

Inventory

This chapter contains the following topics:

- [Viewing Inventory Information, on page 1](#)
- [Discovery, on page 24](#)

Viewing Inventory Information

Beginning with Cisco DCNM release 6.x, you can view the inventory and the performance for both SAN and LAN switches by using the global Scope pane. You can select LAN, SAN, or both to view the inventory information. You can also export and print the inventory information.

You can either Print this information or export to Microsoft Excel.

Note You can use the **Print** icon to print the information that is displayed or you can also use the **Export** icon to export the information that is displayed to a Microsoft Excel spreadsheet. You can also choose the column that you want to display.

The Inventory menu includes the following submenus:

Viewing Inventory Information for Switches

To view the inventory information for switches from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
- The **Switches** window with a list of all the switches for a selected Scope is displayed.
- Step 2** You can also view the following information.
- **Group** column displays the switch group to which the switch belongs.
 - In the **Device Name** column, select a switch to display the Switch Dashboard.

- **IP Address** column displays the IP address of the switch.
- **WWN/Chassis ID** displays the Worldwide Name (WWN) if available or chassis ID.
- **Health** displays the health situation of the switch.
 - Note** To refresh and recalculate the latest health data for all the switches on Cisco DCNM, click the **Recalculate Health** button above the switches table.
- **Mode** column displays the current mode of the switch. The switch can be in **Normal**, **Maintenance**, or **Migration** mode.
- **Status** column displays the status of the switch.
- **# Ports** column displays the number of ports.
- **Model** column displays the model name of the switch.
- **Serial No.** column displays the serial number of the switch.
- **Release** column displays the switch version.
- **Up Time** column displays the time period for which the switch is active.
- **Container Based ISSU Mode** column indicates whether the Container Based ISSU Mode is enabled or not. The container-based ISSU can be enabled for Cisco Nexus 3000 and Cisco Nexus 9000 series switches. This is a one-time configuration on the device.

Enhanced in-service software upgrade (ISSU)—Enables you to upgrade the device software while the switch continues to forward traffic, which reduces the downtime typically caused by software upgrades (similar to the regular ISSU, also known as a non-disruptive upgrade). However, with container-based ISSU, the software runs inside a separate Linux container (LXC) for the supervisor and line cards, and a third container is created as part of the ISSU procedure and is brought up as a standby supervisor.

Container-based ISSUs are supported on Cisco Nexus 3164Q, 9200 series switches, 9332PQ, 9372PX, 9372TX, 9396PX, 9396TX, 93120TX, and 93128TX switches.

For more information about the Cisco Nexus 3000 and 9000 switches, where the Container-based ISSU feature is supported, see the following URLs:

[Cisco Nexus 9000 Series NX-OS Software Upgrade and Downgrade Guide, Release 9.x](#)

Step 3

Click **Health** to access the Health score window for a device. The Health score window includes health score calculation and health trend. The Overview tab displays the overall health score. All the modules, switch ports and alarms are taken into consideration while calculating the health score. Hover over the graph under Health Trend for detailed information on specific dates. Hover over the info icon next to Alarms to display the number of Critical, Major, Minor, and Warning alarms that have been generated.

N9k-C9316d-gx

Overview Modules Switch Ports Alarms

Health score: 68%

Here's how we computed the score:

Component	Percent	Weight	Percent Contribution
Modules	92.86%	0.2	18.57%
Switch ports	100.00%	0.2	20.00%
Alarms i	50.00%	0.6	30.00%
total			68%

Health Trend

Click the **Modules** tab to display information about the various modules in the device. This tab displays information such as Name, Model name, Serial number, Status, Type, Slot, Hardware revision and Software revision.

N9k-C9316d-gx

Click the **Switch Ports** tab to display information about the device ports. This tab displays information such as Name, Description, Status, Speed, and the device to which a port is connected .

N9k-C9316d-gx

N9k-C9316d-gx						
Overview						
Modules						
Switch Ports						
Alarms						
	Name	Description	Status	Speed	Connected To	
1	mgmt0		ok	1Gb		
2	Ethernet1/1		ok	40Gb	N9k_tucher (Ethernet1/99)	
3	Ethernet1/2		ok	40Gb	N9k_3408s_179 (Ethernet1/1)	
4	Ethernet1/3		ok	40Gb	N9k_c9316d-gx_10 (Ethernet1/3)	
5	Ethernet1/4		XCVR not inserted	400Gb		
6	Ethernet1/5		XCVR not inserted	400Gb		
7	Ethernet1/6		XCVR not inserted	400Gb		
8	Ethernet1/7		XCVR not inserted	400Gb		
9	Ethernet1/8		XCVR not inserted	400Gb		
10	Ethernet1/9		XCVR not inserted	400Gb		

Click the **Alarms** tab to display information about the alarms that have been generated. This tab displays information such as alarm Severity, Message, Category, and the Policy that has been activated due to which the alarm is generated.

N9k-C9316d-gx

Severity	Message	Category	Policy
CRITICAL	10.106.228.90(N9k-C931...	CRITICAL	Config-Compliance: G1: Device Level Status Alarm

In the **Health** column, the switch health is calculated by the capacity manager based on the following parameters:

- Total number of modules
- Total number of modules impacted by the warning
- Total number of switch ports
- Total number of switch ports impacted by the warning
- Total number of critical severity alarms
- Total number of warning severity alarms
- Total number of major severity alarms
- Total number of minor severity alarms

Step 4 The value in the **Health** column is calculated based on the following:

- Percentage of modules impacted by warnings (Contributes 20% of the total health).
- Percentage of ports impacted by warnings (Contributes 20% of the total health).
- Percentage of alarms (Contributes 60% of the total health). The critical alarms contribute the highest value to this percentage followed by major alarms, minor alarms and warning alarms.

You may also have your own health calculation formula by implementing the common interface class: `com.cisco.dcbu.sm.common.rif.HealthCalculatorRif`.

The default Java class is defined as: `health.calculator=com.cisco.dcbu.sm.common.util.HealthCalculatorAlarms`.

- Capacity Manager calculates health only for the license switches. If the health column does not display a value, the switch either does not have a license or it has missed the capacity manager daily cycle.
- If the switch is unlicensed, click **Unlicensed** in the DCNM License column. The **Administration > License** window appears which allows you to assign a license to the user.

- The capacity manager runs two hours after the DCNM server starts. So, if you discover a device after two hours of the DCNM start time, the health will be calculated 24 hours after this DCNM start time

Starting from Cisco DCNM 11.3(1) Release, you can view information about switch health along with the switch summary by clicking on a switch in the **Topology** window or by choosing **Control>Fabrics>Fabric Builder**, selecting a fabric and clicking on a switch in the **Fabric Builder** window.

Viewing System Information

The switch dashboard displays the details of the selected switch.

