CHAPTER 5

Configuring PKI

This chapter describes the Public Key Infrastructure (PKI) support on the Cisco NX-OS device. PKI allows the device to obtain and use digital certificates for secure communication in the network.

This chapter includes the following sections:

- Information About PKI, page 5-1
- Licensing Requirements for PKI, page 5-6
- PKI Guidelines and Limitations, page 5-6
- Configuring CAs and Digital Certificates, page 5-6
- Verifying the PKI Configuration, page 5-24
- Example PKI Configurations, page 5-24
- Default Settings, page 5-46
- Additional References, page 5-47
- Feature History for PKI, page 5-47

Information About PKI

This section provides information about PKI, and includes the following topics:

- CAs and Digital Certificates, page 5-2
- Trust Model, Trustpoints, and Identity CAs, page 5-2
- RSA Key Pairs and Identity Certificates, page 5-2
- Multiple Trusted CA Support, page 5-3
- PKI Enrollment Support, page 5-3
- Manual Enrollment Using Cut-and-Paste, page 5-4
- Multiple RSA Key Pair and Identity CA Support, page 5-4
- Peer Certificate Verification, page 5-4
- CRL Support, page 5-5
- Import and Export Support for Certificates and Associated Key Pairs, page 5-5
- Import and Export Support for Certificates and Associated Key Pairs, page 5-5
CAs and Digital Certificates

Certificate authorities (CAs) manage certificate requests and issue certificates to participating entities such as hosts, network devices, or users. The CAs provide centralized key management for the participating entities.

Digital signatures, based on public key cryptography, digitally authenticate devices and individual users. In public key cryptography, such as the RSA encryption system, each device or user has a key pair that contains both a private key and a public key. The private key is kept secret and is known only to the owning device or user only. However, the public key is known to everybody. Anything encrypted with one of the keys can be decrypted with the other. A signature is formed when data is encrypted with a sender’s private key. The receiver verifies the signature by decrypting the message with the sender’s public key. This process relies on the receiver having a copy of the sender’s public key and knowing with a high degree of certainty that it really does belong to the sender and not to someone pretending to be the sender.

Digital certificates link the digital signature to the sender. A digital certificate contains information to identify a user or device, such as the name, serial number, company, department, or IP address. It also contains a copy of the entity’s public key. The CA that signs the certificate is a third party that the receiver explicitly trusts to validate identities and to create digital certificates.

To validate the signature of the CA, the receiver must first know the CA’s public key. Typically this process is handled out of band or through an operation done at installation. For instance, most web browsers are configured with the public keys of several CAs by default.

Trust Model, Trustpoints, and Identity CAs

The PKI trust model is hierarchical with multiple configurable trusted CAs. You can configure each participating device with a list of trusted CAs so that a peer certificate obtained during the security protocol exchanges can be authenticated if it was issued by one of the locally trusted CAs. The Cisco NX-OS software locally stores the self-signed root certificate of the trusted CA (or certificate chain for a subordinate CA). The process of securely obtaining a trusted CA’s root certificate (or the entire chain in the case of a subordinate CA) and storing it locally is called CA authentication.

The information about a trusted CA that you have configured is called the trustpoint and the CA itself is called a trustpoint CA. This information consists of a CA certificate (or certificate chain in case of a subordinate CA) and certificate revocation checking information.

The Cisco NX-OS device can also enroll with a trustpoint to obtain an identity certificate to associate with a key pair. This trustpoint is called an identity CA.

RSA Key Pairs and Identity Certificates

You can obtain an identity certificate by generating one or more RSA key pairs and associating each RSA key pair with a trustpoint CA where the Cisco NX-OS device intends to enroll. The Cisco NX-OS device needs only one identity per CA, which consists of one key pair and one identity certificate per CA.

The Cisco NX-OS software allows you to generate RSA key pairs with a configurable key size (or modulus). The default key size is 512. You can also configure an RSA key-pair label. The default key label is the device fully qualified domain name (FQDN).
Information About PKI

The following list summarizes the relationship between trustpoints, RSA key pairs, and identity certificates:

- A trustpoint corresponds to a specific CA that the Cisco NX-OS device trusts for peer certificate verification for any application.
- An Cisco NX-OS device can have many trustpoints and all applications on the device can trust a peer certificate issued by any of the trustpoint CAs.
- A trustpoint is not restricted to a specific application.
- An Cisco NX-OS device enrolls with the CA that corresponds to the trustpoint to obtain an identity certificate. You can enroll your device with multiple trustpoints which means that you can obtaining a separate identity certificate from each trustpoint. The identity certificates are used by applications depending upon the purposes specified in the certificate by the issuing CA. The purpose of a certificate is stored in the certificate as a certificate extension.
- When enrolling with a trustpoint, you must specify an RSA key pair to be certified. This key pair must be generated and associated to the trustpoint before generating the enrollment request. The association between the trustpoint, key pair, and identity certificate is valid until it is explicitly removed by deleting the certificate, key pair, or trustpoint.
- The subject name in the identity certificate is the fully qualified domain name for the Cisco NX-OS device.
- You can generate one or more RSA key pairs on a device and each can be associated to one or more trustpoints. But no more than one key pair can be associated to a trustpoint, which means only one identity certificate is allowed from a CA.
- If the Cisco NX-OS device obtains multiple identity certificates (each from a distinct CA), the certificate that an application selects to use in a security protocol exchange with a peer is application specific (see the “SSH Authentication Using Digital Certificates” section on page 6-2).
- You do not need to designate one or more trustpoints for an application. Any application can use any certificate issued by any trustpoint as long as the certificate purpose satisfies the application requirements.
- You do not need more than one identity certificate from a trustpoint or more than one key pair to be associated to a trustpoint. A CA certifies a given identity (or name) only once and does not issue multiple certificates with the same name. If you need more than one identity certificate for a CA and if the CA allows multiple certificates with the same names, you must define another trustpoint for the same CA, associate another key pair to it, and have it certified.

