Preface

This preface describes the audience, organization, and conventions of the Cisco Nexus 5000 Series NX-OS Layer 2 Interfaces Command Reference. It also provides information on how to obtain related documentation.

This preface includes the following sections:
- Audience, page 1
- Supported Switches, page 1
- Organization, page 2
- Document Conventions, page 3
- Related Documentation, page 4
- Obtaining Documentation and Submitting a Service Request, page 6

Audience

This publication is for experienced users who configure and maintain Cisco NX-OS devices.

Supported Switches

This section includes the following topics:
- Cisco Nexus 5000 Platform Switches, page 1
- Cisco Nexus 5500 Platform Switches, page 2

Cisco Nexus 5000 Platform Switches

Table 1 lists the Cisco switches supported in the Cisco Nexus 5000 Platform.

Note

For more information on these switches, see the Cisco Nexus 5500 Platform and Cisco Nexus 5000 Platform Hardware Installation Guide available at the following URL:
Send comments to nexus5k-docfeedback@cisco.com

Table 1  Supported Cisco Nexus 5000 Platform Switches

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Nexus 5010 Switch</td>
<td>The Cisco Nexus 5010 is a 1 rack unit (RU) switch. It delivers 500 Gbps of wire-speed switching capacity designed for traditional, virtualized, unified, and high-performance computing (HPC) environments.</td>
</tr>
<tr>
<td>Cisco Nexus 5020 Switch</td>
<td>The Cisco Nexus 5020 is a 2 rack unit (RU) switch. It delivers 1+ Tbps of wire-speed switching capacity designed for traditional, virtualized, unified, and HPC environments.</td>
</tr>
</tbody>
</table>

Note: The Cisco Nexus 5000 Platform switches only support Internet Group Management Protocol (IGMP) snooping. IGMP, Protocol Independent Multicast (PIM), and Multicast Source Discovery Protocol (MSDP) are not supported on the Cisco Nexus 5000 Platform switches.

Cisco Nexus 5500 Platform Switches

Table 2 lists the Cisco switches supported in the Cisco Nexus 5500 Platform.

Note: For more information on these switches, see the Cisco Nexus 5500 Platform and Cisco Nexus 5000 Platform Hardware Installation Guide available at the following URL: http://www.cisco.com/en/US/products/ps9670/tsd_products_support_series_home.html

Table 2  Supported Cisco Nexus 5500 Platform Switches

<table>
<thead>
<tr>
<th>Switch</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco Nexus 5548P Switch</td>
<td>The Cisco Nexus 5548P switch is the first switch in the Cisco Nexus 5500 Platform. It is a one-rack-unit (1 RU), 10-Gigabit Ethernet and Fibre Channel over Ethernet (FCoE) switch that offers up to 960-Gbps throughput and up to 48 ports.</td>
</tr>
<tr>
<td>Cisco Nexus 5596P Switch</td>
<td>The Cisco Nexus 5596P switch is a top-of-rack, 10-Gigabit Ethernet and FCoE switch offering up to 1920-Gigabit throughput and up to 96 ports.</td>
</tr>
</tbody>
</table>

Organization

This document is organized as follows:
Chapter Title               Description
---                        -----------
New and Changed Information  Describes the new and changed information for the new Cisco NX-OS software releases.
B Commands                  Describes the Cisco NX-OS Ethernet commands that begin with B.
C Commands                  Describes the Cisco NX-OS Ethernet commands that begin with C.
D Commands                  Describes the Cisco NX-OS Ethernet commands that begin with D.
E Commands                  Describes the Cisco NX-OS Ethernet commands that begin with E.
F Commands                  Describes the Cisco NX-OS Ethernet commands that begin with F.
H Commands                  Describes the Cisco NX-OS Ethernet commands that begin with H.
I Commands                  Describes the Cisco NX-OS Ethernet commands that begin with I.
L Commands                  Describes the Cisco NX-OS Ethernet commands that begin with L.
M Commands                  Describes the Cisco NX-OS Ethernet commands that begin with M.
N Commands                  Describes the Cisco NX-OS Ethernet commands that begin with N.
P Commands                  Describes the Cisco NX-OS Ethernet commands that begin with P.
R Commands                  Describes the Cisco NX-OS Ethernet commands that begin with R.
S Commands                  Describes the Cisco NX-OS Ethernet commands that begin with S.
Show Commands              Describes the Cisco NX-OS Ethernet show commands.
U Commands                  Describes the Cisco NX-OS Ethernet commands that begin with U.
V Commands                  Describes the Cisco NX-OS Ethernet commands that begin with V.

Document Conventions

Command descriptions use these conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boldface font</td>
<td>Commands and keywords are in boldface.</td>
</tr>
<tr>
<td>italic font</td>
<td>Arguments for which you supply values are in italics.</td>
</tr>
<tr>
<td>[ ]</td>
<td>Elements in square brackets are optional.</td>
</tr>
<tr>
<td>{x</td>
<td>y</td>
</tr>
<tr>
<td>[ x</td>
<td>y</td>
</tr>
<tr>
<td>string</td>
<td>A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.</td>
</tr>
</tbody>
</table>

Screen examples use these conventions:

<table>
<thead>
<tr>
<th>Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>screen font</td>
<td>Terminal sessions and information that the switch displays are in screen font.</td>
</tr>
<tr>
<td>boldface screen font</td>
<td>Information you must enter is in boldface screen font.</td>
</tr>
<tr>
<td>italic screen font</td>
<td>Arguments for which you supply values are in italic screen font.</td>
</tr>
</tbody>
</table>
Send comments to nexus5k-docfeedback@cisco.com

This document uses the following conventions:

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt; &gt;</code></td>
<td>Nonprinting characters, such as passwords, are in angle brackets.</td>
</tr>
<tr>
<td><code>[ ]</code></td>
<td>Default responses to system prompts are in square brackets.</td>
</tr>
<tr>
<td><code>!</code></td>
<td>An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.</td>
</tr>
</tbody>
</table>

Note

Means reader take note. Notes contain helpful suggestions or references to material not covered in the manual.

Caution

Means reader be careful. In this situation, you might do something that could result in equipment damage or loss of data.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see What’s New in Cisco Product Documentation. To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the What’s New in Cisco Product Documentation RSS feed. The RSS feeds are a free service.
New and Changed Information

This chapter provides release-specific information for each new and changed feature in the Cisco Nexus 5000 Series NX-OS Layer 2 Interfaces Command Reference. The latest version of this document is available at the following Cisco website:

To check for additional information about this Cisco NX-OS Release, see the Cisco Nexus 5000 Series Switch Release Notes available at the following Cisco website:

New and Changed Information for Cisco NX-OS Releases

This section includes the following topics:

</table>
| Spanning Tree Protocol (STP) pseudo parameters | This feature was introduced to configure spanning tree pseudo parameters for Layer 2 gateway switches. The following commands were introduced:  
- mst (STP)  
- spanning-tree pseudo-information  
- vlan (STP)  
The following command was updated:  
- show running-config spanning-tree | mst (STP), spanning-tree pseudo-information, vlan (STP), show running-config spanning-tree |
| Spanning Tree Protocol (STP) enhancements | The following commands were introduced:  
- spanning-tree bridge assurance  
- spanning-tree domain  
- spanning-tree mst pre-standard  
- spanning-tree vlan cost  
- spanning-tree vlan port-priority | spanning-tree bridge assurance, spanning-tree domain, spanning-tree mst pre-standard, spanning-tree vlan cost, spanning-tree vlan port-priority |
| Interface speed enhancement | Interface speed of 100 Mbps and the auto keyword was introduced.  
The following command was updated:  
- speed (interface) | speed (interface) |
| Interface VLAN enhancement | You can set the carrier delay on a serial interface. | carrier-delay |
| Interface duplex mode | This feature was introduced. | duplex |
| Interface statistics collection interval | This feature was introduced. | load-interval |
| Link Aggregation Control Protocol (LACP) graceful convergence | The following command was added:  
- lACP graceful-convergence | lACP graceful-convergence |

B Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with B.
To set the inherited and received bandwidth values for an interface, use the `bandwidth` command. To restore the default values, use the `no` form of this command.

```
bandwidth {kbps | inherit [kbps]}
no bandwidth {kbps | inherit [kbps]}
```

**Syntax Description**

- `kbps`: Informational bandwidth in kilobits per second. Valid values are from 1 to 10000000.
- `inherit`: (Optional) Specifies that the bandwidth be inherited from the parent interface.

**Command Default**

1000000 kbps

**Command Modes**

- Interface configuration mode
- Subinterface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(3)N1(1)</td>
<td>Support for Layer 3 interfaces was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `bandwidth` command sets an informational parameter to communicate only the current bandwidth to the higher-level protocols; you cannot adjust the actual bandwidth of an interface using this command.

The `bandwidth inherit` command controls how a subinterface inherits the bandwidth of its main interface.

The `no bandwidth inherit` command enables all subinterfaces to inherit the default bandwidth of the main interface, regardless of the configured bandwidth. If a bandwidth is not configured on a subinterface, and you use the `bandwidth inherit` command, all subinterfaces will inherit the current bandwidth of the main interface. If you configure a new bandwidth on the main interface, all subinterfaces will use this new value.

If you do not configure a bandwidth on the subinterface and you configure the bandwidth inherit command on the main interface, the subinterfaces will inherit the specified bandwidth.

In all cases, if an interface has an explicit bandwidth setting configured, then that interface will use that setting, regardless of whether the bandwidth inheritance setting is in effect.

**Examples**

This example shows how to configure the bandwidth for a Layer 2 interface:

```
switch(config)# interface ethernet 1/5
switch(config-if)# bandwidth 1000
switch(config-if)#
```
This example shows how to configure subinterfaces to inherit the bandwidth from the parent routed interface:

```
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# bandwidth inherit 30000
switch(config-if)# interface ethernet 1/1.1
switch(config-subif)#
```

<table>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show interface</td>
<td>Displays the interface configuration information.</td>
</tr>
</tbody>
</table>
beacon (interface)

To turn on the beacon LED for a port of an interface, use the beacon command. To turn off the beacon LED for the interface, use the no form of this command.

```
beacon
no beacon
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the beacon command to toggle the port LED of an interface to easily identify each time a beacon is sent to check for pending packets on the interface.

**Examples**

This example shows how to turn on the locator beacon LED for a specific interface:

```
switch(config)# interface ethernet 2/1
switch(config-if)# beacon
```

This example shows how to turn off the locator beacon LED for a specific interface:

```
switch(config)# interface ethernet 2/1
switch(config-if)# no beacon
```

</table>
bind (virtual Ethernet interface)

To bind an interface to a virtual Ethernet interface, use the `bind` command. To remove the binding of an interface, use the `no` form of this command.

```
bind interface ethernet slot/port channel number
no bind interface ethernet slot/port channel number
```

**Syntax Description**

- `interface ethernet` Specifies that the virtual Ethernet interface be bound to a specified Ethernet interface.
- `slot/port` Ethernet interface slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.
- `channel` Specifies that the virtual Ethernet interface be bound to a specified EtherChannel interface.
- `number` EtherChannel number. The range is from 1 to 65535.

**Command Default**

Disabled

**Command Modes**

Virtual Ethernet interface configuration mode

**Command History**

<table>
<thead>
<tr>

C Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with C.
capability (virtual Ethernet interface)

To set a profile capability for a virtual Ethernet interface, use the capability command. To remove the profile capability of an interface, use the no form of this command.

```
profile capability iscsi-multipath
no profile capability iscsi-multipath
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>iscsi-multipath</th>
<th>Configure an iSCSI multipath profile.</th>
</tr>
</thead>
</table>

### Command Default

None

### Command Modes

Virtual Ethernet interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to set the profile capability for a specific virtual Ethernet interface:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# capability iscsi-multipath
switch(config-if)#
```

### Related Commands

</tr>
</tbody>
</table>
carrier-delay

To set the carrier delay on a serial interface, use the `carrier-delay` command. To return to the default carrier delay value, use the `no` form of this command.

```
carrier-delay {delay-seconds | msec milliseconds}

no carrier-delay
```

**Syntax Description**

- `delay-seconds` Time, in seconds, to wait for the system to change states. Enter an integer in the range 0 to 60.
- `msec` Specifies the delay time in milliseconds.
- `milliseconds` Time, in milliseconds, to wait for the system to change states. Enter an integer in the range 0 to 1000.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command on a VLAN interface.

If a link goes down and comes back up before the carrier delay timer expires, the down state is effectively filtered, and the rest of the software on the switch is not aware that a link-down event occurred. Therefore, a large carrier delay timer results in fewer link-up/link-down events being detected. Setting the carrier delay time to 0 means that every link-up/link-down event is detected.

This command does not require a license.

**Examples**

This example shows how to change the carrier delay to 10 seconds:

```
switch# configure terminal
switch(config)# interface vlan 5
switch(config-if)# carrier-delay 10
```

This example shows how to revert to the default carrier delay value:

```
switch# configure terminal
switch(config)# interface vlan 5
switch(config-if)# no carrier-delay
```
<table>
<thead>
<tr>
<th>Related Commands</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show running-config</td>
<td>Displays the running configuration information for an interface.</td>
</tr>
<tr>
<td></td>
<td>interface</td>
<td></td>
</tr>
</tbody>
</table>
To enable the Cisco Discovery Protocol (CDP) and configure CDP attributes, use the `cdp` command. To disable CDP or reset CDP attributes, use the `no` form of this command.

```
cdp {advertise {v1 | v2} | enable | format device-id {mac-address | serial-number | system-name} | holdtime seconds | timer seconds}
```

```
no cdp {advertise | enable | format device-id {mac-address | serial-number | system-name} | holdtime seconds | timer seconds}
```

### Syntax Description

<table>
<thead>
<tr>

channel-group (Ethernet)

To assign and configure a physical interface to an EtherChannel, use the `channel-group` command. To remove the channel group configuration from the interface, use the `no` form of this command.

```
channel-group number [force] [mode {active | on | passive}]
no channel-group [number]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Number of channel group. The <code>number</code> range is from 1 to 4096. Cisco NX-OS creates the EtherChannel associated with this channel group if the EtherChannel does not already exist.</td>
</tr>
<tr>
<td><code>force</code></td>
<td>(Optional) Specifies that the LAN port be forcefully added to the channel group.</td>
</tr>
<tr>
<td><code>mode</code></td>
<td>(Optional) Specifies the EtherChannel mode of the interface.</td>
</tr>
<tr>
<td><code>active</code></td>
<td>Specifies that when you enable the Link Aggregation Control Protocol (LACP), this command enables LACP on the specified interface. The interface is in an active negotiating state, in which the port initiates negotiations with other ports by sending LACP packets.</td>
</tr>
<tr>
<td><code>on</code></td>
<td>This is the default channel mode. Specifies that all EtherChannels that are not running LACP remain in this mode. If you attempt to change the channel mode to active or passive before enabling LACP, the switch returns an error message. After you enable LACP globally, by using the <code>feature lacp</code> command, you enable LACP on each channel by configuring the channel mode as either active or passive. An interface in this mode does not initiate or respond to LACP packets. When an LACP attempts to negotiate with an interface in the <code>on</code> state, it does not receive any LACP packets and becomes an individual link with that interface; it does not join the channel group. The default mode is <code>on</code>.</td>
</tr>
<tr>
<td><code>passive</code></td>
<td>Specifies that when you enable LACP, this command enables LACP only if an LACP device is detected. The interface is in a passive negotiation state, in which the port responds to LACP packets that it receives but does not initiate LACP negotiation.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(2)N2(1)</td>
<td>The <code>force</code> keyword was added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Use this command to create a channel group that includes the interface that you are working on and to add or remove specific interfaces from the channel group. Use this command to move a port from one channel group to another. You enter the channel group that you want the port to move to; the switch automatically removes the specified port from its present channel group and adds it to the specified channel group.

Use the `force` keyword to force the addition of the interface into the specified channel group.

After you enable LACP globally, by using the `feature lacp` command, you enable LACP on each channel by configuring the channel mode as either `active` or `passive`. An EtherChannel in the `on` channel mode is a pure EtherChannel and can aggregate a maximum of eight ports. The EtherChannel does not run LACP.

You cannot change the mode for an existing EtherChannel or any of its interfaces if that EtherChannel is not running LACP; the channel mode remains as `on`. The system returns an error message if you attempt to change the mode.

Use the `no` form of this command to remove the physical interface from the EtherChannel. When you delete the last physical interface from an EtherChannel, the EtherChannel remains. To delete the EtherChannel completely, use the `no` form of the `interface port-channel` command.

The compatibility check includes the following operational attributes:

- Port mode
- Access VLAN
- Trunk native VLAN
- Tagged or untagged
- Allowed VLAN list
- Switched Port Analyzer (SPAN) (cannot be SPAN source or destination port)
- Storm control

Use the `show port-channel compatibility-parameters` command to see the full list of compatibility checks that Cisco NX-OS uses.

You can only add interfaces configured with the channel mode set to `on` for static EtherChannels, that is, without a configured aggregation protocol. You can only add interfaces configured with the channel mode as `active` or `passive` to EtherChannels that are running LACP.

You can configure these attributes on an individual member port. If you configure a member port with an incompatible attribute, Cisco NX-OS suspends that port in the EtherChannel.

When the interface joins an EtherChannel, some of its individual parameters are overridden with the values on the EtherChannel, as follows:

- MAC address
- Spanning Tree Protocol (STP)
- Service policy
- Quality of service (QoS)
- Access control lists (ACLs)

Interface parameters, such as the following, remain unaffected when the interface joins or leaves a EtherChannel:

- Description
- Cisco Discovery Protocol (CDP)
Send comments to nexus5k-docfeedback@cisco.com

- LACP port priority
- Debounce
- Rate mode
- Shutdown
- SNMP trap

If interfaces are configured for the EtherChannel interface and a member port is removed from the EtherChannel, the configuration of the EtherChannel interface is not propagated to the member ports. Any configuration changes that you make in any of the compatibility parameters to the EtherChannel interface are propagated to all interfaces within the same channel group as the EtherChannel (for example, configuration changes are also propagated to the physical interfaces that are not part of the EtherChannel but are part of the channel group).

Examples

This example shows how to add an interface to LACP channel group 5 in active mode:

```
switch(config)# interface ethernet 1/1
switch(config-if)# channel-group 5 mode active
switch(config-if)#
```

This example shows how to forcefully add an interface to the channel group 5:

```
switch(config)# interface ethernet 1/1
switch(config-if)# channel-group 5 force
switch(config-if)#
```

### Usage Guidelines

This command does not require a license.

### Examples

This example shows how to clear all LACP counters:

```
switch# clear lacp counters
```

This example shows how to clear the LACP on a port channel:

```
switch# clear lacp counters interface port-channel 100
```

<tbody>
<tr>
<td>show mac access-lists</td>
<td>Displays the information about the MAC address table.</td>
</tr>
</tbody>
</table>
clear mac address-table dynamic

To clear the dynamic address entries from the MAC address table, use the `clear mac address-table dynamic` command.

```
clear mac address-table dynamic [[address mac-addr] | [interface {ethernet slot/port | port-channel number}]][vlan vlan-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>address mac-addr</code></td>
<td>(Optional) Specifies the MAC address to remove from the table. Use the format EEEE.EEEE.EEEE.</td>
</tr>
<tr>
<td><code>interface</code></td>
<td>(Optional) Specifies the interface for which MAC addresses should be removed from the table. The type can be either Ethernet or EtherChannel.</td>
</tr>
<tr>
<td><code>ethernet slot/port</code></td>
<td>(Optional) Specifies the Ethernet interface and the slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.</td>
</tr>
<tr>
<td><code>port-channel number</code></td>
<td>(Optional) Specifies the EtherChannel for which MAC addresses should be removed from the table. Use the EtherChannel number. The <code>number</code> range is from 1 to 4096.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>(Optional) Specifies the VLAN from which MAC addresses should be removed from the table. The range is from 1 to 3967 and from 4049 to 4093.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to <code>clear mac address-table dynamic</code>.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the `clear mac address-table dynamic` command with no arguments to remove all dynamic entries from the table.

To clear static MAC addresses from the table, use the `no mac address-table static` command.

If the `clear mac address-table dynamic` command is entered with no options, all dynamic addresses are removed. If you specify an address but do not specify an interface, the address is deleted from all interfaces. If you specify an interface but do not specify an address, the switch removes all addresses on the specified interfaces.

### Examples

This example shows how to clear all the dynamic entries from the MAC address table:

```
switch# clear mac address-table dynamic
```
This example shows how to clear all the dynamic entries from the MAC address table for VLAN 2:

```
switch# clear mac address-table dynamic vlan 2
```
To clear port security information, use the `clear port-security dynamic` command.

`clear port-security dynamic {address MAC-addr vlan vlan-ID | interface {ethernet slot/port [vlan vlan-ID] | port-channel channel-num [vlan vlan-ID]}}`

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>MAC-addr Clear all dynamically secured MAC address information. The MAC address can be in the format E.E.E.</td>

clear spanning-tree counters

To clear the counters for the Spanning Tree Protocol (STP), use the **clear spanning-tree counters** command.

```
clear spanning-tree counters [interface {ethernet slot/port | port-channel channel}] [vlan vlan-id]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface</td>
<td>(Optional) Specifies the interface type.</td>
</tr>
<tr>
<td>ethernet slot/port</td>
<td>Specifies the Ethernet interface slot and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.</td>
</tr>
<tr>
<td>port-channel channel</td>
<td>Specifies the EtherChannel number. The number range is from 1 to 4096.</td>
</tr>
<tr>
<td>vlan vlan-id</td>
<td>(Optional) Specifies the VLAN. The range is from 1 to 3967 and from 4049 to 4093.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can clear all the STP counters on the entire switch, per VLAN, or per interface.

**Examples**

This example shows how to clear the STP counters for VLAN 5:

```
switch# clear spanning-tree counters vlan 5
```
clear spanning-tree detected-protocol

To restart the protocol migration, use the `clear spanning-tree detected-protocol` command. With no arguments, the command is applied to every port of the switch.

```
clear spanning-tree detected-protocol [interface {ethernet slot/port | port-channel channel}]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Rapid per VLAN Spanning Tree Plus (Rapid PVST+) and Multiple Spanning Tree (MST) have built-in compatibility mechanisms that allow them to interact properly with other versions of IEEE spanning tree or other regions. For example, a switch running Rapid PVST+ can send 802.1D bridge protocol data units (BPDUs) on one of its ports when it is connected to a legacy device. An MST switch can detect that a port is at the boundary of a region when it receives a legacy BPDU or an MST BPDU that is associated with a different region.

These mechanisms are not always able to revert to the most efficient mode. For example, a Rapid PVST+ switch that is designated for a legacy 802.1D bridge stays in 802.1D mode even after the legacy bridge has been removed from the link. Similarly, an MST port assumes that it is a boundary port when the bridges to which it is connected have joined the same region.

To force a port to renegotiate with its neighbors, enter the `clear spanning-tree detected-protocol` command.

### Examples

This example shows how to restart the protocol migration on a specific interface:

```
switch# clear spanning-tree detected-protocol interface ethernet 1/4
```

### Related Commands

clear vtp counters

To clear VLAN Trunking Protocol (VTP) counters, use the clear vtp counters command.

`clear vtp counters`

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use this command to clear the VTP statistics, such as the VTP requests, VTP advertisements, and configuration revisions.

**Examples**
This example shows how to clear the VTP counters:

```
switch# clear vtp counters
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

</tbody>
</table>
clock protocol

To set the synchronization protocol for the clock to a protocol, use the `clock protocol` command. To remove the clock protocol, use the `no` form of this command.

```
clock protocol {none | ntp}
no clock protocol {none | ntp}
```

### Syntax Description
- **none**: Specifies that the clock can be set manually.
- **ntp**: Specifies that the clock be set to the Network Time Protocol (NTP).

### Command Default
None

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
This command does not require a license.

### Examples
This example shows how to set the synchronization protocol for the clock to NTP:
```
switch# configure terminal
switch(config)# clock protocol ntp
switch(config)#
```

### Related Commands
- **show running-config**: Displays the running system configuration information.
connect

To initiate a connection with a vCenter Server, use the connect command. To disconnect from a vCenter Server, use the no form of this command.

```
connect
no connect
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
No connection with a vCenter Server

**Command Modes**
SVS connection configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
There can be only one active connection at a time.

This command does not require a license.

**Examples**
This example shows how to connect to a vCenter Server:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# protocol vmware-vim
switch(config-svs-conn)# remote hostname vcMain
switch(config-svs-conn)# vmware dvs datacenter-name DemoDC
switch(config-svs-conn)# connect
```

This example shows how to disconnect from a vCenter Server:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# no connect
switch(config-svs-conn)#
```

**Related Commands**

</tbody>
</table>
D Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with D.
default shutdown (virtual Ethernet interface)

To enable default commands on a virtual Ethernet interface, use the `default shutdown` command.

```
default shutdown
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

No description is added.

**Command Modes**

Virtual Ethernet interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for virtual Ethernet interface was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to enable a virtual Ethernet interface:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# default shutdown
switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface vethernet</td>
<td>Displays the virtual Ethernet interface configuration information.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays the contents of the currently running configuration file.</td>
</tr>
</tbody>
</table>
delay (interface)

To set a delay value for an interface, use the delay command. To restore the default delay value, use the no form of this command.

```
delay tens-of-microseconds

no delay
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tens-of-microseconds</td>
<td>Throughput delay in tens of microseconds. The range is from 1 to 16,777,215.</td>
</tr>
</tbody>
</table>

**Command Default**

10 microseconds

**Command Modes**

- Interface configuration mode
- Subinterface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(3)N1(1)</td>
<td>Support for Layer 3 interfaces was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to set a delay of 30,000 microseconds on an interface:

```
switch(config)# interface ethernet 1/1
switch(config-if)# delay 30000
switch(config-if)#
```

This example shows how to set a delay of 1000 microseconds on a subinterface:

```
switch(config)# interface ethernet 1/1.1
switch(config-subif)# delay 1000
switch(config-subif)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface ethernet (Layer 3)</td>
<td>Configures an Ethernet routed interface.</td>
</tr>
<tr>
<td>show interface</td>
<td>Displays the interface configuration information.</td>
</tr>
</tbody>
</table>
description (interface)

To add a description to an interface configuration, use the `description` command. To remove the description, use the `no` form of this command.

```
description description

no description
```

**Syntax Description**

- `description String description of the interface configuration. This string is limited to 80 characters.`

**Command Default**

No description is added.

**Command Modes**

- Interface configuration mode
- Subinterface configuration mode
- Virtual Ethernet interface configuration

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(3)N1(1)</td>
<td>Support for Layer 3 interfaces was added.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for virtual Ethernet interface was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The `description` command is meant to provide a reminder in the configuration to describe what certain interfaces are used for. The description appears in the output of the following commands such as `show interface` and `show running-config`.

You can use this command on the following interfaces:

- Ethernet interface
- Management interface
- Subinterfaces
- Virtual Ethernet interface

**Examples**

This example shows how to add a description for an interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# description "10G Server Link"
switch(config-if)#
```

This example shows how to add a description for a virtual Ethernet interface:

```
switch# configure terminal
switch(config)# interface vethernet 1
```
switch(config-if)# description "Virtual interface"
switch(config-if)#

## Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface ethernet</td>
<td>Displays the interface configuration information.</td>

<tr>
<td>show interface vethernet</td>
<td>Displays the virtual Ethernet interface configuration information.</td>
</tr>
<tr>
<td>show running-config</td>
<td>Displays the contents of the currently running configuration file.</td>
</tr>
</tbody>
</table>
description (SPAN, ERSPAN)

To add a description to an Ethernet Switched Port Analyzer (SPAN) or an Encapsulated Remote Switched Port Analyzer (ERSPAN) session configuration, use the `description` command. To remove the description, use the `no` form of this command.

```
description description
no description
```

**Syntax Description**

```
description  String description of the SPAN session configuration. This string is limited to 80 characters.
```

**Command Default**

No description is added.

**Command Modes**

SPAN session configuration mode
ERSPAN session configuration mode

**Command History**

```
Release  Modification
4.0(0)N1(1a)  This command was introduced.
5.1(3)N1(1)  Support for ERSPAN was added.
```

**Usage Guidelines**

Use the `description` command to provide a reminder in the configuration to describe what certain SPAN sessions are used for. The description appears in the output of the following commands such as `show monitor session` and `show running-config monitor`.

**Examples**

This example shows how to add a description for a SPAN session:

```
switch# configure terminal
switch(config)# monitor session 9 type local
switch(config-monitor)# description A Local SPAN session
switch(config-monitor)#
```

This example shows how to add a description for an ERSPAN session:

```
switch# configure terminal
switch(config)# monitor session 9 type erspan-source
switch(config-erspan-src)# description An ERSPAN session
switch(config-erspan-src)#
```
### Related Commands

<td>Configures a source SPAN port.</td>
</tr>
</tbody>
</table>
To configure an Encapsulated Remote Switched Port Analyzer (ERSPAN) destination IP address, use the `destination` command. To remove the destination ERSPAN IP address, use the `no` form of this command.

```
destination ip ip_address

no destination ip ip_address
```

**Syntax Description**

- `ip` Configures the remote IP address.
- `ip_address` IPv4 address in the format `A.B.C.D`.

**Command Default**

None

**Command Modes**

ERSPAN session configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure only one destination IP address for an ERSPAN source session. This command does not require a license.

**Examples**

This example shows how to configure an ERSPAN destination IP address:

```
switch# configure terminal
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# destination ip 192.0.3.1
```

**Related Commands**

</tbody>
</table>
To configure a Switched Port Analyzer (SPAN) destination port, use the `destination` command. To remove the destination SPAN port, use the `no` form of this command.

```
destination interface {ethernet slot/port}
no source interface {ethernet slot/port}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Interface</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ethernet</td>
<td>Specifies the Ethernet interface to use as the destination SPAN port. The slot number is from 1 to 255 and the port number is from 1 to 128.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

SPAN session configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each local SPAN session destination session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source port.

The destination port can be any Ethernet physical port and must reside on the same switch as the source port (for a local SPAN session). The destination port cannot be a source port, a port channel, or SAN port channel group.

A destination port receives copies of sent and received traffic for all monitored source ports. If a destination port is oversubscribed, it can become congested. This congestion can affect traffic forwarding on one or more of the source ports.

**Examples**

This example shows how to configure an Ethernet interface SPAN destination port and activate the SPAN session:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# switchport monitor
switch(config-if)# exit
switch(config)# monitor session 9 type local
switch(config-monitor)# description A Local SPAN session
switch(config-monitor)# source interface ethernet 1/1
switch(config-monitor)# destination interface ethernet 1/5
switch(config-monitor)# no shutdown
switch(config-monitor)#
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>source (SPAN session)</td>
<td>Configures a source SPAN port.</td>
</tr>
<tr>
<td>monitor session</td>
<td>Creates a new SPAN session configuration.</td>
</tr>
<tr>
<td>show monitor session</td>
<td>Displays SPAN session configuration information.</td>
</tr>
<tr>
<td>show running-config monitor</td>
<td>Displays the running configuration information of a SPAN session.</td>
</tr>
</tbody>
</table>
To specify the duplex mode as full, half, or autonegotiate, use the **duplex** command. To return the system to default mode, use the **no** form of this command.

```
    duplex {full | half | auto}
```

```
    no duplex {full | half | auto}
```

### Syntax Description

- **full**: Specifies the duplex mode as full.
- **half**: Specifies the duplex mode as half.
- **auto**: Specifies the duplex mode as autonegotiate.

**Note**: This keyword is not supported on a management interface.

### Command Default

None

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The interface speed that you specify can affect the duplex mode used for an interface, so you should set the speed before setting the duplex mode. If you set the speed for autonegotiation, the duplex mode is automatically set to be autonegotiated. If you specify 10- or 100-Mbps speed, the port is automatically configured to use half-duplex mode, but you can specify full-duplex mode instead. Gigabit Ethernet is full duplex only. You cannot change the duplex mode on Gigabit Ethernet ports or on a 10/100/1000-Mbps port that is set for Gigabit Ethernet.

