

Configuring the Embedded Event Manager

This chapter describes how to configure the Embedded Event Manager (EEM) to detect and handle critical events on Cisco NX-OS devices.

This chapter contains the following sections:

- About EEM, on page 1
- Prerequisites for EEM, on page 5
- Guidelines and Limitations for EEM, on page 5
- Default Settings for EEM, on page 6
- Configuring EEM, on page 6
- Verifying the EEM Configuration, on page 20
- Configuration Examples for EEM, on page 21

About EEM

EEM monitors events that occur on your device and takes action to recover or troubleshoot these events, based on your configuration.

EEM consists of three major components:

- Event statements—Events to monitor from another Cisco NX-OS component that may require some action, workaround, or notification.
- Action statements—An action that EEM can take, such as executing CLI commands, sending an email through the use of Smart Call Home feature, and disabling an interface to recover from an event.
- Policies—An event that is paired with one or more actions to troubleshoot or recover from the event.

Policies

An EEM policy consists of an event statement and one or more action statements. The event statement defines the event to look for as well as the filtering characteristics for the event. The action statement defines the action EEM takes when the event occurs.

This figure shows the two basic statements in an EEM policy.

Figure 1: EEM Policy Statements

EEM Policy

Event Statement

Tells your system: Look for this specific event to happen.

For example, when a card is removed.

Action Statement

Tells your system: If that event happens, do these things.

For example, when a card is removed, log the details.

7000

You can configure EEM policies using the command-line interface (CLI) or a VSH script.

EEM gives you a device-wide view of policy management. You configure EEM policies on the supervisor, and EEM pushes the policy to the correct module based on the event type. EEM takes any actions for a triggered event either locally on the module or on the supervisor (the default option).

EEM maintains event logs on the supervisor.

Cisco NX-OS has a number of preconfigured system policies. These system policies define many common events and actions for the device. System policy names begin with two underscore characters ().

You can create user policies to suit your network. If you create a user policy, any actions in your policy occur after EEM triggers any system policy actions that are related to the same event as your policy.

You can also override some system policies. The overrides that you configure take the place of the system policy. You can override the event or the actions.

Use the **show event manager system-policy** command to view the preconfigured system policies and determine which policies that you can override.

Note

You should use the **show running-config eem** command to check the configuration of each policy. An override policy that consists of an event statement and no action statement triggers no action and no notification of failures.

Note

Your override policy should always include an event statement. An override policy without an event statement overrides all possible events in the system policy.

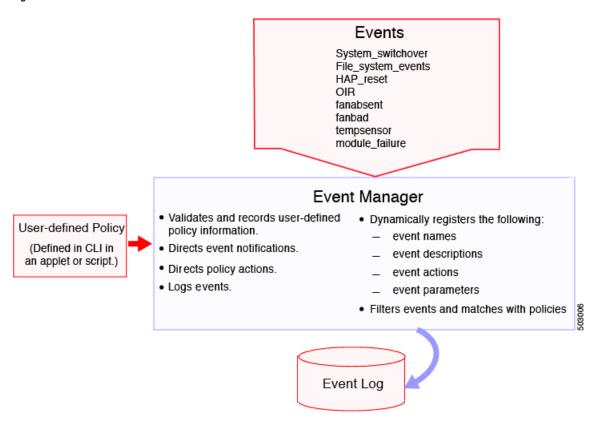

Event Statements

An event is any device activity for which some action, such as a workaround or a notification, should be taken. In many cases, these events are related to faults in the device such as when an interface or a fan malfunctions.

EEM defines event filters so only critical events or multiple occurrences of an event within a specified time period trigger an associated action.

This figure shows events that are handled by EEM.

Figure 2: EEM Overview

Event statements specify the event that triggers a policy to run. You can configure multiple event triggers.

EEM schedules and runs policies on the basis of event statements. EEM examines the event and action commands and runs them as defined.

Note

If you want to allow the triggered event to process any default actions, you must configure the EEM policy to allow the event default action statement.

Action Statements

Action statements describe the action triggered by a policy. Each policy can have multiple action statements. If no action is associated with a policy, EEM still observes events but takes no actions.

EEM supports the following actions in action statements:

- Execute any CLI commands.
- Update a counter.
- · Log an exception.
- Force the shutdown of any module.
- · Reload the device.