Multiple Trusted CA Support

The Cisco NX-OS device can trust multiple CAs by configuring multiple trustpoints and associating each with a distinct CA. With multiple trusted CAs, you do not have to enroll a device with the specific CA that issued the certificate to a peer. Instead, you can configure the device with multiple trusted CAs that the peer trusts. The Cisco NX-OS device can then use a configured trusted CA to verify certificates received from a peer that were not issued by the same CA defined in the identity of the peer device.

PKI Enrollment Support

Enrollment is the process of obtaining an identity certificate for the device that is used for applications. It occurs between the device that requests the certificate and the certificate authority.
Information About PKI

The Cisco NX-OS device performs the following steps when performing the PKI enrollment process:

1. Generates an RSA private and public key pair on the device.
2. Generates a certificate request in standard format and forward it to the CA.

**Note** The CA administrator may be required to manually approve the enrollment request at the CA server, when the request is received by the CA.

3. Receives the issued certificate back from the CA, signed with the CA’s private key.
4. Writes the certificate into a nonvolatile storage area on the device (bootflash).

Manual Enrollment Using Cut-and-Paste

The Cisco NX-OS software supports certificate retrieval and enrollment using manual cut-and-paste. Cut-and-paste enrollment means that you must cut and paste the certificate requests and resulting certificates between the device and the CA.

You must perform the following steps when using cut and paste in the manual enrollment process:

1. Create an enrollment certificate request, which the Cisco NX-OS device displays in base64-encoded text form.
2. Cut and paste the encoded certificate request text in an e-mail or in a web form and send it to the CA.
3. Receive the issued certificate (in base64-encoded text form) from the CA in an e-mail or in a web browser download.
4. Cut and paste the issued certificate to the device using the certificate import facility.

Multiple RSA Key Pair and Identity CA Support

Multiple identity CAs enable the device to enroll with more than one trustpoint, which results in multiple identity certificates, each from a distinct CA. With this feature the Cisco NX-OS device can participate in applications with many peers using certificates issued by CAs that are acceptable to those peers.

The multiple RSA key-pair feature allows the device to maintain a distinct key pair for each CA with which it is enrolled. It can match policy requirements for each CA without conflicting with the requirements specified by the other CAs, such as the key length. The device can generate multiple RSA key pairs and associate each key pair with a distinct trustpoint. Thereafter, when enrolling with a trustpoint, the associated key pair is used to construct the certificate request.

Peer Certificate Verification

The PKI support on a Cisco NX-OS device can verify peer certificates. The Cisco NX-OS software verifies certificates received from peers during security exchanges for applications. The applications verify the validity of the peer certificates. The Cisco NX-OS software performs the following steps when verifying peer certificates:

1. Verifies that the peer certificate is issued by one of the locally trusted CAs.
2. Verifies that the peer certificate is valid (not expired) with respect to current time.
3. Verifies that the peer certificate is not yet revoked by the issuing CA.
For revocation checking, the Cisco NX-OS software supports only the certificate revocation list (CRL). A trustpoint CA can use one or both of these methods to verify that the peer certificate has not been revoked.

Certificate Revocation Checking

The Cisco NX-OS software can check that revocation status of CA certificates. The applications can use the revocation checking mechanisms in the order that you specify. The choices are CRL, none, or a combination of these methods.

This section includes the following topics:

- CRL Support, page 5-5

CRL Support

The CAs maintain certificate revocation lists (CRLs) to provide information about certificates revoked prior to their expiration dates. The CAs publish the CRLs in a repository and provide the download public URL in all issued certificates. A client verifying a peer’s certificate can obtain the latest CRL from the issuing CA and use it to determine if the certificate has been revoked. A client can cache the CRLs of some or all of its trusted CAs locally and use them later if necessary until the CRLs expire.

The Cisco NX-OS software allows the manual configuration of predownloaded CRLs for the trustpoints, and then caches them in the device bootflash (cert-store). During the verification of a peer certificate, the Cisco NX-OS software checks the CRL from the issuing CA only if the CRL has already been cached locally and the revocation checking is configured to use the CRL. Otherwise, the Cisco NX-OS software does not perform CRL checking and considers the certificate to be not revoked unless you have configured other revocation checking methods.

Import and Export Support for Certificates and Associated Key Pairs

As part of the CA authentication and enrollment process, the subordinate CA certificate (or certificate chain) and identity certificates can be imported in standard PEM (base64) format.

The complete identity information in a trustpoint can be exported to a file in the password-protected PKCS#12 standard format. It can be later imported to the same device (for example, after a system crash) or to a replacement device. The information in a PKCS#12 file consists of the RSA key pair, the identity certificate, and the CA certificate (or chain).

