

Working with Configuration Files

This chapter describes how to work with your device configuration files.

- Finding Feature Information, on page 1
- Information About Configuration Files, on page 1
- Managing Configuration Files, on page 2
- Verifying the Device Configuration, on page 12
- Examples of Working with Configuration Files, on page 12
- Additional References for Configuration Files, on page 13

Finding Feature Information

Your software release might not support all the features documented in this module. For the latest caveats and feature information, see the Bug Search Tool at https://tools.cisco.com/bugsearch/ and the release notes for your software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the "New and Changed Information" chapter or the Feature History table in this chapter.

Information About Configuration Files

Configuration files contain the Cisco NX-OS software commands used to configure the features on a Cisco NX-OS device. Commands are parsed (translated and executed) by the Cisco NX-OS software when the system is booted (from the startup-config file) or when you enter commands at the CLI in a configuration mode.

To change the startup configuration file, you can either save the running-configuration file to the startup configuration using the **copy running-config startup-config** command or copy a configuration file from a file server to the startup configuration.

Types of Configuration Files

The Cisco NX-OS software has two types of configuration files, running configuration and startup configuration. The device uses the startup configuration (startup-config) during device startup to configure the software features. The running configuration (running-config) contains the current changes that you make to the startup-configuration file. The two configuration files can be different. You might want to change the device configuration for a short time period rather than permanently. In this case, you would change the running

configuration by using commands in global configuration mode but not save the changes to the startup configuration.

To change the running configuration, use the **configure terminal** command to enter global configuration mode. As you use the Cisco NX-OS configuration modes, commands generally are executed immediately and are saved to the running configuration file either immediately after you enter them or when you exit a configuration mode.

To change the startup-configuration file, you can either save the running configuration file to the startup configuration or download a configuration file from a file server to the startup configuration.

Managing Configuration Files

This section describes how to manage configuration files.

Saving the Running Configuration to the Startup Configuration

You can save the running configuration to the startup configuration to save your changes for the next time you that reload the device.

Procedure

	Command or Action	Purpose
Step 1	(Optional) show running-config	Displays the running configuration.
	Example: switch# show running-config	
Step 2	copy running-config startup-config Example:	Copies the running configuration to the startup configuration.
	switch# copy running-config startup-config	

Copying a Configuration File to a Remote Server

You can copy a configuration file stored in the internal memory to a remote server as a backup or to use for configuring other Cisco NX-OS devices.

	Command or Action	Purpose
Step 1	copy running-config scheme://server/[url /]filename	Copies the running-configuration file to a remote server.
	Example:	

	Command or Action	Purpose	
switch# copy running-config tftp://10.10.1.1/swl-run-config.bak		 For the <i>scheme</i> argument, you can enter tftp:, ftp:, scp:, or sftp:. The <i>server</i> argument is the address or name of the remote server, and the <i>url</i> argument is the path to the source file on the remote server. The <i>server</i>, <i>url</i>, and <i>filename</i> arguments are case sensitive. 	
Step 2	copy startup-config scheme://server/[url /]filename	Copies the startup-configuration file to a remote server.	
	Example: switch# copy startup-config tftp://10.10.1.1/swl-start-config.bak	For the <i>scheme</i> argument, you can enter tftp: , ftp: , scp: , or sftp: . The <i>server</i> argument is the address or name of the remote server, and the <i>url</i> argument is the path to the source file on the remote server. The <i>server</i> , <i>url</i> , and <i>filename</i> arguments are case sensitive.	

Example

This example shows how to copy the configuration file to a remote server:

```
switch# copy running-config
tftp://10.10.1.1/swl-run-config.bak
switch# copy startup-config
tftp://10.10.1.1/swl-start-config.bak
```

Downloading the Running Configuration From a Remote Server

You can configure your Cisco NX-OS device by using configuration files that you created on another Cisco NX-OS device and uploaded to a remote server. You then download the file from the remote server to your device using TFTP, FTP, Secure Copy (SCP), or Secure Shell FTP (SFTP) to the running configuration.

Before you begin

Ensure that the configuration file that you want to download is in the correct directory on the remote server.

Ensure that the permissions on the file are set correctly. Permissions on the file should be set to world-read.

Ensure that your Cisco NX-OS device has a route to the remote server. The Cisco NX-OS device and the remote server must be in the same subnetwork if you do not have a router or a default gateway to route traffic between subnets.

Check connectivity to the remote server using the **ping** or **ping6** command.

