XML Management Interface

This section contains the following topics:

- About the XML Management Interface, on page 1
- Licensing Requirements for the XML Management Interface, on page 2
- Prerequisites to Using the XML Management Interface, on page 3
- Using the XML Management Interface, on page 3
- Information About Example XML Instances, on page 16
- Additional References, on page 23

About the XML Management Interface

Information About the XML Management Interface

You can use the XML management interface to configure a device. The interface uses the XML-based Network Configuration Protocol (NETCONF), which allows you to manage devices and communicate over the interface with an XML management tool or program. The Cisco NX-OS implementation of NETCONF requires you to use a Secure Shell (SSH) session for communication with a device.

NETCONF is implemented with an XML Schema (XSD) that allows you to enclose device configuration elements within a remote procedure call (RPC) message. From within an RPC message, select one of the NETCONF operations that matches the type of command that you want the device to execute. You can configure the entire set of CLI commands on the device with NETCONF. For information about using NETCONF, see the Creating NETCONF XML Instances, on page 6 and RFC 4741.

For more information about using NETCONF over SSH, see RFC 4742.

This section includes the following topics:

NETCONF Layers

The following table lists the NETCONF layers:

<table>
<thead>
<tr>
<th>Layer</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transport protocol</td>
<td>SSHv2</td>
</tr>
</tbody>
</table>
### SSH xmlagent

The device software provides an SSH service that is called xmlagent that supports NETCONF over SSH Version 2.

---

**Note**

The xmlagent service is referred to as the XML server in Cisco NX-OS software.

NETCONF over SSH starts with the exchange of a Hello message between the client and the XML server. After the initial exchange, the client sends XML requests, which the server responds to with XML responses. The client and server terminate requests and responses with the character sequence `>`. Because this character sequence is not valid in XML, the client and the server can interpret when messages end, which keeps communication in sync.

The XML schemas that define the XML configuration instances that you can use are described in Creating NETCONF XML Instances, on page 6.

## Licensing Requirements for the XML Management Interface

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>The XML management interface requires no license. Any feature that is not included in a license package is bundled with the Cisco NX-OS image and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <em>Cisco NX-OS Licensing Guide</em>.</td>
</tr>
</tbody>
</table>
Prerequisites to Using the XML Management Interface

Using the XML management interface has the following prerequisites:

- You must install SSHv2 on the client PC.
- You must install an XML management tool that supports NETCONF over SSH on the client PC.
- You must set the appropriate options for the XML server on the device.

Using the XML Management Interface

This section describes how to manually configure and use the XML management interface.

Note

Use the XML management interface with the default settings on the device.

Configuring the SSH and the XML Server Options Through the CLI

By default, the SSH server is enabled on your device. If you disable SSH, you must enable it before you start an SSH session on the client PC.

You can configure the XML server options to control the number of concurrent sessions and the timeout for active sessions. You can also enable XML document validation and terminate XML sessions.

Note

The XML server timeout applies only to active sessions.

For more information about configuring SSH, see the Cisco NX-OS security configuration guide for your platform.

For more information about the XML commands, see the Cisco NX-OS system management configuration guide for your platform.

Procedure

Step 1
Enter global configuration mode.

configure terminal

Step 2
(Optional) Display information about XML server settings and active XML server sessions. You can find session numbers in the command output.

show xml server status

Step 3
Validate XML documents for the specified server session.

xml server validate all
Step 4  Terminate the specified XML server session.

```
xmserver terminate session
```

Step 5  (Optional) Disable the SSH server so that you can generate keys.

```
no feature ssh
```

Step 6  Enable the SSH server. (The default is enabled.)

```
feature ssh
```

Step 7  (Optional) Display the status of the SSH server.

```
show ssh server
```

Step 8  Set the number of XML server sessions allowed.

```
xmserver max-session sessions
```

The range is from 1 to 8. The default is 8.

Step 9  Set the number of seconds after which an XML server session is terminated.

```
xmserver timeout seconds
```

The range is from 1 to 1200. The default is 1200 seconds.

Step 10 (Optional) Display information about the XML server settings and active XML server sessions.

```
show xml server status
```

Step 11 (Optional) Saves the running configuration to the startup configuration.

```
copy running-config startup-config
```

Example

The following example shows how to configure SSH and XML server options through the CLI:

```
switch# configure terminal
switch(config)# xmserver validate all
switch(config)# xmserver terminate 8665
switch(config)# no feature ssh
switch(config)# feature ssh server
switch(config)# xmserver max-session 6
switch(config)# xmserver timeout 2400
switch(config)# copy running-config startup-config
```

Starting an SSHv2 Session

You can start an SSHv2 session on a client PC with the `ssh2` command that is similar to the following:

```
ssh2 username@ip-address -s xmlagent
```

Enter the login username, the IP address of the device, and the service to connect to. The xmlagent service is referred to as the XML server in the device software.
The SSH command syntax can differ based on the SSH software on the client PC.

