Base Articles (TechNotes), on page 486
- Cisco Support Community, on page 486
- Customer Support, on page 486
- Registering for a Cisco Account to Access Resources, on page 487
- Cisco Welcomes Your Comments, on page 487
- Third Party Contributors, on page 487

Cisco Notification Service

Sign up to receive notifications relevant to your Cisco Content Security Appliances, such as Security Advisories, Field Notices, End of Sale and End of Support statements, and information about software updates and known issues.

You can specify options such as notification frequency and types of information to receive. You should sign up separately for notifications for each product that you use.

To sign up, visit http://www.cisco.com/cisco/support/notifications.html

A Cisco.com account is required. If you do not have one, see Registering for a Cisco Account to Access Resources, on page 487.

Documentation Set

Related documentation for Cisco Web Security Appliances is available from the following locations:

<table>
<thead>
<tr>
<th>Product</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>(Includes hardware documentation.)</td>
<td></td>
</tr>
</tbody>
</table>
Training

Training for Cisco email and web security products:

Knowledge Base Articles (TechNotes)

Step 2 Look for links with TechNotes in the name.

Cisco Support Community

Access the Cisco Support Community for web security and associated management at the following URL:

https://supportforums.cisco.com/community/5786/web-security

The Cisco Support Community is a place to discuss general web security issues as well as technical information about specific Cisco products. For example, posts may include troubleshooting videos.

Customer Support

For instructions for virtual appliances, see the Cisco Content Security Virtual Appliance Installation Guide.

For non-critical issues, you can also open a support case from the appliance.

Registering for a Cisco Account to Access Resources

Access to many resources on Cisco.com requires a Cisco account.

If you do not have a Cisco.com UserID, you can register for one here: https://tools.cisco.com/RPF/register/register.do

Cisco Welcomes Your Comments

The Cisco Technical Publications team is interested in improving the product documentation. Your comments and suggestions are always welcome. You can send comments to the following email address: contentsecuritydocs@cisco.com

Please include the title of this book and the publication date from the title page in the subject line of your message.

Third Party Contributors

Some software included within AsyncOS is distributed under the terms, notices, and conditions of software license agreements of FreeBSD, Inc., Stichting Mathematisch Centrum, Corporation for National Research Initiatives, Inc., and other third party contributors, and all such terms and conditions are incorporated in license agreements. The full text of these agreements can be found here:

https://support.ironport.com/3rdparty/AsyncOS_User_Guide-1-1.html

Portions of the software within AsyncOS is based upon the RRDtool with the express written consent of Tobi Oetiker.

Portions of this document are reproduced with permission of Dell Computer Corporation. Portions of this document are reproduced with permission of McAfee, Inc. Portions of this document are reproduced with permission of Sophos Plc.
End User License Agreement

This appendix contains the following sections:

- Cisco Systems End User License Agreement, on page 489
- Supplemental End User License Agreement for Cisco Systems Content Security Software, on page 495

Cisco Systems End User License Agreement

IMPORTANT: PLEASE READ THIS END USER LICENSE AGREEMENT CAREFULLY. IT IS VERY IMPORTANT THAT YOU CHECK THAT YOU ARE PURCHASING CISCO SOFTWARE OR EQUIPMENT FROM AN APPROVED SOURCE AND THAT YOU, OR THE ENTITY YOU REPRESENT (COLLECTIVELY, THE "CUSTOMER") HAVE BEEN REGISTERED AS THE END USER FOR THE PURPOSES OF THIS CISCO END USER LICENSE AGREEMENT. IF YOU ARE NOT REGISTERED AS THE END USER YOU HAVE NO LICENSE TO USE THE SOFTWARE AND THE LIMITED WARRANTY IN THIS END USER LICENSE AGREEMENT DOES NOT APPLY. ASSUMING YOU HAVE PURCHASED FROM AN APPROVED SOURCE, DOWNLOADING, INSTALLING OR USING CISCO OR CISCO-SUPPLIED SOFTWARE CONSTITUTES ACCEPTANCE OF THIS AGREEMENT.