See the *Cisco Nexus 5000 Series NX-OS Layer 2 Switching Configuration Guide* for more information on interface speed and duplex settings.

This command does not require a license.

### Examples

This example shows how to specify the duplex mode for full duplex:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# duplex full
switch(config-if)#
```
<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show interface</td>
<td>Displays information about the interface, which includes the duplex parameter.</td>

</tbody>
</table>
dvs-name

To configure the Distributed Virtual Switch (DVS) name in the vCenter Server, use the `dvs-name` command.

```
dvs-name name [name]
```

Syntax Description

```
name DVS name. The name can be a maximum of 80 alphanumeric characters.
```

Command Default

None

Command Modes

SVS connection configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>

</table>
E Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with E.
encapsulation dot1Q

To enable IEEE 802.1Q encapsulation of traffic on a specified subinterface, use the `encapsulation dot1q` command. To disable encapsulation, use the `no` form of this command.

```
encapsulation dot1q vlan-id

no encapsulation dot1q vlan-id
```

### Syntax Description
- `vlan-id` VLAN to set when the interface is in access mode; valid values are from 1 to 4093, except for the VLANs reserved for internal switch use.

### Command Default
No encapsulation

### Command Modes
Subinterface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
IEEE 802.1Q encapsulation is configurable on Ethernet and EtherChannel interfaces. IEEE 802.1Q is a standard protocol for interconnecting multiple switches and routers and for defining VLAN topologies. Use the `encapsulation dot1q` command in subinterface range configuration mode to apply a VLAN ID to the subinterface.

**Note**
This command is not applicable to loopback interfaces.

This command does not require a license.

### Examples
This example shows how to enable dot1Q encapsulation on a subinterface for VLAN 30:

```
switch(config)# interface ethernet 1/5.1
switch(config-subif)# encapsulation dot1q 30
switch(config-subif)#
```

### Related Commands

</thead>
<tbody>
<tr>
<td><code>show vlan dot1Q</code></td>
<td>Displays dot1Q encapsulation information for a VLAN.</td>
</tr>
</tbody>
</table>
errdisable detect cause

To enable error-disable (err-disabled) detection in an application, use the `errdisable detect cause` command. To disable error disable detection, use the `no` form of this command.

```
errdisable detect cause {all | link-flap | loopback}
```

```
no errdisable detect cause {all | link-flap | loopback}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>all</th>
<th>Enables error detection on all cases.</th>
</tr>
</thead>
<tbody>
<tr>
<td>link-flap</td>
<td></td>
<td>Enables error disable detection on linkstate-flapping.</td>
</tr>
<tr>
<td>loopback</td>
<td></td>
<td>Enables error disable detection on loopback.</td>
</tr>
</tbody>
</table>

### Command Default

Enabled

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When error disable detection is enabled and a cause is detected on an interface, the interface is placed in an err-disabled state, which is an operational state that is similar to the link-down state.

### Examples

This example shows how to enable the err-disabled detection on linkstate-flapping:

```
switch(config)# errdisable detect cause link-flap
switch(config)#
```

### Related Commands

<table>
<thead>
<tr>

<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>errdisable recovery</td>
<td>Configures recovery from the err-disabled state.</td>
</tr>
<tr>
<td>show interface status err-disabled</td>
<td>Displays the interface error disabled state.</td>
</tr>
</tbody>
</table>
errdisable recovery cause

To configure the application to bring the interface out of the error-disabled (err-disabled) state and retry coming up, use the `errdisable recovery cause` command. To revert to the defaults, use the `no` form of this command.

```
errdisable recovery cause { all | bpduguard | failed-port-state | link-flap-recovery | pause-rate-limit | udld }
```

```
no errdisable recovery cause { all | bpduguard | failed-port-state | link-flap-recovery | pause-rate-limit | udld }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>Enables a timer to recover from all causes.</td>
</tr>
<tr>
<td><code>bpduguard</code></td>
<td>Enables a timer to recover from bridge protocol data unit (BPDU) Guard error disable state.</td>
</tr>
<tr>
<td><code>failed-port-state</code></td>
<td>Enables a timer to recover from a Spanning Tree Protocol (STP) set port state failure.</td>
</tr>
<tr>
<td><code>link-flap</code></td>
<td>Enables a timer to recover from linkstate flapping.</td>
</tr>
<tr>
<td><code>pause-rate-limit</code></td>
<td>Enables a timer to recover from the pause rate limit error disabled state.</td>
</tr>
<tr>
<td><code>udld</code></td>
<td>Enables a timer to recover from the Unidirectional Link Detection (UDLD) error disabled state.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When error disable recovery is enabled, the interface automatically recovers from the err-disabled state, and the device retries bringing the interface up.

**Examples**

This example shows how to enable error disable recovery from linkstate-flapping:

```
switch(config)# errdisable recovery cause link-flap
switch(config)#
```
### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>

<td></td>
</tr>
</tbody>
</table>
errdisable recovery interval

To configure the recovery time interval to bring the interface out of the error-disabled (err-disabled) state, use the `errdisable recovery interval` command. To revert to the defaults, use the `no` form of this command.

```
   errdisable recovery interval time
   no errdisable recovery interval
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>time</code></td>
<td>Error disable recovery time interval. The range is from 30 to 65535 seconds.</td>
</tr>
</tbody>
</table>

### Command Default

Disabled

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When error disable recovery is enabled, the interface automatically recovers from the err-disabled state, and the device retries bringing the interface up.

The device waits 300 seconds to retry.

### Examples

This example shows how to enable error disable recovery time interval to 100 seconds:

```
switch(config)# errdisable recovery interval 100
switch(config)#
```

### Related Commands

extension-key

To configure the extension key to be used to connect to the vCenter Server, use the extension-key command.

`extension-key extn-ID`

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>extn-ID</code></td>
<td>Extension ID. The ID can be a maximum of 80 alphanumeric characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

SVS connection configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to configure the extension key for a vCenter Server:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# extension-key vckey
switch(config-svs-conn)#
```

**Related Commands**

</table>
F Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with F.
feature flexlink

To enable Flex Links, use the **feature flexlink** command. To disable Flex Links, use the **no** form of this command.

```
feature flexlink
no feature flexlink
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**
This example shows how to enable Flex Links on the switch:

```
switch(config)# feature flexlink
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show feature</td>
<td>Displays the status of features enabled or disabled on the switch.</td>
</tr>
<tr>
<td>switchport backup interface</td>

<tr>
<td></td>
<td>other, on a Layer 2 interface.</td>
</tr>
</tbody>
</table>
feature interface-vlan

To enable the creation of VLAN interfaces, use the `feature interface-vlan` command. To disable the VLAN interface feature, use the `no` form of this command.

```
feature interface-vlan

no feature interface-vlan
```

Syntax Description
This command has no arguments or keywords.

Command Default
VLAN interfaces are disabled.

Command Modes
Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines
You must use the `feature interface-vlan` command before you can create VLAN interfaces.

Examples
This example shows how to enable the interface VLAN feature on the switch:
```
switch(config)# feature interface-vlan
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface vlan</td>
<td>Creates a VLAN interface.</td>
</tr>
<tr>
<td>show feature</td>
<td>Displays the features that are enabled or disabled on the switch.</td>
</tr>
</tbody>
</table>
feature lacp

To enable the Link Aggregation Control Protocol (LACP), which bundles a number of physical ports together to form a single logical channel, use the feature lacp command. To disable LACP on the switch, use the no form of this command.

```
feature lacp
no feature lacp
```

Syntax Description

This command has no arguments or keywords.

Command Default

LACP is disabled.

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

You must remove all the LACP configuration parameters from all EtherChannels on the switch before you can disable LACP.

Even after you enable LACP globally, you do not have to run LACP on all EtherChannels on the switch. You enable LACP on each channel mode using the channel-group mode command.

Examples

This example shows how to enable LACP EtherChannels on the switch:

```
switch(config)# feature lacp
```

Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show lacp</td>
<td>Displays information on LACP.</td>
</tr>
<tr>
<td>show feature</td>
<td>Displays whether or not LACP is enabled on the switch.</td>
</tr>
</tbody>
</table>
feature lldp

The Link Layer Discovery Protocol (LLDP), which is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network, is enabled on the switch by default.

**Command Default**

Enabled

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This feature was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot enable or disable LLDP on a Cisco Nexus 5000 Series switch. LLDP is enabled on the switch by default. However, the `feature lldp` command shows as part of the running configuration on the switch, as shown below:

```
switch# show running-config

!Command: show running-config
!Time: Tue Feb 10 12:36:03 2009

version 5.0(3)N1(1)
feature telnet
feature lldp
username admin password 5 $1$d8lkfqC8$4VfRuOoZTKvCTq8VARK2q/ role network-admin
no password strength-check
ip domain-lookup
hostname switch
class-map type qos class-fcoe
class-map type qos match-all c1
  match cos 1
<--Output truncated-->
switch#
```

The Cisco Discovery Protocol (CDP) is a device discovery protocol that runs over Layer 2 (the data link layer) on all Cisco-manufactured devices (routers, bridges, access servers, and switches). CDP allows network management applications to automatically discover and learn about other Cisco devices connected to the network.

To support non-Cisco devices and to allow for interoperability between other devices, the switch supports the Link Layer Discovery Protocol (LLDP). LLDP is a neighbor discovery protocol that is used for network devices to advertise information about themselves to other devices on the network. This protocol runs over the data-link layer, which allows two systems running different network layer protocols to learn about each other.

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>lldp</td>
<td>Configures the global LLDP options on the switch.</td>
</tr>
<tr>
<td>lldp (Interface)</td>
<td>Configures the LLDP feature on an interface.</td>
</tr>
<tr>
<td>show feature</td>
<td>Displays that LLDP is enabled on the switch.</td>
</tr>
</tbody>
</table>
feature port-security

To enable port security on Layer 2 interfaces, use the **feature port-security** command. To disable port security, use the **no** form of this command.

```
feature port-security

no feature port-security
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Use the port security feature to secure a port by limiting and identifying the MAC addresses of the switches that are allowed to access the port.

You can enable port security on a virtual port channel (vPC) port only if the following occurs:
- Port security is enabled on both the vPC peers
- Port security is enabled on the vPC port on both the vPC peers.

This command does not require a license.

**Examples**
This example shows how to enable port security on the switch:
```
switch# configure terminal
switch(config)# feature port-security
switch(config)#
```

This example shows how to disable port security on the switch:
```
switch# configure terminal
switch(config)# no feature port-security
switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show feature</strong></td>
<td>Displays the features that are enabled or disabled on the switch.</td>
</tr>
</tbody>
</table>
### Command Description

<table>
<thead>
<tr>

<tr>
<td>switchport port-security</td>
<td>Configures the switchport parameters to establish port security.</td>
</tr>
</tbody>
</table>
feature private-vlan

To enable private VLANs, use the `feature private-vlan` command. To return to the default settings, use the `no` form of this command.

```
feature private-vlan
no feature private-vlan
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Private VLANs are disabled.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
The private VLAN commands are not available until you enable the private VLAN feature.

You cannot disable the private VLANs if there are operational ports on the switch that are in private VLAN mode.

**Note**
A private VLAN-isolated port on a Cisco Nexus 5000 Series switch running the current release of Cisco NX-OS does not support IEEE 802.1Q encapsulation and cannot be used as a trunk port.

**Examples**
This example shows how to enable private VLAN functionality on the switch:

```
switch(config)# feature private-vlan
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>private-vlan</td>
<td>Configures a VLAN as either a community, isolated, or primary private VLAN.</td>
</tr>
<tr>
<td>show vlan private-vlan</td>
<td>Displays information on private VLANs. If the feature is not enabled, this command is not available.</td>
</tr>
<tr>
<td>show feature</td>
<td>Displays whether or not private VLAN is enabled on the switch.</td>
</tr>
</tbody>
</table>
feature udlld

To enable the Cisco-proprietary Unidirectional Link Detection (UDLD) protocol, which allows ports that are connected through fiber optics or copper Ethernet cables to monitor the physical configuration of the cables and detect when a unidirectional link exists, use the `feature udlld` command. To disable UDLD on the switch, use the `no` form of this command.

```
feature udlld
```

```
no feature udlld
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

UDLD is disabled.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(1a)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enable UDLD on the switch:

```
switch(config)# feature udlld
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show udlld</td>
<td>Displays the administrative and operational UDLD status.</td>
</tr>
<tr>
<td>show feature</td>
<td>Displays whether or not UDLD is enabled on the switch.</td>
</tr>
</tbody>
</table>
feature vmfex

To enable the Cisco Virtual Machine Fabric Extender (VM-FEX), use the `feature vmfex` command. To disable VM-FEX, use the `no` form of this command.

```
feature vmfex
no feature vmfex
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before you use this command, make sure that you install and enable the virtualization feature set using the `install feature-set virtualization` and `feature-set virtualization` commands respectively.

- If you attempt to disable the VM-FEX feature with virtual Ethernet interface or port profile configurations enabled, the switch returns an error message.
- This command requires an Enhanced Layer 2 license.

**Examples**

This example shows how to enable VM-FEX on the switch:

```
switch# configure terminal
switch(config)# feature vmfex
switch(config)#
```

This example shows how to disable VM-FEX on the switch:

```
switch# configure terminal
switch(config)# no feature vmfex
switch(config)#
```

**Related Commands**

</table>
feature-set virtualization

To enable the Cisco Virtual Machine features on the switch, use the feature-set virtualization command. To disable the virtualization feature, use the no form of this command.

    feature-set virtualization

    no feature-set virtualization

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

Global configuration mode

Command History

Release Modification
5.1(3)N1(1) This command was introduced.

Usage Guidelines

Note

The Cisco virtual machine feature is supported only on the Cisco Nexus 5500 Series switches.

Before you use this command, make sure that you install the virtualization feature set on the switch by using the install feature-set virtualization command.

You cannot view or access any virtualization commands until you enable a Cisco virtual machine on the switch.

Note

You must install the Cisco virtual machine feature set before you enable virtualization on the switch.

Before you disable this feature on the switch, do the following:

- Remove all virtual Ethernet interface configurations on the switch.
- Remove all virtual network tag (VNTag) configurations on the switch.
- Remove all port profiles of type vethernet.
- Change the port mode to access by using the switchport mode access command.

This command requires an Enhanced Layer 2 license.

Examples

This example shows how to enable the virtualization feature on the switch:

switch# configure terminal
switch(config)# feature-set virtualization
This example shows how to disable the virtualization feature on the switch:

```
switch# configure terminal
switch(config)# no feature-set virtualization
switch(config)#
```

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with H.
To use hardware hashing for multicast traffic on an EtherChannel interface, use the `hardware multicast hw-hash` command. To restore the defaults, use the `no` form of this command.

```
hardware multicast hw-hash
no hardware multicast hw-hash
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
The software selection method is used for multicast traffic.

**Command Modes**
Interface configuration mode

**Command History**
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

**Usage Guidelines**
By default, ingress multicast traffic on any port in the switch selects a particular EtherChannel member to egress the traffic. To reduce potential issues with the bandwidth and to provide effective load balancing of the ingress multicast traffic, hardware hashing is used for multicast traffic.

**Note**
Hardware hashing is not available on a Cisco Nexus 2000 Series Fabric Extender HIF port (downlink port).

**Examples**
This example shows how to set the hardware hashing for multicast traffic on an EtherChannel interface:
```
switch(config)# interface port-channel 21
switch(config-if)# hardware multicast hw-hash
switch(config-if)#
```

This example shows how to restore the default software selection method for multicast traffic on an EtherChannel interface:
```
switch(config)# interface port-channel 21
switch(config-if)# hardware multicast hw-hash
switch(config-if)# no hardware multicast hw-hash
switch(config-if)#
```

**Related Commands**
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface</td>
<td>Displays the status of the EtherChannel interface configuration.</td>
</tr>
<tr>
<td>port-channel</td>

Send comments to nexus5k-docfeedback@cisco.com
high-performance host-netio (virtual Ethernet interface)

To turn on high performance on the host, use the `high-performance host-netio` command. To disable high performance, use the `no` form of this command.

```
  high-performance host-netio
  no high-performance host-netio
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Disabled

**Command Modes**

Virtual Ethernet interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to enable high performance on the host:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# high-performance host-netio
switch(config-if)#
```

**Related Commands**

I Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with I.
install certificate

To install a certificate that is used to connect to a vCenter Server, use the `install certificate` command. To remove a certificate, use the `no` form of this command.

```
install certificate {bootflash://server/ | default}
```

```
no install certificate
```

**Syntax Description**

- `bootflash:///server/` Specifies the source or destination URL for boot flash memory to install the certificate. The `server` argument value is `module-1`, `sup-1`, `sup-active`, or `sup-local`.
- `default` Specifies the default path.

**Command Default**

None

**Command Modes**

SVS connection configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to install a certificate to the boot flash memory:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# install certificate bootflash:///server/
```

This example shows how to remove a certificate:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# no install certificate
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show svs connections</td>
<td>Displays SVS connection information.</td>
</tr>
<tr>
<td>svs connection</td>
<td>Enables an SVS connection.</td>
</tr>
</tbody>
</table>
install feature-set virtualization

To install the Cisco virtual machine feature set on the switch, use the **install feature-set virtualization** command. To remove the Cisco virtual machine feature set, use the **no** form of this command.

```
install feature-set virtualization

no install feature-set virtualization
```

### Syntax Description
This command has no arguments or keywords.

### Command Default
Disabled

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

**Note**
The Cisco virtual machine feature is supported only on the Cisco Nexus 5500 Series switches.

This command requires an Enhanced Layer 2 license.

### Examples
This example shows how to install the Cisco virtual machine feature set on the switch:

```
switch# configure terminal
switch(config)# install feature-set virtualization
switch(config)#
```

### Related Commands

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td><strong>feature vmfex</strong></td>
<td>Enables or disables Cisco Virtual Machine Fabric Extender (VM-FEX) on the switch.</td>
</tr>
<tr>
<td><strong>feature-set virtualization</strong></td>
<td>Enables the Cisco virtual machine feature set on the switch.</td>
</tr>
<tr>
<td><strong>show feature-set</strong></td>
<td>Displays the status of the virtualization feature set.</td>
</tr>
<tr>
<td><strong>show running-config</strong></td>
<td>Displays the running system configuration information.</td>
</tr>
</tbody>
</table>
instance vlan

To map a VLAN or a set of VLANs to a Multiple Spanning Tree instance (MSTI), use the `instance vlan` command. To delete the instance and return the VLANs to the default instance (Common and Internal Spanning Tree [CIST]), use the `no` form of this command.

```
instance instance-id vlan vlan-id
no instance instance-id [vlan vlan-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>instance-id</code></td>
<td>Instances to which the specified VLANs are mapped. The range is from 0 to 4094.</td>
</tr>
<tr>
<td><code>vlan vlan-id</code></td>
<td>Specifies the number of the VLANs that you are mapping to the specified MSTI. The VLAN ID range is from 1 to 4094.</td>
</tr>
</tbody>
</table>

### Command Default

No VLANs are mapped to any MST instance (all VLANs are mapped to the CIST instance).

### Command Modes

MST configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- The VLAN identifier is entered as a single value or a range.
- The mapping is incremental, not absolute. When you enter a range of VLANs, this range is added to or removed from the existing instances.
- Any unmapped VLAN is mapped to the CIST instance.

⚠️ **Caution**

When you change the VLAN-to-MSTI mapping, the system restarts MST.

### Examples

This example shows how to map a range of VLANs to MSTI 4:

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# instance 4 vlan 100-200
```
<table>
<thead>
<tr>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show spanning-tree mst configuration</td>
<td>Displays information about the MST protocol.</td>
</tr>
<tr>
<td></td>
<td>spanning-tree mst configuration</td>
<td>Enters MST configuration mode.</td>
</tr>
</tbody>
</table>
interface ethernet

To enter interface configuration mode for an Ethernet IEEE 802.3 interface, use the `interface ethernet` command.

```
interface ethernet [chassis_ID/] slot/port
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
</table>
| `chassis_ID` | (Optional) Specifies the Fabric Extender chassis ID. The chassis ID is from 100 to 199.  
   *Note* This argument is not optional when addressing the host interfaces of a Cisco Nexus 2000 Series Fabric Extender. |
| `slot` | Slot from 1 to 3. The following list defines the slots available:  
   - Slot 1 includes all the fixed ports. A Fabric Extender only has one slot.  
   - Slot 2 includes the ports on the upper expansion module (if populated).  
   - Slot 3 includes the ports on the lower expansion module (if populated). |
| `port` | Port number within a particular slot. The port number is from 1 to 128. |

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.0(1a)N2(1)</td>
<td>This command was modified to provide the chassis ID argument.</td>
</tr>
<tr>
<td>5.0(3)N1(1)</td>
<td>Support for Layer 3 interfaces was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enter configuration mode for Ethernet interface 1/4:

```
switch(config)# interface ethernet 1/4  
switch(config-if)#
```

This example shows how to enter configuration mode for a host interface on a Fabric Extender:

```
switch(config)# interface ethernet 101/1/1  
switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>interface vethernet</td>
<td>Configures a virtual Ethernet interface.</td>
</tr>
<tr>
<td>show fex</td>
<td>Displays all configured Fabric Extender chassis connected to the switch.</td>
</tr>
</tbody>
</table>
**I Commands**

**interface ethernet**

---

**show interface ethernet**

Displays various parameters of an Ethernet IEEE 802.3 interface.

**speed**

Sets the speed on the interface.

**vtp (interface)**

Enables VLAN Trunking Protocol (VTP) on an interface.

---
interface ethernet (Layer 3)

To configure a Layer 3 Ethernet IEEE 802.3 routed interface, use the `interface ethernet` command.

```
interface ethernet [chassis_ID/ slot/port[.subintf-port-no]]
```

### Syntax Description

- **chassis_ID** *(Optional)* Specifies the Fabric Extender chassis ID. The chassis ID is from 100 to 199.
- **slot** Slot from 1 to 3. The following list defines the slots available:
  - Slot 1 includes all the fixed ports. A Fabric Extender only has one slot.
  - Slot 2 includes the ports on the upper expansion module (if populated).
  - Slot 3 includes the ports on the lower expansion module (if populated).
- **port** Port number within a particular slot. The port number is from 1 to 128.
- **.** *(Optional)* Specifies the subinterface separator.
- **subintf-port-no** *(Optional)* Port number for the subinterface. The range is from 1 to 48.

### Command Default
None

### Command Modes
- Global configuration mode
- Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must use the `no switchport` command in the interface configuration mode to configure the interface as a Layer 3 routed interface. When you configure the interface as a Layer 3 interface, all Layer 2 specific configurations on this interface are deleted.

Use the `switchport` command to convert a Layer 3 interface into a Layer 2 interface. When you configure the interface as a Layer 2 interface, all Layer 3 specific configurations on this interface are deleted.

### Examples

This example shows how to enter configuration mode for a Layer 3 Ethernet interface 1/5:

```
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip address 10.1.1.1/24
switch(config-if)#
```
This example shows how to configure a Layer 3 subinterface for Ethernet interface 1/5 in the global configuration mode:

```bash
switch(config)# interface ethernet 1/5.2
switch(config-if)# no switchport
switch(config-subif)# ip address 10.1.1.1/24
```

This example shows how to configure a Layer 3 subinterface in interface configuration mode:

```bash
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# interface ethernet 1/5.1
switch(config-subif)# ip address 10.1.1.1/24
```

This example shows how to convert a Layer 3 interface to a Layer 2 interface:

```bash
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)# ip address 10.1.1.1/24
switch(config-if)# switchport
```

### Related Commands

</tbody>
</table>
interface loopback

To create a loopback interface and enter interface configuration mode, use the `interface loopback` command. To remove a loopback interface, use the `no` form of this command.

```
interface loopback number

no interface loopback number
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>number</code></td>
<td>Interface number; valid values are from 0 to 1023.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `interface loopback` command to create or modify loopback interfaces.

From the loopback interface configuration mode, the following parameters are available:

- **description**—Provides a description of the purpose of the interface.
- **ip**—Configures IP features, such as the IP address for the interface, Address Resolution Protocol (ARP) attributes, load balancing, Unicast Reverse Path Forwarding (RPF) or IP Source Guard.
- **logging**—Configure logging of events.
- **shutdown**—Shut down traffic on the interface.

This command does not require a license.

**Examples**

This example shows how to create a loopback interface:

```
switch(config)# interface loopback 50
switch(config-if)# ip address 10.1.1.1/24
switch(config-if)#
```

**Related Commands**

<table>

<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface loopback</td>
<td>Displays information about the traffic on the specified loopback interface.</td>
</tr>
</tbody>
</table>
interface mgmt

To enter the management interface configuration mode, use the interface mgmt command.

```
interface mgmt mgmt-intf-num
```

**Syntax Description**

- **mgmt-intf-num**
  - Management interface number. The interface number is 0.

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to enter the management interface configuration mode:

```
switch# configure terminal
switch(config)# interface mgmt 0
switch(config-if)#
```

**Related Commands**

<table>

<tr>
<td>rate-limit cpu direction</td>
<td>Configures the packet per second (PPS) rate limit for an interface.</td>
</tr>
<tr>
<td>snmp trap link-status</td>
<td>Enables Simple Network Management Protocol (SNMP) link trap generation on an interface.</td>
</tr>
<tr>
<td>speed</td>
<td>Configures the transmit and receive speed for an interface.</td>
</tr>
<tr>
<td>vrf member</td>
<td>Adds an interface to a virtual routing and forwarding (VRF) instance.</td>
</tr>
</tbody>
</table>
interface port-channel

To create an EtherChannel interface and enter interface configuration mode, use the `interface port-channel` command. To remove an EtherChannel interface, use the `no` form of this command.

```
interface port-channel channel-number[.subintf-channel-no]
no interface port-channel channel-number[.subintf-channel-no]
```

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>channel-number</code></td>
<td>Channel number that is assigned to this EtherChannel logical interface. The range is from 1 to 4096.</td>
</tr>
<tr>
<td><code>.</code></td>
<td>(Optional) Specifies the subinterface separator.</td>
</tr>
<tr>
<td><code>subintf-channel-no</code></td>
<td>(Optional) Port number of the EtherChannel subinterface. The range is from 1 to 4093.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command Default</th>
<th>None</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Command Modes</th>
<th>Global configuration mode</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Interface configuration mode</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Command History</th>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>4.0(0)N1(1a)</td>

</tr>
<tr>
<td></td>
<td>5.0(3)N1(1)</td>
<td>Support for Layer 3 interfaces and subinterfaces was added.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Usage Guidelines</th>
<th>A port can belong to only one channel group.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>When you use the <code>interface port-channel</code> command for Layer 2 interfaces, follow these guidelines:</td>
</tr>
<tr>
<td></td>
<td>- If you are using CDP, you must configure it only on the physical interface and not on the EtherChannel interface.</td>
</tr>
<tr>
<td></td>
<td>- If you do not assign a static MAC address on the EtherChannel interface, a MAC address is automatically assigned. If you assign a static MAC address and then later remove it, the MAC address is automatically assigned.</td>
</tr>
<tr>
<td></td>
<td>- The MAC address of the EtherChannel is the address of the first operational port added to the channel group. If this first-added port is removed from the channel, the MAC address comes from the next operational port added, if there is one.</td>
</tr>
<tr>
<td></td>
<td>You must use the <code>no switchport</code> command in the interface configuration mode to configure the EtherChannel interface as a Layer 3 interface. When you configure the interface as a Layer 3 interface, all Layer 2 specific configurations on this interface are deleted.</td>
</tr>
</tbody>
</table>
Use the `switchport` command to convert a Layer 3 EtherChannel interface into a Layer 2 interface. When you configure the interface as a Layer 2 interface, all Layer 3 specific configurations on this interface are deleted.

You can configure one or more subinterfaces on a port channel made from routed interfaces.

### Examples

This example shows how to create an EtherChannel group interface with channel-group number 50:
```
switch(config)# interface port-channel 50
switch(config-if)#
```

This example shows how to create a Layer 3 EtherChannel group interface with channel-group number 10:
```
switch(config)# interface port-channel 10
switch(config-if)# no switchport
switch(config-if)# ip address 192.0.2.1/24
switch(config-if)#
```

This example shows how to configure a Layer 3 EtherChannel subinterface with channel-group number 1 in interface configuration mode:
```
switch(config)# interface port-channel 10
switch(config-if)# no switchport
switch(config-if)# interface port-channel 10.1
switch(config-subif)# ip address 192.0.2.2/24
switch(config-subif)#
```

This example shows how to configure a Layer 3 EtherChannel subinterface with channel-group number 20.1 in global configuration mode:
```
switch(config)# interface port-channel 20.1
switch(config-subif)# ip address 192.0.2.3/24
switch(config-subif)#
```

### Related Commands

interface vethernet

To enter interface configuration mode for a virtual Ethernet (vEth) interface, use the **interface vethernet** command. To remove a virtual Ethernet interface, use the **no** form of this command.

```
interface vethernet veth-id[, vethernet veth-id, ...]
no interface vethernet veth-id[, vethernet veth-id, ...]
```

**Syntax Description**

| veth-id | Virtual Ethernet interface number. The range is from 1 to 1,048,575. You can specify more than one virtual Ethernet interface. Make sure you use the comma (,) separator. |

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you use a virtual Ethernet interface, you must enable the Cisco Virtual Machine Fabric Extender (VM-FEX) on the switch by using the **feature vmfex** command.

You must configure a virtual Ethernet interface on each switch. The configuration in the secondary switch must be identical to that of the primary switch.

You can create a maximum of 1000 virtual Ethernet interfaces on a Cisco Nexus 5548 switch. Before you disable Adapter-FEX on the switch, make sure that you delete these interfaces. After you delete a virtual Ethernet interface, make sure that you save the running configuration of the switch to the startup configuration file.

**Examples**

This example shows how to enter configuration mode for virtual Ethernet interface 10:

```
switch# configure terminal
switch(config)# interface vethernet 10
switch(config-if)#
```

This example shows how to enter configuration mode for multiple virtual Ethernet interfaces:

```
switch# configure terminal
switch(config)# interface vethernet 10, vethernet 2
switch(config-if-range)#
```

This example shows how to bind an interface, configure a vEthernet access interface, assign the access VLAN for that interface, and then assign a port profile named ppVEth, and a class of service (CoS) value 3 to a virtual Ethernet interface:
interface vethernet

switch# configure terminal
switch(config)# port-profile type vethernet ppVEth
switch(config-port-prof)# switchport mode access
switch(config-port-prof)# service-policy type qos input my_policy1
switch(config-port-prof)# exit
switch(config)# interface vethernet 10
switch(config-if)# bind interface ethernet 1/5 channel 10
switch(config-if)# inherit port-profile ppVEth
switch(config-if)# untagged cos 3
switch(config-if)#

This example shows how to remove a virtual Ethernet interface:

switch# configure terminal
switch(config)# no interface vethernet 2
switch(config)#

### Related Commands

interface vlan

To create a VLAN interface and enter interface configuration mode, use the `interface vlan` command. To remove a VLAN interface, use the `no` form of this command.

```
interface vlan vlan-id
no interface vlan vlan-id
```

### Syntax Description

| `vlan-id` | VLAN to set when the interface is in access mode; valid values are from 1 to 4094, except for the VLANs reserved for the internal switch use. |

### Command Default

None

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before you use this command, enable the interface-vlan feature by using the `feature interface-vlan` command.

Use the `interface vlan` command to create or modify VLAN interfaces.

The VLAN interface is created the first time that you enter the `interface vlan` command for a particular VLAN. The `vlan-id` argument corresponds to the VLAN tag that is associated with the data frames on an IEEE 802.1Q-encapsulated trunk, or the VLAN ID that is configured for an access port.

This command does not require a license.

### Examples

This example shows how to create a VLAN interface for VLAN 50:

```
switch(config)# interface vlan 50
switch(config-if)#
```

### Related Commands

ip igmp snooping (EXEC)

To enable Internet Group Management Protocol (IGMP), use the `ip igmp snooping` command. To disable IGMP snooping, use the `no` form of this command.

```
ip igmp snooping
no ip igmp snooping
```

Syntax Description
This command has no arguments or keywords.

