System Management Features 3

CHAPTER 3

Configuring Switch Profiles 7

Information About Switch Profiles 8

Switch Profile Configuration Modes 8

Configuration Validation 9

Software Upgrades and Downgrades with Switch Profiles 10

Prerequisites for Switch Profiles 10

Guidelines and Limitations for Switch Profiles 10

Configuring Switch Profiles 12

Adding a Switch to a Switch Profile 13

Adding or Modifying Switch Profile Commands 15

Importing a Switch Profile 17

Importing Configurations in a vPC Topology 19

Verifying Commands in a Switch Profile 19

Isolating a Peer Switch 20

Deleting a Switch Profile 20

Deleting a Switch from a Switch Profile	21
Displaying the Switch Profile Buffer	22
Synchronizing Configurations After a Switch Reboot	23
Switch Profile Configuration show Commands	23
Configuration Examples for Switch Profiles	24
Creating a Switch Profile on a Local and Peer Switch Example	24
Verifying the Synchronization Status Example	26
Displaying the Running Configuration	27
Displaying the Switch Profile Synchronization Between Local and Peer Switches	27
Displaying Verify and Commit on Local and Peer Switches	28
Successful and Unsuccessful Synchronization Examples	29
Configuring the Switch Profile Buffer, Moving the Buffer, and Deleting the Buffer	29
Importing Configurations	30
Sample Migrations Using the Import Command	33
Migrating Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender A-A Topology Example	33
Migrating Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender Fabric Extender Straight-Through Topology Example	33

CHAPTER 4

Configuring Module Pre-Provisioning 35

Information About Module Pre-Provisioning	35
Guidelines and Limitations	35
Enabling Module Pre-Provisioning	36
Removing Module Pre-Provisioning	36
Verifying the Pre-Provisioned Configuration	37
Configuration Examples for Pre-Provisioning	38

CHAPTER 5

Using Cisco Fabric Services 39

Information About CFS	39
Cisco Fabric Services over Ethernet	40
Guidelines and Limitations for CFS	41
CFS Distribution	41
CFS Distribution Modes	41
Uncoordinated Distribution	42
Coordinated Distribution	42

Unrestricted Uncoordinated Distributions	42
Disabling or Enabling CFS Distribution on a Switch	42
Verifying the CFS Distribution Status	43
CFS Distribution over IP	43
CFS Distribution over Fibre Channel	45
CFS Distribution Scopes	45
CFS Merge Support	45
CFS Support for Applications	46
CFS Application Requirements	46
Enabling CFS for an Application	46
Verifying Application Registration Status	46
Locking the Network	47
Verifying CFS Lock Status	47
Committing Changes	48
Discarding Changes	48
Saving the Configuration	48
Clearing a Locked Session	49
CFS Regions	49
About CFS Regions	49
Example Scenario	50
Managing CFS Regions	50
Creating CFS Regions	50
Assigning Applications to CFS Regions	50
Moving an Application to a Different CFS Region	51
Removing an Application from a Region	51
Deleting CFS Regions	52
Configuring CFS over IP	52
Enabling CFS over IPv4	52
Enabling CFS over IPv6	53
Verifying the CFS Over IP Configuration	53
Configuring IP Multicast Addresses for CFS over IP	53
Configuring IPv4 Multicast Address for CFS	54
Configuring IPv6 Multicast Address for CFS	54
Verifying the IP Multicast Address Configuration for CFS over IP	55
Displaying CFS Distribution Information	55

Default Settings for CFS	57
Enabling CFS to Distribute Smart Call Home Configurations	57
Enabling CFS to Distribute DPVM Configurations	58
Enabling CFS to Distribute FC Domain Configurations	59
Enabling CFS to Distribute FC Port Security Configurations	59
Enabling CFS to Distribute FC Timer Configurations	60
Enabling CFS to Distribute IVR Configurations	61
Enabling CFS to Distribute NTP Configurations	62
Enabling CFS to Distribute RADIUS Configurations	62
Enabling CFS to Distribute RSCN Configurations	63
Enabling CFS to Distribute TACACS+ Configurations	64

CHAPTER 6

Configuring PTP 65

Information About PTP	65
PTP Device Types	66
PTP Process	67
Clock Management	68
High Availability for PTP	68
Licensing Requirements for PTP	68
Guidelines and Limitations for PTP	68
Default Settings for PTP	69
Configuring PTP	69
Configuring PTP Globally	69
Configuring PTP on an Interface	71
Verifying the PTP Configuration	72

CHAPTER 7

Configuring User Accounts and RBAC 75

Information About User Accounts and RBAC	75
User Roles	75
Predefined SAN Admin User Role	76
Rules	77
SAN Admin Role-Feature Rule Mapping	77
User Role Policies	79
User Account Configuration Restrictions	80
User Password Requirements	80

Guidelines and Limitations for User Accounts	81
Configuring User Accounts	82
Configuring SAN Admin Users	83
Configuring RBAC	84
Creating User Roles and Rules	84
Creating Feature Groups	85
Changing User Role Interface Policies	86
Changing User Role VLAN Policies	86
Changing User Role VSAN Policies	87
Verifying the User Accounts and RBAC Configuration	88
Configuring User Accounts Default Settings for the User Accounts and RBAC	88

CHAPTER 8

Configuring Session Manager 91

Information About Session Manager	91
Guidelines and Limitations for Session Manager	91
Configuring Session Manager	92
Creating a Session	92
Configuring ACLs in a Session	92
Verifying a Session	93
Committing a Session	93
Saving a Session	93
Discarding a Session	93
Configuration Example for Session Manager	94
Verifying the Session Manager Configuration	94

CHAPTER 9

Configuring Online Diagnostics 95

Information About Online Diagnostics	95
Bootup Diagnostics	95
Health Monitoring Diagnostics	96
Expansion Module Diagnostics	97
Configuring Online Diagnostics	98
Verifying the Online Diagnostics Configuration	98
Default Settings for Online Diagnostics	98

CHAPTER 10

Configuring System Message Logging 101

Information About System Message Logging	101
Syslog Servers	102
Licensing Requirements for System Message Logging	102
Guidelines and Limitations for System Message Logging	103
Default Settings for System Message Logging	103
Configuring System Message Logging	103
Configuring System Message Logging to Terminal Sessions	103
Configuring System Message Logging to a File	105
Configuring Module and Facility Messages Logging	107
Configuring Logging Timestamps	108
Configuring the ACL Logging Cache	109
Applying ACL Logging to an Interface	110
Configuring the ACL Log Match Level	111
Configuring Syslog Servers	111
Configuring syslog on a UNIX or Linux System	113
Configuring syslog Server Configuration Distribution	114
Displaying and Clearing Log Files	115
Configuring DOM Logging	116
Enabling DOM Logging	116
Disabling DOM Logging	116
Verifying the DOM Logging Configuration	116
Verifying the System Message Logging Configuration	117

CHAPTER 11

Configuring Smart Call Home	119
Information About Smart Call Home	119
Smart Call Home Overview	120
Smart Call Home Destination Profiles	120
Smart Call Home Alert Groups	121
Smart Call Home Message Levels	122
Call Home Message Formats	123
Guidelines and Limitations for Smart Call Home	128
Prerequisites for Smart Call Home	128
Default Call Home Settings	129
Configuring Smart Call Home	129
Registering for Smart Call Home	129

Configuring Contact Information	130
Creating a Destination Profile	131
Modifying a Destination Profile	132
Associating an Alert Group with a Destination Profile	134
Adding Show Commands to an Alert Group	134
Configuring E-Mail Server Details	135
Configuring Periodic Inventory Notifications	136
Disabling Duplicate Message Throttling	137
Enabling or Disabling Smart Call Home	138
Testing the Smart Call Home Configuration	138
Verifying the Smart Call Home Configuration	139
Sample Syslog Alert Notification in Full-Text Format	140
Sample Syslog Alert Notification in XML Format	140

CHAPTER 12

Configuring Rollback	145
Information About Rollbacks	145
Guidelines and Limitations	145
Creating a Checkpoint	146
Implementing a Rollback	147
Verifying the Rollback Configuration	147

CHAPTER 13

Configuring DNS	149
Information About DNS Client	149
Name Servers	149
DNS Operation	150
High Availability	150
Prerequisites for DNS Clients	150
Licensing Requirements for DNS Clients	150
Default Settings for DNS Clients	150
Configuring DNS Clients	151

CHAPTER 14

Configuring SNMP	153
Information About SNMP	153
SNMP Functional Overview	153
SNMP Notifications	154

SNMPv3	154
Security Models and Levels for SNMPv1, v2, and v3	155
User-Based Security Model	156
CLI and SNMP User Synchronization	156
Group-Based SNMP Access	157
Licensing Requirements for SNMP	157
Guidelines and Limitations for SNMP	157
Default SNMP Settings	158
Configuring SNMP	158
Configuring SNMP Users	158
Enforcing SNMP Message Encryption	159
Assigning SNMPv3 Users to Multiple Roles	159
Creating SNMP Communities	160
Filtering SNMP Requests	160
Configuring SNMP Notification Receivers	160
Configuring SNMP Notification Receivers with VRFs	162
Filtering SNMP Notifications Based on a VRF	162
Configuring a Source Interface for Sending Out All SNMP Notifications	163
Configuring a Host Receiver for SNMP Notifications	164
Configuring SNMP for Inband Access	164
Enabling SNMP Notifications	165
Configuring Link Notifications	167
Disabling Link Notifications on an Interface	168
Enabling One-Time Authentication for SNMP over TCP	169
Assigning SNMP Switch Contact and Location Information	169
Configuring the Context to Network Entity Mapping	169
Disabling SNMP	170
Verifying the SNMP Configuration	170
Feature History for SNMP	171

CHAPTER 15

Configuring RMON	173
Information About RMON	173
RMON Alarms	173
RMON Events	174
Configuration Guidelines and Limitations for RMON	174

Verifying the RMON Configuration 175

Default RMON Settings 175

Configuring RMON Alarms 175

Configuring RMON Events 176

CHAPTER 16

Configuring SPAN 179

Information About SPAN 180

SPAN Sources 180

Characteristics of Source Ports 180

SPAN Destinations 181

Characteristics of Destination Ports 181

Guidelines and Limitations for SPAN 182

Creating or Deleting a SPAN Session 182

Configuring an Ethernet Destination Port 182

Configuring MTU Truncation for Each SPAN Session 183

Configuring the Rate Limit for SPAN Traffic 184

Configuring Fibre Channel Destination Port 185

Configuring Source Ports 186

Configuring Source Port Channels, VSANs, or VLANs 186

Configuring the Description of a SPAN Session 187

Activating a SPAN Session 188

Suspending a SPAN Session 188

Troubleshooting SPAN session issues 189

Troubleshooting SPAN session with large number of source ports issues 189

Displaying SPAN Information 190

CHAPTER 17

Configuring ERSPAN 191

Information About ERSPAN 191

ERSPAN Source Sessions 191

Monitored Traffic 192

ERSPAN Sources 192

Truncated ERSPAN 193

Multiple ERSPAN Sessions 193

High Availability 193

Licensing Requirements for ERSPAN 193

Prerequisites for ERSPAN	193
Guidelines and Limitations for ERSPAN	194
Default Settings for ERSPAN	195
Configuring ERSPAN	195
Configuring an ERSPAN Source Session	195
Configuring a Source Rate Limit for an ERSPAN Session	197
Configuring an Origin IP Address for ERSPAN Packets	200
Configuring Truncated ERSPAN	200
Shutting Down or Activating an ERSPAN Session	201
Verifying the ERSPAN Configuration	203
Configuration Examples for ERSPAN	203
Configuration Example for an ERSPAN Source Session	203
Configuration Example for an IP Address as the Source for an ERSPAN Session	204
Configuration Example for Truncated ERSPAN	204
Additional References	204
Related Documents	204

Preface

The preface contains the following sections:

- [Audience, page xiii](#)
- [Document Conventions, page xiii](#)
- [Documentation Feedback, page xv](#)
- [Obtaining Documentation and Submitting a Service Request, page xv](#)

Audience

This publication is for network administrators who configure and maintain Cisco Nexus devices and Cisco Nexus 2000 Series Fabric Extenders.

Document Conventions

Note

As part of our constant endeavor to remodel our documents to meet our customers' requirements, we have modified the manner in which we document configuration tasks. As a result of this, you may find a deviation in the style used to describe these tasks, with the newly included sections of the document following the new format.

Command descriptions use the following conventions:

Convention	Description
bold	Bold text indicates the commands and keywords that you enter literally as shown.
<i>Italic</i>	Italic text indicates arguments for which the user supplies the values.
[x]	Square brackets enclose an optional element (keyword or argument).

Convention	Description
[x y]	Square brackets enclosing keywords or arguments separated by a vertical bar indicate an optional choice.
{x y}	Braces enclosing keywords or arguments separated by a vertical bar indicate a required choice.
[x {y z}]	Nested set of square brackets or braces indicate optional or required choices within optional or required elements. Braces and a vertical bar within square brackets indicate a required choice within an optional element.
<i>variable</i>	Indicates a variable for which you supply values, in context where italics cannot be used.
string	A nonquoted set of characters. Do not use quotation marks around the string or the string will include the quotation marks.

Examples use the following conventions:

Convention	Description
<code>screen font</code>	Terminal sessions and information the switch displays are in screen font.
boldface screen font	Information you must enter is in boldface screen font.
<i>italic screen font</i>	Arguments for which you supply values are in italic screen font.
< >	Nonprinting characters, such as passwords, are in angle brackets.
[]	Default responses to system prompts are in square brackets.
!, #	An exclamation point (!) or a pound sign (#) at the beginning of a line of code indicates a comment line.

This document uses the following conventions:

Note

Means *reader take note*. Notes contain helpful suggestions or references to material not covered in the manual.

Caution

Means *reader be careful*. In this situation, you might do something that could result in equipment damage or loss of data.

Documentation Feedback

To provide technical feedback on this document, or to report an error or omission, please send your comments to: nexus5k-docfeedback@cisco.com.

We appreciate your feedback.

Obtaining Documentation and Submitting a Service Request

For information on obtaining documentation, using the Cisco Bug Search Tool (BST), submitting a service request, and gathering additional information, see [What's New in Cisco Product Documentation](#).

To receive new and revised Cisco technical content directly to your desktop, you can subscribe to the [What's New in Cisco Product Documentation RSS feed](#). RSS feeds are a free service.

New and Changed Information

This chapter contains the following sections:

- [New and Changed Information, page 1](#)

New and Changed Information

The following table provides an overview of the significant changes made to this configuration guide. The table does not provide an exhaustive list of all changes made to this guide or all new features in a particular release.

Table 1: New and Changed Information in Release 5.2(1)N1(1)

Feature	Description	Where Documented
Predefined SAN Admin Role	New predefined SAN admin role for RBAC	Configuring User Accounts and RBAC, on page 75
Precision Time Protocol (PTP) Support	IEEE 1588 Support for PTP	Configuring PTP, on page 65
Configuration Synchronization Enhancements	Configuration Synchronization improvements for deleting and restoring switch profile configuration.	Configuring Switch Profiles, on page 7

Overview

This chapter contains the following sections:

- [System Management Features, page 3](#)

System Management Features

The system management features documented in this guide are described below:

Feature	Description
Switch Profiles	<p>Configuration synchronization allows administrators to make configuration changes on one switch and have the system automatically synchronize the configuration to a peer switch. This feature eliminates misconfigurations and reduces the administrative overhead.</p> <p>The configuration synchronization mode (config-sync) allows users to create switch profiles to synchronize local and peer switch.</p>
Module Pre-Provisioning	<p>Module pre-provisioning feature allows users to pre-configure interfaces before inserting or attaching a module to a Cisco Nexus Series switch. If a module goes offline, users can also use pre-provisioning to make changes to the interface configurations for the offline module. In some vPC topologies, pre-provisioning is required for the configuration synchronization feature. Pre-provisioning allows users to synchronize the configuration for an interface that is online with one peer but offline with another peer.</p>

Feature	Description
Cisco Fabric Services	The Cisco MDS NX-OS software uses the Cisco Fabric Services (CFS) infrastructure to enable efficient database distribution and to promote device flexibility. CFS simplifies SAN provisioning by automatically distributing configuration information to all switches in a fabric.
Precision Time Protocol	The Precision Time Protocol (PTP) is a time synchronization protocol for nodes distributed across a network. Its hardware timestamp feature provides greater accuracy than other time synchronization protocols such as Network Time Protocol (NTP).
User Accounts and RBAC	User accounts and role-based access control (RBAC) allow you to define the rules for an assigned role. Roles restrict the authorization that the user has to access management operations. Each user role can contain multiple rules and each user can have multiple roles.
Session Manager	Session Manager allows you to create a configuration and apply it in batch mode after the configuration is reviewed and verified for accuracy and completeness.
Online Diagnostics	<p>Cisco Generic Online Diagnostics (GOLD) define a common framework for diagnostic operations across Cisco platforms. The online diagnostic framework specifies the platform-independent fault-detection architecture for centralized and distributed systems, including the common diagnostics CLI and the platform-independent fault-detection procedures for boot-up and run-time diagnostics.</p> <p>The platform-specific diagnostics provide hardware-specific fault-detection tests and allow you to take appropriate corrective action in response to diagnostic test results.</p>
System Message Logging	<p>You can use system message logging to control the destination and to filter the severity level of messages that system processes generate. You can configure logging to a terminal session, a log file, and syslog servers on remote systems.</p> <p>System message logging is based on RFC 3164. For more information about the system message format and the messages that the device generates, see the <i>Cisco NX-OS System Messages Reference</i>.</p>

Feature	Description
Smart Call Home	Call Home provides an e-mail-based notification of critical system policies. Cisco NX-OS provides a range of message formats for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. You can use this feature to page a network support engineer, e-mail a Network Operations Center, or use Cisco Smart Call Home services to automatically generate a case with the Technical Assistance Center.
Configuration Rollback	The configuration rollback feature allows users to take a snapshot, or user checkpoint, of the Cisco NX-OS configuration and then reapply that configuration to a switch at any point without having to reload the switch. A rollback allows any authorized administrator to apply this checkpoint configuration without requiring expert knowledge of the features configured in the checkpoint.
SNMP	The Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.
RMON	RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. Cisco NX-OS supports RMON alarms, events, and logs to monitor Cisco NX-OS devices.
SPAN	The Switched Port Analyzer (SPAN) feature (sometimes called port mirroring or port monitoring) selects network traffic for analysis by a network analyzer. The network analyzer can be a Cisco SwitchProbe, a Fibre Channel Analyzer, or other Remote Monitoring (RMON) probes.

Feature	Description
ERSPAN	<p>Encapsulated remote switched port analyzer (ERSPAN) is used to transport mirrored traffic in an IP network. ERSPAN supports source ports, source VLANs, and destinations on different switches, which provide remote monitoring of multiple switches across your network. ERSPAN uses a generic routing encapsulation (GRE) tunnel to carry traffic between switches.</p> <p>ERSPAN consists of an ERSPAN source session, routable ERSPAN GRE-encapsulated traffic, and an ERSPAN destination session. You separately configure ERSPAN source sessions and destination sessions on different switches.</p> <p>To configure an ERSPAN source session on one switch, you associate a set of source ports or VLANs with a destination IP address, ERSPAN ID number, and virtual routing and forwarding (VRF) name. To configure an ERSPAN destination session on another switch, you associate the destinations with the source IP address, the ERSPAN ID number, and a VRF name.</p> <p>The ERSPAN source session copies traffic from the source ports or source VLANs and forwards the traffic using routable GRE-encapsulated packets to the ERSPAN destination session. The ERSPAN destination session switches the traffic to the destinations.</p>

Configuring Switch Profiles

This chapter contains the following sections:

- [Information About Switch Profiles, page 8](#)
- [Switch Profile Configuration Modes, page 8](#)

- [Switch Profile Configuration show Commands, page 23](#)
- [Configuration Examples for Switch Profiles, page 24](#)

Information About Switch Profiles

Several applications require consistent configuration across Cisco Nexus Series switches in the network. For example, with a Virtual Port Channel (vPC), you must have identical configurations. Mismatched configurations can cause errors or misconfigurations that can result in service disruptions.

The configuration synchronization (config-sync) feature allows you to configure one switch profile and have the configuration be automatically synchronized to the peer switch. A switch profile provides the following benefits:

- Allows configurations to be synchronized between switches.
- Merges configurations when connectivity is established between two switches.
- Provides control of exactly which configuration gets synchronized.
- Ensures configuration consistency across peers through merge and mutual-exclusion checks.
- Provides verify and commit semantics.
- Supports configuring and synchronizing port profile configurations.
- Provides an import command to migrate existing vPC configurations to a switch profile.

Switch Profile Configuration Modes

The switch profile feature includes the following configuration modes:

- Configuration Synchronization Mode
- Switch Profile Mode
- Switch Profile Import Mode

Configuration Synchronization Mode

The configuration synchronization mode (config-sync) allows you to create switch profiles using the **config sync** command on the local switch that you want to use as the master. After you create the profile, you can enter the **config sync** command on the peer switch that you want to synchronize.

Switch Profile Mode

The switch profile mode allows you to add supported configuration commands to a switch profile that is later synchronized with a peer switch. Commands that you enter in the switch profile mode are buffered until you enter the **commit** command.

Switch Profile Import Mode

When you upgrade from an earlier release, you have the option to enter the **import** command to copy supported running-configuration commands to a switch profile. After entering the **import** command, the switch profile mode (config-sync-sp) changes to the switch profile import mode (config-sync-sp-import). The switch profile import mode allows you to import existing switch configurations from the running configuration and specify which commands you want to include in the switch profile.

Because different topologies require different commands that are included in a switch profile, the **import** command mode allows you to modify the imported set of commands to suit a specific topology. For example, a dual homed Fabric Extender (FEX) topology requires that most of the configuration is synchronized. In other vPC topologies, the configuration that needs to be synchronized might be a much smaller set of commands.

You need to enter the **commit** command to complete the import process and move the configuration into the switch profile. Because configuration changes are not supported during the import process, if you added new commands before entering the **commit** command, the switch profile remains unsaved and the switch remains in the switch profile import mode. You can remove the added commands or abort the import. Unsaved configurations are lost if the process is aborted. You can add new commands to the switch profile after the import is complete.

Configuration Validation

Two types of configuration validation checks can identify two types of switch profile failures:

- Mutual Exclusion Checks
- Merge Checks

Mutual Exclusion Checks

To reduce the possibility of overriding configuration settings that are included in a switch profile, mutual exclusion (mutex) checks the switch profile commands against the commands that exist on the local switch and the commands on the peer switch. A command that is included in a switch profile cannot be configured outside of the switch profile or on a peer switch. This requirement reduces the possibility that an existing command is unintentionally overwritten.

As a part of the commit process, the mutex-check occurs on both switches if the peer switch is reachable; otherwise, the mutex-check is performed locally. Configuration changes made from the configuration terminal occur only on the local switch.

If a mutex-check identifies errors, they are reported as mutex failures and they must be manually corrected.

The following exceptions apply to the mutual exclusion policy:

- Interface configuration—Port channel interfaces must be configured fully in either switch profile mode or global configuration mode.

Note

Several port channel subcommands are not configurable in switch profile mode. These commands can be configured from global configuration mode even if the port channel is created and configured in switch profile mode.

For example, the following command can only be configured in global configuration mode:

```
switchport private-vlan association trunk primary-vlan secondary-vlan
```

- Shutdown/no shutdown
- System QoS

Merge Checks

Merge checks are done on the peer switch that is receiving a configuration. The merge checks ensure that the received configuration does not conflict with the switch profile configuration that already exists on the receiving switch. The merge check occurs during the merge or commit process. Errors are reported as merge failures and must be manually corrected.

When one or both switches are reloaded and the configurations are synchronized for the first time, the merge check verifies that the switch profile configurations are identical on both switches. Differences in the switch profiles are reported as merge errors and must be manually corrected.

Software Upgrades and Downgrades with Switch Profiles

When you downgrade to an earlier release, you are prompted to remove an existing switch profile that is not supported on earlier releases.

When you upgrade from an earlier release, you have the option to move some of the running-configuration commands to a switch profile. The **import** command allows you to import relevant switch profile commands. An upgrade can occur if there are buffered configurations (uncommitted); however, the uncommitted configurations are lost.

When you perform an In Service Software Upgrade (ISSU) on one of the switches included in a switch profile, a configuration synchronization cannot occur because the peer is unreachable.

Prerequisites for Switch Profiles

Switch profiles have the following prerequisites:

- You must enable Cisco Fabric Series over IP (CFS over IP) distribution over mgmt0 on both switches by entering the **cfs ipv4 distribute** command.
- You must configure a switch profile with the same name on both peer switches by entering the **config sync** and **switch-profile** commands.
- Configure each switch as peer switch by entering the **sync-peers destination** command

Guidelines and Limitations for Switch Profiles

The Switch profile has the following guidelines and limitations:

- You can only enable configuration synchronization using the mgmt0 interface.
- Configuration synchronization is performed using the mgmt 0 interface and cannot be performed using a management SVI.
- You must configure synchronized peers with the same switch profile name.
- Commands that are qualified for a switch profile configuration are allowed to be configured in the configuration switch profile (config-sync-sp) mode.
- Supported switch profile commands relate to virtual port channel (vPC) commands. Fiber Channel over Ethernet (FCoE) commands are not supported.

- One switch profile session can be in progress at a time. Attempts to start another session will fail.
- Supported command changes made from the configuration terminal mode are blocked when a switch profile session is in progress. You should not make unsupported command changes from the configuration terminal mode when a switch profile session is in progress.
- When you enter the **commit** command and a peer switch is reachable, the configuration is applied to both peer switches or neither switch. If there is a commit failure, the commands remain in the switch profile buffer. You can then make necessary corrections and try the commit again.
- We recommend that you enable preprovisioning for all Generic Expansion Modules (GEMs) and Cisco Nexus Fabric Extender modules whose interface configurations are synchronized using the configuration synchronization feature. Follow these guidelines in Cisco Nexus Fabric Extender active/active topologies where the Fabric Extenders might not be online on one switch and its configuration is changed and synchronized on the other switch. In this scenario, if you do not enable preprovisioning, a commit fails and the configuration is rolled back on both switches.
- Once a port channel is configured using switch profile mode, it cannot be configured using global configuration (config terminal) mode.

**Note**

Several port channel subcommands are not configurable in switch profile mode. These commands can be configured from global configuration mode even if the port channel is created and configured in switch profile mode.

For example, the following command can only be configured in global configuration mode:

```
switchport private-vlan association trunk primary-vlan secondary-vlan
```

- Shutdown and no shutdown can be configured in either global configuration mode or switch profile mode.
- If a port channel is created in global configuration mode, channel groups including member interfaces must also be created using global configuration mode.
- Port channels that are configured within switch profile mode may have members both inside and outside of a switch profile.
- If you want to import a member interface to a switch profile, the port channel including the member interface must also be present within the switch profile.

Guidelines for Synchronizing After Reboot, Connectivity Loss, or Failure

- Synchronizing configurations after vPC peer link failure—If both switches are operational when a peer link fails, the secondary switch shuts down its vPC ports. In a Fabric Extender A/A topology, the A/A Fabric Extender disconnects from the secondary switch. If the configuration is changed using a switch profile on the primary switch, configurations are not accepted on the secondary switch unless the A/A Fabric Extender is preprovisioned. When using the configuration synchronization feature, we recommend that you preprovision all A/A Fabric Extenders.
- Synchronizing configurations after mgmt0 interface connectivity loss—When mgmt0 interface connectivity is lost and configuration changes are required, apply the configuration changes on both switches using the switch profile. When connectivity to the mgmt0 interface is restored, both switches synchronize automatically.

If a configuration change is made on only one switch, a merge occurs when the mgmt0 interface comes up and the configuration is applied on the other switch.

- Synchronizing configurations when an ISSU is performed on one switch and a configuration change is made on the peer switch—In a vPC topology, configuration changes on the peer switch are not allowed when an ISSU is performed on the other switch. In topologies without vPCs, configuration changes are allowed and the switch undergoing an ISSU synchronizes new configurations when the upgrade is complete.

Configuring Switch Profiles

You can create and configure a switch profile. Enter the **switch-profile** *name* command in the configuration synchronization mode (config-sync).

Before You Begin

You must create the switch profile with the same name on each switch and the switches must configure each other as a peer. When connectivity is established between switches with the same active switch profile, the switch profiles are synchronized.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	cfs ipv4 distribute Example: <pre>switch(config)# cfs ipv4 distribute switch(config)#</pre>	Enables CFS distribution between the peer switches.
Step 3	config sync Example: <pre>switch# config sync switch(config-sync)#</pre>	Enters configuration synchronization mode.
Step 4	switch-profile <i>name</i> Example: <pre>switch(config-sync)# switch-profile abc switch(config-sync-sp)#</pre>	Configures the switch profile, names the switch profile, and enters switch profile synchronization configuration mode.
Step 5	sync-peers destination <i>IP-address</i> Example: <pre>switch(config-sync-sp)# sync-peers destination 10.1.1.1 switch(config-sync-sp)#</pre>	Configures the peer switch.

	Command or Action	Purpose
Step 6	show switch-profile <i>name</i> status Example: <pre>switch(config-sync-sp)# show switch-profile abc status switch(config-sync-sp)#</pre>	(Optional) Views the switch profile on the local switch and the peer switch information.
Step 7	exit Example: <pre>switch(config-sync-sp)# exit switch#</pre>	Exits the switch profile configuration mode and returns to EXEC mode.
Step 8	copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure a switch profile and shows the switch profile status.

```
switch# configuration terminal
switch(config)# cfs ipv4 distribute
switch(config-sync-sp)# switch-profile abc
switch(config-sync-sp)# sync-peers destination 10.1.1.1
switch(config-sync-sp)# show switch-profile abc status
Start-time: 15801 usecs after Mon Aug 23 06:21:08 2010
End-time: 6480 usecs after Mon Aug 23 06:21:13 2010

Profile-Revision: 1
Session-type: Initial-Exchange
Peer-triggered: Yes
Profile-status: Sync Success

Local information:
-----
Status: Commit Success
Error(s):

Peer information:
-----
IP-address: 10.1.1.1
Sync-status: In Sync.
Status: Commit Success
Error(s):
switch(config-sync-sp)# exit
switch#
```

Adding a Switch to a Switch Profile

Enter the **sync-peers destination *destination IP*** command in switch profile configuration mode to add the switch to a switch profile.

Follow these guidelines when adding switches:

- Switches are identified by their IP address.
- Destination IPs are the IP addresses of the switches that you want to synchronize.

- The committed switch profile is synchronized with the newly added peers (when they are online) if the peer switch is also configured with configuration synchronization.

If you want to import a member interface to a switch profile, the port channel including the member interface must also be present within the switch profile.

Before You Begin

After creating a switch profile on the local switch, you must add the second switch that will be included in the synchronization.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: switch# config sync switch(config-sync)#	Enters configuration synchronization mode.
Step 2	switch-profile <i>name</i> Example: switch(config-sync)# switch-profile abc switch(config-sync-sp)#	Configures switch profile, names the switch profile, and enters switch profile synchronization configuration mode.
Step 3	sync-peers destination <i>destination IP</i> Example: switch(config-sync-sp)# sync-peers destination 10.1.1.1 switch(config-sync-sp)#	Adds a switch to the switch profile.
Step 4	exit Example: switch(config-sync-sp)# exit switch#	Exits switch profile configuration mode.
Step 5	show switch-profile peer Example: switch# show switch-profile peer	(Optional) Displays the switch profile peer configuration.
Step 6	copy running-config startup-config Example: switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Adding or Modifying Switch Profile Commands

To modify a command in a switch profile, add the modified command to the switch profile and enter the **commit** command to apply the command and synchronize the switch profile to the peer switch if it is reachable.

Follow these guidelines when adding or modifying switch profile commands:

- Commands that are added or modified are buffered until you enter the **commit** command.
- Commands are executed in the same order in which they are buffered. If there is an order-dependency for certain commands, for example, a QoS policy must be defined before being applied, you must maintain that order; otherwise, the commit might fail. You can use utility commands, such as the **show switch-profile name buffer** command, the **buffer-delete** command, or the **buffer-move** command, to change the buffer and correct the order of already entered commands.