CISCO SYSTEMS, INC. OR ITS SUBSIDIARY LICENSING THE SOFTWARE INSTEAD OF CISCO SYSTEMS, INC. ("CISCO") IS WILLING TO LICENSE THIS SOFTWARE TO YOU ONLY UPON THE CONDITION THAT YOU PURCHASED THE SOFTWARE FROM AN APPROVED SOURCE AND THAT YOU ACCEPT ALL OF THE TERMS CONTAINED IN THIS END USER LICENSE AGREEMENT PLUS ANY ADDITIONAL LIMITATIONS ON THE LICENSE SET FORTH IN A SUPPLEMENTAL LICENSE AGREEMENT ACCOMPANYING THE PRODUCT OR AVAILABLE AT THE TIME OF YOUR ORDER (COLLECTIVELY THE "AGREEMENT"). TO THE EXTENT OF ANY CONFLICT BETWEEN THE TERMS OF THIS END USER LICENSE AGREEMENT AND ANY SUPPLEMENTAL LICENSE AGREEMENT, THE SUPPLEMENTAL LICENSE AGREEMENT SHALL APPLY. BY DOWNLOADING, INSTALLING, OR USING THE SOFTWARE, YOU ARE REPRESENTING THAT YOU PURCHASED THE SOFTWARE FROM AN APPROVED SOURCE AND BINDING YOURSELF TO THE AGREEMENT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THE AGREEMENT, THEN CISCO IS UNWILLING TO LICENSE THE SOFTWARE TO YOU AND (A) YOU MAY NOT DOWNLOAD, INSTALL OR USE THE SOFTWARE, AND (B) YOU MAY RETURN THE SOFTWARE (INCLUDING ANY UNOPENED CD PACKAGE AND ANY WRITTEN MATERIALS) FOR A FULL REFUND, OR, IF THE SOFTWARE AND WRITTEN MATERIALS ARE SUPPLIED AS PART OF ANOTHER PRODUCT, YOU MAY RETURN THE ENTIRE PRODUCT FOR A FULL REFUND. YOUR RIGHT TO RETURN AND REFUND EXPIRES 30 DAYS AFTER PURCHASE FROM AN APPROVED SOURCE, AND APPLIES ONLY IF YOU ARE THE ORIGINAL AND REGISTERED END USER.
PURCHASER. FOR THE PURPOSES OF THIS END USER LICENSE AGREEMENT, AN "APPROVED SOURCE" MEANS (A) CISCO; OR (B) A DISTRIBUTOR OR SYSTEMS INTEGRATOR AUTHORIZED BY CISCO TO DISTRIBUTE / SELL CISCO EQUIPMENT, SOFTWARE AND SERVICES WITHIN YOUR TERRITORY TO END USERS; OR (C) A RESELLER AUTHORIZED BY ANY SUCH DISTRIBUTOR OR SYSTEMS INTEGRATOR IN ACCORDANCE WITH THE TERMS OF THE DISTRIBUTOR'S AGREEMENT WITH CISCO TO DISTRIBUTE / SELL THE CISCO EQUIPMENT, SOFTWARE AND SERVICES WITHIN YOUR TERRITORY TO END USERS.

THE FOLLOWING TERMS OF THE AGREEMENT GOVERN CUSTOMER'S USE OF THE SOFTWARE (DEFINED BELOW), EXCEPT TO THE EXTENT: (A) THERE IS A SEPARATE SIGNED CONTRACT BETWEEN CUSTOMER AND CISCO GOVERNING CUSTOMER'S USE OF THE SOFTWARE, OR (B) THE SOFTWARE INCLUDES A SEPARATE "CLICK-ACCEPT" LICENSE AGREEMENT OR THIRD PARTY LICENSE AGREEMENT AS PART OF THE INSTALLATION OR DOWNLOAD PROCESS GOVERNING CUSTOMER'S USE OF THE SOFTWARE. TO THE EXTENT OF A CONFLICT BETWEEN THE PROVISIONS OF THE FOREGOING DOCUMENTS, THE ORDER OF PRECEDENCE SHALL BE (1) THE SIGNED CONTRACT, (2) THE CLICK-ACCEPT AGREEMENT OR THIRD PARTY LICENSE AGREEMENT, AND (3) THE AGREEMENT. FOR PURPOSES OF THE AGREEMENT, "SOFTWARE" SHALL MEAN COMPUTER PROGRAMS, INCLUDING FIRMWARE AND COMPUTER PROGRAMS EMBEDDED IN CISCO EQUIPMENT, AS PROVIDED TO CUSTOMER BY AN APPROVED SOURCE, AND ANY UPGRADES, UPDATES, BUG FIXES OR MODIFIED VERSIONS THERETO (COLLECTIVELY, "UPGRADES"), ANY OF THE SAME WHICH HAS BEEN RELICENSED UNDER THE CISCO SOFTWARE TRANSFER AND RE-LICENSING POLICY (AS MAY BE AMENDED BY CISCO FROM TIME TO TIME) OR BACKUP COPIES OF ANY OF THE FOREGOING.

