Configuring IGMP Snooping

This chapter describes how to configure Internet Group Management Protocol (IGMP) snooping on a Cisco NX-OS device.

- About IGMP Snooping, on page 1

- Clearing IGMP Snooping Statistics, on page 12
- Configuration Examples for IGMP Snooping, on page 12

About IGMP Snooping

We recommend that you do not disable IGMP snooping on the device. If you disable IGMP snooping, you might see reduced multicast performance because of excessive false flooding within the device.

IGMP snooping software examines Layer 2 IP multicast traffic within a VLAN to discover the ports where interested receivers reside. Using the port information, IGMP snooping can reduce bandwidth consumption in a multi-access LAN environment to avoid flooding the entire VLAN. IGMP snooping tracks which ports are attached to multicast-capable routers to help the routers forward IGMP membership reports. The IGMP snooping software responds to topology change notifications. By default, IGMP snooping is enabled on the device.

This figure shows an IGMP snooping switch that sits between the host and the IGMP router. The IGMP snooping switch snoops the IGMP membership reports and Leave messages and forwards them only when necessary to the connected IGMP routers.
The IGMP snooping software operates upon IGMPv1, IGMPv2, and IGMPv3 control plane packets where Layer 3 control plane packets are intercepted and influence the Layer 2 forwarding behavior.

The Cisco NX-OS IGMP snooping software has the following proprietary features:

- Source filtering that allows forwarding of multicast packets based on destination and source IP addresses
- Multicast forwarding based on IP addresses rather than the MAC address
- Multicast forwarding alternately based on the MAC address

For more information about IGMP snooping, see RFC 4541.

**IGMPv1 and IGMPv2**

Both IGMPv1 and IGMPv2 support membership report suppression, which means that if two hosts on the same subnet want to receive multicast data for the same group, the host that receives a member report from the other host suppresses sending its report. Membership report suppression occurs for hosts that share a port.

If no more than one host is attached to each VLAN switch port, you can configure the fast leave feature in IGMPv2. The fast leave feature does not send last member query messages to hosts. As soon as the software receives an IGMP leave message, the software stops forwarding multicast data to that port.

IGMPv1 does not provide an explicit IGMP leave message, so the software must rely on the membership message timeout to indicate that no hosts remain that want to receive multicast data for a particular group.

---

**Note**

The software ignores the configuration of the last member query interval when you enable the fast leave feature because it does not check for remaining hosts.

**IGMPv3**

The IGMPv3 snooping implementation on Cisco NX-OS supports full IGMPv3 snooping, which provides constrained flooding based on the (S, G) information in the IGMPv3 reports. This source-based filtering enables the device to constrain multicast traffic to a set of ports based on the source that sends traffic to the multicast group.
By default, the software tracks hosts on each VLAN port. The explicit tracking feature provides a fast leave mechanism. Because every IGMPv3 host sends membership reports, report suppression limits the amount of traffic that the device sends to other multicast-capable routers. When report suppression is enabled, and no IGMPv1 or IGMPv2 hosts requested the same group, the software provides proxy reporting. The proxy feature builds the group state from membership reports from the downstream hosts and generates membership reports in response to queries from upstream queriers.

Even though the IGMPv3 membership reports provide a full accounting of group members on a LAN segment, when the last host leaves, the software sends a membership query. You can configure the parameter last member query interval. If no host responds before the timeout, the software removes the group state.

**IGMP Snooping Querier**

When PIM is not enabled on an interface because the multicast traffic does not need to be routed, you must configure an IGMP snooping querier to send membership queries. You define the querier in a VLAN that contains multicast sources and receivers but no other active querier.

The querier can be configured to use any IP address in the VLAN.

As a best practice, a unique IP address, one that is not already used by the switch interface or the Hot Standby Router Protocol (HSRP) virtual IP address, should be configured so as to easily reference the querier.

Note

The IP address for the querier should not be a broadcast IP address, multicast IP address, or 0 (0.0.0.0).

When an IGMP snooping querier is enabled, it sends out periodic IGMP queries that trigger IGMP report messages from hosts that want to receive IP multicast traffic. IGMP snooping listens to these IGMP reports to establish appropriate forwarding.

The IGMP snooping querier performs querier election as described in RFC 2236. Querier election occurs in the following configurations:

- When there are multiple switch queriers configured with the same subnet on the same VLAN on different switches.
- When the configured switch querier is in the same subnet as with other Layer 3 SVI queriers.

