

CHAPTER 4

Configuring Call Home

Call Home provides e-mail-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. Common uses of this feature may include direct paging of a network support engineer, e-mail notification to a Network Operations Center, and utilization of Cisco Smart Call Home services for direct case generation with the Technical Assistance Center.

Note

Cisco Autonotify is upgraded to a new capability called Smart Call Home. Smart Call Home has significant functionality improvement over Autonotify and is available across the Cisco product range. For detailed information on Smart Call Home, see the Smart Call Home page at this location: <http://www.cisco.com/go/smartcall/>

The Call Home feature provides message throttling capabilities. Periodic inventory messages, port syslog messages, and RMON alert messages are added to the list of deliverable Call Home messages. If required you can also use the Cisco Fabric Services application to distribute the Call Home configuration to all other switches in the fabric.

This chapter includes the following sections:

- [Call Home Features, page 4-2](#)
- [About Smart Call Home, page 4-3](#)
- [Obtaining Smart Call Home, page 4-5](#)

About Call Home

The Call Home service provides e-mail-based notification of critical system events. A versatile range of message formats are available for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications.

Common features may include the following:

- Paging the network support engineer
- E-mailing the Network Operations Center
- Raising a direct case with the Technical Assistance Center

The Call Home functionality is available directly through the Cisco MDS 9000 Family switches and the Cisco Nexus 5000 Series switches. It provides multiple Call Home messages, each with separate potential destinations. You can define your own destination profiles in addition to predefined profiles; you can configure up to 50 e-mail addresses for each destination profile. Flexible message delivery and format options make it easy to integrate specific support requirements.

The Call Home feature offers the following advantages:

- Fixed set of predefined alerts for trigger events on the switch.
- Automatic execution and attachment of relevant command output.

Call Home Features

The Call Home functionality is available directly through the Cisco MDS 9000 Family switches and the Cisco Nexus 5000 Series switches. It provides multiple Call Home profiles (also referred to as *Call Home destination profiles*), each with separate potential destinations. You can define your own destination profiles in addition to predefined profiles.

The Call Home function can even leverage support from Cisco Systems or another support partner. Flexible message delivery and format options make it easy to integrate specific support requirements.

The Call Home feature offers the following advantages:

- Fixed set of predefined alerts and trigger events on the switch.
- Automatic execution and attachment of relevant command output.
- Multiple message format options:
 - Short Text—Suitable for pagers or printed reports.

Send documentation comments to fm-docfeedback@cisco.com

- Plain Text—Full formatted message information suitable for human reading.
- XML—Matching readable format using Extensible Markup Language (XML) and document type definitions (DTDs) named Messaging Markup Language (MML). The MML DTD is published on the Cisco.com website at <http://www.cisco.com/>. The XML format enables communication with the Cisco Systems Technical Assistance Center.
- Multiple concurrent message destinations. You can configure up to 50 e-mail destination addresses for each destination profile.
- Multiple message categories including system, environment, switching module hardware, supervisor module, hardware, inventory, syslog, RMON, and test.

About Smart Call Home

Smart Call Home is a component of Cisco SMARTnet Service that offers proactive diagnostics, real-time alerts, and personalized web-based reports on select Cisco devices.

Smart Call Home provides fast resolution of system problems by analyzing Call Home messages sent from your devices and providing a direct notification path to Cisco customer support.

Smart Call Home offers the following features:

- Continuous device health monitoring and real-time diagnostics alerts.
- Analysis of Call Home messages from your device and where appropriate, automatic service request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.
- Secure message transport through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases requiring support for multiple devices or in cases where security requirements mandate that your devices not be connected directly to the Internet.
- Web-based access to Call Home messages and recommendations, inventory and configuration information for all Call Home devices. Provides access to associated Field Notices, Security Advisories and End-of-Life Information.

Send documentation comments to fm-docfeedback@cisco.com

Table 4-1 lists the benefits of Smart Call Home.

Table 4-1 Benefits of Smart Call Home Compared to Autonotify

Feature	Smart Call Home	Autonotify
Low touch registration	The registration process is considerably streamlined. Customers no longer need to know their device serial number or contract information. They can register devices without manual intervention from Cisco by sending a message from those devices. The procedures are outlined at www.cisco.com/go/smartcall	Requires the customer to request Cisco to add each specific serial number to the database.
Recommendations	Smart Call Home provides recommendations for known issues including those for which SRs are raised and for which SRs are not appropriate but for which customers might want to still take action on.	Autonotify raises SRs for a set of failure scenarios but no recommendations are provided for these.
Device report	Device report includes full inventory and configuration details. Once available, the information in these reports will be mapped to field notices, PSIRTs, EoX notices, configuration best practices and bugs.	No.
History report	The history report is available to look up any message and its contents, including show commands, message processing, analysis results, recommendations and service request numbers for all messages sent over the past three months.	A basic version is available that does not include contents of message.

Send documentation comments to fm-docfeedback@cisco.com

Table 4-1 Benefits of Smart Call Home Compared to Autonotify (continued)

Feature	Smart Call Home	Autonotify
Network summary report	A report that provides a summary of the make-up of devices and modules in the customer network (for those devices registered with Smart Call home)	No.
Cisco device support	Device Support will be extended across the Cisco product range. See the supported products table at www.cisco.com/go/smartcall	Deprecated in favor of Smart Call Home in October 2008.

Obtaining Smart Call Home

If you have a service contract directly with Cisco Systems, you can receive automatic case generation from the Technical Assistance Center by registering with the Smart Call Home service.

You need the following items to register:

- The SMARTnet contract number for your switch.
- Your e-mail address
- Your Cisco.com ID

For detailed information on Smart Call Home, including quick start configuration and registration steps, see the Smart Call Home page at this location:

<http://www.cisco.com/go/smartcall/>

Configuring Call Home

How you configure the Call Home process depends on how you intend to use the feature. Some points to consider include:

- An e-mail server and at least one destination profile (predefined or user-defined) must be configured. The destination profile(s) used depends on whether the receiving entity is a pager, e-mail, or automated service such as Cisco Smart Call Home.
- Switches can forward events (SNMP traps/informs) up to 10 destinations.
- The contact name (SNMP server contact), phone, and street address information must be configured before Call Home is enabled. This configuration is required to determine the origin of messages received.
- The Cisco MDS 9000 switch and the Cisco Nexus 5000 Series switch must have IP connectivity to an e-mail server.
- If Cisco Smart Call Home is used, an active service contract must cover the device being configured.

Send documentation comments to fm-docfeedback@cisco.com

To configure Call Home, follow these steps:

-
- Step 1** Assign contact information.
 - Step 2** Configure destination profiles.
 - Step 3** Associate one or more alert groups to each profile as required by your network. Customize the alert groups, if desired.
 - Step 4** Configure e-mail options.
 - Step 5** Enable or disable Call Home.
 - Step 6** Test Call Home messages.
-

Configuring Contact Information

Each switch must include e-mail, phone, and street address information. You can optionally include the contract ID, customer ID, site ID, and switch priority information.

Note

Switch priority is configured by a user for each switch in the fabric. This priority is used by the operations personnel or TAC support personnel to decide which Call Home message they should respond to first. You can prioritize Call Home alerts of the same severity from each switch.

To assign the contact information using Fabric Manager, follow these steps:

-
- Step 1** In the Fabric Manager Physical Attributes pane, expand **Switches**, expand **Events**, and select **Call Home**.

You see the Call Home tabs in the Information pane (see [Figure 4-1](#)).

