

Configuring a Fabric with eBGP Underlay

This chapter describes how to configure a typical spine-leaf based routed fabric with eBGP as the routing protocol of choice. This is the preferred deployment choice for Massively Scalable Data Center (MSDC) networks. Both Single-AS and Multi-AS options are supported. A routed fabric has no layer-2 stretch or subnet stretch across leafs. In other words, networks are localized to a pair of leafs or a rack, with leafs hosting the default gateway for the directly attached server workloads. Subnet advertisement across racks are communicated over eBGP via the spine thereby providing any-to-any reachability within the routed fabric.

- [Overview, on page 1](#)
- [Creating an eBGP-based Fabric, on page 1](#)
- [Adding Switches to a Fabric, on page 11](#)
- [Deploying Fabric Underlay eBGP Policies, on page 24](#)
- [Deploying Networks in eBGP-based Fabrics, on page 25](#)
- [VXLAN EVPN Deployment with eBGP EVPN, on page 33](#)

Overview

This chapter describes how to configure a fabric with eBGP-based underlay.

It covers the following two use cases where eBGP-based fabric can be used:

- [Deploying Networks in eBGP-based Fabrics, on page 25](#)
- [VXLAN EVPN Deployment with eBGP EVPN, on page 33](#)

The following sections are applicable for both use cases:

- [Creating an eBGP-based Fabric, on page 1](#)
- [Adding Switches to a Fabric](#)
- [Deploying Fabric Underlay eBGP Policies, on page 24](#)

Creating an eBGP-based Fabric

1. Choose **Control > Fabric Builder**.

The **Fabric Builder** screen appears. When you log in for the first time, the **Fabrics** section has no entries. After you create a fabric, it is displayed on the **Fabric Builder** screen, wherein a rectangular box represents each fabric.

- Click **Create Fabric**. The **Add Fabric** screen appears.

The fields are explained:

Fabric Name - Enter the name of the fabric.

Fabric Template - From the drop-down menu, choose the **Easy_Fabric_eBGP** fabric template. The fabric settings for creating a standalone routed fabric comes up.

Add Fabric ✕

* Fabric Name :

* Fabric Template : Easy_Fabric_eBGP

General	EVPN	vPC	Protocols	Advanced	Manageability	Bootstrap	Configuration Backup
<p>* BGP ASN for Spines <input type="text"/> <small>? 1-4294967295 1-65535[.0-65535]</small></p> <p>* BGP AS Mode <input type="text" value="Multi-AS"/> <small>? Multi-AS: Unique ASN per Leaf/Border Dual-AS: One ASN for all Leafs/Borders</small></p> <p>* Underlay Subnet IP Mask <input type="text" value="30"/> <small>? Mask for Underlay Subnet IP Range</small></p> <p>Manual Underlay IP Address Allocation <input type="checkbox"/> <small>? Checking this will disable Dynamic Underlay IP Address Allocations</small></p> <p>* Underlay Routing Loopback IP Range <input type="text" value="10.2.0.0/22"/> <small>? Typically Loopback0 IP Address Range</small></p> <p>* Underlay Subnet IP Range <input type="text" value="10.4.0.0/16"/> <small>? Address range to assign Numbered and Peer Link SVI IPs</small></p> <p>* Subinterface Dot1q Range <input type="text" value="2-511"/> <small>? Per Border Dot1q Range For VRF Lite Connectivity (Min:2, Max:4095)</small></p> <p>NX-OS Software Image Version <input type="text"/> <small>? If Set, Image Version Check Enforced On All Switches. Images Can Be Uploaded From Control:Image Upload</small></p>							

- The **General** tab is displayed by default. The fields in this tab are:

BGP ASN for Spines: Enter the BGP AS number of the fabric's spine switches.

BGP AS Mode: Choose **Multi-AS** or **Dual-AS**.

In a **Multi-AS** fabric, the spine switches have a unique BGP AS number and each leaf switch has a unique AS number. If two leaf switches form a vPC switch pair, then they have the same AS number.

In a **Dual-AS** fabric, the spine switches have a unique BGP AS number and the leaf switches have a unique AS number.

The fabric is identified by the spine switch AS number.

Underlay Subnet IP Mask - Specifies the subnet mask for the fabric interface IP addresses.

Manual Underlay IP Address Allocation – Select this check box to disable Dynamic Underlay IP Address Allocations.

Underlay Routing Loopback IP Range: Specifies loopback IP addresses for the protocol peering.

Underlay Subnet IP Range: IP addresses for underlay P2P routing traffic between interfaces.

Subinterface Dot1q Range: Specifies the subinterface range when L3 sub interfaces are used.

NX-OS Software Image Version: Select an image from the drop-down list.

If you upload Cisco NX-OS software images through the image upload option, the uploaded images are listed in this field. If you select an image, the system checks if the switch has the selected version.

If not, an error message is displayed. You can resolve the error by clicking on Resolve. The image management screen comes up and you can proceed with the ISSU option. Alternatively, you can delete the release number and save it later.

If you specify an image in this field, all switches in the fabric should run that image. If some devices do not run the image, a warning is prompted to perform an In-Service Software Upgrade (ISSU) to the specified image. Till all devices run the specified image, the deployment process will be incomplete.

If you want to deploy more than one type of software image on the fabric switches, don't specify any image. If an image is specified, delete it.

4. Click **EVPN**. The Enable EVPN VXLAN Overlay option must be explicitly disabled. Note that this checkbox is enabled by default. This option should be enabled only for use-cases where customers want to build an eBGP-underlay/overlay based VXLAN EVPN fabric.

General	EVPN	vPC	Protocols	Advanced	Manageability	Bootstrap	Configuration Backup
Enable EVPN VXLAN Overlay <input type="checkbox"/> ⓘ							
* First Hop Redundancy Protocol		hsrp		ⓘ HSRP or VRRP			
Anycast Gateway MAC				ⓘ Shared MAC address for all leaves (xxxx.xxxx.xxxx)			
Enable VXLAN OAM		<input checked="" type="checkbox"/>		ⓘ Enable the Next Generation (NG) OAM feature for all switches in the fabric to aid in trouble-shooting VXLAN EVPN fabrics			
Enable Tenant DHCP		<input checked="" type="checkbox"/>		ⓘ			
vPC advertise-pip		<input type="checkbox"/>		ⓘ For Primary VTEP IP Advertisement As Next-Hop Of Prefix Routes			
Replication Mode				ⓘ Replication Mode for BUM Traffic			
Multicast Group Subnet				ⓘ Multicast address with prefix 16 to 30			
Enable Tenant Routed Multicast		<input type="checkbox"/>		ⓘ For Overlay Multicast Support In VXLAN Fabrics			
Default MDT Address for TRM VRFs				ⓘ IPv4 Multicast Address			
Rendezvous-Points				ⓘ Number of spines acting as Rendezvous-Point (RP)

VRF Template				ⓘ Default Overlay VRF Template For Leaves			
Network Template				ⓘ Default Overlay Network Template For Leaves			

Routed Fabric: In a Routed Fabric, once the IP reachability between the spine—leaf network has been established, you can easily create and deploy networks on the leaves using either HSRP or VRRP as the First-Hop Routing Protocol (FHRP) of choice. For more information, see [Overview of Networks in a Routed Fabric, on page 25](#).

When you create an eBGP Routed fabric, the fabric uses eBGP as the control plane to build intra-fabric connectivity. Links between spine and leaf switches are autoconfigured with point-to-point (p2p) numbered IP addresses with eBGP peering built on top.

Note that **Routed_Network_Universal Template** is only applicable to a Routed Fabric.

First Hop Redundancy Protocol: Specifies the FHRP protocol. Choose either **hsrp** or **vrrp**. This field is only applicable to a Routed Fabric.

**Note**

- After a network has been created, you cannot change this fabric setting. You should delete all network and then change the FHRP setting.
- The rest of the fields in the EVPN tab section are only applicable if you enable the EVPN VXLAN Overlay.

5. Click **vPC**. The fields in the tab are:

General	EVPN	vPC	Protocols	Advanced	Manageability	Bootstrap	Configuration Backup
		* vPC Peer Link VLAN	3600	VLAN for vPC Peer Link SVI (Min:2, Max:3967)			
		Make vPC Peer Link VLAN as Native VLAN	<input type="checkbox"/>				
		* vPC Peer Keep Alive option	management	Use vPC Peer Keep Alive with Loopback or Management			
		* vPC Auto Recovery Time	360	Auto Recovery Time In Seconds (Min:240, Max:3600)			
		* vPC Delay Restore Time	150	vPC Delay Restore Time For vPC links in seconds (Min:1, Max:3600)			
		vPC Peer Link Port Channel Number	500	Port Channel ID for vPC Peer Link (Min:1, Max:4096)			
		vPC IPv6 ND Synchronize	<input checked="" type="checkbox"/>	Enable IPv6 ND synchronization between vPC peers			
		Fabric wide vPC Domain Id	<input type="checkbox"/>	Enable to use same vPC Domain Id on all vPC pairs in the fabric			
		vPC Domain Id		vPC Domain Id to be used on all vPC pairs in the fabric			
		Enable Qos for Fabric vPC-Peering	<input type="checkbox"/>	Qos on spines for guaranteed delivery of vPC Fabric Peering communication			
		Qos Policy Name		Qos Policy name should be same on all spines			

vPC Peer Link VLAN: VLAN used for the vPC peer link SVI.

Make vPC Peer Link VLAN as Native VLAN - Enables vPC peer link VLAN as Native VLAN.

vPC Peer Keep Alive option: Choose the management or loopback option. If you want to use IP addresses assigned to the management port and the management VRF, choose management. If you use IP addresses assigned to loopback interfaces (and a non-management VRF), choose loopback. If you use IPv6 addresses, you must use loopback IDs.

vPC Auto Recovery Time: Specifies the vPC auto recovery time-out period in seconds.

vPC Delay Restore Time: Specifies the vPC delay restore period in seconds.

vPC Peer Link Port Channel Number - Specifies the Port Channel ID for a vPC Peer Link. By default, the value in this field is 500.

vPC IPv6 ND Synchronize: Enables IPv6 Neighbor Discovery synchronization between vPC switches. The check box is enabled by default. Clear the check box to disable the function.