Virtualization Support

Except for removing the configuration for a missing module, the configuration file operations are local to the virtual device context (VDC). You can remove the missing module configuration only from the default VDC. For more information on VDCs, see the Cisco Nexus 7000 Series NX-OS Virtual Device Context Configuration Guide, Release 4.1.
Licensing Requirements for PKI

The following table shows the licensing requirements for this feature:

<table>
<thead>
<tr>
<th>Product</th>
<th>License Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cisco NX-OS</td>
<td>PKI files require no license. Any feature not included in a license package is bundled with the Cisco NX-OS system images and is provided at no extra charge to you. For a complete explanation of the Cisco NX-OS licensing scheme, see the <em>Cisco Nexus 7000 Series NX-OS Licensing Guide, Release 4.1</em>.</td>
</tr>
</tbody>
</table>

PKI Guidelines and Limitations

PKI has the following configuration guidelines and limitations:

- The maximum number of key-pairs you can configure on a Cisco NX-OS device is 16.
- The maximum number of trust points you can declare on a Cisco NX-OS device is 16.
- The maximum number of identify certificates you can configure on a switch is 16.
- The maximum number of certificates in a CA certificate chain is 10.
- The maximum number of trust points you can authenticate to a specific CA is 10.
- Configuration rollbacks do not support the PKI configuration.

Configuring CAs and Digital Certificates

This section describes the tasks that you must perform to allow CAs and digital certificates on your Cisco NX-OS device to interoperate. This section includes the following sections:

- Configuring the Hostname and IP Domain Name, page 5-7
- Generating an RSA Key Pair, page 5-8
- Creating a Trustpoint CA Association, page 5-10
- Authenticating the CA, page 5-11
- Configuring Certificate Revocation Checking Methods, page 5-13
- Generating Certificate Requests, page 5-14
- Installing Identity Certificates, page 5-16
- Ensuring Trustpoint Configurations Persist Across Reboots, page 5-17
- Exporting Identity Information in PKCS#12 Format, page 5-18
- Importing Identity Information in PKCS#12 Format, page 5-19
- Configuring a CRL, page 5-20
- Deleting Certificates from the CA Configuration, page 5-22
- Deleting RSA Key Pairs from Your Switch, page 5-23
Configuring the Hostname and IP Domain Name

You must configure the hostname and IP domain name of the device if you have not yet configured them because the Cisco NX-OS software uses the fully qualified domain name (FQDN) of the device as the subject in the identity certificate. Also, the Cisco NX-OS software uses the device FQDN as a default key label when you do not specify a label during key-pair generation. For example, a certificate named DeviceA.example.com is based on a device hostname of DeviceA and a device IP domain name of example.com.

**Caution**

Changing the hostname or IP domain name after generating the certificate can invalidate the certificate.

**BEFORE YOU BEGIN**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

**SUMMARY STEPS**

1. `configure terminal`
2. `hostname hostname`
3. `ip domain-name name [use-vrf vrf-name]`
4. `exit`
5. `show hosts`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;switch# configure terminal&lt;br&gt;switch(config)#</td>
<td></td>
</tr>
<tr>
<td><code>hostname hostname</code></td>
<td>Configures the hostname of the device.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;switch(config)# hostname DeviceA</td>
<td></td>
</tr>
<tr>
<td><code>ip domain-name name [use-vrf vrf-name]</code></td>
<td>Configures the IP domain name of the device. If you do not specify a VRF name, the command uses the default VRF.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;DeviceA(config)# ip domain-name example.com</td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong>&lt;br&gt;switch(config)# exit&lt;br&gt;switch#</td>
<td></td>
</tr>
</tbody>
</table>
Generating an RSA Key Pair

You can generate an RSA key pairs are used to sign and/or encrypt and decrypt the security payload during security protocol exchanges for applications. You must generate the RSA key pare before you can obtain a certificate for your device.

BEFORE YOU BEGIN

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

SUMMARY STEPS

1. `configure terminal`
2. `crypto key generate rsa [label label-string] [exportable] [modulus size]`
3. `exit`
4. `show crypto key mypubkey rsa`
5. `copy running-config startup-config`
## Configuring CAs and Digital Certificates

### Step 1
**Command:**
```
configure terminal
```

**Example:**
```
switch# configure terminal
switch(config)#
```

**Purpose:** Enters global configuration mode.

### Step 2
**Command:**
```
crypto key generate rsa [label label-string] [exportable] [modulus size]
```

**Example:**
```
switch(config)# crypto key generate rsa
exportable
```

**Purpose:** Generates an RSA key pair. The maximum number of key pairs on a device is 16.

The label string is alphanumeric, case sensitive, and has a maximum length of 64 characters. The default label string is the hostname and the FQDN separated by a period character (.).

Valid modulus values are 512, 768, 1024, 1536, and 2048. The default modulus size is 512.

**Note** The security policy on the Cisco NX-OS device and on the CA (where enrollment is planned) should be considered when deciding the appropriate key modulus.

By default, the key pair is not exportable. Only exportable key pairs can be exported in the PKCS#12 format.

**Caution** You cannot change the exportability of a key pair.

### Step 3
**Command:**
```
exit
```

**Example:**
```
switch(config)# exit
switch#
```

**Purpose:** Exits configuration mode.

### Step 4
**Command:**
```
show crypto key mypubkey rsa
```

**Example:**
```
switch# show crypto key mypubkey rsa
```

**Purpose:** (Optional) Displays the generated key.

### Step 5
**Command:**
```
copy running-config startup-config
```

**Example:**
```
switch# copy running-config
startup-config
```

**Purpose:** (Optional) Copies the running configuration to the startup configuration.
Creating a Trustpoint CA Association

You must associate the Cisco NX-OS device with a trustpoint CA.

BEFORE YOU BEGIN

Ensure that you are in the correct VDC (or use the `switchto vdc` command).
Generate the RSA key pair (see the “Generating an RSA Key Pair” section on page 5-8).