Before You Begin

After configuring a switch profile on the local and the peer switch, you must add and commit the supported commands to the switch profile. The commands are added to the switch profile buffer until you enter the **commit** command. The **commit** command does the following:

- Triggers the mutex check and the merge check to verify the synchronization.
- Creates a checkpoint with a rollback infrastructure.
- Applies the configuration on the local switch and the peer switch.
- Executes a rollback on all switches if there is a failure with an application on any of the switches in the switch profile.
- Deletes the checkpoint.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: <pre>switch# config sync switch(config-sync)#</pre>	Enters configuration synchronization mode.
Step 2	switch-profile name Example: <pre>switch(config-sync)# switch-profile abc switch(config-sync-sp)#</pre>	Configures the switch profile, names the switch profile, and enters switch profile synchronization configuration mode.
Step 3	<i>Command argument</i> Example: <pre>switch(config-sync-sp)# interface Port-channel100 switch(config-sync-sp-if)# speed 1000 switch(config-sync-sp-if)# interface Ethernet1/1</pre>	Adds a command to the switch profile.

	Command or Action	Purpose
	<pre>switch(config-sync-sp-if)# speed 1000 switch(config-sync-sp-if)# channel-group 100</pre>	
Step 4	show switch-profile <i>name</i> buffer Example: <pre>switch(config-sync-sp)# show switch-profile abc buffer switch(config-sync-sp)#</pre>	(Optional) Displays the configuration commands in the switch profile buffer.
Step 5	verify Example: <pre>switch(config-sync-sp)# verify</pre>	Verifies the commands in the switch profile buffer.
Step 6	commit Example: <pre>switch(config-sync-sp)# commit</pre>	Saves the commands in the switch profile and synchronizes the configuration with the peer switch.
Step 7	show switch-profile <i>name</i> status Example: <pre>switch(config-sync-sp)# show switch-profile abc status switch(config-sync-sp)#</pre>	(Optional) Displays the status of the switch profile on the local switch and the status on the peer switch.
Step 8	exit Example: <pre>switch(config-sync-sp)# exit switch#</pre>	Exits the switch profile configuration mode.
Step 9	copy running-config startup-config Example: <pre>switch# copy running-config startup-config</pre>	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to create a switch profile, configure a peer switch, and add commands to the switch profile.

```
switch# configuration terminal
switch(config)# cfs ipv4 distribute
switch(config-sync)# switch-profile abc
switch(config-sync-sp)# sync-peers destination 10.1.1.1
switch(config-sync-sp)# interface port-channel100
switch(config-sync-sp-if)# speed 1000
switch(config-sync-sp-if)# interface Ethernet1/1
switch(config-sync-sp-if)# speed 1000
switch(config-sync-sp-if)# channel-group 100
switch(config-sync-sp)# verify
switch(config-sync-sp)# commit
switch(config-sync-sp)# exit
switch#
```

The following example shows an existing configuration with a defined switch profile. The second example shows how the switch profile command changed by adding the modified command to the switch profile.

```
switch# show running-config
switch-profile abc
  interface Ethernet1/1
    switchport mode trunk
    switchport trunk allowed vlan 1-10

switch# config sync
switch(config-sync)# switch-profile abc
switch(config-sync-sp)# interface Ethernet1/1
switch(config-sync-sp-if)# switchport trunk allowed vlan 5-10
switch(config-sync-sp-if)# commit

switch# show running-config
switch-profile abc
  interface Ethernet1/1
    switchport mode trunk
    switchport trunk allowed vlan 5-10
```

Importing a Switch Profile

You can import a switch profile based on the set of commands that you want to import. Using the configuration terminal mode, you can do the following:

- Add selected commands to the switch profile.
- Add supported commands that were specified for an interface.
- Add supported system-level commands.
- Add supported system-level commands excluding the physical interface commands.

When you import commands to a switch profile, the switch profile buffer must be empty.

If new commands are added during the import, the switch profile remains unsaved and the switch remains in the switch profile import mode. You can enter the **abort** command to stop the import. For additional information importing a switch profile, see the “Switch Profile Import Mode” section.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: switch# config sync switch(config-sync)#	Enters configuration synchronization mode.
Step 2	switch-profile name Example: switch(config-sync)# switch-profile abc switch(config-sync-sp)#	Configures the switch profile, names the switch profile, and enters switch profile synchronization configuration mode.
Step 3	import {interface port/slot running-config [exclude interface ethernet]}	Identifies the commands that you want to import and enters switch profile import mode.

	Command or Action	Purpose
	Example: <pre>switch(config-sync-sp)# import ethernet 1/2 switch(config-sync-sp-import)#</pre>	<ul style="list-style-type: none"> • <CR>—Adds selected commands. • interface—Adds the supported commands for a specified interface. • running-config—Adds supported system-level commands. • running-config exclude interface ethernet—Adds supported system-level commands excluding the physical interface commands.
Step 4	commit Example: <pre>switch(config-sync-sp-import)# commit</pre>	Imports the commands and saves the commands to the switch profile.
Step 5	abort Example: <pre>switch(config-sync-sp-import)# abort</pre>	(Optional) Aborts the import process.
Step 6	exit Example: <pre>switch(config-sync-sp)# exit switch#</pre>	Exits switch profile import mode.
Step 7	show switch-profile Example: <pre>switch# show switch-profile</pre>	(Optional) Displays the switch profile configuration.
Step 8	copy running-config startup-config Example: <pre>switch# copy running-config startup-config</pre>	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to import supported system-level commands excluding the Ethernet interface commands into the switch profile named sp:

```
switch(config-vlan)# conf sync
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# show switch-profile buffer

switch-profile : sp
-----
Seq-no  Command
-----

switch(config-sync-sp)# import running-config exclude interface ethernet
```

```

switch(config-sync-sp-import)#
switch(config-sync-sp-import)# show switch-profile buffer

switch-profile : sp
-----
Seq-no  Command
-----
3       vlan 100-299
4       vlan 300
4.1     state suspend
5       vlan 301-345
6       interface port-channel100
6.1     spanning-tree port type network
7       interface port-channel105

switch(config-sync-sp-import)#

```

Importing Configurations in a vPC Topology

You can import configurations in a two-switch vPC topology.

Note

For specific information about the following steps, see the appropriate sections in this chapter.

- 1 Configure the switch profile with the same name on both switches.
- 2 Import the configurations to both switches independently.

Note

Ensure that the configuration moved to the switch profile on both switches is identical; otherwise, a merge-check failure might occur.

- 3 Configure the switches by entering the **sync-peer destination** command.
- 4 Verify that the switch profiles are the same by entering the appropriate show commands.

Verifying Commands in a Switch Profile

You can verify the commands that are included in a switch profile by entering the **verify** command in switch profile mode.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: switch# config sync switch(config-sync)#	Enters configuration synchronization mode.

	Command or Action	Purpose
Step 2	switch-profile <i>name</i> Example: switch(config-sync)# switch-profile abc switch(config-sync-sp)#	Configures the switch profile, names the switch profile, and enters switch profile synchronization configuration mode.
Step 3	verify Example: switch(config-sync-sp)# verify	Verifies the commands in the switch profile buffer.
Step 4	exit Example: switch(config-sync-sp)# exit switch#	Exits the switch profile configuration mode.
Step 5	copy running-config startup-config Example: switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Isolating a Peer Switch

You can isolate a peer switch in order to make changes to a switch profile. This process can be used when you want to block a configuration synchronization or when you want to debug configurations.

Isolating a peer switch requires that you remove the switch from the switch profile and then add the peer switch back to the switch profile.

To temporarily isolate a peer switch, follow these steps:

- 1 Remove a peer switch from a switch profile.
- 2 Make changes to the switch profile and commit the changes.
- 3 Enter debug commands.
- 4 Undo the changes that were made to the switch profile in Step 2 and commit.
- 5 Add the peer switch back to the switch profile.

Deleting a Switch Profile

You can delete a switch profile by selecting the **all-config** or the **local-config** option:

- **all-config**—Deletes the switch profile on both peer switches (when both are reachable). If you choose this option and one of the peers is unreachable, only the local switch profile is deleted. The **all-config** option completely deletes the switch profile on both peer switches.

- **local-config**—Deletes the switch profile on the local switch only.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: <pre>switch# config sync switch(config-sync)#</pre>	Enters configuration synchronization mode.
Step 2	no switch-profile name {all-config local-config profile-only} Example: <pre>switch(config-sync)# no switch-profile abc local-config switch(config-sync-sp)#</pre>	Deletes the switch profile as follows: <ul style="list-style-type: none"> • all-config—Deletes the switch profile on the local and peer switch. If the peer switch is not reachable, only the local switch profile is deleted. • local-config—Deletes the switch profile and local configuration. • profile-only—Deletes the switch profile without the local configuration.
Step 3	copy switch-profile-config Example: <pre>switch (config-sync-sp)# copy switch-profile-config bootflash: switch (config-sync-sp)#</pre>	(Optional)
Step 4	exit Example: <pre>switch(config-sync-sp)# exit switch#</pre>	Exits configuration synchronization mode.
Step 5	copy running-config startup-config Example: <pre>switch# copy running-config startup-config</pre>	(Optional) Copies the running configuration to the startup configuration.

Deleting a Switch from a Switch Profile

You can delete a switch from a switch profile.

Procedure

	Command or Action	Purpose
Step 1	config sync Example: switch# config sync switch(config-sync)#	Enters configuration synchronization mode.
Step 2	switch-profile <i>name</i> Example: switch(config-sync)# switch-profile abc switch(config-sync-sp)#	Configures the switch profile, names the switch profile, and enters the switch profile synchronization configuration mode.
Step 3	no sync-peers destination <i>destination IP</i> Example: switch(config-sync-sp)# no sync-peers destination 10.1.1.1 switch(config-sync-sp)#	Removes the specified switch from the switch profile.
Step 4	exit Example: switch(config-sync-sp)# exit switch#	Exits the switch profile configuration mode.
Step 5	show switch-profile Example: switch# show switch-profile	(Optional) Displays the switch profile configuration.
Step 6	copy running-config startup-config Example: switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Displaying the Switch Profile Buffer

Procedure

	Command or Action	Purpose
Step 1	switch# configure sync	Enters configuration synchronization mode.
Step 2	switch(config-sync) # switch-profile <i>profile-name</i>	Enters switch profile synchronization configuration mode for the specified switch profile.

	Command or Action	Purpose
Step 3	switch(config-sync-sp) # show switch-profile <i>profile-name</i> buffer	Enters interface switch profile synchronization configuration mode for the specified interface.

The following example shows how to display the switch profile buffer for a service profile called sp:

```
switch# configure sync
Enter configuration commands, one per line. End with CNTL/Z.
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# show switch-profile sp buffer
-----
Seq-no  Command
-----
1       vlan 101
1.1     ip igmp snooping querier 10.101.1.1
2       mac address-table static 0000.0000.0001 vlan 101 drop
3       interface Ethernet1/2
3.1     switchport mode trunk
3.2     switchport trunk allowed vlan 101

switch(config-sync-sp)# buffer-move 3 1
switch(config-sync-sp)# show switch-profile sp buffer
-----
Seq-no  Command
-----
1       interface Ethernet1/2
1.1     switchport mode trunk
1.2     switchport trunk allowed vlan 101
2       vlan 101
2.1     ip igmp snooping querier 10.101.1.1
3       mac address-table static 0000.0000.0001 vlan 101 drop
switch(config-sync-sp)#
```

Synchronizing Configurations After a Switch Reboot

If a Cisco Nexus Series switch reboots while a new configuration is being committed on a peer switch using a switch profile, complete the following steps to synchronize the peer switches after reload:

Procedure

-
- Step 1** Reapply configurations that were changed on the peer switch during the reboot.
 - Step 2** Enter the **commit** command.
 - Step 3** Verify that the configuration is applied correctly and both peers are back synchronized.
-

Switch Profile Configuration show Commands

The following **show** commands display information about the switch profile.

Command	Purpose
show switch-profile <i>name</i>	Displays the commands in a switch profile.
show switch-profile <i>name</i> buffer	Displays the uncommitted commands in a switch profile, the commands that were moved, and the commands that were deleted.
show switch-profile <i>name</i> peer <i>IP-address</i>	Displays the synchronization status for a peer switch.
show switch-profile <i>name</i> session-history	Displays the status of the last 20 switch profile sessions.
show switch-profile <i>name</i> status	Displays the configuration synchronization status of a peer switch.
show running-config expand-port-profile	Displays details about the port profile.
show running-config exclude-provision	Displays the configurations for offline preprovisioned interfaces that are hidden.
show running-config switch-profile	Displays the running configuration for the switch profile on the local switch.
show startup-config switch-profile	Displays the startup configuration for the switch profile on the local switch.

For detailed information about the fields in the output from these commands, see the system management command reference for your platform.

Configuration Examples for Switch Profiles

Creating a Switch Profile on a Local and Peer Switch Example

The following example shows how to create a successful switch profile configuration on a local and peer switch including configuring QoS policies; a vPC peer-link, and a vPC in a switch profile.

Procedure

	Command or Action	Purpose
Step 1	Enable CFSvIP distribution on the local and the peer switch. Example: switch# configuration terminal switch(config)# cfs ipv4 distribute	
Step 2	Create a switch profile on the local and the peer switch. Example: switch(config-sync)# switch-profile abc switch(config-sync-sp)# sync-peers destination 10.1.1.1	
Step 3	Verify that the switch profiles are the same on the local and the peer switch.	

	Command or Action	Purpose
	<p>Example:</p> <pre>switch(config-sync-sp)# show switch-profile abc status</pre> <p>Start-time: 15801 usecs after Mon Aug 23 06:21:08 2010 End-time: 6480 usecs after Mon Aug 23 06:21:13 2010</p> <p>Profile-Revision: 1 Session-type: Initial-Exchange Peer-triggered: Yes Profile-status: Sync Success</p> <p>Local information: ----- Status: Commit Success Error(s):</p> <p>Peer information: ----- IP-address: 10.1.1.1 Sync-status: In Sync. Status: Commit Success Error(s):</p>	
Step 4	<p>Add the configuration commands to the switch profile on the local switch. The commands will be applied to the peer switch when the commands are committed.</p> <p>Example:</p> <pre>switch(config-sync-sp)# class-map type qos c1 switch(config-sync-sp-cmap-qos)# match cos 2 switch(config-sync-sp-cmap-qos)# class-map type qos c2 switch(config-sync-sp-cmap-qos)# match cos 5 switch(config-sync-sp-cmap-qos)# policy-map type qos p1 switch(config-sync-sp-pmap-qos)# class c1 switch(config-sync-sp-pmap-c-qos)# set qos-group 2 switch(config-sync-sp-pmap-c-qos)# class c2 switch(config-sync-sp-pmap-c-qos)# set qos-group 3 switch(config-sync-sp-pmap-c-qos)# system qos switch(config-sync-sp-sys-qos)# service-policy type qos input p1 switch(config-sync-sp-sys-qos)# vlan 1-50 switch(config-sync-sp-vlan)# interface port-channel 100 switch(config-sync-sp-if)# vpc peer-link switch(config-sync-sp-if)# switchport mode trunk switch(config-sync-sp-if)# interface port-channel 10 switch(config-sync-sp-if)# vpc 1 switch(config-sync-sp-if)# switchport mode trunk switch(config-sync-sp-if)# switchport trunk allowed vlan 1, 10-50</pre>	
Step 5	<p>View the buffered commands.</p> <p>Example:</p> <pre>switch(config-sync-sp-if)# show switch-profile switch-profile buffer</pre> <pre>----- Seq-no Command ----- 1 class-map type qos match-all c1 1.1 match cos 2 2 class-map type qos match-all c2 2.1 match cos 5</pre>	

	Command or Action	Purpose
	<pre> 3 policy-map type qos p1 3.1 class c1 3.1.1 set qos-group 2 3.2 class c2 3.2.1 set qos-group 3 4 system qos 4.1 service-policy type qos input p1 5 vlan 2-50 6 interface port-channel100 6.1 vpc peer-link 6.2 switchport mode trunk 7 interface port-channel10 7.1 vpc 1 7.2 switchport mode trunk 7.3 switchport trunk allowed vlan 1, 10-50 </pre>	
Step 6	<p>Verify the commands in the switch profile.</p> <p>Example:</p> <pre> switch(config-sync-sp-if)# verify Verification Successful </pre>	
Step 7	<p>Apply the commands to the switch profile and to synchronize the configurations between the local and the peer switch.</p> <p>Example:</p> <pre> switch(config-sync-sp)# commit Commit Successful switch(config-sync)# </pre>	

Verifying the Synchronization Status Example

The following example shows how to verify the synchronization status between the local and the peer switch:

```

switch(config-sync)# show switch-profile switch-profile status
Start-time: 804935 usecs after Mon Aug 23 06:41:10 2010
End-time: 956631 usecs after Mon Aug 23 06:41:20 2010

Profile-Revision: 2
Session-type: Commit
Peer-triggered: No
Profile-status: Sync Success

Local information:
-----
Status: Commit Success
Error(s):

Peer information:
-----
IP-address: 10.1.1.1
Sync-status: In Sync.
Status: Commit Success
Error(s):

switch(config-sync)#

```

Displaying the Running Configuration

The following example shows how to display the running configuration of the switch profile on the local switch:

```
switch# configure sync
switch(config-sync)# show running-config switch-profile
switch-profile sp
  sync-peers destination 10.1.1.1
  class-map type qos match-all c1
    match cos 2
  class-map type qos match-all c2
    match cos 5
  policy-map type qos p1
    class c1
      set qos-group 2
    class c2
      set qos-group 3
  system qos
    service-policy type qos input p1
  vlan 2-50

interface port-channel10
  switchport mode trunk
  vpc 1
  switchport trunk allowed vlan 1,10-50

interface port-channel100
  switchport mode trunk
  vpc peer-link
switch(config-sync)#
```

Displaying the Switch Profile Synchronization Between Local and Peer Switches

This example shows how to display the synchronization status for two peer switches:

```
switch1# show switch-profile sp status

Start-time: 491815 usecs after Thu Aug 12 11:54:51 2010
End-time: 449475 usecs after Thu Aug 12 11:54:58 2010

Profile-Revision: 1
Session-type: Initial-Exchange
Peer-triggered: No
Profile-status: Sync Success

Local information:
-----
Status: Commit Success
Error(s):

Peer information:
-----
IP-address: 10.193.194.52
Sync-status: In Sync.
Status: Commit Success
Error(s):

switch1#

switch2# show switch-profile sp status

Start-time: 503194 usecs after Thu Aug 12 11:54:51 2010
```

```

End-time: 532989 usecs after Thu Aug 12 11:54:58 2010

Profile-Revision: 1
Session-type: Initial-Exchange
Peer-triggered: Yes
Profile-status: Sync Success

Local information:

```

Displaying Verify and Commit on Local and Peer Switches

This example shows how to configure a successful verify and commit of the local and peer switch:

```

switch1# configure sync
Enter configuration commands, one per line.  End with CNTL/Z.
switch1(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch1(config-sync-sp)# interface ethernet1/1
switch1(config-sync-sp-if)# description foo
switch1(config-sync-sp-if)# verify
Verification Successful
switch1(config-sync-sp)# commit
Commit Successful
switch1(config-sync)# show running-config switch-profile
switch-profile sp
  sync-peers destination 10.193.194.52
  interface Ethernet1/1
  description foo
switch1(config-sync)# show switch-profile sp status

Start-time: 171513 usecs after Wed Aug 11 17:51:28 2010
End-time: 676451 usecs after Wed Aug 11 17:51:43 2010

Profile-Revision: 3
Session-type: Commit
Peer-triggered: No
Profile-status: Sync Success

Local information:
-----
Status: Commit Success
Error(s):

Peer information:
-----
IP-address: 10.193.194.52
Sync-status: In Sync.
Status: Commit Success
Error(s):

switch1(config-sync)#

switch2# show running-config switch-profile
switch-profile sp
  sync-peers destination 10.193.194.51
  interface Ethernet1/1
  description foo

```

```

switch2# show switch-profile sp status

Start-time: 265716 usecs after Wed Aug 11 16:51:28 2010
End-time: 734702 usecs after Wed Aug 11 16:51:43 2010

Profile-Revision: 3

Sync-status: In Sync.
Status: Commit Success
Error(s):

switch2#

```

Successful and Unsuccessful Synchronization Examples

The following example shows a successful synchronization of the switch profile on the peer switch:

```

switch# show switch-profile abc peer

switch# show switch-profile sp peer 10.193.194.52
Peer-sync-status      : In Sync.
Peer-status           : Commit Success
Peer-error(s)         :
switch1#

```

The following example shows an unsuccessful synchronization of a switch profile on the peer switch, with a peer not reachable status:

```

switch# show switch-profile sp peer 10.193.194.52
Peer-sync-status      : Not yet merged. pending-merge:1 received_merge:0
Peer-status           : Peer not reachable
Peer-error(s)         :
switch#

```

Configuring the Switch Profile Buffer, Moving the Buffer, and Deleting the Buffer

This example shows how to configure the switch profile buffer, the buffer-move configuration, and the buffer-delete configuration:

```

switch# configure sync
Enter configuration commands, one per line.  End with CNTL/Z.
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# vlan 101
switch(config-sync-sp-vlan)# ip igmp snooping querier 10.101.1.1
switch(config-sync-sp-vlan)# exit
switch(config-sync-sp)# mac address-table static 0000.0000.0001 vlan 101 drop
switch(config-sync-sp)# interface ethernet1/2
switch(config-sync-sp-if)# switchport mode trunk
switch(config-sync-sp-if)# switchport trunk allowed vlan 101
switch(config-sync-sp-if)# exit
switch(config-sync-sp)# show switch-profile sp buffer
-----

```

```

Seq-no  Command
-----
1       vlan 101
1.1     ip igmp snooping querier 10.101.1.1
2       mac address-table static 0000.0000.0001 vlan 101 drop
3       interface Ethernet1/2
3.1     switchport mode trunk
3.2     switchport trunk allowed vlan 101

switch(config-sync-sp)# buffer-move 3 1
switch(config-sync-sp)# show switch-profile sp buffer
-----
Seq-no  Command
-----
1       interface Ethernet1/2
1.1     switchport mode trunk
1.2     switchport trunk allowed vlan 101
2       vlan 101
2.1     ip igmp snooping querier 10.101.1.1
3       mac address-table static 0000.0000.0001 vlan 101 drop

switch(config-sync-sp)# buffer-delete 1
switch(config-sync-sp)# show switch-profile sp buffer
-----
Seq-no  Command
-----
2       vlan 101
2.1     ip igmp snooping querier 10.101.1.1
3       mac address-table static 0000.0000.0001 vlan 101 drop

switch(config-sync-sp)# buffer-delete all
switch(config-sync-sp)# show switch-profile sp buffer
switch(config-sync-sp)#

```

Importing Configurations

The following example shows how to import an interface configuration:

```

switch# show running-config interface ethernet1/3

!Command: show running-config interface Ethernet1/3
!Time: Wed Aug 11 18:12:44 2010

version 5.0(2)N1(1)

interface Ethernet1/3
  switchport mode trunk
  switchport trunk allowed vlan 1-100

switch# configure sync
Enter configuration commands, one per line.  End with CNTL/Z.
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1

switch(config-sync-sp)# import interface Ethernet1/3
switch(config-sync-sp-import)# show switch-profile sp buffer
-----
Seq-no  Command
-----
1       interface Ethernet1/3
1.1     switchport mode trunk
1.2     switchport trunk allowed vlan 1-100

switch(config-sync-sp-import)# verify
Verification Successful
switch(config-sync-sp-import)# commit
Commit Successful
switch(config-sync)#

```

The following example shows how to import the supported commands in a running configuration:

```
switch(config-sync)# switch-profile sp
Switch-Profile started, Profile ID is 1
switch(config-sync-sp)# import running-config
switch(config-sync-sp-import)# show switch-profile sp buffer
-----
Seq-no  Command
-----

47.2      switchport mode fex-fabric
47.3      channel-group 101
48      interface Ethernet2/7
48.1      fex associate 101
48.2      switchport mode fex-fabric
48.3      channel-group 101
49      interface Ethernet2/8
49.1      fex associate 101
...
89      interface Ethernet100/1/32
90      interface Ethernet100/1/33
91      interface Ethernet100/1/34
92      interface Ethernet100/1/35
93      interface Ethernet100/1/36
...
105     interface Ethernet100/1/48
switch(config-sync-sp-import)#

```

The following example shows how to import selected supported commands. First, show the port profile running configuration to identify the configuration that you are going to import:

```
switch# show running-config port-profile
```

```
!Command: show running-config port-profile
!Time: Thu Aug 12 12:09:11 2010
```

```

version 5.0(2)N1(1)
port-profile type ethernet ppl
  bandwidth 5000
  bandwidth inherit
  speed 10000
  state enabled

```

```
switch#
```

```
switch# configure sync
```

```
Enter configuration commands, one per line. End with CNTL/Z.
```

```
switch(config-sync)# switch-profile sp
```

```
Switch-Profile started, Profile ID is 1
```

```
switch(config-sync-sp)# import
```

```
switch(config-sync-sp-import)# port-profile type ethernet ppl
```

```
switch(config-sync-sp-import-if)# bandwidth 5000
```

```
switch(config-sync-sp-import-if)# bandwidth inherit
```

```
switch(config-sync-sp-import-if)# speed 10000
```

```
switch(config-sync-sp-import-if)# state enabled
```

```
switch(config-sync-sp-import-if)# show switch-profile sp buffer
```

```
-----
Seq-no  Command
```

```

-----
1      port-profile type ethernet ppl
1.1    bandwidth 5000
1.2    bandwidth inherit
1.3    speed 10000
1.4    state enabled

```

```
switch(config-sync-sp-import-if)# verify
```

```
Verification Successful
```

```
switch(config-sync-sp-import)# commit
```

```
Commit Successful
```

```
switch(config-sync)# show running-config switch-profile
```

```
switch-profile sp

```

```
    bandwidth 5000
```

```
    bandwidth inherit
```

```
    speed 10000
```

```
    state enabled
```

```
switch(config-sync)#
```

Sample Migrations Using the Import Command

Migrating Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender A-A Topology Example

This examples shows the tasks used to migrate to Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender A-A topology. For details on the tasks, see the appropriate sections in this chapter.

Procedure

- Step 1** Ensure configurations are the same on both switches.
 - Step 2** Configure the switch-profile with same name on both switches.
 - Step 3** Enter the **import running config** command on both switches.
 - Step 4** Enter the **switch-profile name buffer** command to ensure all configurations are correctly imported on both switches.
 - Step 5** Remove unwanted configuration settings by editing the buffer.
For details, see [Configuring the Switch Profile Buffer, Moving the Buffer, and Deleting the Buffer](#), on page 29.
 - Step 6** Enter the **commit** command on both switches.
 - Step 7** Enter the **sync-peers destination IP-address** command to configure the peer switch on both switches.
 - Step 8** Enter the **switch-profile name status** command to ensure both switches are synchronized.
-

Migrating Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender Fabric Extender Straight-Through Topology Example

This example shows the tasks used to migrate to Cisco NX-OS Release 5.0(2)N1(1) in a Fabric Extender Straight-Through topology. For details on the tasks, see the appropriate sections in this chapter.

Procedure

- Step 1** Ensure the vPC port-channel configurations are the same on both switches.
- Step 2** Configure the switch-profile with the same name on both switches.
- Step 3** Enter the **import interface port-channel x-y, port-channel z** command for all vPC port-channels on both switches.
- Step 4** Enter the **show switch-profile name buffer** command to ensure all configurations are correctly imported on both switches.
- Step 5** Remove unwanted configuration settings by editing the buffer.
For details, see [Configuring the Switch Profile Buffer, Moving the Buffer, and Deleting the Buffer](#), on page 29.

- Step 6** Enter the **commit** command on both switches.
- Step 7** Enter the **sync-peers destination *IP-address*** command to configure the peer switch on both switches.
- Step 8** Enter the **show switch-profile *name* status** command to ensure both switches are synchronized.
-

Configuring Module Pre-Provisioning

This chapter contains the following sections:

- [Information About Module Pre-Provisioning, page 35](#)
- [Guidelines and Limitations, page 35](#)
- [Enabling Module Pre-Provisioning, page 36](#)
- [Removing Module Pre-Provisioning, page 36](#)
- [Verifying the Pre-Provisioned Configuration, page 37](#)
- [Configuration Examples for Pre-Provisioning, page 38](#)

Information About Module Pre-Provisioning

The pre-provisioning feature allows you to preconfigure interfaces before inserting or attaching a module. If a module goes offline, you can also use pre-provisioning to make changes to the interface configurations for the offline module. When a pre-provisioned module comes online, the pre-provisioning configurations are applied. If any configurations were not applied, a syslog is generated. The syslog lists the configurations that were not accepted.

In some Virtual Port Channel (vPC) topologies, pre-provisioning is required for the configuration synchronization feature. Pre-provisioning allows you to synchronize the configuration for an interface that is online with one peer but offline with another peer.

Guidelines and Limitations

Pre-provisioning has the following configuration guidelines and limitations:

- When a module comes online, commands that are not applied are listed in the syslog.
- If a slot is pre-provisioned for module A and if you insert module B into the slot, module B does not come online.
- There is no MIB support for pre-provisioned interfaces.
- Cisco DCNM is not supported.

Enabling Module Pre-Provisioning

You can enable pre-provisioning on a module that is offline. Enter the **provision model** *model* command in module pre-provision mode.

Note

After enabling pre-provisioning, you can configure the interfaces as though they are online.

Procedure

	Command or Action	Purpose
Step 1	configuration terminal Example: switch# config t switch(config)#	Enters global configuration mode.
Step 2	slot slot Example: switch(config)# slot 101 switch(config-slot)#	Selects the slot to pre-provision and enters slot configuration mode.
Step 3	provision model model Example: switch(config-slot)# provision model N2K-C2248T switch(config-slot)#	Selects the module that you want to pre-provision.
Step 4	exit Example: switch(config-slot)# exit switch#	Exits slot configuration mode.
Step 5	copy running-config startup-config Example: switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

This example shows how to select slot 101 and the N2K-C2232P module to pre-provision.

```
switch# configure terminal
switch(config)# slot 101
switch(config-slot)# provision model N2K-C2232P
switch(config-slot)# exit
```

Removing Module Pre-Provisioning

You can remove a module that has been pre-provisioned.

Procedure

	Command or Action	Purpose
Step 1	configuration terminal Example: switch# config t switch(config)#	Enters global configuration mode.
Step 2	slot slot Example: switch(config)# slot 101 switch(config-slot)#	Selects the slot to pre-provision and enters slot configuration mode.
Step 3	no provision model model Example: switch(config-slot)# no provision model N2K-C2248T switch(config-slot)#	Removes pre-provisioning from the module.
Step 4	exit Example: switch(config-slot)# exit switch#	Exits slot configuration mode.
Step 5	copy running-config startup-config Example: switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

This example shows how to remove a preprovisioned module from a chassis slot:

```
switch(config)# slot 2
switch(config-slot)# no provision model N5K-M1404
switch(config-slot)#
```

Verifying the Pre-Provisioned Configuration

To display the pre-provisioned configuration, perform one of the following tasks:

Command	Purpose
show module	Displays module information.
show switch-profile	Displays switch profile information.
show running-config exclude-provision	Displays the running configuration without the pre-provisioned interfaces or modules that are offline.
show provision failed-config	Displays the pre-provisioned commands that were not applied to the configuration when the interface or module came online.

Command	Purpose
	This command also displays a history of failed commands.
show running-config	Displays the running configuration including the pre-provisioned configuration.
show startup-config	Displays the startup configuration including the pre-provisioned configuration.

Configuration Examples for Pre-Provisioning

The following example shows how to enable pre-provisioning on slot 110 on the Cisco Nexus 2232P Fabric Extender and how to pre-provision interface configuration commands on the Ethernet 110/1/1 interface.

```
switch# configure terminal
switch(config)# slot 110
switch(config-slot)# provision model N2K-C2232P
switch(config-slot)# exit

switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# interface Ethernet110/1/1
switch(config-if)# description module is preprovisioned
switch(config-if)# show running-config interface Ethernet110/1/1
Time: Wed Aug 25 21:29:44 2010

version 5.0(2)N1(1)
```

```
interface Ethernet110/1/1
  description module is preprovisioned
```

The following example shows the list of pre-provisioned commands that were not applied when the module came online.

```
switch(config-if-range)# show provision failed-config 101
The following config was not applied for slot 33
=====
```

```
interface Ethernet101/1/1
  service-policy input test
```

```
interface Ethernet101/1/2
  service-policy input test
```

```
interface Ethernet101/1/3
  service-policy input test
```

This example shows how to remove all pre-provisioned modules from a slot:

```
switch(config)# slot 2
switch(config-slot)# no provision model
switch(config-slot)#
```

Using Cisco Fabric Services

This chapter contains the following sections:

- [Information About CFS, page 39](#)
- [Guidelines and Limitations for CFS, page 41](#)
- [CFS Distribution, page 41](#)
- [CFS Support for Applications, page 46](#)
- [CFS Regions, page 49](#)
- [Configuring CFS over IP, page 52](#)
- [Displaying CFS Distribution Information, page 55](#)
- [Default Settings for CFS, page 57](#)

Information About CFS

Some features in the Cisco Nexus Series switch require configuration synchronization with other switches in the network to function correctly. Synchronization through manual configuration at each switch in the network can be a tedious and error-prone process.

