

Cisco Application Virtual Switch Release Notes, Release 5.2(1)SV3(3.11)

This document describes the features, bugs, and limitations for the Cisco Application Virtual Switch (AVS) software.

Note: Use this document in combination with the Cisco Application Policy Infrastructure Controller (APIC) Release Notes, which you can view at the following location:

<http://www.cisco.com/c/en/us/support/cloud-systems-management/application-policy-infrastructure-controller-apic/tsd-products-support-series-home.html>

Release notes are sometimes updated with new information about restrictions and caveats. See the following website for the most recent version of this document:

<http://www.cisco.com/c/en/us/support/switches/application-virtual-switch/products-release-notes-list.html>

Table 1 shows the online change history for this document.

Table 1 Online History Change

Date	Description
2017-10-09	Created release notes for the Cisco AVS 5.2(1)SV3(3.11) release.
2018-03-30	Restored Cisco AVS 5.2(1)SV3(3.3) to Table 2.
2018-04-13	Added Cisco AVS 5.2(1)SV3(3.4) to Table 2.

[New and Changed Information](#)

[Limitations and Restrictions](#)

[Bugs \(Caveats\)](#)

[Documentation](#)

Introduction: Cisco AVS

Cisco AVS is a hypervisor-resident distributed virtual switch that is specifically designed for Cisco Application Centric Infrastructure (ACI) and managed by the Application Policy Infrastructure Controller (APIC). Cisco AVS implements the OpFlex protocol for control plane communication.

Cisco AVS supports two modes of traffic forwarding: local switching and no local switching. The forwarding mode is selected during Cisco AVS installation.

Cisco AVS is supported as a vLeaf for Cisco APIC with the VMware ESXi hypervisor. It manages a data center defined by the vCenter Server.

Cisco AVS is compatible with any upstream physical access layer switch that complies with the Ethernet standard, including Cisco Nexus switches. Cisco AVS is compatible with any server hardware listed in the [VMware Hardware Compatibility Guide](#).

Cisco AVS Software Compatibility

Cisco AVS Release 5.2(1)SV3(3.11) is supported as a vLeaf for Cisco APIC with releases 5.5, 6.0, and 6.5 of the VMware ESXi hypervisor.

Note: When you choose a Cisco AVS VIB, you must choose the one compatible with the version of VMware ESXi hypervisor that you use. ESXi 5.5 uses xxx.3.2.1.vib, ESXi 6.0 uses xxx.6.0.1.vib, and ESXi 6.5 uses xxx.6.5.1.vib.

Compatibility and Upgrade/Downgrade Considerations

Table 2 lists the compatibility of Cisco AVS with Cisco APIC. Note the following:

- The “Recommended Cisco APIC Version” in the second column of the table is the version that has been thoroughly tested with the Cisco AVS version.
- The “Upgrade Compatible” versions in the third column of the table are versions that you can upgrade from to the recommended Cisco APIC version.
For example, you cannot upgrade from Cisco APIC version 1.1(4l) to Cisco APIC version 2.1(1h); you can upgrade only from the versions in upgrade compatible list.
- The “Downgrade Compatible” versions in the third column are versions to which you can downgrade to from the recommended Cisco APIC version.
For example, you cannot downgrade from APIC version 2.1(1h) to Cisco APIC version 1.1(4l); you can downgrade only to the versions in the downgrade compatible list.
- Although you can upgrade or downgrade Cisco APIC to a compatible version, you also should upgrade or downgrade Cisco AVS to a recommended version.
For example, if you downgrade Cisco APIC from version 2.1(1h) to 2.0(2f), you also should downgrade Cisco AVS 5.2(1)SV3(2.5) to Cisco AVS 5.2(1)SV3(2.2). The Cisco AVS version in the first column is the recommended version for the Cisco APIC version in the second column.
- In the table, all Cisco APIC versions in the third column are upgrade and downgrade compatible unless otherwise stated.

