

Advanced Fibre Channel Features and Concepts

This chapter contains the following sections:

- [Advanced Fibre Channel Features and Concepts, page 1](#)

Advanced Fibre Channel Features and Concepts

Fibre Channel Timeout Values

You can modify Fibre Channel protocol-related timer values for the switch by configuring the following timeout values (TOVs):

- Distributed services TOV (D_S_TOV)—The valid range is from 5,000 to 10,000 milliseconds. The default is 5,000 milliseconds.
- Error detect TOV (E_D_TOV)—The valid range is from 1,000 to 10,000 milliseconds. The default is 2,000 milliseconds. This value is matched with the other end during port initialization.
- Resource allocation TOV (R_A_TOV)—The valid range is from 5,000 to 10,000 milliseconds. The default is 10,000 milliseconds. This value is matched with the other end during port initialization.

Note

The fabric stability TOV (F_S_TOV) constant cannot be configured.

Timer Configuration Across All VSANs

You can modify Fibre Channel protocol related timer values for the switch.

Caution

The D_S_TOV, E_D_TOV, and R_A_TOV values cannot be globally changed unless all VSANs in the switch are suspended.

**Note**

If a VSAN is not specified when you change the timer value, the changed value is applied to all VSANs in the switch.

To configure Fibre Channel timers across all VSANs, perform this task:

SUMMARY STEPS

1. switch# **configure terminal**
2. switch(config)# **ftimer R_A_TOV timeout**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters configuration mode.
Step 2	switch(config)# ftimer R_A_TOV timeout	Configures the R_A_TOV timeout value for all VSANs. The units is milliseconds. This type of configuration is not permitted unless all VSANs are suspended.

Timer Configuration Per-VSAN

You can also issue the ftimer for a specified VSAN to configure different TOV values for VSANs with special links such as Fibre Channel. You can configure different E_D_TOV, R_A_TOV, and D_S_TOV values for individual VSANs. Active VSANs are suspended and activated when their timer values are changed.

**Note**

This configuration must be propagated to all switches in the fabric. Be sure to configure the same value in all switches in the fabric.

To configure per-VSAN Fibre Channel timers, perform this task:

SUMMARY STEPS

1. switch# **configuration terminal**
2. switch(config)# **ftimer D_S_TOV timeout vsan vsan-id**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters configuration mode.

	Command or Action	Purpose
Step 2	switch(config)# ftimer D_S_TOV timeout vsan vsan-id	Configures the D_S_TOV timeout value (in milliseconds) for the specified VSAN. Suspends the VSAN temporarily. You have the option to end this command, if required.

The following example configures the timer value for VSAN 2:

```
switch(config)# ftimer D_S_TOV 6000 vsan 2
Warning: The vsan will be temporarily suspended when updating the timer value This
configuration would impact whole fabric. Do you want to continue? (y/n) y
Since this configuration is not propagated to other switches, please configure the same
value in all the switches
```

About ftimer Distribution

You can enable per-VSAN ftimer fabric distribution for all Cisco SAN switches in the fabric. When you perform ftimer configurations, and distribution is enabled, that configuration is distributed to all the switches in the fabric.

You automatically acquire a fabric-wide lock when you enter the first configuration command after you enabled distribution in a switch. The ftimer application uses the effective and pending database model to store or commit the commands based on your configuration.

For additional information, refer to Using Cisco Fabric Services in the *Cisco Nexus 5000 Series System Management Configuration Guide*.

Enabling or Disabling ftimer Distribution

To enable or disable ftimer fabric distribution, perform this task:

SUMMARY STEPS

1. switch# **configuration terminal**
2. switch(config)# **ftimer distribute**
3. switch(config)# **no ftimer distribute**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters configuration mode.
Step 2	switch(config)# ftimer distribute	Enables ftimer configuration distribution to all switches in the fabric. Acquires a fabric lock and stores all future configuration changes in the pending database.

	Command or Action	Purpose
Step 3	switch(config)# no fctimer distribute	Disables (default) fctimer configuration distribution to all switches in the fabric.