License. Conditioned upon compliance with the terms and conditions of the Agreement, Cisco grants to Customer a nonexclusive and nontransferable license to use for Customer's internal business purposes the Software and the Documentation for which Customer has paid the required license fees to an Approved Source. "Documentation" means written information (whether contained in user or technical manuals, training materials, specifications or otherwise) pertaining to the Software and made available by an Approved Source with the Software in any manner (including on CD-Rom, or on-line). In order to use the Software, Customer may be required to input a registration number or product authorization key and register Customer's copy of the Software online at Cisco's website to obtain the necessary license key or license file.

Customer's license to use the Software shall be limited to, and Customer shall not use the Software in excess of, a single hardware chassis or card or such other limitations as are set forth in the applicable Supplemental License Agreement or in the applicable purchase order which has been accepted by an Approved Source and for which Customer has paid to an Approved Source the required license fee (the "Purchase Order").

Unless otherwise expressly provided in the Documentation or any applicable Supplemental License Agreement, Customer shall use the Software solely as embedded in, for execution on, or (where the applicable Documentation permits installation on non-Cisco equipment) for communication with Cisco equipment owned or leased by Customer and used for Customer's internal business purposes. No other licenses are granted by implication, estoppel or otherwise.

For evaluation or beta copies for which Cisco does not charge a license fee, the above requirement to pay license fees does not apply.

General Limitations. This is a license, not a transfer of title, to the Software and Documentation, and Cisco retains ownership of all copies of the Software and Documentation. Customer acknowledges that the Software and Documentation contain trade secrets of Cisco or its suppliers or licensors, including but not limited to the specific internal design and structure of individual programs and associated interface information. Except as otherwise expressly provided under the Agreement, Customer shall only use the Software in connection with the use of Cisco equipment purchased by the Customer from an Approved Source and Customer shall have no right, and Customer specifically agrees not to:
(i) transfer, assign or sublicense its license rights to any other person or entity (other than in compliance with any Cisco re licensing/transfer policy then in force), or use the Software on Cisco equipment not purchased by the Customer from an Approved Source or on secondhand Cisco equipment, and Customer acknowledges that any attempted transfer, assignment, sublicense or use shall be void;

(ii) make error corrections to or otherwise modify or adapt the Software or create derivative works based upon the Software, or permit third parties to do the same;

(iii) reverse engineer or decompile, decrypt, disassemble or otherwise reduce the Software to human-readable form, except to the extent otherwise expressly permitted under applicable law notwithstanding this restriction or except to the extent that Cisco is legally required to permit such specific activity pursuant to any applicable open source license;

(iv) publish any results of benchmark tests run on the Software;

(v) use or permit the Software to be used to perform services for third parties, whether on a service bureau or time sharing basis or otherwise, without the express written authorization of Cisco; or

(vi) disclose, provide, or otherwise make available trade secrets contained within the Software and Documentation in any form to any third party without the prior written consent of Cisco. Customer shall implement reasonable security measures to protect such trade secrets.

To the extent required by applicable law, and at Customer's written request, Cisco shall provide Customer with the interface information needed to achieve interoperability between the Software and another independently created program, on payment of Cisco's applicable fee, if any. Customer shall observe strict obligations of confidentiality with respect to such information and shall use such information in compliance with any applicable terms and conditions upon which Cisco makes such information available.

Software, Upgrades and Additional Copies. NOTWITHSTANDING ANY OTHER PROVISION OF THE AGREEMENT: (1) CUSTOMER HAS NO LICENSE OR RIGHT TO MAKE OR USE ANY ADDITIONAL COPIES OR UPGRADES UNLESS CUSTOMER, AT THE TIME OF MAKING OR ACQUIRING SUCH COPY OR UPGRADE, ALREADY HOLDS A VALID LICENSE TO THE ORIGINAL SOFTWARE AND HAS PAID THE APPLICABLE FEE TO AN APPROVED SOURCE FOR THE UPGRADE OR ADDITIONAL COPIES; (2) USE OF UPGRADES IS LIMITED TO CISCO EQUIPMENT SUPPLIED BY AN APPROVED SOURCE FOR WHICH CUSTOMER IS THE ORIGINAL END USER PURCHASER OR LESSEE OR OTHERWISE HOLDS A VALID LICENSE TO USE THE SOFTWARE WHICH IS BEING UPGRADED; AND (3) THE MAKING AND USE OF ADDITIONAL COPIES IS LIMITED TO NECESSARY BACKUP PURPOSES ONLY.

Proprietary Notices. Customer agrees to maintain and reproduce all copyright, proprietary, and other notices on all copies, in any form, of the Software in the same form and manner that such copyright and other proprietary notices are included on the Software. Except as expressly authorized in the Agreement, Customer shall not make any copies or duplicates of any Software without the prior written permission of Cisco.