Cisco Fabric Services (CFS) provides a common infrastructure for automatic configuration synchronization in the network. It provides the transport function and a set of common services to the features. CFS has the ability to discover CFS-capable switches in the network and to discover feature capabilities in all CFS-capable switches.

Cisco Nexus Series switches support CFS message distribution over Fibre Channel and IPv4 or IPv6 networks. If the switch is provisioned with Fibre Channel ports, CFS over Fibre Channel is enabled by default while CFS over IP must be explicitly enabled.

CFS provides the following features:

- Peer-to-peer protocol with no client-server relationship at the CFS layer.
- CFS message distribution over Fibre Channel and IPv4 or IPv6 networks.
- Three modes of distribution.

- Coordinated distributions—Only one distribution is allowed in the network at any given time.
- Uncoordinated distributions—Multiple parallel distributions are allowed in the network except when a coordinated distribution is in progress.
- Unrestricted uncoordinated distributions—Multiple parallel distributions are allowed in the network in the presence of an existing coordinated distribution. Unrestricted uncoordinated distributions are allowed to run in parallel with all other types of distributions.

The following features are supported for CFS distribution over IP:

- One scope of distribution over an IP network:
 - Physical scope—The distribution spans the entire IP network.

The following features are supported for CFS distribution over Fibre Channel SANs:

- Three scopes of distribution over SAN fabrics.
 - Logical scope — The distribution occurs within the scope of a VSAN.
 - Physical scope — The distribution spans the entire physical topology.
 - Over a selected set of VSANs — Some features require configuration distribution over some specific VSANs. These features can specify to CFS the set of VSANs over which to restrict the distribution.
- Supports a merge protocol that facilitates the merge of feature configuration during a fabric merge event (when two independent SAN fabrics merge).

Cisco Fabric Services over Ethernet

The Cisco Fabric Services over Ethernet (CFSoE) is a reliable state transport mechanism that you can use to synchronize the actions of the vPC peer devices. CFSoE carries messages and packets for many features linked with vPC, such as STP and IGMP. Information is carried in CFS/CFSoE protocol data units (PDUs).

When you enable the vPC feature, the device automatically enables CFSoE, and you do not have to configure anything. CFSoE distributions for vPCs do not need the capabilities to distribute over IP or the CFS regions. You do not need to configure anything for the CFSoE feature to work correctly on vPCs.

You can use the `show mac address-table` command to display the MAC addresses that CFSoE synchronizes for the vPC peer link.

Note

Do not enter the **no cfs eth distribute** or the **no cfs distribute** command. CFSoE must be enabled for vPC functionality. If you do enter either of these commands when vPC is enabled, the system displays an error message.

When you enter the **show cfs application** command, the output displays "Physical-eth," which shows the applications that are using CFSoE.

Guidelines and Limitations for CFS

CFS has the following configuration guidelines and limitations:

- If the virtual port channel (vPC) feature is enabled for your device, do not disable CFSoS.

Note CFSoS must be enabled for the vPC feature to work.

- All CFSoS-enabled devices with similar multicast addresses form one CFSoS fabric.
- Make sure that CFS is enabled for the applications that you want to configure.
- Anytime you lock a fabric, your username is remembered across restarts and switchovers.
- Anytime you lock a fabric, configuration changes attempted by anyone else are rejected.
- While a fabric is locked, the application holds a working copy of configuration changes in a pending database or temporary storage area, not in the running configuration.
- Configuration changes that have not been committed yet (still saved as a working copy) are not in the running configuration and do not display in the output of **show** commands.
- If you start a CFS session that requires a fabric lock but forget to end the session, an administrator can clear the session.
- An empty commit is allowed if configuration changes are not previously made. In this case, the **commit** command results in a session that acquires locks and distributes the current database.
- You can use the **commit** command only on the specific device where the fabric lock was acquired.
- CFSoS and CFSoS are not supported for use together.
- CFS regions can be applied only to CFSoS applications.

CFS Distribution

The CFS distribution functionality is independent of the lower layer transport. Cisco Nexus Series switches support CFS distribution over IP and over Fibre Channel. Features that use CFS are unaware of the lower layer transport.

CFS Distribution Modes

CFS supports three distribution modes to accommodate different feature requirements:

- Uncoordinated Distribution
- Coordinated Distribution
- Unrestricted Uncoordinated Distributions

Only one mode is allowed at any given time.

Uncoordinated Distribution

Uncoordinated distributions are used to distribute information that is not expected to conflict with information from a peer. Parallel uncoordinated distributions are allowed for a feature.

Coordinated Distribution

Coordinated distributions allow only one feature distribution at a given time. CFS uses locks to enforce this feature. A coordinated distribution is not allowed to start if locks are taken for the feature anywhere in the network. A coordinated distribution consists of three stages:

- A network lock is acquired.
- The configuration is distributed and committed.
- The network lock is released.

Coordinated distribution has two variants:

- CFS driven —The stages are executed by CFS in response to a feature request without intervention from the feature.
- Feature driven—The stages are under the complete control of the feature.

Coordinated distributions are used to distribute information that can be manipulated and distributed from multiple switches, for example, the port security configuration.

Unrestricted Uncoordinated Distributions

Unrestricted uncoordinated distributions allow multiple parallel distributions in the network in the presence of an existing coordinated distribution. Unrestricted uncoordinated distributions are allowed to run in parallel with all other types of distributions.

Disabling or Enabling CFS Distribution on a Switch

If the switch is provisioned with Fibre Channel ports, CFS over Fibre Channel is enabled by default. CFS over IP must be explicitly enabled.

You can globally disable CFS on a switch to isolate the features using CFS from network-wide distributions while maintaining physical connectivity. When CFS is globally disabled on a switch, CFS operations are restricted to the switch.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters configuration mode.
Step 2	switch(config)# no cfs distribute	Globally disables CFS distribution (CFS over Fibre Channel or IP) for all applications on the switch.

	Command or Action	Purpose
Step 3	switch(config)# cfs distribute	(Optional) Enables CFS distribution on the switch. This is the default.

Verifying the CFS Distribution Status

The **show cfs status** command displays the status of CFS distribution on the switch:

```
switch# show cfs status
Distribution : Enabled
Distribution over IP : Enabled - mode IPv4
IPv4 multicast address : 239.255.70.83
IPv6 multicast address : ff15::efff:4653
Distribution over Ethernet : Enabled
```

CFS Distribution over IP

CFS distribution over IP supports the following features:

- Physical distribution over an entirely IP network.
- Physical distribution over a hybrid Fibre Channel and IP network with the distribution reaching all switches that are reachable over either Fibre Channel or IP.

Note

The switch attempts to distribute information over Fibre Channel first and then over the IP network if the first attempt over Fibre Channel fails. CFS does not send duplicate messages if distribution over both IP and Fibre Channel is enabled.

- Distribution over IP version 4 (IPv4) or IP version 6 (IPv6).

Note

CFS cannot distribute over both IPv4 and IPv6 from the same switch.

- Keepalive mechanism to detect network topology changes using a configurable multicast address.
- Compatibility with Cisco MDS 9000 Family switches running release 2.x or later.

The following figure (*Network Example 1*) shows a network with both Fibre Channel and IP connections. Node A forwards an event to node B over Fibre Channel. Node B forwards the event node C and node D using unicast IP. Node C forwards the event to node E using Fibre Channel.

Figure 1: Network Example 1 with Fibre Channel and IP Connections

The following figure (*Network Example 2*) is the same as the previous figure except that node C and node D are connected using Fibre Channel. All processes is the same in this example because node B has node C and node D the distribution list for IP. Node C does not forward to node D because node D is already in the distribution list from node B.

Figure 2: Network Example 2 with Fibre Channel and IP Connections

The following figure (*Network Example 3*) is the same as the previous figure except that node D and node E are connected using IP. Both node C and node D forward the event to E because the node E is not in the distribution list from node B.

Figure 3: Network Example 3 with Fibre Channel and IP Connections

CFS Distribution over Fibre Channel

For CFS distribution over Fibre Channel, the CFS protocol layer resides on top of the FC2 layer. CFS uses the FC2 transport services to send information to other switches. CFS uses a proprietary SW_ILS (0x77434653) protocol for all CFS packets. CFS packets are sent to or from the switch domain controller addresses.

CFS Distribution Scopes

Different applications on the Cisco Nexus Series switches need to distribute the configuration at various levels. The following levels are available when using CFS distribution over Fibre Channel:

- VSAN level (logical scope)

Applications that operate within the scope of a VSAN have the configuration distribution restricted to the VSAN. An example application is port security where the configuration database is applicable only within a VSAN.

Note Logical scope is not supported for FCS distribution over IP.

- Physical topology level (physical scope)

Some applications (such as NTP) need to distribute the configuration to the entire physical topology.

- Between two selected switches

Some applications operate only between selected switches in the network.

CFS Merge Support

CFS Merge is supported for CFS distribution over Fibre Channel.

An application keeps the configuration synchronized in a SAN fabric through CFS. Two such fabrics might merge as a result of an ISL coming up between them. These two fabrics could have two different sets of configuration information that need to be reconciled in the event of a merge. CFS provides notification each time an application peer comes online. If a fabric with M application peers merges with another fabric with N application peers, and if an application triggers a merge action on every notification, a link-up event results in M×N merges in the fabric.

CFS supports a protocol that reduces the number of merges required to one by handling the complexity of the merge at the CFS layer. This protocol runs per application per scope. The protocol involves selecting one switch in a fabric as the merge manager for that fabric. The other switches do not have a role in the merge process.

During a merge, the merge manager in the two fabrics exchange their configuration databases with each other. The application on one of them merges the information, decides if the merge is successful, and informs all switches in the combined fabric of the status of the merge.

In case of a successful merge, the merged database is distributed to all switches in the combined fabric and the entire new fabric remains in a consistent state. You can recover from a merge failure by starting a distribution

from any of the switches in the new fabric. This distribution restores all peers in the fabric to the same configuration database.

CFS Support for Applications

CFS Application Requirements

All switches in the network must be CFS capable. Switches that are not CFS capable do not receive distributions, which results in part of the network not receiving the intended distribution. CFS has the following requirements:

- Implicit CFS usage—The first time that you issue a CFS task for a CFS-enabled application, the configuration modification process begins and the application locks the network.
- Pending database—The pending database is a temporary buffer to hold uncommitted information. The uncommitted changes are not applied immediately to ensure that the database is synchronized with the database in the other switches in the network. When you commit the changes, the pending database overwrites the configuration database (also known as the active database or the effective database).
- CFS distribution enabled or disabled on a per-application basis—The default (enable or disable) for the CFS distribution state differs between applications. If CFS distribution is disabled for an application, that application does not distribute any configuration and does not accept a distribution from other switches in the network.
- Explicit CFS commit—Most applications require an explicit commit operation to copy the changes in the temporary buffer to the application database, to distribute the new database to the network, and to release the network lock. The changes in the temporary buffer are not applied if you do not perform the commit operation.

Enabling CFS for an Application

All CFS-based applications provide an option to enable or disable the distribution capabilities.

Applications have the distribution enabled by default.

The application configuration is not distributed by CFS unless distribution is explicitly enabled for that application.

Verifying Application Registration Status

The **show cfs application** command displays the applications that are currently registered with CFS. The first column displays the application name. The second column indicates whether the application is enabled or disabled for distribution (enabled or disabled). The last column indicates the scope of distribution for the application (logical, physical, or both).

**Note**

The **show cfs application** command only displays applications registered with CFS. Conditional services that use CFS do not appear in the output unless these services are running.

```
switch# show cfs application
```

```

-----
Application      Enabled      Scope
-----
ntp              No          Physical-all
fscm             Yes         Physical-fc
rscn             No          Logical
fctimer          No          Physical-fc
syslogd          No          Physical-all
callhome         No          Physical-all
fcdomain         Yes         Logical
device-alias     Yes         Physical-fc
Total number of entries = 8

```

The **show cfs application name** command displays the details for a particular application. It displays the enabled/disabled state, timeout as registered with CFS, merge capability (if it has registered with CFS for merge support), and the distribution scope.

```
switch# show cfs application name fscm
```

```

Enabled          : Yes
Timeout          : 100s
Merge Capable    : No
Scope            : Physical-fc

```

Locking the Network

When you configure (first-time configuration) a feature (application) that uses the CFS infrastructure, that feature starts a CFS session and locks the network. When a network is locked, the switch software allows configuration changes to this feature only from the switch that holds the lock. If you make configuration changes to the feature from another switch, the switch issues a message to inform the user about the locked status. The configuration changes are held in a pending database by that application.

If you start a CFS session that requires a network lock but forget to end the session, an administrator can clear the session. If you lock a network at any time, your username is remembered across restarts and switchovers. If another user (on the same machine) tries to perform configuration tasks, that user's attempts are rejected.

Verifying CFS Lock Status

The **show cfs lock** command displays all the locks that are currently acquired by any application. For each application the command displays the application name and scope of the lock taken. If the application lock is taken in the physical scope, then this command displays the switch WWN, IP address, user name, and user type of the lock holder. If the application is taken in the logical scope, then this command displays the VSAN in which the lock is taken, the domain, IP address, user name, and user type of the lock holder.

```
switch# show cfs lock
```

```

Application: ntp
Scope      : Physical

```

```

-----
Switch WWN      IP Address      User Name      User Type
-----
20:00:00:05:30:00:6b:9e  10.76.100.167  admin          CLI/SNMP v3
Total number of entries = 1

```

```

Application: port-security
Scope      : Logical

```

```

-----
VSAN   Domain   IP Address      User Name      User Type
-----
1      238        10.76.100.167  admin          CLI/SNMP v3
2      211        10.76.100.167  admin          CLI/SNMP v3

```

```
Total number of entries = 2
```

The **show cfs lock name** command displays the lock details for the specified application.

```
switch# show cfs lock name ntp
```

```
Scope      : Physical
```

Switch WWN	IP Address	User Name	User Type
20:00:00:05:30:00:6b:9e	10.76.100.167	admin	CLI/SNMP v3

```
Total number of entries = 1
```

Committing Changes

A commit operation saves the pending database for all application peers and releases the lock for all switches.

The commit function does not start a session; only a lock function starts a session. However, an empty commit is allowed if configuration changes are not previously made. In this case, a commit operation results in a session that acquires locks and distributes the current database.

When you commit configuration changes to a feature using the CFS infrastructure, you receive a notification about one of the following responses:

- One or more external switches report a successful status—The application applies the changes locally and releases the network lock.
- None of the external switches report a successful state—The application considers this state a failure and does not apply the changes to any switch in the network. The network lock is not released.

You can commit changes for a specified feature by entering the **commit** command for that feature.

Discarding Changes

If you discard configuration changes, the application flushes the pending database and releases locks in the network. Both the abort and commit functions are supported only from the switch from which the network lock is acquired.

You can discard changes for a specified feature by using the **abort** command for that feature.

Saving the Configuration

Configuration changes that have not been applied yet (still in the pending database) are not shown in the running configuration. The configuration changes in the pending database overwrite the configuration in the effective database when you commit the changes.

Caution

If you do not commit the changes, they are not saved to the running configuration.

Clearing a Locked Session

You can clear a lock held by an application from any device in the fabric.

Caution

When you clear a lock in the fabric, any pending configurations in any device in the fabric are discarded.

Before You Begin

You must have administrator permissions to release a lock.

Procedure

	Command or Action	Purpose
Step 1	switch# show application-name status	(Optional) Shows the current application state.
Step 2	switch# clear application-name session	Clears the application configuration session and releases the lock on the fabric. All pending changes are discarded.
Step 3	switch# show application-name status	(Optional) Shows the current application state.

```
switch# show ntp status
Distribution : Enabled
Last operational state: Fabric Locked
switch# clear ntp session
switch# show ntp status
Distribution : Enabled
Last operational state: No session
```

CFS Regions

About CFS Regions

A CFS region is a user-defined subset of switches for a given feature or application in its physical distribution scope. When a network spans a vast geography, you might need to localize or restrict the distribution of certain profiles among a set of switches based on their physical proximity. CFS regions allow you to create multiple islands of distribution within the network for a given CFS feature or application. CFS regions are designed to restrict the distribution of a feature's configuration to a specific set or grouping of switches in a network.

Note

You can only configure a CFS region based on physical switches. You cannot configure a CFS region in a VSAN.

Example Scenario

The Smart Call Home application triggers alerts to network administrators when a situation arises or something abnormal occurs. When the network covers many geographies, and there are multiple network administrators who are each responsible for a subset of switches in the network, the Smart Call Home application sends alerts to all network administrators regardless of their location. For the Smart Call Home application to send message alerts selectively to network administrators, the physical scope of the application has to be fine tuned or narrowed down. You can achieve this scenario by implementing CFS regions.

CFS regions are identified by numbers ranging from 0 through 200. Region 0 is reserved as the default region and contains every switch in the network. You can configure regions from 1 through 200. The default region maintains backward compatibility.

If the feature is moved, that is, assigned to a new region, its scope is restricted to that region; it ignores all other regions for distribution or merging purposes. The assignment of the region to a feature has precedence in distribution over its initial physical scope.

You can configure a CFS region to distribute configurations for multiple features. However, on a given switch, you can configure only one CFS region at a time to distribute the configuration for a given feature. Once you assign a feature to a CFS region, its configuration cannot be distributed within another CFS region.

Managing CFS Regions

Creating CFS Regions

You can create a CFS region.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# cfs region <i>region-id</i>	Creates a region.

Assigning Applications to CFS Regions

You can assign an application on a switch to a region.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# cfs region <i>region-id</i>	Creates a region.

	Command or Action	Purpose
Step 3	switch(config-cfs-region)# <i>application</i>	Adds application(s) to the region. Note You can add any number of applications on the switch to a region. If you try adding an application to the same region more than once, you see the "Application already present in the same region" error message.

The following example shows how to assign applications to a region:

```
switch# configure terminal
switch(config)# cfs region 1
switch(config-cfs-region)# ntp
switch(config-cfs-region)# callhome
```

Moving an Application to a Different CFS Region

You can move an application from one region to another region.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# cfs region <i>region-id</i>	Enters CFS region configuration submode.
Step 3	switch(config-cfs-region)# <i>application</i>	Indicates application(s) to be moved from one region into another. Note If you try moving an application to the same region more than once, you see the "Application already present in the same region" error message.

The following example shows how to move an application into Region 2 that was originally assigned to Region 1:

```
switch# configure terminal
switch(config)# cfs region 2
switch(config-cfs-region)# ntp
```

Removing an Application from a Region

Removing an application from a region is the same as moving the application back to the default region (Region 0), which brings the entire network into the scope of distribution for the application.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# cfs region <i>region-id</i>	Enters CFS region configuration submenu.
Step 3	switch(config-cfs-region)# no application	Removes application(s) that belong to the region.

Deleting CFS Regions

Deleting a region nullifies the region definition. All the applications bound by the region are released back to the default region.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# no cfs region <i>region-id</i>	Deletes the region. Note You see the, "All the applications in the region will be moved to the default region" warning.

Configuring CFS over IP

Enabling CFS over IPv4

You can enable or disable CFS over IPv4.

**Note**

CFS cannot distribute over both IPv4 and IPv6 from the same switch.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	switch(config)# cfs ipv4 distribute	Globally enables CFS over IPv4 for all applications on the switch.
Step 3	switch(config)# no cfs ipv4 distribute	(Optional) Disables (default) CFS over IPv4 on the switch.

Enabling CFS over IPv6

You can enable or disable CFS over IPv6.

Note

CFS cannot distribute over both IPv4 and IPv6 from the same switch.

Procedure

	Command or Action	Purpose
Step 1	switch# configure	Enters configuration mode.
Step 2	switch(config)# cfs ipv6 distribute	Globally enables CFS over IPv6 for all applications on the switch.
Step 3	switch(config)# no cfs ipv6 distribute	(Optional) Disables (default) CFS over IPv6 on the switch.

Verifying the CFS Over IP Configuration

The following example show how to verify the CFS over IP configuration:

```
switch# show cfs status
Distribution : Enabled
Distribution over IP : Enabled - mode IPv4
IPv4 multicast address : 239.255.70.83
IPv6 multicast address : ff15::ffff:4653
```

Configuring IP Multicast Addresses for CFS over IP

All CFS over IP enabled switches with similar multicast addresses form one CFS over IP network. CFS protocol-specific distributions, such as the keepalive mechanism for detecting network topology changes, use the IP multicast address to send and receive information.

**Note**

CFS distributions for application data use directed unicast.

Configuring IPv4 Multicast Address for CFS

You can configure a CFS over IP multicast address value for IPv4. The default IPv4 multicast address is 239.255.70.83.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# cfs ipv4 mcast-address <i>ipv4-address</i>	Configures the IPv4 multicast address for CFS distribution over IPv4. The ranges of valid IPv4 addresses are 239.255.0.0 through 239.255.255.255 and 239.192/16 through 239.251/16.
Step 3	switch(config)# no cfs ipv4 mcast-address <i>ipv4-address</i>	(Optional) Reverts to the default IPv4 multicast address for CFS distribution over IPv4. The default IPv4 multicast address for CFS is 239.255.70.83.

Configuring IPv6 Multicast Address for CFS

You can configure a CFS over IP multicast address value for IPv6. The default IPv6 multicast address is ff13:7743:4653.

Procedure

	Command or Action	Purpose
Step 1	switch# configure	Enters configuration mode.
Step 2	switch(config)# cfs ipv6 mcast-address <i>ipv4-address</i>	Configures the IPv6 multicast address for CFS distribution over IPv6. The range of valid IPv6 addresses is ff15::/16 (ff15::0000:0000 through ff15::ffff:ffff) and ff18::/16 (ff18::0000:0000 through ff18::ffff:ffff).
Step 3	switch(config)# no cfs ipv6 mcast-address <i>ipv4-address</i>	(Optional) Reverts to the default IPv6 multicast address for CFS distribution over IPv6. The default IPv6 multicast address for CFS over IP is ff15::efff:4653.

Verifying the IP Multicast Address Configuration for CFS over IP

The following example shows how to verify the IP multicast address configuration for CFS over IP:

```
switch# show cfs status
Fabric distribution Enabled
IP distribution Enabled mode ipv4
IPv4 multicast address : 10.1.10.100
IPv6 multicast address : ff13::e244:4754
```

Displaying CFS Distribution Information

The **show cfs merge status name** command displays the merge status for a given application. The following example displays the output for an application distributing in logical scope. It shows the merge status in all valid VSANs on the switch. The command output shows the merge status as one of the following: Success, Waiting, or Failure or In Progress. In case of a successful merge, all the switches in the network are shown under the local network. In case of a merge failure or a merge in progress, the local network and the remote network involved in the merge are indicated separately. The application server in each network that is mainly responsible for the merge is indicated by the term Merge Master.

```
switch# show cfs merge status name port-security

Logical [VSAN 1] Merge Status: Failed
Local Fabric
-----
Domain Switch WWN                IP Address
-----
238      20:00:00:05:30:00:6b:9e  10.76.100.167    [Merge Master]

Remote Fabric
-----
Domain Switch WWN                IP Address
-----
236      20:00:00:0e:d7:00:3c:9e   10.76.100.169    [Merge Master]

Logical [VSAN 2] Merge Status: Success
Local Fabric
-----
Domain Switch WWN                IP Address
-----
211      20:00:00:05:30:00:6b:9e  10.76.100.167    [Merge Master]
1        20:00:00:0e:d7:00:3c:9e   10.76.100.169

Logical [VSAN 3] Merge Status: Success
Local Fabric
-----
Domain Switch WWN                IP Address
-----
221      20:00:00:05:30:00:6b:9e  10.76.100.167    [Merge Master]
103      20:00:00:0e:d7:00:3c:9e   10.76.100.169
```

The following example of the **show cfs merge status name** command output displays an application using the physical scope with a merge failure. The command uses the specified application name to display the merge status based on the application scope.

```
switch# show cfs merge status name ntp

Physical Merge Status: Failed
Local Fabric
-----
Switch WWN                IP Address
-----
20:00:00:05:30:00:6b:9e  10.76.100.167    [Merge Master]
```

```

Remote Fabric
-----
Switch WWN                IP Address
-----
20:00:00:0e:d7:00:3c:9e  10.76.100.169    [Merge Master]

```

The **show cfs peers** command output displays all the switches in the physical network in terms of the switch WWN and the IP address. The local switch is indicated as Local.

```

switch# show cfs peers

Physical Fabric
-----
Switch WWN                IP Address
-----
20:00:00:05:30:00:6b:9e  10.76.100.167    [Local]
20:00:00:0e:d7:00:3c:9e  10.76.100.169
Total number of entries = 2

```

The **show cfs peers name** command displays all the peers for which a particular application is registered with CFS. The command output shows all the peers for the physical scope or for each of the valid VSANs on the switch, depending on the application scope. For physical scope, the switch WWNs for all the peers are indicated. The local switch is indicated as Local.

```

switch# show cfs peers name ntp

Scope      : Physical

-----
Switch WWN                IP Address
-----
20:00:00:44:22:00:4a:9e  172.22.92.27     [Local]
20:00:00:05:30:01:1b:c2  172.22.92.215

```

The following example **show cfs peers name** command output displays all the application peers (all switches in which that application is registered). The local switch is indicated as Local.

```

switch# show cfs peers name port-security
Scope      : Logical [VSAN 1]

-----
Domain    Switch WWN                IP Address
-----
124       20:00:00:44:22:00:4a:9e  172.22.92.27     [Local]
98        20:00:00:05:30:01:1b:c2  172.22.92.215

Total number of entries = 2

Scope      : Logical [VSAN 3]

-----
Domain    Switch WWN                IP Address
-----
224       20:00:00:44:22:00:4a:9e  172.22.92.27     [Local]

```

```
151      20:00:00:05:30:01:1b:c2  172.22.92.215
```

```
Total number of entries = 2
```

Default Settings for CFS

The following table lists the default settings for CFS configurations.

Table 2: Default CFS Parameters

Parameters	Default
CFS distribution on the switch	Enabled
Database changes	Implicitly enabled with the first configuration change
Application distribution	Differs based on application
Commit	Explicit configuration is required
CFS over IP	Disabled
IPv4 multicast address	239.255.70.83
IPv6 multicast address	ff15::eff:4653

The CISCO-CFS-MIB contains SNMP configuration information for any CFS-related functions. See the MIB reference for your platform.

Enabling CFS to Distribute Smart Call Home Configurations

You can enable CFS to distribute Call Home configurations to all Cisco NX-OS devices in the network. The entire Call Home configuration is distributed except the device priority and the sysContact names.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Call Home configuration mode.
Step 3	switch(config-callhome)# distribute	Enables CFS to distribute Smart Call Home configuration updates.

	Command or Action	Purpose
Step 4	switch(config-callhome)# show <i>application-name status</i>	(Optional) For the specified application, displays the CFS distribution status.
Step 5	switch(config-callhome)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

```

switch# configure terminal
switch(config)# callhome
switch(config-callhome)# distribute
switch(config-callhome)# show callhome status
Distribution : Enabled
switch(config-callhome)# copy running-config startup-config

```

Enabling CFS to Distribute DPVM Configurations

You can enable CFS to distribute dynamic port VSAN membership (DPVM) configurations in order to consistently administer and maintain the DPVM database across all Cisco NX-OS devices in the fabric.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Make sure that you enable the DPVM feature. To do so, use the **feature dpvm** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# dpvm distribute	Enables CFS to distribute DPVM configuration updates.
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute DPVM configurations:

```

switch(config)# dpvm distribute
switch(config)# show dpvm status

```

```
Distribution is enabled.
switch(config)# copy running-config startup-config
[#####] 100%
```

Enabling CFS to Distribute FC Domain Configurations

You can enable CFS to distribute Fibre Channel (FC) domain configurations in order to synchronize the configuration across the fabric from the console of a single Cisco NX-OS device and to ensure consistency in the allowed domain ID lists on all devices in the VSAN.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# fcdomain distribute	Enables CFS to distribute FC domain configuration updates.
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute FC domain configurations:

```
switch(config)# fcdomain distribute
switch(config)# show fcdomain status
fcdomain distribution is enabled
switch(config)# copy running-config startup-config
[#####] 100%
```

Enabling CFS to Distribute FC Port Security Configurations

You can enable CFS to distribute Fibre Channel (FC) port security configurations in order to provide a single point of configuration for the entire fabric in the VSAN and to enforce the port security policies throughout the fabric.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Make sure that you enable the FC port security feature. To do so, use the **feature fc-port-security** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# fc-port-security distribute	Enables CFS to distribute FC port security configuration updates.
Step 3	switch(config)# show cfs application	(Optional) Displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute FC port security configurations:

```
switch(config)# fc-port-security distribute
switch(config)# show cfs application
-----
Application Enabled Scope
-----
fc-port-securi Yes Logical
switch(config)# copy running-config startup-config
[#####] 100%
```

Enabling CFS to Distribute FC Timer Configurations

You can enable CFS to distribute Fibre Channel (FC) timer configurations for all Cisco NX-OS devices in the fabric.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# ftimer distribute	Enables CFS to distribute FC timer configuration updates.
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.

	Command or Action	Purpose
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute FC timer configurations:

```
switch(config)# fctimer distribute
switch(config)# show fctimer status
Distribution : Enabled
switch(config)# copy running-config startup-config
[#####] 100%
```

Enabling CFS to Distribute IVR Configurations

You can enable CFS to distribute inter-VSAN routing (IVR) configurations in order to enable efficient IVR configuration management and to provide a single point of configuration for the entire fabric in the VSAN.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Make sure that you install the Advanced SAN Services license.

Make sure that you enable the IVR feature. To do so, use the **feature ivr** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# ivr distribute	Enables CFS to distribute IVR configuration updates. Note You must enable IVR distribution on all IVR-enabled switches in the fabric.
Step 3	switch(config)# show cfs application	(Optional) Displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute IVR configurations:

```
switch(config)# ivr distribute
switch(config)# show cfs application
-----
```

```

Application Enabled Scope
-----
ivr Yes Physical-fc
switch(config)# copy running-config startup-config
[#####] 100%

```

Enabling CFS to Distribute NTP Configurations

You can enable CFS to distribute NTP configurations to all Cisco NX-OS devices in the network.

Before You Begin

Make sure that you enable the NTP feature (using the **feature ntp** command).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# ntp distribute	Enables CFS to distribute NTP configuration updates.
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

```

switch# configure terminal
switch(config)# ntp distribute
switch(config)# show ntp status
Distribution : Enabled
switch(config)# copy running-config startup-config

```

Enabling CFS to Distribute RADIUS Configurations

You can enable CFS to distribute RADIUS configurations to all Cisco NX-OS devices in the network.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# radius distribute	Enables CFS to distribute RADIUS configuration updates.

	Command or Action	Purpose
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

```
switch# configure terminal
switch(config)# radius distribute
switch(config)# show radius status
Distribution : Enabled
switch(config)# copy running-config startup-config
```

Enabling CFS to Distribute RSCN Configurations

You can enable CFS to distribute registered state change notification (RSCN) configurations to all Cisco NX-OS devices in the fabric.

Before You Begin

Make sure that you are in the storage VDC. To change to the storage VDC, use the **switchto vdc fcoe** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# rscn distribute	Enables CFS to distribute RSCN configuration updates.
Step 3	switch(config)# show cfs application	(Optional) Displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to enable CFS to distribute RSCN configurations:

```
switch(config)# rscn distribute
switch(config)# show cfs application
-----
Application Enabled Scope
-----
rscn Yes Logical
```

```
switch(config)# copy running-config startup-config
[#####] 100%
```

Enabling CFS to Distribute TACACS+ Configurations

You can enable CFS to distribute TACACS+ configurations to all Cisco NX-OS devices in the network.

Before You Begin

Make sure that you enable the TACACS+ feature (using the **feature tacacs+** command).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# tacacs+ distribute	Enables CFS to distribute TACACS+ configuration updates.
Step 3	switch(config)# show application-name status	(Optional) For the specified application, displays the CFS distribution status.
Step 4	switch(config)# copy running-config startup config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

```
switch# configure terminal
switch(config)# tacacs+ distribute
switch(config)# show tacacs+ status
Distribution : Enabled
switch(config)# copy running-config startup-config
```

Configuring PTP

This chapter contains the following sections:

- [Information About PTP, page 65](#)
- [PTP Device Types, page 66](#)
- [PTP Process, page 67](#)
- [Clock Management, page 68](#)
- [High Availability for PTP, page 68](#)
- [Licensing Requirements for PTP, page 68](#)
- [Guidelines and Limitations for PTP, page 68](#)
- [Default Settings for PTP, page 69](#)
- [Configuring PTP, page 69](#)

Information About PTP

PTP is a time synchronization protocol for nodes distributed across a network. Its hardware timestamp feature provides greater accuracy than other time synchronization protocols such as the Network Time Protocol (NTP).