Command or Action		Purpose	
Step 1	<pre>copy scheme://server/[url/]filename running-config</pre>	Downloads the running-configuration file from a remote server.	
	<pre>Example: switch# copy tftp://10.10.1.1/my-config running-config</pre>	For the <i>scheme</i> argument, you can enter tftp: , ftp: , scp: , or sftp: . The <i>server</i> argument is the address or name of the remote server, and the <i>url</i> argument is the path to the source file on the remote server. The <i>server</i> , <i>url</i> , and <i>filename</i> arguments are case sensitive.	
Step 2	(Optional) show running-config Example: switch# show running-config	Displays the running configuration.	
Step 3	(Optional) copy running-config startup-config Example: switch# copy running-config startup-config	Copies the running configuration to the startup configuration.	
Step 4	(Optional) show startup-config Example: switch# show startup-config	Displays the startup configuration.	

Downloading the Startup Configuration From a Remote Server

You can configure your Cisco NX-OS device by using configuration files that you created on another Cisco NX-OS device and uploaded to a remote server. You then download the file from the remote server to your device using TFTP, FTP, Secure Copy (SCP), or Secure Shell FTP (SFTP) to the startup configuration.

Caution This procedure disrupts all traffic on the Cisco NX-OS device.

Before you begin

Log in to a session on the console port.

Ensure that the configuration file that you want to download is in the correct directory on the remote server.

Ensure that the permissions on the file are set correctly. Permissions on the file should be set to world-read.

Ensure that your Cisco NX-OS device has a route to the remote server. The Cisco NX-OS device and the remote server must be in the same subnetwork if you do not have a router or a default gateway to route traffic between subnets.

Check connectivity to the remote server using the **ping** or **ping6** command.

	Command or Action	Purpose	
Step 1	write erase	Erases the startup configuration file.	
	Example:		
	switch# write erase		
Step 2	reload	Reloads the Cisco NX-OS device.	
	<pre>Example: switch# reload This command will reboot the system. (y/n)? [n] y Enter the password for "admin": <password> Confirm the password for "admin": <password> Would you like to enter the basic configuration dialog (yes/no): n switch#</password></password></pre>	NoteDo not use the setup utility to configure the device.NoteBy default, the reload command reloads the device from a binary version of the startup configuration.Beginning with Cisco NX-OS 6.2(2), you can use the reload ASCII command to copy an ascii version of the configuration to the start up configuration when reloading the device.	
Step 3	<pre>copy scheme://server/[url /]filename running-config Example: switch# copy tftp://10.10.1.1/my-config running-config</pre>	Downloads the running configuration file from a remote server. For the <i>scheme</i> argument, you can enter tftp: , ftp: , scp: , or sftp: . The <i>server</i> argument is the address or name of the remote server, and the <i>url</i> argument is the path to the source file on the remote server.	
		The <i>server</i> , <i>url</i> , and <i>filename</i> arguments are case sensitive.	
Step 4	<pre>copy running-config startup-config Example: switch# copy running-config startup-config</pre>	Saves the running configuration file to the startup configuration file.	
Step 5	(Optional) show startup-config Example: switch# show startup-config	Displays the running configuration.	

Copying Configuration Files to an External Flash Memory Device

You can copy configuration files to an external flash memory device as a backup for later use.

Before you begin

Insert the external Flash memory device into the active supervisor module.

	Command or Action	Purpose	
Step 1	(Optional) dir { slot0: usb1: usb2: }[<i>directoryl</i>]	Displays the files on the external flash memory device.	
	Example:		
	switch# dir slot0:		
Step 2	<pre>copy running-config {slot0: usb1: usb2: }[directory/]filename</pre>	Copies the running configuration to an external flash memory device. The <i>filename</i> argument	
	Example:	is case sensitive.	
	<pre>switch# copy running-config slot0:dsn-running-config.cfg</pre>		
Step 3	<pre>copy startup-config {slot0: usb1: usb2:}[directory/]filename</pre>	Copies the startup configuration to an external flash memory device. The <i>filename</i> argument	
	Example:	is case sensitive.	
	<pre>switch# copy startup-config slot0:dsn-startup-config.cfg</pre>		

Copying the Running Configuration from an External Flash Memory Device

You can configure your Cisco NX-OS device by copying configuration files created on another Cisco NX-OS device and saved to an external flash memory device.

Before you begin

Insert the external flash memory device into the active supervisor module.