- Shut down specified modules because the power is over budget.
- Generate a syslog message.
- · Generate a Call Home event.
- · Generate an SNMP notification.
- Use the default action for the system policy.

Note

EEM can only process a complete action cli list of up to 1024 characters in total. If more actions are required, you must define them as a new redundant applet with same trigger.

Note

If you want to allow the triggered event to process any default actions, you must configure the EEM policy to allow the default action. For example, if you match a CLI command in a match statement, you must add the event-default action statement to the EEM policy or EEM will not allow the CLI command to execute.

Note

Verify that your action statements within your user policy or overriding policy do not negate each other or adversely affect the associated system policy.

VSH Script Policies

You can also write policies in a VSH script, using a text editor. These policies have an event statement and action statement(s) just as other policies, and these policies can either augment or override system policies. After you write your VSH script policy, copy it to the device and activate it.

Environment Variables

You can define environment variables for EEM that are available for all policies. Environment variables are useful for configuring common values that you can use in multiple policies. For example, you can create an environment variable for the IP address of an external email server.

You can use an environment variable in action statements by using the parameter substitution format.

This example shows a sample action statement to force a module 1 shutdown, with a reset reason of "EEM action."

```
switch (config-eem-policy)# action 1.0 forceshut module 1 reset-reson "EEM action."
```

If you define an environment variable for the shutdown reason, called default-reason, you can replace that reset reason with the environment variable, as shown in the following example.

```
switch (config-eem-policy) # action 1.0 foreshut module 1 reset-reason $default-reason
```

You can reuse this environment variable in any policy.

EEM Event Correlation

You can trigger an EEM policy based on a combination of events. First, you use the **tag** keyword to create and differentiate multiple events in the EEM policy. Then using a set of boolean operators (**and**, **or**, **andnot**), along with the count and time, you can define a combination of these events to trigger a custom action.

High Availability

Cisco NX-OS supports stateless restarts for EEM. After a reboot or supervisor switchover, Cisco NX-OS applies the running configuration.

Virtualization Support

Not all actions or events are visible. You must have network-admin privileges to configure policies.

Prerequisites for EEM

EEM has the following prerequisites:

• You must have network-admin user privileges to configure EEM.

Guidelines and Limitations for EEM

EEM has the following configuration guidelines and limitations:

- The maximum number of configurable EEM policies is 500.
- Action statements within your user policy or overriding policy should not negate each other or adversely
 affect the associated system policy.
- To allow a triggered event to process any default actions, you must configure the EEM policy to allow the default action. For example, if you match a CLI command in a match statement, you must add the event-default action statement to the EEM policy or EEM will not allow the CLI command to execute.
- When you configure an EEM policy action to collect **show tech** commands, make sure to allocate enough time for the **show tech** commands to complete before the same action is called again.
- Note the following about override policies:
 - An override policy that consists of an event statement without an action statement triggers no action and no notification of failures.
 - An override policy without an event statement overrides all possible events in the system policy.
- The following rules apply to regular command expressions:
 - All keywords must be expanded.
 - only the * symbol can be used for argument replacement.

- Note the following about EEM event correlation:
 - EEM event correlation is supported only on the supervisor module.
 - EEM event correlation is not supported across different modules within a single policy.
 - EEM event correlation supports up to four event statements in a single policy. The event types can be the same or different, but only these event types are supported: cli, counter, module, module-failure, oir, snmp, and syslog.
 - EEM event correlation does not override the system default policies.
- When more than one event statement is included in an EEM policy, each event statement must have a **tag** keyword with a unique tag argument.
- Default action execution is not supported for policies that are configured with tagged events.
- You can invoke EEM from Python. For more information about Python, see the Python Scripting topic in the *Cisco Nexus 3400-S Series NX-OS Progammability Guide*.

Default Settings for EEM

This table lists the default settings for EEM parameters.

| Parameters | Default |
|-----------------|---------|
| System policies | Active |

Configuring EEM

You can create policies that contain actions to take based on system policies. To display information about the system policies, use the **show event manager system-policy** command.

Defining an Environment Variable

You can define a variable to serve as a parameter in an EEM policy.

