- Configuration Examples for Segment Routing, page 25
- Additional References, page 29

About Segment Routing

Segment routing is a technique by which the path followed by a packet is encoded in the packet itself, similar to source routing. A node steers a packet through a controlled set of instructions, called segments, by prepending the packet with a segment routing header. Each segment is identified by a segment ID (SID) consisting of a flat unsigned 32-bit integer.

Border Gateway Protocol (BGP) segments, a subclass of segments, identify a BGP forwarding instruction. Prefix segments steer packets along the shortest path to the destination, using all available equal-cost multi-path (ECMP) paths.

Border Gateway Protocol - Link State (BGP-LS) is an extension to BGP for distributing the network’s Link-State (LS) topology model to external entities. BGP-LS advertise routing updates only when they occur which uses bandwidth more effectively. They advertise only the incremental change to all routers as a multicast update. They use variable length subnet masks, which are scalable and use addressing more efficiently.

The segment routing architecture is applied directly to the MPLS data plane.
BGP Prefix SID

In order to support segment routing, BGP requires the ability to advertise a segment identifier (SID) for a BGP prefix. A BGP prefix SID is always global within the segment routing BGP domain and identifies an instruction to forward the packet over the ECMP-aware best path computed by BGP to the related prefix. The BGP prefix SID identifies the BGP prefix segment.

Segment Routing Global Block

The segment routing global block (SRGB) is the range of local labels reserved for MPLS segment routing. The default label range is from 16000 to 23999.

SRGB is the local property of a segment routing node. Each node can be configured with a different SRGB value, and hence the absolute SID value associated to a BGP prefix segment can change from node to node. The SRGB must be a proper subset of the dynamic label range and must not overlap the optional MPLS static label range. If dynamic labels in the configured or defaulted SRGB range already have been allocated, the configuration is accepted, and the existing dynamic labels that fall in the SRGB range will remain allocated to the original client. If the BGP router attempts to allocate one of these labels, the SRGB mapping fails, and the BGP router reverts to dynamic label allocation. A change to the SRGB range results in the clients deallocating their labels independent of whether the new range can be allocated.

High Availability for Segment Routing

In-service software upgrades (ISSUs) are minimally supported with BGP graceful restart. All states (including the segment routing state) must be relearned from the BGP router's peers. During the graceful restart period, the previously learned route and label state are retained.
BGP Prefix SID Deployment Example

In the simple example below, all three routers are running iBGP and advertising Network Layer Reachability Information (NRLI) to one another. The routers are also advertising their loopback interface as the next hop, which provides the ECMP between routers 2.2.2.2 and 3.3.3.3.

Figure 1: BGP Prefix SID Simple Example

Licensing Requirements for Segment Routing

The following table shows the licensing requirements for this feature:
License Requirement

Layer 3 EVPN over segment routing MPLS requires a VPN Fabric license. Other supported segment routing features do not require a license. Any feature not included in a license package is bundled with the nx-os image and is provided at no extra charge to you.

Border Gateway Protocol (BGP) requires an Enterprise Services license.

For a complete explanation of the Cisco NX-OS licensing scheme and how to obtain and apply licenses, see the Cisco NX-OS Licensing Guide.

### Guidelines and Limitations for Segment Routing

Segment routing has the following guidelines and limitations:

- Beginning with Cisco NX-OS Release, Segment Routing Application (SR-APP) module is used to configure the segment routing functionality. Segment Routing Application (SR-APP) is a separate internal process that handles all the CLIs related to segment routing. It is responsible for reserving the SRGB range and for notifying the clients about it. It is also responsible for maintaining the prefix to SID mappings. See Configuring Segment Routing Using Segment Routing Application Module for more information.

- Beginning with Cisco NX-OS Release 7.0(3)I7(3), you can configure segment routing using Segment Routing Application (SR-APP) module. SR-APP is a separate internal process that handles all the CLIs related to segment routing. SR-APP reserves the SRGB range and for notifying the clients and it maintains SID mappings prefixes.

- Starting with Cisco NX-OS Release 7.0(3)I7(3), ISIS-SR is supported on Cisco Nexus 3172, Cisco Nexus 3132, Cisco Nexus C31128PQ-10GE and Cisco Nexus N3K-C3164Q-40GE switches.

- Cisco Nexus 3500 Series switches do not support Segment Routing on Cisco NX-OS Release 7.0(3)I7(2) and the previous releases.

- Segment routing is supported only on Cisco Nexus 3100 Series switches that are running in N9K mode.

- Beginning with Cisco NX-OS Release 7.0(3)I7(3), Segment Routing is also supported on Cisco Nexus N9K-X9736C-FX line cards.

- Beginning with Cisco NX-OS Release 7.0(3)I5(1), BGP allocates a SRGB label for iBGP route-reflector clients only when next-hop-self is in effect (for example, the prefix is advertised with the next hop being one of the local IP/IPv6 addresses on RR). When you have configured next-hop-self on a RR, the next hop is changed for the routes that are being affected (subject to route-map filtering).