6. Click the **Protocols** tab. The fields in the tab are:

General	EVPN	vPC	Protocols	Advanced	Manageability	Bootstrap	Configuration Backup
* Routing Loopback Id <input type="text" value="0"/> ⓘ (Min:0, Max:1023)							
VTEP Loopback Id <input type="text"/> ⓘ (Min:0, Max:1023)							
* BGP Maximum Paths <input type="text" value="4"/> ⓘ (Min:1, Max:64)							
Enable BGP Authentication <input type="checkbox"/> ⓘ							
BGP Authentication Key Encryption Type <input type="text"/> ⓘ BGP Key Encryption Type: 3 - 3DES, 7 - Cisco							
BGP Authentication Key <input type="text"/> ⓘ Encrypted BGP Authentication Key based on type							
Enable PIM Hello Authentication <input type="checkbox"/> ⓘ							
PIM Hello Authentication Key <input type="text"/> ⓘ 3DES Encrypted							
Enable BFD <input type="checkbox"/> ⓘ							
Enable BFD For BGP <input type="checkbox"/> ⓘ							
Enable BFD Authentication <input type="checkbox"/> ⓘ							
BFD Authentication Key ID <input type="text"/> ⓘ							
BFD Authentication Key <input type="text"/> ⓘ Encrypted SHA1 secret value							

Routing Loopback Id - The loopback interface ID is populated as 0 by default. It is used as the BGP router ID.

BGP Maximum Paths - Specifies the BGP maximum paths.

Enable BGP Authentication: Select the check box to enable BGP authentication. Deselect the check box to disable it. If you enable this field, the BGP Authentication Key Encryption Type and BGP Authentication Key fields are enabled.

BGP Authentication Key Encryption Type: Choose the 3 for 3DES encryption type, or 7 for Cisco encryption type.

BGP Authentication Key: Enter the encrypted key based on the encryption type.

Note Plain text passwords are not supported. Login to the switch, retrieve the encrypted key and enter it in the Authentication Key field. Refer the Retrieving the Authentication Key section for details.

Enable BFD: Select the check box to enable **feature bfd** on all switches in the fabric. This feature is valid only on IPv4 underlay and the scope is within a fabric.

From Cisco DCNM Release 11.3(1), BFD within a fabric is supported natively. The BFD feature is disabled by default in the Fabric Settings. If enabled, BFD is enabled for the underlay protocols with the default settings. Any custom required BFD configurations must be deployed via the per switch freeform or per interface freeform policies.

The following config is pushed after you select the **Enable BFD** check box:

```
feature bfd
```

Note After you upgrade from DCNM Release 11.2(1) with BFD enabled to DCNM Release 11.3(1), the following configs are pushed on all P2P fabric interfaces:

```
no ip redirects
no ipv6 redirects
```

For information about BFD feature compatibility, refer your respective platform documentation and for information about the supported software images, see *Compatibility Matrix for Cisco DCNM*.

Enable BFD for BGP: Select the check box to enable BFD for the BGP neighbor. This option is disabled by default.

Enable BFD Authentication: Select the check box to enable BFD authentication. If you enable this field, the **BFD Authentication Key ID** and **BFD Authentication Key** fields are editable.

BFD Authentication Key ID: Specifies the BFD authentication key ID for the interface authentication.

BFD Authentication Key: Specifies the BFD authentication key.

For information about how to retrieve the BFD authentication parameters, see *Retrieving the Encrypted BFD Authentication Key, in Cisco DCNM LAN Fabric Configuration Guide*.

7. Click the **Advanced** tab. The fields in the tab are:

General	EVPN	vPC	Protocols	Advanced	Manageability	Bootstrap	Configuration Backup
				* Intra Fabric Interface MTU	9216		(Min:576, Max:9216). Must be an even number
				* Layer 2 Host Interface MTU	9216		(Min:1500, Max:9216). Must be an even number
				* Power Supply Mode	ps-redundant		Default Power Supply Mode For The Fabric
				* CoPP Profile	strict		Fabric Wide CoPP Policy. Customized CoPP policy should be separately defined, when 'manual' is selected
				VTEP HoldDown Time			NVE Source Interface HoldDown Time (Min:1, Max:1500) in seconds
				* VRF Lite Subnet IP Range	10.33.0.0/16		Address range to assign P2P DCI Links
				* VRF Lite Subnet Mask	30		Mask for Subnet Range (Min:8, Max:31)
				Enable CDP for Bootstrapped Switch	<input type="checkbox"/>		Enable CDP on management interface
				Enable NX-API	<input checked="" type="checkbox"/>		Enable NX-API on port 443
				Enable NX-API on HTTP port	<input checked="" type="checkbox"/>		Enable NX-API on port 80
				Enable Strict Config Compliance	<input type="checkbox"/>		Enable bi-directional compliance checks to flag additional configs in the running config that are not in the intent/expected config
				Enable AAA IP Authorization	<input type="checkbox"/>		Enable only, when IP Authorization is enabled in the AAA Server
				Enable DCNM as Trap Host	<input checked="" type="checkbox"/>		Configure DCNM as a receiver for SNMP traps
				Enable TCAM Allocation	<input checked="" type="checkbox"/>		TCAM commands are automatically generated for VxLAN and vPC Fabric Peering when Enabled
				* Greenfield Cleanup Option	Disable		Switch Cleanup Without Reload When PreserveConfig=no
				Enable Default Queuing Policies	<input type="checkbox"/>		
				N9K Cloud Scale Platform Queuing Policy			Queuing Policy for all 92xx, -EX, -FX, -FX2, -FX3, -GX series switches in the fabric
				N9K R-Series Platform Queuing Policy			Queuing Policy for all R-Series switches in the fabric
				Other N9K Platform Queuing Policy			Queuing Policy for all other switches in the fabric
				Enable MACsec	<input type="checkbox"/>		Enable MACsec in the fabric

Intra Fabric Interface MTU - Specifies the MTU for the intra fabric interface. This value should be an even number.

Layer 2 Host Interface MTU - Specifies the MTU for the layer 2 host interface. This value should be an even number.

Power Supply Mode: Choose the appropriate power supply mode.

CoPP Profile: Choose the appropriate Control Plane Policing (CoPP) profile policy for the fabric. By default, the strict option is populated.

VRF Lite Subnet IP Range and **VRF Lite Subnet Mask** – These fields are populated with the DCI subnet details. Update the fields as needed.

Enable CDP for Bootstrapped Switch - Select the check box to enable CDP for bootstrapped switch.

Enable NX-API - Specifies enabling of NX-API on HTTPS. This check box is checked by default.

Enable NX-API on HTTP - Specifies enabling of NX-API on HTTP. Enable this check box and the **Enable NX-API** check box to use HTTP. This check box is checked by default. If you uncheck this check box, the applications that use NX-API and supported by Cisco DCNM, such as Endpoint Locator (EPL), Layer 4-Layer 7 services (L4-L7 services), VXLAN OAM, and so on, start using the HTTPS instead of HTTP.

Note If you check the **Enable NX-API** check box and the **Enable NX-API on HTTP** check box, application HTTP.

Enable Strict Config Compliance - Enable the Strict Config Compliance feature by selecting this check box.

For Strict Configuration Compliance, see *Enhanced Monitoring and Monitoring Fabrics Guide*.

Note If Strict Config Compliance is enabled in a fabric, you cannot deploy Network Insights for Resources Cisco DCNM.

Enable AAA IP Authorization - Enables AAA IP authorization, when IP Authorization is enabled in the AAA Server.

Enable DCNM as Trap Host - Select this check box to enable DCNM as a trap host.

Enable TCAM Allocation: TCAM commands are automatically generated for VXLAN and vPC Fabric Peering when enabled.

Greenfield Cleanup Option: Enable the switch cleanup option for greenfield switches without a switch reload. This option is typically recommended only for the data center environments with the Cisco Nexus 9000v Switches.

Enable Default Queuing Policies: Check this check box to apply QoS policies on all the switches in this fabric. To remove the QoS policies that you applied on all the switches, uncheck this check box, update all the configurations to remove the references to the policies, and save and deploy. From Cisco DCNM Release 11.3(1), pre-defined QoS configurations are included that can be used for various Cisco Nexus 9000 Series Switches. When you check this check box, the appropriate QoS configurations are pushed to the switches in the fabric. The system queuing is updated when configurations are deployed to the switches. You can perform the interface marking with defined queuing policies, if required, by adding the required configuration to the per interface freeform block.

Review the actual queuing policies by opening the policy file in the template editor. From Cisco DCNM Web UI, choose **Control > Template Library**. Search for the queuing policies by the policy file name, for example, **queuing_policy_default_8q_cloudscale**. Choose the file and click the **Modify/View template** icon to edit the policy.

See the *Cisco Nexus 9000 Series NX-OS Quality of Service Configuration Guide* for platform specific details.

N9K Cloud Scale Platform Queuing Policy: Choose the queuing policy from the drop-down list to be applied to all Cisco Nexus 9200 Series Switches and the Cisco Nexus 9000 Series Switches that ends with EX, FX, and FX2 in the fabric. The valid values are **queuing_policy_default_4q_cloudscale** and **queuing_policy_default_8q_cloudscale**. Use the **queuing_policy_default_4q_cloudscale** policy for FEXes. You can change from the **queuing_policy_default_4q_cloudscale** policy to the **queuing_policy_default_8q_cloudscale** policy only when FEXes are offline.

N9K R-Series Platform Queuing Policy: Choose the queuing policy from the drop-down list to be applied to all Cisco Nexus switches that ends with R in the fabric. The valid value is **queuing_policy_default_r_series**.

Other N9K Platform Queuing Policy: Choose the queuing policy from the drop-down list to be applied to all other switches in the fabric other than the switches mentioned in the above two options. The valid value is **queuing_policy_default_other**.

Leaf Freeform Config: Add CLIs that should be added to switches that have the Leaf, Border, and Border Gateway roles.

Spine Freeform Config - Add CLIs that should be added to switches with a Spine, Border Spine, and Border Gateway Spine roles.

Intra-fabric Links Additional Config - Add CLIs that should be added to the intra-fabric links.

8. Click the **Manageability** tab.

Field	Help Text
DNS Server IPs	Comma separated list of IP Addresses(v4/v6)
DNS Server VRFs	One VRF for all DNS servers or a comma separated list of VRFs, one per DNS server
NTP Server IPs	Comma separated list of IP Addresses(v4/v6)
NTP Server VRFs	One VRF for all NTP servers or a comma separated list of VRFs, one per NTP server
Syslog Server IPs	Comma separated list of IP Addresses(v4/v6)
Syslog Server Severity	Comma separated list of Syslog severity values, one per Syslog server (Min:0, Max:7)
Syslog Server VRFs	One VRF for all Syslog servers or a comma separated list of VRFs, one per Syslog server
AAA Freeform Config	Note ! All configs should strictly match 'show run' output, with respect to case and newlines. Any mismatches will yield unexpected diffs during deploy.

The fields in this tab are:

DNS Server IPs - Specifies the comma separated list of IP addresses (v4/v6) of the DNS servers.

DNS Server VRFs - Specifies one VRF for all DNS servers or a comma separated list of VRFs, one per DNS server.

NTP Server IPs - Specifies comma separated list of IP addresses (v4/v6) of the NTP server.

NTP Server VRFs - Specifies one VRF for all NTP servers or a comma separated list of VRFs, one per NTP server.

