

Configuring System Message Logging

This chapter describes how to configure system message logging on Cisco NX-OS devices.

This chapter contains the following sections:

- Finding Feature Information, on page 1
- About System Message Logging, on page 1
- Guidelines and Limitations for System Message Logging, on page 3
- Default Settings for System Message Logging, on page 3
- Configuring System Message Logging, on page 4
- Verifying the System Message Logging Configuration, on page 14
- Configuration Example for System Message Logging, on page 15
- Additional References, on page 15
- Feature History for System Message Logging, on page 15

Finding Feature Information

Your software release might not support all the features documented in this module. For the latest caveats and feature information, see the Bug Search Tool at https://tools.cisco.com/bugsearch/ and the release notes for your software release. To find information about the features documented in this module, and to see a list of the releases in which each feature is supported, see the "New and Changed Information" chapter or the Feature History table in this chapter.

About System Message Logging

You can use system message logging to control the destination and to filter the severity level of messages that system processes generate. You can configure logging to terminal sessions, a log file, and syslog servers on remote systems.

System message logging is based on RFC 3164. For more information about the system message format and the messages that the device generates, see the *Cisco NX-OS System Messages Reference*.

By default, the device outputs messages to terminal sessions and logs system messages to a log file.

The following table describes the severity levels used in system messages. When you configure the severity level, the system outputs messages at that level and lower.

Table 1: System Message Severity Levels

Level	Description
0 – emergency	System unusable
1 – alert	Immediate action needed
2 – critical	Critical condition
3 – error	Error condition
4 – warning	Warning condition
5 – notification	Normal but significant condition
6 – informational	Informational message only
7 – debugging	Appears during debugging only

The device logs the most recent 100 messages of severity 0, 1, or 2 to the NVRAM log. You cannot configure logging to the NVRAM.

You can configure which system messages should be logged based on the facility that generated the message and its severity level.

Syslog Servers

The syslog servers run on remote systems that log system messages based on the syslog protocol. You can configure up to eight IPv4 or IPv6 syslog servers.

To support the same configuration of syslog servers on all switches in a fabric, you can use Cisco Fabric Services (CFS) to distribute the syslog server configuration.

Note

When the device first initializes, messages are sent to syslog servers only after the network is initialized.

Binary Tech Support

Binary tech support is a log-collecting framework that collects logs internally from all Cisco NX-OS processes that are running on the device. Enter the **show tech-support all binary** *uri* command to collect logs from across the entire device, including virtual device contexts (VDCs), and linecards. The logs are saved under one tarball that can be easily transferred for later analysis. If a line card fails during the log collection, binary tech support continues to collect logs from all remaining line cards and VDCs.

Virtualization Support

A virtual device context (VDC) is a logical representation of a set of system resources. System message logging applies only to the VDC where commands are entered.

For information about configuring VDCs, see the *Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide*.

Guidelines and Limitations for System Message Logging

System messages are logged to the console and the log file by default.

For the secure syslog server(s) to be reachable over in-band (non-management) interface, the CoPP profile may need tweaks especially when multiple logging servers are configured, and when lot of syslogs get generated in a short time (such as boot up, configuration application, and so on).

Platform related syslogs would be showing up only in the log file of the admin VDC or VDC 1 (default VDC) if the admin VDC is not in use. However, these events may impact the functionality of other VDCs (such as fabric CRC errors generated from specific modules, and so on). Hence it is required to configure syslog server in this VDC as well as have the IP reachability to syslog server in the admin VDC or VDC 1 (default VDC) in order to capture and monitor platform related syslog events.

When you upgrade from Cisco NX-OS Release 8.4(3) to 8.4(6a), below mentioned logging commands are not supported for the switch:

- logging level adbm 6
- logging level diag port lb 6
- logging level ifmgr 6
- logging level mhbfd_tracker 6
- logging level pixm gl 6
- logging level pixm_vl 6
- logging level port-channel 6
- logging level port-profile 6
- logging level spanning-tree 6

Default Settings for System Message Logging

The following table lists the default settings for the system message logging parameters.

