Overview

Cisco Data Center Network Manager (DCNM) is a management system for Cisco NXOS-based storage fabrics. In addition to provisioning, monitoring, and troubleshooting the data center network infrastructure, the Cisco DCNM provides a comprehensive feature-set that meets the routing, switching, and storage administration needs of data centers. It streamlines the provisioning for the Programmable Fabric and monitors the SAN components.

Cisco DCNM provides a high level of visibility and control through a single web-based management console for Cisco Nexus Series Switches, Cisco MDS, and Cisco Unified Computing System (UCS) products. Cisco DCNM also includes Cisco DCNM-SAN client and Device Manager functionality.

This section contains the following sections:

- Introduction, on page 1
- Installation Options, on page 2
- Deployment Options, on page 2
- System Requirements for Cisco DCNM, on page 3

Introduction

Cisco DCNM provides an alternative to the command-line interface (CLI) for switch configuration commands. In addition to complete configuration and status monitoring capabilities for Cisco MDS 9000 switches, Cisco DCNM-SAN provides powerful fiber channel troubleshooting tools. The in-depth health and configuration analysis capabilities leverage unique MDS 9000 switch capabilities: Fiber Channel Ping and Traceroute.

Beginning with Release 11.1(1), Cisco DCNM allows you to monitor Cisco UCS Blade servers also.

Cisco DCNM includes these management applications:

Cisco DCNM Server

The Cisco DCNM-SAN Server component must be started before running Cisco DCNM-SAN. Cisco DCNM-SAN server is installed as a service. This service can then be administered using the Windows Services in the control panel. Cisco DCNM-SAN Server is responsible for discovery of the physical and logical fabric and for listening for SNMP traps, syslog messages, and Performance Manager threshold events.
Cisco DCNM Web UI
Cisco DCNM Web UI allows operators to monitor and obtain reports for Cisco MDS and Nexus events, performance, and inventory from a remote location using a web browser. Licensing and discovery are part of the Cisco DCNM Web UI. You can configure the MDS9000 Fabric, also.

Cisco DCNM-SAN Client
The Cisco DCNM-SAN Client displays a map of your network fabrics, including Cisco MDS 9000 Family switches, third-party switches, hosts, and storage devices. The Cisco DCNM-SAN Client provides multiple menus for accessing the features of the Cisco DCNM SAN functionality.

Device Manager
The Device Manager is embedded with the Cisco DCNM Web UI. After the switches are discovered, navigate to Inventory > Switches > Device Manager to launch the Device Manager.
Cisco DCNM-SAN automatically installs the Device Manager. Device Manager provides two views of a single switch:
- **Device View**: displays a graphic representation of the switch configuration and provides access to statistics and configuration information.
- **Summary View**: displays a summary of xE ports (Inter-Switch Links), Fx ports (fabric ports), and Nx ports (attached hosts and storage) on the switch, Fibre Channels, and IP neighbor devices. You can create charts, print, or save the summary or real-time statistics to a file in tab-delimited format.

Performance Manager
Performance Manager presents detailed traffic analysis by capturing data with SNMP. This data is compiled into various graphs and charts that can be viewed on the Cisco DCNM Web UI. Performance Manager stores data into Elastic search time series database. DCNM doesn't support API access to Elastic search.

Installation Options
Cisco DCNM software images are packaged with the Cisco DCNM installer, signature certificate, and signature verification script. Unzip the desired Cisco DCNM installer image ZIP file to a directory. Verify the image signature by following the steps in the README file. The installer from this package installs the Cisco DCNM software.

**DCNM Windows Installer**
This installer is available as an executable (.exe) file.

**DCNM Linux Installer**
This installer is available as a binary (.bin) file.

Deployment Options
You can deploy the Cisco DCNM installer in one of the following modes:
**Standalone Server**

All types of installers are packaged along with PostgreSQL database. The default installation steps for the respective installers result in this mode of deployment.

**Standalone with external Oracle**

If you have more switches in your setup or you expect your setup to grow over time, we recommend that you use an external Oracle server. This mode of deployment requires the default installation setup, followed by steps to configure DCNM to use the external Oracle. For more information about Scalability, see https://www.cisco.com/c/en/us/td/docs/switches/datacenter/sw/11_0_1/scalability_guide/b_scale_guide_dcnm_11.html.

**DCNM Federation**

Cisco DCNM federation is the HA mechanism for SAN devices. Every node in the DCNM federated setup can manage many groups of SAN devices. A single client interface can manage all devices. Federation mode is used for resilience and scalability. It allows you to monitor 20,000 FC ports. DCNM Windows and Linux Installers can be deployed in Federation mode to have resilience in case of application or OS failures. For Cisco DCNM-SAN federation, the database URL (properties) must remain the same for all Cisco DCNM-SAN nodes in the federation.

# System Requirements for Cisco DCNM

This section describes the various system requirements for proper functioning of your Cisco DCNM, Release 11.2(1).

**Java Requirements**

The Cisco DCNM Server is distributed with JRE 1.8.0_201 into the following directory:

```
DCNM_root_directory/java/jre1.8
```

**Server Requirements**

Cisco DCNM, Release 11.2(1), supports the Cisco DCNM Server on these 64-bit operating systems:

- **SAN Deployments:**
  - Microsoft Windows 2016
  - Microsoft Windows 2012 R2
  - Red Hat Enterprise Linux Release 7.3, 7.4, and 7.6

Cisco DCNM Release 11.2(1) supports the following databases:

- Oracle11g Express (XE), Standard, and Enterprise Editions, and Oracle 11g Real Application Clusters (RAC)
- Oracle 12c Enterprise Edition (Conventional)—(Nonpluggable installation)
Cisco DCNM Release 11.2(1) does not support the Oracle 12c pluggable database version installation.

- Oracle 12c RAC (nonpluggable installation)

The Cisco DCNM database size is not limited. The database size increases according to the number of nodes and ports that the DCNM manages, with Performance Manager Collections enabled. You cannot restrict the database size. If you choose an Oracle database, we recommend that you use Oracle SE or Enterprise edition, instead of Oracle XE due to table space limitations.

You are responsible for all the support that is associated with the Oracle databases, including maintenance, troubleshooting, and recovery. We recommend that you take regular backup of the database; either daily or weekly, to ensure that all the data is preserved.

**Supported Hypervisors**

**Server Resource Requirements**

<table>
<thead>
<tr>
<th>Deployment</th>
<th>Deployment Type</th>
<th>Small (Lab or POC)</th>
<th>Large (Production)</th>
<th>Compute</th>
</tr>
</thead>
<tbody>
<tr>
<td>SAN</td>
<td>Windows, Linux (standalone or VM)</td>
<td>CPU: 8 vCPUs, RAM: 24 GB, DISK: 500 GB</td>
<td>CPU: 16 vCPUs, RAM: 128 GB, RAM (with SAN Insights) or 32 GB (without SAN Insights), DISK: 10 TB Disk (with SAN Insights) or 500 GB (without SAN Insights)</td>
<td>Not Applicable</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note: Standalone functioning of SAN Insights requires 28 vCPUs.</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
• Cisco DCNM Small deployments does not support SAN Insights feature.
• You can use the SAN Insights feature on a medium-sized deployment with 2 TB disk space as well.
• Every Federation node must consists of 3 Large configuration nodes.
• From Cisco DCNM Release 11.2(1), you must synchronize the Federation nodes from the Primary node only.

Client Requirements

Cisco DCNM SAN desktop client and Cisco Device Manager support Microsoft Windows 10, Microsoft Windows 2012, Microsoft Windows 2016, and Red Hat Linux. The following table lists the minimum hardware requirements for these client systems.

Table 1: Client Hardware Requirements

<table>
<thead>
<tr>
<th>Hardware</th>
<th>Minimum Requirements</th>
</tr>
</thead>
<tbody>
<tr>
<td>RAM (free)</td>
<td>6 GB or more</td>
</tr>
<tr>
<td>CPU speed</td>
<td>3 GHz or faster</td>
</tr>
<tr>
<td>Disk space (free)</td>
<td>20 GB</td>
</tr>
</tbody>
</table>

If you install Cisco DCNM on a virtual machine, you must reserve resources equal to the server resource requirements to ensure a baseline with the physical machines.

Some Cisco DCNM features require a license. Before using the licensed features, you must install a Cisco DCNM license for each Nexus-managed or MDS-managed platform. For information about Licensing in DCNM, see https://www.cisco.com/c/en/us/td/docs/switches/datacenter/sw/11_x/licensing/cisco_dcnm_licensing_guide_11_x.html.

Supported Web Browsers

Cisco DCNM supports the following web browsers:

• Google Chrome Version 74.0.3729.13
• Mozilla Firefox Version 66.0.4 (32/64 bit)
• Microsoft Internet Explorer Version 11.706 update version 11.0.120

Other Supported Software

The following table lists the other software that is supported by Cisco DCNM, Release 11.2(1).
### Table 2: Other Supported Software

<table>
<thead>
<tr>
<th>Component</th>
<th>Features</th>
</tr>
</thead>
<tbody>
<tr>
<td>Security</td>
<td>• ACS versions 4.0, 5.1, 5.5, and 5.8.</td>
</tr>
<tr>
<td></td>
<td>• Telnet Disabled: SSH Version 1, SSH Version 2, Global Enforce SNMP</td>
</tr>
<tr>
<td></td>
<td>Privacy Encryption.</td>
</tr>
<tr>
<td></td>
<td>• Web Client and Cisco DCNM-SAN Server Encryption: HTTPS with TLS 1, 1.1</td>
</tr>
<tr>
<td></td>
<td>and 1.2</td>
</tr>
</tbody>
</table>

Also, Cisco DCNM supports call-home events, fabric change events, and events that are forwarded by traps and email.
Guidelines and Limitations

The guidelines and limitations for installing and upgrading Cisco DCNM Release 11.2(1) are as follows:

**General Guidelines and Limitations**

- Adhere to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:
  - It must be at least 8 characters long and contain at least one alphabet and one numeral.
  - It can contain a combination of alphabets, numerals, and special characters.
  - Do not use any of these special characters in the DCNM password: <SPACE> & $ % * " ^ = < > ; : 

- From Cisco DCNM Release 11.0(1), the characters that are allowed in the Administrative password is restricted for OVA and ISO installations. Therefore while upgrading, the old password used in DCNM 11.0(1) or 11.1(1) is not valid. However, different passwords are allowed during Upgrade. The new Administrative password that is entered is used in the following scenarios.
  — accessing the DCNM appliance via its console.
  — accessing the appliance via SSH
  — for applications running on the appliance, e.g. Postgres DBMS

However, after the upgrade, since Postgres DBMS is restored from the backup that is taken on DCNM 10.4(2), you must logon to the Cisco DCNM Web UI using the password used on DCNM Release 10.4(2) appliance.

- Do not interrupt the boot process (such as pressing the Ctrl+ALT + DELETE keys) when installing DCNM. If you interrupt, you must restart the installation process.
- Ensure that you configure the timezone after installation or upgrade, before performing any other operations on the Cisco DCNM Appliance. Use the NTP server for configuring timezones.
Fresh Installation

- For Windows and Linux installers, the installer installs Cisco DCNM-SAN and Cisco SMI-S agent on your system.

Upgrade

- For Windows and Linux installers, the default is to upgrade to the latest version of Cisco DCNM.
- If you need to run Network Insights applications, you must install 3 compute nodes.
Prerequisites

This chapter provides release-specific prerequisites information for your deployment of Cisco Data Center Network Manager.

• General Prerequisites, on page 9
• Prerequisites for Installing DCNM on Windows, on page 22
• Prerequisites for Installing DCNM on Linux, on page 23
• Oracle Database for DCNM Servers, on page 24
• Remote Oracle Database Utility Scripts for Backup and Restore, on page 29
• Local PostgreSQL Database Utility Scripts for Backup and Restore, on page 29

General Prerequisites

This section includes the following topics:

Before you begin

Before you can install Cisco DCNM, ensure that the Cisco DCNM system meets the following prerequisites:

• Before installing Cisco DCNM, ensure that the host name is mapped with the IP address in the hosts file under the following location:
  • Microsoft Windows–C:\WINDOWS\system32\drivers\etc\hosts
  • Linux–/etc/hosts

  ![Note]

  If Oracle RAC is chosen as the database for Cisco DCNM, ensure that the database host IP addresses and virtual IP addresses are added to the hosts file with their host-names.

  • For RHEL, the maximum shared memory size must be 256 MB or more. To configure the maximum shared memory to 256 MB, use the following command:

    ```bash
    sysctl -w kernel.shmmax=268435456
    ```
This setting, kernel.shmmax=268435456, should be saved in the /etc/sysctl.conf file. If this setting is not present or if it is less than 268435456, the Cisco DCNM server will fail after the server system is rebooted. For more information, visit the following URL:

http://www.postgresql.org/docs/8.3/interactive/kernel-resources.html

The server system must be registered with the DNS servers. The server hosting DCNM application must be dedicated to run DCNM alone and must not be shared with any other applications which utilizes memory and system resources.