Syslog Server IPs – Specifies the comma separated list of IP addresses (v4/v6) IP address of the syslog servers, if used.

Syslog Server Severity – Specifies the comma separated list of syslog severity values, one per syslog server. The minimum value is 0 and the maximum value is 7. To specify a higher severity, enter a higher number.

Syslog Server VRFs – Specifies one VRF for all syslog servers or a comma separated list of VRFs, one per syslog server.

AAA Freeform Config – Specifies the AAA freeform configs.

If AAA configs are specified in the fabric settings, **switch_freeform** PTI with source as **UNDERLAY_AAA** and description as “**AAA Configurations**” will be created.

9. Click the **Bootstrap** tab.

Enable Bootstrap - Select this check box to enable the bootstrap feature.

After you enable bootstrap, you can enable the DHCP server for automatic IP address assignment using one of the following methods:

- External DHCP Server: Enter information about the external DHCP server in the **Switch Mgmt Default Gateway** and **Switch Mgmt IP Subnet Prefix** fields.
- Local DHCP Server: Enable the **Local DHCP Server** check box and enter details for the remaining mandatory fields.

Enable Local DHCP Server - Select this check box to initiate enabling of automatic IP address assignment through the local DHCP server. When you select this check box, the **DHCP Scope Start Address** and **DHCP Scope End Address** fields become editable.

If you do not select this check box, DCNM uses the remote or external DHCP server for automatic IP address assignment.

DHCP Version – Select DHCPv4 or DHCPv6 from this drop-down list. When you select DHCPv4, the **Switch Mgmt IPv6 Subnet Prefix** field is disabled. If you select DHCPv6, the **Switch Mgmt IP Subnet Prefix** is disabled.

Note Cisco DCNM IPv6 POAP is not supported with Cisco Nexus 7000 Series Switches. Cisco Nexus 9000 and 3000 Series Switches support IPv6 POAP only when switches are either L2 adjacent (eth1 or out-of-band) or they are L3 adjacent residing in some IPv6 /64 subnet. Subnet prefixes other than /64 are not supported.

DHCP Scope Start Address and DHCP Scope End Address - Specifies the first and last IP addresses of the IP address range to be used for the switch out of band POAP.

Switch Mgmt Default Gateway: Specifies the default gateway for the management VRF on the switch.

Switch Mgmt IP Subnet Prefix: Specifies the prefix for the Mgmt0 interface on the switch. The prefix should be between 8 and 30.

DHCP scope and management default gateway IP address specification - If you specify the management default gateway IP address 10.0.1.1 and subnet mask 24, ensure that the DHCP scope is within the specified subnet, between 10.0.1.2 and 10.0.1.254.

Switch Mgmt IPv6 Subnet Prefix - Specifies the IPv6 prefix for the Mgmt0 interface on the switch. The prefix should be between 112 and 126. This field is editable if you enable IPv6 for DHCP.

Enable AAA Config – Select this check box to include AAA configs from the Manageability tab during device bootup.

Bootstrap Freeform Config - (Optional) Enter additional commands as needed. For example, if you are using AAA or remote authentication related configurations, you need to add these configurations in this field to save the intent. After the devices boot up, they contain the intent defined in the **Bootstrap Freeform Config** field.

Copy-paste the running-config to a **freeform config** field with correct indentation, as seen in the running configuration on the NX-OS switches. The freeform config must match the running config. For more information, see *Resolving Freeform Config Errors in Switches in Enabling Freeform Configurations on Fabric Switches*.

DHCPv4/DHCPv6 Multi Subnet Scope - Specifies the field to enter one subnet scope per line. This field is editable after you check the **Enable Local DHCP Server** check box.

The format of the scope should be defined as:

DHCP Scope Start Address, DHCP Scope End Address, Switch Management Default Gateway, Switch Management Subnet Prefix

For example: 10.6.0.2, 10.6.0.9, 10.6.0.1, 24

10. Click the **Configuration Backup** tab. The fields on this tab are:

General EVPN vPC Protocols Advanced Manageability Bootstrap Configuration Backup

Hourly Fabric Backup ? Backup hourly or on Re-sync only if there is any config deployment since last backup

Scheduled Fabric Backup ? Backup at the specified time only if there is any config deployment since last backup

Scheduled Time ? Time in 24hr format. (00:00 to 23:59)

Hourly Fabric Backup: Select the check box to enable an hourly backup of fabric configurations and the intent.

You can enable an hourly backup for fresh fabric configurations and the intent as well. If there is a configuration push in the previous hour, DCNM takes a backup.

Intent refers to configurations that are saved in DCNM but yet to be provisioned on the switches.

Scheduled Fabric Backup: Check the check box to enable a daily backup. This backup tracks changes in running configurations on the fabric devices that are not tracked by configuration compliance.

Scheduled Time: Specify the scheduled backup time in a 24-hour format. This field is enabled if you check the **Scheduled Fabric Backup** check box.

Select both the check boxes to enable both back up processes.

The backup process is initiated after you click **Save**.

Note Hourly and scheduled backup processes happen only during the next periodic configuration compliance activity, and there can be a delay of up to an hour. To trigger an immediate backup, do the following:

- a. Choose **Control > Fabric Builder**. The Fabric Builder screen comes up.
- b. Click within the specific fabric box. The fabric topology screen comes up.
- c. From the **Actions** panel at the left part of the screen, click **Re-Sync Fabric**.

You can also initiate the fabric backup in the fabric topology window. Click **Backup Now** in the **Actions** pane.

Click **Save** after filling and updating relevant information.

Salient Points

- Deploy the leaf underlay policies on all leaf switches at once, since they have a common AS number.
- Brownfield migration is not supported for eBGP fabrics.
- You cannot change the leaf switch AS number after it is created and the Save & Deploy operation is executed. You need to delete the **leaf_bgp_asn** policy and execute the Save & Deploy operation to remove BGP configuration related to this AS first. Then, you can add the leaf_bgp_asn policy with the new AS number.
- If you want to switch between Multi-AS and Dual-AS modes, remove all manually added BGP policies (including leaf_bgp_asn on the leaf switch and the ebgp overlay policies), and execute the **Save & Deploy** operation before the mode change.
- The supported roles are leaf, spine, and border leaf.
- On the border device, VRF-Lite is supported with manual mode.
- You must apply policies on the leaf and spine switches for a functional fabric.

Adding Switches to a Fabric

Switches in each fabric are unique, and hence, each switch can only be added to one fabric.

Click the **Add Switches** option from the **Actions** panel to add switches to the fabric created in DCNM. The **Inventory Management** screen comes up. The screen contains two tabs, one for discovering existing switches and the other for discovering new switches. Both options are explained.

Additionally, you can pre-provision switches and interfaces. For more information, see [Pre-provisioning a Device](#) and [Pre-provisioning an Ethernet Interface](#).

Discovering Existing Switches

1. After clicking on **Add Switches**, use the **Discover Existing Switches** tab to add one or more existing switches into the fabric. In this case, a switch with known credentials and a pre-provisioned IP address, is added to the fabric. The IP address (Seed IP), administrator username, and password (**Username** and **Password** fields) of the switch are provided as the input by a user. The **Preserve Config** knob is set to **yes** by default. This is the option that a user would select for a brownfield import of a device into the fabric. For a greenfield import where the device configuration will be cleaned up as part of the import process, the user should set the **Preserve Config** knob to **no**.

Note Easy_Fabric_eBGP does not support brownfield import of a device into the fabric.

Inventory Management

Discover Existing Switches
PowerOn Auto Provisioning (POAP)

Discovery Information >
 Scan Details >

Seed IP
Ex: "2.2.2.20"; "10.10.10.40-60"; "2.2.2.20, 2.2.2.21"

Authentication Protocol ▼

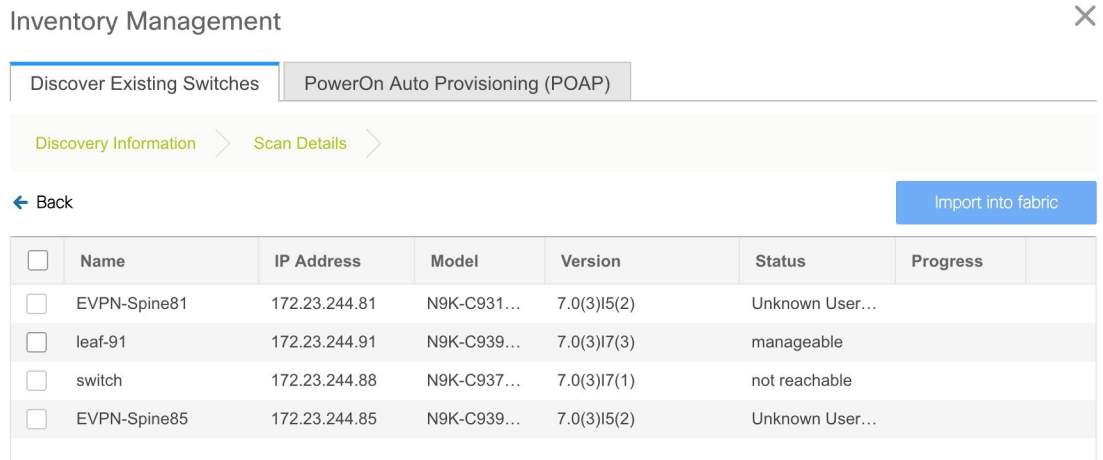

Username

Password

Max Hops hop(s)

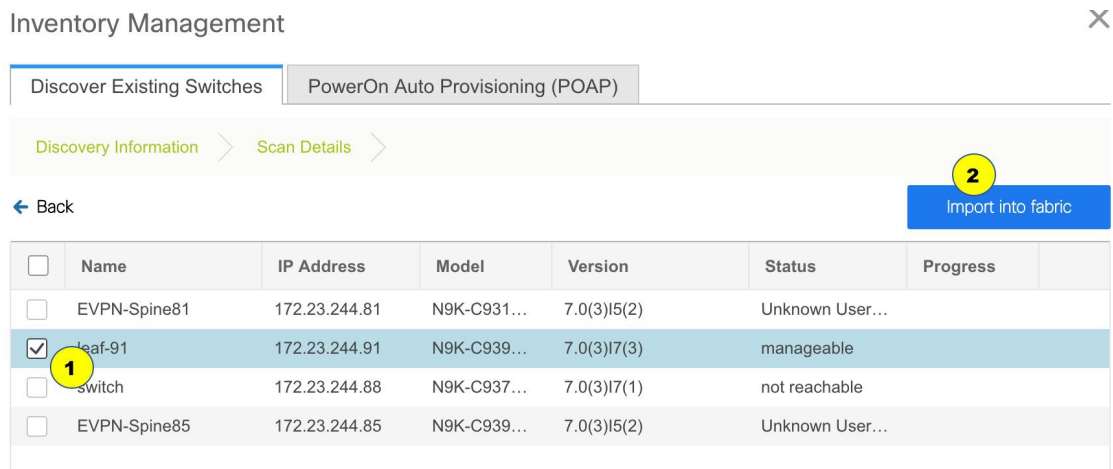

Preserve Config no yes
Selecting 'no' will clean up the configuration on switch(es)

- Click **Start discovery**. The **Scan Details** window comes up shortly. Since the **Max Hops** field was populated with 2 (by default), the switch with the specified IP address (leaf-91) and switches two hops from that switch, are populated in the **Scan Details** result.