SUMMARY STEPS

1. `configure terminal`
2. `crypto ca trustpoint name`
3. `enrollment terminal`
4. `rsakeypair label`
5. `exit`
6. `show crypto ca trustpoints`
7. `copy running-config startup-config`

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
<tr>
<td><strong>Example:</strong></td>
<td><code>switch# configure terminal</code>&lt;br&gt;<code>switch(config)#</code></td>
</tr>
</tbody>
</table>
| **Step 2** | `crypto ca trustpoint trustpoint-label` | Declares a trustpoint CA that the device should trust and enters trustpoint configuration mode. The `trustpoint-label` argument is alphanumeric, case sensitive, and has a maximum length of 64 characters.  
**Note** The maximum number of trustpoints that you can configure on a device is 16. |
| **Example:** | `switch(config)# crypto ca trustpoint admin-ca`<br>`switch(config-trustpoint)#` | |
| **Step 3** | `enrollment terminal` | Enables manual cut-and-paste certificate enrollment. The default is enabled.  
**Note** The Cisco NX-OS software supports only the manual cut-and-paste method for certificate enrollment. |
| **Example:** | `switch(config-trustpoint)# enrollment terminal` | |
| **Step 4** | `rsakeypair label` | Specifies the label of the RSA key pair to associate to this trustpoint for enrollment.  
**Note** You can specify only one RSA key pair per CA. |
| **Example:** | `switch(config-trustpoint)# rsakeypair SwitchA` | |
Chapter 5  Configuring PKI

Configuring CAs and Digital Certificates

Send document comments to nexus7k-docfeedback@cisco.com

Authenticating the CA

The configuration process of trusting a CA is complete only when the CA is authenticated to the Cisco NX-OS device. You must authenticate your Cisco NX-OS device to the CA by obtaining the self-signed certificate of the CA in PEM format, which contains the public key of the CA. Because the certificate of the CA is self-signed (the CA signs its own certificate) the public key of the CA should be manually authenticated by contacting the CA administrator to compare the fingerprint of the CA certificate.

**Note**
The CA that you are authenticating is not a self-signed CA when it is a subordinate CA to another CA, which itself may be a subordinate to yet another CA, and so on, finally ending in a self-signed CA. This type of CA certificate is called the **CA certificate chain** of the CA being authenticated. In this case, you must input the full list of the CA certificates of all the CAs in the certification chain during the CA authentication. The maximum number of certificates in a CA certificate chain is 10.

**BEFORE YOU BEGIN**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).
Create an association with the CA (see the Creating a Trustpoint CA Association, page 5-10).
Obtain the CA certificate or CA certificate chain.

**SUMMARY STEPS**

1. `configure terminal`
2. `crypto ca authenticate trustpoint-label`
3. `exit`
4. `show crypto ca trustpoints`
5. `copy running-config startup-config`

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>exit</code></td>
<td>Exits trustpoint configuration mode.</td>
</tr>
<tr>
<td><code>show crypto ca trustpoints</code></td>
<td>(Optional) Displays trustpoint information.</td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>
**Configuring CAs and Digital Certificates**

---

**Send document comments to nexus7k-docfeedback@cisco.com**

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>Enters global configuration mode.</td>
</tr>
</tbody>
</table>

**Example:**
```
switch# configure terminal
```

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 2</strong></td>
<td>Prompts you to cut and paste the certificate of the CA. Use the same name that you used when declaring the CA. The maximum number of trustpoints that you can authenticate to a specific CA is 10.</td>
</tr>
</tbody>
</table>

**Note** For subordinate CA authentication, the Cisco NX-OS software requires the full chain of CA certificates ending in a self-signed CA because the CA chain is needed for certificate verification as well as for PKCS#12 format export.

