

## **Configuring MSDP**

This chapter describes how to configure Multicast Source Discovery Protocol (MSDP) on a Cisco NX-OS device.

- Information About MSDP, on page 1
- Prerequisites for MSDP, on page 3
- Default Settings for MSDP, on page 4
- Configuring MSDP, on page 4
- Verifying the MSDP Configuration, on page 12
- Monitoring MSDP, on page 13
- Configuration Examples for MSDP, on page 14
- Related Documents, on page 15
- Standards, on page 15

### Information About MSDP

You can use the Multicast Source Discovery Protocol (MSDP) to exchange multicast source information between multiple BGP-enabled Protocol Independent Multicast (PIM) sparse-mode domains. In addition, MSDP can be used to create an Anycast-RP configuration to provide RP redundancy and load sharing. For information about PIM, see *Configuring PIM and PIM6*. For information about BGP, see the *Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide*.

When a receiver joins a group that is transmitted by a source in another domain, the rendezvous point (RP) sends PIM join messages in the direction of the source to build a shortest path tree. The designated router (DR) sends packets on the source-tree within the source domain, which may travel through the RP in the source domain and along the branches of the source-tree to other domains. In domains where there are receivers, RPs in those domains can be on the source-tree. The peering relationship is conducted over a TCP connection.

The following figure shows four PIM domains. The connected RPs (routers) are called MSDP peers because they are exchanging active source information with each other. Each MSDP peer advertises its own set of multicast source information to the other peers. Source Host 2 sends the multicast data to group 224.1.1.1. On RP 6, the MSDP process learns about the source through PIM register messages and generates Source-Active (SA) messages to its MSDP peers that contain information about the sources in its domain. When RP 3 and RP 5 receive the SA messages, they forward them to their MSDP peers. When RP 5 receives the request from Host 1 for the multicast data on group 224.1.1.1, it builds a shortest path tree to the source by sending a PIM join message in the direction of Host 2 at 192.1.1.1.

Figure 1: MSDP Peering Between RPs in Different PIM Domains

When you configure MSDP peering between each RP, you create a full mesh. Full MSDP meshing is typically done within an autonomous system, as shown between RPs 1, 2, and 3, but not across autonomous systems. You use BGP to do loop suppression and MSDP peer-RPF to suppress looping SA messages.

Note

You do not need to configure BGP in order to use Anycast-RP (a set of RPs that can perform load balancing and failover) within a PIM domain.

Note

You can use PIM Anycast (RFC 4610) to provide the Anycast-RP function instead of MSDP. For information about PIM, see *Configuring PIM and PIM6*.

For detailed information about MSDP, see RFC 3618.

### **SA Messages and Caching**

MSDP peers exchange Source-Active (SA) messages to propagate information about active sources. SA messages contain the following information:

- · Source address of the data source
- Group address that the data source uses
- IP address of the RP or the configured originator ID

When a PIM register message advertises a new source, the MSDP process reencapsulates the message in an SA message that is immediately forwarded to all MSDP peers.

The SA cache holds the information for all sources learned through SA messages. Caching reduces the join latency for new receivers of a group because the information for all known groups can be found in the cache. You can limit the number of cached source entries by configuring the SA limit peer parameter. You can limit the number of cached source entries for a specific group prefix by configuring the group limit global parameter. The SA cache is enabled by default and cannot be disabled.

The MSDP software sends SA messages for each group in the SA cache every 60 seconds or at the configured SA interval global parameter. An entry in the SA cache is removed if an SA message for that source and group is not received within SA interval plus 3 seconds.

### **MSDP Peer-RPF Forwarding**

MSDP peers forward the SA messages that they receive away from the originating RP. This action is called peer-RPF flooding. The router examines the BGP or MBGP routing table to determine which peer is the next hop in the direction of the originating RP of the SA message. This peer is called a reverse path forwarding (RPF) peer.

If the MSDP peer receives the same SA message from a non-RPF peer in the direction of the originating RP, it drops the message. Otherwise, it forwards the message to all its MSDP peers.