Table 2: Default System Message Logging Parameters

Parameters	Default
Console logging	Enabled at severity level 2
Monitor logging	Enabled at severity level 5
Log file logging	Enabled to log messages at severity level 5
Module logging	Enabled at severity level 5

Parameters	Default
Facility logging	Enabled
Time-stamp units	Seconds
Syslog server logging	Disabled
Syslog server configuration distribution	Disabled

Configuring System Message Logging

Note

Be aware that the Cisco NX-OS commands for this feature might differ from those commands used in Cisco IOS.

Configuring System Message Logging to Terminal Sessions

You can configure the device to log messages by their severity level to console, Telnet, and SSH sessions. By default, logging is enabled for terminal sessions.

Note

The current critical (default) logging level is maintained if the console baud speed is 9600 baud (default). All attempts to change the console logging level will generate an error message. To increase the logging level (above critical), you must change the console baud speed to 38400 baud.

	Command or Action	Purpose
Step 1	terminal monitor	Enables the device to log messages to the
	Example:	console.
	switch# terminal monitor	
Step 2	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 3	[no] logging console [severity-level]	Configures the device to log messages to the
	Example:	console session based on a specified severity level or higher. A lower number indicates a
	switch(config)# logging console 3	higher severity level. Severity levels range from 0 to 7:
		• 0 – emergency

	Command or Action	Purpose
		• 1 – alert
		• 2 – critical
		• 3 – error
		• 4 – warning
		• 5 – notification
		• 6 – informational
		• 7 – debugging
		If the severity level is not specified, the default of 2 is used. The no option disables the device's ability to log messages to the console.
Step 4	(Optional) show logging console	Displays the console logging configuration.
	Example:	
	switch(config)# show logging console	
Step 5	<pre>[no] logging monitor [severity-level] Example: switch(config) # logging monitor 3</pre>	Enables the device to log messages to the monitor based on a specified severity level or higher. A lower number indicates a higher severity level. Severity levels range from 0 to 7:
		• 0 – emergency
		• 1 – alert
		• 2 – critical
		• 3 – error
		• 4 – warning
		• 5 – notification
		• 6 – informational
		• 7 – debugging
		The configuration applies to Telnet and SSH sessions.
		If the severity level is not specified, the default of 2 is used. The no option disables the device's ability to log messages to the Telnet and SSH sessions.
Step 6	(Optional) show logging monitor	Displays the monitor logging configuration.
	<pre>Example: switch(config)# show logging monitor</pre>	

	Command or Action	Purpose
Step 7	<pre>[no] logging message interface type ethernet description Example: switch(config) # logging message interface type ethernet description</pre>	Ethernet interfaces and subinterfaces in the system message log. The description is the same description that was configured on the interface.
Step 8	(Optional) copy running-config startup-config Example: switch (config) # copy running-config startup-config	Copies the running configuration to the startup configuration.

Logging System Messages to a File

You can configure the device to log system messages to a file. By default, system messages are logged to the file log:messages.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	[no] logging logfile logfile-name severity-level [size bytes]	Configures the name of the log file used to store system messages and the minimum severity
	Example:	level to log.
	switch(config)# logging logfile my_log 6	When you configure a new logfile without specifying the size, the existing/previously specified logfile size is assigned and the default file size is not considered.
		A lower number indicates a higher severity level. Severity levels range from 0 to 7:
		• 0 – emergency
		• 1 – alert
		• 2 – critical
		• 3 – error
		• 4 – warning
		• 5 – notification