Committing fctimer Changes

When you commit the fctimer configuration changes, the effective database is overwritten by the configuration changes in the pending database and all the switches in the fabric receive the same configuration. When you commit the fctimer configuration changes without implementing the session feature, the fctimer configurations are distributed to all the switches in the physical fabric.

To commit the fctimer configuration changes, perform this task:

SUMMARY STEPS

1. switch# **configuration terminal**
2. switch(config)# **fctimer commit**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters configuration mode.
Step 2	switch(config)# fctimer commit	Distributes the fctimer configuration changes to all switches in the fabric and releases the lock. Overwrites the effective database with the changes made to the pending database.

Discarding fctimer Changes

After making the configuration changes, you can choose to discard the changes by discarding the changes instead of committing them. In either case, the lock is released.

To discard the fctimer configuration changes, perform this task:

SUMMARY STEPS

1. switch# **configuration terminal**
2. switch(config)# **fctimer abort**

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters configuration mode.
Step 2	switch(config)# ftimer abort	Discards the ftimer configuration changes in the pending database and releases the fabric lock.

Fabric Lock Override

If you have performed a ftimer fabric task and have forgotten to release the lock by either committing or discarding the changes, an administrator can release the lock from any switch in the fabric. If the administrator performs this task, your changes to the pending database are discarded and the fabric lock is released.

The changes are only available in the volatile directory and are subject to being discarded if the switch is restarted.

To use administrative privileges and release a locked ftimer session, use the **clear ftimer session** command.

```
switch# clear ftimer session
```

Fabric Database Merge Guidelines

When merging two fabrics, follow these guidelines:

- Be aware of the following merge conditions:
 - The merge protocol is not implemented for distribution of the ftimer values. You must manually merge the ftimer values when a fabric is merged.
 - The per-VSAN ftimer configuration is distributed in the physical fabric.
 - The ftimer configuration is only applied to those switches containing the VSAN with a modified ftimer value.
 - The global ftimer values are not distributed.
- Do not configure global timer values when distribution is enabled.

Note

The number of pending ftimer configuration operations cannot be more than 15. After 15 operations, you must commit or abort the pending configurations before performing any more operations.

For additional information, refer to CFS Merge Support in the *Cisco Nexus 5000 Series System Management Configuration Guide*.

Verifying Configured fctimer Values

Use the **show fctimer** command to display the configured fctimer values. The following example displays the configured global TOVs:

```
switch# show fctimer
F_S_TOV  D_S_TOV  E_D_TOV  R_A_TOV
-----
5000 ms   5000 ms   2000 ms  10000 ms
```

Note

The F_S_TOV constant, though not configured, is displayed in the output of the **show fctimer** command.

The following example displays the configured TOV for VSAN 10:

```
switch# show fctimer vsan 10
vsan no.  F_S_TOV  D_S_TOV  E_D_TOV  R_A_TOV
-----
10        5000 ms   5000 ms   3000 ms  10000 ms
```

World Wide Names

The world wide name (WWN) in the switch is equivalent to the Ethernet MAC address. As with the MAC address, you must uniquely associate the WWN to a single device. The principal switch selection and the allocation of domain IDs rely on the WWN.

Cisco Nexus 5000 Series switches support three network address authority (NAA) address formats. (see the following table).

Table 1: Standardized NAA WWN Formats

NAA Address	NAA Type	WWN Format	
IEEE 48-bit address	Type 1 = 0001b	000 0000 0000b	48-bit MAC address
IEEE extended	Type 2 = 0010b	Locally assigned	48-bit MAC address
IEEE registered	Type 5 = 0101b	IEEE company ID: 24 bits	VSID: 36 bits

Caution

Changes to the world-wide names should be made by an administrator or individual who is completely familiar with switch operations.