Procedure

- Step 1** From the Cisco DCNM home page, choose **Inventory > View > Switches**.
- An inventory of all the switches that are discovered by Cisco DCNM Web UI is displayed.
- Step 2** Click a switch in the **Device Name** column.
- The **Switch** dashboard that corresponds to that switch is displayed along with the following information:
- Step 3** Click the **System Information** tab. This tab displays detailed system information such as group name, health, module, time when system is up, serial number, the version number, contact, location, DCNM license, status, system log sending status, CPU and memory utilization, and VTEP IP address are displayed. Click **Health** to access the Health score screen, which includes health score calculation and health trend. The popup contains Overview, Modules, Switch Ports, and Events tabs.
- (Optional) Click **SSH** to access the switch through Secure Shell (SSH).
 - (Optional) Click **Device Manager** to view a graphical representation of a Cisco MDS 9000 Family switch chassis, a Cisco Nexus 5000 Series switch chassis, a Cisco Nexus 7000 Series switch chassis, or a Cisco Nexus 9000 Series switch chassis including the installed switching modules, the supervisor modules, the status of each port within each module, the power supplies, and the fan assemblies.
 - (Optional) Click **HTTP** to access the switch through Hypertext Transfer Protocol (HTTP) for that switch.
 - (Optional) Click **Accounting** to go to the Viewing Accounting Information window pertaining to this switch.
 - (Optional) Click **Backup** to go to the Viewing a Configuration window.
 - (Optional) Click **Events** to go to the [Viewing Events Registration](#) window.
 - (Optional) Click **Show Commands** to display the device show commands. The Device Show Commands page helps you to view commands and execute them.
 - (Optional) Click **Copy Running Config to Startup Config** to copy the running configuration to the startup configuration.
 - Click **Generate tac-pac** to collect technical support from a device in Cisco DCNM. See the *Collecting Technical Support from Devices* section for more information.
-

Collecting Technical Support from Devices

You can choose the protocol while generating technical support from a device in Cisco DCNM Web Client. To collect technical support from a device in Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
An inventory of all the switches that are discovered by Cisco DCNM is displayed.
- Step 2** Click a switch in the **Device Name** column.
The switch dashboard that corresponds to that switch appears.
- Step 3** In the **Actions** area, click **Generate tac-pac**.
The **Generate tac-pac** dialog box appears.
- Step 4** Choose a management interface by clicking the appropriate radio button.
Valid values are **default**, **vrf management**, and **vrf default**. The default value selected is **default**.
Note This option is valid only for Nexus switches.
- Step 5** Choose the transport protocol from switch to DCNM by clicking the appropriate radio button.
Valid values are **TFTP**, **SCP**, and **SFTP**.
Note If you choose the **SCP** or **SFTP** option, enter the DCNM server credentials.
- Step 6** Click **Ok**.
After the tac-pac is generated and saved on server, a dialog box appears to open or save the file on your local machine.
-

Viewing Device Manager Information

Note After you install Cisco DCNM for Windows, you must edit and provide credentials in the Cisco DCNM SAN Services to Log on. Navigate to **Services > Cisco DCNM SAN Server > Cisco DCNM SAN Server Properties > Log On** tab. Select This account radio button, and provide username and password. Click **Ok**. Log on to SSH and stop DCNM services. After you start the DCNM services, you must be able to use Device Manager.

Note After you install Cisco DCNM for Linux, perform the procedure that is provided on the screen for Device Manager to be functional. Device Manager requires graphical environment that is configured properly in the Linux/OVA DCNM server.

The switch dashboard displays the details of the selected switch.

Procedure

- Step 1** From the left menu bar, choose **Inventory > View > Switches**.
An inventory of switches discovered by Cisco DCNM Web Client is displayed.
- Step 2** Click a switch in the **Device Name** column.
The **Switch** dashboard that corresponds to that switch is displayed along with the following information:
- Step 3** Click the **Device Manager** tab. The Device Manager login dialog box appears. Log into the Device Manager application. The Device Manager provides a graphic representation of the installed switching modules, the supervisor modules, the status of each port within each module, the power supplies, and the fan assemblies.
For more information about the Device Manager, go to the following URL:
[Cisco DCNM SAN Client Online Help](#)
-

Interfaces

Displaying Interface Show Commands

To display interface show commands from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
You see the **Switches** window displaying a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display **Switch Dashboard**.
- Step 3** Click the **Interfaces** tab.
- Step 4** Click **Show** to display the interface show commands.
The **Interface Show Commands** window helps you to view commands and execute them.
-

Rediscovering Interfaces

To rediscover interfaces from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
The **Switches** window is displayed showing a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display **Switch Dashboard**.
- Step 3** Click the **Interfaces** tab.

- Step 4** Click **Rediscover** to rediscover the selected interfaces. For example, after you edit or enable an interface, you can rediscover the interface.
-

Viewing Interface History

To view the interface history from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
- You see the Switches window displaying a list of all the switches for a selected Scope.
- Step 2** In the **Device Name** column, select a switch to display **Switch Dashboard**.
- Step 3** Click the **Interfaces** tab.
- Step 4** Click **Interface History** to display the interface history details such as **Policy Name**, **Time of Execution**, and so on.
-

VLAN

You create a VLAN by assigning a number to it; you can delete VLANs and move them from the active operational state to the suspended operational state.

To configure VLANs, choose **Inventory > View > Switches**, and then click a switch in the **Device Name** column.

The following table describes the buttons that appear on this page.

Table 1: VLAN Tab

Field	Description
Clear Selections	Allows you to unselect all the VLANs that you selected.
Add	Allows you to create Classical Ethernet or Fabric Path VLANs.
Edit	Allows you to edit a VLAN.
Delete	Allows you to delete a VLAN.
No Shutdown	Allows you to enable a VLAN.
Shutdown	Allows you to disable a VLAN.
Show	Allows you to display the VLAN show commands.

This section contains the following:

Adding a VLAN

To add a VLAN from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
You see the **Switches** window displaying a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display the **Switch Dashboard**.
- Step 3** Click the **VLAN** tab.
- Step 4** Click **Add** to create Classical Ethernet or Fabric Path VLANs. In the **Add VLAN** window, specify the following fields:
- In the **Vlan Id** field, enter the VLAN ID.
 - In the **Mode** field, specify whether you are adding Classical Ethernet or Fabric Path VLAN.
 - Select the **Admin State ON** check box to specify whether the VLAN is shut down or not.
-

Editing a VLAN

To edit a VLAN from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
The **Switches** window is displayed with a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display the **Switch Dashboard**.
- Step 3** Select one or more VLANs, and then click the **Edit**.
-

Deleting a VLAN

To delete a VLAN from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
You see the **Switches** window displaying a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display the **Switch Dashboard**.
- Step 3** Click **VLAN** tab.
- Step 4** Select the VLAN that you want to delete, and then click **Delete**.
-

Shutting Down a VLAN

To shut down a VLAN from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
You see the **Switches** window displaying a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display **Switch Dashboard**.
- Step 3** Click the **VLAN** tab.
- Step 4** Click **Shutdown** to disable a VLAN.
To enable a VLAN, click **No Shutdown** button. For example, if you want to start traffic flow on a VLAN you can enable it.
-

Displaying VLAN Show Commands

To display VLAN show commands from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Switches**.
The **Switches** window is displayed, showing a list of all the switches for a selected **Scope**.
- Step 2** In the **Device Name** column, select a switch to display **Switch Dashboard**.
- Step 3** Click the **VLAN** tab.
- Step 4** Click **Show** to display the VLAN show commands. Based on the VLAN selection, you can show the VLAN commands. **Interface Show Commands** window displays the commands and allows you to execute them.
-

FEX

The Fabric Extender feature allows you to manage a Cisco Nexus 2000 Series Fabric Extender and its association with the Cisco NX-OS switch that it is attached to. A Fabric Extender is connected to the switch through physical Ethernet interfaces or a Port Channel. By default, the switch does not allow the attached Fabric Extender to connect until it has been assigned a chassis ID and is associated with the connected interface. You can configure a Fabric Extender host interface port as a routed or Layer 3 port. However, no routing protocols can be tied to this routed interface.

