Private VLAN Configuration

Use this chapter to configure a private VLAN (PVLAN) that divides a normal VLAN into isolated Layer 2 partitions.

The chapter contains the following topics:

- Information About Private VLANs, page 4-1
- Configuring a Private VLAN, page 4-5
- Verifying Private VLAN Configuration, page 4-21
- Private VLAN Example Configuration, page 4-21
- Private VLAN Using Port Profiles Example Configuration, page 4-21
- Default Settings, page 4-25
- Additional References, page 4-25
- Feature History for Private VLANs, page 4-26

Information About Private VLANs

PVLANs achieve device isolation through the use of three separate port designations, each having its own unique set of rules regulating each connected endpoint's ability to communicate with other connected endpoints within the same private VLAN domain.

This section includes the following topics:

- Private VLAN Domains, page 4-1
- Spanning Multiple Switches, page 4-2
- Private VLAN Ports, page 4-2

Private VLAN Domains

A private VLAN domain consists of one or more pairs of VLANs. The primary VLAN makes up the domain; and each VLAN pair makes up a subdomain. The VLANs in a pair are called the primary VLAN and the secondary VLAN. All VLAN pairs within a private VLAN have the same primary VLAN. The secondary VLAN ID is what differentiates one subdomain from another (see Figure 4-1).
Spanning Multiple Switches

Private VLANs can span multiple switches, just like regular VLANs. Inter-switch link ports need not be aware of the special VLAN type and carry frames tagged with these VLANs just like they do any other frames. Private VLANs ensure that traffic from an isolated port in one switch does not reach another isolated or community port in a different switch even after traversing an inter-switch link. By embedding the isolation information at the VLAN level and by transporting it along with the packet, it is possible to maintain consistent behavior throughout the network. Therefore, the mechanism which restricts Layer 2 communication between two isolated ports in the same switch, also restricts Layer 2 communication between two isolated ports in two different switches.

Private VLAN Ports

Within a private VLAN domain, there are three separate port designations. Each port designation has its own unique set of rules which regulate the ability of one endpoint to communicate with other connected endpoints within the same private VLAN domain. The following are the three port designations:

- promiscuous
- isolated
- community

Figure 4-2 shows the private VLAN ports.
Primary VLANs and Promiscuous Ports

The primary VLAN encompasses the entire private VLAN domain. It is a part of each subdomain and provides the Layer 3 gateway out of the VLAN. A private VLAN domain has only one primary VLAN. Every port in a private VLAN domain is a member of the primary VLAN. In other words, the primary VLAN is the entire private VLAN domain.

As the name suggests, a promiscuous port (p1 in Figure 4-2) can talk to all other types of ports. A promiscuous port can talk to isolated ports as well as community ports and vice versa. Layer 3 gateways, DHCP servers and other trusted devices that need to communicate with the customer endpoints are typically connected with a promiscuous port. A promiscuous port can be either an access port or a hybrid/trunk port according to the terminology presented in Annex D of the IEEE 802.1Q specification.

Secondary VLANs and Host Ports

Secondary VLANs provide Layer 2 isolation between ports in a private VLAN domain. A private VLAN domain can have one or more subdomains. A subdomain is made up of a VLAN pair consisting of the primary VLAN and a secondary VLAN. Since the primary VLAN is a part of every subdomain, secondary VLANs differentiate the VLAN subdomains.

In order to communicate to the Layer 3 interface, a secondary VLAN must be associated with at least one of the promiscuous ports in the primary VLAN. You can associate a secondary VLAN to more than one promiscuous port within the same private VLAN domain, for example, if needed for load-balancing or redundancy. A secondary VLAN that is not associated with any promiscuous port cannot communicate with the Layer 3 interface.
A secondary VLAN can be one of the following types:

- **Isolated VLANs**—Isolated VLANs use isolated host ports. An isolated port (i1 or i2 in Figure 4-2) cannot talk to any other port in that private VLAN domain except for promiscuous ports. If a device needs to have access only to a gateway router, then it should be attached to an isolated port. An isolated port is typically an access port, but in certain applications it can also be a hybrid or trunk port.