SUMMARY STEPS

- 1. configure terminal
- 2. event manager environment variable-name variable-value
- **3.** (Optional) show event manager environment {variable-name | all}
- 4. (Optional) copy running-config startup-config

| | Command or Action | Purpose |
|--------|--------------------|-----------------------------------|
| Step 1 | configure terminal | Enters global configuration mode. |
| | Example: | |

| | Command or Action | Purpose |
|--------|---|---|
| | <pre>switch# configure terminal switch(config)#</pre> | |
| Step 2 | <pre>event manager environment variable-name variable-value Example: switch(config) # event manager environment emailto "admin@anyplace.com"</pre> | variable-name can be any case-sensitive, alphanumeric string up to 29 characters. The variable-value can be any |
| Step 3 | (Optional) show event manager environment {variable-name all} Example: switch(config) # show event manager environment all | Displays information about the configured environment variables. |
| Step 4 | (Optional) copy running-config startup-config Example: switch(config) # copy running-config startup-config | Copies the running configuration to the startup configuration. |

Defining a User Policy Using the CLI

You can define a user policy using the CLI to the device.

SUMMARY STEPS

- 1. configure terminal
- **2. event manager applet** *applet-name*
- **3.** (Optional) **description** *policy-description*
- 4. event event-statement
- 5. (Optional) tag tag {and | andnot | or} tag [and | andnot | or {tag}] {happens occurs in seconds}
- **6.** action number[.number2] action-statement
- 7. (Optional) show event manager policy-state name [module module-id]
- 8. (Optional) copy running-config startup-config

| | Command or Action | Purpose |
|--------|---|-----------------------------------|
| Step 1 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | <pre>switch# configure terminal switch(config)#</pre> | |

| | Command or Action | Purpose |
|--------|---|--|
| Step 2 | <pre>event manager applet applet-name Example: switch(config) # event manager applet monitorShutdown switch(config-applet) #</pre> | Registers the applet with EEM and enters applet configuration mode. The <i>applet-name</i> can be any case-sensitive, alphanumeric string up to 29 characters. |
| Step 3 | (Optional) description policy-description Example: switch(config-applet) # description "Monitors interface shutdown." | Configures a descriptive string for the policy. The string can be any alphanumeric string up to 80 characters. Enclose the string in quotation marks. |
| Step 4 | <pre>event event-statement Example: switch(config-applet) # event cli match "conf t; interface * ; shutdown"</pre> | Configures the event statement for the policy. Repeat this step for multiple event statements. See Configuring Event Statements, on page 8. |
| Step 5 | (Optional) tag tag {and andnot or} tag [and andnot or {tag}] {happens occurs in seconds} Example: switch(config-applet) # tag one or two happens 1 in 10000 | Correlates multiple events in the policy. The range for the <i>occurs</i> argument is from 1 to 4294967295. The range for the <i>seconds</i> argument is from 0 to 4294967295 seconds. |
| Step 6 | <pre>action number[.number2] action-statement Example: switch(config-applet) # action 1.0 cli show interface e 3/1</pre> | Configures an action statement for the policy. Repeat this step for multiple action statements. See Configuring Action Statements, on page 13. |
| Step 7 | (Optional) show event manager policy-state name [module module-id] Example: switch(config-applet) # show event manager policy-state monitorShutdown | Displays information about the status of the configured policy. |
| Step 8 | (Optional) copy running-config startup-config Example: switch(config) # copy running-config startup-config | Copies the running configuration to the startup configuration. |

Configuring Event Statements

Use one of the following commands in applet configuration mode to configure an event statement:

| Command | Purpose |
|---|--|
| event application [tag tag] sub-system sub-system-id type event-type | Triggers an event when an event specification matches the subsystem ID and application event type. |
| switch(config-applet)# event application sub-system 798 type 1 | The range for the <i>sub-system-id</i> and for the <i>event-type</i> is from 1 to 4294967295. |
| | The tag <i>tag</i> keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | Note To use this command, you must first enable the feature evmed command to enable generic event detectors. |
| event cli [tag tag] match expression [count repeats time seconds] | Triggers an event if you enter a command that matches the regular expression. |
| <pre>Example: switch(config-applet)# event cli match "conf t; interface *; shutdown"</pre> | The tag <i>tag</i> keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | The <i>repeats</i> range is from 1 to 65000. The time range, in seconds, is from 0 to 4294967295, where 0 indicates no time limit. |
| event counter [tag tag] name counter entry-val entry entry-op {eq ge gt le lt ne} [exit-val exit exit-op {eq ge gt le lt ne}] Example: | Triggers an event if the counter crosses the entry threshold based on the entry operation. The event resets immediately. Optionally, you can configure the event to reset after the counter passes the exit threshold. |
| <pre>switch(config-applet)# event counter name mycounter entry-val 20 gt</pre> | The tag tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | The <i>counter</i> name can be any case-sensitive, alphanumeric string up to 28 characters. The <i>entry</i> and <i>exit</i> value ranges are from 0 to 2147483647. |
| event fanabsent [fan number] time seconds | Triggers an event if a fan is removed from the device |
| Example: | for more than the configured time, in seconds. The <i>number</i> range is module-dependent. The <i>seconds</i> |
| <pre>switch(config-applet)# event fanabsent time 300</pre> | range is from 10 to 64000. |
| event fanbad [fan number] time seconds | Triggers an event if a fan fails for more than the |
| Example: | configured time, in seconds. The <i>number</i> range is module-dependent. The <i>seconds</i> range is from 10 to |
| switch(config-applet)# event fanbad time 3000 | 64000. |

| Command | Purpose |
|---|---|
| <pre>event fib {adjacency extra resource tcam usage route {extra inconsistent missing}} Example: switch(config-applet) # event fib adjacency extra</pre> | Triggers an event for one of the following: adjacency extra—If there is an extra route in the unicast FIB. resource tcam usage—Each time the TCAM utilization percentage becomes a multiple of 5, in either direction. route {extra inconsistent missing}—If a route is added, changed, or deleted in the unicast FIB. |
| event gold module {slot all} test test-name [severity {major minor moderate}] testing-type {bootup monitoring ondemand scheduled} consecutive-failure count Example: switch(config-applet) # event gold module 2 test ASICRegisterCheck testing-type ondemand consecutive-failure 2 | Triggers an event if the named online diagnostic test experiences the configured failure severity for the configured number of consecutive failures. The <i>slot</i> range is from 1 to 10. The <i>test-name</i> is the name of a configured online diagnostic test. The <i>count</i> range is from 1 to 1000. |
| event interface [tag tag] {name interface slot/port parameter} | Triggers an event if the counter is exceeded for the specified interface. |
| Example: switch(config-applet)# event interface ethernet 2/2 parameter | The tag tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | Note To use this command, you must first enable the feature evmed command to enable generic event detectors. |
| <pre>event memory {critical minor severe} Example: switch(config-applet) # event memory critical</pre> | Triggers an event if a memory threshold is crossed. See also Configuring Memory Thresholds, on page 17. |
| event module [tag tag] status {online offline any} module {all module-num} | Triggers an event if the specified module enters the selected status. |
| Example: switch(config-applet)# event module status offline module all | The tag tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |

| Command | Purpose |
|--|--|
| event module-failure [tag tag] type failure-type module {slot all} count repeats [time seconds] | Triggers an event if a module experiences the failure type configured. |
| Example: switch(config-applet)# event module-failure type lc-failed module 3 count 1 | The tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| type to farred module 3 count 1 | The <i>repeats</i> range is from 0 to 4294967295. The <i>seconds</i> range is from 0 to 4294967295, where 0 indicates no time limit. |
| event none | Manually runs the policy event without any events specified. |
| Example: switch(config-applet)# event none | Note To use this command, you must first enable the feature evmed command to enable generic event detectors. |
| event oir [tag tag] {fan module powersupply} {anyoir insert remove} [number] Example: | Triggers an event if the configured device element (fan, module, or power supply) is inserted or removed from the device. |
| switch(config-applet)# event oir fan remove 4 | The tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | You can optionally configure a specific fan, module, or power supply number. The <i>number</i> range is as follows: |
| | Fan number—Module dependent. |
| | Module number—Device dependent. |
| | • Power supply number—The range is from 1 to 3. |
| event policy-default count repeats [time seconds] | Uses the event configured in the system policy. Use this option for overriding policies. |
| Example: switch(config-applet)# event policy-default count 3 | The <i>repeats</i> range is from 1 to 65000. The <i>seconds</i> range is from 0 to 4294967295, where 0 indicates no time limit. |
| event poweroverbudget | Triggers an event if the power budget exceeds the |
| Example: | capacity of the configured power supplies. |
| <pre>switch(config-applet)# event poweroverbudget</pre> | |