Note FEX feature is available on LAN devices only. Therefore, you will see FEX on Cisco DCNM **Inventory Switches**. If a Cisco Nexus Switch is discovered as part of SAN fabric, FEX feature is not available. FEX is also not supported on Cisco Nexus 1000V devices.

Note 4x10G breakout for FEX connectivity is not supported on Cisco Nexus 9500 Switches.

Note The Fabric Extender may connect to the switch through several separate physical Ethernet interfaces or at most one port channel interface.

This section describes how to manage Fabric Extender (FEX) on Cisco Nexus Switches through Cisco DCNM.

You can create and manage FEX from Cisco DCNM **Inventory > Switches**.

Note FEX tab is visible only if you choose a LAN device.

The following table describes the fields that appear on this page.

Table 2: FEX Operations

Field	Description
Add	Click to add a new FEX to a Cisco Nexus Switch.
Edit	Select any active FEX radio button and click Edit to edit the FEX configuration. You can create an edit template and use it for editing FEX. Select template type as POLICY and sub type as FEX.
Delete	Select the FEX radio button, and click Delete icon to delete the FEX associated with the switch.
Show	Allows you to view various configuration details for the selected FEX ID. You can select the following from the drop-down list. <ul style="list-style-type: none"> • show_diagnostic • show_fex • show_fex_detail • show_fex_fabric • show_fex_inventory • show_fex_module <p>The variables for respective show commands are displayed in the Variables area. Review the Variables and click Execute. The output appears in the Output area.</p> <p>You can create a show template for FEX. Select template type as SHOW and sub type as FEX.</p>

Field	Description
FEX History	Allows you to view the history of the FEX configuration tasks for a particular FEX. You can review the Event Type, Policy Name, Status, Time of Execution, User Name for the selected FEX.

Table 3: FEX Field and Description

Field	Description
Fex Id	Uniquely identifies a Fabric Extender that is connected to a Cisco NX-OS device.
Fex Description	Description that is configured for the Fabric Extender.
Fex Version	Specifies the version of the FEX that is associated with the switch.
Pinning	An integer value that denotes the maximum pinning uplinks of the Fabric Extender that is active at a time.
State	Specifies the status of the FEX as associated with the Cisco Nexus Switch.
Model	Specifies the model of the FEX.
Serial No.	Specifies the configured serial number. Note If this configured serial number and the serial number of the Fabric Extender are not the same, the Fabric Extender will not be active.
Port Channel	Specifies the port channel number to which the FEX is physically connected to the Switch.
Ethernet	Refers to the physical interfaces to which the FEX is connected.
vPC ID	Specifies the vPC ID configured for FEX.

This chapter includes the following sections:

Add FEX

To add single-home FEX from the Cisco DCNM Web UI, perform the following steps:

Before you begin

You can add a Fabric Extender (FEX) to the Cisco Nexus Switches through the Cisco DCNM Web Client. If the FEX is physically connected to the switch, FEX will become online after it is added. If the FEX is not physically connected to the switch, the configuration is deployed to the switch, which in turn enables FEX when connected.

Note You can create only single homed FEX through **Inventory > Switches > FEX > Add FEX**. To create a dual-homed FEX, use the vPC wizard through **Configure > Deploy > vPC**.

Ensure that you have successfully discovered LAN devices and configured LAN credentials before you configure FEX.

Procedure

Step 1 Choose **Inventory > Switches > FEX**.

The **FEX** window is displayed.

Step 2 Click the **Add FEX** icon.

Step 3 In the General tab, in the **PORTCHANNEL** field, enter the interface port channel number which is connected to the FEX.

Step 4 In the **INT_RANGE** field, enter the interface range within which the FEX is connected to the switch.

Note Do not enter the interface range, if the interfaces are already a part of port channel.

Step 5 In the **FEX_ID** field, enter the ID for FEX that is connected to a Cisco NX-OS device.

The identifier must be an integer value between 100 to 199.

Step 6 Click **Add**.

The configured Single-home FEX appears in the list of FEXs associated to the device.

Edit FEX

To edit and deploy FEX from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > Switches > FEX**.

The **FEX** window is displayed.

Step 2 Select the FEX radio button that you must edit. Click **Edit FEX** icon.

Step 3 In the Edit Configuration window, from the Policy drop-down list, select **Edit_FEX** to edit the FEX configuration.

Step 4 Edit the **pinning** and **FEX_DESC** fields, as required.

Note If you initially configured port 33 on the parent switch as your only fabric interface, all 48 host interfaces are pinned to this port. If you provision another port, for example 35, then you must perform this procedure to redistribute the host interfaces. All host interfaces are brought down and host interfaces 1 to 24 are pinned to fabric interface 33 and host interfaces 25 to 48 are pinned to fabric interface 35.

Step 5 Click **Preview**.

You can view the generated configuration for the selected FEX ID. The following is a configuration example for FEX ID 101.

```
fex 101
pinning max-links 1
description test
```

- Step 6** After you review the configuration summary on the Preview window, on the Edit Configuration screen, click **Deploy** to deploy the FEX for the switch.

VDCs

This section describes how to manage Virtual Device Contexts (VDCs) on Cisco Nexus 7000 Switches through Cisco DCNM.

Users with the network administrator (network-admin) role can create Virtual Device Contexts (VDCs). VDC resource templates limit the amount of physical device resources available to the VDC. The Cisco NX-OS software provides a default resource template, or you can create resource templates.

You can create and manage VDCs from Cisco DCNM **Inventory > Switches > VDCs**. As Cisco DCNM supports DCNM on Cisco Nexus 7000 Series only, click an active Cisco Nexus 7000 Switch. After you create a VDC, you can change the interface allocation, VDC resource limits, and the high availability (HA) policies.

The following table describes the fields that appear on this page.

Table 4: VDC Operations

Field	Description
Add	Click to add a new VDC.
Edit	Select any active VDC radio button and click Edit to edit the VDC configuration.
Delete	Allows you to delete the VDC. Select any active VDC radio button and click Delete to remove the VDC associated with the device.
Resume	Allows you to resume a suspended VDC.
Suspend	<p>Allows you to suspend an active non-default VDC.</p> <p>Save the VDC running configuration to the startup configuration before suspending the VDC. Otherwise, you will lose the changes to the running configuration.</p> <p>Note You cannot suspend the default VDC.</p> <p>Caution Suspending a VDC disrupts all traffic on the VDC.</p>
Rediscover	Allows you to resume a non-default VDC from the suspended state. The VDC resumes with the configuration that is saved in the startup configuration.