Command Default
IGMP snooping is enabled.

Note
If the global setting is disabled, then all VLANs are treated as disabled, whether they are enabled or not.

ip igmp snooping (VLAN)

To configure Internet Group Management Protocol (IGMP) on a VLAN, use the `ip igmp snooping` command. To negate the command or return to the default settings, use the `no` form of this command.

```
ip igmp snooping parameter
no ip igmp snooping parameter
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>parameter</code></td>
<td>Parameter to configure. See the “Usage Guidelines” section for additional information.</td>
</tr>
</tbody>
</table>

**Command Default**

The default settings are as follows:

- `explicit-tracking`—enabled
- `fast-leave`—disabled for all VLANs
- `last-member-query-interval seconds`—1
- `querier IP-address`—disabled
- `report-suppression`—enabled

**Command Modes**

VLAN configuration mode

<tr>
<td><code>mrouter interface interface</code></td>
<td>Configures a static connection to a multicast router. The specified interface is Ethernet or EtherChannel.</td>
</tr>
</tbody>
</table>
Example

This example shows how to configure IGMP snooping parameters for VLAN 5:

```
switch# configure terminal
switch(config)# vlan 5
switch(config-vlan)# ip igmp snooping last-member-query-interval 3
switch(config-vlan)# ip igmp snooping querier 192.168.2.106
switch(config-vlan)# ip igmp snooping explicit-tracking
switch(config-vlan)# ip igmp snooping fast-leave
switch(config-vlan)# ip igmp snooping report-suppression
switch(config-vlan)# ip igmp snooping mrouter interface ethernet 1/10
switch(config-vlan)# ip igmp snooping static-group 192.0.2.1 interface ethernet 1/10
switch(config-vlan)# ip igmp snooping static-group 192.0.2.12 interface vethernet 4/1
```

L Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with L.
To configure port channel Link Aggregation Control Protocol (LACP) graceful convergence, use the `lacp graceful-convergence` command. To disable graceful convergence on a port channel interface, use the `no` form of this command.

```
lacp graceful-convergence
no lacp graceful-convergence
```

### Syntax Description
This command has no arguments or keywords.

### Command Default
Enabled

### Command Modes
Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
You can use this command only on a port channel interface that is in an administratively down state. You cannot configure (or disable) LACP graceful convergence on a port channel that is in an administratively up state. If you do so, you will see the following error message:

```
ERROR: Cannot set/reset lacp graceful-convergence for port-channel10 that is admin up
```

To avoid port suspension, we recommend that you disable graceful convergence on LACP ports on a peer switch that is not running Cisco NX-OS.

This command does not require a license.

### Examples
This example shows how to enable LACP graceful convergence on a port channel:

```
switch# configure terminal
switch(config)# interface port-channel 100
switch(config-if)# shutdown
switch(config-if)# lacp graceful-convergence
switch(config-if)#
```

This example shows how to disable LACP graceful convergence on a port channel:

```
switch# configure terminal
switch(config)# interface port-channel 100
switch(config-if)# no lacp graceful-convergence
switch(config-if)#
```
## Related Commands

</tbody>
</table>
To set the priority for the physical interfaces for the Link Aggregation Control Protocol (LACP), use the `lacp port-priority` command. To return the port priority to the default value, use the `no` form of this command.

```
lacp port-priority priority
no lacp port-priority
```

### Syntax Description

<table>
<thead>
<tr>
<th>Priority</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>priority</code></td>
<td>Priority for the physical interfaces. The range of valid numbers is from 1 to 65535.</td>
</tr>
</tbody>
</table>

### Command Default

System priority value is 32768.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Each port configured to use LACP has an LACP port priority. You can configure a value between 1 and 65535. LACP uses the port priority in combination with the port number to form the port identifier. The port priority is used with the port number to form the port identifier. The port priority is used to decide which ports should be put into standby mode when there is a hardware limitation that prevents all compatible ports from aggregating.

**Note**

When setting the priority, note that a higher number means a lower priority.

### Examples

This example shows how to set the LACP port priority for the interface to 2000:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# lacp port-priority 2000
switch(config-if)#
```

### Related Commands

<table>

</tbody>
</table>
To configure the rate at which control packets are sent by the Link Aggregation Control Protocol (LACP), use the `lacp rate fast` command. To restore the rate to 30 seconds, use the `no` form of this command or the `lacp rate normal` command.

```
lacp rate fast
no lacp rate
no lacp rate fast
lacp rate normal
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
1 second

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enable LACP before using this command.

You can configure the LACP rate fast feature on the LACP ports of a Cisco Nexus 5000 Series switch or a Cisco Nexus 2000 Series Fabric Extender that is connected to a Cisco Nexus 5000 Series switch.

The LACP rate fast feature is used to set the rate (once every second) at which the LACP control packets are sent to an LACP-supported interface. The normal rate at which LACP packets are sent is 30 seconds.

**Examples**

This example shows how to configure the LACP fast rate feature on a specified Ethernet interface:

```
switch(config)# interface ethernet 1/1
switch(config-if)# lacp rate fast
```

This example shows how to remove the LACP fast rate configuration from a specified Ethernet interface:

```
switch(config)# interface ethernet 1/1
switch(config-if)# no lacp rate fast
```

**Related Commands**

<table>

To configure short time out for Link Aggregation Control Protocol (LACP) fast rate, use the `lacp short-timeout` command. To restore the default rate to 15 seconds, use the `no` form of this command.

```plaintext
lacp short-timeout

no lacp short-timeout
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
15 seconds

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>7.3(0)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You must enable LACP rate fast before using this command.

You can configure the LACP rate fast feature on the LACP ports of a Cisco Nexus 5000 Series switch or a Cisco Nexus 2000 Series Fabric Extender that is connected to a Cisco Nexus 5000 Series switch.

The LACP short-time out command is used to set the fast rate timeout at which the LACP control packets are sent to an LACP-supported interface. The normal rate at which LACP packets are sent is 15 seconds. To adhere to the IEEE802.3ad standards, the `lacp short-timeout` command enables users to set a faster convergence rate of 3 seconds for LACP timeout.

**Note**
LACP short timeout of 3 seconds for rate fast is not supported on FEX interfaces.

**Examples**
This example shows how to configure the LACP short-timeout for fast rate feature:

```
switch(config)# lacp short-timeout 3
```

This example shows how to restore the default lacp short-timeout value for the LACP fast rate feature:

```
switch(config)# no lacp short-timeout
```

**Note**
The default short-timeout value (15) is not displayed in the running configuration.
### L Commands

**lacp suspend-individual**

To enable Link Aggregation Control Protocol (LACP) port suspension on a port channel, use the **lacp suspend-individual** command. To disable port suspension on a port channel interface, use the **no** form of this command.

```
lacp suspend-individual
no lacp suspend-individual
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Disabled

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(2)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

LACP sets a port to the suspended state if it does not receive an LACP bridge protocol data unit (BPDU) from the peer ports in a port channel. This can cause some servers to fail to boot up as they require LACP to logically bring up the port.

This command does not require a license.

**Examples**

This example shows how to enable LACP port suspension on a port channel:

```
switch# configure terminal
switch(config)# interface port-channel 100
switch(config-if)# shutdown
switch(config-if)# lacp suspend-individual
switch(config-if)#
```

This example shows how to disable LACP port suspension on a port channel:

```
switch# configure terminal
switch(config)# interface port-channel 100
switch(config-if)# shutdown
switch(config-if)# no lacp suspend-individual
switch(config-if)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</table>
lACP system-priority

To set the system priority of the switch for the Link Aggregation Control Protocol (LACP), use the `lACP system-priority` command. To return the system priority to the default value, use the `no` form of this command.

```
lACP system-priority priority
no lACP system-priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>priority</th>
<th>Priority for the physical interfaces. The range of valid numbers is from 1 to 65535.</th>
</tr>
</thead>
</table>

**Command Default**

System priority value is 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Each device that runs LACP has an LACP system priority value. You can configure a value between 1 and 65535. LACP uses the system priority with the MAC address to form the system ID and also during negotiation with other systems.

When setting the priority, note that a *higher* number means a *lower* priority.

**Examples**

This example shows how to set the LACP system priority for the device to 2500:

```
switch(config)# lACP system-priority 2500
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</thead>
<tbody>
<tr>
<td>show lACP</td>
<td>Displays LACP information.</td>
</tr>
</tbody>
</table>
link debounce

To enable the debounce timer on an interface, use the `link debounce` command. To disable the timer, use the `no` form of this command.

```
link debounce [time milliseconds]
no link debounce
```

### Syntax Description
- `time milliseconds` (Optional) Specifies the extended debounce timer. The range is from 0 to 5000 milliseconds. A value of 0 milliseconds disables the debounce time.

### Command Default
None

### Command Modes
Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The port debounce time is the amount of time that an interface waits to notify the supervisor of a link going down. During this time, the interface waits to see if the link comes back up. The wait period is a time when traffic is stopped.

**Caution**
When you enable the debounce timer, link up and link down detections are delayed, resulting in a loss of traffic during the debounce period. This situation might affect the convergence of some protocols.

### Examples
This example shows how to enable the debounce timer and set the debounce time to 1000 milliseconds for an Ethernet interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# link debounce time 1000
```

This example shows how to disable the debounce timer for an Ethernet interface:

```
switch(config-if)# no link debounce
```
<table>
<thead>
<tr>

<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show interface ethernet</td>
<td>Displays the interface configuration information.</td>
</tr>
<tr>
<td></td>
<td>show interface debounce</td>
<td>Displays the debounce time information for all interfaces.</td>
</tr>
</tbody>
</table>
load-interval

To change the sampling interval for statistics collections on interfaces, use the `load-interval` command. To return to the default sampling interval, use the `no` form of this command.

```
load-interval [counter {1 | 2 | 3}] seconds
no load-interval [counter {1 | 2 | 3}] [seconds]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Clause</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Specifies the number of counters configured on the interface.</td>
</tr>
<tr>
<td>2</td>
<td>Specifies the interval between sampling statistics on the interface. The range is from 60 to 300 seconds for VLAN network interfaces, and the range is from 30 to 300 seconds for Ethernet and port-channel interfaces.</td>
</tr>
</tbody>
</table>

**Command Default**

- 1—30 seconds; 60 seconds for VLAN network interface
- 2—300 seconds
- 3—not configured

**Command Modes**

- Interface configuration mode

**SupportedUserRoles**

- network-admin
- vdc-admin

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use the `load-interval` command to obtain bit-rate and packet-rate statistics for three different durations. You can set the statistics collection intervals on the following types of interfaces:

- Ethernet interfaces
- Port-channel interfaces
- VLAN network interfaces

You cannot use this command on the management interface or subinterfaces. This command sets the sampling interval for such statistics as packet rate and bit rate on the specified interface. This command does not require a license.
Examples

This example shows how to set the three sample intervals for the Ethernet port 3/1:

```
switch# configure terminal
switch(config)# interface ethernet 3/1
switch(config-if)# load-interval counter 1 60
switch(config-if)# load-interval counter 2 135
switch(config-if)# load-interval counter 3 225
```

</table>
M Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with M.
mac address-table aging-time

To configure the aging time for entries in the MAC address table, use the `mac address-table aging-time` command. To return to the default settings, use the `no` form of this command.

```
mac address-table aging-time seconds [vlan vlan-id]
no mac address-table aging-time [vlan vlan-id]
```

**Syntax Description**
- `seconds`: Aging time for MAC address table entries. The range is from 0 to 1000000 seconds. The default is 300 seconds. Entering 0 disables MAC address aging.
- `vlan vlan-id`: (Optional) Specifies the VLAN to which the changed aging time should be applied.

**Command Default**
300 seconds

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to <code>mac address-table aging-time</code>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Enter 0 seconds to disable the aging process.

The age value may be rounded off to the nearest multiple of 5 seconds. If the system rounds the value to a different value from that specified by the user (from the rounding process), the system returns an informational message.

When you use this command in EXEC mode, the age values of all VLANs for which a configuration has not been specified are modified and those VLANs with specifically modified aging times are not modified. When you use the `no` form of this command without the VLAN parameter, only those VLANs that have not been specifically configured for the aging time reset to the default value. Those VLANs with specifically modified aging times are not modified.

When you use this command and specify a VLAN, the aging time for only the specified VLAN is modified. When you use the `no` form of this command and specify a VLAN, the aging time for the VLAN is returned to the current global configuration for the aging time, which may or may not be the default value of 300 seconds depending if the global configuration of the switch for the aging time has been changed.

The aging time is counted from the last time that the switch detected the MAC address.

**Examples**

This example shows how to change the length of time an entry remains in the MAC address table to 500 seconds for the entire switch:

```
switch(config)# mac address-table aging-time 500
```
### Related Commands

mac address-table static

To configure a static entry for the MAC address table, use the `mac address-table static` command. To delete the static entry, use the `no` form of this command.

```
mac address-table static mac-address vlan vlan-id {drop | interface {ethernet slot/port | port-channel number[subinterface-number]} [auto-learn]}

no mac address-table static mac-address {vlan vlan-id}
```

**Syntax Description**

- `mac-address`  
  MAC address to add to the table. Use the format EEEE.EEEE.EEEE.
- `vlan vlan-id`  
  Specifies the VLAN to apply the static MAC address. The VLAN ID range is from 1 to 4094.
- `drop`  
  Drops all traffic that is received from and going to the configured MAC address in the specified VLAN.
- `interface`  
  Specifies the interface. The type can be either Ethernet or EtherChannel.
- `ethernet slot/port`  
  Specifies the Ethernet interface and the slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.
- `port-channel number`  
  Specifies the EtherChannel interface and EtherChannel number. The range is from 1 to 4096.
- `.subinterface-number`  
  (Optional) EtherChannel number followed by a dot (.) indicator and the subinterface number.
- `auto-learn`  
  (Optional) Allows the switch to automatically update this MAC address.

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to <code>mac address-table static</code>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot apply the `mac address-table static mac-address vlan vlan-id drop` command to a multicast MAC address.

When you install a static MAC address, it is associated with a port. If the same MAC address is seen on a different port, the entry is updated with the new port if you enter the `auto-learn` keyword.

**Examples**

This example shows how to add a static entry to the MAC address table:

```
switch(config)# mac address-table static 0050.3e8d.6400 vlan 3 interface ethernet 1/4
```
<table>
<thead>
<tr>

</table>
management

To configure a switch virtual interface (SVI) that should be used for in-band management, use the `management` command. To remove the in-band management access to a VLAN interface IP address, use the `no` form of this command.

```plaintext
management

no management
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
Interface configuration mode
Switch profile configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can use this command on a VLAN interface.

**Examples**
This example shows how to configure a VLAN interface to allow in-band management access:

```
switch# configure terminal
switch(config)# interface vlan 5
switch(config-if)# management
switch(config-if)#
```

This example shows how to remove the in-band management access to a VLAN interface:

```
switch# configure terminal
switch(config)# interface vlan 5
switch(config-if)# no management
switch(config-if)#
```

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you change the origin IP address in the default VDC, it impacts all the sessions.

This command does not require a license.

**Examples**

This example shows how to configure the ERSPAN origin IP address:

```
switch# configure terminal
switch(config)# monitor erspan origin ip-address 10.1.1.1 global
switch(config)#
```

This example shows how to remove the ERSPAN IP address:

```
switch# configure terminal
switch(config)# no monitor erspan origin ip-address 10.1.1.1 global
switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<tbody>
<tr>
<td>monitor session</td>
<td>Configures a SPAN or an ERSPAN session.</td>
</tr>
</tbody>
</table>
To create a new Ethernet Switched Port Analyzer (SPAN) or an Encapsulated Remote Switched Port Analyzer (ERSPAN) session configuration for analyzing traffic between ports or add to an existing session configuration, use the `monitor session` command. To clear SPAN or ERSPAN sessions, use the `no` form of this command.

```
monitor session {session-number [shut] | type {local | erspan-source} | all shut}
no monitor session {session-number | all} [shut]
```

### Syntax Description

- **session-number**: SPAN session to create or configure. The range is from 1 to 18.
- **all**: Specifies to apply configuration information to all SPAN sessions.
- **shut** (Optional): Specifies that the selected session will be shut down for monitoring.
- **type** (Optional): Specifies the type of session to configure.
  - **local**: Specifies the session type to be local.
  - **erspan-source**: Creates an ERSPAN source session.

### Command Default
None

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>

</tr>
<tr>
<td></td>
<td>The `monitor session {session-number</td>
</tr>
<tr>
<td>5.0(2)N2(1)</td>
<td>Limit on the number of egress (TX) sources in a monitor session has been lifted.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for ERSPAN was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
To ensure that you are working with a completely new session, you can clear the desired session number or all SPAN sessions.

### Note
The Cisco Nexus 5000 Series switch supports two active SPAN sessions. The Cisco Nexus 5548 Switch supports four active SPAN sessions. When you configure more than two SPAN sessions, the first two sessions are active. During startup, the order of active sessions is reversed; the last two sessions are...
active. For example, if you configured ten sessions 1 to 10 where 1 and 2 are active, after a reboot, sessions 9 and 10 will be active. To enable deterministic behavior, explicitly suspend the sessions 3 to 10 with the `monitor session session-number shut` command.

Note

Beginning with Cisco NX-OS Release 5.0(2)N2(1), the limit on the number of egress (TX) sources in a monitor session has been lifted. Port-channel interfaces can be configured as egress sources.

After you create an ERSPAN session, you can describe the session and add interfaces and VLANs as sources and destinations.

**Examples**

This example shows how to create a SPAN session:

```
switch# configure terminal
switch(config)# monitor session 2
```

This example shows how to enter the monitor configuration mode for configuring SPAN session number 9 for analyzing traffic between ports:

```
switch(config)# monitor session 9 type local
switch(config-monitor)# description A Local SPAN session
switch(config-monitor)# source interface ethernet 1/1
switch(config-monitor)# destination interface ethernet 1/2
switch(config-monitor)# no shutdown
```

This example shows how to configure any SPAN destination interfaces as Layer 2 SPAN monitor ports before activating the SPAN session:

```
switch(config)# interface ethernet 1/2
switch(config-if)# switchport
switch(config-if)# switchport monitor
switch(config-if)# no shutdown
```

This example shows how to configure a typical SPAN destination trunk interface:

```
switch(config)# interface Ethernet1/2
switch(config-if)# switchport
switch(config-if)# switchport mode trunk
switch(config-if)# switchport monitor
switch(config-if)# switchport trunk allowed vlan 10-12
switch(config-if)# no shutdown
```

This example shows how to create an ERSPAN session:

```
switch# configure terminal
switch(config)# monitor session 1 type erspan-source
```

To configure the Multiple Spanning Tree (MST) designated bridge and root bridge priority, use the `mst` command. To revert to the default settings, use the `no` form of this command.

```
mst instance-id [{designated | root} priority priority-value]
no mst instance-id [{designated | root} priority priority-value]
```

### Syntax Description

- **instance-id**  
  MST instance. The range is from 0 to 4094.
- **designated**  
  (Optional) Sets the designated bridge priority for the spanning tree.
- **root**  
  (Optional) Sets the root bridge priority for the spanning tree.
- **priority priority-value**  
  (Optional) Specifies the STP-bridge priority; the valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, 61440. All other values are rejected.

### Command Default

None

### Command Modes

Spanning-tree pseudo configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter the `instance-id` argument as a single instance or a range of instances, for example, 0-3,5,7-9.

This command does not require a license.

### Examples

This example shows how to configure a spanning-tree domain:

```
switch# configure terminal
switch(config)# spanning-tree pseudo-information
switch(config-pseudo)# mst 2 designated priority 8192
switch(config-pseudo)# mst 2 root priority 4096
switch(config-pseudo)#
```

mvr group

To configure a Multicast VLAN Registration (MVR) group for an interface, use the `mvr group` command. To remove the MVR group from an interface, use the `no` form of this command.

```
mvr group {group_IP_address | IP_prefix/length} [count count_value] [vlan vlan_ID [...vlan vlan_ID]]
no mvr group {group_IP_address | IP_prefix/length} [count count_value] [vlan vlan_ID [...vlan vlan_ID]]
```

**Syntax Description**

- `group_IP_address` Group IP address in the format `A.B.C.D`.
- `IP_prefix/length` IP prefix and network mask length in the format `x.x.x.x/m`.
- `count count_value` Specifies the count value. The range is from 1 to 64.
- `vlan vlan_ID` Specifies the global default MVR VLAN. The range is from 1 to 4094.

**Command Default**

None

**Command Modes**

Interface configuration mode
Virtual Ethernet interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>

<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use this command on the following interfaces:

- Ethernet interface
- Virtual Ethernet interface

Before you use a virtual Ethernet interface, you must enable the Cisco Virtual Machine Fabric Extender (VM-FEX) on the switch by using the `feature vmfex` command.

This command does not require a license.

**Examples**

This example shows how to configure an MVR VLAN group for an interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# mvr group 192.0.2.1/12 vlan 1
switch(config-if)#
```

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with N.
name (VLAN configuration)

To set the name for a VLAN, use the `name` command. To remove the user-configured name from a VLAN, use the `no` form of this command.

```
name vlan-name

no name
```

**Syntax Description**

| `vlan-name` | Name of the VLAN; you can use up to 32 alphanumeric, case-sensitive characters. The default name is VLANxxxx where xxxx represents four numeric digits (including leading zeroes) equal to the VLAN ID number (for example, VLAN0002). |

**Command Default**
None

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You cannot change the name for the default VLAN, VLAN 1, or for the internally allocated VLANs.

**Examples**

This example shows how to name VLAN 2:

```
switch(config)# vlan 2
switch(config-vlan)# name accounting
```

**Related Commands**

<table>
<thead>
<tr>

<td>Displays VLAN information.</td>
</tr>
</tbody>
</table>
name (MST configuration)

To set the name of a Multiple Spanning Tree (MST) region, use the **name** command. To return to the default name, use the **no** form of this command.

**name name**

**no name name**

**Syntax Description**

| name | Name to assign to the MST region. It can be any string with a maximum length of 32 alphanumeric characters. |

**Command Default**

None

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two or more switches with the same VLAN mapping and configuration version number are considered to be in different MST regions if the region names are different.

**Caution**

Be careful when using the **name** command to set the name of an MST region. If you make a mistake, you can put the switch in a different region. The configuration name is a case-sensitive parameter.

**Examples**

This example shows how to name a region:

```shell
switch(config)# spanning-tree mst configuration
switch(config-mst)# name accounting
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>show spanning-tree mst configuration</strong></td>
<td>Displays information about the MST protocol.</td>
</tr>
<tr>
<td><strong>spanning-tree mst configuration</strong></td>
<td>Enters MST configuration mode.</td>
</tr>
</tbody>
</table>
To configure the interface as a Layer 3 Ethernet interface, use the `no switchport` command.

```
no switchport
```

### Syntax Description

This command has no arguments or keywords.

### Command Default

None

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can configure any Ethernet port as a routed interface. When you configure an interface as a Layer 3 interface, any configuration specific to Layer 2 on this interface is deleted.

If you want to configure a Layer 3 interface for Layer 2, enter the `switchport` command. Then, if you change a Layer 2 interface to a routed interface, enter the `no switchport` command.

### Examples

This example shows how to enable an interface as a Layer 3 routed interface:

```
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport
switch(config-if)#
```

This example shows how to configure a Layer 3 interface as a Layer 2 interface:

```
switch(config)# interface ethernet 1/5
switch(config-if)# switchport
switch(config-if)#
```

<td>Ethernet interface, including the pinning configuration.</td>
</tr>
</tbody>
</table>
**port**

To configure a unified port on a Cisco Nexus 5548UP switch or Cisco Nexus 5596UP switch, use the `port` command. To remove the unified port, use the `no` form of this command.

```
port port-number type {ethernet | fc}
no port port-number type {ethernet | fc}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>port-number</code></td>
<td>Port number. The range is from 1 to 199.</td>
</tr>
<tr>
<td><code>type</code></td>
<td>Specifies the type of port to configure on a slot in a chassis.</td>
</tr>
<tr>
<td><code>ethernet</code></td>
<td>Specifies an Ethernet port.</td>
</tr>
<tr>
<td><code>fc</code></td>
<td>Specifies a Fibre Channel (FC) port.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Slot configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Unified ports allow you to configure ports as Ethernet, native Fibre Channel or Fibre Channel over Ethernet (FCoE) ports. By default, the ports are Ethernet ports but you can change the port mode to Fibre Channel on the following unified ports:

- Any port on the Cisco Nexus 5548UP switch or the Cisco Nexus 5596UP switch.
- The ports on the Cisco N55-M16UP expansion module that is installed in a Cisco Nexus 5548P switch.

You must configure Ethernet ports and FC ports in a specified order:

- FC ports must be configured from the last port of the module.
- Ethernet ports must be configured from the first port of the module.

If the order is not followed, the following errors are displayed:

```
ERROR: Ethernet range starts from first port of the module
ERROR: FC range should end on last port of the module
```

On a Cisco Nexus 5548UP switch, the 32 ports of the main slot (slot1) are unified ports. The Ethernet ports start from port 1/1 to port 1/32. The FC ports start from port 1/32 backwards to port 1/1.

**Examples**

This example shows how to configure a unified port on a Cisco Nexus 5548UP switch or Cisco Nexus 5596UP switch:

```
switch# configure terminal
```
This example shows how to configure a unified port on a Cisco N55-M16UP expansion module:

```
switch# configure terminal
switch(config)# slot 2
switch(config-slot)# port 32 type fc
switch(config-slot)# copy running-config startup-config
switch(config-slot)# reload
```

This example shows how to configure 20 ports as Ethernet ports and 12 as FC ports:

```
switch# configure terminal
switch(config)# slot 1
switch(config-slot)# port 21-32 type fc
switch(config-slot)# copy running-config startup-config
switch(config-slot)# reload
```

### Related Commands

</tbody>
</table>
To configure the load-balancing method among the interfaces in the channel-group bundle, use the `port-channel load-balance ethernet` command. To return the system priority to the default value, use the `no` form of this command.

```
port-channel load-balance ethernet method [hash-polynomial]

no port-channel load-balance ethernet [method]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>method</code></td>
<td>Load-balancing method. See the “Usage Guidelines” section for a list of valid values.</td>
</tr>
<tr>
<td><code>hash-polynomial</code></td>
<td>(Optional) Hash polynomial that is used to determine the egress port selected for a port channel. See the “Usage Guidelines” section for a list of valid values.</td>
</tr>
</tbody>
</table>

**Note**

This is applicable only on a Cisco Nexus 5548 switch and a Cisco Nexus 5596 switch.

**Command Default**

Loads distribution on the source and destination MAC address.

The default hash polynomial is CRC8a.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(3)N2(1)</td>
<td>Support for configurable hash polynomials was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The valid load-balancing `method` values are as follows:

- **destination-ip**—Loads distribution on the destination IP address.
- **destination-mac**—Loads distribution on the destination MAC address.
- **destination-port**—Loads distribution on the destination port.
- **source-destination-ip**—Loads distribution on the source and destination IP address.
- **source-destination-mac**—Loads distribution on the source and destination MAC address.
- **source-destination-port**— Loads distribution on the source and destination port.
- **source-ip**—Loads distribution on the source IP address.
- **source-mac**—Loads distribution on the source MAC address.
- **source-port**— Loads distribution on the source port.
Use the option that provides the balance criteria with the greatest variety in your configuration. For example, if the traffic on an EtherChannel is going only to a single MAC address and you use the destination MAC address as the basis of EtherChannel load balancing, the EtherChannel always chooses the same link in that EtherChannel; using source addresses or IP addresses might result in better load balancing.

Beginning with Cisco NX-OS Release 5.0(3)N2(1), the Cisco Nexus 5548 switch and Cisco Nexus 5596 switch support 8 hash polynomials that can be used for compression on the hash-parameters (software-configurable selection of source and destination MAC addresses, source and destination IP addresses, and source and destination TCP and UDP ports). Depending on variations in the load-balancing method for egress traffic flows from a port channel, different polynomials could provide different load distribution results.

The valid load-balancing hash-polynomial values are as follows:
- **CRC8a**—Hash polynomial CRC8a.
- **CRC8b**—Hash polynomial CRC8b.
- **CRC8c**—Hash polynomial CRC8c.
- **CRC8d**—Hash polynomial CRC8d.
- **CRC8e**—Hash polynomial CRC8e.
- **CRC8f**—Hash polynomial CRC8f.
- **CRC8g**—Hash polynomial CRC8g.
- **CRC8h**—Hash polynomial CRC8h.

---

**Note**
The hash polynomial that you choose affects both the multicast and unicast traffic egressing from all the local port channels. The hash polynomial does not affect the port channels whose member ports are on a Cisco Nexus 2148T Fabric Extender, Cisco Nexus 2232P Fabric Extender, or Cisco Nexus 2248T Fabric Extender.

---

### Examples

This example shows how to set the load-balancing method to use the source IP:
```
switch(config)# port-channel load-balance ethernet source-ip
```

This example shows how to set the load-balancing method to use the source IP and the CRC8c polynomial to hash a flow to obtain a numerical value that can be used to choose the egress physical interface on a Cisco Nexus 5548 switch:
```
switch(config)# port-channel load-balance ethernet source-ip CRC8c
```

### Related Commands

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enable private VLANs by using the `feature private-vlan` command before you can configure private VLANs. The commands for configuring private VLANs are not visible until you enable private VLANs.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive. When you enter the `no private-vlan` command, the VLAN returns to the normal VLAN mode. All primary and secondary associations on that VLAN are suspended, but the interfaces remain in private VLAN mode. When you reconvert the specified VLAN to private VLAN mode, the original associations are reinstated.

If you enter the `no vlan` command for the primary VLAN, all private VLAN associations with that VLAN are lost. If you enter the `no vlan` command for a secondary VLAN, the private VLAN associations with that VLAN are suspended and are reenabled when you recreate the specified VLAN and configure it as the previous secondary VLAN.

You cannot configure VLAN1 or the internally allocated VLANs as private VLANs.

A private VLAN is a set of private ports that are characterized by using a common set of VLAN number pairs. Each pair is made up of at least two special unidirectional VLANs and is used by isolated ports and/or by a community of ports to communicate with routers.

An isolated VLAN is a VLAN that is used by isolated ports to communicate with promiscuous ports. An isolated VLAN’s traffic is blocked on all other private ports in the same VLAN. Its traffic can only be received by standard trunking ports and promiscuous ports that are assigned to the corresponding primary VLAN.

A promiscuous port is defined as a private port that is assigned to a primary VLAN.
A community VLAN is defined as the VLAN that carries the traffic among community ports and from community ports to the promiscuous ports on the corresponding primary VLAN.

A primary VLAN is defined as the VLAN that is used to convey the traffic from the routers to customer end stations on private ports.

Multiple community and isolated VLANs are allowed. If you enter a range of primary VLANs, the system uses the first number in the range for the association.

---

**Note**

A private VLAN-isolated port on a Cisco Nexus 5000 Series switch running the current release of Cisco NX-OS does not support IEEE 802.1Q encapsulation and cannot be used as a trunk port.

If VLAN Trunking Protocol (VTP) is enabled on a switch, you can configure private VLANs only on a device configured in Transparent mode.