**Example:**
```
switch(config)# crypto ca authenticate admin-ca
input (cut & paste) CA certificate (chain) in PEM format; end the input with a line containing only END OF INPUT :
-----BEGIN CERTIFICATE-----
MIIC4jCCAvygAwIBAgIQBWDSlayyGZDRPSRI1jK02eJANBkgkhkig9w0OaQkADCBkDBmgN4GCsdGQsGSIbDQExcelARYW1hbmRzRZUBYaXNjby5oc2oAJIBgNVBAkMBW91dGwwDQYJKoZIhvcNAQEFBQAwHGUIMWgAFwAIAQGBwADSwAwSAJQwAAAM5fMADgHCQgAwEB/zAgEAAAB3HhE9yGgAcCwEAc9FECsZDAkHgYIKwYBBQUHAgEEIwIgCIIBCQAAMCAcEdwzDR0MAAQG9vdD1TAQJB/BAIuAiwEB/zADBiCVQ4EfgQJUjyjRoMbrCMMRujuOyBrQG6mWdN#awwYDRoFBoGwYJu6GcGgoGoHR0oDoyL3NzZS0wOC9DZXJ0RW5yb2xasL0FwYXJuYSYU6zMenBhMwYyNgwA1oIaQGh20s2T0vL1xnc3Nnts4XEn1cnRFbnJvLkGxcQXBhmc5hJyJl efficacy of certificate verification as well as for PKCS#12 format export.

Cisco Nexus 7000 Series NX-OS Security Configuration Guide, Release 4.1

OL-18345-01
Configuring Certificate Revocation Checking Methods

During security exchanges with a client, the Cisco NX-OS device performs the certificate verification of the peer certificate sent by the client. The verification process may involve certificate revocation status checking.

The Cisco NX-OS software provides the CRL method. You can configure the device to check the CRL downloaded from the CA. Downloading the CRL and checking locally does not generate traffic in your network. However, certificates can be revoked between downloads and your device would not be aware of the revocation.

**BEFORE YOU BEGIN**

Authenticate the CA (see the “Authenticating the CA” section on page 5-11).

Ensure that you have configured the CRL if you want to use CRL checking (see the “Configuring a CRL” section on page 5-20).

**SUMMARY STEPS**

1. `configure terminal`
2. `crypto ca trustpoint trustpoint-label`
3. `revocation-check {crl [none] | none}`
4. `exit`
5. `show crypto ca trustpoints`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>configure terminal</code></td>
</tr>
</tbody>
</table>
| Example: | switch# configure terminal  
switch(config)# | |
| **Step 2** | `crypto ca trustpoint trustpoint-label` | Specifies a trustpoint CA and enters trustpoint configuration mode. |
| Example: | switch(config)# crypto ca trustpoint admin-ca  
switch(config-trustpoint)# | |
| **Step 3** | `revocation-check {crl [none] | none}` | Configures the certificate revocation checking methods. The default method is `crl`. The Cisco NX-OS software uses the certificate revocation methods in the order that you specify. |
| Example: | switch(config-trustpoint)# revocation-check  
opensc none | |
| **Step 4** | `exit` | Exits trustpoint configuration mode. |
| Example: | switch(config-trustpoint)# exit  
switch(config)# | |
Generating Certificate Requests

You must generate a request to obtain identity certificates from the associated trustpoint CA for each of your device’s RSA key pairs. You must then cut and paste the displayed request into an e-mail or in a website form for the CA.

BEFORE YOU BEGIN

Ensure that you are in the correct VDC (or use the `switchto vdc` command).
Create an association with the CA (see the “Creating a Trustpoint CA Association” section on page 5-10).
Obtain the CA certificate or CA certificate chain.

SUMMARY STEPS

1. `configure terminal`
2. `crypto ca enroll trustpoint-label`
3. `exit`
4. `show crypto ca certificates`
5. `copy running-config startup-config`

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show crypto ca trustpoints</code></td>
<td>(Optional) Displays the trustpoint CA information.</td>
</tr>
<tr>
<td><code>crypto ca enroll trustpoint-label</code></td>
<td></td>
</tr>
<tr>
<td><code>exit</code></td>
<td></td>
</tr>
<tr>
<td><code>show crypto ca certificates</code></td>
<td></td>
</tr>
<tr>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>

</tbody>
</table>
Installing Identity Certificates

You can receive the identity certificate from the CA by e-mail or through a web browser in base64 encoded text form. You must install the identity certificate from the CA by cutting and pasting the encoded text.

**BEFORE YOU BEGIN**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

Create an association with the CA (see the “Creating a Trustpoint CA Association” section on page 5-10).

Obtain the CA certificate or CA certificate chain.

**SUMMARY STEPS**

1. `configure terminal`
2. `crypto ca import trustpoint-label certificate`
3. `exit`
4. `show crypto ca certificates`
5. `copy running-config startup-config`
### Configuring CAs and Digital Certificates

### Ensuring Trustpoint Configurations Persist Across Reboots

You can ensure that the trustpoint configuration persists across Cisco NX-OS device reboots.
Chapter 5 Configuring PKI

Configuring CAs and Digital Certificates

The trustpoint configuration is a normal Cisco NX-OS device configuration that persists across system reboots only if you copy it explicitly to the startup configuration. The certificates, key pairs, and CRL associated with a trustpoint are automatically persistent if you have already copied the trustpoint configuration in the startup configuration. Conversely, if the trustpoint configuration is not copied to the startup configuration, the certificates, key pairs, and CRL associated with it are not persistent since they require the corresponding trustpoint configuration after a reboot. Always copy the running configuration to the startup configuration to ensure that the configured certificates, key pairs, and CRLs are persistent. Also, save the running configuration after deleting a certificate or key pair to ensure that the deletions permanent.

The certificates and CRL associated with a trustpoint automatically become persistent when imported (that is, without explicitly copying to the startup configuration) if the specific trustpoint is already saved in startup configuration.

We recommend that you create a password protected backup of the identity certificates and save it to an external server (see the “Exporting Identity Information in PKCS#12 Format” section on page 5-18).

---

**Note**

Copying the configuration to an external server does include the certificates and key pairs.

Exporting Identity Information in PKCS#12 Format

You can export the identity certificate along with the RSA key pair and CA certificate (or the entire chain in the case of a subordinate CA) of a trustpoint to a PKCS#12 file for backup purposes. You can import the certificate and RSA key pair to recover from a system crash on your device or when you replace the supervisor modules.

---

**Note**

You can use only the bootflash:filename format when specifying the export URL.

BEFORE YOU BEGIN

Ensure that you are in the correct VDC (or use the switchto vdc command).
Generate an exportable RSA key pair (see the “Generating an RSA Key Pair” section on page 5-8).
Authenticate the CA (see the “Authenticating the CA” section on page 5-11).
Install an identity certificate (see the “Installing Identity Certificates” section on page 5-16).

SUMMARY STEPS

1. configure terminal
2. crypto ca export trustpoint-label pkcs12 bootflash:filename
3. exit
4. copy bootflash:filename scheme://server[/url]filename
**Send document comments to nexus7k-docfeedback@cisco.com**

## Chapter 5  Configuring PKI

### Configuring CAs and Digital Certificates

#### Detailed Steps

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> switch# configure terminal switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> crypto ca export trustpoint-label pkcs12 bootflash:filename password</td>
<td>Exports the identity certificate and associated key pair and CA certificates for a trustpoint CA. The password is alphanumeric, case sensitive, and has a maximum length of 128 characters.</td>
</tr>
<tr>
<td><strong>Example:</strong> switch(config)# crypto ca export admin-ca pkcs12 bootflash:adminid.p12 nbv123</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> exit</td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Example:</strong> switch(config)# exit switch#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> copy bootflash:filename scheme://server/[url]/filename</td>