• While using Remote PostgreSQL Database server, ensure that the Cisco DCNM Host IP addresses are added to the pg_hba.conf file present in the PostgreSQL installation directory. After the entries are added, restart the database.

• Users installing Cisco DCNM must have full administrator privileges to create user accounts and start services. Users should also have access to all ports. For more information, see Running Cisco DCNM Behind a Firewall, on page 61.

• When you connect to the server for the first time, Cisco DCNM checks to see if you have the correct Sun Java Virtual Machine version installed on your local workstation. Cisco DCNM desktop clients look for version 1.8(x) during installation. If required, install the Sun Java Virtual Machine software.

**Note**

When launching the Cisco DCNM installer, the console command option is not supported.

**Note**

Using the Cisco DCNM installer in GUI mode requires that you must log in to the remote server using VNC or XWindows. Using Telnet or SSH to install Cisco DCNM in GUI mode is not possible.

Before you can use Cisco DCNM to manage network switches, you must complete the following tasks:

• Install a supervisor module on each switch that you want to manage.

• Configure the supervisor module with the following values using the setup routine or the CLI:
  • IP address assigned to the mgmt0 interface
  • SNMP credentials (v3 user name and password or v1/v2 communities), maintaining the same user name and password for all the switches in the fabric.

**Initial Setup Routine**

The first time that you access a Cisco NXOS-based switch for MDS or Nexus, it runs a setup program that prompts you for the IP address and other configuration information necessary for the switch to communicate over the supervisor module Ethernet interface. This information is required to configure and manage the switch. All Cisco Nexus or Cisco MDS switches have the network administrator as a default user (Admin). You cannot change the default user at any time. You must explicitly configure a strong password for any switch in the Cisco Nexus or Cisco MDS. The setup scenario differs based on the subnet to which you are adding the new switch:
• Out-of-band management—This feature provides a connection to the network through a supervisor module front panel Ethernet port.

• In-band management—This feature provides IP over Fibre Channel (IPFC) to manage the switches. The in-band management feature is transparent to the network management system (NMS).

Note
IP address for a Cisco Nexus switch or a Cisco MDS switch can be set via CLI or USB key or POAP.

Preparing to Configure the Switch

Before you configure a switch in the Cisco Nexus or Cisco MDS 9000 Family for the first time, you need the following information:

• Administrator password, including:
  • Creating a password for the administrator (required).
  • Creating an additional login account and password (optional).

• IP address for the switch management interface—The management interface can be an out-of-band Ethernet interface or an in-band Fibre Channel interface (recommended).

• Subnet mask for the switch's management interface (optional).

• IP addresses, including:
  • Destination prefix, destination prefix subnet mask, and next-hop IP address if you want to enable IP routing. Also, provide the IP address of the default network (optional).
  • Otherwise, provide an IP address of the default gateway (optional).

• SSH service on the switch—To enable this optional service, select the type of SSH key (dsa/rsa/rsa1) and number of key bits (768 to 2048).

• DNS IP address (optional).

• Default domain name (optional).

• NTP server IP address (optional).

• SNMP community string (optional).

• Switch name—This is your switch prompt (optional).

Note
Be sure to configure the IP route, the IP default network address, and the IP default gateway address to enable SNMP access. If IP routing is enabled, the switch uses the IP route and the default network IP address. If IP routing is disabled, the switch uses the default gateway IP address.
You should verify that the Cisco DCNM-SAN Server host name entry exists on the DNS server, unless the Cisco DCNM-SAN Server is configured to bind to a specific interface during installation.

**Default Login**

All Cisco Nexus and Cisco MDS 9000 Family switches have the network administrator as a default user (Admin). You cannot change the default user at any time (see the Security Configuration Guide, Cisco DCNM for SAN).

You have an option to enforce a secure password for any switch in the Cisco MDS 9000 Family. If a password is trivial (short, easy-to-decipher), your password configuration is rejected. Be sure to configure a secure password (see the Security Configuration Guide, Cisco DCNM for SAN). If you configure and subsequently forget this new password, you have the option to recover this password (see the Security Configuration Guide, Cisco DCNM for SAN).

**Note**

Adhere to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:

- It must be at least 8 characters long and contain at least one alphabet and one numeral.
- It can contain a combination of alphabets, numerals, and special characters.
- Do not use any of these special characters in the DCNM password for any deployment mode: <SPACE> & $ % * ^ = < > ; :

**Setup Options**

The setup scenario differs based on the subnet to which you are adding the new switch. You must configure a Cisco MDS 9000 Family switch or a Cisco Nexus switch with an IP address to enable management connections from outside of the switch (see Figure 1: Management Access to Switches, on page 13).
Assigning Setup Information

This section describes how to initially configure the switch for both out-of-band and in-band management.

**Note**
Press Ctrl + C at any prompt to skip the remaining configuration options and proceed with what is configured until that point. Entering a new password for the administrator is a requirement and cannot be skipped.

**Tip**
If you do not wish to answer a previously configured question, or if you wish to skip answers to any questions, press Enter. If a default answer is not available (for example, switch name), the switch uses what was previously configured and skips to the next question.

Configuring Out-of-Band Management

You can configure both in-band and out-of-band configuration together by entering Yes in both in the following procedure.

**Procedure**

**Step 1**
Power on the switch. Switches in the Cisco Nexus and Cisco MDS 9000 Family boot automatically.
Do you want to enforce secure password standard (Yes/No)?

**Step 2**
Enter Yes to enforce a secure password.

a) Enter the administrator password.

Enter the password for admin: 2008asdf*lkjh17

**Note** The password can contain a combination of alphabets, numeric, and special characters. Do not use any of these special characters in the DCNM password for any deployment mode: <SPACE> & $ % ‘ “ ^ = < > ;:

b) Confirm the administrator password.

Confirm the password for admin: 2008asdf*lkjh17

**Tip** If a password is trivial (short, easy to decipher), your password configuration is rejected. Be sure to configure a secure password as shown in the sample configuration. Passwords are case sensitive.

**Step 3**
Enter yes to enter the setup mode.

**Note** This setup utility guides you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

Please register Cisco MDS 9000 Family devices promptly with your supplier. Failure to register may affect response times for initial service calls. MDS devices must be registered to receive entitled support services.

Press Enter anytime you want to skip any dialog. Use ctrl-c at anytime to skip away remaining dialogs.

Would you like to enter the basic configuration dialog (yes/no): yes

The setup utility guides you through the basic configuration process. Press Ctrl + C at any prompt to end the configuration process.

**Step 4**
Enter the new password for the administrator (Admin is the default).

Enter the password for admin: admin

**Step 5**
Enter yes (no is the default) to create additional accounts.

Create another login account (yes/no) [n]: yes

While configuring your initial setup, you can create an additional user account (in the network administrator role) in addition to the administrator’s account. See the Security Configuration Guide, Cisco DCNM for SAN for information on default roles and permissions.

**Note** User login IDs must contain non-numeric characters.

a) Enter the user login ID [administrator].

Enter the user login ID: user_name

b) Enter the user password.

Enter the password for user_name: user-password

The password can contain a combination of alphabets, numeric, and special characters. Do not use any of these special characters in the DCNM password for any deployment mode: <SPACE> & $ % ‘ “ ^ = < > ;:

c) Confirm the user password.

Confirm the password for user_name: user-password
Step 6

Enter yes (no is the default) to create an SNMPv3 account.

Configure read-only SNMP community string (yes/no) [n]: yes

a) Enter the username (Admin is the default).

SNMPv3 user name [admin]: admin

b) Enter the SNMPv3 password (minimum of eight characters). The default is admin123.

SNMPv3 user authentication password: admin_pass

Step 7

Enter yes (no is the default) to configure the read-only or read-write SNMP community string.

Configure read-write SNMP community string (yes/no) [n]: yes

a) Enter the SNMP community string.

SNMP community string: snmp_community

Step 8

Enter a name for the switch.

Enter the switch name: switch_name

Step 9

Enter yes (yes is the default) to configure out-of-band management.

Continue with Out-of-band (mgmt0) management configuration? [yes/no]: yes

a) Enter the mgmt0 IP address.

Mgmt0 IPv4 address: ip_address

b) Enter the mgmt0 subnet mask.

Mgmt0 IPv4 netmask: subnet_mask

Step 10

Enter yes (yes is the default) to configure the default gateway (recommended).

Configure the default-gateway: (yes/no) [y]: yes

a) Enter the default gateway IP address.

IPv4 address of the default gateway: default_gateway

Step 11

Enter yes (no is the default) to configure advanced IP options such as in-band management, static routes, default network, DNS, and domain name.

Configure Advanced IP options (yes/no)? [n]: yes

a) Enter no (no is the default) at the in-band management configuration prompt.

Continue with in-band (VSAN1) management configuration? (yes/no) [no]: no

b) Enter yes (no is the default) to enable IP routing capabilities.

Enable the ip routing? (yes/no) [n]: yes

c) Enter yes (no is the default) to configure a static route (recommended).

Configure static route: (yes/no) [n]: yes

Enter the destination prefix.

Destination prefix: dest_prefix

Enter the destination prefix mask.

Destination prefix mask: dest_mask
Enter the next-hop IP address.

Next hop ip address: `next_hop_address`

**Note** Be sure to configure the IP route, the default network IP address, and the default gateway IP address to enable SNMP access. If IP routing is enabled, the switch uses the IP route and the default network IP address. If IP routing is disabled, the switch uses the default gateway IP address.

d) Enter *yes* (no is the default) to configure the default network (recommended).

Configure the default network: (yes/no) [n]: `yes`

Enter the default network IP address.

**Note** The default network IP address is the destination prefix provided in .

Default network IP address [dest_prefix]: `dest_prefix`

c) Enter *yes* (no is the default) to configure the DNS IP address.

Configure the DNS IPv4 address? (yes/no) [n]: `yes`

Enter the DNS IP address.

DNS IPv4 address: `name_server`

e) Enter *yes* (default is no) to configure the default domain name.

Configure the default domain name? (yes/no) [n]: `yes`

Enter the default domain name.

Default domain name: `domain_name`

Step 12 Enter *yes* (no is the default) to enable Telnet service.

Enable the telnet server? (yes/no) [n]: `yes`

Step 13 Enter *yes* (no is the default) to enable the SSH service.

Enabled SSH server? (yes/no) [n]: `yes`

Step 14 Enter the SSH key type.

Type the SSH key you would like to generate (dsa/rsa)? `dsa`

Step 15 Enter the number of key bits within the specified range.

Enter the number of key bits? (768 to 2048): `768`

Step 16 Enter *yes* (no is the default) to configure the NTP server.

Configure NTP server? (yes/no) [n]: `yes`

Configure clock? (yes/no) [n]: `yes`

Configure clock? (yes/no) [n]: `yes`

Configure timezone? (yes/no) [n]: `yes`

Configure summertime? (yes/no) [n]: `yes`

Configure the ntp server? (yes/no) [n]: `yes`
a) Enter the NTP server IP address.

NTP server IP address: `ntp_server_IP_address`

Step 17 Enter *noshut* (shut is the default) to configure the default switch port interface to the shut state.

Configure default switchport interface state (shut/noshut) [shut]: `noshut`
Step 18  Enter on (on is the default) to configure the switch port trunk mode.
Configure default switchport trunk mode (on/off/auto) [on]: on

Step 19  Enter no (no is the default) to configure switchport port mode F.
Configure default switchport port mode F (yes/no) [n] : no

Step 20  Enter permit (deny is the default) to deny a default zone policy configuration.
Configure default zone policy (permit/deny) [deny]: permit
This step permits traffic flow to all members of the default zone.

Step 21  Enter yes (no is the default) to disable a full zone set distribution (see the Fabric Configuration Guide, Cisco DCNM for SAN). Disables the switch-wide default for the full zone set distribution feature.
Enable full zoneset distribution (yes/no) [n]: yes
You see the new configuration. Review and edit the configuration that you have just entered.

Step 22  Enter no (no is the default) if you are satisfied with the configuration.
The following configuration will be applied:
username admin password admin_pass role network-admin
username user_name password user_pass role network-admin
snmp-server community snmp_community ro
switchname switch
interface mgmt0
  ip address ip_address subnet_mask
  no shutdown
  ip routing
  ip route dest_prefix dest_mask dest_address
  ip default-network dest_prefix
  ip default-gateway default_gateway
  ip name-server name_server
  ip domain-name domain_name
telnet server enable
ssh key dsa 768 force
ssh server enable
ntp server ipaddr ntp_server
system default switchport shutdown
system default switchport trunk mode on
system default port-channel auto-create
zone default-zone permit vsan 1-4093
zoneset distribute full vsan 1-4093
Would you like to edit the configuration? (yes/no) [n]: no

Step 23  Enter yes (yes is default) to use and save this configuration:
Use this configuration and save it? (yes/no) [y]: yes
Caution  If you do not save the configuration at this point, none of your changes are updated the next time the switch is rebooted. Enter yes to save the new configuration to ensure that the kickstart and system images are also automatically configured.