### Examples

This example shows how to assign VLAN 5 to a private VLAN as the primary VLAN:

```
switch# configure terminal
switch(config)# vlan 5
switch(config-vlan)# private-vlan primary
```

This example shows how to assign VLAN 100 to a private VLAN as a community VLAN:

```
switch# configure terminal
switch(config)# vlan 100
switch(config-vlan)# private-vlan community
```

This example shows how to assign VLAN 109 to a private VLAN as an isolated VLAN:

```
switch# configure terminal
switch(config)# vlan 109
switch(config-vlan)# private-vlan isolated
```

private-vlan association

To configure the association between a primary VLAN and a secondary VLAN on a private VLAN, use the `private-vlan association` command. To remove the association, use the `no` form of this command.

```
private-vlan association { [add] secondary-vlan-list | remove secondary-vlan-list }
no private-vlan association
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You must enable private VLANs by using the `feature private-vlan` command before you can configure private VLANs. The commands for configuring private VLANs are not visible until you enable private VLANs.

If you delete either the primary or secondary VLAN, the ports that are associated with the VLAN become inactive. When you enter the `no private-vlan` command, the VLAN returns to the normal VLAN mode. All primary and secondary associations on that VLAN are suspended, but the interfaces remain in private VLAN mode. However, when you reconver the specified VLAN to private VLAN mode, the original associations are reinstated.

If you enter the `no vlan` command for the primary VLAN, all private VLAN associations with that VLAN are lost. However, if you enter the `no vlan` command for a secondary VLAN, the private VLAN associations with that VLAN are suspended and return when you recreate the specified VLAN and configure it as the previous secondary VLAN.

The `secondary-vlan-list` argument cannot contain spaces. It can contain multiple comma-separated items. Each item can be a single secondary VLAN ID or a hyphenated range of secondary VLAN IDs. The `secondary-vlan-list` parameter can contain multiple secondary VLAN IDs.

A private VLAN is a set of private ports that are characterized by using a common set of VLAN number pairs. Each pair is made up of at least two special unidirectional VLANs and is used by isolated ports and/or by a community of ports to communicate with routers.

Multiple community and isolated VLANs are allowed. If you enter a range of primary VLANs, the system uses the first number in the range for the association.
Isolated and community VLANs can only be associated with one primary VLAN. You cannot configure a VLAN that is already associated to a primary VLAN as a primary VLAN.

**Note**
A private VLAN-isolated port on a Cisco Nexus 5000 Series switch running the current release of Cisco NX-OS does not support IEEE 802.1Q encapsulation and cannot be used as a trunk port.

**Examples**
This example shows how to create a private VLAN relationship between the primary VLAN 14, the isolated VLAN 19, and the community VLANs 20 and 21:

```
switch(config)# vlan 19
switch(config-vlan)# private-vlan isolated
switch(config)# vlan 20
switch(config-vlan)# private-vlan community
switch(config)# vlan 21
switch(config-vlan)# private-vlan community
switch(config)# vlan 14
switch(config-vlan)# private-vlan primary
switch(config-vlan)# private-vlan association 19-21
```

This example shows how to remove isolated VLAN 18 and community VLAN 20 from the private VLAN association:

```
switch(config)# vlan 14
switch(config-vlan)# private-vlan association remove 18,20
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature private-vlan</td>
<td>Enables private VLANs.</td>
</tr>
<tr>

<td>Displays information about private VLANs.</td>
</tr>
</tbody>
</table>
**private-vlan synchronize**

To map the secondary VLANs to the same Multiple Spanning Tree (MST) instance as the primary VLAN, use the `private-vlan synchronize` command.

```
private-vlan synchronize
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not map secondary VLANs to the same MST instance as the associated primary VLAN when you exit the MST configuration mode, the device displays a warning message that lists the secondary VLANs that are not mapped to the same instance as the associated VLAN. The `private-vlan synchronize` command automatically maps all secondary VLANs to the same instance as the associated primary VLANs.

**Examples**

This example shows how to initialize private VLAN synchronization:

```
switch(config)# spanning-tree mst configuration
switch(config-mst)# private-vlan synchronize
```

**Related Commands**

</thead>
<tbody>
<tr>
<td>show spanning-tree mst configuration</td>
<td>Displays information about the MST protocol.</td>
</tr>
<tr>
<td>spanning-tree mst configuration</td>
<td>Enters MST configuration mode.</td>
</tr>
</tbody>
</table>
To enable the VMware Infrastructure Software Development Kit (VI SDK), use the `protocol vmware-vim` command. To disable the VI SDK, use the `no` form of this command.

```
protocol vmware-vim

no protocol vmware-vim
```

### Syntax Description
This command has no arguments or keywords.

### Command Default
None

### Command Modes
SVS connection configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
The VMware VI SDK is published by VMware and it allows clients to talk to a vCenter server. You must first create an SVS connection before you enable the VMware VI SDK. This command does not require a license.

### Examples
This example shows how to enable the VMware VI SDK:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# protocol vmware-vim
switch(config-svs-conn)#
```

This example shows how to disable the VMware VI SDK:

```
switch# configure terminal
switch(config)# svs connection SVSConn
switch(config-svs-conn)# no protocol vmware-vim
switch(config-svs-conn)#
```

<td></td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Slot configuration mode
Switch profile configuration mode
**Usage Guidelines**

Use this command to define the modules (line card or Cisco Nexus 2000 Series Fabric Extender) to preprovision. If the card type does not match the card in the slot or the module is not compatible with the chassis, you see the following messages:

ERROR: The card type does not match the card in slot

or

ERROR: This module cannot be configured for this chassis

You can configure features or interfaces (Ethernet, Fibre Channel) on the modules before the modules are inserted in the switch chassis. You can also use this command to manage the configuration of these features or interfaces when the module is offline due to a failure or scheduled downtime. These configurations are applied when the module comes online.

When you preprovision a module by specifying the type of module, platform manager will allow only modules of matching type to come online. If you configure the interfaces for the module without specifying the module type, the configuration is applied when the module comes online, regardless of the module type.

You can preprovision modules and interfaces in a switch profile. The modules and interfaces are preprovisioned when you apply (commit) the switch profile. Once the module is inserted and interfaces are created, the preprovisioning module passes on the configuration to the respective applications before the interfaces come up.

Mutual exclusion is a mechanism where configuration outside the switch profile is not allowed in the switch profile and vice-versa. This requirement is to ensure that configuration in the switch profile is exactly the same on both switches. Preprovisioned configuration is the same as a configuration when the module is online, so mutual exclusion checks would continue to apply normally.

When you downgrade from Cisco NX-OS release 5.0(2)N1(1), which supports preprovisioning, to an earlier release of Cisco NX-OS that does not support module preprovisioning, you will be prompted to remove preprovisioning configuration that you configured on the switch.

**Examples**

This example shows how to preprovision a module in slot 2 of the chassis:

```
switch(config)# slot 2
switch(config-slot)# provision model N5K-M1404
switch(config-slot)#
```

This example shows how to configure a switch profile to enable a chassis slot for preprovisioning of a module:

```
switch# config sync
Enter configuration commands, one per line. End with CNTL/Z.
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# slot 2
switch(config-sync-sp-slot)# provision model N5K-M1600
switch(config-sync-sp-slot)#
```

This example shows how to remove a preprovisioned module from a chassis slot:

```
switch(config)# slot 2
```
This example shows how to remove all preprovisioned modules or line cards from a chassis slot:

```
switch(config)# slot 2
switch(config-slot)# no provision model
```

**Related Commands**

R Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with R.
rate-limit cpu direction

To set the packet per second (PPS) rate limit for an interface, use the `rate-limit cpu direction` command. To revert to the default value, use the `no` form of this command.

```
rate-limit cpu direction {both | input | output} pps pps_value action log
```

```
no rate-limit cpu direction {both | input | output} pps pps_value action log
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>both</td>
<td>Sets the maximum input and output packet rate.</td>
</tr>
<tr>
<td>input</td>
<td>Sets the maximum input packet rate.</td>
</tr>
<tr>
<td>output</td>
<td>Sets the maximum output packet rate.</td>
</tr>
<tr>
<td>pps pps_value</td>
<td>Specifies the packets per second. The range is from 0 to 100,000.</td>
</tr>
<tr>
<td>action</td>
<td>Specifies the action is logged.</td>
</tr>
<tr>
<td>log</td>
<td>Writes a syslog message if the PPS value matches or exceeds the specified rate limit.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to set the maximum input packet rate to 3 for an interface and enable the logging of syslog messages:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# rate-limit cpu direction input pps 3 action log
```

</tr>
</tbody>
</table>
revision

To set the revision number for the Multiple Spanning Tree (MST) region configuration, use the revision command. To return to the default settings, use the no form of this command.

```
revision version

no revision version
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revision 0</td>
<td></td>
</tr>
</tbody>
</table>

**Command Modes**

MST configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Two or more switches with the same VLAN mapping and name are considered to be in different MST regions if the configuration revision numbers are different.

Caution

Be careful when using the revision command to set the revision number of the MST region configuration because a mistake can put the switch in a different region.

**Examples**

This example shows how to set the revision number of the MST region configuration:

```
switch(config)＃ spanning-tree mst configuration
switch(config-mst)＃ revision 5
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst</td>
<td>Displays information about the MST protocol.</td>
</tr>

S Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with S.
shut (ERSPAN)

To shut down an Encapsulated Remote Switched Port Analyzer (ERSPAN) session, use the shut command. To enable an ERSPAN session, use the no form of this command.

```
shut

no shut
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
ERSPAN session configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command does not require a license.

**Examples**

This example shows how to shut down an ERSPAN session:
```
switch# configure terminal
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# shut
switch(config-erspan-src)#
```

This example shows how to enable an ERSPAN session:
```
switch# configure terminal
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# no shut
switch(config-erspan-src)#
```

**Related Commands**

<table>
<thead>
<tr>

**shutdown**

To shut down the local traffic on an interface, use the `shutdown` command. To return the interface to its default operational state, use the `no` form of this command.

```
shutdown

no shutdown
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Not shut down

**Command Modes**

- Interface configuration mode
- Subinterface configuration mode
- Virtual Ethernet interface configuration mode

**Command History**

- **4.0(0)N1(1a)**: This command was introduced.
- **5.0(3)N1(1)**: Support for Layer 3 interfaces and subinterfaces was added.
- **5.1(3)N1(1)**: Support for virtual Ethernet interface was added.

**Usage Guidelines**

You can use this command on the following interfaces:

- Layer 2 interface (Ethernet interface, EtherChannel interface, subinterface)
- Layer 3 interface

**Note**

Use the `no switchport` command to configure an interface as a Layer 3 interface.

- Layer 3 subinterface
- Management interface
- Virtual Ethernet interface

**Examples**

This example shows how to shut down, or disable, a Layer 2 interface:

```
switch(config)# interface ethernet 1/10
switch(config-if)# shutdown
```

This example shows how to shut down a Layer 3 Ethernet subinterface:

```
switch(config)# interface ethernet 1/5.1
switch(config-subif)# shutdown
```
This example shows how to shut down a virtual Ethernet interface:

```plaintext
switch(config)# interface vethernet 10
switch(config-if)# shutdown
switch(config-if)#
```

shutdown (VLAN configuration)

To shut down the local traffic on a VLAN, use the `shutdown` command. To return a VLAN to its default operational state, use the `no` form of this command.

```
shutdown

no shutdown
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Not shut down

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You cannot shut down, or disable, VLAN 1 or VLANs 1006 to 4094. After you shut down a VLAN, the traffic ceases to flow on that VLAN. Access ports on that VLAN are also brought down; trunk ports continue to carry traffic for the other VLANs allowed on that port. However, the interface associations for the specified VLAN remain, and when you reenable, or recreate, that specified VLAN, the switch automatically reinstates all the original ports to that VLAN.

To find out if a VLAN has been shut down internally, check the Status field in the `show vlan` command output. If a VLAN is shut down internally, one of these values appears in the Status field:

- act/lshut—VLAN status is active and shut down internally.
- sus/lshut—VLAN status is suspended and shut down internally.

**Note**
If the VLAN is suspended and shut down, you use both the `no shutdown` and `state active` commands to return the VLAN to the active state.

**Examples**
This example shows how to restore local traffic on VLAN 2 after you have shut down, or disabled, the VLAN:

```
switch(config)# vlan 2
switch(config-vlan)# no shutdown
```
### Related Commands

To enable preprovisioning on a slot in a chassis, use the `slot` command. To disable the slot for preprovisioning, use the `no` form of this command.

```
slot slot-number

no slot slot-number
```

**Syntax Description**
- `slot-number` Slot number in the chassis. The range is from 2 to 199.

**Command Default**
None

**Command Modes**
- Global configuration mode
- Configuration synchronization mode

**Command History**
- **Release** 5.0(2)N1(1) This command was introduced.

**Usage Guidelines**
Use this command to enable preprovisioning of features or interfaces of a module on a slot in a chassis. Preprovisioning allows you configure features or interfaces (Ethernet, Fibre Channel) on modules before the modules are inserted in the switch chassis.

**Examples**
This example shows how to enable a chassis slot for preprovisioning of a module:

```
switch(config)# slot 2
switch(config-slot)#
```

This example shows how to configure a switch profile to enable a chassis slot for preprovisioning of a module:

```
switch# config sync
Enter configuration commands, one per line. End with CNTL/Z.
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# slot 2
switch(config-sync-sp-slot)#
```

This example shows how to disable a chassis slot for preprovisioning of a module:

```
switch(config)# no slot 2
switch(config)#
```
<table>

### Command Default

None

### Command Modes

- SPAN session configuration mode
- ERSPAN session configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(2)N1(1)</td>
<td>Port Channel and SAN Port Channel interfaces can be configured as ingress or egress source ports. The limit on the number of egress (TX) sources in a monitor session has been lifted.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for a virtual Ethernet interface and ERSPAN was added.</td>
</tr>
</tbody>
</table>
Usage Guidelines

A source port (also called a monitored port) is a switched port that you monitor for network traffic analysis. In a single local SPAN session, you can monitor source port traffic such as received (Rx), transmitted (Tx), or bidirectional (both).

A source port can be an Ethernet port, port channel, SAN port channel, VLAN, or a VSAN port. It cannot be a destination port.

Note

For Cisco NX-OS Release 4.2(1)N2(1) and earlier, the Cisco Nexus 5010 Switch and the Cisco Nexus 5020 Switch supports a maximum of two egress SPAN source ports.

Beginning with Cisco NX-OS Release 5.0(2)N2(1):

- There is no limit to the number of egress SPAN source ports.
- SAN Port Channel interfaces can be configured as ingress or egress source ports.
- The limit on the number of egress (TX) sources in a monitor session has been lifted.
- Port-channel interfaces can be configured as egress sources.

For ERSPAN, if you do not specify both, rx, or tx, the source traffic is analyzed for both directions.

Examples

This example shows how to configure an Ethernet SPAN source port:

```
switch# configure terminal
switch(config)# monitor session 9 type local
switch(config-monitor)# description A Local SPAN session
switch(config-monitor)# source interface ethernet 1/1
```

This example shows how to configure a port channel SPAN source:

```
switch# configure terminal
switch(config)# monitor session 2
switch(config-monitor)# source interface port-channel 5
```

This example shows how to configure an ERSPAN source port to receive traffic on the port:

```
switch# configure terminal
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# source interface ethernet 1/5 rx
```

spanning-tree bridge assurance

To enable Spanning Tree Protocol (STP) Bridge Assurance on all network ports on the switch, use the `spanning-tree bridge assurance` command. To disable Bridge Assurance, use the `no` form of this command.

```
spanning-tree bridge assurance

no spanning-tree bridge assurance
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Enabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.1(3)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use Bridge Assurance to protect against certain problems that can cause bridging loops in the network.

**Note**

Bridge Assurance is supported only by Rapid per VLAN Spanning Tree Plus (Rapid PVST+) and Multiple Spanning Tree (MST). Legacy 802.1D spanning tree does not support Bridge Assurance.

Bridge Assurance is enabled by default and can only be disabled globally.

Bridge Assurance is enabled globally by default but is disabled on an interface by default. You can enable Bridge Assurance on an interface by using the `spanning-tree port type network` command.

For more information on Bridge Assurance, see the *Cisco Nexus 5000 Series NX-OS Layer 2 Switching Configuration Guide*.

This command does not require a license.

**Examples**

This example shows how to enable Bridge Assurance globally on the switch:

```
switch# configure terminal
switch(config)# spanning-tree bridge assurance
switch(config)#
```
### Related Commands

</table>
spanning-tree bpdufilter

To enable bridge protocol data unit (BPDU) Filtering on the interface, use the `spanning-tree bpdufilter` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpdufilter {enable | disable}
```

Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU Filtering on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU Filtering on this interface.</td>
</tr>
</tbody>
</table>

Command Default

The setting that is already configured when you enter the `spanning-tree port type edge bpdufilter default` command.

Command Modes

Interface configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Entering the `spanning-tree bpdufilter enable` command to enable BPDU Filtering overrides the spanning tree edge port configuration. That port then returns to the normal spanning tree port type and moves through the normal spanning tree transitions.

⚠️ Caution

Be careful when you enter the `spanning-tree bpdufilter enable` command on specified interfaces. Explicitly configuring BPDU Filtering on a port this is not connected to a host can cause a bridging loop because the port will ignore any BPDU that it receives, and the port moves to the STP forwarding state.

Use the `spanning-tree port type edge bpdufilter default` command to enable BPDU Filtering on all spanning tree edge ports.

Examples

This example shows how to explicitly enable BPDU Filtering on the Ethernet spanning tree edge port 1/4:

```
switch (config)# interface ethernet 1/4
switch(config-if)# spanning-tree bpdufilter enable
```

spanning-tree bpduguard

To enable bridge protocol data unit (BPDU) Guard on an interface, use the `spanning-tree bpduguard` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree bpduguard {enable | disable}

no spanning-tree bpduguard
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>enable</td>
<td>Enables BPDU Guard on this interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables BPDU Guard on this interface.</td>
</tr>
</tbody>
</table>

**Command Default**
The setting that is already configured when you enter the `spanning-tree port type edge bpdufilter default` command.

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
BPDU Guard prevents a port from receiving BPDUs. If the port still receives a BPDU, it is put in the error-disabled state as a protective measure.

⚠️ **Caution**
Be careful when using this command. You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the switch and network operation.

When you enable this BPDU Guard command globally, the command applies only to spanning tree edge ports. See the `spanning-tree port type edge bpdufilter default` command for more information on the global command for BPDU Guard. However, when you enable this feature on an interface, it applies to that interface regardless of the spanning tree port type.

This command has three states:

- `spanning-tree bpduguard enable`—Unconditionally enables BPDU Guard on the interface.
- `spanning-tree bpduguard disable`—Unconditionally disables BPDU Guard on the interface.
- `no spanning-tree bpduguard`—Enables BPDU Guard on the interface if it is an operational spanning tree edge port and if the `spanning-tree port type edge bpdufilter default` command is configured.

Typically, this feature is used in a service-provider environment where the network administrator wants to prevent an access port from participating in the spanning tree.
Examples

This example shows how to enable BPDU Guard on this interface:

```
switch(config-if)# spanning-tree bpduguard enable
```

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>

<td>Displays information about the spanning tree state.</td>
</tr>
</tbody>
</table>
spanning-tree cost

To set the path cost of the interface for Spanning Tree Protocol (STP) calculations, use the `spanning-tree cost` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree [vlan vlan-id] cost {value | auto}

no spanning-tree [vlan vlan-id] cost
```

**Syntax Description**

- `vlan vlan-id` (Optional) Lists the VLANs on this trunk interface for which you want to assign the path cost. You do not use this parameter on access ports. The range is from 1 to 4094.

- `value` Value of the port cost. The available cost range depends on the path-cost calculation method as follows:
  - short—The range is from 1 to 65536.
  - long—The range is from 1 to 200,000,000.

- `auto` Sets the value of the port cost by the media speed of the interface (see Table 1 for the values).

**Command Default**

Port cost is set by the media speed.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The STP port path cost default value is determined from the media speed and path cost calculation method of a LAN interface (see Table 1). See the `spanning-tree pathcost method` command for information on setting the path cost calculation method for Rapid per VLAN Spanning Tree Plus (Rapid PVST+).

**Table 1 Default Port Cost**

<table>
<thead>
<tr>
<th>Bandwidth</th>
<th>Short Path Cost Method Port Cost</th>
<th>Long Path Cost Method Port Cost</th>
</tr>
</thead>
<tbody>
<tr>
<td>10 Mbps</td>
<td>100</td>
<td>2,000,000</td>
</tr>
<tr>
<td>100 Mbps</td>
<td>19</td>
<td>200,000</td>
</tr>
<tr>
<td>1-Gigabit Ethernet</td>
<td>4</td>
<td>20,000</td>
</tr>
<tr>
<td>10-Gigabit Ethernet</td>
<td>2</td>
<td>2,000</td>
</tr>
</tbody>
</table>

When you configure the `value`, higher values will indicate higher costs.
On access ports, assign the port cost by port. On trunk ports, assign the port cost by VLAN; you can configure all the VLANs on a trunk port as the same port cost.

The EtherChannel bundle is considered as a single port. The port cost is the aggregation of all the configured port costs assigned to that channel.

**Note**

Use this command to set the port cost for Rapid PVST+. Use the `spanning-tree mst cost` command to set the port cost for MST.

**Examples**

This example shows how to access an interface and set a path cost value of 250 for the spanning tree VLAN that is associated with that interface:

```
switch(config)# interface ethernet 1/4
switch(config-if)# spanning-tree cost 250
```

spanning-tree link-type

To configure a link type for a port, use the `spanning-tree link-type` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree link-type { auto | point-to-point | shared }

no spanning-tree link-type
```

**Syntax Description**

- `auto`: Sets the link type based on the duplex setting of the interface.
- `point-to-point`: Specifies that the interface is a point-to-point link.
- `shared`: Specifies that the interface is a shared medium.

**Command Default**

Link type set automatically based on the duplex setting.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Fast transition (specified in IEEE 802.1w) functions only on point-to-point links between two bridges. By default, the switch derives the link type of a port from the duplex mode. A full-duplex port is considered as a point-to-point link while a half-duplex configuration is assumed to be on a shared link.

**Note**

On a Cisco Nexus 5000 Series switch, port duplex is not configurable.

**Examples**

This example shows how to configure the port as a shared link:

```
switch(config-if)# spanning-tree link-type shared
```

**Related Commands**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Loop Guard provides additional security in the bridge network. Loop Guard prevents alternate or root ports from becoming the designated port because of a failure that could lead to a unidirectional link.

Loop Guard operates only on ports that are considered point-to-point links by the spanning tree, and it does not run on spanning tree edge ports.

Entering the `spanning-tree guard loop` command for the specified interface overrides this global Loop Guard command.

### Examples
This example shows how to enable Loop Guard:

```
switch(config)# spanning-tree loopguard default
```

### Related Commands

<table>
<thead>
<tr>

spanning-tree mode

To switch between Rapid per VLAN Spanning Tree Plus (Rapid PVST+) and Multiple Spanning Tree (MST) Spanning Tree Protocol (STP) modes, use the `spanning-tree mode` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mode {rapid-pvst | mst}
```

```
no spanning-tree mode
```

**Syntax Description**

- `rapid-pvst` Sets the STP mode to Rapid PVST+.
- `mst` Sets the STP mode to MST.

**Command Default**

Rapid PVST+

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You cannot simultaneously run MST and Rapid PVST+ on the switch.

⚠️ **Caution**

Be careful when using the `spanning-tree mode` command to switch between Rapid PVST+ and MST modes. When you enter the command, all STP instances are stopped for the previous mode and are restarted in the new mode. Using this command may cause the user traffic to be disrupted.

**Examples**

This example shows how to switch to MST mode:

```
switch(config)# spanning-tree mode mst
switch(config-mst)#
```

**Related Commands**

</table>
spanning-tree mst configuration

To enter the Multiple Spanning Tree (MST) configuration mode, use the `spanning-tree mst configuration` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst configuration

no spanning-tree mst configuration
```

Syntax Description

This command has no arguments or keywords.

Command Default

The default value for the MST configuration is the default value for all its parameters:

- No VLANs are mapped to any MST instance. All VLANs are mapped to the Common and Internal Spanning Tree (CIST) instance.
- The region name is an empty string.
- The revision number is 0.

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

The MST configuration consists of three main parameters:

- Instance VLAN mapping—See the `instance vlan` command.
- Region name—See the `name (MST configuration)` command.
- Configuration revision number—See the `revision` command.

The `abort` and `exit` commands allow you to exit MST configuration mode. The difference between the two commands depends on whether you want to save your changes or not:

- The `exit` command commits all the changes before leaving MST configuration mode.
- The `abort` command leaves MST configuration mode without committing any changes.

If you do not map secondary VLANs to the same instance as the associated primary VLAN, when you exit MST configuration mode, the following warning message is displayed:

```
These secondary vlans are not mapped to the same instance as their primary:
-> 3
```

See the `switchport mode private-vlan host` command to fix this problem.

Changing an MST configuration mode parameter can cause connectivity loss. To reduce service disruptions, when you enter MST configuration mode, make changes to a copy of the current MST configuration. When you are done editing the configuration, you can apply all the changes at once by using the `exit` keyword.
In the unlikely event that two administrators commit a new configuration at exactly the same time, this warning message is displayed:

% MST CFG:Configuration change lost because of concurrent access

Examples

This example shows how to enter MST-configuration mode:

```
switch(config)# spanning-tree mst configuration
switch(config-mst)#
```

This example shows how to reset the MST configuration (name, instance mapping, and revision number) to the default settings:

```
switch(config)# no spanning-tree mst configuration
```

Related Commands

<table>
<thead>

<td>Displays the information about the MST protocol.</td>
</tr>
</tbody>
</table>
spanning-tree mst cost

To set the path-cost parameter for any Multiple Spanning Tree (MST) instance (including the Common and Internal Spanning Tree [CIST] with instance ID 0), use the `spanning-tree mst cost` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst instance-id cost {cost | auto}
no spanning-tree mst instance-id cost
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>Instance ID number. The range is from 0 to 4094.</td>
</tr>
<tr>
<td>cost</td>
<td>Port cost for an instance. The range is from 1 to 200,000,000.</td>
</tr>
<tr>
<td>auto</td>
<td>Sets the value of the port cost by the media speed of the interface.</td>
</tr>
</tbody>
</table>

**Command Default**

Automatically set port cost values:

- 10 Mbps—2,000,000
- 100 Mbps—200,000
- 1-Gigabit Ethernet—20,000
- 10-Gigabit Ethernet—2,000

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The port cost depends on the port speed; the faster interface speeds indicate smaller costs. MST always uses long path costs.

Higher cost values indicate higher costs. When entering the cost, do not include a comma in the entry; for example, enter 1000, not 1,000.

The EtherChannel bundle is considered as a single port. The port cost is the aggregation of all the configured port costs assigned to that channel.

**Examples**

This example shows how to set the interface path cost:

```
switch(config-if)# spanning-tree mst 0 cost 17031970
```

spanning-tree mst hello-time

To set the hello-time delay timer for all the instances on the switch, use the `spanning-tree mst hello-time` command. To return to the default settings, use the `no` form of this command.

```
  spanning-tree mst hello-time seconds

  no spanning-tree mst hello-time
```

### Syntax Description

- **seconds**: Number of seconds to set the hello-time delay timer for all the instances on the switch. The range is from 1 to 10 seconds.

### Command Default

2 seconds

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

If you do not specify the `hello-time` value, the value is calculated from the network diameter.

### Examples

This example shows how to set the hello-time delay timer:

```
switch(config)# spanning-tree mst hello-time 3
```

spanning-tree mst port-priority

To set the port-priority parameters for any Multiple Spanning Tree (MST) instance, including the Common and Internal Spanning Tree (CIST) with instance ID 0, use the `spanning-tree mst port-priority` command. To return to the default settings, use the `no` form of this command.

`spanning-tree mst instance-id port-priority priority`

`no spanning-tree mst instance-id port-priority`

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>Instance ID number. The range is from 0 to 4094.</td>
</tr>
<tr>
<td>priority</td>
<td>Port priority for an instance. The range is from 0 to 224 in increments of 32.</td>
</tr>
</tbody>
</table>

**Command Default**

Port priority value is 128.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Higher `port-priority` values indicate smaller priorities.

The priority values are 0, 32, 64, 96, 128, 160, 192, and 224. All other values are rejected.

**Examples**

This example shows how to set the interface priority:

```
switch(config-if)# spanning-tree mst 0 port-priority 64
```

**Related Commands**

</table>
spanning-tree mst pre-standard

To force a prestandard Multiple Spanning Tree (MST) bridge protocol data unit (BPDU) transmission on an interface port, use the `spanning-tree mst pre-standard` command. To revert to the defaults, use the `no` form of this command.

```
spanning-tree mst pre-standard
no spanning-tree mst pre-standard
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to force a prestandard MST BPDU transmission on port:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# spanning-tree mst pre-standard
switch(config-if)#
```

**Related Commands**

spanning-tree mst priority

To set the bridge priority, use the `spanning-tree mst priority` command. To return to the default setting, use the `no` form of this command.

```
spanning-tree mst instance-id priority priority-value
no spanning-tree mst instance-id priority
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance-id</td>
<td>Instance identification number. The range is from 0 to 4094.</td>
</tr>
<tr>
<td>priority-value</td>
<td>Bridge priority. See the “Usage Guidelines” section for valid values and additional information.</td>
</tr>
</tbody>
</table>

**Command Default**

Bridge priority default is 32768.

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can set the bridge priority in increments of 4096 only. When you set the priority, valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, and 61440.

You can set the `priority-value` argument to 0 to make the switch root.

You can enter the `instance-id` argument as a single instance or a range of instances, for example, 0-3,5-7-9.

**Examples**

This example shows how to set the bridge priority:

```
switch(config)# spanning-tree mst 0 priority 4096
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree mst</td>
<td>Displays the information about the MST protocol.</td>
</tr>
</tbody>
</table>
spanning-tree mst root

To designate the primary and secondary root and set the timer value for an instance, use the `spanning-tree mst root` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree mst instance-id root {primary | secondary} [diameter dia [hello-time hello-time]]
no spanning-tree mst instance-id root
```

### Syntax Description

- **instance-id**: Instance identification number. The range is from 0 to 4094.
- **primary**: Specifies the high priority (low value) that is high enough to make the bridge root of the spanning-tree instance.
- **secondary**: Specifies the switch as a secondary root, if the primary root fails.
- **diameter dia** (Optional) Specifies the timer values for the bridge that are based on the network diameter.
- **hello-time hello-time** (Optional) Specifies the duration between the generation of configuration messages by the root switch. The range is from 1 to 10 seconds; the default is 2 seconds.

### Command Default

None

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can enter the `instance-id` argument as a single instance or a range of instances, for example, 0-3,5,7-9.

If you do not specify the `hello-time` argument, the argument is calculated from the network diameter. You must first specify the `diameter dia` keyword and argument before you can specify the `hello-time hello-time` keyword and argument.