Field	Description
Show	<p>Allows you to view the Interfaces and Resources that are allocated to the selected VDC.</p> <p>In the Interface tab, you can view the mode, admin-status, and operational status for each interface associated with the VDC.</p> <p>In the Resource tab, you can view the allocation of resources and current usage of these resources.</p>

Table 5: Vdc Table Field and Description

Field	Description
Name	Displays the unique name for the VDC
Type	<p>Species the type of VDC. The two types of VDCs are:</p> <ul style="list-style-type: none"> • Ethernet • Storage
Status	Specifies the status of the VDC.
Resource Limit-Module Type	Displays the allocated resource limit and module type.

Field	Description
HA-Policy <ul style="list-style-type: none"> • Single Supervisor • Dual Supervisor 	<p>Specifies the action that the Cisco NX-OS software takes when an unrecoverable VDC fault occurs.</p> <p>You can specify the HA policies for single supervisor module and dual supervisor module configurations when you create the VDC. The HA policy options are as follows:</p> <p>Single supervisor module configuration:</p> <ul style="list-style-type: none"> • Bringdown—Puts the VDC in the failed state. To recover from the failed state, you must reload the physical device. • Reload—Reloads the supervisor module. • Restart—Takes down the VDC processes and interfaces and restarts it using the startup configuration. <p>Dual supervisor module configuration:</p> <ul style="list-style-type: none"> • Bringdown—Puts the VDC in the failed state. To recover from the failed state, you must reload the physical device. • Restart—Takes down the VDC processes and interfaces and restarts it using the startup configuration. • Switchover—Initiates a supervisor module switchover. <p>The default HA policies for a non-default VDC that you create is restart for a single supervisor module configuration and switchover for a dual supervisor module configuration. The default HA policy for the default VDC is reload for a single supervisor module configuration and switchover for a dual supervisor module configuration.</p>
Mac Address	Specifies the default VDC management MAC address.
Management Interface <ul style="list-style-type: none"> • IP Address Prefix • Status 	Species the IP Address of the VDC Management interface. The status shows if the interface if up or down.
SSH	Specifies the SSH status

Note If you change the VDC hostname of a neighbor device after initial configuration, the link to the old VDC hostname is not replaced with the new hostname automatically. As a workaround, we recommend manually deleting the link to the old VDC hostname.

This chapter includes the following sections:

Add VDCs

To add VDC from the Cisco DCNM Web UI, perform the following steps:

Before you begin

Ensure that you have discovered the physical device using a username that has the network-admin role.

Obtain an IPv4 or IPv6 address for the management interface (mgmt 0) if you want to use out-of-band management for the VDC.

Create a storage VDC to run FCoE. The storage VDC cannot be the default VDC and you can have one storage VDC on the device.

Procedure

- Step 1** Choose **Inventory > Switches > VDC**.
The **VDC** window is displayed.
- Step 2** Click the **Add VDC** icon.
- Step 3** From the drop-down list, select the VDC type.
You can configure the VDC in two modes.
- [Configuring Ethernet VDCs](#)
 - [Configuring Storage VDCs](#)
- The default VDC type is Ethernet.
- Step 4** Click **OK**.
-

Configuring Ethernet VDCs

To configure VDC in Ethernet mode from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** In the General Parameter tab, specify the **VDC Name**, **Single supervisor HA-policy**, **Dual supervisor HA-policy**, and **Resource Limit - Module Type**.
- Step 2** In the Allocate Interface tab, select the network interfaces (dedicated interfaces membership) to be allocated to the VDC.

Click **Next**.

Step 3 In the Allocate Resource tab, specify the resource limits for the VDC.

Select the radio button and choose **Select a Template from existing Templates** or **Create a New Resource Template**. VDC resource templates describe the minimum and maximum resources that the VDC can use. If you do not specify a VDC resource template when you create a VDC, the Cisco NX-OS software uses the default template, vdc-default.

- If you choose **Select a Template from existing Templates**, from the **Template Name** drop-down list, you can select **None**, **global-default**, or **vdc-default**.

The template resource limits are detailed in the following below:

Table 6: Template Resource Limits

Resource	Minimum	Maximum
Global Default VDC Template Resource Limits		
Anycast Bundled		
IPv6 multicast route memory	8	8 Route memory is in megabytes.
IPv4 multicast route memory	48	48
IPv6 unicast route memory	32	32
IPv4 unicast route memory		
VDC Default Template Resource Limits		
Monitor session extended		
Monitor session mx exception		
Monitor SRC INBAND		
Port Channels		
Monitor DST ERSPAN		
SPAN Sessions		
VLAN		
Anycast Bundled		
IPv6 multicast route memory		
IPv4 multicast route memory		
IPv6 unicast route memory		
IPv4 unicast route memory		

Resource	Minimum	Maximum
VRF		

- If you choose Create New Resource Template, enter a unique **Template Name**. In the Resource Limits area, enter the minimum and maximum limits, as required for the resources.

You can edit individual resource limits for a single VDC through the Cisco DCNM **Web Client > Inventory > Switches > VDC**.

Click **Next**.

Step 4 In the Authenticate tab, you can allow the Admin to configure the password and also authenticate users using AAA Server Groups.

In the Admin User Area:

- Check the **Enable Password Strength Check** checkbox, if necessary.
- In the **Password** field, enter the admin user password.
- In the **Confirm Password** field, reenter the admin user password.
- In the **Expiry Date** field, click the down arrow and choose an expiry date for the admin user from the Expiry Date dialog box. You can also select **Never** radio button not to expire the password.

In the AAA Server Groups area:

- In the **Group Name** field, enter an AAA server group name.
- In the **Servers** field, enter one or more host server IPv4 or IPv6 addresses or names, which are separated by commas.
- In the **Type** field, choose the type of server group from the drop-down list.

Click **Next**.

Step 5 In the Management Ip tab, enter IPv4 or IPv6 Address information.

Click **Next**.

Step 6 In the Summary tab, review the VDC configuration.

Click **Previous** to edit any parameters.

Click **Deploy** to configure VDC on the device.

Step 7 In the Deploy tab, the status of the VDC deployment is displayed.

A confirmation message appears. Click **Know More** to view the commands that are executed to deploy the VDC.

Click **Finish** to close the VDC configuration wizard and revert to view the list of VDCs configured on the device.

Configuring Storage VDCs

To configure VDCs in storage mode from the Cisco DCNM Web UI, perform the following steps:

Before you begin

Create a separate storage VDC when you run FCoE on the device. Only one of the VDCs can be a storage VDC, and the default VDC cannot be configured as a storage VDC.

You can configure shared interfaces that carry both Ethernet and Fibre Channel traffic. In this specific case, the same interface belongs to more than one VDC. The shared interface is allocated to both an Ethernet and a storage VDC.

