

CHAPTER

25

V Commands

The commands in this chapter apply to the Cisco MDS 9000 Family of multilayer directors and fabric switches. All commands are shown here in alphabetical order regardless of command mode. See “[About the CLI Command Modes](#)” section on page 1-3 to determine the appropriate mode for each command.

 virtual-domain (SDV virtual device configuration submode)

virtual-domain (SDV virtual device configuration submode)

To configure a persistent virtual domain, use the **virtual-domain** command in SDV virtual device configuration submode. To remove a persistent virtual domain, use the **no** form of the command.

virtual-domain *domain-name*

no virtual-domain *domain-name*

Syntax Description	<i>domain-name</i>	Specifies the persistent virtual domain. The range is 1 to 239 or 0x1 to 0xef.
--------------------	--------------------	--

Defaults	No virtual domains are configured by default.
----------	---

Command Modes	SDV virtual device configuration submode.
---------------	---

Command History	Release	Modification
	3.1(2)	This command was introduced.

Usage Guidelines	None.
------------------	-------

Examples	The following example shows how to configure a persistent virtual domain:
----------	---

```
switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# sdv virtual-device name sqal vsan 1
switch(config-sdv-virt-dev)# virtual-domain 1
```

Related Commands	Command	Description
	sdv enable	Enables or disables SAN device virtualization.
	show sdv statistics	Displays SAN device virtualization statistics.

virtual-fcid (SDV virtual device configuration submode)

To configure a persistent virtual FC ID, use the **virtual-fcid** command in SDV virtual device configuration submode. To remove a persistent virtual FC ID, use the the **no** form of the command.

virtual-fcid *fc-id*

no virtual-fcid *fc-id*

Syntax Description	<i>fc-id</i>	Specifies the persistent virtual FC ID. The format is <i>0xhhhhhh</i> , where <i>h</i> is a hexadecimal number.
---------------------------	--------------	---

Defaults	No virtual FC IDs are configured by default.
-----------------	--

Command Modes	SDV virtual device configuration submode.
----------------------	---

Command History	Release	Modification
	3.1(2)	This command was introduced.

Usage Guidelines	None.
-------------------------	-------

Examples	The following example shows how to configure a persistent virtual FC ID:
-----------------	--

```
switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# sdv virtual-device name sqal vsan 1
switch(config-sdv-virt-dev)# virtual-fcid 0xd66e54
```

Related Commands	Command	Description
	sdv enable	Enables or disables SAN device virtualization.
	show sdv statistics	Displays SAN device virtualization statistics.

vrrp

vrrp

To enable VRRP, use the **vrrp** command in configuration mode. Use the **no** form of the command to revert to the factory defaults or to negate a command.

```
vrrp ipv4-vr-group-number {address ip-address [secondary] | advertisement-interval seconds | authentication {md5 keyname spi index | text password} | preempt | priority value | shutdown | track interface {mgmt 0 | vsan vsan-id} } ipv6 ipv6-vr-group-number {address ipv6-address | advertisement-interval centiseconds | preempt | priority value | shutdown | track interface {mgmt 0 | vsan vsan-id} }
```

```
vrrp ipv4-vr-group-number address ip-address [secondary] | advertisement-interval seconds | authentication {md5 keyname spi index | text password} | preempt | priority value | shutdown | track interface {mgmt 0 | vsan vsan-id} } ipv6 ipv6-vr-group-number {address ipv6-address | advertisement-interval centiseconds | preempt | priority value | shutdown | track interface {mgmt 0 | vsan vsan-id} }
```