If you do not receive a Hello message from the XML server, verify the following conditions:

- The SSH server is enabled on the device.
- The `max-sessions` option of the XML server is adequate to support the number of SSH connections to the device.
- The active XML server sessions on the device are not all in use.

### Sending a Hello Message

You must advertise your capabilities to the server with a Hello message before the server processes any other requests. When you start an SSH session to the XML server, the server responds immediately with a Hello message. This message informs the client of the capabilities of the server. The XML server supports only base capabilities and, in turn, expects that the client supports only these base capabilities.

The following are sample Hello messages from the server and the client:

#### Hello Message from a Server

```xml
<?xml version="1.0"?>
<hello xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
  <capabilities>
    <capability>urn:ietf:params:xml:ns:netconf:base:1.0</capability>
  </capabilities>
  <session-id>25241</session-id>
</hello>
```

#### Hello Message from a Client

```xml
<?xml version="1.0"?>
  <nc:capabilities>
  </nc:capabilities>
</nc:hello>
```

### Obtaining XML Schema Definition (XSD) Files

#### Procedure

1. From your browser, navigate to the Cisco software download site at:
http://software.cisco.com/download/navigator.html

The Download Software window is displayed.

**Step 2**
From the list of products that are displayed, choose **Switches > Data Center Switches > platform model.**

**Step 3**
If you are not already logged in as a registered Cisco user, you are prompted to log in now.

**Step 4**
From the **Select a Software Type** list, choose **NX-OS XML Schema Definition.**

**Step 5**
Find the desired release and click **Download.**

**Step 6**
If you are requested to, follow the instructions to apply for eligibility to download strong encryption software images.

The Cisco End User License Agreement is displayed.

**Step 7**
Click **Agree** and follow the instructions to download the file to your PC.

---

### Sending an XML Document to the XML Server

To send an XML document to the XML server through an SSH session that you opened in a command shell, copy the XML text from an editor and paste it into the SSH session. Although typically you use an automated method to send XML documents to the XML server, you can verify the SSH connection to the XML server through this copy-paste method.

The following are the guidelines to follow when sending an XML document to the XML server:

- Verify that the XML server has sent the Hello message immediately after you started the SSH session, by looking for the Hello message text in the command shell output.

- Send the client Hello message before you send XML requests. Note that the XML server sends the Hello response immediately, and no additional response is sent after you send the client Hello message.

- Always terminate the XML document with the character sequence `]]>]]>`.

### Creating NETCONF XML Instances

You can create NETCONF XML instances by enclosing the XML device elements within an RPC tag and NETCONF operation tags. The XML device elements are defined in feature-based XML schema definition (XSD) files, which enclose available CLI commands in an XML format.

The following are the tags that are used in the NETCONF XML request in a framework context. Tag lines are marked with the following letter codes:

- X — XML declaration
- R — RPC request tag
- N — NETCONF operation tags
- D — Device tags

#### NETCONF XML Framework Context

```xml
X <?xml version="1.0"?>
R <nc:rpc message-id="1" xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0"
```
RPC Request Tag

All NETCONF XML instances must begin with the RPC request tag `<rpc>`. The `<rpc>` element has a message ID (message-id) attribute. This message-id attribute is replicated in the `<rpc-reply>` and can be used to correlate requests and replies. The `<rpc>` node also contains the following XML namespace declarations:

- **NETCONF namespace declaration**—The `<rpc>` and NETCONF tags that are defined in the `urn:ietf:params:xml:ns:netconf:base:1.0` namespace, are present in the netconf.xsd schema file.

- **Device namespace declaration**—Device tags encapsulated by the `<rpc>` and NETCONF tags are defined in other namespaces. Device namespaces are feature-oriented. Cisco NX-OS feature tags are defined in different namespaces. RPC Request Tag `<rpc>` is an example that uses the NFCLI feature. It declares that the device namespace is `xmlns=http://www.cisco.com/nxos:1.0:nfcli`. `nfcli.xsd` contains this namespace definition. For more information, see Obtaining XML Schema Definition (XSD) Files, on page 5.