Table 2 – Cisco AVS and Cisco APIC compatibility

Cisco AVS Version	Recommended Cisco APIC Version	Upgrade/Downgrade Compatible Cisco APIC Version
5.2(1)SV3(3.11)	3.0(2h)	<ul style="list-style-type: none"> • Upgrade compatible versions: 3.0(1k), 2.3(1f), 2.2(3j), 2.2(2q) • Downgrade compatible versions: 3.0(1k), 2.3(1f), 2.2(3j), 2.2(2q)

Cisco AVS Version	Recommended Cisco APIC Version	Upgrade/Downgrade Compatible Cisco APIC Version
5.2(1)SV3(3.10)	3.0(1k)	<ul style="list-style-type: none"> Upgrade compatible versions: 2.3(1f), 2.2(2k), 2.2(10) Downgrade compatible versions: 2.3(1f), 2.2(2k), 2.2(10)

5.2(1)SV3(1.10a)	1.2(1m)	1.1(4i), 1.1(4e), 1.1(3f), 1.1(2h), 1.1(1s), 1.0(4q)
5.2(1)SV3(1.10)	1.2(1i) ¹	1.1(4i), 1.1(4e), 1.1(3f), 1.1(2h), 1.1(1s), 1.0(4q)

For compatibility and other information about Cisco AVS releases earlier than 5.2(1)SV3(1.5), see the [Cisco AVS Release Notes](#) for the specific release on Cisco.com.

New and Changed Information

Cisco AVS Release 5.2(1)SV3(3.11) supports all of the features that were introduced in 5.2(1)SV3(1.10), 5.2(1)SV3(1.10a), 5.2(1)SV3(1.15), 5.2(1)SV3(1.16), 5.2(1)SV3(1.16a), 5.2(1)SV3(1.16b), 5.2(1)SV3(1.20), 5.2(1)SV3(1.20a), 5.2(1)SV3(1.25), 5.2(1)SV3(2.1), 2(1)SV3(2.1a), 5.2(1)SV3(2.2), 5.2(1)SV3(2.5), 5.2(1)SV3(2.14), 5.2(1)SV3(3.2), 5.2(1)SV3(3.5), and 5.2(1)SV3(3.10). For details, see the [Cisco Application Virtual Switch Release Notes](#) for these releases.

CoS Marking

Beginning with Cisco AVS Release 5.2(1)SV3(3.10), class of service (COS) marking is supported. CoS marking enables you to mark priority for traffic based on endpoint groups. For information about the new feature, see the section "Class of Service and Cisco AVS" in the [Cisco Application Virtual Switch Configuration Guide](#).

NetFlow Support

Cisco AVS supports NetFlow technology beginning with Cisco AVS Release 5.2(1)SV3(3.10). NetFlow technology provides the metering base for a key set of applications. These include network traffic accounting, usage-based network billing, network planning, denial of services monitoring, network monitoring, and data mining. For information, see the section "NetFlow with Virtual Machine Networking" in the [Cisco ACI Virtualization Guide](#).

Endpoint Retention

Beginning with Cisco AVS Release 5.2(1)SV3(3.10), you can introduce a delay between the time when you detach an endpoint from a host and the time it is detached from the leaf. The delay can prevent drops in traffic when you use VMotion. For information, see the section "Endpoint Retention Configuration" in the [Cisco ACI Virtualization Guide](#).

End of support for ESXi 5.1

The VMware ESXi 5.1 hypervisor is no longer supported in Cisco AVS Release 5.2(1)SV3(3.10).

Limitations and Restrictions

For Cisco AVS scalability information, see the [Verified Scalability Guide for Cisco ACI](#) for the relevant Cisco APIC release.

Changing the MTU VTEP Interface while Decommissioning Cisco APIC

If you are decommissioning a Cisco APIC, do not change the maximum transmission unit (MTU) Virtual Tunnel Endpoint (VTEP) at the same time. If you do so, when you recommission the Cisco APIC, the lease does not appear available although the leaf still has the VTEP entry.

First Hop Security Not Supported

First Hop Security is not supported for Cisco AVS VXLAN domains. A fault is raised when an EPG in a Switch Integrated Security Features (SISF) bridge domain is attached to a Cisco AVS VXLAN domain or when SISF is enabled on a bridge domain under which a Cisco AVS VXLAN EPG is present.

Intra-EPG Isolation of Microsegment EPGs not Supported

Using intra-EPG isolation on a Cisco AVS microsegment (uSeg) EPG is not currently supported. Communication will be possible between two endpoints that reside in separate uSeg EPGs if either has intra-EPG isolation enforced, regardless of any contract that exists between the two EPGs.

Upgrades of Cisco APIC, Leaf Switches, and Cisco AVS to Cisco APIC 1.2(2g) or Later

Starting with the Cisco APIC 1.2(2g) release, the Cisco AVS uses site-specific certifications; previously, the Cisco AVS used image-based certifications. So when you upgrade from an earlier release to Cisco APIC 1.2(2g) or later, you need to follow a particular sequence when upgrading Cisco APIC, leaf switches, and the Cisco AVS. See the section "Upgrading from a Previous Release to Cisco APIC Release 1.2(2g) or Later" in the [Cisco Application Virtual Switch Installation Guide](#).