Syntax Description	
<i>ipv4-vr-group-number</i>	Specifies an IPv4 virtual router group number. The range is 1 to 255.
address <i>ip-address</i>	Adds or removes an IP address to the virtual router.
secondary	(Optional) Configures a virtual IP address without an owner.
advertisement-interval <i>seconds</i>	Sets the time interval between advertisements. For IPv4, the range is 1 to 255 seconds.
authentication	Configures the authentication method.
md5 <i>keyname</i>	Sets the MD5 authentication key. Maximum length is 16 characters.
spi <i>index</i>	Sets the security parameter index. The range is 0x0 to 0xffff.
text <i>password</i>	Sets an authentication password. Maximum length is 8 characters.
preempt	Enables preemption of lower priority master.
priority <i>value</i>	Configures the virtual router priority. The range is 1 to 254.
shutdown	Disables the VRRP configuration.
track	Tracks the availability of another interface.
interface fc <i>slot/port</i>	Adds a member using the Fibre Channel interface to a Cisco MDS 9000 Family switch.
mgmt 0	Specifies the management interface.
vsan <i>vsan-id</i>	Specifies a VSAN ID. The range is 1 to 4093.
ipv6	Specifies VRRP IPv6 on the interface. The range is 1 to 255.
<i>ipv6-vr-group-number</i>	
address <i>ipv6-address</i>	Adds or removes an IPv6 address to the virtual router.
advertisement-interval <i>centiseconds</i>	Sets the time interval between advertisements. For IPv6, the range is 100 to 4095 centiseconds.

Defaults	Disabled.
----------	-----------

Command Modes	Interface configuration mode.
---------------	-------------------------------

Command History	Release	Modified
	1.0(2)	This command was introduced.
	3.0(1)	<ul style="list-style-type: none"> Added the IPv6 option. Added the address and advertisement-interval options that are specific to IPv6.

Usage Guidelines

You enter the Virtual Router configuration submode to access the options for this command. From the VSAN or mgmt0 (management) interface configuration submode, enter **vrrp number** to enter the switch(config-if-vrrp)# prompt. By default, a virtual router is always disabled (**shutdown**). VRRP can be configured only if this state is disabled. Be sure to configure at least one IP address before attempting to enable a virtual router.

The total number of VRRP groups that can be configured on a Gigabit Ethernet port, including main interfaces and subinterfaces, cannot exceed seven. This limitation applies to both IPv4 and IPv6 groups.

**Note**

If you configure secondary VRRP IPv6 addresses on an IPFC VSAN interface, you must remove the secondary VRRP IPv6 addresses before downgrading to a release prior to Cisco Release 3.0(1). This is required only when you configure IPv6 addresses.

Examples

The following example enables VRRP configuration:

```
switch(config-if-vrrp)# no shutdown
```

The following example disables VRRP configuration:

```
switch(config-if-vrrp)# shutdown
```

The following example configures an IPv4 address for the selected VRRP:

```
switch# config terminal
switch(config)# interface vsan 1
switch(config-if)# vrrp 250
switch(config-if-vrrp)# address 10.0.0.10
```

Related Commands

Command	Description
clear vrrp	Clears all the software counters for the specified virtual router.
show vrrp	Displays VRRP configuration information.

vsan (iSCSI initiator configuration and iSLB initiator configuration)

vsan (iSCSI initiator configuration and iSLB initiator configuration)

To assign an iSCSI or iSLB initiator to a VSAN other than the default VSAN, use the **vsan** command in iSCSI initiator configuration submode or iSLB initiator configuration submode. To disable this feature, use the **no** form of the command.

vsan *vsan-id*

no vsan *vsan-id*

Syntax Description	<i>vsan-id</i> Specifies a VSAN ID. The range 1 to 4093.						
Defaults	None.						
Command Modes	iSCSI initiator configuration submode. iSLB initiator configuration submode.						
Command History	<table border="1"> <thead> <tr> <th>Release</th> <th>Modification</th> </tr> </thead> <tbody> <tr> <td>1.3(2)</td> <td>This command was introduced.</td> </tr> <tr> <td>3.0(1)</td> <td>Added iSLB initiator configuration submode.</td> </tr> </tbody> </table>	Release	Modification	1.3(2)	This command was introduced.	3.0(1)	Added iSLB initiator configuration submode.
Release	Modification						
1.3(2)	This command was introduced.						
3.0(1)	Added iSLB initiator configuration submode.						
Usage Guidelines	When you configure an iSLB initiator in a VSAN other than VSAN 1 (the default VSAN), the initiator is automatically removed from VSAN 1. For example, if you configure an iSLB initiator in VSAN 2 on						

The following example assigns an iSCSI initiator to a VSAN other than the default VSAN:

```
switch# config terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# iscsi initiator name iqn.1987-02.com.cisco.initiator
switch(config-iscsi-init)# vsan 40
switch(config-iscsi-init)#
```