### **MSDP Mesh Groups**

You can use MSDP mesh groups to reduce the number of SA messages that are generated by peer-RPF flooding. By configuring a peering relationship between all the routers in a mesh and then configuring a mesh group of these routers, the SA messages that originate at a peer are sent by that peer to all other peers. SA messages received by peers in the mesh are not forwarded.

A router can participate in multiple mesh groups. By default, no mesh groups are configured.

### **Virtualization Support**

A virtual device context (VDC) is a logical representation of a set of system resources. Within each VDC, you can define multiple virtual routing and forwarding (VRF) instances. The MSDP configuration applies to the VRF selected within the current VDC.

You can use the **show** commands with a VRF argument to provide a context for the information displayed. The default VRF is used if no VRF argument is supplied.

For information about configuring VDCs, see the *Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide*.

For information about configuring VRFs, see the *Cisco Nexus* 7000 Series NX-OS Unicast Routing Configuration Guide.

### **Prerequisites for MSDP**

MSDP has the following prerequisites:

• You are logged onto the device.

- You are in the correct virtual device context (VDC). A VDC is a logical representation of a set of system resources. You can use the **switchto vdc** command with a VDC number.
- For global commands, you are in the correct virtual routing and forwarding (VRF) mode. The default configuration mode shown in the examples in this chapter applies to the default VRF.
- You configured PIM for the networks where you want to configure MSDP.

### **Default Settings for MSDP**

This table lists the default settings for the MSDP parameters.

**Table 1: Default MSDP Parameters** 

Parameters	Default
Description	Peer has no description
Administrative shutdown	Peer is enabled when it is defined
MD5 password	No MD5 password is enabled
SA policy IN	All SA messages are received
SA policy OUT	All registered sources are sent in SA messages
SA limit	No limit is defined
Originator interface name	RP address of the local system
Group limit	No group limit is defined
SA interval	60 seconds

### **Configuring MSDP**

You can establish MSDP peering by configuring the MSDP peers within each PIM domain.

- 1. Select the routers to act as MSDP peers.
- 2. Enable the MSDP feature.
- **3.** Configure the MSDP peers for each router identified in Step 1.
- **4.** Configure the optional MSDP peer parameters for each MSDP peer.
- 5. Configure the optional global parameters for each MSDP peer.
- **6.** Configure the optional mesh groups for each MSDP peer.

Note

The MSDP commands that you enter before you enable MSDP are cached and then run when MSDP is enabled. Use the **ip msdp peer** or **ip msdp originator-id** command to enable MSDP.

Note

If you are familiar with the Cisco IOS CLI, be aware that the Cisco NX-OS commands for this feature might differ from the Cisco IOS commands that you would use.

### **Enabling the MSDP Feature**

#### Before you begin

Before you can access the MSDP commands, you must enable the MSDP feature.

#### **Procedure**

config t	Enters global configuration mode.
Example:	
<pre>switch# config t switch(config)#</pre>	
feature msdp	Enables the MSDP feature so that you can enter
Example:	MSDP commands. By default, the MSDP feature is disabled.
switch# feature msdp	Teature is disubled.
show running-configuration   grep feature	(Optional) Displays feature commands that you
Example:	specified.
switch# show running-configuration   grep feature	
copy running-config startup-config feature	(Optional) Saves configuration changes.
Example:	
<pre>switch(config)# copy running-config startup-config</pre>	
	Example:  switch# config t switch(config)#  feature msdp  Example:  switch# feature msdp  show running-configuration   grep feature  Example:  switch# show running-configuration   grep feature  copy running-config startup-config feature  Example:  switch(config)# copy running-config

### **Configuring MSDP Peers**

You can configure an MSDP peer when you configure a peering relationship with each MSDP peer that resides either within the current PIM domain or in another PIM domain. MSDP is enabled on the router when you configure the first MSDP peering relationship.

#### Before you begin

Ensure that you configured PIM in the domains of the routers that you will configure as MSDP peers.

