

Configuring the MAC Address Table

This chapter contains the following sections:

- Information About MAC Addresses, page 1
- Configuring MAC Addresses, page 1
- Verifying the MAC Address Configuration, page 3

Information About MAC Addresses

To switch frames between LAN ports, the switch maintains an address table. When the switch receives a frame, it associates the media access control (MAC) address of the sending network device with the LAN port on which it was received.

The switch dynamically builds the address table by using the MAC source address of the frames received. When the switch receives a frame for a MAC destination address not listed in its address table, it floods the frame to all LAN ports of the same VLAN except the port that received the frame. When the destination station replies, the switch adds its relevant MAC source address and port ID to the address table. The switch then forwards subsequent frames to a single LAN port without flooding all LAN ports.

You can also enter a MAC address, which is termed a static MAC address, into the table. These static MAC entries are retained across a reboot of the switch.

In addition, you can enter a multicast address as a statically configured MAC address. A multicast address can accept more than one interface as its destination.

The address table can store a number of unicast and multicast address entries without flooding any frames. The switch uses an aging mechanism, defined by a configurable aging timer, so if an address remains inactive for a specified number of seconds, it is removed from the address table.

Configuring MAC Addresses

Configuring Static MAC Addresses

You can configure static MAC addresses for the switch. These addresses can be configured in interface configuration mode or in VLAN configuration mode.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # mac-address-table static mac_address vlan vlan-id {drop interface {type slot/port} port-channel number}	Specifies a static address to add to the MAC address table.
Step 3	switch(config)# no mac-address-table static mac_address vlan vlan-id	(Optional) Deletes the static entry from the MAC address table.
		The mac-address-table static command to assign a static MAC address to a virtual interface.

This example shows how to put a static entry in the MAC address table:

```
switch# configure terminal
switch(config) # mac-address-table static 12ab.47dd.ff89 vlan 3 interface ethernet 2/1
switch(config) #
```

Configuring the Aging Time for the MAC Table

You can configure the amount of time that an entry (the packet source MAC address and port that packet ingresses) remain in the MAC table. MAC aging time can be configured in either interface configuration mode or in VLAN configuration mode.

The Cisco Nexus device does not support per-VLAN CAM aging timers.

Procedure

	Command or Action	Purpose	
Step 1	switch# configure terminal	Enters global configuration mode.	
Step 2	switch(config)# mac-address-table aging-time seconds	Specifies the time before an entry ages out and is discarded from the MAC address table. The <i>seconds</i> range is from 0 to 1000000. The default is 1800 seconds. Entering the value 0 disables the MAC aging.	

This example shows how to set the aging time for entries in the MAC address table to 1800 seconds (30 minutes):

```
switch# configure terminal
switch(config) # mac-address-table aging-time 1800
switch(config) #
```

Clearing Dynamic Addresses from the MAC Table

You can clear all dynamic entries in the MAC address table.

Command	Purpose
switch(config)# clear mac-address-table dynamic {address mac-addr} {interface [type slot/port port-channel number} {vlan vlan-id}	Clears the dynamic address entries from the MAC address table.

This example shows how to clear the dynamic entries in the MAC address table:

```
switch# clear mac-address-table dynamic
```

Verifying the MAC Address Configuration

Use one of the following commands to verify the configuration:

Table 1: MAC Address Configuration Verification Commands

Command	Purpose
switch# show mac-address-table aging-time	Displays the MAC address aging time for all VLANs defined in the switch.
switch# show mac-address-table	Displays the contents of the MAC address table.

This example shows how to display the MAC address table:

switch# show mac-address-table							
VLAN MA	C Address	Type	Age	Port			
1 00:	18.b967.3cd0	dynamic	10	Eth1/3			
1 00: Total MAC Add		dynamic	200	Eth1/3			

This example shows how to display the current aging time:

Verifying the MAC Address Configuration