The following example assigns an iSLB initiator to a VSAN other than the default VSAN:

```
switch# config t
switch(config)# islb initiator ip-address 100.10.10.10
ips-hac2(config-islb-init)# vsan ?
    <1-4093>  Enter VSAN
ips-hac2(config-islb-init)# vsan 10
```

The following example removes the iSLB initiator:

```
switch (config-islb-init)# no vsan 10
```

Related Commands	Command	Description
	iscsi initiator name	Assigns an iSCSI name and changes to iSCSI initiator configuration submode.
	show islb initiator	Displays iSLB initiator information.
	show iscsi initiator	Displays information about a configured iSCSI initiator.
	show iscsi initiator configured	Displays iSCSI initiator information for the configured iSCSI initiator.
	show iscsi initiator detail	Displays detailed iSCSI initiator information.
	show iscsi initiator summary	Displays iSCSI initiator summary information.
	show islb initiator	Displays iSLB initiator information.
	show islb initiator configured	Displays iSLB initiator information for the configured iSLB initiator.
	show islb initiator detail	Displays detailed iSLB initiator information.
	show islb initiator summary	Displays iSLB initiator summary information.

vsan database

To create multiple fabrics sharing the same physical infrastructure, assign ports to VSANs, turn on or off interop mode, load balance either per originator exchange or by source-destination ID, and in order to be able to define these VSANs and specify the various VSAN attributes, use the **vsan database** command in the vsan database submode.

Syntax Description This command has no arguments or keywords.

Defaults None.

Command Modes Configuration mode.

Command History	Release	Modification
	1.2(2)	This command was introduced.

Usage Guidelines None.

Examples The following examples show how to create multiple fabrics sharing the same physical infrastructure and how to assign ports to VSANs:

```
switch# config terminal
switch(config)# vsan database
switch(config-vsan-db) #
```

Related Commands	Command	Description
	vsan wwn	Configures a WWN for a suspended VSAN that has interop mode 4 enabled.

vsan interface

To add the interfaces to a VSAN, use the **vsan interface** command. Use the **no** form of this command to delete a configured role.

```
vsan vsan-id interface {fc slot/port | fcip fcip-id | fv slot/dpp-number/fv-port | iscsi slot/port | port-channel portchannel-number.subinterface-number}
```

```
no vsan vsan-id interface {fc slot/port | fcip fcip-id | fv slot/dpp-number/fv-port | iscsi slot/port | port-channel portchannel-number.subinterface-number}
```

Syntax Description	<p>vsan vsan-id Specifies the VSAN ID. The range is 1 to 4093.</p> <p>interface fc slot/port (Optional) Specifies the Fibre Channel interface by slot and port number on a Cisco MDS 9000 Family switch.</p> <p>interface bay port ext port (Optional) Specifies the Fibre Channel interface by port number on a Cisco Fabric Switch for HP c-Class BladeSystem or on a Cisco Fabric Switch for IBM BladeCenter. The range is 0 to 48.</p> <p>fcip fcip-id (Optional) Specifies the FCIP interface on a Cisco MDS 9000 Family switch.</p> <p>fv slot/dpp-number/fv-port Configures the virtual F port (FV port) interface in the specified slot along with the data path processor (DPP) number and the FV port number.</p> <p>iscsi slot/port (Optional) Configures the iSCSI interface in the specified slot/port on a Cisco MDS 9000 Family switch.</p> <p>port-channel portchannel-number.subinterface-number Configures the PortChannel interface specified by the PortChannel number followed by a dot (.) indicator and the subinterface number.</p>
---------------------------	--

Defaults All interfaces are in VSAN 1 by default.

Command Modes Configuration mode—vsan database submode.

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines You can configure a role so that it only allows commands to be performed for a selected set of VSANs. By default, the VSAN policy of a role is **permit**. In other words, the role can perform commands configured by the **rule** command in all VSANs. In order to selectively allow VSANs for a role, the VSAN policy needs to be set to **deny** and then the appropriate VSANs need to be permitted.

