

# Configuring MPLS Label Imposition

---

This chapter contains information on how to configure multiprotocol label switching (MPLS) label imposition.

- [About MPLS Label Imposition, on page 1](#)
- [Guidelines and Limitations for MPLS Label Imposition, on page 2](#)

## About MPLS Label Imposition

An outgoing label stack having one or more labels can be statically provisioned using the MPLS Label Stack Imposition feature. The outgoing label stack is used in the following two types of statically configured MPLS bindings:

- Prefix and Label to Label Stack - Here an IP prefix or an incoming label is mapped to an outgoing stack, similar to static MPLS. An incoming prefix is mapped to out-label-stack for IP-only ingress traffic.
- Label to Label Stack - Here only an incoming label is mapped to an outgoing stack without any prefix.

The new MPLS binding types are implemented in the static MPLS component and are available only when the **feature mpls segment-routing** command is enabled.

If configured next-hops of MPLS label imposition are SR recursive next-hops (RNH), then they are resolved to actual next-hops using RIB. The outer label of the out-label stack is imposed automatically from the SR allocated labels.

ECMP is also supported by adding a number of path configurations.

---

**Note**

The static MPLS process is started when either the **feature mpls segment-routing** command or the **feature mpls static** command is run. Certain standard static MPLS commands will not be available when static MPLS is run using the **feature mpls segment-routing** command, and the commands for MPLS bindings will not be available when the **feature mpls static** command is run.

---

# Guidelines and Limitations for MPLS Label Imposition

The MPLS label imposition has the following guidelines and limitations:

- The MPLS label imposition supports only IPv4.
- The maximum number of labels in an out-label stack is three for Nexus 3000-XL switches.
- The MPLS label imposition is supported on Nexus 3000-XL running in Nexus 9000 mode.
- Multicast is not supported for the MPLS label imposition.
- For the MPLS label imposition, upto 128 Label Switched Paths (LSPs) can be configured and each LSP can have a maximum of 32 next-hops.
- In the multi-label stack configuration, changing an outgoing path is not allowed, instead delete it.
- Sub-interfaces are not supported for multi-label imposition.
- Contention between MPLS label imposition and Segment Routing or any other routing protocol including static routes is not supported.
- The maximum number of labels in an out-label stack is three for Nexus 3000-XL switches. If more than three labels are tried to impose, then the trailing label is truncated automatically and a syslog error message appears signaling to correct the configurations.

# Configuring MPLS Label Imposition

## Enabling MPLS Label Imposition

You must install and enable the MPLS feature set and then enable the MPLS segment routing feature before you can configure MPLS label imposition.

### Procedure

	Command or Action	Purpose
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> switch# configure terminal switch(config) #	Enters global configuration mode.
<b>Step 2</b>	<b>[no] install feature-set mpls</b>  <b>Example:</b> switch(config) # install feature-set mpls	Installs the MPLS feature set. The <b>no</b> form of this command uninstalls the MPLS feature set.
<b>Step 3</b>	<b>[no] feature-set mpls</b>  <b>Example:</b> switch(config) # feature-set mpls	Enables the MPLS feature set. The <b>no</b> form of this command disables the MPLS feature set.

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 4</b>	<p><b>[no] feature mpls segment-routing</b></p> <p><b>Example:</b></p> <pre>switch(config)# feature mpls segment-routing</pre>	Enables the MPLS segment routing feature. The <b>no</b> form of this command disables the MPLS segment routing feature.
<b>Step 5</b>	<p>(Optional) <b>show feature-set</b></p> <p><b>Example:</b></p> <pre>switch(config)# show feature-set Feature Set Name      ID      State ----- mpls                  4       enabled</pre>	Displays the status of the MPLS feature set.
<b>Step 6</b>	<p>(Optional) <b>show feature   grep segment-routing</b></p> <p><b>Example:</b></p> <pre>switch(config)# show feature   grep segment-routing segment-routing      1       enabled</pre>	Displays the status of MPLS segment routing.

## Reserving Labels for MPLS Label Imposition

You can reserve the labels that are to be statically assigned. Dynamic label allocation is not supported.

### Before you begin

Ensure that the MPLS segment routing feature is enabled.