Figure 4-1 Call Home in Fabric Manager

Switch	Contact	ServicePriority	Enable	Duplicate MsgThrottle
sw172-22-46-224	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-225	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-220	Mani	debug(8)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-223	mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-233	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-174	Mani	debug(8)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-221	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-222	Mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

- Step 2** In Device Manager, click **Admin > Events > Call Home** (see [Figure 4-2](#)).

Send documentation comments to fm-docfeedback@cisco.com

Figure 4-2 Call Home in Device Manager

- Step 3** Click the **General** tab, then assign contact information and enable the Call Home feature. Call Home is not enabled by default. You must enter an e-mail address that identifies the source of Call Home notifications.
- Step 4** Click the **Destination(s)** tab to configure the destination e-mail addresses for Call Home notifications. You can identify one or more e-mail addresses that will receive Call Home notifications.

Note Switches can forward events (SNMP traps/informs) up to 10 destinations.

- a. Click the **Create** tab to create a new destination. You will see the create destination window (see [Figure 4-3](#)).

Figure 4-3 Create Destination Window

- b. Enter the profile name, ID and type of destination. You can select **email** or **http** in the **Type** field. If you select email, you can enter the e-mail address in the **EmailAddress** field. The **HttpUrl** field is disabled.
- If you select http, you can enter the HTTP URL in the **HttpUrl** field. The **EmailAddress** field is disabled.
- c. Click **Create** to complete the destination profile creation.

Send documentation comments to fm-docfeedback@cisco.com

- Step 5** Click the **e-mail Setup** tab to identify the SMTP server. Identify a message server to which your switch has access. This message server will forward the Call Home notifications to the destinations.
- Step 6** In Fabric Manager, click the **Apply Changes** icon. In Device Manager, click **Apply**.
-

Destination Profiles

A destination profile contains the required delivery information for an alert notification. Destination profiles are typically configured by the network administrator. At least one destination profile is required. You can configure multiple destination profiles of one or more types. You can use one of the predefined destination profiles or define a desired profile. If you define a new profile, you must assign a profile name.

Using alert groups you can select the set of Call Home alerts to be received by a destination profile (predefined or user defined). Alert groups are predefined subsets of Call Home alerts supported in all switches in the Cisco MDS 9000 Family and the Cisco Nexus 5000 Series. Different types of Call Home alerts are grouped into different alert groups depending on their type. You can associate one or more alert groups to each profile as required by your network.

Note

If you use the Cisco Smart Call Home service, the XML destination profile is required (see http://www.cisco.com/en/US/partner/products/hw/ps4159/ps4358/products_configuration_example09186a0080108e72.shtml).

You can configure the following attributes for a destination profile:

- Profile name—A string that uniquely identifies each user-defined destination profile and is limited to 32 alphanumeric characters. The format options for a user-defined destination profile are full-txt, short-txt, or XML (default).
- Destination address—The actual address, pertinent to the transport mechanism, to which the alert should be sent.
- Message formatting—The message format used for sending the alert (full text, short text, or XML).

Configuring Destination Profiles

To configure predefined destination profile messaging options using Fabric Manager, follow these steps:

- Step 1** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.

Note

The **Destination** tab is disabled, until you click the **Profiles** tab. The profiles have to be loaded for the destination tab to be populated.

- Step 2** Click the **Profiles** tab in the Information pane.
- You see the Call Home profiles for multiple switches (see [Figure 4-4](#)).

Send documentation comments to fm-docfeedback@cisco.com

Figure 4-4 Call Home Profiles for Multiple Switches

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	dddddddd	xml	32	debug	
sw172-22-46-220	full_txt	FullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 3** Set the profile name, message format, message size, and severity level.
- Step 4** Click in the Alert Groups column and select or remove an alert group.
- Step 5** Click the **Apply Changes** icon to create this profile on the selected switches.

To configure a new destination-profile (and related parameters) using Fabric Manager, follow these steps:

- Step 1** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.

Note The **Destination** tab is disabled, until you click the **Profiles** tab. The profiles have to be loaded for the destination tab to be populated.

- Step 2** Click the **Profiles** tab in the Information pane.
You see Call Home profiles for multiple switches.

Figure 4-5 Call Home Profiles for Multiple Switches

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	dddddddd	xml	32	debug	
sw172-22-46-220	full_txt	FullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 3** Click the **Create Row** icon to add a new profile.
- Step 4** Set the profile name, message format, size, and severity level.
- Step 5** Click an alert group and select each group that you want sent in this profile.
- Step 6** Click a transport method. You can select **email**, **http** or **emailandhttp**.
- Step 7** Click **Create** to create this profile on the selected switches.

Send documentation comments to fm-docfeedback@cisco.com

Call Home Alert Groups

An alert group is a predefined subset of Call Home alerts supported in all switches in the Cisco MDS 9000 Family and Cisco Nexus 5000 Series. Alert groups allow you to select the set of Call Home alerts to be received by a destination profile (predefined or user-defined). A Call Home alert is sent to e-mail destinations in a destination profile only if that Call Home alert belongs to one of the alert groups associated with that destination profile.

Using the predefined Call Home alert groups you can generate notification messages when certain events occur on the switch. You can customize predefined alert groups to execute additional **show** commands when specific events occur and to notify you of output other than from the predefined **show** commands.

Different types of Call Home alerts are grouped into different alert groups depending on their type. You can associate one or more alert groups to each profile as required by your network.

The alert group feature allows you to select the set of Call Home alerts to be received by a destination profile (either predefined or user-defined). You can associate multiple alert groups with a destination profile.

Note

A Call Home alert is sent to e-mail destinations in a destination profile only if that Call Home alert belongs to one of the alert groups associated with that destination profile.

Associating an Alert Group

To associate an alert group with a destination profile using Fabric Manager, follow these steps:

- Step 1** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
- Step 2** Click the **Profiles** tab in the Information pane.
You see the Call Home profiles for multiple switches (see [Figure 4-6](#)).

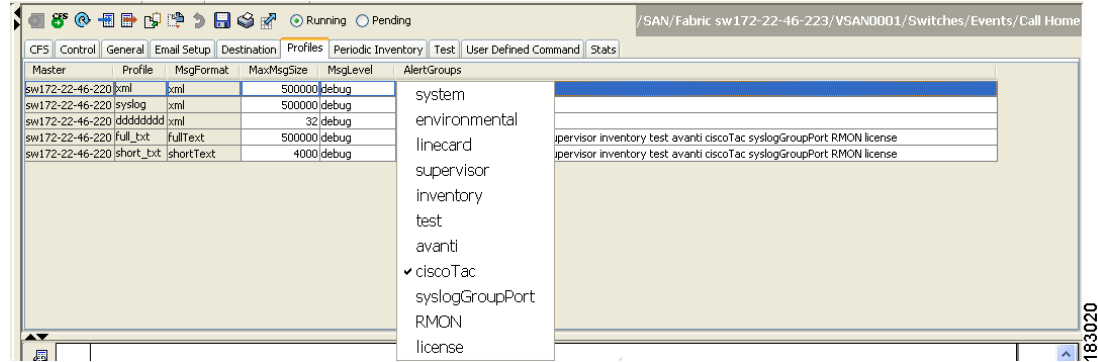

Figure 4-6 Call Home Profiles for Multiple Switches

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	dddddddd	xml	32	debug	
sw172-22-46-220	full_txt	fullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 3** Click the **Alert Groups** column in the row for the profile you want to associate.
You see the alert groups drop-down menu (see [Figure 4-7](#)).