	Command or Action	Purpose
		6 – informational7 – debugging
		You can optionally specify a maximum file size. The default severity level is 5, and the default file size is 4194304 bytes. The file size range is from 4096 to 4194304 bytes.
Step 3	<pre>logging event {link-status trunk-status} {enable default} Example: switch# logging event link-status default switch(config)#</pre>	Logs interface events. • link-status—Logs all UP/DOWN and CHANGE messages. • trunk-status—Logs all TRUNK status messages. • enable—Specifies to enable logging to override the port level configuration. • default—Specifies that the default logging configuration is used by interfaces not explicitly configured.
Step 4	(Optional) show logging info Example: switch(config) # show logging info	Displays the logging configuration.
Step 5	(Optional) copy running-config startup-config Example: switch(config) # copy running-config startup-config	Copies the running configuration to the startup configuration.

Configuring Module and Facility Messages Logging

You can configure the severity level and time-stamp units of messages logged by modules and facilities.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	[no] logging module [severity-level]	Enables module log messages that have the
Example: specified severing range from 0 to	Example:	specified severity level or higher. Severity levels
	range from 0 to 7.	

	Command or Action	Purpose
		• 0 – emergency
		• 1 – alert
		• 2 – critical
		• 3 – error
		• 4 – warning
		• 5 – notification
		• 6 – informational
		• 7 – debugging
		If the severity level is not specified, the default of 5 is used. The no option disables module log messages.
Step 3	(Optional) show logging module	Displays the module logging configuration.
	Example:	
	switch(config)# show logging module	
Step 4	[no] logging level facility severity-level Example:	Enables logging messages from the specified facility that have the specified severity level or higher. Severity levels range from 0 to 7:
	switch(config)# logging level aaa 2	• 0 – emergency
		• 1 – alert
		• 2 – critical
		• 3 – error
		• 4 – warning
		• 5 – notification
		• 6 – informational
		• 7 – debugging
		To apply the same severity level to all facilities, use the all facility. For defaults, see the show logging level command.
		The no option resets the logging severity level for the specified facility to its default level. If you do not specify a facility and severity level, the device resets all facilities to their default levels.

	Command or Action	Purpose
Step 5	(Optional) show logging level [facility] Example: switch(config) # show logging level aaa	Displays the logging level configuration and the system default level by facility. If you do not specify a facility, the device displays levels for all facilities.
Step 6	[no] logging timestamp {microseconds milliseconds seconds}	Sets the logging time-stamp units. By default, the units are seconds.
	<pre>Example: switch(config) # logging timestamp milliseconds</pre>	Note This command applies to logs that are kept in the switch. It does not apply to the external logging server.
Step 7	(Optional) show logging timestamp Example: switch(config) # show logging timestamp	Displays the logging time-stamp units configured.
Step 8	(Optional) copy running-config startup-config Example: switch (config) # copy running-config startup-config	Copies the running configuration to the startup configuration.

Configuring Syslog Servers

You can configure up to eight syslog servers that reference remote systems where you want to log system messages.

Note

Cisco recommends that you configure the syslog server to use the management virtual routing and forwarding (VRF) instance. For more information on VRFs, see the *Cisco Nexus 7000 Series NX-OS Unicast Routing Configuration Guide*.

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	[no] logging server host [severity-level [use-vrf vrf-name]]	Configures a syslog server at the specified hostname or IPv4 or IPv6 address. You can limit logging of messages to a particular VRF by using the use-vrf keyword. Severity levels
	Example:	
	switch(config)# logging server 192.0.2.253	range from 0 to 7:
		• 0 – emergency