<input type="checkbox"/>	Name	IP Address	Model	Version	Status	Progress
<input type="checkbox"/>	EVPN-Spine81	172.23.244.81	N9K-C931...	7.0(3)I5(2)	Unknown User...	
<input type="checkbox"/>	leaf-91	172.23.244.91	N9K-C939...	7.0(3)I7(3)	manageable	
<input type="checkbox"/>	switch	172.23.244.88	N9K-C937...	7.0(3)I7(1)	not reachable	
<input type="checkbox"/>	EVPN-Spine85	172.23.244.85	N9K-C939...	7.0(3)I5(2)	Unknown User...	

- If the DCNM was able to perform a successful shallow discovery to a switch, the status will show up as **Manageable**. Select the check box next to the appropriate switch(es) and click **Import into fabric**.

<input type="checkbox"/>	Name	IP Address	Model	Version	Status	Progress
<input type="checkbox"/>	EVPN-Spine81	172.23.244.81	N9K-C931...	7.0(3)I5(2)	Unknown User...	
<input checked="" type="checkbox"/>	leaf-91	172.23.244.91	N9K-C939...	7.0(3)I7(3)	manageable	
<input type="checkbox"/>	switch	172.23.244.88	N9K-C937...	7.0(3)I7(1)	not reachable	
<input type="checkbox"/>	EVPN-Spine85	172.23.244.85	N9K-C939...	7.0(3)I5(2)	Unknown User...	

Though this example describes the discovery of one switch, multiple switches can be discovered at once.

The switch discovery process is initiated. The **Progress** column displays progress for all the selected switches. It displays **done** for each switch on completion.

Note You must not close the screen (and try to add switches again) until all selected switches are imported or an error message comes up.

If an error message comes up, close the screen. The fabric topology screen comes up. The error message is displayed at the top right part of the screen. Resolve the errors wherever applicable and initiate the import process again by clicking **Add Switches** in the Actions panel.

DCNM discovers all the switches, and the Progress column displays **done** for all switches, close the screen. The *Standalone* fabric topology screen comes up again. The switch icons of the added switches are displayed in it.

Note You will encounter the following errors during switch discovery sometimes.

- Click **Refresh topology** to view the latest topology view.

When all switches are added and roles assigned to them, the fabric topology contains the switches and connections between them.

- After discovering the devices, assign an appropriate role to each device. For this purpose, right-click the device, and use the **Set role** option to set the appropriate role. Alternatively, the tabular view may be employed to assign the same role to multiple devices at one go.

If you choose the Hierarchical layout for display (in the Actions panel), the topology automatically gets aligned as per role assignment, with the leaf devices at the bottom, the spine devices connected on top of them, and the border devices at the top.

Assign vPC switch role - To designate a pair of switches as a vPC switch pair, right-click the switch and choose the vPC peer switch from the list of switches.

AAA server password - During fabric creation, if you have entered AAA server information (in the **Manageability** tab), you must update the AAA server password on each switch. Else, switch discovery fails.

When a new vPC pair is created and deployed successfully using Cisco DCNM, one of the peers might be out-of-sync for the **no ip redirects** CLI even if the command exists on the switch. This out-of-sync is due to a delay on the switch to display the CLI in the running configuration, which causes a diff in the configuration compliance. Re-sync the switches in the **Config Deployment** window to resolve the diff.

6. Click **Save & Deploy** at the top right part of the screen.

The template and interface configurations form the underlay network configuration on the switches. Also, freeform CLIs that were entered as part of fabric settings (leaf and spine switch freeform configurations entered in the Advanced tab) are deployed. For more details on freeform configurations, refer [Enabling Freeform Configurations on Fabric Switches](#).

Configuration Compliance: If the provisioned configurations and switch configurations do not match, the **Status** column displays out-of-sync. For example, if you enable a function on the switch manually through a CLI, then it results in a configuration mismatch.

To ensure configurations provisioned from DCNM to the fabric are accurate or to detect any deviations (such as out-of-band changes), DCNM’s Configuration Compliance engine reports and provides necessary remediation configurations.

When you click **Save & Deploy**, the **Config Deployment** window appears.

✕

Step 1. Configuration Preview > Step 2. Configuration Deployment Status >

Switch Name	IP Address	Switch Serial	Preview Config	Status	Re-sync	Progress
N9K-2-Leaf	111.0.0.92	SAL18422FVP	0 lines	In-sync		100%
N9K-4-BGW	111.0.0.94	FDO20260UEK	20 lines	Out-of-sync		100%
N9K-3-BGW	111.0.0.93	FDO20291AVQ	20 lines	Out-of-sync		100%
N9K-1-Spine	111.0.0.91	SAL18432P2T	0 lines	In-sync		100%

Deploy Config

If the status is out-of-sync, it suggests that there is inconsistency between the DCNM and configuration on the device.

The Re-sync button is displayed for each switch in the Re-sync column. Use this option to resynchronize DCNM state when there is a large scale out-of-band change, or if configuration changes do not register in the DCNM properly. The re-sync operation does a full CC run for the switch and recollects “show run” and “show run all” commands from the switch. When you initiate the re-sync process, a progress message is displayed on the screen. During the re-sync, the running configuration is taken from the switch. The Out-of-Sync/In-Sync status for the switch is recalculated based on the intent defined in DCNM.

Click the **Preview Config** column entry (updated with a specific number of lines). The Config Preview screen comes up.

The **Pending Config** tab displays the pending configurations for successful deployment.

The **Side-by-side Comparison** tab displays the current configurations and expected configurations together.

In DCNM 11, multi-line banner motd configuration is supported. Multi-line banner motd configuration can be configured in DCNM with freeform configuration policy, either per switch using **switch_freeform**, or per fabric using leaf/spine freeform configuration. Note that after the multi-line banner motd is configured, deploy the policy by executing the **Save & Deploy** option in the (top right part of the) fabric topology screen. Else, the policy may not be deployed properly on the switch. The **banner** policy is only to configure single-line banner configuration. Also, you can only create one banner related freeform configuration/policy. Multiple policies for configuring banner motd are not supported.

7. Close the screen.

In the Configuration Deployment screen, click Deploy Config at the bottom part of the screen to initiate pending configuration onto the switch. The Status column displays FAILED or SUCCESS state. For a FAILED status, investigate the reason for failure to address the issue.

After successful configuration provisioning (when all switches display a progress of 100%), close the screen.

The fabric topology is displayed. The switch icons turn green to indicate successful configuration.

If a switch icon is in red color, it indicates that the switch and DCNM configurations are not in sync. When deployment is pending on a switch, the switch is displayed in blue color. The pending state indicates that there is a pending deployment or pending recomputation. You can click on the switch and review the pending deployments using **Preview** or **Deploy Config** options, or click **Save & Deploy** to recompute the state of the switch.

Note If there are any warning or errors in the CLI execution, a notification will appear in the **Fabric builder** window. Warnings or errors that are auto-resolvable have the **Resolve** option.

When a leaf switch boots up after a switch reload or RMA operation, DCNM provisions configurations for the switch and FEX devices connected to it. Occasionally, FEX connectivity comes up after DCNM provisions FEX (host interface) configurations, resulting in a configuration mismatch. To resolve the mismatch, click **Save & Deploy** again in the fabric topology screen.

From Cisco NX-OS Release 11.4(1), if you uncheck the **FEX** check box in the **Topology** window, FEX devices are hidden in the **Fabric Builder** topology window as well. To view FEX in **Fabric Builder**, you need to check this check box. This option is applicable for all fabrics and it is saved per session or until you log out of DCNM. If you log out and log in to DCNM, the FEX option is reset to default, that is, enabled by default. For more information, see [Show Panel](#).

An example of the **Deploy Config** option usage is for switch-level freeform configurations. Refer [Enabling Freeform Configurations on Fabric Switches](#) for details.

Discovering New Switches

1. When a new Cisco NX-OS device is powered on, typically that device has no startup configuration or any configuration state for that matter. Consequently, it powers on with NX-OS and post initialization, goes into a POAP loop. The device starts sending out DHCP requests on all the interfaces that are up including the mgmt0 interface.
2. As long as there is IP reachability between the device and the DCNM, the DHCP request from the device, will be forwarded to the DCNM. For easy day-0 device bring-up, the bootstrap options should be enabled in the **Fabric Settings** as mentioned earlier.
3. With bootstrap enabled for the fabric, the DHCP request coming from the device will be serviced by the DCNM. The temporary IP address allocated to the device by the DCNM will be employed to learn basic information about the switch including the device model, device NX-OS version, etc.
4. In the DCNM GUI, go to a fabric (Click **Control > Fabric Builder** and click a fabric). The fabric topology is displayed.

Go to the fabric topology window and click the **Add switches** option from the **Actions** panel. The Inventory Management window comes up.

5. Click the **POAP** tab.

As mentioned earlier, DCNM retrieves the serial number, model number, and version from the device and displays them on the Inventory Management along window. Also, an option to add the IP address, hostname, and password are made available. If the switch information is not retrieved, refresh the window.

- Note**
- At the top left part of the window, *export* and *import* options are provided to export and import the .csv file that contains the switch information. You can pre-provision devices using the *import* option as well.

Close

Select the checkbox next to the switch and enter the switch credentials: IP address and host name.

Based on the IP address of your device, you can either add the IPv4 or IPv6 address in the **IP Address** field.

Beginning with Release 11.2(1), you can provision devices in advance. To pre-provision devices, refer to [Pre-provisioning a Device](#).

- In the **Admin Password** and **Confirm Admin Password** fields, enter and confirm the admin password. This admin password is applicable for all the switches displayed in the POAP window.

- Note** If you do not want to use admin credentials to discover switches, you can instead use the AAA authentication that is, RADIUS or TACACS credentials for discovery only.

- (Optional) Use discovery credentials for discovering switches.
 - Click the **Add Discovery Credentials** icon to enter the discovery credentials for switches.

*Confirm Discovery Password:

OK Clear

Close

Click **OK** to save the discovery credentials.

If the discovery credentials are not provided, DCNM uses the admin user and password to discover switches.

8. Click **Bootstrap** at the top right part of the screen.

DCNM provisions the management IP address and other credentials to the switch. In this simplified POAP process, all ports are opened up.