Send documentation comments to fm-docfeedback@cisco.com

Figure 4-7 Alert Groups Drop-down Menu

- Step 4** Click an alert group to select it for association.
- Step 5** You see a check next to that alert group. To deselect it and remove the check, click it again.
- Step 6** Click the **Apply Changes** icon.

Customized Alert Group Messages

An alert group is a predefined subset of Call Home alerts supported in all switches in the Cisco MDS 9000 Family and Cisco Nexus 5000 Series switches. Alert groups allow you to select the set of Call Home alerts to be received by a destination profile (predefined or user-defined). The predefined Call Home alert groups generate notification messages when certain events occur on the switch. You can customize predefined alert groups to execute additional **show** commands when specific events occur. The output from these additional **show** commands is included in the notification message along with the output of the predefined **show** commands.

Note You can assign a maximum of five user-defined **show** commands to an alert group. Only **show** commands can be assigned to an alert group.

Note Customized **show** commands are only supported for full text and XML alert groups. Short text alert groups (short-txt-destination) do not support customized **show** commands because they only allow 128 bytes of text.

To assign **show** commands to be executed when an alert is sent, you must associate the commands with the alert group. When an alert is sent, Call Home associates the alert group with an alert type and attaches the output of the **show** commands to the alert message.

Note Make sure the destination profiles for a non-Cisco-TAC alert group, with a predefined **show** command, and the Cisco-TAC alert group are not the same.

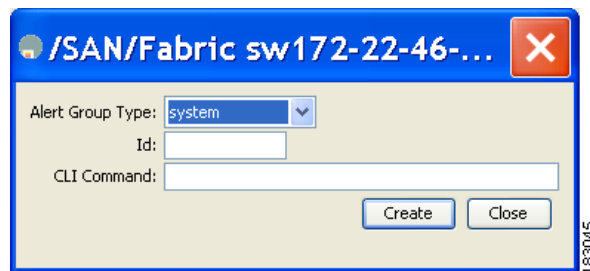

Send documentation comments to fm-docfeedback@cisco.com

Customizing Alert Group Messages

To customize Call Home alert group messages using Fabric Manager, follow these steps:

-
- Step 1** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
 - Step 2** Click the **User Defined Command** tab in the Information pane.
You see the User Defined Command information (see [Figure 4-8](#)).

Figure 4-8 User Defined Command Dialog Box

- Step 3** Click the **Create Row** icon.
 - Step 4** Check the check boxes in front of the switches from which you want to receive alerts.
 - Step 5** Select the alert group type from the Alert Group Type drop-down list.
 - Step 6** Select the ID (1-5) of the CLI command. The ID is used to keep track of the messages.
 - Step 7** Enter the CLI **show** command in the CLI Command field.
 - Step 8** Click **Create**.
 - Step 9** Repeat Steps 3 through 7 for each command you want to associate with the profile.
 - Step 10** Click **Close** to close the dialog box.
-

Call Home Message Level Feature

The Call Home message level feature allows you to filter messages based on their level of urgency. Each destination profile (predefined and user-defined) is associated with a Call Home message level threshold. Any message with a value lower than the urgency threshold is not sent. The urgency level ranges from 0 (lowest level of urgency) to 9 (highest level of urgency), and the default is 0 (all messages are sent).

Note

Call Home severity levels are not the same as system message logging severity levels.

Send documentation comments to fm-docfeedback@cisco.com

Setting the Call Home Message Levels

To set the message level for each destination profile for Call Home using Fabric Manager, follow these steps:

- Step 1** In Fabric Manager, expand the **Switches** folder in the Physical Attributes pane, expand **Events** and then select **Call Home**.
- You see the Call Home information in the Information pane.
- In Device Manager, choose **Admin > Events > Call Home**.
- Step 2** Click the **Profiles** tab in the Information Pane.
- You see the Call Home profiles (see [Figure 4-9](#)).

Figure 4-9 Call Home Profiles

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	ddddddd	xml	32	debug	
sw172-22-46-220	full_txt	FullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 3** Set a message level for each switch using the drop-down menu in the MsgLevel column.
- Step 4** Click the **Apply Changes** icon to save your changes.

Syslog-Based Alerts

You can configure the switch to send certain syslog messages as Call Home messages. The messages are sent based on the mapping between the destination profile and the alert group mapping, and on the severity level of the generated syslog message.

To receive a syslog-based Call Home alert, you must associate a destination profile with the syslog alert groups (currently there is only one syslog alert group—syslog-group-port) and configure the appropriate message level.

The syslog-group-port alert group selects syslog messages for the port facility. The Call Home application maps the syslog severity level to the corresponding Call Home severity level (see the [“Call Home Message Levels”](#) section on page 4-33). For example, if you select level 5 for the Call Home message level, syslog messages at levels 0, 1, and 2 are included in the Call Home log.

Whenever a syslog message is generated, the Call Home application sends a Call Home message depending on the mapping between the destination profile and the alert group mapping and based on the severity level of the generated syslog message. To receive a syslog-based Call Home alert, you must associate a destination profile with the syslog alert groups (currently there is only one syslog alert group—syslog-group-port) and configure the appropriate message level (see the [“Call Home Message Level Feature”](#) section on page 4-12).

Send documentation comments to fm-docfeedback@cisco.com

**Note**

Call Home does not change the syslog message level in the message text. The syslog message texts in the Call Home log appear as they are described in the *Cisco MDS 9000 Family System Messages Reference*.

Configuring the Syslog-Based Alerts

To configure the syslog-group-port alert group using Fabric Manager, follow these steps:

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane. You see the Call Home information in the Information pane.
- Step 3** Click the **Profiles** tab. You see the Call Home profiles (see [Figure 4-10](#)).

Figure 4-10 Call Home Profiles

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	ddddddd	xml	32	debug	
sw172-22-46-220	full_txt	fullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 4** Click the **Create Row** icon. You see the Create Call Home Profile dialog box.
- Step 5** Select the switches for which you want to send alerts.
- Step 6** Enter the name of the profile in the Name field.
- Step 7** Choose the message format, message size, and message severity level.
- Step 8** Check the **syslogGroupPort** check box in the AlertGroups section.
- Step 9** Click **Create** to create the profile for the syslog-based alerts.
- Step 10** Close the dialog box.

RMON-Based Alerts

You can configure the switch to send Call Home notifications corresponding to RMON alert triggers. All RMON-based Call Home messages have their message level set to NOTIFY (2). The RMON alert group is defined for all RMON-based Call Home alerts. To receive an RMON-based Call Home alert, you must associate a destination profile with the RMON alert group.

[Send documentation comments to fm-docfeedback@cisco.com](mailto:fm-docfeedback@cisco.com)

Configuring RMON Alerts

To configure RMON alert groups using Fabric Manager, follow these steps:

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
You see the Call Home information in the Information pane.
- Step 3** Click the **Profiles** tab.
You see the Call Home profiles (see [Figure 4-11](#)).

Figure 4-11 Call Home Profiles

Master	Profile	MsgFormat	MaxMsgSize	MsgLevel	AlertGroups
sw172-22-46-220	xml	xml	500000	debug	ciscoTac
sw172-22-46-220	syslog	xml	500000	debug	ciscoTac
sw172-22-46-220	ddddddd	xml	32	debug	
sw172-22-46-220	Full_txt	FullText	500000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license
sw172-22-46-220	short_txt	shortText	4000	debug	system environmental linecard supervisor inventory test avanti ciscoTac syslogGroupPort RMON license

- Step 4** Select the **Create Row** icon.
You see the Create Call Home Profile dialog box.
- Step 5** Select switches to send alerts.
- Step 6** Enter the name of the profile.
- Step 7** Select the message format, message size, and message severity level.
- Step 8** Check the **RMON** check box in the AlertGroups section.
- Step 9** Click **Create** to create the profile for the RMON-based alerts.
- Step 10** Close the dialog box.