Procedure

-
- Step 1** In the General Parameter tab, specify the VDC **Name**, **Single supervisor HA-policy**, **Dual supervisor HA-policy**, and **Resource Limit - Module Type**.
- Step 2** In the Allocate FCoE Vlan tab, select the available **Ethernet Vdc** from the drop-down list. The existing Ethernet VLANs range is displayed. Select **None** not to choose any available Ethernet VDCs. You can allocate specified FCoE VLANs to the storage VDC and specified interfaces. Click **Next**.
- Step 3** In the Allocate Interface tab, add the dedicated and shared interfaces to the FCoE VDC.
- Note** The dedicated interface carries only FCoE traffic and the shared interface carries both the Ethernet and the FCoE traffic.
- You can configure shared interfaces that carry both Ethernet and Fibre Channel traffic. In this specific case, the same interface belongs to more than one VDC. FCoE VLAN and shared interface can be allocated from same Ethernet VDC.
- Click **Next**.
- Step 4** In the Authenticate tab, you can allow the Admin to configure the password and also authenticate users using AAA Server Groups.
- In the Admin User Area:
- Check the **Enable Password Strength Check** checkbox, if necessary.
 - In the **Password** field, enter the admin user password.
 - In the **Confirm Password** field, reenter the admin user password.
 - In the **Expiry Date** field, click the down arrow and choose an expiry date for the admin user from the Expiry Date dialog box. You can also select **Never** radio button not to expire the password.
- In the AAA Server Groups area:
- In the **Group Name** field, enter an AAA server group name.
 - In the **Servers** field, enter one or more host server IPv4 or IPv6 addresses or names, which are separated by commas.

- In the **Type** field, choose the type of server group from the drop-down list.

Click **Next**.

Step 5 In the Management Ip tab, enter IPv4 or IPv6 Address information.

Click **Next**.

Step 6 In the Summary tab, review the VDC configuration.

Click **Previous** to edit any parameters.

Click **Deploy** to configure VDC on the device.

Step 7 In the Deploy tab, the status of the VDC deployment is displayed.

A confirmation message appears. Click **Know More** to view the commands that are executed to deploy the VDC.

Click **Finish** to close the VDC configuration wizard and revert to view the list of VDCs configured on the device.

Edit VDC

To edit VDC from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > Switches > VDC**.

The **VDC** window is displayed.

Step 2 Select the VDC radio button that you must edit. Click the **Edit VDC** icon.

Step 3 Modify the parameters as required.

Step 4 After you review the configuration summary on the Summary tab, click **Deploy** the VDC with the new configuration.

Viewing Inventory Information for Modules

To view the inventory information for modules from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > View > Modules**.

The **Modules** window is displayed with a list of all the switches and its details for a selected Scope.

Step 2 You can view the following information.

- **Group** column displays the group name of the module.

- **Switch** column displays the switch name on which the module is discovered.
 - **Name** displays the module name.
 - **ModelName** displays the model name.
 - **SerialNum** column displays the serial number.
 - **2nd SerialNum** column displays the second serial number.
 - **Type** column displays the type of the module.
 - **Slot** column displays the slot number.
 - **Hardware Revision** column displays the hardware version of the module.
 - **Software Revision** column displays the software version of the module.
 - **Asset ID** column displays the asset id of the module.
 - **OperStatus** column displays the operation status of the module.
 - **IO FPGA** column displays the IO field programmable gate arrays (FPGA) version.
 - **MI FPGA** column displays the MI field programmable gate arrays (FPGA) version.
-

Viewing Inventory Information for Licenses

To view the inventory information for licenses from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > View > Licenses**.
- The **Licenses** window is displayed based on the selected Scope.
- Step 2** You can view the following information.
- **Group** column displays the group name of switches.
 - **Switch** column displays the switch name on which the feature is enabled.
 - **Feature** displays the installed feature.
 - **Status** displays the usage status of the license.
 - **Type** column displays the type of the license.
 - **Warnings** column displays the warning message.
-

Discovery

Starting from Cisco DCNM release 10.x, Cisco DCNM Web Client allows the **admin** to associate **user** to one or more device scope or group. That means you can only access and configure the associated group or scope devices based on Role Based Access Control (RBAC). Though you might not have the access to other users' associated devices, you can still see all the discovered devices under the **Inventory > Discovery** tab.

From the left menu bar, go to **Administration > Management Users**. You can create users and associate groups, manage remote authentication, and see all the connected clients. For more information about RBAC, navigate to [Management Users](#).

Adding, Editing, Re-Discovering, Purging and Removing LAN, LAN Tasks and Switch

Cisco DCNM Web Client reports information that is obtained by the Cisco DCNM-LAN devices.

Tip If the discovered Device is not in the scope of the current user the check box for the LAN Device in the LAN table grays out.

This section contains the following:

Adding LAN Switches

To add LAN switches from the Cisco DCNM Web UI, perform the following steps.

For any switch to be successfully imported into DCNM, the user defined on the switch via local or remote AAA, and used for import into DCNM should have the following permissions:

- SSH access to the switch
- Ability to perform SNMPv3 queries
- Ability to run **show** commands

Procedure

-
- Step 1** Choose **Inventory > Discovery > LAN Switches**.
You see the list of LAN devices in the **Switch** column.
- Step 2** Click the **Add** icon to add LAN.
You see the **Add LAN Devices** dialog box.
- Step 3** Select **Hops from seed Switch** or **Switch List**. The fields vary depending on your selection.
- Step 4** Enter the **Seed Switch** IP address for the fabric.
For LAN Switches Discovery, DCNM allow both IPv4 and IPv6 address for the Seed Switch.

- Step 5** The options vary depending on the discovery type selected. For example, if you check **Use SNMPv3/SSH**, varied fields are displayed.
- Step 6** Click the drop-down list and choose **Auth-Privacy** security level.
- Step 7** Enter the **Community**, or user credentials.
- Step 8** Select the LAN group from the LAN groups candidates which is in the scope of the current user.
- Note** Select DCNM server and click **Add** to add LAN switches.
- Step 9** Click **Next** to begin the shallow discovery.
- Step 10** In the **LAN Discovery** window, you can select all switches by using the checkbox next to the switch name column or select individual switches. Click Previous to go back and edit the parameters.
- Note**
- In the Status column, if the switch status is **timeout** or **Cannot be contacted**, these switches cannot be added. Only the switches that are reachable and not managed yet are available to select. The checkbox is disabled for the switches that are not available
 - When you add or discover LAN devices in DCNM, java is used as a part of the discovery process. If firewall blocks the process then it uses TCP connection port 7 as a discovery process. Ensure that the **cdp.discoverPingDisable** server property is set to **true**. Choose **Web UI > Administration > DCNM Server > Server Properties** to set the server property.
- Step 11** Select a switch and click **Add** to add a switch to the switch group.
- If one of more seed switches is not reachable, it is shown as “unknown” on the shallow Discovery window.
-

Editing LAN Devices

To edit LAN devices from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > Discovery > LAN Switches**.
- Step 2** Select the check box next to the LAN that you want to edit and click **Edit** icon.
- You see the **Edit LAN** dialog box.
- Step 3** Enter the **Username** and **Password**.
- Note** Select **Credential** or **Management State** to change the Credential or Management state. If **Credential** is selected, you can change the SNMP version and Auth-Privacy if v3, username or password. If **Management State** is selected, you can change the status to managed or unmanaged.
- Step 4** Select the LAN status as **Managed** or **Unmanaged**.
- Step 5** Click **Apply** to save the changes.
-

Removing LAN Devices from Cisco DCNM

You can remove a LAN switch from Cisco DCNM.