### Examples

This example shows how to designate the primary root:

```
switch(config)# spanning-tree mst 0 root primary
```

This example shows how to set the priority and timer values for the bridge:

```
switch(config)# spanning-tree mst 0 root primary diameter 7 hello-time 2
```
### Related Commands

spanning-tree mst simulate pvst

To reenable specific interfaces to automatically interoperate between Multiple Spanning Tree (MST) and Rapid per VLAN Spanning Tree Plus (Rapid PVST+), use the `spanning-tree mst simulate pvst` command. To prevent specific MST interfaces from automatically interoperating with a connecting device running Rapid PVST+, use the `spanning-tree mst simulate pvst disable` command. To return specific interfaces to the default settings that are set globally for the switch, use the `no` form of this command.

```
spanning-tree mst simulate pvst
spanning-tree mst simulate pvst disable
no spanning-tree mst simulate pvst
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Enabled. By default, all interfaces on the switch interoperate seamlessly between MST and Rapid PVST+. See the `spanning-tree mst simulate pvst global` command to change this setting globally.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

MST inter-operates with Rapid PVST+ with no need for user configuration. The PVST+ simulation feature enables this seamless interoperability. However, you may want to control the connection between MST and Rapid PVST+ to protect against accidentally connecting an MST-enabled port to a Rapid PVST+-enabled port.

When you use the `spanning-tree mst simulate pvst disable` command, specified MST interfaces that receive a Rapid PVST+ (SSTP) bridge protocol data unit (BPDU) move into the STP blocking state. Those interfaces remain in the inconsistent state until the port stops receiving Rapid PVST+ BPDUs, and then the port resumes the normal STP transition process.

**Note**

To block automatic MST and Rapid PVST+ interoperability for the entire switch, use `no spanning-tree mst simulate pvst global` command.

This command is useful when you want to prevent accidental connection with a device running Rapid PVST+.

To reenable seamless operation between MST and Rapid PVST+ on specific interfaces, use the `spanning-tree mst simulate pvst` command.
**spanning-tree mst simulate pvst**

**Examples**

This example shows how to prevent specified ports from automatically interoperating with a connected device running Rapid PVST+:

```
switch(config-if)# spanning-tree mst simulate pvst disable
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
</table>
| spanning-tree mst simulate pvst global | Enables global seamless interoperation between MST and Rapid PVST+.

spanning-tree mst simulate pvst global

To prevent the Multiple Spanning Tree (MST) switch from automatically interoperating with a connecting device running Rapid per VLAN Spanning Tree Plus (Rapid PVST+), use the `spanning-tree mst simulate pvst global` command. To return to the default settings, which is a seamless operation between MST and Rapid PVST+ on the switch, use the `no spanning-tree mst simulate pvst global` command.

```
spanning-tree mst simulate pvst global
no spanning-tree mst simulate pvst global
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Enabled. By default, the switch interoperates seamlessly between MST and Rapid PVST+.

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
MST does not require user configuration to interoperate with Rapid PVST+. The PVST+ simulation feature enables this seamless interoperability. However, you may want to control the connection between MST and Rapid PVST+ to protect against accidentally connecting an MST-enabled port to a Rapid PVST+-enabled port.

When you use the `no spanning-tree mst simulate pvst global` command, the switch running in MST mode moves all interfaces that receive a Rapid PVST+ (SSTP) bridge protocol data unit (BPDU) into the Spanning Tree Protocol (STP) blocking state. Those interfaces remain in the inconsistent state until the port stops receiving Rapid PVST+ BPDUs, and then the port resumes the normal STP transition process.

You can also use this command from the interface mode, and the configuration applies to the entire switch.

---

**Note**
To block automatic MST and Rapid PVST+ interoperability for specific interfaces, see the `spanning-tree mst simulate pvst` command.

This command is useful when you want to prevent accidental connection with a device not running MST. To return the switch to seamless operation between MST and Rapid PVST+, use the `spanning-tree mst simulate pvst global` command.
This example shows how to prevent all ports on the switch from automatically interoperating with a connected device running Rapid PVST+:

```
switch(config)# no spanning-tree mst simulate pvst global
```
spanning-tree pathcost method

To set the default path-cost calculation method, use the `spanning-tree pathcost method` command. To return to the default settings, use the `no` form of this command.

```
spanning-tree pathcost method {long | short}
no spanning-tree pathcost method
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>Specifies the 32-bit based values for port path costs.</td>
</tr>
<tr>
<td>short</td>
<td>Specifies the 16-bit based values for port path costs.</td>
</tr>
</tbody>
</table>

### Command Default

Short

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

The `long` path-cost calculation method uses all 32 bits for path-cost calculations and yields valued in the range of 2 through 2,000,000,000.

The `short` path-cost calculation method (16 bits) yields values in the range of 1 through 65535.

### Note

This command applies only to the Rapid per VLAN Spanning Tree Plus (Rapid PVST+) spanning tree mode, which is the default mode. When you are using Multiple Spanning Tree (MST) spanning tree mode, the switch uses only the long method for calculating path cost; this is not user-configurable for MST.

### Examples

This example shows how to set the default pathcost method to long:

```
switch(config)# spanning-tree pathcost method long
```

### Related Commands

<table>
<thead>
<tr>

spanning-tree port-priority

To set an interface priority when two bridges compete for position as the root bridge, use the `spanning-tree port-priority` command. The priority you set breaks the tie. To return to the default settings, use the `no` form of this command.

```
spanning-tree [vlan vlan-id] port-priority value

no spanning-tree [vlan vlan-id] port-priority
```

### Syntax Description

- **vlan vlan-id**  
  (Optional) Specifies the VLAN identification number. The range is from 0 to 4094.

- **value**  
  Port priority. The range is from 1 to 224, in increments of 32.

### Command Default

Port priority default value is 128.

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

- Do not use the `vlan vlan-id` parameter on access ports. The software uses the port priority value for access ports and the VLAN port priority values for trunk ports.
- The priority values are 0, 32, 64, 96, 128, 160, 192, and 224. All other values are rejected.

**Note**

Use this command to configure the port priority for Rapid per VLAN Spanning Tree Plus (Rapid PVST+) spanning tree mode, which is the default STP mode. To configure the port priority for Multiple Spanning Tree (MST) spanning tree mode, use the `spanning-tree mst port-priority` command.

### Examples

This example shows how to increase the probability that the spanning tree instance on access port interface 2/0 is chosen as the root bridge by changing the port priority to 32:

```
switch(config-if)# spanning-tree port-priority 32
```

### Related Commands

</table>
spanning-tree port type edge

To configure an interface connected to a host as an edge port, which automatically transitions the port to the spanning tree forwarding state without passing through the blocking or learning states, use the `spanning-tree port type edge` command. To return the port to a normal spanning tree port, use the `no spanning-tree port type` command.

```
spanning-tree port type edge [trunk]
no spanning-tree port type
```

**Syntax Description**

- `trunk` (Optional) Configures the trunk port as a spanning tree edge port.

**Command Default**

The default is the global setting for the default port type edge that is configured when you entered the `spanning-tree port type edge default` command. If you did not configure a global setting, the default spanning tree port type is normal.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can also use this command to configure a port in trunk mode as a spanning tree edge port.

**Caution**

You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the switch and network operation.

When a linkup occurs, spanning tree edge ports are moved directly to the spanning tree forwarding state without waiting for the standard forward-time delay.

**Note**

This is the same functionality that was previously provided by the Cisco-proprietary PortFast feature.

When you use this command, the system returns a message similar to the following:

```
Warning: portfast should only be enabled on ports connected to a single host. Connecting hubs, concentrators, switches, bridges, etc... to this interface when portfast is enabled, can cause temporary bridging loops. Use with CAUTION
```

When you use this command without the `trunk` keyword, the system returns an additional message similar to the following:

```
%Portfast has been configured on Ethernet1/40 but will only have effect when the interface is in a non-trunking mode.
```
To configure trunk interfaces as spanning tree edge ports, use the **spanning-tree port type trunk** command. To remove the spanning tree edge port type setting, use the **no spanning-tree port type** command.

The default spanning tree port type is normal.

### Examples

This example shows how to configure an interface connected to a host as an edge port, which automatically transitions that interface to the forwarding state on a linkup:

```
switch(config-if)# spanning-tree port type edge
```
spanning-tree port type edge bpdufilter default

To enable bridge protocol data unit (BPDU) Filtering by default on all spanning tree edge ports, use the spanning-tree port type edge bpdufilter default command. To disable BPDU Filtering by default on all edge ports, use the no form of this command.

```
spanning-tree port type edge bpdufilter default
no spanning-tree port type edge bpdufilter default
```

Syntax Description
This command has no arguments or keywords.

Command Default
Disabled

Command Modes
Global configuration mode

Command History
```
<table>
<thead>
<tr>
<th>Release</th>
<th>Notifcation</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
```

Usage Guidelines
To enable BPDU Filtering by default, you must do the following:

- Configure the interface as a spanning tree edge port, using the spanning-tree port type edge or the spanning-tree port type edge default command.
- Enable BPDU Filtering.

Use this command to enable BPDU Filtering globally on all spanning tree edge ports. BPDU Filtering prevents a port from sending or receiving any BPDUs.

Caution
Be cautious when using this command; incorrect usage can cause bridging loops.

You can override the global effects of this spanning-tree port type edge bpdufilter default command by configuring BPDU Filtering at the interface level. See the spanning-tree bpdufilter command for complete information on using this feature at the interface level.

Note
The BPDU Filtering feature’s functionality is different when you enable it on a per-port basis or globally. When enabled globally, BPDU Filtering is applied only on ports that are operational spanning tree edge ports. Ports send a few BPDUs at a linkup before they effectively filter outbound BPDUs. If a BPDU is received on an edge port, that port immediately becomes a normal spanning tree port with all the normal transitions and BPDU Filtering is disabled. When enabled locally on a port, BPDU Filtering prevents the switch from receiving or sending BPDUs on this port.
Examples

This example shows how to enable BPDU Filtering globally on all spanning tree edge operational ports by default:

switch(config)# spanning-tree port type edge bpdufilter default

spanning-tree port type edge bpduguard default

To enable bridge protocol data unit (BPDU) Guard by default on all spanning tree edge ports, use the `spanning-tree port type edge bpduguard default` command. To disable BPDU Guard on all edge ports by default, use the `no` form of this command.

```
spanning-tree port type edge bpduguard default

no spanning-tree port type edge bpduguard default
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

To enable BPDU Guard by default, you must do the following:

- Configure the interface as spanning tree edge ports by entering the `spanning-tree port type edge` or the `spanning-tree port type edge default` command.
- Enable BPDU Guard.

Use this command to enable BPDU Guard globally on all spanning tree edge ports. BPDU Guard disables a port if it receives a BPDU.

Global BPDU Guard is applied only on spanning tree edge ports.

You can also enable BPDU Guard per interface; see the `spanning-tree bpduguard` command for more information.

**Note**

We recommend that you enable BPDU Guard on all spanning tree edge ports.

**Examples**

This example shows how to enable BPDU Guard by default on all spanning tree edge ports:

```
switch(config)# spanning-tree port type edge bpduguard default
```

spanning-tree port type edge default

To configure all access ports that are connected to hosts as edge ports by default, use the `spanning-tree port type edge default` command. To restore all ports connected to hosts as normal spanning tree ports by default, use the `no` form of this command.

```
spanning-tree port type edge default

no spanning-tree port type edge default
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Disabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to automatically configure all interfaces as spanning tree edge ports by default. This command will not work on trunk ports.

⚠️ **Caution**

Be careful when using this command. You should use this command only with interfaces that connect to end stations; otherwise, an accidental topology loop could cause a data-packet loop and disrupt the switch and network operation.

When a linkup occurs, an interface configured as an edge port automatically moves the interface directly to the spanning tree forwarding state without waiting for the standard forward-time delay. (This transition was previously configured as the Cisco-proprietary PortFast feature.)

When you use this command, the system returns a message similar to the following:

```
Warning: this command enables portfast by default on all interfaces. You should now disable portfast explicitly on switched ports leading to hubs, switches and bridges as they may create temporary bridging loops.
```

You can configure individual interfaces as edge ports using the `spanning-tree port type edge` command.

The default spanning tree port type is normal.

**Examples**

This example shows how to globally configure all ports connected to hosts as spanning tree edge ports:

```
switch(config)# spanning-tree port type edge default
```
<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree summary</td>
<td>Displays information about the spanning tree configuration.</td>
</tr>
<tr>
<td>spanning-tree port type edge</td>
<td>Configures an interface as a spanning tree edge port.</td>
</tr>
</tbody>
</table>
spanning-tree port type network

To configure the interface that connects to a switch as a network spanning tree port, regardless of the global configuration, use the `spanning-tree port type network` command. To return the port to a normal spanning tree port, use the `no` form of this command.

```
spanning-tree port type network

no spanning-tree port type
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

The default is the global setting for the default port type network that is configured when you entered the `spanning-tree port type network default` command. If you did not configure a global setting, the default spanning tree port type is normal.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to configure an interface that connects to a switch as a spanning tree network port. Bridge Assurance runs only on Spanning Tree Protocol (STP) network ports.

**Note**

If you mistakenly configure ports connected to hosts as STP network ports and enable Bridge Assurance, those ports will automatically move into the blocking state.

**Note**

Bridge Assurance is enabled by default, and all interfaces configured as spanning tree network ports have Bridge Assurance enabled.

To configure a port as a spanning tree network port, use the `spanning-tree port type network` command. To remove this configuration, use the `no spanning-tree port type` command. When you use the `no spanning-tree port type` command, the software returns the port to the global default setting for network port types.

You can configure all ports that are connected to switches as spanning tree network ports by default by entering the `spanning-tree port type network default` command.

The default spanning tree port type is normal.
This example shows how to configure an interface connected to a switch or bridge as a spanning tree network port:

```
switch(config-if)# spanning-tree port type network
```

### Related Commands

<table>

spanning-tree port type network default

To configure all ports as spanning tree network ports by default, use the `spanning-tree port type network default` command. To restore all ports to normal spanning tree ports by default, use the `no` form of this command.

```
spanning-tree port type network default
no spanning-tree port type network default
```

### Syntax Description
This command has no arguments or keywords.

### Command Default
Disabled

### Command Modes
Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines
Use this command to automatically configure all interfaces that are connected to switches as spanning tree network ports by default. You can then use the `spanning-tree port type edge` command to configure specified ports that are connected to hosts as spanning-tree edge ports.

**Note**
If you mistakenly configure ports connected to hosts as Spanning Tree Protocol (STP) network ports and Bridge Assurance is enabled, those ports will automatically move into the blocking state.

Configure only the ports that connect to other switches as network ports because the Bridge Assurance feature causes network ports that are connected to hosts to move into the spanning tree blocking state.

You can identify individual interfaces as network ports by using the `spanning-tree port type network` command.

The default spanning tree port type is normal.

### Examples
This example shows how to globally configure all ports connected to switches as spanning tree network ports:

```
switch(config)# spanning-tree port type network default
```

```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command in a topology with hybrid switches (for example, a virtual port channel [vPC] connected to a non-vPC switch) to configure VLAN-based load balancing.

To meet the VLAN-based load-balancing criteria, you must configure a different Spanning Tree Protocol (STP) bridge priority value for the root bridge and the designated bridge.

This command does not require a license.

**Examples**

This example shows how to enable Bridge Assurance globally on the switch:

```
switch# configure terminal
switch(config)# spanning-tree pseudo-information
switch(config-pseudo)#
```

**Related Commands**

<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>
Usage Guidelines

Caution

When disabling spanning tree on a VLAN using the `no spanning-tree vlan` `vlan-id` command, ensure that all switches and bridges in the VLAN have spanning tree disabled. You cannot disable spanning tree on some switches and bridges in a VLAN and leave it enabled on other switches and bridges in the same VLAN because switches and bridges with spanning tree enabled have incomplete information about the physical topology of the network.

Caution

We do not recommend disabling spanning tree even in a topology that is free of physical loops. Spanning tree is a safeguard against misconfigurations and cabling errors. Do not disable spanning tree in a VLAN without ensuring that there are no physical loops present in the VLAN.

When setting the `max-age seconds`, if a bridge does not see BPDUs from the root bridge within the specified interval, it assumes that the network has changed and recomputes the spanning-tree topology.

The `spanning-tree root primary` alters this switch’s bridge priority to 24576. If you enter the `spanning-tree root primary` command and the switch does not become the root, then the bridge priority is changed to 4096 less than the bridge priority of the current bridge. The command fails if the value required to be the root bridge is less than 1. If the switch does not become the root, an error results.

If the network devices are set for the default bridge priority of 32768 and you enter the `spanning-tree root secondary` command, the software alters the bridge priority of the current bridge to 28762. If the root switch fails, this switch becomes the next root switch.

Use the `spanning-tree root` commands on the backbone switches only.

Examples

This example shows how to enable spanning tree on VLAN 200:

```
switch(config)# spanning-tree vlan 200
```

This example shows how to configure the switch as the root switch for VLAN 10 with a network diameter of 4:

```
switch(config)# spanning-tree vlan 10 root primary diameter 4
```

This example shows how to configure the switch as the secondary root switch for VLAN 10 with a network diameter of 4:

```
switch(config)# spanning-tree vlan 10 root secondary diameter 4
```

# speed (interface)

To configure the transmit and receive speed for an interface, use the `speed` command. To reset to the default speed, use the `no` form of this command.

```
speed {100 | 1000 | 10000 | auto}
no speed
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
</table>
| 100    | Sets the interface speed to 100 Mbps.  
**Note** This keyword is not supported on a management interface. |
| 1000   | Sets the interface speed to 1 Gbps. |
| 10000  | Sets the interface speed to 10 Gbps. This is the default speed.  
**Note** This keyword is not supported on a management interface. |
| auto   | Specifies that the speed of the interface is auto negotiated. |

## Command Default

The default speed is 10000 (10-Gigabit).

## Command Modes

Interface configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>

</tr>
</thead>
<tbody>
<tr>
<td>4.0(1a)N1(1)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Interface speed of 100 Mbps and the <code>auto</code> keyword was introduced.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

The first 8 ports of a Cisco Nexus 5010 switch and the first 16 ports of a Cisco Nexus 5020 switch are switchable 1-Gigabit and 10-Gigabit ports. The default interface speed is 10-Gigabit. To configure these ports for 1-Gigabit Ethernet, insert a 1-Gigabit Ethernet SFP transceiver into the applicable port and then set its speed with the speed command.

If the interface and transceiver speed is mismatched, the SFP validation failed message is displayed when you enter the `show interface ethernet slot/port` command. For example, if you insert a 1-Gigabit SFP transceiver into a port without configuring the `speed 1000` command, you will get this error.

By default, all ports on a Cisco Nexus 5000 Series switch are 10 Gigabits.

## Examples

This example shows how to set the speed for a 1-Gigabit Ethernet port:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# speed 1000
```
This example shows how to set the an interface port to automatically negotiate the speed:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# speed auto
switch(config-if)#
```

<table>

To set the operational state for a VLAN, use the `state` command. To return a VLAN to its default operational state, use the `no` form of this command.

```
state {active | suspend}
no state
```

**Syntax Description**
- **active**: Specifies that the VLAN is actively passing traffic.
- **suspend**: Specifies that the VLAN is not passing any packets.

**Command Default**
The VLAN is actively passing traffic.

**Command Modes**
VLAN configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You cannot suspend the state for VLAN 1 or VLANs 1006 to 4094. VLANs in the suspended state do not pass packets.

**Examples**

This example shows how to suspend VLAN 2:
```
switch(config)# vlan 2
switch(config-vlan)# state suspend
```

svs veth auto-setup

To enable the Virtual Supervisor Module (VSM) to automatically create a virtual Ethernet interface when a new port is activated on a host, use the **svs veth auto-setup** command. To remove this control, use the **no** form of this command.

```
svs veth auto-setup

no svs veth auto-setup
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

Enabled

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to enable automatic creation and configuration of virtual Ethernet interfaces:

```
switch# configure terminal
switch(config)# svs veth auto-setup
switch(config)#
```

This example shows how to disable automatic creation and configuration of virtual Ethernet interfaces:

```
switch# configure terminal
switch(config)# no svs veth auto-setup
switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

</tbody>
</table>
switchport access vlan

To set the access VLAN when the interface is in access mode, use the **switchport access vlan** command. To reset the access-mode VLAN to the appropriate default VLAN for the switch, use the **no** form of this command.

```
switchport access vlan vlan-id

no switchport access vlan
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN to set when the interface is in access mode. The range is from 1 to 4094, except for the VLANs reserved for internal use.</td>
</tr>
</tbody>
</table>

### Command Default

VLAN 1

### Command Modes

- Interface configuration mode
- Virtual Ethernet interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for virtual Ethernet interface was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Use the **no** form of the **switchport access vlan** command to reset the access-mode VLAN to the appropriate default VLAN for the switch. This action may generate messages on the device to which the port is connected.

### Examples

This example shows how to configure an Ethernet interface to join VLAN 2:

```
switch# configure terminal
switch(config)# interface ethernet 1/7
switch(config-if)# switchport access vlan 2
switch(config-if)#
```

This example shows how to configure a virtual Ethernet interface to join VLAN 5:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport access vlan 5
switch(config-if)#
```

switchport backup interface

To configure Flex Links, which are two interfaces that provide backup to each other, on a Layer 2 interface, use the `switchport backup interface` command. To remove the Flex Links configuration, use the `no` form of this command.

```
switchport backup interface {ethernet slot/port | port-channel channel-no} [multicast fast-convergence | preemption {delay delay-time | mode [bandwidth | forced | off]}]

no switchport backup interface {ethernet slot/port | port-channel channel-no} [multicast fast-convergence | preemption {delay delay-time | mode [bandwidth | forced | off]}]
```

**Syntax Description**

- **ethernet slot/port**: Specifies the backup Ethernet interface. The slot number is from 1 to 255 and the port number is from 1 to 128.
- **port-channel channel-no**: Specifies the port channel interface. The interface number is from 1 to 4096.
- **multicast**: (Optional) Specifies to configure the multicast parameters.
- **fast-convergence**: (Optional) Configures fast convergence on the backup interface.
- **preemption**: (Optional) Specifies to configure a preemption scheme for a backup interface pair.
- **delay delay-time**: (Optional) Specifies a preemption delay. The range is from 1 to 300 seconds.
- **mode**: (Optional) Specifies the preemption mode.
- **bandwidth**: (Optional) Specifies that the interface with the higher available bandwidth always preempts the backup.
- **forced**: (Optional) Specifies the interface that always preempts the backup.
- **off**: (Optional) Specifies no preemption occurs from backup to active.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

- **Note**: This command is applicable to the Cisco Nexus 5548 Series switch and the Cisco Nexus 5596 Series switch.
Before you use this command, make sure that you enable Flex Links on the switch by using the `feature flexlink` command.

**Note**
Make sure the virtual port channel (vPC) is disabled on the switch.

A Flex Links port can be a physical Ethernet port or a port channel.

You cannot configure Flex Links port on the following types of interface:
- Fabric Extender (FEX) fabric port and FEX host port
- Virtual Fibre Channel interface
- Virtual network tag (VNTag)
- Interface with port security enabled
- Layer 3 interface
- Switched Port Analyzer (SPAN) destination
- Port channel member
- Interface configured with private VLAN
- Endnode mode
- Fabric path core interface (Layer 2 multipath)

**Examples**

This example shows how to configure Ethernet 1/1 and Ethernet 1/12 as Flex Links:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# switchport backup interface ethernet 1/12
```

This example shows how to configure EtherChannel 100 and EtherChannel 101 as Flex Links:

```
switch# configure terminal
switch(config)# interface port-channel 100
switch(config-if)# switchport backup interface port-channel 101
```

This example shows how to configure the Ethernet interface to always preempt the backup:

```
switch# configure terminal
switch(config)# interface ethernet 1/10
switch(config-if)# switchport backup interface ethernet 1/2 preemption mode forced
```

This example shows how to configure the Ethernet interface preemption delay time:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# switchport backup interface ethernet 1/12 preemption delay 150
```

This example shows how to configure fast convergence on the backup interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# switchport backup interface ethernet 1/12 multicast fast-convergence
```

</tbody>
</table>
**switchport block**

To prevent the unknown multicast or unicast packets from being forwarded, use the `switchport block` command. To allow the unknown multicast or unicast packets to be forwarded, use the `no` form of this command.

```
switchport block {multicast | unicast}
no switchport block {multicast | unicast}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>multicast</td>
<td>Specifies that the unknown multicast traffic should be blocked.</td>
</tr>
<tr>
<td>unicast</td>
<td>Specifies that the unknown unicast traffic should be blocked.</td>
</tr>
</tbody>
</table>

**Command Default**

Unknown multicast and unicast traffic are not blocked. All traffic with unknown MAC addresses is sent to all ports.

**Command Modes**

- Interface configuration mode
- Virtual Ethernet interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for virtual Ethernet interface was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can block the unknown multicast or unicast traffic on the switch ports.

Blocking the unknown multicast or unicast traffic is not automatically enabled on the switch ports; you must explicitly configure it.

**Examples**

This example shows how to block the unknown multicast traffic on an interface:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# switchport block multicast
switch(config-if)#
```

This example shows how to block the unknown unicast traffic on a virtual Ethernet interface:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport block unicast
switch(config-if)#
```
### S Commands

**switchport block**

<table>

<td>show interface vethernet</td>
<td>Displays the virtual Ethernet interface configuration information.</td>
</tr>
</tbody>
</table>
switchport host

To configure the interface to be an access host port, use the **switchport host** command. To remove the host port, use the **no** form of this command.

```
switchport host
no switchport host
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Ensure that you are configuring the correct interface. It must be an interface that is connected to an end station.

An access host port handles the Spanning Tree Protocol (STP) like an edge port and immediately moves to the forwarding state without passing through the blocking and learning states. Configuring an interface as an access host port also disables EtherChannel on that interface.

**Examples**
This example shows how to set an interface as an Ethernet access host port with EtherChannel disabled:

```
switch(config)# interface ethernet 2/1
switch(config-if)# switchport host
switch(config-if)#
```

**Related Commands**

<table>

<tbody>
<tr>
<td>show interface brief</td>
<td>Displays a summary of the interface configuration information.</td>
</tr>
<tr>
<td>show interface switchport</td>
<td>Displays information on all interfaces configured as switch ports.</td>
</tr>
</tbody>
</table>
switchport mode

To configure the interface as a nontrunking nontagged single-VLAN Ethernet or virtual Ethernet interface, use the `switchport mode` command. To remove the configuration and restore the default, use the `no` form of this command.

```
switchport mode {access | trunk | vntag}

no switchport mode {access | trunk | vntag}

no switchport mode
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>access</code></td>
<td>Specifies that the interface is in access mode.</td>
</tr>
<tr>
<td><code>trunk</code></td>
<td>Specifies that the interface is in trunk mode.</td>
</tr>
<tr>
<td><code>vntag</code></td>
<td>Specifies that the interface is in port mode.</td>
</tr>
</tbody>
</table>

**Note**: This keyword does not apply to a virtual Ethernet interface.

### Command Default

An access port carries traffic for VLAN 1.

### Command Modes

Interface configuration mode

Virtual Ethernet interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support for a virtual Ethernet interface was added.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

An access port can carry traffic in one VLAN only. By default, an access port carries traffic for VLAN 1. To set the access port to carry traffic for a different VLAN, use the `switchport access vlan` command. The VLAN must exist before you can specify that VLAN as an access VLAN. The system shuts down an access port that is assigned to an access VLAN that does not exist.

A virtual network tag (VNTag) port helps to identify the virtual interfaces on that physical port.

For a virtual Ethernet interface, use the `no` form of the command without the keywords.

### Examples

This example shows how to set an interface as an Ethernet access port that carries traffic for a specific VLAN only:

```
switch(config)# interface ethernet 2/1
switch(config-if)# switchport mode access
switch(config-if)# switchport access vlan 5
```

This example shows how to set an interface as a VNTag port:
This example shows how to set a virtual Ethernet interface in trunk port mode:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport mode trunk
switch(config-if)#
```

### Related Commands

</tbody>
</table>
switchport mode private-vlan host

To set the interface type to be a host port for a private VLAN, use the `switchport mode private-vlan host` command. To remove the configuration, use the `no` form of this command.

```
switchport mode private-vlan host
no switchport mode
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
- Interface configuration mode
- Virtual Ethernet interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support was added for virtual Ethernet interfaces.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
When you configure a port as a host private VLAN port and one of the following applies, the port becomes inactive:
- The port does not have a valid private VLAN association configured.
- The port is a Switched Port Analyzer (SPAN) destination.
- The private VLAN association is suspended.

If you delete a private VLAN port association or if you configure a private port as a SPAN destination, the deleted private VLAN port association or the private port that is configured as a SPAN destination becomes inactive.

**Note**
We recommend that you enable spanning tree BPDU Guard on all private VLAN host ports.

**Examples**
This example shows how to set a port to host mode for private VLANs:
```
switch(config-if)# switchport mode private-vlan host
```

This example shows how to set a virtual Ethernet interface port to host mode for private VLANs:
```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport mode private-vlan host
switch(config-if)#
```
### Related Commands

</tr>
<tr>
<td><code>show vlan private-vlan</code></td>
<td>Displays the status of the private VLAN.</td>
</tr>
</tbody>
</table>
switchport mode private-vlan promiscuous

To set the interface type to be a promiscuous port for a private VLAN, use the `switchport mode private-vlan promiscuous` command.

```
switchport mode private-vlan promiscuous
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

When you configure a port as a promiscuous private VLAN port and one of the following applies, the port becomes inactive:

- The port does not have a valid private VLAN mapping configured.
- The port is a Switched Port Analyzer (SPAN) destination.

If you delete a private VLAN port mapping or if you configure a private port as a SPAN destination, the deleted private VLAN port mapping or the private port that is configured as a SPAN destination becomes inactive.

See the `private-vlan` command for more information on promiscuous ports.

**Examples**

This example shows how to set a port to promiscuous mode for private VLANs:

```
switch(config-if)# switchport mode private-vlan promiscuous
```

**Related Commands**

<table>
<thead>
<tr>

**switchport mode private-vlan trunk**

To configure the port as a secondary trunk port for a private VLAN, use the `switchport mode private-vlan trunk` command. To remove the isolated trunk port, use the `no` form of this command.

```
switchport mode private-vlan trunk [promiscous | secondary]
no switchport mode private-vlan trunk [promiscous | secondary]
```

**Syntax Description**

- **promiscous** (Optional) Specifies the promiscuous port.
- **secondary** (Optional) Specifies the secondary port.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

In a private VLAN domain, isolated trunks are part of a secondary VLAN. Isolated trunk ports can carry multiple isolated VLANs.

**Examples**

This example shows how to configure Ethernet interface 1/1 as a promiscuous trunk port for a private VLAN:

```
switch(config)# interface ethernet 1/1
switch(config-if)# switchport mode private-vlan trunk promiscous
switch(config-if)#
```

This example shows how to configure Ethernet interface 1/5 as a secondary trunk port for a private VLAN:

```
switch(config)# interface ethernet 1/5
switch(config-if)# switchport mode private-vlan trunk secondary
switch(config-if)#
```

This command does not require a license.

**Examples**

This example shows how to configure the maximum number of secure MAC addresses on a port:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# switchport port-security maximum 5
switch(config-if)#
```

This example shows how to override the maximum number of secure MAC addresses set for a specific VLAN:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# switchport port-security maximum 3 vlan 10
switch(config-if)#
```

This example shows how to set the maximum number of secure MAC addresses on a port to the default value:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport port-security maximum 5
switch(config-if)#
```
<table>

</tbody>
</table>
**switchport port-security violation**

To set the action to be taken when a security violation is detected, use the `switchport port-security violation` command. To revert to the default settings, use the `no` form of this command.

```
switchport port-security violation { protect | restrict | shutdown }
no switchport port-security violation { protect | restrict | shutdown }
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>protect</td>
<td>Drops all the packets from the insecure hosts at the port-security process level but does not increment the security-violation count.</td>
</tr>
<tr>
<td>restrict</td>
<td>Drops all the packets from the insecure hosts at the port-security process level and increments the security-violation count.</td>
</tr>
<tr>
<td>shutdown</td>
<td>Shuts down the port if there is a security violation.</td>
</tr>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to configure the port security violation mode on a port:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# switchport port-security violation protect
```

This example shows how to set the port security violation mode on a port to the default value:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport port-security violation protect
```

**Related Commands**

</table>
switchport priority extend

To configure the switch to override the priority of frames arriving on the Cisco IP phone port from connected devices, use the `switchport priority extend` command. To return the port to its default setting, use the `no` form of this command.

```
switchport priority extend {cos cos-value | trust}
```

```
no switchport priority extend
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>cos</code></td>
<td>Specifies that the switch will send CDP packets to instruct the Cisco IP phone to mark data traffic with class of service (CoS) value.</td>
</tr>
<tr>
<td><code>cos-value</code></td>
<td>CoS value. The range is from 0 to 7.</td>
</tr>
<tr>
<td><code>trust</code></td>
<td>Specifies that the switch will send CDP packets to instruct the Cisco IP phone to trust tagged data traffic.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Examples

This example shows how to set the Cisco IP phone port to trust tagged data traffic:

```
switch(config)# interface ethernet 1/28
switch(config-if)# switchport priority extend trust
```

This example shows how to set the Cisco IP phone port to mark data traffic with CoS value:

```
switch(config)# interface ethernet 1/28
switch(config-if)# switchport priority extend cos 3
```

This example shows how to return to the default settings:

```
switch(config)# interface ethernet 1/28
switch(config-if)# no switchport priority extend
```

### Related Commands

switchport private-vlan association trunk

To associate an isolated trunk port with the primary and secondary VLANs of a private VLAN, use the `switchport private-vlan association trunk` command. To remove the isolated trunk port association, use the `no` form of this command.