- A non-disruptive ISSU is not supported with MPLS features for Cisco Nexus 9300-EX and 9300-FX platform switches.

- Static MPLS, MPLS segment routing, and MPLS stripping cannot be enabled at the same time.

- Because static MPLS, MPLS segment routing, and MPLS stripping are mutually exclusive, the only segment routing underlay for multi-hop BGP is single-hop BGP. iBGP multi-hop topologies with eBGP running as an overlay are not supported.
• MPLS pop followed by a forward to a specific interface is not supported. The penultimate hop pop (PHP) is avoided by installing the Explicit NULL label as the out-label in the label FIB (LFIB) even when the control plane installs an IPv4 Implicit NULL label.

• BGP labeled unicast and BGP segment routing are not supported for IPv6 prefixes.

• BGP labeled unicast and BGP segment routing are not supported over tunnel interfaces (including GRE and VXLAN) or with vPC access interfaces.

• MTU path discovery (RFC 2923) is not supported over MPLS label switched paths (LSPs) or segment routed paths.

• The BGP configuration commands `neighbor-down fib-accelerate` and `suppress-fib-pending` are not supported for MPLS prefixes.

• The uniform model as defined in RFC 2973 and RFC 3270 is not supported. Consequently, the IP DSCP bits are not copied into the imposed MPLS header.

• Reconfiguration of the segment routing global block (SRGB) results in an automatic restart of the BGP process to update the existing URIB and ULIB entries. Traffic loss will occur for a few seconds, so you should not reconfigure the SRGB in production.

• If the segment routing global block (SRGB) is set to a range but the route-map label-index delta value is outside of the configured range, the allocated label is dynamically generated. For example, if the SRGB is set to a range of 16000-23999 but a route-map label-index is set to 9000, the label is dynamically allocated.

• For network scalability, Cisco recommends using a hierarchical routing design with multi-hop BGP for advertising the attached prefixes from a top-of-rack (TOR) or border leaf switch.

• BGP sessions are not supported over MPLS LSPs or segment routed paths.

• The Layer 3 forwarding consistency checker is not supported for MPLS routes.

• Starting with Cisco NX-OS Release 7.0(3)I5(1), Cisco Nexus 3000 switches support Link-State distribution and Egress Peer Engineering (EPE) using BGP.

• Starting with Cisco NX-OS Release 7.0(3)I7(1), Segment routing and SR-EVPN is supported on Cisco Nexus C31108PC-V, Cisco Nexus C31108TC-V and Cisco Nexus C3132Q-V switches.

Overview of BGP Egress Peer Engineering With Segment Routing

Cisco Nexus 3000 Series switches are often deployed in massive scale data centers (MSDCs). In such environments, there is a requirement to support BGP Egress Peer Engineering (EPE) with Segment Routing (SR).

Segment Routing (SR) leverages source routing. A node steers a packet through a controlled set of instructions, known as segments, by prepending the packet with an SR header. A segment can represent any topological or service-based instruction. SR allows steering a flow through any topological path or any service chain while maintaining per-flow state only at the ingress node of the SR domain. For this feature, the Segment Routing architecture is applied directly to the MPLS data plane.

In order to support Segment Routing, BGP requires the ability to advertise a Segment Identifier (SID) for a BGP prefix. A BGP-Prefix is always global within the SR or BGP domain and it identifies an instruction to
forward the packet over the ECMP-aware best-path that is computed by BGP to the related prefix. The BGP-Prefix-SID is the identifier of the BGP prefix segment.

The SR-based Egress Peer Engineering (EPE) solution allows a centralized (SDN) controller to program any egress peer policy at ingress border routers or at hosts within the domain.

In the following example, all three routers run iBGP and they advertise NRLI to one another. The routers also advertise their loopback as the next-hop and it is recursively resolved. This provides an ECMP between the routers as displayed in the illustration.

*Figure 2: Example of Egress Peer Engineering*
The SDN controller receives the Segment IDs from the egress router 1.1.1.1 for each of its peers and adjacencies. It can then intelligently advertise the exit points to other routers and hosts within the controller’s routing domain. As displayed in the illustration, the BGP Network Layer Reachability Information (NLRI) contains both the Node-SID to the Router 1.1.1.1 and the Peer-Adjacency-SID 24003, indicating that the traffic to 7.7.7.7 should egress over 12.1.1.1->12.1.1.3.