Verifying WWN Information

Use the **show wwn** commands to display the status of the WWN configuration. The following example displays the status of all WWNs:

```
switch# show wwn status
Type      Configured      Available      Resvd.      Alarm State
-----
1         64              48 ( 75%)     16          NONE
2,5      524288          442368 ( 84%) 73728       NONE
```

The following example displays the information for block ID 51:

```
switch# show wwn status block-id 51
WWNs in this block: 21:00:ac:16:5e:52:00:03 to 21:ff:ac:16:5e:52:00:03
Num. of WWNs:: Configured: 256 Allocated: 0 Available: 256
```

Block Allocation Status: FREE

The following example displays the WWN for a specific switch:

```
switch# show wwn switch
Switch WWN is 20:00:ac:16:5e:52:00:00
```

Link Initialization WWN Usage

Exchange Link Protocol (ELP) and Exchange Fabric Protocol (EFP) use WWNs during link initialization. ELPs and EFPs both use the VSAN WWN by default during link initialization. However, the ELP usage changes based on the peer switch's usage:

- If the peer switch ELP uses the switch WWN, then the local switch also uses the switch WWN.
- If the peer switch ELP uses the VSAN WWN, then the local switch also uses the VSAN WWN.

Configuring a Secondary MAC Address

To allocate secondary MAC addresses, perform this task:

SUMMARY STEPS

1. switch# **configuration terminal**
2. switch(config)# **wwn secondary-mac** *wwn-id range value*

DETAILED STEPS

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters configuration mode.
Step 2	switch(config)# wwn secondary-mac <i>wwn-id range value</i>	Configures the secondary MAC address. This command cannot be undone.

The following example shows how to configure the secondary MAC address:

```
switch(config)# wwn secondary-mac 00:99:55:77:55:55 range 64
This command CANNOT be undone.
Please enter the BASE MAC ADDRESS again: 00:99:55:77:55:55
Please enter the mac address RANGE again: 64
From now on WWN allocation would be based on new MACs. Are you sure? (yes/no) no
You entered: no. Secondary MAC NOT programmed
```

FC ID Allocation for HBAs

Fibre Channel standards require a unique FC ID to be allocated to an N port attached to an F port in any switch. To conserve the number of FC IDs used, Cisco Nexus 5000 Series switches use a special allocation scheme.

Some HBAs do not discover targets that have FC IDs with the same domain and area. The switch software maintains a list of tested company IDs that do not exhibit this behavior. These HBAs are allocated with single FC IDs. If the HBA can discover targets within the same domain and area, a full area is allocated.

To allow further scalability for switches with numerous ports, the switch software maintains a list of HBAs that can discover targets within the same domain and area. Each HBA is identified by its company ID (also known as Organizational Unique Identifier, or OUI) used in the pWWN during a fabric log in. A full area is allocated to the N ports with company IDs that are listed and for the others, a single FC ID is allocated. Regardless of the type (whole area or single) of FC ID allocated, the FC ID entries remain persistent.

Default Company ID List

All Cisco Nexus 5000 Series switches contain a default list of company IDs that require area allocation. Using the company ID reduces the number of configured persistent FC ID entries. You can configure or modify these entries using the CLI.

Caution

Persistent entries take precedence over company ID configuration. If the HBA fails to discover a target, verify that the HBA and the target are connected to the same switch and have the same area in their FC IDs, then perform the following procedure:

- 1 Shut down the port connected to the HBA.
- 2 Clear the persistent FC ID entry.
- 3 Get the company ID from the port WWN.
- 4 Add the company ID to the list that requires area allocation.
- 5 Bring up the port.

The list of company IDs have the following characteristics:

- A persistent FC ID configuration always takes precedence over the list of company IDs. Even if the company ID is configured to receive an area, the persistent FC ID configuration results in the allocation of a single FC ID.
- New company IDs added to subsequent releases are automatically added to existing company IDs.
- The list of company IDs is saved as part of the running and saved configuration.
- The list of company IDs is used only when the fcinterop FC ID allocation scheme is in auto mode. By default, the interop FC ID allocation is set to auto, unless changed.

Tip We recommend that you set the `fcinterop` FC ID allocation scheme to auto and use the company ID list and persistent FC ID configuration to manipulate the FC ID device allocation.

Use the `fcinterop FCID allocation auto` command to change the FC ID allocation and the `show running-config` command to view the currently allocated mode.