Configuring E-Mail Options

You can configure the from, reply-to, and return-receipt e-mail addresses. While most e-mail address configurations are optional, you must configure the SMTP server address for the Call Home functionality to work.

Configuring General E-Mail Options Using HTTPS Support

The HTTPS support for Call Home provides a transport method called HTTP. HTTPS support is used for a secure communication, and HTTP is used for nonsecure communication. You can configure an HTTP URL for the Call Home destination profile as a destination. The URL link can be from a secure server or nonsecure server. For a destination profile configured with the HTTP URL, the Call Home message is posted to the HTTP URL link.

Send documentation comments to fm-docfeedback@cisco.com

**Note**

The Call Home HTTP configuration can be distributed over CFS on the switches running NX-OS Release 4.2(1) and later. The Call Home HTTP configuration cannot be distributed to switches that support the nondistributable HTTP configuration. Switches running lower versions than NX-OS Release 4.2(1) and later will ignore the HTTP configuration.

For multiple SMTP server capability, use the following command:

Periodic Inventory Notification

You can configure the switch to periodically send a message with an inventory of all software services currently enabled and running on the switch along with hardware inventory information. The inventory is modified each time the switch is restarted nondisruptively.

When you enable this feature without configuring an interval value, the Call Home message is sent every 7 days. This value ranges from 1 to 30 days. By default, this feature is disabled in all switches in the Cisco MDS 9000 Family and Cisco Nexus 5000 Series switches.

**Note**

There is no MIB available for Timeofday. You can not change the time of day of the Periodic Inventory using the Device Manager and Fabric Manager. You can use the CLI to change the time of day of the Periodic Inventory (see the *Cisco MDS 9000 Family NX-OS Configuration Guide*).

Enabling Periodic Inventory Notifications

To enable periodic inventory notification in a Cisco MDS 9000 Family switch and Cisco Nexus 5000 Series switches using Fabric Manager, follow these steps:

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
You see the Call Home information in the Information pane.
- Step 3** Click the **Periodic Inventory** tab.
You see the Call Home periodic inventory information (see [Figure 4-12](#)).

Figure 4-12 Call Home Periodic Inventory Tab

- Step 4** Select a switch in the Information pane.
- Step 5** Check the **Enable** check box.
- Step 6** Enter the number of days for which you want the inventory checked.
- Step 7** Click the **Apply Changes** icon.

[Send documentation comments to fm-docfeedback@cisco.com](mailto:fm-docfeedback@cisco.com)

Duplicate Message Throttle

You can configure a throttling mechanism to limit the number of Call Home messages received for the same event. If the same message is sent multiple times from the switch within a short period of time, you may be swamped with a large number of duplicate messages.

By default, this feature is enabled in all switches in the Cisco MDS 9000 Family and the Cisco Nexus 5000 Series switches. When enabled, if the number of messages sent exceeds the maximum limit of 30 messages within the 2-hour time frame, then additional messages for that alert type are discarded within that time frame. You cannot modify the time frame or the message counter limit.

If 2 hours have elapsed since the first such message was sent and a new message has to be sent, then the new message is sent and the time frame is reset to the time when the new message was sent and the count is reset to 1.

Enabling Message Throttling

To enable message throttling in a Cisco MDS 9000 Family switch and Cisco Nexus 5000 Series switches using Fabric Manager, follow these steps:

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane. You see the Call Home information in the Information pane.
- Step 3** Click the **Control** tab. You see the information (see [Figure 4-13](#)).

Figure 4-13 Call Home Control Tab

Switch	Contact	ServicePriority	Enable	Duplicate MsgThrottle
sw172-22-46-224	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-225	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-220	Mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-223	mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-233	Mani	debug(8)	<input type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-174	Mani	debug(8)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-221	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-222	Mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

- Step 4** Select a switch in the Information pane.
- Step 5** Check the **Duplicate Message Throttle** check box.
- Step 6** Click the **Apply Changes** icon.

Enabling Call Home Function

Once you have configured the contact information, you must enable the Call Home function.

To enable the Call Home function using Fabric Manager, follow these steps:

Send documentation comments to fm-docfeedback@cisco.com

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
You see the Call Home information in the Information pane.
- Step 3** Click the **Control** tab.
You see the information (see [Figure 4-14](#)).

Figure 4-14 Call Home Control Tab

Switch	Contact	ServicePriority	Enable	Duplicate MsgThrottle
sw172-22-46-224	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-225	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-220	Mani	debug(8)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-223	Mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-233	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-174	Mani	debug(8)	<input checked="" type="checkbox"/>	<input type="checkbox"/>
sw172-22-46-221	Mani	debug(8)	<input type="checkbox"/>	<input checked="" type="checkbox"/>
sw172-22-46-222	Mani	debug(8)	<input checked="" type="checkbox"/>	<input checked="" type="checkbox"/>

- Step 4** Select a switch in the information pane.
- Step 5** Check the **Duplicate Message Throttle** check box.
- Step 6** Click the **Apply Changes** icon.

Call Home Configuration Distribution

You can enable fabric distribution for all Cisco MDS and NX-OS 5000 switches in the fabric. When you perform Call Home configurations, and distribution is enabled, that configuration is distributed to all the switches in the fabric. However, the switch priority and the Syscontact names are not distributed.

You automatically acquire a fabric-wide lock when you enter the first configuration command operation after you enable distribution in a switch. The Call Home application uses the effective and pending database model to store or commit the configuration changes. When you commit the configuration changes, the effective database is overwritten by the configuration changes in the pending database and all the switches in the fabric receive the same configuration. After making the configuration changes, you can choose to discard the changes by aborting the changes instead of committing them. In either case, the lock is released. See [Chapter 2, “Using the CFS Infrastructure”](#) for more information on the CFS application.

Note The switch priority and the Syscontact name are not distributed.

Enabling Call Home Fabric Distribution

To enable Call Home fabric distribution using Fabric Manager, follow these steps:

- Step 1** Select a switch in the Fabric pane.
- Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
You see the Call Home information in the Information pane.

Send documentation comments to fm-docfeedback@cisco.com

Step 3 Click the CFS tab.

You see the CFS information for Call Home (see [Figure 4-15](#)).

Figure 4-15 Call Home CFS Tab

Switch	Feature Admin	Feature Oper	Global State	Config Action	Last Command	Last Result	Lock Owner Switch	Lock Owner User Name	Merge Status	Master	Scope
sw172-22-46-220	noSelection	enabled	enable	noSelection					Failure...	<input checked="" type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-221	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-224	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	n/a
sw172-22-46-222	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-223	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-233	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-225	noSelection	disabled	enable	noSelection						<input type="checkbox"/>	FcFabric ipNetwork
sw172-22-46-174	noSelection	enabled	enable	noSelection					Failure...	<input type="checkbox"/>	FcFabric ipNetwork

Step 4 Select a switch in the Information pane.

Step 5 Select **Enable** from the drop-down list in the Admin column in the row for that switch.

Step 6 Click the **Apply Changes** icon to commit the changes.

Fabric Lock Override

If you have performed a Call Home task and have forgotten to release the lock by either committing or discarding the changes, an administrator can release the lock from any switch in the fabric. If the administrator performs this task, your changes to the pending database are discarded and the fabric lock is released.

Tip

The changes are only available in the volatile directory and are subject to being discarded if the switch is restarted.