Configuring In-Band Management

The in-band management logical interface is VSAN 1. This management interface uses the Fibre Channel infrastructure to transport IP traffic. An interface for VSAN 1 is created on every switch in the fabric. Each
Switch should have its VSAN 1 interface that is configured with an IP address in the same subnetwork. A default route that points to the switch that provides access to the IP network should be configured on every switch in the Fibre Channel fabric (see Fabric Configuration Guide, Cisco DCNM for SAN).

You can configure both in-band and out-of-band configuration together by entering in the following procedure.

Procedure

**Step 1**
Power on the switch. Switches in the Cisco MDS 9000 Family boot automatically.

**Step 2**
Enter the new password for the administrator.

Enter the password for admin: 2004asdf*lkjh18

The password can contain a combination of alphabets, numeric, and special characters. The password can contain a combination of alphabets, numeric, and special characters. Do not use any of these special characters in the DCNM password for any deployment mode: <SPACE> & $ % ^ = < > ; :

**Step 3**
Enter yes to enter the setup mode.

This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.

Please register Cisco MDS 9000 Family devices promptly with your supplier. Failure to register may affect response times for initial service calls.

MDS devices must be registered to receive entitled support services.

Press Enter in case you want to skip any dialog. Use ctrl-c at anytime to skip away remaining dialogs.

Would you like to enter the basic configuration dialog (yes/no): yes

The setup utility guides you through the basic configuration process. Press Ctrl-C at any prompt to end the configuration process.

**Step 4**
Enter no (no is the default) if you do not wish to create more accounts.

Create another login account (yes/no) [no]: no

**Step 5**
Configure the read-only or read-write SNMP community string.

a) Enter no (no is the default) to avoid configuring the read-only SNMP community string.

Configure read-only SNMP community string (yes/no) [n]: no

**Step 6**
Enter a name for the switch.

Note: The switch name is limited to 32 alphanumeric characters. The default is switch.

Enter the switch name: switch_name

**Step 7**
Enter no (yes is the default) at the configuration prompt to configure out-of-band management.

Continue with Out-of-band (mgmt0) management configuration? [yes/no]: no

**Step 8**
Enter yes (yes is the default) to configure the default gateway.

Configure the default-gateway: (yes/no) [y]: yes

a) Enter the default gateway IP address.

IP address of the default gateway: default_gateway
Step 9  Enter yes (no is the default) to configure advanced IP options such as in-band management, static routes, default network, DNS, and domain name.
Configure Advanced IP options (yes/no)? [n]: yes
a) Enter yes (no is the default) at the in-band management configuration prompt.
Continue with in-band (VSAN1) management configuration? (yes/no) [no]: yes
   Enter the VSAN 1 IP address.
   VSAN1 IP address: ip_address
   Enter the subnet mask.
   VSAN1 IP net mask: subnet_mask
b) Enter no (yes is the default) to enable IP routing capabilities.
   Enable ip routing capabilities? (yes/no) [y]: no
c) Enter no (yes is the default) to configure a static route.
   Configure static route: (yes/no) [y]: no
d) Enter no (yes is the default) to configure the default network.
   Configure the default-network: (yes/no) [y]: no
e) Enter no (yes is the default) to configure the DNS IP address.
   Configure the DNS IP address? (yes/no) [y]: no
f) Enter no (no is the default) to skip the default domain name configuration.
   Configure the default domain name? (yes/no) [n]: no
Step 10 Enter no (yes is the default) to disable Telnet service.
   Enable the telnet service? (yes/no) [y]: no
Step 11 Enter yes (no is the default) to enable the SSH service.
   Enabled SSH service? (yes/no) [n]: yes
Step 12 Enter the SSH key type (see the Security Configuration Guide, Cisco DCNM for SAN) that you want to generate.
   Type the SSH key you would like to generate (dsa/rsa/rsa1)? rsa
Step 13 Enter the number of key bits within the specified range.
   Enter the number of key bits? (768 to 1024): 1024
Step 14 Enter no (no is the default) to configure the NTP server.
   Configure NTP server? (yes/no) [n]: no
Step 15 Enter shut (shut is the default) to configure the default switch port interface to the shut state.
   Configure default switchport interface state (shut/noshut) [shut]: shut
   Note  The management Ethernet interface is not shut down at this point—only the Fibre Channel, iSCSI, FCIP, and Gigabit Ethernet interfaces are shut down.
Step 16 Enter auto (off is the default) to configure the switch port trunk mode.
Configure default switchport trunk mode (on/off/auto) [off]: auto

**Step 17**
Enter deny (deny is the default) to deny a default zone policy configuration.

Configure default zone policy (permit/deny) [deny]: deny

This step denies traffic flow to all members of the default zone.

**Step 18**
Enter no (no is the default) to disable a full zone set distribution.

Enable full zoneset distribution (yes/no) [n]: no

This step disables the switch-wide default for the full zone set distribution feature.

You see the new configuration. Review and edit the configuration that you have entered.

**Step 19**
Enter no (no is the default) if you are satisfied with the configuration.

The following configuration will be applied:

```
username admin password admin_pass role network-admin
snmp-server community snmp_community rw
switchname switch
interface vsan1
  ip address ip_address subnet_mask
  no shutdown
  ip default-gateway default_gateway
  no telnet server enable
  ssh key rsa 1024 force
  ssh server enable
  no system default switchport shutdown
  system default switchport trunk mode auto
  no zone default-zone permit vsan 1-4093
  no zoneset distribute full vsan 1-4093
```

Would you like to edit the configuration? (yes/no) [n]: no

**Step 20**
Enter yes (yes is default) to use and save this configuration.

Use this configuration and save it? (yes/no) [y]: yes

**Caution** If you do not save the configuration at this point, none of your changes are updated the next time the switch is rebooted. Enter yes to save the new configuration. To ensure that the kickstart and system images are also automatically configured.

---

**Using the setup Command**

To make changes to the initial configuration at a later time, you can enter the `setup` command in EXEC mode.

```
switch# setup
---- Basic System Configuration Dialog ----
This setup utility will guide you through the basic configuration of the system. Setup configures only enough connectivity for management of the system.
*Note: setup always assumes a predefined defaults irrespective of the current system configuration when invoked from CLI.
Press Enter incase you want to skip any dialog. Use ctrl-c at anytime to skip away remaining dialogs.
Would you like to enter the basic configuration dialog (yes/no): yes
```

The setup utility guides you through the basic configuration process.
Starting a Switch in the Cisco MDS 9000 Family

The following procedure is a review of the tasks you should have completed during hardware installation, including starting up the switch. These tasks must be completed before you can configure the switch.

Procedure

**Step 1**
Verify the following physical connections for the new Cisco MDS 9000 Family switch:
- The console port is physically connected to a computer terminal (or terminal server).
- The management 10/100 Ethernet port (mgmt0) is connected to an external hub, switch, or router.

**Tip**
Save the host ID information for future use (for example, to enable licensed features). The host ID information is provided in the Proof of Purchase document that accompanies the switch.

**Step 2**
Verify that the default console port parameters are identical to those of the computer terminal (or terminal server) attached to the switch console port:
- 9600 baud
- 8 data bits
- 1 stop bit
- No parity

**Step 3**
Power on the switch.
The switch boots automatically and the switch# prompt appears in your terminal window.

Accessing the Switch

After initial configuration, you can access the switch in one of the three ways:
- Serial console access—You can use a serial port connection to access the CLI.
- In-band IP (IPFC) access—You can use Telnet or SSH to access a switch in the Cisco MDS 9000 Family or use SNMP to connect to a Cisco DCNM-SAN application.
- Out-of-band (10/100BASE-T Ethernet) access—You can use Telnet or SSH to access a switch in the Cisco MDS 9000 Family or use SNMP to connect to a Cisco DCNM-SAN application.

After initial configuration, you can access the switch in one of three ways (see Figure 2: Switch Access Options, on page 22):
- Serial console access—You can use a serial port connection to access the CLI.
• In-band IP (IPFC) access—You can use Telnet or SSH to access a switch in the Cisco MDS 9000 Family or use Cisco DCNM-SAN to access the switch.

• Out-of-band (10/100BASE-T Ethernet) access—You can use Telnet or SSH to access a switch in the Cisco MDS 9000 Family or use Cisco DCNM-SAN to access the switch.

Figure 2: Switch Access Options

Prerequisites for Installing DCNM on Windows

• During the initial installation, disable all security and antivirus tools that are running on your Windows server.

• Do not run any other management applications on the Cisco DCNM server or the Cisco DCNM database server.

• Before installing Cisco DCNM, ensure that the hostname is mapped with the IP address in the hosts file under the location C:\WINDOWS\system32\drivers\etc\hosts.

• On Windows, remote Cisco DCNM installations or upgrades must be done through the console using VNC or through the Remote Desktop Client (RDC) in console mode (ensuring RDC is used with the /Console option). This process is important if the default PostgreSQL database is used with Cisco DCNM, because this database requires the local console for all installations and upgrades.

• Telnet Client application is not installed by default on Microsoft Windows Vista. To install Telnet Client, choose Start > Programs > Control Panel > Click Turn Windows features on or off (if you have UAC turned on, provide permissions to continue). Check Telnet Client check box and click Ok.
• You can run CiscoWorks on the same PC as Cisco DCNM although the Java requirements are different. When installing the later Java version for Cisco DCNM, make sure that it does not overwrite the earlier Java version that is required for CiscoWorks. Both versions of Java can coexist on your PC.

• Ensure that you use the same Operating System for all the nodes in the Federation setup.

• In the Federation setup, ensure that the server time is synchronized across all the nodes of the Federation setup. The servers will not be able to communicate if the time is not synchronized. We recommend that you use NTP server to synchronize time across all the nodes.

• Ensure that you uninstall the Windows Defender application, and restart Windows 2016 server before installing Cisco DCNM on Windows 2016 server.

## Prerequisites for Installing DCNM on Linux

• For RHEL, the maximum shared memory size must be 256 MB or more. To configure the maximum shared memory to 256 MB, use the following command: `sysctl -w kernel.shmmax=268435456`. Save the `kernel.shmmax=268435456` value in the `/etc/sysctl.conf` file. If this value is not correct, the Cisco DCNM server fails after the server system reboots. For more information, visit the following URL: [http://www.postgresql.org/docs/8.4/interactive/kernel-resources.html](http://www.postgresql.org/docs/8.4/interactive/kernel-resources.html)

• The server system must be registered with the DNS servers.

• No other programs must be running on the server.

• Ensure that you select English as the preferred language during RHEL installation.

• Ensure that you use the same Operating System for all the nodes in the Federation setup.

• In the Federation setup, ensure that the server time is synchronized across all the nodes of the Federation setup. The servers will not be able to communicate if the time is not synchronized. We recommend that you use NTP server to synchronize time across all the nodes.

• After you upgrade from Cisco DCNM Release 11.2(1) on Linux Standalone server, ensure that you clear the browser cache and Java console cache before you launch the Web UI and download the SAN Client. The Java console remembers the previous version of the SAN client data. If you do not clear Java console cache, you will not be able to use the latest downloaded SAN Client.

## Antivirus exclusion

Scanning the Cisco DCNM includes the scanning of the database files. This process will hamper the performance on the DCNM while operation. While scanning the Cisco DCNM on Linux RHEL server, exclude the directory `/usr/local/cisco/dcm/db` and `/var/lib/dcnm`.

For more information, refer to [https://wiki.postgresql.org](https://wiki.postgresql.org).

---

**Note**

We recommend you to stop Anti-Virus scanning while installing DCNM because the port being used or blocked might cause failures. After the installation, you can enable or install Anti-Virus application with specific guidelines to avoid DCNM directories as part of the scan.
Oracle Database for DCNM Servers

This section details about the database required for the installation of DCNM server.

Note
This section is not applicable for Cisco DCNM Native HA installation.

Cisco DCNM supports the following databases:

• Oracle Database 11g
• Oracle Database 12c
• Oracle RAC 11g, and 12c

You can change from the local database to an external Oracle database, if required.

Note
Cisco DCNM is configured with AL32UTF8 character set.

The Cisco DCNM Database size is not limited and increases based on the number of nodes and ports that the DCNM manages with Performance Manager Collections enabled. You cannot restrict the database size. Cisco recommends that you use Oracle SE or Enterprise edition, instead of Oracle XE, due to table space limitations.

This section contains the following:

Oracle SQLPlus Command-Line Tool

The Oracle database procedures in this section require the use of the SQL*Plus command-line tool. The SQL*Plus executable is typically installed in the bin directory under the Oracle home directory.

Linux Environment Variables

If you are using Linux, before you use the SQL*Plus command-line tool, ensure that the ORACLE_HOME and ORACLE_SID environment variables are set to correct values.