9. Click **Refresh Topology** to get updated information. The added switch goes through the POAP cycle. Monitor and check the switch for POAP completion.
10. After the added switch completes POAP, the fabric builder topology page is refreshed with the added switch thereby depicting its discovered physical connections. Set the appropriate role for the switch followed by a Save & Deploy operation at the fabric level. The Fabric Settings, switch role, the topology etc. are evaluated by the Fabric Builder and the appropriate intended configuration for the switch is generated as part of the Save operation. The pending configuration will provide a list of the configurations that need to be deployed to the new switch in order to bring it IN-SYNC with the intent.

Note For any changes on the fabric that results in the Out-of-Sync, then you must deploy the changes. The procedure is the same as explained in the *Discovering Existing Switches* section.

During fabric creation, if you have entered AAA server information (in the **Manageability** tab), you must update the AAA server password on each switch. Else, switch discovery fails.

11. After the pending configurations are deployed, the **Progress** column displays 100% for all switches.
12. Click **Close** to return to the fabric builder topology.
13. Click **Refresh Topology** to view the update. All switches must be in green color indicating that they are functional.
14. The switch and the link are discovered in DCNM. Configurations are built based on various policies (such as fabric, topology, and switch generated policies). The switch image (and other required) configurations are enabled on the switch.
15. In the DCNM GUI, the discovered switches can be seen in the *Standalone* fabric topology. Up to this step, the POAP is completed with basic settings. You must setup interfaces through the **Control > Interfaces** option for any additional configurations, but not limited to the following:
 - vPC pairing.
 - Breakout interfaces.
 - Port channels, and adding members to ports.

When you enable or disable a vPC pairing/un-pairing or the advertise-pip option, or update Multi-Site configuration, you should use the **Save & Deploy** operation. At the end of the operation, an error prompts you to configure the **shutdown** or **no shutdown** command on the nve interface. A sample error screenshot when you enable a vPC setup:

You can right-click the switch to view various options:

- **Set Role** - Assign a role to the switch (Spine, Border Gateway, and so on).

Note

- Changing of the switch role is allowed only before executing **Save & Deploy**.
- Starting from DCNM 11.1(1), switch roles can be changed if there are no overlays on the switches, but only as per the list of allowed switch role changes given at [Switch Operations](#).

- **Modes** - Maintenance and Active/Operational modes.
- **vPC Pairing** - Select a switch for vPC and then select its peer.
You can create a virtual link for a vPC pair or change the existing physical link to a virtual link for a vPC pair.
- **Manage Interfaces** - Deploy configurations on the switch interfaces.
- **View/Edit Policies** - See switch policies and edit them as required.
- **History** - View per switch deployment and policy change history.

The **Policy Change History** tab lists the history of policies along with the users who made the changes like add, update, or delete.

History for mini-leaf2(FDO21332E6X)

Deployment History Policy Change History

Policy ID	Template	Description	PTI Operation	Generated Config	Entity Name	Entity Type	User	Created On

Under the **Policy Change History** tab, for a policy, click **Detailed History** under the **Generated Config** column to view the generated config before and after.

Generated Config Details for FDO22471AXH

Generated Config Before

Generated Config After

```
hostname es-leaf1
```

The following table provides the summary of generated config before and after for Policy Template Instances (PTIs).

PTI Operations	Generated Config Before	Generated Config After
Add	Empty	Contains the config
Update	Contains config before changes	Contains config after changes
Mark-Delete	Contains the config to be removed.	Contains the config to be removed with colour change.
Delete	Contains the config	Empty

Note When a policy or profile template is applied, an instance is created for each application of the template, which is known as Policy Template Instance or PTI.

- **Preview Config** - View the pending configuration and the side-by-side comparison of the running and expected configuration.
- **Deploy Config** - Deploy per switch configurations.
- **Discovery** - You can use this option to update the credentials of the switch, reload the switch, rediscover the switch, and remove the switch from the fabric.

The new fabric is created, the fabric switches are discovered in DCNM, the underlay configuration provisioned on those switches, and the configurations between DCNM and the switches are synced. The remaining tasks are:

- Provision interface configurations such as vPCs, loopback interface, and subinterface configurations. [Refer [Interfaces](#)].
- Create networks and deploy them on the switches. [Refer [Creating and Deploying Networks and VRFs](#)].

Deploying Fabric Underlay eBGP Policies

The topology shows a Routed fabric enabled with eBGP as the routing protocol for distributing reachability information. In DCNM, a fabric with the **Easy_Fabric_eBGP** template is created. One spine switch (n9k-29) and three leaf switches (n9k-30, and vPC switch pair n9k-31 and n9k-32) are imported to it.

The two different types of fabrics are:

- **Creating a Multi-AS mode fabric:** In a Multi-AS mode fabric, spine switches have a common BGP AS number and each leaf switch has a unique BGP AS number. Use the same steps for Dual-AS to Multi-AS mode fabric conversion.
- **Creating a Dual-AS mode fabric:** Alternate steps are mentioned for Dual-AS mode fabric creation. Use the same steps for Multi-AS to a Dual-AS mode fabric conversion.

In a Dual-AS fabric, all spine switches have a common BGP AS number and all leaf switches have a common BGP AS number (differing from the spine switches' BGP AS number). You must deploy policies as explained in the next section.

To deploy fabric underlay eBGP policy, you must manually add the **leaf_bgp_asn** policy on each leaf switch to specify the BGP AS number used on the switch. Implementing the **Save & Deploy** operation afterward

will generate eBGP peering over the physical interface between the leaf and spine switches to exchange underlay reachability information.

1. Click **Tabular View** at the left part of the screen. The **Switches | Links** screen comes up.
2. Select the leaf switch (n9k-30 check box for example) and click **View/Edit Policies**. The View/Edit Policies screen comes up.

Note When you create an eBGP fabric in the Dual-AS mode (or change from the Multi-AS mode to Dual-AS mode), select all leaf switches since they have a common BGP AS number.

3. Click **Add**. The **Add Policy** screen comes up.
4. From the Policy drop down box, select **leaf_bgp_asn** and enter the BGP AS number in the **BGP AS #** field.
5. Click **Save**.
6. Repeat the procedure for the vPC switches. For a vPC switch pair, select both switches and apply the **leaf_bgp_asn** policy.

Note This step is not needed if you create a fabric in the Dual-AS mode (or converting to the Dual-AS mode) if you have assigned a BGP AS number to all of them, as explained in the earlier steps.

7. Close the **View/Edit Policies** window.
8. In the topology screen, click **Save & Deploy** at the top right part of the screen.
9. Deploy configurations as per the **Config Deployment** wizard.

Deploying Networks in eBGP-based Fabrics

Overview of Networks in a Routed Fabric

From Cisco DCNM Release 11.3(1), you can create a top-down network configuration for a routed fabric using DCNM. A routed fabric is run in one VRF, which is the default VRF. Note that creating VRFs manually is disabled for a routed fabric. Since the fabric is an IPv4 fabric, IPv6 address within the network is not supported. In a routed fabric, a network can only be attached to one device or a pair of vPC devices, unless it is a Layer 2 only network.

Note A routed fabric network configuration will not be put under a config-profile.

When the eBGP fabric is configured as Routed Fabric (EVPN is disabled), at the fabric level, you can select the first hop redundancy protocol (FHRP) for host traffic to be either HSRP or VRRP. HSRP is the default value.

For a vPC pair, DCNM generates network level HSRP or VRRP configuration based on the fabric setting. If HSRP is chosen, each network is configured with one HSRP group, and the HSRP VIP address. By default, all the networks will share the same HSRP group number allocated by DCNM, while you can overwrite it per network. VRRP support is similar to HSRP.

Guidelines

- HSRP authentication or VRRP authentication is not supported. If you want to use authentication, you can enter the applicable commands in the network freeform config.
- vPC peer gateway can be used to minimize peer link usage in the case that some third-party devices ignore the HSRP virtual-MAC and use the ARP packet source MAC for ARP learning. In Routed fabric mode, DCNM generates vPC peer gateway command for VPC devices.
- For an eBGP fabric, changing between routed fabric type and EVPN fabric type, or HSRP and VRRP, is not allowed with the presence of networks and VRFs. You need to undeploy and delete these networks and VRFs before changing the fabric type or FHRP. For more information, see *Undeploying Networks for the Standalone Fabric* and *Undeploying VRFs for the Standalone Fabric*.
- After the upgrade from DCNM Release 11.2(1) to 11.3(1), if the fabric was running in Routed Fabric mode previously, the default fabric values such as FHRP protocol and network VLAN range are internally set for a Routed Fabric. You need to edit the fabric settings if you want to configure different values. Before deploying a network configuration, you need to update the FHRP protocol fabric setting and click **Save & Deploy**.

Creating and Deploying a Network in a Routed Fabric

This procedure shows how to create and deploy a network in a routed fabric.

Before you begin

Create a routed fabric and deploy the necessary leaf and spine policies.

Procedure

- Step 1** Navigate to **Control > Networks**.
- Step 2** From the **SCOPE** drop-down list, choose a routed fabric.
- Step 3** Click the **Add** button in the **Networks** window to create a network.

Network Name: Specifies the name of the network. The network name should not contain any white spaces or special characters except underscore (`_`) and hyphen (`-`).

Layer 2 Only: Optional. Specifies whether the network is a Layer 2 only network. FHRP configuration is not generated in a Layer 2 only network.

Note When an L3 Network template is attached to a standalone device, no FHRP configuration is generated.

Network Template: Select the **Routed_Network_Universal** template.

VLAN ID: Optional. Specifies the corresponding tenant VLAN ID for the network.

Network Profile section contains the General and Advanced tabs.

General tab

IPv4 Gateway/NetMask: Specifies the IPv4 gateway address with subnet.

Intf IPv4 addr on active: Specifies the IPv4 interface address on an active device in a vPC pair. This field is applicable only when you are creating and deploying a network for a vPC pair of devices.

Intf IPv4 addr on standby: Specifies the IPv4 interface address on a standby/backup device in a vPC pair. This field is applicable only when you are creating and deploying a network for a vPC pair of devices.

Note The IPv4 gateway address and interface addresses should be in the same subnet.

The following fields under the **General** tab are optional:

Vlan Name: Specifies the VLAN name.

Interface Description: Specifies the description for the interface.

Standby Intf Description: Specifies the description for the standby interface in a vPC pair.

MTU for the L3 interface: Enter the MTU for Layer 3 interfaces.

Routing Tag: Specifies the routing tag that is associated with each gateway IP address prefix.

Advanced tab: This tab is applicable only when you are creating and deploying a network for a vPC pair of devices.

First Hop Redundancy Protocol: A read-only field that specifies FHRP selected in the fabric settings.

Active/master Switch Priority: Specifies the priority of the active or master device.