Database Merge Guidelines

See the “[CFS Merge Support](#)” section on page 2-10 for detailed concepts.

When merging two Call Home databases, follow these guidelines:

- Be aware that the merged database contains the following information:
 - A superset of all the destination profiles from the dominant and subordinate switches that take part in the merge protocol.
 - The e-mail addresses and alert groups for the destination profiles.
 - Other configuration information (for example, message throttling, periodic inventory) from the switch that existed in the dominant switch before the merge.
- Verify that two destination profiles do not have the same name (even if they have different configuration information) on the subordinate and dominant switches. If they do contain the same name, the merge operation will fail. You must then modify or delete the conflicting destination profile on the required switch.

Send documentation comments to fm-docfeedback@cisco.com

Call Home Communications Test

You can test Call Home communications by sending a test message to the configured destination(s) or sending a test inventory message to the configured destination(s).

Testing Call Home

To test the Call Home function and simulate a message generation using Fabric Manager, follow these steps:

-
- Step 1** Select a switch in the Fabric pane.
 - Step 2** Expand **Switches**, expand **Events**, and select **Call Home** in the Physical Attributes pane.
You see the Call Home information in the Information pane.
 - Step 3** Click the **Test** tab.
You see the configured tests for the switch and the status of the last testing.
 - Step 4** Select a switch in the Information pane.
 - Step 5** Select **test** or **testWithInventory** from the TestAction drop-down list in the row for that switch.
 - Step 6** Click the **Apply Changes** icon to run the test.
-

Table 4-2 includes all the traps for EMC Call Home.

Table 4-2 EMC Call Home Traps

SNMP Trap	Send EMC Call Home When
connUnitStatusChange	operStatus == failed(5)
cefcModuleStatusChange	operStatus != {ok(2), boot(5), selfTest(6), poweredUp(16), syncInProgress(21)}
cefcPowerStatusChange	operStatus = {offDenied(4), offEnvPower(5), offEnvTemp(6), offEnvFan(7), failed(8)}
cefcFRURemoved	all
cefcFanTrayStatusChange	all
cieDelayedLinkUpDown	operStatusReason != {linkFailure, adminDown, portGracefulShutdown}
cefcFRUInserted	all
entSensorThresholdNotification	value >= threshold

Clearing Call Home Name Server Database

When the Call Home name server database is full, a new entry cannot be added. The device is not allowed to come online.

To clear the name server database, increase the database size or perform a cleanup by removing unused devices. A total of 20,000 name server entries are supported.

Configuring EMC E-mail Home Delayed Traps

Fabric Manager can be configured to generate EMC E-mail Home XML e-mail messages. In SAN-OS Release 3.x or earlier, Fabric Manager listens to interface traps and generates EMC E-mail Home e-mail messages. Link traps are generated when an interface goes to down from up or vice versa. For example, if there is a scheduled server reboot, the link goes down and Fabric Manager generates an e-mail notification.

Cisco NX-OS Release 4.1(3) provides the ability to generate a delayed trap so that the number of generated e-mail messages is reduced. This method filters server reboots and avoids generating unnecessary EMC E-mail Home e-mail messages. In NX-OS Release 4.1(3), users have the ability to select the current existing feature or this new delayed trap feature.

Configuring Delayed Traps

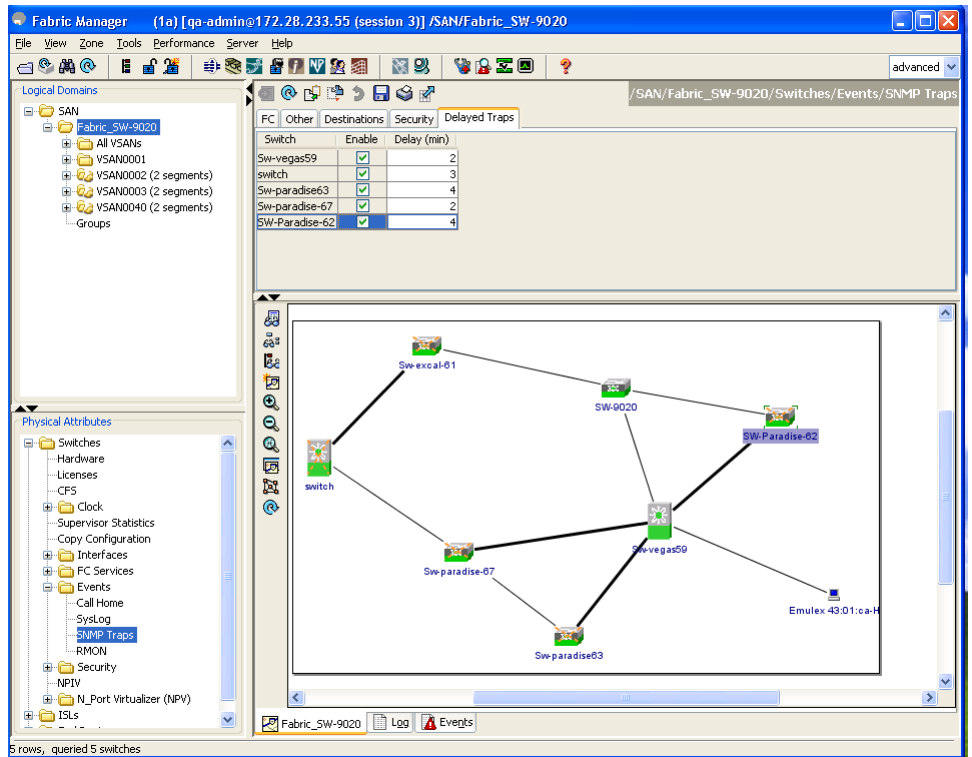

The `server.callhome.delayedtrap.enable` property is added to section 9 Call Home in the `server.properties` configuration file. The property file can enable the Fabric Manager server to use delayed traps instead of regular linkDown traps for EMC E-mail Home messages. To enable this feature, you need to turn on delayed traps at switch level, and then set the `server.callhome.delayedtrap.enable` property in the `server.properties` configuration file to true. By default, the `server.callhome.delayedtrap.enable` option is disabled and regular linkDown traps are used.

To enable delayed traps on switches running NX-OS Release 4.1(3) and later using Fabric Manager, follow these steps:

-
- Step 1** In the **Physical Attributes**, expand **Switches > Events**, and select **SNMP Traps**.
In the table above the map layout in Fabric Manager, click the **Delayed Traps** tab.

Send documentation comments to fm-docfeedback@cisco.com

Figure 4-16 Delayed Trap Dialog Box

- Step 2** Check the **Enable** check box for the switches on which you want to enable delayed traps.
- Step 3** Enter the **timer** value in the Delay column.
- Step 4** Click **Apply** to save your changes.

Note If no value is entered, the default value of 4 minutes is used.