	Command or Action	Purpose	
Step 1	(Optional) dir {slot0: usb1: usb2:}[directory/]	Displays the files on the external flash memory device.	
	Example:		
	switch# dir slot0:		
Step 2	<pre>copy {slot0: usb1: usb2:}[directory/]filename running-config</pre>	Copies the running configuration from an external flash memory device. The <i>filename</i>	
	Example:	argument is case sensitive.	
	switch# copy slot0:dsn-config.cfg running-config		
Step 3	(Optional) show running-config	Displays the running configuration.	
	Example: switch# show running-config		

	Command or Action	Purpose	
Step 4	(Optional) copy running-config startup-config	Copies the running configuration to the startu configuration.	
	Example:		
	switch# copy running-config startup-config		
Step 5	(Optional) show startup-config	Displays the startup configuration.	
	Example:		
	switch# show startup-config		

Copying the Startup Configuration from an External Flash Memory Device

You can recover the startup configuration on your Cisco NX-OS device by downloading a new startup configuration file saved on an external flash memory device.

Before you begin

Insert the external flash memory device into the active supervisor module.

Procedure

	Command or Action	Purpose	
Step 1	(Optional) dir {slot0: usb1: usb2:}[directory/]	Displays the files on the external flash memor device.	
	Example: switch# dir slot0:		
Step 2	<pre>copy {slot0: usb1: usb2: }[directory /]filename startup-config Example: switch# copy slot0:dsn-config.cfg startup-config</pre>	Copies the startup configuration from an external flash memory device. The <i>filename</i> argument is case sensitive.	
Step 3	(Optional) show startup-config Example: switch# show startup-config	Displays the startup configuration.	

Copying Configuration Files to an Internal File System

You can copy configuration files to the internal memory as a backup for later use.

	Command or Action	Purpose	
Step 1	copy running-config [filesystem:][directory/] [directory/]filename	Copies the running-configuration file to internal memory.	
	Example:	The filesystem, directory, and filename	
	switch# copy running-config bootflash:swl-run-config.bak	arguments are case sensitive.	
Step 2	copy startup-config [filesystem:][directory/] [directory/]filename	Copies the startup-configuration file to internal memory.	
	Example: switch# copy startup-config bootflash:swl-start-config.bak	The <i>filesystem</i> , <i>directory</i> , and <i>filename</i> arguments are case sensitive.

Copying Files

Rolling Back to a Previous Configuration

Problems, such as memory corruption, can occur that make it necessary for you to recover your configuration from a backed up version.

Note Each time that you enter a **copy running-config startup-config** command, a binary file is created and the ASCII file is updated. A valid binary configuration file reduces the overall boot time significantly. A binary file cannot be uploaded, but its contents can be used to overwrite the existing startup configuration. The **write erase** command clears the binary file.

	Command or Action	Purpose
Step 1	write erase	Clears the current configuration of the switch.
	<pre>Example: switch# write erase</pre>	
Step 2	reload	Restarts the device. You will be prompted to
	Example: switch# reload	provide a kickstart and system image file for the device to boot and run.

Command or Action	Purpose	
	Note	By default, the reload command reloads the device from a binary version of the startup configuration.
		Beginning with Cisco NX-OS 6.2(2), you can use the reload ascii command to copy an ASCII version of the configuration to the start up configuration when reloading the device.
copy configuration_file running-configuration	Copies a previously saved configuration file to the running configuration.	
<pre>Example: switch# copy bootflash:start-config.bak running-configuration</pre>	Note	The <i>configuration_file</i> filename argument is case sensitive.
<pre>copy running-config startup-config Example: switch# copy running-config</pre>	Copies t configu	the running configuration to the start-up ration.
	<pre>commune configuration_file copy configuration_file running-configuration Example: switch# copy bootflash:start-config.bak running-configuration copy running-config startup-config Example:</pre>	copy configuration_file Copies a running-configuration Kerner Example: Note switch# copy bootflash:start-config.bak Note copy running-config startup-config Copies a example: Switch# copy bootflash:start-config.bak switch# copy bootflash:start-config Copies a switch# copy bootflash:start-config Copies a copy running-config startup-config Copies a switch# copy running-config startup-config Copies a switch# copy running-config Copies a switch# copy running-config Copies a switch# copy running-config Copies a

Removing the Configuration for a Missing Module

When you remove an I/O module from the chassis, you can also remove the configuration for that module from the running configuration.

You can only remove the configuration for an empty slot in the chassis.

Before you begin

Remove the I/O module from the chassis.