Examples

**RPC Request Tag `<rpc>`**

```xml
  xmlns=http://www.cisco.com/nxos:1.0:nfcli">
  ...
</nc:rpc>]]>]]>
```

**Configuration Request**

```xml
<nc:rpc message-id="16" xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0"
  xmlns=http://www.cisco.com/nxos:1.0:if_manager">
  <nc:edit-config>
    <nc:target>
      <nc:running/>
    </nc:target>
    <nc:config>
      <configure>
```
**NETCONF Operations Tags**

NETCONF provides the following configuration operations:

<table>
<thead>
<tr>
<th>NETCONF Operation</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>close-session</td>
<td>Closes the current XML server session.</td>
<td>NETCONF Close Session Instance, on page 17</td>
</tr>
<tr>
<td>commit</td>
<td>Sets the running configuration to the current contents of candidate configuration.</td>
<td>NETCONF Commit Instance: Candidate Configuration Capability, on page 21</td>
</tr>
<tr>
<td>confirmed-commit</td>
<td>Provides the parameters to commit the configuration for a specified time. If a commit operation does not follow this operation within the confirm-timeout period, the configuration is reverted to the state before the confirmed-commit operation.</td>
<td>NETCONF Confirmed Commit Instance, on page 22</td>
</tr>
<tr>
<td>copy-config</td>
<td>Copies the contents of the source configuration datastore to the target datastore.</td>
<td>NETCONF Copy Config Instance, on page 18</td>
</tr>
<tr>
<td>delete-config</td>
<td>Operation not supported.</td>
<td>—</td>
</tr>
</tbody>
</table>
### Device Tags

The XML device elements represent the available CLI commands in XML format. The feature-specific schema files contain the XML tags for CLI commands of that particular feature. See Obtaining XML Schema Definition (XSD) Files, on page 5.

Using this schema, it is possible to build an XML instance. The relevant portions of the nfcli.xsd schema file that was used to build the NETCONF instances. See (Creating NETCONF XML Instances, on page 6).

**show xml Device Tags**

```
<xs:element name="show" type="show_type_Cmd_show_xml"/>
<xs:complexType name="show_type_Cmd_show_xml">
<xs:annotation>
<xs:documentation>to display xml agent information</xs:documentation>
</xs:annotation>
<xs:sequence>
<xs:choice maxOccurs="1">
<xs:element name="xml" minOccurs="1" type="xml_type_Cmd_show_xml"/>
<xs:element name="debug" minOccurs="1" type="debug_type_Cmd_show_debug"/>
</xs:choice>
</xs:sequence>
<xs:attribute name="xpath-filter" type="xs:string"/>
```
Device Tags

Server Status Device Tags

<xs:complexType name="xml_type_Cmd_show_xml">
  <xs:annotation>
    <xs:documentation>xml agent</xs:documentation>
  </xs:annotation>
  <xs:sequence>
    <xs:element name="server" minOccurs="1" type="server_type_Cmd_show_xml"/>
  </xs:sequence>
</xs:complexType>

<xs:complexType name="server_type_Cmd_show_xml">
  <xs:annotation>
    <xs:documentation>xml agent server</xs:documentation>
  </xs:annotation>
  <xs:sequence>
    <xs:choice maxOccurs="1">
      <xs:element name="status" minOccurs="1" type="status_type_Cmd_show_xml"/>
      <xs:element name="logging" minOccurs="1" type="logging_type_Cmd_show_logging_facility"/>
    </xs:choice>
  </xs:sequence>
</xs:complexType>

Device Tag Response

<xs:complexType name="status_type_Cmd_show_xml">
  <xs:annotation>
    <xs:documentation>display xml agent information</xs:documentation>
  </xs:annotation>
  <xs:sequence>
    <xs:element name="__XML__OPT_Cmd_show_xml___readonly__" minOccurs="0">
      <xs:complexType>
        <xs:sequence>
          <xs:group ref="og_Cmd_show_xml___readonly__" minOccurs="0" maxOccurs="1"/>
        </xs:sequence>
      </xs:complexType>
    </xs:element>
  </xs:sequence>
</xs:complexType>

<xs:group name="og_Cmd_show_xml___readonly__">
  <xs:sequence>
    <xs:element name="__readonly__" minOccurs="1" type="__readonly___type_Cmd_show_xml"/>
  </xs:sequence>
</xs:group>

<xs:complexType name="__readonly___type_Cmd_show_xml">
  <xs:sequence>
    <xs:group ref="bg_Cmd_show_xml_operational_status" maxOccurs="1"/>
    <xs:group ref="bg_Cmd_show_xml_maximum_sessions_configured" maxOccurs="1"/>
    <xs:group ref="og_Cmd_show_xml_TABLE_sessions" minOccurs="0" maxOccurs="1"/>
  </xs:sequence>
</xs:complexType>

<xs:attribute name="uses-namespace" type="nxos:bool_true"/>
</xs:complexType>

---

Note

The __XML__OPT_Cmd_show_xml___readonly__ tag is optional. This tag represents the response. For more information on responses, see RPC Response Tag, on page 15.