Examples The following example show how to add the interfaces to a VSAN:

vsan interface

```
switch# config terminal
switch(config)# vsan database
switch(config-vsan-db)# vsan 2
switch(config-vsan-db)# vsan 2 interface fv2/8/2
switch(config-vsan-db)# vsan 2 interface iscsi 2/1
switch(config-vsan-db)# end
switch#
```

vsan interop

To specify the VSAN interoperability mode value, use the **vsan interop** command. Use the **no** form of this command to delete a configured role.

```
vsan vsan-id interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}]
```

```
no vsan vsan-id interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}]
```

Syntax Description	vsan vsan-id Specifies the VSAN ID. The range is 1 to 4093. interop Turns on interoperability mode. mode Specifies the interop mode. The range is 1 to 4. loadbalancing Configures load-balancing scheme. src-dst-id Sets src-id/dst-id for load-balancing. src-dst-ox-id Sets ox-id/src-id/dst-id for load-balancing (default).
---------------------------	---

Defaults interop mode none and src-dst-ox-id.

Command Modes Configuration mode—vsan database submode.

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines You can configure a role so that it only allows commands to be performed for a selected set of VSANs. By default, the VSAN policy of a role is **permit**. In other words, the role can perform commands configured by the **rule** command in all VSANs. In order to selectively allow VSANs for a role, the VSAN policy needs to be set to **deny** and then the appropriate VSANs need to be permitted.

Examples The following example shows how to specify the Interoperability mode value for Src-id/dst-id loadbalancing:

```
switch# config terminal
switch(config)# vsan database
switch(config-vsan-db)# vsan 2
switch(config-vsan-db)# vsan 1 interop 1 loadbalancing src-dst-id
vsan 1: interoperability mode 1 allowed domain list [97-127] does not include all
assigned and configured domains or conflicts with existing allowed domain lists
switch(config-vsan-db) #
```

 vsan loadbalancing

vsan loadbalancing

To configure the VSAN loadbalancing scheme, use the **vsan loadbalancing** command. Use the **no** form of this command to delete a configured role.

vsan *vsan-id* loadbalancing {src-dst-id | src-dst-ox-id}

no vsan *vsan-id* loadbalancing {src-dst-id | src-dst-ox-id}

Syntax Description	vsan <i>vsan-id</i> Specifies the VSAN ID. The range is 1 to 4093. loadbalancing Configures load-balancing scheme. src-dst-id Sets src-id/dst-id for load-balancing. src-dst-ox-id Sets ox-id/src-id/dst-id for load-balancing (default).
---------------------------	--

Defaults . src-dst-ox-id

Command Modes Configuration mode—vsan database submode.

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines You can configure a role so that it only allows commands to be performed for a selected set of VSANs. By default, the VSAN policy of a role is **permit**. In other words, the role can perform commands configured by the **rule** command in all VSANs. In order to selectively allow VSANs for a role, the VSAN policy needs to be set to **deny** and then the appropriate VSANs need to be permitted.

Examples The following example shows how to configure loadbalancing scheme for a Src-id/dst-id loadbalancing:

```
switch# config terminal
switch(config)# vsan database
switch(config-vsan-db)# vsan 2 loadbalancing src-dst-ox-id
switch(config-vsan-db)#

```

vsan name

To assign a name to a VSAN, use the **vsan name** command. Use the **no** form of this command to delete a configured role.

```
vsan vsan-id name name [interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}] |
loadbalancing {src-dst-id | src-dst-ox-id} | suspend [interop [mode] [loadbalancing
{src-dst-id | src-dst-ox-id}]]
```

```
no vsan vsan-id name name [interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}] |
loadbalancing {src-dst-id | src-dst-ox-id} | suspend [interop [mode] [loadbalancing
{src-dst-id | src-dst-ox-id}]]
```

Syntax Description	<pre>vsan vsan-id Specifies the VSAN ID. The range is 1 to 4093. name name Assigns a name to the VSAN. Maximum length is 32 characters. interop Turns on interoperability mode. mode Specifies the interop mode. The range is 1 to 4. loadbalancing Configures load-balancing scheme. src-dst-id Sets src-id/dst-id for load-balancing. src-dst-ox-id Sets ox-id/src-id/dst-id for load-balancing (default).</pre>
---------------------------	---

Defaults no name, no suspend, interop mode none and src-dst-ox-id.