### Procedure

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<p><b>configure terminal</b></p> <p><b>Example:</b></p> <pre>switch# configure terminal switch(config) #</pre>	Enters global configuration mode.
<b>Step 2</b>	<p><b>[no] mpls label range min-value max-value</b></p> <p><b>[static min-static-value max-static-value]</b></p> <p><b>Example:</b></p> <pre>switch(config)# mpls label range 17 99 static 100 10000</pre>	<p>Reserves a range of labels for static label assignment.</p> <p>The range for the minimum and maximum values is from 16 to 471804.</p>
<b>Step 3</b>	<p>(Optional) <b>show mpls label range</b></p> <p><b>Example:</b></p> <pre>switch(config)# show mpls label range</pre>	Displays the label range that is configured for static MPLS.

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 4</b>	(Optional) <b>copy running-config startup-config</b>  <b>Example:</b> <pre>switch(config)# copy running-config startup-config</pre>	Copies the running configuration to the startup configuration.

## Configuring MPLS Label Imposition

You can configure MPLS label imposition on the device.

**Note** The **feature mpls segment-routing** command cannot be enabled when the following commands are in use: **feature nv overlay**, **nv overlay evpn**, **feature vpc**, and **feature vn-segment-vlan-based**.

### Before you begin

Ensure that the MPLS segment routing feature is enabled.

Set a static label range as follows: **mpls label range 16 16 static 17 50000**.

### Procedure

	<b>Command or Action</b>	<b>Purpose</b>
<b>Step 1</b>	<b>configure terminal</b>  <b>Example:</b> <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
<b>Step 2</b>	<b>interface type slot/port</b>  <b>Example:</b> <pre>switch(config)# interface ethernet 2/2 switch(config-if)#</pre>	Enters the interface configuration mode for the specified interface.
<b>Step 3</b>	<b>[no] mpls ip forwarding</b>  <b>Example:</b> <pre>switch(config-if)# mpls ip forwarding</pre>	Enables MPLS on the specified interface. The <b>no</b> form of this command disables MPLS on the specified interface.
<b>Step 4</b>	<b>mpls static configuration</b>  <b>Example:</b> <pre>switch(config-if)# mpls static configuration switch(config-mpls-static) #</pre>	Enters MPLS static global configuration mode.
<b>Step 5</b>	<b>address-family ipv4 unicast</b>  <b>Example:</b>	Enters global address family configuration mode for the specified IPv4 address family.

	<b>Command or Action</b>	<b>Purpose</b>
	switch(config-mpls-static)# address-family ipv4 unicast switch(config-mpls-static-af) #	
<b>Step 6</b>	<b>lsp name</b>  <b>Example:</b> switch(config-mpls-static-af) # lsp lspl switch(config-mpls-static-lsp) #	Specifies a name for LSP.
<b>Step 7</b>	<b>in-label value allocate policy prefix</b>  <b>Example:</b> switch(config-mpls-static-lsp) # in-label 8100 allocate policy 15.15.1.0/24 switch(config-mpls-static-lsp-inlabel) #	Configures an in-label value and a prefix value (optional).
<b>Step 8</b>	<b>forward</b>  <b>Example:</b> switch(config-mpls-static-lsp-inlabel) # forward switch(config-mpls-static-lsp-inlabel-forw) #	Enters the forward mode.
<b>Step 9</b>	<b>path number next-hop ip-address</b> <b>out-label-stack label-id label-id</b>  <b>Example:</b> switch(config-mpls-static-lsp-inlabel-forw) # path 1 next-hop 13.13.13.13 out-label-stack 16 3000	Specifies the path. The maximum number of supported paths is 32.
<b>Step 10</b>	(Optional) <b>copy running-config startup-config</b>  <b>Example:</b> switch(config-mpls-static-lsp-inlabel-forw) # copy running-config startup-config	Copies the running configuration to the startup configuration.

## Verifying the MPLS Label Imposition Configuration

To display the MPLS label imposition configuration, perform one of the following tasks:

<b>Command</b>	<b>Purpose</b>
<b>show feature   grep segment-routing</b>	Displays the status of MPLS label imposition.
<b>show feature-set</b>	Displays the status of the MPLS feature set.
<b>show forwarding ecmp recursive</b>	Displays VOBJ and the label stack.

## Verifying the MPLS Label Imposition Configuration

Command	Purpose
<b>show forwarding mpls ecmp [module slot   platform]</b>	Displays the MPLS forwarding statistics for equal-cost multipath (ECMP).
<b>show forwarding mpls label label</b>	Displays MPLS label forwarding statistics for a particular label.
<b>show mpls label range</b>	Displays the label range that is configured for MPLS label imposition.
<b>show mpls static binding {all   ipv4}</b>	Displays the configured static prefix or label bindings.
<b>show mpls switching [detail]</b>	Displays MPLS label switching information.
<b>show running-config mpls static</b>	Displays the running static MPLS configuration.