A PTP system can consist of a combination of PTP and non-PTP devices. PTP devices include ordinary clocks, boundary clocks, and transparent clocks. Non-PTP devices include ordinary network switches, routers, and other infrastructure devices.

PTP is a distributed protocol that specifies how real-time PTP clocks in the system synchronize with each other. These clocks are organized into a master-slave synchronization hierarchy with the grandmaster clock, which is the clock at the top of the hierarchy, determining the reference time for the entire system. Synchronization is achieved by exchanging PTP timing messages, with the members using the timing information to adjust their clocks to the time of their master in the hierarchy. PTP operates within a logical scope called a PTP domain.

Starting from Cisco NXOS Release 6.0(2)A8(3), PTP supports configuring multiple PTP clocking domains, PTP grandmaster capability, PTP cost on interfaces for slave and passive election, and clock identity.

All the switches in a multi-domain environment, belong to one domain. The switches that are the part of boundary clock, must have multi-domain feature enabled on them. Each domain has user configurable

parameters such as domain priority, clock class threshold and clock accuracy threshold. The clocks in each domain remain synchronized with the master clock in that domain. If the GPS in a domain fails, the master clock in the domain synchronizes time and data sets associated with the announce messages from the master clock in the domain where the GPS is active. If the master clock from the highest priority domain does not meet the clock quality attributes, a clock in the subsequent domain that match the criteria is selected. The Best Master Clock Algorithm (BMCA) is used to select the master clock if none of the domains has the desired clock quality attributes. If all the domains have equal priority and the threshold values less than master clock attributes or if the threshold values are greater than the master clock attributes, BMCA is used to select the master clock.

Grandmaster capability feature controls the switch's ability of propagating its clock to other devices that it is connected to. When the switch receives announce messages on an interface, it checks the clock class threshold and clock accuracy threshold values. If the values of these parameters are within the predefined limits, then the switch acts as per PTP standards specified in IEEE 1588v2. If the switch does not receive announce messages from external sources or if the parameters of the announce messages received are not within the predefined limits, the port state will be changed to listening mode. On a switch with no slave ports, the state of all the PTP enabled ports is rendered as listening and on a switch with one slave port, the BMCA is used to determine states on all PTP enabled ports. Convergence time prevents timing loops at the PTP level when grandmaster capability is disabled on a switch. If the slave port is not selected on the switch, all the ports on the switch will be in listening state for a minimum interval specified in the convergence time. The convergence time range is from 3 to 2600 seconds and the default value is 3 seconds.

The interface cost applies to each PTP enabled port if the switch has more than one path to grandmaster clock. The port with the least cost value is elected as slave and the rest of the ports will remain as passive ports.

The clock identity is a unique 8-octet array presented in the form of a character array based on the switch MAC address. The clock identity is determined from MAC according to the IEEE1588v2-2008 specifications. The clock ID is a combination of bytes in a VLAN MAC address as defined in IEEE1588v2.

PTP Device Types

The following clocks are common PTP devices:

Ordinary clock

Communicates with the network based on a single physical port, similar to an end host. An ordinary clock can function as a grandmaster clock.

Boundary clock

Typically has several physical ports, with each port behaving like a port of an ordinary clock. However, each port shares the local clock, and the clock data sets are common to all ports. Each port decides its individual state, either master (synchronizing other ports connected to it) or slave (synchronizing to a downstream port), based on the best clock available to it through all of the other ports on the boundary clock. Messages that are related to synchronization and establishing the master-slave hierarchy terminate in the protocol engine of a boundary clock and are not forwarded.

Transparent clock

Forwards all PTP messages like an ordinary switch or router but measures the residence time of a packet in the switch (the time that the packet takes to traverse the transparent clock) and in some cases the link delay of the ingress port for the packet. The ports have no state because the transparent clock does not need to synchronize to the grandmaster clock.

There are two kinds of transparent clocks:

End-to-end transparent clock

Measures the residence time of a PTP message and accumulates the times in the correction field of the PTP message or an associated follow-up message.

Peer-to-peer transparent clock

Measures the residence time of a PTP message and computes the link delay between each port and a similarly equipped port on another node that shares the link. For a packet, this incoming link delay is added to the residence time in the correction field of the PTP message or an associated follow-up message.

**Note**

PTP operates only in boundary clock mode. We recommend that you deploy a Grand Master Clock (10 MHz) upstream. The servers contain clocks that require synchronization and are connected to the switch. End-to-end transparent clock and peer-to-peer transparent clock modes are not supported.

PTP Process

The PTP process consists of two phases: establishing the master-slave hierarchy and synchronizing the clocks. Within a PTP domain, each port of an ordinary or boundary clock follows this process to determine its state:

- Examines the contents of all received announce messages (issued by ports in the master state)
- Compares the data sets of the foreign master (in the announce message) and the local clock for priority, clock class, accuracy, and so on
- Determines its own state as either master or slave

After the master-slave hierarchy has been established, the clocks are synchronized as follows:

- The master sends a synchronization message to the slave and notes the time it was sent.
- The slave receives the synchronization message and notes the time that it was received. For every synchronization message, there is a follow-up message. The number of sync messages should be equal to the number of follow-up messages.
- The slave sends a delay-request message to the master and notes the time it was sent.
- The master receives the delay-request message and notes the time it was received.
- The master sends a delay-response message to the slave. The number of delay request messages should be equal to the number of delay response messages.

- The slave uses these timestamps to adjust its clock to the time of its master.

Clock Management

By default, Cisco NX-OS uses NTP to update the system clock. However, if the **clock protocol** property is configured to **PTP**, PTP is allowed to update the system clock.

If PTP is enabled, NTP does not update the system time.

High Availability for PTP

Stateful restarts are supported for PTP. After a reboot or a supervisor switchover, the running configuration is applied.

Licensing Requirements for PTP

PTP requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the *Cisco NX-OS Licensing Guide*.

Guidelines and Limitations for PTP

- PTP operates only in boundary clock mode. End-to-end transparent clock and peer-to-peer transparent clock modes are not supported.
- PTP supports transport over User Datagram Protocol (UDP). Transport over Ethernet is not supported.
- PTP supports only multicast communication. Negotiated unicast communication is not supported.
- PTP is limited to a single domain per network.
- All management messages are forwarded on ports on which PTP is enabled. Handling management messages is not supported.
- PTP is only configurable on switch ports. Configuring PTP on FEX ports is not supported.
- PTP-capable ports do not identify PTP packets and do not time-stamp or redirect those packets unless you enable PTP on those ports.
- PTP is only supported on physical Ethernet-based ports.
- In VPC environments, PTP must be individually configured on each member port.
- PTP over FabricPath is not supported.
-

Default Settings for PTP

The following table lists the default settings for PTP parameters.

Table 3: Default PTP Parameters

Parameters	Default
PTP	Disabled
PTP version	2
PTP domain	0. PTP multi domain is disabled by default.
PTP priority 1 value when advertising the clock	255
PTP priority 2 value when advertising the clock	255
PTP announce interval	1 log second
PTP sync interval	0 log seconds
PTP announce timeout	3 announce intervals
PTP minimum delay request interval	0 log seconds
PTP VLAN	1

Configuring PTP

Configuring PTP Globally

You can enable or disable PTP globally on a device. You can also configure various PTP clock parameters to help determine which clock in the network has the highest priority to be selected as the grandmaster.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # [no] feature ptp	Enables or disables PTP on the device. Note Enabling PTP on the switch does not enable PTP on each interface.

	Command or Action	Purpose
Step 3	switch(config) # [no] ptp source <i>ip-address</i> [vrf <i>vrf</i>]	Configures the source IP address for all PTP packets. The <i>ip-address</i> can be in IPv4 or IPv6 format.
Step 4	switch(config) # [no] ptp domain <i>number</i>	(Optional) Configures the domain number to use for this clock. PTP domains allow you to use multiple independent PTP clocking subdomains on a single network. The range for the <i>number</i> is from 0 to 128.
Step 5	switch(config) # [no] ptp priority1 <i>value</i>	(Optional) Configures the priority1 value to use when advertising this clock. This value overrides the default criteria (clock quality, clock class, and so on) for the best master clock selection. Lower values take precedence. The range for the <i>value</i> is from 0 to 255.
Step 6	switch(config) # [no] ptp priority2 <i>value</i>	(Optional) Configures the priority2 value to use when advertising this clock. This value is used to decide between two devices that are otherwise equally matched in the default criteria. For example, you can use the priority2 value to give a specific switch priority over other identical switches. The range for the <i>value</i> is from 0 to 255.
Step 7	switch(config) # show ptp brief	(Optional) Displays the PTP status.
Step 8	switch(config) # show ptp clock	(Optional) Displays the properties of the local clock.
Step 9	switch(config) # copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure PTP globally on the device, specify the source IP address for PTP communications, and configure a preference level for the clock:

```
switch# configure terminal
switch(config)# feature ptp
switch(config)# ptp source 10.10.10.1
switch(config)# ptp priority1 1
switch(config)# ptp priority2 1
switch(config)# show ptp brief
PTP port status
-----
Port State
-----
switch(config)# show ptp clock
PTP Device Type: Boundary clock
Clock Identity : 0:22:55:ff:ff:79:a4:c1
Clock Domain: 0
Number of PTP ports: 0
```

```

Priority1 : 1
Priority2 : 1
Clock Quality:
Class : 248
Accuracy : 254
Offset (log variance) : 65535
Offset From Master : 0
Mean Path Delay : 0
Steps removed : 0
Local clock time:Sun Jul 3 14:13:24 2011
switch(config)#

```

Configuring PTP on an Interface

After you globally enable PTP, it is not enabled on all supported interfaces by default. You must enable PTP interfaces individually.

Before You Begin

Make sure that you have globally enabled PTP on the switch and configured the source IP address for PTP communication.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # interface ethernet slot/port	Specifies the interface on which you are enabling PTP and enters interface configuration mode.
Step 3	switch(config-if) # [no] feature ptp	Enables or disables PTP on an interface.
Step 4	switch(config-if) # [no] ptp announce {interval log seconds timeout count}	(Optional) Configures the interval between PTP announce messages on an interface or the number of PTP intervals before a timeout occurs on an interface. The range for the PTP announcement interval is from 0 to 4 seconds, and the range for the interval timeout is from 2 to 10.
Step 5	switch(config-if) # [no] ptp delay request minimum interval log seconds	(Optional) Configures the minimum interval allowed between PTP delay-request messages when the port is in the master state. The range is from log(-6) to log(1) seconds. Where, log(-2) = 2 frames per second.
Step 6	switch(config-if) # [no] ptp sync interval log seconds	(Optional) Configures the interval between PTP synchronization messages on an interface. The range for the ptp sync interval is from -3 seconds to 1 second.

	Command or Action	Purpose
Step 7	switch(config-if) # [no] ptp vlan <i>vlan-id</i>	(Optional) Specifies the VLAN for the interface where PTP is being enabled. You can only enable PTP on one VLAN on an interface. The range is from 1 to 4094.
Step 8	switch(config-if) # show ptp brief	(Optional) Displays the PTP status.
Step 9	switch(config-if) # show ptp port interface <i>interface slot/port</i>	(Optional) Displays the status of the PTP port.
Step 10	switch(config-if)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to configure PTP on an interface and configure the intervals for the announce, delay-request, and synchronization messages:

```
switch# configure terminal
switch(config)# interface ethernet 2/1
switch(config-if)# ptp
switch(config-if)# ptp announce interval 3
switch(config-if)# ptp announce timeout 2
switch(config-if)# ptp delay-request minimum interval 4
switch(config-if)# ptp sync interval -1
switch(config-if)# show ptp brief
PTP port status
-----
Port State
-----
Eth2/1 Master
switch(config-if)# show ptp port interface ethernet 1/1
PTP Port Dataset: Eth1/1
Port identity: clock identity: f4:4e:05:ff:fe:84:7e:7c
Port identity: port number: 0
PTP version: 2
Port state: Slave
VLAN info: 1
Delay request interval(log mean): 0
Announce receipt time out: 3
Peer mean path delay: 0
Announce interval(log mean): 1
Sync interval(log mean): 1
Delay Mechanism: End to End
Cost: 255
Domain: 5
switch(config-if)#
```

Verifying the PTP Configuration

Use one of the following commands to verify the configuration:

Table 4: PTP Show Commands

Command	Purpose
show ptp brief	Displays the PTP status.
show ptp clock	Displays the properties of the local clock, including the clock identity.
show ptp clock foreign-masters-record	Displays the state of foreign masters known to the PTP process. For each foreign master, the output displays the clock identity, basic clock properties, and whether the clock is being used as a grandmaster.
show ptp corrections	Displays the last few PTP corrections.
show ptp parent	Displays the properties of the PTP parent and grandmaster clock.
show ptp port interface ethernet <i>slot/port</i>	Displays the status of the PTP port on the switch.
show ptp time-property	Displays the PTP clock time properties.
show ptp domain data	Displays multiple domain data, domain priority, clock threshold and information about grandmaster capabilities.
show ptp interface domain	Displays information about the interface to domain association.
show ptp cost	Displays PTP port to cost association.

Configuring User Accounts and RBAC

This chapter contains the following sections:

- [Information About User Accounts and RBAC, page 75](#)
- [Guidelines and Limitations for User Accounts, page 81](#)
- [Configuring User Accounts, page 82](#)
- [Configuring RBAC, page 84](#)
- [Verifying the User Accounts and RBAC Configuration, page 88](#)
- [Configuring User Accounts Default Settings for the User Accounts and RBAC, page 88](#)

Information About User Accounts and RBAC

Cisco Nexus Series switches use role-based access control (RBAC) to define the amount of access that each user has when the user logs into the switch.

With RBAC, you define one or more user roles and then specify which management operations each user role is allowed to perform. When you create a user account for the switch, you associate that account with a user role, which then determines what the individual user is allowed to do on the switch.

User Roles

User roles contain rules that define the operations allowed for the user who is assigned the role. Each user role can contain multiple rules and each user can have multiple roles. For example, if role1 allows access only to configuration operations, and role2 allows access only to debug operations, users who belong to both role1 and role2 can access configuration and debug operations. You can also limit access to specific VSANs, VLANs, and interfaces.

The switch provides the following default user roles:

network-admin (superuser)

Complete read and write access to the entire switch.

network-operator

Complete read access to the switch. However, the network-operator role cannot run the **show running-config** and **show startup-config** commands.

**Note**

If you belong to multiple roles, you can execute a combination of all the commands permitted by these roles. Access to a command takes priority over being denied access to a command. For example, suppose a user has RoleA, which denied access to the configuration commands. However, the user also has RoleB, which has access to the configuration commands. In this case, the user has access to the configuration commands.

**Note**

Only network-admin user can perform a Checkpoint or Rollback in the RBAC roles. Though other users have these commands as a permit rule in their role, the user access is denied when you try to execute these commands.

Predefined SAN Admin User Role

The SAN admin user role is a noneditable, predefined user role that is designed to provide separation between LAN and SAN administrative tasks. Users that have been assigned the SAN admin user role have read-only access to all Ethernet configuration tasks. Write access for Ethernet features is not granted to SAN admin users unless it is assigned to them through another user role.

The following capabilities are permitted to SAN admin users:

- Interface configuration
- Attribute configuration for Fibre Channel Unified Ports, except creation and deletion
- VSAN configuration, including database and membership
- Mapping of preconfigured VLANs for FCoE to VSANs
- Zoning configuration
- Configuration of SNMP-related parameters, except SNMP community and SNMP users
- Read-only access to all other configurations
- Configuration and management of SAN features such as the following:
 - FC-SP
 - FC-PORT-SECURITY
 - FCoE
 - FCoE-NPV
 - FPORT-CHANNEL-TRUNK
 - PORT-TRACK
 - FABRIC-BINDING

- Configuration and management for the following of EXEC mode commands:
 - DEBUG
 - FCDOMAIN
 - FCPING
 - SAN-PORT-CHANNEL
 - SHOW
 - ZONE
 - ZONESET

**Note**

The SAN Admin role permits configuration on all interface types, not just Fibre Channel interfaces. The predefined SAN Admin user role was designed to allow access to all interfaces—including Ethernet interfaces—so it would not interfere with SNMP operations.

Rules

The rule is the basic element of a role. A rule defines what operations the role allows the user to perform. You can apply rules for the following parameters:

Command

A command or group of commands defined in a regular expression.

Feature

Commands that apply to a function provided by the Cisco Nexus device. Enter the **show role feature** command to display the feature names available for this parameter.

Feature group

Default or user-defined group of features. Enter the **show role feature-group** command to display the default feature groups available for this parameter.

These parameters create a hierarchical relationship. The most basic control parameter is the command. The next control parameter is the feature, which represents all commands associated with the feature. The last control parameter is the feature group. The feature group combines related features and allows you to easily manage the rules.

You can configure up to 256 rules for each role. The user-specified rule number determines the order in which the rules are applied. Rules are applied in descending order. For example, if a role has three rules, rule 3 is applied before rule 2, which is applied before rule 1.

SAN Admin Role-Feature Rule Mapping

The SAN admin role is not editable. The following role-features are part of preconfigured role. The preconfigured role comes complete read access and the following rules:

Table 5: Role-Feature Rules for SAN Admin User Role

Feature	Permissions
copy	Read and write permissions for copy-related commands
fabric-binding	Read and write permissions for fabric binding-related commands
fcdomain	Read and write permissions for Fibre Channel domain-related commands
fcfe	Read and write permissions for Fibre Channel FE-related commands
fcmgmt	Read and write permissions for Fibre Channel management-related commands
fcns	Read and write permissions for Fibre Channel-related service FCNS commands
fcoe	Read and write permissions for Fibre Channel over Ethernet-related commands
fcsp	Read and write permissions for Fibre Channel Security Protocol (FCSP)-related commands
fdmi	Read and write permissions for Fabric Device Management Interface (FDMI)-related commands
fspf	Read and write permissions for Fabric Shortest Path First (FSPF)-related commands
interface	Read and write permissions for interface-related commands, which includes all interfaces, not just Fibre Channel interfaces.
port-track	Read and write permissions for port track-related commands
port-security	Read and write permissions for port security-related commands
rdl	Read and write permissions for Remote Domain Loopback (RDL)-related commands
rmon	Read and write permissions for RMON-related commands

Feature	Permissions
rscn	Read and write permissions for Registered State Change Notification (RSCN)-related commands
snmp	Read and write permissions for SNMP-related commands
snmpTargetAddrEntry	Read and write permissions for SNMP trap target-related commands
snmpTargetParamsEntry	Read and write permissions for SNMP trap target parameter-related commands
span	Read and write permissions for SPAN-related commands
trapRegEntry	Read and write permissions for SNMP trap registry-related commands
trunk	Read and write permissions for Fibre Channel port channel trunk-related commands
vsan	Read and write permissions for VSAN-related commands
vsanIfvsan	Read and write permissions for FCoE VLAN-VSAN mapping command-related commands
wwnm	Read and write permissions for World Wide Name (WWN)-related commands
zone	Read and write permissions for zoning commands

User Role Policies

You can define user role policies to limit the switch resources that the user can access, or to limit access to interfaces, VLANs, and VSANs.

User role policies are constrained by the rules defined for the role. For example, if you define an interface policy to permit access to specific interfaces, the user does not have access to the interfaces unless you configure a command rule for the role to permit the **interface** command.

If a command rule permits access to specific resources (interfaces, VLANs, or VSANs), the user is permitted to access these resources, even if the user is not listed in the user role policies associated with that user.

User Account Configuration Restrictions

The following words are reserved and cannot be used to configure users:

- adm
- bin
- daemon
- ftp
- ftpuser
- games
- gdm
- gopher
- halt
- lp
- mail
- mailnull
- man
- mtsuser
- news
- nobody
- san-admin
- shutdown
- sync
- sys
- uucp
- xfs

Caution

User Password Requirements

Cisco Nexus device passwords are case sensitive and can contain alphanumeric characters only. Special characters, such as the dollar sign (\$) or the percent sign (%), are not allowed.

**Note**

Starting from Cisco NX-OS Release 7.2(0)N1(1), special characters, such as the dollar sign (\$) or the percent sign (%), can be used in Cisco Nexus device passwords.

If a password is trivial (such as a short, easy-to-decipher password), the Cisco Nexus device rejects the password. Be sure to configure a strong password for each user account. A strong password has the following characteristics:

- At least eight characters long
- Does not contain many consecutive characters (such as "abcd")
- Does not contain many repeating characters (such as "aaabbb")
- Does not contain dictionary words
- Does not contain proper names
- Contains both uppercase and lowercase characters
- Contains numbers

The following are examples of strong passwords:

- If2CoM18
- 2009AsdfLkj30
- Cb1955S21

**Note**

For security reasons, user passwords do not display in the configuration files.

Guidelines and Limitations for User Accounts

User accounts have the following guidelines and limitations when configuring user accounts and RBAC:

- Up to 256 rules can be added to a user role.
- A maximum of 64 user roles can be assigned to a user account.
- You can assign a user role to more than one user account.
- Predefined roles such as network-admin, network-operator, and san-admin are not editable.
- Add, delete, and editing of rules is not supported for the SAN admin user role.
- The interface, VLAN, and/or VSAN scope cannot be changed for the SAN admin user role.

**Note**

A user account must have at least one user role.

Configuring User Accounts

Note

Changes to user account attributes do not take effect until the user logs in and creates a new session.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# show role	(Optional) Displays the user roles available. You can configure other user roles, if necessary.
Step 3	switch(config) # username <i>user-id</i> [password <i>password</i>] [expire <i>date</i>] [role <i>role-name</i>]	Configures a user account. The <i>user-id</i> is a case-sensitive, alphanumeric character string with a maximum of 28 characters. The default <i>password</i> is undefined. Note If you do not specify a password, the user might not be able to log into the switch. The expire <i>date</i> option format is YYYY-MM-DD. The default is no expiry date.
Step 4	switch(config) # exit	Exits global configuration mode.
Step 5	switch# show user-account	(Optional) Displays the role configuration.
Step 6	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure a user account:

```
switch# configure terminal
switch(config)# username NewUser password 4Ty18Rnt
switch(config)# exit
switch# show user-account
```

Configuring SAN Admin Users

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # username <i>user-id</i> role san-admin password <i>password</i>	Configures SAN admin user role access for the specified user.
Step 3	switch(config) # show user-account	(Optional) Displays the role configuration.
Step 4	switch(config) # show snmp-user	(Optional) Displays the SNMP user configuration.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure a SAN admin user and display the user account and SNMP user configuration:

```
switch# configure terminal
switch(config) # username user1 role san-admin password xyz123
switch(config) # show user-account
user:admin
    this user account has no expiry date
    roles:network-admin
user:user1
    this user account has no expiry date
    roles:san-admin
switch(config) # show snmp user
```

SNMP USERS

User	Auth	Priv(enforce)	Groups
admin	md5	des(no)	network-admin
user1	md5	des(no)	san-admin

NOTIFICATION TARGET USES (configured for sending V3 Inform)

User	Auth	Priv
switch(config) #		

Configuring RBAC

Creating User Roles and Rules

The rule number that you specify determines the order in which the rules are applied. Rules are applied in descending order. For example, if a role has three rules, rule 3 is applied before rule 2, which is applied before rule 1.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # role name <i>role-name</i>	Specifies a user role and enters role configuration mode. The <i>role-name</i> argument is a case-sensitive, alphanumeric character string with a maximum of 16 characters.
Step 3	switch(config-role) # rule number {deny permit} command <i>command-string</i>	Configures a command rule. The <i>command-string</i> can contain spaces and regular expressions. For example, interface ethernet * includes all Ethernet interfaces. Repeat this command for as many rules as needed.
Step 4	switch(config-role)# rule number {deny permit} {read read-write}	Configures a read-only or read-and-write rule for all operations.
Step 5	switch(config-role)# rule number {deny permit} {read read-write} feature <i>feature-name</i>	Configures a read-only or read-and-write rule for a feature. Use the show role feature command to display a list of features. Repeat this command for as many rules as needed.
Step 6	switch(config-role)# rule number {deny permit} {read read-write} feature-group <i>group-name</i>	Configures a read-only or read-and-write rule for a feature group. Use the show role feature-group command to display a list of feature groups. Repeat this command for as many rules as needed.
Step 7	switch(config-role)# description <i>text</i>	(Optional) Configures the role description. You can include spaces in the description.
Step 8	switch(config-role)# end	Exits role configuration mode.

	Command or Action	Purpose
Step 9	switch# show role	(Optional) Displays the user role configuration.
Step 10	switch# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to create user roles and specify rules:

```
switch# configure terminal
switch(config)# role name UserA
switch(config-role)# rule deny command clear users
switch(config-role)# rule deny read-write
switch(config-role)# description This role does not allow users to use clear commands
switch(config-role)# end
switch(config)# show role
```

Creating Feature Groups

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # role feature-group <i>group-name</i>	Specifies a user role feature group and enters role feature group configuration mode. The <i>group-name</i> is a case-sensitive, alphanumeric character string with a maximum of 32 characters.
Step 3	switch(config) # exit	Exits global configuration mode.
Step 4	switch# show role feature-group	(Optional) Displays the role feature group configuration.
Step 5	switch# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

This example shows how to create a feature group:

```
switch# configure terminal
switch(config) # role feature-group group1
switch(config) # exit
switch# show role feature-group
switch# copy running-config startup-config
switch#
```

Changing User Role Interface Policies

You can change a user role interface policy to limit the interfaces that the user can access. Specify a list of interfaces that the role can access. You can specify it for as many interfaces as needed.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # role name <i>role-name</i>	Specifies a user role and enters role configuration mode.
Step 3	switch(config-role) # interface policy deny	Enters role interface policy configuration mode.
Step 4	switch(config-role-interface) # permit interface <i>interface-list</i>	Specifies a list of interfaces that the role can access. Repeat this command for as many interfaces as needed. For this command, you can specify Ethernet interfaces, Fibre Channel interfaces, and virtual Fibre Channel interfaces.
Step 5	switch(config-role-interface) # exit	Exits role interface policy configuration mode.
Step 6	switch(config-role) # show role	(Optional) Displays the role configuration.
Step 7	switch(config-role) # copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to change a user role interface policy to limit the interfaces that the user can access:

```
switch# configure terminal
switch(config)# role name UserB
switch(config-role)# interface policy deny
switch(config-role-interface)# permit interface ethernet 2/1
switch(config-role-interface)# permit interface fc 3/1
switch(config-role-interface)# permit interface vfc 30/1
```

Changing User Role VLAN Policies

You can change a user role VLAN policy to limit the VLANs that the user can access.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # role name <i>role-name</i>	Specifies a user role and enters role configuration mode.
Step 3	switch(config-role) # vlan policy deny	Enters role VLAN policy configuration mode.
Step 4	switch(config-role-vlan) # permit vlan <i>vlan-list</i>	Specifies a range of VLANs that the role can access. Repeat this command for as many VLANs as needed.
Step 5	switch(config-role-vlan) # exit	Exits role VLAN policy configuration mode.
Step 6	switch# show role	(Optional) Displays the role configuration.
Step 7	switch# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Changing User Role VSAN Policies

You can change a user role VSAN policy to limit the VSANs that the user can access.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config-role) # role name <i>role-name</i>	Specifies a user role and enters role configuration mode.
Step 3	switch(config-role) # vsan policy deny	Enters role VSAN policy configuration mode.
Step 4	switch(config-role-vsan) # permit vsan <i>vsan-list</i>	Specifies a range of VSANs that the role can access. Repeat this command for as many VSANs as needed.
Step 5	switch(config-role-vsan) # exit	Exits role VSAN policy configuration mode.
Step 6	switch# show role	(Optional) Displays the role configuration.

	Command or Action	Purpose
Step 7	switch# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Verifying the User Accounts and RBAC Configuration

Use one of the following commands to verify the configuration:

Command	Purpose
show role [<i>role-name</i>]	Displays the user role configuration
show role feature	Displays the feature list.
show role feature-group	Displays the feature group configuration.
show startup-config security	Displays the user account configuration in the startup configuration.
show running-config security [all]	Displays the user account configuration in the running configuration. The all keyword displays the default values for the user accounts.
show user-account	Displays user account information.

Configuring User Accounts Default Settings for the User Accounts and RBAC

The following table lists the default settings for user accounts and RBAC parameters.

Table 6: Default User Accounts and RBAC Parameters

Parameters	Default
User account password	Undefined.
User account expiry date	None.
Interface policy	All interfaces are accessible.

Parameters	Default
VLAN policy	All VLANs are accessible.
VFC policy	All VFCs are accessible.
VETH policy	All VETHs are accessible.

Configuring Session Manager

This chapter contains the following sections:

- [Information About Session Manager, page 91](#)
- [Guidelines and Limitations for Session Manager, page 91](#)
- [Configuring Session Manager, page 92](#)
- [Verifying the Session Manager Configuration, page 94](#)

Information About Session Manager

Session Manager allows you to implement your configuration changes in batch mode. Session Manager works in the following phases:

- **Configuration session**—Creates a list of commands that you want to implement in session manager mode.
- **Validation**—Provides a basic semantic check on your configuration. Cisco NX-OS returns an error if the semantic check fails on any part of the configuration.
- **Verification**—Verifies the configuration as a whole, based on the existing hardware and software configuration and resources. Cisco NX-OS returns an error if the configuration does not pass this verification phase.
- **Commit**—Cisco NX-OS verifies the complete configuration and implements the changes atomically to the device. If a failure occurs, Cisco NX-OS reverts to the original configuration.
- **Abort**—Discards the configuration changes before implementation.

You can optionally end a configuration session without committing the changes. You can also save a configuration session.

Guidelines and Limitations for Session Manager

Session Manager has the following configuration guidelines and limitations:

- Session Manager supports only the access control list (ACL) feature.
- You can create up to 32 configuration sessions.
- You can configure a maximum of 20,000 commands across all sessions.

Configuring Session Manager

Creating a Session

You can create up to 32 configuration sessions.

Procedure

	Command or Action	Purpose
Step 1	switch# configure session <i>name</i>	Creates a configuration session and enters session configuration mode. The name can be any alphanumeric string. Displays the contents of the session.
Step 2	switch(config-s)# show configuration session [<i>name</i>]	(Optional) Displays the contents of the session.
Step 3	switch(config-s)# save <i>location</i>	(Optional) Saves the session to a file. The location can be in bootflash or volatile.

Configuring ACLs in a Session

You can configure ACLs within a configuration session.

Procedure

	Command or Action	Purpose
Step 1	switch# configure session <i>name</i>	Creates a configuration session and enters session configuration mode. The name can be any alphanumeric string.
Step 2	switch(config-s)# ip access-list <i>name</i>	Creates an ACL.
Step 3	switch(config-s-acl)# permit <i>protocol source destination</i>	(Optional) Adds a permit statement to the ACL.

	Command or Action	Purpose
Step 4	switch(config-s-acl)# interface <i>interface-type number</i>	Enters interface configuration mode.
Step 5	switch(config-s-if)# ip port access-group <i>name in</i>	Adds a port access group to the interface.
Step 6	switch# show configuration session [<i>name</i>]	(Optional) Displays the contents of the session.

Verifying a Session

To verify a session, use the following command in session mode:

Command	Purpose
switch(config-s)# verify [verbose]	Verifies the commands in the configuration session.

Committing a Session

To commit a session, use the following command in session mode:

Command	Purpose
switch(config-s)# commit [verbose]	Commits the commands in the configuration session.

Saving a Session

To save a session, use the following command in session mode:

Command	Purpose
switch(config-s)# save <i>location</i>	(Optional) Saves the session to a file. The location can be in bootflash or volatile.

Discarding a Session

To discard a session, use the following command in session mode:

Command	Purpose
switch(config-s)# abort	Discards the configuration session without applying the commands.

Configuration Example for Session Manager

The following example shows how to create a configuration session for ACLs:

```
switch# configure session name test2
switch(config-s)# ip access-list acl2
switch(config-s-acl)# permit tcp any any
switch(config-s-acl)# exit
switch(config-s)# interface Ethernet 1/4
switch(config-s-ip)# ip port access-group acl2 in
switch(config-s-ip)# exit
switch(config-s)# verify
switch(config-s)# exit
switch# show configuration session test2
```

Verifying the Session Manager Configuration

To verify Session Manager configuration information, perform one of the following tasks:

Command	Purpose
show configuration session [<i>name</i>]	Displays the contents of the configuration session.
show configuration session status [<i>name</i>]	Displays the status of the configuration session.
show configuration session summary	Displays a summary of all the configuration sessions.