	Command or Action	Purpose	
	Example:	• 1 – alert	
	<pre>switch(config)# logging server 2001:db8::3 5 use-vrf red</pre>	• 2 – critical	
		• 3 – error	
		• 4 – warning	
		• 5 – notification	
		• 6 – informational	
		• 7 – debugging	
		The default outgoing facility is local7.	
		The no option removes the logging server for the specified host.	
		The first example forwards all messages on facility local 7. The second example forwards messages with severity level 5 or lower for VRF red.	
Step 3	logging source-interface interface	Sets the source interface whose IP address is	
	Example:	displayed in the log messages. This static configuration ensures that same IP address	
	<pre>switch(config) # logging source-interface loopback 5</pre>	appears in all log messages that are sent from an individual Cisco NX-OS device.	
Step 4	(Optional) show logging server	Displays the syslog server configuration.	
	Example:	Note The output of this command will	
	switch(config)# show logging server	display the syslog server configuration details along with a message stating This server is temporarily unreachable." Please ignore this message.	
Step 5	(Optional) copy running-config startup-config	Copies the running configuration to the startup	
	Example:	configuration.	
	<pre>switch(config)# copy running-config startup-config</pre>		

Configuring Secure Syslog Servers

Procedure

	Command or Action	Purpose
Step 1	configure terminal	Enters global configuration mode.
	Example:	
	<pre>switch# configure terminal switch(config)#</pre>	
Step 2	[no] logging server host [severity-level [port port-number][secure[trustpoint client-identity trustpoint-name]][use-vrf vrf-name]] Example:	Configures a syslog server at the specified hostname or IPv4 or IPv6 address. Optionally, you can enforce a mutual authentication by installing the client identity certificate that is signed by any CA and using the trustpoint
	switch(config)# logging server 192.0.2.253 secure	client-identity option.
	Example: switch(config) # logging server 2001::3 5 secure trustpoint client-identity myCA use-vrf red	The default destination port for a secure TLS connection is 6514.
Step 3	(Optional) logging source-interface interface name	Enables a source interface for the remote syslog server.
	Example:	
	switch(config) # logging source-interface	
Step 4	(Optional) show logging server Example: switch(config) # show logging server	Displays the syslog server configuration. If the secure option is configured, the output will have an entry with the transport information. By default, the transport is UDP if the secure option is not configured.
Step 5	(Optional) copy running-config startup-config	Copies the running configuration to the startup configuration.
	Example:	
	<pre>switch(config)# copy running-config startup-config</pre>	

Configuring Destination Port for Forwarding Syslogs

You can specify the destination port to be used while forwarding the system messages to the remote server where they will be logged.

Note

You will need to change the remote server syslog configuration file to listen to the specified user-defined port. By default, system messages are sent as a UDP payload over port number 514 to the remote server for logging.

Procedure

	Command or Action	Purpose	
Step 1	configure terminal	Enters global configuration mode.	
	Example:		
	<pre>switch# configure terminal switch(config)#</pre>		
Step 2	[no] logging server host [severity-level [use-vrf vrf-name]]	Specifies the destination port on which the syslogs are forwarded to remote server. The	
	Example:	port numbers range from 1 to 65535.	
	switch(config)# logging server	The default destination port number is 514.	
	192.0.2.253 port 600 Example: switch(config) # logging server 192.0.2.253 5 port 600	Note To remove the custom destination	
		port or to reset it to its default value, use the logging server	
		command without specifying any port number. Optionally, you can specify the port number as 514.	
		The first example forwards all messages on user-defined port number 600. The second example forwards messages with severity level 5 or lower on user-defined port number 600.	
Step 3	(Optional) show logging server	Displays the syslog server configuration.	
	Example:		
	switch(config)# show logging server		
Step 4	(Optional) copy running-config startup-config	Copies the running configuration to the startup	
	Example:	configuration.	
	<pre>switch(config)# copy running-config startup-config</pre>		

Configuring Syslog Servers on a UNIX or Linux System

You can configure a syslog server on a UNIX or Linux system by adding the following line to the /etc/syslog.conf file:

facility.level <five tab characters> action

The following table describes the syslog fields that you can configure.