**Virtualization Support**

You can define multiple virtual routing and forwarding (VRF) instances for IGMP snooping.

You can use the `show` commands with a VRF argument to provide a context for the information displayed. The default VRF is used if no VRF argument is supplied.

For information about configuring VRFs, see the *Cisco Nexus 9000 Series NX-OS Unicast Routing Configuration Guide*. 
Licensing Requirements for IGMP Snooping

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>IGMP snooping requires no license. Any feature not included in a license package is bundled with the nx-os image and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see Cisco NX-OS Licensing Guide.</td>
</tr>
</tbody>
</table>

Prerequisites for IGMP Snooping

IGMP snooping has the following prerequisites:

- You are logged onto the device.
- For global commands, you are in the correct virtual routing and forwarding (VRF) mode. The default configuration mode shown in the examples in this chapter applies to the default VRF.

Guidelines and Limitations for IGMP Snooping

IGMP snooping has the following guidelines and limitations:

- Mrouter/IGMP querier is not supported on the FEX HIF ports.
- IGMP snooping is not supported with PVLAN.
- Cisco Nexus 9000 Series switches support IGMP snooping for IPv4 but do not support MLD snooping for IPv6.
- Layer 3 IPv6 multicast routing is not supported.
- Layer 2 IPv6 multicast packets will be flooded on the incoming VLAN.
- Cisco Nexus 9000 Series switches support IGMP snooping with vPCs.
- You must enable the `ip igmp snooping group-timeout` command when you use the `ip igmp snooping proxy general-queries` command. We recommend that you set it to "never". Otherwise, you might experience multicast packet loss.
- All external multicast router ports (either statically configured or dynamically learned) use the global ltl index. As a result, traffic in VLAN X goes out on the multicast router ports in both VLAN X and VLAN Y, in case both multicast router ports (Layer 2 trunks) carry both VLAN X and VLAN Y.
Default Settings

Configuring IGMP Snooping Parameters

Note
If you are familiar with the Cisco IOS CLI, be aware that the Cisco NX-OS commands for this feature might differ from the Cisco IOS commands that you would use.

Note
You must enable IGMP snooping globally before any other commands take effect.

Configuring Global IGMP Snooping Parameters

To affect the operation of the IGMP snooping process globally, you can configure various optional IGMP snooping parameters.

Notes for IGMP Snooping Parameters

- IGMP Snooping Proxy parameter

  To decrease the burden placed on the snooping switch during each IGMP general query (GQ) interval, the Cisco NX-OS software provides a way to decouple the periodic general query behavior of the IGMP snooping switch from the query interval configured on the multicast routers.

  You can configure the device to consume IGMP general queries from the multicast router, rather than flooding the general queries to all the switchports. When the device receives a general query, it produces proxy reports for all currently active groups and distributes the proxy reports over the period specified
by the MRT that is specified in the router query. At the same time, independent of the periodic general
query activity of the multicast router, the device sends an IGMP general query on each port in the VLAN
in a round-robin fashion. It cycles through all the interfaces in the VLAN at the rate given by the following
formula.

\[
\text{Rate} = \{\text{number of interfaces in VLAN}\} \times \{\text{configured MRT}\} \times \{\text{number of VLANs}\}
\]

When queries are run in this mode, the default MRT value is 5,000 milliseconds (5 seconds). For a device
that has 500 switchports in a VLAN, it would take 2,500 seconds (40 minutes) to cycle through all the
interfaces in the system. This is also true when the device itself is the querier.

This behavior ensures that only one host responds to a general query at a given time, and it keeps the
simultaneous reporting rate below the packet-per-second IGMP capability of the device (approximately
3,000 to 4,000 pps).

Note When you use this option, you must change the `ip igmp snooping group-timeout` parameter to a high value or to never time out.

The `ip igmp snooping proxy general-queries [mrt]` command causes the snooping function to proxy
reply to general queries from the multicast router while also sending round-robin general queries on each
switchport with the specified MRT value. (The default MRT value is 5 seconds.)

• IGMP Snooping Group-timeout parameter

Configuring the group-timeout parameter disables the behavior of an expiring membership based on
three missed general queries. Group membership remains on a given switchport until the device receives
an explicit IGMP leave on that port.