Configuring Online Diagnostics

This chapter contains the following sections:

- [Information About Online Diagnostics, page 95](#)
- [Configuring Online Diagnostics, page 98](#)
- [Verifying the Online Diagnostics Configuration, page 98](#)
- [Default Settings for Online Diagnostics, page 98](#)

Information About Online Diagnostics

Online diagnostics provide verification of hardware components during switch bootup or reset, and they monitor the health of the hardware during normal switch operation.

Cisco Nexus Series switches support bootup diagnostics and runtime diagnostics. Bootup diagnostics include disruptive tests and nondisruptive tests that run during system bootup and system reset.

Runtime diagnostics (also known as health monitoring diagnostics) include nondisruptive tests that run in the background during normal operation of the switch.

Bootup Diagnostics

Bootup diagnostics detect faulty hardware before bringing the switch online. Bootup diagnostics also check the data path and control path connectivity between the supervisor and the ASICs. The following table describes the diagnostics that are run only during switch bootup or reset.

Table 7: Bootup Diagnostics

Diagnostic	Description
PCIe	Tests PCI express (PCIe) access.
NVRAM	Verifies the integrity of the NVRAM.
In band port	Tests connectivity of the inband port to the supervisor.

Diagnostic	Description
Management port	Tests the management port.
Memory	Verifies the integrity of the DRAM.

Bootup diagnostics also include a set of tests that are common with health monitoring diagnostics.

Bootup diagnostics log any failures to the onboard failure logging (OBFL) system. Failures also trigger an LED display to indicate diagnostic test states (on, off, pass, or fail).

You can configure Cisco Nexus device to either bypass the bootup diagnostics or run the complete set of bootup diagnostics.

Health Monitoring Diagnostics

Health monitoring diagnostics provide information about the health of the switch. They detect runtime hardware errors, memory errors, software faults, and resource exhaustion.

Health monitoring diagnostics are nondisruptive and run in the background to ensure the health of a switch that is processing live network traffic.

The following table describes the health monitoring diagnostics for the switch.

Table 8: Health Monitoring Diagnostics Tests

Diagnostic	Description
LED	Monitors port and system status LEDs.
Power Supply	Monitors the power supply health state.
Temperature Sensor	Monitors temperature sensor readings.
Test Fan	Monitors the fan speed and fan control.

The following table describes the health monitoring diagnostics that also run during system boot or system reset.

Table 9: Health Monitoring and Bootup Diagnostics Tests

Diagnostic	Description
SPROM	Verifies the integrity of backplane and supervisor SPROMs.
Fabric engine	Tests the switch fabric ASICs.
Fabric port	Tests the ports on the switch fabric ASIC.

Diagnostic	Description
Forwarding engine	Tests the forwarding engine ASICs.
Forwarding engine port	Tests the ports on the forwarding engine ASICs.
Front port	Tests the components (such as PHY and MAC) on the front ports.

Expansion Module Diagnostics

During the switch bootup or reset, the bootup diagnostics include tests for the in-service expansion modules in the switch.

When you insert an expansion module into a running switch, a set of diagnostics tests are run. The following table describes the bootup diagnostics for an expansion module. These tests are common with the bootup diagnostics. If the bootup diagnostics fail, the expansion module is not placed into service.

Table 10: Expansion Module Bootup and Health Monitoring Diagnostics

Diagnostic	Description
SPROM	Verifies the integrity of backplane and supervisor SPROMs.
Fabric engine	Tests the switch fabric ASICs.
Fabric port	Tests the ports on the switch fabric ASIC.
Forwarding engine	Tests the forwarding engine ASICs.
Forwarding engine port	Tests the ports on the forwarding engine ASICs.
Front port	Tests the components (such as PHY and MAC) on the front ports.

Health monitoring diagnostics are run on in-service expansion modules. The following table describes the additional tests that are specific to health monitoring diagnostics for expansion modules.

Table 11: Expansion Module Health Monitoring Diagnostics

Diagnostic	Description
LED	Monitors port and system status LEDs.
Temperature Sensor	Monitors temperature sensor readings.

Configuring Online Diagnostics

You can configure the bootup diagnostics to run the complete set of tests, or you can bypass all bootup diagnostic tests for a faster module boot up time.

Note

We recommend that you set the bootup online diagnostics level to complete. We do not recommend bypassing the bootup online diagnostics.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# diagnostic bootup level [complete bypass]	Configures the bootup diagnostic level to trigger diagnostics when the device boots, as follows: <ul style="list-style-type: none"> • complete—Performs all bootup diagnostics. This is the default value. • bypass—Does not perform any bootup diagnostics.
Step 3	switch# show diagnostic bootup level	(Optional) Displays the bootup diagnostic level (bypass or complete) that is currently in place on the switch.

The following example shows how to configure the bootup diagnostics level to trigger the complete diagnostics:

```
switch# configure terminal
switch(config)# diagnostic bootup level complete
```

Verifying the Online Diagnostics Configuration

Use the following commands to verify online diagnostics configuration information:

Command	Purpose
show diagnostic bootup level	Displays the bootup diagnostics level.
show diagnostic result module <i>slot</i>	Displays the results of the diagnostics tests.

Default Settings for Online Diagnostics

The following table lists the default settings for online diagnostics parameters.

Table 12: Default Online Diagnostics Parameters

Parameters	Default
Bootup diagnostics level	complete

Configuring System Message Logging

This chapter contains the following sections:

- [Information About System Message Logging, page 101](#)
- [Licensing Requirements for System Message Logging, page 102](#)
- [Guidelines and Limitations for System Message Logging, page 103](#)
- [Default Settings for System Message Logging, page 103](#)
- [Configuring System Message Logging, page 103](#)
- [Configuring DOM Logging, page 116](#)
- [Verifying the System Message Logging Configuration, page 117](#)

Information About System Message Logging

You can use system message logging to control the destination and to filter the severity level of messages that system processes generate. You can configure logging to terminal sessions, a log file, and syslog servers on remote systems.

System message logging is based on [RFC 3164](#). For more information about the system message format and the messages that the device generates, see the *Cisco NX-OS System Messages Reference*.

By default, the Cisco Nexus device outputs messages to terminal sessions.

By default, the switch logs system messages to a log file.

The following table describes the severity levels used in system messages. When you configure the severity level, the system outputs messages at that level and lower.

Table 13: System Message Severity Levels

Level	Description
0 – emergency	System unusable
1 – alert	Immediate action needed

Level	Description
2 – critical	Critical condition
3 – error	Error condition
4 – warning	Warning condition
5 – notification	Normal but significant condition
6 – informational	Informational message only
7 – debugging	Appears during debugging only

The switch logs the most recent 100 messages of severity 0, 1, or 2 to the NVRAM log. You cannot configure logging to the NVRAM.

You can configure which system messages should be logged based on the facility that generated the message and its severity level.

Syslog Servers

Syslog servers run on remote systems that are configured to log system messages based on the syslog protocol. You can configure the Cisco Nexus Series switch to send logs to up to eight syslog servers.

To support the same configuration of syslog servers on all switches in a fabric, you can use Cisco Fabric Services (CFS) to distribute the syslog server configuration.

Note

When the switch first initializes, messages are sent to syslog servers only after the network is initialized.

Licensing Requirements for System Message Logging

Product	License Requirement
Cisco NX-OS	System message logging requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <i>Cisco NX-OS Licensing Guide</i> .

Guidelines and Limitations for System Message Logging

System messages are logged to the console and the logfile by default.

Default Settings for System Message Logging

The following table lists the default settings for system message logging parameters.

Table 14: Default System Message Logging Parameters

Parameters	Default
Console logging	Enabled at severity level 2
Monitor logging	Enabled at severity level 2
Log file logging	Enabled to log messages at severity level 5
Module logging	Enabled at severity level 5
Facility logging	Enabled
Time-stamp units	Seconds
Syslog server logging	Disabled
Syslog server configuration distribution	Disabled

Configuring System Message Logging

Configuring System Message Logging to Terminal Sessions

You can configure the switch to log messages by their severity level to console, Telnet, and Secure Shell sessions.

By default, logging is enabled for terminal sessions.

Procedure

	Command or Action	Purpose
Step 1	switch# terminal monitor	Copies syslog messages from the console to the current terminal session.

	Command or Action	Purpose
Step 2	switch# configure terminal	Enters global configuration mode.
Step 3	switch(config)# logging console [severity-level]	<p>Enables the switch to log messages to the console session based on a specified severity level or higher (a lower number value indicates a higher severity level). Severity levels range from 0 to 7:</p> <ul style="list-style-type: none"> • 0 – emergency • 1 – alert • 2 – critical • 3 – error • 4 – warning • 5 – notification • 6 – informational • 7 – debugging <p>If the severity level is not specified, the default of 2 is used.</p>
Step 4	switch(config)# no logging console [severity-level]	<p>(Optional)</p> <p>Disables logging messages to the console.</p>
Step 5	switch(config)# logging monitor [severity-level]	<p>Enables the switch to log messages to the monitor based on a specified severity level or higher (a lower number value indicates a higher severity level). Severity levels range from 0 to 7:</p> <ul style="list-style-type: none"> • 0 – emergency • 1 – alert • 2 – critical • 3 – error • 4 – warning • 5 – notification • 6 – informational • 7 – debugging <p>If the severity level is not specified, the default of 2 is used.</p> <p>The configuration applies to Telnet and SSH sessions.</p>
Step 6	switch(config)# no logging monitor [severity-level]	<p>(Optional)</p> <p>Disables logging messages to Telnet and SSH sessions.</p>

	Command or Action	Purpose
Step 7	switch# show logging console	(Optional) Displays the console logging configuration.
Step 8	switch# show logging monitor	(Optional) Displays the monitor logging configuration.
Step 9	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure a logging level of 3 for the console:

```
switch# configure terminal
switch(config)# logging console 3
```

The following example shows how to display the console logging configuration:

```
switch# show logging console
Logging console:                  enabled (Severity: error)
```

The following example shows how to disable logging for the console:

```
switch# configure terminal
switch(config)# no logging console
```

The following example shows how to configure a logging level of 4 for the terminal session:

```
switch# terminal monitor
switch# configure terminal
switch(config)# logging monitor 4
```

The following example shows how to display the terminal session logging configuration:

```
switch# show logging monitor
Logging monitor:                  enabled (Severity: warning)
```

The following example shows how to disable logging for the terminal session:

```
switch# configure terminal
switch(config)# no logging monitor
```

Configuring System Message Logging to a File

You can configure the switch to log system messages to a file. By default, system messages are logged to the file log:messages.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# logging logfile logfile-name severity-level [size bytes]	Configures the name of the log file used to store system messages and the minimum severity level to log. You can

	Command or Action	Purpose
		<p>optionally specify a maximum file size. The default severity level is 5 and the file size is 4194304.</p> <p>Severity levels range from 0 to 7:</p> <ul style="list-style-type: none"> • 0 – emergency • 1 – alert • 2 – critical • 3 – error • 4 – warning • 5 – notification • 6 – informational • 7 – debugging <p>The file size is from 4096 to 10485760 bytes.</p>
Step 3	switch(config)# no logging logfile [<i>logfile-name severity-level [size bytes]</i>]	(Optional) Disables logging to the log file. You can optionally specify a maximum file size. The default severity level is 5 and the file size is 4194304.
Step 4	switch# show logging info	(Optional) Displays the logging configuration. You can optionally specify a maximum file size. The default severity level is 5 and the file size is 4194304.
Step 5	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure a switch to log system messages to a file:

```
switch# configure terminal
switch(config)# logging logfile my_log 6 size 4194304
```

The following example shows how to display the logging configuration (some of the output has been removed for brevity):

```
switch# show logging info
Logging console:          enabled (Severity: debugging)
Logging monitor:          enabled (Severity: debugging)
Logging linecard:         enabled (Severity: notifications)
Logging fex:              enabled (Severity: notifications)
Logging timestamp:        Seconds
Logging server:           disabled
Logging logfile:          enabled
                          Name - my_log: Severity - informational Size - 4194304
Facility      Default Severity      Current Session Severity
-----
aaa           3
acلمgr       3
afm           3
```

altos	3	3

...		

Configuring Module and Facility Messages Logging

You can configure the severity level and time-stamp units of messages logged by modules and facilities.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# logging module [<i>severity-level</i>]	<p>Enables module log messages that have the specified severity level or higher. Severity levels range from 0 to 7:</p> <ul style="list-style-type: none"> • 0 – emergency • 1 – alert • 2 – critical • 3 – error • 4 – warning • 5 – notification • 6 – informational • 7 – debugging <p>If the severity level is not specified, the default of 5 is used.</p>
Step 3	switch(config)# logging level <i>facility severity-level</i>	<p>Enables logging messages from the specified facility that have the specified severity level or higher. Severity levels from 0 to 7:</p> <ul style="list-style-type: none"> • 0 – emergency • 1 – alert • 2 – critical • 3 – error • 4 – warning • 5 – notification • 6 – informational • 7 – debugging

	Command or Action	Purpose
		To apply the same severity level to all facilities, use the all facility . For defaults, see the show logging level command. Note If the default severity and current session severity of a component is the same, then the logging level for the component will not be displayed in the running configuration.
Step 4	switch(config)# no logging module [<i>severity-level</i>]	(Optional) Disables module log messages.
Step 5	switch(config)# no logging level [<i>facility severity-level</i>]	(Optional) Resets the logging severity level for the specified facility to its default level. If you do not specify a facility and severity level, the switch resets all facilities to their default levels.
Step 6	switch# show logging module	(Optional) Displays the module logging configuration.
Step 7	switch# show logging level [<i>facility</i>]	(Optional) Displays the logging level configuration and the system default level by facility. If you do not specify a facility, the switch displays levels for all facilities.
Step 8	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure the severity level of module and specific facility messages:

```
switch# configure terminal
switch(config)# logging module 3
switch(config)# logging level aaa 2
```

Configuring Logging Timestamps

You can configure the time-stamp units of messages logged by the Cisco Nexus Series switch.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# logging timestamp {microseconds milliseconds seconds}	Sets the logging time-stamp units. By default, the units are seconds.

	Command or Action	Purpose
Step 3	switch(config)# no logging timestamp { microseconds milliseconds seconds }	(Optional) Resets the logging time-stamp units to the default of seconds.
Step 4	switch# show logging timestamp	(Optional) Displays the logging time-stamp units configured.
Step 5	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure the time-stamp units of messages:

```
switch# configure terminal
switch(config)# logging timestamp milliseconds
switch(config)# exit
switch# show logging timestamp
Logging timestamp:                Milliseconds
```

Configuring the ACL Logging Cache

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# logging ip access-list cache entries <i>num_entries</i>	Sets the maximum number of log entries cached in software. The range is from 0 to 1000000 entries. The default value is 8000 entries.
Step 3	switch(config)# logging ip access-list cache interval <i>seconds</i>	Sets the number of seconds between log updates. Also if an entry is inactive for this duration, it is removed from the cache. The range is from 5 to 86400 seconds. The default value is 300 seconds.
Step 4	switch(config)# logging ip access-list cache threshold <i>num_packets</i>	Sets the number of packet matches before an entry is logged. The range is from 0 to 1000000 packets. The default value is 0 packets, which means that logging is not triggered by the number of packet matches.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example show how to set the maximum number of log entries to 5000, the interval to 120 seconds, and the threshold to 500000:

```
switch# configure terminal
switch(config)# logging ip access-list cache entries 5000
switch(config)# logging ip access-list cache interval 120
switch(config)# logging ip access-list cache threshold 500000
switch(config)# copy running-config startup-config
```

Applying ACL Logging to an Interface

Before You Begin

- Create an IP access list with at least one access control entry (ACE) configured for logging.
- Configure the ACL logging cache.
- Configure the ACL log match level.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# interface mgmt0	Specifies the mgmt0 interface.
Step 3	switch(config-if)# ip access-group name in	Enables ACL logging on ingress traffic for the specified interface.
Step 4	switch(config-if)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to apply the mgmt0 interface with the logging specified in acl1 for all ingress traffic:

```
switch# configure terminal
switch(config)# interface mgmt0
switch(config-if)# ip access-group acl1 in
switch(config-if)# copy running-config startup-config
```

Configuring the ACL Log Match Level

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# aclog match-log-level <i>number</i>	Specifies the logging level to match for entries to be logged in the ACL log (aclog). The <i>number</i> is a value from 0 to 7. The default is 6. Note For log messages to be entered in the logs, the logging level for the ACL log facility (aclog) and the logging severity level for the logfile must be greater than or equal to the ACL log match log level setting. For more information, see Configuring Module and Facility Messages Logging , on page 107 and Configuring System Message Logging to a File , on page 105.
Step 3	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Configuring Syslog Servers

You can configure up to eight syslog servers that reference remote systems where you want to log system messages.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	logging server <i>host</i> [<i>severity-level</i> [<i>use-vrf</i> <i>vrf-name</i> [<i>facility</i> <i>facility</i>]]] Example: switch(config)# logging server 172.28.254.254 5 use-vrf default facility local3	Configures a host to receive syslog messages. <ul style="list-style-type: none">• The <i>host</i> argument identifies the hostname or the IPv4 or IPv6 address of the syslog server host.• The <i>severity-level</i> argument limits the logging of messages to the syslog server to a specified level. Severity levels range from 0 to 7. See Table 13: System Message Severity Levels, on page 101.

	Command or Action	Purpose
		<ul style="list-style-type: none"> The use vrf <i>vrf-name</i> keyword and argument identify the <i>default</i> or <i>management</i> values for the virtual routing and forwarding (VRF) name. If a specific VRF is not identified, management is the default. However, if management is configured, it will not be listed in the output of the show-running command because it is the default. If a specific VRF is configured, the show-running command output will list the VRF for each server. <p>Note The current Cisco Fabric Services (CFS) distribution does not support VRF. If CFS distribution is enabled, the logging server configured with the default VRF is distributed as the management VRF.</p> <ul style="list-style-type: none"> The facility argument names the syslog facility type. The default outgoing facility is local7. <p>The facilities are listed in the command reference for the Cisco Nexus Series software that you are using.</p> <p>Note Debugging is a CLI facility but the debug syslogs are not sent to the server.</p>
Step 3	no logging server <i>host</i> Example: <pre>switch(config)# no logging server 172.28.254.254 5</pre>	(Optional) Removes the logging server for the specified host.
Step 4	show logging server Example: <pre>switch# show logging server</pre>	(Optional) Displays the syslog server configuration.
Step 5	copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following examples show how to configure a syslog server:

```
switch# configure terminal
switch(config)# logging server 172.28.254.254 5
use-vrf default facility local3
```

```
switch# configure terminal
switch(config)# logging server 172.28.254.254 5 use-vrf management facility local3
```

Configuring syslog on a UNIX or Linux System

You can configure a syslog server on a UNIX or Linux system by adding the following line to the `/etc/syslog.conf` file:

```
facility.level <five tab characters> action
```

The following table describes the syslog fields that you can configure.

Table 15: syslog Fields in syslog.conf

Field	Description
Facility	Creator of the message, which can be auth, authpriv, cron, daemon, kern, lpr, mail, mark, news, syslog, user, local0 through local7, or an asterisk (*) for all. These facility designators allow you to control the destination of messages based on their origin. Note Check your configuration before using a local facility.
Level	Minimum severity level at which messages are logged, which can be debug, info, notice, warning, err, crit, alert, emerg, or an asterisk (*) for all. You can use none to disable a facility.
Action	Destination for messages, which can be a filename, a hostname preceded by the at sign (@), or a comma-separated list of users or an asterisk (*) for all logged-in users.

Procedure

Step 1 Log debug messages with the local7 facility in the file `/var/log/myfile.log` by adding the following line to the `/etc/syslog.conf` file:

```
debug.local7 /var/log/myfile.log
```

Step 2 Create the log file by entering these commands at the shell prompt:

```
$ touch /var/log/myfile.log
$ chmod 666 /var/log/myfile.log
```

Step 3 Make sure that the system message logging daemon reads the new changes by checking `myfile.log` after entering this command:

```
$ kill -HUP ~cat /etc/syslog.pid~
```

Configuring syslog Server Configuration Distribution

You can distribute the syslog server configuration to other switches in the network by using the Cisco Fabric Services (CFS) infrastructure.

After you enable syslog server configuration distribution, you can modify the syslog server configuration and view the pending changes before committing the configuration for distribution. As long as distribution is enabled, the switch maintains pending changes to the syslog server configuration.

Note

If the switch is restarted, the syslog server configuration changes that are kept in volatile memory might get lost.

Before You Begin

You must have configured one or more syslog servers.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# logging distribute	Enables distribution of the syslog server configuration to network switches using the CFS infrastructure. By default, distribution is disabled.
Step 3	switch(config)# logging commit	Commits the pending changes to the syslog server configuration for distribution to the switches in the fabric.
Step 4	switch(config)# logging abort	Cancels the pending changes to the syslog server configuration.
Step 5	switch(config)# no logging distribute	(Optional) Disables the distribution of the syslog server configuration to network switches using the CFS infrastructure. You cannot disable distribution when configuration changes are pending. See the logging commit and logging abort commands. By default, distribution is disabled.
Step 6	switch# show logging pending	(Optional) Displays the pending changes to the syslog server configuration.
Step 7	switch# show logging pending-diff	(Optional) Displays the differences from the current syslog server configuration to the pending changes of the syslog server configuration.

	Command or Action	Purpose
Step 8	switch# show logging internal info	(Optional) Displays information about the current state of the syslog server distribution and the last action taken.
Step 9	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

Displaying and Clearing Log Files

You can display or clear messages in the log file and the NVRAM.

Procedure

	Command or Action	Purpose
Step 1	switch# show logging last <i>number-lines</i>	Displays the last number of lines in the logging file. You can specify from 1 to 9999 for the last number of lines.
Step 2	switch# show logging logfile [start-time yyyy mmm dd hh:mm:ss] [end-time yyyy mmm dd hh:mm:ss]	Displays the messages in the log file that have a time stamp within the span entered. If you do not enter an end time, the current time is used. You enter three characters for the month time field and digits for the year and day time fields.
Step 3	switch# show logging nvram [last <i>number-lines</i>]	Displays the messages in the NVRAM. To limit the number of lines displayed, you can enter the last number of lines to display. You can specify from 1 to 100 for the last number of lines.
Step 4	switch# clear logging logfile	Clears the contents of the log file.
Step 5	switch# clear logging nvram	Clears the logged messages in NVRAM.

The following example shows how to display messages in a log file:

```
switch# show logging last 40
switch# show logging logfile start-time 2007 nov 1 15:10:0
switch# show logging nvram last 10
```

The following example shows how to clear messages in a log file:

```
switch# clear logging logfile
switch# clear logging nvram
```

Configuring DOM Logging

Enabling DOM Logging

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# system ethernet dom polling	Enables transceiver digital optical monitoring periodic polling.

The following example shows how to enable DOM logging.

```
switch# configure terminal
switch(config)# system ethernet dom polling
```

Disabling DOM Logging

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# no system ethernet dom polling	Disables transceiver digital optical monitoring periodic polling.

The following example shows how to disable DOM logging.

```
switch# configure terminal
switch(config)# no system ethernet dom polling
```

Verifying the DOM Logging Configuration

Command	Purpose
show system ethernet dom polling status	Displays the transceiver digital optical monitoring periodic polling status.

Verifying the System Message Logging Configuration

Use these commands to verify system message logging configuration information:

Command	Purpose
show logging console	Displays the console logging configuration.
show logging info	Displays the logging configuration.
show logging internal info	Displays the syslog distribution information.
show logging ip access-list cache	Displays the IP access list cache.
show logging ip access-list cache detail	Displays detailed information about the IP access list cache.
show logging ip access-list status	Displays the status of the IP access list cache.
show logging last <i>number-lines</i>	Displays the last number of lines of the log file.
show logging level [<i>facility</i>]	Displays the facility logging severity level configuration.
show logging logfile [start-time <i>yyyy mmm dd hh:mm:ss</i>] [end-time <i>yyyy mmm dd hh:mm:ss</i>]	Displays the messages in the log file.
show logging module	Displays the module logging configuration.
show logging monitor	Displays the monitor logging configuration.
show logging nvram [last <i>number-lines</i>]	Displays the messages in the NVRAM log.
show logging pending	Displays the syslog server pending distribution configuration.
show logging pending-diff	Displays the syslog server pending distribution configuration differences.
show logging server	Displays the syslog server configuration.
show logging session	Displays the logging session status.
show logging status	Displays the logging status.
show logging timestamp	Displays the logging time-stamp units configuration.
show running-config aclog	Displays the running configuration for the ACL log file.

Configuring Smart Call Home

This chapter contains the following sections:

- [Information About Smart Call Home, page 119](#)
- [Guidelines and Limitations for Smart Call Home, page 128](#)
- [Prerequisites for Smart Call Home, page 128](#)
- [Default Call Home Settings, page 129](#)
- [Configuring Smart Call Home, page 129](#)
- [Verifying the Smart Call Home Configuration, page 139](#)
- [Sample Syslog Alert Notification in Full-Text Format, page 140](#)
- [Sample Syslog Alert Notification in XML Format, page 140](#)

Information About Smart Call Home

Smart Call Home provides e-mail-based notification of critical system events. Cisco Nexus Series switches provide a range of message formats for optimal compatibility with pager services, standard e-mail, or XML-based automated parsing applications. You can use this feature to page a network support engineer, e-mail a Network Operations Center, or use Cisco Smart Call Home services to automatically generate a case with the Technical Assistance Center (TAC).

If you have a service contract directly with Cisco, you can register your devices for the Smart Call Home service. Smart Call Home provides fast resolution of system problems by analyzing Smart Call Home messages sent from your devices and providing background information and recommendations. For issues that can be identified as known, particularly GOLD diagnostics failures, Automatic Service Requests will be generated by the Cisco TAC.

Smart Call Home offers the following features:

- Continuous device health monitoring and real-time diagnostic alerts.
- Analysis of Smart Call Home messages from your device and, where appropriate, Automatic Service Request generation, routed to the appropriate TAC team, including detailed diagnostic information to speed problem resolution.

- Secure message transport directly from your device or through a downloadable Transport Gateway (TG) aggregation point. You can use a TG aggregation point in cases that require support for multiple devices or in cases where security requirements mandate that your devices may not be connected directly to the Internet.
- Web-based access to Smart Call Home messages and recommendations, inventory and configuration information for all Smart Call Home devices, and field notices, security advisories, and end-of-life information.

Smart Call Home Overview

You can use Smart Call Home to notify an external entity when an important event occurs on your device. Smart Call Home delivers alerts to multiple recipients that you configure in destination profiles.

Smart Call Home includes a fixed set of predefined alerts on your switch. These alerts are grouped into alert groups and CLI commands that are assigned to execute when an alert in an alert group occurs. The switch includes the command output in the transmitted Smart Call Home message.

The Smart Call Home feature offers the following:

- Automatic execution and attachment of relevant CLI command output.
- Multiple message format options such as the following:
 - Short Text—Text that is suitable for pagers or printed reports.
 - Full Text—Fully formatted message information that is suitable for human reading.
 - XML—Matching readable format that uses the Extensible Markup Language (XML) and the Adaptive Messaging Language (AML) XML schema definition (XSD). The XML format enables communication with the Cisco TAC.
- Multiple concurrent message destinations. You can configure up to 50 e-mail destination addresses for each destination profile.

Smart Call Home Destination Profiles

A Smart Call Home destination profile includes the following information:

- One or more alert groups—The group of alerts that trigger a specific Smart Call Home message if the alert occurs.
- One or more e-mail destinations—The list of recipients for the Smart Call Home messages that are generated by alert groups assigned to this destination profile.
- Message format—The format for the Smart Call Home message (short text, full text, or XML).
- Message severity level—The Smart Call Home severity level that the alert must meet before the switch generates a Smart Call Home message to all e-mail addresses in the destination profile. The switch does not generate an alert if the Smart Call Home severity level of the alert is lower than the message severity level set for the destination profile.

You can also configure a destination profile to allow periodic inventory update messages by using the inventory alert group that will send out periodic messages daily, weekly, or monthly.

Cisco Nexus switches support the following predefined destination profiles:

- CiscoTAC-1—Supports the Cisco-TAC alert group in XML message format.
- full-text-destination—Supports the full text message format.
- short-text-destination—Supports the short text message format.

Smart Call Home Alert Groups

An alert group is a predefined subset of Smart Call Home alerts that are supported in all Cisco Nexus devices. Alert groups allow you to select the set of Smart Call Home alerts that you want to send to a predefined or custom destination profile. The switch sends Smart Call Home alerts to e-mail destinations in a destination profile only if that Smart Call Home alert belongs to one of the alert groups associated with that destination profile and if the alert has a Smart Call Home message severity at or above the message severity set in the destination profile.

The following table lists the supported alert groups and the default CLI command output included in Smart Call Home messages generated for the alert group.

Table 16: Alert Groups and Executed Commands

Alert Group	Description	Executed Commands
Cisco-TAC	All critical alerts from the other alert groups destined for Smart Call Home.	Execute commands based on the alert group that originates the alert.
Diagnostic	Events generated by diagnostics.	show diagnostic result module all detail show moduleshow version show tech-support platform callhome
Supervisor hardware	Events related to supervisor modules.	show diagnostic result module all detail show moduleshow version show tech-support platform callhome
Linecard hardware	Events related to standard or intelligent switching modules.	show diagnostic result module all detail show moduleshow version show tech-support platform callhome

Alert Group	Description	Executed Commands
Configuration	Periodic events related to configuration.	show version show module show running-config all show startup-config
System	Events generated by a failure of a software system that is critical to unit operation.	show system redundancy status show tech-support
Environmental	Events related to power, fan, and environment-sensing elements such as temperature alarms.	show environment show logging last 1000 show module show version show tech-support platform callhome
Inventory	Inventory status that is provided whenever a unit is cold booted, or when FRUs are inserted or removed. This alert is considered a noncritical event, and the information is used for status and entitlement.	show module show version show license usage show inventory show sprom all show system uptime

Smart Call Home maps the syslog severity level to the corresponding Smart Call Home severity level for syslog port group messages.

You can customize predefined alert groups to execute additional **show** commands when specific events occur and send that **show** output with the Smart Call Home message.

You can add **show** commands only to full text and XML destination profiles. Short text destination profiles do not support additional **show** commands because they only allow 128 bytes of text.

Smart Call Home Message Levels

Smart Call Home allows you to filter messages based on their level of urgency. You can associate each destination profile (predefined and user defined) with a Smart Call Home message level threshold. The switch does not generate any Smart Call Home messages with a value lower than this threshold for the destination profile. The Smart Call Home message level ranges from 0 (lowest level of urgency) to 9 (highest level of urgency), and the default is 0 (the switch sends all messages).

Smart Call Home messages that are sent for syslog alert groups have the syslog severity level mapped to the Smart Call Home message level.

**Note**

Smart Call Home does not change the syslog message level in the message text.

The following table shows each Smart Call Home message level keyword and the corresponding syslog level for the syslog port alert group.

Table 17: Severity and Syslog Level Mapping

Smart Call Home Level	Keyword	Syslog Level	Description
9	Catastrophic	N/A	Network-wide catastrophic failure.
8	Disaster	N/A	Significant network impact.
7	Fatal	Emergency (0)	System is unusable.
6	Critical	Alert (1)	Critical conditions that indicate that immediate attention is needed.
5	Major	Critical (2)	Major conditions.
4	Minor	Error (3)	Minor conditions.
3	Warning	Warning (4)	Warning conditions.
2	Notification	Notice (5)	Basic notification and informational messages.
1	Normal	Information (6)	Normal event signifying return to normal state.
0	Debugging	Debug (7)	Debugging messages.

Call Home Message Formats

Call Home supports the following message formats:

- Short text message format
- Common fields for all full text and XML messages
- Inserted fields for a reactive or proactive event message
- Inserted fields for an inventory event message
- Inserted fields for a user-generated test message

The following table describes the short text formatting option for all message types.

Table 18: Short Text Message Format

Data Item	Description
Device identification	Configured device name
Date/time stamp	Time stamp of the triggering event
Error isolation message	Plain English description of triggering event
Alarm urgency level	Error level such as that applied to a system message

The following table describes the common event message format for full text or XML.