The distinct characteristic of an isolated VLAN is that it allows all its ports to have the same degree of segregation that could be obtained from using one separate dedicated VLAN per port. Only two VLAN identifiers are consumed in providing this port isolation.

*Note* While there can be multiple community VLANs in a private VLAN domain, one isolated VLAN is sufficient to serve multiple customers. All endpoints connected to its ports are isolated at Layer 2. Service providers can assign multiple customers to the same isolated VLAN, and be assured that their Layer 2 traffic cannot be sniffed by other customers sharing the same isolated VLAN.

- **Community VLANs**—Community VLANs use community host ports. A community port (c1 or c2 in Figure 4-2) is part of a group of ports. The ports within a community can have Layer 2 communications with one another and can also talk to any promiscuous port. If an ISP customer has, for example, 4 devices and wants them isolated from those of other customers but still be able to communicate among themselves, then community ports should be used.

*Note* Because trunks can support a VLAN carrying traffic between its ports, it is possible for VLAN traffic to enter or leave the device through a trunk interface.

### Communication Between Private VLAN Ports

The following table shows how access is permitted or denied between private VLAN port types.

<table>
<thead>
<tr>
<th>Table 4-1 Communication Between Private VLAN Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>Isolated</td>
</tr>
<tr>
<td>Isolated</td>
</tr>
<tr>
<td>Promiscuous</td>
</tr>
<tr>
<td>Community 1</td>
</tr>
<tr>
<td>Community 2</td>
</tr>
<tr>
<td>Interswitch Link Port</td>
</tr>
</tbody>
</table>

1. An interswitch link port is a regular port that connects two switches and that happens to carry two or more VLANs.

2. This behavior applies to traffic traversing inter-switch link ports over an isolated VLAN only. Traffic from an inter-switch link port to an isolated port will be denied if it is in the isolated VLAN. Traffic from an inter-switch link port to an isolated port will be permitted if it is in the primary VLAN.
Configuring a Private VLAN

Use the following procedures in this section to configure a private VLAN.

- Creating a Private VLAN, page 4-5
- Configuring a VLAN as a Primary VLAN, page 4-6
- Configuring a VLAN as a Secondary VLAN, page 4-7
- Associating the VLANs in a P VLAN, page 4-9
- Configuring a Private VLAN Host Port, page 4-11
- Associating a Host Port with a Private VLAN, page 4-12
- Configuring a Layer 2 Interface as a Promiscuous Trunk Port, page 4-14
- Configuring a Private VLAN Promiscuous Access Port, page 4-16
- Associating a Promiscuous Access Port with a Private VLAN, page 4-18
- Removing a Private VLAN Configuration, page 4-19

Creating a Private VLAN

Use this procedure to create a private VLAN (P VLAN).

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- You have identified the VLAN IDs to include in this P VLAN; and they already exist on the switch.

  **Note** If the VLAN does not already exist, you are prompted to create it. To create a VLAN, see the section, Creating a VLAN, page 3-3.

- You have identified which VLAN will be the primary VLAN.
- You have identified which VLANs will be the secondary VLANs and whether they will function as community VLANs or isolated VLANs.

SUMMARY STEPS

1. `config t`
2. `vlan primary-vlan-id`
3. `private-vlan primary`
4. `vlan secondary-vlan-id`
5. `private-vlan {community | isolated}`
6. `vlan primary-vlan-id`
7. `private-vlan association {add | remove} secondary vlan-id`
8. `interface interface name`
9. `switchport mode private-vlan host`
Configuring a Private VLAN

Use this procedure to configure a VLAN to function as the primary VLAN in a PVLAN.

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- The VLAN you are configuring as a primary VLAN already exists in the system as a normal VLAN, and you know the VLAN ID.

Note: If the VLAN does not already exist, you are prompted to create it when you create the primary VLAN. To create a VLAN, see the “Creating a VLAN” procedure on page 3-3.