Term and Termination. The Agreement and the license granted herein shall remain effective until terminated. Customer may terminate the Agreement and the license at any time by destroying all copies of Software and any Documentation. Customer's rights under the Agreement will terminate immediately without notice from Cisco if Customer fails to comply with any provision of the Agreement. Upon termination, Customer shall destroy all copies of Software and Documentation in its possession or control. All confidentiality obligations of Customer, all restrictions and limitations imposed on the Customer under the section titled "General Limitations" and all limitations of liability and disclaimers and restrictions of warranty shall survive termination of this Agreement. In addition, the provisions of the sections titled "U.S. Government End User Purchasers" and "General Terms Applicable to the Limited Warranty Statement and End User License Agreement" shall survive termination of the Agreement.
Customer Records. Customer grants to Cisco and its independent accountants the right to examine Customer's books, records and accounts during Customer's normal business hours to verify compliance with this Agreement. In the event such audit discloses non-compliance with this Agreement, Customer shall promptly pay to Cisco the appropriate license fees, plus the reasonable cost of conducting the audit.

Export, Re-Export, Transfer and Use Controls. The Software, Documentation and technology or direct products thereof (hereafter referred to as Software and Technology), supplied by Cisco under the Agreement are subject to export controls under the laws and regulations of the United States (U.S.) and any other applicable countries' laws and regulations. Customer shall comply with such laws and regulations governing export, re-export, transfer and use of Cisco Software and Technology and will obtain all required U.S. and local authorizations, permits, or licenses. Cisco and Customer each agree to provide the other information, support documents, and assistance as may reasonably be required by the other in connection with securing authorizations or licenses. Information regarding compliance with export, re-export, transfer and use may be located at the following URL:

U.S. Government End User Purchasers. The Software and Documentation qualify as "commercial items," as that term is defined at Federal Acquisition Regulation ("FAR") (48 C.F.R.) 2.101, consisting of "commercial computer software" and "commercial computer software documentation" as such terms are used in FAR 12.212. Consistent with FAR 12.212 and DoD FAR Supp. 227.7202-1 through 227.7202-4, and notwithstanding any other FAR or other contractual clause to the contrary in any agreement into which the Agreement may be incorporated, Customer may provide to Government end user or, if the Agreement is direct, Government end user will acquire, the Software and Documentation with only those rights set forth in the Agreement. Use of either the Software or Documentation or both constitutes agreement by the Government that the Software and Documentation are "commercial computer software" and "commercial computer software documentation," and constitutes acceptance of the rights and restrictions herein.

Identified Components; Additional Terms. The Software may contain or be delivered with one or more components, which may include third-party components, identified by Cisco in the Documentation, readme.txt file, third-party click-accept or elsewhere (e.g. on http://www.cisco.com/) (the "Identified Component(s)") as being subject to different license agreement terms, disclaimers of warranties, limited warranties or other terms and conditions (collectively, "Additional Terms") than those set forth herein. You agree to the applicable Additional Terms for any such Identified Component(s).

Limited Warranty
Subject to the limitations and conditions set forth herein, Cisco warrants that commencing from the date of shipment to Customer (but in case of resale by an Approved Source other than Cisco, commencing not more than ninety (90) days after original shipment by Cisco), and continuing for a period of the longer of (a) ninety (90) days or (b) the warranty period (if any) expressly set forth as applicable specifically to software in the warranty card accompanying the product of which the Software is a part (the "Product") (if any): (a) the media on which the Software is furnished will be free of defects in materials and workmanship under normal use; and (b) the Software substantially conforms to the Documentation. The date of shipment of a Product by Cisco is set forth on the packaging material in which the Product is shipped. Except for the foregoing, the Software is provided "AS IS". This limited warranty extends only to the Software purchased from an Approved Source by a Customer who is the first registered end user. Customer's sole and exclusive remedy and the entire liability of Cisco and its suppliers under this limited warranty will be (i) replacement of defective media and/or (ii) at Cisco's option, repair, replacement, or refund of the purchase price of the Software, in both cases subject to the condition that any error or defect constituting a breach of this limited warranty is reported to the Approved Source supplying the Software to Customer, within the warranty period. Cisco or the Approved Source supplying the Software to Customer may, at its option, require return of the Software and/or Documentation as a condition to the remedy. In no event does Cisco warrant that the Software is error free or that Customer
will be able to operate the Software without problems or interruptions. In addition, due to the continual
development of new techniques for intruding upon and attacking networks, Cisco does not warrant that the
Software or any equipment, system or network on which the Software is used will be free of vulnerability to
intrusion or attack.