Table 19: Common Fields for All Full Text and XML Messages

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Time stamp	Date and time stamp of event in ISO time notation: <i>YYYY-MM-DD HH:MM:SS GMT+HH:MM</i>	/aml/header/time
Message name	Name of message. Specific event names are listed in the preceding table.	/aml/header/name
Message type	Name of message type, such as reactive or proactive.	/aml/header/type
Message group	Name of alert group, such as syslog.	/aml/header/group
Severity level	Severity level of message.	/aml/header/level
Source ID	Product type for routing.	/aml/header/source

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Device ID	<p>Unique device identifier (UDI) for the end device that generated the message. This field should be empty if the message is nonspecific to a device. The format is <i>type@Sid@serial</i>:</p> <ul style="list-style-type: none"> • <i>type</i> is the product model number from backplane IDPROM. • <i>@</i> is a separator character. • <i>Sid</i> is C, identifying the serial ID as a chassis serial number. • <i>serial</i> is the number identified by the Sid field. <p>An example is WS-C6509@C@12345678</p>	/aml/ header/deviceID
Customer ID	Optional user-configurable field used for contract information or other ID by any support service.	/aml/ header/customerID
Contract ID	Optional user-configurable field used for contract information or other ID by any support service.	/aml/ header /contractID
Site ID	Optional user-configurable field used for Cisco-supplied site ID or other data meaningful to alternate support service.	/aml/ header/siteID

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Server ID	<p>If the message is generated from the device, this is the unique device identifier (UDI) of the device.</p> <p>The format is <i>type@Sid@serial</i>:</p> <ul style="list-style-type: none"> • <i>type</i> is the product model number from backplane IDPROM. • <i>@</i> is a separator character. • <i>Sid</i> is C, identifying the serial ID as a chassis serial number. • <i>serial</i> is the number identified by the Sid field. <p>An example is WS-C6509@C@12345678</p>	/aml/header/serverID
Message description	Short text that describes the error.	/aml/body/msgDesc
Device name	Node that experienced the event (hostname of the device).	/aml/body/sysName
Contact name	Name of person to contact for issues associated with the node that experienced the event.	/aml/body/sysContact
Contact e-mail	E-mail address of person identified as the contact for this unit.	/aml/body/sysContactEmail
Contact phone number	Phone number of the person identified as the contact for this unit.	/aml/body/sysContactPhoneNumber
Street address	Optional field that contains the street address for RMA part shipments associated with this unit.	/aml/body/sysStreetAddress
Model name	Model name of the device (the specific model as part of a product family name).	/aml/body/chassis/name
Serial number	Chassis serial number of the unit.	/aml/body/chassis/serialNo
Chassis part number	Top assembly number of the chassis.	/aml/body/chassis/partNo
Fields specific to a particular alert group message are inserted here.		

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
The following fields may be repeated if multiple CLI commands are executed for this alert group.		
Command output name	Exact name of the issued CLI command.	/aml/attachments/attachment/name
Attachment type	Specific command output.	/aml/attachments/attachment/type
MIME type	Either plain text or encoding type.	/aml/attachments/attachment/mime
Command output text	Output of command automatically executed.	/aml/attachments/attachment/atdata

The following table describes the reactive event message format for full text or XML.

Table 20: Inserted Fields for a Reactive or Proactive Event Message

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Chassis hardware version	Hardware version of chassis.	/aml/body/chassis/hwVersion
Supervisor module software version	Top-level software version.	/aml/body/chassis/swVersion
Affected FRU name	Name of the affected FRU that is generating the event message.	/aml/body/fru/name
Affected FRU serial number	Serial number of the affected FRU.	/aml/body/fru/serialNo
Affected FRU part number	Part number of the affected FRU.	/aml/body/fru/partNo
FRU slot	Slot number of the FRU that is generating the event message.	/aml/body/fru/slot
FRU hardware version	Hardware version of the affected FRU.	/aml/body/fru/hwVersion
FRU software version	Software version(s) that is running on the affected FRU.	/aml/body/fru/swVersion

The following table describes the inventory event message format for full text or XML.

Table 21: Inserted Fields for an Inventory Event Message

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Chassis hardware version	Hardware version of the chassis.	/aml/body/chassis/hwVersion

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Supervisor module software version	Top-level software version.	/aml/body/chassis/swVersion
FRU name	Name of the affected FRU that is generating the event message.	/aml/body/fru/name
FRU s/n	Serial number of the FRU.	/aml/body/fru/serialNo
FRU part number	Part number of the FRU.	/aml/body/fru/partNo
FRU slot	Slot number of the FRU.	/aml/body/fru/slot
FRU hardware version	Hardware version of the FRU.	/aml/body/fru/hwVersion
FRU software version	Software version(s) that is running on the FRU.	/aml/body/fru/swVersion

The following table describes the user-generated test message format for full text or XML.

Table 22: Inserted Fields for a User-Generated Test Message

Data Item (Plain Text and XML)	Description (Plain Text and XML)	XML Tag (XML Only)
Process ID	Unique process ID.	/aml/body/process/id
Process state	State of process (for example, running or halted).	/aml/body/process/processState
Process exception	Exception or reason code.	/aml/body/process/exception

Guidelines and Limitations for Smart Call Home

- If there is no IP connectivity, or if the interface in the virtual routing and forwarding (VRF) instance to the profile destination is down, the switch cannot send Smart Call Home messages.
- Operates with any SMTP e-mail server.

Prerequisites for Smart Call Home

- You must have e-mail server connectivity.
- You must have access to contact name (SNMP server contact), phone, and street address information.
- You must have IP connectivity between the switch and the e-mail server.

- You must have an active service contract for the device that you are configuring.

Default Call Home Settings

Table 23: Default Call Home Parameters

Parameters	Default
Destination message size for a message sent in full text format	4000000
Destination message size for a message sent in XML format	4000000
Destination message size for a message sent in short text format	4000
SMTP server port number if no port is specified	25
Alert group association with profile	All for full-text-destination and short-text-destination profiles. The cisco-tac alert group for the CiscoTAC-1 destination profile.
Format type	XML
Call Home message level	0 (zero)

Configuring Smart Call Home

Registering for Smart Call Home

Before You Begin

- Know the sMARTnet contract number for your switch
- Know your e-mail address
- Know your Cisco.com ID

Procedure

-
- Step 1** In a browser, navigate to the Smart Call Home web page:
<http://www.cisco.com/go/smartcall/>

Step 2 Under **Getting Started**, follow the directions to register Smart Call Home.

What to Do Next

Configure contact information.

Configuring Contact Information

You must configure the e-mail, phone, and street address information for Smart Call Home. You can optionally configure the contract ID, customer ID, site ID, and switch priority information.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# snmp-server contact <i>sys-contact</i>	Configures the SNMP sysContact.
Step 3	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 4	switch(config-callhome)# email-contact <i>email-address</i>	<p>Configures the e-mail address for the primary person responsible for the switch.</p> <p>The <i>email-address</i> can be up to 255 alphanumeric characters in an e-mail address format.</p> <p>Note You can use any valid e-mail address. The address cannot contain spaces.</p>
Step 5	switch(config-callhome)# phone-contact <i>international-phone-number</i>	<p>Configures the phone number in international phone number format for the primary person responsible for the device. The <i>international-phone-number</i> can be up to 17 alphanumeric characters and must be in international phone number format.</p> <p>Note The phone number cannot contain spaces. Use the plus (+) prefix before the number.</p>
Step 6	switch(config-callhome)# streetaddress <i>address</i>	<p>Configures the street address for the primary person responsible for the switch.</p> <p>The <i>address</i> can be up to 255 alphanumeric characters. Spaces are accepted.</p>
Step 7	switch(config-callhome)# contract-id <i>contract-number</i>	<p>(Optional)</p> <p>Configures the contract number for this switch from the service agreement.</p> <p>The <i>contract-number</i> can be up to 255 alphanumeric characters.</p>
Step 8	switch(config-callhome)# customer-id <i>customer-number</i>	<p>(Optional)</p> <p>Configures the customer number for this switch from the service agreement.</p>

	Command or Action	Purpose
		The <i>customer-number</i> can be up to 255 alphanumeric characters.
Step 9	switch(config-callhome)# site-id <i>site-number</i>	(Optional) Configures the site number for this switch. The <i>site-number</i> can be up to 255 alphanumeric characters in free format.
Step 10	switch(config-callhome)# switch-priority <i>number</i>	(Optional) Configures the switch priority for this switch. The range is from 0 to 7, with 0 being the highest priority and 7 the lowest. The default is 7. Note Switch priority is used by the operations personnel or TAC support personnel to decide which Call Home message should be responded to first. You can prioritize Call Home alerts of the same severity from each switch.
Step 11	switch# show callhome	(Optional) Displays a summary of the Smart Call Home configuration.
Step 12	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure the contact information for Call Home:

```
switch# configuration terminal
switch(config)# snmp-server contact personname@companyname.com
switch(config)# callhome
switch(config-callhome)# email-contact personname@companyname.com
switch(config-callhome)# phone-contact +1-800-123-4567
switch(config-callhome)# street-address 123 Anystreet St., Anycity, Anywhere
```

What to Do Next

Create a destination profile.

Creating a Destination Profile

You must create a user-defined destination profile and configure the message format for that new destination profile.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome)# destination-profile {ciscoTAC-1 {alert-group group email-addr address http URL transport-method {email http}} profilename {alert-group group email-addr address format {XML full-txt short-txt} http URL message-level level message-size size transport-method {email http}} full-txt-destination {alert-group group email-addr address http URL message-level level message-size size transport-method {email http}} short-txt-destination {alert-group group email-addr address http URL message-level level message-size size transport-method {email http}}}	Creates a new destination profile and sets the message format for the profile. The profile-name can be any alphanumeric string up to 31 characters. For further details about this command, see the command reference for your platform.
Step 4	switch# show callhome destination-profile [profile name]	(Optional) Displays information about one or more destination profiles.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to create a destination profile for Smart Call Home:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# destination-profile Noc101 format full-text
```

Modifying a Destination Profile

You can modify the following attributes for a predefined or user-defined destination profile:

- Destination address—The actual address, pertinent to the transport mechanism, to which the alert should be sent.
- Message formatting—The message format used for sending the alert (full text, short text, or XML).
- Message level—The Call Home message severity level for this destination profile.
- Message size—The allowed length of a Call Home message sent to the e-mail addresses in this destination profile.

**Note**

You cannot modify or delete the CiscoTAC-1 destination profile.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome)# destination-profile { <i>name</i> full-txt-destination short-txt-destination } email-addr <i>address</i>	Configures an e-mail address for a user-defined or predefined destination profile. You can configure up to 50 e-mail addresses in a destination profile.
Step 4	destination-profile { <i>name</i> full-txt-destination short-txt-destination } message-level <i>number</i>	Configures the Smart Call Home message severity level for this destination profile. The switch sends only alerts that have a matching or higher Smart Call Home severity level to destinations in this profile. The range for the <i>number</i> is from 0 to 9, where 9 is the highest severity level.
Step 5	switch(config-callhome)# destination-profile { <i>name</i> full-txt-destination short-txt-destination } message-size <i>number</i>	Configures the maximum message size for this destination profile. The range is from 0 to 5000000 for full-txt-destination and the default is 2500000. The range is from 0 to 100000 for short-txt-destination and the default is 4000. The value is 5000000 for CiscoTAC-1, which is not changeable.
Step 6	switch# show callhome destination-profile [<i>profile name</i>]	(Optional) Displays information about one or more destination profiles.
Step 7	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to modify a destination profile for Smart Call Home:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# destination-profile full-text-destination email-addr
person@example.com
switch(config-callhome)# destination-profile full-text-destination message-level 5
switch(config-callhome)# destination-profile full-text-destination message-size 10000
switch(config-callhome)#
```

What to Do Next

Associate an alert group with a destination profile.

Associating an Alert Group with a Destination Profile

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome)# destination-profile name alert-group {All Cisco-TAC Configuration Diagnostic Environmental Inventory License Linecard-Hardware Supervisor-Hardware Syslog-group-port System Test}	Associates an alert group with this destination profile. Use the All keyword to associate all alert groups with the destination profile.
Step 4	switch# show callhome destination-profile [profile name]	(Optional) Displays information about one or more destination profiles.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to associate all alert groups with the destination profile Noc101:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# destination-profile Noc101 alert-group All
switch(config-callhome)#
```

What to Do Next

Optionally, you can add **show** commands to an alert group and configure the SMTP e-mail server.

Adding Show Commands to an Alert Group

You can assign a maximum of five user-defined **show** commands to an alert group.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.

	Command or Action	Purpose
Step 3	switch(config-callhome)# alert-group { Configuration Diagnostic Environmental Inventory License Linecard-Hardware Supervisor-Hardware Syslog-group-port System Test } user-def-cmd <i>show-cmd</i>	Adds the show command output to any Call Home messages sent for this alert group. Only valid show commands are accepted. Note You cannot add user-defined show commands to the CiscoTAC-1 destination profile.
Step 4	switch# show callhome user-def-cmds	(Optional) Displays information about all user-defined show commands added to alert groups.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to add the **show ip routing** command to the Cisco-TAC alert group:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# alert-group Configuration user-def-cmd show ip routing
switch(config-callhome)#
```

What to Do Next

Configure Smart Call Home to connect to the SMTP e-mail server.

Configuring E-Mail Server Details

You must configure the SMTP server address for the Smart Call Home functionality to work. You can also configure the from and reply-to e-mail addresses.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome)# transport email smtp-server ip-address [port number] [use-vrf vrf-name]	Configures the SMTP server as either the domain name server (DNS) name, IPv4 address, or IPv6 address. The <i>number</i> range is from 1 to 65535. The default port number is 25. Optionally, you can configure the VRF instance to use when communicating with this SMTP server.

	Command or Action	Purpose
Step 4	switch(config-callhome)# transport email from <i>email-address</i>	(Optional) Configures the e-mail from field for Smart Call Home messages.
Step 5	switch(config-callhome)# transport email reply-to <i>email-address</i>	(Optional) Configures the e-mail reply-to field for Smart Call Home messages.
Step 6	switch# show callhome transport-email	(Optional) Displays information about the e-mail configuration for Smart Call Home.
Step 7	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure the e-mail options for Smart Call Home messages:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# transport email smtp-server 192.0.2.10 use-vrf Red
switch(config-callhome)# transport email from person@example.com
switch(config-callhome)# transport email reply-to person@example.com
switch(config-callhome)#
```

What to Do Next

Configure periodic inventory notifications.

Configuring Periodic Inventory Notifications

You can configure the switch to periodically send a message with an inventory of all software services currently enabled and running on the device with hardware inventory information. The switch generates two Smart Call Home notifications; periodic configuration messages and periodic inventory messages.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome)# periodic-inventory notification [<i>interval days</i>] [<i>timeofday time</i>]	Configures periodic inventory messages. The interval <i>days</i> range is from 1 to 30 days. The default is 7 days. The timeofday <i>time</i> is in HH:MM format.

	Command or Action	Purpose
Step 4	switch# show callhome	(Optional) Displays information about Smart Call Home.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure the periodic inventory messages to generate every 20 days:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# periodic-inventory notification interval 20
switch(config-callhome)#
```

What to Do Next

Disable duplicate message throttling.

Disabling Duplicate Message Throttling

You can limit the number of duplicate messages received for the same event. By default, the switch limits the number of duplicate messages received for the same event. If the number of duplicate messages sent exceeds 30 messages within a 2-hour time frame, the switch discards further messages for that alert type.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome) # no duplicate-message throttle	Disables duplicate message throttling for Smart Call Home. Duplicate message throttling is enabled by default.
Step 4	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to disable duplicate message throttling:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# no duplicate-message throttle
switch(config-callhome)#
```

What to Do Next

Enable Smart Call Home.

Enabling or Disabling Smart Call Home

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome) # [no] enable	Enables or disables Smart Call Home. Smart Call Home is disabled by default.
Step 4	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to enable Smart Call Home:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome)# enable
switch(config-callhome)#
```

What to Do Next

Optionally, generate a test message.

Testing the Smart Call Home Configuration

Before You Begin

Verify that the message level for the destination profile is set to 2 or lower.

**Important**

Smart Call Home testing fails when the message level for the destination profile is set to 3 or higher.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	switch(config)# callhome	Enters Smart Call Home configuration mode.
Step 3	switch(config-callhome) # callhome send diagnostic	Sends the specified Smart Call Home message to all configured destinations.
Step 4	switch(config-callhome) # callhome test	Sends a test message to all configured destinations.
Step 5	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to enable Smart Call Home:

```
switch# configuration terminal
switch(config)# callhome
switch(config-callhome) # callhome send diagnostic
switch(config-callhome) # callhome test
switch(config-callhome) #
```

Verifying the Smart Call Home Configuration

Use one of the following commands to verify the configuration:

Command	Purpose
show callhome	Displays the status for Smart Call Home.
show callhome destination-profile <i>name</i>	Displays one or more Smart Call Home destination profiles.
show callhome pending-diff	Displays the differences between the pending and running Smart Call Home configuration.
show callhome status	Displays the Smart Call Home status.
show callhome transport-email	Displays the e-mail configuration for Smart Call Home.
show callhome user-def-cmds	Displays CLI commands added to any alert groups.
show running-config [callhome callhome-all]	Displays the running configuration for Smart Call Home.
show startup-config callhome	Displays the startup configuration for Smart Call Home.
show tech-support callhome	Displays the technical support output for Smart Call Home.

Sample Syslog Alert Notification in Full-Text Format

This sample shows the full-text format for a syslog port alert-group notification:

```
source:MDS9000
Switch Priority:7

Configuring Rollback

This chapter contains the following sections:

- [Information About Rollbacks, page 145](#)
- [Guidelines and Limitations, page 145](#)
- [Creating a Checkpoint, page 146](#)
- [Implementing a Rollback, page 147](#)
- [Verifying the Rollback Configuration, page 147](#)

Information About Rollbacks

The rollback feature allows you to take a snapshot, or user checkpoint, of the Cisco NX-OS configuration and then reapply that configuration to your switch at any point without having to reload the switch. A rollback allows any authorized administrator to apply this checkpoint configuration without requiring expert knowledge of the features configured in the checkpoint.

You can create a checkpoint copy of the current running configuration at any time. Cisco NX-OS saves this checkpoint as an ASCII file which you can use to roll back the running configuration to the checkpoint configuration at a future time. You can create multiple checkpoints to save different versions of your running configuration.

When you roll back the running configuration, you can trigger an atomic rollback. An atomic rollback implements a rollback only if no errors occur.

Guidelines and Limitations

Rollback has the following configuration guidelines and limitations:

- You can create up to ten checkpoint copies.
- You cannot apply the checkpoint file of one switch into another switch.
- Your checkpoint file names must be 75 characters or less.
- You cannot start a checkpoint filename with the word system.

- Beginning in Cisco NX-OS Release 5.0(2)N1(1), you can start a checkpoint filename with the word `auto`.
- Beginning in Cisco NX-OS Release 5.0(2)N1(1), you can name a checkpoint file summary or any abbreviation of the word `summary`.
- When FCoE is enabled, the checkpoint and configuration rollback functionality are disabled.
- Only one user can perform a checkpoint, rollback, or copy the running configuration to the startup configuration at the same time.
- After you enter the **write erase** and **reload** command, checkpoints are deleted. You can use the `clear checkpoint database` command to clear out all checkpoint files.
- When checkpoints are created on bootflash, differences with the running-system configuration cannot be performed before performing the rollback, and the system reports “No Changes.”
- Checkpoints are local to a switch.
- Checkpoints that are created using the **checkpoint** and **checkpoint checkpoint_name** commands are present upon a switchover for all switches.
- A rollback to files on bootflash is supported only on files that are created using the **checkpoint checkpoint_name** command and not on any other type of ASCII file.
- Checkpoint names must be unique. You cannot overwrite previously saved checkpoints with the same name.
- Checkpoints are not supported post upgrade or downgrade.
- The Cisco NX-OS commands may differ from the Cisco IOS commands.

Creating a Checkpoint

You can create up to ten checkpoints of your configuration per switch.

Procedure

	Command or Action	Purpose
Step 1	switch# checkpoint { [<i>cp-name</i>] [description <i>descr</i>] file <i>file-name</i> } Example: switch# checkpoint stable	Creates a checkpoint of the running configuration to either a user checkpoint name or a file. The checkpoint name can be any alphanumeric string up to 80 characters but cannot contain spaces. If you do not provide a name, Cisco NX-OS sets the checkpoint name to <code>user-checkpoint-<number></code> where number is from 1 to 10. The description can contain up to 80 alphanumeric characters, including spaces.
Step 2	switch# no checkpoint <i>cp-name</i> Example: switch# no checkpoint stable	(Optional) You can use the no form of the checkpoint command to remove a checkpoint name. Use the delete command to remove a checkpoint file.

	Command or Action	Purpose
Step 3	switch# show checkpoint <i>cp-name</i> Example: [all] switch# show checkpoint stable	(Optional) Displays the contents of the checkpoint name.

Implementing a Rollback

You can implement a rollback to a checkpoint name or file. Before you implement a rollback, you can view the differences between source and destination checkpoints that reference current or saved configurations.

Note

If you make a configuration change during an atomic rollback, the rollback will fail.

Procedure

	Command or Action	Purpose
Step 1	show diff rollback-patch { checkpoint <i>src-cp-name</i> running-config startup-config file <i>source-file</i> } { checkpoint <i>dest-cp-name</i> running-config startup-config file <i>dest-file</i> } Example: switch# show diff rollback-patch checkpoint stable running-config	Displays the differences between the source and destination checkpoint selections.
Step 2	rollback running-config { checkpoint <i>cp-name</i> file <i>cp-file</i> } atomic Example: switch# rollback running-config checkpoint stable	Creates an atomic rollback to the specified checkpoint name or file if no errors occur.

The following example shows how to create a checkpoint file and then implement an atomic rollback to a user checkpoint name:

```
switch# checkpoint stable
switch# rollback running-config checkpoint stable atomic
```

Verifying the Rollback Configuration

Use the following commands to verify the rollback configuration:

Command	Purpose
show checkpoint <i>name</i> [all]	Displays the contents of the checkpoint name.
show checkpoint all [user system]	Displays the contents of all checkpoints in the current switch. You can limit the displayed checkpoints to user or system-generated checkpoints.
show checkpoint summary [user system]	Displays a list of all checkpoints in the current switch. You can limit the displayed checkpoints to user or system-generated checkpoints.
show diff rollback-patch { checkpoint <i>src-cp-name</i> running-config startup-config file <i>source-file</i> } { checkpoint <i>dest-cp-name</i> running-config startup-config file <i>dest-file</i> }	Displays the differences between the source and destination checkpoint selections.
show rollback log [exec verify]	Displays the contents of the rollback log.

**Note**

Use the **clear checkpoint database** command to delete all checkpoint files.

Configuring DNS

This chapter contains the following sections:

- [Information About DNS Client](#) , page 149
- [Prerequisites for DNS Clients](#), page 150
- [Licensing Requirements for DNS Clients](#), page 150
- [Default Settings for DNS Clients](#), page 150
- [Configuring DNS Clients](#), page 151

Information About DNS Client

If your network devices require connectivity with devices in networks for which you do not control name assignment, you can assign device names that uniquely identify your devices within the entire internetwork using the domain name server (DNS). DNS uses a hierarchical scheme for establishing hostnames for network nodes, which allows local control of the segments of the network through a client-server scheme. The DNS system can locate a network device by translating the hostname of the device into its associated IP address.

On the Internet, a domain is a portion of the naming hierarchy tree that refers to general groupings of networks based on the organization type or geography. Domain names are pieced together with periods (.) as the delimiting characters. For example, Cisco is a commercial organization that the Internet identifies by a com domain, so its domain name is cisco.com. A specific hostname in this domain, the File Transfer Protocol (FTP) system, for example, is identified as ftp.cisco.com.

Name Servers

Name servers keep track of domain names and know the parts of the domain tree for which they have complete information. A name server may also store information about other parts of the domain tree. To map domain names to IP addresses in Cisco NX-OS, you must first identify the hostnames, then specify a name server, and enable the DNS service.

Cisco NX-OS allows you to statically map IP addresses to domain names. You can also configure Cisco NX-OS to use one or more domain name servers to find an IP address for a hostname.

DNS Operation

A name server handles client-issued queries to the DNS server for locally defined hosts within a particular zone as follows:

- An authoritative name server responds to DNS user queries for a domain name that is under its zone of authority by using the permanent and cached entries in its own host table. If the query is for a domain name that is under its zone of authority but for which it does not have any configuration information, the authoritative name server replies that no such information exists.
- A name server that is not configured as the authoritative name server responds to DNS user queries by using information that it has cached from previously received query responses. If no router is configured as the authoritative name server for a zone, queries to the DNS server for locally defined hosts receive nonauthoritative responses.

Name servers answer DNS queries (forward incoming DNS queries or resolve internally generated DNS queries) according to the forwarding and lookup parameters configured for the specific domain.

High Availability

Cisco NX-OS supports stateless restarts for the DNS client. After a reboot or supervisor switchover, Cisco NX-OS applies the running configuration.

Prerequisites for DNS Clients

The DNS client has the following prerequisites:

- You must have a DNS name server on your network.

Licensing Requirements for DNS Clients

The following table shows the licensing requirements for this feature:

Product	Licence Requirement
Cisco NX-OS	DNS requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <i>Cisco NX-OS Licensing Guide</i> .

Default Settings for DNS Clients

The following table shows the default settings for DNS client parameters.

Parameter	Default
DNS client	Enabled

Configuring DNS Clients

You can configure the DNS client to use a DNS server on your network.

Before You Begin

- Ensure that you have a domain name server on your network.

Procedure

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters global configuration mode.
Step 2	switch(config)# vrf context managment	Specifies a configurable virtual and routing (VRF) name.
Step 3	switch(config)# ip host name <i>address1 [address2... address6]</i>	Defines up to six static hostname-to-address mappings in the host name cache.
Step 4	switch(config)# ip domain name <i>name [use-vrf vrf-name]</i>	(Optional) Defines the default domain name server that Cisco NX-OS uses to complete unqualified hostnames. You can optionally define a VRF that Cisco NX-OS uses to resolve this domain name server if it cannot be resolved in the VRF that you configured this domain name under. Cisco NX-OS appends the default domain name to any host name that does not contain a complete domain name before starting a domain-name lookup.
Step 5	switch(config)# ip domain-list <i>name [use-vrf vrf-name]</i>	(Optional) Defines additional domain name servers that Cisco NX-OS can use to complete unqualified hostnames. You can optionally define a VRF that Cisco NX-OS uses to resolve this domain name server if it cannot be resolved in the VRF that you configured this domain name under. Cisco NX-OS uses each entry in the domain list to append that domain name to any hostname that does not contain a complete domain name before starting a domain-name lookup. Cisco NX-OS continues this for each entry in the domain list until it finds a match.
Step 6	switch(config)# ip name-server <i>server-address1</i> <i>[server-address2...</i>	(Optional) Defines up to six name servers. The address can be either an IPv4 address or an IPv6 address.

	Command or Action	Purpose
	<i>server-address6</i>] [use-vrf <i>vrf-name</i>]	You can optionally define a VRF that Cisco NX-OS uses to reach this name server if it cannot be reached in the VRF that you configured this name server under.
Step 7	switch(config)# ip domain-lookup	(Optional) Enables DNS-based address translation. This feature is enabled by default.
Step 8	switch(config)# show hosts	(Optional) Displays information about DNS.
Step 9	switch(config)# exit	Exits configuration mode and returns to EXEC mode.
Step 10	switch# copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

The following example shows how to configure a default domain name and enable DNS lookup:

```
switch# config t
switch(config)# vrf context management
switch(config)# ip domain-name mycompany.com
switch(config)# ip name-server 172.68.0.10
switch(config)# ip domain-lookup
```

Configuring SNMP

This chapter contains the following sections:

- [Information About SNMP, page 153](#)
- [Licensing Requirements for SNMP, page 157](#)
- [Guidelines and Limitations for SNMP, page 157](#)
- [Default SNMP Settings, page 158](#)
- [Configuring SNMP, page 158](#)
- [Disabling SNMP, page 170](#)
- [Verifying the SNMP Configuration, page 170](#)
- [Feature History for SNMP, page 171](#)

Information About SNMP

The Simple Network Management Protocol (SNMP) is an application-layer protocol that provides a message format for communication between SNMP managers and agents. SNMP provides a standardized framework and a common language used for the monitoring and management of devices in a network.

SNMP Functional Overview

The SNMP framework consists of three parts:

- An SNMP manager—The system used to control and monitor the activities of network devices using SNMP.
- An SNMP agent—The software component within the managed device that maintains the data for the device and reports these data, as needed, to managing systems. The Cisco Nexus device supports the agent and MIB. To enable the SNMP agent, you must define the relationship between the manager and the agent.
- A managed information base (MIB)—The collection of managed objects on the SNMP agent

**Note**

Cisco NX-OS does not support SNMP sets for Ethernet MIBs.

The Cisco Nexus device supports SNMPv1, SNMPv2c, and SNMPv3. Both SNMPv1 and SNMPv2c use a community-based form of security.

Cisco NX-OS supports SNMP over IPv6.

SNMP is defined in RFC 3410 (<http://tools.ietf.org/html/rfc3410>), RFC 3411 (<http://tools.ietf.org/html/rfc3411>), RFC 3412 (<http://tools.ietf.org/html/rfc3412>), RFC 3413 (<http://tools.ietf.org/html/rfc3413>), RFC 3414 (<http://tools.ietf.org/html/rfc3414>), RFC 3415 (<http://tools.ietf.org/html/rfc3415>), RFC 3416 (<http://tools.ietf.org/html/rfc3416>), RFC 3417 (<http://tools.ietf.org/html/rfc3417>), RFC 3418 (<http://tools.ietf.org/html/rfc3418>), and RFC 3584 (<http://tools.ietf.org/html/rfc3584>).

SNMP Notifications

A key feature of SNMP is the ability to generate notifications from an SNMP agent. These notifications do not require that requests be sent from the SNMP manager. Notifications can indicate improper user authentication, restarts, the closing of a connection, loss of connection to a neighbor router, or other significant events.

Cisco NX-OS generates SNMP notifications as either traps or informs. A trap is an asynchronous, unacknowledged message sent from the agent to the SNMP managers listed in the host receiver table. Informs are asynchronous messages sent from the SNMP agent to the SNMP manager which the manager must acknowledge receipt of.

Traps are less reliable than informs because the SNMP manager does not send any acknowledgment when it receives a trap. The switch cannot determine if the trap was received. An SNMP manager that receives an inform request acknowledges the message with an SNMP response protocol data unit (PDU). If the Cisco Nexus device never receives a response, it can send the inform request again.

You can configure Cisco NX-OS to send notifications to multiple host receivers.

SNMPv3

SNMPv3 provides secure access to devices by a combination of authenticating and encrypting frames over the network. The security features provided in SNMPv3 are the following:

- Message integrity—Ensures that a packet has not been tampered with in-transit.
- Authentication—Determines the message is from a valid source.
- Encryption—Scrambles the packet contents to prevent it from being seen by unauthorized sources.

SNMPv3 provides for both security models and security levels. A security model is an authentication strategy that is set up for a user and the role in which the user resides. A security level is the permitted level of security within a security model. A combination of a security model and a security level determines which security mechanism is employed when handling an SNMP packet.

Security Models and Levels for SNMPv1, v2, and v3

The security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The various security levels that exist within a security model are as follows:

- noAuthNoPriv—Security level that does not provide authentication or encryption. This level is not supported for SNMPv3.
- authNoPriv—Security level that provides authentication but does not provide encryption.
- authPriv—Security level that provides both authentication and encryption.

Three security models are available: SNMPv1, SNMPv2c, and SNMPv3. The security model combined with the security level determine the security mechanism applied when the SNMP message is processed.

Table 24: SNMP Security Models and Levels

Model	Level	Authentication	Encryption	What Happens
v1	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
v2c	noAuthNoPriv	Community string	No	Uses a community string match for authentication.
v3	authNoPriv	HMAC-MD5 or HMAC-SHA	No	Provides authentication based on the Hash-Based Message Authentication Code (HMAC) Message Digest 5 (MD5) algorithm or the HMAC Secure Hash Algorithm (SHA).
v3	authPriv	HMAC-MD5 or HMAC-SHA	DES	Provides authentication based on the HMAC-MD5 or HMAC-SHA algorithms. Provides Data Encryption Standard (DES) 56-bit encryption in addition to authentication based on the Cipher Block Chaining (CBC) DES (DES-56) standard.

User-Based Security Model

SNMPv3 User-Based Security Model (USM) refers to SNMP message-level security and offers the following services:

- Message integrity—Ensures that messages have not been altered or destroyed in an unauthorized manner and that data sequences have not been altered to an extent greater than can occur nonmaliciously.
- Message origin authentication—Confirms that the claimed identity of the user who received the data was originated.
- Message confidentiality—Ensures that information is not made available or disclosed to unauthorized individuals, entities, or processes.

SNMPv3 authorizes management operations only by configured users and encrypts SNMP messages.

Cisco NX-OS uses two authentication protocols for SNMPv3:

- HMAC-MD5-96 authentication protocol
- HMAC-SHA-96 authentication protocol

Cisco NX-OS uses Advanced Encryption Standard (AES) as one of the privacy protocols for SNMPv3 message encryption and conforms with RFC 3826.

The **priv** option offers a choice of DES or 128-bit AES encryption for SNMP security encryption. The **priv** option and the **aes-128** token indicates that this privacy password is for generating a 128-bit AES key #. The AES priv password can have a minimum of eight characters. If the passphrases are specified in clear text, you can specify a maximum of 64 characters. If you use the localized key, you can specify a maximum of 130 characters.

Note

For an SNMPv3 operation using the external AAA server, you must use AES for the privacy protocol in user configuration on the external AAA server.

CLI and SNMP User Synchronization

SNMPv3 user management can be centralized at the Access Authentication and Accounting (AAA) server level. This centralized user management allows the SNMP agent in Cisco NX-OS to leverage the user authentication service of the AAA server. Once user authentication is verified, the SNMP PDUs are processed further. Additionally, the AAA server is also used to store user group names. SNMP uses the group names to apply the access/role policy that is locally available in the switch.

Any configuration changes made to the user group, role, or password results in database synchronization for both SNMP and AAA.

Cisco NX-OS synchronizes user configuration in the following ways:

- The **auth** passphrase specified in the **snmp-server user** command becomes the password for the CLI user.

- The password specified in the **username** command becomes the **auth** and **priv** passphrases for the SNMP user.
- If you create or delete a user using either SNMP or the CLI, the user is created or deleted for both SNMP and the CLI.
- User-role mapping changes are synchronized in SNMP and the CLI.
- Role changes (deletions or modifications from the CLI) are synchronized to SNMP.

**Note**

When you configure passphrase/password in localized key/encrypted format, Cisco NX-OS does not synchronize the user information (passwords, rules, etc.).

Group-Based SNMP Access

**Note**

Because a group is a standard SNMP term used industry-wide, roles are referred to as groups in this SNMP section.

SNMP access rights are organized by groups. Each group in SNMP is similar to a role through the CLI. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

You can begin communicating with the agent once your username is created, your roles are set up by your administrator, and you are added to the roles.

Licensing Requirements for SNMP

This feature does not require a license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the *Cisco NX-OS Licensing Guide*.

Guidelines and Limitations for SNMP

Cisco NX-OS supports read-only access to Ethernet MIBs.

For more information about supported MIBs, see the following URL:

<http://www.cisco.com/public/sw-center/netmgmt/cmtk/mibs.shtml>

Cisco NX-OS does not support the SNMPv3 noAuthNoPriv security level.

Default SNMP Settings

Table 25: Default SNMP Parameters

Parameters	Default
license notifications	Enabled
linkUp/Down notification type	ietf-extended

Configuring SNMP

Configuring SNMP Users

Note

The commands used to configure SNMP users in Cisco NX-OS are different from those used to configure users in Cisco IOS.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	<pre>switch(config)# snmp-server user name [auth {md5 sha} passphrase [auto] [priv [aes-128] passphrase] [engineID id] [localizedkey]]</pre> Example: <pre>switch(config)# snmp-server user Admin auth sha abcd1234 priv abcdefgh</pre>	<p>Configures an SNMP user with authentication and privacy parameters.</p> <p>The passphrase can be any case-sensitive, alphanumeric string up to 64 characters.</p> <p>If you use the localizedkey keyword, the passphrase can be any case-sensitive, alphanumeric string up to 130 characters.</p> <p>The engineID format is a 12-digit, colon-separated decimal number.</p>
Step 3	<pre>switch# show snmp user</pre> Example: <pre>switch(config) # show snmp user</pre>	<p>(Optional)</p> <p>Displays information about one or more SNMP users.</p>

	Command or Action	Purpose
Step 4	copy running-config startup-config Example: switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure an SNMP user:

```
switch# conf t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# snmp-server user Admin auth sha abcd1234 priv abcdefgh
```

Enforcing SNMP Message Encryption

You can configure SNMP to require authentication or encryption for incoming requests. By default, the SNMP agent accepts SNMPv3 messages without authentication and encryption. When you enforce privacy, Cisco NX-OS responds with an authorization error for any SNMPv3 PDU request that uses a security level parameter of either **noAuthNoPriv** or **authNoPriv**.

Use the following command in global configuration mode to enforce SNMP message encryption for a specific user:

Command	Purpose
switch(config)# snmp-server user <i>name</i> enforcePriv	Enforces SNMP message encryption for this user.

Use the following command in global configuration mode to enforce SNMP message encryption for all users:

Command	Purpose
switch(config)# snmp-server globalEnforcePriv	Enforces SNMP message encryption for all users.

Assigning SNMPv3 Users to Multiple Roles

After you configure an SNMP user, you can assign multiple roles for the user.

Note

Only users who belong to a network-admin role can assign roles to other users.

Command	Purpose
switch(config)# snmp-server user <i>name</i> <i>group</i>	Associates this SNMP user with the configured user role.

Creating SNMP Communities

You can create SNMP communities for SNMPv1 or SNMPv2c.

Command	Purpose
switch(config)# snmp-server community <i>name</i> <i>group</i> { ro rw }	Creates an SNMP community string.

Filtering SNMP Requests

You can assign an access list (ACL) to a community to filter incoming SNMP requests. If the assigned ACL allows the incoming request packet, SNMP processes the request. If the ACL denies the request, SNMP drops the request and sends a system message.

Create the ACL with the following parameters:

- Source IP address
- Destination IP address
- Source port
- Destination port
- Protocol (UDP or TCP)

The ACL applies to both IPv4 and IPv6 over UDP and TCP. After creating the ACL, assign the ACL to the SNMP community.

Tip

For more information about creating ACLs, see the NX-OS security configuration guide for the Cisco Nexus Series software that you are using.

Use the following command in global configuration mode to assign an IPv4 or IPv6 ACL to an SNMPv3 community to filter SNMP requests:

Command	Purpose
switch(config)# snmp-server community <i>name</i> [use-ipv4acl <i>ipv4acl-name</i>] [use-ipv6acl <i>ipv6acl-name</i>] switch(config)# snmp-server community public use-ipv4acl <i>myacl</i>	Assigns an IPv4 or IPv6 ACL to an SNMPv3 community to filter SNMP requests.

Configuring SNMP Notification Receivers

You can configure Cisco NX-OS to generate SNMP notifications to multiple host receivers.

You can configure a host receiver for SNMPv1 traps in a global configuration mode.

Command	Purpose
<code>switch(config)# snmp-server host <i>ip-address</i> traps version 1 community [udp_port number]</code>	Configures a host receiver for SNMPv1 traps. The <i>ip-address</i> can be an IPv4 or IPv6 address. The community can be any alphanumeric string up to 255 characters. The UDP port number range is from 0 to 65535.

You can configure a host receiver for SNMPv2c traps or informs in a global configuration mode.

Command	Purpose
<code>switch(config)# snmp-server host <i>ip-address</i> {traps informs} version 2c community [udp_port number]</code>	Configures a host receiver for SNMPv2c traps or informs. The <i>ip-address</i> can be an IPv4 or IPv6 address. The community can be any alphanumeric string up to 255 characters. The UDP port number range is from 0 to 65535.

You can configure a host receiver for SNMPv3 traps or informs in a global configuration mode.

Command	Purpose
<code>switch(config)# snmp-server host <i>ip-address</i> {traps informs} version 3 {auth noauth priv} username [udp_port number]</code>	Configures a host receiver for SNMPv3 traps or informs. The <i>ip-address</i> can be an IPv4 or IPv6 address. The username can be any alphanumeric string up to 255 characters. The UDP port number range is from 0 to 65535.

Note

The SNMP manager must know the user credentials (authKey/PrivKey) based on the SNMP engineID of the Cisco Nexus device to authenticate and decrypt the SNMPv3 messages.

The following example shows how to configure a host receiver for an SNMPv1 trap:

```
switch(config)# snmp-server host 192.0.2.1 traps version 1 public
```

The following example shows how to configure a host receiver for an SNMPv2c inform:

```
switch(config)# snmp-server host 192.0.2.1 informs version 2c public
```

The following example shows how to configure a host receiver for an SNMPv3 inform:

```
switch(config)# snmp-server host 192.0.2.1 informs version 3 auth NMS
```

Configuring SNMP Notification Receivers with VRFs

You can configure Cisco NX-OS to use a configured VRF to reach the host receiver. SNMP adds entries into the cExtSnmpTargetVrfTable of the CISCO-SNMP-TARGET-EXT-MIB when you configure the VRF reachability and filtering options for an SNMP notification receiver.

Note

You must configure the host before configuring the VRF reachability or filtering options.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch# snmp-server host <i>ip-address use-vrf vrf_name</i> [udp_port number]	Configures SNMP to use the selected VRF to communicate with the host receiver. The IP address can be an IPv4 or IPv6 address. The VRF name can be any alphanumeric string up to 255 characters. The UDP port number range is from 0 to 65535. This command adds an entry into the ExtSnmpTargetVrfTable of the CISCO-SNMP-TARGET-EXT-MB.
Step 3	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure the SNMP server host with IP address 192.0.2.1 to use the VRF named "Blue:"

```
switch# configuration terminal
switch(config)# snmp-server host 192.0.2.1 use-vrf Blue
switch(config)# copy running-config startup-config
```

Filtering SNMP Notifications Based on a VRF

You can configure Cisco NX-OS filter notifications based on the VRF in which the notification occurred.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# snmp-server host <i>ip-address filter-vrf vrf_name</i> [udp_port number]	Filters notifications to the notification host receiver based on the configured VRF. The IP address can be an IPv4 or IPv6 address. The VRF name can be any alphanumeric string up to 255 characters. The UDP port number range is from 0 to 65535.

	Command or Action	Purpose
		This command adds an entry into the ExtSnmpTargetVrfTable of the CISCO-SNMP-TARGET-EXT-MB.
Step 3	switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

The following example shows how to configure filtering of SNMP notifications based on a VRF:

```
switch# configuration terminal
switch(config)# snmp-server host 192.0.2.1 filter-vrf Red
switch(config)# copy running-config startup-config
```

Configuring a Source Interface for Sending Out All SNMP Notifications

You can configure SNMP to use the IP address of an interface as the source IP address for notifications. When a notification is generated, its source IP address is based on the IP address of this configured interface.

Note

Configuring the source interface IP address for outgoing trap packets does not guarantee that the device will use the same interface to send the trap. The source interface IP address defines the source address inside of the SNMP trap and the connection is opened with the address of the egress interface as source.

Complete the following steps to configure a source interface for sending out all SNMP notifications:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	switch(config) # snmp-server source-interface {traps informs} if-type if-number Example: switch(config) # snmp-server source-interface traps ethernet 2/1	Configures a source interface for sending out SNMPv2c traps or informs. Use ? to determine the supported interface types.

This example shows how to configure a source interface to sending out SNMPv2c traps:

```
switch# configure terminal
switch(config) # snmp-server source-interface traps ethernet 2/1
```

What to Do Next

To display information about configured source interfaces, enter the **show snmp source-interface** command.

Configuring a Host Receiver for SNMP Notifications

**Note**

This configuration overrides the global source interface configuration.

Complete the following steps to configure a host receiver on a source interface responsible for receiving all SNMP notifications:

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	<pre>switch(config) # snmp-server host ip-address source-interface if-type if-number [udp_port number]</pre> Example: <pre>switch(config) # snmp-server host 192.0.2.1 source-interface traps ethernet 2/1</pre>	Configures a host receiver for SNMPv2c traps or informs. The <i>ip-address</i> can be an IPv4 or IPv6 address. Use ? to determine the supported interface types.

To the following example configures a source interface responsible for receiving all SNMP notifications:

```
switch# config t
switch(config) # snmp-server host 192.0.2.1 source-interface ethernet 2/1
```

What to Do Next

To display information about configured source interface, enter the **show snmp source-interface** command.

Configuring SNMP for Inband Access

You can configure SNMP for inband access using the following:

- Using SNMP v2 without context—You can use a community that is mapped to a context. In this case, the SNMP client does not need to know about the context.
- Using SNMP v2 with context—The SNMP client needs to specify the context by specifying a community; for example, <community>@<context>.
- Using SNMP v3—You can specify the context.

Procedure

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters global configuration mode.
Step 2	switch(config)# snmp-server context <i>context-name</i> vrf <i>vrf-name</i>	Maps an SNMP context to the management VRF or default VRF. Custom VRFs are not supported. The names can be any alphanumeric string up to 32 characters.
Step 3	switch(config)# snmp-server community <i>community-name</i> group <i>group-name</i>	Maps an SNMPv2c community to an SNMP context and identifies the group to which the community belongs. The names can be any alphanumeric string up to 32 characters.
Step 4	switch(config)# snmp-server mib community-map <i>community-name</i> context <i>context-name</i>	Maps an SNMPv2c community to an SNMP context. The names can be any alphanumeric string up to 32 characters.

The following SNMPv2 example shows how to map a community named snmpdefault to a context:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# snmp-server context def vrf default
switch(config)# snmp-server community snmpdefault group network-admin
switch(config)# snmp-server mib community-map snmpdefault context def
switch(config)#
```

The following SNMPv2 example shows how to configure and inband access to the community comm which is not mapped:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# snmp-server context def vrf default
switch(config)# snmp-server community comm group network-admin
switch(config)#
```

The following SNMPv3 example shows how to use a v3 username and password:

```
switch# config t
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# snmp-server context def vrf default
switch(config)#
```

Enabling SNMP Notifications

You can enable or disable notifications. If you do not specify a notification name, Cisco NX-OS enables all notifications.

**Note**

The **snmp-server enable traps** CLI command enables both traps and informs, depending on the configured notification host receivers.

The following table lists the CLI commands that enable the notifications for Cisco NX-OS MIBs.

Table 26: Enabling SNMP Notifications

MIB	Related Commands
All notifications	snmp-server enable traps
BRIDGE-MIB	snmp-server enable traps bridge newroot snmp-server enable traps bridge topologychange
CISCO-AAA-SERVER-MIB	snmp-server enable traps aaa
ENTITY-MIB, CISCO-ENTITY-FRU-CONTROL-MIB, CISCO-ENTITY-SENSOR-MIB	snmp-server enable traps entity snmp-server enable traps entity fru
CISCO-LICENSE-MGR-MIB	snmp-server enable traps license
IF-MIB	snmp-server enable traps link
CISCO-PSM-MIB	snmp-server enable traps port-security
SNMPv2-MIB	snmp-server enable traps snmp snmp-server enable traps snmp authentication
CISCO-FCC-MIB	snmp-server enable traps fcc
CISCO-DM-MIB	snmp-server enable traps fcdomain
CISCO-NS-MIB	snmp-server enable traps fcns
CISCO-FCS-MIB	snmp-server enable traps fcs discovery-complete snmp-server enable traps fcs request-reject
CISCO-FDMI-MIB	snmp-server enable traps fdmi
CISCO-FSPF-MIB	snmp-server enable traps fspf
CISCO-PSM-MIB	snmp-server enable traps port-security
CISCO-RSCN-MIB	snmp-server enable traps rscn snmp-server enable traps rscn els snmp-server enable traps rscn ils

MIB	Related Commands
CISCO-ZS-MIB	snmp-server enable traps zone snmp-server enable traps zone default-zone-behavior-change snmp-server enable traps zone enhanced-zone-db-change snmp-server enable traps zone merge-failure snmp-server enable traps zone merge-success snmp-server enable traps zone request-reject snmp-server enable traps zone unsupp-mem
CISCO-CONFIG-MAN-MIB Note Supports no MIB objects except the following notification: ccmCLIRunningConfigChanged	snmp-server enable traps config

**Note**

The license notifications are enabled by default.

To enable the specified notification in the global configuration mode, perform one of the following tasks:

Command	Purpose
switch(config)# snmp-server enable traps	Enables all SNMP notifications.
switch(config)# snmp-server enable traps aaa [server-state-change]	Enables the AAA SNMP notifications.
switch(config)# snmp-server enable traps entity [fru]	Enables the ENTITY-MIB SNMP notifications.
switch(config)# snmp-server enable traps license	Enables the license SNMP notification.
switch(config)# snmp-server enable traps port-security	Enables the port security SNMP notifications.
switch(config)# snmp-server enable traps snmp [authentication]	Enables the SNMP agent notifications.

Configuring Link Notifications

You can configure which linkUp/linkDown notifications to enable on a device. You can enable the following types of linkUp/linkDown notifications:

- **cieLinkDown**—Enables the Cisco extended link state down notification.

- **cieLinkUp**—Enables the Cisco extended link state up notification.
- **cisco-xcvr-mon-status-chg**—Enables the Cisco interface transceiver monitor status change notification.
- **delayed-link-state-change**—Enables the delayed link state change.
- **extended-linkUp**—Enables the Internet Engineering Task Force (IETF) extended link state up notification.
- **extended-linkDown**—Enables the IETF extended link state down notification.
- **linkDown**—Enables the IETF Link state down notification.
- **linkUp**—Enables the IETF Link state up notification.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# configure terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	snmp-server enable traps link [cieLinkDown cieLinkUp cisco-xcvr-mon-status-chg delayed-link-state-change] extended-linkUp extended-linkDown linkDown linkUp] Example: <pre>switch(config)# snmp-server enable traps link cieLinkDown</pre>	Enables the link SNMP notifications.

Disabling Link Notifications on an Interface

You can disable linkUp and linkDown notifications on an individual interface. You can use these limit notifications on a flapping interface (an interface that transitions between up and down repeatedly).

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# interface type slot/port	Specifies the interface to be changed.
Step 3	switch(config-if)# no snmp trap link-status	Disables SNMP link-state traps for the interface. This feature is enabled by default.

Enabling One-Time Authentication for SNMP over TCP

You can enable a one-time authentication for SNMP over a TCP session.

Command	Purpose
switch(config)# snmp-server tcp-session [auth]	Enables a one-time authentication for SNMP over a TCP session. This feature is disabled by default.

Assigning SNMP Switch Contact and Location Information

You can assign the switch contact information, which is limited to 32 characters (without spaces), and the switch location.

Procedure

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters global configuration mode.
Step 2	switch(config)# snmp-server contact <i>name</i>	Configures sysContact, the SNMP contact name.
Step 3	switch(config)# snmp-server location <i>name</i>	Configures sysLocation, the SNMP location.
Step 4	switch# show snmp	(Optional) Displays information about one or more destination profiles.
Step 5	switch# copy running-config startup-config	(Optional) Saves this configuration change.

Configuring the Context to Network Entity Mapping

You can configure an SNMP context to map to a logical network entity, such as a protocol instance or VRF.

Procedure

	Command or Action	Purpose
Step 1	switch# configuration terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	switch(config)# snmp-server context <i>context-name</i> [instance <i>instance-name</i>] [vrf <i>vrf-name</i>] [topology <i>topology-name</i>]	Maps an SNMP context to a protocol instance, VRF, or topology. The names can be any alphanumeric string up to 32 characters.
Step 3	switch(config)# snmp-server mib community-map <i>community-name</i> context <i>context-name</i>	Maps an SNMPv2c community to an SNMP context. The names can be any alphanumeric string up to 32 characters.
Step 4	switch(config)# no snmp-server context <i>context-name</i> [instance <i>instance-name</i>] [vrf <i>vrf-name</i>] [topology <i>topology-name</i>]	<p>(Optional) Deletes the mapping between an SNMP context and a protocol instance, VRF, or topology. The names can be any alphanumeric string up to 32 characters.</p> <p>Note Do not enter an instance, VRF, or topology to delete a context mapping. If you use the instance, vrf, or topology keywords, you configure a mapping between the context and a zero-length string.</p>

Disabling SNMP

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	switch(config) # no snmp-server protocol enable Example: no snmp-server protocol enable	Disables SNMP. SNMP is disabled by default.

Verifying the SNMP Configuration

To display SNMP configuration information, perform one of the following tasks:

Command	Purpose
show snmp	Displays the SNMP status.

Command	Purpose
show snmp community	Displays the SNMP community strings.
show snmp engineID	Displays the SNMP engineID.
show snmp group	Displays SNMP roles.
show snmp sessions	Displays SNMP sessions.
show snmp trap	Displays the SNMP notifications enabled or disabled.
show snmp user	Displays SNMPv3 users.

Feature History for SNMP

Table 27: Feature History for SNMP

Feature Name	Releases	Information
IPv6 support	5.2(1)N1(1)	This feature was introduced.

Configuring RMON

This chapter contains the following sections:

- [Information About RMON, page 173](#)
- [Configuration Guidelines and Limitations for RMON, page 174](#)
- [Verifying the RMON Configuration, page 175](#)
- [Default RMON Settings, page 175](#)
- [Configuring RMON Alarms, page 175](#)
- [Configuring RMON Events, page 176](#)

Information About RMON

RMON is an Internet Engineering Task Force (IETF) standard monitoring specification that allows various network agents and console systems to exchange network monitoring data. The Cisco NX-OS supports RMON alarms, events, and logs to monitor Cisco Nexus device.

An RMON alarm monitors a specific management information base (MIB) object for a specified interval, triggers an alarm at a specified threshold value (threshold), and resets the alarm at another threshold value. You can use alarms with RMON events to generate a log entry or an SNMP notification when the RMON alarm triggers.

RMON is disabled by default and no events or alarms are configured in Cisco Nexus devices. You can configure your RMON alarms and events by using the CLI or an SNMP-compatible network management station.

RMON Alarms

You can set an alarm on any MIB object that resolves into an SNMP INTEGER type. The specified object must be an existing SNMP MIB object in standard dot notation (for example, 1.3.6.1.2.1.2.2.1.17 represents ifOutOctets.17).

When you create an alarm, you specify the following parameters:

- MIB object to monitor

- Sampling interval—The interval that the Cisco Nexus device uses to collect a sample value of the MIB object.
- Sample type—Absolute samples take the current snapshot of the MIB object value. Delta samples take two consecutive samples and calculate the difference between them.
- Rising threshold—The value at which the Cisco Nexus device triggers a rising alarm or resets a falling alarm.
- Falling threshold—The value at which the Cisco Nexus device triggers a falling alarm or resets a rising alarm.
- Events—The action that the Cisco Nexus device takes when an alarm (rising or falling) triggers.

**Note**

Use the `hcalarms` option to set an alarm on a 64-bit integer MIB object.

For example, you can set a delta type rising alarm on an error counter MIB object. If the error counter delta exceeds this value, you can trigger an event that sends an SNMP notification and logs the rising alarm event. This rising alarm does not occur again until the delta sample for the error counter drops below the falling threshold.

**Note**

The falling threshold must be less than the rising threshold.

RMON Events

You can associate a particular event to each RMON alarm. RMON supports the following event types:

- SNMP notification—Sends an SNMP `risingAlarm` or `fallingAlarm` notification when the associated alarm triggers.
- Log—Adds an entry in the RMON log table when the associated alarm triggers.
- Both—Sends an SNMP notification and adds an entry in the RMON log table when the associated alarm triggers.

You can specify a different event for a falling alarm and a rising alarm.

Configuration Guidelines and Limitations for RMON

RMON has the following configuration guidelines and limitations:

- You must configure an SNMP user and a notification receiver to use the SNMP notification event type.
- You can only configure an RMON alarm on a MIB object that resolves to an integer.

Verifying the RMON Configuration

Use the following commands to verify the RMON configuration information:

Command	Purpose
show rmon alarms	Displays information about RMON alarms.
show rmon events	Displays information about RMON events.
show rmon hcalarms	Displays information about RMON hcalarms.
show rmon logs	Displays information about RMON logs.

Default RMON Settings

The following table lists the default settings for RMON parameters.

Table 28: Default RMON Parameters

Parameters	Default
Alarms	None configured.
Events	None configured.

Configuring RMON Alarms

You can configure RMON alarms on any integer-based SNMP MIB object.

You can optionally specify the following parameters:

- The eventnumber to trigger if the rising or falling threshold exceeds the specified limit.
- The owner of the alarm.

Ensure you have configured an SNMP user and enabled SNMP notifications.

Before You Begin

Ensure you have configured an SNMP user and enabled SNMP notifications.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# rmon alarm <i>index mib-object sample-interval</i> {absolute delta} rising-threshold <i>value</i> [event-index] falling-threshold <i>value</i> [event-index] [owner name]	Creates an RMON alarm. The value range is from –2147483647 to 2147483647. The owner name can be any alphanumeric string.
Step 3	switch(config)# rmon hcalarm <i>index mib-object sample-interval</i> {absolute delta} rising-threshold-high <i>value</i> rising-threshold-low <i>value</i> [event-index] falling-threshold-high <i>value</i> falling-threshold-low <i>value</i> [event-index] [owner name] [storagetype type]	Creates an RMON high-capacity alarm. The value range is from –2147483647 to 2147483647. The owner name can be any alphanumeric string. The storage type range is from 1 to 5.
Step 4	switch# show rmon {alarms hcalarms}	(Optional) Displays information about RMON alarms or high-capacity alarms.
Step 5	switch# copy running-config startup-config	(Optional) Saves this configuration change.

The following example shows how to configure RMON alarms:

```
switch# configure terminal
switch(config)# rmon alarm 1 1.3.6.1.2.1.2.2.1.17.83886080 5 delta rising-threshold 5 1
falling-threshold 0 owner test
switch(config)# exit
switch# show rmon alarms
Alarm 1 is active, owned by test
Monitors 1.3.6.1.2.1.2.2.1.17.83886080 every 5 second(s)
Taking delta samples, last value was 0
Rising threshold is 5, assigned to event 1
Falling threshold is 0, assigned to event 0
On startup enable rising or falling alarm
```

Configuring RMON Events

You can configure RMON events to associate with RMON alarms. You can reuse the same event with multiple RMON alarms.

Ensure you have configured an SNMP user and enabled SNMP notifications.

Before You Begin

Ensure that you have configured an SNMP user and enabled SNMP notifications.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# rmon event <i>index</i> [description <i>string</i>] [log] [trap] [owner <i>name</i>]	Configures an RMON event. The description string and owner name can be any alphanumeric string.
Step 3	switch(config)# show rmon { alarms hcalarms }	(Optional) Displays information about RMON alarms or high-capacity alarms.
Step 4	switch# copy running-config startup-config	(Optional) Saves this configuration change.

Configuring SPAN

This chapter contains the following sections:

- [Information About SPAN, page 180](#)
- [SPAN Sources, page 180](#)
- [Characteristics of Source Ports, page 180](#)
- [SPAN Destinations, page 181](#)
- [Characteristics of Destination Ports, page 181](#)
- [Guidelines and Limitations for SPAN, page 182](#)
- [Creating or Deleting a SPAN Session, page 182](#)
- [Configuring an Ethernet Destination Port, page 182](#)
- [Configuring MTU Truncation for Each SPAN Session, page 183](#)
- [Configuring the Rate Limit for SPAN Traffic, page 184](#)
- [Configuring Fibre Channel Destination Port, page 185](#)
- [Configuring Source Ports, page 186](#)
- [Configuring Source Port Channels, VSANs, or VLANs, page 186](#)
- [Configuring the Description of a SPAN Session, page 187](#)
- [Activating a SPAN Session, page 188](#)
- [Suspending a SPAN Session, page 188](#)
- [Troubleshooting SPAN session issues, page 189](#)
- [Displaying SPAN Information, page 190](#)

Information About SPAN

SPAN Sources

SPAN sources refer to the interfaces from which traffic can be monitored. The Cisco Nexus device supports Ethernet, Fibre Channel, virtual Fibre Channel, port channels, SAN port channels, VSANs and VLANs as SPAN sources. With VLANs or VSANs, all supported interfaces in the specified VLAN or VSAN are included as SPAN sources. You can choose the SPAN traffic in the ingress direction, the egress direction, or both directions for Ethernet, Fibre Channel, and virtual Fibre Channel source interfaces:

- Ingress source (Rx)—Traffic entering the device through this source port is copied to the SPAN destination port.
- Egress source (Tx)—Traffic exiting the device through this source port is copied to the SPAN destination port.

If the SPAN source interface sends more than 6-Gbps traffic or if traffic bursts too much, the device drops traffic on the source interface. You can use the **switchport monitor rate-limit 1G** command on the SPAN destination to reduce the dropping of actual traffic on the source interface; however, SPAN traffic is restricted to 1 Gbps. For additional information see [Configuring the Rate Limit for SPAN Traffic, on page 184](#)

**Note**

The **switchport monitor rate-limit 1G** command is not supported on the Nexus 5500 platform.

On the Cisco Nexus 5548 device, Fibre Channel ports and VSAN ports cannot be configured as ingress source ports in a SPAN session.

Characteristics of Source Ports

A source port, also called a monitored port, is a switched interface that you monitor for network traffic analysis. The switch supports any number of ingress source ports (up to the maximum number of available ports on the switch) and any number of source VLANs or VSANs.

A source port has these characteristics:

- Cannot be a destination port.
- Can be configured with a direction (ingress, egress, or both) to monitor. For VLAN and VSAN sources, the monitored direction can only be ingress and applies to all physical ports in the group. The RX/TX option is not available for VLAN or VSAN SPAN sessions.
- There is no limit to the number of egress SPAN ports, but there is upper limit of 128 source ports in the monitor session.
- Port Channel and SAN Port Channel interfaces can be configured as ingress or egress source ports.
- Can be in the same or different VLANs or VSANs.
- For VLAN or VSAN SPAN sources, all active ports in the source VLAN or VSAN are included as source ports.

**Note**

- If some of the FEX ports are being used by a SPAN session as source ports, the remaining FEX ports cannot be a part of a different SPAN session.
- The maximum number of source ports per SPAN session is 128 ports.
- The maximum number of SPAN sessions supported on the Nexus 5000 Series and Nexus 5500 Series switches is 4.
- The maximum number of SPAN sessions supported on the Nexus 5600 Series and Nexus 6000 Series switches is 16.

SPAN Destinations

SPAN destinations refer to the interfaces that monitors source ports. The Cisco Nexus Series device supports Ethernet and Fibre Channel interfaces as SPAN destinations.

Source SPAN	Dest SPAN
Ethernet	Ethernet
Fibre Channel	Fibre Channel
Fibre Channel	Ethernet (FCoE)
Virtual Fibre Channel	Fibre Channel
Virtual Fibre Channel	Ethernet (FCoE)

Characteristics of Destination Ports

Each local SPAN session must have a destination port (also called a monitoring port) that receives a copy of traffic from the source ports, VSANs, or VLANs. A destination port has these characteristics:

- Cannot be a source port.
- Cannot be a port channel or SAN port channel group.
- Does not participate in spanning tree while the SPAN session is active.
- Is excluded from the source list and is not monitored if it belongs to a source VLAN of any SPAN session.
- Receives copies of sent and received traffic for all monitored source ports.
- The FEX interface cannot be a span destination.

Guidelines and Limitations for SPAN

SPAN traffic is rate-limited as follows on Nexus 5500 series switches to prevent a negative impact to production traffic:

- SPAN is rate-limited to 5 Gbps for every 8 ports (one ASIC).
- RX-SPAN is rate-limited to 0.71 Gbps per port when the RX-traffic on the port exceeds 5 Gbps.

Creating or Deleting a SPAN Session

You create a SPAN session by assigning a session number using the **monitor session** command. If the session already exists, any additional configuration information is added to the existing session.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# monitor session <i>session-number</i>	Enters the monitor configuration mode. New session configuration is added to the existing session configuration.

The following example shows how to configure a SPAN monitor session:

```
switch# configure terminal
switch(config) # monitor session 2
switch(config) #
```

Configuring an Ethernet Destination Port

You can configure an Ethernet interface as a SPAN destination port.

Note

The SPAN destination port can only be a physical port on the switch.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# interface ethernet <i>slot/port</i>	Enters interface configuration mode for the Ethernet interface with the specified slot and port.

	Command or Action	Purpose
		Note To enable the switchport monitor command on virtual ethernet ports, you can use the interface vethernet slot/port command.
Step 3	switch(config-if)# switchport monitor	Enters monitor mode for the specified Ethernet interface. Priority flow control is disabled when the port is configured as a SPAN destination.
Step 4	switch(config-if)# exit	Reverts to global configuration mode.
Step 5	switch(config)# monitor session session-number	Enters monitor configuration mode for the specified SPAN session.
Step 6	switch(config-monitor)# destination interface ethernet slot/port	Configures the Ethernet SPAN destination port. Note To enable the virtual ethernet port as destination interface in the monitor configuration, you can use the destination interface vethernet slot/port command.

The following example shows how to configure an Ethernet SPAN destination port (HIF):