- For information about private VLANs, see the “Private VLANs” section on page 1-6.

SUMMARY STEPS

1. config t
2. vlan primary-vlan-id
3. private-vlan primary
4. exit
5. show vlan private-vlan
6. copy running-config startup-config
## Configuring a Private VLAN

### Configuring a VLAN as a Secondary VLAN

Use this procedure to configure VLANs to function as secondary VLANs in a PVLAN.

**BEFORE YOU BEGIN**

- You are logged in to the CLI in EXEC mode.
- The VLANs you are configuring as secondary VLANs already exists in the system as normal VLANs, and you know their VLAN IDs.
Configuring a Private VLAN

Note
If the VLAN does not already exist, you are prompted to create it when you create the secondary VLAN. To create a VLAN, see the section, Creating a VLAN, page 3-3.

- You know whether you want the secondary VLANs to be community VLANs or isolated VLANs, and the VLAN IDs for each.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

SUMMARY STEPS

1. config t
2. vlan secondary-vlan-id
3. private-vlan {community | isolated}
4. exit
5. show vlan private-vlan
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| Step 1  | config t
Example:
n1000v# configure t
n1000v(config)# | Places you in CLI Global Configuration mode. |
| Step 2  | vlan secondary-vlan-id
Example:
n1000v(config)# vlan 303
n1000v(config-vlan)# | Places you in VLAN Configuration mode for the specified VLAN; and configures the secondary VLAN ID in the running configuration. |
| Step 3  | private-vlan {community | isolated}
Example:
n1000v(config-vlan)# private-vlan community
n1000v(config-vlan)#
Example:
n1000v(config-vlan)# private-vlan isolated
n1000v(config-vlan)# | Designates the VLAN as either a community or isolated private VLAN in the running configuration. |
| Step 4  | Do one of the following:
- If you are configuring additional secondary VLANs for your PVLAN, repeat Step 2 and Step 3.
- Otherwise, continue with Step 5. |
| Step 5  | exit
Example:
n1000v(config-vlan)# exit
n1000v(config)# | Exits the VLAN Configuration mode. |
Configuring a Private VLAN

Example:

```
n1000v(config)# vlan 303
n1000v(config-vlan)# private-vlan community
n1000v(config-vlan)# exit
n1000v(config)# show vlan private-vlan
Primary Secondary Type Ports
------- --------- -------------- --------------------------------------------------
202        primary                      
303        community                      
```

Associating the VLANs in a PVLAN

Use this procedure to associate the primary VLANs in a PVLAN with the secondary VLANs.

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- The primary VLAN for this PVLAN is already configured as a PVLAN.
- The secondary VLANs for this PVLAN are already configured as PVLANs.
- You know the VLAN IDs for each VLAN that is a part of the PVLAN.
- For information about private VLANs, see the “Private VLANs” section on page 1-6.

SUMMARY STEPS

1. `config t`
2. `vlan primary-vlan-id`
3. `private-vlan association {add | remove} secondary vlan-id`
4. `exit`
5. `show vlan private-vlan`
6. `copy running-config startup-config`

Example:

```
n1000v(config)# vlan 303
n1000v(config-vlan)# private-vlan community
n1000v(config-vlan)# exit
n1000v(config)# show vlan private-vlan
Primary Secondary Type Ports
------- --------- -------------- --------------------------------------------------
202        primary                      
303        community                      
```

(Optional) Displays the PVLAN configuration.

(Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.