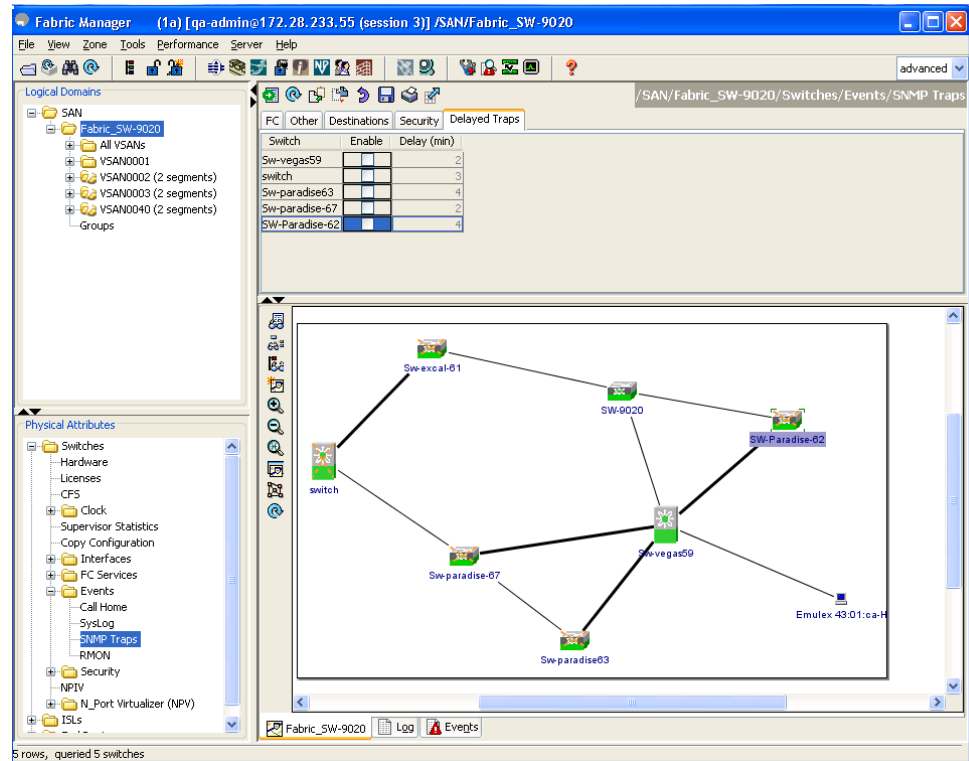

To disable delayed traps, follow these steps:

- Step 1** Uncheck the **Enable** check box.

189646

Send documentation comments to fm-docfeedback@cisco.com

Figure 4-17 Delayed Trap Dialog Box

Step 2 Click **Apply**.

Enabling Delayed Traps Using Cisco Device Manager

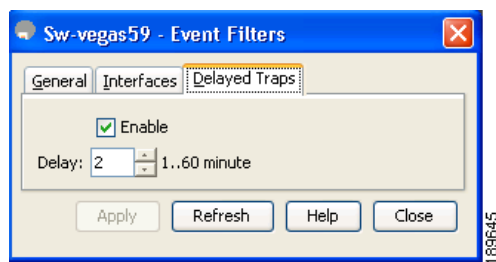

To enable the delayed trap feature using Device Manager, follow these steps:

Step 1 In Device Manager, choose **Admin > Events > Filters > Delayed Traps**.

You can see the Events Filters information in the Information pane.

Step 2 Click the **Delayed Traps** tab.

Figure 4-18 Delayed Traps Dialog Box

Step 3 Check the **Enable** check box to enable delayed traps.

Delay interval will only be available when the feature is enabled.

Send documentation comments to fm-docfeedback@cisco.com

Step 4 To disable Delayed Traps, uncheck the **Enable** check box and click **Apply**.

Figure 4-19 Disable Traps Dialog Box

Notification in Event Filter Using Cisco Device Manager

To see the descriptive notification using Device Manager, follow these steps:

Step 1 In Device Manager, choose **Admin > Events > Filters**.

You can see the Event Filters information in the Information pane (see [Figure 4-20](#)).

Figure 4-20 Event Filters

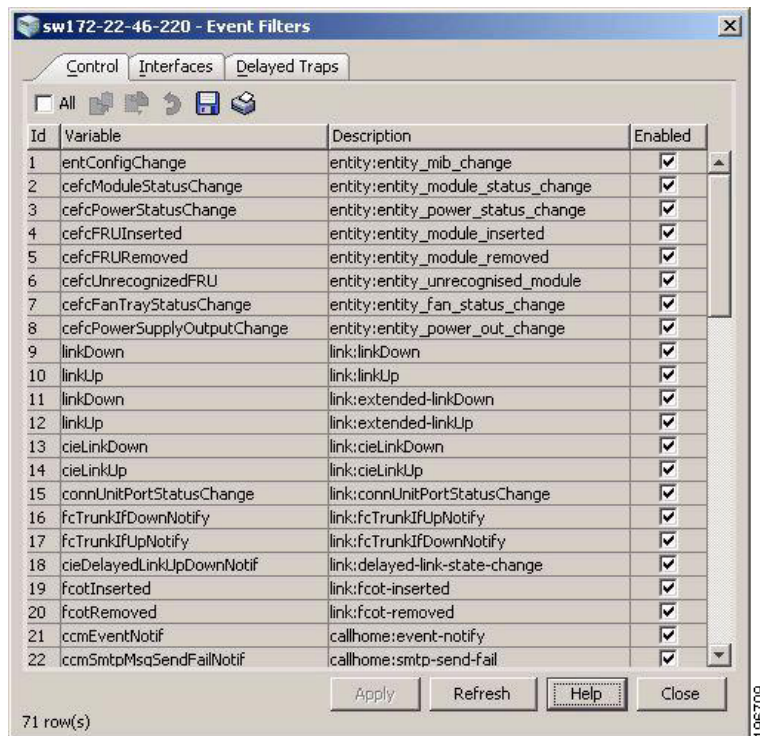

198708

The Event Filters screen displays the descriptive information about the notification (see [Figure 4-21](#)).

Event Triggers

This section discusses Call Home trigger events. Trigger events are divided into categories, with each category assigned CLI commands to execute when the event occurs. The command output is included in the transmitted message.

Table 4-3 lists the trigger events.

Table 4-3 Event Triggers

Event	Alert Group	Event Name	Description	Call Home Message Level
Call Home	System and CISCO_TAC	SW_CRASH	A software process has crashed with a stateless restart, indicating an interruption of a service.	5
	System and CISCO_TAC	SW_SYSTEM_INCONSISTENT	Inconsistency detected in software or file system.	5
	Environmental and CISCO_TAC	TEMPERATURE_ALARM	Thermal sensor indicates temperature reached operating threshold.	6
		POWER_SUPPLY_FAILURE	Power supply failed.	6
		FAN_FAILURE	Cooling fan has failed.	5
	Line Card Hardware and CISCO_TAC	LINECARD_FAILURE	Line card hardware operation failed.	7
		POWER_UP_DIAGNOSTICS_FAILURE	Line card hardware failed power-up diagnostics.	7
	Line Card Hardware and CISCO_TAC	PORT_FAILURE	Hardware failure of interface port(s).	6
	Line Card Hardware, Supervisor Hardware, and CISCO_TAC	BOOTFLASH_FAILURE	Failure of boot compact flash card.	6
	Supervisor Hardware and CISCO_TAC	NVRAM_FAILURE	Hardware failure of NVRAM on supervisor hardware.	6
	Supervisor Hardware and CISCO_TAC	FREEDISK_FAILURE	Free disk space is below a threshold on supervisor hardware.	6
	Supervisor Hardware and CISCO_TAC	SUP_FAILURE	Supervisor hardware operation failed.	7
		POWER_UP_DIAGNOSTICS_FAILURE	Supervisor hardware failed power-up diagnostics.	7
	Supervisor Hardware and CISCO_TAC	INBAND_FAILURE	Failure of in-band communications path.	7
	Supervisor Hardware and CISCO_TAC	EOBC_FAILURE	Ethernet out-of-band channel communications failure.	6

Send documentation comments to fm-docfeedback@cisco.com

Table 4-3 Event Triggers (continued)

Event	Alert Group	Event Name	Description	Call Home Message Level
Call Home	Supervisor Hardware and CISCO_TAC	MGMT_PORT_FAILURE	Hardware failure of management Ethernet port.	5
	License	LICENSE_VIOLATION	Feature in use is not licensed, and are turned off after grace period expiration.	6
Inventory	Inventory and CISCO_TAC	COLD_BOOT	Switch is powered up and reset to a cold boot sequence.	2
		HARDWARE_INSERTION	New piece of hardware inserted into the chassis.	2
		HARDWARE_REMOVAL	Hardware removed from the chassis.	2
Test	Test and CISCO_TAC	TEST	User generated test.	2
Port syslog	Syslog-group-port	SYSLOG_ALERT	Syslog messages corresponding to the port facility.	2
RMON	RMON	RMON_ALERT	RMON alert trigger messages.	2

Table 4-4 lists event categories and command outputs.