Procedure

- Step 1** Choose **Inventory > Discovery > LAN Switches**.
 - Step 2** Select the check box next to the LAN that you want to remove and click **Delete** to remove the switches and all their data.
 - Step 3** Click **Yes** to review the LAN device.
-

Moving LAN Devices Under a Task

You can move LAN devices under a task to a different server using Cisco DCNM Web Client. This feature is available only in the federation setup and the Move LAN is displayed in the federation setup screen.

You can move the LAN from a server, which is down, to an active server. The management state remains the same.

Procedure

- Step 1** Choose **Inventory > Discovery > LAN Switches**.
 - Step 2** Choose the LAN devices from the LAN table. Click **Move**.
 - Step 3** In the **Move LAN Tasks to another DCNM Server** dialog box, enter the LAN Device to be moved and specify the DCNM server.
All the LAN devices under the selected tasks will be moved.
-

Rediscover LAN Task

Procedure

- Step 1** Choose **Inventory > Discovery > LAN Switches**.
 - Step 2** Click **Rediscover LAN**.
 - Step 3** Click **Yes** in the pop-up window to rediscover the LAN.
-

Adding, Editing, Re-Discovering, Purging and Removing the Managed Fabrics

Cisco DCNM reports information that is obtained by the Cisco DCNM-SAN on any fabric known to Cisco DCNM-SAN. To view the SAN Switches, choose **Inventory > Discovery > SAN Switches**.

The Status column of the SAN Switches page displays the fabric status.

- **managedContinuously**—The fabric is automatically managed when the Cisco DCNM-SAN server starts and continues to be managed until this option is changed to Unmanage.
- **managed**—The fabric is managed by Cisco DCNM-SAN Server until there are no instances of DCNM-SAN viewing the fabric.
- **unmanaged**—Cisco DCNM-SAN Server stops managing this fabric.

This section contains the following:

Adding a Fabric

Before you begin

Before you discover a new fabric, ensure that you create an SNMP user on the switch.

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- The **SAN Switches** window is displayed with a list of fabrics, if any, managed by Cisco DCNM-SAN.
- Step 2** Click **Add** to add a new fabric.
- The **Add Fabric** window appears.
- Step 3** Enter the **Fabric Seed Switch** IP address or DNS name for this fabric.
- Step 4** (Optional) Check the **SNMP** check box to use SNMPv3 or SSH. If you check the SNMP check box, the field **Community** changes to **Username** and **Password**.
- Step 5** Enter the **Username** and **Password** for this fabric.
- Step 6** Select the privacy settings from the **Auth-Privacy** drop-down list.
- Step 7** (Optional) Check the **Limit Discovery by VSAN** check box to specify the included VSAN list or excluded VSAN list from the VSANs provided to discover a new fabric.
- Step 8** (Optional) Check the **Enable NPV Discovery in all Fabrics** check box. If you check enable NPV discovery in all fabrics, the changes are applied to all the fabrics that are previously discovered.
- Step 9** Click **Options** and specify the **UCS Username** and **UCS Password**.
- Step 10** Select a DCNM server from the **DCNM Server** drop-down list.
- Note** This option is applicable only for Federation setups.
- Step 11** Click **Add** to begin managing this fabric.
- You can remove single or multiple fabrics from the Cisco DCNM Web Client.
-

Deleting a Fabric

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
 - Step 2** Select the check box next to the fabric that you want to remove.
 - Step 3** Click **Delete** to remove the fabric from the datasource and to discontinue data collection for that fabric.
-

Editing a Fabric

To edit a fabric from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- Step 2** Select the check box next to the fabric that you want to edit and click the **Edit** icon.
You see the **Edit Fabric** dialog box. You can edit only one fabric at a time.
- Step 3** Enter a new fabric **Name**.
- Step 4** (Optional) Check the SNMPV3 check box. If you check SNMPV3, the **Community** field change to **Username** and **Password**.
- Step 5** Enter the **Username** and **Password**, privacy and specify how you want DCNM Web Client to manage the fabric by selecting one of the status options.
- Step 6** Change the fabric management state to **Managed**, **Unmanaged**, or **Managed Continuously**.
- Step 7** Click **Apply** to save the changes.
- Step 8** To modify the password, go to from the Cisco DCNM Web UI, perform the following steps:
 - a) Choose **Inventory > Discovery > SAN Switches**.
 - b) Select the fabric for which the fabric switch password is changed.
 - c) Click **Edit**, unmanage the fabric, specify the new password, and then manage the fabric.

You will not be able to open the fabric as the new password is not be validated with the database.

You can go to **Administration > Credentials Management > SAN Credentials** to validate the password.

Moving Fabrics to Another Server Federation

This feature is only available on the federation setup and the Move Fabric is only displayed in the federation setup screen.

You can move the fabrics from a server, which is down, to an active server. The management state remains the same.

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- Step 2** Select the fabric(s) that you want to move to a different server, and then click **Move**.
- Step 3** In the **Move Fabric** dialog box, select the DCNM server where the fabrics will be moved.

The **To DCNM Server** drop-down list lists only the active servers.

Note The status of the Fabric will display **Unmanaged** for a few minutes, and displays **managedContinuously**, later.

Rediscovering a Fabric

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- Step 2** Select the check box next to the fabric and click **Rediscover**.
- Step 3** Click **Yes** in the pop-up window.

The **Fabric** is rediscovered.

Purging a Fabric

You can clean and update the fabric discovery table through the **Purge** option.

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- Step 2** Select the check box next to the fabric and click **Purge** fabric icon.
- Step 3** Click **Yes** in the pop-up window.

The **Fabric** is purged.

UCS Fabric Interconnect Integration

From Release 11.3(1), you can discover and manage UCS FI devices.

Enable Discovery

To allow Cisco DCNM to discover UCS FI server blade and service profile information, you must modify the **server.properties** file.

On the Cisco DCNM Web UI, choose **Administration > DCNM Server > Server Properties**. Locate the **fabric.enableUcsHttpDiscovery** property. Ensure that this value is set to **true**.