Example:

```
n1000v(config)# show vlan private-vlan
```

Example:

```
n1000v(config)# copy running-config startup-config
```

(Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>config t</code></td>
</tr>
</tbody>
</table>
| **Example:** | `n1000v# configure t`  
| `n1000v(config)#` | Places you in CLI Global Configuration mode. |
| **Step 2** | `vlan primary-vlan-id` |
| **Example:** | `n1000v(config)# vlan 202`  
| `n1000v(config-vlan)#` | Places you in VLAN Configuration mode and associates the VLANs to function as a PVLAN in the running configuration. |
| **Step 3** | `private-vlan association {add | remove} secondary vlan-id` |
| **Example:** | `n1000v(config-vlan)# private-vlan association add 303`  
| `n1000v(config-vlan)#` | Associates a specified secondary VLAN with the primary VLAN to function as a PVLAN in the running configuration. |
| **Step 4** | Do one of the following: |
|  | - If you are associating additional secondary VLANs, repeat **Step 3**. |
|  | - Otherwise, continue with **Step 5**. |
| **Step 5** | `exit` |
| **Example:** | `n1000v(config-vlan)# exit`  
| `n1000v(config)#` | Exits the VLAN Configuration mode and returns you to CLI Global Configuration mode. |
| **Step 6** | `show vlan private-vlan` |
| **Example:** | `n1000v(config)# show vlan private-vlan` | (Optional) Displays the PVLAN configuration. |
| **Step 7** | `copy running-config startup-config` |
| **Example:** | `n1000v(config)# copy running-config startup-config` | (Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration. |

**Example:**

```
n1000v(config)# vlan 202  
n1000v(config-vlan)# private-vlan association add 303  
n1000v(config-vlan)# exit  
n1000v(config)# show vlan private-vlan  
Primary Secondary Type Ports  
--------- --------- ---------- ---------------------------  
202 303 community Veth1  
n1000v(config)#
```
Configuring a Private VLAN Host Port

Use this procedure to configure an interface as a host port to function with a PVLAN.

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- The primary VLAN for this PVLAN is already configured as a PVLAN.
- The secondary VLANs for this PVLAN are already configured as PVLANs.
- The secondary VLANs are already associated with the primary VLAN.
- You know the name of the interface to be used with the PVLAN as a host port.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

SUMMARY STEPS

1. config t
2. interface interface name
3. switchport mode private-vlan host
4. exit
5. show interface interface name
6. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>

### Associating a Host Port with a Private VLAN

Use this procedure to associate the host port with the primary and secondary VLANs in a PVLAN.

**BEFORE YOU BEGIN**

- You are logged in to the CLI in EXEC mode.
- You know the VLAN IDs of the primary and secondary VLANs in the PVLAN.
- The primary and secondary VLANs are already configured as PVLAN.
- You know the name of the interface functioning in the PVLAN as a host port.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

**SUMMARY STEPS**

1. `config t`
2. `interface interface name`
3. `switchport private-vlan host-association primaryvlan-id secondary vlan-id(s)`
4. `exit`