#### **Procedure**

	Command or Action	Purpose
Step 1	config t	Enters global configuration mode.
	Example:	
	<pre>switch# config t switch(config)#</pre>	
Step 2	ip msdp peer peer-ip-address connect-source interface [remote-as as-number]	Configures an MSDP peer with the specified peer IP address. The software uses the source
	Example:	IP address of the interface for the TCP connection with the peer. The interface can take
	<pre>switch(config)# ip msdp peer 192.168.1.10 connect-source ethernet 2/1</pre>	the form of <i>type slot/port</i> . If the AS number is the same as the local AS, then the peer is within
remote-as 8	remote-as 8	the PIM domain; otherwise, this peer is external to the PIM domain. By default, MSDP peering is disabled.
		Note MSDP peering is enabled when you use this command.
Step 3	Repeat Step 2 for each MSDP peering relationship by changing the peer IP address, the interface, and the AS number as appropriate.	_
Step 4	show ip msdp summary [vrf vrf-name   known-vrf-name   all]	(Optional) Displays a summary of MDSP peers.
	Example:	
	switch# show ip msdp summary	
Step 5	copy running-config startup-config	(Optional) Saves configuration changes.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

### **Configuring MSDP Peer Parameters**

You can configure the optional MSDP peer parameters described in this table. You configure these parameters in global configuration mode for each peer based on its IP address.

#### **Table 2: MSDP Peer Parameters**

Parameter	Description
Description	Description string for the peer. By default, the peer has no description.

Parameter	Description
Administrative shutdown	Method to shut down the MSDP peer. The configuration settings are not affected by this command. You can use this parameter to allow configuration of multiple parameters to occur before making the peer active. The TCP connection with other peers is terminated by the shutdown. By default, a peer is enabled when it is defined.
MD5 password	MD5-shared password key used for authenticating the peer. By default, no MD5 password is enabled.
SA policy IN	Route-map policy <sup>1</sup> for incoming SA messages. By default, all SA messages are received.
SA policy OUT	Route-map policy <sup>2</sup> for outgoing SA messages. By default, all registered sources are sent in SA messages.
SA limit	Number of (S, G) entries accepted from the peer and stored in the SA cache. By default, there is no limit.

<sup>&</sup>lt;sup>1</sup> To configure route-map policies, see the *Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide*.

<sup>&</sup>lt;sup>2</sup> To configure route-map policies, see the *Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide*.

Note

Only the **match ip multicast group** command is supported for MSDP SA policy. The **match ip address** command for matching an ACL is not supported.

#### **Procedure**

	Command or Action		Purpose
Step 1	config t		Enters global configuration mode.
	Example:		
	<pre>switch# config t switch(config)#</pre>		
·   Option   Description	The following commands configure the MSDP		
	<pre>ip msdp description peer-ip-address Example: switch(config) # ip msdp description 192.168.1.10 peer in Engineering network</pre>		peer parameters.

	Command or Action	Purpose
Step 3	show ip msdp peer [peer-address] [vrf vrf-name   known-vrf-name   all]	(Optional) Displays detailed MDSP peer information.
	Example:	
	switch# show ip msdp peer 1.1.1.1	
Step 4	copy running-config startup-config	(Optional) Saves configuration changes.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

## **Configuring MSDP Global Parameters**

You can configure the optional MSDP global parameters described in this table.

**Table 3: MSDP Global Parameters** 

Parameter	Description
Originator interface name	IP address used in the RP field of an SA message entry. When Anycast RPs are used, all RPs use the same IP address. You can use this parameter to define a unique IP address for the RP of each MSDP peer. By default, the software uses the RP address of the local system.  Note We recommend that you use a loopback interface for the RP address.
Group limit	Maximum number of (S, G) entries that the software creates for the specified prefix. The software ignores groups when the group limit is exceeded and logs a violation. By default, no group limit is defined.
SA interval	Interval at which the software transmits Source-Active (SA) messages. The range is from 60 to 65,535 seconds. The default is 60 seconds.