```
switchport private-vlan association trunk primary-id secondary-id

no switchport private-vlan association trunk
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>primary-id</code></td>
<td>Primary VLAN ID. The range is from 1 to 3967 and from 4048 to 4093.</td>
</tr>
<tr>
<td><code>secondary-id</code></td>
<td>Secondary VLAN ID. The range is from 1 to 3967 and from 4048 to 4093.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The secondary VLAN should be an isolated VLAN. Only one isolated VLAN under a given primary VLAN can be associated to an isolated trunk port.

**Examples**

This example shows how to map the secondary VLANs to the primary VLAN:

```
switch(config)# interface ethernet 1/1
switch(config-if)# switchport mode private-vlan trunk secondary
switch(config-if)# switchport private-vlan association trunk 5 100
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show interface switchport</td>
<td>Displays information on all interfaces configured as switch ports.</td>
</tr>
<tr>
<td>switchport mode private-vlan trunk</td>
<td>Configures the port as a secondary trunk port for a private VLAN.</td>
</tr>
<tr>
<td>show vlan private-vlan</td>
<td>Displays the status of the private VLAN.</td>
</tr>
</tbody>
</table>
switchport private-vlan host-association

To define a private VLAN association for an isolated or community port, use the **switchport private-vlan host-association** command. To remove the private VLAN association from the port, use the no form of this command.

```
switchport private-vlan host-association {primary-vlan-id} {secondary-vlan-id}
```

```
no switchport private-vlan host-association
```

### Syntax Description

<table>
<thead>
<tr>
<th>Argument</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>primary-vlan-id</td>
<td>Number of the primary VLAN of the private VLAN relationship. The range is from 1 to 3967 and 4048 to 4093.</td>
</tr>
<tr>
<td>secondary-vlan-id</td>
<td>Number of the secondary VLAN of the private VLAN relationship. The range is from 1 to 3967 and 4048 to 4093.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

- Interface configuration mode
- Virtual Ethernet interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support was added for virtual Ethernet interfaces.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

There is no run-time effect on the port unless it is in private VLAN-host mode. If the port is in private VLAN-host mode but neither of the VLANs exist, the command is allowed but the port is made inactive. The port also may be inactive when the association between the private VLANs is suspended.

The secondary VLAN may be an isolated or community VLAN.

See the **private-vlan** command for more information on primary VLANs, secondary VLANs, and isolated or community ports.

**Note**

A private VLAN-isolated port on a Cisco Nexus 5000 Series switch running the current release of Cisco NX-OS does not support IEEE 802.1Q encapsulation and cannot be used as a trunk port.

### Examples

This example shows how to configure a Layer 2 host private VLAN port with a primary VLAN (VLAN 18) and a secondary VLAN (VLAN 20):

```
switch(config-if)# switchport private-vlan host-association 18 20
```

This example shows how to remove the private VLAN association from the port:

```
switch(config-if)# no switchport private-vlan host-association
```
This example shows how to configure a virtual Ethernet interface host private VLAN port with a primary VLAN (VLAN 5) and a secondary VLAN (VLAN 23):

```bash
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport private-vlan host-association 5 23
```

### Related Commands

</tbody>
</table>
# switchport private-vlan mapping

To define the private VLAN association for a promiscuous port, use the `switchport private-vlan mapping` command. To clear all mapping from the primary VLAN, use the `no` form of this command.

```plaintext
switchport private-vlan mapping {primary-vlan-id | trunk primary-vlan-id} {secondary-vlan-id | add | remove} secondary-vlan-id

no switchport private-vlan mapping [{primary-vlan-id | trunk primary-vlan-id} secondary-vlan-id]
```

## Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>primary-vlan-id</code></td>
<td>Number of the primary VLAN of the private VLAN relationship.</td>
</tr>
<tr>
<td><code>trunk</code></td>
<td>Specifies the private VLAN promiscuous trunk port.</td>
</tr>
<tr>
<td><strong>Note</strong></td>
<td>This keyword applies to only Layer 2 interfaces.</td>
</tr>
<tr>
<td><code>add</code></td>
<td>(Optional) Associates the secondary VLANs to the primary VLAN.</td>
</tr>
<tr>
<td><code>remove</code></td>
<td>Clears the association between the secondary VLANs and the primary VLAN.</td>
</tr>
<tr>
<td><code>secondary-vlan-id</code></td>
<td>Number of the secondary VLAN of the private VLAN relationship.</td>
</tr>
</tbody>
</table>

## Command Default

None

## Command Modes

- Interface configuration mode
- Virtual Ethernet interface configuration mode

## Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(2)N2(1)</td>
<td>Number of secondary VLANs is limited to 16.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support was added for virtual Ethernet interfaces.</td>
</tr>
</tbody>
</table>

## Usage Guidelines

There is no run-time effect on the port unless it is in private VLAN-promiscuous mode. If the port is in private VLAN-promiscuous mode but the primary VLAN does not exist, the command is allowed but the port is made inactive.

The secondary VLAN may be an isolated or community VLAN.

See the `private-vlan` command for more information on primary VLANs, secondary VLANs, and isolated or community ports.

## Note

A private VLAN-isolated port on a Cisco Nexus 5000 Series switch running the current release of Cisco NX-OS does not support IEEE 802.1Q encapsulation and cannot be used as a trunk port.
This example shows how to configure the associated primary VLAN 18 to secondary isolated VLAN 20 on a private VLAN promiscuous port:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# switchport mode private-vlan promiscuous
switch(config-if)# switchport private-vlan mapping 18 20
```

This example shows how to add a VLAN to the association on the promiscuous port:

```
switch# configure terminal
switch(config)# interface ethernet 1/2
switch(config-if)# switchport mode private-vlan promiscuous
switch(config-if)# switchport private-vlan mapping 18 add 21
```

This example shows how to configure the associated primary VLAN 30 to secondary isolated VLANs 20-32 on a private VLAN promiscuous trunk port:

```
switch# configure terminal
switch(config)# interface ethernet 1/21
switch(config-if)# switchport mode private-vlan promiscuous trunk
switch(config-if)# switchport private-vlan mapping trunk 30 20-32
```

This example shows the error message that appears when you configure the associated primary VLAN 30 to secondary isolated VLANs 50-100 (beyond the total permissible limit of 16 secondary VLANs) on a private VLAN promiscuous trunk port:

```
switch# configure terminal
switch(config)# interface ethernet 1/12
switch(config-if)# switchport mode private-vlan promiscuous trunk
switch(config-if)# switchport private-vlan mapping trunk 30 50-100
ERROR: secondary VLAN list contains primary VLAN id in trunk promiscuous port mapping.
```

This example shows how to remove all private VLAN associations from the port:

```
switch# configure terminal
switch(config)# interface ethernet 1/5
switch(config-if)# no switchport private-vlan mapping
```

This example shows how to configure the primary VLAN 12 to secondary isolated VLAN 20 on a virtual Ethernet interface host:

```
switch# configure terminal
switch(config)# interface vethernet 1
switch(config-if)# switchport private-vlan mapping 12 20
```

---

**Note**

Beginning with Cisco NX-OS Release 5.0(2)N2(1), the number of mappings on a private-vlan trunk port is limited to 16.

</tbody>
</table>
switchport private-vlan trunk allowed vlan

To configure the allowed VLANs for the private trunk interface, use the `switchport private-vlan trunk allowed vlan` command. To remove the allowed VLANs, use the `no` form of this command.

```
switchport private-vlan trunk allowed vlan {vlan-list | {add | except | remove} vlan-list | all | none}
no switchport private-vlan trunk allowed vlan vlan-list
```

**Syntax Description**

- **vlan-list**: VLAN IDs of the allowed VLANs when the interface is in private-vlan trunking mode. The range is from 1 to 4094, except for the VLANs reserved for internal use.
  - Use a hyphen (-) to separate the beginning and ending IDs of a range of VLAN IDs; for example, 70-100.
  - Use a comma (,) to separate individual VLAN IDs and ranges of VLAN IDs; for example, 20,70-100,142.

- **add**: Specifies the VLANs to be added to the current list.
- **except**: Specifies all VLANs to be added to the current list, except the specified VLANs.
- **remove**: Specifies the VLANs to be removed from the current list.
- **all**: Specifies all VLANs to be added to the current list.
- **none**: Specifies that no VLANs be added to the current list.

**Command Default**

Allows only associated VLANs on the private VLAN trunk interface.

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The primary VLANs do not need to be explicitly added to the allowed VLAN list. They are added automatically once there is a mapping between primary and secondary VLANs.

**Examples**

This example shows how to add VLANs to the list of allowed VLANs on an Ethernet private VLAN trunk port:

```
switch(config)# interface ethernet 1/3
switch(config-if)# switchport private-vlan trunk allowed vlan 15-20
switch(config-if)#
```
<table>
<thead>

switchport private-vlan trunk native

To configure the native VLAN ID for the private VLAN trunk, use the `switchport private-vlan trunk native` command. To remove the native VLAN ID from the private VLAN trunk, use the `no` form of this command.

```bash
switchport private-vlan trunk native vlan vlan-list
no switchport private-vlan trunk native vlan vlan-list
```

**Syntax Description**

| `vlan vlan-list` | Specifies the VLAN ID. The range is from 1 to 3967 and from 4048 to 4093. |

**Command Default**

VLAN 1

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Secondary VLANs cannot be configured with a native VLAN ID on promiscuous trunk ports. Primary VLANs cannot be configured with a native VLAN ID on isolated trunk ports.

**Examples**

This example shows how to map the secondary VLANs to the primary VLAN:

```bash
switch(config)# interface ethernet 1/1
switch(config-if)# switchport private-vlan trunk native vlan 5
switch(config-if)#
```

**Related Commands**

### Examples

This example shows how to configure VLAN 3 as the voice VLAN:

```
switch(config)# interface ethernet 1/28
switch(config-if)# switchport voice vlan 3
```

This example shows how to configure an Ethernet port to send CDP packets that configure the Cisco IP phone to transmit voice traffic in 802.1p frames:

```
switch(config)# interface ethernet 1/28
switch(config-if)# switchport voice vlan dot1p
```

This example shows how to configure an Ethernet port to send CDP packets that configure the Cisco IP phone to transmit untagged voice traffic:

```
switch(config)# interface ethernet 1/28
switch(config-if)# switchport voice vlan untagged
```

This example shows how to stop voice traffic on an Ethernet port:

```
switch(config)# interface ethernet 1/28
switch(config-if)# no switchport voice vlan
```
**system private-vlan fex trunk**

To configure a PVLAN FEX trunk on port, use the `system private-vlan fex trunk` command. To remove the PVLAN FEX trunk ports, use the `no` form of this command.

```plaintext
system private-vlan fex trunk

no system private-vlan fex trunk
```

⚠️ **Caution**

You must disable all the FEX Isolated trunk ports before configuring PVLANs on the FEX trunk ports. If the FEX Isolated trunk ports and the FEX trunk ports are both enabled, unwanted traffic might occur.

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to configure PVLAN over a FEX trunk port:

```plaintext
switch# configure terminal
switch(config-if)# system private-vlan fex trunk
switch(config-if)# copy running-config startup-config
```

**Related Commands**

</table>
system vlan reserve

To configure a reserved VLAN range, use the `system vlan reserve` command. To delete the reserved VLAN range configuration, use the `no` form of this command.

```
system vlan vlan-start reserve
no system vlan vlan-start reserve
```

**Syntax Description**

| `vlan-start` | Starting VLAN ID. 80 VLANs are reserved starting from the start VLAN ID. For example, if you specify the starting VLAN ID as 1006, the reserved VLAN range is from 2006 to 1085. |

**Command Default**

3968-4096

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The user-configured system reserved VLAN range comes in to effect only after a reload. This command does not require a license.

**Examples**

This example shows how to configure a reserved VLAN range:

```
switch(config)# system vlan 1006 reserve
This will delete all configs on vlans 1006-1085. Continue anyway? (y/n) [no] yes
Note: After switch reload, VLANs 1006-1085 will be reserved for internal use.
This requires copy running-config to startup-config before
switch reload. Creating VLANs within this range is not allowed.
```

This example shows how to remove the reserved VLAN configuration:

```
switch# no system vlan 1006 reserve
This will delete all configs on vlans 3968-4047. Continue anyway? (y/n) [no] yes
Note: After switch reload, VLANs 3968-4047 will be reserved for internal use.
This requires copy running-config to startup-config before
switch reload. Creating VLANs within this range is not allowed.
```

**Related Commands**

</tbody>
</table>
Show Commands

This chapter describes the Cisco NX-OS Ethernet show commands.
show cdp all

To display the interfaces in the Cisco Discovery Protocol (CDP) database, use the `show cdp all` command.

```
show cdp all
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(3)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the interfaces in the CDP database:

```
switch# show cdp all
mgmt0 is up
    CDP enabled on interface
    Refresh time is 60 seconds
    Hold time is 180 seconds
Ethernet1/1 is down
    CDP enabled on interface
    Refresh time is 60 seconds
    Hold time is 180 seconds
Ethernet1/2 is down
    CDP enabled on interface
    Refresh time is 60 seconds

</table>
show cdp interface

To display the Cisco Discovery Protocol (CDP) parameters for an interface, use the `show cdp interface` command.

```
show cdp interface {ethernet slot/port | mgmt mgmt-num}
```

### Syntax Description

- **ethernet slot/port**: Specifies an Ethernet interface. The slot number is from 1 to 255 and the port number is from 1 to 128.
- **mgmt mgmt-num**: Specifies a management interface. The management interface number is 0.

### Command Default

None

### Command Modes

EXEC mode

### Command History

### Examples

This example shows how to display the CDP parameters for an Ethernet interface:

```
switch# show cdp interface ethernet 1/30
Ethernet1/30 is down
   CDP enabled on interface
   Refresh time is 60 seconds
   Hold time is 180 seconds
switch#
```

This example shows how to display the CDP parameters for a management interface:

```
switch# show cdp interface mgmt 0
mgmt0 is up
   CDP enabled on interface
   Refresh time is 60 seconds
   Hold time is 180 seconds
switch#
```

### Related Commands

</table>
show cdp neighbors

To display the Cisco Discovery Protocol (CDP) neighbors, use the `show cdp neighbors` command.

```
show cdp neighbors [interface {ethernet slot/port | mgmt mgmt-num}] [detail]
```

**Syntax Description**

- **interface** (Optional) Displays CDP neighbor information for an interface, Ethernet or management.

- **ethernet slot/port** (Optional) Displays CDP neighbor information for an Ethernet interface. The slot number is from 1 to 255 and the port number is from 1 to 128

- **mgmt mgmt-num** (Optional) Displays CDP neighbor information for a management interface. The management interface number is 0.

- **detail** (Optional) Displays the detailed information about CDP neighbors.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

- **Release** 5.0(3)N2(1)  
  - This command was introduced.

**Examples**

This example shows how to display all CDP neighbors:

```

**Examples**

This example shows how to display the CDP traffic statistics for an Ethernet interface:

```
switch# show cdp traffic interface ethernet 1/29
----------------------------------------
Traffic statistics for Ethernet1/29
Input Statistics:
  Total Packets: 3203
  Valid CDP Packets: 3203
    CDP v1 Packets: 0
    CDP v2 Packets: 3203
  Invalid CDP Packets: 0
    Unsupported Version: 0
    Checksum Errors: 0
    Malformed Packets: 0
Output Statistics:
  Total Packets: 3203
    CDP v1 Packets: 0
    CDP v2 Packets: 3203
  Send Errors: 0
```

This example shows how to display CDP traffic statistics for a management interface:

```
switch# show cdp traffic interface mgmt 0
----------------------------------------
Traffic statistics for mgmt0
Input Statistics:
  Total Packets: 3201
```

```
Note the following in the above display:

- Ethernet 1/5 is a Layer 3-ready interface. The following fields in the display help identify an interface as a configured Layer 3 interface:
  - Mode—routed
  - Status—up
  - Reason—none

- Ethernet 1/5.2 is a Layer 3 subinterface; however, the interface is not ready for Layer 3 configuration (Status—down).

- Interface Lo10 is a Layer 3 loopback interface.

This example shows how to display a brief summary of interfaces configured as FabricPath interfaces on a switch that runs Cisco NX-OS Release 5.1(3)N1(1):

```
switch# show interface brief
```

```

show interface capabilities

To display detailed information about the capabilities of an interface, use the `show interface capabilities` command.

```
show interface ethernet slot/port capabilities
```

**Syntax Description**

```
ethernet slot/port  Specifies an Ethernet interface slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.
```

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

```
Release  Modification

4.0(0)N1(1a)  This command was introduced.
```

**Usage Guidelines**

You can use the `show interface capabilities` command only for physical interfaces.

**Examples**

This example shows how to display the interface capabilities for a specific interface:

```
switch# show interface ethernet 1/1 capabilities
Ethernet1/1
   Model: NSX-C5020P-BF-XL-SU
   Type (SFP capable): SFP-H10GB-CU1M
   Speed: 1000,10000
   Duplex: full
   Trunk encap. type: 802.1Q
   Channel: yes
   Broadcast suppression: percentage(0-100)
   Flowcontrol: rx-(off/on),tx-(off/on)
   Rate mode: none
   QOS scheduling: rx-(6qlt),tx-(lp6q0t)
   CoS rewrite: no
   ToS rewrite: no
   SPAN: yes
   UDLD: yes
   Link Debounce: yes
   Link Debounce Time: yes
   MDIX: no
   Pvlan Trunk capable: yes
   TDR capable: no
   Port mode: Switched
   FEX Fabric: yes

switch#
```

<td>none</td>
<td>10G(D)</td>
<td>--</td>
<td></td>
</tr>
</tbody>
</table>
Send comments to nexus5k-docfeedback@cisco.com

This example shows how to display the purpose of a specified subinterface:

```
switch# show interface ethernet 1/5.2 description

<table>
<thead>
<tr>
<th>Port</th>
<th>Type</th>
<th>Speed</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Eth1/5.2</td>
<td>eth</td>
<td>10G</td>
<td>Eth 1/5.2 subinterfaces</td>
</tr>
</tbody>
</table>
```

This example shows how to display the switchport information for a specific interface:

```
switch# show interface ethernet 1/2 switchport
Name: Ethernet1/2
Switchport: Enabled
Switchport Monitor: Not enabled
Operational Mode: trunk
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: 1,300–800
Pruning VLANs Enabled: 2–1001
Administrative private-vlan primary host-association: none
Administrative private-vlan secondary host-association: none
Administrative private-vlan primary mapping: none
Administrative private-vlan secondary mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
Monitor destination rate-limit: 1G
```

In the above display, the Monitor destination rate-limit field displays the rate limit configured on a switchport interface on a Cisco Nexus 5010 Series switch.

**Note**

You can configure the monitor destination rate-limit only on a Cisco Nexus 5010 Series switch or Cisco Nexus 5020 Series switch.

**Table 1  show interface loopback Field Description (continued)**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>reliability</td>
<td>Reliability of the interface as a fraction of 255 (255/255 is 100 percent reliability), calculated as an exponential average over 5 minutes.</td>
</tr>
<tr>
<td>txload</td>
<td>Load on the interface for transmitting packets as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over 5 minutes.</td>
</tr>
<tr>
<td>rxload</td>
<td>Load on the interface for receiving packets as a fraction of 255 (255/255 is completely saturated), calculated as an exponential average over 5 minutes.</td>
</tr>
</tbody>
</table>

Encapsulation

Encapsulation method assigned to interface.

LOOBACK

Indicates whether loopback is set.

packets input

Total number of error-free packets received by the system.

bytes

Total number of bytes, including data and MAC encapsulation, in the error-free packets received by the system.

multicast frames

Total number of multicast frames enabled on the interface.

compressed

Total number of multicast frames compressed on the interface.

input errors

Sum of all errors that prevented the receipt of datagrams on the interface being examined. This may not balance with the sum of the enumerated output errors, because some datagrams may have more than one error and others may have errors that do not fall into any of the specifically tabulated categories.

frame

Number of packets received incorrectly having a CRC error and a noninteger number of octets. On a serial line, this is usually the result of noise or other transmission problems.

overrun

Number of times the serial receiver hardware was unable to hand received data to a hardware buffer because the input rate exceeded the receiver’s ability to handle the data.

fifo

Number of First In, First Out (FIFO) errors in the receive direction.

packets output

Total number of messages transmitted by the system.

bytes

Total number of bytes, including data and MAC encapsulation, transmitted by the system.

underruns

Number of times that the far-end transmitter has been running faster than the near-end router’s receiver can handle. This may never happen (be reported) on some interfaces.

output errors

Sum of all errors that prevented the final transmission of datagrams out of the interface being examined. Note that this may not balance with the sum of the enumerated output errors, as some datagrams may have more than one error, and others may have errors that do not fall into any of the specifically tabulated categories.

collisions

Loopback interface does not have collisions.

fifo

Number of First In, First Out (FIFO) errors in the transmit direction.
This example shows how to display the brief information for a specific loopback interface:

```
switch# show interface loopback 10 brief
```

<table>
<thead>

show interface mac-address

To display the information about the MAC address, use the `show interface mac-address` command.

`show interface [type slot/port | portchannel-no] mac-address`

**Syntax Description**

- **type** (Optional) Interface for which MAC addresses should be displayed. The type can be either Ethernet or EtherChannel.

- **slot/port** Ethernet interface port number and slot number. The slot number is from 1 to 255, and the port number is from 1 to 128.

- **portchannel-no** EtherChannel number. The EtherChannel number is from 1 to 4096.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you do not specify an interface, the system displays all the MAC addresses.

**Examples**

This example shows how to display the information on MAC addresses for the entire switch:

```
switch# show interface mac-address
```

<table>
<thead>
<tr>
<th>Interface</th>
<th>Mac-Address</th>
<th>Burn-in Mac-Address</th>
</tr>
</thead>
<tbody>
<tr>
<td>Ethernet1/1</td>
<td>0005.9b78.6e7c</td>

show interface mgmt

To display the configuration information for a management interface, use the `show interface mgmt` command.

```
show interface mgmt [inf-num] [brief | capabilities | counters [detailed | all] | errors [snmp]] |
               description | status]
```

**Syntax Description**

- **inf-num**: Management interface number. The value is 0.
- **brief**: (Optional) Displays a summary of the configuration information for the management interface.
- **capabilities**: (Optional) Displays the interface capabilities information.
- **counters**: (Optional) Displays information about the management interface counters.
- **detailed**: (Optional) Displays detailed information of only the nonzero interface counters.
- **all**: (Optional) Displays all nonzero interface counters.
- **errors**: (Optional) Displays the interface error counters, such as receive or transmit error counters.
- **snmp**: (Optional) Displays the Simple Network Management Protocol (SNMP) MIB values for the nonzero interface counters.
- **description**: (Optional) Displays the interface description.
- **status**: (Optional) Displays the interface line status.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

</table>
show interface private-vlan mapping

To display information about private VLAN mapping for primary VLAN interfaces, use the `show interface private-vlan mapping` command.

```
show interface private-vlan mapping
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you can configure private VLANs, you must enable them by using the `feature private-vlan` command. The commands for configuring private VLANs are not visible until you enable private VLANs.

This command displays the mapping information between the primary and secondary VLANs that allows both VLANs to share the VLAN interface of the primary VLAN.

**Examples**

This example shows how to display information about primary and secondary private VLAN mapping:

```
switch# show interface private-vlan mapping
```

**Related Commands**

<table>
<thead>
<tr>

<td><code>show vlan private-vlan</code></td>
<td>Displays information for all private VLANs on the device.</td>
</tr>
</tbody>
</table>
show interface status err-disabled

To display the error disabled state of interfaces, use the show interface status err-disabled command.

```
show interface status err-disabled
```

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>

<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(3)N1(1)</td>
<td>Support to configure traffic rate limit on a switch port was added.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can configure the rate limit on the following Cisco Nexus 5000 Series switches using the `switchport monitor rate-limit 1G` command:

- Cisco Nexus 5010 Series
- Cisco Nexus 5020 Series

This command does not require a license.

**Examples**

This example shows how to display information for all Ethernet interfaces:

```
switch# show interface switchport
Name: Ethernet1/1
  Switchport: Enabled
  Switchport Monitor: Not enabled
  Operational Mode: fex-fabric

  Administrative private-vlan trunk private VLANs: none
  Operational private-vlan: none
  Unknown unicast blocked: disabled
  Unknown multicast blocked: disabled

Name: Ethernet1/2
  Switchport: Enabled
  Switchport Monitor: Not enabled
  Operational Mode: trunk
  Access Mode VLAN: 1 (default)
  Trunking Native Mode VLAN: 1 (default)
  Trunking VLANs Enabled: 1,300-800
  Pruning VLANs Enabled: 2-1001
```
In the above display, the significant field for Ethernet interface 1/2 is highlighted.

This example shows how to display the voice VLAN information for an Ethernet interface on a switch that runs Cisco NX-OS Release 5.0(3)N2(1):

```
switch# show interface ethernet 1/28 switchport
Name: Ethernet1/28
Switchport: Enabled
Switchport Monitor: Not enabled
Operational Mode: access
Access Mode VLAN: 3000 (VLAN3000)
Trunking Native Mode VLAN: 1 (default)
Trunking VLANs Enabled: 1,200,300-302,500,2001-2248,3000-3001,4049,4090
Pruning VLANs Enabled: 2-1001
Voice VLAN: 3
Extended Trust State : not trusted [COS = 0]
Administrative private-vlan primary host-association: none
Administrative private-vlan secondary host-association: none
Administrative private-vlan primary mapping: none
Administrative private-vlan secondary mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Unknown unicast blocked: disabled
Unknown multicast blocked: disabled
```

```
switch#
```
show interface switchport backup

To display information about all the switch port Flex Links interfaces, use the `show interface switchport backup` command.

```
show interface switchport backup [detail]
```

show interface transceiver

To display the information about the transceivers connected to a specific interface, use the `show interface transceiver` command.

```
show interface ethernet slot/port transceiver [details]
```

**Syntax Description**

- `ethernet slot/port` Displays information about an Ethernet interface slot number and port number. The `slot` number is from 1 to 255, and the `port` number is from 1 to 128.
- `details` (Optional) Displays detailed information about the transceivers on an interface.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You can use the `show interface transceiver` command only for physical interfaces.

**Examples**

This example shows how to display the transceivers connected to a specified Ethernet interface:

```
switch# show interface ethernet 1/1 transceiver
Ethernet1/1
    transceiver is present
    type is SFP-H10GB-CU1M
    name is CISCO-MOLEX
    part number is 74752-9044
    revision is 07
    serial number is MOC14081360
    nominal bitrate is 10300 MBit/sec
    Link length supported for copper is 1 m
    cisco id is --
    cisco extended id number is 4

switch#
```

show interface vethernet

To display information about a virtual Ethernet (vEth) interface configuration, use the `show interface vethernet` command.

```
show interface vethernet veth-id [brief | description | detail | mac-address | status | switchport | trunk]
```

### Syntax Description

- **veth-id**: Virtual Ethernet interface number. The range is from 1 to 1,048,575.
- **brief**: (Optional) Displays brief information about the vEth interface.
- **description**: (Optional) Displays the vEth interface description.
- **detail**: (Optional) Displays detailed configuration information about the vEth interface.
- **mac-address**: (Optional) Displays the MAC address of the vEth interface.
- **status**: (Optional) Displays the vEth interface line status.
- **switchport**: (Optional) Displays the vEth interface switchport information.
- **trunk**: (Optional) Displays the vEth interface trunk information.

show interface vethernet counters

To display information about the virtual Ethernet (vEth) interface counters, use the show interface vethernet counters command.

```
show interface vethernet veth-id counters [brief | detailed [all] | errors [snmp] | snmp]
```

### Syntax Description

- **veth-id**: Virtual Ethernet interface number. The range is from 1 to 1,048,575.
- **brief**: (Optional) Displays brief information about the vEth interface counters.
- **detailed**: (Optional) Displays detailed information of only the nonzero vEth interface counters.
- **all**: (Optional) Displays all nonzero vEth interface counters.
- **errors**: (Optional) Displays the vEth interface error counters, such as receive or transmit error counters.
- **snmp**: (Optional) Displays the Simple Network Management Protocol (SNMP) MIB values for the nonzero vEth interface counters.

<td>(Optional) Displays information about virtual interfaces on a bound interface.</td>
</tr>
<tr>
<td>ethernet</td>
<td>(Optional) Displays information about a specific ethernet interface. The slot number is from 1 to 255 and the port number is from 1 to 128.</td>
</tr>
<tr>
<td>vm-fex</td>
<td>(Optional) Displays information about all floating virtual interfaces.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you use this command, make sure that you enable Cisco Virtual Machine Fabric Extender (VM-FEX) on the switch by using the `feature vmfex` command.

**Examples**

This example shows how to display brief information about the counters configured on a specified virtual Ethernet interface:

```
switch# show interface virtual status
Interface VIF-index Bound If Chan Vlan Status Mode Vntag
-------------------------------------------------------------------------
Total 1 Veth interfaces
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>

</tbody>
</table>
show interface vlan

To display brief descriptive information about specified VLANs, use the `show interface vlan` command.

```
show interface vlan vlan-id [brief | private-vlan mapping]
```

**Syntax Description**

- **vlan-id**: Number of the VLAN. The range is from 1 to 4094.
- **brief**: (Optional) Displays a summary information for the specified VLAN.
- **private-vlan mapping**: (Optional) Displays the private VLAN mapping information, if any, for the specified VLAN.

**Command Default**
None

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

You must enable interface VLANs by using the `feature interface-vlan` command. The commands for configuring interface VLANs are not visible until you enable this feature.

This command displays descriptive information for the specified VLAN, including private VLANs.

The switch displays output for the `show interface vlan vlan-id private-vlan mapping` command only when you specify a primary private VLAN. If you specify a secondary private VLAN, the output is blank.

**Examples**

This example shows how to display information about the specified VLAN:

```
switch# show interface vlan 10
Vlan10 is up, line protocol is up
   Hardware is EtherSVI, address is 0005.9b78.6e7c
   MTU 1500 bytes, BW 1000000 Kbit, DLY 10 usec,
switch#
```

This example shows how to display a brief description for the specified VLAN:

```
switch# show interface vlan 10 brief
-------------------------------------------------------------------------
Interface Secondary VLAN(Type)        Status Reason
-------------------------------------------------------------------------
Vlan10      --                          up     --
switch#
```
Send comments to nexus5k-docfeedback@cisco.com

This example shows how to display the private VLAN mapping information, if any, for the VLAN:

```
switch# show interface vlan 10 private-vlan mapping
```

When you specify a primary VLAN, the switch displays all secondary VLANs mapped to that primary VLAN.

show ip igmp snooping

To display the Internet Group Management Protocol (IGMP) snooping configuration of the switch, use the `show ip igmp snooping` command.

```
```

**Syntax Description**

- `explicit-tracking` (Optional) Displays information about the explicit host-tracking status for IGMPv3 hosts. If you provide this keyword, you must specify a VLAN.
- `vlan vlan-id` (Optional) Specifies a VLAN. The VLAN ID range is from 1 to 4094.
- `groups` (Optional) Displays information for the IGMP group address.
- `detail` (Optional) Displays detailed information for the group.
- `mrouter` (Optional) Displays information about dynamically detected multicast routers.
- `querier` (Optional) Displays information about the snooping querier if defined.

**Command Default**

None

**Command Modes**

EXEC mode

show mac address-table count

To display the number of entries currently in the MAC address table, use the **show mac address-table count** command.