	Command or Action	Purpose
Step 1	(Optional) show hardware	Displays the installed hardware for the device.
	Example:	
	switch# show hardware	
Step 2	purge module <i>slot</i> running-config	Removes the configuration for a missing
	Example:	module from the running configuration.
	<pre>switch# purge module 3 running-config</pre>	

	Command or Action	Purpose
Step 3	(Optional) copy running-config startup-config	
	Example:	configuration.
	switch# copy running-config startup-config	

Erasing a Configuration

You can erase the configuration on your device to return to the factory defaults.

You can erase the following configuration files saved in the persistent memory on the device:

- Startup
- Boot
- Debug

The write erase command erases the entire startup configuration, except for the following:

- · Boot variable definitions
- The IPv4 configuration on the mgmt0 interface, including the following:
 - Address
 - Subnet mask

To remove the boot variable definitions follow step-1 and step-2.

To remove the boot variables, running configuration, and the IP configuration on the management interface follow step-3 to step-5.

	Command or Action	Purpose
Step 1	write erase boot	Erases the boot variable definitions.
	Example:	
	switch# write erase boot	
Step 2	reload	Restarts the device. You will be prompted to
	Example:	provide a kickstart and system image file for the device to boot and run. By default, the
	switch# reload	reload command reloads the device from a binary version of the startup configuration.
Step 3	write erase	Erases the boot variable definitions.
	Example:	
	switch# write erase	

	Command or Action	Purpose
Step 4	write erase boot Example:	Erases the boot variable definitions and the IPv4 configuration on the management interface.
	switch# write erase boot	
Step 5	reload	Restarts the device. You will be prompted to
	Example:	provide a kickstart and system image file for the device to boot and run. By default, the
	switch# reload	reload command reloads the device from a binary version of the startup configuration.

Clearing Inactive Configurations

You can clear inactive Quality of Service (QoS) and/or access control list (ACL) configurations.

	Command or Action	Purpose
Step 1	(Optional) show running-config <i>type</i> inactive-if-config	Displays any inactive ACL or QoS configurations.
	<pre>Example: # show running-config ipqos inactive-if-config</pre>	The values for the <i>type</i> argument are aclmgr and ipqos . • aclmgr — Displays any inactive
		configurations for aclmgr.
		• ipqos —Displays any inactive configurations for qosmgr.
Step 2	clear inactive-config policy	Clears inactive configurations.
	<pre>Example: # clear inactive-config qos clear qos inactive config Inactive if config for QoS manager is saved at/bootflash/qos_inactive_if_config.cfg for vdc default & for other than default vdc: /bootflash/vdc_x/qos_inactive_if_config.cfg (where x is vdc number) you can see the log file @ show inactive-if-config log</pre>	• acl—Clears inactive ACL configurations.
Step 3	<pre>(Optional) show inactive-if-config log Example: # show inactive-if-config log</pre>	Displays the commands that were used to clear the inactive configurations.

Verifying the Device Configuration

To verify the configuration after bootstrapping the device using POAP, use one of the following commands:

Command	Purpose
show running-config	Displays the running configuration.
show startup-config	Displays the startup configuration.

For detailed information about the fields in the output from these commands, see the Cisco Nexus command reference for your device.

Examples of Working with Configuration Files

This section includes examples of working with configuration files.

Copying Configuration Files

This example shows how to copy a running configuration to the bootflash: file system:

Backing Up Configuration Files

This example shows how to back up the startup configuration to the bootflash: file system (ASCII file): switch# copy startup-config bootflash:my-config

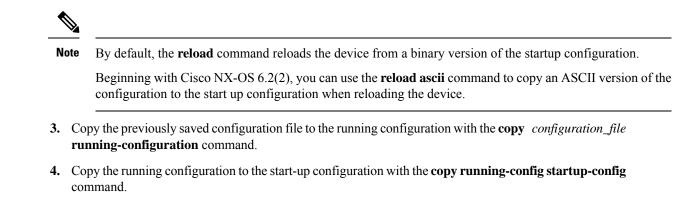

This example shows how to back up the startup configuration to the TFTP server (ASCII file): switch# copy startup-config tftp://172.16.10.100/my-config

This example shows how to back up the running configuration to the bootflash: file system (ASCII file): switch# copy running-config bootflash:my-config

Rolling Back to a Previous Configuration

To roll back your configuration to a snapshot copy of a previously saved configuration, you need to perform the following steps:

- 1. Clear the current running image with the write erase command.
- 2. Restart the device with the reload command.

Additional References for Configuration Files

This section includes additional information related to managing configuration files.