| Command | Purpose |
|---|--|
| event snmp [tag tag] oid oid get-type {exact next} entry-op {eq ge gt le lt ne} entry-val entry [exit-comb {and or}] exit-op {eq ge gt le lt ne} exit-val exit exit-time time polling-interval interval | Triggers an event if the SNMP OID crosses the entry threshold based on the entry operation. The event resets immediately, or optionally you can configure the event to reset after the counter passes the exit threshold. The OID is in dotted decimal notation. |
| Example: switch(config-applet) # event snmp oid 1.3.6.1.2.1.31.1.1.1.6 get-type next entry-op lt 300 entry-val 0 exit-op eq 400 exit-time 30 polling-interval 300 | The tag keyword-argument pair identifies this specific event when multiple events are included in the policy. The <i>entry</i> and <i>exit</i> value ranges are from 0 to 18446744073709551615. The time, in seconds, is from 0 to 2147483647. The interval, in seconds, is from 1 to 2147483647. |
| <pre>event storm-control Example: switch(config-applet) # event storm-control</pre> | Triggers an event if traffic on a port exceeds the configured storm control threshold. |
| <pre>event syslog [occurs count] {pattern string period time priority level tag tag} Example: switch(config-applet) # event syslog period 500</pre> | Triggers an event if the specified syslog threshold is exceeded. The range for the count is from 1 to 65000, and the range for the time is from 1 to 4294967295. The priority range is from 0 to 7. The tag tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| event sysmgr memory [module module-num] major major-percent minor minor-percent clear clear-percent Example: switch (config-applet) # event sysmgr memory | Triggers an event if the specified system manager memory threshold is exceeded. The range for the percentage is from 1 to 99. |
| <pre>event sysmgr switchover count count time interval Example: switch(config-applet) # event sysmgr switchover count 10 time 1000</pre> | Triggers an event if the specified switchover count is exceeded within the time interval specified. The switchover count is from 1 to 65000. The time interval is from 0 to 2147483647. |
| <pre>event temperature [module slot] [sensor-number] threshold {any major minor} Example: switch(config-applet) # event temperature module 2 threshold any</pre> | Triggers an event if the temperature sensor exceeds the configured threshold. The sensor range is from 1 to 18. |
| | |

| Command | Purpose |
|---|---|
| , | Triggers an event if the specified time is reached. The range for the time is from 1 to 4294967295. |
| | absolute time—Triggers an event when the specified absolute time of day occurs. |
| | countdown time—Triggers an event when when the specified time counts down to zero. The timer does not reset. |
| | • cron cronentry—Triggers an event when the CRON string specification matches the current time. |
| | watchdog time—Triggers an event when the specified time counts down to zero. The timer automatically resets to the initial value and continues to count down. |
| | The tag tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | Note To use this command, you must first enable the feature evmed command to enable generic event detectors. |
| event track [tag tag] object-number state {any down up} | Triggers an event if the tracked object is in the configured state. |
| Example: | The tag tag keyword-argument pair identifies this specific event when multiple events are included in |
| switch(config-applet)# event track 1 state down | the policy. |
| | The <i>object-number</i> range is from 1 to 500. |

Configuring Action Statements

Use the following commands in EEM configuration mode to configure action statements:

| Command | Purpose |
|---|--|
| action number[.number2] cli command1 [command2] [local] Example: | Runs the configured CLI commands. You can optionally run the commands on the module where the event occurred. The action label is in the format number1.number2. |
| <pre>switch(config-applet)# action 1.0 cli "show interface e 3/1"</pre> | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |

| Command | Purpose |
|---|--|
| action number[.number2] counter name counter value val op {dec inc nop set} | Modifies the counter by the configured value and operation. The action label is in the format number 1. number 2. |
| Example: switch(config-applet) # action 2.0 counter name mycounter value 20 op inc | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| | The counter name can be any case-sensitive, alphanumeric string up to 28 characters. The <i>val</i> can be an integer from 0 to 2147483647 or a substituted parameter. |
| action number[.number2] event-default Example: | Executes the default action for the associated event. The action label is in the format number1.number2. |
| switch(config-applet)# action 1.0 event-default | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| action number[.number2] forceshut [module slot xbar xbar-number] reset-reason seconds | Forces a module, crossbar, or the entire system to shut down. The action label is in the format number 1. number 2. |
| Example: switch(config-applet) # action 1.0 forceshut module 2 reset-reason "flapping links" | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| | The reset reason is a quoted alphanumeric string up to 80 characters. |
| action number[.number2] overbudgetshut [module slot[-slot]] | Forces one or more modules or the entire system to shut down because of a power overbudget issue. |
| Example: switch(config-applet) # action 1.0 overbudgetshut module 3-5 | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| action number[.number2] policy-default Example: | Executes the default action for the policy that you are overriding. The action label is in the format number1.number2. |
| <pre>switch(config-applet)# action 1.0 policy-default</pre> | <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| action number[.number2] publish-event | Forces the publication of an application-specific event. The action label is in the format number1.number2. |
| Example: switch(config-applet) # action 1.0 publish-event | number can be any number up to 16 digits. The range for number2 is from 0 to 9. |
| action number[.number2] reload [module slot[-slot]] | Forces one or more modules or the entire system to reload. |
| Example: switch(config-applet) # action 1.0 reload module 3-5 | number can be any number up to 16 digits. The range for number2 is from 0 to 9. |

| Command | Purpose |
|--|---|
| <pre>action number[.number2] snmp-trap {[intdata1 data [intdata2 data]] [strdata string]}</pre> Example: | Sends an SNMP trap with the configured data. <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| switch(config-applet)# action 1.0 snmp-trap strdata "temperature problem" | The <i>data</i> arguments can by any number up to 80 digits. The <i>string</i> can be any alphanumeric string u to 80 characters. |
| action number[.number2] syslog [priority prio-val] msg error-message Example: | Sends a customized syslog message at the configured priority. <i>number</i> can be any number up to 16 digits. The range for <i>number2</i> is from 0 to 9. |
| switch(config-applet)# action 1.0 syslog priority notifications msg "cpu high" | The <i>error-message</i> can be any quoted alphanume string up to 80 characters. |

Note

If you want to allow the triggered event to process any default actions, you must configure the EEM policy to allow the default action. For example, if you match a CLI command in a match statement, you must add the event-default action statement to the EEM policy or EEM will not allow the CLI command to execute. You can use the **terminal event-manager bypass** command to allow all EEM policies with CLI matches to execute the CLI command.

Defining a Policy Using a VSH Script

You can define a policy using a VSH script.

Before you begin

Ensure that you are logged in with administrator privileges.

Ensure that your script name is the same name as the script filename.

- **Step 1** In a text editor, list the commands that define the policy.
- **Step 2** Name the text file and save it.
- **Step 3** Copy the file to the following system directory: bootflash://eem/user_script_policies.

Registering and Activating a VSH Script Policy

You can register and activate a policy defined in a VSH script.

SUMMARY STEPS

- 1. configure terminal
- 2. event manager policy policy-script
- 3. (Optional) copy running-config startup-config

DETAILED STEPS

| | Command or Action | Purpose |
|--------|---|---|
| Step 1 | configure terminal | Enters global configuration mode. |
| | <pre>Example: switch# configure terminal switch(config)#</pre> | |
| Step 2 | <pre>event manager policy policy-script Example: switch(config)# event manager policy moduleScript</pre> | Registers and activates an EEM script policy. The <i>policy-script</i> can be any case-sensitive alphanumeric string up to 29 characters. |
| Step 3 | (Optional) copy running-config startup-config Example: switch(config) # copy running-config startup-config | Copies the running configuration to the startup configuration. |

Overriding a Policy

You can override a system policy.