Restrictions. This warranty does not apply if the Software, Product or any other equipment upon which the
Software is authorized to be used (a) has been altered, except by Cisco or its authorized representative, (b)
has not been installed, operated, repaired, or maintained in accordance with instructions supplied by Cisco,
(c) has been subjected to abnormal physical or electrical stress, abnormal environmental conditions, misuse,
negligence, or accident; or (d) is licensed for beta, evaluation, testing or demonstration purposes. The Software
warranty also does not apply to (e) any temporary Software modules; (f) any Software not posted on Cisco's
Software Center; (g) any Software that Cisco expressly provides on an "AS IS" basis on Cisco's Software
Center; (h) any Software for which an Approved Source does not receive a license fee; and (i) Software
supplied by any third party which is not an Approved Source.

DISCLAIMER OF WARRANTY

EXCEPT AS SPECIFIED IN THIS WARRANTY SECTION, ALL EXPRESS OR IMPLIED
CONDITIONS, REPRESENTATIONS, AND WARRANTIES INCLUDING, WITHOUT LIMITATION,
ANY IMPLIED WARRANTY OR CONDITION OF MERCHANTABILITY, FITNESS FOR A
PARTICULAR PURPOSE, NON-INFRINGEMENT, SATISFACTORY QUALITY,
NON-INTERFERENCE, ACCURACY OF INFORMATIONAL CONTENT, OR ARISING FROM A
 COURSE OF DEALING, LAW, USAGE, OR TRADE PRACTICE, ARE HEREBY EXCLUDED TO
THE EXTENT ALLOWED BY APPLICABLE LAW AND ARE EXPRESSLY DISCLAIMED BY
CISCO, ITS SUPPLIERS AND LICENSORS. TO THE EXTENT THAT ANY OF THE SAME CANNOT
BE EXCLUDED, SUCH IMPLIED CONDITION, REPRESENTATION AND/OR WARRANTY IS
LIMITED IN DURATION TO THE EXPRESS WARRANTY PERIOD REFERRED TO IN THE
"LIMITED WARRANTY" SECTION ABOVE. BECAUSE SOME STATES OR JURISDICTIONS
DO NOT ALLOW LIMITATIONS ON HOW LONG AN IMPLIED WARRANTY LASTS, THE
ABOVE LIMITATION MAY NOT APPLY IN SUCH STATES. THIS WARRANTY GIVES
CUSTOMER SPECIFIC LEGAL RIGHTS, AND CUSTOMER MAY ALSO HAVE OTHER RIGHTS
WHICH VARY FROM JURISDICTION TO JURISDICTION. This disclaimer and exclusion shall apply
even if the express warranty set forth above fails its essential purpose.

Disclaimer of Liabilities - Limitation of Liability. IF YOU ACQUIRED THE SOFTWARE IN THE UNITED
STATES, LATIN AMERICA, CANADA, JAPAN OR THE CARIBBEAN, NOTWITHSTANDING
ANYTHING ELSE IN THE AGREEMENT TO THE CONTRARY, ALL LIABILITY OF CISCO, ITS
AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS
COLLECTIVELY, TO CUSTOMER, WHETHER IN CONTRACT, TORT (INCLUDING NEGLIGENCE),
BREACH OF WARRANTY OR OTHERWISE, SHALL NOT EXCEED THE PRICE PAID BY CUSTOMER
TO ANY APPROVED SOURCE FOR THE SOFTWARE THAT GAVE RISE TO THE CLAIM OR IF THE
SOFTWARE IS PART OF ANOTHER PRODUCT, THE PRICE PAID FOR SUCH OTHER PRODUCT.
THIS LIMITATION OF LIABILITY FOR SOFTWARE IS CUMULATIVE AND NOT PER INCIDENT
(I.E. THE EXISTENCE OF TWO OR MORE CLAIMS WILL NOT ENLARGE THIS LIMIT).

IF YOU ACQUIRED THE SOFTWARE IN EUROPE, THE MIDDLE EAST, AFRICA, ASIA OR OCEANIA,
NOTWITHSTANDING ANYTHING ELSE IN THE AGREEMENT TO THE CONTRARY, ALL LIABILITY OF CISCO, ITS AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS COLLECTIVELY, TO CUSTOMER, WHETHER IN CONTRACT, TORT (INCLUDING NEGLIGENCE), BREACH OF WARRANTY OR OTHERWISE, SHALL NOT EXCEED THE PRICE PAID BY CUSTOMER TO CISCO FOR THE SOFTWARE THAT GAVE RISE TO THE CLAIM OR IF THE SOFTWARE IS PART OF ANOTHER PRODUCT, THE PRICE PAID FOR SUCH OTHER PRODUCT. THIS LIMITATION OF LIABILITY FOR SOFTWARE IS CUMULATIVE AND NOT PER INCIDENT
(I.E. THE EXISTENCE OF TWO OR MORE CLAIMS WILL NOT ENLARGE THIS LIMIT). NOTHING IN THE AGREEMENT SHALL LIMIT (I) THE LIABILITY OF CISCO, ITS AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS TO CUSTOMER FOR PERSONAL INJURY OR DEATH CAUSED BY THEIR NEGLIGENCE, (II) CISCO'S LIABILITY FOR FRAUDULENT MISREPRESENTATION, OR (III) ANY LIABILITY OF CISCO WHICH CANNOT BE EXCLUDED UNDER APPLICABLE LAW.