```
switch# configure terminal
switch(config)# interface ethernet100/1/24
switch(config-if)# switchport monitor
switch(config-if)# exit
switch(config)# monitor session 1
switch(config-monitor)# destination interface ethernet100/1/24
switch(config-monitor)#
```

The following example shows how to configure a virtual ethernet (VETH) SPAN destination port:

```
switch# configure terminal
switch(config)# interface vethernet10
switch(config-if)# switchport monitor
switch(config-if)# exit
switch(config)# monitor session 2
switch(config-monitor)# destination interface vethernet10
switch(config-monitor)#
```

Configuring MTU Truncation for Each SPAN Session

To reduce the SPAN traffic bandwidth, you can configure the maximum bytes allowed for each replicated packet in a SPAN session. This value is called the maximum transmission unit (MTU) truncation size. Any SPAN packet larger than the configured size is truncated to the configured size.

Note

MTU Truncation is not supported for SPAN-on-Drop sessions.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # monitor session <i>session-number</i>	Enters monitor configuration mode and specifies the SPAN session for which the MTU truncation size is to be configured.
Step 3	switch(config-monitor) # [no] mtu	Configures the MTU truncation size for packets in the specified SPAN session. The range is from 64 to 1518 bytes.
Step 4	switch(config-monitor) # show monitor session <i>session-number</i>	(Optional) Displays the status of SPAN sessions, including the configuration status of MTU truncation, the maximum bytes allowed for each packet per session, and the modules on which MTU truncation is and is not supported.
Step 5	switch(config-monitor) # copy running-config startup-config	(Optional) Copies the running configuration to the startup configuration.

This example shows how to configure MTU truncation for a SPAN session:

```
switch# configure terminal
switch(config) # monitor session 3
switch(config-monitor) # mtu
switch(config-monitor) # copy running-config startup-config
switch(config-monitor) #
```

Configuring the Rate Limit for SPAN Traffic

By configuring a rate limit for SPAN traffic to 1Gbps across the entire monitor session, you can avoid impacting the monitored production traffic.

On Nexus 5000 series switches:

- When spanning more than 1Gbps to a 1 Gb SPAN destination interface, SPAN source traffic will not drop.
- When spanning more than 6 Gbps (but less than 10Gbps) to a 10Gb SPAN destination interface, the SPAN traffic is limited to 1Gbps even though the destination/sniffer is capable of 10Gbps.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# interface ethernet <i>slot/port</i>	Enters interface configuration mode for the specified Ethernet interface selected by the slot and port values.
Step 3	switch(config-if)# switchport monitor rate-limit 1G	Specifies that the rate limit is 1 Gbps.
Step 4	switch(config-if)# exit	Reverts to global configuration mode.

This example shows how to limit the bandwidth on Ethernet interface 1/2 to 1 Gbps:

```
switch(config)# interface ethernet 1/2
switch(config-if)# switchport monitor rate-limit 1G
switch(config-if)#
```

Configuring Fibre Channel Destination Port

**Note**

The SPAN destination port can only be a physical port on the switch.

You can configure a Fibre Channel port as a SPAN destination port.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config)# interface fc <i>slot/port</i>	Enters interface configuration mode for the specified Fibre Channel interface selected by the slot and port values.
Step 3	switch(config-if)# switchport mode SD	Sets the interface to SPAN destination (SD) mode.
Step 4	switch(config-if)# switchport speed 1000	Sets the interface speed to 1000. The auto speed option is not allowed.
Step 5	switch(config-if)# exit	Reverts to global configuration mode.
Step 6	switch(config)# monitor session <i>session-number</i>	Enters the monitor configuration mode.
Step 7	switch(config-monitor)# destination interface fc <i>slot/port</i>	Configures the Fibre Channel destination port.

The following example shows how to configure an Ethernet SPAN destination port:

```
switch# configure terminal
switch(config)# interface fc 2/4
switch(config-if)# switchport mode SD
switch(config-if)# switchport speed 1000
switch(config-if)# exit
switch(config)# monitor session 2
switch(config-monitor)# destination interface fc 2/4
```

Configuring Source Ports

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # monitor session <i>session-number</i>	Enters monitor configuration mode for the specified monitoring session.
Step 3	switch(config-monitor) # source interface <i>type slot/port</i> [rx tx both]	Adds an Ethernet SPAN source port and specifies the traffic direction in which to duplicate packets. You can enter a range of Ethernet, Fibre Channel, or virtual Fibre Channel ports. You can specify the traffic direction to duplicate as ingress (Rx), egress (Tx), or both. By default, the direction is both.

The following example shows how to configure a virtual Fibre Channel SPAN source port:

```
switch# configure terminal
switch(config)# monitor session 2
switch(config-monitor)# source interface vfc 129
switch(config-monitor)#
```

Configuring Source Port Channels, VSANs, or VLANs

You can configure the source channels for a SPAN session. These ports can be port channels, SAN port channels, VSANs and VLANs. The monitored direction can be ingress, egress, or both and applies to all physical ports in the group.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.

	Command or Action	Purpose
Step 2	switch(config) # monitor session <i>session-number</i>	Enters monitor configuration mode for the specified SPAN session.
Step 3	switch(config-monitor) # source { interface { port-channel san-port-channel } <i>channel-number</i> [rx tx both] vlan <i>vlan-range</i> vsan <i>vsan-range</i> }	Configures port channel, SAN port channel, VLAN, or VSAN sources. For VLAN or VSAN sources, the monitored direction is implicit.

The following example shows how to configure a port channel SPAN source:

```
switch# configure terminal
switch(config) # monitor session 2
switch(config-monitor) # source interface port-channel 1 rx
switch(config-monitor) # source interface port-channel 3 tx
switch(config-monitor) # source interface port-channel 5 both
switch(config-monitor) #
```

This example shows how to configure a SAN port channel SPAN source:

```
switch(config-monitor)#switch# configure terminal
switch(config) # monitor session 2
switch(config-monitor) # source interface san-port-channel 3 rx
switch(config-monitor) #
```

The following example shows how to configure a VLAN SPAN source:

```
switch# configure terminal
switch(config) # monitor session 2
switch(config-monitor) # source vlan 1
switch(config-monitor) #
```

switch(config-monitor)#This example shows how to configure a VSAN SPAN source:

```
switch(config-monitor)#switch# configure terminal
switch(config) # monitor session 2
switch(config-monitor) # source vsan 1
switch(config-monitor) #
```

Configuring the Description of a SPAN Session

For ease of reference, you can provide a descriptive name for a SPAN session.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # monitor session <i>session-number</i>	Enters monitor configuration mode for the specified SPAN session.
Step 3	switch(config-monitor) # description <i>description</i>	Creates a descriptive name for the SPAN session.

The following example shows how to configure a SPAN session description:

```
switch# configure terminal
switch(config) # monitor session 2
switch(config-monitor) # description monitoring ports eth2/2-eth2/4
switch(config-monitor) #
```

Activating a SPAN Session

The default is to keep the session state shut. You can open a session that duplicates packets from sources to destinations.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # no monitor session {all session-number} shut	Opens the specified SPAN session or all sessions.

The following example shows how to activate a SPAN session:

```
switch# configure terminal
switch(config) # no monitor session 3 shut
```

Suspending a SPAN Session

By default, the session state is **shut**.

Note

The Cisco Nexus switch supports two active SPAN sessions. The Cisco Nexus 5548 Switch supports four active SPAN sessions. When you configure more than two SPAN sessions, the first two sessions are active. During startup, the order of active sessions is reversed; the last two sessions are active. For example, if you configured ten sessions 1 to 10 where 1 and 2 are active, after a reboot, sessions 9 and 10 will be active. To enable deterministic behavior, explicitly suspend the sessions 3 to 10 with the **monitor session session-number shut** command.

Procedure

	Command or Action	Purpose
Step 1	switch# configure terminal	Enters global configuration mode.
Step 2	switch(config) # monitor session {all session-number} shut	Suspends the specified SPAN session or all sessions.

The following example shows how to suspend a SPAN session:

```
switch# configure terminal
switch(config) # monitor session 3 shut
switch(config) #
```

Troubleshooting SPAN session issues

If a SPAN session is down, do the following:

- Check if one of the destination port is operational by performing the following:
 - Use the **show running interface** *interface* command and check if the switchport monitor is configured.
 - Use the **show interface** *interface* command and check if the destination interface shows the status as "admin up".
- Use the **show interface** *interface* command to check if one of the source port is operational and if the source interface shows the status as "admin up".

Troubleshooting SPAN session with large number of source ports issues

Table 29: Troubleshooting SPAN session with large number of source ports

Problem Description	Solution	Recommendation
When a SPAN session is configured with maximum supported range of 128 source ports at one go, the configuration session may encounter "Service not responding" message.	Remove the ports and configure them in smaller ranges (example, 1 to 48) and then use the shutdown and no shutdown command on the session.	Configure the individual ports in small ranges (example, 1 to 48).
After using the shutdown and then no shutdown on a range of SPAN session configured with maximum of ports (example, 128), some sessions do not come up.	Remove some ports from the specific SPAN session. Add the removed ports back to the same SPAN session and then use the no shutdown command.	Use the shutdown command on each port.

After creating a SPAN session with 128 source ports, the no shutdown command displays a "Service not responding" message.	Use the no shutdown command repeatedly to bring up the SPAN session.	
----------------------------------------------------------------------------------------------------------------------------------	-----------------------------------------------------------------------------	--

Displaying SPAN Information

Procedure

	Command or Action	Purpose
Step 1	switch# show monitor [session {all session-number range session-range} [brief]]	Displays the SPAN configuration.

The following example shows how to display SPAN session information:

```
switch# show monitor
SESSION  STATE      REASON          DESCRIPTION
-----  -
2        up          The session is up
3        down       Session suspended
4        down       No hardware resource
```

The following example shows how to display SPAN session details:

```
switch# show monitor session 2
session 2
-----
type           : local
state          : up
acl-name       : acl1
source intf    :

source VLANs   :
rx             :
source VSANs   :
rx             : 1
destination ports : Eth3/1
```

Configuring ERSPAN

This chapter contains the following sections:

- [Information About ERSPAN, page 191](#)
- [Licensing Requirements for ERSPAN, page 193](#)
- [Prerequisites for ERSPAN, page 193](#)
- [Guidelines and Limitations for ERSPAN, page 194](#)
- [Default Settings for ERSPAN, page 195](#)
- [Configuring ERSPAN, page 195](#)
- [Configuration Examples for ERSPAN, page 203](#)
- [Additional References, page 204](#)

Information About ERSPAN

ERSPAN transports mirrored traffic over an IP network, which provides remote monitoring of multiple switches across your network. The traffic is encapsulated at the source router and is transferred across the network. The packet is decapsulated at the destination router and then sent to the destination interface.

ERSPAN consists of an ERSPAN source session, routable ERSPAN generic routing encapsulation (GRE)-encapsulated traffic, and an ERSPAN destination session. You can separately configure ERSPAN source sessions and destination sessions on different switches.

ERSPAN Source Sessions

An ERSPAN source session is defined by the following:

- A session ID.
- A list of source ports, source VLANs, or source VSANs to be monitored by the session.
- An ERSPAN flow ID.
- Optional attributes related to the GRE envelope such as IP TOS and TTL.

- Destination IP address.
- Virtual Routing and Forwarding tables.

ERSPAN source sessions do not copy ERSPAN GRE-encapsulated traffic from source ports. Each ERSPAN source session can have ports, VLANs, or VSANs as sources. However, there are some limitations. For more information, see Guidelines and Limitations for ERSPAN.

The following figure shows an example ERSPAN configuration.

Figure 4: ERSPAN Configuration

Monitored Traffic

By default, ERSPAN monitors all traffic, including multicast and bridge protocol data unit (BPDU) frames.

The direction of the traffic that ERSPAN monitors depends on the source, as follows:

- For a source port, the ERSPAN can monitor ingress, egress, or both ingress and egress traffic.
- For a source VLAN or source VSAN, the ERSPAN can monitor only ingress traffic.

ERSPAN Sources

The interfaces from which traffic can be monitored are called ERSPAN sources. Sources designate the traffic to monitor and whether to copy ingress, egress, or both directions of traffic. ERSPAN sources include the following:

- Source Ports—A source port is a port monitored for traffic analysis. You can configure source ports in any VLAN, and trunk ports can be configured as source ports and mixed with nontrunk source ports.
- Source VLANs—A source VLAN is a virtual local area network (VLAN) that is monitored for traffic analysis.
- Source VSANs—A source VSAN is a virtual storage area network (VSAN) that is monitored for traffic analysis.

Truncated ERSPAN

Truncated ERSPAN can be used to reduce the amount of fabric or network bandwidth used in sending ERSPAN packets.

The default is no truncation so switches or routers receiving large ERSPAN packets might drop these oversized packets.

**Note**

Do not enable the truncated ERSPAN feature if the destination ERSPAN router is a Cisco Nexus 6001 or Cisco Nexus 6004 switch because the Cisco Nexus 6000 Series switch drops these truncated packets.

Multiple ERSPAN Sessions

For information about shutting down ERSPAN sessions, see [Shutting Down or Activating an ERSPAN Session](#), on page 201.

High Availability

The ERSPAN feature supports stateless restarts. After a reboot, the running configuration is applied.

Licensing Requirements for ERSPAN

The following table shows the licensing requirements for this feature:

Product	License Requirement
Cisco NX-OS	ERSPAN requires no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <i>License and Copyright Information for Cisco NX-OS Software</i> available at the following URL: http://www.cisco.com/en/US/docs/switches/datacenter/sw/4_0/nx-os/license_agreement/nx-ossw_lisns.html .

Prerequisites for ERSPAN

ERSPAN has the following prerequisite:

- You must first configure the Ethernet interfaces for ports on each device to support the desired ERSPAN configuration. For more information, see the Interfaces configuration guide for your platform.

Guidelines and Limitations for ERSPAN

ERSPAN has the following guidelines and limitations:

- Cisco Nexus 5000 Series switches support only ERSPAN source sessions. Destination sessions are not supported.
- The Cisco Nexus 5000 Series switch supports a maximum of 2 sessions.
- The Cisco Nexus 5500 Series switch supports a maximum of 4 sessions.
- The maximum number of ports for each ERSPAN session is 32.
- You can have source ports, source VLANs, and source VSANs in one ERSPAN session.
- On Cisco Nexus 5000 Series switches, ERSPAN can monitor ingress, egress, or both ingress and egress traffic on a source port and only ingress traffic on source VLANs or source VSANs as long as the VLAN is not mapped to a VSAN.
- On Cisco 5500 Series switches, source ports and source VLANs can be in the same ERSPAN session.
- ERSPAN traffic can exit the switch through a Layer 2 interface, Layer 3 interface, port channel, or FabricPath core port.
- The Cisco Nexus 5000 series switch cannot reach a destination IP address of a remote switch through a virtual Ethernet port or FEX port. This functionality is not supported.
- ERSPAN traffic is not load balanced if the reachability to a destination IP address is a Layer 3 ECMP or a port channel. In the case of ECMP, the ERSPAN traffic is sent to only one next-hop router or one member of the port channel.
- ERSPAN on the Cisco Nexus 5000 Series switch supports Fast Ethernet, Gigabit Ethernet, TenGigabit Ethernet, and port channel interfaces as source ports for a source session.
- When a session is configured through the ERSPAN configuration commands, the session ID and the session type cannot be changed. In order to change them, you must first use the no version of the configuration command to remove the session and then reconfigure the session.
- ERSPAN traffic might compete with regular data traffic.
- ERSPAN traffic is assigned to the QoS class-default system class (qos-group 0).
- To ensure that data traffic is prioritized over ERSPAN traffic, you can create a QoS system class with prioritization above the class-default system class on the ERSPAN destination port.
On Layer 3 networks, ERSPAN traffic can be marked with a the desired Differentiated Services Code Point (DSCP) value using the ip dscp command. By default, ERSPAN traffic is marked with a DSCP value of 0.
- Consider a scenario in which an ERSPAN session and a local SPAN session is configured on a switch. Egress ports on both sessions are different. However, the ingress port on the local SPAN session is also receiving GRE-encapsulated traffic from the ERSPAN session. In such a scenario, the local SPAN session captures only the non-GRE-encapsulated traffic from the port that is defined as the source.
- ERSPAN can monitor ingress traffic on a source VSAN only on Cisco Nexus 5010 and 5020 switches.
- ERSPAN cannot monitor egress traffic on source VLANs and VSANs on any Cisco Nexus 5000 Series switch.

- ERSPAN can monitor ingress, egress, or both ingress and egress traffic on a source port.
- VSANs as ERSPAN sources are not allowed on Cisco Nexus 5548 and 5596 switches.
- ERSPAN source sessions are supported on F3 Series modules. Beginning with Cisco NX-OS Release 7.0, ERSPAN destination sessions are also supported on these modules. However, ERSPAN ACL sessions are not supported on F3 Series modules.
- The SPAN session ignores any permit or deny actions specified in the access-list, and spans only the packets that match the access-list filter criteria.

Default Settings for ERSPAN

The following table lists the default settings for ERSPAN parameters.

Table 30: Default ERSPAN Parameters

Parameters	Default
ERSPAN sessions	Created in the shut state.
Truncated ERSPAN	Disabled.

Configuring ERSPAN

Configuring an ERSPAN Source Session

The ERSPAN source session defines the session configuration parameters and the ports or VLANs to be monitored. This section describes how to configure an ERSPAN source session.

Procedure

	Command or Action	Purpose
Step 1	configuration terminal Example: switch# config t switch(config)#	Enters global configuration mode.
Step 2	monitor session <i>span-session-number</i> type {erspan-source local} Example: switch(config)# monitor session 1 type erspan-source switch(config-erspan-src)#	Defines an ERSPAN source session using the session ID and the session type, and places the command in ERSPAN monitor source session configuration mode. The <i>span-session-number</i> argument range is from 1 to 1024. The same session number cannot be used more than once.

	Command or Action	Purpose
		<p>The session IDs for source sessions are in the same global ID space, so each session ID is globally unique for both session types.</p> <p>The session ID (configured by the <i>span-session-number</i> argument) and the session type (configured by the erspan-source keyword) cannot be changed once entered. To change session ID or session type, use the no version of the command to remove the session and then recreate the session through the command with a new session ID or a new session type.</p>
Step 3	description <i>erspan_session_description</i> Example: <pre>switch(config-erspan-src) # description source1</pre>	<p>(Optional)</p> <p>Describes the ERSPAN source session.</p> <p>The <i>erspan_session_description</i> argument can be up to 240 characters and cannot contain special characters or spaces.</p>
Step 4	source interface { ethernet slot/chassis number portchannel number } Example: <pre>switch(config-erspan-src) # source interface eth 1/1</pre>	<p>Associates the ERSPAN source session number with the source ports (1-255).</p>
Step 5	source vlan number Example: <pre>switch(config-erspan-src) # source vlan 1</pre>	<p>Associates the ERSPAN source session number with the VLANs (1-4096).</p>
Step 6	source vsan number Example: <pre>switch(config-erspan-src) # source vsan 1</pre>	<p>On Cisco Nexus 5000 Series switches, specifies the VSAN ID number. The range is 1 to 4093. On Cisco Nexus 5500 Series switches, you cannot configure source VSANs.</p>
Step 7	destination ip ip-address Example: <pre>switch(config-erspan-src) # destination ip 192.0.2.2</pre>	<p>Configures the destination IP address in the ERSPAN session. Only one destination IP address is supported per ERSPAN source session.</p>
Step 8	erspan-id flow-id Example: <pre>switch(config-erspan-src) # erspan-id 5</pre>	<p>Configures the flow ID to identify the ERSPAN flow. The range is from 1 to 1023.</p>

	Command or Action	Purpose
Step 9	vrf { <i>vrf-name</i> default } Example: <pre>switch(config-erspan-src)# vrf default</pre>	Configures the VRF to use instead of the global routing table. You can use a VRF that you have specifically configured or the default VRF.
Step 10	ip ttl <i>ttl-number</i> Example: <pre>switch(config-erspan-src)# ip ttl 5</pre>	(Optional) Configures the IP time-to-live (TTL) value of the packets in the ERSPAN traffic. Valid values are from 1 to 255. The default value is 255.
Step 11	ip dscp <i>dscp_value</i> Example: <pre>switch(config-erspan-src)# ip dscp 42</pre>	(Optional) Configures the IP Differentiated Services Code Point (DSCP) value of the packets in the ERSPAN traffic. Valid values are from 0 to 63. The default value is 0.
Step 12	no shut Example: <pre>switch(config-erspan-src)# no shut</pre>	Enables the ERSPAN source session. By default, the session is created in the shut state. Note On Cisco Nexus 5000 Series switches, only two ERSPAN source sessions can be running simultaneously. On Cisco Nexus 5500 Series switches, up to four source sessions can be running simultaneously.
Step 13	exit Example: <pre>switch(config-erspan-src)# exit switch(config)# exit</pre>	Updates the configuration and exits ERSPAN source session configuration mode.
Step 14	copy running-config startup-config Example: <pre>switch(config-erspan-src)# copy running-config startup-config</pre>	(Optional) Copies the running configuration to the startup configuration.

Configuring a Source Rate Limit for an ERSPAN Session

Depending upon the platform, each TCAM region might have a different minimum/maximum/aggregate size restriction. The default size of the EFP TCAM for IPv4 Egress VACL (e-vacl) is 512 and Egress RACL (e-racl) is 512.

To enable the ERSPAN rate-limit feature, you must carve e-racl TCAM region to program TCAM entry in the EFP TCAM to match on ERSPAN mirror copy traffic and provide policer result with the new configured rate-limit. If the default values of the egress TCAM are not changed or if the e-racl region has a non-zero value, then you need not explicitly carve TCAM to enable ERSPAN egress rate-limit feature. However, if the e-racl region was carved to be zero earlier then you must resize other TCAM regions to allocate entries for e-racl region. After TCAM carving, you must save the configuration and reload the switch.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: <pre>switch# config t switch(config)#</pre>	Enters global configuration mode.
Step 2	monitor session {session-number all} type erspan-source Example: <pre>switch(config)# monitor session 1 type erspan-source switch(config-erspan-src)#</pre>	Configures an ERSPAN source session.
Step 3	hardware profile tcam region {arpacl {ipv6-e-racl e-racl} ifacl ipsg {ipv6-qos qos} qoslbl {ipv6-racl racl} vael } tcam_size	<p>Changes the ACL TCAM region size.</p> <ul style="list-style-type: none"> • arpacl—Configures the size of the Address Resolution Protocol (ARP) ACL (ARPACL) TCAM region. • e-racl—Configures the size of the egress router ACL (ERACL) TCAM region. • e-vacl—Configures the size of the egress VLAN ACL (EVACL) TCAM region. • ifacl—Configures the size of the interface ACL (ifacl) TCAM region. The maximum number of entries is 1500. • ipsg—Configures the size of the IP Source Guard (IPSG) TCAM region. • qos—Configures the size of the quality of service (QoS) TCAM region. • qoslbl—Configures the size of the QoS Label (qoslbl) TCAM region. • racl—Configures the size of the router ACL (RACL) TCAM region. • vacl—Configures the size of the VLAN ACL (VACL) TCAM region. • tcam_size—TCAM size. The range is from 0 to 2,14,74, 83, 647 entries. <p>Note vacl and e-vacl TCAM regions should be set to the same size. You must carve e-racl regions with non-zero TCAM values.</p>

	Command or Action	Purpose
Step 4	copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.
Step 5	switch(config)# show hardware profile tcam region Example: <pre>switch(config)# show hardware profile tcam region</pre>	Displays the TCAM sizes that will be applicable on the next reload of the switch.
Step 6	switch(config)# reload Example: <pre>switch(config)# reload</pre>	Copies the running configuration to the startup configuration. Note The new size values are effective only upon the next reload after saving the copy running-config to startup-config .
Step 7	switch(config)# hardware rate-limit erspan-egress Example: <pre>switch(config)# hardware rate-limit erspan-egress 1000 kbps</pre>	Specifies the ERSPAN egress rate-limit.
Step 8	switch(config)# show hardware rate-limit erspan-egress Example: <pre>switch(config)# show hardware rate-limit erspan-egress</pre>	Displays the configured ERSPAN egress rate-limit and also the permitted and dropped ERSPAN traffic statistics.
Step 9	switch(config)# clear hardware rate-limit erspan-egress statistics Example: <pre>switch(config)# clear hardware rate-limit erspan-egress statistics</pre>	Clears the currently permitted and dropped ERSPAN traffic statistics.

The following example shows how to change the size of the e-VACL region:

```
switch(config)# hardware profile tcam region e-vacl 256
[SUCCESS] New tcam size will be applicable only at boot time.
You need to 'copy run start' and 'reload'
```

```
switch(config)# copy running-config startup-config
switch(config)# reload
WARNING: This command will reboot the system
Do you want to continue? (y/n) [n] y
```

The following example shows how to configure ERSPAN rate-limit:

```
switch# configure terminal
switch(config)# hardware rate-limit erspan-egress 1000 kbps
```

Configuring an Origin IP Address for ERSPAN Packets

You must configure an IP address to be used as the source of the ERSPAN traffic.

Procedure

	Command or Action	Purpose
Step 1	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.
Step 2	monitor erspan origin ip-address <i>ip_address</i> Example: switch(config)# monitor erspan origin ip-address 192.0.2.1	Configures an IP address to be used as the source of the ERSPAN traffic.
Step 3	exit Example: switch(config-erspan-src)# exit	Updates the configuration and exits ERSPAN source session configuration mode.
Step 4	copy running-config startup-config Example: switch(config)# copy running-config startup-config	(Optional) Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.

Configuring Truncated ERSPAN

You can configure an MTU size for the ERSPAN traffic to reduce the amount of fabric or network bandwidth used in sending ERSPAN packets.

Procedure

	Command or Action	Purpose
Step 1	enable Example: switch> enable	Enables privileged EXEC mode. Enter your password if prompted.
Step 2	configure terminal Example: switch# configure terminal switch(config)#	Enters global configuration mode.

	Command or Action	Purpose
Step 3	monitor session <i>erspan_session_number</i> type {erspan-source local} Example: <pre>switch(config)# monitor session 1 type erspan-source switch(config-erspan-src)#</pre>	<p>Defines an ERSPAN source session using the session ID and the session type, and places the command in ERSPAN monitor source session configuration mode.</p> <p>The span-session-number argument range is from 1 to 1024. The same session number cannot be used more than once.</p> <p>The session IDs for source sessions are in the same global ID space, so each session ID is globally unique for both session types.</p> <p>The session ID (configured by the span-session number argument) and the session type (configured by the erspan-source keyword) cannot be changed once entered. To change session ID or session type, use the no version of the command to remove the session and then re-create the session through the command with a new session ID or a new session type.</p>
Step 4	mtu <i>mtu-value</i> Example: <pre>switch(config-erspan-src)# mtu 64</pre>	<p>Defines the maximum transmission unit (MTU) truncation size for ERSPAN packets. Valid values are from 64 to 1518.</p> <p>The default is no truncation enabled.</p>
Step 5	exit Example: <pre>switch(config-mon-erspan-src)# exit</pre>	<p>Updates the configuration and exits ERSPAN source session configuration mode.</p>
Step 6	copy running-config startup-config Example: <pre>switch(config)# copy running-config startup-config</pre>	<p>(Optional)</p> <p>Saves the change persistently through reboots and restarts by copying the running configuration to the startup configuration.</p>

Shutting Down or Activating an ERSPAN Session

You can shut down ERSPAN sessions to discontinue the copying of packets from sources to destinations. Because only a specific number of ERSPAN sessions can be running simultaneously, you can shut down a session to free hardware resources to enable another session. By default, ERSPAN sessions are created in the shut state.

You can enable ERSPAN sessions to activate the copying of packets from sources to destinations. To enable an ERSPAN session that is already enabled but operationally down, you must first shut it down and then enable it. You can shut down and enable the ERSPAN session states with either a global or monitor configuration mode command.

Procedure

	Command or Action	Purpose
Step 1	configuration terminal Example: <pre>switch# configuration terminal switch(config)#</pre>	Enters global configuration mode.
Step 2	monitor session {<i>session-range</i> all} shut Example: <pre>switch(config)# monitor session 3 shut</pre>	Shuts down the specified ERSPAN sessions. The session range is from 1 to 48. By default, sessions are created in the shut state. Note <ul style="list-style-type: none"> • In Cisco Nexus 5000 and 5500 platforms, two sessions can run simultaneously. • In Cisco Nexus 5600 and 6000 platforms, 16 sessions can run simultaneously.
Step 3	no monitor session {<i>session-range</i> all} shut Example: <pre>switch(config)# no monitor session 3 shut</pre>	Resumes (enables) the specified ERSPAN sessions. The session range is from 1 to 48. By default, sessions are created in the shut state. Only two sessions can be running at a time. Note If a monitor session is enabled but its operational status is down, then to enable the session, you must first specify the monitor session shut command followed by the no monitor session shut command.
Step 4	monitor session <i>session-number</i> type erspan-source Example: <pre>switch(config)# monitor session 3 type erspan-source switch(config-erspan-src)#</pre>	Enters the monitor configuration mode for the ERSPAN source type. The new session configuration is added to the existing session configuration.
Step 5	monitor session <i>session-number</i> type erspan-destination Example: <pre>switch(config-erspan-src)# monitor session 3 type erspan-destination</pre>	Enters the monitor configuration mode for the ERSPAN destination type.
Step 6	shut Example: <pre>switch(config-erspan-src)# shut</pre>	Shuts down the ERSPAN session. By default, the session is created in the shut state.
Step 7	no shut Example: <pre>switch(config-erspan-src)# no shut</pre>	Enables the ERSPAN session. By default, the session is created in the shut state.

	Command or Action	Purpose
Step 8	show monitor session all Example: <pre>switch(config-erspan-src)# show monitor session all</pre>	(Optional) Displays the status of ERSPAN sessions.
Step 9	show running-config monitor Example: <pre>switch(config-erspan-src)# show running-config monitor</pre>	(Optional) Displays the running ERSPAN configuration.
Step 10	show startup-config monitor Example: <pre>switch(config-erspan-src)# show startup-config monitor</pre>	(Optional) Displays the ERSPAN startup configuration.
Step 11	copy running-config startup-config Example: <pre>switch(config-erspan-src)# copy running-config startup-config</pre>	(Optional) Copies the running configuration to the startup configuration.

Verifying the ERSPAN Configuration

Use the following command to verify the ERSPAN configuration information:

Command	Purpose
show monitor session {all session-number range session-range}	Displays the ERSPAN session configuration.
show running-config monitor	Displays the running ERSPAN configuration.
show startup-config monitor	Displays the ERSPAN startup configuration.

Configuration Examples for ERSPAN

Configuration Example for an ERSPAN Source Session

The following example shows how to configure an ERSPAN source session:

```
switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# monitor session 1 type erspan-source
```

```

switch(config-erspan-src)# description source1
switch(config-erspan-src)# source interface ethernet 1/1
switch(config-erspan-src)# source vlan 1
switch(config-erspan-src)# source vsan 1
switch(config-erspan-src)# destination ip 192.0.2.2
switch(config-erspan-src)# erspan-id 1
switch(config-erspan-src)# vrf default
switch(config-erspan-src)# ip ttl 5
switch(config-erspan-src)# ip dscp 5
switch(config-erspan-src)# no shut
switch(config-erspan-src)# exit
switch(config)# copy running-config startup config
switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# description source1
switch(config-erspan-src)# source interface ethernet 1/1
switch(config-erspan-src)# source vlan 1
switch(config-erspan-src)# source vsan 1
switch(config-erspan-src)# destination ip 192.0.2.2
switch(config-erspan-src)# erspan-id 1
switch(config-erspan-src)# vrf default
switch(config-erspan-src)# ip ttl 5
switch(config-erspan-src)# ip dscp 5
switch(config-erspan-src)# no shut
switch(config-erspan-src)# exit
switch(config)# copy running-config startup config

```

Configuration Example for an IP Address as the Source for an ERSPAN Session

This example shows how to configure an IP address as the source for an ERSPAN session:

```

switch# configure terminal
switch(config)# monitor erspan origin ip-address 192.0.2.1
switch(config)# exit
switch(config)# copy running-config startup config

```

Configuration Example for Truncated ERSPAN

This example shows how to configure truncated ERSPAN:

```

switch# configure terminal
switch(config)# monitor session 1 type erspan-source
switch(config-erspan-src)# mtu 64
switch(config-mon-erspan-src)# exit
switch(config)# copy running-config startup config

```