<td>Copies the PKCS#12 format file to a remote server.</td>
</tr>
<tr>
<td><strong>Example:</strong> switch# copy bootflash:adminid.p12 tftp:adminid.p12</td>
<td>For the <em>scheme</em> argument, you can enter <em>tftp:</em>, <em>ftp:</em>, <em>scp:</em>, or <em>sftp:</em>. The <em>server</em> argument is the address or name of the remote server, and the <em>url</em> argument is the path to the source file on the remote server. The <em>server</em>, <em>url</em>, and <em>filename</em> arguments are case sensitive.</td>
</tr>
</tbody>
</table>

### Importing Identity Information in PKCS#12 Format

You can import the certificate and RSA key pair to recover from a system crash on your device or when you replace the supervisor modules.

#### Note

You can use only the `bootflash:filename` format when specifying the import URL.

### Before You Begin

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

Ensure that the trustpoint is empty by checking that no RSA key pair is associated with it and no CA is associated with the trustpoint using CA authentication.

### Summary Steps

1. `copy scheme://server/[url]/filename bootflash:filename`
2. `configure terminal`
3. `crypto ca import trustpoint-label pkcs12 bootflash:filename`
4. `exit`
5. `show crypto ca certificates`
6. copy running-config startup-config

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td>copy <code>scheme://server[/url/]filename</code> <code>bootflash:filename</code></td>
</tr>
<tr>
<td>Example:</td>
<td>switch# <code>copy tftp:adminid.p12 bootflash:adminid.p12</code></td>
</tr>
<tr>
<td></td>
<td>Copies the PKCS#12 format file from the remote server. For the <code>scheme</code> argument, you can enter <code>tftp:</code> or <code>scp:</code>. The <code>server</code> argument is the address or name of the remote server, and the <code>url</code> argument is the path to the source file on the remote server. The <code>server</code>, <code>url</code>, and <code>filename</code> arguments are case sensitive.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td>configure terminal</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# <code>configure terminal</code></td>
</tr>
<tr>
<td></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td>crypto ca import <code>trustpoint-label</code> <code>pkcs12</code> <code>bootflash:filename</code></td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config)# <code>crypto ca import admin-ca pkcs12 bootflash:adminid.p12 nbv123</code></td>
</tr>
<tr>
<td></td>
<td>Imports the identity certificate and associated key pair and CA certificates for trustpoint CA.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td>exit</td>
</tr>
<tr>
<td>Example:</td>
<td>switch(config)# <code>exit</code></td>
</tr>
<tr>
<td></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td>show crypto ca certificates</td>
</tr>
<tr>
<td>Example:</td>
<td>switch# <code>show crypto ca certificates</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Displays the CA certificates.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td>copy <code>running-config</code> <code>startup-config</code></td>
</tr>
<tr>
<td>Example:</td>
<td>switch# <code>copy running-config startup-config</code></td>
</tr>
<tr>
<td></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>

**Configuring a CRL**

You can manually configure CRLs that you have downloaded from the trustpoints. The Cisco NX-OS software caches the CRLs in the device bootflash (cert-store). During the verification of a peer certificate, the Cisco NX-OS software checks the CRL from the issuing CA only if you have downloaded the CRL to the device and you have configured certificate revocation checking to use the CRL.

**BEFORE YOU BEGIN**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

Ensure that you have enabled certificate revocation checking (see the “Configuring Certificate Revocation Checking Methods” section on page 5-13).
**SUMMARY STEPS**

1. `copy scheme://server/[url]/filename bootflash:filename`
2. `configure terminal`
3. `crypto ca crl request trustpoint-label bootflash:filename`
4. `exit`
5. `show crypto ca crl name`
6. `copy running-config startup-config`

**DETAILED STEPS**

<table>
<thead>
<tr>
<th>Step</th>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong></td>
<td><code>copy scheme://server/[url]/filename bootflash:filename</code></td>
<td>Downloads the CRL from a remote server. For the <code>scheme</code> argument, you can enter <code>tftp:</code>, <code>ftp:</code>, <code>scp:</code>, or <code>sftp:</code>. The <code>server</code> argument is the address or name of the remote server, and the <code>url</code> argument is the path to the source file on the remote server. The <code>server</code>, <code>url</code>, and <code>filename</code> arguments are case sensitive.</td>
</tr>
<tr>
<td><strong>Step 2</strong></td>
<td><code>configure terminal</code></td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td><strong>Step 3</strong></td>
<td><code>crypto ca crl request trustpoint-label bootflash:filename</code></td>
<td>Configures or replaces the current CRL with the one specified in the file.</td>
</tr>
<tr>
<td><strong>Step 4</strong></td>
<td><code>exit</code></td>
<td>Exits configuration mode.</td>
</tr>
<tr>
<td><strong>Step 5</strong></td>
<td><code>show crypto ca crl trustpoint-label</code></td>
<td>(Optional) Displays the CA CRL information.</td>
</tr>
<tr>
<td><strong>Step 6</strong></td>
<td><code>copy running-config startup-config</code></td>
<td>(Optional) Copies the running configuration to the startup configuration.</td>
</tr>
</tbody>
</table>
Deleting Certificates from the CA Configuration

You can delete the identity certificates and CA certificates that are configured in a trustpoint. You must first delete the identity certificate, followed by the CA certificates. After deleting the identity certificate, you can disassociate the RSA key pair from a trustpoint. You must delete certificates to remove expired or revoked certificates, certificates that have compromised (or suspected to be compromised) key pairs, or CAs that are no longer trusted.

BEFORE YOU BEGIN

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

SUMMARY STEPS

1. configure terminal
2. crypto ca trustpoint trustpoint-label
3. delete ca certificates
4. delete certificate [force]
5. exit
6. show crypto ca certificates [trustpoint-label]
7. copy running-config startup-config

DETAILED STEPS

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Step 1</strong> configure terminal</td>
<td>Enters global configuration mode.</td>
</tr>
<tr>
<td>Example: switch# configure terminal switch(config)#</td>
<td></td>
</tr>
<tr>
<td><strong>Step 2</strong> crypto ca trustpoint trustpoint-label</td>
<td>Specifies a trustpoint CA and enters trustpoint configuration mode.</td>
</tr>
<tr>
<td>Example: switch(config)# crypto ca trustpoint admin-ca</td>
<td></td>
</tr>
<tr>
<td><strong>Step 3</strong> delete ca-certificates</td>
<td>Deletes the CA certificate or certificate chain.</td>
</tr>
<tr>
<td>Example: switch(config-trustpoint)# delete ca-certificate</td>
<td></td>
</tr>
<tr>
<td><strong>Step 4</strong> delete certificate [force]</td>
<td>Deletes the identity certificate. You must use the <code>force</code> option if the identity certificate you want to delete is the last certificate in a certificate chain or only identity certificate in the device. This requirement ensures that you do not mistakenly delete the last certificate in a certificate chain or only identity certificate and leave the applications without a certificate to use.</td>
</tr>
<tr>
<td>Example: switch(config-trustpoint)# delete certificate</td>
<td></td>
</tr>
</tbody>
</table>
Deleting RSA Key Pairs from Your Switch

You can delete the RSA key pairs on your device if you believe the RSA key pairs were compromised in some way and should no longer be used.