Discovering UCS FI devices

From Release 11.3(1), Cisco DCNM can discover UCS FI server blade and service profile from the Web UI. To discover UCS FI devices from the Cisco DCNM Web UI, perform the following steps:

Procedure

- Step 1** Choose **Inventory > Discovery > SAN Switches**.
- The SAN Switches window displays list of fabrics, if any, managed by Cisco DCNM-SAN.
- Step 2** Click **Add (+)** icon to add a new fabric.
- The Add Fabric window appears.
- Step 3** Enter the **Fabric Seed Switch** IP address or DNS name for this fabric.
- Step 4** (Optional) Check the **SNMP** check box to use SNMPv3 or SSH.
- If you check the SNMP check box, the field Community changes to Username and Password.
- Step 5** Enter the Username and Password for this fabric.
- Step 6** Select the privacy settings from the **Auth-Privacy** drop-down list.
- Step 7** (Optional) Check the **Limit Discovery by VSAN** check box to specify the included VSAN list or excluded VSAN list from the VSANs provided to discover a new fabric.
- Step 8** (Optional) Check the **Enable NPV Discovery in all Fabrics** check box.
- If you check enable NPV discovery in all fabrics, the changes are applied to all the fabrics that are previously discovered.
- Note** By default, the Cisco UCS FI is in NPV mode. Therefore, we recommend that you check the **Enable NPV Discovery in All Fabrics** check box.
- Step 9** Click **Options** and specify the UCS Username and UCS Password.
- Note** Username and password is the SNMP credential; while, UCS User Name and password is the UCS FI CLI admin credential.
- Step 10** Select a DCNM server from the DCNM Server drop-down list.
- This option is applicable only for Federation setups.
- Step 11** Click **Add** to begin managing this fabric.
- You can remove single or multiple fabrics from the Cisco DCNM Web Client.
- Note** UCS FI prohibits using SNMP user **admin**.
-

Creating SNMP User on UCS FI

To create a separate SNMP user on UCS FI, follow steps below.

Procedure

- Step 1** Login to UCS Manager.
Enter appropriate UCS FI IP Address to the web browser and click **Launch UCS Manager**.

- Step 2** Click **Admin** tab and choose **Communication Management > Communication Services**.
Step 3 In the SNMP section **Admin State** field, select **Enabled**.

The screenshot displays the UCS Manager interface for configuring Communication Services. The left-hand navigation pane is expanded to show 'Communication Services' under the 'Communication Management' category. The main content area is titled 'All / Communication Management / Communication Services' and contains the following configuration options:

- SNMP Configuration:**
 - Admin State: Enabled Disabled
 - Port: 161
 - Community/Username: Set: Yes
 - System Contact:
 - System Location:
- SNMP Traps:** A table with columns for Name, Community/Username, Port, Version, and v3Pri. The table is currently empty, displaying 'No data available'.
- SNMP Users:** A table with a single column for Name. It lists two users: 'admin' and 'dcmuser'.

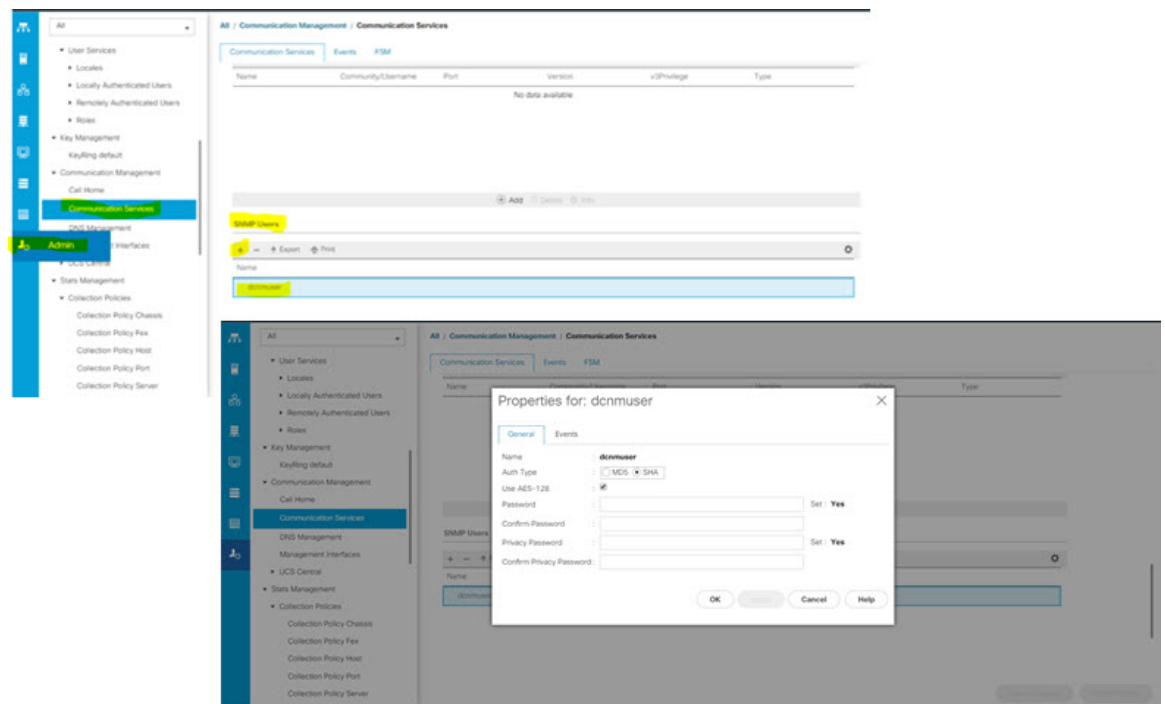

Step 4 Create a new SNMP user and provide the credentials.

UCS Manager 3.2(3) and later releases do not support MD5 authentication if SNMPv3 is in Federal Information Processing Standards (FIPS) mode.

Alternatively, use SHA with AES-128 encryption.

UCS FI supports SNMP communication over SHA_AES Authentication type only (not MD5). Therefore, you must configure SNMP user on both the UCS FI and all switches in the fabric, so that the DCNM can communicate with both the switches and the FI using that common user, such as **dcmuser**.

Step 5 Configure **dcmuser** on the UCS FI and set the SNMP password as **password1**. Note that this can be different from the **admin or read-only CLI user** password of the UCS FI, say **password2**.

On all the switches in the fabric, you must configure the same SNMP user **dcnmuser** as **network-admin** or **network-operator** with authentication type as **SHA_AES**.

```
MDS9396T-174145# show run | i dcnmuser
username dcnmuser password **** role network-admin
snmp-server user dcnmuser network-admin auth sha **** priv aes-128
**** localizedkey
MDS9396T-174145#
```

```
MDS9396T-174145# show snmp user
```

```

SNMP USERS
-----
User      Auth  Priv(enforce) Groups      acl_filter
-----
admin     md5   des(no)      network-admin
dcnmuser  sha   aes-128(no)  network-admin

NOTIFICATION TARGET USERS (configured for sending V3 Inform)
-----
```

```
User      Auth  Priv
-----
```

This applies to the Cisco NPV switches, also.

```
MDS9132T-1747# show feature | i npv
npv                1          enabled
```

```
MDS9132T-1747# show snmp user
```

```

SNMP USERS
-----
User      Auth  Priv(enforce) Groups      acl_filter
-----
```

Viewing the UCS FI Switches in the Inventory

```
admin          md5    des(no)    network-admin
dcmuser       sha    aes-128(no) network-admin    network-operator
```