Guidelines and Limitations for BGP Egress Peer Engineering

See the following guidelines and limitations for BGP Egress Peer Engineering:

- Cisco Nexus 3500 Series switches do not support BGP Egress Peer Engineering on Cisco NX-OS Release 7.0(3)I7(2) and the previous releases.
- BGP Egress Peer Engineering is only supported for IPv4 BGP peers. IPv6 BGP peers are not supported.
- BGP Egress Peer Engineering is only supported in the default VPN Routing and Forwarding (VRF) instance.
- Any number of Egress Peer Engineering (EPE) peers may be added to an EPE peer set. However, the installed resilient per-CE FEC is limited to 32 peers.
- A given BGP neighbor can only be a member of a single peer-set. Peer-sets are configured. Multiple peer-sets are not supported. An optional peer-set name may be specified to add neighbor to a peer-set. The corresponding RPC FEC load-balances the traffic across all the peers in the peer-set. The peer-set name is a string that is a maximum length of 63 characters (64 NULL terminated). This length is consistent with the NX-OS policy name lengths. A peer can only be a member of a single peer-set.
- Adjacencies for a given peer are not separately assignable to different peer-sets.
- If a downgrade is performed from Release 7.0(3)I5(1) to Release 7.0(3)I3(1) or from Release 7.0(3)I5(1) to Release 7.0(3)I4(1) and Egress Peer Engineering (EPE) is configured, the EPE configuration is not removed even though it is not supported in Release 7.0(3)I3(1) and Release 7.0(3)I4(1).

Configuring Segment Routing

Configuring Segment Routing Using Segment Routing Application

Beginning with Cisco NX-OS Release 7.0(3)I7(3), you can configure segment routing using Segment Routing Application (SR-APP) module. SR-APP is a separate internal process that handles all the CLIs related to segment routing. SR-APP reserves the SRGB range and for notifying the clients and it maintains SID mappings prefixes. Beginning with Cisco NX-OS Release 7.0(3)I7(3), SR-APP support is added for the BGP and IS-IS protocols.

Complete the following steps to configure segment routing:

Before You Begin

Ensure the following conditions are met before configuring Segment Routing using the Segment Routing Application (SR-APP).
The feature-set mpls and feature mpls segment-routing commands should be present for configuring the segment-routing mpls command.

The feature mpls segment-routing command starts the SR-APP process.

When segment-routing mpls is configured, SR state moves to SR_DISABLED and notifies the same to the clients. In this state, clients can allow protocol specific SR configurations but clients cannot do SID label bindings.

If the global block is configured, the specified range is used. Otherwise, the default 16000 – 23999 range is used. If the value is less than 16000, then that value will be automatically converted to 16000.

With the introduction of SR-APP, all configuration is done under segment-routing mpls and the prefix SID configuration is handled by SR-APP.

BGP now uses both set label-index <value> configuration and the new connected-prefix-sid-map CLI. In case of a conflict, the configuration in SR-APP is preferred.

**SUMMARY STEPS**

1. configure terminal
2. segment-routing mpls
3. global-block <min> <max>
4. connected-prefix-sid-map
5. address-family ipv4
6. <prefix>/<masklen>[index|absolute] <label>

**DETAILED STEPS**

</table>
Enabling MPLS Segment Routing

You can enable MPLS segment routing as long as mutually-exclusive MPLS features such as static MPLS are not enabled.

Before You Begin

You must install and enable the MPLS feature set using the `install feature-set mpls` and `feature-set mpls` commands.

SUMMARY STEPS

1. `configure terminal`
2. `[no] feature mpls segment-routing`
3. (Optional) `show running-config | inc 'feature mpls segment-routing'`
4. (Optional) `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>
| Example | switch# configure terminal  
switch(config)# | |
| Step 2 | `[no] feature mpls segment-routing` | Enables the MPLS segment routing feature. The `no` form of this command disables the MPLS segment routing feature. |
| Example | switch(config)# feature mpls segment-routing | |
| Step 3 | `show running-config | inc 'feature mpls segment-routing'` | (Optional) Displays the status of the MPLS segment routing feature. |
| Example | switch(config)# show running-config | inc 'feature mpls segment-routing' |
## Enabling MPLS on an Interface

You can enable MPLS on an interface for use with segment routing.

### Before You Begin

You must install and enable the MPLS feature set using the `install feature-set mpls` and `feature-set mpls` commands.

### SUMMARY STEPS

1. `configure terminal`
2. `interface type slot/port`
3. `[no] mpls ip forwarding`
4. (Optional) `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Step 4</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>

---

### Step 1

**configure terminal**

**Example:**
```
switch# configure terminal
switch(config)#
```

### Step 2

**interface type slot/port**

**Example:**
```
switch(config)# interface ethernet 2/2
switch(config-if)#
```

### Step 3

```
[no] mpls ip forwarding
```

**Example:**
```
switch(config-if)# mpls ip forwarding
```

### Step 4

**copy running-config startup-config**

**Example:**
```
switch(config-if)# copy running-config startup-config
```
Configuring EVPN Over Segment Routing or MPLS

Starting with Cisco NX-OS Release 7.0(3)I6(1), you can configure EVPN over segment routing or MPLS. Follow these steps to configure EVPN over segment routing or MPLS:

Before You Begin

You must enable the command `feature interface-vlan` before configuring EVPN over segment routing or MPLS.