Disclaimer of Liabilities - Waiver of Consequential Damages and Other Losses. IF YOU ACQUIRED THE SOFTWARE IN THE UNITED STATES, LATIN AMERICA, THE CARIBBEAN OR CANADA, REGARDLESS OF WHETHER ANY REMEDY SET FORTH HEREIN FAILS OF ITS ESSENTIAL PURPOSE OR OTHERWISE, IN NO EVENT WILL CISCO OR ITS SUPPLIERS BE LIABLE FOR ANY LOST REVENUE, PROFIT, OR LOST OR DAMAGED DATA, BUSINESS INTERRUPTION, LOSS OF CAPITAL, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL, OR PUNITIVE DAMAGES HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY OR WHETHER ARISING OUT OF THE USE OF OR INABILITY TO USE SOFTWARE OR OTHERWISE AND EVEN IF CISCO OR ITS SUPPLIERS OR LICENSORS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATION OR EXCLUSION OF CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT APPLY TO YOU.

IF YOU ACQUIRED THE SOFTWARE IN JAPAN, EXCEPT FOR LIABILITY ARISING OUT OF OR IN CONNECTION WITH DEATH OR PERSONAL INJURY, FRAUDULENT MISREPRESENTATION, AND REGARDLESS OF WHETHER ANY REMEDY SET FORTH HEREIN FAILS OF ITS ESSENTIAL PURPOSE OR OTHERWISE, IN NO EVENT WILL CISCO, ITS AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS BE LIABLE FOR ANY LOST REVENUE, PROFIT, OR LOST OR DAMAGED DATA, BUSINESS INTERRUPTION, LOSS OF CAPITAL, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL, OR PUNITIVE DAMAGES HOWEVER CAUSED AND REGARDLESS OF THE THEORY OF LIABILITY OR WHETHER ARISING OUT OF THE USE OF OR INABILITY TO USE SOFTWARE OR OTHERWISE AND EVEN IF CISCO OR ANY APPROVED SOURCE OR THEIR SUPPLIERS OR LICENSORS HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES.

IF YOU ACQUIRED THE SOFTWARE IN EUROPE, THE MIDDLE EAST, AFRICA, ASIA OR OCEANIA, IN NO EVENT WILL CISCO, ITS AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS, BE LIABLE FOR ANY LOST REVENUE, LOST PROFIT, OR LOST OR DAMAGED DATA, BUSINESS INTERRUPTION, LOSS OF CAPITAL, OR FOR SPECIAL, INDIRECT, CONSEQUENTIAL, INCIDENTAL, OR PUNITIVE DAMAGES, HOWEVER ARISING, INCLUDING, WITHOUT LIMITATION, IN CONTRACT, TORT (INCLUDING NEGLIGENCE) OR WHETHER ARISING OUT OF THE USE OF OR INABILITY TO USE THE SOFTWARE, EVEN IF, IN EACH CASE, CISCO, ITS AFFILIATES, OFFICERS, DIRECTORS, EMPLOYEES, AGENTS, SUPPLIERS AND LICENSORS, HAVE BEEN ADVISED OF THE POSSIBILITY OF SUCH DAMAGES. BECAUSE SOME STATES OR JURISDICTIONS DO NOT ALLOW LIMITATION OR EXCLUSION OF CONSEQUENTIAL OR INCIDENTAL DAMAGES, THE ABOVE LIMITATION MAY NOT FULLY APPLY TO YOU. THE FOREGOING EXCLUSION SHALL NOT APPLY TO ANY LIABILITY ARISING OUT OF OR IN CONNECTION WITH: (I) DEATH OR PERSONAL INJURY, (II) FRAUDULENT MISREPRESENTATION, OR (III) CISCO'S LIABILITY IN CONNECTION WITH ANY TERMS THAT CANNOT BE EXCLUDED UNDER APPLICABLE LAW.