---

```
Configuring a Layer 2 Interface as a Promiscuous Trunk Port

Use this procedure to configure a Layer 2 interface as a promiscuous trunk port that does the following:

- Combines multiple promiscuous ports into a single trunk port.
- Carries all normal VLANs.
- Carries multiple PVLAN primary VLANs each with selected secondary VLANs.

**Note**
A promiscuous port can be either access or trunk. If you have one primary vlan you can use a promiscuous access port. If you have multiple primary vlans you can use a promiscuous trunk port.

**BEFORE YOU BEGIN**

- You are logged in to the CLI in EXEC mode.
- The `private-vlan mapping trunk` command does not decide or override the trunk configuration of a port.
- The port is already configured in a regular trunk mode before adding the private-vlan trunk configurations.
- Primary VLANs must be added to the list of allowed VLAN for the promiscuous trunk port.
- Secondary VLANs are not configured in the allowed VLAN list.
- The trunk port can carry normal VLANs in addition to primary VLANs.

**SUMMARY STEPS**

1. `config t`
2. `interface type slot/port`
3. `switchport mode private-vlan trunk promiscuous`
4. `switchport private-vlan trunk allowed vlan all`
5. `switchport private-vlan mapping trunk primary_vlan_ID {secondary_vlan_list | add secondary_vlan_list | remove secondary_vlan_list}`
6. `exit`
7. `show interfaces [type slot/port] switchport`
8. `copy running-config startup-config`
### Configuring a Private VLAN

Configuring a Private VLAN Promiscuous Access Port

Use this procedure to configure a port to be used as a promiscuous access port in a PVLAN.

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- You know the name of the interface that will function as a promiscuous access port.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

SUMMARY STEPS

1. config t
2. interface type [slot/port | number]
3. switchport mode private-vlan promiscuous
4. exit
5. show interface type [slot/port | number]
6. copy running-config startup-config
## Detailed Steps

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> config t</td>
<td>Places you in CLI Global Configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v# configure t n1000v(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> interface type [slot/port</td>
<td>number]</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v(config-if)# interface veth1 n1000v(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v(config-if)# interface eth3/2 n1000v(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> switchport mode private-vlan promiscuous</td>
<td>Designates that the interface is to function as a promiscuous access port for a PVLAN in the running configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v(config-if)# switchport mode private-vlan promiscuous n1000v(config-if)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Returns you to Global Configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v(config-if)# exit n1000v(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 5</strong> show interface type [slot/port</td>
<td>number]</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v(config)# show interface eth3/2</td>
<td></td>
</tr>
<tr>
<td><strong>Step 6</strong> copy running-config startup-config</td>
<td>(Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.</td>
</tr>
<tr>
<td><strong>Example:</strong> n1000v# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>

**Example:**
```
Example: 
n1000v# config t
n1000v(config)# interface eth3/2
n1000v(config-if)# switchport mode private-vlan promiscuous
n1000v(config-if)# exit
n1000v(config)# show int eth3/2
```

Associating a Promiscuous Access Port with a Private VLAN

Use this procedure to associate the promiscuous access port with the primary and secondary VLANs in a PVLAN.

BEFORE YOU BEGIN

- You are logged in to the CLI in EXEC mode.
- You know the VLAN IDs of the primary and secondary VLANs in the PVLAN.
- The primary and secondary VLANs are already configured as PVLAN.
- You know the name of the interface functioning in the PVLAN as a promiscuous access port.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

SUMMARY STEPS

1. config t
2. interface type [slot/port | number]
3. switchport private-vlan mapping primary vlan-id secondary vlan-id(s)
4. exit
5. show interface type [slot/port | number]
6. copy running-config startup-config

DETAILED STEPS

<table>

Chapter 4  Private VLAN Configuration

Configuring a Private VLAN

Send document comments to nexus1k-docfeedback@cisco.com.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 3</td>
<td>switchport private-vlan mapping primary vlan-id secondary vlan-id(s)</td>
</tr>
<tr>
<td>Example:</td>
<td>n1000v(config-if)# switchport private-vlan mapping 202 303 n1000v(config-if)#</td>
</tr>
</tbody>
</table>

| Step 4  | exit | Returns you to EXEC mode. |
| Example: | n1000v(config-if)# exit n1000v(config)# |

| Step 5  | show interface type [slot/port | number] | (Optional) Displays the interface configuration. |
| Example: | n1000v(config)# show vlan private-vlan |

| Step 6  | copy running-config startup-config | (Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration. |
| Example: | n1000v# copy running-config startup-config |

Example:

```
Step 3
n1000v(config-if)# switchport private-vlan mapping 202 303
n1000v(config-if)# exit
```