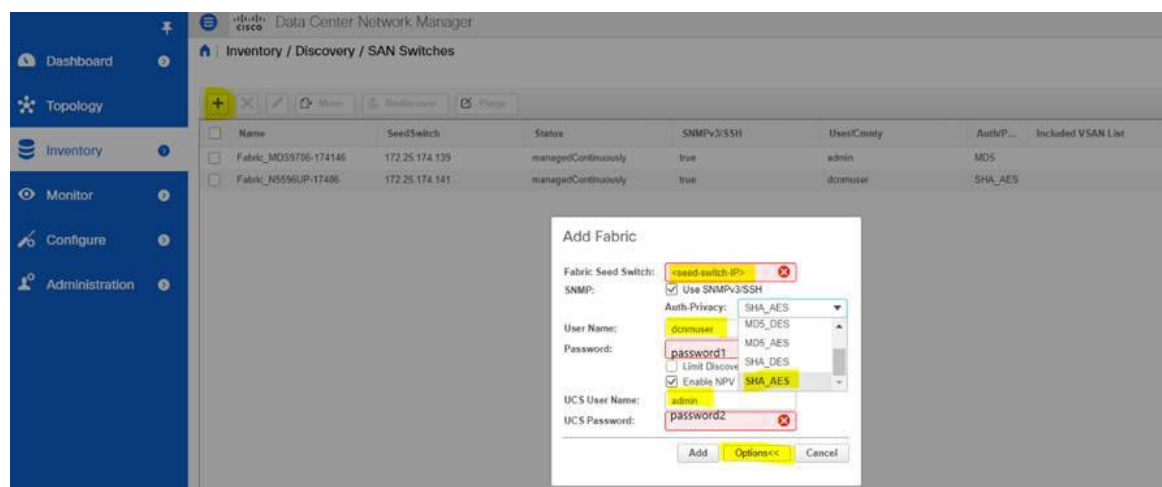

NOTIFICATION TARGET USERS (configured for sending V3 Inform)

```
User          Auth  Priv
_____      _____
```

Step 6 After the UCS FI and the switches are accessible using the same credentials, username: **dcmuser** and password: **password1**, you can discover the Fabric.

Choose **Inventory > Discovery > SAN Switches**, to discover the Fabric.

Note that you must use username: **admin or read-only CLI username** and password: **password2** for UCS FI.

Step 7 Verify if the UCS FI switches are listed on Cisco DCNM Web UI > **Inventory > Switches**. Ensure that the status of these switches are correct.

Viewing the UCS FI Switches in the Inventory

You can view the interfaces of the UCSFI switches through **Inventory > Switches > UCSFI > Interfaces**, on the Cisco DCNM Web Client.

The Interfaces tab shows the UCS FI interfaces and the Server Blades that they connect to.

Cisco Data Center Network Manager

Adding, Editing, Removing, Rediscovering and Refreshing SMI-S Storage

The SMI-S providers are managed using the Cisco DCNM Web UI.

This section contains the following:

Adding SMI-S Provider

To add an SMI-S provider from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > Discovery > Storage Devices**.

The **Storage Devices** window is displayed.

Step 2 Click the **Add SMI-S** provider icon.

The **Add SMI-S Provider** window is displayed.

Step 3 Use the drop-down to select the **Vendor**.

All the supported vendors are available in the drop-down list. More SMI-S storage vendors are discovered through a 'best effort' handler using the **Other** vendor option in the drop-down.

Note At least one valid DCNM license must be provisioned before adding the data sources for SMI-S storage discovery.

Step 4 Specify the **SMI-S Server IP**, **Username**, and **Password**.

Step 5 Specify the **Name Space** and **Interop Name Space**.

Step 6 By default, the **Port** number is prepopulated.

If you select the **Secure** checkbox, then the default secure port number is populated.

When using the **Secure** mode with EMC, the default setting is mutual authentication. For more information, see the EMC documentation about adding an SSL certificate to their trust store. Also, you can set `SSLClientAuthentication` value to *None* in the *Security_Settings.xml* configuration file and restart the ECOM service.

Step 7 Click **Add**.

The credentials are validated and if it's valid the storage discovery starts. If the credential check fails, you will be prompted to enter valid credentials.

Deleting SMI-S Provider

To delete the SMI-S provider from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > Discovery > Storage Devices**.

Step 2 Use the check-box to select the SMI-S provider and click **Delete** icon.

The provider is removed and all data that is associated with the provider is purged from the system.

Editing SMI-S Provider

To edit the SMI-S provider from the Cisco DCNM Web UI, perform the following steps:

Procedure

Step 1 Choose **Inventory > Discovery > Storage Devices**.

Step 2 Use the check-box to select the SMI-S provider and click the **Edit** SMI-S provider icon.

Step 3 In the **Edit SMI-S Provider** window, use the drop-down to select the **Vendor**.

Step 4 Specify the **SMI-S Sever IP**, **User Name** and **Password**.

Step 5 Specify the **Name Space** and **Interop Name Space**.

Step 6 By default, the **Port** number is pre-populated.

If you select the **Secure** checkbox, then the default secure port number is populated.

Step 7 Click **Apply**.

The storage discovery is stopped and a new task is created using the new information and the storage discovery is re-started.

Re-Discover SMI-S Provider

Procedure

- Step 1** Choose **Inventory > Discovery > Storage Devices**.
- Step 2** Use the check box to select the SMI-S provider and click **Rediscover SMI-S provider**.
-

Purge SMI-S Provider

Procedure

- Step 1** Choose **Inventory > Discovery > Storage Devices**.
- Step 2** Use the check box to select the SMI-S provider and click **Purge**.
- The providers are purged.
-

Adding, Editing, Re-Discovering and Removing VMware Servers

Cisco DCNM reports information that is gathered by Cisco DCNM-SAN on any VMware servers supported by Cisco DCNM-SAN.

Note Ensure that the SANdiscovered before you add the vCenter on the datasource.

This section contains the following:

Adding a Virtual Center Server

You can add a virtual center server from Cisco DCNM.

Procedure

- Step 1** Choose **Inventory > Discovery > Virtual Machine Manager**.
- You see the list of VMware servers (if any) that are managed by Cisco DCNM-SAN in the table.
- Step 2** Click **Add**.

You see the **Add VCenter** window.

- Step 3** Enter the **Virtual Center Server** IP address for this VMware server.
 - Step 4** Enter the **User Name** and **Password** for this VMware server.
 - Step 5** Click **Add** to begin managing this VMware server.
-

Deleting a VMware Server

You can remove a VMware server from the Cisco DCNM.

Procedure

- Step 1** Choose **Inventory > Discovery > Virtual Machine Manager**.
 - Step 2** Select the check box next to the VMware server that you want to remove and click **Delete** to discontinue data collection for that VMware server.
-

Editing a VMware Server

You can edit a VMware server from Cisco DCNM Web Client.

Procedure

- Step 1** Choose **Inventory > Discovery > Virtual Machine Manager**.
 - Step 2** Check the check box next to the VMware server that you want to edit and click **Edit** virtual center icon.
You see the **Edit VCenter** dialog box.
 - Step 3** Enter a the **User Name** and **Password**.
 - Step 4** Select managed or unmanaged status.
 - Step 5** Click **Apply** to save the changes.
-

Rediscovering a VMware Server

You can rediscover a VMware server from Cisco DCNM.

Procedure

- Step 1** Choose **Inventory > Discovery > Virtual Machine Manager**.
- Step 2** Select the check box next to the VMware that you want to rediscover.
- Step 3** Click **Rediscover**.

A dialog box with warning "Please wait for rediscovery operation to complete." appears.

Step 4 Click **OK** in the dialog box.