**Note**

After you delete RSA key pairs from a device, ask the CA administrator to revoke your device’s certificates at the CA. You must supply the challenge password that you created when you originally requested the certificates. See the “Generating Certificate Requests” section on page 5-14.

**BEFORE YOU BEGIN**

Ensure that you are in the correct VDC (or use the `switchto vdc` command).

**SUMMARY STEPS**

1. `configure terminal`
2. `crypto key zeroize rsa label`
3. `exit`
4. `show crypto key mypubkey rsa`
5. `copy running-config startup-config`
Verifying the PKI Configuration

To verify the PKI configuration, use the following commands:

<table>
<thead>
<tr>
<th>Command</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>show crypto key mypubkey rsa</code></td>
<td>Displays information about the RSA public keys generated on the Cisco NX-OS device.</td>
</tr>
<tr>
<td><code>show crypto ca certificates</code></td>
<td>Displays information about CA and identity certificates.</td>
</tr>
<tr>
<td><code>show crypto ca crl</code></td>
<td>Displays information about CA CRLs.</td>
</tr>
<tr>
<td><code>show crypto ca trustpoints</code></td>
<td>Displays information about CA trustpoints.</td>
</tr>
</tbody>
</table>

Example PKI Configurations

This section shows an example of the tasks that you can use to configure certificates and CRLs on Cisco NX-OS devices using a Microsoft Windows Certificate server.

Note: You can use any type of certificate server to generate digital certificates. You are not limited to using Microsoft Windows Certificate server.
Configuring Certificates on the Cisco NX-OS Device

To configure certificates on an Cisco NX-OS device, follow these steps:

---

**Step 1** Configure the device FQDN.
```
switch# configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
switch(config)# hostname Device-1
```

**Step 2** Configure the DNS domain name for the device.
```
Device-1(config)# ip domain-name cisco.com
```

**Step 3** Create a trustpoint.
```
Device-1(config)# crypto ca trustpoint myCA
Device-1(config-trustpoint)# exit
Device-1(config)# do show crypto ca trustpoints
trustpoint: myCA; key: 
revokation methods:  crl
```

**Step 4** Create an RSA key pair for the device.
```
Device-1(config)# crypto key generate rsa label myKey exportable modulus 1024
Device-1(config)# do show crypto key mypubkey rsa
key label: myKey
key size: 1024
exportable: yes
```

**Step 5** Associate the RSA key pair to the trustpoint.
```
Device-1(config)# crypto ca trustpoint myCA
Device-1(config-trustpoint)# rsakeypair myKey
Device-1(config-trustpoint)# exit
Device-1(config)# do show crypto ca trustpoints
trustpoint: myCA; key: myKey
revokation methods:  crl
```

**Step 6** Download the CA certificate from the Microsoft Certificate Service web interface (see the “Downloading a CA Certificate” section on page 5-28).

**Step 7** Authenticate the CA that you want to enroll to the trustpoint.
```
Device-1(config)# crypto ca authenticate myCA
input (cut & paste) CA certificate (chain) in PEM format; end the input with a line containing only END OF INPUT :
```
Example PKI Configurations

Step 12  Save the certificate configuration to the startup configuration.

Device-1# copy running-config startup-config
Example PKI Configurations

Chapter 5 Configuring PKI

Send document comments to nexus7k-docfeedback@cisco.com

Downloading a CA Certificate

To download a CA certificate from the Microsoft Certificate Services web interface, follow these steps:

**Step 1** From the Microsoft Certificate Services web interface, click **Retrieve the CA certificate or certificate revocation task** and click **Next**.

**Step 2** From the display list, choose the CA certificate file to download from the displayed list. Then click **Base 64 encoded** and click **Download CA certificate**.

**Step 3** Click **Open** in the File Download dialog box.
Step 4  In the Certificate dialog box, click **Copy to File** and click **OK**.

Step 5  From the Certificate Export Wizard dialog box, choose the **Base-64 encoded X.509 (CER)** and click **Next**.
Example PKI Configurations

Chapter 5 Configuring PKI

Example PKI Configurations

Send document comments to nexus7k-docfeedback@cisco.com

Step 6 In the File name: text box on the Certificate Export Wizard dialog box, enter the destination file name and click Next.

Step 7 In the Certificate Export Wizard dialog box, click Finish.
Step 8  
Enter the Microsoft Windows `type` command to display the CA certificate stored in Base-64 (PEM) format.
Requesting an Identity Certificate

To request an identity certificate from a Microsoft Certificate server using a PKCS#12 certificate signing request (CRS), follow these steps:

**Step 1**
From the Microsoft Certificate Services web interface, click **Request an identity certificate** and click **Next**.

**Step 2**
Click **Advanced Request** and click **Next**.
Step 3  Click Submit a certificate request using a base64 encoded PKCS#10 file or a renewal request using a base64 encoded PKCS#7 file and click Next.

Step 4  In the Saved Request text box, paste the base64 PKCS#10 certificate request and click Next. The certificate request is copied from the Cisco NX-OS device console (see the “Generating Certificate Requests” section on page 5-14 and “Configuring Certificates on the Cisco NX-OS Device” section on page 5-25).
Step 5  
Wait one or two days until the certificate is issued by the CA administrator.

Step 6  
Note that the CA administrator approves the certificate request.
Send document comments to nexus7k-docfeedback@cisco.com

**Step 7** From the Microsoft Certificate Services web interface, click **Check on a pending certificate** and click **Next**.

**Step 8** Choose the certificate request that you want to check and click **Next**.
Step 9  
Click **Base 64 encoded** and click **Download CA certificate**.

Step 10  
In the File Download dialog box, click **Open**.
Step 11  In the Certificate box, click Details tab and click Copy to File.... In the Certificate Export Dialog box, click Base-64 encoded X.509 (.CER), and click Next.

Step 12  In the File name: text box on the Certificate Export Wizard dialog box, enter the destination file name and click Next.
Step 13  Click Finish.

Step 14  Enter the Microsoft Windows **type** command to display the identity certificate in base64-encoded format.
Revoking a Certificate

To revoke a certificate using the Microsoft CA administrator program, follow these steps:

**Step 1** From the Certification Authority tree, click **Issued Certificates** folder. From the list, right-click the certificate that you want to revoke.

**Step 2** Choose **All Tasks > Revoke Certificate**.
Example PKI Configurations

Send document comments to nexus7k-docfeedback@cisco.com

Step 3
From the Reason code drop-down list, choose a reason for the revocation and click Yes.

Step 4
Click the Revoked Certificates folder to list and verify the certificate revocation.
Generating and Publishing the CRL

To generate and publish the CRL using the Microsoft CA administrator program, follow these steps:

**Step 1**
From the Certification Authority screen, choose *Action > All Tasks > Publish.*

**Step 2**
In the Certificate Revocation List dialog box, click *Yes* to publish the latest CRL.
Example PKI Configurations

Chapter 5  Configuring PKI

Downloading the CRL

To download the CRL from the Microsoft CA website, follow these steps:

**Step 1**  From the Microsoft Certificate Services web interface, click Request the CA certificate or certificate revocation list and click Next.

**Step 2**  Click Download latest certificate revocation list.

**Step 3**  In the File Download dialog box, click Save.
Step 4  In the Save As dialog box, enter the destination file name and click Save.

Step 5  Enter the Microsoft Windows type command to display the CRL.
### Importing the CRL

To import the CRL to the trustpoint corresponding to the CA, follow these steps:

**Step 1**  
Copy the CRL file to the Cisco NX-OS device bootflash.

