

Configuring and Using Cisco DCNM SMI-S Server

This chapter provides the steps to configure Cisco DCNM SMI-S Server in Cisco DCNM products and provides some sample scenarios for using CIM objects to manage your SAN. This chapter includes the following sections:

- Installing Cisco DCNM SMI-S Server, page 3-1
- Performing Discovery and Performance Monitoring, page 3-2
- Modeling a Module Using the Blade Subprofile, page 3-2
- Configuring Zoning, page 3-3

For information about CLI commands, refer to the Cisco MDS 9000 Family Command Reference.

Installing Cisco DCNM SMI-S Server

Cisco DCNM SMI-S Server is installed as part of the Cisco DCNM installation. You can use Cisco DCNM-SAN installed locally to discover the SAN fabric. For more information on discovering the fabric using Cisco DCNM-SAN client, see the *Cisco DCNM Fundamentals Guide*.

I

All the platforms supported by Cisco DCNM are supported by SMI-S Server. SMI-S Server is configured as a startup service.

Changing the Default SMI-S Port

To change the default SMI-S port, follow these steps:

- **Step 1** Stop the Cisco SMI-S agent service.
- Step 2 Rename <installdir>/dcm/smis/server/jserver/bin/tcppe.properties.0 file to <installdir>/dcm/smis/server/jserver/bin/tcppe.properties.

- **Step 3** Edit **<installdir>/dcm/smis/server/jserver/bin/tcppe.properties** file to change the port by updating the property **cim-xml.http.portnumber** or **cim-xml.https.portnumber**, depending on whether DCNM is installed with http or https. Only one of this property is present in the file.
- **Step 4** Save the file and close it.
- **Step 5** Restart the Cisco SMI-S Agent service.
- **Step 6** SMI-S provider will use the port number assigned to the property above.

Performing Discovery and Performance Monitoring

You can use the Fabric and Switch profiles to implement discovery and performance monitoring. See the "Fan Profile" section on page 2-13 and the "FDMI Profile" section on page 2-21 for more information on these profiles.

Discovery provides information about the physical and logical entities within the SAN. This information changes dynamically as SAN entities are added, moved, or removed. Discovery also includes the discovery of object classes as well as related association classes, properties, and return status codes that are provided by servers in the managed environment.

Table 3-1 shows how to perform discovery by using the intrinsic methods defined by CIM. Use these methods to retrieve information about the switch and fabric.

Method	How Used
enumerateInstances()	Enumerates instances of a CIM class.
enumerateInstanceNames()	Enumerates names of instances of a CIM class.
getInstance()	Gets a CIM instance.
associators()	Enumerates associators of a CIM object.
associatorName()	Enumerates names of associators of a CIM object.
references()	Enumerates references to a CIM object.
referenceName()	Enumerates names of references to a CIM object.

Table 3-1 Performing Discovery

The target of these methods is the location of Cisco DCNM SMI-S Server, which is identified by the switch IP address.

Performance monitoring provides the status and statistics for the local ports. Only ports on the local switch can be monitored. You can retrieve statistics from the properties of the FCPOrtStatistics class for FCPort class instances on Cisco DCNM SMI-S Server.

1

The namespace of Cisco DCNM SMI-S Server is cimv2.

Modeling a Module Using the Blade Subprofile

You can use the Blade subprofile to model a supervisor module, switching module, or services module within a switch. Table 3-2 shows how to use the association classes in this subprofile to map ports to modules and modules to switches.

Table 3-2 Using the Blade Subprofile Association Classes

Class	How Used
Realizes	Associates the LogicalModule class to the PhysicalPackage class. Use this class to map modules to the switch.
ModulePort	Associates the FCPort class to the LogicalModule class. Use this class to map individual ports to modules within the switch.

See the "Blade Subprofile" section on page 2-7 for more information about the Blade subprofile.

Configuring Zoning

[doc team: need info to use SCVMM/SMI-S/DCNM to configure Cisco zoning]

In the 10.1x installation guide I found -

"Cisco Prime Network Services Controller (NSC) provides the orchestration and automation of network services in Cisco Programmable Fabric. The Prime NSC supports integration with virtual computer and storage managers such as vCenter and System Center Virtual Machine Manager (SCVMM) and provides end-to-end orchestration and automation for services in Cisco Programmable Fabric."

Is NSC needed.

The zoning model in the SMI-S uses extrinsic and intrinsic methods to manage zoning within the SAN fabric. Extrinsic methods are methods specific to a particular class. Intrinsic methods are methods inherited from the CIM and present in every applicable class.

To create a zone member (referred to as ZoneMembershipSettingData), zone, zone alias, or zone set, use invokeMethod(operand). The operand can be one of the extrinsic methods from the zoning subprofiles as shown in Table 3-3.

Extrinsic Method	How Used
CreateZoneMembershipSettingData()	Creates a ZoneMembershipSettingData and adds it to the specified Zone or NamedAddressCollection. The ConnectivityMemberID is dependent upon the ConnectivityMemberType.
CreateZone()	Creates a Zone and associates it to AdminDomain where the ZoneService is hosted.
CreateZoneAlias()	Creates a ZoneAlias and associates it to AdminDomain where the ZoneService is hosted.
CreateZoneSet()	Creates a ZoneSet and associates it to the AdminDomain where the ZoneService is hosted.

Table 3-3 Zoning Extrinsic Methods

Extrinsic Method	How Used
AddZone()	Adds the zone to the specified zoneSet. Adding a zone to a zoneSet extends the zone enforcement definition of the zoneSet to include the members of that zone. If adding the zone is successful, the zone should be associated to the ZoneSet by MemberOfCollection.
AddZoneMembershipSettingData()	Adds ZoneMembershipSettingData to the Zone or NamedAddessCollection.
AddZoneAlias()	Adds the Zone Alias to the Zone.
ActivateZoneSet ()	Sets the ZoneSet to active.
ZoneSetDistribute()	Distributes the full zoneSet along with active zone set per VSAN in the fabric.
CreatDeviceAlias()	Creates a device alias with the given device alias name and PWWN.

Table 3-3	Zoning Extrinsic Methods (continued)
-----------	--------------------------------------

Use the DeleteInstance(*instance_name*) intrinsic method to remove a zoning item from a collection or to delete the zoning item entirely. The DeleteInstance() method requires a reference to one of the instances shown in Table 3-4.

Table 3-4	Deleting Zoning Entities
-----------	--------------------------

Class	How Used
CIM_ElementSettingData	Removes a zone member from a zone or zone alias. Use deleteInstance() to delete the instance of ElementSettingData that associates the zone member to the zone.
CIM_MemberOfCollection	Removes a zone or zone alias from a zone set. Use deleteInstance() to delete the instance of MemberOfCollection that associates the zone or zone alias to the zone set.
CIM_ZoneMembershipSettingData	Deletes a zone member. This automatically removes it from any zone or zone alias.
CIM_Zone	Deletes a zone.
CIM_ZoneAlias	Deletes a zone alias.
CIM_ZoneSet	Deletes a zone set.
RemoveDeviceAlias()	Removes the device alias with the given device alias name.

See the "Zone Control Subprofile" section on page 2-26 and the "Enhanced Zoning and Enhanced Zoning Control Subprofile" section on page 2-25 for information about the zoning subprofiles.

For more information about SMI-S, refer to the SNIA website at http://www.snia.org. For more information about CIM, refer to the DMTF website at http://www.dmtf.org.