You can use the | XML option to find the tags that you can use to execute a <get> operation. The following is an example of the | XML option. This example shows you that the namespace-defining tag to execute
operations on this device is [http://www.cisco.com/nxos:1.0:nfcli](http://www.cisco.com/nxos:1.0:nfcli), and that the nfcli.xsd file can be used to build requests.

You can enclose the NETCONF operation tags and the device tags within the RPC tag. The </rpc> end tag is followed by the XML termination character sequence.

### XML Example

Switch#> show xml server status | xml
<?xml version="1.0" encoding="ISO-8859-1"?>
xmlns="http://www.cisco.com/nxos:1.0:nfcli">
<nf:data>
<xml>
<server>
<status>
<__XML__OPT_Cmd_show_xml___readonly__>
<__readonly__>
<operational_status>
<o_status>enabled</o_status>
</operational_status>
<maximum_sessions_configured>
<max_session>8</max_session>
</maximum_sessions_configured>
<__readonly__>
<__XML__OPT_Cmd_show_xml___readonly__>
</status>
</server>
</xml>
</nf:data>
</nf:rpc-reply>
]]>]]>

### Extended NETCONF Operations

Cisco NX-OS supports an <rpc> operation named <exec-command>. The operation allows client applications to send CLI configuration and show commands and to receive responses to those commands as XML tags.

The following is an example of the tags that are used to configure an interface. Tag lines are marked with the following letter codes:

- X — XML declaration
- R — RPC request tag
- EO — Extended operation

The following table provides a detailed explanation of the operation tags:

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;exec-command&gt;</td>
<td>Executes a CLI command.</td>
</tr>
</tbody>
</table>
Contains the CLI command. A command can be a show command or configuration command. Separate multiple configuration commands by using a semicolon (;). Although multiple show commands are not supported, you can send multiple configuration commands in different <cmd> tags as part of the same request. For more information, see the Example on Configuration CLI Commands Sent Through <exec-command>.

<table>
<thead>
<tr>
<th>Tag</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;cmd&gt;</td>
<td>Contains the CLI command. A command can be a show command or configuration command. Separate multiple configuration commands by using a semicolon (;). Although multiple show commands are not supported, you can send multiple configuration commands in different &lt;cmd&gt; tags as part of the same request. For more information, see the Example on Configuration CLI Commands Sent Through &lt;exec-command&gt;.</td>
</tr>
</tbody>
</table>

Replies to configuration commands that are sent through the <cmd> tag are as follows:

- <nf:ok>—All configuration commands are executed successfully.
- <nf:rpc-error>—Some commands have failed. The operation stops at the first error, and the <nf:rpc-error> subtree provides more information about which configuration has failed. Configurations that are executed before the failed command would have been applied to the running configuration.

**Configuration CLI Commands Sent Through the <exec-command>**

The show command must be sent in its own <exec-command> instance as shown in the following example:

```
```

**Response to CLI Commands Sent Through the <exec-command>**

The following is the response to a send operation:

```
```

**Show CLI Commands Sent Through the <exec-command>**

The following example shows how the show CLI commands that are sent through the <exec-command> can be used to retrieve data:

```
```
Response to the show CLI Commands Sent Through the <exec-command>

Failed Configuration
After a command is executed, the interface IP address is set, but the administrative state is not modified (the **no shut** command is not executed. The administrative state is not modified because the **no port-channel 2000** command results in an error.

The **<rpc-reply>** is due to a **show** command that is sent through the **<cmd>** tag that contains the XML output of the **show** command.

You cannot combine configuration and show commands on the same **<exec-command>** instance. The following example shows **config** and **show** commands that are combined in the same instance.

### Combination of configure and show Commands

```xml
```

### show CLI Commands Sent Through the **<exec-command>**

```xml
```
NETCONF Replies

For every XML request sent by a client, the XML server sends an XML response that is enclosed in the RPC response tag `<rpc-reply>`.