Standby/backup Switch Priority: Specifies the priority of the standby or backup device. The default value is 100. Note that this default value is not displayed when you preview the network configuration before deployment.

Enable Preempt: Specifies whether the standby/backup device can preempt an active device.

HSRP/VRRP Group #: Specifies the HSRP or VRRP group number. By default, HSRP group number is 1.

Virtual MAC Address: Optional. Specifies the virtual MAC address. By default, VMAC is internally generated based on the HSRP group number (0000.0c9f.f000 + group number). The virtual MAC address is only applicable when **hsrp** is selected in the fabric settings.

HSRP Version: Specifies the HSRP version. The default value is 1. The **HSRP version** field is only applicable for HSRP.

Step 4 Click **Create Network**.

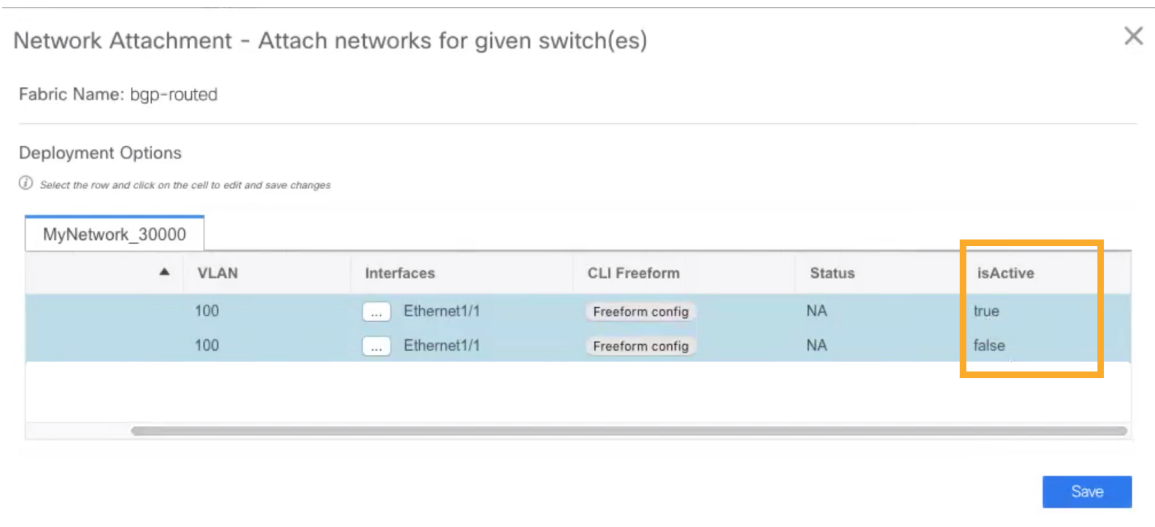

Step 5 In the **Networks** window, select the check box next to a network and click **Continue**.

Note A non Layer 2 network can be only applied to a vPC pair of devices or a single device. For example, if you have deployed a network on a single device, you cannot deploy the same network on another device or a vPC pair of devices.

Step 6 Select a device or a vPC pair to deploy a network.

Note In a routed fabric, when you try to attach a network on a vPC pair without active or standby IP addresses, an error is displayed saying that the IP address fields are not filled. After you add the IP addresses and save the network, the network state changes to **PENDING** without the need to attach the network again.

Step 7 In the **Network Attachment** window, for a vPC pair, assign the active state for a device. Enter **true** under the **isActive** column for an active device and **false** for a standby device. Click **Save**.

Network Attachment - Attach networks for given switch(es) ✕

Fabric Name: bgp-routed

Deployment Options

① Select the row and click on the cell to edit and save changes

MyNetwork_30000	VLAN	Interfaces	CLI Freeform	Status	isActive
	100	... Ethernet1/1	Freeform config	NA	true
	100	... Ethernet1/1	Freeform config	NA	false

[Save](#)

Note In a routed fabric, when you edit a deployed network and save without making any changes, the status of the network changes to **Pending**. Similarly, if a **Network Attachment** window is opened for a deployed network, and saved without any changes, the status of the network changes to **Pending**. In these cases, click the **Preview** icon to preview the config. This action changes the network status back to **Deployed**.

Step 8 (Optional) Click the **Preview** icon to preview the configs that will be deployed on devices. The **Preview Configuration** window is displayed.

Preview Configuration ✕

Select a Switch:

n9k-30 ▼

Select a Network

    priority 120
    mac-address aa11.2222.3333
  preempt
  mtu 8000
  description test100_int
  no shutdown
  vlan 100
  name test100
  configure terminal
          