- When you enter a `write erase`, the list inherits the default list of company IDs shipped with a relevant release.

To allocate company IDs, perform this task:

SUMMARY STEPS

1. `switch# configuration terminal`
2. `switch(config)# fcid-allocation area company-id value`
3. `switch(config)# no fcid-allocation area company-id value`

DETAILED STEPS

	Command or Action	Purpose
Step 1	<code>switch# configuration terminal</code>	Enters configuration mode.
Step 2	<code>switch(config)# fcid-allocation area company-id value</code>	Adds a new company ID to the default list.
Step 3	<code>switch(config)# no fcid-allocation area company-id value</code>	Deletes a company ID from the default list.

The following example adds a new company ID to the default list:

```
switch(config)# fcid-allocation area company-id 0x003223
```

Verifying the Company ID Configuration

You can view the configured company IDs by entering the `show fcid-allocation area` command. Default entries are listed first and the user-added entries are listed next. Entries are listed even if they were part of the default list and you later removed them.

The following example displays the list of default and configured company IDs:

```
switch# show fcid-allocation area
FCID area allocation company id info:
00:50:2E <----- Default entry
00:50:8B
00:60:B0
00:A0:B8
00:E0:69
00:30:AE + <----- User-added entry
00:32:23 +
00:E0:8B * <----- Explicitly deleted entry (from the original default list)
Total company ids: 7
+ - Additional user configured company ids.
* - Explicitly deleted company ids from default list.
```

You can implicitly derive the default entries shipped with a specific release by combining the list of Company IDs displayed without any identification with the list of deleted entries.

You can also view or obtain the company IDs in a specific WWN by entering the **show fcid-allocation company-id-from-wwn** command. Some WWN formats do not support company IDs. In these cases, you may need to configure the FC ID persistent entry.

The following example displays the company ID for the specified WWN:

```
switch# show fcid-allocation company-id-from-wwn 20:00:00:05:30:00:21:60
Extracted Company ID: 0x000530
```

Switch Interoperability

Interoperability enables the products of multiple vendors to interwork with each other. Fibre Channel standards guide vendors towards common external Fibre Channel interfaces.

Not all vendors follow the standards in the same way, which results in the need for interoperability modes. This section briefly explains the basic concepts of these modes.

Each vendor has a regular mode and an equivalent interoperability mode, which specifically turns off advanced or proprietary features and provides the product with a standards-compliant implementation.

Note

For more information on configuring interoperability for Cisco Nexus 5000 Series switches, see the *Cisco MDS 9000 Family Switch-to-Switch Interoperability Configuration Guide*

About Interop Mode

Cisco NX-OS software supports the following four interop modes:

- Mode 1—Standards-based interop mode that requires all other vendors in the fabric to be in interop mode.
- Mode 2—Brocade native mode (Core PID 0).
- Mode 3—Brocade native mode (Core PID 1).
- Mode 4—McData native mode.

For information about configuring interop modes 2, 3, and 4, see the *Cisco MDS 9000 Family Switch-to-Switch Interoperability Configuration Guide*, available at the following location: http://www.cisco.com/en/US/docs/storage/san_switches/mds9000/interoperability/guide/intopgd.html

The following table lists the changes in switch operation when you enable interoperability mode. These changes are specific to Cisco Nexus 5000 Series switches while in interop mode.

Table 2: Changes in Switch Operation When Interoperability Is Enabled

Switch Feature	Changes if Interoperability Is Enabled
Domain IDs	<p>Some vendors cannot use the full range of 239 domains within a fabric.</p> <p>Domain IDs are restricted to the range 97 to 127, to accommodate McData's nominal restriction to this same range. Domain IDs can either be static or preferred, which operate as follows:</p> <ul style="list-style-type: none"> • Static: Cisco switches accept only one domain ID; if a switch does not get that domain ID it isolates itself from the fabric. • Preferred: If the switch does not get its requested domain ID, it accepts any assigned domain ID.
Timers	All Fibre Channel timers must be the same on all switches as these values are exchanged by E ports when establishing an ISL. The timers are F_S_TOV, D_S_TOV, E_D_TOV, and R_A_TOV.
F_S_TOV	Verify that the Fabric Stability Time Out Value timers match exactly.
D_S_TOV	Verify that the Distributed Services Time Out Value timers match exactly.
E_D_TOV	Verify that the Error Detect Time Out Value timers match exactly.
R_A_TOV	Verify that the Resource Allocation Time Out Value timers match exactly.
Trunking	Trunking is not supported between two different vendor's switches. This feature may be disabled on a per port or per switch basis.
Default zone	The default zone operation of permit (all nodes can see all other nodes) or deny (all nodes are isolated when not explicitly placed in a zone) may change.