SUMMARY STEPS

1. `feature bgp`
2. `install feature-set mpls`
3. `feature-set mpls`
4. `feature mpls segment-routing`
5. `feature mpls evpn`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>feature bgp</code></td>
<td>Enables BGP feature and configurations.</td>
</tr>
<tr>
<td>Step 2</td>
<td><code>install feature-set mpls</code></td>
<td>Enables MPLS configuration commands.</td>
</tr>
<tr>
<td>Step 3</td>
<td><code>feature-set mpls</code></td>
<td>Enables MPLS configuration commands.</td>
</tr>
<tr>
<td>Step 4</td>
<td><code>feature mpls segment-routing</code></td>
<td>Enables segment routing configuration commands.</td>
</tr>
<tr>
<td>Step 5</td>
<td><code>feature mpls evpn</code></td>
<td>Enables EVPN over MPLS configuration commands. This command is mutually exclusive with the <code>feature-nv</code> command.</td>
</tr>
</tbody>
</table>

This example shows how to configure a VRF:

```
vrf context customer1
  rd auto
  address-family ipv4 unicast
    route-target import auto
    route-target export auto
    route-target import auto evpn
    route-target export auto evpn
```

This example shows how to configure a SRBGP over segment routing:

```
  mpls label range 1000 25000
  segment-routing mpls
  global-block 11000 20000

  int lo1
```
Configuring Segment Routing with IS-IS Protocol

Beginning with Cisco NX-OS Release 7.0(3)I7(3), you can configure segment routing with IS-IS protocol.

Before You Begin

Ensure the following conditions are met to enable IS-IS Segment Routing:

- The mpls segment-routing feature is enabled.
- The IS-IS feature is enabled.
- Segment routing is enabled for at least one address family under IS-IS.

SUMMARY STEPS

1. configure terminal
2. router isis instance-tag
3. net network-entity-title
4. (Optional) is-type {level-1 | level-2 | level-1-2}
5. log-adjacency-changes
6. address-family ipv4 unicast
7. segment-routing mpls
8. (Optional) show running-config segment-routing
### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> router isis instance-tag</td>
<td>Creates a new IS-IS instance with the configured instance tag.</td>
</tr>
<tr>
<td><strong>Step 3</strong> net network-entity-title</td>
<td>Configures the NET for this IS-IS instance.</td>
</tr>
</tbody>
</table>
| **Step 4** is-type {level-1 | level-2 | level-1-2}               | (Optional)
|                                   | Configures the area level for this IS-IS instance. The default is level-1-2. |
| **Step 5** log-adjacency-changes   | Sends a system message whenever an IS-IS neighbor changes the state.    |
| **Step 6** address-family ipv4 unicast| Enters address family configuration mode.                             |
| **Step 7** segment-routing mpls    | Configures segment routing with IS-IS protocol.                       |
| **Step 8** show running-configure segment-routing | (Optional)
|                                   | Displays the status of the segment routing.                           |

See the following configuration example for configuring segment routing with IS-IS protocol.

```plaintext
switch# config t
router isis SR-ISIS-1
  bfd
  shutdown
  net 31.0000.0000.0000.000e.00
  is-type level-1-2
  log-adjacency-changes
  address-family ipv4 unicast
    segment-routing mpls                >>> New command added for ISIS.
    redistribute direct route-map EVERYTHING
    address-family ipv6 unicast
      bfd

switch# show running-config segment-routing

!Command: show running-config segment-routing
!Time: Fri Dec 22 12:51:59 2017

version 7.0(3)I7(3)
segment-routing mpls
global-block 201000 280000
connected-prefix-sid-map
to-ipv4 2.11.5/32 absolute 201101
  2.10.1.5/32 index 10001
```

Note
Beginning with Cisco NX-OS Release 7.0(3)I7(3), this new command is added for segment routing with IS-IS protocol. This command is supported only on the IPv4 address family. It is not supported on the IPv6 address family.
Configuring MPLS Label Allocation

You can configure MPLS label allocation for the IPv4 unicast address family.

**Before You Begin**

You must install and enable the MPLS feature set using the `install feature-set mpls` and `feature-set mpls` commands.

You must enable the MPLS segment routing feature. See Enabling MPLS Segment Routing, on page 9.