Customer acknowledges and agrees that Cisco has set its prices and entered into the Agreement in reliance upon the disclaimers of warranty and the limitations of liability set forth herein, that the same reflect an allocation of risk between the parties (including the risk that a contract remedy may fail of its essential purpose and cause consequential loss), and that the same form an essential basis of the bargain between the parties.
Controlling Law, Jurisdiction. If you acquired, by reference to the address on the purchase order accepted by the Approved Source, the Software in the United States, Latin America, or the Caribbean, the Agreement and warranties ("Warranties") are controlled by and construed under the laws of the State of California, United States of America, notwithstanding any conflicts of law provisions; and the state and federal courts of California shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties. If you acquired the Software in Canada, unless expressly prohibited by local law, the Agreement and Warranties are controlled by and construed under the laws of the Province of Ontario, Canada, notwithstanding any conflicts of law provisions; and the courts of the Province of Ontario shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties. If you acquired the Software in Europe, the Middle East, Africa, Asia or Oceania (excluding Australia), unless expressly prohibited by local law, the Agreement and Warranties are controlled by and construed under the laws of England, notwithstanding any conflicts of law provisions; and the English courts shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties. In addition, if the Agreement is controlled by the laws of England, no person who is not a party to the Agreement shall be entitled to enforce or take the benefit of any of its terms under the Contracts (Rights of Third Parties) Act 1999. If you acquired the Software in Japan, unless expressly prohibited by local law, the Agreement and Warranties are controlled by and construed under the laws of Japan, notwithstanding any conflicts of law provisions; and the Tokyo District Court of Japan shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties. If you acquired the Software in Australia, unless expressly prohibited by local law, the Agreement and Warranties are controlled by and construed under the laws of the State of New South Wales, Australia, notwithstanding any conflicts of law provisions; and the State and federal courts of New South Wales shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties. If you acquired the Software in any other country, unless expressly prohibited by local law, the Agreement and Warranties are controlled by and construed under the laws of the State of California, United States of America, notwithstanding any conflicts of law provisions; and the state and federal courts of California shall have exclusive jurisdiction over any claim arising under the Agreement or Warranties.

For all countries referred to above, the parties specifically disclaim the application of the UN Convention on Contracts for the International Sale of Goods. Notwithstanding the foregoing, either party may seek interim injunctive relief in any court of appropriate jurisdiction with respect to any alleged breach of such party's intellectual property or proprietary rights. If any portion hereof is found to be void or unenforceable, the remaining provisions of the Agreement and Warranties shall remain in full force and effect. Except as expressly provided herein, the Agreement constitutes the entire agreement between the parties with respect to the license of the Software and Documentation and supersedes any conflicting or additional terms contained in any Purchase Order or elsewhere, all of which terms are excluded. The Agreement has been written in the English language, and the parties agree that the English version will govern.

Supplemental End User License Agreement for Cisco Systems Content Security Software

IMPORTANT: READ CAREFULLY

This Supplemental End User License Agreement ("SEULA") contains additional terms and conditions for the Software product licensed under the End User License Agreement ("EULA") between You ("You" as used herein means You and the business entity you represent or "Company") and Cisco (collectively, the "Agreement"). Capitalized terms used in this SEULA but not defined will have the meanings assigned to them
in the EULA. To the extent that there is a conflict between the terms and conditions of the EULA and this SEULA, the terms and conditions of this SEULA will take precedence.

In addition to the limitations set forth in the EULA on your access and use of the Software, you agree to comply at all times with the terms and conditions provided in this SEULA.

DOWNLOADING, INSTALLING, OR USING THE SOFTWARE CONSTITUTES ACCEPTANCE OF THE AGREEMENT, AND YOU ARE BINDING YOURSELF AND THE BUSINESS ENTITY THAT YOU REPRESENT TO THE AGREEMENT. IF YOU DO NOT AGREE TO ALL OF THE TERMS OF THE AGREEMENT, THEN CISCO IS UNWILLING TO LICENSE THE SOFTWARE TO YOU AND (A) YOU MAY NOT DOWNLOAD, INSTALL OR USE THE SOFTWARE, AND (B) YOU MAY RETURN THE SOFTWARE (INCLUDING ANY UNOPENED CD PACKAGE AND ANY WRITTEN MATERIALS) FOR A FULL REFUND, OR, IF THE SOFTWARE AND WRITTEN MATERIALS ARE SUPPLIED AS PART OF ANOTHER PRODUCT, YOU MAY RETURN THE ENTIRE PRODUCT FOR A FULL REFUND. YOUR RIGHT TO RETURN AND REFUND EXPIRES 30 DAYS AFTER PURCHASE FROM CISCO OR AN AUTHORIZED CISCO RESELLER, AND APPLIES ONLY IF YOU ARE THE ORIGINAL END USER PURCHASER.