```
show mac address-table count [address EEEE.EEEE.EEEE] [dynamic | static] [interface {ethernet slot/port | port-channel number}] [vlan vlan-id]
```

**Syntax Description**

- **address EEEE.EEEE.EEEE** (Optional) Displays a count of the MAC address table entries for a specific address.
- **dynamic** (Optional) Displays a count of the dynamic MAC addresses.
- **static** (Optional) Displays a count of the static MAC addresses.
- **interface** (Optional) Specifies the interface. The interface can be Ethernet or EtherChannel.
- **ethernet slot/port** (Optional) Specifies the Ethernet interface slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.
- **port-channel number** (Optional) Specifies the EtherChannel interface. The EtherChannel number is from 1 to 4096.
- **vlan vlan-id** (Optional) Displays information for a specific VLAN. The range is from 1 to 4094.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>

</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to show mac address-table count.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the number of dynamic entries currently in the MAC address table:

```
switch# show mac address-table count dynamic
MAC Entries for all vlans:
Total MAC Addresses in Use: 7
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mac address-table</td>
<td>Displays information about the MAC address table.</td>
</tr>
</tbody>
</table>
show mac address-table notification

To display notifications about the MAC address table, use the `show mac address-table notification` command.

```
show mac address-table notification {mac-move | threshold}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>mac-move</td>
<td>Displays notification messages about MAC addresses that were moved.</td>
</tr>
<tr>
<td>threshold</td>
<td>Displays notification messages sent when the MAC address table threshold was exceeded.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to <code>show mac address-table notification</code>.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display MAC address move notifications:

```
switch# show mac address-table notification mac-move
MAC Move Notify : disabled
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show mac address-table</td>
<td>Displays information about the MAC address table.</td>
</tr>
</tbody>
</table>
**show mac address-table**

To display the information about the MAC address table, use the `show mac address-table` command.

```plaintext
show mac address-table [address mac-address] [dynamic | multicast | static] [interface {ethernet slot/port | port-channel number}] [vlan vlan-id]
```

**Syntax Description**

- `address mac-address` (Optional) Displays information about a specific MAC address.
- `dynamic` (Optional) Displays information about the dynamic MAC address table entries only.
- `interface` (Optional) Specifies the interface. The interface can be either Ethernet or EtherChannel.
- `ethernet slot/port` (Optional) Specifies the Ethernet interface slot number and port number. The slot number is from 1 to 255, and the port number is from 1 to 128.
- `port-channel number` (Optional) Specifies the EtherChannel interface. The EtherChannel number is from 1 to 4096.
- `multicast` (Optional) Displays information about the multicast MAC address table entries only.
- `static` (Optional) Displays information about the static MAC address table entries only.
- `vlan vlan-id` (Optional) Displays information for a specific VLAN. The VLAN ID range is from 1 to 4094.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>4.2(1)N1(1)</td>
<td>The command syntax is changed to <code>show mac address-table</code>.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The switch maintains static MAC address entries that are saved in its startup configuration across reboots and flushes the dynamic entries.

**Examples**

This example shows how to display information about the entries for the MAC address table:

```plaintext
switch# show mac address-table
Legend:
    * - primary entry, G - Gateway MAC, (R) - Routed MAC, O - Overlay MAC
    age - seconds since last seen, + - primary entry using vPC Peer-Link

VLAN  MAC Address   Type  age  Secure NTPY  Ports
-----------------------------------------------
```
**Send comments to nexus5k-docfeedback@cisco.com**

This example shows how to display information about the entries for the MAC address table for a specific MAC address:

```shell
switch# show mac address-table address 0018.bad8.3fbd
```

This example shows how to display information about the dynamic entries for the MAC address table:

```shell
switch# show mac address-table dynamic
```

**Legend:**
- * - primary entry
- G - Gateway MAC
- (R) - Routed MAC
- O - Overlay MAC
- age - seconds since last seen
- + - primary entry using vPC Peer-Link

**Show Commands**

`show mvr members`

To display the active Multicast VLAN Registration (MVR) groups and receiver members, use the `show mvr members` command.

```
show mvr members [count | interface [ethernet slot/port | port-channel channel-num | vethernet veth-num] | vlan vlan-ID]
```

**Syntax Description**

- **count**: (Optional) Displays the active MVR groups on each MVR VLAN.
- **interface**: (Optional) Displays the active MVR groups configured on an interface.
- **ethernet slot/port**: (Optional) Displays the active MVR groups configured on an Ethernet IEEE 802.3z interface. The slot number is from 1 to 255 and the port number is from 1 to 128.
- **port-channel channel-num**: (Optional) Displays the active MVR groups configured on an EtherChannel interface. The range is from 1 to 4096.
- **vethernet veth-num**: (Optional) Displays the active MVR groups configured on a virtual Ethernet interface. The range is from 1 to 1048575.
- **vlan vlan-ID**: (Optional) Displays the active MVR groups on VLANs. The range is from 1 to 4094.

**Command Default**

None

**Command Modes**

EXEC mode

</tr>
</tbody>
</table>

### Examples
This example shows how to display the EtherChannel interface parameters:

```bash
switch# show port-channel compatibility-parameters
* port mode
Members must have the same port mode configured.

* port mode
Members must have the same port mode configured, either E,F or AUTO. If
they are configured in AUTO port mode, they have to negotiate E or F mode
when they come up. If a member negotiates a different mode, it will be
suspended.

* speed
Members must have the same speed configured. If they are configured in AUTO
speed, they have to negotiate the same speed when they come up. If a member
negotiates a different speed, it will be suspended.

* MTU
Members have to have the same MTU configured. This only applies to ethernet
port-channel.

* shut lan
Members have to have the same shut lan configured. This only applies to
ethernet port-channel.

* MEDIUM
Members have to have the same medium type configured. This only applies to
ethernet port-channel.
```
show port-channel compatibility-parameters

* Span mode

Members must have the same span mode.

* load interval

Member must have same load interval configured.

show port-channel database

To display the aggregation state for one or more EtherChannel interfaces, use the `show port-channel database` command.

```
show port-channel database [interface port-channel number[.subinterface-number]]
```

**Syntax Description**

- `interface` *(Optional)* Displays information for an EtherChannel interface.
- `port-channel number` *(Optional)* Displays aggregation information for a specific EtherChannel interface. The `number` range is from 1 to 4096.
- `.subinterface-number` *(Optional)* Subinterface number. Use the EtherChannel number followed by a dot (.) indicator and the subinterface number. The format is `portchannel-number.subinterface-number`.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

- **Release**
  - 4.0(0)N1(1a) This command was introduced.

**Examples**

This example shows how to display the aggregation state of all EtherChannel interfaces:

```
switch# show port-channel database
port-channel19
    Last membership update is successful
    4 ports in total, 4 ports up
    First operational port is Ethernet199/1/24
    Age of the port-channel is 0d:09h:11m:30s
    Time since last bundle is 0d:09h:12m:20s
    Last bundled member is
    Ports:   Ethernet199/1/24 [active ] [up] *
              Ethernet199/1/28 [active ] [up]
              Ethernet199/1/30 [active ] [up]
              Ethernet199/1/31 [active ] [up]

port-channel21
    Last membership update is successful
    1 ports in total, 1 ports up
    First operational port is Ethernet2/3
    Age of the port-channel is 0d:09h:11m:30s
    Time since last bundle is 0d:09h:12m:20s
    Last bundled member is
    Ports:   Ethernet2/3 [on] [up] *

port-channel50
    Last membership update is successful
    --More--
    <---output truncated--->
```
This example shows how to display the aggregation state for a specific EtherChannel interface:

```
switch# show port-channel database interface port-channel 21
   port-channel21
       Last membership update is successful
       1 ports in total, 1 ports up
       First operational port is Ethernet2/3

</tbody>
</table>
show port-channel load-balance

To display information about EtherChannel load balancing, use the show port-channel load-balance command.

```
show port-channel load-balance [forwarding-path interface port-channel number {, | vlan vlan_ID} [dst-ip ipv4-addr] [dst-ipv6 ipv6-addr] [dst-mac dst-mac-addr] [l4-dst-port dst-port] [l4-src-port src-port] [src-ip ipv4-addr] [src-ipv6 ipv6-addr] [src-mac src-mac-addr]]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>forwarding-path</td>
<td>(Optional) Identifies the port in the EtherChannel interface that forwards</td>
</tr>
<tr>
<td>interface port-channel</td>
<td>the packet.</td>
</tr>
<tr>
<td>number</td>
<td>EtherChannel number for the load-balancing forwarding path that you want</td>
</tr>
<tr>
<td></td>
<td>to display. The range is from 1 to 4096.</td>
</tr>
<tr>
<td>.</td>
<td>(Optional) Subinterface number separator. Use the EtherChannel number</td>
</tr>
<tr>
<td></td>
<td>followed by a dot (.) indicator and the subinterface number. The format is</td>
</tr>
<tr>
<td></td>
<td>portchannel-number.subinterface-number.</td>
</tr>
<tr>
<td>vlan</td>
<td>(Optional) Identifies the VLAN for hardware hashing.</td>
</tr>
<tr>
<td>vlan_ID</td>
<td>VLAN ID. The range is from 1 to 3967 and 4048 to 4093.</td>
</tr>
<tr>
<td>dst-ip</td>
<td>(Optional) Displays the load distribution on the destination IP address.</td>
</tr>
<tr>
<td>ipv4-addr</td>
<td>IPv4 address to specify a source or destination IP address. The format is</td>
</tr>
<tr>
<td></td>
<td>A.B.C.D.</td>
</tr>
<tr>
<td>dst-ipv6</td>
<td>(Optional) Displays the load distribution on the destination IPv6 address.</td>
</tr>
<tr>
<td>ipv6-addr</td>
<td>IPv6 address to specify a source or destination IP address. The format is</td>
</tr>
<tr>
<td></td>
<td>A::B::C::D.</td>
</tr>
<tr>
<td>dst-mac</td>
<td>(Optional) Displays the load distribution on the destination MAC address.</td>
</tr>
<tr>
<td>dst-mac-addr</td>
<td>Destination MAC address. The format is AAAAA:BBBB:CCCCC.</td>
</tr>
<tr>
<td>l4-dst-port</td>
<td>(Optional) Displays the load distribution on the destination port.</td>
</tr>
<tr>
<td>dst-port</td>
<td>Destination port number. The range is from 0 to 65535.</td>
</tr>
<tr>
<td>l4-src-port</td>
<td>(Optional) Displays the load distribution on the source port.</td>
</tr>
<tr>
<td>src-port</td>
<td>Source port number. The range is from 0 to 65535.</td>
</tr>
<tr>
<td>src-ip</td>
<td>(Optional) Displays the load distribution on the source IP address.</td>

</tr>
<tr>
<td>src-mac-addr</td>
<td>source MAC address. The format is AA:BB:CC:DD:EE:FF.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode
Usage Guidelines

You must use the `vlan` keyword to determine the use of hardware hashing.

When you do not use hardware hashing, the output displays all parameters used to determine the outgoing port ID. Missing parameters are shown as zero values in the output.

If you do not use hardware hashing, the outgoing port ID is determined by using control-plane selection. Hardware hashing is not used in the following scenarios:

- The specified VLAN contains an unknown unicast destination MAC address.
- The specified VLAN contains a known or an unknown multicast destination MAC or destination IP address.
- The specified VLAN contains a broadcast MAC address.
- The EtherChannel has only one active member.
- The destination MAC address is unknown when the load distribution is configured on the source IP address (src-ip), source port (l4-src-port), or source MAC address (src-mac).
- If multichassis EtherChannel trunk (MCT) is enabled and the traffic flows from a virtual port channel (vPC) peer link, the output displays “Outgoing port id (vPC peer-link traffic)”.

To get accurate results, you must do the following:

- (For unicast frames) Provide the destination MAC address (dst-mac) and the VLAN for hardware hashing (vlan). When the destination MAC address is not provided, hardware hashing is assumed.
- (For multicast frames) For IP multicast, provide either the destination IP address (dst-ip) or destination MAC address (dst-mac) with the VLAN for hardware hashing (vlan). For non-ip multicast, provide the destination MAC address with the VLAN for hardware hashing.
- (For broadcast frames) Provide the destination MAC address (dst-mac) and the VLAN for hardware hashing (vlan).

Examples

This example shows how to display the port channel load-balancing information:

```
switch# show port-channel load-balance
Port Channel Load-Balancing Configuration:
 System: source-dest-ip

Port Channel Load-Balancing Addresses Used Per-Protocol:
 Non-IP: source-dest-mac
 IP: source-dest-ip source-dest-mac

switch#
```

Table 3 describes the fields shown in the display.
This example shows how to display the port channel load-balancing information when hardware hashing is not used:

```
switch# show port-channel load-balance forwarding-path interface port-channel 5 vlan 3 dst-ip 192.168.2.37
Missing params will be substituted by 0's.
Load-balance Algorithm on FEX: source-dest-ip
 crc8_hash: Not Used     Outgoing port id: Ethernet133/1/3
Param(s) used to calculate load-balance (Unknown unicast, multicast and broadcast packets):
   dst-mac: 0000.0000.0000
   vlan id: 3
```

This example shows how to display the port channel load-balancing information when hardware hashing is not used to determine the outgoing port ID:

```
switch# show port-channel load-balance forwarding-path interface port-channel 10 vlan 1 dst-ip 192.168.2.25 src-ip 192.168.2.10 dst-mac ffff.ffff.ffff src-mac aa:bb:cc:dd:ee:ff l4-src-port 0 l4-dst-port 1
Missing params will be substituted by 0's.
Load-balance Algorithm on switch: source-dest-port
 crc8_hash: Not Used     Outgoing port id: Ethernet1/1
Param(s) used to calculate load-balance (Unknown unicast, multicast and broadcast packets):
   dst-mac: ffff.ffff.ffff
   vlan id: 1
```

This example shows how to display the port channel load-balancing information when MCT is enabled and traffic flows from a vPC peer link:

```
switch# show port-channel load-balance forwarding-path interface port-channel 10 vlan 1 dst-ip 192.168.2.25 src-ip 192.168.2.10 dst-mac ffff.ffff.ffff src-mac aa:bb:cc:dd:ee:ff l4-src-port 0 l4-dst-port 1
Missing params will be substituted by 0's.
Load-balance Algorithm on switch: source-dest-port
 crc8_hash: Not Used     Outgoing port id (non vPC peer-link traffic): ethernet1/2
 crc8_hash: Not Used     Outgoing port id (vPC peer-link traffic): Ethernet1/1
Param(s) used to calculate load-balance (Unknown unicast, multicast and broadcast packets):
   dst-mac: ffff.ffff.ffff
   vlan id: 1
```

This example shows how to display the port channel load-balancing information when hardware hashing is used to determine the outgoing port ID:
Send comments to nexus5k-docfeedback@cisco.com

```bash
switch# show port-channel load-balance forwarding-path interface port-channel 10 vlan 1 dst-ip 192.168.2.25 src-ip 192.168.2.10 src-mac aa:bb:cc:dd:ee:ff l4-src-port 0 l4-dst-port 1
Missing params will be substituted by 0's.
Load-balance Algorithm on switch: source-dest-port
crc8_hash: 204 Outgoing port id: Ethernet1/1
Param(s) used to calculate load-balance:
   dst-port: 1
   src-port: 0
   dst-ip: 192.168.2.25
   src-ip: 192.168.2.10
   dst-mac: 0000.0000.0000
   src-mac: aabb.ccdd.eeff

switch#
```

show port-security

To display the port security configuration on an interface, use the `show port-security` command.

```
show port-security [address [interface {ethernet slot/port | port-channel channel-num}] | interface {ethernet slot/port | port-channel channel-num} | state]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>address</td>
<td>(Optional) Displays the secure MAC address of a port.</td>
</tr>
<tr>
<td>interface</td>
<td>(Optional) Displays the secure address for an interface.</td>
</tr>
<tr>
<td>ethernet slot/port</td>
<td>(Optional) Displays the secure address for an Ethernet interface. The slot number is from 1 to 255 and the port number is from 1 to 128.</td>
</tr>
<tr>
<td>port-channel channel-num</td>
<td>(Optional) Displays the secure address for an EtherChannel interface. The channel number is from 1 to 4096.</td>
</tr>
<tr>
<td>state</td>
<td>(Optional) Displays whether a port is secure.</td>
</tr>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command does not require a license.

**Examples**

This example shows how to display the port security configuration on an interface:

```
switch# show port-security

Total Secured Mac Addresses in System (excluding one mac per port) : 0
Max Addresses limit in System (excluding one mac per port) : 8192

--------------------------------------------------
Secure Port  MaxSecureAddr  CurrentAddr  SecurityViolation  Security Action
           (Count)            (Count)               (Count)                   (Count)
--------------------------------------------------
Ethernet1/5      10            0             0               0         Shutdown

switch#
```

show running-config interface

To display the running configuration for a specific port channel, use the **show running-config interface** command.

```
show running-config interface [ { ethernet slot/port | fc slot/port | loopback number | mgmt 0 | port-channel channel-number [ membership ] | vethernet veth-id vlan vlan-id } ] [ all | expand-port-profile ]
```

**Syntax Description**

- **ethernet slot/port** (Optional) Displays the Ethernet interface slot number and port number. The slot number is from 1 to 255 and the port number is from 1 to 128.
- **fc slot/port** (Optional) Displays the configuration information of the Fibre Channel interface. The slot number is from 1 to 2 and the port number is from 1 to 48.
- **loopback number** (Optional) Displays the number of the loopback interface. The range of values is from 1 to 4096.
- **mgmt 0** (Optional) Displays the configuration information of the management interface.
- **port-channel channel-number** (Optional) Displays the number of the port-channel group. The range of values is from 0 to 1023.
- **membership** Displays the membership of the specified port channel.
- **vethernet veth-id** (Optional) Displays the configuration information of the virtual Ethernet interface. The range is from 1 to 1048575.
- **vlan vlan-id** (Optional) Displays the configuration information of the VLAN. The range of values is from 1 to 4096.
- **all** (Optional) Displays configured and default information.
- **expand-port-profile** (Optional) Displays the configuration information of port profiles.

**Command Default**

None

### Usage Guidelines

This command does not require a license.

### Examples

This example shows how to display the running system configuration of all secure ports on an interface:

```
switch# show running-config port-security

!Command: show running-config port-security
!Time: Tue Apr 12 10:06:56 2005

version 5.1(3)N1(1)
feature port-security

interface Ethernet1/5
  switchport port-security
  switchport port-security aging time 3
  switchport port-security maximum 10
  switchport port-security mac-address sticky

switch#
```

show running-config spanning-tree

To display the running configuration for the Spanning Tree Protocol (STP), use the `show running-config spanning-tree` command.

```
show running-config spanning-tree [all]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>all</code></td>
<td>(Optional) Displays current STP operating information including default settings.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.1(3)N1(1)</td>
<td>Support to display spanning tree pseudo information parameters was added.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display information on the running STP configuration:

```
switch# show running-config spanning-tree
```

This example shows how to display detailed information on the running STP configuration:

```
switch# show running-config spanning-tree all
```

**Note**

Display output differs slightly depending on whether you are running Rapid Per VLAN Spanning Tree Plus (Rapid PVST+) or Multiple Spanning Tree (MST).

This example shows how to display information on the running STP configuration, including the spanning tree pseudo information, on a switch that runs Cisco NX-OS Release 5.1(3)N1(1):

```
switch# show running-config spanning-tree
spanning-tree domain 1
spanning-tree pseudo-information
  mst 1 root priority 4096
  mst 2 designated priority 4096
interface port-channel1
  spanning-tree port type network
switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree</td>
<td>Displays information about STP.</td>
</tr>
</tbody>
</table>
show running-config vlan

To display the running configuration for a specified VLAN, use the `show running-config vlan` command.

```
show running-config vlan vlan-id
```

**Syntax Description**
- `vlan-id` Number of VLAN or range of VLANs. Valid numbers are from 1 to 4096.

**Command Default**
None

**Command Modes**
EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
This command provides information on the specified VLAN, including private VLANs.
The display varies with your configuration. If you have configured the VLAN name, shutdown status, or suspended status, these are also displayed.

**Examples**

This example shows how to display the running configuration for VLAN 5:

```
switch# show running-config vlan 5
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show vlan</td>
<td>Displays information about all the VLANs on the switch.</td>
</tr>
</tbody>
</table>
show running-config vtp

To display the VLAN Trunking Protocol (VTP) running configuration, use the `show running-config vtp` command.

show running-config vtp

**Syntax Description**

This command has no arguments or keywords.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display the VTP running configuration on the switch:

```
switch# show running-config vtp

!Command: show running-config vtp
!Time: Tue Sep  7 08:45:14 2010

version 5.0(2)N1(1)
feature vtp

vtp mode transparent
vtp domain MyDomain
vtp file bootflash:/myvtp.txt

switch#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>copy running-config</td>
<td>Copies the running configuration to the startup configuration file.</td>
</tr>
<tr>
<td>startup-config</td>
<td></td>
</tr>
<tr>
<td>feature vtp</td>
<td>Enables VTP on the switch.</td>
</tr>
<tr>
<td>vtp domain</td>
<td>Configures the VTP administrative domain.</td>
</tr>
<tr>
<td>vtp file</td>
<td>Stores the VTP configuration in a file.</td>
</tr>
<tr>
<td>vtp mode</td>
<td>Configures a VTP device mode.</td>
</tr>
</tbody>
</table>
show spanning-tree

To display information about the Spanning Tree Protocol (STP), use the `show spanning-tree` command.

```
show spanning-tree [blockedports | inconsistentports | pathcost method]
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>blockedports</td>
<td>(Optional) Displays the alternate ports blocked by STP.</td>
</tr>
<tr>
<td>inconsistentports</td>
<td>(Optional) Displays the ports that are in an inconsistent STP state.</td>
</tr>
<tr>
<td>pathcost method</td>
<td>(Optional) Displays whether short or long path cost method is used. The method differs for Rapid Per VLAN Spanning Tree Plus (Rapid PVST+) (configurable, default is short) and Multiple Spanning Tree (MST) (nonconfigurable, operational value is always long).</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The STP port type displays only when you have configured the port as either an STP edge port or an STP network port. If you have not configured the STP port type, no port type displays.

Table 4 describes the fields that are displayed in the output of `show spanning-tree` commands.

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Role</td>
<td>Current port STP role. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• Desg (designated)</td>
</tr>
<tr>
<td></td>
<td>• Root</td>
</tr>
<tr>
<td></td>
<td>• Altn (alternate)</td>
</tr>
<tr>
<td></td>
<td>• Back (backup)</td>
</tr>
</tbody>
</table>

Table 4: `show spanning-tree` Command Output Fields
show spanning-tree

Display output differs slightly depending on whether you are running Rapid Per VLAN Spanning Tree Plus (Rapid PVST+) or Multiple Spanning Tree (MST).

Examples

This example shows how to display spanning tree information:

switch# show spanning-tree

VLAN0001
   Spanning tree enabled protocol rstp
   Root ID  Priority 1
            Address 000d.ecb0.fdb0
            Cost 2
            Port 4096 (port-channel1)
            Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec

   Bridge ID  Priority 61441 (priority 61440 sys-id-ext 1)
            Address 0005.9b78.6e7c
            Hello Time 2 sec  Max Age 20 sec  Forward Delay 15 sec

   Interface  Role  Sts  Cost  Prio.Nbr  Type
              ----------  ------ --------- --------------------------------
   Po1        Root  FWD 1  128.4096 (vPC peer-link) Network P2p
   Po3        Root  FWD 1  128.4098 (vPC) P2p
   Po123      Desg  FWD 4  128.4218 Edge P2p
   Eth1/11    Desg  BKN*2 128.139 P2p *TYPE_Inc
   Eth1/12    Desg  BKN*2 128.140 P2p *TYPE_Inc
   Eth1/15    Desg  BKN*2 128.143 P2p *TYPE_Inc
   Eth1/16    Desg  BKN*2 128.144 P2p *TYPE_Inc
   Eth1/33    Desg  FWD 2  128.161 Edge P2p
   Eth1/35    Desg  FWD 2  128.163 Edge P2p

Note

Display output differs slightly depending on whether you are running Rapid Per VLAN Spanning Tree Plus (Rapid PVST+) or Multiple Spanning Tree (MST).

Table 4  show spanning-tree Command Output Fields (continued)

<table>
<thead>
<tr>
<th>Field</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sts</td>
<td>Current port STP state. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• BLK (blocking)</td>
</tr>
<tr>
<td></td>
<td>• DIS (disabled)</td>
</tr>
<tr>
<td></td>
<td>• LRN (learning)</td>
</tr>
<tr>
<td></td>
<td>• FWD (forwarding)</td>
</tr>
<tr>
<td>Type</td>
<td>Status information. Valid values are as follows:</td>
</tr>
<tr>
<td></td>
<td>• P2p/Shr—The interface is considered as a point-to-point (shared) interface by the spanning tree.</td>
</tr>
<tr>
<td></td>
<td>• Edge—The port is configured as an STP edge port (either globally using the default command or directly on the interface) and no BPDU has been received.</td>
</tr>
<tr>
<td></td>
<td>• Network—The port is configured as an STP network port (either globally using the default command or directly on the interface).</td>
</tr>
<tr>
<td></td>
<td>• *ROOT_Inc, *LOOP_Inc, *PVID_Inc, *BA_Inc, and <em>TYPE_Inc—The port is in a broken state (BKN</em>) for an inconsistency. The broken states are Root inconsistent, Loopguard inconsistent, PVID inconsistent, Bridge Assurance inconsistent, or Type inconsistent.</td>
</tr>
</tbody>
</table>

Sts: Current port STP state. Valid values are as follows:

- BLK (blocking)
- DIS (disabled)
- LRN (learning)
- FWD (forwarding)

Type: Status information. Valid values are as follows:

- P2p/Shr—The interface is considered as a point-to-point (shared) interface by the spanning tree.
- Edge—The port is configured as an STP edge port (either globally using the `default` command or directly on the interface) and no BPDU has been received.
- Network—The port is configured as an STP network port (either globally using the `default` command or directly on the interface).
- *ROOT_Inc, *LOOP_Inc, *PVID_Inc, *BA_Inc, and *TYPE_Inc—The port is in a broken state (BKN*) for an inconsistency. The broken states are Root inconsistent, Loopguard inconsistent, PVID inconsistent, Bridge Assurance inconsistent, or Type inconsistent.

## Examples

This example shows how to display detailed information on the STP configuration on a switch that runs Cisco NX-OS Release 5.0(3)N2(1):

```
switch# show spanning-tree detail

VLAN0001 is executing the rstp compatible Spanning Tree protocol
Bridge Identifier has priority 32768, sysid 1, address 0005.9b23.407c
Configured hello time 2, max age 20, forward delay 15
We are the root of the spanning tree
Topology change flag not set, detected flag not set
Number of topology changes 0 last change occurred 663:31:38 ago
Times:  hold 1, topology change 35, notification 2
       hello 2, max age 20, forward delay 15
Timers: hello 0, topology change 0, notification 0

Port 159 (Ethernet1/31) of VLAN0001 is designated forwarding
Port path cost 2, Port priority 128, Port Identifier 128.159
Designated root has priority 32769, address 0005.9b23.407c
Designated bridge has priority 32769, address 0005.9b23.407c
Designated port id is 128.159, designated path cost 0
Timers: message age 0, forward delay 0, hold 0
Number of transitions to forwarding state: 1
The port type is edge by port type edge trunk configuration
Link type is point-to-point by default
Bpdu guard is enabled
Bpdu filter is enabled
BPDU: sent 0, received 0

switch#
```

<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The STP port type displays only when you have configured the port as either an STP edge port or an STP network port. If you have not configured the STP port type, no port type displays.

If you specify an interface that is not running STP, the switch returns an error message.

When you are running Multiple Spanning Tree (MST), this command displays the Per VLAN Spanning Tree (PVST) simulation setting.
Show Commands

Send comments to nexus5k-docfeedback@cisco.com

Note
If you are running Multiple Spanning Tree (MST), use the show spanning-tree mst command to show more detail on the specified interfaces.

Examples
This example shows how to display STP information on a specified interface:
```
switch(config)# show spanning-tree interface ethernet 1/3
```
This example shows how to display detailed STP information on a specified interface:
```
switch(config)# show spanning-tree interface ethernet 1/3 detail
```

This example shows how to display STP information about a specific Multiple Spanning Tree (MST) instance:
```
switch)# show spanning-tree mst 0
```

This example shows how to display detailed STP information about the Multiple Spanning Tree (MST) protocol:
```
switch)# show spanning-tree mst detail
```

This example shows how to display STP information about specified Multiple Spanning Tree (MST) interfaces:
```
switch)# show spanning-tree mst interface ethernet 8/2
```

This example shows how to display information about the Multiple Spanning Tree (MST) configuration:
```
switch)# show spanning-tree mst configuration
```

This example shows how to display the MD5 digest included in the current Multiple Spanning Tree (MST) configuration:
```
switch)# show spanning-tree mst configuration digest
```

See Table 4 on page 365 for descriptions of the fields that are displayed in the output of the show spanning-tree commands.

</table>

**Usage Guidelines**

The display output for this command differs when you are running Rapid Per VLAN Spanning Tree Plus (Rapid PVST+) or Multiple Spanning Tree (MST).

**Examples**

This example shows how to display a summary of STP information on the switch:

```
switch# show spanning-tree summary
Switch is in rapid-pvst mode
Root bridge for: VLAN0001, VLAN0005
Port Type Default is disable
Edge Port [PortFast] BPDU Guard Default is disabled
Edge Port [PortFast] BPDU Filter Default is disabled
Bridge Assurance is enabled
Loopguard Default is disabled
Pathcost method used is short

Name                   Blocking Listening Learning Forwarding STP Active
---------------------- -------- --------- -------- ---------- ----------
VLAN0001               2         0        0          5          7
VLAN0005               1         0        0          0          1
---------------------- -------- --------- -------- ---------- ----------
2 vlans                3         0        0          5          8
switch#
```

**Related Commands**

</tr>
</thead>
<tbody>
<tr>
<td>show spanning-tree</td>
<td>Displays information about STP.</td>
</tr>
</tbody>
</table>
**show spanning-tree vlan**

To display Spanning Tree Protocol (STP) information for specified VLANs, use the `show spanning-tree vlan` command.

```
show spanning-tree vlan [vlan-id] [active [brief | detail]]
show spanning-tree vlan [vlan-id] [blockedports]
show spanning-tree vlan [vlan-id] [bridge [address] | brief | detail | forward-time | hello-time | id | max-age | priority [system-id] | protocol]
show spanning-tree vlan [vlan-id] [brief [active]]
show spanning-tree vlan [vlan-id] [detail [active]]
show spanning-tree vlan [vlan-id] [inconsistentports]
show spanning-tree vlan [vlan-id] [interface [ethernet slot/port | port-channel number] [active [brief | detail]] | brief [active] | cost | detail [active] | edge | inconsistency | priority | rootcost | state]
show spanning-tree vlan [vlan-id] [root [address | brief | cost | detail | forward-time | hello-time | id | max-age | port | priority [system-id]]
show spanning-tree vlan [vlan-id] [summary]
```

**Syntax Description**

- `vlan-id`  
  VLAN or range of VLANs that you want to display.

- `active`  
  (Optional) Displays information about STP VLANs and active ports.

- `brief`  
  (Optional) Displays a brief summary of STP information for the specified VLANs.

- `detail`  
  (Optional) Displays detailed STP information for the specified VLANs.

- `blockedports`  
  (Optional) Displays the STP alternate ports in the blocked state for the specified VLANs.

- `bridge`  
  (Optional) Displays the status and configuration of the bridge for the specified VLANs.

- `address`  
  (Optional) Displays the MAC address for the specified STP bridge for the specified VLANs.

- `forward-time`  
  (Optional) Displays the STP forward delay interval for the bridge for the specified VLANs.

- `hello-time`  
  (Optional) Displays the STP hello time for the bridge for the specified VLANs.

- `id`  
  (Optional) Displays the STP bridge identifier for the specified VLANs.

- `max-age`  
  (Optional) Displays the STP maximum-aging time for the specified VLANs.

- `priority`  
  (Optional) Displays the STP priority for the specified VLANs.

- `system-id`  
  (Optional) Displays the bridge identification with the system ID added for the specified VLANs.

- `protocol`  
  (Optional) Displays which STP protocol is active on the switch.

</table>
show startup-config vtp

To display the VLAN Trunking Protocol (VTP) configuration from the startup configuration file, use the show startup-config vtp command.

show startup-config vtp

Syntax Description

This command has no arguments or keywords.