The `ip igmp snooping group-timeout {timeout | never}` command modifies or disables the behavior of
an expiring IGMP snooping group membership after three missed general queries.

Procedure

Step 1

`configure terminal`

Example:

`switch# configure terminal
switch(config)#`

Enters global configuration mode.

Use the following commands to configure global IGMP snooping parameters.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>ip igmp snooping</code></td>
<td>Enables IGMP snooping for the device. The default is enabled.</td>
</tr>
</tbody>
</table>

`switch(config)# ip igmp snooping`
If the global setting is disabled with the `no` form of this command, IGMP snooping on all VLANs is disabled, whether IGMP snooping is enabled on a VLAN or not. If you disable IGMP snooping, Layer 2 multicast frames flood to all modules.

**Note**

Configures the size of the event history buffer. The default is small.

```plaintext
ip igmp snooping event-history
```

```
switch(config)# ip igmp snooping event-history
```

Configures the group membership timeout value for all VLANs on the device.

```plaintext
ip igmp snooping group-timeout {minutes | never}
```

```
switch(config)# ip igmp snooping group-timeout never
```

Configures link-local groups suppression for the entire device. The default is enabled.

```plaintext
ip igmp snooping link-local-groups-suppression
```

```
switch(config)# ip igmp snooping link-local-groups-suppression
```

Configures the IGMP snooping proxy for the device. The default is 5 seconds.

```plaintext
ip igmp snooping proxy general-inquiries [mrt seconds]
```

```
switch(config)# ip igmp snooping proxy general-inquiries
```

Limits the membership report traffic sent to multicast-capable routers. When you disable report suppression, all IGMP reports are sent as-is to multicast-capable routers. The default is enabled.

```plaintext
ip igmp snooping v3-report-suppression
```

```
switch(config)# ip igmp snooping v3-report-suppression
```

Configures IGMPv3 report suppression and proxy reporting. The default is disabled.

```plaintext
ip igmp snooping report-suppression
```

```
switch(config)# ip igmp snooping report-suppression
```

**Step 3**  
`copy running-config startup-config`

**Example:**

```
Example:
```
**Configuring IGMP Snooping Parameters per VLAN**

To affect the operation of the IGMP snooping process per VLAN, you can configure various optional IGMP snooping parameters.

**Procedure**

**Step 1** configure terminal

**Example:**

```
switch# configure terminal
switch(config)#
```

Enters global configuration mode.

**Step 2** ip igmp snooping

**Example:**

```
switch(config)# ip igmp snooping
```

Enables IGMP snooping. The default is enabled.

**Note** If the global setting is disabled with the `no` form of this command, IGMP snooping on all VLANs is disabled, whether IGMP snooping is enabled on a VLAN or not. If you disable IGMP snooping, Layer 2 multicast frames flood to all modules.

**Step 3** vlan configuration vlan-id

**Example:**

```
switch(config)# vlan configuration 2
switch(config-vlan-2)#
```

Configures the IGMP snooping parameters you want for the VLAN. These configurations do not apply until you create the specified VLAN.