For example, if you are using Oracle 11g on Linux, the following commands set the environment variables to the default Oracle home directory and SID if you are using a bash shell:

```
export ORACLE_HOME=<usr_home_directory>/app/oracle/product/11.2.0/
(or identify the Oracle home on the Oracle installed server)
export ORACLE_SID=XE
```

init.ora File

The init.ora file specifies startup parameters. The default name and location of the file is platform specific, as shown in the following table.
Table 3: Name and Default Location of init.ora File

<table>
<thead>
<tr>
<th>Oracle Version</th>
<th>Operating System</th>
<th>Location of init.ora File</th>
</tr>
</thead>
<tbody>
<tr>
<td>12c</td>
<td>Microsoft Windows</td>
<td>C:\app\Administrator\virtual\product\12.2.0\dbhome_1\srvm\admin\init.ora</td>
</tr>
<tr>
<td></td>
<td>Linux</td>
<td>/usr/lib/oracle/orcl/app/oracle/product/12.2.0/db_1/srvm/initORCL.ora</td>
</tr>
<tr>
<td>11g</td>
<td>Microsoft Windows</td>
<td>C:\app\Administrator\product\11.1.0\db_1\dbs\initORCL.ora</td>
</tr>
<tr>
<td></td>
<td>Linux</td>
<td>/usr/lib/oracle/orcl/app/oracle/product/11.1.0/db_1/dbs/initORCL.ora</td>
</tr>
</tbody>
</table>

Back up the Oracle Database

Copy the oracle backup/restore script from the Cisco DCNM server directory DCNM_SERVER_Install/dcm/dcnm/bin.

For Linux, the script name is backup-remote-oracledb.sh/restore-remote-oracledb.sh and edit the DB_HOME variable to point to the Oracle installation.

For Windows, the script name is backup-remote-oracledb.bat/restore-remote-oracledb.bat and edit DB_HOME variable to point to the Oracle installation.

Use the following path for Oracle DBHOME:

- On Linux – /usr/lib/oracle/xe/app/oracle/product/10.2.0/server
  Replace /usr/lib/oracle with the Oracle installation path.
- On windows – C:\oraclexe\app\oracle\product\10.2.0\server
  Replace C:\oraclexe with the Oracle installation path.

Preparing the Oracle Database

You can prepare an Oracle database.

Procedure

Step 1
Increase the number of sessions and processes to 150 each. For more information, see the Increasing the Number of Sessions and Processes to 150 Each, on page 27.

Step 2
Increase the number of open cursors to 1000. For more information, see the Increasing the Number of Open Cursors to 1000, on page 27.

Logging Into Oracle

You can log into the Oracle database by using the SQL*Plus command-line tool.
Before you begin

Ensure that you know the database administrator username and password.

Procedure

Step 1

Run the SQL*Plus executable.

A command prompt appears.

Step 2

Enter the `connect` command.

The Username prompt appears.

Step 3

Enter the database administrator username.

The Password prompt appears.

Step 4

Enter the password for the username that you specified.

For example, if the Oracle administrator username is system and the password is oracle, you would log in as follows:

**Example:**

Username: `sys as sysdba`

Password: `oracle`

What to do next

For more information about using SQL*Plus, see the documentation for the Oracle database version that you are using.

Increasing the SYSTEM Tablespace

You can increase the SYSTEM tablespace.

Procedure

Step 1

Use the SQL*Plus command-line tool to log in to the Oracle database. For more information, see the Oracle SQLPlus Command-Line Tool, on page 24.

Step 2

Enter the following command:

```
select file_name, bytes, autoextensible, maxbytes
from dba_data_files where tablespace_name='SYSTEM';
```

Step 3

Enter the following command:

```
alter database datafile filename autoextend on next 100m maxsize 2000m;
```

where `filename` is the filename from the output of the `select` command in the previous step.

The SYSTEM tablespace is increased.
Step 4

Enter the **exit** command.

---

### Increasing the Number of Sessions and Processes to 150 Each

For each DCNM instance configured in the same Oracle database, the number of cursors and processes must be increased to more than the 150 and 1000.

For example, if two DCNM standalone (non HA) instances are configured to use the same Oracle database, the cursors and process must be increased to 300 and 2000 approximately, depending on any performance degradation or SQL Exception errors occurred during normal operations of either of the DCNM instances.

**Procedure**

**Step 1**

Ensure that the `init.ora` file exists and that it contains the single line that is applicable for your Oracle database installation. If there are additional lines, remove them.

For more information, see the *init.ora File*, on page 24.

**Step 2**

Use the SQL*Plus command-line tool to log in to the Oracle database. For more information, see the Oracle SQLPlus Command-Line Tool, on page 24.

**Step 3**

Shut down the system by entering the `shutdown` command. If the command fails, use the `shutdown abort` command.

**Step 4**

Enter the following command:

```
startup pfile='init_file_name';
```

where `init_file_name` is the init.ora filename for your Oracle database installation. For more information, see the *init.ora File*, on page 24.

**Step 5**

Set the number of sessions to 150 by entering the following command:

```
alter system set sessions = 150 scope=spfile;
```

**Step 6**

Shut down the system by entering the `shutdown` command. If the command fails, use the `shutdown abort` command.

**Step 7**

Start up the system by entering the `startup` command.

**Step 8**

Verify that the number of sessions and processes is changed to 150 by entering the following command:

```
show parameter sessions
```

**Step 9**

Exit by entering the `exit` command.

---

### Increasing the Number of Open Cursors to 1000

You can increase the number of open cursors to 1000.

**Procedure**

**Step 1**

Ensure that the init.ora file exists and that it contains the single line that is applicable for your Oracle database installation. If there are additional lines in the file, remove them.
For more information, see the `init.ora` File, on page 24.

**Step 2**  
Use the SQL*Plus command-line tool to log in to the Oracle database. For more information, see the Oracle SQLPlus Command-Line Tool, on page 24.

**Step 3**  
Shut down the system by entering the `shutdown` command. If the command fails, use the `shutdown abort` command.

**Step 4**  
Enter the following command:

```
startup pfile='init_file_name'
```

where `init_file_name` is the init.ora filename for your Oracle database installation. For more information, see the init.ora File, on page 24.

**Step 5**  
Set the number of open cursors to 1000 by entering the following command:

```
alter system set open_cursors = 1000 scope=spfile;
```

**Step 6**  
Shut down the system by entering the `shutdown` command. If the command fails, use the `shutdown abort` command.

**Step 7**  
Start up the system by entering the `startup` command.

**Step 8**  
Verify that the number of open cursors is changed to 1000 by entering the following command:

```
show parameter open_cursors
```

**Step 9**  
Exit by entering the `exit` command.

---

### Creating an Oracle DB User using the Command Prompt

To create an Oracle DB user using the command prompt, follow these steps:

```
export ORACLE_SID=XE
export ORACLE_HOME=/usr/lib/oracle/xe/app/oracle/product/10.2.0/server
cd $ORACLE_HOME/bin
sqlplus
sys as sysdba
create user dcnmdbusername identified by dcnmdbuserpassword default tablespace users temporary
tablespace temp;
grant connect, resource to dcnmdbusername;
grant create session to dcnmdbusername;
grant dba to dcnmdbusername;
```

---

**Note**  
Ensure you set the Oracle_SID and Oracle_Home and enter the values for the DB Username and password fields.

---

**Note**  
When a DBA account cannot be created, an account with DML/DDL/schema privilege is sufficient.

---

### Connecting to an Oracle RAC with SCAN Feature Type DB

To connect to an Oracle RAC with SCAN Feature type DB, enter the following command:
Database for Federation Setup

Cisco DCNM can be deployed as Cisco DCNM-SAN federation. For Cisco DCNM-SAN federation, the database URL (properties) must remain the same for all Cisco DCNM-SAN nodes in the federation.

Note
Ensure that you do not provide multicast addresses to form the federation.

Remote Oracle Database Utility Scripts for Backup and Restore

Irrespective of the platform, Cisco DCNM is installed (Windows or Linux), the following scripts to backup and restore the remote Oracle database.

Utility scripts for Oracle database that is installed on Linux platform are:
1. backup-remote-oracledb.sh
2. restore-remote-oracledb.sh

Utility scripts for Oracle database that is installed on Windows platform are:
1. backup-remote-oracledb.bat
2. restore-remote-oracledb.bat

Cisco DCNM host is configured to run with a remote Oracle database. As part of housekeeping, you can copy DCNM utility scripts to a remote Oracle database and restore the DCNM database schema.

To run the utility scripts, you need the database administrator credentials. These scripts will prompt you for:
1. DCNM database password (the user name is already present)
2. Username/password of the admin user.

While entering the DBA user credentials, ensure that you do not to enter "sys" as sysdba" because in some versions of Oracle, the presence of space might cause the backup/restore to fail. Instead, user should provide valid user credentials that does not have a space in the user name, for example, system or sysdba. The admin credentials are not saved/cached and hence they do not leak sensitive credential information.

Note
User scripts under dcnm/bin can be run only by administrator user.

Local PostgreSQL Database Utility Scripts for Backup and Restore

Utility scripts for Local PostgreSQL database that is installed in RHEL machine are:
1. backup-pgsql-dcnm-db.sh
2. restore-pgsql-dcnm-db.sh

Utility scripts for Local PG database that is installed in Windows machine are:

1. backup-pgsql-dcnm-db.bat
2. restore-pgsql-dcnm-db.bat
CHAPTER 4

Installing the Cisco DCNM

This chapter contains the following sections:

- Installing Cisco DCNM on Windows, on page 31
- Installing Cisco DCNM on Linux, on page 38
- Launching SAN Client and Device Manager, on page 45

Installing Cisco DCNM on Windows

Perform the following tasks to install Cisco DCNM on Windows.

Uninstalling the Cisco DCNM on Windows

Perform this procedure to uninstall Cisco DCNM on Windows.

Note

We recommend that you follow these steps in the same order.

Before you begin

You must remove the Cisco DCNM instance completely before you use the same server to install a different version of DCNM.

Procedure

Step 1  Stop Cisco DCNM Services.
Step 2  Uninstall the Postgres database.
Step 3  Uninstall the Cisco DCNM.
Step 4  Navigate to C:\Users\Administrator location, and delete .cisco_mds9000 folder.
Step 5  Navigate to C:\Program Files\Zero G Registry location, and delete the Zero G Registry folder.
Step 6  Navigate to C:\Users\Administrator location, and delete InstallAnywhere folder.
Step 7  Ensure that all the ports required for Cisco DCNM installation are free and available.
Step 8  Delete the Cisco DCNM directory.
Step 9  Restart the Windows VM.

---

**Downloading the Cisco DCNM Windows Installer and Properties File**

The first step to installing the DCNM on Windows is to download the dcnm.exe file.

---

**Note**

If you plan to use Federation application functions, you must deploy the dcnm.exe file twice.

---

**Procedure**

**Step 1**  Go to the following site: [http://software.cisco.com/download/](http://software.cisco.com/download/).

**Step 2**  In the Select a Product search box, enter Cisco Data Center Network Manager. Click on Search icon.

**Step 3**  Click on Data Center Network Manager from the search results. A list of the latest release software for Cisco DCNM available for download is displayed.

**Step 4**  In the Latest Releases list, choose Release 11.2(1).

**Step 5**  Locate the DCNM Windows Installer and click the Download icon. The installer file is of the format dcnm-installer-x64.11.2.1.exe.

**Step 6**  Locate the DCNM Silent Installer Property Files and click the Download icon. This file will be used during Silent Installation.

**Step 7**  Save both the files to your directory that will be easy to find when you begin the installation.

---

**Installing Cisco DCNM on Windows Using the GUI**

Perform the following steps to install DCNM Windows using the GUI:

---

**Procedure**

**Step 1**  Locate the dcnm.exe file that you have downloaded. Double click on the dcnm.exe file. InstallAnywhere progress bar appears to show the progress.

**Step 2**  On the Introduction screen, read the instructions. Choose a vendor from the OEM Vendor drop-down list.

  - Cisco Systems, Inc—to install Cisco Data Center Network Manager.
• IBM—to install the IBM Data Center Network Manager.

Click Next.

Step 3  
Check Add server to existing federation checkbox if DCNM is installed as a secondary appliance in a Federation setup.

Step 4  
Check Secure Ciphers checkbox to allow only switches with strong ciphers to be discovered by DCNM.

Step 5  
To install DCNM-SAN and SMI-S for the first time, choose the location for installation. In the Install Location field, click Choose, and provide the appropriate folder path. Click Restore Default Folder if DCNM is installed as a part of the Federation setup.

Click Next.

Step 6  
Choose the appropriate RDBMS for the DCNM server.

Select the database that is based on your requirement.

- Install PostgreSQL—Installs the PostgreSQL database that is bundled along with the dcnm.exe.
- Existing PostgreSQL 9.4
- Existing Oracle 10g/11g/12c
- Existing Oracle 10g/11g/12c RAC

In the Service Name field, enter the service name of the Oracle RAC server. Enter a maximum of three host IP addresses. Click OK. The DB URL is generated.