This example shows sample output for the **show forwarding ecmp recursive** command:

## Displaying MPLS Label Imposition Statistics

To monitor MPLS label imposition statistics, perform one of the following tasks:

Command	Purpose
<b>show forwarding [ipv4] adjacency mpls stats</b>	Displays MPLS IPv4 adjacency statistics (both, packets and bytes).
<b>show forwarding mpls drop-stats</b>	Displays MPLS forwarding packet drop statistics.
<b>show forwarding mpls label <i>label</i> stats [<i>platform</i>]</b>	Displays MPLS label forwarding statistics.
<b>show mpls forwarding statistics [<i>interface type slot/port</i>]</b>	Displays MPLS forwarding statistics.
<b>show mpls switching labels <i>low-label-value</i> [<i>high-label-value</i>] [<i>detail</i>]</b>	Displays MPLS label switching statistics. The range for the label value is from 0 to 524286.

This example shows sample output for the **show forwarding adjacency mpls stats** command:

```

```

This example shows sample output for the **show mpls forwarding statistics** command:

```

MPLS software forwarding stats summary:
  Packets/Bytes sent      : 0/0
  Packets/Bytes received   : 0/0
  Packets/Bytes forwarded  : 0/0
  Packets/Bytes originated : 0/0
  Packets/Bytes consumed   : 0/0
  Packets/Bytes input dropped : 0/0
  Packets/Bytes output dropped : 0/0

```

## Clearing MPLS Label Imposition Statistics

To clear the MPLS label imposition statistics, perform these tasks:

Command	Purpose
<b>clear forwarding [ipv4] adjacency mpls stats</b>	Clears the MPLS IPv4 adjacency statistics.
<b>clear forwarding mpls drop-stats</b>	Clears the MPLS forwarding packet drop statistics.
<b>clear forwarding mpls stats</b>	Clears the ingress MPLS forwarding statistics.
<b>clear mpls forwarding statistics</b>	Clears the MPLS forwarding statistics.
<b>clear mpls switching label statistics [interface type slot/port]</b>	Clears the MPLS switching label statistics.

## Configuration Examples for MPLS Label Imposition

This example shows how to configure MPLS label imposition by allocating a prefix and an incoming-label to out-label-stack binding:

```

switch(config-if)# mpls static configuration
switch(config-mpls-static)# address-family ipv4 unicast
switch(config-mpls-static-af)# lsp LI_TEST1
switch(config-mpls-static-lsp)# in-label 8100 allocate policy 25.25.0.0/16
switch(config-mpls-static-lsp-inlabel)# forward

```

```
switch(config-mpls-static-lsp-inlabel-forw)# path 1 next-hop 12.12.1.2 out-label-stack 3131  
17  
switch(config-mpls-static-lsp-inlabel-forw)# path 2 next-hop 12.12.2.2 out-label-stack 3131  
17  
switch(config-mpls-static-lsp-inlabel-forw)# path 3 next-hop 12.12.3.2 out-label-stack 3131  
17  
switch(config-mpls-static-lsp-inlabel-forw)# path 4 next-hop 12.12.4.2 out-label-stack 3131  
17
```

To remove a next-hop, you can use

```
no path 1
```

To remove the named lsp, you can use

```
no lsp LI_TEST1
```

This example shows how to configure MPLS label imposition by allocating an incoming-label to out-label-stack binding (no prefix):

```
switch(config-if)# mpls static configuration  
switch(config-mpls-static)# address-family ipv4 unicast  
switch(config-mpls-static-af)# lsp LI_TEST1  
switch(config-mpls-static-lsp)# in-label 8200 allocate  
switch(config-mpls-static-lsp-inlabel)# forward  
switch(config-mpls-static-lsp-inlabel-forw)# path 1 next-hop 12.12.3.2 out-label-stack 3132  
16  
switch(config-mpls-static-lsp-inlabel-forw)# path 2 next-hop 12.12.4.2 out-label-stack 3132  
16  
switch(config-mpls-static-lsp-inlabel-forw)# path 3 next-hop 12.12.1.2 out-label-stack 3132  
16  
switch(config-mpls-static-lsp-inlabel-forw)# path 4 next-hop 12.12.2.2 out-label-stack 3132  
16
```