```

Step 9 Click the **Deploy** button in the **Network / VRF Deployment** window.

You can also deploy the network by navigating to the **Fabric Builder** window and clicking the **Deploy** button.

Creating Inter-Fabric Links Between a Routed Fabric and an External Fabric

From DCNM Release 11.3(1), you can use an inter-fabric link to connect a route fabric to an edge router. This link configures an IP address on the physical interface and establish eBGP peering with the edge router on default vrf. The BGP configuration includes advertising default route to leaf switches.

Note The **Fabric Monitor Mode** check box in the external fabric settings can be unchecked. Unchecking the **Fabric Monitor Mode** check box enables DCNM to deploy configurations to the external fabric. For more information, see [Creating an External Fabric](#).

Procedure

- Step 1** Navigate to **Control > Fabric Builder**.
- Step 2** Click a routed a fabric in the **Fabric Builder** window.
- Step 3** Click **Tabular view** in the **Actions** panel that is displayed at the left part of the window.
- Step 4** Click the **Links** tab.
- Step 5** Click the **Add** icon to add a link.
The **Link Management – Add Link** window is displayed.

Link Type – Choose **Inter-Fabric** to create an inter-fabric connection between two fabrics, via their border switches or edge routers.

Link Sub-Type – This field populates the IFC type. Choose **ROUTED_FABRIC** from the drop-down list.

Link Template: The link template is populated. The templates are autopopulated with corresponding pre-packaged default templates that are based on your selection. For a routed fabric, the **ext_routed_fabric** template is populated.

Source Fabric - This field is prepopulated with the source fabric name.

Destination Fabric - Choose the destination fabric from this drop-down box.

Source Device and **Source Interface** - Choose the source device and Ethernet or port channel interface that connects to the destination device. Only device with the border role can be chosen.

Destination Device and **Destination Interface**—Choose the destination device and Ethernet or port channel interface that connects to the source device.

Based on the selection of the source device and source interface, the destination information is autopopulated based on Cisco Discovery Protocol information, if available. There is an extra validation performed to ensure that the destination external device is indeed part of the destination fabric.

General tab in the Link Profile section.

BGP Local ASN: In this field, the AS number of the leaf is autopopulated if you have created and applied the **leaf_bgp_asn** policy.

IP Address/Mask: Fill up this field with the IP address of the source interface that connects to the destination device.

BGP Neighbor IP: Fill up this field with the IP address of the destination interface.

BGP Neighbor ASN: In this field, the AS number of the destination device is autopopulated.

BGP Maximum Paths: Specifies the maximum supported BGP paths.

The **Advanced** tab contains the following optional fields:

Source Interface Description and **Destination Interface Description** – Describe the links for later use. After **Save & Deploy**, this description will reflect in the running configuration.

Source Interface Freeform CLIs and **Destination Interface Freeform CLIs:** Enter the freeform configurations specific to the source and destination interfaces. You should add the configurations as displayed in the running configuration of the switch, without indentation. For more information, refer to *Enabling Freeform Configurations on Fabric Switches*.

- Step 6** Click **Save** to finish adding a link.
- Step 7** Click the **Back** icon to navigate back to the Fabric Builder window.
- Step 8** Right-click the device which is connecting to the edge router in the external fabric, and select **Deploy Config**.
- Step 9** In the **Config Deployment** window, click **Deploy Config**.
- Step 10** Navigate to the external fabric in the **Fabric Builder** window, and click **Tabular view** in the **Actions** panel. Click the **Links** tab to see all the links for the external fabric.

You can see the inter-fabric link that has been created.

Note The inter-fabric link is created if the External fabric is not in the monitor mode.

- Step 11** Click the **Back** icon twice to navigate back to the **Fabric Builder** window.

- Step 12** Click the external fabric connecting to the routed fabric.
- Step 13** Right-click the device which is connecting to the routed fabric, and select **Deploy Config**.
- Step 14** In the **Config Deployment** window, click **Deploy Config**.

VXLAN EVPN Deployment with eBGP EVPN

Deploying Fabric Overlay eBGP Policies

You must manually add the eBGP overlay policy for overlay peering. DCNM provides the eBGP leaf and spine overlay peering policy templates that you can manually add to the leaf and spine switches to form the EVPN overlay peering.

Deploying Spine Switch Overlay Policies

Add the `ebgp_overlay_spine_all_neighbor` policy on the spine switch n9k-29. This policy can be deployed on all spine switches at once, since they share the same field values.

Add Policy
✕

* Priority (1-1000):

* Policy: ▼

General

* Leaf IP List ? list of leaf IP address for peering list e.g. 10.2.0.

* Leaf BGP ASN ? BGP ASN of each leaf, separated by ,

* BGP Update-Source Interface ? Source of BGP session and updates

Enable Tenant Routed Multicast ? Tenant Routed Multicast setting needs to match the fabric setting

Enable BGP Authentication ? BGP Authentication needs to match the fabric setting

Variables:

The fields on the screen are:

Leaf IP List - IP addresses of the connected leaf switch routing loopback interfaces.

10.2.0.2 is the loopback 0 peering IP address of leaf switch n9k-30. 10.2.0.3 and 10.2.0.4 are the IP addresses of the vPC switch pair n9k-31 and n9k-32.

Leaf BGP ASN – The BGP AS numbers of the leaf switches. Note that the AS number of vPC switches is the same, 31.

Note When you create fabric in the Dual-AS mode, (or convert to Dual-AS mode), you must update this field with the common BGP AS number all the leaf switches belong to.

BGP Update-Source Interface – This is the source interface of the BGP update. You can use loopback0 in this field, that is, the loopback interface for underlay routing.

Enable Tenant Routed Multicast – Select the checkbox to enable TRM for handling overlay multicast traffic. TRM enabling must match the fabric setting.

Enable BGP Authentication – Select the checkbox to enable BGP authentication.

The BGP authentication must match the fabric setting. Refer the Retrieving the Authentication Key section to know more about BGP authentication.

Deploying Leaf Switch Overlay Policies

Add the **ebgp_overlay_leaf_all_neighbor** policy on all the leaf switches, to establish eBGP overlay peering towards the spine switch. This policy can be deployed on all leaf switches at once, since they share the same field values.

Add Policy
✕

* Priority (1-1000):

* Policy: ▼

* Spine IP List ? list of spine IP address for peering list e.g. 10.2.

* BGP Update-Source Interface ? Source of BGP session and updates

Enable Tenant Routed Multicast ? For Overlay Multicast Support In VXLAN Fabrics

Enable BGP Authentication ? BGP Authentication needs to match the fabric setting

Variables:

The fields on the screen are:

Spine IP List – IP addresses of the spine switch routing loopback interfaces.

10.2.0.1 is the loopback 0 peering IP address of spine switch n9k-29.

BGP Update-Source Interface – This is the source interface of the BGP update. You can use loopback0 in this field, that is, the loopback interface for underlay routing.

Enable Tenant Routed Multicast – Select the checkbox to enable TRM for handling overlay multicast traffic. TRM enabling must match the fabric setting.

Enable BGP Authentication – Select the checkbox to enable BGP authentication.

The BGP authentication must match the fabric setting. Refer the Retrieving the Authentication Key section to know more about BGP authentication.

Click **Save & Deploy** at the top right part of the screen, and deploy configurations as per the Config Deployment wizard. Or, use the **View/Edit Policy** option to select the policy and click **Push Config** to deploy the configuration.

Creating and Deploying Networks and VRFs

The steps for overlay networks and VRFs provisioning are:

1. Create networks and VRFs for the fabric.
2. Deploy the networks and VRFs on the fabric switches.

Note The undeployment and deletion of overlay networks and VRFs are explained after the explanation of deployment. Finally, creation of external fabrics and fabric extensions from VXLAN to external fabrics are documented.

You can navigate to the networks and VRFs window through any of the following options:

- From the home page: Click the **Networks & VRFs** button in the Cisco DCNM Web UI landing page.
- From the Control menu: From the home page of the Cisco DCNM Web UI, choose **Control > Fabrics > Networks** to navigate to the **Networks** window. Choose **Control > Fabrics > VRFs** to navigate to the **VRFs** window.
- From a fabric topology window: Right-click anywhere in the fabric topology window. Choose **Overlay View > VRF View** or **Overlay View > Network View**, accordingly. This option is applicable only for switch fabrics, easy fabrics, and MSD fabrics.

You can toggle between the network view and VRF view in both the windows by clicking the **VRF View** or **Network View** button. When you are in the networks or VRFs window, ensure you choose the appropriate fabric from the **Scope** drop-down list before you create any networks or VRFs.

Viewing Networks and VRFs for a Fabric

- Click **Control > Networks** from the main menu.

The **Networks** screen comes up. The SCOPE drop down box (at the top right part of the screen) lists all fabrics managed by the DCNM instance, in alphabetical order. You can choose the correct fabric from SCOPE. When you select a fabric, the **Networks** screen refreshes and lists networks of the selected fabric.

SCOPE: bgp2 admin

Network / VRF Selection > Network / VRF Deployment

Fabric Selected: bgp2

Selected 1 / Total 1

Network Name	Network ID	VRF Name	IPv4 Gateway/Subnet	IPv6 Gateway/Prefix	Status	VLAN ID
<input checked="" type="checkbox"/> MyNetwork_30000	30000	NA			NA	

- Click **Control > VRFs** from the main menu.

The VRFs screen comes up. The SCOPE drop down box (at the top right part of the screen) lists all fabrics managed by the DCNM instance, in alphabetical order. You can choose the correct fabric from SCOPE. When you select a fabric, the VRFs screen refreshes and lists VRFs of the selected fabric.

SCOPE: bgp2 admin

Network / VRF Selection > Network / VRF Deployment

Fabric Selected: bgp2

Selected 1 / Total 1

VRF Name	VRF ID	Status
<input checked="" type="checkbox"/> MyVRF_50000	50000	NA

Note The **Networks** or **VRFs** windows are applicable only for the Easy or MSD fabrics.

Creating Networks for the Standalone Fabric

1. Click **Control > Networks** (under **Fabrics** submenu).

The Networks screen comes up.

2. Choose the correct fabric from SCOPE. When you select a fabric, the **Networks** screen refreshes and lists networks of the selected fabric.

SCOPE: bgp2 admin

Network / VRF Selection > Network / VRF Deployment

Fabric Selected: bgp2

Selected 1 / Total 1

Network Name	Network ID	VRF Name	IPv4 Gateway/Subnet	IPv6 Gateway/Prefix	Status	VLAN ID
<input checked="" type="checkbox"/> MyNetwork_30000	30000	NA			NA	

3. Click the + button at the top left part of the screen (under **Networks**) to add networks to the fabric. The Create Network screen comes up. Most of the fields are autopopulated.

The fields in this screen are:

Network ID and Network Name: Specifies the Layer 2 VNI and name of the network. The network name should not contain any white spaces or special characters except underscore (_) and hyphen (-). The corresponding Layer 3 VNI (or VRF VNI) is generated along with VRF creation.

VRF Name: Allows you to select the Virtual Routing and Forwarding (VRF).

When no VRF is created, this field appears blank. If you want to create a new VRF, click the + button. The VRF name should not contain any white spaces or special characters except underscore (_), hyphen (-), and colon (:).

Layer 2 Only: Specifies whether the network is Layer 2 only.

Network Template: A universal template is autopopulated. This is only applicable for leaf switches.

Network Extension Template: A universal extension template is autopopulated. This allows you to extend this network to another fabric. The methods are VRF Lite, Multi Site, and so on. The template is applicable for border leaf switches and BGWs.

VLAN ID: Specifies the corresponding tenant VLAN ID for the network.

Network Profile section contains the *General* and *Advanced* tabs.

General tab

IPv4 Gateway/NetMask: Specifies the IPv4 address with subnet.

Note If the same IP address is configured in the IPv4 Gateway and IPv4 Secondary GW1 or GW2 fields of network template, DCNM does not show an error, and you will be able to save this configuration. However, after the network configuration is pushed to the switch, it would result in a failure as the configuration is not allowed by the switch.

IPv6 Gateway/Prefix: Specifies the IPv6 address with subnet.

Specify the anycast gateway IP address for transporting the L3 traffic from a server belonging to MyNetwork_30000 and a server from another virtual network. By default the anycast gateway IP address is the same for MyNetwork_30000 on all switches of the fabric that have the presence of the network.

VLAN Name - Enter the VLAN name.

Interface Description: Specifies the description for the interface. This interface is a switch virtual interface (SVI).