If the Cisco DCNM installer detected an existing RDBMS installation, the DB URL field shows the hostname.

Cisco DCNM installation with existing PostgreSQL requires an existing schema with the same name as the DCNM username, which is owned by the same username. When there are no schemas existing with the DCNM username, or if you don’t have the ownership of the schema with the same dcnmuser name, the tables are created in the default schema, which is known as “public”.

Note  
You can’t upgrade the DCNM Server with tables created in the default public schema.

Note  
In Oracle, when a new user is created, a schema name with the same name as the username is created automatically.

In the DCNM DB User field, enter the username that the Cisco DCNM uses to access the database. In the DCNM DB Password field, enter the password for the database user account that you specified. If you select Add Server to an existing federation, modify the database URL by selecting the corresponding RDBMS option. Because all the servers in federation refer to the same database, you must provide the dcnmuser name and password of the primary server.

Click Next. Review the limitations with Oracle Database and click OK.

Click Next.

Step 7  
In the Port Configuration Options screen, choose the interface and web ports for Cisco DCNM.

- From the Server IP Address list, choose the IP address that you want to use for the Cisco DCNM server. The list shows only the IP addresses currently that are assigned to network interfaces on the server system.

- If you want to change the port that the Cisco DCNM-SAN web server listens to, enter the new port number in the SAN Web Server Port field. By default, the Cisco DCNM-SAN web server listens to TCP port 443.
During Cisco DCNM installation, use port numbers that are not commonly used. For example, 87 and 23 are reserved or restricted web ports.

Click Next.

**Step 8**

In the Choose archive Folder for DCNM screen, provide a folder path to store device configuration files, user preferences and so on.

Perform one of the following:

- Click **Choose** to select a path to store the DCNM LAN archive directory.

  **Note** If you must choose a remote system, provide the UNC path. For example: 
  //Server/Share/directorypath.

- Click **Restore Default Folder** to retain the default folder.

  **Note** Ensure that this folder is accessible by all nodes in the Federation setup.

Click Next.

**Step 9**

In the Local User Credentials screen, provide a valid username and password to access both DCNM SAN and DCNM LAN appliances.

- In the Admin Username field, enter a name for a Cisco DCNM server user. The installer creates the Cisco DCNM server user and assigns the Administrator role to it.

- In the Password field, enter a password for the user, and in the Confirm Password field, reenter the password.

Adhere to the following password requirements. If you don’t comply with the requirements, the DCNM application may not function properly:

- It must be at least 8 characters long and contain at least one alphabet and one numeral.

- It can contain a combination of alphabets, numerals, and special characters.

- Do not use any of these special characters in the DCNM password for any deployment mode: 
  `<SPACE> & $ % " ' ^ = <> ; :`

Click Next.

**Step 10**

In the Authentication Settings screen, choose the authentication method that the Cisco DCNM server should use to authenticate users who log on to the Cisco DCNM client. You can choose one of the following:

- **Local**—Cisco DCNM client users are authenticated by the Cisco DCNM server user accounts only.

- **RADIUS**—Cisco DCNM client users are authenticated by a RADIUS server.

- **TACACS+**—Cisco DCNM client users are authenticated by a TACACS+ server.

You can configure LDAP authentication after installing DCNM.
After TACACS/RADIUS/LDAP is enabled, Local user "admin" can’t be accessible. This is default behavior.

Only if the TACACS/RADIUS/LDAP server isn’t reachable or down, the Local user will be validated and is able to log in.

If LDAP/RADIUS/TACACS server is reachable and authentication fails on TACACS/LDAP/RADIUS, then no fallback to local.

**Step 11**
If you chose RADIUS or TACACS+, do the following:

a) In the primary server address field, enter the IPv4 address of the server in dotted-decimal format.

b) In the primary server key field, enter the shared secret of the server.

c) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click **Verify**.

d) In the secondary server address field, enter the IPv4 address of the server in dotted-decimal format.

e) In the secondary server key field, enter the shared secret of the server.

f) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click **Verify**.

h) In the tertiary server address field, enter the address of the server in the dotted-decimal format.

i) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click **Verify**.

Click **Next**.

**Step 12**
In the Choose Shortcut Folder screen, specify path where you want to create the DCNM icons.

If you want the installer to create the shortcuts for all users who can log into the server system, check the **Create icons for All Users** check box.

Click **Next**.

**Step 13**
In the Pre-Installation Summary screen, review the installation configuration.

Click **Previous** to go to the previous tabs and modify the configuration.

Click **Next**.

**Step 14**
On the confirmation window, click **Yes** to begin the DCNM installation.

The progress bar description shows the process during the installation.

**Step 15**
On the Install Complete screen, the installed components are listed. Click **Done** to start the DCNM server.

**Note** Ensure that you click **Done** on the Install Complete screen. If you fail to click **Done**, the `installvariables.properties` and `dcnm_installer.log` aren’t generated. This restricts the next upgrade/uninstall for your DCNM setup.

Wait until the DCNM is deployed on the system.

The prompt will return after the silent install is complete.

**Step 16**
Open a browser and enter `https://<<DCNM_server_IP_Address>>`.

Press **Return** key to launch the Web Interface of Cisco DCNM on Windows for LAN and SAN Management.
Installing Cisco DCNM Windows in a Server Federation Environment using GUI

To install DCNM in a server federation environment:

**Before you begin**

Ensure that you have installed DCNM on the Primary server. Follow the instructions provided in Installing Cisco DCNM on Windows Using the GUI, on page 32 section.

**Procedure**

**Step 1**

While installing DCNM on the Secondary server, check **Add server to existing federation** checkbox. This makes the DCNM installed as a secondary appliance in a Federation setup. The Pre-installation Summary screen displays the Federation status and nodes in the Federation Settings area.

**Step 2**

Check **Secure Ciphers** checkbox to allow only switches with strong ciphers to be discovered by DCNM, only if the Secure Ciphers was enabled on the Primary. Cisco DCNM uses both strong and weak ciphers when connecting to switches. If user you wants to use only strong ciphers for network, select the checkbox. Ensure that the switches in your network support strong ciphers before you select checkbox, as DCNM will not be able to connect to switches which do not support strong ciphers.

**Step 3**

Modify the database URL by selecting the corresponding RDBMS option.

**Note**

All the servers in federation refer to the same database, and therefore you must provide the DCNM user name and password of the primary server. Also, you must provide the database user name and password of the primary server.

The user name and password of the database are same for all the server installation forming the federation. Similarly, the user name and password of DCNM are same for all the server installation forming the federation.

---

Installing Cisco DCNM Windows through Silent Installation

Cisco DCNM supports Silent installation only on Local Authorization mode and not on Remote Authorization mode. Perform the following steps to install DCNM Windows through silent installation.

**Procedure**

**Step 1**

Unzip, extract and open the `installer.properties` file and update the following properties.

```plaintext
#-----------------BASIC Properties---------------------
DCNM_IP_ADDRESS=<ip_address_of_host_machine>
USER_INSTALL_DIR=C:\Program Files\Cisco Systems
INSTALLATION_TYPE=NEW_INSTALL
```

---

Cisco DCNM Installation and Upgrade Guide for SAN Deployment, Release 11.2(1)
SAN_FEDERATION=FALSE
SAN_FEDERATION=TRUE

**Step 2** Configure the database parameters.

If you are using PostgreSQL database, edit this block:

```bash
#------------------DATABASE Properties-------------------
#User can configure these properties to use existing database or
# install fresh Postgres as database for the DCNM. Existing database
# can be postgres (remote or local), Oracle (remote or local)
# or it can be Oracle RAC.
#----------------------------------------------------
USE_EXISTING_DB=FALSE
USE_EXISTING_DB=TRUE
PG_DB_PATH=C:\Program Files\Cisco Systems\dcm\db

#----------New Postgres---------------------------------
DCNM_DB_URL=jdbc:postgresql://localhost:5432/dcmdb
DCNM_DB_NAME=dcmdb
SELECTED_DATABASE=postgresql
DCNM_DB_USERNAME=dcnmuser
DCNM_DB_USER_PASSWORD=dcnmuser
```

If you are using the Oracle database, edit this block:

```bash
#------------------DATABASE Properties-------------------
#User can configure these properties to use existing database or
# install fresh Postgres as database for the DCNM. Existing database
# can be postgres (remote or local), Oracle (remote or local)
# or it can be Oracle RAC.
#----------------------------------------------------
USE_EXISTING_DB=FALSE
USE_EXISTING_DB=TRUE
ORA_DB_PATH=C:\oraclexe\app\oracle\product\10.2.0\server
```

**Step 3** Configure the user credentials for DCNM.

```bash
#-----------------User Configuration-----------------
#DCNM User Configuration Properties
#if you want to use special characters in DCNM_ADMIN
#credentials, please use escape character(\) before
#the symbol (For eg. Password "an$6x12" must be specified as "an\$6x12" ).
#----------------------------------------------------
DECRYPT_PASSWORDS=FALSE
DCNM_ADMIN_USER=admin
DCNM_ADMIN_USER_PASSWORD=admin123

#-----------------User Configuration-----------------
```

**Step 4** Enable the Secure Ciphers.

```bash
#----------------Secure Ciphers-------------------------------------
#DCNM uses both strong and weak ciphers when connecting to switches
#if user wants to use only strong ciphers for connection, please set
#property to TRUE. Make sure your switches support strong ciphers before
#setting the property as DCNM will not be able to connect to switches which
#support only weak ciphers.
#----------------------------------------------------
SECURE_CIPHER=FALSE
```
#SECURE_CIPHER=TRUE
#------------------------------------IBM Raven Support----------------------
#Set true if Vendor is IBM, by default false
#------------------------------------
IBM_INSTALL=FALSE /*Does not install IBM Data Center Network Manager*/
#------------------------------------

**Step 5** Configure IBM Raven to install IBM Data Center Network Manager.

**Step 6** Navigate to the directory where you downloaded the Cisco DCNM Windows software and run the appropriate installer by using the following command:

dcnm-release.exe -i silent -f path_of_installer.properties_file

You can check the status of installation in the Task Manager process.

**Step 7** Open a browser and enter https://<<DCNM_server_IP_Address>>.

Press Return key to launch the Web Interface of Cisco DCNM for SAN Management.

---

### Installing Cisco DCNM on Linux

Perform the following tasks to install Cisco DCNM on Linux.

### Uninstalling the Cisco DCNM on Linux

Perform this procedure to uninstall Cisco DCNM on Linux.

**Note** We recommend that you follow these steps in the same order.

**Before you begin**

You must remove the Cisco DCNM instance completely before you use the same server to install a different version of DCNM.

**Procedure**

**Step 1** Stop DCNM services on the DCNM server using the /root/Stop_DCNM_Servers command.

**Step 2** Uninstall the Postgres database using the <<dcnm_directory_location>/db/uninstall-postgresql command.

**Step 3** Uninstall the Cisco DCNM Server using the /root/Uninstall_DCNM command.

**Step 4** Delete the hidden .cisco_mds9000 file, using the rm -rf .cisco_mds9000 command.

**Step 5** Delete the Zero G Registry using the rm -rf /var/.com.zerog.registry.xml command.

**Step 6** Delete the hidden InstallAnywhere folder using the rm -rf .InstallAnywhere command.

**Step 7** Ensure that all the ports required for Cisco DCNM installation are free and available.
Step 8
Delete the DCNM directory using the `rm -rf /usr/local/cisco/*`. Delete the DCNM directory if you've saved in any other directory.

Step 9
Restart the RHEL system.

Uninstalling the Cisco DCNM on Linux

The following sample shows the list of commands that you must run, to uninstall the Cisco DCNM on Linux.

```
[dcnm-linux]# /root/Stop_DCNM_Servers
[dcnm-linux]# /<dcnm_installed_dir>/db/uninstall-postgresql
[dcnm-linux]# /root/Uninstall_DCNM
[dcnm-linux]# rm -rf .cisco_mds9000
[dcnm-linux]# rm -rf /var/.com.zerog.registry.xml
[dcnm-linux]# rm -rf .InstallAnywhere
[dcnm-linux]# rm -rf /usr/local/cisco/*
[dcnm-linux]# restart
```

Downloading the Cisco DCNM Linux Installer and Properties File

The first step to installing the DCNM on Linux is to download the dcnm.bin file.

**Note**
If you plan to use Federation application functions, you must deploy the dcnm.bin file twice.

**Procedure**

**Step 1**
Go to the following site: [http://software.cisco.com/download/](http://software.cisco.com/download/).

**Step 2**
In the Select a Product search box, enter Cisco Data Center Network Manager. Click on Search icon.

**Step 3**
Click on **Data Center Network Manager** from the search results.

A list of the latest release software for Cisco DCNM available for download is displayed.