Distributed Firewall when Using Direct Service Return with Load Balancing

You should disable Distributed Firewall if you are using direct service return with load balancing. If Distributed Firewall is enabled, an HTTP session will not be established.

Features not Supported for Cisco AVS with Multipod

The following features are not supported for Cisco AVS with multipod in the Cisco APIC 2.0(1.x) release:

- L3 Multicast
- Storage vMotion with two separate NFS in two separate PODs
- ERSPAN destination in different PODs
- Distributed Firewall syslog server in different PODs

Pre-provisioning not Supported for EPG Resolution Immediacy

When you set EPG resolution immediacy, Cisco AVS does not support pre-provisioning, which downloads a policy to a switch before the switch is installed.

Number of Cisco AVS Instances on ESX or ESXi Host

You can connect a single ESX or ESXi host to only one Cisco AVS at a time. You cannot add multiple Cisco AVS to a single ESX or ESXi host.

Bugs (Caveats)

Using the Bug Search Tool

Use the Bug Search tool to search for a specific bug or to search for all bugs in a release.

1. Go to <http://tools.cisco.com/bugsearch>.
2. At the Log In screen, enter your registered Cisco.com username and password; then, click **Log In**. The Bug Search page opens.
Note: If you do not have a Cisco.com username and password, you can register for them at <http://tools.cisco.com/RPF/register/register.do>.
3. To search for a specific bug, enter the bug ID in the **Search For** field and press **Return**.
4. To search for bugs in the current release:
 - a. In the **Search For** field, enter a problem, feature, or a product name and press **Return**. (Leave the other fields empty.)
 - b. When the search results are displayed, use the filter tools to find the types of bugs you are looking for. You can search for bugs by modified date, status, severity, and so forth.
5. To export the results to a spreadsheet, click the **Export Results to Excel** link.

Open Bugs

Table 3 lists the open bugs in Cisco AVS Release 5.2(1)SV3(3.11):

Table 3 – Open Cisco AVS bugs

Bug ID	Headline
CSCut61064	An IP-based microsegment breaks for a quiet VM moved to a guest OS-based microsegment in another bridge domain.
CSCux27711	ASAv ping stops at protected VMs after VEM restarts.
CSCva15371	MC traffic floods due to IGMP support limitation on Cisco AVS.
CSCvc02318	New port attach on same ltl retains old dfw syslog flows of old port.
CSCvc77434	Cisco AVS traffic not sent on uplinks after ESXi host vmnic down and up commands.
CSCvc80341	LACP hashing parameter does not persist across host reboot.
CSCvd39664	VPC LACP down on UCS C-series with VIC on ESXi 6.5 due to enic driver that comes with ESX installer.
CSCvd60582	vRealize: Add support for DVS version 6.5 in vRealize workflow for VMM creation.
CSCvd95133	VSUM 2.1: Observed exception while uploading 5.2(1)SV3(3.2) latest patch bundle.

Resolved Bugs

Table 4 lists the resolved bugs in Cisco AVS Release 5.2(1)SV3(3.11):

Table 4 – Resolved Cisco AVS bugs

Bug ID	Headline
CSCuv50632	VEM does not send an IGMP join and therefore cannot resolve ARP.

CSCuz32676	Distributed Firewall: Flows in Last_ACK even after closing the connection.
CSCuz52137	AVS shows invalid output for the command "vemcmd show dfw globals."
CSCva21169	Traffic between enforced and unenforced EPGs will not work with Cisco Ngooo as IPN.
CSCva39464	Kernel panic when putting a host into maintenance mode.
CSCva49536	Cisco AVS: Migration of ports across base and VM attributes may not work.
CSCva85030	Newer Cisco AVS doesn't report stats to older TOR.
CSCva94195	Configuration for vSwitch policy moved to VMM domain since Cisco APIC version 1.2x.
CSCvb00780	Cisco AVS doesn't apply IP or MAC microsegment EPG to VM port.
CSCvb04299	Error when adding host to AVS through vCenter Web Client.
CSCvb48774	Traffic drops when Useg EPG is deleted and source and destination endpoints are in two different TORs.
CSCvc74777	UCS topology: On VEM restart, pinning keeps change on some of hosts.

The compatible Cisco APIC version contains bug fixes; see the Cisco APIC [Release Notes](#).