```
Device-1# copy tftp:aparnaCA.crl bootflash:aparnaCA.crl
```

**Step 2**  
Configure the CRL.

```
Device-1# configure terminal
Device-1(config)# crypto ca crl request myCA bootflash:aparnaCA.crl
Device-1(config)#
```

**Step 3**  
Display the contents of the CRL.

```
Device-1(config)# show crypto ca crl myCA
Trustpoint: myCA

Revocation Date: Nov 12 04:34:42 2005 GMT
Signature Algorithm: sha1WithRSAEncryption
1a:9f:1a:49:b7:9c:58:24:d7:72

Note
The identity certificate for the device that was revoked (serial number
0A338EA100000000074) is listed at the end.

**Default Settings**

Table 5-1 lists the default settings for PKI parameters.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>Trustpoint</td>
<td>None</td>
</tr>
<tr>
<td>RSA key pair</td>
<td>None</td>
</tr>
<tr>
<td>RSA key-pair label</td>
<td>Device FQDN</td>
</tr>
</tbody>
</table>
Table 5-1  Default PKI Parameters (continued)

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Default</th>
</tr>
</thead>
<tbody>
<tr>
<td>RSA key-pair modulus</td>
<td>512</td>
</tr>
<tr>
<td>RSA key-pair exportable</td>
<td>Enabled</td>
</tr>
<tr>
<td>Revocation check method</td>
<td>CRL</td>
</tr>
</tbody>
</table>