**Step 4** Use the following commands to configure IGMP snooping parameters per VLAN.
<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>ip igmp snooping</strong></td>
<td>Enables IGMP snooping for the current VLAN. The default is enabled.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping</code></td>
<td></td>
</tr>
<tr>
<td>**ip igmp snooping access-group (prefix-list</td>
<td>route-map) policy-name**</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping access-group prefix-list plist interface ethernet 2/2</code></td>
<td></td>
</tr>
<tr>
<td><strong>ip igmp snooping explicit-tracking</strong></td>
<td>Tracks IGMPv3 membership reports from individual hosts for each port on a per-VLAN basis. The default is enabled on all VLANs.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping explicit-tracking</code></td>
<td></td>
</tr>
<tr>
<td><strong>ip igmp snooping fast-leave</strong></td>
<td>Supports IGMPv2 hosts that cannot be explicitly tracked because of the host report suppression mechanism of the IGMPv2 protocol. When you enable fast leave, the IGMP software assumes that no more than one host is present on each VLAN port. The default is disabled for all VLANs.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping fast-leave</code></td>
<td></td>
</tr>
<tr>
<td>**ip igmp snooping group-timeout {minutes</td>
<td>never}**</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping group-timeout never</code></td>
<td></td>
</tr>
<tr>
<td><strong>ip igmp snooping last-member-query-interval seconds</strong></td>
<td>Removes the group from the associated VLAN port if no hosts respond to an IGMP query message before the last member query interval expires. Values range from 1 to 25 seconds. The default is 1 second.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping last-member-query-interval 3</code></td>
<td></td>
</tr>
<tr>
<td><strong>ip igmp snooping proxy general-queries [mrt seconds]</strong></td>
<td>Configures an IGMP snooping proxy for specified VLANs. The default is 5 seconds.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping proxy general-queries</code></td>
<td></td>
</tr>
<tr>
<td><strong>ip igmp snooping querier ip-address</strong></td>
<td>Configures a snooping querier when you do not enable PIM because multicast traffic does not need to be routed. The IP address is used as the source in messages.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping querier 172.20.52.106</code></td>
<td></td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ip igmp snooping querier-timeout seconds</td>
<td>Configures a snooping querier timeout value for IGMPv2 when you do not enable PIM because multicast traffic does not need to be routed. The default is 255 seconds.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping querier-timeout 300</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping query-interval seconds</td>
<td>Configures a snooping query interval when you do not enable PIM because multicast traffic does not need to be routed. The default value is 125 seconds.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping query-interval 120</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping query-max-response-time seconds</td>
<td>Configures a snooping MRT for query messages when you do not enable PIM because multicast traffic does not need to be routed. The default value is 10 seconds.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping query-max-response-time 12</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping report-policy prefix-list</td>
<td>Configures a filter for IGMP snooping reports that is based on a prefix-list or route-map policy. The default is disabled.</td>
</tr>
<tr>
<td>route-map policy-name interface slot/port</td>
<td></td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping report-policy route-map rmap interface ethernet 2/4</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping startup-query-count value</td>
<td>Configures snooping for a number of queries sent at startup when you do not enable PIM because multicast traffic does not need to be routed.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping startup-query-count 5</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping startup-query-interval seconds</td>
<td>Configures a snooping query interval at startup when you do not enable PIM because multicast traffic does not need to be routed.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping startup-query-interval 15000</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping robustness-variable value</td>
<td>Configures the robustness value for the specified VLANs. The default value is 2.</td>
</tr>
<tr>
<td>switch(config-vlan-config)# ip igmp snooping robustness-variable 5</td>
<td></td>
</tr>
<tr>
<td>ip igmp snooping report-suppression</td>
<td>Limits the membership report traffic sent to multicast-capable routers. When you disable report</td>
</tr>
<tr>
<td>Option</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------</td>
<td>--------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping report-suppression</code></td>
<td>suppression, all IGMP reports are sent as-is to multicast-capable routers. The default is enabled.</td>
</tr>
<tr>
<td><code>ip igmp snooping mrouter interface interface</code></td>
<td>Configures a static connection to a multicast router. The interface to the router must be in the selected VLAN. You can specify the interface by the type and the number, such as <code>ethernet slot/port</code>.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping mrouter interface ethernet 2/1</code></td>
<td></td>
</tr>
<tr>
<td><code>ip igmp snooping static-group group-ip-addr [source source-ip-addr] interface interface</code></td>
<td>Configures the Layer 2 port of a VLAN as a static member of a multicast group. You can specify the interface by the type and the number, such as <code>ethernet slot/port</code>.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping static-group 230.0.0.1 interface ethernet 2/1</code></td>
<td></td>
</tr>
<tr>
<td><code>ip igmp snooping link-local-groups-suppression</code></td>
<td>Configures link-local groups suppression for the specified VLANs. The default is enabled.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping link-local-groups-suppression</code></td>
<td></td>
</tr>
<tr>
<td><code>ip igmp snooping v3-report-suppression</code></td>
<td>Configures IGMPv3 report suppression and proxy reporting for the specified VLANs. The default is enabled per VLAN.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping v3-report-suppression</code></td>
<td></td>
</tr>
<tr>
<td><code>ip igmp snooping version value</code></td>
<td>Configures the IGMP version number for the specified VLANs.</td>
</tr>
<tr>
<td><code>switch(config-vlan-config)# ip igmp snooping version 2</code></td>
<td></td>
</tr>
</tbody>
</table>

**Step 5**

**copy running-config startup-config**

**Example:**

```
switch(config)# copy running-config startup-config
```

(Optional) Copies the running configuration to the startup configuration.
Verifying the IGMP Snooping Configuration