Table 3: Syslog fields in syslog.conf

Field	Description
Facility	Creator of the message, which can be auth, authpriv, cron, daemon, kern, lpr, mail, mark, news, syslog, user, local0 through local7, or an asterisk (*) for all. These facility designators allow you to control the destination of messages based on their origin. Note Check your configuration before using a local facility.
Level	Minimum severity level at which messages are logged, which can be debug, info, notice, warning, err, crit, alert, emerg, or an asterisk (*) for all. You can use none to disable a facility.
Action	Destination for messages, which can be a filename, a hostname preceded by the at sign (@), a comma-separated list of users, or an asterisk (*) for all logged-in users.

Procedure

Step 1 Log debug messages with the local7 facility in the file /var/log/myfile.log by adding the following line to the /etc/syslog.conf file:

Example:

debug.local7 var/log/myfile.log

Step 2 Create the log file by entering these commands at the shell prompt:

Example:

```
$ touch /var/log/myfile.log
$ chmod 666 /var/log/myfile.log
```

Step 3 Make sure the system message logging daemon reads the new changes by checking myfile.log after entering this command:

Example:

\$ kill -HUP ~cat /etc/syslog.pid~

Displaying and Clearing Log Files

You can display or clear messages in the log file and the NVRAM.

Procedure

	Command or Action	Purpose
Step 1	Required: show logging last number-lines Example: switch# show logging last 40	Displays the last number of lines in the logging file. You can specify from 1 to 9999 for the last number of lines.
Step 2	<pre>show logging logfile [start-time yyyy mmm dd hh:mm:ss] [end-time yyyy mmm dd hh:mm:ss] Example: switch# show logging logfile start-time 2013 oct 1 15:10:0</pre>	Displays the messages in the log file that have a timestamp within the span entered. If you do not enter an end time, the current time is used. You enter three characters for the month time field and digits for the year and day time fields.
Step 3	show logging nvram [last number-lines] Example: switch# show logging nvram last 10	Displays the messages in the NVRAM. To limit the number of lines displayed, you can enter the last number of lines to display. You can specify from 1 to 100 for the last number of lines.
Step 4	clear logging logfile Example: switch# clear logging logfile	Clears the contents of the log file.
Step 5	clear logging nvram Example: switch# clear logging nvram	Clears the logged messages in NVRAM.

Verifying the System Message Logging Configuration

To display system message logging configuration information, perform one of the following tasks:

Command	Purpose
show logging console	Displays the console logging configuration.
show logging info	Displays the logging configuration.
show logging last number-lines	Displays the last number of lines of the log file.
show logging level [facility]	Displays the facility logging severity level configuration.
show logging logfile [start-time yyyy mmm dd hh:mm:ss] [end-time yyyy mmm dd hh:mm:ss]	Displays the messages in the log file.
show logging module	Displays the module logging configuration.
show logging monitor	Displays the monitor logging configuration.
show logging nvram [last number-lines]	Displays the messages in the NVRAM log.
show logging server	Displays the syslog server configuration.

Command	Purpose
show logging timestamp	Displays the logging time-stamp units configuration.

Configuration Example for System Message Logging

This example shows how to configure system message logging:

```
configure terminal
logging console 3
logging monitor 3
logging logfile my_log 6
logging module 3
logging level aaa 2
logging timestamp milliseconds
logging server 172.28.254.253
logging server 172.28.254.254 5 facility local3
copy running-config startup-config
```

Feature History for System Message Logging

Your software release might not support all the features in this document. For the latest caveats and feature information, see the Bug Search Tool at https://tools.cisco.com/bugsearch/ and the release notes for your software release.

Table 4: Feature History for System Message Logging

Feature Name	Releases	Feature Information
System message logging	7.2(0)D1(1)	This feature was introduced.
System message logging	5.2(1)	Added the ability to add the description for physical Ethernet interfaces and subinterfaces in the system message log.

Syslog servers	5.1(1)	Increased the number of supported syslog servers from three to eight.
IPv6 support	4.2(1)	Added support for IPv6 syslog hosts
System message logging	4.0(1)	This feature was introduced.