Switch Feature	Changes if Interoperability Is Enabled
Zoning attributes	<p>Zones may be limited to the pWWN and other proprietary zoning methods (physical port number) may be eliminated.</p> <p>Note On a Brocade switch, use the cfgsave command to save fabric-wide zoning configuration. This command does not have any effect on Cisco Nexus 5000 Series switches if they are part of the same fabric. You must explicitly save the configuration on each Cisco Nexus 5000 Series switch.</p>
Zone propagation	<p>Some vendors do not pass the full zone configuration to other switches, only the active zone set gets passed.</p> <p>Verify that the active zone set or zone configuration has correctly propagated to the other switches in the fabric.</p>
VSAN	<p>Interop mode only affects the specified VSAN.</p> <p>Note Interop modes cannot be enabled on FICON-enabled VSANs.</p>
TE ports and SAN port channels	<p>TE ports and SAN port channels cannot be used to connect Cisco switches to non-Cisco SAN switches. Only E ports can be used to connect to non-Cisco SAN switches. TE ports and SAN port channels can still be used to connect a Cisco switch to other Cisco SAN switches even when in interop mode.</p>
FSPF	<p>The routing of frames within the fabric is not changed by the introduction of interop mode. The switch continues to use src-id, dst-id, and ox-id to load balance across multiple ISL links.</p>
Domain reconfiguration disruptive	<p>This is a switch-wide impacting event. Brocade and McData require the entire switch to be placed in offline mode and/or rebooted when changing domain IDs.</p>
Domain reconfiguration nondisruptive	<p>This event is limited to the affected VSAN. Cisco Nexus 5000 Series switches have the capability to restart only the domain manager process for the affected VSAN and not the entire switch.</p>
Name server	<p>Verify that all vendors have the correct values in their respective name server database.</p>

Configuring Interop Mode 1

The interop mode1 in Cisco Nexus 5000 Series switches can be enabled disruptively or nondisruptively.

Note Brocade's `msplmgmtdeactivate` command must explicitly be run prior to connecting from a Brocade switch to either Cisco Nexus 5000 Series switches or to McData switches. This command uses Brocade proprietary frames to exchange platform information, which Cisco Nexus 5000 Series switches or McData switches do not understand. Rejecting these frames causes the common E ports to become isolated.

To configure interop mode 1 in any switch in the Cisco Nexus 5000 Series, perform this task:

SUMMARY STEPS

1. Place the VSAN of the E ports that connect to the OEM switch in interoperability mode.
2. Assign a domain ID in the range of 97 (0x61) through 127 (0x7F).
3. Change the Fibre Channel timers (if they have been changed from the system defaults).
4. When making changes to the domain, you may or may not need to restart the domain manager function for the altered VSAN.

DETAILED STEPS

Step 1 Place the VSAN of the E ports that connect to the OEM switch in interoperability mode.

```
switch# configuration terminal
switch(config)# vsan database
switch(config-vsan-db)# vsan 1 interop 1
switch(config-vsan-db)# exit
```

Step 2 Assign a domain ID in the range of 97 (0x61) through 127 (0x7F).

Note This is an limitation imposed by the McData switches.

In Cisco Nexus 5000 Series switches, the default is to request an ID from the principal switch. If the preferred option is used, Cisco Nexus 5000 Series switches request a specific ID, but still join the fabric if the principal switch assigns a different ID. If the static option is used, the Cisco Nexus 5000 Series switches do not join the fabric unless the principal switch agrees and assigns the requested ID.