**Step 4**
In the Latest Releases list, choose Release 11.1(1).

**Step 5**
Locate the DCNM Linux Installer and click the **Download** icon. The installer file is of the format `dcnm-installer-x64.11.1.1.bin`.

**Step 6**
Locate the DCNM Silent Installer Property Files and click the **Download** icon. This file will be used during Silent Installation.

**Step 7**
Save both the files to your directory that will be easy to find when you begin the installation.
Installing Cisco DCNM on Linux Using the GUI

Perform the following steps to install DCNM Linux using the GUI:

**Procedure**

**Step 1** Locate the `dcnm-installer-x64.<release-name>.bin` file that you have downloaded. Run the `dcnm.bin` installer file. InstallAnywhere progress bar appears showing the progress.

**Step 2** On the Introduction screen, read the instructions. Choose a vendor from OEM Vendor drop-down list.

- Cisco Systems, Inc—to install Cisco Data Center Network Manager
- IBM—to install IBM Data Center Network Manager

Click **Next**.

**Step 3** Check **Add server to existing federation** checkbox if DCNM is installed as a secondary appliance in a Federation setup.

**Step 4** Check **Secure Ciphers** checkbox to allow only switches with strong ciphers to be discovered by DCNM.

**Step 5** To install DCNM-SAN and SMI-S for the first time, choose the location for installation. In the Install Location field, click **Choose**, and provide the appropriate folder path. Click **Restore Default Folder** if DCNM is installed as a part of the Federation setup.

Click **Next**.

**Step 6** Choose the appropriate RDBMS for the DCNM server.

Select the database that is based on your requirement.

- Install PostgreSQL—Installs the PostgreSQL database that is bundled along with the `dcnm.bin`
- Existing PostgreSQL 9.4—Existing PostgreSQL database that is already set up, with a clean schema.
- Existing Oracle 10g/11g/12c—Existing Oracle database that is already set up, with a clean schema.
- Existing Oracle 10g/11g/12c RAC—Existing Oracle database that is already set up, with a clean schema.

In the Service Name field, enter the service name of the Oracle RAC server. Enter a maximum of three host IP addresses. Click **OK**. The DB URL is generated.

If the Cisco DCNM installer detected an existing RDBMS installation, the DB URL field shows the hostname.

**Note** Cisco DCNM installation with existing PostgreSQL requires an existing schema with the same name as the DCNM username, which is owned by the same username. When there is no schema existing with the DCNM username, or if you do not have the ownership of the schema with the same dcnmuser name, the tables are created in the default schema, known as “public”.

If the tables are created in the default schema, you may encounter authentication issues after upgrading Cisco DCNM. You will have to create a schema with the same name as the DCNM username owned by the same username. For instructions, see User and Schemas, on page 71.
In Oracle, when a new user is created, a schema name with the same name as the username is created automatically.

In the **DCNM DB User** field, enter the username that Cisco DCNM user uses to access the database. In the **DCNM DB Password** field, enter the password for the database user account that you specified. If you select **Add Server to an existing federation**, modify the database URL by selecting the corresponding RDBMS option. Because all the servers in Federation refer to the same database, you must provide the dcnmusername and password of the primary server.

Click **Next**. Review the limitations with Oracle Database and click **OK**.

Click **Next**.

**Step 7**  
In the Port Configuration Options screen, choose the interface and web ports for Cisco DCNM.

- From the Server IP Address list, choose the IP address that you want to use for the Cisco DCNM server. The list shows only the IP addresses currently that are assigned to network interfaces on the server system.

- If you want to change the port that the Cisco DCNM-SAN web server listens to, enter the new port number in the SAN Web Server Port field. By default, the Cisco DCNM-SAN web server listens to TCP port 443.

  **Note**  
  During Cisco DCNM installation, use port numbers that are free. For example, 87 and 23 are reserved or restricted web ports.

Click **Next**.

**Step 8**  
In the Choose archive Folder for DCNM screen, provide a folder path to store device configuration files, user preferences and so on.

Perform one of the following:

- Click **Choose** to select a path to store the DCNM archive directory.

  **Note**  
  If you must choose a remote system, provide the UNC path. For example: //Server/Share/directorypath.

- Click **Restore Default Folder** to retain the default folder.

Click **Next**.

**Step 9**  
In the Local User Credentials screen, provide a valid username and password to access DCNM SAN appliances.

- In the Admin Username field, enter a name for a Cisco DCNM server user. The installer creates the Cisco DCNM server user and assigns the Administrator role to it.

- In the Password field, enter a password for the user, and in the Confirm Password field, reenter the password.

Adhere to the following password requirements. If you do not comply with the requirements, the DCNM application may not function properly:

- It must be at least eight characters long and contain at least one alphabet and one numeral.

- It can contain a combination of alphabets, numerals, and special characters.

- Do not use any of these special characters in the DCNM password for any deployment mode: <SPACE> & $ % ' “ ^ = < > ; :
Click Next.

**Step 10**

In the Authentication Settings screen, choose the authentication method that the Cisco DCNM server must use to authenticate users who log on to the Cisco DCNM client. You can choose one of the following:

- **Local**—Cisco DCNM client users are authenticated by the Cisco DCNM server user accounts only.
- **RADIUS**—Cisco DCNM client users are authenticated by a RADIUS server.
- **TACACS+**—Cisco DCNM client users are authenticated by a TACACS+ server.

**Step 11**

If you chose RADIUS or TACACS+, do the following:

a) In the primary server address field, enter the IPv4 address of the server in dotted-decimal format.
b) In the primary server key field, enter the shared secret of the server.
c) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click Verify.
d) In the secondary server address field, enter the IPv4 address of the server in dotted-decimal format.
e) In the secondary server key field, enter the shared secret of the server.
f) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click Verify.
g) In the tertiary server address field, enter the address of the server in the dotted-decimal format.
h) In the tertiary server key field, enter the shared secret of the server.
i) (Optional) If you want to ensure that Cisco DCNM can communicate with the server, click Verify.

Click Next.

The Choose Link Folder is skipped and by default the location is `/root` directory.

**Step 12**

In the Pre-Installation Summary screen, review the installation configuration.

Click Previous to go to the previous tabs and modify the configuration.

Click Next.

**Step 13**

On the confirmation window, click Yes to begin the DCNM installation.

The progress bar description shows the process during the installation.

**Step 14**

On the Install Complete screen, the installed components are listed. Click Done to start the DCNM server.

Wait until the DCNM is deployed on the system.

**Step 15**

Open a browser and enter `https://<<DCNM_server_IP_Address>>`. Press Return key to launch the Web Interface of Cisco DCNM for SAN Management.

---

**Installing Cisco DCNM Linux in a Server Federation Environment Using GUI**

To install DCNM in a server federation environment:

**Before you begin**

Ensure that you have installed DCNM on the Primary server. Follow the instructions in *Installing Cisco DCNM on Linux Using the GUI*, on page 40 section.
Procedure

Step 1 While installing DCNM on the Secondary server, check Add server to existing federation checkbox. This makes the DCNM installed as a secondary appliance in a Federation setup. The Pre-installation Summary screen displays the Federation status and nodes in the Federation Settings area.

Step 2 Check Secure Ciphers checkbox to allow only switches with strong ciphers to be discovered by DCNM, only if the Secure Ciphers were enabled on the Primary.

Cisco DCNM uses both strong and weak ciphers when connecting to switches. If you use only strong ciphers for the network, select the checkbox. Ensure that the switches in your network support strong ciphers before you select checkbox, as DCNM will not be able to connect to switches which do not support strong ciphers.

Step 3 Modify the database URL by selecting the corresponding RDBMS option.

Note All the servers in federation refer to the same database, and therefore you must provide the DCNM username and password of the primary server. Also, you must provide the database username and password of the primary server.

The username and password of the database are same for all the server installation forming the federation. Similarly, the username and password of DCNM are same for all the server installation forming the federation.

Installing Cisco DCNM Linux Through Silent Installation

Cisco DCNM supports Silent installation only on Local Authorization mode and not on Remote Authorization mode.

Perform the following steps to install DCNM Linux through silent installation.

Procedure

Step 1 Unzip, extract, and open the installer.properties file and update the following properties.

```properties
#-----------------BASIC Properties---------------------
DCNM_IP_ADDRESS=<ip_address_of_host_machine>
USER_INSTALL_DIR=/usr/local/cisco/dcm
INSTALLATION_TYPE=NEW_INSTALL
SAN_FEDERATION=FALSE
#SAN_FEDERATION=TRUE
```

Step 2 Configure the database parameters.

If you are using PostgreSQL database, edit this block:

```properties
#--------------New Postgress---------------------------
#PG_DB_PATH=/usr/local/cisco/dcm/db
PG_DB_PATH=/opt/dctest/cisco/dcm/db /*non-default installation directory*/
#BACKUP_FILE=/opt/dctest/cisco/dcm/dcm/bin/<backup-filename> /*non-default backup file directory*/
DCNM_DB_URL=jdbc\:postgresql\://localhost\:5432/dcmdb
```
Step 3 Configure the Data Path for DCNM.

#---------------------DATA PATH----------------
#Data path is the folder location where DCNM LAN related
#information like Config archives, templates etc. are stored.
#In DCNM LAN Cluster mode this folder has to be a shared folder.
#For linux and windows it will be different as the folder structure varies
#----------------------------------------------------
DATA_PATH=/usr/local/cisco/dcm/dcnm
#---------------------DATA PATH----------------

Step 4 Configure the user credentials for DCNM.

#-----------------User Configuration-----------------
#DCNM User Configuration Properties
#If you want to use special characters in DCNM_ADMIN
#credentials,Please use escape character(\) before
#the symbol [For eg. Password "an$6x12" must be specified as "an\$6x12"].
#----------------------------------------------------
DECRIPT_PASSWORDS=FALSE
DCNM_ADMIN_USER=admin
DCNM_ADMIN_USER_PASSWORD=admin123
#-----------------User Configuration-----------------

Step 5 Enable the Secure Ciphers.

#----------------Secure Ciphers--------------------------
#DCNM uses both strong and weak ciphers when connecting to switches
#if user wants to use only strong ciphers for connection, please set
#property to TRUE. Make sure your switches support strong ciphers before
#setting the property as DCNM will not be able to connect to switches which
#support only weak ciphers.
#----------------------------------------------------
SECURE_CIPHER=FALSE
SECURE_CIPHER=TRUE
#----------------------------------------------------

Step 6 Configure IBM Raven to install IBM Data Center Network Manager.

#------------------IBM Raven Support---------------------
#Set true if Vendor is IBM, by default false
#----------------------------------------------------
Launching SAN Client and Device Manager

This following sections explain the various methods to launch Cisco DCNM SAN Client and Device Manager.

Launching SAN Client and Device Manager from Web UI

To launch Cisco DCNM SAN Client and Device Manager from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Log in to Cisco DCNM Web UI after installing Cisco DCNM SAN deployment.

Step 2 Click on the gear icon, and click DCNM SAN & DM.

Step 3 Save the dcmn-client.zip to your directory.

Step 4 Extract the contents of dcmn-client.zip to dcmn-clientzip/bin directory.

To launch the SAN Client and Device Manager:

- **If you are launching DCNM on Windows environment:**
  - Double-click on the FMClient.bat file to launch the Cisco DCNM SAN Client.
  - Double-click on the DeviceManager.bat to launch the Cisco DCNM Device Manager.

- **If you are launching DCNM on Linux environment:**
  - Run ./FMClient.sh Script to launch SAN Client.
  - Run ./Devicemanager.sh script to launch Device Manager.
Launching SAN Client and Device Manager from DCNM Server

By default, the SAN Client and Device Manager are installed along with the Cisco DCNM Server, when you install DCNM. To launch Cisco DCNM SAN Client and Device Manager from the Cisco DCNM Server, perform the following steps:

Procedure

Step 1  Log in to the DCNM server.
Step 2  Navigate to Cisco Systems\dcm\fm\bin\ directory.
Step 3  To launch the SAN Client and Device Manager:
   • For Windows deployment:
      Double-click on the FabricManager.bat file to launch the Cisco DCNM SAN Client.
      Double-click on the DeviceManager.bat file to launch the Cisco DCNM Device Manager.
   • For Linux deployment:
      Run the ./FabricManager.sh script to launch the Cisco DCNM SAN Client.
      Run the ./DeviceManager.sh script to launch the Cisco DCNM Device Manager.

Launching DCNM SAN Client from DCNM SAN for Windows deployment with SSL enabled

When you install Cisco DCNM for Windows with custom SSL configured on the DCNM server, you can’t launch the SAN Client. Modify the certificates to launch the SAN Client successfully.

To modify the certificates and launch the DCNM SAN Client from Windows Deployment, perform the following steps:

Procedure

Step 1  Extract public key using the keytool.exe -exportcert -file dcnmweb.crt -alias sme C:\[DCNM Install directory]\cisco\dcm\wildfly-14.0.1.Final\Standalone\configuration\fmserver.jks command.