**SUMMARY STEPS**

1. `configure terminal`
2. `[no] router bgp autonomous-system-number`
3. `address-family ipv4 unicast`
4. `[no] allocate-label {all | route-map route-map-name}`
5. `exit`
6. `neighbor ipv4-address remote-as autonomous-system-number`
7. `address-family ipv4 labeled-unicast`
8. (Optional) `show bgp ipv4 labeled-unicast prefix`
9. (Optional) `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><strong>configure terminal</strong>&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;switch# configure terminal&lt;br&gt;switch(config)#</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>[no] router bgp autonomous-system-number</code>&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;switch(config)# router bgp 64496&lt;br&gt;switch(config-router)#</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>address-family ipv4 unicast</code>&lt;br&gt;&lt;br&gt;<strong>Example:</strong>&lt;br&gt;switch(config-router)# address-family ipv4 unicast&lt;br&gt;switch(config-router-af)#</td>
</tr>
</tbody>
</table>
### Configuring BGP EVPN and Label Allocation Mode

Beginning with Cisco NX-OS Release 7.0(3)I6(1), you can use MPLS tunnel encapsulation using the new CLI `encapsulation mpls` command. You can configure the label allocation mode for the EVPN address family.

Advertisement of (IP or Label) bindings from a Cisco Nexus 9000 Series switch via BGP EVPN enables a remote switch to send the routed traffic to that IP using the label for that IP to the switch that advertised the IP over MPLS.

The IP prefix routes (Type-5) are:
• Type-5 route with VXLAN encapsulation

RT-5 Route – IP Prefix

RD: L3 RD
IP Length: prefix length
IP address: IP (4 bytes)
Label1: L3VNI
Route Target

RT for IP-VRF
Tunnel Type VxLAN
Router MAC

• Type-5 route with MPLS encapsulation

RT-5 Route – IP Prefix

RD: L3 RD
IP Length: prefix length
IP address: IP (4 bytes)
Label1: BGP MPLS Label
Route Target
RT for IP-VRF

VPN labels can be per-prefix or aggregate (per-VRF). It is recommended to have per-VRF label for Layer 3 EVPN over MPLS.

Complete the following steps to configure BGP EVPN and label allocation mode:

**Before You Begin**

You must install and enable the MPLS feature set using the install feature-set mpls and feature-set mpls commands.

You must enable the MPLS segment routing feature. See [*About Segment Routing*, on page 1.](#)

**SUMMARY STEPS**

1. configure terminal
2. [no] router bgp autonomous-system-number
3. address-family l2vpn evpn
4. exit
5. neighbor ipv4-address remote-as autonomous-system-number
6. address-family l2vpn evpn
7. encapsulation mpls
8. vrf <customer_name>
9. send-community
10. send-community extended
11. address-family ipv4 unicast
12. advertise l2vpn evpn
13. redistribute direct route-map DIRECT_TO_BGP
14. label-allocation-mode per-vrf
**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 2</strong> [no] router bgp autonomous-system-number</td>
<td>Enables BGP and assigns the AS number to the local BGP speaker. The AS number can be a 16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in xx.xx format. Use the no option with this command to remove the BGP process and the associated configuration.</td>
</tr>
<tr>
<td><strong>Step 3</strong> address-family l2vpn evpn</td>
<td>Enters global address family configuration mode for the Layer 2 VPN EVPN.</td>
</tr>
<tr>
<td><strong>Step 4</strong> exit</td>
<td>Exits global address family configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong> neighbor ipv4-address remote-as autonomous-system-number</td>
<td>Configures the IPv4 address and AS number for a remote BGP peer.</td>
</tr>
<tr>
<td><strong>Step 6</strong> address-family l2vpn evpn</td>
<td>Advertises the labeled Layer 2 VPN EVPN.</td>
</tr>
</tbody>
</table>
| **Step 7** encapsulation mpls | Enables BGP EVPN address family and sends EVPN type-5 route update to the neighbors.  
**Note** The default tunnel encapsulation in EVPN for the IP route type in NX-OS is VXLAN. To override that, a new CLI is introduced to indicate MPLS tunnel encapsulation. |

---

In the example:  
- switch(config-router)# router bgp 64496  
- switch(config-router)#

Example:

```
switch(config-router)# router bgp 64496  
switch(config-router-router)#
```

  neighbor 192.168.5.6 remote-as 20  
  address-family ipv4 labeled-unicast  
  send-community extended           | Configures the VRF.                                                                          |

**Step 8**  
`vrf <customer_name>`  
Configures the VRF.

**Step 9**  
`send-community`  
To send the Border Gateway Protocol (BGP) community attribute to a peer, use the send-community command. To revert to the defaults, use the no form of this command.

**Step 10**  
`send-community extended`  
Provides an extended range to the send-community command, ensuring that communities can be assigned for many purposes, without overlap.

**Step 11**  
`address-family ipv4 unicast`  
Enters global address family configuration mode for the IPv4 address family.

**Step 12**  
`advertise l2vpn evpn`  
Advertises Layer 2 VPN EVPN.

**Step 13**  
`redistribute direct route-map DIRECT_TO_BGP`  
Redistributes the directly connected routes into BGP-EVPN.

**Step 14**  
`label-allocation-mode per-vrf`  
Sets the label allocation mode. The default label allocation is per VRF. You have to configure per-vrf label allocation mode explicitly.