Note When changing the domain ID, the FC IDs assigned to N ports also change.

Step 3 Change the Fibre Channel timers (if they have been changed from the system defaults).

Note The Cisco Nexus 5000 Series, Brocade, and McData FC Error Detect (ED_TOV) and Resource Allocation (RA_TOV) timers default to the same values. They can be changed if needed. The RA_TOV default is 10 seconds, and the ED_TOV default is 2 seconds. Per the FC-SW2 standard, these values must be the same on each switch within the fabric.

```
switch(config)# fctimer e_d_tov ?
<1000-100000> E_D_TOV in milliseconds (1000-100000)

switch(config)# fctimer r_a_tov ?
<5000-100000> R_A_TOV in milliseconds (5000-100000)
```

Step 4 When making changes to the domain, you may or may not need to restart the domain manager function for the altered VSAN.

- Force a fabric reconfiguration with the **disruptive** option.

```
switch(config)# fcdomain restart disruptive vsan 1
```

or

- Do not force a fabric reconfiguration.

```
switch(config)# fcdomain restart vsan 1
```

Verifying Interoperating Status

This section highlights the commands used to verify if the fabric is up and running in interoperability mode.

To verify the resulting status of entering the interoperability command in any switch in the Cisco Nexus 5000 Series, perform this task:

SUMMARY STEPS

1. Verify the software version.
2. Verify if the interface states are as required by your configuration.
3. Verify if you are running the desired configuration.
4. Verify if the interoperability mode is active.
5. Verify the domain ID.
6. Verify the local principal switch status.
7. Verify the next hop and destination for the switch.
8. Verify the name server information.

DETAILED STEPS

Step 1 Verify the software version.

Example:

```
switch# show version
Cisco Nexus Operating System (NX-OS) Software

Last reset at 510130 usecs after Wed Nov 26 18:12:23 2008
Reason: Reset Requested by CLI command reload
System version: 4.0(1a)N1(1)
Service:

plugin
  Core Plugin, Ethernet Plugin

```

Step 2 Verify if the interface states are as required by your configuration.

Example:

```
switch# show interface brief
```

```

-----
Interface  Vsan   Admin  Admin  Status      SFP   Oper  Oper  Port
          Mode   Trunk
          Mode
          (Gbps)
-----
fc3/1      1      E      on     trunking    sw1   TE    2    --
fc3/2      1      auto   on     sfpAbsent   --    --    --    --
fc3/3      1      E      on     trunking    sw1   TE    2    --
fc3/4      1      auto   on     sfpAbsent   --    --    --    --
fc3/5      1      auto   auto   notConnected sw1   --    --    --
fc3/6      1      auto   on     sfpAbsent   --    --    --    --
fc3/7      1      auto   auto   sfpAbsent   --    --    --    --
fc3/8      1      auto   auto   sfpAbsent   --    --    --    --

```

Step 3 Verify if you are running the desired configuration.

Example:

```
switch# show running-config
```

```
Building Configuration...
```

```

interface fc2/1
no shutdown
interface fc2/2
no shutdown
interface fc2/3
interface fc2/4
<snip>
interface mgmt0
ip address 6.1.1.96 255.255.255.0
switchport encap default
no shutdown
vsan database
vsan 1 interop
boot system bootflash:/nx5000-system-23e.bin
boot kickstart bootflash:/nx5000-kickstart-23e.bin
callhome
fcdomain domain 100 preferred vsan 1
ip route 6.1.1.0 255.255.255.0 6.1.1.1
ip routing
line console
  databits 5
  speed 110
logging linecard
ssh key rsa 512 force
ssh server enable
switchname switch
username admin password 5 $1$Li8/fBYX$SNc72.xt4nTXpSnR9OUFB/ role network-admin

```

Step 4 Verify if the interoperability mode is active.

Example:

```

switch# show vsan 1
vsan 1 information
  name:VSAN0001 state:active
  interoperability mode:yes <----- verify mode
  loadbalancing:src-id/dst-id/oxid
  operational state:up

```

Step 5 Verify the domain ID.**Example:**

```
switch# show fcdomain vsan 1
```

The local switch is a Subordinated Switch.