// extract public key from the new fmserver.jks and save it to dcnmweb.crt, alias “sme”,
password “fmserver_1_2_3”
c:\[DCNM install directory]\cisco\dcm\java\jdk11\bin>keytool.exe -exportcert -file dcnmweb.crt
-alias sme C:\[DCNM Install directory]\cisco\dcm\wildfly-14.0.1.Final\Standalone\configuration\fmserver.jks
Enter keystore password:
Certificate stored in file <dcnmweb.crt>
c:\[DCNM install directory]\cisco\dcm\java\jdk11\bin>dir
chain-cert.pem dcnmweb.crt jjs keytool rmiregistry
dcnm.csr java jrunscript rmid
Step 2  Generate key store using the `keytool.exe -importcert -trustcacerts -file dcnmweb.crt -keystore fmtrust.jks -storetype jks` command.

```
// generate key store without password, during the command, just use random password
dcnm123
C:\[DCNM install directory]\dcnm\java\jdk11\bin>keytool.exe -importcert -trustcacerts -file dcnmweb.crt -keystore fmtrust.jks -storetype jks
Enter keystore password:
Re-enter new password:
Owner: CN=Lin, OU=cisco, O=cisco, L=sj, ST=CA, C=US
Issuer: CN=rhel144, OU=DCBu, O=Cisco, L=BGL, ST=KA, C=IN
Serial number: 1086
Certificate fingerprints:
Signature algorithm name: SHA256withRSA
Subject Public Key Algorithm: 2048-bit RSA key
Version: 3
```

Extensions:

```
#1: ObjectId: 2.16.840.1.113730.1.13 Criticality=false

] ]

Trust this certificate? [no]: yes
Certificate was added to keystore
```

Step 3  Copy the newly created `fmtrust.jks` to `\fm\lib\fm` directory.

```
c:\[DCNM install directory]\dcnm\java\jdk11\bin>dir
chain-cert.pem dcnmweb.crt java jrunscript rmid
dcnm.csr fmtrust.jks jjs keytool rmiregistry
```

Step 4  Locate the `dcnm-client.zip`, downloaded from Web UI or DCNM server.

Step 5  Unzip and replace the `bin\fmtrust.jks` with the newly created `fmtrust.jks` file.

Step 6  Run the `FabricManager.bat` batch file to launch the Cisco DCNM SAN Client.
Launching DCNM SAN Client from DCNM SAN for Linux deployment with SSL enabled

When you install Cisco DCNM for Linux with custom SSL configured on the DCNM server, you can't launch the SAN Client. You must modify the certificates to launch the SAN Client successfully.

To modify the certificates and launch the DCNM SAN Client from Linux Deployment, perform the following steps:

Procedure

Step 1  Extract public key using the following command.

```
```

Step 2  Generate key store using the following command.

```
./keytool -importcert -trustcacerts -file dcnmweb.crt -keystore fmtrust.jks -storetype jks
```

Step 3  Copy the newly created `fmtrust.jks` to `/fm/lib/fm` directory.

Step 4  Locate the `dcnm-client.zip`, downloaded from Web UI or DCNM server.

Step 5  Replace the `fmtrust.jks` in the `/bin` directory with the newly created `fmtrust.jks` file.

Step 6  Run the `./FabricManager.sh` script to launch the Cisco DCNM SAN Client.

Example

The following sample example shows the command to modify the certificates and launch the DCNM SAN Client from Linux Deployment.

```bash
// extract public key from the new fmserver.jks and save it to dcnmweb.crt, alias “sme”, password “fmserver_1_2_3”
[root@dcnm-lnx1 bin]# ./keytool -exportcert -file dcnmweb.crt -alias sme -keystore /usr/local/cisco/dcm/wildfly-14.0.1.Final/standalone/configuration/fmserver.jks
Enter keystore password:
Certificate stored in file <dcnmweb.crt>
[root@dcnm-M5-2-lnx1 bin]# ls
chain-cert.pem dcnmweb.crt jjs keytool rmiregistry
dcnm.csr java jrunscript rmid

// generate key store without password, during the command, just use random password dcnn123
[root@dcnm-lnx1 bin]# ./keytool -importcert -trustcacerts -file dcnmweb.crt -keystore fmtrust.jks -storetype jks
Enter keystore password:
Re-enter new password:
Owner: CN=Lin, OU=cisco, O=cisco, L=sj, ST=CA, C=US
Issuer: CN=rhel144, OU=DCBu, O=Cisco, L=BGL, ST=KA, C=IN
Serial number: 1086
Certificate fingerprints:

Launching DCNM SAN Client from DCNM SAN for Linux deployment with SSL enabled
CHAPTER

Upgrading Cisco DCNM

This section includes instructions for upgrading your Cisco DCNM Appliance installation in the following scenarios:

<table>
<thead>
<tr>
<th>Cisco DCNM Installer version</th>
<th>Release from which you can upgrade</th>
</tr>
</thead>
<tbody>
<tr>
<td>DCNM 11.2(1)</td>
<td>• DCNM 11.1(1)</td>
</tr>
<tr>
<td></td>
<td>• DCNM 11.0(1)</td>
</tr>
</tbody>
</table>

Adhere to the following password requirements. If you do not comply with the requirements, the DCNM application might not function properly:

- It must be at least 8 characters long and contain at least one alphabet and one numeral.
- It can contain a combination of alphabets, numerals, and special characters.
- Do not use any of these special characters in the DCNM password for all platforms:
  & $ % " ^ = < > ; :

However, after the upgrade, since Postgres DBMS is restored from the backup that is taken on DCNM 10.4(2), you must logon to the Cisco DCNM Web UI using the password used on DCNM Release 10.4(2) appliance.

This chapter contains the following:

- Upgrading Cisco DCNM, on page 51
- Retaining the CA Signed Certificate, on page 52
- Upgrading to Cisco SAN on Windows, on page 52
- Upgrading to Cisco SAN on Linux, on page 56

Upgrading Cisco DCNM

Before Cisco DCNM Release 11.0(1), DCNM OVA, and ISO supported SAN functionality. From Cisco DCNM Release 11.3(1), you can install Cisco DCNM for SAN Deployment on both OVA and ISO virtual appliances. However, there is not upgrade path for SAN OVA\ISO.

From Release 11.3(1), Cisco DCNM OVA and ISO is supported for SAN functionality.

The following table summarizes the type of upgrade that you must follow to upgrade to Release 11.3(1).
Retaining the CA Signed Certificate

Perform this procedure if you need to retain the CA signed SSL Certificate after upgrade.

Note that if you change the keystore password or alias, you need to update it in the standalone-san.xml document located at:

<DCNM_install_root>\dcm\wildfly-10.1.0.Final\standalone\configuration\standalone-san.xml

Update the password in the keystore tag and alias:

<keystore key-password>="fmserver_1_2_3 key-alias="updated-key-alias" keystore-password="updated-password" path="<DCNM_install_root>\dcm\wildfly-10.1.0.Final\standalone\configuration\fmserver.jks">

Procedure

Step 1
Backup the signed certificate from the location:
- For Windows: <DCNM_install_root>\dcm\wildfly-10.1.0.Final\standalone\configuration\fmserver.jks
- For Linux: <DCNM_install_root>/dcm/wildfly-10.1.0.Final/standalone/configuration/fmserver.jks

Step 2
Upgrade to Cisco DCNM Release 11.2(1).

Step 3
After upgrade, copy the certificate to the same location on the upgraded version of the Cisco DCNM.

Note You must load the certificates to the same location as mentioned in Step 1, on page 52.

Step 4
Restart the DCNM Services.

Upgrading to Cisco SAN on Windows

The following sections provide instructions to upgrade Cisco DCNM SAN on Windows to the latest version:

Uninstalling the Cisco DCNM on Windows

Perform this procedure to uninstall Cisco DCNM on Windows.

Note
We recommend that you follow these steps in the same order.

Before you begin
You must remove the Cisco DCNM instance completely before you use the same server to install a different version of DCNM.
### Procedure

**Step 1**  
Stop Cisco DCNM Services.

**Step 2**  
Uninstall the Postgres database.

**Step 3**  
Uninstall the Cisco DCNM.

**Step 4**  
Navigate to `C:\Users\Administrator` location, and delete `.cisco_mds9000` folder.

**Step 5**  
Navigate to `C:\Program Files\Zero G Registry` location, and delete the Zero G Registry folder.

**Step 6**  
Navigate to `C:\Users\Administrator` location, and delete `InstallAnywhere` folder.

**Step 7**  
Ensure that all the ports required for Cisco DCNM installation are free and available.

**Step 8**  
Delete the Cisco DCNM directory.

**Step 9**  
Restart the Windows VM.

### Upgrading Cisco DCNM Windows using GUI

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

#### Procedure

**Step 1**  
Stop the DCNM services.

**Step 2**  
Run the Cisco DCNM software for Release 11.2(1) executable file.

Upgrade Notification window appears.

**Step 3**  
Click **OK** to begin the upgrade.

**Step 4**  
Click **Done** after the upgrade is complete.

The Cisco DCNM Release 11.2(1) services will start automatically.

### Upgrading Cisco DCNM Windows Federation using GUI

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

#### Note

Ensure that both primary and secondary database properties are same.

#### Procedure

**Step 1**  
Stop both the primary and secondary DCNM services.

**Step 2**  
On the primary server, run the Cisco DCNM Release 11.2(1) executable file.

Upgrade notification window appears.
Step 3 Click OK to begin the upgrade.

Step 4 On the primary server, click Done after the upgrade is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the primary server.

Step 5 On the secondary server, perform run the Cisco DCNM Release 11.2(1) executable file.

Upgrade notification window appears.

Step 6 Click OK to begin the upgrade.

Step 7 On the secondary server, click Done after the upgrade is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the secondary server.

---

Upgrading Cisco DCNM Windows through Silent Installation

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

Note Cisco DCNM supports Silent installation and upgrade only on Local Authorization mode and not on Remote Authorization mode.

Procedure

Step 1 Stop the DCNM services.

Step 2 Open the installer.properties file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
ORA_DB_PATH=C:\oraclexe\app\oracle\product\10.2.0\server
#---------------Use Existing Oracle--------------
DCNM_DB_URL=jdbc:oracle:thin:@<ip_address_of_oracle_machine>:1521:XE
DCNM_DB_NAME=XE
SELECTED_DATABASE=oracle
DCNM_DB_USERNAME=oracledbadmin1
DCNM_DB_USER_PASSWORD=oracledbadmin1
```

Step 3 Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcmn-release.exe -i silent -f <path_of_installer.properties>
```

The Cisco DCNM Release 11.2(1) services will start after the upgrade is complete.

You can check the status of the upgrade in the Task Manager process.
Upgrading Cisco DCNM Windows Federation through Silent Installation

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

---

**Note**
Cisco DCNM supports Silent installation and upgrade only on Local Authorization mode and not on Remote Authorization mode.

---

**Note**
Ensure that both primary and secondary database properties are same.

---

**Procedure**

**Step 1**
Stop both the primary and secondary DCNM services.

**Step 2**
On the primary server, open the installer.properties file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
```

**Step 3**
Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcnm-release.exe -i silent -f <path_of_installer.properties>
```

You can check the status of the upgrade in the Task Manager process.

The Cisco DCNM Release 11.2(1) services will start automatically on the primary server.

**Step 4**
On the secondary server, open the installer.properties file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
ORA_DB_PATH=C:\oracle\product\10.2.0\server
#------------------Use Existing Oracle------------------
DCNM_DB_URL=jdbc:oracle:thin:@<ip_address_of_oracle_machine>:1521:XE
DCNM_DB_NAME=XE
SELECTED_DATABASE=oracle
DCNM_DB_USERNAME=oracledbadmin1
DCNM_DB_USER_PASSWORD=oracledbadmin1
```

**Step 5**
Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcnm-release.exe -i silent -f <path_of_installer.properties>
```

You can check the status of the upgrade in the Task Manager process.

The Cisco DCNM Release 11.2(1) services will start automatically on the secondary server.
Upgrading to Cisco SAN on Linux

The following sections provide instructions to upgrade Cisco DCNM SAN on Linux to the latest version:

Uninstalling the Cisco DCNM on Linux

Perform this procedure to uninstall Cisco DCNM on Linux.

Note: We recommend that you follow these steps in the same order.

Before you begin

You must remove the Cisco DCNM instance completely before you use the same server to install a different version of DCNM.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Stop DCNM services on the DCNM server using the <code>/root/Stop_DCNM_Servers</code> command.</td>
</tr>
<tr>
<td>2</td>
<td>Uninstall the Postgres database using the <code>&lt;&lt;dcnm_directory_location&gt;&gt;/db/uninstall-postgresql</code> command.</td>
</tr>
<tr>
<td>3</td>
<td>Uninstall the Cisco DCNM Server using the <code>/root/Uninstall_DCNM</code> command.</td>
</tr>
<tr>
<td>4</td>
<td>Delete the hidden <code>.cisco_mds9000</code> file, using the <code>rm -rf .cisco_mds9000</code> command.</td>
</tr>
<tr>
<td>5</td>
<td>Delete the Zero G Registry using the <code>rm -rf /var/.com.zerog.registry.xml</code> command.</td>
</tr>
<tr>
<td>6</td>
<td>Delete the hidden <code>InstallAnywhere</code> folder using the <code>rm -rf .InstallAnywhere</code> command.</td>
</tr>
<tr>
<td>7</td>
<td>Ensure that all the ports required for Cisco DCNM installation are free and available.</td>
</tr>
<tr>
<td>8</td>
<td>Delete the DCNM directory using the <code>rm -rf /usr/local/cisco/*</code>. Delete the DCNM directory if you've saved in any other directory.</td>
</tr>
<tr>
<td>9</td>
<td>Restart the RHEL system.</td>
</tr>
</tbody>
</table>

Uninstalling the Cisco DCNM on Linux

The following sample shows the list of commands that you must run, to uninstall te Cisco DCNM on Linux.