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp snooping [vlan vlan-id]</td>
<td>Displays the IGMP snooping configuration by VLAN.</td>
</tr>
<tr>
<td>show ip igmp snooping groups [source [group]</td>
<td>Displays IGMP snooping information about groups by VLAN.</td>
</tr>
<tr>
<td>group [source]] [vlan vlan-id] [detail]</td>
<td></td>
</tr>
<tr>
<td>show ip igmp snooping querier [vlan vlan-id]</td>
<td>Displays IGMP snooping queriers by VLAN.</td>
</tr>
<tr>
<td>show ip igmp snooping mroute [vlan vlan-id]</td>
<td>Displays multicast router ports by VLAN.</td>
</tr>
<tr>
<td>show ip igmp snooping explicit-tracking [vlan vlan-id]</td>
<td>Displays IGMP snooping explicit tracking information by VLAN.</td>
</tr>
</tbody>
</table>

Displaying IGMP Snooping Statistics

You can display the IGMP snooping statistics using these commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>show ip igmp snooping statistics vlan</td>
<td>Displays IGMP snooping statistics. You can see the virtual port channel (vPC) statistics in this output.</td>
</tr>
<tr>
<td>show ip igmp snooping {report-policy</td>
<td>access-group} statistics [vlan vlan]</td>
</tr>
</tbody>
</table>

Clearing IGMP Snooping Statistics

You can clear the IGMP snooping statistics using these commands.

<table>
<thead>
<tr>
<th>Command</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>clear ip igmp snooping statistics vlan</td>
<td>Clears the IGMP snooping statistics.</td>
</tr>
<tr>
<td>clear ip igmp snooping {report-policy</td>
<td>access-group} statistics [vlan vlan]</td>
</tr>
</tbody>
</table>

Configuration Examples for IGMP Snooping

Note: The configurations in this section apply only after you create the specified VLAN. See the Cisco Nexus 9000 Series NX-OS Layer 2 Switching Configuration Guide for information on creating VLANs.
The following example shows how to configure the IGMP snooping parameters:

```
cfg t
ip igmp snooping
vlan configuration 2
  ip igmp snooping
  ip igmp snooping explicit-tracking
  ip igmp snooping fast-leave
  ip igmp snooping last-member-query-interval 3
  ip igmp snooping querier 172.20.52.106
  ip igmp snooping report-suppression
  ip igmp snooping mrouter interface ethernet 2/1
  ip igmp snooping static-group 230.0.0.1 interface ethernet 2/1
  ip igmp snooping link-local-groups-suppression
  ip igmp snooping v3-report-suppression
```

The following example shows how to configure prefix lists and use them to filter IGMP snooping reports:

```
ip prefix-list plist seq 5 permit 224.1.1.1/32
ip prefix-list plist seq 10 permit 224.1.1.2/32
ip prefix-list plist seq 15 deny 224.1.1.3/32
ip prefix-list plist seq 20 deny 225.0.0.0/8 eq 32
vlan configuration 2
  ip igmp snooping report-policy prefix-list plist interface Ethernet 2/2
  ip igmp snooping report-policy prefix-list plist interface Ethernet 2/3
```

In the above example, the prefix-list permits 224.1.1.1 and 224.1.1.2 but rejects 224.1.1.3 and all the groups in the 225.0.0.0/8 range. The prefix-list is an implicit "deny" if there is no match. If you wish to permit everything else, add `ip prefix-list plist seq 30 permit 224.0.0.0/4 eq 32`.

The following example shows how to configure route maps and use them to filter IGMP snooping reports:

```
route-map rmap permit 10
  match ip multicast group 224.1.1.1/32
route-map rmap permit 20
  match ip multicast group 224.1.1.2/32
route-map rmap deny 30
  match ip multicast group 224.1.1.3/32
route-map rmap deny 40
  match ip multicast group 225.0.0.0/8
vlan configuration 2
  ip igmp snooping report-policy route-map rmap interface Ethernet 2/4
  ip igmp snooping report-policy route-map rmap interface Ethernet 2/5
```

In the above example, the route-map permits 224.1.1.1 and 224.1.1.2 but rejects 224.1.1.3 and all the groups in the 225.0.0.0/8 range. The route-map is an implicit "deny" if there is no match. If you wish to permit everything else, add `route-map rmap permit 50 match ip multicast group 224.0.0.0/4`.