For the EVPN address family, the default label allocation is per-vrf, compared to per-prefix mode for the other address-families where the label allocation CLI is supported. No form of CLI is displayed in the running configuration.

See the following example for configuring per-prefix label allocation:

```
router bgp 65000
  [address-family l2vpn evpn]
  neighbor 10.1.1.1
    remote-as 100
    address-family l2vpn evpn
  neighbor 20.1.1.1
    remote-as 65000
    address-family l2vpn evpn
  encapsulation mpls
  vrf customer1
    address-family ipv4 unicast
    advertise l2vpn evpn
    redistribute direct route-map DIRECT_TO_BGP
    no label-allocation-mode per-vrf
```
## Configuring the Segment Routing Global Block

You can configure the beginning and ending MPLS labels in the segment routing global block (SRGB).

**Before You Begin**

You must install and enable the MPLS feature set using the `install feature-set mpls` and `feature-set mpls` commands.

You must enable the MPLS segment routing feature. See Enabling MPLS Segment Routing, on page 9.

### SUMMARY STEPS

1. `configure terminal`
2. `[no] segment-routing mpls`
3. `[no] global-block beginning-label ending-label`
4. (Optional) `show mpls label range`
5. `show segment-routing`
6. (Optional) `copy running-config startup-config`

### DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode. Example: <code>switch# configure terminal switch(config)#</code></td>
</tr>
<tr>
<td><strong>Step 2</strong> [no] segment-routing mpls</td>
<td>Enters the segment routing configuration mode and enables the default SRGB of 16000 to 23999. The no form of this command unallocates that block of labels. Example: <code>switch(config)# segment-routing mpls switch(config-segment-routing-mpls)#</code></td>
</tr>
<tr>
<td><strong>Step 3</strong> [no] global-block beginning-label ending-label</td>
<td>Specifies the MPLS label range for the SRGB. Use this command if you want to change the default SRGB label range that is configured with the <code>segment-routing mpls</code> command. The permissive values for the beginning MPLS label and the ending MPLS label are from 16000 to 471804. The <code>mpls label range</code> command permits 16 as the minimum label, but the SRGB can start only from 16000. Example: <code>switch(config-segment-routing-mpls)# global-block 16000 471804</code></td>
</tr>
</tbody>
</table>

**Note** With releases prior to 7.0(3)I7(3), the minimum value for the `global-block` command starts from 16. Beginning with Cisco NX-OS Release 7.0(3)I7(3), the minimum value for the `global-block` command starts from 16000. If you upgrading from previous releases to Cisco NX-OS Release 7.0(3)I7(3), you should modify the SRGB so that it falls within the supported range before triggering an upgrade.
### Configuring the Label Index

You can set the label index for routes that match the `network` command. Doing so causes the BGP prefix SID to be advertised for local prefixes that are configured with a route map that includes the `set label-index` command, provided the route map is specified in the `network` command that specifies the local prefix.

#### Note

Beginning with Cisco NX-OS Release, Segment Routing Application (SR-APP) module is used to configure the segment routing functionality. BGP now uses both `set label-index <value>` configuration under route-map and the new `connected-prefix-sid-map` CLI for prefix SID configuration. In case of a conflict, the configuration in SR-APP is preferred.

#### Note

Route-map label indexes are ignored when the route map is specified in a context other than the `network` command. Also, labels are allocated for prefixes with a route-map label index independent of whether the prefix has been configured by the `allocate-label route-map route-map-name` command.

### SUMMARY STEPS

1. configure terminal
2. route-map map-name
3. [no] set label-index index
4. exit
5. router bgp autonomous-system-number
6. address-family ipv4 unicast
7. network ip-prefix [route-map map-name]
8. (Optional) show route-map [map-name]
9. (Optional) copy running-config startup-config
# DETAILED STEPS