SUMMARY STEPS

- 1. configure terminal
- 2. (Optional) show event manager policy-state system-policy
- 3. event manager applet applet-name override system-policy
- **4.** (Optional) **description** *policy-description*
- 5. event event-statement
- **6.** action number action-statement
- 7. (Optional) show event manager policy-state name
- 8. (Optional) copy running-config startup-config

| | Command or Action | Purpose |
|--|--|--|
| Step 1 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | <pre>switch# configure terminal switch(config)#</pre> | |
| Example: switch(conf: policy-state Policyeth | (Optional) show event manager policy-state system-policy | |
| | Example: | to override, including thresholds. Use the show event manager system-policy command to find the system policy |
| | <pre>switch(config-applet)# show event manager policy-stateethpm_link_flap Policyethpm_link_flap Cfg count : 5</pre> | names. |

| | Command or Action | Purpose |
|--------|---|---|
| | Cfg time interval : 10.000000 (seconds) Hash default, Count 0 | |
| Step 3 | <pre>event manager applet applet-name override system-policy Example: switch(config) # event manager applet ethport overrideethpm_link_flap switch(config-applet) #</pre> | Overrides a system policy and enters applet configuration mode. The <i>applet-name</i> can be any case-sensitive alphanumeric string up to 29 characters. The <i>system-policy</i> must be one of the existing system policies. |
| Step 4 | (Optional) description policy-description Example: description "Overrides link flap policy." | Configures a descriptive string for the policy. The string can be any alphanumeric string up to 80 characters. Enclose the string in quotation marks. |
| Step 5 | Required: event event-statement Example: switch(config-applet)# event policy-default count 2 time 1000 | Configures the event statement for the policy. |
| Step 6 | Required: action number action-statement Example: switch(config-applet)# action 1.0 syslog priority warnings msg "Link is flapping." | Configures an action statement for the policy. Repeat this step for multiple action statements. |
| Step 7 | (Optional) show event manager policy-state name Example: switch(config-applet) # show event manager policy-state ethport | Displays information about the configured policy. |
| Step 8 | (Optional) copy running-config startup-config Example: switch(config) # copy running-config startup-config | Copies the running configuration to the startup configuration. |

Configuring Memory Thresholds

You can set the memory thresholds that are used to trigger events and set whether the operating system should kill processes if it cannot allocate memory.

Before you begin

Ensure that you are logged in with administrator privileges.

SUMMARY STEPS

- 1. configure terminal
- 2. system memory-thresholds minor minor severe severe critical critical
- 3. (Optional) system memory-thresholds threshold critical no-process-kill
- 4. (Optional) show running-config | include "system memory"

5. (Optional) **copy running-config startup-config**

| | Command or Action | Purpose |
|--------|--|--|
| Step 1 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | <pre>switch# configure terminal switch(config)#</pre> | |
| Step 2 | system memory-thresholds minor minor severe severe critical critical | Configures the system memory thresholds that generate EEM memory events. The default values are as follows: |
| | Example: | • Minor-85 |
| | <pre>switch(config)# system memory-thresholds minor 60 severe 70 critical 80</pre> | • Severe-90 |
| | | • Critical-95 |
| | | When these memory thresholds are exceeded, the system generates the following syslogs: |
| | | • 2013 May 7 17:06:30 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: MINOR |
| | | • 2013 May 7 17:06:30 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: SEVERE |
| | | • 2013 May 7 17:06:30 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: CRITICAL |
| | | • 2013 May 7 17:06:35 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: MINOR ALERT RECOVERED |
| | | • 2013 May 7 17:06:35 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: SEVERE ALERT RECOVERED |
| | | 2013 May 7 17:06:35 switch %\$ %PLATFORM-2-MEMORY_ALERT: Memory Status Alert: CRITICAL ALERT RECOVERED |
| Step 3 | (Optional) system memory-thresholds threshold critical no-process-kill | Configures the system to not kill processes when the memory cannot be allocated. The default value is to allow |
| | Example: | the system to kill processes, starting with the one that |
| | switch(config)# system memory-thresholds threshold critical no-process-kill | consumes the most memory. |
| Step 4 | (Optional) show running-config include "system memory" | Displays information about the system memory configuration. |

| | Command or Action | Purpose |
|---|---|----------------|
| | Example: | |
| | <pre>switch(config-applet)# show running-config include "system memory"</pre> | |
| Step 5 (Optional) copy running-config startup-config Copies the r | Copies the running configuration to the startup | |
| | Example: | configuration. |
| | switch(config)# copy running-config startup-config | |
| | | |

Configuring Syslog as EEM Publisher

You can monitor syslog messages from the switch.

Note

The maximum number of searchable strings to monitor syslog messages is 10.

Before you begin

EEM should be available for registration by syslog.

The syslog daemon must be configured and executed.