#### **Procedure**

	Command or Action	Purpose
Step 1	config t	Enters global configuration mode.
	Example:	
	switch# config t switch(config)#	

	Command or Action	1	Purpose
Step 2	Option Description		
	<pre>ip msdp originator-id interface Example: switch(config) # ip msdp originator-id loopback0</pre>	Sets a description string for the peer. By default, the peer has no description.  Sets the IP address used in the RP field of an SA message entry. The interface can take the form of type slot/port. By default, the software uses the RP address of the local system.  Note We recommend that you use a loopback interface for the RP address.	
	<pre>ip msdp group-limit limit source source-prefix  Example: switch(config) # ip msdp group-limit 1000 source 192.168.1.0/24</pre>	Maximum number of (S, G) entries that the software creates for the specified prefix. The software ignores groups when the group limit is exceeded and logs a violation. By default, no group limit is defined.	
	<pre>ip msdp sa-interval seconds Example: switch(config) # ip msdp sa-interval 80</pre>	Interval at which the software transmits Source-Active (SA) messages. The range is from 60 to 65,535 seconds. The default is 60 seconds.	
Step 3	show ip msdp sum known-vrf-name   a	mary [vrf vrf-name   ll]	(Optional) Displays a summary of the MDSP configuration.
	switch# show ip	msdp summary	

	Command or Action	Purpose
Step 4	copy running-config startup-config	(Optional) Saves configuration changes.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

### **Configuring MSDP Mesh Groups**

You can configure optional MDSP mesh groups in global configuration mode by specifying each peer in the mesh. You can configure multiple mesh groups on the same router and multiple peers per mesh group.

#### **Procedure**

	Command or Action	Purpose
Step 1	config t	Enters global configuration mode.
	Example:	
	<pre>switch# config t switch(config)#</pre>	
Step 2	ip msdp mesh-group peer-ip-addr mesh-name	Configures an MSDP mesh with the peer IP
	Example:	address specified. You can configure multiple meshes on the same router and multiple peers
	<pre>switch(config)# ip msdp mesh-group 192.168.1.10 my_mesh_1</pre>	per mesh group. By default, no mesh groups are configured.
Step 3	Repeat Step 2 for each MSDP peer in the mesh by changing the peer IP address.	_
Step 4	show ip msdp mesh-group [mesh-group] [vrf vrf-name   known-vrf-name   all]	(Optional) Displays information about the MDSP mesh group configuration.
	Example:	
	switch# show ip msdp summary	
Step 5	copy running-config startup-config	(Optional) Saves configuration changes.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

### **Restarting the MSDP Process**

#### Before you begin

You can restart the MSDP process and optionally flush all routes.

#### **Procedure**

	Command or Action	Purpose
Step 1	restart msdp	Restarts the MSDP process.
	Example:	
	switch# restart msdp	
Step 2	config t	Enters global configuration mode.
	Example:	
	<pre>switch# config t switch(config)#</pre>	
Step 3	ip msdp flush-routes	Removes routes when the MSDP process is
	Example:	restarted. By default, routes are not flushed.
	<pre>switch(config)# ip msdp flush-routes</pre>	
Step 4	show running-configuration   include flush-routes	(Optional) Shows flush-routes configuration lines in the running configuration.
	Example:	
	<pre>switch(config) # show running-configuration   include flush-routes</pre>	
Step 5	copy running-config startup-config	(Optional) Saves configuration changes.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

# **Verifying the MSDP Configuration**

To display the MSDP configuration, perform one of the following tasks:

Command	Description
show ip msdp count [as-number] [vrf vrf-name   known-vrf-name   all]	Displays MSDP (S, G) entry and group counts by the AS number.
show ip msdp mesh-group [ mesh-group] [ vrf vrf-name   known-vrf-name   all]	Displays the MSDP mesh group configuration.
show ip msdp peer [ peer-address] [vrf vrf-name   known-vrf-name   all]	Displays MSDP information for the MSDP peer.
show ip msdp rpf [rp-address] [vrf vrf-name   known-vrf-name   all]	Displays next-hop AS on the BGP path to an RP address.
show ip msdp sources [vrf vrf-name   known-vrf-name   all]	Displays the MSDP-learned sources and violations of configured group limits.