Local switch run time information:

```
State: Stable
Local switch WWN: 20:01:00:05:30:00:51:1f
Running fabric name: 10:00:00:60:69:22:32:91
Running priority: 128
Current domain ID: 0x64(100) <-----verify domain id
```

Local switch configuration information:

```
State: Enabled
Auto-reconfiguration: Disabled
Contiguous-allocation: Disabled
Configured fabric name: 41:6e:64:69:61:6d:6f:21
Configured priority: 128
Configured domain ID: 0x64(100) (preferred)
```

Principal switch run time information:

```
Running priority: 2
```

Interface	Role	RCF-reject
fc2/1	Downstream	Disabled
fc2/2	Downstream	Disabled
fc2/4	Upstream	Disabled

Step 6 Verify the local principal switch status.**Example:**

```
switch# show fcdomain domain-list vsan 1
```

Number of domains: 5

Domain ID	WWN
0x61(97)	10:00:00:60:69:50:0c:fe
0x62(98)	20:01:00:05:30:00:47:9f
0x63(99)	10:00:00:60:69:c0:0c:1d
0x64(100)	20:01:00:05:30:00:51:1f [Local]

```
0x65(101)    10:00:00:60:69:22:32:91 [Principal]
-----
```

Step 7 Verify the next hop and destination for the switch.

Example:

```
switch# show fspf internal route vsan 1
```

```
FSPF Unicast Routes
```

```
-----
VSAN Number  Dest Domain  Route Cost  Next hops
-----
           1      0x61(97)      500      fc2/2
           1      0x62(98)     1000      fc2/1
                                   fc2/2
           1      0x63(99)      500      fc2/1
           1      0x65(101)    1000      fc2/4
```

Step 8 Verify the name server information.

Example:

```
switch# show fcns data vsan 1
```

```
VSAN 1:
```

```
-----
FCID          TYPE  PWWN                                (VENDOR) FC4-TYPE:FEATURE
-----
0x610400      N     10:00:00:00:c9:24:3d:90 (Emulex)   scsi-fcp
0x6105dc      NL    21:00:00:20:37:28:31:6d (Seagate)  scsi-fcp
0x6105e0      NL    21:00:00:20:37:28:24:7b (Seagate)  scsi-fcp
0x6105e1      NL    21:00:00:20:37:28:22:ea (Seagate)  scsi-fcp
0x6105e2      NL    21:00:00:20:37:28:2e:65 (Seagate)  scsi-fcp
0x6105e4      NL    21:00:00:20:37:28:26:0d (Seagate)  scsi-fcp
0x630400      N     10:00:00:00:c9:24:3f:75 (Emulex)   scsi-fcp
0x630500      N     50:06:01:60:88:02:90:cb                scsi-fcp
0x6514e2      NL    21:00:00:20:37:a7:ca:b7 (Seagate)  scsi-fcp
0x6514e4      NL    21:00:00:20:37:a7:c7:e0 (Seagate)  scsi-fcp
0x6514e8      NL    21:00:00:20:37:a7:c7:df (Seagate)  scsi-fcp
0x651500      N     10:00:00:e0:69:f0:43:9f (JNI)
```

```
Total number of entries = 12
```

Note The Cisco switch name server shows both local and remote entries, and does not time out the entries.

Default Settings for Advanced Features

The following table lists the default settings for the features included in this chapter.

Table 3: Default Settings for Advanced Features

Parameters	Default
CIM server	Disabled
CIM server security protocol	HTTP
D_S_TOV	5,000 milliseconds
E_D_TOV	2,000 milliseconds
R_A_TOV	10,000 milliseconds
Timeout period to invoke fctrace	5 seconds
Number of frame sent by the fcping feature	5 frames
Remote capture connection protocol	TCP
Remote capture connection mode	Passive
Local capture frame limits	10 frames
FC ID allocation mode	Auto mode
Loop monitoring	Disabled
Interop mode	Disabled