RPC Response Tag

The following example shows the RPC response tag `<rpc-reply>`:

```
xmlns:http="http://www.cisco.com/nxos:1.0:nfcli">
<ok/>
</nc:rpc-reply>
```

RPC Response Elements

The elements `<ok>`, `<data>`, and `<rpc-error>` can appear in the RPC response. The following table describes the RPC response elements that can appear in the `<rpc-reply>` tag:

<table>
<thead>
<tr>
<th>Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>&lt;ok&gt;</code></td>
<td>The RPC request completed successfully. This element is used when no data is returned in the response.</td>
</tr>
<tr>
<td><code>&lt;data&gt;</code></td>
<td>The RPC request completed successfully. The data that are associated with the RPC request is enclosed in the <code>&lt;data&gt;</code> element.</td>
</tr>
<tr>
<td><code>&lt;rpc-error&gt;</code></td>
<td>The RPC request failed. Error information is enclosed in the <code>&lt;rpc-error&gt;</code> element.</td>
</tr>
</tbody>
</table>

Interpreting the Tags Encapsulated in the data Tag

The device tags encapsulated in the `<data>` tag contain the request, followed by the response. A client application can safely ignore all the tags before the `<readonly>` tag, as show in the following example:
RPC Reply Data

<?xml version="1.0" encoding="ISO-8859-1"?>
xmlns="http://www.cisco.com/nxos:1.0:if_manager">
<nf:data>
<nf:show>
<nf:interface>
<__XML__OPT_Cmd_show_interface_brief___readonly__>
<__readonly__>
<TABLE_interface>
<ROW_interface>
<interface>mgmt0</interface>
<state>up</state>
<ip_addr>xx.xx.xx.xx</ip_addr>
<speed>1000</speed>
<mtu>1500</mtu>
</ROW_interface>
<ROW_interface>
<interface>Ethernet2/1</interface>
<vlan>--</vlan>
<type>eth</type>
<portmode>routed</portmode>
<state>down</state>
<state_rsn_desc>Administratively down</state_rsn_desc>
<speed>auto</speed>
<ratemode>D</ratemode>
</ROW_interface>
</TABLE_interface>
</__readonly__>
</__XML__OPT_Cmd_show_interface_brief___readonly__>
</interface>
</show>
</nf:data>
</nf:rpc-reply>

Note

<__XML__OPT.*> and <__XML__BLK.*> appear in responses and are sometimes used in requests. These tags are used by the NETCONF agent and are present in responses after the <__readonly__> tag. They are necessary in requests, and should be added according to the schema file to reach the XML tag that represents the CLI command.

Information About Example XML Instances

Example XML Instances

This section provides examples of the following XML instances:

- NETCONF Close Session Instance, on page 17
- NETCONF Kill Session Instance, on page 17
- NETCONF Copy Config Instance, on page 18
The following examples show the close-session request, followed by the close-session response:

Close Session Request

```xml
<?xml version="1.0"?>
xmlns="http://www.cisco.com/nxos:1.0">
  <nc:close-session/>
</nc:rpc>
```

Close Session Response

```xml
xmlns="http://www.cisco.com/nxos:1.0" message-id="101">
  <nc:ok/>
</nc:rpc-reply>
```

The following examples show the kill session request, followed by the kill session response:

Kill Session Request

```xml
xmlns="http://www.cisco.com/nxos:1.0">
  <nc:kill-session>
    <nc:session-id>25241</nc:session-id>
  </nc:kill-session>
</nc:rpc>
```

Kill Session Response

```xml
<?xml version="1.0"?>
xmlns="http://www.cisco.com/nxos:1.0" message-id="101">
  <nc:ok/>
</nc:rpc-reply>
```
NETCONF Copy Config Instance

The following examples show the copy config request, followed by the copy config response:

Copy Config Request

```
<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<copy-config>
<target>
<running/>
</target>
<source>
?url=https://user@example.com:passphrase/cfg/new.txt</url>
</source>
</copy-config>
</rpc>
```

Copy Config Response

```
<rpc-reply xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>
```

NETCONF Edit Config Instance

The following examples show the use of NETCONF edit config:

Edit Config Request

```
<?xml version="1.0"?>
<nc:rpc message-id="16" xmlns:nc="urn:ietf:params:xml:ns:netconf:base:1.0"
xmlns="http://www.cisco.com/nxos:1.0:if_manager">
<nc:edit-config>
<nc:target>
<nc:running/>
</nc:target>
<nc:config>
<configure>
<__XML__MODE__exec_configure>
<interface>
<ethernet>
<interface>2/30</interface>
<__XML__MODE_if-ethernet>
<__XML__MODE_if-eth-base>
<description>
<desc_line>Marketing Network</desc_line>
</description>
</__XML__MODE_if-eth-base>
</__XML__MODE_if-eth-ethernet>
</ethernet>
</interface>
</__XML__MODE__exec_configure>
</configure>
</nc:config>
</nc:rpc>
```
Edit Config Response

The operation attribute in edit config identifies the point in configuration where the specified operation is performed. If the operation attribute is not specified, the configuration is merged into the existing configuration data store. The operation attribute can have the following values:

- create
- merge
- delete

Edit Config: Delete Operation Request

The following example shows how to delete the configuration of interface Ethernet 0/0 from the running configuration:

```xml
  <target>
    <running/>
  </target>
  <default-operation>none</default-operation>
  <config xmlns:xc="urn:ietf:params:xml:ns:netconf:base:1.0">
    <top xmlns="http://example.com/schema/1.2/config">
      <interface xc:operation="delete">
        <name>Ethernet0/0</name>
      </interface>
    </top>
  </config>
</edit-config>
```

Response to Edit Config: Delete Operation

The following example shows how to edit the configuration of interface Ethernet 0/0 from the running configuration:

```xml
  <ok/>
</rpc-reply>
```

NETCONF Get Config Instance

The following examples show the use of NETCONF get config:
Get Config Request to Retrieve the Entire Subtree

```xml
<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<get-config>
<source>
<running/>
</source>
<filter type="subtree">
<top xmlns="http://example.com/schema/1.2/config">
<users/>
</top>
</filter>
</get-config>
</rpc>
```

Get Config Response with Results of a Query

```xml
<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<data>
<top xmlns="http://example.com/schema/1.2/config">
<users>
<user>
<name>root</name>
<type>superuser</type>
<full-name>Charlie Root</full-name>
<company-info>
<dept>1</dept>
</company-info>
</user>
<!-- additional <user> elements appear here... -->
</users>
</top>
</data>
</rpc-reply>
```

NETCONF Lock Instance

The following examples show a lock request, a success response, and a response to an unsuccessful attempt:

Lock Request

```xml
<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<lock>
<target>
<running/>
</target>
</lock>
</rpc>
```

Response to a Successful Acquisition of Lock

```xml
<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
```
Response to an Unsuccessful Attempt to Acquire Lock

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<rpc-error><!-- lock failed -->
<error-type>protocol</error-type>
<error-tag>lock-denied</error-tag>
<error-severity>error</error-severity>
<error-message>
Lock failed, lock is already held
</error-message>
<error-info>
<!-- lock is held by NETCONF session 454 -->
</error-info>
</rpc-error>
</rpc-reply>

NETCONF Unlock Instance

The following examples show the use of NETCONF unlock:

Unlock Request

<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<unlock>
<target>
<running/>
</target>
</unlock>
</rpc>

Response to an Unlock Request

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>

NETCONF Commit Instance: Candidate Configuration Capability

The following examples show a commit operation and a commit reply:

Commit Operation

<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<commit/>
</rpc>
Commit Reply

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>

NETCONF Confirmed Commit Instance

The following examples show a confirmed commit operation and a confirmed commit reply:

Confirmed Commit Request

<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<commit>
<confirmed/>
<confirm-timeout>120</confirm-timeout>
</commit>
</rpc>

Confirmed Commit Response

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>

NETCONF Rollback-On-Error Instance

The following examples show how to configure rollback on error and the response to this request:

Rollback-On-Error Capability

<rpc message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<edit-config>
<target>
<running/>
</target>
<error-option>rollback-on-error</error-option>
<config>
<top xmlns="http://example.com/schema/1.2/config">
<intface>
<name>Ethernet0/0</name>
<mtu>100000</mtu>
</intface>
</config>
</edit-config>
</rpc>
Rollback-On-Error Response

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>]]>]]>

NETCONF Validate Capability Instance

The following examples show the use of NETCONF validate capability. The string
urn:ietf:params:netconf:capability:validate:1.0 identifies the NETCONF validate capability.

Validate Request

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<validate>
<source>
<candidate/>
</source>
</validate>
</rpc>]]>]]>

Response to Validate Request

<rpc-reply message-id="101"
xmlns="urn:ietf:params:xml:ns:netconf:base:1.0">
<ok/>
</rpc-reply>]]>]]>

Additional References

This section provides additional information that is related to implementing the XML management interface.