Command	Description
show ip msdp summary [vrf vrf-name   known-vrf-name   all]	Displays a summary of the MSDP peer configuration.

For detailed information about the fields in the output from these commands, see *Cisco Nexus 7000 Series NX-OS Multicast Routing Command Reference*.

# **Monitoring MSDP**

You can display and clear MSDP statistics by using the features in this section.

### **Displaying Statistics**

You can display MSDP statistics using the commands listed in this table.

Command	Description
show ip msdp [as-number] internal event-history {errors   messages}	Displays memory allocation statistics.
show ip msdp policy statistics sa-policy peer-address { in   out} [vrf vrf-name   known-vrf-name   all]	Displays the MSDP policy statistics for the MSDP peer.
show ip msdp {sa-cache   route} [source-address] [group-address] vrf vrf-name   known-vrf-name   all] [asn-number] [ peerpeer-address]	Displays the MSDP SA route cache. If you specify the source address, all groups for that source are displayed. If you specify a group address, all sources for that group are displayed.

### **Clearing Statistics**

You can clear the MSDP statistics using the commands listed in this table.

**Table 4: MSDP Clear Statistics Commands** 

Command	Description
clear ip msdp peer [ peer-address] [vrf vrf-name   known-vrf-name]	Clears the TCP connection to an MSDP peer.
clear ip msdp policy statistics sa-policypeer-address {in   out } [vrf vrf-name   known-vrf-name]	Clears statistics counters for MSDP peer SA policies.
clear ip msdp statisticspeer-address [vrf vrf-name   known-vrf-name]	Clears statistics for MSDP peers.
clear ip msdp {sa-cache   route} [group -address] [vrf vrf-name   known-vrf-name] all]	Clears the group entries in the SA cache.

### **Configuration Examples for MSDP**

To configure MSDP peers, some of the optional parameters, and a mesh group, follow these steps for each MSDP peer:

1. Configure the MSDP peering relationship with other routers.

```
switch# config t
switch(config)# ip msdp peer 192.168.1.10 connect-source ethernet 1/0
remote-as 8
```

**2.** Configure the optional peer parameters.

```
switch# config t
switch(config)# ip msdp password 192.168.1.10 my_peer_password_AB
```

**3.** Configure the optional global parameters.

```
switch# config t
switch(config)# ip msdp sa-interval 80
```

**4.** Configure the peers in each mesh group.

```
switch# config t
switch(config)# ip msdp mesh-group 192.168.1.10 mesh_group_1
```

This example shows how to configure a subset of the MSDP peering.

```
RP 3: 192.168.3.10 (AS 7)
config t
 ip msdp peer 192.168.1.10 connect-source ethernet 1/1
 ip msdp peer 192.168.2.10 connect-source ethernet 1/2
 ip msdp peer 192.168.6.10 connect-source ethernet 1/3 remote-as
 ip msdp password 192.168.6.10 my_peer_password_36
 ip msdp sa-interval 80
 ip msdp mesh-group 192.168.1.10 mesh group 123
 ip msdp mesh-group 192.168.2.10 mesh group 123
 ip msdp mesh-group 192.168.3.10 mesh group 123
RP 5: 192.168.5.10 (AS 8)
config t
 ip msdp peer 192.168.4.10 connect-source ethernet 1/1
 ip msdp peer 192.168.6.10 connect-source ethernet 1/2 remote-as
 ip msdp password 192.168.6.10 my peer password 56
 ip msdp sa-interval 80
```

```
RP 6: 192.168.6.10 (AS 9)

config t
   ip msdp peer 192.168.7.10 connect-source ethernet 1/1
   ip msdp peer 192.168.3.10 connect-source ethernet 1/2 remote-as

7
   ip msdp peer 192.168.5.10 connect-source ethernet 1/3 remote-as

8
   ip msdp password 192.168.3.10 my_peer_password_36
   ip msdp password 192.168.5.10 my_peer_password_56
   ip msdp sa-interval 80
```