Command Modes Configuration mode—vsan database submode.

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines You can configure a role so that it only allows commands to be performed for a selected set of VSANs. By default, the VSAN policy of a role is **permit**. In other words, the role can perform commands configured by the **rule** command in all VSANs. In order to selectively allow VSANs for a role, the VSAN policy needs to be set to **deny** and then the appropriate VSANs need to be permitted.

Examples The following example shows how to assign a name to a VSAN:

```
switch# config terminal
switch(config)# vsan database
switch(config-vsan-db)# vsan 2 name vname
switch(config-vsan-db) #
```

vsan suspend

vsan suspend

To suspend a VSAN, use the **vsan suspend** command. Use the **no** form of this command to delete a configured role.

```
vsan vsan-id suspend [interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}]
src-dst-ox-id}]
```

```
no vsan vsan-id suspend [interop [mode] [loadbalancing {src-dst-id | src-dst-ox-id}]]
```

Syntax Description	
vsan vsan-id	Specifies the VSAN ID. The range is 1 to 4093.
suspend	Suspends the VSAN.
interop	Turns on interoperability mode.
<i>mode</i>	Specifies the interop mode. The range is 1 to 4.
loadbalancing	Configures load-balancing scheme.
src-dst-id	Sets src-id/dst-id for load-balancing.
src-dst-ox-id	Sets ox-id/src-id/dst-id for load-balancing (default).

Defaults interop mode none and src-dst-ox-id..

Command Modes Configuration mode—vsan database submode.

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines You can configure a role so that it only allows commands to be performed for a selected set of VSANS. By default, the VSAN policy of a role is **permit**. In other words, the role can perform commands configured by the **rule** command in all VSANS. In order to selectively allow VSANS for a role, the VSAN policy needs to be set to **deny** and then the appropriate VSANS need to be permitted.

Warning

vsan suspend command done on an active VSAN is a very invasive command that requires a lot of supervisor processing. The supervisor is responsible for logging each device out, deprogramming ACLs, removing FCNS entries, generating RSCNs, etc. Because of this, care should be taken when doing this when there are many devices logged into the switch in the VSAN. After suspending the VSAN a minimum of 5 minutes should elapse prior to doing an **no vsan suspend** to ensure that all of the prior processing has completed.

Examples The following example shows how to suspend a VSAN and enable interop mode 4:

```
switch# config t
switch(config)# vsan database
```

```
switch(config-vsan-db)# vsan 100 suspend  
switch(config-vsan-db)#[/pre>
```

 vsan policy deny

vsan policy deny

To configure a VSAN-based role, use the **vsan policy deny** command in configuration mode. Use the **no** form of this command to delete a configured role.

vsan policy deny permit vsan *vsan-id*

no vsan policy deny permit vsan *vsan-id*

Syntax Description	permit Remove commands from the role. vsan <i>vsan-id</i> Specifies the VSAN ID. The range is 1 to 4093.
---------------------------	---

Defaults	Permit.
-----------------	---------

Command Modes	Configuration mode—role name submode.
----------------------	---------------------------------------

Command History	Release	Modification
	1.2(1)	This command was introduced.

Usage Guidelines	You can configure a role so that it only allows commands to be performed for a selected set of VSANS. By default, the VSAN policy of a role is permit . In other words, the role can perform commands configured by the rule command in all VSANS. In order to selectively allow VSANS for a role, the VSAN policy needs to be set to deny and then the appropriate VSANS need to be permitted.
-------------------------	--

Examples	The following example places you in sangroup role submode:
-----------------	--

```
switch# config t
switch(config)# role name sangroup
switch(config-role)#

```

The following example changes the VSAN policy of this role to deny and places you in a submode where VSANS can be selectively permitted:

```
switch(config)# vsan policy deny
switch(config-role-vsan)#

```

The following example deletes the configured VSAN role policy and reverts to the factory default (permit):

```
switch(config-role)# no vsan policy deny

```

The following example permits this role to perform the allowed commands for VSANS 10 through 30:

```
switch(config-role)# permit vsan 10-30

```

The following example removes the permission for this role to perform commands for VSAN 15 to 20:

```
switch(config-role-vsan)#! no permit vsan 15-20

```

■ vsan policy deny