Table 4-4 Event Categories and Executed Commands

Event Category	Description	Executed Commands
System show module show version show tech-support platform show tech-support sysmgr show hardware show sprom all	Events generated by failure of a software system that is critical to unit operation.	show tech-support show system redundancy status
Environmental show module show version show environment show logging logfile tail -n 200	Events related to power, fan, and environment sensing elements such as temperature alarms.	show module show environment

Send documentation comments to fm-docfeedback@cisco.com

Table 4-4 **Event Categories and Executed Commands (continued)**

Event Category	Description	Executed Commands
Line Card Hardware show module show version show tech-support platform show tech-support sysmgr show hardware show sprom all	Events related to standard or intelligent line card hardware.	show tech-support
Supervisor Hardware show module show version show tech-support platform show tech-support sysmgr show hardware show sprom all	Events related to supervisor modules.	show tech-support
Inventory show module show version show hardware show inventory show system uptime show sprom all show license usage	Inventory status is provided whenever a unit is cold booted, or when FRUs are inserted or removed. This is considered a noncritical event, and the information is used for status and entitlement.	show version
Test show module show version	User generated test message.	show version

Call Home Message Levels

Call Home messages (sent for syslog alert groups) have the syslog severity level mapped to the Call Home message level (see the “[Syslog-Based Alerts](#)” section on page 4-13).

This section discusses the severity levels for a Call Home message when using one or more switches in the Cisco MDS 9000 Family and the Cisco Nexus 5000 Series switches. Call Home message levels are preassigned per event type.

Send documentation comments to fm-docfeedback@cisco.com

Severity levels range from 0 to 9, with 9 having the highest urgency. Each syslog level has keywords and a corresponding syslog level as listed in [Table 4-5](#).

Note

Call Home does not change the syslog message level in the message text. The syslog message texts in the Call Home log appear as they are described in the *Cisco MDS 9000 Family System Messages Reference*.

Note

Call Home severity levels are not the same as system message logging severity levels (see the *Cisco MDS 9000 Family System Messages Reference*).

Table 4-5 Severity and Syslog Level Mapping

Call Home Level	Keyword Used	Syslog Level	Description
Catastrophic (9)	Catastrophic	N/A	Network wide catastrophic failure.
Disaster (8)	Disaster	N/A	Significant network impact.
Fatal (7)	Fatal	Emergency (0)	System is unusable.
Critical (6)	Critical	Alert (1)	Critical conditions, immediate attention needed.
Major (5)	Major	Critical (2)	Major conditions.
Minor (4)	Minor	Error (3)	Minor conditions.
Warning (3)	Warning	Warning (4)	Warning conditions.
Notify (2)	Notification	Notice (5)	Basic notification and informational messages. Possibly independently insignificant.
Normal (1)	Normal	Information (6)	Normal event signifying return to normal state.
Debug (0)	Debugging	Debug (7)	Debugging messages.

Message Contents

The following contact information can be configured on the switch:

- Name of the contact person
- Phone number of the contact person
- E-mail address of the contact person
- Mailing address to which replacement parts must be shipped, if required
- Site ID of the network where the site is deployed
- Contract ID to identify the service contract of the customer with the service provider

[Table 4-6](#) describes the short text formatting option for all message types.

Send documentation comments to fm-docfeedback@cisco.com

Table 4-6 Short Text Messages

Data Item	Description
Device identification	Configured device name
Date/time stamp	Time stamp of the triggering event
Error isolation message	Plain English description of triggering event
Alarm urgency level	Error level such as that applied to system message

Table 4-7, Table 4-8, and Table 4-9 display the information contained in plain text and XML messages.

Table 4-7 Reactive Event Message Format

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Time stamp	Date and time stamp of event in ISO time notation: <i>YYYY-MM-DDTHH:MM:SS</i> . Note The time zone or daylight savings time (DST) offset from UTC has already been added or subtracted. T is the hardcoded limiter for the time.	/mml/header/time - ch:EventTime
Message name	Name of message. Specific event names are listed in the “ Event Triggers ” section on page 4-31.	/mml/header/name
Message type	Specifically “Call Home.”	/mml/header/type - ch:Type
Message group	Specifically “reactive.”	/mml/header/group
Severity level	Severity level of message (see Table 4-5).	/mml/header/level - aml-block:Severity
Source ID	Product type for routing.	/mml/header/source - ch:Series
Device ID	Unique device identifier (UDI) for end device generating message. This field should empty if the message is non-specific to a fabric switch. Format is <i>type@Sid@serial</i> , where: <ul style="list-style-type: none"> <i>type</i> is the product model number from backplane SEEPROM. @ is a separator character. <i>Sid</i> is “C,” identifying the serial ID as a chassis serial number. <i>serial</i> is the number identified by the Sid field. Example: DS-C9509@C@12345678	/mml/ header/deviceId
Customer ID	Optional user-configurable field used for contract info or other ID by any support service.	/mml/header/customerID - ch:CustomerId
Contract ID	Optional user-configurable field used for contract info or other ID by any support service.	/mml/header/contractId - ch:ContractId>
Site ID	Optional user-configurable field used for Cisco-supplied site ID or other data meaningful to alternate support service.	/mml/header/siterId - ch:SiteId

[Send documentation comments to fm-docfeedback@cisco.com](mailto:fm-docfeedback@cisco.com)

Table 4-7 Reactive Event Message Format (continued)

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Server ID	If the message is generated from the fabric switch, it is the unique device identifier (UDI) of the switch. Format is <i>type@Sid@serial</i> , where: <ul style="list-style-type: none"> <i>type</i> is the product model number from backplane SEEPROM. <i>@</i> is a separator character. <i>Sid</i> is "C" identifying the serial ID as a chassis serial number. <i>serial</i> is the number identified by the Sid field. Example: DS-C9509@C@12345678	/mml/header/serverId - -blank-
Message description	Short text describing the error.	/mml/body/msgDesc - ch:MessageDescription
Device name	Node that experienced the event. This is the host name of the device.	/mml/body/sysName - ch:SystemInfo/Name
Contact name	Name of person to contact for issues associated with the node experiencing the event.	/mml/body/sysContact - ch:SystemInfo/Contact
Contact e-mail	E-mail address of person identified as contact for this unit.	/mml/body/sysContacte-mail - ch:SystemInfo/Contacte-mail
Contact phone number	Phone number of the person identified as the contact for this unit.	/mml/body/sysContactPhone Number - ch:SystemInfo/ContactPhone Number
Street address	Optional field containing street address for RMA part shipments associated with this unit.	/mml/body/sysStreetAddress - ch:SystemInfo/StreetAddress
Model name	Model name of the switch. This is the specific model as part of a product family name.	/mml/body/chassis/name - rme:Chassis/Model
Serial number	Chassis serial number of the unit.	/mml/body/chassis/serialNo - rme:Chassis/SerialNumber
Chassis part number	Top assembly number of the chassis.	/mml/body/fru/partNo - rme:chassis/Card/PartNumber
Chassis hardware version	Hardware version of chassis.	/mml/body/chassis/hwVersion - rme:Chassis/HardwareVersion
Supervisor module software version	Top level software version.	/mml/body/fru/swVersion - rme:chassis/Card/SoftwareIde ntity
Affected FRU name	Name of the affected FRU generating the event message.	/mml/body/fru/name - rme:chassis/Card/Model
Affected FRU serial number	Serial number of affected FRU.	/mml/body/fru/serialNo - rme:chassis/Card/SerialNum ber
Affected FRU part number	Part number of affected FRU.	/mml/body/fru/partNo - rme:chassis/Card/PartNumber