For purposes of this SEULA, the Product name and the Product description you have ordered is any of the following Cisco Systems Email Security Appliance ("ESA"), Cisco Systems Web Security Appliance ("WSA") and Cisco Systems Security Management Application ("SMA") (collectively, "Content Security") and their Virtual Appliance equivalent ("Software"):

Cisco AsyncOS for Email  
Cisco AsyncOS for Web  
Cisco AsyncOS for Management  
Cisco Email Anti-Spam, Sophos Anti-Virus  
Cisco Email Outbreak Filters  
Cloudmark Anti-Spam  
Cisco Image Analyzer  
McAfee Anti-Virus  
Cisco Intelligent Multi-Scan  
Cisco Data Loss Prevention  
Cisco Email Encryption  
Cisco Email Delivery Mode  
Cisco Web Usage Controls  
Cisco Web Reputation  
Sophos Anti-Malware  
Webroot Anti-Malware  
McAfee Anti-Malware  
Cisco Email Reporting  
Cisco Email Message Tracking  
Cisco Email Centralized Quarantine
Cisco Web Reporting
Cisco Web Policy and Configuration Management
Cisco Advanced Web Security Management with Splunk
Email Encryption for Encryption Appliances
Email Encryption for System Generated Bulk Email
Email Encryption and Public Key Encryption for Encryption Appliances
Large Attachment Handling for Encryption Appliances
Secure Mailbox License for Encryption Appliances

Definitions
For purposes of this SEULA, the following definitions apply:

"Company Service" means the Company's email, Internet, security management services provided to End Users for the purposes of conducting Company's internal business.

"End User" means: (1) for the WSA and SMA, the employee, contractor or other agent authorized by Company to access the Internet and the SMA via the Company Service; and (2) for the ESA, the email boxes of the employees, contractors, or other agent authorized by Company to access or use the email services via the Company Service.

"Ordering Document" means the purchase agreement, evaluation agreement, beta, pre-release agreement or similar agreement between the Company and Cisco or the Company and a Cisco reseller, or the valid terms of any purchase order accepted by Cisco in connection therewith, containing the purchase terms for the Software license granted by this Agreement.

"Personally Identifiable Information" means any information that can be used to identify an individual, including, but not limited to, an individual's name, user name, email address and any other personally identifiable information.

"Server" means a single physical computer or devices on a network that manages or provides network resources for multiple users.

"Services" means Cisco Software Subscription Services.

"Telemetry Data" means samples of Company's email and web traffic, including data on email message and web request attributes and information on how different types of email messages and web requests were handled by Company's Cisco hardware products. Email message metadata and web requests included in Telemetry Data are anonymized and obfuscated to remove any Personally Identifiable Information.

"Term" means the length of the Software subscription You purchased, as indicated in your Ordering Document.

"Virtual Appliance" means the virtual version of Cisco's email security appliances, web security appliances, and security management appliances.

"Virtual Machine" means a software container that can run its own operating system and execute applications like a Server.

Additional License Terms and Conditions
LICENSE GRANTS AND CONSENT TO TERMS OF DATA COLLECTION
License of Software.

By using the Software and the Documentation, Company agrees to be bound by the terms of this Agreement, and so long as Company is in compliance with this Agreement, Cisco hereby grants to Company a nonexclusive, non-sublicensable, non-transferable, worldwide license during the Term to use the Software only on Cisco's hardware products, or in the case of the Virtual Appliances, on a Virtual Machine, solely in connection with the provision of the Company Service to End Users. The number of End Users licensed for the use of the Software is limited to the number of End Users specified in the Ordering Documents. In the event that the number of End Users in connection with the provision of the Company Service exceeds the number of End Users specified in the Ordering Documents, Company shall contact an Approved Source to purchase additional licenses for the Software. The duration and scope of this license(s) is further defined in the Ordering Document. The Ordering Document supersedes the EULA with respect to the term of the Software license. Except for the license rights granted herein, no right, title or interest in any Software is granted to the Company by Cisco, Cisco's resellers or their respective licensors. Your entitlement to Upgrades to the Software is subject to the Service Description. This Agreement and the Services are co-terminus.

Consent and License to Use Data.

Subject to the Cisco Privacy Statement at http://www.cisco.com/web/siteassets/legal/privacy.html, Company hereby consents and grants to Cisco a license to collect and use Telemetry Data from the Company. Cisco does not collect or use Personally Identifiable Information in the Telemetry Data. Cisco may share aggregated and anonymous Telemetry Data with third parties to assist us in improving your user experience and the Software and other Cisco security products and services. Company may terminate Cisco's right to collect Telemetry Data at any time by disabling SenderBase Network Participation in the Software. Instructions to enable or disable SenderBase Network Participation are available in the Software configuration guide.

Description of Other Rights and Obligations

Please refer to the Cisco Systems, Inc. End User License Agreement, Privacy Statement and Service Description of Software Subscription Support Services.