MTU for the L3 interface - Enter the MTU for Layer 3 interfaces.

IPv4 Secondary GW1 - Enter the gateway IP address for the additional subnet.

IPv4 Secondary GW2 - Enter the gateway IP address for the additional subnet.

Advanced tab: Optionally, specify the advanced profile settings by clicking the **Advanced** tab:

ARP Suppression – Select the checkbox to enable the ARP Suppression function.

Ingress Replication - The checkbox is selected if the replication mode is Ingress replication.

Note Ingress Replication is a read-only option in the Advanced tab. Changing the fabric setting updates the

Multicast Group Address- The multicast IP address for the network is autopopulated.

Multicast group address is a per fabric instance variable. The number of underlay multicast groups supported is only 128. If all networks are deployed on all switches, you need not use a different multicast group per L2 VNI or a network. Therefore, multicast group for all networks in a fabric remains same. If a new multicast group address is required, you can generate it by clicking the **Generate Multicast IP** button.

DHCPv4 Server 1 - Enter the DHCP relay IP address of the first DHCP server.

DHCPv4 Server 2 - Enter the DHCP relay IP address of the next DHCP server.

DHCPv4 Server VRF- Enter the DHCP server VRF ID.

Routing Tag – The routing tag is autopopulated. This tag is associated with each gateway IP address prefix.

TRM enable – Select the check box to enable TRM.

L2 VNI Route-Target Both Enable - Select the check box to enable automatic importing and exporting of route targets for all L2 virtual networks.

Enable L3 Gateway on Border - Select the check box to enable a Layer 3 gateway on the border switches.

A sample of the Create Network screen is given below.

Editing Networks for the Standalone Fabric

To edit networks for standalone fabrics from Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Click **Control > Networks**.
The **Networks** window appears.
- Step 2** Choose a fabric from the **SCOPE** drop-down list.

The **Networks** window refreshes and lists the networks in the fabric.

Step 3 Choose a network.

Step 4 Click the **Edit** icon.

The **Edit Network** window appears.

Step 5 Update the fields in the **General** and **Advanced** tabs of the **Network Profile** area as needed.

Note You can edit the network name. The edited network name appears in the **Network Name** column in the **Networks** window. The original name, which you used while creating a network, appears in the **Display Name** column. To view the original network name from the **Display Name** column in the **Networks** window, click **Settings**. Expand the **Columns** drop-down list, and choose the **Display Name** option. Click **Close**. You can also view the original network name in the network topology view.

Step 6 Click **Save** at the bottom right part of the window to save the updates.

Creating VRFs for the Standalone Fabric

1. Click **Control > VRFs** (under **Fabrics** submenu).

The VRFs screen comes up.

2. Choose the correct fabric from **SCOPE**. When you select a fabric, the **VRFs** screen refreshes and lists VRFs of the selected fabric.

Fabric Selected: bgp2

VRF Name	VRF ID	Status
MyVRF_50000	50000	NA

3. Click the + button to add VRFs to the *Standalone* fabric. The Create VRF screen comes up. Most of the fields are autopopulated.

Create VRF
✕

▼ VRF Information

VRF Vlan Name

VRF Intf Description

VRF Description

The fields in this screen are:

VRF ID and **VRF Name**: The ID and name of the VRF.

Note For ease of use, the VRF creation option is also available while you create a network.

VRF Template: This template is applicable for VRF creation, and only applicable for leaf switches.

VRF Extension Template: The template is applicable when you extend the VRF to other fabrics, and is applicable for border devices.

Fill the fields in the **VRF Profile** section.

General tab – Enter the VLAN ID of the VLAN associated with the VRF, the corresponding Layer 3 virtual interface, and the VRF ID.

Advanced tab – The fields in the tab are autopopulated.

Routing Tag – If a VLAN is associated with multiple subnets, then this tag is associated with the IP prefix of each subnet. Note that this routing tag is associated with overlay network creation too.

Redistribute Direct Route Map – Specifies the route map name for redistribution of routes in the VRF.

Max BGP Paths and **Max iBGP Paths** – Specifies the maximum BGP and iBGP paths.

TRM Enable – Select the check box to enable TRM.

If you enable TRM, then the RP address, and the underlay multicast address must be entered.

Is RP External – Enable this checkbox if the RP is external to the fabric. If this field is unchecked, RP is distributed in every VTEP.

RP Address – Specifies the IP address of the RP.

RP Loopback ID – Specifies the loopback ID of the RP, if **Is RP External** is not enabled.

Underlay Multicast Address – Specifies the multicast address associated with the VRF. The multicast address is used for transporting multicast traffic in the fabric underlay.

Note The multicast address in the **Default MDT Address for TRM VRFs** field in the fabric settings screen is auto-populated in this field. You can override this field if a different multicast group address should be used for this VRF.

Create VRF

▼ VRF Information

* VRF ID

* VRF Name

* VRF Template

* VRF Extension Template

▼ VRF Profile

General

Advanced

Is RP External ? Is RP external to the fabric?

RP Address ? IPv4 Address

RP Loopback ID ? 0-1023

Underlay Mcast Add... ? IPv4 Multicast Address

Overlay Mcast Groups ? 224.0.0.0/8 to 239.255.255.255/8

Enable IPv6 link-loc... ? Enables IPv6 link-local Option under VRF SVI

Advertise Host Routes ? Flag to Control Advertisement of /32 and /128 Routes to Edge Routers

Advertise Default Route ? Flag to Control Advertisement of Default Route Internally

Overlay Multicast Groups – Specifies the multicast group subnet for the specified RP. The value is the group range in “ip pim rp-address” command. If the field is empty, 224.0.0.0/24 is used as default.

Enable IPv6 link-local Option - Select the check box to enable the IPv6 link-local option under the VRF SVI. If this check box is unchecked, IPv6 forward is enabled.

Advertise Host Routes – Enable the checkbox to control advertisement of /32 and /128 routes to Edge Routers.

Advertise Default Route – Enable the checkbox to control advertisement of default routes internally.

To allow inter-subnet communication between end hosts in different VXLAN fabrics, where the subnets are present in both fabrics, you must disable the **Advertise Default Route** feature (clear the **Advertise Default Route** checkbox) for the associated VRF. This will result in /32 routes for hosts being seen in both fabrics. For example, Host1 (VNI 30000, VRF 50001) in Fabric1 can send traffic to Host2 (VNI

30001, VRF 50001) in Fabric2 only if the host route is present in both fabrics. When a subnet is present in only one fabric then default route is sufficient for inter-subnet communication.

4. Click **Create VRF**.

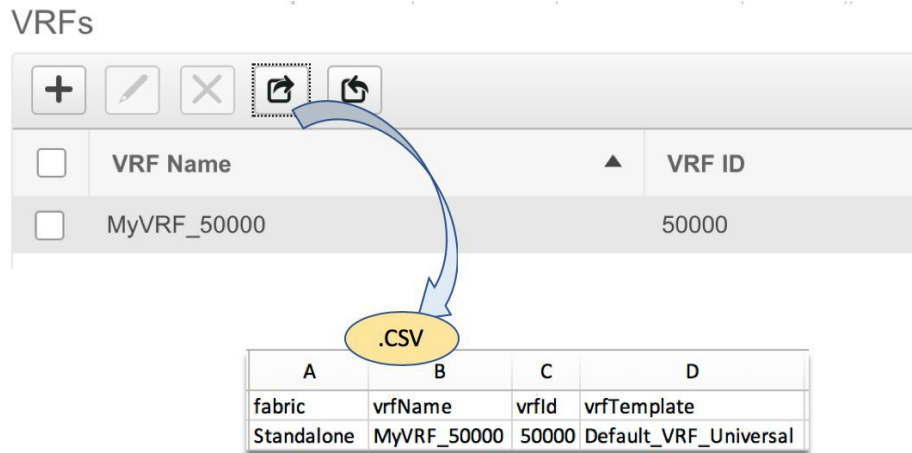

The *MyVRF_50001* VRF is created and appears on the VRFs page.

Export and Import VRF Information

You can export VRF information to a .CSV file. The exported file contains information pertaining to each VRF, including the fabric it belongs to, the templates used to create the VRF, and all other configuration details that you saved during VRF creation.

In the VRFs screen, click the Export icon to export VRF information as a .CSV file.

You can use the exported .CSV file for reference or use it as a template for creating new VRFs. To import VRFs, do the following:

1. Update new records in the .CSV file. Ensure that the **vrfTemplateConfig** field contains the JSON Object.
2. In the VRFs screen, click **Import** icon and import the .CSV file into DCNM.

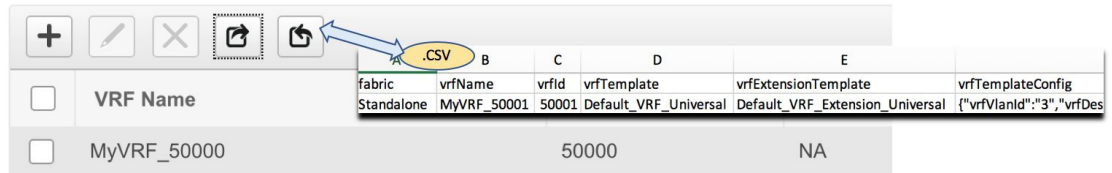

A message at the bottom right part of the screen displays errors and success messages. This screenshot depicts a new VRF being imported.

Note When you create a VRF using the **Import** option on the VRF window or using the DCNM APIs, you see an error saying: Instance name is not specified.

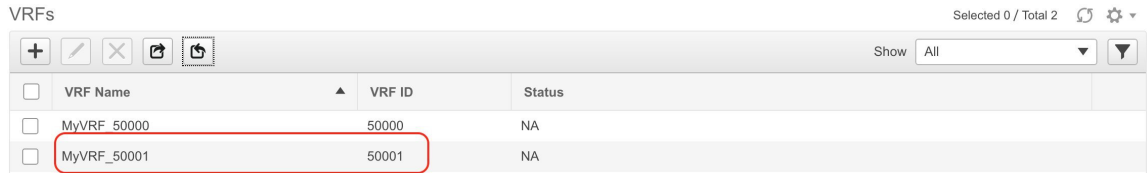

This error is because of a tagging issue. To remove this error, edit the VRF in DCNM Web UI and then d

Editing VRFs for the Standalone Fabric

1. Choose the correct fabric from SCOPE. When you select a fabric, the **VRFs** screen refreshes and lists VRFs of the selected fabric.

SCOPE: bgp2

Fabric Selected: bgp2

<input type="checkbox"/>	VRF Name	VRF ID	Status
<input checked="" type="checkbox"/>	MyVRF_50000	50000	NA

2. From the **Select a Fabric** drop-down list, select the fabric *Standalone*, and click **Continue** on the top right part of the screen. The Networks page is displayed.
3. Click the **VRF View** at the top right part of the screen. The VRFs page appears.

Fabric Selected: New7200

<input type="checkbox"/>	VRF Name	VRF ID	Status
<input type="checkbox"/>	MyVRF_50000	50000	NA
<input type="checkbox"/>	MyVRF_50001	50001	NA

4. Select the **VRF** and click the **Edit** option at the top left part of the screen. The **Edit VRF** screen comes up.
5. Update the fields in the **General** and **Advanced** tabs of the **VRF Profile** section as needed.
6. Click **Save** at the bottom right part of the screen to save the updates.

Undeploying Networks for the Standalone Fabric

You can undeploy VRFs and networks from the deployment screen. The DCNM screen flow for undeployment is similar to the deployment process flow. Go to the deployment screen (Topology View) to undeploy networks:

1. Click **Control > Networks** (under **Fabrics** submenu).

The Networks screen comes up.

2. Choose the correct fabric from **SCOPE**. When you select a fabric, the **Networks** screen refreshes and lists networks of the selected fabric.

3. Select the networks that you want to undeploy and click **Continue**. The topology view comes up.
4. Select the **Multi-Select** button (if you are undeploying the networks from multiple switches), and drag the cursor across switches with the same role. The **Network Attachment** screen comes up.
 - (For a single switch, double-click the switch and the **Network Attachment** screen comes up).
 - (For a single switch, double-click the switch and the **Switches Deploy** screen comes up).
5. In the **Network Attachment** screen, the **Status** column for the deployed networks is displayed as **DEPLOYED**. Clear the check boxes next to the switches, as needed. Ensure that you repeat this on all tabs since each tab represents a network.
6. Click **Save** (at the bottom right part of the screen) to initiate the undeployment of the networks. The *Topology View* comes up again.

Note Alternatively, you can click the **Detailed View** button to undeploy networks.

7. Refresh the screen, preview configurations if needed and click **Deploy** to remove the network configurations on the switches. After the switch icons turn green, it indicates successful undeployment.
8. Go to the **Networks** page to verify if the networks are undeployed.

Undeploying VRFs for the Standalone Fabric

You can undeploy VRFs from the deployment screen. The DCNM screen flow for undeployment is similar to the deployment process flow.

1. Choose **Control > Fabrics > VRFs**.
2. Choose the correct fabric from **SCOPE**. When you select a fabric, the **VRFs** screen refreshes and lists networks of the selected fabric.

3. Select the VRFs that you want to undeploy and click **Continue**. The *Topology View* page comes up.
4. Select the Multi-Select option (if you are undeploying the VRFs from multiple switches), and drag the cursor across switches with the same role. The VRF Attachment screen comes up.
(For a single switch, double-click the switch and the VRF Attachment screen comes up).
5. In the Switches Deploy screen, the **Status** column for the deployed VRFs is displayed as DEPLOYED. Clear the check boxes next to the switches, as needed. Ensure that you repeat this on all tabs since each tab represents a VRF.
6. Click **Save** (at the bottom right part of the screen) to initiate the undeployment of the VRFs. The topology view comes up again.

Note Alternatively, you can click the **Detailed View** button to undeploy VRFs.

7. Refresh the screen, preview configurations if needed and click **Deploy** to remove the VRF configurations on the switches. After the switch icons turn green, it indicates successful undeployment.
8. Go to the VRFs page to verify if the networks are undeployed.

Deleting Networks and VRFs

If you want to delete networks and corresponding VRFs in the MSD fabric, follow this order:

1. Undeploy the networks, if not already done.
2. Delete the networks.
3. Undeploy the VRFs, if not already done.
4. Delete the VRFs.

Configuring Multiple VLAN IDs to a Single VNI

The following procedure shows how to tag multiple VLAN IDs to a single VNI in DCNM.

Procedure

- Step 1** Navigate to **Control > Networks**.
- Step 2** Select the fabric from the **Scope** drop-down list and then select the network. Click **Continue**.
- Step 3** Check the **Multi-Select** check box and drag the cursor over the switches that needs to be updated with VLAN IDs.

Step 4 In the **Network Attachment** window, edit the VLAN ID for the switches and click **Save**.

Network Extension Attachment - Attach extensions for given switch(es) ✕

Fabric Name: SITE_B

Deployment Options

① Select the row and click on the cell to edit and save changes

MyNetwork_30000 ← Network VNI

<input type="checkbox"/>	Switch	VLAN	Extend	Interfaces	CLI Freeform	Status
<input type="checkbox"/>	B-BGW-SP-3	2300	MULTISITE			NA
<input type="checkbox"/>	B-BGW-SP-4	2300	MULTISITE	...	Freeform config	NA

← Switches

Save

Step 5 Click **Deploy** to deploy the configuration.