Command Default

None

Command Modes

EXEC mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Examples

This example shows how to display the VTP configuration stored in the startup configuration file:

switch# show startup-config vtp

!Command: show startup-config vtp
!Time: Tue Sep 7 08:45:33 2010
!Startup config saved at: Tue Sep 7 08:45:03 2010

version 5.0(2)N1(1)
feature vtp

vtp mode transparent
vtp domain MyDomain
vtp file bootflash:/myvtp.txt

switch#
show svs connections

To display the current SVS connections to the Cisco Nexus 5000 Series switch for verification, use the `show svs connections` command.

```
show svs connections [conn_name]
```

### Syntax Description

- **conn-name**: (Optional) Name of the SVS connection. The name can be a maximum of 64 alphanumeric characters.

### Command Default

None

### Command Modes

EXEC mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

This command does not require a license.

### Examples

This example shows how to display information about the local and remote SVS connections:

```
switch# show svs connections

Local Info:
-----------
connection SVSConn:
  ip address: 192.0.2.12
  remote port: 21
  vrf: default
  protocol: vmware-vim https
  certificate: default
  datacenter name: DCName
  extension key: Cisco_Nexus_1000V_1155927
  dvs name: DVS_DC
  DVS uuid: -
  config status: Disabled
  operational status: Disconnected
  sync status: -
  version: -

Peer Info:
----------
  hostname: -
  ip address: -
  vrf: -
  protocol: -
  extension key: -
```
This example shows how to display the SVS information of the local machine:

```
switch# show svs connections SVSConn

Local Info:
-----------
connection SVSConn:
    ip address: 10.0.0.1
    remote port: 21
    vrf: default
    protocol: vmware-vim https
    certificate: default
    datacenter name: DCName
    extension key: Cisco_Nexus_1000V_1199955927
    dvs name: DVS_DC
    DVS uuid: -
    config status: Disabled
    operational status: Disconnected
    sync status: -
    version: -
switch#
```

<tr>
<td>svs connection</td>
<td>Enables an SVS connection.</td>
</tr>
</tbody>
</table>
show system vlan reserved

To display the system reserved VLAN range, use the `show system vlan reserved` command.

```
show system vlan reserved
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
None

**Command Modes**
Any command mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>

show tech-support port-channel

To display troubleshooting information about EtherChannel interfaces, use the show tech-support port-channel command.

```
show tech-support port-channel
```

**Syntax Description**

This command has no arguments and keywords.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

The output from the show tech-support port-channel command is very long. To better manage this output, you can redirect the output to a file.

**Examples**

This example shows how to display Cisco technical support information for EtherChannel interfaces:

```
switch# show tech-support port-channel
`show port-channel internal event-history all`
Low Priority Pending queue: len(0), max len(2) [Thu Jul  8 04:05:04 2010]
High Priority Pending queue: len(0), max len(32) [Thu Jul  8 04:05:04 2010]
PCM Control Block info:

</tbody>
</table>
show udlld

To display the Unidirectional Link Detection (UDLD) information for a switch, use the `show udlld` command.

```
show udlld [ethernet slot/port | global | neighbors]
```

**Syntax Description**

- **ethernet slot/port**: Displays UDLD information for an Ethernet IEEE 802.3z interface. The `slot` number is from 1 to 255, and the `port` number is from 1 to 128.
- **global**: Displays the UDLD global status and configuration information on all interfaces.
- **neighbors**: Displays information about UDLD neighbor interfaces.

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(1a)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Examples**

This example shows how to display UDLD information for all interfaces:

```
switch# show udlld

Interface Ethernet1/1
-------------------------
Port enable administrative configuration setting: device-default
Port enable operational state: enabled
Current bidirectional state: bidirectional
Current operational state: advertisement - Single neighbor detected
Message interval: 15
Timeout interval: 5

Entry 1
-------
Expiration time: 41
Cache Device index: 1
Current neighbor state: bidirectional
Device ID: FLC12280095
Port ID: Ethernet1/1
Neighbor echo 1 devices: SSI130205RT
Neighbor echo 1 port: Ethernet1/1

Message interval: 15
Timeout interval: 5
CDP Device name: N5Kswitch-2(FLC12280095)

Interface Ethernet1/2
```

<td>(Optional) Displays information about a single VLAN that is identified by</td>
</tr>
<tr>
<td></td>
<td>the VLAN name.</td>
</tr>
<tr>
<td>summary</td>
<td>(Optional) Displays the number of existing VLANs on the switch.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

EXEC mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

This command displays information for all VLANs, including private VLANs, on the switch.

Each access port can belong to only one VLAN. Trunk ports can be on multiple VLANs.

Although a port can be associated with a VLAN as an access VLAN, a native VLAN, or one of the trunk allowed ports, only access VLANS are shown under Ports in the display.

If you shut down a VLAN using the `state suspend` or the `state active` command, these values appear in the Status field:

- suspended—VLAN is suspended.
- active—VLAN is active.

If you shut down a VLAN using the `shutdown` command, these values appear in the Status field:

- act/ishut—VLAN status is active but shut down locally.
- sus/ishut—VLAN status is suspended but shut down locally.

If a VLAN is shut down internally, these values appear in the Status field:

- act/ishut—VLAN status is active but shut down internally.
- sus/ishut—VLAN status is suspended but shut down internally.

If a VLAN is shut down locally and internally, the value that is displayed in the Status field is act/ishut or sus/ishut. If a VLAN is shut down locally only, the value that is displayed in the Status field is act/ishut or sus/ishut.
**Examples**

This example shows how to display information for all VLANs on the switch:

```
switch# show vlan
```

This example shows how to display the VLAN name, status, and associated ports only:

```
switch# show vlan brief
```

This example shows how to display the VLAN information for a specific VLAN by name:

```
switch# show vlan name test
```

This example shows how to display information about the number of VLANs configured on the switch:

```
switch# show vlan summary
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>

<td>Displays private VLAN information.</td>
</tr>
</tbody>
</table>
show vlan dot1Q tag native

To display the status of tagging on the native VLANs, use the `show vlan dot1Q tag native` command.

```
switch# show vlan dot1Q tag native
vlan dot1q native tag is enabled
switch#
```

Syntax Description
This command has no arguments or keywords.

Command Default
None

Command Modes
EXEC mode

Command History

```
Release   Modification
4.0(0)N1(1a) This command was introduced.
```

Examples
This example shows how to display the status of 802.1Q tagging on the native VLANs:

```
switch# show vlan dot1Q tag native
vlan dot1q native tag is enabled
switch#
```

Related Commands

```
Command        Description
---            ---
vlan dot1q tag native Enables dot1q (IEEE 802.1Q) tagging for all native VLANs on all trunked ports on the switch.
```
show vlan id

To display information and statistics for an individual VLAN or a range of VLANs, use the `show vlan id` command.

```
show vlan id {vlan-id}
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax Description</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>VLAN or range of VLANs that you want to display.</td>
</tr>

<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Use this command to display information and statistics on an individual VLAN or a range of VLANs, including private VLANs.

**Note**

You can also display information about individual VLANs using the `show vlan name` command.

**Examples**

This example shows how to display information for the individual VLAN 5:

```
switch# show vlan id 5
```

**Related Commands**

**Usage Guidelines**

Before you use this command, you must enable VTP on the switch by using the **feature vtp** command.

**Note**

VTP pruning is not supported in Cisco NX-OS Release 5.0(2)N2(1).

**Examples**

This example shows how to display the VTP counters on a switch that runs Cisco NX-OS Release 5.0(2)N2(1):

```
switch# show vtp counters
VTP statistics:
  Summary advertisements received     : 0
  Subset advertisements received       : 0
  Request advertisements received      : 0
  Summary advertisements transmitted  : 0
  Subset advertisements transmitted   : 0
  Request advertisements transmitted  : 0
  Number of config revision errors    : 0
  Number of config digest errors      : 0
  Number of V1 summary errors         : 0

VTP pruning statistics:

show vtp interface

To display the VLAN Trunking Protocol (VTP) interface status and configuration information, use the show vtp interface command.

```
show vtp interface [ethernet slot/port | port-channel channel-no]
```

### Syntax Description

- **ethernet slot/port** (Optional) Displays the VTP configuration on Ethernet interfaces. The slot number is from 1 to 255, and the port number can be from 1 to 128.
- **port-channel channel-no** (Optional) Displays the VTP configuration on EtherChannel interfaces. The EtherChannel number can be from 1 to 4096.

### Command Default

None

### Command Modes

EXEC mode

### Command History

<table>

</tr>
</tbody>
</table>

### Usage Guidelines

Before you use this command, you must enable VTP on the switch by using the feature vtp command.

### Examples

This example shows how to display the VTP configuration information on all interfaces:

```
switch# show vtp interface

    Interface   VTP Status
    ------------------------
    port-channel23         Enabled
    port-channel167        Enabled
    port-channel400        Enabled
    port-channel1504       Enabled
    Ethernet1/2            Enabled
    Ethernet1/12           Enabled
    switch#
```

This example shows how to display the VTP configuration information for an Ethernet interface:

```
switch# show vtp interface ethernet 1/12

    Interface   VTP Status
    ------------------------
    Ethernet1/12          Enabled
    switch#
```

This example shows how to display the VTP configuration information for an EtherChannel interface:

```
switch# show vtp interface port-channel 23
```
<table>
<thead>
<tr>
<th>Interface</th>
<th>VTP Status</th>
</tr>
</thead>
<tbody>
<tr>
<td>port-channel23</td>
<td>Enabled</td>
</tr>
</tbody>
</table>

**Related Commands**

</tbody>
</table>
show vtp password

To display the VLAN Trunking Protocol (VTP) administrative password, use the `show vtp password` command.

```
show vtp password [domain domain-id]
```

### Syntax Description

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>domain</code></td>
<td>(Optional) Specifies the VTP administrative domain.</td>
</tr>
<tr>
<td><code>domain-id</code></td>
<td>VTP domain ID. The ID can be from 0 to 4294967295.</td>
</tr>
</tbody>
</table>

### Command Default

None

Usage Guidelines

Before you use this command, you must enable VTP on the switch by using the `feature vtp` command.

Examples

This example shows how to display the VTP domain status on a Cisco NX-OS Release 4.2(1)N1(1):

```
switch# show vtp status
VTP Version : 1
Configuration Revision : 0
Maximum VLANs supported locally : 1005
VTP Operating Mode : Transparent
VTP Domain Name :
VTP Pruning Mode : Disabled
VTP V2 Mode :
VTP Traps Generation : Disabled
```

This example shows how to display the VTP domain status in Cisco NX-OS Release 5.0(2)N1(1):

```
switch# show vtp status
VTP Status Information
----------------------
VTP Version : 2 (capable)
Configuration Revision : 0
Maximum VLANs supported locally : 1005
Number of existing VLANs : 504
VTP Operating Mode : Transparent
VTP Domain Name : MyDomain
VTP Pruning Mode : Disabled (Operationally Disabled)
VTP V2 Mode : Disabled
VTP Traps Generation : Enabled
MD5 Digest : 0x55 0xDE 0xF3 0x03 0x0F 0xE5 0x9D 0x6B
Configuration last modified by 0.0.0.0 at 00:00:00
VTP version running : 1
Local updater ID is 5.1.1.4
```
This example shows how to display the VTP domain status in Cisco NX-OS Release 5.0(2)N2(1):

```
switch# show vtp status
VTP Status Information
----------------------
VTP Version                     : 2 (capable)
Configuration Revision          : 0
Maximum VLANs supported locally : 1005
Number of existing VLANs        : 14
VTP Operating Mode              : Server
VTP Domain Name                 : cisco
VTP Pruning Mode                : Disabled (Operationally Disabled)
VTP V2 Mode                     : Disabled
VTP Traps Generation            : Disabled
MD5 Digest                      : 0x70 0x06 0xAE 0x94 0x0B 0x33 0xFB 0xD4
Configuration last modified by 0.0.0.0 at 0-0-00 00:00:00
Local updater ID is 0.0.0.0
VTP version running             : 1
```

U Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with U.
udld (configuration mode)

To configure the Unidirectional Link Detection (UDLD) protocol on the switch, use the `udld` command. To disable UDLD, use the `no` form of this command.

```
udld {aggressive | message-time timer-time | reset}
no udld {aggressive | message-time | reset}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>aggressive</code></td>
<td>Enables UDLD in aggressive mode on the switch.</td>
</tr>
<tr>
<td><code>message-time</code></td>
<td>Sets the period of time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional. The range is from 7 to 90 seconds. The default is 15 seconds.</td>
</tr>
<tr>
<td><code>timer-time</code></td>
<td>Sets the period of time between UDLD probe messages on ports that are in advertisement mode and are currently determined to be bidirectional. The range is from 7 to 90 seconds. The default is 15 seconds.</td>
</tr>
<tr>
<td><code>reset</code></td>
<td>Resets all the ports that are shut down by UDLD and permit traffic to begin passing through them again. Other features, such as spanning tree, will behave normally if enabled.</td>
</tr>
</tbody>
</table>

### Command Default

Disabled

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(1a)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

UDLD aggressive mode is disabled by default. You can configure UDLD aggressive mode only on point-to-point links between network devices that support UDLD aggressive mode. If UDLD aggressive mode is enabled, when a port on a bidirectional link that has a UDLD neighbor relationship established stops receiving UDLD frames, UDLD tries to reestablish the connection with the neighbor. After eight failed retries, the port is disabled.

To prevent spanning tree loops, normal UDLD with the default interval of 15 seconds is fast enough to shut down a unidirectional link before a blocking port transitions to the forwarding state (with default spanning tree parameters).

When you enable the UDLD aggressive mode, the following occurs:

- One side of a link has a port stuck (both transmission and receive)
- One side of a link remains up while the other side of the link is down

In these cases, the UDLD aggressive mode disables one of the ports on the link, which prevents traffic from being discarded.

### Examples

This example shows how to enable the aggressive UDLD mode for the switch:

```
switch# configure terminal
```
U Commands

udld (configuration mode)

This example shows how to reset all ports that were shut down by UDLD:

switch# configure terminal
switch(config)# udld reset

<table>
<thead>
<tr>
<th>Related Commands</th>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>show udld</td>
<td>Displays the administrative and operational UDLD status.</td>
</tr>
</tbody>
</table>
To enable and configure the Unidirectional Link Detection (UDLD) protocol on an Ethernet interface, use the **udld** command. To disable UDLD, use the **no** form of this command.

```
udld {aggressive | disable | enable}
```

```
no udld {aggressive | disable | enable}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>aggressive</td>
<td>Enables UDLD in aggressive mode on the interface.</td>
</tr>
<tr>
<td>disable</td>
<td>Disables UDLD on the interface.</td>
</tr>
<tr>
<td>enable</td>
<td>Enables UDLD in normal mode on the interface.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Interface configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(1a)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

You can configure normal or aggressive UDLD modes for an Ethernet interface. Before you can enable a UDLD mode for an interface, you must make sure that UDLD is enabled on the switch. UDLD must also be enabled on the other linked interface and its device.

To use the normal UDLD mode on a link, you must configure one of the ports for normal mode and configure the port on the other end for the normal or aggressive mode. To use the aggressive UDLD mode, you must configure both ends of the link for aggressive mode.

### Examples

This example shows how to enable the normal UDLD mode for an Ethernet port:

```
switch# configure terminal
switch(config)# interface ethernet 1/1
switch(config-if)# udld enable
```

This example shows how to enable the aggressive UDLD mode for an Ethernet port:

```
switch(config-if)# udld aggressive
```

This example shows how to disable UDLD for an Ethernet port:

```
switch(config-if)# udld disable
```
### Related Commands

V Commands

This chapter describes the Cisco NX-OS Ethernet and virtual Ethernet commands that begin with V.
vethernet auto-create

To enable the automatic creation of virtual Ethernet interfaces globally, use the `vethernet auto-create` command. To disable automatic creation of virtual Ethernet interfaces, use the `no` form of this command.

```
vethernet auto-create
no vethernet auto-create
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before you use a virtual Ethernet interface, you must enable Cisco Virtual Machine Fabric Extender (VM-FEX) on the switch by using the `feature vmfex` command.

**Examples**
This example shows how to enable automatic creation of virtual Ethernet interfaces on the switch:

```
switch(config)# vethernet auto-create
switch(config)#
```

This example shows how to disable automatic creation of virtual Ethernet interfaces:

```
switch(config)# no vethernet auto-create
switch(config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature vmfex</td>
<td>Enables VM-FEX on the switch.</td>
</tr>
<tr>
<td>interface vethernet</td>
<td>Configures a virtual Ethernet interface.</td>
</tr>
<tr>
<td>port-profile</td>
<td>Configures a port profile.</td>
</tr>
</tbody>
</table>
To add a VLAN or to enter the VLAN configuration mode, use the `vlan` command. To delete the VLAN and exit the VLAN configuration mode, use the `no` form of this command.

```
 vlan {vlan-id | vlan-range}
```

```
 no vlan {vlan-id | vlan-range}
```

### Syntax Description

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>vlan-id</code></td>
<td>Number of the VLAN. The range is from 1 to 4094. &lt;br&gt; <strong>Note</strong> You cannot create, delete, or modify VLAN 1 or any of the internally allocated VLANs.</td>
</tr>
<tr>
<td><code>vlan-range</code></td>
<td>Range of configured VLANs; see the “Usage Guidelines” section for a list of valid values.</td>
</tr>
</tbody>
</table>

### Command Default

None

### Command Modes

Global configuration mode

**Note**

You can also create and delete VLANs in the VLAN configuration mode using these same commands.

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

When you enter the `vlan` `vlan-id` command, a new VLAN is created with all default parameters and causes the CLI to enter VLAN configuration mode. If the `vlan-id` argument that you entered matches an existing VLAN, nothing happens except that you enter VLAN configuration mode.

You can enter the `vlan-range` using a comma (,), a dash (-), and the number.

VLAN 1 parameters are factory configured and cannot be changed; you cannot create or delete this VLAN. Additionally, you cannot create or delete VLAN 4095 or any of the internally allocated VLANs.

When you delete a VLAN, all the access ports in that VLAN are shut down and no traffic flows. On trunk ports, the traffic continues to flow for the other VLANs allowed on that port, but the packets for the deleted VLAN are dropped. However, the system retains all the VLAN-to-port mapping for that VLAN, and when you reenable, or recreate, that specified VLAN, the switch automatically reinstates all the original ports to that VLAN.

In Cisco NX-OS 5.0(2)N1(1), you can configure VLANs on a device configured as a VLAN Trunking Protocol (VTP) server or transparent device. If the VTP device is configured as a client, you cannot add a VLAN or enter the VLAN configuration mode.
Examples

This example shows how to add a new VLAN and enter VLAN configuration mode:

```
switch(config)# vlan 2
switch(config-vlan)#
```

This example shows how to add a range of new VLANs and enter VLAN configuration mode:

```
switch(config)# vlan 2,5,10-12,20,25,4000
switch(config-vlan)#
```

This example shows how to delete a VLAN:

```
switch(config)# no vlan 2
```
To configure spanning tree designated bridge and root bridge priority for VLANs, use the `vlan` command. To revert to the default settings, use the `no` form of this command.

```
vlan instance-id [designated | root] priority priority-value
no vlan instance-id [designated | root] priority priority-value
```

**Syntax Description**
- `instance-id`: MST instance. The range is from 0 to 4094.
- `designated`: (Optional) Sets the designated bridge priority for the spanning tree.
- `root`: (Optional) Sets the root bridge priority for the spanning tree.
- `priority priority-value`: (Optional) Specifies the STP-bridge priority; the valid values are 0, 4096, 8192, 12288, 16384, 20480, 24576, 28672, 32768, 36864, 40960, 45056, 49152, 53248, 57344, 61440. All other values are rejected.

**Command Default**
None

**Command Modes**
Spanning-tree pseudo configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
You can enter the `instance-id` argument as a single instance or a range of instances, for example, 0-3,5,7-9.

This command does not require a license.

**Examples**
This example shows how to configure a spanning-tree domain:

```
switch# configure terminal
switch(config)# spanning-tree pseudo-information
switch(config-pseudo)# vlan 1 designated priority 4096
switch(config-pseudo)# vlan 1 root priority 8192
switch(config-pseudo)#
```

**Related Commands**

**V Commands**

---

**vlan configuration**

To configure a VLAN prior to or without needing to actually create the VLAN, use the `vlan configuration` command.

```
vlan configuration vlan-id
```

**Syntax Description**

- **vlan-id**: The range is from 1 to 2499 and from 2628 to 4093. The VLAN range can be specified in the format shown in this example: 1-5, 10 or 2-5,7-19.

**Defaults**

None

**Command Modes**

- Global configuration mode (config)

**Supported User Roles**

- network-admin
- vdc-admin

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.1(3)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you use the `vlan configuration` command to configure a VLAN that you have not yet created and you later want to create that VLAN, use the `vlan` command to create the configured VLAN.

The `show vlan` command does not display any VLAN until and unless you actually create the VLAN.

This command does not require a license.

**Examples**

This example shows how to configure a VLAN and enter the VLAN configuration mode:

```
switch# configure terminal
switch(config)# vlan configuration 2-5,7-19
switch(config-vlan-config)#
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show running-config vlan</code></td>
<td>Displays the running configuration for a specified VLAN.</td>
</tr>
</tbody>
</table>
To enable dot1q (IEEE 802.1Q) tagging for all native VLANs on all trunked ports on the switch, use the `vlan dot1Q tag native` command. To disable dot1q (IEEE 802.1Q) tagging for all native VLANs on all trunked ports on the switch, use the `no` form of this command.

```
vlan dot1Q tag native
no vlan dot1Q tag native
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
Disabled

**Command Modes**
Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.0(0)N1(1a)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Typically, you configure 802.1Q trunks with a native VLAN ID, which strips tagging from all packets on that VLAN.

To maintain the tagging on the native VLAN and drop untagged traffic, use the `vlan dot1q tag native` command. The switch will tag the traffic received on the native VLAN and admit only 802.1Q-tagged frames, dropping any untagged traffic, including untagged traffic in the native VLAN.

Control traffic continues to be accepted as untagged on the native VLAN on a trunked port, even when the `vlan dot1q tag native` command is enabled.

**Note**
The `vlan dot1q tag native` command is enabled on global basis.

**Examples**
This example shows how to enable 802.1Q tagging on the switch:
```
switch(config)# vlan dot1q tag native
switch(config)#
```

This example shows how to disable 802.1Q tagging on the switch:
```
switch(config)# no vlan dot1q tag native
Turning off vlan dot1q tag native may impact the functioning of existing dot1q tunnel ports
switch(config)#
```
## vlan dotQ tag native

vtp (interface)

To enable VLAN Trunking Protocol (VTP) on an interface, use the `vtp` command. To disable VTP on an interface, use the `no` form of this command.

```
vtp

no vtp
```

**Syntax Description**
This command has no arguments or keywords.

**Command Default**
VTP is enabled on a trunk interface

**Command Modes**
Interface configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(2)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**
Before you use this command, you must enable VTP on the switch by using the `feature vtp` command.

VLAN Trunking Protocol (VTP) is a Cisco Proprietary Layer 2 messaging protocol used to distribute the VLAN configuration information across multiple devices within a VTP domain.

**Examples**
This example shows how to enable VTP on an interface:

```
switch(config)# interface ethernet 1/1
switch(config-if)# vtp
```

**Related Commands**

vtp domain

To configure the name of the VLAN Trunking Protocol (VTP) administrative domain, use the `vtp domain` command. To remove the domain name, use the `no` form of this command.

```
vtp domain name
```

```
no vtp domain
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Syntax</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>name</code></td>
<td>VTP domain name. The name can be a maximum of 32 ASCII characters.</td>
</tr>
</tbody>
</table>

**Command Default**

Blank (NULL)

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

Before you use this command, you must enable VTP on the switch by using the `feature vtp` command. VLAN Trunking Protocol (VTP) is a Cisco Proprietary Layer 2 messaging protocol used to distribute the VLAN configuration information across multiple devices within a VTP domain. Without VTP, you must configure VLANs in each device in the network. Using VTP, you configure VLANs on a VTP server and then distribute the configuration to other VTP devices in the VTP domain.

**Examples**

This example shows how to create a VTP domain named accounting:

```
switch(config)# vtp domain accounting
switch(config)#
```

**Related Commands**

</tbody>
</table>
vtp file

To store the VLAN Trunking Protocol (VTP) configuration information in a file, use the `vtp file` command. To stop storing the configuration in a file, use the `no` form of this command.

```
vtp file bootflash:server[directory/]filename
no vtp file
```

### Syntax Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>bootflash:</code></td>
<td>Specifies that the VTP configuration file is to be stored in the bootflash memory of the NVRAM. The colon character (:) is required after the file system name.</td>
</tr>
<tr>
<td><code>server</code></td>
<td>Name of the server. Valid values are <code>///</code>, <code>//module-1//</code>, <code>//sup-1//</code>, <code>//sup-active//</code>, or <code>//sup-local//</code>. The double slash (<code>/</code>) is required.</td>
</tr>
<tr>
<td><code>directory/</code></td>
<td>(Optional) Name of the destination directory. The directory name is case sensitive.</td>
</tr>
<tr>
<td><code>filename</code></td>
<td>Name of the VTP configuration file.</td>
</tr>
</tbody>
</table>

**Note**

There can be no spaces in the `bootflash://server[directory/]filename` string. Individual elements of this string are separated by colons (:) and slashes (/).

### Command Default

VTP database file, vlan.dat

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(2)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

Before you use this command, you must enable VTP on the switch by using the `feature vtp` command. The default configuration file is stored in the VTP database, vlan.dat, in NVRAM. VTP configuration information is also stored in the startup configuration file.

**Note**

Do not delete the vlan.dat file.

When a switch in a VTP domain reloads, the switch updates the VTP domain and VLAN configuration information from the information contained in the VTP database file (vlan.dat) or the startup configuration file. Depending on the VTP mode configured for the switch, the information is updated as follows:
server—If the startup configuration file indicates the switch to be configured in VTP server mode, the switch recovers the VTP and VLAN configuration information from the VTP database file available in the bootflash storage file system. If the VTP configuration cannot be retrieved from the file in the bootflash file system, the default VLAN configuration (VLANs 1–1005) is applied to the VTP server configuration, and the configuration revision number is set to zero (0).

client—If, within 5 seconds, the VTP client does not receive the VTP configuration information from the VTP server or other VTP devices in the VTP domain, it uses the locally configured VLAN information. This locally configured VTP information is overwritten by the configuration that it later receives from the VTP server.

transparent—If both the VTP database and the startup configuration file show the VTP mode as transparent and the VTP domain names match, the VTP database is ignored. The VTP and VLAN configurations in the startup configuration file are used to restore the configuration in this VTP device.

If the VTP domain information in the startup configuration file does not match with that in the VTP database file, then the configuration in the VTP database file is used to restore the configuration in the transparent VTP device.

Examples

This example shows how to store the VTP configuration to a file named myvtp.txt in the local writable storage file system, bootflash:

```
switch(config)# vtp file bootflash:///myvtp.txt
switch(config)#
```

</table>
vtp mode

To configure the VLAN Trunking Protocol (VTP) device mode, use the `vtp mode` command. To revert to the default server mode, use the `no` form of this command.

```
vtp mode {client | off | server | transparent}
```

```
no vtp mode
```

### Syntax Description

- **client**: Specifies the device as a client.
- **off**: Specifies the device mode as off.
- **server**: Specifies the device as a server.
- **transparent**: Specifies the device mode as transparent.

### Command Default

Server

### Command Modes

Global configuration mode

### Command History

<table>
<thead>
<tr>

</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
<tr>
<td>5.0(2)N2(1)</td>
<td>Added support for client, server, and off device modes.</td>
</tr>
</tbody>
</table>

### Usage Guidelines

VLAN Trunking Protocol (VTP) is a Cisco Proprietary Layer 2 messaging protocol used to distribute the VLAN configuration information across multiple devices within a VTP domain. Without VTP, you must configure VLANs in each device in the network. Using VTP, you configure VLANs on a VTP server and then distribute the configuration to other VTP devices in the VTP domain.

In VTP transparent mode, you can configure VLANs (add, delete, or modify) and private VLANs. VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. The VTP configuration revision number is always set to zero (0). Transparent switches do forward VTP advertisements that they receive out their trunk ports in VTP version 2.

A VTP device mode can be one of the following:

- **server**—You can create, modify, and delete VLANs and specify other configuration parameters, such as VTP version, for the entire VTP domain. VTP servers advertise their VLAN configuration to other switches in the same VTP domain and synchronize their VLAN configuration with other switches based on advertisements received over trunk links. VTP server is the default mode.

### Note

You can configure VLANs 1 to 1005. VLANs 1002 to 1005 are reserved for token ring in VTP version 2.
V Commands

vtp mode

- **client**—VTP clients behave the same way as VTP servers, but you cannot create, change, or delete VLANs on a VTP client.

- **transparent**—You can configure VLANs (add, delete, or modify) and private VLANs. VTP transparent switches do not participate in VTP. A VTP transparent switch does not advertise its VLAN configuration and does not synchronize its VLAN configuration based on received advertisements. Because of this, the VTP configuration revision number is always set to zero (0). Transparent switches do forward VTP advertisements that they receive out their trunk ports in VTP version 2.

- **off**—In the above three described modes, VTP advertisements are received and transmitted as soon as the switch enters the management domain state. In the VTP off mode, switches behave the same as in VTP transparent mode with the exception that VTP advertisements are not forwarded. You can use this VTP device to monitor the VLANs.

**Note**

If you use the no vtp mode command to remove a VTP device, the device will be configured as a VTP server. Use the vtp mode off command to remove a VTP device.

**Examples**

This example shows how to configure a VTP device in transparent mode and add VLANs 2, 3, and 4:

```
switch(config)# vtp mode transparent
switch(config)# vlan 2-4
```

This example shows how to remove a device configured as a VTP device:

```
switch(config)# vtp mode off
```

This example shows how to configure a VTP device as a VTP server and adds VLANs 2 and 3:

```
switch(config)# vtp mode server
switch(config)# vlan 2,3
```

This example shows how to configure a VTP device as a client:

```
switch(config)# vtp mode client
```

**Related Commands**

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>feature vtp</td>
<td>Enables VTP on the switch.</td>

</tbody>
</table>
vtp password

To set the password for the VTP administrative domain, use the `vtp password` command. To remove the administrative password, use the `no` form of this command.

```plaintext
vtp password password
no vtp password
```

**Syntax Description**

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>password</td>
<td>VTP domain password. The password is in ASCII text and can be a maximum of 64 characters.</td>
</tr>
</tbody>
</table>

**Command Default**

None

**Command Modes**

Global configuration mode

**Command History**

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>5.0(2)N2(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

**Usage Guidelines**

If you configure a password for VTP, you must configure the password on all switches in the VTP domain. The password must be the same password on all those switches. The VTP password that you configure is translated by an algorithm into a 16-byte word (MD5 value) that is carried in all summary-advertisement VTP packets.

**Examples**

This example shows how to configure a password for the VTP administrative domain named accounting:

```plaintext
switch(config)# vtp domain accounting
switch(config)# vtp password cisco
switch(config)#
```

**Related Commands**

<table>

<td>Displays VTP information.</td>
</tr>
</tbody>
</table>
vtp version

To configure the administrative domain to a VLAN Trunking Protocol (VTP) version, use the vtp version command. To revert to the default version, use the no form of this command.

vtp version version

no vtp version

Syntax Description

| Command Default         | Version 1 enabled | Version 2 disabled |

Command Modes

Global configuration mode

Command History

<table>
<thead>
<tr>
<th>Release</th>
<th>Modification</th>
</tr>
</thead>
<tbody>
<tr>
<td>4.2(1)N1(1)</td>
<td>This command was introduced.</td>
</tr>
</tbody>
</table>

Usage Guidelines

Before you use this command, you must enable VTP on the switch by using the feature vtp command. If you enable VTP, you must configure either version 1 or version 2. If you are using VTP in a Token Ring environment, you must use version 2.

Examples

This example shows how to enable VTP version 2 for Token Ring VLANs:

```
switch(config)# vtp version 2
switch(config)#
```