SUMMARY STEPS

- 1. configure terminal
- **2. event manager applet** *applet-name*
- **3. event syslog** [tag tag] {occurs number | period seconds | pattern msg-text | priority priority}
- 4. (Optional) copy running-config startup-config

| | Command or Action | Purpose |
|--------|--|---|
| Step 1 | configure terminal | Enters global configuration mode. |
| | Example: | |
| | <pre>switch# configure terminal switch(config)#</pre> | |
| Step 2 | event manager applet applet-name | Registers an applet with EEM and enters applet configuration mode. |
| | Example: | |
| | <pre>switch(config)# event manager applet abc switch(config-applet)#</pre> | |
| Step 3 | event syslog [tag tag] {occurs number period seconds pattern msg-text priority priority} | Monitors syslog messages and invokes the policy based on the search string in the policy. |
| | Example: | |

| | Command or Action | Purpose |
|--------|---|--|
| | switch(config-applet)# event syslog occurs 10 | • The tag keyword-argument pair identifies this specific event when multiple events are included in the policy. |
| | | • The occurs <i>number</i> keyword-argument pair specifies the number of occurrences. The range is from 1 to 65000. |
| | | • The period <i>seconds</i> keyword-argument pair specifies the interval during which the event occurs. The range is from 1 to 4294967295. |
| | | • The pattern <i>msg-text</i> keyword-argument pair specifies the matching regular expression. The pattern can contain character text, an environment variable, or a combination of the two. If the string contains embedded blanks, it is enclosed in quotation marks. |
| | | • The priority <i>priority</i> keyword-argument pair specifies the priority of the syslog messages. If this keyword is not selected, all syslog messages are set at the informational priority level. |
| Step 4 | (Optional) copy running-config startup-config Example: | Copies the running configuration to the startup configuration. |
| | switch(config)# copy running-config startup-config | |

Verifying the EEM Configuration

To display EEM configuration information, perform one of the following tasks:

| Command | Purpose |
|---|---|
| show event manager environment [variable-name all] | Displays information about the event manager environment variables. |
| show event manager event-types [event all module slot] | Displays information about the event manager event types. |
| show event manager history events [detail] [maximum num-events] [severity {catastrophic minor moderate severe}] | Displays the history of events for all policies. |
| show event manager policy-state policy-name | Displays information about the policy state, including thresholds. |
| show event manager script system [policy-name all] | Displays information about the script policies. |

| Command | Purpose |
|--|---|
| show event manager system-policy [all] | Displays information about the predefined system policies. |
| show running-config eem | Displays information about the running configuration for EEM. |
| show startup-config eem | Displays information about the startup configuration for EEM. |

Configuration Examples for EEM

This example shows how to override the __lcm_module_failure system policy by changing the threshold for just module 3 hitless upgrade failures. This example also sends a syslog message. The settings in the system policy, __lcm_module_failure, apply in all other cases.

```
event manager applet example2 override __lcm_module_failure event module-failure type hitless-upgrade-failure module 3 count 2 action 1 syslog priority errors msg module 3 "upgrade is not a hitless upgrade!" action 2 policy-default
```

This example shows how to override the ethpm link flap system policy and shuts down the interface:

```
event manager applet ethport override __ethpm_link_flap
event policy-default count 2 time 1000
action 1 cli conf t
action 2 cli int et1/1
action 3 cli no shut
```

This example creates an EEM policy that allows the CLI command to execute but triggers an SNMP notification when a user enters configuration mode on the device:

```
event manager applet TEST
event cli match "conf t"
action 1.0 snmp-trap strdata "Configuration change"
action 2.0 event-default
```

Note

You must add the **event-default** action statement to the EEM policy or EEM will not allow the CLI command to execute.

This example shows how to correlate multiple events in an EEM policy and execute the policy based on a combination of the event triggers. In this example, the EEM policy is triggered if one of the specified syslog patterns occurs within 120 seconds.

```
event manager applet eem-correlate event syslog tag one pattern "copy bootflash:.* running-config.*" event syslog tag two pattern "copy run start" event syslog tag three pattern "hello" tag one or two or three happens 1 in 120 action 1.0 reload module 1
```

Note

For additional EEM configuration examples, see Embedded Event Manager System Events and Configuration Examples.
