About the REST APIs

Automation relies on the Application Policy Infrastructure Controller (APIC) northbound Representational State Transfer (REST) APIs. Anything that can be done through the APIC UI can also be done using XML-based REST POSTs using the northbound APIs. For example, you can monitor events through those APIs, dynamically enable EPGs, and add policies.

You can also use the northbound REST APIs to monitor for notifications that a device has been brought onboard, and to monitor faults. In both cases, you can use the monitoring as events that trigger specific actions. For example, if you see faults that occur on a specific application tier and determine that there is a loss of connectivity and a leaf node is going down, you can trigger an action to redeploy those applications somewhere else. If you have certain contracts on which you detect packet drops occurring, you could enable some copies of those contracts on the particular application. You can also use a statistics monitoring policy, where you monitor certain counters because of issues that have been reported.

The *Cisco APIC REST API User Guide* contains a list of the northbound REST APIs, along with information on how you can use the APIs. You can write your own orchestration tools using these APIs to configure your services on the APIC.

For information on how to construct the XML files submitted to the APIC northbound API, see *Cisco APIC Layer 4 to Layer 7 Device Package Development Guide*.

The following Python APIs, defined in the *Cisco APIC Management Information Model Reference*, can be used to submit REST POST calls using the northbound API:

- `vns:LDevVip`: Upload a device cluster
- `vns:CDev`: Upload a device
- `vns:LIF`: Create logical interfaces
- `vns:AbsGraph`: Create a graph
- `vz:BrCP`: Attach a graph to a contract

For information on how to construct POSTs using the northbound REST API, including information how to do so in Python, see the *Cisco APIC REST API User Guide*.

Examples of Automating Using the REST APIs

      <fvRsCtx tnFvCtxName="MyNetwork"/>
      <fvSubnet ip="10.10.10.10/24">
        </fvSubnet>
      </fvBD>

    <!-- Bridge Domain for MyClnt EPG -->
    <fvBD name="MyClntBD">
      <fvRsCtx tnFvCtxName="MyNetwork"/>