<table>
<thead>
<tr>
<th>Step</th>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch# configure terminal&lt;br&gt;switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 2</td>
<td><code>route-map map-name</code></td>
<td>Creates a route map or enters route-map configuration mode for an existing route map.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config)# route-map SRmap&lt;br&gt;switch(config-route-map)#</td>
<td></td>
</tr>
<tr>
<td>Step 3</td>
<td><code>[no] set label-index index</code></td>
<td>Sets the label index for routes that match the <code>network</code> command. The range is from 0 to 471788. By default, a label index is not added to the route.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-route-map)# set label-index 10</td>
<td></td>
</tr>
<tr>
<td>Step 4</td>
<td><code>exit</code></td>
<td>Exits route-map configuration mode.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-route-map)# exit&lt;br&gt;switch(config)#</td>
<td></td>
</tr>
<tr>
<td>Step 5</td>
<td><code>router bgp autonomous-system-number</code></td>
<td>Enables BGP and assigns the AS number to the local BGP speaker. The AS number can be a 16-bit integer or a 32-bit integer in the form of a higher 16-bit decimal number and a lower 16-bit decimal number in <code>xx.xx</code> format.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config)# router bgp 64496&lt;br&gt;switch(config-router)#</td>
<td></td>
</tr>
<tr>
<td>Step 6</td>
<td><code>address-family ipv4 unicast</code></td>
<td>Enters global address family configuration mode for the IPv4 address family.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-router)# address-family ipv4 unicast&lt;br&gt;switch(config-router-af)#</td>
<td></td>
</tr>
<tr>
<td>Step 7</td>
<td><code>network ip-prefix [route-map map-name]</code></td>
<td>Specifies a network as local to this autonomous system and adds it to the BGP routing table.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-router-af)# network 10.10.10.10/32&lt;br&gt;route-map SRmap</td>
<td></td>
</tr>
<tr>
<td>Step 8</td>
<td><code>show route-map [map-name]</code></td>
<td>(Optional) Displays information about route maps, including the label index.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-router-af)# show route-map</td>
<td></td>
</tr>
<tr>
<td>Step 9</td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
<tr>
<td></td>
<td><strong>Example:</strong>&lt;br&gt;switch(config-router-af)# copy running-config startup-config</td>
<td></td>
</tr>
</tbody>
</table>
Configuring BGP Link State Address Family

With the introduction of RFC 7752 in Cisco NX-OS Release 7.0(3)I5(1), you can configure an link-state in address family configuration mode. The link-state address family is supported in global configuration mode and results in an entry into the config-router-af submode for address family link-state.

Before You Begin
Prerequisites - waiting for inputs from the reviewer.

SUMMARY STEPS

1. configure terminal
2. [no] address-family link-state

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1 configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example:</td>

<td></td>
</tr>
<tr>
<td>switch(config)# router bgp 64497</td>
<td>Enters link-state address family configuration mode.</td>
</tr>
<tr>
<td>switch(config-router)# addressfamily link-state</td>
<td>Enters link-state address family configuration mode.</td>
</tr>
</tbody>
</table>

Configuring Neighbor Egress Peer Engineering Using BGP

With the introduction of RFC 7752 in Cisco NX-OS Release 7.0(3)I5(1), you can configure Egress Peer Engineering (EPE). The feature is valid only for external BGP neighbors and is not configured by default. EPE uses RFC 7752 encoding.

Before You Begin

- You must enable BGP.
- After an upgrade from Release 7.0(3)I3(1) or Release 7.0(3)I4(1) to Release 7.0(3)I5(1), configure the TCAM region before configuring Egress Peer Engineering (EPE) on Cisco Nexus 3000 Series switches using the following commands:

1. switch# hardware access-list tcam region vpc-convergence 0
2. switch# hardware access-list tcam region racl 0
3. switch# hardware access-list tcam region mpls 256 double-wide
With Release 7.0(3)I5(1), save the configuration and reload the switch.

For more information, see the Using Templates to Configure ACL TCAM Region Sizes and Configuring ACL TCAM Region Sizes sections in the Cisco Nexus 3000 Series NX-OS Security Configuration Guide.

**SUMMARY STEPS**

1. `configure terminal`
2. `[no|default] egress-engineering [peer-set peer-set-name]`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command or Action</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# configure terminal</code> <code>switch(config)#</code></td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>`[no</td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch(config)# router bgp 64497</code> <code>switch(config-router)# neighbor 30.1.1.1</code> <code>switch(config-router)# egress-engineering peer-set NewPeer</code></td>
</tr>
</tbody>
</table>

---

**Configuration Example for Egress Peer Engineering**

See the Egress Peer Engineering sample configuration for the BGP speaker 1.1.1.1. Note that the neighbor 20.20.20.20 is the SDN controller.

```
hostname epe-as-1
install feature-set mpls
feature-set mpls
feature telnet

Verifying the Segment Routing Configuration

To display the segment routing configuration, perform one of the following tasks:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show bgp ipv4 labeled-unicast prefix</code></td>
<td>Displays the advertised label index and the selected local label for the specified IPv4 prefix.</td>
</tr>
<tr>
<td><code>show bgp paths</code></td>
<td>Displays the BGP path information, including the advertised label index.</td>
</tr>
<tr>
<td><code>show mpls label range</code></td>
<td>Displays the configured SRGB range of labels.</td>
</tr>
<tr>
<td><code>show route-map [map-name]</code></td>
<td>Displays information about a route map, including the label index.</td>
</tr>
<tr>
<td>`show running-config</td>
<td>inc 'feature mpls segment-routing'`</td>
</tr>
<tr>
<td><code>show running-config segment-routing</code></td>
<td>Displays the status of the segment routing feature.</td>
</tr>
</tbody>
</table>

This example shows how the `show bgp ipv4 labeled-unicast` command can be used with a prefix specification to display the advertised label index and the selected local label:

```
switch# show bgp ipv4 labeled-unicast 19.19.19.19/32
BGP routing table information for VRF default, address family IPv4 Label Unicast
BGP routing table entry for 19.19.19.19/32, version 2
Paths: (1 available, best #1) Flags: (0x20c0012) on xmit-list, is in urib, is backup urib route, has label
label af: version 2, (0x100002) on xmit-list
local label: 16010

Advertised path-id 1, Label AF advertised path-id 1
Path type: external, path is valid, is best path
AS-Path: 19, path sourced external to AS 60.1.1.19 (metric 0) from 60.1.1.19 (100.100.100.100)
  Origin IGP, MED not set, localpref 100, weight 0
  Received label 3
  Prefix-SID Attribute: Length: 10
  Label Index TLV: Length 7, Flags 0x0 Label Index 10

Path-id 1 not advertised to any peer
Label AF advertisement
Path-id 1 not advertised to any peer
```

Configuration Examples for Segment Routing

The examples in this section show a common BGP prefix SID configuration between two routers.
This example shows how to advertise a BGP speaker configuration of 10.10.10.10/32 and 20.20.20.20/32 with a label index of 10 and 20, respectively. It uses the default segment routing global block (SRGB) range of 16000 to 23999.

```
hostname s1
install feature-set mpls
feature-set mpls
feature telnet
feature bash-shell
feature scp-server
feature bgp
feature mpls segment-routing

segment-routing mpls
  vlan 1
  route-map label-index-10 permit 10
    set label-index 10
  route-map label-index-20 permit 10
    set label-index 20
  vrf context management
    ip route 0.0.0.0/0 10.30.108.1

interface Ethernet1/1
  no switchport
  ip address 10.1.1.1/24
  no shutdown

interface mgmt0
  ip address dhcp
  vrf member management

interface loopback1
  ip address 10.10.10.10/32

interface loopback2
  ip address 20.20.20.20/32

line console
line vty

router bgp 1
  address-family ipv4 unicast
    network 10.10.10.10/32 route-map label-index-10
    network 20.20.20.20/32 route-map label-index-20
    allocate-label all
  neighbor 10.1.1.2 remote-as 2
    address-family ipv4 labeled-unicast
```

This example shows how to receive the configuration from a BGP speaker.

```
hostname s2
install feature-set mpls
feature-set mpls
feature telnet
feature bash-shell
feature scp-server
feature bgp
feature mpls segment-routing

segment-routing mpls
  vlan 1

vrf context management
  ip route 0.0.0.0/0 10.30.97.1
  ip route 0.0.0.0/0 10.30.108.1

interface Ethernet1/1
  no switchport
```
ip address 10.1.1.2/24
ipv6 address 10:1:1::2/64
no shutdown

interface mgmt0
ip address dhcp
vrf member management

interface loopback1
ip address 2.2.2.2/32
line console
line vty

router bgp 2
address-family ipv4 unicast
allocate-label all
neighbor 10.1.1.1 remote-as 1
address-family ipv4 labeled-unicast

This example shows how to display the configuration from a BGP speaker. The show command in this example displays the prefix 10.10.10.10 with label index 10 mapping to label 16010 in the SRGB range of 16000 to 23999.

switch# show bgp ipv4 labeled-unicast 10.10.10.10/32

BGP routing table information for VRF default, address family IPv4 Label Unicast
BGP routing table entry for 10.10.10.10/32, version 7
Paths: (1 available, best #1)
Flags: (0x20c001a) on xmit-list, is in urib, is best urib route, is in HW, , has label
label af: version 8, (0x100002) on xmit-list
local label: 16010
Advertised path-id 1, Label AF advertised path-id 1
AS=Path: 1, path sourced external to AS
10.1.1.1 (metric 0) from 10.1.1.1 (10.10.10.10)
Origin IGP, MED not set, localpref 100, weight 0
Received label 0
Prefix-SID Attribute: Length: 10
Label Index TLV: Length 7, Flags 0x0 Label Index 10
Path-id 1 not advertised to any peer
Label AF advertisement
Path-id 1 not advertised to any peer

This example shows how to configure egress peer engineering on a BGP speaker.

hostname epe-as-1
install feature-set mpls
feature-set mpls
feature telnet
feature bash-shell
feature scp-server
feature bgp
feature mpls segment-routing
segment-routing mpls
vlan 1
vrf context management
ip route 0.0.0.0/0 10.30.97.1
ip route 0.0.0.0/0 10.30.108.1

interface Ethernet1/1
no switchport
ip address 10.1.1.1/24
no shutdown

interface Ethernet1/2
no switchport
ip address 11.1.1.1/24
no shutdown

interface Ethernet1/3
no switchport
ip address 12.1.1.1/24
no shutdown

interface Ethernet1/4
no switchport
ip address 13.1.1.1/24
no shutdown

interface Ethernet1/5
no switchport
ip address 14.1.1.1/24
no shutdown

The following is an example of show ip route vrf 2 command.

to route Table for VRF "2"