```
[dcnm-linux]# /root/Stop_DCNM_Servers
[dcnm-linux]# <<dcnm_installed_dir>>/db/uninstall-postgresql
[dcnm-linux]# /root/Uninstall_DCNM
[dcnm-linux]# rm -rf .cisco_mds9000
[dcnm-linux]# rm -rf /var/.com.zerog.registry.xml
[dcnm-linux]# rm -rf .InstallAnywhere
[dcnm-linux]# rm -rf /usr/local/cisco/*
[dcnm-linux]# restart
```
Upgrading Cisco DCNM Linux using GUI

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Stop the DCNM services.</td>
</tr>
<tr>
<td>Step 2</td>
<td>Run the Cisco DCNM software for Release 11.2(1) executable file. Upgrade Notification window appears</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>OK</strong> to begin the upgrade.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Click <strong>Done</strong> after the upgrade is complete. The Cisco DCNM Release 11.2(1) services will start automatically.</td>
</tr>
</tbody>
</table>

What to do next

After you upgrade from Cisco DCNM Release 11.2(1) on Linux Standalone server, ensure that you clear the browser cache and Java console cache before you launch the Web UI and download the SAN Client. The Java console remembers the previous version of the SAN client data. If you do not clear Java console cache, you will not be able to use the latest downloaded SAN Client.

Upgrading Cisco DCNM Linux Federation using GUI

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

Note

Ensure that both primary and secondary database properties are same.

Procedure

<table>
<thead>
<tr>
<th>Step</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 1</td>
<td>Stop both the primary and secondary DCNM services.</td>
</tr>
<tr>
<td>Step 2</td>
<td>On the primary server, run the Cisco DCNM Release 11.2(1) executable file. Upgrade notification window appears.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Click <strong>OK</strong> to begin the upgrade.</td>
</tr>
<tr>
<td>Step 4</td>
<td>On the primary server, click <strong>Done</strong> after the upgrade is complete. The Cisco DCNM Release 11.2(1) services will start automatically on the primary server.</td>
</tr>
<tr>
<td>Step 5</td>
<td>On the secondary server, perform run the Cisco DCNM Release 11.2(1) executable file. Upgrade notification window appears.</td>
</tr>
<tr>
<td>Step 6</td>
<td>Click <strong>OK</strong> to begin the upgrade.</td>
</tr>
</tbody>
</table>
Step 7 On the secondary server, click **Done** after the upgrade is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the secondary server.

---

**Upgrading Cisco DCNM Linux through Silent Installation**

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

**Note**

Cisco DCNM supports Silent installation and upgrade only on Local Authorization mode and not on Remote Authorization mode.

**Note**

You must use the same database for Release 11.2(1) as in the existing DCNM set up.

**Procedure**

**Step 1**

Stop the DCNM services.

**Step 2**

Open the `installer.properties` file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
```

**Step 3**

Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcnm-release.bin -i silent -f <path_of_installer.properties>
```

The Cisco DCNM Release 11.2(1) services will start after the upgrade is complete.

You can check the status of the upgrade process by using the following command: `ps -ef | grep 'LAX'`. The prompt will return after the silent install is complete.

---

**Upgrading Cisco DCNM Linux Federation through Silent Installation**

Before you begin, make sure that Cisco DCNM 11.0(1) or 11.1(1) is up and running.

**Note**

Cisco DCNM supports Silent installation and upgrade only on Local Authorization mode and not on Remote Authorization mode.

**Note**

Ensure that both primary and secondary database properties are same as in the previous Release set up.
**Procedure**

**Step 1** Stop both the primary and secondary DCNM services.

**Step 2** On the primary server, open the `installer.properties` file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
```

**Step 3** Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcnm-release.bin -i silent -f <path_of_installer.properties>
```

You can check the status of the upgrade process by using the following command: `ps -ef | grep ‘LAX’`. The prompt will return after the silent install is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the primary server.

**Step 4** On the primary server, click Done after the upgrade is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the primary server.

**Step 5** On the secondary server, open the `installer.properties` file and update the following properties:

```
INSTALLATION_TYPE=UPGRADE
USE_EXISTING_DB=TRUE
```

**Step 6** Go to the directory where you downloaded the Cisco DCNM software and run the appropriate installer by using the following command:

```
dcnm-release.bin -i silent -f <path_of_installer.properties>
```

You can check the status of the upgrade process by using the following command: `ps -ef | grep ‘LAX’`. The prompt will return after the silent install is complete.

The Cisco DCNM Release 11.2(1) services will start automatically on the secondary server.
Running Cisco DCNM Behind a Firewall

This chapter provides information about running Cisco DCNM behind a firewall.

- Running Cisco DCNM Behind a Firewall, on page 61

Running Cisco DCNM Behind a Firewall

Generally, an Enterprise (external world) and Datacenter is separated by a firewall, i.e., DCNM is configured behind a firewall. The Cisco DCNM Web Client, Cisco DCNM SAN Client, and Cisco Device Manager connectivity will pass-through that firewall. A firewall can be placed between the DCNM Server and DCNM-managed devices also.

Beginning with Cisco DCNM Release 11.0(1), DCNM SAN Client initiates communication with DCNM SAN Server on HTTPS port 443. However, both DCNM SAN Client and Device Manager communicate with the devices directly also. Device Manager can be invoked through DCNM SAN Server UI and it runs within the context of the DCNM SAN Server. The Device Manager communication with devices remains same, as if it was running independently.

DCNM SNMP proxy services on DCNM SAN Server use a configurable TCP port (9198 by default) for SNMP communications between the DCNM SAN Client or Device Manager, and DCNM Server.

The UDP SNMP TRAP local ports are between 1163-1170, for both Cisco DCNM-SAN and Device Manager. DCNM-SAN Client and Device Manager use the first available UDP port for sending and receiving SNMP responses.

You can select the UDP port that the Device Manager uses for SNMP responses by uncommenting the following statement:

- On a Windows desktop, uncomment the following in the DeviceManager.bat file in the C:\Program Files\Cisco Systems\MDS9000\bin directory:

```
rem JVMARGS=%JVMARGS% -Dsnmp.localport=[localport]
```

Where [localport] is the value of free local port.

**Note**

On the windows VM, run the `netstat -nab` command, to view the ports that are used by the `javaw.exe` process.
• On a LINUX desktop, uncomment the following in the `DeviceManager.sh` file in the `$HOME/.cisco_mds9000/bin` directory:

```bash
# JVMARGS=$JVMARGS -Dsnmp.localport=[localport]
```

Where `[localport]` is the value of free local port.

Any standard port where the Ingress traffic enters from clients cannot be modified unless you disable the local firewall.

The following table lists all ports that are used for communication between DCNM Web Client, DCNM SAN Client, Device Manager, SSH Client, and DCNM Server.

<table>
<thead>
<tr>
<th>Port Number</th>
<th>Protocol</th>
<th>Service Name</th>
<th>Direction of Communication</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>TCP</td>

<td>-----------------------------</td>
<td>---------</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td>Cisco DCNM SNMP proxy services use the TCP port (9198 by default) on DCNM SAN Server for SNMP communications between the Cisco DCNM SAN Client or Cisco Device Manager and the Cisco DCNM Server. Cisco DCNM SAN Client picks a random free local port (UDP) or 9198 (TCP) to reach SNMP proxy. The port can be changed with the client -Dsnmp.localportoption. Cisco Device Manager picks a random free local port (UDP) or 9198 (TCP) to reach SNMP proxy. The port can be changed in the server.properties file. DCNM SNMP proxy is used when SAN Client or Device Manager cannot reach the managed devices directly and SNMP responses coming to DCNM SAN Server from managed devices can be relayed to SAN Client and Device Manager. DCNM</td>
</tr>
</tbody>
</table>
The following table lists all the ports that are used for communication between Cisco DCNM Server and Managed devices.

<table>
<thead>
<tr>
<th>Port Number</th>
<th>Protocol</th>
<th>Service Name</th>
<th>Direction of Communication</th>
<th>Remarks</th>
</tr>
</thead>
<tbody>
<tr>
<td>22</td>
<td>TCP</td>
<td>SSH</td>

Cisco DCNM Installation and Upgrade Guide for SAN Deployment, Release 11.2(1)
User and Schemas

This chapter provides information about creating Users and user-specific schema for Cisco Data Center Network Manager.

• Creating New Users, on page 71
• Creating New Schema for Existing Users, on page 71

Creating New Users

Perform this task, to create a new user.

Procedure

Step 1 Logon to the SSH terminal of the DCNM Appliance.
Step 2 Create a new user using the create user username command.
Step 3 Enter a valid password at the password prompt.
Step 4 Create a new schema with same name as the user, using the create schema username authorization username.
Step 5 Enable all permissions on the schema, using the grant all on schema username to username.

Example

The following example shows the sample output for creating new users

dcnm# create user user1
password: password
dcnm# create schema user1 authorization user1;
dcnm# grant all on schema user1 to user1;

Creating New Schema for Existing Users

Perform this task to retain the same create new schema to an existing user.
### Procedure

**Step 1** Logon to the SSH terminal of the DCNM Appliance.

**Step 2** Drop the existing user by using the `drop user username cascade` command.

**Step 3** Drop the existing schema with same name as `username`, by using the `drop schema username cascade` command.

**Step 4** Create a new user using the `create user username` command.

**Step 5** Enter a valid password at the password prompt.

**Step 6** Create a new schema with same name as the user, using the `create schema username authorization user_name` command.

**Step 7** Enable all permissions on the schema, using the `grant all on schema username to user_name`.

### Example

The following example shows the sample output for creating new users:

```
dcnm# drop user user_old cascade

dcnm# drop schema user_old cascade

dcnm# create user user_new
password: password

dcnm# create schema user_new authorization user_new;

dcnm# grant all on schema user_new to user_new;
```
Certificates

• Collecting PM Data, on page 73

Collecting PM Data

To setup a shared rrd path to collect PM data, perform these steps:

Procedure

<table>
<thead>
<tr>
<th>Step 1</th>
<th>Locate the server.properties file under C:\Program Files\Cisco Systems\dcm\fm\conf.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Step 2</td>
<td>Add the pm.rrdpath property file information to the server.properties file. For example, add the server location that needs to be accessible from the DCNM server.</td>
</tr>
<tr>
<td>Step 3</td>
<td>Save the server.properties file.</td>
</tr>
<tr>
<td>Step 4</td>
<td>Restart the Cisco DCNM-SAN server.</td>
</tr>
</tbody>
</table>

What to do next

Once PM server is ready, the new shared location will be used by the PM server to save .rrd files. PM will create a new directory called db under pm. Ensure you do not open or change these .rrd files as PM server is actively writing into the .rrd files.
Secure Client Communications for Cisco DCNM Servers

This section describes how to configure HTTPS on Cisco Data Center Network Manager Servers.

**Note**
You must enable SSL/HTTPS on the Cisco DCNM before you add a CA signed SSL certificate. Therefore, perform the procedure in the below mentioned order.

This section includes the following topics:

- Secure Client Communications for Cisco DCNM Servers, on page 75

**Secure Client Communications for Cisco DCNM Servers**

This section describes how to configure HTTPS on Cisco Data Center Network Manager Servers.

**Note**
You must enable SSL/HTTPS on the Cisco DCNM before you add a CA signed SSL certificate. Therefore, perform the procedure in the below mentioned order.

This section includes the following topics:

**Enabling SSL/HTTPS on Cisco DCNM in Federation on RHEL or Windows**

To enable SSL/HTTPS on RHEL or Windows for Cisco DCNM in Federation, perform the following:

**Procedure**

**Step 1**
Configure the primary server with a self signed SSL certificate.

**Note**
In a CA signed certificate, each server has their own certificate generated. Ensure that the certificate is signed by the signing certificate chain which is common for both the servers.

**Step 2**
On the secondary server, perform one of the following:
• While executing the installer, choose HTTPS upfront and select to run in the HTTPs mode.
• While silent installation, choose HTTPs while you execute the installer.