Send documentation comments to fm-docfeedback@cisco.com

Table 4-7 **Reactive Event Message Format (continued)**

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
FRU slot	Slot number of FRU generating the event message.	/mml/body/fru/slot - rme:chassis/Card/LocationWithinContainer
FRU hardware version	Hardware version of affected FRU.	/mml/body/fru/hwVersion - rme:chassis/Card/SoftwareIdentity
FRU software version	Software version(s) running on affected FRU.	/mml/body/fru/swVersion - rme:chassis/Card/SoftwareIdentity
Command output name	The exact name of the issued command.	/mml/attachments/attachment/name - aml-block:Attachment/Name
Attachment type	Specifically command output.	/mml/attachments/attachment/type - aml-block:Attachment type
MIME type	Normally text or plain or encoding type.	/mml/attachments/attachment/mime - aml-block:Attachment/Data encoding
Command output text	Output of command automatically executed (see Table 4-4).	/mml/attachments/attachment/atdata - aml-block:Attachment/Data

Table 4-8 **Inventory Event Message Format**

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Time stamp	Date and time stamp of event in ISO time notation: <i>YYYY-MM-DDTHH:MM:SS</i> . Note The time zone or daylight savings time (DST) offset from UTC has already been added or subtracted. T is the hardcoded limiter for the time.	/mml/header/time - ch:EventTime
Message name	Name of message. Specifically “Inventory Update” Specific event names are listed in the “Event Triggers” section on page 4-31.	/mml/header/name
Message type	Specifically “Inventory Update.”	/mml/header/type - ch-inv:Type
Message group	Specifically “proactive.”	/mml/header/group
Severity level	Severity level of inventory event is level 2 (see Table 4-5).	/mml/header/level - aml-block:Severity
Source ID	Product type for routing at Cisco. Specifically “MDS 9000.”	/mml/header/source - ch-inv:Series

[Send documentation comments to fm-docfeedback@cisco.com](mailto:fm-docfeedback@cisco.com)

Table 4-8 Inventory Event Message Format (continued)

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Device ID	<p>Unique Device Identifier (UDI) for end device generating message. This field should empty if the message is non-specific to a fabric switch. Table 4-9 User-Generated Test Message Format

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Time stamp	Date and time stamp of event in ISO time notation: <i>YYYY-MM-DDTHH:MM:SS</i> . Note The time zone or daylight savings time (DST) offset from UTC has already been added or subtracted. T is the hardcoded limiter for the time.	/mml/header/time - ch:EventTime
Message name	Name of message. Specifically test message for test type message. Specific event names listed in the “Event Triggers” section on page 4-31).	/mml/header/name
Message type	Specifically “Test Call Home.”	/mml/header/type - ch:Type
Message group	This field should be ignored by the receiving Call Home processing application, but may be populated with either “proactive” or “reactive.”	/mml/header/group
Severity level	Severity level of message, test Call Home message (see Table 4-5).	/mml/header/level - aml-block:Severity
Source ID	Product type for routing.	/mml/header/source - ch:Series
Device ID	Unique device identifier (UDI) for end device generating message. This field should empty if the message is nonspecific to a fabric switch. Format is <i>type@Sid@serial</i> , where: <ul style="list-style-type: none"> <i>type</i> is the product model number from backplane SEEPROM. @ is a separator character. <i>Sid</i> is “C” identifying the serial ID as a chassis serial number. <i>serial</i> is the number identified by the Sid field. Example: DS-C9509@C@12345678	/mml/ header /deviceId
Customer ID	Optional user-configurable field used for contract info or other ID by any support service.	/mml/header/customerID - ch:CustomerId
Contract ID	Optional user-configurable field used for contract info or other ID by any support service.	/mml/header/contractId - ch:ContractId
Site ID	Optional user-configurable field used for Cisco-supplied site ID or other data meaningful to alternate support service.	/mml/header/siterId - ch:SiteId
Server ID	If the message is generated from the fabric switch, it is the Unique device identifier (UDI) of the switch. Format is <i>type@Sid@serial</i> , where: <ul style="list-style-type: none"> <i>type</i> is the product model number from backplane SEEPROM. @ is a separator character. <i>Sid</i> is “C” identifying the serial ID as a chassis serial number. <i>serial</i> is the number identified by the Sid field. Example: “DS-C9509@C@12345678	/mml/header/serverId - -blank-
Message description	Short text describing the error.	/mml/body/msgDesc - ch:MessageDescription

Table 4-9 ***User-Generated Test Message Format (continued)***

Data Item (Plain text and XML)	Description (Plain text and XML)	XML Tag (XML only)
Device name	Switch that experienced the event.	/mml/body/sysName - ch:SystemInfo/Name
Contact name	Name of person to contact for issues associated with the node experiencing the event.	/mml/body/sysContact - ch:SystemInfo/Contact
Contact e-mail	E-mail address of person identified as contact for this unit.	/mml/body/sysContacte-mai l - ch:SystemInfo/Contacte-mai l
Contact phone number	Phone number of the person identified as the contact for this unit.	/mml/body/sysContactPhone Number - ch:SystemInfo/ContactPhon eNumber
Street address	Optional field containing street address for RMA part shipments associated with this unit.	/mml/body/sysStreetAddress - ch:SystemInfo/StreetAdres s
Model name	Model name of the switch. This is the specific model as part of a product family name.	/mml/body/chassis/name - rme:Chassis/Model
Serial number	Chassis serial number of the unit.	/mml/body/chassis/serialNo - rme:Chassis/SerialNumber
Chassis part number	Top assembly number of the chassis. For example, 800-xxx-xxxx.	/mml/body/fru/partNo - rme:chassis/Card/PartNumb er
Command output text	Output of command automatically executed after event categories listed in Table 4-4 .	/mml/attachments/attachmen t/atdata - aml-block:Attachment/Data
MIME type	Normally text or plain or encoding type.	/mml/attachments/attachmen t/mime - aml-block:Attachment/Data encoding
Attachment type	Specifically command output.	/mml/attachments/attachmen t/type - aml-block:Attachment type
Command output name	The exact name of the issued command.	/mml/attachments/attachmen t/name - aml-block:Attachment/Nam e

Default Settings

[Table 4-10](#) lists the default Call Home settings.

Send documentation comments to fm-docfeedback@cisco.com

Table 4-10 **Default Call Home Default Settings**

Parameters	Default
Destination message size for a message sent in full text format.	500,000
Destination message size for a message sent in XML format.	500,000
Destination message size for a message sent in short text format.	4000
DNS or IP address of the SMTP server to reach the server if no port is specified.	25
Alert group association with profile.	All
Format type.	XML
Call Home message level.	0 (zero)