```
Step 5
n1000v(config)# show vlan private-vlan
Primary  Secondary  Type             Ports
-------  ---------  ---------------  -------------------------------------------
202      303        community        Eth3/2, Veth1
```

Removing a Private VLAN Configuration

Use this procedure to remove a private VLAN configuration and return the VLAN to normal VLAN mode.

**BEFORE YOU BEGIN**

- You are logged in to the CLI in EXEC mode.
- The VLAN is configured as a private VLAN, and you know the VLAN ID.
- When you remove a PVLAN configuration, the ports associated with it become inactive.
- For information about private VLANs, see the section, Private VLANs, page 1-6.

**SUMMARY STEPS**

1. config t
2. vlan private vlan-id
3. no private-vlan {community | isolated | primary}
4. exit
5. show vlan private-vlan
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>config t</strong></td>
</tr>
</tbody>
</table>
| **Example:**                                 | **n1000v# configure t**  
n1000v(config)#**                                                      |
| **Purpose**                                  | Places you in CLI Global Configuration mode.                           |
| **Step 2**                                   | **vlan private-vlan-id**                                               |
| **Example:**                                 | **n1000v(config)# vlan 5**  
n1000v(config-vlan)#**                                                   |
| **Purpose**                                  | Places you in the VLAN configuration mode for the specified VLAN.      |
| **Step 3**                                   | **no private-vlan {community | isolated | primary}**                 |
| **Example:**                                 | **n1000v(config-vlan)# no private-vlan primary**  
n1000v(config-vlan)#**                                                   |
| **Purpose**                                  | Removes the specified VLAN from a PVLAN in the running configuration.   |
| **Step 4**                                   | **exit**                                                                |
| **Example:**                                 | **n1000v(config-vlan)# exit**  
n1000v(config)#**                                                          |
| **Purpose**                                  | Exits the VLAN configuration submode.                                  |
| **Step 5**                                   | **show vlan private-vlan**                                            |
| **Purpose**                                  | *(Optional) Displays the PVLAN configuration.*                        |
| **Step 6**                                   | **copy running-config startup-config**                                |
| **Example:**                                 | **n1000v# copy running-config startup-config**                        |
| **Purpose**                                  | *(Optional) Saves the running configuration persistently through reboots and restarts by copying it to the startup configuration.* |
Verifying Private VLAN Configuration

Use the following commands to display configuration information about private VLANs.

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>show running-config vlan &lt;vlan-id&gt;</td>
<td>Displays VLAN information.</td>
</tr>
<tr>
<td>show vlan private-vlan [type]</td>
<td>Displays information about private VLANs</td>
</tr>
<tr>
<td>show interface private-vlan mapping</td>
<td>Displays interface private VLAN information.</td>
</tr>
<tr>
<td>show interface switchport</td>
<td>Displays information about all interfaces configured as switchports.</td>
</tr>
</tbody>
</table>

Private VLAN Example Configuration

The following example shows how to configure interface Ethernet 2/6 as the following:
- private VLAN trunk port
- mapped to primary private VLAN 202 which is associated with secondary VLANs 303 and 440
- mapped to primary private VLAN 210 which is associated with secondary VLANs 310 and 450

Example:

n1000v# config t
n1000v(config)# int eth2/6
n1000v(config-if)# switchport mode private-vlan trunk promiscuous
n1000v(config-if)# switchport private-vlan trunk allowed vlan all
n1000v(config-if)# switchport private-vlan mapping trunk 202 303, 440
n1000v(config-if)# switchport private-vlan mapping trunk 210 310, 450
n1000v(config-if)# show int switchport
Name: Vethernet1
  Switchport: Enabled
  Operational Mode: trunk
  Access Mode VLAN: 156(VLAN0156)
  Trunking Native Mode VLAN: 1 (default)
  Trunking VLANs Enabled: 1-3967,4048-4093
  Administrative private-vlan host-association: not available
  Administrative private-vlan mapping: not available
  Administrative private-vlan trunk native VLAN: none
  Administrative private-vlan trunk encapsulation: dot1q
  Administrative private-vlan trunk normal VLANs: none
  Administrative private-vlan trunk private VLANs: none
  Operational private-vlan: not available

n1000v(config-if)#

Private VLAN Using Port Profiles Example Configuration

The following is a sample configuration showing interface eth2/6 using port-profile, upvlnpromtrunk156.

In this configuration, packets from secondary interfaces 153, 154, and 155 are translated into the primary VLAN 156 as a result of the command, `switchport private-vlan mapping trunk 156 153-155`.

Example:
Private VLAN Using Port Profiles Example Configuration

Send document comments to nexus1k-docfeedback@cisco.com.

```
vlan 153-154
  private-vlan community
vlan 155
  private-vlan isolated
